As far as the choice of the metals of which the compensating balance is made is concerned, it is well to take two metals of very different degrees of dilatibility so that a sufficiency of counteraction of the two rods takes place, and producing the necessary compensation. Steel and brass are generally used, and by hardening the steel, the balance obtains more solidity, retains its shape better and is not so easily exposed to the danger of being bent. Other artisans of the trade construct the rods of platinum and brass, but this method, although very good, is not employed at present.

It is very important that the two metals forming the compensating rods be united very firmly, because in case that they should not adhere most perfectly, irregularities in their movements would take place and consequently in the rate of the watch. The method of fusing brass around steel is generally done in England; it is a good one, although equally as good is to solder the brass and steel together with silver solder; care is only necessary that the layer of solder uniting the two metals be equally thick everywhere around the circumference of the balance.

 JOSEPH B. BOWDEN.....Of J. B. Bowden & Co.  
 GEORGE R. HOWE.....Of Carter, Sloan & Co.  
 CHARLES G. LEWIS.....Of Randel, Baremore & Billings.

THE JEWELERS' CIRCULAR is the *exclusive* official paper of the Jewelers' League, and has been selected for the publication of all matters of interest pertaining thereto. Letters or inquiries pertinent to its business or purposes, and which might interest the trade or inquirers, will herein be answered. Address *Jewelers' League, Box 3,444, P. O., New York*, or the office of THE CIRCULAR.

At the regular meeting of the Executive Committee held Aug. 1st, 1884, there were present Vice-President Kimball, and Messrs. Johnson, Bowden, Howe and Sexton.

A double assessment was ordered on account of the deaths of H. W. Hurlburt, of Hartford, Conn., and George Frantz, of New Orleans, La.

- Two (2) members were reinstated.
- Seven (7) changes of beneficiaries were granted.
- Two (2) applications were rejected.
- Three (3) applications were referred.

The following twenty applicants were accepted:

M. L. Strasburger, H. H. L. Siebenerchen, F. H. Schultz, M. T. Rice, L. H. Cohn, New York City; F. S. Searles, Mt. Vernon, N. Y.; E. L. Heaton, Canton, N. Y.; F. Bauer, Pittsburg, Pa.; C. H. Barber, W. Philadelphia, Pa.; E. E. Parmelee, Meriden, Conn.; C. W. Hoyt, A. Clark, Stamford, Conn.; C. A. Ring, Waltham, Mass.; A. L. Lilienthal, Boston, Mass.; J. F. Teichner, Detroit, Mich.; T. J. Rodgers, New Orleans, La.; I. B. Callahan, Cincinnati, Ohio; J. H. Gilbert, Kansas City, Mo.; A. S. Bleyer, Central City, Neb.; J. F. Pietz, Fort Wayne, Ind.

The following resolution, out of respect to the memory of the late D. H. Hopkinson, was unanimously adopted:—

“It having been the edict of an omniscient Deity that our friend and brother D. H. Hopkinson should be removed by death from the fraternal, business and social circles of which he was such a useful member, we bow with resignation to the Divine will.

“Of our late associate we shall ever retain a pleasant memory.

As a member of our League he was active in any enterprise tending to promote its interests. In his capacity as editor of a widely known journal his pen was at all times ready and earnest in advocating the merits of the League in its benefactions to widows and orphans; in his business prompt, affable, considerate, kindly; in his social habits most genial, and painstaking in all the elements which tend toward an elevated, pure-minded plane of life.

“In this loss we have met with one which is well nigh irreparable; mourn it as we may, however, it can but appear as a contrast with that of his widow and child, with whom we join in sorrow and to whom we extend our heartfelt sympathy in their bereavement.”

**The Jewelers' Security Alliance.**

P. O. Box 3277.

Room 2, 170 Broadway, New York.

HON. ALGERNON S. SULLIVAN, *Counsel.*

THE REGULAR meeting of the Executive Committee was held at the office of the Alliance, 170 Broadway, on the 8th inst. There were present Messrs. Dodd, Sloan, Kimball, Alford, Bowden, Dorrance and Untermeyer.

The reports of Standing Committees were received and other routine business transacted. The quarterly report of the Treasurer was read, showing a steadily increasing general fund.

Action was also taken relative to the death of Mr. Hopkinson by the Chair appointing a Committee of Three, Messrs. Dodd, Sloan and Dorrance, to draft suitable resolutions to be tendered to Mrs. Hopkinson and placed on the records of the Alliance.

The following applicants were admitted to membership, viz.:

F. Kramer & Son, Baltimore, Md.; Geo. H. Morrill & Co., Boston, Mass.; Martin, Copeland & Co., New York City; Mason, Draper & Co., Attleboro Falls, Mass.; J. F. Pietz, Ft. Wayne, Ind.; Ernest Peschke, Macon, Ga.; Simons Bros., Columbus, O.; W. P. Sedgwick, Bath, N. Y.

NEW YORK, August 8th, 1884.

*Dear Madam:*

At a meeting of the Executive Committee of the Jewelers' Security Alliance, held at their room August 8th, a Resolution was adopted expressing the feelings of the Committee in view of the death of Mr. Hopkinson;

And a Committee was appointed to express to you our Sincere Sympathy in your great loss, feeling that we were not rudely trespassing upon the sacred precincts of your home, when we expressed our esteem and high regard for your deceased husband.

By his kind courtesy, his manly qualities, his high sense of honor, his interest in all that pertained to the welfare of the Jewelry Trade, he secured for himself the highest regard, not only of our Board, but of the entire Jewelry Trade.

Words but tamely express feelings on such an occasion, and we can only tender you our deep sympathy in this your irreparable loss.

Signed, { DAVID C. DODD, JR.  
 AUGUSTUS K. SLOAN.  
 E. F. DORRANCE.

## Review of the Different Gravity Escapements.

(Continued from May number.)

THE SCAPE WHEEL of the Dennison escapement is recently constructed with three, four, five and six prongs. The double three-pronged escapement, however, is used mostly, of which we add a sketch. Such an escapement is absolutely perfect for the larger kinds of steeple clocks, and on account of the larger number of prongs the wear and tear caused by hooks, etc., is here reduced to a minimum. The escapement itself consists of two separate three-pronged wheels, between which lie the arms  $m$  and  $n$ , and corresponding to this are also located the points of detent  $q$  and  $p$ , the shoulder  $q$  lies in front, and only operates upon the prongs  $A B C$ , while the shoulder  $p$  lies behind  $m$ , and only acts upon  $a b c$ . (C

does therefore not stand in contact with  $p$ , as would appear from the sketch.) Both detents are arranged in such a manner that the radii of the scape wheel form right angles with the arms  $m$  and  $n$ ;  $w w$  is the fly.

When the distance  $d$  of centers is a little smaller than  $2a$  ( $a$  is the length of tooth,) the points of contact of the scape wheel lie then truly in a hexagon; this is of no importance, however, but the reason why  $d$  is not exactly equal to  $2a$  in this case is because the axis of  $m$  and  $n$  are necessarily separated from each other, and the theoretical center, therefore, lies a little above the real.

The advantages of this escapement consist in that by the longer teeth and shorter arms  $m n$ , the resistance offered to the pendulum by pressure and friction is reduced and the drop of the arms is greater, and therefore their necessary effective weight becomes essentially smaller. This reduction of weight, or rather, diminution of the moment of inertia and of the blow upon the pendulum, or the friction upon its pivots is of the greatest importance, and much contributes to the constant operation of the pendulum. More recently, this double three-pronged escapement is also used for smaller clocks, and the six prongs are then made of wire, the elasticity of which is intended to prevent the blow upon the pendulum at each oscillation.

The pins for unlocking, close at the center of the scape wheel, are formed of a toothed wheel of six teeth, each second tooth of which is filed out.

*The four-pronged scape wheel.*—The same end, even if not as perfect, may also be obtained by a simple wheel with four prongs or teeth and eight unlocking pins, for the alternating forward and backward motion. The banking pins  $q$  and  $p$  are then also in different planes.

In this escapement the length of the scape wheel prongs and of the levers  $m n$  is not optional as is the case with the three-pronged, but it depends upon several geometrical axioms. If we designate with  $a$  the length of the teeth, and with  $d$  the distance of the theoretical center from the arms  $m n$ , we will find  $d = 2.6a$ , and  $p$  the distance from the lever center to the banking points equal to  $2.4a$  (with the

double three-pronged only  $1.73a$ ). The power necessary for a four-pronged scape wheel, therefore, is almost double as large as for a six-pronged, and smaller than for a three-pronged.

The four-pronged escape wheels as already said, operate perfect, although not as uniform as the double three-pronged in large clocks, which always contain a large quantity of superfluous power. The four-pronged escapement is employed for regulators, and the absolute weight of the levers is also lessened in them.

[THE END.]

## Advice to Watchmakers' Apprentices.

BY A MAN WHO HAS SPENT TWENTY YEARS AT THE BENCH.

AMONG THE old scraps of gold which accumulate in a jewelry store are many pieces which are more or less contaminated with soft solder, and as a very small amount of this material will render gold unfit to work, it stands one in hand to look out that none gets in with the scrap we melt. It is well to put all such bits as show any trace of this precious substance into a box by itself and treat it in the following manner: Take 4 ounces of muriatic acid and add  $\frac{1}{2}$  an ounce of crocus; put these two ingredients into a bottle and shake them well together. Put 1 ounce of this mixture into 4 ounces of boiling water in an ordinary tea cup; put the scrap gold contaminated with soft solder into the tea cup and keep the mixture hot over a lamp or gas jet and in a few minutes all the soft solder will be dissolved off leaving the scrap fit to be melted with other scrap gold. In a former article the writer gave a method of melting, and promised some future time to give additional methods for refining scrap and gold which worked badly. It is a business of a lifetime to be a proficient in gold melting, so many details have to be mastered; trifles in themselves but still going a long way in making up the sum of knowledge necessary to the gold worker. Economy is one essential thing in all jewelry repair shops. Save your scraps and filings; pick out all the scraps large enough to be picked up with the tweezers and put into your scrap to be melted. In regard to filings you should have a good-sized steel magnet to pass through your filings to remove all iron and steel filings and chips. The manner of using the magnet is to simply run the two poles of the magnet back and forth through the pan of the bench at which you work, brushing off the particles of iron as fast as they accumulate, letting the iron filing go into the sweep as they will mechanically carry away some gold. The sweepings of even a small place is far more valuable than most persons would imagine and should be carefully saved. The floor of a jewelry repair shop should be carefully laid to avoid cracks and corners. The best way if a floor is to be laid new is to have the plank of which the floor is to be laid well seasoned and quite narrow. After the floor is laid it should be well oiled with boiled linseed oil or painted with oil paint, and the cracks puttied with hard putty composed of white lead and coach varnish—the kind of coach varnish known as rubbing varnish—the puttying should be done after the oil is applied or the paint put on. The varnish putty is difficult to use as it dries very quickly; keep it under water except as fast as you use it. If you have an old floor full of cracks put sheet zinc over the whole floor where you work; let the sheets lap well, and if a hole wears through put a piece over it as soon as seen. A common soft wood floor will hold an unbelievable amount of scrap and filing to say nothing about the cracks. This is true also of oil cloth, and an old oil cloth which has been on the floor for any length of time should be burned and the ashes put into the sweepings. Scraps of paper and old match sticks lying on the floor should all go into the sweepings. These sweepings should be put in a tight box or barrel until enough have accumulated (say a barrel or two) to pay for burning. The way to burn sweepings is, if you use a stove clean it out when you are going to burn a lot of sweepings, and put the dirt with the scraps of paper in a little at a

time until all is reduced to ashes. A barrel of sweeping will be reduced in this way to two or three quarts; this reduction is another economy when you come to send it to the sweep smelters which it is better to do than to try and recover the precious metals it contains yourself. Such a melting furnace as the writer described in a former article is a good place to burn sweepings in. The residue of three or four barrels of sweeping can be put in an old paper flour sack, and the flour sack which will not permit a particle of anything it contains to escape can be put in a quite small box and shipped to your sweep smelter whom you will notify of the shipment and mention how you treated your sweep. After burning such a lot of sweepings you of course will be careful to remove every particle from the stove or furnace, as the gold being heavy will fall to the bottom. A person working gold or silver should brush his clothes and apron with a bristle clothes brush kept for this purpose before leaving his work. Filings can be treated as follows: It should be melted by itself with a flux composed of two parts of carbonate of potash (*sal tartar*), and one part of nitrate of potash (*saltpeter*). This flux will remove the iron and steel particles which escaped the magnet. The button of gold should be remelted with sal ammoniac and charcoal powder and cast in the ingot mould. If on attempting to roll it it cracks, it is a pretty sure indication that some lead or tin is present; but if the precaution given above is taken of treating the suspected scrap with the muriatic acid and crocus there is very little danger but the gold will come out in condition to roll and work well; but if it does crack remelt it with a flux of charcoal and corrosive sublimate, two parts (by weight) of charcoal to one of corrosive sublimate. This treatment will destroy the last trace of lead or tin. Sometimes one will get hold of old gold pens with iridium points; these points should be carefully removed as they are pernicious things to get into gold you have to work, being so hard that a file will not touch them, and they will also indent the hard steel rollers. If only one or two such points get into an ingot they should be instantly cut out with a small cold chisel. But if quite a number of such points should get into a lot of gold the way to proceed is to remelt the lot in a crucible which has a strongly marked hollow conical bottom. The heat should be raised (using fine charcoal as a flux) until the gold is rendered very fluid. The crucible should now be removed from the fire and allowed to cool. On removing the button from the crucible all the pen points will be found to have settled to the bottom of the crucible, and now are congregated at the very apex of the cone of the gold button. The reason for this is that iridium being heavier than gold (and not melting as easy), when the gold was in a melted state settled to the bottom. The part of the button containing the iridium points can now be cut off with a cold chisel and treated as follows: The gold can be dissolved in *aqua regia*—composed of two parts of muriatic acid to one of nitric acid; after the gold is dissolved the acid can be poured from the points (now visible and separated); to the gold solution add oxalic acid crystals until the brown deposit ceases; this brown deposit is pure gold and can be melted into a button with a blow pipe, using carbonate of potash as a flux.

#### Up and Down Indicator of the Mainspring.

M. AMEDEVILLE VALLET, says C. SAUNIER in the *Revue Chronométrique*, one of our deserving watchmakers of Bordeaux, lately sent to us a specimen of his new indicator to show the tension of the mainspring. It differs from that of Mr. Barthet in two particulars: 1. It is more simple; and, second, it utilizes the motions of the stop-work.

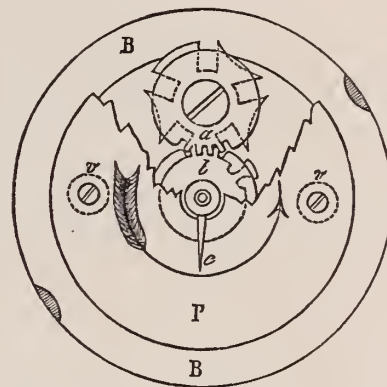

The following is the history that prompted the invention: A marine officer, who owned a fine watch, was constantly in doubt whether he had wound it or not. He inquired of M. Vallet whether a contrivance could be introduced that would indicate the state of

the spring's tension. The artisan went to work and devised the following:

He fastened a border upon the plate, to raise the dial, whereby the center rim of the case had to be made broader. Beside this, a hole was drilled through the dial, in the prolongation of the barrel.

After the parts had been prepared in this manner, he disposed the mechanism in the following manner:

The barrel cover *B B*, furnished with the ordinary stop-work (male and female stops), bears upon the female stop, firmly united with it and retained by the same screw, a toothed wheel *a*. Another wheel *b* depths into this wheel, similar to the minute canon. This wheel *b* revolves freely upon a pivot fixed in the barrel axis, and with gentle friction upon the male stop.

Over the whole is fixed to the barrel cover, upon two studs, shown in the dotted circles, by the screws *v v*, a disc *v P v*, perforated in the center to admit the canon of the wheel *b*. (This disc, which is supported upon the screw of the female stop, is broken away to exhibit the action of the pieces placed underneath).

The arrow, exhibited in the design, being traced upon the disc *v P v*, and a hand *c*, having been fitted upon the wheel canon *b*, it will at once be seen that as soon as the watch is wound the hand *c* of the wheel *b* will move toward the point of the arrow, and that when the axis has become immovable the barrel will move the hand *c* of the wheel *b* by means of the wheel *a* firmly united with the female stop, and move it toward the plumed end of the arrow.

This return motion is accomplished by divisions: The first must respond to the point of the arrow; the second to the base of its triangle; the third to the middle of the round and smooth arrow shaft; the fourth to the first plumes; and the fifth to the last; and, finally, the sixth (the spring is almost run down) to that position when the hand *c* stands at the extreme end of the arrow rod, which follows immediately after the plumed end (it has been forgotten by the engraver).

[It appears to us that a simple division in figures would be easier understood].

It is evident that before the arrow is drawn upon the disc *v P v*, to set the arrangement into motion, experiments must be instituted to establish the single points of the division.

#### The French Crown Jewels.

A EUROPEAN exchange—the *Gaulois*—contains some very interesting reminiscences, written by a French lady, who signs herself "Damed'Atours," prompted by the approaching sale of the French crown jewels. This time, it appears, they will be sold without reserve; although they were several times advertised to be sold, yet the dread that some plebeian democratic American—*ces sans culotte*—with more money than forefathers might be the purchaser, each time prevented them from being brought under the hammer; but times, especially in France, are hard, and money must be gotten somewhere, *cout qu'il cout*. But to return to the jewels.

The seven historical stones which were among the first diamonds

cut, and which were bought in Italy by Cardinal Mazarin whose name they still bear, formed part of the regalia in the reign of Louis XV. The collective value of these seven diamonds is estimated at \$1,300,000, but one of the seven is to be retained by the government, and this will considerably diminish the value of the six others. The only crown diamonds which Queen Marie Antoinette wore were the large acorn-shaped stones which she could arrange either as bracelets, necklaces or stomacher. She had some magnificent aigrettes and clasps, and a great many brooches for looping up her dresses, and diamond sprays; but these, like the splendid ear rings which she always wore, were her own property, and the greater portion was handed down to the Duchesse of Angauleme, the remainder being distributed among her friends. She did not like the diadem, and generally wore on state occasions the small crown which is placed at the back of the head. The Empress Josephine had a great fondness for colored stones, being of opinion that diamonds darkened her complexion; and as many of the ceremonies during the Empire took place in the daytime, she wore chiefly sapphires and rubies, which latter she styled the set off of brunettes (*le fard des brunes*). She often wore a row of flat pearls over the forehead. The Empress Marie Louise, being very fair, did not mind wearing diamonds, and she was also fond of sapphires; the splendid diadem of sapphires with the small crown of the same stones which are included in the projected sale, belonged to her. The Duchesse d'Angauleme wore the diamonds bequeathed to her by Marie Antoinette; and the Duchesse de Berry, who was renowned for her fair hair and shapely arms, wore her finest jewels mounted either as combs or bracelets—not the large combs and heavy bracelets of the First Empire, but smaller and more tasteful articles. Queen Marie Amélie, wife of Louis Philippe, sometimes wore in the form of a necklace, pearls belonging to the regalia; but she more frequently wore the sapphires and diamonds handed down by the Panthièvre family. Each princess of the Orleans family received at her marriage a full set of diamonds—diadem, necklace, ear rings, bracelets and sprays for the corsage, and was expected to wear them when presented at the Tuileries, those of the Duchesse d'Aumall being specially remarkable. The Duchesse de Montpensier received a very fine set of emeralds from the Spanish Court, which are now the property of her daughter, the Comtesse de Paris, and a curious story is told about them. A short time after his marriage, the Duc de Montpensier gave a large ball at Vincennes, and as the hairdresser had not arranged them in the duchesse's coiffure to his, the Duke's, liking, he took her hair down and arranged them according to his fancy, while the guests who had arrived first, were waiting for their host and hostess. The Empress Eugénie wore the crown jewels more frequently than any of her predecessors, and she completed the unequalled set of pearls, which, with its four necklaces, can be used as a stomacher or to garnish a train. The Empress, who for a long time would not wear any ornaments which increased the height of the forehead, had a very handsome Russian diadem which looks comparatively low on the forehead made for her. This diadem reversed makes a very pretty necklace. The Empress gradually got to like the higher setting diadems, and one which in later years she frequently wore is that of diamonds and turquoises which is included in the sale. She sold a short time ago a diadem of emeralds and brilliants which were her own property, and the so-called pigeon's-egg necklace of pearls which was bought by the late Madame de Paiva. Among the other pieces of jewelry mounted by her order is a large quantity of vine leaves and currants set in diamonds and very delicately wrought. This also will be sold.

#### A Stem Winder of the Last Century.

MANY WATCHMAKERS think that the stem winding arrangement, such as is ordinarily used at the present day, is a modern invention; nevertheless, every day brings additional proofs that the idea is far older than we are willing to give it credit for.

In the accompanying cut we give an interesting sketch of a stem winder used in an English watch, which was placed in our hands by our colleague M. P. Garnier. This watch is marked: "Frederic Kehlhoff, London, by his majesty's patent," and is recorded at London for the patent, in 1764; it is constructed in the style of Louis XV., without fusee, pin escapement, center seconds, with stop.

A single glance will inform the reader that by turning between the fingers the pendant *p* in an appropriate direction the wheel *d* will actuate the wheel *b*, which again causes to revolve wheel *a*, adjusted on the square of the barrel arbor. This last wheel, by its small click *i*, presses against a tooth of the ratchet, causes it to turn and winds the mainspring, while the large click *j*, whose center of motion is upon the plate, will prevent the ratchet from going back. At *C* is represented the development of the height proportions of the two clicks and ratchet. This part of the design shows that during the act of winding the watch the wheel *a* and its click pass under the large click at *C*.

When the watch has been wound the pendant is placed in a proper position by turning it in an opposite direction.—[C. SAUNIER, *Revue Chronométrique*.]

#### Rules of "Auld Lang Syne" for Owners of Watches.

[While hunting through our horological library we came across a French work, dated 1824, which contained the following set of rules to be observed by owners of watches]:

If the watchmaker is requested by a watch owner to furnish him with rules to be observed for the good care of his watch, let him do about as follows:

It is a main requirement for the preservation of the watch to always keep it clean. The dust is to be wiped off from the dial and out of the outer case, using a fine and clean linen or cotton handkerchief for the purpose, and from the corner and edges of the inner case rim it may be wiped away with a feather. Also for cleaning the key a feather is to be used; employ the plumed pointed end for the purpose or you may take a sharp piece of wood. Persons who are engaged in dusty or unclean avocations should not neglect to frequently clean their watches.

Dirt must never be permitted to collect to any excess in a watch nor must the oil be permitted to entirely dry up. When this happens the uniform rate is deteriorated, the pivots wear down, and the cylinders of cylinder watches wear out by the action of the scape wheel. It is advisable, therefore, to have a watch cleaned at least every three years and provided with new and good oil. Persons whose watch pocket is very hot must have their watches cleaned still more frequently because the oil dries quicker. This undue warmth may partly be guarded against by doubly lining the pocket. Inexperienced or ignorant persons in order to avoid paying the watchmaker for cleaning and repairing their timepiece often lubricate it themselves by supplying oil everywhere and in excessive quantities, as if they were greasing a door lock. This is decidedly injurious. Only the pivots and their holes must be lubricated, to be done with a small drop hanging to a fine wire as sharp as a needle.

Since humidity will cause metals to rust a watch should be kept as dry as possible. It should be opened only when required, least of all in dusty, smoky, damp places. Snuff takers should not take snuff when winding or opening their watch. \* \* \* \* It is well to wind the watch at the same hour every day, although this precaution is unnecessary when the fusee is truly made, since the watch must then go as correct in the first hour of its winding as in its last; it is but seldom, however, that we meet with a fusee so exact, and in the greater majority of cases we will find that the watch goes faster for the first hours than for the last. Such a watch can always be regulated in such a manner that the error will be compensated during the 24 hours; but if the watch were to be wound at different hours, then the compensation would no longer take place.

Neither is it advisable to wind the watch in very cold weather, because the mainspring snaps easily, nor should it be done on the street, so that no dust can enter, nor during walking, riding or driving, because the watch might be injured by the sudden jolts.

Many people believe that it is of advantage to let the spring run down at certain times so that it has the chance to stretch out and rest. This is a mistake. The spring cannot stretch out under these circumstances, and a watch that does not go is injured by reason of the rusting of the pivots and thickening of the oil. The rate of a watch that was not wound up for some time will always vary and must be regulated again. For these reasons it is also well to let a repeater strike sometimes to keep its repeating movement in order.

\* \* \* \* Many watchmakers will advise to keep the watch as near as possible in the same position, consequently a vertical one. According to others it is better to sometimes hang it up at night, and sometimes to keep it horizontal, changing sides; that is, at times with dial up and then again with dial down. If a watch hangs constantly there will be more wear on the lower sides of the pivot holes than at their end faces. If a watch is laid flat constantly, then the pivots will drill at their end faces and wear off visibly.

A watch must not be hung either on a window or a door that is continuously opened.

Its hands must never be moved with bare fingers but with the watch key which is to be placed upon the square of the canon pinion; it might happen that the hands are bent or broken with the fingers, beside this, the moisture of the latter would cause them to rust. It is not even advisable to turn the heads too often with the key, for instance, if it should have been forgotten to wind the watch, because the canon pinion becomes shaky thereby.

[And many other childish pieces of advice which a school boy of the present day would scoff at and consider insulting to his intelligence. We have learned various lessons since that time].

---

### Stage Diamonds.

[BY NYM CRINKLE.]

"Let me," said he, smilingly, "Rhea is going to have a dress of Spanish lace next season covered with the diamonds that she received from the Emperor of Russia, isn't she? She's going to wear it in her great role, eh?"

Such is the meagre but inflaming announcement that I have seen in the newspapers.

"Well," said he, "you ask Mr. Jimmy Morrissey to let you see the box that Mlle. Rhea's diamonds travel in when the campaign opens.

"Why the box? I don't want to see the box."

"Oh, yes you do. You want to look at it well and notice if it is made of mahogany, polished, with two heavy brass bands running round it with a crest engraved on them."

"And if I do notice all this?"

"Why then, you'll know that it's the regular old box and stock of diamonds that have been doing service for six or eight years. Let me see. The jewels started with Modjeska.

"See here," said he, seeing that I looked incredulous, "you don't mean to tell me that you are not up to the diamond dodge? Sit down there and I'll tell you something about it.

"In the first place, there are only two women familiar to American audiences who have got real diamonds enough to make an exhibition. One of them is Mme. Patti, the other is Mme. Janauschek, and they never do exhibit them.

"By the way, speaking of Janauschek, I see that the announcements of Ristori's coming are supplemented in one or two of the dramatic paragraphs with the additional intelligence that she is the greatest histrionic artist America has ever seen. That sounds very much as if America had never seen Rachel and hadn't got Janauschek yet. I wish you'd do me the favor to say that in my opinion Ristori never was and never will be as great an artist as Janauschek. She hasn't got the versatility, the emotion, the intensity or the power of Janauschek. Why, they played simultaneously here in 1866 and in the same roles, and if you go back to the criticisms of the *World* you will find that Janauschek walked away with the honors. Certainly nobody supposes that Ristori could play Hortense or Brunhilde, and after seeing Janauschek play Mr. Edwin Booth into the wings with her Lady Macbeth I don't think Ristori's artificial handling of that role would amount to much. But that isn't what I was going to tell you."

"No, it isn't! It was something about a mahogany box."

"Yes. Well, when Mr. H. J. Sargent started in the Modjeska season he had a countess on his hands who, so far as the theatrical business was concerned, was destitute of diamonds.

"She had some very fine jewels, as became a Polish nobleman's wife, but she wasn't going to have them trotted out. This annoyed Sargent, who knew perfectly well that in the Mississippi Valley there was an unassailable conviction that any foreign actress who had not received at least two diamond necklaces from the Emperor of Russia couldn't amount to much.

"One day when he had just got into—Buffalo, I think it was, to play that night, he saw in a jeweler's window a very showy necklace of stage diamonds. He went in and found that it had been made for Mary Anderson to wear in Pauline and she had refused to take it because her directions had not been followed with regard to the setting. 'How much do you want for it?' asked Sargent. 'Forty dollars,' said the jeweler. 'Give you thirty-five,' said Sargent. Then they compromised on thirty-seven.

"'Now, I want a box,' says the manager, and after running all over the town he got hold of a second-hand mahogany casket bound in brass. 'How long will it take you to polish this up and put two heavy handles on it?' he asked of the jeweler.

"'Have it done in an hour,' was the assurance of the obliging merchant.

In an hour Sargent was on his way to the theater with that box under his arm. He noticed with pensive care that the town had not thrilled much as yet under the flowing announcement that the Countess Bojenta would appear that night. Trade flowed on in its unbroken currents. Life was unperturbed. The great prosaic interests of the world did not appear to care whether Bojenta or Johannes had arrived.

"Mr. Sargent strode into the office of the theater. He was flushed and excited. 'Where's your safe?' he asked. They had not got any safe. He put the box down on the table and kept his hand on it. 'No safe!' he cried. 'What are you talking about? Do you know what's in that box? It's got jewelry in it worth \$50,000. I'm not going to take the responsibility of the thing any longer. Here, send to the police station. I must have a couple of men to watch it while I go to the bank.'

Then he got two officers to stay there and not take their eyes off the mahogany box, while he went off to the hotel and opened a bottle of wine. As he had shouted a good deal there was quite a group collected round the office. And in less than half an hour the Bojenta current began to stir along the sluggish street. He let it

work. When the two policemen were relieved the entire force knew of the Emperor of Russia's gift, and before 6 o'clock they had quadrupled the rumor by means of wives and sisters and sweet-hearts. At 8 o'clock there was only one person in that city who had not heard of the Emperor of Russia's gift.

"That person was the Countess Bojenta.

"The mahogany box worked so well that Sargent began to look upon it as a sort of Aladdin's lamp, and he rubbed it up every day and got a new idea.

"The first inspiration was to have it stolen. Hitherto only the policemen had made obeisance to it. Now the telegraph and the night editors fell down. The wires flashed it through sixteen States. The Emperor's diamond necklace was gone. A heavy reward was offered. It must have cost Sargent something to hire detectives to work up the case. I believe the *Bellefountain Bugle* published the original despatch of condolence from the Emperor of Russia.

"When the sympathy for Modjeska had become national, and there was some likelihood of the emotional women of the country making up a fund to replace her diamonds, a rash reporter forced an entrance to her boudoir one day when Sargent's back was turned, and found that her distress at the unparalleled loss was altogether disproportionate to the circumstances.

"An infamous and suborned press then began to give way to ignoble doubts about the robbery, and the *Bellefountain Bugle* even printed an editorial throwing suspicion not only on the Emperor's gift but upon the Emperor himself.

"Sargent was equal to the emergency. He took two of the most versatile and copious pressmen into his confidence. He pledged them to secrecy, that being the shortest cut to publicity. 'Now,' he said, 'I have a confession to make. I was so afraid that the Countess's jewels would be stolen that I had an imitation set made just like them for show purposes, and it was the imitation set that was stolen. The real gems are here.'

"With that he unlocked the safe and got out the mahogany box.

"'Gentlemen,' he observed, as he unlocked the box, 'you can examine those jewels. You can see for yourself whether they are of the first water. I'll send for an expert if you wish it.'

"The versatile and copious drew themselves up with dignity, 'As if,' they said, 'we are not experts enough to tell real gems like those from stage jewels!'

"This dodge worked very well for a few days. A new crop of stories broke out about the Emperor's necklace. But the original syndicate of night editors and local reporters who had sworn to the real robbery felt aggrieved. A committee waited on Mr. Sargent. 'See here,' said the spokesman, 'as we understand this thing, you agreed to have the real necklace stolen, not an imitation one. It's an outrage on the public and the press. You're a fraud.'

"'Go slow, my dear fellows,' said Sargent. 'I don't think you've got the thing right. If you will not give me away, I'll tell you. The fact is, I set that story going about the bogus necklace having been stolen, in hopes that it would reach the thieves and make them send back the real one. Of course, you saw the real necklace two months ago, and would know it if you saw it again.'

"The committee remarked that they should smile.

"'Very well,' said Sargent; 'here's the only necklace I've got now.'

"Then out came the mahogany box.

"'If you think that that is the genuine article, all I've got to say is, you are not up in stage jewels. If you'd like one of those pieces of glass as a souvenir, just pull it off.'

"The American press was pretty equally divided by this time on the question of the diamond necklace, and the American managers were getting to have a superstitious regard for Sargent and his box.

"But Sargent had got enough of it and he sold out the scheme to some other manager.

"I think it was six or eight months afterwards that Minnie Palmer lost her diamonds, and, meeting John Rodgers one day, he

began to tell me about it. 'The first thing the thieves took was a diamond necklace,' said he. 'But they left the casket.'

"Then out came the mahogany box.

"'John,' said I, 'I've seen that box before.'

"'Oh, well,' said he, 'I don't mind telling you privately that I had this made for show purposes'—

"John never got any further. We looked in each other's eyes and a dead silence reigned.

"Well, a year after, Kate Putnam began to be celebrated for her diamonds. I don't remember whether it was the Emperor of Russia or of Hayti who gave her a diamond necklace, but there was a great deal of anxiety observable in the press and the community for fear she'd be robbed; and Barron told me himself that the responsibility of it was undermining his health.

"'Let me see it,' I said.

"Then, by Jove, out came that mahogany box!

"'Never mind,' I said; 'you needn't open it. I've seen the necklace. The Emperor of Russia showed it to me before he presented it.'

"That ended Putnam.

"Well, the next one was Aimee. I suppose you know that Aimee at her last season in America, found it necessary to supplement her voice with a few diamond necklaces. I suppose Aimee had more Kohinoors than an Indian princess, and Grau asked me in one day to hear about it. 'Would you like to see some of the gems?'

"'Yes,' I said.

"By the eternal stones of Venice—out came that infernal mahogany box!

"'Look here, Grau,' said I, 'I can stand almost anything, but there's one thing that makes a fiend incarnate of me—it's a mahogany box. I'm surprised that you so far forget yourself.'

"He has never spoken to me since. Now, what I want you to do when you see Jimmy is to notice if the jewels that the Emperor of Russia gave Rhea are kept in a mahogany box, with two brass straps and a crest.'

"'I will.'"

### Superstitions Regarding Precious Stones.

A WRITER IN the July issue of the *London Jeweler and Metal Worker* contributes an interesting article relative to ancient and even modern superstitions regarding various precious stones. The writer had evidently ransacked numerous venerable authorities to obtain his information.

If any stone deserves worship for its beauty it is the opal; and, so rightly valued at its proper worth was the opal in olden days, that after ages admired the Roman senator who, when Marc Antony coveted his opal ring, went into voluntary exile, preferring to part with his country rather than his gem. Yet in these days there are numbers of people who will refuse the gift of an opal or sell any they may possess on account of its bad reputation as a bringer of bad luck and a dispeller of affection. Yet it was the reverse of an inauspicious stone in former days. According to Ohamakritus it was one of the stones that would insure the efficacy of prayer. According to Barquem the opal made the wearer lovable and conciliated love; it rejoiced the heart, preserved from poison and infection, dissipated melancholy and strengthened the sight. What, then, could be more desirable, either as a gift or a possession? Whence, then, arose the bad reputation of the opal?

Barbot, in his *Treatise on Precious Stones*, says that it is evidently due to its connection with the legend of Robert the Devil, without explaining further, while sometimes it is traced to the opal in Sir Walter Scott's *Anne of Gierstein*. It will be remembered that, in the weird tale of Anne's grandfather, the Persian lady whom he married possessed a marvellous opal, which, on the day of the christening of their child, when some holy water came in contact with it, first shot

out a brilliant spark, and was in the next instant "lightless and colorless as a common pebble." The Persian heroine fainted and died and was followed by her husband, Herman of Arnheim, three years afterward; and their granddaughter, referring to their history, said that she had heard of the opal growing pale, it being the nature of that noble stone to do so on the approach of poison, and Hermoine having been thought to have been poisoned by the jealous Baroness Steinfeld.

But it is evident that there is not enough in either of these tales to account for a total change of popular superstition, neither the legend of Robert the Devil nor of the Persian Hermoine having ever been sufficiently known to have had the slightest influence on common opinion. Till, therefore, some better explanation can be thought of, the wrong that is at present done to that fairest of all gems, the opal, must be set down as one of those freaks of superstition which is without justification or reason. But the superstition that yet lingers about the precious stones represents, happily, a fast diminishing quantity.

Who would think now of attributing to each stone a special influence over each month, and wearing, therefore, the sapphire in April, the agate in May, and so forth? Yet our ancestors did this, and even appropriated to twelve kinds of precious stones the twelve signs of the zodiac and the twelve apostles. Perhaps there was some pious intent in making the jasper the symbol of Saint Peter, the cysolite of Saint Matthew, or the uncertain beryl of the disbelieving Saint Thomas; but the modern spirit needs not these reminders, and their value at any time must have been very doubtful. But, smile as we may at the superstition that ruled in bygone times with regard to precious stones, we have to admit that it was not altogether without its brighter side. In the Dark Ages, for instance, it can have been no mean happiness to possess gems which, like the sapphire, ensured the fulfilment of prayer, or, like the diamond and amethyst, reduced war to a safe and pleasant pastime. What charm have we wherewith to face the perils and misfortunes of life comparable to the faith in their talisman which supported our ancestors?

### Obituary.

---

MONROE MARX.

MONROE MARX, junior partner in the firm of Kossuth Marx & Co., died at El Paso, Texas, Aug. 13th, 1884, after a brief illness. Mr. Marx was born in Syracuse, New York, April 28th, 1858, and graduated at the High School in that city at the age of fifteen. He then entered the office of M. H. Barber, a prominent insurance agent in Syracuse, where he remained over two years, his intelligence and capacity soon making him a trusted and confidential employee in the business and winning for him substantial advancement. He subsequently came to New York to engage in business with his brothers and became one of their representatives among their retail customers, traveling extensively in the west and southwestern section of the country. He was especially ambitious and successful in developing trade in new territory. On his usual southwestern trip at this season of the year he was overtaken by the disease that resulted in his death.

On the first of January last he was admitted to the firm as junior partner but continued to travel for the house. A telegram received by his brothers announced his illness at El Paso, and one of the employees was at once started for that city to care for him. On his arrival at St. Louis he was met by a dispatch announcing the death of Mr. Marx. He was sick only thirty-six hours, the doctors pronouncing his disease inflammation of the brain. His body was brought immediately to Syracuse for interment, his funeral being attended by many personal friends and business associates.

Monroe Marx was a young man of great energy and enterprise,

intelligent, ambitious and possessed of rare executive ability. He was quiet and gentlemanly in his deportment at all times, made friends readily and maintained their friendship permanently. There was something especially winning in his manners that tended to convert mere business acquaintances into personal friends almost immediately. He was a man of sterling integrity, extremely conscientious, painstaking and careful in all his transactions. His loss is a serious one to the firm of which he was a member and will be deeply mourned by all who knew him.

He was a member of the Jewelers' League and the New York Jewelers' Club.

---

JOHN S. BIRCH.

Mr. John S. Birch, of the firm of John S. Birch & Co., of this city, died July 26, of Bright's disease. He was known to the trade as the inventor and manufacturer of Birch's Patent Self-Adjusting and Adjustable Watch Keys, an ingenious device that has been very popular, and which brought to its inventor excellent pecuniary returns. Mr. Birch commenced business in this city in 1847 as a wholesale dealer in paper and paper hangings. He subsequently engaged in the manufacture of sewing silk, having a factory at Newark. He was also in the commission business, dealing in China and East India goods, and at another time in Japanese silks. As a merchant he met with severe reverses and was forced to give up business. Then he tried his fortunes in real estate and stock operations, but met with no better success. Being possessed of an inventive turn of mind, he devised and patented the Self-Adjusting Watch Key, which proved to be a success from the first and laid the foundation for his future prosperity. He was led on to make other inventions in other lines of industry, several of which proved to be useful and were well received. The only other devices of his known to the trade were his self-adjusting wrenches and key rings. Mr. Birch was a man of good intelligence, of indefatigable industry and unconquerable perseverance; he was kind and pleasant in his dealings with others, generous and charitable, and commanded the respect of all who knew him. Mr. Birch was 56 years of age, and left a widow but no children.

---

### Aristarchius Plumbago's Bicycle Watch Movement.

*To the Editor of the Jewelers' Circular.*

Through the columns of THE CIRCULAR the world has already been made aware of some of the beauties and important features of the bicycle movement, invented and patented by me. That conception or inspiration was borne in upon my gigantic intellect, as I have heretofore explained, while I was in temporary retirement through the machinations of over-zealous friends, in an asylum for erratic geniuses who are afflicted with an inordinate craving for things spiritual—in short, in an inebriate asylum. My brain reeled with excitement when I saw, in my mental laboratory, that it was possible to make a watch that would keep perfect time and serve a variety of other useful purposes, with only two wheels, a big one and a little one. In an excess of philanthropic benevolence I hastened to place before your many thousand readers the particulars of this creation of my superabundant intellect, and there is where I made my mistake. While this movement presented itself clearly to my mental vision, and there was painted upon the tissues of my brain the glowing panorama of the benefits that would come to the human race—of which I am No. 1—through the introduction of the bicycle movement, that movement had yet to be put in practical form and there was the rub. When I was released from surveillance I hastened to Chicago, where I knew business enterprise and unemployed capital existed in about equal proportions, determined to enlist both in the production of the greatest invention the world ever saw. Alas! to what bitter disappointment was I doomed! Enterprise I found most

certainly in unlimited quantities, and unemployed capital I heard of but could not grapple with. Like the small pox or the fever and ague I never could come into its actual presence, but learned that it was "just across the way" or "right round the corner;" whenever I put out my hand to clutch it, it melted away into air, into thin air like the baseless fabric of a vision. In short, the capital I required to develop my invention fought shy of me. I pursued it day and night but like the will-o'-the-wisp it eluded me, and led me into the quagmires of abject poverty and prospective starvation. Several persons, reputed to possess large amounts of unemployed capital, listened attentively to my eloquent descriptions of the bicycle movement; they showed apathy at first, then interest, and as my eloquence warmed with the theme, betrayed eager excitement. At the conclusion of my description they invariably said, "Show it to me." When informed that it existed only in my brain, and that I relied upon them for the means with which to clothe the child of my inspiration with visible shape and marketable form, they turned from me with averted eyes, and I am confident that I heard them make some remark about "crank." I hastened to explain that it was not a crank movement that I contemplated but a bicycle movement, but I could not prevail upon them to listen.

But light shone in upon me finally, and, as I wrote you, I made arrangements with a company that was about to erect factories at Stoneville for the manufacture of watches and jewelry, and supposed that the anserine fowl was suspended at the proper elevation. How easy it is to be mistaken. The Stoneville Company was full of promise, and promises was all I could get out of them. Supposing I had untold wealth at my command, I levied pecuniary contributions upon my friends to obtain my daily sustenance, and I am still indebted to them for the sums advanced. The Stoneville Company had no bottom; it was a visionary speculation inaugurated for the purpose of booming the town and selling corner lots of which the company owned many; in fact, they owned nothing but corner lots—they all cornered on a swamp that had no bottom but yielded an abundant crop of bull frogs and fever and ague. Thus was I deceived. Oh! it was cruel that I, Aristarchius Plumbago, public benefactor and professional philanthropist, should be deceived and defrauded by these guileless barbarians of the boundless prairie. But so it was, and the bicycle movement is as yet an airy nothing, floating in the innermost recesses of the brain of its great inventor whose name it shall yet make famous throughout the world. I can wait. I can illy afford to do so, but so long as kind friends continue their weekly contributions I shall rest quietly content for the appearance of that combination of enterprise and unemployed capital so necessary to my success, and for which my soul yearneth even as the soul of that Scripture fellow yearned seven years and more for his best girl.

But you have noted, of course, the consternation caused in the watchmaking industry of this country by the simple announcement of my bicycle movement. The great combinations of monopolists who are engaged in the manufacture of movements saw the announcement of my invention and read therein their doom. Their hearts quaked and their intangible legs trembled beneath their incorporeal bodies. They saw that the time had come when the price of movements would be brought so low that they could not compete in their production; when good, trusty, reliable bicycle movements in every imaginable form, and under every possible device would flood the market and drive them to the wall; they felt that the time was upon them when bicycle movements would be as common as wooden toothpicks in a cheap restaurant, and that they would have no hand in supplying this popular demand or in reaping the profits therefrom. They saw themselves dwarfing into insignificance and pecuniary impecuniosity, while the name of Aristarchius Plumbago, the blessed public benefactor, should wave from the tallest pinnacle in the temple of fame! They became demoralized and conjured among themselves how they should dispose of their stocks of movements on hand and save themselves from bankruptcy and ruin. The first thing to

be done was to stop the production, so factories were ordered to be closed, ostensibly for a summer vacation and cleaning up, workmen were discharged, the hum of busy machinery ceased to resound through the land. The factories that were filled with thousands of employees and abundant life and activity were stricken as if with palsy; the doors were locked and the shutters were put up; the sign "to rent" has not yet appeared upon them, but it is only a question of time when it will.

The next thing for these bloated monopolistic incorporeal incorporations to do was to get rid of the movements they had accumulated in anticipation of a continued demand. So they "put up a job"—to speak in popular parlance—on the trade to induce dealers to buy extensively. Emissaries were sent out to visit the dealers in every section and give them a quiet and confidential "tip" to the effect that they had private information that there were immense foreign orders for movements rolling in upon the watch companies, and that these were so great that it would take months to fill them; that in consequence there would be a scarcity of movements in this country; that the companies had grown so jealous of each other about these foreign orders that they were determined to underbid each other, and consequently there would soon be a cut in prices. The emissaries advised every dealer to buy up all the movements possible as soon as there was a break in prices. With such wild and delusive statements did the manufacturers seek to beguile the unwary dealers. Then came the other part of the programme; one company cut the price of its movements and advertised the fact liberally; then another followed with a reduction in price, and then another and another, till finally all of them had cut prices to a tremendous extent hoping thereby to get back at least the first cost of the movements. And all this was the result of the simple announcement that I was about to introduce my cheap but wholly reliable bicycle movement. If such demoralization followed the mere announcement of this greatest of modern discoveries, what will be the result when the movements are actually in the market? Why, these monopolies who have tried to act the part of the dog in the manger will find themselves, instead of respectable mastiffs, nothing but little skunks under the barn. Their efforts to save themselves are frantic but useless. By their own acts have they killed themselves.

But I made a mistake in announcing the bicycle movement before I was prepared to produce them in great quantities, and so take advantage of the popular tide in their favor. I should have waited, but my indiscretion in this respect has taught me to appreciate the truth of the remark that Napoleon made to Bismarck at the battle of Waterloo, "to rock the cradle when it is empty is injurious to the child." I should have waited till the child had assumed material shape and form. I want capital. A few millions of dollars advanced for the production of the bicycle movements will make the fortunes of those who contribute it. I am open to propositions, and hope to receive them speedily. Although at present in needy circumstances, I will not part with the control of the business. With my practical knowledge of mechanics, and my enlarged business ideas, I alone am a fortune to any who engage with me, and in addition I am willing to put into the business my incomparable inventions, including the bicycle movement, which is destined to revolutionize the watchmaking industry of the whole world. I appeal to enterprise and unemployed capital to come forward; I will meet them half way, and will guarantee that there are millions upon millions of dollars to be made. Unfortunately I cannot show a model of the bicycle movement, for the reason that the model makers to whom I have applied have ungenerously insinuated that a deposit would be required before they would do any work on my account, and my supply of deposits was exhausted. But the idea is perfected, and it is all mine. In the seething furnace of my brain I see the perfected bicycle movement as distinct and tangible to me as though made of brass or other base metal. Oh! why should civilization be forced to stay its progress for the lack of a few million dollars. I have my suspicions that the great monopoly watch companies are intriguing for my downfall, but

Aristarchus Plumbago, the great public benefactor, will rise above them all in defiance of their malignant detraction. Can you not send me a capitalist? It is not necessary that the millions of dollars alluded to should all be advanced at once. I tell you confidentially that for the present I could get along with the paltry sum of \$10. Do you know of anyone who will pay \$10 in cash for a half interest in the bicycle movement? If you do, give me his address; he's my mutton.

Yours expectantly,

ARISTARCHUS PLUMBAGO.

P. S.—I have just made an important discovery which will add another laurel to the crown which must eventually adorn my massive alabaster brow. I have discovered that the bicycle movement can be made with one wheel and two holes instead of two wheels and one hole. This will, of course, lessen the cost of production, for the holes can be made in sections and cut off to the requisite lengths. The profits will be proportionately greater. Oh! where! Oh! where! is that coming capitalist with a ten dollar note?

ARISTARCHUS P.

P. S. No. 2.—It has just dawned upon me that possibly I can dispense with one of the holes, and will now concentrate my intellect to solve this problem. Five dollars would aid me wonderfully at this critical moment. A wink is as good as a nod to a blind horse.

ARISTARCHUS P.

### Coloring and Polishing Brass Articles.

**I**N ORDER to prevent the constant oxidizing of brass articles, agents have for a long time been experimented with to protect the surface of these articles against the influence of the atmosphere, and the following method has been proposed as the most suitable and practicable one:

If brass is left for some time in moist sand it assumes a very handsome brown color, which, if polished with a dry brush, remains constant, and requires no cleaning or polishing. A darker or lighter green color may also be imparted if a thin layer of verdigris is created upon the surface by means of dilute acids, which are to be left on until dry. The antique appearance imparted to the brass in this manner is very handsome, and more or less durable. But it is not always possible, for want of time, to do this with each article, and a more rapid method for effecting the ends is therefore necessary, and the simplest way to do it is to cover the brass with a coating of varnish.

All the necessary work is to be done before the bronzing, and the brass annealed, dipped in old or dilute nitric acid until the scales can be loosened from the surface, which is then treated with sand and water and dried. The next step is to produce the desired bronze. Although this word actually signifies a brown color, being derived from the Italian word "bronzine," or, in English, "burned brown," it is rather loosely applied in the trades at present, and applied to all colors.

*Brown*, of all shades, is produced by immersion in a solution of nitrate or chloride of iron, whereby the strength of the bath determines the depth of the color.

*Violet* shades are obtained by immersing in a solution of chloride of antimony.

*Olive green*, if the surface is blackened by means of a solution of iron and arsenic in muriatic acid; it is then polished with a plumbago brush, and, when warm, coated with a lacquer composed of 1 part varnish lacquer, 4 parts turmeric, and 1 part gamboge.

A *steel gray* color is precipitated upon brass by means of a weak boiling solution of arsenic chloride. And a

*Blue* by an attentive treatment with a strong sulphide of soda.

*Black* is much used for optical instruments, and is produced by painting with a platinum solution or with chloride of gold mixed with nitrate of tin. The Japanese bronze their brass by boiling it in a solution of sulphate of copper, alum and verdigris.

The success in the art of bronzing chiefly depends upon circumstances, for instance, the temperature of the alloy or solution, the proportions and qualities of the material used for alloying, the proper moment at which the article is to be withdrawn, its drying and a hundred other minutiae of attention and manipulation require a skill only taught by experience.

If the brass is to receive no artificial color, but simply to be protected against tarnishing and oxidizing, it is to be lacquered after having been thoroughly cleansed. In order to prepare the brass for this coating it must be dipped, after having been annealed, and, as aforesaid, rinsed and washed, dipped either for a moment in pure commercial nitric acid and then washed in clean water and dried in sawdust, or immersed in a pickle of equal parts of nitric acid and water, until covered with a white coating of the appearance of curdled milk, when the article is taken out, rinsed in clean water and dried in sawdust. In the first case the brass becomes lustrous, in the latter it becomes mat, which is generally improved by smoothing and polishing the prominent places. The article is then dipped for a moment in nitric acid as found in commerce, and containing a little crude cream of tartar in order to preserve the color up to the moment of lacquering, and finally dried in warm sawdust. When prepared in such a manner the article is taken in hand to be lacquered, for which purpose it is first to be heated upon a hot plate to be lacquered afterward. For this purpose is used a simple alcohol varnish, consisting of 1 ounce shellac dissolved in 1 pint alcohol. To this simple varnish are afterward to be added the coloring substances, such as sanders wood, dragon's blood and annatto, which increase the luster of the color. In order to moderate the shading of the color, turmeric, gamboge, saffron, cape aloes and gum sandal are added. The first colors make the lacquer reddish, the second yellowish, while the two, when mixed, give a nice orange.

A good pale lacquer consists of 3 parts aloes and 1 part turmeric, to 1 part of the simple varnish. A gold lacquer is obtained by adding 4 parts dragon's blood and 1 part turmeric, to 1 part of the simple varnish, while a red lacquer is produced from 32 parts annatto and 8 parts dragon's blood, to 1 part of the varnish.

Lacquers are subject to chemical change by heat and light and therefore must be kept in a dark place. The vessels in which they are stored are generally of glass or clay, and the brushes with which they are applied must be camel hair and have no metallic parts about them.

### Agates and the Agate Industry.

**S**COTLAND, according to Professor Ruskin, is "itself one magnificent mineralogical specimen," and probably there is no similar area of the earth's surface from which so many mineral species have been obtained. These include a goodly number of the so-called "precious stones," as the topaz, the garnet, and such forms of silica as the cairngorm, bloodstone, jasper and agate. Scotland is famed for its agates, better known as "Scotch pebbles," which, although small compared with those found elsewhere, are yet unequaled in the variety and beauty of their colors. To the mineralogist, agates have the further attraction of being to some extent enigmas as regards their mode of formation. Professor Ruskin, in his recent paper to the Mineralogical Society, stated that the question of the production and painting of a Scottish pebble had been more or less the occupation of his best wits ever since childhood, yet he had not solved the problem. His advice, however, to the rising generation of mineralogists, that "a quick eye, a candid mind and an earnest heart were all the microscopes and laboratories they needed," raises the suspicion that the Professor's methods were defective. In the days when quick eyes were unaided by microscopes and laboratories, rock crystal was regarded as petrified ice, and agates were esteemed as an infallible specific in many diseases. Agates are found in trap and other ancient volcanic rocks where they lie like almonds in a cake. Their presence there is explained in the

following manner: When those palæozoic traps were molten lavas they were more or less saturated with steam, as many modern lavas are; and the expansion of this imprisoned vapor in the still plastic rock produced cavities throughout its mass, just as the gas generated by fermentation in bread gives rise to a cellular structure in the previously solid dough. Subsequently water, holding more or less carbonic acid in solution, filtered through the cellular trap rock and gradually dissolved out its silica, and this siliceous liquid entering the cavities, there deposited its mineral matter until these got filled up. Thus it is believed agates have come to be in those ancient trap rocks. The main difficulty lies in understanding the mode of entrance of the silica into the cavity so as to produce the concentric layers so characteristic of the agate. These in some cases are so fine that 100 of them may be counted in the space of a quarter of an inch. Dr. Reusch has shown how the agate structure may be strikingly reproduced artificially. He took an irregularly shaped cavity and introduced into it a thin cream of plaster of Paris, which, after shaking round, he poured out, thus leaving a thin coating of the material lining the interior. This was repeated with different colored creams of plaster until the entire cavity was filled up, and on cutting through the nodule thus formed the concentric layers of different colored plasters exactly reproduced the appearance of a banded agate. It is difficult, however, to see how such a process of rinsing the cavity with a solution of silica could have been effected in nature. Until lately the favorite theory was that the silica made its way into the hollow by a special opening termed the "point of infiltration;" the only argument, apparently, in favor of this view being the fact that many agates when cut show a channel somewhat resembling the neck of a bottle through which the agate-forming material was supposed to have flowed. On this theory, however, it is impossible to understand how the layers of silica should have been deposited of equal thickness all over the interior of the cavity as in most cases they are. The more generally accepted theory now is, that the solution of silica passed everywhere through the porous walls of the cavity by what is known as *osmosis*, and was thus deposited equally over its interior. A residual water gathered in the cavity, and as the latter got filled up with siliceous deposit, this water was gradually forced out through the so-called "point of infiltration," which thus formed a means, not of entrance, but of exit. "The point of infiltration," says Dr. Heddle, in a recent number of *Nature*, "instead of being at once filled up as would result from the inflow of coagulable silica, is in reality the last point filled up, being truly the point of escape; indeed, it frequently is not altogether filled up, remaining an open tube." The colors in different agate bands are due to the presence of oxides of iron and manganese, and partly also, it is supposed, to differences in rate of deposition; but why silica should deposit itself in one layer as chalcedony and in another as jasper, while in a third it is amethystine quartz, are points that still await explanation.

Scottish pebbles are found chiefly at Kinnoul Hill, near Perth, on the shore near Montrose, at Dungleigh, and at Burn Aune, near Galston, Ayrshire; but whether they occur on the shore or in river gravels they have been all previously washed out of trap rocks. The pebbles, cut by Edinburgh lapidaries, are used in the manufacture of Scottish jewelry. The chief seat of the agate industry of the world, however, is at Oberstein, in Rhenish Bavaria, where it has been carried on for centuries. It arose there naturally enough owing to the presence in the volcanic rocks of the neighborhood of abundance of fine agates; but it has continued and extended long after those rocks have ceased to yield, or at least to be mined for, the raw material of the industry. The agate quarries of Oberstein were abandoned owing to the discovery, fully half a century ago, of a rich supply of those stones in the river gravels of Uruguay. Some German workers in agate, who had emigrated to that region, noticed the courtyard of a farmhouse paved with pebbles that reminded them of the agates of their native Oberstein. Specimens were accordingly sent home and cut, and the surmise proved correct. Since that time

there has been a regular export of agate nodules from Uruguay to Oberstein, where they have long formed the staple material used in the agate mills. These "Brazilian agates," as they are called, when brought to Germany, are arranged in lots and sold by auction, stones of ordinary quality bringing, it is said, not more usually than 15s. per cwt. "German agates" are thus for the most part South American stones cut and polished at Oberstein. The extent of the industry has greatly increased with this accession of fresh material, and a few years ago there were no fewer than 153 agate mills working 724 grindstones, and giving employment altogether to about 3,000 persons. Cheapness of labor and a plentiful supply of water power have had much to do with the continuance of this industry at Oberstein. The labor is both ill-paid and severe. "The agate-worker," says Professor Rudler, who some years ago visited the mines and mills, "lies upon a low wooden grinding-stool, specially constructed to fit to the chest and abdomen, leaving the limbs free; the hands are engaged in holding and grinding the agate, whilst the feet are firmly pressed against short stakes or blocks of wood screwed into the floor; the reaction enabling the grinder to press the agate with much force against the moving millstone. The friction thus produced causes the agate to glow with a beautiful phosphorescent light, and red carnelians under this treatment look, it is said, as if they were red-hot. The millstones are of red sandstone, measure five feet in diameter, and generally make three revolutions per second. The finer agates are sliced by means of steel wheels and diamond or emery powder, but the coarser stones are simply chipped into shape and ground. Afterwards they are polished on rotating cylinders of wood or lead covered with moistened tripoli."

The ingenuity of the agate worker is not confined merely to cutting, carving and polishing his material into all manner of shapes. He has also succeeded in varying its color by artificial means. The layers composing an agate differ considerably in porosity, those that are transparent, for example, being less porous than opaque layers. Some, indeed, seem to be altogether impervious at ordinary temperature and pressure; and agate workers both at Oberstein and in India have availed themselves of this peculiarity in applying their staining processes. A suitable agate, after being thoroughly dried, is immersed in a mixture of honey and water or in olive oil, and is kept thus for at least three days exposed to a moderate heat. It is then washed, dried and put into a vessel containing enough of sulphuric acid to cover it. The vessel is thereafter exposed to a gentle heat for a varying number of hours, when the porous layers are found to have become much darker in color. The reason of this is that these layers, having become saturated with the syrup or oil, are acted upon by the sulphuric acid, which decomposes the sugary or oily constituent and forms in its place a deposit of carbon. It is in this way that banded agate is converted into the onyx with its black and white layers, used in the production of cameos and intaglios. Exposure to strong sunlight was long ago found to give a reddish tint to gray-colored agates, and this suggested the burning of such stones so as to convert them into carnelians. At Oberstein, likely stones for this purpose are first dried thoroughly, then saturated in sulphuric acid, and afterwards exposed in an earthenware crucible to a red heat. They are allowed to cool slowly and are then seen to be of a bright red color. Not content with imitating the rarer natural varieties of agate, such as onyx and carnelian, German manufacturers have taken to staining agates blue and all sorts of colors unknown in the natural stones. Aniline dyes, as unnatural as they are fugitive, have also been lately used for agate staining. It is possible that the stones themselves may yet be artificially produced—indeed, according to King, ("Natural History of Gems"), a Florentine anatomist long ago accomplished the feat, although unfortunately, the secret died with him. He is said to have petrified human viscera into real agates. "In the hospital of S. Spirito may be inspected still by the incredulous," says King, "a table-top made up of hearts, lungs, livers, etc., thus agatised into one large slab—meet board for a banquet of vampires!" Organic remains in agates are not unknown, for Bowerbank states that in the moss-agates of Oberstein he has found microscopic organisms; and Dr. Heddle that he has found undoubted organic remains of considerable size in agates from Ayrshire and other localities.

## Foreign Gossip.

PROGRESSIVE CIVILIZATION.—At a European scientific meeting a young lady read a paper "On the Blastophone of the Newt." After recovering our breath, we pause to ask, is civilization a failure?

HOME ELECTRICAL EXHIBITION.—Persons desiring to participate should remember that the International Electrical Exhibition will open at Philadelphia on September 2, and close on October 11.

ANOTHER EMINENT MAN GONE.—The demise is announced of Mr. A. S. Braithwaite, who, in conjunction with Mr. Ericson, designed the "Novelty," the locomotive which competed so closely with Stephenson's "Rocket" at the memorable trial in 1829. Mr. Braithwaite had been settled in New Zealand for many years, and died there recently, aged eighty-three.

MORE DIAMONDS.—At Bingera, New South Wales, the discovery of a new diamond field has been reported, which promises to rival the Kimberley diamond deposit of South Africa. A considerable number of fine diamonds have been discovered within the last few months. It is soon time that some poet will remodel Byron's celebrated line, "Thick as the leaves in Villambrosa." We tried it, but not being a poet, made several failures and gave it up in disgust.

"CARRYING COAL TO NEWCASTLE."—In former years it was often said by way of ridicule, of a man who did a gratuitous work, that he was "carrying coal to Newcastle," which was then the center of the English coal trade. This is about to become the sober truth, for we read in our English exchanges that the ship *Port Jackson* recently arrived at Liverpool from Sydney, New South Wales, with a cargo of 3,100 tons of Australian cannel coal for the Liverpool Gas Company.

MEETING OF GEOLOGISTS.—The International Geological Congress which has not met since the Bologna gathering in 1881, will hold a session next autumn in Berlin. The venerable Dr. Von Dechen has been appointed honorary president, while Professor Beyrich is the president of the organizing committee, and Dr. Hauchecorne the secretary. The meeting will extend from September 25 to 30, and will be followed by geological excursions from October 1 to 5. Arrangements of a very liberal character are being made for the reception of foreigners.

SPANISH EXPOSITION IN BERLIN.—It appears that the Prussian and Spanish governments have organized a mutual self-admiration society. A permanent exhibition of Spanish crude products is to be opened in Berlin, and a like one of ready German products will be opened in Madrid, to facilitate commercial intercourse between the two countries. This clear piece of policy was executed by the German Crown Prince during his recent visit to "El Rey Don Alphonso" of Spain, and is calculated to open a large market to Germany; beside this a commercial treaty has been effected between the two countries in which Germany is the favored nation.

CASTELLANI COLLECTION.—Very high prices were obtained for several lots at the twenty-one days' sale of the Castellani collection at Rome; thirty of the most valuable articles having been withdrawn, and those sold realized about \$140,000. A vase found in the Santa Maria Church at Capua, painted in various colors, brought \$5,000; a Greek mirror from Corinth, with bronze frame and figures of Venus and Cupid, \$770; a small statuette of an Etruscan warrior, a trifle above four inches in height, \$705, and a Diana in terra cotta, of a period a little later than Phidias, \$1,400. The terra cottas which the late Signor Castellani had purchased in Asia Minor realized the highest prices ever known; a figure of Victory, holding a gilt crown and a bouquet of flowers, was sold for \$1,240, and a Venus recumbent, for \$1,200. A large shrine made in the shape of a house, decorated with Limoges enamel, of the thirteenth century, by Raphael Grimaldi, was bought for the South Kensington Museum, of England, for \$5,100.

THE EXHIBITION AT PESTH.—We mentioned several months ago that an exhibition of goldsmith's work would be opened at Pesth, Hungary. Messrs. Franz and Karl Pulsky are the originators and promoters of this exhibition, and they have spared neither money nor trouble to make it a success. The imperial court, spiritual magnates, and wealthy abbey, temporal princes and magnates all were implored and offered their treasure, to adorn the exposition with the costliest and rarest works in their possession. It is said that there are mountains of gold and jewels exhibited, the commercial value of which is enormous, apart from the historical, artistical, and imaginary value.

A REMARKABLE FEAT IN TELEGRAPHY.—An achievement in telegraphy is reported by *The Telegraphist*, whose representative recently paid a visit to the offices of the Indo-European Telegraph Company, in Old Broad street, London, and was put into communication with the clerk in charge at Emden. After a few signals the line was opened to Odessa, and afterwards to Teheran. At the suggestion of the operator at Teheran, Keerachee was called, and the signals still found clear and good. Keerachee opened the line to Agra, and Agra switched on the line to Calcutta, and to the surprise of all concerned, the Calcutta operator asked, "Are you really London?" The signals were excellent and the speed no less than twelve words a minute. The total length was 7,000 miles of wire.

DISCOVERY OF A PYRAMID IN SONORA.—Our Mexican correspondent says that four leagues from Magdalena a pyramid has been discovered in the primeval forest. It measures 4,350 feet at base and 750 feet in altitude, which would make it to be twice as high as the pyramid of Cheops. A highway winds round about it and leads to the apex. The outer walls are carefully erected from large granite blocks. At a short distance is a hill of the same height, the surface of which is honeycombed with dwelling rooms dug into the rock. Hundreds of small rooms from 5 to 15 feet broad and 10 to 15 feet long are carefully excavated in the mountain-rock; they are generally eight feet high, with an entrance, but no window. The walls are covered with hieroglyphs and phantastical figures, and many stone tools lie about. It is supposed that these dwellings were built by the Mayos, an Indian tribe still in existence there, although it is only a surmise.

GARFIELD'S MONUMENT.—Professor Lenz, of Nuremberg, has obtained the order from San Francisco to cast the monument of President Garfield for this city. The model, made by the sculptor Happersberger, a native American at the time in Munich, represents the President in a standing position, with bared head, ("in simple citizen's dress," the German paper adds, perhaps in wonder that a President of the U. S. is not dressed up in the pomp and circumstance of office). The hands are lightly folded over each other, and the left clasps a document. The statue is 3½ meters high, and will stand upon a base of the same height. Upon the steps of the base sits a mourning female figure with a star diadem; its right hand seizes the sword, while the left deposits a wreath. On the sides of the base are to be introduced trophies of war and the American eagle. On the front side, underneath a large star, stands in large letters "GARFIELD."

THE PRESENT LINE OF VISIBILITY.—Although there is, perhaps, much to be desired in the improvement of microscopic objectives, we may still consider our present state quite an advanced one. Although the present theoretical limit of visibility is fixed at 146,528 lines to the inch, we need not be deterred from attempting to pass this point. The limit which was accepted some years ago as the true one, although considerably lower, was quietly ignored, as the angular aperture in objectives increased. It is only a few years ago that the majority of microscopists refused to believe that *A pellucida* which has about 100,000 lines to the inch, could be resolved, and now it is the work of beginners to do so. But supposing 146,528 lines to be the limit, it is evident that the one-eighth or one-tenth objective with a one-half inch eye-piece, is of amply sufficient magnifying power to make the lines visible to the eye, and there is therefore no need of using more. It is a good rule to follow, under all circumstances, not to use a greater power than is necessary to comfortably do the required work.

## Workshop Notes.

**TO MAKE GREEN GOLD.**—To make green gold, melt together nineteen grains of pure gold and five grains of pure silver. The metal thus prepared has a beautiful green shade.

**GOLD TINGE.**—A bright gold tinge may be given to silver by steeping it for a suitable length of time in a weak solution of sulphuric acid and water, strongly impregnated with iron rust.

**TO REMOVE GOLD.**—Gold is taken from silver by spreading over it a paste composed of pulverized sal ammoniac with aquafortis, and heating it till the matter smokes and is nearly dry, when the gold may be separated by rubbing with a scratch brush.

**TO RECOVER GOLD FROM GILT METAL.**—Take a solution of borax water, apply to the gilt surface, and sprinkle over it some finely powdered sulphur; make the article red hot and quench it in water; then scrape off the gold and recover it by means of lead.

**HOW TO MELT ALUMINUM.**—To melt alumina use a black lead crucible. Drive the alumina foil into an iron cone much the same shape as the bottom of the crucible, place the alumina in the crucible and cover with crude soda and charcoal pulverized together. Heat slowly.

**TO MAKE ALUMINUM GOLD.**—To make aluminum gold or bronze melt 90 parts copper with soda and borax for a flux, then add ten parts aluminum (all by weight) a little at a time by putting small pieces in a split stick of hard wood and pushing down to the bottom of the crucible. This mixture is of the color of gold, tough and malleable, and does not tarnish.

**FACETIOUS GOLD.**—It is averred that the following recipes will produce alloys of metals so nearly resembling genuine gold as to almost baffle goldsmiths without a resort to thorough tests. Fuse together with saltpeter, sal ammoniac and powdered charcoal, 4 parts platinum,  $2\frac{1}{2}$  parts pure copper, 1 part pure zinc, 2 parts block tin, and  $1\frac{1}{2}$  parts pure lead. Another good recipe calls for 2 parts platinum, 1 part silver and 3 parts copper.

**SILVEROID.**—Silveroid is the trade name given to a new, close-grained, brilliant white alloy, regarding the composition of which little is known beyond the fact that cadmium enters into it. It is intended to take the place of the brass, bronze and gun metal classes of alloys, and if all turns out to be true which is spoken in its favor it will soon do so, especially in the manufacture of articles which must be strong and capable of taking a fine polish.

**THE DIVISIONS OF TROY WEIGHT.**—Standard gold is compounded of 440 grains of fine gold and 40 grains (Troy weight) to the ounce of alloy; therefore, when you judge how much gold a piece of work will take, compound it to the standard weight by the following directions: *Assay weight*—The weight of gold is a pound, which is divided into 12 ounces; each ounce into 24 karats, each karat into 4 grains, and lastly, each grain into 4 quarts; then you see the assay quarter grain is in reality  $1\frac{1}{4}$  grains Troy.

**OLD RECIPE FOR COLORING BRASS.**—The *Neuste Erfahrungen und Erfindungen* reproduces an old recipe for the production of various colors on brass, but which we re-produce as it may be new to many of our readers: Dissolve 60 grains of bi-trartrate of potash in a liter of water, to which add 30 grams of protochloride of tin dissolved in a fifth of a liter of water, heat to boiling and permit the resulting precipitate to settle. The clear liquid is now to be poured under constant stirring into a solution of 180 grams of hyposulphate of soda in  $\frac{1}{4}$  liter of water and again heated to boiling, during which operation a quantity of sulphur will be separated. The resulting clear solution is now ready for use, and gives to brass articles suspended in it or when applied on the metallic surface according to the length of the exposure or the amount of the application, a great variety of shades of color. First follows a light color, then all shades successively from red, dark blue, light blue and finally brown. The sulphide of copper produces similar effects.

**MELTING AND REFINING.**—In melting brass gold, urge the fire to a great heat and stir the metal with the long stem of a tobacco pipe to prevent honeycombing. If steel or iron filings get into gold while melting, throw in a piece of sandiver the size of a common nut; it will attract the iron or steel from the gold into the flux, or sublimate of mercury will destroy the iron or steel. To cause gold to roll well melt with a good heat, add a tablespoonful of sal ammoniac and charcoal, equal quantities, both pulverized; stir up well, put on the cover for two minutes and pour.

**ALUMINUM SILVER.**—It is devoutly to be hoped that some practical way for obtaining aluminum cheap will soon be devised as this metal contains property highly valuable for articles which of rights should be light in weight. Octants and sextants of this alloy have been received with great favor by practical navigators. Those parts of such instruments which, if made with other metals, would weigh 4 pounds, will, when made of the above alloy, only weigh 1 pound. An excellent alloy aluminum silver is prepared by smelting together 1 part of silver with 3 or 4 parts of aluminum.

**ACID COLOR FOR 14-KARAT GOLD.**—Saltpeter, 4 parts; salt, 2 parts; muriatic acid, 3 parts. Put the first two in the pot and heat strongly; add a little water; let boil up, and when it becomes a thin paste add the muriatic acid; stir up and put in the work, taking care to completely submerge it in the color; let it boil two minutes, add as much water as you did before muriatic acid, make it boil quickly again for two minutes, take out the work, boil in hot water, then in another pot of hot water to which a few drops of muriatic acid have been added, rinse in hot water and dry as above.

**SOLDERING SILVER.**—The best solder for general purposes to be employed in soldering silver, consists of 19 parts (by weight) of silver, 10 parts of brass and 1 part of copper, carefully smelted together and well incorporated. To use this for fine work it should be reduced to powder by filing; the borax should be rubbed up on a slate with water to the consistency of cream. This cream should then with a fine brush be applied to the surfaces intended to be joined, between which the powdered solder (or pellet) is placed, and the whole supported on a block of charcoal to concentrate the heat. In the hands of a skillful workman the work can be done with such accuracy as to require no scraping or filing, it being necessary only to remove the borax when the soldering is complete, by immersing in jewelers' pickle.

**CARE OF WATCHMAKERS' BRUSHES.**—Watchmakers' brushes are a constant accompaniment to the watch bench; nothing except pliers, screwdrivers and tweezers being in more constant use; and how few use them properly, or rather, how few keep them in proper use. A soft brush for rough work is quite useless, a hard one for fine work is ruinous, and a dirty brush of either kind is a nuisance. The methods adopted for cleaning them are nearly as varied as the workmen that use them, and there are some who never even make the attempt. Some clean the brush with dry bread; some lay a piece of tissue or other paper across the wide open bench vise, the sharp corners formed by the jaws taking off on the paper a little of the dirt; others vigorously brush a piece of clean cork; and one man we knew who used his knuckles for the same purpose. All these various methods are imperfect while some of them can be called slovenly. The only good way to clean a brush is with soap and water—warm water, if convenient, being preferable. Wet two brushes, soap them and then rub them together in plenty of water and the job is done. The only objection to this way is the delay by drying; but this need not be, for six brushes assorted will give you three clean ones to use while the other three are drying; and the workman who cannot afford half a dozen had best seek some more lucrative occupation. More damage to the appearance of the movement is done by injudicious brushing than by any other means. The watch may not be injured in its quality as a timepiece, but it grows prematurely old in looks by such severe treatment.—[*Revue Chrono.*

## Trade Gossip.

D. L. Van Moppes arrived from Europe in the *L'Amérique* on August 18.

The gold edge bracelets, manufactured by W. E. White & Co., are very popular and having a large sale.

The firm of Martins & Tissot was dissolved by mutual consent, on August 9. H. Tissot will continue the business.

We are pleased to inform the many friends of George N. Fenn that he has completely recovered from his recent severe illness.

Edward Dreyfus, of Levy, Dreyfus & Co., has just returned from a four months' sojourn in Europe with his health completely restored.

In order to accommodate Eastern trade, the Excelsior Sign Co. have arranged with Cross & Beguelin to attend to all orders for their signs.

Mr. Henry Horwitz has arranged to travel for S. Dessau, importer of diamonds, and will hereafter have full charge of his diamond department.

C. S. Raymond has recently opened an attractive store at Omaha, which he has filled with an elegant assortment of attractive and desirable goods.

M. A. Myers, of S. F. Myers & Co., returned from Europe in the *Austral*, on August 16th. While abroad, he purchased many novelties for the Fall season.

The firm of Chester & Cornwell, Silver Cliff, Colorado, has been dissolved by mutual consent; E. P. Chester retiring, L. F. Cornwell continuing the business.

Samuel Perry, of the firm of Perry Brothers, has withdrawn from that firm, and formed a co-partnership under the firm name of Perry & Mead, 102 State street, Chicago.

E. Ira Richards & Co. are getting out their usual line of novelties this season, and are prepared to supply dealers with almost everything necessary for them to carry in stock.

J. M. Morrow, for many years with the Illinois Watch Co., has been appointed agent of the Hampden Watch Co., and opened an office in the Bryant Building, corner Liberty and Nassau streets.

George W. Pearce is traveling for the F. B. Rogers Silver Ware and Cutlery Co., of Boston, and attending to the requirements of the trade in New York, Boston, Philadelphia, Baltimore and Washington.

There are evidently two Charles Cook's in the jewelry trade; the one with F. M. Whiting & Co., is not the one with J. B. Mathewson & Co., and the one with J. B. M. & Co. is not the one with F. M. W. & Co.

Lestie Clime, a clerk of the Kirby House, was arrested recently, charged with systematic robbery of the guests of the hotel. It is alleged that Clime has been robbing traveling salesmen, principally jewelers, for years.

The hair spring stud index is the name of a new tool introduced to the trade by Joseph P. Wathier & Co. It is highly endorsed by practical watchmakers as a valuable tool for the bench and a great saving in the matter of time.

Chas. C. Haensler, of this city, has introduced some very attractive novelties in jewel cases, in velvet, plush, morocco, alligator skin, etc. He manufactures, also, show-case and sample trays for the trade, to which attention is invited.

Mrs. Mackay, it is said, gives away \$150,000 in charity every year. Her benevolence recently led to a pathetic appeal from some Parisian whose daughter was about to be married for any old diamonds or rubies she could spare.

The old-established house of Leroy W. Fairchild present again in this number of THE CIRCULAR more examples of novelties for the Fall season. The line including match boxes, cigar-cutters, charms, etc., are made in their usual attractive designs, and cannot fail to become very popular in the trade.

Henry Abbott has discontinued the manufacture of watch dials, having sold that branch of his business to Mr. Wm. Kirkpatrick, who will continue the business at No. 305 Pearl street. Mr. Abbott will continue the manufacture of the now very popular stem-winding attachments, the same as heretofore.

Edward Keeler, who was recently found guilty of blowing open the safe in the jewelry establishment of Elden B. Hayden, at No. 205 Fulton street, Brooklyn, and removing its entire contents, valued at \$5,000, has been sentenced to five year's imprisonment in the King's County penitentiary.

There are all sorts of clocks, but a new invention is badly needed—it is one that, instead of striking at 11 P. M., will pick up a dilatory lover and fire him out the front door. A clock of this description would make a fortune for the inventor, as there are probably a million of American fathers who would buy one.

An escapement for timepieces has been patented by Mr. August W. Kientoff, of Dallas, Ore. This invention relates to balance wheel or pendulum escapements, and provides a novel construction and arrangement of parts, making an escapement which can also be applied to a common toothed escapement wheel.

A stop watch has been patented by Mr. Samuel C. Scott, of Brooklyn, N. Y. The invention consists in an adjustable hollow arbor, attached to or a part of the arm of the lever for operating the chronograph mechanism of a watch movement, the arbor to receive the square winding arbor of the watch, the shoulder of which winding arbor operates the said lever.

A stem-holding device for watches has been patented by Mr. George T. Baughman, of Bellefontaine, O. The invention consists mainly of a collet or ring within the pendant, through which the stem, having an inner shoulder, is permitted to turn freely, the collet having one or more screws or pins arranged to enter the hole or holes in the pendant in which the ends of the bows fit.

A drummer representing a Philadelphia house, called upon the trade in Brenham, Texas, a few days ago, claiming to be an exclusive wholesale dealer in first class watches and jewelry. After finding that business was very dull, and failing to sell to the jewelers, he took his samples to a first-class dry-goods store and tried to retail any of his goods at wholesale figures to private parties.

In the August number of THE CIRCULAR, we stated that we had been shown an enameled nickel case, wherein various colors were harmoniously blended in different designs. This case is now offered to the trade by Joseph Fahys & Co. They have also arranged with Giles Brothers & Co. to attach their anti-magnetic shield to their dust-proof watch cases, and now offer them to the trade.

A stem-winding watch has been patented by Mr. George F. Johnson, of Aurora, Ill. The invention consists in a novel construction and combination especially of the setting lever and locking bar, and spring controlling the latter, whereby the spring operates to hold the setting lever in position, both when drawn out and pressed in, and prevents it when closed from dropping, and by striking the cover of the watch case, interfering with the closing of the case.

A fashion writer states that a revival emanating from the highest quarters is that of the locket or pendant worn at the throat with open dresses—one of the few ornaments suitable and becoming to all ages. Nothing unites richness and simplicity more than a glittering diamond pendant or cross depending from a narrow velvet neckband and worn with a clinging trained evening dress of pure white lace or tulle. One in black is equally effective.

A device for protecting balance wheels of watches has been patented by Mr. Everton J. Arrick, of McConnellsville, Ga. This invention is mainly designed for use in watch repairing, and consists in a flanged holder for balance wheels, which will admit of necessary work or repair without removing the staff from the wheel, and of the wheel being chucked in the lathe at either end of the staff, free from all risk of damage to the rim of the wheel while in the lathe.

The firm of A. Luthy & Co. have patented and introduced to the trade a new and handsome ornament for jewelry, in the way of a self-locking pin mounted in many unique designs, and styled the Claustra. The pin is on the principle of a jersey, having a stylish ornament on one end and a tip of neat design on the other, covering the point of the pin and at the same time locking it securely. The self-locking pin is susceptible of innumerable applications in jewelry.

A piece of work of unparalleled patience and ingenuity is reported from Karthaus in Bohemia, the wonderful workman being a youth in durance for five years for theft. He has turned his enforced leisure to use and manufactured a straw watch five centimetres in diameter by two in thickness. The works comprise a few bits of straw, some cotton, two needles and a pin, a small piece of paper forming a dial. It is said to go for six hours, and could be made to go twelve with a few improvements.

Messrs. L. Straus & Sons are sole agents in the United States for the New York & Rudolstadt Pottery Co., the largest factory devoted to the manufacture of bisque figures in the world. This factory, we are informed, employs a large corps of modellers, and by this means they are enabled to produce novelties in bisque figures and flowered goods and kindred art articles, in accordance with the demands of the market. Among their latest productions is the old Derby Decor, which is well known to lovers of art.

The new firm of Smith, Lesquereux & Co., manufacturers and dealers in optical goods, have appointed L. C. Fairchild & Co. as their New York agents. H. C. Lesquereux and W. H. Hurlburt have been for many years associated with the Burbank Manufacturing Company, and the new firm having bought the plant of the old company, they are identified with it in the same capacities as in the Burbank Company. They are live, energetic men who will push the business with characteristic vim, while Mr. Fairchild will second them with his usual ability.

Among the bone ornaments preserved in the Guildhall Museum, London, an armlet has lately been discovered engraved with incised Runic decorations. It was found in May, 1870, in Martins-le-Grand, and is said by the Scandinavian specialist, who detected it among the other specimens, to be unique of its kind. It has, in consequence, been placed separately in a glass case, above the Danish Runic Stone found in St. Paul's churchyard in 1852, to which it forms a fitting companion. Although Roman, Saxon, and even British remains are frequently met with in underground London, the relics of the Danish occupation of London are of very rare occurrence.

In our July number attention was directed to the operations of a person who sometimes goes by the name of C. B. Thompson, and hails from Bridgewater, Conn. He is in the habit of sending orders for goods to the trade, and when the goods are sent it is found exceedingly difficult to receive payment from Mr. Thompson. He recently wrote to John Frick & Co., ordering some goods, but Mr. Frick happened to recollect a transaction he had with a person of that name some time before, and instead of sending the goods, wrote him a letter recalling their former correspondence and suggesting that if he was the same individual, a remittance on account of "back dues" would be in order before he sent any more goods to the individual bearing the name of C. B. Thompson (without a "p").

The clock in Trinity Church tower in this city is the heaviest in America. The frame stands nine feet long, five feet high and three feet wide. The main wheels are thirty inches in diameter. There are three wheels in the time train, and three each in the strike and the chime. The winding wheels are formed of solid castings thirty inches in diameter and two inches thick, and are driven by a "pinion and arbor." On this arbor is placed a jack, or another wheel, pinion and crank, and it takes 850 turns of this crank to wind each weight up. It requires 700 feet of three-inch rope for the three cords, and over an hour for two men to wind the clock. The pendulum is eighteen feet long, and oscillates twenty-five times per minute. The dials are eight feet in diameter, although they look little more than half that size from Broadway. The three weights are about eight hundred, twelve hundred, and fifteen hundred pounds respectively. A large box is placed at the bottom of the well, that holds about a bale of cotton waste, so that if a chord should break the cotton would check the concussion.

Fred. A. Fiedler, the jeweler, Milton, Pa., has purchased an old, useful, ornamental and novel relic, in the form of a "Grandfather's Clock," evidently over one hundred years old. Matthias Fiedler, of Germany, is the maker. It is cased in very fine mahogany, and is nine feet high, twenty-seven inches wide at the top, and twenty-two inches wide by eighteen inches deep at the bottom. The movement is made entirely of brass and steel, and is a correct time keeper. In addition it denotes the day of the month. One of the most striking features of this clock is an oil painting above and at either side of the dial, representing William Tell, the Swiss patriot, making his escape from the boat as an Austrian prisoner, in the direction of Kiissnacht; he is in the attitude of leaping from a boat at "Tell's Rock" or "Leap." Above this handsome painting, in a triangular space, is the motto, "Hurrah for Liberty!" Just below, and on the right is represented the "Goddess of Liberty," being carried by the American eagle and shield in hand. On the left, Monarchy or Tyranny is represented by a king with a buckler in hand, and a lion at his feet. Between these representations of Tyranny and Liberty is the dial denoting the time of day and the day of the month.

How the hundredth part of a second is measured is told in the *Washington Post*. It says: "The chronograph, as its name implies, is a time-writer. Without it the division of time into the hundredth part of a second—a division so small that the mind can hardly appreciate it—would be impossible. It is a revolving cylinder, bearing a fountain pen attached to a magnet. As the pendulum of the clock swings its seconds, it sends the electric current to the magnet. The latter gives a nervous click, and the pen marks a small but distinct break on the paper. These breaks distinguish the seconds, and the space between them is measured by fine divisions on a slip of steel. A second in time, measured by space, is about as long as this: — — —."

The diamond beds of Bahia and Minas Geraes, in Brazil, are very similar in character, as regards the minerals composing them and their plateau form, or situation on water courses. A new bed has been recently opened on the Rio Pardo in Bahia, which presents some differences to those hitherto known in Brazil. The country around is low and marshy, and covered with forests. The working of these forests has led to the discovery of the diamonds, which are found in a white clay along with beds of decomposed leaves. The deposit appears of modern formation. The minerals of the clay accompanying the diamonds are, according to M. Gorceux, quartz, siliceous, monazite, zircon, disthene, staurolite, grenat almandine, corindon and some oxides of iron. There are no oxides of titanium, or tourmalines, as is frequently the case in diamond beds. The clay appears to be, from its character and situation, the debris of the granite mountains bordering on the Bahia coasts.

A curious point in diamond lore has just been established, to the delight of savants in Paris, where the exhibition of the crown jewels at the Louvre has made the subject very popular for the moment. It has long been laid down that the diamond has the power of retaining light, and of afterwards emitting it in the dark. The theory has been well buttressed by reasons; but the proof has not been easy of test. All, or nearly all, the great diamonds, such as the Kohinoor, the Regent, the Grand Mogul, cannot, for public reasons, be made the subject of experiment, and stones of a lesser size do not always give satisfactory results. Happily, a private individual, the owner of a gem of ninety-two karats, and estimated at a value of 300,000 f., has lent his diamond for scientific investigations. These have been most satisfactory, and the "phosphorescence" of the stone may be regarded as proved. The diamond was exposed for an hour to the direct action of the sun's rays and afterwards removed into a dark room. For more than twenty minutes afterwards it emitted a light, feeble indeed, but still sufficiently strong to make a sheet of white paper held near it quite visible in the dark. A similar result was arrived at by a very different experiment, and light was generated by rubbing the stone with a piece of hard flannel.

A pleasant event transpired in Providence recently, in the presentation of gold-headed ebony canes to George and Smith Owen, of the firm of G. & S. Owen & Co. The presentation was made to celebrate the fiftieth anniversary of the day when the Brothers associated themselves together in the jewelry business, and the fact that for fifty years they have conducted business harmoniously together. The canes were presented by their partners and bore the following inscriptions: "Presented to George and Smith Owen, from their partners, James P. Snow and Charles E. Westcott, as tokens of their high esteem and to commemorate the fiftieth anniversary of their establishment in business. 1834-1884." George and Smith Owen were born in Gloucester, R. I., the former in 1805 and the latter in 1809, and consequently they will be seventy-nine and seventy-five years of age respectively in September and November next. They subsequently removed to Providence, and George first learned his father's trade, subsequently entering the shop of Davis & Babbitt, jewelers, where he remained five or six years; while Smith learned the trade of jeweler and chaser of Mr. Joseph Veazie. Afterwards they became partners in the firm of Hunter, Owens & Co., but Mr. Hunter soon retired from the establishment and the business was continued under the firm name of G. & S. Owen. Later they admitted others to the firm, and the present members are Messrs. George Owen, Smith Owen, James P. Snow (admitted January 1st, 1872), and Charles E. Westcott (admitted January 1st, 1875). It is seldom in this country that business men are associated together for a term of half a century—exceeding, by considerable, the average business life of men—and should still continue in sufficiently good health to attend to business daily. A notable feature in connection with the firm is the extraordinary length of time some of their employees have remained with them, their terms of service varying from ten to forty years.

## THE JEWELERS' CIRCULAR AND HOROLOGICAL REVIEW

*The recognized organ of the Trade, and the official representative of the  
Jewelers' League.*

A Monthly Journal devoted to the interests of Watchmakers, Jewelers, Silversmiths, Electro-plate Manufacturers, and those engaged in the kindred branches of art industry.

### SUBSCRIPTION:

To All Parts of the United States and Canada,  
**\$2.00 Per Annum; Postage paid.**

To Great Britain, France, Switzerland, Germany, the West Indies, Mexico, the Republics of South America, and Australia, \$3.00 per annum. Postage paid.

*All communications should be addressed to THE JEWELERS' CIRCULAR PUBLISHING CO., 42 Nassau Street, New York.*

*Advertising rates made known on application.*

### The Circular—Its Future.

UPON THE death of our friend and leader, Mr. D. H. Hopkinson, in July last, the proprietorship of THE JEWELERS' CIRCULAR fell to his widow. Not feeling equal to the task of conducting the business herself, a company was formed under the title of THE JEWELERS' CIRCULAR PUBLISHING COMPANY, the object of which is to carry on the publication of this journal, and to issue from time to time such technical publications as may be deemed of interest to the trade or to any particular branch of it. Mrs. Hopkinson preserves a considerable interest in the company, while the direction of the business falls to the lot of gentlemen of proved experience and ability.

For the past sixteen years Mr. Hopkinson devoted the best of his life and thought—almost regardless of personal comfort and pecuniary outlay—to the firm establishment of this journal, and at his death its place was made, its connections were established and a trained corps of writers and business men were devoted to his service. Its policy was fixed, each department had its trained specialists. So well ordered and trained was this that the last three numbers have been regularly, and, we think, creditably issued while deprived of the assistance of the lamented chief.

The entire staff of contributors to the various literary departments of the paper who were associated with the late proprietor, and also every one of the gentlemen who aided him in the management of its business will continue in the service of the company. The publication of THE CIRCULAR will, therefore, be continued under substantially the same auspices as during the lifetime of Mr. Hopkinson.

A special technical magazine of this character necessarily requires the services of many writers, for no one man, however great his literary attainments and varied his study, can possibly be possessed of that technical knowledge that alone enables one to write intelligently upon the many branches of art that are comprised in the general

term, the jewelry trade. By way of illustration we may mention that in our columns there have appeared each month editorials upon current topics that engaged the attention of the trade; there have been special contributions upon silverware, upon ancient and modern art in jewelry, upon table ware, upon the manufacture of jewelry and almost every specialty in the trade, while "Excelsior," the well known practical horologist, has contributed many invaluable articles upon the subject of which he is the master. In addition, translators and technologists have made many important contributions to our columns. There are also the departments of "Trade Gossip," "Workshop Notes," "Foreign Gossip," etc., each of which requires careful editing. It will be seen then that a very considerable corps of writers and specialists has been at the service of THE CIRCULAR in the past, and, we are pleased to announce, will continue in the future as they have done to make this a thoroughly representative journal of the jewelry trade in all its branches.

While we are pleased to make this announcement as an assurance that THE CIRCULAR will maintain the high standard it has already achieved, we are sufficiently imbued with the progressive spirit of the age to induce us to enlarge the sphere of the journal's usefulness, and to make such improvements as will enable it to better serve the best interests of the trade. It is our intention that every branch of the business to which so many of the arts and sciences are tributary, shall have space devoted to it in our columns. Arrangements are already in progress having for their object the securing of special writers covering a wider range of topics than ever before; also for securing correspondents in the more prominent centers of trade who will keep our readers informed as to the current news of interest to them transpiring in these places. No sectional limitations shall hamper us, no local jealousies prejudice our utterances; THE CIRCULAR will recognize only the universality of the great industry it represents and champion every effort, wherever made, to enlarge its interests or better its condition. For many years this journal has maintained a high reputation for enterprise, fairness, independence and the taste and ability with which its contributors have treated the various technical subjects upon which they have written; a magazine so full of instruction should be in the hands of every person identified with the jewelry interest. It will be the special aim of the present managers to extend its circulation as much as possible, and thereby greatly increase its usefulness. The business of THE CIRCULAR imposed too large an amount of labor upon one man, and, in attempting to carry more than his share of the burden, the lamented founder of it undoubtedly shortened his life. This management will now be carried forward by several persons instead of one, but this new blood and this awakening and carrying out the new plan which the deceased designed executing we feel perfectly safe in promising that their enterprise and ability will make THE CIRCULAR more attractive and valuable than ever before, and of greater practical benefit to its many patrons.

In view of the fact that much interest, not to say anxiety, has been expressed in the trade as to the future of this journal, this much of an announcement regarding the future of the trade organ seemed proper.

### A Vicious Business Practice.

IT IS CUSTOMARY for a man in business to think, or at least to represent, that his is the worst line of business known, and that no other is so permeated with unbusinesslike and vicious practices. If he has opportunity, however, to look abroad among his neighbors and observe closely what they are doing, he will soon ascertain that his particular sphere of labor does not monopolize all the evils that afflict trade and commerce. In rare seasons of extraordinary prosperity, when everybody is overtaxed to fill orders, the evils of trade are comparatively few in number; but such seasons beget over-production and excessive competition, so that when the reaction comes, and stagnation takes the place of activity, merchants find themselves overstocked, and all sorts of means are resorted to in order to realize upon their stock on hand. Extraordinary inducements in the way of prices and credits are offered dealers in order to persuade them to select from the overstocked shelves, and every effort is made to shift this burden of over-production from one pair of shoulders to another. The manufacturer exhausts his eloquence upon the jobber and the jobber labors with the retail dealer. It is through over-production and too great competition that the evils so generally complained of have crept into our business methods. The jewelry trade is no greater sufferer by them than other mercantile lines of business, but they have become so pronounced that a reform in some of them seems to be a condition of future prosperity.

One of the worst of these evils is that of dating bills ahead, so as to surreptitiously give a creditor longer time on his purchases than is warranted by either the unwritten laws of business or proper regard for the creditor class. This practice has already worked serious disaster in the jewelry trade, and will do much more havoc unless put an end to. There are comparatively few houses that can afford to give such long credits as are secured by this means of dating bills ahead. They require all their capital in their business, and, to be successful, should be able to turn it over rapidly. When, however, what should be three and four months' credits are extended to six or eight months by this process of dating bills ahead, their capital is tied up and not available for current transactions. Let us illustrate: An out-of-town buyer comes here to make his purchases; if he is a retail dealer he goes to a jobber, but if a jobber he goes to a manufacturer, and agrees to buy goods provided his bill is dated ahead; suppose he buys on the 5th of September, his bill will be dated November 5, and he then gives a note at four months dated November 5; by this means he secures six months' credit with a four months' note, the seller losing the interest for two months. If the manufacturer or jobber does much of this business he will find himself soon loaded down with a lot of paper that he cannot negotiate. Most of the banks accommodate our business men by discounting their bills receivable when endorsed by the firm to whom they are drawn, but they cannot handle notes that are dated ahead and have not begun to run as against the maker. As a consequence those who require ready money are obliged to hawk their own paper through the streets or get note brokers to do it for them, and thus bring their credit under suspicion. When once afloat upon the sea of note discounting it is a hard matter to tell when to stop, and the victim is liable to go on till his outstanding notes are in excess of his visible assets. In short, he has resorted to that dangerous practice of over-certification that has brought so many banks to ruin. There is always the probability, too, that the debtor who has obtained six months' credit on a four months' note will want it renewed for four months longer, and in the end the seller finds that his bid of two months' credit without interest has resulted in tying up his capital for twelve or fourteen months.

This practice of dating ahead has grown to be very general in the jewelry trade, and is the result of too much competition. One firm makes this a bid to obtain custom, and is followed by the others who value present patronage more than true business principles. When once competition resorts to such unbusinesslike methods, there is no foretelling to what lengths it may not go. Credit is essential to the

prosperity of a country so new and so undeveloped, comparatively, as ours, but when credit is pushed beyond certain limitations it becomes dangerous. There is such a thing as too much credit and too great liberality in dispensing it. Many a man has been ruined and carried disaster to many besides himself, by having unlimited credit thrust upon him by over-zealous bidders for his patronage. It is a duty the creditor class owes to itself and to the public to see that credit, the keystone of business, is not abused. It is time to call a halt in this matter of promiscuous credits extended to unwarranted limits by the pernicious practice of dating bills ahead.

---

### The Business Outlook.

THE PRESENT business condition of the country presents some anomalies that are exceedingly difficult of explanation. Such of the crops as have been harvested have yielded most abundantly and all others promise to be equally prolific; everything necessary for the wants of the people exists in abundance, money is plentiful and all the conditions for general prosperity seem to be present. Yet the fact remains that for several months business has been exceedingly inactive; thousands of workmen in various lines of industry are lying idle, factories are operated on short time, and the "nimble sixpence" in trade has been extremely sluggish in its movements. Why this should be so is a problem political economists are striving in vain to solve. Abundant harvests are the best possible evidence that the country is rich, but producers seem disinclined to put this wealth, dug from our prolific soil, into circulation. The probable reason for this is the low prices that prevail for almost everything. The holders of our agricultural products, the producers themselves, are not inclined to part with their wealth at the prices offered. They have learned from previous experience to regard a bushel of wheat as worth to them a dollar, and they decline to sell when the price falls below that sum, as it has done this season; prices for other products are correspondingly low, and the farmers are holding on to their crops. Inactivity in the movement of the agricultural products of the country causes inactivity in all branches of productive industry, and, consequently, in all lines of business. But such a condition as at present exists is unnatural, and cannot long continue. A country having so much wealth in its agricultural productions, for which there is a reasonable demand, and having, also, an abundance of money with which to send these crops forward to supply the necessities of the world, should be at the height of business activity and commercial prosperity. Buyer and seller must eventually come together and agree upon an equitable price for this hoarded wealth in the hands of its producers, and when once the flood gates are opened and it begins to flow through the regular channels of commerce, a new impetus will be given to business of all kinds, and activity will usurp the place of stagnation.

In seeking for the moving cause of this deadlock between buyer and seller of the nation's products, we have but to turn our eyes to those great marts of trade, the Stock and Produce Exchanges, where speculation runs riot and gamblers hold the balance of power that controls business operations. By their wild and reckless dealings they have, within the past two years, reduced the market value of negotiable securities of various kinds by hundreds of millions of dollars in the aggregate; fortunes have been swept away in a few hours by this shrinkage of values, and the business community has been injured by so much as these annihilated values represented money that was invested in business. Add to the operations of the gamblers of the various exchanges, the dishonest transactions of a large number of trusted officers of financial institutions, and it is not to be wondered at that investors and the people have lost confidence and have called a halt in order that time may be secured to see where they stand. The prevailing spirit of gambling that seems to have seized upon almost every one is responsible for the hard

times of the past few months. This gambling is miscalled speculation, but it has no more the characteristics of legitimate business transactions than have the operations of the "faro dealer" or the "bunco steerer." The country is afflicted with "tickers" and "tape worms," that are to be found in almost all business houses, tempting their victims to risk their money in perilous ventures and eating away the substance of all who yield to their seductive influence. Every click of these pernicious machines sounds the knell that marks the financial death struggle of some victim. True and abiding prosperity will never come to our industrial and agricultural interests till this devil of speculation is driven out of the people. We have heretofore spoken strongly on this subject, and wish that every writer in the land would raise his voice in warning against it.

As a matter of course the jewelry trade suffers from the same conditions as other lines of business. Trade is dull, and it is folly to seek to disguise the fact. It would be useless for us to attempt to "bull" a "bear" market; the cry heard on every hand is in lamentation at the dullness of trade. There are more or less goods being sold, but the sales are not up to the anticipations of manufacturers and jobbers. Retail merchants are not buying extensively, and the orders of jobbers are governed by their prospective sales to the retail trade. All base their hopes upon the probable early movement of the crops, and their conversion into cash. Farmers cannot hold out forever against low prices, and when they once make up their minds that there will be no advance, or when buyers come to their terms, the money now lying idle will be brought into circulation, and trade will revive. As we have before said the condition is an anomalous one; the country teeming with wealth in its productions and also in money, and the two holding aloof from each other because speculative gambling has made them distrust each other. The demands of commerce will eventually break the deadlock, and business will resume its accustomed sway. This time is not far distant in the judgment of intelligent observers.

### Russian Art Work in Precious Metals.

THERE IS about to be added to the Metropolitan Museum of Art a most interesting collection of reproductions illustrative of ancient Russian art as applied to the precious metals. This collection consists of fac-simile reproductions of works of art that are treasured in the Kremlin at Moscow, and the Hermitage at St. Petersburg. Never before have the Russian authorities consented to have these works reproduced, but have jealously guarded them from the possibility of being copied by foreigners. When the Earl of Granville was prominent in the British Ministry, he used his influence, at the request of the Lords of the Committee on Education, to secure for them the privilege of copying for the Kensington Museum some of the works of art that are kept in the Russian art treasuries. After much trouble, he obtained the consent of the Emperor and the ecclesiastical authorities, and the result was that over three hundred pieces were reproduced by the electrolytic process. Three sets were made, one of which goes to the Kensington Museum, one to Cincinnati, while the third set was acquired by Mr. Henry G. Marquand, who presents it to the Metropolitan Museum of this city. The collection will be placed on exhibition in the course of a few weeks.

It is our privilege to present to the public a scholarly, illustrated description of this collection, prepared by Mr. John W. Miles, a gentleman well known for his artistic tastes, his love for the antique, and for his literary attainments. By permission of General di Cesnola, director of the museum, and of Mr. Marquand, the donor, Mr. Miles was enabled to make a careful study of this collection, and, as a result, he has prepared a description of it that will be treasured by all lovers of art. In this issue of THE JEWELERS' CIRCULAR will be found the first instalment of Mr. Miles' paper; it will run

through several numbers of our journal, and, when completed, will be the most finished and accurate description of these Russian reproductions that has been written. There will be several illustrations—some of them large and elaborate—with each instalment printed. It will be noted that we have copyrighted this article, which is done with the intention of publishing it in book form, in order that so valuable a document may be permanently preserved by those who are interested in art work of the character described.

### Gossip of the Month.

"FASHION is fickle" is an axiom so old and so trite that it is recognized as a truism. It may be added that fashion is queen in the jewelry business. Scarcely any other line of mercantile enterprise is subject to so many changes and fluctuations, brought about by the imperial mandates of this fickle queen, as the jewelry trade. Whatever she decrees is law and gospel to her devotees, and the jeweler is driven to his wits' end to keep pace with her demands. Jewelry that was all the rage one year is *passé* the next, and styles that were the fashion for a brief season must give way to new forms and designs. This is good for artists and designers, who are kept busy devising new styles, but it is rather hard on the manufacturer who is so often compelled to consign to the melting pot large quantities of goods that are out of date. But there is an old saying that fashions repeat themselves every seven years, so while the manufacturer may with profit melt over goods that are *passé*, he would do well to preserve his designs and his dies, for that fickle, coquette, fashion, may call them into service again. We will not vouch for the truth of the old saying referred to, but if fashions do not return every seven years they certainly do in time. A manufacturer recently remarked that "there is nothing new in the way of designs; the ancients covered the whole ground pretty much, and our most successful goods are reproductions of old designs, or are worked out of old combinations. As Shakespeare stole all the good things away from you 'literary fellers,' so those grand old goldsmiths of olden times left little for their successors to work out. The most profitable field of study for the designers of to-day is embraced in the art museums of the world, where examples of old gold and silver work are to be found. These combine exquisite beauty and splendid workmanship, offering opportunities for making beautiful combinations. Besides, ancient and classical designs in jewelry are in demand now, as it is the fashion, and fashion is the goddess whose slaves we are. Our American designers are full of originality in the production of special work to order, but these are not the taking goods in our ordinary mercantile transactions. We must make what the masses want, and not confine ourselves to the demands of the few who have artistic tastes and sufficient wealth to gratify them."

\* \*

\* \*

\* \*

SPEAKING of fashions, it was decreed some time ago that ladies should wear no gold jewelry, confining their personal decorations to precious stones. Those who could not afford these costly jewels eschewed jewelry—better to be without any ornaments than to plead poverty. This is the same principle that the man exhibited who refused to have his trousers mended, asserting that in the eyes of the multitude a hole might be the accident of a moment but a patch on his trousers indicated premeditated poverty. But the decree that banished gold jewelry has been revoked, and it is the fashion once more for ladies to appear in the street and the drawing-room with those golden articles of decoration that are so becoming. A modest brooch of classic design at the throat, with ear rings to match, are not only permitted in street and drawing-room costume, but are demanded by autocratic Dame Fashion; rings upon the fingers never

yielded their place entirely, and, even under the most rigorous dispensation were quietly tolerated; now they are fairly demanded; the watch, which was recently held in the belt by a ribbon matching the costume, may now be suspended from the neck by a "neat but not gaudy" gold chain, brought through at the front of the waist and holding the watch in the belt. In fact, gold jewelry is again the fashion with ladies; the dear creatures must have something to set off their many charms, and diamonds are too costly to be worn on every occasion. Besides, they offer too great a temptation to that numerous class of citizens who have no regard for that commandment which lays a positive prohibition upon stealing. Then, too, the ladies know that nothing calls attention to a pretty throat and neck or to their shell-like ears, like a bit of bright gold of some chaste and tasteful pattern. It was with feelings of deep regret that they laid aside, even for a brief period, these fascinating personal decorations, and now that they are once more permitted, our fair charmers have blossomed out fuller and sweeter than ever with their golden decorations. And well they may, for never before did they have such a rich variety to select from as is now temptingly spread out before them in the stores of the merchants. Our manufacturers apparently had a premonition of the demand that was to spring up—perhaps they have telephonic communication with Dame Fashion herself—and they have outdone themselves in producing new and attractive designs in gold goods, rich and sumptuous in their nature rather than large and showy. Well, let the ladies gratify their little vanity in personal decoration; it does them lots of good and injures no one. Then, too, the prettier they look the better we masculines like them.

\* \*

\* \*

\* \*

BUT WE masculines had better remove the beam from our own eyes before charging the ladies with vanity in the matter of personal decorations. Look at the ornaments fashion decrees us to wear: First, there is the inevitable and indispensable gold watch, sometimes two of them, the necessary gold chain with its pendant seal or locket, the scarf pin, the sleeve buttons (flop-overs), the collar and cuff buttons (also flop-overs), a possible diamond here or there, glove rings, with quaintly cut initials prominent, a tiny gold chain for the eye-glasses, or gold-bowed spectacles in place thereof, etc., etc. These for the average business man, but the possible lengths to which the "dude" may go in personal decoration no man can tell. Let him go; he needs much to make him tolerable. But, on the whole, the male specimen of the genus homo has little room for poking fun at his gentle sister on account of her desire to make her person attractive by the use of those numerous ornaments made ready for her by the goldsmiths. It is a question of fashion with both sexes, and it is difficult to decide which one is the more devout worshipper at the shrine of this changeable goddess.

\* \*

\* \*

\* \*

PASSING by the place of business of the New Haven Clock Company, in Park Place, a few days since, we noticed an oddity in the shape of a clock which had also attracted the attention of a number of passers-by. It is a small affair but difficult to describe. Outside of the case proper are two small, upright columns; projected from the top of the case is a straight piece which, for want of a better name, we may call a yard arm; suspended from the end of this by a thread is a small metallic ball; as the clock ticks this arm describes a half circle, throwing the suspended ball against the right hand column; then the thread winds around the column three or four times; then it unwinds itself; then it reverses the action and winds itself up again the other way; then it unwinds itself again, the yard arm is released, describes another half circle, comes slam bang against the left hand column, and there the little boomerang of a ball repeats the process of winding and unwinding around that col-

umn. Why it does it, nobody knows, but it does; and so that yard arm goes on describing half circles, slam banging and boomeranging first against one column and then another all day, and possibly all night. It is an eccentric contrivance and attracts scores of persons to the store. They say, too, that it keeps good time in spite of its proclivity to tangle itself up around lamp posts and other obstacles. By the way, the New Haven Company makes a most attractive display of clocks of all kinds, and the indications are that there is life and activity in that line of business at least.

\* \*

\* \*

\* \*

THIS gossip observes that there is a good deal of silver filigree work being worn now, especially by young ladies and misses. We are informed that large quantities of it are being sold to merchants from the interior where it has become very popular. There are some very handsome designs in this class of goods, while its gossamer-like appearance makes it very attractive.

\* \*

\* \*

\* \*

IN THE early days of September this vicinity was visited by a "heated term" of almost unprecedented length and severity. In the city the sun poured down its heated rays with prostrating intensity; the pavements almost glowing with fiery heat, while the solid walls of brick buildings that line the streets were charged with caloric to a degree that threatened immediate combustion, heating the little air that was stirring to an almost intolerable degree. Everybody that could do so fled to the mountains or the seaside, preferring to swelter and melt away in the open air, where there was plenty of room, to suffering cremation in the brick-bound city. Among those who flitted away were the members of the Horological Club, those venerable and expert horologists whose amiable discussions of technical questions have conveyed so much valuable information to our readers. The Chairman came down from the mountains for the express purpose of presiding at the monthly meeting; his costume consisted of a linen duster and two palm leaf fans. At the appointed hour he tapped the table with his gavel but none of his able associates appeared; of all that noble army he alone had courage to brave the dangers of the heated term. Perspiring at every pore, he gazed about him sadly; although nearly disintegrated by the heat, and almost emulating a late distinguished actor of Bowery fame, who used to advertise that he would "appear in several pieces," the Chairman decided that while there was a possibility of his being obliged to occupy all the chairs, there was not enough of him to constitute a quorum. So he adjourned himself for one month. The last seen of him he was evaporating in the direction of the Catskills on a cake of ice, his two palm leaf fans vainly striving to still further lower the temperature of his body.

\* \*

\* \*

THERE IS nothing so good for trade as competition—except plenty of buyers and a flush money market. But competition should be confined to legitimate and honest limits. It is not legitimate competition when one seeks to build up his own business by tearing down that of another. Detraction and misrepresentation are not commendable business methods. Yet there are men in the trade and travelers on the road who are irresistibly impelled to discredit the productions of their competitors wherever they come in contact with them. If the goods show no fault in workmanship they invent them, inveigh against the quality of the gold in them and ridicule the style and design. These men seem to have been born with a chronic disposition to find fault; they would grumble if they were about to be hanged for persistent grumbling. A country dealer

recently caught one of these peripatetic fault-finders in his own trap. Before opening his own samples, the traveler looked over the stock in the dealer's show case, found fault with this thing and criticised that; wondered how this manufacturer dared to send out such goods and why the other one did not have some regard to styles. Presently he opened his own samples and began to extol the excellence of his goods. Then he and the dealer changed places, and the dealer became the grumbler and fault-finder. He criticised adversely everything shown him; he examined the workmanship with a magnifying glass and pointed out all sorts of defects; the styles were antediluvian and the designs were caricatures. For an hour the traveler listened while his goods were dissected and their imperfections distorted, till finally he became enraged and took his departure in haste, while the dealer quietly remarked as he chuckled to himself, "the adornment that suffices to decorate the anserine fowl of the female persuasion is a sufficient garniture for the male insect of the same species," which being translated into the vernacular implies that "what is sauce for the goose is sauce for the gander." Moral—detraction is a boomerang that is liable to re-act upon the proboscis of him who indulges in it.

\* \*

\* \*

\* \*

BUT commercial travelers are not, as a rule, given to making themselves obnoxious to their customers. On the contrary, they are, generally speaking, jovial, whole-souled, sharp, keen, wide-awake gentlemen, the trusted representatives of important interests, anxious to serve their customers and their employers fairly and honestly, and in as expeditious a manner as possible. The traveler is a sort of migratory shuttle-cock, batted about from pillar to post, always hurrying to catch a train and his mind filled with anxiety lest he should miss a connection. While preserving a calm and impassive exterior his soul is writhing in anguish lest the dilatoriness of his customer shall cause him to lose a train and so to miss his next day's appointments. He eats and sleeps as circumstances permit, never with regularity, and seldom satisfactorily; he is away from his family weeks at a time, and possibly, by missing his connections is also deprived of regular communication with them. His life is a hard one, and those whom he favors with calls should bear in mind the fact that to every commercial traveler "time is money." They are deserving of courteous and gentlemanly treatment at the hands of every customer. He may come down upon you at an inopportune moment when you do not desire any goods, or are, perhaps, especially busy; if so, it will take but a moment to state the facts courteously, and to show that while you recognize that he is a gentleman you are also one. We heard a traveler during the heated term indulging in some very heated language regarding a dealer on whom he had called, and who kept him waiting two hours before he would give him an audience. Meantime the dealer was in a back room getting his fishing tackle ready to go fishing next day (Sunday). As a consequence of the delay, the traveler was compelled to remain in that city over Sunday when he ought to have been in another place a hundred miles away. Politeness is indissolubly connected with the characteristics of a gentleman, and however much a gentleman may be annoyed, he never so far forgets himself as to be rude or boorish. Commercial travelers are an indispensable boon to the mercantile community, and, being gentlemen, are entitled to be treated with that respect and courtesy which make of business a pleasure.

\* \*

CASE makers complain of the demoralization that has fallen upon their business. This is not attributable especially to over-production but to unwise competition. Possibly if the production of cases could be suspended for a time the business would slough off its unbusinesslike methods, for when the demand for any class of

goods runs ahead of the supply they sell themselves, and it is not necessary to resort to unhealthy practices to get rid of them. But when supply and demand are evenly balanced, manufacturers become so afraid of being caught with a surplus stock that they cut prices, become reckless in their sales and so kill the goose that lays the golden egg. Prices for cases have become so demoralized that workmanship suffers, and the maker is fortunate if he can get back the price of the metal in his cases without any compensation for workmanship. In its present condition there is no profit in case making, and those in the business are complaining loudly of the situation. In many instances a reduction of prices means a degradation of quality; in regard to cases, various devices are resorted to by some makers to make their goods correspond to prices, and, by substituting base metal wherever possible to maintain the standard of weight, still making a saving on the precious metal employed. Steel is made to fill the space where the gold or silver is cut away, and heavy springs are introduced to compensate for the absence of the more valuable metals. So individual morals are corrupted in an effort to sell a dollar's value for seventy-five cents. It is singular that the good, practical, sensible men engaged in case making cannot come together and agree to abandon those unbusinesslike practices that are so injurious to them. It seems as though a little effort properly directed might so harmonize conflicting, or rather, competing elements as to do away with some of the evils complained of, and put the case making industry on a basis whereby those interested might fairly hope to get back at least a new dollar for every old one sent out. Half a dozen of the leading case makers might, by united action, revolutionize the trade in this respect.

\* \*

AN ENGLISH paper announces that the Scottish pearl seekers have met with unusual success this year, securing pearls in great numbers, some of which have been sold at high prices. Some of the rivers in the north of Scotland abound in pearl-bearing mussels, and this year has been unusually favorable to obtaining them, owing to the low stage of water in the rivers. As a consequence of these remarkably valuable "finds," the inhabitants along the banks of the river have abandoned their usual avocations and turned their attention to mussel hunting. It is feared that great injury has been inflicted upon the pearl industry of the future by the reckless destruction of mussels that has been caused by this rush of pearl seekers, who prosecute their work without regard to future production. A demand is made for some sort of legal protection for the incipient but possible pearl-bearing mussels.

\* \*

VERY elaborate and costly bric-à-brac cabinets adorn the residences of our wealthy citizens, but it is not alone the wealthy who delight in things of beauty and elegance. There are thousands of persons who cannot afford expensive cabinets who, nevertheless, derive pure and unalloyed happiness from the contemplation of a few valuable pieces of bric-à-brac of which they are the fortunate possessors. A lady friend of ours, who has a few choice pieces of old silverware, showing examples of rare workmanship, and some quaint specimens of ancient pottery (which, by the way, are to the modern eyes exceedingly ugly) has solved the difficulty of a cabinet without incurring the expense that lies in ebony cabinets elaborately carved. She has made some shelves of pine wood, and these she has covered with plush and hung on the walls or fitted into odd corners. On these she displays her treasures, and their artistic arrangement, the various cherished articles nestling in beds of soft plush, shows them to most excellent advantage. Heirlooms of old silver may be made to look very attractive in this manner, with a plush background to the shelves.

THERE were a good many buyers in the city last month from all sections of the country. Those that were here during the heated term were not in a humor to make purchases while the mercury was struggling among the nineties, and the heat was intense enough to blister the pavements, so they hied them to Coney Island, Long Branch, and other seaside places, where they were at least sure of spending a cool evening. It was a harvest time for summer resort landlords, without which their season's business would have been a failure. But the buyers turned up smiling when the "cold wave" reached here, and were all the more affable after their brief rest and recreation. Their purchases were only moderately liberal, but their orders were sufficient to wake up the street somewhat, and to give assurance that the fall trade will not be so bad as has been predicted. We do not claim to be the son of a prophet, nor the seventh son of a seventh son, but some months ago we ventured the prediction that when the trade has closed its books for the year, and the balance is struck, it will be found that the volume of business will show a fair average with that of the past five years, and this prediction we still adhere to. Perhaps the margin of profit may be reduced, but that is not our lookout; it is our business to do all we can to stimulate trade, and if the merchants do not make a fair profit on what comes to them, they cannot accuse us of having made their prices.

\* \*

\* \*

\* \*

DOING business for love is not a profitable operation, as the chain makers are beginning to find out. Like the case makers, the chain makers have been afflicted with unbusinesslike competition that has broken down prices till there is no profit in the business. At least, this is their complaint, and as it is general among them it is, no doubt, true. But who is to blame for this? We know that competitors in business always excuse themselves for cutting prices by saying: "Well, my rival did it first, and I had to follow him or lose my business." This never seemed to us a valid excuse for cutting prices so they would not cover the cost of production. When a man does that it is good policy to let him have the whole of the business—it will break him up all the sooner, and when he is gone the others can easily win back their customers. When a man finds that he cannot make a fair living profit on his productions, it is time he looked for other business, unless he is so infatuated with it and is so much of a philanthropist that he prefers to continue it for love. It is bad for all lines of business when any one industry fails to yield a fair and reasonable profit upon the capital, labor and ability invested in it. The country at large is never so strong and lusty as when all its business men are being adequately compensated for their labor and investments. The workmen are then properly rewarded and contentment reigns supreme. The chainmakers have made several efforts of late to organize for the purpose of correcting the abuses that exist in their business methods, but there is always a small minority who refuse to give in their allegiance to the organization, and the majority is afraid to go on and leave them on the outside. Every army has its corps of "bummers" and its bands of guerrillas, but while the army may be annoyed by their acts of brigandage, it moves right along upon its objective point, and swerves neither to the right nor left at the bidding of "bummers" or guerrillas. If the majority of the chain makers determine to organize to correct the evils that afflict their business, they are strong enough to carry out the measures they in their wisdom may determine upon. They can also carry the war into Africa, and force the guerrillas to lay down their arms and come into camp. Go for their business; retaliate; if necessary, undersell them with every customer they have, but maintain good faith with each other. There is a little story current that seems apropos to this advice. A young gentleman was walking out with his summer resort girl one evening, when suddenly she uttered a scream of terror, a look of horror settled

upon her features, and turning to her amazed companion, she exclaimed: "Run for help! Run for your life! Go quickly!" "What is the matter?" anxiously asked her companion. "Oh! hurry up! Go for some one, quick! There's a bug down my back!" shrieked the fair maiden. "Hadn't I better go for the bug!" murmured the sensible young man. The chain makers should ascertain what particular bug it is that is undermining their business and then "go for" that identical insect with all the energy they can command. The remedy is in their own hands, and it is useless to call on Jupiter for aid till they have first put their own shoulder to the wheel. In this country an honest majority, acting in good faith, can always win.

---

## Jewels and Jewelry.

*Continued from page 235.*

IN ORDER to give a proper idea of how jewelry is manufactured, probably the best way is to describe a large manufactory in Newark which I visited. In the basement are extensive store rooms for coal and coke; there are large rooms for the clothing of the male operatives, for they are required to change their clothing on entering the shop; and there are 2 rooms devoted to the saving of the immeasurably small particles of gold, which but for the closest scrutiny and care might be lost. In one of these rooms is a powerful grinding machine for reducing to dust all the sweepings, filings, the small pieces of gold detached from articles in process of manufacture, and all other waste solid substances collected from the work rooms from day to day. This is transferred to the amalgamator, a machine in which it is treated with mercury, to separate the gold as is done on a larger scale in mining. In another room is a series of filters through which is passed all the water from the sinks in which the employees wash at the close of each half day of labor, as also the water used for washing the towels and articles of clothing used only in the factory. Nothing is allowed to be taken from the building to be washed; the importance of this strict care is evinced by the fact that often the profits of a whole year's work consists in the value of these sweepings; there is a finishing room where all finished work is properly examined; in the vaults are stored the stock of metals, and on the same floor is the supply room where the metals are given out under a complete system, so that should an operator be inclined to dishonesty the temptation is precluded by the certainty of detection. In another room is the coloring room; in another the gold, silver and copper are melted and combined; for greater facility the metal is first granulated by melting and pouring slowly into water, the gold taking the form of small pieces of very irregular shape. There is a tool room where the dies are made and the remainder of the floor contains drop presses and rolling machines. The routine of work begins with melting and combining of metals, casting into ingots, subjecting it to powerful rolling machines, rolling it as fine as tissue paper if necessary. The next process, stamping, in which drop presses are used, develops the figure either in *repoussé* or relief, or gives the full outline and shape of the whole or part of any article, as a locket or the links of a chain. The various parts of a chain or other article are then put together with a rapidity which would astonish anybody not in the business. Engraving is the next operation. In articles in which the figure is wholly or in part of enamel, at first only the part of figure which is to be filled with enamel is engraved. This material, which has for its basis pure crystal glass or "frit," ground together with a fine oxide of lead and tin and variously colored by adding other substances, chiefly the oxides of different metals, is applied in the form of paste and then submitted to the action of heat, sufficient, without melting the gold, to form a close adherence between the enamel and the gold, and at the same time to vitrify the enamel so that it may have at once the hardness of crystal and its susceptibility to a high polish. The sur-

face of the enamel is then filed or ground down and the engraving of such parts of the figure as are not enameled is completed. The article is then polished and finished. In the manufacture of jewelry machinery supersedes hand labor to a less extent than in most other industries; used wherever desirable, it is rather to facilitate and supplement than to take the place of manual dexterity and skill. Automatic machinery is not used; at present  $\frac{9}{10}$  of all gold jewelry in the United States is manufactured in New York and Newark. Very little is imported, as American jewelry is superior in design to any other, and in solidity is probably only exceeded by English jewelry, whose patterns, however, are very inartistic and clumsy. The interior towns are supplied by means of commercial travelers who are continually scouring the country, carrying all their goods with them in values ranging from \$25,000 to \$100,000. So important has this industry become that every hotel contains a special safe for the accommodation of jewelry salesmen. In regard to the amount of jewelry manufactured annually in this country, no statistics are obtainable, but in 1880 the Director of the Mint endeavored to ascertain the amount of gold used in manufactories, and mailed circulars to every manufacturer in the United States requesting information as to the amount consumed, and although many failed to reply yet from returns received it appears that out of \$40,000,000 worth of gold and \$38,750,000 of silver taken out of the mines about \$5,500,000 worth of gold and \$500,000 worth of silver was consumed by jewelers. Taking the intrinsic value of the gold to be about  $\frac{1}{4}$  the value of the article when finished, we obtain a result of \$22,000,000 as the annual production of jewelry in the United States; adding 25 per cent. as the retail price we see that about \$30,000,000 are spent for gold jewelry alone not including precious stones. As fully 50 per cent. of this is spent by young men on their sweethearts in the shape of Christmas and betrothal presents, it will be seen how much it costs the American youth to love. If ice cream and theatre statistics could be added to this the result would be simply awful. It is the retail jewelry store which has a noble mission to perform in this world and the happiness of many a damsel is yearly owing to the jewelry salesman, who, by his eloquence and unselfish interest of her welfare, causes many a heartlessly economical lover to relax and invest a part of his savings to decorate his fair one who might otherwise have passed such a thing as jewelry in silent contempt. And so the cry of many a fair damsel is: "Long live the jewelry salesman."

As no paper on jewelry would be complete without a mention of the precious stones, I will pass briefly over the jewels used in its manufacture:

#### JEWELS.

To give a complete description of all the precious stones used in jewelry, together with their history, composition and characteristics would be an impossibility in the time allotted to me, and I will close with a brief description of those most generally used. The diamond is, of course, the stone of all stones. In regard to value, brilliancy, hardness and popularity it surpasses all the others. The base of the diamond is pure carbon, and they are found in crystalized shapes lying in the sand or imbedded in a matrix of quartz. The oldest diamond mines of the world are those of the East Indies which are now almost exhausted but from which some of the finest blue-white stones, called old mine stones, have been taken. The most diamonds are now taken from the South African mines, while the yield from the Brazilian mines has seriously diminished of late years, and unless some new fields are discovered or unless there is some truth in the story that diamonds are reproducing themselves in the older mines, there is danger that we may yet live to suffer from a diamond famine. In the East Indies they are found in a conglomerate of sandstone, consisting of quartz grains and disintegrated by the ferruginous sand. In the mountain chain Ralla-Nalla in Hindostan, the boulders and the sands of deserts and rivers yield diamonds mostly rounded or in granular form. The Island of Borneo also yields diamonds, and according to Jameson, diamonds

were found in the Indies in the coal formation. In Brazil they were discovered in 1728 by chance. After a few persons had gathered a great many rough diamonds and made a fortune out of their sale the government's attention was drawn to the matter, and in 1730 it was declared that all diamonds found there belong to the crown. In Russia the first diamond was discovered in July, 1829, by Humboldt, on the west side of the Ural Mountains. The washing establishments of the diamond in Brazil in the Tejuco district is conducted as follows: The waters of the small streams are diverted from their channels and the beds of those channels allowed to dry out, and the sediment consisting of a conglomerate of quartz pebbles kept together by oxide of iron is brought to one place for washing. There are benches of triangular form so as to keep 20 to 30 negroes busy; in the middle of this bench is a gutter with which is connected a trough and another gutter with a trough is joined further down. The negro who has collected in the dry season a large quantity of the sediment, is occupied in the rainy season in putting from 15 to 18 pounds at a time in the trough, spreading it there and allowing so much water to run over it until it runs off quite clear from the lower trough. He then begins to pick out the larger stones from the earthy part, then the smaller, until he comes to grains which he examines with the greatest care on account of the diamonds. As soon as a negro has found one he must make it known by clapping his hands, and the surveyor, who is seated on an elevated chair so he can oversee his work, takes and deposits it in a dish filled with water in which all those found during the day are collected; they are delivered twice a week to the government at Tejuco. The lines of the diamond district are guarded by sentinels who will not allow strangers to pass through without permission from the chief, and everybody must, on leaving the district, submit to a personal and strict examination and search by soldiers. All the diamonds produced are delivered up yearly to the government of Rio Janiero. In the years between 1772 and 1775, 5,000 negroes were employed and to-day they scarcely number 1,000. Their condition is pitiable; they receive a mere pittance for their work; they stand in water all day and in the mountainous regions are constantly exposed to the danger of being buried by the cavings of a bank. In order to encourage the negroes presents of tobacco, cloth, etc., are awarded according to the size of the diamond they find; the one who finds (for instance) a stone of 17 karats receives his entire liberty. Notwithstanding the most rigorous regulations and the most watchful attention of all the officers, the frauds in stolen diamonds are very considerable and it is estimated that the smuggling amounts to  $\frac{1}{3}$  the whole income. The smugglers, who are generally runaway slaves, examine the most remote parts of the district or steal the diamonds at night from the working establishments. Others, again, will take the stolen diamonds from the negroes and devise means of escaping with them, either in the soles of their boots or in hollow canes, etc., and it is a remarkable fact that all diamonds obtained from the smugglers are invariably larger and more beautiful than those to be obtained from the government. The thieves practice all manner of tricks even in presence of the surveyors. They conceal diamonds during the washing hours between the fingers, the toes, in the hair, ears, mouth, swallow them or throw them away with the other stones in order to pick them up at night, etc.

The diamonds, after being found in the mines, are sent from all parts of the world to Amsterdam and to Antwerp in Belgium, which are the great centers for diamond cutting; where the art of cutting it with its own powder was discovered by Lewis Van Berghen. The work of the lapidary is by no means insignificant, for in the way in which he cuts and finishes a stone a great part of its value depends. About  $\frac{1}{2}$  of the rough diamond is lost in cutting; the rough stone is usually cemented or sunk into a cup of molten lead at the end of a stick. It is then held over a revolving lead wheel which are fed with moistened diamond powder which imbeds itself into the metal until the upper side or table of the diamond is formed. The stone is then taken from the molten lead or cement and re-cemented at

another angle and again held over the wheel, and this operation is repeated until the stone is cut. But the mathematical accuracy of all the facets and sides that are obtained without the use of any measuring instrument whatever shows the skill and experience necessary to the diamond cutter. To show the amount lost in cutting I will here give the weight of some of the great diamonds before and after cutting:

|                          | When Rough.               | When Cut.                  | A Loss of.    |
|--------------------------|---------------------------|----------------------------|---------------|
| The Regent weighed . . . | 410 karats.               | 136 $\frac{1}{8}$ karats.  | $\frac{2}{3}$ |
| Grand Mogul " . . .      | 780 $\frac{1}{2}$ karats. | 279 $\frac{9}{16}$ karats. | $\frac{2}{3}$ |
| Kohinoor " . . .         | 186 $\frac{1}{2}$ karats. | 82 $\frac{1}{8}$ karats.   | $\frac{1}{2}$ |
| South Star " . . .       | 254 $\frac{1}{2}$ karats. | 124 $\frac{1}{8}$ karats.  | $\frac{1}{2}$ |

The color of the diamond takes in all the colors from white to black, the stones having a blue-white color being the most valuable, while the yellow ones are the cheapest; a blue stone being worth sometimes 5 times as much as a yellow stone of the same weight. The price of stones increases very rapidly in proportion to its weight. If a stone weighing 1 karat is worth \$100 per karat, a stone of the same quality weighing 2 karats is worth \$150 and weighing 3 karats \$200 per karat. Fine stones weighing over 6 karats a piece are comparatively rare. In the year 1871 precious stones to the value of \$2,346,732 were imported into the United States, and in 1880 the value of these imports was 6 $\frac{3}{4}$  millions. In 1881 gems to value of 8 $\frac{1}{2}$  millions passed through the Custom House and last year the amount was still greater. The New York market for jewels is to-day one of the greatest in the world; in no other country do working people own such valuable gems. Diamonds, rubies, cats'-eyes, sapphires, opals, onyxes, carbuncles and other valuable stones are now being sold at the rate of 6 to 1 as compared to the year 1871. There is to-day a finer selection of diamonds to be found in Maiden Lane and John street than in any other city of the world, and the retailer can buy them cheaper here than abroad; this is due to competition. The masses here purchase the jewels, while abroad the trade is confined to the wealthy and aristocratic. The American consumer of gems is more critical than the European, and while fine stones are eagerly bought up, poor ones are difficult to dispose of and find their way mostly to southern and eastern countries where the habit is to wear a great many precious stones without much regard to the quality.

The name diamond is derived from the Greek adamas, meaning invincible and referring to the hardness. The Syrians are said to have first known the diamond, and it was in early ages the subject of trade to the people of the East. The Carthagenians are said to have carried on their trade with the Etrurians who procured diamonds from the interior of Africa. Pliny mentions six species of diamonds, among which, however, the Indian are to be considered the true, in contradistinction to the quartz crystals which were likewise called diamonds in those times. The diamond was highly esteemed and many medicinal virtues were attributed to it, particularly against mania and as an antidote for poisons. It was then worn in the rough state. After the discovery in 1476 of cutting with its own powder, it was first cut in the table form with one row of facets on the surface. In 1520 the Rhomb cut was adopted and at last the form of brilliants (its present form) was invented in the reign of Louis XII. Cardinal Mazarin was the first who had diamonds polished in this form, some of which yet belong to the crown of France. The fact that the diamond was composed of carbon was first hinted at by Newton in 1675, and in 1694 the first trial was made at the Academy of Florence, the members of which volatilized diamonds within the focus of a mirror. Many experiments have been made to artificially produce diamonds, but it was not until 1880 that any faith was attached to these experiments, when, in that year, two Scotchmen, James McIrar in Glasgow and Mr. Hannay in London, succeeded in obtaining crystals similar to the diamond. Those of Mr. McIrar, however, were speedily proven not to be carbon, but a combination of silicic acids and many bases and therefore no diamonds; those of Mr. Hannay, however, were pro-

nounced real diamonds. The crystals were microscopically small worth from 1 to 2 fr. while 150 fr. was expended in the experiment, so as a practical measure the experiment was a failure; but there seems to be no reason to doubt that they were real diamonds.

From the diamond we pass to the ruby and sapphire which have the same composition but differ in color. The base of this group as well as of the emerald is alumina. Alumina, crystalized with iron rust, gives us the ruby; with other foreign substances we obtain the emerald, the white sapphire, the topaz, the amethyst, the indigo sapphire, the beryl, etc. The primitive form of these crystals is a six sided prisme, and nearly all of the rubies and sapphires are brought from India. Large stones are very rare and very high in price. A perfect ruby of 5 karats is worth 4 times as much as a diamond of the same weight, and I do not believe there is a 10 karat ruby in the United States. The largest ruby known is owned by the Shah of Persia and weighs 175 karats. There are 3 kinds of rubies, the Oriental ruby, the spinel ruby and the balas ruby; the first is the only true one. Sapphires are divided into Oriental sapphires, star sapphires and cats'-eyes. Star sapphires show a white light running in six rays resembling three white planes or stripes crossing themselves at one point. They are found in the colors of red, blue, yellow, etc. The stripes are caused by foreign substances or vacuities left between the molecules at the moment of crystalization. Cats'-eye sapphires are from Ceylon and has threads of white asbestos enclosed within it, and the light is reflected from these with intense brightness. When it is cut *en cabochon* a white band of light is seen floating in its interior which changes position as the gem passes before the eye; they are very rare and valuable. The sapphire was well known to the ancients and its name is taken from the Hebrew. Pliny gives a description of the star sapphire under the name of asteria. The finest ruby sapphire occurs in the Capelan mountains, near Syrian, a city of Pegu, in the kingdom of Ava. Large masses of blue sapphire of opaque color have been found in North Carolina, United States, and they are found in the sands of rivers or in boulders with garnets, zircons, kyanite and in basalt. Of topaz there are two varieties, the Oriental, of nearly pure alumina, and the occidental, which contains less than  $\frac{6}{10}$  of the subject. The true topaz is found in the Red Sea but is very difficult to get it. The cheaper topaz are found in Brazil, Mexico, Siberia and Saxony, and some have recently been discovered in Maine by Mr. Kunz, at one time a member of the chemistry class of this institute. Emerald, beryl and aquamarine are scientifically considered almost identical, but in commerce the value of the emerald is very much greater. The perfect emerald is one of the rarest and most exquisite of gems, but perfect emeralds are as scarce as hen's teeth. Its color is due to the presence, in combination with alumina, of a rather large quantity of oxide of chromium. Another gem has recently been discovered in North Carolina by Mr. Hidden, who also used to attend the Cooper Institute. It is similar to the emerald and far exceeds it in hardness and brilliancy; it is called Hiddenite after the discoverer, who is continuing explorations in the comparatively unexplored region of the United States, and who confidently expects to find diamonds and all the other gems in this country so as to render us independent of the markets of the old world. The beryl and the aquamarine have the general composition as the emerald but the oxide of chromium which distinguishes the last is replaced in them by oxide of iron. They are inferior gems and not very valuable. The aquamarine has little value as a gem yet it possesses the singular property of retaining its brilliancy by artificial light, while a magnificent blue sapphire which by day is dazzling, by night becomes dull and lifeless, while the cheap aquamarine shines with a brilliancy even more intense. The finest beryl known is in possession of Mr. Hope; it weighs more than 6 ounces and came from the East Indian mines. A magnificent beryl surmounts the globe in the royal crown of England.

The turquoise is another aluminous stone but only about half of its bulk is alumina. The blue color which makes it famous is

derived from a combination of phosphoric acid, copper, iron and water; it is abundant and though beautiful not costly. The occidental turquoise is a fossil ivory produced from the teeth of an extinct race of animals brought accidentally into contact with substances containing copper, which has been absorbed in quantities sufficient to color the entire mass. The turquoise stands alone among all the aluminum gems as having no electrical properties and no crystals.

The other stones used at the present day, such as pearls, coral, garnet, amethyst, onyx, cameo, intaglios, moss agate, etc., would require too much time to describe; so thanking you for the patience you have shown I must postpone the balance for some other time.

---

### The Hooking in of the Mainspring.

**M**ANY SPRINGS, says a contributor to a European horological paper, are broken owing to the hook in the barrel arbor being too long; therefore, this is a considerable item to be examined by the operator if he knows that a certain watch spring gets broken very often. Some of the closely made English watches, where a small barrel is used, frequently get their springs broken because the arbor hook stands too prominent. This hook should never be left longer than the thickness of the spring; this is quite sufficient to hold firmly, provided the hole in the spring is properly chamfered. The hole made in this end of the spring should be sufficiently large to allow the arbor hook plenty of room so that it will not raise or lower the center of the spring if the hook should be a little out of the center. In some of the flat Geneva watches, where a very thin spring is used, we have to be very careful in this particular; for, with such a thin—or low—spring, there is not the room to make the hole sufficiently large for the hook without making it a little weaker; or, if we are not careful, we are very liable to get the spring slightly ruptured in this part. Now, rather than run a risk of this kind, we had better stone off a part of the sides of the hook. Or, if the hook should be a little out of the center of the arbor we can then stone off one side only in order to bring the hole central.

When these little items are attended to we are not very likely to have the center of the spring chafing on the lid or bottom of the barrel unless the spring has not been properly finished, which is frequently the case with some of the cheap springs. Some of them have a rough burr on the edge which will often cause considerable trouble; for, in this instance, when the spring is nearly down and at its weakest point, it is then deprived of part of its strength by this chafing. Now, if the outside of the spring chafes, owing to getting in anyway bulged by riveting the hook on, this chafing is not so liable to affect the watch to such an extent, for, when this part of the spring is in action, there are more coils at work than when the spring is nearly exhausted; hence, its strength is better able to overcome the chafing. We see from this that the inner end of the spring should always be carefully examined; for we had better fit a spring that is a size too low than allow any chafing whatever.

---

### Clockmaking in the Black Forest.

**T**HE ROYAL Commission on Technical Education has published a report of their investigations, from which we make the following extract in reference to clockmaking in the Black Forest.

By means of lotteries and further grants, the Gewerbe-Halle was erected and opened in 1874, and the school was transferred to the new building, and was re-constituted and formally opened in June, 1877. The Government grant for this purpose was £650. The school is managed by a local council chosen from the surrounding districts, and consisting of eight persons. The annual budget is

£360, of which sum the Province of Freiburg contributes £25 and Villingen £50. The school is held in two small rooms, very ill-suited for the purpose, and a new building is in course of erection by the local Gewerbe-Verein (trade society) at a cost of from £1,250 to £1,500. There are at present eighteen pupils. Most of them are admitted free, and many are supported by exhibitions which are given by the neighboring towns, and may amount to £20 per annum. The school fee is £1 per annum. The students must have been previously engaged for at least two years in practical clockmaking before they can be admitted. The course lasts one year. In the morning they have theoretical studies, consisting of geometry, arithmetic, algebra, physics, mechanics, technology of watch and clockmaking, geometrical drawing, projection, technical drawing, bookkeeping and commercial arithmetic; together with thirty hours' practical work per week in the shops in the afternoon. The lathes and tools seem excellent of their kind, but the accommodation was very cramped.

By far the most important manufacture of the Black Forest is that of small carved clocks, many of them with musical accompaniments, known as cuckoo-clocks. In Triberg and a group of small towns and villages surrounding it, known as the clock country, 13,500 people, the population of upwards of ninety parishes, are engaged in clockmaking. We went to Schonach, a village in the hills above Triberg, where almost every cottage is the home of a clockmaker. The houses are large and substantially built. They are generally a considerable distance apart, and are surrounded with meadow-land and pastures. In addition to the home workers there are three or four small factories in which the wheels and other parts of clocks (Uhrenbestandtheile) are made. In one of these, visited by us, there were about five or six workmen employed and an apprentice. The power was derived from a small overshot wheel. There was a wire-cutting and straightening machine for preparing the pinions, a lathe for shouldering and tapering the pinions, some fine drills, a tooth-cutting machine, a shaping machine for the wheel teeth and a small press for driving on the bosses, etc. The machinery was ingenious and well adapted for its purpose. The rough castings made in the village were excellent. We were told that the men working piece work in the factories could earn from two to three marks per diem, though a very small proportion of the workmen earn the latter sum. In a second factory we visited subsequently, the movements made here were being fitted together and made into clocks. Carpenters were making the rough framework to contain the wheels, and others were preparing the varnished outer cases. The clock passed from hand to hand, one man adding the winding barrel, another the train of wheels, a third the escapement, and another placing the works into the case. The clocks were being packed up for sale in another part of the works. They seemed all pretty much of one pattern and of a very common description. The proprietor informed us that he produced clocks of exactly the same kind as those that were made in the cottages. They went mainly to various parts of Europe. None now go to England or to America. The Americans not only supply themselves with cheap clocks, but they have driven out the Black Forest maker from the English markets. The people employed at clockmaking live, we were told, very poorly—mainly on potatoes—though we saw soup and meat in some of the cottages. The cottages are very large; some of them contain as many as twelve families. Many of the people have only one or two rooms and a bit of land, probably about twenty perches, for which they pay from ten to fourteen marks rent per month. An old gentleman mowing in a very wet meadow was pointed out to us as the Bürgermeister of Schonach. We went into several of the cottages and saw the people at the work. The women were polishing the clock cases, and the men were making the wheel work. We were told here that an industrious worker at home could earn as much as a good workman in a factory. The water power is everywhere most ingeniously utilized, and the water itself is, as in many parts of England, employed for irrigation on the steep hill-sides.

The watchmakers' school of Paris is situated in the Faubourg du Temple, and when it was visited by the Royal Commissioners on Technical Education, it contained twenty-five pupils. The course extends over four years, the hours being from 8 A. M. to 7 P. M. in winter, and from 7 A. M. to 7 P. M. in summer, with an interval from 12 to 1.30 for meals and recreation. The theoretical instruction comprises French, the elements of mathematics, geometry and machine construction in their application to watch and clockmaking, the theory of the construction of watches, algebra, trigonometry, physics and chemistry, cosmography, bookkeeping and linear and industrial drawing. The practical instruction consists in the first year, of the use of tools and roughing-out work; in the second year, finishing; in the third year, escapements; and in the fourth year, regulating and repairs. The pupils, who must be fourteen years of age on admission, pay £12 per annum, and find their own small tools. For the support of the school, the "Syndicate" or Guild of Watchmakers annually contributes £560; the Government, £80; and the city of Paris, £40.

### How to Measure and Fit Spectacles.

EVERY JEWELRY store in the country is expected to carry a stock of spectacles and eye-glasses, and the question of measuring spectacle glasses, not only for old people, but for near-sighted people also, is one of weekly occurrence. It is not expected that every dealer in spectacles should be able to give a learned disquisition on optics, or diagnose every abnormal condition of the eye; but still there are certain things that every dealer who expects to suit his customers with suitable glasses should know.

He should know how to measure or obtain the focal distance of any convex or concave lens; he should also be able to determine the sum or difference of any combination of such lenses; and if the place to combine cylindrical or prismatic lenses with either of the above; but in all small places there is so little demand for either of the latter that it is hardly worth while to keep a stock of them on hand; and yet it would be well to *know when* a customer needs such glasses. If local resident dealers in spectacles knew more about this matter than they do, in fact knew what they *ought* to know, they could, if they wished, to a great extent break up the trade of itinerant swindling spectacle peddlers, who interfere no little with the legitimate trade of any regular dealer. These peddlers always sell inferior goods at exorbitant prices, and carry off a considerable sum of money from every town or city that they visit unless some one is prepared to show them up in their true light. I presume there is not a city or town in the United States but has been afflicted with these "Professors" just from "Vienna," "Berlin," "Munich," or some other European city, who has "just come to this country with the *only* spectacles that are or ever have been made upon truly scientific principles, approved by all the scientific men and crowned heads of Europe," etc. They manage to sell quite a number of spectacles in most every place they visit, and at from three to ten times their value.

We would suggest to those engaged in the trade that as soon as one of these "Dr. Eisenbarts" makes his appearance in a city, that the trade put a "stunning" advertisement in their local paper proposing to sell "spectacles at from one-half to one-fourth the price charged for the same quality of goods by itinerant peddlers." Something of this kind usually kills them off at once and their stay is very limited.

But let us come back to the main subject.

Probably every dealer knows how to measure a convex lens, but still there is no harm in stating that to do so a wall or partition furthest from some window, should be selected at a point near the counter shelf if possible, on which have a measure about sixty inches long, graduated in inches, counting *from* the wall; to measure

a convex lens hold it so that the light from the window will pass through it, and form an image of the window frame or some out-of-door object on the wall, moving the lens back and forth and near the measure until you find the point where the image is the most distinct; note the distance in inches the lens is from the wall, which will be the focal distance of the lens, whether it be a plano convex, double convex or concavo-convex, usually called periscopic convex. This is getting the focus by refraction.

A *concave* lens cannot by itself be measured by refraction of light, but it can be by *reflection*. To do so, hold the lens the same as you would a convex, but hold a white card or piece of paper between it and the light in such a position as will allow the light to pass over the card and fall upon the face of the lens, remembering that the angle of reflection is always equal to the angle of incidence, when an image of the window frame or other object will be reflected on the card, moving it back and forth until a distinct image is formed; note the distance the card is from the glass in inches and fractions of an inch; and if a plano-convex multiply this number by 4, and if a *double* concave multiply by 2, which gives you the focal distance or number of the lens. For instance, if a plano-convex lens showed the image of  $4\frac{1}{2}$  inches, it would be number 18; if a double concave showed the image at the same distance, it would be number 9.

There is another way to ascertain the focus of a concave lens, viz., by neutralization. For instance, an 18 convex will neutralize an 18 concave lens; if you look through the two when placed together, it will be the same as looking through a piece of plane or flat glass.

Some parties arrange every number of lens in their strips of wood, say about 6 or 8 lenses in each. Then to find the focus of a concave lens they find what number of convex will just neutralize the concave, so that the next number stronger or lower number will show a focus on the wall at same distance; this is the method usually adopted to ascertain the focus of a concave lens, especially the periscopic concave. This method is not generally accurate for the following reason: Suppose we have a number 16 convex and a number 18 concave; no image would be formed at any ordinary distance for measuring; but if we hold them at a distance of 144 inches a distinct image will be formed. It is only the numbers about which we can be certain in this way. But if a convex lens much stronger than the concave is used, we can get at the result more accurately and with the same facility. Let the numbers of all lenses be represented by vulgar fractions; the convex lens will always be designated by the + (plus) sign, and the concave by the - (minus) sign, and any one having a slight knowledge of algebra will be able to determine the number of any lens, either concave or convex, also the sum or difference of any combination of them.

To make this plain we will give a few examples, commencing with the convex:

A No. 10 and a No. 15, if placed together, would be the same as one lens No. 6; for  $\frac{1}{10} + \frac{1}{15}$  (by reducing to a common denominator)  $= \frac{3}{30} + \frac{2}{30} = \frac{5}{30} = \frac{1}{6}$ . Again let us suppose that a customer, who has had a cataract removed from his eyes, wants "cataract" glasses; we find that by putting on a pair of No. 5 and a pair of No. 8 he can see distinctly; then "cataract" glasses No. 3 would suit him as this would be the nearest number indicated by their combination, for  $\frac{1}{5} + \frac{1}{8} = \frac{8}{40} + \frac{5}{40} = \frac{13}{40} = \frac{1}{3.113}$ ; in other words,  $X = \frac{1}{5} + \frac{1}{8} = \frac{1}{3.113}$ .

Supposing we have an unknown concave lens and wish to get its focus; we test it with a No. 10 convex, for instance, and find that the two produce a focus on the wall at a distance of 30 inches; then we say  $X = \frac{1}{10} - \frac{1}{30} = \frac{3}{30} - \frac{1}{30} = \frac{2}{30} = \frac{1}{15}$ , consequently our concave lens is a No. 15. In this case the combination has taken a certain amount *from* the convex lens or reduced its value, so we must subtract the  $\frac{1}{30}$  from the  $\frac{1}{10}$ , both being positive or + numbers, for if we add  $-\frac{1}{30}$  to  $+\frac{1}{10}$  we have  $+\frac{1}{15}$ .

Suppose a near-sighted customer should try on a pair of No. 10 near-sighted or concave spectacles, which, with a pair of No. 15 convex, together just suited him; what number of concave spec-

tacles would suit him? We say  $X = -\frac{1}{10} + \frac{1}{15} = -\frac{3}{30} + \frac{2}{30} = -\frac{1}{30}$ ; in other words, No. 30 concave lenses would be required. Suppose that a No. 6 concave, with a No. 15 convex suited, then we have  $X = -\frac{1}{6} + \frac{1}{15} = \frac{1}{30} + \frac{2}{30} = \frac{3}{30} = \frac{1}{10}$ .

To find the focus of a combination of concave lenses, proceed the same as with convex lens. For example: A No. 8 concave and a No. 12 concave would be the same as a  $4\frac{2}{3}$  concave. We prove this by the following statement:  $X = -\frac{1}{8} + (-\frac{1}{12}) = -\frac{3}{24} + (-\frac{2}{24}) = -\frac{5}{24} = \frac{1}{4.8}$ , always reducing until the numerator is 1, when the denominator will show the number required.

We have endeavored to express ourself as intelligibly as possible and hope that the tyro optician will not be puzzled to understand us and focus his glasses.

---

### Some Famous Diamonds.

WHILE MUCH has been written and printed about the famous diamonds of the world, it still appears that too much cannot be said about them to satisfy the cravings of the public. When one cannot possess a thing it is some satisfaction to read about it. The following account of some of the most noted diamonds we find in a recent English journal. If it does not tell anything new about them it bears the impress of being historically correct, though the writer himself cannot vouch for that absolutely:

To the big diamonds of the world another has just been added. Advices from the Cape report that on March 27 last a digger was so fortunate as to find a rough diamond measuring nearly two inches in length and an inch and a quarter in diameter, and weighing no less than three hundred and two karats. "This," says Mr. Bryce-Wright, "is by far the largest precious stone yet discovered in South Africa, or, in fact, elsewhere, if we except the Pitt and the Mattam in their uncut state, and some diamonds of apocryphal history." It is a common fallacy to suppose that all the large diamonds existing in different parts of the globe are as well known and as capable of substantiation as pictures with an undoubted pedigree. Truth compels us to state that many of the so-called big diamonds known to history are little deserving of their reputation.

For instance, it is generally believed that the Braganza diamond—which is now included among the Portuguese State jewels—far exceeds all other gems in size, weight and value. The Braganza was found nearly a century and a half since in Brazil, a country which, rich as it undoubtedly is in precious stones of all kinds, has hitherto yielded but few large diamonds. "Brazil," says a recent writer of authority, "produces yearly from twenty-five to thirty thousand karats of diamonds, of which not more than nine thousand are capable of being cut, the rest being either very small or of very inferior quality." If the Braganza stone, which weighs nearly seventeen hundred karats, or about twelve ounces, and is as big as a large egg, were beyond all question a diamond, its commercial value would be simply incalculable. It has never been cut, however, and the Portuguese government, jealous of any possible damage to the national credit which might ensue, has always exhibited a reluctance to have "the Braganza" closely examined, or even handled, by experts. A widespread belief has therefore sprung up that, instead of being a diamond, it is only a white topaz.

Even the Mattam diamond, which has remained for the last century and a quarter in possession of the family of a Rajah in Borneo, where the stone was originally found, has not altogether escaped some invidious insinuations that it also is a topaz. Be the stone what it may, it has always been held in exceptional honor by its possessors for the time being as a talisman which brought them happiness, long life and good luck, just as the Kohinoor was always regarded, before the birth of the East India Company, as conferring upon its owner supremacy in Hindustan. No temptation—and many have been offered—has ever availed to induce the Rajah and

his successors to part with the Mattam diamond; and, although many fierce battles have been fought for its possession, it has never left the Rajah's family.

We come next to that magnificent stone called variously the Great Mogul and the Kohinoor, or "Mountain of Light," which, in 1850, became the Queen's property. Its reputed history might vie with that told by the young German baroness, in Sir Walter Scott's beautiful romance of "Anne of Geierstein," to Arthur Philipson, about that lustrous opal gem which turned pale on the approach of poison, and which an ancestor of the baroness won in battle from the Sultan of Trebizond. The history of the Kohinoor dates back vaguely to a period anterior to the birth of Christ, although nothing is known about it with positive certainty until it was owned in the fourteenth century by the Rajah of Malwa. From him it passed successively into the possession of the Bahmani, Khili, Lodi and Mogul kings until, in 1739, it came into the hands of Nadir Shah, the Persian, who gave it the name of "Mountain of Light." When Nadir Shah, at the head of his wild Tartars, burst over the blue mountains beyond the Indus, and descended upon Delhi, he demanded that everything in the treasury of the Mogul dynasty should be surrendered to him. The great-grandson of Aurengzebe, Mohammed Shah, valued the Kohinoor so highly, on the ground chiefly that it conferred supreme power and good fortune upon its temporary holder, that he kept the gem back from Nadir Shah by concealing it in his own turban. The story runs that a woman of his harem, who had received unworthy treatment from Mohammed, secretly apprised his conqueror where the jewel was hidden. The two rulers sat down together at a great feast held in Dehli, and, with protestations full of oriental insincerity, swore eternal friendship and love for each other. Suddenly Nadir Shah declared, to his mortified and dissimulating neighbor, that before the feast closed he must exchange turbans with him. Snatching off his own head-dress Nadir Shah gave it to his brother chief and possessed himself of the treasure. No sign of emotion or reluctance was exhibited by the subtle Eastern ruler, who trusted that the hidden jewel would escape detection, and that he should soon be able to regain possession of it. Scarcely had he entered his own tent when Nadir Shah searched his beaten enemy's turban, and within its folds he discovered that priceless gem, to which he instantly gave the name of "The Mountain of Light." He carried it back with him to Khorassan, investing it, in his delight, with all sorts of miraculous properties, but when he died his feeble son was unable to retain it. From him it passed to Ahmed, the founder of the Cabul dynasty, and it ultimately became the property of Shah Sujah, who, when driven out of Cabul and bereft of sight, took the gem with him, and clung to it with more tenacity than to his life. His wanderings brought him at last to Lahore, where he was the guest of Runjeet Singh, "the Lion of the Punjaub." A rumor reached Runjeet's ears that Shah Sujah carried the Kohinoor about his person, and he employed every device of menace, entreaty and cajolery to get hold of the precious treasure. For a long time he was unsuccessful, until, baffled in his efforts, he resolved to try his hand upon the Begum, who was Shah Sujah's wife. At length, on June 1, 1813, Shah Sujah resigned the glorious gem to his conqueror, avowing that it should alone belong to those who were triumphant over their enemies. Every means was used to induce Runjeet to bequeath it on his deathbed to the idol Juggernaut, but he preferred to hand it to his successor as the symbol of empire. When the Punjaub was annexed by the English government, the crown jewels at Lahore were taken from the Maharajah Dhuleep Singh, who was then a boy, and it was stipulated by the East India Company that the Kohinoor should be delivered to her Majesty. Lord Dalhousie sent two officers in charge of the gem to England, and on June 3, 1850, it passed into the possession of the future Empress of India. Those who remember the great exhibition of 1851 will recall the sensation which the Kohinoor created, and it was then valued at something like one hundred and fifty thousand pounds. It had, however,

been so unskillfully cut that Sir David Brewster recommended that Herr Voorsanger, an expert from Amsterdam, should be invited to England in order that he might cut out the flaws and reset it. On July 6 the Duke of Wellington placed the stone upon the cutting mill over which Herr Voorsanger presided, and its weight was decreased by the process from one hundred and eighty-six to one hundred and two karats.

It ranks in general estimation with the celebrated Pitt diamond, bought by the grandfather of the first Earl of Chatham from an Indian diamond merchant for twelve thousand five hundred pounds. From Governor Pitt it was bought for a fabulous sum—considerably more than one hundred thousand pounds—by the Regent-Duke of Orleans, and having experienced all sorts of vicissitudes during the French revolution, it passed into the hands of the Emperor Napoleon, who had it fixed in the hilt of his sword. Before it was cut it weighed more than four hundred karats, but it was reduced in the cutting mill to about one hundred and forty. As the greatest and most valuable gem among the crown jewels of France, it and the Kohinoor have always ranked among the most illustrious diamonds of the world.

Within the last few years South Africa has successfully asserted its claim to vie with Brazil, with Ceylon and with Australia as a producer of precious stones, and among famous gems the Dudley diamond and the Stewart diamond, both found at the Cape, have lately come into prominence. It may be that the great diamond, weighing, in the rough, more than three hundred karats, and just found in the Kimberley mines of South Africa, is destined, when it is brought under Mr. Bryce-Wright's inspection, to equal, even if it does not surpass, in value and luster, the Kohinoor and the Pitt.

South Africa is distinguished for the largeness of the diamonds already found among its mountains and in the beds of its rivers, and, although the market for small diamonds is said at this moment to have shared in the common depression of commerce all over the world, there is little probability that large stones of pure quality will ever lack a wealthy purchaser. It is a characteristic, for instance, of those few millionaires in the United States who, like Mr. W. H. Vanderbilt and Mr. Mackay, can afford to buy rare precious stones, that they are content with nothing but the purest and most costly gems. Anyhow, the arrival in England of the latest paragon from South Africa will be eagerly awaited by the large and increasing circle of diamond fanciers, who have made the English metropolis the greatest center and distributor of precious stones in the world.

## Computation of Time and Changes of Style in the Calendar.

Addressed to Students of History and Genealogy.

[BY SPENCER BONSALE.]

Continued from page 205.

### CALENDAR OF THE FRENCH REPUBLIC FROM 1792 TO 1806.

ALTHOUGH Encyclopædias and other works mention the French Republican Calendar, and in some cases attempt to give copies of it, I have yet to find, in the English language, a correct exemplar, or one that can be used for practical purposes. The Calendar here given may be relied on for perfect accuracy in every particular, as it has been prepared directly from the "Almanach National de France," and the "Gazette Nationale, ou Le Moniteur Universel."

The zeal for innovation which accompanied the French revolution induced the rulers to change their calendar along with their government. It was decreed by the National Convention, in the autumn of 1793, that the vulgar era should be abolished in all civil concerns; that the new French era should be reckoned from the foundation of the republic, September 22, 1792, of the vulgar era, on the day of the true autumnal equinox; that each year should begin on the midnight of the day on which the autumnal equinox falls; and that the

first year of the French republic had begun immediately after 12 o'clock P. M. of the 21st of September, 1792, and had terminated on the midnight between the 21st and 22d of September, 1793. In order to effect a correspondence between the seasons and the civil year, it was decreed that the fourth year of the republic should be the first sextile, or leap year, that a sixth complementary day should be added to it, and that it should terminate the first *Franciade*; that the sextile, or leap year, should take place every four years, and should mark the close of each *Franciade*; that the first, second, and third centesimal years, viz., 100, 200, and 300 of the republic, should be common, and that the fourth, viz., 400, should be sextile; and this should be the case every four centuries until the fortieth, which should terminate with a common year.

It was intended that the year should have been divided into ten parts, conformably to the decimal system; but, in taking the divisions of the months, the twelve revolutions of the moon round the earth made it absolutely necessary to admit twelve months. These were named after the seasons to which they belonged.

|        |             |                   |                             |          |
|--------|-------------|-------------------|-----------------------------|----------|
| Autumn | Vendémiaire | Vintage month     | September 22 to October 21, | 30 days. |
|        | Brumaire    | Foggy month       | October 22 to Nov. 20,      | 30 "     |
|        | Frimaire    | Frosty month      | November 21 to Dec. 20,     | 30 "     |
| Winter | Nivôse      | Snowy month       | December 21 to Jan. 19,     | 30 "     |
|        | Pluviôse    | Rainy month       | January 20 to Feb. 18,      | 30 "     |
|        | Ventôse     | Windy month       | February 19 to March 20,    | 30 "     |
| Spring | Germinal    | Germinating month | March 21 to April 19,       | 30 "     |
|        | Floréal     | Flowery month     | April 20 to May 19,         | 30 "     |
|        | Prairial    | Meadow month      | May 20 to June 18,          | 30 "     |
| Summer | Messidor    | Harvest month     | June 19 to July 18,         | 30 "     |
|        | Thermidor   | Hot month         | July 19 to August 17,       | 30 "     |
|        | Fructidor   | Fruit month       | August 18 to Sept. 16,      | 30 "     |

As the French months consisted of 30 days each, making in all 360 days, the remaining five days required to complete the year were called *complementary days* and *sans-culottides*. They were named as follows:

|             |                      |                          |
|-------------|----------------------|--------------------------|
| 1. Primedi  | Fête de la Vertu     | The Virtues, Sept. 17th. |
| 2. Duodi    | Fête du Génie        | Genius, " 18th.          |
| 3. Tridi    | Fête du Travail      | Labor, " 19th.           |
| 4. Quartidi | Fête de l'Opinion    | Opinion,* " 20th.        |
| 5. Quintidi | Fête des Récompenses | Rewards, " 21st.         |

The intercalary day of every fourth year was called *La sans-culottide*, and was to be the Festival of the Revolution, to be dedicated to a grand solemnity, in which the French should celebrate the period of their enfranchisement, and the institution of the Republic. The National oath, "To live free or die," was to be renewed.

Each day was divided according to the decimal system, into ten parts or hours, and these into ten others, and so on.

Each month was divided into three decades, each consisting of ten days; the names of which were taken from the Latin numerals. The first was called *Primedi*, 2d *Duodi*, 3d *Tridi*, 4th *Quartidi*, 5th *Quintidi*, 6th *Sextidi*, 7th *Septidi*, 8th *Octidi*, 9th *Nonidi*, and 10th *Décadi*. The last was the day of rest, and superseded the former Sunday.

This decimal arrangement did not appear to give general satisfaction, the French Republicans rarely adopting the new names of the days, in dating their letters, or in conversation, but using the number of the day of each month of their calendar. Thus: the 6th, 17th, 28th, or 30th Nivôse, the 9th Fructidor, the 12th Germinal, the 16th Frimaire, the 23d Prairial, etc. The system was abandoned, and religious worship restored after *Septidi*, † 27th Germinal, year X. (17th April, 1802), and the next day, Sunday, commenced with the usual names of the days of the week: *Dimanche*, *Lundi*, *Mardi*, *Mercredi*, *Jeudi*, *Vendredi*, and *Samedi*.

\* "This festival, absolutely original, and perfectly adapted to the French character, was to be a sort of political carnival of twenty-four hours, during which people should be allowed to say or to write with impunity, whatever they pleased concerning every public man. It was for opinion to do justice upon opinion itself; and it behooved all magistrates to defend themselves by their virtues against the truths and the calumnies of that day."—Thiers' *History of the French Revolution*.

† See *Gazette Nationale ou Le Moniteur Universel*, 18, 20 Germinal, year X. (8, 10 April, 1802) for act of the Corps-Législatif, and speech of Lucien Bonaparte.

This calendar existed until the 10th Nivôse, year XIV. (the 31st December, 1805). The next day, January 1, 1806, the Gregorian mode of computation was restored.

With the aid of the preceding and following tables, a complete calendar for any month, or year, of the French Republic can easily be constructed.

NOTES ON SUNDRY CALENDARS.

BY ALEXANDER WILCOCKS.

The very interesting article by Mr. Spencer Bonsall on "Changes of Style in the Calendar," rather piques the curiosity of students of history and genealogy as to the character of other calendars which have had, or may still have, existence.

On examining the fifty short chapters in which the subject of Calendars is treated by M. François Arago in his "Astronomie Populaire," one is rewarded by learning some valuable facts regarding them.

Perhaps the most interesting of the non-Christian Calendars described by him, because of its superior accuracy, was that of Persia.

The following is a translation of Mons. Arago's account of it as it appears in Chapter XIX., Book XXIII.:

THE PERSIAN YEAR IN THE ELEVENTH CENTURY.

The Persians had already adopted in the eleventh century an intercalation which brought their civil year very near to the astronomical one, and which maintained the equinoxes and the solstices upon the same days of the civil year.

It was thus constituted: Three ordinary years of 365 days were followed by a leap year of 366 days, and this period of four years was repeated seven times. This was succeeded by a period in which the leap year did not occur until after four ordinary years.

Let us ask what length of year ensues from this mode of intercalation? Here is the answer:—

The first seven periods form a total of 28 years, the eighth period comprises five years, making a total of 33 years.

Therefore, in 33 years the Persians intercalate 8 days. Hence the fractional part of the year beyond the 365 days may be expressed thus,

$$\frac{8 \text{ days}}{33} = 0.2424 \text{ days.}$$

|  |           |                             |
|--|-----------|-----------------------------|
| 10,000 years with the Persian mode of intercalation comprise | - - - - - | 3,652,424 <sup>ds</sup>     |
| 10,000 astronomical years comprise                           | - - - - - | 3,652,422 <sup>ds</sup> .64 |

The difference is only - - - - - 1<sup>dy</sup>.36

Between the civil year as amended by Gregory XIII.† and the astronomical year there is a difference of - - - - - 2<sup>ds</sup>.36

Thus it appears that the Persian mode of intercalation is superior in accuracy to the Gregorian Calendar now adopted by the greater part of Europe, and of the New World.

In his "History of the French Revolution," M. Thiers describes the twelve months into which the year was divided by the Directory. He also tells us of the complementary days, and the "sans culottides;" but about the manner in which the "Republican year" was made to keep pace with the astronomical year he says absolutely nothing.

More strange still than the above is the fact that while M. Arago describes with minuteness so many different calendars, upon the above interesting point in the Republican Calendar he says as little as does M. Thiers.

Upon one point only he enlarges, and thereon bases the reflection, that as the exact day on which the autumnal equinox occurs was to be calculated upon the longitude of the meridian of Paris, the founders of the Republican Calendar might have been assured that national jealousy would certainly prevent the people of other countries from adopting it.

In the "Atlas Universel d'Histoire et de Géographie," par M. N. Bouillet, under the head of "Chronologie," may be found a short but minute account of the Republican Calendar.

† *Astronomie Populaire*, vol. iv., p. 688.

\* For the year IV. of the Republic, after the 28th of February, use the first column under the year I., as 1796 was a Gregorian leap year. The 10th Ventôse was the 29th of February.

The following is a translation of the article:—

REPUBLICAN ERA.

This era, the most recent of all, is also that which has lasted the shortest time. Established in France by a decree of the Convention on the 5th October, 1793, it had a retroactive commencement from the 22d Sept., 1792.

As precedently, the ordinary years were to contain 365 days, those which contained 366 days were to be called *sextiles* (and not *bisextiles*). The difference consisted solely in the mode of intercalation.

It was ordered that the year 3 should be sextile, that from this epoch each fourth year should be sextile until the year 15; after which a 366th day should not be added till the year 20.

This sequence was to be repeated until the years 48 and 53 of the era. Thereafter a cycle of 33 years should be conformed to, in which every fourth year a sixth day called *épagomène* (that is to say, intercalated) should be added, but in such a manner that after the seventh intercalation no addition should be made to the complementary days until the fifth year, when the 8th intercalation was to be made.

Special decrees in the years 1793 and 1794 abolished this mode of intercalation, and ordered that the first day of the year should always be that of the autumnal equinox, which was to be ascertained each year by astronomical calculations.

The duration of the Republican era was only 13 years and 100 days. By a *Senatus consultum* of the 22d Fructidor in the year 13, the conservative senate abolished this institution, and the 10th Nivôse of the year 14 was followed immediately by the 1st of January, 1806.

In the preparation of the article "Chronologie" in the "Atlas," from which the above is translated, the Collaborator of Mons. Bouillet was Mons. Caillet.

It will be observed that by the combined testimony of these two authorities, the mode of intercalation by which the Convention proposed to keep their civil year in coincidence with the astronomical year was absolutely identical with that adopted in Persia in the Eleventh Century.

Another calendar described in detail by M. Arago is that of the Christian Church. All are familiar with the mode in which the time for the celebration of Easter was determined at the Council of Nice.

M. Arago mentions a fact with which most persons are unacquainted, viz., that "the paschal moon is a conventional moon; and may arrive at its full one or two days before or after the true or mean astronomical moon."

"Hence ensue frequent reclamations of the public, being unaware that the time of Easter is based upon the phases of a fictitious or imaginary moon, and not upon those of the real moon." "Astronomers are, therefore, taxed with ignorance or carelessness for causing the celebration of Easter to take place a month after the proper time."

There are other calendars and sundry eras described by M. Arago which would repay perusal by those interested in such subjects.

The same is true of the subject of Chronology as treated in the "Atlas d'Histoire et de Géographie."

[THE END.]

### To Prevent Watches from being Magnetized.

AN INTERESTING article in the July number of the London *Horological Journal*, written by Mr. Thos. D. Wright, relates how he made watches that were proof against magnetism. We extract as follows:

In consequence of the great advance in electrical pursuits during the last few years, involving the use of dynamo machines and other powerful magnetic appliances, considerable inconvenience has been caused by the liability of the ordinary watch to become magnetized; and a consequent demand, which will probably grow, for watches

unaffected in their timekeeping properties by magnetic influences. Even when the tedious process of demagnetizing has been thoroughly successful, the cure is not of much use to the watch as usually made, because it may be as bad as ever the next day, if brought too near a powerful magnet.

As I have had to make some watches during the last two or three years which should be proof against magnetism, so far as their timekeeping was concerned, it may interest some of your readers to know how far the attempts were successful, and how the desired result was obtained. In making such a watch, we must assume that it will be subjected to such powerful magnetic attraction that every particle of steel in it becomes a permanent magnet. We have next to consider how far each of such parts so magnetized will affect the time. This, perhaps, could only be determined by experiment. I concluded—and the result justified these conclusions—that the motion of the arbors and pinions was really so slow that it would not matter how much they were magnetized. I was afraid of the escape pinion, which has an appreciable radius, and moves much faster than the others; but although I have found in each case that it had become powerfully magnetized, I could not detect that it had the slightest effect on the time.

I had heard of brass mainsprings being used, but I neither feared nor found any inconvenience from using the ordinary steel mainspring. The only parts to which attention need be paid are the escapement, the balance, and the balance spring. The first one I made had pallets, lever, and roller of brass. The pallet maker complained that he could not polish the pallet stones well, as the brass seemed to mingle with the polishing stuff, and prevent him from getting necessary smoothness. The latter ones, therefore, have been made of aluminium bronze, which has proved to be better than brass in many ways for each of these pieces; the balances in each case have been ordinary gold ones; the balance springs have been Paillard's palladium springs, as sold by Messrs. Haswell. It is also advisable not to use steel hands, *especially the seconds hand*.

These watches have been submitted to severe tests; have been saturated with magnetism; have been placed on a dynamo for hours, and between the poles of a powerful electro-magnet without any apparent alteration in their vibration, and without any alteration in their rate, either while they were undergoing the tests or after they had been removed from the machine. Although it is quite possible that a current might be used strong enough to stop them, I do not think that it would have any permanent effect, but that the watch would resume its original rate directly it was removed from the influence of the current. The stud, index, jewel settings, and screws have been made of brass, but I do not think this was really necessary, except for appearance; steel ones would probably have no sensible effect. As I found that the palladium springs had a rather greater temperature error than the steel ones, I made some attempts at compensation, but hitherto without success.

### Chinese Children and their Diamonds.

DURING THE morning four children of a rich Chinese merchant, attended by a train of Chinese and Malay servants, came to see Mrs. Shaw. There were a boy and a girl of 5 and 6 years and two younger children. A little description of their appearance reads like fiction. The girl wore a yellow petticoat of treble satin, (mandarin yellow), with broad box-plaits in front and behind, exquisitely embroidered with flowers in shades of blue silk, with narrow box-plaits between, with a trail of blue silk flowers on each. Over this there was a short robe of crimson brocaded silk, with a broad border of cream-white satin, with the same exquisite floral embroidery in shades of blue silk. Above this was a tippet of three rows of embroidered lozenge-shaped "tabs" of satin. The child wore a crown on her head, the basis of which was black vel-

vet. At the top was an aigrette of diamonds of the purest water, the center one as large as a sixpenny piece. Solitaires flashing blue flames blazed all over the cap, and the front was ornamented with a dragon in fine filigree work in red Malay gold set with diamonds. I fear to be thought guilty of exaggeration when I write that this child wore seven necklaces, all of gorgeous beauty. The stones were all cut in facets at the back, and highly polished, and their beauty was enhanced by the good taste and skillful workmanship of the setting. The first necklace was of diamonds set as roses and crescents, some of them very large, and all of great brilliancy; the second of emeralds, a few of which were as large as acorns, but spoiled by being pierced; the third of pearls set whole; the fourth of hollow filigree beads in red, burned gold; the fifth of sapphires and diamonds; the sixth a number of finely-worked chains of gold, with a pendant of a gold filigree fish, set with diamonds; the seventh, what they all wear, a massive gold chain, which looked heavy enough even by itself to weigh down the fragile little wearer, from which depended a gold shield, on which the Chinese characters forming the child's name were raised in rubies, with fishes and flowers in diamonds around it; at the back a god in rubies, similarly surrounded. Magnificent diamond ear rings and heavy gold bracelets completed the display, and all this weight of splendor, valued at the very least at \$40,000, was carried by a frail human mite barely four feet high, with a powdered face, gentle, pensive expression, and quiet grace of manner, who came forward and most winsomely shook hands with us, as did the other grave, gentle mites. They were also loaded with gold and diamonds. Some sugar-plums fell on the floor, and as the eldest girl stooped to pick them up diamond solitaires fell out of her hair, which were gathered up by her attendants as if they were used to such occurrences. Whenever she moved her diamonds flashed, scintillated, and gave forth their blue light. Then came the children of the richest Chinaman in Malacca, but the little creatures were motherless, and mourning for a mother lasts three years, so they were dressed in plain blue and white, and as ornaments wore only very beautiful sapphires and diamonds set in silver.—*The Golden Chersonese—Miss I. L. Bird.*

### Precious Metals in Architecture.

THE Decorative Treatment of Metals in Architecture was the title of a lecture recently delivered in Boston, by Mr. George H. Birch, A. R. I. B. Having explained that he should treat his subject from an art, and not from a constructional, point of view, the lecturer alluded to the immense importance of the metals to man, asking the audience to transport themselves in imagination to the primitive ages, when metallic currency was not, and consider to what straits they would be reduced when chipping the primeval flint or scraping the pre-historic bone. Co-existent with the first germs of civilization, the use of the metals had expanded with its growth, and, from the cradle to the grave, man was absolutely dependent upon the metals for existence. Numberless generations had passed away, but the metals which they fashioned for use or adornment might still exist, albeit melted, remelted and reformed, divided and dispersed infinitesimally, and might continue in existence for countless ages to come.

Taking up, in the first place, the employment of the precious metals, gold and silver, in connection with architecture, we found in Egyptian hieroglyphics many references to their use. The *stèle* of Hatharsa of the twelfth dynasty stated that he compelled chiefs "to wash gold," and on the tablet of Nebuian, in the reign of Thothmes III., we read that, as high priest of Osiris, "I dedicated numerous works in the house of my father, Osiris, of silver and gold. . . . I was called to the house of gold. . . . I made to thee a secret chapel of stone, the bolts on it of brass covered with gold." And in other passages of the same record we were informed that the folding-doors

and the tablets of the temple of Khonsa, in Thebes, were plated with gold, and that the hinges of the gates were of silver, with coverings of gold, while the columns, the cornices and lintels of other temples were referred to as of sandstone, plated with pure gold. Egyptian architecture at the present day showed little trace of any metallic adornment, nor was its use at any time so prevalent there as with the Assyrian, Chaldean, Babylonian, Medo-Persian, and other Semitic races. Gilding was applied by the Egyptians, not as by us, in sheets beaten to an infinitesimal density, but in strips of considerable thickness, as might be seen by an inspection of some of the mummy-cases in the British Museum and the Louvre. In Egypt, sculpture and painting were profusely employed, to the exclusion of other forms of decoration; but many of the obelisks were decorated with gold, both the pyramidon and base being gilded, and they were often surmounted by a disc of gold. The gold mines of Midian were extensively worked by the Egyptians. Captain Burton discovered the cartouche of Rameses III. in some of the disused workings, and the cartouche of a much earlier King Kheper-teara in the Sinaitic peninsula.

The great Assyrian empire was remarkable for its use of the precious metals as architectural adornments. Herodotus told us that the temple built by Nebuchadnezzar at Borsuppa consisted of several stories, diminishing in size, the outer walls of two of these stages being covered with gold and silver respectively; and that at Agbatana, the capital of the Medo-Persian empire, the king's palace had wooden beams, ceilings and pillars covered with plates of gold and silver, and was roofed with silver tiles, and the latter statement was confirmed by Polybius. The temple at Babylon, called by Herodotus that of Jupiter Belus, was also said to be richly decorated with gold.

In the case of the contemporary kingdom of Israel, we knew from the Bible the extensive use made by that purely Semitic race of the precious metals; it being recorded that in the days of Solomon gold was nothing accounted of, and silver in Jerusalem was as the stones of the streets. Even from the time when the children of Israel were journeying in the wilderness they employed the precious metals "borrowed" from the Egyptians in making the sockets, rings, and capitals of the Tabernacle, the columns being overlaid with pure gold—possibly a hyperbolic way of describing plain gilding—and the candle-stick, lamps, and altar of incense being of pure gold. Four hundred and eighty years afterwards a wonderful temple was built by Solomon, of which the chief adornments were metallic. Indeed, one modern manufacturer had gravely attempted to prove that the temple was entirely made of metal, and that no stone was used except for the foundations, basing his belief on the well-known verse (1 Kings, vi. 7) which stated that there was neither hammer nor axe, nor any tool of iron heard in the house while it was building, so that all the parts must have been put together with screws! One might with equal reason start the theory that it was entirely of cedar or other wood, and quote the same chapter as an authority, "as there was no stone seen." Josephus' description of the Temple, although mainly derived from the First Book of Kings, was interesting, as it was interwoven with other traditions; and after allowing for the unintentional love of hyperbole natural to Oriental nations, it was seen that this Temple must have been resplendent with the precious metals, and an object of admiration, wonder and cupidity to other nations. The description of Solomon's palace having roof and walls adorned with gold, gave an accurate idea of those palaces unearthed by Layard at Ninevah and Khorsabad, even to the sculptured lining slabs and ivory thrones. In the biblical account mention was made of Hiram, King of Tyre, who assisted Solomon, especially in making the metal ornaments for which the Jews seemed to have had little aptitude, and from Menander we learned that Hiram also dedicated a golden pillar in the temple of Jupiter at Tyre, and rebuilt the temples of Hercules and Astarte.

The lecturer next referred to the poems of Homer, written apparently about eleven centuries before the Christian era. Homer

described, in language almost sublime, various palaces and halls, such as those he must have seen or heard of, and while affording no idea of their architectural style, he dwelt much upon the golden doors and the silver ornaments, graphically portraying such a wealth of metallic splendor that, to borrow a phrase of his own, his descriptions "poured along like a fire that swept the whole earth before it." In illustration of this vivid imagery, Mr. Birch quoted from Pope's version the well-known descriptions of the Palace of Alcinoüs, and the Hall of Menelaus in Sparta. Doubts had been thrown on the existence of the Homeric heroes, but Dr. Schliemann's discoveries at Mycenæ, Orchomenos, and Hissarlik, of tombs containing immense stores of gold buried with ancient warriors, was striking testimony in confirmation of the poet's story. In a lesser degree we found the same in the tombs of the primitive inhabitants of Italy, the Etruscans, pointing to a common origin, perhaps Pelasgic. Turning back to Greece, we were tempted to ask, as we gazed upon the ruins of the Parthenon or the Athenian Acropolis, could there possibly have been room for any decoration in this temple beyond the perfect symmetry of its own faultless proportion? The answer must be in the affirmative. Not only was color applied, as we saw, beyond power of dispute, in the sculptures by Phidias, now in the British Museum, but metallic decoration also lent its aid in adding to a beauty almost perfect in itself. On the Parthenon were still visible the holes for clamps in the architrave, and circular stains upon the marble, showing that under each of the metopes was suspended a gilded shield, and smaller holes under the triglyphs indicated that inscriptions in gilded letters formerly existed between each. These had been supposed to indicate the votive offerings of shields taken by Alexander from the Persians, and given by him to the Parthenon; but the lecturer believed they formed part of the original design. The acroteria which decorated the mounts and corners of the pediments were also of gilded metal, and the railings or grilles between the columns and the antæ were likewise gilded. Passing within, the most prominent object was the chryselephantine statue by Phidias, in which the glittering golden raiment and crested helm contrasted with the soft creamy beauty of ivory flesh. We knew that the temples of Jupiter at Olympia, and of Apollo at Delphi were also full to overflowing with the votive offerings of generations. The inner sanctuary of Herod's Temple at Jerusalem was decorated with a golden vine; indeed, so immense was the quantity of gold in this temple that after the destruction of Jerusalem gold was sold in Syria, by the soldiers of Titus, for half its value.

Passing on to Imperial Rome, one was almost bewildered by the many examples of the employment of the precious metals in the adornment of its edifices, such as the Golden House of Nero, the gilded Capitol, the Temple of Ceres, and the gilded statues and trophies of the Ulphian Basilica. In the New Rome, on the banks of the Bosphorus, the same traditions as to the use of the precious metals were maintained. The Church of St. Sophia must, in the days of its first magnificence, have been refulgent with the precious metals; apart from the universal use of gold and silver mosaics in its dome and vaults, the columns of the ciborium and the baldachino over the altar were formed of silver-gilt; the sculptured lilies and fruits which adorned it, and the cross which surmounted it, were of solid gold; and of gold were also the solea and ambones. At the Church of the Resurrection, in the same city, the under side of its wooden vault was covered with plates of gold by Basil, the Macedonian. In the Church of St. Demetrius, at Thessalonica, A.D. 458, there was a ciborium of silver, and the shrine of the saint was hexagonal; both the six columns and the walls being of silver, covered with incised ornament, and the circular cover and the sphere and cross above were also of silver. This seemed to have been the prototype of many of the gorgeous shrines of Mediæval churches. The three immense basilicas at Rome:—St. Peter, St. John Lateran, and St. Paul-without-the-Walls, were rich in the precious metals. In some of the Italian churches, and also in Spain and Germany, were still preserved magnificent altar-pieces of silver-gilt, called *pala d'oro*.

In St. Mark's, Venice, was a superb specimen which was uncovered on great festivals; it was of Byzantine workmanship, and richly jeweled; it was made in 976 by order of the Doge Pietro Orseolo, but was much altered by successive Doges. St. Ambrose's Church, Milan, possessed one of the richest in Christendom, and slightly earlier (A.D. 835) than the Venetian one. The front was of gold, and the sides and back of silver; it was richly enameled and set with jewels. The name of the artist had been preserved, Wolvernus. In the Duomo at Monza, was an altar-frontal silver-gilt, of the tenth century, and at Citta di Castello, a silver altar-piece of the twelfth century. A magnificent *pala d'oro*, formerly in the Cathedral of Bale, now formed one of the chief treasures of the museum at the Hôtel Cluny, Paris. It was given to the cathedral by the Emperor, Henry III., about the commencement of the eleventh century, and, although betraying Greek influence, was probably of Lombardice, and not Byzantine workmanship. It was of solid gold, on a foundation of cedar, and was remarkable for the life-like energy of the figures in high relief, and exquisite workmanship of the foliage, animals, and filigree enrichments. The tomb of St. Margaret, in the church of the same name at Cortona, was of the thirteenth century, and had a silver front. At Florence, in the Opera del Duomo, was preserved a silver retable beautifully enameled; it was five feet high, fifteen feet long, and was divided into twelve compartments, and in the center was a figure of St. John. Begun in 1366, it was not finished till 1477, and Ghiberti, Orcagna, Verrochio, and other artists worked upon it. In the present day gold and silver were far too precious to be used except in ordinary currency; in Europe alone it was estimated that these metals were employed for this purpose to the extent of over two thousand billion sterling—or in small objects of use or ornament.

---

### The Tempering and Annealing of Steel.

WE COLLECT under this title the results of experiences, says the *Journal Suisse d'Horlogerie*, which we have gathered on the method of tempering and annealing steel, and of the agents proper to be used for this purpose. We first have the composition of the mixture of M. Raoul, of Paris, for hardening his world-renowned files:

- 906 grams mutton suet, not prepared, but simply cut in pieces.
- 906 grams bacon.
- 56 grams pulverized white arsenic.

This mixture, cut into an iron pot, is left to boil until a handful of freshly-gathered hawkweed (*hieracium piloselle*) which has been placed with the mixture near the fire, has curled up and swims on the surface of the fluid, which proves that the entire humidity has disappeared.

This work as well as the hardening of the files must be performed under the flue of a smithy, in order to avoid as much as possible the arsenious vapors; besides this, the workman must close very effectively both mouth and nostrils, so as not to breathe these noxious emanations.

After repeated experiments with English files of every size and sort, chosen from among the best and hardest, all were attacked by the Raoul's files, and the superiority of the latter is thereby established.

When tempering razors and cutting instruments, it is necessary to thoroughly free the steel from the crust formed by forging; by this precautionary rule a very high degree of temper can be imparted, and that with a degree of heat inferior to that necessary if said rule had not been observed, because the hardening operates stronger and more uniformly on the bright steel than on the crust.

The following process, which has been acknowledged to be the

best for hardening cutting tools by a skillful workman of Sheffield, is described as follows by his employer, M. Stoddard: Since said workman has mixed leather cuttings among his charcoal, he has not had a single crack in his razors, while he often had them formerly.

The cause of these cracks, which frequently appear upon the surface of hardened bodies, may be explained in the following manner:

It is known that soft steel increases its volume when it is hardened, and it is easy to arrive at the conclusion that the steel is less dense in proportion as it approaches the condition of iron. If, therefore, a piece of steel is heated in the open fire and an air current is passed over it, then the outer part of the metal, in consequence of its decarburization partakes less of the nature of steel than formerly; thence follows that the interior part of the article, compared to the outer, becomes too large, and the workman is consequently exposed to the danger to see it burst. But when the piece is surrounded with a mixture suitable for effecting cementation, or exposed to a fire, which may also operate with a steel-forming effect, containing animal charcoal, then the opposite phenomenon will result. The outer part, instead of being decarbonized by the fire, becomes richer in carbon than the inner portion; in consequence of which, in place of cracking during the cooling, it will become harder and more dense.

The cracks which often appear when steel is dipped into water, do not always seem to be due to a simple decarburization of the surface, but they may be owing to the sudden contraction which the latter experiences; while the interior portion remains expanded by the heat, and retains its increase of volume for another moment, after the exterior has been brought in contact with the water.

The above described method may be followed for the hardening of stamps and matrices, similar as for dies, but remembering their fragility and delicacy, they are to be annealed pale yellow, even violet.

We have received valuable data from one of our subscribers, who is an adept in hardening and annealing steel, and they confirm to a certain extent the foregoing remarks.

When punches are to be hardened, which are for the purpose of being driven in steel matrices, they must be heated until annealed blue, then rub them with the fatty part of a beef sinew, until covered with a thick coat, which excludes the air from the steel, and conveys to it carbon, instead of withdrawing it. For the same purpose, either small pieces of carpet or wool are to be laid upon the fire. The gases covering the body are permitted to develop fully, and when it has become sufficiently cherry-red, it is dipped into old water, which has previously been boiled and cooled again.

The punches are pickled by dropping upon their surface a drop of muriatic acid; they are then rubbed off with a brush, washed, and anointed with fat. When fairly clean and without flaws, they are annealed pale yellow, and they then possess sufficient hardness to be driven cold into softened steel.

For the purpose of softening the steel, a well-closing little sheet-iron box is necessary; upon its bottom is spread a good layer of charcoal dust, which should not be too fine, however; an occasional little piece is advantageous, as it facilitates the circulation of the gases; upon this stratum is laid the steel, which again is covered with coal dust. The box is then wrapped around with strong iron wire, and again enveloped in coal dust; it is now heated for at least two hours in a furnace fed with charcoal. Great care is to be exercised not to have any coke in the coal, because this contains sulphur, which would harden the steel. After the lapse of this time cease feeding the fire, and let it cool off slowly by excluding air, which might penetrate into the box. This gradual cooling and protection against contact with the atmosphere softens the steel.

It is easy to see whether the process has been successful; it can be recognized by the outward color of the punches; when worked, they will remain white, and when unworked, they will be of a gray color, and be soft under the file.

## Gossip From Providence.

[From Our Own Correspondent.]

**B**USINESS here continues very dull. The majority of the factories are running only eight hours a day, and with about half the usual number of hands at that. As a natural consequence there are many working jewelers out of employment. A gentleman who recently advertised for a coachman told me last week that among the applications he received for the position, nine were from jewelers. The reports from travelers on the road are also very discouraging. The jobbers, they say, will buy only in the merest sample lines, and in many instances decline even to look at goods. If sales be bad, collections are a great deal worse. The leading houses say that they never experienced such a hard time in this respect, and many of the smaller and weaker concerns are in consequence very much cramped.

My prognostication as to credit in a former letter is fully borne out by existing conditions. The best firms are exercising great caution in filling orders, and if there be any cause for suspicion they decline to sell save for cash. The recent failures in the trade, coupled with the bad showing made to the creditors, has caused much unfavorable comment, and tends largely to augment the existing feeling of despondency and suspicion. How to prevent the recurrences of these financial fiascos is a problem much under discussion at the present time. The remedy appears to me very simple provided that unanimity of action can be obtained. Let the New England Manufacturing Jewelers' Association take the matter up and appoint a committee to investigate all cases of failure in which members are interested, and where there is fair cause to suspect fraud or unfair dealing, let them black-list the party so suspected, and let it be binding upon the members of the association not to sell any person or firm so black-listed even for cash. This course would drive out of business all the dishonest harpies who prey upon the manufacturers, would inaugurate a new field of usefulness for the association, largely increase its membership, and give the best class of the wholesale dealers a better chance. Nothing in my opinion can be more unfair than when a man fails, (preferring "His sisters, his cousins, and his aunts" to the extent of all his available assets), to accept a compromise of from 10 per cent. to 25 per cent., and then go on selling him again. How can the honest wholesale dealer expect to compete successfully with a man who can afford to sell say at 50 per cent. less than he can? This is a matter for serious consideration, and the sooner some stringent action is taken the better it will be both for manufacturers and jobbers.

The following circular has been printed and circulated extensively among the manufacturers here:

### TO THE JOBBING JEWELERS.

THE OTHER SIDE.

*Editors Watchmaker and Metalworker:*

The article in your July number headed "Very Important" appears to me to be clear off. The jobbers have no reason to complain of the Eastern manufacturers selling to retail trade, as they have brought this state of affairs about themselves, and in this way:

1st. They come into the market, look over the different lines, get prices, and go from one manufacturer to the other quoting each other's prices, or a little less than the irprices, in order to beat them down.

2d. When they have bought their goods, and the bill has run from six to nine months, they will send their note at from three to six months in payment, not forgetting to deduct the cash discount.

3d. At the end of the season, if they have a few goods left in stock which they don't wish to carry another season, back they go to the manufacturer.

Now, the manufacturers have got tired of this kind of business, and unless the jobbers change their way of dealing with them, in a few years there will be no jobbers, as each year the manufacturers grow more and more determined not to be bulldozed. If the jobbers want the manufacturers to let the retail trade alone, they must give us a fair profit and fair dealing.

A MANUFACTURER.

Providence, R. I.

The usual monthly meeting of the New England Manufacturing Jewelers' Association was held at their rooms on Saturday, Sept. 6, 1884. The President, Mr. Potter, called the meeting to order at 8 P. M. The records of the last meeting were read by the Secretary, and approved. An Entertainment Committee made up of the following gentlemen was appointed for the coming season: Messrs. O. C. Devereux, W. Dodge, F. Pearce, H. F. Carpenter and J. S. Haskell. There was no other business transacted. ASMODEUS. Providence, R. I., Sept. 15, 1884.

## A Review of the Experiments of the Old Masters of Horology.

*Continued from page 251.*

WE NEXT quote the opinions of another celebrated master of horology, Mr. J. H. Martens, on the manufacture of a compensation balance, which we borrow from his excellent work: "The escapements of higher horology." Martens at first contradicts the assertions of Mr. Jürgensen, and says:

In the construction of compensation balances two methods are made use of for joining the two metals of which the compensating rim is to be formed. The first consists in soldering together the brass and steel with silver solder, and the second by melting the brass around the steel. The first method is not by any means practical, since in the soldering of an object like the present, the solder will not divide equally because the brass ring, which is at first to be forced around the steel, will expand far more by the heat necessary for the process than the steel, and when said brass ring cools more solder will remain upon one side than upon the other. Furthermore, spots will be found in the hoop where the brass and steel have not become intimately united by the silver solder, which defect becomes visible, especially when the brass is to be hardened by hammering. The method, by which the brass is melted around the steel is preferable, and I will therefore explain the latter.

First glow-heat the steel and let it cool slowly; then file one side flat and cement the piece to a chuck of the lathe, turn it in the shape shown in fig. 10; at the same time drill a hole in the center, and in order to have it very true turn it out to a fitting size. The lower rim, shown in fig. 10, which remains standing, is to be left 0.2 mm. thick. In order to ascertain the exact size for the high part, it is necessary to first establish the diameter of the balance, that is, that of the rim, and the thickness of the latter. When the diameter and the height of the balance have been definitely established, the thickness and size of the rim is to be ascertained, to be done as follows:

Let us assume, for instance, that a balance of 20 mm. diameter is to be made, then the thickness of the rim to the diameter of the balance is proportioned as 0.3 is to 10; consequently the thickness of the rim will have to be 0.6 mm., with a diameter of balance of 20 mm. This thickness is for the two metals (steel and brass), and it is necessary next to divide it properly for both, which we do according to the following rules:

We assume the entire thickness of the rim =  $\frac{5}{8}$ , of which we take  $\frac{2}{5}$  for the steel and  $\frac{3}{5}$  for the brass, and the latter having a rim of 0.6 mm. thick must be 0.36 mm. We next must deduct the height intended for the screws from the diameter of the balance. When, for instance, the height of the screws for this size of balance (20 mm.) is to be 1.2 mm., then this number taken twice = 2.4 mm., to be deducted from the diameter (= 20 mm.), and there remains 17.6 mm. for the exterior diameter of the rim. From this we deduct the quantity for the brass parts 0.36 mm. twice (= 0.72 mm.), and we

find for the steel a diameter of = 16.88 mm. After having turned the elevated part of the steel exactly according to these proportions, and a little higher than the balance is to be, take the blank from the lathe and clean off any adhering cement. Next make the preparations necessary for casting. For this purpose prepare a sheet iron hoop about twice the height of the turned steel blank and sufficiently large to embrace it entirely, then fasten it with soft binding wire around the blank. See fig. 11, in which the hoop is marked with *g*.

FIG. 11.

In order to protect the hole from being filled with the melted brass, tightly drive in a basswood plug. This basswood will be charred into a hard coal by the fusing metal and prevent it from running into the hole. In place of wood equal parts of pulverized graphite and slate, kneaded with water into a thick paste, may be used and pressed tightly into the hole. For greater security make still another elevation of this paste above the hole and let it stand out a little all around, and press it firm all around upon the blank. Next prepare a similar paste of clay and water, and lute the lower face thus that even the smallest openings are closed between hoop and blank and let everything dry slowly. This mold is laid upon a metal sheet and slightly heated above an alcohol flame; then moisten the interior with water in which borax has been dissolved, using a small brush or feather for the purpose; let the borax effervesce by the heat, and be careful to have especially the circumference of the blank, with which the brass is to unite, uniformly coated with the borax. Having advanced so far with your preparations, fill in the entire space up to the upper edge of the hoop with powdered borax, (which, however, must previously be melted in a crucible to prevent too violent an effervescence), place a sufficient quantity of small pieces of fine brass upon the borax, expose the whole to a proper heat so that the brass comes into the rough fusion and runs around the rim of the steel blank and intimately unites with it.

The heat necessary for fusing may also be produced between two large pieces of charcoal, with an alcohol flame and a blowpipe.

It stands to reason that for a large balance the heat produced in this manner is not sufficient, and in this case make a well drawing fire and place the mold upon a firm underlay of stone or iron. When using such a fire, however, great attention is to be paid that the heat does not become too strong either upon one side or the other, because the steel might easily be burned thereby. When the fusion has been effected let everything cool well, clean off the adhering borax, file off the hoop and again cement the piece with its lower surface to the chuck, turn down the brass level to the upper face of the steel, turn the blank over on the other side and cement it with the turned-down face to the chuck. Next turn off sufficient of the lower face to lay bare the brass, and at the same time turn away from the brass rim so much that it remains three times as thick as it is to be when ready. Now, glow-heat the blank cautiously and let it cool off slowly. When cold hammer the brass carefully with very regular taps upon the high edge of the balance. When the blank has been treated twice all around in this manner, file off the brass that spread over the sides and anneal the blank blue. Again hammer the brass in the same manner once more but be careful to do it uniformly all around, and that the blows do not penetrate into the steel so as not to alter its roundness. When the brass has been hammered into about one-half of its original thickness, and if no open flaws have been revealed during the operation between steel and brass, that portion of the latter which spread over the sides is to be filed away, and the blank is to be again annealed blue.

Cement the blank again to the lathe chuck and turn it down to the size required for the balance, that is, that it will be of the correct diameter after the brass has been ground off smooth. Next proceed to the turning out in the steel, in which operation both rim and bottom have to be left a little thicker than they are to be in a ready condition (the bottom for a balance of 20 mm. diameter has to have a thickness of 0.4 mm.) When the turning out is finished

from one side, or, should the shape of the balance under manipulation require it, from both sides, grind them out first with a round disc of soft steel and fine emery and oil, until all turning marks have disappeared, and next with a full hard disc and oilstone powder moistened with oil until the bottom is ground entirely smooth. The first disc of those used must be much smaller than the inner space of the turning out of the balance, and be filed flat very often because the face will become untrue in grinding. The second disc, however, which must be hard, is only to be a trifle smaller than the inner turning out. When the height of the rim has been set in order, the holes for the screws are to be drilled in. For this purpose a chuck must have been made for the lathe, the spindle of which is provided with a graduation as shown in fig. 12. In this chuck is fastened a

FIG. 12.

pin *a*, which is turned off truly and of sufficient thickness that it fits full tight in the balance hole. Now, upon this pin *a* the balance (in the bottom of which two holes are to be drilled for the screws of the covering plate of the chuck), is to be mounted and fastened by means of the covering plate and the two screws. (The chuck must be a little smaller in diameter than the size intended for the balance). Next, the rim is to be laid off for the screw holes and the holes drilled. For want of a graduated scale on the lathe the division has to be made on a cutter and rounder or other contrivance provided with a graduation. The arms are next to be made and the screw threads cut into the holes. If weights are to be made for the regulating of the compensation, then upon the lower high edge a part of the rim, on each side between the arms, is to be provided with a division. When this has been done a boxwood chuck is to be made for the latter, as shown in fig. 13. Into this chuck is turned a sink of the size of the balance, and of such a depth that when the balance is pressed in the one-half or one-third of its height projects beyond the chuck, as will be seen by the same figure. The arms are then again to be ground with a hardened flat steel disc and finely powdered oilstone, carefully keeping the disc flat so that the arms will not lose their flatness. When satisfied that the arms are duly flat and ground smooth, take good strong elderberry pith, cut one end flat, put a little oilstone powder and oil on it and apply the pith very flat upon the arms, but let the balance in this work revolve only a few times while moving the elderberry pith slowly to and fro. A very handsome mat white finish is produced hereby. Progressing, chamfer the sharp edges of the rim, polish them, and grind also the face of the high edge with a glass plate and finely-ground oilstone. But if the surface is to be polished it is effected best by means of a sheet of tin upon which a little fine rouge is put. When the work has advanced this far, take the balance out of the wooden chuck, clean it carefully and again fasten it in the chuck (fig. 12), next grind the rim above with a tin file and finely-scraped waterstone and oil, and if it is to be polished on top, clean it first very carefully and polish it next with a well rubbed burnishing steel, exercising great care when bearing upon the latter.

FIG. 13.

After burnishing, take a fraise and open the rim on two places in the vicinity of the arms (the two notches in fig. 12 cut into the chuck are made for this purpose), chamfer the two edges of the cut and make the rim truly round. In this operation only plyers with wood-lined jaws must be employed, so as not to injure the brass part of the rim.

The regulating screws are to be made next. The necessary little steel screws upon which they are to be fastened are screwed from

the inside into the rim, and the regulating screws screwed upon these. It has previously been mentioned that these regulating screws must always move with hard friction upon the small steel screws, and it is advisable, therefore, to cut them open on one side and to press them together a little. The weights that are to be used for the regulating of the composition, are also made now in the following manner:

After filing flat the pieces to be used for this purpose on their end, take a sheet of brass 2 or 3 mm. thick, and with compasses strike upon it a circle of the size described by the wings of the balance; solder the pieces with tin upon the plate so that the center of the pieces comes exactly above the circle, cement the piece on a lathe chuck, and finally turn in a groove of the size of the wings. When this has been done, turn the pieces both inside and outside so that they are of an equal thickness, take down the plate from the chuck, and unsolder the pieces, after which you may give them any shape you desire. Before finishing them altogether examine them as to their equipoise, adjust this and then finish them, after which they are to be fastened upon the balance wings with little screws.

Figs. 14, 15 and 16 is a compensation balance taken from the said work of Martens. The first two are top and bottom views, the

FIG. 14.

FIG. 15.

FIG. 16.

third is a side view. The weights *a* are those used for the regulating of the compensation; *b* and *d* are the screws for more closely regulating the vibrations of the balance, which are movable, and fastened in such a manner that they fit tight to prevent them from being displaced by the vibrations of the balance. When the balance vibrates slowly they approach its center; when rapidly, they remove from it.

*d.* LOSEBY'S COMPENSATED CHRONOMETER BALANCE.

Loseby specified as defect of the ordinary compensated balance that even if a chronometer has been perfectly regulated to the extremest changes of temperature it is nevertheless very difficult to obtain a correct rate for the intermediate degrees of temperatures, because the elasticity of the balance spring decreases at a ratio greater than the effect produced by the less metallic compensation strip composing the balance, and he believes to have successfully corrected this defect by the introduction of carved glass tubes filled with mercury and attached to the balance, which are constructed in such a manner that while the mercury expands by reason of change of temperature, the quicksilver, and consequently also the point of vibration, will in a gradually increasing degree approach to the balance axis.

Fig. 17 gives the surface view, fig. 18 the side view of such a com-

FIG. 17.

pensated balance. With the balance arm *A* are united, by the regulating screws *C C*, the bi-metallic compensated ring pieces *B B*; *D D* are the weights for regulating the ordinary compensation, *E E*

the glass compensation tubes added by Loseby; *FF* and *GG* are the parts through which these tubes are fastened to the balance.

FIG. 18.

The screws *II* serve for connecting the parts *F* and *G*; these screws also permit the adjustment of the auxiliary compensation by turning inward or outward the tubes.

(To be continued.)

### The Jewelers' Security Alliance.

President, DAVID C. DODD, JR.

Vice-President, AUGUSTUS K. SLOAN.....Of Carter, Sloan & Co.  
Treasurer, W. C. KIMBALL.....Of H. F. Barrows & Co.  
Secretary, C. C. Champenois.....Of Champenois & Co.

#### EXECUTIVE COMMITTEE.

C. G. ALFORD, *Chairman*.....Of C. G. Alford & Co.  
C. B. BISHOP.....Of Carrow, Bishop & Co.  
HENRY HAYES.....Of Wheeler, Parsons & Hayes.  
J. B. BOWDEN.....Of J. B. Bowden & Co.  
DAVID UNTERMAYER.....Of Keller & Untermeyer.  
E. F. DORRANCE.....Of Dorrance & Brother.

P. O. Box 3277.

Room 2, 170 Broadway, New York.

HON. ALGERNON S. SULLIVAN, *Counsel*.

AT A MEETING of the Executive Committee held at the office of the Alliance, 170 Broadway, on the 12th inst., the following applicants were admitted to membership, viz.:

N. J. Battershell, Heyworth, Ill.; Bullard Bros., St. Paul, Minn.; S. H. Dodge, Ypsilanti, Mich.; Henry Greenman, Richfield Springs, N. Y.; J. Gansl, Tuscaloosa, Ala.; S. Hecht, Wichita, Kansas; C. Hulse & Son, Goshen, N. Y.; Everett Lane, Gloucester, Mass.; A. G. Page, Jr., Bath, Me.; A. Shire, Paris, Ky.

### The Jewelers' League.

President, GILBERT T. WOGLOM.....Of Woglom & Miller.  
First Vice-President, WM. C. KIMBALL.....Of H. F. Barrows & Co.  
Second Vice-President, AUG. KURTZBORN.....Of L. Bauman Jewelry Co. St. Louis, Mo.  
Third Vice-President, JAMES P. SNOW.....Of G. & S. Owen & Co.  
Fourth Vice-President, HENRY HAYES.....Of Wheeler, Parsons & Hayes.  
Secretary and Treasurer, WILLIAM L. SEXTON.....Of Sexton & Cole.

#### EXECUTIVE COMMITTEE.

ROBERT A. JOHNSON, *Chairman*.....Of Colby & Johnson.  
SAMUEL W. SAXTON.....Of Saxton, Smith & Co.  
CLEMENT B. BISHOP.....Of Carrow, Bishop & Co.  
JOSEPH B. BOWDEN.....Of J. B. Bowden & Co.  
GEORGE R. HOWE.....Of Carter, Sloan & Co.  
CHARLES G. LEWIS.....Of Randel, Baremore & Billings.

THE JEWELERS' CIRCULAR is the *exclusive* official paper of the Jewelers' League, and has been selected for the publication of all matters of interest pertaining thereto. Letters or inquiries pertinent to its business or purposes, and which might interest the trade or inquirers, will herein be answered. Address *Jewelers' League*, Box 3,444, P. O., New York, or the office of THE CIRCULAR.

THE REGULAR meeting of the Executive Committee was held on Sept. 5th, 1884. There were present Vice-President Kimball and Messrs. R. A. Johnson, (Chairman), G. R. Howe, J. B. Bowden, C. G. Lewis and W. L. Sexton.

Owing to the deaths of P. J. Elinquist, Morris, Minnesota, Monroe Marx, New York City, F. A. Cady, Charleston, S. C., E. D. Rhodes, North Attleboro, Mass., D. H. Hopkinson, Brooklyn, N. Y., an assessment of \$10 was ordered.

There is but one other death known of, that of Philip Nast, of Nast & Greensweig, N. Y. City. The proof of his death not yet

being presented, it was impossible to include it in the present assessment.

There were 14 changes of beneficiaries granted.

Nine applications were referred for correction.

One application was rejected.

The following 18 applicants were admitted to membership:

N. D. Prentiss, H. W. Souade, F. J. Bejborn, New York City, N. Y.; J. O. Thurston, Brooklyn, N. Y.; J. F. Jarvis, Jr., Mt. Vernon, N. Y.; J. W. Forsinger, E. E. Wilkinson, Chicago, Ill.; A. T. Westlake, Springfield, Ill.; F. G. Thearle, Englewood, Ill.; E. DeF. Wilkinson, Providence, R. I.; E. G. Pearson, Boston, Mass.; F. Scott, Carthage, Mo.; S. Joseph, Des Moines, Iowa; H. F. Schmidt, Terre Haute, Ind.; R. J. Tafel, Louisville, Ky.; F. R. Herz, Virginia, Nev.; W. Thoustrup, San Francisco, Cal.; H. T. Hollingworth, Santa Ana, Cal.

### Advice to Watchmakers' Apprentices.

BY A MAN WHO HAS SPENT TWENTY YEARS AT THE BENCH.

IN MY last communication I gave some hints in regard to economizing the sweepings, and gave directions for burning the sweepings to diminish the bulk; I ought to have added that the fire should be a smouldering one, with as little direct draft as possible, as a strong flame has a tendency to carry more or less gold up the chimney. The safest and most economical method is to put the sweep into an iron pot, with an iron cover, and put the pot into the furnace and burn the contents out by a slow combustion. But, if the process is conducted as directed in last article with the precaution of making the combustion as slow as possible, very little gold will be lost. The acids used in coloring and pickling should not be thrown away until treated to recover the gold. All wet coloring acids and muriatic acid pickle after using should be thrown into a stoneware jar and when nearly full treated as follows: A saturated solution of green copperas (*proto-sulphate of iron*), in the proportion of 8 oz. of hot water to 1 oz. of the sulphate. In getting the sulphate it is best to get such as is used for medicinal and chemical purposes, as it is essential to be pure; also avoid all such pieces as are air slacked or present the look of rusty iron; such pieces are chemically changed to such an extent as to be deliterious to the process. The solution of sulphate should be added to the acids in the stoneware vessel until it fails to produce any effect. Allow the precipitate to settle (after stirring well) when the acid can be poured off. The precipitate is nearly pure gold, and if of sufficient quantity can be directly recovered by melting with a strong flux. By a strong flux I mean one which will resist a high temperature, as the complete reduction of the gold will require intense heat. After the precipitate is thoroughly dried, to every 4 oz. of precipitate add 2 oz. of sal tartar (*carbonate of potash*), 1 oz. of common salt, 1 oz. of green glass (any glass which contains no lead). All the ingredients should be reduced to a fine powder and well mixed, when it can be put in a crucible. While the melting is going on a little saltpeter can be added occasionally to aid the process. But in small quantities the precipitate can be thrown into the burnt sweep; as also the old sulphuric acid pickle used in jobbing. The true course to pursue as far as scouring is concerned, is to look sharp to all the filings of gold on plated jobs. There is more gold wasted here than in any part of the job shop. And as I remarked in a former communication, the gold derived from filings seldom or never works well; and for this reason it is best to melt it into a button, so as to get at the fineness and sell it to the refiner. The best course to pursue with filings ("*lemel*," it is termed), is to first pass it through a fine sieve to remove all pieces of gold of any size; these should be put in with the scrap. After all the coarse particles of gold and silver are removed, the magnet should again be employed to remove any iron or steel particles which may remain. In refining and melting filings, for every 12 oz. of filing take 2 oz. of sal tartar

(carbonate of potash) 1 oz. of common salt. Mix the filings and flux together well, and put them into a crucible and cover the mixture with common salt. The crucible should now be put into the furnace and a continual high melting heat kept up for 30 or 40 minutes, adding a little saltpeter from time to time. Care must be taken to add the saltpeter sparingly as it may cause the mixture to rise and flow over. A little very dry common salt if added, as indications of rising too high occur, will check it. I will now give a few hints about enameling. This beautiful art is an immense addition to the splendor of gold goods, but I would premise by saying that enameling is a trade by itself, and it is hardly to be hoped that in the sense in which these articles are written that a man could practice the jewelers' art and the enamellers' both in a high degree of excellence. It is quite easy for a jeweler who is at all skillful with the graver to prepare his work so that all the enamer has to do is to fill in the cutting, leaving it for him (the jeweler) to finish by grinding and polishing. We will first discuss the manner of engraving for enameling. The *rationale* of the process is that a sink or recess is made in the gold or other metal to be enameled of sufficient depth and form to contain a layer of colored glass, which will polish off and leave a surface exactly corresponding with the surface of the gold. Suppose we have an initial we wish to enamel. By means of flat bottom gravers we cut away the gold to such a depth as will enable us to fill the recessed attic with enamel. A good deal of judgment is required in the engraving so as to get the best results. We will first speak of enameling done with opaque colors. The engraving should be of sufficient depth to ensure a firm coating, yet the cutting should not be carried to a depth sufficient to weaken the metal or to form pools as it were of glass. The cutting should be of equal depth throughout; generally  $\frac{1}{100}$  of an inch will be about right. The edges of the recess should be as near vertical as possible. An illustration is given at Fig. 1 of an initial say of white

enamel; *b b* is a vertical section of the letter on the line *a a*. This shows the broad lines or sinks of equal depth as well as of the hair line. On the line *d d* are shown a shallow gothic-shaped recess. The reader will see that this sort of recess would not enamel satisfactorily, as it is evident that the gold would show through the edge as at the dotted line *c*; and further, it is evident that when the surface comes to be ground and polished to finish the enamel, that the margin of the letter or other design would be irregular. Consequently all parts which are to show a bright metal surface should be cut so as to leave a sharp clear edge, even in small lines, as illustrated in fig. 2, which is copied directly from a fair specimen of Swiss (Geneva) enameling. This cut (fig. 2) gives a sample of encrusting with rose diamonds. It is difficult to give with a simple black and white engraving the effect of the colors and the diamonds. To describe it, the background to the extent of the dark space enclosed in the outer ring or line is a dark blue enamel, but sufficiently transparent to show a geometric lathe pattern through it. The bird was produced almost entirely of gold with diamonds set as shown, the lines in the wings were cut in and filled with the blue enamel of the ground, but looked quite black by contrast when in fine lines. The flowers below the bird were of white enamel, but with a bright gold line surrounding each petal.

Indeed the whole pattern or design was made out as if outlined with gold wire. The vine in front and over the bird was a bright gold line, and the three leaves were outlined with gold and filled with emerald green enamel. In engraving for this job, of course, all the parts which show black had to be recessed back evenly to the depth of about  $\frac{1}{100}$  of an inch, and filled in with the different enamels, and these enamels fused to make them flow. The filling must be in excess so that a smooth, even surface can be produced by polishing.

## The History of Goldsmithing.

*Continued from Page 232.*

THESE DIFFERENCES of taste were noticeable even in the works of the goldsmith. During the centuries of greatest sumptuousness, when the art of goldsmithing was at its height, gold and silver were hardly ever employed, except in a pure state, and fine stones were also added after a while to heighten both the effect and the value of the piece. But after a time this no longer satisfied the cravings after novelties of the Lower Empire—the goldsmith was required to produce something startling, and he had recourse to embellishing gold and silver surfaces with the brightest of colors, and in this manner he employed a device hitherto entirely unknown to his Greek and Roman predecessors. Not alone were jewels and fine stones employed in great profusion, together with pearls and cameos, but by this grasping after effects and novelty, the Byzantine goldsmith also discovered a means of enhancing the beauty of less costly surfaces with colored glass, and thus the first step toward the art of enameling was made.

The enamel first used by the Byzantines is nothing else than a glassy substance applied upon the surface of the metal, and fixed by means of fusion; the different colors are generally separated by a low partition, which style has retained its French name in all languages, to wit, *cloison*; *cloisonnage*; these partitions serve a double purpose. They separate the colors and clearly define the pattern. The colors of the Byzantine enamel generally are of great vivacity and have the further advantage of being perfectly inalterable.

It is, perhaps, useless to ask the question from whom did the Byzantines learn this industry? It was most probably an invention of their own, because it appears that it was unknown to the ancients, except a slight film which the latter applied in an adroit manner by means of the blow-pipe upon trinkets of personal adornment. The Byzantine art of enameling rapidly spread upon the continent, and it is most probable that it became universal in the time of Justinian, in the sixth century, in which opinion we are sustained by the following passage of a contemporaneous poet, Corippus, who celebrates the pomp and circumstance of the Imperial court:

“On a table covered with purple,” says our historian, “could be seen vessels of gold, the weight of which was greatly enhanced by the profusion of precious stones. The portrait of Justinian was painted upon all the pieces. . . .” And further on: “The Emperor had ordered that the history of his triumphs should be traced upon each piece of his dishes.”

And in effect, enameling, which can be used for the representation of all kinds of subjects, was a veritable branch of art painting in the hands of the goldsmith. Thus it came that during several centuries figures either sacred or profane, those of Christ and his holy mother, of the Evangelists, of the apostles and the principal saints of the Oriental Church, those of the Emperors, their wives or princes of the empire, were re-produced *ad infinitum*. As specimens of the paintings of this kind we give the accompanying, figure 9, of St. Procopius and St. George, taken from a small enameled plate in the art collection of St. Mark in Venice.

But the time arrived when the adoration of images, and shortly afterward the re-production of the human figure in all the ramifications of religious service was forbidden by the Church of the

Orient. This schism, known by the name of the schism of the *Iconoclastes*, and which lasted about a century, gave rise to rigorous prosecutions. It struck a severe blow to the art. Among other consequences it caused a large number of Byzantine artists to emigrate; they carried with them first into Italy, from there into the rest of Europe, the arts and industries of their country, of which they had hitherto enjoyed the monopoly.

FIG. 9.

It would disarrange the order of chronology, which we intend to observe in this History of Goldsmithing, were we to follow the fortunes simply of Byzantine goldsmithing. This much, however, we may add, that it continued to prosper even under the severe government of the *Iconoclastes*, and found powerful protectors

such as the Emperor Basil I., the Macedonian, in the ninth century, and, in the tenth, Constantine Porphyrogenitus, who is renowned as having himself been one of the foremost artists of his age.

In the foregoing pages we have sought to show that the art of the goldsmith descended from the earliest antiquity to later civilized nations; it remains for us next to inquire into the state in which it was developed among the barbarians. This will be the object of the following chapter.

#### b. GOLDSMITHING AMONG THE BARBARIANS.

The barbarians, in times of yore so often vanquished by Rome, took, in the first centuries of our era, a terrible revenge on what once was called the "Roman World."

Whence came they? No one can answer the question.

From the north and the east of Europe, from the extremes of Asia, issued an incessant avalanche of nomadic people, uniting and overrunning every country in Europe which might in the least tempt their cupidity. They were the Huns, the Vandals, the Goths, afterward divided into Ostrogoths and Visigoths; the Lombards, the Franks, the Saxons, the Burgundians, who issued from the forests of Germany; the Danes, the Normans, and other pirates of the North of whom innumerable hordes overran in turn, Gaul, Great Britain, Spain and even Italy, where they carried terror into Rome.

The barbarian state differs from the savage in that while with the latter there is an utter absence of every kind of civilization, the former generally has an incomplete state of civilization, although in keeping with his unbridled passions. The barbarians all understand how to work the metals, and principally how to manufacture arms and utensils from them. They also appreciate the bright side of wealth and luxury, and barbarian chiefs have their treasures which they carry with them. History informs us of lengthy journeys in which the early Romans engaged, and we have seen what treasures their victorious generals brought back from countries that were called barbarian. These countries, it is true, generally stood in commercial relations with others farther advanced than theirs, such as Greece, Asia Minor, and afterwards the Orient, the latter of which was itself repeatedly called on to wrestle with the barbarians, and to protect itself against their inroads by paying tribute or making presents.

The treasures of the barbarians were thus composed in part of the fruit of their rapine, in part of objects of art which had more or less benevolently been offered to them by other names except the title of tribute, while still another part was the product of their own industry.

The most ancient remains of their goldsmithing is to be found in Russia, in the Museum of the Hermitage. Russia appears to have been the veritable cradle whence all these hordes issued, and it has for years collected with great assiduity all the antique objects manufactured by those barbarian nations. It has formed two distinct collections, that of the Antiquities of the Cimmerian Bosphorus, and the Scythian Collection, which already possess hundreds of trinkets and vases, or other objects of goldsmithing in solid gold dating from remote periods.

Among the latter we must particularly mention two pieces of a great intrinsic worth, and perhaps of a still greater artistic value; we append the description of a Roumanian archæologist, Mr. A. Odobesco:

One of them, figure 10, is a diadem or crown, a kind of a royal

FIG. 10.

insignia of the greatest richness. It was found at Novo-Tcherkask, on the banks of the Don, and made of very pure gold, ornamented with pearls, and a superb cameo of Greek workmanship. It would have made the center piece of the diadem, although it has been disposed of simply as an auxiliary.

The other object, preserved at the Museum of the Hermitage, is also wrought of very pure gold incrustated with garnets. It is an enormous fibula in the shape of a sparrowhawk, which holds a bunch of leaves in one of its claws.

Immediately after the find of this treasure of the goldsmith's work another discovery of great importance was made by some farmers who were engaged in plowing their land in one of the Danubian Provinces, near the city of Petrossa, in Wallachia—in this mountainous country once completely overrun by the Goths, who themselves were afterward expelled again by the irresistible invasion of the Huns. How, when or by whom it was hidden will most probably remain a problem forever—perhaps on the eve of some great battle between the contending forces, and the owner doubtless fondly hoped that by to-morrow evening he would unearth it again. Fate had willed otherwise, however, and it was destined to be sepulchred for fourteen centuries.

The treasure, when found, consisted of twenty-two pieces, but unhappily the finders, impelled by sordid cupidity, smelted ten, wherefore only twelve remain, which have been exhibited in all the expositions of Europe, and are at present exhibited at Buda-Pesth, Hungary. Seven of the ornaments are set with garnets.

FIG. 11.

The first peculiarity that strikes our attention is that this treasure of Petrossa encloses neither arms nor pieces of armour, that none of the pieces partakes of Christian workmanship, and that at the same time very few of the pieces would serve for the uses of every-day life. On the contrary, all seemed to indicate that they may have served, a few of them, for instance, the fibulas, rings and collar-spangles, as ornament of a pontifical or princely costume; the others, jug, plate, patera and skillets, for drinking vessels or ceremonies of a belief anterior to the Christian. One of the rings bears a Runic inscription, and philologists have deciphered it as belonging to the worship of Odin, the principal god of the primitive population of Northern Europe. Now, it is known that the Goths, who took possession of the banks of the Danube in the first centuries of our era, had come precisely from these countries, and that they professed this religion up to the day of their conversion to the Christian faith,

which took place toward the end of the fourth century. We may, therefore, conclude that this Petrossa treasure is of Gothic origin, and that it belongs to the date just mentioned.

As is known, the Goths only remained two or three centuries upon the banks of the Danube. It would be comparatively easy to follow them in their new migrations, thanks to the finds of goldsmith's works of the same kind which have been made in several of the countries which they traversed. The Museum at Pesth has collected quite a goodly number of specimens. We find the art of goldsmithing, as practiced among them, plainest, however, in the countries where they settled permanently.

In the course of their migrations they sub-divided into several branches. Some invaded Italy, the others Southern France and Spain. The Franco-Hispanian branch, represented by the Visigoth monarchy, became of some importance and has left various pieces of goldsmith's work that speak of a high degree of civilization.

We are not confined to the simple recital of historians who speak of the vastness of the riches of that age or the value of the treasures gathered by the kings of the Visigoths. Many specimens have come down to us. The Cathedral of Oviedo, in Spain, possesses a very beautiful cross and several other objects of the work belonging to this age and nation, and in 1858 a very rich find of the crowns of Guarrazar was made which were sent to the Museum of Cluney.

This costly treasure is composed of eight magnificent votive golden crowns, ornamented with jewelry and crosses, all embellished with gems. To the lower part of the largest crown is suspended a series of golden letters incrustated with garnets, which letters, when joined together, compose the name of the Visigoth king Reccevinthus, who died in 672, and, very probably, there never was made a discovery of ancient gold articles that is so well authenticated as far as age is concerned.

Thus, by a curious chain of accidents, do we find the same style of goldsmith's work within the heart of Spain that we just now described as having been found on the banks of the Danube, and farther on we will find the traces in still other countries that were overrun by these conquering nomades, who are ordinarily styled "barbarians."

The principal part of the crown consists of a diadem or band with hinge and formed of two sheets of gold, one serving as lining to the other. Upon the outside sheet are set in three lines, thirty sapphires uncut, and as many more pearls of an enormous size, between which the goldsmith has cut out symmetric ornaments in form of palm leaves, the empty spaces having been filled in by lamellæ of garnets, the greater portion of which have fallen out. The upper and lower rim of the diadem are enriched with borders with regularly shaped ornaments, also cut out and studded with garnets and colored glass. Finally, to the lower border are hung by small chains a series of letters, all of which together form three words, "RECCEVINTHVS REX OFFERET." To each of these letters, very artistically wrought in gold with garnet incrustations, is again suspended a pale sapphire. The whole is pendant on a crystal button by four chains of very rich work. To the same button is also hung a very handsome cross of gold ornamented with pearls and sapphires, suspended in the center of the crown. It would be difficult to find a richer piece of work.

FIG. 12.

The other Visigothic crowns found at Guarrazar are far from being of the same importance. Three of them are rather remarkable for their shape. They are made somewhat in the style of cross-bar work, of solid gold, embellished with pearls and precious stones at each point of intersection, at the lower knobs are suspended drops.

In later excavations which the Spanish government caused to be made at the same place, other votive crowns were found, particularly that of the King Suinthila, all of which are kept at the *Armoria Real* of Madrid. With the exception of a few differences, these objects are all of the same pattern.

FIG. 13.

Let us continue to rapidly examine the principal remains of this Gothic goldsmithing, still existing in the other countries that were overrun by these hordes that came from the banks of the Danube or those of the Baltic.

At Ravenna, in Italy, where the second branch of the Goths, which for sake of distinction was called the Ostrogoth, founded its capital at the moment of its greatest power in the time of Theodoric, was found some ten years ago a broken piece of a golden armour, incrustated with garnet and *cloissonage* enamel work, the finest of the kind, perhaps, that ever was manufactured. It belonged most probably to a cuirass, and is at present preserved in the Museum of the city of Ravenna.

At the Cathedral of Monza, near Milan, are preserved other objects of the same nature emanating from the liberality of the Lombard king, Agilulphe, and his wife Theodelinde, other conquerors, both of German origin. We would especially mention a very precious Evangel, the magnificent gold covering of which, of goldsmith's work, is ornamented with cameos, pearls, precious stones, and surrounded by a border of garnets and colored glasses.

The ancient and celebrated abbey of St. Mauricius in Valois, established by the Burgundians, contains a priceless relic, the shrine of St. Mauricius, born 539, and executed Nov. 27, 602, ornamented

Shrine of St. Mauricius, Front Elevation, Figure 14.

with cameos, pearls and fine stones, in which we also meet again with the same style of jewelry work of garnet incrustation, and bearing both the name of the person who ordered it and of him who made it: Theodoric, Nordoalaus or Nordwald, etc.

Shrine of St. Mauricius, Side Elevation, Figure 15.

At Pouhans, in Champagne, France, in the vast plains where, in the fifth century, the Huns, conducted by Attila, and the Visigoths, under the command of Theodoric, met each other in battle array,

have repeatedly been found magnificent arms, enriched with goldsmith's work of *cloissonné* gold with garnet incrustations, and trinkets of the same work. These arms and trinkets, by the style of their ornamentation, entirely resemble the objects anteriorly found at Tournay in the tomb of Chilperic.

This discovery of the tomb of Chilperic, made in 1653, is the largest of the kind. The objects of which the treasure is composed, both by their intrinsic value and by the interesting epoch it recalls, is of an importance which immediately fixed the attention of the scientific world. They have since that epoch been carefully described, commented upon, and have ever since served as standards for establishing the date of a number of discoveries subsequently made. They are at present preserved at the Louvre, and consist principally of goldsmith's work; among them can be seen a sword hilt and scabbard ornament, a fibula, the buckle of a sword belt, a bracelet, the ornamental work of a purse and a large number of bees, all incrustated with garnets.

Other finds were also made in Britany, in a number of Anglo-Saxon graves, the specimens of which, gold trinkets incrustated with garnets, have been preserved in the art collections of Europe, both public and private; in England, London, Edinburg, Oxford, in the Mayer Gallery of Liverpool, etc.

We bring this chapter to a close with the statement that of the many finds throughout Europe, none antedates the period of the great people's migration.

(To be Continued.)

## Problems in the Detached Lever Escapement.

BY DETENT.

WE WILL now proceed to take up the so-called club tooth lever escapement. The great advantage of this style of lever escapement is its strength and ability to resist the "two" handed watchmaker; it also has an advantage in the form of the back of the tooth by which we can realize  $\frac{1}{2}$  a degree more impulse from the scape wheel, or even a full degree if the pallets are carefully made and set. A word of explanation. Some parties in noting my method of drawing the ratchet tooth lever escapement understood the description to say that the tooth only passed through 10 degrees of space for each escapement; this is a mistake, the tooth at every tick, or escape, passes through 12 degrees, 2 degrees being lost in drop, while 10 degrees of the advance of the scape wheel is directly applied as impulse to the pallet. But in the club tooth we can even in the commoner watches of this style realize  $10\frac{1}{2}$  degrees, while in a fine, carefully made escapement fully 11 degrees can be utilized. In the present illustration we use the pallets with equidistant locking faces. This arrangement is now generally adopted by the majority of makers of the club tooth lever escapement. There is a peculiarity about the escape wheel which should be particularly noticed, and this is, the escape wheel is larger than the nominal measurement. As, for instance, in the present instance we take (for our model) in our dividers  $2\frac{1}{2}$  inches and sweep on the sheet brass for our club tooth scape wheel a circle 5 inches in diameter (the cut is half size). But in reality the scape wheel is larger by the inclined face of the extremity of the tooth, which extends from the line circles *b* to *a*. This is because a portion of the impulse incline is on the tooth, instead of the impulse being derived entirely from the pallet as in the ratchet tooth escapement. In the present cut it is, of course, understood that only a portion of the scape wheel is shown. We sweep the circle *b b* 5 inches in diameter, as shown in fig. 1, and also sweep the segment shown in fig. 2, and divide it into degrees as has been described in a former communication. We next draw the line *c d*, and with our dividers take from the circle at fig. 2 30 degrees, and establish the lines *d e* and *d f*. We raise a perpendicular on these lines (see November, 1883, number of this

journal), and determine the location of the center of pallet action at *h*. We next sweep the circle *i i* from *h* as a center (it is, of course, understood that we use the  $2\frac{1}{2}$  inches used to sweep the circle *b b*, as the parent of all the measurements used in our delineations), and on this, from where the line *h g* crosses the circle *i i*, lay off  $2\frac{1}{2}$  degrees and draw the line *h j*; and next set your dividers on the center *d*, and through the intersection of the lines *h j* and *d f* sweep the circle *a a*; this line establishes the extreme points of the scape wheel teeth, and gives  $2\frac{1}{2}$  degrees of the 10 degrees of lever impulse action to the incline on the club teeth. In the present form the pallet action is divided so that  $2\frac{1}{2}$  degrees of the impulse is derived from the form of the tooth and 6 degrees from the pallet arm, with  $1\frac{1}{2}$  degrees lock. We next establish the width of the pallet arm. To do this we lay off 7 degrees (from the line *d f*) on the circle *b b*, and draw the line *d k*. We next set our dividers with one leg at *h*, and sweep the circles *l l* and *n n*, through where the lines *k d* and *f d* intersect the circle *b b*. Now it is evident that the inner and outer angles of the entrance pallet must be somewhere on these circles, no matter in what position the pallet stands. The

length of the tooth is established by taking one-half of the space from one tooth to another (12 degrees), and set it off on the line *c d* and sweep the circle *m*. The front of the club tooth has the same angle as the ratchet tooth (24 degrees) and is established in the same way, by sweeping the circle *o o*. To draw the incline plane of the tooth we lay off on the circle *b b*  $3\frac{1}{2}$  degrees and draw the line *d p*. Now draw the line at *r*, from the circles *a b* between the radial lines *f d* and *p d* as shown, and we define the impulse plane of the tooth at *B*. On the circle shown at *i i* we establish the extent of the pallet action. Now, it is evident that the angle at *v* of the pallet *A* (entrance pallet) when the tooth *B* escapes, will be swung around on the circle *n*, until the extremity of the tooth *B* will pass or escape from the pallet *A* on the circle *a*. To define the pallet action we lay off on the circle *i i*  $1\frac{1}{2}$  degrees for lock, and draw the line *h t*; this defines the lock. We next add 6 degrees more arc on the circle *i i*, and draw the line *h s*. Where this line (*h s*) crosses the circle *i i* is located the inner angle of the entrance pallet. By drawing a line from the intersection of the line *h t* with the circle *l l*, to the intersection of the line *h s* with the circle *n n*, we establish the face of the impulse plane of the entrance pallet *A*. The manner of laying off and delineating the locking face and general form of the pallets, except as described, is no way different from the method given for the ratchet tooth pallet. To delineate the exit pallet we continue the circle *l* until it again crosses the circle *b*, when it coincides with the line *d e*, from the intersection of *l* with *b*, we lay off on *b* 7 degrees to represent the width of the pallet and draw the line *d w*; we also draw from *h* through this intersection the line *h x*. We find the circle shown at *i*, continued at *i'*, on this we lay off from where *h x* intersects it  $2\frac{1}{2}$  degrees, to represent the impulse plane

of the tooth and draw the line  $h q''$ ; we next lay off 6 degrees on  $i''$  and draw  $h y$ ; we add  $1\frac{1}{2}$  degrees and draw the line  $h z$ . The 6 degrees just mentioned represents the impulse plane of the pallet, and the  $1\frac{1}{2}$  degrees the lock. It is evident as the pallets vibrate back and forth in their action that when the pallet  $D$  is engaged the line  $h z$  will occupy the position shown at  $h x$ . Consequently, to correctly delineate the locking face of the pallet  $D$ , we must raise a perpendicular to the line  $h z$ ; the manner of doing this has already been described. In making a model of such a scape wheel a piece of sheet brass large enough should be taken so the accessory lines can be carefully drawn. In laying out the teeth all that is necessary is to drill a hole in the sheet brass corresponding to  $d$  and carefully file out a piece shaped as shown at  $E$ , with the correct form of a tooth at one end as shown at  $H$ ; by putting a needle through a hole in the piece  $E$ , and a hole in the plate from which the wheel is to be cut,  $E$  can be used as a templet to mark around with a sharp point to get the exact form of each tooth. The manner of proceeding is to drill a hole at  $d$ , sweep the circles  $a m$ , sweeping  $a$  last, and while the dividers are still set for  $a$ , space it into 6 parts; divide these into 5 each; this will give 30 divisions; let the point of the movable tooth  $h$  be placed at every other space and mark out the teeth, when they can be sawn out. The arms and other parts are made as for the ratchet tooth wheel.

### Russian Reproductions

At the Metropolitan Museum of Art.

[BY JOHN W. MILES.]

A King's Bracelet, Figure 1.

NO PERIOD since the Renaissance has there existed a greater respect for the relics of past taste and skill than that which prevails to-day. The workmanship of hands that centuries ago mouldered into dust, the inspirations and sentiments that swayed the minds of artists long since at rest, and the implements, utensils and ornaments which were used by nations existing now only in history, bring to the modern world a vast amount of historical, moral and æsthetical instruction upon which we build our own superstructure of civilization, and out of which we weave our finest webs of artistic conceptions. From the noisome shades of crypt and tumulus the vase-recorded chronicles of antiquity spring again to life, touching those universal traits of nature which truly "makes the world akin," and teaching again and again the truth that whether in earthen sherd or creamy marble, in sun-baked clay or rusted bronze, in glass, or silver or gold, the soul of the artist cannot die, but forever lives to reveal its humanity to all succeeding generations of mankind. Every fragment, therefore, which bears upon it the impress of thought is of value, not alone to the antiquary but to all who delight in the self-interpreting language of art, and every effort to bring the people into closer connection with the treasures of antiquity accelerates the growth and power of native genius, yielding that subtle influence which, in both art and song, speaks from soul to soul without regard to time or season.

It is a matter, therefore, for more than usual congratulation that the Lords of the Committee of Council on Education in Great Britain succeeded four years ago, through Earl Granville, then Secretary of State for Foreign Affairs, in obtaining permission from the emperor, ecclesiastical authorities and numerous private owners, to re-produce in fac-simile those articles of plate which were known to be preserved in the Kremlin at Moscow, the Hermitage at St. Petersburg and other storehouses of art in Russia. The value of this achievement may be more fully appreciated if we remember the

national characteristic of exclusiveness which is so strongly developed in the Russian people. That inborn repugnance to any disclosure of their inner life, repelling investigations either with a calm taciturnity or with willful misrepresentations, has been in the past the plaint of very many ordinary travelers. Even the Marquis de Custine, who secured privileges of observation far exceeding anything before obtained, writes, as late as 1843, that "In Russia secrecy presides over everything; a silence that is superfluous insures the silence that is necessary; in short, the people are Chinese disguised; they do not like to avow their aversion to foreign observation, but if they dared to brave the reproach of barbarism as the true Chinese do, access to Petersburg would be as difficult for us as is the access to Peking." The collection which was secured by the Lords comprises three hundred and three pieces, all of which were reproduced by electrotypy and hence may be safely trusted as exact copies of the originals. Three sets of *replicas* only were made, one for the Museum at South Kensington, one has been taken for Cincinnati and the other enriches the exhibits of the Metropolitan Museum of Art in New York.

Being desirous of examining these objects, the writer during the early part of January, 1884, applied both to the director of the Museum, General L. P. Di Cesnola, and to the donor of the collection, Mr. Henry G. Marquand, receiving from these courteous gentlemen the kind permission of numerous private inspections with every facility at their command for an exhaustive study. In the pursuit of information regarding this collection the observation of the writer has been greatly assisted also, not only by the *carte blanche* so generously extended by the Museum authorities, but by the writings of other pens, notably that of the *Antiquites du Bosphore Cimmerien*, and *Comptes rendus de la Commission Archeologique de St. Petersburg*, from which has been gathered several illustrations without incurring the additional labor of original drawings. The writer would also state, lest the title of this essay should appear misleading, that a comparatively small portion (82) of the pieces are of pure Russian work, for although Russia has existed as a nation for over a thousand years, and although her vast domain occupies one-seventh of the territorial part of the earth's surface, she has given birth to very few artists in any of the higher branches. Semi-barbaric as a large proportion of her people are, nevertheless in her larger cities and towns there is a state of culture and refinement equal to anything in the west and which should produce its quota of assistance in art progress. Whether due to the form of government or to a national lethargy we must admit that so far Russia has given very little, proportionately, to the world of art. Quoting again from the Marquis de Custine: "Here the *artistes* obtain wealth but they do not draw inspiration; riches and elegance foster talents, but that which is yet more indispensable to them is the good taste and the freedom of public opinion. The Russians have not reached the point of civilization at which there is real enjoyment of the arts. At present their enthusiasm on these subjects is pure vanity; it is a pretense like their passion for classic architecture. Let these people look within themselves, let them listen to their primitive genius, and if they have received from Heaven a perception of the beauties of art they will give up copying in order to produce what God and nature expect from them." Certainly the advice of the Marquis has a clear ring to it, breathing a wise counsel that other nations than Russia need not hesitate to accept.

The fac-similes in the possession of the Museum include many objects executed by the artists of Italy, France, Germany, England and other countries, which were originally gifts to the Czar and other nobles, and types of the art work of the periods to which they belong and of the countries producing them. The most ancient among them all are those excavated from the antique tombs of Scythia, revealing not only the influence of the Grecian art but also workmanship purely Greek in design and execution. The sepulchres of the Scythians were among their most sacred possessions around which clustered those sentiments which nations less nomadic bestow upon home and fireside. When Darius, in his unsuccessful invasion

of their country, sent to inquire why they always fell back before his advance without giving battle, Indathyrus, their king, returned this reply: "This is the case with me, O Persian! I never yet fled from any man out of fear, neither before nor do I now so flee from thee; nor have I done anything different now from what I am wont to do even in time of peace; but why do I not forthwith fight thee I will now explain. We have no cities nor cultivated lands for which we are under any apprehension lest they should be taken or ravaged and therefore should hastily offer you battle. Yet, if it is by all means necessary to come to this at once, we have the sepulchres of our ancestors; come, find these, and attempt to disturb them, then you will know whether we will fight for our sepulchres or not; but before that unless we choose we will not engage with thee."\*

Out of the mouths of such grim store-houses the modern world gathers a large proportion of its facts regarding ancient history and ancient arts. The fictile-painted vases of the Greeks, the exquisitely cut gems and other rare exponents of an age brimming over with rich artistic conceptions, are treasures for which we are almost wholly indebted to early burial rites and the kind guardianship of mother earth.

Fac-similes of Greco-Scythian relics thus exhumed (of which we are somewhat familiar through books and illustrations) are now brought within reach, and will be soon placed on exhibition to the information of the people and the delight of admirers of art work in metal.

A reference to the initial letter of this chapter, figure 1, will give some idea of the rich artistic beauty of the ornaments worn by the Scythian kings. It represents one of two bracelets of gold exactly alike, each weighing  $41\frac{1}{2}$  zolotinks† and measuring 6 inches in diameter. Even amid all the other marvelously beautiful works of Grecian skill this merits especial admiration for exquisite taste and perfect execution. The massive rolling cable has its two ends terminating with Theban Spinxes,‡ a collar upon the neck and with the body fastened into a ferule of filigreed work having a border of blue enamel. A knot of gold thread similar to the band is held in the paws and joins the open ends. Other bracelets, with lions' heads or with mounted Scythians, are also in the collection, demonstrating the high excellence of the Grecian goldsmiths four and five centuries before our era.

Our next illustration, figure 2, is also a gold bracelet or armband, weighing  $25\frac{1}{2}$  zolotinks, and having a diameter of 7 inches and a width of about 1 inch. This was worn upon the right arm of the king below the elbow. It is formed of two plates of gold, one over the other, the outer or superior plate being worked in *repoussé*, representing two episodes in Greek mythology and dotted with the flower of the myosotis. The borders are narrow and filigreed.

A King's Bracelet,  
Figure 2.

The two subjects depicted upon this piece are among the most interesting of the heroic fables of Greece. Thetis in her struggles against Péleus, and E'os (Aurora) with Keph- alos, or, most probably, E'os carrying the body of her son Memnón who was killed under the walls of Troy. Of the first it will be remembered by the reader that Thetis, the most beautiful of all the Néréides, was loved and sought by both Zeus (Jupiter) and Poseidón (Neptune). Themis, however, having predicted that the son of Thetis would be a greater man than his sire the gods desisted, and desiring to reward the virtue of Péleus gave her to him in marriage. In order to escape from the misfortune of marrying a mortal, Thetis changed herself into all the forms, taking successively fire, water, a serpent and a lion, but Cheirón, becoming informed of the will of the gods, revealed to Péleus the means of winning her. The fruit of this union was the famous Achilleus (Achilles). Upon our bracelet Thetis is actively defending herself against the hero, who in turn is threatened by a lion—a symbol of the form taken by the goddess.

The second subject may have two significa-

tions, as I have stated, but it is most likely that it represents E'os and her son. Homer tells us that Memnón was of divine beauty. His father was Tithónos, son of Laomedón, king of Troy, and he himself fought upon that side during the siege, killing Antilochos. A combat with Achilleus over the body of Antilochos proved fatal to Memnón, when a truce was declared for restoring to his own people the body of the hero. Whether this is what the artist intended or whether he had in his mind the myth of E'os and Keph- alos, he had an opportunity for the most beautiful and delicate expression. In the latter he could depict the love of the lover in contrast with the love that subdues the woman; in the former the overwhelming love of the mother—both ideas being equally exquisite.

The design of the figures and draperies are in the grand style of the age of Phidias, and the piece was, without doubt, made at or near his epoch (5th century B. C.) Each scene is repeated five times around the outer circumference.

One of the most interesting pieces as regards association is a mask of gold weighing 62 zolotinks, from the tumulus in the neighborhood of Glinstche, a Tartar village which to-day adjoins the gates of Kertch, figure 3. This was found in 1837 by Mr. Aschik. In

Gold Mask of a Queen, Figure 3.

excavating this tumulus Mr. Aschik discovered, at a depth of fourteen feet, a sarcophagus of marble having a cover in the semblance of a pediment and with acroteria at the sides like those often seen in ancient burials. The sarcophagus was buried in the earth of the tumulus itself. It contained the skeleton of a woman whose face was covered by a mask,§ and surmounted with a funeral crown. In his report of this discovery Mr. Aschik says: "My joy was mixed with surprise when upon removing the cover I found in the sarcophagus a skeleton with a golden face and a diadem upon the head and completely dressed. The robe of this queen was covered with golden ornaments; the stuff which covered the head and fell as far as the waist had retained its color. It was a woolen tissue with golden designs, but at the first contact with the air all the stuff fell

‡ The Theban (Thebes in Bœotia) Sphinx differed from the true Egyptian representation. The former had the head of a woman, body of a lion, and was winged; the latter the head of a man, body of a lion, and was without wings. Further, the Greeks gave the Sphinx any position, while with the Egyptians the figure was always carved lying down.

§ The ancients employed masks not only in the theatre but also in religious ceremonies, and in the festivals of certain divinities, such as Bacchus, Cybele, Isis, Syria, etc. The mask was first made from the bark of a tree, the wood covered with leather or woven stuff. In funerals they were used to cover or veil the face of the dead as a symbol of respect.

\* Herodotus, IV., 127.

† A zolotink is equal to about 4.266 grammes.

to dust and left only some golden spangles."|| We are already familiar with the fact of golden garments being made and worn by the ancients, but those which have been found are of wrought gold without any other material, and not woven into the texture of silk or other fabric as at the present day. The dress of this queen, therefore, could not have been like the one described by Pliny\* as worn by the younger Agrippina, wife of Claudius, but covered with small attached dots of gold forming little or no part of the stuff itself. Both the mask and the crown are judged to be of primitive workmanship, but the latter, not being included in this collection, I have no means of confirmation as to that. The mask certainly is crude in finish, which may have been due to the haste with which it was prepared, but it bears evidence of a bold, unhesitating hand and one thoroughly conversant with the work demanded. It was forged from the middle of a placque of gold and the marks of the hammer are quite distinct, although not quite so pronounced as might appear from the illustration. It is probable that the artist had a plaster cast of the face before him which was moulded immediately after death, and in the mask itself there are perceptible hollows in that portion of the eyes corresponding to the pupils, which a slight pressure easily indents at death. The artist probably finished his labor in one day in order that the face might be covered as soon as possible to hide the ravages of decay. The features of the mask would seem to indicate a woman of something over thirty years of age, and the name Rheseuporis, graven in dotted Greek letters upon a silver plate found in the tumulus, identifies her as the wife or favorite of a prince of that name—a name common to eight kings of the Bosphorus since Tiberias and before Constantine. This fixes the date at not later than about A. D. 212-229. The tumulus, which has been named that of the "Reine de la Masque" (Queen of the Mask) contained, also, two ear pendants with bezels of garnet very much damaged, a circle of gold matching two bracelets, three rings (one in massive gold), all in the positions, upon head, hands and arms of the skeleton, which they would naturally occupy in life. At the side of the skeleton there were found a plain pin of gold, a spindle, a bridle and a small satchel or purse, made of red leather and ornamented with the figure of a bird in black leather fastened on the outside. There were also two little fibulæ, one of gold and one of bronze, some beads of both glass and cornelian—probably forming originally a necklace—a golden flagon and several garnets mounted in bezels, a sort of medal, and lastly, about one hundred little stamped plates of gold, having been evidently strewn over the clothing of the queen. All these articles, found both within and without the sarcophagus, I have enumerated on the authority of *Antiquités du Bosphore Cimmerien* in order to give an idea of the rich store of antique objects which seem to fill all these excavated Scythian tombs. The lower part of the sarcophagus was hewn from a solid block, and to-day forms the basin of a fountain which exists in Tzarskaia-Pristane in Kertch.

In an Indian Lotah-shaped vase of electrum, figure 4, found in a tomb of the Koul-Oba, we have a representation of the features, dress and weapons of the Scythes in a scene evidently intended to perpetuate some warlike achievement of the king. The form of the vase is characterized by the graceful outline which was so strongly an attribute of the Greek workmanship, and in connection with the finished and harmonious details of the figures—some of which appear to be portraits from life—designates the piece as a product throughout of a Greek artist. The scene itself is situated in a plain covered

|| *Mon ravissement fut mêlé de surprise lorsque le couvercle enlevé je découvris dans le sarcophage un squelette à visage d'or un diadème sur la tête et complètement vêtu. Le vêtement de cette reine était tout parsemé d'ornements en or, l'étoffe dont était couverte la tête retombait jusqu'à la ceinture et avait conservé sa couleur. C'était un tissu de laine à dessins d'or mais au premier contact de l'air toute cette étoffe tomba en poussière et ne laissa que des paillettes d'or.*

\* *Nos vidimus Agrippinam Claudii principis edente eo navalis proelii spectaculum indutam paludamento auro textili sine alia materia.*—"We saw Agrippina, wife of the Emperor Claudius, at an exhibition of a naval battle dressed in a cloak of wrought gold without any other material."

with enameled flowers. The figures arranged in groups tell a continuous story. We have first the king sitting upon a hillock and leaning upon his lance listening intently to the relation which is being given by the person kneeling before him. It is evident that some great enterprise is about to be undertaken, and the narrator is reporting the position of the enemy, the plan of battle or other serious matters attending its execution. In the second group the king appears again, although, being wounded in the mouth, the likeness is less strikingly apparent owing to the expression of pain which distorts the features. In the third group his majesty has been wounded in the leg and himself directs the application of the bandages. The resemblance in these figures is remarkable, and, as Dubrux states that in the skeleton found there were two teeth missing and also

Vase from the Tomb of Koul-Oba, Figure 4.

evidence of some malady that swelled the lower jaw, the interpretation of the pictorially recorded story is quite probable. Dubrux also asserts in addition that the king's skeleton was that of a man of thirty or forty years of age, and measuring 6 feet 4 inches high. The figure bending the bow had also its significance (possibly a symbol of preparation for war), and the bow itself is of the Scythian form which, we are told, was crooked and something similar to the oldest Greek letter *sigma*. The true Grecian bow was almost entirely straight, being curved only at the tips. I know of but one instance where the Scythian bow is represented in the hands of a Grecian, which is a work wherein Appolo and Heracles are represented together, the latter carrying a bow of the Scythian form.

The vase was placed in the tomb of Koul-Oba near the feet of the queen—a precious souvenir of the king's exploits. Its form is not unfamiliar to modern art, and the decoration of the lower part especially is extensively used in designs of the present day. The ornamental band is evidently treated conventionally, but the costumes of the figures may, I think, be relied upon as exact portraits. Some portions of the armour we shall have occasion to refer to again later on.

We come now to another interesting piece from the same source, which is in silver and of a form similar to the *patera* or *cylix* of the Greeks, figure 5. There were two of these found absolutely alike

Cup from the Tomb of Koul-Oba, Figure 5.

and having the peculiarity of a loose disk fitting into the bottom of

the interior. In the shape of this cup—which is perfectly plain—we find that simple beauty which was always so strongly developed in the work of the Greek artists. It is thought to have been used as a drinking cup, and that when required the disk was placed in the interior, converting it into a vessel for pouring out libations to Appolo. The disk itself is a thin plate of silver engraved and gilded with a design representing Hélios, having rays surrounding his head and urging forward his four “dazzling white” steeds, *Eos*, *Æthón*, *Bronté* and *Astrapé*, with a whip which he holds in his right hand. The small portion of the earth which is given on the line of the horizon is sprayed with enameled flowers—an emblem of rejoicing at his appearance.

(To be continued.)

### Exhibition of the French Crown Diamonds.

FOR THE first time since the Paris Exposition of 1878 is an opportunity offered to the public to admire the French crown diamonds, and it is very probably also the last time; the idea of selling them and using the money for better purposes is daily considered more seriously under the republic.

In the large state *salon* of the Flora pavilion in the Louvre, has been built the handsome, but at the same time burglar and fire proof pavilion, which, propelled by a simple mechanism, sinks at night or at any threatening danger into the ground, together with all its precious contents. Treasures of modern goldsmithing, bronzes in the manufacture of which, as is well known, Paris stands unrivaled; watches, and other products of the finer art trades, fill the remaining space of the *salon*, because it was necessary to exhibit as much material as possible, the income being intended for the *écoles professionnelles du Syndicat*. It is barely worth mentioning that the crown diamonds are the center of attraction. Pillowed upon deep-red velvet cushions, every set has by itself been tastefully arranged upon one of the eight divisions of the pavilion—and indeed, the admirable stones show off to great advantage, with their unsurpassable iridescence, glowing in all the hues of the rainbow, and the eye does not tire in looking at them. An admirable spray of flowers, composed of thousands of diamonds of the collection, silently but impressively informs us that we are in the presence of baubles once worn by the queens and empresses of France;\* bedded above this field are arranged the largest diamonds, several of which bear a historical name. Surrounded by five brilliant stars in semi-circle reposes the gigantic “Regent” upon its pillow; farther below we see the “Mazarin;” to the right the oldest crown diamonds, which are characterized by their cutting; to the left a buckle of Cape diamonds with a yellowish tinge; tiaras, shoe buckles, rosettes and brooches are seen in large numbers; a four-string necklace composed wholly of brilliants; a pair of bracelets also of diamonds; simple hoops and diadems for the hair and brow; necklaces; large and small crowns studded with diamonds, adorn several other divisions, while rubies, sapphires and emeralds, interspersed between these matchless solitaires and master works of jewelry, heighten the effect of the latter.

Truly overpowering is the effect of a necklace composed of pear-shaped pearls and colored jewels, in the Oriental style of network.

\* The translator could do no less than quote the trite, but true, Biblical verse: “Better is a mess of herb in peace, than a stalled ox and hatred therewith,” when mustering the group of illustrious persons who wore these diamonds for the past one hundred and fifty years: Mazarin, who bought the largest, was hated and despised by the people; Louis XV. loaned them to his courtesans, Madame de Barry, etc.; Marie Antoinette was beheaded; Josephine divorced; Marie Louise returned in disgrace to Austria; Marie Amélie, wife of Louis Philippe, was driven from the country; Eugénie dethroned and driven from the country. Surely France has all reasons to alienate property with as black a history as its crown diamonds. Will the ill-luck that until now clung to them be transferred to the purchaser?

Much admired is also the marvellous pearl diadem with the alternating round and pear-shaped pearls; rosettes and buckles, single cords with pendant pearls and smooth, many-stringed necklaces belong to the ornament. Ten long strings of pearls nestle closely together, although each one represents a king's ransom. Pearls signify tears, and the last princely wearer of this *chef d'œuvre* of the art of the jeweler, the proud and beautiful Empress Eugénie, who wore the crown jewels so often to enhance her personal charms, was called on to verify the truth of this old saying.

Every ray of the sun falling upon this matchless collection of jewels, draws a flood of sparkling light from them, while the pearls glitter in their mat, mellow luster peculiar to them. The insignia of orders are grouped between two parade swords, and fill an entire division; large, flashing stars covered with brilliants, represent the main orders of Europe, together with the ribbon of the knighthood of the garter with its verse in brilliants, and the peculiar Asiatic order of the elephant. The body of the animal is enameled white, while colored jewels adorn the palankin upon its back.

And yet, what a contrast between the productions of the art of jewelry of a pampered age and the remarkably simple and sombre crowns of Charlemagne and Louis XV., which are kept in a glass case of the Apollo gallery of the Louvre, and still more so between the votive crowns of the Gothic kings, the treasure of Guarrazar in the Cheny Museum in Paris! It is a pity that these old treasures were not exhibited with the others, if for nothing else than contrast.

The public will also, upon the payment of a fee, be admitted two evenings per week, and the light of the 24 incandescent lamps of the pavilion will be flashed back with double their intensity from the thousands of facets of the crown jewels, and it is confidently expected that these evening exhibitions will be eminently successful.

When the student of French history dispassionately looks through its pages, it will be to him almost a matter of surprise that there should be any crown jewels at all in the *Garde-Meuble*, the vessel of the French state having been so terribly tossed about in tempests political during the last one hundred and ten years. The purchase of the Pitt diamond, only four years after the conclusion of the peace of Utrecht, when France was left bleeding at every pore, and with her finances to all appearance in a bankrupt condition owing to the war of succession, has often been quoted as a proof of her recuperative powers, and the comparative ease with which she can recover from seemingly overwhelming military and pecuniary reverses. On the other hand, the transaction might be cited as an illustration of the cynical indifference to the sufferings of an indigent people exhibited by the Regent d'Orleans in lavishing a huge sum of money, which would have given bread to thousands, on a trinket for the brow of a child still in the nursery. The transaction, notwithstanding, was quite in keeping with the traditions of splendidly overweening selfishness with which the idea of French royalty was then surrounded. What could be fitter than that the circlet of sovereignty with the Pitt diamond should adorn a royal little boy whose juvenile copy-books are yet preserved in the library of the hermitage at St. Petersburg—one of them being headed with the exemplary maxim: “Kings do as they please; their subjects obey them.” When the royal little boy was taking exercise with his nurse one afternoon, on the terrace at Versailles, a great noble of the court took the child in his arms, and, pointing to the great concourse of people in their holiday dress—it was a fete day—in the gardens, said: “Behold, my king! all those men, women and children, their money, their prosperity, their lives belong to you.”

Clearly, although France might be insolvent—and chronically insolvent she continued to be until the cataclysm of the revolution and the *assignat* system brought utter bankruptcy, from which she rose permanently refreshed by ruin—it was indispensable that the king, to whom more than thirty millions of people “belonged,” should have a crown worthy of his autocratic “supremacy.” It was the Sieur Rodé fils who made the last royal crown of the *ancien régime*. It weighed thirty-two ounces and contained two hundred

and seventy-three diamonds and sixty-four colored gems. The circlet of very thin beaten gold was adorned with brilliants, rubies, emeralds and sapphires; the branches or arches sprang from eight flowers de luce; the basis of the crest was a row of pearls between two rows of brilliants, surrounded by a double flower de luce, of which the pear-shaped summit was the "Beau Sancy," a rose diamond of two hundred and twenty grains. The inner cap or "calotte," of this gorgeous badge of sovereignty was of violet satin, embroidered with gold, and enriched with seventy-five diamonds. The crown royal, manufactured by the Sieur Rodé fils, exists at present only in the portfolio of the collector of old engravings. The portrait of this vanity of vanities was duly taken for the edification of posterity, but the bauble itself is clear gone—as completely vanished as the more renowned diamond necklace of notorious fame.

That famous, or rather infamous *Collier de la Reine* had its origin in a whim of Louis XV., who, in his infatuated dotage, wished to bestow on Madame de Barry the costliest set of diamonds that could be collected throughout Europe. Shameless as he was, he hesitated to present the "Regent" or the "Sancy" to his mistress, but otherwise the royal spendthrift gave *carte blanche* to the court jewelers, Böhmer and Bossange, who ransacked the diamond markets of the world to produce a necklace, which they valued at two millions of livres. How Louis XV. died from one of the most horrible forms of small pox; how Böhmer and Bossange, fallen into difficulties through their inordinate purchases of jewels, vainly strove to sell the necklace to the young Queen Marie Antoinette; and how they were ultimately swindled out of the precious necklace by the notorious Madame de la Motte and her associates, are matters of history. The diamond necklace disappeared piece-meal. Its counterfeit presentment is likewise extant in engravings, but the article itself is no more. It vanished. The Crown Royal of France was not long in following it; but, strangely enough, throughout all the vicissitudes of the revolution, and notwithstanding the terrible straits for money to which the successive Republican governments between 1791 and 1800 were reduced, the State never lost its hold on the "Pitt" and the "Sancy" diamonds. Indeed, in one sense the Republican rulers of France were conservators rather than destroyers. They melted down all the church bells to make "sous" of, and cast the lead of all the coffins in the royal tombhouse at St. Denis into bullets. They sowed potatoes and mangold-wurzel in the gardens of the Tuileries, and allowed the mob to demolish scores of castles and abbeys, but they did their best to preserve the furniture and ornaments of the royal palaces from annihilation, and between the cessation of the Reign of Terror and the termination of the rule of the Directory an immense collection of jewels, furniture, and objects of art were brought together. There were not enough gems, however, to furnish forth the diadem of a new monarch; and Napoleon I. was fain to entreat the well-known jeweler, M. Edmé-Champion, to give him credit for that Crown Imperial which, metaphorically, the Corsican "aventurier" confessed that he had "picked it out of the kennel." But the crown which had encircled the brow of a Bonaparte was deemed unworthy to press the forehead of a restored Bourbon. Louis XVIII., elected to be taken as crowned, and for the *sacre* of Charles X., a new crown was made. The jewels in it have long since been separated from the body of the diadem; and the "Regent" was displayed in an isolated state in the Paris Universal Exposition of 1878. Neither Louis Philippe nor Napoleon III. was ever crowned; and the contingency of any future head of the State in France requiring the services of a Sieur Rodé fils or of an Edmé-Champion, appears, to say the least, extremely problematical. Old crowns partake, to a considerable extent, of the nature of old clothes, and are not exempt from the same vicissitudes to which cast-off garments are liable. Still the "Regent" is worth more than a disused overcoat, and cannot so easily vanish into space.

## Palladium.

A VALUED correspondent to THE JEWELERS' CIRCULAR requested us some time ago to furnish him with full data concerning this metal; his request is complied with by the following, clipped from a European source:

This metal was discovered in 1803 by Dr. Wollaston ("Philosophical Transactions," 1804 and 1805). On adding bi-cyanuret of mercury dissolved in water to a neutral solution of the ore of platinum, either before or after the separation of that metal by muriate of ammonia, a yellowish-white flocculent precipitate is gradually deposited, which is cyanuret of palladium. When this compound is heated to redness, cyanogen is expelled and pure palladium remains. In order to obtain it in a malleable state, the metal should be heated with sulphur, and the resulting sulphuret purified by cupellation in an open crucible, with borax and a little niter. It is then roasted at a low red heat on a flat brick, and when reduced to a pasty consistence it is pressed into a square or oblong perfectly flat cake. It is again to be roasted very patiently, at a low red heat, until it becomes spongy on the surface, and when quite cold it is condensed by frequent tapplings with a light hammer. By alternate roastings and tapplings, the sulphur is burned off, and the metal sufficiently dense to be laminated. Thus prepared, it is rather brittle while hot, which Dr. Wollaston supposed to arise from a small remnant of sulphur ("Philosophical Transactions," p. 7).

Palladium resembles platinum in color and luster. It is ductile as well as malleable, and is considerably harder than platinum. Its specific gravity varies from 11.3 to 11.8 (Wollaston). For fusibility it is intermediate between gold and platinum, and is dissipated in sparks when intensely heated by the oxy-hydrogen blow-pipe. At a red heat in oxygen gas its surface acquires a fine blue color, owing to superficial oxidation, but the increase is so slight as not to be appreciated.

Palladium is oxidized and dissolved by nitric acid, and even the sulphuric and muriatic acids act upon it by the aid of heat, but its proper solvent is nitro-muriatic acid. Its oxide forms beautiful red-colored salts, from which metallic palladium is precipitated by proto-sulphate of iron, and all the metals described, excepting silver, gold and platinum.

It is only half as heavy as platinum, so that it is much better adapted for making very accurate balances and other philosophical apparatus, the graduated scales of astronomical instruments, etc. It destroys the color of gold, one part fused with six of gold forms a white alloy, which from its hardness and durability was, it is said, employed by Troughton for the graduated part of the mural circle for the Royal Observatory at Greenwich. It possesses little or no elasticity; it is a very bad conductor of heat and also less expansible. It may be alloyed with many metals—gold, silver, iron and steel. The alloy with iron is brittle, and in the proportion of one per cent. it is said to improve the quality of steel for certain cutting instruments.

A manufacturer has sent us a spring of, we believe, unalloyed palladium, and at once we are forced to say that we consider it an unfit material for the use of balance springs of chronometers; first, from its great weight, and, second, its behavior under the pliers. In attempting to curve it into figure, it is as dull and as inelastic as lead itself, and the curve falls down, nearly touching the second coil of the spring. Chronometer makers, as a rule, understand the nature of steel, and soon find out that some steel hardens at a much lower temperature than others, etc.; and on the other hand, if those springs advertised as palladium springs are alloyed, which they must be, they cannot be pure palladium springs, but an alloyed metal, containing palladium in more or less quantities. The alloy may be of nickel, or of steel, etc.; if it is alloyed with silver it becomes dental alloy. It will be the grand test to place them side by side with chronometers with steel springs on the public trials at the observatories, and if they give flattering results on their first trials it will take years to prove that they possess any superiority over the

steel springs, or are of a suitable material for the use of balance springs to chronometers.

The following results are obtained from an English firm, E. Dent & Co.: Mr. Dent says that palladium springs were first tried by his grandfather, E. J. Dent, who found that with a palladium spring of 11.34 inches long a chronometer with a glass balance took, for a change of temperature from 32° Fahr. to 100°, 2' 21" as against 6' 25" lost by a chronometer with the usual steel spring 11.04 inches long. Further, as regards the palladium spring, that of this amount —2' 21"—1' 48" is due to loss of elasticity, and 33" to increase of length, as against 5' 6" due to loss of elasticity in the use of the steel spring, and 1' 19" increase in length. It would appear in these experiments no allowance is made for the increase of the diameter of the balance; in the case of the experiments by Berthoud, with a brass balance and a steel spring in one of his marine watches in passing from 32° to 92° Fahr.:

|  | Sec.       |      |
|--|------------|------|
| Loss per diem by expansion of diameter of balance.....       | 62         |      |
| Ditto, by loss of spring's elastic force.....                | 312        |      |
| Ditto, by elongation of spring.....                          | 19         |      |
|  | Minutes, 6 | 23   |
|  | Min.       | Sec. |
| E. J. Dent's experiment with glass balance and steel spring, |            |      |
| loss per diem.....   | 5          | 6    |
| Loss of elasticity.....                                      |            |      |
| Ditto, increase of length.....                               | 1          | 19   |
|  | Minutes, 6 | 25   |
| With glass balance and palladium spring .....                | 1          | 48   |
| As due to loss of elasticity.....                            |            |      |
| Increase of length.....                                      |            | 33   |

Taken that the expansion of glass is equal in both instances in the disc of the balance used for these trials, it is difficult to ascertain the correctness of the trials. According to the tables of Lavoisier and Laplace the elongation of glass tube, when heated from 32° to 212°, was  $\frac{1}{248}$  of its length, while brass was  $\frac{1}{32}$  of its length. Knowing the elongation of any substance for a given number of degrees of the thermometer, its total increase in bulk may in general be calculated by trebling the number which expresses its increase in length; thus, if a tube of glass elongates  $\frac{1}{248}$  when heated from the freezing to the boiling point of water, its bulk increases  $\frac{3}{248}$  or  $\frac{1}{82.67}$  of its former bulk. But palladium springs were abandoned by Mr. Dent from some cause not stated; how the present alloyed palladium springs will succeed becomes a question for time to solve; but we fear that they will not sustain their elasticity for any length of time; in such a case, a constant losing on the rates of chronometers must ensue.

Another great objection is urged against them: their excessive trembling and quivering motion under the vibration of the balance; this would arise either from the non-elastic qualities of the metal, or from the want of ability to stand the torsion, so requisite a quality in the springs of chronometers.

#### A Bric-a-brac Hunter in Morocco.

A CORRESPONDENT of the *Mercury* of Leeds, England, has been bric-à-brac hunting in Morocco, and thus relates his experience:

The leather work for which Morocco has so long been famous will probably disappoint most persons who visit the country. The usual red and yellow Arab slippers are to be obtained here at a very cheap rate. The common ones cost two shillings a pair, which is about half the price charged in Tunis. For ladies' embroidered slippers any sum up to five dollars a pair may be paid. Perhaps the most useful form the leather works take is in the shape of covers for foot-stools, embroidered in gold and silver wire. These covers may be bought for eighteen pence each, and when they have been stuffed with wool or horse hair they make remarkably good and handsome footstools, which have the advantage of harmonizing well with the present fashions in furniture and house decoration. I have seen inferior specimens of these cushions offered for sale in England. I need hardly say at prices greatly in excess of that which I have named. It is impossible to resist the conclusion that a brisk trade in these leather covers might easily be organized between Morocco and England.

Another staple industry of the country is pottery. Before me, as I write, stands a collection of platters, vases, jugs, etc., brought from Tangier. The cost of the whole collection was probably less than thirty shillings, and yet it includes many remarkably fine specimens of the gorgeous Rabat ware, which forms so telling an ornament in a modern hall or in a room in which a little brilliant color is desirable, as well as several shapely pieces of the blue and white wares of Fez and Mekenes. There are, too, in this collection a number of the earthenware drums, or tomtoms, of which mention has been made in the course of my narrative, as well as some of the quaint lamps which are used in the interior of Morocco, and which surely furnish the very earliest and crudest form of the duplex flame.

Lastly, in connection with this question of bric-à-brac, something must be said about the painted woodwork from Tetuan, which is so popular in Moorish houses. It is quite possible that its brilliant colors and rich arabesque patterns may seem gaudy to the European eye. But, gaudy or not, the brackets and mirror frames which are sent out from Tetuan are often singularly beautiful, and deserve a place in any house where things which are rare and artistic are not cast aside merely because they happen to be unconventional.

I have said enough, I think, to satisfy the bric-à-brac hunter that he will find at least as much in Tangier to engage his attention as he will discover in the curio shops of Nice, or Naples, or Florence. He must, however, beware of the Oriental modes of doing business. There is only one thing of which he need not be afraid in Tangier, and that is of offering too small a sum for any article he wants to buy, when he begins his bargaining. One day a man who dealt in the matting of which I have spoken, and of whom I had purchased one or two pieces, came up to Bruzeaud's carrying a fresh piece on his shoulders. He spread it out upon the terrace for my inspection. "Very good!" said he. "Yes," said I; "but I don't want it; I have bought enough." "Very cheap!" he urged. "I don't want it," I answered. "Six shillings!" he cried; "worth ten shillings!" "Nonsense! I tell you I don't want it." "How much you give me?" he demanded next. "Sixpence," says I, in order to get rid of him. "Sixpence!" he laughed derisively. "No; five shillings." "Sixpence!" I repeated, doggedly. He laughed once more, rolled up the matting, hoisted it on his shoulder, and turned towards the steps leading from the terrace. Suddenly he paused, propped the roll of matting against a tree, and, coming up to me with outstretched hand, said quietly, "Very well, I take sixpence." He could not refuse money when it was offered to him, however trifling be the amount. I was so much ashamed of this transaction that I gave the fellow his sixpence and his roll of matting, which was twelve feet long by five wide.

#### Exposition of Goldsmithing at Nuremberg in 1885.

THE JEWELERS' CIRCULAR, sometime ago, spoke of the projected International Exposition of works of the precious metals and their alloys, to be held at Nuremberg, Bavaria, in 1885. The Presidency of the exposition was tendered to and accepted by the King Louis II., of Bavaria, and the various medals of merit are being struck at the royal mint.

Both the foreign and German Embassies and Consulates have enlisted in the promotion of the undertaking, and it is due to their exertions that quantities of East Indian work trinkets and ornaments of the Cabyls, specimens from the treasure of the Shah of Persia, etc., have been promised. The plan has met with the warmest approval in Spain and Portugal, and Japan has also given notification of its participation.

The historical department promises to be of a high interest, and many possessors of old and rare chef d'œuvres have promised to send theirs.

The buildings for the purpose are nearly finished and ready for apportionment, and everything that was suggested by experience to enhance the comfort of the exhibitors, and to place their goods in as favorable a light as possible, has been thought of and incorporated in the structure.

The government has signified its willingness that the goods will be admitted free of duty, and those not sold permitted to be withdrawn free of duty, and promises in all other respects to favor the best interests of the exhibitors to its utmost power.

We hope that America will be represented fully.

## How to Make and Engrave Silver Bangles.

BY EXPERT.

THE MANNER of breaking the electric circuit was sufficiently explained in our last, and now we will describe the arrangement of the magnets and such parts as are necessary to the production of the dots. As we recommended for such small work as a dime the changing of the pentagraph to  $\frac{1}{10}$  proportion, and as the bars of our pentagraph are 12 inches, one-tenth must be  $1\frac{1}{10}$  inches for the short bar; consequently our stippling arrangement can only rest on or be secured to one of the short bars and project backward over one of the main bars as shown at *a b*, fig. 1. There are many

ways by which the stroke can be given, but it is of importance that the stroke be given as near instantaneous as possible in order to have the work look perfectly even. A good form for the arrangement of the stippling point is shown at fig. 2, which is an enlarged view seen in the direction of the arrow near *a*. It consists of a helix *A*, formed of insulated copper wire (No. 24). Insulated wire, as my readers are probably aware, is wire wound with some non-conducting substance like silk or cotton to prevent the coils of wire from coming in actual contact. Wire wound with silk is the best; it costs more but it is worth the difference. The helix should be about 2 inches long and be wound on a spindle  $\frac{3}{8}$  of an inch in diameter. There is some care necessary in making the helix and other working parts. To make the helix, take a piece of wire about 4 inches long and  $\frac{3}{8}$  in diameter, and wrap it with two turns of writing paper, glueing the turns down as you wrap it as shown in fig. 3, where *d* represents the spindle and *f* the paper. The spindle should not be wrapped so tight that it cannot be drawn easily out of the paper tube which the paper when dry forms. After the paper is dry two discs of thin wood should be slipped on the paper tube and glued fast as shown in fig. 4, where *f* represents the paper tube and *e e* the wooden discs. These discs are glued fast to the paper tube and form a spool on which the insulated wire is to be wound. In winding on the wire a small hole should be made in one of the discs, and the end of the wire should be allowed to protrude as shown at *g*, then go on with the winding as if you were winding thread on a spool, keeping the layers even until the spool is full. In the present case the first course or layer should be wound on so as to cover the paper tube (with the wire *d* inside it), evenly from disc to disc, when we should brush over the wire a coat of tolerably thick shellac varnish, made by dissolving shellac in alcohol. The coat of varnish should be allowed to dry perfectly, when you should try if the wire *d* can be removed. There is generally no trouble about getting the wire *d* out if care is taken when the paper *f* is put on. Go on winding a course of wire and varnishing with shellac until the spool is full. Heating the ends of *d* with the lamp will hasten the drying, but such heating is apt to make bubbles and lessen the stability of the helix. After the spool is full a hole near the outer edge of the disc should be made to permit the outer end of the wire to protrude as shown at *h*. We have now the helix made and the two ends of the insulated wire wove together so as to make connection. The ends of the wire when first wound should protrude about 3 inches. The wire *d* should now be withdrawn leaving

a hole through the center a trifle over a quarter of an inch in diameter. The ends of the paper tube should be cut away even to the discs, and the helix mounted as shown at *A* in fig. 2. The manner of mounting is to take a heavy piece of sheet brass—No. 8 or 10—about  $\frac{3}{4}$  of an inch wide and 4 inches long, and bend one inch of it at right angles, as shown at *B*, fig. 5, the part at *j* being secured to one of the short pins shown at *a*, fig. 1. The helix *A* is clamped to *B* by means of two open boxes as shown at fig. 6, when the part at *k* is flattened and screwed to the cock *B* with 2 screws. These boxes (fig. 6) are made in half and secured together with two screws shown at *l l*. These clamps or boxes are shown at *m m*, fig. 2, and serve to hold the helix *A* firmly in place. The principle on which the helix works is that if we take a helix, as shown in fig. 7, and connect the wires *g h* (which are the two ends of the wire forming the helix) to a battery, and insert a piece of iron wire as shown at *n*, we will find a strong tendency of the wire *n* to be drawn in until it assumes the position shown at the dotted lines *o*. Or, perhaps it will be better understood if I suppose a helix 2 inches long and a piece of iron wire as long as the helix, is inserted one inch in one end. Now the full magnetic tendency of the battery is exerted to draw the wire into the helix until the center of the wire corresponds to the center of the helix. In making one stippling machine we take advantage of this principle and insert in each end of *n* (the soft iron wire to be drawn in) two smaller wires to serve as guides to *n*, and let these wires pass through the guides *r s*, fig. 2, we have the elements of the stippler. A good deal of care must be used in fitting up the piece *n* and guide wires *o p*, to have them true so the iron wire *n* will vibrate back and forth in the helix without touching or causing unnecessary friction. Attached to the wire *p* is a very fine spiral spring, such as telegraphers use to draw back the armatures to the relay of their instruments. This spiral spring is shown at *u*, fig. 2, and serves to draw the iron wire *n* upward and retain it in position until the current of the battery is exerted, when the large iron wire *n* is drawn down into the helix so quickly and with such force as to indent the work in hand by the properly shaped point on *o*. The ends of the wires *g h* are attached to the usual clamp screws for attaching the connecting wires of the battery, one of which is shown at *v*, fig. 2. But such clamp screws are in too common use to need further notice. The reader will remember that I gave the method of breaking the battery current in the last communication. I will say a few words about conveying the current from the part of the apparatus by which the current is broken in following the pattern to where it does its work at the stippling device. By having a support for the wires extending from *b* to *c*, fig. 1, at *F*, all fear of having the wires in the way can be avoided. The flexibility of the wires will compensate for the joint at *F*, and if the support (at *F*) is of wood their is no need of the connecting wires being insulated. Of course it is understood that if uninsulated wires are used they must not touch one another. By varying the length of stroke and by the strength of the battery the dots can be given of any depth. At fig. 8 is given a *resuma* of the principle; *u* represents the breaking spring, *x* the tracing point, *y* the connection, *z* the stippler.

## Lathes and Lathe Work.

BY THE MODEL WATCHMAKER.

ABOUT THE next thing to do in constructing our lathe is to mount it on a suitable table or bench. And also provide ourselves with a foot wheel. This should be quite heavy, weighing at least 35 pounds. If a second-hand wheel can be obtained and used to advantage, all right; if not, a suitable wheel can generally be got of some of those persons who deal in agricultural implements. The wheel should be about 2 feet in diameter, and can be grooved in the outer rim for a round leather band or can be used for a flat belt. A flat faced pulley or wheel can be used by glueing on the iron first

paper and then a piece of leather belting as wide as the belt to be used. After it has dried on, trim off the edges so the leather will present a convex surface. The flat belt will not leave the leather, as all flat belts have a tendency to run to the largest part of a wheel or pulley. The wheel should now be mounted on our arbor with a suitable crank as shown in fig. 1, where  $A A$  represents the arbor and  $b$  the double crank. Such an arbor is simply a piece of  $1\frac{1}{4}$  inch square iron forged to the shape shown, with the part between the dotted lines rounded for the action of the pitman or connecting rod connecting it with the treadle. The crank shown at  $b$  should have a throw of 5 inches which is doubled by the treadle as will be subsequently shown. This arbor is squared off at the ends as shown at  $a a$ , and in the center of the end is drilled a hole  $\frac{1}{8}$  of an inch in diameter and  $\frac{3}{4}$  deep; these holes are to be countersunk and serve to receive the set screws  $e e$ . These set screws can be bought of any large hardware dealer, and are known to the trade as case-hardened set screws. The size wanted is  $\frac{5}{8}$  diameter, 3 inches long under the (square) head, and the kind known as No. 5, which number only indicates that the point is cone shaped. These set screws pass through the frame at  $d$ , and the cone points enter the holes in the ends of the arbor  $A$  and form very cheap and easy running bearings. Such an arbor with its crank any ordinary blacksmith can make as well as round up the part  $b$ . The arbor should be  $24\frac{1}{2}$  inches long. The bench on which the lathe sets should be 30 inches long by 24 wide, and made of hard wood 2 inches thick. The frame work at

each end is indicated at fig. 2, where  $c c$  shows the upright supports made of hard wood joist 2x3 inches, as also the cross piece  $d$  which carries the set screw  $e$ . The cap piece  $f$  which joins  $c c$  is also 2x3 inches, but laid flatwise as shown in fig. 3. The bench should be 36 inches high to top off the 2 inch plank  $g$ . The treadle should be made of 5 pieces of hard wood (ash is preferable) tenoned together as shown at  $D D D D D$ , fig. 4; these pieces are  $1\frac{1}{2} \times 2$  inches, the 2 inch width extending horizontally. This gate treadle is hinged to a piece  $h$  extending from one frame to another as shown in fig. 3. The hinging is done with two heavy (4 inch) wrought iron butts as shown at  $j j$ , fig. 4. The piece  $h$  should be 8 inches above the floor, and the treadle  $D$  should not descend low enough to pinch one's toes. The manner of putting on the butts is shown in diagram  $H^*$ ; this enables us to have a free working joint. The bottom of the cross piece  $d$  should be  $10\frac{1}{2}$  inches above the floor, and at the center of this cross piece the set screw  $e$  should be placed for the arbor  $A$  to run on; thus the center of the arbor  $A$  will be 21 inches above the floor. These proportions are right for a wheel 2 feet in diameter. When I speak of the crank  $b$  having a throw of 5 inches, I mean the crank should be  $2\frac{1}{2}$  inches from the axis of the arbor to the axis of the wrist pin. This will cause the pitman or connecting rod to pass up and down 5 inches, and as this motion is doubled by the treadle gate it will cause the front of the treadle at  $k$  to move up and down 10 inches. The part of the arbor  $A$  where the wheel  $B$  goes can be rounded by forging or it could better be turned, but if carefully filed it will answer very well as the accuracy of the work produced

depends but little on this part. The balance wheel should be attached to the arbor  $A$  by a set screw or a key wedge. The pieces  $x x$  which serve as braces are 2 inches square. The braces  $l l$  are of iron and serve to strengthen the frame work. At fig. 2 is shown an end view of the lathe and table with countershaft supports. These end supports are of cast iron and are alike at each end, and are bolted to the plank  $g$  with small carriage bolts. Extending from  $F$  to  $F$ , fig. 3, is a rod  $L$  with a nut on each end which serves to keep  $F F$  from spreading by the action of the pointed set screws  $n n$  on which the countershaft  $M$  runs, the same as the driving axle  $A$ . The countershaft  $M$  is a piece of cold rolled shafting 1 inch in diameter and 24 inches long. On it are two pulleys, one 3 and the other 6 inches in diameter. These pulleys have hubs attached with set screws so the pulleys can be changed about. In fig. 3 the lathe is not shown as it would interfere with the view of the countershaft, but its position can readily be inferred from fig. 2 where an end view is given. In the cut the driving wheel  $B$  and pulley  $O$  are shown as for a flat belt, but on some accounts a round leather belt about  $\frac{3}{8}$  of an inch in diameter is to be preferred as it enables us to use the pulleys  $m o$  for different speeds. As, for instance, we let the band from the driving wheel  $B$  pass to the pulley  $m$  which is 6 inches in diameter. Now, of course, the countershaft  $M$  turns 4 times around for every time the wheel  $B$  turns once. If, on the other hand, we applied the band directly from  $B$  to  $o$ , which is three inches in diameter, we should have 8 times the speed of  $B$  by the countershaft  $M$ , and a band passed from  $m$  to the lathe an exalted speed would be obtained. The reader will see if one of the pulleys  $m$  or  $o$  was arranged for a flat belt such changes could not be effected. There is no doubt but a flat band has the most power, but a round band  $\frac{3}{8}$  inch diameter will convey all the power one can maintain for any length of time on the treadle. For turning any piece of steel or brass up to 1 inch in diameter, the 6 inch pulley  $m$  will give ample power; and for larger work a train of gear wheels extending from  $M$  to the lathe can be used. Such gear wheels can be made of cast zinc, as they are amply strong for such purposes, and if nicely made work very smoothly and with but little friction. We must now get up our slide rest, but first we must provide temporary centers for our heads to enable us to turn some which are true and reliable. The lathe can readily be made to cut the teeth in such zinc wheels as I mentioned. The wheels can be cast from a wood pattern molded in such sand as can be obtained from any foundry; full instructions will be given as the article progresses. It is to be noticed that fig. 4 is drawn to a smaller scale than the other figures, but all sizes are given in figures in the letter press.

### The Age of Inventions.

OUR NINETEENTH century, says the *Central Anzeiger*, is without a doubt the age of inventions, and the number of the latter is, perhaps, without an equal in the world's history. Of course, inventions for the benefit of the human race have been made ever since his creation, but when we look back simply for one hundred years, we must be astonished at the number of inventions made in so short a space of time, and how many of them date only since fifty years ago! The perfection of the locomotive and steamboat, telegraph, telephone, audiphone, electric light, sewing machine, photography, chromo-lithography, cylinder printing presses, elevators for high buildings, cotton gin, spinning machine, reaper and mower, steam threshing machine, steam fire engine, improvements in the manufacture of steel, dynamometry, the employment of anæsthetics to ease pain, and many more, pertain to this period. Various other important discoveries and inventions are in a nascent state. The use of coal gas and petroleum for heating and cooking is already a success, also the supplying of steam as motive power and for heating from central stations. The artificial preparation of butter is a notorious fact; flying through the air is a subject of experimenting, and the use of electric motive power is on the eve of being solved. Several problems of mechanics have until now evaded solution; but will they be more difficult to solve than the problem of the ocean cable, by means of which two persons separated by thousands of miles of ocean, converse with each other, or of photography, or of telephony? We employ chemical agents and freeze ice, which equals the best product of nature, in the torrid heat of midsummer. Our surgeons transplant the skin from the arm of one man into the face of another one; it adheres and becomes a part of his own body. We manufacture a mile of printing paper, swathe it around a spindle from which a printing press unrolls, prints, cuts, folds, counts, and in the course of time delivers, all counted, so many thousand of printed papers per hour.

Verily, our age is an age of inventions, and it would be foolhardy to draw the line between the possible and impossible.

## Foreign Gossip.

**PRESENTATION BOWL.**—A beautiful silver bowl, weighing about 7 pounds and richly chased, has been presented to Viscount Saver-nake on his coming of age. The bowl was manufactured by Elkington & Co.

**CORRECTION OF EARTH'S SURFACE.**—A proposal to construct a canal from the Atlantic, by the Gironde, past Toulouse, by Lang-guedoc, and joining the Mediterranean near Narbonne, is receiving a great deal of influential support.

**SOME CITY.**—A report was read at a late meeting of the Institute of Civil Engineers, in which the aggregate length of the streets of London was given at 1,966 miles, of which, excluding 248 miles in course of formation, 1,718 miles are thus maintained by various authorities.

**ENGLISH IMPORTATION OF WATCHES.**—During the month of June England imported 46,123 watches valued at £51,512, a large increase in number and value over the corresponding month of last year. For the first six months of this year there were 343,500 watches valued at £208,635, imported by England, of which number the United States sent 174,134 as against 157,641 sent the first six months of last year.

**PROTECTION AGAINST RUST.**—Dr. Beckers has invented a preservative against rust which is sold under the name of oil of caoutchouc, and which is said to have been introduced into general use by the German army. It is a varnish prepared by mechanical means which have hitherto been kept secret, but which result in so intimate a mixture of the oil and caoutchouc that the latter preserves all its elasticity and communicates it also to the oil. When rubbed by a flannel upon a metallic surface it dries slowly, forming a perfectly elastic, adhesive pellicle, which protects the metal from atmospheric influences.

**A STANDARD MICROMETER.**—A "standard" micrometer has been made for the American Society of Microscopists, by the U. S. Bureau of Weights and Measures. The scale is engraved on platinum-iridium, twenty per cent. iridium. The examination as to the correctness of this standard was carried on through seven months of last year by Prof. W. A. Rogers, of Harvard College Observatory, and it has now been accepted by the society. It is to be kept in approved safe deposit vaults, and not to pass out of the hands of the custodian except with the permission of the committee, president and secretary of the society, but other micrometers will be compared with the standard and the result certified to for a reasonable fee.

**WHERE DIAMONDS ARE FOUND.**—Until the South African mines were discovered the diamond was always found in sands and gravels, different from the mineral in which it was believed to be formed. At Griqualand West, however, the consolidated eruptive mud of the mines was believed by some to be the true matrix of the diamond; but opinions differed on the question, and arguments were found on both sides. M. Chaper, a French geologist, has, however, during a scientific mission to Hindostan, succeeded in finding the diamond in its mother rock. At Naizam, near Bellary, in the Madras Presidency, M. Chaper has found the diamond in a rose pegmatite, where it is associated with corundum. The tract of country is almost denuded of trees, bare and rocky, and the rains wasting the rock every year expose fresh diamonds in the soil. The rock is traversed by veins of feldspar and epidotiferous quartz. Here the diamond is always found associated with epidotiferous rose pegmatite. The diamond crystals observed are octahedral, but less distinct in line than the stones of South Africa, which seem to have been formed in a freer matrix. It follows from M. Chaper's discovery that diamonds may exist in all rocks arising from the destruction or erosion of pegmatite, for example, in quartzites with or without mica, clay, pudding stones, etc.

**TIME'S CHANGE.**—One of our home papers states that fifty years ago the English were so much astonished at the low price at which clocks were imported into the British Isles, that they seized a cargo of the clocks and sold them at auction, turning the proceeds over to the owner of the clocks. The profit on this transaction was so large that another cargo of clocks were sent to England forthwith. Again the prices fixed were low, and they were regarded as a deliberate undervaluation. The cargo was seized and sold as before much to the satisfaction of the owner of the clocks who made a great deal of money by it. A third cargo was soon sent with the expectation that it would be seized and sold in the same manner, but the English custom-house people had learned wisdom, and they allowed the Yankee clocks to pass in unmolested at the valuation fixed on them.

**CURIOSITY.**—A wealthy inhabitant of Vienna, Austria, had two "clocks of vitality" made, one for himself and the other for his wife. Beside the hours and minutes these clocks are provided with a certain kind of almanac which records the exact age of the parties. To these two clocks were added, in the course of time, four others for children born to them, which are provided in a like manner. The most remarkable feature of these mechanisms, however, is that while at the time of marriage the calendar hands indicated the husband's age to be 21, the wife's 17, the former is at present 51 years, 60 days and 8 hours, while the wife is 35 years, 9 days and 15 hours. Mathematicians and men "quick at figures," have for some time puzzled their brains how this difference could have arisen. Can it be possible that she sets back the hands occasionally? Avaunt, base suspicion.

**EIGHT DAY ALARM CLOCK.**—The specification of an English application for a patent for an alarm clock recites that the object is to provide alarm attachments for clocks, which will sound once each day for eight days with one winding up of the spring, and it consists in an eight day clock alarm constructed with a dial and cam connected with the clock work, and operating a lever connected by wires with an arm attached to the pallet of the alarm, and with a stop lever arranged to engage with stop pins attached to the pallet wheel, and provided with a follower to engage with a trip wheel connected with the main wheel driven by a spring. The cam revolves once in twelve hours, and the lever drops so as to release the pallet and allow the alarm to be sounded, while at the next revolution the alarm is prevented from sounding by the stop lever entering between the pins attached to the pallet wheel.

**THE THERMOMETER.**—Mr. R. H. Scott, President of the Royal Meteorological Society, London, has compiled some interesting notes on the history of the thermometer. The name of the actual inventor of the instrument is unknown, and the earliest mention of it as a scientific appliance then 50 years old was in a work by Dr. R. Fludd published in 1638. Bacon, who died in 1636, also takes notice of it. But the earliest thermometers were really sympiezometers, as the end of the tube was opened and plunged into water, which rose or fell in the tube as the air in the bulb was expanded or contracted. Pascal soon discovered that pressure as well as temperature affected such instruments. Simultaneously with them, however, thermometers with closed tubes were made in Florence, early specimens of which may be seen in the collection of the Florentine Academy. As to the instrument as it now exists Robert Hooke suggested the use of the freezing point; Halley, the boiling point and the substitution of mercury for spirit, and Newton, blood heat. Fahrenheit, although a German by birth, was a protégé of James I., and died in England. Réaumur's thermometer in its final form owes its origin to De Luc; and although the centigrade thermometer is almost universally attributed to Celsius, it was really invented by Linnæus. Celsius' instrument had its scale the reverse way, the boiling point being 0° and the freezing point 100°. Mr. Scott's paper concludes with a short account of the principal forms of the self-registering and self-recording thermometers.

## Workshop Notes.

**TO PART LEAD FROM GOLD.**—As lead melts at 617° F. and gold at 2,000° F., melting the lead and removing the gold would be the simple method for you to adopt for separating the two metals.

**TO BEND GLASS TUBES.**—Fill the tubes with finely-sifted sand, close both ends, and heat it over the flame of a Bunsen burner. It may thus be easily bent, without losing its roundness at the elbow.

**TO REMOVE GOLD.**—Gold is taken from the surface of silver by spreading over it a paste made of pulverized sal ammoniac with aquafortis, and heating it till the matter smokes and is nearly dry, when the gold may be separated by rubbing it with a scratch-brush.

**CLEANING GILT SURFACES.**—Gilt metallic surfaces are best cleaned with a solution of 30 grams (19 dwts. 7 grains) borax and 1 kilogram (32 ounces 3 dwts.) water; rub them gently with it, rinse with cold water, and dry with a soft linen cloth. Picture frames only bear pure water.

**TO CLEAN BRASS.**—The method prescribed for cleaning brass, and in use in all the U. S. arsenals, is claimed to be the best in the world. The plan is to make a mixture of one part common nitric acid and one-half part sulphuric acid in a stone jar, having also ready a pail of fresh water and a box of sawdust. The articles to be treated are dipped into the acid, then thrown into the water, and finally rubbed with sawdust. This immediately changes them into a brilliant color. If the brass has become greasy, it is first dipped in a strong solution of potash and soda in warm water; this cuts the grease, so that the acid has full power to act.

**SOFT-SOLDERING ARTICLES.**—Moisten the parts to be united with soldering fluid, then, having joined them together, lay a small piece of solder upon the joint, and hold over the lamp, or direct the blaze upon it with your blow-pipe, until fusion is apparent. Withdraw them from the blaze immediately, as too much heat will render the solder brittle and unsatisfactory. When the parts to be joined can be made to spring or press against each other, it is best to place a thin piece of solder between them before exposing to the lamp. When two smooth surfaces are to be soldered one upon the other, you may make an excellent job by moistening them with the fluid, and then having placed a sheet of tin-foil between them, holding them pressed together over your lamp till the foil melts. If the surfaces fit nicely, a joint may be made in this manner so close as almost to be imperceptible. The bright-looking lead, which comes as a lining of tea boxes, is better than tin-foil.

**ACID-COLORING SOLID GOLD.**—Saltpeter, 2 parts; salt, 1 part; muriatic acid, 1 part. Put saltpeter and salt into the coloring pot, and heat it without water, then add hot water sufficient to produce a thick paste, let it boil, add the muriatic acid and stir it up well. As soon as the brown vapor arises, plunge in the work quickly, being careful to submerge it completely (since the vapor will affect the work if exposed to it). Let the work boil over a quick and lively fire (and preserve it during the whole process) for about three minutes, stirring it about constantly, taking care not to let any part of it come to the surface of the liquid. Then rinse the work in a light pickle, and thereupon plunge it into hot water. Quick and careful handling in dipping in and taking out the work is important. This done, the acid color should be thinned by adding hot water, or one-half old color, which is preferable. Submerge the work again, let it boil two minutes, and should some pieces require it, such should boil one minute longer. Now boil the work in a pickle, two thimblefuls of muriatic acid to one gallon of water, then again in a pickle containing only a few drops of acid, then dry off the work carefully in hot sawdust. Remember that work not properly dried will draw spots.

**CLEANSING MAT GOLD.**—Take 80 grams chloride of lime, 80 gr. of bi-carbonate of soda, and 20 gr. table salt; pour over this about 3 liters distilled water, and fill in bottles, to be kept well corked. For use, lay the dirty articles into a dish, pour over the well shaken fluid, let it submerge them, leave them in it for a short time, and in extra cases when very dirty warm them a little. Next wash the articles, rinse them in alcohol, dry them in sawdust, and they will appear like new. The fluid is of no further use.

**TO PERFORATE GLASS.**—To perforate glass by electricity, Fayes (*Chemiker Zeitung*) makes a sheet of hard India rubber, 18 centimeters long and 12 cm. broad, for a battery of 12 cm. spark, runs a brass wire through it, and fastens it with a screw. The wire end he moistens by a few drops of olive oil, places the glass plate upon it, and passes the current conduit of the outer pole over the glass. The spark is then permitted to pass through the glass. By drawing the glass plate slowly over the caoutchouc, many small, closely situated together, are obtained, and the glass may be broken in their direction.

**COLORING GOLD AS IN ETRUSCAN JEWELRY.**—There are various methods for coloring gold as in Etruscan jewelry; in fact, every jeweler has a method of his own. The following, however, has been successfully used for some years, and has given general satisfaction: 2½ ounces crocus, 2 ounces yellow ochre, 1½ ounces verdigris, 1½ ounces copperas, ½ ounce white vitriol, ¼ ounce borax. All these ingredients are to be reduced in a mortar to an impalpable powder and intimately mixed with 5 ounces yellow beeswax; or, 20 dwts. saltpeter, 20 dwts. common salt, 2½ dwts. copperas, 2½ dwts. white vitriol, 2½ dwts. alum. The ingredients are to be put into an old crucible, and set over the fire, and the articles to be colored boiled in it until on trial they are found to have acquired the desired color. The beautiful satin finish is given to the class of goods called Roman gold by carefully brushing the dead gold surface with a scratch-brush made from spun glass.

**ACID COLORING.**—There are two processes for coloring similar in purpose and effect; the oldest is called dry coloring, because the chemicals used are solids, namely saltpeter, alum and salt; but acid coloring has come into more general use on account of its being easier to manage and of the wider range of qualities of gold which can be submitted to the process. The purpose is simply to remove from the surface of the gold all alloy, so as to leave a coating of pure gold of rich yellow color, which is very finely frosted, to obtain which, with perfect equality, it is necessary to have the surface smooth, then anneal and boil out in pickle, made of nitric acid and water; lastly, annealing black, before dipping in the color. A good formula for coloring mixture: Saltpeter, 9 ounces 12 dwts.; salt, 4 ounces 16 dwts.; muriatic acid, 6½ ounces. The effect on the article is necessarily to reduce the weight, therefore the quicker it is done the better, and, if the gold be properly alloyed, 1½ minutes is sufficient time to expose them to the action of the mixture, which must boil up till it fills a No. 10 black lead crucible. In all acid colored work there is between the body of gold and the outside color a brown coat of partially colored material, and if the work is left too long in the mixture the coat is much thickened, and the fine color may be easily peeled off, especially if the gold be too low in quality. The finest color and best surface may be obtained on about 15-karat gold, but the range is from 12 to 20 karats, and to be successful the operator needs considerable practice. Before using a crucible it is necessary to have it well annealed, as accidents are thereby avoided. To prevent a change in the color of goods after coloring, it is well to wash them in ammonia, which will neutralize any salts that remains in the somewhat porous surface, and if the articles are scratch-brushed, which slightly brightens them, they are less liable to soil. It is best not to give the ammonia bath till after brushing, following with a good wash in hot water and drying in hot sawdust.

## Trade Gossip.

L. F. Cahn, of this city, has opened a branch office at 67 and 69 Washington street, Chicago.

I. N. Miller, of the firm of Miller Bros., has just returned from a trip to Europe very much improved in health.

Louis Neresheimer, of the firm of E. August Neresheimer & Co., sailed for Europe in the steamer *Fulda*, Sept. 10.

C. N. Thorpe, of The Keystone Watch Case Co., left for Europe during the past month. His stay abroad will be a limited one.

Mr. G. Willemin sailed for Europe in the *Canada* Sept. 24. He has been closely confined to business for several years and goes abroad for his health.

Giles, Bro. & Co., Chicago, have perfected machinery for de-magnetizing watches and tools, which, it is claimed, works to perfection—doing its work well and quickly.

Comparatively few failures occurred in the jewelry trade during the summer months, an indication that the merchants have put their business in such condition that even dull times do not bring disaster.

Moses Kahn, of the firm of L. & M. Kahn, returned from an extended trip through Europe with a well selected stock of diamonds, watches and other desirable goods purchased by him while abroad for the fall trade.

The firm of Mussina Bros., Williamsport, Pa., has been dissolved, Sylvester Mussina continuing at the old stand. Wood Mussina has formed a co-partnership with I. E. Bowers, under the firm name of I. E. Bowers & Co.

Keller & Untermeyer are circulating in the trade an elegant lithographic advertisement illustrative of their specialty, which is highly ornamented watch cases. The picture is suitably framed, and, being printed in several colors, makes a most attractive advertisement.

Buyers who have been abroad this season are now returning with liberal supplies of European novelties. They were not in the least frightened by the cholera nor intimidated by the war in Egypt, neither did the French complications in China disturb their equanimity.

A plaque has been patented by Stella A. Jackson, of New York city. It is of glass, with a transparent spot in the center on which to mount a picture, the remainder of the plaque being frosted or made in imitation of porcelain by grinding, or by grinding and painting.

The trade is warned against an alleged watchmaker who goes by the name of Harry Hirsch. He has been operating in the interior of this State, claiming to have worked in Switzerland and England. He has an impediment in his speech, and has victimized a number of dealers by various petty tricks.

The collar button lately patented by Messrs. Krementz & Co., is claimed to have unusual strength in consequence of its being made from a single piece of gold without solder. The illustration given in their advertisement conveys an excellent idea of this new device, which promises to become popular.

Frank Aenzen, a clerk for Black, Starr & Frost, jewelers, at Fifth avenue and Twenty-eighth street, was held for examination recently in the Jefferson Market Police Court. When arrested pawn-tickets representing twenty gold watches were found on him. He had obtained over \$1,000 on the watches.

Louis Seyforth, an alleged watchmaker, recently went from this city to Utica, where he entered the employment of P. Taylor. He worked a short time and finally decamped with several hundred dollars worth of diamonds and watches belonging to Mr. Taylor. He was subsequently arrested in Canada.

Mr. Martin Marcus, of J. Emrich, returned from an extended trip abroad, Sept. 15th. While in Europe Mr. M. perfected arrangements to manufacture their own garnet jewelry in Prague. He brought out many novelties for the holiday season, among which are tiger claws mounted which are now so popular in Europe.

C. C. Offerman, for many years traveling salesman for L. A. Kotzow & Co., and for the past two years with Martin Copeland & Co., has severed his connection with the latter house and made an engagement with William Smith & Co., whose chains he will exhibit on the road hereafter. He is well known in the trade and makes friends wherever he goes.

A. & J. Plaut, of Cincinnati, carry a complete line of American movements and cases, and are prepared to fill orders on short notice. They also have in stock all the latest novelties and attractive goods in the jewelry line. This firm makes a specialty of emblems for fraternal and trade organizations, and make to order anything that may be desired of this nature, or in the way of prizes and trophies.

F. Krober is introducing some novelties in clocks for the holidays. There are many elegant designs in plush velvet, and ornamental cases of every description in a great variety of forms, including ink stands, toilette sets, etc., suitable for Christmas presents. The demand for ornamental goods, combining utility with artistic designs, is growing every year, and enterprising manufacturers spare no effort to keep pace with it.

At the New Jersey State Fair a few weeks ago, the crowd was thoroughly "worked" by industrious pickpockets, and, as a consequence, the loss of a large number of watches and chains, diamond pins and other articles of personal adornment was reported. There seems to be an organized gang of pickpockets that go about from one fair to another seeking victims. Local papers should warn the public to look out for them.

The importation of diamonds for the American market has been quite large this season, the buyers for American houses have scoured Europe in search of desirable goods in this line. Some of the settings this year are very attractive, combining artistic designs with fine, delicate workmanship that produce most desirable effects. Buyers this fall have splendid assortments of diamond goods from which to make their selections.

J. T. Scott & Co., agents in this country for the Roskopf Watch and Triumph-Roskopf, keep also a full line of American movements and cases, as well as a complete stock of desirable goods of all kinds. They keep up with the times in all novelties produced by the manufacturers. Their facilities for transacting business were greatly improved by their change of quarters this spring, and all orders are filled with the utmost promptness.

O. Johanson has devised a novel charm made from coin of the realm or any other realm. He splits the coin and then pivots them together with an invisible pivot; a portion of the metal inside is removed, making a receptacle for a portrait. Just now these are being utilized for campaign purposes, the candidates of either party being carried in miniature inside a ten cent piece or a quarter of a dollar. When closed the charm looks like an ordinary coin.

Lincoln, Bacon & Co. have just obtained a patent for an adjustable slide clasp for their roller chain gold bracelets. The trouble with the slide fastenings generally used for such bracelets is that they wear the edges of the chain. By the new device the chain is clasped tightly in an adjustable clasp, by means of which the bracelet can be lengthened or shortened to fit any arm. The clasp is variously ornamented and makes a handsome and desirable finish for the bracelet. It is entirely new, and has already given evidence that it will become popular.

The Chicago papers announce the failure of Henry G. Moorhead a jeweler doing business at No. 211 Madison street, for about \$1,720. He made an assignment for the benefit of his creditors to Joseph D. Hubbard, and soon after confessions of judgment were entered against him in the Superior Court in favor of Charlotte M. Moorhead for \$1,126; Alice Brown, \$429; and John Moorhead, \$165. According to the schedule filed by Moorhead his liabilities amount to \$6,070, while his assets, consisting of stock and book accounts, are valued at \$5,600.

Peripatetic peddlers of campaign medals, presenting the pictures of the various Presidential candidates, are to be met with on every corner, in the street cars and on the ferryboats. They are made by the million, sold at a low price, and the wonder is what becomes of them all. The various news companies have been handling them extensively this year, sending them in quantities to every newsdealer in the land. It is seldom anyone is seen wearing them in the street, so it is presumed that they appear principally in processions and "wigwam" meetings.

On October 1, Mr. Gustave Walter retired from the firm of Albert Berger & Co., with which he has been prominently identified for twenty years. "Gus," as he is familiarly called, entered the house of Albert Berger & Co. in 1864 as a clerk, was promoted to manager of the business and finally was admitted to partnership, continuing as business manager. His retirement is in consequence of new business arrangements he has in contemplation, of which the trade will be duly advised through these columns. He will take with him the best wishes of the trade in whatever line of business he may engage.

The show windows of the jewelers have, for the past few weeks, been a great source of attraction to passers-by. They are filled with new and attractive goods of every variety, rich in material and workmanship. Retail dealers report an increasing demand for gold goods for ladies' wear, these articles of personal adornment being once more in fashion. Novel designs in pins, ear rings, bracelets, etc., are to be met with on every hand, and it is not surprising that the ladies are captivated by them.

Mr. George F. Kunz, with Tiffany & Co., whose contributions upon various precious stones have appeared in THE CIRCULAR, is preparing a monograph on the American pearl. He proposes to give its history, describe where it is found and its peculiarities, whether due to locality or other causes; also to give estimates as to the production and value of those secured. Any person in possession of information on the subject will confer a favor on Mr. Kunz by forwarding it to him as early as possible.

An Atlanta paper contains a lengthy description of the jewelry establishment of J. P. Stevens & Co., of that city. It occupies four floors, the first and second as salesrooms, the third as jewelry factory and the fourth as watch factory. Every modern appliance is employed for facilitating operations in their business, and the most perfect system used in each department. The paper speaks in highly complimentary terms of the enterprise of the firm that has succeeded in building up so important an industry in the south.

Among the interested visitors to the Electrical Exhibition at Philadelphia, we noted the names of a number of gentlemen who have achieved distinction in the science of horology. Their studies have, naturally, led them to experimenting more or less with electric forces, and more than one of them has attained rank among the prominent electricians of the day. Our old friend and well known contributor "Excelsior" is one of these. He has already obtained several patents for electrical inventions of utility, and is pushing experiments with others with unflagging application. Professor Leonard Waldo, of the Yale Observatory, who is also a familiar contributor to the columns of THE CIRCULAR, is also well up in electrical science, and was chosen on some of the Committees of Awards at the Exhibition. Electricity will, in the future, play a more important part in horology and kindred sciences than it has heretofore.

The fifty-third exhibition of the American Institute opened Sept. 24, and will continue open until Nov. 29, and possibly longer. These exhibitions are doing magnificent work for manufacturers and merchants, affording them an opportunity to bring their goods before the eyes of thousands of interested persons. The manufacturers and merchants of New York are becoming alive to the fact that the energies of rival cities are attracting wholesale and retail trade to them. Chicago, Cincinnati, St. Louis, Louisville, Boston, Philadelphia and New Orleans have each done more by their respective exhibitions to secure enlarged trade than has been attempted by New York citizens. The managers of the American Institute Fair have during half a century offered to New York citizens the opportunity of taking the lead in all things pertaining to the methods and merits of annual expositions. They have encouraged American inventors, stimulated improvements in American manufactures, and afforded instruction to hundreds of thousands whose eyes and brains have been educated by the fifty-two expositions of human progress which have been held under their auspices. These exhibitions should be more generally utilized by the trade in this city.

The firm of Wm. Kendrick's Sons, Louisville, were recently swindled out of a pair of diamond ear rings valued at \$1,500, by the same means recently employed to defraud dealers in St. Paul and other western cities. A young man entered the store and introduced himself as Wm. Larr, Jr., a member of a distilling firm in good standing at Lexington. He looked at clocks, diamonds, etc., and left, saying he would order when he reached home. A day or two later a letter was received by the jewelers, written on a beautiful lithographed letterhead of the distilling firm, enclosing its check in payment of a clock. Soon after the young man appeared, inquired if his letter had been received, and again took a look at the diamonds. He finally decided to take the ear rings, provided the firm would accept a draft on his house in Lexington. This was agreed to, the jewelers having ascertained that the distilling firm was in good financial standing, and the diamonds were delivered. It soon got noised about that the young man had been buying furniture and other goods in the same way, and a telegram to Lexington brought the information that there was no such person as Wm. Larr, Jr. Meantime the imposter had left and no trace of him has been discovered. Moral—transactions with strangers should be on a cash basis.

J. T. Bonestell, of the firm of Levison Bros., of San Francisco, was in the city during the past month, on his annual pilgrimage to the city of ideas and business enterprise. The genial manners of Mr. Bonestell are well known to the trade, and he is as popular as he well can be. Of course, he was eagerly sought for by those having new styles of goods, for he is known to be a liberal but discriminating buyer. After business hours, and when every store and office was closed, Mr. Bonestell recreated at Coney Island, Long Branch and other watering places where youth and beauty congregate. He was entirely at home in such society, and after an evening at the seaside felt sufficiently recuperated to continue his business next day. He lost no time while here, either in his business transactions or in the enjoyment of the social side of New York life. Mr. Herman Levison, who has just returned from Europe after three years' absence, joined Mr. Bonestell in this city, and they returned together to San Francisco. Mr. L. was much improved in health by his trip abroad.

The following we clip from a Chicago paper, which shows that Chicago lawyers at least are very wide awake: The Chicago creditors of the collapsed jewelry firm of S. Friedman & Co., who failed recently, are said to be secure in their claims against the firm at all events, owing to the clever ruse of Jacob Newman, one of the attorneys. Friedman had a large clothing house at Minneapolis, and early Saturday morning Mr. Newman started for St. Paul, while his partner, Mr. Moses, entered the confessions of judgment here and prepared for a levy. At 10 o'clock Monday morning, Mr. Newman had engaged 60 men and 20 American Express wagons in St. Paul, and with them proceeded to Friedman's store, of which he had the key. In about an hour he had loaded up all of the \$40,000 worth of stock, and transferred it to a special train of three freight cars and a caboose of the Rock Island road, chartered at a cost of \$1,500. The engineer was directed to run to Chicago at the rate of 45 miles an hour, stopping at no county seats. At 6.30 this morning the train arrived at Blue Island, just inside the county line, when Mr. Newman found Deputy Sheriff Burke waiting to levy on the goods. It was a sharp trick.

The Tenth Annual Meeting of the New York Jewelers' Association was held at their rooms, 692 Broadway, on Tuesday, Sept. 9. The following officers were elected: Wm. R. Alling, President; Geo. C. White, Jr., Vice-President; A. K. Sloan, Treasurer. The Executive Committee re-appointed H. Olmstead, Secretary, a position he has occupied since April, 1878. The Executive Committee consists of the following named gentlemen: F. S. Douglas, Alfred H. Smith, E. Holbrook, C. H. Brahe, D. F. Appleton. The Finance Committee is: C. G. Lewis, J. A. Riley, L. L. Woolley, D. C. Dodd, Jr., B. K. Knapp. Membership Committee: F. H. Richardson, J. C. Aikin, W. S. Hedges, J. D. Lyon, J. G. Bacon. The Committee appointed to prepare a letter of condolence to be presented to the widow of the late D. H. Hopkinson, reported having sent the following:

NEW YORK, September, 3d, 1884.

*Dear Madam:*—By request of the members of the New York Jewelers' Association, at their annual meeting held September 2d, 1884, we beg leave to express to you their heartfelt sorrow and sympathy in this, the hour of your supreme affliction.

Mr. Hopkinson, although not a member of our association, was well known and highly esteemed by us all.

It was the privilege of some of our members to be on close personal and social intimacy with your late husband. To them his death will leave behind it a more poignant sorrow, but all of us will mourn his loss, and remember those gentle ways and kindly manners that made him so many friends.

In the prime of life, in the vigor of his early manhood, with, as it would seem, a long life of happiness and usefulness before him, with his life work well laid out yet hardly commenced, "God's finger touched him and he slept."

We are taught to believe and we do know, that sorrow like yours sooner or later must come to all, and is ordered for the best by Him who guideth all things, and "not even a sparrow falleth to the ground without His knowledge," so may our Heavenly Father be your constant companion and friend, direct you in all your ways, shed light upon your pathway in life, and as you bear the cross so shall you wear the crown, and gain "the golden key that opens the palace of eternity."

With our kind personal regards, we remain, dear madam,

Truly your friends,

THOMAS G. BROWN,  
A. K. SLOAN.

THE  
JEWELERS' CIRCULAR AND HOROLOGICAL REVIEW

*The recognized organ of the Trade, and the official representative of the  
Jewelers' League.*

A Monthly Journal devoted to the interests of Watchmakers, Jewelers, Silversmiths, Electro-plate Manufacturers, and those engaged in the kindred branches of art industry.

SUBSCRIPTION:

To All Parts of the United States and Canada,

**\$2.00 Per Annum; Postage paid.**

To Great Britain, France, Switzerland, Germany, the West Indies, Mexico, the Republics of South America, and Australia, \$3.00 per annum. Postage paid.

All communications should be addressed to SETH W. HALE, President, THE JEWELERS' CIRCULAR PUBLISHING CO., 42 Nassau Street, New York.

Advertising rates made known on application.

The Business Outlook Improving.

AS THIS number of THE CIRCULAR meets the eye of the reader the presidential campaign will be virtually closed. Election day is at hand, and the winner of the prize for which the two great political parties of the country have been contending for months will be awarded to one or other of the contestants. It will be a great relief to every one when the result is definitely announced, for this has been one of the most disreputable presidential contests ever known. From its earliest stages it has been characterized by disgraceful scandals and personal abuse of candidates and their adherents to an extent seldom equaled. The result of such a contest is to excite violent partisanship, and to gradually draw into the political maelstrom all classes of citizens, to unsettle business of all kinds and to produce a feeling of unrest and uncertainty. While this is always the case in a presidential election year, it has been especially so on this occasion because of the bitterness evoked by the personal nature of the contest, to which was added the disheartening effects of the Wall street failures early in the season.

But during all the excitement of the political campaign, and the dullness that pervaded all branches of business, there has been the utmost confidence that the fall trade would be all the better for the summer's stagnation; that when the election should be over business would resume activity, and business men would be all the more

energetic and all the more determined to take advantage of the favorable conditions that pervade the country. In our issue for October we alluded to the anomaly presented by the situation at that time, the crops having yielded abundant harvests, but business being dull because prices were so low that producers would not sell their crops, while money was abundant and buyers anxious to purchase. We predicted that this deadlock would soon be broken and that the crops would begin to move, stimulating business enterprise in all directions. Our prediction bids fair to be realized even sooner than we expected, for early in October there was a marked advance in the price of some of our agricultural products, corn, for instance, going up several cents a bushel in the Chicago market; wheat also had an upward tendency, as did most other staples. The effect was to bring out the harvests, and to put money into circulation. All kinds of trade felt the improvement, and toward the latter part of the month transactions in the principal trade centers became quite lively. The jewelry trade caught its fair share of the new impetus thus given to business, buyers were more numerous and a better feeling generally prevailed. There were many representatives of the trade in New York from all sections of the country, and their unanimously expressed opinion was that when the election was fairly over there would be a marked improvement in trade, and that the volume of business transacted between now and the holidays would compare favorably with that of any one of the previous five years. We observe, too, that this opinion regarding improvement in business after election is shared in by those journals especially devoted to the commercial interests of the country, and these give statistics showing the abundance of the harvest and the favorable conditions for trade that exist in the country. They attribute the dullness of the summer trade to the election excitement, but show that in previous presidential years the business of the summer and early fall was light, but was fully compensated for by the increased activity after election. This they think will be the case this year.

To sum up—the situation is decidedly more promising than it was a month ago; the political campaign is near its close; the deadlock that existed between the producers of our agricultural wealth and those who handle it have been partly, if not entirely broken by an advance in prices that has induced farmers to sell a portion of their crops, and grain is now coming forward liberally; money that has been lying idle in the banks is finding its way into circulation, and everybody is feeling better and richer in consequence. In reply to the salutation with which we greet everybody, "how's trade," we now receive the reply almost universally, "picking up," instead of the doleful announcement that it is "dead" that has greeted us for a few months past. We note, too, an increase in the number of express wagons that visit Maiden Lane and vicinity daily, collecting packages from the trade for shipment to fill orders from the country, which is the best evidence we can have that the retail dealers are reaping the benefit of the increased circulation of money, and are giving the jobbers an opportunity to share their good fortune. The indications now are that November and December will be excellent

months for the trade, and that the transactions between now and Christmas will tend greatly to bring up the average of the year's business to that of previous years.

### Diversity of Interests in the Trade.

THE JEWELRY trade may properly be divided into three distinct classes—manufacturers, jobbers and retail dealers. According to tradition, the lines of demarkation between these classes were formerly broad and distinct, each confining itself within the limitations fixed by custom, and not seeking to invade the province of the others. But customs change, and the complaint is now general that the barriers that once sufficed to keep these classes of trade apart are now being broken down and trodden under foot. The legitimate function of the manufacturer is to produce such goods as the market requires; of the jobber, to receive these goods in bulk and distribute them among the thousands of retail dealers; and of the latter, to sell them directly to the consumer. Each class is necessary to the other, and its operations do not necessarily conflict with its fellows. Manufacturers cannot readily reach all of the thousands of retail dealers located in all sections of the country; if they could, they could not afford to go into all the details necessary to conducting a limited amount of business with each. The intervention of the jobbers is, therefore, a necessity. These are located in the various commercial cities, and come in direct contact with the retail trade that is tributary to such cities. Catering to a limited extent of country, each jobber can supply the retail trade within his district with comparatively little trouble, and each constitutes in effect a branch house for the manufacturer. The retail dealer is in closer communion with the jobber located in his vicinity than he can hope to be with the distant manufacturer; his trade is sought by the jobber, and from him he can order goods when he wants them with a certainty of receiving them promptly and in such quantities as he may require. The jobber being near at hand, he relieves the retail dealer of the necessity of carrying a large stock of goods, which might go out of style before he could sell them, and affords him an opportunity to keep himself supplied with the freshest goods and the latest novelties. He is thus in position to suit the wants of his customers with alacrity, and, what is greatly to the purpose, without the employment of a large amount of capital. When these natural limitations are observed, trade runs smoothly; the manufacturer is not burdened with a multiplicity of customers and a confusion of accounts, but confines his dealings to the jobbers, who become his distributing agents, placing his goods in the hands of the great army of retailers, who are the only ones who should come in direct contact with the consumers.

But, as we have said, complaints are heard on every side that the traditionary laws of trade are being violated by each one of the three classes; the retailers complain that the jobbers seek to trade directly with the consumer; the jobbers complain that the manufacturers sell to retail dealers, and both allege that manufacturers also cultivate too intimate relations with the customers who should be the patrons of the retail dealers; the manufacturers complain—well, their complaint is a general one, and relates to the unbusinesslike habits of the trade in general and the jobbers in particular. Efforts have been made by the different interests mentioned to rectify the abuses of which they complain; the retailers have undertaken to proscribe the jobbers who sell to consumers, and the jobbers have threatened to have no dealings with the manufacturers who supply retail dealers without their intervention. Still another complaint charges jobbers and manufacturers alike with selling goods to merchants who are not in the trade, thus inducing them to enter into competition with the retailers for the patronage of the consumers.

That these complaints are founded in fact, every one familiar with existing business conditions can testify. When an evil exists it is

best to acknowledge it, seek for its cause, and try to discover a remedy. The primary cause of the troubles referred to, as well as many others, is undue competition. The business, in all its branches, is overdone; like "gold diggings" that have yielded profitably, it swarms with "prospectors," who delve in every crevice, wash down every embankment, crowd and jostle each other upon every stream, till the yield of profit is so diffused among the many who claim a share of it that none are satisfied, while many are driven to desperate means to maintain themselves. As the consumption of goods produced by manufacturers is limited, and the number of producers too great, the competition among them to dispose of their goods leads to the adoption of unbusinesslike methods to accomplish the object. They overstock the jobber if possible, and then some of them seek the retailers who should be the patrons of the jobber. The jobber, in turn, stocks up the retailer, and then undermines him in his own locality by stealing his retail trade away from him. Competition, too, induces the manufacturer and jobber to sell to the outside merchants, and thus competition begets competition, to the injury of all interested. This excessive competition can only be cured by restricting the credit system, which, in the jewelry trade, has long since passed the bounds of prudence. It requires so little capital to obtain a large credit in the trade that every Tom, Dick and Harry is inclined to set up as a jeweler, regardless of his business qualifications. He has everything to gain and nothing to lose, for if he fails his creditors will compromise for a few cents on the dollar and give him credit for more goods with which to make a fresh start. He thus comes into the market with a stock of goods that has cost him little or nothing, and is able to undersell his competitors, who are expected to pay dollar for dollar. If credits in the trade were subjected to reasonable restrictions there would be far less ruinous competition.

As to restoring trade to the traditionary channels, it is doubtful if that can ever be done. Like the Mississippi river in a heavy freshet, under the stimulus of excessive competition trade has broken down the barriers, and will continue to flow through the courses it has made for itself. In this it is governed by the immutable laws of supply and demand. These provide that every man shall do the best he legitimately and honorably can for himself, and if he can make more money by ignoring the customs of his particular industry, he is going to laugh at custom and go for the dollars every time. The motto of most business men is "quick sales and small profits," and with most of them the quick sales is a matter of necessity, owing to their limited capital. To make money they must turn their capital over as often as possible, buying and selling as rapidly as opportunity can be made. To do this the manufacturer is tempted to reach out beyond the jobber, and the jobber to compete with the retailer, while the prudent public is always going to buy where it can buy cheapest. If the manufacturer can realize cash for his products sooner by selling to a drygoods merchant than he can by selling to the jewelry trade, he will sell to him regardless of the protests of the trade. He would, no doubt, prefer to keep within the trade, but if outsiders treat him better than the trade does his preferences will give way to his desire for ready cash. So it is with the jobber—wherever he can realize a dollar the quickest there he is going for it, whether it be in the store of a gents' furnishing goods merchant, the study of a clergyman or the office of a lawyer. And these individuals will buy of him in preference to patronizing the retail dealer if they can save anything by doing so, precisely as the jeweler will buy his boots of a drygoods merchant in preference to the boot and shoe dealer if he can get them at a less price. Sentiment and tradition have nothing to do with business; dollars and cents have the innings and will make the score every time.

It is useless to kick against the pricks or to quarrel with accomplished facts. The trade itself is responsible for the evils that afflict it. It has encouraged a credit system that has long been a burden and a reproach to it; it has fostered illegitimate competition till competition has turned to rend it; it has pitted class against class

and individuals against each other; in the effort to counteract these evils it has sacrificed something of its old-time honor by debasing quality to save cost; it has substituted in its practices the illegitimate for the legitimate. No one class is more responsible for this than another; the retailer, by demanding extended credit and unusual privileges, has exhausted the patience of the jobber; the jobber, by similar methods, has antagonized the manufacturer, and the latter, by ignoring custom, has offended both the other classes. The evils complained of may be lightened, but their entire eradication, if ever accomplished, will be a work of time. As a beginning of the work of reform, the entire credit system should be revised, so that a person engaged in the business shall furnish at least a portion of the capital he works on and not rely entirely upon the creditor class for it. This would reduce competition decidedly and be a very great encouragement to that large and honorable class of merchants whose ambition it is to pay dollar for dollar. The retailers should aim to become better merchants, to supply each his market with such goods as sell readily, to diversify his stock accordingly, to buy on short time and meet his obligations promptly. When he treats the jobber as well as outsiders do, the jobber will be able to deal in a more businesslike manner with the manufacturer, and all will be less inclined to cut each others' throats. Each class has its rights as well as its grievances, and while the latter are so freely ventilated the former should be respected.

In this connection we desire to say that it is and always has been the purpose of THE CIRCULAR to represent every branch of the jewelry trade. It has no particular interests to serve, but seeks the good of the trade in general. To this end our columns are always open to correspondents to discuss any phase of the business, within reasonable editorial restrictions, and we cordially invite communications as well on the mercantile as the technical features of the business. Manufacturers, jobbers, retail merchants and all others interested are invited to a free expression of opinion in our columns.

---

### Free Trade and Protection.

THIS IS A question that interests every laboring man in this country, whether he follows the plow or works at the bench making watches or repairing jewelry. It is simply the question whether the laws of this country shall be made to protect him in the fruits of his industry, or whether he shall be placed in direct competition with the pauper labor of Europe. As this is now one of the great political questions of the day, and as Congress will be asked this winter to modify the tariff on imported goods, every man should be prepared to discuss the subject intelligently, and to use his influence to secure proper and reasonable protection to American industry. Mr. Robert P. Potter recently delivered an interesting lecture in Boston entitled "Protection and Free Trade To-day," which has since been published in pamphlet form by James R. Osgood & Co. of that city. We extract from it as follows:

"The abandonment of protection will in no way help the farmer, as the free-traders claim. It will stop immigration, and hence lessen the ever-increasing demand for food at home, while it will leave him in a much worse position than he now is in, in the matter of Indian and Russian competition. In the words of Judge Kelley, of Pennsylvania:

"The primary want of the American farmer is a quick, remunerative home market. When our mills, forges, furnaces and factories were busy and our operatives were well paid, we consumed nine-tenths of all the cereals we could grow; but with idleness prevailing in industrial centers, with the reduction of wages and the power to consume, and with great branches of industry expelled from the country, we cannot look to an increase in the home demand or the maintenance of past prices."

"How does this question affect the men and women engaged in

manufacturing, mechanical and mining industries and transportation in the United States? The time has come for this army of 4,400,000 persons to examine free trade and protection for themselves. Our imported manufactured goods come chiefly from Great Britain, France, Germany, Austria, Italy, Spain, Portugal, Belgium, Holland and Scandinavia. In these countries over 31,000,000 men and women are engaged in manufacturing and mining pursuits. The average annual income of these millions is less than \$4 a week, or \$200 a year. Unless they emigrate to the United States, they have no hope to rise from the condition to which they were born.

"The official returns of these countries bring out the astonishing fact that over 8,000,000 persons, a number exceeding one-fourth of the industrial population, are returned as paupers, and that annually the taxpayers, already burdened with the immense cost of imperial armies, have to pay the enormous sum of \$150,000,000 to prevent these people from dying of starvation. Of this amount of free trade Great Britain alone contributes over one-third, or \$50,200,000. So terrible has the fight for existence become in these countries, that every year thousands who can scrape together a few dollars leave their homes in the old world and cast their lot with us on this side of the Atlantic. From the British Isles alone during the last ten years have come 1,333,247, and from the other nations of Europe 2,359,468, making a total of 3,892,715, equaling almost, in point of number, the population of Holland. With the same environments, with the same institutions to bring out their higher manhood, the citizens of the republic extend a welcome hand to this tremendous army of emigrants.

"But we are not ready to extend this same privilege of competition to those who still remain in other nations; to men who are living in different surroundings, who have not been educated up to the plane of the American workman, but who are content to slave on through life as their ancestors have done before them; who are chained to the forge, the mine, the loom and the despotic ruler, without hope and without future. Yet this is what free trade, or the de-nationalization of the United States, demands of the American workmen. To support this demand the workingman is made the victim of the most extravagant statements; he is told that the purchasing power of his wages will increase the moment he begins to compete even-handed with the 30,000,000 poorly paid workers of Europe. He is told the 'pauper labor cry' is a myth, and yet before him troops the gaunt host of 8,000,000 men and women dependent on charity. With wages varying from 50 to 150 per cent. higher in the United States than in Europe, the workingman pays less for his necessaries of life.

"Our experience vindicates the policy of protection; its strength lies in the prosperity it has given the nation; in the great industrial cities it has built up; in the prosperous and diversified industries it has founded; in the profitable home market it has given our farmers; in the varied employment it has given the men and youths of the country; in the homes and profitable work it has offered our kin beyond the sea.

"The cause of protection is the people's cause; it affects the vast masses of the people, and they must and will understand it. It cannot alone be studied in the lecture room. It can be studied in the light of the experiences of other nations, and in the experience of our own country.

"I cannot do better than quote from Mr. Ellis Robert's recent lectures before Cornell University, as he makes this point remarkably clear. He said: 'Beef, pork and poultry are cheaper with us, and so, the country through, are tea, coffee, and even sugar at retail. The Liverpool market fixes the price, not of grain in general, as is often said, but of our surplus. Our own price determines whether there will be any surplus or not. The American buys his cotton fabrics as cheaply as anybody. Anything made of wood which is higher here than elsewhere must be a curiosity or something which takes value from age. We are constantly exporting leather and many of its products. In many of the products of iron we excel

other nations, and in steel we are at the forefront. In iron our progress is the most rapid. Many of our tools are cheaper than the English. Tea and coffee are sold in this country cheaper than anywhere in Europe, and certainly much more so than under the heavy British duties. Sugar pays a very high duty in the United States, and yet such are the facilities for refining here that our retail prices are as low as those of Britain. At an equal distance from the mines coal is sold as cheaply in this country as in Britain. The most careful study will prove that all articles of prime necessity, including food in the essential varieties and the comforts of life, are cheaper here, not only in their relation to wages, but in money, than in any other country.

"When a family starts to set up a home in this country, it will find that for furniture and cutlery and the miscellaneous articles necessary, it will be charged as low rates as in any part of Britain or Europe. Plain pottery is as cheap, glassware twenty per cent. cheaper, coarse carpets and blankets are as cheap here as elsewhere. A like equipment for a house is to be bought for as little here as in Britain. The savings here on food will pay for the small share of the earnings appropriated to silks and woollens, of which the prices are higher. Rent is not more here than in Britain or Europe under like conditions, though our people demand better accommodation and naturally have to pay for it. Our studies show that for three-fourths of the usual expenditures of a family, the prices are in favor of the United States. The money cost is actually less here than in the land of lower wages, and with like comforts the expense is, on the whole, lower in this country. Even the exceptional articles tend downward in the United States as nowhere else."

#### AVERAGE WAGES HERE AND IN GREAT BRITAIN.

"Below I print what Mr. Carroll D. Wright, of the Bureau of Statistics of Massachusetts, calls the general average weekly wages paid to all employees in Massachusetts and Great Britain in 1883:

| INDUSTRIES.  | GENERAL AVERAGE WEEKLY WAGES PAID TO ALL EMPLOYEES. |               |
|--|---|---------------|
|  | Massachusetts.                                      | Gt. Britain.* |
| Agricultural implements.....                                   | \$10.25   | \$8.85        |
| Artisans' tools.....   | 11.80   | 4.89          |
| Boots and shoes.....   | 11.63   | 4.37          |
| Brick.....   | 8.63  | 4.16          |
| Building trades.....   | 14.99   | 7.21          |
| Carpetings.....  | 6.08  | 4.11          |
| Carriages and wagons.....                                      | 13.80   | 4.89          |
| Clothing.....  | 10.01   | 6.71          |
| Cotton goods.....  | 6.45  | 4.66          |
| Flax and jute goods.....                                       | 6.46  | 2.84          |
| Food preparations.....   | 9.81  | 2.72          |
| Furniture.....   | 11.04   | 7.96          |
| Glass.....   | 12.28   | 6.94          |
| Hats—fur, wool and silk.....                                   | 11.01   | 5.51          |
| Hosiery.....   | 6.49  | 4.67          |
| Liquors—malt and distilled.....                                | 12.87   | 12.66         |
| Machines and machinery.....                                    | 11.75   | 6.93          |
| Metals and metallic goods.....                                 | 11.25   | 7.40          |
| Printing and publishing.....                                   | 11.37   | 5.52          |
| Printing, dyeing, bleaching and finishing cotton textiles..... | 8.67  | 4.94          |
| Stone.....   | 14.39   | 8.58          |
| Wooden goods.....  | 12.19   | 5.67          |
| Woolen goods.....  | 6.90  | 4.86          |
| Worsted goods.....   | 7.32  | 3.60          |
| All industries.....  | \$10.31   | \$5.86        |

\* "Average" instead of "high" wages rate for Great Britain.

the wages in Massachusetts thus being nearly double the average weekly wages paid in the same industries and to the same class of employees in Great Britain."

#### Dry Rot in Business.

IT IS AN old saying that he who does not go forward goes backward, and, in this age of progress and enterprise, the saying is particularly applicable to business houses. The age is a progressive one, and he who would be successful must keep pace with it. Business methods are constantly changing, new ideas are introduced and enterprise takes on new forms frequently. It does not do to stand still or seek to rest on the laurels acquired in former years. The youth and energy of the country are alive and pushing, eagerly seeking business opportunities, and they are sure to crowd in wherever they see any indication of a willingness to falter in the race for business. The course is "free for all," and those possessed of the most aggressive and staying qualities will win the prize.

There are houses in the jewelry trade from which the spirit of enterprise seems to have departed. The names at the head of them are widely known and highly honored; in years past the men themselves were representatives of the energy and activity for which the jewelry trade is noted; every avenue of trade was canvassed by them, and no opportunity was lost for making custom and swelling the volume of business; they were keen, active, wide awake and fully alive to the requirements of the business. But, as age crept over them, and they found themselves fairly supplied with this world's goods, they began to take life easier, to be less energetic, and to consult their ease and comfort more, trusting to the reputations they had established to keep up their prestige and maintain their standing in the trade. In short, dry rot has seized upon them and is sapping the foundations of their reputations and their business. Younger blood has entered the lists against them, and is crowding them to the wall, as they, in their younger days, crowded out the "old fogies" who preceded them. They are virtually laid upon the shelf, and have little influence upon the tides of business as they ebb and flow past them. Many a firm which, in the early days of THE CIRCULAR, was the pride of the trade, has yielded to the ravages of dry rot, and their places are now filled by younger and more vigorous men. Others still exist, but the work of decay is plainly visible and the inevitable is near at hand. Still other respected firms have saved themselves from this fate by a transfusion of blood, admitting to partnership the young and faithful men who have served them long and honorably. The venerated names of the founders of the business are retained as a trade mark as it were, but the business itself is in the hands of the younger men, whose energy is of the present generation and in keeping with the progressive spirit of the times. We know of a number of firms that have thus passed through several generations, the names of their founders being preserved in the person of a son or a grandson, the reputation acquired by the first of the name combining with the young blood of his successors to keep the house in the van of the fight for success. But those who have depended upon reputations acquired in other years and under other conditions, have lived to see their business dwindle away and to fall into the hands of more active competitors.

The only cure for dry rot is young blood—new, fresh and vigorous. The young man who has his fortune to make is worth a dozen old ones who have made the fight and *are satisfied with their achievements*. Success is a coquette, who must be wooed with vigor and pertinacity before she will surrender; nor is she content to linger long in the arms of anyone; she wants to be pursued with ardor, and gives her pursuer no time for rest or idleness; the moment he begins to express contentment with his achievements she flits away to one more ardent in his devotions. Although coy, she may be easily won, but will not come for simply calling.

"It will be seen from this table that the average wages to all employees for the twenty-four industries considered in Massachusetts was \$10.31 a week, while that for Great Britain is \$5.86 a week—

All of which means that the necessary elements to win success are persistent energy, intelligent activity and unslumbering enterprise. Youth possesses these qualifications to a greater degree than age, and when age finds itself falling behind in the competitive commercial race it should ally itself with youth, and thus combine youthful vigor with hard-earned experience. Let youth supply the steam and age serve as the safety valve; let youth pursue the coquettish maiden, success, while age directs him with the advice of experience. So may honored names be preserved in the trade, and houses that would otherwise crumble away with dry rot be maintained in a career of usefulness and honor from generation to generation. But he who folds his hands and bases his claims to recognition on *what he has been* rather than upon *what he is* will find himself stranded upon the shoals of neglect, while the busy tides of active commerce pass him by unnoticed. This is a progressive age, and he who halts goes back. Old fogyism and dry rot are synonymous terms in this connection, and must yield their places to youth, energy and enterprise.

for excess of baggage, and not be subjected to delays and annoyances every time they change from one road to another. These same organizations are also filing vigorous protests against the discriminating tax imposed in some States on the merchants of other States in the shape of a license fee for travelers. Such laws exist in several States, and various municipalities require travelers to take special licenses in addition to the State license. The Supreme Court of the United States has decided such laws to be unconstitutional, but the several States go on collecting the license fees just the same. It will be a good thing if the trade organizations referred to can bring about the reforms suggested. It is a matter in which the entire commercial community is interested, and the jewelry trade, that sends out so many travelers, should not be laggard in lending its influence to secure the action necessary. Many of the travelers are members of the organizations named, but the merchants themselves, who will reap the greatest benefit by the reforms proposed, should give cordial and substantial support.

### Gossip of the Month.

PEOPLE speak about their eyes being fatigued, said a distinguished optician recently, meaning that the retina or seeing portion of the brain is fatigued, but such is not the case, as the retina hardly ever gets tired. The fatigue is in the inner and outer muscles attached to the eyeball and the muscle of accommodation, which surrounds the lens of the eye. When a near object is to be looked at, this muscle relaxes and allows the lens to thicken, increases its refractive power. The inner and outer muscle are used in covering the eye on the object to be looked at, the inner one being especially used when a near object is to be looked at. It is in the three muscles mentioned that the fatigue is felt, and relief is secured temporarily by closing the eyes or gazing at far distant objects. The usual indication of strain is a redness of the rim of the eyelid, betokening a congested state of the inner surface, accompanied with some pain. Rest is not the proper remedy for a fatigued eye, but the use of glasses of sufficient power to render unnecessary so much effort to accommodate the eye to vision. But glasses must be adjusted with judgment or more injury than benefit is likely to result from their use. All persons who sell optical goods should inform themselves as to their nature so as to avoid mistakes. The eye is an organ that cannot be trifled with, and eyesight is altogether too precious to be left to the mercy of ignorant and unskilled persons. At the first indication of trouble with the eyes an oculist should be consulted.

\* \*

COMMERCIAL travelers have long complained that the railroads do not extend to them the traveling facilities and accommodations they should do, but, in fact, discriminate against them in some instances. They are required to pay full tariff fares as passengers, and are charged full price for extra baggage, while a traveling theatrical troupe or a cheap minstrel show can get reduced fares and liberal terms regarding baggage. As commercial travelers are the best customers the railroads have, being persistent travelers in all seasons, they feel that they are entitled to some consideration at the hands of the railroad magnates. New York merchants affirm that they have been discriminated against especially by some of the western roads, which make special rates for travelers for western houses. There are several organizations among the travelers that, among other things, are trying to secure a reform in this matter. What they desire is the privilege of buying thousand or hundred mile tickets that will be good on any road in the country at commuted rates; also to have some arrangement whereby they can commute

THE jewelry trade puts up with the poorest accommodations, and the greatest amount of inconvenience and annoyance in consequence, of any of the great commercial industries we know of. For the value and quantity of goods handled they are the poorest housed of any merchants or manufacturers in New York. Maiden Lane is the center of the jewelry trade; thence it radiates into Nassau, John, Courtlandt and Liberty streets, finding lodgment also in Broadway within these boundaries. This is one of the oldest sections of the city, Maiden Lane having been a cow path in the days when the city scarcely extended above Bowling Green, and the old Dutch settlers played skittles on the Green and smoked their pipes in phlegmatic contentment. Some of the buildings now used by the trade in Maiden Lane have the appearance of having been erected in those primitive days, and been subjected to such modernization as they would admit of. They are, generally speaking, low, narrow, badly lighted and illy ventilated, and possess few of the conveniences usually found in modern mercantile establishments. One of the greatest deficiencies is in the matter of light, an element so essential to the proper display of jewelry. There is also a great scarcity of room, and two or three firms are found huddled into one small, uncomfortable room that is scarcely sufficient for one of them. The owners of these rickety old buildings evidently think them all that can be desired, judging from the amount of rent they charge the occupants. Knowing the great desire of the trade to keep together, and having learned that they will submit to almost any extortion and inconvenience rather than seek commodious quarters elsewhere, the landlords charge the jewelers two or three times as much rent as they could possibly obtain from other tenants. If the jewelry trade was to remove to other localities, the old buildings would soon give place to modern business structures, and moderate rentals be charged for better accommodations. There is a splendid opportunity here for some capitalist, or a syndicate of capitalists, to put up one or more elegant, commodious and attractive buildings in Maiden Lane—after the style of the Wells, the Morse or the Field buildings, which are designed expressly for offices—for the use of the jewelry trade. Such a structure, nine or ten stories high, abundantly supplied with elevators, so arranged that each suite of offices would be bountifully provided with air and light, would be a boon to the trade, and at least a ten or fifteen per cent. investment for the capitalists who might build it. There has long been talk in the trade of seeking other localities, and some of the firms have removed to the vicinity of Union Square, where they find better accommodations, but the majority is wedded to its present quarters, and cannot be induced to leave a section of the city that has been devoted to the jewelry interests since the days when the original Dutch settlers swapped baubles and trinkets with the Indians for furs and for the land they

stood on. A mammoth office building would solve the problem, giving hundreds of jewelers opportunity to become tenants, thereby exchanging their present insufficient offices for better ones, and still permitting them to wander in their familiar haunts. Experience with this class of buildings has demonstrated that access to the upper floors by elevators is not inconvenient, and that, as a matter of fact, the ninth and tenth story offices are the most desirable, being so far above the noise and din of the streets, removed from their dust and dirt, and accessible to the pure air that comes sweeping up from the South, being cooled and purified as it kisses the waters of the Bay. An elegant, large, high office building, running through from Maiden Lane to John street is what the trade needs, and if it does not get it before long there will be a scatteration that will bring confusion.

\* \*

ONE would scarcely think of looking in the daily reports of the Chicago corn market for matters of interest to jewelers, but in a dispatch to *The Tribune* of this city we read the following:

"Jim" Love's Kohinoor dazzled the eyes of the cash corn crowd early this morning, but did not, at first, inveigle any of its members into buying September of him at 72½ cents. The rays from Frank Crittenden's smaller diamond modestly flashed across the room. John R. Bensley tripped about the crowd, suggesting, by his agility and archness a "coyly, tenacious maiden."

If the "bulls and the bears" will only spend their money for diamonds and other articles of personal adornment, we shall not object to their accumulating those vast fortunes that are said to be picked up so easily in the "wheat pit" or the "petroleum ring." But we greatly fear that those brilliant diamonds only serve as additional lures to tempt the young and inexperienced into stock gambling, taking chances on "puts and calls," or otherwise indulging the gambling spirit that has taken such strong possession of our young men. When "Kohinoors" are exhibited on the shirt-fronts of those who take life so easily as brokers seem to, young men are apt to feel inclined to shirk true manly work, and tempt fortune by rash speculation in the hope that they, too, may sport "Kohinoors" and be called "Jim" in the daily papers.

\* \*

IT WAS with rare pleasure that we noted at various times during the summer, the arrest of several European pilgrims who had undertaken, on their return, to smuggle into the country silks, satins, laces, millinery goods, precious stones, jewelry, etc. We are always glad to hear of the arrest of smugglers, not only because they are violating the law and defrauding the revenue, but because those who are successful throw upon the market a lot of goods that can be sold at low prices, not having paid duty, and legitimate dealers who do pay duties are forced to sell at a sacrifice in order to compete with them. Our laws in regard to tourists bringing foreign goods here are liberal enough to cover all that a person requires for his own personal use, but are intended to prevent the introduction of goods for sale unless duties are paid. The astounding elasticity of conscience possessed by some persons when dealing with the government presents a curious phase of human nature. It is thought to be a "smart thing" to overreach government officers, transgress the laws of the land, and thereby perpetrate an injustice upon the great body of taxpayers; for those who do pay have to make up the deficiency caused by those who do not. Yet persons who claim to be upright business men and good Christians will not hesitate to do a little smuggling on their own account when opportunity presents. We were once on the dock when a steamship arrived from Europe, and were interested in an effusive greeting bestowed upon a bright, handsome young lady by the friends who were awaiting her arrival. She was evidently of good family, educated, refined, and a belle in the society in which

she moved. As the merry group passed out of the gateway, we overheard the newly-arrived young lady say in French to a friend: "I have twelve dozen gloves sewed in my bustle." Of course, the detective had not looked *there* for smuggled goods. Now, that young lady had committed a grave offense in smuggling dutiable goods into the country, and possibly added perjury, or at least falsehood, in declaring that she had none. Yet she thought it only a good joke, and expected congratulations on having evaded the vigilance of the customs officers. And, no doubt, she was congratulated, for the worst of this whole business is that public sentiment does not frown upon this sort of thing. If it did, and every law-breaker was not only punished but held up to public contempt, there would be fewer fractures of the statutes. As it is, it is the laws and the law-makers that are objects of contempt, and those who successfully defy them are regarded as "smart."

\* \*

THE novelties in the way of lace pins are innumerable; they take on as many forms and designs as the scarf pins for gentlemen, which embrace everything, from a realistic house fly to a running horse at full speed, a bicycle or a grand piano. The ladies, too, have taken to wearing gentlemen's scarf pins for lace pins; two of these are fastened together by a light chain, and then made to cross each other as they are pushed through the lace. These are considered quite "the thing," especially for young ladies, and as all ladies are young ladies, it follows logically that these pins are very much worn.

\* \*

SOME genius has been calculating values as related to human energy in various departments of life, and as a result of his research announces that the British Poet Laureate can take a worthless sheet of paper, and by writing a poem on it can make it worth \$65,000; that's genius. Vanderbilt can write a few words on a sheet of paper and make it worth \$5,000,000; that's capital. The United States can take an ounce and a quarter of gold and stamp on it an "eagle bird," and make it worth \$20; that's money. The mechanic can take the material worth \$5 and make it into a watch worth \$100; that's skill. The merchant can take an article worth 25 cents and sell it for \$1; that's business.

\* \*

\* \*

AN editorial writer in the *Art Amateur*, who should know better, says: "Some time ago I called attention to a trick not uncommon in the American jewelry trade, of selling for a real diamond what actually consisted of a thin layer of diamond neatly attached to a body of mere glass—a dangerous trick, for the made-up stone tested in its setting would readily pass as genuine." If he had said that such spurious diamonds were sometimes worked off on greenhorns by "bunco steerers" and "sawdust swindlers," he might have been somewhere near right. But when he declares it to be "a trick not uncommon in the American jewelry trade," he does a gross injustice to a large body of honorable importers and merchants. Imitation diamonds and imitations of all other precious stones are certainly used to a great extent in the jewelry trade; they are as much a part of legitimate merchandise as the pure gems themselves; they enter largely into the manufacture of cheap jewelry, for which there is a regular and legitimate demand. But these imitation stones do not deceive anybody, nor are they intended to; they are bought and sold at their true value, and hold relatively the same position to real gems that chromos do to oil paintings. There is a demand for both precious stones and imitations, and the trade supplies the demand.

But the idea that the American jewelry trade ever attempts to palm off imitation diamonds for genuine is absurd; it couldn't if it would, and wouldn't if it could. No one could be imposed upon by them unless his verdancy was of a kind that would imperil his safety when an intelligent cow was in sight. Editors of respectable papers should have more sense than to give currency to such absurd statements containing reflections upon a large and honorable class of citizens.

\* \*

\* \*

\* \*

WIT AND humor are indigenous to the soil of this country. Every man and every woman enjoys fun, and most of them are wits in their own way. Our most quoted American authors are our humorists, and every generation gives birth to one or more "funny" men whose printed witticisms are read with avidity and repeated with pronounced gusto. The prominent magazines, art and literary papers, the religious press and even the daily journals devote more or less space to the sayings of our funny men. Being a hard worker, with little time for social enjoyment, pushing and driving from morning till night, the average business man has little time to indulge his fancy, and so the printed fun that can be grasped in a moment of leisure, tickles his imagination and makes him pleased with himself and all the world, at least for the time being. The humorist comes to him as a relief to his cares, and he thoroughly enjoys him. Following the example of nearly every literary and artistic publication, we introduce with this issue a humorous department into THE CIRCULAR, made up from clippings from our exchanges. We should be glad to receive original contributions to this department; there is fun enough going on in the trade to keep it well supplied if it could only be recorded. We trust our friends will remember us when they hear a good thing, and use our columns for communicating it to the rest of their friends in the trade.

\* \*

\* \*

SOME time ago Messrs. Fowler Bros. obtained a patent for crape jewelry, the specifications covering a peculiar method whereby the appearance of crape is given to jet stones. This is applicable to many forms of goods, and, as a consequence, crape jewelry at once became popular. Like all other good things, the idea was immediately stolen by some of the pirates in the trade, and imitations were at once put on the market. Fowler Bros. find that in order to reap the benefits of this invention, for which they had received a patent, they must conduct a lengthy and costly litigation against the infringers, and suits are now pending in the courts. This is another illustration of the utter disregard some persons in the trade have for the laws of *meum* and *tuum*. A patent is property; it has a cash value to its owner, and is just as much entitled to respect as are the contents of his pocket book. By what species of reasoning a man can excuse himself for appropriating one while he would respect the other we cannot understand. It was most excellent authority that declared "thou shalt not steal," and that prohibition applies as well to one kind of property as another. The laws of the country while they do not attempt to regulate a man's conscience, are lax in regard to patent pirates. If a thief steals a pocket book, he can be, if captured, speedily consigned to State prison; but the patent thief can only be reached through long, vexatious and costly law suits, and then the result is far from satisfactory to the one who has been robbed. The jewelry trade is a great sufferer in this respect, and there should be an understanding among all reputable members of it that they will not buy goods of one who infringes upon the rights of another. A patent should be held to be *prima facie* proof of property rights in the thing patented, and a notification to the trade that imitations of patented goods are being made should be sufficient to prevent the trade buying of the infringers. Owners of patents,

however, owe it to themselves and to the public to prosecute to the bitter end every patent pirate who steals their ideas and imitates their goods.

\* \*

\* \*

\* \*

New and attractive designs in gold goods for personal adornment were never so plentiful nor so attractive as this season. The manufacturers are entitled to great credit for the new and desirable designs they have devised for all classes of goods. There are various combinations with different colored gold, wherein superior workmanship goes hand in hand with artistic conception, and the result is such elegant and tasteful jewelry as the finest lady in the land might covet. These articles do not need the addition of precious stones to make them attractive, but possess a beauty all their own. Brooches, ear rings, bracelets, locket, etc., are to be found in most attractive varieties, and are now much worn; chatelaines take on as many and as fanciful forms as do the ladies for whose adornment and convenience they are intended, while the variety of styles in ladies' cuff buttons are innumerable. A glance at the show windows of dealers who take their cues from prevailing fashions, is proof positive that gold jewelry is again the style.

\* \*

\* \*

\* \*

BUT there is a degree of luxury and elegance about jewelry into which precious stones enter that never grows old and is never fully satiated. Fashions may change in everything else, but precious gems are never *passé*; the forms in which they are worn are subject to changes, but the gems themselves are always fashionable. American ladies are more fastidious regarding them, however, than those of any other country. In Europe, diamonds are handed down for generations in the precise forms in which their original owners had them set, but here the setting is changed as frequently as the fashion in settings does or as the owners of the gems can afford it. But precious stones are for the wealthy, while chaste and artistic gold goods can be worn by every one, and, at the same time, there is the widest latitude in its selection for the display of the peculiar taste of the wearer. Both classes of jewelry are now much worn; each class has its place, and the jewelry trade is prepared to supply the most critical taste at the present time in either class.

\* \*

\* \*

\* \*

WITH all the abuses that are complained of by the jewelry trade, it is no worse off, if reports are to be depended upon, than other industries. Ask a dry goods dealer how trade is and he will respond "business is fair, but it is all cut to pieces;" the hardware men sing the same song; insurance companies vow they haven't made any money for five years because "rate cutting has knocked profits higher'n Beecher's Bible;" as to the job printing business, we know it is "cut all to pieces;" and so it is in regard to every industry whose special organs we find among our exchanges. The cause of all this is excessive competition, and this is what ails the jewelry business. "Competition is good for trade" within certain limitations; when it produces goods in excess of demand, competition is likely to result in unbusinesslike practices, the manufacturers adopting unusual methods to work off their goods. When a bad practice once becomes a custom it is difficult to enforce a remedy; nothing but a revolution can accomplish the work of reform. Such a revolution is produced either by a panic which consumes capital and so lessens competition, or by a season of prosperity which absorbs the surplus product and re-establishes the equilibrium between supply and demand. On the whole, the jewelry trade is no worse off than other industries, and those engaged in it had better "bear the ills

they have than fly to others they know not of." "A bird in the hand is worth three of a kind;" "an honest man gathers no moss;" "a rolling stone is the thief of time;" "the shoemaker sticks to his last," and other homely proverbs will suggest themselves to enforce our text, that there are many worse lines of business than the jewelry trade.

\* \*

\* \*

\* \*

THERE were an unusual large number of robberies of jewelry last month from individuals. If thieves really feel that they must have jewelry, it is pleasant to note that they are transferring their attentions from the trade to individual owners of it. For a long time the thieves victimized the dealers throughout the country, but last month they seemed to be devoting their time largely to robbing private owners of jewelry. This is good for trade, in a certain sense, creating a demand for more jewelry to supply the place of that which finds its way to the melting pot in the attics of the pawnbrokers. It is better for the trade and the public in general, however, when these depredators upon private property are captured and consigned to prison walls, as has been the case with several recently; the trade breathes freer whenever a thief is "sent up," for the chances are that he has raided some member of it at some time or was contemplating doing so. We noticed in the daily papers in one day last month accounts of four different robberies of jewelry, and in no instance was a dealer the victim, a circumstance so remarkable that it is deserving of being recorded.

\* \*

\* \*

\* \*

A FOREIGN exchange calls attention to a singular barometer said to have been discovered by some member of the Araucarian race, which inhabits the southernmost province of Chili. It consists, we are told, of the cast-off shell of a crab, which, from its curious application, is called the "Barometro Araucano." The dead shell is said to be extremely sensitive to atmospheric changes, remaining quite white in fair, dry weather, but indicating the approach of a moist atmosphere by the appearance of small red spots, which grow both in number and in size as the moisture in the air increases, until finally, with the actual occurrence of rain, the shell becomes entirely red, and remains so throughout the rainy season.

EDWARDS, an authority on the subject, makes the statement that a few years ago the signet ring of the famous Turlough Lynnoch was found at Charlemont, in the county of Armagh, Ireland. It bears the bloody hand of the O'Neils, and initials T. O. The signet part of the ring is circular, and the whole of it is silver. O'Neils had been Kings of Ireland and were also Earls of Ulster. The symbol of the province of Ulster was a bloody hand. Fergus, the first King of Scotland, was descended from the O'Neils. King James the First made this bloody hand the distinguishing badge of a new order of baronets, and they were created to aid by service or money for forces in subduing the O'Neils.

\* \*

\* \*

THE season of weddings is upon us, when the young of both sexes of the human family are seeking their mates. As a rule (having numerous exceptions) a person gets married but once in a lifetime, and regards that event as one to be commemorated as a red letter day in Ilfe's calendar. Custom has decided that presents of various kinds shall be showered upon the newly wedded couple by their

numerous friends, and, very naturally, the skill of gold and silver-smiths is taxed to bring forth articles of use and ornament that shall combine excellence of workmanship with artistic designs. Our workmen have proved equal to the occasion, and elegant goods of every description, suitable for wedding presents, may be found conspicuously displayed in the stores of our merchants. A glance at these is sufficient to tempt a man to propose forthwith to his regular-stand-by-girl in the hope that his friends will be liberal in sending in presents so attractive and that are "so handy to have in the house." We did think of enumerating some of the most attractive goods of this kind, but the list is so long that we have not space; and, besides, where all are so deserving of commendation it would be unfair to discriminate. To all who contemplate matrimony, or who are called upon to celebrate the marriage of friends, we can truly say you will be wise to visit those stores where gold and silver-ware form the staple articles of trade.

Continued from Page 292.

Scythian Gold Ornament.

EVERAL OF the little gold ornaments that were attached to the garments of the Scythians will be found illustrated in initial letters during the progress of this description. Similar pieces are not known to exist elsewhere. They were made of thin plates of gold, and as many of them have been found precisely alike it is thought that they were produced by means of dies. A large number were unearthed at the tumulus of the Koul-Oba, lying in little heaps upon the ground beneath the nails upon which the clothing was suspended at the time of burial; the clothing itself, with the exception of some tangled masses of gold thread, having long since mouldered away. A great quantity was also found in the tomb of the "Reine de la Masque," of which mention has been made. Nineteen of these dress ornaments were selected for reproduction, and their *fac-similes* are in the museum collection.

Of the weapons carried by the Scythians, the lance and the bow were the most prominent, although a short sword was also used. For the latter a sheath of leather was provided, covered on its outer side with a thin placque of metal. For the common soldiers this placque was most probably of iron or bronze, but for the kings they were made of pure gold richly decorated. Two of these sheaths or scabbard covers are illustrated in figures 6 and 7. They are similar in shape and very handsomely worked in *repoussé*. That represented in figure 6, found at Koul-Oba, is 24 inches long. At the extreme tip of this piece is the mask of a lion followed by a species of leopard attacking an antelope or gazelle. Then comes a stag brought down by a lion and a griffin, and, in the separate section formed at its widest part, a hippocampus. Near the tip the word 'IOPNAXO (? Иорвашо) occurs in *repoussé* letters.

That the figures have a special and prominent significance cannot be doubted. The work is Greek, and Greek art, wherever applied, always had a meaning. It was not only made *by* a Grecian but it was also made *for* a Scythian, and this is plainly apparent from the character of the figures themselves. As the people of the United States have chosen for their emblem the eagle with extended wings, as the English have chosen the lion, and the Chinese the dragon, so also the ancient inhabitants of Panticapæum selected the griffin, those of the Caucasus the goat, of the Koudan the boar, of Cherson the stag and of Panagoria the lion. In the light of these facts the

sagacious interpretation of Dubois appears quite probable when he explains these scenes, so manifestly emblematic, by the theory that the griffin of Panticapæum and the lion of Panagoria throwing down the stag of Cherson was intended to symbolize the victories of a Leuconide over his enemies of the peninsular and the warrior people of the Caucasus. All of these animals appear more or less frequently, and the griffin especially is rarely forgotten. The name of ΠΟΡΝΑΧΟ which appears at the tip may, indeed, be that of the maker, but as we can hardly make a Greek name of it, it was more probably that of the person for whose use it was originally intended. Its period is that of the fourth century B. C.

Scythian Gold Sword Sheath,  
Figure 6.

Scythian Gold Sword Sheath,  
Figure 7.

The sheath covering illustrated in figure 7, although somewhat smaller (21 inches long) than the one we have been considering, is much the finer of the two, not only artistically but also in execution. It was found in the Nicopol tomb and belongs to the same age as the other. It is hardly possible, however, that it could have been made by the same hand, as it so far excels the plaque of Koul-Oba as the work of the master excels that of his pupil. The five scenes depicted upon the body of this piece are those of combats between Hellenes and barbarians—probably Scythians. The leaders of the two forces are at the widest part. From the dress, helmet and arms of the first figure there can be no doubt that it represents a Grecian, and, for the same reasons, we may safely class the second figure as a Scythian. The former wears a plumed helmet, a short corslet and over it a coat

of mail. Greaves are upon his legs and a short sword hangs at his side, suspended by a band passing over the right shoulder. As he presses eagerly upon the enemy, he turns to encourage and bring forward his troops, utterly unconscious of the Scythian leader stealing upon him with drawn sword. The sword here represented is such a one as might be carried in a sheath of the style of the plaque under discussion, the widest part covering the hilt and handle, and the blade resting beneath the narrow portion. No sheath, however, is seen upon the figure, nor any other weapon except a bow in the left hand. In the second group a Grecian is endeavoring to assist to his feet a wounded companion and at the same time shield him from the fierce attack of a barbarian. In the third scene the barbarian has fallen upon his knees but still defends himself with an axe, while a fellow warrior, mounted, is vainly striving to raise his horse who has stumbled. Two Grecians are given in the fourth scene, one of them apparently wounded and the other in surgical attendance upon him. The wound is evidently one requiring the use of both hands as the attendant is obliged to hold his knife in his teeth to leave his hands free. In the fifth scene the barbarian has been thrown from his horse and is being dragged rapidly over the ground by the bridle. He has no visible opponent, probably for lack of space, but a Grecian helmet is given as a suggestion of one. The whole series is bordered by a cable, outside of which are holes punctured for attachment to the leather scabbard. At the termination of the two ends of the cable are two griffins afrontes with a flower of the myosotis over each. The other compartment holds a large griffin devouring a stag, the head and horns only of the latter appearing to the view, and perhaps that was all that was left of him.

In the work upon this piece one is forcibly impressed with the exquisite tact of the artist in leaving the result of the different struggles undecided. No warrior among them all is wholly victorious, nor does it appear that either side are unequally represented in the quality of courage. It would scarcely be possible for the patriotism of a Greek artist to depict his own countrymen as otherwise than brave, neither would it be politic for him to portray the Scythians as vanquished, since the piece was made for a Scythian king. In leaving the award of glory an open question, the artist has displayed a *finesse* extremely delicate and sagacious. He has, however, complimented the Scythians in the griffin of Panticapæum, who is certainly having the best of it with the stag of Cherson, a subject conveying no dishonor to Greece. We may also observe with admiration the masterly manner with which the grouping is handled, in its accommodation to the space available. There is no diminution of size in the figures occupying the narrowest part, and, what is still more skillful, there is no lack of life and action at these points. Whether the scenes here given were intended as a record of some historical event, or whether the principal personages were meant to be portraits, we have no means of determining. However, the artistic character of the work renders it one of the most valuable of the few pieces belonging to the period which we possess, revealing alike the skill and imaginative genius of the Grecian goldsmith. It is a fitting introduction to the object which we are about to examine and which was probably executed by the same artist.

By referring to the scene depicted upon the vase of electrum, illustrated in figure 4, we will find suspended at the left side of the Scythian warriors a bow held in a case, which covers something more than half the weapon. This case, like the sheath for the sword, was made of leather, and had also an exterior plaque of metal in order to give it firmness. It had, besides, a smaller pocket for arrows, thus serving in the capacity of a quiver as well as a bow case. Among a people famous for excellence in archery, and depending upon the arrow more than upon any other weapon for success in war, we may well conceive that the bow case, or Goryt as it is called, was an object of more than usual importance. Next to his horse, the bow and its receptacle was a part of the Scythian himself, and an object of his most careful solicitude. It would be natural, therefore, that the Goryt should receive a large amount of that magnificent and ori-

entally elaborate ornamentation which prevailed in their horse accoutrements, and, in case of royalty, in their garments. We can see in the vase scene that, although ornamentation is applied nearly everywhere with luxuriant extravagance, the Goryt bears decorations equal to any other part of the equipment. It is a most remarkable example of this important piece which I illustrate in figure 8—a placque of gold weighing almost 44 zolotinks and measuring 18½ inches long and 11 inches wide at its widest part. It needs but a glance at the beautiful *repoussé* work upon this Goryt, to determine its date as that of the highest stage of Greek art—the age of Praxiteles. The rich Ionic ornaments, the serpents' tongues and prophylactic emblems, win our admiration in a no less degree than the two mythological scenes filling the main part of the surface. All means of identifying the artist who executed this wonderful work is, of course, beyond our reach. We can only judge of him by the character of the work itself, which seemingly proves beyond question that he was a Greek, and not only that, but also a Greek possessing the most elevated Attic culture, in combination with a perfect knowledge of Scythian customs. Hence we see upon the upper edge a stag, which has fallen a prey to a lion and a panther, another lion which is attacking a boar, a female panther tearing a deer, a lioness attacking a steer, and an incomplete animal which may have been intended for a dog. These are all in small proportions. Occupying a prominent and quite extensive space in the lower projecting part we find a group much larger and more carefully executed of a male and female griffin struggling with a panther. Even if the ingenious explanations of Dubois are incorrect, we certainly cannot dispute the griffin of Panticapaeum nor deny the almost invincible proof by which its prominence settles the destination of the piece as a decoration for the Goryt of a Scythian king. However, it is no part of my intention to discuss questions of more interest to the archeologist than to the goldsmith, and we will, therefore, at once review the principal scenes covering the larger portion of the placque. We will first, then, examine these groups as they are, after which I will give in full, without apology, the entire myth to which they refer, for I am quite sure, from a most careful investigation, that it will be found in few, if any, of the mythological works in the English language.

The lower scene is divided into two compartments by a curtain, on the left side of which are represented four female figures. There can be little doubt as to the principal personage in this group. She not only sits upon a seat more elaborate than those occupied by the two other sitting figures, but she also rests her hands upon the shoulders of her companions, as if rightfully claiming both their fealty and friendship. The position of the entire group is one of expectation, but on the face of the principal personage there is also an expression of sorrow and anxiety, not unmixed with fear. They are evidently awaiting the termination of some event that fills them with the deepest apprehension—an event depending upon the result of what is taking place on the other side of the curtain, and which directly and intimately concerns the principal person. That is the expression which the artist doubtless designed to give and certainly he has succeeded admirably.

Turning now to the companion picture we find here also the prominent figure clearly defined, although two others share that distinction in a slightly lesser degree. The bearded man sitting upon an elaborately worked chair, or throne, bears the expression in both face and posture of a calm attentive judge. The young man who has thrown his shield and arms upon the ground before him and allowed his garment to fall below his waist, is evidently conducting an investigation with an eagerness which belongs to youth and to a direct personal interest in the circumstances. In his left hand he holds a shallow casket from which he has removed the cover with his right hand. The bearded men on either side of him are probably members of a lower order. They are both supported upon crutches (in one the crutch is hidden by the drapery of his clothing, but the position of the body would require such a support and undoubtedly received it) and one having a cane in addition. They are being examined and

questioned by the young man regarding the contents of the casket. The remaining figure is of a woman carrying in her arms a babe which she has covered with a portion of her dress. Upon her face there is an expression of hesitancy and sorrow. The sorrow is of a less dignified character than that of the woman in the first group. There is less nobility about it and more evidences of a lack of will to patiently endure.

The scene in the upper picture is entire. There has been a conversation of some nature between the young man who is standing and the young woman who is endeavoring to run away. This conversation reached at last a point where the anger of the young man

Scythian Bow Case, Figure 8.

could no longer be restrained. He springs to his feet and drawing a short sword evidently intends the death of the woman, but is prevented by the man sitting by him who grasps his arm. The woman, with terror depicted upon every line of her face, attempts an escape, but is, in her turn, held captive by another woman occupying a part of the seat just vacated. The scene is intensely tragic and full of pathos. On the left are two more female figures witnesses of the exciting scene just mentioned. One of these holds to her breast a boy, who has fled to her affrighted at the impending deed of blood. Although a part of the group and attentive to the proceedings, they appear less actively interested in the result than might be expected,

but, as we shall see later on, this arrangement was a part of the sagacious plan of the artist. At the extreme left of the group a young man is teaching a boy the use of the bow, and both of them are utterly unconcerned with what is taking place in close proximity. Again, upon the right, we see a bearded man sitting, and hanging his head in evident sorrow. The expression of painful regret and grief, which veils his countenance, is most pathetic. In front of him, in a reclining position, is a young man, holding in his right hand a sheathed sword, to which is attached a ribbon band. His shield and armour lie upon the ground behind him. He, too, takes little interest in the tragic scene that is being enacted before his eyes.

Examining the piece still more closely we are compelled to arrive at the following conclusions:—the woman in the group of four females in the lower picture, and the woman flying for her life in the upper scene, are one and the same person; the judge who sits with his right arm resting upon the back of his chair, and the left arm over his head, can be no other than the sad-faced figure on the right in the upper group; the youth, who is holding the casket and seeking an explanation of its contents, is again seen in the upper representation with drawn sword and angry countenance, and the other women in the lower left hand group are all duplicated in the upper picture. The connection between the two is thus proven, and we may reasonably consider that the passionate occurrence of the upper scene is the direct result of the investigation taking place in the lower one. Having gotten from the piece something of what it itself teaches us, we may now apply the myth of which it is an illustration.

Alope, the beautiful daughter of Kerkyon, was loved by Poseidon (Neptune). In great fear lest the liaison should be discovered, Alope caused her babe to be exposed upon the mountains, where he was suckled and preserved by a mare. Soon after, the child was found by a shepherd, who took him, together with the raiment and jewelry found upon his person, to his own house, but afterwards gave him to a second shepherd, retaining, however, the valuable robes and ornaments. Upon this, a quarrel arose between them, as the second shepherd insisted that the articles should be delivered with the child, and the dispute at last grew so fierce that it was decided to leave the matter to the judgment of the king. Accordingly, this was done, but Kerkyon, when he saw the royal garments and other objects, recognized them as belonging to his daughter Alope. Hereupon, an investigation was instituted, which terminated in the confession of the nurse, who had exposed the babe. The judgment of the king decreed that the child should be again exposed, and some say, that he himself slew Alope, and others, that he pined away with grief at the disgrace which had fallen upon his name and family. By a fortunate reiteration, the mare again suckled the boy, and the same shepherd again found him. This singular repetition so strongly impressed the shepherd that he conceived for the child the paternity of a god, and reared him with all the respect due to a divine origin. The waif thus rescued was called Hippothoon (*ἵππος*—a horse, and *θετὸν*—adopted by) and figures much more prominently than his mother in Grecian mythology. It is evident that the artist of our placque accepted that rendering of the myth which records Kerkyon as being consumed with sorrow for the indiscretion of his daughter, and more especially since that interpretation agrees with the following conclusion of the legend, and with the illustrations given upon the Goryt. Theseus, himself a reputed son of Poseidon, included among his many wives and favorites the heroine of our story. It is most probable that this relationship existed shortly previous to the discovery of Alope's lack of faith, and that the appearance of the babe, with its attendant revelations, provoked a violent quarrel between them. If Kerkyon, who was a famous wrestler, was slain by Theseus, who was still more famous in that exercise, it must have been an event taking place subsequently to the occurrences which we have before us upon the placque. Accepting, therefore, as we must, the version of our artist, in order to understand the ideas which he has so exquisitely portrayed, the future fate of the principal personages can be briefly stated. Poseidon, whether jealous of the

attentions of Theseus or on account of her own request for succor, changed Alope into a spring, and a fountain, bearing her name, long existed in Greece. Pausanias, in his *Itinerary*, also describes a sepulchre erected to her memory, which he himself saw on the way from Eleusis to Megara. Hippothoon, having arrived at manhood, besought Theseus to restore to him the kingdom of his grandfather (Kerkyon), and the hero, in consideration of their relationship, complied with his request.

Without discussing too exhaustively the questions arising from this legend, that more particularly belong to the realm of the mythologist, such is the story which our artist has selected for his subject. That it was a subject fitly chosen we may well conceive, since Poseidon was the god of horses, and the Scythians were preeminently a nation of horsemen. Any myth, therefore, which in any manner referred to this god, could not be otherwise than acceptable to the people holding him in such high estimation, and, in selecting that of Alope, the artist has hit upon one of the most beautiful and tragically poetic of them all.

It needs no especial perspicacity to identify the figures upon our placque with the principal persons of the legend. The bearded man of sorrowful mein is Kerkyon, the young man with the open casket questioning the two disputing shepherds is Theseus, while the nurse, still holding the infant Hippothoon, either has confessed or is tormented with the growing necessity for doing so. The others may be classed as friends or near relatives of the chief personages and conversant with the dishonorable secret.

Aside from the perfect execution of the work, we must also admire the keen perception of the artist in the arrangement of the figures, and the delicacy with which he has expressed the ideas belonging to the myth. In the upper scene especially he has relieved the intense strain upon our sympathies, excited by the tragedy occurring in the central portion, by representing at either end scenes of a more calm and peaceful nature, which, though a part of the picture, soften the harshness of a tableaux which threatens to result in an appalling crime. I commend an examination of this piece to those who think that the term "fine art" should apply exclusively to the art of painting and the art of sculpture.

(To be Continued.)

### Changing of the Dials.

NOW that the question of standard time seems definitely settled, despite the defection of Louisville, the attention of railroad men and scientists, the two classes most concerned in the above reform, is turned toward the question of dial reform. Instead of our two divisions of twelve hours apiece, which now make up the day and night of twenty-four hours, the advisability of numbering the hours consecutively from one to twenty-four is being discussed. Already in many jewelers' windows may be seen watch faces provided with a double ring of figures, the inner one of which shows the figures 13 to 24. Though to some extent this meets the primary objection to the change of hours, namely, that the twelve hour watch movements would be rendered useless, it does not altogether work simply and satisfactorily. Another system has been invented by Dr. Whitney, a Philadelphia enthusiast. This needs a complete distribution of the figures on the dial, and in this particular only is bettered by the form above described, which can be adapted to any existing watch-face. According to the new method the figures 1 to 24 are arranged as it were upon an endless band which crosses on itself so that the figures 6 and 18 are in contact. Thus it will be seen that there is an outer rim with the figures 1, 2, 3, 4, 5, 18, 19, 20, 21, 22, 23, 24, and an inner rim with the figures 13, 14, 15, 16, 17, 6, 7, 8, 9, 10, 11, 12. The 13 of the inner rim is under the 1 of the outer rim, and the other numbers follow in the order given. Starting our twenty-four hours at midnight, one can use up half the

outer rim until the morning hour of the work-a-day world is reached. at six o'clock one can shift to the inner rim and use this throughout the day until the approach of dusk warns us that we have changed again on the outer rim, which is accordingly used until midnight. It may be remarked that the day would have to begin at midnight instead of in astronomical fashion at midday. Were this not the case it would be one day of the month in the morning and the next day in the afternoon.

This plan of arranging the dial has secured the warm commendation of Sanford Fleming, who was one of the chief movers in the introduction of the standard time system. There seems but little doubt that at the international convention shortly to be held the subject will receive full discussion, and it is hoped that the railroad companies will make the first move by adapting it on their timetables, thus doing away with the necessity of the awkward and puzzling "A. M." and "P. M." It has been suggested by the inventor of the above-described dial that to satisfy the conservative-minded ones who would still cling to the system of their forefathers and would affect to be puzzled by the new notation, the following plan should be adopted: A foot-note might be printed at the bottom of each page of the time-table: *Note:* For P. M. hours, read 12 less. Thus a time table would read: "Trains arrive: From Pittsburg, 6.10, 11.20, 19.30 and 22.20 daily. From Washington and Baltimore: 6.30, 6.40, 13.20, 15.40, 15.50, 17.30, 21.20, 22.20 and 22.35.

*Note:* For P. M. hours, read 12 less."

---

### Tortoise Shell.

THE horn-like epidermoid plates which cover the dorsal buckler or carapace of the sea tortoise, are in some species so fine and of such beautiful colors as to be employed for various purposes of art. It is only those, however, of the hawk bill (*Eretmochelys imbricata*) and caret species that possess any great trade value; the plates being stronger, thicker and clearer than in other species. There are usually thirteen plates on the carapace called, collectively in trade, "the head"—four on each side and five on the back, the last bent in the center. Of the side plates, the two middle are the most valuable, being the largest and thickest; those on the back and margin, known as the "hoofs" or "claws," are comparatively of less value. There are twenty-four marginal pieces, which are termed the "feet" or "noses." The *lamellæ* or plates vary in thickness from  $\frac{1}{8}$  to  $\frac{1}{4}$  of an inch, according to the age and size of the animal, and weigh collectively from 4 to 6 pounds or upward. In an animal of ordinary size, about 3 feet long and  $2\frac{1}{2}$  feet wide, the largest plates weigh about 9 ounces and measure about 13 by 8 inches, and are  $\frac{1}{4}$  of an inch thick in the middle.

Tortoise shell is usually detached from the carapace and bony framework by placing heat below, or sometimes by soaking it in boiling water. In the West Indies the plates or blades of tortoise shell are removed by burying the carapace in the ground or sand for ten or twelve days. When taken up the blades fall off, and the thirteen dorsal pieces are easily collected. A small hole is bored in each, so as to string them together, for no experienced buyer will purchase a case of tortoise shell unless the whole of the shell is thus presented. The "feet" or "noses" of the tortoise shell are chiefly in demand in China.

The blades of the hawk bill or imbricated turtle are very transparent, and more beautifully mottled than those of the caret turtle; the scales of the latter are thinner, and are not used for the same purposes, but employed for veneering and inlaying work. The shell of the hawk bill has a blackish-green color, with yellowish spots, while the color of the plates of the caret turtle is blackish, with irregular transparent spots of golden yellow and veined with red and white, or of a brownish-black of various shades. The plates of the green or edible turtle (*Chelonia mydas*) are thin and flexible, and of slight

manufacturing use. The scales of the loggerhead turtle (*Thalassochelys caouana*) are of a dark chestnut brown, very thin, and neither clear nor beautifully colored, hence they are of little value; but latterly some use appears to be made of them, for the English imports of turtle shell (as it is named in contradistinction to tortoise shell) have averaged in the last four or five years \$30,000 in value.

Tortoise shell is worked upon like horn, and is usually softened or rendered plastic by placing in boiling water containing a handful of salt to the quart; by this means it is rendered so soft that it can be pressed into moulds. The moulds employed are double, so as to contain the shell between them. When all is ready the mould is put into a press, and the upper half gently pressed down upon the shell. The whole is then put into boiling water, and as the shell becomes more and more softened the upper half of the mould is from time to time screwed down, until at length the shell is completely pressed into the lower mould, so that any devices that may have been engraved or embossed upon the two halves of the mould leave corresponding impressions upon the shell. When two pieces of tortoise shell are to be joined together the two edges are beveled off, so that one inclined edge may lie on the other. The edges are then scraped perfectly clean, contact with the fingers or any greasy substance being carefully guarded against. A piece of paper is then bound around the overlapped edges and fastened with a string. A pair of tongs or pincers are then heated and applied to the shell, one jaw above and the other beneath, by which the shell is grasped throughout the length of the seam or overlap. By holding it for some time in this position the heat of the iron softens the shell and causes the two pieces to unite or weld firmly. For modern uses thick tortoise shell is more valuable than thin. The uses of the article for ornament are varied, and the number of articles made from it are very numerous. Brown and light colored shell is imported from India and China to France for fans, the former costing \$6.25 per pound and the latter as much as \$20. In China and Japan very beautiful cups and saucers and fancy boxes are made from this material.

Tortoise shell has always been a favorite material for combs, but it is only in recent years that jewelry made from it has become fashionable in Europe and America. England imports annually large quantities of tortoise shell, and, according to Mr. P. L. Simmonds, from whose "Commercial Products of the Sea" these notes are borrowed, maintains the monopoly of this artistic material. The material is received from India, China, the Eastern Archipelago and Pacific Islands, Australia, the West Indies, South America and Africa.

### Some Facts About Amber.

THERE ARE in this city several houses that import amber extensively and work it up into various forms for commercial uses. Some of their productions are of a highly artistic nature and very valuable. There are amber enthusiasts, who revel in a peculiar piece of amber as a lover of precious stones gloats over a fine diamond. A reporter encountered one of these recently in the midst of his collection and elicited the following information regarding this beautiful substance:

"Yes," he said, "I have a special liking for amber, and I have just returned from a trip which I made to the amber district on the Baltic. All the amber of commerce comes from there now, although amber is found in many parts of the world—in China, in Japan, since recently in Patagonia, and from time to time in the United States. It is a peculiar fact that the amber found here and in Patagonia is particularly fine. It is of the transparent kind, or, as we say in commerce, clear amber, but it is much darker than the Baltic clear quality, of a reddish yellow, approaching the color of a fine Oriental topaz. Pieces of this fine quality have been found in Amboy, N. J. I was very much struck with one fact in East Prussia: All the amber that is found is in a vein of bluish green sand. I picked out a piece

myself, and showed it to a friend who knew something of mineralogy, and he pointed out to me fine particles of mica glittering in the sand which adhered to the piece, for I kept it unwashed on purpose. He said to me that he thought this sand was in reality decomposed aluminous clay. Now at Amboy there is, I understand, a large deposit of this clay which is used extensively in the potteries of Trenton. It may be that the pieces of amber found at Amboy were in a bed of this clay decomposed by the action of the sea in past ages. However that may be, it is certain that on the southern shores of the Baltic the men who worked for this amber by raking the seaweed after storms, long ago came to the conclusion that the precious article was rolled out by the tide from this peculiar bluish green sand. So they follow the veins of the sand and mine them regularly. The government assumes to own all the amber and farms the work out to one contractor, who pays 300 thalers each working day for the privilege of working it.

"I visited first the village of Palmricken, which is about three hours' ride by rail from Konigsberg. There were about 600 inhabitants who were supported entirely by amber mining. There was one central shaft which went down about 100 feet, and there were different galleries and cross-cuts, just like streets and cross streets. I think there must have been forty miles of them. The workmen dig into this sand, and fill small tram cars that hold about 500 pounds. These are run to the elevator and hoisted up by steam. The sand is then washed in a sluice just as in gold mining, the pieces of amber being stopped by nets of various meshes at different intervals. Then skilled workmen take the pieces and assort them according to size, shape and quality. Pieces containing foreign substances, so dear to the collector, are put on one side. At the first handling they are considered inferior until further examination shows the exact nature of the inclosed substance. Pieces that are cracked are of little value and generally go to the varnish maker. They could be utilized in a much more remunerative way, for a delicate perfume is made in Spain and Italy from this substance. But this is done nowhere else. I got Colgate to experiment with scraps from our workshop, but he did not succeed. Large pieces are much more valuable than small pieces. A lump of amber weighing a pound would bring \$50, while one weighing thirteen pounds would be worth \$5,000. There is in the National Mineralogical Museum at Berlin a piece weighing nearly fourteen pounds. The shape also is a consideration. An oblong piece is worth more than a round piece, and a well-shaped round piece is worth more than an ill-formed round piece.

"The cutting is chiefly done in Dantzig. Here this same man that contracts with the government has an army of work people. He has 500 men employed in one branch alone, making mouth-pieces, and 500 more employed on beads and jewelry for Russia alone. He takes their work for the whole year and disposes of the whole in a week in the great fair at Nijni Novgorod. Then he has many more workmen who manufacture beads for China, Japan, India, Turkey and Arabia.

"You must know that the two great divisions of amber are into clear and cloudy. Now it is a peculiar fact that the Americans agree with the Turks and Arabs and Persians in preferring the clouded, whereas Europeans esteem particularly the clear, and so do the Chinese and Japanese, and the non-Mohammedan inhabitants of India. A Mogul of Delhi will have his prayer beads clouded, and as red as he can get them. But the wives and daughters of Brahmins, Banians and Rajpoots will take nothing but the clear. They especially delight in cylinder ear rings an inch long and as thick as the middle finger, and have some superstitious idea that these prevent earache and headache. Such ornaments are light in spite of their size and do not pull the lobe of the ear down. The demand in the East is so great that it never has been supplied. In America the amber mouth-piece is the one article for which there is much inquiry. We are endeavoring to combine the two qualities in cameo-like ornaments, with a background of the clear, and a decoration in the cloudy cut in high relief. We cut medallion portraits, fruit, flowers, etc., and

unite the two with mastic. And we have many sets of amber jewelry that are really fascinating. But there is on the part of the public a liking for gold jewelry, and amber for personal decoration is the choice of a few very refined people. There is a lady in New Jersey, Mrs. E. A. Smith, who is a most passionate lover of amber. She has a set of beads which she wears over black velvet in a peculiar way. The beads are arranged in concentric curves so as to form a curious covering for the entire corsage, and the effect is said to be splendid. Her beads are all clouded. Mrs. A. T. Stewart has a complete set in tortoise shell and amber. She has also a collection of odd pieces, one of which, about the size of the palm of the hand, contains a small fish. It cost Mr. Stewart \$4,200. The Empress of Russia has a tea service of amber, twelve cups and saucers, milk jug, and sugar bowl. There are some ladies who buy amber articles of me who can hardly contain themselves when they hear of it. They would like to drink tea out of amber amazingly. I don't know whether it would communicate a delicately delicious flavor to the tea. It might; but then the Czarina has the finest tea in the world, sent specially as a present by the Imperial family of China. A German professor told me that there were Roman emperors who drank their wine out of amber cups, and that it was customary in Rome to reduce amber to a powder and mix it with beverages. I should think it would taste pretty much the same as copal gum.

"Now let me show you some of our odd pieces." The young man produced a cabinet and pulled out a number of drawers. "I told you that the assorters put on one side, as inferior, pieces containing foreign substances. When these have been washed and cleaned and cut it is often found that the object is of such a nature as to make a piece very valuable indeed. For instance, here is a piece with a small lizard; here is another with a scorpion. And a merchant in Hamburg has a piece containing a leaf that looks like an olive leaf. It is not curled up, but is flattened out as perfectly as it would be in a herbarium. He asks for it thirty thousand marks, or \$7,500."

---

### The Relation of Barrel and Spring.

THE question which often appears on the surface of the daily experience of watchmakers is: "How to select a spring to a given barrel, in strength and length, that will develop the greatest energy over the longest period?" In the inquiry for the best practical answer to this question, certain data have to be accepted as a unit.

In every barrel, the space or annulus contained between the barrel-arbor and rim of the barrel is the path over which the action of the spring occurs, and within certain limits we have the option to dispose of strength and length of this action. If we represent the available space as a sum which is made up of two factors, viz.: strength and length of spring, then it is evident that this sum, again, represents the work of the spring, which will be a constant quantity and equal to the energy with the period of rotation.

The caliber of a watch sets the limit to the rim of the barrel, and on the other side we have a boundary in the barrel-arbor. It has become quite an orthodox practice to make the barrel-arbor one-third of the barrel, regardless of the conditions of the spring. Nevertheless, the data of this measure rests on the "bending moment" of the spring, for which the diameter of the barrel has become an approximate substitute.

It is evident that the surface of the barrel-arbor forms a mold for the curve of the inmost surface of the nearest coil, whose outer surface, again, becomes the mold for the next, and so on. By an immeasurable difference, the radii of the adjacent surface of two coils are equal, and therefore, likewise, their circumferences; hence the variation in the measure of the circumferences is not between one coil and the next, but between the inner and the outer surfaces of the same coil. This difference is the measure of compression of

the inner surface and of the elongation of the outer of each coil. It can be shown that the measure of this compression and elongation is proportionate to the ratio of the difference of the circumferences is always constant for the same barrel, however we may vary the spring; whereas, by increasing the strength, we diminish the number of coils, and inversely we increase them by applying a thinner spring. But half the quotient of the difference of circumferences by the number of coils, divided by the length of each coil, is the line of the angle of deflection, from which it follows that the thicker the spring the greater the angle of deflection, and that the contrary is true in a thinner spring.

This angle of deflection is synonymous with the principle of the "bending moment" of the spring, which, again, may be represented by a statical couple, whose moments are the pressure and tension of the opposite surfaces into the thickness of the spring. Hence, for equal bending moments, a thinner spring will admit of a much greater angle of deflection than a thicker one, and therefore will admit of a smaller barrel-arbor.

Since the number of turns or angle of rotation of a barrel has become almost uniform in all modern watches, and the strength of the mainspring has a definite relation to this measure and the size of the barrel, the latter has become the convenient unit for the bending moment of the spring, which is determined by the diameter of the barrel-arbor.

It is unfortunate that the conditions of bending moment clash with the angle of rotation of the barrel. If we increase the thickness or strength of the spring we require more space, or a larger path for the action of the spring, but the principal of bending moments not only will not admit this increase, but for the sake of the durability of the spring, demands a barrel-arbor of larger diameter, and therefore curtails the space, and hence the number of barrel rotations. The dimensions of the barrel-arbor are therefore controlled by two conditions. No stronger spring than such a one whose bending moment is satisfied by a barrel-arbor whose diameter is one-third of the barrel could be used so as to get sufficient turns; and, on the other hand, few watches will admit of a spring that will warrant a departure, as a rule, in the other direction; therefore, without any further proof, we will take the diameter of the barrel-arbor in the general caliber of watches as one-third of the barrel rim (inside measure).

The question becomes now one of area, or space occupied by each coil of the spring, and appears somewhat paradoxical. If the mainspring is wound onto a spring winder whose diameter corresponds with that of the barrel-arbor, the number of rotations of the winder will equal the coils gathered up, conditional that the coils on the spring are not concentric with the center of the winder. Thus it will hold good, if the spring is straight or gathered up from a bobbin, but not when the spring is held by the hand and concentric with the winder. It is this latter condition which is identical with the spring in the barrel. If we make a slot in the rim of the barrel and gather the spring onto the arbor through this slot, we should find that the barrel-arbor would turn once for every coil it collects, but when the spring is gathered on to the arbor from the coils collected within the barrel we obtain a different result, and thus, though in the first case the number of coils on the arbor would represent the number of turns the arbor had made in turning, in the latter this assumption would be altogether misleading.

That this is so can be easily verified. If a barrel is very full, the number of coils collected on the arbor when wound up are proportioned to the length of the spring, but the number of rotations that the barrel-arbor has made in collecting them has become less as the number of coils increased.

Again, if the spring is shortened, we increase the number of rotations of the barrel-arbor as we diminish the number of coils we gather up. This increase progresses to a certain point, beyond which the decrease in the number of coils and rotations progresses in a parallel instead of an inverse ratio. It is evident, then, that what-

ever spring we use, there is a definite point in its length where we obtain the maximum number of rotations. In a given barrel and spring we have three quantities that determine the number of rotations, viz.: the area of the space, the strength of spring and its length. Starting with the first as a unit, we shall endeavor to determine the second when the first and third are given, and the third when the first and second are given, which will be an answer to the question heading this paper.

#### PROPOSITION A.

*In a given barrel, the number of rotations of the arbor in winding the spring, or of the barrel during its development, is proportionate to the difference of the diametrical measures of the area's covert, when the spring is wound up, and when it is down.*

In reality the spring forms a spiral, hence no one coil represents a perfect circle. If, however, we take the distance from the center to any point between any two coils as radius then the two radii into 3.1416 will give the accurate measure of a coil. Now it is evident, that the number of rotations of the arbor in winding the spring is equal to the sum of the differences of the circumferences of the coils when down, and when gathered onto the arbor. This can be verified by experiment. If a spring is put into a barrel that almost fills it, the arbor will make very few turns in winding the spring. This is due to the fact that as the coils that are to be gathered up lay very close to the surface they are to cover, the difference of their circumferences must be very small; hence, though we get a larger mass on to the arbor, the number of turns that it makes in gathering them is really less than with a shorter spring.

There is another condition which becomes a factor in diminishing the turns with a full barrel. As coil after coil is collected onto the arbor, they become part and parcel of the arbor, and thus the radius of the last turn gathered is to the following one as the radius of the barrel-arbor to the first coil. But the angle of rotation of the arbor in gathering a single coil is proportionate to the difference mentioned divided by the radius; hence, as in equal arcs, the angles vary inversely as the radii, it follows that at each coil the arbor must move through a smaller angle than it did in the preceding one. We see, therefore, that the angular motion of the spring is in an inverse ratio to the coils gathered.

It follows, therefore, that as we shorten the spring and diminish the number of coils, we increase the angular motion of the arbor-barrel. This holds good up to a certain point only. Suppose we apply a spring so short that it occupies one or two turns only when down, then, though the difference between the circumferences when reposing against the rim of the barrel and when coiled up is at maximum, yet their sum must necessarily be small; hence it is apparent that there is a limit in this direction, and that the length of the spring is also a factor in the barrel rotations.

We have shown that in starting with a full barrel, by gradually shortening the spring, we increase the angular motion of the arbor; and that there is a point somewhere in its length and if we shorten it beyond that point the angular motion of the arbor will again diminish. Now, if we can show also that the angular motion of the arbor or barrel in winding or unwinding a long or a short spring is in ratio of the diametrical or radial measure of the areas covered by the spring in both conditions, we shall have proved the proposition.

The respective areas covered by the spring are annuluses, and are always equal in surface measure; hence, it follows that as the diameters of this annulus diminish, the difference in their diameters or radii must increase and that when they increase the reverse will be true.

But we have to show that the differences of the radial measure of the areas covered by the spring is in every respect similar to the sum of the circumferential differences of the coils, and that hence both are in the same ratio to the motion of the arbor or barrel.

It can be shown that this difference is least with a full spring or with a short one, and greatest at some intermediate point.

We have already stated that the space covered by the spring when wound up or when down, is always equal, and that its form is called an annulus.

The area of an annulus is found by multiplying the sums of its diameters by their difference, and this into 0.7854.

Suppose the radius of a barrel (inside measure) is = 1, the radial measure of the spring is = 0.333, then the space covered by the spring, when down, is an annulus whose outside radius is = 1, and inside radius = 0.666;

$$\text{Hence half its area} = (1 + 0.666) \times (1 - 0.666) \times 0.7854.$$

Let the radius of the barrel-arbor = 0.333, then when the spring is wound up this will represent its inside radius, and its outer will be x. Then

$$(x + 0.333) \cdot (x - 0.333) \times 0.7854 = (1 + 0.666) \cdot (1 - 0.666) \times 0.7854;$$

therefore,

$$\begin{aligned} x^2 - 0.333^2 &= 1 - 0.666^2 \\ x^2 &= 0.5564 + 0.333^2 \\ x &= \sqrt{.667289} \\ x &= .816 \end{aligned}$$

and the difference in the radial measure

$$\begin{aligned} &= (.816 - .333) - .333 \\ &= .483 - .333 \\ &= .15 \end{aligned}$$

Let the spring, when down, cover one-half the barrel, then when it is wound up, we have

$$(x + .333) \cdot (x - .333) \times .7854 = (1 + .5) \times (1 - .5) \times .7854$$

therefore,

$$\begin{aligned} x &= \sqrt{.860889} \\ &= .927 \end{aligned}$$

and difference

$$\begin{aligned} &= (.927 - .333) - .5 \\ &= .594 - .5 \\ &= .094 \end{aligned}$$

Again, let the area covered by the unwound spring equal  $\frac{1}{8}$ , or .1666, thus:

$$(x + .333) \times (x - .333) \cdot 7854 = 1 + .8334 \times (1 - .8334) \times .7854;$$

therefore,

$$\begin{aligned} x &= \sqrt{.416333} \\ &= .645 \end{aligned}$$

and difference

$$\begin{aligned} &= (.645 - .333) - .1666 \\ &= .312 - .1666 \\ &= .1454 \end{aligned}$$

Thus we see that in either extreme case the difference in the diameters is least, and it can be shown, that at no ratio will it be greater than when the spring occupies .25 to .26 of the space. But this difference, divided by the thickness of the spring, gives the number of the rotations of the barrel arbor, hence the proposition at the head of this paper is proved.

PROPOSITION B.

*In a given barrel the unit for length and strength of the mainspring is the diameter of the barrel space.*

In a barrel whose radius is = 1, and the radial measure of the area covered by the spring when it is unwound = .25, the radius of the outside turn when wound up,

$$\begin{aligned} &= \sqrt{1 - .75^2 \times 333^2} \\ &= \sqrt{.547389} \\ &= .739 \end{aligned}$$

and as the variation in the radius would not change the ratio, it follows that for a barrel, whose diameter = 1, and therefore radius of space =  $\frac{1}{2}$ , the radius of the outer coil when wound up

$$\begin{aligned} &= .333 \\ &= .3695 \end{aligned}$$

Then the radial measure of the annulus, or area of the coils of the spring, which represents the rotation of the barrel or barrel-arbor

$$\begin{aligned} &= .3695 - (.333 + .25^2) \\ &= .3695 - .2915 \\ &= .078 \end{aligned}$$

It has to be remembered that this space represents an extra coil. Thus starting from the hook on the barrel-arbor, it will be noticed that when one coil is gathered up, the radial measure is equal to two coils, hence in any spiral the number of thicknesses is always one more than the number of coils. Hence if we require five rotations of the barrel or arbor, then it is evident that the measure of the thickness of six coils = .078 of the barrel unity, and therefore the thickness or strength of one coil

$$\begin{aligned} &= \frac{.078}{6} \\ &= .013 \end{aligned}$$

To find the length of a spring of this strength that shall make the given number of rotations, we have to proceed thus:

The radial measure of the annulus, covered by the whole spring, when wound up, is

$$\begin{aligned} &= .3695 - .333^2 \\ &= .203 \end{aligned}$$

Since .013 is the measure of the thickness of one coil, the number of coils represented by .203

$$\begin{aligned} &= \frac{.203}{.013} \\ &= 15\frac{1}{2} - 1 = 14\frac{1}{2} \end{aligned}$$

Therefore the length of the spring is obtained by multiplying the mean diameter of the annulus into the number of coils, and this into 3.1416.

$$\begin{aligned} &= 2 \times (.203 - .013) + .013 + \frac{.333}{4} \times 3.1416 \times 14.5 \\ &= 2 \times .19425 \times 3.1416 \times 14.5 \\ &= 17.6974 \end{aligned}$$

The mean diameter being increased by two thicknesses of spring becoming part and parcel of the barrel-arbor. Thus in a barrel whose inside diameter is = 1 inch, and if we use a spring whose thickness = .013 of an inch, and length = 17.6974, we obtain five turns of the barrel-arbor in winding the spring.

Now it is evident that if we vary the thickness of spring in the same ratio of the diameter of the barrel, we retain the same number of rotations of the barrel. Again, since the number of coils would remain constant, the only factor in the length which varies, is the mean diameter of the area covered by the spring, and this evidently varies in the same ratio as the diameter of the barrel, and, therefore, the length must also vary in the same ratio; hence the diameter of the barrel is the unit for length and strength to a given number of rotations of the barrel.

From this it follows that on the basis of the foregoing formulas tables can be constructed to barrel unity, giving length and number of turns when strength is known, and giving strength and length when the number of turns is given.—[J. HERMANN.

The Decoration of Clocks.

IF THE giving of such and such forms to the clocks which take a place in our dwellings is not a matter of indifference, and if good taste demands that their mounting should be varied to harmonize with the rooms in which they are to be placed, or to suit the taste of the person who has to use them, it is not less necessary to pay the same attention, to bestow the same delicate foresight on the construction of those monumental clocks which ornament the exteriors of public buildings. These have a value and a rôle so perfectly determined, they have in some way a social function so characteristic that it is very evident that architects have no right not to take into consideration how to make them suit the purpose for which they were intended. These clocks, in fact, dependent on the monument of

which they form a part, according to the town or the quarter where they sound the hour regularly, have they not a differing importance? Are they not charged, amid the feverish activity which carries away the inhabitants of a city, with regulating the course of the day's work, with indicating for each one his duty, the moment for business, and the moment for repose? Addressing themselves thus indiscriminately to everybody, rendering a service to everyone, especially in our modern cities where the value of time is so much insisted on, does it not follow that it is indispensable to well consider the situation which is best adapted to them, the form which they ought to affect, the architectural arrangement which shall be proper to one and not to others, so that they shall be plainly visible, and their decoration in accord with those general ideas which they are destined to evoke?

The Middle Ages and Renaissance understood so perfectly the function of public clocks that almost all those which were made during those epochs testify to the different preoccupations of those who constructed them. In the twelfth century, when striking clocks began to appear, there was introduced in their decoration a remarkable degree of fantasy, which was yet always logical. In the fourteenth century there were scarcely any cities in Italy, Germany or France where was not seen, either on a public house or on a church, a clock, a veritable *chef-d'œuvre*, which indicated clearly, by its happy forms and the vast dimensions of the dial, often decorated with painting, and by the pleasing ingenuity of the mechanism of the striking parts, the formal intention which had presided over its establishment. Each inhabitant could, from a distance, distinctly tell the hour.

The clock, provided with a complicated peal of bells which sent out its joyous chimes even to the depths of the most dingy dwellings, had its own personality, its own peculiar character, in which were incorporated and incarnated all the diversities of local character. The proverb to-day so much in vogue, which speaks of the love which one has for his clock-tower, does it not come from this, that this venerated clock-tower, ornamented with its ancient clock, records the sorrows and the joys of every hour of life?

Everybody has seen or heard of the celebrated clocks of the cathedrals at Lyons, Strasburg, Caen, Lille, Metz, Auxerre, Sens, Dijon, etc., which were embellished with puppets (*jacquemarts*) which struck the hour with hammers.

That at Strasburg is composed of

CLOCK ON PALAIS DE JUSTICE,  
PARIS.

a large wooden disc, on which were painted indications of the principal movable feasts. In the middle is a dial whose hands mark the movement of the sun, the moon, the hours and their subdivisions. It is crowned by a statuette of the Virgin, before which at noon come to prostrate themselves the Magi; a cock crows at the same time and flaps his wings, and a little peal of bells plays tunes at certain hours.

At Berne, in Switzerland, can be seen a clock whose movement is yet more peculiar. At each hour a cock crows, and a clown strikes with two hammers upon two bells, while a personage seated on a throne turns his head, opens his mouth, and with one hand waves a sceptre, and with the other an hour-glass as many times as the hammers strike. Before this king defile bears in every kind of position and costume.

At Lunden, Switzerland, there used to be a clock so artistically arranged that when the hour struck two knights encountered each other, and exchanged as many blows as there were hours to strike. Then a door opened, and at the back appeared a theatre, where the

Virgin Mary, seated on a throne and holding the infant Jesus in her arms, received the visit of the Magi, followed by a cavalcade. The kings prostrated themselves and offered their presents, two trumpets sounding during the ceremony, then the spectacle closed abruptly, and recommenced an hour afterward. We give here a fac-simile of a design composed by Nicolo dell' Abate for the sculptural decoration of the clock on the public palace at Bologna. The principal

CLOCK AT BOLOGNA, DESIGNED BY  
NICOLO DELL' ABATE.

panel, included between two Ionic columns, shows the zodiac, surrounded by six allegorical figures—above, Justice and Faith, below them Apollo and Saturn standing, and below two reclining Rivers, doubtless the Reno and Felsina (Bologna). Behind the rivers are to be seen the two characteristic towers of Bologna, l'Asinelli and la Garisenda, and near the figure Felsina a shield bearing the device "*Liber-tas*." We could cite many other examples of such Italian clocks as perfectly equipped and as sumptuously constructed.

At Paris the monumental clock on the Palace of Justice, whose construction dates back to Charles V., and which, under Charles IX. and Henry III., was refurbished, repainted and frescoed, and then ornamented with figures by Germain Pilon, and restored by M. Duc in our own time, is one of the most ancient and most remarkable public clocks in France. Our architects may still seek inspiration from it as a model, excellent for its simplicity and the frankness of its conception, the harmony of its lines and its just proportions. Unfortunately, we have lost the *naïveté* of our forbears, and we can no longer recover their luminosity of invention, nor their love for the logical in the search of elegance. The new clock of the Hôtel de Ville, Paris, it must be allowed, has been treated by the eminent architect of this fine work with quite a special care. We willingly give him credit, for he has well understood the place which in buildings of this sort should be occupied by the instrument charged with

CLOCK, HOTEL DE VILLE, PARIS.

regulating the time, and indicating to the great masses the hours which go by. Situated in the middle of the façade, this clock forms in a certain sense in this vast monument a little building by itself, with its pediments, entablature, pilasters, its sub-basement harmonizing strictly with the general lines, and detaching its fine, rich *silhouette*, without disturbing the unity of the whole. At right and left of the dial, arranged in the break of the lower pediment, are two

standing statues, surrounded by infants and divers attributes. These represent Commerce and Industry. Then above, reclining on the consoles, are two figures seemingly personifying the Seine and Marne. Above the dial, in a panel between two pilasters, is the City of Paris, with proud and haughty mien, but who seems ill at ease in the position, for she seems imprisoned in her frame of stone. At the top of all is a triangular pediment, in the midst of which is the coat-of-arms of the city of Paris, surmounted at each side by two female figures, Vigilance and Prudence. It is the most finished morsel in the whole work, is delicate in execution, and elegant and pure in design, conceived in the sentiment of the Renaissance, and carried out with the delicacy of jewel-work. It is the work of a very able sculptor, M. Charles Gauthier, professor at the Ecole des Arts Décoratifs, and the author of several remarkable works; but there is a shadow over this picture, and it is here that presents itself the problem which we indicated at the outset. In the midst of these eleven figures magnificently mounted, in this monumental clock, what becomes of the dial, the principal motive about which all the rest should be but accessories? Alas, it disappears humbly and effaces itself before this richness, and it was with difficulty that one could from the ground see the hands, before the architect, in order to remedy this deplorable defect which he only detected after the work was done, attempted to increase their proportions, so that the mind was inevitably seized by the following dilemma: Either the architect had no intention of establishing there a clock, and therefore this minute dial is only an incomprehensible and useless ornament—a very rebus laid before the eyes of the passers; or, really intending to construct a clock, he has confounded the accessories with the principal, and has committed an unpardonable solecism by crushing the latter under the luxuriousness of the former.

Such is the criticism which has appeared to us worth making. It has already been made in the journal "*De l'Horlogerie*," by a clock-maker, who is likewise an artist, M. Gustav Sandos, whose judgment we find in perfect accord with ours.

To the foregoing criticisms he adds the following reflections, which may be held as excellent advice: "In our epoch," says he, "remarkable efforts are made to attenuate the coldness of stone by employing in construction marble, bronze and faience. It was a unique opportunity to introduce in the central portion a polychromatic decoration, which has been evidently sought by placing men-at-arms sparkling with gold upon the roof. This employment of color would certainly have been there more in place, and would have agreeably drawn the eye by breaking the monotony of the façade."

Surely those grave persons who to-day smile over the antique clocks with their chimes and puppets, whose mythical apparition rejoiced the hearts of our ancestors, cannot find fault that an attempt is made to enliven so monotonous an object as a dial. Art and science have not yet declared war, I imagine, and it is not forbidden to bestow a little grace and harmonious equilibrium upon our public clocks under pretext that these pretend to go with precision.—[VICTOR CHAMPIER in the *Revue des Arts Décoratifs*.

### The Regulating of Watches.

[By HERMANN GROSCH, in his *Praktisches Handbuch für Uhrmacher*.]

INTRODUCTION.—Although the subject of regulating watches will be considered by many as pretty well exhausted, in view of the great number of works existing on horology, and more especially the excellent work of Mr. C. Saunier, still I do not think that a simple article, written with the view of being understood by every reader, and containing the experience of many years, will fill the already full measure to overflowing. I am forced to confess, on the contrary, that this subject has always appeared to me as not being treated with due consideration; good regulators were very scarce years ago; there were a few at Geneva who made a great mystery of their art and taught

no apprentices; it was not much better in Paris; London possessed several good regulators, although, if we were to believe the statements of Mr. Glasgow, the very reverse was the fact. We record with great satisfaction that German watches, especially those of Mr. Lange, of Glashütte, show a closeness of regulating, which, as far as anchor watches are concerned, stands unexcelled.\* Total differences of only two seconds within four weeks, according to the certificates from the Leipzig Observatory are next to nothing, especially when we consider the severe tests to which watches are subjected at such places.

What constitutes the actual value of a watch in the eye of its possessor? The answer is simple: Its good rate; that the watch preserves its rate not alone in the different positions, but also in the different temperatures. Present your friend with a fine watch that has not been well regulated, and he will simply pronounce it to be of an inferior grade. Frequently, very severe remarks about watch-makers are made even by persons who ought to know better; who bought a fine grade watch which was not very closely regulated, and they were disappointed in its timekeeping qualities. That much of this disappointment is due to a wrong treatment at their hands is beyond question, but, after all, it is only too true that many watch-makers are perfectly in the dark on the subject of regulating watches, and a great service to horology would be rendered if some one were to teach an art of regulating, based upon substantial foundations and performed with convenient means. By "convenient means" we understand those by the use of which a continued correctness of rate is produced without the disagreeable necessity of taking down various parts, and continually disturbing the performance of the watch.

What are these means, and upon what principles are they based? Mr. M. Phillips, in his treatise on the balance spring, confirmed by his most ingenious reasonings the suppositions of Berthoud, the discovery of Breguet's over-coil spring and the observations of Moinet, etc., and arrived by power of his reasoning to the following results, which were heretofore merely suspected by former regulators and which have been fully confirmed by practice, to wit:

Isochronism, or the equal duration of the larger and smaller balance vibrations, can be established by the following conditions:

1. The center of gravity of the whole balance spring must be upon the balance staff.
2. The single coils of the balance spring must also during its activity, in other words, during the vibrations of the balance, be concentric to the center of the balance staff.
3. The balance pivots must, during the expansion of the spring, exert no pressure upon the sides of the hole.

These conditions are best complied with by a cylindrical spring, next by an over-coil or Breguet spring, and under certain conditions by a flat.

We will in the following article confine ourselves chiefly to the Breguet or over-coil spring; and we shall principally devote our attention to the regulating of finer grade watches, that is, those with compensated balance and over-coil spring, and finally add a few remarks on the regulating of inferior grade anchor and cylinder watches. [The author next speaks in terms of high encomium of the prize essay by Mr. Immisch: "Isochronism of the Balance Spring," although he urges several objections to different statements, as follows]:

We would say, however, that we do not unconditionally subscribe to everything recommended by the author; according to our experience we do not agree with him when he proposes the flattening, or worse yet, the grinding oblique of the pivot ends; regulating in hanging and lying is, after all, nothing else than the reduction to isochronism of the smaller and larger vibrations in these two different positions. When regulating in the vertical position many difficulties

\* The translator would state that this article was written *before* the sweeping triumphs of the AMERICAN WATCH, and he therefore translated these ebullitions of self-vanity together with the article.

are to be overcome in consequence of the pivot frictions; the vibrations are smaller and of greater duration while in a horizontal position, when the friction of the pivots is diminished larger vibrations, but of a shorter duration, occur. This is the most important and at the same time the most difficult point in regulating; according to our view, every friction is to be reduced as much as possible. By reason of the thickening of the oil, which unhappily takes place far too soon, the frictions are increased anyhow, and we therefore would recommend slightly rounded-off pivots, well polished, with edges well rounded-off, so that they do not scratch the finger nail; the best form is the conical, although the part moving in the jewel hole must be perfectly cylindrical, pass through the jewel hole, its end run against the cap jewel, and, in general, be not too thick, while at the same time not so weak that their breakage is to be feared at every concussion; the jewel holes must be of an olive shape and well polished, fit well to the pivots, at the same time permitting them due shake so that the balance vibrates as freely as possible.

As we chiefly write for the young beginner we would recommend that he first satisfy himself whether there are no defects that will render a regulating impossible; all the functions of the escapement must be in thorough working order; a defect, trifling in itself, may jeopardize the entire final result. One defect, which is generally found only in good watches, and consequently is often overlooked, consists in too great an exactness of the different parts of the escapement. The drop is frequently unequal or so scant that in certain cases it already suffices to remove the gilding from those places of the plate against which the fork, during its rests, applied itself, in order to correct it. So as to be very certain, let him pass through each single tooth of the wheel, by detaining the fork in this process with a pointed pegwood, and conducting it to both sides up to detent.

Satisfy yourself that all jewel holes are set straight, that no pinchings occur, and that all the holes of the center wheel are in order, as they are frequently neglected. The wheel must have sufficient shake, nor must the holes be too contracted, otherwise the oil will draw away from the pivots, after which they commence to wear each other and the rate of the watch suffers. It is barely worth mentioning that the depths must be inspected, also the barrel stop work and the development of the spring. It must be duly taken into account that every want of attention, every neglect, will eventually avenge itself; time is wasted uselessly, and the regulator retrogresses instead of progresses; unhappily, there are too many watches which are constitutionally very rebellious and inclined to backslidings.

Also satisfy yourself that the balance pivots are round; we have often found them oval on conical pivots. It is difficult to detect this defect, which produces the same effect as a balance out of poise, that is, it is absolutely impossible to establish an isochronism with them; there is no other remedy than to make a new staff, which, of course, is to be well hardened.

There are certain errors more readily detected by the ear than by the touch and sight; for this purpose wind the watch partially and listen, placing it in all possible positions. To these belongs a slight scraping of the ruby pin in the notch of the fork or on the guard pin, or on the prongs of the fork, the scraping of the balance spring or its bad developments, etc.

The balance, especially, demands all our attention; it must run perfectly straight and true, and be poised faultlessly exact. It will have happened to many a regulator that a watch which he regulated with great exactness, and the balance of which was truly round, was returned to him after a certain time because it no longer would keep correct time and could not be regulated, without any visible cause to produce it. When closely examined it was found that the balance had drawn out of true, in consequence of which the regulating had been destroyed. This may be owing to an imperfect and faulty homogeneity of the metals of the balance. To prevent another occurrence of this kind, heat the balance upon a flat metallic plate to about 70 degrees, let it cool, and then cautiously round it between the fingers; heat it again and continue the manipulation until a fur-

ther alteration will no longer occur, and you are certain that it will resume its exact round shape.

When on a hot summer day it becomes necessary to handle a balance repeatedly, which is necessary when turning a new staff, regulating the compensation or other work of the same nature, it is advisable to occasionally cool it off upon a cold metal plate; without this precaution it may happen that the balance rim will contract so that it alters its diameter in mean or low temperature, in consequence of which the regulating is disordered.

The size of the barrel cover has generally been accepted as indicative of the diameter of the balance, and half the breadth of the mainspring as the height of its rim. This rim is provided with from 12 to 16 gold screws. We must at this opportunity again highly recommend the balances of..... A highly original device and conscientious execution prevent the above mentioned two defects.. .. Beside this they are provided with fine slits for the regulating screws; as is well known a balance contains two or four screws for the sole purpose of shifting the center of vibration or gravity to a small degree, by being screwed in or out after the watch has been regulated with the balance spring, by means of which the last exact regulating is produced; where these screws are located in said balances, a longitudinal split has been made with a very thin fraise in the center of the balance rim, so that a springing screw hole is obtained. We have never, in the many years that we were engaged in regulating with these balances found a single instance confirming the objection that the regulating screws are prone to fall out, although we found this repeatedly in balances of English and Swiss manufacture.

If a watch advances in heat, it will be necessary to remove the screws or the balls upon the balance rim more toward the arms or the closed part of the rim. If a satisfactory compensation is not obtained thereby, cut or file a trifle from the rim at the place of the cut, make this wider and replace the wanting weight by two small screws placed opposite to each other.

(To be Continued.)

### A DISTINGUISHED BODY OF WATCH AND CLOCK MAKERS.

*One hundred and twenty-fourth discussion.—Communicated by the Secretary.*

[NOTICE.—Correspondents should write all letters intended for the Club separate from any other business matters, and headed "Secretary of the Horological Club." Direct the envelope to D. H. Hopkinson, Esq. Write only on one side of the paper, state the points briefly, mail as early as possible, as it must be received here not later than the eighth day of the month, in order to be discussed and reported in the CIRCULAR for the next month.

---

### NEW ARITHMETICS AND NEW KINDS OF WEIGHTS.

#### *Secretary of Horological Club:*

By answering the following questions you will greatly oblige a young subscriber:

I have an arithmetic which says: 20 mites=1 grain; 20 grs.=1 pwt.; 20 pwts.=1 oz.; 12 ozs.=1 lb. Is it correct? If not, please give the correct table. The same book says: "The term karat is also applied to a weight of 3½ grs. Troy, used in weighing diamonds; it is divided into 4 parts called *grains*; 4 grs. Troy are thus equal to 5 grs. diamond weight." Is it right?

I have obtained a few numbers of THE CIRCULAR of 1882, and seen the Patent Report, which I think very interesting and instructive. Why is it not published now?

Can back numbers of THE CIRCULAR be obtained at the office?

J. B. S.

Mr. Clerkenwell thought he knew something about arithmetic, but he must acknowledge his ignorance of the "mite" as a weight. As to the table being correct, our correspondent did not state what was the system or name of the table. It evidently is not Troy, nor

Apothecary's, nor Avoirdupois, which comprise all the usual weights. There may be such a system in use somewhere, for some purpose, but he did not know of any such, and would like to know what the book called it; also the name of the book and how old it was.

As regards the statement about the diamond weights, a short calculation would show its incorrectness. If the karat is  $3\frac{1}{2}$  grains Troy, then 1 grain diamond weight would be one-fourth of that, or  $\frac{7}{8}$  of a grain Troy. On the other hand, if 4 grains Troy are equal to 5 grains diamond weight, then one grain diamond weight would be  $\frac{4}{5}$  of a Troy grain. There is quite a difference between  $\frac{7}{8}$  and  $\frac{4}{5}$ , according to common arithmetics, but perhaps this one can get around that by some new arithmetical discovery. By all means give us the name, etc. We live to learn, and if it is possible to convert  $\frac{7}{8}$  into  $\frac{4}{5}$ , we can extend it a little further and make 1 equal to 2, and so keep on stretching it out until we can convert *tuum* into *meum* and make our everlasting fortunes by it.

The back numbers of THE CIRCULAR, he believed, were exhausted up to quite a recent date, but odd numbers could probably be supplied for several years back. That could only be ascertained by naming the numbers wanted at the office.

#### WATCH REPAIRING—"TRAIN TESTER."

*Secretary of Horological Club:*

Your honorable body has favored me with some numbers of *The Metallurgist*, for which please accept my thanks until you are better paid. As your paper is the medium of correspondents who wish to contribute to the interest of our watchmakers at large, I take this opportunity to say that I have worked all my life at the watchmaker's business, and have felt that there was a great difficulty in discovering difficulties of watches that have worn themselves into a constitutional ailment, and the same with some of our cheap made new American watches. To illustrate: a workman must take a watch to pieces, look it all over and see what is to be seen, and clean and repair all that he can find wanting to be done to make the watch run. He then puts it up and still it fails to run. Again he takes it to pieces and looks more closely, then puts it up again to be disappointed. He then takes it down and tries the pivots and deepthing of all the wheels, puts up the job again; perhaps it may run and perhaps it won't turn a wheel. Now, I have invented a little device that I have used, which is of great worth to our trade. After I clean and repair a watch, I attach what I call a train tester that I attach to the movement, and it allows the watch to run the second wheel around once in 4 seconds, giving me the opportunity of seeing the train run in all its perfection; or, if it is imperfect, it will not operate the train tester, so that I am able to learn in two minutes what it will take two days to find out without this little device. Every watchmaker should have one, and I have shown it to two of our best workmen here; they think it is of great value to our trade. I think that there is money in it, to myself and all parties that are interested in laying it before the trade. When once seen it will be appreciated. I have not patented it yet but have taken steps to secure my rights, and I now wish to have some active party to become half owner with myself. Terms can be learned on application by letter. I will here state a case in which I have had the benefit of my invention, the train tester. A man brought in an Elgin watch, said he had carried for 20 years; it had always proved a faithful servant but now had stopped. I applied the train tester; it would not move. I took it to pieces, cleaned it, put it up. It would run a minute or so then stop. I attached the train tester; it would not move. I took it apart again and looked it all over, was about to put it up again for trial, when I noticed a faint mark on the end of the cogs of the barrel wheel. On examination I found that the 20 year winding had worn the barrel so that it inclined over toward the plate pillar, and rubbed against a little bead that was turned on the pillar for ornament, taking from the train the power due it from the mainspring. I filed off the little bead and put the watch together, attached the train tester; it works fine. I then completed the watch in case and it works well. I have written to B. F. Norris, of Chicago, offering to subject it to an investigating committee, if I can find the party that wishes to take out the patent complete, and complete the manufacturing of the device and lay it before the consumer. You are at liberty to publish this if you deem it of any interest to our trade. Address Box 478, San Diego, California.

J. H. TIBBITS, Watchmaker.

Mr. O'Lever said the device appeared to be something for moving the wheels without putting the watch all together. No doubt it

would be useful in many cases, and we publish Mr. Tibbit's letter in order to give him an opportunity to find a party to take hold of it.

But as for repeatedly taking a watch down and putting it up again before finding the trouble, that is something that a skillful workman seldom does—indeed, a good workman feels ashamed to have to take a watch apart even the second time, for he considers it a reflection upon his skill in examining watches for defects. In the case stated, a workman knowing that the watch had run twenty years should always expect to find the barrel worn and inclining more or less, and should give special attention to that part in the examination. As a rule, a good workman who examines a movement carefully and thoroughly, should be able to discover its faults the first time. There is, of course, a system or order in which the parts should be examined to economize time and labor, and all workmen would do well to study the remarkably full and valuable directions for examining the different kinds of watches given by "Excelsior" in his "Practical Hints on Watch Repairing," published in THE CIRCULAR a few years ago. Any one who follows them properly will seldom have to repeat the examination, but may feel confident that he can put the watch up and have it "stay fixed."

#### REMOVING SOFT SOLDER—OILING LEVER PALLETS.

*Secretary of Horological Club:*

What is there that will remove soft solder from cases, breast pins, etc., preparatory to hard soldering, and that will not interfere to any extent with the gold or silver, as you are probably aware of difficulty experienced with such articles that have been in the hands of some "botch," the Lord only knows of the thousands too many of such we have in "the land of the free." Would you advise not oiling pallets or scape teeth of lever watches. I customarily oil them slightly; had a P. S. B. as I believe in good order but which did not make a first-class motion as I thought, until I applied a trifle of oil to scapement.

S. R. T.

Mr. McFuzee replied that a method was published in our Proceedings a couple of years ago for removing solder by a chemical solution which dissolved the solder without affecting gold and silver. He did not remember the formula, but it was simple and cheap. Owing to recent business changes, moving, etc., our files of THE CIRCULAR are not accessible, and we cannot refer to them for the details. But very likely Mr. T. had the back numbers and could readily refer to them.

As for oiling the pallets of detached levers, it depends somewhat on circumstances. Very fine movements are supposed to be so highly finished as not to need oil there, which is held to be detrimental to fine timekeeping; but the more usual practice, especially with ordinary watches, is to oil them. They should not be smeared with oil so as to run up on the under side of the lever fork, or on the top of the escape wheel, as it will gather dirt and lead to sticking and clogging the wheel while passing near or under the fork. Only the pallet stones should be oiled and sparingly.

#### POLISHING STEEL.

*Secretary of Horological Club:*

Will you please tell me how to get a bright polish on steel, such as highly polished steel parts of watches? And what kind of steel should be employed, and where can it be bought?

At what speed should the polishing lathe be run for such work? By answering the above questions in THE CIRCULAR you will greatly oblige me.

B.

Mr. Uhrmacher said that the polish did not depend on the kind of steel used. Any good, close-grained steel would do. It should be properly hardened and tempered, and (after being brought as nearly as possible to its final shape by turning or otherwise), then ground with oilstone dust and oil till a fine gray surface is obtained. The polish is then put on with crocus and diamantine. Different kinds of "laps" are used by different workmen, the most common being soft iron, copper, tin, type metal and bell metal. The latter is generally preferred for small laps on account of its hardness, keeping its shape well. But type metal is also a very good material. Large type can be bought at any printing office very cheaply, after

being worn too much for printing from, and filed into shape. Bell metal slips can be obtained from any material dealer. The speed of the lathe should be quite rapid for polishing. But the chief requisite for obtaining a good polish is to have the surfaces truly plane or flat. An irregular surface can never have a perfect polish. All the corners should be cut clean and square, and the flats must extend to the very edges—if edges are rounded off it shows poor workmanship.

#### ISOCHRONAL HAIR SPRINGS.

##### *Secretary of Horological Club:*

Is there no hair spring that will not have to go through such a long process before it will be isochronal? It seems as if there might be something invented which would not require so much labor—something that would be isochronal naturally. Why not? I see that "Excelsior" has got up a new kind of spring. Is that naturally isochronal? How is it made? Has he introduced it into use yet? If he has I would like to know where I could get one to examine. By answering the above you will very much oblige an old subscriber.  
W. H.

Mr. Regulator replied there is no such spring now used, nor has any ever been made known unless "Excelsior's" new spring is of that kind, and his circular seemed to imply that it was. Nobody knows how it is made, as he says that he shall keep it secret until he finds some manufacturer who wants to buy such a spring. He evidently thinks that the best way to keep a secret is to keep it in his own head—in which he is probably not far out of the way. It will be a pity, though, if none of our makers should have enterprise and trade pride enough to secure and introduce it, for such a spring would inaugurate a new era in watchmaking. Only imagine even the cheapest watches having isochronal hair springs! Lever clocks fitted with them would be as good timekeepers as pendulum clocks, and would probably soon supersede them. It is to be hoped that he has found a purchaser, and that the springs are now being made and applied to use.

All springs thus far known require to be tested and adjusted till they are brought into such size, form and length, that their strength will increase and decrease in proper proportion as the balance vibrates and the coils open and close. They are then called isochronized or isochronal. That is what occupies so much time. It is a long and tedious process at the best, although it may be considerably shortened by following some system. The different methods of isochronizing are fully described in "Excelsior's" book, the "Practical Treatise on the Balance Spring," and a careful study of them until the reasons are fully understood will enable the adjuster to work intelligently and easily, and to perform the adjustment closely and with certainty. Even after springs have been properly adjusted, any change in their length, either by taking up or letting out, injures or destroys their isochronism.

But there does not appear to be any reason why a spring might not be devised which would have that property naturally, and which would not be affected by altering the length—if we only had "gumption" enough to do it. When somebody does find such a spring, it will very likely be so simple and easy that we shall all wonder why *we* could not have thought of that ourselves, and will want to kick ourselves for being so blank blank stupid as not to see it.

---

#### Our Providence Letter.

[FROM OUR SPECIAL CORRESPONDENT.]

THERE IS no improvement in trade, and the outlook continues gloomy. The general impression seems to be that there will be but little business done until after the New Year. The recent failures of S. Friedman & Co., of Chicago, and E. Dahlheimer, of Cincinnati, have caused much unfavorable comment, and are of a

nature that should serve as a warning to the trade. In the latter case the circumstances were of a peculiarly aggravated nature. Dahlheimer spent about a fortnight in this city and Attleboro during the month of July last, visited quite a number of houses, made extensive selections of goods, and in almost every case volunteered a full showing of his affairs. His apparent candor in this respect in several instances gained the confidence of parties who had no former dealings with him, and despite the cautions they received from the mercantile agency they shipped their goods. Dahlheimer seemed to possess a peculiar influence over those with whom he came in contact as the following incident will show. One of our manufacturers, a sharp, shrewd business man, called on him the day prior to his failure, and told him that he had been told he was in some financial trouble. Dahlheimer indignantly denied this, produced his books for his inspection, and his creditor left him fully believing him to be a much maligned man, and from the examination he made of the books was satisfied that he was in easy circumstances and worth from \$30,000 to \$35,000 over all liabilities. You may judge his surprise when he heard of his assignment on the following day. The local papers have had lengthy notices of this failure, and an indignation meeting of creditors was held at the office of Mr. Chas. S. Pine on the 8th ult. A general meeting of the trade to consider the subject of how to prevent failures of this class is announced to be held at the rooms of the New England Manufacturing Jewelers' Association on the 18th inst. It is hoped that an association may be formed that will eventually drive out of the trade all persons whose transactions are of a questionable nature. It is a duty the manufacturers owe to the honest dealer, and they seem fully determined to carry it through.

The monthly meeting of the New England Manufacturing Jewelers' Association was held at their rooms on the 4th inst., the President in the chair. The minutes of the previous meeting were read by the Secretary and approved. The Treasurer then read his statement, which was approved and put on file. An application from a social club was read for the use of the rooms of the Association for one night. Some discussion arose as to the desirability of such an innovation, and it was finally resolved to decline the proposal. Mr. McCloy spoke very feelingly of the death of Mr. Peck, an old and respected member of the Association, and it was moved and unanimously resolved that a floral tribute should be sent his family. It was also resolved that the Association should, in each case of the death of a member, send a like tribute of respect. The meeting then adjourned.

Messrs. Ellison & Vester are bringing out an entirely novel line of goods. I have seen some specimens, and I think they will command a large and ready sale.

The firm of A. Holt & Co., platers and manufacturing jewelers, have dissolved, Mr. Joseph Weaver selling out his interest to Mr. S. Field. The business will continue under the same style. Mr. Weaver is about to move to Attleboro, where he will make a line of plated chain. His friends here (and they are many), cordially wish him success in his undertaking.

At the meeting alluded to above, it is probable that the subject of forming a Jewelers' Board of Trade will be ventilated. The trade feels the pressure of the dull times, and seems convinced that some united action is necessary in their own interest.

I heard a good story of one of our manufacturers here the other day, who bears the reputation of being a persistent practical joker. It appears that he had had a number of pigs attacked with "staggers," and a neighbor of his being in similar trouble appealed to him as follows: "Say, B., what did you give your pigs when they had the staggers?" "Rum and rock salt," was the reply. "How much did you give them?" "Why as much as they would drink." Away went the neighbor to try the remedy. The following day he put in an appearance at B.'s office with a very elongated visage. "Didn't you tell me you gave your pigs rum and rock salt?" said he. "Yes,"

said B., "I did." "Well, I gave it to mine and they are all dead." "So are mine," said B. triumphantly. I have not heard that B has been asked for any further medical advice in the case of sick pigs. Providence, Oct. 14, 1884. ASMODEUS.

CHARLES G. LEWIS.....Of Randel, Baremore & Billings.

THE JEWELERS' CIRCULAR is the exclusive official paper of the Jewelers' League, and has been selected for the publication of all matters of interest pertaining thereto. Letters or inquiries pertinent to its business or purposes, and which might interest the trade or inquirers, will herein be answered. Address Jewelers' League, Box 3,444, P. O., New York, or the office of THE CIRCULAR.

AT THE regular meeting of the Executive Committee held Oct. 3d, 1884, the following members were present: President Woglom and Messrs. Johnson, Lewis, Howe, Bowden, Saxton and Sexton.

In compliance with the wishes of many members of the League, an extension of the time was ordered, for the payment of assessments Nos. 36, 37, 38, 39 and 40, (\$10.00) closing Oct. 20th, 1884, for the period of one month (the extreme time allowed by the constitution.)

The above assessments will, therefore, close November 20th, 1884.

Treasurer reported balance in General Fund \$2,762.14.

Nine (9) changes of beneficiaries were granted.

Two (2) applications were rejected.

Six (6) applications were referred.

The following 20 applicants were accepted:

H. H. Horst, A. Lindo, I. Lindo, C. J. Shelton, New York City, N. Y.; F. J. Hutchinson, Hornellsville, N. Y.; F. Krementz, Newark, N. J.; S. H. Megie, Plainfield, N. J.; F. Schober, Philadelphia, Pa.; O. C. Boillotat, Milford, Pa.; E. B. Towle, Newburyport, Mass.; G. K. Ballentine, Grafton, W. Va.; W. S. Pyle, Dublin, Md.; F. F. Bon-

### Sight.

WHAT THE OPTICIAN SHOULD KNOW ABOUT OPTICS.

Based upon an extensive hospital experience in Austria, Germany, England and New York. By C. A. BUCKLIN, M. D., New York. Author of Detection and Correction of Visual Imperfections, Cause and Cure of Cross Eyes, Effects of Color on Distance, and Monograph on Astigmatism.

Continued from page 245.

MINDEN, Oct. 8th, 1884.

Dr. C. A. Bucklin:

DEAR SIR—I take advantage of your kind offer in THE JEWELERS' CIRCULAR AND HOROLOGICAL REVIEW, to ask you a few questions concerning a young man of this place.

Not long since this young man had a severe attack of fever, and, when convalescent, very imprudently injured his eyes by almost constant reading. As a consequence his eyesight is now—at the age of 27—like that of extreme age. Although the iris and cornea both appear perfectly clear, and even the muscles of accommodation seem, but slightly impaired, this young man cannot even recognize a familiar face at six feet distance, and no glasses in my assortment (which is small) seem to benefit him in the least. The best he can do with the test letters is to read very black inch letters at the normal distance—or 14 inches, and even these he does not see distinctly.

If you can benefit this young man's case in any way please let me know through THE JEWELERS' CIRCULAR as soon as possible.

Yours respectfully, EDWARD ETTER.

P. S.—Since writing the above I have ascertained that the young man can see best at 7 or 8 inches distance; at this distance he can read the printed address on the envelope of this letter. E. E.

The fact that one can read fine print at seven or eight inches only would appear to indicate excessive myopia (near-sight). It is, however, true, that persons having degrees of far-sight requiring convex glasses No. six will be able to read at seven inches by straining. Such a person sees very badly at a distance, and can only see near objects. The conclusion, therefore, is that he is myopic, which is wrong.

It is easily understood how a person having excessive myopia could have the above symptoms. A person having a high degree of astigmatism will frequently give the same history.

A person having BAD vision from any cause may give these symptoms.

This apparently unreasonable statement is explained in this way: The person seeing poorly finds by bringing the observed object very near he causes his accommodation to be forced to the highest point; by doing this his pupils are made to contract to the greatest possible extent; thus the indistinctness of the retinal image caused by the circles of diffusion resulting from the visual defect are in a large degree compensated for by a "pin hole" pupil.

The vision in such cases is also greatly improved by causing the patient to look through a pin hole in a card.

The only way to determine the cause of such symptoms is to exclude far-sight by the use of convex lenses; if all convex lenses make distant vision worse, far-sight does not exist. If concave lenses fail to improve distant vision, then you may conclude that no degree of myopia exists which can be corrected.

Having excluded far-sight and near-sight, you exclude astigmatism by calling the attention to a clock dial at some five or ten feet distance; if there are any two figures directly opposite of each other which are darker than the others you may safely conclude that the person has astigmatism. I suspect in this case excessive myopia, which has followed an inflammation of the sclerotic and choroid coats of the eye; these coats having become softened have allowed the eye-ball to stretch and become elongated, thus causing myopia.

Without some experimental data gained by the trial of concave

and convex lenses, I could not give any directions of a practical nature which would enable the enquirer to benefit his patient. Would, however, be pleased to hear more definitely from him.

The following letter is from a gentleman who never has had any previous experience in correcting astigmatic defects. He is miles from any reliable expert, and he has succeeded with the *Ophthalmoscopic Test Lenses* in making a young man see who was little better than blind, who probably never would have seen had not this gentleman had the courage to attack the subject of astigmatism.

WAPAKONETA, O., Oct. 16th, 1884.

Dr. Bucklin:

My astigmatic customer resides 14 miles distant, and only came to see me to-day, which explains the delay in answering your very kind and instructive letter of Oct. 3d.

My customer (a young man of 18 whose eyes were always as they are now) cannot see to read any of the letters on the visual test at 20 feet, and no plain convex or concave lenses will in the least improve his vision at that distance. The fan lines at a few feet distance show the horizontal lines heavy, and vertical lines appear pale and thin, and continue thus as far as he can see them (about 20 feet.)

*The Right Eye*—Convex cylindrical lense either 8+ or 10+, axis 90°, corrects the astigmatism, *i. e.*, make the fan lines appear normal and enable him to see the letters L on the visual test. The addition of plain convex lenses make vision worse, but for reading at 13 to 17 inches the addition of either 20 to 24 convex lense improves the vision at that distance.

*Left Eye*—Convex cylindrical lense 14+ to 18+ corrects the astigmatism, axis 110°, and enables him to see the block letters XL on visual test at 20 feet, and no combination will produce as clear a vision at 20 feet as the above. For reading at 13 to 17 inches the addition of a convex lense 10 to 12 improves the vision and enables him to see fine newspaper print.

My idea of the combination required for reading is:

*Right Eye* +10 concave, +24 convex, axis 90°.

*Left Eye* +14 concave, +12 convex, axis 110°.

Pupillary distance, 2 $\frac{5}{8}$  inches.

And for seeing at a distance to omit the convex combinations and use cylinders alone. I think he desires glasses for reading principally—but you can tell best which will do him the most good.

I have been a little diffusive in stating this case, but the work is new to me and I was anxious to cover all the points, which reminds me that I ought to tell that "he" can read ordinary print at 10 to 14 inches without glasses, but it is straining on him; convex lenses help him little or nothing. Very resp'y yours, HENRY MOSER.

Concave nor convex lenses not improving distant vision, we are forced to the conclusion that neither myopia nor far-sight exists. It is a case of simple astigmatism.

The age of the person being only 18 years, we would not suspect any reduction in the power of accommodation. The experiment of convex lenses improving vision at the reading distance, is evidence against our conclusion.

The last remark strengthens, however, our first conclusion. He can read at fourteen inches by straining; convex lenses do not help him. My conclusion is that he should have the cylindrical correction required. The axis of the lenses being plainly marked and they should be set in round frames, so that if the patient has deceived himself as to the proper axis it can readily be corrected by rotating the lenses in the frames.

He mentions the pupillary distance as 2 $\frac{5}{8}$  inches, which was measured by "The Pupillary Distance Measure."

This instrument consists of two disks with a fine slot through the middle of each. A lamp or object is observed with the left eye through the left disk; the other disk is cautiously slid inward till the object appears double and the pupillary distance is observed on the scale. If the two objects be exactly under each other or only lack two or three inches of being under each other the muscles of the eye may be said to have their normal relative strength.

The following case is very interesting: Mr. B. is a hypercritical optician, he has every possible optical appliance. He was induced to make a study of optics owing to his own troublesome vision; he had found and exactly measured a slight astigmatism which he had but still his eyes were very troublesome. He thought that the pupil-

lary distance measure was an entirely superfluous instrument. I directed his attention at a gas flame some ten feet distant through the *pupillary distance measure*, and the *lateral* distance between the two flames was some three or more feet; 8 of prism, base in, brought the flames together.

I gave him a pair of 36 convex with 4. of prism, for both eyes, bases in which made him very happy. He went home convinced that there was more common sense in that little instrument than he had been willing to believe.

It being necessary with these kind of lenses to grind the convex surface entirely on one side and the prism on the other, a curved or hollow appearance is frequently given to surfaces, which can only be overcome by carefully centering the lenses for the working distance.

There are many watchmakers who complain of the following difficulty: They have no trouble in writing or reading, but to use an eye-glass in their watch work causes them great fatigue. The difficulty is explained in the following way: Some have a slight myopic astigmatism which is increased sufficiently by glancing through the strong eye-glass, sufficiently to cause the vision to be indistinct. Others who have eyes which are perfectly normal have a conformation of the orbit which always causes an eye-glass, when seized by the orbicular muscle, to deviate considerably from the axis of vision, thus producing an astigmatic effect by directing the visual axis slantingly through the lense. These defects can be corrected by slightly changing the form of the lense holder or by the use of a cylindrical lense. These defects escape the attention of the most expert oculists, because when they test the vision for the distance it is found to be perfectly normal.

---

## A Review of the Experiments of the Old Masters of Horology.

*Continued from page 284.*

### 6. THE ISOCHRONISM OF THE BALANCE VIBRATIONS AND THE CYLINDRICAL BALANCE SPRING.

The arcs of vibration of the balance decrease in due ratio with the length of time that the watch has been running, because its frictions increase by the drying and thickening of the oil, in consequence of which the train cannot communicate its full force to the regulator, which will, beside this, meet with another and new resistance to its activity, the thickening of the oil at its own pivots. The jars which a watch experiences when worn, and which a chronometer suffers on board ship, also disturbs more or less their balance vibrations, and, consequently, more or less change the amplitudes of the latter. These changes of amplitude are very injurious to the regularity of rate of timepieces intended for the exact measurement of time. Two distinguished horologists, however, instituted experiments in the premises and discovered a way how to make of equal duration the large and the small vibrations of the balance—in other words, how to render them isochronous.

An appropriate isochronism of their balance vibrations is the chief requisite for the exact performance of chronometers. The two celebrated artists, to whom we owe the discovery of the isochronous motion of the balance spring, arrived at the same results by two different ways.

The method of Pierre LeRoy is the one most generally employed, and is based upon the observation that a very short spring, which is of a uniform thickness throughout its entire length, is in a far greater degree acted on by the balance vibrations than a longer one; the larger vibrations are therefore accomplished in a shorter time than the smaller. A very long spring, on the other hand, is acted on far less, or in a far smaller degree, than the former, and therefore the large vibrations require more time for being accomplished than the smaller. But between two extremes there is a medium in which the

large and the small arcs of vibration are of an equal duration; and practice has fully confirmed these truths.

Ferdinand Berthoud's method of rendering the balance spring isochronous is based upon a principle entirely different from the preceding; he produced isochronism with the shape of the spring, not with its length. Berthoud made the coils of the balance spring increasingly thinner, tapering them in progression with their distance from the center. A spring shorter than the one employed by LeRoy might thus be rendered isochronous by his method.

Both methods can be used to advantage, although that of LeRoy is preferable by reason of the greater convenience it offers to the watchmaker, as he can use a spring of uniform thickness of coil. It may occasionally happen, however, that he is forced to have recourse to Berthoud's method, if the available space in the watch should happen to be too scant to allow the employment of any other kind of spring; but he will be sure to meet with another very great difficulty of execution; the thickness of the spring must decrease in a very exact and thoroughly uniform progression.

We will at some future time come back to the subject of isochronism, when we intend to elucidate the medium most appropriate between the duration of large and small balance vibrations; experience teaches that in order to produce a regular rate of a chronometer for any length of time, it is best to deviate to a certain point from the principle of perfect isochronism.

Fig. 18 represents the shape of a balance spring for chronometers. It will be seen that this spring is cylindrical, because by this form the single coils are less exposed to disturbances, and they will not touch each other even by violent concussions. At the same time the watchmaker can with greater facility manufacture a spring of this shape than a flat one. (Although it appears that the spherical form allows the greatest elasticity to the spring, and permits the balance more freedom than any other). Either gold or steel can be used as material; when using steel, it may be hardened either by fire or by hammering. There is less danger of rendering the spring fragile by hardening it by pressing. Making the spring from steel is at the same time the most convenient and best way, as the flattened and hardened material of every diameter can readily be obtained anywhere. Jurgensen used 16 and 18 karat gold for many springs he manufactured, and he assures us that he always employed this metal with great satisfaction, as it assumes an elasticity which leaves nothing more to be desired, and is in no manner inferior to untempered steel. Although the manufacture of gold springs is connected with far greater difficulties, they possess one great advantage in that they are not attacked by rust, which will invariably occur sooner or later with chronometer steel springs.

When 18 karat gold has been alloyed with very pure copper, it will retain its elasticity completely.

It is next to impossible to determine beforehand the exact length of the balance spring, as its several proportions depend upon the size and weight of the balance, as well as upon the thickness of its pivots and shape of the holes. Approximately correct may be assumed the proportion, by considering the size, or the diameter of the cylindrical steel spring, as being equal to one-third of the balance diameter and making it of 8 or 9 coils. Should the watch or chronometer be unduly flat it becomes necessary to make it of less coils; in this case, however, the latter must be of a greater diameter, so that the length of the spring shall amount to fully the ninefold of the balance diameter. The flat or over-coil spring of Breguet is made of 10 or 11 coils, and its size is to be so that it measures from 1 to  $1\frac{1}{2}$  coils beyond the radius of the balance.

Experience teaches that with cylindrical balance springs, isochronism is more easily established than with flat springs, as the coils of the former lie at the same distance from the spring's center, and,

consequently, the motions of the coils will always remain equal among themselves. Breguet also tried to impart a greater isochronism to the flat balance spring by the ingenious disposition shown in fig. 19, and the eminent success he attained thereby is of very great importance, because of the tendency at present to manufacture flat timepieces, in which the cylindrical spring can no longer be employed. Breguet's disposition consists in bringing the outer coil back to the center, by which, beyond question, an excellent effect for the uniform flexion of the coils during the activity of the spring is produced.

FIG. 19.

It is perhaps worthy of note that flat springs with a greater number of closely laid coils are more easily made isochronous than those of an equal length, the coils of which are more open, however, because the spring whose coil remains nearer to the center develops during its activity more uniformly in the flexion of its coils, than one whose coils are spread over a larger area.

In the representation of the cylindrical spring (fig. 18), *a* is the upper and *b* the lower end; it shows at the same time how the two ends must be curved toward their fastening points. The fastening of the ends of such a spring in the collet (of which fig. 20 gives both a side and an upper view), and in the stud (of which fig. 21 gives the same two views), must take place at the same distance from the center of the spring, as where the motive power exerts itself upon the lever of the balance. With the free chronometer escapement, therefore, the point of fastening the springs can be determined by the size of the roller.

FIG. 20.

An equality in the motion of the spring during its activity is produced thereby. Concerning this subject, Mr. Martens remarks, that attention must be paid to locate the ends to be fastened upon a line imagined as drawn to the center of the spring or else at right angles to each other. This is also applicable to flat springs, because such a position of the ends to each other materially facilitates regulating.

FIG. 21.

## 7. HOW TO MAKE A BALANCE SPRING ACCORDING TO MARTENS.

### a. Making a Cylindrical Spring.

As material for a cylindrical balance spring choose a smoothly drawn, highly polished, so-called spring wire, which can be purchased of every desired thickness, and make a cylinder of brass, the diameter of which is equal to one-third of that of the balance, and it is to be about twice as high as the balance spring is to be. Drill a hole near each end of the cylinder, cut in a screw thread and insert two screws. Then mount the cylinder upon a turning arbor in the lathe, and fasten the ends of two spring wires to the cylinder by means of one of the screws, firmly wind up the two wires side by side and fasten them with the other screw at the other end. It occasionally happens that the place in the timepiece is too contracted for the required number of coils of the balance spring, so that between them a space equal in thickness to one coil could be left. In this case it becomes necessary to take as companion wire a thinner one than that for the spring, and to wrap the two in the indicated manner upon the cylinder. When it is ascertained that the dispositions made will result in the height desired of the spring, we proceed to temper it as follows:

Tightly inclose the cylinder in a sheet iron box filled with fine charcoal dust, and heat it in a charcoal fire until satisfied that the inclosed cylinder is red hot; quickly open the box, take out the cylinder and expeditiously submerge it vertically in water. Then grind the coils clean on top, which can be done with soft wood and coarse rouge, polish them with finer rouge, take out the screws and take down the balance spring. Next grind and polish the coils interiorly with soft wood and rouge upon a cork, take another cylinder from the one upon which the spring was hardened; this

cylinder must be a trifle larger than the original one, place the spring upon it and expose the whole upon the bluing plate over a flame, until the spring is handsomely blue, after which let it cool.

After this has been done, the ends of the spring are to be reduced into their proper shape. For this is to be used a pair of pliers with a hollow and a raised jaw. Both jaws must be a little smaller than the arc of the bending which the spring is to receive. Place one of the spring ends to be bent into the pliers, and expose it over a flame until the jaws begin to turn blue; then let it cool off and the end of the spring will have received the requisite shape. Should the curvature be not yet as desired, the treatment is to be repeated. In the same manner treat the other end of the spring.

Balance springs manufactured in this manner are the best by all odds; a fairly serviceable spring can also be made by hardening the wire by drawing, after which it is to be nicely polished, wrapped upon the cylinder and blued. When working by this method, however, it is necessary to make the cylinder somewhat smaller than of rights it should be; the spring, after having been loosened, will to a certain degree uncoil; it is also necessary to examine after a time the rate of the timepiece for which such a spring is used, as the latter will gradually lose a little of its activity.

To sum up: A very careful treatment and skill in the work are indispensable conditions for the manufacture of a nice and truly cylindrical spring.

#### b. *Making the Curves of the Flat Spring.*

As the precise length of a balance spring cannot be determined beforehand, it is to be established by practical experiments. For this purpose bend, after you have reduced the spring to its approximate correct length, the outer coil upward, and place it in such a curve around the center of the spring as is required by the distance of the fastening point in the stud from the center, fasten it, mount it upon the balance and examine if the balance vibrates with the necessary speed. In case that you have not been successful, alter the length of the spring until the vibrations are approximately correct. Next, the curvature of the outer coil is to be made in accordance with the shape given in fig. 19. In order to bend this knee, take a pair of strong tweezers, place the spring upon an ivory or horn plate, seize the spring at the place where the curve is to be bent, and with a pair of pliers carefully draw the end straight upward. The first bend will thus be produced. Next seize the spring at the place where the second bending is to be made, and bend the end carefully downward. You now have made the knee. The other bend is to be made as sketched in fig. 19.

In order to attain a certain proficiency in bending a spring à la Breguet, it is advisable to practice beforehand with old springs; first attempts generally miscarry.

#### THE MOTIVE POWER.

##### *General Remarks on Motive Power According to Jurgensen.*

In order to restore the loss of power experienced by the pendulum of a clock, which loss is occasioned by friction and resistance of air, a periodically renewed quantity of power is imparted to the pendulum by a succession of wheels and pinions in increasing velocity through the escapement. This power must be sufficiently large to conquer the inertia of the train and friction so as to sustain the velocity of the motion required of the pendulum. It is only in rare instances that the quantity of motive power necessary for the propulsion of a clock can with precision be established by experiments. It is difficult to estimate the quantity of the friction of the wheel work, escapement, pendulum and the inertia of the train, and it is consequently still more difficult to calculate the power necessary for conquering them.

The motive power is generated either by means of specific gravity or by elasticity—that is, either by weight or by spring. Weights are used for stationary clocks; springs are employed for those exposed to jars. The former operate by a cord which is wrapped around a cylinder connected with the main wheel. The effect of a weight is

invariably the same, and the motive power generated with it must be considered as the most uniform, and therefore weights should always be preferred to springs whenever they can conveniently be employed. Of course, for watches, only springs can be employed; they operate upon the train either directly or by the interposition of a chain wheel—that is, a fusee.

(*To be continued.*)

## The History of Goldsmithing.

*Continued from page 288.*

THE PERIOD OF THE MEROVINGIANS AND CARLOVINGIANS. THE CENTURIES PRIOR TO THE YEAR 1,000.

### 1.—*Merovingian and Carolingian France.*

WHEN THE Frankish kings, the descendants of Mervig or Merovaens (who ruled about the middle of the 5th century), had taken full possession of the rich countries which they had conquered, and thereby outlined the primary foundations of the French monarchy, Gaul, which had for a long time been a Roman province, was already far from being in that state of barbarism in which Julius Cæsar had found it at the time of his conquest. Stimulated by the civilizing influence of the metropolis Rome, industry and the liberal arts had rapidly spread, and constituted what we to-day call the "Gallo-Roman" art.

Gaul had already its goldsmiths of renown. One of the most celebrated appears to have been a certain Mabuinus, who lived in the third century. Perpetuus, bishop of Tours, who died in the beginning of the next century, mentions him in his testament, as having constructed a large golden cross for his church.

Fifty or sixty years later, Childebert, having been victorious at the battle of Narbonne, seized a large and rich booty, from which we can see how wealthy even at this early time the churches of Gaul were in pieces of goldsmiths' work. The list of precious objects seized by Childebert mentions sixty chalices, fifteen patens, and twenty boxes for evangelists. We must remember, however, that the greater portion was of Visigothic workmanship, because Childebert was victorious over Amalarich, the king of the Visigoths, and this was doubtless the same treasure which Clovis found at Toulouse after having defeated Alarich.

The beautiful industry of goldsmithing appears to have been in great favor under the kings of the Merovingian dynasty. We find ample records of it from the sixth century forward—that is, from the century when the children of Clovis began to reign. Gregory of Tours states that during a visit which he paid to Chilperic, at his royal palace of Nogent, the king showed him a very handsome gold plate ornamented with jewelry, which had been wrought according to his directions; "I have caused this to be made," added Chilperic, "to enhance and to make renowned the nation of the Franks."

This example was followed by the majority of his followers. The bishops took a great pride in decorating their churches very sumptuously at their own expense, or, if too poor, they appealed to the piety and munificence of the princes, who generally responded with a donation of utensils and sacred vessels.

In this same sixth century, we hear of Syagrius, bishop of Autun, covering with gold and ornamenting with mosaics the eastern portion of his church, which was soon afterward imitated by Didier, bishop of Auxerre. This latter, a kinsman of Queen Brunehilde, and, through her, of the kings of France and Burgundy, appears to have been one of the wealthiest and most lavish of the prelates of his time. His wealth was so great, historians tell us, that there was not a church of any importance, either in Burgundy or in Aquitania, which had not received a donation from him. The objects of goldsmiths' work which he caused to be made for his own cathedral were as varied as they were beautiful. A very ancient manuscript, still preserved in the archives of Auxerre, contains a complete inventory. This docu-

ment is very precious on account of the details it contains of the sacerdotal furniture and vessels used at this period. Beside the chalices, lamps, covering of the altar and reliquaries, the use of which was just commencing, beside the plates, patens, basins, pans, and a variety of other sacred vessels, such as the *ichidaria* and the *schidones*, the nature and purposes of which are to us unknown, we read of buckets and vessels for washing, special vessels (*recentoria*) for wine, others for water (*bacchonica*), employed in the celebration of the holy mass, of salt cellars or vessels for blessing the salt, spoons for stirring the wine in the chalice, forks (in their literal sense), the use of which we do not at present know, down to foot-stools, of goldsmith work, and different kinds of gorget, which at that time pertained to the clerical costume.

Many of these objects were ornamented with figures in chasing; some were of niello, others engraved. According to the description just quoted, a large number represented temporal and even pagan subjects—sorcerers, Olympian gods, etc., and bearing Greek inscriptions. This would seem to indicate that they had not been manufactured for their present purposes, but were simply treasures hoarded by reason of their great value and beauty, although Gaul at that time possessed goldsmiths of eminence. We mentioned one, Mabuinus, who lived in the third century. In the sixth century we find Thorsomodus, whose name was engraven on a large silver plate, of the weight of twenty-seven pounds, which Queen Brunehilde offered as a present to St. Germain of Auxerre. Brunehilde also donated to the cathedral of this city a very beautiful chalice of onyx mounted in gold, which sufficiently attests the great estimation in which the workmanship of the goldsmith was held even at that time.

Limoges was at that time one of the towns of Gaul (or of France, as we shall hereafter call the country), where the working of the precious metals had attained to a high state of development. It possessed a mint, the striking of coins being at this time confided to the goldsmiths, the most ancient coiner, whose name has descended to us, was Abbon, although we know almost nothing of his works. St. Elias was his pupil, however, which honor sufficiently entitles him to be preserved from oblivion.

St. Elias, the illustrious canonized goldsmith, who, as such, has become the patron saint of the trade, was born at Limousin toward the end of the sixth century. Raised in the school of Abbon, he appears to have settled, while still young, in the north of France, where he wrought several noteworthy pieces of work. On account of his relationship Bobbon, the treasurer of King Clotaire II., recommended him to the king, by whom he was engaged as a coiner and for whom he manufactured various pieces of goldsmith work.

The favor which St. Elias enjoyed under Clotaire increased under the reign of the following king. Everyone is acquainted with the history of the famous chair ordered of the saint by King Dagobert. This chair was to be wrought entirely of gold, and ornamented with jewelry. According to the custom of the times, the king caused to be delivered to the saint the quantity of gold considered necessary for the work, and in due course of time the artist delivered the chair as ordered; the king was overjoyed at the exquisite workmanship, but still more so at the probity of the workman, who returned half the gold to the royal treasury, by which we are led to think that the kings of that epoch were not accustomed to be served with strict honesty, unless he founded this honesty largely on alloy.

There has been preserved for a long time at St. Denis a chair called Dagobert's chair, which it is said is the one manufactured by St. Elias. It is doubtful, however, whether it has descended to us.

Thenceforward the favor in which St. Elias was held knew no limits. The king, who had all confidence in him, made him his minister, and he was afterward appointed to an episcopate, the bishopric of Noyon, which he filled for many years.

All these dignities, however, did not prevent him from continuing his cherished pursuits of the art of goldsmithing, although he worked only for the church. None of his works authenticated as such have

come down to us, but we still possess the list as well as the description of the pieces manufactured by him.

St. Owen, who wrote a very interesting history of the life of the goldsmith saint of Limousin, mentions a number of articles which he wrought for the king—purses, belts and other personal ornaments, which he enriched with gold and jewels. Concerning his pieces for ecclesiastical purposes, St. Owen mentions among the most important the shrine, entirely covered with gold and jewels, which he made for St. Martin of Tours, also that of St. Denis, the first bishop of Paris, and other saints of the same diocese, to wit: Saints Severin, Geneva, Columbus; next, in other provinces, Saints Julien, Brice, Piat, Quentin, Lucius, Maximin and Lollien.

St. Elias also worked for the basilica of St. Denis, the favorite church of Dagobert, for which he made a gold cross of over five feet high, of exquisite work, and entirely covered with jewels, which was placed behind the main altar.

In the diocese of Limoges, Chatelard, who is reputed to have been born in the same place with St. Elias, boasted of possessing a chalice and a cross made by the latter. Various other churches also felt honored in possessing work by his hand, which, of course, has been swept away by the vicissitudes of over one thousand years; we can simply add a sketch of the cross said to have been manufactured by him, as being illustrative of the style of goldsmithing of the seventh century; it will be seen that it largely consists of filigree work.

FIG. 16.

goldsmith, and refer the student of history to the chronicles of the bishops of Auxerre for full data on the subject. Coming down to the present day, the writer knows of several goldsmiths in Maiden Lane who should take pattern by their patron, St. Elias, and try to be canonized, although the biblical verse that it "is easier for a camel to pass through the eye of a needle," etc., prompts itself to him at this inopportune moment.

This leads us to the dawn of the Carolingian period. We would at once commence with the reign of Charlemagne if we had not, in a piece of work a little anterior to his reign, found a new process applied for the purpose of decorating certain pieces of goldsmiths' work.

We already mentioned, in a preceding number of *THE JEWELERS' CIRCULAR*, that the Byzantine goldsmiths had invented and with great skill practiced the art of enameling. It was but seldom that their enamels were applied immediately upon the body of the piece itself. It was often manufactured and mounted separately, set in little boxes, so that it might be used for decorating all kinds of work. They were thus used in the same manner as are to-day the ready-made jewel holes of a watch, and the Byzantine goldsmiths transacted quite a lucrative business with them. The goldsmiths of other countries, to whom the process of enameling appears to have been unknown, made use of them to embellish their work; this explains why we often find in antique work enamels evidently Byzantine, mounted on pieces of work wrought by western goldsmiths.

The earliest piece of enamel-ornamented work is a small reliquary of the eighth century, presented to the cathedral of Sion by one of

its bishops, who died in 790—the bishop Altheus, who is said to have

FIG. 17.—Front View.

FIG. 17.—Side View.

been an uncle of Charlemagne. One of the faces of the reliquary, which we here reproduce, figure 17, represents the Holy Virgin and St. John, relief figures, accompanied by inscriptions in Roman letters. The opposite side has inserted three settings of *cloisonné* enamel, the larger two of which form irregular squares. The third is a small circular medallion. Nothing is more simple than the setting and the manner in which the boxes are applied upon the plane surface of the object.

The above described work, as far as beauty is concerned, contains nothing of interest to either the goldsmith or the designer. Each one of the larger two squares encloses two busts of saints, who are not distinguished by any attributes. All the description that can be given is that the

heads of the figures are surrounded by the saints' halo, and each figure carries a book in the folds of his habiliment, which might seem to indicate that they are to represent the four evangelists; the fifth figure closely resembles the other four, and is not any better characterized; all the five faces are void of expression; they consist of

FIG. 18.

white enamel, the features divided by the *cloisonné* lines; the nose is indicated by two simple lines of wire, without indicating the nostrils, the eyes are two small ovals of a darker enamel, and the student will at once perceive that he is examining a specimen belonging to the very infancy of the enamellers' art. We have mentioned it for the twofold reason, first, because its enamel belongs to the kind we spoke of above, and, second, it is a specimen when the art was in its childhood.

We will not tarry any longer, but at once hasten to that epoch when the rising sun of civilization began to throw its first rays athwart the sky hitherto obscured by the densest of nights. The colossus of those times, Charlemagne, the powerful, the extraordinary genius, has assumed the reins of government of the Western Empire, and is everywhere opening schools of learning, promoting art and science, and appears emulous to add the glories of civilization to those of his arms.

The art of goldsmithing was not neglected by him; one of his ordinances required that goldsmiths shall establish themselves in all the jurisdictions of his empire.

Although on ordinary occasions he affected a simplicity that almost amounted to shabbiness, as far as his own person was concerned, yet he thoroughly understood how to surround himself on solemn occasions with all the pomp and circumstance of rank. His historian, Eginhard, says that on such occasions he was wont to dress in the richest of costumes covered with gold and jewelry. Costly embroidery adorned his cloak, which was clasped over his breast with a gold buckle. On his head he carried a diadem set with emeralds, sapphires, agates and pearls. Even his buskins glittered with jewelry, and in his hand he carried a baton terminating in a gold apple exquisitely chased in lieu of a scepter.

The crown of Charlemagne, represented in the accompanying sketch, figure 19, and of which we gave a description in THE JEWELERS' CIRCULAR, Vol. XIII., is still preserved in the Imperial treas-

FIG. 19.

ury at Vienna, Austria; and its authenticity is beyond a doubt, although archeologists say that it has undergone several alterations at the hands of the various emperors who have worn it.

Also his sword is kept in a museum at Paris, although only the hilt and guard appear to be original.

If Charlemagne was imposing in his ceremonies, he was none the less so in the decoration of his numerous palaces, in which he collected the rarest and costliest objects. Particularly that of Aix-la-Chapelle, which he built to be his principal residence, he embellished in the handsomest manner. The columns, brought from Ravenna, were of the rarest marble, and the furniture of the most sumptuous kind that could be gotten at that time. Among other things there was a gold table, the leaf of which was divided into three circular compartments, representing the earth as it was known at that time, the motion of the stars, and of the planets. Two silver tables represented, one the plan of Rome, and the other that of Constantinople. Charlemagne, at his death, bequeathed the latter two to the church of St. Peter, in Rome, and to the cathedral at Ravenna. The gold table fell as heirloom to Louis le Débonnaire or the pious (778 to 840, son of Charlemagne by his third wife, Hildegarde), but after him his son Lothaire cut it up and presented the pieces to his followers.

Charlemagne made numerous donations of goldsmiths' work to the principal churches of his vast empire. An old tradition asserts that he presented to twenty-four different abbeys pieces consisting of the single letters of the alphabet. This tradition is not well proven; still, it would appear to be true, if we recall to mind several little circumstances, among which that an inventory of the treasury of the Holy Chapel of Paris, in 1480, mentions, without further explanations, two pieces of filigree in the form of M, ornamented with jewelry; a bull of the twelfth century fulminates excommunication

against the thieves who had robbed the abbey of Brioude of a reliquary in the shape of a C, and, finally, there is still preserved in the treasury of the ancient abbey of Conques (Aveyron) a reliquary resembling in shape the letter A, which has always been known by the name of Charlemagne's A.

Figure 20 represents the letter, and even if the resemblance should be purely accidental it represents at all events a very ancient piece

FIG. 20.

of goldsmithing. The lower traverse bar has been added subsequently, but the two principal limbs and the large boss uniting them are of undoubted Carolingian workmanship.

At his death it is said that Charlemagne desired that the treasures which he had accumulated should be divided among the twenty metropolis of his empire, but the church which he desired to enrich in preference to all others was that of Aix-la-Chapelle, which city was his favorite as well as his last residence, and the construction and decoration of its church was one of his cherished ideas. All its altars, all its interior walls, displayed a profusion of gold and silver, and it contained an unknown wealth of sacred vases, reliquaries, lamps, candelabras, sacerdotal vestments, etc. Precious little of all this is left to-day, as the church has been stripped repeatedly, together with every other species of wealth which it happened to possess at the time.

Charlemagne, in tenor with his wish, was, at Aix-la-Chapelle, placed in a vault constructed for this purpose under the dome of the new cathedral. His body, embalmed and arrayed in magnificent habiliments, and accompanied with all the attributes of his sovereign power, was set upon a throne of gold. A copy of the Evangels, magnificently bound, was placed upon his knees. His hand rested upon a scepter, and before him was suspended a golden shield.

So much wealth tempted the cupidity of his successors. Otho III. was the first to despoil the sepulchre, but he contented himself with taking the golden cross which the emperor wore suspended around the neck. The next grave robber was Frederic Barbarossa, who caused Charlemagne to be canonized at the same time; he thought undoubtedly that the latter, after having been pronounced a saint, should rest content with the boundless wealth of celestial glory, and he could therefore well dispense with the many valuable objects of mundane lucre which he had collected around him.

Goldsmithing continued to flourish under the successors of Charlemagne. Louis le Débonnaire in particular appears to have expended large sums for this purpose. All the historians of the time mention the great value of the treasures which he had amassed, and how he loved to display them on all occasions. He overwhelmed with presents Pope Stephen IV. and the Danish king Harold, who, together with his wife, was baptized after him. In the inventory of

presents, still preserved, we read of a diadem and a flexible belt ornamented with jewelry, a large collar, a hoop of gold twisted for the neck, bracelets, etc. Next, as equipments for battle, we find sword hilts of gold, silver and ivory, sword belts ornamented with precious stones, gold sword scabbards, etc.

Among the precious objects with which, at this epoch, the chapel of the emperors, kings and powerful vassals were ornamented, we frequently see mentioned altar reliquaries overlaid with sheets of gold or silver, crystal or enamel.

The altars thus mentioned were generally small portable ones, which the princes, who were at that time eternally embroiled in wars, carried with them in their campaigns, so that the chaplains might celebrate mass at any place where they would stop for the night. They were retained in use until the fourteenth century, and several of them are still in existence; a goodly number are found in Germany: in the cathedral of Bamberg, Triers, in the museums at Berlin, Darmstadt, Hanover; next in France, in the treasure of the church of Conques, which possesses two. One of them has all the appearance of being of Carolingian workmanship.

(To be Continued.)

## Regulations Governing the Issue of Certificates of Rates of Timepieces, after October 1st, 1884.

### I.—Classes of Certificates.

The following classes of certificates will be issued with timepieces which have been deposited at this observatory for trial:

The certificate will contain a detailed statement of the results obtained with each particular movement.

In describing the position of a movement, the term "Dial up" indicates that the plane of the dial is horizontal, and with the engraved side uppermost. "Dial vertical" indicates that the plane of the dial is vertical.

The temperature of the refrigerator is approximately 40° F., that of the oven is approximately 90° F., and the ordinary temperature ranges between 65° and 75° F.

1. Class A includes those certificates issued with pocket chronometers or watches which have been subjected while rating to the following variations of position and temperature:

| Period.  | Occurs during the days of the trial. | Position.                     | Temperature.  |
|----------|--------------------------------------|-------------------------------|---------------|
| First.   | 1st to 6th.                          | Dial Vertical, Pendant up.    | Ordinary.     |
| Second.  | 6th to 11th.                         | Dial Vertical, Pendant Right. | Ordinary.     |
| Third.   | 11th to 16th.                        | Dial Vertical, Pendant Left.  | Ordinary.     |
| Fourth.  | 16th to 22d.                         | Dial up.                      | Refrigerator. |
| Fifth.   | 22d to 28th.                         | Dial up.                      | Ordinary.     |
| Sixth.   | 28th to 34th.                        | Dial up.                      | Oven.         |
| Seventh. | 34th to 40th.                        | Dial down.                    | Ordinary.     |
| Eighth.  | 40th to 45th.                        | Dial Vertical, Pendant up.    | Ordinary.     |

The trial comprises forty-five days, during which the movement is rated in five positions during periods of five days each, and is exposed to cold, warm and average temperatures. In order that the movements may assume their new rates under changed conditions, the first day's rating in the 4th, 5th, 6th and 7th periods are not used in making up the record of a movement's performance.

2. Class B includes those certificates issued with pocket chronometers or watches which have been subjected while rating to the following variations of position and temperature:

| Period. | Occurs during the days of the trial. | Position.                  | Temperature.  |
|---------|--------------------------------------|----------------------------|---------------|
| First.  | 1st to 15th.                         | Dial Vertical, Pendant up. | Ordinary.     |
| Second. | 15th to 29th.                        | Dial up.                   | Ordinary.     |
| Third.  | 29th to 30th.                        | Dial up.                   | Refrigerator. |
| Fourth. | 30th to 31st.                        | Dial up.                   | Ordinary.     |
| Fifth.  | 31st to 32d.                         | Dial up.                   | Oven.         |

3. Class C includes those certificates issued with pocket chronometers or watches which have been subjected while rating to the following variations of position and temperature:

| Period. | Occurs during the days of the trial. | Position.                  | Temperature. |
|---------|--------------------------------------|----------------------------|--------------|
| First.  | 1st to 9th.                          | Dial Vertical, Pendant up. | Ordinary.    |
| Second. | 9th to 17th.                         | Dial up.                   | Ordinary.    |

Certificates of the classes A, B and C are issued in two grades. The ordinary certificate is issued when the observed ratings show that an excellence has been obtained which is within the limits assigned in the third column of the table following and the certificates have the words "especially good" attached to them by the officer signing the certificate, when a degree of excellence has been attained within the limits shown in the fourth column.

| Class. | Condition.  | Col. III.           | Col. IV.           |
|--------|---|---------------------|--------------------|
| A.     | When the mean difference of the daily rate under the same condition of temperature and position, and during the same period, does not exceed..... | 2 <sup>s</sup> .00  | 0 <sup>s</sup> .75 |
| B.     | do. do. ....  | 2 .00               | 0 75               |
| C.     | do. do. ....  | 2 .00               | 0 .75              |
| A.     | When the difference between the mean daily rate, Pendant up, differs from the mean daily rate, Dial up, by less than.....                         | 5 <sup>s</sup> .00  | 2 <sup>s</sup> .50 |
| B.     | do. do. ....  | 10 .06              | 5 .00              |
| C.     | do. do. ....  | 16 .10              | 5 .00              |
| A.     | When the difference between the mean daily rate, Pendant up, and the mean daily rate in any position except Dial up is greater than.....          | 10 <sup>s</sup> .00 | 5 <sup>s</sup> .00 |
| A.     | When the variation for 1° F. does not exceed  | 0 <sup>s</sup> .30  | 0 <sup>s</sup> .15 |
| B.     | do. do.   | 0 .30               | 0 .20              |

In addition to the above described certificates there will be furnished records of rate for any timepieces deposited at the Observatory for such a purpose. These records are meant to indicate the performance of timepieces, and may take any form the person desires who enters the timepieces, subject to the approval of the officer in charge. When such timepieces are box chronometers, and they have been rated for a minimum period of two months, and have been rated in the refrigerator and in the oven, and there has been no daily variation greater than 2<sup>s</sup>.0 or than 0<sup>s</sup>.3 for 1° F., certificates of the class D will be issued with them.

When such a timepiece is a clock, and it has been rated for a minimum period of three months at ordinary temperatures, and has been tested for compensation in temperature, and when the daily variation of rate has not exceeded 1<sup>s</sup>.0, except there has been an attendant variation of the barometer in its case as great as 0<sup>IN</sup>.70, and when the variation for 2° F. has not exceeded 0<sup>s</sup>.30, a certificate of the class E will be issued with it.

II.—Cost of Certificates.

| Designation.  | Observatory charge. | Remarks.  |
|---------------|---------------------|---|
| Certificates: |                     |   |
| Class A.      | \$7.50              | Discount of one-third when five movements are rated at the same time.       |
| Class B.      | 5.00                | do. do.   |
| Class C.      | 3.00                | do. do.   |
| Class D.      | 7.50                | do. do.   |
| Class E.      | 20.00               | An additional charge for clock mounting will be made depending on its cost. |
| Rate records. | Per diem, \$0.10    | An additional entrance fee of \$0.25 will be charged for each movement.     |

The Outlook at Trade Centers.

THE FOLLOWING extracts from our exchanges indicate the condition of business at different important trade centers. While these do not specially mention the condition of the jewelry

trade, they indicate an improvement in other branches of business, and a continued hopefulness on the part of merchants. The jewelry trade is dependent upon the prosperity of business in general, and the conditions prevailing in the leading industries furnishes "a pointer" by which the trade can be guided. The reports are, on the whole, of a favorable character.

*Philadelphia Record*.—"The business situation is about the same as during the early part of the month. Cooler weather has quickened the distribution of some lines of goods, but there has been no general nor noteworthy activity. A very conservative feeling prevails, and transactions in all departments are on a moderate scale proportioned to well assured requirements."

*Boston Commercial List*.—"The business situation has not improved in any important particular during the month. Nearly all branches report a slow and unsatisfactory movement, and there is little prospect of any permanent change for the better this season. Some people blame the very mild weather; others say that the political excitement is the principal cause. But we can see gleams of light in the distance. The process of liquidation and adjustment through which the business affairs of the country are now passing will place them on a healthy basis, and the recovery, when it does come, will be rapid and substantial. What is now most wanted is confidence."

*Chicago Times*.—"To a considerable extent merchants are living on hope, the current sales being a good deal behind last year. They know that, owing to the 'hand-to-mouth' manner of buying that has been pursued for a long time by western merchants, supplies nearly everywhere have become greatly reduced, and as soon as the weather becomes colder they are confident that a sharp demand for dry goods, clothing, hats and caps, boots, shoes and rubbers, etc., will spring up."

*Baltimore American*.—"In the home distributive trade some departments report a fair volume of business, and in several trade centers at the West the movement is said to be measurably active; but, it is constantly observed, the persistent adherence to the conservative methods of buying that provide for current wants only, which policy, while it may secure a steady outlet for supplies, yet deprives trade of all elasticity and 'chic.' The onus of carrying stock is thus thrown upon manufacturers and importers; but, all the same, consumption is and will be steadily maintained, the course of trade for nearly a year past showing that the actual consumption during that period of all food staples, groceries, dry goods and clothing has never been greater. The aggregate amount used up, therefore, will be as large as ever before."

*Montreal Gazette*.—"We find and cheerfully chronicle some improvement in general trade, which may be sustained during the remainder of the season. At all events, there is a fair volume of business compared with the earlier stages of the year, and it has a tendency to increase."

*Minneapolis Tribune*.—"Merchandise jobbing, as a whole, compares favorably with a year ago. Groceries sell very freely, but the hardware and dry goods departments, while not particularly disappointing, are not so active as at this time last year. Both of these latter have increased. The recent business has been fairly satisfactory in the movement of merchandise. Prices show little alteration."

*Savannah Morning News*.—"During the month business was fully as active as that previously reported. Collections continue slow, and this condition of affairs is beginning to be felt more severely in commercial circles. Trading in dry goods was not up to the previous sales. The continued mild weather, it is thought, is the chief cause. Prices are quite steady."

*Nashville American*.—"Trade during the past month has been moderately good. Considerable complaint continues to be made by jobbers of the difficulty in making collections. Cotton has begun to move only to a limited extent, and money matters are as yet strident in the country. When this trouble has been removed, as it will be soon, commerce will revive very rapidly."

*Detroit Free Press.*—"Collections have improved somewhat during the past two or three weeks. There is confidence, however, in the future, and, as much money is being paid out for wheat, in time it is sure to return through channels requiring it. The change in the weather and a certainty that a low thermometer will now prevail is received with much favor in most business circles. Distributors of dry goods, clothing, boots and shoes and leather are especially rejoicing at the change as sure to bring about a quickened movement of their goods, though no heavy demand for supplies is anticipated."

---

### Traders' and Travelers' Union.

THE ABOVE company, organized in the interests of New York city merchants, has been incorporated under the laws of this State, and is purely a business corporation purposing to unite the capital and patronage of the associate merchants for mutual protection and benefit. In brief, it designs upon the co-operative plan to obtain for its members favorable transportation and telegraph rates to secure them against undue exactions under the guise of license laws or otherwise, to procure and collect indemnity in case of fatal accident, to provide against injury to or loss of baggage, and generally to acquire, preserve and disseminate valuable business information, and adopt and enforce such measures as shall promote the prosperity of the company and of its members. Members are classified so that the benefits of such co-operation may be most equitably apportioned. The term of the Union's charter is twenty-five years. The Union combines some forty classes of trade; its board of directors representing many kinds of trade, to the end that the needs of each may be intelligently considered. Its policy will be to remedy the abuses to which its members are at present subjected, and to obtain the advantages named above by means of friendly negotiation; only when this method fails will resource be had to severe measures.

A circular issued by the company states: "It is also unnecessary to particularize the many grievances caused by unjust discrimination in *freight rates*, whereby other localities have been favored at the expense of New York. In the matter of *passenger rates* it is well known that traveling troupes of various kinds, even excursionists for short distances, obtain special rates, while the merchant, his traveling agents and his customers who furnish the bulk of freight and the larger percentage of travel, are treated with no such consideration. Reference is here made to the merchants of New York. The case is different in other localities. Western railroads co-operate with the merchants of western cities, and, by means of special rates, free passes and excursion trains, both are benefitted to the injury of the merchants of New York. The Union proposes to remedy this gross injustice.

"By a business combination that can turn its entire patronage into selected channels, special rates will also be obtained for its members with *express* and *telegraph* companies.

"Reduction in *baggage rates* is a positive necessity. The casual passenger must no longer be better treated than the constant commercial traveler.

"The Union further proposes to meet a long-felt want in case of *lost or destroyed baggage*. The forms of insurance hitherto obtainable provide for but a small percentage of the damage sustained by merchants and their travelers. Trunks and packages containing valuable samples and mercantile stock are exposed to the many risks of transportation with little or no remedy in case of injury or loss.

"A special feature proposed for the *traveling salesman* is to secure for his designated beneficiaries a reasonable amount, to be paid in the event of his *death by accident* while in the prosecution of his business.

"The Union proposes, moreover, by all legitimate means, to protect its members against imposition in the guise of *local license*

*laws*, rife in certain sections of the country. Relieving members of the annoyance and expense of defending themselves, singly, in case of unjust taxation, the Union will respond for them and protect them to the full extent.

"The capital stock of this company is owned and held exclusively by prominent mercantile houses of this city."

The large number of firms already associated with the Union include E. S. Jaffray & Co., George H. Clark & Co., P. Lorillard & Co., Lord & Taylor, Manhattan Cloak & Suit Co., and other houses. The officers are: Daniel C. Robbins, president; Robert F. Austin, vice-president; J. H. T. Martin, treasurer; and John V. Cheney, secretary. Further information will be given by Mr. J. V. Cheney, 287 Broadway.

---

### How Exact Time is Transmitted.

THE DETERMINATION and transmission of exact time forms, in a utilitarian sense, is an important part of the National Observatory work. It is interesting to observe the routine followed every day by the time officer. At 11 o'clock he enters the chronometer room and spends half an hour or more in comparing and winding the chronometers. Some of these are ready to go on sea voyages, while others must undergo a long period of correction. In the room are also two clocks, a mean time and a transmitting clock. The former is never corrected, and when the *Post* reporter visited the observatory it was nine and some hundredths seconds fast. It is never over thirty seconds out of the way. Once a year it is taken down and cleaned, but is never tinkered with or "regulated." Every day its error is closely calculated by the lieutenant in charge.

At 11.40 the error of the transmitting clock is obtained. This is done by recording on a chronograph both its beats and the beats of the mean time clock. If they do not register simultaneously the difference can be determined to the hundredth part of a second. The point of a lead pencil held just near enough to the pendulum of the transmitting clock to retard it, if it is fast, or accelerate it, if it is slow, enables the officer to make the difference between the clocks just equal to the error of the mean time clock, which will be shown on the tell-tale chronograph.

At 11.50 the officer signals to the watchman on the roof and he hoists the time ball.

At 11.56 the chronograph is connected with the mean time clock, and the clicking—each click represents a second—begins.

Half a minute later the officer turns a switch and the transmitting clock is ready to be connected with the outgoing wires.

At 11.56.44 the repeater switch, connecting these wires is closed, and the beat of the next second, the forty-fifth, goes out, the first signal that the hour of noon is approaching.

At 11.58.55 an automatic break arrangement causes the clock to cease transmitting the electric current, and for five seconds there are no beats. The next click begins the last minute before noon. This click is the signal for the watchman on the roof to slip a bolt through a ring, thus fastening the ball.

Ten seconds before 12 a final adjustment is made. There is a moment's silence—then a click as the second hand reaches sixty, and the ball on the dome has dropped and the hour of noon has been flashed across the land in every direction.

It used to be the custom for the time officer to listen for the click and then press a key. This has been abandoned, and now the signal flashes direct from the clock itself. There are several telegraph instruments connected with the clock, communicating with the several telegraph companies, the fire alarm bells, and by a private line with clocks in the War, State, and Navy Department, White House, National Museum, Clerk's office United States Senate, Government Printing Office, Interior and Post-Office Departments, City Post-Office, the Pension Office, Treasury Department, Attorney-General's office, and the headquarters of the Surgeon-General. The Signal Office also gets the correct time.—*Washington Post*.

## Current Humor.

---

"A little nonsense now and then  
Is relished by the wisest men."

---

## CURIOSITIES OF ENGLISH SCHOOLS.

The London *Times* says the following were recently among the written answers in examination on Scripture by her Majesty's inspector of schools:

"Who was Moses?" "He was an Egyptian. He lived in a bark maid of bullrushes, and he kept a golden carf and worshipt braizen snakes and he het nothin' but qwahles and manner for forty years. He war kort by the air of his 'ed while ridin under a bow of a tree, and he was killed by his son Abselon as he was hanging from the bow. His end was peace."

"What do you know of the patriarch Abraham?" "He was the father of Lot and had tew wives. One was called Hismale and tother Haygur. He kept wun at home and he hurried the tother into the desert, where she became a pillow of salt in the daytime and a pillow of fire at nite."

"Write an account of the Good Samaratin." "A certing man went down from Jer slam to Jerker and he feld among thawns and the thawns sprank up and chuked him. Whereupon he gave tuppins to the hoast and said tak care on him and put him on his hown hass. And he past bye on the hother side."

## JUDGING BY APPEARANCES.

Foreigner (at fashionable American watering place)—"I cannot see why such plain, humble-looking people as some of those you have here should be willing to come to a gay place like this or be able to pay the enormous prices you charge. I should think farmers would want to save their money to buy ploughs and hoes and such things." Hotel Clerk—"I do not notice any such people here as you describe." "Why, look at that old gentleman over there. Belongs in some small village, don't he—a mere nobody evidently." "That is a very eminent member of the Cabinet." "Bless my stars! Well, who is that distinguished looking personage in a dress suit looking out the window?" "That is the head waiter."

## KEEPING IN PRACTICE.

He was out back of the barn tickling a mule's heel with a straw. "Here, get away from that mule's heels. He'll kick you into kingdom come," said a passer. "You let me alone. I know my biz." The mule blazed away and landed the tickler across the barn-yard against the fence kerswat. "There, didn't I tell you?" "Well, what if you did?" said the tickler, gathering himself up and returning to his tickling only to be raised back with more force than before. "Well, you are an infernal idiot," said the passer, starting to go. "No I ain't, stranger. I do this every morning before there's going to be a game. You see, I am a base-ball umpire, and—" "Oh, ah, well, excuse me, sir."

## AN INTELLIGENT DOG.

"Talking about the sagacity of animals," said a well-known citizen, "here's a story, Mr. Idler, which illustrates the intellectual capacity of the dog. The late Judge Smalley, who was very fond of a fine dog, one day bought a splendid English bull-dog, which he placed in a kennel close to one occupied by a big Newfoundland that he owned. Mr. Bull-dog took a fancy to Mr. Newfoundland's house, and immediately proceeded to drive him out of it. A pitched battle ensued, in which the Newfoundland dog was beaten by a large majority. Now, at this time there was kept at the American hotel a gigantic mastiff—the biggest dog ever seen in these parts. It was a quiet, well-behaved animal, and had never been known to leave the

hotel premises. Well, one fine night Judge Smalley's entire household was awakened by the noise of a desperate dog-fight. There were barks and howls and yowls of every description. Lanterns were immediately lighted and an investigation was had, and what do you suppose we found? Well, sir, that Newfoundland had gone to the hotel, told the big mastiff of his ill-treatment, and persuaded him to go home with him and help him; and the mastiff and the Newfoundland had torn that bull-dog all to pieces. He was scattered all over an acre, and no single piece was big enough to weigh an ounce. I tell you, dogs can talk to each other, in their way, and this story proves it."—*Burlington Free Press*.

## AGRICULTURAL PAPERS.

Honest Farmer—"These here agricult'ral papers don't know nothing. Anybody might see they was edited by city chaps." Mrs. Honest Farmer—"What are they saying now?" Honest Farmer—"Why, this paper says that on wet days, when a farmer can't work in the field, he ought to mend the tools, oil the harness, and pick out the decayed fruit and vegetables in the cellar." Mrs. Honest Farmer—"Well, it seems to me that's purty sensible." Honest Farmer—"Sensible! Why, what on arth is the use of picking out decayed fruit and vegetables, when it is so wet that you can't take em to market?"

## A SHILLING'S WORTH.

A fellow who came by the railroad, being a stranger, strolled about for some time on the "outskirts" of a town in search of a barber. He finally discovered one, and requested the operator to take off a shilling's worth of hair. The barber trimmed his locks very neatly, soaped up the remainder very handsomely and then combed and brushed him till his head looked as if it belonged to some other person than himself.

"Are you done?" asked the stranger, as the barber removed the napkin from his neck.

"Yes, sir," said the barber with a polite bow.

"Are you certain that you took off a shilling's worth?"

"Yes, sir; there's a glass, you can look for yourself."

"Well," said the stranger, "if you think you have a shilling's worth off, I don't know as I have any use for it, I haven't got no change, so you may just take the hair for your trouble."

On hearing this the barber made a jump for the man, whereupon he made a jump for the door which not being bolted, he bolted himself.

## A COPIOUS LANGUAGE.

The copiousness of the English tongue, as well as the difficulty of acquiring the ability to use its immense vocabulary correctly, is well exhibited in the following array of synonymous words, which, if not new, is yet a capital illustration of the nice distinctions which characterize so many of our vocables. It is no wonder that we slip occasionally, even the wariest of us. A little girl was looking at the picture of a number of ships, when she exclaimed: "See what a flock of ships!" We corrected her by saying that a flock of ships is called a fleet, and that a fleet of sheep is called a flock. And here we would add for the benefit of the foreigner who is mastering the intricacies of our language in respect to nouns of multitude, that a flock of girls is called a bevy, that a bevy of wolves is called a pack, and that a pack of thieves is called a gang, and that a gang of angels is called a host, and a host of porpoises is called a shoal, and a shoal of buffalos a herd, and a herd of children is called a troop, and a troop of partridges is called a covey, and a covey of beauties is called a galaxy, and a galaxy of ruffians is called a horde, and a horde of rubbish is called a heap,

and a heap of oxen is called a drove, and a drove of blackguards is called a mob, and a mob of whales is called a school, and a school of worshipers is called a congregation, and a congregation of engineers is called a corps, and a corps of robbers is called a band, and a band of locusts is called a swarm, and a swarm of people is called a crowd, and a crowd of gentlemen is called the elite; and the elite of the city's thieves and rascals is called the most dangerous men in the community.

---

AN EXCELLENT REASON.

Old Uncle Ben, the veteran stage-driver, was an inveterate joker and was fond of practising his art upon his passengers who shared the driver's box with him. One day his horses were toiling along a lonely country road, and just at night they passed a solitary farm house a mile distant from any other and bearing an appearance of a lack of thrift.

"There," said Uncle Ben, pointing with his whip, "there's a woman been lying in that house for more than a fortnight, and she isn't buried yet."

"Dreadful," said a passenger. "The authorities ought to attend to it. Hasn't she any friends and why don't they bury her?"

"Got friends enough, but she ain't dead; she's as lively as a cricket."

---

HOW TO HANDLE A GUN.

The first thing you do when you go out gunning with another boy is to guard yourself against accident. The best way to do this is to shoot the other boy before he has time to load his gun. Then take both guns to the nearest creek and throw them in. Throw the powder and shot in after them. If you have any matches about your clothes throw them in also. Then start at once and go home as fast as ever you can. And if you are under eighteen years, young man, the chances are, even with these precautions, that you will get both legs and a section of your back filled to the brim with bird shot before you reach home.

"How?"

Goodness only knows how, my son, I don't. I have often wondered how it did happen, but I never could ascertain. I am not here to advance ingenious theories, but merely to state cold facts; and I know it to be a solemn truth that a boy, with a single barrel gun twice as long as himself, can manage somehow to shoot himself in more places at once than a man can with a seven-shooter revolver.

"And am I going to buy you a gun?" Yes, I am; some time in the long vacation, when time hangs heavily on my hands, and I think I would enjoy entertaining you by picking shot out of your legs with a nut pick.

"But you will be very careful with it?" So is a woman very careful with an umbrella, my son, and yet science is unable to account for the startling increase of one-eyed men every summer.

---

THE WIDOW'S INSURANCE.

One of the steamers plying between Detroit and Cleveland ran over a skiff one night and drowned its occupant. When he had been identified, an agent called upon his wife to see if a settlement could be effected. She was not in tears nor prostrate with grief. On the contrary, she was at the wash-tub and in good humor. When the matter was broached she said:

"Well, now, my husband took home the washings, brought in the coal, and was of use in several other ways, and his death is quite a loss to me."

"About what sum do you feel would make you good?" he asked.

"Now, then, be honest with me," she replied after taking a moment to think. "How much will a bang-up bridal tower from here to Niagara Falls and back cost?"

"Well, \$300 ought to put you through first-class, and give you three days at the Falls."

"Well, say \$350. That gives me money for new shoes and a bonnet, and I may want to dye my hair and buy some stockings."

The money was handed over and a receipt taken, and the "tower" took place the next week.

---

THE colored brother is a creature of imitative propensities. We have long known that he is ambitious to be a Mason or an Odd Fellow; that he joins a band of music or a military company; that he buys lottery tickets and speculates in graveyard insurance; that he goes to camp-meetings, and that he forms associations which require some knowledge of parliamentary rules. But we were not aware, until we learned it from the *Arkansaw Traveller*, that he has taken a hint from presidents of companies who believe in the assertion of the one-man power, and that he has improved on the absolutism of voting by proxy. Referring to a convention recently held in Little Rock, the *Traveller* relates that during a clamor for recognition the chairman said:

"Let de cheer—let de cheer rule on dat p'int. De cheer rules dat de two gennermen kain't talk at de same time. One gennerman mus' talk an' aiter he gits dun, de udder gennerman he kin talk."

"Who's got de flo'?" demanded a delegate.

"Neber mind who's got de flo'. Keep on axin' yer unpovermently questions an' yer see who'll hab de flo'—hab all ob it dat yer kin kiver. I takes dis heah mefod fur ter 'nounce myse'f de nominee fur county jedge. All in faber ob de measure will make it known by sayn' 'I,' an' dose opposed will please gin up dar seats ter pussons what's got more sense. De 'I's' hab it."

---

HOW HE OVERDID IT.

For once the superabundant life agent has overdone it, and allowed his vaulting ambition to overleap itself. Assure a man that he will live forever and he will be satisfied with that assurance, while it is another sort of assurance that the agent is anxious to dispose of. This is the way the *Philadelphia Call* puts it:

Insurance Agent—"It's all right. The doctor says you are the best risk he ever examined."

Citizen—"The best risk?"

"Yes; soundest constitution and perfect health, you know."

"Did he say that?"

"Yes, indeed. No trouble about your case. He said there was nothing to prevent you from living a hundred years."

"You don't mean it?"

"Honest truth. Come right around to my office and I'll fix up the papers at once."

"No, thank you; it wont pay. I'm too healthy."

---

A LAWYER BADLY SOLD.

He was so hopping mad about it that he had to swallow the lump in his throat three or four times before he could speak English. When the other had patted him on the back and led him around in a circle he began with:

"Of course, if I make a debt I expect to pay it."

"Of course."

"I'm worth \$30,000, and I don't owe \$200 in the world."

"Of course not."

"Well, I was sitting in the office about 11 o'clock this forenoon, when in came a stranger. He introduced himself and took a chair. I was smoking, and it was only courtesy to offer him a cigar. He said he had frequently heard my name mentioned, and I supposed he was some gentleman from the interior of the State who wanted my written legal opinion."

"Certainly; your luminous opinion."

"He seemed rather diffident and embarrassed, and as he had not made his wants known up to noon I invited him home with me to dinner. He readily accepted."

"I see."

"After dinner I showed him all over the house, played billiards with him for half an hour, and then brought him back to the office and gave him another fifteen cent cigar, and asked him to come to the point."

"And he came?"

"He did—bless him! He handed me a bill of fifty cents from a tin shop here in town for mending the wash boiler and putting a new nose on the tea-kettle."

WEALTH NO BARRIER TO SORROW.

He was a busy man and she was a society woman. One evening he suddenly looked up from his paper and said:

"By the way, didn't we have a baby in this house about the time Midland Broad-Gauge went up to ninety-eight?"

"Yes," she said, "Oscar was born the night of the Everingham reception."

"Boy, was it?" he said, with a show of interest. "I had forgotten; must be about seven months old by this time. Where is he?"

She touched a bell, the servant appeared, and she ordered Oscar to be brought into the presence of his sire. Instead of whom the weeping nurse appeared alone, and with many tears confessed that the infant Oscar had been kidnapped in the park six weeks before, and that the most careful search, aided by advertisements in the daily papers, had thus far failed to reveal his whereabouts. Thus we see that wealth is no barrier to sorrow, and even into the homes of the rich and the great trouble creeps with its stealthy tread and sometimes breaks up a whole evening of enjoyment.

IT WAS SIMPLY ABSENT-MINDEDNESS.

"Did you see the defendant drink?" asked the attorney of the witness.

"I did not," replied the witness.

"Why, then, do you think he was drunk?"

"Because he was on his way home from the convention and attempted to wind up the door-knob with his watch-key."

"Is that your only reason for swearing that the defendant was drunk?"

"Yes; but I think that is reason enough."

"Your honor, the court," said the lawyer, springing to his feet, "the witness is unable to distinguish between absent-mindedness and drunkenness. Such evidence as this is preposterous, and if entertained would convict all of us. Why, even the court would not escape. Your honor knows that the court last night bit the end of a cucumber pickle, stuck it in his mouth, scratched a tooth-pick on his pants, and tried to light it for a cigar. Of course, your honor was thinking of a case——"

"Yes," said the court, "I was thinking of a case—a case of beer. I was absent-minded. The case is dismissed."

SHE ASKED HIM GENTLY.

Young Wife—"My dear, you were the stroke oar at college, weren't you?"

Young Husband—"Yes, love."

"And a very prominent member of the gymnastic class?"

"I was the leader."

"And quite a hand at all athletic contests?"

"Quite a hand? My gracious! I was the champion walker, the best runner, the head man at lifting heavy weights, and as for carrying! why, I could shoulder a barrel of flour and——"

"Well, love, just please carry the baby a couple of blocks; I'm tired."

Sweepings.

A barefooted little boy stepped on a bee, and soon after said to his mother: "Ma, I didn't know that bees had splinters in their tails!"

A married woman said to her husband: "You have never taken me to the cemetery." "No, dear," replied he, "that is a pleasure I have yet in anticipation."

"Ain't that a lovely critter, Bill?" said Jerusha, as they stopped opposite the leopard's cage. "Wa'al, yes," said Bill; "but he is drefffully freckled, ain't he?"

"Waiter, I saw your thumb in this soup as you were bringing it to me!" "Oh, you're kind, I am sure, sir, but it's of no consequence. It wasn't hot enough to hurt much, sir."

They were sitting on the stoop, and as he patted her little cheek he asked, "Clarabel, what is the reason that your cheeks are so warm?" "I don't know," she answered, "unless it is that I haven't had any ice cream this evening."

A shrewd old lady cautioned her married daughter against worrying her husband too much, and concluded by saying: "My child, a man is like an egg. Kept in hot water a little while he may boil soft; but keep him there too long and he hardens."

New York millionaire—Are the girls locked up for the night wife?" "Yes." "Coachman chained?" "Yes." "Has the patent butcher catcher in the front yard been oiled so that it works well?" "Yes." "Well, we might as well chloroform the gardener and go to sleep."

Princess Beatrice—"Ma, there's a man at the door says he wants to buy Windsor Castle." Queen—"Mercy on us! Call the police. He must be a lunatic. There is not a man in England rich enough to buy Windsor Castle." Princess Beatrice—"But he is an American." Queen—"What is his business?" Princess—"He is a plumber." Queen—"Ask him in."

The other day a gentleman surprised a Boston lady who was saying to her baby, "On-ny, no-ny, e mussy tick out his little footsy tootsies." Just then she caught sight of her visitor, blushed and muttered: "No, no, you must not expose your pedal extremities by extending them beyond the protecting covering of the blanket, or you will lay your system open to attacks of catarrhal affection."

"Whar' ye bin?" he asked, as the other boy suddenly came round the corner. "To the doctor's!" "Fur yer mother?" "No—fur me." "What ails you?" "Tongue all coated—see there." "What does that mean?" "Heaps!" chuckled the other. "That means rhubarb to begin on, and loaf sugar, sweet cake, a velocipede, roller skates and a jack-knife before I get through! Don't you wish you were me?"

A gentleman and his wife, the latter with a six months' old infant in her arms, were about to enter the Austin Opera House to see the performance one night, when the doorkeeper suddenly said: "Beg pardon, ma'am, but you can't take infants inside." "Very well," said the lady, "so much the better for me. You just take care of the little fellow till the play is over—and, by the way, here's the milk bottle in case he should cry."

"Stop that car!" cried old Mr. Nosengale, chasing a flying car up the street, the car fresh as a daisy and Nosengale badly blown. "Stop that car!" he shouted, to a distant but fleet-limbed boy. "Certainly," shrieked back the obliging boy; "what shall I stop it with?" "Tell it to hold on," shouted the abandoned passenger. "Hold on to what?" yelled the boy. "Make it wait for me," puffed Nosengale. "You've got too much weight now," said the boy, "that's what's the trouble with you!" "Call the driver!" gasped the perspiring citizen, and as the car rounded the corner and passed out of sight, the mocking echo of the obliging answer came floating cheerily back—"All right! What shall I call him?"

## Foreign Gossip.

—Some idea of the difficulties in the way of making large telescopes may be had from the fact that there have been nineteen failures to cast the thirty-six inch glass for the large telescope to be mounted in California.

**THE STAFF OF LIFE.**—An extraordinary yield of wheat is recorded by Mr. Troyman, of Winchester, England, a single grain having produced 39 ears containing 2,800 grains. The three best ears had respectively 104, 103 and 101 grains.

**GOLD IN GREAT BRITAIN.**—Gold is still found in Great Britain, says an English exchange. In the year 1882, 226 ounces of the precious metal were produced from auriferous ore at a mine in Wales, the value of which at the average market price was £863.

**SALE OF ANTIQUITIES.**—At the auction sale of the collection Faw, in Paris, which was especially rich in articles of the fifteenth and sixteenth centuries, enormous prices were obtained. Among other articles of antiquity, were several German table clocks with horizontal dial and reliefs in gilt copper, which were sold at from 4,000 to 5,000 francs.

**INTERNATIONAL EXPOSITION AT NUREMBERG IN 1885.**—The Bavarian "Gewerbe-Museum" has projected an international exposition to be held in the famous old city of Nuremberg, in 1885, of gold and silversmiths' work, jewelry, bronzes and kindred articles, and, thanks to the vigorous support it is receiving on all sides, it promises to be a decided success.

**GUARD AGAINST PICKPOCKETS.**—A correspondent of the London *Times* recommends, among the many other devices suggested for baffling watch-pilfering pickpockets, a short piece of chain attached to the pendant and to the watch guard. This is at best but a clumsy contrivance, and far inferior to the turning pendant, a false pendant or collar, that encircles the true pendant and turns stiffly on it, friction tight, so that if any attempt is made to wrench the bow off, it simply slips around the pendant.

**WHIMS OF FASHION.**—The goddess of fashion, whether she be a myth or not, is at least one whose vagaries are very costly to the jewelry trade. No sooner has a manufacturer prepared some dies of long ear rings than it is decreed that short ones shall be worn. Therefore, with the best grace possible, the jeweler puts by his dies and stock of long ear rings and sets about producing some of the smaller pattern. Perhaps these have not had a very long run before an edict goes forth that only the very smallest of patterns are to be worn; and then comes the cutting of other dies and the putting aside of old ones, until eventually, when the manufacturer looks around his warehouse, he sees hundreds of dollars worth lying idle in dies that had to be discarded all through the changes of fashion.

**"TAKE YOUR BEARINGS!"**—In *Les Mondes* is described a very simple and convenient instrument, invented by Captain Bernauf, which will often be useful for sailors. When the ocean horizon is clouded, it is difficult to measure the altitude of a star. The difficulty is obviated by a circle of iron to which a small telescope is attached. Along the circle, in a groove, is placed a tube containing mercury. The metal occupies the lower part of the tube, and oscillates according to the positions which the circle takes in the hand of the observer, as it would do in the two branches of a U-tube. In every position, however, the straight line along the surfaces of the mercury in the two branches is horizontal. The observer takes the circle in his hand, directs the telescope toward the portion of the sky which he desires to explore, and when he holds the star in the field of vision, he immediately fixes the mercury in its place by touching a button which controls an ingenious mechanism. He has then only to read, on a graduated circle, the angle formed between the direction of the telescope and that of the horizontal line.

**TIMES CHANGE.**—The Hong Kong Observatory, which is to be devoted chiefly to magnetical and meteorological observations, is now in working order. It is situated opposite the city on a couple of low hills in the peninsula of Kaulung, about 300 feet from each other. The main building is 110 feet above mean sea level, and the magnetic hut is placed on the summit of the other hill. Meteorological observations are made the issue of a daily weather report, telegrams being received from Manila, Nagasaki and Wladivostock. The observatory has a mean time clock and a six foot time ball, which is stationed near the harbor and about a mile from the main building; a small transit instrument, provided with a level and a refractor on loan, has been promised by the astronomer royal of England.

—The Japanese native papers are crying out at the extinction of the lacquer industry of the country. The tree from which the lacquer is obtained is disappearing. Formerly, like the silkworm fields, it was protected by law. Each family of the upper classes was obliged to rear one hundred trees, the middle class seventy, and the lower classes forty. Since this law fell into desuetude, the cultivation of the lacquer tree has rapidly declined. The trees were cut down without care and none were planted to replace them, so that they have become exceedingly rare, while the price of the lacquer has enormously increased. Similar complaints, too, are heard of the process of disafforestation going on in Japan since the ancient law which required every one who cut down a tree to plant two in its place has been abolished.

**INTERNATIONAL EXHIBITION OF MUSIC, ETC.**—An international exhibition, devoted to inventions and music, is to be held at South Kensington, England, next year. In the division of inventions it will consist of apparatus, appliances, processes and products, invented or brought into use since 1862; and in that of music it will consist of instruments and appliances constructed or in use since 1800; of music, engraving and printing, and of historic collections. The forms of application for space must be sent in not later than the 1st of October next. For obvious reasons the "inventions" must be preferably illustrated by models, and only under exceptional circumstances can inventions be admitted which have been shown in previous exhibitions at South Kensington since 1880. Manufactured goods will not be shown unless accompanied by illustrations of the process of manufacture. No charge will be made for space, but exhibitors and their assistants will not be allowed to invite visitors to purchase goods. Motive power will be supplied free, but exhibitors will have to pay for any gas or water they may require. Properly carried out, this should be the most interesting exhibition of those held or suggested.

**REMARKABLE HISTORY OF A WATCH.**—In December, 1787, a party of fishermen engaged in fishing in the Thames, near Blackwall, caught a seawolf. They noticed that the fish appeared to be sick or on the point of dying, as it made no resistance when caught. When brought to the shore, killed and opened, a silver watch with chain, a garnet ring and shreds of gold lace were found in his stomach, and by the presence of the latter it was suspected that these articles had belonged to an officer who had fallen overboard and been devoured by the fish, which suspicion was soon found to be correct. The watch was marked within, "Henry Watson, London, No. 1369." Inquiries were instituted, and the books of Mr. Watson proved that the watch had been sold to a Mr. Thompson about two years ago; this gentleman, when called on, recognized it as one which he had presented to his son when starting on a voyage. Further inquiries also revealed that he had mysteriously disappeared from the ship during his watch. He had doubtless fallen overboard and been devoured by the fish which had feasted on the body, while the metallic portions proved too much for him. The officer had undoubtedly died with the quotation of Shakespeare, "Let me sit heavy on thy soul to-morrow."

## Workshop Notes.

**TO CLEAN FILES.**—Files may be readily cleaned of grease by holding them for a moment in a steam jet from a blow-off cock.

**SOLDERING FLUID.**—The *Scientific American* gives the following recipe for making a soldering fluid for soft soldering jewelry: Dissolve sheet zinc in muriatic acid until the acid will take up no more zinc. Turn off the clear liquid and dilute it with alcohol instead of water. When diluted with water it must retain acid enough to rust, but with alcohol the dilution can go on until the acid is not perceptible to the tongue.

**OLIVE-GREEN BRONZE.**—There are two methods for coloring brass a fine olive-green. 1. Dissolve 1 part of perchloride of iron and 2 parts of water together, and then dip the articles therein; you will get a pale or deep olive-green according to the time of immersion. Then wash, dry and brush. Or, 2. Paint the surface of the brass with a solution of iron and arsenic in nitric acid, polishing with a small quantity of lead glance, and, after heating, coat the whole with a varnish composed of 1 part varnish, 4 parts turmeric and 1 part gamboge.

**GILDING STEEL.**—Polished steel may be beautifully gilded by means of the ethereal solution of gold. Dissolve pure gold in aqua regia, evaporate gently to dryness so as to drive off the superfluous acid, re-dissolve in water and add three times its bulk in sulphuric ether. Allow to stand for twenty-four hours in a stoppered bottle, and the ethereal solution of gold will float at top. Polished steel dipped in this is at once beautifully gilded, and by tracing patterns on the surface of the metal with any kind of varnish, beautiful devices in plain metal and gilt will be produced. For other metals the electro process is best.

**COLORLESS VARNISH.**—A colorless varnish, suitable for optical instruments, prints, oil paintings and hard white wood, may be made by dissolving two and one-half ounces of shellac in a pint of rectified spirits of wine. To this, about five ounces of well burnt animal charcoal, which has recently been heated must be added, and the whole boiled for a few minutes. If, on filtering a small portion of the mixture through blotting paper it is not found to be perfectly colorless, more charcoal must be added until the desired result is obtained. When this has been achieved, the mixture is to be strained through a piece of silk and filtered through a blotting paper.

**TO SILVER GLASS.**—Dissolve 3 grains of ammoniacal nitrate of silver in 1 ounce distilled water, which solution must be rendered somewhat clouded by sufficient nitrate of silver and then filtered. Immediately before use mix 1 ounce of this solution with  $2\frac{1}{2}$  grains Rochelle salts. The glass to be silvered having been cleansed to its utmost, is placed into a suitable vessel, the bottom of which is provided with a few wax cones, thus raising the glass about one inch above the bottom, and the fluid is poured over it. The vessel is placed on the northern side of the house, or in a place with deadened light, and the silver precipitate will be sufficiently thick in two hours. It is taken out, washed and dried; if the glass with the silver pellicle is to be used as reflector or speculum, the coating must be protected by varnish.

**SOLDER FOR ALUMINUM.**—Col. Wm. Frischmuth says: The following recipes to solder aluminum have been tried by me and found practical. Take 10 parts silver, 10 parts copper, 20 parts aluminum, 60 parts tin, 30 parts zinc. The above solder is excellent for chains, etc., and can be used for the blowpipe operations. For a solder with the common soldering iron, take either 95 parts of tin, 5 parts of bismuth; or, 98 parts of tin and 2 parts of bismuth; also 99 parts of tin and 1 part of bismuth; the fuse to use in all cases is either paraffine, stearine, petrolatum, balsam copaiba, benzine. Articles so soldered must be cleaned well before soldering, and the parts to be soldered must be heated just enough to make the solder adhere to the parts to be soldered. These alloys of solders, as above stated, can be changed to suit the operator.

**GRINDING GLASSES.**—Provide two pieces of cork, one concave and one convex (which may be cut to shape after fitting to lathe). Take a copper cent or other suitable article and soft solder a screw to fit the lathe and then wax it to the cork; then get a twenty-five cent emery wheel, such as is used on sewing machines, and you have a complete outfit for cutting your watch glasses. Polish the edge on the zinc collar of the emery wheel, or use a piece of zinc to do it. The other cork should be waxed to a penny and centered. The spectacle lenses may be cut on the same emery wheel, if the wheel is attached to the lathe so as to revolve. Another method is to take a common piece of window glass (green glass is the best), and make a grindstone of that, using the flat surface to grind on. Cement it on a large chuck, the glass being from 2 to 2.5 inches in diameter.

**TO COLOR SOFT SOLDER.**—The following is a method for coloring soft solder so that when it is used for uniting brass the colors may be about the same: First prepare a saturated solution of sulphate of copper—blue stone—in water, and apply some of this on the end of a stick to the solder. On touching it then with an iron or steel wire it becomes coppered, and by repeating the experiment the deposit of copper may be made thicker and darker. To give the solder a yellow color, mix one part of a saturated solution of sulphate of zinc with two of sulphate of copper; apply this to the coppered spot and rub it with a zinc rod. The color can be still further improved by applying gilt powder and polishing. On gold jewelry or colored gold the solder is first coppered as above, then a thin coat of gum or isinglass solution is laid on and bronze powder dusted over it, making a surface which can be polished smooth and brilliant after the gum is dry.

**BRASS FINISHING BY ACIDS.**—Many articles of brass cannot readily be finished by the file or by abrading substances, owing to the intricacies of their surfaces. Especially is this true of brass castings of an ornamental character. But a most elegant finish can be obtained by means of acids, which may be protected, if desired, by means of lacquer or varnish; the acid finish, however, is generally preferred without the addition of a varnish. If the work to be finished is greasy, it should be cleaned by heating and dipping in acidulated water—vinegar and water or washing soda in water—and then in clear water. The finishing bath may be either nitric acid, two parts; water, one part; or one part sal ammoniac, one part sulphuric acid, one part nitric acid, one part water; all by measure, and the sal ammoniac to be dissolved in water until a saturated solution is obtained. The articles should not be allowed to remain in the acid more than ten seconds, then taken out, plunged into clear, cold water, then into hot soapy water, and dried in hot sawdust.

**ETCHING ON GLASS AND METAL.**—Glass is etched by means of hydrofluoric acid gas or liquid hydrofluoric acid, that is, a solution of the gas in water. The former in contact with glass produces a rough surface, as on ground glass, while the latter ordinarily leaves the surface clear. The gas is prepared by mixing together finely powdered fluor spar, calcium fluoride, three parts, and strong sulphuric acid, two parts, in a leaden dish and applying a very gentle heat. The plates to be etched may be placed over the dish. The operation should be conducted under a hood or in the open air, to avoid inhaling the pernicious fumes. The plates are prepared by cooling them while warm with wax or paraffine, through which to the surface of the glass the design is cut with suitable graving. In preparing the liquid acid, the mixture of spar and oil of vitriol is placed in a leaden or platinum retort which is heated, and the gas given off is conducted into a leaden bottle partly filled with water, which absorbs it. In contact with the flesh the acid produces stubborn sores. Metals are usually etched with dilute nitric acid, or nitre and sulphuric acid, or sulphate of copper and salt, or hydrochloric acid and chlorate of potash.

## Trade Gossip.

D. Des Mendes has just returned from Europe with a large stock of rough diamonds.

S. Dessau has just added a diamond cutting and polishing department to his diamond business.

Mr. C. A. Fowler, of Fowler Bros., was recently made the happy father of a boy. Congratulations are in order.

Albert E. Morlan, formerly of New Orleans, now United States Consul to Belire, was in the city during the past month.

J. G. Doty, formerly with Louis Strasburger & Co., has entered the employ of D. L. Van Moppes and will travel for them in future.

Mr. Addison Hubbard, of the firm of Cowell & Hubbard, of Cleveland, Ohio, recently spent several days in New York with his bride.

L. L. Schwob, of Brookhaven, Miss., recently departed from that town, leaving a goodly number of creditors to mourn his untimely departure.

F. I. Marcy & Co. have introduced this season a very attractive line of antique coin buttons with their acme lever attachment. These goods are made in sterling silver.

C. B. Burgess, a representative of the Whiting Manufacturing Co., purchased the first ticket at the new depot of the Cumberland Valley Railroad at Hagerstown, Md., October 4.

The brass band, composed of employees of the American Watch Company, entertained the good people of Waltham during the summer with open air concerts in the public parks.

Ladies' fob watchchains, in oxidized and bright silver, gold, or silver and gold combined, are about five inches long, and have a coin, ball or bell at one end. Some have a guard also.

A gentleman in Waltham has a field glass by which, on a clear day, the time given by the clock on the Providence depot in Boston can be plainly seen from the top of Prospect Hill.

Antique coin bangles, lacepins, watchfobs, etc., of oxidized silver are very popular. Many of the coins are made smooth on one side, and the monogram of the wearer engraved thereon.

D. C. Greenleaf, of Jacksonville, Florida, arrived home from Europe October 28. His partner, Mr. Crosby, met him in this city, and before going home they made liberal purchases here.

The business of the firm of J. S. Birch & Co., manufacturers of Birch's universal watch key, is to be continued under the same name, notwithstanding the recent death of the senior member of it.

Robert Nelson has removed from Dunkirk, N. Y., to Toledo, Ohio, where he has a store in the Chamber of Commerce building. He will carry on a general jobbing business in watches, tools, materials, etc.

Mr. L. B. Citroen died September 14 suddenly in Paris at the age of 43 years. He had been engaged in the diamond business in this city for twenty years and widely known and highly respected by the trade.

The annual report of the Yale College Observatory had not been made public at the hour of our going to press. Prof. Waldo writes that it has been unavoidably delayed, but will be ready in a very short time.

The Fredonia Watch Company is pushing its business with much enterprise and is selling many goods. Aikin & Lambert are the selling agents for these watches in the East, and Stein & Ellbogen have charge of the Western territory.

Stern & Stern have made special preparations for the holiday trade, and offer attractive lines of diamond jewelry, gold cases, movements, and novel and standard designs in gold jewelry of all kinds. They also carry a stock of rolled plate goods.

We have received a circular, dated at Boston, announcing that it is proposed to have an exhibition of American art products and manufactures in London, beginning in May of next year. The co-operation of leading American manufacturers is said to have been secured.

H. H. Kayton has accepted the agency for Miller's self-registering gage, for selecting or putting in cylinders, pinions, wheels, arbors, etc. It is claimed that it will save half the time ordinarily required for such work. It is a small, convenient tool, and has given satisfaction wherever used.

Bawo & Dotter announce a large stock of novelties for the holiday trade in the way of artistic pottery, plaques, bisque, parian ware, glass ware, cutlery, etc. These goods afford dealers an opportunity to diversify their stocks, making them attractive and introducing new lines.

E. R. Glover, salesman for A. Bernhard & Co., of this city, was recently taken sick at La Grange, Texas, and died at the hotel after a brief illness. He was attended by two physicians, and local dealers did all in their power for him. Mr. Glover was about twenty-five years of age, and had been a jewelry salesman for a number of years.

A spoon bowl has been patented by Mr. Henry Nickolds, Sr., of Taunton, Mass. The bowl of this spoon by this construction, instead of having a sharp edge, has its margin bent outward or extended in the manner of a flange, or made with what is styled a returned edge, so it will present a more smooth and agreeable surface to the upper lip.

Amasa Lyon, the well known manufacturer of umbrellas, parasols, etc., has a large stock of novelties in his line, embracing all the latest styles and fashions in umbrellas and parasols. He also has every variety of canes and cane heads that can be thought of. These goods are well calculated to attract custom, and are exceedingly appropriate for jewelers to carry in stock.

One Saturday noon last month an unknown man went into the office of Martin & Runyan, No. 102 Broadway, and asked to see a gold bar valued at \$500. Upon it being handed to him he dashed out of the office and ran rapidly up the steps leading from the pavement to the upper portion of the building, from whence he escaped to Pine street. The affair caused considerable excitement.

The jewelers of this city manifested much interest in the political campaign just closed, participating in various demonstrations on one side or the other. They were organized into Cleveland and Blaine clubs, the political sentiments being about equally divided. We heard of quite a number of bets being made during the excitement which is an indication that there is still some money in the jewelry business. As THE CIRCULAR is a non-partisan in politics, it hopes that all parties interested won their bets.

One of the handsomest advertisements issued this season has been got out by Fowler Bros., manufacturers of crape stone jewelry. It is a full length lithographic portrait of Christine Nielson, the famous opera singer, and is not only valuable for the richness and style of the colorings of the picture but also as a portrait of the lady. In her hand she carries a mourning handkerchief, on which appears the advertisement of the firm. The picture is a gem in its way, being both a good likeness and possessing much artistic merit.

Hodge, Slemmons & Co., of Pittsburg, have issued a very complete and comprehensive catalogue of tools, materials, optical goods and watchmakers' supplies, of all of which they carry full lines. The catalogue is profusely illustrated, showing the forms of all tools and appliances required in the watchmaking trade, styles of optical goods, watch material, etc., with prices. It is handsomely printed, and will prove an invaluable guide to persons desiring to purchase goods of this class. The firm also carry a full line of American movements, and a general stock of jewelry, clocks, silverware, etc.

A western paper tells of a watch that was lost in the fall of 1880 by a farmer while plowing. In the spring the field was harrowed and planted with corn, during the summer the corn was cultivated, and the next spring the field was again ploughed and sown with oats. That fall it was again ploughed and wheat was put in, and the next summer, while harvesting, the watch, which was lost three years before, was found in good condition. It was an open-face one and the glass was not even broken. It was wound up and it was found to run all right. The watch is still running and in good condition.

The Hanover Fire Insurance Company has issued a very handsome lithograph of the new building of the Mutual Life Insurance Company, in which the Hanover occupies conspicuous offices. The site of this building is historic ground, having been first occupied by a church in the early days of the settlement of the city and subsequently by the Post Office. It is now covered by one of the finest buildings to be found in the country. The Hanover is a prominent fire insurance company, doing a careful conservative business, and having an abundance of assets with which to meet its liabilities. It is noted for the prompt manner in which it settles its losses, and for liberality in dealing with its patrons.

At the time the Greely expedition was being fitted out, Lieutenant Greely obtained from the E. Howard Watch and Clock Company, at their Boston office, a watch for his own personal use. He selected one from their regular stock, and carried it through all his explorations and tribulations. On his return he voluntarily wrote to Mr. Albert Howard stating that the watch had given "extreme satisfaction." He says: "Three years' experience justify me in especially recommending such watches for field work in Arctic or other explorations where timepieces are subjected to remarkably rough treatment and extreme changes of temperature."

A guest of the New York hotel bought six rings, worth over \$600, from Tiffany & Co., on Thursday, and lost them on the way to the hotel. The hotel detective suspected two men of having them, and followed them into a bar room, where, over a schooner of beer and a cigar, he mentioned the missing rings. The men exchanged quick glances and retired to the rear of the room. They soon returned to Larkin and asked if he was the hotel detective. He said that he was, and added that they might as well hand over the package. After some hesitation they did so, upon the promise that he would not "give them away." They had picked it up in the street.

"Leisure Hours among the Gems," by Augustus C. Hamlin, a well known writer on precious stones, is the title of an interesting book just issued by James R. Osgood & Co. of Boston. The work is a description of some of the famous gems of the world, and contains, also, an account of various important "finds" of stones, and a general description of the character of the different varieties. The whole is written in a popular and pleasing style, containing much that is historical and much that is romantic in regard to the subject treated of. This work can be had at publishers' prices, by addressing The Jewelers' Circular Publishing Company. Price of single copies \$2.00.

Thieves entered the jewelry store of Leopold Michel at 112 Ewen street, Williamsburgh, recently, and carried away \$4,500 worth of jewelry from the show cases. Mr. Michel had a friend visiting him that evening, and he sat up somewhat later than usual. As the friend was leaving they went out to take a glass of beer, and Mr. Michel locked the shop door behind him. He believes he locked it carefully, but it is possible he shot the bolt before closing the door. Next morning the jeweler found that the shop door was ajar and the bolt of the lock was sprung as if someone had locked the door before closing it. There were no marks of forcible entry about the lock or the door. The thieves had opened a large glass showcase and had taken from it several hundred gold rings, a dozen gold watches, and two dozen silver watches, and other small articles, the whole valued at about \$4,500. In the same case they had overlooked a box containing \$2,200 worth of diamonds, a tray of gold watches, and other gold articles. They took a quantity of plated lockets and left those which were of gold. They also overlooked a much richer mine. In a corner of the shop was Mr. Michel's safe, and in it were \$12,000 worth of diamonds and jewelry. The safe doors were unlocked and could have been pulled open, as the lock was broken and it was impossible to work it. No clue to the thieves was found.

During the past month we have noticed the following jewelry merchants in this city making their fall purchases: Henry Ginder, of A. B. Griswold & Co., New Orleans, La.; James Allan, Charleston, S. C.; Mr. Thomas, of Carrington, Thomas & Co., Charleston, S. C.; M. Scoler, New Orleans, La.; Mr. Freeman, of Freeman & Crankshaw, Atlanta, Ga.; S. G. Brooks, Boston, Mass.; W. L. Kelley, New Bedford, Mass.; Edward Harris, of Harris & Shafer, Washington, D. C.; A. M. Hill, New Orleans, La.; C. L. Byrd, Memphis, Tenn.; T. G. Calvert, Lexington, Ky.; W. F. Fischer, Chatanooga, Tenn.; C. K. Giles, Chicago, Ills.; T. E. Thompson, Galveston, Texas; H. M. Ordway, Lowell, Mass.; J. M. Connell, Portsmouth, N. H.; J. E. Rood, Portsmouth, N. H.; Julian Gyot, Jefferson City, Mo.; D. R. Brown, Johnstown, N. Y.; Mr. Grant, of Brown & Grant, East Saginaw, Mich.; A. C. Wortley, Kalamazoo, Mich.; Mr. Jebb, of Jebb Bros., Jacksonville, Ills.; O. E. Curtis, Decatur, Ills.; H. A. Kingsbury, Norwich, Conn.; T. & E. Dickinson, Buffalo, N. Y.; T. H. Graham, Cleveland, O.; George Banks, of Bailey, Banks & Biddle, Phila., Pa.; Wm. G. Bailey, Helena, Montana; M. B. Wright, Kansas City, Mo.; Jacob Hammel, Syracuse, N. Y.; O. E. Zadek, Mobile, Ala.; Charles Thompson, of George R. Calhoun & Co., Nashville, Tenn.; S. L. Goldstein, Syracuse, N. Y.; L. S. Stowe, Springfield, Mass.; Mr. Hosley, of Woods & Hosley, Springfield, Mass.; E. T. Child, Hamilton, Bermuda; A. M. Bronson, Susquehanna, Pa.; G. H. Waldin, Burlington, Iowa; C. W. Carter, Norwich, Conn.; L. Braverman, San Francisco, Cal.; S. Nordlinger, Los Angeles, Cal.; A. C. Titcomb, San Francisco, Cal.

At a numerously attended meeting of the manufacturing jewelers of Providence and Attleboro, held at Providence, it was determined to organize a Jewelers' Board of Trade. This is deemed necessary in consequence of recent failures in the trade, whereby the manufacturers have been serious losers. At the preliminary meeting Mr. John A. McCloy called the meeting to order, and Mr. Dutee Wilcox was elected Chairman. Mr. McCloy was then appointed Secretary, and read the call for the meeting. Mr. Graham, of Dun's Mercantile Agency, read statistics respecting recent failures in the wholesale jewelry business, dividing them into three classes: First, honest failures; second, doubtful failures, and third, dishonest failures. Of the first, he said there were thirteen with liabilities amounting to \$745,751; of the second there were eleven with \$292,254 liabilities; of the last there were six with liabilities amounting to \$270,400. The total number of failures was thirty and the total number of liabilities \$1,308,405. The largest amount offered in compromise was 33 $\frac{1}{3}$  per cent., and the smallest 10 per cent. The following gentlemen were appointed a Committee to frame a Constitution and By-Laws, and to attend to other work necessary to the proposed organization; Mr. Dutee Wilcox, Chairman; Mr. H. Howard, Mr. George Briggs, Mr. Alfred S. Potter, of Providence, Mr. Everett Horton, Mr. S. E. Fisher, Mr. R. L. Sweet, of Attleboro. Mr. Howard read a paper containing some of his experience in the business and said that such an institution as that proposed should be founded on truth and honor. There is only one way to get this, he said, and that was by showing to men that they lose caste in the community if they misrepresent their neighbors. The Chairman of the Committee on Constitution and By-Laws reported that there was not a quorum of the committee present, so they were instructed to report at the next meeting and were empowered to engage the services of Mr. Graham as Secretary. On motion of Mr. B. W. Dodge, of the firm of Dodge, Platt & Co., the sense of the meeting was taken on the proposed permanent organization of a Board of Trade for manufacturing jewelers, and the motion was adopted unanimously. After a vote of thanks had been extended to Mr. McCloy for his efforts in behalf of the proposed organization, the meeting adjourned to Saturday, October 25.

A woman named Mrs. J. F. Heustis was arrested early in the month in Boston, on complaint of Mrs. Theresa Lynch, a dealer in diamonds, of this city. Mrs. Heustis is the widow of J. F. Heustis, who is reported to be the son of a Boston policeman and formerly a stock operator in this city. He and his wife lived in most extravagant style in this city and at Boston, patronizing the most fashionable hotels, driving elegant equipages, the lady blazing in diamonds, and she and her husband dressed in the extreme of fashion. Where the money came from to support this extravagance was a mystery to their friends. Mr. Heustis owned a beautiful country place at Marshfield, Mass., where he entertained his friends with princely hospitality. He always seemed to have plenty of money, was an occasional borrower, but paid promptly. A few months ago he died, and his widow soon after disappeared from New York, leaving many debts, of liberal amounts, unpaid. While here she formed the acquaintance with Mrs. Lynch, and seems to have been on friendly and social terms with her. It is reported that she frequently borrowed valuable diamonds of Mrs. Lynch and after wearing them would return them. In her complaint Mrs. Lynch avers that it is part of her business to loan diamonds, and claims that Mrs. Heustis represented that she was worth \$2,000,000. At different times, as set forth in the complaint, she obtained of Mrs. Lynch a diamond pin valued at \$2,000, two diamond rings worth \$900 and \$1,200, diamond ear rings worth \$1,500, a sapphire and diamond ring worth \$250, a gold watch valued at \$60, three diamond crescent pins and ear rings that cost \$1,600, a gentleman's repeating watch worth \$500, a nine-stone diamond pin worth \$2,500 and other jewelry, including a pin and ruby ring worth \$3,000. Some of this jewelry Mrs. Heustis borrowed "to show her husband." None of it did she ever return. The total amount of money held by Mrs. Heustis and belonging to Mrs. Lynch is placed at \$16,300. On this complaint Mrs. Heustis was arrested in Boston by detectives, who sought to bring her to New York, but were opposed by counsel for the prisoner. Her friends claim that Mr. Heustis was a man of property but lived beyond his means and so got into debt; that he bought the diamonds of Mrs. Lynch on credit and presented them to his wife. Mrs. Lynch will be remembered by readers of THE CIRCULAR as having figured in criminal proceedings relating to diamonds on several previous occasions. For a dealer in gems she is peculiarly unfortunate in encountering customers who get possession of her valuables without depositing their equivalent in cash. The case of Mrs. Heustis had not been disposed of as we go to press.

THE  
**JEWELERS' CIRCULAR AND HOROLOGICAL REVIEW**

*The recognized organ of the Trade, and the official representative of the Jewelers' League.*

A Monthly Journal devoted to the interests of Watchmakers, Jewelers, Silver-smiths, Electro-plate Manufacturers, and those engaged in the kindred branches of art industry.

SUBSCRIPTION:

To All Parts of the United States and Canada,  
**\$2.00 Per Annum; Postage paid.**

To Great Britain, France, Switzerland, Germany, the West Indies, Mexico, the Republics of South America, and Australia, \$3.00 per annum. Postage paid.

All communications should be addressed to SETH W. HALE, President, THE JEWELERS' CIRCULAR PUBLISHING CO., 42 Nassau Street, New York.

Advertising rates made known on application.

Congress and Commercial Interests.

AT THE TIME the November issue of THE CIRCULAR went to press, the great political parties of the country were engaged in a struggle for supremacy. The prize for which they contended was the presidency, and the administration of the government for the ensuing four years. For months politics claimed the attention of the people, and seldom has there been a presidential campaign that so interested and excited all classes as the one just terminated. During the canvass the commercial interests were made to play an important part; one of the issues much discussed—an issue upon which both parties are divided—was Free Trade vs. Protection. The discussion of this question, which promises to be a live and active one for a long time to come, served to draw our business men into an active participation in the campaign to an extent seldom equalled, and the merits of this very important subject were more fully and popularly discussed than ever before. As a manufacturing industry the jewelry trade is unquestionably large in favor of protection to our home industries, and desires a discriminating tariff that shall tax goods of foreign manufacture that enter into competition with our own industrial products; such a tariff as will enable our manufacturers to pay better wages to their workmen, and still compete with their foreign rivals in the markets of this country; also such discrimination in imposing duties as will admit free such raw material as enters into our manufactures. While our statesmen are busying themselves with schemes for extending our commerce with other nations, they should give some attention to the measures necessary to enable our manufacturers to compete in our own markets with the products of foreign cheap labor.

The November election did something more than determine the

question of presidential succession; in various districts members of Congress were chosen who will take their seats—or will be full-fledged members—on the fourth of March next. The present Congress will convene on the first of the present month, and the session will terminate with the inauguration of the new president, March 4th. As business men were so extensively drawn into an active participation in the canvass, it will be well for them to continue their interest in politics until various measures in the interests of trade and commerce are satisfactorily disposed of by Congress. The one of most vital importance is the amendments to the tariff which should be done in the interests of our productive industries. For several years this matter has been under discussion, and at each session of Congress apprehension has been felt lest something should be done prejudicial to American manufacturers—lest, in fact, the free trade element should prove strong enough to make such amendments to the tariff as would admit to the country the products of foreign cheap labor on such a basis that our manufacturers could not compete with them without cutting down the wages of their own workmen to starvation prices. So long as this agitation over the tariff is kept up, so long will it tend to check enterprise and demoralize trade. Capital is easily frightened, and nowhere is it more sensitive than when invested in manufacturing enterprises. The best interest of the commercial and manufacturing industries demand that the tariff question shall be disposed of definitely at an early day, and all the influence of our business men should be brought to bear on our representatives in Congress to secure this result.

One other thing demanded by the mercantile class is a national bankruptcy law. Last year Congress was urged to adopt such a measure, but it spent so much time in political wrangles that it failed to do so. The experience of the business community during the past year has served to strengthen the belief that a national bankruptcy law is an absolute necessity. The diverse State laws are so lax and so difficult of application that the creditor class is virtually at the mercy of swindlers and thieves, who deliberately lay their plans to obtain goods on credit, then fail, and trust to the imperfections of the State bankruptcy laws to get away with their plunder. The jewelry trade has been most seriously victimized of late by experiences of this kind. There is before Congress what is known as the Lowell bankruptcy bill; it was drafted by Judge Lowell, of Massachusetts, received the endorsement of most of the commercial exchanges of the country and of numerous trade organizations. The bill passed the Senate, and is now on the Speaker's table in the House in condition to be taken up at any time and pushed to a vote. If the commercial bodies of the country and business men in general desire this measure to become a law during the coming session of Congress, they should take steps to press it upon the attention of the House. It should be borne in mind that, allowing for the holiday recess, Congress will be in session but about two months and a half; that there will be an unusual rush of business and much political buncombe to be exploited; if anything is to be done with the bankruptcy bill the work should be commenced as soon as Congress

assembles. The various organizations in the jewelry trade should take an active part in this work, and, by pushing this bill to adoption, aid in securing some degree of protection from the swindlers who make failing a business. If there could be united action of the various organized bodies representing the interests of business men, it would have great weight with members of Congress; it would be a good thing for such organizations to appoint a committee to confer with the members from New York State and show them the importance of this measure; the committee should also go to Washington and improve every opportunity of forcing this matter upon the attention of members from other parts of the country.

The year 1883 showed a greater number of failures than any other year in our history except 1878, the total number being reported at 10,299, with aggregate liabilities amounting to \$175,968,000. This recently led the Chairman of the Special Committee of the Board of Trade and Transportation to the inference that "the majority of those who failed in 1883 were small dealers, who doubtless, in many instances, have been tempted to do so by the opportunities afforded by the exceeding loose State assignment laws, which may not be inappropriately termed, *acts to encourage frauds.*" One of the worst features of the State bankruptcy laws, and which should be specifically guarded against in any national law, is the facility afforded bankrupts for putting their property into the hands of convenient friends by making them preferred creditors. To what extent this swindle is on the increase is shown by the following exhibit of the failures of 1883 compared with those of the previous year:

|                     | Failures. | Gross Liabilities. | Actual Assets. | Specified Preferences. |
|---------------------|-----------|--------------------|----------------|------------------------|
| 1883.....           | 10,299    | \$175,968,000      | \$90,804,000   | \$9,685,568            |
| 1882..              | 7,635     | 93,238,936         | 47,469,674     | 4,919,823              |
| Excess in 1883..... | 2,664     | \$82,729,064       | \$43,334,326   | \$4,765,745            |

Here it is seen that the "preferences" in 1883 are almost double those of the year previous, demonstrating beyond dispute the increasing tendency to prefer personal friends, to the not infrequent cutting off of every *bona fide* creditor from a legitimate share in assets. The foregoing statistics do not include the amounts preferred under the guises of chattel and reality mortgages, confessed judgments, etc., given shortly prior to the assignment or failure; if these were added, the figures would reach startling proportions. The Board of Trade and Transportation, the Chamber of Commerce and other organizations of the kind have performed excellent work in exposing the glaring injustice of the system and awakening the public conscience—if we may so speak—to the fraudulent practices which are thus possible under the forms of law, and it is to be hoped the work will be unflinchingly pushed forward until success crowns their labors, and secures a national bankruptcy law based upon principles of equity. The jewelry trade should not be laggard in aiding this work.

#### How to Make Retail Stores Attractive.

THE RETAIL jewelry merchants continue to complain of the encroachments made upon their business by outside dealers—the fancy goods merchants, dry goods men, druggists, fancy bazaar keepers, etc.—who carry certain lines of jewelry which they use as a means of attracting custom and sell at low prices. We are requested to urge manufacturers and jobbers to cease selling goods to outsiders, and confine their transactions to the legitimate trade channels. THE CIRCULAR has, in the past, given much space to the discussion of this abuse that has grown up in the trade, and has pointed out its origin and suggested remedies, but we fear it has become so engrafted upon the business system that it never can be eradicated. The jewelry trade, like all other industrial and mercantile pursuits, is governed by the immutable laws of supply and demand; demand governs production, and from whatever direction

it comes, the producers will endeavor to meet it. They have their money invested in their business, and it is necessary to their financial success that they should sell their products as rapidly as possible and so keep their money turning over. It is with them precisely as it is with the retail merchants, who frequently take for their motto, "Quick sales and small profits." Business men, to whatever class they belong in trade, cannot afford to have their means tied up in dead stock; it is better to sell on a small margin of profit, re-invest and sell again, than to tie it up in goods and hold them for large profits. Indeed, we often find them selling at a sacrifice rather than carry stock that has not life enough in it to move itself. It is a fundamental principle in business to keep capital moving. To do this every good business man, be he a manufacturer, jobber or retail merchant, will sell his goods to the best customers he can find regardless of their relations to the trade. The manufacturer who has a large stock of goods on hand, is not going to hold them for jobbers in the trade to come along at their leisure and buy, when men in other lines of business are proffering him "cash on delivery" for them, and this is just what is being done in the jewelry trade. Those business men in whom the mercantile instinct is strong, have realized the fact that diversified stocks attract customers; hence the great bazaars in our large cities, where one can buy anything, from wedding rings to household furniture, including kitchen ranges, and the pots, pans and kettles necessary thereto. These men are merchants in the highest sense of the word; studying the wants of the public they aim to supply them fully; realizing the power of money they buy for cash, obtaining thereby bottom prices, and generally order large quantities, whereby they obtain the advantage of every possible discount allowed by the manufacturer; they sell for cash, realize a small profit and speedily have their funds in hand again for re-investment. Carrying a supply of almost everything the public wants, they make their stores attractive and so keep them crowded with customers. There are a dozen or more bazaars of this kind in New York, while every place of importance in the country has more or less of them. A. T. Stewart, who may be regarded as the pioneer in this class of business, was loudly condemned because, it was said, he absorbed the trade of innumerable small dealers. This was true, but he demonstrated that what might be a hardship for small dealers was his path to success. His immense fortune was accumulated because he had the true mercantile instincts largely developed, kept what the public wanted, bought for cash and sold at a small profit. It is not surprising that manufacturers and jobbers ignore trade limitations and cater to outside customers when these outsiders make it profitable for them to do so. All things being equal, they would, no doubt, prefer to sell through the trade, but as money is their object, they will supply the demand from whatever source it comes.

To meet this outside competition, retail jewelry merchants should imitate the successful merchants in other lines who are becoming their competitors. Diversify their stocks, supply the public wants and make their stores attractive. We do not mean to advise them to go into the hardware or furniture business or to handle an incongruous medley of goods, but to carry in stock those thousand and one things that are of kin to jewelry. Almost everything pertaining to art, as well as many that belong to the sciences, are appropriate adjuncts to a stock of jewelry, while many lines of ordinary merchandise can be successfully introduced. With the rage for art in all its forms that now exists, the jeweler would find a profit in carrying a line of artist supplies; these would naturally bring to him examples of drawing and painting for exhibition, adding to the attractiveness of his place of business. Very attractive goods in pottery and glassware are now to be seen everywhere, and, with the development of the pottery industry in this country, the demand for artistic examples of it is becoming widespread. To decorate china handsomely is the ambition of many ladies; why should not the jeweler afford them the materials and the facilities for doing it? Artistic stationery is also in great demand, and there is here much room for the display of taste in fine engraving and printing; as pens and

pencils constitute a part of every well selected stock of jewelry, the stationery should naturally go with it. Music is one of the sciences akin to art, and the material used in its production might well make an attractive feature in the stock of the jeweler. Musical instruments, in endless variety, are always in demand, and there is a fair profit in handling them. Of bric-à-brac there is no end, while the demand for it is so extensive that no lady is happy without various articles that come under this generic head, and "the children cry for it." In every community there are disciples of good old Isaac Walton, in whose eyes there is nothing so beautiful as a good supply of fishing tackle. Modern invention has produced some very attractive articles in this line which would prove tempting bait in a jeweler's show case. There are other varieties of sporting and athletic goods, lawn tennis, croquet, etc., which would help to introduce custom and add attractiveness to the store of the merchant.

We might continue this list indefinitely, mentioning many varieties of goods that would be entirely appropriate in a jewelry store, and that would tend to attract custom, but it is unnecessary. What we desire to convey is the idea that retail merchants should appropriate a leaf from the experience of others, and, by offering the public the means for supplying a fair share of its multifarious wants, attract to themselves a more liberal portion of its patronage. With a good stock of carefully selected jewelry on hand, they have laid the foundation on which to build up a business that shall include the sale of all kinds of goods that appeal, directly or indirectly, to the artistic tastes of the community in which they live. Let them make art bazaars of their business places, avoiding the incongruities that are to be found in the other class of bazaars we have alluded to, and provide a display of fine goods that shall appeal to the eye and gratify a taste for the beautiful. By this means they direct attention to their stock of jewelry, and will not need to fear competition from outsiders. Times have changed greatly in the past few years, and business methods have changed with them. Trade no longer flows through the channels prescribed for it by tradition, but, like the Mississippi river, breaks down all barriers and flows wherever it finds a convenient outlet. Those who would benefit by it must be prepared to take advantage of every change, and to conform their habits and practices to the new order of things. The manufacturer must produce what the public wants, and supply the demand through such agencies as he finds at hand, while he who seeks to live by buying and selling must cultivate his mercantile instincts to the highest degree and be prepared to meet competition on its own ground. We do not say that the new methods of doing business are better than the traditional ones that recognized the manufacturers, jobbers and retail merchants as three distinct classes, each having rights the others were bound to respect, we simply look at the situation as it exists to-day and speak accordingly. No one class is more responsible than another for the breaking down of trade barriers; this is due to increased competition solely in all branches of the trade; a competition that has forced it to broaden out and extend itself in such directions as it could find outlets.

---

### National Exhibitions.

THERE ARE in progress now, or are announced for the coming year, several exhibitions which, from the magnificent proportions of the preparations, are deemed worthy of being called national. The one now in progress at New Orleans is the outgrowth of an effort made several years ago to improve the cotton culture of this country. It was a fact lamented by political economists, that much ignorance prevailed among cotton growers as to the best methods of preparing their product for the market, and that, consequently, it deteriorated from twenty to fifty per cent. between the time it was picked and its advent in the factories where it was manufactured into various fabrics. It was thought a desirable thing to get up an exhibition whereat could be exhibited the improved machinery invented for handling cotton in its various stages, show the best

methods of handling and storing it, and, in fact, to bring producers, inventors and consumers together, where each could learn from the other something regarding the requirements of each. The scheme was a brilliant one, was successfully carried out and has already brought forth good fruit. What was originally designated a cotton exhibition, is now termed a "World's Industrial Exposition," or something similar, and appeals not only to the industries of this country but of other nations, to come forward and compare notes of progress made and results achieved. In two or three European countries similar exhibitions are proposed for next year, and the present outlook for their success is quite promising.

To what extent the gold and silversmiths' art, the watch and clock-making sciences, and the many other special industries in the jewelry business, will avail themselves of these opportunities to show the world what they are doing, we have no intimation; but, for the general welfare of the business, we trust they will make their best exhibits and attend them largely. We are thorough believers in the practical utility of these national and international industrial congresses. The Philadelphia exhibition of 1876 did more to stimulate invention and to encourage workmen than anything that has ever taken place in this country. It was a museum of natural and industrial curiosities, an art school and a grand international workshop combined. It is still referred to as one of the greatest events this country has ever witnessed, and the many thousands of persons who visited it still refer with pride and satisfaction to what they saw at the Philadelphia exhibition. Crowds of workmen in various callings attended to study their specialties, often being sent long distances at the expense of their employers. It was the grandest recognition of the achievements and power of labor that was ever made, and did more to educate our workmen and stimulate them to renewed efforts than would have come to them from years of hard plodding at the work bench or in the factory. The arts employed in the jewelry trade never appeared to better advantage than at the Philadelphia exhibition, and it was a proud day for our horologists, our watch-makers, gold and silversmiths, and our manufacturers of jewelry, when they could stand side by side with the workmen of Europe and show to the world that, while this nation is young in art work by comparison, it was equal to a comparative competition with those nations where the arts were old when our nation was born. That exhibition served to teach our own people that it was not necessary to go abroad when they wanted fine examples of work in the precious metals, and that the taste of our manufacturers in producing articles for personal adornment were far in advance of those of their European brethren. It would be a grand thing for the jewelry trade if there was a permanent exhibition of this kind in this country; it would serve the purpose, to a great extent, of an art school, and prove a valuable aid in developing our young workmen into artists in metal work.

But there is no permanent exhibition and no art school; in their absence the trade should take advantage of every opportunity offered to exhibit the products of their workshops, and thus sustain the good impression formed by the people at the Philadelphia exhibition. It is not always possible to get a competitive exhibition with European manufacturers, but it is a good thing to show our people what we ourselves are doing and the progress we are making in the arts and sciences. It will serve not only as a stimulus to better efforts on the part of artists and workmen, but will have a tendency to improve trade and put money in circulation. Why is it not feasible and desirable to have a gold and silversmiths' exhibition in this city every year?

---

### The Holiday Trade.

THE HOLIDAY trade has been better thus far than could reasonably have been expected earlier in the season. During the latter part of October there was a noticeable improvement in the

volume of business transacted, and during November it continued to swell until it became fairly brisk. From the expression of the buyers who were in the city, it is evident that a fair amount of business is anticipated by the retail trade to close the year. There is a better feeling pervading the business men in the rural districts; farmers have generally marketed their crops, and while they were somewhat disappointed as to the prices obtained, they nevertheless realized a fair profit, and were satisfied to put in circulation the money they received. Retail dealers have felt justified in ordering more liberally than they contemplated doing, and thus the jobbers' orders are more extensive than they promised to be. It may be said that business was fairly active during November, with a promise of its continuing so throughout the present month at least. Then comes, in the natural course of trade, a lull till spring, which time is taken advantage of by the houses in the trade to make up their books, take account of stock and get ready for the business of next year.

The temptation to buy holiday goods has been unusually great this year, for the prevalence of attractive and desirable goods, combining utility, novelty and excellent workmanship, has been universal. New designs in almost every class of goods is the rule; the public demands novelty, and the manufacturers meet them squarely and satisfactorily on that issue. Their artists and designers are kept busily at work all the time, and there is scarcely an article known to the trade that has not this year appeared in some new form, or that is not made novel by a new style of ornamentation. The most critical artistic taste is satisfied with the results, while to the uncritical eye the work seems perfection. In gold and silverware the number, variety and elegance of the articles offered has never been equalled, and in gold goods for personal ornaments, the forms, devices and styles defy enumeration, while for attractiveness they leave nothing to be desired. In diamond jewelry the variety of settings is endless, running from the very elaborate to severe plainness. In gems there can scarcely be said to be any fashion; once possessed of the gems themselves the owner can exercise his or her own taste as regards the form or style of setting. Yet many improvements have been made in these of late, all, of course, designed to show the gems to the best advantage. In every line of goods there is exhibited a spirit of progress, and each new article as it comes from the factory possesses attractions peculiarly its own. If, therefore, the holiday trade is not voluminous and profitable it will not be the fault of the manufacturers, for never before have they appeared with so tempting a display of goods. Up to the present writing the trade has been quite as good as was expected, and the outlook is promising for the present month.

---

## Gossip of the Month.

---

HAVING surreptitiously caught a glimpse of the editor's proofs this gossip observes that he asks, in another column of THE CIRCULAR, why it is not feasible and desirable to have an annual exhibition of the products of our gold and silversmiths, horologists, manufacturing jewelers, etc., embracing all those goods handled by the jewelry trade. As to the desirability of such an exhibition there can be no doubt, but on the question of practicability there will be variety of opinions. That the trade could make a most attractive exhibition, contributing thereby greatly to art study, and to stimulating artists and designers to more original and better work, cannot be denied; but will they do it? In answer to this steps in the selfishness of the individual, and he can see nothing beyond the present outlay; the dollar of immediate expense blinds him to prospective thousands. The individual argues: "I pay large rent for my show room, there all my goods can be seen at all times by whoever calls; why should I contribute of these to make an exhibition whereby my competitors will profit as much or more than I can; here I have a

permanent exhibition, and it is to this immediate spot that I desire to attract the public." This is arguing from a purely selfish and shortsighted standpoint. Thousands of persons will visit an exhibition where the combined products of many manufacturers can all be seen at once, who would not take the time to visit the many places of business of the individual manufacturers. Being at the exhibition, and being delighted with its magnitude and with the magnificence of its artistic exhibits, they would be tempted to buy liberally then and there; a lively interest in this branch of manufactures would also be excited, and they would be on the lookout for future developments. Such an exhibition, under proper management, would attract many thousands of visitors, could be made self-sustaining and would be the grandest showing of the progress made in the arts of metal working that could be devised. The annual exhibition of the American Institute has been of immense advantage to the hundreds of persons who take part therein each year, evidence of which is found in the number that exhibit and the many thousands of persons who go to see this heterogeneous collection of articles of use and value, comparatively few of which, however, appeal to the sense that admires that which is beautiful; every exhibition of paintings is largely attended, and it is conceded that they are necessary to the cultivation of the artistic perceptions of our people and to the success of the artists. Such a magnificent exhibition as could be made annually by the jewelry trade would command an attendance equal to those alluded to, and would serve, also, as an art school for both the general public and those within the trade. If the selfish interest of individuals will give way to a desire to promote the general welfare of the trade, such an exhibition annually of trade products would not only be feasible but highly beneficial, serving to stimulate a more active demand for goods, and to increase the public estimation of those industries that are capable of producing such artistic work.

\* \*

\* \*

\* \*

THE story is told of a young husband going home to his wife, wearing a careworn, discouraged look, and saying to her in doleful tones: "Julia, my dear, we are ruined." "Ruined, my love, what do you mean?" queried the sympathetic partner of all his joys and as few of his sorrows as possible. "I mean that I am ruined—can't pay my debts—have failed—am busted wide open." "Oh! George! how you frightened me—I thought something dreadful had happened," said his affectionate spouse. "But I'm so glad you have failed, George. That's just what I've been praying for." "Glad of it!" says George. "Glad I am ruined! Oh! you unfeeling woman!" "Of course I'm glad, George, for I'm sure you've made me a preferred creditor for \$100,000 or so, and now we can go to Europe and enjoy ourselves!" So wags the world. The preferred creditor dodge has enabled many a man to live in luxurious ease, snapping his fingers at those creditors whose claims against his estate were honest and legitimate. It seems as though we had heard of transactions, savoring of the nature of the above, in the jewelry trade, but perhaps we are mistaken. Anyhow, a reasonable and equitable national bankruptcy law would prevent any such occurrences in the future.

\* \*

THERE is room for the display of much artistic taste in displaying goods attractively and making them show for their full value. We have seen the show windows of some jewelers that were about as attractive as the windows of a junk shop; there were goods enough—too many, in fact—of excellent quality, but they had the appearance of having been pitched into the window with a barn shovel. No attempt was made at artistic arrangement, nothing done to attract attention to the merits of each particular article, but silverware,

watches, chains, bracelets, diamond goods and rolled plate all mixed in together, higglety-pigglety, on a foundation of pine boards covered with an old newspaper. Similar disorder characterized the show cases in the store, the glass of which was smouched and cracked and the metal work discolored and dirty. Dirt and disorder were in evidence everywhere, and the proprietor sat at his bench smoking an old foul pipe wondering why people did not come in to buy goods. The public was treating him with the same indifference with which he treated them—he took no pains to attract their attention and they were not attracted. In some of the large dry goods and fancy stores of this city men are employed at large salaries to “dress” the stores; they have the eyes of artists, and the good taste to so arrange the goods selected for display as to exhibit them to the best advantage, while each contributes something to creating a harmonious exhibit; the general effect—the *tout ensemble*—is pleasing to the eye and attracts customers. This last is the objective point; if the artistic display once induces a person to enter the store, the ingenuity of the salesman is relied upon to make him a customer. Some of the most attractive show windows in New York belong to the jewelers. They are kept supplied with fresh goods, frequent changes being made, and whatever is new and attractive is exhibited in such manner as to set off its beauties to the best advantage. There is seldom an over display, but the idea is to put forward a few things attractively. Fine goods, diamonds and other gems, are arranged on a back ground of dark velvet; draperies are frequently hung in the windows upon which various goods are displayed; vases, bisque figures, ornamental clocks, statuettes, examples of artistic pottery, are displayed frequently to give a finished setting to the jewelry and command attention. Crowds gather about these show windows, and during all the busy hours of the day, there is a constantly changing throng of curious persons gazing upon the varied attractions of the show windows. Many are induced to enter the store, and, finding the same desire to interest them displayed, they become purchasers. The public is a peculiar and sensitive creature; to get into his good graces he must be approached in a pleasant and agreeable manner, while he who would win favors from his majesty must cater to all his wants, peculiarities and eccentricities. The very best way to appeal to the public is through its universal appetite; the next best is to charm the eye; fascinate it with that which is beautiful and desirable and the way to the multitudinous pocketbook is materially shortened. There are art, skill and science in properly “dressing” a show window.

\* \*

THE Goddess of Fashion having decreed, as we have previously stated, that gold jewelry, as well as precious stones, may be worn by her votaries, a new impetus has been given to the production of stylish designs. Manufacturers vie with each other in making goods in endless variety, calculated to suit the varying taste of the public, and to satisfy the most fastidious critic. Never before were gold goods so attractive or so well adapted to the captivation of the feminine eye. It has long been a recognized fact in every well regulated newspaper office that a lady is the only competent person to write about fashions for ladies. In accordance with this idea we have engaged the services of a lady who is a well known fashion writer for the daily press, to furnish us with an article each month describing “Fashions in Jewelry.” She will visit the various houses in the trade from time to time for the purpose of ascertaining what new goods are being made to supply the demands of fashion. Her first contribution will be found in this issue, and a perusal of it will indicate to the retail trade some of the many styles of jewelry that are prized by the ladies of this vicinity. It is a matter of accident almost when the average fashion writer makes any allusion to jewelry, or to the new styles that are being constantly brought out at so much expenditure of time and money. They sometimes describe a party

costume or a wedding toilette, wherein various gems form a conspicuous feature, but they entirely omit to mention the styles of jewelry worn by ladies in their every day costumes, in the street, at home or at ordinary receptions. Now, every lady must have more or less jewelry for her ordinary every day adornment, and as there is the greatest latitude for selection among the endless productions of our manufacturers, it will be the purpose of our fashion writer to point out the beauties of the various articles to be found in this city, the head center of the jewelry trade, for the information and benefit of the ladies in particular and the retail trade in general. This new feature of THE CIRCULAR will be an important one to the trade, for we intend it to be so thorough that it will furnish the material for the fashion notes of most of the papers of the country, and fill a want in fashion intelligence that has never before been attempted. As the lady in charge of this department will call upon members of the trade from time to time, duly accredited from this office, any courtesies shown her will be appreciated by us.

\* \*

\* \*

DURING the political canvass just ended, each party promised that, in the event of its being successful, there would be an immediate “business boom” that would bring prosperity to every one. Well, the contest is ended, the result is known, and we are all ready for the booming to begin. For the last month of the canvass business was almost suspended, and men, women and children became politicians for the time being, to the neglect of their legitimate occupations. Never before have we seen the jewelry trade so given over to the discussion of politics; but it was in the air, like an epidemic, and there was no escape from it. It is fortunate for the country that such political cyclones, so disastrous to business of all kinds, come but once in four years; it would be better if it was once in ten years. But now that the election is over, it is in order for every one to settle down to business, and so each in his own way contribute to the extent of his ability to the redemption of the party pledges. All that is wanted is a unanimous determination that times shall be better and they will be. The country is in a condition to command prosperity; our national affairs are in good shape; our granaries are filled with the abundance of the year's harvests; money is plentiful and eager for investment; all that is wanted is confidence in the future on the part of one and all. With our resources, business should be active, and we should be the most prosperous nation on earth, especially as we have been going through a period of liquidation that has squeezed the water out of all speculations and brought us to a basis of hard pan values. The election is behind us, and for the next four years, at least, we can devote ourselves to business exclusively. As Gen. Grant said to Gen. Sheridan just as they were getting out of the Wilderness, “Now is the time to push things.”

\* \*

\* \*

WE FIND in a San Francisco paper the statement that in February last, the Mexican Government granted to a native company a concession for sixteen years to fish for pearls from Cape St. Lucas to the Colorado River. This concession was transferred last July to a San Francisco company, composed of one Mexican, Juan Hidalgo, and four Americans, G. W. Waltz, D. Samuels, R. E. Phillips and J. Jacobs. All are wealthy business men. They pay a royalty of \$10 a ton on pearl shells for three years, and \$15 for the remainder of the time. From pearls alone their revenue is estimated at a quarter of a million, and from shells \$150,000 a year. They also have power to arrest any one poaching on their preserves. We are not in favor generally of creating monopolies, but the pearl fisheries of the Mexican coast are likely to be more thoroughly worked by American enterprise than by the constitutionally tired Mexicans. If the new

arrangement succeeds in making pearls more plentiful, the jewelry trade will not complain even if a few American citizens do make money in the operation.

AN arrangement of an important nature to foreign inventors and patentees has lately been entered into by the governments of Great Britain, France, Italy, Belgium, Spain, Holland, Portugal, Switzerland, Servia, Brazil, Guatemala, San Salvador, Ecuador and Tunis, for the formation of an "International Union for the Protection of Industrial Property," under the rules of which "the subjects or citizens of each of the contracting States shall enjoy, in all the other States of the Union, in everything that concerns patents for inventions, designs, models and trade marks, the same advantages that the law of these States accords to their own citizens, including the same protection, and the same legal remedy against persons infringing their rights, on the sole condition of submitting to the formalities and regulations which each State imposes on its own citizens." It was also made a part of the treaty that commercial names shall be protected in all States belonging to the Union, to the extent of seizing any goods imported into any of them under the counterfeited name of an established firm. An International Bureau is to be established under the protection of the Swiss Government, which will have general supervision of the management of industrial property, and is to collect and publish statistics, and answer questions submitted to it. Besides this International Bureau, each of the treaty States will establish a local Administration, which is to gather information for transmission to the central Bureau, and is to publish a periodical account of matters relating to the subject in each country. It is a matter of surprise that the United States Government, which is usually foremost in proposing international treaties, was not a party to the one referred to. As a consequence, inventors acquiring patents in this country, will not be permitted to share the advantages conferred by this union, but will be subject to all the patent laws of the different nations as heretofore. Perhaps the new administration will make application to be counted in on this Industrial Union scheme, but it is unfortunate that the government was not present by deputy to have a voice in the preliminary arrangements.

It is wonderful what an endless variety there is in clocks, and also how low the price is for reliable timekeepers. For the matter of that, however, one can pay as high a price as he chooses for a clock and still get the worth of his money, for they come in all styles of "architecture," in all sorts of shapes, of all sizes, and ornamented in every possible style of decoration. There is a vast amount of capital invested in this country in the clock making industry, and nowhere are so many clocks used by the people. Our people are not satisfied unless they have a clock in nearly every room in the house—upstairs, down-stairs, and a particularly elegant one in my lady's chamber. There are parlor clocks, hall clocks, dining room clocks, boudoir clocks, chamber clocks, cuckoo clocks, grandfather clocks, carriage clocks, alarm clocks, kitchen clocks, and, we suppose, clocks for the cellar and clocks for the coal hole. However this may be, from the endless variety offered, embracing novelty of construction, elegance of material and workmanship, together with perfection as timekeepers, the intending purchaser cannot fail to be satisfied, whether he wishes a gorgeous and useful present for a bride or an alarm to waken the servant in time for breakfast. Clocks have taken on many artistic and fanciful forms especially for holiday presents, small movements being smuggled into designs where their presence would never be suspected but for the dial or the hands that point them out. Ornamental frames in plush or decorated by hand paint-

ing make fanciful clocks for odd places in interior decoration of houses, and constitute surprises when one comes upon them unexpectedly in stray nooks or corners. A vast amount of ingenuity, artistic and mechanical, is expended in getting up these novel designs, but in doing so successfully the manufacturers contrive to keep fully abreast of the times, and to contribute their share towards making this a progressive age.

THE prime meridian conference that assembled in Washington Oct. 1, consisted of forty members representing twenty-four different governments, as follows: Austria-Hungary, Brazil, Colombia, Costa Rica, Denmark, France, Germany, Great Britain, Guatemala, Hawaii, Italy, Japan, Mexico, Netherlands, Paraguay, Russia, San Domingo, San Salvador, Spain, Sweden and Norway, Switzerland, Turkey, Venezuela and the United States. The conference was not as prompt to adopt the general meridian of Greenwich as had been expected, but a resolution to that effect was finally passed, and that meridian recommended to all governments for adoption, the representatives of twenty-one governments voting in favor of it, San Domingo against it, and France and Brazil abstaining from voting. The conference also resolved that longitude continue to be counted as at present in two directions, up to 180°, instead of in one direction up to 360°, as had been recommended by the Roman conference. Although the Greenwich meridian has long been the standard for four-fifths of the world's navigators and geographers, its adoption by all will be a common benefit. The ancient geographers drew the first meridian through Ferro, the westernmost of the Canary Islands, and this is yet followed to some extent. The French have also used the meridian of Paris, the Spaniards that of Madrid, while we have used both that of Greenwich and Washington.

THE trade is constantly being victimized in various parts of the country by ingenious swindlers, who apparently sit up nights to devise new methods for overreaching the guileless and unsuspecting jeweler. The "tricks and the manners" of these swindlers are as varied as the individuals who perpetrate them. One of these most successful methods has been the bogus check dodge, the accomplished perpetrator first gaining the confidence of the dealer by representing himself as connected with some well known business house in good standing, writing to him on the letter heads of such house, and finally paying for the goods he orders with a check bearing the name of the house. It takes several days to lead up to this swindle, during which time the operator is winning the confidence of the dealer, and finally gets away with some valuable article of jewelry and a balance in cash between the value of the goods and the amount for which the bogus check is filled out. Another method is to send a messenger to the jeweler, asking that certain goods be sent to the house of some well known citizen from which a selection is to be made; the package is left as directed, when along comes the swindler and says the goods have been left by mistake, gets the package and makes off with it. These tricks have been played quite frequently of late, and with a degree of success that must be flattering to the swindlers. The only consolation the jewelers can have lies in the fact that merchants in other lines have been swindled in a similar manner. While it is true that "misery loves company," the fact that another has been robbed will not bring back the lost goods. Jewelers are particularly sought out by confidence men as victims, for the reason that the goods in which they deal make small packages, are easily got away with and are readily converted into cash. The old rule of law that every man is supposed to be innocent until he is proved guilty, ought to be reversed when a stranger enters a jewelry store. It is well to exercise the greatest degree of caution, and either

confine all transactions with strangers to a purely cash basis, or else require every individual to bring the strongest kind of credentials. No honest man will take offense at being required to identify himself, and if a stranger objects to doing so, that is an additional reason for suspecting him. A merchant should be as careful in letting goods go out of his possession as he would about trusting so much cash to another, yet many, fearing lest they should lose a sale, entrust hundreds of dollars worth of goods to men whom they would not loan five dollars under any consideration—to absolute strangers, in fact. This lack of caution and ordinary business prudence has cost the jewelry trade a vast amount of money. More danger is to be apprehended from the confidence men—the smooth, suave, pleasant spoken, well dressed stranger—than from the professional thief or burglar; one class can be provided against, but the man who is so frank and open in his address throws his intended victim off his guard at once. The trade would do well to devote a little more time to developing its bump of caution.

\* \*

\* \*

\* \*

QUITE a number of prominent dealers in this city have resolutely set their faces against that unbusinesslike and pernicious practice of dating bills ahead, thereby giving six months credit for a four months note. There never was any excuse for this practice obtaining a foothold in the trade; it was introduced first as a special accommodation to retail merchants, and as an inducement to them to buy goods more liberally, but finally became a recognized custom with some which the retail dealers were quick to take advantage of and insist upon. It only requires united effort on the part of a few of the more prominent houses to entirely do away with this evil which has no place in legitimate business, but is a positive injury to both buyer and seller. The retail trade can no longer count on this extra accommodation; instead they will be generally required to pay extra for extra long credit. Special discounts will be given them as an inducement to pay promptly, such discounts being less as the time of payment is extended. But the buyer who comes with cash in hand is the one who will get the greatest advantage in the trade, and is precisely the man all are looking for. The merchant who can place all his transactions on a cash basis will find that he has greatly increased his margin of profit.

\* \*

\* \*

\* \*

THE annual banquet of the Jewelers' Association, that took place at Delmonico's on the evening of November 13, was one of those enjoyable social events that occur in the trade but too seldom. There was a good dinner to satisfy the inner man, good wine to warm the cockles of his heart, good speeches to tickle his ear and excite his risibilities, and a good cigar to aid his digestion and sharpen his appreciation of the other blessings. Under such cheering and inspiring conditions the most frigid nature could not help but thaw and glow with genial warmth, responding heartily to the spirit of fraternization and brotherly regard that pervaded the atmosphere. Such social re-unions tend to soften the asperities of business competition, to smooth the pathway of our active, pushing lives, to broaden one's views and enlarge his humanity. "All work and no play makes Jack a dull boy;" the same rule applied to business men is apt to make them crusty, nervous, irritable and otherwise objectionable. The trouble with all our business men is that they take life too seriously, and give too little time to relaxation. Such events as the annual banquet of the Jewelers' Association are, therefore, to be hailed with delight, as affording each participant an opportunity to lay off his business mask and stand revealed before his fellows as a good-natured, whole-souled, sociable atom of humanity whom it is good to know. The banquet, like all its predecessors, was a most enjoyable

one, and in every way creditable to the Association and its guests, which means that the committee of arrangements did its work in a manner deserving of high commendation.

\* \*

\* \*

\* \*

WE ARE glad to learn that the memorandum nuisance is abating somewhat. As THE CIRCULAR has repeatedly in times past shown how burdensome to the jobbers and manufacturers is the practice of retail dealers demanding to have goods sent them on memorandum, we feel justified in claiming some credit for having contributed to reducing the magnitude of this evil. It is by no means entirely done away with—the custom is only scotched, not killed—but the demand for goods on memorandum is reported as being very much less than it was two years ago. While the jobbers are ready to do everything reasonable to promote the welfare of the retail merchants, the latter should exercise judgment and some degree of modesty when seeking favors. To respond to the unlimited demand formerly made upon the jobbers for goods on memorandum required them to keep on hand a large and unnecessary stock of goods, thus tying up capital that should have been employed in other directions. The return of most of these goods, insecurely packed and in a more or less damaged condition, was a matter that inflicted much needless expense upon the jobbers and manufacturers. Retail merchants are, at times, justified in requesting to have goods sent them on memorandum, but when they do so, they should, if unsold, return them promptly (charges paid), and see that they reach their owner in as good condition as they were when he loaned them. By the exercise of a little consideration in this matter, and seeking to make a practical application of the golden rule to each transaction, the retail dealers can reduce the proportions of the goods-on-memorandum evil to such an extent that it will no longer be a burden upon the jobbers and manufacturers.

\* \*

\* \*

\* \*

TRADE became quite active immediately after the election excitement was over, and our city merchants wore smiling countenances once again. In response to the universal inquiry, "how's trade?" came the invariable answer, "it's improving; nothing to complain of now." Coming down to particulars, the general report was that a good many buyers were in the city during the latter part of last month who ordered goods with a fair degree of liberality, while orders by mail contributed to make business fairly active. Before the election merchants in all lines acted as though they really put faith in the political buncombe belched forth by stump orators to the effect that if their opponents were successful the country would immediately go to everlasting smash and business be destroyed beyond the possibility of redemption. The funny part of it was that these assertions were made with the utmost gravity by Democrats and Republicans alike, and with such a degree of earnestness that it really seemed as though they believed them and expected others to. These blatant pothouse statesmen evidently forgot that there are nearly sixty millions of people in this country, all of them engaged in some kind of business, and that they are not made of that kind of stuff that would stand idly by and see their prospects ruined or the stability of our government threatened to please any little clique of politicians. The country has gone through perils to which the election of a president is but a flea-bite, and came out of them in good shape, improved financially and materially. This country is pretty securely anchored fore and aft, and it is not in the power of any captain to drive it from its moorings or imperil its safety. Those sixty million of people are going to have something to say when there are breakers ahead. But the atmosphere is clearer since the polls closed, and those who listened to such rambling talk have settled quietly back to their daily avocations, intent upon doing their share

towards "booming business," regardless of their ante-election party predilections. The holidays are upon us, and it is time every dealer had his stock in hand prepared to take advantage of the demand that always comes at this season. During the two weeks just passed more goods were sold than in the preceding two months, and dealers generally are well stocked for the holidays. Those who have postponed their orders should not delay longer; they have missed something already by not having the first pick of the holiday goods, but it is not too late to remedy the neglect if they now hurry forward their orders.

\* \*\*  
\* \*

THAT very useful and enterprising and altogether indispensable individual, the commercial traveler, appears to have fallen on hard lines in some of the Southern States, especially in Texas, where, as we are informed by the local papers, he is regarded as an elegant but expensive luxury. We own our inability to conceive how any enterprising merchant can justify this sentiment regarding the commercial traveler, in view of his position in its various relations to modern methods of transacting business. However that may be, the *Galveston News* states that "the leading wholesale houses of that city are withdrawing from service the greater portion of their traveling force, reducing expenses somewhat difficult to be borne in these times of business stringency." That journal also advocates doing away altogether with the travelers, alleging that they are far too expensive, eating up all the profits of trade, while the system itself is deprecated as "the outgrowth of ill-directed competition." Due notice is given that the merchants of Galveston "have definitely decided to do away with the drummer system, and will not in future compete for trade in this way." We predict, then, that the merchants of Galveston will find a material falling off in the volume of their trade, and that their more enterprising neighbors will reap the benefit of their apathy. The *New Orleans Times-Democrat*, in fact, says that the merchants of that city are not prepared to follow this example. The experience of New Orleans in the matter is thus stated: "This city found, some years ago, that its trade was suffering greatly from the invasion of the territory commercially belonging to it by drummers from Chicago, St. Louis and other points; and it saw the necessity of adopting the system for its protection. It has managed through it to secure considerable business in Texas of late years, and it is likely to do better than ever in that State if the merchants of Galveston and other towns cease to send out a traveling force." In these days of hurry and bustle, the commercial traveler is a power and an influence that cannot be ignored. He is a personal appeal, a substantial entity, to the retail trade, going out from the jobbers laden with examples of all that is choice, attractive and desirable in their stocks; he lays them down to the retail dealer without subjecting him to the loss of time or the expense that would be necessary if he went to hunt up the goods himself. He is, also, the medium of communication between the different classes in the trade, an encyclopædia of useful information, and a standard authority on styles, fashions, designs, etc. He is a living reality, capable of presenting, with eloquent tongue, the merits of the goods he exhibits. He is a walking advertisement, a peripatetic descriptive circular, having the advantage over printed ones that he cannot be readily thrown into the waste basket before imparting the information with which he is loaded. Under modern methods of doing business the commercial traveler cannot be ignored or safely dispensed with.

---

### Swiss Wood Carving.

THE LONDON *Times*, in a letter from one of its correspondents, referring to the removal of a number of Swiss carvers to the United States, says that they earn as much as eight dollars a day

—more than they can earn at home in a week. This turned into francs sounds a good deal, and is, indeed, an undeniably high wage, eight dollars a day being nearly 10 pounds a week, only a little less, says the writer, than the salary of the President of the Confederation. For all that, the *Berner Post* and other papers of the district are strongly of opinion that the wood carvers would do much better to stay at home. They say: "Do not be so selfish as to follow the example of the horologists of the Jura, and establish in America a new trade which will compete with one of our most important local industries. In the United States you will be far away from your native mountains, from the scenes which suggest and the objects which inspire. The only works of art you will see are statues of Washington and Lafayette, and though you may earn more money you will not be half as happy as you are at Brienz, and Meyringen and Interlaken. Stay at home, and instead of going to America let the Americans come to you and buy your chalets, your bears and your chamois, in the land where they are made."

How far these persuasions will be effective remains to be seen, but it is greatly to be feared that the inducement of 40 francs a day may prove more potent. On the other hand, the attachment of the Swiss to their homes has passed into a proverb; and although some of the watchmakers of the Jura have gone to America, the deftest of them, those who live in the valley of Lake Joux, resolutely refuse to leave their native mountains and abandon their traditional habits for all the inducements that foreign capital can offer.

Swiss wood carving is a much younger industry than Swiss watchmaking. It was introduced into the Bernese Oberland some fifty years ago by Christian Fischer, a self-taught peasant artist of Brienz. But he was more peasant than artist, detested working indoors, and his ambition did not extend beyond carving rings for table napkins, cutting wooden egg cups and adorning them with flowers. He was also a musician and village bone setter, and altogether a man of versatile genius. But his great merit was being the creator of a new industry, for though Fischer did no great doings himself, he put into practice a valuable idea and founded a school. Peter Baumann, of Grindelwald, and a man named Flenz belonging to the same country, improving on Fischer's idea, began the making of those charming Swiss chalets now so popular, and which it is now almost *de rigueur* for tourists in Switzerland to purchase. What was more natural than for these peasant artists to model, first of all their own picturesque houses with their overhanging roofs, their quaint galleries, their painted ornaments and carved figures brown with age, standing on a plinth of white stone, overshadowed with trees, within sound of a rushing torrent, and sheltered from avalanches and the north wind by the rocky rampart of some Alpine height?

Peter Baumann, who seems to have been more thrifty and steadfast than his predecessor, settled at Meyringen and taught his art to his three sons, one of whom, Andreas, became the *facile princeps* of wood carving. His work is deemed unapproachable, and his bouquets of roses still serve as models for aspiring sculptors. The success and celebrity acquired by the Baumanns caused the industry to spread, and wood carving soon became the winter occupation of every household in the vale of Hasli. But there was no regular market for their productions, their only customers were casual visitors, their only agents hotel porters and small shop keepers who took the lion's share of the profits. The trade wanted organizing, in fact, and after several tentative efforts in this direction, the Brothers Wirth established their extensive workshops, where several hundred sculptors of the Oberland now find regular employment. In this industry, as in almost every other, the best results are obtained by a division of labor. Every carver has his or her specialty. Some prefer to shape groups of animals, others like better plants and flowers, others again take to building miniature chalets and making curious caskets, and what they like the best is generally the best done. Elaborate artistic furniture is also made in great variety in the establishment of the Brothers Wirth. In 1862 the industry had become so important that the Cantonal Government deemed it expe-

dient to found a school of design at Brienz, which is maintained by the State, the communes and the fees of pupils, the last, however, being little more than nominal. In 1869 a master modeler, maintained in like manner, was appointed for the instruction of the carvers of Interlaken. The pay of a sculptor varies from two francs a day for beginners to five francs for the more expert, among whom is a large proportion of women, their natural tastefulness and deftness of touch making them formidable rivals to the men. Brienz is the headquarters and chief mart of the trade, which has entirely changed the character of the town, and gives it an appearance of prosperity that in former years was conspicuous by its absence. The number of male and female sculptors employed at Meyringen and Brienz amounts to 2,500, and their industry brings into the district some two million francs a year.

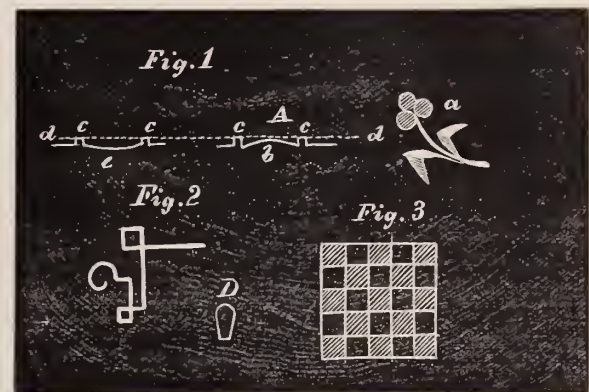

Successful enterprise is always a healthy and stimulating influence, and the success of wood carving at Brienz suggested the idea of making parqueterie and chalets at Interlaken. The former has already grown into a large business, the annual production of one establishment alone amounting to nearly 700,000 square feet of parqueterie, valued at half a million francs. Chalets are made for use, not for show, in parts, and, the parts being numbered and arranged to fit without trouble, a man may order a house by post, have it delivered by rail and enter into possession, all within a few weeks. Attempts have also been successfully made to turn to account the indigenous stone of the country—variegated marbles, which are found in great variety, as also a soft stone peculiar to the Oberland, which, while easily worked and susceptible of a high polish, acquires by exposure to the air an adamantine hardness, and has the further quality of being almost indestructible by fire.

### Advice to Watchmakers' Apprentices.

BY A MAN WHO HAS SPENT TWENTY YEARS AT THE BENCH.

THE ENGRAVING or cutting for enameling can be made to heighten and beautify the work very much, as, for instance, small sinks with a bright gold rim, if filled with transparent enamel, if properly cut, will, in a measure, imitate such stones as ruby or emerald. As at *a*, fig. 1, the three circles are to be filled with transparent red enamel; we do the cutting as shown at *A* in vertical section (enlarged); the dotted line *d* represents the finished surface of the enamel; the edges at *c c* show the bright gold surrounding each circle, and the conical shaped rise at *b* represents the bottom of the sink. Now, this part being slightly raised shines through the transparent enamel from two causes; first, the part *b* is polished and bright, and, from its shape, the highest part above *b* comes nearer to the surface, must enhance the brilliancy. The best of this class of effects are in transparent red and green enamels; still very fine effects like grapes can be obtained by using a half transparent purple enamel, and, in some instances, making the sink concave on the bottom as shown at *e*. For practicing, on fine close grained copper is, after gold, the best metal one can use. It must be carefully cleaned with acid and dried, after being cut, before the enamel is applied. Enamel, as we all know, is a kind of glass colored with different kinds of metallic oxides. The kind of glass used as the base of all enamels is called fritz; this fritz is simply a flux of soft glass ready to receive any color we may wish to add. It is made of different degrees of hardness, this hardness, as a rule, agreeing with the temperature at which the fritz or flux melts, it being easy to reduce the temperature at which the fritz melts by the addition of borax or sal-tartar. This reduction of the melting point generally keeping pace with the hardness of the enamel, and its power to resist the acids used in coloring it. The best method for the pupil who is ambitious in this way is to first learn to cut (engrave) and prepare his work properly for enameling, and then procure black enamel and learn to fill and fuse such patterns as are easily managed—like broad

incised lines such as are shown in fig. 2. Such lines are simply cut in with the graver, a flat bottom one shown (enlarged) in cross section at *D*. Black enamel can be bought in lumps of irregular shape of about the size of peas. This must be broken up still finer with a very hard steel hammer, when it is to be reduced to powder in an agate mortar. These mortars can be bought of almost any lapidary, and those with fewest dark lines are the best. The crushed enamel is ground to a powder with an agate pestle in this mortar; even the grinding of the enamel is attended with no small amount of manual dexterity. The motion given to the pestle is a sort of double rolling—a swinging around of the pestle at the same time the pestle is slightly revolved. The enamel should not be ground too fine, and the size of particles will depend on the job to be done a good deal. As, for instance, for lines at fig. 2 the particles should be about the size of o emery. The grinding should be continued until no particles remain in the mass larger than described. The mortar should be nearly filled with water, and, after agitating the particles, the water should be poured off to carry away the very fine particles. Now, fill in the lines as show white at fig. 2 with the paste of ground enamel and water. In large work a very soft towel or napkin is used to absorb the water. A quill, cut somewhat like a toothpick, will be about the most convenient spatula to fill in such lines. The lines must be filled more than full as the enamel sinks when fused, and generally has to be filled the second time if it is desired to polish off

smooth and flat. In the majority of cases such black lines are left a little sunk, and the glass from the fusion is left undisturbed on the surface which is far enough below the metal to escape the action of finishing the gold surface. But for fine enameled work the enamel should rise above the gold and be ground off with fine emery and water, and a final polish given with a boxwood lap and putty powder (oxide of tin) and water. Such trifling work as shown in fig. 2 can be fired on a charcoal with the blow pipe. White enamel can be used in the same way only it is a little harder to grind and manage. A sort of checker board pattern of black and white squares, as shown at fig. 3, is a good specimen for a beginner, only stick to the black until you get to understand something about it. A margin of metal should surround each square, and the white squares should be enameled first, generally, although occasionally the reverse is the order of proceeding. As the writer hinted some time back, enameling is an art only to be acquired by patient practice under instruction if one desires to excel. But by cutting your own designs and getting them enameled you will strike the true economy, as some of our best enamelers are but sorry engravers. To any person who is bound to learn I would say, learn to cut as has been described, then take a few lessons of some enameled. An emery file made of very fine flour of emery and shellac melted together is the best to grind off the surface before the putty powder and water is used. We have several books which pretend to give instructions in enameling, among them "Gee's Gold Worker," and with all due deference to Mr. Gee's work, which in other respects is an admirable one, and should be in the hands of every working jeweler, I would say he gives very little that can be of use in enameling. Among the recipes are several kinds of fritz all correct and useful, but the reader must not imagine because he knows the composition he is going to get the results which he sees

others; or, to state it different, that he (the reader) is going to get the same results with the same material that a skillful enameler will with precisely the same material. For this reason, if no other, you prepare the work and let the enameler have the job he is almost sure to excel in. Colored enamels can be bought as well as black and white, and when used are to be ground in an agate mortar and treated as described for black enamel. Enameler's furnaces can be bought of any first-class material house, as well as the colored enamels ready to be ground as directed for the black. A job after it is filled with enamel should be dried slowly and not allowed to cool off before it is fired, *i. e.*, the enamel melted. The reader may think the writer is not very gracious in starting on a subject and then telling him that there is no hope of his mastering it. Now, I do not wish to be understood in this way. I merely wish to forewarn the reader that it is an art in which to excel he will meet with so many obstacles that it is safe to say that out of ten who will make the attempt nine will fail more or less. In my next communication I will give receipts and formulas from the very best authorities, with notes and corrections from my own experience. To illustrate: we have a recipe calling for sillicious sand; now all sand is more or less sillicious, but all sand will not answer as well; but if we know what we want we generally know when we get it; consequently if we try a given kind of sand and it does not give the desired result we know where the trouble is, and without changing the other ingredients simply try another specimen of sand.

### How to Make and Engrave Silver Bangles.

BY EXPERT.

THE INCREASING demand for silver goods induces me to give a few additional hints in regard to silver bangles and ornaments in the so-called antique styles. Monograms of letters cut in relief, and then oxidized, like the antique coins so much in vogue, is a desirable novelty. The method of cutting is quite different from ordinary engraving as also the effect. The manner of proceeding is to lay out the letters as usual (after facing off the coin—usually a quarter of a dollar), and then proceed to produce the letters in relief somewhat after the manner of the wood engravers. The designing or drawing of the letters will have to be changed a good deal from those to cut in the usual way. A little study of the effect to be produced in conjunction with practice will enable anything like a skillful engraver to catch the idea. We will suppose, for an illustration, we have the letters J. O. S. to combine in a monogram and cut in this way. I might as well say here this is no cheap style of bangle, but rather something new and nice, and when made is to be paid for. And if only a few are made and sold, still it adds to the dignity of the place where they are made, and appearances in this world is a great deal. The letters are designed a little broader on the face than where they are to be cut in in the usual manner, as shown in fig. 2, together with the border, shown at *a a*. We next, with a broad, flat-bottom graver, proceed to reduce all that portion of the quarter between the letters and the border. This is best done by *wriggling*, as it is termed, which is worked by holding the graver pretty well up as shown at fig. 3, where *d* represents the graver and *f* the job. This wriggling should be crossed and re-crossed until all the parts surrounding the letters are reduced below the face of the letters about  $\frac{1}{16}$  of an inch. The cutting should be done so as to make the reduction as near level as possible after the wriggling is done; by means of a coarse matting tool the surrounding surface should be brought up to a coarse stippled surface. Such a matting tool can be made by driving a center punch into the end of a piece of soft steel as shown at *D*. A little practice in making such a matting tool will enable one to produce a tool of superior excellence. There should be no burr raised by the center punch removed, as it all serves to enhance the irregularity of the matting. Any of the

coarser matting tools can be used, or a punch with a slightly convex face. Even the surface left by the wriggling, if skillfully managed, can be made to give a very fine effect. A great variety of finish can be given to the letters, but the management will be found quite different from the ordinary bright cut letter. Specific instruction can hardly be given, but the style of ornamentation for such letters will readily suggest itself. The main thing is to obtain a letter in strong relief, the mere working it into a rustic or other ornamentation is simple enough. In such matters I have found if the pupil has a vein of originality, the best way is to give the principles and he will soon strike out something better than if he tried to follow a routine. After the ground or surroundings of the monogram is sunk to sufficient depth, there can be letters or objects sunk still deeper into the surface; these are a little difficult to show in the cut, but a brief description, I think, will help us out. The letters of the monogram are left in relief; all the surrounding surface between the letters and the border are sunk to the depth of about  $\frac{1}{16}$  of an inch and matted; into this matted surface intaglio figures and letters can be cut still deeper. After the oxidizing these cut in designs will be still darker and add a great deal to the effect. The best tool for cutting in of such work is a round-bottom graver. The so-called oxidizing is really sulphurizing, as it is best done with a solution of liver of sulphur. A solution of one part of liver of sulphur and two parts of water will, in a few seconds, give the peculiar shade so much admired. Wash off the bangle with water, and, after it is dry, rub with a stiff brush and the extreme high portion will begin to brighten; now it is when the sunk letters and figures will begin to look to advantage. In fig. 1, the trident and fishes mean nothing, but are only put in to give an antique look to it. A solution of chloride of platinum will

give a fine steel gray to silver work of this kind, but there is nothing that will beat the solution of liver of sulphur. Bright cutting can be added after the oxidizing, and if it would only stay and stand as it looks when fresh cut it would be very desirable, but it very soon blackens and the trouble is it cannot be cleaned and restored. To make the leading or dominant letter full faced with a flat surface as shown at fig. 1 gives a very good effect, as it and the border soon wears bright and shows in strong contrast to the other letters, which have rough or tooled surfaces. Even the brushing with a stiff, hard brush brings out the relief. Bangles with relief letters of this kind can be set with small stones or half pearls, as nothing relieves such work more than an oxidized silver surface. Curious and original effects can be made by a combination of *repoussé* work let into a coin. I speak of this more as a curiosity than as a desirable or profitable product of the workshop. If we take a silver quarter dollar and turn it out on one side to the depth of two-thirds the thickness, as shown in vertical section at fig. 4. We next take a piece of thin sheet silver, a trifle too large to go into the recess shown at *n*, fig. 4. The piece of sheet silver should not be too thin for several reasons; first, it will not work as well, and next it should nearly fill up the turned in recess, only leaving a margin of coin to form a border, as shown at *n n*, diagram *F*. The disc of silver just

mentioned should be laid on a block of wood sawn off across the grain, and, by means of punches of different forms, the disc of metal *k*, fig. 5, is indented into the wood, care being taken not to break through the metal. This part of the work is merely a delicate *repoussé* work. I do not wish the reader to imagine that this is a coarse, clumsy art, for it is not. In the hands of a skillful artisan this process is capable of producing exquisite work. The outline should be made with a tracing point, when, by means of punches shaped like miniature cold chisels (both flat edged and concave) the outline must be followed. Of course the chisel shaped punches must be delicate enough so as not to break up the sharpness and perfection of the outline. We next by broader faced punches force the parts inside of the outline into high relief, as shown in fig. 6. After the relief is produced the edges is filed so it will merely fit into the recess shown in diagram *F* and in fig. The back of *k* should be filled in with soft solder so that the whole face of *k* can be gone over with punches from the face side after *k* is soldered into place. The finer and more delicate parts can be touched up with gravers of different forms, and if the joining at the border *n* is properly managed it will be very difficult to detect. The coin should be oxidized and given an extra hard rubbing with a stiff brush.

---

### Infringements of Patents.

IN A RECENT suit for infringement of patent, tried in the United States Circuit Court for the district of Indiana, Judge Woods charged the jury as follows:

In an action at law for infringement of a patent all parties who participate in the infringement are liable, although some are simply acting as officers of a corporation. All parties who participate in a tort or trespass are liable, and a man cannot retreat behind a corporation and escape liability for infringements in which he actively participates.

It is for the court, as a matter of law, to construe a patent, and for the jury, as a question of fact, to determine whether it has been infringed, and the amount of damages that should be allowed.

In an infringement suit the burden is on the plaintiff to show the amount of damages he has suffered; and if he furnishes reasonably satisfactory evidence on that subject, he is entitled to substantial damages; otherwise to nominal damages.

On the question of damages, it is competent for the patentee to prove the prices at which licenses were granted under the patent while it was in force; but in order to be competent evidence of value, the prices agreed upon must have been prices fixed with regard to the future use, when, there being no liability between the parties, they are presumed on both sides to have acted voluntarily, and therefore to have made up their minds deliberately as to what was a fair price. Such arrangements, licenses thus granted, fees thus fixed, are competent evidence to consider in determining what the actual value of an invention is and what the recovery ought to be for its use.

It is not competent for a patentee to prove the prices paid for infringements already perpetrated. Such settlements are not at all admissible on the subject of value.

The value of an invention for which an infringer is liable is the value at the time of the infringement. A man who has got a patent owns it as property, and if anybody sees fit to infringe it he is bound to pay for its fair value; and the fact that there is something else as good or better does not entirely destroy its value but may affect it.

The doctrine of a confusion of goods has no application to a suit for infringement of a patent, especially where there is only a confusion of bookkeeping and not a confusion of the articles themselves, the articles being incapable of mixture.

If a party shows an unwillingness to let the truth out, and keeps back facts and the means of getting at facts in his power, then the

jury is warranted in drawing the strongest possible inferences against him which may be drawn from the evidence actually given in favor of the other party; but if he comes forward with his books, furnishes all the evidence in his power and is fairly candid in the matter, no inferences should be drawn against him, except such as are fairly drawn from the evidence adduced.

Every one is bound to take notice of the existence of a patent and of the rights of parties under it. Like the record of a deed to real estate, the record of a patent at Washington is notice thereof to all the world.

### Ingenious Music Boxes

IN THIS land of abundant music, where every female child almost is taught to play the piano, and the very street arabs rejoice in mouth organs, it would hardly be thought that there could be much of a demand for music boxes. But there is, and our people are not only the largest purchasers of them, but pay the highest prices for fancy and intricate music boxes. A dealer in such musical instruments, exhibiting an elegant affair of the kind, encased in a handsome rosewood box, gave the following information regarding this branch of industry:

"That is undoubtedly," he said, "the most perfect mechanical music box in this country. It was made in our factory in Sainte Croix, Switzerland, under several recent patents, which make it much superior to instruments of this kind as ordinarily constructed. The price, too, is very low, only \$1,500. Is that the highest priced instrument we have? Yes. We do not keep higher priced instruments in stock. We only make them to order. We have got as high as \$6,000 for a box, but the music produced was not so perfect as this, because the instrument lacked the patented improvements which this has. This has a regular set of reeds, with a mechanical arrangement producing an almost perfect imitation of the human voice, together with bells, drums, castanets, and the harp, all of which are used with the finest orchestral effects. Besides, by means of interchangeable cylinders, the number of tunes may be increased to any extent the owner may desire, so that if he tires of one set of tunes, by a trifling expenditure he can get another—in fact as many additional sets as he chooses, embracing tunes of his own selection, or ours, whichever he may prefer. This box plays forty-eight airs without change of cylinder. Rather high priced music you think? Not at all when you come to consider the quality and amount of labor involved in the construction of these instruments, the mechanism of which is as intricate, in expensive boxes, as that of the watch. Indeed, about the same amount of mechanical skill is required in their construction as is needed in making and putting together the delicate machinery of a fine watch. Our different grades are the ordinary box, with no accompaniment, and those with bells, castanets, drums, zither, piccolo, etc., producing the finest results in expression and harmony. Indeed, the harmony produced by some of our expensive boxes reaches the sublime in point of musical expression.

"We employ in our factory in Switzerland about 800 skillful artisans. Our instruments are shipped to all parts of the world, the instruments playing the favorite airs of each country to which they are sent. We manufacture both small and large boxes. Prices range from a dollar up to \$6,000, or more if a purchaser desires. The musical mechanism of these boxes is also placed in many fancy articles made chiefly in France and Germany, such as albums, work boxes, cigar cases, writing desks, clocks, jewelry cases, etc. In clocks the air is played when the hour strikes. We place the mechanism also in chairs, which play when you sit down upon them, automatic figures, mechanical toys, etc. This mechanism, although requiring great skill in its construction, is simple in ordinary boxes. It consists of a brass roller with projecting points, a steel comb, the teeth of which give the sounds, a spring to give the revolving motion to the cylinder, and a fly wheel or fan to regulate the revolving

motion. The rough parts used in the construction of a music box, such as the bed plate, the blank roller, the mainspring, the comb, the running gear, etc., are made in large machine shops in Switzerland, which furnish these parts to all the box manufacturers there. There are only two of those shops that turn out really good works in the shape of rough parts. The music has first to be arranged for the boxes by thorough musical artists. The cylinder is then given to a person—generally a woman—who, with the aid of the written music and a very ingenious machine, marks the places on the cylinder where the points are to be inserted. Another person then drills all the little holes and another inserts the points. The cylinder is then filled with molten cement and then placed on a lathe and revolved very rapidly. The cement adheres to the inside surface holding the points, and is then allowed to cool. On another machine the points are filed down so as to be of equal length. While this is going on the comb is turned, the turner having first to file the teeth to give the proper flexibility. The tone is lowered by filing near the base, and heightened by filing near the point. The cylinder is set on the bed plate, and opposite to it the comb is fastened, so that the points of the cylinder and the teeth of the comb exactly meet. These are the main features of the ordinary mechanical music box. Of course, the construction and adjustment of the various accompaniments, etc., in the larger boxes are more complicated.

"We make large and expensive music boxes of various styles to order. One style resembles a handsome writing desk, inlaid with ornamental woods and having a desk attachment. Another style has the form of a side-board. It is made of ebony and has four panels of porcelain decorated with artistically painted flowers in gilt, bronze, and ordinary colors. The top is of plate glass, so that the works can be seen without opening the box. In fact, we make boxes to order in many novel and expensive styles. Of course, our trade is more largely with the wealthy classes, although the price of our cheaper productions bring them within the reach of the very poorest. A box which used to cost \$25 now costs only \$5. All of our music boxes are intended solely for private entertainment, the music produced by them being too soft to be used on public occasions."

---

### Travelers' Taxes.

A GENERAL WAR has been declared against the license taxes imposed on commercial travelers in certain Southern and Western sections of the country, and the prospects are that these taxes will soon be abolished. The following are some of the places where such licenses are imposed and the amounts exacted:

Beaufort, S. C., \$10 per week; Bennettsville, S. C., \$1 per day; Memphis, Tenn., \$10 per week, or \$25 per month; Mobile, Ala., \$3 per day; Augusta, Ga., \$3 per day; Natchez, Miss., \$2.50 per day; Jessup, Ga., \$5 per day; Georgetown, S. C., \$3 per day; Tucson, A. T., \$50 per three months; Orangeburg, S. C., \$2 per day; State of Virginia, \$75 per year; State of Nevada, \$100 per year; State of Texas, \$35 per year; New Mexico Territory, \$250 per year; Florence, S. C., formerly exacted one dollar per day, but the authorities have abolished the tax.

The Superior Court at Quebec, Canada, has decided that the tax imposed on commercial travelers by the city is illegal, and in a test case brought before it condemned the city to pay \$150 damages for arresting a traveler who displayed samples without first obtaining a license from the city corporation.

At the recent annual meeting of the National Association of Commercial Travelers, held in Boston, the following resolutions were adopted:

*Whereas*, Certain cities and States in these United States have upon their statute books and are enforcing certain discriminating and excessive licenses and tax laws against commercial travelers from other States and cities; and

*Whereas*, It is clearly unconstitutional for any State or municipality to enforce said discriminating laws; therefore, be it

*Resolved*, That the National Association of Commercial Travelers of the United States do most earnestly protest against the passage or enforcement of any such laws.

*Resolved*, That so far as the exchange of produce, manufactured articles or merchandise is concerned between the different locations of these United States, we are most emphatically for free trade.

*Resolved*, That we cannot see the wheels of commerce clogged by these license and tax laws without putting ourselves on record as opposed to the whole system, and in order to work systematically for the abrogation of these said laws, be it resolved that a committee of three (to be called the Legislative Committee) be appointed by the convention, whose duty it shall be to communicate with the Senators and Representatives in Congress in reference to such legislation as the exigencies of the case require.

*Resolved*, That this committee be instructed to carry out such means for effecting legislation in the interests of commercial travelers as may seem to them best, and that the members of this association pledge themselves to assist and aid in all honorable measures which may be instituted by Boards of Trade, Chambers of Commerce, and similar bodies or associations looking to this end.

*Resolved*, That this association strongly favors the bill introduced by the Hon. Mr. Brewer in this interest.

---

### Something About Cameos.

NEWSPAPER reporters are aware of the fact that the general public likes to read about anything pertaining to jewelry, so when news is slack they "interview" some one in the jewelry trade and faithfully report whatever he tells them. The following is from the *New York Tribune*:

"Well, there are few people who can afford to do that!" So thought a *Tribune* reporter as he watched a man in a little room overlooking upper Broadway, as he sat pounding up diamonds with a pestle and mortar. "That's not the only costly part of cameo making," said Mr. Zoellner, the artist, as he pounded away at the little uncut diamonds; "it takes eyesight, a great deal of time and patience and years of experience. Then the onyx stones, from which the cameos are made, cost considerable, sometimes as much as \$50. The choicest have a layer of cream-colored stone on a dark chocolate-colored base. But some people like the red, orange, black, or shell-pink stones just as well. You know they are found in the Uruguay Mountains and in Brazil. The onyx is a half-precious stone of the quartz family. It is taken to Europe and cut into oval or oblong shapes, and then I have to pay ten per cent. duty to get it through the Custom House."

The cutter of cameos turned to his lathe by the window and rubbing some of the diamond dust, which he had mixed with sperm oil, on the end of a small drill, began his work. He was making, for a cabinet piece, a large cameo, two by two and a half inches, one of the largest ever cut, of an old gentleman in Germany, whose portrait was placed before him. "I have 125 of these soft iron drills," said he; "they are made soft so as to catch the diamond dust, which is the only thing that will cut a cameo. A cameo is indestructible except you take a hammer and smash it. It is an old art and was practised by the Romans, Greeks and Egyptians. Dr. Schleichmann found some cameos in good preservation that were probably 3,000 years old. It takes several weeks to cut a large piece like this. Afterward it has to be polished with tripoli, first being smoothed with emery and oil, using the lead instruments similar to those for cutting. It is easier to cut a profile than a full face portrait. Some people prefer intaglios, in which the portrait is depressed instead of raised. They are made on sards and cornelians, the former being a dark, reddish brown and the latter a clear red. They are harder

to make than cameos. I have to keep taking impressions in wax of the work as I go on. I usually cut portraits from photographs, but sometimes have done them from life and even from casts of dead persons. I also cut fancy designs of all kinds for pins, lockets, etc. In the night I have a globe containing distilled water with a little sulphate of copper which concentrate the light of the lamp on my work."

Among the portraits cut by this artist are those of ex-President Hayes, Mrs. Hayes, William Cullen Bryant, J. S. T. Stranahan, the Rev. Dr. Buddington, Bayard Taylor, Peter Cooper and others. A large cameo copy of Gerome's "Cleopatra before Cæsar" is held by the artist at \$1,500.

And this paragraph we find in the Philadelphia *Times*:

"Cameos are cut in this country, as well as in Europe," said Mr. Isaacs, the Chestnut street jeweler. "The finest American work, which of course is not by any means equal to the best foreign work, is done in New York, and a little of it—a very little, by the way—in Philadelphia. That our people should turn out work equal to that of the best foreign artists is scarcely to be expected, since cameo-cutting was almost unknown here thirty years ago, whereas in Europe some families in Florence, Rome, Paris or Naples have pursued it as a calling for half a dozen generations. Cameos are not as extensively worn as formerly, these fashions come and go, but a great many persons still wear them because they are heirlooms or relics of some departed ancestor. A cameo is where the image on the stone is raised above the surface; where it is cut in the stone it is known as 'intaglio.' The stones generally used for this purpose are the onyx, sardonyx, bloodstone and agate. The latter is the hardest stone to cut. The onyx consists of several layers and the cameo is obtained by cutting the figure out of the upper layer, when it appears as a raised medallion upon the lower one. It is the easiest stone to work on. The art of ancient cameo-cutting was entirely lost during the Middle Ages, and only reappeared during the Renaissance. The Romans, in my opinion, excelled the Greeks in this branch of art; but the moderns have never approached the ancients in accuracy of design or finish. Look at this head of Augustus Cæsar, cut on a species of agate harder than any we know anything about. That sort of work could not be done now. It was found in Rome during some excavations made a few years ago near the Capitol, and though not much larger than a quarter of a dollar is worth \$75. The sunken portions of the face, the whites of the eyes, the hollows of the cheeks, are polished. That could not be done by any cameo-cutter alive to-day. It is positive proof that the cameo is an antique. The finest specimen of cameo-cutting in the world are the classic figures cut on what is known as the Mantuan vase in the Brunswick Museum. The base is cut out of a single agate and is seven inches high by two and a half in width."

---

### The Credit System throughout the World.

THE COMMERCIAL community recognize more and more the value of our consuls as promoters of American trade and commerce. The State Department has just issued a new volume of valuable information of which we give a synopsis.

The Board of Trade, of Scranton, Pa., having recently represented to the Department of State that reports on the system of credit which prevails in the several countries of the world would be greatly appreciated by the financial and industrial interests of the United States, the consuls of the United States were requested to prepare reports on that subject. These reports have been received at the State Department and published. Following are condensed statements from the principal consulates:

Consul General Stearns, at Montreal, Canada, says:—"The

experience of merchants and traders in this city and throughout the Dominion has been that the credit system is of great assistance in developing and sustaining all business enterprises. The average allowance to cash buyers, taking business all through, is five per cent. discount, thirty days being considered cash. The retail clothing stores, however, generally allow ten per cent., dry goods and fancy goods four to five per cent. and provisions two and a half per cent. But at retail stores buyers, if at all responsible, are encouraged to keep accounts and settle quarterly or half yearly."

David H. Strother, Consul General of the city of Mexico, says:—"It is generally considered that credit is essential to trade in Mexico, and that without it all the more extensive commercial transactions would cease, and the leading business establishments would be obliged to close their doors. Nearly all the great mercantile houses in Mexico city and State sell largely on credits of from four, six to eight months, and often for longer periods."

Consul Morrel, of San Jose, Costa Rica, says:—"Until lately importers obtained all the goods asked for in Europe on credits from six to twelve months, especially if the debtors agreed to consign coffee in payment in lieu of retaining bills; but several heavy failures of importers having occurred European credits have been greatly restricted."

Consul General Andrews, at Rio Janeiro, says:—"The long credit system of this country is a subject of frequent complaint in all business circles; the system has probably been caused, in a large degree, by the great extent of the country and the difficulties of communication. At least three-fourths of the volume of business will be on credit. With a capital of \$20,000 it is usual to be owing about \$100,000 or in that proportion."

The report from Buenos Ayers says that about seven-eighths of the business is done on credit in the Argentine Republic.

In Bermuda "fully four-fifths of all foreign products for domestic use are sold on credit. All time sales become due on the 30th of June when there is no agreement to the contrary." An effort is being made to abolish the system of long credits.

In Cuba the bulk of trade is based on credits. "The exporter of sugar and molasses, whose business reaches a volume during the year of many millions of dollars, may have a capital of from \$25,000 to \$50,000, but he relies on credits generously granted him by bankers of the United States and Europe. The wholesale provision dealer purchases his supplies at three, four, six and sometimes eight months' time. He in turn sells to the planter on credit, formerly on twelve months time, but now rarely more than one to three months are granted."

The reports from Europe are very lengthy. Consul Grinnel at Bradford says in part:—"Credit in the wholesale branch prevails to a very great extent in proportion to the volume of business transacted, varying in time from one to six months, the retail business being conducted mostly for cash and to considerable extent by cooperative stores. The losses in connection with the latter (the retail) when credit is given are considerable, in some cases amounting to five per cent. of the total sales; whereas in connection with the former (the wholesale) the losses incidental to business amount to probably no more than one to two per cent. Interest is also usually demanded on overdue accounts, the time allowed for payment being specified on the billheads. Credit is not extended by tradesmen to the laboring classes as readily as to persons in business, unless they are old and well known residents."

Consul Shaw, of Manchester, says:—"Borrowers who can show that they have made 'a good thing' by buying in a risking market are trusted all the more freely on that account."

Consul Piatt, at Cork, Ireland, says:—"Without credit this community, being almost entirely agricultural, could not exist, as the whole commercial structure rests on the produce of the land, and the tillers are generally poor, owing, as many claim, to the oppressive land system which has obtained for centuries in Ireland. It would

be impossible to develop the resources of the country without an extended system of credit."

In Scotland:—In large transactions common terms are cash in three months, with  $2\frac{1}{2}$  per cent. discount if paid at the end of the three months; but every trade or manufacture has its own terms. It is understood that no discount is allowed if the account be not duly paid.

The evils of credit are most conspicuous among the working classes and among that large part of the community who have no realized means or estate and who are dependent for their support on their daily labor.

Consul Harper, of Munich, says:—"Germany is not rich enough to do without credit. The credits are here longer than in France or England."

Consul General Bremer, at Berlin, says:—"The percentage of business done on credit is undoubtedly large."

At Dresden:—"Credit in the wholesale trade is absolutely necessary to stimulate and encourage business, and manufacturers are forced and obliged to extend long and often risky credits, as competition is so sharp among them and most companies are well supplied with capital sufficient to enable such extension and take such risks."

Adolph Stein, Vice Consul at Brussels, says:—"In Belgium, although relatively a rich country, there are no large associations of capitalists that do business, and most all tradesmen begin trade modestly and with little capital. Therefore, credit which is confidence in the solvability of a person, is indispensable for the success of trade. It might even be said that trade in this kingdom would be nearly impossible without credit."

Consul Frisbie, at Rheims, France, says:—"It is next to impossible to form any estimate of the proportion of cash transactions to the whole volume of business, but it may be taken for granted that the former are mainly confined to dealings in the prime necessities of life."

In Switzerland:—"The credit system in several branches of the business is largely in excess in proportion to the volume of business, while in reference to the manufacture and export of watches and of cheese the proportion is said to be a normal one."

In Italy:—"Credit, if given at all, is very limited, unless against good collateral securities. Advances and discounts in Florence last year, as made by six banking institutions, amounted to \$275,551,723.08."

In Portugal:—"Trade is mainly carried on by credits."

In Spain, Consul General Reed, at Madrid, says:—"The extent of credit in proportion to the amount of business transacted may be safely estimated at one-fifth of the same."

In Austria:—"The amount of credit given depends more on the commercial reputation of the individual than on the character of the business. Most of the small manufacturers depend almost entirely on borrowed capital or advances made on orders before the delivery of the goods, while for more extensive operations conducted by responsible parties credits are easily found, although generally at high rates, but if the borrowers are unknown or in great commercial straits, these rates become at once exorbitant and ruinous. It is estimated that in general the amount of credit so received may equal about seventy-five per cent. of the volume of business or interest involved."

Turkey:—"Credit is nearly universal for actual requirements of life, but colonials, imports and exports, generally demand credit. The exact proportion of credit to the volume of business is impossible to determine in a country where there are no statistics, but it certainly exceeds fifty per cent."

In Russia:—"From one-half to two-thirds of the business is done on credit. In some branches nearly the entire trade is done on credit, and generally speaking trade in Russia would be impossible without it."

Assyrian Seal from a Scythian Tumulus.

URING THE continuation of this examination of these highly interesting pieces, I shall keep them as nearly as possible in chronological order. I illustrate, therefore, in figure 9, a curious covering for the tip of a quiver case, in electrum. Although a Scythian relic, since it was found in a Scythian tumulus, we can hardly ascribe it to any portion of the Scythian armour. As we have seen, the Scythian warriors provided a pocket for carrying their arrows, in the Goryt, and it is not likely that a second receptacle was used for those weapons, neither do we find in the representations of the Scyths any accoutrement that even resembles a quiver. It is not even probable that it was used by a Grecian, since the bow was not a Greek weapon and was rarely, if ever, used by them; the archers, which sometimes formed part of their armies, being recruited from the colonies bordering the Black Sea, and, without doubt, principally from the Scythian nation. I am of the opinion, therefore, that it belonged originally to a Persian, or perhaps even an Assyrian, and the latter appears more correct since among the numerous smaller objects found in the Scythian tombs was an Assyrian seal, which will be found illustrated in the initial letter of this chapter. That this seal was, even at the age of the tomb, an antiquity, I am inclined to believe. The Scythians were at one time (if we may believe Herodotus\*), the supreme rulers of all Asia, and this seal may have been one of the objects taken with them on their expulsion from Medea by the exasperated people of that country. The placque, however, is of a style of a much later date (fourth century, B. C.), and strongly characterized by Scythian sentiment. It is not at all unlikely that it may have been used by a Persian resident in Scythia, and it may even have been made by a Greek, under directions of the Scythian king, for an Assyrian or Persian favorite. Indeed the line of conjecture regarding its origin and destination may take a number of directions and still be wide of the truth. In an estimate of the things of antiquity, that which we know and that of which we are uncertain, bear a very unequal proportion—the latter having a tremendous majority.

As may be seen, the placque is of triangular shape and pierced with holes on the outer edge for attachment to the quiver. It is also bent into a concave form. Along the upper edge is a dentilated border, and just below a group of two animals has been stamped, probably with a die. One of these animals we have no difficulty in recognizing as of the roebuck species, but the other is partly that of a panther and partly fabulous. Four or five similar pieces have been uncovered by the spade.

Tip of Arrow Case, Figure 9.

A placque of gold, which by some is thought to be a shield covering, and by others a Phiale (*phiale omphalatos*), is, unfortunately, of so elaborate a character and worked so minutely that its illustration

\* Herodotus, IV., 1.

upon the small scale required for these pages would give too imperfect an idea of its ornamentation to warrant me in making the attempt. It is 9 inches in circumference, and the work is a mass of detail, resembling filigree in fineness. If it is a shield covering—as the twisted loops of metal, which appear at opposite points of its circumference, might imply\*—it is certainly a most remarkable instance of Oriental splendor. If it is a Phial, which we know was used for libations and ceremonial purposes, it is but another proof that the ancients devoted their highest skill and richest art to the service of the gods. At its center is a boss, which, from its appearance, would seem to have held some other attachment, now lost. In a circle surrounding the boss is a sort of zone, containing dolphins and other fishes of different sizes in great profusion. From this, in radiating curves to the circumference, are several divisions, holding at their terminations heads of the Medusa. Between these divisions we find the heads and faces of Scythians, bearded and with a menacing expression, wearing the pointed cap of their nation. Other spaces have boars' heads, and every conceivable point, where decoration could be artistically used, is occupied with chased or *repoussé* work. While there may be a doubt regarding the uses of this piece, there can be no hesitancy as to its artistic excellence, which is quite similar in style and character with some of the Etruscan monuments. However, it is a Greek work of the fourth century, B. C. It weighs 163½ zolotinks and is 21 karats fine.

We come now to a piece, the uses of which is not a matter of doubt, but which is of more than usual interest, by reason of its being the only one of the kind known in the noble metal. The *Pilos* (*Πίλος*—a metal cap), which is shown in figure 10, may not exhibit as much artistic beauty as some of the pieces previously illustrated, but while we have examples of these objects in iron, bronze and bronze gilded, this is the only one in massive gold. I think it will be found to be a fact that the helmets of the warriors were always made of metal. Many of them are of this form, and some of the Grecian helmets have also side pieces for the protection of the cheeks. These, however, are without the side plates, neither are they ever represented upon the coins nor the sepulchres, other than in the form of our illustration. The design of this *Pilos*, although fantastical, is somewhat upon the familiar Ionic order. The lower band is treated conventionally with leaf and flower work. Above this, a shell, from which rises large volutes, and this is three times repeated around the helmet. The gold has been beaten up to form the design, and the ground cut out, leaving it open worked.

Massive Gold Helmet, Figure 10.

In measurement, the height and diameter are equal (7 inches). With this piece, I leave the section, already too much extended, which has been devoted exclusively to the Scythian and Greco-Scythian treasures. We have seen how a nation, barbarous by nature and tradition, assimilated to itself a culture and love for the beautiful, under the influence of a neighboring nation possessing both in the highest degree, and yet, although appreciating the art that flourished so luxuriously in Greece, developed no genius of her own. In these specimens of metal work we possess, therefore, illustrations of Greek art in three different materials, gold, silver and electrum, for it is scarcely possible that the Scythians who were, like the modern Tartars, nomadic by nature and training, gave birth to any artists capable of even correctly copying the Greek style. Other pieces of the collection exhibit the varying treatment of different workmen, who were doubtless barbarians, and who sought to reproduce or imitate the superior work of the Greeks, but meeting with

very imperfect success. It was hardly necessary, in view of the close proximity of Greece, for the Scythian kings to attempt the development of art under such unfavorable conditions as those surrounding their mode of life. I opine also, that in a nation holding its greatest wealth in cattle, there was little gold and silver, and that the rich stores which have been exhumed from their buried tombs, comprised perhaps nearly all of their possessions in this material.

Regarding the art exhibited in our illustrations, the indications tend to class many of them in what Winckelmann was pleased to term the "grand style" of Greek art, and the date of most of them, established by the inscriptions and coins found in their company, would perhaps place them nearer the age of Phidias than of Praxiteles. There is manifest in the decorations a severity of correctness as a leading *motif* which characterized the period of the earlier artist—a severity very much modified at a later age, when idealization, unfettered, rounded off the angles, and while clinging closely to truth, nevertheless rendered it subservient to beauty. We have few relics of Greek art in the precious metals, nor would these have been preserved had not the tombs been held so strongly sacred, and located at some distance from the ravaging cupidity of ancient armies and the insane destructiveness of the Iconoclasts.

We are not yet compelled to leave the classic shades of Greece. The famous cameo, which will be found pictured in figure 11, is

Cameo Portrait of Ptolemy II. and his Wife, Figure 11.

indeed, for many reasons, one of the most remarkable specimens of antique lithoglyptic work extant. It is an Oriental sardonyx of very large dimensions (6¾ inches long), and having three layers. The lowest *couche*, of a dark smoke color, is semi-transparent; the next is white on which the heads are cut, and the last is almost black and has been used by the artist for making the casque and ægis of the king. In the consideration of this gem, we may find four characteristics which establish its worth, aside from the value of the stone itself. First, its antiquity, having been executed in the third century, B. C.; second, its size; third, its importance as portraits of prominent historical personages, and, fourth, its art.

It will be remembered that Ptolemy Soter (Saviour) was one of the most cultured of the kings of Egypt. It was this sovereign that established the Museum and famous library of Alexandria. The

\* These loops, for some reason, do not appear in the reproduction.

destruction of the latter by fire was one of the most severe losses that the world ever knew, and one that scholars and historians bitterly regret to this day. How much of ancient learning, how much of instruction regarding the "lost arts," how much of priceless information bearing vital relations to the world's civilization, was devoured by the flames that turned to ashes 700,000 volumes of books, can never be known or fully realized.

Following in the footsteps of his father, Ptolemy II. continued the policy of toleration of the different religious beliefs, the cultivation of literature, of arts and of sciences. The salient features of his reign are too familiar for reiteration, but their importance to the world are of sufficient magnitude to create for his portrait an interest equal to that of any ancient ruler. That the head upon our cameo is a portrait cannot be doubted. A comparison with the coins and medals which were struck during his reign establishes that fact beyond question.\* The son of Soter is here represented in the flower of his youth. His cheeks are covered with a slight beard, and his beautiful hair—the praises of which were sung by a contemporaneous Greek poet—is raised above the forehead in a manner similar to that on the heads of Zeus, and falls in waves upon the neck. The divine ægis which covers his breast in lieu of a breast plate is woven in scales and garnished with serpents. Upon it we see also the mask of the Gorgan and yet another mask, bearded, which was without doubt that of Phobos, the god of terror, and which the Greeks believed to be the son and companion of Arés (Mars). Upon the skull of the casque is a large serpent with wings. It is the serpent of Déméter (Ceres)—a divinity that the Greeks of Alexandria confounded with the Isis of the Egyptians. The star Sothis (Sirius—the "dog star"), a star which was connected with that goddess of Memphis, is placed above the head of the serpent. The casque is encircled with a laurel wreath.

Ptolemy II. was twice married. His first wife was Arsinoe, the daughter of Lysimaque, the same Lysimaque who married the sister of Ptolemy also named Arsinoe. In connection with his physician, Chrysippe of Rhodes, Arsinoe conspired against the prince and was banished by his order to Coptos in upper Egypt. Afterwards Ptolemy contracted an incestuous marriage with his widowed sister Arsinoe—a custom frequently practiced by the Persian rulers of that epoch. This action is the one blot upon his character, but it appears that she not only made him a good wife and cared tenderly for her step-children, but she also became very prominently connected with the fortunes of the state and shared equally with her husband in the honors of his reign. By reason of this marriage Ptolemy was given the surname of Philadelphus (*nearly related*), and he is distinctively known under the two names to-day. From the youthful appearance of his head upon our cameo it is extremely doubtful if the female profile is that of Arsinoe, his wife and sister. Neither is it that of the famous Berenice, his mother, as may be proven by the coins of the period. We must, therefore, believe it to be that of Arsinoe, his first wife, and that the stone was cut before her conspiracy and banishment.

From the antique examples of the glyptic art which we possess, it appears that the ancients were more fond of cutting in intaglio than in cameo. This may have been due to the fact that the engraved stones were mostly used for seals, producing the relief in the impressions. Among the early Egyptians the art of carving in relief was either very imperfectly understood or prohibited by sacerdotal law. The effect of relief which is seen in their sculptured monuments was invariably produced by incised lines, and no part of the relief surface protrudes beyond the outer surroundings. With the Greeks, however, carving in relief attained a high state of perfection—a per-

\* We can hardly estimate the value of these ancient coins and medals to both history and art. In a late address, Mr. Algernon S. Sullivan stated that the Numismatic and Archeological Society of New York, of which he is a member, possessed a collection of coins from which a history of the world could be written if all the books extant were to be destroyed. Aside from the known high character of the speaker, such a statement is too broad and important to be made carelessly.

fection nowhere more beautifully illustrated than in our cameo. This stone was at one time in the possession of the Empress Josephine of France. It has been given, therefore, the name of the castle near Versailles to which she retired after her divorce from Napoleon, and is to-day known as the "Malmaison" cameo.

The silver pail pictured in figure 12 is antique Roman, but probably executed by a Grecian artist at a period still full of past traditions in the world of art. The style is that of the second century of our era. It was found in Moldavia on the right bank of the river Pruth in a village belonging to the district of Dorohoé. The height is 5½ *verschoks*\* and the weight 9 livres.† On the upper and lower rims are borders of flower scroll work between beaded edges. The handle is also beaded with beads diminishing in size from the center towards either end. The attachments of the handle are two flat, engraved and open-work pieces in the form of dolphins. The main beauty of this piece, however, lies in the mythological representations which fill the space between the two borders and which are worked in *repoussé*. They illustrate three different legends of Greek mythology, Hylas captured by the Nymphs, Daphné sued by Apolló and Léda with the swan.

Of Hylas it will be remembered that he was a youth very much beloved by Héraklés (Hercules) and was taken by him on the famous Argonautic expedition. On their way to Kolchis in search of the Golden Fleece, the Argó stopped at Mysia where Hylas left the company seeking for water. He found the spring, but as he was dipping his urn, the Nymphs, falling in love with the comely youth, seized and detained him. Answering his calls for succor, Polyphémos went with drawn sword to assist him, and meeting Héraklés on the way told him what had happened. The two heroes continued the unsuccessful search until the Argó put to sea and left them there.

The representations of the fable of Hylas which have been preserved are very limited in number. It seemed to exercise the talents of the ancient artists much less frequently than the other two myths upon our pail. Here the figure of Hylas in the midst of four of the Nymphs of the spring cannot be mistaken. He stands with crossed feet, and resting the left arm upon one of the urns belonging to the Nymphs. Upon his face there is an expression of affliction and chagrin. At the beginning of his captivity we are told that the young lad fell to tears, and the Nymphs, sinking upon their knees before him, sought to stimulate his courage and assuage his grief by loving words. It is evident that the artist has chosen a time when Hylas realizes that his escape has been interdicted, and the necessity of accepting his fate and remaining with the young girls has become apparent. He is not yet, however, wholly reconciled to these circumstances. The Nymph grasping his arm in a posture of solicitation meets with coldness and disdain. All of the Nymphs are nude and evidently engaged in bathing, being surrounded with water urns from which the water is pouring. Upon each arm—as indeed is the case with all the other female representations upon the pail—are two bracelets, and upon the neck a collar.

The second group, of Daphné and Apolló, shows the former close by a stream of water (probably the Ladon in Arcadia), and she is filling from it her water urn. She, also, is nude, in preparation for the ablutions of the toilette. The river is symbolized by a Nymph with her arm resting upon an urn of running water. Daphné, kneeling at the stream, has already filled her urn, when the god of music, bearing his symbol of the lyre and quiver and accompanied by a little Love with a flambeau, approaches. Alarmed at the sight, Daphné lets fall her urn and opposes with her right hand the advance of the eager god. In the hands of both Apolló and the Nymph we see branches of bay.

The Homeric Apolló was a god of remarkable purity. It was only when the pride of lineage tempted the heroes and heroic families to ascribe their origin to Olympos that Apolló was furnished with love adventures, but it appears that his wooings were habitually

\* 9½ inches, a *verschok* is equal to 4.445 centimetres.

† A *livre* is equal to 96 *zlotinks*.

unfortunate. According to Ovidius, his first love was Daphné, the daughter of Péneios. Apolló, elated with his victory over the Python, saw Erós (Cupid) bending his bow and laughed at the efforts of the puny god. Erós, indignant, shot him with one of his golden arrows of love, and at the same time wounded Daphné with one of his leaden shafts of aversion. Apolló saw her and became infatuated, while she, loving nothing but the chase, flies from him. The powers of his eloquence, possessions and rank were unable to

The ancient Greeks gave to their divinities without hesitation all the passions and foibles of humanity. Even Zeus (Jupiter), the god of gods, seems to have been credited with all the emotions and weaknesses of mortals, and hence did not escape the power of love. No one of his intrigues, however, is rendered under a more beautifully poetic form than that with Léda. Léda was already married when the all-powerful god sought her embrace. The terrible thunder and lightning which always surrounded him in his proper person

*A Silver Pail, Figure 12.*

overcome her aversion. Exhausted and nearly overtaken, the Nymph falls upon the banks of her father's stream calling upon Péneios for protection and a change of form. The river god complied, and, covering his daughter with bark and leaves, changed her into the bay tree, and this tree, as we know, was forever sacred to Apolló. The artist of our pail has chosen the moment immediately preceding the metamorphosis for his scene, and has expressed very delicately the ultimate fate of the Nymph by the branches of bay.

prevented his appearance to mankind except in some other form, and he therefore pressed his suit with the chaste Léda in the form of a swan. She, innocently admiring the bird, took it to her breast folding her mantle over it, when the god revealed himself. The fruit of this liaison was the marvelously beautiful Helené of Troy.

Such is the legend which our artist has selected for the third and last scene upon the pail. Like Daphné, Léda is disrobed and occupied with the toilette of the bath. Upon an elevation rests a

little vase filled, we may conjecture, with perfumes or ornaments. Standing upon the back of Erós the god approaches in the form of a swan, and the artist has chosen to represent Léda repulsing him with her hand. The little Erós is showing the young woman a globe, and, if this was intended by the artist to signify to her that the swan was not a simple bird but the god of the universe, it was a most exquisite idea.

The scenes and legends embodied in this piece may not be strictly in accordance with the modern code of ethics, but the art, in which is woven the mythic symbols of the Greek religious creed, is God-given. Could we but appreciate the intense fervor with which Greece (and Rome before her days of dissipation) worshipped the gods and all forms of beauty in art that visibly depicted them, we might recognize at sight the deeper meanings of cosmogony and morality which they symbolized.

(To be continued.)

---

## Proceedings of the Horological Club.

### A DISTINGUISHED BODY OF WATCH AND CLOCK MAKERS.

One hundred and twenty-fifth discussion.—Communicated by the Secretary.

[NOTICE.—Correspondents should write all letters intended for the Club separate from any other business matters, and headed "Secretary of the Horological Club." Direct the envelope to D. H. Hopkinson, Esq. Write only on one side of the paper, state the points briefly, mail as early as possible, as it must be received here not later than the eighth day of the month, in order to be discussed and reported in the CIRCULAR for the next month.

#### POLISHING GRAVERS.

Secretary of Horological Club:

Please inform me how engravers polish their gravers so as to make a clean burnished cut when engraving. I have been told several methods for polishing gravers but none of them seem to come up to just what I want. One way was to put diamantine on a piece of boxwood with alcohol, and after the graver was sharpened draw it over the boxwood. But that seems to take the sharp point off from the graver; the diamantine seems to stick to the point. Another way was to put rotten stone on a piece of sheet brass, and then apply the graver in the same way. But that doesn't seem to work right. I have often seen articles on engraving in THE CIRCULAR, so I take the liberty of writing to you knowing you to be posted on such matters. Hoping to hear from you soon, I remain,  
E. A.

Mr. Expert said the requisites for a smooth cut were a steady, even handling of the graver, holding at the right angle when making curves, and having the edges smooth, fine and sharp. There is no particular way for making them so. Probably it can be done by any of the methods recommended to you. Your trouble doubtless comes from not holding the graver firmly at the proper angle while giving it the final finish, resulting in *rounding off* the edge or points. The polishing must not be allowed to take away from the sharpness, but the faces must be as "square" to the very edges, when polished, as they were before. Possibly you polish *too much*, and the lost keenness is due to that. It is a little difficult to polish a piece perfectly flat, to the extreme edge, with no sign of rounding off, but if you cannot do that it will be better to leave the graver as it comes from a fine, flat oil stone, until practice enables you to get a *polished* flat as perfect as that.

#### CYANIDE OF POTASSIUM FOR CLEANING CLOCKS.

Secretary of Horological Club:

Will the Club please tell me whether or not it is injurious to use cyanide of potassium for cleaning clocks?  
S. W. R.

Mr. McFuzee replied that cyanide of potassium was not fit for "cleaning" clocks. Its use is for removing tarnish and stains and it should be employed after the "cleaning" or removal of the grease and dirt has been done; otherwise there will be a stain of different color at every spot of grease. The pieces should be left in the

cyanide solution only long enough to brighten them up, and they should then be thoroughly washed and rinsed in warm or hot water, for if the slightest bit of cyanide remains it is sure to rust all the steel works. It is difficult to remove it so thoroughly that no trace of it is left, and in most old established shops its use for cleaning is forbidden for that reason. Even the fumes from a dish of it will rust all the steel watch chains and other articles in the neighborhood. When cyanide is used at all it should be kept in the back shop away from the watches and other goods liable to be rusted by it, and the vessel containing it should be kept *tightly* closed. Any neglect on this point will cost you dearly.

It must also be remembered that this is a deadly poison, and not only must not be swallowed, but must not be allowed to get into any sore, cut or other abrasion of the skin. Even smelling of it will make some persons sick.

#### PROCESS OF CLEANING WATCHES IN WATCH FACTORIES.

Secretary of Horological Club:

In looking over the July number of your valuable journal, I find an inquiry from "L" as to "process of cleaning watches in watch factories." Having had some experience during 3 years' employment in the repairing department of one of the leading factories, I herein send you an account of the method there used.

The movement, when taken apart, was placed into a wooden box with separate apartment for plates, dial, each wheel, steel works, screws, etc., balance jewels taken out and all steel work taken off, then carried to a sink where it was dipped into solution of cyanide of potassium, then washed with warm water, soap and brush, then put into alcohol, then dried in boxwood sawdust. Steel works were washed in benzine and dried as before. Balance jewels were washed with alcohol, with stiff brush, and dried in a small chamois skin. The above method was used on both old and new movements, and I would say that I have continued the same plan in my regular business and find it works much better than by using chalk or any other preparation. Would also state that all balances should be trued and poised, hair spring trued and escapement adjusted.  
X. Q. Z.

Mr. Clerkenwell hoped our friend "Z." would write again and more fully. It was not quite clear from his letter whether he placed "all steel work" in the cyanide with the wheels, plates, etc. If so, it was at the risk of leaving some of the cyanide in the screw threads, etc., in which case it would be sure to cause rust of the steel parts. He says afterwards that the steel works were washed in benzine. Was that in place of washing with soap and water or afterwards? He says that balances should be poised, escapements adjusted, etc. He probably meant that it should be done before the cleaning, but does not say so. Why should a *wooden* box be used for dipping into the cyanide solution? It must soak up the solution, which could not be washed out of the wood, but would give off fumes continually to rust the steel work in its vicinity. If it has a separate compartment for each wheel, plates, etc., it must require a large dish of cyanide to dip it into. Does he use such for his private watch repairing business? We should be glad to hear further from him and more in detail, not only about cleaning but also the modes of repairing and other work with which he is familiar as followed in the watch factory. It would be of interest to all watchmakers, who might get valuable hints to follow in their repairing work.

#### WRITING ON WATCH REPAIRING.

Secretary of Horological Club:

I am writing a work on watch repairing, and, as it is my first attempt in that line, I would like to have the opinion of those that are versed in that line. I know of none better qualified in that respect than this honorable body, and knowing your desire to encourage even the humblest of your readers, without ridiculing their attempts, I have made so bold as to inquire of you, if I send on an unrevised and crude sample of my effort in that line, would you pass your judgment upon it and save me any more unnecessary trouble in finishing it? I have written it off-hand in a blank book for convenience, and if I thought it had any real merit I would take great pains with it. If it has not, I would cease at once and save myself valuable time, as I am a poor trade watch repairer and I could put it to better use. Of that, this right honorable body will be the judge.  
S. V. L.

Mr. Horologer said that he had examined the article sent in, and

was convinced that the writer was a good practical workman and understood the subject upon which he wrote. As he had stated that it was crude and unrevised, its literary style could not properly be criticised at this time. The statements or expressions are too general and vague, and the technical terms used are not sufficiently precise. One well acquainted with the subject would understand what was *meant*, but such articles are not intended for that class—only for those who do *not* know. They require to be expressed in language so clear and definite that even the tyro cannot fail to get its meaning, simply because it cannot mean anything else but what the writer intended. Writers seldom appreciate this point fully, unless it happens that they themselves have tried to obtain information from books upon some subject *they* did not understand, and found that the wording would admit of being construed in two or three different ways—and could not tell which would be correct. Generalities may do in oratory, theology or politics, but mechanical treatises cannot be too definite and exact. A most excellent example of clear and precise expression will be found in the famous "Practical Hints on Watch Repairing," by "Excelsior," published in THE CIRCULAR, and are worth studying.

As our friend says this is his first attempt, we would advise him not to undertake too much at first, but write awhile for practice. Let him write short articles upon subjects which he thoroughly understands practically, put them in the best shape he can, make them solid with facts and information and send them to THE CIRCULAR for publication from month to month. The publishers are always glad to receive worthy contributions, and he can soon tell whether writing is his *forte*. When his article is before him "in cold print," he will see it as others do. If it does not suit him he can make the next one better—or, if he cannot, he will see where his weakness is, and, bowing to the inevitable, give it up and devote his time to other pursuits. It is not every good workman who can make a good teacher or writer. But he should not be too easily discouraged. One cannot expect to be fully successful the first time. He must practice at writing the same as at working, and persevere till he succeeds. We hope Mr. L., and all others who are expert in any branch, will give the readers of THE CIRCULAR the benefit of their knowledge, and we shall heartily wish them the same success with the pen as they have had at the bench.

THE NEW STYLE ARITHMETIC.—DIAMOND WEIGHTS OR KARATS

Secretary of Horological Club:

In your interesting answer to my question in your November Proceedings, you ask for the name of the table, etc. I found the table in Orton's Lightning Calculator, by Hoy D. Orton; published by Collins, printer, 705 Jayne St., Philadelphia; copyrighted 1871. He calls it Troy Weight, and says: "By this weight, gold, silver, platina and precious stones, except diamonds, are estimated." (The table comes in here). "Any quantity of gold is supposed to be divided into 24 parts, called *karats*. If pure, it is said to be 24 karats fine; if there be 22 parts of pure gold and 2 parts alloy, it is said to be 22 karats fine. The standard of American coin is  $\frac{9}{10}$  pure gold and is worth \$20.67. What is called the *new standard*, used for watch cases, etc., is 18 karats fine." Then follows the remark about diamond weight. By giving the correct table for weighing diamonds, and its relation, if any, to Troy Weight, you will greatly oblige,

J. B. S.

Mr. Ruby Pin answered that the weight of diamonds is estimated in karats, so there is no occasion to go above that into any particular system of weights. It may be said, however, that the karat is Troy Weight, and the full table, including karats, would be as follows:

*Troy Weight.*

- 4 Grains. . . . . make 1 Karat.
- 24 Grains . . . . . " 1 Pennyweight.
- 20 Dwts. or 480 Grains. . . . . " 1 Ounce.
- 12 Ozs. or 5,760 Grains. . . . . " 1 Pound (lb).

In giving the weight of diamonds, we say it weighs so many karats or such a fraction of a karat, and do not express it either in grains or pennyweights.

In speaking of the fineness of gold, etc., it is usual, in order to

make a distinction between the terms for weight and for quality, to say "karats." He was not aware of any "new standard" of fineness. It is not customary to make watch cases finer than 18 karat, on account of the softness and poor wearing quality of gold finer than that. But that fact does not constitute it a "new standard" any more than 16 karat and 14 karat are "new standards," which they are not, although they are more used than 18 karat. The word karats means simply so many twenty-fourths, *i. e.*, 18 karat means that  $\frac{18}{24}$  of the weight is pure gold. But the word karat, as a weight, indicates an absolute an invariable quantity. The one is a positive weight, while the other merely means a certain *proportion* of whatever weight is spoken of.

So it appears that the new style of arithmetic is operated by "lightning." We might have known that there was something electric about it, for there was a sort of magnetic attraction which caused us to tackle to the idea by instinct. They say everything is going to be run by electricity, and we are glad to see that Mr. Orton has already got the arithmetic reconstructed on the electric system. We intend to adopt it at once as the basis of our financial operations. We cordially approve of the principle and shall hasten to put it in practice. First, we can make  $\frac{1}{2}$  equal to  $\frac{1}{3}$ , then 1 equal to 2, and finally we shall probably be able to add a cypher to the right hand figure without disturbing the equilibrium—then we are made. The whole thing is accomplished by lightning—which means like lightning—or "in a jiffy," as it were. But even suppose it takes as long as a second, we could make 60 turns to the minute, and allowing fifty or a hundred dollars at a clip, it would foot up to quite a respectable figure at the end of the day's work. By industry, perseverance and strict attention to business, together with close economy, frugality and saving, we might hope to realize a handsome competence by the time we were old enough to be laid on the shelf. All we need is to get started once and we are all right. If Mr. S., or any other man, will send us a copy of that invaluable work, we will give him the first \$5 we get out of it, and will bequeath him our seat in the Club when we retire. We also solemnly promise to furnish all the coal the Club requires, so the members will not have to go out so often between the acts to "get warm." This will save them a great deal of trouble and prevent their noses getting so red eating cloves. We hope some kind hearted gentleman will see the gravity of the situation and forward us a copy (post paid) before our next meeting. He will thereby confer a favor upon suffering humanity which can never be repaid, and the heirs to our fortunes shall rise up and call him blessed. N. B.—The number of members is thirteen and each would like a copy.

## Fashions in Jewelry.

### A Lady's Rambles Among the Jewelers.

THE severe simplicity that has characterized feminine attire in the world of fashion the last few years is a thing of the past. Neutral tints have faded before a galaxy of bright hues; soft clinging fabrics modeled to follow the outline of the figure, have given place to stately velvets and showy brocades fashioned over cushions and hoops; the gayest of plumage nods from the Frenchiest of French bonnets and jaunty hats. In a word, a revolution has taken place, quietly but surely, from "elegant simplicity" to "stylish elegance;" a distinction without a difference to most masculine minds, but every woman appreciates the absoluteness of the change. This change means more to the jewelry trade than a casual observer imagines; it means a revival of jewelry in the world of society. Ladies rarely do things by halves, especially in matters pertaining to dress. When that arbitrary mistress called "Fashion" decreed that it was commonplace, even vulgar, to wear long chains, heavy bracelets and

massive brooches, these adornments were banished with other condemned styles. No class of manufacturers appreciate more fully than do the jewelers how loyal the ladies were to the plain mode of dress. The restraint, however, is at last removed, for a redundant style has been introduced, not only by the manufacturers of fabrics and garnitures, but by the modistes, which require for its completeness the richness and glitter of gems and jewelry. Ever since fashion had a history, jewelry has followed as a necessary accessory to pronounced colors and voluminous draperies. The transition from almost no jewelry at all to jewelry *ad libitum* promises to be all the more speedy because every woman possesses an inborn love of finery, and the fact that she has been prohibited for a number of consecutive seasons from freely indulging this inherent taste, gives a keener zest for the revival. This revival, by the way, is being made with unique and beautiful designs, and unusually fine workmanship in all classes of jewelry.

\* \*

\* \*

\* \*

THE manufacturers and designers of gold jewelry have been peculiarly fortunate in the character of the new productions sent out to meet the incoming demand. The new patterns while decidedly unique, are, at the same time, graceful and simple in style. There is an absence of heavy, massive effects, and a decided tendency to association with gems, semi-precious stones, onyx and the like. Enamel has never been employed with more beautiful results than have been gained this season in the fashionable flower patterns where daisies, forget-me-nots, pansies, violets and other flowers are faithfully imitated in size, form and color. These flower patterns appear to decided advantage in the propitiatory "flower-pins," pretty little hybrids between the popular lace pin and the brooch. These flower pins, by the way, afford in their gold petals an appropriate resting place for diamonds and other gems. In illustration may be cited a cluster of daisies which gain the required yellow heart worn in nature by the insertion of a lemon-colored diamond set in the center of each; or, an apple blossom on whose blush-hued lines quiver diamonds like so many dew drops. Bracelets, which are gaining in popularity, are this season attractively made in gold wire or cord, terminating in a single gold flower or a cluster of blossoms with or without the sparkle of gems. Bangle bracelets, always in more or less demand, afford a popular design for the retail trade at large in the padlock pattern. In this the bracelet is a chain of gold, silver or onyx, as the wearer may desire, and fastened with a padlock of similar substance. The padlocks admit of a great diversity of finish, and many of them are incrustated with jewels.

\* \*

\* \*

\* \*

THE hammered or beaten surface in jewelry has been displaced by three styles of finish known as "nugget," "fiber" and "snowflake." The last mentioned is the newest, and all produce a rough surface. Lace pins, sleeve buttons, watch cases and other articles represent these several finishes as well as the plain Roman gold. Popular combinations are gold and platinum, and gold and silver. The former is much employed in gentlemen's fancy vest and the two-pocket chains, match safes, cigar cases, pencils and the like.

\* \*

\* \*

\* \*

THERE is no denying the fact that serious inroads have been made in the sales of the retail jewelry stores, by the tendency of the times towards diversity of stock in dry goods and fancy houses which carry, many of them, large lines of jewelry and silverware. Retail jewelers who have refused to meet the foe on their own ground, and confined their goods to spoons, forks, jewelry, watches and clocks, feel the

effects of the innovation most sorely, and are making complaints of the manufacturers who sell outside the regular trade. These complaints are of no avail; the goods have been made to sell, and when an order comes it will naturally be filled, whether it be from Macy's popular bazaar or Tiffany's world-famed establishment. The safety of each retail jeweler lies in keeping pace with the times, by meeting in his own stock the requirements of the present and growing demand for a diversity of goods. Jewelers who have added *objects d'art* and fantasies as a background and frame work to the legitimate stock of their trade have reported favorable results, and substantiate these reports by carrying more largely each season choice ceramics, artistic bronzes, brasses and other decorative articles. Quite new among specimens of choice pottery are vases and other small objects in Egyptian ware which affords unique effects as regards color and form. Royal Worcester, Crown Derby, Berlin and Vienna fancy goods are included in desirable importations. In Copeland ware come very attractive "creams and sugars" in silver plated stands. Bronzes and fine brasses afford the usual variety of articles; and objects of antique shape in old iron—a recent fancy—are having a run. Novelties in glassware include vases of artistic form and decoration in what is called the cameo glass. Silversmiths have added largely to the list of popular and artistic articles in way of all kinds of gift sets. Their catalogues out for autumn illustrate many novelties which city patrons are selecting from their stocks with a view to the holidays.

\* \*

\* \*

\* \*

THE "Queen" is the newest form of watch chain for ladies' wear, and it has been produced in such a variety of pattern and material as to insure a large patronage. This chain, as most readers are aware, is three or four inches in length and finished with a ball on one end and a swivel for the watch at the other. The watch is worn inside the dress bodice, and the weight of the ball balances and holds it in place. This ball is often made to divide in half in form of a locket or viniagrette. Sometimes a cube or three small balls take the place of the solitary large ball; again, the finish is fanciful, as a teapot of antique shape, or a rosebud. The "Queen" chains come in black onyx, also in silver and with enamel finish. Among oxidized silver chains are those terminating at one end with *fac similes* of ancient coins. These coins, by the way, differ from those introduced on the lace pins last season, in that they are finished on both sides. The fancy vest chain remains the standard watch chain for ladies; the new patterns are, for the most part, exceedingly dainty in design, and embrace both double and single chains. Enameled chains incrustated with gems or semi-precious stones are made to wear with watches similarly decorated; in this connection it may be explained that ladies' watches, as a rule, run in small sizes.

\* \*

\* \*

\* \*

NUMBERED with several articles in gold and silver jewelry, especially adapted for the holiday season, and commending themselves to every retail jeweler's stock by reason of their combination of beauty and utility, are button hooks, charm pencils, match safes, whistles, cigar cutters and bouquet pins. Among the newest designs in the first mentioned are solid gold and silver hooks that close like a knife blade, in an elaborately decorated handle, and others in cases with telescopic movements that produce much longer handles than have been previously made. The latter arrangement is especially recommended to stout people who find buttoning their shoes with a short hook a tedious operation. In pencils for charms the ingenuity of the designer has provided an exceedingly interesting collection. Little jugs, champagne bottles, kittens in a basket, lanterns, bells, balls and other fanciful articles shoot out a pencil point where least expected. Whistle charms used by ladies for the various purposes of arresting

the coachman's attention, calling a pet dog and the like, are this season introduced in gold and platinum with attractive effects. The same may be said for match safes and pencil cases, many of which are exceedingly beautiful. A new and pleasing pattern in these consists in alternate oval bands or rings of gold and platinum. Bouquet pins are out in several sizes to suit the sizes of bouquets worn; these have proven a great convenience and will be in demand so long as natural flowers are worn on the corsage.

\* \*

\* \*

\* \*

THE tiny ribbon pins that so suddenly appeared on every bow knot tied under a lady's chin, have proven such convenient affairs as to insure their reproduction for the fall and winter trade in a great diversity of designs. On these popular pins are represented flies, bees, spiders, dady-long-legs, darning needles and other small specimens from the insect family; also all the small flowers. Very often two of these pins are connected with a gold chain and worn as a neck pin. The newest popular design in gentlemen's scarf pins is the "knot," though star, claw-and-ball, crescent and flower patterns are all desirable.

\* \*

\* \*

\* \*

FINE black onyx jewelry is always more or less worn, and therefore always appears in new and desirable designs. It is *par excellence* the material most sought after by the middle-aged and ladies in mourning. Associated with pearls and diamonds it is attractive to a large class, being an admirable foil to the complexion, and therefore a becoming adornment. In black onyx, this season, are to be found all the new styles in watch chains, bracelets, ear rings, lace pins and other articles that have been produced in gold jewelry. In a word, it is difficult to name any style or ornament worn by ladies that cannot be found in black onyx. For mourning purposes the usual plain finish gives place, in many instances, to what is variously termed the dead satin and crape finish. Popular articles in black onyx jewelry are, at the present time, bracelets made in sectional pieces, and set with diamonds and pearls; shawl and lace pins in unique design; the queen chain and hoop ear rings, on the front edge of which appears a solitary pearl or diamond. An article in black onyx for which there is always a steady sale is the memorial or widow's locket. This is often made with an elaborate setting of pearls and diamonds; again, it is as plain as possible, to be worn suspended from a slender chain under the dress and quite out of sight.

\* \*

\* \*

\* \*

HERMATITE has this season been successfully introduced on lace pins, ear rings, scarf pins and other articles of gold jewelry. The spherical shapes of this mineral with every movement present varying shades of color in concentric bands, from very dark brown to black, after the manner of black pearls, which they closely resemble. These little balls are carefully mounted in clamp settings, the same as are diamonds and pearls, and afford novel and elegant ornaments at a comparatively small price. Hermatite jewelry promises to have a long and successful run, judging from the attention it is at present attracting.

\* \*

\* \*

\* \*

NO LADY, nowadays, considers her collection of accessories to the toilette complete without one or two scent bottles and viniagrettes. Indeed, to be *a la mode* she must have an assortment of receptacles for aromatic vinegars, atter of rose, eau de cologne and smelling

salts, for she wears one to church and another to the opera; to confuse these would be as disastrous as a transfer of prayer book and lorgnette. Conspicuous in this assortment is that cumbersome freak of fashion, the cut glass cologne bottle with gold or silver cap, measuring all the way from six or eight inches to a foot and a half in length. These monster bottles owe their speedily gained popularity in polite society to the fact that they are *outré* as regards both appearance and cost—a sure passport to a desirable class of patrons. A full dress toilette for the opera is not complete without one of these scent bottles, which is carried in a long plush bag drawn at the top on a cord with tassels. The newest models in these cologne bottles represent fish, snakes, horns and other irregular shapes; they are also manufactured in sterling silver and fine ceramics. Passing from one extreme to another, is the tiny glove viniagrette worn under the glove in the palm of the hand; for this style there is a large and steady sale. Other popular designs are the gold and silver viniagrettes suspended from a chain to be worn at the side, and the minute viniagrette charms for watch chains.

\* \*

\* \*

\* \*

THERE no longer remains any reason why everybody should not take note of time as it passes. The importers and manufacturers of dials and clocks have certainly afforded in their stocks this season a sufficient variety of timepieces to accommodate the most fastidious in regard to accurate timekeepers in decorative form, and the most impecunious as regards the cost of clocks. The flying pendulum clock is counted with novelties. The clocks with chimes and cathedral gong strikes are attracting universal attention. Just now jobbers are busy picking up odd things for the holiday trade in clocks in padlock form, owls, stars, scrolls, barrels and other queer shapes.

\* \*

\* \*

\* \*

FOR rare gems there is always a demand; this fluctuates, it is true, as money is more or less plentiful in the country, but it never ceases. Unlike other personal ornaments, therefore, precious stones are ever in fashion. The style of mounting them varies with recurring seasons, and the association of colors changes to satisfy certain requirements of fashion, but the jewels are worn, in one way or another, from year to year, no matter what form of bonnet or dress the Princess of Wales chances to render popular by her patronage. Perfect rubies, emeralds and diamonds of desirable size are becoming scarcer, and consequently more costly to the importers every year. As yet, this increase of value has not affected prices with retail buyers, who find them about the same as last season. Scarcity insures to fine gems a certain money value for all time to come, and renders them a safe investment even in "hard times." The owners of desirable jewels, therefore, enjoy the double satisfaction of possessing in snug, compact form, elegant ornaments and a little fortune. The present fashion in gems tends decidedly to an exhibition of the gems pure and simple; the setting being subordinate; indeed, when practicable, not showing at all. The intrinsic worth of an ornament is usually concentrated in one object, as a flawless diamond in the center of a pendant and worth \$10,000, suspended from a slender gold neck chain that did not cost over \$25. Fine gems for ladies wear, are, as a rule, set high with as little of the setting in view as is practicable. The pendant is a favorite form for wearing precious stones, the value—as has already been intimated—being chiefly concentrated in the center of the piece. These ornaments, by the by, are made in many instances to wear in a variety of ways, as a neck pin, a finish to a bracelet, or in a pin for the hair. There is a growing demand for pearl necklaces; in these ornaments the pearls are strung on silk threads like so many beads, presenting on the neck a simple strand of pearls. Single stone necklaces are also in favor;

those composed of small diamonds being specially sought after. In these the stones are mounted so that no gold is visible. Fine gems for gentlemen's wear, notably in rings, are embedded in a comparative massive setting. Small stones are also embedded with pleasing effect in the decoration of watches, lace pins, sleeve buttons and articles showing Indian chasing, rococo and other rough surface finish. The sapphire is at the present time one of the most popular of gems; this is largely due to the fact that they are exceedingly plentiful, and therefore correspondingly reasonable in cost. The favor with which colored gems is regarded the world over cannot be more significantly illustrated than was done the other day at a wedding in high life in England, where, contrary to all tradition, the bride wore colored jewels.

\* \*

\* \*

\* \*

MANUFACTURERS and importers, in the face of a doubtful season, have assumed large risks by putting on the market in all departments pertaining to ladies' attire, an attractive and extended line of novelties. The truth of this statement as regards dry goods and millinery is substantiated in the show windows, and on the tables and counters of our leading retail houses, where goods are displayed with a view to catching and holding the eye of every passer by. Many of these houses consider an attractive arrangement of stock of so much importance that they employ on large salaries men of artistic taste and quick perception, for the sole purpose of dressing their windows and cases. As a rule, it may be claimed that a profitable percentage of the number who pause before a show window to admire enter the house to buy. Now, the manufacturers and importers of gems, jewelry, silverware and *objects d'art*, are not at all behind hand in way of novelties, striking and beautiful, but the retail trade fails, in some instances, to make the best exhibit of these various articles. Gold and fancy jewelry, spoons, forks and gems crowded into one window, regardless of harmony in design, color or value, produce a chaotic picture as a whole, and lose individuality to the several departments represented. There are beautiful specimens in this mixed collection but their value is dwarfed by the near presence of numerous commonplace articles. The assistance to quick sales of attractive windows and show cases is second only to a clever salesman; the first arrests the customer, the second persuades him to empty his pocketbook. Without the arrest, the salesman—no matter how well versed in his business—has lost a golden opportunity.

\* \*

\* \*

\* \*

A RICH background of contrasting color, when judiciously selected, adds greatly to the effectiveness of both jewelry and silverware. A pretty plush or morocco case, with what is termed the popular trade, is an important factor in a sale. This is notably true with gift articles, such as holiday, birthday and anniversary presents. An article of comparatively small value even gains a decided importance with the average buyer when presented on a velvet cushion or satin lining. In this connection may be appropriately mentioned the pleasing variety of styles in new show cases, window trays, ring bars, cases for jewelry, silver and the like. In the celluloid cases have been gained exceedingly satisfactory results in ebony, tortoise shell, agate and other effects. Trays for rings have taken on fancy forms, such as scrolls, stars, horseshoes and crescents. Jewelry boxes and toilet cases in diversified patterns afford attractive articles for the retail jeweler's stock. So do the new escreteires containing wax tapers, tiny candlesticks of antique shape, a seal and sticks of colored

sealing wax. These escreteires promise to be popular holiday articles, for they not only meet the requirements of the present fancy for sealing with wax and stamping a letter, but are manufactured in a sufficient number of grades to give a wide range in prices.

ELSIE BEE.

### Tenth Annual Dinner of the New York Jewelers' Association.

THE ANNUAL dinner of the New York Jewelers' Association at Delmonico's in the fall of each year is regarded as one of the principal social events of the season. The Association is composed of the representative manufacturers in the trade, and the aggregation of wealth invested in manufacturing by its members is considerable, being greater probably than is represented in any other trade association in the country. On Thursday night, November 13, the tenth annual dinner of the Association was given at Delmonico's, and in all respects it was equal in elegance and brilliancy to any of the dinners in preceding years. In this re-union of practical business men who come together each year, and, throwing aside business rivalries and asperities, devote their attention for an evening to the cultivation of pleasanter relations, much substantial good results to the Association of Jewelers as an organization, to the members individually, and to the entire trade in general.

At half-past six a suite of Delmonico's best reception rooms was thrown open to receive the assembling jewelers and their invited guests. Among the guests who came were gentlemen distinguished in the judiciary, in government, at the bar and in literary and artistic pursuits. At seven o'clock the committee having the affair in charge escorted the banqueters into the dining hall. Within the banquet room all was a scene of exquisite brilliancy and magnificence. The decorations were elaborate, floral and silver embellishments in abundance beautified the five tables that were spread, four being at right angles to the fifth, which was elevated and occupied by the President of the Association and the speakers of the evening. From the balcony above familiar operatic airs were played by the band engaged by the Association, and floods of light from countless chandeliers and candelabra lent magnificent brilliancy to a fairy-like scene. Flags in variety were hung about the walls of the hall in artistic arrangement, with the national shield below each group of flags, and facing the entrance and directly over the head of the President was a handsome representation of the national emblem, presenting a towering and life-like spread eagle. Tropical palms of rare and superb variety were placed about in convenient corners, and delicate flowers and emblematical designs added charm to the banquet tables. Roses, chrysanthemums, pinks and a variety of other fragrant cut flowers pleased the eye of the diners and tended to increase the appetite for the substantial and delicacies about to be served. The flowers were provided by the Association, and not, as is customarily done, by Delmonico. The silver decorations on the tables attracted much attention and were very beautiful and elaborate. The metal was of the true quality, some of the pieces were valued at a thousand dollars a piece, and the entire decorations were furnished by the Gorham Manufacturing Company. The gentlemen having the affair in charge did themselves honor, and their efforts were fully rewarded by the effect. The urbane Secretary of the Association, Mr. H. Olmsted, was untiring in his efforts to assist in every possible way to make the dinner a success, and due appreciation was shown for his courtesies. The company were escorted to their seats, each one of which was designated by an artistic card bearing the occupant's name. The *menu* cards were backed on various colored grograin silks, with red, white and blue decorative ribbons; they were the most handsome *menus* the Association has had at any dinner. Before the dinner began, the President, Mr. W. R. Alling, called on Rev. J. H. Rylance, of St. Mark's Church, to invoke the blessing of

God, while the gentlemen present bowed their heads. The guests being seated the dinner was served. Following is the *menu*:

| Choux-fleurs au gratin            |                                  |                      |
|                                   | SORBET                           |                      |
|                                   | à la Régence                     |                      |
|                                   | ROTI                             |                      |
| Perdreaux                         |                                  | Salad de laitue      |
|                                   | Extremets Sucrés                 |                      |
|                                   | Pouding à la Bagration           |                      |
| Gelée pistaches, Orientale        |                                  | Meringues à la crème |
|                                   | DESSERT                          |                      |
| Glaces Napolitaine                |                                  | Biscuit Rivoli       |
| Fruits                            | Petits fours                     | Cafe                 |
|                                   | VINS                             |                      |
| Haut Sauterne                     | Sherry                           | Pontet Canet         |
| Cliquot sec.                      |                                  | Pommard              |

Le 13 November, 1884

DELMONICOS.

The following named gentlemen were the guests invited by the Association and who responded to the toasts, their names being given in the order in which they sat from right to left, the President occupying the presiding chair in the center of the line:

## ASSOCIATION GUESTS.

Hon. Chauncey M. Depew, Chief Justice Noah Davis, Mayor Low, President W. R. Alling, Rev. J. H. Rylance, D. D., Colonel Charles H. Gibson, Hon. Algernon S. Sullivan, and J. Seaver Page, Esq.

The following is a complete list of the members of the Association and the guests of members that were present at the banquet:

## MEMBERS AND GUESTS.

*From New York*—A. Carter, Jr., H. S. Cozzens, J. S. Franklin, Geo. R. Howe, C. E. Hastings, Geo. B. Jaques, Thos. Le Boutillier, B. H. Knapp, J. H. Johnston, J. C. Aikin, Jos. Fahys, J. F. Chatellier, Jas. Hedges, Geo. A. French, J. C. Mount, H. C. Ostrander, J. P. Snow, J. B. Bowden, J. R. Greason, W. H. Atwater, Geo. S. Brown, A. J. G. Hodenpyl, Geo. H. Hodenpyl, L. L. Woolley, E. J. Scofield, S. E. Thomas, W. T. Woodruff, C. H. Brahe, N. H. White, C. G. Alford, Wm. R. Alling, W. B. Kerr, Jno. D. Alling, F. S. Douglas, Alfred H. Smith, Geo. M. Hard, W. B. Durand, C. F. Greene, Thos. G. Brown, Horace S. Woodbury, Louis C. Nash, Wm. F. Michael, Andrew C. Craig, Jr., H. B. Beach, C. E. Breckinridge, D. C. Dodd, Jr., Chas. Fellows, J. T. Scott, B. K. Hills, Irving Smith, W. G. Appleton, D. F. Appleton, Geo. Wilkinson, W. C. Spencer, E. Holbrook, J. W. Beacham, Geo. C. White, Jr., R. N. Petersen, G. T. Woglom, Mr. Newell, L. B. Haff, H. B. Dominick, Hiram W. Brown, A. Dominick, S. W. Hale, H. Olmsted, S. S. Battin, Jr. *From Washington*—M. W. Galt, H. Semken. *From Philadelphia*—Geo. W. Banks, O. S. Hamrick, C. Weaver, J. A. Caldwell. *From New Haven*—Gen. Geo. H. Ford, A. O. Jennings, F. B. Jennings, W. H. Stevens, M. Jennings. *From Boston*—Geo. H. Richards, Jr., Mr. Low, of Shreve, Crump & Low. *From Providence*—Henry Tilden, Jr., H. B. Houston, Geo. H. Houghton. *From Other Cities*—S. B. Sandford, Troy; J. G. Bacon, Meriden; J. H. Hart, Brooklyn; F. M. Lewis, J. S. MacDonald, Baltimore; A. O. Headley, Newark.

The viands and wine accompaniments were discussed from seven to about nine o'clock, when coffee and cigars were served and the toast speeches began.

Following was the address of President W. R. Alling to the Association:

## ADDRESS OF PRESIDENT ALLING.

*Fellow Members of the New York Jewelers' Association:*

You did me the honor two months ago to elect me your President, and, as I have not seen many of you since that time, I wish to return my thanks for the honor conferred on one so unworthy to occupy the highest place in our trade.

I wish to congratulate you on this, our 10th annual dinner, and hope you and our guests have enjoyed the good things Delmonico has provided, and are in a happy state of mind to listen to the brilliant speeches from some of our friends on my right and left.

The 10th anniversary is generally known as the tin wedding. But as tin would be out of place in this assemblage of dealers in diamonds, watches and costly goods, one of our members has kindly decorated our tables with some of the most artistic silverware manufactured.

Now, I am not going to detain you with any review or statistics of our Association, but merely to allude to our continued prosperity, and to congratulate you on the fact that death has not entered our number during the past year, and although these cannot be called prosperous times, still we have seen much worse, and have every reason to be thankful that we can again meet and exchange pleasant greetings with old and new friends.

I cannot make any lengthy speech this evening, as you all know speech-making is not my forte, and I would only be consuming the time that would be occupied by such orators as grace this table.

In the early part of the day preceding the evening of the banquet President Alling unfortunately was prostrated by sickness, an attack of acute dyspepsia. He recovered sufficiently toward evening to be induced to attend the dinner and occupy the President's chair at the table, but as the evening progressed his condition again grew worse, and, finding himself unable to enter heartily into the festivities of the evening, he decided to retire, and, later, to go home, notwithstanding the urgent effort of his fellow members and friends to persuade him to stay, a feeling which afterward gave way to genuine sympathy for the sickness of their President.

At a little after nine o'clock, one of the old Presidents, Mr. D. F. Appleton, who had been requested to take Mr. Alling's place, rapping his gavel on the table, called the assemblage to silence. He then addressed the company:

## INTRODUCTORY REMARKS OF MR. APPLETON.

*Gentlemen:*

I am very sorry to say that the President, Mr. Alling, is indisposed, and I am requested by the Vice-President of the Association to take his place here temporarily. I sincerely hope that he will soon be able to resume his place here.

I find on Mr. Alling's memorandum that the first regular toast of the evening is,

*"The President of the United States,"*

and I ask you to fill your glasses and drink to the health of the President of the United States, (Cries from the audience: "Who is the President of the United States?") the Honorable Chester A. Arthur. Your President has made a memorandum to call on the Honorable Chauncey M. Depew to respond to this toast.

Mr. Depew spoke as follows:

## ADDRESS OF CHAUNCEY M. DEPEW.

*Mr. President and Gentlemen:*

About thirty minutes since the President of the Association came to me and stated that neither the President of the United States was here, nor the Mayor of the city of New York, who had promised to respond if the President could not, and asked me to respond for the President or the Mayor. I said yes, if wanted to respond to one of these toasts I would prefer to speak for the Mayor of this city. With that peculiarity in the jeweler mind which makes the ordinary practitioner in that business go contrary to what anybody else wants, he immediately appointed me to the other place. Now I have been speaking on the President of the United States for about six months, and it occurred to me, when he arbitrarily made that decision, that he wanted that speech that I have been delivering during the recent campaign. I could condense it into two hours and a half, but I do not propose to deliver it to-night. (Sighs throughout the room). Your sighs of relief gratify me. The question naturally recurs to me which president am I to respond for. (Laughter). I certainly cannot meet this question, with Sulli-

van present, with all the fairness and judicial discrimination that the case demands; and I think that there is no one probably in this community to whom the Jewelers' Association are under greater obligations in this presidential subject than they are to Sullivan. I do not mean that Sullivan's efforts elected Cleveland, (Loud applause and three cheers for Cleveland) but what I do mean is this: On the Thursday night following the election there appeared in the Democratic newspapers of the city of New York a call for the Cleveland and Hendricks clubs to meet at Wall street the next day for the purpose of hanging the newspapers that claimed Blaine's election. (Laughter). Mr. Sullivan prevented that riot by remarking to his assembled associates that while it may be proper to hang a candidate who had violated his sworn duty, to hang a newspaper man who was printing the facts as he heard them was something in his judgment that the present condition of the Democratic party could not stand. (Laughter). Now, as all rioters, after hanging the people they have in view, immediately proceed to loot the jewelers' houses and the silversmiths' quarters, the fact that a jewelry establishment remains in the city of New York is due to Sullivan, and hereafter, when any of us purchase any of your manufactures, we expect to see on the bottom of it "S. S.," "Savior Sullivan." (Laughter and applause).

Now there is a peculiarity about dinners of this character that the first one is always the best and is looked back to with more eagerness, for the reason that the narrow range of the topics that can best be discussed cause a repetition of the same illustrations year after year, and there is a peculiarity about the human mind, even the jeweler mind, that the best things said, after a while, fail the appetite, and I know of nothing that has such longevity as an apt application that is always applicable. I remember when Chicago was burned down, at the first public meeting some distinguished man made a reputation by speaking of "the Phœnix rising from her own ashes." It was a happy thought. While it occurred to him, it occurred to every other man in the United States, but he had the first chance to get it off. Every other orator thereafter got it off, not knowing that it had been repeated before, until, when any one went to Chicago thereafter, his friends had to advise him not to mention the Phœnix, unless he wished to be assisted to climb the golden stairs.

While the jewelers are, so far as I know, a pious people, I know, however, that whatever their presidential candidates were, none of them were for St. John, because I have been flooded with every liquor known to the still to-night and Apollinaris I could not get. (Laughter).

But to return to what I was remarking, the sacred gentleman who wrote the beautiful sentiment about the golden stairs must have been a jeweler, because every jeweler I have ever met managed somehow or other to make a delicate allusion to his place of business. (Laughter). I said to the gentleman beside me to-night: "This is a beautiful dinner, and I never saw anything more handsome than these table decorations." He said: "Yes, the Gorham manufactory contributed these things. Each of them are worth a thousand dollars. The trade are always pleased to have them upon the table, and they are recognized universally as the very best evidence of the jewelers' art in the world." I said: "My dear friend, who are you?" He said: "I am the agent of the company." (Laughter and applause. The joke was at the expense of Mr. Holbrook, the agent of the Gorham Company, who was present and occupied a seat at one of the lower tables and who had not been near Mr. Depew's seat).

Well, now, gentlemen, in all seriousness, there is only one organization that I know of that is free of this constant recourse to the same topics, and that is the New England Society, of which my friend, Appleton, is one of the distinguished officers, and the reason for this is that the New England sons claim that all there is in this world come from them, so that there is nothing in the broad range of human achievement that the New England Society cannot talk about with propriety. (Laughter).

We have, in this presidential election, some of us been frightfully disappointed and some of us have been pleased. Both parties claim that the election has settled everything, and each have their own view of what has been settled. One party thinks it has settled the country so decisively that it will never rise, (Laughter) and the other party thinks it has settled the country for a glorious future. (Laughter and applause). There is one thing which it has settled, and that is a question that has agitated the public mind for the last twenty-five years, and it is now settled beyond dispute forever, and that is the propriety of the clergyman interfering with politics. (Loud applause and laughter). It has settled another question. There is no surer, bolder and sharper man than the political manager. But this election has settled the question that there is one thing the political manager does not understand, and that is, the effect of the Delmonico dinner. (Continued laughter).

But to be serious again, I have the profoundest faith in the elasticity and growth and future strength and power of the American people and the American Republic. While I firmly believe that they would be better and stronger and more gloriously great under a Republican dispensation, still I have the profoundest faith that they can stand whatever the other fellows believe in. And from my standpoint, speaking for the President of the United States, and on this question now agitating the public mind—from my standpoint, I desire to say that if Governor Cleveland should be declared President of the United States, as I think he will be, (Applause) I can submit to the inevitable with great grace. He has before him a quarter of a century of Republican Presidents. If he is equal to the poorest of them he will receive my respect; (Laughter) if he is equal to the best of them he shall have my support. (Applause).

But I remember, gentlemen, you are gathered here to-night as the Jewelers' Association. When I was in London last summer I went into a street of old London two hundred and fifty years ago, and the most interesting part of what I saw were the various guilds practicing their business in the uniform of the dress occasions of the guilds of olden period. I inquired into these guilds and I found that the jewelers' guilds of to-day have not a single old jeweler in them. They have all become peers, British lords. I know of no House of Lords in this country except the jewelers. (Laughter). I would like to know what profession we have that represents the tempter of womankind better than the jewelers of this country. (Laughter). We lawyers make it our business to study human nature for the purpose of capturing, by the manner in which we present our case, the jury and the court. But we yield, in our knowledge of human nature, to the ordinary jeweler. The manner in which an ordinary jeweler will hold up, before a lady he knows can pay for it, a diamond necklace, surpasses anything in the knowledge of human nature. The manner in which an ordinary jeweler will take—and the extraordinary ones can do anything—I am now speaking of the ordinary common kind—there are none of those here to-night—the manner in which the ordinary jeweler will take a parvenu who has just struck a fortune and who is in search of wonderful things, present to him the evidence of antique art in his establishment, and make him believe that, by the proper amount of purchases, he cannot but gratify his natural taste for the beautiful, surpasses anything in the line of human capture that is known to those elements that prey upon the human kind. (Laughter).

And now, gentlemen, laying aside politics and laying aside the shop, I want to say, finally, that the world owes to you a debt which it is my part to stand here and voice. It is true that our profession gets out of you nothing that we do not pay for except this annual dinner (Laughter); but we have no grudge against you for that, and I want to say, in all seriousness, that there is nothing that is recognized in this world, at this day, more than the fact that the world is better now than it has been, and that civilization is more pronounced, and that blessings are more generally distributed, and all is due to the fact that the artistic mind has been so cultivated, that art has gone down to the lowest walks in life. There is in this country no house so plain, no cottage so simple, that you do not find on its exterior or in its interior some sort of artistic cultivation which elevates the man above the level of the brute and makes him a better citizen and tends to maintain a stronger government. There is no business that we have to deal with that so caters to the beauties of art that we meet with in the domestic uses than that of the jewelers. (Applause).

MR. APPLETON—I regret very much that Mr. Alling has not made his appearance. I find a memorandum made that the second toast is one to which you will listen with a great deal of pleasure and pride. The toast is:

*"The Mayor of New York; Chief of this Imperial City, second only in responsibility to the head of this nation."*

I know we will listen to this toast with gratification for the health of the gentleman who is toasted. The honored Mayor of the city is not present, and I think we ought to drink to his health as at the head of this city, which the toast calls for. We are very fond of this city, standing as she does grand and glorious in her imperial eminence above all other cities on this continent, and, progressing as she has, giving us certainty that she will, before long, be the chief commercial city of the world. I think we, as a trade association, ought to dwell more upon this subject and express oftener our pride in the grand city of New York. Fill your glasses and drink, gentlemen, to the health of the Mayor of New York, who is unavoidably absent to-night, I am told.

After the toast had been drunk Mr. Appleton continued:—Now we

cannot all live in New York, and that leads us to think of that city which is, in all respects excepting in its municipal organization, a part of the city of New York, and it is with great pleasure that I propose the health of the distinguished and honored Mayor of the city of Brooklyn, and I will ask you to drink to the health of Mayor Low, who is with us to-night. (Three cheers for Mayor Low were given).

Mayor Low responded to the toast as follows:

ADDRESS OF MAYOR SETH LOW.

*Mr. Chairman and Gentlemen:*

When I received your invitation to be present I had just read the address of James Russell Lowell upon the Democracy, wherein he stated that events had proved singularly regardful of the recognition of prophets, and I could not but think how fortunate it was that the brilliant anticipations of Colonel Sellers had not all been true. You will remember in one of those prophecies of Colonel Sellers he said that for a side speculation he proposed to invest in hogs, and that he and his friends would lock them up until hogs should be jewels. I do not know whether it was in anticipation of that prophecy that your craft has imitated the original animal and made him popular, but certainly I am glad that it was not true. I feel embarrassed, speaking for the city of Brooklyn, until I have heard what the Mayor of New York could say about your own city. The last time I had the pleasure of meeting him at a dinner he suggested that the city of Brooklyn should be joined to the first ward of New York, and I illustrated to him the terms upon which such a compact may be made. I pointed out to him that you never heard of the New York Bridge: it is always the Brooklyn Bridge. If the time ever comes when the two cities join, farewell to New York. Therefore, you can understand that there is a very slight step from such a subject to undertaking to say a word or two in regard to the city of which I am Mayor, and perhaps I ought to first illustrate the leading thought, in the terms of your trade. To my conception, New York is to Brooklyn as the pendant that hangs on the neck of some fair dame. (Applause). If you will look at the Bridge on any night and see the brilliancy of the lights, you will naturally conceive, I am sure, that something very brilliant must be the rare jewel that culminates the chain.

But, gentlemen, when you have responded to the toast of your city on every occasion through a single term, whatever ambition you may have to serve the city a second term, you certainly could wish that at public dinners that toast might be eliminated. (Laughter). I shall not, therefore, dilate on this subject this evening, for indeed, in attempting to do justice to the city of Brooklyn in a single evening would be an impossible task. On great occasions the city of Brooklyn speaks for herself. Nevertheless I do feel to-night like acknowledging the compliment that was implied by hailing us as a sister city, for in view of what took place last week we must be one of the graces. I believe there are three graces altogether: New York being one and Brooklyn the second, and I have a little doubt in my mind whether the third is Long Island City or Jersey City. (Laughter). I rather incline to the latter, partly because I believe the President of the Jewelers' Association is a Jerseyman.

I am not well enough up in the jewelers' art to make such touching allusions to what it can do, as the gentleman who responded to the toast of the President of the United States, but I am reminded of a singular mistake that Providence or some other cause has made when I reflect that Brooklyn is the headquarters admittedly of the sugar industry, of the oil industry and of other businesses, and I have wondered why it is that the jewelers' art does not also find its home in Brooklyn. I only know, though, that we have the heart of the trade there, (Laughter and applause) and I suppose that we ought not to begrudge to the city of New York the head, or even the city of Newark where, I understand, the real head for the moment does reside. (Laughter). I thank you, gentlemen, cordially for your courtesy and for your dinner, and I wish to the Jewelers' Association all prosperity.

MR. APPLETON—Gentlemen, I ask you to give your intention to the next regular toast:

*"Our Western States."*

This will be responded to by a western man who was born and bread in the Hoosier State, and I will be very glad to follow the suggestions made on this memorandum and call upon a very old friend of ours; we are always glad to see him; I refer to the Honorable Algernon S. Sullivan.

Mr. Sullivan was received with repeated cheers and spoke to the toast as follows:

ADDRESS OF ALGERNON S. SULLIVAN.

*Gentlemen:*

You must not take up too much of my time. I understand we have been allowed only seven minutes to speak, and Mr. Depew used up the time that was to be divided between the rest of us.

I want at once in responding to this toast, while Mr. Alling is absent from the room, to make a special response which I think that he had in view in framing that toast, and for which I am not sorry he intended to apply to me. I wish to speak to you as his neighbors in trade about him. Mr. Alling and I were born in the little Hoosier village, Madison, Indiana. I am one of those who always intend to carry a western heart until it is laid away cold, (Applause) and for one reason, and that is, that I wonder if there is a place in the world in which the attachments are more lasting than were the attachments that were formed between the boys who were schoolmates and friends in that region in which we were born, which was then more decidedly frontier than it is to-day at any points between here and the Pacific shore. I am glad to recall to-night the vision of the little square brick house at the end of what was called Main street in a little village, prettily situated at the end of a high hill, where she, whom everybody admired, whom everybody respected and loved for all the virtues that adorn womanhood, whom everybody esteemed for that which was a perfect example of the Christian widow, such qualities were associated with the name of Mrs. Alling, the mother of your President. (Applause). There is no tradition of that little town that is cherished with more pleasure than the recollection of that little home and the life of that pure widow, with her noble struggles to rear a large family of little children. That is the image of that little Alling home, and it was with great delight when I received this toast to know that it had been prompted by the friend of my boyhood. He has encouraged and cherished those principles taught him that make fine men and useful citizens. This is a tribute that has come from the heart of one who is happy and proud to speak of Mr. Alling as his life-long friend. (Applause).

The toasts that have been given has brought to mind necessarily again the subject which all of us have been so anxious to forget, and singularly enough the President and the Mayor came first in the arrangement of toasts, and you may not be able at once to see why and how, and it is my privilege to tell you. It has come about that every mayor now in the United States expects by natural progression to come next to the governorship and next to the Presidency, especially the reform mayors (Laughter at Mayor Low's expense); especially those who recognize thoroughly and believe in civil service reform, and especially those who have tact and a knowledge of human nature. Now, Mr. President and gentlemen, in referring to the presidential subject, it was just as well if my friend, Mr. Depew, had recognized that the real source of the exultation with some of us—what I believe after all is the sober satisfaction, and contentment, and placidity which is settling down upon all the community—is that there was a desire to have that which was promised—a redemption of promises to the country. Nothing that can be said on an occasion like this can be understood more than the views that within the limits of good taste and pleasantry serve to show good fellowship after a period of great excitement. One thing I say has been demonstrated, and that is, whatever has been promised must and will be fulfilled to the people of the United States or else they will know the reason why, and we understand now that whatever has been promised must be fulfilled, or else there will come wisely, and properly, and justly, a day of recompense and a day of change again. (Applause). For one I can say that if the promise be not fulfilled, if the hope be not realized, then it must not long be when the change shall come again. (Continued applause). Now, we all know that it is very easy to make promises, and a great many promises are made that after all are not made by those who have the intention or power to fulfill them. I am reminded while I say that about an anecdote told by a friend of mine who, having been a planter and owned a plantation, when slavery was abolished, called his slaves together and said to them: "Let us occupy this land together, cultivate it and divide the profits." He told me that one day going out from his house and passing down by a cabin toward the woods, when he came near to a lane, he saw a colored woman coming and carrying on her head what he thought was a bundle of firewood that sank her down under its weight. And just when he was about to meet her he saw another colored woman, and when the two girls came within reach, one said to the other: "Dam you nigger! who tole you to fetch dat iron frum de cabin." And the other retorted, "O, de Lord! woman, Massa Depew tole me." "Why, you fool nigger," said the first, "dun you know Massa Depew can't be trusted." (Laughter). Now, the lesson is, that we must have promises only from the mouths of those who can be relied upon.

The last time I saw the jewelers was not at dinner. I heard the reverend

neighbor on my right remark upon the very fine appearance of the jewelers here to-night. (Laughter). He, perhaps, did not have the pleasure of seeing them as I saw them last. Gilmore's band was at their head, and as they marched along in the great procession they were the admiration of all. Every window on Broadway was occupied by handsome women. Flags were flying and hands were clapping; and the best looking fellows, the most smiling, the most obstreperous and deliciously noisy section of the grand procession that moved up Broadway, New York, several days ago, was the jewelers. The coroners have been busy holding inquests ever since over the fair women that were smitten, and who could not get down to the street fast enough to where the jewelers were. (Laughter and applause). It seems to me in that procession on that bright afternoon that they were so numerous, and they were all carrying their consciences with them, and I never so frantically saluted by elevating my hat as I did on that occasion. (Applause).

I hope, gentlemen, that it will at some time be a pleasure to you as great as it has been to me to-night, to join in festive assemblies with your own trade or others, and that you will have the fortune of meeting with old friends so that everything shall recall to you the pleasant, the happy days of your boyhood as it has to me to-night.

MR. APPLETON—I find put down for the next regular toast the following:

*"Our Friends who have honored us with their presence this evening."*

It used to be said that you cannot get along without clergymen. Some of us have thought lately that we could have gotten along just as well without them, (Laughter) but we must consider that as something out of the ordinary course of things, and resume the old notion, especially as this evening we have with us one who is discreet as well as learned and eloquent, and I am sure, while he will instruct and entertain us, will not make any trouble. I have the pleasure of calling upon the Rev. Dr. Rylance. (Applause).

Dr. Rylance responded:

ADDRESS OF THE REV. J. H. RYLANCE, D. D.

*Mr. Chairman and Gentlemen:*

If the process of subtraction has been going on since Mr. Sullivan began there cannot be more than a few moments left for me to speak. I can only have about two minutes. It was I that uttered the reflection privately—it was I who made the observation as to the beautiful and healthy men before me. You cannot make much of men who are not physically strong. There must be health as a substratum for work.

When I received your invitation to come and be one of your company, I hesitated for a moment because I belong to the orthodox calling of my profession (though the *Saturday Review* has recently taken me to task because of my loose sentiments), but I am orthodox enough to have scruples about departing from apostolic revelation, and my orthodox instruction embraces this: that women should not decorate themselves with gold, and when I received your invitation and thought of this, I said to myself: How can parsons reconcile themselves with jewelers—reconcile the instructions of St. Peter with the temptations offered by jewelers for women to do this? Well, of course, I have managed to reason around that by remembering that historic christianity has a great deal that was time-serving; that is to say, things that were wise and prudent and fitted for the time and occasion. For you remember what restraints were placed on christian women in the early days of christianity. Long ago it was necessary for christian women to separate themselves visibly from the world; from all contact with the womanhood of that time, and you will see that there was good occasion for christian women to be advised thus visibly by these outward signs and tokens to separate themselves from the women at that time. But their christianity had to work its way in the world. It had to do a great deal of these things and so the time came afterward when it was safe and proper enough for a christian woman to deck herself with gold and fine wearing apparel. So I found no difficulty in coming before you to-night. I remember in that same Book of divine spiritual directions to which I have referred, there is one earlier than St. Peter spoken of, Bezaleel by name, who was divinely inspired to be a worker in fine gold. I believe that inspiration of Bezaleel was a divine inspiration, upon the principle that every good and perfect gift comes from the Lord, and Bezaleel's gift to work in precious metals was a divine gift. And you who have carried on that work have bettered civilization and have become benefactors of mankind. You have enabled husbands to make nice and pleasant presents to their wives, and you have beautified the homes of all of us and made life easier and brighter. (Applause.)

MR. APPLETON—My friends, the next regular toast that I think our President has designated is:

*"Our National Character."*

When I met Judge Davis here to-night first, I said that he seemed to occupy a sort of parental supervision over the New York Jewelers' Association. And I am sure that whatever position he does occupy, towards you all, it is one of kindly good feeling on his part, and I know that that is responded to on your part by affectionate regard and a very high respect for him individually and for the high official position which he holds. On this toast, "Our National Character," you will be very glad to hear from our old friend, the Honorable Noah Davis.

Judge Davis was received with applause and said:

ADDRESS OF CHIEF JUSTICE NOAH DAVIS.

*Mr. President and Gentlemen:*

I acknowledge that I am old but I am not old enough to occupy much of your time to-night. I have but one minute to speak according to the calendar of the reverend gentleman that has just sat down, and I shall spend but a very few moments in alluding to the text that has been given to me. Texts and toasts are fitly represented by those little signs that you see about the park: "Keep off the grass." No man at these assemblages is expected to speak of the subject given to him. The President told me that my subject should be the American citizen, and I have been contemplating that subject, when I have been suddenly capped and handicapped by another toast: The American Character. After the remarks of Mr. Depew, there is certainly very little opportunity for me to speak of the American character. Of the American citizen I could have said something, because I could have adopted Sam Slick's opinion, which he applied to society. He said society was like a barrel of meat; always bad at the top and bottom, but sweet in the middle. The American character is dependent upon the American citizenship, and American citizenship must depend upon the character of American citizens.

You have noticed that all the speakers so far have been depressed by the condition of things existing just at this moment. We have passed through the most extraordinary canvass that the country has ever witnessed—extraordinary in the manner in which it has been conducted, extraordinary in its personal assaults upon character, extraordinary in the abandonment of discussion of principle, and in the devotion of each party to an attempt to destroy, if possible, the character of its opponents. Now, to a stranger coming from the old world and coming in our midst, what an extraordinary spectacle this has been. If he were a wise man, if a philanthropist, if he were seeking to find here an elevated class of men, seeking to find those who have been made free and were equal to the great duties which were imposed upon them, what sort of an idea would he have of us? What would be his idea of American citizenship and American character. The great trouble with us is that we suffer our passions to carry away our judgments until we overleap our good judgment. We, most of us, know that we have not shown to the world that the American character is truly equal to the duties—the great and important duties and responsibilities that devolve upon it, by the fact that America alone chooses for itself, by the voice of its own people, not only its form of government, but all its citizens themselves who are supposed to be most able to carry on its government for them. Now with these few remarks I proceed to say that no one has any right to derive from the excitement of the hour any estimate whatever of the true American character. I will say this right here of the candidate I supported that I think that he has been most unjustly scandalized. I think that in the conduct of his canvass, during his entire progress through the country, in which he addressed his fellow-citizens in four hundred speeches, he has shown great ability to discuss principle and a desire to avoid personality, with careful discrimination that nothing be said of his opponent. I say that he has shown that capacity beyond that of any candidate whom I have ever known. (Applause). On the other hand, I will say here to-night of the other candidate who has been chosen by the voice of the people (Applause), he I have known longer than I have known Mr. Blaine; he I, as Presiding Judge in Western New York, admitted to the bar many years ago, and he I knew as a practicing lawyer in courts held by myself, and he I have known since I came to this city, but not intimately—that although there had been in his career an unfortunate lapse from virtue, though with that signal and unfortunate incident that has been talked about in a manner not creditable to any one—with that single exception his career has shown him to be a fair average sample of good American citizenship. (Repeated applause). In the high office which he now holds he has

exhibited a capacity which may be reasonably anticipated to make him a good and capable President of the United States. (Continued applause).

The present incumbent of that high office, our own fellow-citizen, General Arthur, who was appointed under circumstances most trying in character, a man of respectable character, by the nature of a firm desire to be just and do right and discharge the duties of any position to which he may be called; he has shown how such a man may grow in such a great place as the Presidency of the United States and fill that office with high honor and win the confidence and the respect of the whole country. (Applause).

If I had any wish in my heart in respect to Grover Cleveland, as sincerely as I believed that it was best that he should not be elected, I say if I have any thought or feeling in my heart against him, I hope it may be crushed out. I am willing to concede to him every possible opportunity for the fullest and fairest trial. I desire him, now that he is elected to the Presidency, to take his seat. May the day never come when the free North shall hesitate to see to it that the voice of the people, as expressed in favor of any nominee, shall be fully regarded by placing him in the office to which he is elected. (Applause, and "Three cheers for Grover Cleveland").

And now that the election is settled, and now that it is determined that Mr. Cleveland has been elected to the Presidency, we have but one duty before us. He ceases under our Constitution to be a President of a faction or of a party, and of any single portion of the people, for he becomes the President of the United States, representing in that high vocation all the people in the United States, independent of party attachments and party ties. (Applause). I desire, therefore, to express the hope that however we may have felt hitherto, however more ardently we may have desired Mr. Blaine to be President, every one of us, looking solely at results which have placed another there, should not hesitate, should not fail to give him that cordial and hearty support in obedience to the law and Constitution for the great and general interest of the country, that we would have given to our own candidate. And that is the true duty and should be the true nature of American citizens; that is, to obey the obligations imposed upon us by the community into which we have entered for the general and common good.

My fellow-citizens, you will pardon me for having made these allusions which may be regarded in some respects as political, but now, as the contest is over, that, according to the laws and forms of our written Constitution, by the voice of the majority of the people, a certain candidate has been selected for the Presidency, now, we have but one duty, and that duty is to uphold the Constitution and the laws, by yielding that measure of obedience and support to the President of the United States that we would want our candidate to have; that we would have demanded from our fellow-citizens if Mr. Blaine had been elected. I know that there is, on the part of many, great despondency, and it may be thought that it will be disastrous to business interests. That depends largely, not upon the President, but upon ourselves. (Applause). If we, who think that the country is likely to be injured by the change, as soon as the change has come, if we remember ourselves to perform our duty and lift up and elevate the country, place our shoulders under business, shaking off despondency and devote ourselves to the affairs of our private interests; if we do that, just as earnestly and as fully as if Mr. Blaine had been elected, you will see all clouds disappear from the horizon. The people of America are equal to meet and forget any disaster. No nation on earth has ever proved that, in such hours of triumph, after disaster as we, when war came upon us, when disaster after disaster befell us, when we of the North were struggling to maintain the Constitution and the government, when we were seeking, not mere triumphs of victory, but the re-establishment of the great and universal government given us by our fathers; what hours of despondency befell us then, at times when all seemed dark and dismal, and yet through all, the American people, the great people of the North, the common folk of the country, stood under the Constitution, bearing it upon their strong shoulders, bearing it from the field of blood to final victory, and restoring the nation to a power greater, more universally free by far than it had ever been before. The same spirit ought to animate us now. Let us not forget that we are alive, fellow Republicans; if we are disappointed in our hopes and wishes, we must remember that we are a part of the country still and be subject to its obligations and duties, and our aim should be to maintain America as pure and as free as ever before when its flag has flown in its greatest hour of trial. (Three cheers were given for Judge Davis and three cheers for Grover Cleveland, the next President of the United States).

MR. APPLETON—The next regular toast is:

*"The City of Brotherly Love."*

In introducing the next gentleman who is to respond to this toast, I will read what I find written on the memorandum of your President: "We have with us a guest, one of her representative men, who will speak for her, and in introducing him I ask to say, that although born in South Carolina and graduated at West Point, when the dark days of twenty odd years ago had fallen on our country, he never swerved from his allegiance, but fought through the whole conflict and now bears the honorable scars received in many battles, and still has vitality enough to answer when called on." I have now the pleasure of introducing to you Colonel Charles H. Gibson.

Colonel Gibson was welcomed with three chairs and responded as follows:

ADDRESS OF COLONEL CHARLES H. GIBSON.

*Mr. President and Gentlemen:*

If there be any truth in arithmetic there is no time left for me, and I am very glad of it. When I accepted the invitation of your society to dine with you, I had no idea that you intended to apply to me the principle of no song no supper, and for a very good dinner compel me, in grateful return, to give a very poor speech. On the contrary, your invitation aroused in me expectation or hopes—I cannot say expectation—what I now see are never to be realized. From my earliest childhood I have always looked upon the jewelers, and especially manufacturing jewelers, with feelings somewhat akin to awe and which I can now scarcely describe. To my youthful imagination they seemed to be the few, the privileged few, destined by benign fate to be the guardians of the whole world—to be the men who were to replace and perform the functions of the mighty magicians of old, to be able to call the pearl from the depth of the sea and the gem from the bowels of the earth; that their eyes first beheld, their hands first grasped, and, more particularly, distributed the priceless treasures of the land and sea. And so deeply was that impression imprinted on my mind, that when I sat down to-night I more than half expected that your President would offer me pearls with my oysters, sapphires with my soup, rubies with the roast and diamonds with the dessert. I had fondly dreamed that he would imitate that gorgeous East whose richest man poured on her kings barbaric pearls and gold, and I was waiting for the showers. If he had given to me that as an illustration, that as a beautiful illustration of brotherly love, my memory would have locked it up in the innermost cells of her heart and thrown away the key. But, alas! the baseless fabric of this vision, as like your once substantial dinner, faded and left not a rag behind, Shakespeare with variations. But that has nothing to do with my theme, and I will endeavor to liquidate the debt. I am called upon to respond to the toast of the City of Brotherly Love. It is a great misfortune that your President did not warn me in time that I should respond to this toast. Had I known before I left my home that such was to be the case, I would have provided myself with accurate copies of the original grant given by King Charles to William Penn, and with an accurate copy of all the records of the Historical Society of Pennsylvania, of which I have the honor to be a member, and with other incidental things regarding Philadelphia. Unfortunately I have not them with me, and my loss is your eternal gain, or words to that effect.

I have often thought that my venerable friend, William Penn, made a mistake, or at least was rather scant in liberality when he named the city of his finding. Mere brotherly love does not go far enough. It wants filling up and running out, so to speak, and had William only lived, I would have called that to his attention. But I think I can readily catch his idea in calling it the City of Brotherly Love—I can, as it were, penetrate the inner veil of his consciousness, as my friend Hamlet would say, and pluck out the heart of his history. The immense resources of William's intellect were concentrated upon traffic with the aborigines under that admirable rule of trade which prevails to the present day, and is known well to the manufacturing jewelers, to get all you can and give as little for it as possible in exchange. (Laughter). For the rich possessions of hill and valley, field and forest, William proposed to give to the Indians a few beads and baubles and other simple trifles, and a great deal of brotherly love—a sort of stock but little known to the benighted heathen, seldom quoted on the market. William passed it on them for its face value and the Indians were content for a while. It was as a memento of the successful dicker on his part, and all the profit lay on his side of the account and the loss on their side of the account, and he named his city Brotherly Love. He had a great deal of love for their lands and they had a great deal of love for him at that day. Now, what I want to draw your attention to is this: the inadequacy of the total brotherly love to Philadelphia. It would have struck any of you that sisterly love was a more valuable asset. Is there any one of you that has

not felt in his heart that fluttering produced by the rapture that he had love for some other brother's sister, and who, under the circumstances, could be satisfied if that other fellow's sister offered him in return only a brotherly love. I say the other fellow's sister could not give to this fellow a brotherly love, and, of course, the first fellow's sister did not want this other fellow's sister to give him even a sisterly love. The impression that I want to convey to your mind is simply this: that William Penn should have developed this idea of mine and incorporated it in the name of his city. The time is coming, and very soon, when women will be recognized and placed in the sphere to which she properly belongs, and Belva Lockwood has opened the way. And why not? What does not man owe to woman? In the beautiful language of the poet:

Who taught our infant lips to pray?  
 Who taught our infant feet to stray?  
 Who pulled us through the milky way?  
 Who spanked our bottom every day?  
 Further the poet does not say. (Laughter).

But it was woman, lovely woman. But this is wandering from my subject. My toast is the City of Brotherly Love. Philadelphia possesses many advantages never dreamed of by William Penn in his dreamiest dream, if I may be allowed the expression. Conveniently situated, midway between the cities of New York and Baltimore, she furnishes admirable shopping facilities for the residents of both of those cities, with stores whose magnificence William Penn never lived to realize. The Delaware river separates her from the opposite shores of new Spain, and furnishes an effectual barrier to the invasion of Jersey mosquitoes. (Laughter). The Schuylkill River furnishes her with an inexhaustible supply of water able and willing to cope with any East river or Hudson river for possessing micro. And I will leave it to any scientist to dwell upon the wealth of its infusoria in quality of richness.

Philadelphia is a city of homes, not the flats and sharps of New York, but houses complete in themselves from cellar to roof, from turret to foundation stone. She has homes for the rich and homes for the poor; aye, and for the criminal she has houses of refuge and correction. It was not of her, however, the sacred poet sang, "Hark, from the tomb a doleful sound," but of another American city well known to you. Our criminals walk in the best criminal circles. Our burglars burgle with elegance and despatch. Our pickpockets pick with politeness. Our policemen club with civility. Philadelphia has more pure politicians, more moral ministers, more quake in her Quakers—well, more in her than any other city within a radius of five miles. Hers is a realm of pure delight. Sorrow sits lightly upon her. There quietude prevails and not unseemly riot. Her matrons and maidens are virtuous. Her sires and scions are brimming over with love, a love that extends to her sisters, and her cousins, and her aunts. (Laughter). I do not know why I should dilate upon this theme. You would not have me tuck the robes or paint the lily. Suffice it for you to know that I reside in Philadelphia, and right here when I see before me some familiar Philadelphia faces, and some of them anxious to put in a word for their city, I want it distinctly understood in the presence of those gentlemen and in the presence of any representatives of the press who may be here, that by my speech to Philadelphia I am putting in a very strong bid for the mayoralty of that city. If I get to be mayor I will rest content. If chance will have me President, chance may elect me and that is all. (Laughter and applause).

MR. APPLETON—And now, gentlemen, the next regular toast, and I am sorry to say, the last, reads:

*"Art as exemplified in the various callings represented in our Association."*

And I have the pleasure and satisfaction of introducing to you to answer to this toast, Mr. J. Seaver Page.

Mr. Page was applauded as he arose, and responded to the toast as follows.

ADDRESS OF J. SEAVER PAGE.

*Mr. President and Gentlemen:*

You will admit that this is a very dangerous predicament that I find myself in. To make a speech to-night after you have heard such brilliant things from all quarters of the globe, and to find one's self here at last to go through and pick up the scraps is an undertaking that falls to my lot. I remember in "Patience," in a part of the opera, the æsthetic apostle sings "hollow! hollow! hollow!" and some one steps in and asks the pretty maiden "Are you hollow?" and she says, "No, I thank you, I have dined." That is my condition, and I find myself too full to get anything off. I could

wish myself in the condition of woman, wherein, this is required of an orator, viz., a quick conception and an easy deliverance, (Laughter) and I wish that I had that acquirement, because I never felt so anxious as I stand before cultivated and polished gentlemen without the slightest evidence of a speech in my head, and try to work one off before you.

I feel like the medical student who was asked by the professor: "Sir," said he, "suppose a man fell down a well ninety feet deep and fractured his collar bone, what treatment would you give?" "Why, bless my soul, I would go and get a few Irishmen and a load of stones and fill the well up." And that is the way that I feel now, ninety feet deep and the want of some Irishmen and a load of stones to cover me up. Or like the Irishman, who, walking along with a friend, saw a bull in a field and said: "Howld on, Jim, a minute, till I tackle the bull." The result was a very short story. He was very soon landed. But he jumped up after a while and said: "Well, begorra, I am glad that I had me laugh first." I feel to-night that I have had the laugh first, and it is a very difficult undertaking to make the last plunge.

You will allow me to-night to just use one little scrap from one of the speakers before me, wherein he alluded to the American character. If you have noticed, there is a very peculiar sandwich in the order of the speakers here to-night. For some reason we are in the order of Democratic and Republican following, and each somehow or other says something clever of the other side, and I cannot help saying something myself. There is one thing which strikes me very peculiarly, which I am glad to see, that whether Democratic or Republican, however trying, however exhausting this canvass, however it aroused the passions, here within five or seven days of election, and what is the result? You have heard one of the greatest, one of the most splendid of our orators speak here to-night. He spoke about our cause beautifully, and what have you seen? A perfect, quiet, beautiful acceptance of the result, and you will find in me one quite willing to second it. However earnest, however hearty, however eager I was that my candidate should be borne to the front, I am to-day just as hearty, and just as zealous in wishing all success and honor to the future President of the United States. (Cheers for Mr. Cleveland and Mr. Page). It is one of those phases of the American character which I feel is fitting and proper to call into service just now. I remember talking with an Englishman recently who was discussing the way we conduct our canvass over here. He said: "I am very much surprised how your people seem so ready to say ugly and unclever things about your candidates, and yet so anxious and eager to say good things about him after the election. In your country I have witnessed the grandest triumph on the part of politics. I have witnessed the most evenly balanced contest, and yet, within seven days of the contest, and all is peace and quietude. The people of a country that can so easily forget their trials and animosities have no doubt a great future, and I congratulate you, my dear fellow, upon this handsome phase of American character."

Now, gentlemen, I said that I had no speech, and indeed I have none. (Cries: "Keep right on." "Give us a recitation"). It is always so easy for one to fall into a recitation line, and as you all seem to be in good humor, where each and every one is accepted with that toleration and gracefulness, it will be my pleasure, after I have finished what I have to say, to give you a recitation. (Applause). I want to just carry a thought further, to say that there is one further lesson that we ought to hold uppermost just now. There is one thing that we cannot learn too often, namely, that after all, America depends upon our stalwart men for her success. There has been a very beautiful truth uttered by Goldsmith long years ago, and which looked, perhaps, into the future of England, but we will make the application ourselves:

"Ill fares the land, to hastening ills a prey,  
 Where wealth accumulates and men decay;  
 Princes may flourish and may fade,  
 A breath may make them, as a breath has made;  
 But a bold peasantry, when once destroyed,  
 Can never be supplied."

Though the clouds may lower, though we may have depression on hand at the moment, we may see our country like some "eternal sunshine settled on its head." And I may truly say that the lesson of the hour is that though the clouds may lower around us at the moment, I have great hope in the future of the country, for the sunshine may be shining on the top.

Now, gentlemen, I have spoken to you longer than I intended. (Cries to go on and for a recitation). If you will allow me just one more thought, for it occurs to me while I am standing here—will you allow me to say one thing slightly unpleasant. There is one thing that I think, perhaps, that I can bring home to you, that each and every one of you—and I address you purely as Americans—will feel a somewhat sense of humiliation to know

that it has not been carried out. I allude to the fact that at our doors is knocking for the moment a great Statue of Liberty, a Statue of Liberty that is offered by France. We are to-day celebrating the great battle of Monmouth, and the State of New Jersey is alive with excitement, and all its people are gathered about Freehold. The battle of Monmouth is upon our lips to-day. At this moment should not some patriotic sentiment cause a thrill to go through the American heart to the memory of the French people in that great struggle through which we passed? Is it necessary to bring up the sufferings of Valley Forge? Is it necessary to call to your attention the fact that in the hour of our greatest need the French people offered us arms? Is it necessary to call to you in this moment in words of patriotic appeal to stimulate you? Do we offer to them a statue? No, but the people that fought with us, that gave their lives for us and for the cause of liberty, have signaled that act by presenting you with a statue to decorate your New York harbor. And how do you Americans receive it? Coldly, blandly, indifferent. It is not anyone's duty, it is everyone's to be stirred up. It is not Democratic or Republican, but every one to be thrilled with an eager enthusiasm to do what he can to save the national disgrace—to save a blot upon the American character. The French people who have contributed to give it have not millions. It was not received from the rich men of France, but from the peasants and people of the provinces, this magnificent statue is knocking at your doors, begging you to receive it and present only the pedestal upon which to receive it. It is no tribute to American character to be thus indifferent. What has been done here to the memory of Lafayette? We have a statue placed here in our Union Square and on the right and on the left the two great apostles of liberty; on the left the statue of Washington—for him you cannot find marble and gold enough on which to write his name—and on the right the great defender of the cause of liberty, who gave his life for the Government, uttering those beautiful words, "with malice toward none, with charity to all." And in the center you have placed Lafayette, the great triumvirate of liberty, honoring him, as you do, as an American and a Frenchman. And yet when the cause of liberty presents you with a memorial statue and begs you to receive it, how do you do it? Ah! gentlemen, I am sorry to spoil this beautiful phase of American character, but I am reminded that it is high time that something should be done, and we must improve every opportunity to call Americans to account for their lack of patriotism in this respect. Let us see that we will have it no longer. Let us see that the memory of Lafayette and Rochambeau is still fresh, and we will do our part to save it from disgrace. A great Frenchman once said about certain wine: "You will find in this wine-growing district that there is a scum upon the surface of the wine, and there are dregs at the bottom, but in the great interior you will find the pure wine." And so I hope that in America, among the great middle men, among the heart of the people, you find the strength and the growth of the American Republic. And so I appeal to you to say let this utterance be prophetic that among the great middle men you do find the strength of the American Republic, and when you appeal to them that you will find them responsive to every patriotic duty. (Continued applause).

In response to the repeated calls of the audience Mr. Page then delivered an amusing dialect recitation about the "Fifteenth Annual Session of the Society for the Distribution of Blankets and Top-Boots to the Cannibal Islands."

Mr. George C. White, Jr., to whose place it properly fell to occupy the presiding chair in the absence of the President, but who, with characteristic modesty induced ex-President Appleton to take the President's place during the evening, arose, and having humorously alluded to the difficulties and trials involved in presiding over the Vice-President's table, proceeded to say:

ADDRESS OF VICE-PRESIDENT WHITE.

We have another toast which has been overlooked. We have to thank our able ex-President for having kindly taken the place to-night which Mr. Alling was so unfortunately obliged to vacate. You have heard from the clergy, you have heard from the bench, you have heard from the bar, you have heard from a twenty-four karat mayor, and you have heard from other gentlemen, but we have not heard anything from a President, although we have heard a great deal about Presidents. This is our tin wedding—our tenth anniversary. Our venerable ex-President, Mr. Baldwin, wrote us a very pretty note of regret, and I will ask you, gentlemen, to fill your glasses to our ex-Presidents, and I will ask our respected ex-President, Mr. Appleton, to dismiss us with his blessing, after which, to invite you all or as many of you as see fit, to sing "Auld Lang Syne," and to come here again one year from to-day. Always elected unanimously and no doubt about the returns. (Applause).

Ex-President Appleton responded:

ADDRESS OF EX-PRESIDENT DANIEL F. APPLETON.

*Gentlemen and Fellow Members of the New York Jewelers' Association:*

As I arise to resume the duties of presiding officer here, I am embarrassed and almost overwhelmed by the consciousness that I am under the eye of the gentleman who last took his seat, and remembering the model presiding officer which he has presented to us with so much ability, and so much grace, and so much to our entertainment. I am not the only ex-President here to-night, and I do not know why I should be called upon to answer to your toast. Your Vice-President, who should have filled this place to-night, has said that there was one of the toasts—the last toast—which I had overlooked. Your President overlooked the toast and overlooked me, for I had no notice of it. As an ex-President of this Association I have very little to say. I greet you, my old constituents, I thank you very much for responding to the call of your Vice-President, Mr. White. Long ago laid up on the shelf, I have but the pleasantest recollections of my associations with you as a member of this Association, as one connected with your business in active life, and as one having had many business relations with you, all perfectly satisfactory to you in every respect. I feel that I was honored as your President. But I was about to talk to you as Mr. Page described in his recitation of the Chairman of the Society for the Distribution of Blankets and Top-Boots to the Cannibal Islands. I thank you very much for the honor that you have given me, and I know that you all join with me in regretting the unfortunate occurrence that prevented your President being with us in the latter part of the evening. He is a gentleman whom you all know well. You chose him as your President, well knowing that in all respects in exercising supervision over all your affairs, he will acquit himself as well as, if not better, than his predecessors. I am quite sure that this illness of his is only temporary, and let us all hope that we shall see him better to-morrow, about his accustomed work. If anything else that I can say would express the regret which has placed me here, I would say that the Vice-President, Mr. White, was abundantly competent to fill this place, and should have filled it himself, but he declined to do so. May I not call upon Mr. David C. Dodd to make some remarks. (Applause).

Mr. Dodd's name was received with cheers and cries of "Dodd," "Dodd," and he responded as follows:

ADDRESS OF MR. DAVID C. DODD.

*Mr. President and Gentlemen:*

Now you are a pretty fine body of men, and I ask if it is fair and if it is honest, after listening for two hours or more to some of the most brilliant orators, to call upon me at this late hour to say a word as we are about to separate. (Laughter, and cries: "Perfectly honest," "Perfectly honest"). I think that it was one of the sweetest and best of Scotland's poets who said that man was made to mourn, and I thought, as we gathered here to-night, that I saw a tear in the eye of many of the members of our Association, meeting for the first time after the severe contest through which we have passed during the last few months, and yet I think that there is a hearty response on the part of every individual gathered here to-night—a hearty response, though it may be a little hard on the part of a great many of the American people, now that the battle has been fought and the question decided, to cheerfully, quietly and honorably submit to the decision of the American people.

I think that there is a sense of regret in the minds of the members present to-night in the fact that our esteemed President should be so afflicted by illness as to have been prevented to preside here on this occasion. To occupy the President's chair is a sort of test, I may say, to those who are not accustomed to meet with us around this social board—it is a sort of test as to the metal of the man, and we knew when we chose Mr. Alling as our President that he was fully competent to assume the responsibilities and meet the requirements of the Association. I know when I express this regret that I express simply the regret of every gentleman at these tables. (Applause). In a sense, we have lost our President through sickness, in another sense, some of us have lost our President for want of votes. (Laughter). In both cases, I suppose we submit to the overruling hand of Providence. But the nation and the Jewelers' Association will live, and I know that, as far as the President of this Association is concerned, the sentiment of his fellow members is that he shall preside here next year—we shall insist upon it on another occasion that he shall preside, and sick or well, we intend that he shall occupy the chair at our next annual dinner. (Applause). We are not usually in favor of third terms, and we elect some of our Presidents for two terms, but I think that we must have Mr. Alling for three terms so that we can insist that he shall occupy the chair at, at least, two annual dinners. No individual member can more sincerely be

trusted with the representation and honor of the Association to which we belong than Mr. Alling. We have listened with interest to the remarks of the gentleman who said this evening that he was long acquainted with Mr. Alling, and lived in the same town with him when they were boys in Indiana. Though I have not, perhaps, enjoyed so long an acquaintance with him, yet I have a right to say that among his friends, among those who know him well, there is no man more highly esteemed, and for whom a greater regard is entertained on the part of every business man with whom he comes in contact. (Applause). And in making these remarks, I do not intend by any means to detract in any sense from the ex-President, Mr. Appleton, who has presided, and who has so ably and so well represented him on this occasion. I think, sometimes, that we are a sort of mutual admiration society, but I know no other reason and no other measure of judgment that leads to this high opinion, which is entertained among the members of the Jewelers' Association for other members, than the simple fact that the rules of integrity and of business honor may be applied to them without fear of challenge or a question as to the result. And I know another thing. I know if you are not unanimous as to the remark I have just made, you are unanimous in the truth that you know where to go to get good dinners, and you know how to order them. Mr. President and gentlemen, I should not have trespassed on your time but for the simple purpose of paying a tribute to the President of our Association who has been compelled to absent himself, unfortunately, this evening. (Mr. Alling was here toasted, and three cheers were given him by the members). And finally, gentlemen, let us drink to the memory of one who has been with us on all former occasions of this sort, but whose face is missing to-night, whose familiar countenance we shall see no more. He was a warm friend of this Association and of its interests, and his genial face was known to us all. I propose that we drink in silence to the memory of Mr. Daniel H. Hopkinson, the late editor of THE JEWELERS' CIRCULAR.

After the toast had been drunk the company sang "Auld Lang Syne" in chorus, and was then dismissed.

Among the invited guests who were unable to be present at the annual dinner of the Association, letters of regret were received from the following named persons: Chester A. Arthur, President of the United States; Rev. John R. Paxton, Rev. William M. Taylor, Rev. John Hall, Rev. Robt. Collyer, Rev. Howard Crosby, Rev. Edward B. Coe, Rev. C. H. Parkhurst, Surrogate D. G. Rollins, Abram S. Hewitt, Judge Charles P. Daly, M. G. Baldwin, John R. Cravens, A. S. Keasby, Stewart L. Woodford, Otto Young, President of the Chicago Jewelers' Association; George Jones, Editor of the New York Times; Theodore Roosevelt, James H. Goldey and Rev. Winchester Donald.

### The Jewelers' League.

*President*, GILBERT T. WOGLOM.....Of Woglom & Miller.  
*First Vice-President*, WM. C. KIMBALL.....Of H. F. Barrows & Co.  
*Second Vice-President*, AUG. KURTZEBORN..Of L. Bauman Jewelry Co. St. Louis, Mo.  
*Third Vice-President*, JAMES P. SNOW.....Of G. & S. Owen & Co.  
*Fourth Vice-President*, HENRY HAYES.....Of Wheeler, Parsons & Hayes.  
*Secretary and Treasurer*, WILLIAM L. SEXTON.....Of Sexton & Cole.

#### EXECUTIVE COMMITTEE.

ROBERT A. JOHNSON, *Chairman*.....Of Colby & Johnson.  
 SAMUEL W. SAXTON.....Of Saxton, Smith & Co.  
 CLEMENT B. BISHOP.....Of Carrow, Bishop & Co.  
 JOSEPH B. BOWDEN.....Of J. B. Bowden & Co.  
 GEORGE R. HOWE.....Of Carter, Sloan & Co.  
 CHARLES G. LEWIS.....Of Randel, Baremore & Billings.

THE JEWELERS' CIRCULAR is the *exclusive* official paper of the Jewelers' League, and has been selected for the publication of all matters of interest pertaining thereto. Letters or inquiries pertinent to its business or purposes, and which might interest the trade or inquirers, will herein be answered. Address *Jewelers' League*, Box 3,444, P. O., New York, or the office of THE CIRCULAR.

At the regular monthly meeting of the Executive Committee of the Jewelers' League, held Nov. 7th, 1884, there were present Vice-Presidents Kimball and Snow, and Messrs. Johnson, Howe, Saxton, Bowden, Sexton and Dr. Wilbur.

Treasurer reported a balance in the General Fund of \$2,715.64.

One application was rejected.

Three were referred for investigation.

Six changes of beneficiary were granted.

The following 14 applicants were accepted:

P. Dunn, O. W. Maddaus, F. N. Reeve, C. H. Welch, N. Y. City, N. Y.; W. R. Barnes, Rochester, N. Y.; H. M. White, No. Attleboro, Mass.; J. J. Ehmann, T. H. Krementz, Newark, N. J.; C. F. Lauterbach, Petersburg, Va.; J. T. Gourley, Springfield, Ill.; S. B. Emmons, Mendon, Mich.; A. Travis, Jackson, Mich.; A. Eisenberg, M. Spiro, San Francisco, Cal.

There were also several notices of proposed changes in the Constitution to be acted upon at the Annual Meeting in January. These will be mentioned at length in our next month's paper.

### Our Providence Letter.

[FROM OUR SPECIAL CORRESPONDENT.]

**B**USINESS continues in a very depressed condition. There are not six factories in the city, to-day, working on full time, and there are none who employ their full complement of hands. This state of things bears heavily, not only on the manufacturers, but by reflex action, if I may use the expression, upon the whole of the business community. The manufacture of jewelry is the leading interest here, as the following statistics, which I have compiled from reliable data, will show :

There are 183 firms or individuals engaged in the business. They employ a capital of \$3,500,000, and give employment, when running on full time, to 7,000 persons, of whom one-fifth are females. The wages of the males range from \$4 to \$30, and the females from \$4 to \$10 per week. The aggregate amount of wages paid annually to these persons exceeds \$2,000,000. The production, when all the factories are in full operation, amounts to over \$6,000,000. Forty-seven firms manufacture gold goods, and the balance rolled gold and electro plate.

The glaring and unexpected failure of Dahlheimer alluded to in my last letter, has since been supplemented by those of Kopelowich Bros., of Syracuse, and Gowan H. Cragg, of New York City. It is some satisfaction, however, to know that these individuals have no prospect of getting a settlement, and stand a good chance of acquiring a practical insight into the working of some of our State institutions. An inspection of the books of one of these parties showed seven merchandise accounts aggregating about \$5,000 and purporting to have been settled a few weeks before failure, which on investigation showed that no such firms were, or (so far as could be ascertained) ever had been in existence.

The Jewelers' Board of Trade is now organized, and has published a Constitution and By-Laws. The officers consist of a President, two Vice-Presidents, Treasurer and Secretary, and the government is invested in a board of fifteen directors. Mr. Dooty Wilcox has been elected President, and Mr. Jno. McCloy, Treasurer. The Secretary is not as yet appointed. About fifty houses in Attleboro and here have signed the Constitution, but somehow or other things do not appear to work very smoothly; at all events but little progress towards getting into working order seems to have been made. Many of the old houses here have refrained from joining, because, as they say, they want to see clearly the line of action the Board of Directors will take, and also whom they will select as a secretary. The question of the secretaryship at the present time causes considerable feeling among those interested. The trade generally hold that on the ability of the secretary depends the existence, not to say the success, of the Board of Trade, and they are strongly in favor of employing some one thoroughly conversant with the trade and its credit, even if they have to pay a liberal salary for such services, while on the other hand some of the board of directors are understood to be in favor of employing a young, inexperienced man at a small salary. The folly of the latter course is so obvious that it

requires no comment, but I venture to prophesy that upon this issue depends the success or failure of the undertaking.

The firm of Godfrey & Gardiner dissolved by limitation on November 1st, and Mr. Gardiner retired. They are succeeded by Godfrey & Adams.

Hudson & Farnum are taking stock preparatory to a dissolution. Mr. Farnum will retire from the concern.

Mr. Keach, formerly of Keach & Price, has been appointed receiver for Lester & Chadwick, and will settle up their affairs.

The second concert of the season, given by the New England Manufacturing Jewelers' Association, is announced for the 29th inst. We notice that Mr. H. Holland, of Holland & Gosling, is billed to take part. Our friend Harry will find his efforts thoroughly appreciated by his Eastern friends.

ASMODEUS.

Providence, R. I., Nov. 15, 1884.

## A Review of the Experiments of the Old Masters of Horology.

*Continued from page 324.*

A TIMEPIECE with spring is frequently charged with such functions that the greatest uniformity of its motive power, and consequently its regularity of rate, becomes an indispensable condition, and in such a case it is absolutely necessary to employ a fusee. Nearly all chronometers are provided with such a contrivance, which, containing the principal wheel, transmits the power of the spring to the train. This fusee is in the shape of a truncated cone, and the spring imparts to its activity by means of a chain which winds and unwinds in a spiral-form groove cut upon the surface of the fusee. When the spring is wound it actuates upon the part of the fusee nearest to its axis, therefore, upon a short lever, gradually, however, as the spring, when uncoiling, loses its power or tension, it exerts its effects upon those parts of the fusee proportionally further removed from the axis, therefore, upon a longer lever. In this manner, it will be seen, that by duly making the shape of the fusee proportionate to the length of the operating lever and the decreasing power of the spring, it becomes possible to perfectly equalize the increasing loss of strength of the spring.

Experience has demonstrated, however, that it is not indispensably necessary to employ a fusee to make the rate of a good watch, for instance, a chronometer, uniform, and that the watchmaker can obtain very satisfactory results by employing the going barrel, which operates immediately upon the main pinion of the train. On account of its simplicity it offers great advantages, and the several defects almost impossible to be eradicated from the compound mechanism of the fusee and maintaining power, as well as the danger that the chain break, are thereby avoided.

It is possible to obtain an almost perfect uniformity with the help of going barrels, if the proportions of the watch are such that the barrel can be made as large as possible; because in this case it is possible to employ a very long spring with many coils around the core; if then only a few coils are used for the motion of the watch, it is obvious that the difference in the motive power, whether the watch is wound or whether it is run down, can never be very great, and, in proportion to the length of the mainspring, it is only very small. These long and flexible springs possess another advantage: They retain their elasticity better, and are less subject to breaking than strong and short springs, such as are generally used in watches with fusee. The latter property of a spring is very valuable, especially in chronometer, in which the breaking of the spring would be a serious detriment while on a voyage.

By the means indicated in the preceding it becomes possible to reduce the inequality in the motive power to a minimum quantity, although it will never be possible to eliminate it entirely. It is plain

that the spring must operate with more power when recently wound than when half way down, and that it diminishes in strength in ratio with the quantity it uncoils during the goings of the watch. This minute quantity of inequality in the motive power, however, has no influence upon the rate of a chronometer, if care is taken to render the balance spring isochronous, because the more or less large arcs of the balance vibrations will be performed in the same time and the rate of the watch will not be altered.

As far as the spring itself is concerned, it is essential that it be made of tough steel, not easily inclined to breaking and possessing the property of assuming a high degree of hardness, which is to be as uniform as possible. But this exertion of care lies with the manufacturer, and springs should be purchased only of parties who are willing to take the necessary care. Broad and feeble springs are preferable to narrow and strong, because the former are less subject to the danger of warping and wedging themselves in the barrel than narrow springs, and, consequently, they are less apt to rub against the bottom and cover of the barrel. It is also advisable to have the edges of the spring well rounded off and polished so as to lessen the friction in the barrel.

The spring must not rub during its unfolding in the barrel because this friction, which is not always equal, would continually alter the power of the spring; this is another point by which the manufacturer of springs can exhibit his skill.

We have seen some time ago that the isochronism of the balance spring can neutralize the effects of inequality of the propelling power of a watch. With astronomical clocks, this propelling power is always the same, but this invaluable property of the motive power does nevertheless not produce entirely the effects desired.

The frictions in a clock will augment after a time, be it either on account of the thickening of the oil or for other causes, and the restoring power periodically imparted to the pendulum will constantly diminish, and the oscillations of the pendulum become smaller in ratio with the increase of its frictions. The more or less large oscillations of a pendulum are not isochronous, and the small amplitudes will be accomplished in a shorter time than the large; consequently the pendulum oscillations will become faster in the same ratio as the restorative power imparted to the pendulum decreases, and the clock will gain.

This non-isochronism of the pendulum oscillations, therefore, is the reason that the unvarying uniformity of the motive power, obtained by the employment of weights, after all does not produce as much regularity as might be expected.

It would also be desirable that the quantity of the motive power of an astronomical clock could be increased in proportion with the resistance occasioned by the augmenting friction and thickening of the oil. In order to effect this, Jurgensen attached an empty cylinder to the running weight of his astronomical clocks, of the same size and form of the weight, into which he placed a grain of lead of suitable weight to increase the propelling power, for the purpose of sustaining the oscillations of the pendulum at the same amplitude.

It is requisite to provide an astronomical clock with a maintaining power for preserving its rate while it is being wound. This remark also applies to chronometers with fusee. We shall describe this mechanism farther on, and it would, therefore, be superfluous to enter into details at present. We will only state that the maintaining power causes a large increase of work, and that it is necessary to be very careful in making it if we wish to be correct in its functions.

When the going barrel is employed in chronometers in place of the fusee, the mechanism of the maintaining power is dispensed with, since a going barrel has the property of keeping the watch going while it is being wound. The endless cord formerly used might be employed in astronomical clocks, and the maintaining power for them would also be dispensed with in this manner.

It lies in the nature of the endless cord to keep the clock going while it is being wound. But it possesses many imperfections, and, in order to make the astronomical pendulum perfect, it is necessary

that the weight operate in the manner as indicated in the following, and that a maintaining power keep the clock in motion while it is being wound.

The following remarks on the above subject we condense from the work on horology, written in the French language, by the celebrated Mr. Jurgensen and issued in Copenhagen:

FIG. 22.

Fig. 22 shows a mainspring, as seen from above, and fig. 23 gives a side view. Fig. 24 represents the going barrel as contained in a watch without fusee. The outer end of the spring operates on a hook *a*, to which it is fastened by means of a square hole. Fig. 25 shows the barrel arbor, the ends of which move freely but without shake in the openings *c d* of the barrel. Fig. 26 shows the profile of the barrel, as well as the arbor,

which is fastened in the two plates; *b* is a ratchet or a steel wheel with inclined teeth, and *a* is a click bracing against the wheel teeth and thereby preventing its return motion. The click is by a spring

FIG. 23.

continuously pressed against the wheel; click, ratchet and spring are by themselves shown in figs. 27 and 28, and the several pieces together constitute the click work. The barrel is around its circumference provided with teeth, which

FIG. 24.

depth into the first pinion of the train. If we imagine the teeth of the barrel as retained by the just mentioned pinion, it will be seen that the spring can be wound, by revolving the arbor to the appropriate side, and that the spring will thereby coil around said arbor. The spring coiled in this manner will, by reason of its elasticity, seek to regain its

free condition, and it operates with its whole power on the barrel arbor as well as on the barrel itself. The arbor, which is prevented by the click work, remains motionless, and the whole power of the spring operates on the pinion depth into the barrel teeth, and communicates the power of the spring to the other wheel, as we shall see farther on.

FIG. 25.

Nor must the first coils of the spring act upon the train, because they exert a greater power than the last coils and the operation of the spring would thereby be made too irregular.

When we make the spring blade and the diameter of the barrel and barrel arbor of such a size that the spring, when wound, can be given seven coils, it suffices to protect it against breaking or yielding,

FIG. 26.

and to secure to it a satisfactory equality of power in its different

coils, by winding only five coils, so that two remain at rest; and again, of these five coils only two and one-half, or three at most, must act on the train. This is effected by a simple mechanism, to wit:

The stop work, which is contrived in such a manner that the male stop makes  $4\frac{3}{4}$  revolutions before the arbor comes to be stationary, because, by the first revolution of the male stop to the right, part 1 of the wheel advances by one tooth; by the second turn, part 2 advances; by the third, part 3; by the fourth, part 4; and before the fifth revolution is completed, the male stop remains on the outer circumference. If the female stop had one notch less, then the arbor could make only  $3\frac{3}{4}$  revolutions, and, if it had two notches less, then only  $2\frac{3}{4}$  revolutions. The number of these notches may therefore be increased or diminished at will, according to the number of revolutions which the barrel is intended to make. To prevent the feeblest two coils of the spring from operating on the train, the spring is wound two coils, after which the male stop is placed into action.

The danger that the spring lose its elasticity is lessened with the length and number of coils it makes in the barrel; because in such a condition more coils can be left at rest, and at the same time the spring can be wound sufficiently. The watchmaker must, therefore, try to make the barrel as large as possible. If we assume the barrel to be so large that the spring can make nine coils, and that at the same time two revolutions of the barrel suffice to sustain the going of the watch for the required length of time, it will be seen that the spring could be wound four turns, and that, together with the two revolutions necessary for the going of the watch, there would still be left three coils to serve as rest. In consequence of this arrangement the spring would actuate with an ever-equal power.

Going barrels are very suitable in watches for every day use, and although their springs do not act with the highest attainable regularity, still experience has demonstrated that these minute inequalities of power produce no irregularity of rate in watches with dead-beat escapement. Beside they possess the advantage that watches with such barrels when being wound keep on going, because, although the spring is wound at its inner end, it continues to act with its outer end on the barrel rim, and, therefore, it does not cease to exert its influence on the train.

It is indispensable that the spring be made of good steel, and that it be hardened as uniform as possible. It is also necessary that its blade be highly polished, in order to lessen the friction to which it is exposed when coiling or uncoiling. The spring must be uniformly broad and its edges be well rounded off, so that it neither injures the bottom nor the cover of the barrel, and that the friction becomes as gentle as possible. It is also advisable to use very broad springs, as this kind is less inclined to warp in the barrel than narrower ones, and, therefore, rub less on the bottom and cover of the barrel. The two ends of the spring must be annealed so that the holes can be more easily punched in them by which the spring is fastened, and to keep it from breaking at these places. In order to facilitate the fastening of the outer end in the barrel, and to avoid its bending at this place it is well to use a spring winder. When the spring is located in place, it must be slightly lubricated for the purpose of lessening the frictions of the coils.

A watch may be arranged in such a manner that in consequence of the peculiarity of the escapement, the greatest uniformity of the motive power becomes an essential factor in producing a regular rate. In chronometers, also, in whom even the most trifling sources of irregularity are to be avoided, uniformity of the motive power must be produced in the most careful manner. But to obtain that the operation upon the train become uniform, it is necessary to employ the fusee, bearing the first wheel for transporting the power of the spring upon the other portion of the train. This fusee has the form of a truncated cone, and the spring imparts to its effectiveness by means of a chain, which winds and unwinds in a spiral groove around the circumference of the fusee. When the spring is

wound, it actuates upon a part less distant from the axis of the fusee or upon a short lever; in the ratio, however, as the spring uncoils and loses its tension or power, it actuates upon a part farther removed from the axis of the fusee or upon a longer lever, so that if the fusee is constructed in correct proportions, a perfectly uniform action of the spring can be produced, even when it has almost lost its power.

Fig. 29 gives the upper view of the barrel which operates upon a fusee by means of a chain. *A* is the drum, *B* the fusee, *C* the chain

FIG. 29.

wrapped in the spiral groove around the fusee. Fig. 30 gives in profile the drum with the chain and fusee between the plates; *b b* is the barrel ratchet which is fastened upon its arbor, and *a* the click resisting the ratchet. This click work prevents the return motion of the arbor, and serves at the same time to coil the spring. The axis of the fusee ends in a square, as will be seen at *c*, and by means of

FIG. 30.

this square the fusee can be turned or the spring wound. The chain actuates upon the barrel through the hook seen in fig. 30, which is fastened in an opening at the circumference of the barrel; upon the fusee, however, by a hook which catches around a pin fastened in a notch in the first groove of the fusee. When the fusee is turned so that the chain unwinds from the barrel and winds upon the fusee the barrel revolves and the spring is wound, since the barrel arbor remains stationary (fig. 29). The fusee must be stopped, however, as soon as the whole length of the chain is wound upon it else it would break. This stoppage is effected by another very simple apparatus.

The fusee carries a wheel which seizes into the first pinion of the train, and thus communicates the power of the spring to the escapement as was said previously. This wheel will make as many revolutions as the chain has wraps around the fusee, and its motion will always be in the same direction. When the fusee is run down, that is, when the chain is run down, it must be wound again without disturbing the wheel. For this purpose a click work is located in the interior of the fusee which is arranged in such a manner that the spring may be wound without disturbing the wheel, and that after the winding of

FIG. 31.

the spring the wheel follows the direction of the fusee. The click of this click work is fastened in a recess made into the fusee, and the click, together with the spring that presses it against the ratchet, are fastened to the wheel. Fig. 32 represents the fusee with the ratchet; *b* is the axis around which the wheel, fig. 31, moves freely but without shake; the spring *c c c* presses against the click *b*, which braces itself against the teeth of the ratchet. The wheel is very easily pressed against the fusee by a ferrule, which is mounted with

FIG. 32.

friction upon the arbor or axis of the fusee down into the recess made in the wheel.

The shape of the fusee depends upon the spring and cannot be determined beforehand; it is rather difficult to effect that the power of the spring operate with the greatest possible regularity upon the train, and it can only be produced by experiments. While the spring is being wound it cannot operate upon the train, and in order to overcome this defect, a mechanism is used, which, by means of a maintaining power, acts during the ineffectiveness of the spring. We shall describe this mechanism at a future time.

(To be Continued.)

## Workshop Notes.

—Pencil drawings may be preserved by pouring over them, when stretched upon the drawing board, a thin solution of gum arabic or the white of an egg dissolved in dilute ammonia water by agitation with broken glass.

COLORING JEWELRY BY GALVANISM.—Fr. Weil has exhibited to the French Academy various articles of jewelry, which were colored by metallic layers deposited by electro-chemical processes. The colors have a great artistic value, and are very durable, resisting friction, moisture, sulphuretted hydrogen, vapors of ordinary illuminating gas and the action of light. Edmond Becquerel recalled the experiments of his father, in coloring metals by means of thin layers of oxide of lead and oxide of iron. He obtained very brilliant shades of various colors, and he found by increasing the thickness of the layers he could effectually protect metals from rust.

WOODEN MIRROR.—A French journal describes the Rubemick process of metalizing wood, as follows: The wood is first immersed for three or four days, according to its permeability, in a caustic alkaline lye (calcareous soda), at a temperature of from 75 to 90 degrees. From thence it passes directly into a bath of hydrosulphite of calcium, to which is added, after 24 or 36 hours, a concentrated solution of sulphur in caustic potash. The duration of this bath is about 48 hours and its temperature is from 35 to 50 degrees. Finally the wood is immersed for 30 or 50 hours in a hot solution, 35 to 50 degrees, of acetate of lead. This process, as may be seen, is a long one, but the results are surprising. The wood, thus prepared, after having undergone a proper drying at a moderate temperature, acquires under a burnisher of hard wood a polished surface, and assumes a very brilliant metallic luster. This luster is still further increased if the surface of the wood be first rubbed with a piece of lead, tin or zinc, and be afterward polished with a glass or porcelain burnisher. The wood thus assumes the appearance of a true metallic mirror, and is very solid and resistant.

CUTTING GLASS.—The following directions for the old process of cutting glass with a red hot iron are sometimes sold to the unwary as a great secret. The method is very simple, and to those who have failed with the recipes usually published (strings with turpentine and set on fire, friction with strings), the results are rather surprising. There is no difficulty in cutting off broken flasks so as to make dishes, or to carry a cut spirally round a long bottle, so as to cut it into the form of a corkscrew; and when so cut glass exhibits considerable elasticity, and the spiral may be elongated like a ringlet. The process, as has been said, is very simple. The iron rod (a common poker answers very well) should be made somewhat pointed, and the line along which the cut is to be made should be marked by chalk, or by pasting a thin strip of paper alongside of it; then make a file crack to commence the cut; apply the hot iron and a crack will start, and this crack will follow the iron wherever the operator chooses to lead it. In this way jars are easily made from old bottles, and broken vessels of different kinds may be cut up into new forms. Flat glass may also be cut into the most intricate and elegant forms.

## Trade Gossip.

C. G. Alford, of C. G. Alford & Co., has just returned from California.

J. Eugene Robert and family returned Nov. 11, in the steamer *Normandie*, from a seven months' sojourn abroad.

Bradford & Troughton, manufacturing jewelers, of Providence, having resolved to discontinue business, have gone into voluntary liquidation.

A. K. Sloan, of the firm of Carter, Sloan & Co., accompanied by his wife, has gone to the Pacific coast on a business trip. He will spend the month of December in San Francisco.

Albert Lorsch, dealer in precious and imitation stones, has opened an office at No. 179 Broad street, Providence, and is prepared to supply the trade with everything desired in his line.

On Wednesday, Nov. 19, B. S. Freeman, Jr., was married at North Attleboro to Miss Myra A. Ballou. The newly wedded couple received the hearty congratulation of hosts of friends.

Desire Bournique, one of the oldest watch case manufacturers in this country, died Nov. 19, at his residence, Milford, Pa. He was fifty-one years of age, and highly esteemed in the trade.

The American Watch Company will exhibit a full line of their goods at the New Orleans Exposition. These will be displayed in a most attractive manner, and will, no doubt, form one of the most popular features of the exhibition.

The itinerant vendors of presidential medals, badges and charms have, happily for the community, turned their attention to other things, and now devote their attention to jumping jacks, woolly dogs and other instruments of baby torture included in the list of holiday toys.

The Philadelphia *Press* says that the new variety of smelling bottle which the ladies are carrying this year is one of great utility. When not in use for smelling it can be pressed into service as a pickle jar or a celery glass. Some of the better developed ones are used with due effect as umbrella rests.

The Travelers' Protective Association met at Louisville, November 15. Legislation looking to the protection of drummers' interests was discussed, and several hotels in various cities were ordered to be boycotted. The next convention of the association will be held at Philadelphia during the last three days of June, 1885.

One of the latest French clocks is made of brass in perfect imitation of a lighthouse, having a revolving top. On the revolving part are two dials, one marking the time and the other being a barometer; between these are two thermometers. As the lighthouse revolves, first one and then the other dial is brought into view. It is an elegant design and as useful as ornamental.

Following in the footsteps of the New York jewelers, who have formed a mutual security alliance for the purpose of bringing to justice the burglars who may rob their premises, the jewelers of Toronto, Montreal, Hamilton and other places in Canada have formed a similar association. Pinkerton's detectives will be employed should the store of any member of the association be burglarized.

Henry C. Haskell, of No. 12 John street, has introduced many attractive novelties for the holiday trade. Among these are rings of every description for gentlemen and ladies, including special lines of garnet, pearl, intaglio, cameo, tiger stones, etc. Also many novelties in sterling silver jewelry, which is now becoming very popular. These latter include bangle bracelets of every description, pins for monograms, sleeve buttons in antique and nugget finish, monogram coins, and various other attractive and desirable goods.

Joseph P. Wathier & Co., of Chicago, have found a large and unexpected demand for Wathier's Hair Spring Stud Index, which is conclusive proof that its merits are highly appreciated by the trade. This firm has increased its facilities for watch and jewelry repairing, and are prepared to do work of this kind for those in the trade who have more on hand than they can accomplish during the busy holiday season.

By imperial decree dated June 7, 1884, a trade mark law has been promulgated in Japan, the law going into force on the first of October. Persons who counterfeit registered trade marks and employ them, will be punished by imprisonment with hard labor for a term of not less than thirty days and not more than one year, in addition to a fine. A trade mark in Japan runs for 15 years. Nearly all classes of goods manufactured are included under this new act.

A new clock has been invented and is coming into use in Europe, which is warranted by its manufacturers to run for five years without either winding or regulation. The Belgian Government placed one in a railway station in 1881, sealed with the Government seal, and it has kept perfect time ever since. If these watchmakers keep on some of them will discover perpetual motion yet, and invent a clock that will run through all eternity without winding. Then what will become of Keely?

We have previously alluded to the fact that "Gus" Walter had severed his connection with the firm of Albert Berger & Co. for the purpose of engaging in other business. He has formed a company known as the T. A. Willson Optical Company, of which he is president. The company has taken offices at No. 14 Maiden Lane, and will be ready for business January first. Mr. Walter has an extensive acquaintance with the trade, and will undoubtedly make a success of the company, which will handle the optical goods bearing the name of T. A. Willson.

S. F. Myers & Co. have recently issued a very extensive illustrated catalogue which they call "The New York Jeweler and Trade Price List." It contains illustrations of almost everything known to the jewelry trade, and gives the list prices of the various manufacturers. A special discount sheet is sent out by them under separate cover to persons who are recognized as legitimate dealers, due care being taken that this does not fall into improper hands. The catalogue is an exceedingly comprehensive one, embracing pretty much everything in the line of jewelry, is handsomely printed, and may be had on application.

The Meriden Britannia Company has arranged to exhibit a full line of their elegant goods at the New Orleans exhibition. Frank E. Knight will be in charge of the exhibit, and ready to impart to visitors the fullest particulars regarding this industry and the great progress it has made in this country of late years. The Meriden is an enterprising company, and the large and complete exhibition of goods it will make on this occasion cannot fail to be a benefit to the entire trade. Perhaps the day will come when we shall have a permanent exhibition in this city of the exquisite workmanship of our gold and silversmiths, manufacturing jewelers and horologists.

A novelty in clocks that is attracting much attention is manufactured by the Wm. L. Gilbert Clock Company. It represents the old independence bell that adorns Independence Hall in Philadelphia. The bell has a rolling motion similar to the bell on a locomotive. It is fastened on the top of the clock by two hollow pillars, one on either side, through each of which pass a cord wound twice around the bell beam in opposite directions, so that when one unwinds the other winds up. One cord passes through each pillar and is fastened to the end of a small brass rod having a central axis and propelled by power transmitted by the alarm gear through a system of levers having a positive motion. This construction is very simple and easily repaired. The tone of the alarm is loud and clear and will run much longer than the old style.

F. I. Hurstenstein, a Connecticut farmer, recently lost a valuable ring in a singular manner. While talking politics in the street he emphasized an argument by swinging his arm vigorously in a downward direction, when off flew the ring. All search for it at the time proved unavailing, but it was finally found by a man named Webster in his wagon, which was standing opposite Randall's when the ring disappeared. The ring must have bounded from the bricks into Mr. Webster's open wagon and took a ride home with Mr. Webster.

The *Jeweler and Metalworker* of London calls attention to a beautiful jewel recently on exhibition in that city. It is a valuable sapphire with peal pendant, designed and made for a leading British official in the colony of Fiji. This beautiful work of art consists of a star of eight rays, the two larger of which terminate in single pearls of fine shape and unusual size and brilliancy; the others in a *Fleur-de-lis*, in the center of which is a pearl. In the centre of the star is a large fine brilliant sapphire, surrounded by upwards of forty beautifully shaped pearls.

Local shopping for the holidays has already begun, and the retail dealers are having quite a run of custom, which will increase in volume as Christmas gets nearer. Some special orders for elaborate presents have also been placed with manufacturers, and will result in their producing some elegant pieces of original and novel designs. It is getting to be quite "the thing" for wealthy persons who desire to make costly presents to their friends, to order something unique, made from a special design, which will not be duplicated. We commend this idea to our millionaire friends—it is a good thing to do and benefits trade.

An improvement in keyless watches, invented by a Mr. Hurle, of England, is thus described in *Invention*: "The winding stem is superseded by a simple winding wheel, projecting slightly from the rim of the watch, in order to be actuated by the pressure of the thumb. It is well known that in ordinary stem winding watches the movement is more or less cramped by the extent of room occupied by the winding arrangements, whereas in this new arrangement there is the same internal space for the movement as in the case of watches wound with the ordinary key. Our only fear is that dust might accumulate at the slight opening on the edge of the rim whence the winding wheel slightly projects."

Mr. Samuel Joel, of No. 223 Grand street, has recently patented and now offers to the trade a new tool for the use of diamond setters, manufacturing jewelers and polishers. It is designed to hold the setting securely while setting or polishing the stone that belongs to it. The tool consists of a cylindrical piece of metal which is perforated by slots; by turning a screw the points of the metal bar open or close; this is inserted inside the setting, and expanded till it clasps it tightly, thus enabling the workman to handle it in any way. It does away with the old process requiring the use of cement, wax or shellac, and is as convenient as it is useful. An illustration of this tool will be found on another page of this issue.

A firm of London jewelers thus explain how they were swindled: A man came into their establishment and selected an expensive gold watch, the best chain they had and the finest bracelet, the three articles amounting to £136. They were to be sent home to a large house in one of the best West-End squares at an appointed hour. Punctual to the time two of their assistants went with the goods, and were admitted by a servant and saw the victimizer, who took the articles out of the room "to show the lady." Their assistants felt at ease on account of the valuable articles in the room, it being the private house of a wealthy gentleman. They waited, as they thought, long enough, then rang the bell; a servant answered, and on enquiring where Mr. — was they were told he had been out some time. "Who was he?" they said. The servant replied, "He is our footman." The plan unrolled itself—the man had chosen the hour, told his fellow-servants that some friends of his own were coming, and had donned private clothes for the occasion instead of his usual livery.

Simon Dessau, the New York diamond importer, on the day after election commenced cutting a very large diamond, weighing 78 karats, which will weigh 40 to 50 karats when finished. It is without a flaw and will be worth \$40,000 to \$50,000 when cut. Mr. Dessau has named it "The Cleveland Gem," and as such promises to become historical, being the largest and most perfect gem ever cut on the American Continent. The stone was shown when partly finished to Gov. Cleveland, who was much pleased with the compliment. It will be sent to the New Orleans Exposition. This New World's Koh-i-noor was found at the Cape of Good Hope about eight years ago, and has been owned by English brokers until about two months ago, when Mr. Dessau bought it.

Burger & Co., No. 12 John street, sole importers of the celebrated Potter watches, have recently received an invoice of elegant chronographs, repeaters, etc., of the finest make. There are minute repeaters, five minute repeaters, five minute repeaters with one-fifth second chronographs, and plain watches of the highest order of excellence. Among these goods are some elaborate examples of the science of horology. For instance, one of them is a minute repeater whose face shows seconds, minutes, hours, the day of the week, the day of the month, the month of the year and the phases of the moon, the combination making a perpetual calendar. The moon phases are shown on a blue enameled ground, above which is a full moon in silver, surrounded by silver stars. The Potter watches are known throughout the world as excellent timekeepers, made on honor, and unexcelled in workmanship, while the quality of the gold in the cases is eighteen karats. Of course, watches of the high order of these command high prices, but if one wants an elegant and trustworthy watch, he expects to pay a fair price for it. In addition to these elaborate watches, Mr. Burger carries a full line of the Potter watches in lower grades, all of which are warranted to be reliable timekeepers. Nothing could be more suitable for a Christmas present than one of these fine gold watches.

Miss Caroline Schermerhorn Astor, daughter of William Astor, and great-grand-daughter of John Jacob Astor, was married November 18 to Marshall Orme Wilson, son of Richard T. Wilson. As the bride's presents were, as would naturally be supposed, exceedingly numerous and elegant, we append the published list as an indication of the great variety of articles provided by the trade for such occasions. Among the other gifts to the bride were diamonds from her mother, from her aunt and uncle, Mr. and Mrs. John Jacob Astor, from Mr. Wilson, Mrs. Delano, General Van Alen and others. Then there were several sets of silver spoons, knives and forks; a silver basket, a silver perfumery bottle, silver dishes, silver framed mirrors, silver *repoussé* back mirror, silver candlesticks, silver *repoussé* service five pieces, glass smelling bottle, gold lined syrup pitchers, a ruly pin, silver framed mirror, silver pitcher, hammered gold and silver punch bowl, gold lined silver spoons, silver necklace, gold and china clocks, silver smelling bottle, bronze pitcher, a silver group, hammered silver spoon holder, gold card receiver, gold inkstand with dragons, brass thermometer, silver sugar bowl, gold inkstand, silver finger bowl, silver-backed brushes and mirror, gold-lined punch bowl, solid silver tray with monogram, silver *repoussé* tea service in red morocco case, oval carved silver tray, silver oyster forks; knives, forks and spoons of gold in black morocco case lined with white satin; carved fan with gold ornamentation, cologne bottles, brass clock, antique card receiver, silver candlestick in *repoussé*, silver salt cellars, silver card case with porcelain bottom, silver cream jugs, silver spirit flask, chased silver tray, silver candleabra with candlesticks to match, more silver candlesticks, silver pitcher, a case of two dozen ice spoons in antique design, blue satin case of after-dinner coffee spoons; silver, gold lined, ice cream spoon; gold-lined salt cellars and gold tea spoons. There were many other beautiful and costly presents, but the above is a fair indication of what the jewelry trade did towards equipping the gentle bride for married life.

The Jewelers' Circular Publishing Company has just issued, in handsome book form, an authentic historical account of the Russian reproductions now on exhibition at the Metropolitan Art Museum. The work is profusely illustrated with engravings representing the various articles on exhibition. These are reproductions of art work in metal, the originals of which are jealously guarded in the art museums of Russia. It is only recently that permission could be obtained to copy them, and three sets of the reproductions only were permitted to be made. One of these is in the Kensington Museum, London, one here, and one in Cincinnati. They are perfect *fac similes* of the original pieces, and exhibit the form and designs of the various articles in perfect imitation of the various metals of which they are composed. The history and full description of these has been written by John W. Miles, the well-known antiquarian, and is published with the sanction and endorsement of the Managers of the Metropolitan Museum of Art. The book is interesting, not only as a description of the articles enumerated, but also because it gives us a glimpse of the social conditions existing at the time they were made. It is handsomely printed on fine paper from clear cut types, and is neatly and substantially bound. It will be sent postpaid to any address on receipt of the price, which is \$1. Address The Jewelers' Circular Publishing Company, 42 Nassau street, N. Y.

The following letter, which explains itself, we print as an act of justice to Messrs. Howard & Son:

Providence, R. I., November 8, 1884.

*Editor Jewelers' Circular, Dear Sir:*—On the day of the Cleveland Business Men's demonstration in New York, Saturday, November 1st, our New York office, which we share with a house of pronounced Blaine proclivities, was profusely decorated on the front with placards betraying hostility to the Cleveland movement in a manner which was insulting and indecent. Both members of our firm were away from New York at the time, and the action taken was without our consent or knowledge. Our clerks, who were responsible for the occurrence, were well aware that their employers were strongly in favor of Governor Cleveland, but we, being Democrats in the broadest sense of the word, made no effort to coerce or unduly influence the votes of any of our employees, among which there are fifty voters. Our liberal spirit was taken advantage of and we desire to apologize to the gentlemen composing that grand procession for the insult they suffered in our name. It will perhaps be said by some ill-natured persons that this declaration is made at a very late day, but those who know us will say that among those who were for Cleveland "first, last and all the time" are yours truly,

HOWARD & SON.

We notice that the fashion writers for the daily press are at last beginning to notice the revival of the demand for gold articles for feminine decoration. The following item we clip from a recent issue of the *New York World*: "Bangle bracelets are in style, the most fashionable design being that of a chain and padlock, with a tiny key attached. In cuff buttons there is a decided competition between what are known as the 'lever' and the 'propeller' locks. Both styles are convenient and easy of adjustment, even in the stiffest of cuffs. The all-gold lace pins this season show three styles of finish, known as the 'nugget,' the 'snowflake,' and the 'fiber.' These all give a rough surface. Which is most attractive is a question for each lady to decide, it being a matter of taste. Among the newest things in ladies watch chains are short light chains, three inches in length, with a ball at one end and a swivel for the watch at the other. This ball may prove on opening it a locket or vignette. Some patterns are varied by having gold cubes in place of the balls. Gold jewelry is not very much worn abroad at the present time, but has been revived here. The revival is a welcome one, bringing, as it does, a large number of artistic and original designs in lace, scarf and bonnet pins, bracelets, ear rings and other articles of personal adornment. It has been some years since gold jewelry has been largely worn, owing to the furore for gems, hence its reintroduction in dainty and attractive designs insures a prosperous run."

The *Diamond Fields Advertiser* tells the following whopper: Some few months ago, an overseer, reputed to be in the employ of the Central Diamond Mining Company, Kimberley Mine, managed by some means or other to pass through the searching house with a 457 karat, purer in quality and whiter even than the memorable Porter Rhodes. He was not long in making his "find" known to four noted illicit in camp, who joined together to become possessors of what they knew from long experience to be a thing of immense value, and each of them resolved to pay for the diamond the sum of £750, or altogether £3,000, naturally a very magnificent amount in the eyes of, perhaps, an impecunious servant. These illicit diamond buyers who secured the prize played at cards night and day to pass away the time, soothe their agitated nerves, and principally for the object of considering how the diamond could be smuggled out of Kimberley. The play at cards resulted in two of the four losing their interest altogether in it. The other two managed somehow to get it along with them, without molestation from nasty detectives, to Capetown, and there they sold it to a Capetown firm of illicit diamond buyers for the sum of £19,000, a happy sale to both buyer and seller, considering its immense value. A member of this firm went to England with the gem, and when its exceeding purity and sparkling brilliance became known in Hatton Garden, a great deal of excitement arose, especially among those who were in the secret. Some well known individuals, formerly of Kimberley, organized a syndicate of eight, who purchased the stone at the fabulous figure of £45,000, a ninth share of any increase in the price being still maintained—to this extent, that if the "beauty" realized more than the amount already named, a ninth part of that excess was to be paid to the colonial traders in stolen diamonds, who are in a large way of business in Capetown.

In our fashion article allusion is made to some new styles in pencils, pens, match safes, whistles, etc. Whoever wants to see these goods in endless profusion, and in the latest styles and designs, should drop into the place of business of Leroy W. Fairchild, No. 18 John street. Mr. Fairchild is one of the oldest gold pen makers in the country, and during his many years of invention and manufacture, he has acquired facilities for making goods of this kind that are possessed by no other manufacturer. Among the novelties he has brought out for the holiday trade are exquisite match safes and taper safes of gold and silver in combination, and in gold and platinum. They are of convenient size, strongly made and richly ornamented. They are not only substantial and ornamental, but exceedingly useful. He has also many novel designs in cigar cutters, whistles in every variety—in bottles, chamois horns, gold and silver, in various styles of workmanship, dog whistles, bicycle whistles, and whistles for every conceivable purpose. Glove and shoe buttoners for ladies and gentlemen are put up in a variety of attractive forms; one that is expressly popular is an ornamented gold case, like a pencil case, in which the button hook slides back and forth. In pencils the styles are endless, pencil points springing forth from the most unexpected places. For instance, a miniature champagne bottle in silver has a gold cork which pulls out, and a solid, practicable, pencil stands revealed; from a miniature cannon a spring projects a pencil. There are pencils in imitation of human figures, in acorns and in almost every conceivable form. Some of the cases are beautiful, enameled, others are made of gold and platinum, others with gold and silver in combination, all beautiful in form and workmanship. There are pens, too, of every form and style, with all sorts of holders, to suit every style of penmanship. Many of these things are intended to be worn as charms, others to carry in the pocket. For infinite variety of goods of this character, and for excellence of workmanship, Mr. Fairchild's stock is unexcelled. As he makes all these goods himself, and has obtained patents for many of them, he is prepared to warrant them in every particular.

VOLUME XV.

NEW YORK, JANUARY, 1885.

No. 12.

## THE JEWELERS' CIRCULAR AND HOROLOGICAL REVIEW

*The recognized organ of the Trade, and the official representative of the  
Jewelers' League.*

A Monthly Journal devoted to the interests of Watchmakers, Jewelers, Silver-  
smiths, Electro-plate Manufacturers, and those engaged in the  
kindred branches of art industry.

### SUBSCRIPTION:

To All Parts of the United States and Canada,  
**\$2.00 Per Annum; Postage paid.**

To Great Britain, France, Switzerland, Germany, the West Indies, Mexico, the  
Republics of South America, and Australia, \$3.00 per annum. Postage paid.

 All communications should be addressed to SETH W. HALE, President, THE  
JEWELERS' CIRCULAR PUBLISHING CO., 42 Nassau Street, New York.

 Advertising rates made known on application. 

### A Few Words About Ourselves.

THE PRESENT issue of THE JEWELERS' CIRCULAR brings to a close its fifteenth volume, and it will not, we trust, be deemed out of place if we here say a few words regarding the past and the future. For fifteen years THE CIRCULAR has been published in the interests of the jewelry trade, and we use the term "the trade" in its widest scope and signification, including all industries that are essential to the success of the jewelry business. Recognizing that each branch or department in the trade was a necessary factor, THE CIRCULAR has not sought to give prominence to one over another, or to make itself the organ of any particular element in the trade, or any clique or faction, but has always and steadfastly sought to promote the general good of all persons identified with the jewelry business. Manufacturers, jobbers and retailers have all had voice in our columns at all times, while editorially it has been our aim to advocate all things that were calculated to promote the welfare of the trade in its entirety. This was the purpose, faithfully carried out, of the founder of THE CIRCULAR, and this is the purpose of those who, upon his death, succeeded to the management of this journal. The career of THE CIRCULAR has been a phenomenal one. Started as a small, diminutive sheet, with but slight encouragement from the trade to begin with, it soon demonstrated its usefulness, and the fair and honorable manner in which it was conducted speedily won the confidence of the trade. As its circulation and influence increased, and as its patronage became more liberal, it grew in dimensions until it has come to be recognized as the handsomest journal in the world devoted to any special industry. It has always been the ambition of those in control of it to make THE CIRCULAR the representative journal of the trade, *par excellence*, and to

this end they were liberal in their expenditures to improve, not only its typographical appearance, but the character of its contents, thus giving to its patrons a generous return for the support they have accorded it. To this end the best writers on technical subjects were secured at great cost, and its columns have teemed with instructive articles that have since, compiled in more permanent form, become standard text books in the trade. A glance at the advertising pages of THE CIRCULAR show that it has numerous patrons, while a perusal of the reading matter pages will furnish convincing proof that its advertising receipts have been liberally expended in procuring desirable articles from the pens of experts in the various branches of the jewelry business. And we desire to say here that many of our contributors could not have been induced by a mere money consideration to prepare the scientific articles that have appeared over their names, but were impelled by a love for their particular specialty to put in print the result of their laborious researches. THE CIRCULAR offered them facilities for reaching a class of readers whose acquaintance they were desirous of making, and this, more than the compensation they received, prompted them to write for us. No other journal in the world, probably, could have tempted them, but ours was precisely the medium they desired for imparting their experiences to those who would appreciate them. Whoever has a complete file of THE CIRCULAR and will take the trouble to refer to it, will find that it is a regular encyclopædia of useful information regarding the jewelry trade, and kindred arts and sciences. It is by making a journal of this character that its proprietors have sought to give adequate return to its patrons for the liberal sums they have expended upon it in advertising—if they have been liberal we have sought to give them a *quid pro quo*, by making a representative journal second to no other in the land. Knowing as we do the aims, purposes, ambition and achievements of the founder of THE CIRCULAR, we are at liberty to claim for him that he amply fulfilled his promises to the trade, and gave more than value for every dollar he received on account of the journal he so ably conducted.

As to the future, it will be the ambition of the present proprietors of THE CIRCULAR to carry out the aims and objects for which it was established, by at all times catering to the best interests of the trade in all its branches and in all localities. Much space will be given in the future as in the past, to technical articles prepared by specialists in the various arts and sciences that are tributary to the jewelry trade. The science of horology will be discussed in its various phases by our well known contributor, "Excelsior," and others; special articles upon optics and optical goods, upon engraving, upon precious stones, upon gold and silversmithing and upon various other topics of interest, will be given from time to time; translations from well known foreign authors and scientists will form an important feature of our "make-up," while "Workshop Notes," "Foreign Gossip" and "Trade Gossip" will occupy conspicuous space in each issue. A department of "Fashion Gossip," prepared by a well known lady who contributes fashion articles to the daily press, is a new feature recently adopted, and in it will be treated the fashions

in jewelry from a lady's standpoint, with a view to keeping retail dealers and general readers informed regarding the new styles and novelties that are brought out from time to time—in short, it will be the writer's ambition to keep the public informed regarding what is attractive and popular among the goods that go to make up a jeweler's stock. In our editorial columns attention will be given to the changing commercial features of the business, and such matters of general interest to the trade as come up from time to time will be fully discussed from the impartial standpoint of the general good. Correspondence from the various trade centers, giving the outlook in the different prominent cities will also find space in our columns. But we do not desire to be too profuse in promises—the proof of the pudding is in the eating—but prefer that our work from month to month shall speak for itself. Suffice it to say, that neither labor nor expense will be spared in maintaining the high standard of THE CIRCULAR, and in making such improvements from time to time in its general character as the changing phases of the business or the exigencies of the times may demand. With these assurances we close volume XV., thanking our many friends for their courtesies in the past, and hoping they will continue with us for another year, at least, cheering us by their presence from month to month as we labor to promote their interests.

---

#### Abuse of Credit and Hard Times.

HE WOULD not be a faithful chronicler of passing events or true to his journalistic obligations, who would shut his eyes to the fact that the country is now, and has for the past two years, been struggling through a period of financial depression that has imposed heavy burdens upon all classes. It is fully three years since the business interests of the country entered upon a process of liquidation, but it was during the year just passed that the effects of this were felt with the greatest severity. It took several years to recover from the panic of 1873, but a period of prosperity followed, during which all lines of business thrived, new enterprises on a magnificent scale were projected, universal confidence in everything prevailed, and everybody seemed on the high road to that happiness that is engendered of wealth. So favorable did all the conditions seem, that men were tempted to launch out into the stream of speculation, and, as a natural result, the country soon became burdened with the old trouble that has led to every financial crisis we have passed through, inflation of all values, over-speculation and over-production. Property having an actual value was "boomed" to fabulous prices, while speculative enterprises were given a fictitious value, that there was no hope of realizing. Mythical railroads, beginning nowhere and ending in space, were projected by visionary schemers, bonded for fabulous sums, stock issued and sold on the exchanges to a credulous public; mining schemes that had no basis but in the imagination of their projectors, were similarly launched; there was nothing, apparently, that could be suggested that the public would not take hold of and pay its solid money for. Of course, this could not last; a reaction had to come that should bring business back to a basis of actual values. It came first with the bursting of the wild mining schemes, resulting in the closing of the New York Mining Exchange; this was soon followed by a tumble in speculative stocks of all kinds, many of which were eventually thrown out of the exchanges as absolutely worthless; valuable properties suffered in sympathy with the speculative ones, and stocks that were really paying liberal dividends fell below par; failures of banks and bankers necessarily accompanied this terrific shrinkage of values, and a panic of magnificent proportions was, for a time, imminent; it was only prevented by the fact that the period of liquidation had been an extended one, and the water had been pretty nearly squeezed out of all representatives of values. During this reactionary period capital became frightened, and banks and

bankers extremely conservative; money was plentiful but locked up safely in the banks, whence it could be obtained only on "gilt-edged collateral;" the financial institutions had a plethora of money, and soon began cutting down the rate of interest on deposits, or refusing to pay any because they could not make satisfactory investments, and the hard times became general. The shrinkage in values that has taken place in the past three years amounts to hundreds of millions of dollars, exceeding largely, it is said, the losses by the panic of 1873 and following years. While this shrinkage has not excited such a sudden general revolution as panics heretofore have, yet there is scarcely a person in the land that has not been affected by it to some extent. Business has become almost stagnant, manufacturers have been forced to limit their productions, thousands of working men have been thrown out of employment and distress and suffering have been everywhere apparent. To crown all came the presidential canvass, diverting many from their legitimate avocations and unsettling everybody, as such campaigns always do.

The cause leading to the over-inflation of the speculative bubble, resulting in subsequent financial depression and the present hard times, was the general abuse of the credit system which lies at the foundation of our business enterprises. Credit is a necessity in business, and when it is controlled by good judgment and wisdom it is a blessing to all classes; but when credit is abused and through it public confidence is destroyed, it becomes a curse, bringing ruin and disaster to thousands. It was by the abuse of credit that visionary railroad and mining schemes, and other purely speculative enterprises were "boomed" into public confidence; they had no substantial foundation of actual value to rest upon, but were conceived in fraud and brought forth in iniquity for the sole purpose of swindling the public. By misrepresentation they obtained credit with which to gain the confidence of the public and gather in its dollars. When these speculative bubbles were pricked there was a sudden collapse, and confidence received a shock that caused its withdrawal from legitimate as well as speculative enterprises and from business in general. If actual values formed the basis of credit in this country, such speculative bubbles could never be blown up to such magnificent proportions as they too frequently assume. When an existing railroad, having a legitimate business and good prospects for the future, asks for a loan, it has something substantial to offer as security; but when the prospectors of a scheme for a railroad that exists only on paper asks credit to the tune of millions of dollars, the general public has no business to meddle with it; capitalists and speculators may put their money in it if they choose, but men engaged in ordinary business should keep hands off, and until it has something tangible in the way of a road, its stock should never be listed on any of the exchanges or offered to the public. During the mining fever, men made a business of locating mines, buying a few acres of ground in some mining state, then forming stock companies with a fabulous capital—on paper—getting the stock listed on the exchange and selling it for what it would bring, thus realizing large sums on an investment of a few dollars for worthless land and paper on which to print the stock. The blind, unreasoning manner in which credit is given and fraudulent speculations encouraged, is responsible for these swindles, and is responsible, consequently, for the existing financial stringency and business depression.

The jewelry trade not only suffers in common with the general public from the popular abuse of the credit system, but it has grievances in connection therewith peculiar to itself. It has been frequently said that in no other line of business is credit given so unthinkingly, so extensively and with so little inquiry as in the jewelry trade. Recent disgraceful failures are proof of the truth of this assertion. Instances have recently occurred where dealers in small cities have obtained from \$30,000 to \$60,000 worth of goods on credit and failed within thirty days thereafter—or as soon as they could select their preferred creditors and make other arrangements for disposing of the goods. A little inquiry would have revealed the extent to which these men were buying goods, and also the fact that

half the amount would have been a liberal stock for their locality. The purchases they were making were evidence that fraud was intended, but no one took the trouble to make inquiries—all the men had to do was to order the goods and they got them. Probably they will compromise eventually for a few cents on the dollar, thus re-establishing their credit, resume business and repeat the failure dodge after a reasonable lapse of time. The number of retail dealers in the country runs well up into the thousands; probably the names of ten or fifteen thousand, perhaps more, could be obtained from the jobbers in this city; being thus known as dealers, any one of them could come East and obtain goods on credit to an almost unlimited extent; all that is necessary is a good plausible story, for there will be little inquiry into the truth of it. Matters have got to that point where it is scarcely necessary for a jobber or retail dealer to have any money invested in his business; a plausible tongue and unlimited cheek will get him all the goods he wants on credit; if he can sell them to advantage, well and good; if not, let him fail and make his own terms with his creditors. They take all the risk and he makes the profit, if there is any. If his paper is nearing maturity, and he has any scruples about failing, he has only to ask an extension to get all the time he wants. In fact, he can get an extension before he gets the goods, if he desires; he has only to ask to have his bills dated ahead to get six months credit on a four months note, subject to renewal when desired. Finally, as a last resort, failure and compromise are popular methods for getting the best of creditors.

This would seem to be a good time to reform the system of credits in the jewelry business. Owing to the depressed condition of business, there are probably fewer goods out unpaid for at the present time than usual; the times have been so unpromising that dealers have not been liberal buyers during the past year. When trade improves, as it soon must, it would be a good time for the creditor class to insist that buyers should be at least part owners of their stock; that they should have sufficient money of their own invested in their business to afford their creditors a tangible hold upon them; if they have confidence enough to put their own money into the business the jobbers can afford to take some risk, but it is too much to expect them to take it all. It would be well to institute more rigid inquiries relative to the standing, business habits and prospects of every one asking credit, and to be governed accordingly. Then the abuse of dating bills ahead should be abandoned; it is subversive of all business principles and should not be tolerated any longer. Let a four months note mean four months and not six months. These matters rest entirely in the hands of the manufacturers and jobbers; they have but to lay down the rules governing credits and dealers will make their calculations accordingly. Abuse of credit is the evil from which the country at large is suffering at present, and every business man owes a duty to himself and his fellows to do all in his power towards bringing about a reformation.

---

### The Outlook for Business.

THE HOLIDAY season has come and gone. It brought with it a fair amount of trade, but it came reluctantly, hanging off till the last moment, and contenting itself with as limited a volume as was consistent with the joyous season of the year. For a brief space, at least, there will be a lull, and manufacturers, jobbers and retail dealers will have abundant opportunity to take account of stock, post their books and figure up their profits on the year's business. If reports are true, they will not be burdened seriously with the wealth they have accumulated during the year, but, on the whole, business might have been much worse. The trade can congratulate itself that it has held its own, and, indeed, is a little better off than many other lines of industry. Failures in the trade during the year have been few compared to those that have occurred in other branches of business, and if fewer goods have been sold than usual,

there have been fewer made and there are less to carry over. A dull year was foreseen by most manufacturers and they governed themselves accordingly, reducing their product to what would suffice for a limited demand and lopping off their expenses proportionately. Probably not a dealer in the trade expected to do a large business during the year just passed, and therefore he is not disappointed. We have discussed at other times the causes that have existed for several years for the general depression of business, and at various times have commented upon the business situation as it appeared to us. We have never taken a lugubrious view of affairs, nor have we been unduly hopeful; while warning the trade against over-production and over-stocking, we have expressed the belief that, while trade would seem dull the business of the year would average fairly well. We cannot expect prosperity all the time; there will be good years and there will be bad years; the judicious man will so gauge his affairs that the average, year in and year out, will be in his favor. But if he makes money fast one year and spends it as fast as he makes it, he will be very apt to be badly squeezed when the bad years come. Life is made up of averages, and they are quite as well defined in business matters as elsewhere.

The signs of the times indicate a fair business year for 1885, and we shall be much mistaken if it is not a marked improvement over that of the year just closed. In the first place there has been a period of financial stringency extending over three years, which is about the limit of these hard times epochs that are of periodical occurrence. They are followed invariably by a healthy activity that is gradually stimulated to a speculative fever, then comes a panic. These are financial fluctuations that are very well defined, and we think we have reason to hope that the time for the reaction has come. It is always darkest just before dawn, so runs the proverb, and if this holds good in business matters, the dawn should be near at hand. The political barometer does not portend threatening weather, nor does it indicate any particular change. The excitement of the presidential canvass having died out, everybody accepts the result of the election with good grace, and expresses a willingness to aid the incoming administration in putting our national affairs upon such a basis as will improve the condition of the country and develop our commercial relations with other nations. It is not to be apprehended that the change from a Republican to a Democratic administration or *vice versa* can now or at any future time be attended with dire results—our nation is too firmly planted and the government too stable to admit of such a supposition. On the contrary, a change in our political rulers from time to time is likely to be a benefit than otherwise by bringing new men and new ideas to the front. Thus far the out-givings of President-elect Cleveland have been of the most pacific nature, and have won for him the commendation of even his political opponents. So this bugbear of a campaign lie, "that a change of administration was a threatened revolution," may be put aside as the ravings of men who had lost their mental equilibrium during the excitement of a political contest. So far as the political outlook is concerned, it promises well for the business interests of the country. Then the very fact of our having passed through a dull season is good reason for anticipating an improvement in business at an early day. Dealers who have been such modest buyers have been working off their old stock, and for several months have only ordered such new goods as the demand required. They are, as a consequence, reduced in stock, and will embrace the first favorable indication of a coming demand to lay in fresh supplies of new and attractive goods. Jobbers, too, have allowed their stocks to run down, and will watch keenly for a demand that will warrant them in replenishing. Manufacturers are in good condition to increase their product, having everything in readiness to manufacture standard goods and novelties as occasion may require. The trade, in fact, is not suffering from over-production or from being over-stocked, and any demand that may come will give an impetus to trade that will be felt by all. We do not anticipate that such demand will come to any great extent before the

middle of the year. Congress is in session, and that is always a wet blanket on business; then comes the inauguration in March, and, simultaneously, presidential cabinet making. When the President is fairly installed in office and the new heads of departments are warm in their seats, we may fairly anticipate that the country will settle down to business, and that the united efforts of business men will secure a return of public confidence, the one thing needful to insure industrial prosperity. We venture the opinion, therefore, that there will be an excellent fall trade, that it will set in early and be supplemented by an unusually active holiday trade for the season of 1885-6.

---

### A National Bankruptcy Law.

WE HAVE before urged upon the trade the importance of bringing to bear upon Congress all the influence it can command to secure the passage at this session of a national bankruptcy law. Ever since the repeal of the old one, business men have been seeking to secure the adoption of a new and improved law, free from the defects of the old one, that should make the forms of bankruptcy proceedings uniform in all the States. Two years ago Judge Lowell, of Massachusetts, prepared a bill that was submitted to the various commercial exchanges of the country and received their approval; last winter it was passed by the Senate, but in the House it was not reached before the adjournment. An attempt was made to take it up out of the regular order, but this required a two-third vote and it lacked a few of the requisite number. It now lies on the Speaker's table with little prospect of its being reached at this session unless the business men of the country raise a vigorous demand for it. The action of last winter showed that there was a small minority in the House opposed to the Lowell bill, but this opposition would, no doubt, yield to the demand of active business men. It is, as we understand, based upon the old doctrine of States' rights, which would concede to each State the right to regulate the business conditions of its own citizens; but trade and commerce recognize no State boundaries at present. In former days, before the introduction of railroads and telegraph lines, inter-state commerce was exceedingly limited, and State laws were sufficient for the regulation of all business transactions within their respective borders. But now the commerce between the States has assumed such vast proportions that the diverse State laws assuming to regulate it have become burdensome, and should be supplemented by national laws that secure uniformity of practice in all the States and Territories. Especially is this so in all matters pertaining to credits. The great bulk of business in this country is done on credit, and unless the creditor class is properly protected by laws that are universal in their application, there will come a restraint upon the system of credit that will prove a serious embarrassment to the debtor class. For the lack of a national bankruptcy law the man who sells goods on credit assumes risks that ought not to fall to him. To avoid them, he must be familiar with all the laws of all the States bearing on debtors and creditors, in order to know what means of redress they afford him in case his debtor endeavors to avoid his obligation. Usually the laws of each State give its own citizens some advantage over outside creditors, and provide some loophole for their escape. So clear has this been made to the creditor class that it is seldom one attempts to collect by legal means a debt due him from a citizen of another State in the courts of that State. He may embarrass him and force him to a compromise, but the debtor can lead him a long chase through the courts if he chooses to fight rather than to pay.

This is all wrong and a great embarrassment to business men. A man selling goods in New York to a citizen of Maine or Texas, ought to be assured that the same laws governing collections or providing for bankruptcy that are operative in New York will hold good in either of those States. A national bankruptcy law is a necessity in business, and no effort should be spared to secure one from the

present Congress. Efforts are being made by various boards of trade and commercial exchanges to concentrate the influence of business men upon Congress to secure a new bankruptcy law, and the jewelry trade, which is a great sufferer from the lack of such a law, should be prominent in appealing to Congress for the relief as such a bill would give. There is no time to lose if anything is to be done at this session of Congress, for there are but a few weeks before adjournment. So much business has accumulated, that if done at all, the bill will have to be taken up and passed out of its regular order. There should be active and vigorous work on the part of those interested.

---

## Gossip of the Month.

FAREWELL to the Old Year! Welcome to the New! While it is considered unwise and impolitic to speak disrespectfully of the bridge by whose aid we have crossed the stream in safety, yet we may, without impropriety, earnestly hope that the year 1885 will be a more prosperous business year than its immediate predecessor. Indications that it will be are to be found on every side. The country is in a state of peace, the harvests of the past year were bountiful, money is plentiful, speculation has largely lost its fascinations for the masses, and there everywhere seems to be a determination to settle down to the legitimate business of life. The great depreciation in securities of all kinds that has taken place in the past two years has left capitalists, banks and other monied institutions with millions of dollars on hand which they cannot invest advantageously; trust companies and banks have reduced their rate of interest on deposits, or foregone it entirely, till many a man who has acquired a competence has found the interest earnings of his capital insufficient to meet his expenses, and he has been forced to draw upon his principal to make up the deficiency. As a consequence of this condition of affairs, capitalists are looking eagerly for investments, and with the first symptom of a restoration of public confidence the money now locked up and earning nothing will be released and turned into the channels of business enterprise. As an indication that the business outlook is improving, we have observed, while crossing the ferry daily, that every steamship leaving this port goes out loaded clear down to the "Plimpsoll" line, while those arriving from abroad float high in the water, apparently having no cargoes whatever. Large shipments of gold from Europe to this country in payment for these heavy freights going abroad are matters of daily record in the financial columns of the daily papers. The balance of trade is, therefore, largely in our favor, a condition of affairs that is a material factor in our national prosperity, and is one of those straws that indicate that the commercial breezes are setting in our direction. The new year comes in under favorable auspices, and with a fair promise of a good business year.

\* \*

\* \*

\* \*

THE books for 1884 are now closed and the accounts are being made up. It would be useless to contend that it was a year of great prosperity, or that it was a satisfactory one to business men in general; but that it was such a disastrous year in the jewelry trade as the chronic growlers would have us believe we are not prepared to say. We do know that the general complaint for several months was that business was dull, and there is no gainsaying that statement, but we have become so used to hearing this complaint, even in prosperous years, that we now make a liberal discount. But amid the general outcry against dull times we have met a few manufacturers and jobbers who, when we asked "how is business?" invariably replied "we have nothing to complain of; there is no rush, but a fair average amount of orders." One of these, a manufacturer of

gold goods, told us a week ago that his firm was surprised at the total of their November business, the volume of which was fully equal to that of November a year ago. He said they had been pegging away, doing a little something every day, but continually thinking business was dull, till they came to foot up the month's transactions, when they found it was not \$1,000 below that of November, 1883. But there was less profit, because competition has been so great that prices could not be maintained. A gentleman identified with one of the large silverware houses told us substantially the same thing, and from these and other statements we reach the conclusion that the year's business, while not remarkably profitable, was not particularly disastrous in the jewelry trade.

\* \*

\* \*

\* \*

BUT there is one thing we believe must be accepted as a basis of business for a few years at least, and it is that, in all kinds of business, dealers must be content with a smaller margin of profit than they have been accustomed to. One effect of the liquidation the country has been passing through has been to break down prices. All our agricultural products are selling in the market at lower prices than have ruled in years before; all staple manufactured goods are away down in price; everything is at low ebb except the necessities of life—everything but that we eat and drink. All goods in the jewelry line have also been subjected to large reductions, and, as a consequence, the profit in making and handling them will be less. If manufacturers will keep this fact in mind, and regulate their expenses accordingly, they will still find their business a desirable one, but they will have to spend a few more years in business than they otherwise would. The worst feature of this phase of the business outlook is the effect it will have on the workingmen. Capital can always protect itself in some way, but the working class, that is dependent upon daily earnings, has no recourse but to accept such wages as the conditions of trade will warrant. Already, in many lines of industry, wages have been reduced from five to twenty per cent., and, in most instances, the working people, seeing the necessity for it, have readily acquiesced in the reduction, and in a few instances only have there been strikes. But the working classes have this to console them, that if they earn less it costs less to live, for there have been remarkable reductions in almost everything except, possibly, meats, butter, eggs, and some luxuries that we would all be better off without. The prospect, however, for steady employment for regular mechanics is considerably better now than it was six months ago, when many of the factories and mills were obliged to close. Some of these have resumed operations, and some that were running one or two days a week have doubled their working time or are running to their full capacity. In dull seasons the greatest forbearance between capital and labor is necessary, and if there is on both sides an intelligent comprehension of the situation and due consideration of the rights of each, the hardships inherent in the situation may be made lighter for all.

\* \*

\* \*

\* \*

THE number of failures last year was unusually large, as was to have been expected from the prevailing depression in business, but the number of failures in the jewelry trade was small in comparison to the whole. Of course there were a good many, and some most rascally ones, but the legitimate dealers, who were earnestly striving to do an honest business but failed in spite of their best efforts, were fewer than might reasonably have been expected. This may be taken as a sure sign that the retail trade throughout the country is in an excellent condition, that dealers are not overstocked with goods for which they owe jobbers and manufacturers, and that they, like business men in general, have been steadily liquidating their obliga-

tions. These are good indications, promising a liberal volume of business at such time as the demand may become more active. Thus the dull times have their compensations. One of the worst things that can happen to the trade is to have the retail dealers overstocked in a dull season; they are cramped and worried to meet maturing paper, and hampered by a stock of goods for which there is no demand, and which rapidly deteriorate on their hands, or is rendered *passé* by the introduction of new styles; then, when business becomes more active, the dealer feels that he must work off his old stock before ordering new goods, and so the burden falls back upon the shoulders of the jobber and manufacturer. The fact, however, that they have pulled through the hard times thus far with so few failures speaks volumes for their present condition and promises well for the future. For one to obtain a fair idea of the prospects for business, he must watch not only his own field of enterprise but all others. All lines of business are interdependent, and when the dry goods and hardware trades are active, the cotton and woolen mills fully employed, and other branches of business "booming," it may be taken for granted that the jewelry trade is not far behind. We observe by the commercial papers that a steady improvement has been going on for two months in the produce market; that dry goods are moving more readily; that the cotton and woolen mills are increasing their production regularly, and will soon be running to their full capacity; that the shipments of our agricultural products is increasing; and that, in fact, all branches of business are manifesting increased activity and are feeling hopeful. This means that some of the surplus money that has been tied up so long is finding opportunities for employment, and will soon be freely distributed among the masses. This is one of the first symptoms of a reaction that must always follow a period of stagnation. In the course of a few months we expect to see a largely increased activity in the jewelry trade.

\* \*

\* \*

\* \*

REPOUSSE brass work has become very popular in this country for decorative purposes since it has been taken up by amateurs. But in its artistic possibilities it can hardly equal hammered iron. The latter metal is too stubborn for manipulation by amateurs; but why should not the art be revived by the metal workers? In France, admirable results have been attained in this direction, including the production of the most delicate filigree jewelry. Our metal workers are largely employed in the production of artistic decorative work, and ornaments of all kinds, for parlors, club rooms, hotels, etc., furnish elegant exhibits of their skill. What they may yet be able to accomplish with iron remains to be seen.

\* \*

\* \*

\* \*

THE demand for electrical clocks is spreading, and we note that they have made their appearance in New Orleans and one or two other prominent cities. In New York there is a company duly chartered that makes a business of putting up these clocks, which are connected by wires with a central timepiece which, by means of electricity, marks the time on each clock with which it communicates. The gentleman who organized this company and furnishes it with brains, was the inventor of a fire alarm telegraph, and in developing a means of recording in the engine houses the number of any box from which an alarm might be sent, found that he could utilize his method for registering time upon any number of clock dials, hence the electrical clock company. By the same system he communicates messages from the occupants of rooms in hotels to the clerk in the office. Thus, if a lodger wants a pitcher of ice water, instead of ringing a bell, waiting for a waiter to climb up to his room, take his order, go for the water and return, he touches an electrical button, and instantaneously the fact is recorded in the office that "No. 1,001

wants ice water," and a waiter is dispatched with it. By touching another button he can summon the chambermaid, order fresh towels or intimate that it is time he was supplied with his matutinal cocktail. But the clock business pays the company best, and thus far its attention has been turned to their introduction rather than to the propounding of electrical conundrums to hotel clerks.

\* \*

\* \*

\* \*

SPEAKING of the fire alarm telegraph, doubtless manufacturers in the trade are vigorously importuned by agents of hand grenades for fire extinguishment. Don't buy them. They are a delusion and a snare. One bucket of water is worth more than a dozen of them, and one ordinary fire extinguisher worth more than a car load. The grenade is a glass bottle that contains a chemical compound for putting out fires. The theory of their use is that they are to be thrown at an incipient fire, and, on their breaking, the flames are instantly subdued. Very pretty in theory, but in practice they don't work. It requires an expert baseball pitcher to throw them successfully, half the bottles refuse to break, and others break when not wanted from the pressure of the chemicals inside, and when they do break and release the liquid it is no more effective than so much water. Then, too, fires have a bad habit of occurring where they cannot be reached conveniently, and you might throw grenades at them half a day without once hitting the flames. If you are thinking of buying grenades, our advice is—don't. Supply yourself with buckets of water at one-tenth the cost and see that they are kept filled.

\* \*

\* \*

\* \*

IT IS unfortunate that the United States is not a party to the dividing up of that portion of Africa explored by Stanley that the English, German and French governments propose to appropriate to themselves. They want it for colonizing purposes, and to afford an outlet for their surplus productions. What a glorious thing it would be for the jewelry trade if our government could get a slice of it. How those unclothed natives would rejoice in the gold bracelets, for instance, for their arms and legs that our factories could furnish; what a magnificent opportunity for supplying rings for the native fingers and noses, and jingling bells for their toeses, harpoons to fasten up their hair, and every variety of pin for holding up those garments so universally worn which supply the place of the triangular appendage usually accompanying civilized infants; what an outlet is here for those patent fasteners bearing the inscription "Baby Mine," "Mother's Pet," "Father's Joy;" and what a christianizing effect it would have to see a whole nation of savage blacks swaddled in breech cloths bearing such touching mottoes. And what a range there would be for the display of our home talent in adorning the dusky Eves of that far away land. Since jewelry has taken on so largely the forms of flowers and leaves, they could be supplied with anything in this line, from an apple blossom to a fig leaf. Here is an outlet for surplus production that seems to have been overlooked by the powers that be. Our claim to a part of this newly discovered territory is as good as that of either of the European powers, for was not Stanley formerly a reporter for the *Herald*? and was it not in that capacity that he first invaded Africa? The new administration should look into this matter, and, if our rights are being ignored, our fleet should be at once dispatched to the African coast with instructions to bombard the first village of mud huts that is sighted. Our commercial interests must be protected.

\* \*

\* \*

\* \*

FROM a paragraph that will be found in our department of "Trade Gossip" this month, it will be seen that several western railroads

have entered upon a high-handed course of discrimination against the commercial travelers for jewelry houses. Some half a dozen of them have combined in issuing a notice that they will not hereafter receive, check, store or in any manner assume any responsibility whatever for trunks, sample cases or packages carried by travelers in the jewelry interest. Agents of these roads are instructed to refuse to receive any baggage of this description. No reason for this outrage upon a legitimate class of business men is stated in connection with this order, but it is supposed to be based on the fact that the baggage of travelers for jewelry houses is unusually valuable, and that, in case of its loss, the companies have to pay for it. Well, why should they not pay for it? They are common carriers, and charge for the transportation of baggage in the price they receive for carrying its owner; for every trunk destroyed that they are required to pay for they are paid for transporting thousands on which they make a profit. Do they expect their business to be all profit, and never to incur contingent losses? Insurance companies insure property in large sums for very small premiums, and out of the aggregate sum thus collected by them they are enabled to pay such losses as occur. This is precisely the situation with the railroad companies; they have been taking the money of commercial travelers for years in small sums, and have made a fair profit in doing so; why should they "kick" when they are occasionally required to pay a loss, if they ever are? But, as common carriers, we doubt if they have the legal right to make this broad, arbitrary discrimination against a particular class of their patrons. We should like to see the matter tested in the courts, and hope some one who is injured by a refusal to accept his baggage will bring suit for damages. The effect of this order will be to cause travelers to send their baggage by express, entailing heavy cost and great loss of time. Carrying his baggage in the ordinary way, a traveler is often able to visit three or four places in a single day, for he can put his trunks on any train that passes; under the new order he must wait the convenience of the express company to deliver his baggage, and will seldom be able to visit more than one place a day, as the transportation of his baggage will depend upon the frequency with which express trains are run, usually one each way daily on the western roads. Thus he will have to pay express charges, extra hotel bills, and consume from a third to a half more time in making his trips. Some of the prominent firms in the trade have offered to waive all claims for damages if the order is rescinded, but it is reported that this offer has been declined, on the ground that such waiver would not be valid, the companies being responsible notwithstanding it under the laws relating to common carriers. This order may be enforced temporarily, but it certainly cannot be maintained for any length of time. Congress is now considering this subject of inter-state transportation, and eventually will pass such laws regarding it as will prevent such outrages as this being perpetrated upon an honorable class of business men. The Supreme Court of the United States has decided that a state has no right to discriminate against manufacturers or dealers from other states in favor of dealers within its own borders, and we do not question but the same court would give judgment for damages against any railroad that enforced an order of this character against a particular class of its patrons. We hope there is pluck and back bone enough in the trade to make a fight against this gross imposition.

\* \*

\* \*

\* \*

A MOVEMENT for the abolition of the duty on raw materials has been started by manufacturers in New York and vicinity, about fifty of whom recently organized an association and adopted a resolution demanding "the abolition of all duties on raw materials, in order that we may compete in home and foreign markets with other manufacturing nations not one of which taxes raw materials." The association is known as the Manufacturers' Tariff Reform League, and its members are wire, lead, woolen, sole leather, clothing, and other

manufacturers. The jewelry trade ought to be represented in this organization. If they are to compete in all parts of the world with foreign manufacturers they ought to be permitted to buy the material that enters into their products as reasonably as their competitors can—at least our own government should not impose extra burdens upon them.

\* \* \*

\* \* \*

\* \* \*

TRAVELERS returning from Europe are loud in their complaints at the delay and inconvenience to which they are subjected after reaching this port, in consequence of the regulations requiring all passengers to be landed at the new barge office instead of permitting the steamers to go directly to their docks. Passengers are taken off the steamer, with their baggage, by transfer boats run by contract, which are inadequate for the purpose. Sometimes, when two or three steamers arrive simultaneously, some of them are obliged to wait in the lower bay till a transfer boat is at liberty. The conveniences for handling baggage at the barge office are insufficient, and are in the hands of a local politician who is noted for looking out for number one. A committee of the Chamber of Commerce has recently reported that the new system is cumbersome, dilatory, of no advantage to the government, and imposes unnecessary hardships upon travelers. They recommend a return to the old system of landing passengers on the various docks of the steamship companies. The jewelry trade furnishes a greater number of foreign pilgrims than any other industry, and they are unanimous in condemning the present system of dealing with passengers on their arrival in this country.

\* \* \*

\* \* \*

\* \* \*

WE HAVE alluded heretofore to the desire expressed by some members of the trade for the formation of a Board of Trade. At various times this suggestion has been made and attempts to perfect such an organization have actually been entered upon, but success has not crowned these efforts. Such an organization, to be effective, should include in its membership a very large majority of the trade, and should have the power to formulate rules and regulations the observance of which should be imperative. But we greatly fear this never can be accomplished. There are too many incongruous elements in the trade, and interests of too great diversity to warrant the hope that such a degree of harmony could be secured as is necessary to the success of any organization of this character. The very character of the trade, including as it does so many of the arts, and such a variety of commercial interests, precludes the possibility of its ever delegating to a central organization the power to regulate the methods and means of transacting the business. It is only where there is a perfect unity of interests involved that such power can judiciously be conferred upon a representative body. In the jewelry trade the interests of manufacturers, jobbers and retail dealers are substantially identical, yet the attainment of the desired end is very largely a matter of individual judgment and decision. Certain general rules might be agreed upon for the guidance of manufacturers, others for jobbers and still others for retail dealers, but no code of business, morals or ethics can be laid down that will apply to all. The Jewelers' Association serves a good end because its membership is confined to those whose interests are so nearly identical that such rules as they have can be observed by all and are burdensome upon none. But this is not like a Board of Trade; it is more in the nature of a bureau of information, furnishing to its members important data for their guidance. Throw this open to the trade in general and its usefulness would be destroyed at once. Its field could, possibly, be enlarged somewhat with beneficial effect, but to make its membership too large would be to introduce incongruous elements, and make it cumbersome and unwieldy. There may come a time when organi-

zations of a commercial character may be desirable in the different well-defined branches of the trade, but a Board of Trade to represent all interests seems to be an impossibility.

\* \* \*

\* \* \*

\* \* \*

WE ARE informed that there is less desire than heretofore manifested by buyers to demand those special concessions that have been insisted upon by them in the past, and had grown to be serious evils. Fewer of them request to have their bills dated ahead, and less goods on memorandum are required. One jobber informed us recently that he had been obliged for years to carry from \$20,000 to \$30,000 worth of goods in excess of his ordinary requirements, simply to fill orders for goods on memorandum. Of late requests for such favors have fallen off fully one-half, but whether this is due to dull times or to the combined efforts of jobbers and retail merchants to make this burden as light as possible he was unable to say. As to dating bills ahead, many jobbers have determined not to do this in future on any account, preferring to sacrifice some patronage if necessary to continuing a practice that is as unwise as it is unbusinesslike. There is no reason why the jewelry trade should be burdened with practices so unwarranted any more than any other line of business, and it will be much better for it when it so reforms its system of credits as to do away with all abuses of this nature.

\* \* \*

\* \* \*

\* \* \*

WE DESIRE to direct the special attention of all lovers of artistic metal work to the very important and beautifully illustrated series of articles now being printed in our columns on the Russian Reproductions which are on exhibition at the Metropolitan Museum of Art. This is one of the most interesting collections of examples of ancient metal work ever brought to this country, and is attracting daily the attention and admiration of thousands of visitors to the museum. The articles descriptive of this collection were prepared especially for THE JEWELERS' CIRCULAR by John W. Miles, of the Meriden Britannia Company, the well known writer on antiquarian subjects, with the permission of General di Cesnola and the directors of the museum. It is the only authentic historical description of the collection that has been written, and as such is endorsed by the directors of the museum. The series of articles have been compiled in book form, neatly printed and bound, and are for sale at the museum by permission of those in charge. Copies of this work, which should be in the library of every student of art, may be had by addressing this office and enclosing one dollar.

Continued from Page 354.

LASSING\* together the few antique Roman pieces which I have selected from the Museum replicas, we may give our attention for a moment to the silver vase illustrated in figure 13, and with the full scenes, on a slightly smaller scale, in figure 14. This was found at the same time and in the same place with the silver pail which has been noticed. Its height is 10 vershoks and it weighs 12 livres. In consideration of its imposing character and the intrinsic value of its material it excels the silver pail, but, unfor-

\* The above initial is from the bible of Charles the Bald of France (ninth century). I have substituted, however, in place of the round ornament in the center one of the little plates of gold previously mentioned as serving for dress decorations among the Scythians. It represents two women dancing.

tunately, its artistic excellence is far inferior. The work upon it, although a mass of details and very elaborate, is coarse and poorly executed. It has, however, one remarkable characteristic in that it is, with the exception of the Centaurs and the small cylindrical neck, of one piece, which render the *repoussé* work upon it very extraordinary. The two Centaurs, which serve as handles and carry each an amphora-shaped vase, match the style of the piece perfectly and

in driving a stag and doe into a net guarded by a young boy. The latter personage is peculiarly dressed in a cowl which covers his head and shoulders somewhat like the *cucullus* which we see worn sometimes by the Persians. Upon the base is represented three marine monsters, the horse, the panther and the goat, each carrying a Nereid almost nude. One of the Nereids is engaged in arranging her hair, while the other two hold each a scarf distended by the wind.

Silver Vase, Figure 13.

were probably made by the same artist. They are not, however, a part of the vase, but simply attached or applied in a temporary manner. The small cylindrical neck, which forms the only opening, is ornamented with scales and has a boss similarly worked in foliage. The superior part of the vase offers the representation of a chase in two groups. In the first group we see a wild boar attacked by the hunters and three dogs, and in the second a hunter assisting his dog

Between two of these figures we see an open shell. The middle of the vase is very elaborately decorated with three groups depicting combats between Greeks and Amazons. The first is composed of two Amazons and one Greek. The latter person is on the point of piercing with his lance an Amazon who has fallen to the ground, while her companion, mounted, threatens the Greek warrior with a battle ax. In the second group we see another Amazon, also mount-

Detail of Vase. Figure 13.

ed, attacked by two Greeks, one of whom is completely armed and the other bearing only the *chlamys* and a sword. The third group, concluding the series, represents a mounted Amazon fighting a Greek foot warrior. The plain upon which these combats occur is strewn with flowers and trees resembling the cypress. The most noticeable point in these scenes is the highly ornamental character of the vestments worn by the combatants and the harness of the horses. These are very richly worked with most elaborate details.

The existence in ancient times of female warriors is no myth. We find such women among the early German tribes and still earlier among the Sauromatæ, one of the branches of the Scythian nation. The physical impossibility, however, of an exclusive race of women forever separated from the men, living more than a generation, renders it extremely doubtful that such a race ever existed, except in legendary lore. Accounts of them may be found scattered through the mythological tales of both Greece and Rome, but never in authentic history except as hearsay. The earliest historical record—that of Herodotus—is of this nature, and as it is a very pretty story it will bear quoting. Speaking of the different Scythian tribes, Herodotus says:

“Concerning the Sauromatæ, the following account is given: When the Grecians had fought with the Amazons (the Scythians call the Amazons *Aiorpata*, and this name in the Grecian language means manslayers, for they call *Aior* a man, and *Pata* to kill) the story goes, that the Greeks, having been victorious in the battle at the Thermodon, sailed away, taking with them in three ships as many Amazons as they had been able to take alive; but the Amazons attacking them out at sea cut the men to pieces. However, as they had no knowledge of navigation, nor any skill in the use of the rudder, sails or oars, when they had cut the men to pieces, they were carried by the waves and wind, and arrived at Cremni, on the lake Mæotis, but Cremni belongs to the territory of the free Scythians. Here the Amazons, landing from the vessels, marched to the inhabited parts and seized the first herd of horses they happened to fall in with, and, mounting on them, plundered the lands of the Scythians. The Scythians knew not what to make of the matter, for they were not acquainted either with their language, dress or nation, but wondered from whence they came. They conjectured that they were men of the same stature, they therefore gave them battle; but after the battle the Scythians got possession of the dead, and so discovered that they were women. On deliberation, therefore, they resolved on no account to kill them any more, but to send out to them the youngest of their own party, guessing a number equal to theirs; these were to encamp near them, and do the same as they did. Should the Amazons pursue them, they were not to fight, but fly; and when they halted were to come and encamp near them. The Scythians resolved on this, out of a desire to have children by these women. The young men, being despatched, did as they were ordered. When the Amazons found that they had not come to hurt them, they let them alone, and they drew one camp nearer to the other every day. The youths, as well as the Amazons, had nothing except their arms and horses, but obtained their subsistence in the same way as the Amazons did, by hunting and pillage.

\* \* \* \* \*  
\* \* \* \* \*

Afterwards, having joined their camps, they lived together, each having for his wife the person he first attached himself to. The men were not able to learn the language of the women, but the women soon attained that of the men. When, therefore, they understood one another, the men spoke to the Amazons as follows:

‘We have parents and possessions, let us then no longer lead this kind of life, but let us return to the bulk of our people and live with them; we will have you as our wives and no others.’

To this they answered:

‘We never could live with the women of your country, because we have not the same customs with them. We shoot with the bow, throw the javelin and ride on horseback, and have never learnt the employments of women. But your women do none of the things we have mentioned, but are engaged in women’s employments, remaining in their wagons, and do not go out to hunt, or anywhere else; we could not therefore consort with them. If, then, you desire to have us for your wives, and to prove yourselves honest men, go to your parents, claim your share of their property, then return, and let us live by ourselves.’

The youths yielded, and acted accordingly; but when they came back to the Amazons, having received what fell to their share of the possessions, the women spoke to them as follows:

‘Alarm and fear come upon us, when we consider that we must live in this country! In the first place, because we have deprived you of your parents, and, in the next, have committed great depredations in your territory. Since, therefore, you think us worthy to be your wives, do thus with us:—come, let us leave this country, and having crossed the river Tanais, let us settle there.’

The youths consented to this also. Accordingly, having crossed the Tanais, they advanced a journey of three days eastward from the Tannis, and three from the lake Mæotis northward, and having reached the country in which they are now settled, they took up their abode there. From that time the wives of the Sauromatæ retain their ancient mode of living, both going out on horseback to hunt with their husbands, and without their husbands, and joining in war and wearing the same dress as the men. The Sauromatæ use the Scythian language, speaking it corruptly from the first, since the Amazons never learned it correctly. Their rules respecting marriage are thus settled: No virgin is permitted to marry until she has killed an enemy; some of them therefore die of old age without being married, not being able to satisfy the law.”

Through such an account as this we can understand more fully the masculine nature of the warrior women in the scene upon our vase. In the mythological heroics we find them conquered by both Héraclés and Théseus, and various legends are given of their political condition and customs, among which that of cutting off the right breast in order to allow greater freedom in drawing the bow, was an invention of the Greeks, based upon the name of Amazon.

Concluding the consideration of the antique Roman work, we illustrate in figure 15 a shallow plate of silver having a low foot and chased in low relief with a hunting scene. It has a diameter of 11

Silver Plate, Figure 15.

inches. The intention of the artist in this scene is uncertain, but we may with confidence consider it as representative of some ancient myth and of none more probable than that of the Kalydonian hunt—a legend of great antiquity. In that case the two principal personages can be no others than Meleagros and Atalanté. The story of the Kalydonian hunt is repeatedly told in various forms upon the Grecian monuments, and the persons participating in that adventure were gradually augmented to include nearly all the national heroes, as the vanity of the different states of Greece prompted them in claiming for their especial celebrities the glory of every war and every expedition. Meleagros was the son of Æneus and Althæa. In offering sacrifices to the gods at the conclusion of the harvest, Æneus neglected Artemis (Diana), and that goddess, in revenge, sent a wild boar of immense size and strength to ravage the lands of Kalydon. It was to relieve the country of this pest that Meleagros invited all the heroes of Greece, including Atalanté, with whom he was in love. Atalanté was the daughter of Iasion and Klymene. Her father was very desirous of male offspring, and when she was born his chagrin was so great that he exposed her upon the mountains. There she was suckled by a bear, and afterwards found by some hunters who

named and reared her. She grew up very beautiful, very courageous, and passionately fond of the chase. Being afterwards recognized by her parents, her father wished her to marry, and she consented, on condition that her suitors should first race with her in the following manner: The suitor was to have the odds, and if she overtook him she was to kill him, but if not, then he should be rewarded with her hand. Many suitors had been sacrificed before Meilanión obtained from Aphrodité three golden apples and offered himself for the contest. In the trial Meilanión threw the apples on the ground as he ran, and Atalanté, stopping to gather them, lost the race. All this, however, must have been subsequent to the Kalydonian hunt.

At the hunt the hide of the boar was offered to whoever might kill him. Atalanté gave the first wound with an arrow, Amphiaraios shot him in the eye, and Meleagros, at last, ran him through the flanks and killed him, bestowing upon Atalanté the head and hide. Upon this the maternal uncles of Meleagros took the trophy from her, claiming that it fell to them if Meleagros resigned his claim to it, but Meleagros, enraged, killed them both, and restored the skin again to Atalanté. This action proved fatal to Meleagros, for it is stated that when he was seven days old the Moeræ (Fates) declared that when the billet which was burning upon the hearth should be consumed he would die. His mother snatched the stick from the flames and carefully preserved it. Now, however, giving away to resentment at the death of her brothers, she restored it again to the fire and, as it consumed, Meleagros wasted away and died. Repenting, when it was too late, Althæa put an end to her own life.

In the scene upon the plate we observe in the background a castle, strongly resembling the "Tower of the Winds" in Athens. The foreground holds two hunting dogs and a net; on the left is an assistant, represented as slightly bent over, as it was customary to picture the lower classes, and bringing in one of the victims of the chase; and in the center the principal figures with weapons and a horse. Beneath the plate there is an inscription of undeciphered Byzantine characters, which was stamped at some later date.

We turn now to a new field no less interesting and no less interwoven with historical reminiscences. Previous to the settlement of Greece, and contemporaneous with our earliest record of Egypt, there existed in the valley of the Euphrates and the Tigris a powerful nation claiming as their founder the mighty hunter Nimrod. The reïcs, which are constantly being uncovered by the spade in this territory, prove the magnificence of their cities and the strength of their arms. Their houses and palaces were embellished with a regal splendor compared with which all modern efforts sink into insignificance. The centuries of that period, so closely contiguous to the deluge, records for the inhabitants of south-western Asia those changes which perpetually signalize the history of man—the rise, the sovereignty and the overthrow of empires. The long line of Assyrian kings sat upon the conquered thrones of Chaldea, to be again succeeded by Median rulers, who, in turn, yielded to the more powerful and luxurious Babylonian monarchs. The accumulation of this extensive period of conquest and glory fell into the hands of the Persians and those great peoples and governments, which seem prehistoric, were absorbed into the greater and more powerful kingdom of Cyrus. One little state only repulsed the advancing hordes of Asiatics. Greece resisted successfully all attempts upon her freedom, and, eventually, proved the law that the tendency of empire is ever westward by subduing the orient. In 226 Artaxerxes Bebigan reclaimed the different Persian states and founded a dynasty that existed for 425 years, or until the invasion of the Mohammedans. This was the famous dynasty of the Sassanides.

If these brief historical facts appear out of place we must not forget that a magnificent original art requires for its foundation a magnificent people, and, even if art be not original, it must perforce embody some of the traditions of a past glory and exhale the fra-

grance of a brighter epoch. I have given it, however, more to recall the right of the Persians, under the Sassanide kings, to a rich legacy of past skill, and to locate the objects which are to be described. The discovery in a government of Russia so far north as Viatka, of a Sassanide plate of silver is an evidence of the existence of commercial relations extending over a wider territory than, in consideration of the early barbarism of Russia, might be expected. Yet such an object was found, and also others similar in the adjoining government of Perm. Of the first a copy is included in the collection we have been examining. The plate measures 10 inches in diameter, and the silver is of a very high standard. It is bordered with tressed work, and presents, in a center of burnished gold, the figure of a dragon, winged and bearded, and with a pendant tail. His paws are those of a griffin. Before his breast are stamped in relief two flower buds with the stems touching the circumference. The scales upon the body are indicated by dots or *pointille*. It was found by a peasant named Suzof, and was secured for the Russian government by M. Frontisky at the meagre price of 200 roubles (\$152.00). Its period is probably that of the 6th century of our era. With this we also notice a shallow bowl or plate of silver, partly gilt, which has a small circular foot, and appears to have been made of several pieces. Figure 16 is an illustration of it. The subject represents a hunter

Sassanide Silver Plate, Figure 16.

on horseback turning in his saddle, at full gallop, in the well-known manner of the Parthians, and directing an arrow at a lion, already wounded, who is reared upon his hind feet in a threatening posture. From the accoutrements and dress of both man and horse we may infer that the rider is intended for the Sassanide king. In the foreground is a boar, with an arrow in his side, entangled in a thicket. Below this is a conventional representation of water with two fishes and a goose.

The archeological value and interest which is attached to these Sassanide pieces is very great, but the arguments which prove them to be of Sassanide production are too extensive for review, even if the scope of this work permitted the digression. That the skillful artists of the East, from whom the Greeks derived the bulk of their knowledge regarding toreutic work, should have cast the shadow of their art over their descendants is not incredible, and from that shadow, faint though it be, we may gather some idea of that high excellence which, in earlier times, could teach the Greek.

HON. ALGERNON S. SULLIVAN, *Counsel*.

At a meeting of the Executive Committee of the Alliance held in November, on the 21st inst., and at a preceding special meeting, the following applicants were admitted to membership, viz.:

LeG. S. Strang, Amsterdam, N. Y.; E. H. Hohl, Mauch Chunk, Pa.; Jas. B. Hayden, Topeka, Kan.; John Marsh, Antwerp, N. Y.; Sandland, Capron & Co., No. Attleboro, Mass.; H. W. Graber, Brenham, Texas; H. J. Hallock, Wyalusing, Pa.; Ripley Howland Mfg. Co., New York City; H. C. Miller, Washington, N. J.; A. M. Fargeman, Fergus Falls, Minn.

## The History of Goldsmithing.

*Continued from page 327.*

THE CUSTOM of binding the Holy Books very sumptuously, and adorning their boards with ornaments of goldsmithing, gradually became more common. There are very ancient specimens of this kind extant. We have already mentioned the copy of the Gospels of Monza which dates from the eighth century. The Bibliothèque Nationale, of Paris, and the Louvre contain several other very beautiful specimens, several of which belong to the Carolingian period. A copy preserved in the Museum of the Louvre has, unhappily, been despoiled of one of its boards; the other is ornamented with a gold bas-relief, representing the angel and the holy women at the sepulchre of Christ. It is surrounded with a small border, and between two beaded lines are contained inscriptions in Greek letters, by which characteristics we are able to assert that it is of Byzantine origin. Another copy, still more interesting to us, because it is complete and of occidental workmanship, is known as the Bible of Charles the Bald. The manuscript is one of the most precious antique volumes which we possess, both by its own intrinsic worth and the beauty of its binding of goldsmith's work.

At the mention of the name Charles the Bald, we involuntarily remember the magnificent presents which he made to the church of St. Denis when he became its abbot, and among which figured in first line a gold triptych (which was afterward converted into an altar facing, enriched with so great a profusion of jewels that their simple enumeration occupied fourteen pages of the inventory of the abbey), next, a large reliquary, in the composition of which entered nineteen marks of gold and the weight of fourteen marks of precious stones; finally, the celebrated bacchic vase, still preserved in the Cabinet des Antiquities, Paris, by the name of the "Cup of the Ptolemies." The cup is antique, but its mounting is of Carolingian workmanship.

The abbey of St. Denis contained several workshops and a school where goldsmithing was taught—which shows the high esteem in which our art was held at that early age. The prelates and abbots of the monasteries rivaled in ostentation with the kings and princes. Among the former the bishops of Auxerre followed the precedents established by their predecessors. In the year 800, Bishop Aaron, who accompanied Charlemagne to Italy, raised above the main altar of his cathedral a ciborium of gold and silver in imitation of those he had seen in Rome. Alaguilelmus, who died in 828, presented to his church a large gold crucifix, had the altar surrounded with a railing

with silver bas-relief, and added to this ten large silver chandeliers and three crowns. After him, the Bishops Heribald and Vasa endowed their cathedral with a great number of holy vessels of gold and silver. Next, at Rheims, Archbishop Hincmar enclosed the relics of St. Remy in a shrine surrounded by twelve figures of bishops. At Angers, another bishop, the blessed Perpetuees, who died in 877, followed the example of St. Elias, and wrought with his own hand two shrines in the form of spirals or small churches, for enclosing relics. He is considered the first goldsmith who applied the process of casting in molds.

The abbots, on their part, were not to be outdone. While St. Denis overflowed with riches due to royal munificence, Angilbert, abbot of St. Riquier, the favorite of Charlemagne, undertook the reconstruction of his monastery, and decorated the holy place with an extreme sumptuousness. The altar was of rare marble with a facing of gold and silver, studded with jewels, and covered by a ciborium of the same precious materials, to which was suspended a crown and a gold cross. Six bronze columns, ornamented with gold and silver, formed a sort of lobby before the sanctuary, with a roof divided into seventeen arcades, between which were suspended silver vessels.

About the same time, Ansegises, abbot of St. Wandrille, enriched his abbey and that of Luxeuil with a number of holy vessels of a great value, among which must be mentioned a superb chalice ornamented with jewels, several silver chalices with figures in relief, and an altar facing of silver.

FIG. 21.

Begon, on his part, presented to the abbey of Conques, in Rouergue, numerous pieces of goldsmiths' work, a few of which, by strange fortune, have come down to us. M. Darcel attributes to him a gold statue of Sainte Foy, of the height of 34½ inches, which is certainly the most important part of the collection, as far as beauty of workmanship is concerned. Fig. 21 represents the statuette of the saint.

A long list of abbots and prelates, who contributed largely toward making goldsmithing one of the fine arts, might be given, but we forbear for fear of tiring the reader, and we close this chapter by mentioning the names of two Norman goldsmiths, by the name of Othon, one of which lived in the time of William the Conqueror and the other one in the next century. M. Labarte also gives the names of three French goldsmiths: Odulfus, monk of St. Riquier, Berhelinus and Bernuinus, canons of Sens; both are mentioned in the chronicles of this epoch.

## 2.—Italy and Germany from the Fifth to the Tenth Century.

Although since the withdrawal of Constantine, Rome had ceased to be the capital of the Empire, it still remained the seat of the Holy See, and was esteemed as the Holy City in the eyes of the Christian world.

To the vast riches, accumulated there by the emperors, began to be added those which, in the ardor of their new belief, were deposited at the feet of the successors of St. Peter by the princes recently converted to the Christian faith; and the popes, thus placed in possession of an immense wealth, speedily applied it for the benefit of the many churches that sprang up everywhere throughout the Eternal City. The goldsmith was called on to exert his imagination by devising designs for adorning these holy places, and fashion by his handicraft the holy vessels and emblems used in the various ramifications of religion.

Rome had not lost its artists, although the goldsmiths of the Oriental Empire proved to be dangerous rivals, and when, in 357, Constance took a fancy to visit the city abandoned by his father, the Romans caused him to make his entry into the city in a chariot overlaid with gold and glittering with jewels; about twenty years afterward, the Greek Emperor, Gratian, made the same tour with his wife, and, in commemoration of the event, the Romans erected statues of silver in their honor.

Rome, however, lavished the principal bulk of its treasures for the glory of the God of the Christians and the patron saints of the church.

In the fifth century, Pope St. Celestine presented a service of holy vessels, of goldsmiths' work, to the basilica of St. Julius, which he had erected; his successor, St. Sixtus, raised a statue to St. Laurentius, also a *bas-relief* of gold, of Our Lord Jesus Christ and His twelve apostles; soon after them, Saints Hilarius and Symmachus in the same manner enriched their churches with gifts of goldsmiths' work, the list of which has been preserved to us in the *Liber pontificatus*.

What remains of all this immense wealth? Alas, nothing, or almost nothing. Beside a few vases and a small chased silver trunk, pertaining to this epoch, and preserved in the Christian Museum of the Vatican, we actually possess nothing.

From the fifth to the eighth century Italy was so often pillaged, ravaged and sacked by the barbarians, who envied each other the possession of this beautiful country, that it is rather a marvel that anything wrought before their conquests should have had the good fortune to escape. A few of these barbarians were Christians, however, and while they pillaged the country with one hand, they donated new riches to the churches with the other. To this number pertained Theodorick, the king of the Goths, and several Lombard princes. On the other hand, many others were most justly entitled to the cognomen of the "Scourge of God," for instance, Attila, Genserich, the Huns, Vandals, Saracens, these merciless pagans who knew that they could not establish a dynasty that would last any length of time, and therefore mercilessly devastated, killed and burned whatever they could not carry off.

Vainly, during these dark centuries of misfortune, did several of the Roman Pontiffs essay to decorate their churches with works of art, none the less precious in workmanship than in material. Gregory the Great, at the end of the sixth century, caused a ciborium of silver to be raised above the large altar of St. Peter, and St. Serge, in the following century, erected a statue of gold to this saint; but these works simply proved to be a bait to attract the ruthless invaders.

The end of the eighth century, however, finally brought to unhappy Italy a period of rest—gladly would we have written of peace—but, alas, such a condition was unknown at that time, and art and science gradually began to revive. The name of Charlemagne caused the barbarians to retire in hot haste, and under his powerful protection the Church again began to be the promoter of arts and artistic productions.

The first care of the Popes was to hurriedly repair the churches, which had been repeatedly pillaged and wantonly destroyed during the last two or three centuries. From the middle of the century forward, Gregory III. devoted large sums to goldsmithing of sacred objects. His efforts, however, were completely eclipsed by the numberless presents to the churches of Rome by the Popes Adrian and Leo III., contemporaries of Charlemagne, the former dying in 795 and the latter in 816. Adrian used for the holy vessels and in the decoration of the church of St. Peter, five hundred and ninety-seven pounds of gold and one hundred and thirty-six pounds of silver, and the metallic value of the pieces of goldsmiths' work which Leo III. donated to the churches during his pontificate, footed up to a sum total of one thousand and seventy-five pounds of gold and twenty-four thousand seven hundred and forty pounds of silver. Anastasius the Bibliothecary, has left us the details of all this goldsmiths' work, in

which are mentioned forty-two statues of gold, one hundred and thirty chalices and fifteen gold crosses, forty-seven lamps of the same material, etc. It is true that Leo III., who was pontiff during the time of Charlemagne's greatest power, was cunning enough to secure the lion's share of the many gifts which this great emperor loved to make to religious institutions.

His two immediate successors, Stephen IV. and Pascal I., were also lovers of ostentation and pomp. Stephen, when he went to France to crown Louis le Débonnaire, carried with him from Italy a gold crown sparkling with jewels. Unhappily, he died the next year. Pascal I., who lived to enjoy a longer pontificate, caused many handsome pieces of goldsmiths' work to be made, and especially did he have covered with ciborium the principal altars of a number of churches.

If, however, the ninth century, and more especially its first half, had been a flourishing period for the arts both in Italy and France, the following century saw this prosperity decline with the decay of the might of the Carolingian race.

New invaders, the Saracens, had overrun Italy and carried ruin and pillage into the very walls of Rome. All its industries were paralyzed, goldsmithing, perhaps, more so than the others, and only one pope, Sergius III., attempted to worthily decorate again the despoiled walls of the churches of the Eternal City.

But Rome is not Italy. Even while the city staggers under this renewed load of misfortune, the cathedrals and abbeys of all those portions of the country not visited by the invaders, and which think that they can safely escape being plundered, decorate their churches out of daring. From the eighth to the tenth century, the celebrated abbey of Monte Cassino caused to have made a great many pieces of goldsmiths' work, chiefly under the administrations of the abbots Gisulphus (who died in 797), John (who died in 915), and Alegiran (who died in 945). Fortunatus, the patriarch of Grado (who died in 824), follows this example, and the Doge Orseolo ordains the construction of the great altar piece of St. Mark of Venice, known by the name of *Palu d'oro*, which is an incomparable specimen of goldsmith workmanship and left for future generations to finish.

It is true, however, that this *palu d'oro*, at least its more ancient portions, cannot be considered as a product of Italian industry; it is established beyond a doubt that Orseolo ordered its construction of Byzantine goldsmiths. Indeed, it bears all the characteristics of Byzantine workmanship of that age—so rich and delicate in tracery, so complete in all its minute details and exquisite *cloisonné* enamel.

Another altar piece of goldsmiths' work of the same kind, to be seen in the church of Torcello, was also the work of Byzantine artists.

The intimate commercial relations existing between Venice and the Empire of the Orient sufficiently explains the reason why the Venetians made use of the well known talent of the goldsmiths of Constantinople.

On the other hand, the heresy of the iconoclastes and the proscription of the worship of images, had driven a large number of Greek workmen out of the country into Italy, who, little by little, introduced new styles and new methods. Italy had always possessed its share of artists, but to judge by the speed with which they adopted the Greek methods, we are led to think that they must have considered them to be superior to their own.

In support of this hypothesis, we may cite the admirable facing of the altar of St. Ambrosius, at Milan, known by the name of *paliotto*. The erection of this piece of goldsmithing, one of the oldest, richest and handsomest in the world, dates to the year 850.

The names, both of the person who ordered and the artist who executed it, are known to us. The founder was Angilbert, Archbishop of Milan. The artist, whose name, as well as that of Angilbert, is inscribed upon one of the panels of the *paliotto*, was Volvinus—a name whose very sound is not Greek; and although the appearance of the *paliotto* inclines to the Greek style, as do also its enamellings, still, when we examine it closer we will perceive it to be

a corrupt Roman style, by the attitude of the figures, their habiliment, style of drapery, etc.

The number and minuteness of the details which enter into the composition of the *paliotto* of Milan, render it almost impossible to reproduce it in a satisfactory manner for the columns of THE JEWELERS' CIRCULAR, and we must content ourselves with singling out one medallion (and, as we believe, the most interesting one), in which the goldsmith represents himself at the feet of St. Ambrosius. The reader will see at the same time how the borders, which serve as frames to the medallions, are arranged alternately with bezels of enamels and precious stones. Pearls are also employed in profusion in the borders. The figures are chased; those of the anterior face upon sheets of gold, the others upon gilt sheets of silver.

Upon the anterior face we behold, in an almond-shaped border, the figure of Our Lord seated on his celestial throne in the center of a large cross, each of whose branches carries the attributes of one of the four evangelists. Between the branches of the cross are disposed in groups of three, the figures of the twelve apostles. On the two sides of this central part are represented in twelve square tablets (six on each side), the principal events of the life and passion of the Saviour.

The posterior face, as rich as the other, if not by reason of the material, at least by the beauty of its decoration, possesses to us a still greater interest. Twelve square tablets, arranged similar to those of the anterior face, represent incidents from the life of St.

Ambrosius. The central portion, formed of two shutters which open on hinges, is composed of four circular medallions. The upper ones represent the Archangel St. Michael and the Angel Gabriel; in one of the lower ones, Volvius has portrayed himself kneeling at the feet of St. Ambrosius, while the other one portrays the Archbishop Angilbert in the same attitude.

FIG. 22.

The narrow sides of the *paliotto*, those which cover the two ends of the altar, are almost square. Within this square is traced a large lozenge, from the center of which is raised a large cross, sown over with an infinite number of pearls and precious stones. The empty spaces left between the cross and the border of the lozenge inclose figures to the number of eight at each end, of saints most honored in Milan. Finally, eight other figures fill out the angles between the border of the lozenge and the altar piece itself. They are figures of angels carrying suitable attributes.

The richness and exquisiteness of the borders of the frames around the different groups and around the medallions, contribute to make the *paliotto*, perhaps, the rarest piece of workmanship of the early age. Gold, precious stones, pearls and emeralds are employed with such a profusion and harmony that the eye is, at the same time, dazzled and charmed.

To sum up; we do not hesitate to assert that the *paliotto* is the most admirable specimen extant of Christian goldsmithing anterior to the year 1,000.

Germany, however, also possessed its goldsmiths in all times, even the most remote. Tacitus himself speaks of vases of silver which the ancient Germans offered as presents to princes and ambassadors. Although little is known of their productions.

Concerning the goldsmithing of the Germans of the early age, the most ancient specimen known is a chalice from the time of Tassilo, Duke of Bavaria, whose name it bears. Tassilo lived in the eighth century.

In the last years of the next century, Emperor Arnulf, or Arnul-

phus, made very rich presents of goldsmithing to the church of St. Coneran at Ratisbon (Germ. REGENSBURG), and had plated with gold the main altar of this church; he also caused it to be covered with a ciborium which was supported upon eight columns.

It appears that the industry of goldsmithing was cultivated at a very remote period in certain abbeys of the Empire of Germany, chiefly at St. Gall, this celebrated monastery, the sanctuary of science as well as of piety, which still contains a library justly renowned for its rare and admirable manuscripts. Both arts and letters in it found their number of adherents, and many of its monks were goldsmiths. The most ancient one mentioned in its chronicles is Genrich, who lived in 823. At the end of the same and the beginning of the next century, we find another monk of the same community by the name of Tutilo, who wrought for the Abbot Salomon a large cross and an altar (which means the facing of an altar) of gold, set with precious stones. Later, in the tenth century, the altar received another gold facing by the Abbot Imsicon, who appears to have constructed it with his own hands.

The example of St. Gall found imitators. To mention only one instance: toward the end of the tenth century, the Abbot Wittego, or Witigo, of Reichenau near Constance, donated an altar facing to the church of this celebrated monastery.

It is a remarkable fact that only from this century forward do we find any mention in contemporaneous descriptions of goldsmithing of German origin, of the human figure being employed in their designs. To judge from contemporaneous writings and a few specimens descended to us, we are led to conclude that the Germans produced only mediocre work, and as a body were much inferior to French and Italian workmen.

Nor does goldsmithing at this period appear to have been farther advanced in England. We find that in the abbey Ely, an abbot by the name of Brithnodus caused to have made, toward the end of the tenth century, four statues of the Virgin of silver, and enriched with jewels. But a contemporaneous witness says that these statues were of wood, and simply overlaid with sheets of silver.

Thus we see that the art of goldsmithing in Europe was, at this period, still in the cradle, and in common with the greater number of the various other arts, it was to develop only after the dreaded period of the year 1,000 was passed.

(To be Continued.)

## Lathes and Lathe Work.

BY THE MODEL WATCHMAKER.

TO MAKE our lathe centers we should get a piece of round steel  $\frac{3}{4}$  of an inch in diameter and 5 inches long. This piece of steel should be annealed by putting into a charcoal box and heating. The manner of annealing in an iron box has been described, but for those who have not the back numbers of this journal I would say, for such a lathe one should have about 3 sizes of iron boxes made of heavy iron tubing. The largest about 3 inches in diameter and 10 inches long; the next smaller, 2 inches in diameter and 14 inches long; the smallest 1 inch in diameter and 6 inches long. One end of these are to be welded shut with a wrought iron plug, and the other with a loose-fitting plug. Such an annealing tube or box is shown in fig. 1, which shows a longitudinal section; *b b* representing the tube, *a* the loose plug, *d* the welded, in plug, and *c* the piece to be annealed. The space *e e* is filled in with fine charcoal. Such a box has the piece packed with fine charcoal as shown, and the top plug *a* plastered in with clay or whiting made into a thick paste. The box should be put in a coal fire—a wood fire will do—and heated evenly until red hot, at which temperature it should be maintained for an hour, when the box should be buried in hot ashes and left to cool off, which will take 12 hours if one of the larger boxes are used. Our piece of steel should be filed to a conical point at

each end as shown at fig. 2. The points  $f f$  should be as near round and conical as possible without taking too much care. We must now provide a hand rest for our lathe. The principal part of this is made of cast iron and shaped as shown in diagrams  $A^*$  and  $B^*$ , and consists of a flat part  $A$ ,  $2 \times 6$  inches and  $\frac{1}{2}$  an inch thick, with a cylindrical piece projecting upward to hold the tool rest. The piece  $B$  extends under the ways and the bolt  $C$  serves to clamp it in any position. In turning our centers we need no slide rest, but we need a temporary center in one of the heads. This will need only a countersink in the end for one of the conical points  $f$  to run into. It is essential, however, that this temporary center should be firm in the head. To secure this steadiness we will take a piece of round iron (or a short piece of the steel rod we bored out our heads with) half an inch in diameter and  $1\frac{1}{2}$  inches long; shape it as shown in diagram  $D^*$ . To explain the manner of doing this we will refer to diagram  $D^*$ , which is a transverse (horizontal) section of the head  $F$ , fig. 3, parallel to the ways  $E$ . This diagram is enlarged to show the parts. We flatten both sides of  $D$  for  $\frac{7}{8}$  of an inch as shown at  $j$ ; this flattening is to the depth of  $\frac{1}{8}$  of an inch on each side as shown. Now, if we make a washer shaped as shown in diagram  $D^{**}$

it will slip on  $D$  until the inner face is on the line  $g$ . The lines  $g$  and  $m$  represent the inner and outer surfaces of the head  $F$ . If, now, we round up the part of  $D$ , from  $l$  to  $n$ , to  $\frac{1}{4}$  of an inch and cut a screw on it, we can, by means of the nut  $k$ , draw the center  $D$  firm against the head  $F$ . One more addition to  $D$  and we have it complete; this addition consists in filing two notches in  $D$ , as shown at  $o o$ , in which we can slide a washer cut open on one side as shown at diagram  $D^{***}$ . The loose pulley  $H$ , fig. 3, will occupy the space between the dotted lines  $p p$ , diagram  $D^*$ . At  $h$  is drilled a countersink for one of the points  $f$  to go into. The loose pulley  $H$  has a hole in which the pin from the dog  $r$  enters. The peculiarity of the manner in which the work is held in the lathe and pressed against the center  $D$  is by having the dog  $r$  made as shown at diagram  $r^*$ , which is a view seen in the direction of the axis of the lathe, and diagram  $r^{**}$  is as if seen at right angles to the lathe axis. The dotted line in this diagram represents the side of the pulley  $H$ , and the hooks  $s s$  are inserted in the pulley and serve, by means of the elastic bands shown at  $t t$ , to hold the piece  $K$ , fig. 2, pressed into the center  $D$ . We insert the piece  $K$ , fig. 2, in the lathe as shown in fig. 3. Now, one end of  $K$  is inserted into the countersink of  $D$ , and the other just extends through the back rest  $I$ . It is easy now (motion being given to the loose pulley  $H$  by countershaft and foot wheel described in last communication) to turn the point  $f$ , extending through the back rest, to a nice conical point if the piece  $K$  is round. A word or two on getting a piece of round steel for these centers: round steel can generally be obtained up to one inch in diameter almost as round and true as if turned up in a lathe. If such can be got it is best to use it; if no larger than  $\frac{5}{8}$  is to be had it will answer. If the ordinary round steel can only be obtained, point it up as at  $f f$ , so as to have the piece ( $K$ ) run as near true as possible, and without any back rest put it between the two centers,

turn about  $\frac{1}{2}$  an inch of each end true and round. Now, by means of the back rest, working alternately on these trued-up places, turn up the cones into perfect form. Then again put the piece  $K$  between the double centers and proceed to turn with your hand tools until each end is as shown in fig. 4. The reason for changing about with the piece of ordinary round steel, is because the common kinds of round steel is not true enough to get good results with the back rest in turning up the cones. While the temporary points  $f f$  are sufficiently accurate to turn a piece on each end which will enable us with the back rest to turn nearly perfect cones. Fig. 4 only shows one center, the other is supposed to be severed at  $n$ ; the part at  $u$  being  $\frac{1}{4}$  of an inch in diameter and cut into a screw and provided with a nut as shown at  $k$ , diagram  $D^*$ . The part shown at  $N$  is not flattened as in the former center. It is well to have two sets of centers, one set as shown at fig. 4, and another set with hollow cones as indicated at the dotted outline at  $v$ . It is often convenient to use such hollow cone centers for pointed bits of wire one desires to turn. Clock-makers almost universally use pointed ends to their arbors and pinions. In many of the operations of turning, the use of a weight to steady the part (a slide rest, for instance), is better than to depend on the rigidity of the parts. It has undoubtedly suggested itself to the reader that such a lathe would be a little difficult to manage about taking up wear and end shake in a piece we were turning—to illustrate, suppose we have a rod in between the two centers, and the countersinks wear a little so that end shake exists. Now, in a lathe of the ordinary construction, it would be very easy to advance the back center, as this usually is forced forward with a screw. In the present case we have to move up one of the heads with its center. This can be done quite easy by loosening up one of the clamping screws—say at  $w$ , fig. 3—and pushing the head firmly against job to be turned, keeping the guide (which has been described in a former article) pressed against the ways. Another method by which this motion would be facilitated is by putting a spring on the back of the head (say  $L$ , fig. 3). At fig. 5 is shown the bottom of  $L$ , fig. 3, seen from below; here  $y$  represents the guide piece secured to  $L$ , and  $x$  the spring. The position of the way (the back one) is indicated by the dotted lines  $z z$ . Diagram  $L^*$  is a rear view of  $L$  seen from back of the ways, and shows the form of the spring  $x$ .

## Problems in the Detached Lever Escapement.

BY DETENT.

IN WRITING these articles the writer has tried to make them thoroughly practical in every sense, and now he proposes to give the actual use of the knowledge we should have gained. He would advise changing the working model to a club tooth (it needs only the scape wheel and pallets changed—the fork and roller actions are all right), and study the principles involved, moving the adjustable pallets about so as to get effects. Still I would warn the reader that the study is more obscure than in the ratchet tooth, because part of the power is derived from the pallets and part from the impulse face of the tooth. But one golden maxim will help the reader if he takes it as the basis of his study, to solve by patient thought and analysis most of the troubles he will have to overcome, it is this: *In a good sound lever escapement the tooth engaged should leave the locking face a little before the fork has advanced one-fourth of the way to the opposite bankings, but the tooth should not drop from or leave the impulse face until the fork almost (but not quite) touches the opposite banking. And the tooth just released should not drop or fall but a slight distance (2 or 2½ degrees).* If these conditions are strictly fulfilled there is but little—indeed nothing—can be done to improve the pallet action. If your watch does not have a good motion and your escapement in the condition described, look over the fork and roller, and if these are also all right the trouble is in the train. But with faults of depth and proportion of wheel to pinion the writer does not propose, at the

present, to meddle. I do not think I can do better to instruct the student than to give a portion of a letter from a young watchmaker to whom the writer had given (not regular) but occasional instructions. He writes: "I have a fair Swiss lever, full jeweled, and a tolerably well finished train; it has a short, straight line lever which seems to be of the proper length to suit the roller. The angles to the pallets seem to be all right, both impulse and locking, *but the teeth seem to drop away up the pallets*, yet there is no *slide* when the tooth escapes as the fork is over against the bank. I can take hold of the center wheel when the balance is out and reverse the power, and the fork and pallets will buzz backwards like fun. Yet when you take hold of the fork to unlock the escapement you'll have to move the fork half way over before it will unlock. Now, what am I to do with the thing? is the escapement too deep? if so, should I take off the pallets and file the holes and set them back—this would not do, I would still have the same slide. If I close the banks the fork is too long, and if I file off the guard for bank shake the jewel pin won't leave the fork, and if I file out the fork to free the jewel the thing won't go at all, *eh?* Now, please tell me what the trouble is, for the thing has next to no motion and *stops*." Here ends our young friend's letter, and he is in precisely the same fix that lots of my readers may or have been in. Now, if he had applied the rule given in italics above he would have found the *clue* if not the *key* to the mystery in the fact that the escapement did not unlock before the lever had passed one-fourth of the way over to the opposite bank. As he writes "when you take hold of the fork to unlock the escapement you must move it (the fork) half way over before it will unlock." Let us consider the situation; suppose we make a pair of pallets shaped as shown in fig. 1, *i. e.*, pallets with all locking face and no

impulse, so that when the fork is moved over the tooth merely slides over the impulse face without imparting any accelerating influence to the pallets. Or they can be shaped so as to impart only a slight or indifferent impulse to the pallets. Now, this was precisely the case with the escapement the young man had in hand; the pallets had too much lock and not enough impulse. As this is a very common fault in Swiss anchor escapements we will give the subject careful attention. In a case of this kind we should proceed as follows: While the balance is still in put a light spring under the balance so as to hold it in any position; (I should have said, perhaps, try the balance for side shake to the pivots), and then put the tinsel or paper friction under the balance to hold it in any position—turn the balance so the jewel pin is well out of the fork, and with a fine, delicate pointed pair of tweezers test the bank shake, *i. e.*, see if the fork will make about  $\frac{1}{2}$  of its vibration before the guard point will strike the roller—do this on each side. Now, take out the balance for we have established the fact that our bank shake is all right; try the fork to see how far it has to be moved before the unlocking takes place. We see, as described in the extract from our friend's letter, that the fork passes nearly or quite half way to the opposite bank before the pallet engaged is unlocked. We next examine and see that the tooth falls after leaving the engaged pallet but about the right distance ( $1\frac{1}{2}^\circ$ ) before it is arrested by the next pallet. By this course we determine whether the pallet arm is deep enough; by this I mean we should ascertain whether even if the

impulse face should be of the correct form it would hold the tooth to its work until the desired amount of impulse is imparted to the pallet. This part of the subject is a little difficult to get the correct insight into, because some escapement makers divide the impulse up about equally between the pallet and the tooth, while some give the pallet the greatest amount of impulse. If the impulse is about equally divided the pallet *looks* thin; still, it will do its work. But if we apply the italicised rule above we shall be all right in either case. In fig. 1 at the dotted lines  $g d$ ,  $g b$  and  $g e$ , we are shown the correct angular motion of the scape wheel. At every escape or tick the scape wheel should pass through  $12^\circ$ , that is, from  $d$  to  $e$ , and the arc of motion from  $d$  to  $b$ ,  $10\frac{1}{2}^\circ$ , should be utilized as impulse, while  $1\frac{1}{2}^\circ$  from  $b$  to  $e$  is lost in so-called drop. Practically it makes but little difference how the  $10\frac{1}{2}^\circ$  are utilized, *i. e.*, whether  $7^\circ$  of impulse is derived from the pallets and  $3\frac{1}{2}^\circ$  from the tooth, or whether the impulse is equally divided between the tooth and the pallet. What to be looked after is the *drop* and see the tooth does not have to fall too far after it has ceased to act—as all this is lost. The eye will soon learn to judge if more than the necessary  $1\frac{1}{2}^\circ$  is lost in this way. It is probable that one pallet will have too much drop and the other be nearly or quite right. How to treat such inaccuracies will be described subsequently. But in regard to the error under consideration we will have to grind off our pallets so the impulse face will be capable of imparting its power to the balance. We shall have to defer the manner of proceeding of how to cut away the angle until our next; but the writer earnestly desires the pupil to study the problem considered in this communication. To make a sort of recapitulation: The arc embraced by the dotted lines (from the center of the scape wheel  $B$ ) at  $d b$ , represent the advance of the scape wheel, and all this advance should be utilized to propel the balance through the fork, and only the  $1\frac{1}{2}$  degrees between  $b c$  lost in drop. Of the pallet action its arc of motion is shown at dotted lines  $i j k$ , and all the 8 degrees between  $j$  and  $k$  should also be utilized; the arc between  $i$  and  $j$  represents the lock in this arc no power is lost except by friction as the scape wheel does not advance. The result to be accomplished is to utilize *all* the power for the balance which can be got from the angular motion of the scape wheel in its arc  $d b$ , through the pallets in their angular motion from  $j$  to  $k$ . This problem may seem a little dry and prosy, but I assure the reader that let him master it and acquire the technical skill to make the corrections, and he will laugh at any troubles the club tooth escapement may present to him.

### The Regulating of Watches.

[By HERMANN GROSCH, in his *Praktisches Handbuch für Uhrmacher*.]

*Continued from page 318.*

IF A WATCH loses in heat, move the turning screws or weights near the end of the rim closer to the notch, and if this change produces no satisfactory result, then replace the last pair of timing screws standing opposite to each other with platinum screws. This remedy is but seldom necessary, however, with the length of the balance spring at present employed. The proper way to do it is easily acquired by practice.

For adjusting in heat, the watchmaker requires a sheet-iron box, which is heated from below by an alcohol or gas flame and provided with several shelves inside, in which a thermometer, together with the watches, are located. The trials can be prosecuted from 95 to 112 and up to 22 degrees F., lasting each time for twelve hours.

For adjusting in cold in summer, he requires an ice box, the sides of which are stuffed with a non-conducting material; this box contains a strong sheet-zinc box which is filled with equal parts of cooking salt and ice; this, again, encloses another one, in which the watches to be tested, as well as a thermometer, are placed. Each of these tests is also continued for 12 hours at a time. More compli-

cated processes are necessary for producing lower degrees of cold. A very intense degree is produced by 10 parts ice, 4 parts salt, and of each 2 parts sal ammoniac and saltpeter. Timing below zero is but seldom resorted to.

Many a colleague of mine will have cracked his sly joke at my expense when he saw me put watches into the hot box; others have thought that the adjusting of the compensation was something very difficult—far more so than it really is; because, if we rightly consider the matter, we will see that no extra great amount of skill is required to shift a screw from one place to another. Care, of course, is necessary; such a balance wants to be handled gently. There is a certain kind of balances which are called compensated only by courtesy and are cut open, but an angel from heaven, even, would fail to obtain compensation and isochronism with them. In place of these wretched attempts, the Swiss manufacturers would do better to mount a simple steel or brass balance, and if they cannot leave such tomfoolery alone, they might at least desist from cutting such balances open. The sins of this nature committed in Switzerland surpasses all limits.

We finally arrive at the balance spring. There is not the least doubt that isochronism is with far greater difficulty obtained with a short balance spring than with a long one; the latter kind, if too long, are more dangerous for watches, because in consequence of the jars and blows to which they are exposed, they are apt to tangle and catch in the center wheel and regulator; beside this, an unduly long balance spring is too sensitive to concussions which injure the adjustment. Practice has established that 15 coils are suited best for an over-coil spring, the diameter of which may be equal to the radius of the balance. With this size it also becomes possible to use a nice, well hardened spring; it is a somewhat remarkable fact that I have generally found shorter springs not to be as well hardened as longer ones; I suppose that this may be due to a greater difficulty in their manufacture. Use them as broad as possible; they can be more easily manipulated, give better results and are more uniform in their performance than narrow springs, without being liable to cockle as the latter do.

The ear, even, will tell you how the spring performs; almost no sound is audible with a good, steady action, while the flat springs developing with irregularity, produce a peculiar hizzing, singing noise, easily recognized by experience, and which forebodes difficulties in adjusting. It may also be owing to an inequality in the thickness of the spring blade, single coils may be stronger or weaker than others; observe, therefore, the motions of the single coils attentively; such an inequality in the coils betrays itself by a peculiar trembling at the strongest and weakest places. Nothing can be done with such a spring, and it is best to throw it aside and take a new one.

An over-coil spring, in order to be called good, must not tremble, and when it has fifteen coils the eighth must appear to stand still. This is, perhaps, contrary to the opinion of many watchmakers, who demand a perfectly equable development throughout the entire length of the spring. The case is entirely different with a helical spring; a perfectly uniform development of all the coils of the spring must take place here, and this does really occur with every helical spring that was rendered isochronous, that is, by a proper bending of the terminal curves—a regular concentric increase or decrease in the size of the coils occurs with each vibration of the balance. Not so, however, with a flat over-coil spring; it is actuated throughout its whole length; but the first coil, lying nearest to the collet, is acted on far more than the second; this, again, moves more than the third, and so forth up to the eighth which, apparently, remains stationary, while again, the ninth coil moves, but less so than the tenth and so forth up to the fifteenth, which makes more of a motion than the fourteenth. Since at the moment of the greatest tension, when the motion of the balance has arrived at its extreme point, the eighth coil appears to stand still while the seventh and ninth move; it almost appears as if these two had approached to the eighth; this

appearance is repeated at every vibration, and is a good omen that isochronism is easily established with such a spring.

When a balance spring has not been put in yet, and it is necessary to make the terminal curves, I would advise to use for this purpose either strong steel pliers fastened in wood and which can be heated, or strong brass pliers; by the use of the latter there is less danger to injure the spring. Never bend much at a time, so that you do not overdo it, and are forced to bend back again; it is the same here as with bent pivots; if the steel was well annealed it is possible to again straighten a pivot that was not bent too much; but if you exceed the measure and are forced to bend back again, the consequence will be, in nine cases out of ten, that the pivot will break.

The knee is to be bent at a good distance from the place of fastening. I would recommend a gentle, gradual passing over into the upper coil, in place of the sharp knee so often found in Swiss watches; such an abrupt bending causes a greater or smaller disturbance in the molecular arrangement, especially with well hardened springs, which will have an injurious influence upon its capacity for adjustment. The portion of the spring bent up and again brought into parallelism with the lower flat part, is bent into a flat curve, which, when it has toward the center arrived upon the circle of the place of fastening, passes into a circle which coincides with the outer place of fastening in the stud and curb pins; this coil must be placed so that the regulator can be moved to and fro without the pins causing a displacement or a pressure upon one of its parts.

This circular bending is best performed with strong pliers specially adapted for this manipulation; one of its noses must be hollow, the other round and provided with wooden lining, between which the outermost coil of the spring, when it has been layered approximately, is pressed and heated. The rounding of the pliers must be somewhat smaller than required for the balance spring, because the latter always possesses a certain unconquerable elasticity.

The distance of the curb pins from each must not, under any consideration, be greater than twice the thickness of the spring blade. The center of the spring must exactly coincide with the center of the jewel hole.

The inner coil of the balance spring, around the collet, must be at a sufficient distance from the latter, so that there is no danger that it will either touch this or the place of fastening in the folding of the spring. This scraping, which betrays itself by a jerking similar to the cracking of a whip, would cause an acceleration of the large vibrations.

The kind of fastening is not by any means unimportant. If it were possible to make the fastening upon the collet vertical to the center it would be best, according to my opinion; this cannot be done, however, and we must follow the handed-down custom, but try to make the bend of this inner knee not round but as sharp on angles as possible—which must be done with hot pliers, and at once lay the first coil at the proper distance from the collet.

The ends of the balance spring are to be fastened with pins of hardened steel, whose sides, turned to the spring, are provided with flat faces; they possess the advantage that they can be taken out or inserted more conveniently.

Adjusting may be commenced next; the watch is permitted to go for 12 or 24 hours in one position, and we will suppose it to be the vertical; we note down the performance; it is next allowed to go for the same length of time in the horizontal position; we find that it has gained and note down its performance; and, lo, we are brought face to face with the mystery of isochronism. An adjuster who does nothing else than time watches and has a large supply of balance springs on hand, will not hesitate long in taking another spring, keeping the arc just taken down for another watch. We will try, however, to obtain our purpose with the spring in place.

First, draw through the piece still protruding through the stud so as to lengthen the spring; make the curve a little flatter or longer and compare again as before. If no improvement has been effected

by this manipulation we reverse the order, that is, we push the spring through a little more, of course beyond the first place of fastening, and shorten the curve. We then examine again.

An improvement will generally be produced by one of these manipulations, principally, however, by the change of the outer end curve. Should, in spite of this, a balance spring prove to be very obstinate, a last remedy may be employed by breaking a piece from the inner end and fastening the spring anew; it is necessary, therefore, when putting in a spring, not to leave the inner space empty so that use may be made of this last remedy; if it should become necessary when adjusting. When forced to employ this remedy break off only a little at a time.

It is quite an important matter in what angle the two places of fastening stand to each other; it is of advantage to let the inner fall in the center line of the outer curve, or to have the place of fastening at right angles to each other, although no fixed rules can for this be established, as all the other details of the watch, which are different with every one, are also to be taken into account, and the place most suitable has to be ascertained by experiments. Adjusting is a very difficult, vexatious and tedious art, and as much as \$30 are paid in Geneva for adjusting a first-class anchor movement in all positions and temperatures.

As far as my experience goes, isochronism can generally be obtained by treating balance springs in two different ways, viz., by altering the places of fastening and by flattening or rounding the curves.

In one case I was successful in obtaining isochronism by bending a serpent-like terminal curve, similar to the letter S, after I had vainly tried lengthening and shortening the spring. It will be seen, therefore, that under certain conditions, the place at which the spring is fastened, whereby it is given its tension and length, and upon which depends also its reduction into isochronism, can move within exceedingly narrow bounds. In this more had been lengthened and drawn in than could have been effected by the alteration of the curve.

Do not think, however, that isochronism can be obtained solely by the length of the spring; much also depends upon the mutual position of the places of fastening; upon this depends, first: To obtain the correct tension of the spring so that the large vibration arcs of the balance are performed in the same time, and to retain the correct places of fastening coinciding with the curve, which corresponds to this tension; and, secondly, to find the right point where, in a vertical position, in consequence of the contraction of the balance spring, the least pressure or the least friction of the pivots upon the sides of the jewel holes takes place. This point is very important; a diminished pressure makes the balance spring freer by small vibrations; by a larger pressure the balance spring cannot vanquish this friction, so that it is totally impossible to adjust in the different positions a watch with thick straight jewel holes. To make matters worse, these jewel holes are frequently set faulty, because the manufacturers, who use no olive-shaped jewel holes for the escapement holes, care little whether such holes are set oblique or straight.

For obtaining a good, durable adjustment, it is not a matter of unconcern what kind of motion the watch has, that is, how large the vibration arc of its balance is. If the parts of the watch, of the escapement, etc., are in order, and after having become satisfied by different tests, be it either by mounting a weaker mainspring or by winding or unwinding it, of the isochronism of the larger and smaller vibrations as well as in the different positions, it is best to reduce the vibrations of the balance to  $1\frac{1}{4}$  revolutions by mounting an appropriate mainspring. Ordinary anchor watches with flat spring also stand adjusting well with this motion.

We will mention still another peculiarity, the so-called "setting" of the balance spring, which becomes apparent especially in the most difficult and closest adjustments. The watches will retain their adjustment well for a few weeks, after which they will insensibly commence to accelerate, until finally, at about the end of a

year, they have attained the maximum; this is due to a molecular alteration of the steel in the balance spring, which will attain its limits only after a continued activity of the spring, when the watch will retain its adjustment to which it is subjected subsequently. I do not know whether balance springs, made from any other material beside steel, will show this peculiarity of accelerating.

If a complete isochronism could be established simply by the length of the balance spring, then the use of a flat spring would possess various advantages over an over-coil, because the latter is adjusted with far greater difficulty. I have often heard the assertion made that it was an easy matter to obtain isochronism with a flat spring, and it is indeed a matter of fact that a flat spring can be recommended to the watchmaker who is not initiated in the manipulations necessary for an over-coil spring. But in spite of this, I have not yet heard the assertion made by an adjuster, that is, an artisan who is exclusively engaged in timing the finer kinds of watches and marine chronometers—and it can be assumed that they possess a certain experience in their business—that a flat balance spring is preferable. It is beyond dispute that excellent results can be had also with a flat spring with one-half the difficulties of an over-coil, since it is necessary only with the former to operate without regard to the knee and the terminal curve, and it requires simply to draw in or lengthen out, whereby is finally found an approximately suitable place of fastening—and with the latter, the length is an important factor in establishing isochronism. When, however, the assertion is made by watchmakers who proclaim the advantages of the flat over the over-coil spring, the experienced man is really at a loss what to admit most—their inexperience or their cheek. When they thereby base their assertions upon the English watch with flat spring as support, and upon their fame of being closely adjusted, which, by the way, is much exaggerated, I am almost ready to assert that these acceptations are due either to national pride\* or still more upon hearsay and suppositions than upon proper experience. It is true that there are many closely adjusted English watches with flat spring, but this does not yet prove by any means that they are better regulated than good Swiss, French or German watches.

\* \* \* \* \*

But to return to the balance spring, of which there are three different kinds: the helical, generally used in chronometers, the over-coil or Breguet, in fine duplex and anchor watches, together with compensated balance, and third, the flat, less often employed for very close adjustments, but otherwise used in more current watches.

The helical spring unites all the requisite details with which to obtain isochronism.

The over-coil can be used for establishing isochronism, by closely keeping in view all the details necessary therefor, especially by a proper fastening and by an exact execution of the theoretically correct terminal coils.

The virtue of the flat spring for establishing isochronism is still a matter of dispute. While some declare it to be totally unfit, the contrary is proven by the close adjustment of the fine Patek anchor watches with flat spring. It is indisputable that in the hands of a skillful adjuster the over-coil spring renders the closest results obtainable; but a practice and experience of many years are necessary to do this, and unskillful hands, that attempt to meddle with such work only occasionally, can ruin the adjustment forever. A less expert but intelligent watchmaker can establish a fairly good isochronism with a well layered balance spring—one that is well suited, in point of length and thickness, to the balance and its number of vibrations. It is altogether impossible, however, to establish any rules whatever governing its length, thickness and number of coils.

\* I remember a resolution in the British Horological Institute, of Sept. 21, 1866, which was adopted unanimously, as follows: "The meeting is of the opinion that the special preference of the English watches consists in the fact that their escapement is of the best material and execution, and that up to date the English stand unapproached in this regard, and it is the sense of this meeting that these advantages be brought to the knowledge of the public."

This is proportioned to the existing power, kind of construction of the watch, size of arc of vibration, size and weight of balance, and can, according to circumstances, vary between 9 and 13 coils.

The anchor watch, which is the best for the ordinary every day's use, has to contend with the single defect that the friction of the escapement parts is proportionately large and must be overcome by the addition of oil. As soon as the oil commences to thicken the adjustment is often altered, and an early cleaning becomes necessary. Many shifts have been introduced to reduce these frictions to a minimum, by weakening the scape wheel points, rounding the pallets, etc., but in spite of this, the oil and dirt will always offer the greatest hindrances to a thorough and continued adjustment.

I would finally make a few remarks on cylinder watches. The opinion is frequently expressed, by otherwise capable watchmakers, that a mediocre cylinder watch is preferable to a mediocre anchor watch. I, for my part, prefer a mediocre anchor movement to a good cylinder, and I will say why. An anchor escapement, the single parts of which are suitably proportioned to each other, can always be adjusted more easily and for a greater length of time than a good cylinder escapement; the former is an escapement with free detent, the latter one with frictional detent, the friction of which will change unequally with time and give rise to most provocative disturbances. Nor is a compensated balance of any use in a cylinder watch, and next, the pressure exerted by the escape wheel upon the cylinder constantly presses the balance pivots to one side in the jewel holes; and the vibration of the balance, which is never detached, can never be as large as in anchor movements, etc. In consequence of these varying imperfections, we will find very great differences in cylinder watches, due to the influence of corporeal heat. If a cylinder watch is exposed to varying degrees of heat, a difference of rate of from 4 to 7 minutes can be found in temperature extremes of 30 degrees.

Every watchmaker can make this test and even more. A cylinder watch which performs well when worn by one person will fail to do so with another. The number of hours it is worn each day, whether the person moves much or not while wearing it, whether it is constantly worn in the same position and various other points must be duly considered in the adjustment of a cylinder watch. Long, irregular travel by rail, riding or an occasional non-wearing of the watch will produce irregularities. The layman, even, knows what a great difference upon the adjustment of such a watch is caused by the passing from one season into the other.

I beg to be excused from expressing my opinion of ladies' watches. Every watchmaker knows to his heart's content, or rather discontent, what an unpardonable treatment watches experience at the hand of ladies. Many of them consider them only an article of personal adornment or toy, which is hauled forth in a moment of whim or thrown aside, and then, if it does not go, the watchmaker is blamed.

The opinion that a watch should occasionally rest appears to be entertained by many; the watch is then not wound for several days, or, at least, permitted to run down; nothing is more erroneous than this. The regularity of the rate of a watch increases with the regularity with which it is wound every 24 hours; the more uniformly this is performed the more uniform its service and the more correctly it goes.

According to the kind of construction of a watch, the difficulties experienced in adjusting it in the positions augment or diminish, if the cylinder and scape wheel stand in straight line to the push-button, so that the wheel teeth exert a constant pressure upon the cylinder while the watch is hanging; the friction of the balance pivots on the sides of the jewel holes is smaller, and the watch may gain as much in a horizontal as in a vertical position. As a proof that the construction of a watch has much to do with the facility of regulating, it is simply necessary to bring it into some other position, say the VI above, and a considerable difference will be noticed.

I would advise to poise the balance exactly, to lay the balance spring well and to center it; if the watch advances more in lying

than in hanging, make a dot with a small round chamfer upon the upper half of the balance when the watch is suspended; but be careful to remove only a little at a time, so that it is not necessary to take away a quantity from the lower half for correction as the balance would become too light thereby. If, on the contrary, the watch advances more in lying than in hanging, take a bare trifle from the lower half. This remedy, of course, is only a make-shift, because when the watch is worn no care is taken to always keep the XII undeviatingly above; but, nevertheless, a sufficient degree of regularity can be produced hereby. It is advisable that the watchmaker request his customers to place their watches, when not wearing them, in the same position they assume in the pocket, that is, to hang them up.

Another point in the adjustment of a cylinder watch must be remembered: the influence of the heat of the body upon the rate, when wearing the watch; it is best to adjust it so that it will advance from 30 to 80 seconds in 24 hours, according to its kind.

I hope I have given a few data to beginners in the art of adjusting, and although I know that experienced timers will hardly have found anything new in my remarks, still, they will waste no time by reading them.

While recommending the prize essay of Mr. Immisch to the careful perusal of my friends, I will conclude by quoting from him:

"Regulating cannot be learned from books; practice and experience must contribute their part to enable the artisan to do his best in each case, and to obtain the best possible results from every watch."

[THE END.]

## Fashions in Jewelry.

---

---

### A Lady's Rambles Among the Jewelers.

THE season of 1884-85 will long be remembered by importers and producers of fine goods in all departments of manufacture, as "the rich man's poor year." In a word, unusual economy has marked a class of trade proverbial for its prodigality. With this state of affairs jewelers and silversmiths, whose stocks represent luxuries, expected almost no trade at all during the holiday season just passed, while, in point of fact, they had a relatively good one, by which is meant large sales as compared with luxurious and fancy goods in other lines of manufacture. The poor rich man, it is true, contented himself with spending hundreds of dollars where he was wont to spend thousands, but then there was a largely increased trade among many buyers who last season sought their Christmas presents outside of the jewelry stores. In a word, through all the unusual depression New York jewelers have had cause to realize the fact that the "boom" in jewelry across the seas has touched our shores. In New York city the wave is very perceptible, though in localities far removed from great business centers it is scarcely felt yet as a ripple.

\* \* \*

\* \* \*

\* \* \*

RETAIL houses that cater to the requirements of an exclusive fine trade feel the pulse of the people, perhaps, more correctly than any other class of jewelers, for their patrons are the ones after all who set and accept such fashions as a little later on have a run with what is termed the popular trade. Several members of leading up-town firms, in conversation with the fashion writer of THE CIRCULAR, have substantiated the statements made in this journal, that a revival of jewelry has come, and the only reason why a strong reaction in favor of jewelry did not take place this autumn is to be found in the finan-

cial condition of the country. Everything else favors it, and the authorities referred to look for a revival that will be felt from Maine to Texas not later than the fall of 1885.

\* \*

\* \*

\* \*

RETAIL dealers report a very material increase in the demand for all classes of jewelry, especially the beautiful flower patterns in gold jewelry, which this season have employed enamel and small gems in its ornamentation with such successful effects. There is a decided increase in the demand for bracelets and necklaces, two articles that have suffered much depression the past few years. In bracelets, while the newest patterns are flexible ones, such as the chain and link bracelets with and without gems, there is a popular run being made on bangle bracelets and the simple wire band bracelets with top finish of a flower pattern. Bracelets set with gems, by the way, show a decided tendency to Oriental taste in the association of many colored stones, and the elaboration of the gold bracelets. An importer for an up-town retail house, in connection with the subject of bracelets and chains, expressed himself as prepared to sell, one year from now, opera chains and broad band bracelets. This is possibly putting the matter too strongly, but there remains no doubt about bracelets and necklaces being in increased demand. A visit to any fashionable modiste's establishment will convince the most sceptical that these ornaments are required. With low-cut corsages and short elbow sleeves necklaces and bracelets must be worn.

\* \*

\* \*

\* \*

THE florists who reaped their golden harvests while the manufacturers of gold jewelry were most keenly feeling a depression in their business, are now complaining of the present style of corsage which prevents ladies from wearing the huge corsage bouquets that flourished at the balls and operas last winter. Colored gems, mounted in artistic settings, have taken the place of nature's ornaments, not only in the lady's corsage but in her hair, which last fact accounts for the demand for decorative hair pins. Among the very newest designs in these pins are knots and twists of gold mounted on tortoise shell pins. These knots are very effective, especially when studded with gems. Another favorite is represented in hairpins mounted with a flower piece imitating in its colored enamel a daisy, a rose, a rich hued pansy or a lily. When jewels are dropped in the heart of these flower pieces or glisten like dew drops in their leaves, the flower is set on a flexible stem so that it quivers with each movement of the wearer's head. In this connection may be mentioned, as a straw indicating which way the wind blows, the occasional appearance of back combs for the hair in beautifully wrought work.

\* \*

\* \*

\* \*

THE pendant is a popular ornament worn suspended from a gold chain or a necklace of single stones. It is also frequently worn at the throat as a pin; indeed, so popular has this habit become that many of the more enterprising retail houses are forcing quite a trade in pins, holding a middle ground between the favorite lace pin and the brooch. The flower pins first claimed this conservative place and are all the while gaining favor; and now comes the knot pin in a variety of graceful shapes and diversity of ornamentation. In illustration of the growth of these and other styles in conservative pins may be described one seen recently which certainly would not have been made without more or less faith in its success. The pin in question measured about one inch in length, was composed entirely of gems and simulated a fly. Two immense diamonds formed the body, one being of that peculiar green so highly esteemed by connoisseurs. The

wings were composed of brilliants and two rubies formed the eyes. Twenty-five hundred dollars had been put in this pin by a dealer who confidently expects the brooch next autumn, and had already found a sale for his hybrid pin. The advance of the shorter pin, it is believed, will affect but little, if any, the popularity of the lace pin, which is too convenient and practical an article to be banished. The same may be said of the little bonnet pins which ladies of means literally buy by the half dozen.

\* \*

\* \*

\* \*

IMPORTERS of colored stones, as well as the dealers who sell them to the retail trade, report these as more fashionable than ever, and likely to continue in demand with the present tendency to Oriental styles in jewelry. With the natural law of demand and supply, colored gems of fine quality, other points being equal, rank highest in price. The emerald, without a flaw, rarest of all, comes first, then the ruby of perfect tint, after which colored diamonds and pearls of desirable size and hue. In diamonds, colors much prized are a clear green and pink. The black pearl, when perfect, ranks first among pearls, generally speaking. All rare gems have advanced somewhat in value, while smaller stones and those imperfect in luster and color are decidedly cheaper. The sapphire, which a few years ago was comparatively rare and consequently high-priced, is at present a very popular stone, and this, too, at a cost reduced. The occasion of the change is the opening of new mines, which have thrown additional stones on the market. Fine opals are of rare occurrence, and there is a demand for these at good prices in spite of a foolish superstition that has, in times past, affected the popularity of this most beautiful and human of gems. The opal is usually associated with diamonds. Favorite associations in gems are diamonds and rubies, and pearls and diamonds. A necklace illustrating the latter, consists of small diamonds finished in front with three large colored pearls, one pink, one gray and one yellow, each pearl being surrounded with brilliants. In selecting opals it ought to be remembered that they vary as much in the display of brilliant colors as in their enduring qualities. The precious opals of Hungary stand first in the list, being harder as well as more brilliant than the Honduras opals. The former are usually of a bluish or yellowish white color, yellow by transmitted light, show a beautiful play of brilliant colors owing to minute fissures which refract the light. Care ought also to be exercised in the selection of sapphires. The desirable sapphire is of good color, highly transparent and brilliant. The blue sapphires of Ceylon have gained high reputation, and are, as a rule, the finest, though there are some excellent specimens in the market from the Burmah mines.

\* \*

\* \*

\* \*

THE fanciful origin and nature of jewels is an interesting study, and the magical quality ascribed to gems in the days of superstition and ignorance have followed the stones with a strange pertinacity up to the present time. Diamonds, called by the early Christians the "crystalized tears of angels," is the emblem of true happiness and purity; hence its preference for the engagement ring. Pearls, believed by the Russians to be drops of water that had been crystalized in the oyster, are emblems of innocence and modesty. The ruby, which in Burmah is thought to be a human soul in its last stage of transmigration before entering Buddha, is deemed a sacred stone which imbues the wearer with courage and noble instincts; an Oriental ruby, therefore, was early worn as a talisman. Opals, in ancient days, were regarded as royal gems, and attributed by the Greeks to be little fragments of the car of Pherbus or the sun. Originally this stone was accepted as a love gem which inspired hope and dissipated melancholy. Then followed the foolish superstition regarding its bringing ill-luck. This latter, fortunately, is dying out, and the old love gem with its incomparable beauty is again showing

its ever-shifting tints in rings, pendants and bracelets. The emerald, supposed to be far-reaching in its influence for good or for ill and ascribed to be the amulet of Venus, was thought to possess the power of making others love the wearer. Among highly moral stones rank the sapphires, which were early accepted as the jewel for the priests and saints to wear, the superstition being that the gems insured the fulfillment of prayers, preserved chastity and gave freedom from enchantment.

\*  
\* \*

\*  
\* \*

\*  
\* \*

THE holiday season brought about a number of cheering developments to the manufacturers of jewelry. It established the popularity of several new comers in way of adornments. Conspicuous among these is the Langtry chain in gold, silver and black jewelry, which many thought would prove only the fancy of a season or two. The leading retail houses of this city that have been interviewed on the subject of articles in jewelry which sold best during the holiday trade, with one accord report the Langtry chain, flower-pins and artistic designs in other short pins, chain and link bracelets and bangle bracelets, gold beads and silver jewelry in curio style as objects meeting an active demand.

\*  
\* \*

\*  
\* \*

\*  
\* \*

AN exceedingly fanciful pattern among flexible bracelets, by the way, borrows its design from the Langtry watch chain. It consists of four slender chains which fasten around the arm and drop in short lengths terminating with four gold balls. Another popular design is a gold wire bracelet with a top finish composed of a tiny pink shell on which rests a pearl. Beautifully tinted shells, decorated with pearls and diamonds, are also attractively employed on lace and scarf pins. Among new designs in bracelets is one representing a whip, the jeweled handle forming the top of the bracelet and the leash winding around the arm. There are also combination lock bracelets which open on the word "Hope" or "Love," and likely to prove popular as engagement tokens.

\*  
\* \*

\*  
\* \*

\*  
\* \*

MANUFACTURERS of all classes of jewelry who have kept pace with the progress of the times understand that a revival of jewelry and the growing tendency to Oriental tastes does not mean a return of the cumbersome and massive styles which went out when the "artistic craze" came in. People have advanced in their tastes in personal ornaments just as they have advanced in matters pertaining to household decoration, and the most popular articles to-day in gold jewelry owe their popularity to their graceful and beautiful patterns and the excellence of their workmanship. A pretty style of necklace that is gaining ground is made of arrow heads placed on a slender gold chain. The same idea is also carried out in bracelets and necklaces. If gold necklaces are to follow gold beads, as many believe, these must be produced in unique designs possessing artistic merit. The same may be said of the brooch for which there exists splendid possibilities in the near future.

\*  
\* \*

\*  
\* \*

\*  
\* \*

THE old saying as "untrustworthy as a lady's watch" has lost its significance in these days of correct timekeepers for everybody. Ladies' fine watches are now made with minute repeaters striking the hour, the quarters and the minutes. There are also perpetual calendar watches, with phases of the moon, showing also the days of the week, days of the month, and, in fact, the leap year, bringing out the

29th day of February. Ladies' watches range in sizes 10, 12, 13 and 14 line. Of late years the demand has been for watches in plain cases with monogram engraved thereon, and this style remains a popular one. There is also a demand for watches inlaid with diamonds and other precious stones; not in rose diamonds as heretofore, but brilliants, with the lid of the case pierced through, thereby introducing much more beautiful effects. Quite new are neat little watches with calendars that recall appointments made by forgetful ladies on certain days. A pretty little clock imported for the holiday trade and called the "Babé" is only two inches high, although an eight-day timekeeper. In form it follows an upright clock, the four sides or pane's being beautifully painted and otherwise decorated in gold and enamel.

\*  
\* \*

\*  
\* \*

\*  
\* \*

THE English crape stone jewelry, though of comparatively recent introduction, is already well known and popularly received by the retail trade of the country in mourning goods. As the name implies this jewelry presents a surface simulating that universal symbol of deep mourning, fine English crape, in hue, finish and sheen, and is sold on crape bordered cards. This jewelry is made in onyx and jet and is susceptible of elaboration in pattern and by the association of pearls. It presents several grades in quality thereby affording a popular grade in prices. There is manufactured a complete line of these goods, including lace pins, ear drops, bracelets, scarf pins, sleeve buttons and the like.

\*  
\* \*

\*  
\* \*

\*  
\* \*

THE great army of holiday shoppers did not all linger over the jewelers' show cases. Silversmiths deserved and gained a good trade. Retail dealers who were not well stocked with new styles in table ware and popular articles in fancy wares had only themselves to blame. Manufacturers prepared novelties in all departments of silver goods, and many of them were of such convenient and practical nature they could not fail to meet the requirements of a large class of holiday shoppers.

\*  
\* \*

\*  
\* \*

\*  
\* \*

IN sterling silver new tea sets show in their decoration a revival of the old English *repoussé* work, both with and without the oxidized finish. This oxidized *repoussé* work, it is thought, will take well, not only because it is decorative, but because of its enduring finish, which requires less care on the part of the housewife than some other styles, and grows more attractive with age. The fluted finish of Queen Anne's reign is also re-introduced in solid ware, where may be seen, too, an occasional example of the more ancient Indian chasing, and, now and then, specimens of Japanese decoration. The satin finish is still produced to meet the demand that remains for it. In presentation and fancy pieces, ornamentation occurs in applied work and the employment of gold and other metals. Popular articles in table ware are after-dinner coffee sets in Turkish and Moorish designs, and water pitchers modeled after classic shapes. These after-dinner coffee sets, with their tall, slender forms, are quite at variance with the low forms prevailing among most articles of silverware for the table. The present fashion admits of not more than three high pieces, and often only one is used. These are epergnes or fruit stands, and are placed in the center and at the ends of the table. These flower and fruit stands are often very decorative, being ornamented with applied work in fruit and flower designs. New patterns in spoon work are attracting attention, not only at home but abroad. In some of the more elaborate patterns the central figure in each spoon is unlike any of its fellows, presenting various phases of social

life in the times from which the designs were modeled. Children's sets, piece by piece tell, in illustrated story, the varied fortunes of Peter Piper and other nursery heroes.

\*  
\*\*\*  
\*\*\*  
\*\*

THE cosy English fashion of making tea on the table, which has gained some favor here, has brought out, both in sterling silver and fine plate, many beautiful designs in swinging kettles and caddies. This season comes, in this connection, the tea-ball, a Japanese idea. This ball is made of open silver work and hangs suspended from a silver chain; the tea is placed inside the ball, the ball dropped into the urn or kettle of boiling water where it remains until the tea is "steeped," when the ball is withdrawn, leaving the beverage quite free from leaves.

\*  
\*\*\*  
\*\*\*  
\*\*

IN FINE plate ware are to be found the prevailing low shapes and new style of finish that characterize the solid silverware. Indeed, it has become an undisputed fact that plated ware produced by leading manufacturers is not only marked by its excellent wearing qualities, but by good forms, new styles of finish and artistic ornamentation. The advance made by these manufacturers is briefly told in the fact that twenty-five years ago English manufacturers were depended upon in this country for fine plate goods, while now only an occasional piece of English ware is seen, and an export trade to markets formerly held by England is increasing each season. In silver plate ware the variety of finish gives a wide field for selection. In addition to the *repoussé* and fluted work, occurs the damascene engraving associated with fine die cut border. An attractive style of decoration, also new, is that of bright cut engraving on a satin finished surface. The satin finish, which remains popular, is often associated with the plain finish, the latter occurring on the parts exposed to most wear. Oxidizing and copper are much employed for the decoration of silverware, especially such articles as gift pieces, and flower and fruit stands.

\*  
\*\*\*  
\*\*\*  
\*\*

NOT only do the manufacturers of fine plate ware afford their patrons the choice of new forms and styles of decoration, but they produce all the classes of articles to be found in sterling ware. There are not only solid silver manicure sets, shoe lifts and buttons, brushes with solid silver backs and handles, shaving and toilet sets of pure silver, but in heavy plate as well, and showing the varied styles of finish. The articles here mentioned, by the by, were fairly popular ones with holiday patrons, and commend themselves as desirable additions to every retail dealer's stock. The same may be said for the very full and varied line of individual "peppers" and "salts," breakfast and other small casters.

\*  
\*\*\*  
\*\*\*  
\*\*

SOME of the most popular articles in silverware were the hardest to introduce. Every manufacturer will remember the brave struggle made with the public before the pickle stand, of English origin, gained a wide-spread recognition. To-day the retail dealers do not handle a more popular object, unless it be the necessary butter dish and cake basket. Cake baskets, by the by, should be in every jeweler's store, even though the town in which said store is located does not number more inhabitants than the fingers on one hand. Why it is remains a conundrum, but it is a fact that every country housewife covets a cake basket, and is not quite content with her table

ware until it embraces this article. The best styles in cake baskets, it may be explained in this connection, are the low shapes. Another article of practical nature difficult to introduce, but very popular now among the city folk, is the baking dish. Vegetable dishes are also in high favor. These dishes are not very ornamental, but when made of good plate are enduring, outlasting many sets of porcelain ones and proving cheaper in the long run. Of an economical nature, too, are the silver plate water pitchers, which last a life time, and lend attractiveness to the table with their beautiful finish and artistic forms. For water pitchers the demand is all the time increasing.

\*  
\*\*\*  
\*\*\*  
\*\*

EVERYBODY may not know the prominence which American cut glass has attained in the world of fashion. Dealers in choice china and glassware in this city are selling it to their most fastidious customers, who select it when lying side by side with that of English manufacture. Manufacturers of sterling silverware are very generally adopting it. A prominent manufacturer claims that the finest quality of American cut glass, which, it may be explained, is made in this State, gives equal satisfaction with the better grades of English glass, and is used in preference by him. Fine colored glass suited to toilet sets, vases and the like, our jewelers and silversmiths, however, are obliged to import. While on the subject of glassware it is only fair to add, that from Pittsburgh comes a remarkable quality of pressed glass closely imitating cut and engraved glass. The association of silver and glass is an important one, representing not only the usual table pieces, such as casters, epergnes, pickle and cheese dishes, and ice cream and confection plates, but decorative household articles like vases, toilet sets, perfumery bottles, liquor flasks and pungents.

\*  
\*\*\*  
\*\*\*  
\*\*

AMONG silver articles in jewelry that had a great run during the holiday season were silver lace pins in curio style. These reproduce in design antiques, such as old coins, bits of remarkable frieze and models from the British museums. All the antique styles show the oxidized or old silver finish which insures each piece growing more and more attractive with age. Silver Langtry chains also had a run, as did silver bracelets. Novelties in scarf pins showed small antique silver coins mounted in gold. Curiosities in way of silver match boxes and cigar cases are those covered with coins, oxidized so as to represent great age. A unique pin cushion designed for gentlemen's use, is composed of a tiny roll of blue or red velvet wrapped around with a split trade dollar. Another new pattern comes in form of an owl's head in silver with amber eyes. Match box, seen, represents a piece of Fabers' rubber, the wood part being of copper and the rubber portion of silver.

\*  
\*\*\*  
\*\*\*  
\*\*

THE individual "salts" and "peppers" which are out this season in a greater variety than ever, are having a run that reaches more homes, perhaps, than any other modern article of table ware. These goods represent such a wide range of prices that there remains no reason why every retail store, however small, should not possess a full stock of them. With this suggestion may be safely added another to out of town retail dealers. In buying any class of goods, however small in price, have a care to buy silver plate ware of trustworthy manufacturers only, even if you pay more for it. Articles put on the market without the stamp of a good house, mean that no one is willing to be responsible for their manufacture; certainly no dealer can afford to run the risk of selling such goods. Leading manufacturers are all plating on white metal and produce what is termed by some "quadruple plate," in reality a plate 20 per cent. purer than

the old triple plate, and representing the best quality made. One word more. Manufacturers each season incur heavy expense in bringing out new designs. The better class of people in your town, in these days of rapid transit and cheap rates, keep pace with the fashions and want the new things. If they do not find these new goods on the resident jeweler's shelves these jewelers do not get their money, but it goes to the nearest large city. A word to the wise is sufficient. Take advantage of the cheap rates yourself once a year, and through your own eyes learn what is going on among the leading manufacturers of jewelry and silverware.

ELSIE BEE.

### Pearl Fisheries on the Pacific Coast.

ABOUT 100 years ago Juan Oxio first called attention to the vast source of wealth concealed in the mud which lay at the bottom of the waves of the Gulf of California adjacent to the eastern coast of Lower California. He discovered there immense beds of the pearl oyster and realized great wealth. He fished principally for the black shell (Conchanacar), which is found in great quantities from San Sebastian Bay to the mouth of the Rio Colorado. After his death the industry was followed in a desultory fashion until about 1859. From that time till 1872 it was pursued in a more systematic manner, the trade, however, being practically monopolized by the agents of wealthy European houses, who established themselves on the lower peninsula, and purchased the pearls and shells on the ground as soon as removed from the water. About that time some of the merchants of La Paz discovered that they could deal directly with Paris, London and Hamburg, and save the profits of middlemen, and the European agents were, so to speak, starved out. Still the fishing was conducted on the old and time-honored system of using divers trained by long experience to remain perhaps two, or at most three, minutes under water.

In 1875 two schooners, each of about 200 tons, one from Australia, the other from England, went to these waters, liberally supplied with diving apparatus, helmets, rubber suits, hose and life lines, and thirteen boats and boats' crews to operate them. With the aid of these appliances they made a clear profit in six months of \$125,000. The merchants engaged in the fisheries purchased the diving apparatus from the schooners, and since that time the diver's helmet has driven the unfortunate individuals who made their living by holding their breath entirely out of the pearl-fishing fields of labor. But the advantages possessed by the pearl fishers of La Paz were advantages which might be shared in common with any other persons who could command the capital necessary to go into the same business. The idea of seeing strangers and aliens come in and scoop up from the bed of the gulf the wealth which they were beginning to regard as their inalienable inheritance was intolerable. But how to avoid it was the question. That conundrum was soon solved by the elevation to the Mexican Presidency of General Gonzales. That gentleman was applied to, and by "proper representations" his favorable consideration was secured and given to a plan by which, on the 28th of February, 1884, five concessions were granted to five gentlemen. The concessions give these gentlemen, their associates and assigns, the exclusive right and privilege of all shell fisheries in their respective zones for the period of sixteen years, paying therefor a royalty and export duty in full of all claims of the government, amounting altogether to \$10 a ton on all shells exported for the first three years, and \$15 a ton for the remaining thirteen years.

The holders of these concessions immediately consolidated their interests, as no doubt was the original intention, and dispatched Juan Hidalgo, armed with powers of attorney and all necessary credentials, to obtain the capital necessary to systematically work one of the most gigantic schemes of monopoly which the world has ever seen. Senor Hidalgo's efforts in San Francisco have been suc-

cessful, and in July last, under the modest title of the Mother-of-Pearl Shell Company, a corporation was formed under the laws of California, with Juan Hidalgo as President, George W. Watts (General Freight Agent of the Union Pacific Railway) as Secretary, and D. Samuels, R. E. Phillips and Julius Jacobs as directors, with a capital of \$500,000. It is hinted that in addition to the foregoing names a number of our prominent capitalists, among others ex-Governor Perkins, are interested as stockholders. As an evidence of the enormous profit to be made by this gigantic scheme, it may be mentioned that for the past two years the yield of the fisheries, conducted with four schooners and twenty boats, has been from \$200,000 to \$250,000 in pearls, and about 900 tons of shell, worth from £60 to £70—say £65 a ton, or \$292,500, making a gross yield of \$542,000 per annum.

The company has now four schooners on the fishing grounds, the *Porfirio Diaz*, the *Adriana*, the *Consuelo* and the *Paloma*. The fisheries are conducted as follows: Each vessel carries five boats, and each boat carries a crew of six men—a diver, two men to work the air pumps, one at the life line and two at the oars. The vessel having anchored on favorable grounds, the boats put off from the ship's side early in the morning. The diver is lowered and remains on the bottom for two or three hours at a time, and by 3 o'clock in the afternoon he has filled his iron basket with from seven hundred to two thousand shells. At that hour the shells are opened by the officers, who remove and retain in safe keeping the pearls, which are principally what are known as black pearls, of great rarity and value at present. The decks are then cleared up, and the shells consigned to the hold, and work discontinued for the remainder of the day. The pearls and shells are sold in the markets of London, Paris and Hamburg—principally London.

Preparations are being made by the company to send, as soon as possible, a large fleet of vessels, equipped with all the improvements in diving apparatus. As a further instance of the enormous powers conferred by the Gonzales Government on its favored monopolies, the holders of the concessions are authorized, without any process of law, by force of arms, if necessary, to arrest any person found fishing in the waters of the gulf without a permit or license from Senor Hidalgo, and his associates, or their assigns, and to seize their vessels and consign them to the Mexican authorities, to be dealt with according to Mexican law, and all custom-house officers on the gulf coast have been instructed to recognize the permits and licenses of the holders of concession, with the same effect as if issued from the fountain-head of the government.

### Proceedings of the Horological Club.

#### A DISTINGUISHED BODY OF WATCH AND CLOCK MAKERS.

*One hundred and twenty-sixth discussion.—Communicated by the Secretary.*

[NOTICE.—Correspondents should write all letters intended for the Club separate from any other business matters, and headed "Secretary of the Horological Club." Direct the envelope to D. H. Hopkinson, Esq. Write only on one side of the paper, state the points briefly, mail as early as possible, as it must be received here not later than the eighth day of the month, in order to be discussed and reported in the CIRCULAR for the next month.

#### WATCH CLEANING AS DONE IN WATCH FACTORIES.

*Secretary of Horological Club:*

I must beg pardon of "Mr. Clerkenwell" for not being more explicit in my last communication, but think he will excuse my shortcomings when I tell him it was my first attempt, and feared it would not find a place in your valuable journal.

In reply to his inquiries and criticisms I would say that this "wooden box" was for the purpose of holding the movement only, and was not to be "dipped;" and it was very convenient for keeping the different parts of the watch in such a manner as not to get as mixed as my communication appeared to be. I send you a rough

design of the aforesaid box, which I think will enable you to see more clearly what I wished to convey. I would also wish to say that steel works (except pinions) was not put into cyanide at all, but was washed in benzine and dried in sawdust; that the brass work was dipped into a weak solution of cyanide of potassium, not allowed to remain, then washed carefully and thoroughly in warm water with brush and soap, then put into alcohol and dried in sawdust. Balance was trued and poised, and the escapement adjusted before being cleaned. I believe a thorough understanding of escapements, etc., as very necessary, and is the most important part of watch repairing, for, unless the escapement is properly adjusted and the balance true and equally poised, it will be impossible for a watch to keep good time. It is not sufficient that the watch should run, but it must also keep correct time; and my experience in a job shop has been such as to lead me to believe that escapements are not understood by workmen as they should be. For those who might be interested, I would refer them to the design of escapement as published by The Fredonia Watch Co. as a study, and think that by understanding the same they will be more than repaid for their trouble. If they will understand the relations of the jewel pin to the size of slot in the fork, the guard pin to the roller, the banking to the lock, drop and slide of the pallet stones to the teeth of the scape wheel, and all other parts of the watch being equal as to correctness, I will guarantee that watch repairing will become more of a pleasure to them than it has ever been before.

These hints and suggestions without price or favor are given for what they are worth. No charge, and hope they are clear enough to set some one a thinking.  
X. Q. Z.

Mr. Clerkenwell replied, we are always glad to hear from our readers who have special information of any kind which will be interesting to the trade, whether it is obtained from sources not open to others or learned from their own experience or invention. Anything of the kind is sure of insertion in due time. Even when parties have new tools or attachments which they are manufacturing for sale, we are ready to publish descriptions with cuts if furnished us for that purpose. We would not, of course, insert advertisements of anything, but such information about the articles as will interest readers generally, we willingly give without charge. Whenever possible, a sample should be sent for examination to base the description upon. Let us hear from all who can tell us anything new.

It seems that the wooden box is not for dipping into the cyanide solution, but merely to hold the pieces before and after cleaning, having a place for each size of part. The object of cyanide is to remove stain and tarnish and give the pieces a bright fresh look. But great care must be used or it will take off the gilding entirely. Other cautions were given in the discussion in our Proceedings for December.

He agreed with Mr. Z. about the necessity of the watch repairer understanding escapements, etc., for no matter how clean and bright the movement may be, it cannot keep time unless it is mechanically correct. In fact, it is rather aggravating to have a watch look so awful nice when it is not worth a tinker's cuss for time. All repairing and correcting comes before cleaning, both in importance and in order of execution. Workmen who cannot repair a watch properly have no business to touch them for cleaning, for it is an imposition to clean them and leave them out of order. We hope Mr. Z. will give us items upon other matters of factory practice which are better or different from those usually followed by the trade.

#### BOOKS FOR WATCH REPAIRING.

##### *Secretary of Horological Club:*

Can any member of your honorable Club tell me where I can get a suitable book for recording the watches which we sell and repair.

A. W. JOHNSON.

Mr. Uhrmacher said that Mr. J. would find two or three fully described in our Proceedings in the back numbers of THE CIRCULAR, with methods of filling them out, etc., etc. He thought that it would pay the publishers of such works to keep a short advertisement in THE CIRCULAR as they are constantly wanted. The name and address of our correspondent are given in full, so that those who have such for sale may communicate directly with him. We will

also insert short notices of such in our Proceedings, if the publishers choose to furnish us the information.

#### EXCELSIOR'S TREATISE ON THE BALANCE SPRING.

##### *Secretary of Horological Club:*

I have lately been reading "Excelsior's" book on the balance spring, and there are some points in it which I do not understand and would like to have some member of the Club explain it.

On page 77, section 146, he describes how to make the curve for isochronizing the hair spring. Now, I do not see how the outer coil of the spring can be bent into the shape represented in fig. 7 without interfering with the other coils. Also I find it hard to tell the extent of vibration of a balance, as, for instance, in adjusting to positions he says that by watching the balance vibrate one can easily tell whether it will gain or lose in different positions. By explaining these the Club will greatly oblige  
J.

Mr. Isochronal replied that, in the case of a spiral or helical spring the coils would not touch, even if the outer one was bent in the center. When a terminal curve is formed on a flat spring, as in the Breguet form, the outer coil is raised up by an elbow or band, so that it lies *over* the other coil constituting the body of the spring.

To observe the extent of the vibration of the balance, run your eye around the rim and you will see some point, as a screw in the rim, a mark on it or the end of one of the balance arms, which can be distinctly observed when the balance stops and begins to turn the other way. Notice some stationary part that is exactly opposite or under that screw at the turning point of the vibration. Now, whenever that screw fails to reach that point or goes beyond it, you will see at once, and see how much it falls short or goes beyond it. By noticing how far the screw reaches in *both* directions, you have the extent of the vibration between those two points. If the screw reaches the same point from each direction, the vibration is "one turn." If it goes  $\frac{1}{8}$  of a turn further in each direction, that is  $1\frac{1}{4}$  turns; and if it falls short  $\frac{1}{8}$  of a turn both ways, the vibration is  $\frac{3}{4}$  of a turn. A little practice will enable you to notice the extent and variations, and to estimate the proportion of a turn.

#### THE BEST KIND OF OIL FOR FRENCH CLOCKS.

##### *Secretary of Horological Club:*

What is the best kind of oil for French clocks? One jobber wrote me clock oil, another wrote me watch oil. I refer the question to the honorable Club.  
E. K. B.

Mr. McFuzee said the proper kind of oil for clocks was clock oil. It was made, or should be so made, as to have more body than watch oil, which was thinner and better adapted for fine holes and slight pressure. The heavy pressure of clock pivots would be likely to force the thin watch oil entirely out from under it, and so defeat the object of oiling, which is to have a lubricating layer or film between the two solid surfaces.

As to the kind of clock oil, there are a number of good oils on the market. Moebius oil, sold by Keller & Co., 64 Nassau St., is highly spoken of, and the genuine Kelley's oils are known everywhere as good, and can be obtained from any respectable jobber. Only the best clock oil should be used on French clocks as they need something thin, but an oil really fit for watches would be too thin for clocks. Doubtless there are other oils as good as those named, but only such as are known to be good should be bought, whether for clocks or watches.

#### CURIOUS PHENOMENON IN WATCHES.—EXPLANATION WANTED.

##### *Secretary of Horological Club:*

As I have derived much information from your deliberations of late, I would like to further increase it by asking a few questions. A few days ago I took in a common cylinder movement to repair. After taking out the balance I wound the spring a little to see if the train would move, and if not, why. I found that the top jewel of the scape wheel was loose—in fact, so much so that it turned with the wheel, but to my surprise it turned in a *contrary direction*. At the risk of breaking a pivot, I wound the spring well up and found that the jewel increased its speed, but still moved in a contrary direction to the scape wheel. On taking out the barrel and moving the center wheel, I found that whatever way the wheel was made to

move, the jewel would go the other way. I would like to know what caused the seeming inconsistency.

I also send some specimens and questions for the *scientific member* of your honorable body. No. 1 is common enough, probably, as I have seen it in many different places. It is of all sizes and shapes, but always hollow; the inside being filled, when the rock has not been broken, with a red or yellow clay, which dissolves readily in water, which, on being decanted and evaporated, leaves a deposit perfectly free from sand or grit of any kind. To the outside of these hollow rocks are cemented innumerable large and small rocks like Nos. 2 and 3, etc. The surrounding earth is also filled with 2 and 3 of all colors and of different colors in the same piece. These are also found attached to the inside of the hollow rocks. So firmly are they fastened, both inside and out, that they cannot be detached without breaking the rock. The appearance of the No. 2 and 3, etc., would indicate the action of water, while it seems that nothing but heat could have so closely united two bodies of such seemingly different construction. The hollow rocks seem to have been forced into different shapes by some outside influence while in a plastic state and thus left to harden. Depressions on the outside have nearly all corresponding elevations on the inside surface. The strata is about two feet thick, resting on a soft sandstone rock in a yellow clay bed, about ten feet from the surface, where a wash has occurred in a hillside.

I would like to know the theory of the formation of these rocks, and the probable time it has taken.

S.

Mr. Ruby Pin, to whom this letter had been referred for reply, said he was unable to account for the reverse motion of the jewel. If what Mr. S. saw was not a reverse image reflected from the polished surface of the jewel, but there was really a reverse motion of the jewel, then it was a very curious phenomenon which he would have to leave to some one else to explain.

In reply to the other question, he believed that none of the members were acquainted with the science of rockology. He had asked a friend of his, and got an explanation so learned, profound and extended that it had quite upset him. He thought his brains were still a little muddled from the effects of such a deluge of scientific profundity, and about all he could remember of it was that the hollow rocks were of a chalky or limestone nature; that while soft they had either been expanded by liberation of carbonic acid gas from the carbonate of lime, or they had formed a sort of shell for some low order of primitive creature which had subsequently decayed, and all evidence of organic structure had disappeared. The other rocks were united to them by a clayey cement, by the action of water which had evaporated and firmly united them. They were subsequently washed down into beds or strata as found. They belonged to the silurian formation, which was of a comparatively recent date, say only five or six hundred thousand years ago, or such a matter—a mere trifle any way. In conclusion, he said he had manfully endeavored to accomplish the task imposed upon him, regardless of the risk to his mental solvency which he incurred thereby, but he threatened that a due regard for the interests of his family would compel him to resign his seat in the Club rather than again undergo such a trying ordeal.

Mr. Windbag, a new member, thought that the action of the jewel described by Mr. S. could easily be explained under the doctrine of the conservation of energy. No energy can be destroyed. It may disappear in the form in which it had before existed, but it was not annihilated—it had only changed its form, and an equivalent still existed in a different form of energy. As everybody knows, action and reaction are equal. So, when the kinetic energy revolved the wheel in one direction, as a result of its action, re-action would naturally tend to revolve the jewel at an equal speed in the opposite direction. As the jewel was free to move, in this case, the tendency was eventuated into an actuality. He saw nothing very wonderful about it. It was simply a beautiful illustration of the harmonious evolution of natural laws.

The other members blinked hard, but didn't quite seem to comprehend it. Mr. Ruby Pin showed signs of great mental agitation, and soon became quite incoherent in his remarks, declaring that he would move for Mr. Windbag's expulsion as an incendiary, and other

similar expressions indicating a disordered mind. His condition soon became so alarming that the Chairman sent a messenger around the corner for a pitcher of milk (at Mr. Windbag's expense), and the Club then adjourned in order to devote their entire attention to administering the soothing medicine to the sufferer. The Secretary is pleased to state that the medicine had the desired effect. Mr. Ruby Pin became reconciled to Mr. Windbag, and the members separated in a highly benevolent and Christian mood.

---

### Musical Boxes and their Manufacture.

A GENTLEMAN who recently visited Yverdon, Switzerland, where music boxes are extensively made, inspected the large factories of Messrs. Paillard & Co., and furnished an interesting account of his visit to the *Watchmaker, Jeweler and Silversmith* of London. We make the following synopsis of his letters:

I was first taken into the show room of instruments that were complete. The first musical box I examined had some special features well worthy of notice. Among others I may mention the size. It was unusually large; height, 4 ft.; length, 4 ft. 4 in.; breadth, 2 ft. 5 in. The style is that known as Louis XVI., which aims more at grandeur than solidity; there is a lightness and a delicacy in the design which makes it specially suited to the drawing-room. It was made of ebonized Spanish mahogany, profusely inlaid with figures of brass, ivory and mother-of-pearl, all of which were exquisitely engraved. The edges, escutcheons, feet, etc., were of solid cast brass, richly chased and water-gilt, and finally covered with a thin transparent lacquer which effectually prevents tarnish. The workmanship and beauty of finish were of the highest possible order, and it would be no exaggeration to say it would grace the best room in Marlborough House or Windsor Castle; but its chief glory is its music. I can feel its wondrous and ennobling power, and yet my pen is paralyzed and powerless when I try to describe it. It commenced by playing a simple yet plaintive air, and it produced a peculiar lingering effect similar to a band of music that is traveling, and eventually the tune is lost in the distance. And just when I thought the performance had ended, it suddenly burst forth with a volley of sweet thunder, and for a moment I feared that some of the machinery had given way, and the energy of the four great mainsprings that were driving it was about to work speedy destruction, but was soon reassured and again enraptured by the grand chorus which gradually became lower, and then lingered and at last died away; and I listened and listened, hoping to hear a repetition of the sublime harmony.

The playing this air occupied about fourteen minutes without any cessation, and this brings me to consider a new feature in musical boxes, the introduction of which is due to Messrs. Paillard & Co. An ordinary box with the largest cylinder made, diameter, 36 lines, or  $3\frac{1}{4}$  ins., playing at slow time, occupies about one minute and eight seconds to play each air. The mechanical combination employed by Messrs. Paillard & Co. for playing long pieces of music without intermission, consists of a duplex cylinder operating upon two separate combs. In the spaces between the wheels at each end of the cylinder will be found the ordinary arrangement by which the barrel is shifted for playing a fresh tune; but they do not operate simultaneously; the one at the extreme left operates first, and while this barrel has ceased to play and is being shifted for a fresh part of the air, the strain is continued by the barrel on the right hand; immediately the left hand barrel resumes playing, the right hand barrel is then shifted, and they accompany each other. Anything more simple or more mechanically perfect it would be difficult to conceive. The proprietor was kind enough to give me the history of this invention. It appears the first idea occurred to Mr. Amedée Paillard, in the year 1873, while employed in constructing a magnificent musical box for the Philadelphia Exhibition, valued at £1,200.

But the mechanism he suggested was perfected and simplified by a St. Croix workman—a Mr. Jeanrenaud, recently deceased, who sold his invention to the firm of Messrs. Paillard & Co.

When Sir Edmund Becket was designing the celebrated Westminster clock, he experienced what all makers of quarter clocks have experienced—a difficulty in getting machinery to chime the four quarters in equal periods of time. He found that the heavy bar in the first quarter greatly retarded the progress of the fly, and consequently it was played at very slow time; but the fly having to some extent got up speed, the second quarter was played in much less time; the third was quicker still; and the fourth so quick that it completely destroyed the effect. After trying several expedients, he at last adopted what Vullamy had long ago suggested, viz., to increase the size of the fly and its number of revolutions, and also increase the motive power until the desired result—perfect time—had been obtained. Sir Edmund has more than once acknowledged his indebtedness to Vullamy, so that the charge of plagiarism cannot be preferred. The mechanical principles which underlie the foregoing remarks on the fly is precisely what this firm have adopted in all their large musical boxes—abundance of power, with a very large fly measuring  $5\frac{1}{2}$  inches by  $2\frac{1}{2}$  inches. Instead of the old expanding fly they have introduced a new and very ingenious device, which consists of two wings joined together, and may be shifted from a vertical to a horizontal position for the purpose of regulating the time.

The enormous power required in their large boxes is obtained from four large barrels operating in one pinion; the diameter of each barrel is  $5\frac{1}{2}$  inches, and the width  $3\frac{1}{4}$  inches. The advantage of this combination is this: the main springs are all broad and thin, and on this account are not likely to break. I estimate their combined force at four hundred pounds, and though the power is so great, yet by the combination of levers attached to the barrels they may all be wound at once by a child.

The fly is in a vertical position for playing at slow time; but by moving the screw near the top pivot down the slot the wings take a horizontal position, which, in rotating, experiences little atmospheric resistance, and consequently increases the speed. The advantages of this arrangement over the old style are these: It is perfectly noiseless. The whizzing sound in the old fly often arises from the unequal positions of the wings, and forms a most unpleasant accompaniment, especially when the music is soft and smooth, and is more easily shifted, which is a great convenience to those who are not familiar with mechanical operations. It is made in a very fine press tool, out of one piece of sheet brass; so that its parts are few and cannot easily be broken. In its performance I could not detect the slightest hesitation even in the heaviest bar of music. By using this fly a musical box may be made absolutely perfect in time; so perfect, that the most accomplished performers, vocal or instrumental, cannot hope to rival it.

But while a musical box has many great advantages it has its weak points also. Hitherto it lacks expression. I shall be allowed to explain that this word expression is employed to represent, not the mere act or power of uttering articulate sounds, but rather the *manner* of doing it, so as to produce a striking effect and forcibly appeal to the feelings. As in reading and declamation an accent or emphasis is laid upon particular words and syllables, so a similar force of expression is given to certain notes in music. *Expression* constitutes one of the first requisites of a musical performer; and though attention to the rules of art may assist, yet, to give it due effect, much must depend upon feeling, taste and judgment. A master in music will sometimes give such terrible emphasis as to make us tremble at the performance of the "Dead March in Saul;" and it is also the same source which enraptures us with grateful assurance when we listen to the grand production of Haydn in his most beautiful anthem, "As pants the hart for cooling streams," and it is surprising to find how near to perfection are some of the instruments produced by this

firm. The same high commendation may be given for transposition of music; it is as correct as possible.

Time and space would fail me were I to attempt even to enumerate the volumes of music to be found in their library; it must suffice to state it contains the principal productions, sacred and secular, of the greatest masters of ancient and modern times. Here you will not only find the collection of Pope Gregory I., which it is well known contains the very tunes which Jesus sang, but you will also find the most recent air that is sung at the missionary meetings of Moody and Sankey. I was surprised to learn that no less than 6,000 pieces are in stock to select from.

In making a key-board, or comb, as it is sometimes called, no expense is spared by the proprietor in procuring the very best metal that can be obtained, and which experience has proved to be most suited for the purpose. It is that which is known as mild cast steel or spring steel. It is not so highly carbonized as that which is used for gravers and cutters. The workman no sooner takes the rough piece of metal in hand than he commences to examine it most carefully to see if there is any flaw or imperfection in it. The tests applied are such as these: First, the tensile strength is examined; if it shows a tendency to elongate and then return, as it were elastic, it is a good sign; a small piece of the metal is then broken of; if it shows signs of toughness and has to be bent backwards and forwards several times before it gives way, this is also a good sign; but if it should break easily it is at once rejected. The broken surfaces are then examined microscopically, and flaws in the metal, if any, are then easily detected. If on the broken surfaces large bright crystals appear, after showing but little strength in breaking, the metal is undoubtedly bad. The sound of the metal and continuation of the note is also a test. The workmen possess great skill in these preliminary operations. The pieces of metal are cut from the large sheets by shears, and always so cut that the teeth of the comb can be cut in the direction of the grain, *i. e.*, the direction in which the metal is rolled. It is then planished and annealed, being made red hot—a dark red, not white heat—and covered up in plenty of saw-dust so that no air can get to it, and allowed to cool gradually. The teeth are cut with great rapidity and exactness in an elaborate dividing engine worked by steam power. In the tuning of the key-board it is sometimes found, notwithstanding the care in the commencement, that one or two of the keys will show feebleness, and want power and volume of utterance; these keys are taken out and new ones replaced by the following process: A key is made the same shape and temper as the defective one, but on the under part a foot is formed. A slot is then filed out of the steel block of the key-board the exact size of the foot. The new key is then gently hammered into its place, care being taken in this operation to fix it in a line with the other keys. It is then soldered in its place with the ordinary soft solder and soldering spirits used by tinmen. In this operation it is necessary to use a very large soldering copper bit, weighing about seven or eight pounds; a smaller one will not retain sufficient heat to penetrate the key-board. When the key is well fixed, it is filed up perfectly level with the others, and tuned by filing it underneath. If it has been executed by a good workman no one can detect it. A premium is put upon workmen who show great cleverness in this kind of work, as they are generally drafted away to the London or New York depots for repairs, an extensive business of this kind being carried on at each of these houses in difficult repairs that the proprietors would be glad to get rid of, and they contemplate publishing an exhaustive treatise on this subject for the use of their customers.

---

#### Our Providence Letter.

[FROM OUR SPECIAL CORRESPONDENT.]

“WHAT is the prospect for the spring trade?” This is the query propounded by nearly every manufacturer one meets, and is about as knotty a question as could well be put.

There seems to be a somewhat better and more hopeful feeling springing up, and while the January buyers will probably limit their purchases to sample lines, it is likely that toward the end of February there will be some demand for goods, and that trade will steadily improve. I base this opinion upon reports upon other branches of trade from the South, West and North-West States. I had a long conversation with one of the largest cotton manufacturers in this State a few days ago. Speaking of mills shutting down, he said: "Although this may at the first glance appear a very disheartening feature, it is really a good thing. We are getting our stocks rapidly reduced, and in January will start in on full time with plenty of orders ahead. This renewed activity will cause a feeling of confidence all round, and will, I hope, produce a boom in business generally. It is much better to shut down altogether than to run along on half-time with half the usual number of hands. You may rest assured," said he in conclusion, "that the fall of 1885 will prove a pretty busy one for our manufacturers." The Jewelers' Board of Trade have elected Mr. George H. Slade for Secretary, at the liberal remuneration of \$750 per annum. Mr. Slade has not heretofore been connected with the jewelry business, but was employed in a hat store. A waggish manufacturer suggested that he was elected to the position on account of the *affinity* between the trades. Be this as it may, the action of the Board of Directors in the matter has been severely criticised. Parties who had signed the constitution are not inclined to pay their dues, and altogether the outlook of the Board is not very encouraging. In two recent failures, Simons & Wolff of Philadelphia, and M. Strouss of Chicago, members of the Board of Directors were sent out to investigate and take what action was necessary to protect the interest of creditors. In the former case Mr. McKinney succeeded in getting a stay of sale, but in the latter nothing has so far been accomplished. The stay of sale in the first instance will not, I think, be of the slightest benefit to the creditors, as the State laws of Pennsylvania present some peculiar features in this respect. The manufacturers are taxing their ingenuity to the utmost in getting up new designs for the spring trade. Ellison & Vester bid fair to head the list in the way of novelties. They have made up a very handsome line of mourning goods, the black being both in bright and dull colors. The process by which this result is achieved is said to be entirely new. William Butt & Co. have brought out a new patent lever button, and have, in addition, a line of lace pins in augmentation of their old staple line of bracelets. Mr. Charles F. Irons, whose premises were recently injured by fire, has rebuilt and refitted the whole of the upper story of his factory building, and has now one of the most convenient and best lighted workshops in this city. It may be said of him as of the fabled Phoenix, that he rises with renewed vigor from his own ashes. C. S. Pine & Co. have bought out the patent, tools, stock, etc., from the receiver for Lester & Chadwick, and will continue the manufacture of their bracelet. John McCloy is bringing out quite an extensive line of new goods. Mr. Charles Downs has got up a handsome medallion in honor of the New Orleans Exposition. On the one side is Commerce illuminating the world, and on the other the arms of New Orleans and Louisiana. C. Foster & Co. are also getting up an entirely new line of goods that are likely to have a ready sale. The usual monthly meeting of the New England Manufacturing Jewelers' Association was held at their rooms on the 6th inst. Mr. A. Potter, the President of the Association, was in the chair. The minutes of the previous meeting and the Treasurer's report were read and approved. Mr. Carpenter, the Secretary of the Music Committee, read a long and able report. At the conclusion of which he was, on the motion of the President, tendered a hearty vote of thanks. There was no new business before the meeting. A circular asking the manufacturers to sell only to legitimate jobbers, and signed by a large number of the wholesale houses throughout the country, has attracted considerable attention, and it will, perhaps, be well for the members of the Board of Trade to consider how far they were justified in allowing one of their number, at a recent meeting,

to state that he, in common with the greater portion of the Eastern manufacturers, sold all the retail trade he could, and on a motion made by him as to information to be given to customers, alter the term wholesale dealers, as originally set out in the by-laws, to dealers in jewelry. While the manufacturers undoubtedly have their grievances, it must in justice be confessed that the jobbers have theirs also, and their action in issuing this circular shows a friendly feeling and a disposition to do what is right and fair.  
Providence, R. I., December 17, 1884. ASMODEUS.

### The Jewelers' League.

*President*, GILBERT T. WOGLOM.....Of Woglom & Miller.  
*First Vice-President*, WM. C. KIMBALL.....Of H. F. Barrows & Co.  
*Second Vice-President*, AUG. KURTZBORN..Of L. Bauman Jewelry Co. St. Louis, Mo.  
*Third Vice-President*, JAMES P. SNOW.....Of G. & S. Owen & Co.  
*Fourth Vice-President*, HENRY HAYES.....Of Wheeler, Parsons & Hayes.

#### EXECUTIVE COMMITTEE.

ROBERT A. JOHNSON, *Chairman*.....Of Colby & Johnson.  
SAMUEL W. SAXTON.....Of Saxton, Smith & Co.  
CLEMENT B. BISHOP.....Of Carrow, Bishop & Co.  
JOSEPH B. BOWDEN.....Of J. B. Bowden & Co.  
GEORGE R. HOWE.....Of Carter, Sloan & Co.  
CHARLES G. LEWIS.....Of Randel, Baremore & Billings.

THE JEWELERS' CIRCULAR is the *exclusive* official paper of the Jewelers' League, and has been selected for the publication of all matters of interest pertaining thereto. Letters or inquiries pertinent to its business or purposes, and which might interest the trade or inquirers, will herein be answered. Address *Jewelers' League, Box 3,444, P. O., New York*, or the office of THE CIRCULAR.

At the meeting of the Executive Committee held on Dec. 5th, there were present President Woglom, Vice-Presidents Kimball and Snow, Messrs. Johnson, Lewis, Howe, Bowden and Sexton.

Seven (7) changes of beneficiaries were granted.

Three (3) applications referred for investigation.

The following 12 applicants were admitted:

A. Dizerens, L. Stern, R. Sneider, N. Y. City; J. K. Stoddart, Philadelphia, Pa.; P. Geritz, Freeland, Pa.; G. E. Knapp, Boston, Mass.; C. A. Church, Amboy, Ill.; J. W. Good, Springfield, Ill.; J. M. Howe, Hopkinsville, Ky.; F. Trayer, New Orleans, La.; J. A. Montgomery, Los Angeles, Cal.; R. Beeston, London, Eng.

Notices of proposed amendments were received as follows:

By J. F. Minaldi: "To form a half-rate membership, with death benefit not to exceed \$2,500 and death assessment of one dollar."

Another member: "That all proposed amendments to Constitution be published and sent to each member not less than 15 days before the Annual Meeting.

The Secretary was authorized to hire Masonic Hall, cor. 23d St. and 6th Ave., for the Annual Meeting of the League, to be held on Tuesday evening, January 20th, 1885.

## Recent Patents.

The following list of patents relating to the jewelry interests, granted during the past month, is specially reported by FRANKLIN H. HOUGH, Solicitor of American and Foreign Patents, 617 Seventh Street, N. W., Washington, D. C.

*Issue of November 11th, 1884.*

No. 307,833—Chain-hook, Ornamental. C. F. Beyerle, Providence, R. I.

No. 307,869—Finger Ring. A. B. Place and J. B. Peterson, Providence, R. I.

No. 307,968—Watch Case. J. Macher, New York, N. Y.

No. 307,925—Watch Stop. E. J. A. Dupuis, assignor to P. A. Raymond, New York, N. Y.

*Issue of November 18th.*

No. 308,096—Watch, Mainspring Winder. A. F. Robbins, Orange, Mass.

No. 308,320—Watch Spring Holder. C. H. Morgan, E. J. Watson and H. W. Wilson, assignors to Washburn & Moen Manufacturing Company, Worcester, Mass.

*Issue of November 25th.*

No. 308,504—Jewelry, Ornamenting. C. J. Leyers, Newark, N. J.

No. 308,445—Watch Case Spring. C. W. Thiery, Boston, Mass.

No. 308,448—Watch Regulator. G. I. Tuttle, Aurora, Ill.

No. 308,489—Watch, Stem Winding and Setting Mechanism. H. M. Haines, Waltham, Mass.

*Issue of December 2d.*

No. 308,840—Watch, Dust Proof Box and Case combined. C. K. Giles, Chicago, Ill.

*Issue of December 9th.*

No. 309,018—Watch, Bow Fastening. B. A. Barnes, Oelwein, Iowa.

No. 309,158—Watch Case. D. O'Hara, Waltham, Mass.

---

### Cost of Obtaining Foreign Patents.

THE FOLLOWING information, supplied by Munn & Co.'s Patent Office, New York, will be of much interest to inventors desiring patents:

**GERMANY.**—The new Patent law, covering Prussia and all the German States, was put in operation July 1st, 1877. It was formerly necessary to take some twenty-one separate patents, costing several hundred dollars, to cover the same territory which is now protected by a single patent. A patent may be taken for one year or any other number up to fifteen years, by the payment of taxes annually, which are progressive in amount. Must be worked within three years. A patent may be claimed by the first applicant, but if the essential parts of the invention are taken from models or drawings of another person without the latter's consent, the former has no claim to the patent.

Inventions are examined and may be rejected for lack of novelty, or from having been introduced into the Realm before application for a patent was made. An appeal may be taken from the Examiner's decision to another tribunal, similar to the appeal provisions in the United States. Patents for additions, or improvements on inventions already patented, may be had.

The expense for a patent and first year's tax for a simple invention is \$100; when requiring elaborate drawings and a lengthy specification, a small sum in addition.

Patents cannot be obtained in Germany for inventions that have been previously patented in the United States. Therefore the application for the German patent should be made before the U. S. patent is actually issued.

**ITALY.**—The expense to apply for an Italian patent is \$100, which includes all fees for the first year. The patent is granted for fifteen years, subject to a small annual tax. Working must take place within one year. Italy covers a large extent of territory, has an enterprising population of twenty-seven millions, and is making rapid industrial progress.

**AUSTRIA.**—The expense to apply for a patent in Austria is one hundred dollars (\$100), which includes agency, government taxes and all costs for first year. The patent is granted for fifteen years, subject to a small annual tax. The invention must be worked within one year. The Austrian patent covers also Hungary, and includes a total population of forty millions.

**RUSSIA.**—Duration of patent, three, five or ten years. The terms cannot be extended. The invention must be worked in the empire during the first quarter of the period for which the patent has been granted. No annual taxes. The expense to apply is as follows:

|              |       |
|--------------|-------|
| 3 years..... | \$200 |
| 5 " .....    | 250   |
| 10 " .....   | 500   |

**BRAZIL.**—Under the new law recently passed, foreigners can obtain patents in Brazil on very favorable terms. The application must be filed within seven months from the date of the foreign patent. The patent is granted for fifteen years, subject to a small annual tax. Working must take place within three years from the date of the patent. The expense to apply for the patent is \$250, which includes our charges. The law opens a fine field for American inventions.

**TRADE-MARKS.**—Security for trade-marks can be secured by citizens of the United States in the following countries, at the prices annexed, which include both the government and agency fees: Canada, \$50; Great Britain, \$75; Belgium, \$75; France, \$75; Austria, \$75; Switzerland, \$75; Germany, \$100; and in nearly all other countries at same rates.

---

### Swiss Watches for the American Market.

THE DECLARED exports from the consular district of Basle during the fiscal year ending June 30, 1884, show that there has been a net decrease of \$470,612.72, or nearly 15 per cent., as compared with the preceding year. This decrease is chiefly attributable to the diminished exportation of watches and watch materials from the consular agency of Chaux de Fonds, which was \$500,000 less than during the preceding year. That this branch of exportation will continue to decline in consequence of the rapid development of the corresponding industry in the United States, until it ceases altogether, cannot be assumed with entire confidence. As is well known, the Swiss have once recovered their lost ground in this direction. Having seen their American market almost escape them after the Centennial Exhibition in 1876, they were able by the employment of the greatest energy, perseverance and skill to regain what they had lost, and even to increase their export of watches to a point never before reached. In 1882 the amount was \$2,268,731.79 from that district alone.

"This point," says Consul Gifford, "may never be reached again, but the Swiss will not surrender their American market without a renewed struggle. They will in this be seconded by many circumstances which are favorable to their supremacy in this branch of production. The principal advantage is the low rate of wages which must be accepted by men occupying the sterile valleys of the Jura, where agriculture is impossible, and where they have been from their childhood devoted to this one calling. They must make watches, if not for good wages, then for poor wages. It might be supposed that only the higher priced merchandise and timepieces of special construction and extraordinary precision could now find a sale in the United States, considering the immense numbers of low-priced articles produced by our manufacturers. But such is not the case. Very large shipments of so-called watches, invoiced as low as 10 francs each, and even lower, still go forward. A suspicion of gross undervaluation naturally arose under these circumstances; but a personal investigation and examination of the books and original accounts of manufacturers led to the conclusion that watches can be, and are, produced at these seemingly impossible prices. The declared exports also show a decline in the exportation of cheese and aniline colors to the United States during the fiscal year. This decline and the comparatively small increase in the value of the silk ribbons exported are probably to be regarded rather as incidental variations than as indications of a permanent tendency."

## Foreign Gossip.

**DEATH.**—The death is announced of M. Bourdon, the inventor of the metallic manometers, barometers and gauges that bear his name.

**PRECAUTIONS.**—A French paper affirms that the zealous officials of "El reg, Don Alfonso," fumigated a quantity of chloride of lime at the border quarantine station, Irun, according to rules laid down and provided, to keep out that naughty cholera.

**HONORS.**—The *Impartial* says that the committee of the horological school of Locle is soliciting donations from the inhabitants of the city and vicinity, for the purpose of erecting a monument to the lately deceased DANIEL HANS RICHARD, and that they are quite successful in their endeavors.

**STEADY INCREASE IN AUSTRALIAN GOLD DIGGING.**—Mr. G. W. Langtree, Acting Secretary for Mines in Victoria, reports the estimated quantity of gold raised in the quarter ending June 30, as 190,218 ounces, 3 pennyweights; and he gives the number of miners employed on the gold fields during that quarter as 29,075.

**EXPOSITION OF NUREMBERG.**—The exposition of goldsmiths' and jewelry work at Nuremberg promises to be a grand affair; all the art collections of Europe have promised to send their choicest treasures—of course, as loans—and it would well repay the trouble if some of our large manufacturers were to send their designers there to study these *chefs d'auvres* of past ages.

**EFFECTS OF DIFFERENT KINDS OF ILLUMINATIONS.**—The tallow candle is the most unhealthy kind of illumination, while the electric light is the best. The latter produces only one-thirteenth part of the heat generated by a tallow candle and emits no carbonic acid or water. One gas flame is said to vitiate the air of a room as much as six persons do with their corporeal exhalation and breath.

**TOPAZES.**—A remarkable discovery of topazes was made lately in New South Wales. A portion of a large, bluish-green crystal, of the weight of several pounds, was found in Mudjee and sent to the Colonial Museum. Several crystals of 2 to 3 inches were found in Uralia. One specimen of topaz, found in Gundagai, weighed more than 11 ounces, and another one, found in Gulgong, weighs 18 ounces.

**AUSTRALIAN GOLD DIGGINGS.**—Very little is heard at present of the Australian gold diggings, nevertheless there were in March, 1884, in Victoria, 30,474 diggers who made their living exclusively by gold digging. The gold dug in that country in the first quarter of this year was computed to be 181,011 ounces—which is considered a very fair yield. The districts of Sandhurst and Ballarat furnished the largest quantities—each one about 50,000 ounces.

**THE INTERNATIONAL POSTAL UNION.**—The *Union Postale*, the organ of the international bureau in Berne, Switzerland, says that on the 9th day of October last, ten years ago, the several representatives of the postal departments of Europe, the United States of America and Egypt, met in the Old Court house and established the first international postal union. It convened at the instigation of Germany, and before the end of a month the world saw an enterprise completed, the accomplishment of which had been doubted even by the majority of the most enthusiastic members. Great credit is due to the several representatives for their unanimity; the occasion, indeed, well permits us to become enthusiastic, because such a union stands sole of its kind in the history of nations, and so broadly is conceived the foundation of this international structure, that its roof will shelter all the civilized nations of the earth, while the possibility that even the greatest political revolutions can ever affect it appears to be entirely excluded. It is indeed an eternal monument erected to the glory of its constructors, and all those who in any manner participated in its establishment.

**GERMAN PEARL FISHERIES.**—The German pearl fisheries of Saxony and Bohemia, which were formerly very remunerative, are barely worth mentioning at present, as they are rapidly destroyed both by the natural cupidity of man and the filthiness of the streams. The department of the interior lately called the attention of the officials charged with the preservation of these grounds to existing laws, and exacts of them to energetically oppose the wholesale destruction.

**STANDARD MERIDIAN.**—It is rather to be deplored that the international conference for establishing the prime standard meridian has adjourned without coming to any agreement. The meridian of Greenwich being almost universally used in the civilized world, and the basis of nearly all the meridional calculations was proposed, but the French representation "kicked" against it, and, therefore, no satisfactory results were obtained. The world could not well get along without a body of scientific men, but it is rather sad to contemplate that each one of them has some pet theory of his own which he cherishes with all the love and devotion bestowed on a "hobby." When a lot of business men met in 1874 at Berne, and established the international postal union, the grandest piece of international fraternity, they transacted their business in a business-like manner; not so a body of savans, however; each one of them has some hypothetical theory, upon the recognition of which by all he bases his glory everlasting, and hence the difficulty of uniting them to act in harmony.

**THE HYDRAULIC CLOCK IN THE GARDEN OF THE TUILERIES.**—The visitors of the garden of the Tuileries lately pause before a timepiece of extraordinary dimensions, which has been erected upon a terrace at the water's edge. It consists of four columns, painted green, about 8½ yards high, while the dial, glittering in the tricolors of the "Grande Republic," surmounts the columns. The large hand, about 2 meters long, points out the date, while the small hand indicates the day of the week. Beside this the clock contains a smaller dial with hour and minute hands; the striking work tolls the hour on a bronze bell. The action of this "chronometric turbine" is as follows: At the foot is located a metallic drum through which runs a streamlet of water. The drum contains two small turbine wheels which are actuated by the running of the stream. The axes of the turbines, prolonged upward, end in endless screws by which the wheel work, provided with a fly, is propelled. It is obvious that the reservoir from which this stream of water is obtained must always stand at the same level, otherwise the hydraulic pressure would change.

**EXPOSITIONS WITHOUT END.**—In a preceding number of THE JEWELERS' CIRCULAR we called our age the age of expositions, and we were then only half informed of the various expositions going on at the time, and Europe is eminently the country in which these expositions are held. A bi-monthly journal, devoted to the subject of expositions, publishes in its "Contents" the following summary: International World's Exposition of London, 1884.—International Arboricultural Exposition at Edinburgh, 1884.—Industrial Exposition at Teplitz (Bohemia), July to September, 1884.—International Exposition of motors and technical machinery for small tradesmen at Vienna, from July to October, 1884.—Upper Austrian Industrial Exposition at Steyr, August to September, 1884.—International Exposition at Amsterdam, August to September, 1884.—Local Trades' Exposition at Murrhardt.—Electrical Exposition at Turin.—International Exposition of Works of the precious metals and alloys at Nuremberg, 1885.—World's Exposition at Antwerp, 1884.—Exposition of the French crown jewels at Paris.—Exposition of Oriental ceramics at Vienna, from August to November, 1884.—Summer Fruit Exhibition at Berlin, 1884.—German Dairy Exposition at Munich, October, 1884.—Technical, Industrial and Agricultural Exposition in Wels, September, 1884. This, we hope, is enough to satisfy the most fastidious.

## Workshop Notes.

**ENGRAVERS' CEMENT.**—Resin, 1 part; brick dust, 1 part; mix with heat.

**ENGRAVERS' BORDER WAX.**—Beeswax, 1 part; pitch, 2 parts; tallow, 1 part; mix.

**CEMENT FOR MARBLE.**—The following is a good recipe for preparing a cement that will unite marble, etc.: Melt together 8 parts resin and 1 part of wax, and mix the solution with 4 parts of Paris plaster.

**GERMAN SILVER.**—An excellent German silver is prepared by smelting in a crucible 55 parts copper, 23 nickel, 17 zinc, 3 iron and 2 tin. This composition is in every respect equal to silver in appearance, fully as hard and not as vitreous.

**LIQUID FOR CLEANING SILVER.**—The following solution will be found to produce a high brilliancy in silver work: Cream of tartar, 30 parts; sea salt, 30 parts; sulphate of alumina and potash, each 39 parts; water, 1,500 parts. Boil the article in this mixture.

**CLEANING SILVER FILIGREE WORK.**—Anneal your work over a Bunsen flame or with a blowpipe, then let go cold (and this is the secret of success), and then put in a pickle of sulphuric acid and water, not more than five drops to one ounce of water, and let your work remain in it for one hour. If not to satisfaction, repeat the process. This is undoubtedly the best process that can be used.

**ENAMELING ON BRASS AND GERMAN SILVER.**—The adhesion of enamel to brass and German silver, it is said, may be most perfectly effected by first engraving or pressing the design to be enameled into the alloy, and then coating the whole object, or only the depressed design, galvanically with copper. The enamel can be fused upon this surface as usual, and may then be bronzed, or silvered, or treated in any usual way.

**CHARCOAL.**—The charcoal used in soldering, nor, in fact, any other charcoal used by the goldsmiths, should not possess the evil habit of viciously snapping and cracking. Coal burned from oak, or any other coarse-grained wood, will snap and crack, while a close, fine-grained, soft wood coal will not. The underlay coal may have its snap taken out by being heated very hot in an oven or by blowing the flame with a blowpipe upon it.

**MIRROR-LIKE DESIGNS ON GLASS.**—An ingenious method of obtaining mirror-like designs on glass has been devised by Leclerc. The glass, having been silvered by the chemical process, is coated with a thin and uniform layer of sensitive bitumen, and this is exposed under a transparency, the next step being to wash away the unaltered bitumen with oil of turpentine, so as to leave the bitumen design on the silvered glass. The application of moderately strong nitric acid removes the silver, excepting where it has been protected by the bitumen, so that the metallic design shows like a mirror from the reverse side of the glass. The plate may be backed by paint or any other suitable material.

**COLORING METAL.**—Metalic objects may be colored by immersing them in a bath formed of 640 grains of lead acetate, dissolved in 3,450 grains of water, and warmed to from 38° to 90° Fahrenheit. This mixture gives a precipitate of lead in black flakes, and when the object is plunged into the bath the precipitate deposits on it. The color given depends on the thickness of the skin, and care should be taken to treat the object gradually, so as to get a uniform tint. Iron treated thus acquires a blueish aspect like steel; zinc, on the other hand, becomes brown. On using an equal quantity of sulphuric acid, instead of lead acetate, and warming a little more than in the first case, common bronze may be colored red or green, with a very durable skin. Imitations of marble are obtained by covering bronze objects warmed to 100° Fahrenheit, with a solution of lead, thickened with gum tragacanth, and afterwards submitting them to the action of the above mentioned precipitate of lead.

**TO SOLDER A STAY SPRING.**—Stay or lifting springs are often broken, and the watchmaker has frequently none of the right size nor the time to make a new one. In such a predicament he can mend the old one and have it just as good as new, by placing the broken parts together and binding them firmly to a piece of coal, then soldering them with 18-karat gold. It requires a strong heat and plenty of borax; then finish off, nicely harden and temper in the usual manner.

**TO CLEAN A MAINSPRING.**—The botch can never be recognized so quickly in the workshop as by the way he has for cleaning a mainspring. He will take hold of one end and pull the spring about half its length through a greasy rag, with a quick and jerky motion, to save time. This practice is calculated to break springs when nothing else will; and those treated in this manner will invariably break in a few days after, from the very fact that their molecularly was violently destroyed. Never draw the spring out of its coils; if it requires cleaning, lay it flat in your hand, then with a soft oiled rag wrapped around a pegwood, follow through all the intricacies of the coils, reverse the spring, and treat the other side in the same manner, and our word for it, the spring will not break, to the great aggravation of the watch owner.

**RAPID SILVERING.**—The watchmaker is occasionally called on to resilver old clock faces or other parts belonging to clocks. When the article is not exposed to handling the following recipe for silvering will be found to be very efficacious: Get one-quarter ounce of nitrate of silver, to be had at every drug store, dissolve in a teaspoonful of water, and then add one-quarter pound of cream of tartar and three-quarter pound of common table salt; thoroughly mix these ingredients together with a wooden stick, adding sufficient water to make a thick paste. Put this by in a glass-stoppered bottle for use as required, and it will keep any length of time. This is the silvering powder, and before applying it to the brass, this must be made quite clean and bright. Get a piece of chamois leather, and fold it up small enough to be handy; with this rub on the silver paste thoroughly all over, till by the appearance of the brass work you judge the silvering to be properly effected. Now wash the article quite clean, finally polishing off with a little whiting; this will finish, as far as the silvering process is concerned; but to make the coating last under atmospheric influences, it must be protected by a coat of varnish. Any colorless varnish will answer for this, which can be procured anywhere. Of course the more silver powder is rubbed on the thicker the coating, and it will stand good for years.

**ISOCRONISM.**—It will have happened to the repairer and adjuster that when a ruined or badly mounted balance and spring was straightened and set in order by him, the rate of the watch differed materially, and the spring had to be reset; a proof that a spring of equal length and thickness, but of another curve, requires another adjusting; the power of resistance or tension of the spring is virtually altered. Generally when a watch retards it is presumed that its spring is too weak, or, what is the same, too long, and every watchmaker knows that by further drawing through the spiral stud its vibrations are accelerated. The cause of the acceleration, however, does not lie in the immediate shortening and approach of its two ends, but in the alteration of its curves, whereby the proportion of the curve dimensions to the length, and thereby to the weight of the balance, becomes another, and favors a greater power of resistance. If the proportion of length alone were to decide, then the same quantity of shortening of the balance spring would produce the same effect, which, as everyone knows, is not so. By shortening the spring on its inner end, its power of resistance is sensibly augmented, because the operating power of the balance upon the spring is lessened by the change from the center of the inner curve. For this self-same reason the inner curve should be treated with all possible consideration.

## Trade Gossip.

The firm of Theuerner & Church, manufacturers of gold rings, was dissolved by mutual consent December 13. Mr. C. F. Church will continue the business.

A. J. Paillard, of the firm of M. J. Paillard & Co., who recently returned from Europe, has since been dangerously ill with pneumonia, but is now convalescent.

We are pleased to see that our friends, the Spencers, are making a success with their instrument for measuring the eye. This firm is entitled to credit for their efforts to bring optics up to a high standard.

The American Watch Company at Waltham has reduced the rent of the houses occupied by their workmen from 20 to 25 per cent. At the same time, the price of board at the boarding-houses controlled by the company has been materially reduced.

The American Watch Tool Company, of Waltham, was robbed by burglars on the night of Dec. 6, and a lot of tools, lathes, etc., were carried off. A description of the stolen property will be found in the advertising columns of this issue of THE CIRCULAR.

The 14 karat gold filled watch case, manufactured by the Dueber Watch Case Company, of Cincinnati, has met with much favor in the trade, and the company has had difficulty in keeping up with the demand. Those desiring them should place their orders promptly.

R. Henrich, manufacturer of seal and stone rings, has introduced this season a new line of ladies' rings in fanciful patterns, embracing turquoise, cat's-eyes, garnet, etc.; also new designs in self-sizing rings. Their initial rings include a great variety of styles and fancy designs.

The season of calendars is upon us, and we have received several of very handsome design from members of the trade. Among these are the tasteful ones issued by Foster & Bailey and William T. Smith. They are printed in subdued colors, and are very attractive without being gaudy.

The second thimble centenary has just been celebrated at Amsterdam. The first thimble was made in October, 1684, by a goldsmith, Van Benscholten, whose idea in the manufacture of the pretty conceit was to protect the fingers of his lady-love. The English were the first to adopt the new invention.

Koch & Dreyfus, of New Orleans, have issued a handsomely printed circular to the trade, announcing that they will take pleasure in securing suitable accommodation for such as contemplate visiting the Industrial Exposition, and extending any courtesies in their power. Their circular contains full statistical statements regarding the Exposition buildings, etc.

Mr. Clement L. Wragge has started a meteorological station on the summit of Mount Lofty, in connection with his Torrens Observatory at Sydney. He has placed self-registering instruments and a rain-gauge of an improved pattern on the summit, and appeals to the public who may visit the mountain to protect them, and so assist in promoting scientific research.

Hutchison & Huestis send out with this number of THE CIRCULAR an elegant New Year's Greeting to the trade, in the form of a lithographic page which cannot fail to catch the eye of every reader. This firm has acquired an enviable reputation for the manufacture of solid gold stone rings of every variety and style. They sell to jobbers exclusively, and their goods may be found everywhere.

As an indication of confidence in the business outlook, all the cotton factories at Augusta, Ga., have advanced the price of goods one-quarter of a cent per yard, and all the mills there are running on full time. The extensive carpet works of Alexander Smith's Sons, at Yonkers, N. Y., employing 2,000 hands, will soon start up. The cotton mills at Fall River, Biddeford, Lewiston and other localities are also about resuming operations.

In these days of many accidents every person should provide himself with an accident insurance policy. The United States Mutual Accident Company is conducted on the mutual plan, assessment being made on the members to pay liabilities. It costs only \$10 or \$12 a year to carry a policy insuring \$5,000 in case of death by accident, or \$25 indemnity in case of injury. This company has a surplus of \$30,000, and is strongly commended by prominent business men and by thousands to whom it has paid benefits.

Several of the daily papers recently stated that James Greeves, who was arrested for smuggling diamonds, was a member of the firm of John Bowden. There is but one firm in the city engaged in the jewelry business of that name, and that is J. B. Bowden & Co., the well known manufacturers of solid gold rings, at No. 1 Maiden Lane. Mr. Greeves was never a member of this firm nor in any way connected with it. The statement as published was calculated to do injustice to J. B. Bowden & Co., but the papers that printed it with so much alacrity, were extremely niggardly in making the desired correction.

The trade will be well represented at the World's Industrial Exposition at New Orleans. Owing to delay in getting goods into position, it is impossible at the time of our going to press to obtain a proper notice of the exhibits, but we hope to do so in our issue for next month. Among the exhibitors are the American Watch Company, the Meriden Britannia Company and various other large manufacturers. Leroy W. Fairchild, manufacturer of gold pens, pencils and fancy goods, has a full line of his products which have been arranged in a unique and attractive form. These goods will, no doubt, command much attention at the Exposition, as they are exceedingly popular in the trade.

Daring burglars robbed the store of Napoleon Lefebvre, which is just opposite the Central Police Station, in Montreal, on the night of Dec. 17. They gained an entrance through the fanlight, drilled the safe, smashed the combination lock and blasted their way to the inner strong box. They succeeded in walking away with \$10,000 of precious stones and jewelry, and \$8,000 in promissory notes. The stock in the show cases and elsewhere had been thoroughly overhauled by the thieves. The thieves are suspected to be a New York crowd that has been noticed here of late. This is the tenth or eleventh robbery that has occurred in as many weeks, and the worthlessness of policemen and detectives is spreading dismay among storekeepers.

Maier & Delkin, of Atlanta, Ga., were recently victimized by an adroit swindler. He offered some gold foil for sale, representing it to be the waste of china gilders. They assayed it, and finding it good offered \$70 for the lot. The man said he was not authorized to sell it for less than \$75, and, putting it in his pocket, was apparently about to depart, an offer of \$75 was made which he accepted, handed out the foil and departed with the cash. Subsequent examination showed that he had dexterously substituted a package of lead for the package of gold. They were made up alike and weighed precisely the same, but as the firm was busy, the package was not tested the second time it was presented. The trade is warned against this trick of the enemy.

With the first of the year, the T. A. Willson Optical Company, of which Gustave Walter is president, succeeded to the business of T. A. Willson & Co., of Reading, Pa., the celebrated makers of optical goods. Their offices are located at No. 14 and 16 Maiden Lane, and hereafter all goods will pass through the New York office. The company has added increased facilities to the formerly large factory of T. A. Willson, and will hereafter be able to fill all orders promptly and deal liberally with the trade. Mr. Walter is well and favorably known in the trade as an active, enterprising business man, while the T. A. Willson goods have achieved a wide celebrity. These consist of gold, silver, steel, nickel and nickel plated spectacles and eye-glasses, watch glasses, opera glasses, pebble and spectacle lenses, ground and unground, in fact, everything in the line of optical goods.

It has been known for some time that imitation American watches were being sold in Europe, in South America and some of the British Colonies. Messrs. Robbins & Appleton determined to ferret the matter out, and finally their agent succeeded in buying a gold and a silver watch from a Paris house. Legal proceedings were begun against the firm and judgment obtained. It was found that the watches were made in Switzerland, and bore the name of the American Watch Company, Waltham. In the issue of the *London Jeweler and Metal Worker*, Mr. Lewis Jacobs, "pawnbroker and jeweler, 102 Leather lane, Holborn Circus, E. C.," publishes an apology to the American Watch Company for having sold a bogus American watch "by inadvertence," and promises that he will not do so any more. The company is determined to break up this disreputable business if possible.

Mathey Bros. & Mathez have a full line of complicated watches, for which the demand in this country is constantly increasing. These include minute repeaters, which strike the hour, the quarter and the minute; five minute repeaters; split-second fly-back with minute indicator; minute chronographs; plain chronographs; calendar watches, which, in addition to making the time, show the phases of the moon, day of the week and month, and indicating leap year. They have, also, a watch in which all these special features are combined, constituting a most complicated and beautifully accurate example of horological skill and perfect workmanship. This firm also carries a full line of fine Swiss watches and ladies' watches in almost endless variety. Many of these are exquisitely ornamented with precious stones. They also exhibit a miniature clock, only two inches high, appropriately designated "Baby," which runs eight days and keeps excellent time. This firm is so well known in the trade that it needs no commendation at our hands.

Henry Boxhorn & Co., diamond dealers, of Paris, opened a branch office in this city some time ago, a son of the senior member of the firm having charge. As the business was not as profitable as anticipated, orders came to dispose of the stock. E. du Moulin, a friend of young Boxhorn, offered to assist him in disposing of the diamonds. He took a number on memorandum, and represented that he had disposed of them to certain commercial gentlemen who would pay for them in the regular course of business. In this way he is alleged to have secured about \$15,000 worth of diamonds, most of which he pawned and then departed for Canada. Lawyers traced him across the border, but could obtain no better offer than a settlement on the basis of 25 cents on the dollar. Some of the diamonds were recovered from the pawnshops, valued, it is said, at \$10,000. The lawyers employed in the case undertook to collect a bill of about \$2,000 from young Boxhorn, but when they overtook him in Chicago they found nothing to attach. It is supposed that he had what diamonds he had rescued safely deposited where neither thieves nor lawyers could reach them.

The general passenger and baggage agents of the Illinois Central, Minneapolis and St. Louis, St. Louis, Keokuk and Northwestern, Burlington, Rock Island, Kansas City, St. Joseph and Council Bluffs, Hannibal and St. Joe, Northwestern, Sioux City and Pacific, St. Paul, Omaha, Northern Pacific and Manitoba roads on the first of December issued the following notice to take effect at once: "The undersigned companies will not accept any responsibility whatever for the receiving, storage, checking or forwarding of sample trunks, cases or packages carried by jewelers or traveling agents for jewelry houses. From and after the date of this notice their agents will refuse to receive from jewelers or traveling agents for jewelry houses or other persons any sample trunk, case or package that they may know or have reason to believe contains jewelry or jewelers' samples, either for storage in their baggage room, for checking as baggage, or for transportation in the cars of these companies, nor will they take charge of such trunks, cases or packages in any manner whatever. Should such be tendered, they will state to persons making the tender that they cannot be accepted.

At the office of the New Haven Clock Company, in New Haven, there was recently shown a splendid clock just finished, designed for exhibition at the New Orleans Exposition. It was constructed specially with reference to exhibiting at the Exposition, and is probably the finest clock ever made in New England. It cost \$1,000. It stands nine and a half feet high. The case is built of the finest mahogany, with elegant decorative carvings, showing skillful handiwork, while the dial is of silver and gold finish. A door of beveled plate glass, with a light mahogany frame, opens to the dial, and a larger similar decorative door opens below to the weights. Beautifully finished Corinthian pillars flank the main body of the case, surmounted by elegantly carved architraves. The clock rests upon gilded ornamental pedals. The long pendulum beats seconds and the clock chimes the quarter hours either on a set of eight bells or on another known as the Westminster chimes, both sets being very musical and the effect most pleasing. For the first quarter four bells are struck, for the second eight, for the third twelve, the fourth sixteen, and the hour is announced upon a deep-sounding cathedral gong, musical yet solemn, as if the flight of time were a grave matter and no unconsidered trifle. The clock runs eight days and has attachments which shift the striking works to suit the varieties of bells.

James Smith, who speaks with an English accent, entered the jewelry store of Ferdinand Craft, at No. 427 Grand street, and asked to see some rings. A tray containing about seventy gold rings was set on the counter, and he placed two of them on his fingers. He then threw red pepper into Craft's face, and seizing the tray, attempted to carry it off. The proprietor grappled with him and the tray fell to the floor. The thief made an ineffectual effort to get out through a rear passage way. Two detectives soon arrived, and the thief was subdued after drawing a revolver and offering a stubborn resistance. At the Tombs, while the detectives were preparing affidavits against him, the prisoner put on an overcoat that was thrown over his arm, and then approached Officer Walsh at the wicket. He said that he was the complainant in a case of assault, and, pointing to a prisoner, said that he was the accused person. He expressed much surprise that the officer should doubt his word, and presented his card as an evidence of respectability. After consulting with the other officers the gatekeeper discovered that Smith was a prisoner on two charges. He was then placed at the bar, where he manifested much coolness, and said that he was perfectly justified in endeavoring to escape. He then pleaded guilty to charges of assault and attempted larceny. He was committed for trial in default of \$1,500 bail.

We have received complete advance sheets of the fourth annual report of Professor Leonard Waldo, Astronomer at the Observatory of Yale College. In our issue for December we published the large table showing the watch rating results for Class I. certificates, showing the observations made of thirty-nine different watches for forty-two days in five different positions and in the oven and the refrigerator. The complete report shows the observations made of watches receiving certificates in Classes II. and III. Professor Waldo doing excellent service in horology by the care and attention he is bestowing upon the watches submitted for rating. He says "There has been marked increase in the excellence of the movements submitted to our trials, which, so far as can be observed, is a direct result of the interest our work in this department has excited." In addition to the observations of clocks and watches, 6,390 thermometers were examined, 9 hydrometers and 2 barometers. Professor Waldo is endeavoring to establish in the bureau a clock of precision, as they are often required to give daily rates of timepieces when the weather is sometimes cloudy for several days in succession. To this end one of the clocks has been re-mounted in a heavy cast-iron case, and hung between two brick piers. Arrangements have been introduced in it for the control of the pressure and the chemical constitution of the enclosing medium in which the pendulum swings. The report will be found full of interest to makers of watches and students of the science of horology.

**WANTED**—A first-class foreign watchmaker, lately arrived, French, Swiss or Swede preferred. None but first-class need address. Jos. W. Forsyth, Jr., 70 N. Second street, Philadelphia, Pa.

**WANTED**—A situation by a practical watchmaker and engraver, is also a good salesman. A first-class workman in every respect. Best of recommendations given. Address M. B., care Jewelers' Circular.

**FOR SALE**—An old and well-established jewelry store in a large and thriving city in the state of Connecticut. Only moderate capital required. Inquire of Oppenheimer Bros. & Veith, 35 Maiden Lane, New York.

**WANTED**—A situation by a young man in the jewelry business who has had three years' experience at the business. The best of reference given. Address Frank S. McKee, 136 East Federal street, Youngstown, Ohio.

**FOR SALE**—Fourteen volumes of "The Jewelers' Circular," several volumes of "The Jewelers' Journal," and "Watchmaker and Metal Worker." I want a good, cheap Universal lathe. Address J. H. Bell, Tarrytown, N. C.

**MOSELEY & CO.** Elgin, Ill., manufacturers of the "Moseley" Lathe, with full line of fixtures and attachments. Designed especially for the watchmaker and repairer. Combining accuracy, durability, convenience and style.

**WANTED AT ONCE**—A good watchmaker. One who can make a sale when required. Must have good references, sober habits, and strictly honest. Will pay good wages and will give permanent situation. Address F. E. Hollar, Shippensburg, Pa.

**SITUATION** wanted by a young man with a good set of tools, American lathe, etc., as watchmaker, jeweler and engraver. Understands gold working and manufacturing, also fine monogram engraving. Address E. N. Graver, care Jewelers' Circular.

**FOR SALE**—A jewelry store on one of the leading avenues in Brooklyn, N. Y., doing a fair business and a good run of bench work. Satisfactory reasons given for disposing of the business. For particulars address S. T. Clinton, care Jewelers' Circular.

**A YOUNG MAN** who has had six years' experience in the diamond and jewelry trade, also experience in silver plate trade, desires a position with diamond jewelry or silverware house. Has traveled. Best of references. Address L. C., care Jewelers' Circular.

**WANTED**—Situation by a watchmaker of over fifteen years' experience. Can do all kind of watch and job work usually done. Or, will put my experience against capital and engage in the business in some good locality. Address J. F. B., Box 1605, Muskegon, Mich.

**FOR SALE**—The leading jewelry business in a live town of 12,000 inhabitants, doing a profitable business. Purchaser can buy all the stock, about \$4,500, or will keep part of the jewelry. Ill health and change of business a necessity. Address E., Box 771, Lima, Ohio.

**FOR SALE**—The leading jewelry store in Carlisle, Pa., a thriving town of 7,000 inhabitants. Store established over 40 years. Doing a good business and room for a large increase. Will sell with or without fixtures. Cash required about \$5,000. Address R. H. Conly, Carlisle, Pa.

**SITUATION** wanted at the bench and as salesman with an experienced workman to finish the trade. Those who can use a steady young man of 20 and three and a half years' experience in the trade, and can furnish satisfactory reference, address "E.," care Jewelers' Circular.

**GEORGE E. WILKINS**, manufacturer and importer of cutters for watchmakers' use, stem-winding cutters of all the different forms, rounding up cutters of the finest quality, also ratchet cutters. A large stock of second hand and new marine chronometers. No. 21 South Salina street, Syracuse, N. Y.

**WANTED**—In a first-class establishment in prominent city near New York, a jobbing jeweler and letter and monogram engraver, or a good salesman and engraver. Must be perfectly reliable in every way, strictly temperate and well recommended. Address, with references and wages desired, F. H. G., care Carter, Sloan & Co., 15 Maiden Lane, N. Y.

**FOR SALE**—A well-established jewelry business in a fine growing town of 1,800 inhabitants, situated in northern Iowa. County seat, two railroads, churches and schools. Stock invoices about \$1,500. Plenty work, and just the chance for a young man with a small capital. Address R. H. W., care Jewelers' Circular.

**FOR SALE**—An old-established jewelry business in central New York. Established over forty years, with a good reputation, in a thrifty town of 5,000 inhabitants, one of the very best locations. An opportunity for an enterprising man to make a success. Stock and fixtures \$6,000. Will sell any part of same to suit purchaser. For terms address Cross & Bequelin, 21 Maiden Lane, N. Y.

**FOR SALE**—An old-established jewelry business which the present owner started 30 years ago. Stock consists of diamonds, watches, clocks, jewelry, silver and plated ware, etc. to the amount of about \$15,000, all well selected and in good order. Store situated in a city of 60,000 inhabitants. Will sell on easy terms to a responsible purchaser. The strictest investigation is invited. Address A. B. C., care Jewelers' Circular.

**TO THE TRADE**—I make a specialty of supplying the Trade with stones for jobbing purposes. Parties having jewelry out of which the stones have been lost, sending their orders by mail or express, will have them promptly attended to. A large stock of cameos, pearls, turquoise, garnets, amethysts, doublets, foil backs, white and colored imitation stones on hand. All kinds of setting done for the Trade. W. Archibald, 73 Nassau street, New York.

**FOR SALE**—Stock and business (good will) of one of a few of the very best paying jewelry stores in southern Michigan, in one of the most growing and promising towns of the state. Six to eight thousand dollars, half cash, balance on time at low interest on well secured paper. No played out, busted up business, but a rare chance to step into a nice paying business, one that will bear the closest scrutiny. Last year's business the best in 20 years. Best of reasons for selling. Address X. Y. Z., care Jewelers' Circular.

**FOR SALE**—A fine jewelry store in a beautiful thriving western city of 32,000 inhabitants. Has been established 6 years. Fixtures black walnut, nearly new. Store front large plate glass, fine location, cheap rent. Would prefer to sell stock with fixtures, but will sell fixtures only if stock is not wanted. Would want purchaser to take all bulky goods, like clocks and hollow ware. It is an excellent chance for a practical workman. Fixtures would invoice about \$1,800. For further particulars address G. Q., care Jewelers' Circular.

**PATENT WATCH REGULATORS**—Having improved my patent regulators and making them under my own supervision, I now furnish 3 grades to fit all watches, one style fitting all bridge watches, either ladies' or gent's, Swiss or American. Two other sizes fit all full plate watches. Making 3 sizes in all, fit all watches in the market. Send for price list. Medium priced gold and roll gold jewelry a specialty, and at prices 20 per cent. below everybody. Send for selection package. Terms cash. Not over 30 days' time given under any consideration. Buying and selling for cash I can and will sell goods so low it will surprise you. J. A. Await, 177 Vine street, Cincinnati, O.

**FOR SALE**—The retail stock and fixtures of jewelry store located at 65 State street (Central Music Hall Building), Chicago. The best location and cheapest rent on the street, being located only five doors (on same block) from the great dry-goods house of Marshall, Field & Co. The reason for selling is we intend to go up-stairs for larger accommodations for our wholesale and manufacturing business. Amount to purchase from three to five thousand dollars worth. Will sell for part cash, balance secured. For a live man this is an opportunity to secure an established business seldom offered. Lease extends a year from next May. Call on or address R. D. Kirby, Manager, Chicago Jewelry Mfg. Co., 65 State street, Chicago.

**FOR SALE**—The business of the late John Chamberlain, of Greensboro, North Carolina. This prosperous, first-class jewelry and watch establishment, to a man with a proper knowledge of the business, is an extraordinary good chance. It is well-established and thoroughly known in all the adjacent manufacturing villages in the neighborhood, and bears an enviable reputation, especially its repairing department. It is now, and has been for years, returning a handsome income. The subscriber wishes to sell it without delay. In the meantime the stock will be kept complete, and every endeavor will be made to keep it up to the high standard of its former owner. Climate very healthy. For further particulars address Sarah Chamberlain, Administratrix, Greensboro, N. C.

Manufacturer of FINE JEWELRY.  
DIAMOND MOUNTINGS A SPECIALTY,  
24 John St., N. Y. City,

# NEW YORK OPTICAL COMPANY,

OFFICE:

43 MAIDEN LANE, N. Y.

FACTORIES:

Cor. Jay & Plymouth Sts., Brooklyn.

MANUFACTURERS OF

## The Patent Eureka INTERCHANGEABLE

TO CLOSE LOOP OR PUT  
LENS IN FRAME.

## SPECTACLE

AND

## EYE-GLASS.

TO OPEN LOOP OR TAKE  
OUT LENSE.

IN GOLD, SILVER, GERMAN SILVER AND STEEL.

Completely INTERCHANGEABLE in all its parts.

# Beauty, Simplicity, Lightness and Strength!

*These Spectacles are absolutely interchangeable, and duplicate parts may be selected at hazard with a positive certainty of accurate adjustment.*

*The loops of the eye-frames can be enlarged or contracted at will, so that lenses of various sizes may be made to fit tightly in the same frame, thus securing an Interchange of Lenses.*

*The joints or end pieces are made of a slender solid piece of metal from one-quarter to one-half the usual size, and are so constructed that the Temples can be easily detached from one frame and freely adjusted to any other, thereby securing the Interchange of Temples.*

*Should the Temples become loose through wear, they may be easily tightened by the aid of a screw driver.*

## The Simplicity and Solidity of Construction, Lightness of Weight and Interchangeable Quality,

*render them exceedingly Desirable Goods for Dealers to handle, and certainly the most satisfactory to the general wearer, while the price cannot fail to attract the attention of Dealers.*

A Full and Complete Assortment of these Goods kept by the Jobbers.

# A NEW DEPARTURE.

## 14 KARAT GOLD CHAIN, SILVER LINED,

— MADE BY —

### A NEW PROCESS.

Guaranteed to wear as well as the best 14 karat Gold Chain made.  
Every Chain warranted to assay one-third ( $\frac{1}{3}$ ) its entire weight in gold.  
Each Chain stamped with registered trade mark:

*Showing the Relative Thickness*  
OF THE GOLD AND SILVER.

*Showing the Relative Thickness*  
OF THE GOLD AND SILVER.

Money refunded if test is unsatisfactory.

### KOSSUTH MARX & CO.,

Proprietors and Manufacturers,

39 Maiden Lane, New York.

In introducing our new Chain we aim to supply a want which we believe the Trade can place before the public in a legitimate manner without deception, and no detriment to the standard of the most scrupulous dealer.

We offer these goods strictly upon their merits, and give but a few reasons why they can take the place of the older styles of manufacture, viz.:

- 1st.—*In the make up there is no base metal, excepting such as is necessary in standard 14 karat.*
- 2d.—*It makes a larger and more showy appearance for its corresponding weight than the old standard.*
- 3d.—*The cost is materially reduced, bringing it within reach of a greater number who desire a good article.*
- 4th.—*It is a well known fact that the principal cause of wear in chain is the friction produced by its own weight, consequently, being light weight to the extent of a large percentage, their better wear is assured.*

By a strict adherence to quality we hope to create a popular demand for a meritorious article.

Send for selection package, as our travelers do not carry any in stock.

A SITUATION with a first-class watchmaker is open to a young man of good character who has had several years' experience in watch work and wishes to improve his knowledge of repairing. Applicant must furnish own tools. Address, stating ability and amount of wages expected, South, care Jewelers' Circular.

FOR SALE—Stock, fixtures and tools of a profitable jewelry business. Fixtures and stock comparatively new, from \$5,000 to \$7,000; will reduce it to \$3,000. An old established business situated in a thriving southern town of 4,500 inhabitants. Satisfactory reasons for selling. This is a rare opportunity for a responsible man. Address W. B. P., care Jewelers' Circular.

FOR SALE—Stock of jewelry, watches and clocks in one of the most flourishing towns in Minnesota. Two railroads, population 5,000. Fixtures and stock in first-class condition. A good chance for an enterprising watchmaker. Must be sold before August 1st owing to outside business. Will dispose of above at a bargain. Terms easy. Address H. V. Birckett, Owatonna, Minn.

TO THE TRADE.—I make a specialty of supplying the Trade with stones for jobbing purposes. Parties having jewelry out of which the stones have been lost, sending their orders by mail or express, will have them promptly attended to. A large stock of cameos, pearls, turquoise, garnets, amethysts, doublets, foil backs, white and colored imitation stones on hand. All kinds of setting done for the Trade. W. Archibald, 73 Nassau street, New York.

FOR SALE—One of the cleanest stocks and best locations in the U. S. for the size of the city. Stock and fixtures invoice about eight thousand. Has paid over seventy-five per cent. net profit each year for the last three years. Store is brick, iron columns, plate glass front and one of the neatest buildings and store fixtures in the state. Will sell store or rent it. Counters are low and cases high and all plate glass. Will sell tools and materials or without. Population thirty-five hundred. Two R. R., five churches, public schools, state agricultural college in flourishing condition, opera house, city fire department and water works, good hotels. Object of selling, simply this and nothing more: We have all the money we need and made every cent except twenty dollars, our original capital, right in this city and in this business in the last five years, and wish to retire from business. City in an agricultural part of the state and growing rapidly. No we do not wish to trade it for cats or dogs or real estate, but those having cash or bankable security and wishing to invest in the jewelry business will do well to investigate. None others need apply. Address E. W. Reed, Fort Collins, Colorado. Reference, Alkin, Lambert & Co., 23 Maiden Lane, N. Y.

**WANTED.**—A permanent position by a general jeweler, letter and monogram engraver, one who is accustomed to charge of job shop. Address H. H. A., care of Circular.

**A SALESMAN** of pleasant address is desirous of making an engagement with a manufacturer of silver plate goods, to travel south or west. Address Representative, care Jewelers' Circular.

**FOR SALE.**—A first-class jewelry store 20 miles from N. Y. city, is established and a good paying business. Reason on death of proprietor. Address Tell A. Beguelli, 71 Nassau Street, N. Y.

**WANTED.**—Situation by a practical watchmaker and jeweler. Have had 12 years' experience; speaks English and German; correspondence solicited. Address Watchmaker, 871 South High St., Columbus, Ohio.

**WANTED.**—A good watchmaker's lathe with fixtures, in exchange for a quarto job printing press (DeGENER make), complete, 16 fonts of type and 3 fonts of wood type, new. Address P. O. Box 384, Wallingford, Conn.

**FOR SALE.**—One-half interest in a first-class jewelry store in a city of 65,000 inhabitants; location best in the city; a rare chance for a man with cash to buy. Address F., care of Jewelers' Circular and Horological Review.

**WANTS.**—A young man desires a situation to work under instructions for about 6 months on watch work; has worked at the bench over 4 years and is a good jobber. Address Samuel King, P. O. Box 98, Harrisburg, Pa.

**MOSELEY & CO.**, Elgin, Ill., manufacturers of the "Moseley" Lathe, with full line of fixtures and attachments. Designed especially for the watchmaker and repairer. Combining accuracy, durability, convenience and style.

**WANTED.**—Situation by a young man of three years' experience at the bench and salesman, of good morals and strictly temperate; can give best of reference. Address Jos. C. Gibson, care of J. Irvin Bowers, Williamsport, Pa.

**WANTED.**—A partner in a well established jewelry business in a western city; must be an intelligent and practical young man. Capital required about \$5,000; best reference given and required. Address "Partner," care T. Kearney, 133 State St., Chicago, Ills.

**WATCHMAKERS AND JEWELERS.**—Do you ever burn or discolor coral, sea lufoid, or colored leaves on jewelry? buy Spickerman's blow pipe attachment, saves many times its cost to jeweler; fits any blow pipe. Price 35c. John Spickerman, Jefferson, N. Y.

**WANTED.**—Situation immediately by a fine and skillful watchmaker. Has one of the best sets of tools in the country, all nicked; accustomed to the fine work in city stores; first-class references; steady situation desired. Watchmaker, box 121, Minerva, Stark Co., O.

**FOR RENT.**—Desk and vault room in the Jewelers' Exchange Building, corner State and Washington streets, Chicago. Fire-proof building. Fire and burglar-proof vault. Suitable for manufacturing jewelers or importers office. Logau & Baro, 104 State St., Chicago.

**WANTED.**—About August 1st, a good watchmaker who is also a good salesman. A young man of good address preferred who is something of a musician. A long engagement; best of references required; nice town and nice store. Address J. R. Watts & Co., Ashland, Nebraska.

**GEORGE E. WILKINS**, manufacturer and importer of cutters for watchmakers' use, stem-winding cutters of all the different forms, rounding up cutters of the finest quality, also ratchet cutters. A large stock of second hand and new marine chronometers. No. 21 South Salina street, Syracuse, N. Y.

**FOR SALE.**—The leading jewelry store in a thriving town of 7,000 inhabitants; been established 40 years; doing a good business and room for a large increase; will sell for what stock will invoice; fixtures may be bought or rented; satisfactory reasons given for selling. Address R. H. Conlyn, Carlisle, Pa.

**A WATCHMAKER**, fully competent, wishes to change his present location about October 1st, 1884. Is 26 years of age and single, with 8 years' experience, has a complete set of tools, American lathe, etc. California or Texas preferred. Is at present with J. W. Forney, Steubenville, O. "Correspondence solicited.

**FOR SALE.**—First-class jewelry store in town of 8,000 population and thickly settled country around. Leading store of the place in stock and trade. Will invoice stock and fixtures about \$5,000. Reasons for selling are not a practical jeweler and want to move west. Address C. C., care Jewelers' Circular.

**A SITUATION** with a first-class watchmaker is open to a young man of good character who has had several years' experience in watch work and wishes to improve his knowledge of repairing. Applicant must furnish own tools. Address, stating ability and amount of wages expected, South, care Jewelers' Circular.

**FOR SALE.**—Stock, fixtures and tools of a profitable jewelry business. Fixtures and stock comparatively new, from \$5,000 to \$7,000, will reduce it to \$3,000. An old established business situated in a thriving southern town of 4,500 inhabitants. Satisfactory reasons for selling. This is a rare opportunity for a responsible man. Address W. B. P., care Jewelers' Circular.

**FOR SALE.**—Large Universal lathe (cord gear), very accurate and complete. Rounding up tool (cord gearing), cutters, &c. complete; both are Swiss make; 1 large lathe wheel brass boxing; 1 watchmaker's portable work bench (walnut), with veered trout, very nice and complete; been used one week only; must be sold to satisfy debt. Address, with stamp, Universal Lathe, care of this office.

**INTERESTING FOR MANUFACTURERS OF CHARMS.**—A patent right for sale. Or a capable man of honest and noble character with capital as partner wanted. For a quite new and useful charm which is patented in four countries. Already manufactured and sold in Germany with great success, and of no doubt it will make a great success in the United States. For further particulars, address Hohelsen's Patent Charm, care of Jewelers' Circular.

**TO THE TRADE.**—I make a specialty of supplying the Trade with stones for jobbing purposes. Parties having jewelry out of which the stones have been lost, sending their orders by mail or express, will have them promptly attended to. A large stock of cameos, pearls, turquoise, garnets, amethysts, doublets, foil backs, white and colored imitation stones on hand. All kinds of setting done for the Trade. W. Archibald, 73 Nassau street, New York.

Can give good Chicago and other references as to my honesty, integrity, &c. Address H. E. B., care Jewelers' Circular.

**FOR SALE**—An old-established jewelry store in a city of 30,000 inhabitants in central Penna. Stock will invoice about \$1,000. Good run of watch work. Splendid chance for an energetic workman without much capital. One of the best locations in the city. Reason for selling death of proprietor. For particulars address E. F. M., care Jewelers' Circular.

**FOR SALE**—Stock and fixtures of a well-established jewelry business. All the work one man can do. No competition. Best market on the D. & B. C. R. R., and in most prosperous farming section of the state. Only 3 miles from the famous summer resort Lake Orion. A rare chance for a man with \$3,000 cash. Could reduce stock if desired. Change of business reason for wanting to sell. Address W. H. Brownell, Oxford, Mich.

**INTERESTING FOR MANUFACTURERS OF CHARMS**—A patent right for sale. Or a capable man of honest and noble character with capital as partner wanted. For a quite new and useful charm which is patented in four countries. Already manufactured and sold in Germany with great success, and of no doubt it will make a great success in the United States. For further particulars, address Hohelsen's Patent Charm, care of Jewelers' Circular.

**TO THE TRADE**—I make a specialty of supplying the Trade with stones for jobbing purposes. Parties having jewelry out of which the stones have been lost, sending their orders by mail or express, will have them promptly attended to. A large stock of cameos, pearls, turquoise, garnets, amethysts, doublets, foil backs, white and colored imitation stones on hand. All kinds of setting done for the Trade. W. Archibald, 73 Nassau street, New York.

**ENGRAVERS ATTENTION**—1000 copies of any monogram or letter, printed on paper, can be transferred lastingly on metal, &c., so it can be engraved exactly like the copy, by a simple method. Engravers who find it difficult to mark out monograms and fancy letters correctly will appreciate this secret. Instructions how to do above and also receipts for the best hard and soft soldering fluids ever made, sent to any jeweler for \$1.00. Address C. C. Heckart, Springfield, Mo.

**FOR SALE**—A good paying jewelry business in a good live city in middle Nebraska. 3,500 inhabitants, 4 good railroads, county seat, and surrounded by a good farming country. Present stock about \$10,000, can be reduced to suit purchaser. A good run of work, enough for 2 men; good prices for everything, competition light, rent low, and the best location in the city; good, nice and clean stock, all staple. There was never a chance better than this for a man who wants to make money in the jewelry business, it will double discount any big city business with the same capital invested. Good reason given for selling out. For other information write to The Leading Jeweler, P. O. Box 99, Columbus, Nebraska. A man who has not got \$4,000 to \$5,000 need not reply.

**FOR SALE**—First-class jewelry store in town of 6,000 population and thickly settled country around. Leading store of the place in stock and trade. Will invoice stock and fixtures about \$5,000. Reasons for selling am not a practical jeweler and want to move west. Address C. C., care Jewelers' Circular.

**FOR SALE**—At a bargain, in the best town in Maryland, a jewelry store, stock and fixtures. Established six years. Plenty of work. Stock between \$3,000 and \$5,000. Would be reduced if desired, and will be sold at a sacrifice. Correspondence solicited. Address G. R. Bowman, P. O. Box 402, Hagerstown, Md.

**FOR SALE**—One Bliss Transit, No. 10, perfect order and looks almost well as new; will be sold cheap; can be seen at Wm. Mones & Co., 706 Chestnut Street, Philadelphia, second floor. Also one No. 2 stark lathe, good order, and set of chucks, both sold for want of use. Address correspondence to box 65, Kennett Square, Pa.

**A FIRST-CLASS Watchmaker** with all references from New York and Brooklyn, wishes a good, reliable position west or south-west. Well posted in gaining bargains in jewelry, and a good judge of same; can be of great service to a good employer. Speaks English, German and Danish. Address James Cummins, 242 Clinton St., Brooklyn, N. Y.

**WANTED**—Situation by a good watchmaker, twenty-five years of age, with six years' experience, in some city where he can devote one year's time to fine repairing—chronometers, split seconds, etc. South or west preferred; salary not an object; good references given. None without such an opportunity need address P. O. Box 142, Stoughton, Mass.

**TUBING** of every description drawn to order at short notice. Gold pen, pen and pencil cases, novelties, tooth picks, at lower prices than can be purchased elsewhere. Sample line sent on approval to approved parties. Gold pens re-pointed, repaired, exchanged. Ray Manufacturing Company, salesroom and factories, 94 & 96 Nassau St. and 129, 131 and 133 Fulton St., New York.

**FOR SALE**—Stock and fixtures of a well-established jewelry business. All the work one man can do. No competition. Best market on the D. & B. C. R. R., and in most prosperous farming section of the state. Only 3 miles from the famous summer resort Lake Orion. A rare chance for a man with \$3,000 cash. Could reduce stock if desired. Change of business reason for wanting to sell. Address W. H. Brownell, Oxford, Mich.

**INTERESTING FOR MANUFACTURERS OF CHARMS**—A patent right for sale. Or a capable man of honest and noble character with capital as partner wanted. For a quite new and useful charm which is patented in four countries. Already manufactured and sold in Germany with great success, and of no doubt it will make a great success in the United States. For further particulars, address Hohelsen's Patent Charm, care of Jewelers' Circular.

**TO THE TRADE**—I make a specialty of supplying the Trade with stones for jobbing purposes. Parties having jewelry out of which the stones have been lost, sending their orders by mail or express, will have them promptly attended to. A large stock of cameos, pearls, turquoise, garnets, amethysts, doublets, foil backs, white and colored imitation stones on hand. All kinds of setting done for the Trade. W. Archibald, 73 Nassau street, New York.

**SITUATION WANTED** by competent salesman either to represent some house on road or as salesman to some large firm. Have had seven years' experience in jewelry business; thorough knowledge of repairing French clocks and some experience in repairing watches. Can furnish unexceptional references from my present employer and others as to my capabilities, character, etc. Address W. C. Shaw, care S. P. Hamilton, Bsq., Savannah, Ga.

**FOR SALE**—A good paying jewelry business in a good live city in middle Nebraska. 3,500 inhabitants, 4 good railroads, county seat, and surrounded by a good farming country. Present stock about \$10,000, can be reduced to suit purchaser. A good run of work, enough for 2 men; good prices for everything, competition light, rent low, and the best location in the city; good, nice and clean stock, all staple. There was never a chance better than this for a man who wants to make money in the jewelry business, it will double discount any big city business with the same capital invested. Good reason given for selling out. For other information write to The Leading Jeweler, P. O. Box 99, Columbus, Nebraska. A man who has not got \$4,000 to \$5,000 need not reply.

**FOR SALE**—A well established first-class jewelry store, in a town of over 4,000 inhabitants, situated in the northern part of South Carolina, right in sight of the Blue Ridge Mountains. Good society; good water (both freestone and mineral), and extremely healthful climate. Stock and fixtures will invoice about \$6,000. Will sell one-half if desired, or would prefer to sell one-half interest to a good practical business man as a partner. Handsome store rooms and best central business stand in the town. Large hall on second floor used for music department, and is furnished with pianos and organs in consignment. This house is well established and bears an excellent reputation. Reasons for wanting to make a change, am engaged in other business and need help to manage. Address J. W. McMillan, Spartanburg, S. C.

**ENGRAVERS ATTENTION**—1000 copies of any monogram or letter, printed on paper, can be transferred instantly on metal, &c., so it can be engraved exactly like the copy, by a simple method. Engravers who find it difficult to mark out monograms and fancy letters correctly will appreciate this secret. Instructions how to do above and also receipts for the best hard and soft soldering fluids ever made, sent to any jeweler for \$1.00. Address C. C. Heckart, Springfield, Mo.

**FOR SALE**—Stock of jewelry and musical goods in one of the best country seats in a town in northwestern Ind., established 5 years. Average run of bench work \$55.00 per month during the past year and sales in proportion. Will sell fixtures, including a Hall's fire and burglar proof safe and bulky goods, and reserve rest of stock if preferred. Special agent for the Rockford watches and King's spectacles. A rare chance for some one to step into a good paying business. Reason for selling is to get out of the business. Address W. J. F., care Jewelers' Circular.

**WANTED**—A partner who is a practical watchmaker and jeweler, and can furnish from 3 to \$4,000 to buy half interest in an old established jewelry business of 40 years, in a live southern town of 10,000 inhabitants. A rare chance for an energetic young man. Address Partner, care Jewelers' Circular.

**ELECTRO GILDER**, plater, nickeler, etc., thoroughly competent; managed department largest works in Europe. Expert in gilding every description. Undeniable character; 3 years with one firm in Canada. Will be open to re-engagement shortly. Address Electro, 46 Dover Court Road, Toronto, Ont., Canada.

**WANTED**—Situation by young man, Penna., who has had 10 years' experience in retail jewelry business, to take the road in the spring for some good house where good habits and strict attention to business will be appreciated. Reference or security to any amount furnished. Address Energy, care Circular.

**FOR SALE**—First-class jewelry store in town of 8,000 population and thickly settled country around. Leading store of the place in stock and trade. Will invoice stock and fixtures about \$5,000. Reasons for selling are not a practical jeweler and want to move west. Address C. C., care Jewelers' Circular.

**FOR SALE**—A good jewelry business in southern California, near Los Angeles, a town of 3,500 inhabitants, in a rich, growing section. Stock \$4,000, but could be reduced if necessary. Good run of bench work and sales good. For further particulars address Giles, Bro. & Co., Chicago, or H. T. Hollingsworth, Los Angeles, Cal.

**WANTED**—Every reader of this book to send for a sample package of my printed stationery, consisting of 100 envelopes, 100 note heads and 25 fine cards, all nicely printed, and sent post paid to any address for one dollar. Good stock and good work. Sure to suit. Send full address as follows: Ernest F. Robbins, Lock Box 24, Norwood, Mass.

**WANTED**—Two first-class watchmakers who have American lathe and tools of their own. We want men who have learned the trade and can do first-class work. Must thoroughly understand escapements and do staff and pivot work. We will give good wages and permanent situation to steady men who are skilled. Address at once, J. P. Stevens & Co., Atlanta, Ga.

**TUBING** of every description drawn to order at short notice. Gold pen, pen and pencil cases, novelties, tooth picks, at lower prices than can be purchased elsewhere. Sample line sent on approval to approved parties. Gold pens re-pointed, repaired, exchanged. Ray Manufacturing Company, salesroom and factories, 94 & 96 Nassau St. and 129, 131 and 133 Fulton St., New York.

**TIME IS MONEY**—An accurate, hard and highly finished balance staff made in one-half the average time; no dirt, no acid, grease, charcoal or extra tools used. My process is simple, clean and quick, and my own invention. Every watchmaker will see its merits at a glance and profit by its use. Send for receipt and testimonials. Price, \$1.00. F. C. Rice, 103 Second street, Macon, Ga.

**TO THE TRADE**.—I make a specialty of supplying the Trade with stones for jobbing purposes. Parties having jewelry out of which the stones have been lost, sending their orders by mail or express, will have them promptly attended to. A large stock of cameos, pearls, turquoise, garnets, amethysts, doublets, foil backs, white and colored imitation stones on hand. All kinds of setting done for the Trade. W. Archibald, 73 Nassau street, New York.

**FOR SALE**—My retail jewelry and music business, established in 1854. A splendid record; thirty years' successful business; 12 to \$15,000 stock, including fixtures, etc. Reason for selling, moving to Des Moines, where I can pay exclusive attention to my wholesale department. Also my residence and store-room for sale. A rare chance for a live party or parties. No charge for good-will. Possession given immediately. G. W. Marquardt, Iowa City.

**FOR SALE**—A good paying jewelry business in a good live city in middle Nebraska. 3,500 inhabitants, 4 good railroads, county seat, and surrounded by a good farming country. Present stock about \$10,000, can be reduced to suit purchaser. A good run of work, enough for 2 men; good prices for everything, competition light, rent low, and the best location in the city; good, nice and clean stock, all staple. There was never a chance better than this for a man who wants to make money in the jewelry business. It will double discount any big city business with the same capital invested. Good reason given for selling out. For other information write to The Leading Jeweler, P. O. Box 99, Columbus, Nebraska. A man who has not got \$4,000 to \$5,000 need not reply.

† Heinrich's Patent Auxiliary Balance.

# THE CLIMAX REVERSIBLE WATCH CASE,

MANUFACTURED BY THE

## Northwestern Watch Case Company, of Rockford, Illinois.

The outer case, in which the inner case containing movement is placed.

- (1) The bezel and glass which snaps on inside center over dial.
- (2) The inside center in which watch movement is fitted.
- (3) The cap which snaps on inside center over back of movement.

The two cases combined, and being changed from an Open Face to a Hunting Case.

A PERFECT DUST-PROOF WATCH CASE; STEM WINDING AND STEM SETTING; CHANGED FROM AN OPEN FACE TO A HUNTING CASE, OR FROM A HUNTING CASE TO AN OPEN FACE, WITHOUT THE TURN OF A SCREW.

Made in both Gold & Silver to fit all 18 Size American Stem Wind Movements, also the 16 Size Elgins.

**SOLD BY ALL WHOLESALE JEWELERS.**

### VERDICT OF THE TRADE IN THE CASE OF WATHIER'S

## PATENT SELF-ADJUSTING

## HAIR SPRING STUD INDEX

(PRICE, **\$1.25.**)

Confirms the fact that it is one of the most useful and convenient tools to the Watchmaker, and in view of its time-saving feature and absolute reliability as an indicator of the proper position of the Hair Spring Stud for the various makes of American watches, it is **valuable** to the most expert workman as it is **invaluable** to those who have more or less difficulty in putting watches in beat. We submit a few of the numerous testimonials received from leading Watchmakers:

Enclosed find \$1.25 for Index. We think it a good tool and worth many times its price to any jeweler.  
MENDOTA, Ill., July 9, 1884.  
H. MUNSON, Watchmaker and Jeweler.

Enclosed find draft for \$1.25 for Hair Spring Stud Index, with which we are more than satisfied. We can heartily recommend this tool to the trade. You could offer to refund the price to any one not fully satisfied, and we venture to say you would not be called upon to do so **in 20 years** by any honorable man. Hoping your invention will receive what it richly deserves, we are,  
YAKIMA, Wash. Ter., July 2, 1884.  
Yours respectfully, REDFIELD BROS.

I received your Hair Spring Stud Index by mail. Delayed to answer because I wanted to thoroughly test it before doing so, and it takes some time for the various makes of watches indicated on it to come in in the regular course of bench work. At first I thought I had no use for it, having worked at the bench over 40 years—from the old rack and pinion lever down. I have always been in the habit of testing each watch as regards its being in beat, and I thought I had no use for such a tool. But having tested it and found it always correct, I soon found that the saving of time makes it invaluable, even if there be no need of any help to put a watch in beat. As such a **timesaver it is valuable to the most expert workman, and it must be invaluable to the young workman** who distrusts his experience in regard to escapements, etc.  
RACINE, Wis., July 11, 1884.  
J. WATTS, Watchmaker and Jeweler.

Enclosed please find postal note for \$1.25 in payment of your Hair Spring Stud Index. Value of time saved by its use in a **single month** would more than pay its cost.  
SOUTH BEND, Ind., June 27, 1884.  
HIGHT & FAIRFIELD, Jewelers.

Please find enclosed P. O. order for \$1.25 for your Hair Spring Stud Index. I think your tool very practical and one which has been long needed.  
WELLINGTON, Kan., May 31, 1884.  
E. L. ROSER, Watchmaker and Jeweler.

Enclosed you will find postal note for \$1.25, amount for Hair Spring Stud Index. Your Hair Spring Stud Index is immense. I am glad you sent it. I would not take twenty times the amount of its cost and be compelled to do without one. It saves so much time and trouble, every watchmaker in the land ought to have one.  
THORNTOWN, Ind., June 27, 1884.

Your Hair Spring Stud Index received. You ask me to return it if not suitable. Well, I guess not. I know when I have got a good thing and calculate to keep it. It is the handiest little tool on my bench. Enclosed find M. O. for \$1.25.  
MARQUETTE, Mich., June 30, 1884.  
O. N. RIDGWAY, Jeweler and Optician.

Enclosed please find order for \$1.25 due for Hair Spring Stud Index. It is a very handy tool—one that every jeweler ought to have.  
LENA, Ill., July 1, 1884.  
A. P. PARSONS & Co., Watchmakers and Jewelers.

We think your Hair Spring Stud Index a useful tool.  
WALTHAM, Mass., June 6, 1884.  
AMERICAN WATCH TOOL CO., Per Webster.

I received your Hair Spring Stud Index and will say that I think it a very useful tool. Enclosed please find Postal note for same.  
ELKO, Nev., June 17, 1884.  
N. B. NYE, Watchmaker and Jeweler.

Enclosed find \$1.25 to pay for Hair Spring Stud Index. I am well pleased with the same.  
FORT ATKINSON, Wis., June 3, 1884.  
C. B. TOUSLEY, Watchmaker for the trade.

Enclosed find \$1.25 for your Hair Spring Stud Index received. Am much pleased with it.  
TECUMSEH, Neb., June 10, 1884.  
Wm. CONRAD, Jeweler.

For sale by all leading Jobbers. **Price, \$1.25.** Sent by mail on receipt of price, or address the patentees and manufacturers,

# SOMETHING NEW!

## The Giles' Patent Anti-Magnetic Shield

NOW READY FOR THE MARKET.

The application of Anti-Magnetic Shields to pocket timepieces promises to be of very great importance to horologists and watchmakers; it will render operative the fine adjustments and mechanisms which hitherto have been made almost nil and inoperative on account of their susceptibility to the all-pervading magnetic influences. The advantages of magnetic-proof watches are many and very important.

- 1st. Protection against personal magnetism.
- 2d. Protection against electric currents which induce magnetism—magnetic belts and other personal electric appliances.
- 3d. Protection against magnetism caused by dynamo-machines, electric wires, the multiplied electric and magnetic devices of the present day, which places any one in daily danger of coming within their influence and having their watches affected thereby.
- 4th. A protection for railroad men, who are constantly under the influence of electricity and magnetism caused by the moving train.
- 5th. A protection for machinists, who are brought under the magnetic influence caused by the running machinery, belts, etc.
- 6th. Protection for breaking mainsprings caused by the so-called electric storms, or magnetic influences of the atmosphere.
- 7th. A dust-proof case keeps the watch in much better order, the oil fresh and clean, thereby reducing the friction, giving better time, and rendering the watch more durable.

TO THE LEADING JEWELERS.

MILLER'S REVOLVING WATCH SIGNS.

We wish to call your attention to our **BIG WATCH SIGNS**, which are made of Galvanized Iron and Zinc, Painted and Gilded with the best Gold Leaf, and **Warranted in every respect.** We make them all sizes, the largest being 66 inches in diameter and 100 inches high; weight 86 pounds. They are so constructed as to revolve on a post, or swing on a rod from the building, and not blow down. These Watches are patented, and as we sell **only one of the large size in a town**, any enterprising jeweler can appreciate the advantage of an advertisement that his competitors cannot imitate. They are made in perfect proportions to a watch, being symmetrical and perfectly elegant, and the most attractive sign ever put up. To see it is to buy it. We never fail to sell it where we can show it to advantage. We call your attention to the importance of immediate thought and action, as your neighbor may order one ahead of you. Address all communications to

**WANTED**—A situation to travel for a first-class jewelry house (watches and diamonds preferred), by a salesman well acquainted with the trade, gained by an experience of sixteen years. Address B., care Jewelers' Circular.

**MOSELEY & CO.**, Elgin, Ill., manufacturers of the "Moseley" Lathe, with full line of fixtures and attachments. Designed especially for the watchmaker and repairer. Combining accuracy, durability, convenience and style.

**A TRAVELING** salesman, 30 years of age, single, steady habits, 15 years' experience in the trade, will be open for an engagement with a watch and jewelry house or manufacturer after Jan. 1st. Address D. E. G., care Jewelers' Circular.

**TRAVELING** salesman wants position Jan. 1st; young and enterprising; has had 3 years' experience through middle and eastern States. Still with old concern, but would like to make new arrangements for the coming year. C. H. F., Jr., care Jewelers' Circular.

**WANTED**—Situation by a young man 27 years old, practical watchmaker, 5 years' experience. Has been in business for himself; would take charge and run business for small remuneration; prefer country town. Address Geo. Howard, 85 W. Railroad St., Syracuse, N. Y.

**WATCHMAKERS TAKE NOTICE**—Do not fail to send your address and get full particulars of my valuable discovery. Every watchmaker that has tried it is well satisfied. It saves time, money and labor. Address J. B. Dale, Box 656, Edwardsville, Madison Co. Ills.

**WANTED**—A practical jeweler to buy out a \$1,500 stock of jewelry in a new and flourishing town of about 1,000 inhabitants, situated at the junction of the N. Y. P. & O. and W. & L. E. R. Rds; no competition; terms very liberal. Address R. A. Bassett, Creston, Wayne Co., O.

**A TRAVELER** having a fair trade in stone rings in the east and west, and being with a house at present the sixth year, wishes a situation, with a specialty of rings, from 1st of January, 1885. Good references given. Please address J. H. Fink, care of S. Fink, 38 Eldridge St., New York.

**WANTED**—Situation by a watchmaker of 12 years' experience. Can do jewelry jobbing, and script and old English engraving. Have American lathe and fine set of tools; understand all fine and complicated watches; can give first-class references. Address M., care Jewelers' Circular.

**WANTED**—Watchmaker who can invest \$1,000 to \$1,500, to buy out a well established retail jewelry store in a good city in northeast part of Ohio. Present stock about \$5,000, but can be reduced to suit purchaser. Good reason given for selling out. Address Enterprise, care Jewelers' Circular.

**GEORGE E. WILKINS**, manufacturer and importer of cutters for watchmakers' use, stem-winding cutters of all the different forms, rounding up cutters of the finest quality, also ratchet cutters. A large stock of second hand and new marine chronometers. No. 21 South Salina street, Syracuse, N. Y.

**FOR SALE**—First-class jewelry store in town of 8,000 population and thickly settled country around. Leading store of the place in stock and trade. Will invoice stock and fixtures about \$5,000. Reasons for selling am not a practical jeweler and want to move west. Address C. C., care Jewelers' Circular.

**WANTED**—The address of some gentleman of means who would be willing to loan me \$2,000 or \$2,500 on the benefit (\$5,000) of my membership in the Jewelers' League. Or, I will make an outright sale of the same for a sum sufficient to start myself in a small business. Address Loan, care Jewelers' Circular.

**WANTED**—1st February or March, 1885, situation as watchmaker and engraver; 12 years' experience; can do all kinds of watch work; engrave monograms, script and Old English; first-class salesman and understands the business throughout; sober and industrious; first-class reference. Address K. H., care Jewelers' Circular.

**FOR SALE**—Old established jewelry business in town of 12,000 in eastern Pennsylvania. Stock small and clean; part cash and good security required for balance; fine chance for young man; death of owner only reason for selling. For particulars, apply to Mrs. Jos. G. Kelly, Lebanon, Pa., or McCarty & Hurlburt, 131 N. Second St., Philadelphia.

**TUBING** of every description drawn to order at short notice. Gold pen, pen and pencil cases, novelties, tooth picks, at lower prices than can be purchased elsewhere. Sample line sent on approval to approved parties. Gold pens re-pointed, repaired, exchanged. Ray Manufacturing Company, safes, room and factories, 94 & 96 Nassau St. and 129, 131 and 133 Fulton St., New York.

**A TRAVELING** salesman now engaged in selling jewelry for an eastern house wishes to make a change Jan. 1st. Have been with present house three years; am acquainted with the trade and have traveled in 17 States. Would accept situation with a first-class silverware company, clock company or jewelry house; manufacturer preferred. Address "Traveler," care Jewelers' Circular.

**FOR SALE**—Stock, fixtures, good will and lease, or will dispose of good will and lease of a jewelry store doing a large and profitable business. The present owner desires to make a change of climate on account of bad health; the store caters largely to country trade; passengers to boats and ferries pass the door constantly all days. We employ three men for watch work. Address X. Y. Z., care Jewelers' Circular.

**TO THE TRADE**—I make a specialty of supplying the Trade with stones for jobbing purposes. Parties having jewelry out of which the stones have been lost, sending their orders by mail or express, will have them promptly attended to. A large stock of cameos, pearls, turquoise, garnets, amethysts, doublets, foil backs, white and colored imitation stones on hand. All kinds of setting done for the Trade. W. Archibald, 73 Nassau street, New York.

**FOR SALE**—A first-class jewelry store in one of the best towns of Central Pennsylvania of over 2,000 inhabitants. Great manufacturing town and a large country trade; has a good run of bench work and doing a general good business. Store is located the best in town; plate glass front and finely furnished inside; dwelling under same roof; stock of fixtures will inventory about \$3,000; will sell to suit buyer, either the whole or part, or fixtures and material without stock. A long lease can be had for store room alone or for house and store room. Good reasons for selling. For particulars, address Boston Jackson, Watsonown, Pa.

**FOR SALE**—A good paying jewelry business in a good live city in middle Nebraska. 3,500 inhabitants, 4 good railroads, county seat, and surrounded by a good farming country. Present stock about \$10,000, can be reduced to suit purchaser. A good run of work, enough for 2 men; good prices for every thing, competition light, rent low, and the best location in the city; good, nice and clean stock, all staple. There was never a chance better than this for a man who wants to make money in the jewelry business, it will double discount any big city business with the same capital invested. Good reason given for selling out. For other information write to The Leading Jeweler, P. O. Box 99, Columbus, Nebraska. A man who has not got \$4,000 to \$5,000 need not reply.

Purchase the best. **HERRING'S PATENT CHAMPION SAFES** are made to answer every requirement, and the leading manufacturing, wholesale and retail dealers in the Jewelry Trade are supplied with them, and others should be, to avoid the loss by fire or robbery.

**HERRING & CO., 251 & 252 Broadway, New York.**

# VIOLANES DU CAP.

## E. E. KIPLING

Desires to call the attention of the Trade to a NEW STONE, produced from a mineral hitherto little known. The stone is of a magnificent violet color, reflecting brilliant vibrating ruby rays and assuming the color of deep Oriental Ruby by artificial light. In hardness it equals the Rock Crystal. It is susceptible of the highest polish, and on account of these qualities must become most highly appreciated. Annexed is an analysis of the Mineral, by L. MAICHE, PARIS.

All further information concerning the above Stone, OF WHICH WE HAVE THE ENTIRE CONTROL, can be obtained at our office.

6 MAIDEN LANE, NEW YORK.

### ANALYSIS OF THE VIOLANE DU CAP

Made by L. MAICHE, Chemist, Civil Engineer, and Officer of the Academy, Paris.

|                                |       |
|--------------------------------|-------|
| Alumina.....                   | 64.20 |
| Magnesia.....                  | 31.00 |
| Silica.....                    | 2.00  |
| Iron and Manganese, about..... | .80   |
| Loss.....                      | 2.00  |

100.00

**SPECIFIC GRAVITY 2.95 to 3.06.**

From the physical and chemical analysis which I have made of this stone, I have concluded that if it can be obtained of a size and purity sufficient to be cut, it is entitled to be classed by Jewelers among the stones of the first order.

(Signed) L. MAICHE.

Paris, Feb. and March, 1883.

PROMPT ATTENTION TO ORDERS AND REPAIRS.

# IT IS USELESS

**F**OR A RETAIL JEWELER to think of doing business without a stock of American Movements; might just as well try to run water up hill. The majority of the people have their "eyes open" as to the different grades, in fact they are getting so well posted that it takes a smart Retailer to figure out any profit whatever on the average American Watch.

The FREDONIA WATCHES are sold direct to Retail Dealers in Watches only. To such the Company give the exclusive agency. They issue no price lists and thoroughly protect their agents.

The FREDONIA WATCHES have important improvements; they are built on scientific principles; they run close and can be depended on. Just now is a splendid time to have some sent on memorandum. The Leading Jewelers are pushing these goods from the fact that they run well, have a fine appearance and allow a profit.

We have appointed Messrs. **AIKIN, LAMBERT & CO.**, No. 23 Maiden Lane, New York, our **SOLE AGENTS** for the Eastern and Middle States, and **GENERAL SELLING AGENTS** for all the other States and Territories, except Illinois, Wisconsin, Iowa, Minnesota, Nebraska and Michigan, of which States Messrs. **STEIN & ELLBOGEN**, No. 123 State Street, Chicago, are **SOLE AGENTS**.

## FREDONIA WATCH COMPANY, Fredonia, New York.

# "BOOM" YOUR BUSINESS

WITH THE AID OF THE

## FRANCIS ENGRAVING MACHINE.

With the **Francis Engraving Machine** any Jeweler, with a few hours' practice, can do all his engraving, and do it better than the work commonly done by expert hand engravers. He can do this work in one-fifth the time necessary for hand work, and without the possibility of making any mistake.

We have on file many letters from Jewelers now using our Engraving Machine, to the effect that they have greatly enlarged their business, in some cases doubled it by reason of the work done by our Engraver. This they have accomplished by gratuitously engraving names, initials, monograms, emblems, etc., on jewelry, silverware, glass ornaments, etc.

The Francis Machine will do perfect engraving on anything of metal kind, glass, ivory, bone or any other hard substance; the shape of the object is immaterial. It will engrave the inside of a finger ring, the bottom of a cup, the rounded surface of a napkin ring, a glass toilet set, anything that can be done by hand, and many things that a hand engraver cannot do in consequence of difficulty in getting at the work.

Full particulars, with circulars, a long list of references and special commendatory letters from persons using the machine, will be sent to any address on application to the general office of the

## FRANCIS ENGRAVING CO.,

19 PARK PLACE,

NEW YORK.

**"The Waterbury."**

**THE NEW "SERIES C,"**

**With FULL DIAL and SOLID PLATES.**

**NEW SERIES C.**  
Solid Plates and Full Dial.

With each series we have greatly improved the quality of the Watch, and are fully satisfied that "Series C" will be admitted by Dealers generally to be a decided step in advance.

The past three years' experience has enabled us to make the decided improvement so well known and acknowledged by those who have handled the Waterbury since its first introduction.

The "Series A" had open dial and skeleton plates. Our judgment in making the change in "Series B" to full dial and solid plates has received the unanimous verdict of approval, and we have retained them in "Series C."

The metal of the cases of "Series C" will be of Nickel Silver, which always wears white and clean.

Having found the Satin Lined Spring Box admirably adapted for safe transportation of Watches, we shall pack "Series C" in same box.

Material in any desired quantity can be had of New York office only.

**ONE THOUSAND WATCHES MANUFACTURED EVERY WORKING DAY.**

SERIES C.—Full Dial, Solid Plates, - - - \$48.00 per dozen.

**Discount to the Trade.**

Orders for less than one dozen are referred to the nearest Jobber. **We do not fill them.**

# NEW YORK OPTICAL CO.'S

## Patent EUREKA INTERCHANGEABLE Spectacles and Eye-Glasses.

**IN GOLD, SILVER, GERMAN SILVER AND STEEL.**

Completely INTERCHANGEABLE in all its parts.

The **Loops** of the eye-frames can be enlarged or contracted at will, so that lenses of various sizes may be made to fit tightly in the same frame, thus securing an **Interchange of Lenses**.

The joints or end pieces are made of a slender solid piece of metal and are so constructed that the **Temples** can be easily detached from one frame and freely adjusted to any other, thereby securing the **Interchange of Temples**.

Should the temples become loose through wear, they may be easily tightened by the aid of a screw driver.

**THE SIMPLICITY AND SOLIDITY OF CONSTRUCTION,  
LIGHTNESS OF WEIGHT AND INTERCHANGEABLE QUALITY,**

render them exceedingly desirable goods for Dealers to handle, and certainly the most satisfactory to the general wearer, while the price cannot fail to attract the attention of Dealers.

## PATENT IMPROVEMENT IN COUNTER + SHOW + CASES, WITH PERPENDICULAR SLIDING DOORS. DUST PROOF.

The Advantage and Convenience of these Show Cases will be apparent to everyone.

The doors are more conveniently opened and closed, less liable to get out of repair or broken, articles are more easily reached in wide cases, mirrors are more safe, it dispenses with hinges, economizes room, excludes dust, and is air tight when closed.

Drawings furnished and estimates given for fitting stores in cabinet work complete.

Letters Patent having been granted us for the construction of these doors, we shall prosecute all parties using Cases which infringe on our Patents.

# SOMETHING NEW!

## The Giles' Patent Anti-Magnetic Shield

### NOW READY FOR THE MARKET.

The application of Anti-Magnetic Shields to pocket timepieces promises to be of very great importance to horologists and watchmakers; it will render operative the fine adjustments and mechanisms which hitherto have been made almost nil and inoperative on account of their susceptibility to the all-pervading magnetic influences. The advantages of magnetic-proof watches are many and very important.

- 1st. Protection against personal magnetism.
- 2d. Protection against electric currents which induce magnetism—magnetic belts and other personal electric appliances.
- 3d. Protection against magnetism caused by dynamo-machines, electric wires, the multiplied electric and magnetic devices of the present day, which places any one in daily danger of coming within their influence and having their watches affected thereby.
- 4th. A protection for railroad men, who are constantly under the influence of electricity and magnetism caused by the moving train.
- 5th. A protection for machinists, who are brought under the magnetic influence caused by the running machinery, belts, etc.
- 6th. Protection for breaking mainsprings caused by the so-called electric storms, or magnetic influences of the atmosphere.
- 7th. A dust-proof case keeps the watch in much better order, the oil fresh and clean, thereby reducing the friction, giving better time, and rendering the watch more durable.

MAKERS OF  
NOVELTIES IN OPTICAL GOODS.

We now offer to the Jewelers and Opticians our new **Ophthalmoscopic Test Lens**. We have 500 in actual use and can recommend it as being a Scientific and Thoroughly Practical Instrument of detecting all optical defects and determining the lenses needed for their correction, and with a little study and investigation most any person can learn how to correct any visual imperfection.

This Instrument measures each eye separately, which all Oculists agree is the best method. It is simple in its construction and easily understood.

SEND FOR CIRCULAR.

Our New Pebble Tester, one of the most useful articles known in the Optical line, works instantaneously and warranted correct.

**ENGLISH, Swiss and American watches** altered from key to stem winding. Lowest prices consistent with fine workmanship. S. Millard, No. 6 John street, N. Y.

**SITUATION** wanted by a watchmaker and jeweler. Over seventeen years' experience. Good reference. N. Y. State preferred. Address S. M. V. A., care Jewelers' Circular.

**WANTED**—A good watchmaker and jeweler; to the right man a permanent situation will be given; must have good recommendations. Address F. E. Copewell, Farmington, Conn.

**WANTED**—A situation by a watchmaker who understands watch and French clock repair. g. References given. For particulars address S. A. W., Lock Box 285, Brattleboro, Vt.

**THEO. LESPÉRANCE**, No. 1 Maiden Lane, New York, watchmaker and wheel cutter. Changing watches from key to stem winding a specialty. A large stock of diamond and gothic hands constantly on hand.

**WANTED AT ONCE**—An industrious young man to learn the watchmaking and jewelry business. Would prefer a hand of a little experience. Good reference required. Address F. A. Morgan, Lebanon, N. H.

**WANTED**—The addresses of all traveling dealers in watch materials, etc., to introduce an easily selling and well paying novelty. Communications will oblige H. B., care Editor Jewelers' Circular, 42 Nassau St., N. Y.

**MOSELEY & CO.**, Elgin, Ill., manufacturers of the "Moseley" Lathe, with full line of fixtures and attachments. Designed especially for the watchmaker and repairer. Combining accuracy, durability, convenience and style.

**FOR SALE**—Vols. 7, 8, 9, 10, 11, 12, 13 and 14 of The Jewelers' Circular. Neatly bound in cloth with morocco back and corners. Containing all of the second series of "Practical Hints" by Excelsior. Address A. J. Green, Grafton, Neb.

**\$1,000** to \$1,500 will buy the only jewelry store in a central Illinois town of 3,500 inhabitants. Splendid run of work. Elegant store room and living rooms combined. Rent very low. Will sell on easy terms. Address Lock Box 90, Urbana, Ill.

**WANTED**—Experienced traveling salesmen to carry on commission small sample lines of salable goods handled by the jewelry and kindred trades, either separately or in conjunction with other lines, such as clocks, gold pens, silverware, etc. Address D., care Jewelers' Circular.

**WANTED**—Watch and jewelry repairer; hard solder, etc. Young man under 35. Also must clerk in jewelry and book store. Wages moderate. Satisfactory references to ability, character and honesty. To right man situation is permanent. Address Lowell, Box 388, Birmingham, Conn.

**GEORGE E. WILKINS**, manufacturer and importer of cutters for watchmakers' use, stem-winding cutters of all the different forms, rounding up cutters of the finest quality, also ratchet cutters. A large stock of second hand and new marine chronometers. No. 21 South Salina street, Syracuse, N. Y.

**FOR SALE**—First-class jewelry store in town of 8,000 population and thickly settled country around. Leading store of the place in stock and trade. Will invoice stock and fixtures about \$5,000. Reasons for selling are not a practical jeweler and want to move west. Address C. C., care Jewelers' Circular.

**WANTED**—Situation by a young man desirous of finishing his trade. Have had little over one year's experience. Can do ordinary clock and jewelry repairing and engraving. Good habits and reference. Prefer to go on trial for short time before making permanent arrangements. Address Steve Davies, Remsen, N. Y.

**WANTED**—A situation as fine watchmaker. Have a fine set of tools and am familiar with fine watch adjusting and repairing of all kinds. Have had fifteen years' experience at the bench, and can furnish the highest references as to character and ability. Some large city preferred. Address O. Lever, care Jewelers' Circular.

**FOR SALE**—The leading jewelry store in the largest city in the oil country, 10,000 inhabitants. The store is in a brick block, plate glass front and handsomely fitted up. Plenty of work for two men. Only two jewelry stores in the place. Stock will be reduced to suit customer. Good reasons given for selling. Address A. Y. X., care Jewelers' Circular.

**TUBING** of every description drawn to order at short notice. Gold pen, pen and pencil cases, novelties, tooth picks, at lower prices than can be purchased elsewhere. Sample line sent on approval to approved parties. Gold pens re-pointed, repaired, exchanged. Ray Manufacturing Company, salesroom and factories, 94 & 96 Nassau St. and 129, 131 and 133 Fulton St., New York.

**TO THE TRADE**.—I make a specialty of supplying the Trade with stones for jobbing purposes. Parties having jewelry out of which the stones have been lost, sending their orders by mail or express, will have them promptly attended to. A large stock of cameos, pearls, turquoise, garnets, amethysts, doublets, foilbacks, white and colored imitation stones on hand. All kinds of setting done for the Trade. W. Archibald, 73 Nassau street, New York.

**FOR SALE**—Stock and fixtures of leading jewelry store at South Bend, Ind. Will reduce stock to nearly any amount desired and give immediate possession. Have occupied store for ten years; business during that time has averaged \$1,000 monthly; labor about \$100 per month. Best advertised store in Co. and none in the land has a better reputation for honorable dealing. Refer to Mess. C. G. Alford & Co and Mess. Marx & Weis of New York. Hight & Fairfield, South Bend, Ind.

**FOR SALE**—1 No. 1 Moseley (hard) watchmakers' lathe with attachments, including universal head, swing rest with calliper and lateral screw, slide rest, pivot polisher, counter shaft, face plate, screw plate and top, 50 chucks, split; 5 wheel; emery laps, diamond laps, copper, ivory and tortoise shell laps and grinders, spotting and snalling grinders, tapers, cutters for slide rest, extra spindles, etc. Been in use 6 months. Have two of same make. Cost about \$350. Will sell for \$250. Address F. Gilmore, 16 Maiden Lane, care Jno. Ward.

**FOR SALE**—The stock, fixtures, good will and lease of the "Diamond Palace," the leading, prettiest and oldest established jewelry store in Leadville, Colo. Population 18,000. Will reduce stock to suit purchaser, ask nothing for good will and a splendid lease, as must positively get out of the jewelry business by January 10, 1885, and are willing to make big sacrifice to do so. Reasons made known to purchaser. This is indeed a rare chance for anybody. For further particulars address Dan G. Golding, P. O. Box 990, Leadville, Colo.

**FOR SALE**—A first-class jewelry store in one of the best towns of Central Pennsylvania of over 2,000 inhabitants. Great manufacturing town and a large country trade; has a good run of bench work and doing a general good business. Store is located in the best town; plate glass front and finely furnished inside; dwelling under same roof; stock of fixtures will inventory about \$3,000; will sell to suit buyer, either the whole or part, or fixtures and material without stock. A long lease can be had for store room alone or for house and store room. Good reasons for selling. For particulars, address Huston Jackson, Watsonstown, Pa.
