HELICINA.

PLATE I.

Genus HELICINA *Lamarck*.

Testa rotunda, heliciformis, evoluta, lenticularis, aut globosa; aperture marginie interno rotundata, marginem exterum plicisque reflexo vel incrassato.
Operculum concentricum, testaceum vel cornutum, obliqui semilunari vel subquadrate, nucleus subcentralis.
 Shell terrestrial, heliciform, conical, lenticular or globose; inner edge of aperture rather straight, outer margin generally reflected or thickened.
 Operculum concentric, shelly or horny, oblique semilunar or subquadrate, with nearly central nucleus.

It is difficult to assort as useful the numerous generic divisions into which the species of this genus have been separated. The passus from the conical to the globose, the globose to the lenticular, the notched to the entire columella, the imperforate to the thick rounded callus, the rounded to the angular, and then to the lobed by whorls, are by almost imperceptible gradations. That being the case, it is impossible to define such genera as *Terebrula*, *Astarte*, *Lucidula*, &c., so as to distinguish them from each other, and from *Helicina*; while, on the other hand, they unitively form a genus of very various but few, included in one genus as defined above.

The *Helicina* abound most plentifully in continents, particularly the tropics. Cuba, the West Indian Islands, especially Jamaica, the Philippines, and the Pacific Islands are among their favorite habitats, although the tropics, and even the northern parts of the American continent, produce many species. The rapid increase in the number of known species that has taken place in this country may be remarked. In 1842 Mr. Sowerby published 75 species; a large proportion of which were then novelties; and in 1866 his 2nd Monograph with 270 species. In the present work we describe 310.

Species 1. (Mus. Brit.)

HELICINA DISSIMILANS. *Hel. testa depresso-rouleante, concentrica striata; spira depresso-conica, atra tibus parvo, paucis, ultimo anfractu sulcataeulari, medio obtusissime angulata, callo centrali tumidulo, columella aculeata, obliqua; labio externo angusto, reflexo, late, superne rotundata, presso, infra ad columellam non nisi incisi emarginata.*

THE DISSIMULATING HELICINA. Shell depressed, reddish-brown, concentrically striated; spire depresso-

conical, whorls small, few, last whorl rather conical, very obtusely angular in the middle; ventral callus rather thin, columella aculeated, oblique; outer lip narrow, reflected, yellow, sinuously depressed above, notched with an incised figure below at the columella.

PORY. Mem. II., p. 35, t. 4, f. 6, 7.

Hab. Cuba.

Species 2. (Fig. a, b, Mus. Nobis.)

HELICINA SUBMARINATA. *Hel. testa globosa-sulcata, fuscata, vel rubra ad suturam plicisque loco marginata, spiraliiter punctato-striata; spira subconica, atra tibus convexis, majusculis; apice obtuso; ultimo anfractu inflato, medio obscurè angustata; callo centrali magna, alba, tumida, columella obliqua, aculeata; labio externo late, crassus, ad columellam infelix emarginatus.*

THE SUBMARINATED HELICINA. Shell globose-subdepressed, brown, or red generally bordered at the suture with yellow, spirally puncture-striated, spire rather conical, with rather large convex whorls; apex obtuse; last whorl inflated, obscurely angular in the middle; ventral callus large, white, tumid; columella oblique, aculeated; outer lip yellow, thick, notched below at the columella.

GRAY. Zool. Journ. i. p. 68, t. 6, f. 11.

Helicina rubra, Pfeiffer.

Hab. Cuba.

Species 3. (Fig. a, b, Mus. Nobis.)

HELICINA SAGAMANA. *Hel. testa angusta, crassa, subangulata, fusa, epidermis cirridi interdum induta, spiri depresso-conica, apice obtuso, anfractibus convexis, callo centrali expanso, incrassato, columella obtusa, aculeata, labio externo albo, reflexo, ad columellam infelix emarginata.*

THE SAGEA HELICINA. Shell large, thick, rather angular, brown, covered sometimes with a green epidermis; spire depressed-conical, apex obtuse, whorls convex, ventral callus expanded, thickened, columella obtusely aculeate; outer lip white, reflected, notched below at the columella.

OBREGON. Mollusques de l'Isle Cuba.

Helicina Jeannereti? Pfeiffer.

Hab. Cuba.

HELICINA.—PLATE I.

Species 4. (Mus. —? Copied.)

HELICINA FESTIVA. *Hel.* testă solidă, angulată, rubro-fusă concentrică rugată, inter rugis rubro lineata, medio luteo fasciată; callo centrali luteo, rubro marginato, columellă parva, aculeata; labio externo luteo, incrassato, infra ad columellam emarginato.

THE FESTIVE HELICINA. Shell solid, angular, concentrically wrinkled, with red lines between the wrinkles; banded with yellow in the middle; ventral callus yellow, bordered with red; columella small, aculated; outer lip yellow, thickened, notched below at the columella.

GRAY. Zoology of Beechy's Voyage, p. 145, t. 38, f. 23.

Hab. —?

We have met with shells resembling this, but not such as could be considered characteristic. The original type seems to be lost.

Species 5. (Mus. Nobis.)

HELICINA OCHRACEA. *Hel.* testă obliquă angulată, solida, ochracea, concentrică tenuiter rugată; spira convexo-conica, obtusa; ultimo anfractu medio subangulato; callo centrali expanso, crasso; columellă obliqua, parva, subtuberulari; labio externo superne sub-sinuato, medio expanso, jecă în loban producto, ad columellam emarginato.

THE OCHRACEOUS HELICINA. Shell obliquely angular, solid, ochraceous, concentrically finely wrinkled; spire convex-conical, obtuse; last whorl rather angular in the middle; ventral callus expanded, thick, columella oblique, small, subtuberular; outer lip subsinuous above, expanded in the middle, and produced almost into a lobe, emarginated at the columella.

POEY. Mem. p. 112, t. 11, f. 1-4.

Hab. Cuba.

Species 6. (Mus. Brit.)

HELICINA PALLIATA. *Hel.* testă subglobosă, mediocriter tenui, fuso-rubescens; spira conică, subacuminata; anfractibus subplanitatis, ultimo anfractu magna, callo centrali tenui, expanso, columellă brevi, aculeata; apertură magna, labio externo aurantiu, tan, infra ad columellam emarginato.

THE CLOAKED HELICINA. Shell subglobose, moderately thin, reddish-brown; spire conical, subacuminated; whorls rather flattened, last whorl large, ventral callus thin, expanded, columella short,

aculated; aperture large, outer lip orange, broad, notched below at the columella.

C. B. ADAMS. Contributions to Conchology.

Helicina citrinolabris (var.), C. B. Adams.

Helicina albolabris (var.), C. B. Adams.

Helicina consanguinea, C. B. Adams.

Hab. Jamaica.

The above variations are scarcely of specific importance. The mouth is larger than in *Helicina Brownii*.

Species 7. (Mus. Nobis.)

HELICINA MICROSTOMA. *Hel.* testă depresso, tenișculă, pallidă (sed fasciatio magis vivida) fulvă; spira depresso-conică; ultimo anfractu depresso, callo centrali rotundo, columellă obliqua aculeata; apertura lată, comprimită, labio externo reflexo, superne flexuosim depresso, infra ad columellam profundè inviso-emarginata.

THE SMALL-MOUTHED HELICINA. Shell depressed, rather thin, pale (but more brightly in bands) fulvous; spire depressed-conical; last whorl depressed, ventral callus rounded, columella obliquely aculated; aperture broad, compressed, outer lip reflected flexuous, depressed above, with a deeply cut notch below at the columella.

C. B. ADAMS. New York Lyceum.

Hab. Jamaica.

A species easily known by the flexuously depressed form of its outer lip, and other peculiarities.

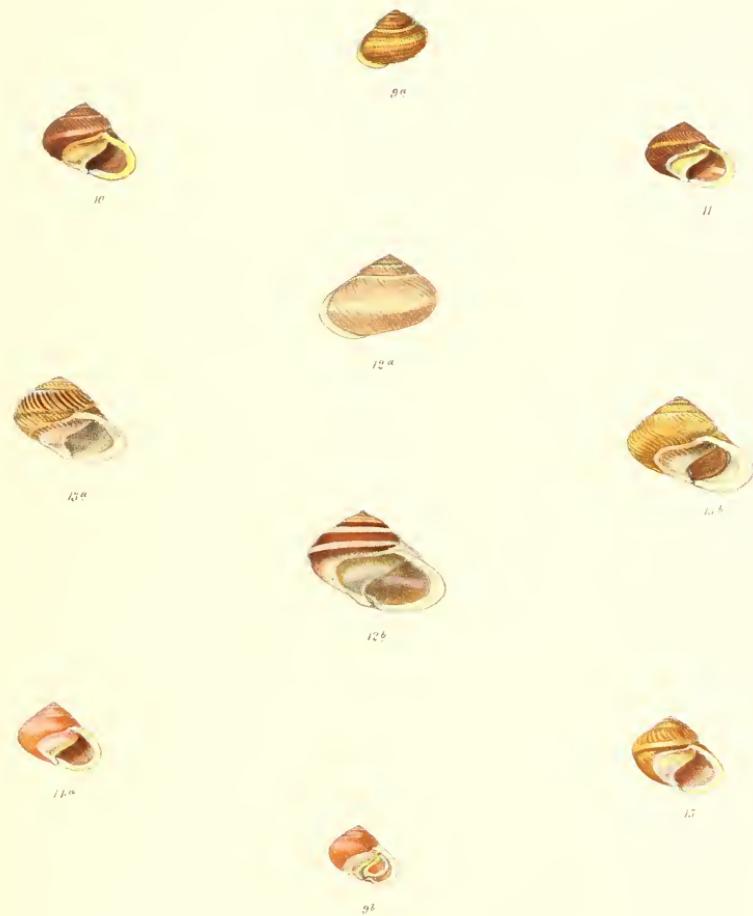

Species 8. (Fig. a, b, Mus. Brit.)

HELICINA MACILENTA. *Hel.* testă albă, comprimită, semi-pelucidă; spira parcă, anfractibus paulo convexis; callo centrali inconspectu; columellă parcă, obliquă aculeata; apertura depresso; labio externo superne arcuato, infra proprie columellam valde flexuosa.

THE LEAN HELICINA. Shell white, compressed, semi-pelucid; spire small, whorls a little convex; ventral callus inconspicuous; columella small, obliquely aculated; aperture depressed, outer lip arched, strongly flexuous below, near the columella.

C. B. ADAMS. Contributions to Conchology.
Hab. Jamaica

A pretty little species, remarkable for its depressed form, and a strong flexure in the lower part of the outer lip near the juncture.

HELICINA.

PLATE II.

Species 9. (Fig. *a, b*, Mus. Cum. in Brit.)

HELICINA BROWNI. *Hel. testā subrotundā, venis angulis,* fuscā vel rubrā, spīraliter substriatā; spīra conicā; aperturā intus uncinatā; labio interno albo, rotundatē callous, in dentē acuminatū terminatū; labio exterō compressa, reflexa, ad juncturam subflexuosa, profundi incisa, ad medium subangulata.

BROWN'S HELICINA. Shell rather rounded, rather thin, brown or red, spirally a little striated; spire conical; aperture orange within; inner lip white, roundly callous, ending in an acuminate tooth; outer lip compressed, reflexed, a little flexuous at the juncture, deeply incised, a little angular at the middle.

GRAY. Zool. Journ., vol. i, p. 68, pl. 6, f. 10.

Helicina hirsuta (var. f. a.), C. B. Adams.

Helicina Holthausi (var.), C. B. Adams.

Hab. Jamaica.

Species 10. (Mus. Cum. in Brit.)

HELICINA CATALINIANA. *Hel. testā angulata subalba pressā,* solida; levigatā, fuscā pīca, aperturā solida, pezoñatā, ad juncturam latitudine contractatā, labio interno subomplana; labio exterō crassā.

CATALIN'S HELICINA. Shell angular, subdepressed, solid, smooth, smoky brown, aperture rather trapzoidal, notched at the juncture of the lips; inner lip rather flat; outer lip thick.

PFEIFFER. Blainville's Malacology.

Hab. Cuba.

Of a more solid and angular character than the preceding, and of a uniform smoky-brown colour.

Species 11. (Mus. Cum. in Brit.)

HELICINA BAYHAMENSIS. *Hel. testā depresso-subangulata;* obliquā rugatā, fuscā, ad angulum contractum lineā

rubrā cinctā, suprad lineam lateo-fuscātā; apertura depresso; labio interno complanato albido, ad terminum dentato; labio exterō albo, rotundatē angulata.

THE BAYHAM'S HELICINA. Shell depressed, rather angular, obliquely wrinkled, brown, belted with a red line at the angle of the whorls, banded above the line with dull yellow; aperture depressed, inner lip flattened, whitish, toothed at the end, outer lip white, roundly angular.

Poey. Mem. p. 416.

Hab. Cuba.

Species 12. (Fig. *a, b*, Mus. Brit.)

HELICINA BRIAREA. *Hel. testā solidā, omnino pallidā,* vel fasciis duabus latīcūcīdī rubris battentā, obliquā subtrachiformā, ad medium angustissimā obtusā angulata, labio interno ad terminum dentato, labio exterō ad juncturam emarginato.

THE BRIAREAN HELICINA. Shell solid, pale all over, or belted with two broad bright red bands, obliquely subtrachiform, obtusely angular at the middle of the whorls; inner lip toothed at the end; outer lip notched at the juncture.

Poey. Mem. p. 109, t. 10, f. 9-12.

Helicina ciliata (var.), Poey.

Helicina fossulata (var.), Poey.

Hab. Cuba.

Species 13. (Fig. *a*, Mus. Brit., *b*, Mus. Taylor.)

HELICINA SILACEA. *Hel. testā crassā, depresso-subtrachiformā, obliquā profundē rugatā;* stramineā vel fuscō-rubescētā late bifasciatā, medio rubro lineatā; labio interno ad terminum dentato; labio exterō lato, crassā, subcomplanata, ad medium producta, subangulata, ad juncturam emarginata.

THE YELLOW HELICINA. Shell thick, depressed, subtrachiform, obliquely deeply wrinkled; straw-

HELICINA.—PLATE II.

coloured, or with two broad bands of reddish-brown, and a red line in the middle; inner lip toothed at the end; outer lip broad, thick, toothed at the middle, notched at the juncture.

MORELET. Testacea Nov.

Hab. Cuba.

Species 14. (Fig. *a*, and fig. *b*, Pl. III., Mus. Brit.)

HELICINA MAJOR. *Hel. testā subrotundā, levigatā, rubrā, insīfrā albida; spira conicā; aperturi semilunari, labio interno albo, callous; labio externo subcomplanato, albo, ad juncturam leviter emarginato.*

THE LARGER HELICINA. Shell rather rounded, smooth, red, whitish below; spire conical; aperture semi-lunar, inner lip white, callous; outer lip rather flattened, white, slightly notched at the juncture.

GRAY. Zool. Journ., vol. i. p. 68, pl. 6, f. 10.

Helicina Gosssei (var.), Pfeiffer.

Helicina nobilis (var.), C. B. Adams.

Hab. Jamaica.

With the general form and appearance of *H. Brownii*.

this species is larger, and instead of an incised notch it is only slightly emarginated at the juncture of the two lips.

Species 15. (Mus. Cuming in Brit.)

HELICINA FULCHEIRIMA. *Hel. depresso-subrotundā, luteo-fuscā, leviter rugatā, medio rubro unilineatā; spira obtusā, subrotunda; labio externo albido, supernē subcontracto; ad medium subproducto; ad juncturam emarginato.*

THE VERY BEAUTIFUL HELICINA. Shell rather rounded, depressed, yellowish-brown, slightly wrinkled, with a single red line in the centre; spire obtuse, a little rounded, outer lip whitish, a little contracted above, a little produced in the middle; notched at the juncture.

LEA. Trans. Amer. Phil. Soc., vol. v., pl. 19, f. 57.

Helicina crassa, D'Orbigny.

Hab. Cuba.

The surface is sometimes covered by a slightly hairy epidermis.

H E L I C I N A.

PLATE III.

FIG. 14. *a*—*b*.

HELICINA VELUTINA., Gray. This variety has been named *Helicina nobilis* by C. B. Adams. It is slightly more Trochiform, and the under side of the body whorl is white.

Species 16. (Mus. Brit.)

HELICINA VELUTINA. *Hel.* testă fusco-subtenui, pro
depresso-conică, înălță lenticulari, media inven-
tuum retrocurvata angulată, apertura compresă;
labio externo subrotundato, cîrligă & supra, flexuosa
depresso, latera inciso-emarginato; callo centrali
tenui, cîrligă & in dentem terminanti.

THE VELVET HELICINA. Shell brownish red, de-
pressed conical above, lenticular beneath, roundly
angular in the middle of the whorls, aperture
compressed, outer lip a little rounded, reflected,
flexuously depressed above, with an incised notch
beneath; ventral callus thin, columella ending in
a tooth.

POEY. Mémoire des Coquilles de Cuba, ii. p. 35, t.
4, f. 6, 7.

Hab. Cuba.

Species 17. (Mus. Brit.)

HELICINA GLOBOSEA. *Hel.* testă albă, solidă, globosă;
spira mucronată; anfractu ultimo ventricosa, su-
perne spiraliter striato, înălță lecigato, post labium
internum subumbilicato; labio interno latiusculo,
complanato, apertura semilunară, labio externo
intus subincurvato.

THE GLOBOSE HELICINA. Shell white, solid, globose;
spire mucronate, last whorl ventricose, spirally
striated above, smooth beneath, slightly umbili-
cated behind the inner lip; inner lip rather

broad, flattened; aperture semilunar, outer lip
thickened within.

GRAY. Zool. of Beechey's Voy., p. 145, pl. 38, f. 22.
Hab. Haiti.

Species 18. (Mus. Brit.)

HELICINA BRAMPHOSTYLA. *Hel.* testă tenui, subdepresso,
pallid roseo-falcă; anfractibus ad suturam fasciă
alba latiusculă, tună fasciă rubra lutea, alteraque
pallidiior spiraliiter cinctă, înălță rubra tinctă, proprie
apertura fusco unifasciata; apertura depresso,
labio externo supra flexuoso depresso, alba, pro-
ducto, reflexo, propri columnellam inciso-emarginato,
callo centrali rotundo, columellă arantă undentata.

THE BEAK-PILLARED HELICINA. Shell thin, subdepressed,
pale rose-brown; whorls spirally banded with a
white, rather broad band at the suture, then with
a broad red band and another paler, stained below
with red, with a band of brown near the aper-
ture; aperture depressed, outer lip flexuously
depressed above, white, produced, reflected,
columella ending in a sharp single tooth.

PFEIFFER. Proc. Zool. Soc. 1856.

Hab. —?

Species 19. (Mus. Brit.)

HELICINA CHEYSOSTOMA. *Hel.* testă trochiformi, albă,
spiraliiter costată; spira conică, acuminată, aper-
tura intus vînde aură; labio externo pallide aureo,
retrosum subexpanso; columellă subtriangularis,
complanata; cum labio externo antică continuo.

THE GOLD-MOUTHED HELICINA. Shell trochiform, light,
white, spirally ribbed; spire conical, acuminate, aperture
bright golden within; outer lip pale golden,
expanded backwards; columella subtri-
gonal, continuous with the outer lip.

HELICINA.—PLATE III.

SHUTTLEWORTH. Sowerby's Thesaurus Conchyliorum.

Helicina (2nd) Pl. III. f. 109, 110.

Hab. Cuba.

A very pretty example of the light trochiform group.

Species 20. (Mus. — ?)

HELICINA SINUOSA. *Hel. testâ solidâ, albâ, subtrochiformi, supernâ conicâ, infernâ rotundatâ-subconicâ, spirâliter striatâ, medio anfractum subcarinatâ; aperturâ subauriformi, labio externo rotundo, supernâ sinuatum depresso, prope juncturam anticus sinuato; labio interno anticâ in columellam tortuam, posticâ in plicam callosam terminanti.*

THE SINUOSA HELICINA. Shell solid, white, somewhat trochiform, conical above, rounded and a little compressed beneath, spirally striated, slightly keeled in the middle of the whorls, aperture somewhat auriform, outer lip round, sinuously depressed above, sinuated near the anterior junction, inner lip terminating anteriorly in a tortuous columella, posteriorly in a callous fold.

PFEIFFER. Zeitsch. für Malak. 1830.
Hab. Mexico.

The aperture of this species is most curiously formed, a sinuous depression in the upper part of the outer lip and a callous semicircular plait on the inner lip near the junction, forming together a kind of loop.

Species 21. (Mus. Brit.)

HELICINA MAXIMA. *Hel. testâ latâ, subcompressâ, lavi-gatiâ, albâ; spira paulò elevatâ, anfractu ultimo compresso-rotundato, callo ventrali expanso, columellâ brevi; aperturâ semilunari, labio externo expanso, reflexo.*

THE VERY LARGE HELICINA. Shell broad, subcompressed, smooth, white; spire a little elevated, last whorl compressed, rounded; ventral callus expanded, columella short; aperture semilunar, outer lip expanded, reflected.

SOWERBY. Proc. Zool. Soc. 1842. Thes. Conch., pl. i. f. 2.

Hab. Jamaica.

Species 22. (Fig. a, b, Mus. Brit.)

HELICINA EXCAVATA. *Hel. testâ trochiformâ, fulvâ, spirâliter striatâ; spira moderatâ elevatâ, acuminatâ; apex mucronato; ultimo anfractu rotundato-subdepresso; aperturâ subrotundâ, intus aureâ; labio externo tenui, planulato, reflexo, columellâ subtri-gona, excavatâ.*

THE EXCAVATED HELICINA. Shell trochiform, fulvous, spirally striated; spire moderately elevated, acuminate; apex mucronated; last whorl rounded, subdepressed; aperture rather rounded, golden within; outer lip thin, flattened, reflected; columella subtriangular, excavated.

PFEIFFER. Proc. Zool. Soc. 1835.
Hab. — ?

Species 23. (Fig. a, b, Mus. Brit.)

HELICINA ADAMSIANA. *Hel. testâ pareâ, rubescens, len-ticulari, levigata; spira convexo-depressa, obliquè leviter striatâ, labio externo albo supernâ depresso, infra propè juncturam tumidiusculo, subflexuoso, columellâ brevisimul, arcuata.*

THE ADAMSIAN HELICINA. Shell small, reddish, lenticular, smooth, spire convexly depressed, obliquely slightly striated, outer lip white, depressed above, rather swelled below near the junction, subflexuous, columella very short, curved.

PFEIFFER. Proc. Zool. Soc. 1842. Sowerby's Thesaurus, fig. 71, 72.

Hab. Jamaica.

HELICINA

Species 28. (Fig. *a*, *b*, Mus. Brit.)

Hedysarum diffusum — *Heliotropium subumbellatum* tenui-luteum

HELICINA.—PLATE IV.

vel rosæ-falvæ; spiræ depresso-conicæ, anfractibus parvis, locisibus; ultimo anfractu compreso, medio rotando, columellâ trigonâ, labio externo albo, tenui, ad juncturam eis emarginato.

THE DUROUS HELICINA. Shell subcompressed, thin, yellowish or rose-fulvous; spire depressed-conical, with small, short whorls; last whorl compressed, rounded in the middle, columnella trigonal, outer lip white, thin, scarcely emarginated at the junction.
C. B. ADAMS. Contributions to Conchology, vol. vi. p. 93.
Hab. Jamaica.

Species 29. (Fig. a, b, Mus. Brit.)

HELICINA BOTUNDA. *Hel. testæ heliciformi, subglobosæ, latei, supernæ fulvo-rubescenti, levigatæ, tenuisculd; spiræ subelevatæ, lateribus concavæ, anfractibus parvis; ultimo anfractu subdepressa; callo ventrali rotundato; columellâ brevi, subtriangoni; aperturâ semilunari; labio externo tenui, reflexo, ad juncturam eis emarginato.*

THE ROUNDED HELICINA. Shell heliciform, subglobose, yellowish, reddish-brown above, smooth, rather thin, spire slightly elevated, with convex sides, whorls small; last whorl a little depressed; ventral callus rounded, columnella short, a little trigonal; aperture semilunar; outer lip thin, reflected, scarcely emarginated at the junction.

D'ORBIGNY. Mollusques de l'île de Cuba, p. 252.
Hab. Cuba.

Species 30. (Mus. Brit.)

HELICINA VIRGINIA. *Hel. testæ globosæ, solidâ, supernæ acuminati, infernæ rotundâ, spirâliter striatâ; spirâ elevatâ, mucronata; aperturâ semilunari; labio columellaris infîni medium lato, excavato; labio externo intus incrassato, ad marginem aucto, infîni medium producto; operculo crasso, extâ granulosæ.*

THE VIRGIN HELICINA. Shell globose, solid, acuminate above, rounded beneath, spirally striated; spire elevated, mucronate; aperture semilunar, columnellar lip below the middle wide, excavated; outer lip thickened within, sharp at the edge, produced beneath the middle; operculum thick, granular outside.

LEA. Obs. on Unio and other Land Shells, vol. i. p. 162, t. 19, f. 58.

Helicina nanopullina, Ferrusac.
Hab. Cuba.

Species 31. (Mus. Brit.)

HELICINA MEGASTOMA. *Hel. testæ subglobosæ, tenui, levigatæ; fulvæ vel rubro-fuscæ; spiræ elevatæ, conicæ; ultimo anfractu rotundato; callo ventrali subrotundato, aperturâ majusculâ; columellâ parec. avata; labio externo rotundato, angusto, ad juncturam leviter emarginato.*

THE LARGE-MOUTHED HELICINA. Shell subglobose, thin, smooth; fulvous or reddish-brown; spire elevated, conical, last whorl rounded; ventral callus rather rounded; aperture rather large, columnella small, sharp; outer lip rounded, narrow, slightly emarginated at the junction.

C. B. ADAMS. Contributions to Conchology.
Helicina affinis, C. B. Adams (var.?).
Hab. Jamaica.

Species 32. (Mus. Brit.)

HELICINA LITORALIS. *Hel. testæ subtrochiformi, tenui, levigatæ, fuscæ-rubescenti; spiræ conicæ; ultimo anfractu rotundato; columellâ parvâ, trigonâ; labio externo superâ decliri, late, planato, tenui, sub-expanso, ad juncturam leviter emarginato.*

THE LITTORAL HELICINA. Shell somewhat trochiform, thin, smooth, reddish-brown; spire conical, last whorl rounded; columnella small, trigonal, outer lip sloped above, yellow, flat, thin, a little expanded, slightly notched at the junction.

GUNELACH. —?
Hab. Barraccas, Cuba.

Species 33. (Mus. Brit.)

HELICINA CRASSICOSTATA. *Hel. testæ compresso-globosæ, albâ, crassi, spirâliter crebrè costatâ; columellâ latâ, subexcavatâ, rectiæsculâ; aperturâ subrotundâ ad juncturam intus plicatâ; labio externo late, planato, supernæ vir depresso.*

THE THICK-RIBBED HELICINA. Shell compressed-globose, white, thick, spirally closely ribbed; columnella broad, subexcavated, rather straight; aperture somewhat beaked, with an interior plait at the juncture; outer lip broad, flattened, very slightly depressed above.

SOWERBY. Thesaurus Conchyliorum, *Helicina*, Species 61, Plate III., f. 97.

dat me sub in gressu, callo ventrali genito, columnella parva, rectus rectus, testiculus, sublabialis, aperturam infra rectale posita, glandulae, tubo extero ad pecten, utricle, membrana.

The ventral **Hila** (Fig. 18).—Shell subglobose, yellowish; spine conical, a little elevated; last whorl roundly umbilicate; ventral callus small, columella short, thin, white, tooth-like, somewhat oblique; operculum dark brownish below the middle, entire body a little elongated at the puncture.

Trans. Proc. Zool. Soc., 1859,

W. A. Monk and Eastern Snags

Spartina $\ddot{\text{a}}$ - Mus. Brit.

HEDUCINA BIRMANA. *Hel. testa parv. depresso, sub-
tenuiculae, obscur. fulvo; spiræ breviter conicæ
culo ventrali parva, columnâ tenui, obliquâ, can-
takio externo conditâ; labio externo superâ de-
presso, sinistro tumido.*

TRI. BURANIA HEDLUND. Shell small, depressed, rather lenticular, dull fulvous; spire shortly conical; ventral callus small, columnella thin, oblique, confluent with the outer lip, outer lip depressed above, sinuous, tumid.

Phil. Trans. Proc. Zool. Soc., 1859, p. 29.

Hab. Nicobar Island.

In this species is observed the first indication of those caudal similitudes in the outer lip, which, passing through gradations in several species, become distinct teeth in *H. auricula*.

Synopsis as Fig. a b c Mus. Brit.

HELICINA REGINA. *Hel.* testū magnū, globosū, spiraliter striatū, varie pictū; spira caniculā, anfractibus concrevatis sulcata; columella planulata, subtriangularis; labio

HELICINA.—PLATE V.

extro supra vallo et orbi paulo sinuatis emarginato, hinc trilobato; lobis medium productus, linguaformis.

THE ROYAL HELICINA. Shell large, globose, spirally striated, variously painted, spire conical, whorls rather convex; columnella flattened, subtriangular; outer lip above much, and below a little sinuously emarginated, thus trilobate, middle lobe produced, tongue-shaped.

MOELET. Test. Nov. 10.

Helicina anguineata, Poey (var. f. 104).

Helicina undulistrigata, Velasquez.

Helicina maculosa, Newcombe.

Hab. Cuba.

Species 39. (Mus. Brit.)

HELICINA RETRACTA. *Hel. testis subglobosus, fusco-rubescens; spiræ convexæ; ultimo anfractu rotundo, infelix subdepresso; columellæ nonatæ, quasi retractæ, labio externo ante obliquè producto, ad juncturam acclivæ, paulo emarginato.*

THE RETRACTED HELICINA. Shell subglobose, reddish-brown; spire convex; last whorl rounded, slightly depressed below; columnella very small, as it were drawn back; outer lip anteriorly obliquely produced, sloped upwards at the junction, a little emarginated.

POEY. Mén. vol. i. p. 116, tab. 12, fig. 20-26.

Hab. Cayabajos, Cuba.

Species 40. (Mus. Brit.)

HELICINA SPRUCEI. *Hel. testis subroseæ, solidi; spiræ subpyramidalis, latribus plurimalis; collo ventrali tenui, parvo; columellæ trigonæ, labio externo angustè represso, ad punctum leviter emarginato.*

SPRECE'S HELICINA. Shell rather pink, solid; spire

subpyramidal, with flattened sides; ventral callus thin, small, columnella trigonal, outer lip narrowly reflected, slightly emarginated at the junction.

PFEIFFER. Proc. Zool. Soc. 1857.

Hab. Tarapota, Andes.

Species 41. (Mus. Brit.)

HELICINA OREGENA. *Hel. testis subgloboso-compressa, roseo-fuscescente, spiræ lenticulari; anfractu ultimo rotundo-depresso; columellæ parvæ, trigonæ; labio externo angustè represso, ad juncturam rixæ emarginato.*

THE MOUNTAIN-BORN HELICINA. Shell subgloboso-compressed, pinky-brown, spire lenticular; last whorl roundly depressed; columnella small, trigonal; outer lip narrowly reflected, scarcely emarginated at the juncture.

D'ORBEIGNY. Synopsis, p. 28.

Hab. Bolivia.

Species 42. (Mus. Brit.)

HELICINA SURUSSCA. *Hel. testis compressa, subangulata, sinuata; spiræ depresso-conicæ; ultimo angustæ depresso-sabangulata; collo ventrali subrotunda; columellæ parvæ, dentiformi; labio externo tenui, propè columellam paulo emarginata.*

THE BROWNISH HELICINA. Shell compressed, rather angular, amber-coloured; spire depressed-conical; last whorl depressed-sabangulular; ventral callus rather rounded; columnella small, tooth-shaped; outer lip thin, a little emarginated near the columnella.

MENKE. Synopsis, p. 79.

PLATE VI.

Species 43. (Mus. Brit.)

Hedleyella elongata (Hed.). Body pale green, with darker longitudinal bands; eyes orange-yellow, skin brownish-yellow, with dark brownish-yellow spots; underparts and mouth pale cream-colored, without darker patches; abapertural area

yellow. Head pale, skin brownish-yellow, with darker longitudinal bands; eyes orange-yellow, skin brownish-yellow, with darker longitudinal bands; mouth pale cream-colored, without darker patches; abapertural area

Mexico. Gulf of California. 1857.

Hed. Cylind.

A narrow band of the basal part

Species 44. (Mus. Brit.)

Hedleyella elongata (Hed.). Body pale green, with darker longitudinal bands; eyes orange-yellow, skin brownish-yellow, with darker longitudinal bands; mouth pale cream-colored, without darker patches; abapertural area

The cocoon of *Hedleyella elongata* (Hed.) is elongated, slightly pointed at both ends, and has a width of approximately 6000-10000 microns, maximum width 5000, color pale yellow, externally perfectly smooth, apparently immovable.

Poly. Mex. II., p. 14, t. 6, fig. 10.

Hedleyella elongata (Gmelin).

Hedleyella elongata (Gmelin).

Hed. Cuba.

One of the most remarkable of the cephalic forms distinguished by a red columnella.

Species 45. (Mus. Brit.)

HELICINA PYRAMIDA. *Hel. testa parvula pallidula viridi conici elevata approximata; ultima osse*

gaster perirectalis squamata subangustata;
ultima testa rotundata, levata, levigata, columella
subangustata, levata.

The cocoon of *Hedleyella*. Shell small, pale greenish-yellow, elevated, rounded; last whorl small, rounded, spirally undressed; outer lip produced, with a shallow, evanescent furrow on right margin.

S. Amer. *Thesmoceras* (Müller), Part 2a, Helicina,

Pl. V, t. 157.

Hed. Cuba.

Species 46. (Mus. Brit.)

Hedleyella (var.). *Hel. testa rotundata pallida, co-*
loquata, levata, levigata, rotundata, ultima ap-
proximata, rotundata, levata, levigata, rotundata,
ultima testa rotundata, columella angustata,
levata.

The cocoon of *Hedleyella*. Shell greenish-pale, elongated, a rounded, slightly pointed, last whorl angular, the margin of the last whorl, spirally undressed, outer lip produced, with a shallow furrow on left margin.

Guiana. Gulf of Paria. 1857.

Hed. Cuba.

Species 47. (Mus. Brit.)

Hedleyella (var.). *Hel. testa rotundata, levata,*
coloquata, levata, levigata, rotundata, ultima ap-
proximata, rotundata, levata, levigata, rotundata,
ultima testa rotundata, columella angustata,
levata.

The cocoon of *Hedleyella*. Shell tan, brown, elongated, a rounded, slightly pointed with white or gold at the aperture, red or bright yellow, or pinky-white, below the band; aperture subtriangular, outer lip flattened, strongly reflected, columnella sanguineous.

Poly. Mex. Cub. II., p. 14, t. 4, f. 19.

Hed. Cuba.

The lip is suddenly reflected so as to form almost a right angle with the body whorl.

HELICINA.—PLATE VI.

Species 48. (Fig. *a, b*, Mus. Brit.)

HELICINA EXACUTA. *Hel. testā straminā, levā, trochiforme; spira subdepressa, acuminata; ultimo anfractu infrah medium angulatū, concavē carinatū; apertura subtriangularis, labio interno rubro, columellā obliquā, labio externo infrah medium angulata.*

THE SHAPEPED HELICINA. Shell straw-coloured, smooth, trochiform; spire subdepressed, acuminate; last whorl angular below the middle, nearly keeled; aperture subtriangular, inner lip red, columella oblique, outer lip angular below the middle.

POEY. Mem. II., p. 114.

Helicina Strominea, Moricand.

Hab. Cuba.

Species 49. (Fig. *a, b*, Mus. Brit.)

HELICINA CONOIDEA. *Hel. testā parvā, albida, depresso-trochiforme; anfractibus planisulcatis, angustis, ultimo anfractu subdepresso, infrah medium acutē angulato; apertura parvā, labio externo superiē declivī, medio angulato, infrah subrotundā.*

THE CONE-SHAPED HELICINA. Shell small, whitish, depressed, trochiform; whorls rather flat, narrow, last whorls depressed, sharply angular below the middle; aperture small, outer lip sloped above, angular in the middle, a little rounded below.

PFEIFFER. Proc. Zool. Soc. 1853.

Hab. Barbadoes.

Species 50. (Mus. Brit.)

HELICINA SUBTERRITA. *Hel. testā parvā, tenui, cincta, subtrochiforme; spira acuminata, conica, anfractibus supra excavatis, medio angulatis, ultimo anfractu infrah convexo; columellā rotundā, acutatā.*

THE SUBTERRITED HELICINA. Shell small, thin, green, subtrochiform; spire acuminate, conical, whorls excavated above, angular in the middle, last whorl convex; columella rounded, needle-shaped.

SOWERBY. Thesaurus Conchyliorum, Part 25. *Helicina*, sp. 103, Pl. V. f. 185.

Hab. —?

A light, thin, horny species with the whorls curiously hollowed above and angular in the centre.

HELICINA.

PMLA VII

Symptom 7) (Males, Boys)

Ulmus laevis L. - Nutmeg elm

Haben wir

$\text{Sp}(\mathfrak{g}) \cong \tilde{\mathcal{O}}_{\mathbb{R}^n}^2$ (Mars, 1971)

The THORACIC HEDERA. Sheath smooth, golden, spic elevated, acuminate, first distal whorl convex below, keeled by the midrib, white, sharp; aperture small, entire, reflected, sinusoidly depressed above, produced in the middle, elevated; columnella small, oblique, nucleated.

SWERDLY, PREV, ZEGL, SENG 1813

Itah, Isle of Negros, Philippines

The form of the lip differs from that of the most laterally compressed variety of *Helicina antissimilis*, which the shell often mimic slightly resembles.

Sect. 4.5.2. (Fig. 4.4, Mus. Bois.)

HELICINA RHODOSTOMA. *Hel. testū suprī infrāpue len-*

The *muscoidea* HEDLUND. Shell lenticular above and below, slightly flattened in the middle, white or fulvous, margin unmarginated; spire short, densely coiled, surface subquadrate, columella rounded, reflected above, produced into a very sharp spine below; outer lip flatly reflected, sharply angular in the middle.

GRAY, Zool. Journ., vol. i, p. 68.

Hab. —?

Species 51. (Fig. *a*, *b*, Mus. Brit.)

H. LICINA CONSERVATA. *Hel. testis pallidus*, stramineo, vel subroseo, oblonge rotundata; superne acutè conica, medio acute carinata, infra convexa, omnino sparsiter striata; aperturā subhorizontalē, labio externo cilio rotundato columnellā mordet, arcuata;

THE CONCERNIC HILICINA. Shell pale straw, rose-tinted, obscurely marked; apertly conical above, apertly keeled in the middle, convex below, all over spirally striated; aperture subtriangular, outer lip rounded in the middle, columella small, arched.

PITTENGER. Proc. Zool. Soc., 1848.

Hab. Venezuela.

Species 55 (Fig. a, b, Mus. Brit.)

HILICINA SPINIFERA. *Hel. testâ tenui, ventricosa, superne conicâ, infra convexâ, medio acute carinata, aureo, infra carinam rubro unicolor, vel purpureo olivâceo strigata, maculis rubris ad surcata carinaque ornata; columnellâ parvâ, in spinam acutam productâ; labio exterior abeo, re-
gione apicali leviter angustata.*

THE SPINIFEROUS HELICINA. Shell thin, ventricose.

HELICINA.—PLATE VII.

conical above, angular beneath, sharply carinated in the middle, golden, with a single red line below the keel, or purple, obliquely striped, ornamented with red spots at the suture and keel; columella small, produced into a sharp spire; outer lip white, reflected, angular and produced in the middle.

PFEIFFER. Proc. Zool. Soc., 1855.

Hab. Solomon's Isle.

Both varieties of this species are very beautiful.

Species 56. (Fig. a, b, Mus. Brit.)

HELICINA SUAVIS. *Hel. testa conivata, medio carinata, infre carinam compresso-convexa; areola, ad suture carinamque maculis puris rubris, infre carinam lineam rubra notata, vel purpurea superne rubra reticulata; apertura medio inflexu angulata.*

THE PLEASANT HELICINA. Shell conical, keeled in the middle, compressed-convex below the keel; golden, marked at the suture and keel with small red spots, below the keel with a red line, or purple reticulated above with red; aperture angular above and beneath.

PFEIFFER. Proc. Zool. Soc., 1856.

Hab. Admiralty Island.

One of the prettiest of the species, more elevated and less compressed than the preceding, and without a spire at the lower angle of the mouth.

Species 57. (Mus. Brit.)

HELICINA ANGULATA. *Hel. testa compressa, superne obtuse conivata, infre lenticulari, medio carinata, omnino fuscata, supra et pseudo infra carinam striatis puris notata; columella paulo arcuata, infre spinifera; labio externo medio angulato.*

THE ANGULAR HELICINA. Shell compressed, obtusely conical above, lenticular beneath, keeled in the middle, all over brownish, above and a little under the keel marked with small stripes; columella a little arched, spiniferous beneath; outer lip angular in the middle.

SOWERBY. Thesaurus Conchyliorum, sp. 245, fig. 414.

Hab. Brazil.

Species 58. (Mus. Brit.)

HELICINA SUTURALIS. *Hel. testa compressa, lenticulari, pallide fulvo, medio leviter carinata, supra carinam rubro oblique striata; apertura acutè angulata, labio externo acuto.*

THE SUTURAL HELICINA. Shell compressed, lenticular, pale yellow, sharply keeled in the middle, obliquely striped with red above the keel; aperture sharply angular, outer lip sharp.

MARTENS. Berlin Academy, 1864.

Hab. Amboyna, Ceram.

This little lenticular shell appears to be full-grown, but has no signs of thickening or reflexion in the outer lip.

HELICINA-OPALINA. *Hel. testa gross rotundata, rubra, parvula, levigata; labio subrotundato, apertura angustiorib; columella sublata, tenuis, subcylindrica, subplanata, ad basim rotundata, rotunda.*

THE SOLITARY HELICINA. Shell compressed, conical, red, spire depressed; last whorl broad, rounded; aperture somewhat transversely minute, outer lip rounded, inner thickened, notched at the junction.

ADAMS (C. B.). Proc. Bost. Soc.,

Helicina Gmelini, Pfeiffer.

Hab. Jamaica.

Species 66. (Mus. Brit.)

HELICINA POLYPSIA. *Hel. testa rotunda, base rotundata, striata, rosso-azzurrina, apertura subangusta, subglobosa, subcompressa, apertura subangusta, subangusta, rotunda, rosso-azzurrina, labio interno subcylindrica, rotundata, rosso-azzurrina, labio interno subcylindrica, rotundata, rosso-azzurrina.*

THE POLYPSIA HELICINA. Shell smooth, yellowish, subglobous, slightly elevated, spire rather low, last whorl rounded, conical; aperture large, outer lip expanded, inner lip small, white, a little curved, outer lip with thin, indistinct

PAGE. Mem. L. p. 113, t. 5, f. 4-6.

Hab. Cuba.

Species 67. (Mus. Brit.)

HELICINA CALIX. *Hel. testa subglobosa, spiralis striata, obscura, apertura et in apertissima, subhorizontalis, parva; apertura elongata, angustiorib; columella contracta; ultima arcuata, rotunda, rotundata, apertura parva; labio interno compressa, rotunda, labio interno latus, supra apertura.*

THE WARM HELICINA. Shell subglobous, spirally striated, whitish, rather red at the apex and in the mouth, thick small; apex acuminate, whorls rather convex; last whorl keeled below the middle; aperture small; inner lip expanded, callous, red; outer lip thickened, depressed above.

WEINLAND —?

Hab. Bahamas.

Species 68. (Mus. Brit.)

HELICINA NITIDA. *Hel. testa depresso, fulvi, tenuiscula, supra depresso-conica, infra lenticulari; columella*

pars, trigonid, rotundata; labio subcylindrica, rotunda, columella hyalina, contracta.

THE SHINING HELICINA. Shell depressed, fulvous, rather thin, depressed conical above, lenticular beneath; columella small, trigonal, acuminated; outer lip acute, slightly notched in front of the columella.

PFEIFFER. Weigmann's Archiv., 1839.

Herium glabra? Gould.

Hab. Cuba.

The outer lip in this species is not reflected.

Species 69. (Mus. Brit.)

HELICINA LACINIOSA. *Hel. testa subglobosa, pallidula, apice elevata, conica; ultima arcuata, depresso-sulcata, post columella hinc impedita; columella parva, brevis; labio interno subcylindrica, semicircularis, ante columellam sic excavata.*

THE LACINIOSA HELICINA. Shell subglobous, pale; spire elevated, conical; last whorl depressed and rounded, flattened behind the columella; columella small, short; outer lip a little expanded, semicircular, scarcely notched in front of the columella.

MONTAGU. Proc. Bost. Soc., 1815.

Hab. Sandwich Islands.

Species 70. (Mus. Brit.)

HELICINA INCROSTATA. *Hel. testa subglobosa, pallidula, sphaerica, fulvo-unifasciata; spira conica; ultima arcuata, depresso-subglobosa, apertura rotunda, semicirculari; labio interno angustus, rectus, laterale producta, ante columellam paulo emarginata; columella parva, trigonid, complanata.*

THE INCROSTED HELICINA. Shell subglobous, pale fulvous, single-banded with brown above; spire conical; last whorl depressed-subglobous, aperture large, semicircular; outer lip narrowly reflected, laterally produced, a little notched in front of the columella; columella small, trigonal, flattened.

GUNDLACH. Pfeiffer Malak., 1859.

Hab. Cuba.

The spire is more raised and the semicircular mouth larger and more laterally produced than in *Helicina laciniosa*.

HELICINA.—PLATE IX.

Species 71. (Mus. Brit.)

HELICINA STRIATULA. *Hel. testā parrā, obliquē concentricē striatā, rubescētā, supernē depresso-conicā, infrah lenticulari; aperturā transversē suboblongā, labio externo albo, angusto, rotundo, infrah paulo incrassato, cum columellā confluenti; columellā parvā.*

THE STRIATED HELICINA. Shell small, obliquely concentrically striated, reddish, depressed-conical above, lenticular beneath; aperture transversely rather oblong; outer lip white, narrow, round, a little thickened below, confluent with the columella; columella small.

SOWERBY. Proc. Zool. Soc., 1842.

Hab. Martinique.

Species 72. (Mus. Brit.)

HELICINA ADAMSIANA. *Hel. testā lenticulari, depresso, fido rubescētā; ultimo anfractū in medio subangulato; aperturā parrā; labio externo albo, supernē sinuatim depresso, infrah prop̄ juncturam sinuatim subincrassato.*

ADAMS'S HELICINA. Shell lenticular, depressed, reddish-filous; last whorl a little angular in the middle; aperture small; outer lip white, sinuously depressed above, sinuously somewhat thickened below near the juncture.

PFEIFFER. Proc. Zool., 1848.

Hab. Jamaica.

Species 73. (Mus. Brit.)

HELICINA FASCIATA. *Hel. testā subdepressā, lenticulari, albida, rubro tenuiātā et angulatim maculata, vel fulvo lati fasciata; aperturā suboblongā; labio externo angustè reflexo, medio producto, columellā indistinctā.*

THE BANDED HELICINA. Shell subdepressed, lenticular, whitish, banded and angularly spotted with red, or broadly banded with fawn colour; aperture rather oblong; outer lip narrowly reflected, produced in the middle, columella indistinct.

Species 75. (Mus. Brit.)

HELICINA ROTELLOIDEA. *Hel. testā parrā, trochiformi, tutei, flammis rubris supernē notatā; anfractibus supernē subexcavatis, medio subcarinato, infrah lenticulari; columellā trigonā, labio externo sic incrassato.*

THE ROTELLA-LIKE HELICINA. Shell small, trochiform, yellowish, marked above with red flames; whorls excavated above, slightly keeled in the middle, lenticular below; columella trigonal, outer lip scarcely thickened.

MIGHELS. Proc. Bost. Soc., 1845.

Hab. Sandwich Islands.

Species 76. (Fig. a, b, Mus. Brit.)

HELICINA CORONULA. *Hel. testā compressā, supernē obtusissimē conicā, infrah lenticulari, obliquē concentricē striatā; ultimo anfractū compresso, subangulato, ad suturam tuberculis minutissimis coronato; aperturā oblongā; labio externo angusto, albo, suprā infrahē sinuatim incrassato.*

THE LITTLE CROWN HELICINA. Shell compressed, very obtusely conical above, lenticular below, obliquely concentrically striated; last whorl compressed, rather angular, crowned at the suture with very minute tubercles; aperture oblong; outer lip narrow, white, sinuously thickened above and beneath.

SHUTTLEWORTH. Pfeiffer Malak., 1862.

Hab. Jamaica.

One of the most depressed of the species which have a sinuous thickening on the upper and lower part of the outer lip.

HELICINA.

PLATE X.

Species 77. (Mus. Brit.)

HELICINA ARTHANASIA. *Hel. testi irregulariter subglobosa, transversaliter rotunda; spirâ pareâ, saepe obscurans; alba punctata vaga, supra superficie levata, prope marginem tumida, iuxta clausum angulata; apertura parvâ, subtriangularis, columella angulata, lobus extimus superius destrictus, intra radula angulata.*
The species HELICINA. Shell irregularly subglobose, thick, greenish; spire small, whorls minute; last whorl large, raised above the aperture, tumid near the summit, scarcely angular below; aperture small, subtriangular, columella nearly straight, outer lip straight above, angular below the middle.
Poey. Proc. Zool. Soc., 1855.
Hab. Loyalty Island.

Species 78. (Mus. Brit.)

HELICINA PELM. *Hel. testi pareâ, luteâ, subglobosâ depressâ, crassâ; spirâ pareâ, aereâ, apicis apicibus nimbatis, ultimo anfractu subdepresso, et media angulata; apertura trigonâ, labio extimo incurvata, intra radula angulata.*
THE ITA HELICINA. Shell small, yellow, subglobosely depressed, thick; spire small, apical whorls minute; last whorl somewhat depressed, angular in the middle; aperture trigonal, outer lip thickened, angular below the middle.

PHILIPPI. Zeitchrift für Malacologie, 1847, p. 124.
Hab. Sandwich Islands.

A pretty little yellow species, resembling a dried pea.

Species 79. (Mus. Brit.)

HELICINA KEATHI. *Hel. testa magnâ, depressâ, supernâ depresso-conica, infra lenticulari, luteâ, ad angulum medianum albo, supra medium rubro fasciatâ; anfractibus subplanulatis; ultimo anfractu depresso,*

medio angulato; apertura subtriangularis, columellâ parvâ, acuminatâ, labio externo reflexo, medio producta.

KEAH'S HELICINA. Shell large, depressed, conically depressed above, lenticular beneath, yellow, banded with white at the median angle and red above the middle; whorls a little flattened, last whorl depressed, middle angular; aperture rather triangular, columella small, acuminated, outer lip reflected, produced in the middle.

PFEIFFER. Proc. Zool. Soc., 1856.

Hab. Granada.

Quite a large and striking shell among the generally small lenticular species.

Species 80. (Mus. Brit.)

HELICINA POLYL. *Hel. testi subdepressâ, rotundâ, albida, fasciis rubris duabus spiralis cinctâ, inter fascias maculâ rubris regularibus ornata, spirâ depresso; anfractu ultimo subrotundato; labio externo reflexo, medio producto; columellâ pareâ, rotundâ.*

POEY'S HELICINA. Shell subdepressed, rounded, whitish, girt with two spiral red bands, ornamented between the bands with regular red spots, spire depressed; last whorl rather rounded; outer lip reflected, produced in the middle; columella small, rounded.

PFEIFFER. Malak. VI., 1859.

Hab. Yateras, Cuba.

Species 81. (Fig. a, b, Mus. Brit.)

HELICINA ADSPERSA. *Hel. testa subglobosa, tenui, luteâ, varie rubro fasciata et maculata; spirâ, subdepresso-conica; ultimo anfractu ventricoso, rotundo; labio externo superne tenui, depresso, medio producto, subexpanso.*

THE SPINKLED HELICINA. Shell subglobose, thin,

yellowish, variously banded and spotted with red; spire subdepressed-conical; last whorl ventricose, rounded, outer lip thin, depressed above, produced and expanded in the middle.

PFEIFFER. Weigmann's Archives, 1839.

Helicina variegata, Orbigny.

Helicina ornata? Sowerby.

Hab. Cuba.

Species 82. (Fig. a, b, Mus. Brit.)

HELICINA AMPLIATA. *Hel. testa subgloboso-conica, albidâ, ad aperturam pallide aurea, vel fasciâ rubra unicâ pictâ; aperturâ subtriangulari, columella parvâ, subplanulatâ; labio externo supernâ depresso et contracto, medio planulato, in linguum producto.*

THE FULL HELICINA. Shell subglobose-conical, whitish, pale golden at the aperture, or painted with a single red band; aperture subtriangular, columella small, rather flattened; outer lip depressed and contracted above, flattened in the middle, produced into a tongue.

C. B. ADAMS. Contributions to Conchology, n. 7, p. 101. Hab. Jamaica.

This species exhibits, in an exaggerated form, the peculiar tightening above and production in the middle of the outer lip which is in a lesser degree characteristic of *Helicina adspersa* and some others.

Species 83. (Fig. a, b, c, Mus. Brit.)

HELICINA BELLULA. *Hel. testa parvâ, subglobosa, luteâ, varie rubro-fasciata; spira elevata, anfractibus apicibus parris, penultimo tumidiâsculo, ultimo rotundo; aperturâ subtriangulari, labio externo supra medium sinuatim producto, medio tenuiter reflexo.*

THE HANISOME LITTLE HELICINA. Shell small, sub-globose, yellow, variously banded with red; spire elevated, apical whorls small, the penultimate rather tumid, last rounded; aperture subtriangular, outer lip sinuously produced above the centre, thinly reflected in the middle.

GUNDLACH. Pfeiffer's Malak. Bl. VI, 1859.

Helicina suturalis (var.) Gundlach.

Helicina perispherica —? (var.)

Helicina Yungnensis —? (var.)

Hab. Cuba.

Species 84. (Fig. a, b, c, Mus. Brit.)

HELICINA CONVEXA. *Hel. testa subglobosi, depresso, utriusque subtectulari, crassâ, tunc vel albâ, fasciâ maculisque variegata; aperturâ subdepresso, labio externo subrotundo, angusto, medio paulò producto.*

THE CONVEX HELICINA. Shell subglobose, depressed, rather lenticular on both sides, thick, yellow or white, variegated with bands and spots; aperture rather depressed, outer lip rather rounded, narrow, middle a little produced.

PFEIFFER. Proc. Zool. Soc., 1848.

Hab. Bermuda.

Species 85. (Mus. Brit.)

HELICINA TENUATA. *Hel. testa depresso-conica, tenui, lutei, supernâ rubro unifasciata; spirâ subdepresso, anfractibus parvis; ultimo anfractu infra lenticulari; aperturâ subtriangulari; labio externo paulò reflexo.*

THE BEEFED HELICINA. Shell depressed-conical, thin, yellow, single red-banded above; spire sub-depressed, whorls small; last whorl lenticular below; aperture subtriangular; outer lip a little reflected.

QUOY. Voyage de l'Astrolabe, Zool. II, p. 194.

Hab. Nauikoro.

Much lighter and less convex than *Helicina concava*.

Species 86. (Mus. Brit.)

HELICINA REPANDA. *Hel. testa parvâ, crassâ, depresso-subglobosa, tutâ, rubro unifasciata; spirâ depresso-concava obtusa, anfractibus parvis, ultimo anfractu subtilis rotundatim callosa; aperturâ subtriangulari, labio externo supernâ depresso, medio producto, infra propriâ juncturam emarginante.*

THE BOWED HELICINA. Shell small, thick, depressed-subglobose, yellow, single-banded with red; spire depressed convex, obtuse, whorls small, last whorl roundly callous beneath; aperture subtriangular, outer lip depressed above, produced in the middle, emarginated below near the junction.

PFEIFFER. Proc. Zool. Soc., 1855.

Hab. —?

The lower lip recedes peculiarly at its junction with the columella.

HELICINA.

PLATE XI.

Species 87. (Fig. a, b, Mus. Brit.)

HELICINA PLATYTRUNCATA. *Hel. testa globosa, aurita, granulosa, velutina, papa, subaequata, aperturam rotundatam, spirae oblique, ad latere convexa; labio externo planus, rotundatus.*

The *platytruncata* HELICINA. Shell globous, solid, yellowish, sometimes painted with red near the apex and margin, smooth; spire obtuse, convex at the sides; last whorl compressed, ventricose, outer lip flattened, reflected.

Micromesia (Bouché) Berl. Gesell. 1, 1, 219, t. 3, f. 11.
Helicina (Bouché) Petriez et Ménard.
Hub. Martínez (Cuba).

Species 88. (Mus. Brit.)

HELICINA TUBICULATA. *Hel. testa rotunda, aurita, angulata, deprimata, angustata, papa, rotundata, oblique rotundata, subaequata; spirae oblique, ad latere convexa, rotundata; labio externo planus, rotundatus, obliquus, rotundatus.*

The *tubiculata* HELICINA. Shell subglobous, angular in the middle, yellow, tinged with bright golden-yellow, spire elevated, apex obtuse, sides convex; last whorl angular in the middle, slightly keeled; aperture subaequata, columnella small, not prominent; outer lip flattened, reflected anteriorly, slightly produced.

Pfeiffer. Zeit. der. 1817, p. 150.

Hub. Brazil.

Species 89. (Mus. Brit.)

HELICINA FULVA. *Hel. testa pallidissimis papa, compressa, angulata, spirae oblique striata; spirae conicae, anfractibus planitatis; ultimo anfractu compressa, medio angulata; aperturam subauriformi, labio externo rotundo, medio subangulato; labio interno rotundo, callosa, columellam brevi, termino crenata.*

The *fulva* HELICINA. Shell very pale, fulvous, compressed, angular, spirally striated; spire conical, whorls flattened; last whorl compressed, angular in the middle; aperture subauriform,

outer lip rounded, rather angular in the middle, inner lip rounded, callous, columnella short, cuneated at the end.

Pfeiffer. Proc. Zool. Soc., 1855.
Hub. —?

Species 90. (Mus. Lord Northampton.)

HELICINA VIRENS. *Hel. testa angulata, subaequata, laterigata, viridis, ad angulum albo-fasciata; spirae depresso-conicae; ultimo anfractu medio acutè crenata, supra infraque concaviscauta; columella albâ, columella callida, termino angulata.*

The *virens* HELICINA. Shell angular, sub-compressed, smooth, green, white-lined at the angle; spire depressed-conical; last whorl sharply keeled in the middle, rather convex above and beneath; columnella white, roundly callous, angular at the end.

Lauvergne. Hist. Nat. Anim. sans Vert.
Hub. St. Domingo.

Species 91. (Mus. Brit.)

HELICINA EBUYLINA. *Hel. testa mox, aurita, depresso-angulata, spirae acuminata, anfractibus apicalibus paucis; ultimo anfractu late, compressa, ad medium rotundatum angulata, callo columellaris expanso, rotundata, rubro marginata, labio externo supra infraque compressa, angusta, rotundata.*

The *ebuylini* HELICINA. Shell large, golden, depressed-trochiform, spire acuminated, apical whorls small; last whorl broad, compressed, roundly angular in the middle, columellar callus expanded, rounded, red-bordered, outer lip compressed above and beneath, narrow, rounded.

Gould. Proc. Bost. Soc., 1847.
Hub. Fiji Islands.

Species 92. (Mus. Brit.)

HELICINA TENUILABRIS. *Hel. testa depresso-angulata, levè, castanea; spirae depresso-conicae; ultimo anfractu compresso, late, rotundatum angulata; aperturam intus subrosea, callo columellaris flavidus,*

HELICINA.—PLATE XI.

rotundo, columellā minutā, aculeatā, labio externo tenui, supernē depresso.

THE THIN-LIPPED HELICINA. Shell depressed-angular, smooth, chestnut; spire depressed-conical; last whorl compressed, wide, roundly angular; aperture pinkish within, columellar callus yellow, rounded, columella small, aculated, outer lip thin, depressed above.

SOWERBY. *Thesaurus Conchyliorum*, Sp. 216, f. 375.

Hab. —?

A rather compressed species with no thickening or reflexion of the outer lip.

Species 93. (Mus. Sowerby.)

HELICINA NODE. *Hel. testā crassā, pallidē fulvā, globoso-subangulatā; spirā depressa-conicā; ultimo anfractū suprē obliquē tenerū rugato, infra convexo-calloso, medio obtusē angulato; labio externo crasso, rotundatim reflexo; columellā parvā, brevi, intuberculatim rotundatim desinenti.*

NODE'S HELICINA. Shell thick, pale fulvous, sub-angularly globose; spire depressed-conical; last whorl finely, obliquely wrinkled above, convexly callous below, obtusely angular in the middle; outer lip thick, roundly reflected; columella small, short, ending in a rounded tubercle.

GUNDLACH —?

Hab. Arango.

Species 94. (Fig. a, b, Mus. Brit.)

HELICINA SUBSTRATATA. *Hel. testā parvā, crassā, subglobosā, spiraliter tenuissimē striatā; spirā convexā; ultimo anfractū mediocri; aperturā parvā, subangulatā; labio interno calloso, columellā aculeatā, obliquā; labio externo crasso, reflexo, lato, duplicito.*

THE SLIGHTLY-STRIATED HELICINA. Shell small, thick, subglobose, spirally very finely striated; spire convex; last whorl of middle size; aperture small, rather angular; inner lip callous, columella aculated, oblique; outer lip thick, reflected, broad, double.

GRAY. *Zool. Journ.*, v.

Helicina sordida, King.

Hab. Cuba.

Species 95. (Fig. a, b, Mus. Brit.)

HELICINA BRAZILIENSIS. *Hel. testā subtrochiformis, tenuis, aureā, spiraliter striatā; spirā convexo-*

acuminatā, anfractibus subrotundis; ultimo anfractū subcompresso-lato, retuso; labio externo complicito, angusta, reflexo; columellā trigonā, aculeatā.

THE BRAZILIAN HELICINA. Shell subtrochiform, thin, gold-coloured, spirally striated; spire convex-acuminated, whorls rather rounded; last whorl subcompressed, broad, rounded; outer lip flattened, narrow, reflected; columella trigonal, aculated.

GRAY. *Zool. Journ.*, i. p. 66.

Hab. Brazil.

Species 96. (Mus. Brit.)

HELICINA GRATULATA. *Hel. testā trochiformi, stramineā, spirā subacuminatā, anfractibus concavisculis; ultimo anfractū subcompresso, medio acutē carinato, suprī infrahē convexa, columellā tenui, obliquā; labio externo tenuissimo.*

THE PLEASANT HELICINA. Shell trochiform, straw-coloured, spire subacuminated, whorls rather convex; last whorl rather compressed, acutely keeled in the middle, convex above and below, columella thin, oblique; outer lip very thin.

BLANDFORD.

Hab. Pegu.

A pretty little light keeled species.

Species 97. (Mus. Brit.)

HELICINA AURANTIO-VIRIDIS. *Hel. testā globoso-subcompressa; spirā aurantiā, parva, depressa, ultimo anfractū globosa, in medio vidiā viridiā, propè suturam aurantiā fasciata, labio columellari lato, excavato, arcuatum aruminate; labio externo rubro-aurantiā, semicirculari.*

THE ORANGE-GREEN HELICINA. Shell globose, sub-compressed; spire orange, small, depressed, last whorl globose, bright-green in the middle, banded with orange near the suture, columellar lip broad, excavated, acuminated in a curve; outer lip orange-red, half-circular.

SOWERBY. *Thesaurus Conchyliorum*. *Helicina*, 2nd Monograph, Sp. 199, f. 380.

Helicina viridis, Sowerby (1st Monograph).

Hab. Philippines?

This beautiful little shell being of a bright green colour in the body whorl has been mistaken by several collectors for *Helicina viridis*.

PLATE XII.

Species 98. (Fig. *a, b*, Mus. Brit.)

HELICINA CRASSILABRA. *Hel. testa crassæ, compressæ, angulatæ, pallidi rubescuti, apicè rubro, aperturæ et callo columellarí auriculæ; spira depresso; ultimo anfractu compresso-angulato; aperturæ parvæ, callo columellarí rotundo, columellæ parvæ, aculeatæ; labio externo crasso, hanc reflexo, superne depresso, medio obtusè angulato.*

THE THICK-LIPPED HELICINA. Shell thick, compressed, angular, pale red, apex red, aperture and columellar callus golden; spine depressed; last whorl compressed, angular; aperture small, columellar callus rounded, columella small, aculeated; outer lip thick, not reflected, depressed above, middle obtusely angular.

PHILIPPI. Zeitschrift für Malak., 1847.

Hab. Venezuela.

A curiously flattened, thick species.

Species 99. (Mus. Brit.)

HELICINA CHITTAYA. *Hel. testa trochiformis, acuminata, livis distantibus spiralis cincta, lutea, viridi rubroque lineata et maculata; ultimo anfractu melio angulata, carina serrata armata; apertura subrotundata, labio externo albo, late, expanso; columella rectiæsculata, planulata.*

CHITTY's HELICINA. Shell trochiform, acuminate, girt with distant spiral ridges, yellow, spotted and lined with green and red; last whorl angular in the middle, armed with a serrated keel; aperture rather rounded; outer lip white, broad, expanded; columella rather straight, flattened.

PEIFFER. Proc. Zool. Soc., 1857.

Hab. Cuba.

A more trochiform shell than *Helicina pulchella*, with the spiral striae more distant and smooth.

Species 100. (Mus. Brit.)

HELICINA PETTIANA. *Hel. testa subtrochiformis, spiraliter striata, albo, viridi maculata vel lutea rubro maculata et fasciata; ultimo anfractu ventri-*

fractu rotundato; labio extenso expando, radiatum crenulato; columella angusta, rectiæsculata, ad terminum angulata.

PETTIT'S HELICINA. Shell rather trochiform, spirally striated, striae rounded, yellow, last whorl rounded; outer lip expanded, radiately crenulated; columella narrow, rather straight, angular at the end.

OEBIGSY. Moll. Cub., i. p. 247.

Hab. Cuba.

The last whorl is more rounded than in the preceding, and the outer lip of the aperture is broad, flattened, expanded, and rayed with the rounded striae of the body.

Species 101. (Mus. Sowerby.)

HELICINA TANKERVILLII. *Hel. testa magna, latè, trochiformis, spiraliter serrato-striata; spira conica, anfractibus convexisculatis, sepe maculis rubris distantiis ornata; ultimo anfractu ventricoso, in medio serrato-carinatæ, infra carinam rubro lineata; labio externo expando, radiatum crenulato; columelli subtortuæ, complanata, cum labium externum confluenta.*

TANKERVILLE'S HELICINA. Shell large, yellow, trochiform, spirally serrato-striated; spire conical, whorls rather convex, ornamented with distant red spots above; last whorl ventricose, with a serrated keel in the middle, red-lined below the keel; outer lip expanded, radiately crenulated; columella rather tortuous, flattened, confluent with the outer lip.

GRAT. Zoological Journal, i. p. 250.

Hab. Jamaica.

This beautiful species was extremely rare in collections till within a comparatively recent date.

Species 102. (Fig. *a, b*, Mus. Brit.)

HELICINA OPIMA. *Hel. testa subglobosa-trochiformis, spiraliter striata, albo, viridi maculata vel lutea rubro maculata et fasciata; ultimo anfractu ventri-*

April, 1873.

HELICINA.—PLATE XII.

coso; *labio externo albo, angusto, planulato, columellā rectiuscula*.

THE FAT HELICINA. Shell subglobose-trochiform, spirally striated, white spotted with green, or yellow spotted with red; last whorl ventricose, outer lip white, narrow, flattened, columella rather straight.

SHUTTLEWORTH. Diagnosis, N. Moll., iii. p. 42.

Hab. Haiti.

More stout and ventricose than those of the same group previously described.

Species 103. (Fig. a, b, Mus. Brit.)

HELICINA PULCHELLA. *Hel. testā trochiformi, angulatā, spiraliter granoso-striatā*; *spira elevatā, acuminatā, lutea, rubro tenuitā*; *ultimum aufractū int̄i medium angulato, serrato-carinatā*; *labio externo expanso, radicum crenulatō*; *columellā planulatā, cum labium extēnum confluenti*.

THE BEAUTIFUL HELICINA. Shell trochiform, angular, spirally granoso-striated; spire elevated, acuminate, yellow banded with red; last whorl angular below the middle, serrato-carinated; outer lip expanded, radiately crenulated, columella flattened, confluent with the outer lip.

GRAY. Zool. Journ., i. p. 64.

Helicina scitula, Wood.

Helicina Grayana, Pfeiffer.

Helicina dilatata, Poey.

Hab. Jamaica.

A well-known beautifully coloured and sculptured species.

Species 104. (Mus. Brit.)

HELICINA ROTELLA. *Hel. testā albī, compressā, angulatā; spirā depresso-conicā, ultimum aufractū obtusō angulatō*; *labio externo paulò reflexo, in medio paulò producto*; *columellā parvā, angustā, leciter angulatā, cum labium extēnum confluenti*.

THE ROTELLA HELICINA. Shell white, compressed, angular; spire depressed-conical, last whorl obtusely angular; outer lip a little reflected, a little produced in the middle; columella small, narrow, slightly angular, confluent with the outer lip.

SOWERBY. Thesaurus Conchyliorum. Helicina, 2nd Monog., No. 205, fig. 358.

Hab. New Hebrides.

Species 105. (Mus. Brit.)

HELICINA GRATIOSA. *Hel. testā angulatā, fuselatā, spirā conicā, elevatā, anfractibus convexisculis, ultimum anfractū medio obtuse angulatō, inf̄rā angulum convexisculo, post columellam spiraliter subexcavato: aperturā int̄as rubra marginatā; labio externo angusto, reflexo; columellā parvā, aculeatā*.

THE GRATEFUL HELICINA. Shell angular, brown; spire conical, elevated, whorls rather convex, last whorl obtusely angular in the middle, rather convex, spirally a little excavated behind the columella; aperture red-bordered within; outer lip narrow, reflected; columella small, aculeated.

PFEIFFER. Proc. Zool. Soc., 1856.

Hab. Admiralty Island.

Species 106. (Mus. Brit.)

HELICINA COSTATA. *Hel. testā globoso-acuminatā, solidā, albī, spiraliter striatā; spirā elevatā, acuminatā; ultimum aufractū rotundato, ventricoso; aperturā parvā, int̄is lutea, labio externo incrassato, supernè declivis; columellā trigonā, subplanulatā*.

THE RIBBED HELICINA. Shell globoso-acuminated, solid, white, spirally striated; spire elevated, acuminate; last whorl rounded, ventricose; aperture small, yellow within, outer lip thickened, sloped above; columella trigonal, a little flattened.

GRAY. Zool. Journ., i. p. 67, t. 6, fig. 8.

Hab. Jamaica.

Species 107. (Mus. Brit.)

HELICINA SEMILIRATA. *Hel. testā subglobosā, albī, solidā, supernè spiraliter exbri-liratā, inf̄rā levigatā; spirā acuminatā, anfractibus convexisculis; ultimum aufractū ventricoso, medio angulatō, carinatō; labio externo planudato, paulò expanso; columellā planulatā, angustā, cum labium extēnum confluenti*.

THE HALF-RIDGED HELICINA. Shell subglobose, white, solid, spirally closely-ridged above, smooth beneath; spire acuminate, whorls rather convex; last whorl ventricose, angular in the middle, keeled; outer lip flattened, a little expanded; columella flattened, narrow, confluent with the outer lip.

PFEIFFER. Proc. Zool. Soc., 1848.

H E L I C I N A.

PLATE XIII.

Species 107. (Fig. *a, b*, Mus. Brit.)

HELICINA ALATA. *Hel. testi subglobosa, lineis ciliatis, distanter striata, straminea, apice rubescens, spirae subconicae, apertura parvula disjuncta, subrotundata, columellam rectilinieam, callo ventrali subtriangulari, labio externo reflexo, apud columellam sinnatum emarginato; operculo utrinque in cuneum acutum producto.*

THE WINGED HELICINA. Shell subglobose, distantly striated with ciliated lines, straw-coloured, reddish at the apex; spire rather conical, aperture a little disjoined, rather round, columella rather straight, ventral callus subtriangular, outer lip reflected, sinusously emarginated close to the columella; operculum produced at each end into a sharp wedge.

MENKE. *Synopsis.* — ? Thesaurus Conchyliorum, Helicina, fig. 65, 66.
Hab. Cordova, Vera Cruz.

There is a peculiarity in this and the two following species which would almost justify a generic or sub-generic division. The operculum has a projecting point at each end fitting into a notch in the outer lip close to the columella.

Species 108. (Fig. *a, b*, Mus. Brit.)

HELICINA PANNUCEA. *Hel. testa globosa, pallidissime fulva, levigata, epidermide rugosa, ciberrimè ciliata induta, apice brevi, compressa; apertura intus subangusta, labio externo utrinque emarginato, rix reflexo, callo ventrali subrotundato; operculo utrinque in cuneum producto.*

THE RAGGED HELICINA. Shell globose, very pale fawn, smooth, covered with a rough, very closely ciliated epidermis, apex short, rather compressed; aperture slightly golden within, outer lip emarginated at both ends, scarcely reflected, ventral callus

slightly rounded; operculum produced into a wedge at each end.

MORELET. — ? Sowerby's Thesaurus, Helicina, fig. 68, 69.

Hab. Vera Cruz.

More globose than the preceding, smooth without the epidermis. The latter is thick, brown, and closely ciliated

Species 109. (Mus. Brit.)

HELICINA NICHOLETTI. *Hel. testi magna, subangustata, rubescens, lineis impressis, ciliatis ciberrimè spiraliiter striata; spirae depresso-conicae; callo centrali spiraliiter tortuo; apertura magna; operculo utrinque producto, cuneato.*

NICHOLETTI'S HELICINA. Shell large, rather angular, reddish, closely spirally striated with impressed hairy lines; spire depressed, conical; ventral callus spirally tortuous; aperture large; operculum produced, cuneate at each end.

SHUTTLEWORTH. — ? Thesaurus Conchyliorum, Helicina, fig. 67.

Hab. Vera Cruz.

The largest and most characteristic of the three species from the same locality possessing the peculiarity mentioned at Species 107.

— = — = — = —

Species 110. (Fig. *a, b*, Mus. Brit.)

HELICINA CHIAPPENSIS. *Hel. testa globosa-conica, levigata, flavida, nonnquam versata, apice rotunda, apertura subtriangularis, labio externo albo, rix ciberrimè columellam subtriangularem, parvam; apice clavata.*

THE CHIAPPA HELICINA. Shell globose-conical, smooth, yellowish, sometimes rosy towards the apex;

HELICINA.—PLATE XIII.

aperture subtrigonal, outer lip white, reflected; columella subtrigonal, small; apex elevated.

PFEIFFER. Proc. Zool. Soc., 1856.

Hab. Mexico.

A more solid shell than *Helicina Heloisea*, with a more elevated spire.

Species 111. (Fig. *a, b*, Mus. Brit.)

HELICINA HELOISEA. *Hel. testā globoso-conicā, flavidā, nonnunquam supernē dimidiatis purpura fasciatā; spirā conicā, anfractibus distinctis, rotundis; aperturā parvā, labio externo reflexo, tenui, columellā crassiūsculā, lati, subarcuatā.*

HELOISE'S HELCINA. Shell globosely-conical, yellow, sometimes banded with brown half way above; spire conical, with distinct rounded whorls; aperture small, outer lip reflected, thin, columella rather thick, broad, rather arched.

SALLÉ. Proc. Zool. Soc., 1856.

Hab. Mexico.

Species 112. (Mus. Brit.)

HELICINA LINDENI. *Hel. testā tenui, subtrochiformi, obscurē angulatā, fusco-cinereā, supernē maculis*

punctisque nebulosis variegatā, vel albā; apice mucronato, anfractibus quinque; aperturā subauriforme, intus vel ad marginem aureā, labio externo tenuiter reflexo; columellā breviūsculā, angulatā.

LINDEN'S HELCINA. Shell thin, rather trochiform, obscurely narrowed, ash-brown variegated above with clouded spots and dots, or white; apex mucronate, whorls five; aperture subauriform, golden within or at the margin; outer lip thinly reflected; columella rather short, angular.

PFEIFFER. Zeitschrift für Malacologia, 1847, p. 126.

Hab. Mexico.

Species 113. (Mus. Brit.)

HELICINA PELLUCIDA. *Hel. testā parvā, subconicā, pellucida, subcirculari; spirā elevata, anfractibus quatuor, parvis; ultimo anfractu rotundo; aperturā subtrigonā, columellā rectiūsculā, brevi; labio externo tenui reflexo.*

THE PELLUCID HELCINA. Shell small, subconical, pellucid, rather green; spire elevated, whorls four, small, last whorl rounded; aperture subtrigonal; columella rather straight, short; outer lip thin, reflected.

SOWERBY. Thes. Conch. (1st monograph), fig. 46.

Hab. French Guiana.

HELICINA.

PLATE XIV.

Species 114. (Mus. Brit.)

HELICINA LACINIOSA. *Hel. testi subglobosa, pallidulae-fuscida, spirâ conicâ, acuminatâ; ultimo anfractu angustiusculo, rotundo; aperturâ majusculâ, scutulari; columellâ rectâ, angustâ, aciculata; labio externo semicirculari, tenui, reflexo, ad columellam vix emarginato.*

THE HEMMED HELICINA. Shell subglobose, pale milky-fawn, spire conical, acuminate; last whorl rather narrow, rounded; aperture rather large, semilunar; columella straight, narrow, pointed, outer lip semicircular, thin, reflected, very slightly notched at the columella.

MIGHELS. Proc. Bost. Soc., 1845.
Hab. Sandwich Islands.

Species 115. (Mus. Brit.)

HELICINA DEPRESSA. *Hel. testâ parvâ, albâ, utrinque compressâ; spirâ parvâ, depresso; ultimo anfractu lato; aperturâ latâ, brevi, labio externo superâ sinuatum depresso, infrâ apud columellam submarginato, margine angusto, rotundo.*

THE DEPRESSED HELICINA. Shell small, white, compressed on each side; spire small, depressed; the last whorl broad; aperture broad, short, outer lip sinuously depressed above, slightly notched below against the columella, margin narrow, rounded.

GRAY. Zoological Journal, vol. i. p. 69.
Hab. Jamaica.

Species 116. (Mus. Brit.)

HELICINA LINEATA. *Hel. testi parvâ, valde depresso, medio angulatâ, pallide fulva, spirâ alterâ sulcatâ; spirâ brevissimâ; callo ventrali rotundato, columellâ parvâ, aciculata, labio externo supra infrâque indentem tumidum incrassatum.*

August, 1873.

THE LINEATED HELICINA. Shell small, much depressed, angular in the middle, pale fulvous, spirally grooved; spire very short; ventral callus rounded, columella small, aciculated, outer lip thickened above and below into a thickened tooth.

C. B. ADAMS. Proc. Bost. Soc.
Hab. Jamaica.

Species 117. (Mus. Brit.)

HELICINA SEMISTRIGATA. *Hel. testâ minutâ, depresso, angulatâ, superè dimidiata spirâ alterâ depresso, infrâ teregitâ; spirâ brevissimâ; aperturâ subtriangularis; labio externo propè columellam infrâ tumido.*

THE HALF-STRIATED HELICINA. Shell minute, depressed, angular, spirally sinuously depressed, smooth below; spire very short; aperture subtriangular; outer lip swollen near the columella below.

SOWERBY. Thesaurus Conchyliorum. Helicina, Sp. 54.
fig. 86.
Hab. —?

A curious little lenticular species striated or grooved only on the upper half. Otherwise resembling Species 116.

Species 118. (Fig. a, b, Mus. Brit.)

HELICINA VINOSA. *Hel. testâ minutâ, depresso, obliqui sulcatâ, pallidâ vinoso-fuscâ; aperturâ parvâ, superâ depresso; labio externo tenui, propè columellam infrâ tumido.*

THE VINOUS HELICINA. Shell minute, depressed, obliquely sulcated, pale vinous brown; aperture small, depressed above; outer lip thin, tumid near the columella below.

SHUTTLEWORTH. —?
Hab. Porto Rico.

HELICINA.—PLATE XIV.

Species 119. (Fig. a, b, Mus. Brit.)

HELICINA PLICATULA. *Hel. testi parvā, pallidē fulvā, subcompressi, concentricè obliquè liratā; callo columellarī expanso, rotundo; aperturā parvā, labio extero suprā infrāque depresso, sinuatim tumidiōsculo.*
THE PLAITED HELICINA. Shell small, pale fulvous, subcompressed, concentrically obliquely ridged; columellar callus expanded, rounded; aperture small, outer lip depressed and sinuously rather tumid above and below.

PFEIFFER. Proc. Zool. Soc., 1848.

Hab. Martinique.

Species 120. (Fig. a, b, Mus. Brit.)

HELICINA RUGOSA. *Hel. testi minutā, valde depressā, pallidē fulvā, liris obliquis, crebris, sculptā; aperturā parvā, labio extero suprā infrāque depresso, sinuatim tumido, superne declivī.*
THE RUGOSE HELICINA. Shell minute, much depressed, pale fulvous, sculptured with oblique, close ridges; aperture small, outer lip depressed, and sinuously tumid above and below, the upper part sloped.

PFEIFFER. Weigman Archives.

Hab. Trinidād.

Species 121. (Fig. a, b, Mus. Brit.)

HELICINA LIRATA. *Hel. testi minutā, acutē angulatā, depresso, spiraliter sulcatā, media carinatā, fulcrobescens; callo ventrali tenui, subplanulato, aperturā trigonā, labio extero suprā medium angulato, suprā infrāque prop̄ juncturam sinuatim tumidiōscens.*
THE RIDGED HELICINA. Shell minute, acutely angular, depressed, spirally grooved, keeled in the middle, reddish-fulvous; ventral callus thin, rather flattened, aperture trigonal, outer lip angular above the middle, rather sinuously tumid above and below near the juncture.

PFEIFFER. Zeitschrift für Mal., 1847.

Hab. Yucatan.

More angular and depressed than *Hel. unidentata*.

Species 122. (Mus. Brit.)

HELICINA UNIDENTATA. *Hel. testi minutā, suprā subcōico-depressā, infrā subrotundā, medio angulatā, subcarinatā, spiraliter sulcatā; apertura subtriangularis.*

labio externo, rotundo, angusto, infrā prop̄ collumellam unidentata.

THE SINGLE-TOOTHED HELICINA. Shell minute, conically depressed above, a little rounded beneath, angular, subcarinated in the middle, spirally grooved; aperture subtriangular, outer lip rounded, narrow, with a single tooth on the lower part near the columella.

PFEIFFER. Proc. Zool. Soc., 1848.

Hab. Honduras.

Species 123. (Mus. Brit.)

HELICINA INEQUALIS. *Hel. testi parvā, trochiforme, plana, spiraliter teniter striata; spira elevata, apice mucronato; ultimo auctractū alto, medio angulato, subcarinato; aperturā parvā, subtriangularis, labio extero albo, reflexo, medio obtuse cuneato, suprā declici, depresso, acutē unidentata, infrā acutissimā unidentata, cum columellā confluenti.*

THE UNEQUAL HELICINA. Shell small, trochiform, yellowish, spirally finely striated; spire elevated, apex mucronate, last whorl raised, angular in the middle, subcarinate; aperture small, subtriangular, outer lip white, reflected, obtusely cuneate in the middle, sloped above, depressed, with a single sharp tooth, very sharply unidentate below, confluent with the columella

PFEIFFER. Proc. Zool. Soc., 1848.

Hab. Jamaica.

Resembling the common species *H. auricula*, but more narrow and elevated.

Species 124. (Fig. a, b, Mus. Brit.)

HELICINA AUREOLA. *Hel. testi subglobosā, aureā, vel subroseā, obscurā angulatā, spiraliter tenuiter suturati; spira lateraliē convexā, apice mucronato; aperturā contracta, labio extero supernā depresso, unidentata, suprā mediana angulata, infrā acutē unidentata, cum columellā confluenti.*

THE GOLDEN HELICINA. Shell subglobose, golden or reddish, obscurely angular, spirally finely grooved; spire laterally convex, apex mucronate; aperture contracted, outer lip depressed, unidentate above, angular above the middle, sharply unidentate below, confluent with the columella.

FERRUSAC. —?

HELICINA.

PLATE XV.

Species 125. (Mus. Brit.)

HELICINA TESTICRASSA. *Hel. testi crassa, angustata, supra tenuiter spiraliiter striata, carina serrata mediae cincta; spirae exaequo elevatae; apertura trigonata, contracta; labio interno medio angustata, spirae infra, medioque acute undulato; columella cum labio externo confluenta.*

THE THREE-TOOCHED HELICINA. Shell minute, angular, spirally finely striated above, banded in the middle with a serrated keel; spire conical, elevated; aperture trigonal, contracted; outer lip angular in the middle, sharply single-toothed; columnella confluent with the outer lip.

SCHUTTELIWORTH. —?

Hab. Jamaica.

Species 126. (Mus. Brit.)

HELICINA UNDULATA. *Hel. testi globosa, fuscopurpureescens carinatata; spiralea undulatim striata, superne lateraliiter convexa, mediae serratae carinata; infra rotundata; apertura contracta; labio interno alba, superne depresso, spirae infraquo undulata.*

THE WAVED HELICINA. Shell globose, variegated with purplish-brown, spirally wavy striated, laterally convex above, with a serrated keel in the middle, rounded below; aperture contracted; outer lip white, depressed above, with a single tooth above and below.

PFEIFFER. Malak., Bl. viii.

Hab. Jamaica.

Very closely connected with *Helicina auricula*, but differing in having the spiral striae undulated.

Species 127. (Mus. Brit.)

HELICINA ELEGANTULA. *Hel. parca, fuscata, trochiformis, levata; spirae elevatae, anfractibus quatuor aut quinque distinctis, infra mediana rotundatis, apice acuminata; anfractus ultimus subdepresso, obtusè angulatus; apertura parva, subtriangularis, labio externo tenue, reflexo.*

THE ELEGANT LITTLE HELICINA. Shell small, brown, trochiform, smooth; spire elevated, whorls four or five, distinct, rounded below the middle, apex acuminate; last whorl rather depressed, obtusely

angular, apertural smooth, sub-triangular, outer lip thin, reflected.

PFLUEGER. Zeitschrift f. Malak., 1850, p. 76.

Hab. Haiti.

Species 128. (Mus. Brit.)

HELICINA TROCHILIA. *Hel. testi minuti, trochiformis subdepresso, medio angulata, carinata, supra etriatum spiraliiter lirata, fuscopurpureescens fasciata; apice rubra; apertura subtriangularis, labio externo tenue.*

THE WINDLESS HELICINA. Shell minute, trochiform, subdepressed, angular, carinated in the middle, spirally ridged above the keel, banded with blackish brown, apex red; aperture subtriangular, outer lip thin.

GORDON. Proc. Bost. Soc., 1847, p. 202.

Hab. Isl. Aurora.

Species 129. (Mus. Brit.)

HELICINA TRICARINATA. *Hel. testi parva, trochiformis, latea, spiraliiter lirata cariniformibus, quorum tribus medianis majoribus cincta; spirae elevatae, anfractibus carinatis; apertura latissima arrisa, columella parva, alba, labio externo alba, angusta.*

THE THREE-KNEELED HELICINA. Shell small, trochiform, yellowish, spirally girt with keel like ridges of which the three middle ones are the larger; spire elevated, whorls keeled; aperture golden within, columnella small, white, outer lip white, narrow.

SOWERBY. Thes. Conch., 2nd Monograph, species 73.

Hab. —?

Species 130. (Mus. Brit.)

HELICINA RUBICUNDA. *Hel. testi trochiformis, fulcorubescens, acuminata, spiraliiter crebrilirata, spirae elevatae, mucronatae; apertura subtriangularis, columella recta, angusta, acuminata, labio exterior tenuiter reflexo.*

THE RUMICUND HELICINA. Shell trochiform, reddish-brown, acuminate, spirally closely ribbed, spire elevated, mucronate, aperture subtriangular, columella straight, narrow, acuminate, outer lip thinly reflected.

GUNDLACH. Pfeiffer, Malak., Bl. iv, 1857.

Hab. Cuba.

HELICINA.—PLATE XV.

Species 131. (Mus. Brit.)

HELICINA RUPESTRIS. *Hel. testā parvā, subaurēa, trochiformi, spirāliter striatā; spirā elevatā, mucronata, apice aculeato, ultimo anfractu depresso, subrotundo; aperturā subtrigonā, columellā angustā, obliquā: labio externo vix reflexo.*

THE ROCK HELICINA. Shell small, rather golden, trochiform, spirally striated, spire elevated, mucronate, apex aculeated, last whorl depressed, rather rounded; aperture subtrigonal, columella narrow, oblique, outer lip very little reflected.

PFEIFFER. Weigman's Archives f. Nat., 1839.
Hub. Cuba.

This little shell much resembles *Helicina rubicunda*, but the last whorl is more depressed and the outer lip is much narrower.

Species 132. (Mus. Brit.)

HELICINA LITTORICOLA. *Hel. testā parvā, crassā, globosā, albida, spirāliter striatā: spirā elevatā, apice mucronata, ultimo anfractu rotundo; aperturā parvā, iatis anreis, labio externo superne declivē, depresso, obliquā producto.*

THE SHORE HELICINA. Shell small, thick, globose, whitish, spirally striated; spire elevated, apex mucronate, last whorl rounded; aperture small, golden within, outer lip sloped, depressed, obliquely produced above.

GUNDLACH. Pfeiffer Malak., Bl. vii. 1860.
Hub. Cuba.

A stout little white-ribbed shell.

Species 133. (Mus. Brit.)

HELICINA ELEGANS. *Hel. testā eleganter trochiformi, fulvā, laevi, angulatā: spirā elevatā, acuminatā: anfractu ultimo subdepresso, medio angulatā: aperturā int̄e subaurēa, subtrigonā, columellā albā, angustissimā, obliquā: labio externo paulò reflexo.*

THE ELEGANT HELICINA. Shell elegantly trochiform, fulvous, smooth, angular; spire elevated, acuminate; last whorl a little depressed, angular in the middle; aperture rather golden within, subtrigonal columella white, very narrow, oblique; outer lip a little reflected.

D'ORBIGNY (Alcide). Mollusques de Cuba.
Helicina coniva, Pfeiffer.
Hub. Cuba.

Species 134. (Mus. Brit.)

HELICINA CALLOSA. *Hel. testā fulvā, parvā, trochiformi, laevitā, angulatā; spirā elevatā, conicā, apice acuminato; ultimo anfractu medio angulato, supra columellam callo rotundo, producto, albo incrassato, aperturā trigonā, labio externo tenuiter reflexo.*

THE CALLOUS HELICINA. Shell fulvous, small, trochiform smooth, angular; spire elevated, conical, apex acuminated; last whorl angular in the middle, thickened by a rounded, produced, white callus above the columella, aperture trigonal, outer lip thinly reflected.

POEY. Mem. I, p. 432, T. 33, f. 13–15.
Hub. Cuba.

Distinguished from the preceding and other trochiform small species by the projecting callus on the aperture edge of the body whorl.

Species 135. (Mus. Brit.)

HELICINA PETROSA. *Hel. testā parvā, trochiformi, aurea, spirāliter tenuiter striatā: spirā mucronata, anfractibus paulò convexis: ultimo anfractu medio subangulata: aperturā subtrigonā, columellā tenui, obliquā: labio externo tenui, leviter reflexo.*

THE STONY HELICINA. Shell small, trochiform, golden-yellow, spirally finely striated; spire mucronate, whorls rather convex; last whorl rather angular in the middle; aperture subtrigonal, columella thin, oblique; outer lip thin, gently reflected.

GUNDLACH. Pfeiffer Malak., iv. 1857.
Hub. Cuba.

Species 136. (Mus. Brit.)

HELICINA CAPILLACEA. *Hel. testā parvā, trochiformi, fusca, spirāliter striis setosis cinctā: spirā conicā, moderatè elevatā: ultimo anfractu subdepresso, medio subangulata: aperturā subtrigonā, labio externo tenui.*

THE HAIRY HELICINA. Shell small, trochiform, brown, spirally girt with hairy striae; spire conical, moderately elevated; last whorl rather depressed, slightly angular in the middle; aperture subtrigonal, outer lip thin.

PFEIFFER. Malak., Bl. iv. 1857.
Hub. Cuba.

HELICINA.

PLATE XVI.

Species 137. (Mus. Brit.)

HELICINA ELONGATA. *Hel. testis pyramidata, levigata, pallide fulva, trochiformis; spirae elevatae, acuminate, anfractibus ad latera rectis; ultimo anfractu medio angulato; apertura subtriangularis, columella rotundata, supra latitudinata, infra attenuata; labio externo medio acute angulato.*

THE ELONGATED HELICINA. Shell pyramidal, smooth, pale fulvous, trochiform; spire elevated, acuminated, whorls straight at the sides; last whorl angular in the middle; aperture subtriangular, columella rather straight, rather wide above, tapering below; outer lip sharply angular in the middle.

D'ORBIGNY (Alcide). Sowerby Thes. Conch., 2nd Monog., Sp. 93, fig. 158.

Hab. Cuba.

A very pyramidal species with straight-sided whorls.

Species 138. (Mus. Brit.)

HELICINA TROCHULINA. *Hel. testis parva, trochiformis, albida, levigata; spirae elevatae, acuminate; ultimo anfractu subrectangulo; apertura subtriangularis; columella arcuata, labio externo tenui.*

THE LITTLE WINDSHELL HELICINA. Shell small, trochiform, whitish, smooth; spire elevated, acuminated, last whorl rather rounded; aperture subtriangular; columella arched; outer lip thin.

D'ORBIGNY (Alcide). Moll. Isl. Cuba, p. 249.
Hab. Cuba.

Smaller, less pyramidal and less angular than the preceding.

Species 139. (Fig. a, b, Mus. Brit.)

HELICINA COLUMBIANA. *Hel. testis globoso-conica, soliduscula, fuscoc-rubescens, vel grisea, vel pallidissime auro in fascis latis cincta; spirae conicae, apice acuminate, apertura semilunari, labio externo expanso, reflexo, columellae parva, subtriangularis.*

THE COLUMBIAN HELICINA. Shell globosely conical, rather solid, belted with reddish-brown, or grey, or very pale yellow in broad bands; spire conical, apex acuminate, aperture semilunar, outer lip expanded, reflected, columella small, subtriangular. PHILLIPPI. Plff. Monog., Sp. 186.
Hab. West Columbia.

Species 140. (Mus. Brit.)

HELICINA MERIDIGERA. *Hel. testis falcata, subglobosa, nonnunquam subtilis flavida; spirae elevatae, anfractibus sex rotundis, distinctis; ultimo anfractu subglobosa, brevissimata; apertura parva; labio externo paulo reflexo.*

THE UNCLEAN HELICINA. Shell fulvous, subglobose, sometimes yellow beneath; spire elevated, whorls six, rounded, distant; last whorl subglobose, rather short; aperture small, outer lip a little reflected.

SALLÉ. Proc. Zool. Soc., 1855.

Hab. Mexico.

Species 141. (Fig. a, b, Mus. Brit.)

HELICINA PARAENSIS. *Hel. testis parva, pallide flavida, conico-globosa, tenui, levigata; spirae conicae, anfractibus paucis, paulo convexis; apertura parva, trapezoidalis, labio externo tenuiter reflexo.*

THE PARA HELICINA. Shell small, pale yellow, globose-conical, thin, smooth; spire conical, whorls few, a little convex; aperture small, trapezoidal, outer lip thinly reflected.

PFEIFFER. Proc. Zool. Soc., 1859.

Hab. Para, Brazil.

Species 142. (Fig. a, b, Mus. Brit.)

HELICINA ALTA. *Hel. testis parva, globoso-subtumata, fuscata, vel flavidio-subviridi; spirae elevatae, subconicae; ultimo anfractu brevissimata, rotunda;*

August, 1873.

HELICINA.—PLATE XVI.

aperturā subtrigonā, labio, extero paulō reflexo : columellā parvā.

THE ELEVATED HELICINA. Shell small, globosely subattenuated, brown, or greenish-yellow; spire elevated, rather conical; last whorl rather short, rounded; aperture subtrigonal, outer lip a little reflected, columella small.

SOWERBY. *Thesaurus Conchyliorum*, *Helicina*. 2nd Monograph, Sp. 151, figs. 251, 252.

Hab. Porto Rico.

Species 143. (Mus. Brit.)

HELICINA CORDILLERAE. *Hel. testi globosa-subdepressā, tenui, levigatā, pallidē fulēd, medio anfractuum fuscistrībus spiralibus rubris teniātā; spirā acuminatā, ultimo anfractu subdepressā; aperturā obliqui semilunari, columellā brevissimā, callo columellarī expanso, labio externo reflexo, planulato.*

THE CORDILLERA HELICINA. Shell globose-subdepressed; thin, smooth, pale fulvous, striped with three spiral red bands; spire acuminated, last whorl subdepressed; aperture obliquely semilunar, columella very short, columellar callus expanded, outer lip reflected.

SALLÉ. Pfr. Proc. Zool. Soc., 1856.

Hab. Cordillera, Mexico.

Species 144. (Mus. Brit.)

HELICINA OWENIANA. *Hel. testi globoso-conicā, solidā, levigatā, fulēd, nonnunquam superne dividiatā*

rubrā; spirā conicā, elevatā, anfractibus lateraliter rectiūsculis; aperturā parvā, pyriformi, plu. alatā, auranteo-rubet; columellā supernē subcomplanatā.

OWEN'S HELICINA. Shell globose-conical, solid, smooth, fulvous, the upper half sometimes red; spire conical, elevated; whorls rather straight at the sides; aperture small, pyriform, flattened, orange-red; columella rather flattened above.

PFEIFFER. Proc. Zool. Soc., 1848.

Hab. Mexico.

Among the globosely conical species distinguished by its orange-red rim.

Species 145. (Fig. a, b, Mus. Brit.)

HELICINA FLAVIDA. *Hel. testi subglobosā, levigatā, flavidā, lineā rubrā medio anfractuum ornatā; spirā obtusiusculā; aperturā parvā, subtrigonā; columellā albā, angustiā, cum labium exterum confluentis; labio externo angustiō reflexo.*

THE YELLOW HELICINA. Shell subglobose, smooth, yellowish, ornamented with a red line in the middle of the whorls; spire rather obtuse; aperture small, subtrigonal; columella white, narrow, confluent with the outer lip; outer lip narrowly reflected.

MENKE. Syn. Ed. II., p. 79.

HELICINA.

PLATE XVII.

Species 146. (Mus. Brit.)

HELICINA CONTINUA. *Hel. testā parvā, flavidā, levigatā, trochiformi, elevatā, spirā convexo-conicā; oper- turā parvā, labio extero angusto, tenui.*

THE CONTINUOUS HELICINA. Shell small, yellowish, smooth, trochiform, elevated, spire convex-conical; aperture small, outer lip narrow, thin.

GUNDLACH. Poey, Mem. Cub., vol. ii. p. 5.
Hab. Cuba.

Species 147. (Fig. a, b, Mus. Brit.)

HELICINA SPECTABILIS. *Hel. testā globoso-subtrochiformi, levigatā, flavidā vel rubrā, in medio anfractuum lineā rubri cinctā; anfractibus convexis, ultimo magno, aperturā semilunari, columellā minutā, labio extero tenui, reflexo.*

THE PRESENTABLE HELICINA. Shell globose-subtrochiform, smooth, yellowish or red, belted with a red line in the middle of the whorls; whorls convex, the last large, aperture semilunar, columella very small, outer lip thin, reflected.

GUNDLACH. Poey, Mem. Cub., vol. ii. p. 5.
Hab. Cuba.

Species 148. (Mus. Brit.)

HELICINA REMOTA. *Hel. testā rubescenti, subtrochiformi, spiraliter obscure lirata, medio anfractūs ultimi obscure bicarinatā; spirā breviter conicā, acuminatā; aperturā latā, intus arcuā; labio extero reflexo expanso, ad medium parvō producta, subangulata.*

THE REMOVED HELICINA. Shell reddish, rather trochiform, spirally obscure ribbed, obscurely bicarinated in the middle of the last whorl; spire shortly conical, acuminated; aperture broad, golden with outer lip reflected; expanded, a little produced and slightly angular in the middle.

POEY. Mem. Cub., vol. ii. p. 27, t. 8, f. 26.
Hab. Cuba.

This species has not the hollow columella of *Hel. excavata*.

Species 149. (Fig. a, b, Mus. Brit.)

HELICINA ZEPHYRINA. *Hel. testā globoso-subtrochiformi, levigatā, rubrā vel flavidā, medio anfractuum et ad suturam albo fasciatā; aperturā semilunari, columellā ad punctum incisā; labio extero albo, tenui, expanso.*

THE ZEPHYRINE HELICINA. Shell globose-subtrochiform, smooth, red or yellow banded with white in the middle of the whorls and at the suture; aperture semilunar, columella incised at the juncture; outer lip white, thin, expanded.

DIVLOS. Guerin. Mag. Nat. Hist.

Helicina tropica? Chemnitz.

Helicina abdominalis, Sowb. (first monograph).

Hab. Texas.

Species 150. (Fig. a, b, Mus. Brit.)

HELICINA TURBELLIA. *Hel. testā minutā, pallidē flavidā, compresso-trochiformi, medio anfractūs ultimi obtusi angulatā, spirā depresso-conicā; aperturā parvā, subquadratā, labio extero rotundo, medio angulato, ad punctum cum columellā confluenti.*

THE LITTLE-TOE HELICINA. Shell minute, pale yellowish, compressed trochiform, obtusely angular in the middle of the last whorl, spire depressed-conical; aperture small, subquadrate, outer lip rounded, angular in the middle, confluent with the columella at the juncture.

PEIFFER. Proc. Zool. Soc., 1855.

Hab. Sydney.

Species 151. (Fig. a, Mus. Brit.) See fig b, in Pl. XIX.

HELICINA CORDILLELLA. *Hel. testā depresso-subtrochiformi, rubescenti, vel pallidē fulvi, medio anfractuum lineis rubris tribus spiraliter cinctā; anfractū ultimo late, depresso; aperturā nonnunquam aurea; labio extero expanso, albo, reflexo.*

HELICINA.—PLATE XVII.

THE COEDILLERAS HELICINA. Shell depressed-subtrochiform, reddish or pale fulvous, spirally girt with thinner red lines in the middle of the whorls; last whorl wide, depressed; aperture sometimes golden; outer lip expanded, white, reflected.

SALLÉ. Proc. Zool. Soc., 1856.

Hab. Mexico.

It may be known by the depressed form of the last whorl. Having inadvertently filled up the plate, we are obliged to defer the banded variety to Plate XIX.

Species 152. (Mus. Brit.)

HELICINA FUNCEI. *Hel. testā subdepressā, lavigatā, superē rubro-maculatā, infrā aurē, medio anfractūs ultimi angulatā; spirā depresso-conicā; labio externo albo, expanso, reflexo, medio angulato.*

FUNCE'S HELIX. Shell subdepressed, smooth, spotted above with red, golden beneath, angular in the middle of the last whorl; spire depressed-conical;

outer lip white, expanded, reflected, angular in the middle.

PFEIFFER. Proc. Zool. Soc., 1848.

Helicina purpureo-flava, Morelet.

Hab. New Granada.

The colouring on the upper part of the shell presents a contrast to that on the lower part.

Species 153. (Fig. a, b, Mus. Brit.)

HELICINA POLYCHROA. *Hel. testā parē, globosā, aureā, in medio anfractuosa et suprā columellam spiraliter rubro lineata; spirā convexo-conicā; aperturā parē, subtrigonā; columellā minutā, trigonā, labio externo angusto, albo, reflexo.*

THE MANY-COLOURED HELICINA. Shell small, globose, golden, spirally red-lined in the middle of the whorls and above the columella; spire convex-conical; aperture small, subtrigonal; columella minute, trigonal, outer lip narrow, white reflected.

PFEIFFER. MS. Cum. Col.

HELICINA.

PLATE XVIII.

Species 154. (Mus. Brit.)

HELICINA GLOBULOSA. *Hel. testā globosā, ləvīgatā, fasciā latā, lineis duabus rubris marginatā suprā medium et infrah fasciā angustā rubrā infrah medium tenuitā; spīrā brevi, acuminatā, ultimo anfractū subdepresso rotundā, aperturā subrotundā, labio externo angusto, albo, columellā parvā, cum labio extēnum confluenti.*

THE GLOBULAR HELICINA. Shell globose, smooth, ribbed above the middle by a broad band edged with two red lines and below the middle by a narrow red band; spire short, acuminated, last whorl a little depressed, rounded, aperture rather rounded, outer lip narrow, white, columella small, confluent with the outer lip.

OEHIGNY. Moll. Cub., p. 254.

Hab. Cuba.

One variety is dark greyish and the other red on the upper part of the whorls and on the spine.

Species 155. (Fig. a, b, Mus. Brit.)

HELICINA ROSTRATA. *Hel. testā globoso-trochiformi, suprā et infrah medium rubro, vel aurantio tenuitā; spīrā brevi, conicā, ultimo anfractū magno, medio angulato, obscurē carinatā; columellā subplanata, confluentā, labio externo lato, reflexo, ad medium in lobam linguisformem producto.*

THE BEAKED HELICINA. Shell globose-trochiform, banded with red or orange above and below the middle; spire short, conical, last whorl large, angular in the middle, obscurely keeled; columella a little flattened, confluent, outer lip broad, produced into a tongue-shaped lobe at the middle.

MORELET. Test. Nov., vol ii. p. 17.

Helicina Salvini, Tristram.

Hab. Vera Paz.

Species 156. (Mus. Brit.)

HELICINA VERNALIS. *Hel. testā subglobosā, aurantiā, infrah medium rubro unifasciatā; columellā parvā, albā; labio extēnum planulato, reflexo.*

THE VERNAL HELICINA. Shell subglobose, orange with a single red band below the middle; columella small, white; outer lip flattened, reflected.

MORELET. Test. Nov. Cub., vol. i. p. 20.

Hab. Cuba.

Species 157. (Mus. Brit.)

HELICINA DENTICULATA. *Hel. testā, globoso-subtrochiformi, pallidā, suprā et infrah medium aurantio tenuitā, aperturā intus aureā; ultimo anfractū medio obscurē carinatā; spīrā acuminatā, suturā denticulatā; labio extēnum planulato, reflexo, in lobum linguisformem ad medium producto.*

THE DENTICULATED HELICINA. Shell globose-subtrochiform, pale, banded with orange above and below the middle; aperture golden within; last whorl obscurely keeled in the middle; spire acuminated, suture denticulated; outer lip flattened, reflected, produced into a tongue-shaped lobe in the middle.

PFEIFFER. Proc. Zool. Soc., 1855.

Hab. Honduras.

Resembling *Helicina rostrata*, but having the suture curiously pitted or dentated.

Species 158. (Mus. Brit.)

HELICINA CROSSEI. *Hel. testā compressā, subangulatā, aurantiā, ləvīgatā; spīrā depressā, apice acuminatā; callo ventrali tumidūsculo; aperturā semilunari, intus rubescēti; labio extēnum planulato, vividē aurantio; ultimo anfractū medio subangulato.*

CROSSE'S HELICINA. Shell compressed, rather angular, orange, smooth; spire depressed, apex acumi-

HELICINA.—PLATE XVIII.

nated; ventral callus rather swelled; aperture semi-lunar, reddish within; outer lip flattened, bright orange; last whorl a little angular in the middle.

SEMPER.—? Sowb. Thes. Conch., fig. 357.

Hab. Isl. Luzon, Philippines.

Species 159. (Mus. Brit.)

HELICINA EGREGIA. *Hel. testā subcompressā, angulatā, aurantiā; suprī medium latā, infrā medium angustā teniatā, ad angulum medianum albo-fusciatā; aper-turā productā, labio externo ad medium angulato, albo; columellā angustā, albā.*

THE UNCOMMON HELICINA. Shell subcompressed, angular, orange; above the middle widely, below the middle narrowly ribanded, on the middle angle white-banded; aperture produced, outer lip angular in the middle, white; columella narrow, white.

PFEIFFER. Proc. Zool. Soc., 1855.

Hab. Isl. Salmon.

Species 160. (Fig. a, b, Mus. Brit.)

HELICINA KIENERI. *Hel. testā globoso-angulatā, supermē griseo vel rubro variegato, spirā conicā, ultimo*

anfractu magno, medio angulato, subcarinato, columellā subplanulatā, latā; labio externo reflexo, medio angulato.

KIENER'S HELICINA. Shell globosely angular, varie-gated above with grey or red, spire conical, last whorl large; middle angular, slightly keeled, columella rather flattened, broad; outer lip re-flected, angular in the middle.

PFEIFFER. Proc. Zool. Soc., 1848. Thes. Conch., 284, 5.

Hab. Caraccas.

Species 161. (Mus. Brit.)

HELICINA TAMSIANA. *Hel. testā globosā, albā, medio anfractuum rubro unilineatum; spirā elevatā, acumini-natā; columellā rectiāsculā; aperturā productā, labio externo angusto, planulato, reflexo.*

THE TAMSIAN HELICINA. Shell globose, white, with a red line in the middle of the whorls; spire raised, acuminated; columella rather straight; aperture produced, outer lip narrow, flattened, reflected.

PFEIFFER. Zeitschrift für Malakologie, 1850.

PLATE XIX.

Fig. 151, b. HELICINA CORDILLERAE, see Pl. XVII.

Species 162. (Fig. a, b, Mus. Brit.)

HELICINA SANDWICHENSIS. *Hel.* testā parvā, subglobosā, fūlēa, rubro variegatā; spira convexuscula, anfractibus carinatis, ultimo anfractu infrah angulum convexo; apertura lateraler subproducent, callo ventrali subrotundo; columellā minutā.

THE SANDWICH ISLANDS HELICINA. Shell small, sub-globose, fulvous, variegated with red; spire a little convex, whorls keeled, last whorl convex below the angle; aperture laterally produced, ventral callus a little rounded; columella minute.

SOULEYET. Voyage de la Bonite. Moll. t. 30, f. 1 5.
Hab. Sandwich Islands.

Species 163. (Mus. Brit.)

HELICINA JAMAICENSIS. *Hel.* testā globosā, solidā, pallidē roseā, spira aurantiā, rubro variegatā, convexā, ultimo anfractu rotundo, rubro unifasciatā; apertura intus aurantiā; labio planulato, reflexo, ad juncturam tenuissimā; columellā parvā, trigonā, ad juncturam tenuissimā.

THE JAMAICA HELICINA. Shell globose, solid, pale rose, spire orange, variegated with red, convex, last whorl rounded, with a single band of red; aperture orange within; lip flattened, reflected, very thin at the juncture; columella small, triangular, very thin at the juncture.

SOWERBY. Thesaurus Conchyliorum, first monograph, t. I, f. 3, 4.

Hab. Jamaica.

Differing from *Helicina aurantia* in not having the same thickened lip and ventral callus, and in the extreme tenuity of the columella and outer lip at their junction.

Species 164. (Fig. a, b, Mus. Brit.)

HELICINA SUBGLOBOSEA. *Hel.* testā globosā, pallidā, interdum rubro spiraliter unifasciatā, spirā acuminatā, convexā, ultimo anfractu subcompressa; columellā parvā, trigonā; labio externo planulato, reflexo.

THE SUBGLOBOSE HELICINA. Shell globose, pale, sometimes with a single spiral bend, spire acuminate, convex, last whorl a little compressed; columella small, trigonal, outer lip flattened, reflected.

Poly. Mem., p. 115.

Hab. Florida.

Species 165. (Fig. a, b, Mus. Brit.)

HELICINA ANTONI. *Hel.* testā parvā, subcircularis, subtrochiformis, spirā elevatā, anfractibus rotundis, ultimo anfractu compressa.

ANTON'S HELICINA. Shell small, greenish, horny, somewhat trochiform, spire elevated, whorls rounded, last whorl broad, rounded, compressed.

PILIFFER. Zeitschrift für Malak., 1848, p. 88.

Hab. Honduras.

Species 166. (Mus. Brit.)

HELICINA MINUTA. *Hel.* testā minutā, compressā, medio angulatā, obliquā striatā; apertura depressā, apice acuminatā; columellā obliquā, labio externo tenui, angulato.

THE MINUTE HELICINA. Shell minute, compressed, angular in the middle, obliquely striated; aperture depressed, apex acuminated; columella oblique, outer lip thin, angular.

SOWERBY. Proc. Zool. Soc., 1842.

Hab. Isl. Opara.

Species 167. (Mus. Brit.)

HELICINA VESTITA. *Hel.* testā globosā, minutā, pallidā cornēa, epidermide tenuissimā indutā, obliquā rugosa.

HELICINA.—PLATE XIX.

laviter rugatā; columellā obliquā; angustā; labio externo tenui.

THE INVESTED HELICINA. Shell globose, minute, pale, horny, covered with a very thin epidermis, obliquely regularly wrinkled; columella oblique, narrow; outer lip thin.

GULDING. Sowerby, Thes. Conch., first monograph, p. 42.

Hab. N. America.

Species 168. (Mus. Brit.)

HELICINA UNICARINATA. *Hel. testā minutā, globosubacuminatā, lineis punctisque griseis variegatā; spirā conicā, ultimo anfractū medio angulata, carinato, aperturā parvā; columellā tenui, labio externo vix reflexo.*

THE ONE-KEELED HELICINA. Shell minute, globose, subacuminated, variegated with lines and spots of grey; spire conical, last whorl angular in the middle, keeled, aperture small; columella thin, outer lip scarcely reflected.

SOWERBY. Thes. Conch., Helicina, 2nd monog. sp. 107.
Hab. —?

Species 169. (Mus. Brit.)

HELICINA RUDIS. *Hel. testā parvā, globo-trochiformi, subrugatā, rubrā, griseo variegatā; spirā elevatā, conicā; ultimo anfractū medio vix angulata, aperturā productā, labio externo vix incrassato.*

THE ROUGH HELICINA. Shell small, globose-trochiform, a little roughened, red variegated with grey; spire elevated, conical; last whorl scarcely angular in the middle; aperture produced, outer lip scarcely thickened.

PFEIFFER. Proc. Zool., 1855.

Hab. Sydney.

Species 170. (Mus. Brit.)

HELICINA INCONSPICUA. *Hel. testā parvā, subviridi, cornēd, subtrochiformi; spirā parvā, acuminatā, ultimo anfractū lato, compresso.*

THE INCONSPICUOUS HELICINA. Shell small, greenish, horny, rather trochiform; spire small, acuminate, last whorl broad, compressed.

PFEIFFER. —? MS, in Cuming's collection.

Hab. —?

Species 171. (Fig. a, b, Mus. Brit.)

HELICINA CORNEA. *Hel. testā minutā, subcompressā, nigrescenti; spirā conicā, depresso, apice acuminatā, ultimo anfractū depresso, medio subangulata; aperturā subangulata; callo ventrali rotundo, rubro marginato.*

THE HORNY HELICINA. Shell minute, rather compressed, blackish; spire conical, depressed, apex acuminate, last whorl depressed, a little angular in the middle; aperture a little angular; ventral callus rounded, pink-edged.

SOWERBY. Thes. Conch., 2nd monograph, sp. 186, 187.
Hab. —?

Species 172. (Mus. Brit.)

HELICINA MULTICOLOR. *Hel. testā minutā, subdepressā, subangulatā, fulvā, suprī medium roseo variegati, spirā depresso-conicā; aperturā angulatā, labio externo tenui; columellā albā, subtrigonā parvā.*

THE MANY-COLOURED HELICINA. Shell minute, sub-depressed, subangular, fulvous variegated with pink, spire depressed-conical; aperture angular, outer lip thin; columella white, subtriangular, small.

GOULD. Proc. Boston Soc.

Hab. Tahiti.

HELICINA.

PLATE XX.

Species 173. (Mus. Brit.)

HELICINA COCCINOSTOMA. *Hel. testā globosā, politā, pallidē roseā vel fulvā, spirā conicā, apice rubro; ultimo anfractu globose, infra vixitē rubro-aurantio, columellā parvā, trigonā, ad juncturam tenui, labio extero crasso, reflexo, in medio subangulato, vixitē rubro-aurantio.*

THE RED-MOUTHED HELICINA. Shell globose, polished, pale rose or fulvous, spire conical, apex red; last whorl globose, bright red-orange below, columnella small, trigonal, thin at the juncture, outer lip thick, reflected, a little angular in the middle, bright red-orange.

MORELET. Test. Noviss. 1, p. 19.

Helicina Oceani, var. Pfeiffer.

Hab. Tabasco, Peru.

Species 174. (Fig a, b, Mus. Brit.)

HELICINA AURANTIA. *Hel. testā globosā, politā, pallidē flavobr., in medio anfractuum spiradit' fuscocuinicatā; spirā conicā, apice fuscō, callo centrali, columellā et labio externo vixitē rubro-aurantii, incrassatis, labio extero crasso, reflexo, angulatō productō.*

THE ORANGE HELICINA. Shell globose, polished, pale yellowish with a single brown spiral line in the middle of the whorls; spire conical, apex brown, ventral callus, columnella, and outer lip bright red-orange, thickened, outer lip thick reflected, produced angularly.

GRAY. Zool. Journ., vol. i, p. 69.

Helicina pyrrhostoma, Menke.

Hab. Jamaica.

Species 175. (Mus. Brit.)

HELICINA SIMILIS. *Hel. testā angulatā, depressā, fuscoaurantia, spirā depresso-conica, apice castaneo,*

October, 1873.

ultimo anfractu medio angulato, columellā parvā, trigonā, labio externo reflexo, planulato, suprā medium angulatō productō, vixitē aurantio.

THE SIMILAE HELICINA. Shell angular, depressed, orange-brown, spire depressed, conical, apex chestnut, last whorl angular in the middle, columnella smooth, trigonal, outer lip reflected, flattened, angularly produced above the centre, bright orange.

SOWERBY. Thesaurus Conchyliorum, first monograph of Helicina, fig. 130. Proc. Zool. Soc., 1842.

Hab. Haïti.

The lip is broader and more angularly produced than in *Helicina polita*.

Species 176. (Fig. a, b, Mus. Brit.)

HELICINA ANTILLARUM. *Hel. testā magnā, depressā, tenuissimē striatā pallidē aurantia vel castaneā, nonnunquam in medio anfractuum albo interrup-
tō unicolorū; spirā depresso-conica, anfractibus convexisculis, ultimo anfractu rotundatā angu-
lato; labio externo subcrysante, planulato, suprā
medium subangulatō.*

THE ANTILLES HELICINA. Shell large, depressed, very finely striated pale orange or chestnut, sometimes with an interrupted white band in the middle of the whorls; spire depressed, conical, whorls rather convex, last whorl roundly angular; outer lip somewhat expanded, flattened, with a slight angle above the middle.

SOWERBY. Thesaurus Conchyliorum. Monog. Helic., Sp. 208, fig. 359, 360.

Hab. Antilles.

Species 177. (Mus. Brit.)

HELICINA AMENA. *Hel. testā angulatā, subrhombeā,
suprā et paulō infrahā angulum medianum rosā,*

HELICINA.—PLATE XX.

lineis rubris minutis reticulata, linea infra aurantiā, columellā rectā, labio externo aurantiō, planulato, reflexo, medio angulato.

THE PLEASING HELICINA. Shell angular, somewhat rhomboidal, above and a little below the medial angle pink reticulated with minute red lines, thence below orange; columnella straight, outer lip orange, flattened, reflected, angular in the middle.

PFEIFFER. Proc. Zool. Soc., 1848.

Helicina purpureo-flava, Morelet.

Hab. Honduras Bay.

Species 178. (Mus. Brit.)

HELICINA SANGUINEA. *Hel. testā depressā, subrhomboidē, aurantiā; spirā depresso-conicā; ultimo anfractu medio obtuse angulato; callo ventrali expando, rotundo, albo, columellā parvī, ad juncturam incisit; labio externo planulato, reflexo.*

THE BLEEDING HELICINA. Shell depressed, subrhomboidal, red-orange; spire depressed-conical; last whorl obtusely angular in the middle; ventral callus expanded, rounded, white, columnella small, incised at the juncture; outer lip flattened, reflected.

PFEIFFER. Proc. Zool. Soc., 1848.

Hab. Honduras.

Species 179. (Mus. Brit.)

HELICINA GUADALOUPENSIS. *Hel. testā compressā, angulatā, flavidō-subviridi, vel castaneā; spirā depresso-conicā, anfractibus convexissimis; ul-*

timo anfractu lato, compressā, medio obtuse angulato; callo ventrali parvo, albo, rotundo; columellā infra subangulatā, labio externo aurantiō, angusto, subrotundo.

THE GUADALOUPITE HELICINA. Shell compressed, angular, greenish-yellow, or chestnut; spire depressed-conical, whorls rather convex; last whorl broad, compressed, middle obtusely angular; ventral callus small, white, rounded; columnella slightly angular below, outer lip orange, narrow, rather rounded.

SOWERBY. Monog. Helicina. Thes. Conch., Sp. 279.

Helicina rufa, var., Pfeiffer.

Hab. Guadalupe.

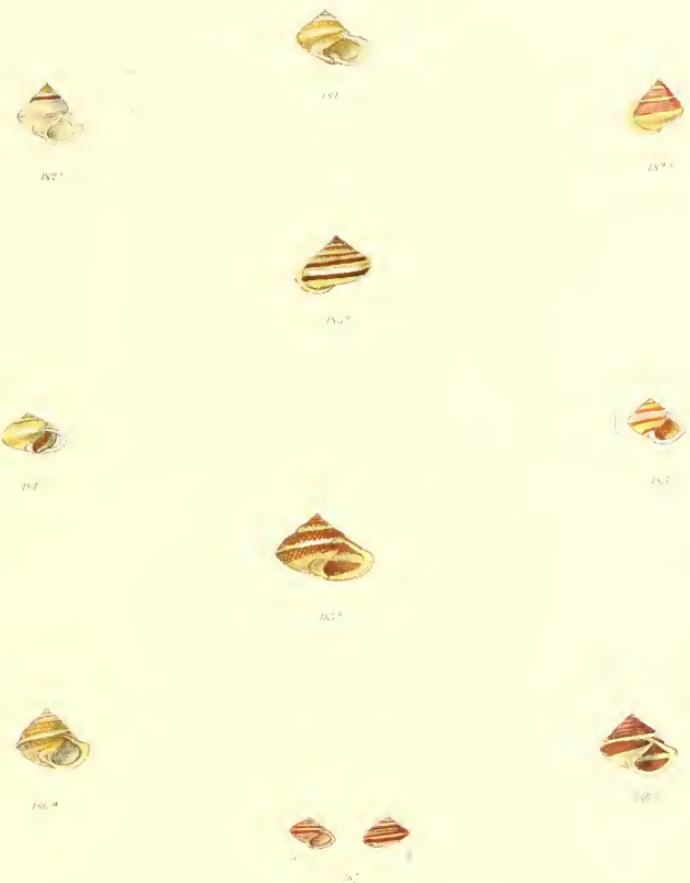

Species 180. (Fig. a, b, Mus. Brit.)

HELICINA NERITELLA. *Hel. testā globosā, tenui, levigatā, rubro spirali ter bifasciatā, vel infra medium unifasciatā, suprī maculis undulatis variegatā; spirā subdepressā; anfractibus paucis, concavissimis, ultimo anfractu magno, inflato, subdepresso; columellā subtriangulari, planulata; labio externo albo, complanata, expanso, reflexo.*

THE LITTLE NERITE HELICINA. Shell globose, thin, smooth, with two red spiral bands, or single banded below the middle and variegated with undulating spots above; spire rather depressed; whorls few, rather convex, last whorl large, inflated, a little depressed; columnella subtriangular, flattened; outer lip white, flattened, expanded, reflected.

LAMARECK. Hist. Nat. Anim. s. Vert.

Hab. Jamaica.

HELICINA.

PLATE XXI.

Species 181. (Mus. Brit.)

HELICINA NORFOLKENSIS. *Hel. testā pallidā, flaviā, subangulatā, subdepressā; inférā sinuatim angulatā; spira conicā, unfractib; paucis, parvis; ultimū anfractū compressū, latū, rotundatū, angulatū; callū centrali expanso, columnellā triplōa in dentes acutus desinunt; labio extēno spira depresso, media rotundatā expansa, inférā sinuatim plicata.*

THE NORFOLK ISLAND HELICINA. Shell pale yellow, narrow, a little depressed, with a sinuous plait below; spire conical, whorls few, small; last whorl compressed, broad, roundly angular; ventral callus expanded, columnella trigonal, ending in a sharp tooth; outer lip depressed above, roundly expanded in the middle, sinuously plaited below.

PFEIFFER. Proc. Zool. Soc., 1847.

Hab. Norfolk Island.

Very curiously contracted and plaited at the lower part.

Species 182. (Fig. a, b, Mus. Brit.)

HELICINA CINCTILLA. *Hel. testā subtrochiformē, tenui, angulatā, albī, unfractib; apicalib; tanacitā, et suprā angulatā rosā, inférā aurantia, ad angulum suturamque albo angustā fasciatā; spira conicā, elevatā; ultimo anfractū subvaricato; labio extēno planulato, reflesto.*

THE LITTLE BELL HELICINA. Shell rather trichiform, thin, angular, white, with the apical whorls banded, or pink above the angle and orange beneath with a narrow white band at the angle and suture; spire conical, elevated; outer lip flattened, reflected.

SHUTTLEWORTH. —?

Hab. Cordova.

The spire is more elevated than in the greater part of these angular species.

Species 183. (Fig. a, b, Mus. Brit.)

HELICINA OCCIDENTALIS. *Hel. testā depresso, angulatā, latā, pallidā aurantia, spiraler fasciis duabus*

angustis, albidis; lata, subangulatā, capiā et rufi angulatā in fusulis latā subangulatis cincti; spira depresso-conica; ultimū anfractū ad medium carinato aperturā subrhomboidale, columnellā brevi, callū centrali parvo, labio extēno latā planulato, reflesto, ad medium angulatā producta.

THE WESTERN HELICINA. Shell depressed, angular, broad, pale orange, spirally girt with two narrow blackish bands above and below the angle, or broad reddish bands; spire depressed, conical; last whorl keeled in the middle; aperture rather rhomboidal, columnella short, ventral callus small, outer lip broad flattened, angularly produced in the middle.

GELDING. Trans. Linn. Soc., p. 339.

Hab. —?

Species 184. (Mus. —? (olim Sowerby.)

HELICINA SUBROVALIS. *Hel. testā compressā, flaviā, obtuse angulatā, spira depresso, obtusa; columnellā parvo, triplōa; labio extēno angusto, rotundo.*

THE EASTERLY OVAL HELICINA. Shell compressed yellowish, obtusely angular, spire depressed, obtuse; columnella small, trigonal, outer lip narrow rounded. SOWERBY. Monog. Helicina, Species 198, fig. 376.

Hab. Jamaica.

Species 185. (Mus. Brit.)

HELICINA ZOE. *Hel. testā parvā, angulatā, rubescens; spira elevatā, conicā, ultimo anfractū subangulato; callū centrali tumido, expanso, aurantio, rotundo; columnellā brevi, cum labium extēnum confluenti, aperturā rhomboidē, intā fasciā, labio extēno albo, tenui, rotundo.*

THE ZOE HELICINA. Shell small, angular, reddish; spire elevated, conical, last whorl rather angular; ventral callus tumid, expanded, orange, rounded; columnella short, confluent with the outer lip, aperture rhomboidal, brown within, outer lip white, thin, rounded.

PFEIFFER. MS.

Hab. Cuba.

October, 1873.

HELICINA.—PLATE XXI.

Species 186. (Fig. *a*, *b*, Mus. Brit.)

HELICINA VARIABILIS. *Hel. testi angulata, ventricosa, spiraliiter striata; purpureo vel rubro late fasciata, vel albâ; spira elevata, conica; ultimo anfractu medio carinato, ad cornuam et infra albo fasciato; aperturâ rhomboidea; labio externo expanso, suprad medium angulata.*

THE VARIABLE HELICINA. Shell angular, ventricose, spirally striated; broadly banded with purple or red, or white; spire raised, conical; last whorl keeled in the middle, banded white on the keel and below; aperture rhomboidal; outer lip expanded, angular above the centre.

WAGNER. Spix, Brazil, p. 25.

Helicina zonata, Sowerby.

Helicina fasciata, Spix.

Helicina flava, Spix.

Hab. Brazil.

Species 187. (Fig. *a*, *b*, Mus. Brit.)

HELICINA NICOBARICA. *Hel. testi parvâ, compressâ, angulata, pallidè fusca, fasciâ rubris, angustis, spiralibus, suprâ angulum anfractuum duabus, infri una tornatâ; ultimo anfractu depresso, carinato; aperturâ parvâ; columellâ minutâ, albâ; labio externo angusto, albo, medio rotundatum angulato.*

THE NICOBAR HELICINA. Shell small, compressed, angular, pale brown, ribanded with narrow red spiral bands, two above one beneath the angle of the whorls; last whorl depressed, keeled; aperture small; columella minute, white; outer lip narrow, white, roundly angular in the middle.

PLATE XXII.

(Species 188.) (Mus. Brit.)

HELICINA RETICULATA. *Hel. testa trochiformis, angulata, levigata, flavola, superi medium laticea pessae, lineis reticulatis velutinatis; spirae elongatae, apice mucronatae; ultima anfractu rotunda, angulata, antice convexa; callo centrali transverso; columella minuta; labio externo angulato, alba, rotula.*

THE RETICULATED HELICINA. Shell trochiform, angular, smooth, yellowish brown above the middle and within, reticulated with reddish lines; last whorl angular in the middle, anteriorly convex; ventral callus very thin; columella minute; outer lip angular, white, thin.

PFEIFFER. Proc. Zool. Soc., 1862.

Hab. Cape Flattery.

Species 189. (Mus. Brit.)

HELICINA POLITA. *Hel. testa depresso-angulata, lirissima, aurantiæ vel pallidæ flavida, non uniforme aurantio vel fuscæ fasciata; spiræ depresso-conica, anfractibus apicalibus parvæ; ultimo anfractu medio angulata; callo centrali rotunda, columella parva, albæ; labio externo reflexo, complanato, medio angulato.*

THE POLISHED HELICINA. Shell depressed, angular, very smooth, orange or pale yellowish, sometimes banded with orange or brown; spire depressed-conical, apical whorls small; last whorl angular in the middle; ventral callus rounded, columella small, white; outer lip reflected, flattened, angular in the middle.

SOWERBY. Proc. Zool. Soc., 1842.

Helicina citrina (var.), Pfeiffer.

Hab. Philippines.

This beautiful species is subject to great variations in shape and colour.

(Species 190.) (Mus. Brit.)

HELICINA SALLÉNSIS. *Hel. testa depresso-angulata, fuscum-fusca, testa subangulata, spiræ conicæ, breviæ; ultimo anfractu sequestrata, rotundata subangulata; callo centrali rotunda, columella parva, levata; labio externo levata callo, edax, in media obtusissime angulata.*

SALLÉ'S HELICINA. Shell depressed, smooth, smoky brown, smooth, rather angular; spire conical, short; last whorl rather large, roundly subangular; ventral callus white; columella small, pointed; outer lip rather thin, rounded, very obtusely angular in the middle.

PFEIFFER. Proc. Zool. Soc., 1852.

Hab. Haiti.

Species 191. (Mus. Brit.)

HELICINA STRIATA. *Hel. testa globoso-subdepressa, fuscum-fusca, longitudinaliter leviter striata; spiræ convexæ; ultimo anfractu inflata; callo ventrali subdepresso; columella parva; labio externo albo, reflexo.*

THE STRIATED HELICINA. Shell globose subdepressed, smoky-brown, longitudinally lightly striated; spire convex; last whorl inflated; ventral callus rather flat; columella small; outer lip white, reflected.

LAMARCK. Hist. Nat. Anim. s. vert.

Hab. Porto Rico.

Species 192. (Fig. a, b, Mus. Brit.)

HELICINA IDE. *Hel. testa parva, depresso-conica, rubescens, tenui; spiræ depresso-angulata, medio lutea, fasciata; apertura parva, depresso, intus fuscæ; callo centrali tenuissimo, columella minuta; labio externo albo, reflexo, complanato.*

October, 1873.

HELICINA.—PLATE XXII.

IDA'S HELICINA. Shell small, depressed-conical, reddish, smooth; spire depressed; last whorl angular, with a yellow band in the middle; aperture small, depressed, brown within; ventral callus very thin, columella minute, outer lip white, reflected, flattened.

PFEIFFER. Proc. Zool. Soc., 1856, p. 339.

Hab. —?

Species 193. (Fig. a, b, Mus. Brit.)

HELICINA MACGILLIVRAYI. *Hel. testá parvá, compresso-conicá, rubro latè bifasciatá; spírù depressá, lateribus concexis; ultimo anfractu rotundatim subangulato; aperturá parvá, labio extero tenui, reflexo.*

MACGILLIVRAY'S HELICINA. Shell small, compressed-conical, with two broad red bands; spire depressed, with convex sides; last whorl roundly subangular; aperture small, outer lip thin, reflected.

PFEIFFER. Proc. Zool. Soc., 1855.

Hab. Isl. of Pines, South Seas.

A pretty little half compressed, half globose red-banded species.

Species 194. (Fig. a, b, Mus. Brit.)

HELICINA VIRENS. *Hel. testá globoso-angulatá, pallidè viridi vel luteá, fuscò fasciatá; spírù elevatá, conico, anfractibus convexiusculis, cariatis; ultimo anfractu magno, medio carinato; callo ventrali tumido; columellá cum labium externum confluenti; labio extero planulato, reflexo, medio latiuseculo, angulato.*

THE GREENISH HELICINA. Shell globosely angular, pale green, or yellow with brown bands; spire elevated, conical, keeled in the middle; last whorl large, keeled in the middle; ventral callus tumid; columella confluent with the outer lip; outer lip flattened, reflected, rather broader in the middle, angular.

PFEIFFER. Proc. Zool. Soc., 1856.

Hab. —?

One of the most strongly keeled shells of the group.

HELICINA.

PLATE XXIII.

Species 195. (Fig. a, b, Mus. Brit.)

HELICINA RHOMA. *Hel. testi globosi, carinati, albido, nonnunquam castano prope carinata nufisicata; spira elevata, anfractibus suprae carinata convexis; ultimo anfractu medio radice carinato, infra carinatum convexo; callo ventrali magno, rotundo; columellâ parvi rectilinealâ, labio externo superne depresso, infî ad juncturam emarginato, medio expanso, angulato.*

RHÔM'S HELICINA. Shell globose, carinated, whitish, sometimes with a single chestnut band near the keel; spire elevated, whorls convex above the keel, last whorl strongly keeled, convex below the keel; ventral callus large, rounded; columella small, rather straight, outer lip depressed above, emarginated, expanded in the middle, angular.

PFEIFFER. Proc. Zool. Soc., 1848.

Helicina Marchionissa, Hombrigh.

Hab. ——?

Species 196. (Fig. a, b, Mus. Brit.)

HELICINA CUBITA. *Hel. testi parvi, depressa, carinata, fulvâ, nonnunquam rubro maculata, intus aurâ, spira convexa, apice mucronata; anfractibus suprae carinatum subrotundis, infra carinatum convexis; ultimo anfractu paulo infî medium medium carinato; aperturâ parvâ.*

THE FRUITFUL HELICINA. Shell small, depressed, keeled, fulvous, sometimes spotted with red, golden within; spire convex, apex mucronate, whorls rather rounded above the keel, convex below the keel; last whorl keeled a little below the middle; aperture small.

GOULD. Proc. Bot. Soc., 1817.

Hab. Sandwich Islands.

Species 197. (Mus. Brit.)

HELICINA ALBO-LABRIS. *Hel. testi depressa, angulata, pallidâ rubrâ; spirâ brevi, conicâ; ultimo anfractu paulo supra medium auctâ carinato, infra carinatum convexo, callo ventrali et columellâ albâ, crassis; labio externo supra medium angulato, hanc refero.*

THE WHITE-LIPPED HELICINA. Shell depressed, angular, pale red; spire short, conical; last whorl sharply keeled a little above the middle, convex below the keel, ventral callus and columella whitish, thick; outer lip angular above the middle, not reflected.

HOMBRIGH. Voy. Pol. Sud. Moll.

Hab. Tahiti.

Species 198. (Mus. Brit.)

HELICINA CORRUGATA. *Hel. testi parvâ, callo depresso, angulatâ, fulmico-fusca, supra medium rugosum undulatâ, spirâ depresso; ultimo anfractu auctâ carinato, carinatâ, undulatâ; callo ventrali crassi-suscito; columellâ cum labio externo confluenti.*

THE CORRUGATED HELICINA. Shell small, much depressed, angular, smoky-brown, roughly undulated above the middle, spire depressed; last whorl sharply keeled, keel undulated; ventral callus rather thick; columella confluent with the outer lip.

PEASE. ——?

Hab. Tahiti.

A curious little species characterized by undulations on the upper part of the whorls and the keel.

Species 199. (Mus. Brit.)

HELICINA MAUGERI. *Hel. testi depressâ, crassâ, angulari, pallidâ rubescens; spirâ depresso-conica; anfractibus supra et infra carinatum castaneo nufisicatis; ultimo anfractu medio auctâ carinato, infra carinatum convexo; callo ventrali lato aurantio, incrassato, columellâ subtriangulari; labio externo crasso, aurantio, medio producto, infra ad juncturam subemarginato.*

MAUGER'S HELICINA. Shell depressed, thick, angular, pale reddish; spire depressed-conical; whorls single reddish with chestnut above and below the keel, last whorl sharply keeled in the middle, convex below the keel; ventral callus broad, orange, thickened, columella subtriangular; outer lip thick, orange, produced in the middle, slightly emarginated below at the juncture.

GRAY. Zoological Journal, vol. i. p. 251.

Hab. Marquesas.

The thickened orange callus and outer lip of this species distinguish it well from others.

Species 200. (Mus. Brit.)

HELICINA ANGULATA. *Hel. testi subdepressâ, angulata, pallidâ stramineâ, marginis parvis supra et infra carinatum variegata; spirâ conicâ; ultimo anfractu medio carinato, infra mediana convexo; columellâ albâ, infra in spiram curvam producto; labio externo supra medium arcuato.*

THE ANGULAR HELICINA. Shell subdepressed, angular, pale straw, variegated with small spots above and below the keel; spire conical; last whorl carinated

HELICINA.—PLATE XXIII.

in the middle, convex below the middle; columella white, produced below into a curved spire; outer lip arched above the middle.

SOWERBY. Thesaurus Conchyliorum, 2nd Mon., Sp. 245.
Hab. Brazil.

Species 201. (Mus. Brit.)

HELICINA GONOCHEILA. *Hel. testā depressā, angulatā, fuscō-fusca, suprā et infrā lineis, medio paucis rubris notatā; spirā depresso-conicā; ultimo anfractu medio angulato, albosaccato; columellā albā, in spirā recurvata producto; labio extero complanato, reflexo.*

THE ANGLE-LIPPED HELICINA. Shell depressed, angular, smoky-brown, marked above and below with red lines and in the middle with spots; spire depressed-conical; last whorl angular in the middle, white-banded; columella white produced into a recurved spire; outer lip flattened, reflected.

PFEIFFER. Proc. Zool. Soc., 1818.
Hab. Venezuela.

Species 202. (Mus. Brit.)

HELICINA SOWERBYANA. *Hel. testā magnā, albida, globoso-angulatā, supernā spirāliter striatā; spirā conicā, apicē acuminatā; ultimo anfractu ventricoso, infri angulum concavo, medio carinatō; callo ventrali crassō, columellā parvā, ad juncturam angulatō; labio extero reflexo, expanso, medio obtuse angulatō.*

SOWERBY'S HELICINA. Shell large, white, globosely angular, spirally striated above; spire conical, apex acuminate; last whorl ventricose, convex below the angle keeled in the middle; ventral callus thick, columella small, angular at the junction; outer lip reflected, expanded, obtusely angular in the middle.

PFEIFFER. Proc. Zool. Soc., 1818.
Hab. Guatemala.

Species 203. (Mus. Brit.)

HELICINA VILLOSA. *Hel. testā pareā, compressā, fuscō-fusca, medio anfractuum aucti carinatā; ad carinum setis crispatis ornatā; ultimo anfractu depresso; aperturā subtrigonā, labio extero crasso, planulato.*

THE HAIRY HELICINA. Shell small, compressed, smoky-brown, keeled in the middle of the whorls, ornamented with curled hairs at the keel; last whorl

depressed; aperture subtrigonal; outer lip thick, flattened.

ANTHONY. ——?

Helicina pilosa, Sowerby.

Hab. Isl. Opará.

Species 204. (Mus. Brit.)

HELICINA ALBO-CINCTA. *Hel. testā parvā, depressā, lenticulari, fuscō-fusca; ultimo anfractu obtuse carinatō; carinā albā; aperturā parvā, columellā tenui, albā, obliquā; labio extero albo, angusto, rotundo.*

THE WHITE-BELTED HELICINA. Shell small, depressed, lenticular smoky-brown; last whorl obtusely keeled; keel white; aperture small; columella thin, white, oblique; outer lip white, narrow rounded.

HOMBRIGH. Voy. Pol. Sud. Moll.
Hab. Ari Island.

Species 205. (Mus. Brit.)

HELICINA HUMILIS. *Hel. testā minutā, fuscā, lenticulari; spirā depressā; ultimo anfractu medio angulato; callo ventrali albā, crassa, columellā arcuati; labio extero band reflexo.*

THE HUMBLE HELICINA. Shell minute, brown, lenticular; spire depressed; last whorl angular in the middle; ventral callus white thick, columella arched, outer lip not reflected.

HOMBRIGH. Voy. Poll. Sud. Moll., t. ii. f. 30-37.
Hab. Hogolm.

Species 206. (Mus. Taylor.)

HELICINA TAYLORIANA. *Hel. testā tenui, angulatā, aurantiā, medio anfractuum aucti carinatā; carina utrinque linei rubrae marginatā; spirā conicē; columellā albā, tenui, infra in spinū producta; labio extero reflexo, albo, planulato.*

TAYLOR'S HELICINA. Shell thin, angular, orange, sharply keeled in the middle of the whorls; keel bordered with a red line on each side; spire conical; columella white, thin, produced into a spine below; outer lip reflected, white, flattened.

SOWERBY.

Hab. ——?

This is one of the prettiest and most characteristic of all the species.

HELICINA.

PLATE XXIV.

Species 207. (Mus. —). Copied.)

HELICINA OXYTROPIS. *Hel. testi trochiformi, acutè carinatè, pallidè; spirè conicè, elevatè, anfractibus ad suturam carinatè; aperturè acutè angulatè; labio externo albo, angusto, planulato; columellâ rotundâ, cum labio externo confluenti, callo centrali planulato.*

THE SHARP-FORMED HELICINA. Shell trochiform, sharply keeled, pale, spire conical, elevated, whorls keeled at the suture; aperture sharply angular; outer lip white, narrow, flattened; columella rounded, confluent with the outer lip, ventral callus flattened.

GRAY. Beechey's Appendix.

Helicina oxytoma, Sowerby, Thes., first monograph.

Hab. Bahia.

Species 208. (Fig. a, b, Mus. Brit.)

HELICINA LAZARUS. *Hel. testi depresso-conica, fusa, subnigra subplanulata; spirè convexo-conica, anfractibus angustis; ultimo anfractu obtusè angulata, depresso; labio externo supernè depresso, medio subproducto; columellâ brevi.*

THE BEGGAR HELICINA. Shell depressed-conical, brown, rather flattened beneath; spire convex-conical; whorls narrow; last whorl obtusely angular, depressed; outer lip depressed above, produced in the middle; columella short.

SOWERBY. Proc. Zool. Soc., 1842.

Hab. Philippines.

Species 209. (Fig. a, b, Mus. Sowerby, &c.)

HELICINA CAROCOLLA. *Hel. testi depressi, acutissimè angulata, auriculati rel. parparei; spirè depressi; ultimo anfractu magno, medio acutè carinata; aperturè angulata; callo columellarì albâ, rotundâ; columellâ cum labio externo confluenti; labio externo lato, planulato, supernè depresso, medio in angulum acutum accivit producto.*

THE CAROCOLLA HELICINA. Shell depressed, very sharply angular, golden or purple; spire depressed; last whorl large, middle sharply keeled; aperture angular; columellar callus white, rounded; columella confluent with the outer lip; outer lip broad, flattened, depressed above, produced in the middle into a sharp upturned angle.

MORICAND. Mem. Gen. VIII. p. 444.

Hab. Brazil.

The peculiarly broad, flattened outer lip with its upturned angle, distinguishes this from the other species of the depressed form.

Species 210. (Mus. Taylor.)

HELICINA JOSEPHINÆ. *Hel. testi trochiformi, tenui, latentes, supernè mucilis subviridis, flammatis variegata; spirè conicè, acuminatè, anfractibus scarubesculis, ad suturam carinatè; ultimo anfractu infid. medium subplanulatis, ad medium carini acutè, serrata viridè; aperturè trigono, labio externo subreflexo, planulato, supernè declivi.*
JOSEPHINE'S HELICINA. Shell trochiform, thin, yellowish, variegated above with greenish flame-shaped spots; spire conical, acuminate, whorls rather seaceous keeled at the suture; last whorl a little flattened below the middle, girt in the middle with an acutely serrated keel; aperture trigonal; outer lip slightly reflexed, flattened, sloped above.

C. B. ADAMS. Contributions to Conchology, p. 27.

Hab. Jamaica.

Species 211. (Mus. Brit.)

HELICINA CONSTELLATA. *Hel. testa trochiforme, secura, straminea, supernè rubro maculata; spirè conicæ, elevata, anfractibus curvâ serrata, acutissimè, marginatis, penultima carinâ exserta; aperturâ parva, angulata; labio externo albo, reflexo, ad medium acutissimè angulata.*

THE CONSTELLATED HELICINA. Shell trochiform, seaceous, straw-coloured, red-spotted above; spire conical, elevated, whorls bordered with a

HELICINA.—PLATE XXIV.

serrated very sharp keel, the last but one with the teeth exserted; aperture small, angular; outer lip white, reflected, very acutely angular in the middle.

MOULLET. *Révue Zoologique*, 1847.

Helicina pagoda, Velasquez.

Hab. —?

This species has the upper whorls more exserted than those of *Helicina stellata*, so that the serrated keel is raised above the suture.

Species 212. (Mus. Brit.)

HELICINA FUSCULA. *Hel. testā parvā, pyramidatā, lavi-*
tuos, costatus supernō bifasciatō; spīrā elevatā,
anfractibus convexis carinatis, apicē sub cārvico;
ultimo anfractu infīdū medium obtusissimū carinato
basi subplano; aperturā parvā, trigonā, labio
externo albo, angusto, infīdū medium angulatō.

To LITTLE BROWN HELICINA. Shell small, pyramidal, smooth, brown, with two chestnut bands above; spire elevated, whorls a little convex, apex bluish; last whorl very obtusely keeled below the centre, rather flattened at the base; aperture small, trigonal, outer lip white, narrow, angular below the centre.

UNDLACH —? *Thesaurus Conchyliorum*. *Helicina*,
sp. 36, f. 465, 6.

Hel. Cuba.

Species 213. (Mus. Brit.)

HELICINA ERYTHREA. *Hel. testā parvā acuminate,*
pyramidatā, levigatā, fuscā; spīrā perlevatā, an-
fractibus superne intense fuscatis; ultimo anfractu
medium obtusissimē angulatō; aperturā
parvā.

To VELASQUEZ HELICINA. Shell small, acuminate, pyramidal, smooth, brown; spire much elevated, whorls strongly browned above; last whorl very obtusely angular below the middle; aperture small.

WRIGHT —? *Sowerby's Thesaurus*. *Helicina*, sp.
35, fig. 161, 462, 463.

Helicina rubello, Wright (var.).

Hel. Cuba.

Species 214. (Mus. Brit.)

HELICINA ALBOVIRIDIS. *Hel. testā parvā, pyramidatā,*
albā, viridi unifasciatā; spīrā elevatā, acuminatā,
apicē viridi; ultimo anfractu rotundatō; labio
externo albī, lateri reflexo, angulatō.

THE WHITE-GREEN HELICINA. Shell small, pyramidal, white, single-banded with green; spire elevated, acuminate, apex green; last whorl rounded; outer lip white, slightly reflexed, angular.

WRIGHT —? *Sowerby's Thesaurus*. *Helicina*, sp. 96.

Hel. Cuba.

Species 215. (Mus. Brit.)

HELICINA PARVA. *Hel. testā minutā, depresso-sub-*
globosā tenui, auricolatō; spīrā parvā; ultimo an-
fractu ventricoso; columellā parvā, albā; labio ex-
terno reflexo, planatō.

THE SMALL HELICINA. Shell very small, depressed-sub-globose, thin, golden; spire small; last whorl ventricose; columella small, white; outer lip reflexed, flattened.

SOWERBY. *Proc. Zool. Soc.*, 1842.

Hel. Philippines.

Species 216. (Mus. Brit.)

HELICINA STELLATA. *Hel. testā depresso-trochiformi,*
superne granosā straminatō; spīrā turrīta, an-
fractibus serrato-carinatis, supernō rubro maculatō;
ultimo anfractu infīdū carinatā plumbatō, rubro
unifasciatō; aperturā angulatō, depresso; parvā;
labio externo superne depresso medio angulatō
productō.

THE STELLATED HELICINA. Shell depressed-trochiform, granose above, straw-coloured; spire turreted; whorls with a serrated keel, spotted with red above; last whorl flattened beneath the keel, having a single red band; aperture angular; depressed, small; outer lip depressed above, produced into an angle at the centre.

VELASQUEZ —? *Jay's Catalogue*. *Thes. Conch.*,
sp. 268, f. 451.

HELICINA.

PLATE XXV.

Species 217. (Mus. Brit.)

HELICINA HEMASTOMA. *Hel. testā subglobosi, lervi, alba, ad labium externum, callum ventralē apicē quoque cīcīdī rubrū; spirā brevi, anfractib⁹ parvis, ultimo anfractu subventricoso, medio obscurē angulato; labio externo supernē subdepresso, medio subelevato, elevato; columellā rotundatula, ad junctionē evanescit.*

THE RED-MOUTHED HELICINA. Shell subglobose, smooth, white, bright red at the outer lip, ventral callus and apex; spire short, whorls small, last whorl rather ventricose, obscurely angular in the middle; outer lip rather depressed, a little angular in the middle, elevated; columella rather straight, cornered at the juncture.

MORICAND. Mem. III. p. 36.
Hab. Bahia.

Species 218. (Mus. Brit.)

HELICINA JUCUNDA. *Hel. testā pyramidatā, lutoi vel pallidē fulvā, columellā et labio externo rubris, fauce aureolatā.*

THE JUCUND HELICINA. Shell pyramidal, yellow or pale fulvous, columella and outer lip red, throat golden. GUNDLACH. Pflr. Bl. Malak., 1863, p. 197.
Hab. Cuba.

Species 219. (Mus. Brit.)

HELICINA CITRINA. *Hel. testā depresso-subglobosa, tenui, lervi, latei; ultimo anfractu ventricoso, columellā brevi, subtrigonā; labio externo albo, reflexo, planulato.*

THE CITRON HELICINA. Shell depressed, subglobose, thin, smooth, yellow; last whorl ventricose, columella short, subtrigonal; outer lip white, reflected, flattened.

GRATELOUP. Not *H. polita*, Sowerby. Not *H. citrina*, Sowerby.

Hab. Cuba.

Species 220. (Fig. a, b, Mus. Brit.)

HELICINA AGGLUTINANS. *Hel. testā depresso, angulatā, aurantia, frequenter ad angulum anfractuum luteum in nodis regularibus agglutinanti; aperturā angulatā; labio externo reflexo, albo, planulato; ultimo anfractu depresso, carinato; columellā obliquā.*

THE AGGLUTINATING HELICINA. Shell depressed, angulated, orange, frequently glueing to it little nodes of mud at the angle of the whorls; aperture angular; outer lip reflected, white, flattened; last whorl depressed, keeled; columella oblique.

SOWERBY. Proc. Zool. Soc., 1842.
Hab. Philippines.

The singular habit of glueing particles of dust and mud in regular form at the keel is not apparently exercised by all the specimens of this species, although the power is possessed.

Species 221. (Mus. Brit.)

HELICINA GLOBULOSA. *Hel. testā globulā tenui, tævigatā, auricolā; spirā brevi, anfractib⁹ parvis; ultimo anfractu ad suturam mediumque albo fasciatu, supra et infra medium rubro fasciatu; aperturā semi-lunatā; labio externo albo, planulato, reflexo.*

THE GLOBOSE HELICINA. Shell globose, thin, smooth, golden; spire short, whorls small; last whorl, suture and middle banded with white above, and below the middle banded with red; aperture semilunar; outer lip white, flattened, reflected.

ORNIGNY. Moll. Cuba, p. 245.
Hab. Cuba.

A small species, very prettily ribanded with red and white.

Species 222. (Mus. Brit.)

HELICINA LUTEA. *Hel. testā crassā, luteā, globoso-angulata; spirā conica, lateraliter convexulata.*

HELICINA.—PLATE XXV.

ultima aninctu medio subangulato, columellā angustā, ad juncturam angulatā.

THE YELLOWISH HELICINA. Shell thick, yellow, globose-angular; spire conical, laterally rather convex; last whorl rather angular in the middle, columella narrow, angular at the juncture.

LESSON. Voy. Coq., p. 350.

Hab. Port Dorez, New Guinea.

Species 223. (Mus. Brit.)

HELICINA HJALMARSONI. *Hel. testā globoso-depressā, fuscā, tenui; spirā depresso; columellā albā trigonā, labio externo albo, tenui, supernē subdepresso.*

HJALMARSON'S HELICINA. Shell globoso-depressed, brown, thin; spire depressed; columella white, trigonal; outer lip white, thin, a little bent down above.

PFEIFFER. Malak. Pl. III., 1856.

Hab. Porto Rico.

Species 224. (Mus. Brit.)

HELICINA BULLA. *Hel. testā albī, crassiūsculā, globoso-subangulatā; spirā conicā, labio externo reflexo, medio subangulato; columelli obliqui, albā.*

THE BUBBLE HELICINA. Shell white, rather thick, globose-subangular; spire conical, outer lip reflected,

a little angular in the middle; columella oblique, white.

PFEIFFER. Proc. Zool. Soc., 1852.

Hab. —— ?

Species 225. (Mus. Brit.)

HELICINA GRANUM. *Hel. testā minutā, albā, globoso-subdepresso, spiraliē striatā; spirā convexā, anfractibus subrotundis; ultimo anfractu post columellam excavato; aperturā parvā, subquadratā.*

THE GRAIN HELICINA. Shell minute, white, globoso-subdepressed, spirally striated; spire convex, whorls rather rounded; last whorl excavated behind the columella; aperture small, rather square.

PFEIFFER. Bl. Malak., 1856.

Hab. Cuba.

Species 226. (Mus. Brit.)

HELICINA CASTANEA. *Hel. testā parvā, subdepresso, obtusā angulatā, castaneā; spirā depresso-conicā; ultimo anfractu medio rotundatim angulatā; aperturā infrā acutē angulatā.*

THE CHESTNUT HELICINA. Shell small, rather depressed, obtusely angular, chestnut; spire depressed-conical; last whorl roundly angular in the middle; aperture with a sharp angle below.

GULDING —? Sowerby's Thesaurus. Helicina, sp. 218, figs. 470, 471.

HELICINA.

PLATE XXVI.

Species 227. (Mus. Brit.)

HELICINA MACULATA. *Hel. testi' parvæ, politæ, medio angulatâ; fulvâ, fasciâ rubris, anæ supra, alterâ infâ angulum, maculâisque angulatis rubris ad angulum ornatâ; spira' conicâ; ultimo anfractu' oblique medium subangulatum concavâ; labio' externo superne depresso, columellâ parvâ.*

THE SNAILLED HELICINA. Shell small, polished, angular in the middle, fulvous, ornamented with one red band above and another below the angle and angular red spots at the angle; spire conical; last whorl below the middle rather angularly convex; outer lip depressed above; columella small.

SOWERBY. Thesaurus Conchyliorum. *Helicina*, sp. 271, f. 172.

Hab. South America.

Species 228. (Mus. Brit.)

HELICINA BRAZILIANA. *Hel. testi' albidâ, depressâ, spirâliter striatâ; spira' depresso-conicâ, anfractu' lobos parvîs, apice acuminato; ultimo anfractu' medio subangulato, infâ convexo, subumbilicato; columellâ rectiunculâ, superne rotundâ, ad juncturam obtuse angulatâ; labio' externo suprâ et infâ compreso, angusto, reflexo.*

THE BRAZILIAN HELICINA. Shell white, depressed, spirally striated; spire depressed-conical, whorls small, apex acuminate; last whorl a little angular in the middle, convex below, somewhat umbilicated; columella rather straight, rounded above, obtusely angular at the juncture; outer lip compressed above and below, narrow, reflected.

GRAY. Zoological Journal, vol. i. p. 61.
Hab. Brazil.

Species 229. (Mus. Brit.)

HELICINA ZEBROLATA. *Hel. testi' parvæ, depressâ, angulatâ, fulvâ, strigis rubris longitudinalibus ruricatâ; ultimo anfractu' acutè carinato.*

THE ZEBRA-STRIPED HELICINA. Shell small, depressed, angular, fulvous, varied with longitudinal red stripes; last whorl sharply keeled.

PFEIFFER. Proc. Zool. Soc., 1855.

Helicina fulgora, Gould.

Hab. Isl. Samar.

Species 230. (Mus. Brit.)

HELICINA MOUROTI. *Hel. testi' angulatâ, depressâ, aureolâ, medio anfractuum carinâ laqueatâ, latâ, deciev' cinetâ; spira' conicâ, depresso; ultimo anfractu' infâ angulum subplanulato; columellâ albâ, obliquâ cum labio externo confluenti; labio' externo compresso, in processum linguiformem producto.*

MOUROT'S HELICINA. Shell angular, depressed, golden, girt in the middle of the whorls with a fluted broad keel sloped downwards; spire conical, depressed; last whorl rather flattened below the angle; columella white, oblique, confluent with the outer lip; outer lip compressed, produced into a tongue-shaped projection.

PFEIFFER. Proc. Zool. Soc., 1862.

Hab. Lao Mountains, Cambodia.

The beautifully fluted keel in this species distinguishes it from all others, excepting *H. corrugata*, which obscurely shows the same tendencies.

Species 231. (Mus. Brit.)

HELICINA MOQUINIANA. *Hel. testi' angulatâ, tenuiunculâ, superne spirâliter striis elevatis, subdistantibus sculptâ, vinosa-fuscâ, maculis rubescutibus superne angulum in scribas duobus variegati; spira' conicâ, ultimo anfractu' acutè carinato, aperturâ obliquâ subquadratâ; labio' externo albo, reflexo, medio angulato; callo ventrali rotundo.*

MOQUIN'S HELICINA. Shell angular, rather thin, spirally sculptured on the upper part with raised rather

HELICINA.—PLATE XXVI.

distant striae, vinous-brown, varied above the angle with two rows of red spots; spire conical; last whorl sharply keeled, aperture obliquely rather square, outer lip white, reflected, angular in the middle; ventral callus rounded.

RECLUZ. Journal de Conchyliologie, 1851.

Hab. New Caledonia.

Species 232. (Mus. Brit.)

HELICINA OXYEHHINCA. *Hel. testā subcompressā, angulatā, auriculatā, tenui; spirā depresso-conicā, anfractibus ad suturam carinatū; ultimo anfractu medio acutissimè carinatū, infrah medius convexo; aperturā rhomboidē; labio externo superius convexo, tunc depresso, ad angulum medianum in processum sublonguiformem extenso.*

THE SHARPE-SOUTON HELICINA. Shell subcompressed, angular, golden-tinted, thin; spire depressed-conical, whorls keeled at the suture; last whorl very sharply keeled in the middle, convex below the middle; aperture rhomboidal; outer lip convex, then depressed, extended into a tongue-shaped process at the middle angle.

CROSS. Journ. Conch., vol. xi. p. 267.

Hab. —?

Species 233. (Mus. Brit.)

HELICINA FLAMMEA. *Hel. testā minutā, depresso-subglobosā, fuscā, lineis rubris undulatis et angulatis variegatā, obtusissimè angulatā, supri angulata depresso-conicā, infrah angulum convexa; aperturā semilunari; labio externo albo, planulata, angusto; columella trigonā, parvā.*

THE FLAME HELICINA. Shell minute, depressed-subglobose, brown, varied with undulating and angular red lines, very obtusely angular, depressed, conical above the angle, convex below; aperture semilunar, outer lip white, flattened, narrow; columella trigonal, small.

BOY. Voy. Astro., vol. ii. p. 193, t. 12, f. 1-2.

Hab. Island of Tonga.

Species 234. (Mus. Brit.)

HELICINA SHANGHAENSIS. *Hel. testā parvā, depresso-maculatā; spirā depresso-conicā; callo ventrali tenui; aperturā parvā, angulatā; labio externo haucl reflexo.*

THE SHANGHAE HELICINA. Shell small, depressed, angular, yellowish, spotted with red at the angle and above; spire depressed-conical; ventral callus thin; aperture small, angular; outer lip not reflexed.

PFEIFFER. Proc. Zool. Soc., 1855.

Hab. Royalty Island.

A pretty little species shaped something like a Rotella.

Species 235. (Mus. Brit.)

HELICINA REEVIANA. *Hel. testā globosā, spirali stratiā, purpurascenti, fasciā rubrā interrupta ad medium anfractuum cinctā; spirā subelevatā, columellā parvā, rectā, labio externo semilunari, albo.*

REEVE'S HELICINA. Shell globose, spirally striated, purplish, girt with an interrupted red band in the middle of the whorls; spire slightly raised, with round whorls; columella small, straight, outer lip semilunar, white.

PFEIFFER. Proc. Zool. Soc., 1848.

Hab. Cuba.

Species 236. (Mus. Brit.)

HELICINA ARTICULATA. *Hel. testā depresso-angulatā levigatā, ad medium anfractuum et ad suturam articulatum maculatā; ultimo anfractu medio acutē carinatā; callo ventrali magno rotundo; aperturā subrhomboidē, labio externo angulatā.*

THE ARTICULATED HELICINA. Shell depressed-angular, smooth, articulately spotted at the middle of the whorls and at the suture; last whorl sharply keeled in the middle; ventral callus large, rounded; aperture rather rhomboidal, outer lip angular.

PFEIFFER. Proc. Zool. Soc., 1853.

Hab. New Hebrides.

PLATE XXVII.

Species 237. (Mus. Brit.)

HELICINA BICOLORE. *Hel. testă angulată, subdepresso, aureolată, supra et infra angulum rubro tenuită; spiră depresso-conică; ultimo anfractu ad angulum acutē carinato; callo ventrali magno, tumido, rotundo; columellă infri obliquè acuminatā, ad juncturam subcavatā, labio externo lati reflexo, medio in angulum acutum producto; callo labiisque fuscō-sanguineis.*

THE TWO-COLOURED HELICINA. Shell angular, subdepressed, golden-coloured, ribanded above and below the angle with red; spire depressed-conical; last whorl sharply keeled at the angle; ventral callus large, tumid, rounded; columella obliquely acuminated, a little aculeated at the juncture, outer lip broadly reflected, produced into a sharp angle in the middle; callus and lips brownish blood-colour.

PFEIFFER. Proc. Zool. Soc., 1853.

Hab. Tahiti.

Species 238. (Mus. Brit.)

HELICINA ROSALLE. *Hel. testă depressă, angulată, aureolată, ad angulum supra et infra rubro tenuită; spiră subdepresso, anfractibus plusminuscō depresso; ultimo anfractu paulo infred mediam antecissimā carinato, infri carinam conexilis; callo ventrali albo, parvo, rotundo, columellă brevissimā; apertură subrhomboidā, columellā superne subcallosā, infra cum labio externo confluenti; labio externo albo, anguste reflexo, medio acutangulo.*

ROSALIE'S HELICINA. Shell depressed, angular, golden, with a ribband of red at the angle above and below; spire rather depressed, whorls a little convex, keeled; last whorl sharply keeled in the middle; convex below the keel; aperture subrhomboidal, columnella rather callous above; confluent with the outer lip; outer lip white, narrowly reflected, sharply angular in the middle.

PFEIFFER. Proc. Zool. Soc., 1863.

Hab. Philippines.

Species 239. (Mus. Brit.)

HELICINA ARUANA. *Hel. testă angulată, straminea, infra angulum rubro anfasciată, supra angulum spiraliter striatā et decussatā; spiră conică; ultimo anfractu infra auricolato, levigato, convexo ad angulum acutē carinato; columellă cum labio externo confluenti; labio externo superne depresso, ad medium acuminato.*

THE ARU ISLAND HELICINA. Shell angular, straw-coloured, with a single band of red below the angle; spirally striated and decussated above the angle; spire conical; last whorl golden, smooth, convex below, sharply keeled at the angle; columella confluent with the outer lip; outer lip depressed above, acuminated at the middle.

PFEIFFER. Proc. Zool. Soc., 1859.

Hab. Aru Island.

Species 240. (Mus. Brit.)

HELICINA RHYNCHOSTOMA. *Hel. testă depresso, angulata, carinata, straminea, ad angulum supra infriquo angusto rubro-fasciatā; spiră conicā, anfractibus plusminuscō depresso; ultimo anfractu paulo infred mediam antecissimā carinato, infri carinam conexilis; callo ventrali albo, parvo, rotundo, columellă brevissimā; apertură intus rubra scuta, labio externo albo, reflexo, in angulum acutissimum producto.*

THE SNOUT-MOUTHED HELICINA. Shell depressed, angular, keeled, straw-coloured, with a narrow red band at the angle above and below; spire conical, whorls more or less depressed; last whorl sharply keeled a little below the middle, rather convex below the keel; ventral callus white, small, rounded, columnella very short; aperture reddish within, outer lip white, reflected, produced into a very sharp angle.

SHUTTLEWORTH —? Sowerby's Thesaurus. *Helicina*, sp. 252, figs. 429, 430.

Hab. Venezuela.

HELICINA.—PLATE XXVII.

Species 241. (Mus. Brit.)

HELICINA CARINIFERA. *Hel. testā depressā, angulatā, stramineā; spiraliter striatā; spirā depresso-conicā, infrafractis vix convexis; ultimo anfractu medio ventrī carinatō, infri medianū conovo; aperturā subquadratā; labio externo reflexo, planulato infrah et suprā angulum convexissimulo.*

THE KILL-BEARING HELICINA. Shell depressed, angular, straw-coloured, spirally striated; spire depressed, conical, whorls scarcely convex; last whorl sharply keeled in the middle, convex below the keel; aperture subquadrate; outer lip reflected, flattened, rather convex above and below the angle.

OREGNY. Voy. Amer. Merid.

Helicina Fischeriana, Montrouzier.

Hab. Woodlark Island.

Species 242.

HELICINA GRIESBRECHII. *Hel. testā depressā, angulatā, stramineā; spiraliter striatā; spirā depresso-conicā; infrafractis convexissimulo, ultimo anfractu, medio ventrī cariatō, infri medianū conovo; callo ventrali parvo, rotundo; columellā brevissimā; labio externo reflexo, planulato, medio subrostrato.*

GRIESBRECHT'S HELICINA. Shell depressed, angular, straw-coloured; spirally striated; spire depressed, rather conical; whorls rather convex, last whorl sharply keeled in the middle, convex below the middle; ventral callus small, round; columella very short; outer lip reflected, flattened.

PFEIFFER. Proc. Zool. Soc., 1856.

Hab. Chiape.

Species 243. (Mus. Brit.)

HELICINA BESKII. *Hel. testā depressā, angulatā, spiraliter striatā, stramineā, ad suturam rubro unifasciati; spirā conicā, infrafractis convexissimulo; ultimo anfractu cariatō, infrah angulum conovo; columellā parvā, trigonā; labio externo albo, reflexo, planulato.*

BESKI'S HELICINA. Shell depressed, angular, spirally striated, straw-coloured, single banded at the

suture with red; spire conical, whorls rather convex; last whorl keeled, convex below the keel; columella small, trigonal; outer lip white, reflected, flattened.

PFEIFFER. Proc. Zool. Soc., 1856.

Hab. Brazil.

This is another of the large angular species which show a convexity in the whorls, and particularly at the lower part of the last whorl.

Species 244. (Mus. Brit.)

HELICINA TECTA. *Hel. testā subdepressā, angulatā, spiraliter striatā, acutissimā carinatā, ad suturam et ad carinam, atque suprā et infrah, maculis repartibibus vividē rubris seriatim ornata; spirā conicā, anfractibus vix convexis, ultimo anfractu infrah convexo; labio externo albo, reflexo.*

THE ROOFED HELICINA. Shell rather depressed, angular, spirally striated, very acutely keeled, ornamented at the suture and at the keel above and below with regular rows of bright red spots; spire conical, whorls scarcely convex; outer lip white, reflected.

SOWERBY. Thesaurus Conchyliorum. *Helicina*, sp. 256, fig. 43.

Hab. —?

Species 245. (Fig. a, b, Mus. Brit.)

HELICINA SOLIDULA. *Hel. testā crassā, angulato-subglobosā, luteā vel purpurā, callo et apertura luteis; spirā convexo-conicā, ultimo anfractu obtuse carinata; callo ventrali rotundo, labio externo medio angulatim producto, infrah angulum sinuato.*

THE SOLID LITTLE HELICINA. Shell thick, angularly-subglobose, yellow or purple, callus and aperture yellow; spire convex-conical; last whorl obtusely keeled; ventral callus rounded, outer lip angularly produced in the middle, sinuated below the angle.

GRAY. Zoology of Beechy's Voyage, p. 146.

HELICINA.

PLATE XXVIII.

Species 246. (Fig. a b.) (Mus. Brit.)

HELICINA ACUTISSIMA. *Hel. testi subconica; planum depresso, angustior; angulus, rotundata, rubro nonnunquam tenuis; spira conica, ultimo anfractu medio vel infra medianam rotundata; aperturam superne depresso, labio externo reflexo, planato, vel angulum medius rotundato et exstense producto.*

THE VERY SHARP HELICINA. Shell rather conical, more or less depressed, very acutely angular, then golden, sometimes banded with red; spire conical, last whorl sharply keeled at the middle or below; aperture depressed above, outer lip reflected, flattened, produced into a beak at the middle angle.

SOWERBY. Proc. Zool. Soc., 1812.

Hab. Philippines.

Species 247. (Mus. Brit.)

HELICINA PALLIDA. *Hel. testi fulca, rotundata, depresso-angulata; spira depresso-conica; ultimo anfractu medio carinato, infra curvum convexus; callo ventrali parvo, rotundato; aperturam subplanata, labio externo superne subarcuata, medio angulata, infra rotundata.*

THE PALE HELICINA. Shell fulvous, rather thick, depressed angular; spire depressed-conical; last whorl keeled in the middle, convex below the keel; ventral callus small, rounded; aperture rather square, outer lip a little arched above, middle angular, rounded below.

GOULD. Proc. Bot. Soc., 1847.

Hab. Fiji Islands.

Species 248. (Mus. Brit.)

HELICINA LENS. *Hel. testi minuta, rufescens, depresso, lenticulari angulata; spira convexa; ultimo an-*

fractu medio obtuse carinato, infra medium convexo; callo ventrali rotundato, columella triplana; apertura transversi oblonga, superne depresso.

THE LENS HELICINA. Shell minute reddish, depressed lenticular, angular; spire convex; last whorl obtusely keeled in the middle, convex below the middle; ventral callus rounded; columella triangular; aperture transversely oblong, depressed above.

LEXA. Obs. 1, p. 161.

Hab. Fiji Islands.

Species 249. (Mus. Brit.)

HELICINA UNIFASCIATA. *Hel. testi depressa, subdintata, spiraliter striata, apud latera supra infraque angulum convexa, supra angulum rubro-unifasciata; aperturam transversi oblonga, labio externo infra angulum validè arcuata, supra depresso-arcuata.*

THE SINGLE-BANDED HELICINA. Shell depressed, lenticular, spirally striated, equally convex above and below the angle, with a single red band above the angle; aperture transversely oblong, outer lip strongly arched below the angle, depressed-arched above.

GRAY. Zoological Journal, vol. i. p. 69.

Hab. —?

Species 250. (Mus. Brit.)

HELICINA ARENICOLA. *Hel. testi globosa, solidi, albâ, spiraler strigata, medio anfractuum carinata; spira convexo-depressa; aperturam subrotundat, columella arcuata, labio externo rotundato, reflexo; callo ventrali tenui.*

THE SAND-DWELLING HELICINA. Shell globose, solid, white, spirally striated, keeled in the middle of the whorls; spire convex depressed; aperture

HELICINA.—PLATE XXVIII.

rather rounded, columella pointed, outer lip round, reflected; ventral callus thin.

MORTON. Test. Nov. Cub.

Hab. Cuba.

Species 251. (Mus. Brit.)

HELICINA DIAPHANA. *Hel. testā parvā, tenui, lucida, subangulatā; spirā brevi, conicā; ultimo anfractu obtuse angulato; columellā trigonā, labio externo medio producto.*

THE TRANSPARENT HELICINA. Shell small, thin, yellow, rather angular; spire short, conical; last whorl obtusely angular; columella trigonal, outer lip produced in the middle.

PFEIFFER. Proc. Zool. Soc., 1850.

Hab. Honduras.

Species 252. (Mus. Brit.)

HELICINA FUMIGATA. *Hel. testā parvā, tenui, angubatā, levigatā, fumoso-fuscā, fusco-rubescētā ad suturam mediumque fasciatā; columellā parvā, aculeatā, labio externo albo, angusto.*

THE FUMIGATED HELICINA. Shell small, thin, angular, smooth, smoky-brown, with a reddish-brown band at the suture and one in the middle; columella small, aculeated, outer lip white, narrow.

SOWERBY. Thesaurus Conchyliorum. Helicina, sp. 193, f. 345.

Helicina Gouldiana, Forbes.

Hab. Cape Flattery.

Species 253. (Mus. Brit.)

HELICINA ORBIGNYI. *Hel. testā depresso, sublepticulari, obscuri fuscā; spirā brevi; ultimo anfractu obtusis-*

simē angulato, callo ventrali tenui, columellā parvā, albā, aculeatā; aperturā transversē oblongā.

ORBIGNY'S HELICINA. Shell depressed, nearly lenticular, dull brown; spire short; last whorl very obtusely angular; ventral callus thin, columella small, white, aculeated; aperture transversely oblong.

PFEIFFER. Monograph No. 65.

Hab. Cuba.

Species 254. (Mus. Brit.)

HELICINA FORBESIANA. *Hel. testā parvā, subangulatā, fulvo-lutescūti; spirā conicā, anfractibus parvis; ultimo anfractu medio obtuse angulato; columellā minutā, albā, aculeatā; labio externo angustissimē reflexo, ad puncturam inferiorem tenuissimo.*

FORBES'S HELICINA. Shell small, rather angular, fulvous yellow; spire conical, whorls small; last whorl obtusely angular in the middle; columella minute, white, aculeated; outer lip very narrowly reflected, very thin at the lower juncture.

PFEIFFER. Proc. Bost. Soc., 1859.

Helicina vercundia?

Hab. Cape York.

Species 255. (Mus. Brit.)

HELICINA MINUTA. *Hel. testā parvā, depresso, sublepticulari, fumoso-fuscā: spirā parvā, anfractibus minutis; ultimo anfractu medio obtuse a. gutato; columellā albā, brevi, acuminatā; labio externo tenui.*

THE MINUTE HELICINA. Shell small, depressed, rather lenticular, smoky-brown; spire small, whorls minute; last whorl obtusely angular in the middle; columella white, short, acuminate; outer lip thin.

PLATE XXIX.

Species 258. (Mus. Brit.)

HELICINA HANLEYANA. *Hel. testā globosa, tenui, pallidi*
fidei; spira conicā, anfractibus convexisculis;
ultimo anfractu subrotundō; columellā trigonā;
labio externo rotundo.

HANLEY'S HELICINA. Shell globoso-conical, pale fulvous; spire conical, whorls rather convex; last whorl rather round, columella trigonal; outer lip round.

PFEIFFER. Proc. Zool. Soc., 1848.

Hab. New Orleans.

Species 257. (Fig. a, b. Mus. Brit.)

HELICINA LOUISIANENSIS. *Hel. testā parrā, pallidissimē*
fulviā, tenui; spira subconicā, depresso; ultimo an-
fractu rotundo; columellā parrā, trigonā; labio
externo reflexo, albo.

THE LOUISIANA HELICINA. Shell small, very pale fulvous, thin; spire a little conical depressed, last whorl round; columella small, trigonal; outer lip reflected, white.

FORBES. Voyage of Rattlesnake.

Hab. Round Island.

Species 258. (Fig. a, b. Mus. Brit.)

HELICINA DYSONI. *Hel. testā depresso-globosā, tenui,*
spiraliter rubro tripliūsculā; spira conicā, depresso;
ultimo anfractu infrā calliso; callo rotundo, albā;
columellā parrā, rectiūsculā; aperturā semilunarī;
labio externo angusto.

DYSON'S HELICINA. Shell depressed-globose, thin, spirally three-banded with red; spire conical, depressed; last whorl callous below, callus rounded white; columella small, rather straight; aperture semilunar; outer lip narrow.

PFEIFFER. Proc. Zool. Soc., 1848.

Helicina foveata, Pfeiffer (Dysoni, var.).

Hab. Honduras, Isl. St. Thomas.

Species 259. (Fig. a, b. Mus. Brit.)

HELICINA MODESTA. *Hel. testā globoso-subangulatā,*
luteā, tenui; spira conicā, sublatā, anfractibus
convexiūsculis; ultimo anfractu rotundo-angulato;
columellā trigonā, acuminatā; labio externo tenui.

THE MODEST HELICINA. Shell globoso-subangular, yellow, thin; spire conical, rather elated, whorls rather convex; last whorl rounded, angular; columella trigonal, acuminate; outer lip thin.

PFEIFFER. Proc. Zool. Soc., 1853.

Hab. New Hebrides.

Species 260. (Mus. Brit.)

HELICINA OCCULTA. *Hel. testā parrā, globosā, pallidi*
fulviā, solidiūsculā, medio albo fasciatā, suprad et
infra rubro fasciatā; spira ria, conicā, anfractibus
parrā, convexiūsculis; ultimo anfractu rotundo;
columellā parrā, trigonā, albā; labio externo albo,
plumulato, reflexo.

THE HIDDEN HELICINA. Shell small, globose, pale fulvous, rather solid, banded with white in the middle, and with red above and below the middle; spire scarcely conical, whorls small, rather convex; last whorl rounded; columella small, trigonal, white; outer lip white, flattened, reflected.

SOWERBY. Thes. Conch. Helicina, f. 137.

Hab. New York.

Species 261. (Mus. Brit.)

HELICINA ORBICULATA. *Hel. testā globosā, crassā, foliā,*
spira parrā; ultimo anfractu ventricoso; callo
centrali rotundo, columellā cum labio externo con-
fluenti, ad juncturam obscurissimē angulato; labio
externo crassiūsculo; aperturā semicirculari.

THE ORBICULAR HELICINA. Shell globose, thick, fulvous; spire small; last whorl ventricose; ventral callus

HELICINA.—PLATE XXIX.

rounded, columella confluent with the outer lip, very obscurely angular at the juncture; outer lip rather thick; aperture half round.

SOWERBY. Philosophical Journal, vol. i. p. 283.

Hab. North America.

Species 262. (Mus. Brit.)

HELICINA JAPONICA. *Hel. testa globosa, albida, crassa, spirâ conicâ, acuminatâ, anfractibus convexisculis; ultimo anfractu rotundo; columellâ trigona, ad juncturam incisa; labio externo crasso, rotundo.*

THE JAPAN HELICINA. Shell globose, whitish, thick, spire conical, acuminate, whorls rather convex; last whorl rounded; columella trigonal, incised at the juncture; outer lip thick, rounded.

A. ADAMS. Ann. and Mag. of Natural History, 1861.

Hab. Japan.

This rounded species rather resembles *Helicina orbiculata*, from which it differs in having the columella separated from the outer lip by an incised notch.

Species 263. (Mus. Brit.)

HELICINA S'CONICA. *Hel. testa albâ, tenuâ, subangulata; spirâ conicâ elevatâ; ultimo anfractu medio obtuse angulato; columellâ cum labio externo confluentâ; labio externo superne declivâ, medio rotundo, basi rectiâsculo.*

THE RATHER CONICAL HELICINA. Shell white, thin, rather angular; spire conical, elevated; last whorl obtusely angular in the middle; columella con-

fluent with the outer lip; outer lip sloped above, rounded in centre, rather straight at the base.

SOWERBY. Thesaurus Conchyliorum. *Helicina*, sp. 140, fig. 226.

Hab. —?

Species 264. (Mus. Brit.)

HELICINA YORKENSIS. *Hel. testa lœvi, subangulata, tenui, latrâ, suprâ et infrâ medium fulvescenti: spirâ conicâ; apertura semilunari; columellâ brevissimâ, aculeatâ.*

THE CAPE-YORK HELICINA. Shell smooth, rather angular, thin, yellowish, fulvescent above and below the middle; spire conical; aperture semi-lunar; columella very short, aculated.

PFEIFFER. Proc. Zool. Soc., 1862.

Hab. Cape York.

Species 265. (Fig. a, b, Mus. Brit.)

HELICINA SUEVIGATA. *Hel. testa globosa-angulata; fimbriâ unicolori vel latrâ suprâ et infrâ fasciatâ; ultimo anfractu subangulato; callo ventrali tumido, rotundo; columellâ minitâ, aculeatâ: labio externo rubro.*

THE SMOOTHISH HELICINA. Shell globose, subangular, uniform fulvous or broadly banded above and below; last whorl rather angular, ventral callus tumid, rounded; columella minute, outer lip red.

PFEIFFER. Proc. Zool. Soc. 1852.

Hab. New Hebrides.

PLATE XXX.

FIG. 261, &c.

The shell inadvertently figured in Plate XXIX, for *Helicina Fuscifascia* is a variety of *H. fuscata*.

Species 266. (Mus. Brit.)

HELICINA DIAMINUS. *Hel. testa globosa-subangulata, tutea, solle levata; spiræ brevi, a frictibus parvis; ultimo anfractu medio rotundatum angulato; columella brevi, albâ, cum tubo extimo confluenti; tubo extimo rotundato, reflexo, albâ.*

DEAYTON'S HELICINA. Shell globose subangular, yellow, rather solid; spire short, whorls small; last whorl roundly angular in the middle; columnella short, white, confluent with the outer lip; outer lip rounded, reflected, white.

PFEIFFER. Proc. Zool. Soc., 1856.

Hab. Australia.

Species 267. (Mus. Brit.)

HELICINA BORNEENSIS. *Hel. testa parvâ, subangulata, subdepressâ, pallidâ fulvâ, spirâ lateris fuso-rubris centi bisinuata; spirâ conico-depressâ; ultimo anfractu angusto, medio obtusè angulato; columellâ parvâ, obliquâ, albâ; tubo extimo vir reflexo.*

THE BORNEAN HELICINA. Shell small, rather angular, rather depressed, pale fulvous, with two reddish-brown spiral bands; spire depressed-conical; last whorl narrow, obtusely angular in the middle; columnella small, oblique, white; outer lip scarcely reflected.

MARTENS. Monaschriften, Berlin Akademie, 1864.
Hab. Borneo.

A very neat little species, with conical spire and two reddish-brown bands.

Species 268. (Mus. Brit.)

HELICINA PICTILLA. *Hel. testa minutâ, depresso-subglobosâ, pallidâ fulvâ, superne flammatis rubris pictâ; columellâ minutâ; tubo extimo tenui.*

THE LITTLE FUSCIFASCIA HELICINA. Shell minute, depressed-subglobose, pale fulvous, painted above with red flammæ; columella minute; outer lip thin. PFEIFFER. Proc. Zool. Soc., 1856.
Hab. Norfolk Island.

Species 269. (Mus. Brit.)

HELICINA OLDESA. *Hel. testa minutâ, globosâ, fadrâ; finis obliquis rubris, medio interruptis vel angularis pecti; spirâ convexo-conica; anfractibus convexis; ultimo anfractu angusto, medio obtuso angulato; columellâ parvâ, albâ, trigonâ; apertura intus fissa; tubo extimo tenui.*

THE FAT HELICINA. Shell minute, globose, fulvous; painted with oblique red lines interrupted or angular in the middle; spire convex-conical; whorls convex; last whorl narrow, obtusely angular in the middle; columnelli small, white, trigonal; aperture brown within, outer lip thin.

PFEIFFER. Proc. Zool. Soc., 1856.

Hab. Haiti.

Species 270. (Mus. Brit.)

HELICINA PHASIANELLA. *Hel. testa parvâ, depresso-subglobosâ, tenui; fulvo-rubescens, maculis proprie suturam et fasciisque duabus medio et infra rubris pictâ; spirâ conica, apice rubro; columellâ trigonâ, albâ; tubo extimo tenui.*

THE PHEASANT HELICINA. Shell small, depressed-subglobose, thin; reddish-brown, painted with red spots near the suture, and two bands in the middle and below; spire conical, apex red; columella trigonal, white; outer lip thin.

PFEIFFER. Malak., vol. iii. 1856.

Hab. Porto Rico.

Species 271. (Mus. Brit.)

HELICINA MULTIFASCIATA. *Hel. testa depresso-subglobosâ, pallidâ, tenuiter spirâ lateris multifasciatâ; spirâ*

HELICINA.—PLATE XXX.

depresso-conicā; ultimo anfractu rotundatim angulato; callo ventrali albo, rotundo; columellā tenuissimā; labio externo tenui, angulato.

THE MANY-BANDED HELICINA. Shell depressed, angular, pale, with numerous thin spiral bands; spire depressed-conical; last whorl roundly angular; ventral callus white, rounded; columella very thin; outer lip thin, angular.

BAIRD. Cruise of the *Curaçoa*.

Hab. South Sea Islands, J. Brenchley, Esq.

Species 272. (Mus. Brit.)

HELICINA JULII. *Hel. testā depresso-subglobosā, pallidē aurantiā, viridi striatā, lineis fulvis ornatā dispositis superne et paulō infīdū medium pictā; ultimo anfractu rotundatim angulato; columellā parvā, albā; labio externo tenui.*

JULIUS'S HELICINA. Shell depressed-subglobose; pale orange, striped with green, painted with fulvous lines arranged ornamenteally above and a little below the middle; last whorl roundly angular; columella small, white; outer lip thin.

BAIRD. Cruise of the *Curaçoa*.

Hab. Cockatoo Island, Solomon's Islands, J. Brenchley, Esq.

Species 273. (Mus. Brit.)

HELICINA BRENCHLEYI. *Hel. testā angulatā, depresso, pallidē fulvā, maculis subquadratis ad suturam et super carinam, lineisque flexuosis ornatā dispositis*

pictā; spirā depressā; ultimo anfractu medio carinato, infīdū carinam ferē immaculato; columellā parvā, rectā, rubro-immaculatā; aperturā angulatā.

BRENCHLEY'S HELICINA. Shell angular, depressed, pale fulvous, painted with red spots at the suture and upon the angle and flexuous lines ornamenteally arranged; spire depressed; last whorl keeled in the middle, almost spotless under the keel; columella small, straight, with a single red spot; aperture angular.

BAIRD. Cruise of the *Curaçoa*.

Hab. South Sea Islands.

Species 274. (Mus. Brit.)

HELICINA STEIGATA. *Hel. testā parvā, roseo-albā, nitenti, translucidā, subangulatā; spirā depresso-conicā, anfractibus supra angulos lineis rubris, eleganter arcuatis pictis; ultimo anfractu depresso-angulato, infīdū angulum fusco unifasciato, callo ventrali tumido, subcaruleo.*

THE STRIPED HELICINA. Shell small, rosy-white, shining, translucent, rather angular; spire depressed-conical, whorls painted with red lines ornamenteally arranged; last whorl depressed-angular, with a single soft band below the angle; ventral callus tumid, bluish.

BAIRD. Cruise of the *Curaçoa*.

Hab. Upolu, Navigators Island.

This and the three preceding interesting little species are described and figured in Mr. Brenchley's "Cruise of H.M.S. *Curaçoa*."

HELICINA.

PLATE XXXI.

Species 275. (Mus. Crosse.)

HELICINA MITOCERATA. *Hel. testa parva, subglobosa, solidâ, albâ; apicis brevis, anfractibus concavisusculis, apicibus rotatis, ultimo anfractu magno, declivis, angulo obtusissimâ angulato; apertura parvâ, obliquâ, subovatâ; labio extero angusto, reflexo, sanguineo; columellâ parvâ, subtrigonâ, callo ventrali late, crasso, sanguineo.*

THE RED-MARGINED HELICINA. Shell small, subglobose, solid, white; spire short, whorls rather convex, the apical ones minute; last whorl large, sloped, obtusely angular in the middle; aperture small, oblique, rather contracted; outer lip narrow, reflected, blood-red; columella small, subtriangular, ventral callus broad, thick, blood-red.

CROSSE. Journ. de Conch., 1871, p. 67, Pl. II, f. 5.
Hab. Pacific.

Species 276. (Fig. a, b, Mus. Brit.)

HELICINA NOTATA. *Hel. testa globose-conica, pallidissimâ fulvo vel flavidâ, solidiusculâ; spiri acuminata, anfracta penultima maculo rotundo notata; labio extero reflexo, columellâ trigonâ, parvâ; callo ventrali inconspicuo.*

THE MARKED HELICINA. Shell globose-conical, pale fulvous or yellowish, rather solid; spire acuminate, last whorl marked with a round spot; outer lip reflected, columella trigonal, small; ventral callus inconspicuous.

SALLÉ. Proc. Zool. Soc., 1856.
Hab. Mexico.

The distinctive description of this species has been inadvertently left incomplete in the Thesaurus Monograph, the sentence being cut short without mentioning the peculiar round spot seen in every specimen, on the penultimate whorl.

Species 277. (Fig. a, b, Mus. Brit.)

HELICINA CINGULATA. *Hel. testa globose-subdepressâ, spirilater striatâ, albida, vel subroseâ, lineâ rubra*

interruptâ medie anfractum columellâ, anfractibus subdepressis, rotundatis, apice rubro, obtusa; apertura intus levigata, labio extero rotundo, columella parva, rectiuscula, albâ.

THE BELIED HELICINA. Shell globose-subdepressed, spirally striated, whitish, or rather pinky, girt with a red interrupted line in the middle of the whorls; whorls rather depressed, rounded, apex red, obtuse; aperture orange within; outer lip rounded; columella small, rather straight, white.

GRAY. Proc. Zool. Soc., 1852.

Hab. Haiti.

Species 278. (Fig. a, b, Mus. Crosse.)

HELICINA LÆTA. *Hel. testa globoso-depressâ, tenui spirilater striatâ, pallide rosâ, infra medium anfractum tornâ angustâ rubrâ, spirali cincta, supra medium flammulis maculisque irregularris rubris ornata; spiri dypressi; anfractibus angustis; ultimo anfractu obscurissimâ angulato; apertura subrhomboidâ; labio extero reflexo, planato, callo ventrali late, crassiusculo, flavido.*

THE JOYOUS HELICINA. Shell globe-depressed, thin, spirally striated, pale pink, girt with a narrow red spiral band below the middle of the whorls, ornamented with irregular red flames and spots above the middle; spire depressed; whorls narrow; last whorl very obscurely angular; aperture subrhomboidal; outer lip reflected, flattened, ventral callus broad, rather thick, yellowish.

CROSSE. Journal de Conchyliologie, 1870, p. 246, 1870.
Pl. VI., fig. 5.

Hab. Mount Mori, New Caledonia.

Much more compressed than the preceding species.

Species 279. (Mus. Crosse.)

HELICINA BENIGNA. *Hel. testa compressâ, levâ, lavisata, sub levâ minutissimâ decussatâ patrescenti, pallide fulvâ; apertura intus fuso-rubra, columelli*

brevissimā, tenui, calli ventrali tenui, rotundo, fuscō-rubro, labio externo tenui; spirā brevissimā.

THE BENIGN HELICINA. Shell compressed, thin, smooth, appearing under the lens very minutely decussated, pale fulvous; aperture brown-red within, columella very short, thin, ventral callus thin, rounded, red-brown, outer lip thin; spire very short.

CROSSE. Journal de Conchyliologie, vol. xviii. p. 246, 1870, Pl. VI. (1871), fig. 7.

Hab. New Caledonia.

Species 280. (Mus. Crosse.)

HELICINA PORPHYROSTOMA. *Hel. testā subtriangulari, levā, albā; spirā breviūsculā, anfractibus parvis, convexiūsculis; ultimo anfractu medio obtusissimā angulato; aperturā rubrā, labio externo tenui, columellā obliqui, angustā, callo ventrali rotundo, rubro.*

THE PORPHYRY-MOUTHED HELICINA. Shell rather trochiform, smooth, white; spire rather short, whorls few, rather convex; last whorl very obtusely angular in the middle; aperture red, outer lip thin, columella oblique, narrow, ventral callus rounded, red.

CROSSE. Journal de Conchyliologie, 1870, p. 245, Pl. VI., f. 6, (1871).

Hab. New Caledonia.

Species 281. (Mus. Crosse.)

HELICINA MORIENSIS. *Hel. testā globo-so-subcompressā, fere albī, aperturā calloque rubris; spirā depressā, subconicā, anfractibus parvis, paucis, planiūsculis; ultimo anfractu compresso, subrotundato; labio externo angustiē reflexo, columellā parvā, arcuatā, callo ventrali expanso.*

THE MOUNT-MORI HELICINA. Shell globose, subcompressed, almost white, aperture and callus red; spire depressed slightly conical, whorls small, few,

rather flat; last whorl compressed, rather rounded; outer lip narrowly reflected, columella small, arched, ventral callus spread.

CROSSE. Journal de Conchyliologie. 1870, p. 246, fig. 5, Pl. VI., 1781.

Hab. Mount Mori, New Caledonia.

Species 282. (Mus. Brit.)

HELICINA GUNDLACHI. *Hel. testā parvā, compressā, solidiūsculā, pallidē fulvā, nonnunquam lineis rubris spiraliter cinctū; spirā depresso, subconicā, ultimo anfractu compresso; aperturā intus pallidē aureā; labio externo cix reflexo; columellā parvā.*

GUNDLACH'S HELICINA. Shell small, compressed, rather solid, pale fulvous, sometimes spirally girt with red lines; spire depressed, rather conical, last whorl compressed; aperture pale golden within; outer lip scarcely reflected; columella small.

PFEIFFER. Malak. Bl. iii. 1856.

Hab. Porto Rico.

Species 283. (Mus. Crosse?)

HELICINA UEANA. *Hel. testā parvā, compressā, albida, vel flavido radiatā; spirā conicā, anfractibus angustis, subplanulatis; apice auritum; aperturā parvā, semicirculari, flexidē; labio externo supernē subarcuato medio rectiūsculo; columellā parvā, brevi, callo ventrali parvo, rotundo, rubro circumcincta.*

THE UEA HELICINA. Shell small, compressed, whitish, or rayed with yellow; spire conical, whorls narrow, rather flat; apex orange; aperture small, semicircular, yellowish; outer lip arched above, rather straight in the middle; columella small, short, ventral callus small, rounded, circumscribed with red.

MOUSSON. Journal de Conchyliologie, 1871, p. 23, Pl. III., fig. 9.

Hab. Uea.

HELICINA.

PLATE XXXII.

SPECIES 284. (Mus. Brit.)

HELICINA CULMINANS. *Hel. testā parvā, globosa-conica, tergitū, suture pallidē fulvā; apicē rubro, penultimo anfractū infīrē rubro-fuscato, ultimo anfractū subcompresso; apertura subconiformis; columella parvā, rectilobula; labio externo angustō rotundo.*

THE NEAT HELICINA. Shell small, globosely conical, smooth, solid, pale fulvous; apex red, penultimate whorl red-banded below, last whorl subcom pressed; aperture somewhat auriform; columella small, rather straight; outer lip narrowly rounded.

GUNDLACH. Malak, Bl. iv, 1857.

Hab. Cuba.

Species 285. (Mus. Brit.)

HELICINA RUGULOSA. *Hel. testā minutā, pallidē fulvā, compressa, tenellūscutulā, obliquē striatā et angulatā; suturā impressā; spira depresso, conicā, anfractibus paucis, parvā, concava; apertura subtriangularis, infīrē planissimā; callo ventrali tenui, depresso; labio externo r. l. incrassato.*

THE WRINKLED HELICINA. Shell minute, pale yellowish, compressed, rather thin, obliquely strongly and roughly striated; suture impressed; spire depressed, conical, whorls few, small, convex; last whorl rounded at the circumference, a little flattened beneath; ventral callus thin, depressed, outer lip scarcely thickened.

PEASE.—?

Hab. Isl. Tahite, Pacific.

— — — — —

Species 286. (Mus. Brit.)

HELICINA PARVULA. *Hel. testā minuta, globosa-subangulata, pallidē griseo-subviridi, tenuissimē striatā, spira conicā, paulo elevatā, suturā impressā; callo ventrali tenuiter grandioso; labio externo tenui, reflexo; columella parvā.*

THE LITTLE HELICINA. Shell minute, globose, somewhat angular, pale greenish-grey, very finely

striated, spire conical, a little elevated, suture impressed; ventral callus finely granular; outer lip thin, reflected; columella small.

PEASE.—?

Hab. Isl. Aitiu, Pacific.

— — — — —

Species 287. (Mus. Crossé?)

HELICINA CULMINANS. *Hel. testā parvā, depresso, angulatā, obliquē striatā, glauca vel carno-alba, spira depresso, exarata, anfractibus paucis, parvā, ultimo anfractū medio carinata, infīrē convexa; apertura subtriangularis, labio externo reflexo, supernā paulo flexuoso; columella parvā, alijs ventrali planitudo, semicircularis.*

THE CULMINATING HELICINA. Shell small, depressed, angular, obliquely striated, yellowish or flesh-white; spire depressed, convex; whorls few, small; last whorl keeled in the middle, convex below the keel; aperture subtriangular, outer lip reflected, a little flexuous above; columella small, ventral callus flattened, semicircular.

MORSSON. Journ. de Conch., 1871, p. 26, Pl. III., t. 10

Hab. Isl. Navao, Pacific.

— — — — —

Species 288. (Mus. Brit.)

HELICINA MUSIVA. *Hel. testā depresso, angulatā, tergitū, pallidē fulvā, supernā et ad angulum novatis rufulis arcuatis ornata; spira brevis, conicā, anfractibus planulatis; ultimo anfractū infīrē medium convexo; callo ventrali levigato; apertura parvā, labio externo leviter reflexo.*

THE MOZART HELICINA. Shell depressed, angular, smooth, pale fulvous, ornamented above and at the angle with red arched spots; spire short, conical, whorls flattened; last whorl convex below the middle; ventral callus smooth; aperture small, outer lip slightly reflected.

GOULD.—?

Hab. Isl. Toxata, Upola, Pacific.

This species is usually found on the leaves of trees.

The specimens of one variety have no markings on the under part of the last whorl.

Species 289. (Mus. Brit.)

HELICINA OCEANICA. *Hel. testā minutā, compressā, levigatā, medio angulatā; superne līcīs undulatīs rubris notatā; aperturā trigonā; labio extēno tenui, hōnd reflexo.*

THE OCEANIC HELICINA. Shell minute, compressed, smooth, angular in the middle; marked above with undulating red lines; aperture triangular; outer lip thin, not reflected.

Gould. —?

Hab. Isl. Apaiang, Pacific.

More flattened than *Hel. musira*, with the outer lip not reflected.

Species 290. (Mus. Crosse.)

HELICINA SCHEMMLI. *Hel. testā parvā, trochiformē, fuscō-conicā, tenui, tenuiter concentricē striatā; spīrā conicā, anfractibus quinque, subelevatis, poulō convexis; ultīmo anfractū suprē medianū obtusē angulatō; columellā albā, infīd subelevatā; callo centrali albo, parvo, rotundō; labio extēno tenui.*

SCHLÄMMI'S HELICINA. Shell small, trochiform, horny, brown, thin, finely concentrically striated; spire conical, whorls five, slightly elevated, a little convex; last whorl obtusely angular above the middle; columella white, a little cuneate below; ventral callus white, small, round, outer lip thin.

CROSSE. Journ. de Conch., 1873, p. 251, Pl. III., f. 10.
Hab. Woods of Matouba, Guadaloupe.

Species 291. (Mus. Brit.)

HELICINA MONTANA. *Hel. testā parvā, valde depresso; fuscō-fuscā; spīrā depresso, anfractibus complanatīs; ultīmo anfractū medio carinā tenui erubescitā cincto, infīd carinā depresso, circā callum ventrale solēto; callo centrali parvo, rotundo; aperturā angulatā; columellā parvā, obliquā, labio extēno medio acutē angulatō.*

THE MOUNTAIN HELICINA. Shell small, much depressed; smoky brown; spire depressed, whorls flattened;

last whorl girt in the middle with a thin crenulated keel, depressed below the keel, sulcated round the ventral callus; ventral callus small, round; aperture angular, columella small, oblique, outer lip sharply angular in the middle.

WEIGHT. —?

Hab. Cuba.

This flattish little species is remarkable for having a depression or groove round the ventral callus.

Species 292. (Mus. Brit.)

HELICINA CONSTRICITA. *Hel. testā crassā, subdepresso, angulatā, straminea vel pallide rosā, nonnaufragium rubrī interruptionē striatā; spīrā convexo-conicā, anfractibus planatīs; ultīmo anfractū paucō infīdā medium angulatō, obtusē carinato, infīdā carinā convexo, prop̄ aperturam contracto; aperturā parvā, rubrā, columellā parvā, callo centrali et labio extēno vīcidē rubris.*

THE CONSTRICTED HELICINA. Shell thick, subdepressed, angular, straw-coloured or pale rose, sometimes interruptedly striped with red; spire convex-conical, whorls flattened; last whorl angular a little below the middle, obtusely keeled, convex below the keel; contracted near the mouth; aperture small, red, columella small, ventral callus and outer lip bright red.

PFEIFFER. Proc. Zool. Soc.

Hab. Sandwich Islands.

Species 293. (Mus. Brit.)

HELICINA RIPARA. *Hel. testā parvā, globosā, griseo-alba; spīrā parvā, acuminatā; anfractibus paucis, parvis; ultīmo anfractū magno, rotundo; callo centrali tumido, aperturā obliquā, semilunarī, columellā parvā, ad junctaram cuneatā; labio extēno angusto, reflexa.*

THE RIVER-BANK HELICINA. Shell small, globose, greyish-white; spire small, acuminated; whorls few, small; last whorl large, round; ventral callus tumid; aperture oblique, semilunar, columella small, cuneate at the juncture; outer lip narrow, reflected.

PFEIFFER. —?

PLATE XXXIII.

Species 294. (Mus. New York.)

HELICINA CYRYSOCHILA. *Hel. testi globoso-pyramidalis, albâ, toni, nitenti, minutissimè punctatâ; spirâ elevata, conicâ; anfractibus convexis, obscurè angulatis, infâ subplanulatis; aperturâ magnâ, subovatâ, subauriculâ; labio externo reflexo; callo ventrali et labio externo auricis.*

THE GOLDEN-MOUTHED HELICINA. Shell globose, pyramidal, white, thin, shining, very minutely punctured; spire elevated, conical; whorls convex, obscurely angular, rather flattened below; aperture large, subovate, golden; outer lip reflected; ventral callus and outer lip golden.

BINNEY. Am. Journ. Conch., 1869, 13, Pl. XVIII., f. 24.
Hab. Texas; Mexico.

Species 295. (Mus. Brit.)

HELICINA NOV.-CALEDONIAE. *Hel. testi subglobosâ, pallidâ, fulvâ, levigatâ; spirâ elevatâ, anfractibus convexis, supernâ declivis; ultimo anfractu inflato, callo ventrali tumido; aperturâ semilunari, labio externo toni, reflexo.*

THE NEW CALEDONIAN HELICINA. Shell subglobose, pale fulvous, smooth; spire elevated, whorls convex, sloped above; last whorl inflated, ventral callus tumid; aperture semilunar, outer lip thin, reflected.

BAIRD. MS. Mus. Brit.
Hab. New Caledonia.

Species 296. (Mus. Brit.)

HELICINA BREVILABRIS. *Hel. testi parvâ, globosâ, stramineâ, semipellucida; anfractibus rubro unilineatis; spirâ elevata, anfractibus paucis, parvis, convexis, apice acuminato; aperturâ infâ medium declivi, labio externo brevi, angusto, rotundo.*

THE SHORT-LIPPED HELICINA. Shell small, globose, straw-coloured, semipellucid; whorls with one red line; spire elevated, whorls few, small,

convex, apex acuminate; aperture sloped below the middle, outer lip short, narrow, rounded.

PFEIFFER. —?

Hab. Chiappa, Mexico.

Species 297. (Fig. a, b, Mus. De Burgh.)

HELICINA HELICINIFORMIS. *Hel. testi globosâ, toni, vividi viridi vel purpurei; spirâ parvâ, anfractibus paucis, apice acuminato; ultimo anfractu magno, rotundo, infâ subcavato; columella crassâ, rotundâ, medio rotundatam callosâ, infâ acutâ; aperturâ magnâ, labio externo latu, rotundo, latè reflexo; operculo corneo, paucispirali.*

THE HELICINIFORM HELIX. Shell globose, thin, bright green or purple; spire small, whorls few, apex acuminate; last whorl large, rounded, slightly excavated below; columella thick, rounded, with a rounded callus in the middle, acutated below; aperture large, outer lip broad, rounded, broadly reflected; operculum horny, spiral, with few whorls.

PFEIFFER. *Helicorum viventium.*

Bourciera heliciniformis. Pfeiffer.

Hab. —?

This is one of two species which differ from the true *Helicina* in having a horny spiral operculum. There are several peculiarities in which this agrees with Sp. 302.

Species 298. (Fig. a, b, Mus. Brit.)

HELICINA COLORATA. *Hel. testi parvâ, solidâ, luteâ, interdum jucû, vel rubro fasciatâ, vultû depresso, angulatâ; spirâ brevissimâ, anfractibus paucis, minutis; ultimo anfractu magno, supernâ convexo, medio obtuse carinato, infâ carinam convexo, callo magno, tumido, columellâ minuta, indistinctâ, labio externo viri incrassato, medio acutè angulato, infâ ad columellam subemarginato.*

THE COLOURED HELICINA. Shell small, solid, yellow, sometimes brown or banded with red, much

(depressed), angular; spire very short, whorls few, minute; last whorl large, convex above, obtusely carinated in the middle, convex below the keel, callus large, tumid; columella very small, indistinct, outer lip scarcely thickened, sharply angular in the middle, slightly emarginated at the columella below.

Pratt. American Journ. of Sci. 1869, Pl. XII, f. 9.
Hab. Amara, Pacific.

Species 299. (Mus. Brit.)

HELICINA FLAVESCENS. *Hel. testā parvā, solidā, globose-trochiformē, flavidā, spirā elevatā, convexā, angustispiris paucis, convexis, apice acuminatā; ultimo anfractū magno, globoso, suprā aperturā elevatā; infra medium obtusā angulatā, vix carinatā; apertura suprā depresso, declivis; callo ventrali cuncto, columellā parvā.*

THE YELLOWISH HELICINA. Shell small, solid, globose-trochiform, yellow, spire elevated, convex, whorls few, convex, apex acuminate; last whorl large, globose, elevated above the aperture, obtusely angular below the middle, scarcely keeled; aperture depressed, sloped above, ventral callus tumid, columella small.

Pratt. Shells of the Pacific Islands.
Hab. Mangaia.

Although this and the preceding species are very different in form, there is a strong affinity between the two.

Species 300. (Mus. Brit.)

HELICINA SUPRAFAS-IATA. *Hel. testā angulatā, subdepresso, tenui; straminea, suprā medium rubro unipunctata; spirā conicā, anfractibus planulatis; ultimo anfractū, medio acutē angulato, carinato, suprā carinam valde convexa; apertura parvā, subrhomboidalē, columellā parvā, aculeatā; labio externo angusto, rotundo, suprā et infra angulum subcurvato.*

THE HIGH-BANDED HELICINA. Shell angular, subdepressed, thin; straw-coloured, single banded with red above the middle; spire conical, whorls flattened; last whorl sharply angular in the middle, keeled, very convex below the keel; aperture small, subrhomboidal, columella small, aculeated;

outer lip narrow, round, rather arched above and below the angle.

SOWERBY.

Hab. Australia.

Dr. Baird does not appear to have described this species among those brought by Mr. Brenchley.

Species 301. (Mus. Brit.)

HELICINA LANIERIANA. *Hel. testā trochiformē, angulatā, tenui, suprā vixciliē sulphureō, infra pallidū; spirā acuminatā, infra apicem paulo concavā, deinde convexā; ultimo anfractū medio angulato; apertura subtriangularē, albā, callo ventrali tenui, columellā aculeatā; labio externo leviter reflexo, paulo expanso.*

LANIER'S HELICINA. Shell trochiform, angular, thin, bright sulphur above, pale below; spire acuminated, a little concave below the apex, thence convex; last whorl angular in the middle; aperture subtriangular, white, ventral callus thin, columella aculeated; outer lip lightly reflected, a little expanded.

D'ORBIGNY. Mollusques de Cuba.

Hab. Cuba.

This is one of the species that we failed to identify in the Thesaurus Monograph.

Species 302. (Mus. Brit.)

HELICINA FRASERI. *Hel. testā globosā, subdepresso, aurantia, spirā parvā, anfractibus paucis; ultimo anfractū magno, globoso-subdepresso; apertura ovatā; labio externo rotundo; columellā crassā, infra retrosim aculeatā; callo ventrali parvo; operculo corneo, paucispiralē.*

FEARNE'S HELICINA. Shell globose, subdepressed, orange, spire small, whorls few; last whorl large, globose-subdepressed; aperture ovate; outer lip rounded; columella thick, aculeated backwards below; ventral callus small; operculum horny, spiral, with few whorls.

PFEIFFER. (Bourciera) *Heliceorum viventium.*

Hab. Cuenca.

The second species of this interesting genus, or subgenus, differs from the first in having a more depressed form, a more oval and less oblique mouth, and less rounded callus.

PLATE XXXIV.

Species 303. (Fig. a, b, Mus. Mousson.)

HELICINA TESTICOSTATA. *Hel. testi trachiforma, subdepressa, medio angulata et carinata, supra carinatum spiraliiter impresso-striata, auriculata, spira subdepressa, anfractibus convexis costata, ultimo anfractu infra oriam laevis, convexa, aperturam obliquè subquadrate, columellam obliquam, callo ventrali tenui.*

THE WOOL-SHAPED HELICINA. Shell trachiforma, subdepressed, angular and keeled in the middle, spirally impressed-striated, orange above the keel; spire depressed, whorls rather convex; last whorl smooth below the keel, convex; aperture obliquely subquadrate, columella oblique; ventral callus thin. Mousson, Journal de Conchyliologie, 1870, p. 199, Pl. VIII., f. 7.
Hab. New Caledonia.

Species 304. (Mus. Crosse.)

HELICINA LIFOCANA. *Hel. testi subglobosa, pallide cinnamomea, carinata; spira convexa, anfractibus porosis, apice obtusa, pallido; ultimo anfractu obscurè angulata, infra callo convexa, callo ventrali late, latu, tumida; aperturam parvam, obliquè semilunari, labio externo angusto, rotundato, superum depresso.*

THE LIFOU HELICINA. Shell subglobose, pale-cinnamon, fleshy; spire convex, whorls small, apex obtuse, pale; last whorl obscurely angular, very convex below; ventral callus broad, yellow, tumid; aperture small, obliquely semilunar, outer lip narrow, round, depressed above.

Crosse, Journ. de Conch., 1869, p. 25, Pl. II., f. 5.
Hab. Lifou, New Caledonia.

Species 305. (Fig. a, b, Mus. —? Copied.)

HELICINA MARIEL. *Hel. testa depresso, griseo-fusca, subangulata, ad angulum suturamque maculis rubris*

rhomboides notata, spira depresso, anfractibus planulatis; ultimo anfractu alto, compresso; aperturam obliquam; columellam parvam, callo ventrali tenui; labio externo angusto, rotundo.

MARIE'S HELICINA. Shell depressed, fulvous grey, slightly angular, marked at the angle and suture with red rhomboidal spots; spire depressed, whorls flattened; last whorl wide, compressed; aperture oblique; columella small, ventral callus thin: outer lip narrow, rounded.

Crosse, Journ. de Conch., 1870, p. 215, Pl. XIII., f. 9.
Hab. New Caledonia.

Species 306. (Mus. Mousson.)

HELICINA INTERNA. *Hel. globoso-subtrachiforme, tenui, levigata, pallide straminea, fasciæ rubrae angustæ paulò supra medium cinctæ; spira conica, elevata; anfractibus paucò concrescit; callo ventrali tenui, expanso, pallide roseo-fusco-rotundato.*

THE INTERNAL HELICINA. Shell globose-subtrachiform, thin, smooth, pale straw, girt with a narrow red band a little above the middle; spire conical, elevated; whorls a little convex, ventral callus thin, expanded, pale bluish rose.

Mousson, Journal de Conchyliologie, 1870, p. 201.
Hab. Viti and Manga Islands.

Species 307. (Mus. Mousson.)

HELICINA SEMPERI. *Hel. testa solidâ, subdepresso, levigata, pallide rubescens irregulariter flammis maculisque rubris notata; spira depresso, apice obtuso, anfractibus convexis costata, ultimo anfractu medio lato, infra medianam convexa; callo ventrali tumidissimo, albo; aperturam depresso, labio externo incrassato, rotundato.*

SEMPER'S HELICINA. Shell solid, subdepressed, smooth, pale reddish, irregularly marked with red flames and spots; spire depressed, apex obtuse, last

HELICINA.—PLATE XXXIV.

whorl broad in the middle, rather convex below the middle; ventral callus rather tumid, white; aperture depressed, outer lip thickened, rounded.
Mousson. Journal de Conchyliologie, 1870, p. 204,
Pl. VIII., f. 8.
Hab. Omcata Island.

Species 308. (Fig. a, b, Mus. Gräffle.)

HELICINA PAZI. *Hel. testā parvā, subglobosā, palliūtē fusca; spirā subdepressā, anfractibus paucis, apice obtuso; ultimo anfractu obtusissimē angulato; aperturā subtrigonā; labio externo reflexo, supernō declivā, medio obscurē angulatō; callo ventrali crassiūsculo, albescenti; maryīne recto, columellā brevissimā.*

PAZ'S HELICINA. Shell small, subglobose, pale brown; spire rather depressed, whorls few, apex obtuse; last whorl very obtusely angular; aperture subtriangular, outer lip reflected, sloped above, obscurely angular in the middle; ventral callus rather thick, whitish with straight margin; columella very short.

HILDAGO. Journal de Conchyliologie, 1865.
Hab. Gambier Islands.

Species 309. (Mus. Crosse? Copied.)

HELICINA ANNAESENSIS. *Hel. testā depressā, parvā, fumoso-flavida; spirā depressā, obtusa, anfractibus paucis; ultimo anfractu depresso, lato, medio sub-*

angulato; aperturā parvā, semilunari, labio externo albo, incrassato; callo ventrali tumido, expanso: columellā brevissimā, crassa.

THE ANNA HELICINA. Shell depressed, small, smoky yellow; spire depressed, obtuse, whorls few; last whorl depressed, broad, rather angular in the middle; aperture small, semilunar, outer lip white, thick, ventral callus tumid, expanded; columella very short, thick.

CROSSE. Journal de Conchyliologie, 1869, p. 67, Pl. V., f. 6.

Hab. Isl. Annae, Pacific.

Species 310. (Mus. —? Copied.)

HELICINA FISCHERIANA. *Hel. testā depressā, angulatā, carinatā, lineis elevatis spiralibus distantibus, validis striatā; pallidē fulvā; spirā depressā, conicā; ultimo anfractu medio validē carinato, infīrā cornu convexo, callo ventrali parvo, albo; aperturi obliquē rhomboideā, angustā; labio externo reflexo, acuto; columellā parvā, rectiūsculo, angulatā.*

FISCHER'S HELICINA. Shell depressed, angular, carinated, striated with raised spiral, strong lines; pale fawn; spire depressed, conical; last whorl strongly keeled in the middle, convex below the keel, ventral callus small, white; aperture obliquely rhomboidal, narrow; outer lip reflected, sharp; columella small, rather straight, angular.

MONTROUZIER. Journal de Couchyliologie, 1863, p. 76, 171, Pl. V., f. 3.

PLATE I.

Genus PANOPÆA Ménard.

Testa bivalvi, binusculosa, utrinque hians, levigata, vel concentrica rugata, epidermide induta, cardine medio utriusque valva unidentato; ligamento conspicuo, externo; impressione palli postice profunde sinuata.

Shell bivalve, binucular, gaping at both ends, smooth or concentrically wrinkled, covered with an epidermis, hinge with one tooth in the middle in each valve; ligament conspicuous, external; palpal impression with a deep sinus.

Some of the species included in this monograph are separated under the name *Glycimeris* in the work of Messrs. Adams. The shells of both genera are stated to be similar, excepting that in PANOPÆA the palpal impression is interrupted. The animals, however, differ in the two genera, the siphons being separated near the extremity in *Panopea* and united to their extremity in *Glycimeris*. It would be impossible to decide absolutely on the validity of this distinction, which is probably one of degree, and therefore of specific value only, without being able to examine specimens of the siphonal integuments of every species. PANOPÆA, SPINGLEI, = *Norvegica* and its near ally *P. Middendorffii* are quite northern in their range, reaching only the northernmost parts of Great Britain, while the other species included by Messrs. Adams in the

genus *Glycimeris* are tropical or southern, their range extending to South Australia.

Species 1. (Mus. Brit.)

PANOPÆA ALDROVANDI. *Pan. testa magna, altâ, sub-rhomboïdâ, rectiungulâ, crassi, profundâ; latera antica breviusculo, acuminato; perobliquâ truncato; margine dorsali recto; medio planiusculo, umbonibus ovatis; latere postico lato, ad terminum sub-arcuato, latâ truncato, margine dorsali concavo.*

ALDROVAND'S PANOPÆA. Shell large, elevated, sub-rhomboidal, rather straight, thick, deep; anterior side rather short, acuminate; very obliquely truncated; dorsal margin straight; middle rather flat, umbones oval; posterior side broad, a little arched at the end, broadly truncated, dorsal margin concave.

LAMARCK. Anim. sans Vert.

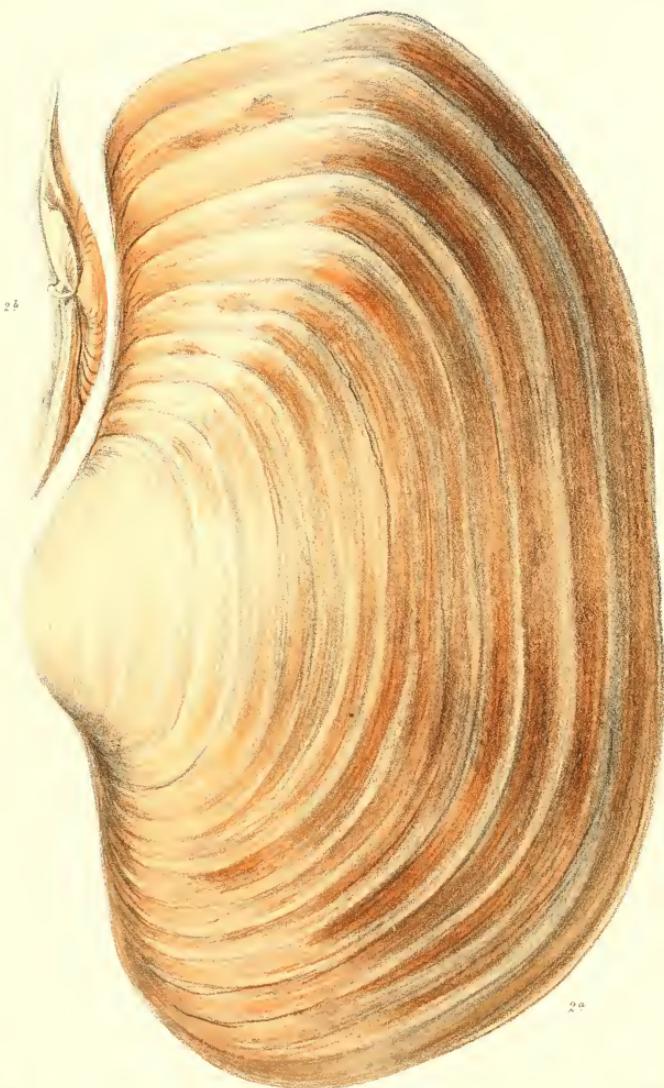

Panopea glycimeris, Deshayes.

Panopea rugosa, Valenciennes.

Hab. Mediterranean.

The three large species of this genus are thus distinguished, namely, *Panopea Aldrovandi* is broad and deep, short and obliquely truncated in front; *Panopea Faujasii* is narrower, nearly equilateral, and not at all oblique; *Panopea attenuata* is narrow, long, and curved posteriorly, broad and reflected anteriorly.

April, 1873.

P A N O P E A.

PLATE II.

Species 2. (Mus. Brit. and Lamarek.)

PANOPEA FAUJASII. *Pan. testa magna, crassiuscula, non
flatâ, altâ, subaequilaterali, levigatâ, sublongitâ,
lateraliter antice breviusculo, rotundo, alto; medio sub-
planata, umbonibus magnis, prominentibus; latere
postice angustiusculo, elongatusculo, ad terminum
arcuatum elevato, truncato; margine dorsali concavo.*
PAUJAS'S PANOPEA. Shell large, rather thick, inflated,
deep, rather equilateral, smooth, somewhat
wrinkled, anterior side rather short, rounded,
deep; middle rather flat, umbones large, pro-
minent; posterior side rather narrow and
lengthened, raised at the end in a curve, trun-
cated; with the dorsal margin depressed convex.

MENARD (de St. Croix). Fossiles d'Italie.

Hab. —? Recent.

M. Valenciennes remarks in his monograph in the Illustrations Conchylogiques de Chénn., that the recent shell figured in Plate II. of his work and copied in ours, is wrongly referred to this species. He states that it is one of two specimens in the collection of Lamarek in the Paris Museum, and that it is only a variety of *Panopaea Aldrovandi*. Now it must be observed, first, that both his shell and one in the British Museum differ in several respects from *P. Aldrovandi*, and secondly that in describing *P. Faujasii* as a fossil only M. Valenciennes points out the same differences between the two species, as those which exist between the recent shells. *P. Aldrovandi* is narrow and pointed at the anterior side, and broad truncated at the posterior, while the reverse is the case with *P. Faujasii*.

February, 1873.

P A N O P E A.

PLATE III.

Species 3. (Mus. Paris.)

Volutea attenuata. *Pan.* testū elongatā, rugosā, levigatā; latere antico latiori, oblique truncato, marginē dorsali elevato; medio compressso, umbonibus parcum prominentibus, marginē ventrali recto; latere postice attenuato, ad terminum arcuato, valde sursum accvto, termino obliquè truncato, marginē dorsali depresso, arcuato.

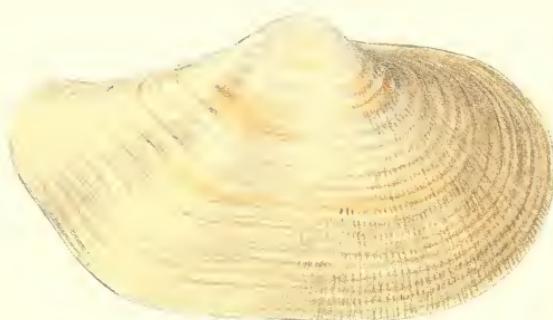

THE ATTENUTATED PANOPEA. Shell elongated, narrow, smooth; anterior side wider, obliquely truncated, dorsal margin elevated; middle compressed, umbones little prominent, ventral margin straight; posterior side attenuated, arched at the end, strongly sloped upwards, end obliquely truncated, dorsal margin depressed, arched.

SOWERBY.

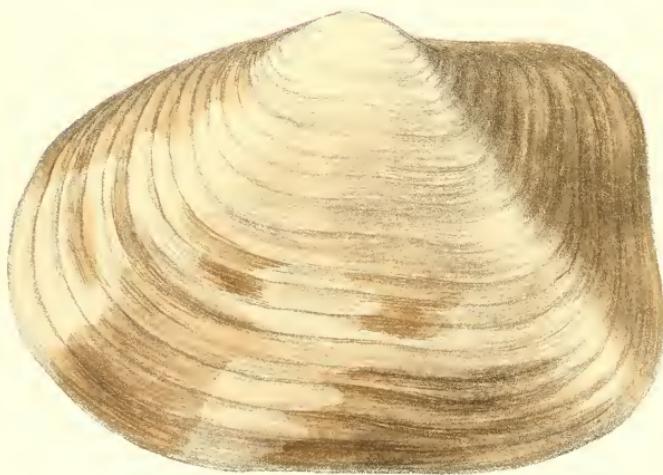

Panopaea Australis, Valenciennes, not Sowerby
Hab. Port Natal.

We have no reason to suppose that this shell is identical with the *P. australis* of Sowerby, or that the last mentioned species ever attains a larger size than the one represented in Plate VI. of this monograph. M. Valenciennes having received a drawing of a smaller specimen in the Cumingian Cabinet by Mr. Sowerby, imagined it to represent the young of his gigantic species; an opinion which we cannot share. *Panopaea attenuata* differs from the two preceding species in shape and proportions, as will be seen from the figure which we have copied.

February, 1873.

4

5

P A N O P E A.

PLATE IV.

Species 4. (Mus. Brit.)

PANOPEA CANCELLATA. *Pan. testis octo-oblongi, fidei, tenuiusculi, utrinque paulo hianti; latere postico levigato, subrostrato, depresso, subarcuato, margini dorsali depresso, concava, termino angusto, rotundo, margini ventrali sorsum acutie; medio convexa, margini ventrali rectiusculo; latere antico inflato, rugis concentricis et striis radiatis cancellato, ad terminum rotundo.*

THE CANCELLED PANOPEA. Shell ovate-sublong, fulvous, rather thin, a little gaping at both ends; posterior side smooth, substrate, depressed, slightly arched, with the dorsal margin depressed, concave, end narrow, rounded, ventral margin sloped upwards; middle convex, ventral margin rather straight; anterior side inflated, cancellated with concentric wrinkles and radiating striae, rounded at the end.

SOWERBY,

Hab. Australia.

This shell gapes much less than the other species, and is remarkable for the sculpture of its anterior

side, which has regular concentric ridges crossed by radiating striae.

Species 5. (Mus. Brit.)

PANOPEA GENEROSA. *Pan. testis lati, brevi, subdeformi, crassae, laminatim rugata; latere postice brevi, subquadrato, lato, ad terminum latissime hianti, truncato, medio planato, margini ventrali rectiusculo; latere antico subtrigono vel subacuminatum rotundo.*

THE GENEROUS PANOPEA. Shell broad, short, rather wedge-shaped, thick, lamellately wrinkled; posterior side short, subquadrate, broad, very widely gaping, and truncated at the end; middle flattish, ventral margin rather straight; anterior side subtrigonal, or subacuminately rounded.

GOULD. Shells of United States Expedition? MS. Mus. Brit.

Hab. —?

Remarkable for its almost trigonal form, and very broad posterior truncation and wide gape.

February, 1873.

P A N O P E A.

PLATE V.

Species 6. (Mus. Brit.)

PANOPEA SOLANDRI. *Pan.* testis oblongi, recte ubeula, solidi, leviter concentricè rugata, inaequilaterali; latere postico angustiusculo, elongato, subangulato, truncato; medio planiusculo; latere antico brevi, lato, rotundo.

SOLANDER'S PANOPEA. Shell oblong, rather straight, solid, slightly concentrically wrinkled, inequilateral; posterior side rather narrow, elongated, rather angular, truncated, rather flat in the middle; anterior side short, wide, rounded.

GRAY, M.S. Chem. Illus. Conch. pl. II, f. 2 a.

Hab. New Zealand.

Species 7. (Mus. Jeffreys.)

PANOPEA SPENGLERI. *Pan.* testis crassâ, oblongo-subquadrate, subrugosa, epidermide fusco-subvirelidi induta; latere postico radiatim angulato, ad terminum truncato, medio depresso, complanato; latere antico brevi, subrotundo, subrugato; umboni-bus subquadritus, medio depressis.

SPENGLER'S PANOPEA. Shell thick, oblong-subquadrate, subrugose, covered with a greenish-brown epidermis; posterior side radiately angular, truncated at the end, depressed in the middle, flattened; anterior side short, rather round, rather rough; umbones squarish, depressed in the middle.

VALENCIENNES. Arch. Mus. Ul. pl. 3, fig. 3, a, b.

Panopaea Norvegica, Sowerby.

Hab. Norway, North of Scotland.

February, 1873.

P A N O P E A.

PLATE VI.

Species 8. (Mus. Brit.)

PANOPEA MIDDENDORFII. *Pan.*, testā subtrigonā, angulatā, concentricē sublaminatā, versūs umbones concentricē leviter rugatā, epidermis' fusco-subrividī indutā, utrinque hianti; latere antico brevi, cauēto, marginē dorsali subdeclivi, marginē ventrali acclivī; medio planitudo, marginē ventrali recto; latere postico expanso, subangulato, marginē dorsali elevato, marginē latero-ventrali subtruncato, sursūm acclivī.

MIDDENDORF'S PANOPEA. Shell subtrigonal, angular, concentrically laminated, concentrically slightly wrinkled towards the umbones, covered with a greenish-brown epidermis, gaping on both sides; anterior side short, cuneate, dorsal margin rather sloped, ventral margin sloped upwards; middle rather flat, ventral margin straight; posterior side expanded, rather angular, dorsal margin elevated, latero-ventral margin rather truncated, sloped upwards.

A. ADAMS. Proc. Zool. Soc., 1854, p. 137.

Hab. Scandinavia.

Possibly this may prove to be but a somewhat triangular form of *Panopaea splengleri*.

Species 9. (Mus. Brit.)

PANOPEA ZELANDICA. *Pan.* testā oblongo-subrhomboidā, pallidè fulvā, concentricē rugatā, utrinque truncato, hianti; latere antico brevissimo, rotundatim angulato; medio latè subplanitudo, umbonibus ovatis; latere postico oblongo, marginē terminali truncata.

THE NEW ZEALAND PANOPEA. Shell oblong-subrhomboidal, pale-fuscous, concentrically wrinkled, truncated and gaping at each end; anterior side rather short, roundly angular, middle widely

rather flattened, umbones ovate; posterior side oblong; terminal margin truncated.

Quoy. Voy. de l'Astrolabe, pl. 83, f. 7—9.

Hab. Moreton Bay.

Species 10. (Mus. Paris.)

PANOPEA ABBRÉVIATA. *Pan.* testā rugosā, laminatā, crassā, rotundatim ovati; latere antico brevi, parvo, marginē dorsali depresso, marginē ventrali acclivī, subsinuato; medio concavo, umbonibus lati, marginē ventrali rotundato; latere postico subelongato, marginē dorsali rectiscuto, terminali subelevato, marginē ventrali rotundo, versūs terminali acclivī; marginē cardinali incrassato.

THE SHORTENED PANOPEA. Shell rough, laminated, thick, roundly ovate; anterior side short, small, dorsal margin depressed, ventral margin sloped upwards, somewhat sinuous; middle convex, umbones wide, ventral margin round; posterior side rather elongated, dorsal margin rather straight, end rather cuneate, ventral margin rounded, sloped upwards towards the end; hinge margin thick.

VALENCIENNES. Illustrations Conchyliologiques, Pl. IX.
f. 1, a, b.

Panopaea antarctica, Gould.

Hab. Coast of Patagonia.

Species 11. (Mus. Brit.)

PANOPEA AUSTRALIS. *Pan.* testī tenuisculi albī, utrinquē latissimē hianti, concentricē rugatā, valde inaequilaterali; latere antico latissimo, reflexo, marginē dorsali elevato, convexa; medio compresso, marginē ventrali concava, umbonibus acuminatis; latere postico angustiori, oblongo, truncato, marginē dorsali depresso.

PANOPLEA.—PLATE VI.

THE AUSTRALIAN PANOPLEA. Shell rather thin, white, very widely gaping on both sides, concentrically wrinkled, very inequilateral; anterior side very wide, reflected, dorsal margin elevated, convex; middle compressed, ventral margin concave, umbones acuminated; posterior side narrower, oblong, truncated, dorsal margin depressed.

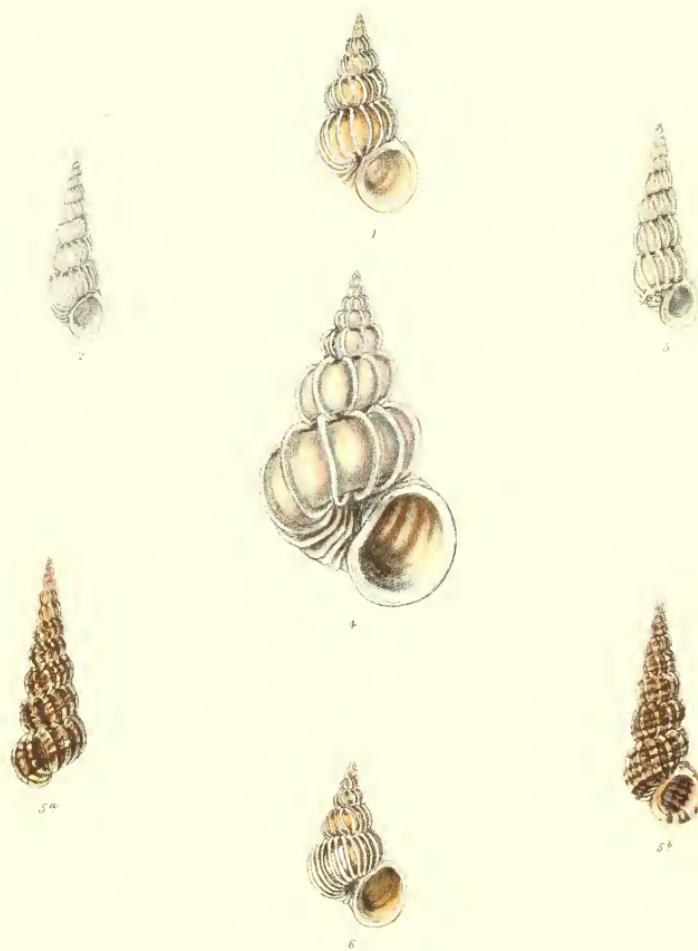

SOWERBY. Genera of Shells, No. 40.

Hab. Tasmania.

Several specimens of this species exist in the collection of the British Museum, and although rather light and thin, appear to be adult. A drawing of one of these was sent to M. Valenciennes, who considered it to represent the young state of the large shell which he has figured in the "Illustrations Conchyliologiques," and which, in our plate, three of this genus is named *Panopaea attenuata*.

MONOGRAPH
OF THE GENUS
S C A L A R I A.

"A ladder quaintly made."—*Shakspeare.*

SCALARIA.

PLATE L.

Genus SCALARIA, Lamarck.

Testa tenuita, frequenter alba, levigata, angustitibus rotundis, frequenter separatis; costis varicosis plus minusve regularibus ornata; apertura integrata, margini reflexa, rotundo. Operculum cornutum, paucispirale.

Shell turreted, frequently white, smooth, whorls rounded, frequently separated; ornamented with more or less varieose ribs; aperture entire, margin reflexed, rounded. Operculum horny, with few whorls.

The system of regular varices, often continued from whorl to whorl in a half-spiral direction up to the apex, the separation of the whorls in some instances, the delicate colouring in others, and the exquisite sculpture of many species, combine to render this one of the most attractive of genera. The geographical distribution of the genus is world-wide, and many individual species have a very wide range indeed. China and the Philippine Islands produce a large number, and a few are found in Great Britain and more northern localities.

Species 1. (Mus. Nobis.)

SCALARIA NEGLECTA. *Sca. testi latè pyramidatè, perforatè, inter varices pallidè fulvæ; angustitibus rapidè crescentibus, disjunctis; varicibus subnumerosis, tenuissimis, continuis, prop' suturam aculeatis.*

THE NEGLECTED SCALARIA. Shell broadly pyramidal, perforated, pale fulvous between the varices; whorls rapidly increasing, disunited; varices rather numerous, rather thin, continuous, aculeated near the suture.

ADAMS & REEVE. Voy. Samarang, Zool., p. 31, pl. 11, f. 15.

Scalaria Pallasi, var. Sowerby Thes. Conch.
Hab. China.

Scalaria Pollicis is a narrow shell with proportionally larger and more distant ribs. The difference between the two species is well maintained in all the specimens.

Species 2. (Mus. Brin.)

SCALARIA GRANATA. *Sca. testi elongato-pyramidalis, elevata, acuminata, albâ; angustitibus contingutibus, lentè crescentibus; costis râc. continuo, tenuissimis, prop' suturam quadratis, subaculeatis.*

THE STEP SCALARIA. Shell elongate, pyramidal, elevated, acuminate, white; whorls continguous, slowly increasing; ribs scarcely contiguous, rather thin, square near the suture, slightly aculeated.

HINTS. Fid. Sowb. Thes., Pl. XXXIV, fig. 109.

Scalaria nodosa, Carpenter.

Hab. Amboyna.

This very characteristic shell appears in the British Museum under the name *nodosa*, Carp.

Species 3. (Mus. Nobis.)

SCALARIA AUSTRALIS. *Sca. testi elongatâ, crassâ, obtusâ, subcylindrica, inter varices griseoventrâ; angustitibus lente crescentibus, contiguis, subcompressis, infra carinam obtusa, crassi cinctis; varicibus crassis, subdistantibus, rectissimis, continuis.*

THE AUSTRALIAN SCALARIA. Shell elongated, thick, rather obtuse, greyish between the varices; whorls slowly increasing, contiguous somewhat compressed, encircled below with an obtuse thick keel; varices thick, rather distant, rather straight, continuous.

LAMARCK. Anim. s. vert. Sowb. Thes. Conch., f. 62.
Hab. Swan River, Australia. Cape of Good Hope.

SCALARIA.—PLATE I.

Species 4. (Mus. Nobis.)

SCALARIA PECTIOSA. *Sca. testā magnā, centricosā, latē perforatā, inter varices pallidè fulvo-purpurascēti; anfractibus rapidē crescentib⁹, rotundis, separatis; varicibus distantib⁹, laminatis, prominentē extantib⁹, rīc crenulat⁹; aperturā magnā, intū fusca; columellā infid̄ reflexā, incrassatā.*

THE PRECIOUS SCALARIA. Shell large, ventricose, broadly perforated, pale fulvous-purple between the varices; whorls rapidly increasing, rounded, separated; varices distant, laminar, prominently outstanding, scarcely crenulated; aperture large, brown within; columnella reflected below, thickened.

LAMARCK. Anim. sans vert.

Turbo Scalaris, Linnaeus.

Hab. China. Australia. Molluccas.

The above name being the one by which this beautiful shell is popularly known, it is preferred to the old specific name, now used generically.

Species 5. (Mus. Brit.)

SCALARIA COMMUNIS. *Sca. testā elongatā, imperforatā, purpureo fuscōque inter varices variegatā, super varices radiatim maculatā, anfractibus numerosis, lentissimē crescentib⁹, contiguis; varicibus in-*

equalibus flexuosis, subextauitibus, ad suturam elevatis, junctis, continuis.

THE COMMON SCALARIA. Shell elongated, imperforate, variegated between the varices, radiately spotted on the varices with purple and brown; whorls numerous, very slowly increased, contiguous; varices unequal, flexuous, rather extant, raised, joined, continuous.

LAMARCK. Anim. sans vert.

Turbo clanthus, Gmel.

Hab. Great Britain. Scandinavia. Mediterranean.

Species 6. (Mus. Brit.)

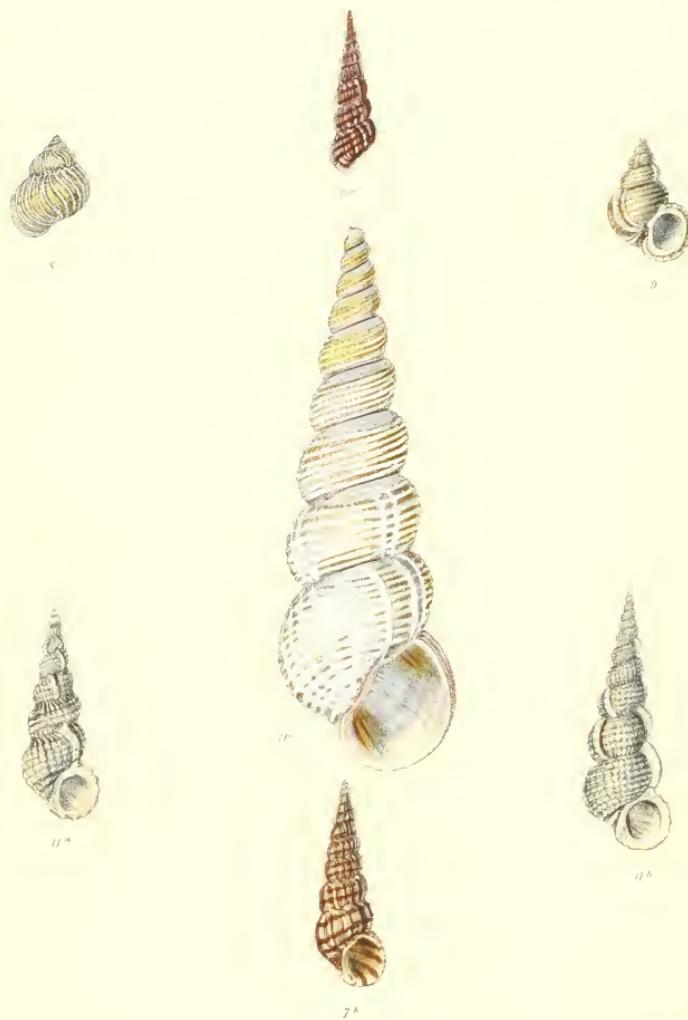

SCALARIA IMPERIALIS. *Sca. testā latē pyramidatā, perforatā, centricosā, tenuiūsculā; anfractibus paucis, rapidē crescentib⁹, inter varices purpuro-fuscis; varicibus numerosis, regularibus, subrotundis; interstititis angustis.*

THE IMPERIAL SCALARIA. Shell broadly pyramidal, perforated, ventricose, rather thin; whorls few, rapidly increasing, purple-brown between the varices; varices numerous, regular, rather rounded; interstices narrow.

SOWERBY. Proc. Zool. Soc., 1844.

Hab. Mozambique. Swan River, Australia.

The bright clear colour of the interstices between the close white ribs, give a peculiar charm to this shell.

S C A L A R I A.

PLATE II.

Species 7. (Fig. a, b. Mus. Brit.)

SCALARIA TULONIS. *Sea. testâ brevi, pallide purpurei, fasciis interruptis, maculisque purpuris vel fasciis variegatâ, imperforatâ, elongatâ; aufractibus contiguis numerosis, paulò convexis; varicibus inaequalibus, planisculis, decumbentibus; ad suturam paulò elevatis; aperturâ subovata, labio interno crasso, rotundo.*

TULON'S SCALARIA. Shell smooth, banded, pale purple, variegated with interrupted bands and spots of purple or brown, imperforate, elongated; whorls contiguous, numerous, a little convex; varices unequal, rather flat, decumbent, a little elevated at the sutures; aperture subovate, inner lip thick, rounded.

RISso —? Sowerby's Thesaurus, *Scalaria*, fig. 89, 106, 7, 8.

Scalaria planirostrata, Bivon.

Hab. Coasts of Great Britain, and Mediterranean.

The whorls are closer and less convex, and the ribs flatter than in *Scalaria communis*. Besides the British and Mediterranean varieties, there is a rather doubtful one of dark colour found in the Philippines.

Species 8. (Mus. Brit.)

SCALARIA BULLATA. *Sea. testâ albâ, brevi, latâ, ventricissimâ; aufractibus paucis, rotundatis; varicibus tenibus, inaequalibus, obliquis, ad suturam elevatis; aperturâ anguit; umbilico parvo.*

THE BUBBLE-SHAPED SCALARIA. Shell white, short, broad, very ventricose; whorls few, rounded; varices thin, very oblique, elevated at the suture; aperture large; umbilicus small.

SOWERBY, Thesaurus Conchyliorum, *Scalaria*, Sp. 45, fig. 87.

Hab. Isl. Capul. Philippines; on coral-reefs.

Species 9. (Mus. Brit.)

SCALARIA BARICOSTATA. *Sea. testâ albâ, crassâ, cancellatâ, pyramidatâ, ventricosa; aufractibus convexes, distincti, rapidè crescentibus; varicibus perpunguis, inaequidistantibus, rotundatis, crenulatis, crassis; aperturâ majusculâ; labio interno antice subexpanso, umbilico minuto.*

THE BARE-CHEEKED SCALARIA. Shell white, thick, cancellated, pyramidal, ventricose; whorls convex, distinct, rapidly increasing; varices very few, unequally distant, rounded, crenulated, thick; aperture rather large; inner lip anteriorly slightly expanded; umbilicus very small.

LAMARCK, Anim. sans Vert. Sowb. Thes., fig. 79, 80, *Hab.* Ceylon.

Species 10. (Mus. Gruner, Brit. &c.)

SCALARIA MAGNIFICA. *Sea. testâ magnâ, elongatâ, pyramidatâ, albida, aufractibus numerosis, leathâ crescentibus, rotundatis, distinctis; costis spiralisbus valvis striisque concentricis interstitialibus cancellatis; varicibus ad aufractus superiores nullis, ad aufractus ultimas ruris, arcuatis, inaequidistantibus; aperturâ subauriformi, columella sub-tortuosa.*

THE MAGNIFICENT SCALARIA. Shell large, elongated, pyramidal, white, whorls numerous, slowly increasing, rounded, distinct; cancellated with strong spiral ribs and concentric interstitial striae; varices on the upper whorls none, on the last whorls few, arched, inequidistant; aperture partly auriform, columella somewhat tortuous.

SOWERBY, Thesaurus Conchyliorum, Sp. 78, fig. 103. *Turbo principatis*, Chemnitz, not Pallas.

Hab. China?

The specimens in the British Museum have not attained the stage of growth at which the varices begin to appear at all numerously.

SCALARIA.—PLATE II.

Species 11. (Fig. *a*, *b*, Mus. Brit.)

SCALARIA VARICOSA. *Sca.* testá albá, crassá, rugis nodulosis cancellatá; angustibas distinctis, ultimo infrá spiráliter carinato; suturá profundá, frequenter lúnatis extantibus interrupta; varicibus varissimis, crassis, crenulatis; aperturá rotundá, labio interno supra et infra expenso, reflexo.

THE VARICOSE SCALARIA. Shell white, thick, cancellated with nodulous wrinkles; whorls distinct, the last spirally keeled below; suture deep, frequently interrupted with outstanding laminae; varices very rare, thick, crenulated; aperture rounded, inner lip expanded and reflected above and beneath.

LAMARCK. Animaux sans Vertèbres.

Scalaria fimbriata, Lamk. Enc. Met.

Hab. Isl. Capul, Luzon, &c., Philippines.

Sermones expositio. Sicut testi illi dixerint, in
periculis calculibus rebusq[ue] iustis, con-
tingebat raptus abruptione, fuscatus, ad
securam proibitatem, incepit enim p[ro]positus.

The broadly scalloped shell white, elongated, im-
perforate; whorls rounded, numerous, contiguous;
varices rather regular, longitudinal, a little dilated
at the suture, irregularly lobed.

PMLR --? Martini

SCHNEIDERINNA. KUNST

*Hub. Xipaxappi, West Columbia, Chester, California,
Crescent.*

The figure given by Pallas and copied by Martini is apparently that of a larger shell than the specimen figured in Sowerby's Thesaurus; but in other respects the characters agree.

Species 13. (Fig. *a, b*, Mus. Brit.)

SCALARIA FASCIATA. *Ser. testa alba, inter varices spiraculariter fuscum unifasciatum, granulatam; anfractibus rotundatis, vix contiguis; varicibus aquilonstantibus, lumenis extansatis, proprii suturam in angulum acuminatum elevatis; aperturâ subovata, labio exteriori ad suturam excavato, tum approximatum acuminato.*

THE BANDED SCALARIA Shell white, spirally single-lipped with brown between the varices, pyramidal; whorls rounded, hardly touching; varices equidistant, laminated, exsert, raised into an acuminate angle; aperture subovate, outer lip excavated at the suture, then acuminate approximately.

SOWERBY. Proc. Zool. Soc., 1844. Thes. Conch.,
Sp. 4, fig. 12, 13.

Hab. Isl. Luzon, Philippines.

This species differs from

narrower), and on the shape of the wings and margin of the aperture. In each species there is an angle on the varix, but in *Scularia fuscata* it is much more pointed and elevated than in *Scularia alata*, and leans towards the whorl.

Species 14. (Mus. Brit.)

SCALARIA ANGULATA. *Sca.* testâ subcylindraceâ, albâ, obtusa; anfractibus separatis, oratis; varicibus subdistantibus, crassis, propè suturam obtuso angulatis; aperturâ suboratâ.

THE ANGULAR SCALARIA. Shell subcylindrical, white, obtuse; whorls separated, ovate; varices rather distant, thick, obtusely angular near the suture, aperture subovate.

SAY, Boston American Journal.

Scaluria Humphreysiana, Kriner.

Hab. North America.

Species 15. (Mus. Brit.)

SCALARIA ALATA. *Sca. testū albā, inter vorices medio anfractum latē unifasciatā, pyramidatā; anfractibus separatis; varicibus lūminis, latis, distantibus, extantibus, superne cępsanis, angulatis; aperturā suboculatā, margine labii extreni ad suturam declici, tā in aliorū angulum distinxerit exposita.*

THE WINGED SCALARIA. Shell white, broadly single-banded in the middle of the whorls between the varices, pyramidal; whorls separate; varices laminated, broad, distant, standing out, expanded above, angular; aperture subovate, margin of the outer lip sloped at the suture, then expanded in a distant angle.

SOWERBY. Proc. Zool. Soc. 1844.

SOWERBY: Proc. Zool. Soc., 1865.

Instead of the elevated point sloped towards the suture which is seen in *Scaluria fuscincta*, the present

SCALARIA.—PLATE III.

species has at the upper part of each varix an angular expansion sloped outwards.

Species 16. (Mus. Brit.)

SCALARIA MARMORATA. *Sea. testi pyramidati, levi, pallidi, inter varices murulis fasciisque interruptis marmorata; varicibus levinatis, angustis, tenuibus, superne obtuse angularibus, ad suturam dolcibus.*

THE MARBLED SCALARIA. Shell pyramidal, smooth, pale, marbled between the varices with spots and interrupted bands; varices laminated, narrow, thin, obtusely angular above, sloped at the suture. SOWERBY, Proc. Zool. Soc., 1844. Thes. Conch., Sp. 5, fig. 9.

Hab. India.

Distinguished from *Scalaria alata* and *Se. jucunda* by the marbled markings, and by the narrow and obtusely angular whorls.

Species 17. (Mus. Brit.)

SCALARIA PYRAMIDALIS. *Sea. testi albi, pyramidato, subventricosa; anfractibus distinctis; varicibus sublaminatis, extantibus, propè suturam in angulum crenatum prodicatis; aperturâ subrotundâ, labio interno concavâ reflexo, cornicato.*

THE PYRAMIDAL SCALARIA. Shell white, pyramidal, subventricose; whorls distinct; varices somewhat laminated, extant, produced into an acute angle near the suture; aperture rather rounded, inner lip anteriorly reflected, cuneate.

SOWERBY, Proc. Zool. Soc., 1844. Thes. Conch., Sp. 9, fig. 4.

Hab. Philippines.

Species 18. (Mus. Brit.)

SCALARIA STATUMINATA. *Sea. testa alba, inter varices carinata, brevi, crassâ, imperforata; anfractibus declivibus, contiguis, ante' carinatis; varicibus erosis, prominenter, obliquè continuis, propè suturam in angulum elevatum expositis.*

THE BUTTERRESSED SCALARIA. Shell white, bluish between the varices, short, thick, imperforate; whorls sloped, contiguous, anteriorly carinated; varices thick, prominent, obliquely continuous, expanded in a raised angle near the suture.

SOWERBY, Proc. Zool. Soc., 1844. Thes. Conch., Sp. 77, fig. 127.

Hab. Hayti, Peru.

A very singular little shell.

Species 19. (Mus. Brit.)

SCALARIA CRENATA. *Sea. testi pyramidati, imperfecti, pallide fuscâ, minutissime granulata; anfractibus contiguis, superne ad suturam angulatis et crenulatis, infra' sive favolatis et carinat crenata mucronatus.*

THE CRENATED SCALARIA. Shell pyramidal, imperforate, pale-brown, very minutely granulated; whorls contiguous, angulated and crenulated above at the suture, bordered below by a pitted groove and crenated keel.

LINNAEUS, (Turbo) Systema Naturae.

Hab. Portugal. West Indies.

Species 20. (Mus. Brit.)

SCALARIA MARTINI. *Sea. elevata, alba, spirali' striata; anfractibus numerosis, rotundatis, rotangnis; varicibus perpansis, rotundatis, crenatis, supra medium leiter arcuatis: aperturâ subauriformi.*

MARTINI'S SCALARIA. Shell elevated, white, spirally striated; whorls numerous, rounded, contiguous; varices very few, rounded, crenated, slightly curved above the middle; aperture a little auriform.

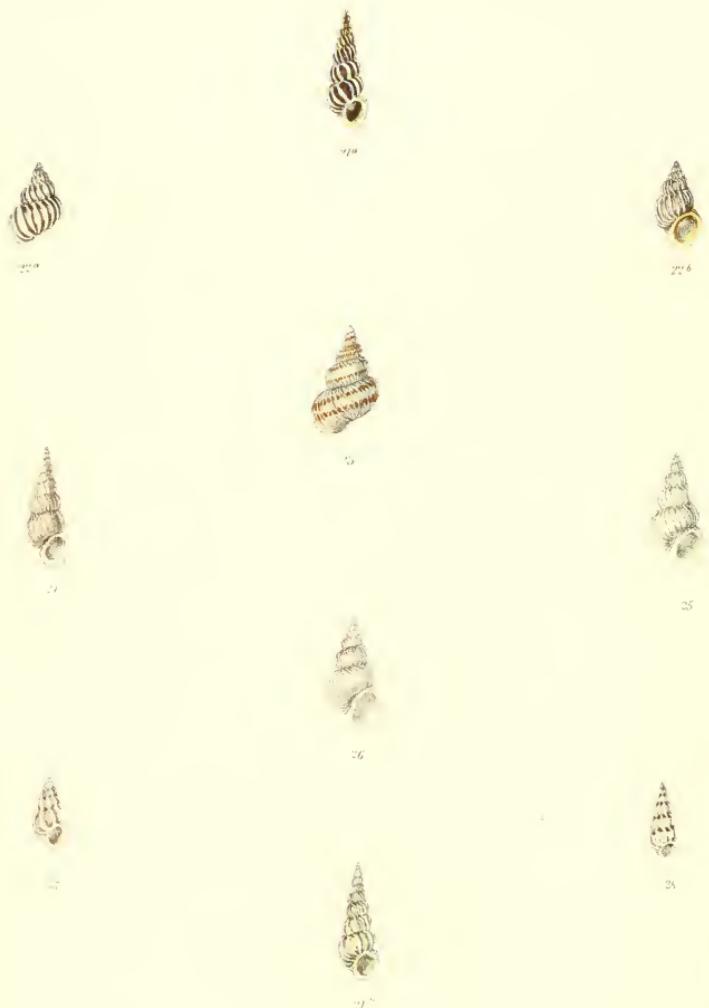

WOOD, Index Testaceologicus.

Scalaria striata, Keiner.

Scalaria varicostata, (pars) Lamarek.

Hab. West Indies.

Resembles *Scalaria varicostata* in the rarity of the varices, but is of a more elevated and graceful form.

S C A L A R I A.

PLATE IV.

Species 21. (Fig. a, b, Mus. Brit.)

SCALARIA PHILIPPINARUM. *Sca. testē angustā, pyramidalē, inter varices falcata vel costata, ad suturam alba; anfractibus numerosis, rotundatis; securis aliis, distantibus, supra' eis angustis; aperturā parvā, rotundatā.*

THE PHILIPPINE SCALARIA. Shell narrow, pyramidal, fulvous or chestnut between the varices, or entirely white; whorls numerous, rounded; varices white, distant, very slightly angular above; aperture small, rounded.

SOWERBY. Proc. Zool. Soc., 1844.
Hab. Philippines and Amboyna.

Species 22. (Fig. a, b, Mus. Brit.)

SCALARIA OBESA. *Sca. testē brevi, latā, ventricosā, obliqui, anfractibus paucis, rotundatis, contiguis; ultimo anfracto ventricosa, varicibus numerosis, erassis, rotundatis; aperturā subrotundatā, ventricosa fulvo.*

THE OBLIQUE SCALARIA. Shell short, broad, ventricose, whitish, whorls few, rounded, contiguous; last whorl ventricose, varices numerous, thick, rounded; aperture subovate, margin fulvous.

SOWERBY. Thesaurus Conchyliorum, No. 4, Scalaria, Sp. 25, fig. 70, 71.
Hab. Australia.

A very stout, short little species.

Species 23. (Mus. Brit.)

SCALARIA LYRA. *Sca. testē ventricosā, brevissimā, pallidè fulvā, spiraliter fulvo bijasciatis, varicibus angustissimis laminatis orbiculatis levata, anfractibus rotundatis contiguis; aperturā auriformi.*

THE LYRE SCALARIA. Shell ventricose, rather short, pale-fulvous, spirally double-banded with fawn colour, very closely ridged with very narrow lamellar varices, whorls rounded, contiguous; aperture auriform.

SOWERBY. Thesaurus Conchyliorum, No. 4, Scalaria, Sp. 27, fig. 81, 82.

Hab. Isl. Masbate, Philippines; H. Cuming.

Species 24. (Mus. Brit.)

SCALARIA IMMACULATA. *Sca. testē alba, elongatā, subumbilicatā, spiraliter striatā; anfractibus rotundatis, contiguis, ad suturam crenulatis; varicibus tenuisimis, inaequalibus, medio anfractuum crenulatis aperturā ovalē.*

THE TWISTED SCALARIA. Shell white, elongated, subumbilicated, spirally striated; whorls rounded, contiguous, crenulated at the suture; varices very thin, unequal, disappearing in the middle of the whorls; aperture ovate.

SOWERBY. Zool. Proc. Thes. Conch., Sp. 39, fig. 58.
Hab. Catamuan, Isl. Luzon, Philippines.

Species 25. (Mus. Brit.)

SCALARIA CRASSA. *Sca. testē pyramidalē, alba, irregulariter tenissimā varicosā, subumbilicatā; anfractibus rotundatis, lata crescentibus; aperturā subovata, lobis interno ante' paulo expansa, cuneata.*

THE THICK SCALARIA. Shell pyramidal, white, irregularly very finely varieose, slightly umbilicated; whorls rounded, slowly increasing; aperture rather oval, inner lip anteriorly a little expanded, cuneate.

SOWERBY. Proc. Zool. Soc., 1844. Thes. Conch., f. 55.
Hab. Philippines.

SCALARIA.—PLATE IV.

Species 26. (Mus. Brit.)

SCALARIA IRREGULARIS. *Sea. testā albā, tenui, umbilicatā, pyramidatā; anfractibus rotundatis, contiguis; varicibus temissimis, numerosis, irregulatibus, ad suturam minutè extantibus; labio interno obliquo.*

THE IRREGULAR SCALARIA. Shell white, thin, umbilicated, pyramidal; whorls rounded, contiguous; varices very thin, numerous, irregular, minutely standing out at the suture; inner lip oblique.

SOWERBY. Proc. Zool. Soc., 1844.

Hab. Catanna, Isl. Luzon. Philippines.

few, obliquely continued, thick, distant; aperture rounded.

SOWERBY. Proc. Zool. Soc., 1844.

Hab. Acapulca.

Species 27. (Mus. Brit.)

SCALARIA HEXAGONA. *Sea. testā parvā, albā, imperforatā, angustā; anfractibus paucis, contiguis; varicibus parvis, obliquè continuis, evanescit, distantes; aperturā rotundatā.*

THE HEXAGONAL SCALARIA. Shell small, pyramidal, white, imperforate; whorls few, contiguous; varices

Species 28. (Mus. Brit.)

SCALARIA UNIFASCIATA. *Sea. testā parvā, albā, imperforatā, angustā; anfractibus ad suturam inter varices fuscō unifasciatā; varicibus paucis, rectiūs colis, super anfractus continuis; aperturā parvā, rotundatā.*

THE SINGLE-BANDED SCALARIA. Shell small, white, imperforate, narrow; whorls single-banded with brown at the suture between the varices; varices few, rather straight, continuous upon the whorls; aperture small, rounded.

SOWERBY. Proc. Zool. Soc., 1844.

Hab. West Indies.

This pretty little species is distinguished by a narrow brown band between the varices at the upper part of the whorls.

SCALARIA.

PLATE V.

Species 29. (Mus. Brit.)

SCALARIA TENUIS. *Sca. testa tenui, levigata, albâ, imperforata; anfractibus numerosis, contiguis; varicibus numerosissimis, tenuibus, levigatis, extantibus, ad suturam continuis; aperturâ subovatâ.*
THE FRAGILE SCALARIA. Shell thin, narrow, white, imperforate; whorls numerous, contiguous; varices very numerous, thin, laminated, extant, continued at the suture; aperture rather oval.

HAXLEY. Book of Species.

Hab. St. Vincent's, West Indies.

Species 30. (Mus. Brit.)

SCALARIA AVERTA. *Sca. testa angustâ, inter costas pallidâ fulvâ, fuscо-rubescenti spiraliiter bifasciatâ; anfractibus numerosis, graduum crescentibus; varicibus tenuibus, arcuatis, subdistantibus, decumbentibus, ad suturam junctis, aperturâ subovata; labio interno ante angulum expanso.*

THE EARED SCALARIA. Shell narrow, pale fawn between the ribs, spirally two-banded with reddish-brown; whorls numerous, gradually increased; varices thin, arched, rather distant, decumbent, joined at the suture, aperture subovate; inner lip anteriorly angularly expanded.

SOWERBY. Proc. Zool. Soc., 1844. Thes. Conch., Sp. 36, fig. 62.

Hab. Coast of Coromandel.

Species 31. (Mus. Brit.)

SCALARIA TENUI-COSTATA. *Sca. testa albâ, subcentricosâ, tenui, imperforata, anfractibus paucis, subovatis; varicibus laminatis, tenuibus, extantibus, ad suturam angulum elevatis; aperturâ subovatâ, labio externo in angulum elevatum expanso.*

THE THIN-RIBBED SCALARIA. Shell, white, subventricose

thin, imperforated, whorls few, rather oval; varices laminated, thin, extant, raised angularly at the suture; aperture rather ovate, outer lip expanded into an elevated angle.

SOWERBY. Proc. Zool. Soc., 1844.
Hab. Isl. Luzon, Philippines.

A pretty little characteristic species, with angular varices.

Species 32. (Mus. Brit.)

SCALARIA LINEOLATA. *Sca. testa pyramidatâ, ventricosa, pallidâ fulvâ, inter varices spiraliiter bilineatâ vel bifasciatâ, umbilicatâ; anfractibus prominentâ rotundatâ; varicibus numerosis, tenuibus, rotundatâ; aperturâ subovatâ, labio interno infra angulum.*

THE LINEOLATED SCALARIA. Shell pyramidal, ventricose, pale fulvous, spirally two-lined or two-banded between the varices, umbilicated; whorls prominently rounded; varices numerous, thin, rounded; aperture subovate, inner lip angular beneath.

SOWERBY. Proc. Zool. Soc., 1844. Thes. Conch., Sp. 32, fig. 45, 46, 48.

Scalaria trifasciata var., Keiner.

Hab. Philippines. Japan.

Species 33. (Fig. a, b, Mus. Sowerby.)

SCALARIA CLATHRUS. *Sca. testa pyramidatâ, ventricosa, albâ, inter varices nonnumquam fulvâ vel fuscâ, imperforata; anfractibus paucis; ultimo anfractu in frâ medium spiraliiter unicostato; varicibus laminatis, tenuibus, extantibus, ad suturam obliquâ continuis.*

THE LATTICE SCALARIA. Shell pyramidal, ventricose, white, sometimes fulvous or brown between the varices, imperforate; whorls few; last whorl

SCALARIA.—PLATE V.

spirally single ribbed below the middle; varices laminated, broad, joined at the suture, continued obliquely on the spire.

LINNEUS. *Systema Naturae.*

Scalaria lamellosa, Lamarck.

Scalaria monocyclo, Kerner. (var.)

Hab. Mediterranean. West Indies.

Species 34. (Fig. *a, b*, Mus. Brit.)

SCALARIA CORONATA. *Sca. testâ ventricosâ, inter varices maculis regulâibus triseriatim dispositis ornata;* imperforatâ; *anfractibus numerosis, contiguis;* ultimo anfractu infîd medium spirâliter vîncoſtato; *varices laminatis, numerosis, latis, ad suturam junctis, super spiram oblique continuis.*

THE CROWNED SCALARIA. Shell ventricose, ornamented with regular spots disposed in three rows between the varices, imperforate; whorls numerous, contiguous; last whorl spirally single ribbed below the middle; varices laminated, numerous, broad, united at the suture, oblique, continued on the spire.

LAMARCK. *Abimare sans Vertebres.*

Hab. West Indies.

More ventricose than *Scalaria clathrus*, and beautifully ornamented by series of spots between the varices.

Species 35. (Mus. Brit.)

SCALARIA GRANULATA. *Sca. testâ pyramidatâ, minutissimâ granulata, fulvâ, rarissimâ varicosa, albâ unifasciatâ; anfractibus decubitus, ad suturam crenulatis; aperturâ subtrigonâ, labio interno crasso, infîd angulato.*

THE GRANULATED SCALARIA. Shell pyramidal, very minutely granulated, fulvous, very rarely varicose, with a single band of white; whorls sloped, crenulated at the suture; aperture subtrigonial, inner lip thick, angular beneath.

QUOY ET GAIMARD. *Voyage de l'Astrolabe.*

Hab. Swan River, Australia.

Species 36. (Mus. Brit.)

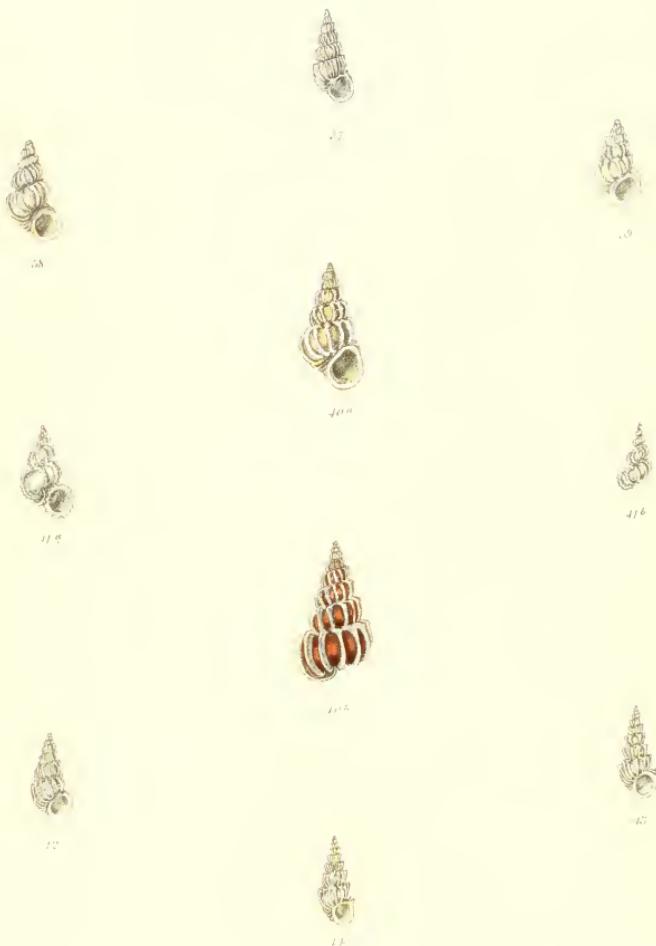

SCALARIA GEORGETTINA. *Sca. testâ pyramidatâ, albâ, tenui, imperforatâ; anfractibus contiguis, rotundatis; variebus tenuibus, rotundatis, numerosis, angustis-imis, rix continuis; aperturâ orata.*

THE GEORGETTINA SCALARIA. Shell pyramidal, white, thin, imperforate; whorls contiguous, rounded; varices thin, numerous, very narrow, scarcely continuous; aperture ovate.

KEINER. *Iconographie.*

Hab. —?

The varices are more rounded than in *Scalaria communiformis*.

SCALARIA.

PLATE VI.

Species 37. (Mus. Brit.)

SCALARIA TENUIS. *Sca. testā albā, tenui, angostā, spirā attenuatā, anfractibus brevibus, varicibus numerosis, laminatis, tenibus, obliquis, ad suturam angulatim acutēs; aperturā parvā, lobio externo proprie suturam angulatim acutēto.*

THE THIN SCALARIA. Shell white, thin, narrow; spire tapering, whorls short, varices numerous, laminated, thin, oblique, angularly acutated at the suture; aperture small, outer lip angularly acutated near the suture.

SWERREY. Proc. Zool. Soc., 1844.
Hab. West Indies.

Species 38. (Mus. Brit.)

SCALARIA LAXATA. *Sca. testā tenui, lœvi, albā, anfractibus multō disjunctis, varicibus numerosis, tenibus, vix regularibus, laminatis, simplicibus; aperturā ovali.*

THE LOOSENED SCALARIA. Shell thin, smooth, white, whorls much disunited, varices numerous, thin, scarcely regular, laminated, simple; aperture oval.

SWERREY. Proc. Zool. Soc., 1844.
Hab. Isl. Luzon, Philippines.

Species 39. (Mus. Brit.)

SCALARIA REPLICATA. *Sca. testā breri, albā, anfractibus sex, paulō disjunctis; varicibus subdistantibus, laminatis, replicatis, propè suturam in lobam elevatam expansis; aperturā magnā, subquadratā, margine subexpanso.*

THE REFOLDED SCALARIA. Shell short, white, whorls six, a little disunited; varices rather distant, laminated, folded back, expanded into an elevated

lobe near the suture; aperture large, subquadrate margin rather expanded.

SWERREY. Proc. Zool. Soc., 1844.

Hab. Lord Hood's Island.

A well characterized shell with varices curiously folded back upon themselves.

Species 40. (Fig. a, b, Mus. Brit.)

SCALARIA PALLASII. *Sca. testā pyramidatā, perforata, inter varices pallidē fulvi, vel fuscā; anfractibus septem, paulō disjunctis; varicibus laminatis, prominentibus, distantibus, regulariter sequentibus, propè suturam obtusā angulatis.*

PALLAS'S SCALARIA. Shell pyramidal, perforated, pale fulvous, or brown between the varices; whorls seven, a little disunited; varices laminar, prominent, distant, following in regular sequence, obtuse angular near the suture.

KIENER. Icon.
Scularia principalis, Nonnul.
Hab. Catannan, Philippines.

I shall describe further on in the monograph the larger shell, hitherto included as a distinct species, under the name of *S. neglecta*. It has a larger whorl and more numerous varices, with their angular points more distinct.

Species 41. (Fig. a, b, Mus. Brit.)

SCALARIA HYALINA. *Sca. testā pyramidatā, albā, lœvi, tenui, pellucidū; anfractibus multō disjunctis; varicibus distantibus, laevis; aperturā rotundatā, ab ultimo anfractu separatā, margine laevo.*

THE HYALINE SCALARIA. Shell pyramidal, white, smooth, thin, pellucid; whorls much disunited.

SCALARIA.—PLATE VI.

varices distant, fluted; aperture rounded, separated from the last whorl, margin fluted.

SOWERBY. Proc. Zool. Soc., 1844.

Hab. Catuman, Isl. Luzon, Philippines.

Species 42. (Mus. Brit.)

SCALARIA DENTICULATA. *Sc. testd albū, oblongo-pyramidalē, spirālē distanter inciso-striatā; spīrā subattenuatā, anfractibus contiguis; carīcībus oblique sequentib⁹, tenuib⁹, numerōs, prop̄ suturam in dentata aculeatā parvam productis.*

THE DENTICULATE SCALARIA. Shell white, oblong-pyramidal, spirally distantly incised, striated; spire rather tapering, whorls contiguous; varices obliquely following in sequence, thin, numerous, produced into a little aculeated tooth near the suture.

SOWERBY. Thesaurus Conchyliorum. Scalaria, Sp. 19, figs. 25, 26.

Hab. West Indies.

Species 43. (Mus. Brit.)

SCALARIA MURICATA. *Sc. testd tenui, albū, elongatā, imperforatā; anfractibus contiguis, varicībus latīs, lannatis, prop̄ suturam in alam acuminatam*

expansis; aperturā ovatā, margine anticē angusto, posticē in alam acuminatam expanso.

THE MURICATED SCALARIA. Shell thin, white, elongated, imperforated; whorls contiguous, varices broad, laminar, expanded into an acuminated wing near the suture; aperture ovate, margin anteriorly narrow, posteriorly expanded into an acuminated wing.

KIENER. Icon. pl. 4, fig. 11.

Species 44. (Mus. Brit.)

SCALARIA MITREFORMIS. *Sc. testd pyramidatā, albū, tenui; spīrā acuminatā, anfractibus contiguis, varicībus numerosis, in lobān aculeatā parvā prop̄ suturam expansis; aperturā ovatā; labio externo ad suturam emarginatō, tum aculeatim lobato.*

THE MITRE-FORMED SCALARIA. Shell pyramidal, white, thin; spire acuminated, whorls contiguous, varices numerous, expanded into an aculeated small lobe near the suture; aperture ovate; outer lip emarginated at the suture, then sharply lobed.

SOWERBY. Proc. Zool. Soc., 1844.

Hab. Guacanayo. Central America.

Very similar to the preceding, but with the varices more numerous, narrower, and forming a smaller and sharper point at the angle.

SCALARIA.

PLATE VII.

Species 45. (Mus. Brit.)

SCALARIA MURICATA. *Sea. testā albā, tenuē, ventrīcosā, semī spirālē pectinatā, anfractibus paucis, latis; varicibus tenuissimis, numerosis, subcōpīis, media pecten oblongatis, ad suturam paulo exspansis.*

THE PLATE-BANDED SCALARIA. Shell white, short, ventricose, thin, spire pyramidal, whorls five, broad; varices very thin, numerous, oblique, nearly obsolete in the middle, a little expanded at the suture.

SOWERBY. Proc. Zool. Soc., 1844.

Hab. —?

The specimen in the Cumingian Cabinet from which this shell was originally described was somewhat incomplete.

Species 46. (Fig. a, b, Mus. Brit.)

SCALARIA ACULEATA. *Sea. testā parvā, albā, angustā, anfractibus acuto, contiguis; varicibus crossūs, subdistantibus, sequentibus ad suturam emarginatis tūm in lobis parvam aculeatum elevato; aperturā ovatā, labio interno posticē emarginato et lobato.*

THE ACULEATED SCALARIA. Shell small, white, narrow, whorls eight, contiguous; varices rather thick, rather distant, following in sequence, emarginated at the suture, then elevated into a small aculeated lobe; aperture ovate, outer lip posteriorly emarginated and lobed.

SOWERBY. Proc. Zool. Soc., 1844.

Hab. Hongkong. Malacca. Philippines.

Species 47. (Fig. a, b, Mus. Brit.)

SCALARIA TRIFASCIATA. *Sea. testā brevissimā, ventrīcosā, inter varices aureo-sulfureā, fasciis tribus spiralib⁹ ornata; spirā brevi, anfractibus paucis, ventrīcosis; varicibus numerosis, inaequālib⁹, subrotundis.*

THE THREE-BANDED SCALARIA. Shell very short, ventricose, golden-brownish between the varices, ornamented with three spiral bands; spire short, whorls few, ventricose; varices numerous, unequal, rather rounded.

Dr. HAN. —?

Hab. Masbate, Philippines.

Very much shorter than *Scalaria imperialis*, which it resembles in the colouring and varices.

— — — — —

Species 48. (Fig. a, b, Mus. Brit.)

SCALARIA ORTUSA. *Sea. testā albā, parvā, brevi, subventrīcosā; spirā brevissimā, apice obtuso, anfractibus paucis, contiguis, varicibus numerosis, tenuebus, supernā obtuso angulatis.*

THE ORTUS SCALARIA. Shell white, small, short, rather ventricose; spire rather short, apex obtuse, whorls few, contiguous, varices numerous, thin, obtusely angular above.

— — — — —

Species 49. (Mus. Brit.)

SCALARIA CUVILINEATA. *Sea. testā subcylindrata, albida, spirā obtusa, anfractibus paucis, oblongis, contiguis, varicibus curvilineatis, simplicibus, aperturā ovatā.*

THE CUVILINEAR SCALARIA. Shell subcylindrical, whitish, spire obtuse, whorls few, oblong, contiguous, varices curvilinear, simple, aperture ovate.

SOWERBY. Proc. Zool. Soc., 1844. Thes. Conch., f. 59.

Hab. Sansonati, Central America.

— — — — —

Species 50. (Mus. Brit.)

SCALARIA CONCINNA. *Sea. testā parvā, albida, pyramidalata, spirā moderatè elevata, anfractibus paucis,*

SCALARIA.—PLATE VII.

contiguis, varicibus numerosis, approximatis, crassiusculis, simplicibus; aperturā ovati.

THE NEAT SCALARIA. Shell small, whitish, pyramidal, spire moderately elevated, whorls few, contiguous: varices numerous, close, rather thick, simple, aperture ovate.

SOWERBY. Proc. Zool. Soc., 1844. Thes. Conch., fig. 63.
Hab. Isl. Bohol, Philippines.

The varices are much more close and numerous than in *Scalaria multicostata*.

Species 51. (Mus. Brit.)

SCALARIA OBLIQUA. *Sc. testā parvā, albī, tenui, spirā attenuatā, infractibus obliquis, viri contiguis, varicibus obliquis, tenuibus, numerosis, propè suturam leviter angulatis.*

THE OBLIQUE SCALARIA. Shell small, white, thin, spire attenuated, whorls oblique, scarcely contiguous,

varices oblique, numerous, slightly angular near the suture.

SOWERBY. Proc. Zool. Soc., 1844. Thes. Conch., fig. 69.
Hab. — ?

More finely and obliquely ribbed than *Scalaria tenuis*.

Species 52. (Mus. Brit.)

SCALARIA FRIABILIS. *Sc. testā albī, pyramidalitati, tenuissimā; spirā elevatā, infractibus contiguis, convexis, varicibus tenuissimis, deasis, ad suturam aculeatā; aperturā majusculā, ovatā.*

THE BRITTLE SCALARIA. Shell white, pyramidal, very thin; spire elevated, whorls contiguous, convex, varices very thin, close, aculeated close to the suture; aperture rather large, ovate.

SOWERBY. Proc. Zool. Soc., 1844. Thes. Conch., fig. 74.
Hab. Swan River, Australia. LIEUT. COLLIE.

The varices are extremely thin and thread-like.

S C A L A R I A.

PLATE VIII.

Species 53. (Mus. Brit.)

SCALARIA GRACILIS. *Sea. testē parvā, attenuatā, inter varicēs falcatā, spīrā raddū elevatā, anfractibus contiguis, numerosis, varicibas albīs, sequentibus, prop̄ suturam emarginatis et acutatis.*

THE SLENDER SCALARIA. Shell small, attenuated, fulvous between the varices, spire much elevated, whorls contiguous, numerous, varices white, following in sequence, emarginated and acutated near the suture.

SOWERBY. Proc. Zool. Soc., 1814. Thes. Conch., fig. 33.
Hab. Dumaguete, Isl. of Negros, Philippines.

Species 54. (Mus. Brit.)

SCALARIA CLATHRATULA. *Sea. testē parvā, albī, tenui, imperforatā, anfractibus numerosis, vix contiguis, varicibus numerosis, rotundatis, irregularibus, prop̄ suturam subangulatis: aperturā ovati.*

THE CROSS-BARRED SCALARIA. Shell small, white, thin, imperforate, whorls numerous, scarcely contiguous, varices numerous, rounded, irregular, slightly angular near the suture; aperture ovate.

MONTAGU. Testacea Britannica.
Hab. Great Britain.

Species 55.

SCALARIA UNICOSTATA. *Sea. testē parvā, pyramidatā, falcatā, infrā spiraliter uniliratā, anfractū ultimo fusco bifasciatō; varicibus ad anfractum utramque undā, sequenti, suturā minutissimē crenulatā; aperturā parvā, rotundi, margine crasso, rotundo.*

THE ONE-RIBBED SCALARIA. Shell small, pyramidal, fulvous, with a spiral ridge below, last whorl with two brown bands; varices, one on each whorl following, suture very minutely crenulated; aperture small, rounded, margin thick, rounded.

SOWERBY.
Hab. America.

This little shell is figured in *Thesaurus Conchyliorum* as a variety of the preceding, but as it has only one varix on each whorl, and a small, round thick-lipped aperture, it may be worthy of a separate name and description.

Species 56. (Mus. Brit.)

SCALARIA LINEATA. *Sea. testē solidā, pyramidatā, inter varicēs purpuro-fusca, spīrā elevata, anfractibus septē, infrā spirāliter uniliratis obliquis, varicibus albīs, numerosis, simplicibus, rotuatis, obliquis: aperturā magisculā, fuscā.*

THE LINED SCALARIA. Shell solid, pyramidal, purple-brown between the varices, spire elevated, whorls seven, with a spiral ridge below oblique, varices white, numerous, simple, rounded, oblique; aperture rather large, brown.

SAY. —?

Hab. N. America.

Species 57. (Mus. Brit.)

SCALARIA ALBOLINEATA. *Sea. testē parvā, angusto-pyramidatā, inter varicēs fusco-purpureā: spīrā elevata, anfractibus octo, varicibus albīs, numerosis, crassiusculis, medio obscurā angulatis; aperturā parvā, rotundi.*

THE WHITE-LINED SCALARIA. Shell small, narrow, pyramidal, brown-purple between the varices; spire elevated, whorls eight, varices white, numerous, rather thick, obscurely angular in the centre; aperture small, rounded.

SOWERBY. *Thesaurus Conchyliorum*, *Scalaria*, Sp. 68, fig. 52.

Hab. —?

Somewhat resembling *Scalaria Philippinarum* but with the whorls less separated and the varices slightly angular.

SCALARIA.—PLATE VIII.

Species 58. (Mus. Brit.)

SCALARIA INCONSPICUA. *Sca. testá minutiá, albidi, brevi,
cylindrici, umbilicata, spirá pyramidata, anfractibus
parvís, rotundis: varicibus numerosis, tenuissimis,
obliquis; aperturá subquadrate, superne virgula
angulata, labio interno basi columella angulata.*

THE INCONSPICUOUS SCALARIA. Shell minute, white, short, ventricose, umbilicated, spire pyramidal, whorls few, rounded; varices numerous, very thin, oblique; aperture subquadrate, scarcely angular above, inner lip angular at the base by the columella.

SOWERBY. Thesaurus Conchyliorum, Scalaria, Sp. 30.
fig. 53.

Hab. West Indies.

Species 59. (Fig. *a, b*, Mus. Brit.)

SCALARIA TURRICULA. *Sca. testá angusto-pyramidalis,
umbilicata; spiráliter minutiissimè striata, inter
varices fulvo-rubescens, anfractibus numerosis,
obtusis, contiguis; varicibus frequentibus, albis,
perennique tenacibus, nonnullis crassioribus: aperturá
rotati, parvæ.*

THE TURRICULATED SCALARIA. Shell narrow, pyramidal, umbilicated; spirally very minutely striated,

reddish brown between the varices, whorls numerous, elevated, contiguous; varices frequent, white, mostly thin, some thicker; aperture ovate, small.

SOWERBY. Thesaurus Conchyliorum, Sp. 37, fig. 62.
Hab. West Indies.

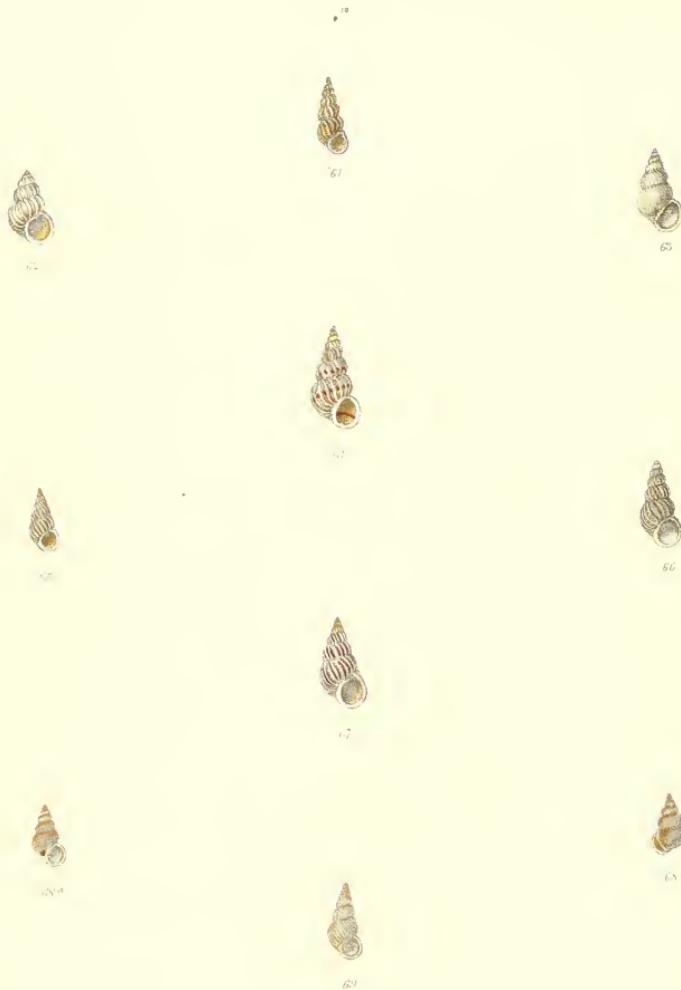

Species 60. (Fig. *a, b*, Mus. Brit.)

SCALARIA BICARINATA. *Sca. testá parvæ, subcylindracoï,
imperforata, albida, angusta, minitissimè cancellata,
spiræ elevata, obtusa, anfractibus lateraler rectius-
culis, attenuatis, ultimo anfractu brevissimo, valde
bicarinato, suture fixeodata, aperturæ parvæ, sub-
quadrate.*

THE BICARINATED SCALARIA. Shell small, subcylindrical, imperforate, whitish, narrow, very minutely cancellated, spire elevated, obtuse, whorls rather straight-sided, attenuated, last whorl rather short, strongly bicarinated, suture pitted, aperture small, rather square.

SOWERBY. Proc. Zool. Soc., 1844. Thes. Conch., Sp.
85, fig. 113, 114.

Hab. Dumaguete, Isl. of Negros, Philippines.

S C A L A R I A.

PLATE IX.

Species 61. (Mus. Brit.)

SCALARIA VENOSA. *Sca. testā pyramidatō, lervi, acuminatā, imperforatā; anfractibus prominutibas, vicē contiguis; varicibus approximatis, crassissimis, medio et infra rotundatū reflectis, supernē angulatis, prop̄ suturam angustioribus; aperturā rotundatā; suturā foveolatā.*

THE VEINED SCALARIA. Shell pyramidal, smooth, acuminate, imperforate; whorls prominent, scarcely touching; varices close, rather thick, roundly reflected in the middle and beneath, angular above, narrower near the suture; aperture rounded; suture pitted.

SOWERBY. *Thesaurus Conchyliorum*, Sp. 26, fig. 72, 73.
Hab. West Indies.

The varices, being roundly reflected have a peculiar vein-like appearance.

Species 62. (Mus. Brit.)

SCALARIA BULBULUS. *Sca. testā brevissimā, ventricosā, imperforatā, fulvā; spira brevi, anfractibus quinque, rotundatā, contiguis, varicibus subdistantibus, leviter arcuatis, rotundis; aperturā magnā, ovato-rotundatā.*

THE BULB SCALARIA. Shell very short, ventricose, imperforated, fulvous; spire short, whorls five, rounded, contiguous, varices rather distant, slightly arched, rounded; aperture large, ovate-rounded.

SOWERBY. *Proc. Zool. Soc.*, 1844. *Thesaurus Conchyliorum*, fig. 85.

Species 63. (Mus. Brit.)

SCALARIA SIMILIS. *Sca. testā albī, tenui, subcentricosā, subtilissimè spiraliter striatā, spirā brevissimulā, anfractibus sc̄r., contiguis, varicibus tenuissimis, aperturā obliquè ovatā.*

THE SIMILAR SCALARIA. Shell white, thin, a little ventricose, very minutely spirally striated, spire rather short, whorls six, contiguous, varices very thin, aperture obliquely ovate.

SOWERBY. *Proc. Zool. Soc.*, 1844. *Thesaurus Conchyliorum*, Sp. 44, fig. 90.

Hab. Philippines.

Species 64. (Mus. Saul.)

SCALARIA BUBROLINÉATA. *Sca. testā subcentrica, perforatā, fulvā, inter varices spiraliter rubro annulatā; spirā brevissimulā, anfractibus quinque, contiguis; varicibus numerosis, albī, moderatè arcuatis, simplicibus, aperturā latuā aurea, columellā obtuse angulatā.*

THE RED-LINED SCALARIA. Shell rather ventricose, perforated, light brown, with a single spiral red line; spire rather short, whorls five, contiguous; varices numerous, white, moderately arched, simple, aperture golden within, columella obtusely angular.

SOWERBY. *Thesaurus Conchyliorum*, Sp. 33, fig. 83, 84.
Hab. ——?

Species 65. (Mus. Brit.)

SCALARIA MULTICOSTATA. *Sca. testā parvā, fulvā, pyramidatā, anfractibus paucis, apice obtuso, varicibus albī, crassissimis, numerosis, inaequalibus; aperturā parvā, rotundatā.*

THE MANY-COSTED SCALARIA. Shell small, fulvous, pyramidal, whorls few, apex obtuse, varices white, rather thick, numerous, unequal; aperture small, rounded.

SOWERBY. *Proc. Zool. Soc.*, 1844.
Hab. Isl. Corrigidor, Philippines.

August, 1873.

SCALARIA.—PLATE IX.

Species 66. (Mus. Brit.)

SCALARIA MINDOROENSIS. *Sca. testā albā, parvā, imperforatā, pyramidatā, spīrā elevatā, anfractibus quinque, contignis, varicibus inaequalibus, numerosis, rotundis, simplicibus, aperturā ovati.*

THE MINDORO SCALARIA. Shell white, small, imperforate, pyramidal, spire elevated, whorls five, contiguous, varices unequal, numerous, rounded, simple, aperture ovate.

SOWERBY. Proc. Zool. Soc., 1844. Thes. Conch., fig. 91.

Hab. Puerto Gallerio, Isl. Mindoro.

Species 67. (Fig. a, b, Mus. Brit.)

SCALARIA CATANUENSIS. *Sca. testā parvā, brevi, fulvo, minutissimè spiraliter striatā, spirā breviūsculā, anfractibus septem, varicibus minutissimis, tenuissimis, una validū prop̄ aperturam dorso conspicuā.*

THE CATANUAN SCALARIA. Shell small, short, brown, very minutely spirally striated, spire rather short, whorls seven, varices very minute, very thin, one strong conspicuous on the back near the aperture.

SOWERBY. Proc. Zool. Soc., 1844. Thesaurus Conchyliorum, Sp. 43, fig. 93, 94.

Hab. Catanuan, Isl. Luzon, Philippines.

Species 68. (Mus. Brit.)

SCALARIA PULCHERRIMA. *Sca. testā parvā, brevi, ventri cuso, inter varices fusco-purporeā; spirā brevi, anfractibus sex, varicibus numerosis, propinquis, obliquis, albis, ad suturam acuminatim lobatis: aperturā ovatā, ad suturam lobatā.*

THE VERY BEAUTIFUL SCALARIA. Shell small, short, ventricose, brownish-purple between the varices; spire short, whorls six, varices numerous, near, oblique, white, acuminately lobed at the suture; aperture ovate, lobed at the suture.

SOWERBY. Proc. Zool. Soc., 1844. Thes. Conch., Sp. 58, fig. 92.

Hab. Dumaguete, Isl. Negros, Philippines.

Species 69. (Mus. Brit.)

SCALARIA CEBERREIMA. *Sca. testā parvā, pallidè grisea, acuminatā, laevi, imperforatā, anfractibus paucis, rotundis; varicibus numerosissimis, levibus, paululum prominentibus: aperturā subrotundatā, labio interno latè reflexo.*

THE CLOSE-RIBBED SCALARIA. Shell small, pale grey, acuminated, smooth, imperforate, whorls few, rounded; varices very numerous, smooth, rather prominent; aperture rather rounded; inner lip widely reflected.

HINDS. Proc. Zool. Soc., 1843. Thesaurus Conchyliorum. Species 56, fig. 95.

Hab. New Guinea.

SCALARIA.

PLATE X.

Fig. 45, b. Mus. Brit. A much more fully developed shell than that figured in the seventh plate.

Species 70. (Mus. Brit.)

SCALARIA MINOR. *Sea. testā turritā, gracili, pallide fulvo spiráliter bifasciatā; spárū elongatā; anfractibus obliquis, prominentibus, suprā subangulatis, inférō spiraliter unicoloratis, inférō costato custaneo, longitudinālē obliquā et arcuatum levatis.*

THE MINOR SCALARIA. Shell turreted, narrow, with two spiral bands of pale brown; spire elongated; whorls oblique, prominent, slightly angular above, with a single spiral rib at the lower part, chestnut below the rib; longitudinally obliquely and sinuously ridged.

SOWERBY.

Aerilla gracilis, A. Adams.

Hab. Mouth of the Indus.

The name *gracilis* having been already applied to another *Scalaria*, cannot be applied to the present species if included in the genus. Would it not be better in separating small groups from old genera, to avoid using specific names already applied to shells belonging to those genera? *Aerilla* may be a very good genus, but its adoption should be left optional, by not using a specific name already occupied in the old genus.

Species 71. (Mus. Brit.)

SCALARIA ATTENUATA. *Sea. testā parvā, angustā, albida; spárū elongatā, attenuatā; anfractibus altis, obscurissimè biangulatis et nodosis, suturis crenulato, forcolatis; ultimo anfractu magis prominenti, distincte nodoso-biungulato; aperturā rotundā, labio externo crasso, expanso.*

THE ATTENED SCALARIA. Shell small, narrow, whitish; spire elongated, attenuated; whorls

elevated, very obscurely biangular and nodose, suture crenulated, pitted; last whorl more prominent, distinctly nodosely biangulated; aperture rounded; outer lip thick, expanded.

PEASE. — ?

Hab. Sandwich Islands.

This species very nearly resembles *Scalaria bicarinata*, Sowerby. It is, however, narrower and more tapering, and the keels on the last whorl are nodose and much less distinct.

Species 72. (Mus. Brit.)

SCALARIA BAIRDII. *Sea. testā parvā, subcæruleo, levigata, pyramidalē; anfractibus novem, altis, media levigatis, suprā infirme plicatis: plicis ad subarum in nodis elevatis, interstitiis foecolatis. aperturā parvā, ovatā, labio externo rotundo.*

BAIRD'S SCALARIA. Shell small, bluish, smooth, pyramidal; whorls nine, elevated, smooth in the middle, plicated above and below; plaits raised into knobs at the suture, interstices pitted; aperture small, ovate, outer lip rounded.

SMITH. Proc. Zool. Soc., 1871.

Hab. Whydah, South Africa.

This pretty little species is among some very interesting shells brought by Captain Knocker from South Africa, and described by Mr. E. Smith of the British Museum, whose advent we welcome as a working conchologist.

Species 73. (Mus. Brit.)

SCALARIA MIRANDA. *Testā parvā, subventricosa, fulvo-saccarrata, inter varices spiráliter tenuissimè striatā; spárū acuminatā, anfractibus octo, rotundis, ultimo anfractu subinfuso; varicibus creberrinis, tenuissimis, laminatis; aperturā ovatā, columellā crassā, arcuata, labio externo tenui.*

SCALARIA.—PLATE X.

THE WONDERFUL SCALARIA. Shell small, subventricose, fulvous-greyish, very finely spirally striated between the varices; spire acuminate, whorls eight, rounded, last whorl somewhat inflated; varices very close, very thin, laminar; aperture ovate, columella thick, arched, outer lip thin.

SMITH. Proc. Zool. Soc., 1873.

Hab. Whydah, South Africa.

Another addition to the *Scalariae* from the same sources as the preceding species.

Species 74. (Fig. a, b, Mus. Brit.)

SCALARIA ACUMINATA. *Sc. testa elongata, imperforata, acuminata, pallidè fulva, spiraliter fuso bijasciata; aufractibus quindecim, paulò convexis, anticè carinatis; variculis numerosissimis, crevissimis, eleganter curvis; aperturā longissimè latè, labio externo tenui, columellā subcomplanatā, arcuata.*

THE ACUMINATED SCALARIA. Shell elongated, imperforated, acuminate, pale fulvous, with two brown spiral bands; whorls fifteen, little convex, anteriorly keeled; varices very numerous, very close, elegantly curved; aperture rather long, outer lip thin, columella flattened, arched.

SOWERBY. Proc. Zool. Soc., 1844.

Hab. Malacca.

The specimens from which figs. a and b are drawn differ so much in their proportions, that the writer has felt almost inclined to assign a new specific name to fig. a. Still we find other species varying in nearly the same degree.

Species 75. (Mus. Brit.)

SCALARIA BOREALIS. *Sc. testa crassa, albida pyramidalis, latissimè; aufractibus octo, anticè obtuse carinatis, ad lateri rectissimis, infra carinam subcomplanatis; variculis paucis, rotundis, indistinctis, inaequalibus, irregularibus, nonnullis medio obconicatis, ad suturam subundosis; aperturā subquadrata, labio externo crasso, rotundo, columellā rectissimā, anticè subcumbenti.*

THE BOREAL SCALARIA. Shell thick, whitish, pyramidal, rather broad; whorls eight, anteriorly obtusely keeled, rather straight at the sides; a little flattened below the keel; varices few, rounded, indistinct, unequal, irregular, some partly disappearing in the middle, somewhat nodose at the suture; aperture squarish, outer lip thick, rounded; columella rather straight, rather cuneate in front.

GOULD. —?

Hab. Vancouver's Island.

A thick-set irregularly formed species.

Species 76. (Mus. Brit.)

SCALARIA MORCHI. *Sc. testa parvæ, imperforata, obtusata, albida, apice fulvo; aufractibus octo, elevatis, levibus, rarissimè varicosis; aperturā ovalis, columellā parvæ, obliquæ.*

MORCH'S SCALARIA. Shell small, imperforated, attenuated, whitish, apex fulvous; whorls eight, raised, smooth, very rarely varieose; aperture oval, columella small, oblique.

ANGAN. Proc. Zool. Soc., 1871.

Hab. Port Jackson.

Species 77. (Mus. Brit.)

SCALARIA POLITA. *Sc. testa tenui, politissimæ, elongata, pallidè grisea; aufractibus numerosis, convexis-calicis; variculis subnumerosis, tenuibus, medio aufractum obsoletis; aperturā subelongata, labio externo tenui.*

THE POLISHED SCALARIA. Shell thin, very polished, elongated, pale grey; whorls numerous, rather convex; varices rather numerous, thin, obsolete in the middle of the whorls; aperture a little lengthened, outer lip thin.

SOWERBY. Proc. Zool. Soc., 1844.

Hab. Xipinappi, West Columbia.

A pretty little species in which the varices, forming a little curved node at the suture, thin out and disappear towards the centre of the whorl.

SCALARIA.

PLATE XI.

Species 78. (Mus. Brit.)

SCALARIA MODESTA. *Sea. testū parvā, imperforatā, ventricosā, pallidē fulcā, breviāsculā; anfractibus septem, convexis, varicibus paucis, laminiformibus, simplicibus; apertura subrotundā, labio externo crassiāsculo.*

THE MODEST SCALARIA. Shell small, imperforated, ventricose, pale fulvous, rather short; whorls seven, rather convex, varices few, laminiform, simple; aperture rather round, outer lip rather thick.

C. B. ADAMS. Shells of Jamaica.
Hab. Jamaica.

Species 79. (Mus. Brit.)

SCALARIA FUMILA. *Sea. testū minutā, breviāsculā, imp̄foratā, ventricosā, pallidē fulcā; anfractibus sex, rotundatis, distinctis; varicibus crassiāsculis, rotundatis, approximatis; apertura rotundā.*

THE DWARF SCALARIA. Shell minute, rather short, imperforate, ventricose, pale fulvous; whorls six, rounded, distinct; varices rather thick, rounded, approximate; aperture rounded.

A. ADAMS. Proc. Zool. Soc.
Hab. Japan.

Species 80. (Mus. Brit.)

SCALARIA JUKESIANA. *Sea. testū parvā, albā, imperforatā, spira elevata; anfractibus novem, ad suturam distinctis, varicibus numerosis, sublaminatis, siccā angulatis, apertura ovata, labio externo tenuiāsculo, ciliis illā arcuata.*

JUKES'S SCALARIA. Shell small, white, imperforate, spire elevated; whorls nine, distinct at the suture, varices numerous, rather laminar, nearly equal; aperture ovate, outer lip rather thin, columella arched.

FOBBES.
Hab. Broken Bay, New South Wales.

The whorls are more distinct and rounded than in *Scalaria clathrus*.

Species 81. (Mus. Brit.)

SCALARIA INDIANORUM. *Sea. testū pyramidatā, albā, imperforatā; spira elevata, anfractibus decem, rotundatis, distinctis; varicibus numerosis, rotundatis, aequalitatis, angularibus, prop̄ suturam obtusā angulatis; apertura subrotundā, columellā infra subvenaeatā.*

THE INDIAN'S SCALARIA. Shell pyramidal, white, imperforate; spire elevated, whorls ten, rounded, distinct; varices numerous, rounded, equally distant, equal, obtusely angular near the suture; aperture rather round, columella rather cuneate below.

CARPENTER. — ?
Hab. Vancouver's Island.

Species 82. (Mus. Brit.)

SCALARIA MAGELLANICA. *Sea. testū albā, breviāsculā, solidā, subventricosā, imperforatā, turreta; spira elevata, anfractibus altis, secatis, distinctis, antice costa inconspicua spirali cinctis; varicibus crassiāsculis numerosis, prop̄ suturam in angulum subrotundum curvā; apertura subquadratā, labio externo posticè angulata; columellā anticè cuneatā.*

THE MAGELLAN SCALARIA. Shell white, rather short, solid, subventricose, imperforate, turreted; spire elevated, whorls high, ladder-like, distinct, girt with an inconspicuous spiral rib anteriorly; varices rather thick, numerous, bent in a roundish angle near the suture; aperture rather square; outer lip posteriorly angular; columella anteriorly cuneated.

PHILIPPI. — ?
Hab. Straits of Magellan.

Belonging to the same group as *Scalaria australis*, but with the whorls fewer, shorter, and more rounded.

SCALARIA.—PLATE XI.

Species 83. (Mus. Brit.)

SCALARIA ESCHRICHTI. *Sca. testā pyramidatā, pallidē griseo-fusco; spirā elevatā, acuminatā, anfractibus octo, vix convexis, ultimo magno, ventricoso, anticeō angulato, varicibus nullis, aperturā magno, utrinque acuminatā; labio extero tenui.*

ESCHRICHT'S SCALARIA. Shell pyramidal, pale grey-fusous; spire elevated, acuminate, whorls eight, scarcely convex, last large, ventricose, anteriorly angular, varices none, aperture large, acuminate at each end; outer lip thin.

HOLMOLL. —?

Hab. Greenland.

Of a similar form to *Scalaria granulosa*, but much lighter in texture and less compact.

Species 84. (Fig. a, b, Mus. Brit.)

SCALARIA DIADEMA. *Sca. testā solidā, brevi, ventricosā, pallidē fusco; vel subcervicā, levigatā; spirā brevi, obtusa, scalatā; anfractibus quadratis, superne angulatis, infrā costā conspicuā carinatis, costis rotundis, crassis, longitudinalibus prop̄ suturam nodosis sculptis, ultimo nonnangquam planulata, costis longitudinalibus nullis.*

THE DIADEM SCALARIA. Shell solid, short, ventricose, pale fulvous or greyish, smooth; spire short, obtuse, ladder-like; whorls quadrate, angular above, keeled with a conspicuous rib below, sculptured with rounded, thick, longitudinal ribs nodose near the suture, the last sometimes flattened, without longitudinal ribs.

SOWERBY. Thesaurus Conchyliorum. Species 89, fig. 121, 122.

Hab. St. James's Island, Galapagos.

Species 85. (Mus. Brit.)

SCALARIA OPTABILIS. *Sca. testā parvā, brevissimā, ventricosā, albida, inter varices regulariter pallidi bimaculatā; spirā brevi, anfractibus paucis, ultimo anfractu ventricoso, varicibus rotundis, aequalibus, subdistantibus; aperturā subovatā.*

THE DESIRABLE SCALARIA. Shell small, very short, ventricose, whitish, with two pale regularly placed spots between the varices; spire short, whorls few, last whorl ventricose, varices rounded, equal, rather distant; aperture subovate.

A. ADAMS. Proc. Zool. Soc.

Hab. —?

A remarkable pretty little species.

(Species 86. Mus. Brit.)

SCALARIA CASTA. *Sca. testā parvā, acuminatā, albā: anfractibus octo, moderate convexis, suturā distinctā; varicibus numerosis, inaequalibus, nonnullis crassiūsculis, ad suturam subnodosis; aperturi orati.*

THE CHASTE SCALARIA. Shell small, acuminate, white; whorls eight, moderately convex, suture distinct; varices numerous, unequal, some rather thick, slightly nodose at the suture; aperture rather oval.

A. ADAMS. Proc. Zool. Soc.

Hab. Japan.

In appearance rather resembling *Scalaria Philippi-norum*, but the varices are much more numerous and some of them laminar.

PLATE XII.

Species 87. (Mus. — ? copied.)

SCALARIA EXIMA. *Sea. testū perrū, pallidē fulvā, spiraliiter inter costas striatā, pyramidatā, anfractibus decim, rotundis, conipectinis; varicibus regularibus, heribes, superē angulatis, ad angulum in spiram acutam productis.*

The choice SCALARIA. Shell small, pale fulvous, spirally striated between the ribs, pyramidal, whorls ten, rounded contiguous; varices regular, smooth, angular above, produced into an acute spine at the angle.

ADAMS AND REEVE. Voy. Samarang. Moll., vol. xi. f. 16.
Hab. — ?

Species 88. (Fig. *a, b*, Mus. Brit.)

SCALARIA ALBINATA. *Sea. testū perrū, subelevatā, fascia cincta-serrata; spiri acuminatā, anfractibus distinctis, spiraliiter striatis; costis paucis, irregulatibus, crassius tuberculatis, ultimo anfractu insitū carinato; aperturā anter. lobis extremitate crescenti.*

The GAY SCALARIA. Shell small, aciculated, reddish brown; spire unenninated, whorls eight, spirally striated; ribs few, irregular, thick, round; last whorl keeled below; aperture ovate, outer lip thick.

HINDS. Proc. Zool. Soc., 1843.

Hab. Malacca.

Species 89. (Fig. *a, b*, Mus. Brit.)

SCALARIA DIANE. *Sea. testū perrū, alligatā, ventricosa, lata; arcuata ultimo infra carinata; varicibus paucis, heribes, angulatim lati expansis.*

DIAN'S SCALARIA. Shell small, whitish, ventricose, smooth; last whorl keeled below; varices few, lamellar, angularly, broadly expanded.

HINDS. Proc. Zool. Soc., 1843.

Hab. Amboyna.

A most wonderful little shell, with broad, wing-like expansions of the varices.

Species 90. (Mus. Brit.)

SCALARIA COCHLEA. *Sea. testū elongatā, attul, spiraliiter subelevatā, anfractibus octo, prominatis, superē validē angulatis, longitudinaliter costatis, nodulatis ex his rugatis; ultimo anfractu insitū carinato; varicibus paucis, distansibus, marginis, superē angulatibz.*

The SEMI-EUROPEAN SCALARIA. Shell elongated, white, spirally subelevated, whorls eight, prominent, with a strong angle above, wrinkled with numerous undulating ripples; last whorl keeled beneath; varices few, distant, large, angular above.

SOWERBY. Proc. Zool. Soc.

Hab. West Coast of Africa.

Distinguished from *Scalaria venusta* by the broad angularity of the whorls.

Species 91. (Mus. — ? copied.)

SCALARIA PERPLEXA. *Sea. testū pyramidatā, albā, anfractibus superē pallide vesteatis anfractuatis; varicibus rotundis, heribes, subdistantibus.*

The PERPLEXED SCALARIA. Shell pyramidal, white; whorls single-banded above with pale chestnut; varices rounded, smooth, rather distant.

PLAIS. Desh. Conch. Réunion, p. 60, Pl. 8, f. 1.

Hab. Isl. Bourbon.

Species 92. (Mus. Jeffreys.)

SCALARIA TELVELYANA. *Sea. testū pyramidatā, fulvā, anfractibus devenit, conjunctis, moderatè convexis;*

SCALARIA.—PLATE XII.

*varicibus numerosis, planulatis, leviter arcuatis,
albescensibus; ad suturam lobatis; aperturā sub-
ovatā, labio externo albo.*

TREVELYAN'S SCALARIA. Shell pyramidal, fulvous,
whorls ten, united, moderately convex; varices
numerous, flat, slightly arched, whitish; lobed at
the suture; aperture subovate, outer lip white.

LEACH — ?

Hab. Great Britain.

Species 93. (Mus. — ? copied.)

SCALARIA LACTEA. *Sea, testā minutā, albā, pyramidatō,
anfractibus novem; varicibus numerosis, laminatis,
extantibus, hæni continuis.*

THE MILK SCALARIA. Shell minute, white, pyramidal,
whorls nine; varices numerous, laminated, extant,
not continuous.

KRAUSS. Sudafrikanischen Mollusken.

Hab. South Africa.

PLATE XIII.

Species 94. (Mus. Brit.)

SCALARIA CONFOCOSTATA. *Sc. testâ parvâ, albâ, brevi : anfractibus paucis; suturâ distinctâ, forcipata; ultimo anfractu infra obsoletâ carinato; varicibus paucis, crassis, rotundis, levibus, subdistantibus.*

THE THICK-KNEED SCALARIA. Shell small, white, short; whorls few; suture distinct, pitted; last whorl obscurely keeled below; varices few, thick, rounded, smooth, rather distant.

SOWERBY. *Thesaurus Conchyliorum*, Sp. 83, fig. 119.
Hab. ——?

Not unlike *Scalaria Australis*, but with the ribs and lower keel much less defined.

Species 95. (Mus. Brit.)

SCALARIA CONNEXA. *Sc. testâ minutâ, subcylindrica, inter costas pallidâ purpurâ; spira obtusa; varicibus obliquis, laminatis, albis, crebris, connexis.*

THE CONNECTED SCALARIA. Shell small, subcylindrical, pale purple between the ribs; spire obtuse; varices oblique, laminar, white, close, connected.

SOWERBY. Proc. Zool. Soc., 1844.
Hab. Isl. Luzon, Philippines.

Species 96. (Mus. Brit.)

SCALARIA OVALIS. *Sc. testâ minutâ, crassâ, ovata, albida, intercostas carulatâ; anfractibus quinque, contiguis, haud prominentibus; varicibus paucis, crassis, supra suturam elevatis; apertura auriformi, marginè expanso.*

THE OVAL SCALARIA. Shell minute, thick, ovate, whitish, bluish between the ribs; whorls five, contiguous, not prominent; varices few, thick,

elevated above the suture; aperture auriform, margin expanded.

SOWERBY. Proc. Zool. Soc., 1844.

Hab. Cagayan, Isl. Mindoro, Philippines.

Species 97. (Mus. Brit.)

SCALARIA SULCATA. *Sc. testâ elongatâ, acuminatâ, tenui, albâ, minuti spirilater striatâ; spirâ arcuatâ; suturâ distinctâ; varicibus numerosis, laminatis, tenuebus.*

THE SULCATED SCALARIA. Shell elongated, acuminated, thin, white, minutely spirally striated; spire arcuated; suture distinct; varices numerous, laminated, thin.

SOWERBY. Proc. Zool. Soc., 1844.

Hab. Catuman, Isl. Luzon, Philippines.

A most delicately sculptured little shell.

Species 98. (Mus. Brit.)

SCALARIA ACICULINA. *Sc. testâ parvâ, elongata aciculata, inter varices purpureo-fuscas; anfractibus numerosis, concrexiæculis; varicibus albis, subdistantibus, tenuebus, rotundis, superne ferè angulatis, continuis.*

THE NEEDLE SCALARIA. Shell small, elegantly acicular, purple-brown between the varices; whorls numerous, rather convex; varices white, rather distant, thin, rounded, nearly angular above, continuous.

HINDS. Proc. Zool. Soc., 1843.

Hab. America.

Species 99. (Mus. Brit.)

SCALARIA GLABRATA. *Sc. testâ pyramidatâ, acuminatâ, nitentâ, inter varices maculis tribus pallidè fusca marmorata; varicibus inæqualibus, sequentibus, albis; suturâ profundâ.*

SCALARIA.—PLATE XIII.

THE SHINING SCALARIA. Shell pyramidal, acuminate, shining, marbled between the varices with three pale brown spots; varices irregular, following, white; suture deep.

HINDS. Proc. Zool. Soc., 1843.

Hab. Maccassar. Malacca.

Species 100. (Mus. — ?)

SCALARIA NOVANGLÆ. *Sc. testi parvâ, fuscâ, spiraliter minutè striatâ, jérè imperforatâ; apice attenuato; varicibus tenuibus, ad suturam acuminatum productis.*

THE NEW ENGLAND SCALARIA. Shell small, brown, spirally minutely striated, nearly imperforate; apex attenuated; varices thin, sharply produced at the suture.

COUTROY. Boston Journal of Science.

Hab. — ?

Species 101. (Mus. Brit.)

SCALARIA VESTALIS. *Sc. testi parvî, alba-carulescenti, breviter pyramidatâ; spiraliter minutissimè striatâ; aufractibus rotundis, varicibus simplicibus, minutis; aperturâ ovatâ, majusculâ.*

THE VESTAL SCALARIA. Shell small, bluish white, shortly pyramidal; spirally very minutely striated; whorls rounded, varices simple, minute; aperture ovate, rather large.

HINDS. Proc. Zool. Soc., 1843.

Hab. New Guinea.

Species 102. (Mus. Brit.)

SCALARIA ELENENSIS. *Sc. testâ parvâ, albâ, breviter pyramidatâ; aufractibus paucis, suturâ profundi: varicibus perpaucis, continuis, simplicibus, ad suturam subplicatis.*

THE ST. ELENA SCALARIA. Shell small, white, shortly pyramidal; whorls few, suture deep; varices very few, continuous, simple, slightly plaited at the suture.

SOWERBY. Proc. Zool. Soc., 1844.

Hab. St. Elena, West Columbia.

A curious little white species, with the varices very far apart, about six in a volution.

Species 103. (Mus. — ? copied.)

SCALARIA MACULOSA. *Sc. testâ elongatâ, pyramidatâ, acuminatâ; inter varices purpureo maculatâ: varicibus regularibus, supernâ angulatis, apertura ovata.*

THE SPOTTED SCALARIA. Shell elongated, pyramidal, acuminate; spotted with purple between the varices; varices regular, angular above, aperture ovate.

ADAMS AND REEVE. Voy. Samarang, Moll. Pl. XI. f. 14.

Hab. — ?

Between each varix there is an arranged ornamentation of purplish spots.

PLATE XIV.

Species 104. (Mus. Brit.)

SCALARIA SUTURATA. *Sca. testâ angustâ, acuminatâ, longiori spirâliter minutissimâ striatâ, albidâ, medio contractum fusca; anfractibus contiguis, subcompresso, ad suturam carinatis, salutis; varicibus rari, rotundis.*

THE SUTURED SCALARIA. Shell narrow, acuminate, imperforate; spirally minutely striated, whitish, brown in the middle of the whorls; whorls contiguous, rather compressed, keeled at the suture and grooved; varices rounded, very infrequent.

HINDE. Proc. Zool. Soc., 1843.

Hab. Malacca.

A *Turritella*-like species, deeply grooved at the suture.

Species 105. (Mus. Brit.)

SCALARIA SUBTILIS. *Sca. testâ parvâ, angustâ; inter varices spirâliter minutissimâ striatâ, fusca; anfractibus contiguis, levè crescentibus; varicibus laminatis, erubris, minutè crenulatis.*

THE SUBTLE SCALARIA. Shell small, narrow, spirally very minutely striated, brown; whorls contiguous, slowly increasing; varices laminar, close, minutely crenulated.

SOWERBY. Proc. Zool. Soc., 1844.

Hab. Isle Camiguina and Corregidor, Philippines.

A most delicately sculptured little species.

Species 106. (Mus. Brit.)

SCALARIA FUSCA. *Sca. testâ elevatâ, acuminatâ, elongatâ, imperforatâ, fusca, flammis castaneis longitudinalibus pictâ, spirâliter tenuissimâ striatâ; anfractibus novem, subrotundis; ultimo infrâ obscurè carinato.*

THE BROWN SCALARIA. Shell elevated, acuminate, elongated, imperforate, brown, painted with longitudinal flames, spirally very finely striated: whorls nine, a little rounded; last whorl keeled. SOWERBY. Proc. Zool. Soc., 1844. Thes. Conch. Scalaria, fig. 138.
Hab. Sierra Leone.

Species 107. (Fig. a, b.)

SCALARIA GREENLANDICA. *Sca. testâ elongatâ, crassâ, spirâliter distanter sulcata; anfractibus contiguis, laterâliter subcompressis; varicibus sinuatâ arcuatis, decumbentibus, ad suturam elevatis, expansis; aperturâ subtriangularis.*

THE GREENLAND SCALARIA. Shell elongated, thick, spirally distantly grooved; whorls contiguous, laterally rather compressed; varices sinuously curved, decumbent, raised and expanded at the suture: aperture subtriangular.

CHEMNITZ. Chemn. II., p. 155, f. 1878-79.

Hab. Newfoundland. Greenland.

Species 108. (Mus. Metcalfe.)

SCALARIA UNDULATA. *Sca. testâ tenui, subpyramidalâ, anfractibus posticâ subattenuatis, spirâliter striatis, supermò leviter costatis, infrâ planiusculis, carinâ obtusâ cinctis.*

THE WAVED SCALARIA. Shell thin, rather pyramidal, whorls a little attenuated above, spirally striated, slightly ribbed above, rather flattened beneath; encircled with an obtuse keel.

SOWERBY. Proc. Zool. Soc., 1844.

Hab. — ?

A light species belonging to the same group as *Scalaria granulosa*.

SCALARIA.—PLATE XIV.

Species 109. (Mus. Brit.)

SCALARIA INDISTINCTA. *Sc. testâ solidiusculâ, elevatâ, imperforatâ, spiraliter temissimè striatâ, longitudinaliter creberimè costatâ; aperturâ subrotundâ.*

THE INDISTINCT SCALARIA. Shell rather solid, raised, imperforate, spirally very finely striated; longitudinally very finely ribbed; aperture rather rounded.

SOWERBY. Proc. Zool. Soc., 1842.

Hab. Gulf of California.

Species 110. (Fig. a, b, Mus. Nobis.)

SCALARIA NUDA. *Sc. testâ breviter pyramidalî, crassâ, lœvigatâ; leviter costellatâ, infri subplanatâ, varicibus rarissimis distantissimis armata.*

THE BARE SCALARIA. Shell shortly pyramidal, thick, smooth; lightly ribbed, partly flattened below, armed with very rare, distant varices.

SOWERBY.

Hab. —?

Lately in the collection of Mr. A. Adams.

Species 111. (Mus. Adams.)

SCALARIA SUBNUDATA. *Sc. testâ pavâ, tenui, pyramidalâ, spiraliter tenuissimè striatâ; varicibus tenuibus, laminatis, ad suturam et infâ expansis, medio anfractuum fere exauditis.*

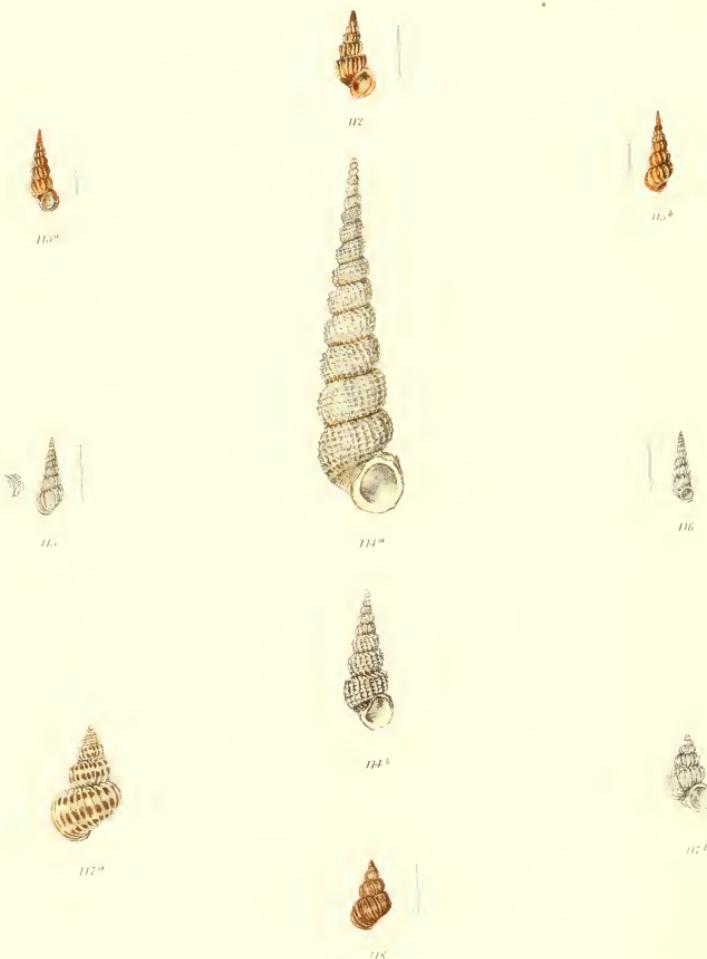

THE HALF-BARE SCALARIA. Shell small, thin, pyramidal, spirally very finely striated; varices thin, laminar, expanded at the suture and below, almost disappearing at the middle of the whorl.

SOWERBY.

Scalaria delicatula, H. Adams, Proc. Zool. Soc., 1865.

Hab. Philippines.

A pretty little species, the thin varices of which almost disappear in the middle of the whorls. The description of this shell as *Scalaria delicatula*, was published in the proceedings of the Zoological Society in the year following that in which *S. delicatula*, Crosse, appeared in the *Journal de Conchyliologie*.

S C A L A R I A.

PLATE XV.

Species 112. (Mus. —? Copied.)

SCALARIA PEGUINA. *Sca. pyramidatâ, brevi, turratâ, fusiâ, imperforatâ; anfractibus turratis; varicibus crassis, propâ suturam acutâ angulatis; interstitiis angustissimis; aperturâ subquadratâ, columella cuneata; labio extero propâ suturam angulari.*

THE EXTENDED SCALARIA. Shell pyramidal, short, turrited, brown, imperforate; whorls turrited; varices thick, acutely angular near the suture; interstices narrow; aperture subquadrate, columella cuneate, outer lip angular near the suture.

HINDS. Proc. Zool. Soc., 1843.

Hab. Straits of Malacca.

Species 113. (Fig. a, b, Mus. —? Copied.)

SCALARIA VULPINA. *Sca. testâ parvâ, fusæ, crassâ, spiraliter striatâ; anfractibus concavis; varicibus rotundis, crassis; ultimo anfractu infre carinâ cinctâ; aperturâ rotatâ, labio extero crasso.*

THE FOX SCALARIA. Shell small, brown, thick, spirally striated; whorls convex; varices rounded, thick; last whorl encircled below with a keel; aperture ovate, outer lip thick.

HINDS. Proc. Zool. Soc., 1843.

Hab. Straits of Malacca.

Species 114. (Fig. a, b, Mus. Brit.)

SCALARIA DUCSSATTA. *Sca. testâ elongatâ, turratâ, anfractibus supermâ angulatis, infre carinatis, liris spiralibus et costellis laqueatis, laminatis, longitudinalibus decussatâ.*

THE DECUSSETED SCALARIA. Shell elongated, turrited, whorls narrow above, keeled below, decussated with spiral ridges and fluted laminated longitudinal ribs.

LAMARCK. Anim. sans vert.

Scularia cancellata, Humphreys.

Hab. Mauritius.

Species 115. (Mus. Nobis.)

SCALARIA DELICATULA. *Sca. testâ tenâ, attenuatâ, minutiissimâ spiraliter striatâ; anfractibus numerosis, rotundis; costis inaequibus, plerumque laminatis, nonnullis incrassatis, ad suturam simplicibus, ultimo anfractu carinâ pareâ, distinctâ cincto.*

THE DELICATE SCALARIA. Shell thin, acuminated, very minutely spirally striated; whorls numerous, rounded; ribs unequal, for the most part laminar, some thickened, simple at the suture, last whorl encircled with a small distinct keel.

CROSSI. Journ. de Conch., 1861.

Hab. Australia.

Species 116. (Mus. Nobis.)

SCALARIA ATTENUATA. *Sca. testâ angostâ, attenuatâ, imperforatâ; anfractibus rotundis, suturâ profundâ; varicibus crassiùsculis, prominentibus, distantibus, obliqui continuis.*

THE ATTENUATED SCALARIA. Shell narrow, attenuated, imperforate; whorls round, suture deep; varices rather thick, prominent, distant, obliquely continuous.

SOWERBY.

Hab. —?

More attenuated than *Scalaria Philippinarum*, with the varices more distant.

Species 117. (Fig. a, b, Mus. Barclay.)

SCALARIA LATIFASCIATA. *Sca. testâ latâ pyramidatâ, perforatâ, albâ, vel pallidâ fulvâ, fasciis tribus fasciis, medianâ latâ, spiraliter pectâ; anfractibus rapidâ crescentibus, rotundis; varicibus numerosis, tenuibus, laminatis, ad suturam simplicibus.*

SCALARIA.—PLATE XV.

THE BROAD-BANDED SCALARIA. Shell broadly pyramidal, perforated, white, or pale fulvous, spirally painted with three brown bands, the middle one broad; whorls rapidly increasing, rounded; varices numerous, thin, laminar, simple at the sutures.

SOWERBY.

Hab. Maheburg, Mauritius.

Collected by Sir David Barclay on sandy mud. In the white variety the very slightest indication of brown bands may be detected. The *Scalaria trifasciata* of the Thesaurus is a much shorter shell and the bands are linear.

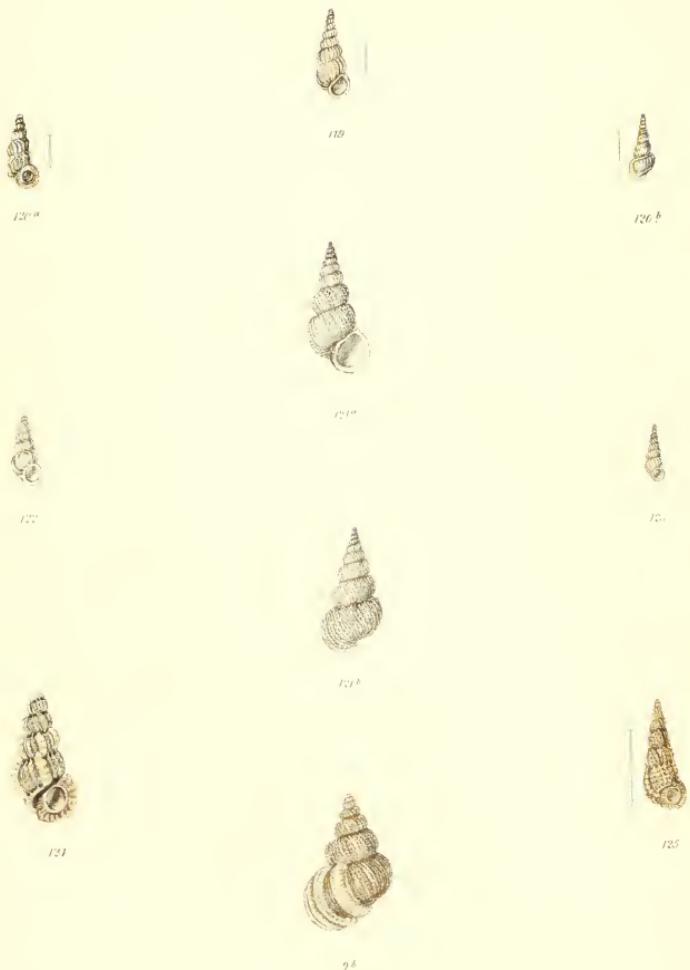

Species 118. (Mus. Nobis.)

SCALARIA TENUILIRATA. *Sca. testā parvā, perforatā, latā pyramidatā, inter varices levigatā, purpureo-fusca; anfractibus sex, rapidē crescentibus, rotundis, suturā profundā; varicibus cereberrimis, inaequalibus, tenuibus, reflexis, rotundatis.*

THE THIN RIDGED SCALARIA. Shell small, perforated, broadly pyramidal, smooth, purple-brown between the varices; whorls six, rapidly increasing, rounded with deep suture; varices very close, unequal, thin, reflected, rounded.

SOWERBY.

Hab. Japan.

S C A L A R I A.

PLATE XVI.

Species 119. (Fig. a, b, Mus. Brit.)

SCALARIA MULTISTRIATA. *Sca. testi parvi, elevatis, spiritaliter transversim striatis; anfractibus nonnum, subrotundis, longe excurrentibus; varicibus numerosissimis, longinquis, extentibus, ad suturam in angulum acutum vel catinus.*

THE MANY-STRIATED SCALARIA. Shell small, raised, spirally very finely striated; whorls nine, rather rounded, slowly increasing; varices very numerous, laminated, standing out, elevated in a sharp angle at the suture.

SAY. Amer. Journ. Sci.

Scalaria pulchella, Bivon.

Hab. North America.

The three small species with minute striae, somewhat resembling each other, may thus be distinguished. *Scalaria delicata* has the fine varices rounded at the centre, and it is very narrow. *Scalaria subundata* has them raised at the sutures and almost obsolete at the centre of the whorl, and *Scalaria multistriata* has them raised in an acute angle at the sutures and by no means thinned away in the centre.

Species 120. (Fig. a, b, Mus. Brit.)

SCALARIA CRASSILABRUM. *Sca. testi albida, imperforata, elongata, spiritaliter minutissimè striata; anfractibus septem, biangulatis, subobsoletè castellatis; varicibus nullis; aperturæ subrotundata, margine crasso, expanso, minutiè striata.*

THE THICK-LIPPED SCALARIA. Shell nearly white, imperforate, elongated, spirally very minutely striated; whorls seven, biangular, rather obsoletely ribbed; varices none; aperture rather rounded; with thick, expanded, minutely striated margin.

SOWERBY. Thesaurus Conchyliorum, *Scalaria*, sp. 87, fig. 115, 116.

Hab. Philippines. Central America.

Species 121. (Fig. a, b, Mus. Brit.)

SCALARIA UNDULATISSIMA. *Sca. testi alba, tenue, pyramidata, perforata, spiritaliter minutissimè striata; anfractibus circi novem, subrapido crescuntibus, ad suturam caudatulatis; varicibus irregularibus, tenuibus, rarissimè crassioribus, concisis undulatis, propè suturam acutodatis; umbilico parvo; aperturæ subovata, margine columellarè tenui, sinuato, margine externo superne crenulato, propè suturam acutato.*

THE MUCH WAVED SCALARIA. Shell white, thin, pyramid, perforated, spirally very minutely striated; whorls about nine, rather quickly increasing; channelled near the suture; varices unequal, thin, very rarely thicker, neatly undulated, acutated near the suture; umbilicus small; aperture subovate, columellar margin thin, sinuous, outer margin crenulated above, acutated near the suture.

SOWERBY.

Hab. ——?

M. Nyst publishes in his "Tableau Synoptique," a fossil species in which the varices are undulated; something the same manner, but more coarsely than in this shell. I know of no other example of this beautifully delicate sculpture.

Species 122. (Fig. a, b, Mus. Nobis.)

SCALARIA JAPONICA. *Sca. testi parvi, albâ, levigata, imperforata; anfractibus rotundis, vix contiguis; varicibus laminatis, solidiusculis, subistantibus, oblique continuis.*

THE JAPAN SCALARIA. Shell small, white, smooth, imperforate; whorls rounded, scarcely touching; varices laminar, rather solid, a little distant, obliquely continuous.

NYST. Tab. Syn., 1874.

Scalaria digna, A. Adams.

Hab. Japan.

June, 1874.

SCALARIA.—PLATE XVI.

Species 123. (Mus. Nobis.)

SCALARIA MURICUL. *Sea. testá parvá, albida, angustá, spiráliter densé striatá; anfractibus numerosis, lentē crescentibus; varicibus creberrius, crassiusculis, ad suturam parvó expansis.*

MURCH'S SCALARIA. Shell small, whitish, narrow, spirally closely striated; whorls numerous, slowly increasing; varices very close, rather thick, a little expanded at the suture.

ANGAS. —?

Hab. ——————

Species 124. (Mus. Barclay.)

SCALARIA ABBREVIATA. *Sea. testá brevi, crassá, subcarinata, imperforata, spiráliter sulcatá, costis planulatis, undulatis, uno latere angulatum laevoletis, ad suturam aculeatis, ad carinam inferiorem prominutibus ornata; interstítia ad suturam et ad carinam profundè foveolata; anfractibus paucis, supernè subdelectiis; ultimo anfractu infrah carinato, ad marginem aperturae incrassato; varicibus magnis, crassis, crenulatis, perpaucis; aperturá subrotundá, muricea crassa, crenata.*

THE ABBREVIATED SCALARIA. Shell short, thick, bluish, imperforate, spirally grooved, ornamented with flattened, undulated ribs, angularly fluted on one side, aculeated at the suture, prominent at the lower keel; interstices deeply sloped above; last whorl keeled below, thickened at the edge of the aperture; varices large, thick, crenulated, very few; aperture rather round, margin thick, crenated.

SOWERBY.

Hab. Tamarind Bay, near Black River, Mauritius.

This is figured in Thesaurus as a variety of *Scalaria varicosa*, from which subsequent examination compels me now to distinguish it.

Species 125. (Mus. Sir D. Barclay.)

SCALARIA MULTIPERFORATA. *Sea. testá pallidè fulvá, acuminata, costis latis, decumbentibus, undulatis, uno latere angulata laevoletis sculpta; interstítia, concavis foveolatis; anfractibus compressis, ad suturam canaliculatis, aculeis elevatis coronatis; ultimo anfractu infrah carinato, ad carinam foveolato: varicibus perpaucis, irregularibus, crassis, prominentibus, ad suturam elevatis, productis.*

THE MANY-HOLED SCALARIA. Shell pale, fulvous, acuminate, sculptured with broad, decumbent, undulated ribs, angularly fluted on one side; interstices neatly pitted; whorls compressed, channelled at the suture, crowned with raised points; last whorl keeled below, pitted at the keel; varices very few, irregular, thick, prominent, raised and produced at the suture.

SOWERBY.

Hab. Black River Bay, Mauritius.

The sculpture of this little shell is exquisite, the flattened ribs being fringed on one side with an angular fluting which leaves little distinct perforations against the back of the adjoining rib. There is an obsolete tendency to the same arrangement of sculpture in *Scalaria varicosa* and *S. abbreviata*, which belong to the same group, but are not nearly so narrow and acuminate, and have not the whorls so laterally compressed.

(Fig. 9, b, Pl. II. Mus Sir D. Barclay.)

SCALARIA RARISOSTATA. This exquisite specimen was dredged by Sir David Barclay, Bart., off Round Island, Mauritius. The ordinary specimens give no idea of the beautiful sculpture which belongs to the shell when in perfect condition. Besides the four larger ribs which in this specimen are crowded in the last whorl, the whole shell is sculptured with fringed and aculeated lesser varices.

C U M I N G I A.

PLATE I.

Genus CUMINGIA, Sowerby.

Testa anguivalvis, inaequilateralis, angustior rotundata, postice angustata depresso, paulo hinc, depresso cardinali utriusque valvis duar, minuti; lateralis in absca rufa dura. Ligamentum in foream costatum et formam medianum efficiunt. Impressum velutinum dura, laterales elongati. Impressa pullo striae rugosae curva.

Shell equivalve, inequilateral, anteriorly rounded, posteriorly narrowed, depressed, a little gaping; cardinal teeth two, minute, in each valve; lateral two in one valve. Ligament fixed in a central spoon-shaped pit. Muscular impressions two, lateral elongated. Impression of the mantle bent back with a large sinus.

The *Cumingia* are often very irregularly formed, because they live in crevices of rocks and hollows of sponges. They are found in Australia, and in both East and West Indies. The West Coast of America and the Philippine Islands have also contributed species.

Species 1. (Mus. Brit.)

CUMINGIA TELLINOIDES. *Cum. testa subcompressa, minusculis striatis, antice rotundata, subangulata; postice rotundata, acuminata, marginem ventrici contractata, marginem dorsali declivis.*

THE TELLINA-LIKE CUMINGIA. Shell compressed, very finely striated, anteriorly rounded, a little inflated; posteriorly beaked, acuminate, ventral margin contracted, dorsal margin sloped.

CONRAD. —?

Hab. California. Maine, U. States.

— — — — —

Species 2. (Fig. a, b; Mus. Brit.)

CUMINGIA CLERII. *Cum. testa subtriangularis, compressa, complanata, levigata; latere postice elongatissima,*

lateralis, latere anteriori, aperto, subangulata, oblique decisa.

CLERI'S CUMINGIA. Shell subtriangular, compressed, flattened, smooth; posterior side rather longer and wider; anterior side a little rounded, much sloped.

A. ADAMS. Proc. Zool. Soc.
Hab. Chili.

Species 3. (Mus. Brit.)

CUMINGIA MEDIALIS. *Cum. testa subaequalis, pallidula, roseo rubescens, minusculis elevatis striatis, linea antecostata, inflata, marginem ventrici contractata, ad terminum subrotundata marginem dorsalem calidè declivis, termino obliquè truncata.*

THE PLAIN CUMINGIA. Shell subovate, pale reddish-brown, very minutely densely striated; anterior side broad, inflated, with ventral margin convex; posterior side subrotund with ventral margin contracted, dorsal margin much sloped downwards, end obliquely truncated.

SOWERBY. Proc. Zool. Soc., 1833.
Hab. Chili, Peru.

This and nearly all the species appear very finely striated when viewed with a lens.

Species 4. (Mus. Brit.)

CUMINGIA TRIGONULARIS. *Cum. testa robusta, trigonum subquadrata, postice brevi, subangulata, truncata marginem dorsalem calidè declivis; irregulariter concentricè laminata, laminis extantibus, nonnullis latitis.*

THE THREE-SIDED CUMINGIA. Shell robust, squarish-trigonal, posteriorly short, rather angular, truncated with dorsal margin much sloped; irregu-

CUMINGIA.—PLATL. I.

lately concentrically laminated, laminae standing out, some broad.

SOWERBY, Proc. Zool. Soc., 1833.

Hab. Chili?

The most irregularly laminated of all the species, and the most triangular in form.

ventral margin contracted near the end; dorsal margin sloped.

SOWERBY, Proc. Zool., 1833.

Hab. Chili.

Species 6. (Mus. Brit.)

CUMINGIA SIMILIS. *Cum. testâ orato-subtrigonâ, levigatâ, lamineis paucis concentricis ornatâ; latere antice inflato, rotundo; latere postico rostrato, ad terminum marginis centralis subacuminata.*

THE SIMILAR CUMINGIA. Shell ovate-subtriangular, smooth, ornamented with few concentric laminae; anterior side inflated, rounded; posterior side beaked slightly, acuminate at the end of the ventral margin.

A. ADAMS, Proc. Zool. Soc., 1850.

Hab. N.W. Coast of America.

Differing from the preceding species chiefly in the fewness and irregularity of the laminae.

Species 5. (Mus. Brit.)

CUMINGIA LAMILLOSA. *Cum. testâ oblongâ, regulariter concentricâ lamineatâ, lamineis angustibus, evanescens, distantibus; latere antice brevi, rotundo; latere postico angulari, attenuato, subrostrato; margini centrali propè terminum contracto; margini dorsali declivis.*

LAMILLAR CUMINGIA. Shell oblong, regularly concentrically laminated, laminae narrow, standing out, distant; anterior side short, rounded; posterior side angular, attenuated, subrostrated;

PLATE II.

Species 7. (Fig. a, b, Mus. Brit.)

CUMINGIA CONCENTRATA. *Cum. testā parvā, regulariter concentricā striatā, laterē līris tenissimō radiatō striatō; antō subquadratā, inflatā, posticō depresso, contractā, declivē, ad terminū marginis ventralis acuminatā.*

THE CONTRACTED CUMINGIA. Shell small, regularly concentrically ridged; very finely radiately striated between the ridges; anteriorly subquadrate, inflated, posteriorly depressed, contracted, sloped downward, acuminate at the end of the ventral margin.

SOWERBY. Proc. Zool. Soc., 1833.

Hab. Philippines.

Species 8. (Fig. a, b, Mus. Brit.)

CUMINGIA ANTILLARUM. *Cum. testā parvā, tenui, minutē regulariter concentricā laminatā; subacutā, vel subtriangulā; posticē subacuminatā.*

THE ANTILLIS CUMINGIA. Shell small, thin, minutely regularly concentrically laminated; somewhat ovate, or subtriangular; posteriorly, rather acuminate.

A. ADAMS. Proc. Zool. Soc., 1850.

Hab. West Indies.

Species 9. (Mus. Hargreaves.)

CUMINGIA ELEGANS. *Cum. testā parvā, obliquē subovata, eleganter crenatā concentricā liratā; laterē antico brevirostrulō, rotunda, inflata; laterē postico subangulata, ante angulum contracta.*

THE ELEGANT CUMINGIA. Shell small, obliquely subovate, elegantly closely concentrically ridged; anterior side rather short, rounded, inflated; posterior side rather angular, contracted in front of the angle.

SOWERBY.

Thyella lamellula, H. Adams.

Hab. Australia.

The want of developed lateral foot, in either valve has caused the separation of this and other species from the genus; and in replacing it we are obliged to apply a new specific name, that of *lamellula* being previously occupied in this genus.

Species 10. (Mus. Brit.)

CUMINGIA VENTRICOSA. *Cum. testā solidā, rosco-pallidā, fasciatā, minutissimō striatā, brevē, inflatā; laterē antico rotundo, ventricoso; laterē postico acuminato, declivē.*

THE VENTRICOSA CUMINGIA. Shell solid, banded with pale rose, very minutely striated, short, inflated anterior side rounded, ventricose; posterior side acuminate, sloped downward.

SOWERBY.

Hab. Probably Chili.

Much shorter and more inflated than *Cumingia mutica*.

Species 11. (Mus. Brit.)

CUMINGIA GRANDIS. *Cum. testā solidā, albā, opaca, sub-compressā, dilatatā; laterē antico brevirostrulō, rotundo; laterē postico rostrato, compresso, vald' declivē, acuminato.*

THE LARGE CUMINGIA. Shell solid, white, opaque, sub-compressed, dilated; anterior side rather short, rounded; posterior side beaked, compressed, much sloped, acuminate.

DESHAYES.

Hab. Chili.

A species of very dilated and rather flattened form, but quite possibly a variety of *Cumingia mutica*.

Species 12. (Mus. Hargreaves.)

CUMINGIA HARGREAVESI. *Cum. testā parvā, subquadratā, levē; laterē antico brevissimō, declivē, obtuso.*

August, 1873.

CUMINGIA.—PLATE II.

*inflatō : laterō posticō validē arcuatim rostrato,
margīnae ventrali ante rostrum contracto, margīne
dorsali voldī declivi.*

HARVEY'S CUMINGIA. Shell small, subquadrate, smooth; anterior side very short, sloped, obtuse, inflated; posterior side strongly beaked with a curve, ventral margin contracted in front of the beak, dorsal margin much sloped.

H. ADAMS (Thyella). Proc. Zool. Soc., 1873.
Hab. New Hebrides.

The writer has not seen the type of Mr. Adams's genus
THYELLA. The two species included in this monograph

of *Cumingia* are all which the genus contains excepting the type.

Species 13. (Fig. *a, b*, Mus. Brit.)

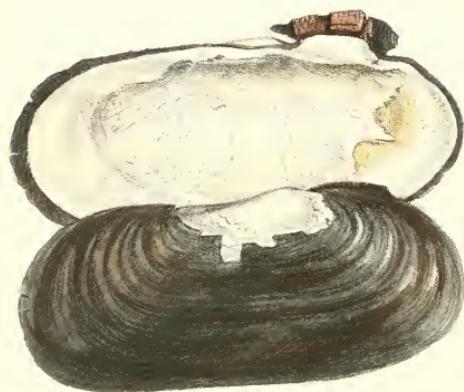

CUMINGIA CALIFORNICA. *Cum. testō irregulariter lamel-
losi, posticō cuneatā, brevi ; antīcē inflatā, expansi-
ō, morgīne dorsali elevato, ventrali convexa.*

THE CALIFORNIAN CUMINGIA. Shell irregularly lamel-
lated, posteriorly cuneate, short; anteriorly in-
flated, expanded with the dorsal margin elevated,
ventral margin convex.

CONRAD. Journ. A. N. S. Phil., vol. vii, pl. 17, f. 12.
Hab. California.

"O'er the deep! o'er the deep!
Where the whale, and the shark, and the sword-fish sleep!"—*Barry Cornwall*

♂

♀

GLYCIMERIS.

PLATE I.

Genus GLYCIMERIS, Lamarck.

Testa transversè oblonga, bivalvis, bimusculosa, equivalvis, crassa, epidermide nigra cornea induta; margine cardinali edentulo. Ligamentum magnum externum fulcrum magnum affixum. Impressiones musculares complexi, palli irregulariter integer.
Shell transversely oblong, bivalve, bimucular, equi-valve, thick, covered with a black, horny epidermis; hinge margin toothless. Ligament large, external. Muscular impressions complex, that of the mantle irregularly entire.

Syn. *Cyrtodaria*, Daudin.

The single species which composes this genus, presents an assemblage of characters which make it difficult to determine its place. Having neither internal cartilaginous pit nor appendage, it certainly does not belong to the genus *Mya*, with which it was formerly united. Yet, as in *Mya*, *Panopaea*, &c., the parts of the animal not covered by the shell are provided with a wrinkled coriaceous covering. It is a molluse of littoral habits and, as might be suggested by its appearance, belongs to northern and arctic seas. In the general characters of the shell it seems, with *Solenomya*, to approach the family of *Solenidae*.

Species 1. (Mus. Sowerby)

GLYCIMERIS SILIQUA. *Glyc. testa oblonga, crassissima, utrinque liranti, ectas epidermide crassissima, nigra, obliquè rugata induta; intus calcarea, irregulatè incrassata et lacraturæ; latere postivo breviuscudo marginis dorsali semilunari; medio compresso, marginis ventrali rectiusculo; cardine edentula, fulcro ligamentifero maximo.*

THE SWORD GLYCIMERIS. Shell oblong, thick, gaping on both sides, covered outside with a thick, black epidermis, obliquely wrinkled; calcareous within, irregularly thickened and jagged; posterior side rather the shorter, dorsal margin semilunar; middle compressed, ventral margin rather straight; hinge toothless, ligamentiferous fulcrum very large.

LAMARCK. Anim. sans Vert., vol. vi. p. 69.

Mya picea, Wood.

Hab. Arctic Coasts.

The so-called *Glycimeris arctica* and *Glycimeris edentula* do not belong to this genus. The first is a *Panopaea*.

C Y P R I N A.

PLATE I.

Genus CYPRINA, Lamarck.

*Tegula bivalvis, ovalis, bimarginata, marina, aequivalvis,
epidermis subrugosa, crassa, indutâ; umbrae
cavæ; dentes in utriusque valvâ tres cardinales uno
intralis posticus, remotus. Impressiones muscularares
in utriusque valvâ duæ, laterales distantes. Impressio
marginalis palliâ integræ. Ligamentum externum,
partim in sinus marginali immersum.*

Shell bivalve, oval, bimarginata, marine, equivalve, covered with a subrugose, thick epidermis; umbrae curved; three cardinal teeth in each valve, one posterior, lateral remote. Muscular impressions two, lateral distant. Muscular impressions of the mantle entire. Ligament external partly inserted in a marginal sinus.

There appears to be really only one recent species of this genus, which belongs to the northern seas of Europe. It is a very Venus-like shell, with the hinge of the Cytherea group, but having one very long, distant posterior lateral tooth.

Species 1. (Fig. a, b, Mus. MacAndrew.)

CYPRINA ISLANDICA. Cyp. testâ subovato-rotundâ,
solida, epidermidè striatâ, crassâ, fusca vel nigra
indutâ; latere antico brevi, margine dorsali
decurvi, umboibus arcuatis, prominentibus, margine
ventrali convexo; latere postico subquadrato,
margine terminali subtruncato, margine dorsali
arcuato.

THE ICELAND CYPRINA. Shell, subovate, rounded, solid, covered with a thick, striated brown or black epidermis; anterior side short, dorsal margin sloped, umboes arched, prominent, ventral margin convex; posterior side subquadrate, terminal margin slightly truncated, dorsal margin arched.

LINNEUS. (Venus) Systema Naturæ.
Cyprina vulgaris, Sowerby.

Venus bucardium, Born.

Hab. Northern British and Scandinavian Coasts.

Fig. 1. a, represents an elliptical form not differing sufficiently from the normal to justify a specific separation.

August. 1873.

MONOGRAPH

f. b.

f. c.

f. d.

f. e.

ANATINELLA.

PLATE I.

ANATINELLA, Sowerby

*Tegula elongata oblonga, aperturæ tenui, modicam
septem dividit, alba, posticæ paulo levigatae. Cardo
rotundatus, processu cochleariforme, cartilagineum
rectum, medio in utrâque valva afferens dentibus
reciprocatibus duabus parvis ante processum positis.
Impressiones muscularis duo que oblonga. Impressio
pauli integræ.*

Shell transversely oblong, equivalve, thin, covered with a thin epidermis, white; a little gaping posteriorly. Hinge narrow, with a cartilage holding a spoon-shaped process fixed in the middle of each valve, and two small cardinal teeth placed before the process in each valve. Muscular impressions two, oblong. Impression of the mantle entire.

This interesting genus of Amatina-like shells is alike in both valves, having a spoon-shaped process in each, thus differing from *Mya*, which has that provision only once. *Lutraria* has both, but differs in obvious particulars, and *Anatinella* proper is characterized by a similar arrangement, and also by a sort of strengthening rib along the umbones. China, Ceylon, and the Philippines are the known localities of the few species with which we are acquainted.

Species 1. (Fig. a, b, Mus. Norris.)

ANATINELLA SIBERBALDI. *Ana. testa sub-ovata, sub-
aequilaterali, ventricosa; minutissime radiatim
striata; latere antico rotundata, latere posterio ad
terminum truncato obliquè subheartato; margini
dorsali depresso; margini ventrali aequaliter convexa;
processus in utrâque valva magno.*

SIBERBALD'S ANATINELLA. Shell subovate, subequilateral, ventricose; very minutely radiately striated; anterior side rounded, posterior side truncated at the end; dorsal margin depressed; ventral margin equally convex; process large in each valve.

SOWERBY. Genera of Shells.

This species is supposed by some conchologists to be identical with *Mya candida* of Gmelin, but it is much more ovate in form, besides being nearly equilateral.

Species 2. (Mus. Brit.)

ANATINELLA CANDIDA. *Ana. testa oblonga, interpa-
latens, radiatim minuti serrato-striata; latere
postico producta, angusta, aliquo truncata, radiatum
et subcavato; marginem ventrali rotule sursus acclivis
tibi inflata, versus anti medium subcontracta; latere
anterio brevi, processu cardinali maximo.*

THE WHITE ANATINELLA. Shell oblong, inequilateral, radiately minutely serrato-striated; posterior side produced, narrow, obliquely truncated, rather sharply keeled, ventral margin much sloped upwards, then inflated, slightly contracted before the middle; anterior side short; cardinal process very large.

A. ADAMS. Proc. Zool. Soc., 1850, p. 41.
Hab. China.

Species 3. (Mus. Brit.)

ANATINELLA VENEROSEA. *Ana. testa oblonga, radi-
atim quadrilaterali, radiatim minuti serrato-striata;
latere postico angusta, attenuata, obliquè truncata,
obscure carinata; marginem ventralis sursum acclivis
medio contracta; latere antico late, subovata, in-
flata.*

THE VENEROSE ANATINELLA. Shell oblong, very inequilateral, radiately minutely serrato-striated; posterior side narrow, attenuated, obliquely truncated, obscurely keeled; ventral margin sloped upwards, contracted in the middle; anterior side broad, rather round, inflated.

A. ADAMS. Proc. Zool. Soc., 1851, p. 41.
Hab. Puteao, Philippines.

More elongated and unequally inflated than *Anatinella candida*.

ANATINELLA.—PLATE I.

Specie 4. (Mus. Brit.)

ANATINELLA DILATATA. *Ana. testa ovata, subcompressa, minutissime striata; latera postica longiuscula, obliquè carinata, post carinatum latè truncata, dilatata, subrugosa; margine ventrali convexa; latera antica breviuscula, rotunda.*

THE DILATED ANATINELLA. Shell ovate, subcompressed, minutely striated; posterior side, rather the

longer; obliquely keeled, broadly truncated behind the keel, dilated, slightly wrinkled; ventral margin convex; anterior side rather short, rounded.

A. ADAMS. Proc. Zool. Soc., 1851, p. 41.
Hab. Puteo, Philippines.

More compressed and broader posteriorly than the other species.

"What mortal could, on thy banks, do wrong,
Then, (quoth) sounding rock, mysterious stream?"—*Mrs. Hemans*

MONOGRAPH
OF THE GENUS
PLICATULA.

4d

PLICATULA.

PLATE I.

Genus PLICATULA, Lamarck.

Testa uniusculosa, inaequivalvis, plicata, irregularis, per apicem valvæ dextræ adhaerens; umbones inaequales, vix auriculatae; area cardinalis, in valvi dextræ parva; dentes cardinales utrèque valvi duce, divergentes transversè striata; foveola ligamentifera inter dentes utrèque calefacta trigona.

Shell with a single muscle, inequivalve, plaited irregular, fixed by the apex of the right valve; umbones unequal, scarcely auriculated; cardinal area in the right valve small; two divergent, transverse, cardinal teeth in each valve striated transversely; a trigonal ligamentiferous pit in each valve between the teeth.

Plicatula is a well defined genus of shells always to be recognised by the teeth and folds. Eight species were described in the latest Monograph, that of the *Thesaurus* by Sowerby. Of the remaining five, two have been described since, and three are here presented.

The Philippines, Australia, New Zealand, and the shores of Western America furnish all the species described in this Monograph, with the exception of *Plicatula Ceylonica*, and the little *Plicatula simplex* from China.

Species 1. (Mus. Brit.)

PLICATULA NOVE ZELANDIE. *Pl. testâ tenuâ, albâ, depressâ, ad laterâ foliacâ; plîcis numerosis, obtusis hinc-illuc divisis, ad marginum dentiformibus.*

THE NEW ZEALAND PLICATULA. Shell thin, white, depressed, leafy at the sides; plaits numerous, obtuse, here and there divided, dentiform at the margin.

SOWERBY.

Hab. New Zealand.

The ribs are so divergent, that those near the dorsal margin are at right angles with the central.

Species 2. (Mus. Brit.)

PLICATULA SIMPLEX. *Pl. testâ parvâ, gibbâ, crassa, rectiusculâ, subovatâ, fusco-subaureâ, nonnunquam*

strigatâ; plîcis paucis, profundis, angulatis similipliibus.

THE SIMPLE PLICATULA. Shell small, gibbous, thick, rather straight, somewhat ovate, of a golden brownish colour, sometimes striped; plaits few, deep angular, simple.

GOULD. —?

Hab. China.

The few plaits of this apparently distinct species do not diverge to any extent, and consequently the shell has a rather straight oval appearance.

Species 3. (Mus. Brit.)

PLICATULA PENICILLATA. *Pl. testâ parvâ, tenuâ, irreguliter ornatâ, rugosâ, minutè aculeatâ, lineis petris, brevibus, custavis, notatâ; plîcis propè marginum minutis, eruberrimis; marginè valed' dextrâ irreguliter denticulata.*

THE FENCED PLICATULA. Shell small, thin, irregularly ovate, rugose, minutely aculeated, marked with small short chestnut lines; plaits very small, very close near the margin; margin of the left valve irregularly denticulated.

CARPENTER.

Hab. North America.

Species 4. (Mus. Brit.)

PLICATULA IMBRICATA. *Pl. testâ magnâ, subtriangulari, solidâ, albâ, vel cinnamonâ, lineis brevibus, divergentibus, rubescutibus notatâ; plîcis magnis, acutè angulatis divercatiis, rarò divisis; plerumque super angulum imbricatis.*

THE IMBRICATED PLICATULA. Shell large, subtriangular, solid, whitish, or cinnamon, marked with short divergent reddish lines; plaits large, acutely angular, divergent, rarely divided; generally imbricated on the angle.

MENKE. Moll. Nov. Hollandiae.

Hab. China, Philippines.—Honduras Bay, &c.

P L I C A T U L A.

PLATE II.

Species 5. (Fig. *a*, *b*, *c*, Mus. Brit.)

Plicatula ramosa. *Pl. testi ponderosa, prop. umbones plerumque gibbosæ, albidae; super plicas lineis maculisque purpureis vel cinnamomeis, vel castaneis notatae; plicis obtusis medio testa paucis, versus marginem in ramis duabus vel tribus jurecati, impressione musculari rotunda, elevata; dentibus cardinalibus fuscis; margine interno fuso lineato.*

THE BRANCHED PLICATULA. Shell ponderous, generally gibbose, whitish; plaits marked with purple or cinnamon or chestnut lines and spots; plaits few in the middle of the shell, divided into one or two branches towards the margin, muscular impression rounded, elevated; cardinal teeth brown; inner margin marked with brown lines.

LAMARCK. Anim. s. Vert., vol. vi. p. 184.

Spondylus plicatus? Gmelin.

Plicatula gibbosa (Lamarck). Sowerby. Genera of Shells.
Hab. Lord Hood's Island.

There is no other species of *Plicatula* the plaits of which branch and divide so much as this.

Species 6. (Fig. *a*, *b*, Mus. Brit.)

Plicatula cristata. *Pl. testi parva, trigonæ, albida, plicis nonnunquam lineatis pictis, magnis, acutæ angulis, perpaucis.*

THE CRESTED PLICATULA. Shell small, trigonal, whitish, the plaits sometimes linearly painted, large, sharply angular, very few.

LAMARCK. Anim. s. Vert., vol. vi. p. 185.

Plicatula reniformis, —?

Hab. Jamaica, A. Adams. Honduras Bay, Mr. Dyson.

A small species of large angular plaits.

Species 7. (Fig. *a*, *b*, Mus. Brit.)

Plicatula depressa. *Pl. testi solidæ, super costas fuso lineatæ et maculatæ; plicis obtusis numerosis, paulò divercatiis prop. maryanum hinc illuc bifurcatiæ.*

THE DEPRESSED PLICATULA. Shell solid, lined and spotted with brown on plaits; plaits obtuse, numerous, a little divergent, here and there, near the margin, bifurcated.

LAMARCK. Anim. s. Vert., vol. vi. p. 185.

Hab. —?

This species is more numerously and less divergently plaited than *Plicatula ramosa*. The plaits, although occasionally divided near the margin, do not branch. The depression from which the species was named is probably an accident of growth in both the specimens figured.

October, 1873.

PLATE III.

Species 8. (Fig. *a, b*, Mus. Brit.)

PLICATULA ESSINGTONENSIS. *Pli. testi magni, sub-aequilaterali; plicis numerosis, cinnamoneo minuti- lineatim notatis, divaricatis, raro dividisis, angulatis.*
THE PORT ESSINGTON PLICATULA. Shell large, nearly equilateral; plaits numerous, rather obtuse, minutely linearly marked with cinnamon, divergent, rarely divided, angular.

SOWERBY.

Hab. Port Essington, Australia.

The ribs are more numerous, less divergent, and less deep than *Plicatula Philippinarum*.

Species 9. (Fig. *a, b*, Mus. Brit.)

PLICATULA MURICATA. *Pli. testi parvi, trigonae, cinnamoneae, vel albæ, maculis trigonis, subradiatis pietæ; plicis eruberrimis, angulatis muricatis, acutæ sub-acuteatis.*

THE MURICATED PLICATULA. Shell small, trigonal, cinnamon coloured, or white, painted with trigonal partly radiating spots; plaits very numerous, angular, muricated, acutely subaculeated.

A. ADAMS. Proc. Zool. Soc.

Hab. —?

A very pretty, characteristic little species.

Species 10. (Fig. *a, c, d*, Mus. Brit.)

PLICATULA AUSTRALIS. *Pli. testi subrotundæ, de- pressæ, tenuiæculæ, nigro punctatæ; plicis parvis, numerosis, obtusis, divaricatis, rugosis, imbricatis, propæ marginem aculeatis.*

THE AUSTRALIAN PLICATULA. Shell roundish, depressed, rather thin, black spotted; plaits small, numerous, obtuse, divergent, branched, imbricated, aculeated near the margin.

LAMARCK. Anim. s. Vert., vol. vi. 85.

Hab. Australia, Lamarck. Philippines, Cuming.

The linguiform specimen is only an instance of irregular growth.

Species 11. (Fig. 10, *b*, Mus. Brit.)

PLICATULA ACULEATA. *Pli. testi albæ, ovatæ, tenui, aculeis fornicateis divaricatis armata.*

THE ACULEATED PLICATULA. Shell white, ovate, thin, armed with vaulted prickles.

SOWERBY.

Plicatula dubia, var. Sowerby, Thes. Conch.

Hab. —?

October, 1873.

P L I C A T U L A.

PLATE IV.

Species 12. (Fig. a, b, c, d, e, Mus. Brit.)

PLICATULA PHILIPPINARUM. *Pli. testā magnā, solidā, pallidē fulvā vel subverruculā, plerumque divaricatū rubro vel nigro lineatā; plīcis magnis, continuis, nonnumquam divisiis, ad angulum rarissimē imbricatis.*

THE PHILIPPINE PLICATULA. Shell large, solid, pale fulvous or bluish, generally divergently lined with red or black; plaits large, continuous, occasionally divided, very rarely imbricated.

HANLEY. Recent shells.

Hab. Various localities among the Philippine Islands.

The figures will show that this species is subject to the usual irregularities in growth. The plaits are larger, more angular, and less branched than those of *Plicatula ranosa*.

Species 13. (Mus. Brit.)

PLICATULA DUBIA. *Pli. testā teni, foliaceā, depresso, subrotundatā; plīcis brevibus, interrupis, irregularibus, foliis extantibus, fornicatis, truncatis, paucis; colore fuso-rubescēti, castaneo maculato, prop̄ umbones minutē punctato.*

THE DUBIOUS PLICATULA. Shell thin, foliaceous, depressed, somewhat rounded; plaits short, inter-

rupted, irregular, with extant vaulted, truncated, few foliations; colour reddish-brown, spotted with chestnut minutely dotted near the umbones.

HANLEY. Recent Shells. Sowerby's Thesaurus. Pl. I. 19.
Hab. Isl. Samar, Philippines.

The small white shell figured in Thesaurus as *Plicatula dubia* (var.) can scarcely belong to this species. It is probably an irregular form of *Plicatula Australis*.

Species 14. (Mus. Brit.)

PLICATULA CEYLONICA. *Pli. testā solidā, subtrigonā, pallidē cinnamonā, posticē productā, acuminatā, plīcis magnis, angulatis, valde divaricatis, imbricatis, lineis divaricatis, brevibus, cinnamonis super costas notatis.*

THE CEYLON PLICATULA. Shell solid, subtriangular, pale cinnamon, produced posteriorly, acuminate, plaits large, angular, very divergent, imbricated, marked on the ribs with short divergent cinnamon lines.

SOWERBY.

Hab. Ceylon.

The ribs are sharply angular, branched, and imbricated; characteristics which taken in connexion with the widely distant locality prevent our placing the shell as a variety of *Plicatula Philippinarum*.

October, 1873.

E M A R G I N U L A.

PLATE I.

Genus EMARGINULA, Lamarck.

*Testa patelliformis, plus minuscere rotunda, plurimqu
ocata, apicem recurva, radiatim costellata vel sul
cata; costæ vel sulcæ dorsali et assarum vel in
sinu procurrente ad notarium costatum se in situ.*

Shell patelliform, more or less conical, generally ovate, with apex recurved, radiately grooved or sulcated; dorsal rib or groove ending in fissure or small sinus at the anterior margin.

In place of the "key-hole" at the apex which characterizes the genus *Fissurella*, there is in shells of the genus *Emarginula* a cicatrix forming a grooved ridge, when distinct, running from the apex to the anterior margin and terminating either in an incised slit, or a more or less perceptible sinus. The *Emarginulae* are principally inhabitants of deep water, the larger number being obtained by dredging on the shores of Australia, the Philippines and West Indies. There are three British and several Mediterranean species.

Species 1. (Fig. a, b, c, d, Mus. Brit., &c.)

*EMARGINULA RUGOSA. Ema. testâ ovatâ, obliquâ conicâ,
viridi, fuscoque varie radiatâ et pictâ; costis
radiantilibus elevatis, distantibus, asperulatis, cum
minoribus interstitialibus, et lîris concentricis validè
cancelatâ; margine intus crenulato, fissurâ pro
fundâ.*

THE RUGOSE EMARGINULA. Shell ovate, obliquely conical, rayed and painted variously with green and brown, strongly cancellated with elevated, distant, roughened radiating ribs, with smaller interstitial ones, and concentric ridges; margin crenulated within, fissure deep.

Quoy. Voyage de l'Astrolabe.

Clypidina acuminata, A. Adams.

Clypidina candida, A. Adams.

Clypidina annulata, A. Adams.

Clypidina fuscopunctata, Gould.

Clypidina comoda, Gould.

Clypidina aspera, Gould.

Emarginula comoda, Reeve.

Hab. Australia.

The long array of synonyms here cited results from the great variation of form and condition to which this species seem to be liable, and to the extent of wearing to which the sculpture has been exposed in different individuals.

Species 2. (Fig. a, b, Mus. Brit. and Sowerby.)

*EMARGINULA TENUICOSTATA. Ema. testâ ovatâ, j. scâis
viridis vel radiis jucis pictâ, costis numerosis,
nudiliferis, et striis concentricis minutis orbâ
cancelatâ; apice versus marginem posticum in
curvo; fissurâ profundâ, incisâ.*

THE THIN-RIBBED EMARGINULA. Shell ovate, painted with green bands or brown rays, closely cancellated with numerous beaded ribs and minute concentric ridges; apex curved inwards towards the posterior margin; fissure deep, incised.

SOWERBY. Thesaurus Conchyliorum, Fissurellida, Emarginula, Sp. 32, fig. 17, 18.

Hab. —?

Species 3. (Fig. a, b, Mus. Brit.)

*EMARGINULA DEPRESSA. Ema. testâ latâ, depressâ,
quinquilaterali, subviridi, costis crassis, nodosis,
quarum quinque majoribus radiatâ; costâ dorsali
brvci, elevatâ, fissurâ extus inconspicuâ; apice
postico.*

THE DEPRESSED EMARGINULA. Shell broad, depressed, five-sided, greenish, rayed with thick, knobbed ribs, of which five are larger; dorsal rib short,

EMARGINULA.—PLATE I.

raised, fissure inconspicuous outside; apex posterior.

BLAINVILLE. Manual of Malacology.

Hab. Honduras Bay.

Species 4. (Mus. Brit.)

EMARGINULA HUZARDI. *Ema. testā ovali, albā, valdē depresso, posticē latiūsculā, costis subrotundis et liris numerosis regularibus concentricis concinnē cancellatā; apice postico, incurvo; fissurā incisā.*

HUZARD'S EMARGINULA. Shell oval, white, much depressed, posteriorly rather broad, neatly cancelled with rather rounded ribs and numerous regular concentric ridges; apex posterior, curved inwards; fissure incised.

PATRAUDEAU. Proc. Zool. Soc., 1851.

Emarginula Cuvieri, Savigny.

Hab. Mediterranean.

The sculpture of this species is fine, regular, and beautiful.

Species 5. (Mus. Brit.)

EMARGINULA FISSURATA. *Ema. testā latā, depresso, crassā, purpureā, concolori vel rubro variegatā; costis numerosis, granosis radiatā, anticē paulō angustatā; apice paulō postico; costā dorsali elevatā, fissurā brevissimā, incisā.*

THE FISSURED EMARGINULA. Shell broad, depressed, thick, purple of one colour, or varied with red; rayed with numerous granular ribs, a little narrowed anteriorly; apex a little posterior; dorsal rib raised, fissure very short, incised.

CHEMNITZ. Conch. Cab. vol. x.

Emarginula variegata, A. Adams.

Hab. Philippines.

A very solid, broad species, not in danger of being confounded with anything else.

EMARGINULA.

PLATE II.

Species 6. (Mus. Sowerby.)

EMARGINULA POLYGONALIS. *Ema*, testa orato-octagona, alba, depresso-conica, apice subcentrali, postice peroblique inclinata, lateribus subcompressa; radis octo praeponitibus subnodosis, interstitialibus minoribus, alter oblique fissuram brevissimam, intus in canulum, cætis in eodem continuat.

THE MANY-SIDED EMARGINULA. Shell ovate-octagonal, whitish, depressed-conical, apex subcentral, a little inclined posteriorly, sides rather compressed; eight principal rays prominent, subnodose, the interstitial ones smaller, alternating; fissure very short, continued in a canal inside, and a rib outside.

A. ADAMS. Proc. Zool. Soc., 1851. Sowerby's Thesaurus, f. 78, 90.

Emarginula duodecima, A. Adams. The young state of this species.

Hab. Catuman, Philippines.

Species 7. (Mus. Brit.)

EMARGINULA PULCHRA. *Ema*, testa sulcdepresso, subovata, vitudi radiata, antice angustissimata; costis dentatis, postice majoribus; dorso ante eum convexo, postice depresso, apice paulo postice inclinato; testa intus vitudi variegata; fissura brevi, incisa.

THE BEAUTIFUL EMARGINULA. Shell subdepressed, subovate, rayed with green, narrower anteriorly; ribs dentated, the posterior ones the larger; back anteriorly convex, posteriorly depressed, apex a little posteriorly inclined; shell within varied with green; fissure short, incised.

A. ADAMS. Proc. Zool. Soc., 1851. Sowerby's Thesaurus, f. 50-51.

Emarginula picta, Dunker.

Hab. Isl. Catuman, Philippines.

This species was collected by Mr. Cuming on rocks exposed at low water.

Species 8. (Mus. Sowerby.)

EMARGINULA CANCELLATA. *Ema*, testa ovata, albâ, recurvata; costis radiantibus, alternatis, alternatis minoribus, et rugis transversis numerosissimis concentricis regulariter cancellata; dorso antice convexo, postice concavo; fissura incisa, longissimata; apex postice, recurvo; costis fissurali forcata.

THE CANCELLED EMARGINULA. Shell ovate, white, recurved; regularly cancellated with radiating ribs alternately smaller, and with very numerous, fine concentric wrinkles; back anteriorly convex, posteriorly concave; fissure incised, rather long; apex posterior, recurved; fissural rib pitted.

PHILIPPI. Enum. Sicil.

Hab. Panorma.

Species 9. (Mus. Jeffreys.)

EMARGINULA ROSEA. *Ema*, testa parvâ, curvata, albâ, rissiculata, radiatim costis crassissimis paucis, concentricis focis interstitialibus cancellata; apice valde incurvo, post marginem posticam producto, d'eso arcuato, elevato, fissura incisa, brevissimata.

THE ROSY EMARGINULA. Shell small, curved, rosy-white, cancellated radiately with rather thick, few ribs, concentrically with interstitial pits; apex strongly incurved, produced beyond the posterior margin, back arched, elevated, fissure incised, rather short.

BELL. Zool. Journ., vol. i.

Emarginula conica, Blainville.

Emarginula curvirostris, Deshayes.

Emarginula pileolata, Michaud.

Hab. Great Britain. Mediterranean.

Species 10. (Mus. Sowerby.)

EMARGINULA FULIGINEA. *Ema*, testa purpurea, ovalata, depresso, minute costata, fuliginea, radiatum nigro

EMARGINULA.—PLATE II.

variegatâ, intus subviridâ; apice obtuso, subcentrali viridescenti; fissurâ brevissimâ.

THE SMOKY EMARGINULA. Shell small, ovate, depressed, minutely ribbed, sooty, radiately variegated with black, greenish within; apex obtuse, subcentral, greenish; fissure very short.

A. ADAMS. Proc. Zool. Soc., 1851. Sowerby's Thesaurus, f. 7, 8.

Hab. —?

Species 11. (Mus. Brit.)

EMARGINULA SULCIFERA. *Ema. testâ ovali, depresso-conicâ, intus viridescenti, extus fusco-purpurâ; apice obtuso, postico; costellis striisque, radiantibus inaequalibus; margine interno crenulato, nigro punctato; canali fissurali laterali, intus profundo; fissurâ parvâ.*

THE GROOVED EMARGINULA. Shell oval, depressed-conical, greenish within, purplish brown without; apex obtuse, posterior; radiating ribs and striae unequal; inner margin crenulated, spotted with black; fissural canal lateral, deep within; fissure small.

A. ADAMS. Proc. Zool. Soc., 1851. Sowerby's Thesaurus, f. 84, 85.

Hab. —? Mus. Cuming.

This is the only species in which the fissure and the canal leading to it are placed, as in *Siphonaria*, a little on one side.

Species 12. (Mus. Brit.)

EMARGINULA CRATITA. *Ema. testâ ovatâ, conicâ, albida; costis radiantibus acutâ nodosis, distantibus, interstitiis cancellatis, apice obtusâ disculo, paulò post-medio; costa fissurali elevata, fissurâ brevissimâ.*

THE WATTLED EMARGINULA. Shell ovate, conical, whitish; radiating ribs sharply nodose, distant, interstices cancellated, apex rather obtuse, post-median; fissural rib elevated, fissure very short.

A. ADAMS. Proc. Zool. Soc., 1851.

Hab. —?

The type specimen in the Cumingian Collection was unaccompanied by any information as to its locality.

Species 13. (Mus. Sowerby.)

EMARGINULA CONCINNA. *Ema. testâ elongatâ, depresso-albâ; costis radiantibus numerosis, subnodosis; interstitiis cancellatis; apice postico, submarginali, arvato, dorso arcuato, costâ fissurali foveolatâ; fissurâ elongatâ.*

THE NEAT EMARGINULA. Shell elongated, depressed, white; radiating ribs numerous, slightly nodose; interstices cancellated; apex posterior, nearly marginal, arched, back arched, fissural rib ribbed; fissure elongated.

A. ADAMS. Proc. Zool. Soc., 1851.

Hab. Mediterranean?

Distinguished from *Marginella elongata*, of Philippi, by the dorsal curve and the nearly marginal position of the apex.

PLATE III.

Species 14. (Mus. Brit.)

EMARGINULA VIMINEXA. *Ema. testa subconica, pallidissimè fulva, radiatum fissurata; costis radianibus nodulosis, inaequalibus, numerosis, lirisque concentricis, crassis cancellata; apice paulò incurvo, post-mediano; costæ fissurali elevata, crenulata, fissuræ brevissimæ.*

THE WICKER-WORK EMARGINULA. Shell rather conical, very pale fulvous, radiately banded; cancellated with nodose, unequal, numerous, radiating ribs and thick concentric ridges; apex a little incurved, post-medial; fissural rib elevated, crenulated; fissure very short.

A. ADAMS. Proc. Zool. Soc., 1851. Sowerby's Thesaurus, f. 12.

Hab. Philippines.

Species 15. (Mus. Sowerby.)

EMARGINULA GALERICULATA. *Ema. testa parvæ, oratæ, subdepressa, curvæ, tenuiter cancellata; apice post-marginali, dorso convexo; cicatrice fissurali depresso, forcato; fissuræ elongatae.*

THE CAP-SHAPED EMARGINULA. Shell small, ovate, rather depressed, curved, finely cancellated; apex post-marginal, back convex; fissural cicatrix depressed, pitted; fissure elongated.

A. ADAMS. Proc. Zool. Soc., 1851.

Hab. Calapan, Isl. Mindoro, Philippines.

Species 16. (Mus. Brit.)

EMARGINULA CAPULIFORMIS. *Ema. testa parvæ, unicinata, elevata, albida, costis validis paucis subaequalibus et rugis transversis interstitialibus cancellata; apice post-marginali, validè incurvo, dorso convexo, perelevata; fissuræ brevi.*

THE HOODED EMARGINULA. Shell small, hooked, elevated, whitish, cancellated with few strong, nearly equal ribs and transverse interstitial

ridges; apex post-marginal, strongly incurved, back convex, much elevated; fissure short.

PHILIPPI. Ema. Moll. Sicile, I. T. vii. f. 42.
Hab. Mediterranean.

The circumference of this small shell is so narrow, and the curved elevation of the back so high, that it is almost a cornucopia in form.

Species 17. (Mus. Sowerby.)

EMARGINULA ELONGATA. *Ema. oblonga, subdepressa, canaliculæ albæ; costis radiantibus validis, subdistans, quorum plurimæ posteriorib; prominentiorib; et rugis concentricis interstitialibus cancellatæ; apice post-mediano, aente, posteriori inclinato; cicatrice fissurali depresso, forcato; fissuræ incisa, longitudine mediae.*

THE ELONGATED EMARGINULA. Shell oblong, subdepressed, conical, white; cancellated with strong, rather distant radiating ribs, of which several posterior ones are more prominent, and concentric interstitial ridges; apex post-medial, sharp, inclined posteriorly; fissural cicatrix depressed, pitted; fissure incised, of medium length.

COSTA. Phil. Ema. Moll. Sicil.

Hab. Mediterranean.

Species 18. (Mus. Brit.)

EMARGINULA INCISA. *Ema. testa oblonga, depressa, pallidè fulva, posteriori magis expansa, anticè magis elevata, costis crenatis, subrotundatis, radiantibus, et striis concentricis sculpta; apice ante-mediano, recurvo, dorso convexo; fissuræ incisa, elongata.*

THE INCISED EMARGINULA. Shell oblong, depressed, pale fulvous, more expanded at the back, more elevated in front, sculptured with rather rounded, close ribs and concentric striae; apex ante-

EMARGINULA.—PLATE III.

medial, recurved, back convex; fissure incised, elongated.

A. ADAMS. Proc. Zool. Soc., 1851.

Hab. —?

The locality of this remarkable shell in the Cumanian collection is not known.

Species 19. (Mus. Brit.)

EMARGINULA AUSTRALIS. *Ema. testā conicā, elevatā, rotundatō oratō, pallidē fulvā, costis radiatib⁹ sebris inaequalib⁹, et lineis concentricis decussatā, costis trib⁹ anticis magnis; apice paulō post-mediano, recurvo, acuminato, elevato; fissurā brevisimū.*

THE AUSTRALIAN EMARGINULA. Shell conical, elevated, roundly ovate, pale fulvous, deenssated with unequal radiating and concentric lines, three anterior ribs large; apex a little post-medial, recurved, acuminate, elevated; figure very short.

QUOY ET GAIMARD. Voy. Astr.

Hab. Australia.

Species 20. (Mus. Brit.)

EMARGINULA PLANULATA. *Ema. testā depresso, pallidē fulvā, posticē planulatā, productā, anticē brevi, convexiūsculā; costis numerosis subaequalib⁹, de-*

pressis radiatā; apice recurvo, multō ante-mediano; fissurā incisā, elongatā.

THE FLATTENED EMARGINULA. Shell depressed, pale fulvous, posteriorly flattened, produced, anteriorly short, rather convex; rayed with numerous nearly equal depressed ribs; apex recurved, very antemedial; fissure incised, elongated.

AUTHOR ADAMS. Proc. Zool. Soc., 1851.

Hab. Philippines.

This species differs from *Emarginula incisura* principally in the sculpture.

Species 21. (Mus. Brit.)

EMARGINULA CLYPEUS. *Ema. testā pallidē fulvā, depressā, costellis radiatib⁹ numerosis subaequalib⁹ et striis concentricis decussatā; lateribus rectiūsculā; costis trib⁹ posticis majorib⁹; apice centrali, paulō recurvo, fissurā incisā, elongatā.*

THE SHIELD EMARGINULA. Shell pale fulvous, depressed, decussated with numerous radiating nearly equal ribs and concentric striae; sides rather straight, three posterior ribs larger; apex central, a little recurved, fissure incised, elongated.

AUTHOR ADAMS. Proc. Zool. Soc., 1873.

Hab. Philippines.

PLATE IV.

Species 22. (Fig. a, b. Mus. Brit.)

EMARGINULA VARIEGATA. *Ema. testa, subconica, depresso, latâ, punctis radiisq; variegata; apice obtuso, paulo post-medianâ; costis inaequalibus, numerosis, engosis, hinc-sic illico nigro quasi-articulatis; fissurâ brevi.*

THE VARIEGATED EMARGINULA. Shell rather conical, depressed, broad, varied with spots and rays; apex obtuse a little behind the middle; ribs unequal, numerous, rugose, here and there seemingly articulated with black: fissure short.

A. ADAMS. Proc. Zool. Soc., 1851.

Hab. Australia.

Nearly of the form of *Emarginula fuliginosa*, but with rougher and stronger ribs.

Species 23. (Mus. Brit.)

EMARGINULA DILECTA. *Ema. testa depresso, posticè latiusculâ, albida; apice subretrorsa; costis sub-aequalibus, subobtusatis: interstitiis concentricâ liratis; fissurâ subelongatâ.*

THE CHOICE EMARGINULA. Shell depressed, rather broad posteriorly, whitish; apex leaning a little backwards; ribs nearly equal, rather distant; interstices concentrically ridged; fissure rather lengthened.

A. ADAMS. Proc. Zool. Soc., 1851.

Hab. George's Sound, South Australia.

The regularly concentric ridges shown in the interstices give this little shell a beautifully cancellated appearance.

Species 24. (Mus. Brit.)

EMARGINULA OBOVATA. *Ema. testa depresso, albida, posticè subexpansâ, anticè angustiusculâ; apice paulo post-medianâ, recurvo; costis imbricatis et liris concentricis parvis cancellatâ; costâ fissurâ forcipatâ, fissurâ subelongatâ, incisiâ.*

THE OBOVATE EMARGINULA. Shell depressed, whitish, a little expanded posteriorly, rather narrow anteriorly; apex a little behind the middle, recurved; cancellated with imbricated ribs, and small concentric ridges; fissural rib pitted, fissure rather long, incised.

A. ADAMS. Proc. Zool. Soc., 1851.

Hab. Catbalonga, Isl. Samar, H. Cuming.

— — —
Species 25. (Mus. Brit.)

EMARGINULA PUNCTICULATA. *Ema. testâ ellipticâ, posticè paulo latiori, albida, costis radiantibus, rugosâ, sub-distantibus et liris tenuibus concentricâ reticulatâ, apice postico aente recurvo: cicatrice fissurali planulatâ; fissurâ latâ, brevissimâ.*

THE PUNCTICULATED FISSURELLA. Shell elliptic, a little broader posteriorly, whitish, reticulated with rough, rather distant radiating ribs and thin concentric ridges; apex posterior sharp, recurved; fissural cicatrix flattened; fissure broad, rather short.

A. ADAMS. Proc. Zool. Soc., 1851.

Hab. — ?

Quite distinct from *Emarginula crassa* in sculpture although similar in form.

— — —
Species 26. (Mus. Brit.)

EMARGINULA CRASSA. *Ema. testâ magnâ, elevatâ, conicâ, solidâ, albâ, posticè latiori, costulis minime nodosis, inaequalibus, fasciculatis, radiatâ, apice retrorsâ, post-medianâ, cix incurvo.*

THE THICK EMARGINULA. Shell large, elevated, conical, solid, white, posteriorly broader, rayed with minutely nodose unequal fasciculated ripples;

EMARGINULA.—PLATE IV.

apex bent backwards, post-medial, scarcely bent inwards.

J. SOWERBY. Min. Con., Pl. 33

Emarginula solidula, Costa.

Hab. Great Britain, Mediterranean.

Species 27. (Fig. b, c, Pl. VIII., Mus. Brit.)

EMARGINULA EMENDATA. *Ema. testā ovali, conicā, latā, fusco : apice elevato, incurvo, valde post-mediani ; costis aequalibus, rotundis, crebris : fissurā elongatā, angustā, propè marginem contractā, ad marginem clausā.*

THE MENDED EMARGINULA. Shell oval, conical, broad, brown; apex elevated, incurved, much behind the middle; ribs equal, rounded, close; fissure elongated narrow, contracted near the margin, closed at the margin.

SOWERBY. Thesaurus Conchyliorum. Emarginula, sp. 31, f. 11.

Hab. —?

By the curious way in which the edges of the fissure are drawn together towards the margin till closed, this shell becomes a sort of link between the genera *Rimula* and *Emarginula*.

Species 28. (Mus. Brit.)

EMARGINULA CUCULLATA. *Ema. testā ovatā, elevatā, albida, anticē contractā ; costis validis posticō magis*

distantibus, radiantibus, et liris concentricis reticulata ; apice elevato retrosum, arcuato, multo post-mediani ; fissurā latā, elongatā, incisā.

THE HOODED EMARGINULA. Shell ovate, elevated, whitish, anteriorly contracted, reticulated with strong radiating ribs more distant posteriorly and concentric ridges; apex elevated, arched backward, much behind the middle; fissure broad, elongated, incised.

A. ADAMS. Proc. Zool. Soc., 1851.

Hab. Singapore.

Found on larger shells in five fathoms of water.

Species 29. (Fig. a, b, Mus. Brit.)

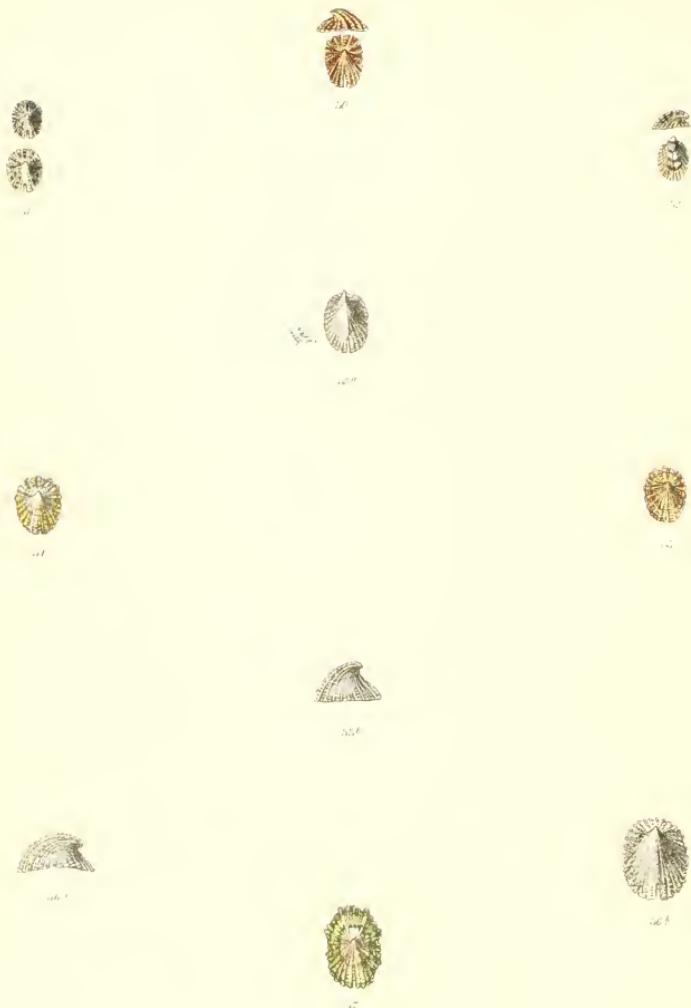

EMARGINULA ADAMSIANA. *Ema. testā pallidè roseā, ellipticā, costis magnis rugosis, et parvis intermedialis radiantibus, et liris concentricis inaequalibus scarosis cancellatā ; dorso arcuato ; apice post marginem posticum declinato ; fissurā longiusculā, incisa.*

ADAMS'S EMARGINULA. Shell pale rose, elliptic; cancellated with large rugose radiating ribs, and unequal scarrous concentric ridges; back arched; apex bent over beyond the posterior margin; fissure rather long, incised.

SOWERBY. Thesaurus Conchyliorum. Emarginula, sp. 26, f. 27, 28.

Hab. Japan.

This species slightly resembles *Emarginula rosea*, but the ribs are much fewer and coarser.

E M A R G I N U L A.

PLATE V.

Species 30. (Mus. Brit.)

EMARGINULA SCABRIUSCULA. *Ema. testā orato-subquadrati, subdepressi, pallidi fulvā, fuscō-rubescēti maculatā, antīcē angustiūsculā, posticē pīpī marginē tumidā, dorso arcuato, apicē recurvo, post-mediotibis; costis radiantibus crassis, rugosis, distan- tibus, interstitiis cancellatis: fissurā elongatā, incisi.*

THE SCABROUS EMARGINULA. Shell ovately subquadrate, subdepressed, pale fulvous, spotted with reddish-brown, rather narrow anteriorly, tumid posteriorly near the margin, back arched, apex recurved, post-medial; radiating ribs thick, rough, distant, with the interstices cancellated; fissure elongated, incised.

A. ADAMS. Proc. Zool. Soc., 1861.

Hab. Japan.

Species 31. (Fig. *a, b*, Mus. ——²)

EMARGINULA PUNCTATA. *Ema. testā parvā, ovato-subrotundā, depresso; costis radiantibus parvis, distantibus, nigro punctatis; interstitiis striatis; apice obtuso, post-medio: fissurā incisi.*

THE DOTTED EMARGINULA. Shell small, rounded ovate, depressed; radiating ribs small, distant, spotted with black; interstices striated; apex obtuse, post-medial; fissure incised.

A. ADAMS. Proc. Zool. Soc., 1851.

Hab. San Nicholas, Isl. Zebu, Philippines.

A little neatly spotted species so shortly oval as to be nearly round.

Species 32. (Fig. *a, b*, Mus. Brit.)

EMARGINULA MACULATA. *Ema. testā parvā, ovatā, depressā, minutiē radiatim costatā, interstitiis con- centrīcī liratis; dorso arcuato, griseo maculato; apicē recurvo, marginem declinato.*

THE SPOTTED EMARGINULA. Shell small, ovate, depressed, minutely radiately ribbed, interstices concentrically ridged; back arched, spotted with grey; apex recurved, bent over behind the margin.

A. ADAMS. Sowerby's Thesaurus. *Emarginula*, sp. 27. f. 31, 32.

Hab. Gotto, Japan.

Species 33. (Fig. *a, b*, Mus. Sowerby.)

EMARGINULA RETICULATA. *Ema. testā albi, conicā, elevatā, costis validis radiatibus, et liris concen- tricis reticulatā; interstitiis profundē foreolatis; apice retrooro, acuto; fissurā elongatā, incisi.*

THE RETICULATED EMARGINULA. Shell white, conical raised, reticulated with strong radiating ribs and concentric ridges; interstices deeply pitted; apex leaning backwards, sharp; fissure elongated incised.

J. SOWERBY. Mineral Conchology.

Tatella fissura (pars.), LINNÆUS.

Emarginula heris, REELING.

Emarginula reticosa, A. ADAMS.

Hab. Isl. Luzon, Philippines.

Species 34. (Mus. Cuming.)

EMARGINULA VANIKOROENSIS. *Ema. testā latā, conicā, arcuatā, tenui, albida, antīcē angustiūsculā: costis latis, tumidis distantibus: margine crenulato; apice post-medio: fissurā brevi.*

THE VANIKORO EMARGINULA. Shell broad, conical, arched, thin, white, rather narrow anteriorly; ribs broad, tumid, distinct; margin crenulated; apex post-medial, fissure short.

Quoy. Voyage de l'Astrolabe.

Hab. Vanikoro.

EMARGINULA.—PLATE V.

Species 35. (Mus. Brit.)

EMARGINULA CLATHRATA. *Em. testā depressā, albida, latā, costis radiantibus rotundis, subdistantibus, et liris concentricis cancellatā, intersticiis foveolatis; apice arcuatim retroso; fissurā elongatā, angustā, incisā.*

THE CROSS-BARRED EMARGINULA. Shell depressed, white, broad, cancellated with rather distant rounded radiating ribs, and concentric ridges with pitted interstices; apex arched backwards; fissure elongated, narrow, incised.

PEASE —? Sowerby's Thesaurus. Emarginula, species 7, f. 54.

Hab. Sandwich Islands.

Species 36. (Fig. a, b, Mus. Brit.)

EMARGINULA BELLULA. *Em. testā ovatā, alba, arcuatā, ventricosā; apice post-mediani, declinato; costis distantibus, prominentibus, et liris intermediis subechinatis; carina fissurali foveolatā; fissurā elongatā.*

THE BEAUTIFUL EMARGINULA. Shell ovate, white, arched, ventriclese; apex post-medial, bent down; ribs

distant, prominent, and small intermediate ones nearly spinose; fissural keel pitted; fissure elongated.

A. ADAMS. Proc. Zool. Soc., 1851.

Hab. Isl. Luzon, Philippines.

This pretty shell is distinguished from *Emarginula cancellata* by its aculeated sculpture.

Species 37. (Mus. Brit.)

EMARGINULA SCUTULATA. *Em. testā oblongā, polygonā, subdepressā, viridi concentricē fasciatā; costis rugosis inaequalibus, fasciculatis; apice obtuso, post-mediane; cicatrice fissurati depressā, minutē foveolatā, fissurā brevi, incisā.*

THE SHIELD-SHAPED EMARGINULA. Shell oblong, polygonal, subdepressed, concentrically banded with green; ribs rough, unequal, collected in bunches; apex obtuse, post-medial; fissural cicatrix depressed, minutely pitted, fissure short, incised.

Species 38. (Mus. Brit.)

EMARGINULA CRASSICOSTATA. *Ema. testā parvā, subovatā, antīcē latūsculā, rugosā; costis radiantibus numerosis, irregularibus, nodulosis, interstitiis concentricis regulariter rotundatis, forcōlatā; apice pustulo; dorso arcuato; cicatrīcē fissurali elevata; fissurā elongatā.*

THE THICK-RIBBED EMARGINULA. Shell small, subovate, anteriorly rather broad, rugose; radiating ribs numerous, equal, nodulose, interstices concentrically ridged, pitted; apex posterior; back arched; fissural cicatrix elevated, fissure elongated.

SOWERBY. *Thesaurus Conchyliorum.* *Fissurellidae.* PL XI. fig. 42.

Hab. —?

Species 39. (Mus. Brit.)

EMARGINULA CRASSILABRUM. *Ema. testā compressā, posticē expansā, fulvā, partim subcinereā, quinque-angulatā, costellis irregularibus, validis, ad angulos pronuntiatiōibus, posticē duplicitatis radiatā, margine dentato; apice obtuso paulā antico; costā fissurali prominenti, fissurā brevi, quadratā.*

THE THICK-RIBBED EMARGINULA. Shell compressed, posteriorly expanded, fulvous, partly subcinereous, five-angled, rayed with unequal, strong ribs, more prominent at the angles, the posterior ones doubled, margin toothed; apex obtuse, a little anterior; fissural rib prominent, fissure short, square.

A. ADAMS. *Proc. Zool. Soc.*, 1851.

Hab. —?

A very limpet-like shell, with no tendency in the beak to curve.

Species 40. (Mus. Brit.)

EMARGINULA NODULOSA. *Ema. testā fulvo-viridi, elevatā, arcuatā, costis septem crassis, lobatis, latis, prominentibus radiatā, inter costas forcōlatā; costā fissurali angustatā, prominenti; fissurā internā; apice revexo, dorso arcuato.*

THE NODULOUS EMARGINULA. Shell fulvous-green, elevated, arched, rayed with seven thick lobed, broad, prominent ribs, pitted between the ribs; fissural rib narrow, prominent; fissure internal; apex recurved, back arched.

A. ADAMS. *Proc. Zool. Soc.*, 1851.

Hab. Sibonga, Isl. Zebu, Philippines.

The ribs are thickly clubbed and the fissure is only visible on the inner edge.

Species 41. (Mus. Brit.)

EMARGINULA CUMINGI. *Ema. testā compressā, pallidē fulvā, medio et versā apicē viridi pictā; costis rugatā, rotundis, inaequaliter fasciculatis radiatā; margine expanso, lobato, octangulato; apice obtuso, ante-mediā; fissurā brevi, incisa.*

CUMING'S EMARGINULA. Shell compressed, pale fulvous, painted with green in the middle and towards the apex; rayed with wrinkled, rounded, unequally grouped ribs; margin expanded, lobed, octangular; apex obtuse, ante-median; fissure short, incised.

SOWERBY. *Thesaurus Conchyliorum.* *Fissurellidae.* PL XII. 76; *Emarginula*, species 76.

Hab. Australia.

Species 42. (Fig. a, b, Mus. Brit.)

EMARGINULA NOTATA. *Ema. testā ovato-subrotundā, depressā, latā, subcarinatā, costis numerosis, depresso-nigris radiatā, intus ad marginem lineis nigris ornati dispositis notatā; apice obtusa, ante-mediā; fissurā inconspicuā.*

THE MARKED EMARGINULA. Shell ovate-subrotund, depressed, broad, bluish, rayed with numerous depressed, black ribs, marked inside at the margin with black lines ornately disposed; apex obtuse, ante-median; fissure inconspicuous.

LINNEUS (Patella). *Systema Naturæ.*

Hab. —?

December, 1873.

EMARGINULA.—PLATE VI.

The fissure in this species is only represented by a slight groove in the interior, scarcely perceptible at the margin. The black lines are placed in ornamenteally festooned clusters on the margin.

Species 43. (Fig. a, b, Mus. Brit.)

EMARGINULA PANHIENSIS. *Ema. testá elevatá, arcuatá, ríridi, cancellatá; costis nodulosis, validis, posticis et lateradibus subangulis, tribus anticis magnis, prominentibus, dicens radiatá; maryiae antico elevato; dorso arcuato, apice postico, acutè recurvo.*

THE PANHI EMARGINULA. Shell elevated, arched, green, cancellated, rayed with nodulose, strong ribs, the hinder and lateral ones nearly equal, three in front large, prominent, divided; anterior margin ele-

vated; back arched, apex posterior, acutely recurved.

QUOY. Voyage de l'Astrolabe.

Emarginula clathrata, Adams and Reeve.
Hab. Panhi; Quoy. Philippines; Cuming.

Species 44. (Fig. a, b, Mus. Brit.)

EMARGINULA SOLIDULA. *Ema. testá parvá, albá, solidatá, ovatá, paulò elevatá; costis rotundis, subnodosis radiatá; intersticiis angustis; apice post-mediani: fissurá elongatá, incisá.*

THE SOLID EMARGINULA. Shell small, white, solid, ovate, little elevated; rayed with rounded subnodose ribs; interstices narrow; apex post-median; fissure elongated, incised.

EMARGINULA.

PLATE VII.

Species 45. (Fig. a, b. Mus. Brit.)

EMARGINULA CANDIDA. *Ema, testā albā, arcuatā, ovalē, costis cylindricis, nodosis, subangulatis circū viginti, radiatī, interstītiis concentricī liratīs et forcipatīs; apicē valde retrocurvā; dorso arcuato; fissurā brevi, subquadratā, incisa.*

THE WHITE EMARGINULA. Shell white, arched, ovate, rayed with about twenty strong, nodose, nearly equal ribs, with concentrically ridged and pitted interstices; apex much recurved; back arched; fissure short, rather square, incised.

A. ADAMS. Sowerby's Thesaurus Conchyliorum. Fissurellidae, Emarginula, sp. 16, figs. 45, 46.
Hab. Port Adelaide, Australia.

This species is of exquisite sculpture.

Species 46. (Mus. Brit.)

EMARGINULA PUMILA. *Ema, testā parvā, pallidō fusca, depresso, costis irregularibus, rotundis, concentricē rugatis radiatā; costā fissurali elevatā; fissurā incisa; brevissimā; apicē obtuso, subcentrali.*

THE DWARFISH EMARGINULA. Shell small, pale brown, depressed, rayed with unequal rounded concentrically wrinkled ribs; fissural rib raised; fissure incised, rather short; apex obtuse, nearly central.

ARTHUR ADAMS. Proc. Zool. Soc., 1851; Sowerby's Thes. Conch. Fissurellidae, Plate V., fig. 57.
Hab. —

A little *patella-like* species with coarse sculpture.

Species 47. (Mus. Brit.)

EMARGINULA STRIATULA. *Ema, testā parvā, albā, oblongā, depresso, costis irregularibus, subrotundis, tribus posticis et quatuor anticus majoribus, lateraliibus minoribus, paucis intermedis radiatā, interstītiis tenuiter concentricē striatis; apicē post-mediana obtuso, fissurā incisa, oblongā.*

THE LITTLE STRIATED EMARGINULA. Shell small, white,

oblong, depressed, rayed with unequal, rather rounded ribs, the three posterior and four anterior larger, and the lateral smaller, a few intermediate, with finely, concentrically striated interstices; apex post-median, fissure incised, oblong.

Quoy. Voyage de l'Astrolabe.

Hab. Australia.

Species 48. (Mus. Brit.)

EMARGINULA LEVICOSTATA. *Ema, testā parvā, albā, griseo radiis latīs pictā, depresso, posticē rotundā, antecē angustiori, angulari, subplanulatā, costis sublängitatis radiatā, interstītiis concinnae forcipatīs et costellis interstitialibus varis; apicē paulū post-medianā; fissurā invisa, oblongā.*

THE SMOOTH-RIBBED EMARGINULA. Shell small, white, painted with grey in broad rays; depressed, rounded posteriorly, narrower anteriorly, angular, rather flat, rayed with rather smooth ribs, with interstices neatly pitted and a few interstitial riblets; apex a little post-median; fissure incised, oblong.

A. ADAMS. Proc. Zool. Soc., 1851; Sowerby's Thes. Conch. Fissurellidae, Plate V., fig. 57.

Hab. —

A pretty little species, with the ribs rather smooth.

Species 49. (Mus. Brit.)

EMARGINULA ACULEATA. *Ema, testā parvā, elongatā, fulvā, fusco radiatā, posticē rotundā, antecē angustiori, costis prominentibus, subnodosis posticē radiolaribus radiatā; interstītiis concentricē liratīs; apicē recurvā, aculeato, post-mediano.*

THE ACULEATED EMARGINULA. Shell small, elongated, fulvous, rayed with brown, rounded posteriorly, narrower anteriorly, rayed with prominent, rather nodose ribs, the posterior stronger, interstices con-

EMARGINULA.—PLATE VII.

centrally ridged; apex recurved, aculeated, post-median.

A. ADAMS. Proc. Zool. Soc., 1851.
Hab. —?

The narrow brown rays give a sprightliness of appearance to this pretty little species.

Species 50. (Mus. Brit.)

EMARGINULA LATA. *Ema. testā depresso-pallidē fulvā, subquadratā, costis rugosis, validis, inaequalibus, laterali subcompressis radiatā, interstitiis angustis; costā fissurali elevatā; fissuri parvā, quadratā; apice centrali, obtuso.*

THE BROAD EMARGINULA. Shell depressed, pale fulvous, subquadrate, rayed with rough, strong, unequal, laterally rather compressed ribs, with narrow interstices; fissural rib raised; fissure small, square; apex central, obtuse.

QUOY. Voyage de l'Astrolabe.
Submarginula catillus, A. Adams.
Hab. Australia.

Species 51. (Fig. a, b, Mus. Brit.)

EMARGINULA ALVEOLATA. *Ema. testā pallidē fulvā, ovatā, subcomicē, elevatā, costis octodecim circū,*

crassis, rugatis radiatā; interstitiis concentricē tiratis; apice postico, retroso, dorso antīcē arcuato, posticē infīrā apicem ferè perpendiculariter declīri; fissurā brevi.

THE CHANNELLED EMARGINULA. Shell pale fulvous, ovate, rather conical, elevated, rayed with about eighteen thick, wrinkled ribs with concentrically ridged interstices; apex posterior, turned back; back arched anteriorly, almost perpendicularly sloped posteriorly below the apex; fissure short.

A. ADAMS. Proc. Zool. Soc., 1851.
Hab. Honduras.

Species 52. (Mus. Brit.)

EMARGINULA LONGIFISSE. *Ema. testā oblongā, depresso-subquadratā, costis anticis distantiis, majoribus lateralibus compressis radiatā; apice longi post-mediani; fissurā elongata, incisā.*

THE LONG-SLAT EMARGINULA. Shell oblong, depressed, subquadrate, rayed with ribs, the anterior ones distant, lateral ones compressed; apex far behind the middle; fissure lengthened, incised.

SOWERBY. Thesaurus Conchyliorum. Fissurellidae,
Emarginula, species 19, Pl. XI f. 62.
Hab. —?

34 a

35

36 a

E M A R G I N U L A.

PLATE VIII.

FIG. 27. *Emarginula*.

EMARGINULA EMELENATA. *Sowerby.* The first figure, given in a previous place, is that of a dark variety, the lighter variety now figured being drawn from specimens in the British Museum under the name of *Emarginula Paivana*, Crosse.

Species 53. (Mus. Brit.)

EMARGINULA SCULPTILIS. *Ema.* testa depressa, antice subquadrate, postice subacuminata; costis rugatis deinceps concinnae sculptis quatuor tribus posticis magnis, tribus antice majoribus, radiatis, pallidis fulvâ, marginis fuscis inter costas pecti; apice obtuso, paulo post-medianum; costâ fissurali prominenti; fissura brevissima.

THE SCULPTURED EMARGINULA. Shell depressed, anteriorly rather square, posteriorly slightly acuminate; rayed with ten wrinkled, neatly sculptured ribs, of which the three posterior are large and the three anterior very large, pale fulvous, painted with brown spots between the ribs; apex obtuse, a little post-median; fissural rib prominent; fissure very short.

A. ADAMS. Proc. Zool. Soc., 1851.

Hab. Calapan, Mindoro, Philippines.

Peculiarly distinguished by rows of brown spots between the well-sculptured ribs.

Species 54. (Brit. Mus.)

EMARGINULA SCABRICOSTATA. *Ema.* testa parva, albâ, depressa, costis quindecim minutissimâ sebris, distantiis radiatis; interstitiis concentricâ levatis; apice post-medianâ; fissurâ brevissimâ, subquadrate.

THE COUGH-RIBBED EMARGINULA. Shell small, white, depressed, rayed with fifteen very minutely scabrous, distant ribs; interstices concentrically ridged; apex post-median; fissure rather short, squarish.

A. ADAMS. Proc. Zool. Soc., 1851.

Hab. Isl. Corregidor, Bay of Manilla.

At first sight, the ribs of this little species appear smooth, but the lens shows that they are in reality very minutely scabrous.

Species 55. (Mus. Brit.)

EMARGINULA DEPRESSA. *Ema.* testa magna, subviridi, depressa, costis molosis inaequalibus radiatis, antice subcontractis, postice paulo magis expansâ; apice obtuso, ante medianum; costâ fissurali brevi; fissura brevissima.

THE DEPRESSED EMARGINULA. Shell large, greenish, depressed, rayed with unequal nodose ribs, anteriorly a little contracted, posteriorly a little more expanded; apex obtuse, ante-median; fissural rib short; fissure very short.

BLAINVILLE. Manuel de Malacologie.

Hab. Honduras.

Species 56. (Mus. Brit.)

EMARGINULA STELLATA. *Ema.* testa pallidè fulvâ, depresso, costis rugosis, radiis inaequalibus, ad marginem prominulis, acutis radiatis; apice obtuso, centrali; costâ fissurali paulo obliquâ; fissurâ brevissimâ.

THE SILLATED EMARGINULA. Shell pale fulvous, depressed, rayed with rugose very unequal ribs, prominent and sharp at the margin; apex obtuse, central; fissural rib a little oblique; fissure very short.

A. ADAMS. Proc. Zool. Soc., 1851.

Hab. Australia.

Somewhat resembling *Emarginula rugosa*, but with the ribs very sharply prominent at the margin, and the fissure a little on one side.

Species 57. (Mus. Brit.)

EMARGINULA IMBRICATA. *Ema.* testa magna, ovata, depresso, fulvâ, medio ferruginosâ, costis rotundis,

EMARGINULA.—PLATE VIII.

nodosis, inaequalibus, quarum tribus anticus majoribus radiatâ; apice centrali, obtuso; fissurâ brevissimâ.

THE IMBRICATED EMARGINULA. Shell large, ovate, depressed, fulvous, ferruginous in the middle, rayed with rounded, nodose, unequal ribs, of which the three anterior are the larger; apex central, obtuse; fissure very short.

A. ADAMS. Proc. Zool. Soc., 1851.

Hab. Mouth of Victoria River, S. Australia.

Species 58. (Mus. Brit.)

EMARGINULA TASMANIAE. *Ema. testâ rugosâ, pallidâ, conicâ, costis magnis, nodosis, inaequalibus radiatâ; apice elevato, valde retroso; costâ fissurali elongatâ, prominenti; fissurâ brevi.*

THE TASMANIAN EMARGINULA. Shell rugose, pale, conical, rayed with large, nodose, unequal ribs; apex elevated, much thrown back; fissural rib elongated, prominent; fissure short.

SOWERBY. Thesaurus Conchyliorum. Fissurellidæ, Emarginula, sp. 49, fig. 72.

Hab. Tasmania.

Species 59. (Fig. a, b, Mus. Brit.)

EMARGINULA JAPONICA. *Ema. testâ subovatâ, posticè sub-*

contractâ, tenuiter costatâ, purpureo-fuscâ; apice valde retroso; dorso anticô arcuato; fissurâ brevissimâ, incisa.

THE JAPAN EMARGINULA. Shell subovate, posteriorly rather contracted, finely ribbed, purple-brown; apex much turned backwards; back arched in front; fissure rather short, incised.

SOWERBY. Thesaurus Conchyliorum. Fissurellidæ, Emarginula, sp. 36, figs. 43, 44.

Hab. Japan.

Species 60. (Mus. Brit.)

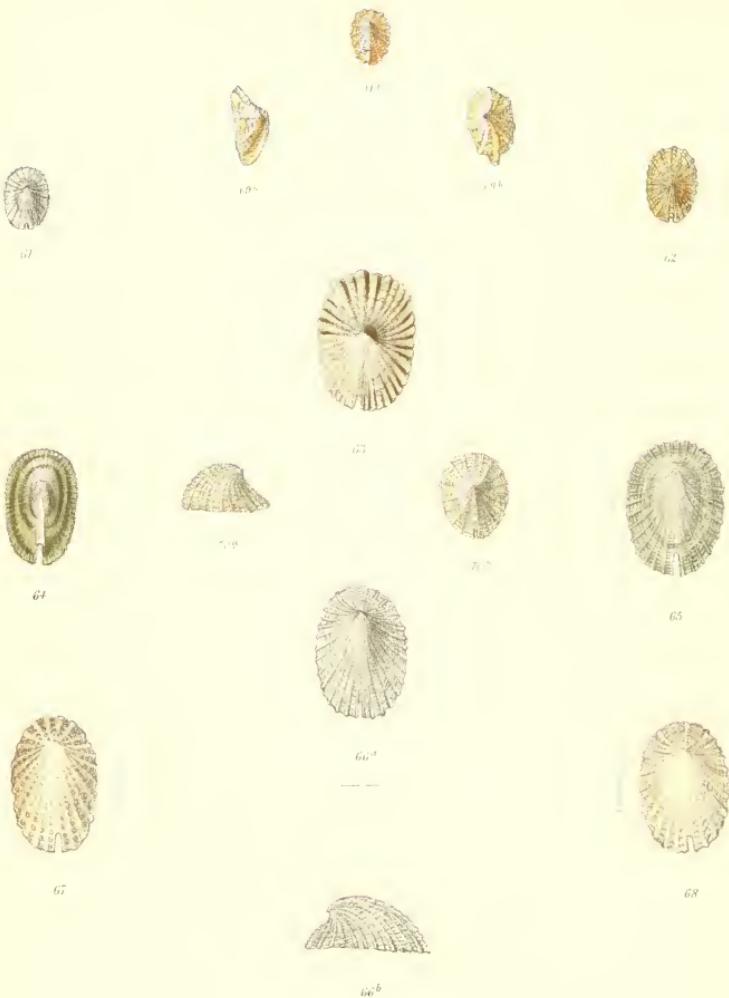

EMARGINULA GUADALOUPENSIS. *Ema. testâ rugosâ, conicâ, viridi, costis inaequalibus, clathratis, nodosis radiatâ; interstitiis forosatis; apice elevato, acuminato; costâ fissurali prominenti; fissurâ brevissimâ.*

THE GUADALOUPE EMARGINULA. Shell rugose, conical, green, rayed with unequal, latticed, nodose ribs, with pitted interstices; apex elevated, acuminate; fissural rib prominent; fissure very short.

SOWERBY. Thesaurus Conchyliorum. Fissurellidæ, Emarginula, sp. 55, fig. 69.

Hab. Guadalupe.

A rough, irregular shell, coarsely resembling *Emarginula Pankiensis*, but not having the symmetrical sculpture of that shell.

EMARGINULA.

PLATE IX.

(Species 14. Fig. b, c.)

EMARGINULA VIMINEA. *A. Adams.* To replace figures *a* and *b*, Plate III., which were representations of *E. tenuistrigata* repeated by mistake.

Species 61. (Mus. Brit.)

EMARGINULA TEXTILIS. *Ema. testā oratā, costis solidis radiatā, striis concentricis cinctā, albidi, subcirculari cirod medium annulatā; margine dentato; apice versus marginem posticum declinato; costā dorsali acutē elevatā, minutē foveolatā; fissurā brevi, incisā.*

THE TEXTILE EMARGINULA. Shell ovate, rayed with solid ribs, surrounded with concentric striae, whitish, with a greenish ring about the middle : margin dentated; sloped towards the posterior margin; dorsal rib sharply raised, minutely pitted ; fissure short, incised.

GOULD. Invertebrates of United States.
Hab. N. America.

Species 62. (Mus. Brit.)

EMARGINULA SCABRICULA. *Ema. testā ovatā, anticē paulō angustatā; pallidē fulvā, costis distans, acutē squamatis, radiatā; liris concentricis inter costas conspicuīs; apice acuto, ante medium recurvo; costā dorsali elevatā, fissurā brevissimā, incisā.*

THE SHARP-SCALED EMARGINULA. Shell ovate, anteriorly a little narrowed; pale fulvous, rayed with distant acutely scaled ribs; concentric ridges conspicuous between the ribs; apex acute, recurved in front of the middle; dorsal rib raised, fissure very short, incised.

A. ADAMS. MS. in Cum. Coll.
Hab. —?

Differing from *Emarginula rugosa* in the sharp prominence of the rather distant ribs.

Species 63. (Mus. —? copied.)

EMARGINULA SCUTELLA. *Ema. testā pallidē fulvā, depresso, irregulariter costatā; costis inaequalibus, rotundis, approximatis, concentricē striatis; apice*

acute, paulō post-medium recurvo; margine postico subangulato.

THE LITTLE SHIELD EMARGINULA. Shell pale fulvous, depressed, irregularly ribbed; ribs unequal, rounded, approximate, concentrically striated ; apex acute, curved backwards a little behind the middle; posterior margin rather angular.

DESHAYES. Conch. Isl. de la Réunion, Pl. XXXIV., f. 1, 2.

Hab. Isl. Bourbon, or Réunion.

An irregular angular character in the posterior outline distinguishes this species.

Species 64. (Mus. Crosse.)

EMARGINULA THOMASI. *Ema. testā parvā, depressā, posticē rotundatā, anticē angustatā, costis numerosis regularibus radiantibus, et striis elevatis concentricis concinnae cancellatā, pallidē subcirculari, fasciis obliquis cinctā; apice obtuso, paulō post medium inclinato; margine arcuato, intus denticulato; fissurā latā; sulco dorsali distincto.*

THOMAS'S EMARGINULA. Shell small, depressed, rounded posteriorly, narrowed anteriorly, neatly cancellated with numerous regular radiating ribs and raised concentric striae, pale greenish, encircled with olive bands; apex obtuse, inclined a little behind the middle; margin arched, denticulated within, fissure broad, with a distinct dorsal groove.

CROSSE. Journal de Conchyliologie, 1855, p. 43.
Hab. Aden, Red Sea.

Species 65. Mus. —? copied.)

EMARGINULA COSTULATA. *Ema. testā ovatā, elevatā, pallidē subcirculari, costis validis, rectangularibus, subdistantibus et liris concentricis distinctis, inaequalibus, quarum plurimis annulatis cancellatā; apice validē retrorsō, canali dorsali profundi; fissurā magnā, incisa.*

THE RIBBED EMARGINULA. Shell ovate, elevated, pale greenish, cancellated with strong rectangular, rather distant ribs and concentric distinct, unequal ribs, of which several are annular; apex much recurved, with a deep dorsal canal; fissure large, incised.

DESHAYES. Conch. Isl. de la Réunion, Pl. XXXIV., f. 5-3.
Hab. Isl. Bourbon, or Réunion.

Some of the concentric ridges are so raised over the ribs as to form scarcely interrupted rings.

EMARGINULA.—PLATE IX.

Species 66. (Fig. a, b, Mus. —? copied.)

EMARGINULA DECORATA. *Ema. testā pāvē, subdepressā, albā, arcuatim convexā, costellis radiantibus angustis, et līris interstitialibus planatis minutis concentricis sculptā; apice obtuso, valdē retrorsō; fissurā brevi, incisā.*

THE DECORATED EMARGINULA. Shell small, sub-depressed, white, arched convexly, sculptured with narrow, radiating ribs and minute flattened, interstitial concentric ridges; apex obtuse, very backward; fissure short, incised.

DESHAYES. Conch. de l'Isl. de la Réunion, p. 49, Pl. VII., f. 68.

Hab. Isl. Réunion (Bourbon).

A very interesting and neatly sculptured minute species.

Species 67. (Fig. a, b, Mus. —? copied.)

EMARGINULA FENESTRELLA. *Ema. testā parrā, albida, convexo-arcuata, oblongo-ovata, costis crassis, levibus, rotundis radiantibus, et foculis purvis, rotundis interstitialibus sculpta; apice obtuso, valde retrorsō; costā fissurali distincto; fissurā breviuscūla, incisā.*

THE CASEMENT EMARGINULA. Shell small, whitish, convexly arched, oblong-ovate, sculptured with thick, smooth, rounded, radiating ribs, and small rounded interstitial pits; apex obtuse, very backward; fissural rib distinct; fissure rather short, incised.

DESHAYES. Conch. de la Réunion, Pl. VII., fig. 12-15.
Hab. Isl. de la Réunion (Bourbon).

Species 68. (Mus. Deshayes.)

EMARGINULA DECORATA. *Ema. testā albā, ovatā, costis validis subdistantibus minutiā, inter costas foveolis subquadratis concentricē cancellati; apice obtuso, retrorsō; fissurā breviuscūla, latā.*

THE DECORATED EMARGINULA. Shell white, ovate, strengthened with rather distant, strong ribs, concentrically cancelled between the ribs with squarish pits; apex obtuse, placed backwards; fissure rather short, broad.

DESHAYES Conchyliologie de l'Isle de la Réunion.
Hab. Isl. Réunion (Bourbon).

Species 69. (Fig. a, b, Mus. Sowerby.)

EMARGINULA OLDFHAMI. *Ema. testā albida, conicā oblonga, irregulariter hexagona, inaequilateralis, costis magnis nodosis quinque majoribus, interstitialibus minoribus radiantibus et līris parvis concentricis sculpta; apice elevato, versus marginem dextram incurvo; costā fissurali lamelliformi, prominenti, fissurā brevi, profunda.*

OLDFHAM'S EMARGINULA. Shell whitish, conical, oblong, irregularly hexagonal, inequilateral, sculptured with five large, nodose, radiating ribs, some interstitial smaller ones and small concentric ridges; apex raised, bent in towards the right margin; fissural rib lamelliform, prominent, fissure short, deep.

Hab. Ceylon.

This remarkably formed species has some affinity with *Emarginula Paphiensis*, in which there is a slight tendency to the one sidedness so decided on the shell before us.

Species 70. (Fig. a, b, Mus. Sowerby.)

EMARGINULA TUMIDA. *Ema. testā ovato-subrotundā, albida, anticē subcontracta, costis prominentibus numerosis subserratis, acutis radiantibus et līris irregulribus concentricis cancellati; dorso anticē valde arcuato, gibbosō; costā fissurali prominenti, fissurā breviuscūla, profunda, incisa; apice versus marginem posticum inclinato.*

THE TUMID EMARGINULA. Shell ovate rotund, whitish, a little concentrated anteriorly, cancelled with numerous slightly serrated, sharp radiating ribs and irregular concentric ridges; back anteriorly much arched, gibbous; fissural rib prominent, fissure rather short, deep, incised; apex inclined towards the posterior margin.

SOWERBY.

Hab. —?

Emarginula candida is a less tum'd shell, and the notch is very short and not incised as in this species.

G N A T H O D O N.

PLATE I.

Genus GNATHODON, Gray.

Testa bivalvis, aquivalve, trigona vel subtrigona, epidermide iodata; umbo distanti; dentes valvae dextrae cardinalis duo, parvi, laterales duo, posticus elongatus, anticus cuneiformis; valva sinistrae cardinalis unus, lateralis duo, posticus elongatus, anticus cuneiformis; impressio muscularis duae, laterales; ligamentum in foream trigonum internum dispositum.

Shell bivalve, aquivalve, trigonal or subtrigonal, covered with an epidermis; umbones distant; teeth in the right valve, two cardinal, small, two lateral, posterior elongated, anterior cuneiform; of the left valve one cardinal, two lateral, posterior elongated, anterior cuneiform; muscular impressions two, lateral; ligament placed in a trigonal internal pit.

Syn. RANGIA, Desmoulins.

This genus belongs to the *Maetra* group, and is remarkable for the cuneiform character of the anterior lateral teeth, and for the deep central pit in the hinge for the reception of the cartilage or ligament. None of the species belong decidedly either to salt or fresh water, but the type is from Lake Pontchartrain in New Orleans, where it has been used as an article of food, and three of the other species, which have much thinner shells covered with a lighter epidermis, are found in mud-banks in brackish water in the Gulf of Mexico. One of the remaining two is from Guadalupe.

Species 1. (Mus. Sowerby.)

GNATHODON CUNEATUS. *Gna. testâ ovato-subtrigonâ, crassa, epidermide crasso olivaceo iodata; latere antico brevi, rotundatum tumido; umbo elevatus, magnis, distantibus; latere postico angulato, ante angulum depresso, ad terminum subrostrata.*

THE CUNEATE GNATHODON. Shell ovate, subtrigonal, thick, covered with a thick olive epidermis;

anterior side short, roundly tumid; umbo elevated, large, distant; posterior side angular, depressed in front of the angle, somewhat beaked at the end.

GRAY. American Journal of Science.

Rangia cyprinoides, Desmoulins.

Hab., Lake Pontchartrain, New Orleans.

The larger the size to which specimens grow, the less oval and more rostrate they become. The smaller specimens, with a lighter and greener epidermis, are more ovate.

Species 2. (Mus. Brit.)

GNATHODON GUADALOUPENSIS. *Gna. testâ tenuissimâ, albâ, subtrigoni, epidermide tenui, pallidè straminei iodata; latere postico obliquè biangulari, producto, subrostrato, ad terminum truncato, latere antico ampli, rotundo.*

THE GUADALOUPA GNATHODON. Shell rather thin, white, subtrigonal, covered with a thin, pale straw-coloured epidermis; posterior side obliquely biangular, produced, somewhat beaked, truncated at the end, full, rounded at the anterior side.

PETIT. Journal de Conchyliologie.

Hab., Guadalupe.

Although different looking shells, this species and the following four present all the essential characters of the genus.

Species 3. (Mus. Brit.)

GNATHODON CANTRAILI. *Gna. testâ tenuissimâ, albâ, subtrigoni, epidermide tenui, pallidè straminei iodata, inflata; latere postico obliquè biangulari, paulò producto; latere antice breviissimo, rotundo; margine ventrali arqualiter concavo.*

CANTRAINE'S GNATHODON. Shell rather thin, white, subtrigonal, covered with a thin, pale straw-

GNATHODON.—PLATE I.

coloured epidermis, inflated; posterior side obliquely biangular, a little produced; anterior side rather short, rounded; ventral margin equally convex.

RECLUZ. —?

Hab. —?

This species is perhaps correctly distinguished from the preceding by being shorter, less produced and rostrated at the posterior end, and being on the whole a much more evenly inflated shell.

Species 4.

GNATHODON TRIGONUS. *Gna. testā trigonā, compressā, latere postico biangulato, declivi, ad terminum truncato; umbonibus haud tantum elevatis; latere antico brevi, declivi.*

THE TRIGONAL GNATHODON. Shell trigonal, compressed, posterior side biangular, sloped, truncated at the end; umboes not much elevated; anterior side short, sloped.

PETIT. Journal de Conchyliologie.

Hab. California. Gulf of Mexico.

Much more compressed and trigonal than the two preceding.

Species 5. (Mus. Brit.)

GNATHODON ROSTRATUS. *Gna. testā compressā, validè inaequilaterali, sublongata; latere postico producto, declivi, leviter biangulato, ante angulos margine convexo; latere antico brevissimo; umbonibus depressis.*

THE BEAKED GNATHODON. Shell compressed, very inequilateral, rather elongated; posterior side produced and sloped, slightly biangular, with a convex margin in front of the angles; anterior side very short; umboes depressed.

PETIT. Journal de Conchyliologie.

Hab. Gulf of Mexico.

Species 6. (Mus. Sowerby.)

GNATHODON PARVUS. *Gna. testā parvā, trigonā, ventricosā, pallidā; latere postico acutē angulato, post angulum lato, depresso, ad terminum rostrato; latere antico brevi, declivi; umbonibus prominentibus, posticō angulatis.*

THE SMALL GNATHODON. Shell small, trigonal, ventricose, pale; posterior side acutely angular, broad and depressed behind the angle, beaked at the end; anterior side short, sloped; umboes prominent, posteriorly angulated.

PETIT. —?

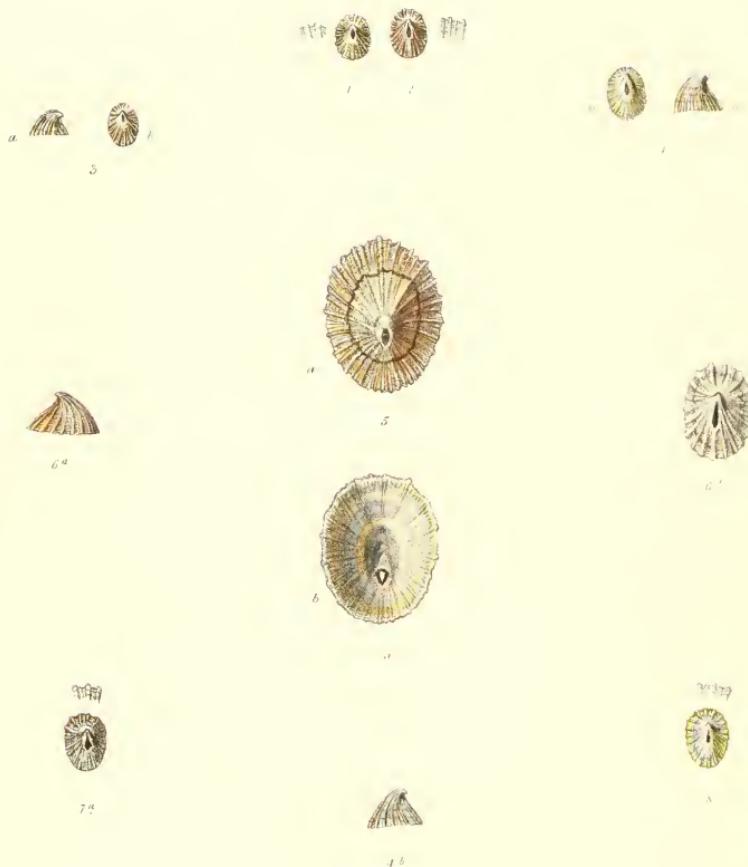

Hab. Mexico.

Beyond the fall of dews
Deeper than plummet lies."—*Longfellow*

C E M O R I A.

PLATE 1.

Genus CEMORIA, *Leach.*

Testa polyformis, ovata, conica, costis radiatis; apex integrus, postice recurvus; foramen infra apicem positum, interne lamina arcuata testarum semichausus.

Shell pelliform, ovate, conical, rayed with ribs; apex entire, posteriorly recurved; foramen placed below the apex and the margin, half-closed within by an arched testaceous lamina.

The species of this genus have a Northern range. In North America, the Northern parts of Britain, Greenland, and Norway, are their habitats chiefly to be found. One species was discovered by Mr. Adams in Japan. Although, like *Rivularia*, the shells have the foramen placed half-way between the apex and the margin, unlike that genus they have it internally half vaulted by a shelly plate.

Species 1. (Mus. Brit.)

CEMORIA GALEATA. *Cem. testâ oratâ, fuscâ, costis numerosis rotundatis, sublevigatis et paucis interstitialibus evanuis radiatis latere postico brevissimo.*

THE CRESTED CEMORIA. Shell ovate, smoky-brown, rayed with numerous rounded rather smooth ribs, and a few thin interstitial ones posterior side rather short.

GOULD. United States Expedition. Shells.
Hab. Puget's Sound.

A little dull-coloured species without many characteristic points.

Species 2. (Mus. Brit.)

CEMORIA COGNATA. *Cem. testâ parvâ, albâ, costis rotundis, prominentibus, concentricâ rugatis, subdistans radiatâ, interstitiis concentricâ liratis; apice acuminato, elevato.*

THE COGNATE CEMORIA. Shell small, white, rayed with rounded, prominent, concentrically wrinkled,

rather distant ribs, with concentrically ridged interstices; apex acuminate, elevated.

GOULD. Shells of the United States Expedition.
Hab. Orange Harbour, Couthenay.

A sharp acuminate species.

Species 3. (Fig. a, b, Mus. Brit.)

CEMORIA CONICA. *Cem. testâ parvâ, elevatâ, conicâ, costis parvis, rotundatis, alternatis, concentricâ striatis radiatâ; dorso elevato, apice vallidâ recurvo.*

THE CONICAL CEMORIA. Shell small, elevated, conical, rayed with small, rounded, alternating, concentrically striated ribs; back elevated, apex much recurved.

D'ORBIGNY. Amérique Méridionale, p. 471, Pl. 78.
Hab. Central America.

Species 4. (Fig. a, b, Mus. Brit.)

CEMORIA FASTIGIATA. *Cem. testâ albâ, ovatâ, conicâ, altissimâ, costis subangulatis, nodosis, alternatis, tenuibus radiatâ; apice elevato, post-medianâ, pallidâ recurvo; dorso antice subarcuato, postice fere perpendiculariter declivi.*

THE HIGH-TOPPED CEMORIA. Shell white, ovate, conical, much elevated, rayed with rather angular, nodose, alternative, thin ribs; apex elevated, post-median, a little curved; back a little arched anteriorly, sloped nearly perpendicularly behind.

A. ADAMS. Proc. Zool. Soc., 1851, p. 228.
Hab. —?

The most elevated of all the species.

Species 5. (Fig. a, b, Mus. Brit.)

CEMORIA CUCULLATA. *Cem. testâ elevatâ, fulvâ, magnâ, atque juniori subspiraliter acuminata; costis inaequalibus, angulatis, concentricâ tenuiter rugatis.*

CEMORIA.—PLATE I.

radiatā, interstices concentricē striatis; apice ante-medianā; lineā dorsali antīcē declivi, rectius-culo.

THE HOODED CEMORIA. Shell elevated, fulvous, large, in a young stage almost spirally acuminate; rayed with unequal, angular concentrically finely wrinkled ribs, with concentrically striated interstices, apex ante-median, dorsal line sloped, rather straight.

Gould. United States Expedition. Shells, p. 14.
Hab. ——?

This shell gives all the characteristics of the genus on a larger scale than the original type.

Species 6. (Fig. a, b, Mus. Brit.)

CEMORIA NOBILIS. *Cem. testā breviusculi, ovatā, conicē elevatissimā; atdūe juniori ferē spiraliter acuminatā; costis octodecim circū distantiis, bravigatis, majoribus, et intermediis nonnullis tenuissimis radiis; apice acuminato, perlevato; dorso utrinque valde declivi.*

Fig. 6 NOBLE CEMORIA. Shell rather short, ovate, conical, much elevated; in a young stage almost spirally acuminate; rayed with about eighteen distant, smooth, larger, and some very thin intermediate ribs; apex acuminate, much elevated, with the back on both sides much sloped.

A. ADAMS. Proc. Zool. Soc.
Hab. Okosiris, Japan.

Species 7. (Fig. a, b, Mus. MacAndrew.)

CEMORIA NOACHINA. *Cem. testā albā, conicē, elevatā, posticē subexpansā, anticē magis angustatā; costis inaequalibus, leviusculis posticē distantiis, anticē magis numerosis radiatā: apice elevate, post-medianā.*

THE NOACHIAN CEMORIA. Shell white, conical, elevated, posteriorly rather expanded, narrower anteriorly; rayed with unequal, rather smooth, posteriorly distant, anteriorly more numerous ribs; apex elevated, post-median.

LINNEUS. Mantissa, 551.

Patella fissurilla, Muller.

Patella apertura, Montagu.

Rimula Flemingii, Macgillivray.

Cemoria princeps, Mighæls.

Hab. Northern Europe.

Species 8. (Mus. Brit.)

CEMORIA FALKLANDICA. *Cem. testā ovatā, albā, elevatā, costis subdistantiis, concentricē striatis radiati: apice recurvo, elevate, post-medianā.*

THE FALKLAND CEMORIA. Shell ovate, white, elevated, rayed with rather distant, concentrically striated ribs; apex recurved, elevated, post-median.

A. ADAMS. Sowerby's Thesaurus. Fissurellidae, Cemoria, Sp. 7, Plate X. fig. 14.

Hab. Falkland Islands.

The ribs are more distant and equal than those of *Cemoria Noachina*, and the oval outline is as broad anteriorly as posteriorly.

R I M U L A.

PLAT. I.

Genus RIMULA, *D'Orbigny*.

Testa rotundata, tenui, cancellata; apice convexo; dorno arcuato; fissura simplex, inter media et marginem intermedia.

Shell pateriform, thin, cancellated; apex recurved; back arched; fissure simple, intermediate between the apex and the margin.

The recent species of this interesting little genus, formerly known only in a fossil state, are, with the exception of one from Mazatlan, found in the Philippine Islands, and first collected there by the late Mr. Cuming.

The gradation in the several genera of Fissurellidae is marked in the position of the fissure. In *Fissurilla*, it is simply a hole in the apex; in *Cenomia* it is just in front of the apex, leaving it entire and generally pointed, and being vaulted over by a little septum on the inside; in *Craumpsis* the septum half covers the fissure on the inside, but the latter is removed to half-way between the apex and the margin; in *Rimula* the fissure is in a similar situation, but has no internal septum; then in *Emarginula* the fissure, commencing about halfway down the dorsal ridge, remains open to the margin and gradually through many species in commencing nearer and nearer to the margin until it becomes lost in an almost imperceptible sinus. In the genus *Zebra*, there is an internal septum near the posterior margin and a fissure, like that of *Emarginula*, in the anterior margin.

Species 1. (Fig. *a, b*, Mus. Brit.)

RIMULA EXQUISITA. *Rim. testa ovato-oblonga, albâ, moderate elevata, costis radiantibus tenibus, et liris concentricis concavâ cancellata; dorso arcuata, apice valde recurvo.*

THE EXQUISITE RIMULA. Shell ovate-oblong, white, moderately elevated, neatly cancellated with thin radiating ribs and concentric ridges; back arched, apex turned far back.

A. ADAMS. Proc. Zool. Soc., 1851.
Hab. Several of the Philippine Islands

This is the largest of the species and of exquisite sculpture.

Species 2. (Mus. Brit.)

RIMULA CUMINGII. *Rim. testâ parvâ, fulcâ, ovatâ, costis radiantibus rotundis concentricâ rugatis et liris concentricis cancellata; dorso elevato; apice acutâ recurvo.*

CUMING'S RIMULA. Shell small, fulvous, ovate, cancellated with rounded concentrically wrinkled ribs and concentric ridges; back elevated; apex sharply recurved.

A. ADAMS. Proc. Zool. Soc., 1851.
Rimula ochiota, Gould.

Hab. Eastern Seas.

Species 3. (Mus. Brit.)

RIMULA PROPINQUA. *Rim. testâ parvâ, albâ, minutâ cancellata; costellis radiantibus prominentioribus, duabus versus marginem anticanum convergentibus; dorso elevato; apice acuto, recurvo.*

THE NEIGHBOURING RIMULA. Shell small, white, minutely cancellated; radiating ribs more prominent; two converging towards the anterior margin; back elevated; apex acute, recurved.

A. ADAMS. Proc. Zool. Soc., 1851.
Hab. Calapan, Philippines.

Species 4. (Mus. Brit.)

RIMULA CARINATA. *Rim. testâ parvâ, albâ, costellis tenibus, conflatis radiatis, intersituâ minutissimâ foccolatis; apice valde recurvo, planulatum carinato.*

THE KEELED RIMULA. Shell small, white, rayed with

RIMULA.—PLATE I.

thin, close ribs, with interstices very minutely
fitted; apex strongly recurved, flatly keeled.

A. ADAMS. Proc. Zool. Soc., 1851.

Hab. Misamis, Isl. Mindinao, Philippines.

A curious characteristic of this little shell is a sort of flattened keel extending from the coiled apex to the fissure. Mr. Adams describes this as being formed by the convergence of several apical rays.

Species 5. (Mus. Brit.)

RIMULA MAZATLANICA. *Rim. testū minutā, pallidē fulvā,*
depressā, oblongā, costis crassis, subimbricatis, sub-
distantibus radiatā.

THE MAZATLAN RIMULA. Shell minute, pale fulvous,
depressed, oblong, rayed with thick, subimbricated,
rather distant ribs.

CARPENTER (P. P.) Shells of Mazatlan.

Hab. Mazatlan.

MONOGRAPH
OF THE GENUS
CRANOPSIS AND ZEIDORA.

"He prayeth best, who loveth best
All things both great and small."—*Cideridyl*.

leidena

CRANOPSIS AND ZEIDORA.

Genus CRANOPSIS, A. Adams.

Testa capuliformis, extus cancellata; apice recurvo, integro; fissura in medio posita, inter apicem et marginem anticum, fornicato interno arcuato.
Shell cap-shaped, cancellated outside; apex recurved, entire; fissure placed midway between the apex and the anterior margin, internal vault arched.

The only two species known of this genus are from Japan. The position of the foramen is the same as in the preceding genus, *Rivularia*; but, unlike that genus, it has the internal vaulted septum of *Ceromia*.

Species 1. (Fig. a, b, Mus. Brit.)

CRANOPSIS FILEOLUS. *Cra. testi pileiformi, costellis radiantibus crenulatis; apice posticè raddi incurvato; fissuri anticè angusti; marginae posticè reflexo; dorso planulato quasi-carinato.*

THE CAP-SHAPED CRANOPSIS. Shell cap shaped, with crenulated radiating riblets; apex much incurved posteriorly; fissure anteriorly sharp; margin posteriorly reflected; back with a kind of flattened keel.

A. ADAMS. Sowerby's Thesaurus. Fissurellidae, Cranopsis, sp. 1, fig. 1, 2.

Hab. Mino-Sima, Japan.

The apex of this shell is coiled and extends posteriorly a little beyond the margin.

Species 2. (Fig. a, b, Mus. Brit.)

CRANOPSIS FELEX. *Cra. testi conici, acuminatæ, costellis radiantibus et liris minutis concentricis cancellata; apice acuminato, recurvo, dorso intice posticè dectiri.*

THE HELMET-SHADED CRANOPSIS. Shell conical, acuminate, cancellated with radiating riblets and minute concentric ridges; apex acuminate, recurved, back sloped anteriorly and posteriorly.

A. ADAMS. Annals and Magazine of Natural History for 1860.

Hab. Mino-Sima, Japan.

Genus ZEIDORA, A. Adams.

Testa patelliformis, oblonga, depresso, extus cancellata; apice post-marginali; margine antico fissurato;

aperturæ ovata, posticè lamina septiformi, transversæ subtigrigoniæ divisæ.

Shell patelliform, oblong, depressed, cancellated on the outside; apex post-marginal, anterior margin fissured; aperture ovate, posteriorly divided by a septiform, transverse, somewhat trigonal lamina.

The *Zeidora*, like the *Cramopsidea*, are comparatively recent discoveries associated with the name of Arthur Adams and with the shores of Japan. Having a septiform plate, like that of *Crepidula* in form, but perhaps more analogous to the small vaulted lamina under the foramen in *Ceromia*, and yet having the marginal slit of *Emarginata*, this curious little genus affords an interesting example of the ever-varying forms of Nature.

Species 1. (Fig. a, b, Mus. Brit.)

ZEIDORA RETICULATA. *Zei. testa oblonga, dorso convexa, lineis elevatis radiantibus et liris concentricis posticè decussatis; aperturæ margine crenulata; fissuri marginati angusti, oblongi.*

THE RETICULATED ZEIDORA. Shell oblong, back convex, very beautifully decussated with raised radiating lines and concentric ridges; aperture crenulated at the margin; marginal fissure narrow, oblong.

A. ADAMS. Ann. and Mag. of Nat. Hist.

Hab. Mino-Sima, Japan.

The form is more convex and the fissure more narrow and deeply cut than in the next species.

Species 2. (Mus. Brit.)

ZEIDORA CALCEOINA. *Zei. testa oblonga, depresso-concava, costellis radiantibus et liris concentricis eleganter cancellata; sulco mediano lateribus elevatis; apice posticè diflexo, septo margine auctor integræ.*

THE SLIPPER ZEIDORA. Shell oblong, depressed-convex, elegantly cancellated with radiating riblets and concentric ridges; middle sulcus with elevated sides; apex bent down posteriorly; septum with a sharp, entire margin.

A. ADAMS. Ann. and Mag. of Nat. Hist., 1860.

Hab. Mino-Sima, Japan.

The dorsal groove forms a sort of broad double-edged keel, pitted between the two edges.

TYPHIS.

PLATE I.

Genus TYPHIS, Moolfort

Testa fusiformis, canalicula varicosa; variebus utroque anfractibus; anfractibus angularis, ad angulum ante utramque varicem tubam penetrantibus; tubis intus penetrantibus, ad apicem aperiens; canal clauso. Operculum cornuum, concentricum, nucleo subterminali.

Shell fusiform, with a canal, varicose; varices three on each whorl; whorls angular, bearing a tube before each varix at the angle; tubes penetrating within, open at the apex; canal closed. Operculum horny, concentric with nearly terminal nucleus.

A tube on the angle of the whorls in front of each varix, sometimes joined to it, but more generally distinct from it and placed half-way between the two varices, forms the distinguishing character of the shells of this genus. In other respects they do not differ from Murices with three varices. The type species, *T. Sowerbeyi*, is a Mediterranean shell. The other species are from Western Columbia, Western Africa, Japan, Borneo, and New Zealand.

Species 1. (Fig. a, b, Mus. Brit.)

TYPHIS GRANDIS. *Typ. testâ magnâ, solidâ, inter varices purpureo-castaneâ; anfractibus rotundato angularis; variebus fulvis, crassis, ad marginem cristatis, ad canalem expansis; tubis brevissimis, magnis inter varices medianis; canali lato; apertura parvâ.*

THE LARGE TYPHIS. Shell large, solid, purple-chestnut between the varices; whorls roundly-angular; varices fulvous, thick, curled at the edge, expanded at the canal; tubes rather short, large half-way between the varices; canal broad; aperture wide.

A. ADAMS. Proc. Zool. Soc., 1865.
Hab. —?

This large solid shell is in every way typical of the genus.

Species 2. (Fig. a, b, Mus. Cumi in Brit.)

TYPHIS CORONATUS. *Typ. testâ oblongâ, pallidâ, fulvâ; anfractibus superne subrotundis; variebus crassis, spiritaliter levatis, ad suturam uncinatis; tubis brevissimis juxta varicem succedentem locatis; canali lato, recto, ad terminum truncato.*

THE CORONATED TYPHIS. Shell oblong, pale fulvous; whorls rounded above; varices thick, spirally ridged, hooked at the suture; tubes very short, placed near the succeeding varix; canal broad, straight, truncated at the end.

BRODERIP. Proc. Zool. Soc., 1832.

Hab. Caraccas Bay.

This interesting species has remained represented by a unique and somewhat undeveloped shell in the Cumingian collection at the British Museum.

Species 3. (Mus. Brit.)

TYPHIS FIMBRIATUS. *Typ. testâ magnâ, tenuiusculâ, oblongâ; anfractibus inter varices subflavidis, infre medium castaneo unifasciatis; proprie varices purpureo fasciatis; variebus expansis, ad faciem radiatum fimbriatis, superne cuneatis, dorso crispati; tubis magnis, proprie varicem succedentem locatis; canali latissimo.*

THE FIMBRIATED TYPHIS. Shell large, rather thin, oblong; whorls yellowish between the varices, with a single band of chestnut below the middle; with a purple band near the varices; varices expanded, fringed in rays on the face, cuneate above, curled at the back; tubes large, placed near the succeeding varix; canal very broad.

A. ADAMS. Proc. Zool. Soc., 1865.

Hab. —?

Remarkable for the broad expansion of the fringed varix.

TYPHIS.—PLATE I.

Species 4. (Fig. *a*, *b*, Mus. Cunn. in Brit.)

TYPHIS CUMINGI. *Typ. testā clavatā, pallidiē fulvā, inter varices purpureā, castaneo maculatā : anfractibus superm̄ inflatis, infīri angostatis, dimidiatim inter varices tuberculis elongatis cum tubis convexis gerentibus ; varicibus angustatis, ad suturam auctatis, ad canalem hanc continuis, ultimo ad sūcūm fibrato ; canali elongato, angustato.*

CUMING'S TYPHIS. Shell clavate, pale fulvous, purple between the varices, chestnut-spotted; whorls inflated above, narrow below, bearing elongated tubercles connected with the tubes half-way between the varices; varices angular, acutulated at the suture, not continued at the canal, the last fringed on the face: canal long, narrow.

BRODERIP. Proc. Zool. Soc., 1832.

Hab. Bay of Caracas.

PLATE II.

Species 5. (Fig. a, b, c, Mus. Brit.)

TYPHIS SOWERBYI. *Typ. testa subtriangularis, albida, vel fusca; spiræ elevata; varicibus angustis, rotundatis, varicibus extubatis, laevoes, expansis, spiræ uncinatis, tubis intermedias utramcunq[ue] oblique curvis, ad canalem truncatis; canal angusto, recurvus.*
SOWERBY'S TYPHIS. Shell subtriangular, whitish, or brown; spire elevated; whorls rather attenuated below; varices projecting, fluted, expanded, hooked above; tubes intermediate, the last elongated, rather recurved, truncated at the canal; canal narrow, recurved.

BRODERIP. Proc. Zool. Soc., 1832.

Hab. Mediterranean.

Species 6. (Fig. a, b, Mus. Brit.)

TYPHIS NITENS. *Typ. testa brevi, albida, subrosea, nitens; spiræ ultimum angustatu longitudinali fere argentei; varicibus laminatis, extubatis, supra angulum elevatis, evanatis, tubis mediorum, canali brevi, rectilineo.*

THE SHINING TYPHIS. Shell short, pinky white, shining; spire nearly equal in length to the last whorl; varices laminar, standing out raised above the angle, evanescing; tubes medial; canal short, rather straight.

HINDS. Voyage of the Sulphur: Mellusea, p. 10, pl. 3, f. 5, 6.

Hab. Id. St. Macassar.

Species 7. (Fig. a, b, Mus. Brit.)

TYPHIS PINNATUS. *Typ. testa albâ, tenui, subaurata, cancellata; spiræ elevata; varicibus latis, laevoes, fibratibus, infra expensis; canali brevissimo.*

THE PINNATED TYPHIS. Shell white, thin, rather ovate, cancellated; spire elevated; varices broad, fluted, fringed, expanded below; canal rather short.

BRODERIP. Proc. Zool. Soc., 1832.

Hab. ——?

The original type was long a unique object in Mr. Wallace's small collection. It was lost, but there are now two specimens in the Cunningham collection of the British Museum.

Species 8. (Fig. a, b, Mus. Taylor.)

TYPHIS DUPLICATUS. *Typ. testa orato-acuminata, inter varices cuneatae; varicibus arcuatis reductis, ead tubis int. restitutis confluentibus, tubis alta, duplicitas efformantibus; spiræ acuminata, elevata, canali latissimo, tenui.*

THE DOUBLED TYPHIS. Shell ovate-acuminated, chestnut between the varices; varices arched backwards, confluent with the interstitial tubes, forming broad double tubes; spire acuminate, elevated; canal rather broad, thin.

SOWERBY. Proc. Zool. Soc., 1870.

Hab. China Seas.

This is the second species discovered in which the varix is so bent back as to be confluent with the preceding tube, the first being *T. arcuatus* of Hinds.

Species 9. (Mus. Brit.)

TYPHIS BELCHERI. *Typ. testa fusiformi, albida; onfractibus rotundis; varicibus angustis, laevoes, infra pinnatis, supra uniplicatis, arcuatis, expansis, ad terminum valle uncinatis, angustatis, tubis intermedias, recurvis; spiræ elevata.*

BELCHER'S TYPHIS. Shell fusiform, whitish; whorls rounded; varices narrow, fluted, pinnated below, uniplated above, with a curved expansion; much hooked and sharpened at the end; tubes intermediate, recurved; spire elevated.

BRODERIP. Proc. Zool. Soc., 1832.

Hab. Cape Blanco.

Species 10. (Mus. Brit.)

TYPHIS ARCUATUS. *Typ. testā brevi, ovati, p̄s̄c̄d̄ vel fulvidā; varicibus arcuatīs, tumidīs, ad tubas precedētis in uno junctis; spira elevatā; canali latiūsculo, ad terminum attenuatō recurvo.*

THE ARCHED TYPHIS. Shell short, oval, brown or slightly fulvous; varices arched, tumid, joined in one to the preceding tubes; spire elevated; canal rather broad, attenuated towards the end, recurved.

HINX. Voyage of the Sulphur, Mollusca, p. 10, Pl. III., f. 5, 6.

Typhis Japonicus, A. Adams.

Hab. Cape of Good Hope—Japan.

In this species the duplication of the tube is less conspicuous than in *Typhis duplicatus*.

Species 11. (Mus. Angas).

TYPHIS CLERII. *Typ. testā fusiformi, pallidē fulvī, fulvo obscurē fasciatā; anfractibus superne rotundis, infidē attenuatis; varicibus digitatis dīgitis uncinatis; tubis intermediis, distinctis; canali elongato, recurvo.*

CLERY'S TYPHIS. Shell fusiform, pale fulvous, obscurely banded with brown; whorls rounded above, attenuated below; varices fingered, fingers uncinate; tubes intermediate, distinct; canal elongated, recurved.

PETIT. Révüe Zoologique, 1846.

Hab. New Zealand.

Species 12. (Fig. a, b, Mus. Nobis.)

TYPHIS EXPANSUS. *Typ. testā lati, pallidē fulvā, subturbanatā; anfractibus superne angulatis, suprad angulum planulatis; varicibus angulatis, superne in spinam acuminatam elevatis, ultimo latē expanso,*

superne multiplicato, retrorsim arcuato, ad marginem acutē levigato; canali lato, breviūsculo; tubis prope varicēs precedētis locatis, retrorsim curvis.

THE EXPANDED TYPHIS. Shell broad, pale fulvous, somewhat turbinated; whorls angular above, flattened above the angle; varices angular, raised above in an acuminate spine, the last broadly expanded, with a single fold above, arched backwards, sharply fluted at the edge; canal broad, rather short; tubes placed near the preceding varices, curved backwards.

SOWERBY (Journ.) 1874.

Hab. —?

Species 13. (Mus. Brit.)

TYPHIS QUADRATUS. *Typ. testā subquadratā, solidā, inter varicēs fulvī, fulvo strigatis: anfractibus pyriformibus: tubis intermediis, breviūsculis; variculus crassus, albī, pallidē strigatis, medio finitatis, suprad uncinatis; canali lato, propē termina angusto, obliquē retroso.*

THE SQUAT TYPHIS. Shell subquadrate, solid, fulvous between the varices, striped with brown; whorls pyriform; tubes intermediate, rather short; varices thick, white, with pale stripes, fringed in the middle, hooked above; canal broad, narrow near the end, turned obliquely backwards.

HINX. Voyage of the Sulphur, Mollusca, p. 10, Pl. III., IV., figs. 5, 6.

Hab. Gulf of Nicoya, Bay of Guayaquil.

Species 14. (Mus. Angas.)

TYPHIS YATESII. *Typ. testā fusiformi, brevi, pallidē rosatī; anfractibus pyriformibus; varicibus pinnatis, medio leviter levigatis, infidē unilobatis, suprad elevatis, acutē uncinatis; tubis intermediis, breviūsculis, distinctis; canali brevi, lato.*

TYPHS.—PLATE III.

YATES's TYPHS. Shell fusiform, short, pale rose; whorls pyriform; varices pinnated, slightly fluted in the middle, with a single lobe below, elevated above, sharply uncinnate; tubes intermediate, rather short, distinct; canal short, broad.

ANGAS. Proc. Zool. Soc.

Hab. Australia.

Species 15. (Mus. Brit.)

TYPHS MONTFORTHI. *Typ. testā fusiformi, parvā, pallidē roseā: anfractibus pyriformibus: spirā ele-*

vatā: varicibus lamunatis, extantibus, medio angulatim plicatis, supernē acutē uncinnatis: tubis propè varices precedentes locatis, ultimis elongatis: canali angustiāculo, subrecurvo.

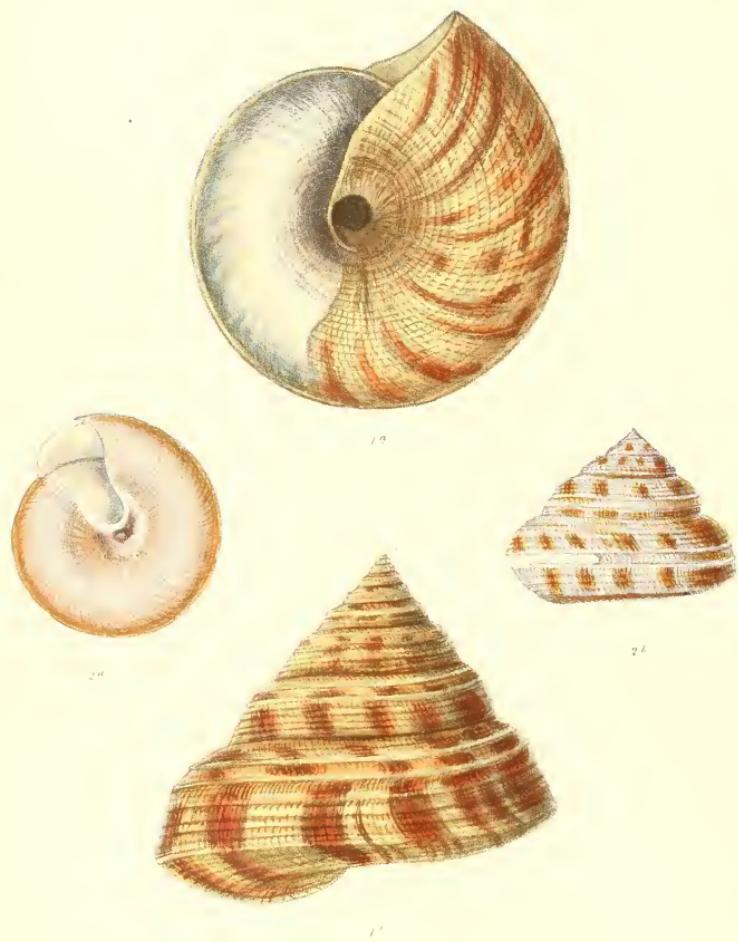

MONTFORTH's TYPHS. Shell fusiform, small, pale rose; whorls pyriform; spire elevated; varices laminated, outstanding, angularly plaited in the middle, sharply hooked above; tubes placed near the preceding varices, the last elongated; canal rather narrow, slightly recurved.

A. ADAMS. Ann. and Mag. of Nat. Hist.

PLATE I.

Genre PLEUROTOMARIA. D'Orbigny.

Terebratula testacea, testa canaliculata; annularis tuberculata, recta et supra canalis crenatus; periphery arcuatum striatum, spiraliter sculptum; labrum exterum fissuram elongatam invasa emarginatum.

Shell trochiform, pearly within, cancellated without; whorls turreted, spirally sculptured in the middle or above, with a scar-like, curved-striated canal. Outer lip emarginated with an elongated incised fissure.

Two species only of this hitherto supposed extinct genus are now known. The first was published in the *Journal de Conchyliologie*, in 1855, from the Island of Marie Galante. The other is in the collection of M. Crosse, the present conductor of that work, who described it in 1861; both represented by unique specimens. In the later and larger specimen the lip is so broken away that it does not exhibit the fissure, which, however, is inferred by a spiral scar on the upper part of the whorls.

Species 1. (Fig. *a, b*, Mus. Crosse.)

PLEUROTOMARIA ADANSONIANA. *Ple. testa rotunda, testa fibra, umbilico non perforato, infra costae planulatae, canalis opercularis lirata, liris membranaceis concentricis decussatis, puluis latescens, canalis rugis irregulardibus pretul: anfractibus undevici, teste crassitudine propria satyram oblique planobatus tunc angulatus: cicatrix spirali latitudo, tenetem arcuatum striatum, ad angulum superius locata.*

ADANSON'S PLEUROTOMARIA. Shell large, trochiform, perforated with a large umbilicus, flattened-convex below; spirally ridged all over, decussated with smaller ribs; pale yellowish, irregularly painted with irregular red patches; whorls eleven, slowly increasing, obliquely flattened near the suture, then angular; spiral cicatrix broad, with fine curved striae, placed at the upper angle.

CROSSE AND FISCHER. *Journal de Conchyliologie*, 1861.

Hab. Marie-Galante.

Species 2. (Fig. *a, b*, Mus. De Burgh.)

PLEUROTOMARIA QUOYANA. *Ple. testa trochiformi, cancellata, imperforata, corneo-purpurascens, muculus subquadratus picta: spira moderate elevata: anfractibus novem, subrotundis, cicatrice spirali profunda, adioli striata circa medium locata: fissura elongata.*

QUOY'S PLEUROTOMARIA. Shell trochiform, cancellated, imperforate, purplish-fleshy, painted with square patches; spire moderately raised; whorls nine, rather rounded; spiral cicatrix deep, strongly striated, placed about the middle; fissure elongated.

FISCHER AND BERNARDI. *Journal de Conchyliologie*, 1855, p. 165.

Hab. —?

This species has no umbilicus, its whorls are fewer than in the preceding species, and the cicatrix is in the centre of the whorls, instead of being at the upper part near the angle.

February, 1874.

G A L E O M M A.

PLATE I.

Genus GALEOMMA, Turt.

Turtonia quadrata, subquadrilateralis, transverso rotata, divergentem granoso striata, ad antequam contractam latere brevis. *Fusula cartilaginea* (nudus) levior, prope. Impressiones muscularae duae, rotundae. Impressio pallidus simple.

Shell equivalve, subquadrilateral, transversely ovate, divergently granosely striated, widely gaping at the ventral margin. Cartilaginous pit under the umbones small. Muscular impressions two, rounded. Impression of the mantle simple.

Comparing this genus with *Sciatella*, we find that it differs in having no hinge teeth, in having a sculptured surface, and always a very wide hiatus at the ventral margin. The type species, *Galeomma Turtoni*, is found in the Channel Islands, as well as on some southern shores of Great Britain; another species is Australian, and all the rest were collected by Mr. Cuming, in the Philippine Islands. The animal attaching itself to rocks by a byssus lies with its valves spread open and their dorsal edge uppermost.

Species 1. (Fig. a, b, c. Mus. Nobis.)

GALEOMMA TURTTONI. *Gal. testā albā, elongatō, strīatā quā acuminatā; conspicuē strīis elevatis, granosū, irregulärer divergentibas sculpti; valvis in medio plerumq[ue] contractis, late hiantis.*

TURTON'S GALEOMMA. Shell white, elongated, acuminate at both ends; conspicuously sculptured with raised granose, irregularly divergent striae; valves generally contracted in the middle, broadly gaping.

SOWERBY. Genera of Shells.
Hab. Guernsey; Exmouth.

The slight central contraction in the valves seen in some specimens, is not visible in all.

Species 2. (Mus. Brit.)

GALEOMMA PACIFICUM. *Gal. testā pallidā, fine, euūter striatā, molle contractā; terminibus acuminis; latere antico paulo longiori, angustiori; latere postico magis inflato.*

THE FINE-STRIATED GALEOMMA. Shell pale fulvous, finely striated, contracted in the middle; ends obtuse; anterior side a little longer, narrower; posterior side more inflated.

DESHAYES. Proc. Zool. Soc., 1855, p. 170.
Hab. Isl. Samar, Philippines.

The sculpture is so fine that it only appears in parts unless closely examined.

Species 3. (Mus. Brit.)

GALEOMMA ANGUSTA. *Gal. testā albida, tenuissime striatā; elongatā, angustā, terminibus subrotundis; marginē centrali rectiūsculo.*

THE NARROW GALEOMMA. Shell whitish, very finely striated; elongated, narrow, ends rather rounded; ventral margin rather straight.

DESHAYES. Proc. Zool. Soc., 1855, p. 170.
Hab. Isl. Bohol, Philippines.

Species 4. (Mus. Brit.)

GALEOMMA FORMOSA. *Gal. testā aurantiā, elongatā, utriq[ue] acuminatā, tenuiter striatā, paulo ante medium contractā; latere postico longiori magis inflato.*

THE BEAUTIFUL GALEOMMA. Shell orange, elongated, acuminate at each end, finely striated, contracted a little before the middle; posterior side a little longer and more inflated.

DESHAYES. Proc. Zool. Soc., 1855, p. 170.
Hab. Australia.

The form of this species resembles that of the typical one. The colour of the finer striae distinguishes it.

GALEOMMA.—PLATE I.

Species 5. (Mus. Brit.)

GALEOMMA CHLOROLEUCA. *Gal. testā elongatā, tenuisimē striatā, pallidē aurantiō medio contractā; terminis obtusis, hiatu angustiūsculo.*

THE ORANGE-WHITE GALEOMMA. Shell elongated, very finely striated, pale orange, contracted in the middle; ends obtuse, hiatus rather narrow.

DESHAYES. Proc. Zool. Soc., 1855, p. 170.
Hab. Isl. Samar, Philippines.

This shell very nearly resembles *Scintilla ambigua* in general appearance, but on close inspection it is found to be striated, and therefore a *Galeomma*.

Species 6. (Fig. a, b. Mus. Brit.)

GALEOMMA INFLATA. *Gal. testā breviūsculo, pallidē fulvā, tenuiter granoso-striatā, medio coactatā; valvis venosis, ad marginem centralē latissimē hiantibus.*

THE INFLATED GALEOMMA. Shell rather short, pale fulvous, finely granosely striated, contracted in the middle; valves arched, very widely gaping at the ventral margin.

DESHAYES. Proc. Zool. Soc., 1855, p. 170.

Species 7. (Mus. Brit.)

GALEOMMA ALIMENTA. *Gal. testā parvā, oblongā, fere albā, tenuiter striatā, ad terminos subtruncatā; ostia argenteā; valvis arcuatīs.*

THE SILVERY GALEOMMA. Shell small, oblong, almost white, finely striated, rather truncated at the end; silvery within; valves arched.

DESHAYES. Proc. Zool. Soc., 1855, p. 169.
Hab. Isl. Samar, Philippines.

This species is more finely striated and more truncated at each end than *Galeomma Turtoni*. It has a peculiar silvery lustre inside.

Species 8. (Mus. Brit.)

GALEOMMA INDECORA. *Gal. testā pallidē fulvā, oblongā, tenuissimē striatā; latere antico breviūsculo, obtuso truncato, paulo contracto; latere postico obliquū inflato.*

THE PLAIN GALEOMMA. Shell pale fulvous, oblong, very finely striated; anterior side rather short, obtusely truncated, a little contracted; posterior side obliquely inflated.

DESHAYES. Proc. Zool. Soc., 1855, p. 169.
Hab. Isl. Masbate, Philippines.

But for the very fine striae that may be seen in parts of this shell, it would seem to belong rather to *Scintilla* than to this genus.

Species 9. (Fig. a, b, Mus. Brit.)

GALEOMMA MACROCHISMA. *Gal. testā brevi, pallidē fulvā, conspicuē granoso-striatā; latere antico subacuminato; latere postico obtuso; valvis media contractatīs, arcuatīs, latissimē hiantibus.*

THE WIDE-GAPING GALEOMMA. Shell short, pale fulvous, conspicuously granosely striated; anterior side rather acuminate; posterior side obtuse; valves contracted in the middle, arched, very widely gaping.

DESHAYES. Proc. Zool. Soc., 1855, p. 171.
Hab. Isl. Masbate, Philippines.

MONOGRAPH
OF THE GENUS
SCIINTILLA.

"Look on the frame
Of this wide universe, and there thou read
The endless kind of creatures, which by name
Thou canst not count, much less their natures; and see" — *Saint*

PLATE I.

Genus SCINTILLA, Deshayes

Motus *scintilla* *accephalum*, *luminescens*. *Testa bivalvis*, *lacerata*, *transversim sub-ovalis*, *margine dorsali seu centrali frequentia hianti*, *caro dentibus utrinque valde duobus divergentibus postico nonnunquam duplicito*; *ligamento pareo*, *lineari*, *interno*. *In pressio palli integrata*.

Mollusca necephalous, bimucular, shell bivalve, smooth, transversely subovate, dorsal or ventral margin frequently gaping; hinge with two divergent teeth in each valve, the posterior sometimes divided; ligament small, linear internal; impression of the mantle entire.

The shells of this genus differ from those of *Galeomma*, in having a smooth, sometimes, polished surface. The mantle is reflected over the backs of the valves, as they lie open when living. Few of the *Scintillæ* gape widely as most of the *Galeomma* do. The greater number of the hitherto recorded species are from the Philippines. Several are from Australia, while Borneo, the Mauritius, and Ceylon add a few to the number.

Species 1. (Mus. Brit.)

SCINTILLA SUCCINÆ. *Sci. testâ politâ, subquadratâ, fusciâ, semipeltuvidiâ, clausâ, subequilaterali: margine ventrali vix convexo*.

THE AMERICAN SCINTILLA. Shell polished, subquadrate, brown, semipellucid, closed, subequilateral; ventral margin scarcely convex.

DESHAYES. Proc. Zool. Soc., 1855, p. 176.

Hab. Isl. Luzon, Philippines.

This rather square shell is closed all round.

Species 2. (Fig. a, b, Mus. Brit.)

SCINTILLA TURGLSCLENS. *Sci. testâ, albâ, inflatâ, clausâ, oblongo-subquadratâ, subequilaterali: umbonibus obtusis; margine ventrali recticulato*.

THE SWILLING SCINTILLA. Shell white, inflated, closed, oblongo-subquadrate, sub-equilateral; umbones obtuse; ventral margin rather straight.

DESHAYES. Proc. Zool. Soc., 1855, p. 175.

Hab. Moreton Bay.

Species 3. (Fig. a, b, Mus. Brit.)

SCINTILLA CUMINGI. *Sci. testâ albâ, partim minutiissimè granulatâ, opaci, solidissimâ, tumidâ, oblongo-subquadratâ, clausâ, subequilaterali, latere antice paulò minori, subtruncato; margine ventrali intus minutè crenulato*.

CUMING'S SCINTILLA. Shell white, in parts very minutely granulated, opaque, rather solid, tumid, oblongo-subquadrate, closed, subequilateral, anterior side rather the smaller, slightly truncated; ventral margin minutely crenulated within.

DESHAYES. Proc. Zool. Soc., 1855, p. 173.

Hab. Panama.

Species 4. (Fig. a, b, Mus. Brit.)

SCINTILLA REEVII. *Sci. testâ compressâ, lata, subtruncatâ, semipellucidâ, margine dorsali utrinquè hianti; posticè declivî, anticè elevato, terminibus latè truncatis*.

REEVE'S SCINTILLA. Shell compressed, broad, subtruncated, semipellucid, dorsal margin gaping on both sides, posteriorly sloped, anteriorly raised; ends broadly truncated.

DESHAYES. Proc. Zool. Soc., 1855, p. 176.

Hab. Isl. Negros, Philippines.

Species 5. (Fig. a, b, Mus. Brit.)

SCINTILLA PHILIPPINENSIS. *Sci. ovatâ, albâ, compressâ, utrinquè paulò hianti; latere postico breviori, obliquâ subtruncato; margine ventrali anticè convexissimo*.

February, 1874.

SCINTILLA.—PLATE I.

THE PHILIPPINE SCINTILLA. Shell ovate, whitish, compressed, a little gaping at each end; posterior side a little the shorter, rather obliquely truncated; ventral margin anteriorly convex.

DESHAYES. Proc. Zool. Soc., 1855, p. 176.

Hab. Philippine Islands.

Species 6. (Mus. Brit.)

SCINTILLA CANDIDA. *Sci. testā lactē, ovatā, clausā, tumidiūsculā, obliquā; latere postico angustiūsculo; margine ventrali anticē convexo.*

THE WHITE SCINTILLA. Shell milk-white, ovate, closed, rather tumid, oblique; posterior side rather narrow, ventral margin anteriorly convex.

DESHAYES. Proc. Zool. Soc., 1855, p. 177.

Hab. Isl. Bureas, Philippines.

Species 7. (Mus. Brit.)

SCINTILLA TENUIS. *Sci. testā ovatā, lactē, clausā sub-compressā, latere postico breviūsculo, subtruncato: margine ventrali aequaliter conve xo.*

THE THIN SCINTILLA. Shell ovate, milk-white, closed, subcompressed, posterior side rather short, sub-truncated; ventral margin equally convex.

DESHAYES. Proc. Zool. Soc., 1855, p. 176.

Hab. Isl. Sama, Philippines.

More ovate, thinner, and less oblique than *Scintilla candida*.

Species 8. (Fig. a, b, Mus. —? Copied.)

SCINTILLA JUKESII. *Sci. testā magnā, subcompressā, lactē, ovato-suboblongā, concentricē leviter rugatā, marginib⁹ terminalib⁹ paulō hiantib⁹, subtruncat⁹; margine ventrali rectiūsculo.*

JUKES'S SCINTILLA. Shell large, rather compressed, milk-white, ovate, rather oblong, concentrically slightly wrinkled, terminal margins a little gaping, rather truncated; ventral margin rather straight.

DESHAYES. Proc. Zool. Soc., 1855, p. 174.

Hab. Australia.

SCINTILLA.

PLATE II.

Species 9. (Mus. Brit.)

Scintilla elongata. *Sci. testa excentrica, brevis oblonga, laevata, rectangulis pectinatis rotundatis apicibus angustis vel levioribus, latere levata, marginis obliquis levioribus.*

The body elongate. Shell bright orange, shortly oblique, equal at both ends, rounded in the middle posterior and a little in the fore, truncated anterior in the ends; dorsal and ventral margins rather straight.

SOWERBY. Proc. Zool. Soc., 1855.
Hab. Borneo.

This is one of the prettiest in the species, from its bright orange colour and regular features.

Species 10. (Mus. Brit.)

Scintilla parallela. *Sci. testa pallida, rotundatissima, comparsa, marginis levata, carinae, latera, antice, obliquis levioribus, suboblique.*

The pale Scintilla. Shell pale brown, elongated, compressed, ventral margin scarcely more anterior than dorsal, slightly slanted, ends rather oblique.

DESHAYES. Proc. Zool. Soc., 1855, p. 175.
Hab. Isl. Zebu, Philippines.

This species resembles *S. intercalans* in general appearance, but it is nearly or wholly blind at the ventral margin.

— — — — —

Species 11. (Mus. Brit.)

Scintilla rosata. *Sci. testa rosata, pallida, latera antice leviori, subtruncata, postice magis rotundata, marginibus ventrali et dorsali rectilineis.*

February, 1874.

The pale Scintilla. Shell somewhat polished, elongated, anterior side short, slanted, rather more pressed, posterior side inclined, obtuse.

DESHAYES. Proc. Zool. Soc., 1855, p. 175.
Hab. Isl. Lunes, Philippines.

Species 12. (Mus. Brit.)

Scintilla Hanleyi. *Sci. testa hirsuta, granulata, pallidissima, oblonga, latera, postice, levata, latero, antice leviori, late, subrotundata, marginibus levioribus.*

HANLEY'S Scintilla. Shell broad, compressed, very pale, hairy, elongated, posterior side rather round, anterior side rather flat, front edge, especially anteriorly, irregular, longitudinal furrows running.

SOWERBY. The genus Conchyliorum. Scintilla Sp. 58, T. 22, pl. 27, 27.
Hab. Singapore.

The valves just each at the umbones and ventral margin.

Species 13. (Mus. Brit.)

Scintilla Strangii. *Sci. testa oblonga, albida, apicem antice leviori, subtruncata, postice magis rotundata, marginibus ventrali et dorsali rectilineis.*

STRANGI'S Scintilla. Shell oblong, white, closely shorter in front, subtruncated, posteriorly more rounded; ventral and dorsal margins rather straight.

DESHAYES. Proc. Zool. Soc., 1855, p. 181.
Hab. Moreton Bay.

Species 14. (Mus. Brit.)

Scintilla Timorensis. *Sci. testa aurantiaca, compressa, subquadrata; margine dorsali ad latera*

SCINTILLA.—PLATE II.

*paulo hianti; marginis ventrali clauso, convexi-
usculo.*

THE TIMOR SCINTILLA. Shell orange, compressed, subquadrate; dorsal margin a little gaping at the sides; ventral margin closed, a little convex.

DESHAYES. Proc. Zool. Soc., 1855, p. 174.
Hab. Timor.

One of the broad scale-like species, which nearly all have the ventral margins closed.

— — — — —

Species 15. (Mus. Brit.)

SCINTILLA CUVIERI. *Sci. testa aurantiaca, subcircu-
lari, compressa; margine dorsali utrinque hianti;
latere postico rotundo; latere antico oblique sub-
truncato.*

CUVIER'S SCINTILLA. Shell orange, rather circular, compressed; dorsal margin gaping at both ends; posterior side rounded; anterior side obliquely subtruncated.

DESHAYES. Proc. Zool. Soc., 1855, p. 174.
Hab. Isl. Bohol, Philippines.

Differing from the preceding species in its more rounded form.

Species 16. (Mus. Brit.)

SCINTILLA OWENII. *Sci. testa pallidè fulvâ, clausâ,
oblongâ, fasciis opacis concentricis variatâ; latere
antico brevi, truncato.*

OWEN'S SCINTILLA. Shell pale fulvous, closed, oblong, varied with opaque concentric bands; anterior side short, truncated.

DESHAYES. Proc. Zool. Soc., 1855, p. 170.
Hab. Isl. Zebu, Philippines.

More straightly oblong and truncated than *Scintilla borneensis*.

Species 17. (Mus. Brit.)

SCINTILLA PUDICA. *Sci. testa oblongo-subovata, roseâ;
latere antico brevi, truncato; margine ventrali
paulo hianti, rectiusculo; latere postico-dorsali
terter declivi.*

THE BLUSHING SCINTILLA. Shell oblong-subovate, rose-coloured; anterior side short, truncated; ventral margin a little gaping, rather straight; postero-dorsal side slightly sloped.

DESHAYES. Proc. Zool. Soc., 1855, p. 178.
Hab. Isl. Zebu, Philippines.

Species 18. (Mus. Nobis.)

SCINTILLA FORBESI. *Sci. testa fulvo-lutescenti, oblongâ,
subovata, tumidiâsculâ; latere antico breviusculo,
subtruncato; margine ventrali paulo hianti.*

FORBES'S SCINTILLA. Shell yellowish buff, oblong, sub-ovate, rather tumid; anterior side rather short, subtruncated; ventral margin a little gaping.

DESHAYES. Proc. Zool. Soc., 1855, p. 170.
Hab. Singapore.

More equally tumid and more oval than the Bornean species *Scintilla aurantiaca*.

PLATE III.

Species 19. (Fig. g, h, i, d, Mus. Nobis.)

SCINTILLA AMBIGUA. *Sci. testā pallidū aurantiō seu albi, tenui oblongi, nonutissimē punctulatū, subdiaphanū, subangulatū; latere postīo longiori, ad terminū subobtusū, prop̄ marginem centram subarcuatum. latere antico subtruncato, medio paucē contracto; margine v. ntralī plus minusvē hiatus.*

THE AMBIGUOUS SCINTILLA. Shell pale orange or white, thin, oblong, very minutely punctured, subdiaphanous, subinflated; posterior side rather the longer, rather sloped at the end, slightly acuminate near the ventral margin; anterior side a little truncated, middle a little contracted; ventral margin more or less gaping.

DESHAYES.—?

Scintilla aurantiaca. Sowerby's Thesaurus as of Deshayes.

Species 20. (Mus. Nobis.)

SCINTILLA MAURITIANA. *Sci. testā elongatū, viridi aurantiō, moderatē inflatū; marginē ventralī latē hiatus, marginē dorsali rectilinēus, terminibus subobliquā breviter truncatis.*

THE MAURITIUS SCINTILLA. Shell elongated, bright orange, moderately inflated; ventral margin widely gaping, dorsal margin rather straight, ends rather obliquely shortly truncated.

DESHAYES. Edition of Lamarck's Anim. s. Vert.

Hab. The Mauritius.—Isl. Bourbon.

We think that the shell figured in Sowerby's Thesaurus for this species is only an elongated variety of *Scintilla ambiguua*.

Species 21. (Mus. Nobis.)

SCINTILLA APERTA. *Sci. testā viridi aurantiō, breviter oblonga, utrinquā subtruncata, concentricā sub-*

rugatā, suberquilaterale, ratibus medio arcuatis, umbonibus tumidis: nō in fine centrali latissime hiuncti.

THE OPEN SCINTILLA. Shell bright orange, shortly oblong, rather truncated on each side, concentrically slightly wrinkled, subequilateral; valves arched in the middle; umbones tumid; ventral margin very wide gaping.

SOWERBY.

Hab. The Mauritius.

Much shorter and more truncated than *Scintilla aurantiaca*, with the valves remarkably arched, and a very wide hiatus in the ventral margin.

Species 22. (Mus. Brit.)

SCINTILLA BORNEENSIS. *Sci. testā albida, concentricā substriatā, forē clausā, subangulatā; latere antico brevis, angustiori, obliquā subtruncato; medio subcontracto.*

THE BOHEAN SCINTILLA. Shell whitish, concentrically substriated, nearly closed, rather inflated; anterior side short, narrower, obliquely subtruncated; slightly contracted in the middle.

DESHAYES.—?

Hab. Borneo.

More inequivale and oblique than *Scintilla ambiguua*, and scarcely if at all gaping.

Species 23. (Mus. Brit.)

SCINTILLA RECLIZIANA. *Sci. testā rosco-purpurascenti, tenuissimi, oblongi, clausā, medio subcontracto; latere antico truncato.*

RECLIZ'S SCINTILLA. Shell rose-purplish, very thin, oblong, closed, slightly contracted in the middle; anterior side truncated.

DESHAYES. Proc. Zool. Soc., 1855, p. 178.

Hab. North Australia.

SCINTILLA.—PLATE III.

Species 24. (Mus. Brit.?)

SCINTILLA FLAVIDA. *Sci. testá tenui, subquadratâ, pallidissimè fulvâ, compressâ, ad marginem dorsalem utrinquè paulò apertâ; altitudine longitudinem ferè equanti.*

THE YELLOWISH SCINTILLA. Shell thin, subquadrate, very pale fulvous, compressed, a little open at the dorsal margin on both sides; height nearly equaling the length.

DESHAYES. Proc. Zool. Soc., 1855, p. 175.

Hab. Philippines.

Species 25. (Mus. Nobis.)

SCINTILLA ADAMSI. *Sci. testâ pallidè fulvâ, oblongâ, clausâ, inaequilaterali, moderatè inflatâ; latere antico brevi, angusto, truncato, margine ventrali rectiusculo.*

ADAM'S SCINTILLA. Shell pale fulvous, oblong, closed, inequilateral, moderately inflated: anterior side short, narrow, truncated: ventral margin rather straight.

DESHAYES. Proc. Zool. Soc., 1855, p. 179.

Hab. Isl. Bohol, Philippines.

Species 26. (Mus. Brit.)

SCINTILLA SEMICIRCULARIS. *Sci. testā ovalē, pallidissimā, tenui, oblongā; operā, rotundatissimā, latere antico brevi, truncato; latere postico truncato, marginis ventrali recto, moderatè haitati.*

THE SPLENDID SCINTILLA. Shell milky-white, brightly polished, dark, oblong, compressed, very mesoquilaterally; anterior side short, truncated; posterior side truncated; ventral margin moderately gaping.

Deshayes. —

Hab. —

This shell is deeper than *Scintilla Layardi*, more truncated and less gaping in front.

Species 27. (Mus. Nobis.)

SCINTILLA INERTIA. *Sci. testā albā, clausā, subglobosa, tumida, striis transversis levigata; sublateraliter quin granosus, decoloratus; latere antico angustissimo, latere postico magis inflato, medio subdepresso.*

THE INERT SCINTILLA. Shell white, closed, solid, tumid, decussated with transverse and longitudinal granulated striae; anterior side rather short, rather narrow; posterior side more inflated, slightly depressed in the middle.

Deshayes. Conchyliologie de l'Île de la Réunion.

Hab. Isl. Bourbon.

Species 28. (Mus. Nobis.)

SCINTILLA OBLONGA. *Sci. pallidi fulvi, tenui, semipellucidā, compressā, breviter oblongā, medio clausā, utrinque haitati; margine ventrali recte ascendo.*

THE OBLONG SCINTILLA. Shell pale fulvous, thin, semi-pellucid, compressed, shortly oblong, closed in

the middle, gaping at each end; ventral margin rather straight.

Sowerby. Proc. Zool. Soc., 1870.

Hab. Borneo.

Species 29. (Mus. Brit.)

SCINTILLA FABA. *Sci. testā lactea, inflatā, oblongo-ovata, clausā; latere antico obliquè subtruncato, latere postico obliquè magis inflato.*

THE BEAN SCINTILLA. Shell milk-white, inflated, oblong-ovate, closed; anterior side obliquely subtruncated; posterior side more inflated obliquely.

Deshayes. Edition of Lamarek's Anim. s. Vert.

Hab. Borneo.

Species 30. (Fig. a, b, Mus. Brit.)

SCINTILLA HYALINA. *Sci. testā compressā, ovata, diaphanā, pallidā, subaequilateralē; margine dorsali utrinque valde haitati; margine ventrali medio clausa.*

THE HYALINE SCINTILLA. Shell compressed, ovate, diaphanous, pale, subaequilateral; dorsal margin gaping at both ends; ventral margin closed in the middle.

Deshayes. Proc. Zool. Soc., 1855, p. 180.

Hab. Torres Straits.

In the open end and transparent texture resembling *Scintilla Haudeyi*, but differing in the oval form.

Species 31. (Fig. a, b, Mus. Brit.)

SCINTILLA LAYARDI. *Sci. testā tenui, albā, semipellucidā, angusti, clo. gatā, medio subinflatā; margine ventrali late aperto; terminibus subrotundatis.*

SCINTILLA.—PLATE IV.

LAYARD'S SCINTILLA. Shell thin, white, semipellucid, narrow, elongated, middle a little inflated; ventral margin widely gaping; ends rather rounded.

DESHAYES. —?

Hab. Ceylon.

This little open species is like a *Galeomma* in all but the structure of the surface.

Species 32. (Mus. Brit.)

SCINTILLA POLITA. *Sci. testā albā, nitenti, semipellucidd, compressā, concentricā rugatā, oblongā, utrinquā truncatā; latere antico breviori; margine ventrali paulo hianti.*

THE POLISHED SCINTILLA. Shell white, shining, semi-pellucid, compressed, concentrically wrinkled, oblong, truncated at each end; anterior side shorter; ventral margin a little gaping.

DESHAYES. —?

Hab. Isl. Samar, Philippines.

Species 33. (Mus. Brit.)

SCINTILLA PORULOSA. *Sci. testā pallidissimā roseā, minime punctatā, compressā, elongatā, medio subdepressā, concentricā obscurā rugatā, marginibus clausis.*

THE POROUS SCINTILLA. Shell very pale rose, very minutely punctured; compressed, elongated; middle rather depressed, concentrically obscurely wrinkled; margins closed.

DESHAYES. Proc. Zool. Soc. 1855, p. 180.

Hab. Isl. of Bohol.

Species 34. (Mus. Brit.)

SCINTILLA OBLIQUA. *Sci. testā obliquā oblongā, fuscā, clausā, valde inaequilaterali; latere antico brevissimo, truncato; latere postico subinflato; marginibus dorsali et ventrali rectiusculis.*

THE OBLIQUE SCINTILLA. Shell obliquely oblong, brown, closed, very inequilateral; anterior side very short, truncated; posterior side rather inflated, dorsal and ventral margins rather straight.

SOWERBY. Thesaurus Conchyliorum. Scintilla, species 32, fig. 33.

Hab. Ecuador.

— — — — —

Species 35. (Mus. —? Copied.)

SCINTILLA DECLIVIS. *Sci. testā semipellucidd, parvā, pallidi fulcā, intus fuscā, clausā; valde inaequilaterali; latere antico brevi; margine dorsali utrinquā declivi.*

THE SLOPED SCINTILLA. Shell semipellucid, small, pale fulvous, brown within, closed, very inequilateral; anterior side short; dorsal margin sloped at each side.

SOWERBY. Thesaurus Conchyliorum, Scintilla, sp. 31, fig. 30.

Hab. —?

This little species is very oblique, and being half transparent, shows through to the outer surface the slight purplish colour of the inside.

PLATE V.

Species 36. (Mus. ——?)

SCINTILLA *oblonga*. *Sci. testâ oblongâ, obliquâ, albâ, inaequangulari, semipellucida, clausâ, latero antero brevi, subrotundato, utrinque dorsum et operculum, latero postero subangulo, margine ventrali convexi sensu.*

THE MILK-WHITE SCINTILLA. Shell oblong, oblique, white, inequangular, semipellucid, closed; anterior side short, subtruncated; dorsal margin sloped on both sides, posterior side rather oblique; ventral margin rather convex.

SOWERBY. Proc. Zool. Soc., 1865.

Hab. ——?

More oblong and less sloped than *Scintilla diabolus*.

Species 37. (Fig. a, b.)

SCINTILLA ANOMALA. *Sci. testâ albâ, pellucidâ, compressâ, subquadrate; marginibus dorsalis utrinque pauci hanciatibus.*

THE ANOMALOUS SCINTILLA. Shell white, pellucid, compressed, subquadrate; with dorsal margins a little gaping at both ends.

DESHAYES. Proc. Zool. Soc., 1855, p. 181.

Hab. Isl. Samar, Philippines.

Much resembling the scales of a fish.

Species 38. (Fig. a, b, Mus. Brit.)

SCINTILLA HYDATINA. *Sci. testâ rotundâ, pellucidâ, compressâ, subquadratâ; marginibus terminalibus utrinque hanciatibus; umbonibus subcentralibus, margine ventrali rectilincol.*

THE TRANSPARENT SCINTILLA. Shell pellucid, compressed, subquadrate; terminal margins gaping on both sides; umbones subcentral, ventral margin rather straight.

DESHAYES. Proc. Zool. Soc., 1855, p. 177.

Hab. Isl. Bohol, Philippines.

Species 39. (Fig. a, b, Mus. Nobis.)

SCINTILLA MEMBRANACEA. *Sci. testâ tenuissimâ, cornuta, pellucida, oblongâ, utrinque subtruncatâ; marginibus dorsali utrinque obvici; margine ventrali latus rectilincol.*

THE MEMBRANACEOUS SCINTILLA. Shell very thin, horny, pellucid, oblong, slightly truncated on each side; dorsal margin gaping at both ends; ventral margin closed, rather straight.

SOWERBY.

Hab. ——?

A remarkably thin transparent shell.

Species 40. (Mus. Brit.)

SCINTILLA STRIATINA. *Sci. testâ albâ, purpâ, transverso, pellucidâ, compressâ, clausâ, subcirculari, concretae rugis transversim striata, lateribus declivibus marginis dorsali hoc cùsculo; margine ventrali rectilincol.*

THE STRIATED SCINTILLA. Shell white, small, very thin, pellucid, compressed, closed; rather equilateral, concretely striated with very thin wrinkles; sides sloped, dorsal margin rather short; ventral margin rather straight.

DESHAYES. Proc. Zool. Soc., 1855, p. 176.

Hab. Isl. Bohol, Philippines.

Species 41. (Mus. Brit.)

SCINTILLA OPALINA. *Sci. testâ obliquâ subovatâ, subconica pressâ, clausâ, semipellucida, albâ; marginibus dorsalis declivibus.*

THE OPAL SCINTILLA. Shell obliquely subovate, subcompressed, closed, semipellucid, white; dorsal margin sloped.

DESHAYES. Proc. Zool. Soc., 1855, p. 177.

Hab. Isl. Luzon, Philippines.

More timid than *Sc. striatina* and not wrinkled or striated.

SCINTILLA.—PLATE V.

Species 42. (Fig. a, b, Mus. Brit.)

SCINTILLA TURGIDA. *Sci. testa, tena, albâ, inflata; latere antico brevi, angustiori, truncato; latere postico obliquâ inflato, rotundo, margine dorsali elevato; margine postico-dorsali ex aperto margine centrali medio inflato, antico contracto.*

THE TURGID SCINTILLA. Shell thin, white, inflated; anterior side short, narrower, truncated, posterior side obliquely inflated, rounded, dorsal margin elevated; posterior dorsal margin very little open; ventral margin inflated in the middle, contracted in front.

DESHAYES. Proc. Zool. Soc., 1855, p. 175.

Hab. Isl. Samar, Philippines.

Species 43. (Fig. a, b, Mus. Brit.)

SCINTILLA SCINTILLANS. *Sci. testa nitenti, medio subcarinata, subpellucida, versus marginem fulrida, opaca. clausa, oblongo-subquadrata; latere antico breviore, marginibus dorsalibus declivibus.*

THE BRIGHT SCINTILLA. Shell shining, subpellucid in the middle, fulvous, opaque towards the margin, closed, subquadrate; anterior side shorter; dorsal margins sloped.

DESHAYES. Proc. Zool. Soc., 1855, p. 175.

Hab. Isl. Behol, Philippines.

Species 44. (Mus. Brit.)

SCINTILLA OVALINA. *Sci. testa, oblongo-subquadrata, tumidissimâ, nitenti, clausâ, partim semipellucida, luteâ; marginibus lateralibus declivibus, margine centrali rectâsculo.*

THE OVAL SCINTILLA. Shell oblong, subquadrate, rather tumid, shining, closed, partly semipellucid, yellowish; lateral margins sloped, ventral margin rather straight.

DESHAYES. Proc. Zool. Soc., 1855, p. 174.

Hab. Isl. Samar, Philippines.

In structure this shell and the next are opaque and pellucid in bands.

SCINTILLA.

PLATE VI.

Species 45. (Fig. a, b. Mus. Brit.)

SCINTILLA SOLIDA. *Sci. testi oblongo-subquadrate, pallide fulvi, solidissimis, tumidi, clausi; marginibus angustis, margine ventre recto, angulis lateribus oblique truncatis.*

The solid SCINTILLA. Shell oblongo-subquadrate, pale yellow, rather solid, tumid, close; umbos large, ventral margin straight, lateral margins obliquely truncated.

Deshayes, Proc. Zool. Soc., 1855, p. 174.

Hab. Isl. Bohol, Philippines.

Species 46. (Mus. Taylor.)

SCINTILLA PURPURASCENS. *Sci. testi ovata, compressa, roseo-purpurea; latere antice breviora, oblique truncata; marginae ventrali concavissimae, paulo hincis.*

The English SCINTILLA. Shell ovate, compressed, rose-purple; interior side shorter, obliquely truncated; ventral margin rather convex, a little gaping.

Sowerby.

Scintilla rufa, Sowerby, Proc. Zool., 1865.

Hab. — ?

The name *Sci. rufa*, given to this species inadvertently in the Proceedings of the Zoological Society, and *Sci. rufa* of Deshayes, Thes. Conch., sp. 9, are quite distinct.

Species 47. (Fig. a, b. Mus. Brit.)

SCINTILLA PISUM. *Sci. testi parva, levigata, tenuis, obliqua, clausa; latere antico angusto, subtruncato; latere postico rotundato.*

The pea SCINTILLA. Shell small, rather orange, tumid, oblique, closed; anterior side narrow, rather truncated; posterior side much inflated.

SOWERBY, Thesaurus Conchyliorum, sp. 27.

Hab. Mauritius.

Species 48. (Mus. Brit.)

SCINTILLA HYDROPHILA. *Sci. testa semipellucida, pallide fulvi, compressa, oblongo-subquadrate; marginis dorsali utrinque paulo aperto.*

The hydrophile SCINTILLA. Shell semi-pellucid, pale fulvous, compressed, oblong subquadrate; dorsal margin a little open at each end.

Deshayes, Proc. Zool. Soc., 1855, p. 178.

Hab. Isl. Luzon, Philippines.

Of a more oblong form than *Scintilla hydriota*.

Species 49. (Mus. Brit.)

SCINTILLA CROcea. *Sci. testa subquadrate, subcompresso; marginibus terminalibus obtuse truncatis; rectangulo ventrali clauso, rectissimo; marginis dorsali utrinque paulo aperto.*

The yellow SCINTILLA. Shell subquadrate, subcompressed, orange; terminal margins obtusely truncated; ventral margin closed, rather straight; dorsal margin a little open at both ends.

Deshayes, Proc. Zool. Soc., 1855, p. 175.

Hab. Isl. Negros, Philippines.

Species 50. (Mus. Brit.)

SCINTILLA SQUAMA. *Sci. testa compressa, lutea, semipellucida, concentrica leviter undulatim rugata; subquadrate; latere postico obliquè paulò proiecta; terminis apertis.*

The scale SCINTILLA. Shell compressed, milk-white, semi-pellucid, with slight concentric wave-like ridges, rather square; posterior side a little obliquely produced; ends open.

SOWERBY, Thesaurus Conchyliorum, sp. 46.

Hab. Isl. Ticao, Philippines.

This pretty scale-like species is easily distinguished.

SCINTILLA.—PLATE VI.

Species 51. (Mus. Brit.)

Scintilla chrysallina. *Sci. testā parvā, fulvā,*
guttulāta, subnudato-cornuta, valde compressa; mar-
ginē dorsali utrinquā levantī.

THE CHRYSTALLINE SCINTILLA. Shell small, fulvous,
 pellucid, subovately rounded, very compressed;
 ends ad margin gaping at both ends.

DESHAYES. Proc. Zool. Soc., 1855, p. 177.

Hab. Isl. Mindinao, Philippines.

The smallest, and one of the most hyaline of all the species.

Species 52. (Fig. a, b, Mus. Brit.)

Scintilla pellicula. *Sci. testā parvā, lactea, sub-*
rotundā, compressā, pellucida, concentricè undulatim
rugulā: terminis apertis; latere antico brevissulo,
subtruncato; latere postico obliquè paulò producto.
 THE PELLICLE SCINTILLA. Shell small, milk-white,
 rather round, compressed, pellucid, concentrically
 unduly wrinkled; ends open; anterior side
 rather short, rather truncated; posterior side a
 little obliquely produced.

DESHAYES. Proc. Zool. Soc., 1855, p. 177.

Hab. Isl. Bohol, Philippines.

A smaller and more rounded shell than *Scintilla quinaria*, with more large and conspicuous wrinkles.

Species 53. (Mus. Brit.)

Scintilla vitrea. *Sci. testā ovato-subquadratā, polita*
fulvā, tenuissimā, compressā, fasciis subopacis-
feri clausā; terminis obliquè truncatis; marginē
dorsali recto; umbonibus acutis.

THE GLASSY SCINTILLA. Shell ovately-subquadrate,
 pale fulvous, very thin, compressed, with rather
 opaque bands; almost closed; ends obliquely
 truncated; dorsal margin straight, umboes
 sharp.

DESHAYES. Proc. Zool. Soc., 1855, p. 177.

Hab. Isl. Bureas, Philippines.

Species 54. (Mus. Nobis.)

Scintilla opaca. *Sci. testā subovata, nitentī, straminei,*
opacā, clausā; latere antico sobtruncato; marginē
ventralib⁹ rectissulo.

THE OPAQUE SCINTILLA. Shell subovate, shining, straw
 coloured, opaque, closed; anterior side rather
 truncated; ventral margin rather straight.

SOWERBY.

Hab. —?

Although brilliantly polished, this little shell is
 opaque.

S T O M A T E L L A.

PLATE I.

Genus STOMATELLA, Lovén.

Testa plus subovoe auriformi, spira parva, ultimo annulo oblique rotunda, spirularis costata; apertura magna, obliqua, longipata, mucosa, iridescentia.

Operculum orbicularis, tenui, cornu, multispirale.

Shell more or less auriform, with small spire and large body whorl, spirally ribbed; aperture large, obliquely elongated, pearly, iridescent.

Operculum orbicular, thin, horny, many-whorled.

It is a question of convenience whether this genus should or should not include the shells separated under the name of *STOMATIA*. The differences in the shells of the two genera are not great, consisting mainly in the present genus not being wrinkled at the suture, like the *Stomatia*, and not having prominent spiral tubercular keels. The presence of an operculum in *Stomatella* and its absence in *Stomatia*, would, if it could be established, be a very important distinction. The typical species is from Torres Straits, and two or three are Australian, but a very large proportion of the remaining species find their habitats among the Philippines.

Species 1. (Mus. Brit.)

STOMATELLA FULGURANS. *Sto. testi suborbiculari, subdepressa, fulvi, lineis oblique fuscoprasincentibus ornata; spira acuminata; infractibus tenimenter tirata; ultimo anfractu subporosa.*

THE LIGHTNING STOMATELLA. Shell suborbicular, subdepressed, fulvous, ornamented with oblique brownish-grey lines; spire acuminate; whorls finely ridged; last whorl partly perforated.

A. ADAMS. Proc. Zool. Soc., 1850.

Hab. Isl. Negros, Philippines.

Species 2. (Fig. a, b, Mus. Brit.)

STOMATELLA SANGUINEA. *Sto. testi depresso, ovoati, crassata, rubra; costis moniliformibus distantibus*

ornata; spira subacuminata, angustitibus rotundis aperturam lati; labio interno late, albo, obliqua, radice arcuata.

THE BLOOD-COLOURED STOMATELLA. Shell depressed, ovate, thick, red; ornamented with distant beaded ribs; spire subacuminated, whorls rounded; aperture broad; inner lip broad, white, oblique, much arched.

A. ADAMS. Proc. Zool. Soc., 1850.

Hab. Isl. Tico, Philippines.

There is no difficulty in recognising this neat little coral-like species.

Species 3. (Fig. a, b, Mus. Nobis.)

STOMATELLA PAPYRACULA. *Sto. testi levigata, subglobosa, tenui, cinerea, fulvi vel rubri, fuscate aut nigro maculata; spirularis costis levigatis, fuscis articulis haud prominenter irato; spira acuminata; apertura orata; columellam albam, planulatam, perobliquam.*

THE PAPYRACEOUS STOMATELLA. Shell smooth, subglobose, thin, ash-coloured, brown or red, spotted with brown or black; spirally ridged, not prominently, with smooth, brown-spotted ribs; spire acuminate; aperture ovate; columella white, flattened, very oblique.

CHEMITS. Conchylien Cabinet, Pl. 182, f. 1817, 1818.

Stomatella tumida, Gould.

Hab. Australia.

Differing from all the rest in the smoothness and slightness of its structure.

Species 4. (Fig. a, b, Mus. Brit.)

STOMATELLA HALIOTIDEA. *Sto. testi depresso, obliqua subauriformi, tenui, fuscata, rufo-alboque variegata; spirali acuminata, anfractibus planulascitis, spirularis costatis; apertura lata.*

THE HALIOTIS STOMATELLA. Shell depressed, obliquely rather auriform, thin, variously painted with

STOMATELLA.—PLATE I.

brown, red, and white, spire acuminate, whorls rather flat, spirally ribbed; aperture wide.
Sowerby. Genera of Shells
Hab. Philippines.

Species 5. (Fig. *a, b*, Mus. Brit.)

STOMATELLA MACULATA. *Sto. testá depresso-ovali, spirular costis noduliformibus liratá : fuscovar. variegatá : apice sublevato, anfractibus concavis, ultimo latu : aperturá obliqui ovata.*

THE SPOTTED STOMATELLA. Shell depressed, obliquely ovate, spirally ridged with beaded ribs; varied with brown or red; apex rather elevated, whorls convex, last wide; aperture obliquely ovate.

Quoy. Voy. de l'Astrolabe, t. iv. p. 315.
Hab. Isl. Vanikoro.

Species 6. (Mus. Brit.)

STOMATELLA JAPONICA. *Sto. testá suborbiculari, subdepressá, fulvo-rubescens, spirular costis levibus, confertis, nodulosis liratá : spirá elevatá : ultimo anfractu inflato : aperturá suborbiculari.*

THE JAPAN STOMATELLA. Shell suborbicular, subdepressed, reddish-brown, spirally ridged with smooth, close, nodulous ribs; spire elevated; last whorl inflated; aperture suborbicular.

A. ADAMS. Proc. Zool. Soc., 1850.
Hab. Japan.

This species bears some resemblance to *Stomatella Malakana* in form.

S T O M A T E L L A.

PLATE II.

Species 7. (Mus. Brit.)

STOMATELLA MONILIFERA. *Sto. testā suborbiculari, pallidē fulvi, fuscō-rubescēti planatā, costis rāpidis, monilifris liratā, interstītiis striatis; aperturā obliquā, subcirculari.*

THE BEADED STOMATELLA. Shell suborbicular, pale fulvous, spotted with reddish-brown, ridged with strong, beaded ribs; interstices striated; aperture oblique, subcircular.

A. ADAMS. Proc. Zool. Soc., 1850.

Hab. ——?

The locality of this pretty little shell has not been ascertained.

Species 8. (Fig. a, Mus. Brit.)

STOMATELLA CANDIDA. *Sto. testā albā, depresso-spiraliter acutē carinatā; carinis parvīs, confertis, numerosis, subcrenatis, angulatis, elevatis, interstītiis concentricē tenuissimis striatis; spirā subdepressā; anfractibus rotundis; aperturā obliquā, suborbiculari.*

THE WHITE STOMATELLA. Shell white, depressed, spirally sharply keeled; keels small, close, numerous, a little crenated, angular, raised, interstices concentrically very finely striated; spire rather depressed, with rounded whorls; aperture oblique, suborbicular.

A. ADAMS. Proc. Zool. Soc., 1850.

Hab. Korean Archipelago.

This species was taken by Mr. Arthur Adams on coral reefs.

Species 9. (Mus. Brit.)

STOMATELLA SPECIOSA. *Sto. testā trochiformi, albā, rubro maculatā, spiraliter carinatā, concentricē striatā; carinis tribus principalibus obtusis, prominentibus, interstītiis minutis: spirā concavā, anfractibus tricarinatis.*

THE SPECIOUS STOMATELLA. Shell trochiform, white, spotted with red, spirally keeled, concentrically

striated; three principal keels obtuse, prominent, interstitial ones minute; spire conical, whorls tricarinate.

A. ADAMS. Proc. Zool. Soc., 1850.

Hab. Grimwood's Island.

The arrangement of the red spots between the keels, gives great beauty to this shell.

Species 10. (Fig. a, b, Mus. Nobis.)

STOMATELLA IMBRICATA. *Sto. testā depresso-orbiculari, scabriō, griseā, fuscō-punctatā; costis transversis numerosis, confertis, imbricato-squamosis liratā; spirā parvā, anfractibus duobus, convexis; aperturā maximā.*

THE IMBRICATED STOMATELLA. Shell depressed-orbicular, scabrous, grey, brown-spotted; ridged with numerous close ribs, with imbricated scales; spire small, whorls two, convex; aperture very large.

LAMARCK. Encyclopédie Méthodique.

Hab. Torres Straits.

Species 11. (Fig. a, b, Mus. Brit.)

STOMATELLA SULCIFERA. *Sto. testā obliquā oblongo-ovatā, tenuissimā, spiraliter costis scabriusculis liratā, griseo-rubescēti, maculis striatisque variegatā, concentricē minūtē striatā; aperturā maximā, obliquā oblongā.*

THE GROOVED STOMATELLA. Shell obliquely oblong-ovate, rather thin, spirally ridged with rather scabrous ribs, reddish-grey, varied with spots and stripes, concentrically minutely striated; aperture very large, obliquely oblong.

LAMARCK. Encyclopédie Méthodique.

Hab. Isl. Ticao, Isl. Samar, Philippines.

Taken at low water from the coral reefs fringing the Islands.

STOMATELLA.—PLATE II.

Species 12. (Fig. *a*, *b*, *c*, Mus. Brit.)

STOMATELLA NOTATA. *Sto. testi suborbiculari-depressa, pallidè rosea, maculis purpureis distinctis, seriatim ornata; spiraliter costata, concentricè perobliquè striata; spiri producta, acuminata; aperturā suborbiculari.*

THE MARKED STOMATELLA. Shell suborbicular, depressed, pale pink, ornamented with distinct purple

spots in rows; spirally ribbed, concentrically very obliquely striated; spire produced, acuminated: aperture suborbicular.

A. ADAMS (Stomatia). Proc. Zool. Soc., 1850.
Hab. Philippines.

It may be doubtful whether the varieties (figs. *b* and *c*) really belong to this species.

PLATE III.

Species 13. (Fig. a, b, Mus. Brit.)

STOMATELLA CANCELLOTA. *Sto. testā suborbiculari, convexa, umbilicata, subcinerea, fasciis fumosofuscis, irregularibus, undulatis, concentricō picta; costellis spiraliis obtusis, inaequalibus, striisque concentricis cancellata; spira prominenti, apice acuto; aperturā subrotundā, margine columnari paullō reflexo, medio rectiūsculo; umbilico costā spirali marginato.*

THE CANCELLED STOMATELLA. Shell suborbicular, convex, umbilicated, rather ashy, concentrically painted with irregular, undulated, smoky brown bands; cancellated with spiral, obtuse, unequally spaced and concentric striae; spire prominent, apex sharp; aperture rather round, columnar margin a little reflected, rather straight in the middle; umbilicus bordered with a spiral rib.

KRAUSS. Sudafrikan. Mollusken.

Hab. Table Bay, Cape of Good Hope.

Species 14. (Fig. a, b, Mus. Brit.)

STOMATELLA ARABICA. *Sto. testā suborbiculari, umbilicata, acuminata, albida, flammulis vel maculis rubris picta; spira producta; anfractibus costellis paucis validis, strisque interstitialibus liratis; regione umbilicali impresso; labio interno reflexo, tenui.*

THE ARABIAN STOMATELLA. Shell suborbicular, umbilicated, acuminate, white, painted with red flames or spots; spire produced; whorls ridged with few strong ribs, and interstitial striae; umbilical area impressed; inner lip reflected, thin.

A. ADAMS. Sowerby's Thesaurus Conchyliorum, Stom. Sp. 13, figs. 27, 28.

Hab. Red Sea.

Species 15. (Fig. a, b, Mus. Brit.)

STOMATELLA SPLENDIDA. *Sto. testā imperforata, subdepressa, suborbiculari, tenui, rubra, ad suturam*

et infra medium flammulis rubris subconcentricis picta; liris asperulatis inaequalibus et striis spiraliis ornata; aperturā transversē oblonga, halitoidea.

THE SPLENDID STOMATELLA. Shell imperforate, rather depressed, suborbicular, thin, red, painted at the suture and below the middle with red subconcentric flames; ornamented with roughened, unequal spiral ribs and striae; aperture transversely oblong, halitoidea-shaped.

A. ADAMS. Sowerby's Thesaurus Conchyliorum, Stom. Sp. 18 a, figs. 15, 16.

Hab. ——?

The locality of this beautiful species is unknown.

Species 16. (Mus. Brit.)

STOMATELLA BACONI. *Sto. testā suborbiculari, solidā, imperforata, spiraliiter striata, pallide fulva, fasciis variegata; spira acuminata, anfractibus rotundis, aperturā obliquè ovata.*

BACON'S STOMATELLA. Shell suborbicular, solid, imperforate, spirally striated, pale fulvous, varied with brown in bands; spire acuminated, whorls rounded, aperture obliquely ovate.

A. ADAMS. Sowerby's Thesaurus Conchyliorum, Stom. Sp. 10, figs. 25, 26.

Hab. Swan River.

Species 17. (Mus. Brit.)

STOMATELLA MARGARITANA. *Sto. testā suborbiculari, rubra, costis subnodosis, rotundis, inaequalibus lirata, spira elevata, acuminata; anfractibus rotundis, distinctis; aperturā subrotunda; umbilico callo obtecto.*

THE MARGARITA STOMATELLA. Shell suborbicular, red, ridged with rather nodose, rounded, unequal ribs, spire elevated, acuminate; whorls rounded.

STOMATELLA.—PLATE III.

distinct; aperture nearly round; umbilicus covered by a callus.

A. ADAMS. Proc. Zool. Soc., 1850.

Hab. Australia.

The name refers to a resemblance in form between this little shell and those of the genus *Margarita*.

Species 18. (Mus. Brit.)

STOMATELLA TIGRINA. *Sto. testā subtrochiformi, perforatā, albidiā, lineis rubris, obliquè subconcentricis striatā; spira conicā, anfractibus angulatis, bicarinatis, inter carinas spiraliter striatis; aperturā suborbiculari, labio interno reflexo, calloso; umbilico distincto, partim obtecto.*

THE LITTLE TIGER STOMATELLA. Shell somewhat trochiform, perforated, whitish, striped with red, obliquely concentric lines; spire conical, whorls

angular, bicarinated, spirally striated between the keels; aperture suborbicular, inner lip reflected, callous; umbilicus distinct, partly covered.

A. ADAMS. Proc. Zool. Soc., 1850.

Hab. — ?

Species 19. (Mus. Brit.)

STOMATELLA PALLIDA. *Sto. testā suborbiculari, albidiā, lineis undulatis pallidē fulvis ornatā; spiraliē costellatis inaequalibus liratā; spiraliē elevatā, acuminate, anfractibus angulatis; labio interno calloso.*

THE PALE STOMATELLA. Shell suborbicular, whitish, ornamented with pale fulvous undulating lines; spirally ridged with unequal ribs; spire elevated, acuminate, whorls angular; inner lip callous.

A. ADAMS (Stomatia). Proc. Zool. Soc., 1850.

Hab. Lord Hood's Island.

A much more elevated shell than *Stomatella tigrina*.

STOMATELLA.

PLATE IV.

FIG. 8 b is a variety of *Stomatella candida*, in which some faint tints of colour are visible.

Species 20. (Mus. Brit.)

STOMATELLA SCUTULA. *Sto. testā parvā, depresso, haliotidē, pallidissimē rosā, rubro punctatā, costellis numerosis liratā; aperturā magno, labio interno albo, acuto, obliquū arcuato.*

THE IRID STOMATELLA. Shell small, depressed, haliotis-shaped, very pale rose, spotted with red; ridged with numerous ribs; aperture large, inner lip white, sharp, obliquely arched.

H. ADAMS. Proc. Zool. Soc., 1872.
Hab. Red Sea.

Species 21. (Mus. Brit.)

STOMATELLA BIPORCATA. *Sto. testā trochiformi, rubrā, bivaricatā; spira elevatā, anfractibus angulatis; aperturā subquadratā; labio externo biungulato; umbilico callo obtecto.*

THE TWO-KNEED STOMATELLA. Shell trochiform, red, two-kneed; spire elevated, whorls angular; aperture subquadrate; outer lip biangular; umbilicus closed by a callus.

A. ADAMS. Proc. Zool. Soc., 1850.
Hab. Australia.

Although, as to the keels, this shell would appear rather to belong to the genus *Stomatia*, it belongs to the present genus on account of the crenulated edge of the whorls at the suture.

Species 22. (Mus. Brit.)

STOMATELLA ARTICULATA. *Sto. testā suborbiculari, depresso convexā, imperforatā, tenuiscutulā, griseō; costellis spiralis nigro articulatis, intersticiis con-*

centrici liratē elevatis rotatis, spirali prominulā, anfractibus concavis, ultimo magno, oblique.

THE ARTICULATED STOMATELLA. Shell suborbicular, depressed, convex, imperforate, rather thin, grey; spiral ribs articulated with black; interstices concentrically ornamented with raised ridges; spire prominent; whorls convex, the last large, oblique.

A. ADAMS. Proc. Zool. Soc., 1850.
Hab. Australia.

Differing slightly in form from *Stomatella inabricata*, but much more in the sculpture. The interstices of the articulated ribs are in a manner cancelled by very fine ridges in the other direction.

Species 23. (Fig. a, b, Mus. Brit.)

STOMATELLA ORBICULATA. *Sto. testā suborbicularatā, subdepressā, subviridi; fusco variegatā, costellis rotundis inaequalibus confertis liratā; spirā prominenti, anfractibus rotundis; aperturā subcirculari.*

THE OCULAR STOMATELLA. Shell nearly round, rather depressed, greenish, variegated with brown; ridged with rounded unequal ribs; spire prominent, whorls rounded; aperture subcircular

A. ADAMS. Proc. Zool. Soc., 1850.
Hab. Mozambique.

Collected by the Rev. W. N. Hennah, under stones at low water.

Species 24. (Mus. Brit.)

STOMATELLA MALUKANA. *Sto. testā suborbiculari, inflata, imperforatā, concentrici striatā, costellis spiralis subrotundis, inaequalibus liratā, fuscō-fusca, striis irregulardis variegatā; spirā prominulā; aperturā subrotatā.*

THE MOLUCCAS STOMATELLA. Shell suborbicular, inflated, imperforated, concentrically striated,

STOMATELLA.—PLATE IV.

ridged with spiral, rouuish, unequal ribs; smoky brown, variegated with irregular stripes; spire rather prominent; aperture subovate.

A. ADAMS. Proc. Zool. Soc., 1850.

Hab. Moluccas.

Species 25. (Fig. a, b, Mus. Cuming.)

STOMATELLA BICARINATA. *Sto. testā trochiformi, perforatā, tenuiūsculā, pallidē fulcā, strigis irregulāribus, subconcentricis, viridis pictā; spirā prominulā, ultimo anfractu distanter bicarinato; apertura subquadratā; labio interno tenui; umbilicus parvo.*

THE TWO-KEELED STOMATELLA. Shell trochiform, perforated, rather thin, pale fulvous, painted with irregular partly concentric green stripes; spire a little prominent; last whorl distantly two-keeled; aperture rather square; inner lip thin; umbilicus small.

A. ADAMS. Sowerby's Thesaurus Conchyliorum, Stomatella, Sp. 21, f 39, 40.

Hab. Moreton Bay, Australia.

Resembling the *Stomatia*, yet differing from them in the same way as *Stomatella biporcata*.

Species 26. (Fig. a, b, Mus. Brit.)

STOMATELLA COCCINEA. *Sto. testā parvā, obliquè subovatā, levigatā, rubrā, maculis albis seriatim in medio onfractus ultimi dispositis ornatā; anfractus ultimi leviter sulcato, subangulato; apertura obliquè lateraliter producto, labio interno albo, lato, semiperforato.*

THE COCHINEAL STOMATELLA. Shell small, obliquely subovate, smooth, red, ornamented with a row of white spots in the middle of the last whorl; last whorl finely sulcated, rather angular; aperture obliquely laterally produced; inner lip white, broad, half perforated.

A. ADAMS. Proc. Zool. Soc., 1850.

Hab. St. John's.

The body-whorl is obtusely angulated by two obscure ribs.

Hab. ——?

Species 28. (Mus. Brit.)

STOMATELLA ELATA. *Sto. testi trochiformi, subangulata, alba, maculis quadratis rubris picta, costis duabus principibus et aliis minoribus rubro articulatis ornata; spirae elevatae, anfractibus exsertis, biangulatis, ad suturam rubro articulatis.*

THE ELEVATED STOMATELLA. Shell trochiform, rather angular, white, painted with squarish red spots, ornamented with two principal, and other smaller red articulated ribs; spire elevated; whorls exserted, biangular, articulated at the suture with red.

II. ADAMS. Proc. Zool. Soc., 1863, p. 433.

Hab. ——?

All the ribs of various sizes are neatly articulated with red spots.

Species 29. (Mus. Brit.)

STOMATELLA SELECTA. *Sto. testi suborbiculari, depressa, levigata, subcinerata variegata; costis fuso-articulatis; spirae clavata, angustata, acuminata; ultimo anfractu lato, subumbilicata, horizontali, medio et supra biangulari et costata; aperturam ovatam, depresso.*

THE CHOICE STOMATELLA. Shell suborbicular, depressed, smooth, variegated with greenish; ribs articulated with brown; spire elevated, narrow, acuminate; last whorl broad, slightly umbilicated, horizontal, biangular and ribbed in the middle and above; aperture ovate, depressed.

A. ADAMS. Proc. Zool. Soc., 1863, p. 433.

Hab. ——?

Species 30. (Mus. Brit.)

STOMATELLA DILEcta. *Sto. testi trochiformi, subrosea, maculis rubris seriatim picta; spirae prominenti, anfractibus subrotundis; ultimo anfractu biangulato, ad angulos costis validis cincto; interstitiis striatis.*

THE ESTEEMED STOMATELLA. Shell trochiform, rather rosy, painted with red spots in rows; spire prominent, whorls roundish; last whorl biangular, belted with strong ribs at the angles; interstices striated.

II. ADAMS. ——?

Hab. ——?

Resembling *Stomatella modesta* in the markings, but more trochiform.

Species 31. (Mus. Brit.)

STOMATELLA CLATHRATULA. *Sto. testi subglobosae, vel trochiformi, alta, albida, fusco-purpureo variegata; costis spiralibus fuso-maculatis, scabris ornata; interstitiis profundè concentricè liratis; ultimo anfractu globosa, propè columellam costis duabus majoribus instructa; columellæ latè reflexa.*

THE LATICEOUS STOMATELLA. Shell rather globose, or trochiform, high, whitish, variegated with purplish-brown, ornamented with brown spotted seaceous spiral ribs; interstices deeply concentrically ridged; last whorl globose with two larger ribs fixed near the columella; columella broadly reflected.

A. ADAMS. ——?

Hab. ——?

April, 1874.

STOMATELLA.—PLATE V.

Species 32. (Mus. Brit.)

STOMATELLA CUMINGI. *Sto. testi auriformi, obliquè oblongo-ovatâ, lutescenti, fusco-maculatâ, spiraliter costis elevatis moniliformibus validis asperatâ; apertura obliquâ elongatâ, labio externo crenato; labio interno valde arecuto.*

CUMING'S STOMATELLA. Shell auriform, obliquely oblong, ovate, yellowish, spotted with brown, spirally roughened with elevated strong beaded ribs; aperture obliquely elongated, outer lip crenated, inner lip strongly arched.

A. ADAMS. Sowerby's Thesaurus Conchyliorum, Plate 175, fig. 38.

Hab. ——?

The locality of this handsome species is unknown.

Species 33. (Fig. a, b, Mus. Brit.)

STOMATELLA CALLISTOMA. *Sto. testâ globoso-suhdepressâ, tenui, rufescenti, fusco variegatâ, costis tenuibus, inaequalibus, spiraliter liratâ; apertura subovatâ, rubrâ, columellâ albâ, valde obliquâ.*

THE RED-MOUTHED STOMATELLA. Shell globose-subdepressed, thin, reddish, variegated with brown, spirally ridged with thin, unequal ribs; aperture rather oval, red, columella white, very oblique.

A. ADAMS. Sowerby's Thesaurus Conchyliorum, Stomatella, Sp. 26, figs. 41, 42.

Hab. Ceylon.

Species 34. (Mus. Brit.)

STOMATELLA MODESTA. *Sto. testâ purvâ, ovatâ, depressi, pallide subroseâ, rubro-nuculatâ, obscurâ viridi nebulatâ; spiraliter costis parvis, rubro articulatis liratâ.*

THE MODEST STOMATELLA. Shell small, ovate depressed, pale rosy, spotted with red, clouded with obscure green; spirally ridged with small red articulated ribs.

H. ADAMS. ——?

Hab. ——?

An interesting, prettily spotted species.

MONOGRAPH
OF THE GENUS
STOMATIA.

Fraud, but a work divine,
With delicate spire and whorl.—*Tenuis*.

33

34

35

36

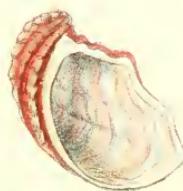

37

38

39

40

S T O M A T I A.

PLATE I.

Genus STOMATIA, *Hedding.*

Tissa halitoidea, vel *subtrochiformis*, *medio anfractus* *ultimi spirali* *bicarinata*; *carinis tuberculatis*. *Spira producta*, *anfractibus ad suturam rugatoplicatis*. *Oprerulum nullum*.
Shell haliotis-shaped, or trochiform, spirally keeled in the middle of the last whorl; keels tuberculated. Spire produced, whorls wrinkled in plait at the suture. Operculum none.

The distinction between this genus and *Stomatella* is, that the shells of *Stomatia* have two more or less distinct tuberculated keels in the middle of the whorls and are crenulated at the suture. The habitats are as in *Stomatella*, the majority being Philippine. The type, *Stomatia phymotis*, is a Red Sea shell, and its nearest ally, *S. Australis*, affects the locality which its name implies, besides being found in the Philippines.

The genus *Microtis*, consisting of but a single species, is hardly worth separating, the distinction being the singular one of the inner margin of the aperture being continued spirally and visible to the apex.

Species 1. (Fig. a, b, c, Mus. Brit., Nobis, &c.)

STOMATIA AUSTRALIS. *Sto. testā obliquā, angustā, aureo-subviridi*, vel *pallidē purpureo-rubescēti*, *vel variegati*, *costellis acutē nodulifervis lirati*; *spira parvā, elevatā, anfractibus duobus, parvis, bicarinatis*; *ultimo anfractu magno, ad suturam calidē plicato*, *infra plicas excavato, tūm moderatē gibbose, deinde declī, media bicarinato, carinis subdistantibus, subequalibus, acutē nodulosis*; *infra carinas rugosis*.

THE AUSTRALIAN STOMATIA. Shell oblique, narrow, greenish gold, or pale purplish-red, or variegated, ridged with little noduliferous ribs; spire small, elevated, whorls two, small, two-keeled; last whorl large, strongly plaited at the suture, ex-

cavated below the plait, then moderately gibbose, thence sloped, bicarinate in the middle, keels rather distant, nearly equal, sharply nodulous; wrinkled below the keel.

A. ADAMS. Proc. Zool. Soc., 1850.
Hab. Australia. Philippines.

Differing from *Stomatia phymotis* in the narrower form, sharp tubercles, and equal central keels. In this species we include all the shells figured as varieties of *St. phymotis* in the Thesaurus. But fig. 51 (Thes.) represents a very abnormal form.

Species 2. (Fig. a, b, Mus. Brit. and Nobis.)

STOMATIA PHYNOTIS. *Sto. testā vīde obliquā, crassā, rugosā, rubro variegatā*; *ad suturam plicato-rugatā*, *tūm tumidā, tuberculatā, medio carinā duobus obtusis, tuberculatā ornato*; *infra tuberculatā costatā*; *aperturā obliquā subquadratā*; *apice elevato, exserto, acuto*.

THE TUBERCLED STOMATIA. Shell very oblique, thick, rugose, variegated with red, plaited in wrinkles at the suture, then tumid, tuberculated, ornamented in the middle with two obtuse, tuberculated keels, with tuberculated ribs below; aperture obliquely subquadrate; apex elevated, exserted, sharp.

HELDING.

Haliotis imperforata, Chemnitz.

Hab. Red Sea. Gulf of Suez.

Species 3. (Fig. a, b, Mus. Nobis.)

STOMATIA OBSCURA. *Sto. testā obliquā subquadratā, pallidissimā rubro variegatā, tuberculis rotundatis plicisque rugatā*; *spira parvā exserta*; *ultimo anfractu ad suturam plicato excavato inter plicas profundē invulnato, tūm carinā tuberculatā elevatā et ad medium carinā duplicitatā prominenti cincto*:

STOMATIA.—PLATE I.

inter carinas excavato, infrā irregulariter tuberculato.

THE OBSCURE STOMATIA. Shell obliquely subquadrate, variegated with very pale red, wrinkled with rounded tubercles and plaits; spire small, exserted; the last whorl plaited and excavated at the suture; deeply pitted between the plaits; then belted with an elevated tubercled keel, and at the middle with a doubled prominent keel; excavated between the keels; irregularly tubercled below.

LAMARCK. Anim. sans Vert., sp. 2.

Hab. Suez.

This remarkable form may possibly only represent a variation of *St. phymatis*, and its identification as Lamarck's shell is by no means clear. It is admitted here, however, as it is recognised in collections.

Species 4. (Fig. a, b, Mus. Brit.)

STOMATIA TUBERCULATA. *Sto. testi auriformi, valde depresso, spiraliter striatā, variegatā, ad suturam validē pliatā; suprā et infrā medium anfractuum bicarinatā; carinis tuberculata; aperturā magnā, labio columellari usque ad apicem perspectivè spirali.*

THE TUBERCULATED STOMATIA. Shell auriform, much depressed, spirally striated, variegated, strongly plaited at the suture; two-keeled above and below the middle of the whorls; keels tuberculated; aperture large, columellar lip perspectively spiral as far as the apex.

A. ADAMS (*Microtis*). Proc. Zool. Soc., 1850.

Microtis tuberculata, H. and A. Adams.

Hab. Isl. Capul, Philippines.

S T O M A T I A.

PLATE II.

Species 5. (Mus. Adams.)

STOMATIA VARIEGATA. *Sto. testā obliquā elevatā, solidū, angustū, fusco-rubescens, flammis variegata; spira elevatā, acuminatā, ultima obscurissimē biangulata; aperturā perobliquā magnō marginē crassissimulo.*

THE VARIEGATED STOMATIA. Shell obliquely elevated, solid, narrow, reddish-brown, variegated with flames; spire raised, acuminate; last whorl very obscurely biangular; aperture very oblique, large, margin rather thick.

H. ADAMS (Stomatia). Proc. Zool. Soc., 1863.
Hab. Mauritius.

Although smooth, like a *Gina*, this species has more the form and (very obscurely) the two spiral keels of a *Stomatia*.

Species 6. (Mus. Brit.)

STOMATIA DECUSSETA. *Sto. estū parvū, trochiformi, striis concentricis et costellis spiraliis densissimis, pallidū, flammulis rubis concentricis ornatū; spira elevatā, anfractibus biangulata.*

THE DECUSSETA STOMATIA. Shell small, trochiform; decussated with concentric striae and spiral riblets, pale, ornamented with concentric red flames; spire elevated, whorls biangular.

A. ADAMS. Proc. Zool. Soc., 1850.
Hab. Island of Luzon, Philippines.

Species 7. (Mus. Brit.)

STOMATIA ACUMINATA. *Sto. testā parvā, fusca, cancellatā, subtrochiformi; spira elevatā, apice acuminatā; ultima anfractu depresso, ad suturam vallē plicato, medio, supra & infra tricostato, costā medianā prominenti, biconvoluta.*

THE ACCUMINATED STOMATIA. Shell small, brown, cancellated, rather trochiform; spire elevated,

apex acuminate; last whorl depressed, strongly plaited at the suture, three-ribbed in the middle, above and below; middle rib prominent, tuberculated.

A. ADAMS. Proc. Zool. Soc., 1850.
Hab. Philippines.

Species 8. (Fig. a, b, Mus. Brit.)

STOMATIA RUBRA. *Sto. testā tenui, depresso, suborbiculari, rubri, albo maculatā, medio et supernè bicarinatā; carinis moniliformibus: aperturā subovatā, columbelli angustē reflexa, arcu post columellarī alba.*

THE RED STOMATIA. Shell thin, depressed, suborbicular, red, white spotted, two keeled in the middle and above; keels headed; aperture subovate, columella narrowly reflected, area behind the columella white.

LAMARCK (Stomatella). Anim. sans Vert. sp. 2.
Hab. Philippine Islands. Korea.

One of the finest examples of the more orbicular form among the *Stomatia*.

Species 9. (Mus. Brit.)

STOMATIA LIRATA. *Sto. testā orbiculatā, depresso, straminō, fusco variegata, costellis subequalibus, tenuibus liratā, medio carinatā, ad suturam plie parsim numerosis rugata.*

THE RIDGED STOMATIA. Shell orbicular, depressed, straw-coloured, variegated with brown, keeled in the middle, ridged with thin, nearly equal ribs, wrinkled with numerous small plaited at the suture.

A. ADAMS. Proc. Zool. Soc., 1850.
Hab. —?

STOMATIA.—PLATE II.

Species 10. (Mus. Brit.)

STOMATIA ANGULATA. *Sto. testā orbiculatā, depressā, pallidā, seriatim maculis strigisque fuscis subcīridis variegatā, minutū decessatā, ad suturam plicatā; propè suturam planulatā, medio et suprā bīcostatā, infra tigratā.*

THE ANGULAR STOMATIA. Shell orbicular, depressed, pale, variegated with greenish-brown spots and stripes; plaited at the suture, flattened near the suture, two ribbed in the middle and above; ridged below.

A. ADAMS. Proc. Zool. Soc., 1850.

Hab. Isl. Luzon, Philippines.

Species 11. (Fig. a, b. Mus. Brit.)

STOMATIA DUPLICATA. *Sto. testā subauriculiformē, variegatā, elevatā, undulatim spiculiter striatā, spira nebuloscula, anfractibus biangulatis; anfractus ultimo medio bīcostato, costis moniliformibus, undā infra, alteri suprā medium dispositis; apertura mediocri, obliqua.*

THE DOUBLE-RIDGED STOMATIA. Shell subauricular, variegated, raised, wavy spirally striated; spire

rather large, whorls biangular; last whorl two-ribbed, ribs beaded, one placed below, the other above the middle; aperture medium-sized, oblique.

SOWERBY. Genera of Shells.

Hab. Isl. Mindinao, Philippines.

A very well distinguished species, in form between the orbicular and the auricular, but inclining to the latter.

Species 12. (Fig. a, b. Mus. Nobis.)

STOMATIA DEPRESSA. *Sto. parca, orbiculari, depresso, fulvo-rubescens, strigis fusco-rubris obliquis ornata, costellis moniliformis tenuibus tigratā, suprā medium anfractuum costis acutē tuberculatis bīcarinatā; apertura subauriformi, mediocri.*

THE DEPRESSED STOMATIA. Shell small, orbicular, depressed, reddish-fawn, ornamented with oblique stripes of red-brown, two-keeled above the middle of the whorls with sharply tuberculated ribs. Aperture subauriform, middle-sized.

SOWERBY.

Hab. —?

MONOGRAPH

OF THE GENUS

G E N A.

"It there's a power above us,
(And that there is, all nature cries aloud
Through all her works)."—*Addison.*

G E N A.

PLATE I.

Genus GENA, Gray

Patella auriculata, depresso, obliqua, levigata aut striata; spira patra, vix exserta, apertura maxima, orata, intus nuda. Operculum nullum.
Shell auriform, depressed, oblique, smooth or striated; spire small, scarcely exserted; aperture very large, ovate, pearly within. Operculum none.

Generally the GENA may be distinguished from the other two Genera of *Stomatellidae* by their flattened form and smooth surface, although some of the smaller species have a somewhat more orbicular form. The animals live among stones or on coral reefs between tides. A large proportion of the species are the results of the late Mr. Cuming's researches in the Philippines, Australia and some of the Pacific Islands contribute a few.

Species 1. (Mus. Brit.)

GENA LINTICULA. Gen. testa parva, elongata, planulata, spirali striata, pallidissime fulvo, rubro variegata; spira minutata; ultimo anfractu supra medium depresso, attenuata.

THE LITTLE-BOAT GENA. Shell small, elongated, flattened, spirally striated, very pale fulvous, variegated with red; spire minute; last whorl depressed above the middle, attenuated.

A. ADAMS. Proc. Zool. Soc., 1850.

Hab. Isl. Mindoro, Philippines.

More elongated and narrow than any other species.

Species 2. (Fig. a, b, Mus. Brit.)

GENA LUTEA. Gen. testa lutea, rubro vel fuscō variegata, levigata, obliquè oblonga, posticè vix depresso; spira minuta, ferè planulata.

THE YELLOW GENA. Shell yellowish, variegated with red or brown, smooth, obliquely oblong, posteriorly scarcely depressed; spire small, almost flat.

LINNEUS (Patella). Systema Naturae.
Stomatella auricula, Lamarck.

Hab. Eastern Seas.

Species 3. (Fig. a, b, Mus. Nobis.)

GENA PLANULATA. Gen. testa oblonga, convexa-planulata, rufiter striata, rufescens, striae subcircularis vel fasciæ articulatis fasciæ subfuscæ variegata; spira minimata, lateraliiter decumbens; labio columellaris albus, latu, vesris suturam subcaelato.

THE FLATTENED GENA. Shell oblong, convex-flattened, finely striated, greenish, variegated with greenish stripes or brown articulated bands and clouds; spire very small, laterally decumbent; columellar lip white, broad, rather callous toward the suture.

LAMARCK (Stomatella). Hist. Nat. Anim. s. Vert.

Hab. Isl. Camiguin, Philippines.

Species 4. (Fig. a, b, Mus. Brit.)

GENA STRIATULA. Gen. testa halitoidea, spirali striata, obliquè oblonga, subinfata, flammulis strigisque rubris vel subcircularis variegata; spira exserta; ultimo anfractu dorso proprie suturam depresso, subexcavata, tunc subglobosa, deinde subdepresso, ad medium obliquè inflata; apertura elongata, labio externo flexuoso supra medium.

THE STRIATED GENA. Shell haliotis-shaped, spirally striated, obliquely oblong, rather inflated, variegated with red or greenish stripes and flames; spire exserted; last whorl depressed at the back, slightly excavated near the suture, then somewhat gibbous, thence depressed, obliquely inflated at

GENA.—PLATE I.

the middle; aperture elongated, outer lip flexuous above the middle.

A. ADAMS. Proc. Zool. Soc., 1850.
Hab. Isl. Mindoro, Philippines.

Species 5. (Fig. *a, b*, Mus. Brit.)

GENA CONCINNA. *Gen. testā parvā, inflatā, subobliquā, albida, rubro variegatā; spirā productā, acuminatā; ultimo anfractu obliqua, supernè declivi; apertura mediocri, intus variegatā.*

THE NEAT GENA. Shell small, inflated, rather oblique, whitish, variegated with red; spire produced, acuminate; last whorl oblique, sloped above; aperture medium-sized, variegated within.

GOULD (Stomatia). Shells of American Expedition.
Hab. Sandy Island.

This little species has the form which more usually characterizes the *Stomatia*.

Species 6. (Fig. *a, b*, Mus. Brit.)

GENA LINEATA. *Gen. testā parvā, inflatā, suborbiculari, subroseā, lineis rubris obliquis ornatā; spirā parvā, acuminatā; apertura subrotundā; labio columellarī albā, latā, planulatā.*

THE LINEATED GENA. Shell small, inflated, suborbicular, pinky, ornamented with red, oblique lines; spire small, acuminate; aperture rather rounded, columellar lip white, broad, flattened.

A. ADAMS. Proc. Zool. Soc., 1850.
Hab. —?

This pretty little shell was in the Cumingian collection, but its locality was unknown.

Species 7. (Mus. Brit.)

GENA PLUMBEA. *Gen. testā auriformi, latā, plumbeā, minutissimè decussatā, medio et infra' inflatā, suprad medium depressā, ad suturam subgi bosā; apertura oblongā, labio externo sinuato.*

THE LEAD-COLOURED GENA. Shell ear-shaped, broad, lead-coloured, very minutely decussated, inflated in the middle and under, depressed above the middle, a little gibbous at the suture; aperture oblong, outer lip sinuous.

A. ADAMS. Proc. Zool. Soc., 1850.
Hab. Java.

The dull leaden colour of this shell gives it a peculiar appearance; and the minute crossing striae form a character worth noting.

G E N A.

PLATE II.

Species 8. (Fig. a, b, Mus. Brit.)

GENA VARIA. *Gen. testā parē, variegatā, luteigatā, obliquā, posticē subangustatā, anticē subexpansā; spirā paulo exsertā, acuminatā, labio columellari, albo, valde arcuato.*

THE VARIOUS GENA. Shell small, variegated, smooth, oblique, posteriorly rather narrowed, anteriorly slightly expanded; spire a little exserted, acuminated, columellar lip white, much arched.

A. ADAMS. Proc. Zool. Soc., 1850.
Hab. Isl. Mindoro, Philippines.

Nearly resembling *Gena lutea*, but broader and not so much depressed on the upper part of the last whorl.

Species 9. (Mus. Brit.)

GENA ORNATA. *Gen. testā solidā, orbicularitā, fusco-rubrā, lineis nigris, albo articulatis spiralibus ornata; ultimo anfractu dorso rotunda; spirā parvā, acuminatā, rubrā; aperturā mediocri, fulvi.*

THE ORNATE GENA. Shell solid, orbicular, red-brown, ornamented with black spiral lines articulated with white; last whorl rounded at the back; spire small, acuminated, red; aperture medium-sized, fulvous.

A. ADAMS. Proc. Zool. Soc., 1850.
Hab. Isl. Ticao, Philippines.

Species 10. (Mus. Brit.)

GENA CALIGINOSA. *Gen. testā obliquā, elevatā, luteisimā, nigrā; spirā elevatā, acuminatā; aperturā obliquā ovatā; labio columellari albo, lente arcuato.*

THE DARK GENA. Shell oblique, elevated, very smooth, black; spire elevated, acuminated; aperture obliquely ovate; columellar lip white, gently arched.

H. & A. ADAMS.

Hab. —?

Species 11. (Fig. a, b, Mus. Brit.)

GENA NIGRA. *Gen. testā obliquā auriformi, elongato-ovali, convexā, hæri, nigrā vel variegatā, intus violaceo-nucrā; spirā minutā, fere terminali; aperturā ovatā.*

THE BLACK GENA. Shell obliquely auriform, elongated-oval, convex, smooth, black or variegated, purplish-pearly within, spire very small, nearly terminal, aperture ovate.

QUOY. Voy. de l'Astrolabe, t. 17, figs. 154, 155.
Hab. Tonga-Tabou, Sandwich Islands.

Species 12. (Mus. Brit.)

GENA STRIGOSA. *Gen. testā obliquā ovatā, convexā, variegatā et spiraliiter strigata, minutè fasciculatim striatā; aperturā oblongā, ovatā; labio externo rix sinuato; spirā subplanata.*

THE STRIPED GENA. Shell obliquely ovate, convex, variegated and spirally striped, with minute striae in bundles; aperture oblong, ovate; outer lip scarcely sinuated; spire partly flattened.

A. ADAMS. Proc. Zool. Soc., 1850.

Hab. —?

More uniformly convex than *Gena striatula*, with the striae inclining to run in groups, and with faint stripes traceable through the clouding and marking of the colours.

GENA.—PLATE II.

Species 13. (Mus. Cuming.)

GENA NEBULOSA. *Gen. testā parvā, breviter auriformi, convexā, pallidē butē, flammulis undulatis variegatā; columellā callo crasso rimam umbilicatum obtegenti.*

THE CLOUDED GENA. Shell small, shortly auriform, convex, pale yellow, variegated with undulated flames; columella with a thick callus covering the umbilical border.

A. ADAMS. Proc. Zool. Soc., 1850.

Hab. Australia.

Species 14. (Mus. Brit.)

GENA DILECTA. *Gen. testā pareā, angustā, planulatā, pallidē purpureo variegatā; ultimo aufractu ad marginem apertura angustissimo.*

THE FAVOURED GENA. Shell small, narrow, flattened, variegated with pale purple; last whorl very narrow at the margin of the aperture.

GOULD. —?

Hab. —?

Species 15. (Mus. (olim.) Metcalfe.)

GENA PULCHELLA. *Gen. testā parvā, ovali, albā, rufō maculati, convexā, spiraliter striatā; spira prominulā; aperturā magnā, orali, intūs iridescenti.*

THE PRETTY GENA. Shell small, oval, white, red-spotted, convex, spirally striated; spire rather prominent; aperture large, oval, iridescent within.

A. ADAMS. Proc. Zool. Soc., 1850.

Hab. —?

Species 16. (Mus. Nobis.)

GENA ASPERULATA. *Gen. testā haliotoidē, obliquē ovatā, liris spiralibus et striis concentricis decussatā, fuscō, medio albo unifasciatā; apice prominulo.*

THE RASPED GENA. Shell haliotis-shaped, obliquely ovate, decussated with spiral ridges and concentric striae, brown, with a single white band in the middle; apex rather prominent.

A. ADAMS. Proc. Zool. Soc., 1850.

Hab. —?

* * * * *

* * * 'tis but to hold

Converse with Nature's charms, and see her stores unrolled."—*Byron.*

S O L E N.

PLATE I.

Genus SOLEN, Linnaeus.

Testa aquiescens, transversè elongata, recta, vel lēntē arcuata utrinquè plus minusve truncatā, hinc, umbonibus terminalibus. Carlo elongatā, dentibus uno et duobus principalibus. Ligamentum externalē. Impressio muscularis antica elongata. Impressio pallii ad terminum quadratum sinuata.

Shell equivalve, transversely elongated, straight, or slightly arched, more or less truncated, gaping, with terminal umbones. Hinge elongated, with one and two principal teeth. Ligament external. Anterior muscular impression elongated. Pallial impression with a square sinus.

There would seem to be no sufficient reason to separate generically the straight from the curved razors-shells. United, they form a capital genus, distinguished from others of the family by having terminal banks. The shell is also divided into two more or less distinct areas by a diagonal line from the apex at the anterior to the posterior lower corner of the truncated posterior extremity.

The habits of the Solens are peculiar. They form deep burrows in the sand, into and out of which they spring with amazing rapidity by a sudden contraction and expansion of the foot. They can also leap forward with great power. They are found in most temperate and tropical countries, but no country possesses many species. On the coasts of Britain we have several well-known species; Mr. Cuming found several in the Philippines, but most of them are scattered singly in almost as many countries as species.

Species 1. (Mus. Brit.)

SOLEN TRUNCATUS. *Sol. testā latā, rectā, subcompressā, fasciis purpureis striatā, ad terminū posticum latē et perpendiculariter truncatā; ad terminū anticum obliquē et acutē truncatā, angulo antieventrali acuto.*

THE TRUNCATED SOLEN. Shell broad, straight, sub-compressed, striped with purple bands, truncated broadly and perpendicularly at the posterior end;

truncated obliquely and sharply at the anterior end, with the antero-ventral angle acute.

SOWERBY. Genus of Shells.

C. glomerata, Dunker.

Hab. Ceylon.

Solen truncatus, including the varieties, forms a very good and easily recognisable species.

Species 2. (Mus. Sowerby.)

SOLEN VAGINA. *Sol. testā rectiusculā, elongatā, subdepressā, versis umbonēs subrotundā, antīcī suboblique paulo arcuatā, posticī suboblique truncatā; margine ventralē sic contracto; margine dorsali medio paulo elevato.*

THE SLEATH SOLEN. Shell rather straight, elongated, subdepressed, rather pink towards the umbones, anteriorly subobliquely truncated; ventral margin scarcely contracted; dorsal margin a little raised in the middle.

LINNEUS. Systema Naturæ.

Hab. Great Britain.

A well-known species, the largest of the true Solens.

Species 3. (Mus. Brit.)

SOLEN ENESIS. *Sol. testā angustissimā, arcuatā, depresso, subtus epidermide pallidè roseā vel griseā striatā, ad terminū anticum subrotundā, ad terminū posticum rectē truncatā; margine dorsali arcuatim excavato; margine ventrali arcuatione convexā.*

THE SWORD SOLEN. Shell very narrow, curved, depressed, striped with pale rose or grey beneath the epidermis, straightly truncated at the posterior end; a little rounded at the anterior end; dorsal margin sloped out in a curve; ventral margin convex in an arch.

LINNEUS. Systema Naturæ.

Siliqua enisa, Schumacher.

Hab. Great Britain.

a'

b

c

d

S O L E N.

PLATE II.

Species 3. (Fig. b, Mus. Nobis.)

It is thought desirable to present this common variety of *SOLEN ENSIS*, because Mr. Dunker seems to have given the name *Solen aruana* to specimens in the British Museum from Aru Island, which can in no way be distinguished from the British forms.

Species 4. (Mus. Nobis.)

SOLEN MARGINATUS. *Sol. testā angustiūsculā, convexā, fulvā; epidermīde tenuī; margine dorsali recto; areā dorsali linearē, inconspicuā; areā umbonati lati, subrugosā; margine ventrali medio vix excavato; margine postico rectiūsculo; margine antico obliquō, elevato, unicostato, post costam canali profundo constricto.*

THE BORDERED SOLEN. Shell rather narrow, convex, fulvous; epidermis thin; dorsal margin straight, dorsal area linear, inconspicuous; umbonal area broad, rather rough; ventral margin very slightly excavated in the middle; anterior margin oblique, raised, single-ribbed, constricted behind the rib by a deep canal.

PULTENY.

Solen rugina, Pennant, non Linnaeus.

Hab. Britain.

Species 5. (Mus. Brit.)

SOLEN GRANDIS. *Sol. testā latā, subcompressā, purpureo strigatā, antice subattenuatā; margine dorsali rectiūsculo, areā latiusculā; margine ventrali ante-*

medium pauci angustato, margine postico angusto, subrotundatim quadrato; margine antico simplici, valde obliquo, ad marginem ventralē obliquē acuminato.

THE LARGE SOLEN. Shell broad, subcompressed, striped with purple, anteriorly rather attenuated; dorsal margin rather straight, area rather broad; ventral margin a little narrowed before the middle, posterior margin narrow, rather roundly square; anterior margin simple, very oblique, obliquely acuminated at the ventral margin.

DUNKER, Proc. Zool. Soc., 1861.

Hab. Philippines.

Broader in proportion than *Solen truncatus*; rather narrowed towards the posterior end, and the anterior margin more oblique.

Species 6. (Mus. Brit.)

SOLEN BREVIS. *Sol. testā rectiūsculā, posticē subcomplutatā et attenuatā, purpureo strigatā; margine dorsali posticē subdeclinī; margine postico angusto, rotundo; margine antico abrupte truncato.*

THE SHORT SOLEN. Shell rather straight, posteriorly a little flattened and tapering, striped with purple; dorsal margin posteriorly sloped; posterior margin narrow, rounded; anterior margin abruptly truncated.

GRAY, in Brit. Mus.

Hab. American Seas.

Differing from *Solen truncatus* in being sloped or tapering towards the posterior end.

April, 1874.

8

9

10

11

12

13

S O L E N.

PLATE III.

Species 7. (Mus. Brit.)

SOLEN EOSTRUM-ANATIS. *Sol. testa brevi, paulo arcuata subtus epidermidem paupero-fasciata, intus et ad umbones rosco-purpurei; postice subteuenata et planulata, margine ventrali medio convexisculo, margine antico elevato, raddi obliqua. Epidermē nitens, aureo-suberida.*

THE DUCK'S BILL SOLEN. Shell short, a little curved, purple-banded under the epidermis, pinky purple at the umbos and within; rather tapering and flattened posteriorly; ventral margin rather convex, anterior margin raised, very oblique. Epidermis shining, greenish-gold.

DUNKER. Proc. Zool. Soc., 1861.

Hab. —?

Species 8. (Mus. Brit.)

SOLEN DELESSerti. *Sol. testa brevi, recta, utrinque truncata, tenitior omnino rugosa, pallida; margine antico elevata, canali profundo constricta.*

DELESSERT'S SOLEN. Shell short, straight, truncated at both ends, finely wrinkled all over, pale; anterior margin elevated, constricted with a deep canal.

CHEV. Illustrations Conchylologiques.

Hab. —?

This curious little *Solen* is wrinkled finely all over, and has a very strong stricture close to the anterior margin.

Species 9. (Mus. Brit.)

SOLEN VITREUS. *Sol. parvus, pallidus, tenui, pellucidi, rectiusculus, margine postice truncatus; margine antico obliquus, ad marginem ventralem accedit.*

THE GLASSY SOLEN. Shell small, pale, thin, pellucid, rather straight; posterior margin truncated; anterior margin oblique, sloped upwards at the ventral margin.

DUNKER. Proc. Zool. Soc., 1861

Hab. Malacca.

This pretty little shell is so thin and transparent that the complicated system of muscle and mantle-marks is seen on the outer surface.

Species 10. (Mus. Brit.)

SOLEN SLOANII. *Sol. testa recta, angusta, utrinque truncata, et opis metaterrisque purpuraceo-aurum carnegiata; marginis dorsali recto, area angustissima, marginis ventralis rectiusculo, proprie terminum antennae contracto; margine antico recto, canali contracto.*

SLOANE'S SOLEN. Shell straight, narrow, truncated at each end, varied in every part with purple stripes and spots; dorsal margin straight, area very narrow; ventral margin rather straight, contracted near the anterior end; anterior margin straight, contracted with a groove.

GRAY.

Solen versicolor, Philippi.

Hab. —?

A prettily variegated shell.

Species 11. (Mus. Brit.)

SOLEN JONESII. *Sol. testa brevi, rectiuscula, subtus epidermidem fulvo-griseescente, ad umbonem purpureo-tincta, post marginem purpureo aurantia; marginem antico incrassato, lata depresso: area umbonata latitudo, areæ dorsali linearis; marginem ventrali propriæ marginem antennæ acutæ.*

JONES'S SOLEN. Shell short, rather straight, under the epidermis brownish-grey, tinted at the umbo with purple, with a ray of purple behind the margin; anterior margin thickened, then depressed; umbonal area broad, dorsal area linear, ventral margin sloped upwards near the anterior margin.

DUNKER. Proc. Zool. Soc., 1861.

Hab. —?

April, 1874.

SOLEN.—PLATE III.

Species 12. (Mus. Brit.)

SOLEN SCALPRUM. *Sol. testá pallidá, compressá, utrinquá paulò arcuatá; epidermí tenuí, pallido, ad marginem inferiorem areæ umbonalis rugato; margine dorsali paulò arcuato; margine ventrali propí terminos arcuato, medio vix excavato.*

THE SCALPEL SOLEN. Shell pale, compressed, a little arched at each end; epidermis thin, pale, wrinkled at the lower margin of umbonal area; dorsal margin a little curved; ventral margin curved near the ends, very slightly excavated in the middle.

KING. Zool. Journal.

Solen Luzonius, Dunker.

Hab. Sea-Bear Bay, Patagonia, King.—Philippines, Coming.

It is quite impossible to discover any specific

difference between the Patagonian and Philippine shells in the British Museum.

Species 13. (Mus. Brit.)

SOLEN PHILIPPINUS. *Sol. testá angustatá, paulò arcuatá, pallidá, maculis pallidissimis fulvo-purpureis variegatá; margine ventrali utrinquá paulò acclivi; margine dorsali medio arcuatum depresso; margine antico obliquo, constricto.*

PHILIPPI'S SOLEN. Shell narrow, a little curved, pale, varied with very pale fulvous-purple; ventral margin a little sloped upwards at each end; dorsal margin depressed in a curve in the middle; anterior margin oblique, constricted.

DUNKEE. Proc. Zool. Soc., 1861.

Hab. Australia.

Species 14. (Mus. Brit.)

SOLEN SICARIUS. *Sol. testâ latâ, brevi, pallidâ, paulò arcuata, compressâ; epidermide strigosa, margine dorsali depresso, arcuato, arcu. angustâ; margine postico subrotundato; margine antico elevato, obliquo, arcuato; margine centrali utriusque paulò acclivis.*

THE SHORT-SWORD SOLEN. Shell broad, short, pale, a little curved, compressed; epidermis straw-coloured; dorsal margin depressed, curved, area narrow; posterior margin rather rounded, anterior side raised, oblique, curved; ventral margin a little sloped upwards at each end.

GOULD. United States Exploring Expedition.

Hab. —?

Species 15. (Mus. Nobis.)

SOLEN GUINEENSIS. *Sol. testâ brêvi, recto, lato, ad umbo radiatim purpureo, ad aream umbonalem purpureo-strigato; margine postico truncato, recto; margine antico subobliquè truncato, constricto.*

THE GUINEA SOLEN. Shell short, straight, broad, radiating with purple at the umbos, striped with purple on the umbonal area; posterior margin truncated, straight; anterior margin rather obliquely truncated, constricted.

GRAY. Brit. Mus. Hanley, Species of Shells.
Hab. Co. of Guinea.

Species 16. (Mus. Nobis.)

SOLEN LAMARCKII. *Sol. testâ brevi, purpureâ, ad aream posticam strigatum, posticè subtenuatum, propè marginem anticum purpureo uniradiatum; margine antico subobliquè truncato; marginebus dorsali ven-*

tratique rectis, margine postico supra marginem subrotundato.

LAMARCK'S SOLEN. Shell short, purple, striped at the posterior area, posteriorly a little tapering, a single purple ray near the anterior margin; anterior margin rather obliquely truncated; dorsal and ventral margins straight; posterior margin a little rounded above and below.

CHEM. Illustrations Conchyliologiques.

Hab. Ceylon.

Species 17. (Mus. Brit.)

SOLEN GRACILIS. *Sol. testâ elongatâ, angustâ, tenui rectiâculâ, pallidâ fulvoâ; arcis indistinctâ; margine postico truncato, recto; margine antico obliquè truncato, simplici.*

THE SLENDER SOLEN. Shell elongated, narrow, thin, rather straight, pale fulvous; areas indistinct; posterior margin truncated, straight; anterior margin obliquely truncated, simple.

PHILIPPI. Abbildungen.

Hab. Hakodaki, Japan.

Species 18. (Mus. Brit.)

SOLEN ROSTRIFORMIS. *Sol. testâ angustâ, compressâ, pallidè roseo strigatum; posticè subattenuatum, ad terminum rotundatum; margine antico elevato, subobliquo.*

THE BEAK-SHAPED SOLEN. Shell narrow, compressed, striped with pale rose; posteriorly a little tapering, rounded at the end; anterior margin raised, rather oblique.

DUNKER. Proc. Zool. Soc., 1861.

Hab. —?

More narrow and tapering than *Solen rostrum-anatum*.

SOLEN.—PLATE IV.

Species 19. (Mus. Brit.)

SOLEN CORNEUS. *Sol. testá angustá, rectá, pallidá, utrinque truncatá; propé umbones pallidé purpureo tinctá; epidermide corneo, pallido.*

THE HORNY SOLEN. Shell narrow, straight, pale, truncated at each end; tinged with pale purple near the umboes; epidermis horny, pale.

LAMARCK. Animaux sans Vertèbres.

Hab. Java.

Species 20. (Mus. Brit.)

SOLEN MALACCENSIS. *Sol. testá elongatá, angustá,*

rotundá, rectiúsculá, fumoso-fulvá, areis obliquis distinctis; margine postico truncato, margine dorsali rectiúsculo; areá dorsali angustá; termino antico truncato, paulò acclivi.

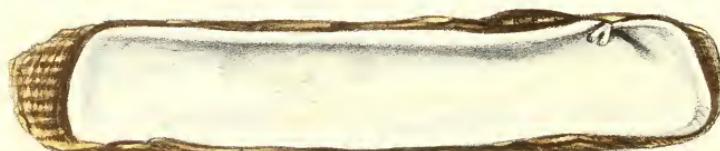

THE MALACCA SOLEN. Shell elongated, narrow, rounded, rather straight, smoky-fulvous, oblique; areas distinct; posterior margin truncated; dorsal margin rather straight; dorsal area narrow; anterior margin truncated, a little sloped upwards.

DUNKER. Proc. Zool. Soc., 1861.

Hab. Malacca.

PLATE V.

Species 21. (Fig. a, b, c, Mus. Brit.)

Solen ambiguus. *Sol.* testā solidā, paulō arcuatā, altiusculā, posticē subexpansī : epidermīde crasso, rugato, fuso-nigrescenti, ultra marginē extenso indutā, etate juvori radius fatiū prepe marginē latitudinibus pīctū : undonibus a termino subdistantibus : marginē cardinali crasso, arcuatiō vix depresso ; marginē postico lat' truncato ; marginē antico incrassato, obliquē truncato.

THE AMBIGUOUS SOLEN. Shell solid, a little arched, rather deep, and posteriorly a little expanded; epidermis thick, wrinkled, covered with a blackish-brown epidermis extending beyond the margins; in a young state painted with fulvous rays becoming broad towards the margin; umbones some distance from the end; cardinal margin thick, depressed, with a very slight curve; posterior margin broadly truncated; anterior margin thick, obliquely truncated.

LAMARCK. Anim. sans Vert., Solen, Sp. 7.

Solen rufulis, C. B. Adams.

Solen obliqua, —?

Solen Philippinarum, Hanley.

Hab. Panama. Philippines.

The umbones of this shell being placed at some distance from the anterior termination, give it a character not strictly agreeing with the "Razor shells," but leading towards the group represented by *Solen cinctellus*, which we shall include in the present monograph.

Species 22. (Mus. Nobis.)

Solen linearis. *Sol.* testā rectā, elongatā, angustissimi, tenui, purpureo rubescēti fasciāti : terminibus truncatis : marginibus dorsali ventralique rectis : areā dorsalī linearī.

THE LINEAR SOLEN. Shell straight, elongated, very narrow, thin, banded with reddish-purple; ends truncated; dorsal and ventral margins straight; dorsal area linear.

CHEMNITZ. Conch., vol. xi. Pl. 138, f. 19, f. 1, 2.

Hab. —?

This is represented by a very young shell of doubtful character in the British Museum, but the specimens from which the present figure is taken present unmistakable characters.

Species 23. (Mus. Brit.)

Solen vaginaloides. *Sol.* testā breviusculā, arcuatiō, utrinque truncatā, posticē paulō expansā, anticē angustiusculā, fasciā pallidē rubris pīctā : epidermīde tenui : marginē antico abrupte truncato, acuto ; marginibus dorsali ventralique arcuatis, areā dorsalī medio subexpanso.

THE SHEATH-LIKE SOLEN. Shell rather short, curved truncated at each end, a little expanded posteriorly, rather narrowed anteriorly, painted with red bands; epidermis thin; anterior margin abruptly truncated, sharp; dorsal and ventral margins arched, dorsal area a little expanded in the middle.

LAMARCK. Anim. sans Vert., Solen, Sp. 3.

Hab. Van Diemen's Land.

—

—

Species 24. (Mus. Brit.)

Solen Luzonicus. *Sol.* testā brevi, rectiusculā, fasciā purpuris, ad aream medianam arcuatis, pīctā, epidermīde vividē fuso indutā : intus purpareo ; termino antico obliquē truncato, marginē acclivi ; termino postico subattenuato, paulō acclivi, marginē rotundo.

THE LUZON SOLEN. Shell short, rather straight, painted with purple bands, curved on the medial area, covered with a bright brown epidermis, purple within; anterior end obliquely truncated, with margin sloped upwards; posterior end rather attenuated, a little sloped upwards, margin rounded.

DICKER. Proc. Zool. Soc., 1861.

Hab. Isl. Luzon, Philippines.

More straight and narrow than *Solen rostriformis*.

SOLES VENUSTIS. *Sol. testa parci, pallido corneti, tenui, paulo arcuata, postice subattenuata, margini subrotundo, oblique latiusculo, margine terminali acclivi, obliqui truncato, subreflexo; margine dorsali recto; margine ventrali convexo.*

THE SOLEX SOLUS. Shell small, pale horny, thin, a little arched, posteriorly subattenuated, with margin a little rounded, anteriorly rather broader, with terminal margin sloped upwards, obliquely truncated, subreflected; dorsal margin straight; ventral margin convex.

SAY. Journ. Acad. Nat. Sci. Philadelphia.
Hab. North America.

Species 26. (Mus. Brit.)

SOLEN PFEIFFERI. *Sol. testa brevi, recta, purpureo fuscata, epidermide fuso, rugato indutâ; margini dorsali rectissimo; areâ angustissimâ; margini ventrali paulo centrico; margini postico abrupte truncato; margini antico convexissimo, obliqui.*

PFEIFFER'S SOLEX. Shell short, straight, banded with purple, covered with a brown wrinkled epidermis; dorsal margin rather straight; area very narrow; ventral margin a little ventricose; posterior margin abruptly truncated; anterior margin rather convex, oblique.

DUNKER. Proc. Zool. Soc., 1861.

Hab. Bay of Caracas.

Species 27. (Mus. Brit.)

SOLEN TIMORENSIS. *Sol. testa recta, latâ, lînis fuscisque purpuris pallidis pecta; antice obliqui truncato, ad marginem ventralim acuminatâ; areâ dorsali angustissimâ; areâ medianâ latâ.*

THE TIMOR SOLEN. Shell straight, broad, anteriorly, painted with pale purple lines and bands; ob-

liquely truncated in front, acuminate at the ventral margin; dorsal area very narrow, middle area broad.

DUNKER. Proc. Zool. Soc., 1861.

Hab. Timor.

Differing from *Solen truncatus* in the great obliquity of the anterior terminal margin and its acuminate ventral corner.

Species 28. (Mus. Brit.)

SOLEN MACHA. *Sol. testa magnâ, subcompressâ, rectissimâ, ad terminos acclivi, epidermide nitentis fusco-subcicâlidi indutâ; umbonibus retrorsis; margini antico elevata, convexa, acclivi versus umbonis acuminata; margini postico paulo acclivi, subobliqui truncato.*

THE HAPPY SOLEX. Shell large, rather compressed, rather straight, sloped at the ends, covered with a shining greenish-brown epidermis; umboes bent backwards; anterior margin, raised, convex, sloped upwards, leaning towards the umboes; posterior margin raised, rather obliquely truncated.

OKEN. —? MS. Mus. Brit.

Hab. —? Specimens in the Cumingian collection.

The shell is not straight as *Solen silqua*, nor curved as *Solen cassis*, but nearly straight except at the ends, which are a little turned up.

Species 29. (Mus. Brit.)

SOLEN FONESII. *Sol. testa brevi, rectissimâ, corneo-subcicâlidi; marginibus dorsali ventralique vix arcuatis; margini postico obtuse truncato, paulo convexo; margini antico acuto, obliqui truncato.*

FONES'S SOLEN. Shell short, rather straight, greenish-horny; dorsal and ventral margins scarcely

SOLEN.—PLATE VI.

arched; posterior margin obtusely truncated, a little convex; anterior margin sharp, obliquely truncated.

DUNKER. Proc. Zool. Soc., 1861.
Hab. Isl. Zebu, Philippines.

Species 30. (Mus. Brit.)

SOLEN REGULARIS. *Sol. testā recti, brevi, pallidē fulvā, subrhomboidē; marginibus ventrali dorsalique*

rectis; terminis obliquè truncatis, antico declivi, postico acclivi.

THE RUE SOLEN. Shell straight, short, pale fulvous, rather rhomboidal; dorsal and ventral margins straight; ends obliquely truncated, anterior sloped downward, posterior sloped upwards.

DUNKER. Proc. Zool. Soc., 1861.
Hab. Malacca.

The dorsal and ventral margins are straight, and the ends obliquely parallel.

More narrow than *Solen exiguum*, Dunker.

Species 32. (Mus. Brit.)

SOLEN EXIGUUS. *Sol. testa parvâ, pallidâ fulvâ, epidermide subargenteo indutâ, latitudinali, rectâ, ad aream medianum substriata, antice perpendiculariter truncatâ, posticâ subconvergo-truncatâ.*

THE NARROW SOLEN. Shell small, pale fulvous, covered with a rather golden epidermis, rather broad, straight, a little striped on the middle area, anteriorly perpendicularly truncated, posteriorly rather convexly truncated.

DUNKER. Proc. Zool. Soc., 1861.
Hab. Borneo.

More straight and broad than *Solen Leani*, and of equal breadth throughout.

Species 33. (Fig. *a, b*, Mus. Brit.)

SOLEN ASPERUS. *Sol. testâ elongatâ, levissimâ arcuatâ, maculis purpuris civileâ variegatâ, propè terminum anticum acutâ, constrictâ; margine dorsali rix excavato; margine ventrali lente convexa.*

THE SPRINKLED SOLEN. Shell elongated, very slightly arched, brightly variegated with purple spots, sloped upwards and constricted near the anterior end; dorsal margin scarcely excavated; ventral margin slightly convex.

DUNKER. Proc. Zool. Soc., 1861.
Hab. Australia.

The younger shell is more finely sprinkled with colour and shows the gentle curve more distinctly than when full grown.

Species 34. (Mus. Hanley.)

SOLEN ACINACIES. *Sol. testâ alba, lente arcuatâ, breviâculâ, antice latitudinali, posticâ attenuatâ; margine antico acutâ et subobliquâ truncato; margine postico angusto, subrotundo.*

THE SCIMITAR SOLEN. Shell white, gently curved, rather short, sloped upwards at each end, rather broad anteriorly, attenuated posteriorly; anterior margin acutely and somewhat obliquely truncated; posterior margin narrow, rather rounded.

HANLEY. Species of Shells.
Hab. —?

We have figured the unique specimen originally described by favour of Sylvanus Hanley, Esq.

August, 1874.

E R R A T U M.

Species 7, Plate III., for *rostrum-anatis*, *Dunker*, read, *GAUDICHARDI*, *Chemn.*, *Tchuelcha*, Orbigny. The fine richly coloured specimen in Mr. Hanley's collection, too late for figuring, has been identified with Mr. Dunker's species, the name of which must become a synonym.

M O N O G R A P H
OF THE GENUS
A D E O R B I S.

" How exquisitely minute,
A miracle of design!" *Tennyson*.

A D E O R B I S.

PLATE I.

Genus ADEORBIS, Wood.

Tedo involvularis, *depressa*, *umbilicata*, *alter*, *anfractibus paucis*, *ultimo magno*. *Apertura magna*, *perireme interrupta*. *Oberulum nullum*.

Shell orbicular, depressed, umbilicated, white; whorls few, last large. Aperture large, perireme interrupted. Operculum none.

The little white shells forming this group differ from *Cyclostrema*, principally in having a more depressed and less conical form, and in the edge of the aperture being interrupted instead of continuous. The genus was created for the little bicarinated British species. Most of the others have been collected either by Mr. Cuming in the Philippines, or Mr. Arthur Adams in Japan. But the most beautiful species is *Adeorbis Angasi* from Australia.

Species 1. (Mus. Brit.)

Adeorbis elegans. *Ade. testā latā, depressā, spirā subplanulatā*; *ultimo anfractu latissimo*; *labio extero eleganter supernū sinuato*; *umbellicō magno*.

THE ELEGANT ADEORBIS. Shell broad, depressed; spire rather flat; last whorl very wide; outer lip elegantly sinuous above; umbilicus large.

A. ADAMS (*Cyclostrema*). Proc. Zool. Soc., 1850.

Hab. Isl. St. Thomas.

Species 2. (Mus. MacAndrew.)

Adeorbis subcarinata. *Ade. testā moderatā depressā*; *spirā paulū exsertā*; *ultimo anfractu supernū subangulata*, *infra bicarinata*; *aperturā ovatā*; *umbellicō mag. o.*

THE LOW-KILLED ADEORBIS. Shell moderately depressed; spire a little exserted; last whorl a little angular above, with two keels below; aperture ovate; umbilicus large.

WALKER (*Helix*). Adeorbis carinata, Wood.

Hab. British Seas.

Species 2. (Mus. Cross.)

ADEORBIS ADAMSI. *Ade. testā valde depressā, subconcentricā livata*; *aperturā magnā obliquā, labio exterō superō moderatō sinuato*.

ADAMS'S ADEORBIS. Shell much depressed, sinuously concentrically ridged; aperture large, oblique. oblong, outer lip moderately sinuous above.

FISCHER. Journal de Conchyliologie, 1857.

Hab. Guadalupe.

Species 4. (Mus. Brit.)

ADEORBIS PLANA. *Ade. testā valde depressā, planā, latā, spirālē striatā*; *umbellicō maximo*; *aperturā latissimā, obliquā*.

THE FLAT ADEORBIS. Shell much depressed, flat, broad, spirally striated; umbilicus very large; aperture very wide, oblique.

A. ADAMS (*Cyclostrema*). Proc. Zool. Soc., 1850.
Hab. Philippines. Japan.

Species 5. (Fig. a, b, Mus. Brit.)

ADEORBIS NITIDA. *Ade. testā subelevatā, solidā*; *spirā conicā, anfractibus rotundatis, distinctis*; *umbellicō magno, circumscripto*; *aperturā subrotundā*.

THE NEAT ADEORBIS. Shell a little raised, solid; spire conical, whorls rounded, distinct; umbilicus large, defined; aperture rather round.

A. ADAMS (*Cyclostrema*). Proc. Zool. Soc., 1850.
Hab. Philippines.

Species 6. (Fig. a, b, Mus. Adams.)

ADEORBIS DEPRESSA. *Ade. testā latā, valde depressā, levigatā*; *spirā subplanulatā*; *anfractibus vix exsertis*; *umbellicō mediorici*; *aperturā parvā, subrotundā*.

ADEORBIS.—PLATE I.

THE DEPRESSED ADEORBIS. Shell broad, much depressed, smooth; spire rather flat; whorls scarcely exserted; umbilicus moderate; aperture small subovate.
 A. ADAMS. Ann. and Mag. of Nat. Hist., 1861.
Hab. Mino-Sima, Japan.

Species 7. (Fig. *a, b*, Mus. Brit.)

ADEORBIS PLANORBULA. *Ade. testā validē depresso; spirā fere planorbili; anfractibus rotundis, ultimo lato; umbilico maximo; aperturā fere rotundā.*

THE PLANORBULAR ADEORBIS. Shell much depressed; spire nearly planorbular; whorls round, the last broad; umbilicus very large; aperture almost round.

A. ADAMS (*Cyclostrema*). Proc. Zool. Soc., 1850.
Hab. Philippines.

Species 8. (Mus. Adams.)

ADEORBIS TROCHULA. *Ade. testā trochiformi, subelevatā; spirā conicā, anfractibus haud prominentibus, supernē declivibus; umbilico parvo, costā circumscriptā; aperturā subrotundā.*

THE LITTLE-TOP ADEORBIS. Shell trochiform, rather elevated; spire conical, whorls not prominent, sloped above; umbilicus small, defined by a rib, aperture rather round.

A. ADAMS. Ann. and Mag. of Nat. Hist., 1863.
Hab. Goto Islands, Japan.

Species 9 (Mus. Brit.)

ADEORBIS ORBELLA. *Ade. testā moderatē depresso; spirā depresso-conica; anfractibus supernē subdeclinibus; umbilico maximo, circumscripto; aperturā obliquā, subrotundā.*

THE SMALL-ORE ADEORBIS. Shell moderately depressed; spire depressed, conical; whorls sloped above; umbilicus very large, defined; aperture oblique, rather round.

A. ADAMS. Ann. and Mag. Hist. Nat., 1861.
Hab. Mino-Sima, Japan.

Species 10. (Fig. *a, b*, Mus. Adams.)

ADEORBIS CARINATA. *Ade. testā depresso subplanata; anfractibus distinctis, rotundatis, ultimo versū suturem gibboso, infra planulato, infra carinato; umbilico magno; aperturā obliquā subquadratā, infra ad marginem externum rotata.*

THE KEELED ADEORBIS. Shell depressed, spire rather flattened; whorls distinct, rounded, last gibbous towards the suture, flattened below, keeled at the base; umbilicus large; aperture rather obliquely squared; beaked below at the outer edge.

A. ADAMS. Ann. and Mag. of Nat. Hist., 1863.
Hab. Seto-Uchi, Japan.

A D E O R B I S.

PLATE II.

Species 11. (Mus. Adams.)

ADEORBIS JAPONICA. *Ade. testā depresso, parrā, teregitā, discoideā; semipellucidi, concentricō obliquō striatā; spira subdiscoidā, anfractibus tenē crescentibus, rotundis, umbilico lato, costulī validi, marginato.*

THE JAPAN ADEORBIS. Shell depressed, small, smooth, discoidal; semipellucid, concentrically obliquely striated; spire rather discoidal, whorls slowly increasing, rounded, umbilicus wide, bordered with a strong rib.

A. ADAMS. Ann. and Mag. of Nat. Hist., 1861.
Hab. Goto Islands, Japan.

Species 12. (Mus. Adams.)

ADEORBIS SINENSIS. *Ade. testā subdiscoidā, solidi, opaci; striis minutissimis spiralibus et concentricis decussatā; spirā subplanulatā, anfractibus regulariter crescentibus, rotundis; umbilico mediocri, aperturā obliquā rotundatim ovato.*

THE CHINESE ADEORBIS. Shell rather discoidal, solid, opaque; decussated with very minute spiral and concentric striae; spire rather flat, whorls regularly increasing, rounded; umbilicus moderately large, aperture obliquely rounded oval.

A. ADAMS. Ann. and Mag. of Nat. Hist., 1861.
Hab. China.

Species 13. (Mus. Adams.)

ADEORBIS PROMINULA. *Ade. testā subdiaphanā, nitida, striis concentricis tenuissimis sculpta; spirā depresso-conica; anfractibus vix prominentibus, rapidē crescentibus; umbilico mediocri, submarginato; aperturā obliquā.*

THE PIGMENTED ADEORBIS. Shell rather transparent, polished, sculptured with very thin concentric striae; spire depressed-conical; whorls scarcely prominent, rapidly increasing; umbilicus

middle-sized, slightly bordered; aperture oblique.

A. ADAMS. Ann. and Mag. of Nat. Hist., 1861.
Hab. Mino-Sima, Japan.

Species 14. (Fig. a, b, Mus. Adams.)

ADEORBIS CLAUSA. *Ade. testā discoideā, subdiaphanā, tenuissimō concentricō striatā; spirā depresso, anfractibus vix prominentibus, supernō subplanulatis; umbilico partim callo obtecto.*

THE CLOSED ADEORBIS. Shell discoidal, rather transparent, very finely concentrically striated; spire depressed, whorls scarcely prominent, rather flattened above; umbilicus partly covered by callus.

A. ADAMS. Ann. and Mag. of Nat. Hist., 1861.
Hab. Mino-Sima, Japan.

The umbilicus being partly filled up by a callus, makes it a leading species towards the genus *Tenostomum*, in which the umbilicus is entirely filled.

Species 15. (Fig. a, b, Mus. Adams.)

ADEORBIS SUTURALIS. *Ade. testā subglobosā, tenui, semi-pellucidi, tenuissimā concentrica striatā; spirā subproductā, anfractibus rapidē crescentibus; sutura profundā; aperturā magnā; umbilico parvo.*

THE SUTURED ADEORBIS. Shell subglobose, thin, semipellucid, very finely concentrically striated; spire a little produced, whorls rapidly increased; suture deep, aperture large; umbilicus small.

A. ADAMS. Ann. and Mag. of Nat. Hist., 1861.
Hab. Ten-Sima, Japan.

Species 16. (Fig. a, b, Mus. Adams.)

ADEORBIS CORNICULUM. *Ade. testā globosā, subdiaphanā, minutissimē striatā; spirā patrā, anfractibus rapidē*

ADEORBIS.—PLATE II.

crescentibus, ultimo magno, rotundo; umbilico angusto, costâ marginato; aperturâ magnâ.

THE LITTLE HORN ADEORBIS. Shell globose, a little transparent, very minutely striated; spire small, whorls rapidly increasing, last large, rounded; umbilicus narrow, bordered with a rib; aperture large.

A. ADAMS. Ann. and Mag. of Nat. Hist., 1861.

Hab. Mino-Sima, Japan.

Species 17. (Fig. a, b, Mus. Brit.)

ADEORBIS ANGASI. *Ade. testâ discoidea, valde depresso, tenui; spirâ parvâ, planulaâ, anfractibus paucis, parris, rapidè crescentibus, ultimo expanso, striato, ad suturam crenulato, ad peripheriam acutâ carinato et conspicuè crenato; umbilico et aperturâ maximis.*

ANGAS'S ADEORBIS. Shell discoidal, much depressed, thin; spire small, flat, whorls few, small, rapidly increased, last expanded, striated, crenulated at the suture; sharply and conspicuously keeled at the periphery; umbilicus and aperture very large.

A. ADAMS. Proc. Zool. Soc., 1861.

Hab. Australia.

This beautiful little shell was collected by Mr. G. F. Angas.

Species 18. (Mus. Brit.)

ADEORBIS NANULA. *Ade. testâ depressâ, subdiscoidea; spirâ paulò exsertâ, anfractibus rotundis, tenui crescentibus; umbilico mediocri, marginato, aperturâ subrotunda.*

THE LITTLE DWARF ADEORBIS. Shell depressed, rather discoidal; spire a little exserted, whorls rounded, slowly increased; umbilicus moderate, bordered, aperture rather rounded.

A. ADAMS. Ann. and Mag. of Nat. Hist., 1861.

Hab. Mino-Sima, Japan.

Species 19. (Mus. Adams.)

ADEORBIS SUBANGULATA. *Ade. testâ solidiusculâ, spirâ paulò exsertâ; anfractibus subangulatis; ultimo anfractu subelevato, propè suturam gibbose, subangulato, infrâ latiusculo, obscurè angulato; umbilico profundo, angustiusculo, margine acuto; aperturâ subovatâ, labio externo, superne sinuatim producto.*

THE SLIGHTLY ANGULAR ADEORBIS. Shell rather solid; spire a little exserted; whorls rather angular; last whorl a little raised, gibbose and obscurely angular near the suture; umbilicus deep, rather narrow, with a sharp edge; aperture subovate, outer lip sinuously produced above.

A. ADAMS. Ann. and Mag. of Nat. Hist., 1861.

Hab. Gotto Islands, Japan.

Species 20. (Fig. a, b, Mus. Adams.)

ADEORBIS DIAPHANA. *Ade. testâ globosâ, diaphantâ; spirâ parvâ, anfractibus rotundis; ultimo anfractu inflato; umbilico parvo; aperturâ subrotundâ.*

THE TRANSPARENT ADEORBIS. Shell globose, transparent, spire small, whorls round; last whorl inflated; umbilicus small; aperture rather round.

A. ADAMS. Ann. and Mag. of Nat. Hist., 1861.

Hab. Gotto Islands, Japan.

Species 21. (Fig. a, b, Mus. Adams.)

ADEORBIS PATRUELI. *Ade. testâ semipellucidâ, depressâ; spirâ paulò productâ, anfractibus obscurè biangularis, ultimo infrâ planiusculo; umbilico angustiusculo; aperturâ magnâ, labio columellarâ rectiusculo.*

THE RELATED ADEORBIS. Shell semipellucid, depressed, spire a little produced, whorls obscurely biangular, the last rather flattened beneath; umbilicus rather narrow; aperture large, columella lip rather straight.

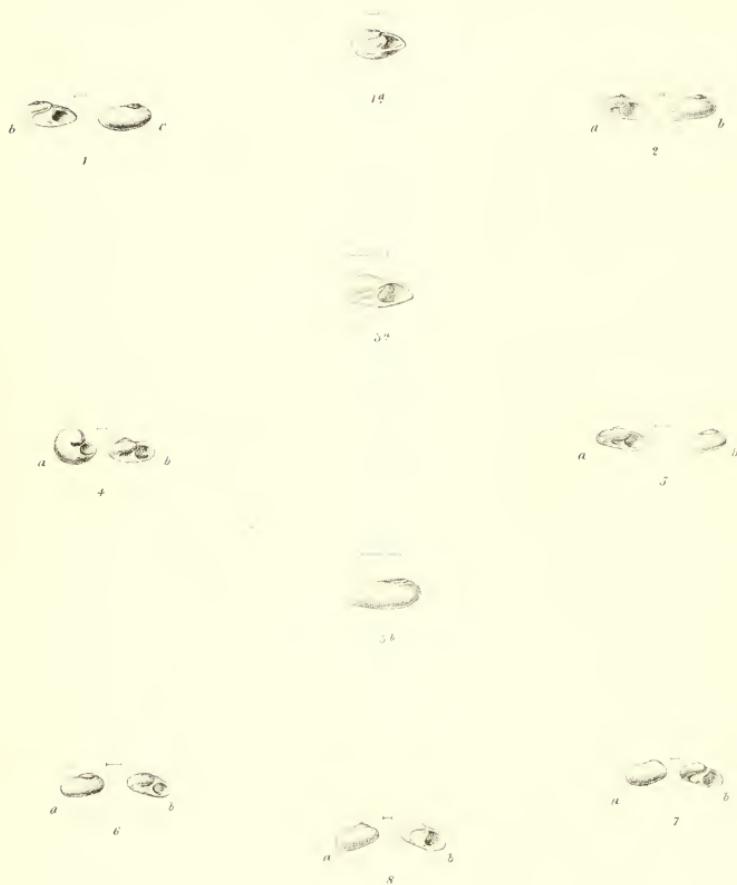

A. ADAMS. Ann. and Mag. of Nat. Hist., 1861.

Hab. Mino-Sima, Japan.

Related to *Adeorbis Japonica*, but with more elate spire.

MONOGRAPH
OF THE GENUS
TEINOSTOMA.

"— Once hid from those who search the main,
Where thousand elfin shapes abide." —*William Collins.*

TEINOSTOMA.

PLATE I.

Genus TEINOSTOMA, A. Adams.

Testa deppressa, alba, polita, solida, raro spiraliiter striata, regione umbilicali callo obtecta: apertura lateraliiter producta, ab axe renata.
Shell depressed, white, polished, solid, rarely spirally striated; umbilical region covered by a callus; aperture laterally produced, distant from the axis.

The difference between this genus and *Adeboris* is that while shells of the former are widely umbilicated, those of the latter have the umbilicus filled up by a callus. The mouth also is laterally produced and out of axis. The localities of the few species known are as remote as Mazatlan, Japan, and the Philippines.

Species 1. (Fig. a, b, c, Mus. Brit.)

TEINOSTOMA AMPLECTANS. *Tei. testa validè depresso, spirà planulatà; aperturā productā, labio externo subrostrato; callo crasso, rotundato.*

THE FOLDING TEINOSTOMA. Shell much depressed, spirally flattened; aperture produced, outer lip rather beaked; callus thick, rounded.

CARPENTER. Cat. Mazatlan Moll., p. 253.
Hab. Mazatlan.

Next to *Teinostoma politum*, this is the most pointed at the outer lip and has the largest callus of any of the species.

Species 2. (Fig. a, b, Mus. Brit.)

TEINOSTOMA CONCENTRICUM. *Tei. testa depresso, spiraliiter lirata, superne convexa: umbilico callo omnino obtecta: aperturā anticè producta, subacuminatā.*

THE CONCENTRIC TEINOSTOMA. Shell depressed, spirally finely ridged, convex above; umbilicus entirely

hidden by a callus; aperture anteriorly produced, slightly acuminated.

A. ADAMS. Ann. and Mag. Nat. Hist., 1863.
Hab. Takano-Sima, Japan.

The only species covered with spiral striae.

Species 3. (Fig. a, b, Mus. Brit.)

TEINOSTOMA POLITUM. *Tei. testa validè depresso, polita, superne planulatà; ultimo anfractu gibbosò, lateraliiter producto; aperturā producta, ovata, ad suturam columellamque incrassatā; labio externo infra medium acutè rostrato.*

THE POLISHED TEINOSTOMA. Shell much depressed, polished, flattened above; last whorl gibbose, laterally produced; aperture produced, ovate, thickened at the suture and columella; outer lip sharply beaked below the middle.

A. ADAMS. Proc. Zool. Soc., 1854.
Hab. Philippine Islands.

Species 4. (Fig. a, b, Mus. Brit.)

TEINOSTOMA SUBSTRIATUM. *Tei. testa minimà, nitentì, propò suturam minutissimè striatà; callo angusto, circò rimam umbilicalem gyranù: aperturā subrotundà; labio interno crasso, fore aufractum penultimum amplectanti.*

THE SUBSTRIATED TEINOSTOMA. Shell very small, shining, very minutely striated near the suture; callus narrow, coiling round the umbilical rim; aperture nearly round; inner lip thick, nearly enveloping the last whorl.

CARPENTER. Cat. Mazatlan Moll., p. 254.
Hab. Mazatlan.

TEINOSTOMA.—PLATE I.

Species 5. (Fig. *a, b*, Mus. Brit.)

TEINOSTOMA CARPENTIERI. *Tei. testā valdē depressā, spirā fere obtecta; ultimā anfractu planulato, medio fissurata; callo umbilicati rotundo; aperturā producta, labio interno suprī anfractum penultimum elevato; labio externo ad medium rostrato.*

CARPENTER'S TEINOSTOMA. Shell much depressed; spire almost hidden; last whorl flattened, with a medial fissure; umbilical callus rounded; aperture produced, inner lip raised above the penultimate whorl, outer lip beaked in the middle.

A. ADAMS, Ann. and Mag. of Nat. Hist., 1861.

Hab. Gulf of Pechili.

The suture and the apex of this shell are covered by an enamel, leaving only a little pit where the point should be.

Species 6. (Fig. *a, b*, Mus. Brit.)

TEINOSTOMA RADIATUM. *Tei. testā depressā, orbiculatā; superne convexiūscula, infri medium planiūscula; lineis incrementi conspicuā concentricā liratā; anfractibus rapidiā crescentibus; aperturā subrotundā, anticē productā; labio interno ad suturam incrassato, usque ad apicem elevato; callo subexcavato.*

THE RAYED TEINOSTOMA. Shell depressed, orbicular, rather convex above, rather flat below the middle; concentrically ridged with conspicuous lines of growth; aperture rather rounded, produced an-

teriorly; inner lip thickened at the suture, raised as far as the apex; callus somewhat excavated.

A. ADAMS, Ann. and Mag. of Nat. Hist., 1860.

Hab. Kino-O-Sima, Japan.

Species 7. (Fig. 1, *a, b*, Mus. Brit.)

TEINOSTOMA LUCIDUM. *Tei. testā orbiculari, depressā, aperturā subobliquā, anticē rotundatim productā; callo rotundo, tumido.*

THE LUCID TEINOSTOMA. Shell orbicular, depressed, aperture a little oblique, anteriorly roundly produced; callus rounded, tumid.

A. ADAMS, Ann. and Mag. of Nat. Hist., 1863.

Hab. Japan.

Species 8. (Fig. *a, b*, Mus. Brit.)

TEINOSTOMA FUSILLUM. *Tei. testā orbiculari, depressā, minutissimē striati; suturā impressa; anfractu ultimo magno, ad peripheriam compresso; labio interno septiformi, recto.*

THE DWARF TEINOSTOMA. Shell orbicular, depressed, very minutely striated; suture impressed; last whorl large, compressed at the circumference; inner lip septiform, straight.

C. B. ADAMS, Conchological Contributions, p. 112.

Teinostoma anomala, H. and A. Adams.

Teinostoma (calcoolina) pusillum, Adams, Genera, Appendix.

Hab. U. States; Tanabe, Japan.

The straight inner lip of this little species gives it the appearance of a *Neritina*.

MONOGRAPH
OF THE GENUS
BRODERIPIA.

B R O D E R I P I A.

PLATE I.

Genus BRODERIPIA, Gray.

Molluscum trachelipodium marinum.

Testa marina, patelliformis, depressa, oblonga, non-spiralis; apice postico, incurvo; aperturā maximā, ovatā, intus margaritacea.

Mollusc, trachelipodous, marine.

Shell marine, patelliform, depressed, oblong, nonspiral; apex posterior, incurved; aperture very large, ovate, pearly within.

The late Mr. Broderip described two shells of this small genus, including them in *Scutella*. But although the animal is not known, the structure of the shell makes it probable that they belong to the family of the *Stomatellinae*; and that they bear the same relation to that family as the *Ancylidae* do to the *Lymnaeidae*.

Two Pacific, one Philippine, and one other species, are all at present known.

Species 1. (Fig. a, b, Mus. Brit.)

BRODERIPIA BOSEA. *Bro. testā parē, minutissimē striatā, ovatā, depressā, dorso arcuatā, lineis flaminisque rubris subreticulatō picti; apice post marginem posticam producto; nucrā intus tenuissimā.*

THE ROSY BRODERIPIA. Shell small, very finely striated, ovate, depressed, back arched, painted network-like with red lines and flames; apex produced beyond the posterior margin, pearl very thin within.

BRODERIPIA (*Scutella*). Proc. Zool. Soc., 1834.
Hab. Grimwood's Island, Pacific.

Species 2. (Fig. a, b, Mus. Brit.)

BRODERIPIA CUMINGII. *Bro. testā subquadratā, subconicā, depressā, minutē granulatā, fasciis rubris propī marginē ratiatā; apice propī marginē posticam declinato; marginē columellarī intus septiformi.*

CUMING'S BRODERIPIA. Shell subquadrate, subconical, depressed, minutely granular, rayed with red bands towards the margin; apex sloped near the posterior margin; columellar margin rather septiform within.

A. ADAMS. Proc. Zool. Soc., 1850.

Hab. Isl. Capul, Philippines.

The shell from which our figure was originally drawn was unfortunately lost from Mr. Cuming's collection, but a drawing is preserved and an inferior specimen remains.

Species 3. (Fig. a, b, Mus. Brit.)

BRODERIPIA SITIDISSIMA. *Bro. testā depresso-conicā, ovatā, intus pallidē purpureā, vividē iridescenti, extus fulmō-fusē, costis regularibus, crassis radiatā; marginē dentato; apice paulō post-mediani.*

THE BRIGHT BRODERIPIA. Shell depressed-conical, ovate, pale purple within, brightly iridescent, smoky-brown without, rayed with regular, thick ribs; margin toothed; apex a little behind the centre.

DESHAYES. Conchyliologie de l'Isle de la Réunion, p. 69.
Hab. Bourbon.

The only species with radiating ribs and correspondingly toothed margin.

Species 4. (Fig. a, b, Mus. Brit.)

BRODERIPIA IRIDESCENTS. *Bro. testā tenui, oculo-oblongā, depressā, intus vividē iridescenti, rubro pallide reticulatā; extus pallidē fulvā rosco vividē oblique reticulato.*

THE IRIDESCENT BRODERIPIA. Shell thin, ovate-oblong, depressed, brightly iridescent within, reticulated with pale red; pale fulvous without, brightly obliquely reticulated with red.

BRODERIPIA (*Scutella*). Proc. Zool. Soc., 1834.
Hab. Grimwood's Island, Pacific.

MONOGRAPH
OF THE GENUS
CULTELLUS.

"How full the earth, and sea, and air!
How great Thy love! what constant care
Of all the host is shown."—*Anon.*

J.

K.

L.

M.

C U L T E L L U S.

PLATE I.

Genus CULTELLUS, Schumacher.

Testa transversē oblonga, inaequilateralis, apicalevis, utrinque bicus, rotunda, umbonalis antivis, interdum paulo arcuata; internum costā umbonalī internū minata. Dentes in una valvā duo, in alterī valvi tres. Ligamentum exterum, elongatum.

Shell transversely oblong, inequilateral, equivalve, gaping at each end, rounded, with anterior umboes, sometimes a little curved, sometimes provided with an internal umbonal rib. Teeth two in one valve, and three in the other. Ligament external, elongated.

Syn. *Mosha*, Conrad.—*Siliqua*, Muhlfeldi.—*Luguminum*, Chemnitz.

Uniting the group represented by *Solea Cultellus*, and that represented by *Solen adspersus*, the latter having an internal umbonal bar or rib, in one genus, we have all the *Solenidae*, excepting *S. ligumen*, divided into three genera—viz., *SOLEX*, including the razor shells, whether straight or curved, with the beaks terminal; *CULTELLUS*, including *Siliqua*, or the “*radula*” group, which, with or without the internal rib, having the beaks near one end, or at least nearer than the middle, and *SOLECURTUS*, including *MACHA*, *SILIQUARIA*, *NOVACULINA* and *PHARELLA*, having the beaks central or nearly so.

Like true *Solen*, the species of *Cultellus* are found in the sands of nearly all climates.

Species 1. (Mus. Brit.)

CULTELLUS LIVIDUS. *Cal. testā elongatā, arcuatā, compressā, liciidi-purpurascens, nebulis fuscis aspersa, posticō attenuatā, subacuminatā, marginē terminali antico perelevato; ligamento brevissimo.*

THE LIVID CULTELLUS. Shell elongated, curved, compressed, livid-purple, sprinkled with brown spots; posteriorly attenuated, subacuminated, anterior terminal margin much raised; ligament short.

DUNKEE. Proc. Zool. Soc., 1861.

Cultellus marmoratus, Dunker.

Hab. Isl. Luzon, Philippines.

The small semipellucid shell described as *C. marmoratus*, is evidently the same with *C. liciidus* in a young state.

Species 2. (Mus. Sowerby.)

CULTELLUS LACTIFUS. *Cal. testā magnā, compressā, levigatā, albidā, rectiuscula, intus subumbonis costā minutā, extis epidermide crassā involuta; laterē antico ante umbonem producto, rotundatim subacuminata; latere postico elongato, ad terminum rotundo; margine ventrali recto; ligamento maximo.*

THE MILK-WHITE CULTELLUS. Shell large, compressed, smooth, whitish, rather straight, strengthened with a rib inside, under the umboes, covered with a thick epidermis outside; anterior side produced in front of the umboes, roundly subacuminated; posterior side elongated, rounded at the end; ventral margin straight; ligament very large.

SPENGLER.

Cultellus orientalis, Dunker.

Hab. Malacca.

Species 3. (Mus. Brit.)

CULTELLUS MAXIMUS. *Cal. testā tenui, compressā, paulo arcuatā, alba, epidermide fulvi indutā, intus costā minutā; laterē postico brevi, in areā complanatā et marginē reflexo terminanti, post aream concentricō rugatā; latere postico elongato, areā dorsali medio arcuatu depresso.*

THE VERY LARGE CULTELLUS. Shell thin, compressed, a little curved, white, covered with a yellow epidermis, strengthened inside with a rib; posterior side short, ending in a flattened area and reflected margin, concentrically wrinkled behind the area; posterior side elongated, dorsal area depressed by a curve in the middle.

GMELIN. Linna. Syst. Nat.

Hab. Malacca.

PLATE II.

Species 4. (Mus. Brit.)

Cultellus pallidus. *Cul.* testă parvă, tenuă, semi-pellucida, elongată, arcuată, antē undulatam brevisquamă; areă postică paulă elevată; margine dorsali vix arcuata; marginē ventrali utrinquē sursum acclivis; marginibas terminalibus subtruncateis.

THE PELLUCID *CULTELLUS*. Shell small, thin, semi-pellucid, elongated, arched, very short in front of the umbo, posterior area a little raised; dorsal margin scarcely arched, ventral margin sloped upwards on each side; terminal margins rather rounded,

PENNANT. Zool. Brit., vol. iv. Pl. 46, f. 23.

Solen papyraceus, Lamarek.

Solen minutus, Montagu.

Hab. British coasts.

Species 5. (Mus. Brit.)

Culcellus Hanleyi. *Cul.* testă elongată, compressă, utrinquē paulă hiantă, rectilinéa, albida, anterē posticē concentricē rugată; latere antico brevi, marginē dorsali excavato, marginē terminali subquadrato; latere postico elongato, marginē dorsali recto, areă angustissimă, marginē terminali subrotunda.

HANLEY'S *CULTELLUS*. Shell elongated, compressed, a little gaping at each end, rather straight, whitish, anteriorly and posteriorly concentrically wrinkled; anterior side short, dorsal margin excavated, terminal margin rather square; posterior side elongated, dorsal margin straight, with very narrow area, terminal margin rather rounded.

DUNKER. Proc. Zool. Soc., 1861.

Hab. ——?

Described in the Proceedings of the Zoological Society from a specimen in the late Mr. Cuming's collection without stated locality.

Species 6. (Mus. Brit.)

Cultellus politus. *Cul.* testă rectă, depressă, anticē hiantă, fuscă, epidermide tenuă, polită indută; umbosibus subterminalibus, marginē antico elevato, reflecto; areă postico albă, elongată, marginē terminali subtruncate; areă dorsali angustă, rectă; marginē ventrali recta.

THE POLISHED *CULTELLUS*. Shell straight, depressed, anteriorly gaping, brown, covered with a thin polished epidermis; umboes nearly terminal, anterior margin elevated, reflected, posterior area white, elongated; terminal margin subtruncated; dorsal area narrow, straight, ventral margin straight.

DUNKER. Proc. Zool. Soc., 1861.

Hab. Mouths of the river Gambia.

A peculiarly straight looking species, with umboes nearly terminal and edges curiously reflected.

Species 7. (Fig. a, b, Mus. Brit.)

Cultellus Cummingianus. *Cul.* testă latitarsculă, breviusculă, arcuată, fuso-purpurea, sparsim superne punctato et maculato; umbonibus terminalibus, marginē antico obliquā retroso; marginē ventrali utrinquē acclivis; marginē postico obtuso; marginē dorsali subarcuatu dpresso.

CUMMING'S *CULTELLUS*. Shell rather broad, short, arched, purple-brown, sparingly dotted and spotted with purple above; umboes terminal, anterior margin obliquely turned backwards; ventral margin sloped upwards at each end; posterior margin obtuse; dorsal margin a little arched and depressed.

DUNKER. Proc. Zool. Soc., 1861.

Cultellus concinna, Dunker.

Hab. Isl. Zebu, Philippines.

Short, deep, and square at the ends.

CULTELLUS.—PLATE II.

Species 8. (Mus. Brit.)

CULTELLUS ATTENUATUS. *Cul. testā depressā, tenui,
albida, epidermide tenissimo indutā; latere antico
antē umbones breviusculo, elevato, rotundo; latere
postico attenuato, elongato, ad terminum subacuminato.*

THE ATTENUTATED CULTELLUS. Shell depressed, thin, whitish, covered with a very thin epidermis; anterior side rather short in front of the umbones, raised, rounded; posterior side attenuated, elongated, rather acuminate at the end.

DUNKER. Proc. Zool Soc., 1861.

Hab. Philippines.

Species 9. (Mus. Brit.)

CULTELLES SUBELLIPTICUS. *Cul. testā depressā, tenui,
brevi, ovati, albī; latere antico breviusculo, angusto;
latere postico late, marginibus dorsali ventralique convexis.*

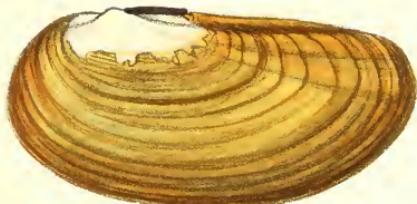

THE SUBELLIPTIC CULTELLUS. Shell depressed, thin, short, ovate, white; anterior side rather short, narrow; posterior side broad, with dorsal and ventral margins convex.

DUNKER. Proc. Zool. Soc., 1861.

Hab. Singapore. Straits of Malacca.

PLATE III.

(Fig. 8.) Species 20. (Mus. Brit.)

CUTTELLUS COSTATUS. *Cul. testā magnā, ventricosā, obliquā, prop̄ umbones aurantiū, purpureo achmatā, epidermide fusco subvirilē nitoñi inductā, intus infra umbonē unicostatā; latere antico brevi, subrotundatō; latere postico elongato, hinc, inflato, marginē dorsali brevi, subexcavato; cardine magno, marginē laterali soprā declīci, infra rotundatō productō.*

The RIBBED *CUTTELLUS*. Shell large, ventricose, oblique, orange near the umbones, elsewhere with purple; covered with a greenish-brown, shining epidermis; with a rib inside under the umbo; anterior side short, rather rounded; posterior side elongated, gaping, inflated, dorsal margin short, slightly excavated; hinge large, lateral margin sloped above, roundly produced below.

SAY American Marine Conchology.

Hab. North America, Cape Krusenstern.

(Fig. 9.) Species 21. (Mus. Brit.)

CUTTELLUS MEDius. *Cul. testā subhemisphaericā, oblongo-ellipticā, utrinquā bimarginata, epidermide crassā, subvirilē, nitenti inductā; intus costā validā infra umbonē utriusque valvā munitā, latere antico brevi, semi-ovata; latere postico oblonga, marginē dorsali rectiūscā; marginē terminali subexcavata, marginē ventrali convexa, ad terminum sorsuā acutā.*

The MEDIUM *CUTTELLUS*. Shell rather compressed, oblong-elliptical, gaping at each end, covered with a thick, greenish, shining epidermis; fortified within by a strong rib under the umbo in each valve; anterior side short, semi-ovate; posterior side oblong, dorsal margin rather straight; terminal margin rather truncated, ventral margin convex, sloped upwards at the end.

GRAY. Zool. Beechy Voy., Pl. 44, t. 2.

Machieria nitida, Gould.

Hab. North America.

Species 10. (Mus. Brit.)

CUTTELLUS WINTERIANUS. *Cul. testā oblongā, subovata, depresso subverrucoso-albā, epidermide tenui inductā, intus costā validā infra umbonē utriusque calvā munitā, latere antico brevi, alti, subrotundatō, marginē dorsali declīci; latere postico subb. nuto, ad terminum subvaruminato, marginē ventrali rectiūsculo.*

WINTER'S *CUTTELLUS*. Shell oblong, rather ovate, depressed, bluish-white; covered with a thin epidermis, fortified inside with a strong rib under the umbo in each valve; anterior side short, high, rather rounded, dorsal margin sloped; posterior side a little attenuated, rather acuminate; posterior side a little attenuated, ventral margin rather straight.

DUNKEL. Proe. Zool. Soc., 1861.

Hab. Java.

This species has a little of the shape of a *Donax*.

Species 11. (Mus. Brit.)

CUTTELLUS NUTTALLI. *Cul. testā magnā, ellipticā, compressā; albida, purpureo ab umbonib. radiatā; epidermide crassā, nitenti inductā, intus costā validā munitā; latere antico brevi, subexcavata, subacuminata; latere postico elongata, ad terminum subtruncata.*

NUTTALL'S *CUTTELLUS*. Shell large, elliptical, compressed; whitish, rayed with purple from the umbones, covered with a thick shining epidermis, fortified inside with a strong rib; anterior side rather short, rather acuminate; posterior side elongated, rather truncated at the end.

CONRAD. Journ. Acad. Nat. Hist. Phil., v. 7.

Hab. North America.

PLATE IV.

Species 12. (Mus. Brit.)

CULTELLUS GRANDIS. *Cul. testá magná, compressí, utrinquá híanti, albióli, purpureo radiatá, epidermide crassi, subviridi, nitente induitó; intus costá solidá, obliquá, infíti umbonem utrinquá valvá munita; latere antico brevi, rotunda; medio paulò excavata, margine ventrali concava; latero postico expando, producto, subinflato; marginé terminali truncato; margine dorsalí compresso, elevato, propumboeas excavato.*

THE LARGE CULTELLUS. Shell large, compressed, gaping at both ends, whitish, rayed with purple, covered with a thick, greenish, shining epidermis; fortified inside with a solid oblique rib under the umbo in each valve; anterior side short, rounded; middle a little excavated, ventral margin concave; posterior side expanded, produced, rather inflated; terminal margin truncated, dorsal margin compressed, elevated, excavated near the umboes.

GMELIN. Linn. Syst. Nat.

Hab. Arctic regions.

Species 13. (Mus. Brit.)

CULTELLUS RADIATUS. *Cul. testi elongati, compressi, tenui, purpureo lati radiati et concentrici fasciati, utrinquá híanti, intus costi albi, validi, obliqua infíti umbonem utrinquá valvá munita; latere antico breviúsculo, propumboeas excavato: latere postico elongato; marginé dorsalí utrinquá rectiúsculo, margine ventrali convexo, arcuato, utrinquá versus terminus acclivis.*

THE RAYED CULTELLUS. Shell elongated, compressed, thin, broadly rayed and concentrically banded with purple; gaping at each end, fortified inside with a strong, white, oblique rib under the umbo in each valve; anterior side rather short, excavated near the umboes; posterior side elongated; dorsal margin rather straight on both sides, ventral margin convex, arched, sloping upward towards the end on each side.

LINNEUS. Systema Nature.

Hab. Sumatra.

Species 14. (Mus. Brit.)

CULTELLUS ROSTRATUS. *Cul. testi magná, compressá, latá, elongatá, obscurè purpureo radiatá; epidermide crasso subviridi intinti, intus costi radii munita; latere antico breviúsculo, semiovato; latero postico attenuato, versù terminali angustato, ad terminum lati truncato, margine dorsalí compresso.*

THE BEAKED CULTELLUS. Shell large, compressed, broad, elongated, obscurely rayed with purple, covered with a thick greenish epidermis, fortified within by a strong rib; anterior side rather short, semiovato; posterior side attenuated, narrowed towards the end, broadly truncated at the end; dorsal margin compressed.

DUNKEE. Proc. Zool. Soc., 1861.

Hab. Arctic regions.

It may be seen at once that this species, although bearing a general resemblance to *Cultellus grandis*, differs from it in the posterior side tapering towards the end, instead of being expanded and inflated.

June, 1874.

PLATE V.

Species 15. (Fig. a, b, Mus. Sowerby.)

CULTELLUS JAPONICUS. *Cul. testă tenui, ovată, pallidă subfuscă, purpureo radiati et concentric fasciata, costă albă validi infra umbonem in utriusque calvā munita; latere antico breviuscule; latere postico magis producta, prop̄ marginem dorsalem compressa, sulcato: margine ventrali convexo, vix constricto.*

THE JAPAN CULTELLUS. Shell thin, ovate, pale brownish, rayed and concentrically banded with purple, strengthened within by a strong white rib under the umbo in each valve; anterior side rather short; posterior side more produced, compressed near the dorsal margin, with a groove; ventral margin convex, hardly contracted in the middle,

DUNKER. Proc. Zool. Soc., 1861.

Siliqua pulcher. Dunker.

Hab. Eastern seas.

The specimens of Mr. Dunker's *Siliqua pulcher*, seem to me to represent the young state of his *S. Japonica*. It is longer in form, but it has the same groove concurrent with the dorsal margin.

Species 16. (Mus. Brit.)

CULTELLUS ALBIDUS. *Cul. testă parvă, subelliptică, albă, semipellucida; latere antico brevi; latere postico oblongo, marginē dorsali convexo: margine ventrali medio vix contracto.*

THE WHITISH CULTELLUS. Shell small, subelliptic, white, semipellucid; anterior side short; posterior side oblong, dorsal margin convex; ventral margin scarcely contracted.

DUNKER —?

Hab. Catanan, Philippines.

Species 17. (Mus. Brit.)

CULTELLUS GRAYANUS. *Cul. testă tenui, elongatā, epidermide tenuissimo indutā, costă intus munita, obscuri purpureo radiati: latere antico brevi; latere postico producto, margine dorsale elevato, compressa.*

GRAY'S CULTELLUS. Shell thin, elongated, covered with a very thin epidermis, strengthened with a rib inside, rayed with dull purple, anterior side short; posterior side produced, dorsal margin elevated, compressed.

DUNKER. Proc. Zool. Soc., 1861.

Hab. Ceylon.

Species 18. (Mus. Brit.)

CULTELLUS SUBSULCATUS. *Cul. testă elliptică, tenui, obscuri purpureo fasciata; intus costă solidă manită; latere antico brevi, rotundo; latere postico obliquo, elongato, prop̄ marginem dorsalem levē sulcato; margine ventrali convexo.*

THE SLIGHTLY-GROOVED CULTELLUS. Shell elliptic, thin, banded with dull purple; strengthened within by a solid rib; anterior side short, rounded; posterior side oblique, elongated, slightly grooved near the dorsal margin; ventral margin convex.

SOWERBY.

Hab. —?

This shell is named in the British Museum collection *S. costatus* var., but it is unlike the larger representatives of that species. It has the same peculiar groove-like depression parallel with the dorsal margin that distinguishes *C. Japonica*, but it is much more inequilateral.

CULTELLUS.—PLATE V.

Species 19. (Mus. Brit.)

CULTELLUS BELCHEEI. *Cul. testi elongatè, compressâ, subcuneiformi, pallidè purpureo rufiùt, epidermide subcividi-fusco indutâ; intus costâ validâ insfrâ unbonem in utrâque valvâ manubriâ; latera antico brevissimo; latera postico attenuato, acclivi.*

BELCHER'S CULTELLUS. Shell elongated, compressed; a little wedge-shaped, rayed with pale purple, covered with a greenish-brown epidermis;

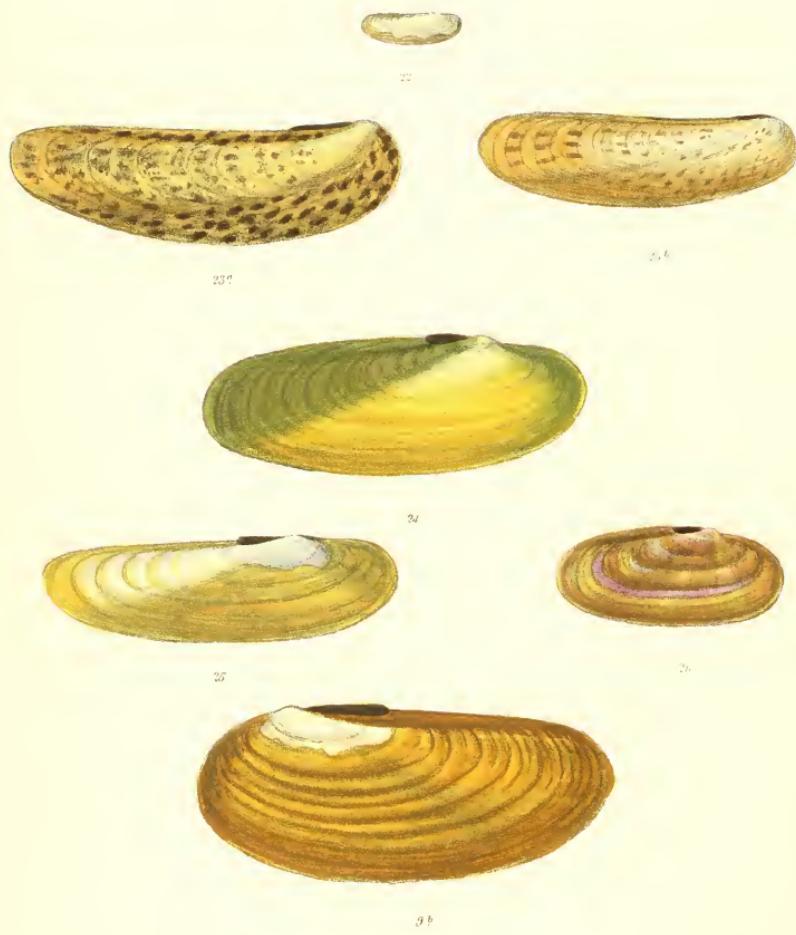

fortified inside with a strong rib under the umbo in each valve; anterior side very short; posterior side attenuated, sloped.

Species 22. (Mus. Brit.)

Cultellus vitreus. *Cul.* testa parva, semipellucida, oblonga, lentissimè arcuata; latere antico brevi, rotundo; margine ventrali aequaliter convexa.

THE GLASSY CULTELLUS. Shell small, semipellucid, oblong, very slightly arched; anterior side short, rounded; ventral margin equally convex.

BOISSY. MS. Brit. Mus.

Hab. Singapore.

This little glassy species somewhat resembles the British *C. pellucidus*.

Species 23. (Fig. a, b.)

Cultellus cultellus. *Cul.* testa aequiformi, arcuata, post-medium latitudo ante-mediu[m] attenuata, terminis utrinque acutilibus; pallida, sparsim maculis purpureis aspersa; umbonibus forae terminalibus.

THE LITTLE CULAS CULTELLUS. Shell scimitar-shaped, arched, broad past the middle, attenuated before the middle, sloping upwards at both ends; pale, sprinkled sparingly with purple spots; umbones almost terminal.

LINNAEUS (Solen). Syst. Naturae.

Cultellus Australis. Dunker.

Hab. Port Essington, Australia.

In *Cultellus lividus* the greatest breadth is before the middle; in the present, which is the typical species, the greatest width is behind the middle.

Species 24. (Mus. Brit.)

Cultellus ovalis. *Cul.* testa elongato-ovata, subventricosa, aureo-subviridis, utrinque versus terminos griseo-ctuti; latere antico producto, subacuminato; latere postico oblongo, obtuso subrenato; margine ventrali convexo; margine dorsali paulo declivis.

THE OVAL CULTELLUS. Shell elongate, oval, subventricose, greenish gold, greyish on both sides towards the ends; anterior side produced, rather acuminate; posterior side oblong, obtusely truncated; ventral margin convex; dorsal margin a little sloped.

DUNKER —? MS. Brit. Mus.

Hab. Singapore.

Larger and more ovate than *Cultellus mediis*.

Species 25. (Mus. Sowerby.)

Cultellus scalpellum. *Cul.* testa elongata, tenui epidermide nitenti, subviridi, induta; latere antico producto, rotundo; latere postico elongato, attenuato, acuminato; margine dorsali recto; margine ventrali concavo, utrinque acutivi.

THE SCALPEL CULTELLUS. Shell elongated, covered with a thin, shining, greenish epidermis; anterior side produced, rounded; posterior side elongated, attenuated, acuminate; dorsal margin straight; ventral margin convex, sloped upwards at each end.

SOWERBY.

Hab. Red Sea.

Of the general form and aspect of *Cultellus cultellus*, but with the anterior end produced as in *Cultellus oratus*.

Species 26. (Mus. Sowerby.)

Cultellus lucidus. *Cul.* testa compressa, ovata, tenui epidermide nitenti, flavido-subviridi induta, fasciis purpureis lati radiati; ad terminum posticum subtruncata; margine dorsali post umbones convexa, arcu submarginali compressa.

THE LUCID CULTELLUS. Shell compressed, ovate, thin, covered with a shining, thin, yellow-greenish epidermis, rayed with broad purple bands; partly truncated at the hinder extremity; dorsal margin convex behind the umbones, with a submarginal compressed area.

PLATE I.

Genus CYCLOSTREMA, Maryatt.

Testa orbicularia, depresso, latè umbilicata; spica parva, anfractibus spiraliè et concentricè, plus minusè levata vel sulcata. Apertura integra, band nucra, margine acuto.

Shell orbicular, depressed, broadly umbilicated; spire small, whorls spirally and concentrically ridged or sulcated. Aperture entire, not pearly, margin acute.

Some of the smaller species of *Delphinula* resemble these little shells, which, with *Adeorbis* and the subgenera of both make a natural group. The difference between the two genera is that *Cyclostrema* has more external sculpture and a wide umbilicus, which in *Adeorbis* is wanting. Of the twenty-three species included in this genus and its subgenera *Davonia*, *Tabiola*, *Microtheca*, and *Morchia*, a dozen were found by Mr. Arthur Adams on the coasts of Japan, half-a-dozen more were collected by the late Mr. Cumming amongst the Philippines, leaving five or six for such widely distant localities as Britain and Australia, China and California, &c.

Species 1. (Fig. a, b, Mus. Brit.)

CYCLOSTREMA CINGULIFERA. *Cyc. testa orbiculari, depresso, anfractibus rapidè crescentibus, ultimo carinis sex acutissimis, prominentibus cincto; umbilico lato, plano; aperturā rotundā, margine exterio superiō lagato.*

THE BELTED CYCLOSTREMA. Shell orbicular, depressed, whorls quickly increasing, the last encircled with six prominent, very sharp ribs; umbilicus wide, flat; aperture rounded, outer margin fluted.

A. ADAMS. PROC. ZOOL. SOC., 1850.
Hab. Isl. of Negroes, Philippines. Japan.

Species 2. (Mus. Brit.)

CYCLOSTREMA EXCAVATA. *Cyc. testa complanata, minutissimè spiraliter striata; anfractibus rapidè crescentibus, ultimo anfractu infra angulato, complanato; umbilico lato; aperturā obliqua, margine tenui.*

THE EXCAVATED CYCLOSTREMA. Shell flattened, very minutely spirally striated; whorls rapidly increasing, last whorl angular, flattened beneath; umbilicus broad; aperture oblique, margin thin.

CARPENTER. PROC. ZOOL. SOC., 1850.

Hab. China Seas.

Species 3. (Mus. Brit.)

CYCLOSTREMA SULCATA. *Cyc. testa orbiculari, depresso, regulariter spiraliter sulcata; spirā valde depresso; ultimo anfractu lato; umbilico latissimo, sulcato; aperturā ferè rotunda.*

THE SULCATED CYCLOSTREMA. Shell orbicular, depressed, regularly spirally sulcated; spire much depressed; last whorl broad; umbilicus very wide, grooved; aperture nearly round.

A. ADAMS. PROC. ZOOL. SOC., 1850.

Hab. Philippines. Japan.

Species 4. (Fig. a, b, Mus. Crosse.)

CYCLOSTREMA VERRAUXII. *Cyc. testa orbicularata, depresso, spirā parvi, anfractibus subquadratīs, rapidè crescentibus; ultimo anfractu tricarinato, carinā medianā prominenti, ad aperturam in lobam linguiformem productā; umbilico mediocri, planato; aperturā magnā, labio externo infra angulato, medio lingulatim producto.*

VERRAUX'S CYCLOSTREMA. Shell orbicular, depressed, spire small, whorls rather square, rapidly

CYCLOSTREMA.—PLATE I.

increasing; last whorl three-keeled; middle keel prominent, produced at the aperture into a tongue-shaped lobe; umbilicus middle-sized, flattened; aperture large, outer lip angular below, with tongue-shaped projection in the middle.

FISCHER (Addeorbis). Journ. de Conch., pl. 10, f. 13.
Hub. California.

Species 5. (Mus. Adams.)

CYCLOSTREMA ANAGLYPTA. *Cyc. testā trochiformi, solidā; spirā exsertā; ultimo anfractu carinis moniliformibus tribus cincto, umbilico lato, planato; aperturā rotundā, labio externo extus crenulato.*

THE CHASED CYCLOSTREMA. Shell trochiform, solid; spire exserted; last whorl encircled with three beaded keels, umbilicus broad, flattened; aperture rounded, outer lip crenulated outside.

A. ADAMS. Ann. and Mag. of Nat. Hist., 1863.
Hub. Seto-Uchi, Japan.

Species 6. (Fig. a, b, Mus. Brit.)

CYCLOSTREMA CANCELLOTA. *Cyc. testā sublenticulari, depressā; spirā planulatā; ultimo anfractu magno,*

medio carinato, supra infrōque carinam costis validis concentricis et liris interstitalibus spiralibus cancellatā; aperturā magnā; umbilico mediocri.

THE CANCELLED CYCLOSTREMA. Shell sublenticular, depressed, spire flattened; last whorl large, keeled in the middle, cancellated above and below the keel with strong concentric ribs and interstitial spiral ridges; aperture large; umbilicus middle-sized.

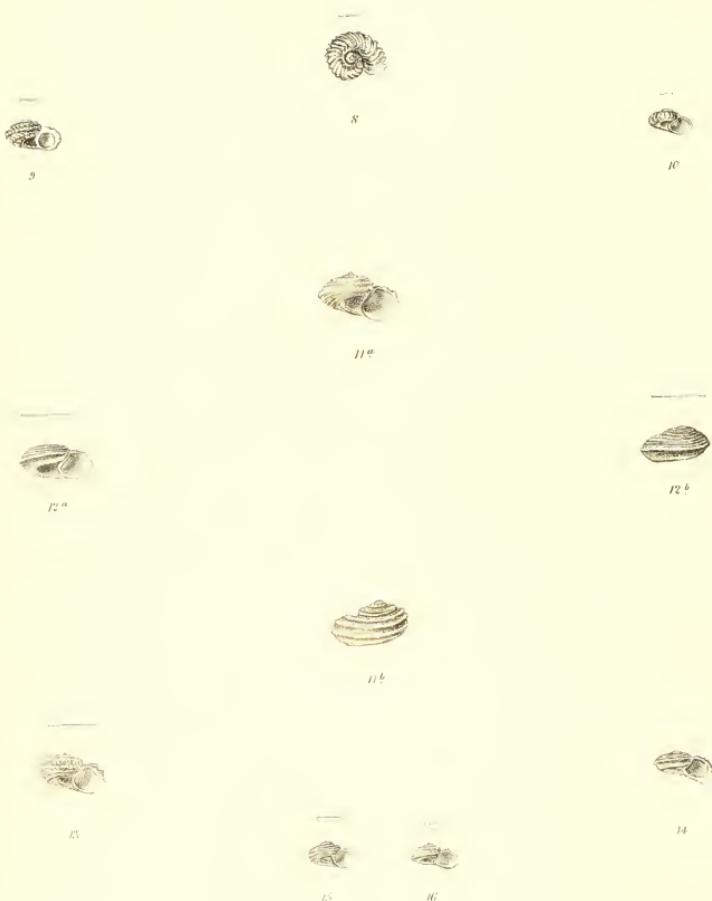

MARYATT. Trans. Linn. Soc., 1818.
Hub. West Indies. Philippines.

Species 7. (Fig. a, b, Mus. Adams.)

CYCLOSTREMA BIPORCATA. *Cyc. testā orbiculato-depressā; spirā planulatā; ultimo anfractu depresso, acutē bicarinato, carinā inferiori magis prominenti; aperturā subrotundā; labio externo bilobato; umbilico parvissculo.*

THE TWO-RIDGED CYCLOSTREMA. Shell orbicularly depressed; spire flattened; last whorl depressed, with two sharp keels, the lower keel more prominent; aperture rather rounded; outer lip two-lobed; umbilicus rather small.

A. ADAMS. Ann. and Mag. of Nat. Hist., 1863.
Hub. Seto-Uchi, Japan.

C Y C L O S T R E M A.

PLATE II.

Species 8. (Mus. Cross.)

CYCLOSTREMA SCHRAMMI. *Cyc. testā subdepressā; spira
subcylindrica, anfractibus propè suturam excavatis;
concentricè obliquè laminae extantibus ornatis,
superè acuminatis.*

SCHRAMMI'S CYCLOSTREMA. Shell subdepressed; spire rather flattened, whorls excavated near the suture; concentrically obliquely ornamented with extant laminae, acuminate above.

FISCHER. Journ. de Conch., pl. 10, f. 10.

Hab. Guadaloupe.

—
Species 9. (Mus. Brit.)

CYCLOSTREMA MICANS. *Cyc. testā depressā, crassā; spira parens, depressa; anfractibus concentricè rugatis, concentricè trivirgatis, carinis noduliferis, mediā magis prominenti; aperturā parens, rotundā; marginē integro, crasso, crenulato; umbilico parvo.*

THE SHINING CYCLOSTREMA. Shell depressed, thick; spire small, depressed; whorls concentrically three-keeled, keels noduliferous, the middle one more prominent; aperture, small, round; margin entire, thick, crenulated; umbilicus small.

A. ADAMS. Proc. Zool. Soc., 1850.

Cyclostrema pulchella, Dunker.

Cyclostrema modesta, Gould.

Hab. Port Lincoln. Japan.

—
Species 10. (Mus. Adams.)

CYCLOSTREMA AMMONOCERA. *Cyc. testā planoribulari, anfractibus depressis, costis concentricis crassiùsculis ornatis, inter costas tenuissimè striatis; ultimo anfractu propè suturam et circa umbilicū planato; umbilico mediocri; aperturā magna; labio externo tenui.*

THE AMMONOCERA CYCLOSTREMA. Shell planoribular, whorls depressed, ornamented with rather thick, concentric ribs, finely striated between the ribs; last whorl flattened near the suture and round the umbilicus; umbilicus middle-sized; aperture large; outer lip thin.

A. ADAMS. Ann. and Mag. of Nat. Hist., 1863.

Hab. Japan.

—
Species 11. (Fig. a, b, Mus. Brit.)

CYCLOSTREMA LEVIS. *Cyc. testā minuscula, subdepressā, levigatā, spira paulò elevatā, anfractibus carinatis; ultimo anfractu carinis subdistantiis cincto; umbilico magno, costā marginata, planulata.*

THE SMOOTH CYCLOSTREMA. Shell rather large, rather depressed, smooth, spire a little elevated, whorls keeled; last whorl encircled with rather distant keels; umbilicus large, bordered with a rib, flat.

KIESER. (Delphinula) Spec. Gen., p. 12, pl. 4. f. 6.

Delphinula nivea, Reeve.

Cyclostrema diastreta, Gould.

Hab. Port Lincoln, Australia. Japan.

—
Species 12. (Fig. a, b, Mus. Brit.)

CYCLOSTREMA ANGULATA. *Cyc. testā minuscula, depressā; anfractibus latis; ultimo anfractu magno, medio angulato, suprà angulum spiraliè costellatā, infra medium planato, circa umbilicū carinato; umbilico lato, planato; aperturā magna, marginē externo angulata.*

THE ANGULAR CYCLOSTREMA. Shell rather large, depressed; whorls broad; last whorl large, angular in the middle, spirally ribbed above the angle; flattened below the middle, keeled round the umbilicus; umbilicus broad, flattened; aperture large, outer margin angular.

A. ADAMS. Proc. Zool. Soc., 1871.

Hab. Isl. Zeba, Philippines.

CYCLOSTREMA.—PLATE II.

Species 13. (Mus. Brit.)

CYCLOSTREMA REEVIANA. *Cyc. testā majusculā, con-*
centricē rugulōriter rugosā; anfractibus depresso-
costis mouillūmīlūs, conspicuūs cinctā; umbilico
medioveri, intūs plūo: aperturā subobliquā.

REEVE'S CYCLOSTREMA. Shell rather large, concentrically regularly wrinkled; whorls depressed, encircled with beaded conspicuous ribs; umbilicus middle-sized, flat within; aperture rather oblique.

HINDS. (*Delphinula*.) *Voyage of the Sulphur*, p. 52,
 pl. 16, f. 17.

Hab. Straits of Malacca.

Species 14. (Mus. Crosse.)

CYCLOSTREMA BEANI. *Cyc. testā depresso-sulcata;*
spira subelevata, anfractibus lente crescentibus;
rotundis, spiraliter sex-costatis; aperturā sub-
rotundā; umbilico parvo.

BEAN'S CYCLOSTREMA. Shell depressed, spire planorbular; last whorl keeled a little above the middle; spirally striated above the keel; flattened below; angular round the umbilicus; umbilicus flat within; aperture expanded; outer lip crenulated

above, produced into an acutely angular process below.

FISCHER. (*Adeorbis*) *Journ. de Conch.*
Hab. Guadaloupe.

Species 15. (Mus. Brit.)

CYCLOSTREMA TORNATA. *Cyc. testā depresso-sulcata;*
spira subelevata, anfractibus lente crescentibus;
rotundis, spiraliter sex-costatis; aperturā sub-
rotundā; umbilico parvo.

THE ENGINE-TURNED CYCLOSTREMA. Shell depressed, subglobose; spire slightly elevated, whorls slowly increasing, round, spirally six-ribbed; aperture rather rounded; umbilicus small.

ARTHUR ADAMS. *Sowerby's Thesaurus, Cyclostrena.*
 Species 10, f. 13.

Hab. Japan.

Species 16. (Mus. Brit.)

CYCLOSTREMA CINGULATA. *Cyc. testā valde depresso,*
carinis acutis propè suturam und, infrā medium
duabus cinctā; aperturā magno, triangulati;
umbilico magno, plūo.

THE ENCIRCLED CYCLOSTREMA. Shell much depressed, encircled with one sharp keel near the suture and two below the middle; aperture large, triangular; umbilicus large, flat.

DUNKER. *Mollusca of Japan.*

PLATE III.

Species 17. (Fig. a, b, Mus. Brit.)

Cyclostrema testaceum. Cyc. testi perpendiculi, compresum, spira elevata, anfractibus rapidi crevissantibus prope angustis, supra rotundata, oblonga dehinc, flattens latitudine levigata; umbilicus maxime, aperturam lassimam, marginem rotundatam.

THE SPIDER CYCLOSTREMA. Shell planorbular, compressed; spire excavated; sides rapidly increasing, spirally elevated, smooth and smooth near the summit, but disengaged; umbilicus, very large; aperture low, outer margin excavated.

A. ADAMS. Trans. Zool. Soc., 1850, p. 44.

Subgenus *Thacum*, A. Adams.

Scaphulina spiralis, J. & A. Adams.

Hab. Philippines.

The shell removed from its resemblance to *scaphula*, being coiled on a flat base and having the last whorls a little apart.

Species 18. (Fig. a, b, Mus. Brit.)

Cyclostrema nivea. Cyc. testi obliqui semiglobosus, lateripedita, superne convexa, infra subtenuitatis, spira prope elevata, anfractibus rapidi crevissantibus; umbilicus maxime; aperturam magni obliquè ovati.

THE SNOWY CYCLOSTREMA. Shell obliquely semiglobose, smooth, convex above, a little flattened below, spire a little raised, whorls rapidly increasing; umbilicus very large; aperture large, obliquely ovate.

CHEMNITZ. (Turbo.) Conch. X., pl. 165, f. 15, 87, 88.
Dolphinula nivea, Philippi.

Tubiola nivea, A. Adams.

Hab. Japan.

This is the largest of the three species mentioned, the subgenus *Thacum*.

Species 19. (Fig. a, b, Mus. Brit.)

Cyclostrema orvoluta. Cyc. testi obliqui ovata, superne depresso, ad latera compressa; spiræ planæ, ultimo anfractu supernæ infiniter angulata, media planula; umbilicus lato; aperturâ obliquâ ovata.

THE WRAPPED UP CYCLOSTREMA. Shell obliquely ovate, depressed above, compressed at the sides; spire flattened, last whorl angular above and below, flattened in the middle; umbilicus wide, aperture obliquely ovate.

A. ADAMS. Ann. and Mag. of Nat. Hist., 1860; Proc. Zool. Soc., 1863.

Hab. Japan.

Species 20. (Fig. a, b, Mus. Brit.)

Cyclostrema cyclotina. Cyc. testi planorbili, levigata, radice depresso; spiræ planæ; ultimo anfractu rapidè crescenti, band contiguo; umbilicus magno, intus planus; aperturâ magni, subrotundata, suprè infiniter obscurè angulata.

THE LITTLE WHEEL CYCLOSTREMA. Shell planorbular, smooth, much depressed; spire flat; last whorl rapidly increasing, not contiguous; umbilicus large, flat within; aperture large, rather rounded, obscurely angular above and below.

A. ADAMS. Sowerby's Thesaurus. Species (*Daronia*) 2.
fig. 35, 36.

Hab. Japan.

A second species of *Daronia* having, like Sp. 17, a planorbular coil and slightly disconnected whorls.

CYCLOSTREMA.—PLATE III.

Species 21. (Fig. *a, b*, Mus. Brit.)

CYCLOSTREMA CORNUELLA. *Cyc. testā minutā, globosā; spirā elevatā; anfractibus paucis, rotundis; ultimo anfractu magno; umbilico lato; aperturā rotundā.*

THE LITTLE HORN CYCLOSTREMA. Shell minute, globose; spire raised; whorls few, rounded; last whorl large; umbilicus wide; aperture rounded.

A. ADAMS. (*Skenea*) Ann. and Mag. of Nat. Hist., 1860.
Tubiola cornuella, A. Adams, 1863.

Hab. Japan.

Species 22. (Fig. *a, b*, Mus. Hanley.)

CYCLOSTREMA DIVISA. *Cyc. testā turbinatā, spirā elevatā, apice obtuso; anfractibus tribus, rotundis; ultimo anfractu obliquè declivi, a penultimo separato; aperturā obliquè ovatā.*

THE DIVIDED CYCLOSTREMA. Shell turbinated, spire elevated, apex obtuse; whorls three, rounded; last whorl obliquely sloped downwards, separated from the penultimate; aperture obliquely ovate.

J. ADAMS. (*Turbo*) Forbes and Hanley's British Mol-lusca.

Helix serpuloides, Montagu.

Hab. British Seas.

Species 23. (Mus. Adams.)

CYCLOSTREMA CRENULIFERA. *Cyc. testā crassā, globosā, latè umbilicatā, longitudinaliter plicato-rugatā; suturā canaliculatā; anfractibus ad suturam crenulatis; aperturā subrotundā; labio externo incrassato, arcuato: umbilico ad marginem crenato.*

THE CRENULED CYCLOSTREMA. Shell thick, globose, broadly umbilicated, longitudinally wrinkled in plaits; suture canaliculated; whorls crenulated at the suture; aperture rather rounded; outer lip thickened, curved; umbilicus crenated at the margin.

A. ADAMS. Ann. and Mag. of Nat. Hist., 1863.
Isunda crenulifera, A. Adams.

Hab. Japan.

MONOGRAPH

OF THE GENUS

P H A R U S.

"Earth with a thousand voices praises God."—*Ode to Joy*.

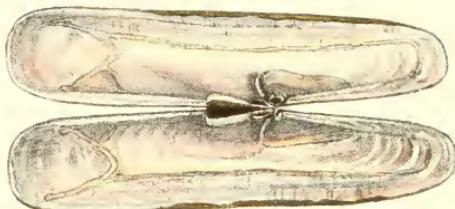

Fig.

Fig.

PHARUS.

PLATE I.

Genus PHARUS, Lovell.

Terræ compresæ, subæquilaterali, epicyanali testæ rotundatae; laterali umbonis costæ, ventrali proponitulari angustæ; carni dentibus in cibis dentatæ tritantes; in cibis sinistræ non contractæ non fimbriatae, rotundæ. Impressiones anteriores rotundæ, oblongæ, latitudinalis. Impressio palliæ sinistra.

Shell compressed, subæquilateral, with yellowish tints; internally under the umboes produced with a strong perpendicular rib; hinge armed with three teeth in the right valve, and a bifid lateral one and a central one in the left. Anterior muscular impression elongated, horizontal. Impression of the mantle sinuate.

Syn. *Solecurtoides*, Desmoulins.

Pallia, *D'Orbigny*.

Ceratisolen, *Forbes*.

The single species that is known of this genus has a rather wide geographical range. Like *Solecurtus* it has a central hinge, but a very compressed, elongated

form; and the interior is strengthened by an umboinal rib. The foot of the animal is rather peculiar.

Species 1.

PHARUS LEGUMEN. *Pho. testæ tenui, compressi, pallidissimæ rosco-purpureo-roseo; latre antico brevirâsculo, attenuato; margine dorsali declinæ; latre postico oblongo, lato, truncato, obtuse angulato; epidermidem tenui, extra marginem testæ extensa.*

THE BEAN-POD PHARUS. Shell thin, compressed, very pale fulvous-rose; anterior side rather short, attenuated; dorsal margin sloped; posterior side oblong, broad, truncated, obtusely angular; epidermis thin, extended beyond the margin of the shell.

LINNAEUS. *Systema Naturæ.*

Hab. Mediterranean.—Red Sea.—Senegal.—British Islands.

August, 1874.

MONOGRAPH
OF THE GENUS
MEGASPERA.

"All hymn Thy glory, Lord, aright.
All worship and rejoice." —Keble.

M E G A S P I R A.

PLATE I.

Genus MEGASPIRA, Lea.

Testa terrestris, elongato-cylindrica, multispiralis, spirâ elongata, aperturâ parvâ, labio externo tenaciter reflexo, columellâ triplicata; labio interno ad anfractum ultimum uniplatata.

Shell terrestrial, elongated, cylindrical, many-whorled spiral, spire elongated, aperture small, outer lip shiny reflexed, columella three-plaited; inner lip single-plate on the last whorl.

There are but two species, both Brazilian, of this singularly formed genus of land shells.

Species 1. (Fig. a, b, Mus. Sowerby.)

MEGASPIRA PLATA. *Meg. testa subcylindrica, evanescens, apicem obtusa, tibi paulo inflata, d'indumento contracta, protus supra medium et infra levissime rugosa, superficies circumdatus longitudinale inter platis fuscâ striatis, leviter et erubescens, columella levata, ad ultimum unifracata, ingassata, triplicata; aperturâ antice subquadrate.*

THE HIGHER MEGASPIRA. Shell subcylindrical, umbilicated, obtuse at the apex, then a little inflated,

afterwards rather contracta, a little above the middle and below very slowly increasing, whorls twenty-two, longitudinally striped with interrupted brown, finely and closely ribbed, columnella short, thickened at the last whorl, three-plaited; aperture anteriorly subquadrate.

SPIX. Shells of Brazil
Hab. Brazil.

Sp. i & 2. (Fig. c, d, Mus. Sowerby.)

MEGASPIRA PLATA. *Meg. testa angusta, cylindrica, apicem obtusa, superficies numerosos, levissimè crescentibus; longitudinaliter transversè striatis; aperturâ subovata; columella uniplatata; ultimo anfractu ad labium internum uniplatata.*

THE FLATTER MEGASPIRA. Shell narrow, cylindrical, apex obtuse, whorls numerous, very slowly increasing; longitudinally very finely striated; aperture subovate; columnella single-plaited; last whorl with a single plate at the inner lip.

GOULD — ?
Hab. Brazil.

More narrow and cylindrical than *Megaspira plata*, with only one plate on the columnella. The whorls are also more finely striated.

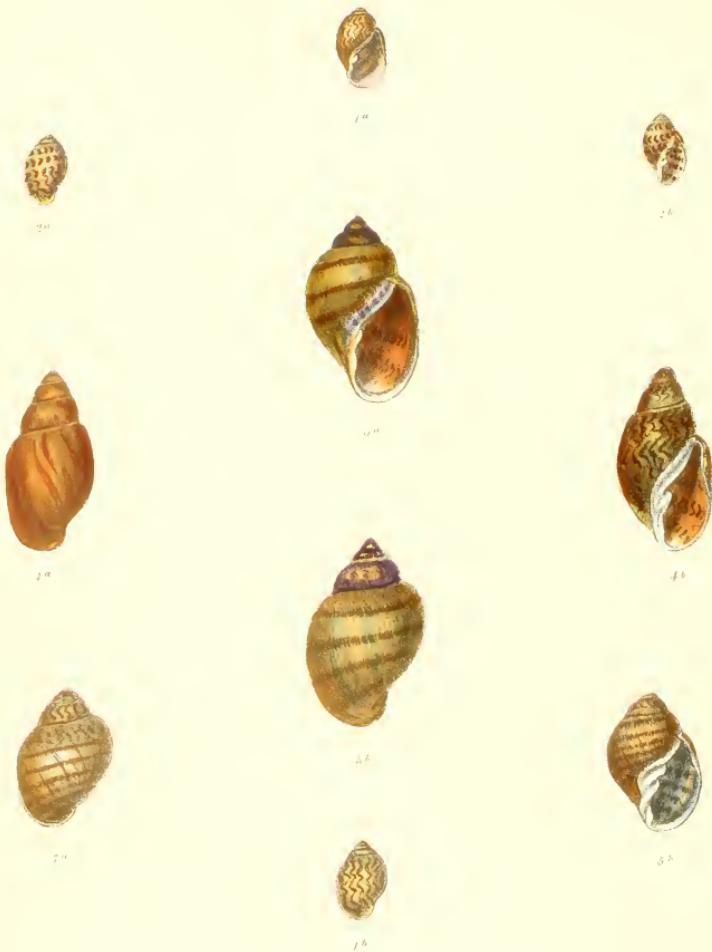

August, 1874.

MONOGRAPH

OF THE GENUS

CHILINA.

"Thy pow'r divine, and bounty beyond thought,
Adored and praised in all that Thou hast wrought."—*Cowper.*

CHILINA.

PLATE I.

Genus CHILINA, Gray.

Testa fluvialis, tenuis, ovata, ventricosa, epidermis olivacea induta, plurimque fasciis maculisque picta; apertura oblonga; columella incrassata, plusminusve plicata; labio externo acuto.

Shell fluvial, thin, ovate, ventricose, covered with an olive epidermis, generally painted with bands and spots; aperture oblong; columella thickened, more or less plicated; outer lip sharp.

Syn. *Dombeyia*, Orbigny. *Ida*, Lea. *Potamophila*, Swainson.

Although some species of *Limnea* approach the *Chilinae* in form and habit, and are also freshwater molluscs, there is no difficulty in distinguishing shells of the two genera. The shells of the *Chilinae* are always striped or spotted under the epidermis, and the columella is thickened, more or less plaited. All the species inhabit the warm regions of South America.

Species 1. (Fig. a, b, Mus. Brit.)

CHILINA FLUVIALIS. *Chi. testa parvâ, ovatâ, maculis fluctuosis fasciatâ pictâ, intus roseâ; spira brevi, conicâ, columellâ anticè rectâ, medio uniplicata.*

THE FLUVIALE CHILINA. Shell small, ovate, painted with fluctuating spots in bands, pink within; spire short, conical, columella straight anteriorly, with one plait in the middle.

GRAY, in Brit. Mus. Sowerby's Conchological Illustrations, fig. 5.

Hab. Chili.

Species 2. (Fig. a, b (and Pl. III.), fig. c., Mus. Brit.)

CHILINA FLUMINEA. *Chi. testa ovatâ, tenui, parvâ, maculis purpureis, subquadris in scriebus quatuor dis-*

tinctis notata; spirâ subproductâ, anfractibus parvis, convergensculis; columellâ crassâ, planatâ, plicis duabus, una ad medium, alterâ suprad medium armatâ.

THE STREAMLET CHILINA. Shell ovate, thin, small, marked with four rows of purple, rather square distinct spots; spire rather produced, whorls few, rather convex; columella thick, flattened, armed with two plaits, one at the middle and one above.

GRAY. Spicilegia Zoologica, p. 5; Conch. Ill. fig. 7.
Hab. S. America.

Species 3. (Fig. a, b, Mus. Brit.)

CHILINA MAJOR. *Chi. testi ovato-venosâ, interruptum quadrifuscata; intus fuscâ; spirâ brevissima, anfractibus obtuse angulatis, ultimo maximo, ventricosa; columellâ obliquâ biplicata.*

THE LARGE CHILINA. Shell oval, ventricose, interruptedly four-banded, brown within; spire rather short, whorls obtusely angular, the last very large, ventricose; columella obliquely two-plaited.

SOWERBY. Malacological Magazine, part 2; Conch. Ill. fig. 7.

Hab. S. America.

This very large species is very characteristic of the genus to which it belongs.

Species 4. (Fig. a, b, Mus. Brit.)

CHILINA DOMBNEYANA. *Chi. testâ oblongâ, ovatâ, intus fuscâ; striis flexuosis in scriebus tribus pictâ; spirâ productâ; anfractibus obtuse angulatis; apertura oblongâ, labio externo suprad medium sinuatim producto; columellâ crassâ, latâ, medio, plica crassa munita.*

DOMBEY'S CHILINA. Shell oblong, ovate, brown within;

CHILINA.—PLATE I.

painted with flexuous stripes in three rows; spire produced; whorls obtusely angular; aperture oblong, with the outer lip sinuously produced above the middle; columella thick, broad, strengthened in the middle by a thick plait.

SOWERBY. Conchological Illustrations, fig. II.
Hab. Chili.

Species 5. (Fig. a, b, Mus. Brit.)

CHILINA ROBUSTIOR. *Chi. testi brevi, crassū, ventricosā, pallidē fuscū, fasciis numerosis angulatim maculatis pictā, intus subcarulata; spira brevissimā, subconicā, anfractibus paucis, obtusissimè angulatis;*

ultimo subcentricoso; aperturā subovatā, labio extero intus incrassato; columellā crassā, plicis una magnā, infra medium, alterā parvā, obliquā, supra medium munīta.

THE ROBUST CHILINA. Shell short, thick, ventricose, pale brown, painted with numerous angularly-spotted bands, bluish within; spire rather short, rather conical, whorls few, very obtusely angular; last whorl rather ventricose; aperture somewhat ovate, outer lip thickened within; columella thick, strengthened with one large plait below, and another small, oblique above the middle.

SOWERBY. Malacological Magazine; Conch. Ill. fig. 1.
Hab. S. America.

8a

9a

9b

8c

C H I L I N A.

PLATE II.

Species 6. (Fig. *a, b*, Mus. Brit.)

CHILINA ACUMINATA. *Chi. testō ovatā, utrinquē acuminatā, tenui, leviter, inaequale plicata, aperturā spirām longitudine exquātē; columellā obliquè biplicata.*

THE ACUMINATED CHILINA. Shell oval, acuminated at each end, thin, slightly banded with spots, aperture equalling spire in length; columella obliquely two-plaited.

SOWERBY.

Hab. Baldivia.

This, like the succeeding species, has a thin columella with two small, oblique folds, but the form is so different that it would be a great anomaly to associate the two shells under one specific name.

(Fig. *6, c.*) *Species 10.* Mus. Brit.

CHILINA OVALIS. *Chi. testō: ovatā, subelevata, fasciata, interdūcere subrotundata; aperturā subovatā, columellā rotundatā, tenui, obliquè biplicata.*

THE OVAL CHILINA. Shell ovate, banded with spots, rather violaceous within; spire acuminated; aperture rather ovate, columella arched, thin, obliquely biplicate.

SOWERBY. Malacological Magazine, Pl. 2, Conch. Illus. f. 6.

Hab. Peru.

Species 7. (Fig. *a, b*, Mus. Brit.)

CHILINA FLUCTUOSA. *Chi. testō subturbinatā, subovatā, tenui, striis fasciatis undulatis, subdistinctibus longitudinalibus ornatā; anfractibus superiōrē subgibbosā, columellā uniplicata.*

THE FLUCTUATING CHILINA. Shell rather turbinated, rather ovate, thin, ornamented with rather distant longitudinal stripes undulated in bands; whorls rather gibbose above, columella single-plaited.

GRAY. Spicilegia Zoologica, t. 6, f. 19, Conch. Illus. fig. 2.

Hab. S. America.

The shell figured in the Conchological Illustrations hardly seems to correspond with the shells in the British Museum to which Mr. Gray's name is attached.

Species 8. (Fig. *a, b*, Mus. Brit.)

CHILINA AMPULLARIA. *Chi. testō ventricosissimā, fasciis maculatā; plicis pīctis, intūs fasciā; apertura magnā, orifice latā, rotundatā; columellā indistincte pīctā; spīra brevi, anfractibus supērē subplanatā.*

THE INFLATED CHILINA. Shell very ventricose, painted with few spotted bands, brown within; aperture large, broad anteriorly, rounded; columella indistinctly plaited; spire short; whorls rather flattened above.

SOWERBY. Malacological Magazine, Pl. 2, Conch. Illus. fig. 3.

Hab. S. America.

Much more inflated than *Chilina Major*.

Species 9. (Fig. *a, b*, Mus. Brit.)

CHILINA GIBBOSA. *Chi. testō brevi, subovatā, solidā, spirālē striatā, immaculatā; apertura ovatā, magnā, albā; columellā rectā, elongatā, crassā, medio uniplicatā, pīca crassā, obliquā; spīra brevissimā; anfractibus supērē planatā.*

THE GIBBOS CHILINA. Shell short, rather oval, solid, spirally striped, not spotted; aperture ovate, large, white; columella straight, elongated, thick, single-plaited in the middle, plain thick, oblique; spire very short; whorls flattened above.

SOWERBY. Malacological Magazine, Pl. 2, Conch. Illus. fig. 4.

Hab. S. America.

CHILINA.

PLATE III.

(Fig. 2 e, Mus. Brit.)

CHILINA FLUMINEA, var., see Plate I.

Species 11. (Mus. Brit.)

CHILINA PUELCHA. *Chi. testā ovatā, maculis quadratis in fasciis quatuor dispositis ornatā, intus albā, maculis purpureis quadratis pictā; spirā brevi, anfractibus obtusè angulatis; columellā tenui, infri plicā tenui, obliquā, suprī plicā majori munida.*

THE "PUELCHA" CHILINA. Shell ovate, ornamented with square spots disposed in four rows, white within, painted with purple spots; spire short, whorls obtusely angular; columella thin, strengthened with a thin oblique rib below, and a larger one above.

ORBIGNY. MS. Sowerby, Conch. Illustr. fig. 13.
Hab. Boldivia.

Species 12. (Mus. Brit.)

CHILINA PATAGONICA. *Chi. testā oblongā, maculato-fasciatā; spirā brevi, anfractibus supernè obtusè angulatis, ultimo magno, lateribus rectiusculis; aperturā ovatā, intus purpureo seriatim maculatā; columellā crassā, plicā crassā in medio munida.*

THE PATAGONIAN CHILINA. Shell oblong, spot-banded; spire short, whorls obtusely angular above, the last large, with rather straight sides; aperture ovate, with rows of purple spots inside; columella thick, strengthened with a thick plait in the middle.

SOWERBY.
Hab. Patagonia.

There is a cylindrical, straight-sided appearance about this shell that seems to distinguish it.

Species 13. (Fig. a, b, Mus. Brit.)

CHILINA TEHUELCHA. *Chi. testā solidā, ovato-subcylindraceā, tenuiter fasciatim striatā; spirā brevi, conicā, anfractibus supernè angulatis, subplanulatis, ultimo subrecto, aperturā magnā, columellā latā, crassā, irregulariter et obscurè biplicata.*

THE "TEHUELCHA" CHILINA. Shell solid, ovate-subcylindrical, thinly striped in bands; spire short, conical, whorls angular above, rather flattened, aperture large, columella broad, thick, irregularly and obscurely biplicate.

ORBIGNY. MS. Sowerby, Conch. Illustr. fig. 9.
Hab. S. America.

A rather solid species, with very stout columella.

Species 14. (Mus. Brit.)

CHILINA ELEGANS. *Chi. testā tenui, ovatā, utrinquè acuminatā, subtus epidermidem eleganter lineis fasciatim undulatis pictā; spirā acuminatā, productā; aperturā ovatā, antice subattenuatā; columellā medio uniplicata.*

THE ELEGANT CHILINA. Shell thin, ovate, acuminate at each end, elegantly painted with lines undulated in bands; spire acuminate, produced; aperture ovate, anteriorly subattenuated; columella with a single plait in the middle.

FAIRFIELD. MS. Brit. Mus.
Hab. Boldivia.

Species 15. (Mus. —? copied.)

CHILINA TENUIS. *Chi. testā tenui, subovatā, subturbanata, intus fuscā, undulatim, pictā; spirā conicā, acu-*

CHILINA.—PLATE III.

minatâ; columellâ angustâ, rectiûsculâ, obliquâ et tenuiter biplicatâ.

THE THIN CHILINA. Shell thin, subovate, rather turbinated, brown within, painted with undulations; spire conical, acuminated; columella narrow, rather straight, obliquely and thinly two-plaited.

GRAY. Sowerby, Conch. Illustrations, fig. 12.
Hab. S. America.

The second figure given in the Conchological Illustrations for *Chilina tenuis* is that of a *C. fluctuosa*.

Species 16. (Mus. Brit.)

CHILINA FASCIATA. *Chi. testâ ovatâ, tenui, fasciis interrupitis tribus cinctâ; spira acuminatâ, anfractibus converxiûsculâ, ultima magna, ovato; columellâ infrâ tortuâ medio obliquâ biplicatâ.*

THE BANDED CHILINA. Shell ovate, thin, encircled with three interrupted bands; spire acuminated, whorls rather convex, the last large, ovate; columella tortuous below, with two oblique folds in the middle.

GOULD —?
Hab. S. America.

The bands of this species are soft and not distinctly interrupted.

Species 17. (Mus. Brit.)

CHILINA SUBCYLINDRICA. *Chi. testâ ovato-subcylindricâ,*

intâs, fuscopurpurascens, spirâ productâ, anfractibus supernâ angulatis, declivibus, ultimo ad latera rectiûsculo, aperturâ subovatâ, labio externo intâs incrassato; columellâ plicis unâ superiori magnâ, alterâ inferiori parvâ, nunitâ.

THE SUBCYLINDRICAL CHILINA. Shell ovate, subcylindrical, purplish-brown, spire produced, whorls angular above, sloped, the last rather straight at the sides, aperture subovate, outer lip thickened within; columella strengthened with an upper large plait, and a lower small one.

SOWERBY,
Hab. Ancud, Chili.

Species 18. (Mus. Brit.)

CHILINA PARCHAPIL. *Chi. testâ oblongo-ovatâ, pallidâ cornet, tenui, striis parvis undulatis rubris in fasciis tribus aut quatuor dispositis ornatâ; spirâ subattenuatâ, anfractibus declivibus, ultimo ovato, supernâ subangulato; columellâ supernâ uniplicatâ, infrâ tortuâ.*

PARCHAPIL'S CHILINA. Shell oblong-ovate, pale horny, thin, ornamented with small red undulated stripes, disposed in three bands; spire rather attenuated, whorls sloped, the last ovate, rather angular above; columella single-plaited above, tortuous below.

ORBIGNY. Synopsis. Sowerby's Conchological Illustrations, fig. 8.

Hab. Conception Island.

PHYSA.

PLATE I.

Genus PHYSA, Draparnaud.

Physa physa, testa tenuis, spiralis, solitaria, plurimaculata; columella dentata, spiralis; tubus internum expansus, cum columella rotunda; columella tortua, angulata. Operculum nullum.

Shell fluvialis, horny, thin, spiral, sinistral, generally ovate acuminate; outer lip sharp, simple; inner lip expanded, continuous with the columnella; columnella tortuous, single plated. Operculum none.

The Physa, like the other Lymnaeidae, are found in ponds, rivers, and fountains. Many of the older species are North American and many of the newer ones are Australian. We have a couple in Great Britain, and there are others in other parts of Europe. South Africa and India abound in species, which on the whole seem to flourish best in warm countries where running streams are to be found.

Species 1. (Mus. Sowerby.)

PHYSA FONTINALIS. Phy. testa tenui, nitenti, translucida, pallid' fulva, ovata; spiri brevi, acuminata; apertura obliqua, columella albâ, tenui, tortuosa; plicis subpronuntiatis; tubo interno levissimo.

THE FOUNTAIN PHYSA. Shell thin, shining, transparent, pale fulvous, ovate; spire short, acuminate; aperture oblique, columnella white, thin, tortuous, with a rather prominent fold; inner lip very thin.

LINNEUS (Bulla). Systema Naturae.
Hab. Great Britain; France; Europe generally.

Mostly found in standing pools and small streams near fountains.

Species 2. (Fig. a, b, Mus. Sowerby.)

PHYSA AFRICANA. Phy. testa ovo-tumida, solidissimâ, nitens, olivacea, fasciis paucis fasciis longitudinalibus ornata; spiri brevissimâ, anfractibus superne gibbosis; columella brevi, albâ, crassâ in angulum dentiformem producta.

THE AFRICAN PHYSA. Shell tumid-ovate, rather solid,

shining, olive-green, ornamented with a few brown longitudinal bands; spire very short, whorls gibbous above; columella short, white, thick, produced into a tooth-like angle.

KRAUSS. Sudafriken Mollusken.

Physopsis Africana, Adams.

Hab. Cape of Good Hope.

The prominent tooth-like angle of the short columella is so remarkable that it has been supposed by some to justify a generic separation.

Species 3. (Fig. a, b, Mus. Brit.)

PHYSA ANCILLARIA. Phy. testa orato-oblonga, pallide cornuta, blino-illuc fasciata, spiri brevissimâ, anfractibus apicalibus parvis, penultimate magno, ultimo oblongo, propè saturam tenuido; apertura ovata, labio interno calato; columellâ tortuosa, placi moderata conspicua.

THE HANDMAID PHYSA. Shell ovate-oblong, pale horny, here and there banded with brown, spire rather short, apical whorls small, penultimate large, last oblong, tumid near the suture; aperture ovate, inner lip strong; columnella fold tortuous, plait moderately conspicuous.

SAY. Haldeman's Archives, Pl. II. f. 1.

Hab. Pennsylvania.

Species 4. (Fig. a, b, Mus. Sowerby.)

PHYSA INFILATA. Phy. testa globosa, inflata, brevi, pallidi fulvi, raro fasciata, spiri brevissimâ, anfractu apicali minuto, secundo inflato; ultimo valde inflato; ultra arcu producta; apertura rotundata, columella arcuata, placi elevata.

THE INFLATED PHYSA. Shell globose, inflated, short, pale fulvous, here and there banded with brown, spire very short, with apical whorl minute, the second inflated, the last much inflated, produced beyond the axis; aperture rounded, columnella arched, plait raised.

ADAMS AND ANNAS. Proc. Zool. Soc.

Hab. S. Australia.

PHYSA.—PLATE I.

Species 5. (Mus. Sowerby.)

PHYSA SUBINFLATA. *Phy. testā brevi, inflatā, ovato-acuminatā, pallidō cornēat; spirā brevi, acuminatā; anfractibus rapidē crescentibus, ultimo inflato, ovali; aperturā subpyriformi; margine vix contracto; columellā obliquā, plicā vix conspicuā.*

THE SUBINFLATED PHYSA. Shell short, inflated, ovately acuminate, pale horn; spire short, acuminate; whorls rapidly increasing, the last inflated, oval; aperture rather pyriform, with margin scarcely contracted, columella oblique, fold scarcely conspicuous.

SOWERBY.

Hab. S. Australia.

Much more ovate and acuminate than either *Physa inflata* or *Ph. Newcombi*, with the latter of which it is associated in the text.

Species 6. (Mus. Brit.)

PHYSA ALICÆ. *Phy. testā subovatā, fumoso-fuscā, liris spiralibus subdistantibus, paulò elevatis, ciliatis et striis longitudinalibus cancellatā; spirā brevi, acuminatā, ultimo anfractu propō suturam angulato; aperturā subovatā, magnā, plicā, conspicuā.*

ALICE'S PHYSA. Shell subovate, smoky-brown, cau-

cellated with rather distant slightly elevated, ciliated ridges and longitudinal striae; spire short, acuminate, the last whorl angulated near the suture; aperture rather oval, large, plait conspicuous.

REEVE. Proc. Zool. Soc.

Hab. India.

Species 7. (Figs. 7 and 7 b, c, Plate XI.

Mus. Sowerby.)

PHYSA HYPNORUM. *Phy. testā elongatā, acuminatā, nitentī, sinuicā; spirā aperturam longitudine aquanti, anfractibus paucis obliquis, attenuatis; aperturā angustā, plicā columellarī conspicuā, tortuā.*

THE MOSS PHYSA. Shell elongated, acuminate, shining, amber coloured; spire equaling aperture in length, whorls few, oblique, attenuated; aperture narrow, columella plait conspicuous, tortuous.

LINNEUS (Bulla). Systema Naturae.

Hab. Great Britain; France; Europe generally; United States (var. 7 b).

The specimen figured (7 b) from Michigan near the Rapids is much larger than the European examples, but presents all the same characteristics.

PHYSIS.

PLATE II.

Species 8. (Mus. Sowerby.)

PHYSIS ACUTA. *Phy. testā ovatā, translucidā, pallidē cornēd, politā; spīrā acuminatā; aperturā semiocatā, intūs propō marginem paulō incrassatā; plīcā columellari rīs prominent, rectiūsculī.*

THE ACUTE PHYSA. Shell ovate, translucent, pale horn, polished; spire acuminated; aperture semioval, a little thickened within near the margin; columellar fold scarcely prominent, rather straight.

DRAPALNAUD. Mollusca, p. 55, pl. 3, f. 10, 11.
Hab. Sicily.

This species, which resembles *Physis fontinalis* in some respects, differs from it in the production and sharpness of the apex.

Species 9. (Mus. Sowerby.)

PHYSIS HILDEBETHIANA. *Phy. testā ovato-oblongā, tenui, semipellucidā, cornēd, fusco-grisecenti, fasciis pallidē fulvis distantibus ornati; aperturā intūs castaneā; columellā subortuā, albida.*

HILDEBETH'S PHYSA. Shell ovate-oblong, thin, semi-pellucid, horny, greyish brown, ornamented with distant pale fulvous bands; aperture chestnut within; columella rather tortuous, whitish.

LEA. —?

Hab. Michigan.

Species 10. (Mus. Brit.)

PHYSIS NOVE HOLLANDIÆ. *Phy. testā subfusiformi, fumoso-straminā; spīrā productā, acuminatā; anfractibus rotundis apicalibus minutis, ultimo anfractu brevi aperturā ferè albā, spīrā longitudine aequali: plīcā columellari tortuā, conspicuā.*

THE NEW HOLLAND PHYSA. Shell subfusiform, smoky-straw-coloured; spire produced, acuminated; whorls round, apical ones small, last whorl short;

aperture nearly white, equalling the spire in length; columellar plait tortuous, conspicuous.

BLAINVILLE. Malacologie, pl. 37, fig. 3.
Hab. New Holland.

Species 11. (Mus. Sowerby.)

PHYSIS MAUGERIAE. *Phy. testā ovato-subpyramidalē, politissimā, fusco-grisecenti, strīgīs albīs longitudinalib⁹ interrup̄tis numerosis notatā; spīrā brevi: versū apicē nigrificanti; ultimo anfractu magno, subcylindraceo, posticē subattenuato, anticē subtruncato: aperturā pallidā, elongatā, pyriformi, plīcā columellari compressā, rectiūsculā, albā.*

MAUGER'S PHYSA. Shell ovate-subpyramidal, very shining greyish brown, marked with numerous white longitudinal interrupted stripes; spire short, darkening towards the apex; last whorl large, subcylindrical, posteriorly subattenuated, anteriorly somewhat truncated; aperture pale, elongated, pyriform, columellar fold compressed, rather straight, white.

QUOY. Voy. de l'Astrolabe.
Hab. Jamaica.

Species 12. (Fig. a, b, Mus. Brit.)

PHYSIS PERUVIANA. *Phy. testā anguste pyramidalē, politissimā, plumbeā vel subaurā vel stramineā; spīrā attenuatā, acuminatā, anfractibus posticē attenuatis; ultimo anfractu anticē inflato, subtruncato: aperturā longiūsculā, anticē latiūsculā, intūs aurei vel pallidē rosēd; plīcā columellari tenui, retrorsum obliquatā.*

THE PERUVIAN PHYSA. Shell narrowly pyramidal, very shining, plum-coloured or rather golden or straw-coloured; spire attenuated, acuminated, whorls posteriorly attenuated; last whorl anteriorly inflated, subtruncated; aperture rather long

PHYS.A.—PLATE II.

anteriorly rather broad, golden within or pale pink; columellar fold thin, turned obliquely backwards.

GRAY. *Spicilegia Zoologica*, p. 5, pl. 6, fig. 10.

Hab. Guayaquil, Peru.

More slender and tapering than *Physa Mangerie*.

Species 13. (Mus. Brit.)

PHYSA AURANTIA. *Phy. testi inflatâ, subpyramidalatâ, aurantio-fuscâ, politissimâ, filis aureis undulatis posticè magis numerosis striatâ, fuscâ aurâ spirali propè suturam marginatâ; aperturâ pyriformiâ, intus aureo-fuscâ, lobio interno expanso.*

THE ORANGE-COLOURED PHYSA. Shell inflated, subpyramidal, orange-brown, very shining, striped with golden, undulated, threads more numerous posteriorly; bordered near the suture with a golden spiral band; aperture pyriform, golden-brown within, inner lip expanded.

— ? MS. Mus. Brit.

Hab. Mexico.

Species 14. (Mus. Brit.)

PHYSA SOLIDA. *Phy. testi ovati, crassiùsculâ, rubro-fuscâ, fasciâ pallidâ subauré longitudinaliter line illuc striatâ; spira breviùsculâ, subacuminatâ; aperturâ intus flavidâ, rubro-fusco propè marginem fasciatâ, pliâ columellarâ tortuosa.*

THE SOLID PHYSA. Shell ovate, rather thick, reddish brown, longitudinally striped here and there with a pale golden band; spire rather short, subacuminate; aperture yellowish within, banded near the margin with reddish brown, columellar plait tortuous.

PHILIPPI. — ? (Adams, Genera.)

Hab. Tennessee, United States.

A somewhat thick-set species, of dark horn colour with an occasional light band.

Species 15. (Mus. Brit.)

PHYSA VINOSE. *Phy. testi brevi, inflata, subovata, rubro-fusca; spirâ brevi, conicâ; aperturâ magnâ, intus castaneâ; pliâ columellarâ crassiùsculâ, tortuâ.*

THE VINOSE PHYSA. Shell short, inflated, subovate, red brown; spire short, conical; aperture large, chestnut within, columellar fold rather thick, tortuous.

GOULD. Expedition Shells.

Hab. Lake Superior.

Species 16. (Mus. Brit.)

PHYSA INFLUVIATA. *Phy. pyramidalatâ, posticè attenuatâ, anticè inflatâ, subtruncatâ, politissimâ, fusco-aurantiâ, versûs apicem vinosâ; spirâ angustâ, elongatâ, acuminatâ; aperturâ latâ; spiram longitudine parvum superantâ; ultimo anfractu anticè valde inflato.*

THE RIVER PHYSA. Shell pyramidal, posteriorly attenuated, anteriorly inflated, subtruncated, much polished, orange-brown, vinous towards the aperture; spire narrow, elongated, acuminate; aperture wide, a little longer than the spire, last whorl much inflated anteriorly.

MORELET. — ?

Hab. Guatemala.

This species belongs to the same group with *Physa Mangerie*, *aurantia*, *Peruviana*, &c., but is more pyriform than either.

PHYSA.

PLATE III.

Species 17. (Fig. a, b, Mus. Brit.)

PHYSA TABULATA. *Phy. testā inflatā, solidā, brevi,* fuscō-subrividī; spīrā obtusā, brevissimā, anfractibas subquadratibas, propī suturam planulatis; anfractū ultimo magno, rotundatā angulo; aperturā latā, intū pallidā, antīcē subacuminatā, labio intēro valido, plīcē columellari crassā, tortuosa.

THE TABULATED PHYSA. Shell inflated, solid, short, greenish brown; spire obtuse, rather short, whorls rather square, flattened near the suture; last whorl large, roundly angular; aperture wide, pale within, slightly acuminate within, inner lip strong, columellar fold thick, tortuous.

GOULD —?

Hab. New Zealand.

Remarkable for the flatness of the whorls above the angle.

Species 18. (Fig. a, b, Mus. Brit.)

PHYSA CARINATA. *Phy. testā subcylindricā, tenui,* pallidē stramineō, posticē latissimā; spīrā brevissimā, truncatā, anfractibus supernē carinatis, supra carinatum planulatis; ultimo anfractū antīcē sub angustatō; aperturā oblongi, antīcē acuminatā, plīcē columellari tenui, leviter tortuosa.

THE KEELED PHYSA. Shell subcylindrical, thin, pale straw, posteriorly rather wide; spire very short, truncated, whorls keeled above, flattened above the keel; last whorl anteriorly rather narrow, aperture oblong, anteriorly acuminate, columellar fold slightly tortuous.

H. ADAMS. Proc. Zool. Soc.
Hab. Boyne River.

Not so flat at the top as *Physa Reevii*, Ad. and Ang., having one or more whorls inserted.

Species 19. (Mus. Brit.)

PHYSA INTEGRA. *Phy. subovatā, angustissimā, politā,* fulvo-vernē, pellucidī; spīrā exsertā, anfractibus convexis, distinctis; ultima anfractū cylindracō; aperturā subelevatā, intū propē marginē parcum incrassatā; plīcē columellari brevissimā, tortuosa.

THE INTEGRAL PHYSA. Shell subovate, rather narrow, polished, fulvous, horn-coloured, pellucid; spire produced, whorls convex, distinct; last whorl cylindrical, aperture rather lengthened, a little thickened within near the margin, columellar fold rather short, tortuous.

HALLEMAN. Monograph.

Hab. Mohawk Bay.

Species 20. (Mus. Brit.)

PHYSA TRUNCATA. *Phy. testā tenui, turbinatā, subrividē fuscā;* spīrā planā, latā, truncatā, anfractibus carinatis; aperturā angustā, intū pallidē purpureo-roseā, antīcē subattenuatā, plīcē columellari tenui, valde tortuosa.

THE TRUNCATED PHYSA. Shell thin, turbinated, greenish-brown; spire flat, broad, truncated, whorls keeled, aperture narrow, pale purple rose-coloured within, a little attenuated anteriorly, columellar fold thin, very tortuous.

H. ADAMS. Proc. Zool. Soc. (not *Ph. truncata*, Ferr.)

Hab. Birdekin River.

This, like *Physa Reevii*, Ad. and Ang., has the spire quite flat, but the aperture tends to narrow towards the anterior termination.

Species 21. (Mus. Brit.)

PHYSA NEWCOMB. *Phy. testā ovato-subglobosā, aureo-stramineō;* spīrā exsertā, acuminatā, anfractibus rotundis, distinctis; ultimo anfractū magno, brevissi-

PHYSA.—PLATE III.

cupo, rotundato, substriato, post columellam excavato; aperturā magnā, latō, intū pallidē roseā; plicā columellari rectiūsculā, elongatā, labio externo obliquē producto.

NEWCOMB'S PHYSA. Shell ovate-subglobose, golden straw-coloured; spire produced, acuminated, whorls rounded, distinct; last whorl large, rather short, rounded, slightly striated, hollow behind the columella; aperture large, broad, pale rose within, columellar fold rather straight, elongated; outer lip obliquely produced.

ADAMS AND ANGAS. Proc. Zool. Soc., 1863, p. 416.

Hab. Central Australia.

Species 22. (Mus. Brit.)

PHYSA SALLEANÆ. *Phy. testā tenui, politā, cornēā, palliū purpureā, spirā acuminatā, attenuatā, ultimo anfractu ovato, angusto; aperturā anticē latiūsculā, intū pallidissimē roseā; plicā columellari brevi, crassā, tortuā.*

SALLE'S PHYSA. Shell thin, polished, horny, pale purple, spire acuminated, attenuated, last whorl ovate, narrow; aperture anteriorly rather broad, very pale pink within; columellar fold short, thick, tortuous.

PFEIFFER. Proc. Zool. Soc. 1853, p. 53.

Hab. St. Domingo.

A smooth shell belonging to the same group as *Physa Peruviana*, with a much more acuminated spire.

Species 23. (Mus. Brit.)

PHYSA ACUMINATA. *Phy. testā angustā, cylindrica, cornēā, semipellucidā, politā; spirā exserta, acuminatā; ultimo anfractu cylindraceo, elongato; aperturā angusta, plicā columellari obliqua.*

THE ACUMINATED PHYSA. Shell narrow, cylindrical, horny, semipellucid, polished; spire exserted, acuminated; last whorl cylindrical, elongated; aperture narrow, columellar fold oblique.

GRAY? MS. Brit. Mus.

Hab. St. Thomas's Isl. W. Indies.

A little resembling the preceding, but narrower and more cylindrical.

Species 24. (Fig. a, b, Mus. Brit.)

PHYSA OBESA. *Phy. testā subviride fuscā vel ferruginea, turbinatā, posticē truncatā; spirā vir exserta, anfractibus planulatis, angulatis, ad angulum carinatis; ultimo anfractu posticē lato, anticē subacuminata; aperturā posticē quadrata, intū pallidē roseā; plicā columellari tenui, subtortuā.*

THE FAT PHYSA. Shell greenish brown or ferruginous, turbinated, posteriorly truncated; spire scarcely exserted, whorls flattened, angular, keeled at the angle; last whorl broad posteriorly, subacuminated anteriorly; aperture posteriorly quadrate, pale pink within; columellar plait thin, somewhat tortuous.

H. ADAMS. Proc. Zool. Soc.

Hab. Fitzroy River.

P H Y S A.

PLATE IV.

Species 25. (Mus. Sowerby.)

PHYSA FERRUGINOSA. *Phy. testi inflata, brevi, ferruginea; spira producta, anfractibus levibus, rotundatis; ultimo anfractu inflato, brevi, post columellam subexcavato; aperturā obliqui declivi, producta, intus obscurè purporat, anticè subacuminata, columellā tenuiuscula, rectilinæcula.*

THE FERRUGINOUS PHYSA. Shell inflated, short, smooth, ferruginous; spire produced, whorls short, rounded; last whorl inflated, short, a little excavated behind the columella; aperture obliquely sloped, produced, dull purple within, anteriorly subacuminated, columella rather thin, rather straight.

ADAMS and ANGAS. Proc. Zool. Soc., 1863, p. 116.
Hab. North Australia.

Species 26. (Mus. Brit.)

PHYSA FRAGILIS. *Phy. testi tenui, pallidæ, subovatæ; aperturæ magni, anticè subacuminatæ; spiræ brevi, anfractibus paucis, parvis; ultimo anfractu lateraliæ inflato.*

THE FRAGILE PHYSA. Shell thin, pale, subovate; aperture large, anteriorly subacuminated; spire short, whorls few, small; last whorl laterally inflated.

MIGHELS. Haldeman's Monograph, Pl. III, f. 11-13.
Hab. Maine, United States.

Species 27. (Mus. Brit.)

PHYSA GIBBOSA. *Phy. testi breviter subcylindracea, pallidæ straminea, polita; spiræ brevi, conicæ, acuminatæ; ultimo anfractu superne gibbose vel rotundato-angulata; anticè subattenuata; aperturæ elongatæ, labio externo rectâculo, plicâ columellarî brevi, tortuosa.*

THE GIBBOSA PHYSA. Shell shortly subcylindrical, pale straw, very smooth; spire short, conical, acuminate; last whorl gibbos or roundly angular above; anteriorly somewhat attenuated; aperture elongated, outer lip rather straight, columellar plait short, tortuous.

GOLDF. Expedition.
Hab. New Zealand.

Species 28. (Fig. a, b, Mus. Brit.)

PHYSA LOEDLI. *Phy. testi inflata, subtrigonæ, solidiuscula, superne angulata; spiræ conicæ, anfractibus angulatis, suprà angulum subplanata; anfractu ultimo inflato, angulato, brevi; aperturæ superne angulata; intus propi marginæ castaneo fasciatæ, anticè acuminatæ, productæ; plicâ columellarî tenui, prominenti, tortuæ.*

LORD'S PHYSA. Shell inflated, subtrigonal, rather solid, angular above; spire conical, whorls angular, a little flattened above the angle; last whorl inflated, angular, short; aperture angular above, banded with chestnut within near the margin, anteriorly acuminate, produced; columellar fold thin, prominent, tortuous.

BAIRD. Proc. Zool. Soc.
Hab. Lake Oregon, British Columbia. Collected by J. K. Lord, Esq.

Species 29. (Fig. a, b, Mus. Brit.)

PHYSA NOVÆ ZELANDIÆ. *Phy. testi turbinatæ, solidi, castanea, levigata; spiræ conicæ, anfractibus rotundatim angulatis; ultimo anfractu inversè conico, anticè subacuminato; aperturæ subauratae; labio interno valido, plicâ columellarî superne subgibbosæ.*

PHYSA.—PLATE IV.

THE NEW ZEALAND PHYSA. Shell turbinated, solid, chestnut, smooth; spire conical, whorls roundly angular; last whorl inversely conical, anteriorly somewhat acuminated; aperture rather golden; inner lip strong; columellar fold a little gibbous at the top.

GRAY. MS. Brit. Mus.
Hab. New Zealand.

Species 30. (Mus. Brit.)

PHYSA ELONGATA. *Phy. testā angustā, elongatā, pyramidalit, nitenti, stramineā vel subaureā, leviter strigatā; spirā aperturam longitudine paulo superante, ultimo anfractu subovato; aperturā breviusculā, intus pallidā, labio interno expanso, plīcā columellarī breviusculā, tenui, tortuā.*

THE ELONGATED PHYSA. Shell angular, elongated, pyramidal, shining, straw-coloured or slightly golden, slightly streaked; spire a little exceeding aperture in length; last whorl somewhat oval; aperture rather short, pale inside, inner lip expanded, columellar fold rather short, thin, tortuous.

SAY. New York Acad. Nat. Sci., vol. ii. p. 171.
Hab. North America?

Species 31. (Mus. Brit.)

PHYSA RIVALIS. *Phy. testā pallidē cornēd, semipellucidā, lāvigatā, angustā, ovato-oblongā; spirā breviusculā, anfractibus convexis; ultimo anfractu elongato;*

aperturā elongatā, intus propē marginem castaneo pallidē fasciatā.

THE RIVER PHYSA. Shell pale horn, semi-pellucid, smooth, narrow, ovate-oblong; spire rather short, whorls convex; last whorl elongated; aperture elongated, with a pale chestnut band near the margin.

SOWERBY. Genera of Shells, Limnæa, fig. 9.
Hab. Columbia River.

Species 32. (Mus. Brit.)

PHYSA MESTA. *Phy. testā inflatā, brevi, obscurē fuscō-subcīridi; spirā exsertā, acuminatā, anfractibus planulatā, angulatā, ad angulum plus minusve subcarinatis; aperturā latā, intus castaneā; plīcā columellarī validi, elevati, crassā.*

THE SAD PHYSA. Shell inflated, short, dull greenish-brown; spire exerted, acuminate, whorls above flattened, angular, more or less keeled at the angle; aperture broad, chestnut within; columellar fold strong, raised, thick.

II. ADAMS. Proc. Zool. Soc.
Hab. New Zealand.

This species has very close relations with *Physa tabulata* of Gould. The chief difference consists in the rounded angles of the whorls in the latter and the distinct square angles in the former. These characters, however, are somewhat varied, and some specimens in each approach very nearly to each other.

P H Y S A.

PLATE V.

Species 32*. (Mus.—? Copied.)

PHYSA TROPICA. *Phy. testū subglobosū, albida, epidermide obscurè subviridiā irudatū; spirā breviāsculā, anfractibus rotundis, distinctis; ultimo anfractu vulnē iugato, rotundo, post columellam excavato; aperturā rotundi, spirām longitudine superanti, obliquè productā, columellā leviter aequalitā.*

THE TROPICAL PHYSA. Shell subglobose, whitish, clothed with a dull greenish epidermis; spire rather short, whorls rounded, distinct; last whorl much inflated, rounded, excavated behind the columella; aperture rounded, longer than the spire, obliquely produced, columella slightly curved.

KRAUSS. Sudafrikanischen Mollusken, tab. 5, fig. 12.
Hab. South Africa.

Species 33. (Fig. a, b, Mus. Brit.)

PHYSA LATILABIATA. *Phy. testū fulvā, brevi, levī, subpyramidalitā; spirā aperturam ferè longitudine approximant; anfractibus rotundissimis, brevibus; ultimo anfractu brevi, rotundo, post columellam umbilicato; aperturā subovatā, lobio externo arcuato, labio interno crasso, late reflexo; columellā latissimā, elevatā, crassā, ferè recti, plicis indistinctis.*

THE WIDE-LIPPED PHYSA. Shell fulvous, short, smooth, rather pyramidal; spire nearly equal in length to the mouth; whorls rounded, short; last whorl short, round, umbilicated behind the columella; aperture subovate, outer lip arched, inner lip thick, widely reflected; columella very wide, elevated, thick, nearly straight, plait indistinct.

SOWERBY.
Hab. Victoria River.

This species has two remarkable characters, namely, the umbilicus in the body whorl, and the very broad columella.

Species 34. (Mus. Brit.)

PHYSA OLIVACEA. *Phy. testū angustā, subfusiformis, obscurè olivaceō, solēliāsculā; spirā elevatā, aperturam longitudine aequanti, anfractibus subangulatis, uno apicis mammillato; anfractu ultimo posticè angulato, aperturā intus castanei; plicis columellarī breviāsculā.*

THE OLIVACEOUS PHYSA. Shell narrow, subfusiform, dull olive, rather solid; spire elevated, equaling the aperture in length, whorls rather angular, the apical one mammillated; last whorl posteriorly angular; aperture chestnut within; columellar fold rather short.

ADAMS AND ANGAS. Proc. Zool. Soc., 1863, p. 416.
Hab. Arnhem's Land. Australia.

Species 35. (Mus. Brit.)

PHYSA CONCINNA. *Phy. subovatā, cornēa, pellucidā; spirā breviāsculā, anfractibus paucis, convexis; ultimo anfractu subcylindrico; aperturā subovatā, intus propè marginem fulvo fasciatā, plicis columellarī subspiraliter tortuā.*

THE NEAT PHYSA. Shell subovate, horny, pellucid; spire rather short, whorls few, convex; last whorl rather cylindrical; aperture subovate, with a fulvous band inside near the margin, columellar fold rather spirally tortuous.

ADAMS AND ANGAS. Proc. Zool. Soc., 1863, p. 417.
Hab. Arnhem's Land.

Species 36. (Mus. Brit.)

PHYSA GYRINA. *Phy. testū ovato-subcylindrici, politā, pallidè succinēa, semipellucidā; spirā convicā, anfractibus convexiāsculis; ultimo anfractu subcylindrico; aperturā elongatā, spirām longitudine multo superanti, intus propè marginem castaneo*

PHYSA.—PLATE V.

fasciata : *plicâ columellari rectiùscula*, *haud prominenti*.

THE RINGLET PHYSA. Shell ovate, subcylindrical, polished, pale amber, semipellucid, spire conical, whorls rather convex; last whorl rather cylindrical, aperture elongated, much longer than the spire, banded with chestnut within near the margin; columellar fold rather straight, not conspicuous.

SAY. Journ. A. N. S. Phil. vol. ii, p. 171.
Hab. Near Grand Rapids, Michigan.

Species 37. (Mus. Brit.)

PHYSA ANTIPODEA. *Phy. testâ fusiformi, inflatâ, fulvo-ferruginea, opavâ, substriatâ; spirâ elevatâ, unifasciatis concrevis; ultimo anfractu ovato, in medio inflato; aperturâ ovali, plicâ columellari elevatâ, tenui, obliquâ subtortuâ.*

THE ANTIPODEAN PHYSA. Shell fusiform, inflated, ferruginous brown, opaque, slightly striated; spire elevated, whorls convex; last whorl ovate, swelled in the middle; aperture ovate, columellar fold elevated, a little obliquely twisted.

SOWERBY.
Hab. New Zealand.

Species 38. (Fig. a, b, Mus. Brit.)

PHYSA BONUS-HENRICUS. *Phy. testâ porcâ, subovatâ, solidiùscula, fuscâ; spirâ brevi, obtusâ, unifasciatis*

parvis, rotundata angulatis; ultimo anfractu perobliquo, propi suturam gibbosâ, ad latera compresso, rectiùsculo; aperturâ obliquâ productâ, declivi, intus pallidi, labio externo rectiùsculo, plicâ columellari leviter tortuâ.

THE GOOD-HENRY PHYSA. Shell small, subovate, rather solid, brown; spire short, obtuse, whorls small, roundly angular, last whorl very oblique, gibbous near the suture, compressed at the sides, rather straight; aperture obliquely produced, sloped downwards, outer lip rather straight, columellar fold slightly twisted.

ADAMS and ANGAS. Proc. Zool. Soc., 1863, p. 417.
Hab. North Australia.

Species 39. (Fig. a, b, Mus. Brit.)

PHYSA GRANULATA. *Phy. testâ parvâ, ovato-subfusiformi, pallidâ fulvâ, minutissimâ granulatâ; spirâ elevatâ, brevi, obtusa, anfractibus duobus, prominentibus; ultimo anfractu supra aperturâ elevata, obliquâ declivi, breviùsculo; aperturâ semi-ovata, plicâ columellari rectâ.*

THE GRANULATED PHYSA. Shell small, ovate-subfusiform, pale fulvous, very minutely granulated; spire elevated, short, obtuse, whorls two, prominent; last whorl elevated above the aperture, obliquely sloped, rather short; aperture semi-ovate, columellar fold straight.

SHUTTLEWORTH. MS.
Hab. Barbadoes.

A characteristic little species, in which the granulations are scarcely perceptible.

PHYSA.

PLATE VI.

Species 40. (Mus. Brit.)

PHYSA REEVII. *Phy. testā turbinatā, tenuissimā, ultō, obscurē fuscō-subcīrdi; spīrā truncatā, planulatā, anfractibus carinatis; ultimo anfractu inversē conicō, anticē subacuminata; aperturā posteriori angulatā, anticē retrospīna subarcuata; plicā columellari retrospīna tortuosa.*

REEVE'S PHYSA. Shell turbinate, rather thin, dull greenish-brown; spire truncated, flattened, whorls emarginated; last whorl inversely conical, anteriorly a little acuminated; aperture posteriorly angular, anteriorly a little arched, columnellar fold twisted a little backwards.

ADAMS AND ANGAS. PROC. ZOOL. SOC., 1863, p. 417.
Hab. North Australia.

Species 41. (Mus. Brit.)

PHYSA HUMEROSA. *Phy. testā breviter subcylindrica, pallidā, crassā; spīrā breviscula, acuminatā; anfractu ultimo supero' prop̄ suturem gibbosā, subangulata, lateris rictū sensilis; aperturā semirotundatā; columellā crassā, vix arcuata, vix plicata.*

THE SHOULDERED PHYSA. Shell shortly subcylindrical, pale, thick; spire rather short, acuminated; last whorl gibbose and somewhat angular above, near the suture, with straight sides; aperture semi-ovate; columella thick, scarcely arched, scarcely plicated.

GOULD. —?
Hab. New Mexico.

Species 42. (Mus. Brit.)

PHYSA SEMIGLOBOSEA. *Phy. testā globosā-subovata, cornucia- subcīrdi, nūtenti, tenuissimā, pellucida; spīrā brevisimā, aperturi magnā, subovata, ultimo anfractu inflata; plicā columellari tenui, arcuata tortuosa.*

THE SEMIGLOBOSE PHYSA. Shell globose, subovate, greenish-horn, shining, very thin, pellucid; spire very short, aperture large, subovate, last whorl inflated; columnellar fold thin, twisted archwise.

WESTERLAND. Mollusques terrestres et d'eau douces, p. 20.

Hab. Sweden.

Species 43. (Fig. a, b, c. Mus. Brit.)

PHYSA PROTEUS. *Phy. testā solidā, fusiformi, levigata, pallidā; fūlē aut cīuerē, fasciis castaneis vel albido-subauratis longitudinalibus variegatā; spīrā elongatā vel brevissimā, anfractibus convexis, nonnunquam subangulatis, aperturā semirotundatā, int̄is purpurascētī; plicā columellari crassā, tortuosa.*

THE PROTEUS PHYSA. Shell solid, fusiform, smooth, pale-fulvous or cinereous, variegated with chestnut or yellowish-white longitudinal bands; spire elongated or rather short, whorls convex, sometimes a little angular; aperture semi-ovate, purplish within; columnellar plait thick, tortuous.

SOWERBY.

Hab. West Australia.

There is quite a gradation from the elegantly fusiform to the stunted angular character.

Species 44. (Mus. Brit.)

PHYSA CUMINGII. *Phy. testā subinflatā, inversē conicā, fūscā-ferrugineā; spīrā brevissimā, planulatā, anfractu ultimo maximo, posticē obtusē subangulata, tenuiō, anticē paolō attenuata; aperturā elongatā, labio externo sinuato, labio interno crasso, lato, plicā columellari tortuosa, validiō.*

CUMING'S PHYSA. Shell a little inflated, inversely conical, ferruginous brown; spire very short,

PHYSA.—PLATE VI.

flattened, last whorl very large, posteriorly obtusely subangular, tumid, a little attenuated in front; aperture elongated, outer lip sinuated, inner lip thick, broad; columellar fold tortuous, strong.

H. ADAMS. Proc. Zool. Soc.
Hab. Port Essington.

Species 45. (Mus. Brit.)

PHYSA HETEROSTROPHA. *Phy. testā ovato-subfusiformi, fulvā, opacā, spirā breviāsculā, acuminatā, anfractibus paucis, parvis, rotundis: ultimo anfractu inflato, brevi post columellam subcavato: aperturā magnā, semiōvalē, intus aurei, propè marginam cunctam fasciatā: columellā elongatā, firē rectā.*

THE HETEROSTROPHIC PHYSA. Shell ovate-subfusiform, fulvous, opaque, spire rather short, acuminate, whorls few, small, rounded; last whorl inflated, short, a little hollow behind the columella; aperture large, semi-ovate, inside aureous, banded with chestnut near the margin, columella elongated, nearly straight.

SAY. Haldeman's Monograph.
Hab. Pittsburgh, Pennsylvania.

Species 46. (Mus. Brit.)

PHYSA SPICULATA. *Phy. testā elongatā, angustā, plicatā cinerascente, roseo-fusco nebulatā, nitenti; spirā productā, attenuatā, acuminatā; aperturā angustā, semiovata, plicatā columellari tenui.*

THE SPIKED PHYSA. Shell elongated, narrow, ashy-brown, clouded with fulvous pink; shining; spire produced, attenuated, acuminate; aperture narrow, semi-ovate; columellar fold thin.

MOELET. — ?

Hab. — ?

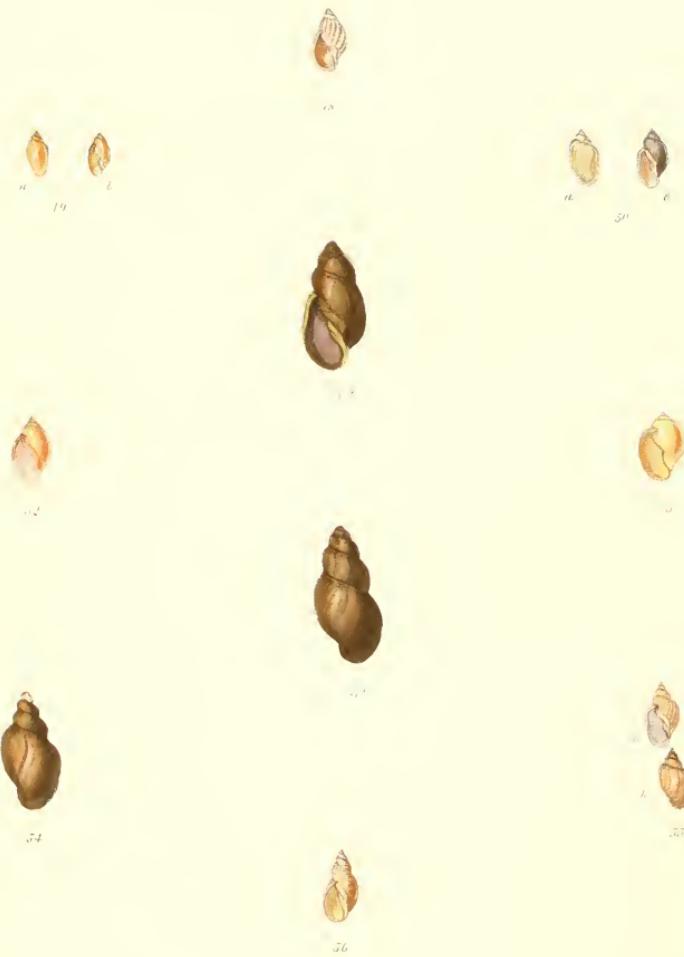

Species 47. (Mus. Brit.)

PHYSA SOWERBYANA. *Phy. testā oblongo-ovalē, politā, obscurē succinctā; spirā elevatā, acuminatā; ultimo anfractu subcavato; columellā tenui, leviter tortuosa.*

SOWERBY'S PHYSA. Shell oblong-ovate, polished, dull amber, spire elevated, acuminate; last whorl nearly oval; columella thin, slightly tortuous.

D'ORBIGNY.
Hab. Jamaica.

Much more inflated than *Physa spiculata*, but not so much so as others of similar form.

PHYSA.

PLATE VII.

Species 48. (Mus. Brit.)

PHYSA VIRENTA. *Phy. testā parvā, ovatā, politā, cincocostata, albo strigata; spira brevissimā, obtusa, infractibus convergētibus; ultimo anfractu orato; aperturā semiorbitā, intus cibarium, plicā columellā elevatā, tenui, obliqua;*

THE SPOTTED PHYSA. Shell small, ovate, polished, greyish-fulvous striped with white; spire rather short, obtuse, whorls rather convex; last whorl ovate; aperture semi-ovate, chestnut within, columellar fold elevated, thin, oblique.

Gouy. — ?
Hub. Mexico.

Species 49. (Fig. a, b, Mus. Brit.)

PHYSA TETRICEA. *Phy. testā parvā, fuscum-succinatā, translucida, angustā, tenissimā; spira brevis; ultimo anfractu subcylindrica; aperturā elongatā, angustā, plicā columellā tenui, lecit tortuosa;*

THE WHEAT PHYSA. Shell small, smoky-amber, translucent, narrow, very thin; spire short; last whorl subcylindrical; aperture elongated, narrow, columellar fold thin, slightly tortuous.

Lia. — ?
Hub. California.

The smallest of the species? Narrow and very transparent.

Species 50. (Fig. a, b, Mus. Brit.)

PHYSA CUBENSIS. *Phy. testā parvā, solidā, pallidē fulva; spirā ciliatula, acuminatā, infractibus brevibus, subangulatis; ultimo anfractu subcylindrica, medio saepe constricta, subrugata; aperturā oblonga, margine rectilatula, plicā columellā concava.*

THE CUBAN PHYSA. Shell small, solid, pale-fulvous, spire rather short, acuminate, whorls short, slightly angular; last whorl subcylindrical, a little constricted in the middle, slightly wrinkled; aperture oblong, margin rather straight, columellar fold conspicuous.

PFEIFFER. — ?
Hub. Cuba.

Species 51. (Fig. a, b, Mus. Sowerby.)

PHYSA RADIA. *Phy. ovo-subcylindrica, fusco-olivacea, solidissimā; spirā elevatā, longitudine aperturam aquanti, anfractibus lati, gibbosis, medio subcompressa; ultimo anfractu breviter subcylindrica; aperturā brevissimā, lati, fusco-purpureo-cresti, lobis extremitate sinuatim producta, antice sinuatim emarginata; columellā dapietata.*

THE RAY PHYSA. Shell ovate-subcylindrical, olive-brown, rather solid; spire elevated, equaling aperture in length; whorls broad, gibbose, compressed in the middle; last whorl shortly cylindrical; aperture rather short, purplish-brown within, outer lip posteriorly sinuously produced, anteriorly sinuously emarginated; columella double-plaited.

ADAMS and ANGAS. Proc. Zool. Soc., 1863, p. 416.
Hub. A tributary to Adelaide river in Arnhem's Land.

Species 52. (Mus. Brit.)

PHYSA SAYI. *Phy. testā ovatā, politissimā, pallidē fulca, roseo suffusa; spirā breviter conica, anfractibus brevibus; ultimo anfractu orato; aperturā semiorbitā, oblongā, antice angustatā, columellā retrorsim tortuosa.*

PHYSA.—PLATE VII.

SAY'S PHYSA. Shell ovate, much polished, pale fulvous, suffused with pink; spire shortly conical, whorls short; last whorl ovate; aperture semiiovate, oblong, anteriorly narrowed; columella twisted backwards.

GRAY. —? Mus. Brit.

Hab. Hudson's River, North America.

Probably a comparison has been made between this species and *Physa gyriina* of Say. It is more obese and less acuminate, and tapers slightly towards the anterior termination.

Species 53. (Mus. Brit.)

PHYSA ALGOENSIS. *Phy. testa ovato-subgloboſa, temiſimā, pallidē succinā, hyalinā, translucidā, anticē subattenuatā; spirā brevi, anfractibus paucis; ultimo anfractu inflato, brevi, plicā columellarī brevi.*

THE ALGOA PHYSA. Shell ovately-subglobose, very thin, pale amber, hyaline, translucent, anteriorly slightly attenuated; spire short, whorls small; last whorl inflated, short, columellar fold short.

MORELET. —?

Hab. Damara Land, Algoa.

Species 54. (Mus. Sowerby.)

PHYSA TONGANA. *Phy. testa fusco-olivacea, levigata, fusiformis; spirā producta, eleganter acuminata; anfractibus obliquè declivibus, subangulatis; ultimo anfractu inflato, superne subangulato, infre subattenuato; aperturi spirām longitudine superanti, posticè subangulato, anticè acuminato, columellā ferè bispicata.*

THE TONGA PHYSA. Shell olive-brown, smooth, fusiform; spire produced, elegantly acuminate; whorls obliquely sloped, somewhat angular; last

whorl inflated, slightly angular above, a little attenuated below; aperture longer than the spire, posteriorly slightly angular, anteriorly acuminate, columella nearly double-plaited.

QUOI. Voyage de l'Astrolabe, Pl. LVIII., fig. 19, 20.
Hab. Australia.

Species 55. (Fig. a, b, Mus. Sowerby.)

PHYSA SINUATA. *Phy. testa parvā, subfusiformis, fuscō ferruginea; spirā producta, acuminata, anfractibus paucis, gibbosis; ultimo anfractu subovato; aperturā intus pallidē purpureā, labio extero sinuato; plicā columellarī parvā, altā.*

THE SINUATED PHYSA. Shell small, subfusiform, ferruginous-brown; spire produced, acuminate; whorls small, gibbose; last whorl rather ovate; aperture pale purple within, outer lip sinuous; columellar fold small, raised.

GOULD. Expedition shells.

Hab. New South Wales.

Species 56. (Mus. Brit.)

PHYSA RETICULATA. *Phy. testi subpyramidalit, gracili, fumoso-cornuti, concentricè et spiraler striatā; spiri elevata, acuminata, anfractibus obliquè declivibus, prominentibus; ultimo anfractu obliquo, anticè subinflato, posticè subattenuato; aperturā subpyramidalit, intus pallidē aureo.*

THE RETICULATED PHYSA. Shell rather pyramidal, smooth, smoky-horn-coloured, concentrically and spirally striated; spire elevated, acuminate, whorls obliquely sloped; prominent; last whorl oblique, anteriorly slightly inflated, posteriorly subattenuated; aperture subpyramidal, pale golden within.

GOULD. —?

Hab. Sandwich Islands.

P H Y S A.

PLATE VIII.

Species 57. (Mus. Brit.)

Physa VANDERKEMP. *Phy. testa rotunda, subquadrata, fusiforme evanescens; spirae levicte, arcuato-fusiformes; subangulatae, suboblongae; apertura obliqua, rectangulata; angulus exterius oblique rotundatus; apertura parvissima, lobus extimus ante aperturam, crenulatus; testa, rotunda.*

VAN DIEMEN'S PHYSA. Shell solid, rather square, smoky brown; spire short, whorls few, subangular; last whorl oblong, angular near the suture, aperture squareish, dull purplish within, outer lip anteriorly expanded, columella tortuous, turned backwards.

SOWERBY.

Hab. Van Diemen's Land.

Of a rather square-oblong form, this species presents an angular appearance - scarcely unusual in the genus. It is, however, only in quite-mature specimens that the angularity appears strongly.

Species 58. (Mus. Brit.)

PHYSA WALBERGII. *Phy. testa elongatâ, turreatâ, pallidâ; spiræ elevatæ, anfractibus quinque concrecâcentis, anfractu ultimo subrotato, latitudine rectiusculis; aperturâ parvâ, oblongâ; plicâ columellarâ prominenti, tortuâ.*

WALBERG'S PHYSA. Shell elongated, turreted, pale; spire elevated, whorls five rather convex, last whorl a little oval, sides a little straight; aperture small, oblong; columellar plait prominent, tortuous.

SOWERBY.

Hab. River Nile, Egypt.

Species 59. (Mus. Taylor.)

PHYSA ACICULATA. *Phy. testa elongatâ, pyramidatâ, attenuatâ, fuscoso-cornatâ, semipellucidi; spiræ*

decurrenti, angustiori, anfractibus vix obliquis; ultimo anfractu subangulato; apertura brevissimâ, columella levigata, obtusa, rectangulata.

THE VANDERKEMP'S PHYSA. Shell elongated, pyramidal, not angular, smoky-brown, well-pellucid; spire elevated, acuminate, whorls six, oblique; last whorl rather fusiform; aperture rather short, columella tortuous, whitish, turned backwards.

SOWERBY.

Hab. New South Wales.

Species 60. (Fig. a, b, Mus. Sowerby.)

PHYSA FUSICA. *Phy. testa ovata, solidâ, levigata, pallidâ fulvoâ, fasciis longitudinalibus rufis castaneis notata; spiræ brevissimâ, obtusa, anfractu penultima rotunda; ultimo anfractu oblongo; aperturâ rotunda castaneo marginata.*

THE RUE PHYSA. Shell ovate, solid, smooth, pale fulvous, marked with rare longitudinal chestnut bands; spire rather short, obtuse, penultimate whorl tumid; last whorl oblong; aperture chestnut, bordered within.

MOGELET. Journal de Conchyliologie, vol. xvi. f. 325.

Hab. Angola and Benguela.

Species 61. (Mus. Taylor.)

PHYSA SUBUNDATA. *Phy. testa fuscocastanea, ventriscosa, concentrica leuite undulata; spiræ brevissimâ, apice acuminata, anfractu penultima lato, subangulata; ultimo anfractu magno, prope suturam rotundata, rotundatissima angulata; aperturâ magno, intus prope marginem castaneo striigata; plicâ columellarâ crassissimâ, tortuâ.*

THE SLIGHTLY-WAVED PHYSA. Shell olive-brown, ventricose, concentrically slightly undulated; spire rather short, apex acuminate, penultimate whorl broad, rather angular, last whorl large, swelled

PHYSA.—PLATE VIII.

near the suture, roundly angular; aperture large, striped with chestnut within near the border; columellar fold rather thick, tortuous.

SOWERBY.

Hab. St. Margaret's, South Australia.

Species 62. (Mus. Brit.)

PHYSA PYRAMIDATA. *Phy. testā solidā, subaureo-fusā, pyramidalē, spīrē productā, anfractibus ser. obliquis, suprā attenuatis, iñfrā inflatis; ultimo anfractū ventricosā, subfusiformē: aperturā auriformē, labio interno crassissimā, plīcā columellari elevatā.*

THE PYRAMIDAL PHYSA. Shell solid, rather golden-brown, pyramidal, spire produced, whorls six, oblique, attenuated above, inflated beneath; last whorl ventricose, rather fusiform; aperture auriform, inner lip rather thick, columellar fold elevated.

SOWERBY.

Hab. Australia.

A shell of graceful form resembling in the slope of the whorls *Limaea stagnalis*, which are too oblique and attenuated for the most aberrant form of *Physa longana*.

Species 63. (Mus. Brit.)

PHYSA AMYGDALUS. *Phy. testā magnā, oblongā, ovatā, solidā, levigatā cornu-juscō: spīrē horiūsulā, anfractibus paucis, inflatis: ultimo anfractū ovato, posticē subattenuata, antīcē magis inflata: aperturā magnā, intūs subaureo, semipellucidā, castaneo fasciata: labio extēno flexuosa: labio interno pallido, lati cōfusa, plīcā columellari crasso, rectiūsculo.*

THE ALMOND PHYSA. Shell large, oblong, ovate, solid, smooth horny-brown; spire rather short, whorls few, inflated; last whorl ovate, posteriorly slightly attenuated, anteriorly more inflated; aperture large, rather golden within, semipellucid, banded with chestnut; outer lip flexuous, inner lip pale, broadly reflected; columellar fold thick, rather straight.

SOWERBY.

Hab. Texas, North America.

One specimen of this fine species is preserved in the British Museum.

Species 64. (Mus. Orbigny in Brit.)

PHYSA STRIATA. *Phy. testā parvā, ovatā, tenui, cornēdā, minutissimē concentricē radiatimque striatā, spīrē brevi, acuminatā, ultimo anfractū ovato; aperturā magnā, plīcā columellari inconspicuā.*

THE STRIATED PHYSA. Shell small, ovate, thin, horny, very finely concentrically and radiately striated, spire short, acuminate, last whorl ovate; aperture large, columellar fold not conspicuous.

D'ORBIGNY. Mollusca of Cuba, p. 192, Pl. XIII. f. 14-16. Hab. Cuba.

A lens is required to see the striation in both directions which characterizes this little species.

Species 65. (Mus. Brit.)

PHYSA VITREA. *Phy. testā tenui, albidā, translucidā, fusiformē, vittatā; spīrē subelevata, obtusa, anfractibus paucis, inflatis; ultimo anfractū oblongo; aperturā senioratā; plīcā columellari rectiūscula.*

THE GLASSY PHYSA. Shell thin, whitish, translucent, fusiform, glassy; spire a little elevated, obtuse, whorls few, inflated; last whorl oblong; aperture semi-ovate; columellar plait rather straight.

PARRY. —?

Hab. Lake Mareotis, Egypt.

Species 66. (Mus. Taylor.)

PHYSA DISPAR. *Phy. testā fusiformē, acuminatā, tenuiter sinuatim rugatā, in partibus fusco-rubescēt, in partibus stramineā; spīrē productā, attenuatā, apicē acuminatā: anfractibus obliquis, attenuatis: ultimo anfractū oblongo, aperturā antīcē attenuata, plīcā columellari haud prominenti, viz arcuata.*

THE DISSIMILAR PHYSA. Shell fusiform, acuminate, finely sinuously wrinkled, in parts reddish-brown, in parts straw-coloured; spire produced, attenuated, apex acuminate; whorls oblique, attenuated; last whorl oblong, aperture anteriorly attenuated, columellar fold not prominent, scarcely arched.

SOWERBY.

Hab. Sydney, New South Wales.

This form does not appear to have been hitherto described.

P H Y S A.

PLATE IX.

Species 67. (Mus. Brit.)

Physa attenuata. *Phy. testa brevi, rotundata, fusiforme;* tergula, solidi; spira brevi, acuminata; ultimo angustato supra tumida, vir angustata, ante subattenuata; apertura levigata, ante subattenuata; plicis columellaris alba, subtortuosa, brevi.

THE ATTENUATED PHYSA. Shell short, inflated, olive-brown, smooth, solid; spire short, acuminate; last whorl tumid above, spirae angular, anteriorly a little elevated; aperture large, anteriorly slightly attenuated; columellar fold white, a little tortuous, short.

FIGURES. Journal de Conchyliologie, vol. vi. Pl. IX. f. 5-6.

Hab. Australia.

Species 68. (Mus. —? copied.)

Physa kanakina. *Phy. testa rotunda, solidi, olivaceo-* *fuscæ;* spira aperturas longitudine esse aequanti; *angustata proctimo inflata;* ultima angusta ovata; *apertura auriformis;* plicis columellaris brevis, tortuosa.

THE KANAKINA PHYSA. Shell ovate, solid, olive-brown; spire nearly equaling aperture in length; penultimate whorl inflated; last whorl ovate; aperture auriform; columellar fold short, tortuous.

GASSIES.

Hab. "Kauakina," Australia.

Species 69. (Mus. —? copied.)

Physa caledonica. *Phy. testa parvæ, tenui, levigata,* *saboreto-fusiformi, cornuta;* spira quam apertura breviori, conica, acuminata; apertura auriformi, plicis columellaris inconspicua.

THE CALEDONIAN PHYSA. Shell small, thin, smooth, subovate-fusiform, horny; spire shorter than

aperture, conical, acuminate; aperture auriform, columellar flat inconspicuous.

MOELET. Soc. Hist. Nat. Moselle, 1856-7.

Hab. New Caledonia.

Species 70. (Mus. Brit.)

Physa tetrica. *Phy. testa iaparata, patulæ, cornicata;* spira brevi, acuminata, angustibas, brevibus; ultimo angustata magno, rotato, labio interno radioso, albus; plicis columellaris arcuatis; apertura ampliata, labio externo expansa.

THE TETRIC PHYSA. Shell inflated, patulous, horny; spire short, acuminate, whorls short; last whorl large, ovate, inner lip strong, white; columellar lip arched; aperture auriform, outer lip expanded. DE KAY. Shells of the United States, p. 78, Pl. V. f. 85.

Hab. North America.

Species 71. (Fig. a, b, Mus. Brit.)

Physa Jukishii. *Phy. testa parvæ, rotunda-rotundata,* *terripita, albæ;* spira levissimata, obtusissimata, angustibas dubius; ultimo angustata magno, inflato, labio interno valido, plicis columellaris dentiformi, truncata.

JUKES'S PHYSA. Shell small, ovate-rounded, smooth, white; spire very short, very obtuse, whorls two; last whorl large, inflated; inner lip strong; columellar fold tooth-shaped, truncated.

A. ADAMS. Proc. Zool. Soc.

Hab. Australia.

This little species is characterized by a small tooth-like projection terminating the columnella similar to that in *Physa Africana*.

PHYSA.—PLATE IX.

Species 72. (Fig. *a*, *b*, Mus. —? Copied.)

PHYSA DISTORTA. *Phy. testā parvā, pallidē cornēd, subovatā, spirā brevi, anfractibus duobus aut tribus, penultimo inflato, subquadrate; ultimo anfractu subcylindraceo, prope suturam tumido, subangulato; columellā latā, leviter arcuata*.

THE DISTORTED PHYSA. Shell small, pale horn, subovate, spire short, whorls two or three, the penultimate inflated, subquadrate; last whorl subcylindrical, tumid, subangular near the suture; columella broad, slightly arched.

HALDEMAN. *Physada*, p. 35, Pl. V. f. 1-3.

Hab. North America.

Species 73. (Mus. Brit.)

PHYSA ELLIPTICA. *Phy. testā elongato-subovatā, fusco-subdivisatā; posticē subattenuatā; spirā producta, conicā; aperturā intū arcuata, prope marginem castaneo fasciatā; labio interno pallidā, albo marginato, columellā crassā, pliā inconspicuā*.

THE ELLIPTICAL PHYSA. Shell elongate, subovate, rather olive-brown; posteriorly subattenuated; spire produced, acuminate; aperture golden within, banded with chestnut near the margin; inner lip pale, white-edged, columella thick, plait inconspicuous.

LEA. *Ann. Phil. Soc.*, vol. v. Pl. XIX. f. 83.

Hab. Indiana.

Not sharply mucronate in the spire as is the case with *Physa gyrina* of Say.

Species 74. (Mus. Brit.)

PHYSA VENTRICOSA. *Phy. testā ovatā, politā, ventricosā, succinatā; spirā brevissimulā, acuminatā; ultimo anfractu ovato; aperturā magnā; columellā rectissimulā, pliā inconspicuā*.

THE VENTRICOSE PHYSA. Shell ovate, polished, ventricose, amber; spire rather short, acuminate; last whorl ovate; aperture large; columella rather straight, plait inconspicuous.

GULDIN. *Zool. Journ.*

Hab. St. Vincent's, West Indies.

Species 75. (Mus. —? New York.)

PHYSA CYLINDRICA. *Phy. testā oblongā, cylindracea, solidā, pallidē rubro-fusca; spirā brevi, conicā; ultimo anfractu oblongo, angusto, rectissimulā; aperturā elongata, labio externo rectissimulo, prope marginem castaneo fasciatā; labio interno pallidā, columellā crassā, subplanatā, rectissimulā*.

THE CYLINDRICAL PHYSA. Shell oblong, cylindrical, solid, pale red-brown; spire short, conical; last whorl oblong, narrow, rather straight; aperture elongated, outer lip rather straight, banded with chestnut near the margin; inner lip pale, columella thick, rather flat, rather straight.

DE KAY. Shells of United States.

Hab. Red Creek, Indiana.

Species 76. (Mus. Brit.)

PHYSA FUSCA. *Phy. testā parvā, subovatā, nictenti, fuscatā, semipellucida; spirā producta, acuminatā, anfractibus subrotundis; ultimo anfractu ampliō, aperturā subauriformi; columellā leviter arcuata*.

THE BROWN PHYSA. Shell small, subovate, shining, brown, semipellucid; spire produced, acuminate, whorls rather round; last whorl full, aperture somewhat auriform; columella slightly curved.

RÖSMASLER —?

Hab. River Mazarin.

Species 77. (Mus. Brit.)

PHYSA BENGUELENSIS. *Phy. testā fusiformi, utrinque acuminatā, pallidā, leviter rugatā; spirā aperturam longitudine superanti, acuminatā; anfractibus tribus, obliquis, convexis; aperturā antice subattenuata*.

THE BENGUELA PHYSA. Shell fusiform, acuminate; at both ends pale, lightly wrinkled; spire exceeding aperture in length, acuminate; whorls three, oblique, convex; aperture a little attenuated anteriorly.

SOWERBY.

Hab. Benguela, Egypt.

PHYSA.

PLATE X.

Species 78. (Mus. Brit.)

PHYSA MARGOTICA. *Phy. testā parvā, subgloboſa, terigata, albidā, spirā plicatilis, spirā obvoluta, anfractibus tribus, subquadratis, ultimo recte rotundatis, subangulata; aperturā oblongā, supra angulata, columellā rectoserrata.*

THE MARGOTIS PHYSA. Shell small, subcylindrical, smooth, whitish, semi-pellucid, spire in steps, whorls three, rather square, the last tumid, angular near the suture; aperture oblong, angular above, columella rather straight.

SOWERBY.

Hab. River Mareotis, Egypt.

Species 79. (Mus. Brit.)

PHYSA NATALINENSIS. *Phy. testā subglobosa, pallide cornuta, brevipoda, semipellucida, spirā levigata; ultimo anfractu inflato, supra subangulata, post columellam excavata; aperturā magnā, posteriorē subangulata, antice subanguminata.*

THE NATAL PHYSA. Shell subglobose, pale-horn, smooth, semi-pellucid, spire very short; last whorl inflated, slightly angular above, excavated behind the columella; aperture large posteriorly somewhat angular, anteriorly slightly acuminate.

KRAUSS. Sudafrikanischen Mollusken, p. 84, Tab. V. f. 10.

Hab. Natal, in stagnant pools.

Species 80. (Mus. —— ? Copied.)

PHYSA MICROSTOMA. *Phy. testā parvā, ovatā, levigatā, albida; spirā aperturā longitudine forcō angustā; aperturā angustā, columellā crassā, leviter bidentata.*

THE SMALL-MOUTHED PHYSA. Shell small, ovate, smooth, white; spire nearly equaling the aperture in

| • length; aperture narrow, columella thick, slightly bidentate.

HALDEMAN. Monograph, Physidae, p. 35, Pl. V. f. 10.
Hab. North America.

On the inner edge of the columnella in this species are two small tooth-like projections.

Species 81. (Mus. —— ? Copied.)

PHYSA DIAPHANA. *Phy. testā parvā, ritrōta, subglobosa; spirā brevi, anfractibus paucis, distinctis, tumidis; ultimo anfractu inflato; aperturā semirotunda; columellā vix arcuata.*

THE DIAPHRANOUS PHYSA. Shell small, glassy, sub-globose; spire short, whorls few, distinct, tumid; last whorl inflated; aperture semirotund; columella scarcely arched.

KRAUSS. Sudafrikanischen Mollusken, p. 84, Tab. V. f. 11.

Hab. Umgani valley, Natal.

A very small transparent species.

Species 82. (Mus. Brit.)

PHYSA NERITOIDEA. *Phy. testā parvā, solidā, obliquè subglobosa, succinino-rufescens, striis albidi notatā, spirā brevi, obtusa, anfractibus duobus, brevibus, ultimo anfractu inflato, anticē obliquè expanso; aperturā subpyriforme; labio externo anticē obliquè producto; columellā latā, complanatā, pliā tortuā, conspicuā.*

THE NERITA-SHAPED PHYSA. Shell small, solid, obliquely subglobose, reddish amber, marked with white stripes, spire short, obtuse, whorls two, short, last whorl inflated, anteriorly obliquely expanded,

PHYSA.—PLATE X.

aperture subpyriform; outer lip anteriorly obliquely produced; columella broad, flattened, plait tortuous, conspicuous.

SOWERBY.

Hab. —?

A little shell of very curious form, with very broad conspicuous plait.

Species 83. (Mus. Brit.)

PHYSA TEREBRA. *Phy. testā attenuatā, albā, ritrātā, levigatā*; spira producta, acuminata, anfractibus levatis, subdiscrepatis, subplanatis, per obliquis, aperturā oblongā, angustā, rectiusculā.

THE TEREbra PHYSA. Shell attenuated, white, glassy, smooth; spire produced, acuminated, whorls loosened, rather distant, a little flattened, very oblique, aperture oblong, narrow, rather straight.

BENSON. *Camphoceras terebra*.
Hab. Moradabah, India.

Singularly contrasting in form with the preceding species, *Physa merita*. The whorls are quite separated.

Species 84. (Mus. —? Copied.)

PHYSA GUILLIANI. *Phy. testā subovatā, cincro-cinerascēti, spira brevissimā*; anfractibus subangulatis, prope suturam subacumulatōis; ultime anfractu subcylindrica, posticū subattenuato, aperturā oblongā; labio extero flexuoso, posticū producta; columellā tortuosa, plieō conspicua.

GUILLIAN'S PHYSA. Shell sub-ovate, cinereous-horny, spire very short; whorls subangular, slightly canaliculated near the suture; last whorl subcylindrical, posteriorly a little attenuated, aperture oblong; outer lip flexuous, posteriorly produced; columella tortuous, plait conspicuous.

CHOSSE ET MARIE. *Journal de Conchyliologie*, vol. vi.
Hab. Reper's Lake, New Caledonia.

Species 85. (Mus. Taylor.)

PHYSA TENUISTRATIA. *Phy. testā subcylindrica, olivacco-fuscā, tenuiter spiraliiter concentricoque striatā*;

spira brevissimā, anfractibus subangulatis, penultimo perobliquū, apice acuminato; aperturā intus castanea, antice subacuminata.

THE FINE-STRIATED PHYSA. Shell subcylindrical, olive-brown, finely spirally and concentrically striated; spire rather short, whorls slightly angular, the penultimate very oblique, apex acuminated; aperture chestnut within, anteriorly a little acuminated.

SOWERBY.

Hab. River Torrens, South Australia.

The decussated texture of this species is peculiar.

Species 86. (Mus. —? Copied.)

PHYSA CASTANEA. *Phy. testā bruci solidā, inflatā, castaneā, levigatā, lineis nigricantibus striatā*; spira brevi, anfractibus paucis, brevibus, angulatis; ultimo anfractu magno, subcylindrica; plio columellari prominenti.

THE CHESTNUT PHYSA. Shell short, solid, inflated, chestnut-coloured, smooth, striped with blackish lines; spire short, whorls few, short, angular; last whorl large, subcylindrical; columellar fold prominent.

SOWERBY. Genera of Shells, Lymnaeæ, Pl. II.

Hab. Australia.

Species 87. (Mus. Brit.)

PHYSA SUBROTUNDA. *Phy. testā parvā, pallidè fulvo-semiglobosā*; spira brevissimā, anfractu unico rotundo, ultimo anfractu magni, inflatā; aperturā magna; plio columellare retrocurva, tortuosa.

THE ROUNDISH PHYSA. Shell small, pale-fulvous, semiglobose; spire very short, with a single rounded whorl, last whorl large, inflated; aperture large; columella turned back, tortuous.

SOWERBY.

Hab. North America.

The writer could not find any description or figure applicable to this shell.

PHYSA.

PLATE XI.

(Fig. 7, 8, Mus. Sowerby.)

PHYSA TESTICORNIS. *Linn.* (Plate I.) The large r. figure, from the Grand Rapids, Michigan, United States, and the smaller (fig. 8), a pretty little chequered shell, from Tasmania.

Species 88. (Fig. a, b, Mus. Legrand.)

PHYSA AESTUARIA. *Phy. testi parvæ, levæ, a. lata, subfusiforme, aperturæ oblique rotundata; spira oblonga, aperturæ angusta, anteriusa, obliqua; aperturæ apertus, rotundatus, superius, obliquus; aperturæ apertus, rotundatus, subrotundatus, obliquus, tertius, planus, punctatus.*

THE STEN PHYSA. Shell small, short, evolute, inflated, covered with an olive-brown epidermis; spire very short, with two whorls; last whorl inflated, rather gibbose above; aperture large, broad, bluish within, columella tortuous, fold rather prominent.

SOWERBY.

Hab. Near Hamilton, Australia.

I am indebted for this interesting little species, and several of the following, to Mr. Legrand, of Hobart Town.

Species 89. (Fig. a, b, Mus. Legrand.)

PHYSA EBURNEA. *Phy. testi gracili, obliqui, subfusiformi, politi, albi, fulvescenti, semipellucidii; spiræ acuminate, quam aperturæ longiori; anfractibus obliquis, decurrentibus, attenuatis; aperturæ breviæ, subcylindrici, intus fusco-cubescenti; columella tortuosa, albi media interdum incrassata.*

THE IVORY PHYSA. Shell slender, oblique, rather fusiform, polished, white fawn, semipellucid; spire acuminate, longer than the aperture; whorls

oblique, decurrent, attenuated; aperture rather short, subcylindric, reflexed, columnæ within, columella tortuous, white, sometimes thickened in the middle.

SOWERBY.

Hab. Near Launceston, Tasmania.

Species 90. (Mus. Legrand.)

PHYSA MAMILLATA. *Phy. testi elongato, fusiforme, subexpanso; spiræ quam aperturæ brevidensib; anfractibus apertilibus, angulis, acuminate, antepenultima inflata, gibbosa, penultima, effusa, gibbosa, elongata; ultima anteriusa obliqua, subcylindrica, antice obliqua subexpansa, aperte, nec oblonga, intus subnudata, columella tenuis, toruosa, plana elevata.*

THE MAMMILLATED PHYSA. Shell elongated, brown, anteriorly somewhat expanded; spire a little shorter than aperture; spiral whorls minute, acuminate, antepenultimate inflated, gibbous, penultimate inflated; last whorl attenuated, subcylindrical, anteriorly obliquely rather expanded; aperture oblong, rather violet within; columella thin, tortuous, plait elevated.

SOWERBY.

Hab. Brunni Island.

The peculiarity of this species is the manner in which the antepenultimate whorl suddenly expands after the contracted apex; and the penultimate drawn out to a great length.

Species 91. (Fig. a, b.)

PHYSA PUNCTURATA. *Phy. testi tenissimæ, olivaceo-fusci, obliquæ subrotundata, tenuissimæ striato-punctata; spiræ productæ, acuminate, anfractibus*

PHYSA.—PLATE XI.

medianis distinctis, versus suturam tumidis, apicalibus parvis; ultimo anfractu inflato, supernè subgibboso, anticè attenuato, acuminato; columellâ tenuissimâ, plicâ conspicuâ, elevatâ.

THE PUNCTURED PHYSA. Shell very thin, olive-brown, obliquely subovate, very finely punctured in striae; spire produced, acuminated, middle whorls distinct, tumid towards the suture, those of the apex small; last whorl inflated, rather gibbous above, attenuated in front, acuminate; columella very thin, plait conspicuous, elevated.

SOWERBY.

Hab. Australia.

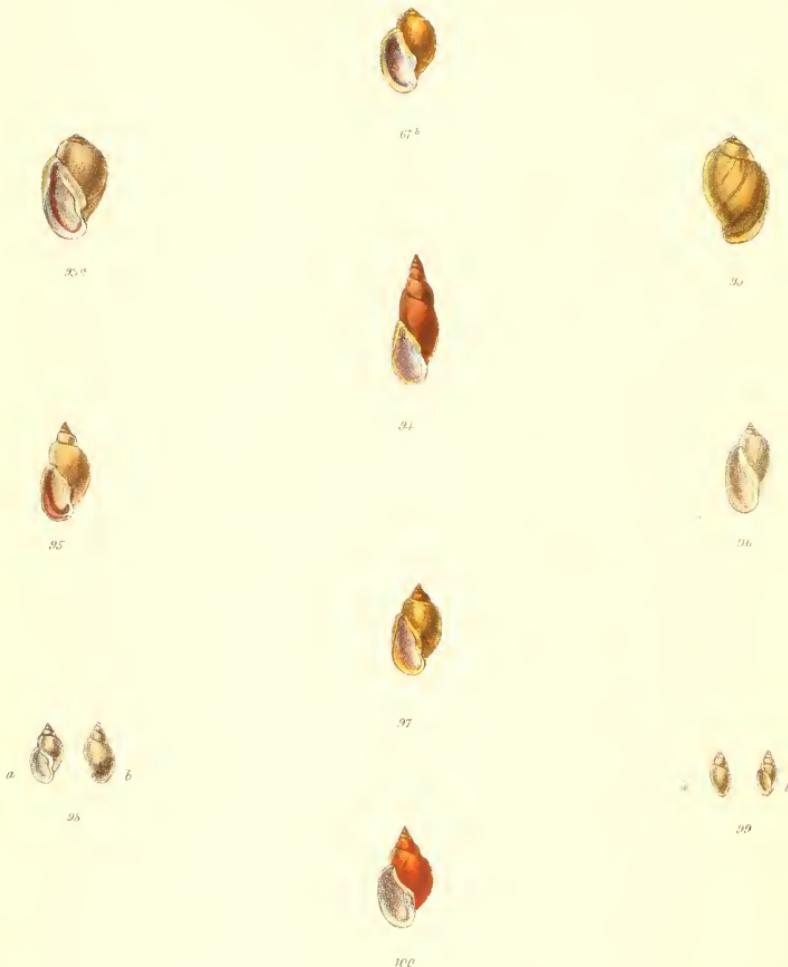

Species 92. (Fig. *a, b*, Mus. Brit.)

PHYSA CONTORTA. *Phy. testâ parvâ, cornicâ, brevi-inflatâ; spirâ brevi, acuminatâ, anfractibus paucis, distinctis; ultimo anfractu brevi, lato, subcylindrico; aperturâ angustâ, rectiùsculâ, plicâ colum-lari inconspicuâ.*

THE CONTORTED PHYSA. Shell small, horny, short, inflated; spire short, acuminate, whorls few, distinct; last whorl short, broad, somewhat cylindrical; aperture narrow, rather straight, columella fold inconspicuous.

MICHAUD —?

Hab. Cape of Good Hope.

PHYSIS.

PLATE XII.

(FIG. 37, b. Mus. Sowerby.)

PHYSIS ATTENUATA. From a more characteristic specimen than in Plate IX.

Species 93. (FIG. a, b. Mus. Sowerby.)

PHYSIS PINGUIS. *Phy. testa ovalis tonata, costata vel pallide olivacea, distanter rotundata, spirae brevi, anfractibus apicalibus parvissim, punctatis et levatis, locis ultime cunctis prope valvum subapicem; apertura rotunda, frequenter crenulata, fasciata; columella nitens suboblonga.*

THE SOLID *PHYSIS*. Shell ovate, tumid, oblique or pale olive, distantly banded with brown; spire short, apical whorls small, punctatim band inflated, short, the last ov. to conus gibbum near the suture; aperture horny without, often banded with chestnut; columella somewhat thickened within.

SOWERBY.

Hab. South Australia.

The doubling of the columellar fold, which may be observed by turning the shell a little, is a character much more conspicuously presented in Species 100.

Species 94. (Mus. Legendre.)

PHYSIS ATTENUATA. *Phy. testa pyramidalis, angustata, obliqua, fusco-cornuta, longitudinaliter tenuiter striata; spirae productae, anfractibus aequaliter crescentibus, decliebus, penultimum longissimum; apertura auriformis, intus purpurea, labio externo sinuato columellam tenet, plicis elevata.*

THE ATTENUATED *PHYSIS*. Shell pyramidal, acuminate, oblique, horned-brown, longitudinally finely striated; spire produced, whorls equally increasing, sloped, last rather long; aperture ear-shaped, purple within, outer lip sinuous, columella thin, fold raised.

SOWERBY.

Hab. Dulverton Lake, Australia.

This species nearly resembles *Physis annulifera* in general appearance, but it has not the sudden swell of the penultimate whorl whence that shell derives its name.

Species 95. (Mus. Sowerby.)

PHYSIS TEXTURATA. *Phy. testa subfusiformis, solidissima, fuscocornuta, minutissime striata; periphery concentrica, texturata; spirae acuminata, fere aequalem longitudine aquanti, astrictioris decliebus, equaliter crescentibus; ultimo anfractu orato, rotundata, apertura inter fasci, columella crassissima, ex plicata.*

THE TEXTURED *PHYSIS*. Shell subfusiform, rather solid, darkly olive, very minutely textured with spiral and concentric striae; spire acuminate, nearly equaling the aperture in length, whorls sloped, rapidly increasing; last whorl ovate, tumid; aperture brown within; columella rather thick, scarcely plaited.

SOWERBY.

Hab. South Australia.

Under the lens this shell appears as if impressed with a fine woven fabric.

Species 96. (Mus. Sowerby.)

PHYSIS PAPILARIA. *Phy. testa oblongo-subcylindrica, teminim, pallide cornuta, minutissime subundulatim striata; spirae brevi; ultimo anfractu oblonga, ad latera paulo compressa; columella tenuis, arcuata, plio vix concepita.*

THE PAPER *PHYSIS*. Shell oblong-subcylindrical, very thin, pale horny, with very minute undulated striae; spire short; last whorl oblong, a little compressed at the sides; columella thin, arched, plait hardly conspicuous.

SOWERBY.

Hab. —?

A remarkably thin, subcylindrical shell.

PHYSA.—PLATE XII.

Species 97. (Mus. Sowerby.)

Physa bullata. *Phy. testā majuscūlā, tenuissimā, fusco-cornēd, distanter fusco fasciatā, ovato-inflatā; rugis tenibus longitudinalibus leviter undulatā; spirā brevi, anfractibus apicalibus minutis, penultimo brevi, inflato; ultimo inflato, superne gibboso, anticē subattenuato; aperturā elongatā, subauriformi; columellā tortuā, plicā tenui, prominenti.*

THE BUBBLE PHYSA. Shell rather large, rather thin, horny-brown, distantly banded with brown; ovate-inflated, lightly undulated with fine longitudinal wrinkles; spire short, apical whorls minute, penultimate inflated, last inflated, gibbous above, rather attenuated anteriorly; aperture elongated, somewhat auriform; columella tortuous, fold thin, prominent.

SOWERBY.

Hab. South Australia.

Physa castana is a much more solid and angular shell than this.

Species 98. (Fig. a, b, Mus. Legrand.)

Physa nitida. *Phy. testā parvā, subfusciformi, pallidē fulve, levigatā, obliquā; spirā breviusculā, anfractibus apicalibus acuminatis, parvis, penultimum inflato; ultimo anfractu ovoato, tumidūsculo, anticē rotuolo; aperturi ovatā, columellā tortuā, plicā inconspicuā.*

THE NEAT PHYSA. Shell small, subfusciform, pale fulvous, smooth, oblique; spire rather short, apical whorls acuminate, small, the penultimate inflated; last whorl ovate, rather tumid, anteriorly rounded; aperture ovate, columella tortuous, plait inconspicuous.

SOWERBY.

Hab. In creeks of South-east Tasmania.

Species 99. (Fig. a, b, Mus. Legrand.)

Physa brunniensis. *Phy. testā parvā, oblongā, angustā, pellucidā, nitenti; spirā breviusculā, anfractibus tribus, distinctis, propè suturam gibbosis, ultimo oblongo; aperturā angustiusculā, columellā tenuissimā, plicā inconspicuā.*

THE BRUNNI ISLAND PHYSA. Shell small, oblong, narrow, pellucid shining; spire rather short, whorls three, distinct, gibbous near the suture, the last oblong; aperture rather narrow, columella very thin, plait inconspicuous.

SOWERBY.

Hab. Brunni Island, Australia.

I am not aware of this pretty little species having been named before.

Species 100. (Mus. Sowerby.)

Physa duplicita. *Phy. testā solidā, castaneā, breviusculā; spirā acuminatā, anfractibus obliquis, declivibus, ultimo inflato, breviusculo; aperturā subovatā, quam spirā longiori; labio externo sinuato; columellā rectiusculā, incrassatā, plicā duplicitā.*

THE DOUBLE-PLAITED PHYSA. Shell solid, chestnut, rather short; spire acuminate, whorls oblique, sloped, the last inflated, rather short; aperture subovate, longer than the spire; outer lip sinuated; columella rather straight, thickened, with a double plait.

SOWERBY.

Hab. Wide Bay, Australia.

MONOGRAPH
OF THE GENUS
SOLECURTUS.

"For the dear God, who loveth us,
He made and loveth all."—*Coleridge*.

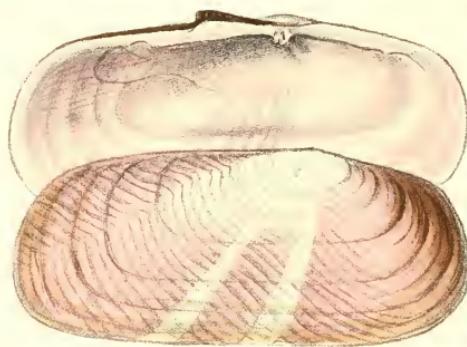

1

2

3

4

S O L E C U R T U S.

PLATE I.

Genus SOLECURTUS, Blainville.

Testa transversè oblonga, bimusculosa, utrinquè truncata, hians; medio planulato, umbonibus centralibus vel subcentralibus. Impressio pallii latè sinuata, ligamentum externum. Dentes cardinales uncinati.

Shell transversely oblong, bimucular, truncated and gaping at each end; flattened in the middle, with central or subcentral umbones. Palleal impression broadly sinuous. Ligament external, cardinal teeth hooked.

Our *Solecurtus* will be found to include the genera *Macha*, *Pharella*, *Siliquaria*, and *Noraculina* of modern authors; so that, with the exception of *Pharus*, all the *Solenidae* are divided into, first, *SOLEN* proper, with the umbones terminal; second, *CULTELLUS*, with the umbones much one-sided, although not terminal; and third, *SOLECURTUS*, with the umbones central, or nearly central. And this distribution by the position of the hinge is pretty generally concurrent with other characters of the shells. The geographical distribution of these, like that of other *Solenidae*, does not appear to be guided by any general rule. We have a couple of species on our own coast; *Noraculina* is found in the mud of Indian and Chinese rivers. North and South America, Africa and Australia, contribute each a few species.

Species 1. (Mus. Brit.)

SOLECURTUS EXARATUS. Sol. testâ rhomboïdeâ, albi, sulcis distantibus, obliquis, dicaricatis sculptâ; margine dorsali recto, umboibus haud prominentibus; latere antico breviâsculo, ad terminum dorsalem cuneato; latere postico elongato, ad terminum obliquè truncato; margine ventrali subconvo.

THE PLOUGHED *SOLECURTUS*. Shell rhomboidal, white, sculptured with distant, oblique, diverging

grooves; dorsal margin straight, umboes not prominent; anterior side rather short, cornered at the end; posterior side elongated, obliquely truncated at the end; ventral margin a little convex.

PHILIPPI. Abbildungen, &c.

Hab. China.

A white shell of more angular form than *S. striatus*.

Species 2. (Mus. Brit.)

SOLECURTUS OBLONGUS. Sol. testâ transversè elongatâ, alba, concentricâ rugatâ, antico obscurè sulcis numerosis obliquis, diraricatis sculptâ; medio planulato, sulco complanato impresso; latere antico breviâsculo, subcuneato; latere postico elongato, ad terminum subrotundo, margine dorsali subexcavato, margine ventrali recto.

THE OBLONG *SOLECURTUS*. Shell transversely elongated, white, concentrically wrinkled, anteriorly obscurely sculptured with numerous oblique diverging sulci, flattened in the middle, impressed with a flattened sulcus; anterior side rather short, rather acuminate; posterior side elongated, rather rounded at the end, with dorsal margin a little hollowed, ventral margin straight.

DORRIS. Proc. Zool. Soc., 1861.

Hab. Isl. Luzon.

Much narrower than *Solecurtus Scheepmacheri*, with dorsal margin excavated, and posterior side more produced.

Species 3. (Mus. Brit.)

SOLECURTUS SOLIDUS. Sol. testâ subrhomboïdeâ, oblongâ, albâ, epidermide fuscâ, rupatâ indutâ; latere antico breviâsculo, subattenuato, margine dorsali decavâ, margine ventrali acclivî; medio planulato, subcontracto, sulco impresso; latere postico rugato.

SOLECURTUS.—PLATE I.

*obtusè angulato, oblongo, margine dorsali recto,
terminali obliquè truncato.*

THE SOLID SOLECURTUS. Shell subrhomboidal, oblong, white, covered with a brown wrinkled epidermis; anterior side rather short, rather attenuated, dorsal margin sloped downwards, ventral sloped upwards; middle flattened, rather contracted, impressed with a groove; posterior side rugose, obtusely angular, oblong, dorsal margin straight, terminal obliquely truncated.

GRAY. Spicilegia Zoologica, t. 3, f. 12.

Hab. Peru.

Species 4. (Mus. Brit.)

SOLECURTUS STRIGILATUS. *Sol. testa convexa, solidata,*

*utrinquè obtusè truncatâ, latè hianti; roseâ, medio
albo biradiatâ, sulcis obliquis, divaricatis, ad
angulum posticum angulatis sculptâ; latere postico
oblongo; latere antico obtusè truncato.*

THE CUREY-COMBE'S SOLECURTUS. Shell convex, solid, obtusely truncated on each side, broadly gaping; pink, with two white rays in the middle, sculptured with oblique, diverging sulci, angular at the posterior angle; posterior side oblong; anterior side obtusely truncated.

LINNAEUS. Systema Naturæ.

Hab. Mediterranean and Atlantic.

The British *Solecurtus candidus* was formerly supposed to belong to this species.

PLATE II.

Species 5. (Mus. Brit.)

SOLECURTUS QUOVI. *Sol. testū obliqui, inquinatulari, albo, medio et posteriori distanter et oblique solitā; sulcis prop' marginem dorsalem recte im angulis; laterē antico brevi, rotundato; laterē posteriori arcuato, obliqu' truncato; marginē dorsali utrinqu' excavato; marginē ventrali convexo.*

Quoy's SOLECURTUS. Shell oblique, inquinatular, white, distantly and obliquely grooved in the middle and posteriorly; grooves angularly turned back near the dorsal margin; anterior side short, rounded; posterior side curved, obliquely truncated; dorsal margin excavated on both sides; ventral margin convex.

Deshayes, MS., in the Cummingian collection.

Hab. Philippines.

Rather an arched species with few curved grooves.

Species 6. (Fig. a, b, Mus. Brit.)

SOLECURTUS ABBREVIATUS. *Sol. testū pallidi fulvi, compressa, utrinqu' truncatā, pauci apertā; concentricē rugato; laterē posteriori obliqu' truncato; laterē antico breviāculo; medio sulco latō depresso; infū medio lecīr costato; marginē ventrali recto, ad selenum medianum sinuato; marginē dorsali utrinqu' declivī.*

THE ABBREVIATED SOLECURTUS. Shell pale fulvous, compressed, truncated at each end, a little open; concentrically wrinkled; posterior side obliquely truncated, anterior side rather short; middle depressed with a broad groove, slightly ribbed at the middle within; ventral margin straight, sinuous at the medial groove; dorsal margin sloped at each side.

GOULD.

Hab. Malacea.

Species 7. (Mus. Brit.)

SOLECURTUS DESHAYESI. *Sol. testū albida, rectō, prop' marginem anticum lāvi, deinde obliqu' subdivaricata.*

June, 1874.

cation solitā; laterē posteriori elongato, obliqu' truncato; marginē ventrali rectiāculo, medio subconstricta; sulcis prop' marginem dorsalem angulatim retrocurva.

Deshayes' SOLECURTUS. Shell whitish, straight, smooth near the anterior margin, thence obliquely, somewhat divergently grooved; posterior side elongated, obliquely truncated; ventral margin rather straight; middle slightly contracted; grooves turned back angularly near the dorsal margin.

DUNKER, Proc. Zool. Soc., 1861.

Hab. Moreton Bay, Australia.

There are no distinct rays of colour, but a slight central contraction in this shell, and the grooves are coiled up towards the dorsal margin, and then turned back at a sharp angle.

Species 8. (Mus. Brit.)

SOLECURTUS COARCTATUS. *Sol. testū oblonga, pallide fulvi, compressa, epidermide rugato indutā, medio coarctatā, levigatā, utrinqu' subtruncatā, hianti; marginē dorsali subdecliui.*

THE NARROWED SOLECURTUS. Shell oblong, pale fulvous, compressed, covered with a wrinkled epidermis, narrowed in the middle, smooth, rather truncated and open at each end; dorsal margin somewhat sloped.

LINNEUS. Systema Nature.

Hab. Naples.

In *Solecurtus abbreviatu*s and *S. antiquatus*, the depression in the centre is defined at the edges so as to form a groove. This is not the case in the present species.

Species 9. (Mus. Brit.)

SOLECURTUS SANCTE-MARTHE. *Sol. testū brevi, altā, albā, oblongo-subquadratā, utrinqu' latē hianti, et*

SOLECURTUS.—PLATE II.

truncatō, versūs marginem anticum lœvi, inde obliquū et crebrè sulcatū; sulcis post medium angulationē divaricatis; latere postico oblongo, latere antico brevi; margine ventrali subcontracto.

THE ST. MARTHA SOLECURTUS. Shell short, elevated, white, oblong-squarish, gaping and truncated widely at each end, smooth towards the anterior margin, thence obliquely and closely grooved; grooves angularly divergent behind the middle; posterior side oblong, anterior side short; ventral margin rather contracted.

DUNKER. MS. Brit. Mus.
Hab. North Australia.

The angles in the sulci radiate from the umbo to the ventral margin of the posterior terminus. It is a deep and widely gaping species resembling *S. strigilatus*, but shorter.

Species 10. (Mus. Brit.)

SOLECURTUS AUSTRALIS. Sol. testū oblongū, subdepressū, tenuī, rosēd, radiatim albo fasciatā, antice prop̄ marginem lœvigatā, ferè omnino tenuiter creberrimē sulcatā; sulcis posticis acutē angulatis; angulis a termino radiatim distantibus.

THE AUSTRALIAN SOLECURTUS. Shell oblong, subdepressed, thin, pink, radiately white-banded, anteriorly smooth near the margin, nearly all over finely very closely grooved; grooves posteriorly sharply angular; angles distant from the end in a radiating direction.

DUNKER. Proc. Zool. Soc., 1861.
Hab. Moreton Bay.

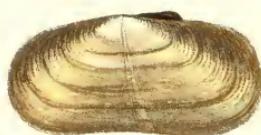

The sculpture of this species is very fine, and the angles of the sulci radiate from the umboes to the posterior ventral angle.

PLATE III.

Species 11. (Mus. Brit.)

Solecurtus sinuatus. Sol. testā parvā, oblongā, semi-pellucida, compressa, subcircularis, levigata, antice tenuiter rugatā; laterē antico breviāscens, sordidū, non rotato, sinuato; laterē postico attenuato, levigata, non acuminata.

THE MINUTE SOLECURTUS. Shell small, whitish, semi-pellucid, compressed, slightly reniform, smooth anteriorly concentrically wrinkled; anterior side rather short; middle narrowed, sinuous; posterior side thin, oblique, rather acuminate.

DUNKER. Proc. Zool. Soc., 1861.

Hab. Moreton Bay.

Species 12. (Mus. Brit.)

Solecurtus philippinum. Sol. testā oblongā, utriquā truncatā, hianti, roseā, medio fasciis albī biradiatā; antice lare pecti, versus angulum anticum, medio et posticō sulcis obliquā arcuatis; propè marginem posticā dorsalem angulis et divergatis sculptā: marginibas dorsali ventralique rectis.

THE PHILIPPINE SOLECURTUS. Shell oblong, truncated at each end, gaping, pink, with two white rays in the middle; smooth anteriorly, towards the anterior angle, in the middle and posteriorly sculptured with obliquely arched sulci; angular and divergent near the posterior dorsal margin; dorsal and ventral margins straight.

DUNKER. Proc. Zool. Soc., 1874.

Hab. Philippines.

This species resembles *Solecurtus striolatus*, but has a wide anterior space without sulci, and the angles of the posterior sulci are in a line near the posterior dorsal margin.

Species 13. (Mus. Brit.)

Solecurtus antiquatus. Sol. testā compressā, oblongā, sordidū, epidermide fuscō-fusco indutā, ad latera

concentricā rugatā, laterē antico angustissimā, ad terminum rotundato; medio subexcavato, subcavato, radiatum evanescere: laterē postico partē longiore, latiore, obliquā subtruncato; umbonibus subcentralibus: marginē antico-dorsali declivis.

THE ANTIQUATED SOLECURTUS. Shell compressed, oblong, dingy, covered with a smoky-brown epidermis, concentrically wrinkled at the sides; anterior side rather narrow, rounded at the end; somewhat excavated and narrowed in the middle, with a radiating groove; posterior side a little longer and wider, a little truncated obliquely; umbo subcentral; antero-dorsal margin sloped downwards.

PENNANT. Zoology.

Hab. Mediterranean.

Species 14. (Mus. Brit.)

Solecurtus scheepmacheri. Sol. testā oblongā, trapezoidē, utriquā subtruncatā, obliquā, paulò hianti; concentricā rugatā, sordidū alba, epidermide rugoso indutā, medio planulato, depresso, radiatum unicolorito; marginē ventrali recto; marginē dorsali utriquā declivis; laterē antico breviāsculo.

SCHEEPMACHER'S SOLECURTUS. Shell oblong, trapezoidal, rather truncated, oblique and a little gaping at each end; concentrically wrinkled, dull white, covered with a rough epidermis; flattened, depressed, and with a single radiating groove in the middle; ventral margin straight, dorsal margin sloped at each end; anterior side rather short.

DUNKER. Proc. Zool. Soc., 1861.

Hab. —?

One of the largest of this depressed form.

Species 15. (Mus. Brit.)

Solecurtus sulcatus. Sol. testā oblongā, roseā, utriquā truncatā, antē medium et deinde ad terminum

SOLECURTUS.—PLATE III.

posticum profundè sulcato; sulcis subdistantibus, undulatim curvis, propè marginem dorsalem recurvis; latere antico brevi, propè marginem dorsalem concentricè rugato, marginie dorsali declivi; latere postico elongato; marginie dorsali paulò arcuato.

THE GROOVED SOLECURTUS. Shell oblong, pink, truncated at each end, deeply grooved before the middle and thence to the posterior end; grooves rather distant, curved in waves, recurred near the dorsal margin; anterior side short, concentrically grooved near the dorsal margin; dorsal margin sloped; posterior side elongated; dorsal margin a little arched.

DUNKER. Proc. Zool. Soc., 1861.

Hab. Moreton Bay.

The wavyly grooved sculpture of this species is very remarkable.

Species 16. (Mus. Brit.)

SOLECUETUS ALBUS. *Sol. testa elongata, angustâ, subcompressi, utrinquè paulò hianti, albâ; latere antico brevi, radiatim leviter costatâ; latere postico elongato, versus umbones obliquè sulcato, versus terminum concentricè rugato, marginie terminali rotundo; marginie centrali subexcavato.*

THE WHITE SOLECURTUS. Shell elongated, narrow, rather compressed, a little gaping at each end, white; anterior side short, slightly radiately

ribbed; posterior side elongated, obliquely grooved towards the umbones; concentrically wrinkled towards the end, terminal margin rounded; ventral margin a little excavated.

MARTIN. —?

Hab. —?

The oblique grooves are few and slight, and the shell is very inequilateral.

Species 17. (Mus. Brit.)

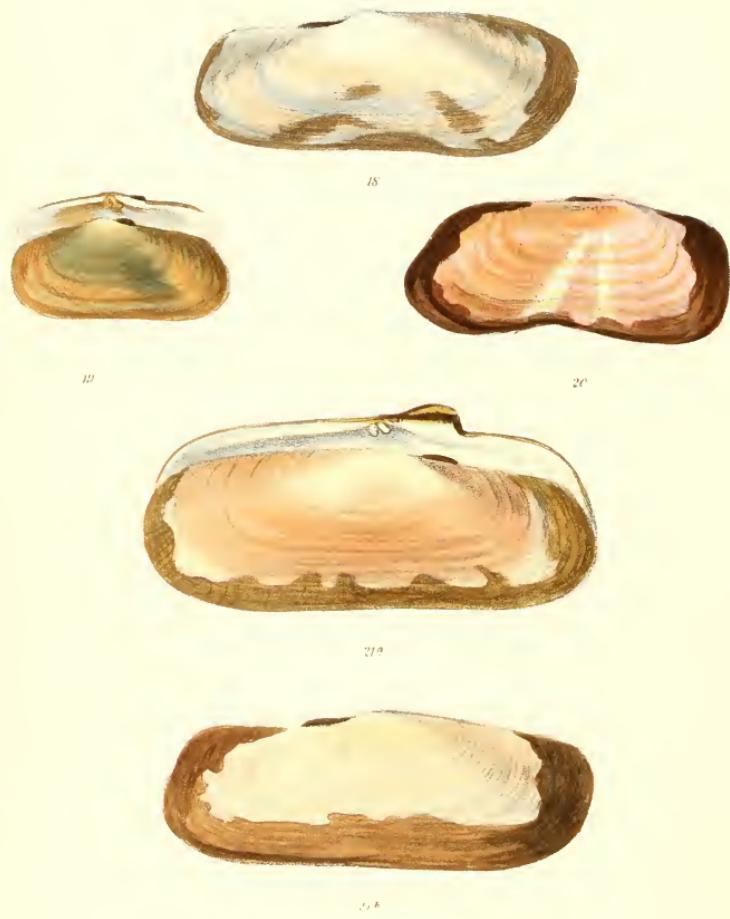

SOLECUETUS CANDIDUS. *Sol. testa oblongâ, albâ, subdepressâ, inaequilaterali, utrinquè hianti, propè terminum anticum levigatâ; feri omnino obliquè sulcato; sulcis versùs marginem dorsalem angulatis, recurvis; latere antico brevi, truncato; latere postico subrotundo; marginie ventrali medio concavo.*

THE CANDID SOLECURTUS. Shell oblong, white, subdepressed, inequilateral, gaping at each end, smooth near the anterior end; obliquely grooved nearly all over; grooves towards the dorsal margin angular and recurred; anterior side short, truncated; posterior side rather rounded; ventral margin concave in the middle.

RENIERI. Desh. Traité Élémentaire.

Hab. British and Mediterranean Seas.

The British specimens are much smaller than the one here figured.

S O L E C U R T U S.

PLATE IV.

Species 18. (Mus. Sowerby.)

SOLECURTUS CENTRALIS. *Sol. testá oblongá, inflatá, albida, epidermide oliveo-fusco indubia; latere antico elongato, ventricoso, versus terminalium rugato, marginem terminali infra sursa acervi, supra subcuneato; margine dorsali elevato, subcuvato; latere antico breviori, angusto, obliquè angulato, ad terminalium truncato; margine ventrali medio subconcreto.*

THE CENTRAL SOLECURTUS. Shell oblong, inflated, whitish, covered with an olive-brown epidermis; anterior side elongated, ventricose, wrinkled towards the end, terminal margin below sloped upwards, above cuneated; dorsal margin elevated, a little arched; anterior side rather shorter, narrow, obliquely angular, truncated at the end; ventral margin a little contracted.

CONRAD —?

Hab. Georgia.

This, like several other approximate species, has the greater length at the anterior side.

Fig. 19. (Mus. Sowerby.)

SOLECURTUS ANTIQUATUS. Species 13, Plate III. It was not till after the plates were printed that the identity of this shell was discovered. It is a very different variety.

Species 20. (Mus. Sowerby.)

SOLECURTUS SEMINUDUS. *Sol. testá oblongá, inflatá, versus umbones mediumque obliquè, distanter subcavata; utrinquè truncata, latè hianti, carinata, fuscius albidis duabus medio radiatá; latere antico brevi, cuneato, subquadrate; latere postico producto, marginem terminali obliquè truncato; margine dorsali recti; margine ventrali medio excavato.*

THE HALF-BARE SOLECURTUS. Shell oblong, inflated, obliquely and distantly grooved towards the umbones and centre, truncated at each end, broadly gaping, flesh-coloured, rayed with two whitish bands in the middle; anterior side short, cuneated, nearly square; posterior side produced, terminal margin obliquely truncated; dorsal margin straight; ventral margin excavated in the middle.

SOWERBY.

Hab. —?

This shell has a peculiar contraction in the middle, and the oblique diverging grooves only extend from the umbonal region to near the middle, then dying out so as to leave the rest of the surface smooth and bare. It has a general resemblance to *Solecurtus strigilatus*, from which it is evidently distinct.

Species 21. (Fig. a, b.)

SOLECURTUS CARIBEUS. *Sol. testá oblongá, albida, reticulata; latere antico quam posticam longiori, rotundo, supernè obscurè cuneato; latere postico obtuse angulato, angustiusculo, margine terminali latè truncato; margine dorsali antice recto, postice excavato, margine ventrali recto.*

THE CARIBBEAN SOLECURTUS. Shell oblong, whitish, rather straight; anterior side larger than the posterior, rounded, obscurely cuneated above; posterior side obtusely angular, rather narrow, terminal margin broadly truncated, dorsal margin anteriorly straight, posteriorly excavated; ventral margin straight.

LAMARCK. Anim. s. Vert. Solen, Sp. 13.

Solen Guineensis, Delwyn.

PLATE V.

Species 22. (Fig. a, b, Mus. Brit. and Sowerby.)

SOLECURTUS COQUIMBENSIS. *Sol. testā oblongā, fasciis latīs purpurīs radiatā, medio planatā, anticē posticēque rugatā; latere antico quam posticus paulō breviori, margine dorsali declici; latere postico ad terminum supernū declici, marginē dorsali proprie umbones excavato; marginē ventrali recto.*

THE COQUIMBO SOLECURTUS. Shell oblong, rayed with broad purple bands, flattened in the middle, wrinkled in front and behind; anterior side a little shorter than posterior, with dorsal margin sloped; posterior side sloped above at the end with dorsal margin excavated near the umbones; ventral margin straight.

SOWERBY.

Hab. Coquimbo.

The smaller specimen is in the British Museum marked as *Dombeyi*, to which I do not think it belongs. The locality attached is as stated above.

Species 23. (Mus. Sowerby.)

SOLECURTUS CYLINDRICUS. *Sol. testā elongatā, angustā, gibbosā utrinquā obliquā angulatā; cibā, pīlē, rīmē fuscō rugatō indutā; latere antico quam anticus longiori, ad terminū acutē angulatō; latere postico angustiori, breviori, subtruncato, marginē dorsali depresso, subexcavato; marginē ventrali recto.*

THE CYLINDRICAL SOLECURTUS. Shell oblong, narrow, gibbose, obliquely angular at both ends; white, covered with a brown rough epidermis; anterior longer than posterior side, sharply angular at the end; posterior side narrower, shorter, subtruncated, with the dorsal margin depressed, rather excavated; ventral margin straight.

SOWERBY.

Hab. ——?

Differing from *Sol. Carilacus* in the narrowness and straightness of the general form and the angularity of the oblique slope at each end.

Species 24. (Mus. Brit.)

SOLECURTUS VIOLASCENS. *Sol. testā elongatā, compressā, utrinquā truncatā, fasciis pallidis purpurīs latīs radiatā, epidermīde pallidī fuscō indutā; latere antico elongato, attenuato; latere postico brevissimulo, latiori, marginē dorsali subexcavato, marginē ventrali ad terminū sursum acutī.*

THE PURPLISH SOLECURTUS. Shell elongated, compressed, truncated at each end, rayed with broad pale purple bands, covered with a pale brown epidermis; anterior side elongated, attenuated; posterior side rather shorter, broader, dorsal margin a little raised, ventral margin sloped upwards at the end.

DESIHAYES ——? MS. Brit. Mus.

Hab. S. W. Mexico.

Species 25. (Fig. a, b, Mus. Sowerby.)

SOLECURTUS ACUTIDENS. *Sol. testā elongatā, angustā, tenui, utrinquā angulatā, versū terminos validē litatū; latere antico brevi, marginē terminali rotundo; latere postico elongato, ad terminū subtruncato; medio compressato, marginē ventrali subcontracto.*

THE SHARP-TOOTH SOLECURTUS. Shell elongated, narrow, thin, angular at each end, strongly ridged towards the ends; anterior side short, with terminal margin rounded; posterior side elongated, somewhat truncated at the end; flattened in the middle, ventral margin a little contracted.

SOWERBY AND BRODERIP. Zoological Journal, vol. iv.

PLATE VI.

Species 26. (Mus. Brit.)

SOLECURTUS MOLLIS. *Sol. testā pallidā, oblongā, anticē posticēque rugatā, medio complanatā, sulco obliquō radiatā, laterē antico brevi, subrotundo; latere postico producto, recto, margine terminali latē truncato; margine dorsali recto; margine ventrali medio paulo contracto.*

THE SOFT SOLECURTUS. Shell pale, oblong, anteriorly and posteriorly wrinkled, flattened in the middle, rayed with an oblique groove; anterior side short, rather rounded; posterior side produced, straight, with the terminal margin broadly truncated; dorsal margin straight; ventral margin a little contracted in the middle.

GOULD —? MS. Mus. Brit.

Hab. —?

Much less oblique and more straightly truncated than *Solecurtus constrictus*, Lamarck.

Species 27. (Mus. Brit.)

SOLECURTUS RUFUS. *Sol. testā compressā, elongatā, subreniformi, subæquilaterali, purpurā, albo radiatā, epidermide auro-fusco indutā; margine dorsali arcuato, utrinquè declivi, terminibus rotundis; margine ventrali arcuatum concavo.*

THE RED SOLECURTUS. Shell compressed, elongated, somewhat kidney-shaped, nearly equilateral, purple rayed with white, covered with a golden brown epidermis; dorsal margin arched, sloped downwards at each end; ends rounded; ventral margin concave in an arch.

BOSCII. —?

Hab. —?

The two ends of this shell are bent down so as to form an arch of the whole.

Species 28. (Mus. —? copied.)

SOLECURTUS INEQUALIS. *Sol. testā elongatā, subinflatā, posticē angulatā; purpureo latē radiatā; latere antico brevi, truncato; latere postico perelongato, subexpanso, ad terminum rotundatim truncato; margine dorsali ante umboes excavato, post umboes recto, versus terminum elevato; margine ventrali ferrè recto.*

THE UNEQUAL SOLECURTUS. Shell elongated, rather inflated, posteriorly angular; broadly rayed with purple; anterior side short, truncated; posterior side very long, rather expanded, roundly truncated at the end; dorsal margin excavated in front of the umboes, straight behind the umboes, raised towards the end; ventral margin nearly straight.

SOWERBY. Reeve, Conch. Cyst. Pl. XXVI.

Solecurtus Dombeii, Reeve, not Lamarck.

Hab. —?

It has been found desirable to copy the figure representing the type.

Species 29. (Mus. Brit.)

SOLECURTUS CONSTRICTUS. *Sol. testā oblongā, subcompressā, utrinquè rugatā, pallidā, epidermide tenui indutā, medio complanatā, sulco obliquō radiatā; latere antico brevi, margine dorsali producto; latere postico perelongato, margine terminali obliquè truncato, margine ventrali producto.*

THE CONSTRICTED SOLECURTUS. Shell oblong, sub-compressed, wrinkled at each end, pale, covered with a thin epidermis, middle flattened, rayed with an oblique sulcus; anterior side short, with dorsal margin produced; posterior side much lengthened, terminal margin obliquely truncated, ventral margin produced.

LAMARCK. Anim. sans Vert. Solen, Sp. 15.

Species 30. (Fig. a, b, Mus. Brit.)

SOLECURTUS DOMBEI. *Sol. testâ elongatâ, subaequilaterali, fasciis purpureis latis rugiatâ; latere antico oblongo, ad terminum truncato; latere postico paulò magis expanso, ad marginem ventralern inflato ad marginem terminalern rotundo; margine dorsali post umbones excavato, ante umbones recto; margine ventrali medio arcuatum excavato.*

DOMBEY'S SOLECURTUS. Shell elongated, subequilateral, rayed with broad purple bands; anterior side oblong, truncated at the end; posterior side a little more expanded, inflated at the ventral margin, rounded at the terminal margin; dorsal margin excavated behind the umboes, straight before the umboes; ventral margin excavated in an arch at the middle.

LAMARCK. Anim. sans Vert. Solen, Sp. 12.
Hab. S. America.

Among the numerous forms that have been referred to this species, the one now figured appears best to agree with the Lamarckian ideal.

Species 31. (Fig. a, b, Mus. Brit.)

SOLECURTUS NOVACULINA. *Sol. testâ oblongâ, trapezoidâ, rectâ, tenui, albida, medio planâ, ad latera concentricè rugatâ; latere antico breviâsculo, latere postico elongato, ad terminum obliquè truncato; margine dorsali recto; margine ventrali vix concavo.*

THE RAZOR SOLECURTUS. Shell oblong, trapezoidal straight, thin, whitish, flat in the middle, concentrically wrinkled at the end; anterior side rather short; posterior side elongated, obliquely truncated at the end; dorsal margin straight; ventral margin scarcely concave.

BENSON. (Genus Novaculina.)

Hab. Near Calcutta.

Species 32. (Mus. Brit.)

SOLECURTUS COMPLANATUS. *Sol. testâ compressâ, tenui, albida, epidermâ rugoso indutâ; latere antico, breviâsculo attenuato, ad terminum rotundato; margine dorsali subdeclivie; latere postico elongato, gradatim versus terminum expanso, ad terminum truncato; margine dorsali rectiâsculo; ligamento in marginem dorsalem impresso.*

THE FLATTENED SOLECURTUS. Shell compressed, thin, whitish, covered with a rough epidermis; anterior side rather short, attenuated, rounded at the end; dorsal margin sloped downwards a little; posterior side elongated and gradually expanded towards the end, truncated at the end; dorsal margin rather straight; ligament impressed into the dorsal margin.

SOWERBY.

Hab. —?

This species partakes somewhat of the form of *Pharus legumen*.

Species 33. (Mus. Brit.)

SOLECURTUS FRAGILIS. *Sol. testā petrī, altū, pallidū, lēvigatū, subaequilaterali, medio-depresā, propū umboes purpuro intus vitudinā; marginē dorsali atrinquē declivi; marginē centrali medio excavato; latere posticō longissimulo.*

THE FRAGILE SOLECURTUS. Shell small, white, pellucid, smooth, rather equilateral, depressed in the middle, rayed near the umboes, with purple inside; dorsal margin sloped at each side; ventral margin excavated in the middle; posterior side rather longer.

DILWYN ——?

Hab. Nicobar Islands.

A single ray of purple near the umboes is seen through the pellucid shell.

Species 34. (Mus. Brit.)

SOLECURTUS NITIDISSIMUS. *Sol. testā oblongā, angustā, compressā, inaequilaterali, pallidū purpureo-rubrūtū, antīcē concentricē tenuiter rugatū; latere antico elongato, ad terminū subrotundo; latere posticō brevissimulo, superne cuncato, ad terminū obliquū truncato.*

THE POLISHED SOLECURTUS. Shell oblong, narrow, compressed, inaequilateral, rayed with pale purple, anteriorly concentrically finely wrinkled; anterior side elongated, rather rounded at the end; posterior side rather short, wedge-shaped above, obliquely truncated at the end.

DOERN. Proc. Zool. Soc., 1861.

Hab. ——?

Species 35. (Mus. Sowerby.)

SOLECURTUS BIDENS. *Sol. testā elongatā, angustā, epidermide lēvigatā, olivacea inductā, intū versis marginē purpureā, ad umboes purpureo uniradiatā;*

latere posticō longissimulo, subfunicato; marginē centrali medio subcontracto.

THE DOUBLE-FOOTED SOLECURTUS. Shell elongated, narrow, covered with a smooth olive epidermis, purple within, towards the margin, with a single ray of purple at the umboes; posterior side rather long, somewhat truncated; ventral margin rather contracted in the middle.

CHEMNITZ. Conch., fig. 1939.

Hab. Nicobar Islands.

The differences between *S. bidens* and *S. fragilis* are those of form, the latter being proportionately narrow and oblong.

Species 36. (Mus. Brit.)

SOLECURTUS CALIFORNIANUS. *Sol. testā elongatā, angustā, compressā, medio pallidū fulvā, utrinquē sordidū olivacea; umboibus subcentralibus; latere posticō obliquē angularē, radiatim striato, ad terminū truncato; latere antico ad terminū subrotundo; marginibus dorsali ventralique rectis.*

THE CALIFORNIAN SOLECURTUS. Shell elongated, narrow, compressed, pale fulvous in the middle, dull olive at each end; umboes nearly central; posterior side obliquely angular, radiately striated, truncated at the end, anterior side rounded at the end, dorsal and ventral margins straight.

CONEAD ——?

Hab. California.

Species 37. (Mus. Brit.)

SOLECURTUS ANGULATUS. *Sol. testā oblongā, subcylindrica, recta, pallidū fulvā, epidermide rugosā inductā; latere posticō brevi, validū angularē, subobliquē truncato; latere antico elongato, concentricē tenuiter lirato, truncato; marginē dorsali declivi, marginē ventrali recto.*

SOLECURTUS.—PLATE VIII.

THE ANGULAR SOLECURTUS. Shell oblong, subcylindrical, straight, fulvous, covered with a rough epidermis; posterior side short, with a very strong angle, rather obliquely truncated; anterior side elongated, concentrically finely ridged, truncated; dorsal margin sloped, ventral margin straight.

SOWERBY.

Hab. West Africa.

Much straighter and more cylindrical than *Solecurtus centralis* or *Caribeus*, with a more decided and gibbous posterior angle. At the same time it is broader, than *Sol. cylindrica*, and not so rigidly straight and angular.

Species 38. (Mus. Brit.)

SOLECURTUS PERUANUS. *Sol. testa tenui, brevi, albida, inflata, utrinque rugata, epidermide tenua, pallidâ, falcâ indutâ; latere postico brevi, margine dorsali excavato, margine terminali rotundatotruncateo, margine ventrali validâ sursum acclivi; medio subplanulato, umbonibus tumidis, margine ventrali vix contracto; latere antico valde inflato, latissculo, margine terminali obtuse truncato, margine ventrali convexo.*

THE PERUVIAN SOLECURTUS. Shell thin, short, whitish, inflated, wrinkled at each end, covered with a thin, pale, fulvous epidermis; posterior side short,

dorsal margin excavated, terminal margin roundly truncated, ventral margin strongly sloped upwards; middle rather flattened, umboes tumid, ventral margin contracted; anterior side much inflated, rather broad, terminal margin obtusely truncated, ventral margin convex.

DUNKER —?

Hab. Tumbez, Peru.

Species 39. (Mus. Brit.)

SOLECURTUS SUBTERES. *Sol. testa elongatâ, angustâ, medio planatâ, posticâ concentricâ rugatâ, purpureo-carnicâ, epidermide oliveaceo-aureâ, levigatâ indutâ; latere postico brevissculo, ad terminum suboblique truncato, margine dorsali subdeclinî; media plano, margine ventrali recto; latere antico producto, ad terminum perpendiculariter truncato.*

THE STRAIGHTENED SOLECURTUS. Shell elongated, narrow, flattened in the middle, concentrically wrinkled, fleshy purple, covered with a golden olive smooth epidermis, posterior side rather the shorter, rather obliquely truncated at the end, dorsal margin rather sloped; middle flat, ventral margin straight; anterior side produced, perpendicularly truncated at the end.

CONRAD, J. A. N. S. Phil., 7, p. 233, t. 17, f. 10.

MONOGRAPH
OF THE GENUS
PETRICOLOA.

"There's not a particle in sea or air
But Nature owns Thy plastic influence there"—*Mother Nature*.

1

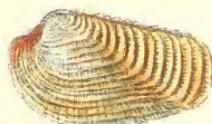

2

3

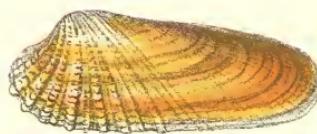

4

5

6

7

P E T R I C O L A.

PLATE I.

Genus PETRICOLA, Lovell.

*Testa testis pholasque alba, apicis oblique, epidermide
tenui ciliata; laterum radiatum costata; latere
anterius brevis crenulata; latera postea producta,
reciprocis obcurvata; Cardo utriusque radiis levigatus;
lunularium laces crenulata. Impressio pallid
punctis rufisata.*

Shell testaceous, usually white, equivalve, covered with a thin epidermis, sometimes radially ribbed; anterior side short, rounded, posterior side produced, increasingly attenuated. Hinge with two teeth in each valve, ligament short, external. Pallial impression posteriorly sinuous.

Like the Veneridae, these are rock-inhabiting shells, the animals attaching themselves by means of a byssus within holes and crevices, to which the shells are often found to conform in their shape, thus becoming irregular. Generally the Petricola are longer than the Veneridae tapering towards the posterior, and in their sculpture the radiate predominates over the concentric ribs or striae. Westward America seems to present the more favourite resorts to these Molluscs, although the shores of the Pacific, the Mediterranean, and Red Seas possess some species. India and Australia are not without them. Besides seeking holes in rocks in which to reside they exercise the power of enlarging, if not entirely excavating new ones, hard stones and corals being sometimes pierced by them.

Species 1. (Mus. Brit.)

PETRICOLA SERRATA. *Pet. testis pholadiformis, elongatâ,
antice brevissimâ, costis acutis, crenulis radiatâ;
postice attenuatâ, striis acutis, elevatis obliquâ
radiatâ, ad terminum acuminatâ.*

THE SERRATED PETRICOLA. Shell pholas-shaped, elongated, anteriorly very short, rayed with sharp, close ribs; posteriorly attenuated, obliquely rayed with sharp, raised close striae, acuminate at the end.

DESHAYES. Proc. Zool. Soc., 1853.

Hab. New Zealand.

Differing chiefly from *Petricola serrata* in the comparative fineness of the sculpture.

Species 2. (Mus. Brit.)

PETRICOLA GRACILIS. *Pet. testis pholadiformis, angustâ,
elongatâ, antice costis crenulatis, distantibus radiatâ;
postice granulatâ attenuatâ, radiatâ striatâ, ad
terminum subterminatâ.*

THE SLender PETRICOLA. Shell pholas-like, narrow, long, anteriorly rayed with crenulated, distant ribs; posteriorly gradually attenuated, radiately striated, rather acuminate at the end.

DESHAYES. Proc. Zool. Soc., 1853.

Hab. — ?

This shell was named by M. Deshayes from a specimen in Mr. Cuming's collection. Notwithstanding the variations to which shells of this genus are subject, the extreme attenuation and finer sculpture in this case may be considered sufficient to distinguish the species from *Petricola pholadiformis*.

Species 3. (Mus. Brit.)

PETRICOLA CONCISA. *Pet. testis oblongi, subcylindrici,
antice brevi, costis crenulatis, subistantibus radiatâ;
postice productâ, concentricâ laminatâ, inter laminae
radiatâ striatâ, ad terminum truncatâ, margine
dorsali paulo declivâ.*

THE NEAT PETRICOLA. Shell oblong, subcylindrical, short in front, rayed with crenulated, rather distant ribs; posteriorly produced, concentrically laminated, radiately striated between the laminae, truncated at the end, with dorsal margin a little sloped.

SOWERBY. Proc. Zool. Soc., 1834, p. 46. Thesaurus
Conchyliorum, f. 3.

Hab. Monte Christi.

The ribs at one end and the distinct and regular laminae at the other give a peculiarly pretty appearance to this shell.

PETRICOLA.—PLATE I.

Species 4. (Mus. Brit.)

PETRICOLA DACTYLUS. *Pet. testā oblongā, valdē inflatā, pholadiformi; anticē paulō hianti, acuminatā, costis decumbentibus, serratis, subduplicatis usque ad medium ratiatā; ad medium ventricosissimā; posticē attenuatā, radiatim striatā, ad terminum truncatā, margine dorsali declivī, ventrali aevlī.*

THE DACTYL PETRICOLA. Shell oblong, much inflated, pholas-shaped; anteriorly a little gaping, acuminate, rayed as far as the middle with decumbent, serrated ribs very ventricose at the middle; posteriorly attenuated, radiately striated, truncated at the end, dorsal margin sloped downwards, ventral sloped upwards.

SOWERBY. Genera of Shells, fig. 3.

Hab. South America.

Species 5. (Mus. Brit.)

PETRICOLA ELEGANS. *Pet. testā oblongā, anticē paulō hianti, acuminatā, concentricē laminatā, radiatim striatā, ad medium inflatā, posticē ante angulum depresso, post angulum, laminis latioribus, extantibus, exfoliatā, ad terminum truncatā; margine dorsali ante umbones excavato, post umbones sub-declivī.*

THE ELEGANT PETRICOLA. Shell oblong, anteriorly a little gaping, acuminate, concentrically laminated, radiately striated, inflated in the middle, posteriorly depressed in front of the angle, exfoliated behind the angle with broader laminae, truncated at the end; dorsal margin excavated before the umbones, somewhat sloped behind them.

DESHAYES (*Venerupis*). Proc. Zool. Soc., 1853.

Hab. —?

Named by M. Deshayes from a shell in the Cumingian collection.

Species 6. (Mus. Brit.)

PETRICOLA CULTELLUS. *Pet. testā pholadiformi, oblongā, anticē rotundā, brevissimā, costis serratis acutis, subobtusantibus radiatā; posticē elongatā, attenuatā, striis elevatis, crebris obliquē radiatā, ad terminum acuminatā.*

THE PRUNING-KNIFE PETRICOLA. Shell pholas-like, oblong, rounded anteriorly, very short, rayed with serrated, sharp, rather distant ribs; posteriorly elongated, attenuated, obliquely rayed with elevated, close striae; acuminate at the end.

DESHAYES. Proc. Zool. Soc., 1853.

Hab. Ceylon.

In *Petricola pholadiformis* the front ribs are strong, rather biangular and distant. In the present species they are sharp, have a single angle, and are less distant.

Species 7. (Mus. Sowerby.)

PETRICOLA PHOLADIFORMIS. *Pet. testā oblongā, subcylindrica, anticē rotundā, brevissimā, costis validis, distantibus, subquadratibus radiatā, posticē elongatā, attenuata costulis acutis, elevatis, crebris, obliquē radiatā, ad terminum acuminatā.*

THE PHOLAS-LIKE PETRICOLA. Shell oblong, subcylindrical, anteriorly rounded, very short, rayed with strong, distant, rather square ribs, elongated posteriorly, obliquely rayed with sharp, elevated, close riblets, attenuated at the end.

LAMARCK. Anim. s. Vert., Petricola, No. 11.

Hab. North America.

The external appearance of this well-known species is that of a Pholas; and it is only the absence of the subumbonal processes and accessory valves that distinguishes it, as far as the shell goes, from that family.

P E T R I C O L A.

PLATE II.

Species 8. (Fig. a, b, Mus. Brit.)

PETRICOLA NIVEA. *Pet. testa oblonga, inflata, pholadiformi, antice brevi, rotundata, radiatim striata; postice elongata, subattenuata, perobliqua angulata, post angulum costis crenatis, acutis, radiata, ad terminum angustè truncata, denticulata.*

THE SNOWY PETRICOLA. Shell oblong, inflated, pholas-shaped, anteriorly short, round, radiately striated; posteriorly elongated, slightly attenuated, very obliquely angular, rayed behind the angle with sharp, close ribs, narrowly truncated at the end, denticulated.

CHEMINTZ (*Mitilus*). Conch., vol. vii. Pl. LXXXII. f. 734.

Petricola rugosa, Sowerby.

Petricola formicata, Say.

Petricola tenuis, Sowerby.

Petricola gibba, Middendorf?

Hab. Nicobar (Ch.), Chili and Peru (Cun.).

Species 9. (Fig. a, b, Mus. Sowerby.)

PETRICOLA DENTICULATA. *Pet. testa pholadiformi, elongata, antice hianti, acuminate, ad marginis acclivi et declivi, costis depresso crenatis radiata; postice radiatim striata, subacuminata; intus ad terminos et proprie marginem centralem cunctae.*

THE DENTICULATED PETRICOLA. Shell pholas-shaped, elongated, anteriorly gaping, acuminate, sloped upwards and downwards at the margins, rayed with depressed crenate ribs; posteriorly radiately striated, rather acuminate; chestnut within, at the ends and near the ventral margin.

SOWERBY. Proc. Zool. Soc., 1834.

Hab. Payti, Peru.

This species is even more pholas-like in form than *Petricola Pholadiformis*, having the anterior end acuminate.

(Species 10. Mus. Brit.)

PETRICOLA INCERTA. *Pet. testa elongata, pholadiformi, antice brevi, rotundata, costis depresso crenulatis radiata; postice subangulata, ante angulum depresso, contracta, post angulum costis numerosis, subacute radiata, ad terminum subrotunda.*

THE UNCERTAIN PETRICOLA. Shell elongated, pholas-shaped, anteriorly short, rounded in front, rayed with depressed ribs; posteriorly subangular, depressed, contracted in front of the angle, rayed behind the angle with numerous rather sharp ribs, somewhat rounded at the end.

SOWERBY.

Hab. ——?

I cannot identify the specimens of this shell in the British Museum with *Petricola nivea*. The latter seems to be characterized by sharp-edged ridges at the posterior end, while in the former the posterior ribs are more decumbent, and less distinct from the structure of other parts.

Species 11. (Fig. a, b, Mus. Sowerby.)

PETRICOLA LITHOPHAGA. *Pet. testa brevi, subcuneiformi, radiatim striata, striis posterioribus majoribus; antice inflata, rotundata, brevissima; postice subattenuata, ad terminum plusminusve truncata.*

THE STONE-EATING PETRICOLA. Shell short, rather cuneiform, radiately striated, the posterior striae the larger; anteriorly inflated, rounded, very short; posteriorly rather attenuated, more or less truncated at the end.

RITZIUS (Venus). Linnaean Transactions of Turin.

Pholas striata, Lamarck.

Mya devussata, Turton.

Pholas costellata, Lamarck.

Pholas rocellaria, Lamarck.

PETRICOLA.—PLATE II.

Pholas rupestris, Blainville.
Hab. British shores.

The species is subject to great variations in form and sculpture, which have given rise to many needless synonyms.

Species 12. (Mus. Brit.)

PETRICOLA ELLIPTICA. *Pet. testā oblongo-ellipticā, sub-compressā, radiatim sulcatā, concentricē distanter laminatā; latere antico brevissimō, rotundato; latere postico producto, ad terminum vix angulatō; margine dorsali rectiūculo.*

THE ELLIPTICAL PETRICOLA. Shell oblong-elliptical, subcompressed, radiately grooved, concentrically distantly laminated; anterior side rather short, rounded; posterior side produced, scarcely angular at the end; dorsal margin rather straight.

SOWERBY. Proc. Zool. Soc., 1834.
Hab. Payti, Peru.

This rather Venus-like species is found in hard mud at low water.

Species 13. (Mus. Brit.)

PETRICOLA CHINENSIS. *Pet. testā brevi, subcuneatā, radiatim striatā; antīcē brevissimā, rotundatā, inflatā, striis tenuibus radiatā; postīcē subattenuatā, angulatā, antīcē angulum dypresū, subcontrarūtō, post angulum costis elevatis ventis radiatō, ad terminum truncatā; margine dorsali declivī.*

THE CHINESE PETRICOLA. Shell short, subcuneate, radiately striated; anteriorly very short, rounded, inflated, rayed with thin striae; posteriorly rather attenuated, angular, rayed with raised, sharp ribs, truncated at the end; dorsal margin sloped.

DESHAYES. Proc. Zool. Soc., 1853.
Hab. Chinese Seas.

Differing from *Petricola lithophaga* in having strong sharp ribs behind the posterior angle.

Species 14. (Mus. Brit.)

PETRICOLA BIPARTITA. *Pet. testā brevissimā, subcuneatā, antīcē brevi, inflatā, divaricatim striatā; postīcē subattenuatā, angulatā, post angulum costis validis serratis radiatā, ad terminum truncatā; umboibus prominentibus, acutis; margine dorsali declivī.*

THE BIPARTITE PETRICOLA. Shell rather short, subcuneate, anteriorly short, inflated, divergently striated; posteriorly rather attenuated, angular, rayed behind the angle with strongly serrated ribs, truncated at the end; umboes prominent, sharp; dorsal margin sloped.

DESHAYES. Proc. Zool. Soc., 1853.
Hab. Island of Samar, Philippines.

Species 15. (Mus. Brit.)

PETRICOLA SOLIDA. *Pet. testā subglobosā, solidā, inflatā, propī umboes utrinquā violaceo-fusca, concentricē distanter laminatā, radiatim serrato-costellatā; latere antico brevi, rotundo; latere postico subacuminato.*

THE SOLID PETRICOLA. Shell rather globose, solid, inflated, violet-brown on each side of the umboes, concentrically distantly laminated, with radiating serrated small ribs; anterior side short, round; posterior side rather acuminate.

SOWERBY. Proc. Zool. Soc., 1834.
Hab. Peru.

Collected by the late Mr. Cuming in hard clay and stones at Lambezeque.

16

17

18

19

20

21

22

23

24

25

P E T R I C O L A.

PLATE III.

Species 16. (Mus. Brit.)

PETRICOLA RUBIGINOSA. *Pet. testā tenui, violaceous, subrhomboidē, omnino diradicatim striatā; latere antico breviusculo, obliquū subtruncato; umbonibus prominentibus, marginē dorsali subdeclinī; latere postico obliquū angulato, ad marginem ventralē acuminato.*

THE RUBY-COLOURED PETRICOLA. Shell thin, reddish-violet, rather rhomboidal, everywhere divergently striated; anterior side rather short, obliquely somewhat truncated; umbones prominent, dorsal margin a little sloped; posterior side obliquely angular, acuminated at the ventral margin.

ADAMS AND ANGAS (Narina). Proc. Zool. Soc.
Hab. —?

Species 17. (Mus. Hanley.)

PETRICOLA BICOLOR. *Pet. testi orato, tenui, radiatim minutē striatā, utrinquā bianti, antice rotundatā, brevi; posticē obliquū subattenuatā, novabū trigonā fuscā post angulum pīctā.*

THE TWO-COLOURED PETRICOLA. Shell ovate, thin, radiately minutely striated, gaping at each end, anteriorly rounded, short; posteriorly a little attenuated, painted with a trigonal patch of brown.

SOWERBY. Thesaurus Conchyliorum, Petricola, f. 22.
Hab. —?

Of the same form, and belong to the same group as *Petricola lithophaga*, but equally striated, and presenting a triangular patch of colour on one side, a very unusual thing in the genus.

Species 18. (Mus. —? copied.)

PETRICOLA SEMILAMELLATA. *Pet. testā parvā, subcuneatā, brevi; antice concentricā tenuiter striatā; posticē angulatā, post angulum laniis prominentibus exfoliatā; marginē dorsali declivī; marginē centrali inflato.*

THE HALF-LAMINATED PETRICOLA. Shell small, rather cuneated, short; anteriorly concentrically finely striated; posteriorly angular, exfoliated behind the angle with prominent laminae; dorsal margin sloped; ventral margin inflated.

LAMARCK. Anim. sans Vert. Petricola, No. 3.
Hab. Rochelle.

The laminae on the hinder part will prevent this species being confounded with *Petricola lithophaga*, which it otherwise resembles.

Species 19. (Mus. Sowerby.)

PETRICOLA EQUISTRITATA. *Pet. testā oblongā, pholasiformi, striis radiatibus numerosis crenulatis, aequalibus, et striis concentricis crenulatis, minuti cancellatā, posticē intus exāsque maculā fusca trigonā pictā; latere antico breviusculo, rotundo; medio valde inflato; latere postico subattenuato, obliquē subtruncato; margine dorsali excavato.*

THE EQUAL-STRIATED PETRICOLA. Shell oblong, pholas-shaped, minutely cancellated with numerous crenulated, equal, radiating striae, painted posteriorly inside and out with a triangular patch of brown; anterior side rather short, rounded; middle much inflated; posterior side rather attenuated, obliquely subtruncated; dorsal margin excavated.

SOWERBY.

Hab. —?

Differing from *Petricola denticulata* in the rounded anterior side and equal decussation.

Species 20. (Fig. a, b, Mus. Sowerby.)

PETRICOLA ROBUSTA. *Pet. testā globoso-cuneatā, extēs subcircularē, intus fuscō-nigriscēt; latere antico radiato; latere postico attenuato, angustato, subangulatō, antē angulum depresso, contracto, post angulum acutē et conspicuē costato, ad terminū truncato; umbonibus elevatis, margine dorsali valdē declivī.*

PETRICOLA.—PLATE III.

THE ROBUST PETRICOLA. Shell globose-cuneate, bluish without, blackish-brown within; anterior side much inflated, rounded, short, rayed with sharp numerous ridges; posterior side attenuated, narrow, rather angular, depressed and contracted in front of the angle, sharply and conspicuously ribbed behind the angle, truncated at the end; umboes raised, dorsal margin much sloped.

SOWERBY. Proc. Zool. Soc., 1834.

Hab. Panama.

Species 21. (Mus. Sowerby.)

PETRICOLA TYPICA. *Pet. testā brevi, inflatā, subglobosā, cuneatā, antīcē rotundā, ventricosā, tenuiter radiatim striatā; posticē subattenuatā, versū terminum costellis acutis radiatā, ad terminum denticulatā, truncatā; margine dorsali antē umboes excavatoe, post umboes declivi.*

THE TYPICAL PETRICOLA. Shell short, inflated, sub-globose, cuneate, anteriorly rounded, ventricose, finely radiately striated; posteriorly somewhat attenuated, towards the end rayed with conspicuous sharp ripples, denticulated, truncated at the end; dorsal margin excavated before the umboes, sloped behind them.

JONAS. Moll. Beitr., p. 2, pl. VII. f. 3.

Hab. Isl. St. Thomas.

Almost as globose in front as *Petricola robusta*. The ribs are finer, and increase gradually towards the end. The shell is much less cuneiform than *P. lithophaga*.

Species 22. (Mus. Sowerby.)

PETRICOLA DIVARICATA. *Pet. testā solidā, subtrapēzoidē, omnino divaricatā tenuiter striatā; antīcē brevissimā, umboibus terminabilibus; posticē oblique truncaē; margine terminali incrassato, fiducioe.*

THE DIVERGENT PETRICOLA. Shell solid, rather trapezoidal, all over divergently finely striated; anteriorly very short, umboes terminal; pos-

teriorly obliquely truncated; terminal margin thickened, foliated.

CHEMINTZ. Conch., pl. CLXXII. f. 1666—1667.

Nariño divaricata, Gray.

Hab. New Holland.

Species 23. (Mus. Brit.)

PETRICOLA VENTRICOSA. *Pet. testā oblongā, inflatā; antīcē subrotundā, tenuiter decussatā; posticē crenulatā, sublancellata, subattenuatā, ad terminum truncatā, intus fuscō pictā.*

THE VENTRICOSA PETRICOLA. Shell oblong, inflated; anteriorly somewhat rounded, finely decussated; posteriorly crenulated, rather laminated, a little attenuated, truncated at the end, painted brown within.

DESHAYES. Proc. Zool. Soc.

Hab. Panama.

A much more ventricose shell than *Petricola denticulata*, not beaked in front, laminated at the end.

Species 24. (Mus. Sowerby.)

PETRICOLA LAPICIDA. *Pet. testā solidā, subtrapēzoidē, omnino divaricatā tenuiter striatā; antīcē breci; umboibus subterminalibus; posticē producedā, rotundatā angulatā, post angulum costellis acutis, conspicuis, radiatā; ad terminum truncatā.*

THE STONE-DESTROYING PETRICOLA. Shell rather solid, rather trapezoidal, all over divergently finely striated; anteriorly short; umboes nearly terminal; posteriorly produced, roundly angular, rayed behind the angle with sharp, conspicuous small ribs; truncated at the end.

CHEMINTZ. Conch., pl. CLXXII. f. 1664—1665.

Nariño costata, Gray.

Hab. Australia. Mauritius.

Differing from *Petricola divaricata* in having strong sharp ribs at the posterior end.

A S T A R T E.

PLATE I.

Genus ASTARTE, J. Sowerby.

Testa arquivalvis, inaequilateralis, subovata, vel orbicularis, vel subtrigona, plerunque subcompressa; concentricè rugata, epidermide crassa imbuta, clausa. Impressiones musculares duar, rugosæ, subreniformes. Impressio pallii integræ. Cardo utriusque valeat tridentatus. Ligamentum externum, arcu dorsali et lunulæ excavatis.

Shell equivalve, inequilateral, subovate, or orbicular, or subtrigonal, generally subcompressed; concentrically wrinkled, covered with a thick epidermis, closed. Muscular impressions two, large, rather kidney-shaped. Impression of the mantle entire. Hinge tridentate in each valve. Ligament external, with dorsal area and lunule excavated.

Syn. Crassina, Lamarck. Tridentata, Schum.

The shells of this genus are not liable to be confounded with those of any other, the several characters included in the description being pretty constant in all. The minute *Astarte triangularis* is the only exception, and is very abnormal in form. The concentric wrinkles have in most species a tendency to become less prominent towards the centre, and even to disappear altogether towards the margin of the shell. All the species, excepting the Mediterranean *A. fusa*, inhabit northern seas; Norway, Greenland, North America, &c., being the chief places in whose sandy shores they burrow.

Species 1. (Fig. a, b, Mus. Sowerby.)

ASTARTE CASTANEA. *Ast. testâ suborbiculari, altâ, obsoletè radiatim sulcata; rugis concentricis distantibus, rix prominibus; versus marginem subevenidis, latere antico brevissimo; umboñibus prominentibus; margine dorsali utrinquè valde declivî.*

THE CHESTNUT ASTARTE. Shell suborbicular, elevated, obsoletely radiately grooved; concentric wrinkles distant, scarcely prominent, partly disappearing towards the margin, anterior side very short;

umboes prominent; dorsal margin much sloped on each side.

SAY. American Journal of Science, 1830, Conch. Pl. I.

Astarte crassidens, Brod. and Sowb.?

Hab. Arctic Seas.

Species 2. (Fig. a, b, Mus. Brit.)

ASTARTE COMPRESSA. *Ast. testâ parvâ, suborbiculari, compressa, pluminusce elevata; rugis concentricis parvis; umbonibus prominentibus, marginibus dorsibus valde declivis; latere antico brevissimo; latere postico vix truncato.*

THE COMPRESSED ASTARTE. Shell small, suborbicular, compressed, more or less elevated; concentric wrinkles small; umboes prominent, dorsal margins much sloped; anterior side very short; posterior side scarcely truncated.

MONTAGU (Venus). Testacea Britannica, Sup., p. 43.

Venus Montagni, Dillwyn.

Astarte striata, Gray.

Astarte multicostata, Macgillivray.

Hab. Great Britain and Norway.

The varieties differ in form and elevation, and some specimens are more compressed than others.

Species 3. (Fig. a, b, Mus. Sowerby.)

ASTARTE SULCATA. *Ast. testâ subquadratâ vel orbiculari-subtrigonâ; sulcis concentricis profundis, regularibus; latere antico breei; latere postico sulcangulato, truncato; margine dorsali rectuculo vel subrotundatum declivî; margine interno interdum denticulato.*

THE GROOVED ASTARTE. Shell subquadrate or orbicularly subtrigonal; concentric ridges deep, regular; anterior side short; posterior side somewhat angular, truncated; dorsal margin rather straight, or somewhat roundly sloped; inner margin sometimes denticulated.

ASTARTE.—PLATE I.

Costa (*Pectunculus*). Brit. Conch., p. 192.

Crassina Danmoniensis, Lamarck.

Crassina Scotica, Turton.

Venus crassatella, Blainville.

Hab. Northern British Seas.

The normal form of this species is angular and truncated, but in some varieties this peculiarity is lost, and the dorsal line is sloped. The variety named *Scotica* sometimes occurs smooth on the inner edge.

Species 4. (Mus. Brit.)

ASTARTE ELLIPTICA. *Ast. testā compressā, oblongo-ovatā; latre postico producto, ad terminū subtruncato; sulcis concentricis medio et infrā obsoletis; umbonibus acuminatis; margine postico-dorsali leviter declivi.*

THE ELLIPTIC Astarte. Shell compressed, oblong-ovate; posterior side produced, rather truncated posteriorly; concentric grooves obsolete in the middle and under; umboes acuminate; posterior dorsal margin gently sloped.

BROWN. Illus. Conch., p. 96, Pl. XXXVIII. f. 3.

Astarte semisulcata, Muller, not Leach.

Crassina sulcata, Nilsson.

Crassina ovata, Brown.

Hab. Northern Europe.

Species 5. (Mus. Brit.)

ASTARTE SUBEQUILATERA. *Ast. testā ovatā, compressā; latre antico pauciō breviori, declivi; umbonibus obtusis, haud prominentibus; latre postico subangulato, ad terminū subtruncato; margine ventrali convexo; rugis concentricis crebris, ad latra subvenanidis.*

THE SUBEQUILATERAL Astarte. Shell ovate, compressed; anterior side a little shorter, sloped; umboes obtuse, not prominent; posterior side

rather angular, rather truncated at the end; ventral margin convex; concentric wrinkles crowded, somewhat evanescent at the sides.

SOWERBY. Thesaurus Conchyliorum, Astarte, No. 6.

Hab. Newfoundland.

The umboes in this species are obtuse, and more nearly central than in most others.

Species 6. (Mus. Sowerby.)

ASTARTE ABBREVIATA. *Ast. testā parvī, crassissimā, suborbiculari, altā, brevi, crebrē et aquaditer sulcatā; latre antico brevissimo, valde declivi; latere postico subquadrate; umbonibus elevatis, rotundis, margine dorsali declivi, margine interno levī.*

THE ABBREVIATED Astarte. Shell small, very thick, suborbicular, elevated, short, finely and equally grooved; anterior side very short, much sloped; posterior side subquadrate; umboes elevated, rounded, dorsal margin sloped, inner margin smooth.

SOWERBY.

Hab. —?

Species 7. (Mus. Brit.)

ASTARTE BANKSI. *Ast. testā tumidā, suborbicularatā, altā; crebrimē sulcatā; umbonibus elevatis; latere antico propè umboes excavato, versū marginem ventralē producto, rotundato; latere postico antē angulum vix conspicuum posticum subdepresso; margine dorsali convexo declivi.*

BANKS'S Astarte. Shell tumid, suborbicular, elevated; very closely grooved; umboes raised; anterior side excavated near the umboes, produced towards the ventral margin, rounded; posterior side a little depressed in front of a scarcely perceptible posterior angle; dorsal margin convexly sloped.

LEACH. Ross's Voyage, Appendix.

Astarte pulchella, Jonas.

Hab. Greenland.

A S T A R T E.

PLATE II.

Species 8. (Mus. Brit.)

ASTARTE QUADRANS. *Ast. testā quadrato-subtrigonā, compressā, altī, subrepandatā, tenuiūsculā, tenūcīstriatā; latere antico breviō; latere postico obliquē declīsi, ad terminum subtruncato; margine interno laxigato.*

THE QUADRANT ASTARTE. Shell rather square, sub-trigonal, compressed, elevated, rather equilateral, rather thin, finely striated; anterior side rather the shorter; posterior side obliquely sloped, somewhat truncated at the end; inner margin smooth. GOULD. Invertebrata of Massachusetts, p. 81, f. 48.
Hab. North America.

Species 9. (Fig. a, b, Mus. Brit.)

ASTARTE CRENATA. *Ast. testā ovatā, inflatā, tenuiūsculā, antice usque ad medium concentricā tenuiter liratā, posticō levigatō; epidermīs tenui, flavidī; cardine angusto; margine ventrali intus crenato.*

THE CRENATED ASTARTE. Shell ovate, inflated, rather thin anteriorly, as far as the middle concentrically finely ridged, posteriorly smooth; epidermis thin, yellowish; hinge narrow; ventral margin crenated within.

GRAY. Brit. Mus.

Astarte oblonga, Sowerby.

Hab. —?

On careful examination I am able to identify the shell I called *Astarte oblonga*, with the specimens of Dr. Gray's *A. crenata*. The latter are younger shells.

Species 10. (Mus. Brit.)

ASTARTE CEREBICOSTATA. *Ast. testā ovato-subtrigonā, compressā; costis concentricis numerosis, crebris, post angulum posticum evanidis; latere antico rotundo, breviūsculo; latere postico producto, angulato, post angulum levigato, planido; margine dorsali obliquē declīsi, ad terminum truncato.*

THE CLOSE-RIBBED ASTARTE. Shell ovate-subtrigonal, compressed; concentric ribs numerous, crowded, disappearing behind the posterior angle; anterior side rounded, rather short; posterior side produced, angular, smooth and flat behind the angle; dorsal margin obliquely sloped, truncated at the end.

FORBES. Ann. Nat. Hist., vol. xix, p. 98.

Hab. North Britain.

The early figures of this shell were taken from one or two dead specimens deprived of their epidermis. There are now fresh specimens in the British Museum.

Species 11. (Mus. Brit.)

ASTARTE UNDATA. *Ast. testā ovato-subtrigonā, altī; rugis concentricis magnis, distantibus, post angulum posticum subsoletis; umbonibus acuminatis; latere antico brevi; latere postico obliquē producto; margine interno crenulato.*

THE WAVED ASTARTE. Shell ovate-subtrigonal, elevated; concentric wrinkles large, distant, rather obsolete behind the posterior angle; umbones acuminate, anterior side short; posterior side obliquely produced; inner margin crenulated.

GOULD. Invertebrata of Massachusetts.

Astarte latisulca, Hanley.

Hab. North America.

Normally a more trigonal or sloping shell than *Astarte sulcata*, with the ribs far more strong and distant.

Species 12. (Mus. Hanley.)

ASTARTE SEMISULCATA. *Ast. testā oblongā, subcompressā, versūs umbones tenuiter rugatā; latere antico breviūsculo, margine dorsali prop̄ umbones excavato; latere postico producto, ad terminum truncato, margine dorsali rectiūsculo.*

THE HALF-GROOVED ASTARTE. Shell oblong, subcom-

ASTARTE.—PLATE II.

pressed, finely wrinkled towards the umboes; anterior side rather short, with dorsal margin excavated near the umboes; posterior side produced, truncated at the end, with dorsal margin rather straight.

LEACH (Crassina). Ann. Phil. 14, fig. 204.
Hab. North Seas.

Species 13. (Mus. Brit.)

ASTARTE INTERMEDIA. *Ast. testā ovato-subtrigonā, utrīngue subacuminatō; rugis numerōsis, rotundis, propē marginē posticum subcanalidī; umbonibus elevatis, margine dorsali utrīngue declivibus; margine interno levī.*

THE INTERMEDIATE ASTARTE. Shell ovate-subtriangular, rather acuminate at each end; wrinkles numerous, rounded, partly disappearing near the posterior margin; umboes elevated, dorsal margin sloped at each side; inner edge smooth.

SOWERBY. Thesaurus Conchyliorum, Astarte, Sp. 3.
Hab. North Europe.

Resembling *Astarte undata* in form, but more pointed, and having many more ribs than *A. sulcata*; almost as many as *Astarte crebricostata*.

Species 14. (Mus. Brit.)

ASTARTE MORTONI. *Ast. testā ovato-suborbiculari, compressā; rugis concentricis distantiib; validis, versūs marginē utrīngue discontinuis; interstitiis latis, profundè excavatis; umbonibus obtusis; latere antico brevi, rotundo; latere postico producto, obscurè truncato; margine ventrali rotundatim convexo; margine interno levigato.*

MORTON'S ASTARTE. Shell ovate-suborbicular, compressed; concentric wrinkles distant, strong, discontinued near the margin on each side; interstices broad, deeply excavated; umboes obtuse; anterior side short, rounded; posterior side produced, obscurely truncated; ventral margin roundly convex; inner margin smooth.

ADAMS—?

Astarte undata, var.? Sowerby in Thesaurus.
Hab. North America.

My only authority for this species is a specimen named as above in the Cumingian collection; not the undeveloped shell quoted in the Thesaurus, but a mature shell of rounded form and dark black epidermis.

Species 15. (Mus. Sowerby.)

ASTARTE SEMILIRATA. *Ast. testā ovato-subtrigonā, elevatā, medio obliquē tumidā; latere antico obliquē producto, infīrū umboes excavato; umbonibus retrorsis, prominentib; acuminatis; latere postico declivi, obscurissimē truncato, margine ventrali acclivi; rugis concentricis versūs umboes numerosis, concavis, acutis, medio et infīrū evanidis.*

THE HALF-RIDGED ASTARTE. Shell ovate-subtriangular, elevated, obliquely tumid in the middle; anterior side obliquely produced, excavated under the umboes; umboes leaning backwards, prominent, acuminate; posterior side sloped, very obscurely truncated, ventral margin sloped upwards; concentric ridges near the umboes numerous, neat, sharp, becoming obscure at the middle and below.

SOWERBY.
Hab. Northern Seas.

Species 16. (Mus. Brit.)

ASTARTE TRIANGULARIS. *Ast. testā parvā, altā, obliquē trigonā, tumidā, politā; umbonibus prominentib; ferē terminalib; latere antico ferē perpendicularari; latere postico declivi, ad marginem ventralum producto; margine interno crenulato.*

THE TRIANGULAR ASTARTE. Shell small, elevated, obliquely trigonal, tumid, polished; umboes prominent, nearly terminal; anterior side almost perpendicular; posterior side sloped, produced at the ventral margin; inner margin crenulated.

MONTAGU (Maetra). Test. Brit., p. 99, pl. 3, f. 5.
Goodallia triangularis, Turt.
Hab. North Britain.

A S T A R T E.

PLATE III.

Species 17. (Fig. a, b, Mus. Brit.)

ASTARTE FUSCA. *Ast. testā suborbiculari, crassā, castanā, rubro obscurè radiatā, propè umboes concentricè, crebre et concinè liratā; umboes subterminalibus; latere antico brevissimo; margine ventrali rotundato, margine postico-terminali subtruncato.*

THE BROWN ASTARTE. Shell rather orbicular, thick, chestnut, obscurely rayed with red, concentrically, closely, and neatly ridged near the umbones; umboes nearly terminal; anterior side very short; ventral margin rounded, posterior terminal margin slightly truncated.

POLI (Tellina). Test. Sic. Tab. 15. f. 22, 23.

Hab. Mediterranean.

Species 18. (Mus. Brit.)

ASTARTE LACTEA. *Ast. testā magnā, compressā, ovato-subtrigonā, epidermide crasso, nigro indutā, propè umboes tenuiter concentricè liratā, intus lactea; latere antico brevi, declivi; latere postico obliquè producto; margine dorsali declivi, ad terminum subtruncato; margine interno levigato.*

THE MILK-WHITE ASTARTE. Shell large, compressed, ovate, subtriangular, covered with a thick black epidermis, finely concentrically ridged near the umboes, milk-white within; anterior side short, sloped; posterior side obliquely produced, dorsal margin sloped, somewhat truncated at the end; inner margin smooth.

BRODERIP. Zoological Journal, vol. iv. p. 356.

Hab. North Europe.

The wrinkles, although fine and distinct near the umboes, are continued a very little way from them in most specimens.

Species 19. (Mus. Brit.)

ASTARTE PRODUCTA. *Ast. testā oblongo-ovatā, compressā, ad umboes, et ferè ad medium tenuiter et regulariter liratā, versùs marginem levigati; latere antico paulò producto; latere postico elongato, ad terminum subacuminato; margine dorsali leviter declivi; margine interno levigato.*

THE PRODUCED ASTARTE. Shell oblong-ovate, compressed, finely and regularly ridged at the umboes and nearly as far as the middle, smooth towards the margin; anterior side a little produced; posterior side elongated, rather acuminate at the end; dorsal margin slightly sloped; inner margin smooth.

SOWERBY.

Hab. North Europe.

The difference between this species and *Astarte laetitia* is the same as that which causes *Ast. elliptica* to be separated from *Ast. sulcata*, namely, a prolongation in form.

Species 20. (Mus. Brit.)

ASTARTE SUBTRIGONA. *Ast. testā crassā, subtrigonā, epidermide castanea induta, intus ad marginem laxe, versùs umboes et ad medium subirregulariter liratā, medio ad marginem levā; latere antico tumido, subrotundo; latere postico angulato, antē angulum compresso; margine dorsali caldè declivi.*

THE SUBTRIGONAL ASTARTE. Shell thick, subtriangular, covered with a chestnut epidermis, smooth at the margin within, rather irregularly ridged towards umboes and to the middle, from the middle to the margin smooth; anterior side tumid, rather

ASTARTE.—PLATE III.

round; posterior side angular, compressed in front of the angle, dorsal margin much sloped.

SOWERBY.

Hab. Northern Seas.

This shell is so decidedly different in form from the normal specimens of *Astarte arctica*, that it seems desirable to separate it.

Species 21. (Fig. *a, b*, Mus. Brit.)

ASTARTE ARCTICA. *Ast. testā elliptico-suborbiculari,
subcompressa, propè umbones medioque subirregu-
lari liratā, versūs marginem lavigatā: latere
autō brevissimo; latere posticō obscurē angulato,*

*truncato; margine dorsali declivi; margine ventrali
rotundo, intus lavigato.*

THE ARCTIC ASTARTE. Shell elliptical-suborbicular, subcompressed, rather irregularly ridged near the umboes and at the middle, smooth towards the margin; anterior side very short; posterior side obscurely angular, truncated; dorsal margin sloped; ventral margin rounded, smooth within.

GRAY (Crassina). App. Capt. Parry's Voyage.

Venus borealis, Chemnitz.

MONOGRAPH
OF THE GENUS
VENERUPIS.

"Ocean exhibits fathomless and broad,
Much of the pow'r and majesty of God."—*Croper.*

VENERUPIS.

PLATE I.

Genus. VENERUPIS, Lamarck.

*Testa subde irregularis, inaequilateralis, exovalvis,
oblonga, plerisque concentricè laminata, radiatim
striata, antice paulò lata.* Impressio muscularis
posticè dura, rotunda, coniformis. Impressio pallii
posticè latè et profundi sinuata. Cardo in valva
dextra tridentata, in valva sinistra bidentata. Ligamentum
externum.

Shell very irregular, inequilateral, equivalve, oblong, generally concentrically laminated, radiately striated, anteriorly a little gaping. Muscular impressions two, large, kidney-shaped. Paléal impression posteriorly and deeply sinuous. Hinge tridentate in right valve, and bidentate in the left. Ligament external.

Spp. Invs. Oken. REPELLARIA, Pl. de Bellevue.

The shells of this genus are found in holes and crevices of rocks, where they are fixed by a hyssus passing between the gaping valves. It is rather difficult to distinguish some of the species from the more irregular rock-inhabiting Tapes on the one hand, and the more Tapes-like Petrieola on the other. The concentric laminae, however, are the more prominent in this genus; whereas the reverse is the case in the Petrieola, and the posterior side is generally truncated, and does not tend to end in a point. The Venerupes are more numerous in northern and temperate climates; many species are European, being found in Scandinavia and the British Islands. There are, however, some species in Australia, and some in the Philippines.

Species 1. (Mus. Brit.)

VENERUPIS CORDIERI. *Ven. testa oblonga, inflata, subcylindrica, laminis concentricis crassis, posticè latioribus, inflexis exfoliatâ; latere antico brevi, decliri, infra subacuminato; umbonibus acuminatis,*

subterminalibus; latere postico elongato, obliquè angulata; margine dorsali rectissimo, margine terminali perpendiculari.

CORDIER'S VENERUPIS. Shell oblong, inflated, rather cylindrical, exfoliated with concentric, thick laminae, wider and inclined posteriorly; anterior side short, sloped, a little acuminate below; posterior side elongated, obliquely angular; dorsal margin rather straight, terminal margin perpendicular.

DESHAYES. Revue Zoologique, 1839.

Hab. California.

Species 2. (Fig. a, b, Mus. Brit.)

VENERUPIS INSIGNIS. *Ven. testa inflata, irregulari radiatim striata, aurantiâ, carmine purpureo-que nebulata, intus rubro-violacea; latere antico brevissimo; umbonibus forcè terminalibus; latere postico producto, obliquè tumido, margine terminali supernè declivis.*

THE WONDERFUL VENERUPIS. Shell inflated, irregular radiately striated, orange, clouded with blue and purple, red-violet within; anterior side very short; umbos nearly terminal; posterior side produced, obliquely tumid, terminal margin sloped above.

DESHAYES. Proc. Zool. Soc., 1853.

Hab. New Zealand.

Of very rich colour and very irregular growth.

Species 3. (Mus. Brit.)

VENERUPIS CRENATA. *Ven. testa oblongo-subquadratâ, posticè obliquè angulata, aurantio purpureo-que nebulata, radiatim striata, concentricè laminis extantibus, crenulatis, posticè latioribus exfoliatâ; latere antico brevi, umbonibus tumidis, subterminalibus; latere postico elongato, margine rectangulari.*

VENERUPIS.—PLATE I.

THE CRENATED VENERUPIS. Shell oblong-subquadrate, posteriorly obliquely angular, clouded with orange and purple; radiately striated, concentrically exfoliated, with outstanding crenulated laminæ, broader posteriorly; anterior side short, umboes tumid, nearly terminal; posterior side elongated, with rectangular margin.

LAMARCK. Anim. sans Vert.
Hab. New Holland.

A beautiful shell, highly characteristic of the genus.

Species 4. (Mus. Brit.)

VENERUPIS MIRABILIS. *Ven. testā oblongo-subquadratā, vallē inflatā, omnino striis angulatim divercatis minutissimè sculptā; latere antico brevi, rotundo; umbonibus inflatis; latere postico producto, obtuse angulato.*

THE ADMIRABLE VENERUPIS. Shell oblong-subquadrate, much inflated, very minutely sculptured in every part with angularly diverging striae; anterior side short, rounded; umboes inflated; posterior side produced, obtusely angular.

DESIHAYES. Proc. Zool. Soc., 1853.
Hab. Monterey, California.

The curious zigzag structure of the surface is similar to that of *Venerupis testa*, but it is very much more minute.

Species 5. (Mus. Sowerby.)

VENERUPIS CARDITOIDES. *Ven. testā pallidā, oblongā, concentricē laminis extantibus, subcrenatis, distantibus, posticē latioribus exfoliatā, sulcis subdistantibus, inequalibus, angulatis radiatā; latere antico brevi, umbonibus depresso; latere postico oblongo, cuneato, obliquè angulato, margine terminali subobliquè truncato.*

THE CARDITA-LIKE VENERUPIS. Shell pale, oblong, concentrically exfoliated with outstanding slightly crenated distant laminae, wider posteriorly, rayed with rather distant unequal, angular sulci; anterior side short, umboes depressed; posterior side oblong, cornered, obliquely angular, terminal margin rather obliquely truncated.

LAMARCK. Anim. sans Vert.
Hab. New Holland.

The distance of the ribs or sulci from each other varies in different specimens and in different parts of the same shell, but there are generally a few broader ones a little in front of the posterior oblique angle.

Species 6. (Mus. Brit.)

VENERUPIS DIGONA. *Ven. testā parvā, tenui, pallidā, antice tenuiter, posticē latē laminatā, laminis posticē biangulatis, ad angulos subspiniferis, inter angulos inflectis; latere antico brevissimum, angusto; latere postico obliqui angulato, lato, marginē dorso-terminali rectangulari.*

THE TWO-SIDED VENERUPIS. Shell small, thin, pale, anteriorly thinly, posteriorly widely laminated, laminae posteriorly biangular, rather spinose at the angles, bent inwards between the angles; anterior side very short, narrow; posterior side obliquely angular, broad, dorso-terminal margin rectangular.

DESHAYES ——?

Hab. ——?

Species 7. (Mus. Sowerby.)

VENERUPIS ATTENUATA. *Ven. testā elongatā, cylindricā, radiatim minutē striatā; intus latea, prop̄ marginem terminalē purpuro ubalatā; latere antico brevissimum, umbonibus ferī terminalibus; latere postico elongato, obliquō angulato, antē angulum subcontracto; post angulum irregulariter laminato, ad terminalē truncato.*

THE ATTENUED VENERUPIS. Shell elongated, cylindrical, radiately minutely striated; yellowish within, clouded with purple near the terminal margin; anterior side very short, umbones nearly terminal; posterior side elongated, obliquely angular, a little contracted in front of the angle; irregularly laminated behind the angle, truncated at the end.

SOWERBY.

Hab. ——?

A curious little cylindrical species.

Species 8. (Mus. Brit.)

VENERUPIS DILECTA. *Ven. testā elongatā, raditio striatā, concentricō laminis crenulatā, posticē producitoribus exfoliatā; latere postico lato, obliquē subquadrate; latere antico acuminatum producto; marginē ventrali contracto.*

THE NEGLECTED VENERUPIS. Shell elongated, radiately striated, concentrically exfoliated with crenulated laminae, more produced posteriorly; posterior side broad, obliquely subquadrate; anterior side acuminate produced; ventral margin contracted.

DESHAYES. Proc. Zool. Soc., 1853.

Hab. Philippines.

Species 9. (Mus. Brit.)

VENERUPIS TEXTA. *Ven. testā oblongo - subquadratā, tenui, inflati, pallidi, striis rugosis angulatō dicaricatis omnino sculptā; latere antico brevissimum, rotundo; medio planulato, lato; latere postico producta, obscurissimē angulato; marginē dorsali vis declivi; marginē ventrali rectūsculo.*

THE TEXTURED VENERUPIS. Shell oblong-subquadrate, thin, inflated, pale, sculptured all over with rough, angularly divergent striae; anterior side rather short, rounded; middle flattened, broad; posterior side produced, very obscurely angular, dorsal margin scarcely sloped; ventral margin rather straight.

DESHAYES ——? MS. Mus. Brit.

Hab. N.E. Australia.

Lighter but coarser in texture than *Venerupis mirabilis*.

Species 10. (Fig. a, b, Mus. Brit.)

VENERUPIS FOLIACEA. *Ven. testā ovato-suborbiculari, compressiūscula, sulcis duplicatis subdistantibus radiati, laminis distantibus, crenulatis extantibus, tenuibus, lati posticē angulum formantibus exfo-*

VENERUPIS.—PLATE II.

latitudo intus flavidat proprie marginem cubro-violaceam;
latere antico brevissimo, umbonibus depresso; latere
postico angulatum expenso, margine dorsali elevato,
subarcuato, margine terminali latè truncato;
margine ventrali convexo, intus crenato.

THE LEAFY VENERUPIS. Shell ovate-suborbicular, rather compressed, rayed with duplicate, rather distant grooves; exfoliated with distant, crenulated, outstanding thin broad laminae forming an angle, posteriorly, yellowish within, reddish-violet near the margins; anterior side very short; umboes depressed; posterior side angularly expanded; dorsal margin raised, a little arched, terminal margin broadly truncated; ventral margin convex; crenated within.

DESHAYES. Proc. Zool. Soc., 1853.

Hab. Mazatlan.

It may be a question whether this beautifully ornamental shell should not have been included in the genus *Venus*.

Species 11. (Mus. Hanley.)

VENERUPIS EXOTICA. *Ven. testa oblongata, subrectangula, albida, lineis rubris postice picta; radiatum distanter, acutè sulcatu;* *laminis crenatis, subdivisatis, extantibus, postice latioribus, angulatis,*

exfoliatâ; latere antico breviuscule; latere postico oblongo, margine terminali recto.

THE EXOTIC VENERUPIS. Shell oblong, rather rectangular, whitish, painted with red lines posteriorly; radiately, distinctly, sharply grooved; exfoliated with rather distant, outstanding crenated laminae, wider and angular posteriorly; anterior side rather short; posterior side oblong, terminal margin straight.

HANLEY. Wood's Index Testaceologicus.

Hab. New Holland.

Species 12. (Fig. a, b, c, Mus. Brit.)

VENERUPIS CYLINDRACEA. *Ven. testa irregulari, levigata,*
subcylindrica, concentricè striata, postice angulata,
productâ, ad terminum truncata.

THE CYLINDRICAL VENERUPIS. Shell irregular, smooth, subcylindrical, concentrically striated, posteriorly angular, produced, truncated at the end.

DESHAYES (Petricola). Revue Zoologique.

Petricola californica, Conrad.

Petricola arcuata, Deshayes.

Petricola subglobosa, Sowerby.

PLATE III.

Species 13. (Mus. Brit.)

VENERUPIS BREVIS. *Ven. testa inflata, brevi, subquadrata; pallida; umbra, intus et ad umbrae violacei, radiatim costata, brevi antice brevissima; latera postice angulata, marginis ventrali convexa.*

THE ORT. VENERUPIS. Shell inflated, short, subquadrate, pale greenish yellow, inside and at the umboes violaceous, radially costated; anterior side very short; posterior side angular, ventral margin convex.

DESHAYES. Proc. Zool. Soc., 1853.

Hab. —?

Described from a specimen in the Cumingian collection.

Species 14. (Fig. a, b. Mus. Hanley.)

VENERUPIS TUMIDA. *Ven. testa pallidâ, flavidâ, ventricosâ, concentricâ tenuiter costata, inter costas tenuissimâ striatâ, antice brevissimâ, angustata, media inflata, postice expanso, angulata, marginis dorsali angustata elevata.*

THE TUMID VENERUPIS. Shell pale yellowish, ventricose, concentrically finely ribbed, between the ribs very finely striated, anteriorly very short, narrow, inflated in the middle, posteriorly expanded, angular, dorsal margin angularly elevated.

SOWERBY. Thesaurus Conchyliorum. Venerupis, Sp. 27.

Hab. —?

A pretty little species described from Mr. Hanley's shell.

Species 15. (Mus. Brit.)

VENERUPIS PULCHERRIMA. *Ven. testa elongata, subcylindrica, postice quadrata, laminis crassiusculis,*

lateralibus, extenuatis, pallidâ angulatis exfoliatâ, latera antice longissima, umbonibus ferâ terminalibus, latera postice elongata, marginibus rectius crenatis.

THE VERY BEAUTIFUL VENERUPIS. Shell elongated, subcylindrical, posteriorly quadrate, exfoliated with rather thick, smooth, outstanding posteriorly angular laminae; anterior side very short; umboes nearly terminal; posterior side elongated, margins rather straight.

DESHAYES. Proc. Zool. Soc.

Hab. Isl. Samar, Philippines.

Species 16. (Mus. Brit.)

VENERUPIS CHINENSIS. *Ven. testa oblongo-subquadrata, depressa, subincurvata, albâ, levigata, laminis erectis crassiusculis postice angulatis, productioribus exfoliatâ; latera antice brevissima; latere postice subattenuata; margine dorsali declivi.*

THE CHINESE VENERUPIS. Shell oblong, subquadrate, depressed, rather irregular, white, smooth, exfoliated with erect, rather thick laminae, posteriorly angular and more produced; anterior side very short; posterior side rather attenuated; dorsal margin sloped.

DESHAYES. Proc. Zool. Soc.

Hab. Flo-Flo, Isl. Panay, Philippines.

Collected by the late Mr. Cuming on rocks at low water.

Species 17. (Mus. Sowerby.)

VENERUPIS DIEMENENSIS. *Ven. testa oblongo-subquadrata; ventricosa, crassa, radiatim costata, intus violacea.*

VENERUPIS.—PLATE III.

concentricè crenulatum et striatâ, costis depressis, serratis, margine dorsali rectiusculo; margine terminali truncato; margine ventrali convexo, intus crenulato.

THE VAN DIEMEN'S LAND VENERUPIS. Shell oblong-subquadrate, ventricose, thick, radiately ribbed, violet within, concentrically crenulated and striated, ribs depressed, serrated, dorsal margin rather straight; terminal margin truncated; ventral margin convex; crenulated within.

Quoy. Voy. Astr., pl. 84, figs. 25, 26.

Hab. Van Diemen's Land.

Very Tapes-like in form and remarkably solid.

Species 18. (Mus. Brit.)

VENERUPIS CUMINGII. *Ven. testâ ovatâ, subcareaâ, purpureo nebulatâ, inaequivalvi, subdepressâ, radiatim costatâ; concentricè laminis crenatis, laqueatis exfoliatâ; valvâ dextrâ valvam sinistram superanti, margine foliacea.*

CUMING'S VENERUPIS. Shell ovate, bluish, clouded with purple, inequivalve, subdepressed, radiately ribbed; concentrically exfoliated with crenated, fluted laminae; right valve overlapping the left, with leafy margin.

DESHAYES. Proc. Zool. Soc., 1853.

Hab. —?

Described from the Cumingian Cabinet.

Species 19. (Mus. Brit.)

VENERUPIS OBLONGA. *Ven. testâ ovato-oblongâ, pallidâ, fuliginea, sulcis duplicitis radiatâ, concentricè laminatâ; latere antico brevi, lunulâ distinctâ; latere postico subquadrate, marginâ postico rectangulari.*

THE OBLONG VENERUPIS. Shell ovate-oblong, pale fulvous, rayed with double grooves; concentrically laminated; anterior side short, lunule distinct; posterior side subquadrate, posterior margin rectangular.

SOWERBY. Proc. Zool. Soc., 1834.

Hab. Pascomayo, Peru.

Species 20. (Mus. Brit.)

VENERUPIS SILIQUA. *Ven. testâ oblongâ, cylindricaâ, fuliginea, concentricè laminatâ; laminâs anticâ teretibus, posticâ angulatis, validioribus; latere antico brevi; latere postico elongato, ad terminalium truncato.*

THE POD VENERUPIS. Shell oblong, cylindrical, fulvous, concentrically laminated; laminæ anteriorly thin, posteriorly angular, stronger; anterior side short; posterior side elongated, truncated at the end.

DESHAYES. Proc. Zool. Soc., 1853.

Hab. New Zealand.

Species 21. (Mus. Brit.)

VENERUPIS MONSTROSA. *Ven. testâ ovatâ, inaequivalvi, compressâ, pallida, anticâ medioque decussatim striatâ, posticâ irregulariter concentricè laminatâ; valvâ dextra laminâs valde exfoliatâs et incrassatâs, valvâm sinistrâm superanti.*

THE MONSTROUS VENERUPIS. Shell ovate, inaequivalve, compressed, pale, anteriorly and in the middle decussately striated, posteriorly irregularly concentrically laminated; laminæ of the right valve much exfoliated and thickened, overlapping the left valve.

CHEMNITZ (Venus). Conch. VII. figs. 445, 446.

Hab. Isl. Nicobar, Philippines.

V E N E R U P I S.

PLATE IV.

Species 22. (Mus. Brit.)

VENERUPIS IRIS. *Ven. testa pallidè fulvi, compressa, oblongo-subquadrata; radutum tenuiter sulcata, concentricè laminata, laminae extantibus, levigatis posticè latioribus; laterè antico brevi, subtilè umbonis excavato; umbonibus decumbentibus; medio compresso, marginè recte subrotundato; laterè postico oblongo, subangulato.*

THE IRIS VENERUPIS. Shell pale fulvous, compressed, oblong-subquadrate, radiately finely grooved, concentrically laminated, laminae extant, fluted, broader posteriorly; anterior side short, excavated under the umboes; umboes decumbent; middle compressed, ventral margin a little contracted; posterior side oblong, rather angular.

LINNEÆUS (Doway). *Systema Naturæ.*
Tellina cornuta usque, Pennant, Brit. Zool.
Cucumis foliatus, Costa.
Hab. Great Britain.

Found in Limestone rocks on the more southern coasts of England, Wales, and Ireland.

Species 23. (Mus. Brit.)

VENERUPIS MACROPHYLLA. *Ven. testa oblonga, radutum striatâ, laminae tenuibus, cancellatis, productis, laguatâs, posticè latioribus concentricè, rotundâ; latere antico declivi; latere postico elongato, ad terminum subrotundato; marginè ventrali rectiusculo, marginè dorsali paulò arcuato, declivi.*

THE LARGE LEAF VENERUPIS. Shell oblong, radiately striated, concentrically ornamented with thin, cancellated, produced, fluted laminae, broader at the posterior side; anterior side sloped; posterior side elongated, rather rounded at the end; ventral margin rather straight, dorsal margin a little arched, sloped.

DESHAYES, Proc. Zool. Soc., 1853.

Hab. Philippines.

A more light and delicate shell than *Venerupis Iris*, with the leafy laminae fewer and more prominent.

Species 24. (Mus. Brit.)

VENERUPIS MITIS. *Ven. testa oblonga, rectangularia, laterè radiatâ striatâ, concentricè tenuiter laminata; laterè antico brevi, declivi; latere postico oblonga, obliquè angulata; marginè dorsali recto; marginè terminali latè truncato.*

THE QUILL VENERUPIS. Shell oblong, rectangular, lightly radiately striated, concentrically finely laminated; anterior side short, sloped; posterior side oblong, obliquely angular; dorsal margin straight; terminal margin broadly truncated.

DESHAYES, Proc. Zool. Soc., 1853.

Hab. —?

The habitat of this interesting little shell is unknown.

Species 25. (Mus. Brit.)

VENERUPIS FIMBRIATA. *Ven. testa subovata, radiatum subdistanter sulcatâ; concentricè laminata; laminae extantibus, laguatâs, posticè latioribus; latere antico brevi, subrotunda, umboibus altis; latere po tieo subangulato; marginè dorsali rectiusculo.*

THE FRINGED VENERUPIS. Shell, subovate; radiately rather distantly grooved; concentrically laminated; laminae outstanding, fluted, broader posteriorly; anterior side short, rather rounded, umboes elevated; posterior side rather angular; dorsal margin nearly straight.

SOWERBY, Thesaurus Conchyliorum, *Venerupis*, No. 12, fig. 24.

Hab. —?

A shell in the Cumingian collection, locality unknown.

VENERUPIS.—PLATE IV.

Species 26. (Fig. *a, b*, Mus. Sowerby.)

VENERUPIS RUGOSA. *Ven. testa oblonga, rectiuscula, crassa, non unguinata ad umbones rosco-purpurea, interdum intus postice fusco-purpurea picta, medio anticèque disrupta et angulatim rugosa, posticè rugis concentricis, crassiusculis lirata; latere postico latiusculo, late truncato.*

THE RUGOSA VENERUPIS. Shell oblong, rather straight, thick, sometimes purplish-rose at the umboes, sometimes painted inside posteriorly with purple-brown, wrinkled in the middle in a broken and angular manner, posteriorly ridged with concentric, rather thick wrinkles; posterior side rather broad; widely truncated.

DESHAYES. Proc. Zool. Soc.

Hab. Swan River.

The form is similar to that of *Tapes perakensis*, but the surface is wrinkled in small angles, excepting at the back, where there are regular ridges.

Species 27. (Mus. Hanley.)

VENERUPIS INTERSTRIGATA. *Ven. testa rhomboidala, postice pallida et minime livore rubra reticulata; concentrica crebre laminata, inter laminae minutissimè striata; latere antico angustiusculo, brevi, subibus umboes excavato; latere postico latiori, obliquè angulata, margine dorsali recto; margine terminali late truncato.*

THE INTERSTRIGATED VENERUPIS. Shell rhomboidal, posteriorly reticulated with fine red lines, concentrically closely laminated, very finely striated between the laminae, anterior side rather narrow, short, excavated beneath the umboes; posterior side broader, obliquely angular, dorsal margin straight; terminal margin broadly truncated.

SOWERBY. Thesaurus Conchyliorum, Venerupis, No. 17, fig. 26.

Hab. —?

Species 28. (Mus. Brit.)

VENERUPIS PAUPERCULA. *Ven. testa parva, brevi, oblongo-subquadrate, concentrica irregulariter rugata;*

rugis sublaminatis, subundatis; latere postico obliquè angulato, margine rectangulari.

THE PAUPER VENERUPIS. Shell small, short, oblong, rather square, concentrically irregularly wrinkled; wrinkles sublaminated, rather undulated; posterior side obliquely angular, with rectangular margin.

DESHAYES. Proc. Zool. Soc., 1853.

Hab. Mazatlan.

Species 29. (Mus. Brit.)

VENERUPIS PLANICOSTA. *Ven. testa subquadrate, distanter concentrica laminis distantibus planubetis lirata; radiis minuti striata; latere antico brevissimo; umboes subterminalibus; latere postico subquadrate, margine dorsali declivie; margine ventrali recto.*

THE FLAT-RIBBED VENERUPIS. Shell subquadrate, distantly concentrically ridged with distant flattened, laminae; radiately minutely striated; anterior side very short; umboes nearly terminal, posterior side rather square, with dorsal margin sloped; ventral margin straight.

DESHAYES. Proc. Zool. Soc., 1853.

Hab. —?

More rectangular than *Venerupis obesa*.

Species 30. (Mus. Hanley.)

VENERUPIS INTEJECTA. *Ven. testa oblongo-subquadrate, postice rosco angulatim lineata, laminis concentrica acutis subdistans rugositi, radiatim minutissimè striata; latere postico obliquè angulato, ad terminum expando, latere dorsali recto, elevato, ad terminum cuneato.*

THE INJECTED VENERUPIS. Shell oblong-subquadrate, posteriorly lined with rose, concentrically wrinkled with sharp, rather distant laminae, radiately very minutely striated; posterior side obliquely angular, expanded at the end; dorsal margin straight, elevated, cuneate at the end.

DESHAYES. Brit. Mus. Cat.

Hab. New Holland.

MONOGRAPH

OF THE GENUS

P A N D O R A.

"Thousands of things do Thee employ
In ruling all
This spacious globe." —*Tennyson.*

P A N D O R A.

PLATE I.

Genus PANDORA, Solander.

Testa inequivalvis, inaqualateralis, postivè producta, rostrata, tenuis, compressa, alba, intùs marginituracea. Impressiones musculares duas, rotundas. Valva dextra complanata, unidentata, cartilagine inter costas laminae radiantes recteante marginem posticodorsalem reflexo. Valva sinistra plusminusve convexa, ad marginem centralem plerumque valvam dextram superans.

Shell inequivalve, inequilateral, posteriorly produced, beaked, thin, compressed, white, pearly within. Muscular impressions two, rounded. Right valve flat, single-toothed, cartilage pitted between two radiating laminated ribs, posterior dorsal margin bent backwards. Left valve more or less convex, generally overlapping the right valve at the ventral margin.

The subgenus Kennerlia is founded by Mr. Carpenter upon the species *Pandora glacialis* and another or two, which are said to have an ossicle. This ossicle seems to me to be only a thickening of the sides of the ligament pit; in which case, the generic description of Pandora by Adams as having "no free ossicle" would be correct of all the species including the above mentioned. It is quite possible that an examination of more specimens might modify my view of this matter.

The Pandore burrow in sand and mud at considerable, but varying depths. Britain has two species; other species are found northwards at Spitzbergen, centrally at Panama, and southwards at New Zealand. The number of species has not very largely increased since the publication of the late Mr. G. B. Sowerby's monograph in the Species Chelydiorum; that is to say, it has not done so in proportion to many other genera during that period.

Species 1. (Mus. Brit.)

PANDORA CRISTATA. *Pan. testa altâ, brevi, dolabriiforme compressa; margine ventrali convexissimâ; latere antico brevi, margine dorsali elevato; laminis cuneatis cristato; latere postico ad marginem dorsalem leviter arcuato, in rostrum productum elevatum angustum terminanti, costâ dorsali angustâ, tumida.*

THE CRESTED PANDORA. Shell elevated, short, hatchet-shaped, compressed; ventral margin very convex;

anterior side short, dorsal margin elevated, crested with cuneate laminae; posterior side slightly arched at the dorsal margin; terminating in a produced, raised, narrow beak; dorsal rib narrow, tumid.

CARPENTER — ? Mus. Brit. MS.

Hab. — ?

Distinguished by a jagged crest on the antero-dorsal margin.

Species 2. (Fig. a, b, Mus. Sowerby.)

PANDORA INEQUIVALVIS. *Pan. testa oblongâ, intùs extreto medio et versis undosis fluidâ; latere antico brevi, subrotundo, versis mediana subflexuoso; latere postico producto, margine dorsali paucis arcuatis depresso; rostro obtuso, truncato; costâ dorsali duplicitâ, depresso; valvâ sinistrâ profundi, flexuosa, ad marginem centralem valvam dextram conspicue superant.*

THE INEQUIVALVE PANDORA. Shell oblong, yellow inside and outside in the middle and towards the umbones; anterior side short, rather rounded, rather flexuous towards the middle; posterior side produced, dorsal margin a little depressed with a curve; beak obtuse, truncated; dorsal rib duplicate, depressed; left valve deep, flexuous, conspicuously overlapping the right valve at the ventral margin.

LINNEUS (Tellina). Syst. Nat.

Pandora rostrata, Lamarek.

Hab. Great Britain.

Species 3. (Fig. a, b, Mus. Brit.)

PANDORA WARDIANA. *Pan. testa altâ, semiorbiculare, subrugosâ, pallidissimâ subpurpureâ; latere antico brevi, angusto, ad marginem centralem sive flexuoso emarginato; latere postico acuminato expanso, margine dorsali flexuoso declivis; valvâ dextrâ complanata, sulcis incisis rubris, linearibus, discaricata radiata; valvâ sinistrâ valde convexa, antice sulcâ flexuosa, leviter depressâ radiata.*

WARD'S PANDORA. Shell elevated, semiorbicicular, rather rough, very pale purplish; anterior side short, narrow, emarginated at the ventral margin with a flexuous sinus; posterior side acuminate, expanded, with dorsal margin flexuously sloped; right valve flattened, diversely rayed with incise,

PANDORA.—PLATE I.

red, linear grooves; left valve very convex, rayed anteriorly with a flexuous, lightly depressed groove.

CARPENTER. Proc. Zool. Soc. 1850.

Hab. California.

In our common British species, the deep valve gives very slight indications of a sort of flexuous depression like that which is fully developed in the present species.

Species 4. (Mus. Brit.)

PANDORA ELONGATA. *Pan. testā tenuissimā, compressā, valvā areatā; latere antico brevissimo, angusto, obliquē elevato; latere postico lato, margine ventrali cōcrescentiōe; marginē dorsali, crescentiforme; rostro angusto, producto; costā dorsali tumida; valvā sinistrā planūscula.*

THE ELONGATED PANDORA. Shell very thin, compressed, much arched; anterior side very short, narrow, obliquely elevated; posterior side broad, ventral margin very convex; dorsal margin crescent-shaped; beak narrow, produced; dorsal rib tumid; left valve rather flat.

CARPENTER—? MS. Mus. Brit.

Hab. —?

The peculiarity of this shell is the oblique narrowing of the anterior side and deepening of the ventral margin on the posterior.

Species 5. (Mus. Brit.)

PANDORA OBLONGA. *Pan. testā tenui, attenuatā, rectiūsculā, latere antico angustiūsculo; latere postico elongato, versus rostrum attenuato; rostro truncato; valvā sinistrā moderatō convexā; dente in valvā planolatō ligamentoque minimis.*

THE OBLONG PANDORA. Shell thin, attenuated, rather straight, anterior side rather narrow; posterior side elongated, attenuated towards the beak; beak truncated; left valve moderately convex; tooth in lower valve and ligament very small.

SOWERBY. Species Conchyliorum, Pt. I. Pandora Sp. f. 10.

Hab. River Gambreon.

This species differs from *Pandora inaequivalvis* in its length and narrowness. The tooth and ligament are also very small.

Species 6. (Mus. Brit.)

PANDORA TRILINEATA. *Pan. testā compressā, altiūsculā*

distanter rugatā, crassiūsculā; margine dorsali paulo depresso-arcuato, rostro obtusissimo, truncato; costā dorsali acutā, subnodosa; valvā dextrā ad marginem ventralē vulcam sinistrā superantē; valvā sinistrā planūscula.

THE TRILINEAR PANDORA. Shell compressed, rather elevated, distantly wrinkled, rather thick; dorsal margin a little depressed in a curve, beak very obtuse, truncated; dorsal rib sharp, rather nodose; right valve overlapping left valve at the ventral margin; left valve rather flat.

SAY. Adams, Proc. Zool.

Hab. Ceylon.

More solid and pearly than either of the British species.

Species 7. (Mus. Sowerby.)

PANDORA OLTUSA. *Pan. testā oratā, rectiūsculā, tenui, latere antico brevi, angulato, superne cuneato, latere postico expanso, truncato, marginē dorsali vix depresso; costā dorsali inconspecta; valvā sinistrā convexa, versus umbones rugatā.*

THE OBTUSE PANDORA. Shell ovate, rather straight, thin, anterior side short, narrow, cuneate above; posterior side expanded, truncated, dorsal margin very little depressed; dorsal rib inconspicuous; left valve convex, wrinkled towards the umboes.

LEACH. MS. Brit. Mus.

Mytilus pinna, Pennant.

Anatina truncata, Turton.

Hab. South-west coast of England.

Species 8. (Mus. Brit.)

PANDORA AEUQUATA. *Pan. testā altiūsculā, dolubriforme, latere antico subproducto, marginē rotundō; latere postivo eleganter arcuato; rostro producto, elevato; valvā sinistrā intus medio et versus umbones costellis margaritaceis radiatā.*

THE ARCHID PANDORA. Shell rather elevated, hatchet-shaped, anterior side rather produced; margin rounded; posterior side elegantly arched, beak produced, elevated; left valve rayed inside, in the middle and near the umboes with pearly riblets.

SOWERBY. Species Conchyliorum, Med. Pl. f. 27, 28.

Hab. —?

There is a peculiar radiation of pearly striae in the interior of this shell, which is rather distinctly beaked and gracefully curved.

P A N D O R A.

PLATE II.

Species 9. (Mus. Brit.)

PANDORA RADIATA. *Pan. testā semirotundā, opacā; marginē ventrali convexo; latere antico brevi, marginē dorsali subtūs umbones excavato, ad terminum cuneato; latere postico versus rostrum subattenuato; rostro brevi, truncato; valvā dextrā planulatā, radūtūm sulcatā, sulcis rubris, linearibus; valvā sinistrā concavā; costā dorsali validā.*
THE RAYED PANDORA. Shell half-round, opaque; ventral margin convex; anterior side short, dorsal margin excavated beneath the umboes, cuneated at the end; posterior side a little attenuated towards the beak; beak short, truncated; right valve flat radiately grooved, grooves red, linear; left valve convex, dorsal rib strong.

SOWERBY. Proc. Zool. Soc., 1835.

Hab. —?

Species 10. (Fig. a, b, Mus. Brit.)

PANDORA FILOSA. *Pan. testā semirotundā, opacā, marginē ventrali medio convexo, utrinquā attenuato, acuminato; marginē dorsali recto; latere antico ad marginem ventralem sinuosim contracto; latere postico ante rostrum attenuato, contracto; rostro producto, ad terminum truncato; valvā sinistrā moderatè convexa.*

THE THREADED PANDORA. Shell semi-ovate, opaque, ventral margin convex in the middle, attenuated and acuminate at each end; dorsal margin straight; anterior side sinuously contracted at the ventral margin; posterior side attenuated and contracted in front of the beak; beak produced, truncated at the end; left valve moderately convex.

CARPENTER. Proc. Zool. Soc.

Hab. Puget's Sound.

Species 11. (Fig. a, b, Mus. Brit.)

PANDORA CUMINGII. *Pan. testā compressā, obliquā, arcuatā; latere antico angusto, elevato; latere postico lato, producto, rostrato, marginē dorsali profundi arcuato, ad terminum elevato, marginē ventrali expanso, ante rostrum contracto.*

CUMING'S PANDORA. Shell compressed, oblique, arched; anterior side narrow, raised; posterior side produced, beaked, dorsal margin deeply arched, raised at the end, ventral margin expanded, contracted in front of the beak.

HANLEY. Proc. Zool. Soc., 1861.

Hab. Philippines.

An extraordinarily formed shell belonging to the same group as *P. Ceylanica*, &c.

Species 12. (Mus. Brit.)

PANDORA BREVIFRONS. *Pan. testā tenuissimā, elongatā, rectā, angustā; latere antico brevi, subacuminato, marginē dorsali elevato; latere postico producto, leviter rostrato, marginē dorsali vix arcuato; valvā sinistrā convexā, valvam dextram ad marginem ventralem superanti.*

THE SHORT-FRONTED PANDORA. Shell very thin, elongated, rather straight, narrow; anterior side short, rather acuminate, with dorsal margin raised; posterior side produced, slightly beaked, dorsal margin very little arched; left valve convex, overlapping the right valve at the ventral margin.

SOWERBY. Proc. Zool. Soc., 1835.

Hab. —?

Longer, straighter, and thinner than *P. oblonga*.

PANDORA.—PLATE II.

Species 13. (Mus. Brit.)

PANDORA PUNCTATA. *Pan. testā expansā, latā, arcuatā; latere antico brevi, marginē supra medium subcuneato, intus impresso-punctatō dente unico, a marginē distanti, radiato; latere postico producto, expanso subrostrato, ad terminū elevato, acuminato; marginē dorsali arcuatim depresso; valvā sinistrā ad marginem ventralē expanso.*

THE PUNCTATED PANDORA. Shell expanded, broad, arched; anterior side short, margin with a slight corner above the middle, inside with impressed-punctures rayed with a single tooth distant from the margin; posterior side produced, expanded, slightly beaked, raised at the end, acuminate; dorsal margin depressed in a curve; left valve expanded at the ventral margin.

CUNRAD. Proc. Zool. Soc., 1855.

Hab. —?

Species 14. (Fig. a, b, Mus. Brit.)

PANDORA GLACIALIS. *Pan. testā latā, breviūsculā, ventricosā, crassicūculā, concentricā rugatā; latere antico via cuneato radiatim sulco inconspicuo impresso, ad marginem sinuato; latere postico latiori, brevissimē rostrato, obtuso, prop̄ marginem costis duabus subnoduliferis radiato, ad marginem ventralē convexo; valvā sinistrā profundā, edentulā; valvā dextrā unidentatā; cartilagine in foveam*

instructā; foveā ad laterā laminā calcareā incrassatā.

THE GLACIAL PANDORA. Shell broad, rather short, ventricose, rather thick, wrinkled concentrically; anterior side with a very slight corner, impressed with a slightly radiating groove, sinuated at the margin; posterior side broader, very shortly beaked, obtuse, rayed near the margin with two rather nodulous ribs, convex at the ventral margin; left valve deep, without teeth; right valve with one tooth; cartilage inserted in a pit; thickened at the sides with a calcareous layer.

LEACH. B. M.

Hab. Spitzbergen.

I can scarcely regard this slight thickening at the sides of the cartilage pit and cartilage as a separate osseicle.

Species 15. (Mus. Brit.)

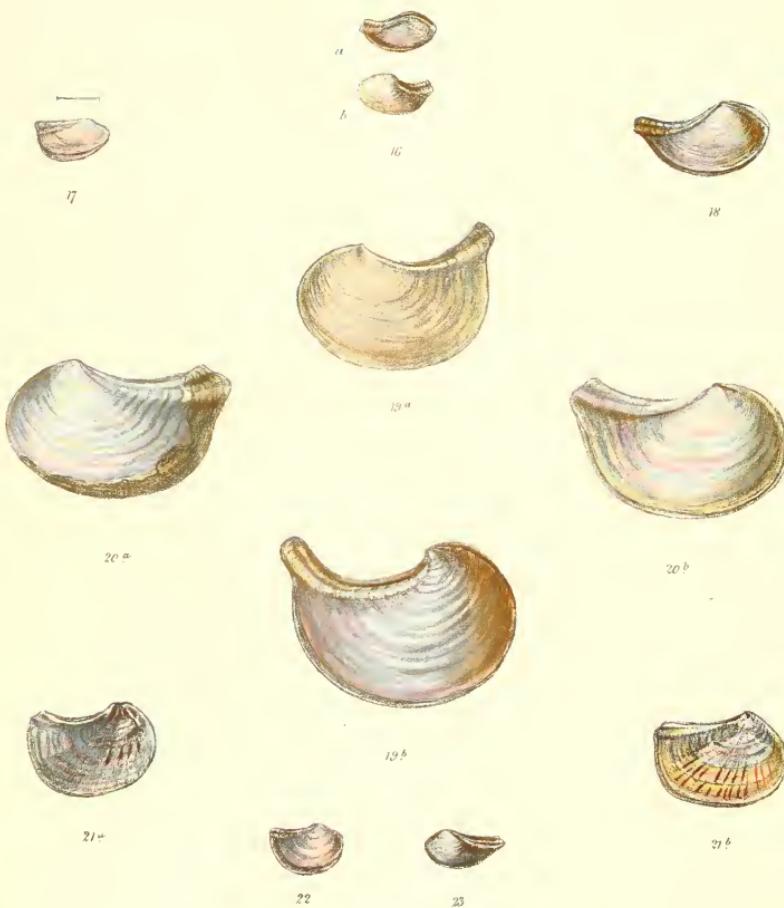

PANDORA BRAZILIENSIS. *Pan. testā brevi, latā, obtusā; latere antico brevissimo; latere postico latē truncato; valvā sinistrā ventricosa.*

THE BRAZILIAN PANDORA. Shell short, broad, obtuse; anterior side very short; posterior side broadly truncated; left valve ventricose.

GOULD —? MS. Brit. Mus.

Hab. Brazil.

I am unacquainted with the upper valve of this shell, which may possibly prove to have been described from a defective specimen.

P A N D O R A.

PLATE III.

Species 16. (Fig. a, b, Mus. Sowerby.)

PANDORA FLEXUOSA. *Pan. testā parvā, breviāsculā, tortuosa; latere antico subacuminato; latere postico attenuato, rostrato, margine dorsali declivi, arcuato, ad terminum elevato, margine terminali truncato; valvā sinistrā profundū, flexuosa; antē rostrum contractū; costis duabus rostralibus validis.*

THE FLEXUOUS PANDORA. Shell small, rather short, tortuous; anterior side slightly acuminate; posterior side attenuated, beaked, dorsal margin sloped, arched, raised at the end, terminal margin truncated; left valve deep, flexuous, contracted in front of the beak; two strong rostral ribs.

SOWERBY. Genera of Shells, No. 2.
Hab. Arabian Gulf.

This beautiful little species is seldom met with.

Species 17. (Mus. Sowerby.)

PANDORA DELICATULA. *Pan. testā parvā, tenuissimā, depressā, medio concentricè leviter rugatā, breviāsculā; antīcē angustā, posticē ad marginem ventralē expansā; antē rostrum leviter contractā; rostro late, depresso, latē truncato, margine dorsali recto.*

THE DELICATE PANDORA. Shell small, very thin, depressed, slightly concentrically wrinkled in the middle, rather short; anteriorly narrow, posteriorly expanded at the ventral margin; a little contracted in front of the beak; beak broad, depressed, broadly truncated, dorsal margin straight.

A. ADAMS. Proc. Zool. Soc.
Hab. Japan.

The specimens from which the figure is taken are young, and I have seen no others.

Species 18. (Mus. —? copied.)

PANDORA NASUTA. *Pan. testā subovatā, arcuatā, medio subexpansā; latere antico subcuneato, margine*

dorsali subalato, declivi; latere postico versus terminum attenuato, conspicuè rostrato; margine dorsali arcuato, margine ventrali autē rostrum contracto, medio convexo.

THE NASUTE PANDORA. Shell subovate, arched, slightly expanded in the middle; anterior side a little cuneate, with dorsal margin slightly alate, sloped; posterior side attenuated towards the end, conspicuously beaked; dorsal margin arched, ventral margin a little contracted in front of the beak, convex in the middle.

SOWERBY. Species Conchyliorum, figs. 18, 19.

Hab. —?

The shell is described in the above work as one of extreme rarity, and as the specimen in the British Museum to which the name is attached does not well agree with the description and original figure, I have thought it best to copy the latter.

Species 19. (Fig. a, b, Mus. Brit.)

PANDORA CEYLANICA. *Pan. testā altā, compressā, dolabiformā, arcuatā, solidiusculā, subequilaterali, concentricè undulatā; intū laminis cardinalibus, unā fornicate, radiatā; latere antico acclivi, margine dorsali subalato; latere postico ad marginem ventralē producto; antē rostrum contracto, margine dorsali profundissimè arcuato; rostro angusto, producto, costā duplicatā rostralī validā, angustā; valvis suberquiditer planulatis.*

THE CEYLON PANDORA. Shell elevated, compressed, hatchet-shaped, arched, rather solid, nearly equilateral, concentrically undulated, rayed within with cardinal layers, one vaulted; anterior side sloped upwards, dorsal margin slightly alate; posterior side produced at the ventral margin; contracted in front of the beak, dorsal margin very deeply arched; beak narrow, produced, double rostral rib strong, narrow; valves almost equally flat.

SOWERBY. Proc. Zool. Soc., 1835.
Hab. Ceylon.

PANDORA.—PLATE III.

Species 20. (Fig. a, b, Mus. Brit.)

PANDORA CLAVICULATA. *Pan. testā altā, dolabiformi, areatā, solidūsculā, concentricē validū undulatū; latere antico elevato, marginē dorsali subdulato; latere postico ad marginem ventralē rotundatim expanso, versū terrenaum sursūm acclivi; marginē dorsali arcuato, rostro terminali acclivi; costis rostralibus crassis, ad terminum elevatis; valvā sinistrā posticē moderatē convexā, flexuosa.*

THE KEY-SHAPED PANDORA. Shell elevated, hatchet-shaped, rather solid, concentrically strongly undulated; anterior side raised, dorsal margin slightly alate; posterior side roundly expanded at the ventral margin; sloped up towards the end; dorsal margin arched, terminal rostrum sloped upwards; rostral ribs thick, raised at the end; left valve posteriorly moderately convex, flexuous.

CARPENTER. Proc. Zool. Soc., 1855.

Hab. —?

Resembling *Pandora Ceylanica* in form, but the under valve is more convex, and the curve of the dorsal margin less strong.

Species 21. (Fig. a, b, Mus. Brit.)

PANDORA DEPRESSA. *Pan. testī altī, solidā, vividē margaritacea, compressi, breviūsculā; latere antico brevissimo; marginē dorsali declivi; latere postico obtuso, viz. rostrato; marginē dorsali leviter arcuato; valvā sinistrā parvā, convexā.*

THE DEPRESSED PANDORA. Shell elevated, solid, brightly pearly, compressed, rather short; anterior side very short; dorsal margin sloped; posterior side obtuse, scarcely beaked; dorsal margin slightly curved; left valve a little convex.

SOWERBY. Species Conchyliorum, Figs. 11, 12.

Pandora tabacea, Gronovius?

Species 22. (Mus. Brit.)

PANDORA DISCOS. *Pan. testā brevi, altā, compressā; latere antico cuneato, subproducto; latere postico breviūsculo; valvā dextri acutē rostratā; costis validis duabus prop̄ marginem radiatā; valvā sinistrā multo ad marginem ventralem, valvam dextram superanti.*

THE DISCORDANT PANDORA. Shell short, elevated, compressed; anterior side cuneate, a little produced posterior side rather short; right valve sharply beaked, rayed near the margin with two strong ribs; left valve much overlapping the right valve at the ventral margin.

SOWERBY. Proc. Zool. Soc., 1835.

Hab. —?

The ventral extension of the deeper valve, from which the name is probably derived, may possibly be a mere imperfection in the specimen described from.

Species 23. (Mus. Brit.)

PANDORA UNGUICULUS. *Pan. testā parvā, arcuata, ventricosa; latere antico subacuminato; latere postico subattenuato, rostro producto, acuminato; costis marginalibus duabus, angustis, approximatis; marginē dorsali leviter arcuato; valvā sinistrā convergē, subflexuosa.*

THE TALON PANDORA. Shell small, curved, ventricose, anterior side rather acuminated; posterior side rather attenuated, beak produced, acuminate; marginal ribs two, narrow, approximate; dorsal margin slightly arched; left valve convex, rather flexuous.

SOWERBY. Species Conchyliorum, figs. 16, 17.

Hab. —?

The posterior side is attenuated gradually towards the beak in this species; whereas in *Pandora flexuosa* it is suddenly contracted.

TRICHOTROPIS.

PLATE I.

Genus TRICHOTROPIS, *Broderip and Sowerby.*

Tista spiralis, carinata, umbilicata, epidermide cornuta
induta; spiræ anfractibus scutatis; aperturæ magna,
autem acuminata canaliculata. Operculum cornutum,
nonspirale, nucleo terminali.

Shell spiral, keeled, umbilicated, covered with a horny
epidermis; whorls of the spire in steps; aperture
large, acuminate anteriorly, with a canal. Oper-
culum horny, not spiral, with terminal nucleus.

Three or four species out of the thirteen are from
Japan, &c., the others are from the northern latitudes
of Europe and America. The species of *Audouin* are
distinguished from those of *Trichotropis*, not only by
the lighter texture, and usually more ovate form of the
shell, but by the absence of an umbilicus.

Species 1. (Fig. a, b, c, Brit. Mus.)

TRICHOTROPIS BOREALIS. *Tri. testæ sulfusiformi, latè
umbilicatâ, quinque-carinatâ, epidermide crasso,
flamulâ fuscâ ad carius hirsuto indutâ, intus
rosâ; spirâ elevatâ; anfractibus paucis, angulatis;
aperturâ latâ, columellâ obliquâ, labio externo tenui,
angulato.*

THE BOREAL TRICHOTROPIS. Shell subfuscous, broadly
umbilicated, five-keeled, covered with a thick
yellow-brown epidermis, with hair at the keels,
pink within; spire elevated; whorls few, angular;
aperture broad, columnella oblique, outer lip thin,
angular.

BRODERIP AND SOWERBY. Zool. Journ. iv. p. 375.

Trichotropis Atlantica. Beck.

Trichotropis umbilicata. Macgillivray.

Trichotropis acuminata. Jeffreys. (Fig. 1, a.)

Hab. Behring Straits, Greenland, North Britain.

The synonyms above quoted appear to be only
conditions and states of the same species. The
second is represented by our figure 1 a. The third is
figured in Thorp's British Marine Conchology as
having all the appearance of an unformed shell.

Species 2. (Mus. Sowerby.)

TRICHOTROPIS BICARINATA. *Tri. testæ angulato-subglobu-
bosâ; anfractibus angulatis, paucis, ultimo maximo,
medio carinis duabus ciliatis, distoantibus cinctis;
umbilico late, margine ciliato; aperturâ maximâ,
subquadratâ, columellâ latâ, infra planatâ, expansa.
Epidermide flavidâ fuscâ.*

THE TWO-KEELED TRICHOTROPIS. Shell angular-subglob-
bose; whorls angular, few; last very large, en-
circled with two ciliated, distant keels; um-
bilicus broad, with ciliated margin; aperture very
large, rather square. Epidermis yellowish-brown.

BRODERIP AND SOWERBY. Zool. Journ. iv.

Hab. Japan.

Species 3. (Mus. Brit.)

TRICHOTROPIS CANCELLOTA. *Tri. testæ pyramidalâ;
spirâ elevatâ; anfractibus subrotundis, ultimo ven-
tricosa, costellis seto crenulatis, ciliatis cincto; um-
bilico pareo; columellâ tenui, arcuatâ; aperturâ
rotundi, autem acutâ.*

THE CANCELLED TRICHOTROPIS. Shell pyramidal;
spire elevated; whorls rather rounded, last whorl
ventricose, encircled with eight crenulated,
ciliated ribs; umbilicus small; columnella thin,
arched; aperture rounded, sharp in front.

HINDS. Proc. Zool. Soc., 1843.

Hab. Sitka, North America.

TRICHOTROPIS.—PLATE I.

Species 4. (Mus. Brit.)

TRICHOTROPIS KUZERI. *Tri. testā subfusiformi, costis distinctis, subdistantibus cinctū, epidermide stramineo-subviridi indutā; spirā conicā, anfractibus paucis; umbilico magno; aperturā magnā, subovatā, antice posticèque acuminatā.*

KUZER'S TRICHOTROPIS. Shell subfusiform, encircled with distinct rather distant ribs, covered with a greenish straw-coloured epidermis; spire conical, with few whorls; umbilicus large; aperture large, subovate, anteriorly and posteriorly acuminate.

PHILIPPI. Menke Zeitschrift, 1848.

Trichotropis Dolium. Petit.

Trichotropis ciliata. Kuzer.

Hab. Spitzbergen.

Species 5. (Mus. Brit.)

TRICHOTROPIS INSIGNIS. *Tri. testā crassā, subgloboſā, epidermide pallidè fuscā indutā, costellis undulatim crenulatis cinctā; aperturā subquadratā, margine crenulato; umbilico parvo.*

THE WONDERFUL TRICHOTROPIS. Shell thick, rather globose, covered with a pale brown epidermis, encircled with undulating crenulated ribs; aperture rather square, with crenulated margin; umbilicus small.

MIDDENDORF. Malac. Ross., p. 107, t. 10, f. 7, 8, 9.

Hab. Behring's Straits.

This species is extremely different from all the rest.

TRICHO TROPI S.

PLATE II.

Species 6. (Mus. Brit.)

TRICHO TROPI S FLAVIDULA. *Tri. testā pyramidatā, angustā, tenui, flavidī; spira elevatā, acuminatā, anfractibus angulatis, costis superi suturam ducibus, cinctis, ultimo quadricestata, inter costas cancellato; umbilico angusto; aperturā pareā, subtriangularē.*

THE YELLOWISH TRICHO TROPI S. Shell pyramidal, narrow, thin, yellowish; spire elevated, acuminate, whorls angular, encircled with two ribs above the suture; the last four-ribbed, cancellated between the ribs; umbilicus narrow; aperture small, subtriangular.

HINDE. Voyage of the *Sulphur*.

ADAMS.

Hab. Sitka, North America.

Species 7. (Fig. a, b, Mus. Brit.)

TRICHO TROPI S CEDO-NULLI. *Tri. testā subpyramidalatā, rufoscutulā, sulcis concentricis et costis moniliformibus spirabilibus cancellatā; spira elevatā; aperturā subrotundā; columellā subtruncatā, retrorsā; labio externo anticē sinuatim producto.*

THE NONPARFIL TRICHO TROPI S. Shell somewhat pyramidal, rather reddish, cancellated with concentric grooves and beaded spiral ribs; spire elevated; aperture rather rounded; columella rather truncated, turned backwards; outer lip sinuously produced in front.

A. ADAMS. Proc. Zool. Soc.

Hab. Japan.

The beauty of this species consists in its cancellated and beaded sculpture.

Species 8. (Mus. Brit.)

TRICHO TROPI S UNICARINATA. *Tri. testā levigatā, orato-*

subfusiformi, epidermide tenui, flavidā indutā; spira elevatā; anfractibus angulatis, ad angulum superne unicarinatis; umbilico lato; aperturā obliquā subquadratā, ad terminum anticum obliquā acuminatā; labio externo ad medium arcuato, supra infringe contracto.

THE ONE-KEELED TRICHO TROPI S. Shell smooth, oval-subfusiform, covered with a thin, yellowish epidermis; spire elevated; whorls angular, with a single keel at the angle; umbilicus broad; aperture obliquely acuminate; outer lip arched at the middle, contracted above and below.

BRODERIE and SOWERBY. Zoological Journal, iv. p. 376.

Hab. Japan.

Species 9. (Fig. a, b, Mus. Brit.)

TRICHO TROPI S QUADRICECARINATA. *Tri. testā pyramidatā, acuminatā, stramineā, epidermide tenui, pallidē fusco indutā; spira elevatā, anfractibus angulatis, suprā suturam bicaninatis; ultimo ventricoso, medio bicaninato; umbilico paucō; aperturā subquadratā, anticē acuminatā; columellā tortuā.*

THE SQUARE-KEELED TRICHO TROPI S. Shell pyramidal, acuminate, straw-coloured, covered with a thin, pale brown epidermis; spire elevated, whorls angular with two keels above the suture; the last ventricose, two-keeled in the middle; umbilicus small; aperture rather square, acuminate anteriorly; columella tortuous.

A. ADAMS. MS.

Hab. Japan.

The whorls have straight sides between the two keels.

TRICHOTROPIS.—PLATE II.

Species 10. (Mus. Erit.)

TRICHOTROPIS CLATHRATA. *Tri. testā fusiformi, epidermide tenui, pallidi indutā, costis, spiralibus submoniliformibus, et costellis interstitialibus regularibus concentricis cancellatā; spirā acuminatā, anfractibus supernē angulatis, carinatis; aperturā subtriangonā, anticē acuminatā; umbilico angusto.*

THE LATTICED TRICHOTROPIS. Shell fusiform, covered with a thin, pale epidermis, cancellated with slightly beaded spiral ribs, and interstitial regular small concentric ribs; spire acuminated, whorls angular, carinated above; aperture subtriangular, anteriorly acuminated; umbilicus narrow.

A. ADAMS. MS.

Hab. New Zealand.

Species 11. (Mus. Brit.)

TRICHOTROPIS INERMIS. *Tri. testā subfusiformi, epidermide stramineo indutā, costis spiralibus submoniliformibus, rotundis, crassissimis crebris et interstitiis angustis striatis sculpti; anfractibus angulatis, supra suturam bicostatis; umbilico mediocri; operatura subcavatā, anticē acuminatā.*

THE UNARMED TRICHOTROPIS. Shell somewhat fusiform, covered with a straw-coloured epidermis, sculptured with slightly beaded, rounded, rather thick, close, spiral ribs, and narrow, striated interstices; whorls angular, two-ribbed above the suture; umbilicus middle-sized; aperture rather ovate, anteriorly acuminated.

HINDS. *Voyage of the Sulphur*, vol. ii., figs. 13, 14.

Hab. N.W. America.

The spiral ribs in this species are rounded and near together.

Species 12. (Mus. Brit.)

TRICHOTROPIS CONICA. *Tri. testā pyramidalē, stramineā, vix umbilicatā; spirā conicā, elevatā; anfractibus tricarinatis, lateribus declivibus; columellā angustā, tortuā; aperturā subquadratā; anticē planatā.*

THE CONICAL TRICHOTROPIS. Shell pyramidal, straw-coloured, scarcely umbilicated; spire conical, elevated; whorls three-keeled with sloped sides; columella narrow, tortuous; aperture rather square, flattened anteriorly.

MÜLLER.

Hab. Greenland.

Species 13. (Mus. Brit.)

TRICHOTROPIS COSTELLATA. *Tri. testā fusiformi, subturbinatā, tenui, costellis tribus superioribus majoribus, tribus quatuor inferioribus hirsutis, cinctā, anguste umbilicatā; aperturā subtriangonā, anticē acuminatā.*

THE SMALL-RIBBED TRICHOTROPIS. Shell fusiform, subturbinate, thin, encircled with three upper, larger, and four lower, smaller, hairy ribs; narrowly umbilicated; aperture subtriangular, anteriorly acuminated.

COUTHOY. *Boston Journal.*

Hab. N. America.

In *Trichotropis Borealis* the ribs are thick and equal. In this species, otherwise much resembling it, the three upper ribs are thin, and the four lower ones still thinner. The entire shell is also thinner, and the umbilicus narrow.
