Minerals Yearbook

CENTENNIAL EDITION 1981

Volume III

AREA REPORTS: INTERNATIONAL

Prepared by staff of the

BUREAU OF MINES

UNITED STATES DEPARTMENT OF THE INTERIOR • James G. Watt, Secretary

BUREAU OF MINES • Robert C. Horton, Director

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities to protect and conserve our land and water, energy and minerals, fish and wildlife, and park and recreation areas, and for the wise use of all those resources. The Department also has a major responsibility for American Indian reservation communities and for the people who live in Island Territories under U.S. administration.

U.S. GOVERNMENT PRINTING OFFICE

WASHINGTON : 1983

Foreword

This edition of the Minerals Yearbook marks the centennial of the first annual publication of comprehensive mineral industry statistics by the Federal Government. The need for complete, reliable mineral statistics on a regular basis was recognized in 1880, when Clarence King, then Director of the United States Geological Survey, stated in his annual report:

"As a whole it is true, and can never be refuted, that the Federal Government alone can successfully prosecute the noble work of investigating and making known the natural mineral wealth of the country, current modes of mining and metallurgy, and the industrial statistics of production."

In response to this suggestion the Forty-seventh Congress, in an appropriations act of August 7, 1882 (22 Stat. 329), placed collection of mineral statistics on an annual basis, stating in the act that "...not to exceed ten thousand dollars of the amount appropriated in this paragraph may be applied under the direction of the Secretary of the Interior to the procuring of statistics in relation to mines and mining other than gold and silver..."

Data on minerals production for 1882, collected under this appropriation, along with census data for 1880 and such data as were available for 1881, were published in a report entitled "Mineral Resources of the United States." That volume began the annual series that has continued unbroken to the present.

"Mineral Resources of the United States" was compiled and published by the Geological Survey from the initial volume through the volume covering 1923. Beginning with the 1924 edition, compilation and publication of this report became the responsibility of the Bureau of Mines, then part of the Department of Commerce. The title "Mineral Resources of the United States" continued in use through the 1931 edition, when after a half century of publication, the title was changed to the current "Minerals Yearbook."

The first "Minerals Yearbook" covered the period 1932-33 and had a statistical appendix. Before the edition was completed, however, the Bureau of Mines was transferred to the Department of the Interior; therefore, the statistical appendix bears the seal of the Department of the Interior, rather than that of the Commerce Department.

Throughout a century of publication, the content, format, and length of these volumes have changed in response to user requirements and a changing industry. Initially a single volume of some 800 pages, the Yearbook became a two-part report "Metals" and "Nonmetals" in 1907 and continued in that format through the 1931 edition. From the combined 1932-33 edition through that of 1951, it returned to single-volume format, although the editions of 1932-33, 1934, and 1935 each had a statistical appendix. Beginning with the 1952 edition, the multivolume format of commodity and geographic area coverage was instituted, continuing through this edition as follows:

1952-62 - Volume I, Metals and Minerals
Volume II, Fuels
Volume III, Area Reports

1963-65 - Volume I, Metals and Minerals
Volume II, Fuels
Volume III, Area Reports, Domestic
Volume IV, Area Reports, International

1966-69 - Volume I—II, Metals, Minerals, and Fuels
Volume III, Area Reports, Domestic
Volume IV, Area Reports, International

1970-76 - **Volume I, Metals, Minerals, and Fuels**
Volume II, Area Reports, Domestic
Volume III, Area Reports, International
1977-81 - **Volume I, Metals and Minerals**
Volume II, Area Reports, Domestic
Volume III, Area Reports, International

Commodity coverage has also changed thoughout the period. Some minerals that were given substantial space in the early volumes no longer have separate chapters, and new mineral commodities have been added. The 1882 edition contained 48 commodity or commodity group chapters whereas this edition contains 71. Data on the mineral fuels, included in the Yearbook from its onset, were deleted beginning with the 1977 edition, when responsibilities for those commodities were transferred to the new Department of Energy.

As we move into the second century of publication, our philosophy remains to publish a viable document responsive to the needs of its varied user community. To this end we continue to invite constructive comments and suggestions from our readers.

Robert C. Horton, *Director*

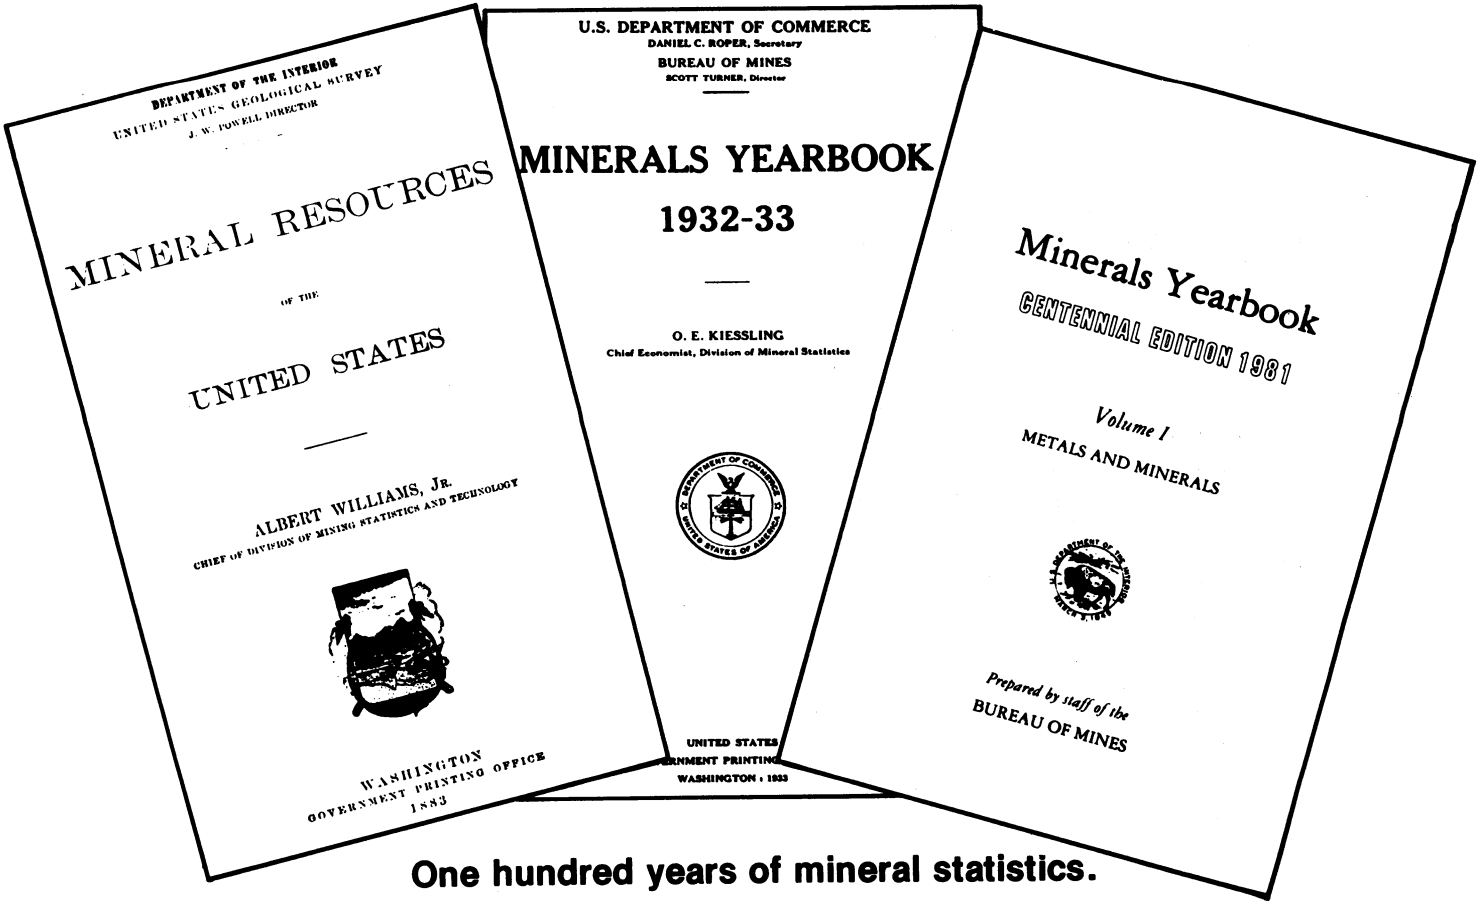
Acknowledgments

In preparing volume III, the Bureau of Mines utilized extensively statistical and other data on mineral production, consumption, and trade provided by various foreign government mineral and statistical agencies through a variety of official publications. The cooperation and assistance of these organizations is gratefully acknowledged: Statistical and informational material was also obtained from airgrams of the U.S. Department of State, from United Nations publications, and from the domestic and foreign technical and trade press. Of particular assistance were the routine and special reports submitted by the minerals, petroleum, economic, and commercial officers and other members of the Department of State. Their contributions are sincerely appreciated.

The text and tables of this volume were prepared by the staff of the Division of Foreign Data, Assistant Directorate, Minerals Information. Final correlation and checking of this volume was performed by the Division of Publication.

The regimes of some countries reviewed in this volume are not recognized by the U.S. Government. The information contained herein is technical and statistical in nature and is not construed as conflicting with or being contradictory of U.S. policies toward these countries.

Albert E. Schreck, *Chief, Division of Publication*



One hundred years of mineral statistics.

Minerals in the World Economy

By Charles L. Kimbell[1] and John Panulas[2]

For the world mineral industry as a whole, the year 1981 was a period of continuation and, in some instances, an acceleration of negative trends extending back into 1980. Most available statistical data reflected stagnation or downturns in activity. Levels of production, trade, and consumption declined for a substantial number of leading mineral commodities, including, most notably, steel and petroleum. Investment, if not lower than in 1980, was evidently increasing at a more modest rate. Prices for major mineral commodities were generally lower, at least in terms of constant dollars, and in some cases even in terms of current dollars. Prospects of a major reversal of these patterns seemed dim. The mineral industry, however, was far from alone in this general downturn; most other elements of the national economies of the world's nations fared little better. General conditions of inflation, recession, and reduced industrial product consumption were reflected in most other sectors of the total economy.

International political events continued to influence mineral output and flow but had less influence on overall levels of activities than on the geographic distribution of these activities. The Iran-Iraq war certainly played a role in reducing mineral industry activities in those nations, but the commodity most affected, petroleum, was available from other sources in sufficient quantity that, in the face of reduced demand, a substantial surplus developed.

In the lands of the eastern Mediterranean, continued internal and international disturbances certainly had an adverse effect on the mineral industries as well as on the general economics of Israel, Syria, Lebanon, and Jordan. However, the relatively small contribution of these nations to world mineral supplies made the impact of these problems minimal on a global basis to the mineral industry.

Similarly, the Soviet incursion into Afghanistan had little impact on world mineral supplies, but that nation's meager mineral output was adversely affected. Of considerably greater world significance were cutbacks in mineral industry activities in Poland as a result of continued worker dissatisfaction and governmental efforts at suppression.

In Africa, problems continued between Angola and the Republic of South Africa in the Namibian area, and the resolution of the political status of Zimbabwe (formerly Southern Rhodesia) did not solve all the problems of that state.

In the Western Hemisphere, continued guerrilla warfare in several Central American Republics curtailed mineral industry activities there.

Efforts continued through the United Nations to achieve international agreement on a Law of the Sea treaty, but there seemed little prospect of agreement by member nations. Moreover, the need for seabed mining, at least in the immediate future, seemed a questionable matter, viewing the developed but unused onshore capacity for the principal minerals available from seabed deposits—manganese, nickel, copper, and cobalt.

PRODUCTION

The estimated value of world crude mineral production in 1981 was $552,200 million in terms of 1978 dollars, an amount approximately equal to the 1980 value, reflecting a stagnation in growth during the year. The output value level for 1980 and 1981 was approximately 2.5% below the historical peak of $566,500 million achieved in 1979. The following table summarizes approximate data on the value of world mineral production for selected years:

Year	Billion constant 1978 dollars	
	Value of 53[1] major crude mineral commodities[2]	Value of all crude mineral commodities[3]
1950	67.8	77.2
1953	88.5	101.7
1958	113.6	136.5
1963	125.7	154.0
1968	145.6	176.5
1973	234.0	281.6
1978	478.9	539.7
1979[r]	502.7	566.5
1980[r]	489.9	552.2
1981	489.9	552.2

[r]Revised.
[1]The list of commodities included appears in table 3 of this chapter; one commodity covered in 1950-68 (beryl) is excluded from the 1973-81 figures, but the overall impact of this omission is regarded as insignificant.
[2]Data for all years except 1979, 1980, and 1981 are as reported in Annales des Mines, November-December 1980, p. 173; data for 1979, 1980, and 1981 are extrapolated from the 1978 Annales des Mines figures on the basis of the United Nations index of extractive industry production in the United Nations Monthly Bulletin of Statistics, August 1982, p. xiv.
[3]Data extrapolated from values for 53 commodities to compensate for other mineral products. For details on the basis for this extrapolation, see accompanying text under "Value of World Mineral Production."

The foregoing data, however, do not completely portray the role of the mineral industry in the world economy, in that they represent only the value for crude mine output (raw materials from mines, quarries, and wells), rather than the considerably enhanced value that results from beneficiation, smelting, refining, and other equivalent downstream processing. If the value added through such processing were included, a 1981 figure on the order of $1,300,000 million (1978 dollars) could be regarded as a conservative estimate of the value of output of mineral industry plants operating from primary materials only. An additional unestimated increment should also be considered for the value of those processed materials recovered from secondary sources—scrap and other reclaimed materials.

It should be stressed that crude and processed mineral commodities constitute not only the overwhelmingly dominant share of the total raw material base for all manufacturing operations but also, in the form of fertilizers, a significant requirement for the agricultural sector and the only significant source of energy for all sectors of the economy of the world as a whole.

PRODUCTION INDEX PATTERNS

The following tabulation summarizes the growth in world mineral industry output as reflected by the United Nations indexes for extractive mineral industry components:

Year	Index numbers (1975=100)			
	Coal	Crude petroleum and natural gas	Metals	Extractive industry total
Annual averages:				
1978	101.1	116.2	101.4	112.7
1979	106.2	122.0	103.8	118.3
1980	109.4	117.1	105.5	115.3
1981	108.5	117.6	103.6	115.3
Quarterly results:				
1980:				
1st quarter	108.9	123.8	106.8	120.0
2d quarter	110.7	117.6	108.2	116.3
3d quarter	106.8	115.9	102.1	113.6
4th quarter	111.3	111.0	105.1	111.3
1981:				
1st quarter	112.6	118.5	102.0	116.3
2d quarter	99.8	123.5	105.4	118.7
3d quarter	108.7	118.7	103.1	115.9
4th quarter	113.0	109.8	104.0	110.4

Source: United Nations. Monthly Bulletin of Statistics. V. 36, No. 8, August 1982, p. xiv.

The pattern of change in the index for the overall extractive industry across the quarters of 1981 is notable. The first quarter of 1981 was significantly above the last quarter of 1980, and growth continued, on a more limited scale, into the second quarter, but thereafter, there was a substantial downturn. This overall trend was mirrored in the trends for petroleum and natural gas and that for metals, but in contrast, the pattern for coal was such that after a good first quarter, there was a sharp downturn in the second quarter and gradual improvement thereafter.

Comparison of the world extractive industry indexes in the foregoing tabulation with indexes for the processing sectors of the mineral industry that are presented in the following tabulation reflects the same general pattern: A general upturn in the first half year followed by a substantial downturn in the last half year but, in the case of the processed materials, fourth quarter indexes for both the chemicals and petroleum group and basic metals group were significantly below the first quarter levels:

	Index numbers (1975=100)		
	Nonmetallic mineral products	Chemicals, petroleum, coal, and rubber products	Base metals
Annual averages:			
1978	117.4	125.5	115.2
1979	121.9	131.8	120.3
1980	122.5	130.8	117.3
1981	121.3	131.2	116.5
Quarterly results:			
1980:			
1st quarter	120.9	134.4	123.2
2d quarter	126.5	132.8	121.2
3d quarter	121.3	125.8	109.6
4th quarter	121.3	130.1	115.1
1981:			
1st quarter	117.6	133.4	119.5
2d quarter	127.1	135.3	120.5
3d quarter	121.9	128.3	113.1
4th quarter	118.5	127.6	113.0

For details on differences in mineral index growth patterns for various geographic areas, see the source publication for the foregoing tabulations.

QUANTITATIVE COMMODITY OUTPUT

Total world production of 95 distinct mineral commodities and/or specific forms of mineral commodities is given in table 1 for 1977-81. Of these commodities, only 38 registered gains in 1981 relative to their 1980 level, and 56 recorded declines (1 commodity registered no change). The overall results were much poorer than those for 1979-80, when 54 registered gains and 41 recorded declines. It is also noteworthy that of the 56 commodities for which declines were noted between 1980 and 1981, 26 had also recorded declines between 1979 and 1980; in contrast, of the 38 commodities registering gains between 1980 and 1981, only 24 had done so between 1979 and 1980 as well.

Of the 50 metallic commodities listed, 16 were produced in greater quantities in 1981 than in 1980; 34 showed production declines, including all stages of iron production (ore, pig iron, ferroalloys, and crude steel), all stages of aluminum production (bauxite, alumina, primary aluminum ingot), and most forms of the other major nonferrous metals (copper, lead, nickel, and zinc).

Among the 34 listed nonmetals, 16 showed increases, 17 showed declines, and 1 was unchanged. Notable among those showing increases were cement, phosphate rock, nitrogen (in ammonia), potash, barite, and fluorspar, while significant among commodities showing declines were sulfur, salt, diamond, and asbestos.

Of the 11 fuel mineral commodities listed (excluding uranium, which is listed under metals), 6 showed increases between 1980 and 1981, while 5 registered declines. The continued decline of crude oil and growth in coal and marketed natural gas were notable.

No viable means exist to sum up the overall performance of the nonfuel mineral industry except on a value basis, and for these commodities, exactitudes on value are not available for 1979-81. Among the fuel commodities, however, the overall pattern of output change can be demonstrated by United Nations data in which all fuels are reduced to a common energy equivalent basis. The following tabulation summarizes world energy commodity output for 1976-80 on this basis; corresponding data for 1981 were not available in time for inclusion here:

Year	Million metric tons of standard coal equivalent[1]				
	Coal	Crude petroleum and natural gas liquids	Natural gas	Hydro and nuclear electricity	Total[2]
1976	2,393	4,309	1,639	231	8,573
1977	2,447	4,482	1,681	249	8,859
1978	2,476	4,526	1,758	274	9,034
1979	2,614	4,715	1,854	288	9,470
1980	2,654	4,506	1,878	300	9,338

[1]Virtually all figures are revised from those published in the 1980 edition of this chapter owing to revisions made by the source agency.
[2]Detail may not add to totals shown because of independent rounding.

[e]Estimated. [p]Preliminary.

[1]Incorporates numerous revisions from the table corresponding to this table in previous editions of this chapter. Figures generally conform to those published in appropriate commodity chapters of volume I of the Minerals Yearbook, 1981 edition.

[2]Includes bauxite equivalent of nepheline syenite and alunite produced in the U.S.S.R. (the only producer on record of such materials as a source of aluminum).

[3]Excludes data for the United States (withheld to avoid disclosing company proprietary data).

[4]Excludes data for China (no adequate basis for estimation available).

[5]Excludes data for the U.S.S.R. (no adequate basis for estimation available).

[6]Includes all metal clearly identified as primary as well as all metal that cannot be subdivided clearly between primary and secondary (see footnote 7).

[7]Includes only that metal that is clearly identified as secondary. Some countries do not distinguish between primary and secondary, and for some of these, no basis is available for estimating the breakdown of total production. For such countries, the total has been included under primary (see footnote 6).

[8]Excludes data for the United States (withheld to avoid disclosing company proprietary data), which in previous years accounted for approximately 50% of the world total.

[9]Includes leucoxene.

[10]Data are for years ending June 30 of that stated.

[11]Comprises sulfur produced by the Frasch process plus sulfur mined in the elemental state from ores.

[12]Comprises sulfur recovered from coal gasification, metallurgical operations (except pyrite processing), natural gas, petroleum, tar sands, spent oxides, and gypsum, whether recovered in the elemental state or as a sulfur compound.

[13]Production of coke other than metallurgical by China and the U.S.S.R. is included with metallurgical coke production.

[14]Of which fuel peat, as follows, in thousand metric tons (balance for agricultural use): 1977—66,377; 1978—67,140; 1979—65,785; 1980—66,958; and 1981—67,196.

VALUE OF WORLD MINERAL PRODUCTION

The value of world crude mineral output in 1981 was estimated at $552.2 billion constant 1978 dollars as shown in a foregoing tabulation. Details on the methodology employed to prepare this estimate are summarized in the 1980 edition of this chapter, to which the reader is referred.

GEOGRAPHIC DISTRIBUTION OF WORLD MINERAL OUTPUT VALUE

Available information is inadequate to extrapolate to 1980 the 1978 data on geographic distribution of world crude mineral output published in Annales des Mines in the November-December 1980 edition of that publication. A summary of the 1978 distribution, together with comparable figures for 1973 and 1950 and additional textual comments on regional distribution of these values, was included in the 1980 edition of this chapter, and the reader is referred to this publication as well as to the original source for further detail.

COMMODITY DISTRIBUTION OF WORLD MINERAL OUTPUT VALUE

As in the case of geographic distribution of world crude mineral output value, the inadequacy of data precludes any reliable extrapolation of the various commodities' shares of the totals shown in the preceding edition of this chapter and in the source publication, Annales des Mines. The reader should refer to these publications for the data for 1978 and prior years.

TRADE

In 1980, the aggregate value of total world trade in mineral commodities reached an estimated $793,900 million (current dollars), a 36.3% increase in the previous high set in 1979. Comparable data for 1981 were not available in time for inclusion in this chapter, but available partial figures clearly suggested a continued increase, at least in terms of current dollars, despite some declines in volume of materials shipped. This current dollar value increase, of course, would be in large measure due to continued inflation, at or near the double-digit level, in a number of countries, but would also be the result of advancing prices, in terms of constant dollars, for some goods. The following tabulation summarizes the growth pattern in mineral commodity trade value for 1976-80, as well as the share of that trade in total commodity trade:

Year	Estimated value of all mineral commodities traded (millions)	Change from previous year (percent)	Mineral commodities' share of all commodities traded (percent)
1976	$353,200	+13.1	35.7
1977	r387,400	r+9.7	r34.4
1978	r407,300	r+5.1	r31.4
1979	r582,600	r+43.0	r35.6
1980	793,900	+36.3	39.8

rRevised.

Table 2, which serves as the basis for the estimates of total mineral commodity trade that appear in the foregoing tabulation, provides reported data on the value of trade in major mineral commodity groups and total commodity trade for 1976-80. Table 3 shows the percentage share of major mineral commodity groups in the aggregate for these commodities for 1976-80, and table 4 provides individual growth (or decline) rates for each of the major mineral commodity groups as well as for total commodity trade for the same 5 years.

Major mineral commodity trade by region (such as tables 8-10 in the 1976 edition of this chapter depicted) may be obtained for more recent years directly from the United Nations Monthly Bulletin of Statistics for May 1982.

CONSUMPTION

NONFUEL MINERAL COMMODITIES

As in 1980, virtually worldwide cutbacks in general industrial production were reflected in consumption data for metallic commodities in 1981. The following tabulation, which provides summary data on estimated world use of seven prominent nonferrous metals for recent years, illustrates this downturn:

Commodity	Thousand metric tons				
	1977	1978	1979	1980	1981[p]
Aluminum, primary refined	14,511	[r]15,325	[r]15,973	[r]15,352	14,685
Cadmium	16	[r]17	18	17	16
Copper, refined[1]	[r]9,056	[r]9,520	[r]9,826	[r]9,351	9,478
Lead, refined[1]	[r]5,404	[r]5,461	[r]5,571	[r]5,296	5,184
Nickel[2]	642	697	[r]774	[r]717	654
Tin, refined[1]	231	231	232	224	[e]218
Zinc, slab[1]	[r]5,818	[r]6,147	[r]6,328	[r]6,125	5,945

[e]Estimated. [p]Preliminary. [r]Revised.
[1]Primary and secondary combined.
[2]Nickel content of refined nickel, ferronickel, and nickel oxide.

Source: World Bureau of Metal Statistics. World Metal Statistics. V. 34, No. 9, London, Aug. 20, 1982, pp. 12, 33, 38, 73, 87, 97, and 101.

The seven commodities listed registered an unweighted average consumption decline of 3.6% between 1980 and 1981; the corresponding weighted average figure was 2.4%. These may be compared with a 4.7% decline on an unweighted average basis and 4.2% on a weighted average basis between 1979 and 1980. Refined copper was the only commodity in the group for which 1981 consumption was higher than that for 1980, and even in that case, the 1981 level remained substantially below that of 1979.

Regarding ferrous metals, less current and complete data are available; nevertheless, a further downturn in 1981 was clearly evident. A downturn in iron ore consumption of 4% to 5% seemed likely, compared with a 2% downturn in 1980. An iron and steel scrap consumption decline of about 1.5% was indicated for 1981 compared with a drop of over 6% in 1980. Manganese ore consumption also almost assuredly declined in 1981 but could not be quantified on the basis of available information.

Considering major nonmetallic commodities, the 4% growth in world cement output and a 1% growth in gypsum production seemed to be evidence that construction material consumption did not edge downward on a worldwide basis, but in the United States at least, the decline in housing starts was reflected in declining consumption of such materials, a downturn apparently compensated for elsewhere. The fertilizer-materials area was a relative bright spot in the mineral commodity sales scene; each of the three fertilizer types registered consumption increases between 1980 and 1981, as shown in the following tabulation:

Commodity	Crop (ending June 30 of year stated)		
	1979[r]	1980[r]	1981
Nitrogenous, million metric tons N	53.5	57.4	60.6
Phosphate, million metric tons P_2O_5	29.7	31.1	31.4
Potassic, million metric tons K_2O equivalent	24.4	24.0	24.1

[r]Revised.

Sources: Nitrogen data: British Sulphur Corp. Ltd. Nitrogen, No. 135, January-February 1982, London, p. 44; phosphate and potassium data: British Sulphur Corp. Ltd. Phosphorus and Potassium, No. 117, January-February 1982, London, pp. 44, 46.

Available information on world sulfur consumption in 1981 suggests a very slight downturn (under 1%), to a total level of about 55.98 million tons.

MINERAL FUEL COMMODITIES

Comprehensive information on world energy consumption are not available for 1981; the following tabulation summarizes consumption by primary energy sources for 1976-80:

Year	Million metric tons of standard coal equivalent				
	Solid fuels	Liquid fuels	Natural gas	Hydro and nuclear electricity	Total
1976	r2,398	r3,602	r1,640	231	r7,872
1977r	2,448	3,716	1,663	248	8,076
1978r	2,490	3,800	1,754	274	8,318
1979	r2,637	r3,867	r1,842	288	r8,634
1980	2,669	3,709	1,871	299	8,548

rRevised.

Source: United Nations Yearbook of World Energy Statistics. New York, 1982, p. 3.

The most salient fact demonstrated is the decline in the share of the total accounted for by liquid fuels between 1979 (44.8%) and 1980 (43.8%). All other energy types—solid fuels, natural gas, and hydro and/or nuclear electricity—showed quantitative gains, and each accounted for a larger share of the 1980 total than in 1979.

INVESTMENT

Comprehensive world mineral industry investment data do not exist, but available figures generally point to a reduced rate of investment on the whole. Data published by the U.S. Department of Commerce relating to U.S. foreign investment in 1981 showed a substantial reduction in the rate of increase.

Available information on steel industry investment by Organization for Economic Cooperation and Development nations (table 5) shows an upturn between 1979 and 1980 (the latest published figures available), but it is not believed that this was matched in 1981.

Regarding market economy country petroleum industry investment, 1981 data are not yet available; information on capital expenditures and exploration expenditures for 1976-80 are given, distributed by major world regions, in table 6, and table 7 provides a distribution of the market economy country capital expenditure total by various activity phases of the industry. Table 8 provides some data on U.S. direct foreign investment in mineral industry activities, divided between (1) mining, smelting, and refining and (2) petroleum for 1979-81. For region-by-region detail such as has been furnished in previous editions of this chapter, the reader is referred to the source publication for this table.

Other scattered data on mineral industry investment follow, on a country-by-country basis, for selected nations. These figures generally represent domestic investment in domestic mineral industry activities for each nation discussed. That is, they exclude investment by these nations in mineral industry activities outside of the country being covered, as well as foreign investment in the mineral industry of the country, but could include domestic investment based on capital borrowed internationally.

In 1981, mineral industry investment in Canada reportedly totaled $924.5 million. Of the sum, the following amounts were expended on projects in various mineral commodity areas: $268.5 million for lead and zinc, $254 million for copper, $145 million for molybdenum, $130 million for uranium, $77 million for asbestos, $35 million for silver, and $15 million for gold. The bulk of those expenditures, which constituted 6.9% of total investment in the Canadian economy, were directed primarily to mineral recovery as well as to mineral processing. The investments were made at a time when the Canadian Government set forth a comprehensive mineral report that stresses the importance of investment as a means by which the Canadian mineral industry could enhance its international competitiveness and by which anticipated

strong demand growth could be met. Additionally, the Canadian Government indicated that it would encourage mineral industry investment by maintaining stability in taxation and by negotiating the settlement of native land claims. More broadly, the Canadian Government marked mineral resource development and, in turn, investment as one of several priorities in Canadian economic development over the next decade.

Information on the Republic of South Africa's mineral industry investment for 1981 indicated a total level equivalent to $683 million, including $530 million for gold production facilities, $36 million for phosphate projects, and $17 million for expansion and improvement of manganese-refining plants.

In Brazil, total mineral industry investment dropped from a reported $660 million in 1980 to $379.5 million in 1981. Of the 1981 total, $149.5 million was spent on phosphate extraction facilities, $130 million on soda ash projects, and $100 million primarily on construction of aluminum smelting facilities. The 1981 investment decline was commensurate with the overall patterns of zero economic growth in Brazil resulting, in part, from Government austerity measures.

In an investment environment dampened by high interest rates, a volatile industrial relations atmosphere, environmental issues, and aboriginal land rights controversies, Australia saw mineral industry capital outlays of $348 million. Of this total, $250 million was directed toward uranium projects, and $98 million was expended for development and expansion of existing aluminum smelting facilities. The investments in aluminum projects are part of a drive to increase aluminum productive capacity to the extent that Australia could account for 5% to 10% of world aluminum production in 1985, compared with approximately 2% in 1981.

Investments of $352.5 million were made in raw copper and gold facilities in the Philippines.

Finally, aggregate mineral industry investment data available for other nations indicate the following: China-$150 million, Cameroon-$130 million, Burma-$124 million, Bahrain-$120 million, the Federal Republic of Germany-$85 million, the United Kingdom-$74 million, Iraq-$70 million, Yugoslavia-$40 million, and Israel-$15 million.

TRANSPORTATION

MARINE TRANSPORT

Tankers, bulk carriers, and freighters are the three classes of vessels engaged in transporting mineral commodities. The number, gross tonnage, and deadweight tonnage of these vessels, as well as similar data for other vessels of the world's merchant fleet, as reported by the U.S. Maritime Administration for 1975-80, are given in table 9.

It should be noted that vessels in each of the three categories are not devoted wholly to mineral commodity transport. Tankers, although largely engaged in moving crude oil and refinery products, also transport liquid chemicals, wine, molasses, and whale oil. Bulk carriers move agricultural products as well as crude minerals and mineral fertilizers, while freighters, because of their great variety, can be devoted wholly to hauling mineral products or wholly to moving nonmineral goods, as well as carrying mixed mineral and nonmineral cargoes.

Table 10 gives information on total loadings and unloadings of vessels, divided between tanker-type cargo and dry cargo, for the years 1976-80. Although it is recognized that these figures on loadings and unloadings include goods other than minerals, they nevertheless serve as a reasonable measure of mineral commodity shipments, because the preponderance of total weight of all goods moved is accounted for by minerals. Some measure of the significance of mineral commodity movement to total commodity movement is apparent in data for the world's two major canals, the Panama and the Suez, and it should be noted that figures for these waterways are skewed in favor of nonmineral commodities by both waterways' inability to handle large supertankers and bulk cargo vessels engaged in ore trade. Although exact recent figures are not available, it appears likely that minerals and mineral products account for three-quarters or more of total cargo carried in any single year on a weight basis.

Tables 11 and 12 provide a geographic breakdown of loadings and unloadings of dry cargo and tanker cargo, respectively, for 1978-80 on a tonnage basis. Again recognizing that both tables include mineral and nonmineral goods, but also recognizing the

dominance of mineral materials from the viewpoint of tonnage, these tables give some idea of the relative importance of various world areas as origins and destinations for mineral materials.

Although physical characteristics of vessels—size, draft, age, crew requirements, type of propulsion system, etc.—as well as fuel costs have an undeniable influence on shipping industry performance, problems of the changes in the quantity and type of material being moved also significantly affect the shipping sector of the world economy. Therefore, before detailing changes in composition of the merchant fleet that serves the mineral industry, some observations on major mineral cargoes seem in order. First in importance because of the volume of material moved was oil; there was a decline of 13% in seaborne oil trade from the 1980 level of 1,665 million tons to a level of 1,445 million tons in 1981, both figures include crude oil and refinery products. Total haulage in 1981 was 13,325,000 million ton kilometers, 12% below the 1980 level. The drop, which marked a continuation of the slump in seaborne oil movement that began in 1980, was a result of the general recession conditions, efforts to conserve energy, and substitution of other sources of energy for oil.

Another mineral commodity with considerable significance to seaborne transport was phosphate rock. Preliminary 1981 statistics indicate that total seaborne trade of phosphate rock was about 41 million tons, a decline of 16% from the 1980 level. Contributing to this reduction were somewhat reduced demand by some importing countries resulting from higher fertilizer prices, as well as general economic sluggishness. For exporting nations, Algeria excepted, these and other conditions led to declining international sales and, in turn, reduced haulage of phosphate rock on dry bulk carriers over 40,000 deadweight tons. Only Morocco and the United States posted significant shipments on such vessels but these nations together accounted for over 60% of the total seaborne phosphate rock shipments.

Bauxite and alumina also were among the mineral commodities accounting for substantial seaborne trade; preliminary statistics indicate total shipments of these materials in 1981 approached 46 million tons, of which 24% was alumina. Of the total, Australian exports accounted for nearly one-third, West African shipments for about one-fourth, Caribbean shipments for another one-fourth, and Guyana-Suriname-Brazil shipments for about one-sixth.

Iron ore shipments fell from 310 million tons in 1980 to 303 million tons in 1981. Despite this drop, iron ore easily retained its position as the largest single dry bulk commodity in world seaborne trade, accounting for 15% of the total quantity of dry cargo moved. Australia, Brazil, Canada, India, Liberia, the Republic of South Africa, and Sweden again accounted for about 80% of total seaborne iron ore exports. Noteworthy was the fact that Brazil and other Latin American nations increased their iron ore exports, sending a particularly high number of shipments to Japan. Largely as a result of this, the average haul length for iron ore increased from 8,288 kilometers in 1980 to 8,409 kilometers in 1981. About 65% of total seaborne iron ore shipments were transported in dry bulk carriers of over 100,000 deadweight tons, serving the long-haul trades from Australia, South America, and the Republic of South Africa, to Europe and Japan. Less than 20% of the total moved in vessels below 40,000 deadweight tons.

Commensurate with an increase in demand for coal, the level of coal shipments rose from 172 million tons in 1980 to 196 million tons (117 million metric tons of metallurgical coal and 79 million tons of steam coal) in 1981. Of the 1981 total moved, the United States, Australia, the Republic of South Africa, Canada, and Poland exported 38.7%, 27%, 12.7%, 6.7%, and 4%, respectively. Exports from the United States rose by 2.6% over that of 1980, reflecting an increase in steam coal shipments of 13 million tons. Relative to 1980, Australia also registered a rise in coal exports on the order of 4.7% as a result of an increase of 2 million tons in steam coal exports. On the other hand, the Republic of South Africa experienced a 1.1% decline in coal exports as steam coal movements did not increase. Combined, the United States, Australia, and the Republic of South Africa accounted for 85% of the total steam coal trade. Poland's coal exports fell 6.6% largely because steam coal availability from that country dropped sharply. In terms of metallurgical coal, the United States exported

41% of the total while Australia exported 37%.

On the import side, Japan ranked first among the world's coal importers, it took an amount of coal 15% greater in 1981 than in 1980. Responsible for this growth was the increase in the import level of steam coal, from 6 million tons in 1980 to 13 million tons in 1981. As a result of this, Japan's intake accounted for 40% of the world's coal imports. Second to Japan was France, which imported 30 million metric tons (including steam and metallurgical coal) of which 32% came from the United States and 26% from the Republic of South Africa. Italy, Belgium, and the Federal Republic of Germany were the other primary importers. Also importing coal were the U.S.S.R., the Republic of Korea, Taiwan, and Brazil.

The aforementioned increases and decreases in the amount of coal exported by various nations coupled with destination points impacted significantly on haul length, which increased from 8,127 kilometers in 1980 to 8,449 kilometers in 1981. Characteristic of this increase is the fact that more vessels, particularly those over 100,000 deadweight tons, were used largely in short-haul European movements, transporting between 25% and 30% of same.

Bulk Carriers.—In 1980, the world's bulk carrier fleet increased by 84 vessels, compared with a 68-vessel increase in 1979. The 1980 growth represented a 1.9% gain on the basis of number of vessels. There was a very small increase in the average gross tonnage and deadweight tonnage of such vessels for a second year. In 1980, the average bulk carrier grossed 22,286 tons and had a deadweight tonnage of 38,622, compared with 1979 figures of 22,346 and 38,676, respectively. The following tabulation shows the distribution of the world's bulk carrier fleet by country of registry for 1979:

Country	Number of vessels	Deadweight tonnage (thousand tons)
Liberia	853	41,520
Greece	943	30,096
Japan	511	22,057
United Kingdom	216	11,086
Panama	406	11,016
Norway	151	10,424
Italy	144	6,851
India	102	4,346
China	95	3,238
U.S.S.R.	161	3,140
Singapore	85	3,118
Brazil	49	2,914
Germany, Federal Republic of	47	2,762
France	48	2,719
Spain	71	2,375
Poland	81	2,023
Sweden	30	1,150
Other	805	24,476
Total	4,798	185,311

Freighters.—In 1980, the world's freighter fleet decreased by 87 vessels, a 0.6% decrease. In terms of total gross tonnage and deadweight tonnage, there were 1.15% and 0.6% increases, respectively, over the 1979 levels. The average freighter in 1980 had a gross weight of 6,367 tons (6,256 tons in 1979) and a deadweight tonnage of 8,514 tons (8,409 tons in 1979), and a modest increase when the number of vessels involved is considered. The following tabulation shows the distribution of the world's freighter fleet by country of registry for 1979:

Country	Number of vessels	Deadweight tonnage (thousand tons)
Greece	1,515	14,765
Panama	1,701	13,301
U.S.S.R.	1,847	11,235
United States	471	6,885
Japan	717	6,503
Liberia	522	5,876
China	495	5,004
United Kingdom	450	4,820
Singapore	431	3,912
Germany, Federal Republic of	359	3,651
India	230	2,826
Netherlands	350	2,444
Norway	194	2,011
Cyprus	344	1,914
Other	4,616	36,105
Total	14,242	121,252

Tankers.—In 1980, the world's tanker fleet was 99 vessels greater than that of 1979. The average vessel's gross tonnage declined from 34,816 tons in 1979 to 34,308 tons in 1980, and deadweight tonnage similarly declined, from 65,757 tons in 1979 to 64,626 tons in 1980.

Accounting for the inconsequential growth in the world's tanker fleet in 1980 was the small but continued reduction in demand for oil.

The following tabulation distributes the world's tanker fleet by country of registry for 1979:

Country	Number of vessels	Deadweight tonnage (thousand tons)
Liberia	889	105,980
Japan	526	33,408
United Kingdom	378	26,323
Norway	248	26,072
Greece	415	24,518
United States	308	16,152
France	117	14,782
Panama	294	13,468
Italy	230	8,687
Spain	117	8,354
U.S.S.R.	467	7,248
Germany, Federal Republic of	64	5,441
Denmark	69	5,228
Netherlands	63	4,794
Singapore	98	4,696
Sweden	67	3,746
Other	1,009	37,432
Total	5,359	346,329

Considering the world's tanker fleet as a whole, there have been some modest changes in the share of the total accounted for by vessels of different size groups over the 5 years 1977-81, as shown in the following tabulation, based on data published on page 24 in the British Petroleum Co. Ltd. annual publication, BP Statistical Review of the World Oil Industry, 1981:

Size group (deadweight tons)	Percent of total		
	1977	1979	1981
10,000-25,000	4.8	4.3	4.3
25,000-45,000	8.0	7.4	8.1
45,000-65,000	5.5	4.7	5.2
65,000-125,000	16.3	15.6	17.3
125,000-205,000	9.7	10.2	9.7
205,000-285,000	42.8	43.4	41.0
285,000 and over	12.9	14.4	14.4

OCEAN FREIGHT RATES

In 1980, dry cargo rates increased while tanker rates fell. In 1981, tanker rates continued to fall. Among the reasons for this were reductions in oil consumption resulting from energy conservation and the use of fuels other than oil, cutbacks in Organization of Petroleum Exporting Countries oil production, and in turn, cutbacks in oil shipments.

Unlike 1980, however, dry cargo rates also dropped. At least three factors were responsible for this. First, there was a large fleet expansion, especially in combination carriers. During 1981, up to 80% of those vessels served the dry cargo markets. Second, overall economic growth was slow. Demand for steel, bauxite and alumina, and phosphate rock was relatively lower than in 1980, resulting in reduced demand for dry bulk carriers. Third, many port congestion problems were at least partly resolved as, for example, at Hampton Roads where bottlenecks were severe. The U.S. coal mine strike helped to alleviate the situation as coal cargoes were withheld. Moreover, by strike's end a system of preallocation and/or preregistration was implemented that diminished delays considerably. Port congestion was also reduced at the Panama Canal and elsewhere similar systems were used. As a result, numerous ports around the world were more able to handle shipping loads.

Specific indices for 1981 ocean freight rates may be found in the March, June, and September 1982 issues of the United Nations Monthly Bulletin of Statistics.

PANAMA AND SUEZ CANALS

Summary data on activity at the Panama Canal for the year ending September 30, 1981, are not yet available, and activity for the previous fiscal year was summarized in the previous edition of this chapter. Readers desiring such information for the more recent year are referred to the annual report of the Panama Canal Co., when it becomes available.

At the Suez Canal, a total of 20,795 vessels transited the canal in 1980, an increase of 432 vessels, relative to 1979 transits (up 2.1%). The tonnage passing through the waterway increased from 266,171,000 tons to 281,305,000 tons. Of the total number of vessel transits, tankers accounted for 2,921, a figure 8.3% above that of 1979. The net tonnage credited to tankers increased from 86,278,000 tons in 1979 to 88,870,000 tons in 1980. The following tabulation indicates the distribution of tankers by number, direction, net tonnage, and status (loaded or in ballast):

Direction	Number		Net tonnage (thousand metric tons)	
	1979	1980	1979	1980
Southbound:				
In ballast	1,026	922	55,913	51,996
Laden	518	717	6,867	10,215
Total	1,544	1,639	62,780	62,211
Northbound:				
In ballast	304	428	3,886	5,447
Laden	850	854	19,612	21,212
Total	1,154	1,282	23,498	26,659

Freighters ranked next after tankers in terms of number of transits and net tonnage, with bulk carriers following in third rank. The following tabulation summarizes transits by these vessel classes:

Vessel class	Number		Net tonnage (thousand metric tons)	
	1979	1980	1979	1980
Freighters:				
In ballast	1,678	1,548	8,422	8,538
Laden	8,884	8,637	60,958	61,336
Total	10,562	10,185	69,380	69,874
Bulk carriers:				
In ballast	343	470	5,673	7,645
Laden	2,050	2,241	30,717	34,348
Total	2,393	2,711	36,390	41,993

In terms of goods transported in a southbound direction on the Suez, 89,729,000 tons was shipped in 1980, an increase over the 1979 figure of 81,919,000 tons. Of the total, oil and oil products totaled 13,994,000 tons, a 56% increase over the 1979 figure of 8,970,000 tons. This increase was due primarily to a tripling in the crude oil quantities shipped. In 1980, 571,000 tons of metal and ores were carried southbound through the Suez, a 37.7% drop from the 1979 level of 916,000 tons. Southbound coal shipments transiting the Suez amounted to 194,000 tons in 1980, as compared with 192,000 tons in 1979.

With regard to northbound movement of commodities through the Suez, 86,547,000 tons were carried in 1980, a 9.9% increase over the 1979 figure. Of the total northbound 1980 commodity volume, crude oil and oil products accounted for 28,474,000 tons or 32.9%. This constitutes a 4.4% increase over the 1979 figure. Northbound metals and ores moved on the Suez increased from 9,906,000 tons in 1979 to 11,989,000 tons in 1980. Finally, whereas 2,201,000 tons of northbound coal and coke transited the Suez in 1979, 2,676,000 tons did so in 1980.

PIPELINES

Limitations of time and space preclude comprehensive assessment of international pipeline activities. Major projects in individual countries are treated in the various country chapters.

PRICES

Comprehensive data on world prices for crude minerals and mineral products are not available; tables 13, 14, and 15 summarize major nonferrous metal prices in the United States, the United Kingdom, and Canada, respectively, for 1978-81 inclusive, with monthly data provided for 1981. A brief review of the 1981 average prices on each of the three markets, comparing them with 1980 average prices, shows that of the

metals shown, only aluminum on the U.S. market and zinc in all three areas averaged a higher price in 1981 than in 1980. Other 1981 average prices were below those of 1980. There was no clearly discernable pattern across the spectrum of nonferrous metals during the year; each metal in each market area fluctuated with seeming independence, which can be better demonstrated by examining the actual figures in the tables rather than by elaborate textual description.

As in 1980, there is no detailed presentation here of world gold prices; these remained subject to considerable variation both across the year within any single market and across the various markets for any given time period. However, it is worthy of note that the speculative price levels attained in early 1980 were not approached in the daily 1981 fluctuations.

Regarding oil prices, final published returns such as were cited in last year's edition of this chapter were not available in time for inclusion here, but it was clear that the oversupply of crude oil on a worldwide basis mitigated against any significant increases in sale prices for that commodity. Readers seeking details should refer to the Department of Energy's 1981 International Energy Annual, which should be available by the time this chapter is published.

STATISTICAL SUMMARY OF WORLD PRODUCTION AND TRADE OF MAJOR MINERAL COMMODITIES

The final 24 tables of this chapter, tables 16-39, extend the statistical series on production that was started in the 1963 edition of the International Area Reports volume of the Minerals Yearbook and was subsequently updated and expanded in the 1965 and 1967-80 editions. They are primarily a supplement to other statistical data within this chapter but also serve as a summary of international production data for major mineral commodities covered in greater detail, on a commodity basis, in volume I of the 1980 Minerals Yearbook and on a country basis in volume III.

In this edition, the data presented in these tables, in most instances, correspond with the data in the individual commodity world production tables appearing in volume I and may differ somewhat from a total that might be obtained by adding figures presented for any single commodity in each of the country chapters of volume III. This apparent disparity results from problems of scheduling compilation of tables in the numerous commodity and country tables in the two volumes. In an effort to provide the user with the most up-to-date information possible, data received after completion of worldwide commodity production tables have been included in many of the individual country production tables. Limitations of time, however, have prevented the incorporation of these revisions in the abbreviated versions of the world commodity tables included here. Thus, a more precise figure for total world production of any commodity could be obtained by adding figures presented in the individual country chapters. For summary purposes, however, it is felt that tables 16-39 of this chapter are sufficiently correct without the inclusion of these generally minor revisions.

The series of data on world trade in major mineral commodities that has appeared in most previous editions of this chapter (tables 57-69 in the 1976 edition) could not be included owing to scheduling problems. It is hoped that these tables will be resumed in the 1982 edition.

[r]Revised.

[1]Data presented are for selected major commodity groups of the Standard International Trade Classification Revised (SITC-R) and as such exclude some mineral commodities classified in that data array together with other (nonmineral) commodities. SITC-R categories included are as follows: All ores, concentrates, and scrap—SITC Div. 28; iron and steel—SITC Div. 67; nonferrous metals—SITC Div. 68; nonmetals (crude only)—SITC Div. 27; and mineral fuels—SITC Div. 3. Major items not included are the metals, metalloids, and metal oxides of SITC Group 513; mineral tar and other coal-, petroleum-, and gas-derived crude chemicals of SITC Div. 52; manufactured fertilizers of SITC Div. 56; and nonmetallic mineral manufactures of SITC Groups 661, 662, 663, and 667. Data include special category exports, ships' stores and bunkers, and other exports of minor importance, and exclude the intertrade of the centrally planned economy countries of Asia and trade between the Federal Republic of Germany and the German Democratic Republic.

eEstimated. pPreliminary. rRevised. NA Not available.

[1]Includes all recorded production of sulfur, regardless of the form in which it is recovered. Thus, it includes elemental sulfur, whether mined by conventional methods or by the Frasch process, as well as (1) elemental sulfur and the S content of compounds such as H_2S, SO_2, and H_2SO_4 recovered as a principal product of pyrite mining and as a byproduct of the recovery of crude oil and natural gas and as a byproduct of petroleum refining, coal treatment, and metal smelting and/or refining; and (2) sulfur recovered from tar sands, spent oxides, and other miscellaneous sources. Table includes data available through May 1982.

[2]Entirely Frasch process sulfur.

[3]Reported figure.

[4]Includes Frasch process sulfur as follows, in thousand metric tons: Poland: 1978—4,546, 1979—4,310, 1980—4,667, and 1981-4,250; the U.S.S.R. (estimated): 1978—800, 1979—800, 1980—900, and 1981-925; and total of individually listed countries and grand total: 1977—13,080, 1978—13,412, 1979—14,277, 1980—14,007 and 1981—13,875. The balance is mined elemental sulfur.

[e]Estimated. [p]Preliminary. [r]Revised.

[1]Comprises all gas collected and utilized as a fuel or as a chemical industry raw material as well as that used for gas lift in fields, including gas used in oilfields and/or gasfields as a fuel by producers, even though it is not actually sold. Excludes gas produced and subsequently vented, flared, or reinjected to reservoirs. Table includes data available through Sept. 30, 1982.

[2]Reported figure.

Table 37.—Leading world producers of natural gas liquids[1]

Other	[r]77	[r]78	66	71	80
Grand total	[r]1,074	[r]1,086	1,143	1,186	1,299

[e]Estimated. [p]Preliminary. [r]Revised.

[1]Every effort has been made to include only those natural gas liquids produced by natural gas processing plants and to exclude natural gas liquids obtained from field treatment facilities including wellhead separators, because the latter are normally blended with crude oil and thus are included in crude oil output statistics. In some cases, however, sources do not clearly specify whether data presented represent only output of natural gas processing plants or if they include field output. Thus, some of the figures may include field condensate. Table includes data available through Sept. 30, 1982.

[2]In addition to the countries listed, China, Czechoslovakia, the German Democratic Republic, the Federal Republic of Germany and Italy may also produce natural gas liquids in substantial quantities, but available information is inadequate to make reliable estimates of output levels.

[3]Reported figure.

The Mineral Industry of Albania

By Walter Steblez[1]

In 1981, the Albanian Government was less forthcoming with yearend planned industrial output results than in previous years. The main reported indicators for the year were national income and gross industrial production, which increased 6% and 7%, respectively, over 1980 levels, and were consonant with published centrally planned targets for 1981.

The last routine Albanian yearend industrial production data were reported in 1973. Subsequently, yearend production results, for the most part, were reported as a percentage growth of output over that of preceding years or as a percentage share of total output for a given year; i.e., mine and/or smelter production were presented as weighted shares of gross industrial output. For 1981, performance results of individual industries were generally not disclosed by Albanian authorities.

Government Policies and Programs.—The Albanian Government set high growth rates for industry for the seventh 5-year plan period (1981-85). Total industrial production was to increase 34% to 36% over that of 1980, although labor productivity was to grow by 2.5% to 2.8% annually during this time. Mining, metallurgy, and machine-building industries were given the highest development priorities during the new 5-year period. Compared with that of 1980, mining output would grow 9.7% annually, and in 1985, the machine-building industry would produce 49% to 51% more machinery and equipment. The planned output of primary energy in 1985 was to increase by about 38% compared with the level of 1980. Furthermore, geological survey work and exploration reportedly would be intensified for both metallic and nonmetallic raw materials. By 1985, the country planned to add 50 new mines to the 60 operating mines in 1980.

Specific production goals for industrial branches in 1982, as in 1981, were not published; however, total industrial production was to increase 8.5% over that of 1981, and the value of foreign trade, 16.9%.

PRODUCTION

Albania's totally nationalized mineral industry produced a wide variety of industrial minerals. Chromite, copper, and nickeliferous iron ore as well as coal and other mineral fuels remained the industry's most important products in terms of production scale as well as export value. Other commodities produced included phosphate, bauxite, nickel ore, dolomite, kaolin, and marble.

Despite reported planned production successes in the mineral industry for the first half of 1981, plan nonfulfillment was reported in a number of mining sectors owing to mismanagement, wornout equipment, absenteeism and other problems. Copper production was reported as having fallen most seriously short of goals for these reasons.

Table 1.—Albania: Production of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity[2]	1977	1978	1979	1980[p]	1981[e]
Asphalt and bitumen, natural[e 3] thousand tons	1,500	1,600	1,650	1,780	1,800
Cement, hydraulic do.	750	800	840	1,000	1,100

Nitrogen: N content of ammonia	65,000	76,000	72,000	75,000	76,000
Petroleum:					
Crude:					
As reported million tons	1,900	r1,900	1,600	1,700	1,700
Converted thousand 42-gallon barrels	12,676	r12,700	10,700	11,300	11,300
Refinery products:[e]					
Gasoline do.	1,488	1,500	1,600	1,700	1,700
Kerosine do.	465	470	500	540	600
Distillate fuel oil do.	2,238	2,250	2,270	2,400	2,300
Residual fuel oil do.	2,330	3,400	3,600	3,800	3,500
Lubricants do.	84	90	100	105	120
Other do.	2,400	2,500	2,600	2,700	3,000
Total[6] do.	9,005	10,210	10,670	11,245	11,220
Salt[e]	50,000	50,000	62,500	66,500	66,500
Sodium compounds, n.e.s.: Sodium carbonate, calcined (soda ash)[e]	23,000	23,200	23,300	25,000	25,500

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Sept. 22, 1982.

[2]In addition to the commodities listed, a variety of crude construction materials (common clay, sand and gravel, and stone) are undoubtedly produced, but output is not reported quantitatively and available information is inadequate to make reliable estimates of output levels. Also, metallic nickel production reportedly began in 1978, but data on the level of production are not available.

[3]Includes petroleum-refinery-produced asphalt and bitumen.

[4]Calculated from reported and estimated weight of nickeliferous ore; the amount of cobalt recovered, if any, is conjectural.

[5]Separate data on marketable production are not available, but gross and marketed output are regarded as nearly equal.

[6]Sums of listed products only; no estimates have been made for other products produced.

TRADE

In 1981, Albania continued to forbid foreign credit borrowing and employed barter as a basis for foreign trade. Although Yugoslavia remained Albania's chief trading partner, mineral trade increased with Western market economy countries during the year. Exports of Albanian ferrochromium increased significantly to such countries as Italy, the Federal Republic of Germany, Sweden, and the Netherlands. Also, commercial contacts with Finland for the purpose of purchasing Finnish mining equipment and technology were reported.

During the 1981-85 5-year plan period, 73% of Albania's mineral exports were to be domestically processed prior to shipment. New commodities scheduled for export were to include nickel, steel, bauxite, selenium, dolomite, quartz, and refractory bricks.

Unless otherwise specified, these data have been compiled from various sources, which include United Nations information and data published by the partner trade countries.

COMMODITY REVIEW

METALS

Bauxite.—Information on bauxite deposits and mining was scant; the mineral was mined in the Dajti area, and the deposits were claimed sufficient to develop an aluminum industry. Albania's sufficiency of hydroelectric power and fuel is expected to provide the energy basis for the industry's development.

Chromite.—The principal chromite mining areas in Albania consisted of four deposits in the eastern part of the country along the Yugoslav border: the Tropoje-Kukës area in the north; the Batër-Martanesh area in central Albania; the Pogradec-Lake Ohrid area, also in central Albania; and the Korçë area in the south.

Albania was a leading world chromite producer, ranking third among the major producers of this commodity. The ore deposits were podiform, and the Cr_2O_3 content ranged from 17% to 43%. The ore was generally marketed with a 42% Cr_2O_3 content.

Tropoje-Kukës and Batër-Martanesh were the major chromite-producing areas during the year. At Tropoje, the Kam Mine had a reported capacity of 25,000 tons per year of ore with a 25% to 35% Cr_2O_3 content; the Kalimash Mine had a 100,000-ton-per-year capacity with a Cr_2O_3 content ranging from 17% to 20%. In the Batër-Martanesh district, the largest producer was the 350,000-ton-per-year Belqizë Mine, where deposits containing 40% to 43% and 25% Cr_2O_3 were worked; the Batër I Mine had a reported capacity of 150,000 tons per

year with a Cr_2O_3 content of about 40%, whereas the 100,000-ton-per-year Batër II Mine produced ore with a 25% Cr_2O_3 content.[2]

In 1981, Albania reported the startup of the third stage of the Belqizë chrome ore concentrator in the Dibra district. The added capacity will increase concentrate production by 50,000 tons per year. Midyear production results indicated that the concentrator was operating above planned norms. The industry, however, reported unsatisfactory exploration and prospecting results during the midyear period.

Chromite remained the country's chief export commodity and most important source of foreign exchange. A significantly larger share of the chromite than in previous years was used to manufacture ferrochrome. In the area of ferroalloys, Albania significantly increased its production of ferrochromium. The country's ferrochromium plant in Burrel produced over 25,000 tons of this alloy. The major importers of Albanian ferrochrome in 1981 were the Federal Republic of Germany, 8,725 tons; Italy, 6,078 tons; the Netherlands (January-October 1981), 5,752 tons; Sweden, 3,543 tons; Belgium-Luxembourg, 3,478 tons; and Spain, 607 tons. In July 1981, the Swedish firm Fondmetall AB signed a multiyear contract with Albania to market Albania's annual ferrochrome production. Chrome production in 1985 was to increase 29% over that of 1980.

Copper.—Most of Albania's low-grade sulfide ore was produced in the Midrite, Krujë, Kukës, Pukë, and Shkodër areas in northern Albania. The ore grade ranged from 3% copper at Kukës to 0.7% to 1.2% at Kurbnesh. Metallurgical facilities were located at Kukës, Fierze-Rubic, and Laç.

The 1981 production plan was not met owing to what was described as negligence by management and professional staffs. A new smelter in Korçë was not put into operation on schedule, thereby reducing planned blister production by 3,200 tons. The only enterprise singled out for praise during the year was the Gjegjan copper mine in the Kukës district for exceeding its production quota by midyear.

The 1981-85 plan called for a 52% copper ore and a 28% blister copper production increase by 1985, compared with that of 1980. During this period, four new copper mines were to be developed in the Kukës area.

Iron Ore (Nickeliferous).—The principal iron ore mines were located in the Pogradec, Librazhd, Kukës, and Dibre areas. The Guri-i-Kuq Mine in Pogradec was rated at about 400,000 tons per year of ore containing about 40% iron and 0.6% to 0.9% nickel; the Prrenjas Mine, also in the Pogradec area, was rated at 400,000 tons per year with an ore content of 40% iron and 1.2% nickel. The Bustrice Mine in the Dibre area had a reported capacity of 400,000 tons per year. The entire output from this mine reportedly was shipped to Czechoslovakia.[3]

A new mine under development during the year was the Bitincke Mine near the Greek border. The ore assayed 40% to 45% iron and 1% nickel; upon completion, this mine would raise nickeliferous iron ore production to about 2 million tons per year. The planned production of nickeliferous iron ore in 1985 was to be 250% greater than that of 1980.

Nickel was reportedly leached out of the ore, and the remaining iron ore fed into blast furnaces. The cobalt content of the ore was about 0.06% and, reportedly, a unit was planned for the production of electrolytic nickel and cobalt salts.[4]

Iron and Steel.—The major developments in the steel industry included the construction and trial runs of the second blast furnace at the 700,000-ton-per-year Elbasan steel complex, as well as the purchase of a merchant mill from the Italian Danieli Co.

The 1981-85 plan set a 67% increase of rolled steel output and an 80% rise of ferrochrome production, compared with that of 1980.

NONMETALS

Cement.—Albania's cement industry was based in the western part of the country at Elbasan, Fushe-Kruje, Shkoder, Tirana, and Vlore. No new capacities were announced during the year. The V. I. Lenin cement works in Vlore, however, was cited for having exceeded the annual plan as well as for having increased efficiency.

Fertilizer Materials.—Albania remained a net importer of fertilizer materials. Although phosphate mining was reported to have commenced, no other data were provided on the scale of the operations or the P_2O_5 content of the rock. Phosphate fertilizer continued to be produced at Laç and Durres, and nitrogenous material was manufactured at the Fier ammonia plant. No new capacities were reported to have been added in the industry during the year.

MINERAL FUELS

Albania continued to be a net exporter of energy. Both electric energy and petroleum continued to be exported in 1981. Electricity was sold to Greece and Yugoslavia, as in previous years, and negotiations with Greece over the construction of a second 200-kilometer powerline were announced during the year. In 1981, work continued on the construction of the 600-megawatt Koman hydropower station. Albania's estimated primary energy balance is presented in table 4.

Coal.—The country's four main lignite deposits were near Durres in the central coastal area, in Krrabe in the central part of the country, at Memaliaj in the south, and in the Korçë vicinity in the southwest. Run-of-mine coal was rated at 2,500 to 3,000 kilocalories per kilogram; after beneficiation, the calorific value increased to 4,500 to 5,000 kilocalories per kilogram.

In 1981, at the end of the 9-month period, January to September, the industry's top producers were the Memaliaj Mine in the Tepelenë area, the Manza Mine in the Durres area, and the Bezhan Mine in Kolonja; these mines reportedly exceeded the production plan for this period by 2,800, 1,200, and 1,000 tons, respectively. The 1981-85 5-year plan envisages a 48% increase in coal production over that of 1980.

Table 4.—Albania: Estimated total primary energy balance

(Million tons of standard coal equivalent)[1]

	Total primary energy	Coal (lignite, anthracite, bituminous) and coke	Crude oil and petroleum products	Natural and associated gas	Hydropower
1981:

[1]1 ton of standard coal equivalent (SCE)=7,000,000 kilocalories. Conversion factors used are lignite, 0.7; crude oil, 1.47; natural gas, 1.33 (per 1,000 cubic meters); hydroelectric power, 0.125 (per kilowatt-hour).
[2]Estimated based on data from various Albanian sources.

Source: United Nations, World Energy Supplies. Statistical Papers, Series J, No. 18, 1976.

Petroleum and Natural Gas.—Petroleum and natural gas production continued to be developed in 1981. As in previous years, Albania claimed the discovery of new but unspecified gas deposits. Petroleum continued to be produced in the Fier and Ballsh areas and continued to be exported. It was also used in the domestic chemical industry, as was domestic natural gas. The Albanian Government set a planned 56% to 58% petroleum production increase by 1985, compared with the 1980 production level.

The Mineral Industry of Algeria

By Suzann C. Ambrosio[1]

Algeria's mining industry, composed largely of iron ore, lead, zinc, mercury, and phosphates, contributed approximately 2% of the 1981 gross domestic product (GDP), estimated at $42 billion.[2] The mineral fuels sector, however, provided an estimated 30% of Algeria's nominal GDP in 1981, down 6% from that of 1980. The 1981 value of hydrocarbon exports was estimated to be similar to 1980 receipts of $12 billion. Factors responsible for the apparent stagnation included pricing disputes, declines in projected natural gas sales, and diminishing crude oil production.

The 1981 GDP, not including hydrocarbons, increased at an approximate 7% real rate and an estimated 11% rate including the hydrocarbon sector. It was estimated that nearly 20% of the overall growth of the GDP was from hydrocarbons, 37% from material production, and 43% from services, including custom duties and import taxes. Inflation remained at the approximate annualized rate of 11%, stemming in part from 12% to 15% wage increases for workers in the Government and agricultural sectors. Nearly all of the hydrocarbon and other mineral enterprises were Government owned and operated.

Even with the decline in crude production, Algeria's oil exports comprised nearly 90% of the nation's total 1981 exports. Although Algeria is not a major world producer of crude oil, 1981 production accounted for 2% of the total world output, 4% of the production by the Organization of Petroleum Exporting Countries (OPEC), and 6% of the Arab world's output. Natural gas production and the continued expansion of natural gas processing facilities held the greatest promise for sustaining Algeria's economic growth.

Algeria's energy consumption patterns have changed over the past decade. Natural gas comprised 51% of the total energy consumed during 1981, representing a near quadrupling of domestic consumption since 1970. The relatively large population growth of 3.2% per year, combined with increasing per capita energy consumption, will require more of Algeria's hydrocarbon production to be diverted from export into domestic markets.

The 1981 Algerian budget was $18 billion, and 1982 expenditures were expected to increase to approximately $21 billion. Of the total 1981 budget, petroleum-based revenues accounted for 60%, and these revenues were projected to constitute the same proportion in 1982. Nonpetroleum revenues (taxes on income and profits, taxes on production and consumption, and customs duties) provided the remaining 40% of revenues in 1981. This represented a near 20% increase over the 1980 revenue share.

Major items in both the 1981 and the proposed 1982 budget included education, defense, and health. The development budget priorities, as outlined in the current 1980-84, 5-year plan, emphasized education, community development, communications, and water. Despite large expenditures in the domestic economy, the Government claimed a 1981 budget surplus of approximately $75 million, an increase of 22% over the reported 1980 budget surplus.

The 5-year plan slated $137 billion for project assistance and capital investments by yearend 1984. Nearly 30% of the investments were earmarked for projects that were expected to be completed after 1984,

and 50% were for projects that commenced prior to 1980. The 1981 investment program called for $16 billion, and 1982 investments were expected to increase 35% to $22 billion.

Although the Government budget retained a surplus in 1980-81, Algeria's current account continued to deteriorate between 1978 and 1981. The 1981 current account, estimated at $800 million, was in deficit for the first time since 1974. The 1981 deficit was largely due to the increased servicing of the foreign debt. Interest and loan repayments were estimated at $2.8 billion in 1981. Algeria decided in 1979 against contracting new loans on the international capital market. This policy was expected to continue into the forseeable future. Debt service payments declined from 25.6% of total exports in 1979 to 20% in 1981. Algeria had maintained a trade surplus since 1979, and the 1981 balance of trade was estimated at $2 billion. Algeria's capital account continued to be in the black, but the 1981 estimated account balance of $300 million was slightly less than one-half the 1980 level.

Although the Algerian Government continued to control most sectors of the economy, a change in investment policies was evident in 1981. The private sector, already involved primarily in agriculture and the building construction fields, was encouraged to increase productive investments. The only legal political party in Algeria passed a resolution that allowed privately owned firms to import spare parts and equipment directly rather than placing orders with state import agencies.

The emphasis on heavy industry and large hydrocarbon complexes was shifted towards a decentralized and diversified economy. The Ministry of Finance and the state-owned banking system were charged with responsibility for implementing the structural changes in the economy. Formerly the largest Government organization, Societe Nationale pour la Recherche, la Production, le Transport, la Transformation, et la Commercialisation des Hydrocabures (SONATRACH) was separated into three agencies in 1980 and restructured into seven technical service entities during 1981. Eight other state-run agencies were also restructured in line with the new decentralization policy.

PRODUCTION AND TRADE

Algeria's nonfuel mineral production continued to be focused on import substitution and on raw material inputs for local construction and agricultural industries. Total production by the mining and quarrying sector was estimated to have increased 9% by volume during 1981. Output of iron ore, steel, lead, mercury, cement, and fertilizer materials continued to increase. Despite an overall growth in domestic consumption of Algeria's nonfuel mineral production, approximately 50% of these products were exported. Plans were under way to continue to increase the output of cement, fertilizers, and iron and steel products. Production of various other minerals showed stagnation and/or decline because of diminished exploration and development investments and near exhaustion of previously developed mines.

Despite a slight increase in iron ore production between 1980 and 1981, both domestic consumption and exports of iron ore during the same period increased by 55% and 19%, respectively. Public sector demand for iron and steel constituted 75% of total domestic demand. Algeria's national steel company, Société Nationale de Sidérurgie (SNS), continued to import about 10 million tons of cast iron during the year, thereby conserving domestic supplies, which have a high manganese content and were desirable for higher industrial value production. SNS marketed and exported limited amounts of cast iron, zinc, and other unclassified products. Cast iron was expected to continue to be imported in the near future, in concert with various steelwork expansion projects. Algerian iron and steel imports were composed of a range of specific products that were not produced domestically in sufficient quantities. The El Hadjar steelworks was expected to meet most of the nation's steel product needs by 1986.

Algeria continued importation of fertilizer materials, although the country became an exporter of ammonia for the first time in 1981. All of Algeria's potash requirements were imported, mostly in the form of potassium sulfate. Potash imports nearly tripled between 1979 and 1980; Spain was the largest supplier. During 1980 and 1981, Algeria substantially increased the volume of triple superphosphate imports from the United States.

With the recent completion of two fertilizer facilities and expansion plans for the Djebel phosphate mine, Algeria was expected to decrease phosphate rock exports and increase phosphate fertilizer processing. Production from the mine and adjacent Annaba and Tebessa fertilizer facilities was transported 161 kilometers by rail to Mediterranean ports. An engineering study was completed in 1980 to construct a 1,500-kilometer mining railroad to provide additional service to the area and also bring service to the Gara Djebel iron ore deposit. A new export harbor located at the mouth of the Macta River on the Mediterranean was also under consideration.

The overall volume of mineral fuel production declined by roughly 5% between 1980 and 1981, owing primarily to the 21% decline in crude oil output. Natural gas production increased 8% over the same period. Algeria produced both nonassociated gas and gas associated with oil. Only nonassociated gas was sold. Associated gas was either flared or used to repressure oil reservoirs to aid in the recovery of additional oil.

Domestic consumption of gas increased to approximately 210 billion cubic feet annually, equivalent to roughly 13% of Algeria's 1981 gross production. Over the past decade, increasing demands at home and abroad for alternative energy sources encouraged SONATRACH to develop the means for producing and exporting more natural gas.

Various natural gas liquefaction units completed during the year resulted in the near doubling of liquefaction capacity to approximately 100 billion cubic feet per year. Algeria's excess liquefaction capacity, resulting in part from the world energy supply glut, caused SONATRACH to shelve plans for three additional liquefaction units. It was estimated that sales contracts were reduced 60% over 1980 levels to roughly 220 billion cubic feet in 1981. Construction schedules for tripling the annual marketable capacity of natural gas from 30 billion cubic feet in 1981 to 100 billion cubic feet in 1984 may change after price negotiations and export volumes are reevaluated.

The decline in revenues from natural gas and crude petroleum exports were partially offset by the increased revenues from exports of refined products (condensate and liquid petroleum products), combined with increased prices for most Algerian hydrocarbons over 1980 price levels. The reduction in hydrocarbon revenues was buffered unintentionally by the strength of the American dollar. Algerian receipts for hydrocarbon exports were paid in dollars and were utilized for imports, primarily in European and Japanese markets. Bartering oil for necessary imported goods has become another means by which the Algerians hope to diminish the impact of the revenue loss.

Algeria's 1981-82 trade objectives were to reduce imports of nonessential goods to shrink the foreign debt and limit the dependence on industrialized nations. During 1980, Algeria's major import suppliers, in descending order by value, consisted of the European Communities (EC), Japan, and the United States. Similarly, Algeria's major export partners were the United States, the EC, and Japan. In general, there has been a recent trend to diversify and shift trade toward developing and socialist countries. More specifically, the Algerian Government expressed interest in expanding trade with sub-Saharan Africa, northwest Africa, Spain, and Eastern Europe. Of particular interest to the mineral industry was the recent trade agreement, signed in 1981, between Zambia and Algeria for a steel and metals trade exchange.

Bitumen and other residues do	411	561	--	Spain 252; West Germany 122; Albania 115.
Bituminous mixtures do	81	48	(1)	France 45; Netherlands 1.
Mineral tar and other coal-, petroleum-, and gas-derived crude chemicals	15,882	21,207	--	France 14,908; United Kingdom 6,000; West Germany 286.

[1]Less than 1/2 unit.

COMMODITY REVIEW

METALS

Aluminum.—Algeria continued to import the bulk of its aluminum metal requirements from European countries. Joint-venture plans to construct the 140,000-ton-per-year M'Sala aluminum smelter were suspended. The Algerian Government and the U.S.S.R. were keeping information confidential on the proposed aluminum project.

Iron Ore.—Output from the Ouenza iron ore mining complex located in northeast Algeria has remained relatively stable during the past few years. Khanguet, the smallest of the three mines comprising the Ouenza complex, had ores averaging 55% iron, but reserves were nearly exhausted. Ouenza reserves were estimated at 100 million tons with a 53% average grade of iron, and the adjacent Bou Khadra ores stood at 50 million tons with a 58% grade.

The three open pit mines had ore beds of 10 to 15 meters thickness and required moving 2 to 3 tons of overburden for every ton of ore mined. Expansion plans were made for the Ouenza and Bou Khadra Mines. Chemical analyses indicated that the Ouenza ores were slightly calcareous and the Bou Khadra ores slightly siliceous, but no impurities were detected that would inhibit steel production.

Current annual production, rated approximately 3 million tons, was expected to increase to 5 million tons by the second half of the decade. An ambitious target was set, to produce 13 million tons of iron ore per year by 1990. Increased production will be required for cost-effective expansion of the El Hadjar steel mill and to accommodate the future Jijel steelworks.

The Gara Djebilit and Mercheri Abudul Aziz iron ore deposits in southwest Algeria continued to be evaluated by the Algerian and the U.S.S.R. Governments. Despite the large magnitude of the iron ore resources, estimated at 3 billion and 2 billion tons of medium-grade ore for the Gara Djebilit and Mercheri Abudul Aziz deposits, respectively, high transportation costs have inhibited development.

Iron and Steel.—The El Hadjar steelworks commissioned its No. 3 converter and No. 2 blast furnace during 1981. Expansion plans to raise annual production capacity from 500,000 tons to 2 million tons included replacing the No. 2 converter and installing a continuous caster. An agreement was signed between Nippon Steel Corp. (Japan) and Algeria's state-run SNS for the former to lend technical advice on the El Hadjar expansion. The technical cooperation agreement, which replaced a similar accord signed in 1977, covered operations, facility improvements, quality control, and production management.

Construction of the 2-million-ton-per-year Jijel direct-reduction steelworks was 2 years behind schedule. Bidding was closed in 1981, and Belgium's Tractionale and Japan's Nippon Steel Corp. were awarded the engineering services contract. Construction plans included a pelletizing plant, electric-furnace shop, and a bloom and billet mill.

SNS was negotiating a $20 million loan from the World Bank to help finance various steel projects. The loan application was withdrawn by yearend 1981, but no other details were made public. The Algerian Government allocated $1.4 billion to expand the El Hadjar steelworks over the current 1980-84, 5-year-plan period.

Other Metals.—Lead and zinc ores continued to be produced at the El Abed Mine and the smaller Bou Caid and Ain Barbar Mines. Algeria operated two zinc concentrators at El Abed and Zerzer-Yousof and a zinc smelter at Ghazaout. All of the plants have been constructed since 1973, but no information was available on current production efficiencies, estimated to be low during 1980-81.

Mercury continued to be mined at Azzaba. Recoverable reserves, estimated at 500,000 flasks, were projected to last until 1990. The state-run Société Nationale de Recherches et d'Exploitations Minières, (SONAREM) envisioned mining wolframite ore, located at Laouni in the Hoggar Mountains, by 1984. The feasibility of constructing a ferrotungsten smelter rated at 500 tons per year was being considered. The remoteness of the Hoggar area and the lack of water resources may continue to postpone development.

NONMETALS

Cement.—Despite recent efforts to expand cement production through construction of numerous new facilities, domestic demand exceeded supplies and approximately 1 million tons of cement was imported in 1981. The annual production tar-

get was set at 12.5 million tons of cement per year by 1984, but some construction schedules have been delayed. For example, the 1-million-ton-per-year Sour El Ghozlane plant currently being constructed by F. L. Smidth (France) was originally scheduled for startup in 1982 and was pushed back to 1983. The current 5-year plan allocated $2.1 billion for the building materials industry and $1.4 billion to increase annual cement production capacity from approximately 6 million tons in 1980 to 10 million tons by 1984.

Fertilizer Materials.—*Nitrogenous.*—SONATRACH operated two ammonia fertilizer units during 1981, both at the Arzew facility. The first 272,000-ton-per-year nitrogen unit was being refurbished during 1981 and was expected to be back onstream by 1982-83. A second ammonia unit, rated at 330,000 tons per year, was brought into production at Arzew in January 1981. Two ammonium nitrate units were also operating at Arzew by yearend 1981, with a combined production capacity of nearly 200,000 tons per year. Cruesot Loire (France) completed construction of a third ammonia unit with production capacity similar to that of Arzew. The unit, located within the Annaba fertilizer complex, was not operational by yearend 1981.

Downstream facilities for the Arzew ammonia production units in 1980, included a 132,000-ton-per-year nitric acid plant, a 55,000-ton-per-year ammonium nitrate plant, and a 61,000-ton-per-year urea plant. These facilities were recently expanded, but a relatively low output efficiency of 30% was reported for 1980-81. The Annaba fertilizer complex included plans for a 350,000-ton-per-year ammonium phosphate plant and a 260,000-ton-per-year nitric acid plant.

Construction of a fourth ammonia unit with similar production capacities was being considered. The proposed location for this facility was at Skikda. The projected startup date was set for 1987. Tentative plans also included the expansion of ammonia-consuming downstream plants and storage facilities. Storage capacity during 1981 was 20,000 tons at Arzew and 6,000 tons at Annaba.

Phosphate.—Algeria's major phosphate deposit and mine was located at Djebel Onk, where reserves were estimated at 200 million tons. The older Kouif deposit, located adjacent to Djebel Onk in the northeast corner of the country, continued to be mined, but reserves were estimated to be near depletion. SONAREM planned to expand output from the Djebel Onk Mine by approximately 2 million tons per year by 1986. Expansion of phosphate processing facilities was being considered to diminish exporting the lower valued raw materials.

The new phosphate facilities at the Annaba fertilizer complex were rated at approximately 230,000 tons per year of diammonium phosphate, 200,000 tons per year of monoammonium phosphate product, 165,000 tons per year of phosphoric acid, and 530,000 tons per year of sulfuric acid. Technical difficulties were reported during 1980-81.

Two more phosphate units, with capacities of 165,000 tons per year of phosphoric acid and 280,000 tons per year of triple superphosphate (P_2O_5), were planned as part of the $400 million Tebessa fertilizer complex. Marubeni Corp. and Hitachi Corp. (Japan) won the contract for the P_2O_5 plant, utilizing the Nissan Chemical process; Polimex-Cekop (Poland) won the contract for the associated 530,000-ton-per-year sulfuric acid plant. The anticipated startup date for the entire Tebessa complex was 1983.

MINERAL FUELS

Petroleum and Natural Gas.—The output of natural gas increased approximately 8% over 1980 output levels. Algeria's commercially proven reserves of 132 trillion cubic feet comprised roughly 5% of the world's natural gas reserves as of January 1, 1981. These reserves were projected to last approximately 370 years at the current production rate.

Petroleum production declined 20% between 1980 and 1981. Proven reserves, estimated at 8.2 billion barrels, were projected to sustain current production levels for only 20 years. Oil liftings declined from 1 million barrels per day in early 1981 to 600,000 barrels per day in October 1981. Despite world market conditions, Algeria continued to maintain one of the highest crude prices throughout 1981, along with Libya and Venezuela. Algerian blend (44° API) was selling at $37.50 per barrel, and condensate exports (63° to 64° API) were increased to $36.70 per barrel in November 1981.

Algeria attempted to negotiate oil barter deals to sell its high-priced crude. Spain's Hispanoil and Cespa Brasileira de Petróleos SA were granted a 4-year crude oil supply contract in exchange for an exploration agreement. The contracts called for an 18,000-barrel-per-day oil supply for Hispan-

oil in return for a $42 million exploration effort in Algeria's Rhadames region. Cespa agreed to purchase 15,000 barrels per day and was obligated to spend $40 million on exploration within Algeria.

Liquefied Natural Gas.—SONATRACH operated four liquefied natural gas (LNG) gas processing plants with total combined gas capacity of 5.3 billion cubic feet per day and gas throughput of 4.3 billion cubic feet per day. The two Hassi R'Mel plants contributed 86% of the gas throughput while facilities at the northern coastal areas Arzew and Skikda continued to be refurbished and completed. Pullman Kellog Algeria Inc., the main contractor at Skikda, completed constructing the fourth through seventh lines at Skikda LNG-2. The annual liquefaction capacity was raised from 583 billion cubic feet to nearly 1.1 trillion cubic feet.

Some of the Arzew facilities were damaged by the severe Mediterranean storm late in December 1980. A tanker was aground at LNG-1, but the LNG port itself was not damaged. In February, only two LNG trains at LNG-1 and LNG-2 were operating. Later in the year, two out of six LNG-1 trains were available for export; three of the lines were slated for the Arzew industrial zone and one was reserved for standby. LNG-2 units continued to be constructed, and the second train was tested in April 1982. Pullman Kellog Algeria Inc. submitted and won a contract in December 1981 to complete the 1-billion-cubic-foot-per-day LNG-2 plant. The planned annual production capacities were 2.6 million barrels propane, 2.2 million barrels butane, and 1.6 million barrels natural gasoline. The company was also bidding for a 3-year technical services contract for all LNG-2 operation phases. Problems were encountered in the startup of the third LNG-2 train, owing primarily to a shortage of nitrogen. Four out of the six LNG-2 trains were completed and tested by yearend 1981.

Liquefied Petroleum Gas.—Despite the emphasis in expanding production of LNG, plans were made to increase the output of liquefied petroleum gas (LPG). Kobe and Marubeni Corp. (Japan) won the $272 million turnkey contract for a LPG recovery plant. The 1.2-million-ton-per-year LPG plant was expected to be constructed at the Hassi R'Mel Gasfield within the Algerian Sahara. The scheduled completion date was 1985. Another $57 million contract was awarded to the Japanese company Mitsubishi to construct an associated gas treatment plant. The planned objective was to recover natural gas liquids and LPG from associated gas and reinject dry gas back into the field. Financing was arranged through Japan's EXIM Bank (60%) and a group of seven Japanese commercial banks (40%), with the loan disbursement period running through June 1984.

SONATRACH planned to start up a 2,300-barrel-per-day lube complex at Arzew in 1982. The engineering contract was awarded to Foster Wheeler (United States). Construction was to be handled by a European firm.

Petroleum and Natural Gas Contracts.—Algeria's natural gas pricing negotiations with several European countries and the United States were for the most part inconclusive by yearend 1981. Belgium was the only country that finalized a long-term supply agreement with Algeria during the year.

Distrigas of Belgium signed a 20-year supply contract in April 1981 for 88 billion cubic feet in 1982, increasing to 177 billion cubic feet from 1986 through the remainder of the 20-year period. The base price agreed upon was $4.80 per million British thermal units (Btu).

In December 1981, it was announced that Gaz de France and Algeria had achieved an agreement on the political level. France was seeking to renegotiate a 20-year supply contract slightly above the 1972 contract price of $3.70 per million Btu. Discussions were under way to develop a price index based on the average price of a basket of crudes. Deliveries under a new contract were expected to commence early in 1982. In the meanwhile, France's Compagnie Français des Petróles (CFP) was granted a 1-year, 60,000-barrel-per-day crude contract to replace the previous 220,000-barrel-per-day agreement.

Negotiations with Italy's state oil group, Ente Nazionale Idrocarburi (ENI) were faltering, despite the recent completion of the $3 billion trans-Mediterranean (Transmed) pipeline project. The pipeline, running from Algeria's Hassi R' Mel Fields through Tunisia, underwater to Sicily, and overland to Naples, was partially financed by Italy. ENI argued against Algeria's price proposals on the basis that Transmed gas was cheaper to transport than LNG, and gas should be indexed against oil product prices rather than crude oil prices. The initiation of the Transmed pipeline will likely hinge

on an acceptable natural gas price. Expansion plans, including a second underwater pipeline and an extension to Bologna in northern Italy, were temporarily shelved. Italy's original 1977 contract was for an eventual delivery of 412 billion cubic feet annually at a base price of $1 per million Btu indexed to a 1975 basket of crudes to $3.42 per million Btu at the Algerian-Tunisian border.

The British Gas Corp. agreed on an interim contract that allowed for an increase in Algerian LNG exports in three stages after the first 9 months of 1981. The average price of $4.60 per million Btu was agreed upon. The Netherlands and Greece were also involved in LNG supply negotiations.

Algeria continued discussions with various U.S. firms throughout the year. There was a deadlock in the El Paso LNG negotiations during February, and no information was available at yearend on the Consolidated Natural Gas Co., Columbia Gas Systems Inc., and Southern Natural Resources Inc. expected replacement of El Paso's intended deliveries.

Trunkline LNG Co. (United States) was scheduled to receive deliveries in August 1981. No deliveries were made by yearend owing to the Trunkline's unfinished LNG facilities and the price dispute. The Trunkline facilities, located in Lake Charles, La., were designed to handle 165 billion cubic feet per year of LNG tanker deliveries. The Trunkline complex also included a regasification plant.

The 1977 United States-Algerian LNG contract called for total deliveries of 3.3 trillion cubic feet of gas over 20 years. The contract price was $3.94 per million Btu f.o.b. and a delivered price of $7.22 per million Btu. Interestingly, the 1977 contract provided for formal price negotiations after 1 month of full volume deliveries. Full volume was equivalent to 4.3 million cubic feet tanker deliveries every 7 days. This volume was never achieved.

Pipelines.—Algeria possessed three natural gas pipelines with a combined annual capacity of 1 trillion cubic feet in 1981. The 1,070-kilometer Transmed pipeline completed in mid-1981 has an annual capacity of 412 billion cubic feet. Algeria concluded additional oil and gas pipeline contracts during the year.

In July 1981, an agreement was signed between the Algeria and Soviet state oil companies for the latter to complete a 421-kilometer section of one of the Hassi R'Mel gas pipelines. In additions, SONATRACH contracted Canadian Bechtel Ltd. to complete a 502-kilometer, 44-inch natural gas network at Rhouda Nouss by 1982.

Bechtel Ltd. (United States) was also contracted to engineer a 510-kilometer, 24-inch and an 11-kilometer, 14-inch LPG line from Hassi R'Mel to Arzew by 1983. A 632-kilometer, 30-inch oil pipeline was expected to connect in Amenas to Haoud El Hamra. The contractor expected a completion date of March 1982. Another 523-kilometer, 30-inch crude oil line between Ohanet and Haoud El Hamra was expected to be constructed by March 1982.

Uranium.—Progress was made on developing the remote Hoggar Mountain uranium deposits. Reserves were estimated between 25,000 and 50,000 tons, and production was envisioned at 1,000 to 1,200 tons of uranium oxide per year. The Davy-McKee Group (United States) was contracted during 1980 to construct the ore treatment plant. Plans were being made to utilize an alkaline leach process, which requires a minimum amount of water. The Union Minière Group (Belgium) was expected to provide technical assistance in mining the deposits. A consortium of Belgian, United States, Swiss, and French international firms was expected to conclude the turnkey contracts by 1982. Initially, plans were made to develop two open pits at Abankor and Daira and an underground mine at Timgaouine. The total estimated cost of the project, including the construction of an airstrip and a small town, was estimated at $300 million.

The Mineral Industry of Angola

By George A. Morgan[1]

In 1981, mineral production levels overall remained low compared with 1974 preindependence levels and relatively unchanged compared with those of 1980. Reactivation of several small-scale mining operations continued.

The economy underwent severe strain during the year owing to a decline in oil revenue and the high cost of internal security and defense. Crude oil sales were the principal source of foreign exchange, accounting for 78% of the value of all exports, followed by diamond and coffee sales. The reduction in revenue led to a decline in foreign exchange reserves from the $308 million recorded at yearend 1980.[2] Military expenditures due to the civil war were estimated to account for over one-half of the material budget. The gross domestic product (GDP) at current prices was $3.34 billion, and about $1 billion at constant 1973 prices. External debt was up sharply at yearend 1981 to $2.3 billion, necessitating short-term borrowing.

The national plan for 1982 development was changed to reflect a 40% reduction in Government-directed investment from 1980. Imports were limited and emphasis was being placed on upgrading management skills which still suffered from the loss of experienced personnel. Food availability remained a severe problem, and all crop production and fish harvest levels were well below 1974 levels. The country's plants were estimated to be operating at less than 30% capacity. Absenteeism was reported to be a severe problem.

Negotiations were conducted with several countries, and agreements were signed for foreign involvement in projects in the agricultural, iron and steel, and mining sectors.

PRODUCTION AND TRADE

Official production and trade data for most mineral commodities were unavailable. Production data for Angola were generally estimated on the basis of best available information. The fall in output of oil was primarily due to technical problems and the exhaustion of reserves in the oldest oilfields. Only a small portion of the associated gas produced was marketed; the remainder continued to be flared.

The decline in price of crude oil sold caused substantial changes in the Government's investment program for other industries, including mining. Attention was to be directed to increasing the efficiency of operation of existing facilities. Diamond production increased modestly from that of 1980, but a number of problems still remained, such as (1) lack of technical personnel and spare parts and (2) poor security.

Electrical power shortages were reported to have occurred frequently in Luanda and other cities. Old equipment and management inefficiencies were cited for the power failures. Several contracts were let to modify damsites for expanding powerplant output. However, most of the power produced was supplied from diesel-powered generators.

The Journal De Angola, the official news organ of the Angolan Government, reported candidly on the shortcomings of the minerals and other sectors of the economy.[3] Failure to achieve goals set in previous years for

various mineral commodities was attributed to a lack of knowledge and realism regarding numerous factors involved in each project undertaken. Reference was made to the successful exploitation for export of quartz crystal and granite as facing stone, but output levels were not confirmed.

Table 1.—Angola: Production of mineral commodities[1]

(Metric tons unless otherwise specified)

[1]Table includes data available through Sept. 27, 1982.

[2]In addition to the commodities listed, a variety of crude construction materials (clays, sand and gravel, and broken stone) presumably is produced for local consumption, but information is inadequate to make reliable estimates of output levels.

COMMODITY REVIEW

METALS

Copper.—Renewed interest in copper mines located in northwest Angola near the border with the Congo was announced by the Government. The Movoio Mine, 28 kilometers from Maquelo do Zambo, was mentioned for possible reactivation. The mine was worked in the 1940's and 1950's by Empreso do Cobre Angola (ECA). Early extensive research had been conducted over the region to determine the source of the oxidized ores, principally malachite, which accounted for most of the original output. Productive deposits were generally believed to be small and relatively shallow residual formations derived from the leaching of overlying cupriferous, argillaceous sandstones. Byproduct gold and silver were also produced.

In 1966, a drilling program reportedly resulted in the discovery of 10 million tons of ore grading 3% to 4% copper at considerable depth in the vicinity of Titelo near Aigl. Output of 20,000 tons of concentrate was reported from Titelo in 1973. A small furnace was also operated by ECA for production of black copper as early as 1949.

Iron Ore.—Austromineral, a subsidiary of Voest-Alpine A.G. of Austria, completed a study of iron ore deposits in the vicinity of Cassinga. The Cassinga North (Jamba) area had 21.7 million tons of measured recoverable detrital iron ore amenable to opencast mining using scrapers. Run-of-mine ore at the deposit contained 44% iron. Reactivation of production of Cassinga, which ceased in late 1975, was anticipated to begin in 1983. About 150,000 tons of previously stockpiled ore, of which 40,000 tons was from Jamba, was shipped in a single lot from the port at Mocamedes to the steel

plants of Voest-Alpine. A 600-meter-long pier with a shiploader capable of loading a 160,000-dead-weight-ton vessel at 5,000 tons per hour was reported operational at Mocamedes.

NONMETALS

Cement.—An agreement reached between Empresa de Cimentos de Angola (CIMANGOLA) and Danish interests provided for refurbishing of the cement plant at Luanda. The company was in poor financial condition with heavy debt and high short-term finance charges. Interest due on short-term bank loans was $1.2 million.[4]

Actual production data have been revised downward to indicate the low-level of capacity utilization, estimated at about 31%. At this level, only about 72% of the production goal was achieved. Sales during fiscal year 1980, including drawdowns from stocks, were 243,000 tons.

Diamond.—Diamond recovery operations in Luanda Norte Province continued to increase in efficiency with a modest rise in output. Several production goals were reported to have been exceeded. Extensive training programs to upgrade worker skills were conducted by Companhia de Diamantes de Angola. Further exploration was also underway.

Serious problems of diamond theft and general security were reported by the Government to have resulted in a substantial portion of production entering the black market.

Phosphate Rock.—Production of phosphate rock commenced at Quindonacache in Zaire Province in late 1981. Production capacity was small at 15,000 tons per year of phosphate containing in excess of 30% P_2O_5 from an open pit operation.

The mine, plant, and infrastructure were designed and built by Bulgargeomin of Bulgaria. Approximately 720 square kilometers were surveyed by Bulgarian geologists in Zaire Province prior to mine and plant development.

Exploration of phosphate in Cabinda Province was planned by Energet of Yugoslavia according to terms of an agreement between the Governments of Angola and Yugoslavia.

MINERAL FUELS

Petroleum and Natural Gas.—Technical difficulties and the drop in world oil prices adversely affected output of crude oil in Angola. Production was about 140,000 barrels per day compared with an expected 178,000 barrels per day. About 60% of the total came from offshore Cabinda Province; most of the remainder was from the Congo Basin. Some oil wells, as in the Kwanza Basin south of Luanda, required special technical maintenance, such as artificial lift methods. Secondary recovery projects using reinjected gas and water were underway at two reservoirs in the Congo Basin. An oil-storage facility, with capacity for 800,000 barrels, was under construction to reduce long loading periods and high demurrage.

A major enhanced-recovery project began in the Cabinda Oilfield involving wildcat and development wells and gas reinjection. Output from the older wells was in a steep decline because of falling pressure gradients. Approximately 78 million cubic feet per day of gas was to be reinjected into two fields beginning in May 1982. Natural gas liquids extraction was also to take place. In addition, fractionators were to be installed to produce propane, butane, and natural gasoline. Liquefied petroleum gas would be moved by pipeline to a refrigerated storage vessel prior to transport. Natural gasoline would be mixed with crude oil and sent ashore for storage via pipeline. A banking syndicate headed by Morgan Guaranty Trust Co. of the United States provided a loan of $50 million while the Export-Import Bank approved $85 million for financing the gas injection, enhanced-recovery project.

In 1981, about 21,500 tons of bottled butane was consumed by 120,000 families, mainly in Luanda. Upgrading of equipment was underway to increase the supply to 60,000 tons per day by 1990.

At yearend 1981, the country's sole refinery at Luanda, with a capacity of 33,000 barrels per day, was damaged by sabotage. Several storage tanks and one of the distillation units were destroyed, necessitating the import of refined products from Gabon and the Canary Islands.

The Sociedade Nacional de Combustiveis de Angola (Sonangol) was constructing a major service and supply center on Kwanda Island, 5 kilometers from Soyo in Zaire Province. Facilities were to include worker housing, warehouses, workshops, and pipe storage facilities. Construction of a quay with 200 meters of berthing area and deepening of Pululu Channel were underway.

Sonangol also announced that it intended to market all crude oil directly without intermediaries wherever possible. Total employment in the state-owned company was 2,100 people.

The Mineral Industry of Argentina

By Pablo Velasco[1]

The Argentine economy, dominated for many years by the agricultural sector, was in recession in 1981. The Nation's gross domestic product (GDP) fell by about 6% to $131 billion[2] at current prices, according to estimates released by the Central Bank. This recession, which started in 1980, became more pronounced during the second quarter of 1981 because of the adoption of adjustment measures that would help to attain continued economic development from 1982 onwards.

Mining in Argentina continued in its incipient stage of growth. Although a wide range of minerals is known to occur in the country, this industry is small by international standards and only iron ore, coal, oil, and natural gas are produced on an economically significant scale, with small output of other minerals including barite, bentonite, borax, copper, fluorspar, gold, gypsum, lead, manganese, salt, silver, sulfur, talc, tin, and zinc. Argentina is one of the few world producers of borax (sodium borate).

Argentina was undertaking an ambitious public investment program, especially in the energy and mining sectors, estimated by the Ministry of Economics at about $115 billion during the 10-year period 1980-89. Foreign investment in all sectors of the economy exceeded $4.5 billion. The principal source was the United States, followed by the Netherlands, Italy, and the Federal Republic of Germany.

Exports of minerals, mineral products, and metals in 1981 decreased 24% to $54.2 million compared with 1980 values. The aluminum industry output declined 6% in 1981 compared with the 1980 output. The prospects for refined aluminum exports would depend upon the availability of a surplus after domestic demand is met.

The Comisión Nacional de Energía Atómica (CNEA) reported that the Government of Argentina has given high priority to the development of the Nation's uranium potential, and that by 1985, CNEA plans to survey between 50,000 and 100,000 square kilometers including test drilling. The Sierra Pintada uranium mine and processing plant was expected to start production in 1983 at an estimated rate of 700 tons per year of U_3O_8 concentrate.

To reduce its dependency on imports of copper, the Government was considering the development of three large ore deposits using domestic and foreign capital. One of those deposits, Farallón Negro in the Province of Catamarca, was producing gold, silver, and manganese. Unlike the two other deposits to be offered, Farallón Negro is for national bidders only, but up to 49% of total equity can be of foreign interest that could supply the necessary technology. Ten kilometers south of Farallón Negro, another deposit, Bajo la Alumbrera, will be put up for international bidding. The Bajo la Alumbrera deposit has already been explored, and reserves of 350 million tons of ore containing copper and gold have been identified. The last of the three deposits to be tendered by the first quarter of 1982 is a 30-square-kilometer deposit, Nevados de Famatina. This deposit in the Province of La Rioja has not yet been explored.

The hydrocarbons sector has been traditionally dominated by two Government agencies: Yacimientos Petrolíferos Fiscales (YPF)—active in onshore and offshore oil and gas exploration, production, and refining; and Gas del Estado—operator of the natural gas transmission system. Argentina's current drive is to attain self-sufficiency by 1985. To accomplish this, YPF

was loosening its tight grip on the industry to allow private operators to carry out a larger share of the work. Over 30 areas have been turned over to private consortia through public bidding, and three offshore risk contracts have been awarded to private groups. The most important gas and petroleum discoveries were made by YPF and two international oil companies in Neuquén Province and in Tierra del Fuego in the south of the country.

A 20-year hydroelectric power plan was underway to make Argentina one of the world's most impressive users of water power for electricity and irrigation. When the plan is completed in 1999, hydroelectricity will provide more power to Argentina's growing industrial complex than fossil fuels and nuclear energy combined. Argentina's largest hydroelectric project on the Paraná River is called Paraná Medio. Construction of the first two dams will be initiated in 1985 with an installed capacity of 5,600 megawatts.

Government Policies and Programs.—Argentina has one of the largest mineral reserves in the world that is still largely unexploited. Considering that during the last decade the mining sector has not developed significantly, the Government revised the Mining Code and promulgated a new Mining Promotion Law in October 1979. This law, No. 22,095, contemplates the following objectives in Chapter I:

1. Promotion of mining activities is ruled by the provisions of this law and the regulations that the Government may issue accordingly. To this effect it shall arrange by agreement with the Provincial Governments the exercise of respective constitutional powers.

2. General objectives: (a) to contribute to the development of the country by increasing the production of minerals and their byproducts; (b) to ensure the rational exploitation of mineral resources in the national territory; (c) to strengthen and support the expansion of mining enterprises of national capital, whatever their legal nature may be; (d) to ensure the development of mining projects required by national defense and security; (e) to establish new opportunities for employment particularly in frontier areas; (f) to improve working conditions, raise the standard of living, and upgrade training of the mining work force; (g) to determine the country's mining potential and ensure its proper management; (h) to promote small- and medium-size mining activities and provide technical assistance; (i) to promote the establishment and development of consulting enterprises of Argentine capital and technical staff; and (j) to ensure that decisions in the mining sector are under national control.

3. Particular objectives: (a) to intensify mineral exploration of the national territory; (b) to supply domestic demand with local raw materials and substitute imports of minerals, ordinary metals, and mineral products of primary processing and products of the chemical industry derived from minerals; (c) to increase mineral exports, provided domestic supply can be satisfied by existing ore reserves, stimulating particularly those mineral products with added value and in accordance with national policies with regard to strategic minerals; (d) to integrate the exploitation of deposits with regional siting of beneficiation plants; (e) to increase productivity of mining operations; (f) to research and develop national technology throughout all stages of mining activity; (g) to promote mining enterprises by attracting domestic savings and investment of foreign capital; (h) to promote free marketing, at international market prices, of mining production; and (i) to promote cooperation and the establishment of consortia among mining producers in order to furnish services or carry out projects of common interest.

4. The National Executive Office is empowered to accumulate stockpiles of strategic minerals and related products in such volume as the Ministries of Economics and Defense deem necessary for the security and defense of the Argentine Nation.

The remaining chapters of Law No. 22095 cover the following: II—Beneficiaries of This Law; III—General Promotion Measures; IV—Special Promotion Measures; V—Mining Promotion Fund; VI—Application Authority; VII—Penalties and Other Remedies for Noncompliance; and VIII—Miscellaneous.

The changes contemplated in the new law provide stimuli for the development of mining by recognizing the value of private initiative acting alongside or complementing the State's efforts in carrying out mine exploration and production.

PRODUCTION

Production of metallic minerals during 1981 amounted to 1.1 million metric tons, a 46% decrease compared with 1980 output; nonmetallic minerals amounted to 5.8 million metric tons, 2% less than in 1980; and output of construction-related minerals was 60 million metric tons, 2% more than in 1980.

The steel industry output in 1981 decreased 6% compared with that of 1980, resulting in imported products totaling 467,000 metric tons. Most of the imported steel products came to Argentina from Japan and Brazil.

Argentina's aluminum industry, which had been growing steadily since startup in 1974, experienced a 6% decrease in output in 1981 compared with that of 1980.

Production of cement has been increasing steadily since 1976 and achieved record levels in 1981. Installed capacity for the cement industry in 1981 was 10.5 million metric tons.

Yacimientos Carboníferos Fiscales (YCF) continued production of coal from the Rio Turbio deposits in the southernmost part of Argentina in Santa Cruz Province, but it was not adequate to meet domestic demand. One-half of the coal consumed in Argentina was supplied by cheaper imports.

Argentina has been almost self-sufficient in oil for several years. Output in 1981 increased 6.3% compared with that of 1980. Argentina continued as the third largest producer of crude oil and natural gas in Latin America. Production of uranium has increased markedly over the last 3 years.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through June 30, 1982.

[2]In addition to the commodities listed, cadmium, lime, and perlite are produced, but output is not reported quantitatively and available information is inadequate to make reliable estimates of output levels.

[3]Reported figure.

[4]Hot-rolled semimanufactures only; excludes castings and cold-rolled semimanufactures produced from imported hot-rolled semimanufactures.

[5]Revised to none.

[6]Includes plastic, semiplastic, and/or ferruginous clays used totally in the manufacture of portland cement.

TRADE

As a result of devaluations of the peso during 1981, exports rose 12% from $8.0 billion in 1980 to $9.1 billion in 1981, while the total value of imports declined from $10.4 billion to $9.1 billion, a 12% decrease.

According to statistics published by the Dirección Nacional de Economía Minera within the Ministerio de Economía, exports of minerals, mineral products, and metals in 1981 earned $54.2 million, a decrease of

24% compared with 1980 values. On the other hand, the volume of mineral exports in 1981 increased 32% to 167,760 metric tons compared with that of 1980.

The most valuable metallic minerals exported in 1981 were 17,712 tons of lead concentrate to the United States, Australia, Bulgaria, and Belgium for a total of $15.7 million. Second in importance was 5,883 tons of tin and silver concentrate to England for a total value of $7.5 million, followed by 16,032 tons of zinc concentrate to England, Holland, and Yugoslavia for a total value of $4.1 million.

Exports of nonmetallic minerals in 1981 were as follows: In first place, 15,833 tons of boron minerals to Brazil for a total value of $12.0 million, followed by 49,090 tons of cement to Paraguay, Chile, Bolivia, and Uruguay for a total value of $4.2 million.

Exports of petroleum products and residual oil in 1981 were valued at $626 million, a 113% increase compared with the 1980 value.

Petroleum imports during 1981 decreased 46% to 9 million barrels, valued at $542 million.

Natural gas imports during 1981, chiefly from Bolivia, increased 8% to 2.2 billion cubic meters. Coal imports during 1981 decreased 19% to 706,000 metric tons.

Argentina imported minerals for a total value of $45.1 million, including iron ore from the Republic of South Africa, Brazil, Bolivia, Canada, United States, Peru, and Venezuela; calcined bauxite from Brazil, United States, Guyana, and China; and lead and tin concentrates from Bolivia. Manganese and coal were imported chiefly from Brazil and the United States, respectively.

[2]The gas reported, imported by Argentina, is presumed to be liquefied petroleum gas except that imported from Bolivia and Chile, which is presumed to be natural gas.

COMMODITY REVIEW

METALS

Aluminum.—Aluminio Argentino S.A.I.C. (ALUAR), which commenced operations in July 1974, continued as the sole producer of primary aluminum. The aluminum plant located at Puerto Madryn, Province of Chubút, has a capacity of 144,000 tons per year. In 1981, ALUAR produced an average of 11,000 tons monthly, considerably above that of prior years when energy was not fully supplied from the Futaleufu hydroelectric plant.

The domestic market for primary aluminum was not expected to expand significantly during 1982, and export trade, although increasing, was expected to be limited. Nevertheless, in view of projected growth in world demand for aluminum over the coming 20 years, ALUAR was planning to expand its production capacity by 25% to 50%. Final plans will depend upon energy costs. Work was planned to begin soon and expected to take up to 2 years to complete.

Copper.—In the last 10 years, Argentina has targeted its largest exploration effort on locating large disseminated copper deposits. This effort has proven to be successful for both the private as well as the public entities involved, resulting in the identification of three large copper deposits: El Pachón located in the San Juan Province, Bajo de la Alumbrera in Catamarca Province, and Nevados de Famatina in La Rioja Province.

The El Pachón project received official approval in November 1979 for development by the St. Joe Minerals Corp. through its Argentine subsidiary Cía. Minera Aguilar S.A. (CMA) which will act as the manager and operator of this project. The project consists of a fully integrated operation to produce 100,000 tons per year of electrolytic copper (at a mining rate of 35,000 tons per day); 350,000 tons per year of sulfuric acid; 1,700 tons per year of molybdenum concentrate; and 200 tons per year of anodic bars with values in silver, gold, selenium, and tellurium. El Pachón's ore reserves were estimated at 800 million tons averaging 0.67% copper and 0.016% molybdenum, together with minor gold values. Development of this project has been delayed pending the issuance of the Argentine Mining Promotion Law. Other major mining companies and the state have been invited to participate in this project.

Information released by the Government of San Juan Province and company representatives indicated that the El Pachón project would be initiated in mid-1982, but production would not come onstream until 1985 or 1986. In the meantime, construction of certain infrastructure elements has been undertaken.

The estimated cost to build and start the El Pachón complex is $1.75 billion. It was estimated that about 40% to 50% of such

expenditures will be for local procurement.

The first of two mining projects to be available for bidding is Nevados de Famatina. The Argentine Government has approved, by Decree No. 2234 of 1981, the bid documents to govern the international and local tender. The bid offer covers geological exploration of the area in the first stage, with an option in the second stage for its exploitation and beneficiation of molybdenum and copper minerals and other byproducts found in the deposit. The reserves are estimated at 200 million tons of ore, with grades of 0.06% molybdenum and 0.17% copper.

The second mining project planned for bidding is Bajo La Alumbrera. The bid documents will require completion of the feasibility study, with the option to exploit the deposit. Reserves have been estimated at 300 million tons, with an average grade of 0.56% copper, 0.68 grams of gold per ton, 2.5 grams of silver per ton, and 0.008% molybdenum. Conditions for this project appear to be favorable because of its location, altitude, and the proximity of access routes such as railways and roads.

Argentina has a number of other copper deposits with a potential for development such as Paramillo Sur with estimated reserves of 140 million tons of ore with an average grade of 0.46% copper and 0.016% molybdenum; Campana Mahuida in Neuquén Province with estimated reserves of 27.5 million tons with an average grade of 0.63% copper; and the Amendel Quantum deposit with a mine known as Mi Vida in Catamarca Province.

Iron Ore.—According to the studies done by the Secretaría de Estado de Minería and Fabricaciones Militares, iron ore reserves in Argentina total almost 1 billion tons as detailed in table 5.

Table 5.—Argentina: Iron ore reserves

(Thousand metric tons)

Deposit	Location (Province)	Reserves	Average grade (percent)	Metal content
Sierra Grande	Rio Negro	265,000	55	145,750

[2]Ferrotitaniferous sands with 16% TiO_2.

Mine output of Hierro Patagónico Sociedad Anónima Minera (HIPASAM) in 1981 was reduced in accordance with the lowered rate of production of the pelletization plant. HIPASAM had reduced earnings because of a decrease in sales of pellets to Sociedad Mixta Siderúrgica Argentina (SOMISA) and increased financial debt at high interest rates.

Of the total output of iron ore in 1981, 364,000 tons were in pellet form. In 1981, HIPASAM contracted for the professional services of Studiengesellschaft fur Eisenerzaufberietung de Othfresen Laboratories of the Federal Republic of Germany to improve the quality of pellets produced. To satisfy the requirements of the blast furnaces, the phosphorus content has been decreased, particularly in the last shipment of the year, to below the admissible level.

Fabricaciones Militares was continuing development of the Nueve de Octubre and Puesto Viejo iron mines in Jujuy and Salta Provinces, respectively, by opening up new drifts and tunnels. Two new plants are to be set up to improve the beneficiation of the ore for use by the Zapla steel plant.

Imports of iron ore and pellets in 1981 came mostly from Brazil (90%) and other countries such as Peru, Venezuela, and the Republic of South Africa. Imports of iron ore declined 13% to 2,350,000 tons compared with the 1980 volume.

Iron and Steel.—Crude steel production declined 7% in 1981 compared with that of 1980. During 1981, installed plant capacity was utilized at only the 50% level for blast furnaces and a slightly higher level for

direct-reduction plants. SOMISA's No. 1 blast furnace was shut down for repair and maintenance and scheduled to resume operation in 1982. During the first half of 1981, SOMISA completed expansion work on the existing hot-rolling mill to increase capacity by 300,000 tons per year, at investment cost of some $25 million.

Primary iron production declined 6%—comprising 936,000 tons of pig iron and 759,000 tons of sponge iron.

ACINDAR S.A. was planning to increase production capacity by 1 million tons, at a cost of some $250 million, to be expended over the coming 5 years. The No. 2 Morgan Line was scheduled to be expanded and modernized during the first half of 1981 at an investment cost of some $30 million. The direct reduction steel plant was to be increased in capacity by 200,000 tons per year to 700,000 tons per year.

Four Argentine steel companies officially merged in October 1981 within ACINDAR S.A., the largest of the group, including GURMENDI S.A., GENARO GRASSO S.A., and SANTA ROSA S.A. ACINDAR shareholders will hold 66.6% of the merged entity.

Imports of steel in 1981 declined in line with the economy's recession.

Lead, Silver, and Zinc.—In July, Argentina joined the International Lead and Zinc Study Group (ILZSG), which has 32 member countries. Until then, Argentina had observer status in the ILZSG. Argentina produced enough lead and zinc to meet the needs of the Nation with some surplus for exports.

Production of zinc and lead concentrate in 1981 declined 5% and increased 16%, respectively. Silver was recovered as a by-product.

CMA, a fully owned subsidiary of St. Joe (Fluor Corp.), continued as Argentina's main lead-zinc producer from its mine in Jujuy Province. In 1981, CMA produced 33,300 tons of lead concentrate, 37,700 tons of zinc concentrate, and 1.65 million troy ounces of silver contained in the concentrate.

The Secretaría de Estado de Minería provided a $600,000 loan to Cía. Minera El Colorado S.A. to further explore the Sentazon deposit in San Juan Province, as part of its efforts to promote mining in the private sector.

Manganese.—Argentina has numerous and widely distributed manganese deposits, but none are known to be of the size and grade of ore to be economically feasible. Production of manganese has been erratic, reaching the greatest output in 1959. Most of the production of manganese ore comes from the mines of Farallón Negro (Catamarca), 9 de Julio and 25 de Mayo (Cordoba), Don Luis (Mendoza), La Negra and La Clemira (Santiago del Estero).

Among these, the most important mine is Farallón Negro. The Farallón Negro Mine, operated by Yacimientos Mineros de Agua de Dionisio (YMAD), the state-owned entity, was exploiting one of a number of vein deposits occurring within a 343-square-kilometer area containing manganese together with gold and silver. The Farallón Negro ore body has reached the most advanced stage of development. Production was 350 tons per day of ore using cut-and-fill mining methods. The manganese concentrate contains about 44% manganese. The ore is subjected to cyanidation for the recovery of gold and silver. Annual produc-

tion was reported at about 25,000 tons of manganese concentrate, 620 kilograms of gold, and 2,500 kilograms of silver.

Proven reserves at Farallón Negro were reportedly about 800,000 tons grading 9 grams of gold per ton, 160 grams of silver per ton, and 16% manganese. Within the Farallón Negro area, there is potential for additional reserves at Alto de La Blenda.

The Secretaría de Estado de Minería approved a loan of $125,000 to a private company in Córdoba Province to further explore for manganese at the 24 de Septiembre Mine located in the Sobremonte Department of this Province. The state will assume the risk of 80% of the loan in case the exploration proves to be unsuccessful.

Tin.—Production of tin concentrate in 1981 was 10% higher than in 1980. The tin and silver production from the Pirquitas Mine in the Province of Jujuy continued active in 1981. Sociedad Minera Pirquitas-Picchetti y Cía. S.A., the major producer, has been producing tin and silver since 1936. During the period of 1936-78, Pirquitas produced 79,100 metric tons of tin concentrate with a tin content from 14% to 20% and 7,200 metric tons of silver. The Sociedad Minera Pirquitas was exploring a large disseminated tin deposit in an area near the Pirquitas Mine.

NONMETALS

Boron Minerals.—Production of boron minerals, which increased by 7% in 1981, was from the deposits of Francisca, Grupo Rosario, Cigarra, Inundada in Jujuy Province, and Tincalayú in Salta Province in the north of Argentina.

Boroquimica S.A.M.I.C.A.F. was developing the Tincalayú deposit in the peninsula Tincalayu near the Salar del Hombre Muerto. The ore deposit measures 1,000 meters long by 150 meters wide with a thickness between 10 to 15 meters.

Cement.—With the addition of three new cement plants, which began production in 1980, the cement industry in Argentina comprised 18 plants scattered over the country with an installed capacity of 10.3 million tons per year. During 1981, two new cement plants were under construction. The first is located in Puesto Viejo, Jujuy Province controlled by Juan Minetti S.A. with a capacity of 720,000 tons per year, and the second is located in Rio Juramento, Salta Province, and is controlled by Cementos Nord Oeste Argentino with a capacity of 625,000 tons per year.

Total consumption of cement in 1980, including imports reached 7.3 million tons, representing an increase of 8.2% compared with that of 1979.

Fluorspar.—Minera Patagónica S.A. began mining fluorspar from deposits located 15 kilometers southwest of Sierra Grande in Rio Negro Province.

The mining project is based on the Delta deposit, the most important, and 30 other smaller ore bodies. The project includes construction of milling, flotation, and briquetting plants at Puerto Madryn, Chubút Province, along with loading and shipping facilities. The Spanish construction firm Dycasa will construct the facilities estimated to cost $18 million using Japan's Kurimotor Iron Works equipment. Open pit mining and subsequent underground mining will be used to exploit the deposit. Operations were scheduled to begin at the end of 1982 at the rate of 150,000 tons per year. The reserves were estimated at over 4 million tons with an average grade of 52% CaF_2. The reserves of the Delta deposit, plus contributions from other mines and local purchases to be made in Chubút, assure a 40-year life of the project.

Drilling at the Delta Mine was performed by Dresser Atlas Co. of Dallas, Tex., and Kaiser Chemical & Aluminum Co. Ore reserve calculations and milling and flotation tests were made by Gallagher Co. of Salt Lake City, Utah, and the School of Mines of San Juan, in Argentina. Extensive briquetting test were performed in Japan. Process flowsheets and construction plans were reviewed by the Austin Co., Cleveland, Ohio. Fluorspar production in 1981 increased 21% compared with that of 1980.

Lithium Minerals.—The existence of a lithium deposit was reported at the Salar del Hombre Muerto. Lithium content on the order of 500 to 1,000 grams of LiO_2 per ton and 0.1% to 0.2% of K_2O was estimated by the National Economic Geology Committee for special investigations. Reserve estimates were not available, but a large figure was indicated. Current production of lithium comes from operations in San Luis, Catamarca, and Cordoba Provinces. Output in 1981 was 10% higher than in 1980.

MINERAL FUELS

Unlike many developing countries, Argentina does not have a deficiency of energy resources. It is nearly self-sufficient in oil and has large gas reserves. The Government has drawn up an energy strategy for

the next two decades. Its aim is to switch the emphasis from oil and gas to hydroelectric and nuclear power and achieve self-sufficiency in oil by 1985, rather than by 1982 as targeted in earlier programs. Total investment needed has been conservatively put at $55 billion, including all energy sectors.

Coal.—The production and development of coal mines in Argentina was controlled by the state entity, YCF, mainly from the remote Rio Turbio deposits in the southern region of Argentina in Santa Cruz Province. The known bituminous coal reserves at Rio Turbio were estimated at some 484 million tons. Record output in Argentina was achieved in 1979, reaching 1.4 million metric tons. During 1980, there was a slowdown in production and sales of coal owing to reduced demand upon the thermal power centers. In 1981, run of mine production increased by 17%.

High production costs in domestic mines have discouraged purchase of locally produced coal; consequently, 50% of the demand for coal is met by cheaper imports from the United States and Poland. YCF announced plans to invest nearly $400 million in coal mining during the 1980-85 period in order to obtain output of 4 million tons per year by 1985. Demand for coal was expected to increase with the startup in 1984 of the thermal powerplant in Bahía Blanca.

Imports of bituminous coal in 1981 declined 19% to 705,800 tons from the United States (85%), Poland (8%), and Colombia (2%)—an experimental shipment.

Natural Gas.—Gas del Estado continued to expand its gas pipeline network to take advantage of Argentina's growing natural gas reserve. Almost one-half of all the gas extracted continued to be lost because of the lack of facilities for piping it to consumption centers.

During 1981, piped natural gas increased by 9.7%, and imported gas went up 13.3% in volume and 96% in cost, to $221 million. In view of the abundance of Argentina's natural gas, negotiations were in process to export gas to Uruguay and Brazil by extending pipelines to the respective borders. Exports of natural gas could provide a significant source of foreign exchange earnings.

The country's proven reserves of natural gas have tripled in the last 5 years, to 22.6 trillion cubic feet as of December 31, 1980. At the current rate of consumption, the proven reserves will supply the country's demand for over 60 years. Probable reserves were estimated at 250 billion cubic meters, a figure that could be expanded in view of the intense exploration activity underway.

The most important gas discoveries were made in the remote part of southern Argentina in Neuquén Province and Tierra del Fuego, and a very substantial investment in pipeline, totaling up to 3,000 kilometers in length, will be needed to carry gas to the densely populated area in the north. A 180-kilometer pipeline across the Straits of Magellan will be required to tap a 52-billion-cubic-meter gasfield on Tierra del Fuego.

YPF of Argentina and Litton Energy Systems of the United States agreed to form a joint venture company for the construction and operation of a 563-kilometer pipeline from the Loma de la Lata Gasfield to the liquefaction plant to be located at Puerto Madryn. The planned plant capacity is about 600 million cubic feet of natural gas per day.

Considering Argentina's excellent availability of hydrocarbons, especially gas, the Government has adopted decisive measures to develop the petrochemical industry. To this end, industrial centers or poles for petrochemical plants were being built in Bahía Blanca and Ensenada (Buenos Aires Province), Rio Tercero (Cordoba Province), San Lorenzo (Santa Fé Province), Luján de Cuyo (Mendoza Province), and in Neuquén Province. These poles, when completed, will supply local needs and provide a large volume for exports, especially to Latin American countries.

The main plant in the Bahía Blanca Petrochemical Pole was scheduled for startup at the end of 1980. Its production capacity will be 200,000 tons of ethylene per year obtained by processing the ethane that will be supplied by the recently opened Gas del Estado plant in General Cerri, at a distance of 10 kilometers from the Bahía Blanca plant. The complex will consist of four plants, one of which, owned by Polisur S.M., will start producing 190,000 metric tons per year of low-density polyethylene. Additional plants by Petropol S.M. and Vinivlor S.M. will produce 20,000 tons of high-density polyethylene and 130,000 tons of vinyl chloride per year, respectively. The plants were planned to be in production by 1983.

Petroleum.—Argentina has been almost self-sufficient in oil for several years. Out-

put continued in an upward trend in 1981, increasing by 6.3%. About 15% of the output was derived from older wells by secondary recovery. YPF controls two-thirds of the wells in production and has trimmed its work force from 50,000 to 30,000. Foreign as well as private Argentine companies are now participating in exploration and development projects on a risk-contract basis. The rate of oil drilling was about 800 new wells per year, but the target has been increased to 7,000 new wells to be drilled by 1984. Oil reserves have been estimated at 7.3 billion barrels.

A new oil discovery, considered to have the largest volume of those currently in production, was announced by YPF. It is located in the north of the Patagonia region, in the Province of Neuquén, and has been identified as Loma de la Lata. The new well achieved an initial production of 1,038 barrels per day. Several other YPF discoveries of oil were announced at Madregones in Salta Province near the Bolivian border.

Exploration was underway in the South Atlantic Ocean in the region of Rio Gallegos and the Straits of Magellan using the offshore platform Interocean II belonging to the Shell Hydrocarbons B.V. Co. The General Mosconi platform, operated by Esso Exploradora y Productora Argentina Co., was exploring in the area assigned to it by YPF opposite Tierra del Fuego. Another risk-contract to explore nearly 4,400 square kilometers in Rio Norte Province was awarded to a group comprised of Cities Service Co., Aminoil, and Petrolar.

Uranium.—Argentina has assigned high priority to the development of the country's uranium potential and was nearing completion of its program to control the full nuclear cycle based on natural uranium. The National Atomic Energy Commission (CNEA) plans to increase its exploration and exploitation efforts by surveying between 50,000 and 100,000 square kilometers by 1985. With test drilling, CNEA hopes to prove a reserve of about 60,000 tons of U_3O_8.

CNEA initiated discussions with foreign companies regarding participation in its development program. Foreign companies operating under risk contracts would be authorized under certain conditions to export 25% of the eventual production of uranium. Uranium exports would be conditional upon finding sufficient reserves to assure the provision of natural uranium for the nuclear plants in operation and those planned for the next 10 years on the basis of 30 years of useful life of such plants.

According to CNEA's calculations, the country's uranium reserves exceed the requirements of the Argentine nuclear plan up to 1999. These reserves can supply more than nine plants of 500-megawatt capacity each during their 30 years of useful life. Actually six plants have been planned, including: Atucha-I (350 megawatts) in operation; Embalse (600 megawatts), to start operating by 1982; Atucha-II (600 megawatts), to be ready in another 4 to 5 years; and three additional plants expected to be operating by 1999.

According to CNEA, the main ore body at Sierra Pintada contains 16,800 metric tons of uranium oxide, with 4,000 metric tons in smaller formations. The Sierra Pintada uranium mine and processing plant was expected to begin commercial production in 1983 at an estimated rate of 700 tons per year of uranium concentrate. Los Gigantes deposit in Cordoba Province was under development.

By late 1981, CNEA was scheduled to have a purifying plant in operation at Cordoba that would eliminate the need to send the uranium abroad for upgrading. The fuel-element plant at Ezeiza, near Buenos Aires Airport, will obviate the present need to import fuel elements from the Federal Republic of Germany. The pilot heavy-water plant at Arroyito was planned for completion in 1982.

[1]Physical scientist, Branch of Latin America and Canada, Division of Foreign Data.

[2]Where necessary, values have been converted from Argentine pesos (M$N) to U.S. dollars at the average exchange rate for 1981 of M$N4,402=US$1.00. The exchange as of Dec. 31, 1981, was M$N7,248=US$1.00.

The Mineral Industry of Australia

By Charlie Wyche[1]

Overall, the Australian minerals industry in 1981 experienced a difficult year, and production of many major commodities declined from the 1980 level. High interest rates caused a weakening in consumer spending, and the low demand for goods and services all contributed negatively to the industry's performance.

In the aluminum industry a number of companies deferred making commitments to major investments in new smelters because of serious market deterioration. Pilbara iron ore mines operated at less than 70% capacity and some expansion plans were dropped. Although zinc, coal, tin, and uranium performed well, they were the exception. In the case of zinc, the industry benefited from a strong demand, high energy costs in traditonal smelting countries, and a worldwide shortage of zinc concentrates.

Foreign investments in the Australian minerals industry continued at a high level. In mineral processing, the Government will be seeking maximum opportunities for Australian equity. At present, mineral processing does not come under the Government requirement whereby at least 50% of new mining ventures should be under Australian ownership and control, except for uranium mining where the level is 75% Australian equity. There is sufficient flexibility, however, to ensure that worthwhile projects are not delayed where Australian equity is not available. The projects in either the committed or final feasibility stages increased from $33.3 billion[2] in December 1980, to $35.5 billion in June 1981. The 1981 value was for a total of 366 projects.

PRODUCTION

Mine production of most of the approximately 70 minerals produced in Australia in 1981 was below the level for 1980. Strong growth continued throughout the Australian coal industry and a new production record was achieved. Tin and zinc output, although affected by industrial disputes at several important mining centers, was higher than that in 1980. Mine output of gold was slightly higher than that in 1980, but output of lead, copper, iron ore, nickel, and silver was lower. Production of uranium oxide almost doubled because of output from the new mine and concentrator at Ranger, Northern Territory. Mine production of bauxite was adversely affected by a strike at Weipa, Queensland. The economic depression in the world steel industry resulted in reduced demand for Australian iron ore and manganese; however, there was a slight increase in demand for Australian steel products. Because of reduced demand for rutile supplies some Australian mineral-sands operators decreased production, particularly on the east coast.

Table 1.—Australia: Production of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1977	1978	1979	1980	1981[p]

e Estimated. p Preliminary. r Revised. NA Not available.

[1] Includes data available through Sept. 27, 1982.

[2] Data are for years ending Nov. 30 of that stated for plants owned by the Broken Hill Pty. Co. Ltd.

[3] Western Australia only. Metal content of nickel ore.

[4] Beginning with 1979, production from Western Australia and Northern Territory is included.

[5] Excludes production from Western Australia.

[6] Data are for years ending June 30 of that stated.

[7] Excludes production from Northern Territory and Australian Capital Territory.

[8] Excludes production from Northern Territory, Australian Capital Territory, and Western Australia.

[9] Excludes natural gasoline and liquefied petroleum gas, which are produced on Barrow Island, off the Western Australia coast. An unspecified portion of the liquefied petroleum gas extracted is apparently marketed locally, but this quantity is limited. The bulk of the liquefied petroleum gas and all of the natural gasoline is blended with crude oil and presumably is counted with crude oil from that area. Gross production of liquefied petroleum gas on Barrow Island was as follows, in thousand barrels: 1977—31, 1978—29, 1979-81—not available; and of natural gasoline: 1977—26, 1978—33, 1979-81—not available. Natural gas liquid output from several gasfields in Western Australia is excluded for similar reasons. Condensate production from these fields was as follows, in thousand barrels: 1977—23, 1978—19, 1979-81—not available.

[10] Residual fuel oil equivalent.

[11] Reported figure.

TRADE

Australia produces a wide variety of commodities, most of which are primarily for the export markets. In 1981, a record high mineral export value of $7.1 billion was established. The value was greatly enhanced by revenue from bituminous coal, which offset the decline in revenue from other minerals. The value of Australia's exports of coal was $2.3 billion, about 33% of all mineral exports. Other large export earners were iron ore and pellets, alumina, copper, lead, nickel, and zinc.

The value of mineral imports rose to $2.4 billion. The imports of crude oil and other refinery feedstock valued at $2.1 billion was the largest single category.

Table 2.—Australia: Exports and reexports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1978-79	1979-80	Destinations, 1979-80	
			United States	Other (principal)

(Metric tons unless otherwise specified)

Commodity	1978-79	1979-80	Destinations, 1979-80	
			United States	Other (principal)
METALS —Continued				
Titanium ores and concentrates, gross weight:				
Ilmenite excluding beneficiated ilmenite ____ thousand tons__	892	1,115	248	United Kingdom 207; U.S.S.R. 170; Japan 88.
Leucoxene ____	10,644	27,796	21,661	Netherlands 4,108; Japan 2,000.
Rutile ____	364,121	534,267	250,381	United Kingdom 83,539; Netherlands 55,705; Japan 36,025.
Tungsten ores and concentrates, gross weight:				
Scheelite ____	4,082	3,628	79	West Germany 1,992; Sweden 585; Japan 392.
Wolframite ____	1,836	124,388	106	West Germany 123,919.
Uranium and thorium ores and concentrates, gross weight:				
Monazite ____	35,493	35,784	28,479	France 5,499; United Kingdom 1,770.
Others ____	r2,220	1,327	411	United Kingdom 394; Canada 308; Japan 214.
Vanadium: Ore and concentrate, gross weight[5] ____	r528	7,878	5,300	Japan 1,607; Republic of Korea 269; Belgium-Luxembourg 179.
Zinc:				
Ore and concentrate, gross weight __	485,726	489,534	3,783	Japan 308,004; United Kingdom 45,208; Republic of Korea 4,031.
Oxides, hydroxides, peroxides ____	606	341	__	Philippines 135; Indonesia 75; Papua New Guinea 40.
Slag and residues ____	3,476	11,872	__	Taiwan 7,938; India 1,725.
Metal including alloys:				
Waste and scrap ____	70	751	__	India 539; Taiwan 170.
Unwrought ____	194,424	173,761	27,624	India 26,295; Indonesia 22,124; Taiwan 21,025.
Semimanufactures ____	15,016	1,726	__	New Zealand 490; India 284; Singapore 224.
Zirconium: Ore and concentrate, gross weight ____	450,767	609,267	74,781	Japan 181,961; Italy 159,525; Netherlands 38,812.
Other:				
Ores and concentrates value, thousands__	r$139,407	NA	NA	NA.
Waste and scrap containing nonferrous metals ____	3,685	16,577	__	Republic of Korea 13,874; Singapore 1,951.
Oxides, hydroxides, peroxides value, thousands__	$12,907	$19,093	$6,676	Taiwan $4,282; Republic of Korea $2,003; New Zealand $1,750.
Metals including alloys, all forms:				
Tungsten, molybdenum, tantalum, magnesium ____	201	38	22	New Zealand 4; Netherlands 3.
Unspecified value, thousands__	$411	$135	__	India $64; New Zealand $30.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Pumice, emery, corundum, etc ____ do____	$1,840	$2,191	__	Thailand $2,159.
Artificial: Corundum ____	__	8	NA	NA.
Dust and powder of precious and semi-precious stones value, thousands__	$43	$32	__	New Zealand $21.
Grinding and polishing wheels and stones ____ do____	$1,014	$889	__	Thailand $382; New Zealand $235; Pakistan $56.
Asbestos, crude ____	38,348	56,711	550	India 16,336; Japan 10,639; Singapore 5,687.
Barite and witherite ____	1,002	21,351	20,451	New Zealand 638.
Cement ____	103,726	247,712	123,138	Saudi Arabia 91,142; Singapore 13,881; Papua New Guinea 10,741.
Clays and clay products:				
Crude ____	9,687	3,243	__	United Kingdom 1,776; Japan 1,014.
Products:				
Nonrefractory value, thousands__	$831	$729	__	Singapore $198; Papua New Guinea $167; Malaysia $96.
Refractory including nonclay brick:				
Brick ____	7,585	7,402	__	Indonesia 2,987; New Zealand 2,970.
Other _ value, thousands__	$1,170	$1,190	__	New Zealand $441; Indonesia $222; Singapore $218.

Diatomite and other infusorial earth ____ value	$2,242	$21,173	NA	NA.
Fertilizer materials:				
Crude	121,122	486	--	Philippines 266; Western Samoa 110; New Zealand 41.
Manufactured:				
Nitrogenous	8,239	24,204	11	New Zealand 10,429; Indonesia 10,000; Papua New Guinea 296.
Phosphatic	2,105	1,441	--	Philippines 1,000; Solomon Islands 287.
Potassic	35	112	--	Singapore 103.
Other including mixed	3,132	4,217	--	Papua New Guinea 4,116.
Ammonia ____ value, thousands	$471	$367	--	New Zealand $316.
Graphite, natural	17	58	--	New Zealand 14.
Gypsum and plasters	263,567	368,934	--	Indonesia 149,678; New Zealand 73,095; Singapore 50,513.
Lime	1,031	730	--	Indonesia 685.
Magnesite, other magnesium carbonate, magnesium oxide	3,598	5,585	1,054	New Zealand 3,859; Philippines 306.
Mica: Worked including agglomerated splittings ____ value	$65,024	$65,750	--	New Zealand $39,004; Indonesia $17,830.
Pigments, mineral: Iron oxides, processed	192	237	--	New Zealand 126; Indonesia 32; Papua New Guinea 21.
Precious and semiprecious stones, except diamond:				
Opal ____ value, thousands	$32,417	$28,698	$4,879	Hong Kong $9,934; Japan $7,050; West Germany $3,221.
Sapphires ____ do ____	$16,059	$16,092	$300	Thailand $11,683; France $1,068.
Other ____ do ____	$2,878	$3,756	$462	Hong Kong $674; Singapore $655; New Zealand $349.
Pyrites, gross weight	347	585	--	New Zealand 287; Malaysia 162.
Salt and brine ____ thousand tons	4,512	4,914	--	Japan 3,609; Taiwan 655; Republic of Korea 517.
Sodium and potassium compounds, n.e.s.:				
Caustic potash including sodic and potassic peroxides	18	17	NA	NA.
Caustic soda[6]	98	743	--	Saudi Arabia 309; New Zealand 191; Papua New Guinea 100.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	1,086	2,762	--	Italy 1,973; Japan 739.
Worked ____ value	$32,512	$33,432	--	Japan $16,716.
Dolomite, chiefly refractory-grade	20,119	--		
Gravel and crushed rock	936	332	--	Indonesia 108; New Zealand 93; Hong Kong 53.
Limestone except dimension	11,351	389	--	Indonesia 350.
Sand, silica	657,887	715,009	30,000	Japan 591,027; Republic of Korea 73,908.
Sulfur: Sulfuric acid	1,428	349	--	Indonesia 137; Papua New Guinea 84; Fiji 67.
Talc, steatite, soapstone, pyrophyllite	118,047	98,339	--	Japan 75,674; Netherlands 13,461.
Other:				
Crude:				
Quartz, mica, feldspar, fluorspar, cryolite	152	436	--	Japan 180; Republic of South Africa 162.
Unspecified ____ value, thousands	$37,834	$1,538	$376	Japan $493; United Kingdom $244.
Oxides, hydroxides, peroxides of strontium, magnesium, barium	4	4	NA	NA.
Slag, dross, similar waste, not metal-bearing ____ value	$23,543	$23,402	--	Taiwan $15,602.
Building materials of asphalt, asbestos and fiber cements, unfired non-metals ____ value, thousands	$11,488	$16,748	$3,261	New Zealand $4,316; Canada $4,060; Bahrain $3,847.

See footnotes at end of table.

Table 2.—Australia: Exports and reexports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1978-79	1979-80	Destinations, 1979-80	
			United States	Other (principal)
MINERAL FUELS AND RELATED MATERIALS				
Carbon black	39,950	46,313	--	Indonesia 14,183; Thailand 12,217; Taiwan 7,120.
Coal, all grades including briquets:				
Bituminous coal and briquets thousand tons	39,103	42,575	83	Japan 28,564; United Kingdom 2,456; Republic of Korea 2,289.
Lignite, peat, and briquets thereof	52,474	114,016	--	Japan 105,930; Norway 6,600.
Coke and semicoke	147,397	165,591	--	Philippines 76,197; Japan 39,737; Algeria 17,000.
Petroleum and refinery products:				
Crude and partly refined thousand 42-gallon barrels	2,330	798	--	New Zealand 414; People's Democratic Republic of Yemen 329.
Refinery products:				
Gasoline do.	2,475	2,075	--	New Zealand 971; Fiji 343; Indonesia 223.
Jet fuel do.	1,913	1,258	--	New Zealand 700; Fiji 514.
Kerosine do.	530	1,394	--	New Zealand 956; New Caledonia 91.
Distillate fuel oil do.	5,424	4,343	--	New Zealand 850; Japan 776; Fiji 601.
Residual fuel oil do.	1,593	2,214	--	Japan 1,345; Singapore 497.
Lubricants do.	1,616	1,572	111	New Zealand 328; Singapore 208; Thailand 159.
Other:				
Mineral jelly and wax do.	5	11	--	Taiwan 6.
Unspecified[7] do.	r742	12	--	New Zealand 5.
Mineral tar and other coal-, petroleum-, and gas-derived crude chemicals value, thousands	$17,156	$10,670	--	New Zealand $8,750; Thailand $1,132.

rRevised. NA Not available.

[1]Data are for fiscal years beginning July 1.

[2]Data are for calendar years 1979 and 1980; principal destinations in 1979 were Japan (601,828 tons) and the United States (119,876 tons).

[3]Ore and concentrate and waste and sweepings are included in those of silver.

[4]May include platinum-group metals.

[5]Some quantity of molybdenum may be included.

[6]Excludes quantity valued at $2,242 in 1978-79 and $383,354 in 1979-80.

[7]Excludes quantity valued at $31,391 in 1978-79 and $309,803 in 1979-80.

r Revised. NA Not available.
[1] Data are for fiscal years beginning July 1.
[2] Less than 1/2 unit.
[3] Excludes quantity valued at $17,139,377 in 1978-79 and $16,235,694 in 1979-80.
[4] Ore and concentrate and waste and sweepings of platinum-group metals are included with those of silver.
[5] Including those of platinum-group metals.
[6] Excludes quantity valued at $1,960,000 in 1978-79 and $222,880 in 1979-80.
[7] May include some finished articles.
[8] Excludes quantity valued at $55,000 in 1978-79 and $18,945 in 1979-80.

COMMODITY REVIEW

METALS

Aluminum, Alumina, and Bauxite.— Australia's bauxite and alumina production in 1981 declined for the third time in 18 years, but aluminum production continued the upward trend. The decline of bauxite was attributed to industrial unrest at the mine of one major producer. For some years Australia has been the world's leading producer of bauxite from mines located at Weipa, Gove, Northern Territory, and the Darling Range, Western Australia. The main cause for the decline in alumina production was the general downturn in the world alumina market. Alcoa of Australia Ltd. cut production by 10% at its two existing alumina refineries at Pinjarra and Kwinana. Slight increases in output by Queensland Alumina Ltd. (QAL) at Gladstone and by Nabalco Pty. Ltd. at Gove failed to offset the decline in Western Australia. Expanded smelter capacity by Alcan Australia Ltd. at Kurri Kurri, New South Wales, and Alcoa's smelter at Point Henry, Victoria, resulted in a record output of primary aluminum in 1981.

At Weipa on Cape York Peninsula, Comalco Pty. Ltd. produced about 15% of the Western World's total bauxite output. At Comalco, which is owned 45% by Conzinc Riotinto of Australia Ltd. (CRA), 45% by Kaiser Aluminum and Chemical Corp., and 10% by the Australian public, output was below that of 1980. Both production of bauxite and shipments from Weipa in 1981 were below the level of 1980 owing to an industrial dispute that curtailed operations for 9 weeks. In 1981, the company shipped approximately 8 million tons of bauxite to international markets, principally Japan and Europe. The largest single outlet was the Gladstone alumina refinery operated by QAL. Comalco supplied the total bauxite demand for QAL which in 1981 totaled about 5 million tons. All of Alcoa's bauxite output was converted to alumina at nearby refineries located at Pinjarra and Kwinana,

which have a combined annual capacity of 3.4 million tons. Roughly one-half of Nabalco's bauxite was exported. The remainder was refined to alumina in an adjacent refinery at Gove, which has an annual capacity slightly in excess of 1 million tons.

Australia's three aluminum smelters operated at near capacity throughout 1981 and production increased during the year. Production of primary aluminum by Alcan and Alcoa was appreciably higher than that of 1980. This increase resulted from new potlines commissioned in 1980 by both companies. The annual rated capacities of the three plants were Camalco at Bell Bay, 112,000 tons; Alcoa at Point Henry, 165,000 tons; and Alcan at Kurri Kurri, 68,000 tons.

Prospects for Australia to occupy a more prominent position in the world aluminum smelting industry continued to improve. Higher prices for crude petroleum have made some oil-fired power stations uneconomic as sources of energy for aluminum production. As a result, Australia's extensive coal resources were recognized as having valuable potential for thermal power generation. Consequently, a number of new aluminum smelting ventures that would use power from coal-fired stations were under consideration. Comalco's new aluminum smelter at Gladstone proceeded on schedule and it is expected to begin production in February 1982. When the full production is achieved in late 1982, the smelter will operate 2 potlines with a total of 480 smelting pots and a production capacity of 206,000 tons annually. In April, final Government approval was given for the Tomago smelter to be built by a consortium comprising Aluminum Pechiney Australia Pty. Ltd. and Gove Alumina Ltd. as major partners. The smelter, with a total capacity of 220,000 tons annually and costing about $600 million, will start production in 1983. Alcoa began a feasibility study for a smelter, probably to be located in the Pinjarra-Wagerup-Bunbury district of Western Australia. Alcoa was considering a minimum economic capacity of 100,000 tons annually that could be increased to 200,000 to 240,000 tons. The project will depend on the availability and cost of power and ultimately will involve an expenditure of about $900 million.

Australia has large resources of bauxite, and production from Comalco's Weipa deposit was a significant source of the Western World's requirements. The company's measured, indicated, and inferred ore reserves in 1981 consisted of 3.0 billion tons with recoverable bauxite content of 2.5 billion tons. The grade of recoverable bauxite in the 599 million tons of measured reserves ranged from 53% to 56% alumina. The alumina content in the indicated reserves was in the range of 48% to 56%.

Copper.—Despite stagnation and weakening world economies, the Australian copper industry showed improvement in all categories during 1981. Increased mine production by Mount Morgan Ltd. in Queensland, Woodlawn Mines Joint Venturer in New South Wales, and Peko-Wallsend Ltd., Northern Territory offset the drop in production by Mount Isa Mines Ltd. (MIM) in Queensland. High production was also reported for both primary refined and primary smelter copper.

Lower mine output by MIM was attributed to a decline in both the quantity and grade of ore treated. MIM is expected to treat 3% less ore in 1982 at 3.4% copper compared with 3.8% in 1981. The company announced that it would spend about $55 million at Mount Isa to sink a new shaft in order to mine an ore body estimated to contain 30 million tons containing 4.2% copper. The shaft sinking could begin in mid-1983 and should be completed by 1986. Production of ore is expected in 1991.

The increased output at the refineries was attributed primarily to the completed modernization at MIM. MIM's refinery at Townsville, Queensland, receives unrefined copper from Mount Isa in the form of anodes. Conversion of blister copper to anodes in the Townsville refinery's reverberatory furnaces has ceased and all furnaces were dismantled. The anode-shaft furnace installed to treat anode scrap produced in the tankhouse was fully operational and performed to design parameters in 1981.

In October, Peko-Wallsend decided to close its Tennant Creek copper smelter and Gecko Mine because of heavy financial losses. The smelter had been reopened in October 1980 after modification. The company also announced that its copper prospect at Goonumble, New South Wales, has a much higher copper grade than previously thought. Using a 0.3% copper cutoff, drilling has indicated measured resources of 86 million tons of 0.62% copper, 0.02 troy ounce of gold per ton plus 166 million tons of 0.74% copper, 0.004 troy ounce of gold per ton, and 0.054 troy ounce of silver per ton.

The Teutonic Bore, a Western Australia mine, was officially opened in June 1981. Owned jointly by Seltrust Mining Corp. Pty., Ltd., 60%, and MIM Holdings, Ltd.,

40%, the mine is expected to produce 300,000 tons of ore annually.

Although one new mine began operating and some old mines could be reopened in 1982-85, the most significant copper production may involve new mines, particularly the Olympic Dam project in South Australia and the Benambra deposit in Victoria. The Western Mining Corp. Ltd. (WMC) is conducting a feasibility study at Olympic Dam that is expected to be completed by 1983. The extent of the ore body is unknown since WMC continues to locate mineralized areas extending northwest and southwest from the main center of operations. Some estimates, however, indicate that the ore body is at least 500 million tons with an average grade of 1.5% to 2% copper, 0.05% uranium, and about 0.02 troy ounce of gold per ton. If economically feasible, Olympic Dam could begin producing by the end of this decade at about 160,000 tons annually.

Output of the principal copper producers in recent years is summarized as follows:

Table 4.—Australia: Major copper production,[1] by company

(Metric tons)

Company	1979	1980[r]	1981
Mines:			
Mount Isa Mines Ltd	152,000	158,732	143,000
Mount Morgan Ltd	1,916	2,302	4,500
Cobar Mines Pty. Ltd	8,100	6,593	4,600
Mount Lyell Mining & Railway Co. Ltd	19,405	19,835	20,339
Peko-Wallsend Ltd	4,330	11,835	17,128
Smelters:[2]

Gold.—Although the Australian gold industry was faced with progressively weaker gold prices in 1981, mine output showed a slight gain. Exploration, new development, and redevelopment continued at a reasonably high level with the major emphasis in Western Australia and Queensland.

Increased production was reported by Peko-Wallsend at Tennant Creek, Northern Territory, because of renewed emphasis on gold rather than copper production. Kia Ora Gold Corp. NL, operator of the Marvel Lock Mine near Southern Cross, Western Australia, also increased output. Since reopening in 1980, production has steadily increased as a result of mine and plant improvements and higher average-head grades. Output by Central Norseman Gold Corp. Ltd., Telfer Mine, and Mount Charlotte Mine—all in Western Australia—approximated the 1980 level.

The Kalgoorlie area in Western Australia was again the main center of redevelopment and exploration activity. The Kalgoorlie Mining Association made steady progress on the reopening of some of their Fimiston leases and opened a $15 million treatment plant at Oroya to handle expanded gold production. Development at Mount Charlotte involved deepening the supply shaft and establishing additional access to the Mount Charlotte ore bodies. Site work also started on the new 1,200-meter shaft at Mount Charlotte. North Kalgoorlie Mines Ltd. continued redeveloping its Fimiston lease areas. Consolidated Gold Mining Areas NL announced a $14.3 million redevelopment program. The program involves rehabilitation of a shaft and construction of a 130,000-ton-per-year mill with production scheduled for 1982. The operation will be based on reported reserves of 735,000 tons measured plus inferred ore grading 0.2 troy ounce of gold per ton.

WMC commissioned a 500,000-ton-per-year gold-treatment circuit at its Kambalda plant in late 1981. WMC has been mining ore at Sand King, 75 kilometers north of Kalgoorlie, in preparation for the new mill. The Hunt Mine at Kambalda has been producing gold with nickel as a byproduct. WMC was also developing the Victory Mine,

south of Kambalda.

Placer Exploration Ltd. announced completion of its feasibility study in 1981 of the Kidston deposit located near Townsville, Queensland. Work has already established a resource of 38.3 million tons of measured and inferred ore averaging 0.06 troy ounce of gold per ton and 0.07 troy ounce of silver per ton.

Peko-Wallsend closed the Mount Morgan Mine in Queensland because the ore has been exhausted. However, the company has begun installing bucket wheel dredges to recover gold from the tailings dam. Production has also been increased at the Mount Chalmers Mine. The company has announced that extensive drilling and exploration in the Goonumble area near Parkes, New South Wales, has confirmed a major new porphyry-copper-gold deposit. To date, seven separate but related centers of mineralization have been delineated, and resources are inferred to be in excess of 250 million tons of ore averaging 0.7% copper and 0.01 troy ounce of gold per ton.

The Wattle Gully Mine, Victoria, operated by the consortium Chewton Gold Associates, was officially reopened in December 1980, but production was lower than planned as more development than originally foreseen was required. In 1981, further exploration and development was undertaken at the mine by CRA in a joint venture with the consortium.

Gold from domestic mines accounted for about 75% of Australia's output in 1981 and refined gold produced from imported crude bullion and domestic and imported scrap accounted for the remainder. The Perth Mint which refines crude gold bullion from mines in Western Australia and the Northern Territory, as well as bullion and scrap from overseas, was the largest domestic refinery of gold. Other gold refiners were Matthey Garrett Ltd. in Sydney, and Engelhard Industries Ltd. in Melbourne. Most of the crude bullion from Fiji and Papua New Guinea was refined by Matthey Garrett. Base metal refineries were the other sources of refined gold. In 1981, the Electrolytic Refining and Smelting Co. recovered about 13,000 troy ounces of gold from tankhouse sludges resulting from electrolytic refining of copper at Port Kembla, and Broken Hill Associated Smelters Pty., Ltd. (BHAS), recovered about 8,000 troy ounces from lead concentrates refined at Port Pirie, South Australia.

Iron and Steel.—In 1981, demand for Australian iron ore decreased owing to a further fall in world steel output. Iron ore production, which was also adversely affected by industrial disputes, decreased by about 10%. Production declined at most mining centers, and because of reduced sales, most producers increased waste removal, mine development, and stockpiles in readiness for a recovery in demand.

Pig iron was also adversely affected by industrial disputes as well as depressed export demand. The weak export market resulted in delayed recommissioning of a blast furnace after being shut down for repair and modification in April. As in recent years, most of the iron ore was produced in the Pilbara region in northwest Western Australia. In this area five major companies produced about 90% of Australia's iron ore. They were Hamersley Iron Pty. Ltd. at Mount Tom Price and Paraburdoo; Mount Newman Iron Ore Pty. Ltd. at Whaleback Hill; Cliffs Western Australian Mining Co. Pty. Ltd. at Robe River; Goldsworthy Mining Ltd. at Mount Goldsworthy, Shay Gap, and Sunrise Hill; and Dampier Mining Co. Ltd. at Koolan Island and Yampi Sound. In addition to the Pilbara region, iron ore was mined at Kollyanobbing by Dampier for use in the Kwinana blast furnace. In South Australia, Broken Hill Pty. Co. Ltd. (BHP) produced ore from the Middleback Ranges for steel plants in Whyalla, South Australia, and in New South Wales, Newcastle, and Port Kembla. In a relatively small project, the iron ore at Savage River, Tasmania, was slurried and pumped to a pelletizing plant at Port Latta for shipment to Japan.

Continuing depression in the world steel industry was reflected in a drop of 26% in Hamersley's iron ore production. Sales to Japan decreased significantly and actual shipments represented only 66% of the minimum-base contractual tonnages. The European Economic Community shipments also declined, but sales to Asian markets, other than Japan, were generally in accordance with long-term contracts.

The salable production from the Tom Price and Paraburdoo Mines was 29.2 million tons compared with 39.5 million tons in 1980. The reduction was due primarily to a union-called strike at the mines. Operational performance of both mines and crushing and screening plants was satisfactory when not impacted by strikes and industrial limitations.

Mount Newman operated at the reduced

rate of that of 1980. Sales totaled 27.7 million tons consisting of about equal quantities of lump ore and fines. The principal market for ore produced by Mount Newman was the Far East, which received 19.3 million tons. The remainder consisted of 5.7 million tons shipped to Australian ports for domestic consumption and 2.7 million tons delivered to Europe.

The principal Australian iron ore producers and their output in 1981 were as follows, in thousand tons:

Table 5.—Australia: Major iron ore production, by company

(Thousand metric tons)

Company	Location	Products	Output	
			1980	1981
Hamersley Iron Pty. Ltd	South Australia	Lump and pellets	r39,439	29,219
Mount Newman Mining Co. Pty. Ltd	Western Australia	Lump	r27,679	27,753
Broken Hill Pty. Co. Ltd	South Australia	Lump and pellets	4,528	3,200
Do	Western Australia	Lump	r2,500	2,720
Goldsworthy Mining Ltd	do	do	r5,991	6,294

rRevised.

Australian reserves of iron ore were estimated at 35 billion tons consisting of 25 billion tons of hematite with 54% or more iron content and 10 billion tons of limonite with 50% or more iron content. Most of Australia's reserves occur in the Pilbara region, which accounted for over 90% of the production in 1981. New mines in the region are being planned since iron ore prices have risen. Australian iron ore exporters and Japanese steelmakers concluded negotiations early in 1981 on prices of iron ore for delivery in the 12 months from April 1981. Japanese sources reported that prices of high-grade fines had been increased by 7.6% and prices of high-grade lump ore had been increased by 9.6%.

BHP remained the only steel producer in Australia with plants at Newcastle and Port Kembla in New South Wales, at Whyalla in South Australia, and at Kwinana in Western Australia. Steel production was also adversely affected by industrial disputes as well as reduced iron availability but, nevertheless, increased by 1% to 7.83 million tons. Total capacity was about 9 million tons per year. Despite idle capacity, BHP was expanding capacity to meet future market estimates.

During the year, some significant developments in energy conservation and oil substitution were continued and additional energy-savings projects were initiated. These included the injection of powdered coal into blast furnaces and firing an oil-coal slurry in the Port Kembla open-hearth furnaces. A reduction in the use of heavy fuel oil was achieved at Port Kembla by the increased substitution of natural gas; similar measures were being undertaken at Newcastle. At BHP's three steelmaking centers, projects to make more efficient use of gases generated in the plant were introduced to reduce purchases of energy from other sources. The most important project involved the recovery of gas from the basic oxygen steelmaking furnaces at Port Kembla.

Lead and Zinc.—Lead production declined in 1981 as a result of curtailment in production during the first quarter by a 3-week strike at the three major Broken Hill mines. Output from Mount Isa and Cobar was also slightly affected by industrial action in early 1981. Production of lead bullion was slightly above the 1980 level despite the shortage of feedstock in the first quarter. Production of primary refined lead by BHAS at Port Pirie was 4% higher than that of 1980. Production of secondary refined lead remained at about the 1980 level.

Mine production of zinc was also affected by industrial stoppage at Broken Hill and Mount Isa, but showed a 2% increase over that of 1980. All refineries continued to operate at near capacity throughout the year producing slightly less refined zinc than that of 1980. Exports of zinc concentrates dropped slightly during the year but were still at relatively high levels reflecting to some extent the continuing worldwide shortage. The shortage was exacerbated by the high incidence of strikes at zinc mines in the United States and Ireland. Exports of refined zinc were considerably below that of 1981 owing to continuing depressed economies in the Western World with the associated drop in demand.

MIM was Australia's largest single producer of lead and zinc. In 1981, 2.4 million tons of lead-zinc ore was mined in 1981 containing 6.2% lead and 6.0% zinc. Mining was concentrated between the 13 level (670 meters) and 15 level (730 meters). The Mount Isa mining methods of cut and fill and open stoping were modified to achieve greater ore recovery and better utilization of workers and equipment. Drilling of the lead-zinc mineralized area continued in the northern part of the Mount Isa Mine throughout 1981.

Considerable preproduction and construction work was done at the Mount Isa Mine in preparation for lead production to be increased by 20% to 180,000 tons annually by 1982 with commensurate increases in zinc and silver output. Modernization of the silver-lead-zinc concentrator was completed during the year. A new heavy medium plant and associated facilities were under construction at yearend. The plant will pretreat the ore by rejecting a large proportion of waste material before it reaches the main concentrator. The overall cost of the modernization and expansion was estimated at $60 million.

The Teutonic Bore zinc-silver-copper project, 80 kilometers south of Agnew, Western Australia, was officially opened in June 1981. Contractors were undertaking the open pit mining operation, which was expected to produce 300,000 tons of ore annually. Underground mining is expected to start by 1985. Concentrate produced on site was being trucked to Leonora, Western Australia, and hauled by rail to the Port of Esperance for delivery to customers. The project is owned by Seltrust Mining Corp. Ltd., 60%, and MIM, 40%.

In 1981, mine output by Australian Mining & Smelting Ltd. and two subsidiaries—Zinc Corp. Ltd. and New Broken Hill Consolidated Ltd. (NBHC)—decreased from the 1980 level. The reduction resulted from industrial action during the 1981 Mines' Industrial Agreement negotiations and a reduction in the grades of ore mined. The first phase of a program to permit mining of large quantities of lower grade ore bodies at NBHC was completed. Although 1982 could result in an increase in tonnage mined at NBHC, the increase will be offset by reduced average grades.

The Woodlawn Mine joint venture, consisting of CRA, and St. Joe Minerals Corp. and Phelps Dodge Corp. of the United States, increased its zinc-concentrate production, but lead-concentrate production declined reflecting a lower lead-head grade. The quality of the lead concentrate was improved because of an additional flotation stage. Mining output increased following the introduction of a 7-day workweek and improvements in drilling and blasting efficiencies.

The BHAS refinery operated at near capacity in 1981, mainly as a result of refining the major portion of lead bullion produced by Sulphide Corp. Pty. Ltd.'s Imperial smelting furnace. Concentrate deliveries from Broken Hill were in short supply in the first half of 1981 owing to industrial problems at the mines. Additional concentrates were acquired from overseas suppliers to maintain production levels. The BHAS lead production totaled 224,696 tons during the year compared with 215,919 tons in 1980. Zinc production in 1981 was 40,712 tons compared with 39,826 tons in 1980.

EZ Industries Ltd. operated two mines—Rosebery and Hercules—both located in Tasmania. These were zinc-lead-copper deposits in association with gold, silver, and pyrite. EZ Industries also treated ore from Aberfoyle Ltd.'s new mine at Que River, Tasmania. Total ore milled came to 540,000 tons producing 96,200 tons of zinc concentrate, 13,300 tons of lead concentrate, and 22,700 tons of copper concentrate together with some gold and silver.

The principal lead and zinc companies and the quantities produced during 1980-81 were as follows:

Table 6.—Australia: Lead-zinc production, by company

(Metric tons)

Company	1980[r]		1981	
	Lead	Zinc	Lead	Zinc
North Broken Hill Ltd	50,150	40,600	46,000	36,500
Zinc Corp. Ltd	75,800	75,750	59,400	52,500
New Broken Hill Consolidated Ltd	71,850	124,400	63,600	112,500
Mount Isa Mines Ltd	163,000	105,000	144,000	99,000
Electrolytic Zinc Co. of Australasia Ltd. (Read-Rosebery)	15,500	54,270	19,400	53,000

[r]Revised.

Manganese Ore.—The Groote Eylandt open pit manganese mine located on an island in the Gulf of Carpentaria accounted for virtually all of Australia's manganese production. Manganese ore production in 1981 by Groote Eylandt Mining Co. Pty. Ltd., a wholly owned subsidiary of BHP, decreased by 28%. BHP announced in October that production was to be scaled down by about 30% because of depressed demand. However, by yearend the production rate at the mine had been reduced to about one-third capacity, in line with decreased consumer requirements. Plans being considered for the expansion of production capacity to about 3 million tons annually were deferred because of the deterioration in market prospects. An expansion in production capacity by 130,000 tons annually to about 2.4 million tons was completed with the installation of a dense-medium-fines beneficiation plant. The plant cost $14 million and produced marketable-grade fines from lower grade fines previously discarded from the fines treatment plant of the Groote Eylandt concentrator.

Exports of manganese ore decreased to 901,000 tons in 1981 and shipments to all major markets including Japan, Europe, the Republic of Korea, and the United States decreased significantly. Exports of ferromanganese decreased from 23,200 tons valued at $6.3 million in 1980 to about 17,500 tons valued at $5.0 million in 1981. Major markets in 1981 were the United States, Indonesia, Qatar, and Thailand.

Australian manganese reserves were estimated at about 889 million tons in 1981; the main part was on Groote Eylandt. The remainder was located principally in the east Pilbara and Peak Hill regions of Western Australia, and at Pernatty Lagoon in South Australia. Known deposits in the Northern Territory were subeconomic. Large secondary enrichment deposits along the outcrop of Marra Mamba iron formation in the Pilbara were being evaluated. These deposits are low in silica and consist of about equal proportions of high-grade ore, 40% manganese, and lower grade ores suitable for beneficiation.

Nickel.—Although the demand for nickel remained at a reduced level, Australia's mine production showed an increase over the 1980 output. An increase in output at Kambalda by WMC and a resumption of nickel production at Mount Windarra and Shell Co. of Australia Ltd. offset decreased output of nickel at Agnew, owned by Selrust Mining Corp. and MIM, and of nickel in ore at Greenvale owned by Queensland Nickel Pty. Ltd. Sulfide-based mines in Western Australia accounted for 60% of production with the remainder coming from the Greenvale lateritic mine in Queensland.

At the end of 1981, the Kambalda Mine at Kalgoorlie was still the principal nickel producer accounting for more than 55% of the Australian production. The Greenvale operation in Queensland was the next largest followed by the Nepean and Agnew Mines in Western Australia, which together produced less than 10% of the Australian total. In 1981, WMC treated 1.4 million tons of ore from its Kambalda operations and produced 344,800 tons of concentrate containing 36,670 tons of nickel. Nickel mining and processing in Western Australia was WMC's main income-producing activity. The operations comprise nine underground mines and a concentrator at Kambalda, a nickel smelter at Kalgoorlie, and a nickel refinery at Kwinana. Late in the year, WMC started production again from the Windarra project. The amount of ore treated came to 31,400 tons at a head grade of 1.63% nickel.

The Agnew project expanded its ore production during the year although lower grades than expected were found. Metallurgical problems also reduced the metal output. The concentrate was sent to WMC's Kalgoorlie smelter and the matte, containing 73% nickel, was sold to AMAX Nickel, Inc., in the United States under a long-term contract. In 1981, about 605,000 tons of ore was mined to produce 14,256 tons of nickel matte.

Mining and refining of nickel was conducted in Queensland by a joint venture of Metals Exploration Ltd. and Freeport of Australia Inc. An ore body at Greenvale, 175 kilometers west of Townsville, containing about 1.57% nickel and 0.12% copper was mined by open cut and the ore taken by rail to a refinery at Yabulu near Townsville for treatment. The operation was severely hit by the increase in the price of fuel oil and has been converted to coal firing. The depressed market for nickel resulted in a loss of nearly $13 million for the 6 months ending December 1981.

Metals Exploration and Freeport also operate a nickel mine at Nepean. The ore was concentrated at WMC's mill at Kambalda. The output of contained nickel for the 6 months ending in December 1981 was 1,601 tons.

Australia's identified nickel resources calculated in 1980 by the Bureau of Mineral Resources (BMR) came to 458.6 million tons of sulfide ore and 155 million tons of lateritic ore. WMC's proved and inferred reserves of sulfide ore came to 24 million tons at a grade of 2.5% nickel plus 4.2 million tons of 3.78% nickel at the Carnilya Hill prospect which was 56% owned by WMC.

Silver.—Most silver was produced as a byproduct of lead-zinc mining with gold and gold-copper mining making a contribution. Total silver production in 1981 was about 12% below the 1980 output. More than 85% of the output came from mines in Mount Isa and Broken Hill. Silver was also produced as a byproduct of copper mining at Tennant Creek, Mount Morgan, Cobar, Woodlawn, and Mount Lyell.

MIM remained Australia's largest producer of silver. In 1981, about 2.47 million tons of lead-zinc ore averaging 5.0 troy ounces of silver per ton was treated to produce 11.8 million troy ounces of silver in concentrates. About 87% of the silver was recovered from lead concentrates, and the remainder from zinc and copper concentrates. The lead concentrates were smelted to lead bullion at Mount Isa and exported to the company's lead refinery at Northfleet, the United Kingdom, where the silver metal was recovered. Over 70% of the zinc concentrate was exported, and the remainder was shipped to the zinc refinery at Risdon, Tasmania. Silver in copper and lead residues from the electrolytic tankhouse slimes from the Townsville copper refinery were either recovered by the Electrolytic Refining and Smelting Co. or exported.

The Broken Hill area remained Australia's second largest source of silver in 1981. Production of silver from the lead-zinc concentrates in 1981 by several companies declined because of industrial action and a lower overall grade of ore mined. The grade of ore treated contained 5.8 troy ounces of silver per ton compared with 6.3 troy ounces per ton in 1980. Most of the silver produced at Broken Hill was contained in lead concentrates that were treated at the BHAS smelting and refining plant at Port Pirie.

EZ Co. produces silver as a byproduct of copper-lead-zinc mining at Rosebery. In 1981, the company treated about 515,680 tons of ore from the Hercules and Rosebery Mines. The Farrell Mine remained on maintenance status. The average silver grade of the complex copper-lead-silver-gold ore treated was 3.8 troy ounces per ton, marginally higher than that of 1980. The tonnage of ore mined was substantially less than in the previous period, mainly owing to strikes by workers.

About 80% of all silver exported in 1981 was contained in lead bullion; lead, zinc, and copper concentrates; blister copper; and various slags, mattes, and residues.

Principal producers of silver and output in thousand troy ounces during 1980-81 were as follows:

Table 7.—Australia: Major silver production, by company

(Thousand troy ounces)

Company	1980	1981
Electrolytic Zinc Co. of Australasia Ltd	2,168	1,930
Mount Isa Mines Ltd	14,592	11,768
New Broken Hill Consolidated Ltd	1,774	1,837
North Broken Hill Ltd	2,703	2,500
Zinc Corp. Ltd	1,650	1,410

Tin.—In 1981, mine production of tin-in-concentrates increased 13% resulting largely from Renison Ltd. reaching full production capacity following completion of its expansion program. However, production of primary refined tin declined 13% as demand for primary tin for use in tin plate fell again. Australia ranks high in the Western World as a producer of tin-in-concentrates, and about one-half of the production was exported.

Renison Ltd. in Western Tasmania, owned by Renison Goldfields Consolidated Ltd., is the world's largest underground tin mine and Australia's largest tin producer. In 1981, the company treated 656,400 tons of ore with an average head-grade of 1.20% tin and recovered 5,546 tons of tin-in-concentrates. The mill recovery of tin metal in concentrates was about 74%. Renison completed expansion of milling capacity to 850,000 tons annually and was in the final phase of commissioning the plant. Following successful matte-fuming trials on low-grade material, a detailed engineering study continued to assess the feasibility of a fuming plant. Renison's combined proved and probable ore reserves were estimated at about 1.3 billion tons in 1981, but the tin grade dropped from 1.13% to 1.12%. The increase in tonnage and reduction in grade was largely a result of adding several million tons of lower grade ore to the reserves.

Aberfoyle Ltd., Australia's second largest tin mining group, operated the Cleveland tin mine at Luina, Tasmania, and the Ard-

lethan Mine in New South Wales. The company has disposed of its unprofitable Aberfoyle and Storeys Creek operation to Forestwood Australia Ltd. Forestwood spent $2.2 million on rehabilitating the mine and then decided it could not be profitably operated and the mine was closed. Aberfoyle's production figures for 1981 were 1,430 tons of tin-in-concentrates from Ardlethan and 578 tons of tin-in-concentrates from Cleveland. The company constructed an experimental matte-fuming plant at Kalgoorlie to develop a method of treating fine-grain ore in its deposits near Zeehan, Tasmania.

Greenbushes Tin NL continued to operate its new electric arc furnace at its plant south of Perth, Western Australia, treating its tin concentrates and some from the Northern Territory. The smelter produces metallic tin- and tantalum-bearing slags. Greenbushes has tantalite resources totaling 21.8 million tons of ore assaying 0.11% tin and 0.044% tantalum over a deposit width of 14.7 meters. At present this is augmented by 9.7 million tons of inferred ore assaying 0.15% tin and 0.06% tantalum. In addition to production of primary refined tin, the new smelter produced about 130 tons of antimonial tin, 99.5% tin.

Associated Tin Smelters Pty. Ltd. (ATS) operating at Alexandria, New South Wales, was the other primary tin smelter. The smelter is owned equally by O. T. Lempriere & Co. Ltd., Consolidated Tin Smelters (Australia) Pty. Ltd., and Australian Iron & Steel Pty. Ltd. Output of the smelter is limited by the low average grade of concentrates currently available and its capacity of about 7,000 tons of refined tin. In 1981, production by ATS, affected by industrial disputes, was 4,200 tons of primary refined tin. Plants in Sydney, Wollongong, and Melbourne produced nearly 400 tons of secondary tin from tinplate scrap and plating wastes.

Titanium and Zirconium.—In contrast to the high demand for titanium and zirconium in 1980, indications of mineral oversupply developed in the latter part of 1981. The economic downturn in the United States and Europe during 1981 reduced demand for rutile, particularly in the pigment section. In contrast, zircon recovered its competitive position as a foundry sand and as a source of high-quality refractories. Although domestic output was reduced in 1981, shipments of zircon concentrates from Australia were maintained nearly at the record level of 1980. Despite the availability of about 200,000 tons of zircon from other sources in 1981, world prices of zircon advanced. This increase resulted in a relative increase in the importance of zircon as a revenue earner in the mineral sand industry on the west coast where the zircon-rutile output ratio is about 3:1 compared with the east coast where the ratio is about 1:1.

World demand for rare-earth oxides firmed with a market shift toward metallurgical applications, particularly in the use of rare-earth oxides in high-strength, low-alloy steels. Australia's output was maintained at about the 1981 level, of which almost 95% was recovered as a byproduct of mineral sand operations in Western Australia. Renewed interest has also been shown in xenotime and monazite concentrates as a source of yttria for use in phosphorus for color television tubes.

As in recent years, virtually all of the rutile, zircon, and monazite output was exported along with about 80% of the ilmenite concentrates. The remainder of the ilmenite was consumed within Australia for the production of titanium dioxide pigments and for the production of synthetic rutile. The principal destinations for the products were Japan, Western Europe, and the United States.

For a number of years, Australia has dominated world production and exportation of heavy mineral sands of rutile, ilmenite, zircon, and monazite. The deposits consist of placer formations on present or ancient shore lines and are usually worked by dredging operations.

The east coast deposits in New South Wales and Queensland still provide the bulk of the country's output of rutile concentrates, but the new mines at Capel and Eneabba in Western Australia were the country's major suppliers of ilmenite, zircon, and monazite. On the east coast, Associated Minerals Consolidated Ltd., Consolidated Rutile Ltd., Mineral Deposits Ltd., and Rutile & Zircon Mines Ltd. accounted for most of the output. On the west coast, Allied Eneabba Pty. Ltd. and Westralian Sands Ltd. supplied most of the output of mineral sands.

Australia has considerable reserves of mineral sands. According to the BMR 1981 assessment, identified resources of ilmenite total about 62 million tons. About one-third of these resources has too high a chromium content or otherwise is not suitable for titanium oxide pigment production by the

current sulfate process. Economically recoverable reserves of other mineral sands include about 9 million tons of rutile, 14 million tons of zircon, and 384,000 tons of monazite. According to recent forecasts, these reserves could maintain Australian production at gradually declining levels until the end of the century. BMR forecasts Australian ilmenite production slipping to 1.2 million tons annually by 1990 and to 900,000 tons by the year 2000, and a similar trend for rutile peaking in 1985 with 295,000 tons and dropping to 150,000 tons by the end of the century. BMR expects zircon production to begin declining in the next couple of years reaching 400,000 tons annually in 1985 and 330,000 tons in the year 2000. BMR has also forecast a marked upturn in the amount of mineral sands processed within Australia. In keeping with its policies to encourage more domestic processing of local mineral production, the Australian Government has been cooperating with the state governments and the mineral sands industry to study the possible creation of new industries using mineral sands as a raw material.

NONMETALS

Diamond.—CRA and its Ashton joint-venture associates have made significant progress in the development of the Argyle diamond prospect in the Kimberly region of Western Australia. A wholly owned CRA subsidiary, Argyle Diamond Mines Pty. Ltd., has been incorporated to be the manager and operator on behalf of the joint ventures. In 1981, a total of 34,300 tons of ore from kimberlite pipe AK-1 was treated and 152,004 carats of diamonds recovered. This included diamonds liberated by recrushing to a smaller size, some previously treated kimberlite samples, and also processing some weathered kimberlite and eroded country rock overlying AK-1. Structural drilling indicated AK-1 to be a substantial body of kimberlite in excess of 100 million tons. Two kimberlite types have been delineated—sandy and nonsandy—with varying diamond grades and qualities.

Work started in November on a definitive feasibility study. This could result in a decision by the joint ventures to construct a large-scale commercial plant. Engineering studies indicate a proposal for a plant with an initial capacity of approximately 2.25 million tons annually. This would result in production of approximately 20 million carats annually beginning in 1985.

Phosphate Rock.—Production of phosphate rock from Phosphate Hill, about 65 kilometers south of Duchess, Queensland, resumed in November 1981. Approximately 32,000 tons of phosphate rock were produced from the operation, which had been on maintenance status for almost 3 years. Western Mining Corp. Holdings Ltd., through its 80.2% ownership of BH South Ltd., now effectively controls the Duchess deposits. The company announced that production of direct-shipping-grade rock (about 31% P_2O_5) would resume at a rate of 200,000 tons annually; at least 100,000 tons annually is committed to the Australian market.

At present, mining is taking place in the high-grade deposit areas where rock can be produced with a 30% P_2O_5 content after washing and screening. The bulk of the deposits are of lower grade rock and will require upgrading onsite before it can be transported and marketed on an economic basis. The company has been actively involved in testing various methods of upgrading rock and this work is to be intensified with the intention of establishing an economic upgrading facility. Upgraded rock would be gradually phased into the market and become the main product in the future.

The main markets for Australian rock will be Australian phosphate fertilizer manufacturers and countries in Southeast Asia. The other two phosphate exporting countries in the Oceania area—Nauru and Christmas Island—both face rapidly declining reserves that are expected to be mined out in a few years. In 1981, these countries were the principal suppliers of phosphate rock to Australia and New Zealand.

An estimated 8,000 tons of phosphate rock was produced in South Australia in 1981 but was unsuitable for superphosphate manufacture because of its high iron and aluminum content and was used directly as fertilizer.

Salt.—In 1981, export and production of salt declined owing to a recession in the chemical industry in Japan. Three companies—Dampier Salt Ltd., Leslie Salt Co., and Shark Bay Salt Pty. Ltd. (all based in Western Australia)—produced more than 80% of the total domestic output. Producers in South Australia, Victoria, and Queensland supplied the remainder. Production was by solar evaporation from seawater, saline lake water, and underground brines; salt was also harvested from dry lake beds. Virtually the entire Western Australian output was exported mainly to

Japan, while salt produced in Queensland, Victoria, and South Australia was generally consumed locally. Less than 5% of Australia's output was consumed as table salt.

Western Australia produced about 4.8 million tons of salt in 1981 and exports totaled 3.2 million tons. Dampier Salt, with operations at Dampier and Lake McLeod, was the principal producer supplying 3.3 million tons. Production from the Dampier operation was 2.42 million tons with the Lake McLeod Field producing 0.89 million tons. The Lake McLeod Field returned to full operational capacity in early 1981 and the first shipment from Cape Cuvier was made in March. This was after a 2-year closure in which the field was upgraded in conjunction with the rebuilding of the shiploading facilities damaged by Cyclone Hazel. Both production sites were seriously affected by interruptions due to industrial activity during the second half of the year. The industrial disputes affected the company's operations and prevented shiploading from Dampier causing loss of sales. Dampier's output comes from evaporation pans at Lake McLeod, north of Carnarvon, where extensive reserves of evaporites occur in brines over a 225,000-hectare area.

Cargill, Inc., formerly Leslie Salt Co., of Minneapolis, Minn., United States, produced 1.3 million tons of salt in 1981. The company operated at full capacity after reconstruction of the concentrator system, which was severely damaged as a result of three cyclones in 1980. The damage sustained in the concentrator system disrupted the flow of brine to the crystallizer. The levees and ponds were repaired in late 1980, and $3.8 million were spent in 1981 to add further clayfill to the levees.

Shark Bay Salt Pty. Ltd. produced about 650,000 tons of salt from its Useless Loop operation in 1981. The company has steadily increased its production in recent years, mainly by improving brine flows within the pond system and enlarging stockpile areas. Output from Shark Bay was exported to Japan, Kenya, Malaysia, the Philippines, and Taiwan.

Salt requirements for Australian industry were supplied mainly by producers in Queensland, Victoria, and South Australia. The principal producer in South Australia and Queensland was Imperial Chemical Industries of Australia and New Zealand Ltd., which operated solar evaporation projects. In Victoria, virtually all of the State's output was produced by Cheetham Salt Ltd.

Australia's consumption of salt in 1981 was estimated at 950,000 tons, of which about 680,000 tons was used by the chemical industry for producing sodium hydroxide and sodium carbonate and 270,000 tons was used in industrial applications, in food processing, and in households.

Sulfur.—Australia has no known deposits of elemental sulfur, but pyrite was mined for its sulfur content at several locations. About 95% of the sulfur was consumed in the form of sulfuric acid to produce fertilizer, particularly superphosphate. Approximately 75% of the sulfuric acid production was from imported brimstone, and 25% was from emissions of various indigenous metal sulfide smelters. Small quantities of elemental sulfur, 14,438 tons in 1981, some of which was used for manufacturing acid, were recovered from crude oil refineries.

Sulfur was also obtained from petroleum by Petroleum Refineries (Australia) Pty. Ltd. at Altona, Victoria, and Hallett's Cove, South Australia; Shell Refining (Australia) Pty. Ltd. at Clyde, New South Wales, and Geelong, Victoria; Australian Oil Refining Pty. Ltd. at Kernell, New South Wales; and Amoco (Australia) Pty. Ltd. at Bulwer Island, Queensland. The combined capacity of the plants was up to 52,000 tons per year, but the total output from petroleum in 1981 was about 15,500 tons.

Only Electrolytic Zinc Co. of Australasia Ltd., at Rosebery, and the Mount Lyell Mining and Railway Co. Ltd. produced pyrite for acid production as a byproduct of base metal mining. Acid from this pyrite was produced at Burnie, Tasmania, by North-West Acid Pty. Ltd., in which the mining companies each have a one-half interest. The production by North-West Acid totaled 275,000 tons of sulfuric acid in 1981 compared with 273,018 tons in 1980. The new No. 6 acid plant was completed during 1981.

Exploration continued on pyrite black slate occurrences near Port Sorell and at Dial Range, both located in Tasmania. Tin deposits at Mount Bischoff and Renison Bell, also in Tasmania, are associated with enormous deposits of pyrite and pyrrhotite and were being investigated.

MINERAL FUELS

Coal.—Strong growth occurred throughout the coal industry in 1981 and record production, consumption, and export levels were achieved. Most of the output was from deposits in the Sydney Basin of New

South Wales, and in the Bowen Basin of Queensland. There were smaller operations in the Collie Field of Western Australia and in Tasmania. Subbituminous coal at Leigh Creek in South Australia was mined for power generation use.

Domestic consumption rose slightly, but growth was restricted by engineering difficulties in electricity-generating equipment in New South Wales. Although consumption of coal in steelmaking rose, continued recession in the steel industry restricted growth in that area.

New South Wales coal production showed a record of 60.8 million tons or 19% more than that of 1980. The coal production from underground mines came to 46.1 million tons, up 25.5%, and from open pit mines, 14.7 million tons, up 4.8%. New South Wales coal exports, although hampered by lack of adequate ports and by industrial disputes, came to 23.3 million tons or 1.6% more than that of 1980. Steam coal exports rose by 8.6% to 9.8 million tons, but coking coal fell 2.3% to 14.4 million tons.

Queensland coal production in 1981 was 34.6 million tons, 21% more than that of 1980. At the end of 1981, coal was being won from 23 open pit mines and 26 underground mines. Two new projects to come into production were the open pit mines at German Creek and Yarrahee in central Queensland. Development of new mines continued. A new underground mine developed for the coking coal export trade was expected to begin production in early 1982. Two open pit coking coal projects were progressing and a third one was at an advanced stage of planning. A combined steam and coking coal mine was in the early development stage. The steam coal from this mine will augment power station supplies in the State while coking coal will be exported. The upsurge in surface mining began in Queensland in the early 1970's when Utah Development Co., owned 89.2% by Utah International, Inc., of the United States and 10.8% by Utah Mining Australia Ltd., started coal production. The company operated three open pit coal mines on the western side of the Bowen Basin at Goonyella, Peak Downs, and Saraji in the Mackay coal mining district, producing over 60% of Queensland's coal output, most of which was exported.

Another Queensland coal producer, Thiess Dampier Mitsui Coal Pty., Ltd., continued a $25 million expansion program to boost output at its Moura-Kianga surface mine from 3 to 5 million tons by 1985. The company also planned to develop two new underground mines in addition to its two existing underground mines. The company exported coal only to Japan but was examining the prospects in other markets, including the Republic of Korea, Taiwan, Europe, the United States, and the Pacific Basin.

Economic resources of black coal reserves in Australia were estimated at 308.3 billion tons at yearend 1981; of this total, 36.3 billion tons was measured and 272 billion tons inferred. Reserves in New South Wales totaled 16.2 billion tons; in Queensland, 17.4 billion tons; in Western Australia, 1.9 billion tons; in South Australia, 720 million tons; and in Tasmania, 120 million tons. Substantial deposits of coal have also been delineated in areas not being mined, notably in the Surat Basin, Queensland, at Lake Phillipson in the Arckaringa Basin, South Australia, and in the Corrabin-Oalands Basin, New South Wales.

Lignite.—Victoria was the only State that produced lignite in 1980. The major deposits in Victoria were in the Latrobe Valley, 130 to 200 kilometers southeast of Melbourne, where the State Electricity Commission at Yallourn and Morwell produced more than 95% of the State's total output. The remainder was produced by privately owned mines at Anglesea and Bacchus Marsh. Output increased during the year following the commissioning of an additional dragline. Coal was won by large draglines with an excavating capacity of 2,500 tons per hour. The Yallourn open pit produced at a rate of 16 million tons annually. Traditionally, production from Yallourn has been used to produce a high-grade solid fuel in the form of briquets for domestic and industrial use. However, briquets were also used for the production of high-grade char, gas, liquid-fuel products, and other chemical industry feedstock.

Several governments and private companies continued research on methods of producing oil from coal. Japanese interests were reported to be willing to establish a demonstration plant for conversion of Victorian lignite into solvent-refined coal suitable for steelmaking. Establishment of a full-scale plant was proposed if the demonstration proves successful.

In 1981, brown coal reserves were estimated at 106 billion tons, 39 billion tons indicated and 67 billion tons inferred. Although South Australia has some brown coal deposits, Victoria accounted for all of

Australia's brown coal production and about 99% of the country's reserves and resources.

Petroleum and Natural Gas.—Production of both crude oil and natural gas increased compared with that of 1980. However, industrial actions involving production, shipping, and refining resulted in some cutbacks during the year. Production from Bass Strait of 133 million barrels was 93% of the indigenous production. The remainder came from Barrow Island, Western Australia, and the nearly exhausted field at Moonie, Queensland. Total oil production represented about 67% of current domestic requirements. With recent discoveries and revised estimates of reserves, it was estimated that this degree of self-sufficiency could be maintained until the mid-1980's.

Crude oil processed at Australian refineries totaled about 216 million barrels in 1981. Indigenous crude oil comprised over 65% of this total, the remainder was supplied principally from the Middle East.

A total of 158 exploration wells were drilled, of which 128 were onshore. Of the onshore total, 75 were in Queensland, 22 in South Australia, and 31 in Western Australia. In addition, 80 development wells were drilled. A total of $480 million was spent in 1981 on exploration and the overall success ratio for exploration wells was 1:4. The Government plans to continue exploration and expects to reverse the decline in indigenous crude oil resources that is projected to occur in the mid-1980's.

Australia's massive North West Shelf Natural Gas Development Project in Western Australia continued to move ahead with one platform scheduled for production in 1984 and another in 1987. A consortium comprising BHP, Shell Oil Co., Woodside Petroleum Co., British Petroleum Co., and California Asiatic Oil Co. would begin exporting to Japan in 1986. The North West Shelf project will produce gas and condensate from the North Rankin Field, pipe it to shore, and process it into pipeline-quality gas, liquefied natural gas (LNG), and condensate suitable for markets in Australia and abroad. In 1979, the Federal Government approved the export of 55% of the current estimated reserves from the project. Approximately 6.5 million tons of LNG could thus be exported annually over a 20-year period. A contract was signed between the consortium and the Western Australian State Energy Commission for the sale of up to 375 million cubic feet of gas per day over a 20-year period. This would be delivered to customers in the southwest of the State through a 1,300-kilometer pipeline from Dampier. Current estimates of the cost of the project now range about $8 billion.

The exploration forecast for 1982 is very optimistic with between 280 and 300 exploration wells planned. The budget for onshore drilling total $450 million with $420 million for offshore exploration. Fifteen drilling vessels and more than 40 land rigs would be used.

Uranium.—Production of U_3O_8 in 1981 was almost double that of 1980 owing to output from the new mine and concentrator at Ranger, Northern Territory, which began production in September. Mary Kathleen Uranium Ltd. (MKU), Australia's oldest uranium mine, was nearing the end of its economic life. Exploration at the mine and in the surrounding district was not successful. WMC's Yeelirrie deposit in Western Australia continued small-scale mining of ore for use in a research plant at Kalgoorlie. WMC's plant could begin production of U_3O_8 by 1986.

In 1981, MKU produced 824.7 tons of U_3O_8, slightly less than the 835 tons produced in 1980. Operations were affected by abnormally heavy rainfall and by an industrial stoppage in early 1981. The company announced that the mine would be closed in September 1982 when the contracted tonnage of uranium oxide has been mined. However, the treatment plant was expected to operate until December 1982 with some U_3O_8 to be stockpiled to meet contract deliveries that will extend until 1984.

Queensland Mines Ltd. (Nabarlek) produced 1,426 tons of U_3O_8 during 1981. The company has a contract with the Kyushu Electric Power Co. and the Shekoku Electric Power Co., both of Japan, for the supply of U_3O_8 during the next 10 years. The grade of ore is about 2% U_3O_8 and was mined by open pit methods. The mill has a capacity of 200 tons per day and the operation has a life of approximately 10 years.

Energy Resources of Australia Ltd., Ranger, began production of U_3O_8 during the year and output totaled 1,122.2 tons at yearend. Energy Resources of Australia has a contract with the Swedish electric power utility, Oskarshamnsverkets Kraftgrupp Aktiebolag, for the sale of 3.150 tons of U_3O_8 over the period 1982-96.

Precontinental Mining Ltd., Jabiluka, reached an agreement with the Northern Land Council concerning Aboriginal rights

in early 1981. The company can now commit itself to the development of the mine and the sale of U_3O_8. Denison Mines Ltd., Koongarra, was going through environmental procedures, and the company was negotiating with the Aboriginal landowners on terms and conditions of mining.

Measured reserves in four large deposits in the Northern Territory total 252,000 tons U_3O_8 comprising Jabiluka, 127,000 tons; Ranger, 100,000 tons; Koongarra, 15,000 tons; and Nabarlek, 10,000 tons.

The Mineral Industry of Austria

By George A. Rabchevsky[1]

Austria's gross domestic product (GDP) declined slightly in 1981 after expanding by 3.6% in 1980. A decline in private consumption and gross asset formation, coupled with weaker export performance, caused the drop.

Of the 8 major industrial enterprises making up the state Österreichische Industrieverwaltungs AG (Austrian Industries Management Co.), with a total of 112,800 employees, only 2 showed a profit in 1981. Most of the nationalized enterprises recorded a deficit for the first time in 1980 and showed an even higher deficit in 1981. The profits derived from Chemie-Linz and the state-owned oil company, Österreichische Mineralölverwaltungs AG (OMV), did not equal the losses sustained by the other state industries. In addition to Chemie-Linz, capital investment was urgently needed by the steel mills, the Bleiberg lead and zinc mining company, and the continually crisis-plagued nonferrous metal group of Vereinigte Metallwerke Ranshofen-Berndorf. The poorest results in 1981 were registered by the Vöest-Alpine AG (VA) steel enterprise, United Austrian Iron and Steel Works Co., employing some 60,000 workers.

The state-owned enterprises, which have previously contributed to Austrian employment stability through job protection, were finally drained financially in 1981 and coincidentally suffered technological setbacks. Major reorganizations of all industrial enterprises may thus be needed in the future to slow down and if possible halt the seemingly irreversible bankruptcies. Such a reorganization was proposed in 1970 by the Austrian Industries Management Co. and again in 1981 by its present director general, Oscar Gruenwald. Doubt was expressed, however, that the State and Provincial governments would implement the unpopular measures required.[2]

Because of the lackluster performance of Austrian industry, the Austrian economy would have approached a state of collapse without the tourist industry.

PRODUCTION

Austria is traditionally known for its production of iron ore, magnesite, salt, and graphite, but in Europe, in 1981, it was also a significant producer of talc, olivine, gypsum, calcium carbonate, silica sand, kaolin, dolomite, and micaceous iron oxide pigments. Basic refractories were among the principal industrial mineral exports in 1981.

Table 1 gives production of minerals and metals in Austria for 1977-81.

[3]Excluding stone used by the cement and iron and steel industries.

TRADE

Most of Austria's raw ore requirements were imported in 1981, including the mineral fuels, except lignite and some nonmetals. The processing of ores, the manufacturing of finished products, and mining engineering services continued to be major contributions to the balance of payments.

Tables 2 and 3 report the mineral trade of Austria for 1979 and 1980, the latest years for which official data were available.

Table 2.—Austria: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1979	1980	Destinations, 1980	
			United States	Other (principal)
METALS				
Aluminum:				
Bauxite	27	92	--	All to West Germany.
Oxides and hydroxides including artificial corundum	47,421	55,719	1,736	Romania 12,262; Poland 11,472; Italy 6,723.
Metal including alloys:				
Scrap	38,864	32,736	--	Italy 20,434; West Germany 12,133.
Unwrought	10,306	9,797	--	West Germany 6,176; Bulgaria 1,326.
Semimanufactures	72,425	63,564	1,917	West Germany 14,304; Switzerland 4,540; France 3,462.
Antimony ore and concentrate	493	291	NA	NA.
Cadmium metal including alloys, all forms	25	31	--	Czechoslovakia 20.
Chromium:				
Chromite	1,028	291	--	West Germany 274.
Oxides	1	27	--	U.S.S.R. 17.
Columbium and tantalum: Tantalum metal including alloys, all forms	15	10	NA	NA.
Copper:				
Ore and concentrate	116	4	NA	NA.
Sulfate	864	67	--	Italy 66.
Metal including alloys:				
Scrap	3,242	3,713	--	West Germany 2,194; Switzerland 381.
Unwrought	20,142	19,340	--	Italy 9,256; West Germany 6,438.
Semimanufactures	15,470	15,041	11	Italy 3,581; West Germany 2,754; France 1,844.
Gold metal including alloys, unwrought and partly wrought troy ounces	24,274	22,763	--	West Germany 13,921.
Iron and steel:				
Ore and concentrate, except roasted pyrite	2	118	--	West Germany 102.
Metal:				
Scrap	13,904	12,721	--	Italy 7,847; Switzerland 3,047.
Pig iron, ferroalloys, similar materials	12,848	12,235	NA	NA.
Steel, primary forms	506,501	408,539	3,737	West Germany 222,979; Italy 78,265; Yugoslavia 50,331.
Semimanufactures:				
Bars, rods, angles, shapes, sections	366,715	378,006	3,959	West Germany 102,707; Italy 95,939; Switzerland 44,856.
Universals, plates, sheets thousand tons	1,172	1,148	4	U.S.S.R. 393; West Germany 310; Italy 111; Yugoslavia 60.
Hoop and strip	105,488	93,082	179	West Germany 23,182; Switzerland 15,832; Syria 8,628.
Rails and accessories	118,877	84,840	--	Switzerland 27,937; Yugoslavia 19,120; Uruguay 12,357.
Wire	65,993	61,115	42	West Germany 20,908; Italy 11,034; Switzerland 6,341.
Tubes, pipes, fittings	194,084	205,051	134	West Germany 44,805; Sweden 23,353; United Kingdom 22,892.
Castings and forgings, rough	12,744	14,945	781	West Germany 4,357; Switzerland 2,523; Italy 1,722.
Lead metal including alloys, all forms	492	394	--	West Germany 379.
Magnesium metal including alloys, all forms	694	805	--	West Germany 384; Italy 299.
Manganese oxides	58	14	NA	NA.
Mercury 76-pound flasks	438	151	--	West Germany 70; Netherlands 38.
Molybdenum metal including alloys, all forms	1,101	1,017	NA	NA.
Platinum-group metals including alloys, unwrought and partly wrought troy ounces	5,755	10,288	--	West Germany 5,626; Romania 1,993.
Silver metal including alloys:				
Bullion thousand troy ounces	1,523	877	--	West Germany 524; Switzerland 311.
Other (powder) do.	3	28	--	West Germany 21; Switzerland 6.
Partly wrought do.	r1,112	531	--	Yugoslavia 438.
Tin metal including alloys, all forms	96	30	--	West Germany 23.
Titanium oxides	37	29	--	Iran 22.
Tungsten:				
Ore and concentrate	25	--	--	
Metal including alloys, all forms	848	1,111	NA	NA.
Zinc:				
Oxides	636	616	--	Hungary 592.
Metal including alloys, all forms	1,339	2,429	--	Yugoslavia 1,171; Czechoslovakia 850.

See footnotes at end of table.

Table 2.—Austria: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980	Destinations, 1980	
			United States	Other (principal)
METALS —Continued				
Other:				
Ores and concentrates	54	134	--	West Germany 66; Italy 40.
Ash and residue containing nonferrous metals	68,290	73,724	--	Italy 54,806; West Germany 14,145.
Waste and sweepings of precious metals including old metals kilograms	40,698	44,543	--	West Germany 44,199.
Oxides, hydroxides, peroxides	1,044	733	--	Italy 525; West Germany 142.
Base metals including alloys, all forms	2,975	609	--	Italy 230; West Germany 191; United Kingdom 105.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Pumice, emery, corundum, etc	11	11	NA	NA.
Grinding and polishing wheels and stones	12,792	14,032	29	West Germany 2,141; Italy 1,611; France 1,140.
Dust and powder of semiprecious stones including diamonds value	$1,271	$8,656	NA	NA.
Asbestos, crude	2	4	NA	NA.
Cement	20,631	32,632	--	West Germany 23,982; Yugoslavia 6,491.
Chalk	3,406	2,495	--	Hungary 1,831; Italy 249.
Clays and clay products:				
Crude:				
Kaolin (china clay)	25,269	29,075	--	Hungary 13,201; Italy 12,561.
Other	155	1,365	--	Hungary 1,144.
Products:				
Refractory including nonclay brick	172,887	188,414	--	Romania 7,676; Czechoslovakia 2,205.
Nonrefractory	85,589	79,908	--	West Germany 74,384.
Diamond:				
Industrial value	$38,674	$11,284	NA	NA.
Gem:				
Crude do	$35,907	$59,823	--	All to Switzerland.
Worked carats	5,00	25,000	--	West Germany 15,000.
Diatomite and other infusorial earth	1,031	1,135	--	Yugoslavia 970; Czechoslovakia 83.
Fertilizer materials: Manufactured, phosphatic	15,077	10,058	--	Hungary 10,056.
Graphite, natural	17,870	16,576	--	Poland 9,050; West Germany 4,610; East Germany 741.
Gypsum and plasters	250,801	136,888	--	West Germany 108,848.
Lime	1,424	1,404	--	West Germany 1,104.
Magnesite	112,021	137,836	--	West Germany 40,348; Poland 32,546; Hungary 13,340.
Mica, all forms	312	365	--	Greece 155; Czechoslovakia 33.
Pigments, mineral including processed iron oxides	7,788	6,301	71	West Germany 2,338; Netherlands 940; United Kingdom 91.
Precious and semiprecious stones:				
Crude, other than diamond thousand carats	5,355	3,200	NA	West Germany 1,030; Italy 1,020.
Manufactured including diamond do	9,600	7,465	1,870	West Germany 725; Switzerland 695.
Pyrite	93	19	NA	NA.
Salt	90	153	--	Italy 140.
Sodium and potassium compounds, n.e.s.:				
Caustic potash	30	3	NA	NA.
Soda ash	2,665	471	--	Yugoslavia 297; Hungary 146.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked:				
Calcareous including marble and limestone	75,222	105,549	--	West Germany 100,598; Switzerland 4,842.
Slate	27	46	NA	NA.
Other	44,951	47,771	--	West Germany 47,273.
Worked:				
Paving stone and flagstone	25,429	20,864	--	West Germany 12,203; Switzerland 8,498.
Slate	46	59	NA	NA.
Other	2,334	2,379	157	West Germany 1,895.
Dolomite, chiefly refractory-grade	10,597	6,865	--	West Germany 4,652.
Gravel and crushed rock	486,511	441,312	--	West Germany 218,256; Switzerland 214,614.

See footnotes at end of table.

Table 2.—Austria: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980	Destinations, 1980	
			United States	Other (principal)
NONMETALS —Continued				
Stone, sand and gravel —Continued				
Limestone, except dimension	48	469	--	West Germany 442.
Quartz and quartzite	93	57	NA	NA.
Sand excluding metal-bearing	160,860	149,885	--	West Germany 88,009; Switzerland 57,094.
Sulfuric acid, oleum	12,074	5,486	--	Yugoslavia 3,005; Italy 2,227.
Talc, steatite, soapstone, pyrophyllite	98,139	97,760	--	West Germany 52,481; Italy 14,059.
Other:				
Crude	4,905	4,914	54	West Germany 3,692; Italy 412.
Slag, dross, and similar waste, not metal-bearing	42,395	174,295	--	Yugoslavia 92,348; West Germany 75,557.
Oxides, hydroxides, peroxides of strontium, barium, magnesium kilograms	100	300	NA	NA.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	72	134	--	West Germany 100.
Carbon black and gas carbon	13	203	--	West Germany 199.
Coal:				
Anthracite and bituminous coal including briquets	97	98	NA	NA.
Lignite and lignite briquets	11,581	24,071	--	West Germany 23,984.
Coke and semicoke	12,090	1,655	--	West Germany 905; Italy 464.
Hydrogen, helium, rare gases thousand cubic feet	68,216	138,596	--	Hungary 81,354; Czechoslovakia 19,896; Yugoslavia 12,912.
Peat including briquets and litter	290	836	--	West Germany 493; Italy 342.
Petroleum refinery products:				
Gasoline, aviation and motor thousand 42-gallon barrels	126	51	--	Switzerland 33; Yugoslavia 18.
Kerosine and jet fuel do	(1)	1	--	NA.
Distillate fuel oil do	3	2	--	Czechoslovakia 1.
Residual fuel oil do	5	1	--	NA.
Lubricants do	551	445	--	Czechoslovakia 190; Yugoslavia 86; Poland 82.
Mineral jelly and wax do	188	175	--	Netherlands 117; West Germany 37.
Liquefied petroleum gas do	484	673	--	Italy 502; Czechoslovakia 41.
Other do	64	100	--	Yugoslavia 50; Poland 21.
Mineral tar and other coal-, petroleum-, and gas-derived crude chemicals	r17,282	18,108	--	West Germany 11,903.

rRevised. NA Not available.
1Less than 1/2 unit.

Table 3.—Austria: Imports of mineral commodities

Semimanufactures	52,541	61,579	60	West Germany 30,837; Italy 7,308; France 6,431.
Gold metal including alloys, unwrought and partly wrought troy ounces	137,219	27,296	--	West Germany 15,239; Switzerland 7,266.
Iron and steel:				
Ore and concentrate, except roasted pyrite thousand tons	3,963	3,336	25	Brazil 1,259; Canada 949; U.S.S.R. 616.
Roasted pyrite	44,854	48,448	--	West Germany 23,738; Yugoslavia 17,934.
Metal:				
Scrap	134,169	143,216	153	West Germany 82,152; U.S.S.R. 27,104; Bulgaria 18,861.
Pig iron, cast iron, spiegeleisen, powder, shot	94,475	103,294	8	U.S.S.R. 37,317; West Germany 13,421; Romania 6,511.
Ferroalloys:				
Ferromanganese	26,275	23,070	52	Norway 14,055; West Germany 6,570.
Other	61,788	51,403	136	Yugoslavia 11,378; West Germany 5,473.
Steel, primary forms	150,961	185,941	63	West Germany 46,183; Bulgaria 32,270; Poland 30,597.
Semimanufactures:				
Bars, rods, angles, shapes, sections, etc	208,435	241,153	27	West Germany 112,340; Italy 61,381; Belgium-Luxembourg 21,559.
Universals, plates, sheets	182,479	227,436	211	West Germany 124,338; Belgium-Luxembourg 26,312; France 20,248.
Hoop and strip	62,527	75,722	27	West Germany 53,947; Belgium-Luxembourg 8,220; France 3,611.
Rails and accessories	2,520	4,908	--	West Germany 2,198; Italy 1,178; Belgium-Luxembourg 485.
Wire	27,626	27,217	1,169	West Germany 11,168; France 4,053; Belgium-Luxembourg 4,005.
Tubes, pipes, fittings	152,045	159,224	61	West Germany 88,861; Italy 23,373; Switzerland 7,373.
Castings and forgings, rough	10,031	12,598	9	West Germany 9,344; Switzerland 880; Italy 420.
Lead:				
Ore and concentrate	6,193	4,156	--	Italy 4,155.
Oxides	297	282	18	West Germany 251.
Metal including alloys:				
Scrap	1,920	2,628	--	Switzerland 1,508; Hungary 1,027.
Unwrought	29,538	32,396	51	West Germany 16,986; United Kingdom 3,802; Denmark 3,657.
Semimanufactures	565	941	--	West Germany 836.
Magnesium metal including alloys, all forms	2,249	2,228	624	Norway 808; Italy 285.
Manganese:				
Ore and concentrate	433	1,726	--	Hungary 1,329.
Oxides	129	111	--	West Germany 66; Belgium 45.
Mercury 76-pound flasks	690	566	--	China 252; U.S.S.R. 122; Japan 122.
Molybdenum:				
Oxides	1,639	1,527	NA	NA.
Metal including alloys, all forms	366	366	172	Canada 110.
Nickel:				
Matte, speiss, and similar materials	1,533	1,279	415	Netherlands 408; Cuba 269.
Metal including alloys:				
Scrap	1,504	1,597	272	U.S.S.R. 606; West Germany 347.
Unwrought	2,849	2,378	393	Canada 354; Republic of South Africa 302; Philippines 219.
Semimanufactures	555	548	191	West Germany 206.

See footnotes at end of table.

Table 3.—Austria: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980	Sources, 1980	
			United States	Other (principal)
METALS —Continued				
Platinum-group metals including alloys, unwrought and partly wrought troy ounces	38,774	26,460	193	West Germany 19,837.
Silver metal including alloys:				
Bullion thousand troy ounces	3,757	2,702	156	West Germany 612; Switzerland 556; Spain 530.
Other (powder) do	4	3	--	Mainly from West Germany.
Partly wrought do	2,566	1,642	2	West Germany 1,489.
Tin:				
Oxides and hydroxides	10	13	--	West Germany 11.
Metal including alloys, all forms	650	752	--	West Germany 316; Thailand 216.
Titanium oxides	8,964	8,728	--	West Germany 5,024; United Kingdom 876; France 823.
Tungsten:				
Ore and concentrate	4,853	4,297	NA	NA.
Oxides and hydroxides	167	159	NA	NA.
Metal including alloys, all forms	728	418	114	West Germany 135; United Kingdom 64; Belgium 47.
Uranium and thorium oxides	607	876	--	India 550; France 219.
Zinc:				
Ore and concentrate	5,621	8,594	--	West Germany 4,071; Czechoslovakia 1,821.
Oxides	841	1,103	--	West Germany 925; France 119.
Metal including alloys:				
Scrap	579	339	--	Hungary 317.
Blue powder	1,266	1,016	--	France 337; Belgium 312; United Kingdom 119.
Unwrought	4,469	4,074	--	West Germany 2,499; Yugoslavia 934; Zambia 578.
Semimanufactures	1,763	1,688	--	West Germany 1,269.
Other:				
Ore and concentrate	10,757	10,411	2,060	Netherlands 3,139; United Kingdom 1,074; Australia 1,056.
Ash and residue containing nonferrous metal	128,618	136,378	1,305	U.S.S.R. 66,351; Hungary 18,543; East Germany 16,994.
Waste and sweepings of precious metals including old metals kilograms	16,132	1,412	--	Yugoslavia 830; United Kingdom 350.
Oxides, hydroxides, peroxides	3,707	3,366	80	Republic of South Africa 2,745.
Rare-earth metals: Yttrium and scandium	6	2	NA	NA.
Base metals including alloys, all forms	3,879	1,929	--	Republic of South Africa 453; U.S.S.R. 394; West Germany 244.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Pumice, emery, corundum, etc	185	224	--	Italy 142.
Artificial: Corundum	6,500	8,595	1,577	West Germany 3,544; France 1,968; Poland 868.
Dust and powder of precious and semiprecious stones including diamonds kilograms	223	301	262	Switzerland 31.
Grinding and polishing wheels and stones	1,058	1,367	16	West Germany 646.
Asbestos, crude	23,912	20,241	13	Canada 8,376; Italy 4,098; Republic of South Africa 3,620.
Barite and witherite	3,228	5,752	--	West Germany 3,631; Ireland 1,200.
Boron materials:				
Crude natural borates	16,044	18,094	6,930	Turkey 11,066.
Oxide and acid	1,025	1,144	--	France 896; United Kingdom 129.
Cement	37,235	39,266	363	West Germany 12,506; Italy 11,322.
Chalk	6,590	11,062	--	Italy 6,001; France 4,001.
Clays and clay products:				
Crude:				
Bentonite	594	883	182	West Germany 466; Yugoslavia 74.
Kaolin	111,887	101,643	10,529	Czechoslovakia 46,565; United Kingdom 32,480.
Other	95,798	104,494	151	West Germany 56,596; Czechoslovakia 34,388.
Products:				
Refractory including nonclay brick	19,971	27,501	9	West Germany 19,250.
Nonrefractory	263,022	277,865	--	Italy 165,252; West Germany 83,818.
Cryolite and chiolite, natural	261	204	--	Denmark 201.

See footnotes at end of table.

COMMODITY REVIEW

METALS

Austria is not endowed with rich metalliferous deposits, and in 1981, no significant new finds were made. The mining of metals of domestic significance continued at Mittersill near Salzburg for tungsten ore (scheelite), at Bleiberg for lead-zinc ore, and for magnesite at various small mines. Some exploration was considered for scheelite minerals. Underground mining at Bleiberg ceased during the year and only low-grade ore and dump material was reprocessed.

The Treibacher Chemische Werke (TCW), located in Treibach, a small village a few kilometers from the Yugoslav and Italian borders in the foothills of the Austrian

Alps, completed a major expansion in 1981 at a cost of about $62.5 million[3] over 5 years. The company's main products were ferroalloys of molybdenum, tungsten, and vanadium; titanium, normally one of the main products, was not produced in 1981 owing to poor market conditions. Slags for a vanadium pentoxide plant were imported from Highveld in the Republic of South Africa, molybdenum oxide came from north Africa and the Republic of South Africa, and a large part of TCW's tungsten ores came from China and Australia. TCW also had a small stake in Australia's Queensland Wolfram Mine. However, not all of TCW's products were low-volume, high-value items. One of its most successful postwar developments was the fused alumina-abrasives plant at nearby Selbach. In 1981, abrasive-grade bauxite, used in production of brown fused alumina, was imported from Australia and Guinea, while Bayer alumina was used for making white fused alumina. Production was about 50,000 tons in 1981; nominal capacity was 60,000 tons. Various grades were produced including grinding wheel material, coated abrasives, and refractory and sandblasting products.

Iron and Steel.—In 1981, steel production was stagnant. The major problems that faced the nationalized industry were the unfavorable world steel market, the large volume of low-priced imports, the outdated operations, identical production lines in too many locations, and overstaffing. The only profit made in 1981 by the entire industry came from sales of a number of flat products and from finished goods such as complete industrial facilities, equipment for the generation of hydroelectric power, and from mining and oilfield equipment. The losses, however, by far outweighed profits in 1981.

To compensate for the financial losses suffered in 1981 by the two nationalized steel companies, VA and Vereinigte Edelstahlwerke AG (VEW), and to enable them to close their accounts without drawing on basic capital (reportedly reserves were no longer adequate to cover the losses), the Austrian Government reportedly assisted the ailing companies by subsidizing them in the amount of about $169 million. A sum of about $75 million was earmarked for the specialty steel producer VEW, and $94 million was made available to VA. Together with the earlier grants allocated to assist VEW, the Government's assistance to the depressed steel industry may have increased to $281 million by 1981.

The world steel recession adversely affected VA, by far the largest steel and engineering enterprise in Austria. Formed by the merger of two companies in 1973, VA was followed 2 years later by the merger of all speciality steel plants under the newly created VEW; this, combined with the shift from crude and rolled steel output to engineering and finished goods, helped in a small way to improve the steel industry's position. Investments at $1.3 billion since 1973 and the closure of obsolete blast furnaces also contributed to international competitiveness. Nevertheless, VA posted considerable losses in 1981, despite a 10% rise in 1980 turnover.

The international steel crisis, the increased reliance on compensation and countertrading, and especially the lack of expected orders from East Europe and China all contributed to the deterioration of profits. The fact that there were six different special steel plants in operation and the fact that, for example, the obsolete plant at Judenburg in Styria had not been closed down, were also major negative factors. VA, especially its special steel sector, has also been burdened by a legacy of weakness in the mining and industrial base that was hopelessly uncompetitive because of geography. This especially applied to upper Styria, an industrial region with a population of 400,000 where steel, special steel, magnesite, paper, and pulp dominated the industry. In Styria about 30% of the industrial labor force was employed by the nationalized industries. The proportion dropped to 13% in Lower Austria and to 7.3% and 5.5% in Carinthia and Upper Austria, respectively. Unemployment in Carinthia reached 11.6% during the winter of 1981.[4]

The poor performance of VA was not surprising. Herbert Koller, former VA executive, had warned since the early 1970's that steel production in Austria was no longer competitive. Franz Geist, director of the Austrian Industries Management Co. at that time, had also pressed for reorganization, just as did the U.S. consulting firm of Booz, Allen & Hamilton Inc., which recommended plant shutdowns in their report.[5]

Tungsten.—Tungsten ore in Austria was mined by Wolfram Bergbau und Hutten GmbH in 1981 as scheelite from a mine at Mittersill, near Salzburg. Since the mine opened in 1976, it had become one of the world's largest opencast tungsten mines. Reserves in this East Field were low, howev-

er, and the ore may be mined out by the mid-1980's. Exploration in the West Field and more efficient underground mining was planned with a view to tripling the ore output to an average of 450,000 tons annually. Because of the complex geology, the mining was extremely difficult and slow, affecting all aspects of extraction, from excavation and haulage to storage, as well as environmental considerations.[6]

Wolfram GmbH was jointly owned and operated by VA of Austria and Metallgesellschaft of the Federal Republic of Germany. The ore was processed by TCW in a plant located near the Italian border. TCW did not operate any domestic mines; all of its tungsten ore was from imports and the Mittersill Mine, in which it had no financial interest.

NONMETALS

Graphite.—The production of graphite in Austria continued to decline in 1981. The two companies, Graphitbergbau Kaisersberg Franz Mayr-Melnhof & Co. and Pryssok & Co. KG, operated four mines and produced mostly amorphous graphite for use in the foundry industry. Most of the production was exported, mainly to the Federal Republic of Germany, Italy, and Eastern Europe. At one time Austria had been one of the largest producers of graphite in the world.[7]

Iron Oxide Pigment.—Austria mined a unique commercial deposit of micaceous iron oxide at Waldenstein in Carinthia. Previously, iron oxide had been mined there principally as a source of iron. Although production was small, about 10,000 tons annually, paints containing that material were used throughout the world. Reportedly, other European mines were in operation but the Austrian material was renowned for its consistently high quality and its platy nature. Virtually all the production was used in the manufacture of corrosion-resistant paints, and as much as 99% of the total output was exported. Extensive drilling was completed around the mine area in 1981 to delineate further reserves, even though the existence of extensive resources in the region was already known. Granular and crystalline iron oxide was also present at the mine, but it was not extracted.

Magnesite.—Internationally, Austria is probably best known as the home of the magnesite industry. In 1981, magnesite continued to be Austria's most important nonmetallic mineral and its major mineral export commodity. Magnesite deposits occur in the Paleozoic limestones of the Northern Greywacke Zone and in limestones of undetermined age in the synclines of the upper Austro-Alpine Basement and of the Tauern Window. Two companies dominated the production and marketing of the product in 1981, Veitscher Magnesitwerke AG (a subsidiary of Magnesia AG of Switzerland) and Österreichische-Amerikanische Magnesit AG (OEAMAG), a subsidiary of the U.S. company General Refractories Inc. The two other smaller companies were Magindag AG, partly owned by Veitscher, and Tiroler Magnesit AG, the latter owned by OEAMAG. There were five operating mines, from which total production was about 1,300,000 tons in 1981. From this crude magnesite, dead-burned magnesite and caustic-calcined magnesite were produced for use as bricks in lining steel furnaces, as monolithic refractory products, as oxychloride cements in abrasives, as slag conditioners, and in other lesser applications.[8]

MINERAL FUELS

Austria continued to be a net exporter of electrical power in 1981. Despite its electricity surplus, however, and the existence of a small but rapidly declining reserve of oil and natural gas, Austria in 1981 continued to be heavily dependent on imports of energy. In 1980, 80% of its coal was imported, as against 73% in 1976; 89% of oil (against 80%); and 59% of gas (against 41%). Overall, net imports accounted for 63% of energy supply in 1973-74, and for 68% for 1979-80. There were also problems of the security of supply. A contract with Iran, for example, for the supply of 63.5 billion cubic feet of natural gas annually starting in 1984, was uncertain owing to political developments in that country. Algerian supplies were too expensive, and additional imports from the Soviet Union were still under negotiation.

Soviet bloc countries in recent years usually took first place as suppliers of all major fuels (oil, gas, and coal)—a fact that reflected both Austria's geographical position on the eastern fringe of West Europe and its political position as a country pledged to maintain neutrality. All together, Soviet bloc imports in recent years accounted for about 45% of Austria's energy imports, with 37% coming from the Organization of Petroleum Exporting Countries and 18% from other sources, including West

European oil companies. Furthermore, experts suggested that deliveries of fuels to Austria by the Soviet bloc countries could be as high as 50% in the near future. The main objectives of Austrian energy policy, therefore, were to reduce oil imports, to switch to alternate fuels, and to conserve. The major fuels intended to replace oil were coal for power generation and district heating, and natural gas for space heating and other domestic uses. Between 1973 and 1980, coal use increased by 30% and gas by more than 20%.

Coal.—Austria had no deposits of anthracite coal and very little, or exhausted, bituminous coal. Government estimates of certain and probable lignite coal reserves were put at 114 million tons. However, economically recoverable reserves were estimated at only 50 million tons and were rapidly declining.

In 1981, production was expected to continue at the 1980 level until 1983, when it was projected to increase by some 300,000 tons annually as a result of the inauguration of a new open pit mine. The new Oberdorf lignite mine at Barnbach near Graz was to increase production to about 3.2 million tons in 1983 and 1984. Coal consumption was increasing owing to the greater use of coal in heating, higher production of metallurgical coal, and the increased use of coal in industry, and was expected to grow substantially in the 1980's, as several large coal-fired powerplants came online, and as industrial consumers of oil and gas switched to coal because of higher prices and concern about the availability of adequate supplies.

Because of the anticipated higher consumption, Austrian coal imports were expected to be at high levels throughout the 1980's, approaching 5 million tons annually. Beginning in 1984, Austria was to receive at least 1 million tons of steam coal annually from Poland under terms of a 20-year contract signed in 1980 by the two countries. The United States accounted for about 2% of Austrian coal imports in 1980, primarily from one West Virginia mine controlled by the Austrian steel giant VA, and these imports were expected to rise in 1981. Czechoslovakia was the other major exporter of coal to Austria. Because of uncertain deliveries of coal, Austria needed to diversify its sources of supply and develop new supply routes. In this regard, the completion of the Rhine-Main-Danube Canal was expected to improve the competitive position of coal from Western European sources and ports.

Natural Gas.—Remaining proven and probable gas reserves of Austria were increased by about 2.5% in 1981 and equaled almost 6 years of production. The ratio of domestic proven plus probable reserves to total gas requirements in 1981 was about 2.4. Austria produced about one-half of its own natural gas requirements.

Production policy and administration of gas reserves was managed similarly to that of oil, mainly through direct agreements between the Austrian Government and OMV and some privately owned companies. As in previous years, about 99% of gas imports came from the Soviet Union. Negotiations for future supplies were continuing with the Soviet Union and Algeria. The gas storage and supply network was expanded during 1980-81 and underground reservoir storage totaled about 71 billion cubic feet, almost 6 months of average supplies.

Gas requirements were expected to expand in the future, by annual growth of 1.6%, which could be accommodated without major problems with the existing internal gas supply network. Gas prices to consumers were fairly high in 1981, reflecting the high proportion of imported gas in total consumption. Despite the prime quality of gas as a fuel, the Government was attempting to keep its price as low as possible to displace imported oil in significant quantities in the future.

The high level of Austrian dependence on the Soviet Union for gas imports caused some concern that supply sources should be diversified. The possibilities under consideration included purchasing gas from Algeria, and interest was also shown in North Sea gas. A contract with Iran for the supply of about 65 billion cubic feet of gas beginning in 1984 was, however, considered unlikely to be concluded. According to some forecasts, Austria's annual demand for natural gas will continue to increase and was expected to reach a total of about 175 billion cubic feet by 1985 and about 245 billion cubic feet by 1990.

Petroleum.—The Austrian state oil company, OMV, produced about 80% of all domestic oil and owned and operated the only refinery in Austria. About 15% of the country's crude oil demand was covered from domestic sources. Reportedly, proven and probable oil reserves were increased by about 1% in 1981 to 140 million barrels.[9]

According to production projections, the Austrian crude oil output was expected to decline to 10 million barrels in 1985 and to 7 million barrels in 1990. On the other hand, other reports estimated that overall requirements for petroleum products were to increase at an average rate of 2.3% per year through 1985.

Exploration for oil and gas was directed by OMV, which owned exploration rights to 84% of Austria's prospective areas. On January 1, 1981, the Government concluded several exploration agreements with OMV and for development and storage of crude oil. The agreements also included requirements for minimum levels of exploration. A second company, Rohöl-Aufsuchungs GmbH, owned by Mobil Oil Co. and Shell Oil Co., also conducted exploration in Austria and made similar agreements with the Government on minimum levels of activity. Negotiations with a third company were also planned.

The Austrian oil depletion policy was based on the objective of maximizing long-term recovery from the oilfields. Enhanced recovery methods were applied where appropriate, and the Government retained the right to demand the application of such methods by the oil companies under certain conditions.

The Mineral Industry of Belgium-Luxembourg

By William Keyes[1]

BELGIUM

The Belgian economy has been in a chronic recession since 1974, showing the ravages of high labor costs and insufficient export competitiveness. Continuing Government deficits tended to maintain purchasing power, but consequent borrowing and a policy of defending the exchange rate of the Belgian franc (BF) kept interest rates very high and inhibited industrial investments. Gross national product increased 6.7% in 1981 to $98.6 billion,[2] but this actually represented a slight decline in real terms.

The ailing steel industry was a major drain on the public treasury. During the year, funding of close to BF40 billion (about $1.1 billion) was tentatively authorized for the industry, subject to ultimate approval by the European Economic Community (EEC). An unprofitable zinc smelter was closed. Coal production continued to be subsidized. The petroleum refining industry was afflicted by low demand for its products in the export market, while the Government struggled to extricate itself from an unfavorable contract for crude entered into with Saudi Arabia a year earlier. Other mineral production in Belgium was minor by world standards, although some of its nonmetallic products, such as calcareous rocks and siliceous blocks, were well known and had a favorable world market.

PRODUCTION

The general production index (excluding construction), which averaged 125.6 in 1980, dropped to 120.3 for the first 9 months of 1981. The coal index, for the leading extractive industry, declined from 40.3 to 38.5 during the same period, while the nonferrous metals and steel indexes also declined. The nonferrous metals index fell from 154.3 in 1980 to 119.6 in 1981, and the steel index fell from 101.6 in 1980 to 82.6 in the period ending July 1981. The metals production industry clearly suffered from the low level of Belgian, and especially European, demand.

Production of minerals and metals in Belgium from 1977 to 1980 and estimates for 1981 are given in table 1.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through June 23, 1982.

[2]In addition to the commodities listed, Belgium produces a number of other metals for which only aggregate output figures are available. These aggregates are included under "Other, nonferrous."

[3]Reported figure.

[4]Known to include gold and silver and may include platinum-group metals.

[5]Derived by subtracting aluminum data from a reported total for unspecified base metals.

TRADE

Exports and imports of minerals and metals in Belgium are given in tables 2 and 3, respectively, for the years 1979 and 1980, the latest years available, with principal destinations and sources. Mineral trade with the United States is highlighted.

Table 2.—Belgium-Luxembourg: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1979	1980	Destinations, 1980	
			United States	Other (principal)
METALS				
Aluminum:				
Bauxite ____	4,531	1,787	--	France 1,727; West Germany 35; Netherlands 25.
Ash and residue containing aluminum	7,508	7,647	NA	West Germany 6,561; France 688.
Oxides and hydroxides ____	1,151	744	--	United Kingdom 259; France 248; Netherlands 107.

(Metric tons unless otherwise specified)

Commodity	1979	1980	Destinations, 1980	
			United States	Other (principal)
NONMETALS —Continued				
Stone, sand and gravel —Continued				
Dolomite, chiefly refractory-grade thousand tons	1,646	1,569	--	Netherlands 688; West Germany 585; France 278.
Gravel and crushed rock ---do---	7,946	8,910	--	Netherlands 4,181; France 4,176; West Germany 551.
Limestone excluding dimension	537,662	553,260	--	Netherlands 361,559; France 190,401.
Quartz and quartzite	13,557	12,940	4	West Germany 7,455; Netherlands 3,058; France 1,235.
Sand excluding metal-bearing thousand tons	3,104	3,422	(1)	Netherlands 1,003; France 994; Italy 422.
Sulfur:				
Elemental:				
Other than colloidal	11,579	14,032	10	France 7,308; West Germany 3,466; Netherlands 509.
Colloidal	42	148	--	Netherlands 33; Venezuela 26; France 23; Italy 23.
Sulfuric acid, oleum	190,805	197,065	(1)	France 100,952; Netherlands 39,487; bunkers 19,500.
Talc, steatite, soapstone, pyrophyllite	21,186	23,331	--	West Germany 5,567; Sweden 3,621; France 3,448.
Other:				
Crude:				
Vermiculite, perlite, chlorite	1,338	328	NA	NA.
Other	151,478	570,884	(1)	Netherlands 537,550; France 19,694; West Germany 9,277.
Slag, dross, and similar waste, not metal-bearing thousand tons	2,181	2,413	--	France 914; Netherlands 891; West Germany 605.
Oxides and hydroxides of barium, magnesium, strontium	153	617	350	West Germany 137; France 111.
Building materials of asphalt, asbestos and fiber cement, unfired nonmetals thousand tons	1,784	1,020	3	Netherlands 573; France 199; West Germany 146.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	9,254	16,435	--	France 16,152; Netherlands 102; Italy 33.
Carbon black	686	390	--	Netherlands 113; France 107; West Germany 54.
Coal and briquets:				
Anthracite and bituminous	445,248	538,043	1,629	West Germany 324,487; France 68,609; Netherlands 64,397.
Briquets of anthracite and bituminous	58,927	25,380	--	France 21,666; West Germany 1,304; Switzerland 1,275.
Lignite including briquets	138	38	--	Netherlands 25; France 13.
Coke and semicoke	638,510	871,067	87,224	Romania 348,314; France 195,775; West Germany 150,257.
Gas:				
Natural ---million cubic feet	7	2,242	--	France 2,240.
Manufactured value, thousands	--	$1	--	NA.
Hydrogen, argon, rare gases	43,100	51,432	NA	France 32,204; West Germany 14,170; Netherlands 484.
Peat including briquets and litter	4,394	2,257	--	Netherlands 1,070; France 778; West Germany 280.
Petroleum:				
Crude---42-gallon barrels	r22	12	--	All to Netherlands.
Refinery products:				
Gasoline---thousand 42-gallon barrels	r34,116	40,635	375	West Germany 11,791; United Kingdom 7,154; Netherlands 5,847.
Kerosine ---do---	r11,533	12,299	151	West Germany 4,047; bunkers 3,023; Nigeria 1,251.
Distillate fuel oil ---do---	26,704	32,115	(1)	West Germany 12,275; Netherlands 5,854; Denmark 2,611.
Residual fuel oil---do---	29,894	37,642	(1)	Bunkers 9,432; Netherlands 7,140; France 5,480.
Lubricants ---do---	r2,676	2,599	1	Netherlands 803; West Germany 263; France 251.
Other:				
Liquefied petroleum gas do---	2,781	3,115	--	Netherlands 1,455; West Germany 600; Portugal 297.

See footnotes at end of table.

COMMODITY REVIEW

Metals.—*Iron and Steel.*—Crude steel production continued in 1981 at the same depressed level as that of 1980, about 12 million tons. The financial picture worsened, however, because of continued soaring costs.

Early in 1981, the Belgian Government and the Commission of the EEC received a report prepared by Nippon Steel Corp. as part of another effort to find a way to make the decisions necessary to put the Belgian steel industry back on its feet. Nippon Steel examined a proposal to merge Cockerill S.A., the large Liège producer, with the "triangle" of Hainant-Sambre S.A. and Forges de Thy-Marcinelle et Providence, S.A., all in the Charleroi area. The report stated that the combined 10-million-ton-per-year capacity (out of a total Belgian capacity of 17 to 18 million tons) should be cut to 8 million tons, of which 60% would be flat rolled products. No recommendations were made as to closures of individual plants. It was warned that the breaking point of the proposed Cockerill-Sambre would remain high without rapid improvement of operating techniques, elevation of labor productivity, and other measures to back up nationalization of production. The plants were found to be considerably less productive than Japanese plants in terms of yield, energy consumption, and manpower.

Government funding of BF40 billion for the merger was tentatively authorized in April, in the form of BF15 billion for fresh capital and BF25 billion to convert debts owed to the state into capital. BF3 billion of this was made immediately available by the private banks to pay wages, but a further BF65 billion emergency credit was questioned by the EEC, which demanded strict conditions of restructuring in coordination with the loan. In this, the EEC was supported by the independent Belgian Steel Association, Eisa.

Cockerill-Sambre S.A. (CS), the new combined firm, was formed on June 26, and considerable stress was generated by its financial problems amid the reluctance of private banks to lend additional money without Government guarantees and by the political problem of growing Flemish (Dutch

speaking) reluctance to acquiesce in a massive Government funding of the Walloon (French speaking) steel industry. The new firm was to have a capacity of 8.5 million tons annually and would be controlled about 80% by the Belgian Government.

Outlook for profitability of the new firm continued poor, and the new chairman of CS said he expected that state aid would be necessary even as far into the future as 1985 and later. It was estimated in business circles that aid in the period 1981-85 would approach BF250 billion.

In November, a general election led to the formation of a new national Government in which the influence of Flemish parties unsympathetic to further aid to the Walloon industry was much stronger. The new premier, Wilfrid Martens, pledged strict adherence to the EEC (actually the European Coal and Steel Community, a constituent body of the EEC) regulation of August 7, 1981, on subsidies to steel industries. The EEC Commission in November vetoed further Belgian state aid by withholding approval of BF8 billion of the Government aid package; the EEC could eventually bring Belgium before the European Court if its wishes are flouted. The EEC was under continuous pressure from other EEC members to take steps to reduce Belgian capacity because the bulk of this steel is exported; only 25% can be consumed in Belgium. This action by the EEC put the Belgian Government in a difficult position because of budgetary problems and the fact that the steel industry would not be able to meet its payroll. The Government would require EEC assistance, and thus approval, to help the industry. At yearend, the caretaker government had not yet arrived at a decision.

Lead and Zinc.—Metallurgie Hoboken-Overpelt S.A., the second largest Belgian zinc producer, commissioned a new furnace at Overpelt to produce secondary zinc from low-grade copper-zinc scrap, such as from junked automobiles. About 25,000 tons per year will be produced by a new technique developed by the Huron Valley Steel Corp. of the United States. Feed will consist mainly of the heavy nonferrous part of the nonmagnetic fraction proceeding from the automobile shredders. Density separation will also be used. Remelted zinc from this operation will be fed to the zinc distillation columns of the refinery. Total cost was expected to be BF80 million (about $2 million).

Société de Prayon, S.A. (actually its subsidiary Société Industrielle de Prayon, S.A.), the smallest Belgian zinc producer, shut down its unprofitable electrolytic zinc plant at Ehein, near Liège, in May. It then attempted to sell its zinc division (capacity 60,000 to 70,000 tons per year) to a number of companies, including Noranda Mines, Ltd., of Canada. Failing in these attempts, it decided to liquidate all assets of the zinc division. An iron oxide plant at Ehein, which produces a high-grade oxide product, remained in operation and would probably be improved with support from the regional development agency, Société Regionale d'Investissement de Wallonie. Also, Prayon's chemical and fertilizer production facilities at nearby Engis were transferred to a newly formed company, Société Chimique Prayon, S.A. Prayon's metallurgical division at Trooz, where cadmium is produced, also was being offered for sale.

Tin.—Metallurgie Hoboken-Overpelt, the only producer of primary tin in Belgium, ceased processing imported cassiterite ores because of the unreliability of supplies, caused by political problems in supplier countries.

An extensive review of the Belgian nonmetallic minerals industry was published.[3]

Nonmetals.—*Barite.*—Production of barite started up again recently, on a moderate scale, although the sole mine also operated from 1890 to 1928. NL Baroid Inc. of the United States purchased the mine, at Fleurus, near Namur, from Kali Chemie AG of the Federal Republic of Germany and Mines de Garrot S.A. of France. Current production, at a rate of about 100,000 tons annually, goes largely to North Sea drilling companies. About one-half of the production, which must be upgraded by flotation, is shipped to GBO Holland BV at IJmuiden, Netherlands, for grinding. Reserves are estimated at about 1 million tons.

Limestone and Other Calcareous Minerals.—Limestone quarrying is the major extractive industry in Belgium. Output is largely from the Meuse Valley and around Tournai, and main uses are for aggregate and for iron and steel production. Of the approximately 30 million tons produced each year, about 6 million tons are exported, of which approximately 4 million go to France and 1.5 million to the Federal Republic of Germany, according to statistics of the 1980 report of the Union des Producteurs Belges de Chaux, Calcaires, Dolomies et Produits Connexes. The largest producer was of the Lhoist-Dumont Group including S.A. Etablissements Leon Lhoist;

S.A. Carrieres et Fours a Chaux Dumont-Wautier; and S.A. des Dolomies de Marcheles-Darnes. Another large producer is S.A. Carrieres et Fours a Chaux de la Meuse (Carmeuse), which also has three subsidiary companies. Both Lhoist-Dumont and Carmeuse have production capacities ranging from 5 to 10 million tons per year.

Belgium has historically been an important marble producer. A variety similar to marble, currently produced in large quantities, is known as petit granite (not a granite) or Belgian bluestone. About 80% of production is concentrated in the Neufvilles-Sognies-Ecaussines area, south of Brussels, where six companies operate quarries. A second producing area is around Sprimont and Pouleseur, south of Liège, where about a dozen producers are active.

Quartz Sand.—Belgium is a major European producer and exporter of several varieties of quartz sand, including exceptionally high-quality sand used in the production of crystal ware and silicon carbide. Belgium has a very important glass industry based on this resource. The largest producer is S.A. SCR Sibelco N.V., which has large operations in both the Mol and Maasmechelen areas in the northeast near the Netherlands border, with an annual production of about 3.5 million tons. The other major producer is De Niewe Zandgroeven van Mol N.V. (in French, Les Nouvelles Sablieres de Mol S.A.), which also produces high-quality sand (about 1.5 million tons) for the glass industry, at Mol and Maasmechelen. Like Sibelco, it exports the bulk of its production.

Silex.—Belgium is a major, and the traditional, producer of this chalcedonic silica, largely used for grinding blocks in mills. A typical analysis of gray-blue Belgium silex is SiO_2, 98.7%; Al_2O_3, 0.3%; CaO, 0.4%; MgO, 0.1%; and others, 0.5%. The material is considered very high grade, and Belgium can compete with other producers (China, Spain, and Yugoslavia) in spite of a higher price.

The major Belgian producer is Siminal S.A., with quarries at Eben-Emael, north of Liège. A second company, Carrieres de Tuffeau, S.p.r.l. (Marnebel), also produces silex in the vicinity. In this area, silex is a by-product of the production of a local limestone (mergel) used in fertilizers. Additional silex production is by S.p.r.l. Freres Evrard near Eben-Emael, four or five smaller producers in Hainaut Province (Mons area), and one in Namur Province (Fraire, south of Charleroi).

Sulfur.—A 36,000-ton-per-year sulfur recovery unit was installed in the petroleum refinery of Albatros Oil Processing GmbH in Antwerp. The refinery, controlled by Albatros GmbH of the Federal Republic of Germany, had a capacity of about 90,000 barrels per day.

Mineral Fuels.—Belgium imports 84% of its total energy supplies, of which one-half is petroleum. Belgian industry is of the heavy, energy-intensive type, and total primary energy requirements per capita are among the highest in Europe. Domestic production of energy is largely from coal mines, which are being exhausted and are heavily subsidized, and from important nuclear capacity. The latter will permit Belgium to decrease its dependence on imported energy to 77% by 1985.

Total primary energy consumption in Belgium has nevertheless been declining for a decade and in 1980 reached the level of 1973, or 46.7 million tons of oil equivalent (68.6 million tons of coal equivalent), owing primarily to economic slowdown in the steel and other energy-intensive industries. Higher prices and better efficiency in such industries as transportation have also played a part.

Successive Belgian Governments have attempted to implement policies outlined in a series of energy papers, appearing in April 1979, June 1979, and March 1980, which called for reducing dependence on oil to less than 50% of total energy demand by 1985 and for reducing growth of energy consumption to 1.5% per year between 1980 and 1990. In July 1981, the first significant conservation measures were taken, with announcement of a series of tax concessions for industry and domestic consumers to encourage investments in insulation and energy efficiency.

Coal.—Over the past few years, demand for coal in Belgium has not been steady. Increased production of hydroelectricity and nuclear-generated electricity together with a negative growth of electricity consumption in 1980 have held down demand. Belgium will, in addition, have four new nuclear power installations onstream by 1985, and this will further soften the demand for steam coal. Countering this to some extent was the effect of the economic recession during 1981, which slowed down increases in the price of imported coal. This, and what was felt to be an inevitable increase in the present low level of steel production, led to some optimism about sales of imported as well as high-cost domestic coal. Belgian buyers nevertheless com-

plained about low quality and transportation bottlenecks in U.S. shipments to Belgium, while recognizing that these problems were related to the great expansion of U.S. exports to Europe in recent years.

A new coal terminal was being built in Ghent to handle expected larger imports, principally from South Africa, by the Rand London Corp. and Anglo International Mining Corp. It will be able to handle 1,000 tons per hour from ships up to 65,000 tons of capacity.

Belgian coal seams are friable and wet, the country rock is not very competent, and the unconsolidated overburden is thick (400 to 600 meters). Mining, under difficult conditions, is at depths of 700 to 1,040 meters. About 85% of the coal is extracted by an advancing method, using chocks (square wooden supports filled with waste), with powered supports at the coal face. Methane is extracted through boreholes at a rate of about 500 to 800 cubic meters per hour per face from about one-third to one-half of the faces; about 60% of this is used at the mines. Over 95% of Belgian coal is mined by N.V. Kempense Steenkolenmijnen in the northeastern Limbourg Province.

Just after the end of 1981, the first ignition took place at the site of the underground coal gasification project near Thulin.

Petroleum.—The contract for the supply of Saudi Arabian crude to Belgium, which began in 1980 and was to extend through 1982, came under study by the new Belgian Government installed near the end of the year. Saudi Arabian officials agreed publicly to consider renegotiation of the price and delivery terms, but this reportedly would involve heavy penalty clauses.

Initially, the contract appeared to be a sound business decision that enabled private suppliers of crude oil to Belgium, including major oil companies, to fulfill requirements and avoid purchases on the spot market. As much as 60% of the crude acquired by Distrigaz, the Belgian Government's semiofficial agency, was taken by the private companies. However, prices declined in 1981, and competitive sales prices set by the Ministry of Economic Affairs were only 89% to 95% of the cost to Distrigaz. It was projected late in 1981 that losses for Distrigaz were at least $16 per ton (over $2 per barrel).

Several additional disadvantages to Belgium to be brought up in the renegotiations were as follows: The contract made Belgium even more heavily dependent on Saudi Arabia (61% in 1981); the Belgian Government, with a heavy financial deficit and requirements for assistance to other industries, such as coal and steel, could ill afford to subsidize its crude oil supply; and the Saudi Arabian contract prevented the Belgian Government from selling the contracted crude outside Belgium.

Uranium.—The plant of Umipray, S.A., a subsidiary of Société de Prayon, Union Miniere S.A., and Metallurgie Hoboken-Overpelt, became operational during the first half of 1980, and work continued according to schedule during 1981. "Operational" as reported by the company meant that the uranium was recovered in some form from the raw material phosphate rock; yellow cake is scheduled to be produced by 1985.

LUXEMBOURG

Metals.—*Iron Ore.*—Domestic production of iron ore declined again in 1980, by 11%, to 560,000 tons, as the last reserves were slowly being mined out. Like the nearby French ores, Luxembourg ores were originally both calcareous and siliceous, but since 1977 only siliceous ore has been mined; this "minette" ore in 1980 had an average iron content between 33% and 34%, with 8.6% CaO, 17% SiO_2, 0.7% P, 0.1% S, and 0.3% Mn. In 1980, only 2 mines remained active compared with 29 in 1950. One of these was an open pit and one (Thillenberg) was underground.

Iron and Steel.—Steel production by Acieries Reunies de Burbach-Eich-Dudelange S.A. (Arbed) fell about 18%, to 3.8 million tons in 1981, which was also a considerable decline from Arbed's peak year, 1974, when Luxembourg steel production was 6.4 million tons.

The Luxembourg Government early in the year approved Arbed's 23.2 billion franc (Lux F)[4] investment plan, to which the Government would contribute Lux F8.0 billion initially, possibly rising to Lux F11 billion. In return Arbed agreed to maintain the work force at 16,500 until 1984 and keep the Government informed about any new commitments. The main features of the proposed plan included a new 650,000-ton-per-year cold rolling mill at Dudelange and a 50,000-ton-per-month medium section mill at Esch-Belval. It was recognized, however,

that the investment program had to be approved by the EEC which might wish Arbed to coordinate with the nearby French mills of Sacilor and Sollac.

In May, another tripartite agreement (Arbed, Government, labor unions) was reached on holding down labor costs by deferral of increases and reducing indexation of certain classes of employees; the Government was also to finance a greater share of the anticrisis division, which provides employment for displaced workers, saving Arbed Lux F600 million.

The Mineral Industry of Bolivia

By Pablo Velasco[1]

The downtrend in economic growth that began in 1977 continued during 1981, owing to chronic political instability and social unrest, as well as adverse conditions in world mineral markets.

The economy suffered from effects of recession, work stoppages, higher costs, and declining mineral production. The gross domestic product grew in real terms by only 0.5% or less in 1981 to the equivalent of $7 billion,[2] calculated at current prices. The rate of inflation increased from 18% in 1978 to 52% in 1981, one of the highest in recent years.

The tin industry remained the cornerstone of the economy, although it has been in decline since 1977. Production of many other minerals has also been declining while operating costs have risen and world metal prices have been depressed. State-owned Corporación Minera de Bolivia (COMIBOL) continued as Bolivia's major mineral producer and the most important generator of foreign exchange. In 1981, COMIBOL continued in financial difficulties that were hampering its part in the implementation of the national investment plan for 1981-85. The plan provides for restructuring the mineral sector at an estimated cost of $637 million and argues for an increase in the role of the private sector in exploration and marketing.

COMIBOL has been relying on outside financing to cover annual deficits in excess of $30 million for some years. In 1981, a former COMIBOL official declared that the nationalized mines were on the "edge of bankruptcy" with the exception of the Huanuni Mine as the only profitable mine among COMIBOL's 14 mining companies. Both COMIBOL and the private mining sector complained that the high charges of the state smelting firm, Empresa Nacional de Fundiciones (ENAF), lowered revenues of the mine producers.

The private mining sector included relatively efficient, well-managed medium miners, some small miners, and mining cooperatives.

Besides tin, Bolivia was an important world producer of antimony and tungsten and a significant producer of silver, zinc, and lead.

Bolivia has become an important producer and exporter of natural gas. In 1981, earnings from natural gas exports were next in importance after those from tin exports.

In the past, Bolivia has been a net exporter of crude petroleum, but in 1981 it was necessary to import certain petroleum products, especially fuel oil and diesel oil. The replacement of fuel oil and diesel oil by natural gas would represent a considerable saving for the country. To accomplish that goal, the Inter-American Development Bank (IDB) in 1981 approved a loan of $97 million to help build a gas pipeline from the gasfields near Santa Cruz to the main industrial and mining centers of Cochabamba, Oruro, and La Paz.

Yacimientos Petrolíferos Fiscales Bolivianos (YPFB), the state oil company, proposed a new 5-year development program aimed at halting the decline in petroleum production. YPFB received formal proposals from 5 foreign oil companies, out of 38 invited, to pursue petroleum exploration under operational contracts governed by the 1977 General Hydrocarbons Law. The five companies are Perez Co. (Argentina), Anschutz Corp., BMF Chemical Corp., Occidental Boliviana Inc., and Tesoro Bolivia Petroleum Co. from the United States. The

two latter companies were already established in Bolivia with operational contracts. Both were producing natural gas and condensate.

Government Policies and Programs.—On December 8, 1981, the long-awaited Investment Law was approved. The law was intended to encourage investments and does not distinguish between national and foreign investors, except that the foreign investor is assured the right of repatriation of profits. The law applies to new investments as well as to reinvestment in agriculture, industry, construction, mining, and tourism. Basically, it provides for duty-free imports of materials and machinery not produced in Bolivia and for various other tax benefits depending on the geographical zone and nature of the investment. The new law provides all the guarantees granted by the Bolivian Constitution and allows for the necessary contractual requirements specified in investment insurance agreements made by foreign governments.

Bolivia was trying to revive its mining sector, which was going through a very difficult period, with output and investment inhibited by political and economic problems. Nevertheless, a promising new mining development plan was agreed upon in July at the country's first top-level meeting in Tarija of Government and private mining representatives. Problems discussed included the friction between tin-mining companies and ENAF, the tax system, the mine leasing system, metals and minerals marketing sales, and the foreign investment policy.

The July meeting resulted in several constructive measures. A major advance was the agreement to work toward reforming the taxation system. The first step is to rationalize and unify the accounting system used by the mines, but this was expected to take at least a year. Meanwhile, many mining companies must still be taxed on "assumed profits," based on the Government's assessment of their operating costs. It was also agreed that mining companies should have better access to potential mining areas restricted to the Government. Suggestions were made regarding joint COMIBOL-private mining projects. This measure could help COMIBOL, which has no funds for new projects, and might also enable private mining concerns to gain access to ore reserves presently closed to them. It was also agreed that there would be freedom to negotiate with ENAF over its smelter charges.

The Government also agreed that $637 million would be invested in the mineral sector in 1981-85, with $130 million earmarked for private miners. It appeared that Bolivia would have to raise this money abroad. The agreements were ratified and converted into the National Mining Policy contained in supreme Decree No. 18509 approved by the President and Ministers on July 23, 1981. The state, through the Ministry of Mines and Metallurgy, will provide strict supervision of the state-owned companies of this sector in the areas of production, research, technology, marketing, procurement, and financing. The National Mining Policy established a program of investment priorities covering the whole gamut of mineral development from exploration to beneficiation.

The 16 separate policies specified in Decree No. 18509 cover (1) exploration, (2) mine development, (3) beneficiation, (4) radioactive minerals, (5) nonmetallic minerals, (6) metallurgy, (7) iron and steel, (8) taxation, (9) financing, (10) investment, (11) pricing, (12) marketing, (13) technical assistance and promotion, (14) basic and applied research, (15) legislation, and (16) social policy.

The $637 million global investment plan for the 5-year period 1981-85 outlined in Decree No. 18509 allocates $130 million to the private mining sector. COMIBOL's investment requirements during this period for exploration, mine development, and beneficiation facilities take up a large share of the global investment plan. The overall investment allocations were programed as follows: exploration, $127 million; mine development, $130 million; and beneficiation facilities, $380 million.

PRODUCTION

Production of virtually all metals continued in a depressed phase that began in 1979 with negative consequences for the national economy. The most important causative factors were: (1) the slow depletion of ore reserves, (2) lack of investment by the public and private mining sector in exploration and development of new ore deposits, and (3) lack of new mining and plant equipment. Management problems affected all of the nationalized mines. Labor unrest and strikes in the larger mines

reduced productivity, especially in the last 3 years.

As detailed in table 1, mineral production in the past 4 years was generally at a lower level than that of 1977, except for gold and silver, which responded to higher world prices. Production of antimony and tin continued its upward trend reflecting better utilization of installed smelter capacity. Mine production of tin, which dropped 1.4% in 1980 compared with the 1979 output, increased 9.3% in 1981. COMIBOL was the most important tin producer in the country, accounting for 70% of output in 1981.

Silver ore production continued its upward trend since 1979, increasing 15% in 1981. The major silver producer was COMIBOL, contributing an average of 85% of the total in the 1979-81 period.

Antimony production, following an increase of 19% in 1980, decreased 1.1% in 1981. The medium- and small-miners groups were the only producers of this metal. Production of zinc in Bolivia, mostly from COMIBOL, decreased 6.4% in 1981.

Production of oil has been falling steadily since 1978 when Bolivia ceased to export crude oil in order to supply rapidly increasing domestic consumption. Oil output reported in 1981 decreased 8% while natural gas output increased 4%.

TRADE

The mining and metallurgical activity in Bolivia, considered as a whole, had an unfavorable performance in 1981, as far as the value of exports is concerned. This outcome was due mainly to a sharp decline in world prices for tin, Bolivia's most important export commodity. As shown in table 5, exports of metallic ores and metals amounted to $556 million in 1981, a decrease of 13.3% compared with that of 1980. While the quantity of silver exports rose 15% in 1981, the earnings decreased 39% because of falling prices.

The value of COMIBOL's exports of concentrates of tin, copper, lead, zinc, tungsten (WO_3), and silver declined 39% in 1981 compared with that of 1980, as shown in table 5.

The metallurgical industry and, in particular, tin smelting has been the only major growth area of the Bolivian mineral export sector in recent years. The country now has the capacity to refine all of the tin that is produced in the mines as concentrate. During 1981, ENAF exports of tin, antimony, and special alloys of tin, lead, antimony, copper, bismuth, and arsenic increased almost 8% compared with that of 1980.

The value of exports of natural gas to Argentina increased 48% to $326.2 million in 1981. Natural gas exports ranked second in importance in Bolivia's export economy after tin metal and concentrate exports. Exports of refinery products of petroleum declined to $2.1 million in 1981.

According to YPFB, Bolivia expects to export 400 million cubic feet of gas per day to Brazil over a period of 20 years; it is already exporting more than 220 million cubic feet per day to Argentina. Before committing itself to selling gas to Brazil, however, Bolivia must verify reserves of at least 3 trillion cubic feet in addition to the reserves it needs for current markets.

COMMODITY REVIEW

METALS

Antimony.—Bolivia was one of the world's leading producers of antimony ore and metal. In 1981, the Bolivian producers formed a new organization known as Comité Boliviano de Productores de Antimonio (CBPA). This was set up with the aim of including all of the world's producers. CBPA called a meeting on September 22-25 to which it invited producers from Austria, Canada, China, Italy, Mexico, Morocco, Peru, the Republic of South Africa, Spain, Thailand, Turkey, and the United States.

The aim of the meeting was to discuss common problems of world antimony producers and to initiate cooperative measures that would encourage the development and progress of the antimony industry, establish an International Council of Antimony, finance promotion and technical developments in new applications of all forms of antimony, organize a statistical and economic secretariat, define trading policies, and protect and establish world antimony prices.

From the total production of 1981, 78% corresponded to the medium-sized mining sector and 22% corresponded to the small-sized mining sector. Empresa Minera Unificada S.A. mined two-thirds of the antimony produced by the medium mining sector or one-half of the national total. Metallic antimony production in 1981 from ENAF's Vinto antimony smelter reached almost 100% of full capacity at 5,116 tons of antimony and 628 tons of antimony trioxide. In 1981, Bolivia's antimony exports increased by 41% in volume and 30% in value.

Gold.—Gold production in Bolivia showed a 26% increase in 1981 compared with that of 1980; 76% of the total corresponds to the small-miners group made up of gold cooperatives with operations in the rivers of

Tipuani, Guanay, and Cangalli. The balance was accounted for by South American Placers Inc. (SAPI). In 1977, a local firm, Cía. Minera del Sur S.A., bought 100% of SAPI shares. There are indications that gold may exist in the north of La Paz, El Beni, and Pando Departments and in the Provinces of Ayopaya and Chapare in Cochabamba Department. These potential sites are in undeveloped areas with little or no infrastructure. Bolivia has not exported gold since 1974. By law, the Banco Minero de Bolivia (BAMIN) purchases all gold produced in the country by cooperatives and small mines and in turn sells it to authorized jewelers and to the Bolivian Central Bank, which is the only institution that can directly export gold.

Bolivia's first gold symposium, held in La Paz in early 1981, strongly recommended special legislation that would have the effect of attracting domestic and foreign capital to develop the country's gold resources. The symposium also recommended a mining investment law that would financially reinforce the gold prospecting and mining activities to be carried out by the Bolivian Geological Service and provide funds for mining and exploration by COMIBOL.

The Government established a commission to study gold legislation to promote the auriferous industry in the country, although incentives existed for the exploration of gold. There was no tax on the production of gold by small-scale operators and cooperatives. Large-scale operators such as SAPI were subject to production taxes. No large-sized operation, highly mechanized, can be expected to develop a gold project that is too risky unless a definite, stable, and uniform taxation law for gold is promulgated by the Government.

Gold cooperatives in the Yungas area near La Paz were in the process of modernization. Access roads have been built, and the World Bank (International Bank for Reconstruction and Development) has provided credit to BAMIN to buy tractors and scrapers. Most of the gold was produced by hand panning and from dangerous shallow shafts and drifts driven into old alluvium. The Tipuani cooperatives comprised about 6,000 miners. Their working methods were considered to be inefficient, and over two-thirds of the gold potential of the river, which could be recovered by modern methods and systematic use of geological surveys, is lost.

Iron Ore.—Empresa Siderúrgica Boliviana S.A. (SIDERSA) continued exporting iron ore from the alluvial deposits of Mutún to the San Nicolas smelter in the Rosario Province of Argentina. In 1981 the limited exports of iron ore amounted to 4,113 tons, 15% higher than that of 1980. The export of this ore was made through Brazilian territory by train to Rio Paraná and then by barge to Argentina. No significant new developments in iron mining were reported in 1981.

Iron and Steel.—Five firms were prequalified by SIDERSA and the National Institute for Pre-Investment to update the feasibility study on the iron and steel complex at Santa Cruz performed by A. G. McKee of Cleveland, Ohio, in 1977. The proposed $60 million, 100,000-ton-per-year rolling mill was to be reviewed as part of the overall study of the firms prequalified. Two were U.S. firms: Morrison Knudsen and United States Steel Corp. The three Brazilian firms were Internacionál de Ingenieros; Hidroservice, in conjunction with the Bolivian firm Consultores Nacionales; and Cía. Brasileira de Proyectos Industriaís (COBRAPI).

In September 1981, SIDERSA announced that COBRAPI, the Brazilian firm, was selected to conduct the updating and complementing of the existing feasibility study. The complementary studies required will address the following topics: (1) internal and foreign markets, (2) transportation systems, (3) ore pelletization, (4) selection of plant sites, (5) urban development; (6) economic and financial study of the entire project, (7) socioeconomic study, and (8) personnel requirements. The updating and complementary study was estimated to cost $700,000 for completion in 6 months. IDB was expected to finance this new study.

Lead.—Lead production decreased 6% in 1981. The largest producer of lead was COMIBOL with 57% of the total, followed by the medium miners with 26% and small miners with the remainder. The Bolivar Mine, which is a zinc-lead-tin mine of COMIBOL, has been under extensive exploration drilling since it was reclaimed from the private sector. This program has helped to make Bolivar Mine one of the most successful ventures that COMIBOL has undertaken in recent years. The Bolivar Mine was expected to supply lead concentrate to the new smelter being built at Karachipampa near Potosí.

The concern of COMIBOL-ENAF officials in 1981 was whether there are sufficient ore reserves in the vicinity of the smelter to allow it to operate at 80% of capacity or better. The Maria Luisa and Chiroma deposits were inadequate, and COMIBOL was concerned whether the Bolivar Mine has

sufficient ore reserves to meet the smelter's requirements.

According to an official order by the Ministry of Mines and Metallurgy, Bolivia was to suspend exports of lead and silver concentrates beginning in January 1983 to ensure adequate supplies for the Karachipampa smelter, which is expected to be in full operation by the end of 1983. From the beginning of 1983, Bolivia's entire production of lead and silver concentrate will be sold to Karachipampa, and any export licenses for those materials will require approval by the company operating the Karachipampa smelter, Sociedad del Complejo Metalúrgico de Karachipampa.

The Ministry of Mines and Metallurgy stated that by November 1982 the terms for purchases of concentrates including treatment charges and deductions would be established. Miners will be guaranteed that total treatment charges will be set on a competitive basis, in accord with the Government's policy on metallic minerals.

The $164 million Karachipampa smelter was being constructed as a joint venture of COMIBOL-ENAF by Sidech S.A. of Belgium and Klöckner Industrie Anlagen GmbH of the Federal Republic of Germany. The smelter was designed to produce annually about 24,000 tons of lead, 200 tons of silver, 800 tons of tin, 2,000 tons of antimony, 3,300 tons of zinc, and some copper and bismuth from a feed of about 50,000 tons of concentrates. The scheduled completion date was the end of 1982 with the smelter ready for operation in 1983.

Silver.—Production of silver ore increased 8% in 1981. COMIBOL was the major producer of silver during the 1979-81 period with an average of 85% of the national total; the medium miners group contributed 12% of the total, and the small miners group contributed 3%.

The value of silver ore exports decreased to $72 million, the second highest among the metallic minerals and third after tin and natural gas among all mineral exports.

Tin.—The tin industry continued as the cornerstone of the Bolivian economy, although its output has been in decline since 1977. Bolivia's overall position as tin producer in the world in 1981 continued in fourth place after Malaysia, Indonesia, and Thailand.

Output of tin, of which about 70% was accounted for by the state-owned mining corporation, COMIBOL, increased 9.3% in 1981 compared with that of 1980. The increase in production was significant, in spite of labor conflict in the tin mines during the year.

The second most important producer of tin was the group of medium-sized miners with a contribution of about 21% of the total. Its output increased almost 8% in 1981. The small-sized miners were the only group that did not increase production in 1981 and experienced a decline of 5%.

In January, the London Metal Exchange opened with a price of $6.50 per pound of fine tin but this fell to $5.70 per pound in the middle of the year. During the second half of the year the price trend reversed, climbing to $7.20 per pound. Tin production provided most of the income of COMIBOL, which benefited from the higher prices during the second half of 1981. During the first half of the year, however, COMIBOL was reported to be losing $1.04 per pound of tin sold, that is the difference between the average cost of production, $7.10 per pound, and the average sale price of $6.06 per pound.

Empresa Minera Huanuni continued as the most important tin producer of the 12 subsidiary companies of COMIBOL and was the only company that earned a profit when the tin price was not unusually high. Its mining costs are one-half of COMIBOL's average costs. The grade of tin mined was still relatively high, 1.0% to 1.1% tin content compared with the other mines of COMIBOL. The ore was easier to concentrate, and the level of recovery was higher than the other COMIBOL mines.

During recent years, Huanuni has intensified exploration and development by taking advantage of greater budget allocations from COMIBOL. As a result of the drilling programed, the company has discovered a continuation at greater depth of several veins worked in upper levels of the mine. Huanuni's production of tin has increased 100% in recent years. The company was planning to improve the haulage and drainage facilities in the mine, to expand the mill capacity, and to add a preconcentration plant to feed 3% tin concentrates to a proposed volatilization plant at Machacamarca, several kilometers west of the mine site.

Empresa Minera Catavi, located at Llallagua, Siglo XX, Department of Potosí, 40 kilometers southeast of the Huanuni Mine, formerly owned by Patiño Mines and E. C. I. and called capitol of the tin industry of Bolivia, continued to experience serious financial problems. The ore grade in its mines was below 0.4% tin content and

declining. Output fell in 1981, and financial losses accumulated. In 1981, losses were reported reaching almost $2 million per month.

Japan's agency of international cooperation in 1981 made an assessment of the Catavi Mines in connection with a request for financial aid to purchase new equipment and machinery. New areas for block cave mining were outlined, and conventional underground exploitation was being extended to lower levels. Open pit mining has been put aside owing to the low average grade of 0.19% tin content.

Empresa Minera Unificada del Cerro de Potosí, another of the famous mines of COMIBOL, also had serious operating problems. The Cerro Rico tin and silver ore deposit, discovered in 1545, has been mined first for silver and afterwards for tin. Currently, the upper ore body is exploited by some 300 small miners and cooperatives operating approximately 575 small mines. The lower part of the Cerro Rico is exploited by COMIBOL. It operated five sectors: Pailaviri, Ingenio Velarde, Colavi, Conutillas, and La Palca. At La Palca, 20 kilometers from Potosí, construction continued on a Soviet-designed tin volatilization plant.

Empresa Minera Quechisla, the most southern mining company of COMIBOL, located 632 kilometers south of La Paz, is formed by a large group of small mines that produce a large variety of different minerals including tin. This group is centered around Telamayu where COMIBOL's bismuth smelter-refinery is located, which in 1981 was shut down.

ENAF, which was set up in the early 1970's, operated three smelters: a high-grade tin smelter with a capacity of about 21,000 tons per year that is 10 years old, a new low-grade tin smelter undergoing trials in 1981, and the antimony smelter built in 1975. The three smelters are located at Vinto, 7 kilometers from Oruro.

The high-grade smelter treated over two-thirds of the tin concentrate produced in 1981. According to Government requirements, COMIBOL and the private mining sector are obligated to supply ENAF with tin concentrate and export only that which cannot be treated by ENAF. ENAF's smelting charge for high-grade, 43% tin concentrate was $630 per ton of contained tin, almost $200 higher than the Texas City smelter in the United States. Low-grade, 25% tin concentrate was $660 per ton, $200 higher than that of Capper Pass smelter in the United Kingdom. Adding other costs for marketing, ENAF's charges totaled $850 per ton.

The La Palca volatilization plant, owned by COMIBOL and designed and built by Machino Export of the Soviet Union at a cost of over $70 million, has a capacity of 400 tons per day of concentrate with 3% to 6% tin content. The plant was undergoing trials and was expected soon to supply tin dust feed to the new low-grade refinery at Vinto. This 10,000-ton-per-year plant, which came onstream in April 1980, still experienced startup problems but nevertheless produced some tin during 1981 to augment COMIBOL's refined tin output. COMIBOL was engaged in repairing the low-grade refinery after its electric furnace broke down in February.

The La Palca plant was expected to be running at full capacity from April 1982. Serious local environmental pollution problems have occurred since the plant was fired up in mid-December 1981. In addition to pollution problems, pipes used in the arsenic exhaust stage were of small, fragile size that are not recommended by the Soviets. Soviet technicians had also recommended an exhaust stack 200 meters high, but the Bolivians reduced the height to 120 meters.

Tungsten.—Despite the worldwide economic recession, tungsten demand remained strong until the latter part of 1981. Bolivia maintained its position as the leading producer in Latin America. Output in 1981 increased by 3% compared with that of 1980. Of the total output, 51% corresponded to the medium miners, 41% to COMIBOL, and 3% to the small miners.

The International Mining Co. from its mines at Chojlla and Enramada produced almost all, 85%, of the tungsten credited to the medium miners group and has played a leading role in recent meetings of the International Association of Tungsten Producers. Exports of tungsten concentrate (WO_3) decreased 10% in volume and declined 9.3% in value in 1981 compared with 1980 exports. The medium miners group exported 47% of the total volume, followed by COMIBOL with 39% and the remainder by the small miners group and others.

Zinc.—Production of zinc in Bolivia in 1981 declined 6.4% compared with that of 1980. The decline in production was due to slow depletion of ore reserves in the producing mines, the lack of private and public investment in exploration, lack of equipment replacement in the mines and processing plants, and labor unrest. COMIBOL

continued as the largest zinc producer in the country with 58% of the total, followed by the medium miners group with 36% and the small miners group with 6%. The Karachipampa zinc smelter, under construction by Klöckner Industrie under the joint venture of COMIBOL-ENAF, was expected to be ready for operation in 1983.

NONMETALS

Cement.—There were three cement companies operating in Bolivia: (1) Cía. Boliviana de Cementos S.A.M., located in Irpa-Irpa, Department of Cochabamba, with a production capacity of 100,000 tons per year; (2) Fabrica Nacional de Cementos S.A., located at Cal Orko, Department of Sucre, with a production capacity of 300,000 tons per year; and (3) Sociedad Boliviana de Cementos S.A., located in Viacha, Department of La Paz, with a capacity of 225,000 tons per year. The total cement capacity for the country amounted to 625,000 tons per year. A fourth cement plant with an initial capacity of 150,000 tons per year was under construction at Yacuces, Department of Santa Cruz. Production from this plant will help meet the growing demand for cement on the domestic market. Under the terms of an economic cooperation agreement signed with Brazil in 1974, a certain percentage of production is expected to be exported to that country during the early years of operation. The $101 million project was under the direction of the Santa Cruz Public Works Committee, and IDB was envisaged as a possible lending source.

Salt.—A technical work published in La Paz in Spanish provides a good description of the salt deposits in Bolivia's Altiplano with a special focus on the Salar de Uyuni.[3]

The Salar de Uyuni is considered to be the largest salt crust in the world (10,000 square kilometers). It originated in the Tauca dried lake and is located in the central depression of the Bolivian Altiplano. The thickness of the crust is about 12 to 13 meters. Reserve estimates indicate that this salt deposit contains 5 million tons of lithium (an amount similar to the total known world reserves to date), 3 million tons of boron, and 100 million tons of potassium.

Twenty smaller salt deposits were also covered in the cited work such as (1) sodium carbonate deposits (Collpa Laguna, Hedionda Sur, Cachi Laguna, and Khara Laguna) with about 100,000 to 150,000 tons of Na_2CO_3; (2) sodium sulfate deposits (Canapa, Laguna Colorada) with about 100,000 recoverable tons of Na_2SO_4; and (3) borate deposits-ulexite (Rio Grande, north of Uyuni salt deposits, Challviri, Capina, Pastos Grandes, and Laguani). Rio Grande is the largest with 1,600,000 tons of boron; the other deposits contain about 3 million tons of boron. Lithium reserves, often associated with the boron, are chiefly located in the Rio Grande deposit as well as the other small salt deposits.

Sulfur.—Nonmetallics have been traditionally of minor importance in the mineral industry of Bolivia. The most important nonmetallic mineral has been sulfur. Sulfur is mined by small miners in the western Cordillera of the Andes along the border of Chile. The occurrence of sulfur in Bolivia is almost always associated with volcanic activity. Output of sulfur continued in a downtrend.

MINERAL FUELS

In 1981, the Consejo Nacional de Asesoramiento y Legislación (CONAL) introduced their final recommendation on the national medium-term hydrocarbons policy through the Minister of Energy and Hydrocarbons for further consideration. CONAL strongly recommended the preparation of a sound general energy policy emphasizing conservation of energy and promotion of studies on the application of alternative sources of energy. CONAL also recommended the establishment of a multidisciplinary commission of high professional level, under the responsibility of the Minister of Energy and Hydrocarbons, in charge of supervision and control of the gas pipeline Santa Cruz-São Paulo project.

Natural Gas.—Natural gas production continued its upward trend since 1977 and increased almost 4% to 175.4 billion cubic feet in 1981. Revenues from natural gas exported to Argentina in 1981 increased 48% to $326.2 million compared with that of 1980. Bolivian natural gas production was determined by the export volume to Argentina since internal consumption was minimal. Just over 50% of the gross output is marketed; the other one-half is reinjected, flared, or vented.

Gas del Estado of Argentina and YPFB were scheduled to resume negotiations in January 1982 to set natural gas prices for the first semester of 1982. While the Bolivians were expected to press for price increases from the December 1981 level of $3.82 per thousand cubic feet, Argentina was expected to seek a decrease in the contracted volume.

Bolivia and Brazil awarded a basic engineering contract for the 1,940-kilometer Santa Cruz-São Paulo pipeline, estimated to cost $1.2 billion, to Italy's Snamprogetti/S.p.A. The engineering study was scheduled for completion by March 1982. A final routing for the gasline is to be selected in the joint meeting of the technical committee in Rio de Janeiro, Brazil.

Plans call for 570 kilometers of pipeline to be constructed in Bolivia and 1,370 kilometers in Brazil. In addition, Bolivia will have to invest $700 million more to upgrade its gas production and transportation facilities. Construction is to be completed by 1987. Exports of gas should continue to provide Bolivia with much needed foreign exchange earnings. The agreement with Brazil provided the most promising long-term export outlet for Bolivia's gas.

Reserves of natural gas were sufficient to support plans for a large expansion of the domestic distribution network as well as for an increase of exports. Plans envisaged a more than doubling of domestic natural gas use in the next 4 years, with a production of 53 million cubic feet per day seen for 1985.

Omnium Technique des Transports par Pipelines of France reported YPFB awarded it a global contract in connection with a 794-kilometer gas pipeline to transport gas from the Santa Cruz area to La Paz. Initial capacity is to be 42 million cubic feet per day, rising eventually to 97 million cubic feet per day.

In late 1981, IDB approved a loan of $97 million for the construction of a 900-kilometer pipeline to supply an additional 33 million cubic feet of gas per day to the three largest cities on the Altiplano-Cochabamba-Oruro and La Paz.

The expanded domestic gas pipeline system emanating from the Santa Cruz area would make a new energy source available to the mining and smelting facilities in Bolivia's mining industry.

Petroleum.—In 1981, production of crude oil and condensate fell by 8% to about 8.0 million barrels compared with the 1980 drop of 14%. The 8-year downtrend brought oil production to a level just below domestic consumption of 24,000 barrels per day. Oil export revenues fell 65% to $8.6 million in 1981 compared with that of 1980.

In 1981, production of crude oil plus condensate averaged 22,311 barrels per day, and YPFB, together with the contracted firms of Occidental, Tesoro, and Anschutz, expects to average 26,600 barrels per day in 1982.

According to YPFB's production schedule projected for 1982, the main producing field will be Rio Grande with a daily average production of 7,540 barrels, followed in order of importance by Porvenir, Monteagudo, La Vertiente, La Peña, and Caranda. In addition, 2,100 barrels per day of natural gasoline will be extracted and processed in the refineries.

Foreign sales of liquid hydrocarbons consisted mostly of natural gas liquids or condensate and yellow gasoline. The decline in oil export revenues was more than offset by increasing income from natural gas exports to Argentina. YPFB's $181 million investment budget for 1982 contemplates the following: exploration, $53.6 million; development, $72.8 million; industrial activity, $3.3 million; transport by pipelines, $38 million; and marketing, $13 million.

Despite the fact that Bolivia's current hydrocarbons law is considered one of the most accommodating in the world, the Government announced in March 1981, that such law will be thoroughly revised in order to facilitate the entry of foreign oil companies. Bolivia does not have the financial capacity to exploit its hydrocarbon potential without foreign capital.

In 1980, the Phillips-Penzoil-Victory Group relinquished Block VII in the El Beni area, northwest of Santa Cruz, after drilling three dry holes. Exxon Company U.S.A. and Amoco Oil Co. were reported by the Minister of Energy and Hydrocarbons to be interested in exploration and production of oil in Bolivia. Occidental and Tesoro were the only two foreign operators that produced oil and gas in the country during 1981.

At the end of 1981, proven crude oil reserves were estimated at 181 million barrels. YPFB was planning to construct several petrochemical plants using the natural gas from Santa Cruz.

The Mineral Industry of Botswana

By Kevin Connor[1]

There was a dramatic change in Botswana's economic fortunes during 1981, caused by a slump in the world diamond market and depressed prices for copper and nickel. Average real growth for the country's economy was 1.7%, considerably down from the previous few years. The country's balance of payments deficit moved from an overall surplus of $81 million at the end of 1980, to a deficit of about $68 million in 1981.[2] The majority of the deficit problem was directly attributable to the slump in their diamond industry, which in 1980 accounted for roughly 62% of total Botswana export revenues, but dropped to approximately 42% in 1981. The depressed market conditions in 1981 resulted in an estimated loss of $110 million in diamond sales revenues to the country's diamond agency, Debswana. Botswana's BCL Ltd. nickel-copper mine at Selebi-Phikwe experienced serious financial difficulties during the year also. The BCL 1981 annual report showed that total sales of nickel-copper matte were down by approximately $60 million below that of 1980.

Planning continued in 1981 for the proposed $800 million trans-Kalahari Desert railroad line, which would link land-locked Botswana with Namibia's Walvis Bay Port. The new rail section would connect the existing line that runs along Botswana's eastern border between Zimbabwe and the Republic of South Africa, and Namibia's network that extends as far east as Gobabis. About 850 kilometers of new track in Botswana would be needed for the project, with an additional 110 kilometers of track needed to stretch from Botswana's western border to Gobabis in Namibia. Results of a 1979 study indicated that the transport of 10 million tons per year of export coal alone would be enough to make the construction of the rail line from Palapye to Gobabis economically feasible. Other countries such as Zambia, Zaire, and Zimbabwe would find the new transportation route extremely useful also. It is estimated that the railway and new ore terminal for load-out at Walvis Bay, would take approximately 5 years to construct from the project startup date.

Regarding the existing rail line on Botswana's eastern border, which is owned and operated by the Government of Zimbabwe, Botswana's plans for this railroad call for complete nationalization by the end of 1986. In yet another area of transportation, the official opening of Botswana's north-south blacktop road between Lobatse and Ramatlabama was held on October 30, 1981. A milestone achievement, the 45-kilometer road cost approximately $12 million to build, and was financed 60% by the Botswana Government and 40% by the European Communities.

To temporarily alleviate the growing power supply shortage in the Gaborone area, a small-scale, 6-megawatt extension unit is being built onto the existing facilities at the Gaborone Power Station. The project is considered an interim measure to deal with the pressing problem of electrical generating capacity, which was predicated to result in widespread loadshedding by early 1982. The project is estimated to cost $9.45 million and is scheduled for completion by late 1982. As a longer term solution to Botswana's power supply needs, planning for a 180-megawatt generating station at Palapye-Morupule was near completion in 1981. Initial construction was set for Janu-

ary 1982. The plant is to be coal-fired, with an initial output of 90 megawatts by 1986, and an additional 90 megawatts by 1989. The plant will supply most of the country through a high-voltage transmission network, the initial portion of which will be built to Gaborone. Cost of the project is estimated at $230 million.

PRODUCTION

Mineral production for Botswana in 1981 remained at about the same level as that of 1980. Diamond production decreased about 3%, and mining and smelter output of nickel-copper matte increased about 14%, while coal production remained the same. The combined outputs from the Orapa and Lethakana diamond mining complex was 9,631,000 tons of ore yielding 4,960,252 carats. The Orapa production for the year was 7,402,000 tons of ore yielding 4,530,720 carats, at a recovery grade of 61.21 carats per 100 tons. The Letlhakane Mine produced a total of 2,229,000 tons of ore yielding 429,532 carats, for a recovery grade of 19.27 carats per 100 tons.[3] High-grade nickel-copper-cobalt matte production for the year was 46,565 tons. The contained metal in the matte averaged 39.2% nickel, 38.3% copper, and 0.55% cobalt. Total production was from the Selebi-Phikwe underground mines. Coal production from Botswana's only coal operation, the Morupule Colliery, was approximately 370,000 tons in 1981.

Table 1.—Botswana: Production of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1977	1978	1979	1980[p]	1981[e]

TRADE

Botswana's two major export commodities are diamonds and nickel-copper matte, which combined accounted for 65% of Botswana's total export revenues of approximately $400 million in 1981. In 1980 these figures were slightly over 85% and $500 million, respectively, a result of the strong diamond market early in the year. Little changed in 1981 regarding mineral trading partners, with diamond production going to De Beers Consolidated Mines Ltd. of the Republic of South Africa, the world's leading diamond cartel; and the nickel-copper matte going to the U.S. refiner, AMAX Nickel Inc. Negotiations late in 1981 where being held between Botswana's BCL agency and Rio Tinto Mining of Zimbabwe (RTMZ), to draw up a minerals cooperation agreement between the companies for sending nickel and copper matte from Botswana to

Zimbabwe for refining, starting in 1982. This mining-related agreement, which involves the cooperation of the Botswana and Zimbabwe Governments, if reached will be the first such arrangement between two members of the nine-nation Southern African Development Corrdination Conference.[4] The attempted contract is welcomed by both Governments as an exercise in regional economic cooperation. Preliminary tonnage estimates of matte shipment to the RTMZ refinery are 4,200 tons per year, which was calculated by RTMZ as needed additional feedstock for operating its Eiffel Flats refinery near Gatooma, at full capacity. This should reduce the costs of finished product produced at the refinery. The arrangement will also help BCL, which has been asked by its contractual refiner, AMAX Nickel, to reduce nickel and copper matte shipments to its Braithwaite, La., plant by 25% in 1982.

COMMODITY REVIEW

METALS

Copper-Nickel-Cobalt.—Since commencing operations in 1973, the Botswana RST Ltd.'s (BRST) Selebi-Phikwe nickel-copper mine and smelter operation has been beset by problems. In the earlier years, the problems were mostly of a metallurgical processing nature. Now that those technical problems have been solved, a major supply-and-demand problem has arisen. The industrial demands for nickel and copper were so weak in 1981, that the BRST operation's contractual refiner has asked for major cuts in smelter matte prices and shipped tonnages in 1982. A 25% reduction in nickel and copper matte shipments came as a strong request from the refiner, AMAX Nickel, in late 1981, as a result of reported 9 months earnings that were 40% lower than the same period in 1980.[5] AMAX Nickel owns approximately 25% of the BRST operation, and the operating subsidiary BCL, and it has been speculated that during 1981 AMAX Nickel offered to sell their share of BCL to the other major partner, Anglo American Corp. of South Africa Ltd. To meet the requested 25% reduction of approximately 10,000 tons of matte per year, negotiations are underway with RTMZ to take 4,000 tons of matte for their Eiffel Flats refinery, and with Falconbridge Nickel Mines Ltd. of Canada to take the other 6,000 tons for their refinery in Kristianland, Norway. The nickel and copper matte that comes from the Selebi-Phikwe Mines, contains about 40% nickel, 40% copper, and 0.6% cobalt. The average level of ore from the mines that was milled in 1981 at the smelter complex was 200,000 tons per month; with 135,000 tons of that coming from the Phikwe underground workings and 65,000 tons from Selebi, which is 14 kilometers away. The new No. 3 shaft is now finished at Phikwe and full production at the shaft should begin in the first half of 1982.

NONMETALS

Diamond.—Botswana produced approximately 4.9 million carats of diamond in 1981; down about 200,000 carats from the 1980 total. The slight decrease in production was attributed to the present slump in diamond prices, which began in 1980 and persisted with increasing severity throughout 1981. A prime example of this condition, was the plummeting of the price for a 1-carat, D-flawless, brilliant-cut diamond, which dropped from an average price of $62,000 in 1980 to an average of $27,000 in 1981. The end result for Botswana was a loss in revenues of $110 million during 1981 compared with that of 1980, and a forecast for 1982 that is bleaker.

The De Beers Co., which controls over 80% of the world's diamond sales, is caught in a binding cash-flow situation. The company's key gem suppliers, of which Botswana is a major contributor, are pressuring De Beers to maximize their purchases of rough gems from them, so that shortfalls in revenues like that experienced by the Botswana Government in 1981 can be avoided. In 1981, De Beers sales dropped 46% to $1.4 billion, and the value of their stockpiles of unsold diamonds doubled to well over $1 billion. This is a tremendous decrease in sales and increase in stocks for that short period of time, and has left De Beers facing its greatest financial strains since the depression years of the 1930's. Influenced by De Beers problems, Debswana, the diamond-controlling company in Botswana, held back almost $150 million worth of marketable diamonds in 1981.

At what could not be a more inopportune time, Debswana is opening up a new operation, the Jwaneng Mine; which is scheduled to begin production early in 1982. Development of this mine began almost 5 years ago, at a time when feasibility studies for new diamond ventures were indicating strong future markets. This will be Botswa-

na's third diamond mine, and biggest producer; promising to double Botswana's diamond production within 2 years of opening. Full-scale production of 400,000 tons of ore per month is due to be achieved by mid-1982, and by early 1983 Botswana should be producing diamonds at twice its output rate of 1981, which equates to well over 9 million carats per year. Because of the current flooded market conditions, it is expected that a considerable portion of the production from the Jwaneng Mine will have to be stockpiled by Debswana in Botswana's capitol city of Gaborone.

During mid-1981, De Beers was forced to set quotas on diamond purchases from its producing countries owing to its own large stockpiles of unsold diamonds.[6] To prevent losing marketing agreements and its marketing monopoly, De Beers is attempting to buy as much of Southern Africa's diamond production as possible. The company's present buying quotas are geared to production statistics and will automatically increase for Botswana as a whole with the opening of the Jwaneng Mine. De Beers would like to see the Botswana Government voluntarily cut back on planned production quotas at the new mine, but understands the Government's concern with unemployment figures and preference to operate at full production.

MINERAL FUELS

Coal.—Botswana contains some of the largest and most economically recoverable coal deposits in Africa. Exploration drilling done over the past several years by Shell Coal Botswana Ltd., Charbonnage de France International Botswana, British Petroleum Botswana Ltd., and AMAX Exploration Inc., has outlined economically recoverable reserves of 3.5 billion tons, with an additional 13 billion tons indicated.[7] Several foreign concerns are showing interest in the exploit and export potential for the coal reserves, much of which is medium-quality steam coal. However, before landlocked Botswana can become an international supplier of this fuel, the difficult question of how to get the coal to an ocean port will have to be resolved. Three different routes, all by rail, are under serious study. The routes are through Zimbabwe to the Mozambique Port of Maputo, through the Republic of South Africa to Richards Bay Port, or westward across the Kalahari Desert to Walvis Bay in Namibia. All three routes have major technical and financial problems, but negotiations are underway with neighboring foreign governments and financial backers alike and most parties concerned feel a viable solution can be found. Another important technical question yet to be answered is where the abundant water supplies needed to wash the coal will come from. The coal is high in ash and sulfur, and water supplies for the coal regions are limited.

At present there is only one active coal operation in Botswana, the Morupule Colliery, which produced over 370,000 tons in 1981. This tonnage was used to fire the power station at Selebi-Phikwe, which at 60 megawatts is the major power supply for Botswana. Owing to the critical need for increased electrical generating capacity, the ever-increasing costs of importing oil, and the potential for coal export, the Government is forging ahead with plans to open a second, much larger mine, near the Morupule Colliery between the towns of Serowe and Palapye. Tentative startup date for the mine is 1984-85. In the short term, the Government hopes to expand the Morupule Colliery to 500,000 tons in 1982.

The Mineral Industry of Brazil

By Travis Q. Lyday[1]

The Brazilian economy declined 3.5% in real terms during 1981, suffering the sharpest setback since figures on national accounts were first compiled in 1947. Brazil's gross domestic product (GDP) in current prices expanded to an estimated $242 billion.[2] As a result of restrictive fiscal and monetary policies adopted late in 1980, which were aimed at reducing the balance-of-payments deficit and controlling inflation, the economy achieved a $1.2 billion trade surplus in 1981, the first such surplus since 1927. The inflation rate, which hit a historic peak of 122% in March, was moderately reduced to 95% on an annualized basis, compared with the 110% rate recorded a year earlier.

In 1981, Brazil attained further progress in lessening its dependence on foreign oil by reducing consumption through price control and rationing, switching some industrial oil users to alternative energy sources, and increasing domestic oil production.

Although Brazil's mining sector, excluding petroleum, produced only about 2% of the total GDP, its share of total exports was about 10%. The inclusion of metals processing and fabrication increases the metal and mining share to about 17% of GDP.

Brazil continued to be an important producer and exporter of iron ore, manganese, beryl, ferroalloys (particularly ferrocolumbium), electronic-grade quartz crystal, and gem stones during 1981.

Government Policies and Programs.—The major policy of the Government concerning the minerals sector during 1981 focused on the development of the large and varied resources of the Carajás mineral province, Pará State, in the south Amazon Basin under the 10-year development plan for the 1981-90 period approved in November 1980. In particular, this plan denotes greater priority to the mining sector than did its predecessor, and if forecast targets are achieved, Brazil was expected to become self-sufficient in a number of mineral commodities by the end of the decade. In addition to having the world's largest high-grade iron ore reserves (18 billion tons averaging 66% iron), Carajás contains substantial reserves of high-grade manganese ore (60 million tons with above 40% manganese) that can be used for the production of ferroalloys, large amounts of copper ore (1 billion tons containing 0.5% to 1% copper), metallurgical-grade bauxite (4.5 billion tons of 40% alumina), and nickel ore (47 million tons of 1.2% to 2.2% nickel), as well as large, but as yet not fully evaluated, deposits of gold, lead, silver, tin, and zinc.

The Grande (Greater) Carajás Development Project, including mineral and agricultural projects, was expected to cost an estimated $61 billion and should provide Brazil with about $15 billion in export earnings per year by 1990.

At the beginning of 1981, the Government announced a major shift in economic policy that would result in the abandonment of directing growth through large-scale projects. Although investments would be channeled into bringing into operation those works that were already well advanced, future funds would be made available only for certain select, and generally small-scale, development projects. Although development of the Grande Carajás program and projects initiated to achieve greater energy self-sufficiency would remain priorities, it was announced that growth would now center on smaller developments that use local raw materials. Moreover, such projects would have to meet stringent requirements

for generating foreign exchange in the shortest time possible.

Although many government agencies and private sector mining companies believe that Brazil has not been adequately explored, recent increases in reserve levels indicate an upswing in exploration activity. Preliminary estimates indicate that $48 to $50 million was spent on exploration in 1981, of which Rio Doce Geológia e Mineração, the Government-owned exploration company and a subsidiary of the Brazilian state mining company Cia. Vale do Rio Doce (CVRD), accounted for $22 million, primarily for projects in the Amazon region.

Mining companies operated under a mining code established in 1967 under Decree Law No. 227, which provides a sound basis for the development of Brazil's mineral wealth. The Departamento Nacional da Produção Mineral (DNPM) (the National Department of Mineral Production) within the Ministry of Mines and Energy was responsible for the implementation of mining policy, enforcement of the mining code, and issuance of exploration and mining licenses. The Government continued to actively promote both domestic and especially private participation in the minerals sector during 1981 through the provision of tax, financial, and customs incentives.

As a result of the war between Iran and Iraq that broke out in late 1980, thus slashing imports of Iranian crude from the top of Brazil's trade list to zero, official policy was set during 1981 to diversify foreign sources as much as possible to avoid a repetition of the economic bind that was generated from relying on only a few sources.

PRODUCTION

Preliminary data indicate that the value of mineral production, including mineral fuels, in 1981 increased 20% in real terms, to $6.5 billion from the 1980 figure of $5.4 billion. The latest available official data reported by DNPM[3] show that the value of mineral output grew by 41% in real terms in 1980 compared with the revised growth figure of 11% in 1979.

During 1980, the latest year for which official data are available, 94% of the value of all metallic mineral production was accounted for by six commodities: iron ore, 55.7%; gold, 14.2%; pyrochlore, 6.7%; bauxite, 6.0%; tin, 5.7%; and manganese, 5.7%. Over 81% of the value of all nonmetallic mineral production was comprised of granite, 28.3%; limestone, 22.1%; phosphate rock, 12.8%; sand, 7.7%; clay, 5.8%; and asbestos, 4.3%. Crude petroleum represented 84.1% of the total fossil fuel value, followed by natural gas, 9.4%, and coal, 6.5%.

Fossil fuels contributed 41.6% of the total value of mineral output in 1980, followed by metallic minerals, 31.6%; nonmetallic minerals, 25.8%; and diamond and gems, 1.0%.

Table 1 provides reported and revised production data for 1977-81. Where reported data were not available for certain minerals in 1981, estimates are given.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Oct. 13, 1982.

[2]In addition to the commodities listed, molybdenite, bismuth, and uranium oxide are produced, but output is not reported and available information is inadequate to make reliable estimates of output levels.

[3]Figure represents sum of (1) crude material sold directly and (2) production of concentrate. Sale of crude material in any given year may exceed production in that year as a result of the sale of stocks of crude material mined but not sold or beneficiated in previous years. Similarly, output of concentrates in any given year may exceed the amount of crude material mined in that year owing to treatment of previously mined but not yet processed ores.

[4]All figures except those for 1978 differ substantially from those appearing in the latest available official Brazilian sources owing to inclusion of estimates for unreported production by small prospectors (garimpeiros). Officially reported figures are as follows: Major mines: 1977—121,047; 1978—128,860; 1979—107,158; 1980—131,500; 1981—not available; garimpeiros: 1977—51,120; 1978—172,038; 1979—36,234; 1980—357,650; 1981—not available.

[5]Includes sponge iron as follows, in thousand metric tons: 1977—358; 1978—270; 1979—324; 1980—275.

[6]Reported figure.

[7]Smelter and/or refined metal.

[8]Includes baddeleyite-caldasite.

[9]Figures represent officially reported output plus official Brazilian estimates of output by nonreporting miners; officially reported output was as follows, in thousands of carats: 1976—76; 1977—65; 1978—86; 1979—83.

[10]Includes the following quantities sold directly without beneficiation, in metric tons: 1976—110; 1977—2,650; 1978—6,051; 1979—5,177; 1980—not available.

[11]Exports.

[12]Less than 1/2 unit.

[13]Listed under dimension stone in previous editions, but only a small part of the 1976 total and none of the output for the other years was dimension stone. Data on output in gravimetric units are not available for 1978 and later years, but output on a volumetric basis was reported as follows, in thousand cubic meters: 1978—37,842; 1979—42,684; 1980—not available.

[14]Apparently includes crude quartz used to produce quartz crystal (listed separately in this table) as well as additional unreported quantities of common quartz.

[15]Produced from a portion of the crude quartzite listed above; crude quartzite processed was as follows, in metric tons: 1976—206,036; 1977—157,531; 1978-80—not available.

TRADE

Despite a trade deficit of $2.8 billion in 1980, a slowing world economy, and an apparent increase in trade protectionism in 1981, Brazil registered an unprecedented $1.2 billion trade surplus during 1981.

Total exports increased almost 16% to $23.3 billion, while imports declined 4% to $22.1 billion. Brazil's imports of oil and other fuels increased in value slightly to $10.9 billion, although the net bill was about $10 billion, considering that Brazil exported some $0.9 billion of petroleum derivatives. The value of oil was the only major category of imports to increase in 1981, and this was entirely due to higher average prices. Iron ore continued to be the major mineral export, accounting for almost 8% of the total value of all exports.

Table 2.—Brazil: Exports and reexports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1979	1980	Destinations, 1980	
			United States	Other (principal)
METALS				
Aluminum:				
Bauxite and concentrate thousand tons	516	2,679	807	Canada 1,518.
Oxides and hydroxides	534	88	--	Uruguay 50; Colombia 20; Japan 15.
Metal including alloys, semimanufactures	4,224	8,033	712	Chile 2,586; Argentina 1,761; West Germany 936.
Antimony metal including alloys, all forms	4	4	--	All to Uruguay.
Beryl: Ore and concentrate	452	500	498	Japan 2.
Chromium:				
Chromite	45,215	--		
Oxides and hydroxides	50	190	--	United Kingdom 138; Finland 50.
Cobalt metal including alloys, all forms	50	4	4	
Columbium and tantalum:				
Ore and concentrate:				
Columbite	25	17	17	
Tantalite	280	411	218	West Germany 105; United Kingdom 80.
Unspecified	23	28	2	West Germany 17; Netherlands 6.
Metal including alloys, all forms:				
Tantalum kilograms	--	4	--	All to Bolivia.
Copper:				
Matte including cement	1,645	1,210	--	West Germany 1,000.
Metal including alloys, all forms	4,763	3,079	695	United Kingdom 672; Uruguay 637.
Gold metal including alloys, unwrought and partly wrought troy ounces	--	1	--	All to Iraq.
Iron and steel:				
Ore and concentrate including roasted pyrite thousand tons	75,588	78,958	2,072	Japan 28,707; West Germany 13,021.
Metal:				
Scrap and waste	--	7	--	All to West Germany.
Pig iron including cast iron	989,343	841,331	90,850	Romania 197,642; Italy 141,900; Argentina 99,320.
Sponge iron, powder, shot	1,097	685	--	Uruguay 170; Argentina 163; Venezuela 78.
Ferroalloys:				
Ferrochrome	48,205	45,921	8,111	Japan 23,500; Canada 9,900.
Ferrocolumbium	12,787	14,566	4,248	Netherlands 3,216; Italy 1,530; Japan 1,154.
Ferromanganese	40,256	37,833	11,400	Venezuela 18,150.
Ferromolybdenum	426	--		
Ferrosilicon	19,642	29,664	17,400	Japan 7,779.
Other	47,993	41,818	12,952	Japan 16,329; Netherlands 7,596.
Steel, primary forms	478,318	284,804	1,394	Greece 104,295; Argentina 75,862; Italy 74,065.
Semimanufactures:				
Bars, rods, angles, shapes, sections	383,685	214,503	37,936	Nigeria 45,368; Iraq 23,574.
Universals, plates, sheets	444,484	743,982	395,033	Argentina 69,172; Italy 55,424; Mexico 40,076.
Hoop and strip	6,020	26,541	36	Argentina 14,062; Mozambique 7,808.
Rails and accessories	4,115	2,903	4	Iraq 2,118.
Wire	24,058	15,521	1,612	Colombia 3,148; Nigeria 1,463; Mozambique 1,329.
Tubes, pipes, fittings	150,480	258,204	75,021	China 52,760; Chile 40,886; Mexico 30,073.
Castings and forgings, rough	887	1,091	51	Liberia 1,000.
Lead:				
Pentoxide	1	--		
Metal including alloys, all forms	247	2,235	--	Republic of South Africa 1,421; Japan 400.
Magnesium: Oxides, hydroxides, peroxides	28	11	--	Argentina 10.
Manganese:				
Ore and concentrate thousand tons	1,187	1,037	--	Norway 153; Japan 143; Czechoslovakia 126.
Oxides	1,822	2,246	1	Argentina 1,495; Colombia 700.
Molybdenum metal including alloys, all forms kilograms	196	148	--	Chile 142.
Nickel metal including alloys, all forms	6	8	5	Uruguay 1.
Platinum-group metals including alloys, unwrought and partly wrought:				
Platinum troy ounces	r6	--		
Paladium do	225	100	--	All to Mexico.
Unspecified do	1,286	--		
Rare earth:				
Oxides kilograms	120,127	400	--	Colombia 200; Italy 200.
Metals including alloys, all forms	4	18	(1)	Argentina 10; Japan 7.
Silicon: Elemental	1,759	6,921	(1)	Japan 4,245; U.S.S.R. 2,000.

See footnotes at end of table.

[1]Less than 1/2 unit.

[2]Value only reported at $8,309,000, of which $3,699,000 was from West Germany, $1,645,000 was from the United States, and $1,163,000 was from the Netherlands.

[3]Value only reported at $67,105,000, of which $35,645,000 was from Mexico, $12,670,000 was from Chile, $11,549,000 was from Peru, and $2,114,000 was from the United States.

[4]Value only reported at $2,000, all from the United States.

COMMODITY REVIEW

Of all the known mineral resources of Brazil, especially those in Amazonia, none is more potentially lucrative now than the minerals of the Serra dos Carajás. The magnitude of Brazil's known reserves in many of its important minerals provides the country with a long-term economic base. Brazilian officials estimated that the Carajás iron ore alone could bring in as much as $700 million per year in foreign exchange earnings. Recent discoveries of large bauxite reserves in the Amazon region have increased Brazil's world ranking to third, after Guinea and Australia. The recently discovered Serra Pelada and Serra dos Andorinhas gold deposits east of Carajás were estimated to contain more than 100 tons of gold.

The major mining projects to date in the Carajás region have been located near commercial waterways or in coastal areas, including the Trombetas bauxite project, Pará State, which has access to the Amazon River; the Alumina do Norte do Brasil S.A. (ALUNORTE) alumina refinery and the Aluminio Brasileiro S.A. (ALBRAS) aluminum smelter, both located in Barcarena, near Belém; and the Alcoa Aluminio do Brasil S.A. refinery and smelter complex near São Luis do Maranhão. The corresponding infrastructure, such as rail and road transportation systems and storage and port facilities, will also aid in opening up the Serra dos Carajás area.

METALS

As a result of increasing exploration activities by Government agencies and private sector companies, DNPM reported substantial increases in the measured reserves of metallic minerals, headed by silver, 2,462%; and followed by gold, 92%; chromium, 45%; and tungsten, 24%.[4] Measured reserve figures published by DNPM are those that are officially approved by the Government on the basis of annual mine reports and final reports on exploration work.

Alumina-Aluminum-Bauxite.—Brazil again was the major producer of primary aluminum in Latin America, producing 256,000 tons. However, this was a decrease of almost 2% from that produced in 1980. Aluminum imports in 1981 decreased 47% from 77,075 tons in 1980.

Brazil was still a modest bauxite producer in 1981 after entering the international market in 1979. DNPM estimated, however, that by 1990 Brazil's production of bauxite would be 17 million tons, of which 15 million tons would be supplied from the northern Amazon region, and the remaining 2 million tons would be from the southeast region. Estimated alumina output for 1990 was 4.35 million tons, with 3.6 million tons being produced in the Amazon region and 750,000 tons from the southeast. Brazil ranks third in world bauxite reserves, behind Guinea and Australia, with 4.5 billion tons, or about 15% of world reserves.

Early in 1981, the Brazilian Government prevented the Aluminum Co. of America (Alcoa) from purchasing the huge bauxite reserves, formerly held by the American industrialist Daniel K. Ludwig, in the Amazon region. Instead, the reserves will be jointly exploited by a group of companies, including Alcoa. Ludwig's reserves, in Parã State, were estimated at about 226 million tons of bauxite.

A major step during 1981 to further advance the development of Brazil's aluminum industry was the creation of Aluminio do Maranhao S.A., a joint venture of Alcoa Aluminio do Brasil S.A. (60%) and two subsidiaries of the Royal Dutch/Shell group, Shell do Brasil S.A. and Billiton BV, to install the Itaqui bauxite refining and aluminum smelting facilities in São Luis, Maranhão State, for the processing of bauxite from the Trombetas River region deposits. The Itaqui production facilities were scheduled to begin operations in 1985, with an annual output of 500,000 tons of alumina and 100,000 tons of primary aluminum. Possible expansion of the facilities was already being considered at yearend, increasing annual production to 3 million tons of alumina and 300,000 tons of aluminum by the end of the decade. Production in excess of domestic demand would be exported.

Brazil's fifth aluminum smelter was expected to come online in early 1982 at Santa Cruz, 40 kilometers southwest of Rio de Janeiro. The 86,000-ton-per-year facility was owned by Valesul Aluminio S.A. (VALESUL), a joint venture of CVRD (53%), Shell do Brasil S.A. (44%), Reynolds Metals Co. (2%), and the State of Rio de Janeiro (1%). The smelter will be fed initially with alumina imported from Guyana and Suriname. The ALUNORTE alumina refinery at Barcarena, Pará State, scheduled for a June 1985 startup to produce 800,000 tons of alumina per year, was subsequently to be the supplier of alumina to both the VALE-

SUL smelter and the ALBRAS smelter, also planned to be onstream in 1985 at Barcarena. CVRD owned 60% of the ALUNORTE alumina refinery and 51% of the ALBRAS aluminum smelter, and Japan's Nippon Amazon Aluminum Co. owned 40% and 49% of the projects, respectively.

Columbium (Niobium).—The pyrochlore deposit at the Araxa carbonatite complex, located 6 kilometers south of the city of Araxa in the State of Minas Gerais, contains the world's largest known reserves of columbium minerals, representing more than 70% of the world's economically extractable reserves. Total reserves consist of 460 million tons of ore containing 2.5% Cb_2O_5, of which 131 million tons are in the measured category.

The mine, operated by Cia. Brasileira de Metalurgia e Mineração (CBMM), has been producing since the early 1960's and for the last 15 years has supplied more than 60% of the Western world's columbium consumption. CBMM is owned by Cia. Metropolitana de Comercio e Participações (52.65%) and Molycorp, Inc., of the United States (47%), with the remaining 0.35% equity held by private Brazilians.

The major part of the columbium produced at Araxa was exported as ferrocolumbium for use in high-strength, low-alloy steels. No pyrochlore concentrates were exported during 1981.

During 1981, CBMM developed a process and constructed a plant to produce especially pure grades of Cb_2O_5 (+99% Cb_2O_5) for optical and electronic applications.

Also during the year, new crushing and concentrating facilities were completed on a site 3.2 kilometers from the open pit mine, with a design capacity of 3,500 tons per day of ore. The rated annual production of the new facilities will be 42,000 tons of pyrochlore concentrates containing 60% Cb_2O_5, or the equivalent of 55 million pounds of contained Cb_2O_5. An expansion, doubling the concentrator capacity to 84,000 tons per year, has been planned, with ore silos, concentrator building, and a second ball mill already completed. In addition, the crushing facilities and all necessary infrastructure have been built for six times the current capacity of the concentrator.

Copper.—A group of Brazilian companies formed a consortium with Corporacion Nacional del Cobre de Chile, the Chilean state copper mining company, for the development of copper deposits in Brazil and Chile. The consortium, named ANDIBRAS, included Tecnica Nacional de Engenharia S.A., Brasil-Invest, Andrade Gutierrez, Caraiba Metais, S.A., and Interbras, the trading subsidiary of Petróleo Brasileiro S.A. (PETROBRAS), the Brazilian state-owned oil company. ANDIBRAS will initially operate on a trial basis for 1 year. Among the first projects planned was a feasibility study of mining the El Abra copper deposit in northern Chile and processing the ore into finished products in Brazil.

Caraiba Metais S.A. brought onstream its new 25,000-ton-per-year underground copper mine at Jaquari in Bahia State. The operation was to be expanded to 75,000 tons per year of copper eventually. The ore, mainly chalcopyrite, was treated at the company-owned concentrator at Camaçari, in Bahia, and subsequently sent to the company's smelter-refining complex, also at Camaçari.

Reportedly, Cia. Brasileira de Cobre S.A. modernized its Camaqua Mine in Rio Grande do Sul to produce 12,000 tons per year of copper concentrate.

Gold.—In the latest available minerals report, DNPM stated 1980 gold output was 489,150 troy ounces, of which 131,500 troy ounces was from mine operations by Morro Velho Mineração S.A. and Mineração Tejucana S.A., with the remainder from many small prospectors (garimpeiros).[5] DNPM noted that the output of the garimpeiros represents only the amount purchased by local agencies of the Federal Government. Bureau of Mines figures in table 1 include estimates for unreported production by the garimpeiros.

In a study published by DNPM, it was reported that the Tapajos region of Pará State contains indicated reserves of ore containing about 29 million troy ounces of gold. The report noted that the deposit is of high grade and suitable for commercial exploitation.

Iron Ore.—Iron ore continued to be the principal mineral mined in Brazil, with an estimated decrease in production of 14% from that of 1980, as well as the principal mineral exported. In 1981, Brazil replaced Australia as the leading iron ore exporting country in the world.

Brazil currently has the largest reserves of iron ore after the Soviet Union in the world; however, after the Carajás region is fully assessed, Brazil may surpass the U.S.S.R. in iron ore reserves. Most of the iron ore deposits of Carajás are located along two flanks of the Serra dos Carajás Range, the Serra Norte and Serra Sul, about 35 kilometers apart. Estimated at 18

billion tons, the iron ore reserves represent the largest concentration of high-grade iron ore, averaging 66% iron, in the world. When smaller lower grade deposits, averaging less than 54% iron, are included, the total iron ore potential of Carajás increases to about 32 billion tons. The Carajás iron ore project was scheduled to come onstream in 1985, with an initial production of 15 million tons per year of ore and to expand to 35 million tons by 1987.

Construction of the single-track, 1.6-meter-gauge, 890-kilometer railway from the minesite, designated N4E, to the new port being built at Ponta da Madeira, on the island of São Luis in Maranhão State, proceeded smoothly during the year. At yearend, most of the right-of-way had been cleared. Ties and rails will be laid at the rate of 2.5 kilometers per day beginning in late 1982. The route follows predominantly flat terrain, which will lower construction costs and eliminate the need for tunnels. The only important bridge will be 2,330 meters in length, passing over the Tocantins River.

Amazonia Mineração S.A., the wholly owned CVRD subsidiary that was charged with implementing the Carajás project, was incorporated into CVRD early in 1981. Thus, the project came under the direct control of CVRD through the establishment of the Superintendencia de Implementação do Projeto Carajás, which reports to the Director of Planning.

The pilot beneficiation plant at the Carajãs minesite became operational in February to characterize the sinter feed and lump ore products, to test the performance of beneficiation equipment, and to train operating personnel.

In addition to the Carajás iron ore reserves, Brazil has substantial reserves of somewhat lower grade iron ore in the Quadrilatero Ferrifero (Iron Quadrangle) region of Minas Gerais State.

In its 1981 annual report, CVRD reported that its total iron ore production decreased 17% to 56.2 million tons, of which 2.1 million tons was iron ore pellets. Exports of iron ore and pellets in 1981 by CVRD generated foreign exchange earnings of $844 million, a gain of 6.6% over that of 1980, with an increase in volume of 3.1%.

Iron and Steel.—Crude steel production in Brazil, Latin America's major producer, declined nearly 14% to 13.2 million tons in 1981. As a result, Brazil dropped to the number 13 producer in the world. Crude steel capacity was estimated at 15.8 million tons, of which the Government-owned sector, held primarily by Siderurgica Brasileira S.A. (SIDERBRAS), had 66%. The private sector, including over 30 firms, had 34% of the capacity.

Of the SIDERBRAS group of nine companies, only three—Usinas Siderúrgicas de Minas Gerais S.A., Cia. Siderúrgica Paulista (COSIPA), and Cia. Siderúrgica Nacional (CSN)—were coke-based works. These three companies had a joint capacity of 9.1 million tons, or 58% of Brazil's capacity. During 1981, 7.1 million tons of crude steel was produced by them, with the remaining 6.1 million tons produced divided about equally between charcoal-fired works and electric furnaces using scrap.

During 1981, the CSN and COSIPA works were being expanded to add 2.7 million tons of capacity. In addition, SIDERBRAS was constructing two new coke-based integrated works, to be operated by Acos de Minas Gerais S.A. and Cia. Siderúrgica de Tubarão, which will add an additional 5.0 million tons of capacity by the end of 1983.

Brazil's pig iron production also declined during 1981, from 13.0 million tons in 1980 to 10.9 million tons in 1981. With an output of 4.2 million tons in 1981, 39% of the country's total, Brazil's charcoal-fired steel sector was the world's largest.

Manganese.—Brazil was one of the top five producers of manganese ore in the world, with production in 1981 estimated at 2.3 million tons, about 8% of world production. The largest producer was Industria e Comercio de Minerios S.A., a joint venture of Cia. Auxiliar de Empresas de Mineração and Bethlehem Steel Corp. of the United States, with mining operations in Serra do Navio in Amapá Territory. Cia. Meridional de Mineração S.A. and Cia. Mineração Urandi S.A. were also small manganese producers in Brazil.

NONMETALS

As of yearend 1980, DNPM reported substantial increases in the measured reserves of diamond, 69%; magnesite, 32%; mica, 31%; limestone, 15%; and talc, 14%.[6]

Asbestos.—The main producer of asbestos fiber in Brazil was S.A. Mineração de Amianto, whose Cana Brava Mine and mill located at Uruacu in Goiás State began limited exports during the year. Although the capacity at Cana Brava is 180,000 tons of crysotile fiber per year, output during 1981 was less than 145,000 tons. Two smaller producers, Sana S.A. Industria e Comercio with a mine and mill in Piauí State

and Cimento Amianto S.A. with a mine and mill in Goiás State, produced less than 2,000 tons each of asbestos in 1981.

Brazil ranked sixth worldwide in the production of asbestos and was the leading producer in Latin America.

Cement.—Cement production in Brazil increased 5% in 1981 to 28.5 million tons. There were 60 cement-producing plants dispersed among the major population centers.

Diamond.—In Brazil, the most important producing state was Minas Gerais, but Bahia State was of particular interest for its black carbonado diamond output. About one-half of Brazil's production was of industrial-grade quality and one-half was gem quality.

The two major mining companies involved were Mineração Brasileria Comercial Ltda. and Mineracão Tejucana S.A. St. Joe Minerals Corp. of the United States was investigating two promising alluvial properties, the Alto Coite and the potentially much larger Araguaia. The major part of Brazil's diamond production was again derived by garimpeiros, however.

Emerald.—Mining was resumed at the Fazenda Belmont placer mine, 18 kilometers from Itabira in Minas Gerais State, at the end of October. The mine was reportedly closed in December 1980 because of theft by miners. As a protective measure during the 10-month hiatus, the deposit was buried under tons of waste.

Belmont Gemas Ltda. was formed to market renewed production, of which an estimated 80% to 90% would be exported.

Potassium.—Construction of the Taquari-Vassouras potash project at Carmopolis in Sergipe State continued during 1981. The mines, scheduled for startup in 1984, will be operated by PETROBRAS Mineração S.A. (PETROMISA), a subsidiary of PETROBRAS. Production, to be achieved in 1987, was designed for 300,000 tons per year of potassium oxide.

PETROMISA continued exploratory drilling for potash during the year in the Amazon Basin southeast of Manaus, Amazonas State.

Brazil currently lacks any domestic production of potash.

MINERAL FUELS

Alcohol Fuel Program.—The Brazilian Government rescheduled its well-advertised alcohol fuel program, which originally was targeted to produce 10.7 billion liters of alcohol by 1985, to reach the 10.7-billion-liter level by 1987. The program, originally budgeted for $5 billion for 1980-84 and now expected to cost $6 billion, has had financing problems associated with developing both industrial and agricultural projects related to the program. To date, the Government has signed contracts for production facilities to provide 8.9 billion liters of alcohol, although there are estimates indicating that only 70% of the needed cane can be made available to meet the production target. However, attractive interest rates and subsidies for cane and alcohol producers appear to have led to a nearly complete industrial package for the desired target.

Brazil continued to increase its efforts to promote the sale of alcohol-fueled cars during 1981 despite the fact that the sale of alcohol-fueled cars declined from 80% of new car sales at the end of 1980 to 10% at yearend 1981, owing to public doubts concerning long-term alcohol supplies.

In 1981, alcohol production was 4.3 billion liters, an increase of 26% over that of 1980.

Coal.—Estimated coal production during 1981 was 5.7 million tons. Although Brazil has made ambitious plans to produce 19.5 million tons by 1985, budgetary and technical restraints have limited the allocation of needed funds.

The Leao I Mine, Brazil's first mechanized mine with one longwall face and located 100 kilometers from Pôrto Alegre in Rio Grande do Sul State, was scheduled to begin production in early 1982. The nearby Leao II Mine, which will provide coal to a 350-megawatt power station on the Jaqui River, was also being developed. Under present plans it will have five longwall faces. Two other major projects underway during 1981 were both located in Rio Grande do Sul State—the development of a 1.5-million-ton open pit mine at Ijuí and the expansion of the Candiota open pit mine from 400,000 tons per year to 2.8 million tons per year by 1983.

Although Rio Grande do Sul State, the southernmost State, contains over 80% of Brazil's estimated 23 billion tons of coal reserves, more coal has been mined in Santa Catarina State, which has most of the remaining reserves. Brazilian coal deposits are almost all of low grade (high sulfur and ash content); thus, Brazil needs to blend its coal with imported coal for use in steel mills.

Natural Gas.—Production of natural gas in 1981 increased 13% over that of 1980 to a new record of 88 million cubic feet. Onshore fields produced 52% and offshore fields

Table 4.—Brazil: Crude oil production by Petróleo Brasileira S.A.

(Thousand 42-gallon barrels)

Area	Production		Share, percent		Change, percent
	1980	1981	1980	1981	
Alagoas	1,183	1,076	r1.7	1.3	-9.0
Bahia	r31,021	28,876	r45.3	35.9	-6.9
Ceará	1,076	2,541	1.6	3.2	+136.2
Espírito Santo	2,848	5,768	r4.2	7.2	+102.5
Rio de Janeiro	10,460	19,687	r15.3	24.5	+88.2

Offshore	r27,335	36,550	r39.9	45.5	+33.7

rRevised.

Source: Annual Report of Petróleo Brasileira S.A., 1981.

produced 48% of gas output. The onshore production was an increase of 5.8% over that of 1980, owing mainly to the contribution from the Espirito Santo and Bahia Fields. Offshore production increased almost 22% over that of 1980, with the most significant increases in the fields off Rio de Janeiro and Ceará States.

At yearend, natural gas reserves increased to 2.129 trillion cubic feet, an improvement of about 15% compared with that of 1980. The increase was derived primarily from the Campos Basin off Rio de Janeiro State but also to a lesser extent from onshore finds in the Upper Amazon region and in Alagoas State.

Petroleum.—As a result of intensified exploration activities, continued efforts to expand domestic production, and progress in energy substitution and conservation measures, Brazil in 1981 further reduced its dependence on foreign energy sources. Brazil's crude oil output increased more than 17% over that of 1980. Production increased from an average of 182,000 barrels per day in 1980 to a record 220,000 barrels per day in 1981, with 46% of the production coming from Continental Shelf fields. In December, a record 260,000 barrels per day was attained.

PETROBRAS continued to give priority to its exploration program in 1981 and was rewarded by increasing recoverable crude oil and natural gas liquids reserves almost 12% to 1.49 billion barrels, after production during the year of 80 million barrels of oil and natural gas liquids. Domestic crude production trimmed oil imports to 41% of supply, from 50% in 1980. Consumption during 1981 averaged 1 million barrels per day, a 9% decrease from the 1980 level.

The exploration effort of PETROBRAS, the state oil monopoly, included 148 wells drilled in 8 land basins as well as 79 wells on the Continental Shelf, including 40 in the Campos Basin off the coast of Rio de Janeiro State. Among the onshore wells, 34 were found to be oil-producing and 8 gas-producing. Of the 79 offshore wells, 17 were found to be oil-producing and 1 gas-producing. Success rates for all exploratory wells were 12.7% onshore and 8.6% offshore. By yearend, Brazilian oil and gas production was from 2,035 wells—2,009 oil and 26 gas.

During 1981, PETROBRAS exploration and development programs accounted for approximately 83% of the company's total investments. The drilling of wells occurred in 13 of the Federal units from Roraima Territory to Santa Catarina State and along the coast from Amapá Territory to Rio de Janeiro State using 81 rigs, 31 of which were offshore.

For the first time, the mark of 1 million meters drilled in 1 year was reached during 1981. Total drilling was 1,063,000 meters, an increase of 31% over that of 1980, of which 525,000 meters were for exploration.

By yearend, PETROBRAS had signed another 22 risk contracts, increasing to 102 the number of contracts signed since 1976 when risk contracts were first introduced. Also, the first commercially viable oilfield in an area operated under a risk contract was discovered during the year. This find occurred in the pioneer well Bahia Submersible, 10 kilometers offshore of Bahia State, operated by the Pectin-Chevron-Union Oil consortium.

During the year, PETROBRAS increased the flexibility of its refineries by starting a program known as "Scraping the Barrel," which called for, among other things, the addition of naphtha hydrodesulfurization, kerosine and diesel units, and sulfur recovery units at its São Jose dos Campos refin-

ery in São Paulo State. The program was intended to allow Brazil's refineries to handle heavier, cheaper crudes.

Shale Oil.—A new method for shale oil retorting was developed that is reportedly simpler and less expensive than the well-known Petrosix process created by PETROBRAS. The Tenenge process, named for the São Paulo-based firm, differs from that of PETROBRAS in that gas is heated indirectly, requires little water or electricity, does not release polluting ash or gases, and costs only $29 per barrel compared with PETROBRAS' $39 per barrel.

PETROBRAS prototype Irati plant for processing oil shale, located in Paraná State and running since 1972, operated about 80% of the year, producing 157,000 barrels of oil and 3,000 tons of sulfur.

Uranium-Nuclear Energy.—During the year, the initial consignment of yellow cake was delivered to Brazil's first nuclear reactor, the 626-megawatt Angra I located near Rio de Janeiro, from the New Osamu Utsumi uranium mine and processing plant, Brazil's first.

The Osamu Utsumi Mine is located in the Poços de Caldas alkaline ring complex in Minas Gerais State. Extractable reserves of U_3O_8 have been estimated at 21,000 tons. Mine production will be 2,500 tons per day of ore, matching the design throughput of the adjacent plant, but there are already plans to raise capacity of both mine and plant to 5,000 tons per day of ore.

Work continued on the 1,245-megawatt Angra II nuclear reactor, located on the same site at Angra do Reis, which was scheduled for completion in 1987. A third reactor, Angra III, is planned to eventually be constructed on this site for the combined generation of about 3,000 megawatts. Two plants are scheduled for São Paulo State, and plans have been made to have completed at least eight nuclear reactors, each having a 1,250-megawatt capacity, by the end of the century.

Since its formation in 1974, Empresas Nucleares Brasileiras S.A., the state-owned company controlling Brazil's nuclear program, including exploration and mining, has increased total reserves of uranium from 11,000 tons to more than 235,000 tons of yellow cake. As a result, Brazil now ranks at least fifth in terms of world reserves and possibly fourth. Seven major deposits are now known, with the more significant ones located in the States of Ceará and Bahia in northern Brazil. In Ceará, promising deposits have been located at Itataia, where the uranium is associated with phosphate and occurs in collaphanite. Reportedly, reserves of U_3O_8 are in excess of 122,000 tons, and a pilot plant could be in operation by 1984 or 1985. Another promising deposit is located at Logoa Real in southern Bahia, where the uranium occurs in uraninite. Reserves were estimated to be about 27,000 tons, and an underground operation, producing 1,000 to 2,000 tons of U_3O_8, was under consideration for possible startup by 1986 or 1987.

The Mineral Industry of Bulgaria

By Tatiana Karpinsky[1]

In 1981, Bulgaria's national economy continued to develop at a steady rate. According to Bulgarian sources, national income increased 7.2% and reached 22 billion leva (L) in current prices.[2] Most of this increase was attributed to a rise in labor productivity. The fixed capital in the national economy was L82.7 billion. Investment in the economy reached L6.7 billion. Bulgaria's industrial output in 1981 increased in comparison with that of 1980 by 5.6%.[3] Base metal production provided some 6% of Bulgaria's industrial output.

In 1981, with Soviet assistance, 20 projects and separate installations were put into operation. The most important were as follows: The Elatsite ore-dressing complex, one of Bulgaria's largest nonferrous metal projects for increasing copper production; a fourth power block, with a capacity of 210 megawatts, installed at the Maritsa-East III thermal power station, which increased total capacity to 840 megawatts; a plant for producing sulfuric acid at the Damyanov copper-smelting factory in Srednegorie, as well as a number of workshops at metallurgical complexes in Kremikovtsi and Pernik. Complete equipment was supplied for expanding the Kozloduy atomic powerplant from 880 to 1,760 megawatts; and equipment for the Assarel copper-dressing complex and Zdravets coal mine was also delivered.

Government Policies and Programs.—In December 1981, the National Assembly approved the plan for Bulgaria's economic development in 1982. The targets set for 1982 appeared to be scaled down from those of 1981. As compared with that of 1981, the plan provided for a 3.6% increase in national income, a 3.5% increase in labor productivity, and a 4.5% increase in the volume of industrial output. The volume of capital investment was to be L7.2 billion. A large part of the capital investment was for renovation and modernization of existing plants. Foreign trade was scheduled to increase by 4% compared with that of 1981.

By the end of the century, 23 beneficiation plants were to be in operation for ferrous and nonferrous metal ores. These are to include nine for lead-zinc ore, eight for copper and copper-pyrite ore, one for tungsten ore, one for placer gold, one for copper slag, two for iron ore, and one for manganese ore.[4]

PRODUCTION

Bulgaria's plan for overall industrial output was reportedly fulfilled. However, the plan's goals were not met in the production of pig iron, ingot steel, alloy steel, mineral fertilizers, calcinated soda, and coal.

In 1981, in comparison with that of 1980, generation of electric energy increased by 6.8%, and ferrous metallurgy, by 6.4%, but the planned increase for ferrous metallurgy was 10.1%. Chemical industry increased by 11%, and metal processing, by 6.6%.

In 1981, an extensive program for the development of the iron and steel industry was underway. In addition, prospecting was intensified, and promising deposits of iron ore, manganese, copper, lead, and zinc were to be developed during 1981-85.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Sept. 21, 1982.

[2]In addition to the commodities listed, bismuth, chromite, gold, palladium, platinum, tellurium, uranium, barite, fluorspar, magnesite, and a variety of crude construction materials (common clays, sand and gravel, dimension stone, and crushed stone) are produced, but available information is inadequate to make reliable estimates of output levels.

TRADE

Bulgaria's foreign trade in 1981 reached L19.8 billion, a 15% increase over that of 1980. Exports increased by 10.5%, while imports rose by 19.7%. The centrally planned economy countries accounted for 72% of the total; the Soviet Union's share amounted to 52%. The trade with the U.S.S.R. rose by 11.2%.

In 1981, imports of machinery and equipment accounted for about 34% of the total value of Bulgaria's imports; fuels, minerals, and metals accounted for about 44%; chemical products, 4%; and building materials, about 1%.

Exports of machinery and equipment comprised about 46% of the value of total exports in 1981; fuels, minerals, and metals, about 15%; chemical products, 4%; and building materials, about 2%.

In 1981, value of imports of fuels, minerals, and metals increased by 24% over that of 1980. The increase by volume in imports was as follows: bituminous coal, 3.9%; pig iron, 5.1%; and iron ore, 2%. The import of coke decreased 9%, and steel, 10%.

The U.S.S.R. and Bulgaria signed an agreement on trade for 1982. The Soviet Union was to supply Bulgaria with iron ore, ferrous and nonferrous metals, natural gas, crude oil, petroleum products, coal, and electrical energy, approximately in the same amounts as in 1981.

Table 2.—Bulgaria: Apparent exports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1979	1980[p]	Destinations, 1980	
			United States	Other (principal)
METALS				
Aluminum:				
Ore and concentrate -- value, thousands	--	$8	--	All to Uruguay.
Oxides and hydroxides	165	NA		
Metal including alloys:				
Scrap	384	604	--	West Germany 304; Italy 217; Austria 83.
Unwrought	5,066	4,817	--	Japan 4,066; Austria 534.
Semimanufactures	12	606	--	Poland 304; West Germany 211.
Bismuth metal including alloys, all forms	23	NA		
Cadmium metal including alloys, all forms	65	52	--	West Germany 40; Czechoslovakia 12.
Copper:				
Matte	--	17	--	All to Turkey.
Sulfate[2]	30	--		
Metal including alloys:				
Scrap	836	646	--	West Germany 327; France 160; Turkey 139.
Unwrought	1,201	1,969	--	Italy 848; West Germany 679; Turkey 204.
Semimanufactures	408	526	--	Morocco 311; Turkey 135; Italy 79.
Iron and steel:				
Ore and concentrate	--	4	--	All to West Germany.
Metal:				
Scrap	[3]130,000	[3]155,000	--	Italy 99,787; Austria 18,861; Yugoslavia 17,443.
Pig iron, cast iron, powder, shot	[4]12,300	[4]34,400	--	Poland 7,782; undetermined 25,361.
Ferroalloys	[3]22,000	[3]23,000	--	West Germany 4,704; undetermined 14,059.
Steel, primary forms	605,343	387,508	--	Italy 82,716; Belgium-Luxembourg 67,078; West Germany 38,748.
Semimanufactures:				
Bars, rods, angles, shapes, sections	[3]189,000	[3]155,000	--	Egypt 79,049; Poland 27,628; Thailand 11,001.
Universals, plates, sheets	[3]430,000	[3]545,000	--	West Germany 94,297;[2] Romania 53,306;[2] Poland 34,301.[2]
Hoop and strip	12,935	[5]22,287	--	Greece 15,512; France 2,945; United Kingdom 2,630.
Rails and accessories	440	51	--	All to Italy.
Wire[3]	32,000	30,000	--	NA.
Tubes, pipes, fittings	[4]69,600	[4]65,000	--	Poland 13,344; Italy 3,999; undetermined 43,354.
Castings and forgings, rough	11,926	1,143	--	Poland 1,071; Saudi Arabia 32.
Lead:				
Ore and concentrate	[6]6,000	NA		
Oxides	2,678	1,810	--	Yugoslavia 611; Egypt 548; West Germany 299.
Metal including alloys:				
Scrap	33	NA		
Unwrought	10,852	7,882	--	Yugoslavia 3,826; Greece 2,423; Italy 1,239.
Semimanufactures	--	7	--	All to Saudi Arabia.

See footnotes at end of table.

Table 2.—Bulgaria: Apparent exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980[p]	Destinations, 1980	
			United States	Other (principal)
METALS —Continued				
Manganese ore and concentrate	[4]5,600	[4]5,600	--	Mainly to Czechoslovakia.
Molybdenum ore and concentrate	54	NA		
Nickel metal including alloys:				
Scrap	26	22	--	West Germany 20.
Unwrought	150	NA		
Semimanufactures	([7])	NA		
Platinum-group metal including alloys, unwrought and partly wrought value, thousands	$96	$1	--	All to Austria.
Silver:				
Waste and sweepings[8] do	$1,529	$4	--	All to Switzerland.
Metal including alloys, unwrought and partly wrought do	$4,595	$3,055	--	Switzerland $2,211; West Germany $538; Netherlands $273.
Tin metal including alloys:				
Scrap	4	NA		
Unwrought	1	NA		
Zinc:				
Oxides	15	NA		
Metal including alloys:				
Scrap	29	18	--	All to Greece.
Unwrought	13,216	10,388	--	Czechoslovakia 5,000; Yugoslavia 1,642; France 1,495.
Semimanufactures	102	NA		
Other metals:				
Ash and residues, nonferrous	136	13	--	All to Switzerland.
Oxides and hydroxides	24	17	--	West Germany 7; Netherlands 5; United Kingdom 5.
Metalloids	37	32	--	All to West Germany.
Base metal including alloys, all forms	7	14	--	Belgium-Luxembourg 8; Switzerland 2; United Kingdom 2.
NONMETALS				
Boron materials, crude, natural borates	2,660	NA		
Cement[2]	454,500	444,200	--	Switzerland 172,800; Libya 36,600; Yugoslavia 12,300.
Clays and clay products:				
Crude:				
Kaolin	7,531	5,625	--	Poland 4,500; Hungary 1,024.
Unspecified	6,041	5,568	--	Greece 4,006; Italy 1,050; Tunisia 512.
Products:				
Nonrefractory	[r]3,404	[9]2,528	--	Yugoslavia 1,220; Saudi Arabia 728; Finland 468.
Refractory	[r]318	21	--	Italy 20.
Diamond:				
Gem, not set or strung value, thousands	$284	$153	--	All to United Kingdom.
Industrial do	$2,005	$3,950	--	United Kingdom $2,132; Belgium-Luxembourg $1,818.
Fertilizer materials:				
Crude, nitrogenous[2]	7,412	6,644	--	U.S.S.R. 2,000; Czechoslovakia 992; Spain 922.
Manufactured:				
Nitrogenous[2]	572,223	622,824	--	Syria 68,788; Egypt 63,999; Vietnam 59,948.
Phosphatic	18,402	6,025	--	Egypt 6,005.
Potassic	506	NA		
Other including mixed	79	853	--	All to Italy.
Gypsum and plasters	24	NA		
Lime	15,165	5,111	--	All to Hungary.
Mica, crude including splittings and waste	--	10	--	All to Turkey.
Pigments, mineral: Iron oxides and hydroxides, processed	--	61	--	Italy 60.
Precious and semiprecious stones:				
Natural value, thousands	--	$60	--	Italy $30; West Germany $26.
Synthetic do	--	$16	--	All to West Germany.
Sodium and potassium compounds:				
Caustic potash	135	NA		
Caustic soda	[4]2,100	[4]47,200	--	Greece 17,623; Yugoslavia 10,193; France 3,528.
Soda ash[2] thousand tons	1,125	1,116	--	U.S.S.R. 460; Hungary 99; West Germany 75.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	1,654	8,775	--	Italy 4,922; Poland 2,280; Spain 657.
Worked	14,370	[10]5,954	--	West Germany 4,030; Saudi Arabia 1,526; Italy 275.
Gravel and crushed rock	3,961	3,045	--	Hungary 2,936.
Limestone excluding dimension	600	NA		
Quartz and quartzite	2	NA		

See footnotes at end of table.

Table 2.—Bulgaria: Apparent exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980[p]	Destinations, 1980	
			United States	Other (principal)
NONMETALS —Continued				
Stone, sand and gravel —Continued				
Sand excluding metal-bearing	[r]4,447	10,411	--	All to Greece.
Sulfur and sulfuric acid[2]	2,284	50	--	All to Romania.
Other nonmetals:				
Crude	9,249	10,872	--	Hungary 9,782; West Germany 1,030.
Slag and dross, not metal-bearing	23	NA		
Halogens	4,978	NA		
MINERAL FUELS AND RELATED MATERIALS				
Carbon black	15	54	--	Italy 50.
Coal and briquets:				
Anthracite and bituminous coal	[4]13,600	74	--	All to Italy.
Lignite including briquets	102	20	--	Do.
Coke and semicoke	39	NA		
Peat including briquets	35	93	3	Greece 90.
Petroleum refinery products:				
Gasoline thousand 42-gallon barrels	698	[11]495	--	Netherlands 252; Portugal 243.
Kerosine and jet fuel do.	322	44	--	Italy 17; Hungary 14; Spain 7.
Distillate fuel oil do.	1,519	3,168	--	Turkey 2,494; Italy 364; Greece 188.
Residual fuel oil do.	5,260	6,147	--	Italy 3,913; Turkey 733; Yugoslavia 713.
Lubricants do.	199	346	--	Yugoslavia 144; Austria 140; Finland 57.
Other:				
Liquefied petroleum gas do.	398	475	--	Yugoslavia 412; Italy 57.
Mineral jelly and wax do.	23	25	--	Italy 18; Turkey 4; Yugoslavia 2.
Nonlubricating oils do.	305	NA		
Bitumen and other residues do.	36	NA		
Unspecified do.	181	153	--	All to Poland.
Mineral tar and other coal-, petroleum-, and gas-derived crude chemicals	3,888	6,963	--	Yugoslavia 2,323; Spain 1,360; Austria 1,044.

[p]Preliminary. [r]Revised. NA Not available.

[1]Owing to a lack of official data published by Bulgaria, this table should not be taken as a complete presentation of this country's mineral exports. Unless otherwise specified, these data have been compiled from various sources, which include United Nations information, data published by the partner trade countries, and partial trade statistics of Bulgaria.

[2]Official trade statistics of Bulgaria.

[3]Quarterly Bulletin of Steel Statistics for Europe, United Nations, New York.

[4]Statistical Yearbook of Members of the Council for Mutual Economic Assistance, Moscow, U.S.S.R.

[5]Excludes imports by Israel valued at $129,000.

[6]Lead and Zinc Statistics, Monthly Bulletin of the International Lead and Zinc Study Group, London, United Kingdom.

[7]Less than 1/2 unit.

[8]May include waste and sweepings of other precious metals.

[9]Excludes imports by Cyprus valued at $70,000.

[10]Excludes imports by Cyprus valued at $37,000.

[11]Excludes imports by Israel valued at $13,853,000.

COMMODITY REVIEW

METALS

Aluminum.—The Shuman Aluminum Combine produced more than 700 types of rolled sections, a large range of pipes from 10 to 100 millimeters in diameter, and metal sheet from 50 to 100 micrometers thick. By 1990, the combine was expected to process over 100,000 tons of aluminum per year. The raw material for the Shuman Combine was supplied by the U.S.S.R. and Yugoslavia. The combine output almost completely met the national demand for aluminum products. A research team from the Niproruda Institute in Bulgaria developed original technology and built equipment for processing slag resulting from aluminum production.

Copper.—In 1981, the plan for the copper industry was fulfilled, and production of copper was slightly greater than that of 1980. Most of the country's copper ore production came from the Medet, Elatsite, and Tsar Arsen open pit mines. The rest, about 10% of the country's copper ore, came from the Chelopech underground mine, the Burgas Mine, and a few other mines. The first stage of the Elatsite complex was completed in 1981, and it included a strip mine with projected capacity of 5 million tons per year of copper ore, a dressing plant, and a 6.5-kilometer tunnel and belt conveyer. The ore was mined in the mountains at an elevation of 1,120 meters and then transported to the ore-dressing plant, located at an 814-meter elevation. The mine was designed with Soviet cooperation; investment reached about L240 million. It was expected that the Elatsite mining complex would produce more than one-half of the national requirement of copper concentrate. The recovery of copper at the Medet beneficiation plant reached 85.22%. The copper concentrates contained 22% copper, and the pyrite concentrates contained 47% to 51% sulfur. The main minerals were chalcopyrite, pyrite, and molybdenite. Electrolytic copper was produced at the Georgi Damyanov plant in Pirdop. Reconstruction and enlargement of the electrolytic copper facilities at the Damyanov plant continued in 1981 and will be one of the major construction projects in 1982.

Bulgaria continued development of the Assarel mining complex. Assarel was a new large copper ore deposit situated at the Sredna Gora Mountain, which in terms of ore available ranked first in the country. The Assarel Mine began operating in 1981. Installations for the complex were designed by Bulgarian and Soviet specialists.

Iron and Steel.—In 1981, the iron and steel industry accounted for 4.4% of the national industrial output. Capitalization exceeded L1.9 billion.

Iron ore was extracted from the Kremikovtsi, Krumovo, and Martinovo deposits. Kremikovtsi remained the principal iron ore center of Bulgaria. Output of iron ore was insufficient to satisfy domestic needs, and 2.3 million tons of iron ore was imported from the U.S.S.R. Indigenous production of iron ore continued to decline.

The Ministry of Metallurgy and Mineral Resources planned to expand geological prospecting for iron ore and for raw materials for ferroalloys and refractories and to open, in 1986, a new iron ore mine near the village of Dryanovo in the Yambol region. It was also planned to begin construction of the mining and processing metallurgical combine in Obrochishte, Tolbukhin region, during the 5-year-plan period 1981-85. Production of pig iron and steel in 1981 was below the 1980 level; however, output of rolled steel increased about 4%.

The Lenin metallurgical complex at Pernik and the Kremikovtsi complex near Sofia continued under renovation in 1981. Additional electric arc furnaces and continuous casting machines at the Lenin plant were scheduled to be completed in 1985. Renovation of the first agglomeration plant at the Kremikovtsi complex was completed, the blooming mill was partially modernized, and new technology was introduced to purify the gases in the production of ferroalloys. A fourth coke battery was expected to be commissioned by 1985. The Kremikovtsi plant supplied some 80% of domestic demand in steel and exported about 30% of its production.

The construction of the country's third metallurgical combine, with a 1-million-ton-per-year capacity, 18 kilometers west of Burgas, started in 1981. The first stage of the combine, a rolling mill with a capacity of 640,000 tons per year, was scheduled to go onstream in 1985.

Lead and Zinc.—The output of lead-zinc ores was concentrated in the Gorubso Fields in the Rhodopes region, in the vicinity of Madan and Rudozem. The principal mining centers of the Gorubso enterprise were Madan, Rudozem, Leki, Madjarovo, and Ustrem. All Bulgarian lead-zinc ores were mined underground at depths of 400 to 500 meters. The main deposits were of the vein

type, and the others were stratified masses or bedded deposits. The complexity of the vein deposits did not permit introduction of advanced technology in the mines; productivity of miners was low, only 4.29 cubic meters per miner per shift and 1.20 cubic meters per underground working per shift. The mining cost was L25.3 per ton, not including concentrator costs.[5]

The development of the Osogovo lead-zinc deposits and construction of an ore concentrator continued in 1981. The recovery of lead at the Rudozem beneficiation plant reached 93.3%, and the recovery of zinc, 84.7%. The lead concentrates contained 70.3% metal, and the zinc concentrates contained 48.9% metal. The typical minerals mined were galena, sphalerite, and anglesite. Lead and zinc concentrates were processed at the Kurdjali and Plovdiv smelters. Recovery of lead at the Plovdiv smelter reached 96%, and at the Kurdjali smelter, 94.8%; recovery of zinc was 94.5% and 86.2%, respectively.

Large investments were made in the mining and metallurgical industry in 1981 to renovate many lead-zinc mines and plants. Lead and zinc metals were processed at the Dimitri Ganew complex of nonferrous metals in Sofia.

NONMETALS

Fluorspar.—Deposits of fluorspar occurred in different parts of Bulgaria. The main deposits were located in central Rodopi.

Domestic fluorspar output came from hydrothermal-metasomatic deposits with a fluorspar content of about 35%. Exploitation of fluorspar yielded concentrates of 40% to 70% CaF_2. The low-grade fluorspar was upgraded by flotation to 85% to 95% CaF_2. Because of limited resources of high-grade fluorspar, plans were to concentrate on low-grade deposits.

Kaolin.—There were large deposits of high-quality kaolin in the northern part of the country. Production of kaolin was concentrated at two mining enterprises Stachanov at Kaolinovo in Kolarovgrad region near Silistra and D. Blagoev at Senovo in the Rasgradsko region. The kaolin deposits were located at depths of about 0.5 to 30 meters with thicknesses of 40 to 50 meters. Kaolin was produced by opencast methods. The mineralization was in the form of kaolin sands, which were mainly composed of quartz and kaolinite. The deposits contained 14% to 22% pure kaolin. It was estimated that total reserves of kaolin in Bulgaria approximate several hundred million tons. More than 10 grades of kaolin were produced to meet the requirements of the ceramics, refractories and porcelain, and paper industries.

Perlite.—Production of crude perlite was carried out at two mines in the southeastern part of the country. Total reserves of perlite were estimated at several million tons. Perlite was processed and used as construction material.

MINERAL FUELS

Coal.—In 1980, coal production fell short of the 5-year plan of 38 million tons by 6.5 million tons. In 1981, the coal mining industry did not achieve the production level of 1980 by 2.3 million tons. The drop was mainly due to the vast scale of reconstruction and renovation of opencast and underground mines. Coal production was to reach 46 million tons in 1985 and 62 million tons in 1990. Deep-mine production was expected to increase from 6.5 million tons in 1980 to 10.6 million tons in 1985. Some L0.688 million was to be invested in the coal industry for the 1980-85 period, mostly for extension and modernization of production capacity already in operation. In 1981, about 80% of all coal mined in Bulgaria was low-calorie lignite with high ash and moisture content. The East Maritsa Basin produced 81% of the lignite; Marbas Basin, 10%; G. Dimitrov, 8%; and Bobov Dol, 1%.[6]

In 1981, about 59% of the brown coal production came from the G. Dimitrov Basin, 30% from Bobov Dol, and 11% from the Balcanbas and Pirin Basins. Bituminous coal was produced in the Balcanbas Basin, and anthracite, in the G. Dimitrov Basin in the Anthracite Mine. The economically recoverable reserves in the East Maritsa Basin were estimated at 3 billion tons. About 80% of the lignite production was used for electric power production. Planned investments at East Maritsa included the construction of a fourth powerplant and expansion of existing powerplants. Electric power capacity was planned to increase from 1,730 megawatts in 1981 to 3,360 megawatts in 1990. Plans also called for wider application of new technology for firing wet lignite, which has been used only in the Maritsa-East III plant.

Recently deposits of high-grade coal were discovered in the Dobrudja region, northeastern Bulgaria, but the seams were at depths of 1,300 to 2,000 meters under layers

of water-bearing limestone. Deposits were estimated to contain 1.2 billion tons of hard coal with a calorific value of 7,000 kilocalories. About 30% to 40% of the Dobrudja coal was estimated to be coking coal. Mining of the Dobrudja coal was scheduled to start in 1990, and production was expected to reach about 3 million tons per year in the 1990's. Cost of the development was estimated at approximately $850 million, of which about $500 million would be required from abroad.

Natural Gas.—Bulgaria relied principally on gas imports from the U.S.S.R. The domestic output, which was small, was utilized for the gas-producing area's own requirement. Bulgaria expected to increase gas imports from the Soviet Union from about 200 billion cubic feet in 1980 to 350 billion cubic feet in 1985. In 1981, work continued on the southern branch of the main U.S.S.R.-Bulgaria gasline crossing the Balkan Range near the town of Karnobat, running towards Plovidiv. It was expected to reach Sofia, where it will join the northern branch by the end of 1985.

Petroleum.—Bulgaria's production of crude oil was negligible. Petroleum supplies came mainly from the U.S.S.R. Indigenous production of crude oil was concentrated at five oil deposits in northern Bulgaria. The country hoped to develop oil and gas deposits in the Black Sea. Exploratory drilling was proceeding with Soviet assistance, but no results were published. An agreement for cooperation in petroleum development, signed with Occidental Petroleum Co. of the United States in 1980, was languishing, but the Bulgarians were purchasing modest amounts of oil-drilling and seismic equipment. Bulgaria also signed an agreement with Romania on cooperation up to 1985 for prospecting and development of oil- and gasfields on the continental shelf of the Black Sea.

The capacity of Bulgaria's three refineries, at Burgas, Pleven, and Russe, was reported to be about 110 million barrels per year. In 1981, the catalytic cracking plant at the Burgas Petrochemical Combine was completed, and trial operations were in progress. Production of high-octane gasoline, diesel fuel, and other derivatives was expected to increase by several thousand tons.

The refinery had a total annual capacity of about 95 million barrels of crude oil; almost all oil for the refinery was received from the Soviet Union via the Druzhba port, which accommodated tankers up to 75,000 tons. Soviet deliveries of crude oil were expected to remain at a steady level for the near future.

The Mineral Industry of Burma

By Gordon L. Kinney[1]

Burma's most important mineral production during 1981 was crude oil and natural gas. Production was sufficient for Burma to maintain petroleum self-sufficiency albeit at the cost of some consumer shortages. In addition to the mineral fuels, Burma also produced economically important amounts of lead, zinc, tin, tungsten, silver, barite, and precious stones. Nineteen other minerals were produced commercially, mostly for domestic consumption.

Prior to World War II, Burma was an important supplier of metals and ores to the world economy. Subsequently, Burma's mineral sector underwent a decline which was only arrested in the last 5 years. Since 1975, Burma's Ministry of Mines has successfully stimulated a major recovery of the mining sector through new investments and rehabilitation of old facilities. Significant loans from bilateral and multilateral sources have been the chief catalysts in the process.[2]

The Burmese plan for fiscal year (FY) 1980-81[3] called for an allocation of $107 million[4] in the mining sector. According to provisional data, however, $161 million was actually spent during the year, exceeding the original allotment by $54 million. The reason for the excess was an increase in expenditure for oil exploration and development, the Monywa copper project, the direct-reduction iron project, and the new Metallurgical Research and Development Center (Ela) of the Department of Geological Survey and Mineral Exploration. The mining expenditure accounted for 15.8% of total public investment in FY 1980-81.[5] The FY 1981-82 plan allocated 14% of capital investment for the mining industry.

In spite of these very significant investments, the Ministry of Mines was unable to maintain the momentum of the general recovery in FY 1980-81. As a result, the overall production results were mixed. Some of the major mining operations still suffer from inefficiency and energy shortages, particularly since the last quarter of 1980. Some of the mining sector renovation projects were slow to come online and delayed expected production increases.

The mining sector employed about 69,000 persons, or 0.5% of the active labor force in 1981. Less than 3% of the total mining work force were employed in private or cooperatively owned mines. The remaining 97% worked in the state-owned mining companies. Mining accounted for just over 2% of the net output of goods and services.

The general policy of the Government in regard to the mining industry was that all the economically important mining operations would be owned and operated by the state. Foreign equity investment was not allowed. However, foreign help was accepted on new projects wherever the technology was needed and funding was available. The mining industry had the highest FY 1981-82 goal set by the Government of any sector, to increase production by 31%. The goal could be reached if sufficient petroleum supplies were available during the period.

Over the past 5 years, Burma has enjoyed a modest economic boom and reversed a previous long period of decline. Growth, as measured in gross domestic product (GDP), has averaged 6.5% in the last 5 years and in FY 1980-81 reached 8.3%, the highest since Burma became independent in 1947. In constant 1970 prices, GDP was $2.91 billion in FY 1978-79, $3.07 billion in FY 1979-80, and $3.32 billion in FY 1980-81. In current prices, GDP was $5.62 billion in FY 1980-81.

Inflation has declined to less than 5% in

recent years, providing a measure of stability not seen since 1962. In the unofficial market, however, the inflation rate is higher than 5%. Per capita income has risen 30% in constant-dollar terms to $170 over the last 4 years.

The Government was predicting a modest growth rate of 5.7% for FY 1981-82. Long-term growth will depend on political stability and the flexibility of Burmese economic planners in the face of changing world conditions.

The Government announced the opening of Burma's first metallurgical research and development laboratory after a 20-month construction period. The laboratory is in Ela, 325 kilometers north of Rangoon. The laboratory will be able to do complete mineral analyses and will also help in the training of metallurgists, chemists, and geologists. The Japanese International Cooperation Agency financed the $8.4 million project.

The electric power sector was a key factor in the economic growth of the country. Burmese planners have programed a steady increase in capacity since 1975 and have built a power system composed of a diversified group of generating facilities. The 1981 plants of the state-owned Electric Power Corp. (EPC) were distributed by type and capacity as follows: Hydroelectric plants, 168,000 kilowatts; thermal powerplants, 74,000 kilowatts; gas-turbine plants, 177,000 kilowatts; and diesel plants, 82,000 kilowatts. Burma has by far the highest proportion of gas-turbine-powered capacity of any of the Southeastern Asian countries. In addition to the EPC capacity, other Burmese organizations had a captive generating capacity totaling 218,000 kilowatts in 1981. The total installed capacity of 719,000 kilowatts was a 19% increase over the 1980 capacity.[6] Over 1.2 billion kilowatt-hours of power was generated in FY 1980-81, or 12% more than in FY 1979-80. Much of the transmission system is old and in poor repair, and 27% of the overall power generated was lost in transmission and distribution.

The EPC was striving to lower this excessively high loss factor by renovation and improvement of the distribution network. Capital investment in the power sector in FY 1980-81 was $74 million, or 7.2% of total public investment. The Government plan called for a 20.5% growth in the power sector for FY 1981-82. A number of projects were underway that will contribute to an increase in both the amount of electric power produced and the reliability of the power supply. The continued aggressive growth of the power sector will contribute to the mining industry by making a reliable electric power source available where and when it is needed.

The No. 4 Mining Corp. was abolished in a reorganization of the Government-owned mining companies. The No. 1 Mining Corp. was unchanged and controlled the lead, zinc, silver, and copper output. The No. 2 Mining Corp. picked up the responsibility for the antimony mines and retained control of the tin and tungsten operations. The No. 3 Mining Corp. retained the coal mines and the steel plant and assumed control of the industrial minerals, including limestone, gypsum, and barite. The Government's Myanma Gem Corp. operates independently.

PRODUCTION

In FY 1980-81, the mining sector produced 84% of the Government's planned output. The value of the output of the mineral sector rose for the fifth consecutive year, according to one Burmese Government source.[7] In current prices, the value of nonfuel minerals totaled about $115 million in FY 1979-80 and $120 million in FY 1980-81. In addition, the value of natural gas production in FY 1980-81 was estimated at over $40 million, and crude oil production would be valued at more than $340 million at world market prices. Technical problems at the oilfields restricted production of crude oil in the last quarter of FY 1980-81.

The Government planned a 31% increase in mineral production for 1982. This goal should be relatively easy to achieve considering that the iron pellet plant was completed late in 1981, the Monywa copper project was scheduled to start up in early 1982, and several other mineral projects were to start operating during the year. The main constraint would be if the problems in the petroleum industry were not resolved and fuel shortages restricted the normal operation of the mining sector.[8]

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through June 30, 1982.

[2]In addition to the commodities listed, pottery clay, common sand, glass sand, other varieties of crude construction stone, and other varieties of gem stones are produced, but available information is inadequate to make reliable estimates of output levels.

[3]Data are for fiscal years beginning Apr. 1 of that stated.

[4]Includes fire clay powder.

[5]Data exclude products used as fuel in refineries.

TRADE

Total foreign trade has had a dramatic increase in recent years. Exports have improved substantially, and total trade has gone from $400 million in FY 1975-76 to $1,200 million in FY 1980-81 and should reach $1,500 million in FY 1981-82. This would be the first time that trade exceeded in constant-dollar value the levels attained before the Socialist government assumed power in 1962.

The main reason for the improvement has been a large input of foreign capital in the form of concessional loans. These loans have enabled Burma to purchase necessary capital equipment and spare parts to rehabilitate old industries and to create new production capabilities.

In 1979-80, Burma's annual balance of trade was in deficit about $250 million, and a similar deficit was forecast for 1981. The large amounts of loan and grant aid helped offset Burma's trade deficits and provided small net surpluses in overall balance of payments in FY 1979-80 ($67 million) and in FY 1980-81 ($49 million).[9]

According to provisional data, 17% of total exports were minerals and gems, while 23% of imports were classed as raw materials in FY 1979-80. Burma's mineral exports (excluding petroleum products) exceeded $52 million in FY 1980-81 compared with $38 million in the year before. The increases were a result of better world market prices and also expanded sales of silver, lead, copper matte, and zinc and tungsten concentrates.

COMMODITY REVIEW

METALS

Copper.—Burma's plans for greatly increasing its copper production appeared to be going well during 1981. Construction activity at the Government-owned Monywa copper project was reportedly ahead of schedule, and production from the mines and concentrator could begin in early 1982. Currently about 100 tons of copper-in-concentrate is believed to be produced as byproduct from the Bawdwin lead mine each year.

RTB Bor of Yugoslavia is providing the design and technology for the mines and copper concentrator. It will also provide operating assistance in the early startup stages. The Kyesintaung and Sabetaung ore bodies are being developed just west of the Chindwin River, opposite the railhead town of Monywa. Overburden removal at the open pits was well underway. Mining and milling capacity was expected to be 12,000 tons per day of chalcocite ore containing 1% to 1.5% copper. Earlier plans had called for a capacity of 8,000 tons per day. Proved reserves are reported to total 250 million tons.

The No. 1 Mining Corp. of Burma was studying the possibility of constructing a flash smelter for production of blister copper or copper cathodes. Estimated cost would be $30 million, and the output would be for export.

Iron and Steel.—In October 1981, the Danieli Co. of Italy completed a 20,000-ton-per-year-capacity Kinglor Metor direct-reduction steel plant. The plant is located in northern Burma at Anisakan in Maymyo Township and is the first commercial application of this noncoking-coal and natural gas-based direct-reduction process outside Italy. A nearby iron ore mine with a small reserve of good ore will supply the plant. Coal, limestone, and natural gas will also be supplied from domestic sources. A 15- to 17-ton-capacity electric arc furnace was apparently still under construction at yearend.

In November 1981, Burma reportedly signed a contract with Danieli for a second direct-reduction stage, doubling the plant's capacity to 40,000 tons per year. In addition, an outdated steelmaking plant will be replaced. The second stage will incorporate a two-strand continuous-casting line for billet production. The completed plant will have a capacity of 25,000 tons per year of reinforcing rods and will supply most of Burma's needs for pig iron.

Lead, Zinc, and Silver.—The Bawdwin mining complex at Namtu in northern Shan State is Burma's only source of lead and zinc ore and refined silver. In FY 1980-81, the mine produced about 250,000 tons of ore assaying 4% zinc, 5% lead, and about 4 ounces of silver per ton of ore. In recent years, the refining capacity of the smelter at Namtu has dropped significantly, lowering the overall productivity of the Bawdwin complex. A new refinery was completed early in the year, and opening ceremonies were conducted by the Minister of Mines on

April 2, 1981.

According to No. 1 Mining Corp. officials, the new plant will handle 500 tons of ore per day and produce 3,000 tons of zinc concentrate, 2,300 tons of refined lead, and 160,000 ounces of silver annually. The Ministry of Mines financed the new facility through a loan from the Federal Republic of Germany. It took 3 years to complete and replace the old smelter, which was built at the turn of the century.

The No. 1 Mining Corp. still had plans to change the underground mine to an open pit operation. The high-grade ore zones have been worked out, but there is still a considerable tonnage of lower grade ore that is readily minable by open pit methods. Conversion to open pit mining would allow an increase of about 60,000 tons per year of ore production.

Tin and Tungsten.—The No. 2 Mining Corp. under Burma's Ministry of Mines took delivery of its new offshore tin dredge Heinze. The dredge was constructed by Far East Livingston Co. of Singapore. Design problems were encountered, and the dredge required extensive alterations. It presumably operated along the Tenasserim coast in southern Burma at least during the last of the fair weather season in 1981.

The Burmese Government officially reported the completion in FY 1980-81 of the Heinda Mine expansion project under the No. 2 Mining Corp.[10] The mine and equipment were ready for a test run and were expected to have an output of 1,000 tons of tin concentrate per year. The mine is located 35 miles east of Tavoy in southern Burma.

The Heinda fossil placer tin deposit is an unusual, tightly cemented series of coarse to fine conglomerate layers. Each ore layer is about 8-meters thick and grades from very coarse at the base to sand and clay at the top. The cassiterite occurs mostly in the coarse basal material. This causes problems in handling the ore horizon, which contains solid granite boulders up to 2 meters in diameter. The entire deposit requires drilling and blasting, and the bigger boulders require secondary blasting. The distribution of the cassiterite in the ore body is highly uneven, varying from 0.05 to 3.0 kilograms SnO_2 per cubic yard. In addition, there is a very wide range of cassiterite grain sizes evenly distributed from 150 millimeters down to 0.075 millimeter causing further complications in the milling process. Reported recoverable ore reserves were put at about 7,000 tons of contained tin metal at Heinda.

The nearby underground Hermyingyi Mine was being rehabilitated, and a detailed ore reserve estimate was being made by the Department of Geological Survey and Mineral Exploration.

Construction began in 1981 on a small (1,000-ton-per-year) tin smelter in Syriam, a southeast suburb of Rangoon. The work was being done with financial and technical assistance from North Korea. Most of the plant's output will be exported and will provide a considerable increase in foreign exchange earnings to the Burmese Government.

The Department of Geological Survey and Mineral Exploration continued a comprehensive survey of the tin and tungsten resources of southern Burma both onshore and offshore.

The FY 1981-82 plan called for production of 1,750 tons of 65% SnO_2 concentrate and 700 tons of 65% WO_3 concentrate. The plan also called for an output of 700 tons of mixed tin-tungsten concentrates. Statistics for the first 8 months of calendar 1981 showed production was proportioned quite differently from the plan. Tin concentrates totaled just over 400 tons and tungsten concentrates just under 400 tons. The mixed tin-tungsten concentrates, however, came to nearly 1,600 tons by the end of August.

The officially reported tin and tungsten production figures are believed to be far less than the actual tonnage mined in Burma each year. Many of the small mines are operated by tribute miners and are located in remote rugged jungle terrain. Political instability in the mining area and a very low price paid to the miners for the tribute concentrates combine to make smuggling both easy and profitable. Some sources believe the true output to be nearly double the official figures.

NONMETALS

Burma began to develop its nonmetallic minerals after 1962 in an effort to become self-sufficient in a number of key areas and to promote local ceramic and cement industries. With the exception of some specialized clays used in ceramics and barite production, this effort has been highly successful, and over the long term, there have been steady production increases.

Barite.—Burma's barite comes from the Maymyo area in Mandalay Div., where this mineral has been extracted over the past decade. Burma mines barite principally to supply the domestic petroleum sector, but

neither the No. 3 Mining Corp. nor the Myanma Oil Corp. (MOC) operates an efficient barite mud production facility. The Canadian International Development Agency had originally planned to construct such a plant and to upgrade the barite mining operation but dropped the project 2 years ago.

Since that time at least one U.S. firm has expressed interest in building such a facility, but negotiations over the price and Burmese difficulties in moving the ore from northern Burma to Rangoon have stalled the discussion.

Fertilizers.—Burma produces urea fertilizer from natural gas at plants in Pagan and Sale. Consumption, however, has gone up faster than production in recent years, and increasing amounts of expensive nitrogenous fertilizers have had to be imported. The Government authorized construction of additional capacity in order to reduce imports and use more of Burma's abundant natural gas resources. It was reported in September 1981 that Petrochemical Industries Corp. of Rangoon awarded a contract to UHDE GmbH of the Federal Republic of Germany to engineer and procure equipment for an ammonia and urea plant complex to be built at Kyawzwa, near Prome, about 350 kilometers north of Rangoon. Urea production capacity is to be 200,000 tons per year. Scheduled completion is for late 1984.

Other Nonmetals.—Limestone and gypsum are mined for cement production, and roughly 90,000 tons of crude clay is used for brick production each year. A French-financed, 200,000-ton-per-year cement plant was under construction during 1981 at Paan in Karen State about 170 kilometers east of Rangoon. In addition to the new mill, the Burmese Government reported that an extension project at the old Kyangin cement mill was progressing on schedule.[11] The report did not explain if new capacity was being added or if the old plant was being reconditioned.

MINERAL FUELS

Coal.—Burma exploits some small deposits of poor-quality coal. The new steel plant reportedly will use this domestic coal in the direct-reduction process. Production from the Kalewa coal mine, the country's largest, presumably will increase as steel production gets underway.

Natural Gas.—Natural gas use has increased at a substantial rate and will continue to do so as more industries take advantage of its relatively low cost and abundance. Several new gas-turbine electric generators were completed during the year, and three 18,000-kilowatt units are planned for completion in 1982. Natural gas also powers a widening variety of industries. Completion of the direct-reduction steel complex should boost consumption of natural gas even further in 1982. The FY 1981-82 plan called for consumption of over 23 billion cubic feet.

Petroleum.—Burma's oil industry ran into serious production problems at the end of FY 1980-81. Press reports indicated that the Mann Oilfield, the country's largest, was overproduced in an effort to increase output beyond its optimum flow. As a result, gas pressurization was reduced and considerable water was mixed with the oil. Official production figures use wellhead flow which includes the water content. Actual crude oil production may have been 10% less than official data.

The production loss came at a time of increasing demand and caused economic hardships, stalled a number of major development projects, and forced the Government to introduce fuel rationing in Rangoon.

Not only was the domestic economy affected, Burma's reemergence as an oil-exporting nation was upset as the Government was unable to fulfill a 1-million-barrel crude oil export contract with Japan. Export of a heavy semirefined fuel oil from the Chauk refinery was unaffected, however, and deliveries to Japan and North Korea continued.

To avoid problems of paying for expensive foreign oil, Burma has refused to import crude oil or refinery products since 1975. Lubricants and aviation fuel, not produced in the country, were imported in small amounts.

The newly completed 6,000-barrel-per-day extension of the 26,000-barrel-per-day Syriam refinery was closed early in 1981 because of the crude oil shortage.

Construction continued on the much delayed 25,000-barrel-per-day refinery at Mann. The plant, under construction by Mitsubishi Heavy Industries of Japan, was rescheduled for completion in late 1982. It now faces the prospect of insufficient crude oil feed if there is no significant increase in the current production rate.

Not all of the news was bad during the year. According to the Prime Minister, MOC has made three important onshore strikes. Two of the strikes were at Tantabin

and Kyontani villages in the northern Irrawaddy Delta. These discoveries mark the first time petroleum and gas have been found in limestone reservoirs in Burma. Four of nine wells at Tantabin struck oil and gas. The oil is sulfur-free and has a gravity of 48.5° API. One well drilled at Kyontani to a Burmese record depth of 4,100 meters struck a 105-meter-thick limestone horizon with recoverable oil and gas reserves and similar characteristics to the Tantabin structure.

The third strike was at Tuyintaung, 8 kilometers east of Pagan in central Burma. The well struck sulfur-free 30.4° API gravity crude from six oil- and gas-bearing sands between 2,440 and 2,990 meters deep. Considerable evaluation work will be necessary to determine the commercial viability of these discoveries.

After 4 years without drilling offshore, Burma is to resume its search by testing the Gulf of Martaban area. Protracted negotiations between the Government and the Japanese National Oil Corp. (JNOC) have resulted in an agreement to form a joint venture to explore four offshore concession blocks south and east of Rangoon. JNOC and 11 private Japanese companies were to work with MOC under a complicated financing arrangement. The consortium was hoping to begin drilling early in 1982. Twenty offshore wells were drilled in 1975-76 with no commercial oil being found. Some natural gas was found but in a location impractical for exploitation.

The Mineral Industry of Canada[1]

By Harold R. Newman, P.E.[2]

In 1981, the Canadian economy displayed a relatively strong economic growth during the first half of the year but experienced a decline in activity with a drop in real output in the second-half of the year. The gross national product rose by approximately 3% to an estimated $331 billion[3] at current prices. The unemployment rate averaged 7.5% for the year, and the consumer price index rose by 12.5%.

The recession of the national economy was reflected in the economic performance of the Canadian mineral industry. The value of output of the mineral industry decreased by 6% in response to the national and worldwide recession. The industry was undergoing production cutbacks in most of the mineral commodities as a result of the depressed domestic and world demand and falling mineral prices.

The Canadian mining industry has suffered from uncoordinated tax legislation, weak markets, high transportation costs, high costs of labor and production, and trade and tariff barriers for its mineral exports and is now closely observing the emergence of the Canadian Government's National Energy Program (NEP). The publicized goal of NEP was to reduce foreign ownership of Canadian oil. The Canadian mining industry has always been predominantly Canadian owned even though there was major foreign capital investment in some Canadian exploration and development projects. The impact of the NEP on the nonfuel mineral sector was uncertain and Government policy was unclear at yearend. Politics notwithstanding, Canada was certain to maintain its prominent position as a world class mineral-producing country.

Government Policies and Programs.—The Canadian mining industry has faced a complex tax regime. It offered incentives to the industry, but also was not without its pitfalls and shortcomings. There was a three-tier tax structure on mining income. First, the Federal Government levied an income tax on the total profits of a mining company. This income tax, which consisted of a basic tax and a surtax, reflected tax incentives for the mining industry that consisted of a resource allowance of 25% of income, computed before deductions of interest and the writeoff for exploration and development costs; an earned depletion allowance, generally $1 for each $3 spent on exploration and new mine assets; an immediate writeoff of exploration and development costs as incurred, and a 30% or better deduction on equipment costs, computed on a declining balance basis. These rules enabled most new mining operations to recover most of their capital costs for revenue before they started paying any significant Federal income tax.

The second element in the three-tier structure was the provincial income tax that was similar, to the Federal tax, however different approaches were used by the various Provinces.

The third tax element was the provincial mining tax and again different approaches to rates and provisions were used by the various Provinces. Theoretically the mining tax applied only to profits from the extraction of ores.

In summary, the mine operators tax burden was the total amount of these three separate tax elements. The combination of taxes and incentives plus various provincial

policies resulted in a complex tax system.[4]

The Foreign Investment Review Agency (FIRA) was setup in 1974 to screen investment proposals of foreign companies seeking to acquire or establish a Canadian business. Investment proposals are evaluated by FIRA against a "significant benefit" to Canada criterion. This phrase, while not clearly defined, appears to include such concepts as the amount of Canadian research and development expenditures in Canada, export prospects, product innovation, processing of natural resources in Canada and an overall appropriateness to Canadian economic policy objectives. The agreements entered into by foreign firms with FIRA are considered legally enforceable and may be subject to monitoring to ensure compliance. FIRA reviews may take from 60 days to years to complete. The proceedings are not disclosed, and the grounds for disapproval are not usually provided. A large majority of proposals are approved; however, a significant number of delays have occurred.

Firms whose proposals are rejected are invited to resubmit revised proposals that provide greater benefits for Canada. It was announced in 1981 by the Canadian Government that a review of FIRA's administrative procedures was under way to determine what changes and streamlining might be warranted.

The NEP, as announced in October 1980 and subsequently amended in September 1981, consisted of a series of measures that increased the role of the Central Government in energy development and established three specific aims. These aims are at least 50% Canadian ownership of oil and gas production capacity by 1990, Canadian control of a significant number of larger oil and gas firms, and an early increase in the share of the oil and gas sector owned by the Government of Canada. The oil and gas industry voiced strong criticism of NEP in what they maintained were discriminatory features of the tax and incentive proposals, and the specifics of the "Canadianization" objective.

The negative reaction of Canada's oil and gas industry to the Government policy was perhaps exemplified by the number of active drilling rigs departing Canada. In October 1980, prior to the introduction of the NEP, Canada had about 434 rigs, the second largest number of active rigs in the world, the bulk of them Canadian owned. One year later, this number had fallen to 214 rigs.

A 1981 study by Canada's National Energy Board indicated that the NEP's oil self-sufficiency goal by 1990 was unlikely considering the NEP's current formulation. Without modifications that return attractive incentives to the industry, improve Canada's investment image to foreign investment, and make nonconventional fuel development economically viable, the NEP may only promote continued and possible growing dependence by Canada upon world oil markets and impair Canada's ability to meet its oil import reduction targets.

Canadian proponents of NEP disagreed with the above analysis. They maintained that the NEP and the Petroleum Incentives Program (PIP), which qualifies firms and individuals for incentives, with preference to Canadian firms and individuals, would induce Canadian-owned firms to increase exploration on Federal lands. The Canadian Minister of Energy, Mines, and Resources stated in May 1981 that under the PIP, the aftertax cost of $1 spent on exploration of the Canada lands will be $0.07 for a 75% Canadian-owned firm and $0.28 for a totally foreign-owned firm.

In 1981, the Canadian Government and the Province of Alberta entered into an agreement for a two-tier pricing system for petroleum. The basic provisions of the agreement were that the price of old oil, previously discovered, would not exceed 75% of the world price level, and new oil, newly discovered and synthetic, would receive world-level prices. It was felt that this two-tier price system would encourage production and reduce consumption.

PRODUCTION

According to the Canadian Department of Energy, Mines, and Resources, the total value of Canada's mineral production in 1981 reached an alltime high of $33 billion, an increase of almost 4% over the previous year's value. The value of output of mineral fuel commodities increased about $1.1 billion although the volume of petroleum and natural gas declined. Metallic mineral output declined $299 million, or 3.1%. The value of output of nonmetallics and of structural materials increased 11.9% and 10.4%, respectively.

Performance of the nonfuel mineral industries was mixed. Copper output increased in volume marginally, but since copper

prices fell, the value of copper output declined about 14%. Iron ore values in 1981 remained about the same as the previous year. Zinc increased about 12% in output, and 39% in value. Gold output was down 7% in volume, and 28% in value. The platinum-group metals increased 48% in volume and 41% in value. Nickel production declined 16%, while producers operated well below capacity.

Asbestos production declined about 14% in volume and 5% in value. Potash output fell 5.4% in volume, but rose 3% in value. The major structural materials, cement and sand and gravel, increased 8% and 17% in volume and value, respectively.

The value of mineral output increased in 8 of the 10 Provinces and in both Territories. The Province of Alberta alone, with its large oil and gas output, accounted for approximately 53% of Canada's total mineral value in 1981. Production values of the Provinces and Territories follow:

Province or Territory	Value, billion dollars	
	1980	1981
Alberta	14.3	17.6
Ontario	4.0	4.3
British Columbia	2.4	3.0
Quebec	2.1	2.4
Saskatchewan	2.0	2.4
Newfoundland-Labrador	.9	1.2

Unspecified do	7,217	3,711	5,440	5,310	5,270
Refinery fuel and losses do	31,697	33,742	34,491	32,035	31,970
Total do	659,003	664,015	711,827	693,629	686,255

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Aug. 30, 1982.

[2]Sb content of antimonial lead alloys, flue dust, and doré slag estimated on the basis of reported gross production.

[3]Refined metal and bullion from domestic ores plus recoverable Bi content of exported concentrates.

[4]Refined metal from domestic ores plus recoverable Cd content of exported ores and concentrates.

[5]Actual output not reported. Data represent Co content of all products derived from ores of Canadian origin, including nickel oxide sinter shipped to the United Kingdom and nickel-copper-cobalt matte shipped to Norway for further processing.

[6]Actual output not reported. Data represent the output within Canada of metallic cobalt from ores of both Canadian and non-Canadian origin.

[7]Blister copper from domestic ores plus recoverable Cu content of exported matte and concentrates.

[8]Series revised to reflect actual mine production rather than sales, which were reported as production in previous editions. Sales figures, on a gross weight basis, in thousand metric tons, follow: 1976—55,416; 1977—53,621; 1978—42,931; 1979—59,617; 1980—50,866; 1981—49,844.

[9]Includes shipments of ingots from primary plants for rolling elsewhere.

[10]Refined nickel from domestic ores plus Ni content of oxide produced and recoverable Ni content of exported matte.

[11]From all sources, including imports and secondary sources.

[12]Cement shipped and/or used by producers.

[13]Includes bentonite,products from common clay, stoneware clay, fire clay, and other clays.

[14]Crushed, building, ornamental, paving, and similar stone.

[15]Including synthetic crude (from oil shale and/or tar sands).

TRADE

In 1981, Canada exported about 44% of its crude mineral production to more than 90 countries. Export values of crude and fabricated mineral products were estimated at $26.9 million or 32% of Canada's total commodity exports.

For reasons of economics and geographical distribution of the resources, Canada also imported large quantities of minerals. Crude mineral imports were valued at $11.2 billion for 1981. Some of the mineral imports were already being produced in the country; oil, coal, and iron ore were the most important. The mineral fuels accounted for about 79% of all mineral imports. Others included bauxite, alumina, phosphate rock, various metals such as chromium, manganese, tin, and some industrial minerals.

Table 2.—Canada: Exports and reexports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1979[r]	1980	Destinations, 1980	
			United States	Other (principal)

Dimension stone, crude and partly worked	304,732	72,900	70,864	Bermuda 1,152; Japan 406.
Limestone, except dimension thousand tons	2,296	2,215	2,214	St. Pierre-Miquelon 1.
Quartzite	60,823	63,166	63,161	Republic of South Africa 5.
Sand and gravel	325,641	386,437	347,564	Bermuda 25,800; Bahamas 12,766.
Sulfur:				
Crude and refined thousand tons	5,155	6,851	1,435	Republic of South Africa 708; Australia 668; Brazil 1,654.
Sulfuric acid	139,425	323,776	323,762	Bermuda 11.
Talc, steatite, soapstone, pyrophyllite[2]	[6]2,096	3,539	3,539	
Other, crude value, thousands	$45,959	$77,153	$28,418	France $12,142; West Germany $11,476; Belgium-Luxembourg $9,572.
MINERAL FUELS AND RELATED MATERIALS				
Coal, bituminous thousand tons	13,853	14,311	22	Japan 10,450; Brazil 1,607; Republic of Korea 1,131.
Coke and semicoke	228,785	342,276	142,809	Belgium-Luxembourg 52,566; Netherlands 41,557; Venezuela 32,139.
Gas, natural million cubic feet	990,493	810,935	810,935	
Petroleum and refinery products:				
Crude thousand 42-gallon barrels	105,260	78,192	78,192	
Refinery products:				
Gasoline do	5,744	4,444	3,576	Netherlands 275; Madagascar 177; Argentina 165.
Distillate fuel oil do	14,940	13,821	914	Netherlands 4,546; Indonesia 1,549; Singapore 1,416.
Residual fuel oil do	14,993	13,093	11,939	Brazil 614; Netherlands 540.
Lubricants do	39	85	47	Belgium-Luxembourg 12; West Germany 7; Cuba 4.
Other:				
Liquefied petroleum gas do	48,965	40,528	38,085	Japan 2,412; Mexico 30.
Asphalt do	1,035	1,004	980	United Kingdom 10; Ivory Coast 3.
Petroleum coke and pitch coke do	690	831	402	Japan 296; Australia 117; Greece 16.
Mineral tar and other coal-, petroleum-, and gas-derived crude chemicals do	17,364	20,113	19,621	Netherlands 310; France 93; United Kingdom 58.

[r]Revised. NA Not available.
[1]May include relatively minor quantities of certain shapes not normally included among semimanufactures.
[2]Partial figures: Data given are for U.S. imports for consumption only.
[3]Includes some scrap.
[4]Largely, if not all, used in the production of heavy aggregate.
[5]Total excludes quantity valued at $10,551,000 in 1979 and $11,143,000 in 1980.
[6]Total excludes quantity valued at $12,063,000 in 1979.

Table 3.—Canada: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1979	1980	Sources, 1980

METALS				
Aluminum:				
Bauxite thousand tons	2,150	3,504	35	Guinea 1,506; Brazil 1,472.
Alumina	952,583	983,971	276,797	Australia 374,058; Japan 171,494; Jamaica 128,666.
Metal including alloys:				
Scrap	30,681	30,724	30,724	
Unwrought	r29,855	13,961	11,883	United Kingdom 1,436.
Semimanufactures	r138,270	114,100	107,053	Venezuela 3,723.
Antimony oxides	794	944	313	United Kingdom 559.
Chromium:				
Ore and concentrate	27,373	28,373	7,769	Mozambique 9,288; Philippines 5,970; Albania 4,719.
Oxide and hydroxide	1,908	1,717	1,624	United Kingdom 57.
Copper:				
Ore and concentrate	r2,653	12,744	6,385	Chile 5,381; Peru 924.
Sulfate	542	142	139	United Kingdom 3.
Metal:				
Scrap including alloys	35,443	35,051	34,935	Peru 75; Haiti 24.
Unalloyed:				
Unwrought	32,541	13,466	8,729	Peru 3,489; Chile 500; Japan 499.
Semimanufactures	r6,565	6,063	4,248	Japan 1,174; Sweden 220; West Germany 167.
Alloys, unwrought and semimanufactures	r18,536	19,937	16,539	West Germany 1,894; United Kingdom 309.
Gold:				
Ore and concentrate value, thousands	$8,129	$33,924	$33,635	Peru $149; Nicaragua $104.
Metal including alloys, unwrought and partly wrought thousand troy ounces	r2,881	2,249	1,854	Switzerland 247; Hong Kong 88.
Iron and steel:				
Iron ore thousand tons	5,913	5,875	5,653	Brazil 222.
Metal:				
Scrap do	1,047	1,015	1,015	
Pig iron and related materials	r19,789	10,751	10,499	West Germany 143.
Ferroalloys:				
Ferrochrome	34,720	41,369	10,515	Republic of South Africa 19,836; Brazil 7,600.
Ferromanganese including spiegeleisen	r83,699	26,704	4,793	Republic of South Africa 12,283; Norway 9,468.
Silicomanganese	21,876	20,901	12,088	Norway 4,050; Republic of South Africa 3,043.
Ferrosilicon	r19,855	18,508	17,177	Brazil 445; Norway 442; France 409.
Ferrotungsten	27	7	2	Portugal 5.
Ferrovanadium	349	520	520	
Other	r6,707	10,506	3,452	Greece 3,794; France 2,101; Brazil 909.
Steel, primary forms	r177,451	104,647	99,368	United Kingdom 5,004.
Semimanufactures:				
Bars, rods, angles, shapes, sections:				
Wire rod	r166,266	106,493	10,668	Japan 47,145; Republic of South Africa 22,889; France 17,519.
Other bars and rods	r133,803	83,410	48,211	United Kingdom 13,740; Japan 7,416; France 4,648.
Angles, shapes, sections	r273,111	207,639	65,402	Belgium-Luxembourg 48,258; Spain 25,524.
Universals, plates, sheets	r1,039,054	582,215	245,826	Japan 134,840; Republic of Korea 24,330; United Kingdom 23,305.
Rails and accessories	20,636	29,689	20,971	Belgium-Luxembourg 3,686; United Kingdom 2,861.
Wire	r60,947	35,270	10,102	United Kingdom 9,617; France 4,185; Belgium-Luxembourg 3,270.
Tubes, pipes, fittings	r285,144	322,111	99,001	Japan 164,338; Republic of Korea 16,823.
Castings and forgings, rough	r139,095	129,363	114,186	United Kingdom 4,552; India 2,243; Spain 2,190.
Lead:				
Oxides	331	926	821	Republic of Korea 60; Mexico 45.
Metal including alloys, all forms	r2,133	2,602	2,593	Japan 5.
Magnesium metal including alloys, all forms	3,147	3,820	3,652	United Kingdom 168.

See footnotes at end of table.

Table 3.—Canada: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980	Sources, 1980	
			United States	Other (principal)
METALS —Continued				
Manganese:				
Ore and concentrate	45,150	95,161	8,010	Gabon 36,346; Republic of South Africa 23,508; Brazil 15,360.
Metal including alloys, all forms	8,275	6,957	440	Republic of South Africa 6,413.
Mercury 76-pound flasks	1,471	1,464	1,257	Japan 207.
Molybdenum oxides and hydroxides	336	362	302	West Germany 60.
Nickel:				
Ore and concentrate including scrap metal	19,047	26,149	11,902	Australia 4,254; France 3,568; United Kingdom 2,221.
Metal including alloys:				
Unwrought	r3,108	5,224	3,238	Norway 1,708.
Semimanufactures	r5,353	2,268	1,546	West Germany 501; United Kingdom 112; Sweden 80.
Platinum-group metals including alloys, unwrought and partly wrought troy ounces	26,585	34,227	23,524	United Kingdom 10,245.
Silver:				
Ore and concentrates[1] value, thousands	$218,867	$846,299	$734,686	Peru $35,511; Panama $26,609; Nicaragua $17,398.
Metals including alloys, unwrought and partly wrought thousand troy ounces	1,232	10,903	10,492	Peru 297; United Kingdom 82.
Sodium metal	8,237	7,110	7,092	United Kingdom 18.
Tin metal including alloys, all forms	r4,689	4,527	3,153	Bolivia 617; Brazil 279.
Titanium:				
Dioxide, pure	r9,815	6,135	3,817	France 809; United Kingdom 565; Australia 483.
Metal including alloys, all forms	731	986	932	United Kingdom 53.
Tungsten ore and concentrate	11	6	6	
Zinc:				
Ore and concentrate including scrap metal	r11,660	59,542	52,040	Australia 3,432; Bolivia 2,198.
Oxides and peroxides	1,717	1,526	1,335	United Kingdom 180.
Metal including alloys:				
Blue powder	304	234	233	NA.
Unwrought	2,573	724	724	
Semimanufactures	r542	557	278	Belgium-Luxembourg 216.
Zirconium metal including alloys, all forms	312	229	191	France 38.
Other:				
Ores and concentrates including scrap metal	r118,131	151,419	81,164	Australia 38,185; Republic of South Africa 17,803.
Base metals including alloys, unwrought and semimanufactures	r1,841	1,338	1,195	Bolivia 54; United Kingdom 38.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Pumice, emery, corundum, etc	r155,612	57,513	57,265	West Germany 118; United Kingdom 113.
Grinding and polishing wheels and stones value, thousands	$16,315	$15,710	$10,557	Italy $1,418; Austria $856.
Asbestos, crude	r1,969	1,156	307	Republic of South Africa 849.
Barite, crude	r20,765	48,749	48,523	United Kingdom 101; China 54; Netherlands 54.
Boric material: Oxide and acid	13,606	12,940	9,888	France 1,771; Netherlands 608.
Cement	248,421	223,247	220,656	Japan 1,175; Italy 955.
Clays and clay products:				
Crude:				
Bentonite	r638,307	471,683	345,345	Greece 125,927.
Chamotte (including refractory scrap)	12,544	19,719	19,719	
Fire clay	52,244	39,334	38,980	United Kingdom 354.
Fuller's earth	r1,710	1,385	1,385	
Kaolin (china clay)	273,422	254,350	222,882	United Kingdom 31,468.
Other	129,133	122,416	121,842	United Kingdom 313; France 79; West Germany 72.
Products:				
Refractory including nonclay bricks value, thousands	r$75,818	$88,664	$80,816	West Germany $2,501; United Kingdom $2,035; Austria $1,647.
Nonrefractory do.	$43,530	$54,219	$6,081	Italy $22,603; Spain $7,882; Japan $5,045.
Cryolite, crude	r518	274	38	Denmark 236.

See footnotes at end of table.

Table 3.—Canada: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980	Sources, 1980	
			United States	Other (principal)
NONMETALS —Continued				
Diamond:				
Gem, not set or strung ____ carats	137,732	133,308	22,275	Belgium-Luxembourg 43,335; Israel 34,269.
Industrial _____ thousand carats	1,332	1,343	799	Ireland 332; Belgium-Luxembourg 75; United Kingdom 68.
Dust and powder _____ do____	1,134	1,287	1,269	Ireland 18.
Diatomite _____	r28,362	26,577	26,577	
Fertilizer materials:				
Crude: Phosphate rock thousand tons	r3,683	4,207	4,207	
Manufactured:				
Nitrogenous _____	165,108	136,449	119,985	Netherlands 7,992; Chile 7,537.
Phosphatic _____	r381,886	248,381	246,763	Belgium-Luxembourg 1,154; Israel 459.
Potassic _____	71,775	82,852	82,844	NA.
Other including mixed _____	132,857	123,374	122,425	Netherlands 745.
Ammonia _____	56,227	33,855	33,855	
Fluorspar _____	167,905	223,940	17,752	Mexico 108,963; Morocco 39,808.
Gypsum _____	152,463	154,717	35,024	Mexico 119,693.
Iodine _____	260	271	54	Japan 212.
Lime _____	r41,480	40,901	39,005	West Germany 1,000; United Kingdom 878.
Magnesium including dead-burned and sintered _____	88,909	76,600	64,572	West Germany 5,071; Greece 4,300; Netherlands 2,560.
Mica, crude _____	3,131	2,597	2,581	NA.
Pigments, mineral: Iron oxides, processed	r12,303	8,869	6,344	West Germany 1,010; Spain 713.
Precious and semiprecious stones excluding diamond value, thousands	r$23,318	$28,933	$10,443	Japan $4,825; West Germany $2,128; Israel $1,501.
Salt and brine _____ thousand tons	1,276	1,151	730	Mexico 388.
Sodium and potassium compounds, n.e.s.:				
Caustic soda _____	r345,698	217,290	203,257	West Germany 10,342.
Caustic potash, sodic and potassic peroxides _____	3,888	4,188	3,899	NA.
Sodium carbonate including sal soda _	184,585	161,383	161,308	NA.
Sodium sulfate _____	23,156	20,211	675	United Kingdom 19,536.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked _____	r48,961	58,039	40,458	Republic of South Africa 8,978; Italy 7,082.
Worked ___ value, thousands	$3,691	$5,106	$695	Italy $3,993.
Dolomite, calcined _____	3,915	4,316	4,316	
Limestone excluding dimension thousand tons	3,216	2,418	2,418	
Quartz, silex and crystallized _____	1,259	280	277	NA.
Sand, gravel, crushed rock:				
Crushed rock _____	79,329	38,401	38,088	United Kingdom 151; Italy 146.
Silica sand ___ thousand tons	1,652	1,200	1,194	NA.
Sand and gravel, n.e.s __do____	1,202	1,210	1,206	NA.
Sulfur:				
Elemental, all forms _____	1,699	1,767	1,755	West Germany 12.
Sulfuric acid _____	r170,617	18,048	18,048	
Talc, steatite, soapstone, pyrophyllite __	r50,350	50,726	50,498	Italy 125; United Kingdom 63.
Vermiculite, crude _____	37,486	34,597	26,841	Republic of South Africa 7,756.
Other:				
Crude _____ value, thousands	$10,310	$9,807	$7,628	Turkey $1,067; United Kingdom $204.
Oxides, hydroxides, peroxides of magnesium, strontium, barium ___	38,405	28,373	27,683	United Kingdom 275; France 143.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals _____ value, thousands	$4,385	$3,787	$3,478	Belgium-Luxembourg $180.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural __do____	r$1,547	$1,568	$1,417	West Germany $106.
Carbon black _____	r11,663	9,663	9,506	United Kingdom 95; France 35.
Coal, all grades including briquets thousand tons	17,587	16,066	16,066	
Coke and semicoke _____	385,526	403,377	403,377	
Gas, hydrocarbon, natural thousand cubic feet	114	104	104	

See footnotes at end of table.

COMMODITY REVIEW

METALS

Aluminum.—Two companies were reported producing primary aluminum metal in Canada—Canadian Reynolds Metals Co., Ltd., and Aluminum Co. of Canada, Ltd. (ALCAN). Canadian Reynolds operated a 154,000-ton-per-year smelter at Baie Comeau, Quebec, while ALCAN had five smelters in Quebec—at Jonquiere, Grand Baie, Isle Maligne, Shawinigan, and Beauharnois—and one at Kitimat, British Columbia. ALCAN had a smelter capacity of 961,000 tons per year and also produced alumina from imported bauxite for use mainly in its Quebec smelters. The Kitimat smelters used alumina imported from Australia.

It was reported that the first 57,000-ton-per-year potline at Grand Baie, Quebec, was officially opened in September, a second line was completed in 1981 and construction was continuing on a third potline. Because of the weakness of the worldwide market ALCAN was to delay indefinitely the start-up of its second 57,000-ton-per-year potline that was completed in 1981.

The 1981 recession was expected to continue into 1982 with aluminum stocks remaining high. If inflation and interest rates decrease, it was expected that additional smelter construction would resume in 1982.

Copper.—The opening of several copper mines in Canada in 1980 was expected to lead to increased production in 1981; however, the depressed world economy caused Canadian producers to reduce output. As the market became weaker in 1981, further production cutbacks and, in some instances, mine closures occurred. This situation was expected to continue unless there is a marked improvement in the price of copper.

The Consolidated Rambler Mines Ltd. copper-gold mine at Baie Verte, Newfoundland, continued to operate through 1981. The mine was expected to operate into the spring of 1982 at a reduced rate, provided there was no futher drop in metal prices. Although the Buchans Mine of ASARCO Incorporated was expected to close in 1981, some additional ore was discovered that should enable the mine to operate for another 2 or 3 years at a reduced rate.

Camchib Resources Inc. maintained operations at its mines at Chibougamau and developed additional ore zones at the Cedar Bay and Henderson No. 2 Mines. Camchib, and others were expected to spend $8 million by mid-1982 on drilling or underground exploration of about 11 mining properties in northwestern Quebec.

Noranda Mines Ltd. announced that it had discovered copper mineralization beneath the town of Murdochville, Quebec, adjacent to its Gaspe division, at a depth of about 700 meters. Noranda also announced that operations would be reduced at its Copper Mountain Mine and concentrator by the end of 1981.

Texasgulf Canada Ltd. was renamed Kidd Creek Mines Ltd. after becoming a wholly owned subsidiary of the Canada Development Corp. Noranda reported its open pit F Group copper-zinc-silver-mine in Ontario was in production early in 1981. The South Bay Mine of Selco Inc., at Confederation Lake, Ontario, was reported closed in 1981 after ore reserves were mined out.

Hudson Bay Mining and Smelting Co. Ltd., Manitoba, was continuing development of the Trout Lake Mine near Flin Flon, Manitoba, the Spruce Point Mine at Reed Lake, and the Rod Mine at Snow Lake.

Tech Corp. reported that its Highmont copper-molybdenum mine in the Highland Valley, British Columbia, was in production.

Gold.—In 1981, gold prices declined and performance was disappointing compared with that of 1980. Weaker gold prices caused the value and volume of production to be reduced from the 1980 level.

In Canada, the reported level of exploration activity that developed in 1980 continued throughout 1981. Claim staking was continued in the older developed gold mining camps, but areas in which new gold discoveries were reported also had substantial staking activity. Exploration of known properties continued with the rehabilitation of old shafts to permit underground exploration and reevaluation of reserve statistics. Much of the exploration has been in the Dawson Mountain range. The Department of Energy, Mines, and Resources reported that the volume of gold production in Canada in 1981 was slightly below that of 1980 as producers continued to mill lower grade ore. The decrease in both volume and unit value of product combined to reduce the value of gold production by 24% from the 1980 level.

At the end of 1981, it was reported that

there were 37 lode gold mines in Canada operated by 28 companies. Four lode gold mines closed during the year.

Several gold mines opened in 1981—three in Quebec, five in British Columbia, and one each in Ontario and the Northwest Territories. Other mines were continuing mill construction and mine development programs and were to be in full-scale production early in 1982. Ontario continued as the leading gold producer, followed by Quebec, British Columbia, and the Northwest Territories.

The Royal Canadian Mint was proceeding with plans for further utilization of gold in their coinage. Canada ranked fourth in the total amount of gold used in coinage with about 914,000 troy ounces used in 1981. The maple leaf 1-ounce coin has been popular and the mint was planning to coin a 0.1-ounce maple leaf. The maple leaf coin, at 999.8 fine gold was considered to have an advantage over other gold coins of lower fineness.

Iron Ore.—Canadian iron ore shipments in 1981 were estimated at about 50 million tons, with a value of $1.9 billion. Shipments in 1980 were 49 million tons valued at $1.7 billion.

The year was marked by a series of production cutbacks and layoffs at several iron ore mines and processing plants in Quebec, Labrador, and Ontario. For most of the industry, 3-year union contracts for iron ore workers were successfully negotiated without work stoppages.

The Iron Ore Co. of Canada suspended operations at its Sept Iles concentrator and pellet plant in Quebec in May 1981 for the balance of the year causing 650 employees to be out of work. Sidbec-Normines Inc., Quebec, was the only company to operate a direct-reduction plant in Canada in 1981. It was estimated that the company produced about 1 million tons of pellets in 1981.

The INCO Ltd. pellet plant at Copper Cliff, Ontario, remained idle in 1981 and the company stated that it had no plans to reopen the facility in 1982.

Iron and Steel.—Production of crude steel in 1981 decreased by almost 8% relative to that of the previous year to approximately 14.8 million tons. The domestic demand for steel during the first half of 1981 was strong and, as a result, all three major steel companies filled orders on an allocation basis. Although there was less demand in the third quarter of the year, domestic producers continued to have difficulty satisfying some orders because of a 4-month strike that affected steel production in one-third of the industry.

The low value of the Canadian dollar relative to the U.S. dollar continued to stimulate exports of Canadian rolled steel products, particularly during the first half of 1981. Exports, expressed in crude-steel equivalent, to all countries were estimated at 4.5 million tons, about the same amount as that of 1980. Imports increased significantly during the last 6 months of the year because of the strengthening of the Canadian dollar, increasing competition, and a shortfall of some domestic products. Accordingly, imports expressed in crude-steel equivalent were reported at 3.8 million tons, an increase of over 80% from that of 1980.

Lead and Zinc.—World economic conditions were not favorable for lead and zinc exports during 1981. Lead and zinc prices weakened in an extremely competitive market and the profits of Canadian producers were not as high as was expected at the beginning of the year.

Refined zinc metal production in Canada has been estimated at 619,000 tons in 1981, compared with 592,000 tons in 1980. Canadian zinc metal producers were operating at an average of 97% capacity.

Brunswick Mining and Smelting Corp. was building a 100,000-ton-per-year zinc reduction plant at Belledune, New Brunswick. Basic engineering and planning was completed and construction was scheduled to start in May 1982, with plant startup targeted for late 1984. The project was estimated to cost about $360 million.

Three zinc metal refineries, Cominco Ltd., Canadian Electrolytic Zinc Ltd., and Kidd Creek Mines Ltd., were in the process of adding to their capacity.

Nickel.—In response to a continued weak world market, Canadian producers operated below capacity and maintained a tight control over production to avoid excessive inventory levels. Temporary shutdowns were necessary in some locations. High interest rates, rising costs, depressed prices, and declining demand had significant a negative impact on revenues.

INCO announced development of a new open pit mine at Thompson to replace the Pipe open pit mine that was expected to be depleted by 1984. The new pit was to be developed in two phases. The first phase was scheduled to be operational by 1984, mining a portion of the ore body to

a depth of about 125 meters. The second phase would develop the remaining ore body with production scheduled by 1991.

Certain development work at Falconbridge Ltd.'s Craig, Lockerby, and Onaping Mines was to be suspended in 1982, although initial production at the Craig deposit continues to be scheduled for 1987.

Exploratory drilling and developmental work continued in 1981 on the New Quebec Raghan Mines Ltd. property in the Ungawa area of northern Quebec.

Platinum-Group Metals.—The platinum-group metals produced in Canada were recovered as a byproduct in the treatment of nickel-copper sulfide ores. INCO and Falconbridge were the two major Canadian producers of platinum-group metals, with INCO the larger of the two. The platinum-group metals recovered from Canadian ores averaged about 43% platinum, 45% palladium, and 12% other metals in the platinum group. It was expected that a strong industrial demand for the platinum-group metals, particularly platinum and ruthenium, would continue through the 1980's.

Silver.—It was reported that silver production in 1981 was valued at approximately $406 million, representing a decrease of about $285 million from the 1980 value. Increased production in New Brunswick and British Columbia offset lower production in Ontario and the Territories.

Canada continued to be a major world producer of silver and ranked third after Mexico and Peru. Production was expected to remain near recent levels; however, the decline in world silver prices will affect expansion and development of existing silver properties and delay exploration. The United States was the major market for Canadian silver in 1981 and accounted for almost three-fourths of Canada's silver exports.

Other Metals.—Consolidated Durham Mines and Resources Ltd. closed Canada's only antimony mines at its Lake George property near Fredericton, New Brunswick, when proven ore reserves were exhausted in early 1981. A new ore body near the existing mine has been discovered with reserves estimated at over 800,000 tons. Options were being investigated to mine the new property.

Production of cobalt increased by about 43% in 1981. Two companies, INCO and Falconbridge, produced cobalt as a byproduct of domestically produced nickel-copper ores while a third, Sherritt Gordon Mines, Ltd., recovered cobalt from tolled and purchased nickeliferous materials. INCO's electrolytic cobalt plant at Port Colborne was expected to come onstream in late 1982 or early 1983. This facility was expected to have a production capacity of about 1,000 tons per year, and will replace the existing production line at Port Colborne.

Two new molybdenum mines, the Kitsanet and Highmont Mines, both in British Columbia, came into production in 1981. As a result of weak demand for molybdenum and an excessive inventory buildup, Placer Development Ltd. initiated a production cutback program at its Endako Mine. Output was reduced by an estimated 30% during 1981. For like reasons the other major producers were expected to initiate or continue production constraints.

NONMETALS

Asbestos.—The soft housing market and slowdown in general construction resulted in weak demand and consequently higher inventories of asbestos fiber in 1981. The decline in shipments of asbestos fiber in 1981 caused reductions in operations and in the work force of the mines. Quebec, the major asbestos producing area in Canada, was especially impacted by the weak market. Continuing environmental concerns were also probably reflected in the weak asbestos market.

Fertilizer Materials.—*Phosphate.*—Canada did not mine phosphate and during 1981 imported its phosphate rock requirement almost entirely from the United States. Sherritt Gordon was conducting exploration and production feasibility studies on a phosphate deposit near Kapuskasing, Ontario, 640 kilometers northwest of Toronto. The property was optioned from International Minerals and Chemical Corp. (Canada) Ltd. (IMCC) in 1979. IMCC had completed an exploration program and reserves were estimated at 56.7 million tons grading 20% P_2O_5.

Potash.—Production and sales were down in 1981, compared with results in 1980. High inventories caused several mines to curtail production. Although prices were declining in the last part of 1981, the major producers in Saskatchewan continued with their various expansion programs, based partly on the assumption that the market would improve in the first quarter of 1982 and that the world demand for potash would continue to grow.

Sulfur.—Canada was the world's largest

exporter of sulfur, accounting for over 40% of the total world sulfur trade. The chief source of sulfur was sour natural gas, produced mainly in Alberta from about 57 sour gas plants. In 1981, Canada's elemental sulfur exports rose 8% over 1980 exports to 8.0 million tons. Although sulfur prices have been volatile over the years, the Canadian sulfur industry was expected to keep pace with the world economy.

Other Nonmetals.—Cement and gypsum production were also moderated by the depressed demand in the construction industry. Total 1981 cement production in Canada was sustained at about the same level as 1980 although exports were estimated to have decreased about 7%. Gypsum was expected to post an overall increase in production and exports of about 6%.

Canada was the world's foremost producer of nepheline syenite, which was mined from extensive deposits near Peterborough, Ontario. Although the value of exports increased in 1981 by an estimated 12%, production remained essentially the same as that of 1980. Canada exported a major portion of its production to the United States for use by the glass industry.

MINERAL FUELS

Coal.—Production and consumption continued to grow in 1981. Development of new mines and expansion of existing properties were proceeding in order for the coal industry to meet growing domestic and foreign demand. Not only were there investments in mines but also in railway and port facilities. Coal liquefaction technology was also receiving attention. The Federal Government was involved through the objectives outlined in the national energy program for finding improved ways to use coal. Increased coal-fired electrical generation plants in Canada were expected to ensure a demand for domestic coal, and an increased demand worldwide for steam and metallurgical coal was expected to create a greatly expanded market in the coming decade.

Natural Gas.—The supply of natural gas exceeded Canada's domestic requirements and authorized export markets in 1981. This factor plus the investment uncertainty created by the introduction of the NEP caused a decline in natural gas in 1981. The Canadian Department of Energy, Mines, and Resources indicated that compared to that of 1980, drilling activity for oil and gas had declined by 25% to 6,800 well completions.

Revenues from the sales of Crown lands decreased by about 40%, geophysical activity was reduced by about 20%, and rig activity in 1981 was expected to decline significantly according to the Department of Energy, Mines, and Resources' estimates.

Petroleum.—Production of crude oil, including synthetic crude and natural gas liquids, was estimated to decline by about 7%. Although refining capacity was reported to remain unchanged, there was an estimated 6% reduction in processing. Recent major oil discoveries in the Beaufort Sea and off the east coast were expected to add to Canada's established reserves estimated at 7.3 billion barrels at yearend.

The investment uncertainty that existed following introduction of the NEP was eased considerably when agreements between the western provincial governments and the Federal Government were signed in late 1981, providing a pricing agreement and other incentives. Revenue-raising measures were also contained in the agreements. This was expected to have a positive effect on exploration and development activity.

Uranium.—The Canadian uranium industry continued to develop. In 1981, there were seven primary uranium producers. Sixty percent of the primary production came from four mines in Ontario with the remainder coming from three mines in Saskatchewan. There was a decrease in exploration activity reflecting the decline in uranium prices and projected lower demand. The Canadian uranium industry was well established and was expected to have no problem competing in the world market.

[1]For more detailed information on the mineral industry of Canada see the Canadian Minerals Yearbooks for 1980 and 1981, and the Canadian Mineral Surveys for 1979 and 1980, both of which were prepared by the Mineral Development Sector, Department of Energy, Mines, and Resources, Ottawa. The U.S. Department of the Interior, Bureau of Mines has arranged to have these Canadian publications placed in libraries in each of the 50 States and Puerto Rico as follows: University of Alabama, Tuscaloosa; E. E. Rasmuson Library, University of Alaska, Fairbanks; University of Arizona, Tuscon; University of Arkansas, Fayetteville; California State Library, Sacramento; A. Lakes Library, Colorado School of Mines, Golden; Wilbur Cross Library, University of Connecticut, Storrs; H. M. The Mineral Industry of Chile

By Pablo Velasco[1]

The Chilean economy entered a period of economic slowdown in the second half of 1981. However, on a full-year basis, the economy grew at an estimated rate of 5%, while inflation was reduced to 9.5%. These figures compare favorably with those of the rest of Latin America.

The Chilean mining sector was affected by depressed world economic conditions, but managed to achieve some growth during 1981. The mining sector, which accounted for 7% of gross domestic product estimated at $32 billion[2] at current prices, grew almost 2% in 1981. This sector was the most important source of Chilean export earnings and was the area with the greatest prospects for major private investment. A new mining law that is favorable to private investment was completed in 1981.

Despite experiencing one of its most disappointing years in international markets, Chile maintained its position as the second largest producer of copper after the United States. Although overall mineral production was maintained in 1981, the sector was seriously affected by price declines. Copper production, which accounted for the major part of mineral output, rose slightly because of a 14% increase in output of small- and medium-size mines. Copper production of Corporación Nacional del Cobre de Chile (CODELCO-Chile), the large state company, fell 1.2%. Chile also ranked second in world output of molybdenum after the United States and second in iodine production after Japan.

Chilean petroleum production exceeded substantially its 1980 level and set a new record. Chile was approximately 45% self-sufficient in petroleum. Production of electrical energy rose almost 6% in 1981. Approximately 80% of Chilean demand for electricity was satisfied by hydroelectric powerplants. The inauguration of the Antuco facility in 1981 expanded electrical generation capacity by one-third. The Colbun-Machicura project, which was under construction, will expand installed capacity by another one-third.

Full production of gold and silver was reached in 1981 at the El Indio gold, silver, and copper mine, owned by the Chilean affiliate of St. Joe International Corp. The mine, developed over a period of several years with an investment of over $200 million, was the largest mining project to be completed under the terms of the 1974 Foreign Investment Law. Sociedad Chilena del Litio Ltda., a joint venture of Foote Minerals Co. and Corporación de Fomento de la Producción (CORFO), initiated a $61 million project to produce 6,350 tons of lithium carbonate from brines located on the Atacama Salt Flats.

Foreign Investment.—Since the enactment in 1974 of the Chilean foreign investment law, which established nondiscriminatory treatment of foreign investors without providing special incentives or disincentives, more than 714 direct foreign investment projects with a total value in excess of $6.5 billion have been authorized by the Chilean Government for all sectors of the economy. U.S. interests accounted for 186 projects or 26% of the total number valued at $5.0 billion or 77% of the total value authorized. Mining projects accounted for almost 85% of the total value. The concentration of investment projects in the mining sector reflected Chilean resource endowment and comparative advantage in mineral development.

In 1981, the number and total value of investment projects as well as the amount of capital actually entering the country showed significant increases that exceeded all previous years since 1974. A total of 185 projects valued at $2.5 billion were author-

ized during 1981, up from 154 projects and $196 million in 1980. While the number of investments increased by 21%, the value soared by almost twelvefold because of the General Electric-Getty Oil $1.5 billion proposal for development of La Escondida copper deposit. Actual investment flow during 1981 increased 25% to $381 million.

Government Policies and Programs.—In December, the Government announced the approval of a proposed new mining law designed to encourage new mining investments in Chile and to modernize its mining legislation. The new mining law was to be sent to the constitutional tribunal for final approval.

In discussing the scope of the new mining law, Government officials expressed the hope that this new mining legislation will stimulate domestic and foreign investment and would result in doubling copper production in the next decade to more than 2 million tons per year. The new mining law provides for the granting of concessions for exploration, exploitation, and marketing of minerals through legal procedures without state intervention. In the past, foreign investors were reluctant to undertake important mining projects because of the possibility of expropriation in which the state unilaterally fixed the amount of compensation or intervened directly in negotiations between the contracting parties.

Concessionaires of exploration or exploitation projects would have the right to be compensated in the event of expropriation for the damages incurred. In the event no agreement is reached, the amount of the compensation would be set by a judge after a report is submitted by experts.

Under the new mining law, the Chilean state-owned copper enterprise, CODELCO-Chile, would continue to own and operate the country's present large-scale copper mining industry, consisting of the Chuquicamata, El Teniente, Andina, and El Salvador Mines. One of the key provisions of the revised mining code establishes the right of private citizens to obtain mining concessions, with the constitutional guarantees of private property (article 19 of the Chilean Constitution concerns private property).

The mining law established two types of concessions—exploration and exploitation. For the first, the concessionaire is given a period of 2 years, subject to another 2-year extension for carrying out exploration work. No time limit is set for exploitation, subject to the payment of an annual license fee. The mining code provides that similar concessions would not be available in the fields of hydrocarbons, lithium, maritime deposits in jurisdictional waters, or in zones regarded as vital to national security.

The owner of a concession is protected by the guarantee of a stable arrangement. Should the state at some time decide to exploit a concession granted to a private investor, it is required to compensate him by paying the commercial value of that concession.

PRODUCTION

Copper production in Chile reached a record level in 1981, the sixth consecutive year of more than 1 million tons of output. CODELCO-Chile production of copper in 1981 declined 1.2% compared with that of 1980, owing to a decrease in ore grade at the Chuquicamata Mines while output at the small- and medium-scale mines increased 14%.

Chilean gold production in 1981 increased by 44% compared with that of 1980. Of the total output, 54% came from the El Indio Mine that is 80% owned by St. Joe International Corp. Production of silver increased 12%.

Production increased in zinc, barite, sodium nitrate, guano, cement, and iodine, but declined in lead, manganese, iron ore, crude steel, potassium, salts, sodium sulfate, and talc. Production of molybdenum, mostly from the CODELCO-Chile El Teniente Mine, increased by 11%.

As for mineral fuels, coal output decreased by 12%, and output of crude petroleum increased almost 20% to a record level.

Table 1.—Chile: Production of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity[2]	1977	1978	1979	1980[p]	1981[e]
METALS					
Copper:

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through July 19, 1982.

[2]In addition to the commodities listed, pyrite is also produced, but available information is inadequate to make reliable estimates of output levels.

[3]Figures are the nonduplicative copper content of ores, concentrates, precipitate, metal, and other copper-bearing products measured at the last stage of processing as reported in available sources.

[4]Figures are total blister and equivalent copper output including that blister subsequently refined in Chile and copper produced by electrowinning.

[5]Figures are total refined copper distributed into two classes according to method of refining.

[6]Excludes castings.

[7]Estimated on the basis of reported vanadium content of vanadiferous slags imported by the United States from Chile.

[8]Includes natural sodium sulfate and anhydrous sodium sulfate, coproducts of the nitrate industry.

TRADE

The Chilean trade deficit enlarged to $2.5 billion in 1981, up substantially from the $1.6 billion trade deficit in 1980. Copper's downward price movement, which began in 1980, was the major factor in the decline in the total value of Chilean exports by 18% to $3.9 billion.

In 1981, the value of copper exports decreased by 23% to $1.7 billion while the value of iron ore exports, the second most important mineral export, remained at the level of $158 million. The value of molybdenum exports decreased by 35%. Weak demand in world markets also brought about reduced income from the other traditional mineral exports of nitrates; however, the value of income from iodine exports increased during 1981. Overall, mineral exports dropped 22% in value in 1981 while accounting for 58% of the total value of Chilean exports.

As a result of a maintenance in the level of exports to the United States, while other principal markets declined, the United States emerged as the largest Chilean market during 1981, accounting for about 15% of total exports. The United States was followed by the Federal Republic of Germany, Japan, and Brazil. Chile exported to a total of 97 countries.

Chilean total imports increased in value by almost 10% to $6.4 billion. The country continued to rely heavily on imports of crude petroleum to meet domestic needs, mainly from the United States, Brazil, Iran, and Japan. Chile imported from a total of 33 countries.

COMMODITY REVIEW

METALS

Copper.—Copper production reached a record level in 1981, which marked the sixth consecutive year with output more than 1 million tons. This represented a 1.2% increase over that of the previous year, confirming a trend toward slowly rising production.

Total large-scale mining output at Chuquicamata, El Teniente, El Salvador, and Andina Mines belonging to CODELCO-Chile (Chilean National Copper Corp.) fell 1.2% to 893,000 tons. This was due mainly to a drop in the ore grade mined at Chuquicamata. Copper output at small- and medium-scale mines rose 14% to 186,700 tons. Three mines were largely responsible for the country's production increase. El Teniente had a rise in output of 10% to

291,000 tons, and production at the Exxon Minerals Chile Inc. Disputada de Las Condes Mine was up 38% to 39,500 tons. The third producer, Lo Aguirre Mines, operated by Sociedad Minera Pudahuel Ltda. y Cía. C.P.A., was brought into production and reached some 13,800 tons.

After additional exploration of its Los Bronces deposit, Exxon Minerals decided that more engineering studies must be made before expanding production to 80,000 tons of ore per day. Investment required for the project has risen from $1.0 billion to $2.0 billion. It was estimated that Exxon Minerals lost $70 million in 1981 from development of the Los Bronces project, which is part of the operation of Disputada de Las Condes S.A.

The Empresa Nacionál de Minería (ENAMI) paid Noranda Mines Ltd. $4.5 million as reimbursement for expenditures at the Andacollo Mine and as compensation for losses from the termination of negotiations on its joint development. ENAMI owes Noranda an additional $4.5 million, which will be paid by the end of 1982. Noranda acquired a 49% interest in Andacollo through public bidding in 1977 and entered into a partnership with ENAMI. At the end of 1980 the Government ended negotiations on joint development of the mine and agreed to compensate Noranda.

CODELCO-Chile was expected to transfer its 49% ownership of the Quebrada Blanca copper deposit to ENAMI. The copper project is located 160 kilometers west of Iquique and is 51% owned by Compañía Explorandora Doña Inés., a joint venture of Superior Oil Co., Falconbridge Nickel Mines Ltd., Canadian Superior Oil Ltd., and McIntyre Mines Nevada Ltd. Since 1977, the foreign partners have invested $17.8 million in exploration and feasibility studies. Reserves were estimated at 130 million tons of ore assaying an average of 1.22% copper and 0.014% molybdenum. Over 100,000 meters of drill holes have been completed, and 2,000 meters of tunneling and raises have been driven.

Rio Algón Ltd., a unit of Rio Tinto Zinc Corp., Ltd., was undertaking advanced exploration of the copper deposit, Cerro Colorado, in northern Chile 115 kilometers east of Iquique. The Toronto-based company was in the process of determining the feasibility of developing the reserves estimated at 60 million tons. An assessment will be made to determine the average grade of the copper ore and whether or not the gold is recoverable. Rio Algón planned to produce copper concentrate for the world market.

General Electric Co. and Getty Oil Co. received authorization to carry out a $1.5 billion copper mining investment in Chile. The project will be executed by an equal partnership between Getty Mining (Chile) Inc., a Getty Oil subsidiary, and Minera Utah de Chile S.A., an affiliate of the San Francisco-based Utah International Inc., which in turn is a wholly owned natural resource subsidiary of General Electric. The companies have decided to go ahead with full development of the La Escondida deposit believed to be one of the largest copper deposits in Chile. La Escondida is about 180 kilometers southeast of Antofagasta. During 1981, the property was in an exploratory stage. Reserves have been estimated at 200 million tons. Preliminary exploration has disclosed an enriched zone with copper values between 1.2% and 2.3%.

Approval of the La Escondida project by the Government brought total authorized foreign investment since 1974 in the mining sector to almost $6 billion. Of this figure, $5 billion was accounted for by 30 mining projects. The Los Pelambres copper project under development by The Anaconda Company was the largest approved project to date.

A group of Brazilian companies formed a consortium with CODELCO-Chile, named Andibras, for the development of copper deposits in Chile and Brazil. The groups included Técnica Nacionál de Engenharía, S.A., Brasil-Invest, Andrade Gutierrez, Caraiba Metais, and Interbras, the trading subsidiary of Petróleo Brasileiro, the Brazilian state-owned oil company. The Andibras consortium will initially operate on a trial basis for a period of 1 year. Among the first projects planned by Andibras was the study of the feasibility of extracting copper from the El Abra Mine in Chile and processing it into finished products in Brazil.

Source: Comisión Chilena del Cobre and CODELCO-Chile Annual Reports.

Iron Ore.—Production of iron ore for 1981 was about 4% lower than that of the previous year. Iron ore production was concentrated in deposits belonging to Compañía de Acero del Pacífico (CAP) through acquisition of Compañía Minera del Pacífico S.A., which are, in order of importance, El Algarrobo, El Romerál, and Los Colorados. During 1981, no activity in iron ore production was registered in the small-mining sector. Production of iron ore pellets from the Huasco pellet plant in 1981 was 3.3 million metric tons, an increase of 4% compared with that of 1980.

In 1981, iron ore was shipped to the following domestic consumers:

Consumer	Tons
CAP, Huachipato Steel Plant	987,106
ENAMI	7,359
INACESA	2,544
Manganesos Atacama S.A	838
Total	997,847

A 400-million-ton deposit of iron ore was discovered in the northern Andes of Chile. The ore body consists of volcanic lava that erupted over several centuries from the El Laco volcano. The ore grade is 60% iron and is spread over the hillside and base of the volcano at an altitude between 4,700 and 5,600 meters above sea level. Significant quantities of vanadium are reportedly present.

Iron and Steel.—Crude steel and pig iron production declined 10% in 1981. State-owned CAP was the principal Chilean steel producer. During 1981, CAP acquired Compañía Siderúrgica de Huachipato S.A. as well as Compañía Minera del Pacífico S.A.

During the year, CAP continued to implement the recommendations made by the several consulting firms to improve productivity and raise the energy efficiency of the plant. Advisory services were rendered by Nippon Kokan K.K., the Japanese steelmaking firm.

During 1981, CAP completed its structural reorganization into a holding company comprised of seven wholly owned but independently functioning and separately incorporated companies. The seven subsidiaries include (1) Compañía de Acero de Rengo, which is the operator of the Rengo steel plant; (2) Manganesos Atacama S.A., the country's principal producer of ferromanganese; (3) Pacific Ores and Trading, the

CAP marketing agency for iron ore and pellets; (4) Compañía Siderúrgica Huachipato, operator of the Huachipato steel plant; (5) Compañía Minera del Pacífico, which mines iron ore and runs the Huasco pellet plant; (6) Acero Comercial S.A., which will market steel products; and (7) Abastecimientos CAP S.A., which will act as the purchasing agent for all companies on a commission basis.

Manganese.—Production of manganese decreased 8% compared with that of 1980. Manganesos Atacama S.A. continued as the sole producer of manganese from deposits located at Coquímbo. At yearend, only the Loma Negra Mine operated by Manganesos Atacama was in production, while the Toda La Vida, Los Loros ,and Mina Alta Mines were shut down. Production of manganese from these mines declined because of a decrease in average grade from 35.7% to 33.6%.

The Guayacán plant also shut down at yearend, having processed 12,500 metric tons of ore into 5,000 metric tons of ferromanganese and 61 metric tons of manganese dioxide.

Molybdenum.—Chile continued to rank second after the United States as a world producer of molybdenum and accounted for about 13% of the world total. CODELCO-Chile, the only Chilean producer of molybdenum as a byproduct of copper, increased production 11% compared with that of 1980 from the following mining divisions: Chuquicamata, El Teniente, El Salvador, and Andina. The El Teniente Mine had the greatest increase in output of molybdenum concentrate.

The principal Chilean facility for molybdenum processing is Molibdenos y Metales S.A., a private company that has been in operation for 15 years. Its industrial complex, located in Santiago, produced about 50% of Chile's molybdenum concentrate and 100% of its molybdenum oxide and rhenium. CODELCO-Chile ships molybdenum concentrate, ferromolybdenum, and oxides to purchasers in Western Europe, Canada, and Japan.

Precious Metals.—Chilean gold production in 1981 increased sharply by 44% over that of 1980. Chilean gold and silver production came not only from gold mines but also as byproducts of copper, silver, lead, and zinc mining and refining. Medium and small gold mining accounted for 71% of total output, and copper accounted for 26% of the total.

In 1981, 54% of the gold output was from the El Indio gold, silver, and copper mine, which is the principal Chilean gold and silver producer. El Indio Mine is located east of La Serena, about 500 kilometers north of Santiago at 14,000 feet. El Indio is owned 80% by St. Joe International Corp. (Fluor Corp.) of the United States and is operated by Cía Minera San José, a Chilean subsidiary.

Engineering and construction management of the El Indio Mine and mill completed during 1981 was performed by Fluor Mining and Metals Inc. and its Chilean associate, Hernán Briónes Ltda.

During construction of the mill, St. Joe mined El Indio reserves of rich, direct-shipping ore containing about 11.5 troy ounces of gold per ton, 4.6 ounces of silver per ton, and 2.6% copper. The major part of reserves at El Indio requiring milling were estimated at 3.4 million tons with an average of 0.4 troy ounce of gold per ton. Initially, direct-shipping ore reserves were estimated to be sufficient through 1982. These reserves were subsequently estimated at 77,000 tons, providing for shipments at a rate of about 2,200 tons per month through 1984. St. Joe shipped 14,000 troy ounces of gold in 1979, 130,600 troy ounces in 1980, and about 171,000 troy ounces in 1981, all contained in direct-shipping ore.

A number of gold projects were under exploration. Sancarrón, 20 kilometers north of El Indio, was being explored by a joint venture of St. Joe, Preussag A.G. of the Federal Republic of Germany and the Chilean Angelini Group, each with 29.25% interest, and other private Chilean investors.

NONMETALS

Iodine.—Sociedad Química y Minera de Chile S.A. (SOQUIMICH) continued as the only producer of iodine as a coproduct of nitrate mining from the María Elena and Pedro de Valdivia Mines in northern Chile.

Iodine production in 1981 increased 3.2% compared with that of 1980. The increase in production was due to the startup of the processing plant for weak solutions built by Coya Sur in 1981. A similar plant will be constructed to process the iodine contained in weak solutions from the Pedro de Valdivia Mine.

Lithium Minerals.—Under Government policy established in November 1979 (decree law 2886), lithium was defined as a strategic mineral by Chile, and lithium operations were reserved for the state, falling under the jurisdiction of the Nuclear Energy Com-

mission. Sociedad Chilena del Litio Ltda., formed by the state, with foreign interests, was planning to begin construction of a lithium carbonate plant in northern Chile in early 1982. The new plant will produce 6,350 tons of lithium carbonate from a brine deposit in the Salar de Atacama. Final engineering on the plant is to begin immediately, and completion of construction and start of production were scheduled for 1984. The cost of the project was estimated at $61 million.

Chile has an estimated 4 million tons of metallic lithium, 39% of the world's known reserves, contained in brines located in the Salar de Atacama and Salar de Pedernales areas of the Atacama Desert about 2,000 kilometers north of Santiago.

To determine the extent of reserves, drilling was underway at the Salar de Pedernales 50 kilometers north of the El Salvador Mine in northern Chile. The 400-square-kilometer area, at an altitude of 3,400 meters, is known to contain deposits of lithium, potassium, and borax. Initial drilling of part of this area has confirmed that salt deposits extend down to an aquifer at about 140 meters, which currently supplies much of the process water for the El Salvador Mine. A lithium and potassium deposit was found below the aquifer. If sufficient reserves are confirmed, the deposit will be offered for development by domestic and international firms.

Other Nonmetals.—CORFO was scheduled to invite bids in late 1981 for the construction of a chemical industrial complex that will produce potassium salts and boric acid. Feasibility studies were carried out by the Comité de Sales Mixtas (Mixed Salts Committee) as part of the development function of CORFO. Saline Processors Inc. of the United States acted as technical advisors for this phase. The projected plants will be located in the Atacama Desert salt flats. Production of 500,000 tons per year of potassium chloride, about 145,000 tons per year of potassium sulfate, and 28,000 tons per year of boric acid was planned. SOQUIMICH was expected to buy about 30,000 tons per year of potassium chloride, and the remainder would be exported. These exports would earn $86 million in foreign exchange each year. Total investment in the project was estimated at $120 million.

MINERAL FUELS

Coal.—Production of coal decreased 12% in 1981 compared with that of 1980. During the last 2 years, Chilean coal imports have grown substantially as high local production costs have made some Chilean mines noncompetitive with imports, almost all of which have come from the United States.

Chilean coal production is forecast to decline. The two largest mines, Schwager and Lota, south of Concepción, extend under the Pacific Ocean, and operating costs keep rising as coal veins are mined further under the sea. Chilean coal consumption was estimated at 1.5 million metric tons in 1981 and was expected to decrease to 1.35 million metric tons in 1982 and increase again to 1.7 million tons in 1983 and 1984. CORFO sold its studies, technical data, and other rights in the Pecket coal deposit to Compañía de Carbones de Chile Ltda. (COCAR) for $3.5 million. COCAR is a joint venture of Compañía de Petróleos de Chile S.A. and the English firm, Northern Strip Mining Ltd. COCAR expects to invest $110 million during the next 4 years in development. The investment would enable COCAR to produce 1.5 million to 2 million tons of coal per year. The Pecket deposit is located near Punta Arenas in Chile's far south near the Straits of Magellan. Studies indicate reserves of 116 million tons of subbituminous coal.

Plans called for the construction of two port facilities, one near the deposit for coal shipments and the other in northern Chile to receive the coal. Construction of the Pecket Mine was scheduled to start in mid-1982 with initial yearly production expected to reach 300,000 tons in 1986 and 500,000 in 1987.

COCAR was negotiating a sales agreement with CODELCO-Chile. Substitution of Pecket coal for petroleum at the CODELCO-Chile Chuquicamata copper operations could mean an annual $30 million savings to the corporation. COCAR was also discussing the utilization of Pecket coal with Compañía Chilena de Electricidad S.A. (CHILECTRA), the Chilean electric company, at its Tocopilla and Ventanas powerplants. The Pecket coal has been tested in various thermoelectric plants and was expected to replace 20% to 25% of the country's petroleum imports.

A newly discovered coal deposit, perhaps the largest found in Chile to date, could meet the country's needs for the next 20 years. Using cost-efficient machinery, workers at El Laurél Mine began to extract the inexpensive coal in December 1981. El

Laurél is located in Pupunahue, approximately 53 kilometers from Valdivia, and is operated by Cía. Valparaiso Ltda. Daily production was expected to fluctuate between 300 and 500 tons at full capacity. The quality of the coal makes it suitable for the production of steam. It was reported that only 80 workers are needed to operate the special machinery, a French-Spanish product that cost $100 million. Coal reserves at El Laurél Mine were estimated at 9.5 million tons, which will allow the company 20 to 30 years of operation.

Petroleum and Natural Gas.—Spiteful No. 5, one of the newest platforms that the Empresa Nacionál del Petróleo (ENAP) put into operation during 1981, enabled the company to reach an output of about 49,400 barrels per day, the highest production rate in its history. The 1981 ENAP oil output was 24% higher than that of 1980, and the company expects to increase its petroleum production by at least another 5% during 1982. Practically all the increased output during 1981 was obtained from three new offshore platforms in Bahía Posesión. Spiteful No. 5 came online in early November and was the latest offshore platform to begin operations in the Straits of Magellan. Spiteful No. 4 and No. 2 began operations in June and September, respectively. They joined six other platforms already in operation in the area of the straits.

The successful ENAP hydrocarbon production efforts have played a substantial role in helping the country reduce its expenditures on imports of energy, which reached $811 million for the purchase of approximately 30 million barrels in 1979 and $815 million in 1980. ENAP supplied 45% of the domestic demand for hydrocarbons.

ENAP and the Comisión Nacional de Energía were offering for sale 42 billion cubic meters (1.5 trillion cubic feet) of natural gas from Magallanes Province with a maximum delivery of 7.7 million cubic meters (275 million cubic feet) per day over a period of 15 years. The Government did not wish to participate in either the financing or development of the project. The gas is located in deposits under production both onshore and offshore in the Magellan Straits area.

ENAP was undertaking a varied approach to finding fossil fuel resources. In addition to commitments with foreign private firms, the company has contracted directly for exploration equipment and qualified personnel. ENAP contracted PRAKLA-Seismos GmbH to carry out seismic studies in three separate areas off the Chilean coast.

Another exploratory project was being carried out by Petrolera del Pacífico, Ltda., an ENAP affiliate, on the Pacific continental shelf between San Antonio and the Bío-Bío River outlet.

ARCO Petroleos Chile S.A. and Amerada Hess Petroleos Chile S.A. invested $40 million in petroleum and natural gas exploration over a period of 3 years, according to company officials. Under a contract with ENAP, the joint-venture of ARCO-Amerada Hess has been exploring an area between Chiloe Island and the Gulf of Peñas using the drilling ship Danwood Ice. In early 1981, ARCO-Amerada Hess leased the drilling ship Ben Ocean Lancer. Oil reserves discovered have been estimated by De Goyler and MacNaughton of Dallas, Tex., and by ENAP, but the amount of these reserves has not been published.

Uranium.—Law 16,483, which created the Comisión Chilena de Energía Nuclear (CCEN), established that uranium and thorium radioactive minerals are for state control and that the exploration, development, and exploitation falls under CCEN jurisdiction. CCEN reported that uranium was not mined anywhere in the country, although prospecting was being carried out, particularly in northern Chile. CCEN specified that the only company that had obtained a license for uranium exploration in Chile was the Essex Mineral Co., a U.S. firm, with which the commission was negotiating an agreement.

On the other hand, a private enterprise specializing in analysis of radioactive materials confirmed the existence of uranium in Chile according to analyses run on mineral samples from the northern part of Chile.

A prefeasibility study for the installation of an uranium recovery plant at the Chuquicamata copper mine continued in 1981. Future production of uranium concentrate from this operation, according to CCEN officials, will depend upon the availability of financing.

The Mineral Industry of China

By Edmond Chin[1]

In 1978, the State Planning Commission announced a readjustment in China's modernization program whereby heavy industry would assist the acceleration in growth of agriculture and light industry. Changes to the national economic plan for 1979-80 were to be a precursor to the embodiment of a sixth 5-year plan (1981-86), replacing the country's 10-year plan for 1976-85. National plans to resolve the disparity and to coordinate the development between agriculture, light industry, and heavy industry were adopted in 1979. The reassessment resulted in nine major guidelines for the current readjustment program. First, further reduce investment in capital construction; for instance, capital investments planned for 1981 were to be reduced from 55 billion yuan to 30 billion yuan.[2] Second, reduce expenditures for national defense, public programs, and administration. Third, increase the output and efficiency of the agricultural and industrial sectors. Fourth, reduce energy consumption and increase energy conservation. Fifth, consolidate and reorganize existing industries to improve production, eliminate redundancy, and reduce waste. Sixth, stabilize domestic prices. Seventh, improve living standards. Eighth, strengthen management. And last, issue treasury bonds and borrow monies from local governments.

In accordance with the National Economic Plan, minerals and metal commodity output levels for 1981 include steel, 35 million tons; 10 nonferrous metals, 1.08 million tons; cement, 78 million tons; chemical fertilizers, 12.3 million tons; coal, 620 million tons; and petroleum, 106 million tons. However, in early 1981, the planned oil output was revised downward to 100 million tons. Coal production by mines whose outputs were distributed by the state was lowered from 359 million tons to 338 million tons. The steel target was lowered from 35 million tons to 33 million tons, ostensibly to reduce the energy consumed and transport capacity used by this sector for the benefit of light industry.

At the beginning of December 1981, the final national financial accounts for 1980 and the estimates for 1981 were reported by the State Council. In 1980, total revenues were 108.52 billion yuan and expenditures, 121.27 billion yuan. The budget deficit of 12.75 billion yuan was 4.31 billion yuan less than 17.06 billion yuan in 1979. The 1980 deficit was credited to high expenditures for capital construction and was covered by credits of 8 billion yuan borrowed from bank loans and 4.75 billion yuan appropriated from receipts of state treasury bonds issued in 1981. Expenditures during 1980 were primarily for boosting industrial and agricultural production; 216 individual projects and 82 multifaceted projects were completed and commissioned during the year.[3]

Increases in industrial production capacity in 1980 include coal extraction, 8.2 million tons; crude oil extraction, 5.7 million tons; electricity-generating output, 2.8 million kilowatts; iron ore production, 2.7 million tons; railway tracking opened, 1,000 kilometers; and harbor loading capacity, 8.1 million tons.

Towards the end of 1981, the Central Committee and the State Council met on several occasions to review the overall economic situation. Basically, the Government's program to stabilize the economy was by a balanced budget and by stable prices. The former was achieved, more or less, by curtailing expenditures, and the

latter by adopting tighter price controls. The general price index rose slightly during the year, and the prices of basic daily necessities remained relatively stable.

Total revenues for 1981 were estimated at 105.86 billion yuan, of which 97.86 billion yuan was from domestic revenues and 8 billion yuan from foreign loans. Taxes accounted for 60.9 billion yuan of the domestic revenues; the remainder was income from state enterprises.

Total expenditures in 1981 were 108.58 billion yuan, resulting in a deficit of 2.72 billion yuan for the year. Eight billion yuan were drawn from foreign loans for capital construction appropriations. Some major components for the remainder of the domestic expenditure (100.58 billion yuan) were allocated as follows in billion yuan: 25.06 for capital construction appropriations; 5.83 for financing the modernization of existing enterprises and trial manufacture of new products; 7.30 for financial assistance to local enterprises and agricultural projects; 17.00 for culture, education, science, and public health; 16.87 for national defense; and 7.24 for administration. Great efforts were expended to balance the budget by reducing the 1981 deficit to less than a quarter of the 1980 deficit. Moreover, measures for readjusting the economy and balancing revenues and expenditures were to continue.

Highlighting the first year of the new economic plan was a 12% growth in output value of light industry. Moreover, despite natural calamities—drought and flooding—there was a 4% increase in output value for agriculture. The following sectors were given first priority for funding and for raw and semifinished materals: power and transport. Also, products and manufactures of the metallurgical, chemical, and machine-building industries were being systematically reoriented to meet market needs.

Output of nonferrous metals (aluminum, antimony, copper, lead, magnesium, mercury, molybdenum, tin, titanium, and zinc) increased 3% to 1,120,000 tons in 1981. Production of steel, coal, oil, and natural gas exceeded the revised targets for the year. Output of rare metals was up 30%.

Investments in capital construction were severely curtailed from 53.9 billion yuan in 1980 to 38 billion yuan in 1981. During the year, 1,714 projects were slated for suspension or postponement; by midyear, 1,546 projects had been deferred. Adjustments were made in appropriations to favor social programs. Wages and salaries were increased. State Treasury bonds were issued, and borrowing from local authorities was negotiated.

In late March, the International Symposium on World Economy was held at Hangzhou. During this meeting, the weak sectors of the Chinese economy were delineated. Foremost was lagging energy production in respect to rising energy demand. Communications and transport facilities were inadequate. Consumer goods, materials for construction, and packaging were in short supply. Urban infrastructure and public utilities were inadequate. Additionally, while China's basic foundation for iron and steel, nonferrous metals, machine building, and chemical industries was sizable, many of the enterprises in these sectors were old and needed technical renovation. In the late 1970's, the country's financial base was overtaxed as a result of launching simultaneously too many programs in its modernization program. Accordingly, the new priorities for the early 1980's were development of new energy resources; new construction for railways, ports, telecommunications, building materials, and urban and industrial infrastructure; establishing projects that bring a fast return of investments through exports in such sectors as chemicals, metallurgical, and electronics; and modernization of existing enterprises.

Preeminent to China's planning were means to increase foreign exchange earnings and the acquiring of foreign funds, the former from exports of products manufactured by low-investment cottage industries, and the latter by foreign loans, joint ventures, foreign cooperation in offshore oil exploration, compensation trade, and leasing. Loan agreements were reached with the Governments of Japan and Belgium. One Japanese loan was negotiated for financing the construction of two ports, three railways, and one power station. Another Japanese loan was for developing coal mines and oilfields. China negotiated with the International Monetary Fund for a loan for $450 million in special drawing rights and was consulting with the World Bank for loans to be used for constructing power stations, ports, and railways. Also, buyer credit agreements were signed with Argentina, Australia, Belgium, Canada, France, the Federal Republic of Germany, Italy, Norway, Sweden, and the United Kingdom.[4]

There was considerable foreign interest in establishing joint ventures in China. By the end of 1980, 20 joint ventures and 300 contractual ventures had been approved. Also, agreement was reached with foreign business for 350 undertakings in compensation trade (payment in products manufactured), totaling $100 million.

Foreign investment in joint offshore oil development remained the most promising means to utilize foreign funds. Japanese and French companies were prospecting in Bohai Bay and the Beibu Gulf. U.S. oil companies were interested in the Yinggehai Basin. Tenders in other areas were also to be offered. The Ministry of Petroleum Industry was preparing the regulations on foreign cooperation in offshore oil development, which were to be promulgated in late January 1982. Under the regulations, the China National Offshore Oil Corp. (CNOOC), a new entity to be formed, would be in full charge of China's offshore oil development. Obligations of the foreign contractor included providing exploration investment, undertaking exploration operations, and bearing all exploration risks. After a commercial strike of oil and/or natural gas was made, both the foreign contractor and CNOOC were to make investment for cooperative development. The foreign contractor was to be responsible for development and production operations until it relinquished responsibility to CNOOC under the terms to be provided in the petroleum contract.

CNOOC was to announce bidding for offshore oil development in mid-February 1982. Invitation for bidding was to be sent to 46 companies which participated in geophysical surveys of China's offshore areas. The bidding was to be conducted in two phases: The first would concern the northern areas in the southern Yellow Sea and the Zhujiang River estuary; the second phase would cover the southern part of the southern Yellow Sea, Beibu Gulf Basin, and Yinggehai Basin.

As an incentive to discover new geologic finds, the Government rewards individuals who volunteer information on new mineral-producing sites. Discovery of a small mineral find rates a cash reward of 10 to 100 yuan; a medium-size discovery, 100 to 400 yuan; and a large mineral bed, 400 to 800 yuan. In the event of a discovery of a very large mineral bed or of minerals deemed strategic or precious to the Government, such as chromium, diamond, gold, jadeite, platinum, ruby, and uranium, the award may range from 800 to 5,000 yuan.

During 1981, discoveries of 110 mineral occurrences were reported and reserves of another 130 mineral deposits were verified. Existence of an oil- and gas-bearing structure with large reserves was confirmed in northern Sichuan, as were five oil- and gas-bearing strata in north China, the south Songhuajiang-Liaohe plain, Ordos, north Jiangsu, and the Tarim Basin. Brown coal deposits with reserves of about 2 billion tons were discovered in the Baiyuanhua Basin. Also, the reserves at the Yongcheng coal mine in Henan were verified at 1.24 billion tons. Among the new discoveries in 1981 were 13 nonferrous metals, including a large molybdenum deposit in Laiyuan County in Hebei and a tin deposit in Yunnan which had 30 rich veins. Other finds included kaolin in Fujian, graphite near Jixi in Heilongjiang, marble in Beijing, Fangshan, and Miyuan, and attapulgite clay in Luhev, Xuyi, and Jiangsu.

The Income Tax Law Concerning Foreign Enterprises was to become effective on January 1, 1982. The tax rate on foreign enterprises ranged from 20% for annual income below 250,000 yuan to 40% for income over 1 million yuan. In addition, a local tax of 10% on the same taxable income was to be levied. Low-profit ventures might be exempt from income taxes in the first profit-making year; be allowed a 50% reduction in the second and third years; and with the approval of the Ministry of Finance, be allowed a 15% to 30% reduction in taxes after the third year for a period of 10 years. Also, losses incurred in a tax year could be carried over to the following year; or if sequential yearly losses occurred, the deductions could be claimed for a period of up to 5 years.

Because of restricted land and water transport capacity, China was to speed up the construction of rail and port facilities, particularly to alleviate problems for shipment of coal and other export goods. The transport capacity of railways used for coal mining, such as the Beijing-Shanhaiguan Beijing-Tongliao, Qindao-Jinan, and Handan-Changzhi lines, were to be expanded. Six railways were to be electrified: Lianyungang-Xinjiang, Beijing-Baotou, Shijiazhuang-Taiyuan, Xinjiang-Chongqing, Chengdu-Chongqing, and Zhuzhou-Guiyang. China had a total of 50,000 kilome-

ters of operational rail line, and in 1981, freight transported totaled 1,048 million tons. For waterways, port transport capacity was to be expanded; barging was to be increased; more hatchways were to be opened; existing docks built by industrial and mining concerns were to be utilized; new transport facilities were to be developed through joint ventures; cargo containerization was to be improved; and efficiency of existing capacity was to be raised.

Beginning in early 1982, the Government of China was to be restructured and streamlined. Under the proposed reorganization, the number of vice premiers was to be reduced from 13 to 2 and the number of governmental organs (ministries, commissions, and agencies) was to be reduced from 98 to 52. Overall employment in the State Council, ministries, and commissions was to be cut from 49,000 to 32,000. Goverment revamping was to be carried out in stages with the first changes at the ministerial level. These included a new Ministry of Water Conservancy and Power (merger of the Ministry of Power Industry and the Ministry of Water Conservancy), a new Ministry of Commerce (merger of Ministries of Food and Commerce, and certain functions of the All-China Federation of Supply and Marketing Cooperatives), and a new Ministry of Foreign Trade and Economic Relations (merger of State Administrative Commission on Import and Export Affairs, Ministries of Foreign Trade and Economic Relations with Foreign Countries, and the State Foreign Investment Commission). The Ministries of Coal, Chemicals, and Textile Industries were to remain as separate entities but were to be reformed with a simplified internal structure.

PRODUCTION

In 1979, the Government announced a readjustment program for the Chinese economy, thereby reordering planning priorities, enunciating new capital construction policies, and generally slowing the pace for modernization. The 10-year plan for 1981-90 was scrapped, and the sixth 5-year plan (1981-86) was substituted in which heavy industry was to support growth and development in light industry and agriculture. Moreover, all phases of Government and industry were to be rejuvenated. While the iron and steel sector was to be deemphasized, the fuel sector (coal, oil, and electric power) continued to receive high priority. In addition, there was to be an expansion of the nonferrous sector. In essence, priority was to be given to projects that required less foreign exchange, provided a faster return on investment, and offered greater export earnings.

Generally, the targets or quota for commodity production in 1981 were lower than the output levels attained in 1980. For instance, while production in the iron and steel sector and in the fuels sector in 1981 was below the 1980 output levels, production in this sector exceeded the targets of 1981.

While China produces a wide variety of mineral and metal commodities, published official statistics are severely limited. For instance, Chinese pronouncements revealed that nonferrous metals production exceeded the 1-million-ton mark in 1979, that the 1980 level exceeded the 1979 output by 8%, and that the 1981 output was 3% greater than that of 1980. For other commodities, no official data were available. While China's gold production was believed to have increased, the country's monetary gold reserves have remained at 12.67 million troy ounces. In addition to being a traditional producer of such commodities as antimony, fluorspar, mercury, tin, and tungsten, China was becoming a significant producer of barite, beryllium, germanium, lithium, rare earths, tantalum, titanium, and vanadium.[5]

Table 1.—China: Estimated[1] production of mineral commodities[2]

(Metric tons unless otherwise specified)

Commodity[3]	1977	1978	1979	1980	1981[p]
METALS					
Aluminum:					
Bauxite, gross weight[4]	1,500,000	1,500,000	1,500,000	1,500,000	1,500,000
Alumina, gross weight	750,000	750,000	750,000	750,000	750,000
Metal, refined, primary	350,000	360,000	360,000	360,000	360,000
Antimony, mine output, metal content	10,000	10,000	10,000	10,000	10,000
Bismuth, mine output, metal content	225	240	260	260	260
Cadmium metal, smelter	200	220	225	225	225
Copper:					
Mine output, metal content	195,000	200,000	200,000	200,000	200,000
Metal:					
Smelter, primary and secondary	195,000	200,000	200,000	200,000	200,000
Refined, primary and secondary	260,000	270,000	280,000	280,000	280,000
Gold, mine output, metal content—troy ounces	100,000	150,000	200,000	225,000	1,700,000
Iron and steel:					
Iron ore, gross weight[5] — thousand tons	r81,000	r70,000	r75,000	75,000	70,000
Pig iron[6] — do.	25,050	34,790	36,730	38,020	34,170

[p]Preliminary. [r]Revised.

[1]Except those figures specifically footnoted as reported.

[2]Table includes data available through July 7, 1982.

[3]In addition to the commodities listed for which quantitative estimates of output have been made, China is known or believed to have produced the following commodities for which no estimates, even of order of magnitude, have been prepared, owing to a paucity of general information upon which to base an estimate: Arsenic, chromite, titanium minerals, uranium, boron minerals, various clays (including kaolin), feldspar, lime, mica, sand, various industrial and dimension stones, and carbon black. Other unlisted commodities also may be produced.

[4]Diasporic bauxite; includes an estimated 165,000 metric tons per year of production for refractory applications.

[5]In terms of 50% Fe ore.

[6]Reported figures.

TRADE

China has signed government-to-government trade agreements and protocols with 90 countries, and trade ties exist with 175 countries. The total value of China's foreign trade was estimated at $20.7 billion in 1978, $29.3 billion in 1979, and $36.7 billion in 1980. Total trade in 1981 was expected to exceed $42.0 billion. In 1981, China's major trading partners were Japan, Xianggang (Hong Kong), the United States, the European Economic Community, the socialist economy countries collectively, and the Association of Southeast Asian Nations, in that order. The major export commodities to Japan consisted of crude oil, coal, textiles, light industrial manufactures, and handicrafts. Chinese imports from Japan were predominantly iron and steel products (particularly shapes and semimanufactures), machinery and equipment, and chemical products. China's trade with Xianggang, a free trade zone, is largely for reexport. By far the largest export category to the United States was light manufactured articles—cotton fabric, textiles, floor coverings, and clothing. Other significant export categories included mineral fuels, crude materials, and chemicals.

During 1981, China was a fledgling purveyor of diverse minerals, metals, and fuel derivatives (refined and intermediary products and raw materials to the United States. In terms of U.S. customs value, these exports totaled $458 million and were as follows in thousand dollars:

Aluminum	21,165
Antimony	5,887
Arsenic	756
Barium	28,844
Beryllium	1,424
Cadmium	270
Calcium	60
Chromium	723

Zinc	1,186
Total	458,113

During the decade, China was expected to realign its trade patterns along the lines followed in its restructuring of domestic industry.[6] For instance, exports of food and sideline products were to decrease in light of domestic demand by a large population. Concomitantly, imports of chemical fertilizers, grains, and other like commodities were not expected to be reduced. By the second half of 1980, export of light industrial products and machinery was to increase, parallel with an increase in imports of advanced technology and capital equipment. China continued to develop its technology to produce refined metallurgical products for export. Initially, refractory bauxite and tungsten were notable examples of products upgraded to meet foreign end use specifications. Other shipments included significant quantities of pig iron, manganese, rare earths, silicon, and tungsten. Moreover, the Government announced plans to develop China's nonferrous base for both internal use and external purchases, particularly by Japan, and perhaps by the United States.

The Government approved the establishment of five special economic zones—four in Guangdong Province (Shantou, Shekou, Shenzhen, and Zhuhai) and one in Fujian Province (Xiamen).[7] In these free export zones, foreign investors may establish 100% owned subsidiaries, heretofore impossible in China. Shenzhen, the largest trade zone, had attracted $1 billion in overseas investments. Furthermore, Guangdong officials stated that they would welcome foreign cooperation in the development of mineral resources on Hainan Island, which would be treated unofficially as a free trade zone.[8]

COMMODITY REVIEW

METALS

Aluminum.—China has extensive resources of aluminous materials, and estimates range around 1 billion tons. Diasporic bauxite is the main aluminum ore mineral in China. Other high-alumina minerals such as cyanite, sillimanite, and andalusite occur throughout the country. Bauxite occurs in Guangxi, Guizhou, Hebei, Henan, Shanxi, and Sichuan. While reserves in Shanxi account for about one-fourth of the total reserves in China, Henan is reportedly the largest producer. A cyanite deposit with an estimated reserve of 1 million tons was discovered in Xingtai County in southwestern Hebei. An alumnite deposit with a verified reserve of 7 million tons was found in eastern Fujian.

Aside from isolated shipments in the early 1970's, China began exporting refractory-grade bauxite to the United

States in 1979. Shipments of metallurgical-grade bauxite were also being considered. Under a preliminary agreement, Minermet S.A. of Italy was to construct a calcining plant in Henan to produce 200,000 tons per year of bauxite using two rotary kilns. Under the agreement, Minermet was to export 50% of the output.

The new aluminum smelter at Guiyang, Guizhou, was commissioned in December 1981 with one operational potline (40,000 tons per year). The second potline of 40,000 tons was expected to be operational in 1982. The bauxite reserve in Guizhou was estimated at over 200 million tons.

China's primary aluminum plants were as follows, with capacity expressed in thousand tons per year:

Hefei, Anhui	25
Lanzhou, Gansu	30
Guiyang, Guizhou	40
Wuhan, Hubei	35
Changsa, Hunan	15
Changchun, Jilin	15
Fushun, Liaoning	100
Baotou, Nei Monggol	NA
Nanding, Shandong	NA
Qingdao, Shandong	15
Taiyuan, Shanxi	25
Kunming, Yunnan	15

NA Not available.

A large refinery proposed for Guangxi was deferred under China's economic retrenchment program.

Antimony.—China has large reserves of antimony and traditionally has been ranked as one of the top three world producers. The Xikuangshan Mine is a large, world-famous antimony mine. Xikuangshan means tin mine; hence, the name arose from misidentification. The mining district covers 14 square kilometers and is divided into two sections with independent mining, processing, and smelting sections. Sulfide ores occur in the southern part, while the northern division has complex ore comprised of mixed oxides and sulfides. Antimony was also mined in Guangdong. In addition to antimony finds in Qinghai, Shaanxi, Sichuan, Xizang, and Yunnan, a rich antimony occurrence was reported in Xihe, Gansu.

Chromium.—Chromite occurrences are widespread in northwest China. The deposits in the east are small, but larger occurrences have been discovered in Xizang. Platinum with associated chromite occurs in Dali, Yunnan. China's largest chromite find is in the Zhayier Mountains, northwest of Junggar Pendi, Xinjiang. Reserves are estimated at 1 million tons of 35% Cr_2O_3 ore. Chromium occurs associated in complex mineralization of iron ore in Panzhihua, Sichuan, and Baiunebo, Nei Monggol. A hard chromium mineral was discovered in the Liuzhuang area of Tongbai, Henan.

Cobalt.—Cobalt was recovered as a byproduct of nickel-copper and platinum refining at Jinchuan, Gansu. The Jinchuan nickel-copper sulfide deposit (0.035% cobalt) contains 100,000 tons of cobalt. The Zhuhou refinery in Hunan also recovers cobalt. Other cobalt association has been reported in ores at Panzhihua, Sichuan; Baiyunnebo, Nei Monggol; Hainan, Guangdong; Donghongshan, Yunnan; and Panshi Xian, Jilian.

Columbium and Tantalum.—China has abundant resources of columbium and tantalum. The quantity of tantalum pentoxide in slag from past tin operations may amount to several million pounds. In March 1981, a 3-year program was to begin to survey columbium, tantalum, and tin deposits in the Wangxiang area of Hunan. The Fujian Provincial Geological Bureau announced the finding of a promising columbium-tantalum deposit in Fujian. Tantalum was recovered as a coproduct from an apogranite-type tin deposit at Yichun, Jiangxi, which was estimated to be about 100 million tons containing 200 grams of tantalum pentoxide per ton of ore. Ore throughput capacity was 200,000 to 250,000 tons per year. Beneficiation produced a 28% tantalum pentoxide concentrate, and the recovery rate was around 60%. At Limu, Guangxi, tantalum was recovered as a byproduct from tin slag. Annual ore production was about 300,000 tons containing 150 grams of tantalum pentoxide per ton. Small amounts of tantalum concentrates were reportedly recovered from pegmatites in the Altai Mountains (north of Urunqi), Xinjiang, and in Guangdong Province.

Copper.—China's most significant copper deposits occur mainly in the valleys of the middle and lower reaches of the Changjiang River and in the southwestern region. There are also important deposits in the northwest and north. Total reserves were estimated to exceed 50.4 million tons of contained metal. The six major mining areas centered around Tongling, Anhui; Baiyanchang, Gansu; Daye, Hubei; Dexing, Jiangxi; Zhongtiaoshan, Shanxi; and Dongchuan, Yunnan. Recent finds of copper

mineralization include Zhangdu, Xizang (reserves of 6.4 million tons); Anjing, Anhui (20 million tons); Tongshankow, Hubei (50 million tons); Qamdo, Xizang (6.48 million tons); and Fengchang, Liaoning (260 million tons).

Current metal output level was only about 300,000 tons, and up to 200,000 tons was imported annually to meet demand. China's copper smelter-refining facilities are as follows in thousand tons:

Tongling, Anhui	
No. 1	30
No. 2	30
Baiyin, Gansu	30
Zhuzhou, Henan	10
Daye, Hubei	30
Zhenyang, Liaoning	50
Shanghai	50
Kunming, Yunnan	45

Small copper facilities are located in Beijing, Hainan, Lanzhon, Taiyuan, and Urunqi. Sumitomo Metal Mining Co. was to resume the construction of a 90,000-ton-per-year copper smelter at Guixi, Jiangxi. The project, along with a Fluor Corp. contract to develop an extensive porphyry deposit in Jiangxi, was suspended during the readjustment period. The $117 million Sumitomo project may later include a refinery and fabricating facilities. Status of the Fluor Corp. project at Dexing, Jiangxi, and the Japanese Government-assisted project at Anqing, Anhui, were not known.

Gold and Silver.—China has a long history of gold mining, and panning was carried out along its coasts in ancient times. Most of the gold mines are concentrated in the northeast, eastern China, and the Qinbeng and Yanshan regions. China's major gold-producing areas are Hebei, Heilongjiang, Liaoning, Nei Monggol, and Shandong. Shandong is probably the principal producer with five major underground mines and up to 30 small mines. Output level in Shandong was estimated at 320,000 to 480,000 troy ounces per year. There were numerous announcements of gold and silver finds—lode, placer, mixed ores—throughout China. Xinjiang was reported to be particularly abundant in alluvial gold. Lode silver was found in the Miyun area, northeast of Beijing. Gold output in 1981 was based on an estimate given by The Gold Institute, Washington, D.C.

Gold production has been variously estimated from 688,000 troy ounces per year to 1,900,000 troy ounces per year. In the spring of 1980, a conference was held on gold production in Urumgi, Xinjiang. Also, to promote increased production, China engaged Wright Engineering of Canada and Davy McKee of Great Britain to conduct feasibility studies on mines in Shandong. Furthermore, the People's Bank of China had lent 46 million yuan for the development of 36 gold mines to increase total production by 140,000 liang. Surveys for gold were underway in over 10 Provinces, including Hebei, Heilongjiang, Liaoning, and Nei Monggol, which have gold-producing areas. In early 1981, a large gold occurrence was reportedly discovered in Yunnan. The Ministry of Metallurgical Industry announced that the planned gold output was overfulfilled by 14.3% in 1979 and by 15.3% in 1980. China's gold transactions on the international market during the last two decades included purchase of 4,822,605 troy ounces in 1965, 1,028,822 troy ounces in 1966, and 2,572,056 troy ounces in 1968, and sale of 2,572,056 troy ounces in 1976. China used 120,000 troy ounces in 1979 for production of its 30th anniversary commemorative gold coin sets, but bought the same amount of gold in Xianggang to replace the metal used.

Iron Ore.—China's reserves of iron ore were estimated at 44 billion tons. The principal mines were Anshan and Benxi in Liaoning, Panzhihua in Sichuan, Maanshan in Anhui, Meishan in Nanjing, Daye in Hubei, Shichang in Hebei, Bayan Obo in Nei Monggul, Jingtieshan in Gansu, and Shilu in Hainan. The Anshan-type ore deposits (sedimentary metamorphic) are the main type in China and are distributed over an area from Anshan, Liaoning, to Jidong, Hebei. The Anshan ore is easily extracted but is not of high grade. There are large beds of titaniferous magnetite containing vanadium spread out in Panzhihua, Sichuan. The Daye-type deposits, formed by the interaction of gas and heat along contact edges, are found around Daye, Hubei, and east of this area. Iron and siderite mineral beds associated with volcanic action were expected to increase China's iron reserve-resource base.

Total mine output of iron ore approaches 120 million tons of mostly low-grade ore (around 30% grade), which is upgraded to 60% or better. Imports from Australia, Brazil, and North Korea (probably totaling less than 10 million tons) supplement domestic mine production.

Many iron ore mines began adopting a technique of ore segregation based on sieving followed by grinding. This technique was initially used with success by the Dagushan iron ore mine of Anshan Iron and Steel Co. Reportedly, ores with at least 30% iron were upgraded with this technique to 67% to 68%.

Iron and Steel.—China's annual capacity to produce steel was around 37 million tons. With the exception of Shanghai, all of the major iron and steel complexes are located near indigenous supplies of coal and iron ore. Shanghai is the only site with a coastal location. Eleven iron and steel complexes account for 86% of China's annual steel production: Anshan, Baotou, Beijing, Benqi, Maanshan, Panzhihua, Shanghai, Taiyuan, Tanggu, Tianjin, and Wuhan. Smaller iron and steelworks exist in every Province and Autonomous Region except Xizang. Collectively these units have an annual production capacity of 11 million tons of iron and 8 million tons of steel and steel products.

China's iron and steelworks were characterized by the Japanese as follows, in terms of annual crude steel output:

OVER 3 MILLION TONS	
Anshan	Wuhan
Baotou	
50,000 TO 3 MILLION TONS	
Anyang	Panzhihua
Beijing	Shanghai
Benqi	Shijingshan
Chengdu	Shoudu

Liubo	Xinyang
Liuzhou	Yanchuan
Macheng	Yangquan
Nanchang	Yantai
Nanjing	Zhejiang
	Banshan

The east coast of China contains by far the highest concentration of steelmaking plants.

During 1979, China reevaluated its modernization programs. The Baoshan iron and steel project was originally to be completed in two stages (3 million tons capacity in 1982 and the remaining 3 million tons by 1985). In November 1980, the Government announced the suspension of the second phase construction. Construction was to continue on the coal-fired powerplant at the site, and work was to continue on the Baoshan first stage at a slower pace. During 1981, Government announcements simply stated that construction of Baoshan continued.

The main thrusts in the iron and steel sector were to be modernization of existing installations by lowering energy and coke

consumption per ton of steel produced, lowering pig iron consumption by increasing scrap utilization, and improving steel-rolling output capacity and technology. Futhermore, steel product specifications were to meet the needs for producing machinery used in the agricultural and light industry sectors.

The installation of a 1,326-cubic-meter inner-volume blast furnace at Shoudu Iron and Steel Co. was completed in 1979, and startup of the furnace began in late December 1979. Operation of the furnace was deemed satisfactory, and productivity was increasing. The utilization coefficient of this blast furnace reportedly reached a monthly average of 1,729 tons per cubic meter per day during March 1980 and a coke consumption ratio of 525 kilograms per ton. In comparison, the No. 1 blast furnace at Shoudu has a monthly utilization coefficient of 3,114 tons per cubic meter per day and a coke ratio of 362 kilograms per ton. Shoudu has four blast furnaces (the smallest being 576 cubic meters) with a total capacity of 3,561 cubic meters. Shoudu reportedly has the highest average utilization coefficient of all Chinese iron and steelworks.

Installation of the No. 2 steel melting furnace, a continuous casting shop, a hot-rolling mill, a cold-rolling mill, and a silicon sheet steel shop at Shoudou was basically completed in December 1978; the entire construction time required 42 months. Commissioning of the 3-million-ton rolled and plate steel facility was in 1979.

In 1981, Beijing's Capitol Iron and Steel Corp. (CISC) was cited by the Government for its management techniques and increased productivity. CISC was reorganized, and independent entities within the corporation such as transport, power, water, supply, and labor were consolidated for easier control and coordination. Each unit in the new organization was given a daily production plan as well as an operational plan. Individual and a position or station responsibility systems were instituted. Bonuses for good performance were given to the work group, rather than the individual, and were to be equally distributed. Cost savings measures initiated during the year resulted in a profit of 312 million yuan (42 million yuan over the quota). Measures to reduce cost included recycling blast furnace ash (coke consumption per ton of iron produced was reduced from 443 kilograms to 412 kilograms), water and electricity conservation, sale of iron ore, sale of services to other enterprises, and shift of product output to consumer goods and building materials.

CISC has captive iron ore mines located 70 to 80 kilometers from Tangshan, Hebei, which produce 12 million tons of ore (24% to 28% iron content) per year. The ore is beneficiated to 68.5% iron before being shipped by rail to the mill. CISC has eight sintering mills for agglomerating the ore. About 5 million tons of coal per year is supplied from mines in Hebei and Shanxi. CISC's four coke ovens produce 1.2 million tons of coke annually. There are four blast furnaces with a combined daily output of 8,500 tons of iron. Half of the pig iron output is used internally for steel production, and the other half is sold. Annual output capacity of 1.4 million tons of steel is by five furnaces. Sixty percent of the steel output is sold as crude steel. Rolling capacity is about 500,000 tons; a 300-millimeter rolling mill produces 430,000 tons of steel beams for construction. There is also a 70,000-ton capacity for seam pipe and a cold-rolling capacity of 10,000 to 20,000 tons. New rolling capacity of 400,000 tons was being installed to produce nails and other items.

Between 1973 and 1979, China imported about 40,000 tons of stainless steel annually. Imports in 1979 were 47,000 tons: 17,000 tons of structural steel, 21,000 tons of steel plate, and 9,000 tons of pipe. Domestic production of stainless steel was 100,000 tons in 1979 and 86,300 tons in 1980. Nearly 80 types of stainless steel compositions were produced. The configuration of stainless steel output in China in 1980 was as follows in percent by product type:

Cold rolled:	
Sheet	35
Strip	3
Hot rolled (medium plate)	17
Hot-worked rods	23
Cold-worked rods	2
Wire	1
Pipe	10
Unspecified	9

The Shanghai Steelworks account for about 67% of the country's output of stainless steel sheet and about 89% of the medium-thickness plate.

Some of China's stainless steel production and finishing facilities included Changcheng Steel Mill (hot extrusion press and electron beam furnace); Taiyuan Steel-

works (medium plate annual capacity of 100,000 tons, cold-rolling plate capacity of 35,000 tons, and a 6-ton argon-oxygen decarburization furnace); Shanghai Steelworks (plate production and equipment for pipe); Dalian Steel Mill (10-ton vacuum-oxygen decarburization (VOD) furnace); and Fushun Steelworks (30-ton VOD furnace and 6-ton vacuum induction furnace).[9]

Lead-Zinc.—China has a long history of lead-zinc mining with deposits occurring widely throughout China. Occurrences being worked included the Shuikoushan Mine, Changsa, Hunan; Totaolin, Hunan; the Fankou deposit, Shaoguan, Guangdong; the Qinting mining district, Lanping, Yunnan; the Zhehai district, Yunnan; and Changpo, Guangxi. In addition, small operations in Guangxi, Xizang, and Yunnan collectively account for about 20,000 tons of ore per year for each Province. Recent reports of lead-zinc mineralization included occurrences in the Lian He Banner region, Nei Monggol; Huili County, Sichuan; Miyun County, Beijing; Cheng County, Gansu; and Xitilshan, Qinghai.

A lead-zinc mine, with confirmed reserves of 3.8 million tons of high-grade ore and inferred reserves of 10 million tons, was expected to open by the end of 1981 in Chengxian, Gansu. The mine will be operated by the Baiyin Nonferrous Metallurgical Corp. During the first 3 years, daily output of lead-zinc concentrates will be 600 tons, which will be expanded to 4,000 tons.

China's smelter facilities were as follows with capacity in thousand tons:

	Lead	Zinc
Liencheng, Fujian	NA	NA
Guangzhons, Guangdong	NA	--
Shaoguan, Guanddong	12	30
Changpo, Guangxi	5	20
Changchun, Heilongjiang	NA	--
Wuhan, Hubei	NA	--
Sungbei, Hunan	10	5
Zhushou, Hunan	50	100
Huludao, Liaoning	--	60
Shanghai	6	--
Shenyang, Liaoning	50	20
Kunming, Yunnan	NA	--

NA Not available.

As part of the current economic plan, China's nonferrous industry was to be modernized and expanded. During prior negotiations, Mitsubishi Metal Corp. of Japan was to assist in the development of the lead-zinc industry. Presumably, both mine and smelter operations were to be developed, expanded, and modernized.

Manganese.—China has large deposits of manganese. The best known mines are located in the south-central region, especially in east and southeast Guangxi. Other producing areas include Fancheng, Guandong; Shaoshanchang, Hunan; and Wafangzu, Liaoning. Also, large deposits were reported in Daxin, Guangxi, and southern Yunnan. The Hunan Geology Bureau surveyed three separate deposits of manganese, each containing about 25 million tons. A large manganese deposit in Daxin County, Guangxi, was reportedly being prepared for mining.

Mercury.—The well-known mercury belt of China is located in Hunan and Guizhou. In fact, Guizhou is known as the "Province of mercury." The five large mercury mines in Guizhou account for 90% of China's total output. Substantial mercury resources, estimated at 5,000 tons have been discovered in the Qinding mountain region.

Molybdenum.—China's large resources of molybdenum are in silicates and in porphyries, mainly distributed in the north. The important occurrences are in the Qingling and Funiushan Mountains. The copper deposits at Dexing, Jiangxi, contain 0.03% to 0.08% molybdenum, and tungsten deposits at Shinzhuyuan in the Waling Mountains, Hunan, contain 0.06% molybdenum. There were also appreciable molybdenum values in the porphyry copper at Jinduicheng, Shaanxi, and in tungsten deposits in Hunan, Jiangxi, and Yunnan. The Yangjiachangzu Mine in Jinxi, Liaoning, reportedly produces 1,000 tons of molybdenum concentrate annually; ore reserves were several million tons of 0.1% to 0.3% molybdenum.

A mineral occurrence reportedly containing 1.5 million tons of molybdenum was reported in Luanchuan County in Henan. Two occurrences of molybdenum were reported in Harquin Zhoyi, Liaoning. Under financial assistance from the China International Trust and Investment Corp., the Xiaosigu mine and milling operation in Hebei was expanded to export molybdenum concentrate.

Nickel.—China's largest nickel mine is at Jinchuan, Gansu, which the Chinese describe as the second largest nickel sulfide deposit in the world. Reserves at the mine have been estimated at 5 million tons of contained nickel, 3.5 million tons of copper, and 100,000 tons of cobalt. The mine, producing 10,000 tons of nickel per year, was

expanded, and output capacity in 1981 was 15,000 tons. The metallurgical complex at Jinchuan began producing electrolytic nickel in 1964 as well as byproduct cobalt, copper, gold, and silver. Nickel finds have been reported in Hebei, Hubei, Hunan, Jiangsu, and Shandong. A copper-nickel prospect in the Kalaton region in the Altai Mountain area of Xinjuang reportedly contains 4.9% copper and 4% nickel. A platinum-nickel occurrence was found in western Sichuan.

Platinum.—In the late 1960's, platinum occurrences were discovered associated with chromite and nickel. Later, platinum mineral beds were also found, as well as other minerals containing associated platinum. Platinum was reported in chromite in Xazang and in Dali, Yunnan, and was found in Guangdong. Nickel-copper sulfide ore at Jinchuan, Gansu, contains about 0.32 gram of platinum per ton of raw ore. A platinum nickel sulfide deposit was discovered in the western plateau of Sichuan. The mineralization also contained cobalt, copper, gold, and silver.

Rare-Earth Minerals.—China has vast reserves of rare-earth minerals estimated at over 36 million tons, 98% of which are in Nei Monggol. The remainder of the reserves were in Guangdong, Hunan, and Jiangxi. The Bayan Obo Mine in Nei Monggol is the country's major producer (reserves of 35 million tons), and its ore is high in europium and samarium. The rare-earth deposits in Jiangxi (reserves of 1.04 million tons) are high in yttrium values. China ranks second in world ouput of bastnasite after the United States. The three largest refinery operations were: No. 1 Smelting Plant, Gansu; Baotou Iron and Steel Co., Nei Monggol; and Yaolong Chemical Plant, Shanghai. The Gansu operation is China's largest refinery with an annual output capacity of 6,000 tons of mixed rare-earth chlorides. Chinese technical personnel have visited the U.S. rare earths industry as well as the world producers.

Tin.—The two main tin-producing centers are Gejiu in Yunnan, and Hechi in Guangxi. There are also tin mines in Guangdong, Hunan, and Jiangxi. Chinese tin is mainly cassiterite and has a high iron content compared to alluvial or placer tin in southeast Asia. On the whole, sulfide fuming has been adopted to separate the tin, leaving the iron in the slags. Electrolytic refining is used to purify the low-grade metal. Tin concentrates containing lead were used to produce solders, and those having arsenic were treated to recover arsenic oxide for insecticides. Byproducts recovered at the smelters were antimony, arsenic, columbium, lead, and tantalum.

China's tin smelter capacity in tons per year was as follows:

Guangzhou, Guangdong	1,000
Kanchou, Guangxi	100
Limo, Guangxi	400
Ping Gui, Guangxi	1,000
Liuchou, Guangxi	2,000
Hengyang, Hunan	100
Kokiu, Yunnan	10,000

All of the tin smelting and refining plants are in the tin belt area located in southeast China. A new smelter planned for Liepen, Guangxi, with an initial capacity of 6,000 tons per year (to be expanded to 12,000 tons) was expected to be opened by 1985.

Titanium.—Ilmenite was recovered from beach sand dredging operations along the Guangdong-Guangxi coast and in Hainan Dao. About 25,000 tons of ilmenite is produced annually in Guangdong, and about 10,000 tons per year in Guangxi. A large quantity of titanium slag is produced at Panzhihua iron and steel complex in Sichuan. Slag treatment facilities at Panzhihua were established to recover vanadium and produce 50,000 tons per year of titania. Titanium slag is also produced at the Chengde iron and steelworks in Hebei. Sponge output at Chengdu is only about 1,000 tons per year. Small electrolytic plants (500-ton-per-year capacity) were reportedly being operated at Fushun, Liaoning, and at Shanghai. China reportedly petitioned the United States to have Chinese exports classified under the General System of Preference. Currently, there is a 25% ad valorem tariff on Chinese titanium (sponge, ingot, and mill products) exported to the United States.

Tungsten.—China is well known for its tungsten, with large occurrences mainly in Jiangxi, Guangdong, and Hunan, south of the Nanling Mountains. Ten large tungsten mines are in operation in southern Jiangxi. The tungsten deposit in Xikuang, Hunan, is reportedly the world's largest; however, it is a low-grade ore, 0.22% tungsten. At the Xiangdong Mine, Hunan, daily throughput is 1,000 tons. The oldest tungsten mine, in Chna Xihuastan, is at Huashan, Jiangxi. Annual output is 2,500 tons of 65% tung-

sten concentrate. Tungsten mining operations in Guangdong were Dachishan, Tangjiang, and Yaoling. Aside from the tungsten in the Nanling Range, other mines in Guangxi included Dongxing, Lingma, and Nashan. The Changyingling ore-dressing plant in Guangxi went into operation in 1981 with a daily ore-treating capacity of 2,000 tons to produce about 4,000 tons per year of tungsten concentrates. The plant will also recover annually 800 tons of tin concentrate, 170 tons of copper concentrate, and 470 tons of zinc concentrate. Ore reserves at Zhizhuyuan (Chen County), Hunan, were reported to be 190 million tons, grading 0.33% tungsten. Other deposits in Hunan included Yaogangxian and Yangjiatan. A tungsten mine was being worked at Dajishan, Zhejiang. Tungsten was also recovered as a byproduct from the tin operation at Limi, Guangxi.

A 10-day tungsten symposium, jointly sponsored by the Chinese Ministry of Geology and the regional mineral resources development center of the United Nations Economic and Social Commission for Asia and the Pacific, was held at Nanchang, Jiangxi, in October 1981. In a joint venture between China Metals and Minerals Corp. and Li Tungsten Corp. of the United States, Chi Mei Metals Corp. (Glen Cove, N.Y.) was formed to market China's products directly to U.S. consumers.

Vanadium.—Vanadiferous slag was recovered from titaniferous magnetite (0.3% vanadium pentoxide) used in ironmaking at Panghihua, Sichuan; Chengde, Hebei; and Naashan, Anhui. While annual slag output capacity was theoretically 50,000 tons, current production was about 30,000 tons of 14% vanadium pentoxide slag at Panzhihua. Annual slag output at Chengde was about 8,000 tons of 13% pentoxide and at Maashan, 5,000 tons of 17.5% pentoxide. Vanadiferous slags were treated at Jinzhou, Liaoning, which produces about one-half of the country's total output of refined vanadium pentoxide. Slags are also treated in plants at Shanghai, Nanjing, and Emei.

NONMETALS

Cement.—The development of China's small cement plants (plants not part of the unified state distribution system) arose from farmland construction and rural housing. There were reportedly about 4,500 small cement plants, with about 3,000 using vertical kilns, in the country, which produced 54.27 million tons of cement in 1980 amounting to 68% of the total output in China. There were 7 million tons produced by plants run by collectives at the commune or production brigade level and 47 million tons by plants above the county level. Medium- and large-size cement plants located in all Provinces and Autonomous Regions except Ningxia and Xizang accounted for the remainder of the national output.

In late 1981, the new cement plants at Baimashan, Anhui, and Wushan, Gansu, each with an annual production capacity of 800,000 tons, began trial operations. The Pingdingshan cement plant in Henan was nearing completion, and cement construction and expansion projects at Changxing, Zhijiang (450,000 tons per year), Qujiang, Sichuan, and Xingiang were on schedule. Construction began on the Jidong cement plant, Hebei (1.5 million tons per year); all of the equipment was imported from Japan. Construction of the Hirachi cement plant near Xuzhon, Jiangsu (1 million tons per year), was also underway. Site preparation was completed for the Ningguo cement plant in Anhui (1.5 million tons per year). Smaller cement plants were being constructed at Yanbian, Jilin, Litang, Guangxi, and Kaiyuan, Yunnan.[10]

Fertilizers.—In 1981, China produced about 60 million tons of chemical fertilizers, making her a world-ranking producer. During the fourth 5-year plan, China purchased 14 large ammonia units, each with a daily capacity of 1,000 tons of ammonia and 1,620 tons of urea. By September 1979, installation was completed and the plants were placed into operation. The 14 units were located as follows: Sichuan Chemical Plant, Lughon Natural Gas Chemical Plant, Yunnan Natural Gas Chemical Plant, Guizhou Cheshui Natural Gas Chemical Fertilizer Plant, Daqing Chemical Fertilizer Plant, Liaoning Liaohe Chemical Fertilizer Plant, Hebei Cangzhon Chemical Fertilizer Plant, Shandong Shengli Petrochemical Complex, Shengli No. 2 Chemical Fertilizer Plant, Jiangsu Nanjing Xixiashan Chemical Fertilizer Plant, Anhui Anqing Petrochemical Complex, Hunan Tongding Nitrogen Fertilizer Plant, Hubei Provincial Chemical Fertilizer Plant, and Guangzhou Petrochemical Complex. China has about 1,500 small nitrogen fertilizer plants, of which 200 have an annual output of about 10,000 tons. In addition, there are 53 middle-sized nitrogen fertilizer plants located throughout the Provinces, municipalities, and Autonomous Regions except for Qinghai and Xizang.[11]

Graphite.—Natural flake graphite is mined in Hebei, Helongjiang, Nei Monggol, and Shandong. The largest production is from Shandong, the smallest from Hebei. Estimated reserves for flake graphite are in excess of 10 million tons. The occurrences appear to be lagoonal deposits containing graphite and marble. Both underground and open pit mining methods are employed. Raw ore with up to 34% fixed carbon is hand-sorted. The ore is crushed, beneficiated by flotation to a carbon content of 80% to 90%, sized, and bagged for shipping.

Magnesite.—The magnesite resource at Da Shih-Qiao, Liaoning, has proven reserves of 3 billion tons, with at least 50% containing 95% MgO on a calcined basis. Three open pit operations are worked at Da Shih-Qiao with each mine producing about 700,000 tons of dead-burned magnesite, 30,000 tons of dead-burned dolomite, and several thousand tons of light-burned magnesite. Mined material is sized and then moved by truck to calcining plants. There were 30 shaft kilns and 2 rotary kilns for calcining. The shaft kilns vary in size and produce 40 to 80 tons per day of dead-burned magnesite. Each of the rotary kilns produces about 200 tons per day. After calcining, the material is cobbed to assure uniform quality before storing in silos. Light-burned material is produced in a separate kiln. Electric arc furnaces, each with an annual output capacity of about 2,500 tons, produce fused magnesite.

Low-iron magnesite is believed to be mined in other Provinces. New magnesite deposits were reportedly discovered in Hebei, Shandong, and Sichuan.

MINERAL FUELS

China's primary energy output in 1981 was 620 million tons in terms of standard coal. China's principal energy source was coal, accounting for 71% of the total; the remainder of the energy was mainly from petroleum and natural gas, 21%; hydropower, 3%; and other, 5%. China has no nuclear powerplants. Under the current economic program, priority will be given to the development of coal and hydropower, as well as to energetic development of oil and natural gas. Nuclear power stations may be built to serve energy-poor areas; and in the vast rural areas, the use of biogas and firewood will continue. Research will be conducted to develop nonconventional energy sources such as solar, geothermal, wind, and marine resources.[12]

China's power industry has a total installed generating capacity of 60 million kilowatts. There are five large power grids—the north, northeast, east, central, and the Shaanxi-Gansu-Qinghai area. In addition, there are 27 provincial power supply networks. Construction of two large power grids in the south and southwest was underway, and work has also been started to integrate the power networks.

Sixty-one large thermal and hydroelectric power stations were under construction or being expanded. When completed, the country's total generating capacity will be increased by 20 million kilowatts. Proposed construction of seven new stations will add 2 million kilowatts. The largest thermal power station currently under construction is at Datong, Shanxi; it has a design capacity of 1.2 million kilowatts. Thermal plants being expanded include Douhe, Hebei (800,000 kilowatts), Matou (400,000 kilowatts), and Yaoming (1.2 million kilowatts).[13]

Large hydropower stations were being built on the Changjiang, Huanghe, Songhua, and Dadu Rivers. The largest of the hydropower stations was Gezhouba on the Changjiang in Hubei with a design capacity of 2,175,000 kilowatts. Two of its generating sets, each with a capacity of 170,000 kilowatts, went into operation in late 1981. Also under construction was the Longyang Gorge hydropower station (1.4 million kilowatts) on the Huanghe in Qinghai.

Coal.—Since 1949, China has opened 2,181 state-owned mines. In addition, 18,000 mines were developed by rural communes and production brigades. In 1980, output by state-controlled mines totaled 344 million tons; that by Province-, prefecture-, and county-owned mines, 162 million tons; and that by commune- and brigade-run mines, 113 million tons. State-controlled mines also produced 24 million tons of oil shale (torbanite). Classification of state-distributed coal was as follows: Anthracite, 40 million tons; bituminous (includes coking coal), 293 million tons; and lignite, 12 million tons. Quality characteristics of Chinese coals follow: Average ash content of marketable coal from state-controlled mines, 22%; average gangue content, 0.5%; dust from washed coal, 10%; and average water content, 12%. Construction of 73 out of 116 washing and sorting projects was completed in 1980, increasing coal-washing capacity by 8 million tons and screening capacity by 4 million tons.

China's principal coal mines were located in Datong, Shanxi; Fengfeng and Kailuan,

Hebei; Benxi and Fushun, Liaoning; Hegang, Heilongjiang; Weibei, Shaanxi; the northern slope of the Tianshan mountains, Xinjiang; Pingdingshan, Henan; and Huainan and Huaibei, Anhui. Guizhou and Yunnan also have important coal mines. Shanxi Province alone accounts for about one-sixth of China's total production.

During 1980, capital investment for construction in the coal sector totaled 3.61 billion yuan—1.352 billion yuan for new mines and 0.422 billion yuan for expanding old mines. Thirty-one mines were completed and commissioned with collectively a total annual output capacity of 8.29 million tons—24 new mines (5.93 million tons) and 7 expansions (2.36 million tons).

New mining sites with a designed annual capacity of 10 million tons or more included Gujiao Mine, Shanxi; Yangzhou Mine, Shandong; Huainan and Huaibei Mines of Anhui; and Hanxing Mine, Hebei. New mines being constructed with an annual capacity of 5 to 10 million tons included Tiefa and Shenbli, Liaoning; and Zaoteng and Yidatum, Shandong. Other large mines under construction included Yanzishan Mine in Datong, and Shanxi (3 million ton capacity) and Xichu Mine in Gujiao.

The China National Coal Development Corp. (CNCDC) and Island Creek Coal Co. (Occidental Petroleum Co.) discussed the feasibility of developing the Antaibao coal deposit in Shanxi. Preliminary design called for a 15-million-ton-per-year open pit mine in the Pingshuo area. Japanese loans were being used in seven coal mining projects with a planned total annual output of 21 million tons; some of the mines were expected to go into operation in 1984. A compensation trade agreement with Romania to operate a mine in Huozian, Shanxi, was in effect. A French export credit loan will be used to import key equipment in the construction of a 4-million-ton-output coal mine; location was not disclosed. Discussions on joint coal development were held with French, West German, Italian, Japanese, Spanish, and U.S. companies. CNCDC also wanted foreign cooperation to help China in coal gasification and liquefaction projects.[14]

Petroleum and Natural Gas.—In 1949, China had only three oilfields—Laojunmiao in Yumen, Gansu; Dushanzi, Xinjiang; and Yanchang, Shaanxi; two gasfields—Shengdengshan and Shiyougou, Sichuan; and two shale oil plants in Liaoning. During 1953-57, the Karamay Oilfield in Xinjiang and the Lenghu Oilfield in Qinghai were discovered and developed. Crude oil output reached 11 million barrels in 1957. During the economic plan for 1958-62, zone prospecting began in several large basins in the north, northeast, and southeast. In 1959, a commercially promising oil-bearing strata was discovered in the sedimentary continental facies in the Song-Liao Basin. In 1960, the development program for Daqing was organized, and national oil production reached 47 million barrels in 1963.

Beginning in 1964, the focus for prospecting shifted to Bohai Bay and to the discovery and development of the Shengli Oilfield in Shandong, Dagang in Tianjin, Liaohe in Liaoning, and Jizhong in Hebei. New oilfields were discovered in Henan, Hubei, Jiangsu, and the Shaanxi-Gansu-Ningxia border region. National oil output reached 77.5 million barrels in 1979, and China became one of the principal oil-producing countries. Oil and gas had been discovered in 19 Provinces, municipalities, and Autonomous Regions, and 122 oil and/or gasfields were in operation. There are 15 oil and natural gas production bases: Cangqing, Dagang, Daqing, Henan, Jianghan, Jiangsu, Jilin, Jizhou, Liaohe, Qinghai, Shengli, Sichuan, Xinjiang, Yangchang, and Yumên.

Daqing is China's largest producer with three oilfields averaging collectively 365 million barrels per year since 1976. The Shengli oil zone, located in the northern Shandong plain, flanks both banks of the Huanghe River near its mouth. There are 23 wells in operation at Shengli, producing a total of about 131 million barrels per year. The Jizhong oil zone is in the northern part of the Northern China Plain. There are 14 wells in operation, altogether producing about 117 million barrels per year. The Liaohe oil zone is in northeast Liaodong Bay. Nine oil wells have been developed with annual production of around 37 million barrels. The Dagang oil zone is south of Tianjin at the estuary of the Haihe. Annual output was around 15 million barrels by nine oil wells. There are three oil wells in the Karamay oil zone of Xinjiang with a total output of about 29 million barrels. The sedimentary basin housing the Sichuan oil-gas zone extends into the western part of Hubei. To date, 59 gas wells and 11 oil wells have been verified. There were 53 gas wells producing 6.3 billion cubic meters of gas. Annual crude oil output was around 73 million barrels.[15]

Two new onshore discoveries were announced in 1981. One was in the Dongpu depression near Zhengzhou, Henan. Seismic exploration was expected to shift to the western and southern parts of the area. The second find was in Dongtai County, Jiangsu, at a depth of 2,416 meters, yielding a flow of 1,600 barrels per day.

Offshore oil was found in 22 of the 95 exploratory wells that were drilled in the Bohai Sea area. Three platforms were built for offshore oil extraction. Seventeen exploratory wells with eight shows were drilled in Beibu Bay, Yinnge Sea, and off the mouth of the Jujiang River. Also, prospecting was being conducted in the Donghai Sea. Since the latter half of 1979, 48 oil companies from 13 countries have taken part in exploration programs in offshore China. In September 1981, the Ministry of Petroleum Industry announced that physical exploration and assessment of oil shows at the Zhujiang River estuary in the South China Sea, the Yingge Sea, Beibu Bay, and the southern part of the Yellow Sea had been basically completed. Public bidding for joint oil exploration by Chinese and foreign corporations would begin at the latest in early 1982. Inasmuch as bidding, document tending, and contract negotiations will consume much of 1982, drilling was not likely to begin until 1983.[16]

China's current annual output level of refinery products was around 60 million tons, compared with an installed capacity of 96 million tons.

Uranium.—No factual data are available on China's uranium resources. Although uranium discoveries have been widely reported throughout the country, it is mostly concentrated in the southeast (Guangdong) and the northwest (Xinjiang). Judging from Chinese literature, most of the development work is by specialized units of the People's Liberation Army. China's reserves of uranium were estimated by one western analyst at around 800,000 tons. Officials of the European Economic Community engaged in discussions with the Chinese assert that China could become a long-term supplier of reasonably priced uranium.

The Mineral Industry of Colombia

By Doris M. Hyde[1]

In 1981, Colombia's gross national product (GNP) at current prices was estimated at $40.4 billion,[2] which in terms of constant 1970 dollars amounted to about $12.5 billion. In real terms, the economy grew at a rate of 2.5%, a decrease from the 4% registered in 1980. The rate of inflation edged up slightly to about 27%.

Colombia's mineral sector has been traditionally centered on the precious metals, emerald, coal, and limestone. In 1981, the value of nonfuel mineral production fell 6% below that of 1980, despite production increases of the major individual contributors. Mining was expected to assume an accelerated role in the future economy, which has over the years maintained about a 1% participation in the GNP.

By the end of 1981, Colombia was completing facilities for the start of ferronickel production. The depressed world market price for this metal has, temporarily at least, somewhat dampened Colombia's economic expectations from the nickel project. For the long term, Colombia was counting on a dramatic increase in coal production and export to stimulate economic growth and lessen the impact of unstable prices for agricultural products, particularly coffee, on foreign exchange earnings. Other future mining ventures planned include several promising copper deposits, bauxite, phosphate rock, and uranium.

Crude oil discoveries in the eastern plains during 1981 and secondary recovery efforts in the Middle Magdalena Valley have increased the possibility that Colombia may regain petroleum self-sufficiency by the mid-1980's. Other energy gains from new hydroelectric projects, completion of the new national electric power grid, and increased industrial use of coal and natural gas have combined to improve Colombia's energy balance.

Government Policies and Programs.—The Ministry of Energy and Mines has initiated a complete inventory of Colombia's mineral resources. The Instituto Nacional de Investigaciones Geologico-Mineras (INGEOMINAS), Empresa Colombiana de Minas (ECOMINAS), Carbones de Colombia (CARBOCOL), Instituto de Asuntos Nucleares de Colombia, and the Empresa Colombiana de Uranio, were mentioned as cooperating in this important undertaking. The study will attempt to establish the location, quantity, and quality of mineral reserves. The program objectives included improving coordination among the participating entities, training mining engineers, and providing a basis for establishing clear rules and guidelines for foreign investment.

In 1981, new foreign investment in Colombia reportedly dropped to $166 million, compared with $1.3 billion in 1980. A large portion of this difference was attributed to the 1980 investment in the El Cerrejón coal project. Excluding this amount, there has been an apparent downtrend since 1979 when foreign investment amounted to about $236 million.

The Government was considering a series of steps to attract foreign investment to Colombia's mining and petroleum sectors. In 1981, the Government was reported as having raised the ceiling on profit remittances abroad by foreign companies acting as consultants in the domestic mining industry. The allowable annual remittance was increased from 20% to 40% of invested capital.

Additional steps were under consideration to clarify the guidelines for foreign participation in coal projects. These guidelines may approximate the policy incor-

porated into the Exxon Corp. contract for the El Cerrejón coal project. The guidelines were expected to stipulate a local participation of 50% in any venture, and allow the possibility for the foreign shareholder to repatriate up to 100% of its profits. If appropriate for the particular concession, the guidelines could include production controls, pricing policies, and provide for the payment of royalties to the state.

A cooperative study for a national mining development program through the year 2000 has been initiated by the United Nations Development Program Technical Mission, the Ministry of Mines and Energy, and various state mining entities.

Regional electrical energy shortages persisted during 1981 and added urgency to Colombia's plans for increasing installed electric capacity by over 2,000 megawatts by the end of 1986 to a total of about 6,500 megawatts.

Several hydroelectric power projects were initiated in 1981. A Colombian firm received a contract to design a 180-meter-high dam on the Río La Miel, about midway between Bogotá and Cali. The dam will be part of a $200 million hydroelectric plant with a design capacity of 324 megawatts.

Colombia obtained a World Bank loan of $85 million to help finance the $346 million Playas hydroelectric project, designed to expand the electric supply to Medellín, Antioquia Department. The Playas plant was to have an installed capacity of 200 megawatts and be situated on the Guatape River. The initial operating date was January 1986. A joint Italian-Colombian venture was awarded the contract to construct the $300 million Betania powerplant, near Neiva in southern Colombia. This plant has a design capacity of 510 megawatts. The projected operating date was April 1986.

The largest power scheme initiated in 1981 was the $1.3 billion Guavio hydroelectric powerplant of Empresa de Energía Electrica de Bogotá. The project was to have a generating capacity of 1,000 megawatts with a designed expansion capability of an additional 600 megawatts. Financing has been obtained from the Inter-American Development Bank, $100 million; the World Bank, $359 million; and commercial banks, $340 million. Also, $129 million in suppliers' credits were anticipated. The World Bank loan was the largest credit the agency has yet approved for a power project in South America. The dam and plant were to be about 50 miles east of Bogotá on the Guavio River, Guavio Province, Cundinamarca Department. Employment opportunities and construction of infrastructure were expected to increase the commercial activity in the area.

Development of geothermal energy also received attention during 1981. A geothermal project was about to be launched with five wells scheduled for drilling at Termales Botero, about 35 kilometers from Manizales, Caldas Department, in central Colombia. It was expected that the project would produce 5 megawatts of electricity.

PRODUCTION

Overall mineral production presented a mixed performance in 1981, with gold, platinum, emerald, coal, and some nonmetals showing gains. However, the total value of mineral production fell to an estimated $443 million, 6% below the 1980 level. This was primarily the result of falling market prices for gold. The value of emerald production also fell significantly. This estimate of decreased total mineral production value was based on current prices and did not take into account factors of inflation and peso devaluation, both of which would serve to accentuate the real difference in production values.

Following a traditional pattern, the production of gold, coal, emerald, and limestone accounted for about 90% of the total value of mineral production in 1981.

There are no significant changes in mineral production envisaged for 1982, except for the entry of ferronickel from the Cerro Matoso project. New petroleum discoveries in the eastern plains and secondary recovery projects in older fields have increased the possibility of Colombia's becoming energy self-sufficient by 1985.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through July 26, 1982.

[2]In addition to the commodities listed, coal briquets are also produced, but output is not reported quantitatively and available information is inadequate to make reliable estimates of output levels.

[3]Revised to zero.

[4]Reported figure.

[5]U.S. imports, largely moralla and gangue, but also including some gem-quality emerald.

[6]Data represent total registered Colombian exports.

[7]Treated salt volumes, as reported by the Ministrio de Mines y Energia.

[8]Includes "industrial benzine" (white gasoline).

TRADE

Colombia's overall trade pattern indicated a trend toward greater market diversification. The United States share of Colombian imports has been declining as other countries increase their marketing in Colombia. Colombia has been seeking new sources of imported petroleum and a wider outlet for its exports.

The Government has set an export goal of 15 million tons of coal annually by 1985, increasing to 25 million tons by 1990, and 60 million tons by the year 2000. Coal sales agreements were being actively pursued to support this ambitious export program.

No significant changes were anticipated in the mineral trade sector until 1982 when ferronickel from the Cerro Matoso project should become available for export.

The trade balance of the mineral sector remained on the deficit side in 1981. Nonfuel mineral exports totaled $389 million, accounted for by gold ($263 million), emerald ($61 million), and others ($65 million). Petroleum exports were valued at $350 million.

Nonfuel mineral imports rose to $598 million, with imports of semiworked and worked metals and inorganic chemical products accounting for about three-fourths of this amount. The remainder of mineral-related imports consisted principally of scrap iron and nonferrous waste metals. In 1981, nonfuel mineral-related imports accounted for about 10% of total imports. Petroleum imports were valued at $700 million and represented 11% of total imports.

COMMODITY REVIEW

METALS

Bauxite.—The Colombian state mining company, ECOMINAS, announced the discovery of an estimated 80 million tons of high-grade bauxite ore in southwestern Colombia. The deposit was found near the boundary between Valle del Cauca and Cauca Departments. It may represent a portion of the clayey bauxites of Morales-Cajibío, Cauca Department, and San Antonio in Valle del Cauca Department, which have been under investigation for several years.

Copper.—The Mocoa copper-molybdenum deposits in the region of Putumayo have been under study in cooperation with the United Nations since 1977. Examined drill cores have indicated ore grades averaging 0.06% molybdenum and 0.43% copper. Reserves were estimated at 160 million tons. Exploratory drilling was scheduled to continue until late 1982, followed by a prefeasibility study of reserves, options, and financial models.

By the end of 1981, INGEOMINAS had completed over 37,000 feet of exploration drilling in the Pegadorcito porphyry copper deposit in the Departments of Chocó and Antioquia. INGEOMINAS worked in cooperation with the United Nations and a Japanese group. As a result, Pegadorcito ore reserves were estimated at 200 million tons grading between 0.7% and 1.2% copper along with some molybdenum.

Iron Ore.—In 1981, iron ore production was valued at about $7 million and represented almost 2% of the total value of mineral production, excluding petroleum. The major portion of iron ore was mined and consumed by the integrated steel complex of Acerías Paz del Río S.A. (APR).

Studies continued on the iron ore deposits at Montelibano in Córdoba Department near the Cerro Matoso nickel project. A second deposit at Planeta Rica in the Porvenir Hills was estimated to contain about 7 million tons of reserves averaging 35%

to 55% iron. Total iron ore reserves in Córdoba Department have been reported as 94 million tons.

Iron and Steel.—Through the Instituto de Fomento Industrial (IFI), the Government and a group of four local nonintegrated steel companies announced they would construct a direct-reduction sponge iron plant on Colombia's Caribbean coast. The plant was projected to cost as much as $86 million for a capacity of 250,000 tons per year. IFI would contribute 30% toward financing; private companies, 35%; and the remainder was to come from overseas credit institutions. Construction bids were received from Italy, Brazil, and Japan. The plant was scheduled to open in 1984 or 1985.

Colombia's latest development plan for the steel industry projected a national demand for 1.5 million tons of steel per year by 1985. To encourage domestic steel producers to expand, the plan recommended a free market price for domestic steel and a 20% customs duty on imported steel. An investment of $1 billion would be required to expand the present national steelmaking capacity of 500,000 tons to the goal of 1.5 million tons.

APR launched a program to increase crude steel capacity from 250,000 tons per year to 380,000 tons per year. The expansion cost was estimated at $150 million but the resulting increase in finished steel could provide a foreign exchange savings of $30 million per year. A second APR expansion project to increase production to 1 million tons per year was under discussion. This second expansion would cost $800 million.

The six other Colombian steelmaking companies had plans to bring their combined capacity to about 500,000 tons per year by 1985.

Lead and Zinc.—Colombia registered production of zinc for the first time since 1976. Lead and zinc concentrates were byproducts of gold processing.

Nickel.—Construction of the Cerro Matoso ferronickel project was nearing completion by the end of 1981, and startup was expected in April 1982. Commercial production was scheduled to commence in early July. The $400 million project was to come onstream at an inauspicious time since in 1981 most world nickel producers were reducing production in response to weak demand and low prices.

Hanna Mining Co., with a 20% equity in Cerro Matoso S.A., has provided technical services. Bechtel Corp. was contracted to perform engineering, procurement, and construction management services. Billiton Metals and Ores International B.V., a 35% shareholder in the company through its subsidiary Billiton Overseas, Ltd., has agreed to purchase and market the entire ferronickel output through its overseas marketing companies.

By the end of 1981, about 2 million tons of material had been removed from the open pit mine. This included about 100,000 tons of ore for the plant. The lateritic ore contains finely dispersed nickel in saprolites and saprolitic peridotites (hydrated nickel magnesium silicates). Expected to average over 3% nickel, the 21 million tons of proven ore reserves occur as a blanket on an isolated oval-shaped hill about 200 meters high, 2,500 meters long, and 1,700 meters wide. This has provided relatively easy and economic mining conditions. At the present programed production capacity of 22,600 tons of nickel contained in ferronickel, the mine has an expected life of 25 years. In addition, 41 million tons of ore averaging 1% to 1.5% nickel has been identified, which could extend production an additional 40 years.

Nine 32-ton caterpiller dump trucks have been purchased to transport ore to the blending and preparation section of the plant. The processing description stated that ore from each mining level is to be stockpiled separately and then blended to obtain a uniform plant feed. Blended ore is then to be fed into a natural gas-fired rotary kiln where the moisture content should be reduced from over 20% to approximately 7%. After blending and agglomeration with locally mined bituminous coal, the pellets pass into a prereduction kiln.

The calcined material is to be smelted in a 51-megavolt-ampere 3-electrode circular electric furnace, having an inside diameter of 21 meters. Metal will be collected from the furnace in 40-ton ladles and refined with ladle refining equipment. After the slag has been removed, the metal will be cast into pigs weighing 22.5 kilograms each. The casting machine has a capacity of 60 tons per hour. Cerro Matoso was considering the installation of facilities to produce ferronickel granules.

To maximize the processing of Cerro Matoso ore to ferronickel, extensive research was done at a pilot plant installed at Hanna's nickel smelter in Riddle, Oreg. These

tests resulted in the plant design under construction. Analyses of the resultant ferronickel revealed the following composition:

	Typical percent	Maximum percent
Nickel[1]	37.50	40.00
Cobalt	.75	1.00
Chromium	.10	.20
Phosphorus	.02	.03
Carbon	.02	.03
Sulfur	.02	.03
Silicon	.50	.70
Copper	.10	.20
Iron	Balance	Balance

[1]Minimum nickel content: 35.00%.

The smelting process requires about 75% of the total energy input, supplied primarily from hydroelectric sources. Natural gas is to provide 20% of needed energy, piped 85 kilometers south from the Jobo Tablon Field. The gas will be used for drying the ore and heating the prereduction kiln. Coal and oil were expected to account for 5% of total energy demand, the coal being used as a reductant and the oil for driving mining equipment.

Peak employment during the construction phase has been about 2,000 workers, 98% of whom were Colombians. When operational, Cerro Matoso will employ about 750 workers, at least 96% Colombian.

Precious Metals.—Continuing a traditional pattern, the three metals, gold, silver, and platinum, accounted for 53% of the total value of mineral production, excluding petroleum. The rapid rise in the world market price of gold during recent years has permitted a reevaluation of reserves and the opening of marginal mines. In 1981, small producers accounted for almost 87% of gold production compared with about 30% in 1970. Gold alone in 1981 contributed almost 52% of the total value of nonpetroleum mineral production.

NONMETALS

At the beginning of the 1970's the industrial minerals represented 44% of the total value of mineral production, excluding petroleum. By 1981, their share of total mineral value had diminished to less than 16% because of the relatively low price increases in relation to other groups in the mineral sector. Volumetrically, the industrial minerals have shown dynamic growth, especially limestone, clay, and sand.

Asbestos.—There was a report in 1980 that Minera las Brisas S.A. had initiated production at the chrysotile mine and processing plant near Campamentos in Antioquia Department. Later information indicated that the startup date would be during the last half of 1981. The plant was expected to produce about 6,000 tons of fiber per year, with an eventual production of 16,000 to 20,000 tons per year. All production was to be sold in the domestic market. One of the investors in the project was Eternit Colombiana S.A., an asbestos cement products manufacturer.

Clays.—Clays, including kaolin, ranked third in importance among the industrial minerals, accounting for 10% of their total value and over 1% of the value of total Colombian mineral production. Approximately three-quarters of clay production was consumed by the cement industry. The remainder, based on partial estimates, was used to make bricks and tiles.

Emerald.—Because of the traditional hand digging and sorting mining method and a large contraband market, information on the actual volume and value of emerald production has been incomplete. For the most part it has been obtained indirectly through registered exports.

In 1981, emeralds represented 12% of the total value of all minerals, excluding petroleum, and was surpassed only by gold and coal.

ECOMINAS has recommended the formation of a Bolsa Nacional de Esmeraldas, similar to the Diamond Exchange of Europe, which would regulate the mining and marketing of this gem stone. It was hoped that such a mechanism would assist in curbing the contraband market and provide purchasers with stones of certified value and quality.

Gypsum.—The production of gypsum has shown a gradual 43% gain since 1970. Most production was by small operators who sell to the domestic cement industry. The cement manufacturers have had to also import gypsum owing to the quality of domestic output.

The more important mines were located in Guajira, Santander, Cundinamarca, and Boyacá Departments. The market value of gypsum has not increased significantly during the last decade, reflecting a limited increase in demand in spite of a high potential market.

Limestone.—Limestone production has doubled since 1970 and has consistently been Colombia's most valuable industrial mineral. In 1981, its production value repre-

sented 60% of that for all industrial minerals. Limestone accounted for 9% of the value of total mineral production, its value being surpassed only by gold, coal, and emerald. The total market value of limestone at current prices has hardly kept pace with the growth rate of production and inflation.

Approximately 76% of limestone production has been used by the domestic cement industry, 2% by the iron and steel industry, with most of the remainder used for the manufacture of lime and fertilizer.

Phosphate Rock.—Phosphate rock production has not been significant in Colombia. The peak output of 13,000 tons occurred in 1975. Following several years of sustained decline, production increased but has remained at a low, stable level for the past 3 years. Production was mainly from the Pesca deposits in Boyacá Department and the Sardinata deposits in Norte de Santander Department.

At yearend, ECOMINAS was soliciting bids for a management contract to develop these two phosphate areas. Work included planning and developing open pit and underground mines, the design and construction of phosphate fertilizer plants, and options for financing. The ambitious project would have a production of 800,000 tons per year from underground mines and 120,000 tons per year from open pit mines. Information given in a feasibility study indicated about 47 million tons of reserves in these two areas.

Salt.—Increased mining costs have been responsible for a 25% decrease in rock salt production since 1970. At Nemocón, Cundinamarca Department, and more recently at Upín, Meta Department, salt has been extracted hydraulically. About 84% of rock salt production has come from Zipaquirá, Cundinamarca Department, where traditional underground mining methods have been practiced. This has required both higher investment and more employees than the hydraulic process employed at Nemocón and Upín.

Because of low market prices and a shortage of labor, the production of marine salt has been declining since 1976. In 1981, the problems of low price and labor supply combined with poor weather conditions and technical difficulties and resulted in a cessation of marine salt production at Galerazamba, Bolívar Department, during the second half of the year.

In 1975, salt accounted for over 5% of the total value of mineral production and about 26% of the value of industrial mineral production. In 1981, it accounted for 3% of the value of total mineral production and 19% of the value of industrial mineral production.

Sulfur.—Sulfur deposits in the base material of the Puracé Volcano, in Cauca Department, were mined and refined by Industrias Puracé S.A. Proven reserves have been estimated at 3 million tons averaging 30% sulfur. Annual production since 1970 had occasionally been erratic but remained more or less stable throughout the period. The Puracé deposits revert to Government ownership in 1983, but negotiations have been undertaken to permit the present owners to continue mining.

At Cumbal, Nariño Department, reserves of about 2 million tons grading 22% sulfur have been identified. ECOMINAS planned to study this deposit to determine the prospects for increasing the reserve base and assess its mining feasibility.

MINERAL FUELS

Coal.—Since 1973, events in the international petroleum market have been reflected by an increase in coal demand and higher prices in the domestic market. Production volumes have doubled since 1970, but the 1981 price index, using 1970 as the base year, indicated a 1,400% growth. It was this sharp growth in demand that encouraged the development of many coal mines during the last decade. Coal exports have not exceeded 200,000 tons per year, limited mostly by high transportation costs to port facilities.

In 1970, coal accounted for almost 19% of the total value of mineral production, excluding petroleum, ranking third in value after gold and limestone. In 1981, coal's share of total mineral production value was 18%, ranking second in value after gold.

At the Exxon Corp. El Cerrejón Norte coal project, heavy rains caused delays in completing the road construction between the mine site and Bahia Portete Port. A construction camp at the port was nearing completion, but equipment still had not arrived. Both the Exxon operating subsidiary International Colombia Resources Corp. and its equal partner in the coal venture, State-owned CARBOCOL, have been actively seeking coal sales contracts.

In addition to the large El Cerrejón Norte coal mining project, a smaller project in the

central zone of El Cerrejón has been under study by CARBOCOL. CARBOCOL planned to initiate mining in 1982. An annual production of 300,000 tons of coal was envisaged with successive expansions to 3 million tons per year.

The Empresa Siderúrgica de Medellín S.A. held mineral rights to areas known as La Loma and La Jagua in César Department. Investigations began in 1979 and have cost $1 million thus far. CARBOCOL has a 2-year agreement with Minera Utah de Colombia, Ltd., a subsidiary of Utah International Inc., whereby Minera Utah can evaluate the work so far accomplished. Minera Utah expected to add to the data and prepare a preliminary technical and economic evaluation of the deposits. Plans included a large, mechanized opencast mine with a producing capacity of about 3 million tons per year.

A reassessment of Colombia's coal resources was made in 1981. From this study, it was concluded that by the year 2000 Colombia could expand its production capacity sufficiently to supply 10% of the world coal export market, or 50 to 60 million tons per year. The new evaluation of Colombian coal reserves is shown below, in million tons:

Type	Measured	Indicated	Inferred	Total
Coking	218	7	454	679
Caking	40	31	163	234
Thermal	3,474	292	6,855	10,621
Undefined	57	73	4,859	4,989
Total	3,789	403	12,331	16,523

The export of 50 million tons per year sustained over a 25-year period, plus local consumption projected at 20 million tons per year by the year 2000, would expend only 11% of reserves. At 1981 export market prices, exports of 50 million tons of coal would result in about $3 billion in annual foreign exchange earnings. The majority of these coal exports were expected to come from the El Cerrejón deposits in the Guajira Peninsula.

In the future, Colombia also has expectations of developing a synthetic fuel industry through the production of liquid fuels and chemicals from coal feedstock.

Natural Gas.—By 1985, as coal and hydroelectric energy sources are developed, natural gas is expected to comprise a gradually decreasing share in Colombia's overall energy balance. In 1979, gas provided 13% of total energy consumption, and in 1981 about 16%; but by 1990, this share was expected to be about 11%, and in the year 2000, about 7%.

Weeks Petroleum Co. increased its interest in the Tasajero contract area from 12.5% to 60% following the withdrawal of Amoco Colombia Oil Co. and Colombia-Cities Service Petroleum Co. Meridith Oil Co. was the remaining partner in this consortium of U.S. companies. Tasajero is in eastern Colombia near Cúcuta on the Venezuelan border. In 1981, the Cerrito No. 1 was the discovery well for a new gasfield in the Tasajero area. Eight other promising structures in this area were scheduled to be drilled. Empresa Colombiana de Petroleos (ECOPETROL) may take a 50% interest in the operation once commercial viability has been established.

During 1981, a new natural gas discovery was made along the Caribbean seaboard in the northwestern region of Córdoba Department. The discovery well was followed by a dry hole, but the operator, Petroleos Colombo Brasileros S.A., was proceeding with a third wildcat.

Exxon Corp. drilled a successful exploration well in the Sucre area of the Middle Magdalena Basin. The well tested at 5 million cubic feet of natural gas per day at a depth of 9,280 feet. On the western side of this basin, ECOPETROL completed a wildcat that tested at 4.5 million cubic feet of natural gas per day along with 150 barrels per day of 40° API gravity crude oil.

The percent distribution of natural gas production, by basin, is shown below:

Basin	1973	1978	1981
Guajira	--	19	37
Middle Magdalena	56	45	35
Lower Magdalena	28	21	15
Amazon	11	12	9
Catatumbo	5	2	3
Upper Magdalena	1	1	1
Total	[1]100	100	100

[1]Data do not add to total shown because of rounding.

Petroleum.—In 1980, Colombia published Resolution 058, which increased the base price for oil production from existing fields and established a mechanism for annual price increases. It also provided a formula to determine prices for future incremental output from older fields. The annual price

increase was to be a function of inflation and devaluation of the peso. In 1981, oil prices increased 13% over the 1980 levels. Resolution 058 and its promise of improved financial results from oil operations was viewed as the leading factor in the stepped-up efforts to increase production from existing fields. In 1980 and 1981, the older fields were responsible for most of the overall petroleum production gains.

The percent distribution of crude oil production, by basin, is shown below:

Basin	1973	1978	1981
Middle Magdalena	49	55	52
Upper Magdalena	2	11	23
Amazon	29	21	14
Catatumbo	19	12	8
Eastern Plains	--	1	3
Lower Magdalena	2	2	1
Total[1]	100	100	100

[1]Data may not add to totals shown because of rounding.

ECOPETROL association contracts with private companies or groups continued to increase during 1981. By the end of the year ECOPETROL had 40 association contracts with 29 companies acting either singly or as members of a group. These contracts covered about 28 million acres, of which 58% were in the Eastern Plains and 21% were in the Lower Magdalena Basin. The standard association contract required the foreign or associated company to assume all exploration costs. Once a discovery has been proven to be commercially viable, ECOMINAS reimburses one-half of the exploration costs and shares all subsequent development expenses as an equal partner in the venture.

Exploratory drilling increased in 1981, and a total of 61 wells were drilled. Of these, 16 were successful, 2 were suspended, 2 were abandoned, 3 were test wells, and 38 were dry holes. ECOPETROL drilled 12 of these exploration wells. Foreign oil companies drilled the remainder, 45 under association contracts and 4 under preexisting concession contracts.

International Petroleum (Colombia) Ltd. (INTERCOL), an Exxon Corp. subsidiary, drilled a confirmation well in its new Arauca Field located in the Eastern Plains of Colombia near the Venezuelan border in Arauca Department. The Arauca No. 2, located about 1 mile northeast of the 1980 discovery well, the Arauca No. 1, confirmed what was considered the most significant Colombian oil discovery in the past 18 years. From an upper zone at a depth of 18,100 feet, the well flowed 2,200 barrels per day of 40° API gravity oil. A lower zone at 19,200 feet flowed 1,900 barrels per day of 32° API gravity oil.

Reserves in the Arauca Field were estimated to be as much as 175 million barrels. It was thought that the field could produce up to 30,000 barrels of crude oil per day. INTERCOL was considering an investment of $1.2 billion during the next 5 years to drill as many as 50 wells. The depth of this field was expected to make development slow and costly. If the field continued to be promising, a $52 million pipeline would be built to the Barrancabermeja refinery.

Exxon added to its concessionary acreage in the Llanos, or Eastern Plains region, through its INTERCOL subsidiary Provincia Petroleum Co. Provincia took a tract to the west and north of Société Nationale Elf Aquitaine's concession where several successful fields were discovered in 1979, and in 1980 at Casanare. Pennzoil Co. has two contracts with ECOPETROL covering 1.5 million acres in the Eastern Plains region and planned to drill in 1982 following seismic work undertaken in 1981.

ECOPETROL was also successful in the Eastern Plains when it drilled the Apiay No. 1 about 100 kilometers east of Bogotá. This well tested at 4,500 barrels per day of metal- and sulfur-free crude oil with 25° API gravity. The producing zone was at a depth of about 10,500 feet. ECOPETROL was continuing its exploration drilling with a second well expected to be completed early in 1982.

Other new onshore areas under investigation included southwestern Colombia around Tumaco; a tract in the west-central coastal basin; an area south of Cartagena; and another east of Cartagena in the Lower Magdalena Valley.

The Inter-American Development Bank granted ECOPETROL a $10 million loan to assist in financing marine seismic studies off the Caribbean and Pacific coasts. The initial cost of this exploration program was estimated at $13 million.

In August, Texas Petroleum Co. (TEXPET), in association with ECOPETROL, initiated a steam injection project in the Cocorná and Nare areas north of Bogotá where reserves of heavy, 13° API gravity oil have received minimum attention. TEXPET expected to bring production up to

15,000 barrels per day in the next 3 years. A total of 144 development wells have been planned for the Cocorná and Nare areas as well as 17 wildcats. In 1981, TEXPET drilled 33 development wells in these two areas. Plans were also underway for exploration and development in the Natagaima area, about 40 miles southwest of Bogotá. Seismic work was planned for this area, after which an undetermined number of wells were expected to be drilled.

At the end of June 1981, Colombia's proved crude oil reserves totaled about 542 million barrels, not including new discoveries still under evaluation. The largest shares of these proved reserves were accounted for by the Middle Magdalena Basin, 52%; and the Upper Magdalena Basin, 21%. As of the end of June 1981, natural gas reserves were estimated at 4.3 trillion cubic feet, of which 75% was attributed to fields in the Guajira Peninsula.

Uranium.—Following preliminary surveys, the Colombian Nuclear Affairs Institute has estimated uranium reserves in the central and eastern areas of the country at 40,000 tons of yellow cake. In 1981, about $12 million was allotted for continuing exploration efforts.

[2]Where necessary, values have been converted from Colombian pesos (Col$) to U.S. dollars at the average exchange rate of Col$54.49=US$1.00. As of Dec. 31, 1981, the rate was Col$59.07=US$1.00.

The Mineral Industry of Cyprus

By John R. Lewis[1]

The Republic of Cyprus, an island in the eastern Mediterranean Sea, is 224 kilometers long and its maximum width is about 96 kilometers. There are two mountain ranges which roughly trend east to west along the north and south coasts. Between them lies a broad basin, which also trends from east to west for most of the length of the island. About the size of the State of Connecticut, Cyprus has been geopolitically divided since 1974. A sector of 3,081 square kilometers, trending east to west and comprising about the northern one-third of the island, is controlled by the Federated Turkish Cypriots. The remainder, 6,170 square kilometers also trending east to west, comprises the south two-thirds of the island and is controlled by the Government of Cyprus. Very little, if any, mineral activity takes place in the Turkish area, and there are no available data. The information in this chapter, therefore, is primarily with respect to the southern sector.

In 1981, Cyprus, a small nation, had no energy resources of its own and only modest economically viable mineral resources. These two factors coupled with an inflation rate of about 14% per year created a balance-of-trade deficit of about $750 million in 1981, up slightly from that of 1980.[2] The value of imports, at about $1,325 million, was more than double the value of the country's exports, which were around $575 million.

Recovery of the Cyprus economy from the 1974 Turkish intervention continued but at a declining rate. Construction and light manufacturing remained strong and active. Construction required mineral raw materials, such as stone, sand and gravel, clay for bricks, etc., but the rate of consumption even of these materials showed less growth than in earlier years. The production of metal ores was off, owing to exhaustion of deposits, reduced world prices, and the location of some deposits in the Turkish sector where no activity was underway.

Inflation continued to inhibit the economic growth of Cyprus. Much of the problem stemmed from the upward spiraling of the cost of crude oil, of which Cyprus imported all of its requirements. The provisional gross national product (GNP) was around $2.2 billion, up considerably from that of 1980. In terms of 1973 constant dollars, however, the GNP only rose about 4.5% in 1981. Contributions to the GNP by mining and related activities declined in 1981, amounting only to 5%. Much of this probably can be attributed to the cessation of production of copper and zinc during 1979-80.

PRODUCTION AND TRADE

Although the production of copper and zinc had virtually ceased in Cyprus by 1981 and chromite production was down owing to depressed world steel markets, other mineral production was generally about equal to that of the previous 2 years. Production data are shown in table 1.

Substantial reserves of asbestos, chrome, gypsum, iron pyrites, marble, building materials, and other minerals occur in Cyprus and could sustain the mining industry there for many years to come. Havara, described as a soft, incoherent but compact-surfaced limestone, was produced in large quantities

in recent years. It was used as a foundation layer in the construction of roads throughout Cyprus. There were also thriving cement and raw mineral pigment industries on the island.

The European Economic Community (EEC) countries continued to be good customers for Cyprus minerals, but purchases by Middle Eastern countries continued to climb, and those countries were Cyprus' best customers, taking 61% of the country's mineral exports. Cyprus bought one-half of the minerals it imported from EEC sources. Monetary values for the country's mineral trade were not available at yearend 1981.

[3]May include waste and sweepings.

COMMODITY REVIEW

METALS

Chromite.—Probably because of severe cutbacks in world steel demand, production of chromite was off significantly in 1981. Most of that produced from Cyprus' two active chromite operations, the Kokkinorotsos and Kannoures Mines in the Troodos Mountains in west-central Cyprus, was exported to European and United Kingdom customers.

NONMETALS

Asbestos.—There was one producer of asbestos in Cyprus in 1981, Cyprus Asbestos Mines, Ltd., at Amiandos. The Amiandos operation was open pit with onsite ore concentration. Capacity was reported to be 5,000 tons per day. About 12,500 tons of long-fiber asbestos plus 12,000 tons of the short-fiber variety were produced in 1981 and went mostly to the United Kingdom and Greece. Since the production of copper ceased, asbestos has been Cyprus' principal mineral export, but recognition that it was a possible hazard to health was probably responsible for a 35% drop in production.

Bentonite.—A prime ingredient in oil-well drilling mud, bentonite production rose dramatically during 1981. This was not surprising, however, when the close proximity of Cyprus to all of the Middle East's intensely active oil development was considered.

Cement.—Despite a leveling off of the country's economy, about the same amount of hydraulic cement, 1.2 million tons, was produced during 1981 as in 1980. Only about 7,500 tons was sent out of the country to nearby Middle Eastern customers. The remainder was used in Cyprus, mostly in construction.

Fertilizer Materials.—Hellenic Chemical

Industries, Ltd., a joint venture of the Hellenic Mining Co. (40%), Cyprus Cooperative Industries, Ltd. (35%), the Government of Cyprus (15%), and the Archbishopric (10%), was well along by the end of 1981 with construction of its fertilizer complex at Vassiliko. The complex was to use pyrites from Cyprus' own reserves to make sulfur. Phosphate rock for the phosphoric acid plant was to come from the Palmyra area of central Syria.

The sulfuric acid plant went onstream during 1981 and had a capacity of 180,000 tons per year. The complex also had the capability to produce 40,000 tons per year of phosphoric acid plus 150,000 tons per year of fertilizers, about 40,000 to 50,000 tons of which were to be used in Cyprus while the balance was to be exported.

The phosphoric acid plant and the fertilizer plant were being built by Lurgi Verwaltungs GmbH of the Federal Republic of Germany. Power for the complex was to come from generating equipment built by General Electric of the United Kingdom, and the ammonia-storage facility was to come from Polimex-Cekop of Poland.

Umber.—A naturally occurring brown earth containing ferric oxide together with silica, alumina, manganese oxides, and lime, umber was produced in large quantities in Cyprus. Raw umber, which was ground and then levigated, together with burnt umber, which was processed at low heat, was exported and also used locally as paint pigment. Umber producers were headquartered in Lanarca on the south coast.

MINERAL FUELS

Petroleum.—Except for very small amounts of imported coal, coke, and peat, Cyprus was fueled entirely on petroleum products. The country had no domestic crude petroleum resources or production in 1981 and relied mostly on Iraq and Saudi Arabia for its supplies of crude oil. Cyprus' sole refinery was at Lanarca on the south coast. Operating as the Cyprus Petroleum Refinery, Ltd., the plant was jointly owned by Shell Oil Co.; British Petroleum Co., Ltd.; Mobil Oil Corp.; and the Cyprus Government. Although listed as having a daily throughput capacity of 16,000 barrels of crude, only about 10,400 barrels of various petroleum products were produced daily, mainly regular- and high-octane motor fuels, jet fuel, and heating oils. Small volumes of these products were exported, mostly to Lebanon. Additional kerosine, jet fuel, and all of the country's residual fuel oil needs were imported, primarily from the Soviet Union.

Like many other nations, Cyprus was caught in 1981 between the worldwide recession and total dependency upon foreign oil with its extremely high cost. The petroleum pricing structure continued to play havoc with Cyprus' balance of trade; the value of the oil that Cyprus was required to import was roughly equal to one-half the value of everything that Cyprus exported.

The Mineral Industry of Czechoslovakia

By Tatiana Karpinsky[1]

Czechoslovakia, with a highly industrialized economy, continued to experience slow growth in 1981. The key goals of the state plan for 1981 included improved efficiency of labor, further development of Czechoslovakia's economy, and improving the balance of payments. However, the goals of the state plan were not met in some sectors (table 1). A shortage of labor was one of the main problems.[2]

Table 1.—Czechoslovakia: Selected production increases for 1981, in percent

Item	Original plan	Fulfillment
National income	2.8	0.2
Industrial output	2.7	2.0
Productivity in industry	2.2	1.6
Coal (bituminous)	-.4	-2.4
Electric energy	2.0	1.0
Metallurgy	1.2	.9

In 1981, Czechoslovakia's national income (gross national product less material costs) reached 454 billion korunas (Kcs),[3] about 0.2% more than that of 1980, compared with a planned increase of 2.8%. Industry contributed 59% of the total. In 1981, capital investment declined 1.9% in comparison with the 1980 level, but considerable amounts were nevertheless spent on expansion of the fuel-energy sector. Mining and quarrying contributed about 4% of the total industrial production in Czechoslovakia. Of this, the share of coal was about 3%; crude oil, 0.1%; metallic ore, 0.5%; and other mining, 0.4%. Petroleum refining contributed about 9% of total industrial output. The nonferrous industry contributed 2.5%, and the nonmetallic mineral industry contributed 2.7%. Consumption of ferrous metals amounted to 5.6 million tons and that of nonferrous metals to 267,000 tons in 1980. The country's domestic iron ore and nonferrous metal production covered its needs only to the extent of 7% and 31%, respectively.

In 1981, the total number of workers and employees in Czechoslovakia was 2,008,000. The number of production workers and other employees in state mineral and energy enterprises by branch is shown in table 2 for 1980.

Table 2.—Czechoslovakia: Workers and employees in 1980

Branch	Number of workers	Number of employees	Number of enterprises
Fuel extraction and processing industry	176,000	137,000	55
Power and heat generation	57,000	38,000	27
Iron and steel production (including ore mining)	168,000	124,000	14
Nonferrous metal production (including ore mining)	43,000	31,000	20

Government Policies and Programs.—The basic tasks and targets of the 1982 state plan were approved by the Communist Party of Czechoslovakia in December 1981. The plan called for a 0.6% increase in national income and an 0.8% increase in gross industrial output. Primary production of fuel and energy was not to exceed the 1980 yield. Imports of oil, electric energy, and coal were expected to be lower than in 1981.

PRODUCTION

Czechoslovakia has reserves of coal, lignite, antimony, magnesite, mercury, uranium, graphite, kaolin and other clays, sand, limestone, and building materials, but the country remains deficient in oil, natural gas, iron ore, and nonferrous ores.

In 1981, the annual plan for coal production was not fulfilled because of bad weather in the fourth quarter and a labor shortage; the planned target for the removal of overburden was also unfulfilled. Nevertheless, no shortages of fuel developed. Electric energy production amounted to 73.5 billion kilowatt-hours, an increase of 1% over that of 1980. The one nuclear powerplant accounted for 83.6% of the total increase in electric energy production. The production increase in ferrous metallurgy amounted to 1.5%, while a 1.8% decrease was registered in ore output and dressing. Production of nonferrous metals slightly declined (0.9%). Crude oil processing declined 0.5%. Cement production was at the 1980 level. River transportation carried 11.1 million tons of goods, or 6.1% more than in 1980. Transportation of coal for the Chvaletice powerplant largely accounted for the increase.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Aug. 13, 1982. In addition to the commodities listed, arsenic, gold, uranium, feldspar, graphite, and a variety of other petroleum products are produced, but information is inadequate to make reliable estimates of output levels.

[2]Reported figure.

[3]This material, although reported as manganese ore, is believed to be manganiferous iron ore with a manganese content of about 17% and as such is not equivalent to material ordinarily reported as manganese ore, which generally contains 25% or more manganese.

[4]Includes gas produced from coal mines. Gross output of natural gas is not reported, but it is believed to exceed reported marketed output by a relatively inconsequential amount.

[5]Data presented are for those products reported in official Czechoslovak sources and in United Nations publications; no estimates have been included for other products or for refinery fuel and losses.

TRADE

In 1981, exports rose faster than imports. Total trade increased 7.5%, and that with centrally planned economy countries 10.6%. Approximately two-thirds of the foreign trade turnover was under long-term agreements with centrally planned economy countries. The Soviet Union's share in Czechoslovakian foreign trade was about 36% in 1981. The Soviet Union supplied about 83% of Czechoslovakia's needs for iron ore and about three-fourths of the country's imports of most nonferrous metals, petroleum, and natural gas.

In 1980, fuels, minerals, raw materials, and metals contributed 17.2% to total export value and 31.7% to total import value. The main exports in this group were metallurgical products, in particular rolled stock, coal, and coke. Deliveries of raw materials and fuels under long-term agreements, primarily from the Soviet Union, were a stabilizing factor.

The Soviet Union supplied 18 million tons of crude oil, 17 million tons of iron ore and metals used in alloying steel, 100,000 tons of aluminum, 2.2 billion kilowatt-hours of electric energy, 32,000 tons of asbestos, 60,000 tons of ammonia, 165,000 tons of apatite concentrate, and more than 300,000 tons of mineral fertilizers.

During the year Czechoslovakia erected two urea plants in Cherkassy and Dneprodzerzhinsk, both in the U.S.S.R., and completed the deliveries for a similar plant in Angarsk, also in the U.S.S.R. Czechoslovakia also delivered equipment for several large Soviet ammonia plants and for phosphate grinding mills in Karatau. Other deliveries to the U.S.S.R. included equipment for catalytic reforming for a Moscow refinery, with an annual output of 1 million tons of high-octane gasoline, and more than 13,000 tons of equipment for the rolling mill plant in Zhdanov.

A trade protocol for 1982 between the U.S.S.R. and Czechoslovakia was signed on December 11, 1981, according to which trade turnover between the two countries will reach about 9 billion rubles, an increase of about 10% over that of 1981. As before, machinery and equipment will account for the largest share in Czechoslovak exports to the U.S.S.R. Deliveries by the U.S.S.R. of the main types of raw materials necessary for the further development of the Czechoslovak economy, including crude oil, natural gas, coal, electrical energy, iron ore, and metals, will be continued.

In 1982, imports of crude oil from the U.S.S.R. were planned to be reduced by 2.5 million tons and imports of gas were to be reduced by about 700 million cubic meters. By the end of the current 5-year plan period, trade turnover between Czechoslovakia and the U.S.S.R. is to be about 13 billion rubles.

Manufactured:				
Nitrogenous	241,669	90,571	--	Yugoslavia 40,974; West Germany 20,788; Italy 10,097.
Phosphatic	40	3,460	--	All to Madagascar.
Potassic	--	5,420	--	All to United Kingdom.
Other including mixed	1,614	508	--	Yugoslavia 262; France 246.
Ammonia	1,198	16,489	--	Austria 12,987; West Germany 2,886.
Graphite, natural	768	951	--	Yugoslavia 854; Greece 82.
Gypsum and plasters	--	27	--	All to Austria.
Lime	15,261	8,349	--	All to Hungary.
Magnesite[3] thousand tons	377	385	--	Hungary 82; Poland 70; East Germany 61.
Mica, worked including agglomerated splittings	105	93	--	Yugoslavia 40; Italy 17; United Kingdom 15.
Pigments, mineral: Iron oxides and hydroxides, processed	1,424	1,340	--	Italy 1,280; Yugoslavia 60.
Precious and semiprecious stones:				
Natural value, thousands	$37	$23	--	Hong Kong $15; Canada $6.
Synthetic do	$271	$101	--	West Germany $38; Canada $36; Yugoslavia $13.
Salt and brine	744	2,029	--	Sweden 1,982; Hungary 47.
Sodium and potassium compounds:				
Caustic potash	[r]595	654	--	Yugoslavia 204; Netherlands 130; Italy 92.
Caustic soda	[9]18,100	[9]19,200	--	Yugoslavia 13,613;[3] West Germany 4,459.
Soda ash	[9]19,700	[9]8,200	--	West Germany 7,580; Italy 150.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	2,183	2,115	--	West Germany 1,850; Austria 108; Netherlands 92.
Worked	4,661	9,988	--	West Germany 9,352; Netherlands 336.
Gravel and crushed rock	74,214	2,706	--	West Germany 2,534; Hungary 122.
Limestone, except dimension	22,800	21,614	--	All to West Germany.
Sand excluding metal-bearing	398,071	277,260	--	Austria 187,220; Hungary 88,070.
Sulfur, elemental, other than colloidal	560	1,577	--	Portugal 1,552.
Talc, steatite	6,720	6,627	--	Poland 6,580; Yugoslavia 40.

See footnotes at end of table.

Table 4.—Czechoslovakia: Apparent exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980[p]	Destinations, 1980	
			United States	Other (principal)
NONMETALS —Continued				
Other, n.e.s.:				
Crude	25,489	24,130	--	Hungary 11,790; West Germany 6,987; Austria 4,472.
Slag, dross, similar waste, not metal-bearing	21,514	24,300	--	All to West Germany.
Halogens	205	NA		
MINERAL FUELS AND RELATED MATERIALS				
Carbon black	18	10	--	All to Italy.
Coal and briquets:				
Anthracite and bituminous coal thousand tons	3,366	3,728	--	Austria 837; East Germany 770; Yugoslavia 621.
Briquets of anthracite and bituminous coal do	[r]196	408	--	All to Greece.
Lignite and lignite briquets[3] do	1,647	2,160	--	West Germany 2,106.
Coke and semicoke[3] do	1,892	1,461	--	East Germany 632; Austria 420; Hungary 199.
Gas, natural million cubic feet	[2]2,341	[2]1,607	--	NA.
Peat including briquets	19	20	--	All to Greece.
Petroleum and refinery products:				
Crude thousand 42-gallon barrels	[2]178	[2]2,411	--	NA.
Refinery products:				
Gasoline do	[2]1,998	[2]2,440	--	West Germany 2,304.
Kerosine and jet fuel do	285	339	--	West Germany 262; Yugoslavia 55.
Distillate fuel oil do	[2]1,455	[2]3,999	--	Switzerland 955; West Germany 696; Austria 140.
Residual fuel oil do	124	2,458	--	West Germany 1,287; Austria 1,126.
Lubricants do	[2]50	[2]75	--	Yugoslavia 48; Austria 7.
Other:				
Liquefied petroleum gas do	936	926	--	West Germany 744; Italy 102; Netherlands 39.
Mineral jelly and wax 42-gallon barrels	[r]480	NA		
Bitumen and other residue do	6,799	15,435	--	Austria 15,023.
Mineral tar and other coal-, petroleum-, and gas-derived crude chemicals	34,107	47,874	--	West Germany 13,408; Italy 12,124; Switzerland 8,706.

[p]Preliminary. [r]Revised. NA Not available.

[1]Owing to a lack of official trade data published by Czechoslovakia, this table should not be taken as a complete presentation of this country's mineral trade. Unless otherwise specified, these data have been compiled from various sources which include United Nations information, data published by the partner trade countries, and partial official trade sources of Czechoslovakia.

[2]Excludes imports by Uruguay valued at $9,000.

COMMODITY REVIEW

METALS

Aluminum.—The output of aluminum in 1981 was at the level of 1980. Domestic raw material shortages caused greater dependence on imports of bauxite and alumina. Aluminum was imported from the U.S.S.R., Hungary, and Yugoslavia.

Antimony.—In 1981, antimony ores were mined at Dubrava (Central Slovak Region) and at Pezinok near Bratislava (West Slovak Region). Deposits containing about 500,000 tons of antimony ore, with some gold and silver, were discovered in the Zlata Idka-Poproe-Betliar area in the Rosnava district. Exports of antimony were expected by 1990.

Copper.—Czechoslovakia's copper ores were mined at various locations. Deposits of copper ore were located in conjunction with iron ores at Rudnany (Slovakia) and near Roznova (Slovakia), copper-lead-zinc ores at Banska Stiavnica (Slovakia), and copper ores at Zlate Hory (Moravia). In 1981, output of copper ore was mainly from the Zlate Hory stratiform deposits and from Banska Stiavnica. In Zlate Hory, reserves of ore were estimated at 3.5 million tons with metal content more than 1%. In 1981, a new plant was under construction at Zlate Hory to process complex sulfide ores containing gold. In 1980, the Banksa Bystrica refinery in Slovakia produced 6.3 kilograms of gold, 621 kilograms of silver, and 355 tons of

copper. It was planned to produce 100,000 tons of copper ore in 1985 and extract 425 tons of copper.

In 1981, further prospecting and experimental mining in old copper mines at Spiska Nova Ves in Slovakia proved up medium-sized economic reserves, especially taking into account the uranium content of the ore. Plans for 1981-85 were to continue evaluation of ore in the main veins.

Imports of copper metal from Poland, the U.S.S.R., and the United Kingdom supplied the main requirements of Czechoslovak industry. Under a long-term trade agreement, Czechoslovakia was participating in the development of Polish copper mines.

Gallium.—Production of gallium was expected to increase from 1,650 kilograms per year to nearly 3,000 kilograms per year with the installation of new equipment at the Ziar nad Hronom aluminum plant in Central Slovakia. Gallium was a byproduct of treating bauxite.

Gold.—Extraction of gold-bearing ore continued in the Kremnice area (Slovakia). The 30,000-ton-per-year ore-dressing plant at Kremnice was being expanded to a capacity of 300,000 tons. At Sturec (Slovakia), 40 kilograms of gold was produced in a few months after modernization of the ore-processing equipment.

The Government created a commission under the Ministry of Metallurgy and Heavy Machine Building to mine gold.

In 1981, exploration for gold was concentrated in old gold mining areas in the Jeseniky Mountains in Northern Moravia, in the Slovak Ore Mountains in Central Slovakia, and in Central Bohemia.

Two grams of gold per ton of ore was considered the minimum economic grade in evaluating the deposits.

The Mineral Raw Materials Institute at Kutna Hora (Bohemia) developed equipment for dealing with so-called scattered deposits, mostly clays, sands, and gravels that contain metals such as gold, tin, and tungsten. This equipment was used in the Plzen region and in the Jeseniky Mountains for gold prospecting and mining.

Further prospecting was planned for the vicinity of the Psi Mountains (Central Bohemia), where ore with an average of 2.5 grams of gold per ton was located by drilling. The gold occurred in association with scheelite, molybdenite, and tellurides. Gold had been mined in Czechoslovakia in 1968 at Jilova near Prague, but has been continuously recovered only from refinery sludges since then. In 1981, the Telsa electrolytic plant in Iiglova thus recovered about 28 kilograms.

Iron and Steel.—Some iron ore is mined at Rudnany, Nina Slava, and other deposits in Slovakia, but the main steel production was based on imported ore from KrivoyRog, in the Soviet Union, where Czechoslovakia continued to invest in iron mining. Iron ore was also imported from Sweden and Brazil. Domestic coking coal production met a large part of the country's needs, but the difficulty of expanding hard coal mining was expected to bring about problems in the long term. In 1981, steel production remained approximately at the 1980 level.

The rate of growth of steel production in Czechoslovakia was to be cut back severely over the next 10 to 15 years. The main reason for the intended slowdown was reported to be expected fuel shortages. In the 1981-85 period, steel production was scheduled to rise by 2.3% per year and in 1986-90 by 1.3%.

In 1981, Czechoslovakia was a net exporter of steel. There was a 2% reduction in exports of steel products, while imports remained essentially at the 1980 level. There were some changes during 1981 in the range of Czechoslovak iron and steel products trade. Exports of semifinished products, strip, and wire rods declined, but those of steel pipe, heavy and light sections, and heavy and medium plate rose. The overwhelming majority of the steel pipe produced was, as in the past, for use in the Soviet oil and gas industry.

The share of oxygen converter steel output in the Czechoslovak total increased from 23.4% in 1979 to 27.0% in 1981, and the share of continuously cast steel increased from 0.95% to 1.49%.

In September, a 1-million-ton-per-year, computer-controlled coke-oven battery was put into operation at the Klement Gottwald steel plant. Construction took 5 years and cost Kcs850 million.

A new 1-million-ton-per-year bar mill at the Klement Gottwald plant was also to come into operation in 1984. A new 25-ton electric arc furnace, imported from the Soviet Union, was put into operation at the Skoda Plzen Enterprise. It was to increase production of steel particularly for the construction of nuclear power equipment.

The East Slovak iron plant at Kosice brought onstream a 66,000-ton-per-year continuous caster and a new coking plant. The caster cost almost Kcs800 million.

At the Trinec iron and steel plant, a new 2.8-million-ton-per-year steel shop with two 200-ton converters was under construction with a 1983 startup date. The country announced plans for a greater emphasis on expanding tube and pipe production. A new seamless-tube-making plant was planned for the Chomutov works.

In 1981, new discussions took place of the prospects for the development of ferroalloy production at plants in Istebne and Siroka.

Lead and Zinc.—Lead-zinc ore continued to be mined at Pribram and Kutna Hora (Central Bohemia), Horni Benesov (Moravia), and Banska Stiavnica (Central Slovakia). About 75% of the total lead-zinc ore came from Czech deposits, and about 25% from Slovak deposits. Production of lead and zinc was far below demand, and these metals continued to be imported, mainly from the U.S.S.R. and Yugoslavia. Intensive prospecting for lead-zinc might lead to increased production of this ore in the future.

NONMETALS

Graphite.—Czechoslovakia is one of the world's largest graphite producers. The major deposits occur in the vicinity of Cesky Budejavice and Cesky-Krumov in Southern Bohemia, and minor deposits occur in Northern Moravia. Graphite occurs in the form of strongly folded layers in gneisses, quartzites, or carbonates, with a carbon content between 15% and 50%. Recently new deposits of graphite were discovered northwest of Cesky Krumov. The raw graphite from the deposits in Southern Bohemia is enriched by multistage flotation at the Netolice dressing plant, located also in Southern Bohemia. The concentrates obtained at the plant contain 80% to 90% carbon in the form of graphite. All Southern Bohemia graphite concentrates are chemically refined at Tin nad Vltava, resulting in a final product containing up to 99.9% carbon. The plant also produces graphite lubricants and various special colloidal suspensions of graphite.

Fertilizer Materials.—Czechoslovak plants continued to concentrate on the production of liquid fertilizers. Capacity in excess of 165,000 tons per year of liquid fertilizers will be brought onstream by 1985. The country would need to import 1.5 million tons of ammonia in 1985 and 1.7 million tons in 1990 in order to satisfy domestic demand for nitrogenous fertilizers. Czechoslovakia decided not to attempt to attain self-sufficiency in manufactured fertilizers because of the high cost of imported raw materials. Increased demand for phosphate fertilizers will be met by importing from developing countries. In 1981, the U.S.S.R. supplied 800,000 tons of assorted fertilizers to Czechoslovakia, together with 430,000 tons of apatite for fertilizer production.

Preliminary tests proved the suitability of Syrian phosphate rock for superphosphate production, and the first 25,000 tons will be imported in 1982. In 1981, a major contract was signed between the Soviet Union's Techmashimport and Chemoproject of Czechoslovakia for the supply by the latter of four new urea plants with capacity of 1,000 tons per day to the U.S.S.R.

Magnesite.—Czechoslovakia was the world's fifth largest producer of magnesite. Approximately 3.9 million tons of magnesite ore was produced from six deposits in Slovakia in 1981. Total exports of magnesite in 1981 were estimated at 385,000 tons. Magnesite was exported mainly to the Council for Mutual Economic Assistance (CMEA) countries[4] and to the Federal Republic of Germany.

MINERAL FUELS

Total energy production from fossil fuels and from hydroelectric and nuclear power generation was estimated at 85.2 million tons of standard coal equivalent (SCE) in 1981, about 2 million tons below that of 1980, with coal, including lignite, supplying about 98%.

Total consumption of primary energy was 123 million tons of SCE with coal providing 67%, oil 22.4%, gas 9.4%, and hydroelectric power and nuclear power 0.5% each. Imported electrical energy was about 0.2% of total consumption.

Table 6.—Czechoslovakia: Total primary energy balance

(Million tons of standard coal equivalent)[1]

	Total primary energy	Coal (bituminous, brown, lignite) and coke	Crude oil and petroleum products	Natural gas	Hydroelectric power	Nuclear power	Turnover of electric energy
1981:							
Production	85.2	83.4	0.1	0.5	0.6	0.6	--
Imports	46.2	5.3	29.5	11.0	--	--	0.4
Exports	8.4	6.2	2.0	--	--	--	.2
Apparent consumption	123.0	82.5	27.6	11.5	.6	.6	.2
1980:							
Production	87.1	85.1	.1	.7	.6	.6	--
Imports	46.7	5.4	29.8	11.1	--	--	.4
Exports	8.6	6.3	2.1	--	--	--	.2
Apparent consumption	125.2	84.2	27.8	11.8	.6	.6	.2

[1]One ton of standard coal equivalent (SCE)=7 million kilocalories. Conversion factors used are as follows: Hard coal, 1.0; brown coal and lignite, 0.6; crude oil, 1.47; natural gas (per 1,000 cubic meters), 1.33; and hydroelectric and nuclear power (per 1,000 kilowatt-hours), 0.125.

Sources: Statistical Yearbook of Czechoslovakia, Prague, 1981; Statisticke Prehledy (Statistic Summary), Prague, No. 4, 1982, p. 106.

Coal.—Coal mines in Czechoslovakia were managed by the Ministry of Power and Fuel. Bituminous coal mining was centered on the Ostrava-Karvina Basin (Northern Moravia) and brown coal mining on the Northern Bohemian and the Socolov Basins. A steady deterioration in mining conditions had led to a fall in the average daily extraction in underground bituminous mines. The plan for bituminous coal production was not fulfilled, and the plan for total brown coal and lignite production was fulfilled only through exceptionally long overtime. Bituminous coal production declined slightly compared with that of 1980. In 1981, difficulties were encountered in the stripping of overburden in opencast brown coal mines owing to outmoded and wornout equipment.

Annual bituminous coal production was expected to remain at about 28 million tons during the 1982-85 period. In 1981, 2.6 million tons of bituminous coal was exported. Austria and the German Democratic Republic were the largest importers of bituminous coal from Czechoslovakia with a total of 0.6 million tons each. In 1981, bituminous coal imports amounted to about 4.4 million tons, of which about 3.2 million tons was imported from the U.S.S.R. and about 1.2 million tons from Poland.

In 1981, about 87% of bituminous coal came from the Ostrava-Karvina Basin, 8% from Kladno, 2% from Plzen, and 3% from Trutow and Rosice. Most of the output of the Ostrava-Karvina Coalfield was suitable for coking. In 1981, some 16 mines were operating in this basin. The average depth in Ostrava-Karvina was about 600 meters with seam thickness from 0.5 to 4.0 meters; however, a considerable part of the reserves at the Ostrava-Karvina Coalfields was found in seams 0.5 to 0.7 meter thick. In 1981, opening of new mines was more costly. The cost of obtaining 1 ton of hard coal was 60% higher in the 1976-80 period than in the preceding 5 years.

In 1981, the Darkov Mine with a projected annual capacity of 5 million tons was under development in the Ostrava-Karvina coal basin; in 1990, this mine was to replace the production from the May 9 and May 1 Mines located in the same district. Preparatory work for the development of new mines in the Probor and Frenstat mining areas, also located in Northern Moravia Region, continued in 1981. Czechoslovakia's bituminous coal deposits were estimated to be sufficient for the next 50 to 60 years. Survey drilling to a depth of 6,000 meters at Jablunka in the Beskydy Mountains of Northern Moravia discovered a deposit of coal which was a continuation of the Ostrava Coalfield. Prospecting was continuing. Geologists also discovered new bituminous coal deposits near Plzen, close to the village of Choticov. Construction of the main mine shaft was expected to be during the seventh 5-year plan period (1981-85), and coal production was expected to start in 1990. Another prospective area was the Slany Basin of Central Bohemia, where large reserves of coal were found. A new mine was under development in that area to produce 2.5 million tons of bituminous coal in 1985.

Brown coal and lignite production was planned to reach 97 million tons in 1982 and 107 million tons in 1990.

In 1981, about 69% of brown coal output came from the Northern Bohemian Basin

and about 22% from the Socolov Basin; the remainder was from the Handlova and Modry Kamen Basins. The calorific value of brown coal in the Northern Bohemian Basin was reported at 3,000 to 4,500 kilocalories per kilogram.

In 1981, development was continued on the large 7-million-ton-annual-capacity annual capacity Vrsany opencast lignite mine near Most. The Vrsany Mine was scheduled to come into operation in 1982 and was to supply coal to the Pocedrany electric powerplant. Operation of the new lignite mine at Dubnany in the Hodonin district, with an annual capacity of 600,000 tons of lignite, started in the first half of 1981.

In September 1981, 65 coal miners were killed in the Pluto Mine, near Zaluzi, in the country's worst mining accident in 20 years.

The Institute for Research and Utilization of Fuels studied the underground gasification of brown coal that could not be conventionally extracted. The result of research work and pilot plant experiments indicated the possibility of economic lignite gasification under favorable conditions.

Natural Gas.—The production of natural gas from domestic deposits was relatively insignificant. In 1981, natural gas imports from the U.S.S.R., about 300 billion cubic feet, was the most important source of gas. The natural gas deliveries were in payment of Czechoslovakia's participation in the building of the gas pipeline and for the transit of the gas for Western Europe across Czechoslovak territory.

At the end of 1980, construction of the third branch of a gas pipeline system to Czechoslovakia, Austria, Italy, Yugoslavia, the Federal Republic of Germany, France, and the German Democratic Republic was completed. This branch runs from the frontier of the Soviet Union through Czechoslovakia, reaching the Federal Republic of Germany at Rozvadov, and measures 909 kilometers. Up to 330 billion cubic feet of the gas will be delivered to Czechoslovakia annually in payment for the use of its territory. When the compressor stations are completed and enlarged in 1984, the system is to carry 1,870 billion cubic feet per year. In the 1981-85 period, it will carry a total of 8,100 billion cubic feet, almost twice as much as in 1976-80.

In the early 1970's, domestic and imported natural gas made up 3% to 4% of all Czechoslovak primary energy resources, but the supplies carried by the new gas pipeline made it possible to increase the use of natural gas to about 9% of energy consumption in 1981.

Petroleum.—Production of crude oil in Czechoslovakia was insignificant, and the country had poor prospects for maintaining crude oil output by increased drilling. However, intensive geological exploration was to continue, with emphasis on finding deeper sources of oil. The Bratislava Petroleum and Gas Industry, a Government corporation, was solely responsible for geological research for petroleum areas. In 1981, domestic crude oil production was mainly between Hodonin and Gbely, both on the Moravia River. New crude oil deposits were discovered near Zdanice, Korycany, and Urice in the Zdanicky Les, about 4,000 meters below the surface.

The price of oil imported from the the Organization of Petroleum Exporting Countries (OPEC) in 1981 reached a level unprofitable for the Czechoslovak economy, and this source of primary energy, which had been counted in preliminary plans for the 1981-85 period, will not be considered either for that period or beyond.

The total capacity of Czechoslovakia's seven refineries, at Bratislava, Kolin, Krolupi, Pardubice, Strazke, Zaluzi, and Zyolen, was approximately 20 million tons. In addition, a crude oil distillation plant, the center of a new refinery division of the chemical combine at Litvinov in Northern Bohemia, was put into trial operation on July 13, 1981. The new refinery was to produce materials for the newly built petrochemical combine. Air Products Co. of the United States also commissioned a new benzene unit for Chemopetrol at Zaluzi in Czechoslovakia, with a capacity of 300,000 tons per year of high-quality benzene.

Uranium.—In 1981, the main mining areas included Hamar-na-Jezere in Northern Bohemia and the Pribram area in Central Bohemia. The deposits of uranium ore at Hamar-na-Jezere were considered relatively large and were expected to last through several decades of exploitation. A new uranium ore chemical processing plant was recently opened at Strazpod Raleskem, in the Ceska Lipa district in Northern Bohemia. This plant will produce uranium oxide to be exported to the U.S.S.R. The Soviet Union controlled the exploration and production of uranium in Czechoslovakia.

The Mineral Industry of Denmark and Greenland

By Joseph B. Huvos[1]

DENMARK

In 1981, Denmark had few known mineral resources of its own and continued to import most fuels and minerals. Production included some oil and gas in the North Sea and some industrial minerals.

In 1981, the recession in Denmark was deeper than in most of Europe and production fell for the second consecutive year. It was aggravated by restraints on domestic demand introduced to slow down a growing payments deficit.

In 1981, the gross national product (GNP) was again down by 1% in real terms and amounted to about $65 billion at current prices.[2] The consumer price index was up 11.7%, and unemployment averaged 8.8% during the year.

The contribution of the principal sectors of the mineral industry to the GNP, in million dollars and average employment, are shown in the following tabulation:

Sector	Contribution to GNP (millions)		Average 1980 employment
	1979	1980	
Iron, steel, metals	r$453	$479	7,496
Nonmetallic minerals	74	73	1,260
Nonmetallic mineral products	1,111	1,091	21,887
Oil refining	1,257	1,653	621
Fertilizers	r142	180	1,367
Total	r3,037	3,476	32,631

Source: Danmarks Statistik (Copenhagen). Industrial Statistics 1980. April 1982, pp. 18, 22-23.

Important events in the mineral industry of Denmark in 1981 included continued construction of the Tyra offshore gasfield and construction of a related gas landing and distribution system. The Government readied new legislation on taxation of hydrocarbons and obtained a bill to salvage the Danish Steel Co.

PRODUCTION

Denmark's production of selected minerals and mineral products for the last 5 years, including 1981, are shown in table 1.

Table 1.—Denmark: Production of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1977	1978	1979	1980	1981[p]

[4]Excludes steel forgings.

[5]Granite and gneiss only; excludes an unreported quantity of other dimension stone with a sales value of $302,938 in 1977 (not available for 1978-81).

[6]Partial figures; exclude an unreported quantity of quartz and quartzite with a sales value of $356,143 in 1977 (not available for 1978-81).

TRADE

The balance of trade was again negative in 1981, by over $1 billion. Main imports of U.S.-origin products were more than 4 million tons of coal, some machinery, and other industrial products; they were valued at about $1.8 billion. Total mineral trade in 1979 and 1980 is shown in tables 2-3.

Oxides	16	7	--	Malta 2; Iceland 1; Sweden 1.
Metal including alloys:				
Scrap	3,317	3,387	--	West Germany 2,364; East Germany 395; Netherlands 261.
Unwrought	288	926	--	Singapore 306; West Germany 190; Belgium-Luxembourg 174.
Semimanufactures	170	289	--	West Germany 175; Norway 34; Tunisia 30.
Other:				
Ores and concentrates	81	442	--	Norway 331; Sweden 47; West Germany 42.
Ash and residues	8,635	5,607	--	West Germany 2,153; Norway 1,786; Sweden 777.
Oxides and hydroxides	51	62	--	Norway 20; United Kingdom 16; Finland 12.
Metalloids	--	2	1	Colombia 1.
Base metals including alloys, all forms	r95	82	1	West Germany 57; Sweden 21.
NONMETALS				
Abrasives:				
Natural: Corundum, emery, pumice, etc	15	10	--	Saudi Arabia 1; Sweden 1.
Grinding and polishing wheels and stones	847	1,310	(2)	Ethiopia 635; Iran 169; Yemen Arab Republic 120.
Asbestos, crude	80	48	--	Switzerland 18; Finland 10; Iceland 7.
Barite and witherite	43	15	--	Iceland 9; Ecuador 6.
Boron materials:				
Crude, natural borates	--	5	--	All to Iceland.
Oxide and acid	35	42	--	Sweden 37; Norway 4.
Cement	280,464	279,055	22,046	Venezuela 89,445; Sweden 36,820; Israel 30,328.
Chalk	14,729	15,300	--	Sweden 8,213; Norway 4,511; Finland 1,754.
Clays and clay products:				
Crude	2,928	1,845	6	Sweden 766; Norway 299; Belgium-Luxembourg 261.
Products:				
Nonrefractory	79,172	88,591	300	West Germany 70,126; Sweden 9,098; Norway 5,100.
Refractory including nonclay brick	36,951	35,500	198	West Germany 5,299; Norway 3,470; Sweden 2,506.
Cryolite and chiolite, natural	27,537	22,678	NA	NA.
Diamond:				
Gem not set or strung value, thousands	$174	$69	--	Belgium-Luxembourg $36; Switzerland $15; West Germany $9.
Industrial do	--	$9	--	Norway $6; Belgium-Luxembourg $3.

See footnotes at end of table.

Table 2.—Denmark: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980[1]	Destinations, 1980	
			United States	Other (principal)
NONMETALS —Continued				
Diatomite and other infusorial earth	58,110	56,270	--	West Germany 21,736; Netherlands 11,833; Switzerland 7,421.
Feldspar, fluorspar, related materials	--	2	--	Sweden 1.
Fertilizer materials:				
Crude:				
Phosphatic	124	--		
Other including mixed	337	324	--	Sweden 223; West Germany 67; Norway 22.
Manufactured:				
Nitrogenous	400	641	--	West Germany 588; Greenland 20; Iceland 19.
Phosphatic	37,978	105,117	--	Nigeria 58,713; Brazil 15,090; Bangladesh 14,828.
Potassic	30	7	--	Norway 6.
Other including mixed	46,884	136,673	--	China 47,001; United Kingdom 18,255; Pakistan 15,752.
Ammonia	527	464	--	Sweden 360; Saudi Arabia 36; Greenland 15.
Graphite, natural	48	7	(2)	Sweden 3; United Kingdom 3.
Gypsum and plasters	123	168	--	Sweden 82; West Germany 43; Malaysia 20.
Lime	15,602	8,426	--	Norway 4,414; West Germany 3,217; Greenland 576.
Magnesite	41	78	--	West Germany 30; Norway 25; Netherlands 13.
Mica:				
Crude including splittings and waste	65	29	--	West Germany 12; Switzerland 5; Yugoslavia 3.
Worked including agglomerated splittings	(2)	1	--	Mainly to Belgium-Luxembourg.
Pigments, mineral: Iron oxides and hydroxides, processed	108	125	--	West Germany 40; Finland 22; Iceland 20.
Precious and semiprecious stones:				
Natural value, thousands	--	$89	--	West Germany $49; Norway $19; Greenland $7.
Synthetic do.		$5	--	West Germany $2; Iceland $1; Norway $1.
Salt and brine	38,211	45,904	155	Sweden 16,648; Finland 11,910; Norway 10,004.
Sodium and potassium compounds:				
Caustic potash	4	8	--	Norway 5; Iceland 2.
Caustic soda	242	2,417	--	Sweden 2,375; Iceland 22; Saudi Arabia 20.
Soda ash	207	171	--	Sweden 63; Peru 28; Iceland 27.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	45,534	67,959	--	West Germany 67,843; Netherlands 91.
Worked	8,806	7,641	(2)	West Germany 7,118; Norway 143; Sweden 129.
Dolomite, chiefly refractory-grade	97	262	--	West Germany 240; Iceland 10.
Gravel and crushed rock thousand tons	1,372	1,184	--	West Germany 1,157; Sweden 20.
Limestone excluding dimension	70,246	73,925	--	Sweden 42,504; West Germany 21,077; Norway 9,503.
Quartz and quartzite	689	226	--	Greenland 92; Sweden 45; Montserrat 40.
Sand excluding metal-bearing	408,085	162,780	--	Sweden 117,835; West Germany 24,292; Finland 11,610.
Sulfur:				
Elemental, all forms	25	51	--	Iceland 50.
Sulfuric acid	50,462	16,245	--	Finland 15,183; Sweden 512; Norway 238.
Talc, steatite, soapstone, pyrophyllite	506	68	--	Ecuador 15; Iceland 14; Oman 10.
Other nonmetals:				
Crude	1,322	1,236	(2)	West Germany 796; Switzerland 207; Finland 76.
Slag and dross, not metal-bearing	19,526	31,831	--	France 23,958; West Germany 4,344; Sweden 1,616.
Oxides and hydroxides of barium, magnesium, strontium	47	3	--	Iceland 1; Norway 1.
Halogens	--	3	--	Ghana 2.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	12,492	8,804	4	Finland 1,772; Sweden 1,743; Norway 1,707.

See footnotes at end of table.

Table 2.—Denmark: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980[1]	Destinations, 1980	
			United States	Other (principal)
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	284	1,073	--	West Germany 1,016; Sweden 51.
Carbon black	34	33	--	Sweden 23; Yugoslavia 3.
Coal and briquets:				
Anthracite and bituminous coal	2,792	4,103	--	Sweden 2,165; Greenland 1,926.
Briquets of anthracite and bituminous coal	--	1	--	NA.
Lignite including briquets	--	27	--	West Germany 26.
Coke and semicoke	r55,704	56,980	--	Norway 26,604; Sweden 23,957; West Germany 6,141.
Peat including briquets	2,081	2,654	--	Sweden 575; United Kingdom 524; West Germany 468.
Petroleum refinery products:				
Gasoline thousand 42-gallon barrels	5,140	3,520	--	Sweden 3,169; France 163; West Germany 62.
Kerosine and jet fuel do.	161	14	--	Sweden 7; Greenland 6.
Distillate fuel oil do.	10,727	6,645	2	Sweden 3,247; United Kingdom 2,019; France 395.
Residual fuel oil do.	2,462	1,194	33	Sweden 487; Netherlands 381; United Kingdom 153.
Lubricants do.	194	208	(2)	Norway 96; Belgium-Luxembourg 61; Sweden 13.
Other:				
Liquefied petroleum gas 42-gallon barrels	95,816	141,474	--	Sweden 85,144; Netherlands 33,220; West Germany 18,073.
Mineral jelly and wax do.	5,281	5,241	--	Sweden 2,998; Norway 519; Finland 268.
Petroluem coke do.	--	2,728	--	All to Iceland.
Bitumen and other residues do.	r660,340	443,537	--	Sweden 180,067; Norway 135,344; Finland 63,557.
Bituminous mixtures do.	15,665	13,653	--	Sweden 4,400; Greenland 2,969; Norway 2,133.
Mineral tar and other coal-, petroleum-, and gas-derived crude chemicals	14,532	22,306	--	Norway 11,897; West Germany 4,624; Sweden 2,792.

rRevised. NA Not available.
[1]Exports for 1980 include Faroe Islands.
[2]Quantity less than 1/2 unit.
[3]May include waste and sweepings of other precious metals.

Table 3.—Denmark: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1979	1980[1]	Sources, 1980	
			United States	Other (principal)
METALS				
Aluminum:				
Bauxite	89,385	90,554	26	Suriname 71,579; Malaysia 14,022; Greece 4,927.
Oxides and hydroxides	3,164	4,018	586	United Kingdom 2,246; West Germany 929; Sweden 60.
Metal including alloys:				
Scrap	1,377	2,269	25	West Germany 1,036; Norway 655; Sweden 500.
Unwrought	21,110	21,935	224	Norway 13,655; United Kingdom 4,079; Netherlands 1,567.
Semimanufactures	62,823	59,030	3,364	West Germany 12,243; Norway 8,655; Sweden 7,846.
Antimony metal including alloys, all forms	24	NA		
Beryllium metal including alloys, all forms	--	1	(2)	All from West Germany.
Cadmium metal including alloys, all forms	8	NA		
Chromium:				
Ore and concentrate	175	200	--	All from Finland.
Oxides and hydroxides	381	370	1	West Germany 316; Italy 52.

See footnotes at end of table.

Table 3.—Denmark: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980[1]	Sources, 1980

METALS —Continued				
Cobalt:				
Oxides and hydroxides	10	5	--	United Kingdom 4.
Metal including alloys, all forms	26	NA		
Copper metal including alloys:				
Scrap	2,909	3,124	144	United Kingdom 901; West Germany 618; France 599.
Unwrought	4,093	3,686	4	Belgium-Luxembourg 2,788; Sweden 340; West Germany 328.
Semimanufactures	38,833	35,211	96	West Germany 9,371; Belgium-Luxembourg 9,077; Sweden 8,228.
Iron and steel:				
Ore and concentrate	1,379	3,345	--	Sweden 3,299; West Germany 25; United Kingdom 12.
Pyrites, roasted	25,581	16,288	--	Norway 16,215; West Germany 73.
Metal:				
Scrap	284,249	216,796	388	United Kingdom 137,637; U.S.S.R. 38,174; West Germany 26,526.
Pig iron, cast iron, powder, shot	24,469	43,607	6	Sweden 18,357; West Germany 9,442; East Germany 3,791.
Ferroalloys	21,049	17,560	1	Norway 13,310; United Kingdom 1,974; Sweden 1,241.
Steel, primary forms	34,231	114,113	(2)	West Germany 41,822; Norway 29,303; Sweden 18,248.
Semimanufactures:				
Bars, rods, angles, shapes, sections	373,218	306,414	60	West Germany 98,223; Sweden 50,019; Belgium-Luxembourg 35,125.
Universals, plates, sheets	707,216	716,756	423	West Germany 282,643; Sweden 71,733; France 66,280.
Hoop and strip	63,208	56,868	8	West Germany 33,540; Sweden 8,251; Belgium-Luxembourg 4,111.
Rails and accessories	12,263	12,952	--	France 5,404; West Germany 4,519; Sweden 320.
Wire	30,136	30,792	76	Belgium-Luxembourg 12,928; West Germany 9,139; Sweden 5,740.
Tubes, pipes, fittings	217,343	183,664	228	West Germany 70,959; Austria 17,302; France 16,342.
Castings and forgings, rough	3,807	6,459	--	West Germany 1,835; United Kingdom 1,677; Norway 1,454.
Lead:				
Oxides	526	547	11	West Germany 286; France 145; East Germany 40.
Metal including alloys:				
Scrap	19,012	16,546	1,087	United Kingdom 4,735; Norway 3,926; West Germany 2,768.
Unwrought	8,884	6,523	952	Sweden 2,167; West Germany 1,109; United Kingdom 618.
Semimanufactures	2,413	3,956	--	West Germany 3,784; United Kingdom 43; Netherlands 21.
Magnesium metal including alloys:				
Unwrought	99	113	20	Norway 93.
Semimanufactures	74	87	47	Switzerland 13; Canada 10; West Germany 8.
Manganese:				
Ore and concentrate	980	819	--	Netherlands 530; West Germany 214; Gabon 75.
Oxides	2,056	2,086	40	Belgium-Luxembourg 1,145; China 300; Greece 260.
Mercury 76-pound flasks	406	290	NA	Netherlands 116; U.S.S.R. 58; United Kingdom 29.
Molybdenum metal including alloys, all forms	6	6	(2)	West Germany 3; Austria 2.
Nickel:				
Matte and speiss	30	21	1	United Kingdom 11; Canada 9.
Metal including alloys:				
Scrap	1	4	--	United Kingdom 3.
Unwrought	206	179	6	Finland 74; United Kingdom 31; West Germany 21.
Semimanufactures	241	213	8	West Germany 72; Finland 66; Norway 26.
Platinum-group metals including alloys, unwrought and partly wrought value, thousands	$6,162	$6,833	$221	Netherlands $2,747; Switzerland $2,083; West Germany $1,181.

[3]May include waste and sweepings of other precious metals.

COMMODITY REVIEW

Metals.—*Iron and Steel.*—Danish Steel Works Ltd. (DDS) was in a very serious financial situation in 1981, and the Danish Parliament passed a bill for the financial reconstruction of the company. The reconstruction plan provided new capital in the form of share capital and subordinated loan capital totaling $50 million, $43 million of which was paid in cash and the rest in the form of converted debt. In addition, an interest reduction of $28 million was granted for the 1981-85 period, and debts totaling $42 million were written off. Finally, the existing share capital and subordinated loan capital was written down by $45 million and an extraordinary depreciation of $36 million was carried out on plant and equipment. Major creditors of the company included foreign and domestic interests plus the Danish Government, whose share in DDS rose to 30% following the granting of new state aid.

In previous years DDS has undergone a complete restructuring, making it an all electric ministeelmaker at its Frederiksvaerk plant, located 60 kilometers north of Copenhagen. In 1981, production showed a 17% decrease compared with 1980 because of the closing down of the old Siemens-Martin plant. The new electric steel plant had a capacity of about 650,000 tons per year.

Nonmetals.—*Cement.*—A/S Aalborg Portland-Cement- Fabrik, a member of the F. L. Smidth Group, remained Denmark's sole cement producer with 2.4 million tons capacity. Cement production in 1981 was centralized at the Rördal works near Aalborg in northern Jutland. The company's former cement plant at Dania near Mariager had been converted to the production of calcined bauxite for refractory use, with a capacity of up to 100,000 tons per year.

Moler.—Moler, one of the most important minerals produced in Denmark, was a natural diatomaceous earth containing 20% to 25% plastic clay. The clay acts as a natural binder during brick formation. A large export oriented industry has developed since 1912, exploiting the deposits located on Fur and Moors Islands. It is used in insulating boards, as absorbent for oil, as an anticaking agent for fertilizers and foodstuffs, as a carrier for insecticides, in explosives, and for refining acids. It is also an additive to cement for enhancing resistance to seawater, as in oil drilling in the North Sea. In 1981, most moler was produced on Fur Island. The larger of the two moler producers was Skarrehage Molervaerk A/S, which was acquiring the operations of Molisol Products, and the smaller was Dansk Moler

Industri A/S, which cooperated with Molervaerk Ludolph Struve & Co.

Denmark no longer produced pure diatomite, since Andreas Jennow A/S at Ego-Vaerkene had closed its operations.

Salt.—Dansk Salt I/S continued as the sole producer of salt in Scandinavia, producing salt by solution mining from a salt dome at Hvornum near Hobro. The salt brine was transported 25 kilometers by pipeline to the Mariager plant where the conventional vacuum salt process was used.

Mineral Fuels.—*Petroleum and Natural Gas.*—Crude oil production on the Danish continental shelf continued at a very modest pace by the Dansk Undergrunds Corsortium (DUC), consisting of Dansk Boreselskab (AP Möller) the operator (30%), Shell Oil Co. (40%), Chevron Oil Co. (15%), and Texaco Oil Co. (15%). Discovered in 1971, the Dan Field, located 200 kilometers west of Ejsberg in 41 meters of water, had been in production since 1972, and had in 1981 estimated reserves of 100 million barrels. Production was transferred by way of a 27-kilometer pipeline to the Gorm Field's loading facilities. Gorm, operational since May 1981 and located in 38 meters of water, was also operated by DUC. It had reserves estimated in 1981 at 125 million barrels; its crude oil production was to reach 26,000 barrels per day in 1983 and was to be tank loaded until 1984, when a pipeline was to enter service for landing the oil on the Danish Continent. Production was to include small amounts of oil from the nearby Skjöld Oilfield.

DUC was continuing construction of the new Tyra Gasfield. One 1,300-ton platform, Tyra B, was installed, with three further platforms to follow, costing about $20 million. Production, due to start in mid-1982, was to be landed by separate gas and condensate pipelines, together with the production from the Dan and Gorm Fields. Ultimately the Tyra Field was to have nine platforms. The project linking the producing fields with onshore points was progressing on schedule. The Government-owned Danish Oil and Natural Gas Co. (DONG) was giving out the contracts for the construction of the pipeline and was to operate the system after its completion. When completed, the pipeline was to run from the gas system of the Federal Republic of Germany near Froslew in the south to Egtved in central Jutland, then further north to Lille Thorup, where it was to terminate in gas storage caverns to be built in salt domes. A branch was to lead from the drilling platforms of the continental shelf to the Danish Continent near Ejsberg, then to join the north-south leg at Egtved, to cross the Little Belt and Big Belt Straits and was to be landed at Kongsmark near Korsör, then extended to the Copenhagen area.

In 1981, Denmark's oil refining (distillation) capacity remained unchanged at 214,000 barrels per calendar day. A/S Dansk Shell operated a 59,000-barrel-per-day facility at Fredericia on Jutland, Dansk Esso A/S operated a 70,000-barrel-per-day facility at Kalundborg on Zealand Island, and Gulf Oil Refining A/S operated an 85,000-barrel-per-day facility at Skaelskor, also on Zealand Island.

The Danish Parliament passed new legislation for the taxation of income in connection with the production of hydrocarbons called the Hydrocarbons Tax Act. Starting with 1982, the Government's terms for a maximum tax take, including an 8.5% royalty, was 83.5% of the value of net production. The average take excluding royalty was to amount to 70% of the net production value, with each field taxed individually so that profits and losses could not be transferred from one field to the other. DUC has strongly criticized the Government's new tax laws, which will lead the consortium to incur a tax liability.

Exploration of the Danish North Sea was formerly under the exclusive license of AP Möller. Starting with 1982, other companies may apply for exploration licenses.

Fulfilling its commitment to the Government to boost exploration and development work, Möller was planning to operate five offshore drilling rigs. Two of the three are to drill wildcat wells.

There was also a rising interest in acquiring drilling permits in areas around the Faroe Islands. The Faroese Government received 25 inquiries from both Danish and foreign firms wishing drilling permits.

The Energy Ministry of Denmark licensed the Western Geophysical Co. of America and Norwegian Geophysical Consultants A/S to undertake seismic exploration in the Danish North Sea sector for the period through 1982. The Ministry is to have full access to seismic data and interpretations. About a dozen companies were lined up with the Danish Government for similar projects.

The Government-owned DONG concluded a cooperation agreement with the British National Oil Corp. (BNOC) on joint explora-

tion and exploitation of hydrocarbons in the Danish continental shelf. BNOC will supply the technical expertise. A similar agreement has also been concluded between DONG and the Norwegian Statoil, covering certain other offshore areas in Denmark.

GREENLAND

Greenland, the world's largest island, with apparently substantial mineral resources, had only a modest mineral production of lead and zinc concentrates. Some crude cryolite ore was also shipped from stocks.

Home rule for Greenland was voted in 1979, and in 1981 a plebiscite revealed that a narrow majority of the about 50,000 inhabitants was opposed to continued membership in the European Economic Communities (EEC) because of EEC policies on fishing quotas and rights. Fishing was the major industry in Greenland. Greenland's council can unilaterally revoke EEC membership as soon as January 1, 1984. As a result it would be possible that exploration for mineral deposits in Greenland would decline further, as several large projects were partly funded by EEC.

PRODUCTION AND TRADE

Greenland's mineral production in 1977 through 1981 is shown in table 4. Greenland's foreign trade in 1979 and 1980 are detailed in tables 5-6.

Table 4.—Greenland: Production of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity[2]	1977	1978	1979	1980	1981[p]
Lead, mine output, metal content:					
Of ore hoisted	33,733	36,018	35,255	34,344	30,080
Of concentrates	28,800	30,600	31,900	30,100	27,400

COMMODITY REVIEW

Metals.—*Lead and Zinc.*—Greenex A/S, a subsidiary of Cominco Ltd. of Canada, continued to operate, the Black Angel Mine at Marmorilik, Greenland's only active mine, and produced silver-bearing lead and zinc concentrates. Concentrate production was exported to Europe. Exploration in 1981 was very extensive and cost $2 million. Proven ore reserves were 3.1 million tons of ore assaying 31 grams per ton of silver, 4.2% lead, and 13.5% zinc. Slightly lower production resulted in 1981 from lower metal content of the ore.

Tungsten.—Encouraging results were reported by the Nordisk Mineselskab A/S in East Greenland between the 70th and 74th parallels north in a survey performed under an EEC contract.

Mineral Fuels.—*Coal.*—Although large reserves of high volatile bituminous coal in workable seams have been found in late Cretaceous sedimentary basins on Nugssua Peninsula at 70° North in West Greenland, no further exploration work was commissioned for the near future.

Petroleum.—There was a mounting interest for oil exploration in East Greenland. The Nordisk Mineselskab A/S, partly owned by the Arco Oil Co. of the United States, decided to perform seismic tests in the south of Jameson Land during the summer of 1982. It was not believed that exploration drilling could start earlier than 10 to 15 years. The Canadian Government's Petro Canada Oil Co. planned to transport liquefied natural gas from the Canadian Arctic Pilot Project, for transporting natural gas from the Melville Islands and the Arctic Archipelago from 1986 on, on an experimental basis through the Northwest Passage between Canada and Greenland. The Government of Greenland expressed opposition to the project for environmental reasons.

Uranium.—The Geological Survey of Greenland gained renewed funding for a remote sensing study in South Greenland for the exploration of uranium.

The Mineral Industry of Egypt

By Peter J. Clarke[1]

Egypt's economic growth continued in 1981 at a somewhat slower pace than the 8% to 9% rate of growth of the gross domestic product (GDP) reported for 1980. The GDP for fiscal year 1980-81 was $26 billion[2] and was expected to rise to $30 billion in fiscal year 1981-82.

Economic expansion has been led by revenues generated from the substantial petroleum production increases of 1980 and 1981. The country's petroleum surplus (exports minus imports) in 1980 was $2.65 billion. This increased to approximately $2.76 billion in 1981, despite lower than expected prices for crude and refined oil.[3]

Revenues from oil exports, Suez Canal receipts, tourism, and remittances from Egyptians working abroad provided the bulk of foreign exchange earnings for the country and held down the current account deficit to about $800 million. Egypt's persistent deficit in the balance of trade, estimated at about $4 billion in 1981, remained a problem. Increased levels of capital inflows ($1.5 billion), as well as a substantial amount of aid from the United States ($1.3 billion) and other Western nations, provided the country with a substantial surplus in the overall balance of payments.

The mining and industrial sectors in Egypt contributed about 14% to the GDP in 1981. Petroleum provided about 25%. The country's major mineral commodities besides petroleum were aluminum, iron and steel, nitrogenous fertilizer, phosphate rock, salt, clays, and construction materials. Major strides were made in the past 2 years in nitrogenous fertilizer production, making the country nearly self-sufficient in 1981. Phosphate rock production also increased as Egypt planned to exploit its vast resources and become a world-scale producer.

The Government continued to emphasize development of the country's underground resources in the 1980-84 5-year plan, to lead the way in overall economic development. Nearly all mining operations in the country were carried out by public mining companies. The Egyptian Geological Survey and Mining Authority (EGSMA), in addition to its own geological surveying work, was preparing to offer some private sector-joint venture arrangements to develop the mineral industry. The country has suffered from a general lack of information on its mineral potential and from old and inefficient equipment used by the public mining companies. In 1981, Egypt received a World Bank loan and a U.S. Agency for International Development (AID) grant to conduct detailed studies of its petroleum and mineral resources. EGSMA prepared a list of several areas and minerals that may be open to private development, which include phosphates, coal, iron ore, and gold.

The Government also planned to reopen several old mines on the Sinai Peninsula. The western two-thirds of the Sinai was restored to Egyptian control in 1981, with the final portion scheduled to be returned to Egyptian sovereignty in April 1982. Mineral development plans centered around the coal deposit at Maghara in central Sinai, manganese at Abu Zeneima, and gypsum at Ras Malaab. All of these mineral deposits had been exploited prior to the Israeli occupation in 1967.

Egypt was also embarking on a major nuclear energy development program. In 1981, Egypt signed cooperative agreements with the United States, France, and the Federal Republic of Germany for nuclear

research and the development of nuclear energy. The agreements formed part of Egypt's overall plan to purchase or build eight nuclear power reactors of approximately 1,000 megawatts each by the year 2000. The agreement with the United States called for the establishment of a framework for peaceful nuclear cooperation, under which the United States may supply nuclear power reactors and low-enriched uranium fuel, to provide a maximum generating capacity of 2,000 megawatts. The agreement with the Federal Republic of Germany also opened the possibility of that country selling up to four nuclear reactors to Egypt before the year 2000.

The French appeared to be the furthest ahead in their cooperative agreement with Egypt. The French were prepared to sell to Egypt two 900-megawatt pressurized water reactors to be built by Framatome (France), utilizing Westinghouse (United States) technology. The power stations were worth about $2 billion each. Egypt was also planning to sign a nuclear cooperation agreement with Canada.

Egypt's switch to nuclear power to satisfy its growing requirement for electricity was expected to make available over $3 billion per year in revenue from petroleum that otherwise would have been consumed for domestic production of electricity.

PRODUCTION AND TRADE

Production of most of Egypt's important mineral commodities increased in 1981 with significant gains in the production of crude petroleum, nitrogenous fertilizers, aluminum, and phosphates. Petroleum production averaged 642,000 barrels per day in 1981, a 3% increase from the 1980 level. Exports of petroleum provided the Government of Egypt with revenues of $2.89 billion for fiscal year 1981-82. Several new discoveries during the year, as well as an increased rate of exploration, brought closer the possibility of the country reaching its goals of producing 1 million barrels per day of crude oil by 1983.

Fiscal year 1981-82 industrial production increased an average of 6.5% from the 1980 level, with public sector production increasing 7% to $5.45 billion, and private sector production increasing 6% to 2.8 billion. Production of nitrogenous fertilizers increased substantially during the year, as the Talkha II ammonia-urea complex came fully onstream. For the first time since fertilizer production began in Egypt, the country approached self-sufficiency in both nitrogen and phosphate fertilizer. Production of phosphate rock also increased during the year, with further increases scheduled within the decade as development of the Abu Tartur deposit in the Western Desert progresses.

Egypt's production of iron and steel posted a slight increase in 1981 but was scheduled to nearly double in 1984, when a new direct-reduction steelworks will come onstream. Iron ore production from the Bahariya Oasis deposits in the Western Desert was to increase substantially to meet the new demand.

Production of cement, gypsum, clays, and sand and gravel also increased in 1981. Output of construction materials was expected to increase rapidly throughout the 1980's to respond to an expanding construction industry in the country. New construction projects were to increase 20% per year for most of the decade. Mineral production in Egypt is shown in table 1.

After showing a significant improvement in the balance of payments in 1980, Egypt's current account balance deteriorated slightly in 1981, mainly owing to lower than expected earnings from the petroleum sector. In 1980, Egypt's merchandise trade deficit shrunk from over $4 billion the previous year to $3.7 billion. Service receipts from tourism ($780 million), the Suez Canal ($660 million), worker remittances ($2.7 billion), and investment income and transfer payments left Egypt with a current account deficit of $680 million in 1980, the smallest since the 1973 war. The growth of the current account deficit in 1981 was partly a result of the rapid growth of imports, 35% of which were for food and other consumable items. Exports of industrial products also declined, despite the Government's programs to encourage them.

Egypt's principal mineral exports were petroleum and petroleum products, aluminum, gypsum, cement, and salt. Petroleum was exported to Italy (40%), Israel (25%), Greece (7%), the United States (6%), the Netherlands (6.4%), and others (15.6%).

The United States remained Egypt's single largest trading partner in 1981, supplying about one-fifth of its imports, worth over $2 billion, and receiving one-ninth of its exports. Of the $2 billion worth of goods Egypt imported from the U.S., about half were financed by AID. The United States also contributed $275 million in agricultural assistance, bringing the total U.S. eco-

nomic assistance to Egypt to about $1.3 billion. Egypt's trade statistics are shown in tables 2 and 3.

Table 1.—Egypt: Production of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1977	1978	1979	1980[p]	1981[e]

Table 2.—Egypt: Exports and reexports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1979	1980	Destinations, 1980	
			United States	Other (principal)
METALS				
Aluminum metal including alloys:				
Scrap	41,240	33,170	1,500	Netherlands 29,288; Yugoslavia 1,487; Italy 499.
Unwrought	--	139	--	All to Saudi Arabia.
Semimanufactures	31,741	12,425	--	Netherlands 8,676; Saudi Arabia 2,279; Japan 1,000.
Copper: Matte and speiss	1	--		
Iron and steel metal, semimanufactures:				
Bars, rods, angles, shapes, sections	10	134	--	All to Saudi Arabia.
Universals, plates, sheets	40,294	50,792	--	Austria 16,100; Italy 12,112; West Germany 10,839.
Tubes, pipes, fittings	502	411	--	Sudan 394; Saudi Arabia 17.
Lead metal including alloys, semimanufactures	--	3	--	All to Saudi Arabia.
Nickel metal including alloys, semimanufactures	1	--		
Tin metal including alloys, semimanufactures	2	--		
Zinc oxides and hydroxides	4	3	--	All to Saudi Arabia.
Other: Metals including alloys, nonferrous scrap	215	--		
NONMETALS				
Abrasives, n.e.s.: Grinding and polishing wheels and stones value	$2,000	--		
Cement	1,700	750	--	All to Sudan.
Clays and clay products:				
Crude	9,100	1,500	--	All to Kuwait.
Products:				
Nonrefractory	--	50	--	Sudan 45; Saudi Arabia 5.
Refractory including nonclay brick	183	47	--	All to Saudi Arabia.
Feldspar and fluorspar	--	10	--	All to Lebanon.
Fertilizer materials:				
Crude, phosphatic	--	25,945	--	China 12,000; Lebanon 5,607; Romania 5,607.
Manufactured:				
Nitrogenous	--	11,105	--	France 5,790; Belgium-Luxembourg 4,600; West Germany 715.
Phosphatic	19,100	10,200	--	Italy 5,200; West Germany 5,000.
Lime	80	--		
Pigments, mineral: Crude natural	505	--		
Precious and semiprecious stones except diamond value, thousands	$11	--		
Salt and brine	84,960	49,407	--	North Korea 21,000; Lebanon 10,357; United Kingdom 9,050.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	2,584	769	--	Italy 724; Saudi Arabia 45.
Worked	1	--		
Gravel and crushed rock	401	--		
Talc, steatite, soapstone, pyrophyllite	1,018	580	--	All to East Germany.
Other: Building materials of asphalt, asbestos and fiber cements, and unfired nonmetals	372	1,227	--	Saudi Arabia 1,209; Sudan 18.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	4,178	1,580	--	Italy 1,130; Switzerland 300; France 150.
Carbon black and gas carbon	--	8,773	--	Romania 7,700; Lebanon 1,073.
Coke and semicoke	23,404	9,145	--	All to Romania.
Petroleum and refinery products:				
Crude thousand 42-gallon barrels	37,980	57,961	6,044	Italy 25,692; People's Democratic Republic of Yemen 7,239; Israel 5,393; Switzerland 3,513.
Refinery products:				
Nonlubricating oils[1] do	11,507	6,722	--	Italy 2,995; Netherlands 1,925; France 636.
Petroleum coke do	--	2	--	All to Switzerland.
Mineral tar and other coal-, petroleum-, and gas-derived crude chemicals	3,185	3,738	--	Switzerland 3,586; Italy 150; United Kingdom 2.

[1]Totals include bunker loadings of 4,476,969 barrels in 1979 and 915,460 barrels in 1980.

Table 3.—Egypt: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1979	1980	Sources, 1980	
			United States	Other (principal)
METALS				
Aluminum:				
Oxides and hydroxides	1,099	492	--	West Germany 215; United Kingdom 86; Italy 79.
Metal including alloys:				
Scrap	1,856	1,587	--	Canada 799; Switzerland 618; Greece 87.
Unwrought	1	3	--	All for ships' bunkers.
Semimanufactures	1,108	2,786	437	Spain 1,244; West Germany 403; Italy 282.
Arsenic: Oxides and acid	10	29	--	West Germany 17; France 12.
Chromium: Oxides and hydroxides	25	110	2	U.S.S.R. 53; Poland 43; West Germany 7.
Cobalt: Oxides and hydroxides	155	(1)	--	All from United Kingdom.
Copper:				
Matte and speiss	893	90	--	Do.
Metal including alloys:				
Scrap	271	1,391	138	Nigeria 1,194; Lebanon 2.
Unwrought	10	--	--	
Semimanufactures	1,026	3,270	429	Greece 811; West Germany 565; United Kingdom 371; Yugoslavia 327.
Iron and steel:				
Pyrites, roasted	3	5,000	--	All from Cyprus.
Metal:				
Scrap	15,829	37,095	14,834	Republic of Korea 6,909; Sudan 3,820; France 3,485.
Pig iron, cast iron, powder, shot	11,688	6,214	--	Turkey 4,670; Switzerland 500; West Germany 491.
Ferroalloys	1,665	310	--	All from Switzerland.
Steel, primary forms	43,561	63,245	13,389	Australia 16,476; Spain 15,080; West Germany 8,333.
Semimanufactures:				
Bars, rods, angles, shapes, sections	514,014	747,031	49,528	West Germany 91,067; Republic of Korea 82,939; Bulgaria 79,049.
Universals, plates, sheets	90,146	84,424	22,378	West Germany 15,385; Bulgaria 8,467; Japan 6,006.
Hoop and strip	2,567	1,057	2	Lebanon 500; West Germany 379; India 172.
Rails and accessories	8,830	8,820	931	Poland 5,999; Japan 999; India 795.
Wire	6,157	7,312	5	West Germany 5,020; Belgium-Luxembourg 581; Romania 379.
Tubes, pipes, fittings	89,660	75,855	614	Japan 24,347; France 20,867; West Germany 14,218.
Lead:				
Oxides and hydroxides	1,196	1,252	--	Bulgaria 548; France 292; United Kingdom 214.
Metal including alloys:				
Scrap	483	--	--	
Unwrought	4,320	9,106	--	United Kingdom 8,179; North Korea 397; West Germany 200.
Semimanufactures	(1)	128	128	
Magnesium: Metal including alloys, all forms	24	19	(1)	Norway 16; Italy 2.
Manganese: Oxides and hydroxides	631	791	--	Belgium-Luxembourg 391; Japan 186; Switzerland 148.
Mercury 76-pound flasks	174	580	--	United Kingdom 377; West Germany 203.
Nickel:				
Matte and speiss	1	3	--	All from United Kingdom.
Metal including alloys: Semimanufactures	7,818	27	--	United Kingdom 17; West Germany 6; Italy 2.
Platinum-group: Metals including alloys, unwrought and partly wrought value, thousands	$310	--		
Silver: Metal including alloys, unwrought and partly wrought do.	$102	$403	--	All from Switzerland.
Tin:				
Oxides and hydroxides	--	55	--	China 29; West Germany 17; Netherlands 5.
Metal including alloys:				
Unwrought	241	35	--	Mainly from Hong Kong.
Semimanufactures	5	(1)	--	All from Netherlands.
Titanium: Oxides and hydroxides	1,218	1,905	--	West Germany 1,258; United Kingdom 269; France 218.
Tungsten: Metal including alloys, unwrought value, thousands	$645	$190	--	All from Netherlands.
Uranium and thorium: Metals including alloys, all forms do.	--	$54	--	All from Gabon.
Zinc:				
Oxides and hydroxides	249	436	--	France 203; United Kingdom 154; Netherlands 61.

COMMODITY REVIEW

METALS

Aluminum.—Aluminum production from the state-owned Aluminum Co. of Egypt increased 12% from the 1980 level as two new potlines came onstream early in 1981. Capacity of the aluminum smelter, located at Nag Hammadi, 550 kilometers south of Cairo on the Nile River, increased from 133,000 to 166,000 tons per year as potlines 9 and 10 were activated, completing the smelter's final stage of expansion. Alumina for the plant was imported from Australia through the Red Sea Port of Safaga, and then trucked 220 kilometers to Nag Hammadi. Approximately 70% of the plant's output was exported, mainly to Japan, China, and Western Europe. The remainder of the output was used by the Arab Aluminum Co. manufacturing facility at Is-

mailia. The plant produced aluminum doors and window frames for export and domestic sale.

In December of 1981, Metallgesellschaft A.G. (Federal Republic of Germany) announced it had sold an aluminum rolling plant to Egypt. The plant was worth about $18 million and was to be used in conjunction with the smelter at Nag Hammadi.

Gold.—In 1981, EGSMA opened an investigation of the Baramya gold mine, which closed when gold was selling at $35 per ounce. EGSMA indicated that the mine may contain as much as 30 million tons of gold-bearing ore in a deposit that averaged nearly 1 ounce of gold per ton of rock. There were no immediate plans to activate the deposit, but EGSMA considered the area one of the best prospects for mineral development in the coming years.

Iron and Steel.—Iron ore production in Egypt continued to increase in 1981 to about 1.94 million tons, most of which was supplied from the Bahariya Oasis deposit, about 350 kilometers west of Helwan. Iron ore at Bahariya Oasis occurs at four locations: Nasser, Gebel Ghorabi, El-Harra, and El-Gedida. The deposits occur in an irregular succession of lenticular beds of Middle Eocene age. Mining is currently limited to El-Gedida, where reserves were estimated at 129 million tons containing 52% to 54% iron. Mining was by open pit methods. Reserves of the deposits at Bahariya Oasis were estimated at over 250 million tons with an average grade of 54% iron and 3% silica. Output from the deposit was expected to increase to 2.5 million tons per year when the Helwan steel plant reaches capacity, and a new steelworks at El-Dekheila is completed, sometime in 1984.

Iron ore was also mined at Aswan, which was the original source of iron ore for the steel plant, but because of its low-grade (44% iron), high-silica content (14% SiO_2), and distance from the main steelworks works at Helwan, the mine was being phased out as output from Bahariya increases.

The Egyptian Geological Survey was investigating iron ore deposits at Wedan El-Faras, about 65 kilometers north of Lake Qarun. These iron ore deposits were reportedly 12 meters thick and less than 1 meter from the surface. No reserve or grade figures were available by the end of the year.

Iron ore from El-Gedida was transported by rail to the state-owned Egyptian Iron and Steel Co.'s steelworks at Helwan, located 33 kilometers south of Cairo on the Nile River. Production of crude and semimanufactured steel remained stable in 1980 and well below the plant's rated capacity of 1.5 million tons per year. The facility was modernized in 1979, with the conversion of three blast furnaces to handle feed from Bahariya, conversion of two blast furnaces to natural gas fuel, and the starting of a fourth blast furnace. Problems with the quality of the ore feed, however, have kept the output below capacity. For this reason, the company planned to start a beneficiation research program aimed at improving the productivity of the ovens and reducing the consumption of coke. Coke for the plant was supplied from a blend of coals imported from Poland, the U.S.S.R., and the United States.

Following 2 1/2 years of neogtiations, an agreement was signed late in 1980 to establish a joint venture company to build Egypt's first direct-reduction steel mill, at El-Dekheila. Equity shares in the National Iron and Steel Co. belong 87% to the Egyptian Government, through state-owned banks, insurance companies, and steelmakers; 5% to Nippon Kokan (NKK) (Japan); 3% to Kobe Steel (Japan); 2% to Toyo Menka Kaisha (Japan); and 2% to the International Finance Corp. (IFC). Most of the engineering work for the plant had been completed by the end of the year, and commissioning was scheduled for early 1985. Formal contracts covering construction of the electric arc furnaces and continuous casters had not been signed by year-end, owing to the assassination of President Sadat, who was also president of the National Iron and Steel Co. NKK was expected to provide the furnaces, and Kobe, the billet casters, as part of their equity participation.

The direct-reduction plant was to have a capacity of 716,000 tons per year, feeding an 816,000-ton-per-year melt shop and a 775,000-ton-per-year continuous casting plant. The mill was expected to produce 720,000 tons per year of rebars and wire rod for the domestic construction industry. Financing for the project, which was expected to cost $835 million, was to be provided by the Japanese Government ($168 million in 30-year loans), the Japanese Export-Import bank ($210 million in similar credits), the IFC ($150 million loan), and the remainder from commercial banks.

Manganese.—The Egyptian Government continued to investigate the possibility of

reopening the manganese mines at Abu Zeneima, on the Sinai Peninsula. In the early 1960's, Egypt had planned to produce ferromanganese from a manganese mine located at Um Bogma in southwestern Sinai. The Israeli occupation of the Sinai cut short plans to commission the smelter, and during the occupation, the entire operation was disassembled or destroyed. Egypt planned to spend over $40 million to build a new processing plant and reactivate the mine. The mine was to produce 60,000 to 70,000 tons per year of ore, which in turn would be processed to produce 19,000 tons per year of ferromanganese alloy. Most of this would be used in the domestic steel industry. Once the El-Dekheila steelworks becomes operational, demand for ferromanganese is expected to rise to 20,000 tons per year. Kaiser Engineers of California (United States) completed a feasibility study of the operation late in 1980, but no date was available for either groundbreaking or commissioning of the new plant. Reserves at Abu Zeneima were estimated at 2 million tons of ore containing between 22% and 38% manganese and from 15% to 36% iron.

Uranium.—Uranium production from Egypt's first uranium mine remained at about 20 to 30 tons per year (U_3O_8) level. The mine opened in January of 1980 and has produced a total of less than 100 tons of reportedly good-quality uranium (U_3O_8). The deposit is located in the Eastern Desert, between Qena and Safaga. Reserves were estimated at 5,000 tons of U_3O_8. The mine and two other small mines scheduled to open in the same region were part of a 5-year research project being conducted by the Nuclear Materials Authority. Annual production was to increase to about 50 tons in 1982 and 100 tons by 1984. Egyptian officials were hoping the ore could be enriched and used for fuel for the 8 nuclear powerplants that Egypt planned to build before the year 2000. Most of the early production was to be exported.

Phosphate deposits near Wadi Qena and at Abu Tartur were also known to contain uranium as an impurity. Large-scale development of Egypt's phosphate may lead to the extraction of uranium as a byproduct. The uranium content of Egypt's phosphate deposits was estimated at 100,000 tons of U_3O_8.

NONMETALS

Cement.—Cement production in Egypt increased significantly in 1981, but remained well below the 8-million-ton-per-year consumption requirement. Three of the five cement producers in Egypt were either undergoing or planning an expansion during the year. Projects already under construction were to double the country's cement capacity of 4 million tons per year by 1983. Fuller Co. (United States) received a $66 million contract from the Suez Cement Co., for a 1.4-million-ton-per-year dry process facility at Qattanya, 55 kilometers from Suez City near the Red Sea. The plant was scheduled to start production early in 1982. Suez Cement Co. was the only privately owned cement company formed in Egypt since nationalization of the industry in 1960.

After completing a 1.4-million-ton-per-year production line in 1978, the Brown Bouveri and F.L. Smith consortium received a repeat order from the Helwan Cement Co., to increase capacity to 3 million tons per year. Also, a consortium of KHD Industrienlager A.G., operating with Deutz France S.A., and CGEE Alsthon S.A., was awarded a contract by National Cement Co. for construction of a 1.5-million-ton-per-year rotary kiln at Assiut, 50 kilometers south of Cairo. Egypt's current and planned cement facilities are listed in the following table.

Location	Company	Startup date	Current capacity (thousand tons)	Planned capacity (thousand tons)
Torah	Torah Portland Cement Co	1929	1,400	1,400
Alexandria	Alexandria Portland Cement Co.	1948	500	1,000
Assiut	National Cement Co	1960	700	1,500
Helwan	Helwan Portland Cement Co.	1978	1,400	3,000
Qattaniya	Suez Cement Co	1982	--	1,400
Nag Hammadi	National Cement Co	1983	--	1,000

Clays.—EGSMA continued to examine the possibility of extracting alumina from the Kalabsha kaolin deposit, 105 kilometers southwest of Aswan. The region currently produces a small amount of kaolin for the domestic ceramic industry. Reserves at Kalabsha were estimated at 16 million tons of kaolin with a 38% alumina content. The obstacles to utilizing the alumina from kaolin were in separating the alumina from its combined silica, and in transporting large quantities of clay from the remote Kalabsha deposit.

The Sinai Peninsula also contains several deposits of white clay and kaolin that were mined and marketed prior to Israeli occupation of the Sinai. The deposits occur about 15 kilometers from Abu Zeneima, near the manganese mines at Um Bogma. EGSMA was considering reopening these mines along with the manganese mines, in order to reindustrialize the Sinai.

Fertilizer Materials.—The Egyptian fertilizer industry was undergoing large-scale expansion in 1981. The most significant achievement during the year was the commissioning of the Talkha II ammonia-urea complex in September 1981. The new plant raised Egypt's nitrogen production capacity to approximately 1 million tons per year. The plant represented the second major addition to the country's nitrogenous fertilizer industry in 2 years, the first being the Abu Qir ammonia-urea complex that began operating in July 1979.

Egypt had similar plans for the development of the phosphate fertilizer industry. Construction was continuing on the Abu Zaabal triple-superphosphate and phosphoric acid plants during the year. When these plants commence operating in 1982, total phosphatic fertilizer capacity is expected to reach 685,000 tons per year.

Egypt's consumption of chemical fertilizer continued to increase nearly as rapidly as its output. Since the completion of the Aswan High Dam and the elimination of the annual floods that provided natural fertilization for the rich Nile River soils, Egyptian agriculture has become increasingly dependent on chemical fertilizer. Consumption in 1980 averaged 554,000 tons of nitrogen in ammonia and urea, and 102,000 tons of P_2O_5 in phosphatic fertilizers. Since 1976, Egypt has imported an average of 250,000 tons per year of nitrogenous fertilizer, or about one-half of its annual consumption. The fertilizer plants now in operation and under construction in Egypt could make it self-sufficient in chemical fertilizer by 1984. Egypt's operating and planned fertilizer plants are listed in the following table.

Location	Company	Primary product	Startup date	Capacity (thousand tons per year)
Suez	Société el Nasr d'Engrais et d'Industries Chimiques.	Calcium nitrate	1951	275
Talkha I	do	Calcium ammonium nitrate	1975	365
Talkha II	do	Ammonia/urea	1981	1,000
Abu Qir	do	do	1979	900
Do	do	Ammonium nitrate	1984	150
Helwan	El Nasr Co. for Manufacturing Coke and Chemicals.	Calcium ammonium nitrate	1964	140
Kafr-el-Zaiyat	Société Financiere et Industrielle d'Egypte S.A.	Single superphosphate	1937	200
Assiut	do	do	1969	200
Kosseir	Kosseir Phosphate Co.	do	1958	50
Abu Zaabal	Abu Zaabal Fertilizer and Chemical Co.	do	1948	200
Do	do	Triple superphosphate	1982	175
Do	do	Phosphoric acid	1982	200

Nitrogen.—The new Talkha II fertilizer complex was composed of a 326,000-ton-per-year contained nitrogen ammonia plant, and a 262,000-ton-per-year nitrogen urea plant. The new complex was located adjacent to Talkha I, which consisted of a 231,000-ton-per-year nitric acid unit, a 118,000-ton-per-year nitrogen calcium ammonium nitrate plant, and a 98,000-ton-per-year ammonia unit. Talkha I came onstream in 1975. Both units received natural gas feedstock piped from the Abu Madi Gasfield in the Nile Delta. The consumption rate of about 30 million cubic feet per day of natural gas was to be increased to 105 million cubic feet per day as the Talkha

unit production expanded. Both Talkha I and Talkha II were built by Foster Wheeler Italiana.

The Abu Qir ammonia-urea plant began operating in 1979. Production capacity of this complex was 350,000 tons per year ammonia and 550,000 tons per year of urea. Feedstock was supplied by the Abu Qir Gasfield. Plans were underway in 1981 to further expand Abu Qir through the addition of a 150,000-ton-per-year ammonium nitrate plant to absorb excess ammonia, and a 135,000-ton-per-year nitric acid facility.

Phosphatic Fertilizer.—Construction was continuing on Egypt's largest phosphatic fertilizer complex at Abu Zaabal, 20 kilometers north of Cairo. Single superphosphate, on which the country's phosphate fertilizer industry had been based, was to be supplemented in 1982 by the first production of triple superphosphate. The Abu Zaabal complex consisted of two single-superphosphate plants and two sulfuric acid plants in addition to the new units. The new plant was to produce 175,000 tons per year of triple superphosphate and 200,000 tons per year of phosphoric acid. Krebs of France was awarded a contract in 1980 to add a third unit that was to produce 215,000 tons per year of sulfuric acid and 100,000 tons per year of 65% oleum. Also under construction were phosphoric acid and triple-superphosphate handling facilities.

Egypt was considering building another fertilizer complex, to be based in the Red Sea area. Late in 1981, the Ministry of Industry invited several companies to prepare studies for a new joint venture fertilizer project. Carbonnage de France Chimie (France) and Technipetrol (Italy) joined to present the Egyptians with a plan for a combined nitrate-phosphate fertilizer complex. The project would produce 1,000 tons per day of ammonia and 1,700 tons per day of urea from gas provided by the Gulf of Suez gasfields. Also included in the plan was a plant to produce 300,000 tons per year of diammonium phosphate, utilizing phosphate rock from the Abu Tartur deposit, which was still in the planning stage. Estimated cost of the project was $400 million. The earliest possible commissioning would be 1984-85.

Gypsum.—Production of gypsum increased in 1981 in response to the expanded capacity in the cement industry. The Egyptian Gypsum, Marble, and Quarries Co. was planning to further expand its output with the construction of a 300,000-ton-per-year gypsum plant in Alexandria. About 50,000 tons per year of the output from the plant was to be used in the manufacture of gypsum blocks, with the remainder going to the domestic cement industry.

Many commercial deposits of gypsum have been located in Egypt, the most important being the 20 million ton reserve that occurs at El-Hamman, southwest of Alexandria, and the deposit at Ras Malaab, on the Sinai Peninsula. The deposit at Ras Malaab had been worked in the late 1950's and early 1960's by the Ras Malaab Mining Co., which produced gypsum for wallboard and cement. The operation was closed after the Israeli occupation but was being considered for revitalization to strengthen Egypt's industrial base in the Sinai. Egypt was considering building a 300,000-ton-per-year processing plant at the site, at a cost of about $20 million. Reserves at Ras Malaab were estimated at 250 million tons.

Phosphate Rock.—Production of phosphate rock continued to increase in 1981, but remained substantially below the targeted output. Production from the Red Sea mines at Kossier and Safaga declined to about 180,000 tons per year, while output from the Hamrawein deposit, in the Eastern Desert increased substantially. The calcining plant at Hamrawein continued to experience some problems and was operating at about 75% of capacity. The mine and plant were expected to become fully operational by 1983 with an annual capacity of 600,000 tons of phosphate concentrate averaging 33% P_2O_5. The Hamrawein deposit was being operated by the Misr Phosphate Co. of Egypt.

The Red Sea Phosphate Co. was considering developing another mine, close to Hamrawein, at Abu Sheigela. The new mine was to replace the Kosseir and Safaga Mines, also operated by the Red Sea Phosphate Co. These older deposits would be nearly depleted by 1985, when Abu Sheigela was to become fully operational.

Expansion was also planned at the West Sabaya Mine, 31 kilometers north of Idfu on the Nile River. Output was to be expanded from the current level of 120,000 tons per year of concentrate to 500,000 tons per year. The increased production was to be used in the Abu Zaabal triple-superphosphate and phosphoric acid fertilizer plant. The deposit and the fertilizer plant were operated by

the Abu Zaabal Fertilizer and Chemical Co.

Progress was also made during the year on development of Egypt's largest phosphate deposit at Abu Tartur in the Western Desert. Reserves of Abu Tartur were estimated at 1 billion tons, containing an average of 25% P_2O_5. Production from the pilot plant began in 1980 and reached about 100,000 tons of concentrate in 1981. The small mine and beneficiation plant was built in 1978 by Sofremines (France) and Alusuisse (Switzerland). The mine provided bulk samples for testing and also some input for the manufacture of single superphosphate at Assuit. The Government planned to increase output to around 3.5 million tons per year by 1983, possibly increasing output to 6 million tons by 1986.

EGSMA examined a phosphate deposit near Wadi Qena in the Eastern Desert where EGSMA had reported a large deposit but had not specified its tonnage or grade. Initial tests indicated a high concentration of uranium in the ore.

Salt.—Salt production in Egypt was scheduled to undergo a large-scale expansion within the next several years. The El Nasr Saline Co., located at Port Said, was increasing its production of sodium chloride through addition of new salt pans. The company was also seeking financial support for a proposed $100 million chemical complex, to be located at Lake Qarun, 83 kilometers southwest of Cairo. The company planned to produce 200,000 tons per year of high-grade salt (99.98% NaCl), 21,000 tons per year of magnesia, and 7,500 tons per year of sodium sulfate. Feasibility studies for the project were carried out by DSS Engineers (United States) and White Consultants (United Kingdom). The earliest possible production date, should financing become available, was 1984.

MINERAL FUELS

Coal.—Negotiations were underway in 1981 to reopen the Maghara coal mine, located in north-central Sinai. The mine was worked between 1959 and 1967 but has been closed since that time. The deposit contained 27.5 million tons of probable reserves. In 1980, the Government allocated $21 million to reopen the mine and repair the rail lines. Once the mine is opened, the Government expects an annual production of about 300,000 tons for the first few years. About half of the annual production was to be used in making coke, with the remainder going to a planned thermal power station to be built near the deposit. Plans for the power station, however, remained tentative during the year.

Natural Gas.—Egypt's production of both associated and nonassociated gas increased significantly from 1980 to 1981. The rise reflected both the increasing production of crude oil and the greater utilization of natural gas reserves for industrial uses and for export as natural gas liquids.

The country produced approximately 200 million cubic feet per day of associated gas from the Gulf of Suez oilfields. Facilities to gather and process a large portion of this gas were under construction in 1981. In 1979, the World Bank's International Bank for Reconstruction and Development granted the Egyptian General Petroleum Authority (EGPA) a $75 million loan to partly finance a project to gather, process, and transport associated gas from the Gulf of Suez oilfields. Late in 1981, Daelim Engineering Co., Ltd., (Republic of Korea) won a $17 million contract to construct a 40-million-cubic-foot-per-day gas gathering station at Ras Bakr, on the west side of the Gulf of Suez. This station was to be linked by a 16-inch pipeline to the main gas processing and compressing station at Ras Skukair. The processing plant was to utilize 120 million cubic feet per day of associated gas to produce 260 tons per day of liquefied petroleum gas (LPG) and 600 tons per day of naphtha. Daelim was also constructing the processing facility. The plant was due onstream in June of 1982.

In 1981, Egypt produced nonassociated gas from three fields: Abu Madi (50 million cubic feet per day) in the northern Nile Delta, Abu Qir (100 million cubic feet per day) offshore in Abu Qir Bay, and Abu Gharadig (70 million cubic feet per day) in the Western Desert.

At the Abu Madi Field, reserves of nonassociated gas were estimated at about 1 trillion cubic feet. Natural gas from Abu Madi was being utilized as feedstock for the Talkha I and Talkha II fertilizer plants and at other industrial ventures in the area. The Belayim Petroleum Co. (Petrobel), a subsidiary of Italy's Ente Nationale Idrocarburi (ENI) group, also operated a gas processing plant at Abu Madi, which processed about 35 million cubic feet per day of gas, to produce about 800 barrels per day of natural gasoline. Total gas capacity of the plant was 120 million cubic feet per day.[4] Production from the field was to increase signifi-

cantly by the middle of the decade to fuel both the fertilizer plants and the gas processing facility.

The offshore Abu Qir Gasfield began production in 1979 at 100 million cubic feet per day and was scheduled to reach 200 million cubic feet per day by the middle of the 1980's. Gas produced at Abu Qir was used in the Abu Qir fertilizer plant and nearby power-generating facilities and industrial plants. The Egyptian General Petroleum Corp. (EGPC) also utilized Abu Qir gas at a 65-million-cubic-foot-per-day gas processing plant, which produced approximately 1,400 barrels per day of natural gasoline. Total gas throughput capacity at the plant was 150 million cubic feet per day.

In October 1981, EGPA invited prequalification bids for the construction of a 200-ton-per-day LPG recovery plant for the Abu Qir Gasfield. EGPA was seeking loans from the World Bank and the European Investment Bank to assist in financing the project.

The Abu Gharadig Field in the Western Desert produced about 70 million cubic feet per day of natural gas in 1981. Reserves at Abu Gharadig were estimated at about 3 trillion cubic feet. Gas production was used at the cement plants at Helwan and Turah, as well as the Helwan iron and steel complex. Amoco International (United States) was operating two processing plants for Abu Gharadig gas; one which produced approximately 1 million barrels per year of condensate, and the other at Dashour, which produced about 1,400 barrels per day of liquefied petroleum gas. The combined throughput capacity of both gas processing facilities was 207 million cubic feet per day of natural gas.

Two significant gas discoveries were made in 1981. The first was by Mobil Oil Corp. (United States) at its Temsah No. 2 well off the Damietta branch of the Nile Delta in the offshore Mediterranean. The well was 28 miles offshore in 228 feet of water. The well tested at 25 million cubic feet per day of gas and 1,440 barrels per day of 48° API condensate. The well was one-half mile northeast of Mobil's Temsah No. 1 well, which produced over 5 million cubic feet per day of gas when discovered in 1977. The General Petroleum Co. (GPC), a subsidiary of EGPC, discovered gas at the GPC-1 well in the Western Desert. Test results from the well were unavailable by yearend.

Petroleum.—Egypt's production of crude oil continued to rise in 1981, registering a 3% increase over the 1980 level. The production level for the year averaged 642,000 barrels per day, which brought the country closer to its target of 1 million barrels per day by 1985. Egypt's total investment in the oil sector for fiscal year 1980-81 was $231 million, of which $105 million was derived from foreign sources. Of the total resources invested, 39% were directed toward exploration and production, 28% to refining and processing, and 33% to transportation and distribution. Seventy exploration wells were drilled during the year, which yielded 13 discoveries—12 offshore in the Gulf of Suez and one onshore in the Western Desert.

The value of Egypt's oil and gas output for fiscal year 1980-81, calculated on world market prices, was $9.1 billion, of which the foreign partners' share came to $1.9 billion. Of the remainder, $4.3 billion was earmarked for local consumption, with the other $2.9 billion for export. The planned investment in the oil sector for fiscal year 1981-82 was $1.275 billion. At the end of 1981, Egypt's petroleum reserves were estimated at 3.2 billion barrels.

Production from the Gulf of Suez oilfields continued to increase in 1981, and many new discoveries were made in the area. The majority of Egypt's oil was produced in the Gulf of Suez by joint venture companies of Amoco Egypt Co. (United States) and EGPA; these companies were the Gulf of Suez Petroleum Co., the Nile Valley Petroleum Co., and the Fayum Petroleum Co.

Several other companies were producing oil in conjunction with EGPA. These include Italy's ENI subsidiary Azienda Generale Italiana Petroleos (AGIP) through Petrobel, the Phillips Petroleum Co. (United States) through ownership in the Western Desert Petroleum Co., and Total-Proche Orient (Total-France). GPC was EGPC's wholly owned subsidiary for production and marketing of Egypt's share of crude oil output. Egypt's major oilfields, their owners and/or operators, estimated production level, and locations are listed in the following table.

Field name	Owner and/or operator	Production level (barrels per day)	Location
El-Morgan	Amoco-EGPA/GUPCO	120,000	Gulf of Suez.
Ramadan	do	140,000	Do.
July	do	60,000	Do.
GS-195	Amoco-EPGA	30,000	Do.
Shiab Ali (Alma)	do	15,000	Western Sinai-Gulf of Suez.
Abu Rudeis	do	100,000	Sinai Peninsula-Offshore.
Belayim	AGIP-EPGA/Petrobel	40,000	Sinai Peninsula.
Balayim Marine	do	70,000	Offshore-Sinai Gulf of Suez.
Alamein/Yidma	Phillips-EGPA/WEPCO	20,000	Western Desert.

Source: International Petroleum Encyclopedia.

New discoveries.—Several significant discoveries of crude oil were made in 1981. A group composed of Deminex (Federal Republic of Germany), Royal Dutch Shell (Netherlands), and British Petroleum (United Kingdom) discovered oil in its third well in the Ghubba-al-Zeit offshore concession at the mouth of the Gulf of Suez. The well tested at 6,000 barrels per day from two formations. The well was the first commercial discovery in a previously untapped part of the Gulf.

Shell Winning N.V. (Netherlands) drilled a highly promising 11,000-foot foot well on its 5,800-square-kilometer production sharing concession at Badr-al Din in the Qattara Depression in Egypt's Western Desert. The well produced 6,000 barrels per day of high-quality 38° to 39° API crude, 400 barrels per day of condensate, and 5 million cubic feet per day of natural gas. This discovery was significant for two reasons: its location was in an area that had produced only a few minor discoveries, and the oil quality was exceptionally good compared with other finds in the area.

Finally, AGIP announced that its subsidiary, International Egyptian Oil Co., made an important crude oil discovery in the Al-Tina Gulf, 50 kilometers east of Port Said off the Sinai Coast. This was the first discovery of commercial quality ever made in Egypt's Mediterranean offshore, in an area that was previously thought to contain only natural gas reserves.

Exploration.—With the number of discoveries continuing to rise in Egypt, international attention has been focused on the areas yet to be claimed for exploration. All exploration agreements signed during the year were production sharing concessions with EGPA, with multiyear exploration obligations, significant signature bonuses, and an output split averaging 80% in favor of EGPA. Exploration agreements were signed in 1981 with the following companies: Total (France), Conoco (United States), Keith Collins Petroleum Corp. (United States), Murphy Oil Co. (United States), Agip (Italy), Petrofina (Belgium), Gulfstream Resources (Canada), and Lochiel Exploration Ltd. (Canada).

In addition to these agreements, two Japanese firms, Mitsui Oil Exploration Corp. and Fuyo Petroleum Development Corp., acquired a 20% interest in Southeastern Drilling Co.'s (Sedco) (United States) 6,000-square-kilometer Tiba tract. Tiba was located 120 kilometers west of Cairo, and 80 kilometers south of the Mediterranean coast. Sedco acquired the tract in 1979. Also Louisiana Land and Exploration Suez Inc., a U.S. firm, planned to drill two wildcats in its 690-kilometer concession in the Eastern Desert adjoining the Gulf of Suez. Drilling began in October 1981.

Pipelines.—The Arab Petroleum Pipelines Co. was considering raising the capacity of the Suez—Mediterranean pipeline, commonly known as SUMED, from the current 590 million barrels per year to the system's design capacity of 850 million barrels per year. With output from the Gulf of Suez fields increasing, international oil companies were anxious to transport oil through the overland pipeline route to the Mediterranean Sea terminal rather than going through the Suez Canal.

Refining.—Egypt's six operating refineries, with a combined crude oil input capacity of over 100 million barrels per year, handled about 40% to 45% of Egypt's domestic crude oil production. In 1981, Egypt's consumption of crude oil averaged 310,000 barrels per day, just slightly above its refinery capacity. A small amount of petroleum products were imported during the year, mainly from Western Europe. Egypt's refinery capacities are listed in the following table.

Company	Location	Capacity (thousand barrels per day)
Suez Oil Processing Co	Suez	10,000
	Mustu-rud,	25,000
	Tanta	10,000
El Nasr Petroleum Co	Suez	18,000
	Am-eriyah,	22,000
Alexandria Petroleum Co	Alexand-ria,	23,000

Source: International Petroleum Encyclopedia.

The Alexandria Petroleum Co. refinery in Alexandria planned to add several new units to the refinery, including a 20,000-barrel-per-day vacuum distillation unit, a 3,000-barrel-per-day lubrication oil plant, and a 260-barrel-per-day wax plant. All the plants were to be built by Chiyoda Chemical Engineering and Construction Co. (Japan). Also under construction were several new units at the Suez Oil Processing Co. plant at Suez, including a new lubrication oil desulfurization complex, a hydrotreater, and a catalytic reforming unit.

Work was also progressing on Egypt's first petrochemical complex, to be located at Ameriyah, adjacent to the El-Nasr Petroleum Co. refinery. The plant was to produce 80,000 tons per year of polyvinyl chloride, 90,000 tons of low-density polyethylene, and 50,000 tons of high-density polyethylene. The ethylene feedstock was to be imported from Montedison of Italy, which was a 25% partner in the operation with EGPA. The plant was scheduled to go onstream in 1982, at a cost of $550 million.

The El-Nasr Petroleum Co. awarded a contract to Snamprogetti of Italy for construction of a 40,000-ton-per-year linear alkylbenzene plant in 1981. The unit, to be constructed at Ameriyah adjacent to the refinery, was to be completed late in 1983, at a cost of $70 million.

The Mineral Industry of Finland

By Joseph B. Huvos[1]

In 1981, after 2 years of economic growth, Finland finally felt the effects of the international recession, which in Finland itself was aggravated by the adverse weather conditions, which lowered agricultural production. The rate of growth of the gross national product (GNP) fell from 5% in 1980 to only 1% in 1981. The GNP was approximately $50 billion[2] at current prices, unemployment rose to over 5%, and inflation was 12%. The contribution of mining and quarrying to the GNP was about 0.5%, but together with manufacturing this sector amounted to 27.4% of the GNP.

Important events in Finland's mineral industry in 1981 included commissioning of new plants and equipment, such as Outokumpu Oy's new copper converter at Harjavalta, Ovako Oy's new rod mill at Dalsbruk, and Kemira Oy's nitric acid plant at Uusikaupunki, a sulfuric acid plant at Pori, and a sodium sulfate plant at Kokkola. Several large projects at existing facilities were started, including enlargement of Kemira Oy's Siilinjärvi phosphate project; construction of Rautaruukki Oy's Laurinoja Mine; expansion of Outokumpu Oy's nickel smelter, Pori electrolytic copper refinery, and Tornio stainless steel plant; and construction of Outokumpu Oy's Enonkoski nickel mine.

PRODUCTION

Production of mineral commodities in 1977-81 is shown in table 1.

Volume indexes (1975=100) of the country's mineral industry and its industry as a whole for 1980-81 are shown in the following tabulation; all mineral-related indexes declined:

Sector	1980	1981[p]
Mining and quarrying	140	119
Nonmetallic minerals processing	114	103
Iron and steel	173	168
Nonferrous metals	140	137
Petroleum refining	148	132
Industrial chemicals	117	112
All industry	127	129

TRADE

The brisk rate of export growth during the past 2 years leveled off by the end of 1981, but Finland's trade balance improved substantially.

The United States continued to maintain a positive balance-of-trade with Finland in 1981, largely on the strength of exports of coal, aircraft, office machinery, and chemicals.

Finland's mineral commodity trade in 1979 and 1980 is shown in tables 2 and 3.

Table 2.—Finland: Exports of mineral commodities

Slag, dross, similar waste	NA	6,507	--	Sweden 6,455; Denmark 25.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	NA	1,474	--	U.S.S.R. 1,001; Norway 234; Libya 80.
Carbon black	NA	6,729	--	Ireland 6,521; Hungary 170; Sweden 22.
Coal and briquets, anthracite and bituminous	--	21	--	All to Sweden.
Coke and semicoke	2,080	5,473	--	Norway 2,830; Iceland 2,361.
Hydrogen, helium, rare gases	NA	370	--	Sweden 321; Norway 44.
Peat including briquets and litter	30,028	42,660	--	Netherlands 12,329; Sweden 8,321; United Kingdom 8,177.
Petroleum refinery products:				
Gasoline thousand 42-gallon barrels	[r]6,240	7,263	--	Sweden 3,956; Netherlands 1,485; United Kingdom 745.
Kerosine do.	[r]101	122	--	Mainly to Sweden.
Distillate fuel oil do.	1,150	3,645	--	Sweden 3,279; West Germany 201; Netherlands 140.
Residual fuel oil do.	2,818	4,967	--	Sweden 2,749; Denmark 927; Portugal 427; France 422.
Lubricants do.	113	89	([1])	U.S.S.R. 65; Nigeria 15; Sweden 6.
Other:				
Liquefied petroleum gas 42-gallon barrels	20,000	220	--	Sweden 128; U.S.S.R. 81.
Mineral jelly and wax do.	165	102	--	Netherlands 47; Nigeria 24.
Bitumen and other residues do.	([7])	17,313	--	U.S.S.R. 14,023; Sweden 2,606.
Bituminous mixtures do.	([7])	21,646	--	U.S.S.R. 15,550; Norway 5,727.
Mineral tar and coal-, petroleum-, and gas-derived crude chemicals	31	3	--	All to Sweden.

[r]Revised. NA Not available.
[1]Less than 1/2 unit.
[2]May include other precious metals.
[3]1979 export was 7,031 kilograms.
[4]Includes aluminum scrap, if any.
[5]Includes metals of cadmium, cobalt, magnesium, molybdenum, and tungsten, if any.
[6]Includes chalk, clay, feldspar or fluorspar, dolomite, quartz or quartzite, talc, etc., if any.
[7]1979 export of bitumen, residues, and bituminous mixtures was 24,961 barrels.

NA Not available.
[1]Less than 1/2 unit.
[2]May include ores and concentrates and wastes and sweepings of other precious and semiprecious metals.
[3]Includes metals of antimony, beryllium, cadmium, cermet, cobalt, magnesium, molybdenum, tantalum, and tungsten, if any.
[4]Includes barite and witherite, natural borates, chalk, clay, cryolite and chiolite, diatomite, feldspar and fluorspar, graphite, gypsum and plaster, magnesite, mica, dolomite, limestone, quartz and quartzite, talc, etc., if any.

COMMODITY REVIEW

METALS

Chromium.—In 1981, Government-owned Outokumpu Oy, the country's only chromite, ferrochrome, and stainless steel producer, continued to exploit chrome ore reserves at its Kemi Mine, at the foot of the Gulf of Bothnia, which was said to be large enough to supply the country well into the next century. In 1981, Finnish chromite production was about 2% of the world's total output.

The first stage of the extension to the Tornio stainless steel plant near Kemi was started. Completion in 1983 was to increase production capacity by 20% to 90,000 tons per year. The ferrochrome capacity of the plant had already been increased.

Cobalt and Molybdenum.—In 1981, Outokumpu Oy reportedly set a new company record for the production of cobalt and molybdenum, facilitated by a previously completed augmentation of the plant capacity for both metals at Kokkola, on the Gulf of Bothnia. Raw materials for 65% of the cobalt produced at Kokkola originated in the company's own mines. In 1982, the company was to start construction of a cobalt salt plant in Kokkola.

Copper.—In 1981, expansion of Outokumpu Oy's Pori electrolytic copper refinery on the west coast from 45,000 tons per year to 55,000 tons per year was completed. A new converter in the company's Harjavalta smelter helped to increase copper production in 1981. The expanded smelting capacity of 60,000 to 80,000 tons could not be used fully since restricted demand by Kemira Oy for sulfur dioxide limited production. Concentrates from the company's own mines accounted for 70% of copper concentrates used in producing copper; the rest were imported from the Lökken Mine in Norway under a new contract. An important contract was also concluded with the two Swedish companies, Luossavaara Kiirunavaara AB (LKAB) and Boliden AB, according to which Outokumpu Oy was to buy 60% of the copper concentrate produced at LKAB's Viscaria Mine in Kiruna, due to go onstream in 1983.

Iron Ore.—In 1981, iron ore production continued at Government-owned Rautaruukki Oy's three iron ore mines, of which the Otanmäki and Mustavaara Mines were located in central Finland and Rautavaara in the north in Finnish Lappland. Otanmäki and Mustavaara also produced some vanadium pentoxide, and Otanmäki produced, in addition, some ilmenite concentrates.

At the Rautavaara Mine, a decision was made in 1981 to start an opencast operation at the nearby Laurinoja copper-bearing iron ore deposit. Stripping at the mine and construction of a flotation plant next to the existing concentrator started immediately. Ore mining was scheduled to begin in 1982.

In 1981, the Mustavaara operation had reached an extremely low level of profitability, but it was decided to continue operation at least until it became necessary to shut down the sintering furnace for repairs.

Finnstroi Oy, a Helsinki construction company, signed an additional $450 million building contract for the enlargement of the U.S.S.R. iron mining town of Kostamus, located close to Finland's eastern border. The first phase of the project, worth almost $700 million, was nearing completion. Work included construction of a city for 9,000 workers, removal of 9 million cubic meters of soil, 40 kilometers of road construction, and erection of 4.3 million cubic meters of industrial and residential buildings.

The new plans for Kostamus call for tripling mine and pelletizing capacity to 9 million tons per year of pellets and for increasing housing capacity to accommodate 20,000 employees.

Iron and Steel.—Ovako Oy's Dalsbruk works, located on Finland's southwest coast, inaugurated a new Ashlow rod mill. There were plans to modernize an older mill at the same location, and also to start production of reinforcing bars for prestressed concrete. The modernizations will boost Finnish steel rod capacity by only 10%, as outdated units are to be shut down.

Rautaruukki Oy and Outokumpu Oy signed an agreement combining their prospecting operation in Lappland and the northeast territory into one organization called Lapin Malmi, effective January 1, 1982.

Finland's largest steelmaker remained Government-owned Rautaruukki Oy with a basic iron and steel plant at Raahe on the west coast. The next largest steelmaker was Ovako Oy, with a basic steel plant and three electric arc furnaces at Imatra, in the south near the Soviet border, and a 500,000-ton-

per-year blast furnace and two Linz-Donawitz (basic oxygen) converters at Koverhar, also in the south.

The smallest major steelmaker in Finland was Outokumpu Oy's Tornio works at the foot of the Gulf of Bothnia. In 1981, steel slabs, rolled stainless steel products, and cast refractories were produced there. Decision was made to proceed with the first phase of an extension of the stainless steel works, including a second pickling and annealing line. Construction on a cold-rolling mill began in the summer of 1981. The first extension phase was to be completed in 1983 when capacity was to reach 90,000 tons per year. Construction of a metal technology laboratory was also started at Tornio.

Lead and Zinc.—At Outokumpu Oy's Kokkola works sole zinc smelter in Finland, plans to produce 140,000 tons of zinc in 1981 were fulfilled in spite of industrial disputes. In 1981, only 35% of the zinc in the concentrates used for metal production originated from Outokumpu Oy's domestic mines, the rest being imported.

Lead concentrates produced at the company's Vihanti Mine continued to be exported, mainly to the Federal Republic of Germany.

Nickel.—Expansion of Outokumpu Oy's nickel plant started at Harjavalta, on the west coast, and was to be completed in 1982, raising output from 13,000 to 16,500 tons per year. Even so, nickel production in 1981 reached an alltime high. Forty-five percent of the nickel concentrates used by the company to produce nickel metal originated from the company's own mines. In November, Outokumpu Oy started work on a 3-kilometer tunnel for a new nickel project near Savonlinna at Enonkoski, southeast Finland, and it was expected that mining operations could start in the mid-1980's.

NONMETALS

Industrial Minerals.—In tonnage terms, limestone was the main mineral produced, but in terms of world trade, talc, feldspar, and wollastonite were of major significance. Efforts were also being made to produce more talc and calcium carbonate fillers for the country's paper industry to replace other mineral fillers. However, production of ilmenite, quartz, and silica was also significant in 1981. Finland's industrial minerals industry was described in detail in the technical literature.[3]

Mica.—Kemira Oy studied the feasibility of exploiting mica contained in its Siilinjärvi phosphate ore. The mica would be processed chemically on a large scale to yield a potassium raw material for fertilizers.

Nitrogen.—Kemira Oy commissioned a new nitric acid plant at Uusikaupunki, on the southwest coast of Finland. Capacity of the plant was not given.

Phosphate.—The year 1981 was the first year of operation at Government-owned Kemira Oy's Siilinjärvi Mine and concentrator in central Finland. The mine yielded over 200,000 tons of apatite concentrate, corresponding to its rated capacity. The planning and procurement phase of a new major project was already underway, consisting of enlargement of much of the Sillinjärvi facility including the construction of a roasting plant and a sulfuric acid plant, and expansion of the mine, the phosphoric acid plant, and the power station. The project was to be completed by the end of 1982.

The company continued research on a process to recover the phosphoric acid by liquid extraction from the ore without producing byproduct gypsum.

Sodium Sulfate.—A sodium sulfate plant enlargement was commissioned at Kemira Oy's Kokkola plant, but no capacity was given.

Sulfur.—A new 250,000-ton-per-year sulfuric acid plant was commissioned by Kemira Oy at its Vuorichemia Div. in Pori on the west coast.

In 1981, Finland's consumption of sulfuric acid for the manufacture of fertilizers was 533,000 tons.

MINERAL FUELS

In 1981, hydroelectric power, domestic peat, fuelwood, and industrial waste supplied about 25% of Finland's energy requirements; the rest was supplied by imports of crude oil, amounting to about 50% of energy supply, some natural gas, nuclear fuel, and coal.

Nuclear and Hydroelectric Power.—In 1981, Finland produced a surplus of electric power. A rainy summer even permitted water to be bypassed over dams. Finland was also importing 250 megawatts of electric power in the daytime and 120 megawatts at night from the U.S.S.R. Normally power was exported to Sweden, but in 1981 this was not possible, as Sweden also had a surplus of hydroelectric and nuclear power.

Finland's power surplus was increased when Loviisa 2, the 440-megawatt nuclear powerplant on Finland's west coast, was put into operation after a shutdown, and all

four of Finland's nuclear powerplants were in operation, with a total nominal generating capacity of about 2,260 megawatts.

Plans were considered to expand Finland's nuclear-power-generating capacity further with a 1,000-megawatt nuclear powerplant. The Government-owned electric power company, the Imatran Voima Oy, contracted for preliminary studies, both with Sofratome of France and with Atomenergoexport of the U.S.S.R.

Petroleum and Natural Gas.—In 1981, Government-owned Neste Oy reexported about 3.7 million barrels of surplus U.S.S.R. crude oil to the West. Simultaneously, Finland imported some crude oil from Saudi Arabia for its bitumen content.

Most oil and gas imports to Finland came by pipeline from the U.S.S.R. In 1981, 79 million barrels of oil was imported from the U.S.S.R., but in 1982, these imports were to decrease by 7 million barrels.

Neste Oy operated the country's only two oil refineries, one at Porvoo and the other at Naantali, both in southern Finland, with a capacity totaling 110 million barrels per year.

Finland entered talks with the U.S.S.R. to supply equipment and expertise to exploit oil in the Barents Sea. Differences of opinion between Norway and the U.S.S.R. on the control of the Barents Sea delayed the commencement of the drillings.

The Mineral Industry of France

By Roman V. Sondermayer[1]

During 1981, the Government of France acquired control of the largest part of the French mineral industry through direct nationalization of mineral- and metal-producing companies or through nationalization of banks that were large shareholders in companies producing and processing minerals.

France remained a large processor of crude minerals and petroleum, but its domestic production was modest when compared to the country's demand. In some regions of the country, the mineral industry was a significant economic factor, and consequently, many mines and other mineral-related facilities in France remained in operation for social reasons during 1981.

The most prominent minerals and metals produced in France during 1981 were, with production expressed as an approximate percentage of world totals, arsenic, 18%; diatomite, 15%; gypsum, 8%; and fluorspar, 5%.

The Bureau de Recherches Géologiques et Minières (BRGM) remained the principal Government-owned minerals organization in France. BRGM had two major branches—Direction des Recherches et du Developpement Minière (Research and Mining Development) and the Service Geologique National. Both branches operated in France and in foreign countries. The largest BRGM project in France was the Inventaire des Ressources Minerales de la France Metropolitaine (Inventory of Mineral Resources of Metropolitan France), and work abroad was performed in Saudi Arabia, former French colonies in Africa, Peru, and Mexico. Another important BRGM activity was the introduction of new technology for exploration and data processing. During 1981, BRGM also acquired instrumentation for interpretation of satellite images to be used in conjunction with its geological work.

Principal events in the mineral industry during 1981 included the nationalization of the principal mining companies, preparation for closure of the Largentiére Mine, the decision not to start production at deposits of mixed sulfides at Bodennec and Port-aux-Moins, and resumption of tin mining.

PRODUCTION

After nationalization in early 1981, most of the large mineral-producing companies were Government-controlled operations. BRGM remained an important instrument of the French Government in securing raw mineral materials for the French industry. Table 1 shows the latest trends in French minerals production.

Table 1.—France: Production of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1977	1978	1979	1980	1981[p]

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Sept. 30, 1982.

[2]Although output reported is at the smelter stage of production rather than at the mine stage and thus could include metal contained in ores mined in other countries, it is believed that any such production derived from ores from other countries is not duplicative to any significant extent of mine production reported for other countries.

[3]Revised to zero.

[4]Series revised to include blast furnace ferroalloys and silicon metal, both hitherto counted separately.

[5]Includes smectic clay.

[6]Includes material for both the glass and ceramics industries.

[7]Series discontinued in original source and will be revised according to new data when available.

[8]Excludes bituminous material produced by oil refineries.

[9]Includes anthracite.

TRADE

Tables 2 and 3 show latest trends in mineral trade in France.

Table 2.—France: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1979	1980	Destinations, 1980	
			United States	Other (principal)
METALS				
Aluminum:				
Bauxite	12,471	10,768	--	Switzerland 3,969; Sweden 3,407; Spain 1,507.
Oxides and hydroxides	326,901	346,714	5,111	Netherlands 95,816; Italy 88,664; Spain 82,682.
Ash and residue containing Al	11,569	12,147	--	Italy 6,620; West Germany 3,780; Belgium-Luxembourg 916.
Metal including alloys:				
Scrap	39,790	47,219	36	Italy 21,935; West Germany 15,869; Belgium-Luxembourg 6,088.
Unwrought	157,598	177,378	1,083	Italy 51,103; West Germany 37,669; Belgium-Luxembourg 31,068.
Semimanufactures	260,798	237,203	3,874	West Germany 74,543; Italy 25,565; United Kingdom 19,549.
Antimony:				
Ore and concentrate	770	104	--	All to Spain.
Metal including alloys, all forms	126	124	NA	Spain 37; Belgium-Luxembourg 32; West Germany 22.
Arsenic metal, all forms	41	104	NA	Belgium-Luxembourg 22.
Beryllium metal including alloys, all forms, value, thousands	$22	$102	$4	Turkey $87; Morocco $10.
Bismuth metal including alloys, all forms	49	11	NA	NA.
Cadmium metal including alloys, all forms	478	265	50	Belgium-Luxembourg 97; West Germany 36.
Chromium:				
Chromite	1,379	1,616	--	Italy 945; Spain 378; West Germany 196.
Oxides and hydroxides	280	533	--	Italy 280; West Germany 157; Switzerland 20.
Metal including alloys, all forms	720	699	347	West Germany 85; Belgium-Luxembourg 71; United Kingdom 57.
Cobalt:				
Ore and concentrate	--	4	NA	NA.
Oxides and hydroxides	118	179	--	Italy 61; West Germany 47; Belgium-Luxembourg 32.
Metal including alloys, all forms	797	831	225	West Germany 224; United Kingdom 80; Italy 71.
Columbium metal including alloys, all forms, value, thousands	$21	$18	NA	NA.
Copper:				
Ore and concentrate	564	1,618	--	All to West Germany.
Matte	1,181	2,344	NA	Spain 2,148; Belgium-Luxembourg 143.
Sulfate	12,549	12,088	NA	West Germany 4,261; Spain 1,347; Netherlands 1,248.
Ash and residue containing Cu	14,691	16,194	--	Belgium-Luxembourg 9,698; Spain 2,609; Sweden 2,254.
Metal including alloys:				
Scrap	104,933	108,369	145	West Germany 39,277; Italy 28,110; Belgium-Luxembourg 26,629.
Unwrought:				
Blister and other unrefined, unalloyed	5,790	3,335	--	All to Belgium-Luxembourg.
Refined, unalloyed	21,756	15,354	108	Italy 6,618; West Germany 2,657; Portugal 2,189.
Master alloys	257	365	--	Italy 128; West Germany 110; Belgium-Luxembourg 53.
Semimanufactures	161,090	215,693	4,049	West Germany 60,553; Italy 52,294; Netherlands 13,843.
Germanium metal including alloys value, thousands	$281	$261	NA	NA.
Gold:				
Waste and sweepings, do.	$41,490	$22,415	--	Spain $21,595; West Germany $336; Switzerland $333.
Metal including alloys, unwrought and partly wrought:				
Of domestic origin, thousand troy ounces	1,081	406	5	United Kingdom 86; West Germany 81; Netherlands 45.
Reexports, do.	172	513	1	Switzerland 336; Netherlands 130; United Kingdom 34.

See footnotes at end of table.

Table 2.—France: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980	Destinations, 1980	
			United States	Other (principal)
METALS —Continued				
Iron and steel:				
Ore and concentrate thousand tons	10,220	8,653	--	Belgium-Luxembourg 6,806; West Germany 1,843.
Metal:				
Scrap do	3,526	3,312	--	Italy 2,596; Spain 392; West Germany 159.
Pig iron, cast iron, spiegeleisen	361,567	285,759	13,394	Italy 149,982; Belgium-Luxembourg 54,220; West Germany 22,323.
Sponge iron, powder, shot	39,520	43,210	86	West Germany 17,484; Italy 12,063; Spain 2,636.
Ferroalloys	602,382	513,798	189,128	West Germany 107,530; Italy 87,559; Belgium-Luxembourg 34,571.
Steel, primary forms thousand tons	r2,528	2,671	379	Italy 728; Belgium-Luxembourg 266; Spain 262.
Semimanufactures:				
Bars, rods, angles, shapes, sections do	r2,931	2,844	194	Germany 615; Belgium-Luxembourg 339; Italy 321.
Universals, plates, sheets do	r3,394	3,528	191	West Germany 665; Italy 531; United Kingdom 221.
Hoop and strip	r530,743	549,471	4,625	West Germany 196,179; Belgium-Luxembourg 68,449; Italy 66,233.
Rails and accessories	253,856	268,348	14,480	Italy 41,611; Tunisia 40,561; Netherlands 17,080.
Wire	r205,742	185,955	38,962	West Germany 39,266; Belgium-Luxembourg 15,783; Italy 10,991.
Tubes, pipes, fittings thousand tons	1,512	1,521	16	U.S.S.R. 285; West Germany 131; Italy 85; Netherlands 79.
Castings and forgings, rough	69,707	64,409	1,023	West Germany 24,894; Belgium-Luxembourg 17,786; Italy 3,442.
Lead:				
Ore and concentrate	34	69	--	Saudi Arabia 33; United Kingdom 20; Brazil 10.
Oxides and hydroxides	14,270	16,368	(1)	Romania 3,552; U.S.S.R. 2,844; Czechoslovakia 1,941.
Ash and residue containing Pb	13,062	13,782	NA	Belgium-Luxembourg 8,639; West Germany 4,858.
Metal including alloys:				
Scrap	30,191	7,851	--	Italy 5,986; Belgium-Luxembourg 546; Netherlands 234.
Unwrought	58,527	57,625	1	Belgium-Luxembourg 16,883; West Germany 12,783; Italy 7,316.
Semimanufactures	3,700	3,513	(1)	Netherlands 954; West Germany 793; Italy 754.
Magnesium metal including alloys:				
Scrap	516	588	37	Italy 418; Netherlands 76; West Germany 53.
Unwrought	4,607	4,195	--	West Germany 2,027; Japan 634; Belgium-Luxembourg 450.
Semimanufactures	146	184	(1)	West Germany 53; Belgium-Luxembourg 44; Spain 37.
Manganese:				
Ore and concentrate	7,092	6,390	--	Italy 3,297; Netherlands 679; Yugoslavia 670.
Oxides and hydroxides	855	991	--	Algeria 450; United Kingdom 143; Upper Volta 140.
Metal including alloys, all forms	2,325	2,276	NA	Italy 1,214; Sweden 421; West Germany 242.
Mercury 76-pound flasks	3,829	1,102	--	Netherlands 870; United Kingdom 116.
Molybdenum:				
Ore and concentrate	395	1,180	--	West Germany 654; Netherlands 299; Italy 109.
Oxides and hydroxides	22	21	--	All to Netherlands.
Metal including alloys, all forms	166	133	16	West Germany 52; United Kingdom 26; Netherlands 14.
Nickel:				
Ore and concentrate	79	(2)	--	All to New Caledonia.
Matte and speiss	2,754	272	NA	Norway 228; East Germany 20.
Oxides and hydroxides	1,033	547	121	West Germany 90; East Germany 65; Yugoslavia 40.
Ash and residue containing Ni	3,723	4,634	NA	Canada 3,586; United Kingdom 371; Italy 221.
Metal including alloys:				
Scrap	2,708	2,179	298	West Germany 774; United Kingdom 598; Japan 146.
Unwrought	5,178	6,757	920	West Germany 2,467; Mexico 755; India 460.

See footnotes at end of table.

Table 2.—France: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980	Destinations, 1980	
			United States	Other (principal)
METALS —Continued				
Nickel —Continued				
Metal including alloys —Continued				
Semimanufactures	5,691	6,301	860	West Germany 3,467; Italy 248; Belgium-Luxembourg 231.
Platinum-group metals:				
Waste and sweepings of platinum value, thousands	r$4,259	$4,822	--	Spain $3,903; Belgium-Luxembourg $513; Switzerland $270.
Waste and sweepings of other precious metals do.	$326	$2,285	--	Spain $1,190; United Kingdom $607; West Germany $366.
Metals including alloys, unwrought and partly wrought:				
Platinum troy ounces	r74,270	80,072	224	Switzerland 33,590; Netherlands 23,529; West Germany 7,223.
Others do.	42,565	28,452	(1)	United Kingdom 7,641; Netherlands 5,427; West Germany 5,353.
Selenium, elemental	21	(1)	NA	NA.
Silver:				
Waste and sweepings value, thousands	r$20,192	$56,199	--	Spain $45,568; Sweden $8,342; West Germany $2,124.
Metal including alloys, unwrought and partly wrought thousand troy ounces	13,759	30,581	1,747	United Kingdom 13,443; Switzerland 7,541; Netherlands 3,960.
Tantalum metal including alloys, all forms	22	20	4	West Germany 9; Belgium-Luxembourg 6.
Tellurium, elemental	12	(1)	NA	NA.
Tin:				
Ore and concentrate	7	8	--	All to Spain.
Oxides and hydroxides	29	27	NA	West Germany 21; Belgium-Luxembourg 5.
Metal including alloys:				
Scrap	881	915	--	Netherlands 579; United Kingdom 199; West Germany 134.
Unwrought	666	643	--	Italy 372; Netherlands 165; Switzerland 24.
Semimanufactures	350	356	(1)	Algeria 79; Italy 65; Switzerland 47.
Titanium:				
Ore and concentrate	715	2,160	NA	Yugoslavia 2,041.
Oxides and hydroxides	2,262	2,502	(1)	Netherlands 451; Italy 347; United Kingdom 339.
Metal including alloys, all forms	604	734	176	Italy 175; West Germany 136; United Kingdom 101.
Tungsten:				
Ore and concentrate	1,082	846	91	West Germany 282; Austria 224; United Kingdom 126.
Oxides and hydroxides	8	40	NA	Switzerland 15; Sweden 12; West Germany 9.
Metal including alloys, all forms	363	267	20	West Germany 76; Belgium-Luxembourg 60; Switzerland 29.
Uranium:				
Ore and concentrate	21	11	NA	NA.
Metal including alloys, all forms	r4	3	--	Netherlands 2; Belgium-Luxembourg 1.
Zinc:				
Ore and concentrate	46,530	43,979	--	Belgium-Luxembourg 22,477; Italy 6,656; U.S.S.R. 4,004.
Matte	1,484	5,201	NA	Italy 4,284; Belgium-Luxembourg 428; West Germany 290.
Oxides and peroxides	17,575	19,470	--	Romania 5,037; West Germany 3,708; Belgium-Luxembourg 2,233.
Ash and residue containing Zn	30,521	21,012	NA	Belgium-Luxembourg 13,870; Sweden 3,150; West Germany 2,905.
Metal including alloys:				
Scrap	4,280	3,209	--	Belgium-Luxembourg 1,769; West Germany 665; Italy 591.
Blue powder	1,748	1,846	NA	West Germany 366; Austria 333; Republic of South Africa 321.
Unwrought	47,486	35,504	3,515	West Germany 10,488; U.S.S.R. 3,525; Portugal 3,410.
Semimanufactures	41,041	42,047	14	Belgium-Luxembourg 20,379; West Germany 14,719; Denmark 2,616.
Zirconium:				
Ore and concentrate	326	260	NA	West Germany 84.
Metal including alloys, all forms	940	888	533	West Germany 120; Sweden 93; Japan 59; Canada 43.
Other:				
Ores and concentrates:				
Precious metals	--	2,500	--	All to Sweden.

See footnotes at end of table.

Alkali, alkaline earth, rare-earth metals	640	447	6	West Germany 156; Belgium-Luxembourg 106; Yugoslavia 101.
Pyrophoric alloys	10	13	NA	NA.
Base metal including alloys, all forms	r6	5	--	West Germany 2; Netherlands 2.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Pumice, emery, corundum, etc	17,908	1,120	(1)	West Germany 540; Tunisia 146; Spain 107.
Artificial: Corundum	24,791	24,610	734	Italy 6,458; Austria 3,373; West Germany 2,848.
Dust and powder of precious and semiprecious stones excluding diamond carats	r7,600	--		
Grinding and polishing wheels and stones	4,218	3,949	45	West Germany 846; Belgium-Luxembourg 434; Italy 320.
Asbestos, crude	1,348	1,574	--	Tunisia 1,140; Italy 192; United Kingdom 124.
Barite and witherite	121,722	98,255	NA	West Germany 63,977; Netherlands 11,487; Cameroon 7,660.
Boron materials:				
Crude natural borates	10,030	4,583	--	Italy 2,255; Spain 1,958; Belgium-Luxembourg 306.
Oxide and acid	34,479	40,536	3,510	West Germany 11,931; East Germany 4,648; Belgium-Luxembourg 3,886.
Cement thousand tons	3,525	2,614	279	Ivory Coast 473; Cameroon 319; West Germany 280.
Chalk	516,187	530,633	2,764	West Germany 220,772; Belgium-Luxembourg 98,710; Netherlands 42,120.
Clays and clay products:				
Crude:				
Bentonite	5,887	6,880	--	Belgium-Luxembourg 1,047; Congo 938; West Germany 772.
Dinas earth	39	53	NA	NA.
Fuller's earth and chamotte	206,445	211,174	NA	Italy 73,993; West Germany 52,135; Poland 20,430.
Kaolin (china clay)	154,671	181,593	--	West Germany 80,083; Italy 52,276; Belgium-Luxembourg 14,617.
Andalusite, kyanite, sillimanite	173	437	--	NA.
Other	r293,362	389,543	--	Italy 216,233; West Germany 92,581; Spain 18,362.
Products:				
Nonrefractory	435,635	422,619	1,682	West Germany 227,339; Belgium-Luxembourg 96,076; Switzerland 28,340.
Refractory including nonclay brick	219,448	216,046	3,688	West Germany 54,253; Belgium-Luxembourg 28,082; Italy 28,020.
Cryolite and chiolite	105	12	--	All to Italy.
Diamond:				
Gem, not set or strung carats	37,166	54,949	2,898	Switzerland 17,246; Belgium-Luxembourg 13,799; Lebanon 9,640.
Industrial do	191,048	177,213	18,822	Belgium-Luxembourg 86,851; Ireland 58,000.
Dust and powder do	124,130	199,770	NA	Switzerland 146,065.
Diatomite and other infusorial earth	28,876	25,852	1	West Germany 7,847; Belgium-Luxembourg 4,128; United Kingdom 2,773.
Feldspar	51,726	56,949	--	Belgium-Luxembourg 27,258; Spain 15,265; Italy 4,935.
Fertilizer materials:				
Crude:				
Nitrogenous	25	11	--	Italy 5; Congo 3; Iraq 3.
Phosphatic	26,017	15,498	--	United Kingdom 9,047; Italy 214; Switzerland 186.

Crude thousand tons	1,206	1,180	(1)	Belgium-Luxembourg 978; Switzerland 187.
Slag, dross, similar waste ---do---	2,717	2,279	(1)	West Germany 1,167; Belgium-Luxembourg 881; Netherlands 164.
Oxides, hydroxides, peroxides of barium, magnesium, strontium ---	9,426	9,363	2,353	U.S.S.R. 4,966; West Germany 885; United Kingdom 172.
Fluorine	25	67	NA	NA.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	139,173	149,526	348	West Germany 28,909; United Kingdom 16,223; Italy 15,997.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	7,248	5,879	--	United Kingdom 2,380; Belgium-Luxembourg 1,445; Ivory Coast 1,109.
Carbon black	r72,665	68,789	14	West Germany 20,392; Italy 10,562; Belgium-Luxembourg 10,440.
Coal and briquets:				
Anthracite and bituminous coal	569,554	459,329	--	West Germany 302,291; Belgium-Luxembourg 59,540; Norway 36,574.
Briquets of anthracite and bituminous coal	41,312	50,249	--	United Kingdom 45,674; Belgium-Luxembourg 2,541; Switzerland 1,701.
Lignite including briquets	6,908	6,617	--	Spain 6,355; West Germany 262.
Coke and semicoke --- thousand tons	1,570	871	199	West Germany 233; Norway 100; Belgium-Luxembourg 57.
Gas, natural ----- million cubic feet	5,854	8,441	--	Belgium-Luxembourg 4,217; Switzerland 4,104.
Hydrogen, helium, rare gases	6,205	6,040	--	Italy 4,122; Belgium-Luxembourg 686; Netherlands 303.
Peat including briquets and litter	2,145	1,680	--	Switzerland 469; West Germany 445; Belgium-Luxembourg 270.
Petroleum:				
Crude and partly refined thousand 42-gallon barrels	540	555	--	Austria 489; United Kingdom 22.
Refinery products:				
Gasoline ---------- do	25,736	23,144	2	Switzerland 4,784; West Germany 3,486; United Kingdom 2,915.
Kerosine and jet fuel ---do---	9,509	10,962	--	Switzerland 2,465; Greece 1,630; West Germany 1,022.
Distillate fuel oil -----do---	35,683	29,067	(1)	Switzerland 7,782; West Germany 7,389; Greece 3,566.
Residual fuel oil ------do---	42,243	39,335	1,744	Italy 11,837; West Germany 4,546; Ireland 3,354.
Lubricants ---------- do	5,235	5,383	4	Belgium-Luxembourg 902; United Kingdom 692; West Germany 675.
Other:				
Liquefied petroleum gas do	8,745	8,183	1	Spain 3,727; West Germany 1,047; Portugal 569; Italy 568.
Mineral jelly and wax do	585	346	1	West Germany 123; Netherlands 60; Italy 52.
Petroleum coke ---do---	2	49	--	Switzerland 19; Netherlands 16; West Germany 14.
Bitumen and other residues do	1,960	1,797	--	West Germany 776; Switzerland 726; Belgium-Luxembourg 179.
Bituminous mixtures do	337	329	(1)	Algeria 149; Belgium-Luxembourg 65; West Germany 22.

COMMODITY REVIEW

METALS

Aluminum.—With the nationalization of Pechiney Ugine Kuhlman S.A. (PUK) and its subsidiary, Aluminium Pechiney S.A., the Government of France became the largest producer of bauxite, alumina, and aluminum in the country. During 1981, bauxite was produced in mines located in the Departments of Var, Herault, Bouches-du-Rhone, and Ariege. Aluminium Pechiney (by far the largest producer), Union des Bauxites, Société Anonyme des Bauxites et Alumines de Provence, and Société Alusuisse de France were the major companies involved in bauxite production in France. Having been mined since the end of the last century, reserves in French bauxite deposits were becoming exhausted; reportedly, reserves in the Midi were adequate to support mining for only an additional 11 years at the present rate of production. Bauxite deposits occurred in an irregular karst structure. Water influx was a serious problem, and large pumping stations were necessary. At the Maraugues Mine, Var, the pumping station had a capacity of 3,000 cubic meters per hour, and at the Montplesir Mine, Herault, the pumping capacity was 3,200 cubic meters per hour. Because of their location in attractive tourist areas, all mines operated under environmental restrictions. Mining was underground and mechanization was low. Roof support was obtained by bolting with protective mesh. Underground mining equipment was specially designed by French industry for bauxite mines in France. Domestic output covered about one-third of the country's demand in 1981. Employment in bauxite mines averaged 800 persons during 1981.

Alumina was produced in three plants with an aggregate annual capacity of 1,390,000 tons. All three belonged to Government-owned PUK, and the largest, with a capacity of 745,000 tons of alumina per year, was located at Gardanne, Bouches-du-Rhone. PUK also produced all aluminum metal. The largest aluminum smelter in the country, at Noguéres, Pyrenees-Atlantiques, accounted for about one-third of the aluminum output in France. In addition, nine plants situated in the Alps and Pyrenees produced aluminum metal. About 7,000 persons worked in aluminum smelters during 1981.

Antimony.—Coframines, the wholly owned subsidiary of BRGM, started antimony production from a deposit at Chani-Quimper (Finistére) on August 1, 1981. At yearend, production reached 320 tons per day of concentrates, but the startup period was difficult. Complex mineralogy of the ore and difficult mining conditions resulting from complicated geometry of the ore body extended the startup time. Investments in the mine and mill totaled about $1 million.[2]

Copper.—After several years of exploration at Chessy, significant reserves with substantial metal content were blocked out. The deposits also contained zinc.

At Bodennec (Finistére) and Port-aux-Moins (Cotes-du-Nord), after long study, a decision was made not to start production. The complex geometry of the ore bodies and difficult problems in concentration led to the negative decision, in spite of significant reserves and the relatively high content of metals.

Germanium.—Capacity for production of electronic-grade germanium oxide was expanded at Penarroya's Imperial smelter at Noyelles-Godault (Pas-de-Calais). However, the size of the new expanded capacities at Noyelles-Godault were not made public during the year.

Gold.—La Combe du Saut Mine (Aude), north of Carcassone, was operated by Mines et Produits Chimiques de Salsigne (in which Coframines, a wholly owned subsidiary of BRGM, held 47.4% of the capital) and had a difficult year. The gold content of the mine ore dropped, and the mine was flooded during January as a result of heavy snow that cut powerlines. Consequently, only 900 kilograms of gold was produced during 1981. Work on a new shaft named Castan continued. Reportedly, the Castan shaft should replace the old Bru shaft sometime in 1982 or early 1983.

Iron and Steel.—After nationalization, which for the French steel industry was nothing more than legalization of a situation existing since 1979, the steel industry continued to have economic difficulties and suffered losses.

During 1981, the consolidation of steel operations continued, and the following installations operated by the Union Siderurgi-

que du Nord et de l'Est de la France were closed: at Rehon, one 35-ton converter and one 23-ton electric furnace; at Neuves-Maison, a small section mill; at Longwy, a steelmaking furnace 2 by 60 tons. At Creusot Loire S.A., at Creusot, a blooming mill, a billet stand, and a bar mill were closed; at Ordain, one 15-ton, 4-megavolt-ampere electric arc furnace was shut down; and at Pamiers, one 12-ton, 3.5-megavolt-ampere electric arc furnace was also shut down. Acieries et Laminoirs de Lorrain-SACILOR closed a basic bessemer converter and a blooming mill at Hagondange.

Lead and Zinc.—During 1981, the Largentiére Mine, operated by Penarroya, was preparing to close. Results of exploration near the mine were negative, and reserves onhand should be exhausted by the end of 1982 or early 1983.

During 1981, Penarroya purchased buildings of a closed factory located several kilometers from their Imperial smelting furnace at Noyelles-Godault (Pas-de-Calais). After substantial investment, this new installation was to start processing about 200,000 tons of residues with a low content of zinc in 1983. In favorable economic circumstances, this raw material should be a significant source of zinc for the installations at Noyelles-Godault.

Tin.—In 1981, France again started mining tin. For several years, the Massif Armoricain, in the central-western part of France, was a site of intensive exploration for tin in an area that had a long history of tin mining dating back to the Romans. In 1981, production started at Montbelleux in a granitic stock containing numerous veins of cassiterite and wolframite. The size of the mine and daily output were not known at yearend. In addition, exploration continued at the Beaulieu deposit, where reserves were estimated at 9,000 tons of tin.

Tungsten.—Société Minière d'Anglade, the largest producer of tungsten in France, started production from a new deposit at Veronique. High metal content in the ore resulted in a successful year for the operator. Coframines, a BRGM subsidiary, held a 7% participation in the Société Minière d'Anglade.

NONMETALS

Bentonite.—Large deposits of bentonite may exist in the Basin of Paris, according to preliminary reports[3] on exploration for bentonite in France published during 1981. The news was important because France imports about 90% of its yearly bentonite demand. The small domestic production consisted of low-grade bentonite with an active clay (smectite) content of less than 50%. Pits producing bentonite were located in Dordogne and in Vaucluse.

Preliminary bentonite inventories prepared by the BRGM showed 12 areas in Sparnacian Beds located in the western and northwestern areas of the Paris Basin, where the grade of the clay (85% smectite) appeared good. Several tests confirmed suitability of the clays for use in foundries. Although reserves were not determined, preliminary reports indicated several thousand tons of clay may be present and economically recoverable.

Lime.—During 1981, burnt lime was produced in about 34 locations spread throughout France. Only three plants have more than a 200,000-ton-per-year capacity. Four companies produced most of the lime; the major ones were the two French subsidiaries of the Lhoist Group of Belgium: S.A. des Chaux et Dolomies du Boulonnais with a 750,000-ton-per-year capacity of quicklime, located at Rety and Boran, in northeastern France, and S.A. des Carrieres et Fours a Chaux de Dugny, which operated a 700,000-ton-per-year installation at Dugny. In addition, Chaux Balthazard et Cotte operated four plants located at la Buisse, Polienas, Sassenage, and Lathuille in eastern France, with an aggregate capacity of 30,000 tons per year. Through its subsidiaries, Chaux de Provence and Chaux de la Tour, Balthazard had a capacity of about 390,000 tons per year of lime in southeast France at Chateauneuf-les-Martigues, in Bouches-du-Rhone, and at Robion in Vaucluse. In addition, the company operated two plants with an aggregate capacity of 100,000 tons per year located at Sauveterre-la-Lemance in Cot-et-Garonne and Terrasson in the Dordogne. Another subsidiary of Balthazard, Fours a Chaux de l'Aisne, operated a 130,000-ton-per-year plant located at Vendeuil.

La Dolomie Francaise operated a 400,000-ton-per-year plant, the largest lime plant in France, at Neau, Mayenne; its production, however, was wholly dolomitic lime and dead-burnt dolomite.

Salt.—France produced salt from mines, brines, and the sea during 1981. Rock salt was produced by the Compagnie des Salins du Midi et des Salines de l'Est (CSMSE)

with facilities at Saint-Nicolas de-Port (Meurthe-et-Moselle). Salt from brine was produced at Varangeville (Meurthe-et-Moselle) and at nearby Dax; the operator was CSMSE. Solvay also produced salt at Tavaux (Jura) and at Bayonne. Salt from the sea was produced at Salins-de-Giraud (Bouches-du-Rhone) and at Aigues-Mortes (Gard) by CSMSE. Table 1 shows the latest trends in salt production of France.

Talc.—As in the past, Talcside Luzenac operated its opencast mine at Trumouns (Ariege) from May until October during 1981. The high altitude of the minesite and abundant snowfall made production during winter impossible. To move overburden, a new larger power shovel was commissioned at the mine. New equipment increased productivity at the mine and led to lower consumption of explosives. At the nearby plant at Luzenac, new installations for production of 30-micrometer fines, for use in the paper industry, were completed during 1981. In addition, a new storage facility was commissioned at the plantsite.

MINERAL FUELS

Coal.—During 1981, for the first time since 1964, French coal production increased over that of the previous year. About 10 coalfields, varying in size, geological conditions, and mining methods, were in production. These were grouped in three coal basins, namely Nord-Pas-de-Calais, Lorraine, and Centre-Midi. The largest producers of coal were mines in the Lorraine Basin located in northeastern France near the border with the Federal Republic of Germany, which accounted for about 50% of the country's total coal production.

The coal industry had an uneventful year, and the production increase resulted from better utilization of existing facilities. The coking plants at mines as well as those at steel plants suffered from low level activities in the iron and steel sector of the mineral industry.

In the coalfield of Aquitaine, plans called for development of two opencast mines based on 15 million tons of reserves not recoverable by present underground mining. The first one would exploit reserves of 5 million tons at the Sainte Marie Mine, and the second one would produce coal from 10 million tons of reserves at the Troniqui-Lavoir Mine. Work at the Sainte Marie Mine could start during 1983 and at the Troniqui-Lavoir Mine during 1990.

During 1981, the center for study and research for the French coal mining industry, Centre d'Etudes et Recherches des Charbonnages de France (CERCHAR), celebrated its 130th anniversary. The laboratories of CERCHAR were located at Verneuil-en-Halatte, north of Paris. Employment at CERCHAR totaled 700 engineers, scientists, and technicians.

During many years of research, CERCHAR worked on problems related to mining at great depths, remote control of mining equipment, designing of equipment including use of high voltages underground, and research into spontaneous oxidation of coal at low temperatures and into the gases emitted during such oxidation. In addition, CERCHAR studied effects of atmospheric pollution in mines on miners' health, and CERCHAR was appointed by the French Government to issue certificates in conformity with mandatory standards for health and safety in mines.

Petroleum.—Although consumption of crude oil was lower by about 11% than that during 1980, France remained heavily dependent on imported crude oil. Domestic production was low and accounted only for slightly less than 2% of the country's consumption during 1981.

Significant increases of expenditures by the oil companies for exploration and development signaled a revival of the search for oil and gas. In 1981, expenditures for exploration and development totaled about $347 million. In 1978, the same expenditures had amounted to only $111 million.

During 1981, 43 wells totaling 88,945 meters onshore and 5 wells totaling 12,699 meters offshore were drilled for exploration. In the Aquitaine Basin, 18 wells totaling 52,107 meters and in the Parisian Basin, 12 wells totaling 27,168 meters comprised the bulk of exploratory drilling in France. Offshore, three wells totaling 7,648 meters were drilled in the Golfe de Gascogne, and two wells totaling 5,051 meters were drilled in Manche-Iroise. From onshore drilling, the only indication of oil and gas was in the Orlon and Marne Basins, Aquitaine. Offshore, all five wells were dry.

During 1981, 89 wells totaling 153,765 meters were drilled for development. The Parisian Basin was the most active area, where 36 wells totaling 43,490 meters were drilled. In addition, 21 wells were drilled in Landes, Aquitaine. In addition to the small production in France, French oil companies

operated in 40 foreign countries and controlled production of about 350 million barrels per year abroad.

During 1981, 24 petroleum refineries with a capacity of 1,155 million barrels per year were operated in France, which was 5.7 million barrels less than in 1980. The largest refinery was at Petite Couronne, operated by Shell Francais. However, in spite of the reduction of operational capacities in French petroleum refineries, utilization of the installed capacity was only 62%, and for the first time since 1970, petroleum refineries processed less than 730 million barrels.

During 1981, three analytic cracking units were under construction in refineries at Donges (Atlantque), Flandres (Mardyck), and Reichstet (Strasbourg). The new additions will increase cracking capacity in France from 81 million barrels per year in 1981 to 101 million barrels per year in 1982. At the Bordeaux refinery operated by ESSO, S.A.F., a new 4.7-million-barrel-per-year desulfurization unit was completed, and at the Mede refinery (Mediterranee-Rhone) operated by Compagnie Francaise de Raffinage, a new 715,000-barrel-per-year alkalinization unit was completed. An experimental platforming unit for treatment of residues was completed at the Feyzin refinery (Mediterranee-Rhone).

Uranium.—France continued to mine and process domestic and foreign uranium ore during 1981.

The mining division of Compagnie Generale des Matieres Nucleaires (COGEMA) at Crouzilles was the largest producer of uranium ore. The uranium content of its output was over 1,000 tons of U_3O_8.

After the startup in the early part of 1980, the mining division at Herault had problems in reaching the designed capacity during 1981.

Exploration for uranium continued at a fast pace. At the beginning of the year, COGEMA had 38 exploration permits covering 3,352 square kilometers. Reserves of the new uranium deposit at Coutras, Province of Nord Aquitaine, reportedly totaled 20,000 tons. Production from the Coutras deposit was planned for the beginning of the next decade.

The capacity of the COGEMA plant at Bessines for the production of yellow cake was increased to 1.1 million tons of ore per year.

The Mineral Industry of Gabon

By Ben A. Kornhauser[1]

The appreciation of the U.S. dollar, with respect to the African Financial Community franc (CFAF), impacted favorably in 1981 on Government oil revenues, which increased 32% over initial estimates.[2] However, the rise in the value of the dollar substantially increased Gabon's foreign debt, which was almost 50% payable in dollars. In addition, the high interest rates in the United States of about 19% and in France of 20%, compared with Gabon rates of between 10% and 15%, attracted Gabon's cash holdings. The devaluation of the French franc also increased the cost of imports outside the franc area since importers had to pay more for foreign exchange in dollars, marks, or yen. Gabon's inflation was projected at 15% for 1981.

The economic growth of Gabon was related directly to the development of its rich natural resources, with petroleum the predominant factor. Higher prices in 1981 offset declining petroleum production, increased Government oil revenues by $492,000, and enabled the gross domestic product (GDP) to grow by almost 12% from $3.32 billion in 1980 to $3.71 billion in 1981. Outstanding public debt was still heavy, although reduced from its 1980 level, and accounted for 36.3% of Government spending in 1981 compared with 38.3% in 1980. Public finance showed continuing substantial improvement through the holding of Government spending to budget limits and increased GDP.

In addition to petroleum, Gabon's wealth was derived from its manganese, uranium, and timber. Major iron ore deposits remained undeveloped. The Trans-Gabon Railroad was being constructed to provide the transport infrastructure to make these resources more accessible, exploitable, and marketable, and to enable Gabon to control their delivery from Gabon's ports. The plan was for prospecting to take place for 100 kilometers on either side of the railroad by the national geological office, France's Bureau de Recherches Géologiques et Minières (BRGM) and by aerial survey by a U.S. company.

In late 1981, France granted Gabon a loan of $24.9 million at 8.5% interest to finance the second leg of the railroad. This section was to extend for 140 kilometers from Ndjole to Booue, the most difficult part of the line that followed along the Ogooue River Valley. This leg was scheduled to open by the end of 1982. The first section of the railroad—182 kilometers between Owendo, the Port of Libreville, and Ndjole on the Ogooue River—became operational in 1979. In 1981, traffic was expected to exceed 80,000 passengers, an estimated 20% increase over that of 1980, with freight remaining at about 300,000 tons.

Gabon planned to raise its participation in three primarily French-controlled companies, from 25% to a 35% to 41% portion in petroleum and from 10% up to 30% in nonfuel minerals. The target companies were Essence et Lubrificants de France (ELF)-Gabon Oil Co., a subsidiary of the ELF-Aquitaine Group involved in petroleum production; the Compagnie Minière de l'Ogooue SA (COMILOG), owned jointly by the United States Steel Corp. (40.76%), France's BRGM (18.3%), Imetal SA (15.8%), the Gabonese Government (15.02%), and Banque des Paris et de Pays-Bas and Japan's Mitsui Mining & Smelting Co. Ltd. (10.12%), involved in the mining of manganese; and the Compagnie des Mines

d'Uranium de Franceville (COMUF), controlled by the French Commissariat à l'Energie Atomique (CEA) and involved in the production of uranium.

The production and distribution of electricity and water in Gabon were controlled by the Société d'Energie et d'Eau du Gabon (SEEG). SEEG was owned by the Gabonese Government (64%) and other private and quasipublic entities. However, the electrical network consisted of unconnected regional centers. Fortunately, Gabon had developed hydroelectric power and could increase that capacity greatly. Also, its oil and natural gas supplies provided thermal power generation. In mid-1980, SEEG's installed capacity was 265,200 kilovolt-amperes (kva), of which 152,000 kva were from hydroelectric facilities and 113,000 kva were from 24 thermal stations. The hydroelectric plants were at the Kinguele Dam (72,000 kva), Tchimbele Dam (57,000 kva), and Petit Poubara Dam (23,200 kva). Capacity was being added at the last two sites. Port Gentil had two gas-oil and natural gas generators producing 78,750 kva. Libreville had a backup thermal generator listed at 18,500 kva. In 1981, 23 towns, including Libreville and Port Gentil, were electrified, and powerlines to Fougamou and Lastoursville were under construction. Several projects that were to increase electrical supply were under study. These possibilities included expanding capacity at Kinguele and Petit Poubara Dams, constructing a 240,000-kva capacity at Grand Poubara Dam, and developing the Ngounie River's Empress Falls, which had a power potential of 3 billion kva. New ministations were planned for several towns; auxiliary power was to be supplied for any major industrial project.

PRODUCTION

The slump in the international markets for manganese, uranium, and wood decreased their value and potential volume in 1981. Although the worldwide economic malaise also reduced petroleum production, increased oil prices and a strengthened U.S. dollar raised the value of the oil produced. Uranium production increased about 11% over that of 1980 and had a value of $63.3 million. France's long-term contract to purchase 1,000 tons of uranium (metal content) undoubtedly was a major stimulus to its mining. Manganese production decreased by about 31% from 1980 at a value of approximately $95 million. Cement production, on the other hand, increased about 37% over that of 1980 and had a value of about $16.1 million.

Table 1.—Gabon: Production of mineral commodities[1]

Commodity[2] and unit of measure	1977	1978	1979	1980[p]	1981[e]
Cement, hydraulic—metric tons	190,000	e190,000	96,205	109,430	149,913

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Aug. 20, 1982.

[2]In addition to the commodities listed, a variety of crude construction materials (clays, sand and gravel, and stone) is also produced, as well as diamond from artisan works, but output is not reported and available information is inadequate to make reliable estimates of output levels.

TRADE

Because Gabon interacted with other countries, its trade was affected greatly by external factors, such as the state of the world economy, interest rates elsewhere, and the strength or weakness of other country currencies, particularly the U.S. dollar and French franc. Preliminary 1981 data indicated that Gabon's foreign trade balance declined from $910 million in 1980 to $740 million in 1981. This decline was attributed primarily to increased spending for imported goods and contracted services. Gabon's foreign assets were expected to increase slightly in 1981 over those in 1980, while balance-of-trade payments were expected to be the same as in 1980.

COMMODITY REVIEW

METALS

Gold.—Data for gold production were unavailable. Previously, gold was produced mainly in the Eteke region with some gold mining in the Lastoursville, Makokou, and Ndjole regions. Gold output was sold on the official market by Société Gabonese de Recherche et d'Exploitation Minière (SOGAREM).

Gold was sought in primitive rock formations in the Eteke (Ngounie) region by the Or Eteke syndicate (Gabon 45%, COMUF 35%, and BRGM 20%). BRGM also intended to prospect actively for gold in 1982. These explorations were aimed first at locating the mother lode of the Eteke gold, from which 15 tons were mined in dispersed locations from 1937 to 1954, and then using open pit and/or underground mining to exploit the source if it proved to be economically feasible.

Iron Ore.—The Board of Directors of the Société des Mines de Fer de Mekambo (SOMIFER) met to restructure its capital and to outline a study for developing its Belinga iron ore deposit near Mekambo, in northeast Gabon near the Congo border. SOMIFER was owned by the Gabon Government (41%), Bethlehem Steel Corp. (United States) (20%), Bergbau AG Niederrhein Exploration (Federal Republic of Germany) (10%), Industralexport (Romania) (5%), Finsider International (Italy) (3.5%), BRGM (France) (3%), Ste' Lorraine et Mèridionale de Laminage Continu (SOLMER) (2.4%), Banque de Paris et des Pays-Bas (1%), Estel Hoogovens BV (Netherlands) (0.5%), and a Japanese group (13.6%). The ore reserves of the deposit were estimated at 910 million tons, with about 65% iron content, of which about 200 million tons contained less than 0.1% phosphorus. Open pit mining was to be used to produce between 7.5 and 10 million tons annually. The development of the deposit was predicated upon construction of the Trans-Gabon Railroad and a northern extension. The railroad would carry the ore to Libreville for export to world markets.

Manganese.—Manganese production in 1981 operated at two-thirds of plant capacity owing to depressed world steel production, in which manganese was essential as a desulfurizer and as an inexpensive hardening element. Gabon was the world's largest producer of manganese from a single mine and was one of the world's four principal producers of manganese ore.

At the Ogooue Mine at Moanda, manganese ore was extracted by the open pit method by COMILOG. With manganese, also, mining expansion and expected ferromanganese alloy production was predicated upon construction of the Trans-Gabon Railroad. Once the railroad would reach Moanda, transportation no longer would be a limiting factor to production. New production was limited by the capacity of the chain-conveyor system that carried the ore from Moanda to M'Binda in the Congo for transport by two railroads to Point Noire, Congo, for export.

France agreed to participate with the Gabonese Government in building a ferromanganese alloy plant at Haut-Ogooue, the proposed site of the hydroelectric plant. France was to conduct studies before bids were invited for the plant. Production capacity was planned at 85,000 tons of ferromanganese and 50,000 tons of silicomanganese per year. The conversion of the manganese ore concentrate to ferroalloys was to boost Gabon's GDP through sale of a higher priced product and increased employment.

NONMETALS

Barite.—Promising indications of 1.2 billion tons of barite deposits were reported

primarily at Dourakiki in the Nyanga region, 110 kilometers north of Mayumba in the southern coastal region. The Dourakiki deposit was reported to have a barite content of 47%. Barite was discovered first in Gabon in the 1960's by BRGM. The feasibility study of the Dourakiki deposit was conducted by the Koussou syndicate, consisting of the Gabonese Government, COMILOG, and BRGM. The deposit was to be exploited jointly by a company composed of the above three plus ELF-Gabon. Beneficiation by gravitation was expected to convert about 80% of the run-of-mine output into a salable product.

The dominant use of crushed and ground barite was in drilling fluids for oil and gas wells, of particular interest in Africa with the increased drilling for petroleum.

Cement.—Cement production was considerably below the clinker-grinding capacity available. The older clinker-grinding plant located at Owendo was operated by the Société des Ciments d'Owendo and had an annual capacity of 270,000 tons. The principal shareholders of the firm were the Gabon Government (20%) and Ciments Lafarge S.A. (France) (71.3%).

Two new plants were constructed and operated by Société des Ciments de Gabon, which is owned by the Gabonese Government (51%), ELF-Gabon (19%), Ciments Lafarge (15%), and Société des Ciments d'Owendo (15%). One plant, located near Ntoum about 40 kilometers from Libreville, was to produce 350,000 tons of clinker from local limestone deposits, thereby reducing dependence on imports. The second plant, a clinker-grinding plant with an annual production capacity of 100,000 tons, was constructed at Franceville.[3]

Talc.—An estimated 100-million-ton deposit of talc was located in the N'dendi Tchibanga region of the Nyanga Province. The Gabonese Government and BRGM continued to consider the feasibility of exploiting the deposit.

MINERAL FUELS

Natural Gas.—Natural gas production, which was associated mostly with petroleum production, declined slightly in step with the drop in crude oil output. About 5% of the gas production was used for power generation and the remainder was flared. Natural gas reserves remained stable at about 70 billion cubic meters.

Petroleum.—*Production.*—Gabon's petroleum production declined again in 1981, owing largely to a decrease in world demand for oil that caused crude oil prices to drop and the Organization for Petroleum Exporting Countries to mandate production controls. Gabon also lost Cameroon as a market for some refined products. Oil production declined to a little under 150,000 barrels per day, about two-thirds of the peak production of 224,000 barrels per day in 1976.

Oil production was mostly from offshore fields with development still centered in offshore areas. ELF-Gabon, which was 25% owned by the Gabonese Government and 75% by Essence et Lubrificants de France-Enterprise de Recherches et d'Activités Pètrolièrs, still dominated oil production in the country. ELF-Gabon operated the Mandji Field, among several others, by itself and in conjunction with other companies. Recent discoveries doubled Gabon's known oil reserves, but 1980 world economic conditions failed to motivate the Government to determine future production levels.

In June 1979, the Gabon Government established the Société Nationale des Pètroles Gabonais (PETROGAB), and all petroleum-producing companies were required to deliver 25% of their annual output to the national company. PETROGAB became independent in 1980 under the Minister of Economy and Finance. PETROGAB was organized into five sections. One section oversaw all exploration and production activities. A second section was responsible for all financial matters. A third division handled legal matters. A fourth section was responsible for refining and petrochemicals, and a fifth section was concerned with storage and transport. By 1981, the first three divisions were operational. The first division proved to be most important because Gabon entered into leases under production-sharing agreements and oversaw the production of the operating companies. Until mid-1981, PETROGAB had no problems in marketing its 25% share of oil produced through long-term or yearly leases. Approximately 70% of PETROGAB's contracts were directly with governments as purchasers and not through intermediaries. When PETROGAB's work force and expertise could be increased, the company planned to become more active in the areas of refining, petrochemicals, storage, and transport. In 1981, Gabon announced its intention of increasing its share of capi-

tal interest in foreign oil companies from 25% to a 35% to 41% portion.[4] New exploration leases were to be on a production-sharing basis, with PETROGAB receiving much larger shares of annual production.

Exploitation of the AYOL I site by the joint partnership of the Wed Gabon Oil Co. (70%) and ELF-Gabon (30%) began in the fall of 1981. The initial discovery was made in 1979 in the North Concession where petroleum was found in the Batenga Stone at a depth of 2,259 meters, with an initial flow of 1,082 barrels per day. Annual production was estimated at 400,000 barrels. The Wed Gabon Oil Co., a Japanese firm, was composed of Japan National Oil Co. (50%), World Energy Development (28.6%), and C. Itoh Energy Development (21.4%).[5]

Exploration.—The pursuit of oil by foreign companies continued actively in 1981. The Wed Gabon Oil and ELF-Gabon partnership drilled in the Assouka Concession without success in 1981. A 50-50 partnership of the Mitsubishi Petroleum Development Co. and ELF-Gabon was exploring the Baliste Concession north of the Wed Gabon site.[6]

The Amoco Gabon Exploration Co. made two significant oil discoveries in the Inguessi Marine block, covering a tract of 1,391 square kilometers lying 86 kilometers southeast of Port Gentil. The wells flowed at daily rates from 1,166 to 2,114 barrels of oil. Amoco Gabon took over this concession after successive abandonment by ELF-Gabon and Exxon Corp. Amoco Gabon Exploration Co. consisted of five companies—Amoco Oil (an affiliate of Standard Oil Co. (Indiana) (50%), Wintershall AG (18.5%), Bristish Petroleum Co. Ltd. (15%), Lingen Exploration Inc. (8.25%), and Preussag AG (8.25%).[7] In addition, Amoco drilled its second exploratory well on its wholly owned Gombi Marine block. At the end of 1981, Amoco had interests in three tracts of about 1,800 square kilometers in offshore Gabon. Amoco had explored four concessions in Gabon under four different names: Gombe Marine, Omboue Sud Marine, Iguela, and Inguessi Marine, in association with other oil companies such as Gulf Gabon, Hispanoil, and Gulf Canada.

ELF-Gabon found oil in two promising wells in wholly owned concessions. The Moubenga Marine exploratory well was in the Paka Marine Concession located 70 kilometers south of Mayoumba and passed through oil-permeated sandstone en route to depths of about 3 kilometers in the Dentale formation. The well flowed at about 2,750 barrels per day. The second, the Kenzi Marine No. 3 test well, went through 30 meters of oil-bearing sandstone between 1080 and 1140 meters. The well was located in the Pongara Marine Concession about 65 kilometers from the Lopez cap. This well was drilled under an exploration and shared production contract between the Gabon Government on the one hand and ELF-Aquitaine (70%) and ELF-Gabon (30%) on the other. In August, the 50-50 partnership of Elf-Gabon and Mitsubishi Petroleum found oil in the Baudroie Marine No. 2 Concession located offshore Gabon. The well passed through the oil-bearing Anguille and Bananga reservoirs.

Refining.—Gabon's two refineries had a combined annual capacity of approximately 22 million barrels of crude oil. The Société Gabonaise de Raffinage (SOGARA) refinery at Port Gentil had an annual production capacity of 12 million barrels. It was owned by the Gabon Government (51%), Elf-Gabon (18.75%), Compagnie Française des Pètroles (18.75%), and a group of petroleum marketing companies (11.5%). SOGARA was supplied with crude oil from the Mandji Isle fields via an 18-kilometer pipeline. Its production was sold on the domestic market and exported to the Central African Republic, to the Congo, and to Cameroon at a lower price to compete with Cameroon's new refinery. The second refinery, which came onstream in Port Gentil in 1977, had an annual capacity of 10 million barrels of crude oil and was operated by the Compagnie Gabonaise-ELF de Raffinage (COGER). COGER was owned by the Government (30%) and ELF-Gabon (70%). Total 1981 production from the COGER refinery was approximately 8.36 million barrels of gasoline, jet fuel, kerosine, distillate fuel oil, and fuel oil. COGER refinery exports were intended for Western European countries.

Uranium.—Major uranium deposits were centered in the Mounana region near the Moanda manganese deposits. However, of the three deposits delineated at Oklo, Boyindzi, and Okelobondo, only the Oklo Mine was being worked, using open pit and underground methods. The mine was operated by COMUF, which was owned jointly by the Gabonese Government (25%), Cie. de Mokta (28%), France's CEA (15%), Minatome S.A. (France) (13.2%), Compagnie Française des Minerais d'Uranium (7.5%), Cie. des Mines d'Huaron (3.75%), and Compagnie de Geston d'Investissements Internationaux (7.5%). Concentrates were sold to the CEA under contract.

The European Investment Bank loaned $17 million to Gabon to modernize its uranium processing plant and to expand the mine from a production capacity of 1,000 to 1,500 tons per year of uranium metal. The loan was granted for 15 years at 8% interest. The run-of-mine ore averaged 5% of U_3O_8 content. The first processing enriched the ore to between 35% and 55% U_3O_8 and the yellowcake plant produced a 70% to 75% uranium concentrate.

The Taiwan company TAIPOWER accepted Gabon's offer to participate in the exploitation of its uranium. Exploration for uranium was concentrated in the recent past in the Booue-Lastoursville-Mounana regions.

The Mineral Industry of the German Democratic Republic

By Walter Steblez[1]

In 1981, the German Democratic Republic (GDR) showed significant economic growth in contrast to several other centrally planned Eastern bloc economies. The GDR national income registered the planned 5% increase over that of 1980, and gross industrial production for the entire economy rose by 5.1%, versus a planned 5.0%; in industrial sectors directly controlled by ministries, the increase amounted to 5.9% versus a planned 5.8%. The relative shares of ferrous and nonferrous metallurgy and mining in total industrial production were approximately 6.4% and 2.4%, respectively, and in the production of fuel and power, about 11.1%.

The total industrial labor force in the GDR economy was in excess of 3.2 million with over 22% employed in key energy and raw and other material sectors of the economy. Reportedly, in 1981, there were more than 125,000 personnel employed in ferrous metallurgy and mining, of which 83,000 were production workers. The nonferrous mining and metallurgical sector employed about 50,000 personnel including approximately 32,000 production workers. The fuel and power and chemical sectors had, respectively, about 271,000 and 274,000 total personnel, of which 175,000 and 170,000, respectively, were production workers. Industrial labor productivity in 1981 rose 5% and was responsible for 90% of the overall industrial production increase.

While the Ministries of Coal and Energy and Mining, Metallurgy, and Potash were increasing production by 1.7% and 1.0%, respectively, in 1981, the GDR continued to pursue and implement policies for the efficient consumption of raw materials and energy and for materials and energy savings. The reported 1981 raw materials and energy savings were achieved by a 5% consumption decrease in industry.

The planned 16% growth of foreign trade turnover for 1981 fell short of the goal and attained a 10% increase over that of 1980. Official sources, however, pointed to a favorable trade balance in 1981 and a trade surplus with "developing and industrialized capitalist countries."[2]

In the GDR, mineral economic policy, to a large extent, determined the content and direction of overall economic development. Despite a leading role in the world production of lignite and potash, the country, with a highly developed industrial base, possessed scant mineral reserves. To meet its industrial material requirements, the GDR relied heavily upon imports of ferrous and nonferrous ores and metallurgical products, as well as upon significant amounts of energy resources.

Government Policies and Programs.—The GDR objectives of maintaining economic growth in the 1980's with concurrent reduction of imports for essential raw material and energy resources included the following trends: (1) Industrial enterprise reorganization; (2) increased technology transfer and reliance upon scientific work in key industries; (3) expanded reliance on secondary raw materials, increased use of special steels, and refining in the ferrous and nonferrous metallurgical sectors; and (4) enhanced marketability of exported commodities.

During the 1976-80 5-year plan, the GDR embarked upon a reorganization of industrial enterprises under respective ministries into large centrally organized firms (Kombinats) with the aim of improving the division of labor and production efficiency. Closely related enterprises were consolidated into vertically organized state monopolies. By

the end of 1981, over 150 Kombinats had been organized, and it was planned to increase their number during the 1981-85 period. Reportedly, the Kombinats were to subordinate foreign trade organizations and have an advisory status in the drafting of national economic plans. To reduce costs and consumption of raw materials, 30 performance quality indices were designated to check Kombinat efficiency, of which 7 were concerned with improving the foreign trade balance. By 1981, these functions had not been officially codified, and it was believed that this was due to the fact that the reorganized industry was undergoing a period of testing and evaluation.[3]

Together with the structural reorganization of industry, the GDR has emphasized industrial modernization through increased use of high technology and automation; much of the country's industry was labor intensive with obsolescent plant and equipment. Capital repair was reputed to run 20 billion marks per year[4] and absorb 9% of the total industrial work force. The productivity of the repair sector was estimated at 40% to 45% below that of the manufacturing sector level. In 1981, some 70% of the GDR total research and development outlays were to be spent on applied sciences with specific emphasis on robotics and microelectronics. In 1981, the GDR reported the installation of 13,000 robots in industry. However, it should be noted that the definition of robotics in the GDR included simple process equipment programmable in less than a three-directional mode. It was reported that in the lignite industry, the first robot was installed at the VEB Schwarze Pumpe Kombinat in 1981 to perform tough repair work on overburden excavators. In ore mining, metallurgy, and potash industries, 2,000 industrial robots were planned for 1985, of which 67% were to be simple, specific-process type.

High material costs and a substantial labor pool in the sectors of the GDR economy producing energy and raw and other materials have prompted the country's planning authorities to upgrade the collection and reutilization of secondary raw materials by 28% to 30%, especially ferrous and nonferrous industrial scrap and used oil and refractories during the 1981-85 plan period. Concurrently, the GDR metalworking sector was to decrease consumption and increase end-use product refinement by means of improved metallurgical processes and input weight reductions of raw materials and energy. By 1985, the planned special steel output was to comprise 80% to 90% of the total rolled-steel output; in the nonferrous sector, 90% of the total output was to be refined. These measures were forecasted to increase material supplies between 0.5% and 0.8% for rolled steel and about 1.0% for nonferrous metals.

The GDR 1981-85 5-year plan set a specific goal for the reduction in the annual consumption rate of important energy and raw-material sources at 5.0% to 5.5%. Primary energy consumption was to be reduced by 4.0% to 5.0% per year. By 1985, planned reductions in energy consumption compared with those of 1980, were to be equivalent to 70 million tons of raw lignite. Measures taken for reduced consumption and improved efficiency in industry were to result in the following savings for the 5-year period: (1) Rolled steel—2.2 million tons, (2) aluminum—more than 50,000 tons, (3) copper—about 15,000 tons, and (4) cement—1.9 million tons.[5]

The GDR national economic plan for 1981-85, published originally in April, and with adjustments in December of 1981, fixed a 28% increase in national income in 1985 in comparison with that of 1980. Likewise, industrial output for the entire economy was to increase by 28%, and, in enterprises under the industrial ministries, a 31% increase was planned. Labor productivity was planned to grow by 29%, and freight transportation, by 11% to 12%.

Total investment for the 1981-85 planning period was set at 256 billion marks, with the construction share of investment maintained at about a 25% level. New production capacities in the lignite industry amounting to 70 million tons were planned for 1985; the share of nuclear-generated electric power was planned to reach 12% to 14% of the produced total.

Increased and more efficient steel production was expected at the Ost Eisenhutten Kombinat with the addition of an oxygen converter and continuous casting technology by 1985. Increased ore output was planned in the copper mining industry, and self-sufficiency in tin production was set for the end of the 1981-85 period. The planned 1985 production targets for key energy and material resources are presented in table 1.

Table 1.—German Democratic Republic: 1980 production and 1985 production goals for key resources

Commodity	1980 production	1985 goals
Electric energy billion kilowatts	99	112
Lignite, mine output million tons	258	290
Nitrogen fertilizers, N content thousand tons	943	1,200
Potash fertilizers:		
Crude, K_2O content do	3,422	3,450
Granulated and globular, K_2O content do	--	2,245
Steel:		
Total rolled do	5,128	9,282
Total rolled (alloyed) special steel do	4,330	7,393

In comparison with that of 1981, the GDR national income was planned to increase 4.8% in 1982. Total manufacturing output and enterprise production under the industrial ministries were set to grow 4.5% and 5.1%, respectively. At the same time, specific consumption of energy was to decrease by 4.0% in 1982. Consumption of rolled steel in the metal-working industry was to decrease by 6.5%, and in the building industry, by 3.9%. Consumption of cement by the building industry was to be reduced by 5.5% in 1982.

In 1982, the GDR planned to increase coal and energy output by 3.7% over that of the preceding year. Electric power generation was expected to reach 103.4 billion kilowatts. Raw lignite output was set at 271.9 million tons, and lignite briquets at over 50 million tons. The ore mining, metallurgical, and potash industries were to increase their output by 3.3% and raise the production of potassic fertilizer (in K_2O content) to 3.45 million tons. Also, labor productivity in industry was to grow by 4.5%, and foreign trade, by 15%; capital investment in industry, however, was reduced by 3.1%.

PRODUCTION

In 1981, every industrial sector in the GDR reportedly met and exceeded production plan targets. Enterprises under the jurisdiction of the coal and energy ministry overfulfilled the plan by 101.7%. The plan for refined coal products was exceeded by 353,000 tons for brown coal briquets and by 22,000 tons for high-temperature brown coal coke. Lignite open pit mines surpassed production quotas and insured adequate supplies for domestic consumption. Also, the GDR put into operation 1,000 megawatts of new electric-power-generating capacity and, overall, increased electric power output during the year.

The production plan goals of enterprises under the Ministry of Ore Mining, Metallurgy, and Potash were met and in some cases exceeded for most essential raw materials. Domestic mineral raw materials and ground water resources were expanded in 1981 by workers of the Ministry of Geology, which exceeded its plan by 105%. Actual production of most mineral commodities did not vary from or significantly exceed output levels of 1980. Rather than emphasize production in gross output, the GDR attempted to give greater impetus to quality and efficiency in commodity output by using the net output indices and reducing material cost per 100 marks of production.

Table 2.—German Democratic Republic: Production of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity[2]	1977	1978	1979	1980[p]	1981[e]
METALS					
Aluminum:					
Alumina:

[e]Estimated. [p]Preliminary. [r]Revised.

[1]Table includes data available through July 12, 1982.

[2]In addition to the commodities listed, magnesium, peat, and a variety of crude construction materials are produced, but output is not reported, and available information is inadequate to make reliable estimates of output levels.

[3]Reported in Metal Statistics, 1970-80, Metallgesellschaft Aktiengesellschaft, 68th ed., Frankfurt am Main, 1981, p. 15.

[4]Source indicates that data include "roasted ore," presumably roasted pyrite.

[5]Figures represent the sum of estimates for silicon metal production (3,000 tons in 1977; 4,000 tons in 1978, 1979, and 1980) and reported figures for production of all other ferroalloys (1981 estimated).

[6]Total of listed products only; no estimates have been made for unreported products or refinery fuels and losses.

TRADE

The key objectives of the GDR foreign trade policy for the 1981-85 plan period were to reduce reliance on imported energy sources and raw materials and to upgrade the marketability of domestic production to increase exports. The rise in world market prices beginning in 1973 for fuel, raw materials, and durable goods, resulted in annual foreign trade deficits. By the end of 1980, the estimated convertible currency debt to industrialized Western countries reached an alarming $11 billion with interest payments absorbing approximtely one-third of the value of exports to the West. The estimated incurred debt to the U.S.S.R. for the period between 1974 to the end of 1980 was valued at roughly $3 billion, corresponding closely with the petroleum price increase in the Council for Mutual Economic Assistance (CMEA) bloc.[6]

According to the 1981-85 plan directives, the GDR was to slowly redirect some of its more profitable exports from CMEA countries to Western markets. By the end of 1980, a slight overall trade shift occurred; the trade share with Western industrial and developing countries rose to 31%; with CMEA countries, the trade share fell from

68% to 65% for the same period, and it decreased from 72% to 69% with other centrally planned economy countries. This was primarily due to a decrease in trade turnover with Poland and Czechoslovakia.

The GDR, as a rule, does not fully publish its annual trade statistics; however, available official sources indicated a successful turning of the trade balance with Western countries and a reduction of the trade deficit with the U.S.S.R. through increased exports in 1981.

Among CMEA bloc countries, the GDR trade with the Soviet Union was the largest in value. The GDR import requirements for domestically processed raw materials were about 60% of the total, with Soviet exports accounting for 100% of the natural gas, 90% of the petroleum, 60% to 70% of the coal, 70% to 80% of the iron ore and rolled ferrous metals and 60% to 70% of the nonferrous metals. Approximately three-quarters of the GDR total cast-iron output was produced from Soviet supplied ore, and about every third ton of steel consumed by the engineering, building, and other industries was manufactured in the U.S.S.R.

The 5-year commercial agreement for the 1981-85 period with the U.S.S.R. provided for annual deliveries to the GDR of about 130,000 tons of aluminum, 3.2 million tons of rolled stock, 4.2 million tons of bituminous coal, 6.5 billion cubic meters of natural gas, and 19 million tons of petroleum. In 1981, however, the petroleum exports were reduced to between 16.5 and 17 million tons; otherwise, Soviet raw material exports to the GDR remained at approximately the 1980 level.

Furthermore, the 1981-85 commercial agreement called for Soviet exports of machine tools, heavy lorries, tractors, and excavators as well as mining and engineering equipment. Soviet equipment deliveries were to be completed for the Jaenschwalde lignite-fired, thermal power station, and with Soviet assistance, work was to continue on the 3,200-cubic-meter blast furnace and hot-rolling mill at the Ost Eisenhutten Kombinat. The U.S.S.R. was also to supply heavy press equipment at the Hettstedt copper billet plant as well as furnace equipment and a cold-rolling mill at the Riesa metallurgical plant.

In turn, the GDR agreed to supply the Soviet Union with presses and forging assemblies (about 5,500 units), milling and toolmaking machines valued at $1.4 billion, metallurgical and strip mining equipment, earthmoving equipment, ships, and plants and individual equipment for the chemical and petroleum industries of the U.S.S.R.

Reportedly, one of the largest industrial-scale agreements in the nonferrous metals field signed in recent years was concluded in 1980 between Licensintorg of the U.S.S.R. and Technocommerz of the GDR. It called for a transfer of technology to the Soviet Union for producing copper electrolytic foil as well as for the delivery of 10 production lines.

The GDR national economic plan was also coordinated with those of other CMEA countries over the 1981-85 period. Inter-CMEA agreements included economic and scienific-technical development as well as trade for the 5-year period.

The GDR was to participate in a CMEA-wide agreement on comprehensive specialization and cooperation on 24 types of nonferrous semimanufacture production from copper, aluminum, nickel, zinc, and their alloys and would specialize in the production of copper wire, aluminum strip for the canning industry, and other aluminum semimanufactures. In general, the exchange of raw materials and mineral commodities with CMEA countries for the 5-year period will include exports of bituminous coal and coke from Czechoslovakia and Poland, alumina and aluminum from Hungary, petcoke and petrochemicals from Romania, aluminum, lead, zinc, and ammonium dioxide from Yugoslavia and nickel-cobalt sinter and concentrate from Cuba. The GDR was to continue to supply these countries with potassium fertilizer, brown coal briquets, cement, and various chemical products.

The GDR trade with Poland was especially important owing to their common border and large-scale commercial agreements. A long-term commercial agreement had established the supply of copper metal and semimanufactures to the GDR in exchange for equivalent values of aluminum and aluminum semimanufactures.

The 1981 commercial agreement between the two countries specified Polish deliveries of bituminous coal and coke, sulfur, nonferrous metals, and manufactured goods to the GDR in exchange for potash, farm machinery, and manufactures, but owing to the continued labor crisis in Poland, significant delivery shortfalls to the GDR occurred for the second straight year. The GDR was particularly hard hit by hard-coal delivery shortfalls in 1981. The amount shipped to

the GDR was about one-third less than in 1980, which necessitated purchases of hard coal from the Federal Republic of Germany (FRG).

The GDR 1981 commercial agreement with Hungary included, among other items, imports of bauxite, alumina, and aluminum. In turn, the GDR supplied Hungary with potash, lignite briquets, and chemical raw materials.

Yugoslavia has played an important role in the GDR mineral trade, and for a number of years, the two countries have been cooperating on the basis of long-term credit arrangements in fields such as nonferrous metallurgy. These agreements were planned to continue for the 1981-85 period. Key Yugoslav mineral exports to the GDR during 1980 and 1981 were bauxite, aluminum in bars and semimanufactured products, rolled aluminum, aluminum castings, electrolytic copper and copper semimanufactures, rolled copper, rolled and slab zinc, forgings and castings of ferrous metallurgy, nickel-cadmium and lead storage batteries, bentonite, and titanium dioxide. The GDR mineral exports to Yugoslavia for this period included potassium salts, kaolin, fluorite, ammonia, rolled ferrous metallurgical products, and open pit mining equipment.

Furthermore, bilateral commercial agreements with Vietnam and Cuba, respectively, formed the basis of supplies of chrome ore and nickel-cobalt sinter and concentrate to the GDR. In 1981, the GDR continued playing an active role in the multilateral CMEA nickel-cobalt mine development plan in Cuba.

In the GDR trade with developed Western countries, the FRG share was over 50%. During the first half of 1981, trade between the FRG and GDR increased by 4% over that during the same period in 1980. The biggest increase in FRG exports to the GDR was in the mining sector, with a 49% increase over that of the previous year. This was due primarily to the rise in hard-coal deliveries to the GDR, owing to Polish delivery shortfalls during the same year. Also, the GDR was reported to have increased purchases of silver from the FRG in 1981 over that of the previous year.

In 1981, the GDR firm Industrieanlagenimport placed an order for a 500,000-ton-per-year magnesium chloride plant to be built near Sonderhausen in Thuringia with Mannesmann Anlagenbau AG, head of the FRG consortium that included Klöckner Industrienlagen GmbH, Standard Messo Dursburg, and others. The magnesium chloride, produced as a byproduct of potash mining, would be used as a raw material for magnesium metal and magnesia production.

Commercial agreements with Austria for 1981 included two orders for Vöest-Alpine of Austria. One was for supply of a 2.55-million-ton-per-year LD shop with continuous bloom and slab casting facilities to the Ost Eisenhutten Kombinat, and the other was for modernization of the 520,000-ton-per-year steel plate mill at Ilsenburg, which was scheduled to undergo trial runs in February 1982.

A number of important commercial arrangements were concluded with Japan in 1981. Industrieanlagenimport contracted Hitachi Ltd., Nippon Steel Corp., and Mitsui and Co. to construct a 400,000-ton-per-year, cold-rolling sheet steel mill at the Ost Eisenhutten Kombinat. The project, valued at $65.5 million, had scheduled equipment deliveries in 1983 and startup by March 1985. A consortium of the Marubeni Corp. and Kubota Ltd. of Japan and Dyckehoff and Widmann AG of the FRG were contracted to build a $182 million, 53,000-ton-per-year foundry near Leipzig for the production of castings for trucks and agricultural machinery. The project was scheduled to come onstream in 1985; the Japanese companies agreed to provide materials and equipment, and the FRG was to provide engineering services. Industrieanlagenimport of the GDR had also contracted Toyo Engineering Corp. and Mitsui and Co. of Japan to provide a $186 million, 240,000-ton-per-year crude oil cracking plant for the Schwedt Petrochemical Kombinat. The plant, designed to produce fuel oil and gasoline, was scheduled for startup in 1984.

Trade with the United States during the first 6 months of 1981 declined by 25% in comparison with that of the same period during the previous year. The United States reported a $217 million trade surplus for this period. In the minerals-related sector, U.S. exports to the GDR consisted of spare parts for mining, drilling, and excavating machinery, and imports from the GDR included potash and machine tools.

GDR commercial relations outside of the CMEA and the Organization for Economic Cooperation and Development (OECD) areas included a tripartite arrangement between India's Mineral and Metals Trading Corp. and the GDR, Hungary, and

Yugoslavia for the shipment of 1.5 million tons of iron ore to the latter countries in 1981. An agreement was reached between Nigeria and the GDR Ernst Thaelmann heavy engineering Kombinat of Magdeburg for the supply of one wire rolling mill train and four steel rolling mill trains for a metallurgical enterprise that was under construction in Nigeria with U.S.S.R. aid. Also, an agreement was reported with Mozambique providing for GDR assistance in the development of the country's cement industry.

Table 3.—German Democratic Republic: Apparent exports of mineral commodities[1]

(Metric tons unless otherwise specified)

Ammonia	r12,098	53,626	--	West Germany 29,258; Spain 11,417; Italy 7,994.

See footnotes at end of table.

Table 3.—German Democratic Republic: Apparent exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980	Destinations, 1980	
			United States	Other (principal)
NONMETALS —Continued				
Graphite, natural	240	50	--	All to Yugoslavia.
Gypsum and plasters	[5]80,353	[5]78,604	--	Hungary 51,707.
Lime	[r]10,418	39,248	--	West Germany 37,212; Hungary 2,036.
Magnesite	--	530	--	Netherlands 430; Denmark 76.
Mica, worked including agglomerated splittings	2	4	--	Italy 3; Belgium-Luxembourg 1.
Precious and semiprecious stones:				
Natural value, thousands	$14	$10	$9	France $1.
Synthetic do.	$15	$1	$1	
Pyrite, unroasted	--	12,725	--	Greece 12,705.
Salt[5] thousand tons	1,232	1,210	--	Sweden 74; Finland 63.
Sodium and potassium compounds:				
Caustic potash	[r]1,976	2,405	--	Hungary 1,487; Finland 307; West Germany 289.
Caustic soda	[8]77,600	[8]137,000	--	Netherlands 65,085; Sweden 57,163.
Soda ash	[5]295,500	[5]311,500	--	Sweden 26,180; Hungary 21,137; Finland 19,054.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	[r]19,191	17,268	--	West Germany 16,615; Norway 428; Yugoslavia 200.
Worked	[r]28,157	27,013	--	West Germany 26,594; Netherlands 151; Norway 120.
Gravel and crushed rock	[5]296,918	[5]385,296	--	West Germany 327,291.
Limestone, except dimension	127,516	80,154	--	All to West Germany.
Sand excluding metal-bearing	[r]66,918	55,176	--	Austria 19,257; Yugoslavia 18,778; Hungary 15,578.
Sand and gravel[5] thousand tons	2,472	2,561	--	All to West Germany.
Sulfur:				
Elemental, other than colloidal	--	1	--	All to Sweden.
Sulfuric acid, oleum	[r 8]4,000	[8]20,500	--	Austria 5,163.
Talc	24	21	--	All to Yugoslavia.
Other:				
Crude	13,011	38,783	--	Denmark 24,446; United Kingdom 7,321; Hungary 5,549.
Slag, dross, and similar waste, not metal-bearing	[r]2,407	35,073	--	Finland 33,451; West Germany 862; Netherlands 600.
Oxides and hydroxides of strontium, barium, magnesium	1,049	1,475	--	Finland 715; Sweden 444; Italy 80.
Halogens	[r]546	792	--	Hungary 381; Switzerland 236; Italy 130.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	--	3	--	All to Finland.
Carbon black	[r]7,950	9,540	11	West Germany 5,642; United Kingdom 1,277; Bulgaria 895.
Coal and briquets:				
Anthracite and bituminous	285,000	300,366	--	Poland 300,000.
Briquets of anthracite and bituminous coal	462,037	537,493	--	Hungary 503,747; Denmark 33,734.
Lignite including briquets[5] thousand tons	1,806	2,212	--	West Germany 906; Czechoslovakia 369; Austria 195.
Coke and semicoke	[r]110,774	209,067	--	West Germany 149,494; Spain 35,651; Austria 17,113.
Gas, manufactured[5] million cubic feet	343	381	--	NA.
Hydrogen, helium, rare gases	16	20	--	West Germany 16; Finland 4.
Peat including briquets	[r]189	124	--	France 62; West Germany 51.
Petroleum refinery products:				
Gasoline thousand 42-gallon barrels	[5]3,340	[5]3,610	--	West Germany 2,337.
Kerosine do.	57	77	--	All to Hungary.
Distillate fuel oil do.	[5]6,932	[5]8,958	--	Mainly to West Germany.
Residual fuel oil do.	[r 5]5,562	[5]7,932	--	West Germany 4,608; Sweden 2,644.
Lubricants do.	[8]31	[8]60	--	Mainly to Austria and West Germany.

See footnotes at end of table.

COMMODITY REVIEW

METALS

In 1981, secondary recovery of industrial scrap and increased metallurgical refining remained the main development trends in the GDR ferrous and nonferrous industries. Approximately 30% of the available scrap in the GDR was used for about 10% of the country's overall raw material requirements. For key metals, the proportions of raw materials covered by scrap in 1981 were as follows: (1) Steel—70% to 75%, (2) copper—37%, (3) lead—46%, (4) zinc—20%, and (5) aluminum—18%.

The GDR Government has planned to increase these proportions to reduce the net import reliance for all metallic raw materials. Most of the country's economic reserves have been depleted, with domestic ore mining only partially covering the country's requirement for iron ore, copper, nickel, and tin. In the nonferrous scrap sector, however, the difficulty was that from 1976 to 1980 there was a decreasing trend for domestically collected scrap. Data collected for this period indicated that in 1980, when compared with that of the 1976 base year, collected lead scrap decreased by 2.9%, aluminum by 1.6%, copper by 4.9%, and zinc by 11.6%. The GDR was reported to have become a net importer of such material. Despite a set growth rate for nonferrous metal consumption, the collection and preparation of scrap and waste material was becoming increasingly difficult, and measures taken to improve the situation were both regulatory and technological.

In 1981, a law was passed requiring scrap-metal recovery quotas to be made part of the annual plans of the industrial Kombinats. The Kombinats would be obliged to contract scrap-metal deliveries to VEB Metallaufbereitung, a national organization responsible for scrap-metal allocation within the GDR and its export and import.

Some of the scrap processing technologies that were applied in 1981 were electromagnetic cable separation, cable processing after preliminary cryogenic separation, belt conveyors for manual sorting, installations for stocking and processing batteries, and copper extraction from saline-bath installations. For example, in 1981, the Liebewalde enterprise under VEB Metallaufbereitung, which handled cable scrap, reported the introduction of electrostatic separation, allowing the firm to reclaim 1,700 tons of copper and 420 tons of aluminum annually, and the use of cryogenic treatment reportedly allowed a 99% metal reclamation from cable.

In the GDR, most nonferrous metallurgical production was controlled by the Wilhelm Pieck Kombinat at Mansfield with copper and aluminum and their alloys constituting the main production elements. The Kombinat's responsibility covered the entire range of activity from mining to importing ores and concentrates, smelting, refining, and production of end-use products.

Aluminum.—Aluminum production changed little in respect to the previous year. The alumina production reported in GDR statistics was used for metallurgical purposes, and alumina used for abrasives, etc., constituted an estimated additional 20,000 tons per year. The bauxite raw material base came primarily from Hungary and Yugoslavia. The Wilhelm Pieck Kombinat in 1981 reported further progress on aluminum refining by means of continuous pouring of aluminum foil up to 1,600 millimeters in width—a process jointly developed with the U.S.S.R. Reportedly, a strip rolling technique that combined casting with hot rolling was claimed to have saved several production steps and decreased material consumption by 5.7% and electrical energy by 550 kilowatt-hours per ton of cold-rolled aluminum.

Copper.—Approximately 50% of the GDR copper requirement was supplied from domestic mining and secondary recovery of scrap. The rest of the demand was met by imports of copper cathode from the U.S.S.R. and concentrate from Western Europe; 70% of the copper production was earmarked for the electronics industry.

Copper mining at the Wilhelm Pieck Kombinat was reported to be an almost fully mechanized operation; between 8 and 10 kilograms of copper was extracted from each ton of ore produced at the Sangerhousen and Allstedt Mines. Mine economy has been decreasing owing to difficult mining conditions, but in 1981, losses were apparently limited to about 2% by the introduction of a slanted caving system.

In 1981, the use of continuous casting and rolling technology resulted in the production increase of 271,000 kilometers of fine copper wire in comparison with that of 1980. The increase was achieved without added material inputs. In 1982, the production of copper wire and thin-walled brass tubes was planned to increase by 88% and 47%, respectively.

Iron and Steel.—The GDR continued to mine small amounts of iron ore in 1981, but decreasing reserves were insufficient to meet national requirements. With scrap satisfying a large share of the domestic demand, about 25% of the demand was met by imports of iron ore and steel, mainly from the Soviet Union. The estimated production of raw steel showed a slight increase in 1981 over that of the previous year, and its production by process was about 9.3% by oxygen; 26.4%, electric; 62.9%, open hearth; and 1.4%, other.

In 1981, the GDR added several new projects and capacities to the steel industry. The Delitzsch enterprise near Leipzig began production of a highly refined trapezoid spring steel. This was the first time this type of special steel was to be manufactured in the GDR or in any of the CMEA countries. The enterprise planned to produce 1,000 tons of steel, which will help reduce its future import requirements.

At the Brandenburg Steel and Rolling Mill, a new 240-meter automated rolling train had been commissioned 7 months ahead of schedule and was the first of its kind in the GDR. Steel ingots were to be rolled into rod of 5 to 9 millimeters in diameter with an output speed of 70 meters per second. Owing to early startup, it was expected to produce 220,000 tons of structural steel in excess of the 1981 production target.

In 1981, the Eisenhutten Kombinat Ost tandem cold-rolling mill was less successful in achieving planned output targets and reportedly registered a shortfall in its production plan.

Lead and Zinc.—The GDR domestic lead ore reserves have been depleted, and mining has been discontinued. In 1981, the country had to meet a little over 50% of its demand for lead through imports, chiefly from the Soviet Union; some lead was also imported from Yugoslavia in the form of concentrate. Domestic production from secondary resources was mainly from battery scrap and about 5% to 10% from industrial scrap. Battery scrap together with slags and other lead-containing products were treated in a shaft furnace at the lead plant in the Freiberg Mining and Metallurgical Enterprise. Some byproduct lead was also recovered from the domestic copper ore.

All of the GDR primary zinc demand was met through imported concentrates, and the country's cadmium supply varied in proportion to the cadmium content in the imported zinc concentrates.

In 1981, the GDR reported the recovery of 200 tons of zinc from zinc sludge produced at the Siegfried Raedel synthetic silk factory in Pirna. Plans were announced to produce zinc from sludge derived from latex manufacture at the Fuerstenwalde lithopone plant. A reported 150,000 tons of sludge have been accumulated at the plant dump, and a potential recovery of 650 tons per year of zinc was estimated.

Nickel.—In 1981, nickel output from the country's mining operations and three smelters remained at approximately the 1980 level. Domestic production was modest and nickel had to be imported for industrial requirements. Reportedly, the GDR imported nickel-cobalt from Cuba and was active in that country's mining development.

In 1981, the Wilhelm Pieck Kombinat at Mansfeld installed equipment to process iron-bearing slag from copper smelting, and constituent cobalt and nickel were to be extracted from the slag.

Silver.—Silver was produced as a byproduct of the GDR nonferrous mining and metallurgical operations and was recovered, for example, from the country's mined copper ore together with lead, nickel, and other components. In 1981, approximately 1 ton of silver was recovered by reprocessing fixing-bath solutions and other industrial chemicals containing silver.

Tin.—The domestic mining and processing industry supplied 80% of the tin required by GDR. Technological advances in tin ore dressing and roasting as well as new extraction procedures in mining and gallery driving were credited with this development. Reportedly, completely new ore concentration equipment was put into operation for processing Altenberg ore in cooperation with the Novosibirsk tin complex of the U.S.S.R. Imported Soviet machinery was claimed to have significantly improved the efficiency of the concentrator, but no technical details were provided. It was further reported that by mid-1981, 1 million tons of 0.3% grade ore had been extracted and processed at the new Altenberg Mine and processing plant since their startup 3 years ago.

NONMETALS

The GDR nonmetallic mining enterprises provided the country with a variety of nonmetallic mineral in sufficient amounts to meet domestic as well as export needs. These commodities included fluorspar, barite, limestone, sand and gravel, chalk, salt, kaolin, and potash. Kaolin and potash were the most important of these minerals, both in terms of the scale of their mining output as well as for export. Nonmetals that the GDR had to import in large quantities were phosphatic fertilizer raw materials, asbestos, pyrite, and some clays such as bentonite.

Cement.—In 1981, the GDR reported construction work continuing on the second stage of its largest and most efficient foamed concrete plant, located at Hennersdorf in the Cottbus district. Continuous production trial runs of the first stage were begun in April. This facility was reported as largely mechanized and automated, and among other tasks, was to provide materials for the reconstruction of electric powerplants built 20 to 30 years ago.

Clays.—Although a number of clays in the GDR were near depletion and had to be imported, the GDR produced enough kaolin in 1981 to claim status as a major world producer. The VEB Silikatrohstoff Kombinat at Kemmlitz managed the silicate mining industry and controlled 5 enterprises that mined about 400,000 tons of raw kaolin per year from 16 opencast mines nearby. Despite this sizable output, the quality of the raw kaolin varied significantly owing to wide varieties and high concentrations of impurities in the mined product. In 1981, it was reported that often as much as 5 tons of raw kaolin was required to produce 1 ton of refined material. The geological conditions in the kaolin mining industry were reported to be growing more complex, and mining was becoming more difficult with overburden removal reaching 4 to 5 million cubic meters per year. Occasionally, 30-meter-thick rock covers had to be removed to expose the deposits. It was also reported that raw kaolin found beneath coal seams was extracted and processed.

Production of kaolin rose by 48% between 1970 and 1980, largely owing to mining facility modernization and expansion at Caminau in 1977. Processed kaolin was used for the production of porcelain and industrial ceramics.

Potash.—In 1981, the GDR remained a leading world producer of potash. The potash mining and processing industry, administered by the VEB Kombinat Kali, produced an average of 20,000 tons per day of potash product from 200,000 tons of crude salt. Apart from sylvinite, associated carnallite and kieserite were extracted from the salt and used in the construction and chemical industries. Moreover, it was planned to use byproduct magnesium chloride as a raw material for the production of magnesium metal and magnesia. In 1981, the potassium chloride content in the mined rock was about 20% and was expected to decline in the future. Consequently, improved extraction and processing of potash byproducts from the mine materials as well as from overburden has been planned. The Rossleben potash works was already reported processing kieserite and bromine in 1981.

In 1981, there were no new planned mining operations reported for the long or short term, and the most important development in the industry during the year was the commissioning in January of the 110-ton-per-hour granulation unit at Zielitz. The plant utilizing Komarek Greaves technology was constructed by Klöckner Werke AG of the FRG.

The GDR exported over two-thirds of its potash. In Western Europe, the United Kingdom was the principal importer; in Eastern Europe, Czechoslovakia; in the Western Hemisphere, Brazil; and in Asia and Africa, India was the chief importer of GDR potash.

MINERAL FUELS

Lignite was the principal domestic energy resource of the GDR. In 1981, the proportion of domestic and imported coal in the country's total energy balance amounted to about 65%, and was planned to increase to 67% by 1985. The country produced minimal amounts of natural gas and petroleum and had to import over 90% of its requirements for these two fuels.

About 80% of GDR energy import requirements were covered by Soviet exports. Imports of Soviet oil alone were equal to roughly one-third of the proceeds from GDR exports to the Soviet Union and formed the chief basis for the GDR incurred debt to that country. To reduce this reliance on imported oil, the GDR short-term energy policy was to minimize energy imports where possible, to increase conservation and efficient use of fuels in industry, and to maximize reliance on domestic lignite re-

sources. To achieve some of these goals, the GDR transportation plan for 1981-85 stipulated more efficient and greater use of railroad and river transportation and less reliance on more energy-intensive truck-based transportation. Also, the amount of petroleum exports from the U.S.S.R. decreased by about 2 million tons from the planned import volume.

The GDR long-term energy objective has been to gradually convert the country's lignite and hydrocarbon fuel base to a nuclear one. By the end of 1980, nuclear energy accounted for 12% of the total electric power generated that year, a 1.9% increase over that of 1979. Coal-generated electric power (including lignite briquets and hard coal) was 79.2% of the total, down 1.7% from that of the previous year. Other sources of power generated in 1980 amounted to about 8.8%.

Table 5.—German Democratic Republic: Primary energy balance for 1980 and 1981

(Million tons of standard coal equivalent)[1]

Year	Total primary energy	Coal (lignite, brown, bituminous)	Crude oil and petroleum products	Natural and associated gas	Hydroelectric power	Nuclear power
1980:						
Production[2]	98.1	85.3	.1	11.4	.2	1.1
Exports	.8	.7	--	--	.1	--
Imports	49.8	9.7	31.2	8.7	.2	--
Apparent consumption	147.1	94.3	31.3	20.1	.3	1.1
1981:						
Production[2]	101.2	88.1	.1	11.4	.2	1.4
Exports	.9	.8	--	--	.1	--
Imports	49.8	9.6	31.3	8.7	.2	--
Apparent consumption	150.1	96.9	31.4	20.1	.3	1.4

[1]One ton standard coal equivalent (SCE)=7,000,000 kilocalories. Conversion factors used follow: Hard coal, 1.0; lignite and brown coal, 0.33; crude oil, 1.47; natural gas, 1.33 (per 1,000 cubic meters); and hydroelectric and nuclear power, 0.123 (per 1,000 kilowatt-hours).

[2]Production is taken from production table.

Coal.—The GDR lignite mining industry was administered by the Ministry of Coal and Energy and organized into seven Kombinats (mining complexes): Senftenberg, "Geiseltal" Grosskayna, "Glueckauf" Knappenrode, Regis, "Erich Weinert" Deuben, Bitterfeld, and Borna. Lignite mining was centered in two major fields, the Eastern-Elbe Field near the Cottbus district and the Western-Elbe Field near Leipzig. Over 50% of the total lignite mined in the GDR orignated from the 13 open pit mines of the Senftenberg Kombinat in the Eastern-Elbe Field.

In 1981, lignite production exceeded the planned output quota for the year. The lignite was strip mined, and to insure greater output, the industry increased its reliance on large-capacity excavators produced by the TAKRAF Kombinat. Swinging rotary bucket SRS 1300 excavators were used, with an 80,000-cubic-meter-per-day overburden output. The strip mine in the Groitzscher Triangle area was reported to be using a 1,600-ton rotary bucket excavator with program control for automatic operation, and at the Griefenhan Mine, a SRS 6300 was in operation with a 14,000-cubic-meter-per-hour overburden handling capacity. Each year the amount of overburden that had to be removed increased, and in 1980-81, the average amount that was to be removed was 4.7 cubic meters per ton of recovered coal. By 1990, this amount was forecast to reach about 6.0 cubic meters per ton of mined coal.

To effectively handle the increasing volume of overburden and coal, the GDR planned an increase in the share of belt conveyers to 90% at new mines commissioned by 1990. In 1981, overburden conveyer bridges constituted 53% of the haulage; belt conveyers, 20%; and locomotive haulage, 27%.

In 1981, GDR reported the startup of two lignite mines; the Zwenkau Mine south of Leipzig in July and the Cottbus North Mine in April. The Zwenkau Mine was reported to have seams up to 15 meters thick and a good overburden-to-coal ratio of 2.5 cubic meters per ton. The Cottbus North Mine produced about 1 million tons of lignite in 1981 and was scheduled to supply the Jaenschwalde coal-fired electric power sta-

tion with fuel. Also, work was reported to have begun at the Graebendorf Mine near Cottbus.

Increasingly unfavorable ground water conditions were reported to be affecting lignite mining. In 1981, over 10,000 vertical filter wells were collecting water, which was then removed by submersible motor pumps, and in 1980, a reported average of 6 cubic meters of water per ton of coal had to be pumped out. During the 1980's, this amount had been estimated to reach 8 to 10 cubic meters per ton with an ensuing rise in production costs.

To achieve production targets, the GDR had planned the reduction of mine development and startup time from 6 to 8 years to 3 to 4 years. It was planned, furthermore, to use robots for repair work; a highly labor-intensive facet of the lignite industry occupying about 30% of the industry's personnel.

Natural Gas and Petroleum.—The GDR produced very little domestic petroleum and natural gas and had to import over 90% of its requirements for this fuel. Offshore petroleum development at Usedom Island and along the northern coast was reported to have made modest gains in the 1970's, but the last estimated production figure for these fields for 1977 was about 7,000 barrels per day.

The GDR had a substantial petrochemical industry, and the most important project during 1981 was the extensive reconstruction of the Schwedt refinery. This included the overhaul of the No. 3 crude distillation plant and the replacement of 30 kilometers of pipeline and 1,800 fittings. New capacities were also added at the Schwedt refinery, such as the 611,000-metric-ton-per-year gasoline unit as well as alkylate and benzene units. The construction was contracted to Creusot-Loir and SC Grande Paroisse, and completion scheduled for 1982.

Nuclear Power.—Nuclear energy development in the GDR, based on a number of bilateral agreements with the U.S.S.R., provided the GDR with enriched nuclear fuel, reactor equipment, expert Soviet assistance in plant assembly, etc.

The GDR first nuclear reactor built with Soviet assistance was constructed and put into operation near Rheinsberg in 1966; its power output was rated at 75 megawatts. The construction of the second and much larger Bruno Leuschner atomic powerplant began in 1967 in Lubin near Greifswald. It was supplied with four 440-megawatt Novo Voronezh type reactor blocks (VVEhR-440). The first block was installed in 1973, the second in 1974, the third in 1978, and the fourth in 1981. In addition, four more reactor blocks had been planned for the Leuschner plant for a total capacity of 3,520 megawatts. A third nuclear powerplant, supplied with 1,000-megawatt reactor blocks, had been reported under construction at Stendal; however, its completion date was not published. A fourth nuclear powerplant was planned but no details were provided. The GDR Government's stated plan was to make nuclear energy the mainstay of the country's energy base by the end of the century.

[4]The GDR mark (M) is a nonconvertible currency officially fixed at 1:1 with the West German Deutsche mark (DM). Western banks, however, exchange the currencies at the rate of 4M-5M=1DM. The GDR mark's relation to the U.S. dollar is based upon the fluctuation of the dollar-DM ratio. Foreign trade figures are denoted in an accounting unit known as the valuta mark (VM). The rate of dollars to valuta marks is US$1.00=3.11VM.

[6]The Council for Mutual Economic Assistance (CMEA) was founded in 1949. The current member states are Bulgaria, Cuba, Czechoslovakia, the German Democratic Republic, Hungary, Mongolia, Poland, Romania, the U.S.S.R., and Vietnam. Yugoslavia was accorded permanent observer status in 1965.

The Mineral Industry of the Federal Republic of Germany

By Joseph B. Huvos[1]

In 1981, for the first time in 6 years, the gross national product (GNP) of the Federal Republic of Germany (FRG) decreased 0.3% in real terms (an increase of 3.8% at current prices) to $691 billion;[2] but there was a foreign trade surplus of almost $12 billion, a favorable sign for 1982 economic performance, and the rate of unemployment was only 5.5% in 1981.

The FRG remained one of the world's major processors and consumers of minerals, most of which were imported. Only coal, potash, and salt were available domestically in sufficient quantities. National efforts remained focused, as previously, on securing and expanding raw material supply by encouraging development of domestic resources, concluding trade agreements, and encouraging exploration, development, and production of raw materials abroad. The contributions of the individual sectors of the mining and minerals processing industries to the GNP and employment in 1980 and 1981 are shown in the following tabulation:

	Contribution to gross national product (million dollars)[1]		Employment at end of 1981 (thousand persons)
	1980	1981[p]	
Coal mining	12,709	9,712	211
Stones and earths	15,808	10,841	184
Iron and steel	25,093	17,896	273
Nonferrous metals	13,399	8,587	78
Chemicals including petroleum	66,911	51,445	565
Total	133,920	[2]98,481	1,311

[p]Preliminary.
[1]Does not include value added tax.
[2]1.4% of the GNP.

Source: Adapted from Statistisches Bundesamt, Wiesbaden. Wirtschaft und Statistik, No. 2, 1982, p. 83.
NOTE: Apparent decrease in output was due to a substantial change in the exchange rate of the Deutsche mark.

Important events in 1981 in the minerals industry of the FRG were few because of the slow performance of the economy. To be noted were negotiations to form a new steel giant, Ruhrstahl AG, transfer of Kali Chemie AG's potash mine to Kali und Salz AG, authorization by the FRG Government to build three new nuclear powerplants, and signature by Ruhrgas AG of a preliminary agreement to import 10.5 billion cubic meters of natural gas from the Soviet Union.

PRODUCTION

In 1981, mining production increased 0.8%, while processing and raw materials production decreased 3.3%. Production of minerals for 1977 through 1981 is shown in table 1.

Bitumen do	22,421	22,866	23,756	20,406	NA
Unspecified do	86,999	[e]76,555	97,846	89,758	NA
Refinery fuel and losses do	46,253	54,362	99,807	91,557	NA
Total do	772,118	788,458	953,360	874,557	NA

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through July 7, 1982.

[2]Reported figure.

[3]Primary nickel and nickel contained in ferronickel, Monel metal, and nickel oxide directly used by the steel industry.

TRADE

The country's trade surplus increased sharply during 1981, contributing substantially to the GNP. Members of the European Communities remained the FRG's principal trading partners, and members of the Organization of Petroleum Exporting Countries were also important. The FRG's mineral commodity trade in 1979-80 is shown in tables 2 and 3.

Table 2.—Federal Republic of Germany: Exports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1979[r]	1980	Destinations, 1980	
			United States	Other (principal)
METALS				
Aluminum:				
Bauxite	21,985	22,645	--	France 7,022; Belgium-Luxembourg 5,759; Finland 2,789.
Alumina	298,443	333,433	2,597	East Germany 73,948; U.S.S.R. 57,338; Austria 49,079; Poland 36,458.
Hydroxides	156,986	145,504	7,094	Switzerland 44,607; France 19,750; Netherlands 19,213.
Metal including alloys:				
Scrap	52,223	69,144	--	Italy 28,678; Netherlands 17,926; France 12,833.
Unwrought	247,866	223,680	3,707	Italy 71,617; France 57,500; Netherlands 31,764.
Semimanufactures	364,791	385,544	3,361	France 74,244; United Kingdom 41,477; Italy 40,797.
Antimony:				
Oxides and hydroxides	372	261	--	Switzerland 30; Taiwan 29; Netherlands 28.
Metal including alloys, all forms	16	47	--	Italy 26.
Arsenic: Trioxide, pentoxide, acid	166	1,010	--	United Kingdom 673; Netherlands 105.
Beryllium metal including alloys, all forms kilograms	17	58	--	United Kingdom 22; Netherlands 13.
Bismuth metal including alloys, all forms	407	316	53	Yugoslavia 86; United Kingdom 58; Italy 30.
Cadmium:				
Oxides and hydroxides	22	28	--	Yugoslavia 15.
Metal including alloys, all forms	494	300	NA	NA.
Chromium:				
Chromite	8,807	5,412	--	Netherlands 1,357; France 956; Romania 890.
Oxides and hydroxides	55,688	49,744	NA	NA.
Metal including alloys, all forms	224	275	46	Italy 66; Netherlands 44; Belgium-Luxembourg 36.
Cobalt:				
Oxides and hydroxides	45	88	--	Italy 43; Czechoslovakia 14.
Metal including alloys, all forms	847	821	NA	NA.
Columbium and tantalum metals including alloys, all forms:				
Columbium	42	90	NA	NA.
Tantalum	81	97	NA	NA.
Copper:				
Ore and concentrate	--	8	NA	NA.
Ash and residue containing Cu	28,150	26,508	--	East Germany 12,682; Austria 9,128.
Matte	96	617	--	Belgium-Luxembourg 369; Switzerland 210.
Oxides and hydroxides	2,814	2,174	209	Netherlands 249; France 204; Denmark 168.
Sulfate	1,452	943	NA	East Germany 6.
Metal including alloys:				
Scrap	72,986	86,810	39	Italy 25,089; East Germany 19,978; France 11,725.
Unwrought:				
Smelter	22,384	24,976	--	United Kingdom 24,694.
Refined:				
Alloyed	11,152	12,534	--	Italy 5,589; France 2,080; Turkey 1,535.
Unalloyed	99,599	76,270	--	Belgium-Luxembourg 17,935; France 9,466; United Kingdom 7,548.
Masteralloys	1,068	1,534	--	East Germany 563; Belgium-Luxembourg 508; France 279.
Semimanufactures	358,345	353,785	23,165	Netherlands 46,038; France 41,009; Switzerland 35,258.

Table 2.—Federal Republic of Germany: Exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1979[r]	1980	Destinations, 1980	
			United States	Other (principal)
METALS —Continued				
Gallium metal including alloys, all forms kilograms	5,400	4,200	500	Japan 1,100; Switzerland 1,000; United Kingdom 900.
Germanium metal including alloys, all forms do	1,300	700	--	United Kingdom 400; North Korea 300.
Gold:				
Ash and waste value	$1,637	$53,914	--	Netherlands $50,613.
Scrap and sweepings value, thousands	$701	$2,760	--	Switzerland $2,028.
Metal including alloys:				
Unwrought thousand troy ounces	739	786	6	United Kingdom 243; Switzerland 211; Belgium-Luxembourg 93.
Partly wrought do	138	96	1	United Kingdom 23; Italy 10; France 9.
Iron and steel:				
Ore and concentrate	3,996	4,467	--	Belgium-Luxembourg 1,426; East Germany 655; Greece 614.
Roasted pyrites	236,795	156,829	--	Belgium-Luxembourg 115,392; Austria 22,873.
Metal:				
Scrap thousand tons	3,073	3,174	(2)	Italy 2,315; Belgium-Luxembourg 298; East Germany 97.
Pig iron including cast iron do	959	1,033	--	France 416; Italy 188; Poland 90; East Germany 31.
Sponge iron, powder, shot do	38	39	1	France 8; Italy 6; Switzerland 6.
Spiegeleisen	1,752	4,763	--	Italy 2,235; France 1,197; Switzerland 650.
Ferroalloys:				
Ferrochrome	27,726	33,524	4,716	France 12,514; Belgium-Luxembourg 7,789.
Ferromanganese	95,818	36,762	--	Italy 9,015; France 6,394; Belgium-Luxembourg 6,228.
Ferronickel	422	86	--	Belgium-Luxembourg 39.
Ferrosilicon	31,553	55,714	206	Belgium-Luxembourg 13,892; France 9,938; Austria 2,723.
Ferrosilicochrome	3,583	1,417	--	Belgium-Luxembourg 544; Italy 498; France 237.
Ferrosilicomanganese	3,590	5,598	--	Italy 2,040; France 2,007.
Others	16,339	13,802	1,414	France 3,828; Austria 1,684; Romania 1,523.
Steel, primary forms thousand tons	3,695	3,722	293	France 646; Italy 428; United Kingdom 286; East Germany 141.
Semimanufactures:				
Bars, rods, angles, shapes, sections do	3,874	3,788	169	France 757; Netherlands 498; Switzerland 242.
Universals, plates, sheets do	6,686	6,750	481	U.S.S.R. 1,349; France 708; United Kingdom 463.
Hoop and strip do	1,335	1,529	32	U.S.S.R. 274; France 188; Netherlands 138.
Rails and accessories do	239	219	45	Italy 42; Netherlands 30; India 20.
Wire do	355	334	13	France 61; Netherlands 48; Belgium-Luxembourg 28.
Tubes, pipes, fittings do	3,558	3,191	124	U.S.S.R. 861; Netherlands 374; France 159.
Castings and forgings, rough do	117	121	6	Netherlands 16; France 15; Belgium-Luxembourg 13.
Lead:				
Ore and concentrate	2,577	2,000	--	All to Bulgaria.
Oxides and hydroxides	10,648	11,810	42	Netherlands 3,506; U.S.S.R. 2,100; Sweden 1,562.
Metal including alloys:				
Scrap	19,964	20,041	--	Italy 7,036; Netherlands 5,259; Denmark 2,785.
Unwrought	107,431	98,780	938	Italy 39,674; Austria 19,199; France 14,220.
Semimanufactures	4,974	18,254	32	Belgium-Luxembourg 4,832; Denmark 3,794; Switzerland 1,439.
Lithium:				
Oxides and hydroxides	717	859	--	France 276; Italy 221; Belgium-Luxembourg 175.
Metal including alloys, all forms	12	23	--	Switzerland 16; France 6.

See footnotes at end of table.

NONMETALS				
Abrasives, n.e.s.:				
Natural: Pumice, emery, corundum, etc	426,761	491,496	--	Netherlands 445,714; Belgium-Luxembourg 35,323.
Artificial:				
Corundum	55,046	59,294	1,549	Italy 10,927; Austria 6,657; France 4,785; East Germany 3,484.
Silicon carbide	28,480	26,445	NA	NA.
Dust and powder of precious and semiprecious stones, kilograms	414	564	70	Brazil 180; Greece 139; Austria 95.
Grinding and polishing wheels and stones	11,853	13,202	546	France 1,191; Switzerland 931; Austria 778.
Asbestos, crude	65,366	27,334	NA	NA.
Barite and witherite	42,261	45,746	--	France 9,380; Nigeria 7,130; Czechoslovakia 3,707.
Boron materials:				
Crude natural borates	11,589	11,045	--	Switzerland 3,235; Belgium-Luxembourg 2,581; Norway 1,450.
Oxides, acid, borates, perborates	41,489	42,382	--	Switzerland 18,720.
Bromine, elemental	13	11	NA	NA.
Cement, thousand tons	2,397	2,216	(2)	Netherlands 1,599.
Chalk	22,538	27,734	--	Switzerland 9,585; Denmark 6,702; Finland 6,418.
Clays and clay products:				
Crude:				
Andalusite and kyanite	9,512	9,490	--	Austria 3,695; Italy 2,998.
Bentonite	26,250	29,755	--	France 13,374; Belgium-Luxembourg 5,291; Netherlands 5,160.
Ceramic clay	776,003	843,902	--	Italy 310,103; Netherlands 215,887; Belgium-Luxembourg 135,517.
Chamotte	45,618	54,202	--	Netherlands 26,198; Italy 8,132; Switzerland 5,200.
Dinas earth	60,770	65,110	--	France 26,255; Italy 10,143; Switzerland 7,756.
Fire clay	283,985	302,716	--	Italy 100,140; Netherlands 75,390; Belgium-Luxembourg 52,332.

See footnotes at end of table.

Clays and clay products —Continued				
Crude —Continued				
Fuller's earth	3,411	5,220	--	Netherlands 2,558; France 1,262; East Germany 275.
Kaolin	114,578	102,004	--	Italy 30,422; Austria 19,115; Belgium-Luxembourg 13,302.
Other	235,133	389,858	21,665	Czechoslovakia 55,112; Netherlands 26,699; France 23,817.
Products:				
Nonrefractory	846,738	829,754	11,150	France 250,195; Belgium-Luxembourg 141,228; Netherlands 102,977.
Refractory including nonclay brick	647,200	669,801	12,220	France 88,327; Netherlands 40,528; Italy 38,784.
Cryolite and chiolite, natural	58	38	NA	NA.
Diamond:				
Gem, not set or strung thousand carats	113	113	6	Belgium-Luxembourg 38; Switzerland 27; United Kingdom 9.
Industrial do	296	228	10	Ireland 82; Belgium-Luxembourg 52; Switzerland 18.
Diatomite and other infusorial earth	5,137	3,210	--	Netherlands 970; East Germany 697; United Kingdom 556.
Feldspar, leucite, nepheline, nepheline syenite	17,802	18,923	--	France 6,787; Italy 3,802; Belgium-Luxembourg 2,070.
Fertilizer materials:				
Crude:				
Phosphatic	952	1,555	--	Switzerland 1,009; Netherlands 233.
Potassic	49,296	38,585	--	Belgium-Luxembourg 19,038; United Kingdom 12,082.
Manufactured:				
Nitrogenous thousand tons	1,619	1,344	21	Belgium-Luxembourg 527; France 116; India 112.
Phosphatic do	54	58	--	France 22; Austria 11.
Potassic do	2,475	2,554	32	Belgium-Luxembourg 773; India 274; Netherlands 130.
Other including mixed do	892	756	(2)	France 150; Austria 135; Belgium-Luxembourg 124.
Ammonia do	242	238	--	Denmark 158; France 38; United Kingdom 27.
Fluorspar	16,609	14,098	--	Austria 5,834; Netherlands 2,966; Yugoslavia 1,783.
Graphite, natural	7,352	8,039	745	Italy 1,826; East Germany 843; France 673; Turkey 558.
Gypsum and plasters	356,984	390,963	--	Netherlands 232,262; Switzerland 48,517; Belgium-Luxembourg 45,873.
Iodine, elemental	46	76	--	Italy 32; France 20.
Lime	573,377	473,949	--	Netherlands 371,958; France 59,615.
Magnesite	20,445	18,547	107	France 4,543; Canada 2,008; Italy 1,894.
Mica:				
Crude including splittings and waste	642	661	--	Austria 212; Yugoslavia 64.
Worked including agglomerated splittings	332	254	--	United Kingdom 65; Australia 22; Yugoslavia 21.
Pigments, mineral:				
Natural, crude	29	85	NA	NA.
Iron oxides, processed	170,421	157,656	19,538	France 23,917; Italy 12,546; United Kingdom 11,964.
Precious and semiprecious stones other than diamond:[4]				
Natural kilograms	169,068	259,099	9,381	China 62,026; Italy 25,420; Austria 24,678.
Synthetic do	26,380	21,995	1,926	Japan 9,518; Netherlands 2,583; Italy 2,434.
Pyrites, gross weight	1,238	968	NA	NA.
Salt and brine thousand tons	2,499	1,841	(2)	Belgium-Luxembourg 1,177; Sweden 263.
Sodium and potassium compounds, n.e.s.:				
Caustic potash including sodic and potassic peroxides do	14	15	NA	NA.
Caustic soda do	1,379	826	24	Netherlands 192; Austria 97; Sweden 63.
Soda ash	218,582	215,524	--	Brazil 21,018; Saudi Arabia 20,816; Italy 15,942.

See footnotes at end of table.

(Metric tons unless otherwise specified)

Commodity	1979[r]	1980	Destinations, 1980	
			United States	Other (principal)
NONMETALS —Continued				
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked:				
Calcareous	5,230	8,813	--	Italy 5,044; Austria 1,188.
Slate	12,556	10,458	--	Denmark 4,134; Netherlands 3,076.
Other	628,865	854,521	--	Netherlands 743,464; Switzerland 83,657.
Worked:				
Slate	1,139	978	--	Netherlands 350; Belgium-Luxembourg 166.
Paving and flagstone	14,917	11,177	--	Denmark 6,051; Belgium-Luxembourg 2,193.
Other	21,884	24,620	43	Belgium-Luxembourg 5,692; Netherlands 3,959; Switzerland 3,675.
Dolomite, chiefly refractory-grade	279,055	302,654	--	France 151,163; Netherlands 108,311; Belgium-Luxembourg 29,831.
Gravel and crushed rock thousand tons	9,264	8,923	--	Netherlands 6,975; Belgium-Luxembourg 732.
Limestone except dimension	80,157	72,917	--	Netherlands 54,287; Belgium-Luxembourg 15,327.
Quartz and quartzite	121,887	122,878	104	Belgium-Luxembourg 57,147; Netherlands 15,259; Austria 12,807.
Sand excluding metal-bearing thousand tons	8,112	7,744	2	Netherlands 6,277; Belgium-Luxembourg 855.
Sulfur:				
Sulfates, natural: Magnesium sulfate (kieserite)	512,916	497,536	20,922	Norway 87,722; Singapore 86,572; France 68,814.
Elemental:				
Other than colloidal	356,669	394,400	--	Netherlands 109,590; Denmark 78,783; Switzerland 47,235.
Colloidal	1,238	952	--	Italy 507; Czechoslovakia 48.
Dioxide	25,687	35,567	--	East Germany 22,842; Netherlands 3,395; Belgium-Luxembourg 2,958; Sweden 2,071.
Sulfuric acid, oleum	841,669	624,343	--	Netherlands 203,859; Belgium-Luxembourg 137,143; France 73,595.
Talc, steatite, pyrophyllite	6,332	6,137	--	Yugoslavia 1,638; Belgium-Luxembourg 526; East Germany 513; United Kingdom 422.
Other:				
Crude:				
Pottery, broken	38,504	33,523	--	Netherlands 14,591; Switzerland 6,885; Austria 4,883.
Vermiculite, perlite, chlorite	4,403	5,183	--	Belgium-Luxembourg 3,868; Austria 402.
Unspecified thousand tons	1,296	1,635	--	Netherlands 1,383.
Slag, dross, similar waste, not metal-bearing:				
From iron and steel manufacture do	2,658	2,630	--	Netherlands 2,480.
Unspecified do	702	718	--	Netherlands 565; France 92.
Oxides and hydroxides of barium and strontium	3,633	2,968	1,131	France 525; Belgium-Luxembourg 446.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	201,190	168,505	NA	NA.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	6,552	4,104	--	Austria 1,015; Belgium-Luxembourg 499; Sweden 277.
Carbon black	126,545	138,360	686	France 23,671; East Germany 16,491; Poland 14,452; Austria 14,198.
Coal and briquets:				
Anthracite and bituminous coal thousand tons	15,607	12,369	--	France 5,254; Italy 2,545; Belgium-Luxembourg 2,241.

See footnotes at end of table.

Table 2.—Federal Republic of Germany: Exports of mineral commodities[1] —Continued

Commodity	1979[r]	1980	Destinations, 1980	
			United States	Other (principal)
MINERAL FUELS AND RELATED MATERIALS —Continued				
Coal and briquets —Continued				
Briquets of anthracite and bituminous coal thousand tons	391	357	--	France 105; United Kingdom 95; Belgium-Luxembourg 87.
Lignite including briquets do	718	877	--	France 193; Belgium-Luxembourg 192; Netherlands 167.
Coke and semicoke do	11,656	8,163	--	Belgium-Luxembourg 2,916; France 2,342; East Germany 898; Netherlands 561.
Gas, hydrocarbon:				
Natural million cubic feet	217,289	345,325	NA	NA.
Manufactured do	39	32	--	All to Switzerland.
Hydrogen, helium, rare gases	23,097	24,807	(2)	Italy 9,726; France 3,648; Austria 3,113; East Germany 1,387.
Peat including briquets and litter	497,431	507,005	--	Netherlands 321,778; France 55,071; Switzerland 52,649.
Petroleum and refinery products:				
Crude and partly refined thousand 42-gallon barrels	7,797	9,080	--	East Germany 8,573; Netherlands 254; Mozambique 252.
Refinery products:				
Gasoline:				
Aviation[5] do	35	80	--	Turkey 63.
Motor do	6,254	8,711	219	Austria 2,371; Switzerland 1,963; Sweden 1,597.
Kerosine do	168	21	--	Austria 6; Australia 3; Sweden 3.
Jet fuel[6] do	10,022	11,508	--	France 1,130; Norway 589.
Distillate fuel oil[7] do	7,043	10,813	--	Switzerland 2,598; Netherlands 1,928; Austria 1,448.
Residual fuel oil[8] do	19,391	20,803	--	France 2,374; Netherlands 2,182; Austria 2,083.
Lubricants do	274	233	(2)	Denmark 111.
Other:				
Liquefied petroleum gas do	4,308	4,988	--	Netherlands 1,177; Italy 977; Belgium-Luxembourg 835.
Mineral jelly and wax do	1,103	1,038	19	Italy 94; Netherlands 90; Austria 75.
Nonlubricating oils do	8,335	5,188	70	France 2,189; Netherlands 932; Belgium-Luxembourg 650.
Petroleum coke do	2,281	1,994	--	Netherlands 571; France 327; Switzerland 263; East Germany 127.
Bitumen and other residues do	2,127	2,063	--	Austria 775; Denmark 345; Switzerland 318.
Bituminous mixtures do	457	268	--	Netherlands 173; Austria 28.
Unspecified do	799	717	(2)	Netherlands 160; Belgium-Luxembourg 147; France 57.
Mineral tar and other coal-, petroleum-, and gas-derived crude chemicals	350,158	337,091	NA	Netherlands 223,106; Italy 14,072.

[r]Revised. NA Not available.

[1]The revised figures for 1979 reflect the inclusion in this table of the Federal Republic of Germany's shipments of the reported commodities to the German Democratic Republic. These data had not been included in previous editions of the Minerals Yearbook.

[2]Less than 1/2 unit.

[3]Includes elemental sodium and potassium.

[4]May include some diamond shipped to the German Democratic Republic.

[5]Includes 16,296 barrels of bunker loadings in 1979.

[6]Includes 8,744,192 barrels of bunker loadings in 1979 and 9,024,480 barrels in 1980.

[7]Includes 1,434,931 barrels of bunker loadings in 1979 and 1,614,680 barrels in 1980.

[8]Includes 40,786 barrels of bunker loadings in 1979 and 8,787,237 barrels in 1980.

Scrap	1,098	1,250	78	Netherlands 430; Sweden 207; Denmark 141.
Unwrought	32,340	31,131	8,029	Norway 15,131; Italy 3,694; France 1,784.
Semimanufactures	500	347	83	Austria 168; Norway 43.

See footnotes at end of table.

Table 3.—Federal Republic of Germany: Imports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1979[r]	1980	Sources, 1980	
			United States	Other (principal)
METALS —Continued				
Manganese:				
Ore and concentrate thousand tons	717	490	(2)	Republic of South Africa 326; Australia 81.
Oxides and hydroxides	5,462	5,059	109	Belgium-Luxembourg 2,507; Greece 920; Ireland 740.
Metal including alloys, all forms	5,848	5,731	1,395	Republic of South Africa 2,651; Netherlands 863.
Mercury 76-pound flasks	13,373	12,659	577	China 3,142; Spain 2,854; U.S.S.R. 2,396.
Molybdenum:				
Ore and concentrate	22,065	18,087	8,700	Canada 2,340; Peru 1,428; Chile 1,331.
Oxides and hydroxides	515	453	48	Netherlands 264; Belgium-Luxembourg 65.
Metal including alloys, all forms	797	1,101	189	Austria 667.
Nickel:				
Ore and concentrate	34	39	--	U.S.S.R. 29.
Matte, speiss, similar material	15,746	14,116	15	Austria 8,705; Cuba 2,753; Canada 2,643.
Oxides and hydroxides	612	391	26	Canada 256; Netherlands 50; France 25.
Metal including alloys:				
Scrap	6,505	7,551	2,134	France 1,672; Netherlands 813; United Kingdom 594.
Unwrought	47,708	39,329	2,588	Canada 6,957; U.S.S.R. 6,411; United Kingdom 4,046.
Semimanufactures	6,325	6,723	676	France 3,227; United Kingdom 1,025.
Platinum-group metals:				
Ash and waste: Platinum value, thousands	$2,580	$2,482	$463	Canada $412; Switzerland $349; Austria $338.
Waste and sweepings: Platinum do	$30,034	$71,058	$17,618	Netherlands $13,852; Belgium-Luxembourg $6,624; Hungary $6,058.
Metals including alloys, unwrought and partly wrought:				
Platinum troy ounces	509,667	416,969	94,904	United Kingdom 113,946; Switzerland 78,908; U.S.S.R. 51,591.
Paladium do	382,027	367,909	52,862	U.S.S.R. 175,273; United Kingdom 58,890; Switzerland 45,446.
Others do	113,898	120,025	48,548	Republic of South Africa 42,785; United Kingdom 13,228.
Rare-earth metals:				
Oxides and other compounds	1,196	904	319	France 274; United Kingdom 171; Austria 126.
Metals, all forms	107	60	NA	NA.
Silicon, elemental	59,236	55,132	(2)	Norway 14,222; France 13,642; Switzerland 6,066.
Silver:				
Ash and waste value, thousands	$20,752	$41,125	$20,816	Switzerland $6,036; United Kingdom $3,984.
Waste and sweepings do	$20,602	$78,265	$13,907	Switzerland $14,123; United Kingdom $12,209; Hong Kong $8,113.
Metal including alloys, unwrought and partly wrought thousand troy ounces	42,542	35,661	5,135	Sweden 5,965; North Korea 2,250; Mexico 1,974.
Tin:				
Ore and concentrate	7,158	3,343	--	United Kingdom 2,360; Bolivia 819.
Oxides and hydroxides	30	36	--	Italy 16; France 11.
Metal including alloys:				
Scrap	340	324	28	Netherlands 86; Switzerland 83; Yugoslavia 32.
Unwrought	17,098	18,304	50	Indonesia 6,182; Thailand 5,222; Malaysia 2,872.
Semimanufactures	1,684	1,541	--	Netherlands 1,446.
Titanium:				
Ore and concentrate	574,005	484,902	--	Norway 334,575; Canada 97,364; Australia 30,533.
Oxides and hydroxides	21,916	18,329	809	Belgium-Luxembourg 9,196; France 2,713; United Kingdom 2,354.
Metal including alloys, all forms	3,836	4,878	613	Japan 2,519; U.S.S.R. 808.
Tungsten:				
Ore and concentrate	4,097	2,931	45	China 1,136; Canada 459; Australia 414.
Oxides and hydroxides	294	127	--	Austria 110.
Metal including alloys, all forms	831	970	96	Austria 422; United Kingdom 127.

See footnotes at end of table.

Table 3.—Federal Republic of Germany: Imports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1979[r]	1980	Sources, 1980	
			United States	Other (principal)
METALS —Continued				
Uranium and thorium:				
Oxides	416	910	1	U.S.S.R. 877.
Metal including alloys, all forms	2	16	--	United Kingdom 15.
Vanadium:				
Oxides and hydroxides	710	1,382	--	China 425; United Kingdom 20.
Metal including alloys, all forms	42	(2)	NA	NA.
Zinc:				
Ore and concentrate	502,951	618,984	10,245	Canada 221,561; Sweden 74,652; Greenland 62,907.
Matte	4,231	3,339	--	Netherlands 1,768; Belgium-Luxembourg 300; Austria 258.
Oxides and hydroxides	6,993	7,089	--	France 2,906; Netherlands 1,453; Italy 1,392.
Metal including alloys:				
Scrap	12,609	11,128	734	Denmark 2,300; Netherlands 2,200; Italy 1,932.
Blue powder	12,705	14,475	--	Belgium-Luxembourg 11,069; Netherlands 1,160.
Unwrought	156,138	161,781	75	Belgium-Luxembourg 68,481; Netherlands 41,488; Norway 14,175.
Semimanufactures	24,014	25,673	--	NA.
Zirconium:				
Ore and concentrate	50,185	56,086	1,355	Australia 29,016; Republic of South Africa 18,511.
Metal including aloys, all forms	218	279	128	France 124.
Other:				
Ores and concentrates:				
Of columbium, tantalum, vanadium	1,458	1,341	205	Brazil 731.
Unspecified	5,319	7,301	273	Chile 4,536; Australia 1,957.
Ash and residue containing nonferrous metals	410,884	483,176	12,559	Canada 140,022; Belgium-Luxembourg 30,065; Italy 28,085; United Kingdom 24,089.
Oxides, hydroxides, peroxides	627	487	57	United Kingdom 255; France 89; U.S.S.R. 65.
Matte, speiss, similar material	40	56	--	All from East Germany.
Metals:				
Metalloids:				
Arsenic and tellurium	54	49	9	U.S.S.R. 14; Belgium-Luxembourg 7.
Selenium and phosphorus	28,873	32,432	NA	NA.
Alkali, alkaline-earth; rare-earth metals	336	246	4	France 164; Canada 25.
Pyrophoric alloys	37	14	--	Austria 13.
Radioactive isotopes value, thousands	$528	$459	--	All from East Germany.
Metals including alloys, all forms	748	1,078	385	Sweden 272; Belgium-Luxembourg 106.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Pumice, emery, corundum, etc	66,202	249,522	1,038	Greece 219,903; Italy 16,341.
Artificial:				
Corundum	40,011	41,497	2,415	Netherlands 16,710; Hungary 6,473; Austria 6,060.
Silicon carbide	66,711	72,364	260	Norway 10,344; Italy 4,688; U.S.S.R. 2,281.
Dust and powder of precious and semiprecious stones, kilograms	2,205	397,430	396,390	Ireland 806.
Grinding and polishing wheels and stones	7,410	8,897	336	Austria 1,853; Spain 989; France 719; East Germany 341.
Asbestos, crude	386,383	392,978	886	Canada 307,756; U.S.S.R. 28,714; Republic of South Africa 27,611.
Barite and witherite	212,735	211,315	--	France 82,203; China 53,628; Spain 37,094; East Germany 9,685.
Boron materials:				
Crude natural borates	143,862	124,693	80,947	Turkey 33,378; Belgium-Luxembourg 9,078.
Oxide, acid, borates, perborates	90,114	87,072	13,334	Belgium-Luxembourg 36,667; France 15,782.
Bromine, elemental	3,008	2,982	--	Israel 2,074; Netherlands 437; East Germany 108.
Cement, thousand tons	1,591	1,686	3	Belgium-Luxembourg 574; France 417; East Germany 326.

See footnotes at end of table.

Table 3.—Federal Republic of Germany: Imports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1979[r]	1980	Sources, 1980	
			United States	Other (principal)
NONMETALS —Continued				
Chalk	119,133	121,736	--	France 91,394; Belgium-Luxembourg 14,113; East Germany 12,098.
Clays and clay products:				
Crude:				
Andalusite and kyanite	65,312	101,824	45,544	Republic of South Africa 49,484.
Bentonite	66,841	78,043	44,392	Greece 23,106; Belgium-Luxembourg 3,647.
Ceramic clay	108,865	133,303	--	France 60,435; Netherlands 28,245; East Germany 14,923.
Chamotte	90,398	79,704	547	Czechoslovakia 33,998; France 31,406.
Dinas earth	6,550	3,949	--	Belgium-Luxembourg 3,853.
Fire clay	134,053	158,659	23,044	France 52,520; Czechoslovakia 43,250; Republic of South Africa 16,888.
Fuller's earth	5,282	5,676	3,835	Spain 1,000; Netherlands 549.
Kaolin	842,983	859,571	112,742	United Kingdom 465,574; Czechoslovakia 123,736; France 57,292; East Germany 56,709.
Other	163,718	139,188	21,665	Czechoslovakia 55,112; Netherlands 26,699; France 23,817.
Products:				
Nonrefractory thousand tons	1,832	1,871	--	Italy 648; Netherlands 608; France 217.
Refractory including nonclay brick do.	268	266	2	Austria 49; France 30; United Kingdom 23.
Cryolite and chiolite, natural	2,724	2,066	--	Greenland 2,043.
Diamond:				
Gem, worked and unworked, not set or strung thousand carats	520	561	5	Belgium-Luxembourg 259; Israel 119.
Industrial do.	1,057	1,105	71	Republic of South Africa 399; Belgium-Luxembourg 363; Ireland 115.
Diatomite and other infusorial earth	40,190	37,506	7,534	Denmark 21,819; France 6,913.
Feldspar, leucite, nepheline, nepheline syenite	120,150	119,288	--	Norway 73,453; Italy 15,934; Finland 10,568.
Fertilizer materials:				
Crude:				
Nitrogenous	2,631	3,136	--	Chile 3,000.
Phosphatic thousand tons	2,584	2,560	1,443	U.S.S.R. 357; Morocco 339.
Potassic do.	120	125	--	All from East Germany.
Manufactured:				
Nitrogenous do.	1,548	1,586	31	Belgium-Luxembourg 397; Netherlands 341; Austria 211.
Phosphatic do.	774	1,005	(2)	Belgium-Luxembourg 804; France 93; East Germany 30.
Potassic do.	91	94	--	France 87; East Germany 2.
Other including mixed do.	1,038	971	83	Austria 221; France 147; Netherlands 103.
Ammonia do.	203	283	30	France 112; Netherlands 53; East Germany 29.
Fluorspar	255,868	279,058	--	China 51,579; Republic of South Africa 43,122; Spain 25,624.
Graphite, natural	26,062	25,123	262	China 4,925; Austria 4,656; Norway 3,299.
Gypsum and plasters	595,650	689,483	106	France 411,794; Austria 200,440; East Germany 31,424.
Iodine	871	1,140	6	Japan 655; Chile 438.
Lime	153,766	188,096	--	France 116,762; East Germany 37,212; Belgium-Luxembourg 16,090.
Magnesite	386,152	420,054	46,492	Greece 118,791; China 43,822; Austria 42,871.
Mica:				
Crude including splittings and waste	8,631	10,330	548	India 3,334; Brazil 2,312; Argentina 1,033.
Worked including agglomerated splittings	611	702	20	France 283; Belgium-Luxembourg 224; Spain 85.
Pigments, mineral:				
Natural, crude	2,174	2,041	--	Austria 1,932.
Iron oxides, processed	6,152	6,550	422	Netherlands 2,375; France 1,210; Belgium-Luxembourg 914.
Precious and semiprecious stones except diamond:				
Natural	1,636	1,724	419	Brazil 906.
Synthetic kilograms	25,587	21,437	3,070	Switzerland 11,385; Japan 3,680.

See footnotes at end of table.

Table 3.—Federal Republic of Germany: Imports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1979[r]	1980	Sources, 1980	
			United States	Other (principal)
NONMETALS —Continued				
Pyrites, gross weight	98,943	132,716	--	U.S.S.R. 100,011; Norway 13,732; Yugoslavia 13,178.
Salt and brine	937,522	628,219	--	Netherlands 453,286; France 87,492; Italy 56,054.
Sodium and potassium compounds, n.e.s.:				
Caustic potash including sodic and potassic peroxides	3,537	4,100	--	Belgium-Luxembourg 1,932; East Germany 289; Spain 286.
Caustic soda	168,556	120,434	--	Belgium-Luxembourg 25,571; Switzerland 9,342; Netherlands 8,740.
Soda ash	220,273	215,886	4,289	Poland 49,530; France 30,080; Netherlands 29,504; East Germany 25,194.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked:				
Calcareous	124,036	151,073	--	Austria 80,452; Italy 30,021; Portugal 11,853.
Slate	33,756	40,249	--	France 21,184; United Kingdom 8,276; Portugal 4,970.
Other	441,289	424,702	170	Denmark 83,292; Sweden 54,477; Italy 50,514.
Worked:				
Slate	17,779	24,576	--	Spain 16,785; Italy 1,586; France 1,302.
Paving and flagstone	212,321	274,007	--	Portugal 134,393; Italy 63,856; Romania 17,082.
Other	540,343	534,035	--	Italy 436,583; East Germany 26,523; Switzerland 13,112.
Dolomite, chiefly refractory-grade	680,951	772,456	--	Belgium-Luxembourg 652,777; United Kingdom 36,561.
Gravel and crushed rock thousand tons	12,605	12,968	--	France 7,715; Denmark 1,939; Norway 885.
Limestone excluding dimension do.	1,501	1,272	--	Austria 691; Belgium-Luxembourg 260; France 144.
Quartz and quartzite	121,860	110,934	622	Belgium-Luxembourg 52,591; Netherlands 25,382; Yugoslavia 11,951.
Sand excluding metal-bearing thousand tons	6,393	6,223	3	France 2,561; East Germany 2,283; Netherlands 935.
Sulfur:				
Elemental:				
Other than colloidal	385,973	360,317	83,517	Poland 168,080; Canada 91,324.
Colloidal	732	661	--	France 636.
Dioxide	8,534	5,731	--	Sweden 3,136; Switzerland 2,290.
Sulfuric acid, oleum	48,309	33,774	--	Switzerland 15,796; France 9,704; East Germany 3,024.
Talc, steatite, soapstone, pyrophyllite	125,688	130,765	389	Austria 52,665; France 27,460; Italy 11,122.
Other:				
Crude:				
Pottery, broken	95,168	104,720	--	France 33,548; Netherlands 18,366; Belgium-Luxembourg 16,425.
Vermiculite, perlite, chlorite	136,938	140,811	3,207	Greece 107,129; Hungary 11,838; Republic of South Africa 16,425.
Unspecified	802,263	990,953	13,471	Norway 358,167; United Kingdom 173,941; Austria 164,567.
Slag, dross, similar waste, not metal-bearing:				
From iron and steel manufacture thousand tons	1,943	1,662	1	France 861; Belgium-Luxembourg 504.
Unspecified do.	429	362	2	France 154; Belgium-Luxembourg 93; Netherlands 38.
Oxides and hydroxides of barium and strontium	791	655	--	France 317; Netherlands 280.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	165,746	176,282	NA	East Germany 10,319.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	21,170	18,185	7,488	Trinidad and Tobago 9,363.
Carbon black	58,321	55,713	3,781	France 19,911; Netherlands 16,685.

See footnotes at end of table.

(Metric tons unless otherwise specified)

Commodity	1979[r]	1980	Sources, 1980	
			United States	Other (principal)
MINERAL FUELS AND RELATED MATERIALS —Continued				
Coal and briquets:				
Anthracite and bituminous coal thousand tons	7,773	9,123	1,751	Poland 1,918; Republic of South Africa 1,492; United Kingdom 1,402.
Briquets of anthracite and bituminous coal	56	365	--	France 310.
Lignite including briquets thousand tons	2,387	3,223	--	Czechoslovakia 2,113; East Germany 1,081.
Coke and semicoke do	1,201	1,225	239	France 234; Netherlands 170; East Germany 150.
Gas, natural million cubic feet	1,645,762	1,765,080	NA	NA.
Hydrogen, helium, rare gases	27,073	32,008	2,571	Netherlands 15,694; Belgium-Luxembourg 13,685.
Peat including briquets and litter	70,297	83,069	--	U.S.S.R. 71,658; Poland 6,673.
Petroleum and refinery products:				
Crude and partly refined thousand 42-gallon barrels	770,942	697,460	--	Saudi Arabia 180,361; Libya 114,094; United Kingdom 104,686.
Refinery products:				
Gasoline:				
Aviation do	270	289	--	Netherlands 127; United Kingdom 118.
Motor do	24,821	29,442	5	Netherlands 14,508; Belgium-Luxembourg 4,191; France 2,648.
Kerosine do	933	359	13	Belgium-Luxembourg 150; Netherlands 124.
Jet fuel do	14,523	14,414	--	Netherlands 9,596; Belgium-Luxembourg 3,722.
Distillate fuel oil do	139,905	117,544	--	Netherlands 49,562; Belgium-Luxembourg 12,080; East Germany 11,552; U.S.S.R. 10,942.
Residual fuel oil do	34,524	41,679	1	Netherlands 12,986; Belgium-Luxembourg 4,847; East Germany 4,608; U.S.S.R. 3,040.
Lubricants do	1,222	1,654	102	United Kingdom 558; France 523; Italy 226.
Other:				
Liquefied petroleum gas do	5,037	7,219	--	Netherlands 1,645; Republic of South Africa 943; Czechoslovakia 744.
Mineral jelly and wax do	1,477	1,497	10	Netherlands 184; France 121; United Kingdom 59.
Nonlubricating oils do	42,566	36,949	147	Netherlands 13,292; U.S.S.R. 6,458; Algeria 3,299.
Petroleum coke do	8,274	6,213	5,461	United Kingdom 287; Netherlands 231.
Bitumen and other residues do	2,077	2,515	--	Netherlands 915; France 749; East Germany 553.
Bituminous mixtures do	144	130	4	Netherlands 85.
Unspecified do	19,919	10,355	177	U.S.S.R. 3,030; Libya 2,578; Romania 1,175.
Mineral tar and other coal-, petroleum-, and gas-derived crude chemicals thousand tons	2,134	2,130	73	Netherlands 1,032; France 231; Belgium-Luxmebourg 96; East Germany 72.

[r]Revised. NA Not available.

[1]The revised figures for 1979 reflect the inclusion in this table of the Federal Republic of Germany's receipts of the reported commodities from the German Democratic Republic. These data had not been included in previous editions of the Minerals Yearbook.

[2]Less than 1/2 unit.

COMMODITY REVIEW

METALS

Aluminum.—Vereinigte Aluminum Werke AG was to cut aluminum capacity at its Lippe plant near Lünen, in the Ruhr area, by 5,000 tons to 33,000 tons per year by the end of 1981. This followed the shutdown of 10,000 tons of capacity early in the year at the same plant.

In 1981, it was reported that the alumina segment of the Giulini Chemie GmbH production plant in Ludwigshafen on the Rhine

was to be sold to the Aluminum Co. of America. Involved were an alumina plant and an aluminum chemicals plant.

In 1981, the FRG's aluminum production declined slightly for the second straight year. Six companies in the FRG operated 10 aluminum plants with a total primary capacity of about 729,000 tons.

Iron and Steel.—Peine Salzitter was to close its Haverlahwiese iron ore mine in Lower Saxony in 1982, causing a drop of almost 0.5 million tons in the FRG's iron ore output. However, another FRG steelmaker, Klöckner-Werke AG's Maxhütte subsidiary, is to expand production from its Leonie iron ore mine near Auerbach in Bavaria to 850,000 tons per year, supplying the company's blast furnaces at Sulzbach Rosenberg.

Metallhüttenwerke Lübeck GmbH, a pig iron producer, filed bankruptcy suits. Causes of the collapse were high fuel costs and loss of the company's Polish business, which had provided the majority of the company's orders. The Government of Schleswig-Holstein was planning efforts in cooperation with Lübeck city authorities to save the 1,000 jobs affected. The company had a capacity of 500,000 tons per year of pig iron and 500,000 tons per year of coke.

Norddeutsche Ferrowerke AG (Nordferro) of Emden, a Midrex-reduced iron producer, was struggling to survive in face of high gas costs and inadequate prices for direct-reduced iron ore. Nordferro was owned by AS Sydvaranger (74.9%) and Korf Stahl AG (25.1%). Sydvaranger was making efforts, together with the Government of Lower Saxony, to interest Thyssen AG or Peine Salzgitter AG in the plant in exchange for supplying Thyssen with an order for six Norwegian submarines.

Krupp Stahl AG and Hoesch-Estel reviewed the approval of their supervisory boards for the formation of a new company, Ruhrstahl AG, to include their steelmaking, coating, and surface finishing activities. The announcement, predicting organization of the new company during 1982, ended 2 years of negotiations. As a result of the merger, cost reductions were to be sought by better utilization of raw steel capacity and by elimination of product line overlap and the duplication of investments. It seemed possible that Government-owned Peine Salzgitter AG (P&S) is to join in on the merger. The steel giant formed thus would have a capacity of about 15 million tons of crude steel, larger than steel industry leader Thyssen AG (12 million tons). In 1980, Krupp and Hoesch had a capacity of little more than 5 million tons each, while P&S produced about 4.5 million tons. Krupp was the FRG's biggest high-grade steel producer, Hoesch was the leader in surface refined sheet metal, and P&S was the only ferromanganese producer in the FRG. Of about 65,000 jobs of the three companies, only about 45,000 would have remained in 1985. While the merging companies sought to receive $2 to $3 billion in help, the Government planned to keep the amount as low as possible.

The FRG has been for a long time the strongest opponent of state aid for the steel industry. In 1980, the European Economic Community agreed to phase out by 1985 all subsidies to the steel industries of its member states. By 1981, it became clear, however, that not all FRG steel concerns could survive without state funds to pull them through. Maxhütte, a subsidiary of Klöckner Werke, was the first company to obtain a restructuring grant by 1980, in this instance, from Bavaria's regional Government. Steel industries in the Saar were the next to obtain joint subsidies, in that they contributed to complete rationalization of production involving substantial cutbacks funded partly by the parent company. The next to seek help from Bonn was to be the Ruhr Industries.

In 1981, the FRG's raw steel and pig iron production declined further for the third consecutive year, although it remained still the largest among West European countries. Top crude steel producers in 1981 and approximate crude steel capacities in million tons, remained virtually unchanged as follows: Thyssen Group (12.2), Hoesch-Estel Group (11.5), Krupp Group (5.1), Peine-Salzgitter Group (4.4), and Mannesmann Group (4.3).

About 48 companies continued to produce stainless and alloy steels in 1981. The most important producers, with about 60% of total production, in order of decreasing output, were the Edelstahlwerke Buderus AG at Wetzlar; Klöckner Werke AG in Osnabrück; Friedrich Krupp Hüttenwerke AG in Bochum; Stahlwerke Röchling-Burbach GmbH of Völklingen in the Saar; Stahlwerke Südwestfalen AG in Siegen; and Thyssen Edelstahlwerke in Krefeld.

Lead, Zinc, and Copper.—Preussag AG decided to cut production of its Harlingerode vertical retort zinc smelter near Goslar in the Harz Mountains from 70,000 to 50,000 tons for 1982 by shutting down a roasting furnace and a sulfuric acid plant.

The nonferrous metal mine in Meggen, the barite mine in Dreislar, and the barite-

fluorite mine in Wolfach were described in the technical literature.[3]

Nonferrous metal mining in the FRG continued at Preussag AG's Rammelsberg (Goslar) and Bad Grund, and Metallgesellschaft AG's subsidiary Sachtleben AG in Meggen.

Mercury.—By yearend, Preussag AG closed its mercury refining operation at Harlingerode, near Goslar in the Harz Mountains. The plant had a capacity of about 200 tons per year of mercury. About 50% of the supply of the plant was from local zinc ores, 45% from contracts with other companies, and about 5% of the feed came from Scandinavia.

Tin.—Exploratory drilling for lead-tin ores in the Sauerland region of North Rhine Westfalia produced promising indications of Mississippi Valley type mineralization. Lead-tin bearing limestone was found in several places at depths from 100 to 500 meters. The German subsidiary of Rio Tinto Zinc worked out an investigation program for the ores.

In 1981, Metallgesellschaft AG of Frankfort operated a tin smelter in Duisburg, based on imported concentrates, with a capacity of 5,000 tons per year of tin and 8,000 tons per year of soft solders (secondary metal). Three brands were marketed, all registered on the London Metal Exchange: M Standard (99.75% Sn), M Special (99.85% Sn), and Rose (99.90% Sn).

Titanium.—In 1981, four companies in the FRG produced pure titanium ingots: Boschgotthardshütte O. Breyer GmbH at Siegen, Contimet-Thyssen Edelstahlwerke AG in Krefeld, WC Heraeus GmbH in Hanau, and Krupp Stahl AG in Essen. These companies produced some or all of the following: Forgings, alloy sheets, plates, bars, rods, wire, disks, and other semimanufactured products in various shapes. Another three companies also produced various commercial shapes: Otto Fuchs Metallwerke in Meinerzhagen, E&S Lohaus KG in Mayen, and Vereinigte Deutsche Metallwerke AG in Duisburg. Finally one company, the Gesellschaft für Elektrometallurgie mbH produced 40% ferrotitanium.

Vanadium.—Several FRG companies processed imported vanadium raw material into ferrovanadium and/or vanadium pentoxide. The Gesellschaft für Electrometallurgie mbH of Düsseldorf produced 3,000 tons per year of vanadium pentoxide from vanadium slag, which was converted to vanadium metal and ferrovanadium. Hermann C. Starck of Berlin produced vanadium metal and ferrovanadium at Laufenburg on the Swiss border and vanadium metal at Goslar in the Harz. Metallhütte Mark KG of Hamburg, a subsidiary of Klöckner & Co. of Duisburg, produced 200 tons per year of ferrovanadium. The company concluded a contract with Agnew Glough Ltd.'s Wundowie Mine in Western Australia to buy a total of 16,000 tons of fused flake vanadium pentoxide during the next 7 years. The Otavi Minen und Eisenbahn Gesellschaft of Frankfort also produced some ferrovanadium.

NONMETALS

Cement.—Cement production declined slightly in 1981. At yearend, 70 cement plants were operated in the FRG by 41 individual companies. Total cement capacity (including clinker) of the plants was 35 million tons per year.

Potash and Salt.—In 1981, Kali and Salz AG (K&S) became the FRG'S only potash producer when it took over the mine at Friedrichshall, previously owned by Kali Chemie AG. K&S was not going to operate the Friedrichshall Mine separately, but would mine its reserves from the nearby Bergmanssegen-Hugo Mine in 1982. Friedrichshall has been in continuous operation since 1930. K&S, with eight active potash mines and seven salt mines in operation, exploited some areas of the potash reserves in the Zechstein Basin, which stretches from Poland to the northeast of England.

Weak demand in world markets resulted in sales reduced to 2.34 million tons of K_2O in 1981; some shutdowns were therefore necessary towards the end of the year. Only salt and some magnesium compound sales increased. Employment in 1981 increased to 8,899. K&S invested about $130 million in the 1970-80 period on expanding and modernizing its industry.

Sulfur.—Sulfur production in 1981 was substantially unchanged and exports declined about 7%. The bulk of the FRG'S sulfur production was recovered by four sour gas processing complexes located at Rütenbrock, Dötlingen near Grossenkneten, Barnstadt near Düste, and Neag near Sulingen, all in Lower Saxony. Output from these sources was 834,000 tons, while production from coking plants and power stations accounted for an additional 30,000 tons. In 1981, supplies of sulfur from oil refining activities fell 10% to 191,000 tons, reflecting a fall in consumption of oil products in the FRG.

Exports by rail to the FRG's major markets such as the Netherlands, Denmark, Belgium, and Switzerland were supplemented by exports of solid slated sulfur by way of the new terminal of Brake, on the Weser south of Bremerhaven, with shipments to the United Kingdom and Senegal. Despite the opening of this new facility, the FRG is unlikely to become a significant exporter on the global scale, as production in the Grossenkneten Gasfield is to decline somewhat in the near future.

MINERAL FUELS

Energy consumption in 1981 was almost 5% below 1980 levels as shown in the following tabulation, in million tons of standard coal equivalent:

	1980	Percent	1981	Percent
Oil	185.7	47.6	165.0	44.5
Bituminous coal	77.1	19.8	78.5	21.2
Lignite	39.2	10.0	40.0	15.9
Natural gas	63.6	16.3	59.0	10.8
Nuclear power	14.3	3.7	17.2	4.6
Hydroelectric power	7.6	1.9	8.4	2.2
Other	2.7	.7	2.9	.8
Total	390.2	100.0	371.0	100.0

Source: Arbeitsgemeinschaft Energie-Bilanzen. American Embassy, Bonn, State Department Telegram No. 3501, Jan. 5, 1982.

Prime reasons for the decline in the energy consumption shown above between 1980 and 1981 were unfavorable economic conditions and a more rational use of energy. Coal and nuclear power expanded their positions, while petroleum and natural gas suffered additional losses. The FRG's energy balance in 1979 and 1980 is shown in table 4.

Table 4.—Federal Republic of Germany: Energy balance in 1979 and 1980

(Million tons of standard coal equivalent)[1]

	Bituminous coal	Lignite	Crude oil	Natural gas	Hydropower	Nuclear power[2]	Fuelwood, peat	Other[3]	Total
1979:									
Production[1]	87,528	37,197	6,943	23,492	5,572	--	412	1,456	162,600
Imports	9,625	1,439	219,672	44,032	5,130	13,892	--	--	293,790
Exports	27,190	570	13,656	415	4,924	--	89	--	46,844
Consumption	75,840	38,076	206,842	66,008	5,778	13,892	323	1,456	408,215
1980:									
Production[1]	88,235	37,862	6,735	20,943	5,686	--	636	1,388	161,485

Coal, Coke, and Lignite.— In 1981, the FRG's bituminous coal production increased slightly for the third consecutive year, exceeding 88 million tons. FRG's stocks of coal and coke at yearend remained constant, representing a supply of approximately 4 months.

The FRG's lignite production in 1981 was almost unchanged at over 130 million tons, but production of briquets made from lignite decreased again and overburden moved was about 450 million cubic meters, or 3.46 cubic meters per ton of lignite produced.

Ruhrkohle AG opened the FRG's first new bituminous coal mine in 17 years at Bergkamen near Dortmund in the Ruhr region. The $300 million facility supplied a mine-mouth powerplant, Verbundkraftwerk Bergkamen, at a design rate of 3.2 million tons per year and employed 3,000

people. The Vereinigte Elektrizitätswerke AG (VEW) and Steag AG decided to build a second 750-megawatt, coal-fired unit at Bergkamen. Construction was to start in 1982, and commissioning of the new unit was to take place in 1987. The plant was to use a total of 3 million tons of bituminous coal per year.

The Neckarwerke Elektrizitäts Versorgungs AG obtained Government approval for the construction of a fifth coal-fired unit of 420 megawatts in Altbach, near Stuttgart.

The Federal Ministry of the Economy lowered the coal price subsidies, paid both by the country's coal producers and consumers, from a country wide average of 4.5% to 4.2%, the latter being sufficient to accumulate about $1 billion in the coal price equalization fund in 1982. Regional contributions to the fund were to vary from state to state between 3.2% in Berlin and 4.8% in North Rhine-Westphalia. Besides these contributions, the Federal Government and North Rhine-Westphalia also contributed substantial amounts to the subsidy.

Ruhrkohle AG and Veba AG put on-stream in the Ruhr city of Bottrop, Europe's biggest coal liquefication plant. The $200 million plant was designed to convert about 75,000 tons of bituminous coal per year into automotive and chemical gasoline, diesel fuel, heating oil, and gas. A crew of 220 was needed to operate the plant.

A 55,000-ton-per-day prototype coal gasification plant was tested in the Ruhr region at Oberhausen by Ruhr-Chemie AG and Ruhrkohle AG. Coal used was from Moundsville, W. Va., United States. The Rheinische Braunkohlenwerke AG started construction of a 1.8-million-ton-per-year lignite gasification plant at the site of the Ville-Berrenrath briquet plant, near Hürth. The plant was to be built in two stages at a total cost of $300 million, and is to generate by 1988 up to 0.9 billion cubic meters of lignite gas per year. No Government subsidy was to be involved for the construction of the plant.

In 1981, the FRG had 38 coal and 20 lignite mines, 18 coking plants, 5 briquet plants, and 20 mine-mouth powerplants. The bituminous coal industry was controlled mainly by seven companies: Three in the Ruhr area, two in the Aachen area, and one each in the Saar and Lower Saxony. The largest industrial group was the Ruhrkohle AG, controlling almost three-quarters of the country's bituminous coal output. Total employment in the bituminous coal industry was 184,000.

The FRG lignite industry was dominated by the Rheinische Braunkohlenwerke AG, which accounted for nine-tenths of total output; remaining production came from three medium-size companies in Bavaria, Helmstedt, and Hesse, and three smaller companies. The lignite industry employed 22,000. The FRG's bituminous coal reserves were estimated at 24 billion tons and lignite reserves were estimated at 35 billion tons. Resources were 230 billion tons of bituminous coal and 55 billion tons of lignite.

Nuclear Power.—For the first time in more than 4 years the construction of new nuclear powerplants was authorized by the Federal Government. The plants to be built were those in Oho, Bavaria; Biblis, Hesse, and Lingen, Lower Saxony.

Construction work on the Gorleben Nuclear Waste Disposal Facility, the first permanent facility to be built in the FRG, was to continue according to a ruling by the Lüneburg (Lower Saxony) Court; work had been halted previously by a lower court in Stade. The FRG's atomic wastes are to be buried underground in salt mines there. Plans for an adjacent fuel reprocessing plant remained blocked by the courts.

A permit was issued for the construction of the first phase of a uranium enrichment plant at Gronau by the Government of North Rhine Westphalia. The plant was to be built by the Uranit-Uran-Isotoptrennungs Gesellschaft mbH and funded by the Federal Ministry for Research and Technology, together with the United Kingdom and the Netherlands. The plant's first stage is to have a capacity of 1,000 tons of separative work units.

In 1981, the FRG had 15 nuclear powerplants in operation with a total nominal gross capacity of 10,358 megawatts (electrical). Another 10 nuclear powerplants were under construction, with a total nominal gross capacity of 11,329 megawatts (electrical), and another 10 nuclear powerplants were in various planning stages with a total nominal gross capacity of 13,898 megawatts (electrical). In 1981, the plants in operation generated 53.4 billion kilowatt-hours, about 21.7% more than in 1980. Nuclear power contributed 17.4% to the generation of the public electricity supply system, which itself supplied 83% of the total electricity supply in the FRG.

Petroleum and Natural Gas.—Production trends continued, with a decrease of crude

oil and an increase of natural gas production in 1981. Drilling activity increased 11% above that of the previous year. Of 89 development holes, 60 resulted in oil or gas finds. Of 27 exploration holes, 7 struck oil or gas. The planned oil drilling by the German North Sea Group (10 companies) in the German sector of the North Sea did not start as planned owing to a delay in the completion of the chartered drilling platform "Dyvi."

In 1981, Saudi Arabia was the country's leading supplier of crude oil, followed by North Sea oil, (Norway, United Kingdom, and Denmark), and in third place, Libya.

Starting with January 18, 1982, royalty rates for oil and gas production were to be raised in the FRG from 22% to 32% in most of the German Länder, notably in Lower Saxony, where 90% of the oil production occurs.

In 1981, the FRG had 25 companies operating 37 oil refineries with a total capacity of 141 million tons per year (throughput). Six of the refineries were being rebuilt or expanded during 1981. In 1981, the FRG's refinery capacity utilization was 57.1%.

Crude oil reserves at the beginning of the year were estimated at 47 million tons. Total resources were estimated at 70 million tons.

A group of gas companies led by Ruhrgas AG signed a preliminary agreement to import 10.5 billion cubic meters of natural gas per year from the Soviet Union starting with 1984. Previously, contracts had been signed for supplying the pipe and compressor stations for the $15 billion, 5,000-kilometer Yamal pipeline.

Important natural gas deposits were found near Sohlingen, south of Hamburg, by the Brigitta & Elverath Management Co., owned by a consortium consisting of the Mobil Oil Co., Texaco, and Wintershall AG. Reserves were estimated at 40 to 60 billion cubic meters out of total FRG reserves estimated at 289 billion cubic meters; total resources were 316 billion cubic meters.

The Mineral Industry of Ghana

By Ben A. Kornhauser[1]

The mineral industry of Ghana in 1981 deteriorated even more than in previous years, owing to the growing unmanageability of the general economy. Ghana was faced with many interlocking, synergistically debilitating problems. These problems included a low rate of capital formation; triple-digit inflation; increasing budget expenditures and deficits; an overvalued currency; shortages of commodities, industrial raw materials, and spare parts; declining export earnings from cocoa and diamonds; a shortage of foreign exchange; and rising oil import costs.

In 1981, the estimated gross domestic product (GDP) was $21,255 million,[2] a 55% increase over the GDP in 1980.[3] However, if the GDP was considered in constant 1975 dollars, the estimated GDP in 1981 was $1,862 million, and there was no increase in GDP over that of 1980. The value of the minerals produced was reported at $517 million, of which gold and diamonds contributed about $158 million of the mineral wealth produced. Cocoa sales, although decreasing, still were the backbone of the economy, accounting for about 10% of GDP and 60% of export earnings.

For the 1981 fiscal year ending June 30, 1981, Government expenditures reached $3.3 billion compared with revenues of $1.6 billion. Prime contributors to this large deficit were a 300% increase in the minimum daily wage in the fall of 1980 and a shortfall in cocoa export earnings of about $400 million.[4] The increase in the fiscal year 1981 wages from $1.44 to $4.32 for about 300,000 civil servants represented about 40% of total Government expenditures. Ghana's inflation kept soaring. Its 1980 average consumer price index (CPI) was about 50% higher than that of 1979. In 1981, the CPI was 116% higher than that of 1980.

Except for the continued petroleum operation of the Agri-Petco Co., very little U.S. or other foreign investments were made in recent years. The new 1981 Investment Code, Act 437, was approved by Parliament in July 1981 to attract greater private foreign investment into priority investment areas, which included mining and oil and/or gas exploration. The emphasis of the code was on developing Ghana's production sectors, using its existing raw materials and enterprises, strengthening its balance of payments, increasing employment, locating enterprises in rural areas, and providing new technology and skills to its work force. Main incentives for new investment were exemption from company tax until the initial risk capital was recovered, exemption from import duties on machine and spare parts for the first 5 years, and guarantees of management control. However, at 1981 official exchange rates, high cedi costs influenced decisions to invest in projects.

Ghana's relatively good transport system of the 1950's and 1960's deteriorated owing to years of neglect and insufficient funding for maintenance and equipment. The highway system consisted of approximately 7,700 miles of trunk roads, 8,500 miles of feeder roads, and 450 miles of village roads, each under a separate authority. The worsening condition of the roads, coupled with a lack of adequate vehicles and spare parts, seriously affected the transport of agricultural and mineral products, and contributed to the increasing inflation of food and material prices.

The Ghana Railway Corp. underwent a major reorganization. In July 1981, the World Bank signed a $29 million International Development Agency loan to rehabil-

itate and to provide technical assistance in improving its management. The African Development Bank supplied an additional $13 million, but the project is under Canadian and Indian technical supervision. A new rail line from Tema to the Akosombo dam port on the Volta Lake was under consideration to increase lake transport.

The condition of Ghana's two seaports, Tema and Takordi, also declined in recent years owing to old, inefficient cargo handling techniques that delay offloading and onloading.

PRODUCTION AND TRADE

Although the GDP in 1981 was an estimated $21,255 million, it was stagnant. The overall value of the reported mineral production in 1981 was essentially the same as that in 1980. The decline in the values of diamond and gold of about 50% and 30%, respectively, were compensated by the increased values of aluminum and cement of approximately 20% and 55%, respectively. In 1981, export earnings were about $766 million or 34% lower than that of 1980. The lower export value was a major factor in the continued deterioration of Ghana's balance of payments and caused a negative balance of trade of about $100 million. The lack of foreign exchange compounded the problems of industrial and mining companies by drastically reducing their imports of commodities, parts, equipment, and services necessary for the operation of their plants and mills.

The black market exchange rate of the Ghanaian new cedi (Nc), Nc40=US$1.00, was about 15 times the official rate. This unrealistic exchange rate, among other factors, distorted the trade balance and the economy by reducing profit margins on some products and by causing the price of some goods to exceed world prices. Net uncommitted foreign reserves thus practically disappeared, reducing Ghana's ability to pay its short-term external trade and service bills, blocked remittances, and equity payments. Strict controls in import licenses were imposed to improve the situation.[5]

At the end of 1981, Ghana's external debt reached $1.6 billion, of which $485 million were short-term external arrears consisting of trade and service bills, overdue remittance, and unpaid equity purchases. These short-term arrears could exceed $600 million by mid-1982.

Ghana's oil imports still consumed from 30% to 40% of its external earnings. Rationing of domestic refinery products plus illegal activities in the distribution of these products created shortages in various sections of the country.

Ghana's largest trading partner was the United States. United States-Ghana trade in 1981 reached almost $400 million, about 20% higher than in 1980. U.S. exports to Ghana in 1981 amounted to $153 million or $26 million more than in 1980. About 60% of Ghana's exports to the United States in 1981 consisted of aluminum from the Volta Aluminum Co. (VALCO), the U.S.-owned aluminum smelter that was the largest U.S. investment in Ghana. Other countries with which Ghana traded included the Federal Republic of Germany, the German Democratic Republic, Japan, Nigeria, Norway, Romania, and the United Kingdom.

Ghana's critical foreign exchange situation affected the payment of overdue loans to aid donors. In many cases, the amount of foreign assistance declined or stopped because the conditions under which the aid was granted were not being met. Other countries, such as China, Libya, and Cuba, provided or intended to provide assistance also. Western countries, particularly the United States, the Federal Republic of Germany, Canada, and the European Communities, focused their financial assistance on agriculture, which still was the most important sector of the Ghanaian economy.

The Kuwait Fund for Arab Economic Development loaned $14.5 million to Ghana to build an electrical powerplant. The loan, which was Kuwait's second to Ghana, was repayable over 15 years at 4% interest.[6]

[1]Table includes data available through Sept. 2, 1982.
[2]In addition to the commodities listed, a variety of crude construction materials (clays, sand and gravel, and stone) are produced, but output is not reported and available information is inadequate to make reliable estimates of output levels.

COMMODITY REVIEW

METALS

Aluminum.—Ghana granted an international consortium $4.5 million for the first phase of a program for the development of the Kibi bauxite alumina project. Brown and Root, Inc., of Houston, Tex., was the general manager of the project; project members included Granges International Mining, A.B., of Sweden and Bankers Trust International of the United Kingdom. Granges International was to be responsible for the mine development of the Kibi project; Bankers Trust was to be the financial adviser; and Brown and Root's subcontractor, Swiss Aluminum Ltd. of Switzerland, was to provide ore testing and process technology. The 16-month study was to determine the feasibility of producing alumina from a bauxite deposit at Kibi, 150 kilometers north of Accra, for domestic use and export. The consortium was to review conclusions of two previous feasibility studies that placed measured deposit reserves at 190 million tons of medium-grade ore averaging 45% Al_2O_3.

The project comprised a four-phase program for the development of an open pit bauxite mine, the design and construction of a plant to extract 800,000 tons per year of alumina from the bauxitic ore, the design and construction of its supporting infrastructure, and the financial implementation of the program. Phase one was the project development plan and report. It included the establishment of ore reserves and mining method, selection of process and design criteria, site investigation, personnel skill survey, training programs, preliminary engineering, estimates of capital and operating costs, an economic analysis and financing plan, and a plan describing the development of the subsequent project phases.

Phase two involved the commercial and financial implementation of the development plan. It consisted of the activities required to determine and implement the financial plans that were then to become firm commitments to finance the construction of the facilities and marketing plans that were to become sales contracts for a substantial portion of the alumina production.

Phase three was the technical implementation of the development plan. It included all the project management, engineering, procurement, construction of the mine, alumina plant, and infrastructure facilities,

plus personnel training required to operate these three areas. Operation of all the facilities was to commence during this phase.

Phase four involved plant operations and personnel training. It was to include accelerating to full design capacities for bauxite mining and alumina production. Training of management, operating and maintenance personnel also was to be accelerated so that Ghanaian personnel replaced expatriate personnel gradually.[7] The alumina refinery was to be about 7 kilometers from the mine with startup projected for the third quarter of 1985.

A state-run firm, Kibi Bauxite Development Co., was to manage and operate the plant once production begins. The owners of the firm, with equal shares, were Ghana's Aluminum Industries Commission, Granges Aluminum, and Brown and Root.

Gold.—An international seminar on Ghana's gold resources, held in Accra on January 6-8, 1981, attracted some 50 participants from foreign countries. Attention was drawn again to Ghana's large gold deposits, the abundance of which centuries ago caused the country to be called the Gold Coast. France, through its Caisse Centrale de Cooperation Economique, agreed to loan Ghana $6.7 million to rehabilitate the Tarkwa gold mine, which now produces under 2 tons per year of gold metal. Reportedly, in the 1950's, the mine produced around 24 tons per year of gold metal. With modernization, in 10 years, production of 60 tons per year of gold metal is thought to be possible.[8]

Ghana was optimistic about establishing a number of large-scale gold mines to exploit its gold resources, the potential of which was in their relative richness, purity, accessibility, and ease of recovery. The two main gold sources were alluvial and eluvial placers and banket reef gold in the rock types of the Birrimian and Tarkwian systems. Gold also probably was reclaimable from existing tailings dumps. To increase gold production, foreign investment and assistance were needed to augment domestic efforts. Ghana had allegedly lost considerable export and tax revenue through illegal gold mining and smuggling.

Of the approximately 335,000 troy ounces of gold produced in 1981, the State Gold Mining Corp. (SGMC), wholly owned by the Government, produced about 75,000 troy ounces and the Ashanti Goldfields Corp. (AGC), owned by SGMC (55%) and Lonhro Ltd. of the United Kingdom (45%), its manager, produced about 259,764 troy ounces. Production in 1981 decreased about 5% from the 353,038 troy ounces produced in 1980 and continued the declining trend from Ghana's gold-output peak of 915,000 troy ounces in 1960. In 1981, gold export earnings were estimated at $160 million or approximately 23% of the total exports that year. The SGMC had become very inefficient and a losing proposition because of labor problems, smuggling, depletion of some reserves, and insufficient importation of capital equipment, materials, and spare parts. In 1981, the Limann Government established a Gold Action Committee to promote development and investment in the gold sector. Among the recommendations of the committee were reduction of taxes, joint ventures, legalization of small-scale mining to reduce smuggling, enclave operation including free port status and external accounts for the two present companies, and the establishment of 14 new mines over the next 15 years.[9] U.S. companies had expressed interest in exploring for gold in Ghana.

Manganese.—The manganese roasting and nodulizing plant to process manganese carbonate ore at Nsuta was scheduled to be online at yearend. The plant, constructed by the Fuller Co. of the United States, was designed to process 1,000 to 1,100 tons per day of carbonate ore. The carbonate ore was mined and processed to supplement the declining manganese oxide ores that were nearing depletion. Reserves of manganese carbonate ore, based on limited drilling, were estimated at 20 million tons of 30% manganese. The Nsuta Mine, operated by the Ghana National Manganese Corp., was a mechanized, relatively modern, open pit operation with a 3,000-ton-per-day capacity. The mine was located in the Tarkwa district in southern Ghana, about 60 kilometers by connecting railroad to the seaport of Takoradi.[10]

NONMETALS

Diamond.—The Government of Ghana underwrote another loan for about $3.5 million to Ghana Consolidated Diamonds Ltd. (GCD) to assure the continued operation of the Akwatia diamond mine, currently Ghana's only diamond producing mine. GCD was owned by the Government (55%) and Consolidated African Selection Trust of the United Kingdom (45%), which managed the company. The mine has been in operation since 1924 with its reserves of

primarily industrial-grade bort expected to be depleted within the next 2 years. The hopes of profitability were dimmed by many factors such as low diamond prices, increasing operating costs owing to old equipment and lack of spare parts, loss of managerial and skilled personnel, diminishing grade of reserves, and the rate of exchange. The future of the mine depended on large investments to upgrade the equipment and to locate better grades of diamond reserves.

India concluded a bilateral trade agreement with Ghana to purchase rough diamonds valued from about $3 to $6 million.

MINERAL FUELS

Petroleum.—The Tema refinery, which had been in operation for 18 years, closed in March for more than a month for maintenance work.[11] In mid-1981, Agri-Petco, which produced petroleum at offshore Saltpond, reported production at the rate of only 1,800 barrels per day because of technical problems. In 1981, Agri-Petco produced 40,500 barrels of petroleum products, of which one-fourth was consumed domestically. The Phillips Petroleum Co. prospected for oil in the Western Region, hoping to find small pockets in which the total output would be worthwhile.[12] Several other U.S. companies had expressed interest in exploring for oil in Ghana.

The Mineral Industry of Greece

By Walter G. Steblez[1]

The Greek economy in 1981 continued to exhibit a declining trend under the impact of inflationary and recessionary pressures as well as an increased oil import bill. The Greek gross national production (GNP) was forecast to grow by only 1% in 1981, down from roughly a 6.4% increase in 1978. The recession, which began at the end of 1979, continued well into 1981, and the inflation rate, twice that of the European Economic Community (EEC) average, was about 25%, in contrast with the 13% annual average rate during 1975-78.

The Greek capital market showed a corresponding decline during the year; the Athens Stock Exchange price averages declined during January-September by 15% compared with the corresponding 9 months in 1980. There was reportedly, on the other hand, a substantial increase in transactions in the mining and metallurgical sectors of the economy, as well as in chemicals and construction materials, except for cement transactions, which declined slightly compared with the same period in 1980. Mining and metallurgy's share of the GNP remained at about 7% in 1981. A noteworthy development in 1981 was Greece's entry into the EEC as a full member, which followed an 18-year association with this body, and a gradual adjustment of policies with those of the EEC.

Government Policies and Programs.—Policies and programs of the Greek Government included domestic legislation to aid the development of the country's industrial base, including mining and metallurgy.

In compliance with EEC regulatory policies, the Greek Government introduced export controls on January 1, 1981, on nonferrous scrap such as copper, zinc, and tin sold outside the EEC. Export quotas for these commodities, as well as for aluminum and lead, were not set; however, their non-EEC export became subject to prior approval by the Bank of Greece.

In 1981, new legislation, Law 1116-81, was adopted to stimulate foreign and domestic investment incentives in less developed areas of Greece by means of Government interest rate subsidies, loans, increased depreciation rates on fixed capital, etc. Law 1116-81 divided Greece into three development areas. The first, the least favored and most highly industrialized area, included the Attica district and the Thessaloniki Province. The second area, with moderate industrial development, included territory from the northern Peloponnesos stretching north of Attica to the eastern part of the mainland and the island of Euboea. The third, the least developed and most favored area, covered the rest of Greece. Mining enterprises were favored under this law by being allowed the highest depreciation rates for both the second and third developmental areas. The legislation also allowed grants of up to 50% of the investment costs to help stimulate investment capital flow into the economy. The grants were aligned with EEC's regional development fund and provided, between March and July 1981, $100 million in grant assistance for 123 investment projects valued at about $300 million.[2] Nonmetallic mining, metallurgy, and the tourist sectors received investment grant shares under the provisions of this law.

Despite these measures, the Greek Association of Mining Enterprises felt that Law 1116-81 insufficiently addressed the problem of markets for Greek mine output caused by worldwide economic recession. The association called for more comprehensive long-term Government policies in mining and mineral processing and research.

In 1981, as in 1980, the Greek Government continued to promote the integration of domestic mining, processing, and fabrication as well as exploration by state-controlled agencies for lead-zinc ore, gold, chromite, bauxite, phosphate, lignite, and other industrial mineral deposits.

In the energy field, the Greek Government pursued policies of decreased consumption of imported petroleum and increased reliance upon domestically produced lignite. Development of alternate energy sources such as geothermal, wind, and solar power was planned as well.

PRODUCTION

The Greek Government, since 1974, had been assuming a more active role in the development of the country's material resource base. Fossil fuels were produced by Government-owned public corporations, and state involvement in the exploration and production of other mineral resources increased steadily. In 1981, the mining and processing industries of Greece were operated by both private and public sectors of the economy. During the same year, there were reported 150 state-owned producing mines and 1,100 privately owned mines. Of the privately held mines, 110 were fully operational and 550 were reported to be under development. Unfavorable world market conditions in 1981 adversely affected most branches of the Greek mining industry with few exceptions, such as bauxite mining.

A number of problems pertinent to the production and end use of ore were identified by Greek business sources.[3] They were: (1) Low secondary technical education standards that have resulted in a lack of midlevel technical personnel qualified in the use of advanced machinery and equipment; (2) less than adequate survey, exploration, and analysis of domestic ore deposits, and (3) the generally slow pace of vertical integration of the Greek mining industry with the industrial sector producing finished products; notable exceptions to this point were the aluminum and magnesite industries which achieved the highest level of integration in the mineral industry. Table 2 indicates the relative level of vertical integration of the Greek mineral industry. The vertical integration of the country's mineral economy continued to be promoted in 1981 with the intention of increasing the value added of the Greek marketable mine production.

TRADE

In 1981, the volume of trade declined by approximately 10%, while exports were down a sharp 17.2%, with respect to that of 1980. In particular, Greece suffered a steep 34% export decline to centrally planned economies, owing chiefly to the termination of certain commercial transaction conditions after Greece's entry into the EEC. Whereas overall exports to the EEC dropped 24.8% in 1981, Greek exports of ore to this market continued to rise in 1981 with respect to that of 1980 as a percentage of total exports. Ore exports to the EEC in 1979 constituted 5.26% of total exports to that market; in 1980, this share increased to 5.94%; and in 1981, it rose to 7.72%. Reportedly, in recent years the share of Greek mineral and metallurgical products constituted 15% of the country's total export volume.

The major mineral raw materials that Greece had to import in 1981 were petroleum, coal, phosphate, lead, and iron ore. Also, most of the mining machinery and equipment had to be imported.

Scrap	511	859	--	Italy 581; Netherlands 268.
Pig iron, sponge iron, powder, shot	20	16	--	All to Italy.
Ferroalloys: Ferronickel	65,526	49,468	--	West Germany 35,348; Finland 4,180; Canada 3,794.
Steel, primary forms	237,078	69,072	--	Italy 54,081; Iran 14,991.
Semimanufactures:				
Bars, rods, angles, shapes, sections	r96,915	167,712	--	Egypt 82,369; Syria 32,021; Algeria 15,410.
Universals, plates, sheets	47,338	173,120	--	Yugoslavia 66,764; Albania 18,776; United Kingdom 17,083.
Hoop and strip	4,619	10,788	--	Syria 3,590; West Germany 3,525; Cyprus 1,180.
Rails and accessories	17	75	--	Morocco 71; Libya 4.
Wire	1,369	4,382	--	Libya 3,248; Albania 496; Bulgaria 275.
Tubes, pipes, fittings	94,660	96,164	42,165	Libya 21,292; Albania 8,083; Iran 6,000.
Castings and forgings, rough	r80	11	4	Saudi Arabia 6; Tunisia 1.
Lead:				
Ore and concentrate	r32,840	39,124	--	Italy 15,705; Belgium-Luxembourg 10,000; Bulgaria 7,000.
Metal including alloys:				
Scrap	100	235	--	All to Italy.
Unwrought	121	550	--	Italy 500; Lebanon 50.
Semimanufactures	16	5	--	All to Saudi Arabia.
Magnesium metal including alloys, all forms	64	--		
Manganese:				
Ore and concentrate	200	750	--	All to Spain.
Oxides and hydroxides	15,118	13,126	2,298	Belgium-Luxembourg 2,558; U.S.S.R. 1,260; United Kingdom 1,238.
Nickel metal including alloys:				
Scrap	--	90	--	Netherlands 70; Belgium-Luxembourg 20.
Semimanufactures	r1,005	981	--	Egypt 683; Netherlands 297.
Platinum-group metals including alloys, unwrought and partly wrought value, thousands	$3	--		
Silver:				
Waste and sweepings do	--	$199	--	Belgium-Luxembourg $132; Switzerland $67.
Metal including alloys, unwrought and partly wrought do	$1,254	$2,102	--	France $2,100; Saudi Arabia $2.
Tin:				
Ore and concentrate	5,365	30,325	--	Romania 24,900; France 5,425.
Metal including alloys:				
Scrap	47	--		
Semimanufactures	--	8	(1)	United Kingdom 7.

See footnotes at end of table.

Table 3.—Greece: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980	Destinations, 1980	
			United States	Other (principal)
METALS —Continued				
Uranium and thorium:				
Ore and concentrate value, thousands	--	$205	--	All to France.
Zinc:				
Ore and concentrate	r47,489	44,741	--	Italy 11,495; Bulgaria 9,048; Belgium-Luxembourg 8,000.
Oxides and hydroxides	--	7	--	All to Saudi Arabia.
Metal including alloys:				
Scrap	753	629	--	Italy 596; United Arab Emirates 33.
Unwrought and semimanufactures	86	42	--	Mainly to United Kingdom.
Other:				
Ores and concentrates	8,832	942	--	Yugoslavia 920; Spain 22.
Ash and residue containing nonferrous metals	25,516	88,208	--	Mexico 26,743; Saudi Arabia 21,683; Italy 15,379.
Base metals including alloys, all forms	--	106	--	All to Netherlands.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Pumice, emery, corundum, etc.	r246,432	412,923	140,557	West Germany 150,044; United Kingdom 65,309; Netherlands 53,973.
Dust and powder of precious and semiprecious stones value, thousands	$172	$79	$62	West Germany $17.
Grinding and polishing wheels and stones	r76	55	--	Switzerland 18; France 13; Lebanon 11.
Barite and witherite	38,537	55,259	28,800	Nigeria 12,100; Saudi Arabia 6,750; Kuwait 6,749.
Cement thousand tons	4,271	5,222	--	Saudi Arabia 2,376; Egypt 724; Yemen Arab Republic 437.
Chalk	157	619	--	Saudi Arabia 342; Cyprus 203.
Clays and clay products:				
Crude	r464,051	485,449	--	Canada 149,452; Italy 60,173; Sweden 41,683.
Products:				
Nonrefractory	14,382	18,154	1	Saudi Arabia 10,145; Libya 2,926; Jordan 1,001.
Refractory including nonclay brick	41,261	43,340	--	Romania 12,645; West Germany 4,456; France 4,169.
Feldspar, fluorspar, leucite, nepheline	73	--		
Fertilizer materials:				
Crude	159	943	--	Jordan 500; Saudi Arabia 443.
Manufactured:				
Nitrogenous	2	--		
Potassic	200	500	--	All to Cyprus.
Other including mixed	r15,350	71,944	--	Algeria 29,850; China 20,530; Italy 7,830.
Gypsum and plasters	r5	19	--	All to Cyprus.
Lime	3,160	130	--	All to Cameroon.
Magnesite	r473,521	423,809	15,122	West Germany 107,001; Italy 74,179; Yugoslavia 40,640.
Pigments, mineral: Iron oxides, processed	1	--		
Precious and semiprecious stones other than diamond: Synthetic value, thousands	$2	$75	--	All to Albania.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	r39,851	51,452	471	Italy 11,635; Lebanon 9,112; West Germany 6,834.
Worked	r19,932	53,328	1	Saudi Arabia 31,409; Libya 8,007; West Germany 5,097.
Gravel and crushed rock	13,719	15,804	--	Libya 15,435; Lebanon 308.
Quartz and quartzite	18,420	27,013	--	Sweden 18,943; Norway 8,050; Lebanon 20.
Sand other than metal-bearing	--	12	--	All to Austria.
Sulfur:				
Elemental: Other than colloidal	10,756	2,046	--	Bulgaria 2,010; United Kingdom 36.
Sulfuric acid	26,637	162,927	--	Turkey 156,609; Albania 3,624; Syria 1,262.
Talc, steatite, soapstone, pyrophyllite	1,405	--		

See footnotes at end of table.

(Metric tons unless otherwise specified)

Commodity	1979	1980	Destinations, 1980	
			United States	Other (principal)
NONMETALS —Continued				
Other:				
Crude	r217,844	285,748	17	West Germany 107,007; France 48,892; United Kingdom 32,035.
Slag, dross, and similar waste, not metal-bearing	18,367	9,007	--	Norway 5,000; Netherlands 976; Italy 937.
Oxides, hydroxides, peroxides of barium, magnesium, strontium	r3,835	6,126	--	France 5,661; Hungary 464.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	r34,152	33,572	--	Saudi Arabia 12,117; Libya 9,584; Cyprus 4,316.
MINERAL FUELS AND RELATED MATERIALS				
Coal: Lignite including briquets	21	45	--	All to Saudi Arabia.
Coke and semicoke	38,123	22,000	--	All to Spain.
Petroleum refinery products:				
Gasoline thousand 42-gallon barrels	2,322	1,222	75	Italy 399; United Kingdom 314; Denmark 269.
Kerosine and jet fuel do	1,297	5,113	2,328	Netherlands 389; Portugal 256; France 233.
Distillate fuel oil do	3,211	2,904	1,044	France 405; Saudi Arabia 392; West Germany 341.
Residual fuel oil do	9,699	10,528	38	Italy 3,447; France 2,699; Netherlands 1,532.
Lubricants do	473	400	73	Egypt 134; Italy 52; Syria 47.
Other:				
Liquefied petroleum gas do	326	51	--	Cyprus 17; France 15; Egypt 13.
Mineral jelly and wax do	82	130	--	West Germany 93; Morocco 36.
Bitumen and other residues do	r304	1	--	Mainly to Cyprus.

rRevised.

Iron and steel:				
Ore and concentrate	r390,590	288,463	--	Republic of South Africa 239,685; Venezuela 48,758.
Metal:				
Scrap	231,286	239,004	217,284	Bulgaria 15,071; Cyprus 2,183.
Pig iron including cast iron	15,014	9,512	--	U.S.S.R. 6,465; West Germany 1,094; Spain 997.
Sponge iron, powder, shot	r493	771	(1)	France 218; Italy 177; United Kingdom 175.
Ferroalloys	r15,146	13,931	11	Portugal 10,007; France 1,988.
Steel, primary forms	385,438	630,584	--	France 146,634; Brazil 104,292; Japan 81,890; Italy 76,050.
Semimanufactures:				
Bars, rods, angles, shapes, sections	217,111	207,360	9	France 51,401; Czechoslovakia 34,570; West Germany 26,843; Italy 24,656.
Universals, plates, sheets	180,859	208,611	950	Japan 48,288; West Germany 37,599; France 28,586; Czechoslovakia 22,387.
Hoop and strip	97,046	121,632	1,268	West Germany 39,252; France 33,338; Bulgaria 15,512; Czechoslovakia 11,033.
Rails and accessories	24,735	1,118	--	West Germany 396; Belgium-Luxembourg 303; Italy 213.
Wire	7,408	8,405	1	West Germany 3,212; Italy 1,371; Belgium-Luxembourg 1,146.
Tubes, pipes, fittings	31,524	31,318	127	West Germany 15,746; France 3,622; Italy 3,006.
Castings and forgings, rough	1,222	2,083	57	Belgium-Luxembourg 737; France 511; West Germany 435.
Lead:				
Ore and concentrate	3,468	7,022	--	Ireland 2,834; Greenland 2,686; Italy 1,502.
Oxides and hydroxides	r70	251	--	France 215; Bulgaria 15; United Kingdom 14.
Metal including alloys:				
Unwrought	r4,806	7,807	(1)	Tunisia 2,975; Bulgaria 2,423; Morocco 978.
Semimanufactures	r156	13	(1)	Netherlands 6; West Germany 5.
Magnesium metal including alloys, all forms	r518	503	73	France 317; Norway 87; Yugoslavia 24.
Manganese:				
Ore and concentrate	r4,721	29,278	--	Brazil 16,898; Republic of South Africa 12,380.
Oxides and hydroxides	54	108	--	Mainly from Belgium-Luxembourg.
Metal including alloys, all forms	140	NA		
Mercury 76-pound flasks	87	87	--	Turkey 58.
Molybdenum metal including alloys, all forms	1	1	(1)	Mainly from Austria and West Germany.
Nickel metal including alloys:				
Scrap	2	1	--	All from Netherlands.
Unwrought	r175	182	(1)	Canada 117; East Germany 22.
Semimanufactures	r43	58	(1)	United Kingdom 19; West Germany 18; Hungary 9; Italy 8.
Platinum-group metals including alloys, unwrought and partly wrought value, thousands	$2,535	$1,595	$461	West Germany $556; Switzerland $416.
Silver metal including alloys, unwrought and partly wrought do.	$17,713	$6,443	$609	Switzerland $2,007; West Germany $1,973; United Kingdom $997.
Tin metal including alloys:				
Unwrought	799	468	--	Malaysia 206; Bolivia 198; West Germany 46.
Semimanufactures	15	19	--	West Germany 10; United Kingdom 7.
Titanium: Oxides and hydroxides	837	680	--	West Germany 378; France 137; Belgium-Luxembourg 121.
Tungsten metal including alloys, all forms	1	5	(1)	Austria 2; Sweden 2.
Uranium and thorium:				
Ore and concentrate value, thousands	--	$22	--	United Kingdom $17; Italy $5.

Zinc:				
Oxides and hydroxides	446	606	(1)	France 219; Netherlands 215; West Germany 146.
Metal including alloys:				
Scrap	43	23	--	Bulgaria 18; Italy 5.
Unwrought	r20,941	18,812	--	Netherlands 5,834; Belgium-Luxembourg 2,614; Zaire 2,562.
Semimanufactures	189	154	--	Norway 59; Belgium-Luxembourg 43; West Germany 38.
Other:				
Ores and concentrates	r1,600	7,498	--	Republic of South Africa 3,982; Italy 1,176; Australia 1,094.
Ash and residue containing nonferrous metals	284	95	--	All from Kuwait.
Metals:				
Metalloids	r535	632	5	France 604; West Germany 21.
Alkali, alkaline-earth, rare-earth metals	1,609	2,080	--	Mainly from West Germany.
Base metals including alloys, all forms	r168	193	5	France 163; Belgium-Luxembourg 11.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Pumice, emery, corundum, etc	8	39	7	Italy 32.
Artificial: Corundum	r605	512	--	West Germany 214; France 157; Poland 60.
Dust and powder of precious and semiprecious stones value, thousands	$2,410	$3,215	$1,069	Belgium-Luxembourg $1,215; West Germany $537.
Grinding and polishing wheels and stones	346	277	6	Italy 91; West Germany 44; Austria 39; East Germany 39.
Asbestos, crude	15,214	14,181	5	Republic of South Africa 6,128; Cyprus 4,591; Canada 1,875.
Barite and witherite	110	137	--	Turkey 60; West Germany 57; United Kingdom 20.
Boron materials:				
Crude natural borates	501	600	600	
Oxide and acid	443	214	--	France 88; Italy 66; Netherlands 47.
Cement	127	770	--	Italy 620; Denmark 64; United Kingdom 33.
Chalk	971	580	--	Austria 311; France 140; United Kingdom 64.
Clays and clay products:				
Crude	r72,615	113,902	276	United Kingdom 67,453; Czechoslovakia 11,509; Italy 10,722.
Products:				
Nonrefractory	45,860	32,454	(1)	Italy 31,408; West Germany 561.
Refractory including nonclay brick	32,783	29,433	117	West Germany 8,434; Italy 4,830; France 4,255.
Cryolite and chiolite, natural	5	NA		
Diatomite and other infusorial earth	677	521	333	West Germany 165; Italy 16.
Feldspar and fluorspar	20,643	16,044	--	Norway 9,557; Italy 2,935; Kenya 2,000.
Fertilizer materials:				
Crude:				
Phosphatic	82,864	244,261	--	Morocco 150,482; Tunisia 83,432; Israel 10,336.
Other including mixed	--	1	--	All from Austria.
Manufactured:				
Nitrogenous	r120,820	73,547	--	Romania 26,802; Bulgaria 25,346; Italy 9,242.
Potassic	r9,116	50,475	--	West Germany 19,090; Spain 17,494; Belgium-Luxembourg 8,401.
Other including mixed	r211	3,538	--	West Germany 2,870; Belgium-Luxembourg 498.
Ammonia	r82,188	68,490	--	Libya 27,626; U.S.S.R. 17,937; Romania 9,920.
Graphite, natural	154	194	--	Czechoslovakia 82; Austria 50; Switzerland 40.
Gypsum and plasters	1,289	1,175	--	Italy 662; West Germany 386; France 80.

See footnotes at end of table.

Table 4.—Greece: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980	Sources, 1980	
			United States	Other (principal)
NONMETALS —Continued				
Magnesite	457	881	2	Austria 665; Yugoslavia 59; France 49.
Mica:				
Crude including splittings and waste	173	272	20	Austria 165; India 45; France 13.
Worked including agglomerated splittings	26	10	(1)	Japan 3; United Kingdom 3; Belgium-Luxembourg 2.
Pigments, mineral: Iron oxides, processed	r2,119	2,103	(1)	West Germany 1,521; United Kingdom 222; Italy 142.
Precious and semiprecious stones other than diamond:				
Natural value, thousands	$564	$191	--	Belgium-Luxembourg $117; Switzerland $24; Brazil $16.
Synthetic do.	$82	$14	--	West Germany $7; Austria $3.
Pyrites, unroasted	r14,413	69,977	--	Cyprus 31,622; U.S.S.R. 14,163; East Germany 12,705.
Salt and brine	r7,288	39,241	--	Romania 21,602; Italy 14,202; Tunisia 3,023.
Sodium and potassium compounds, n.e.s.:				
Caustic potash	256	295	(1)	Italy 174; France 75; West Germany 29.
Caustic soda	r50,956	60,418	7	France 36,682; Bulgaria 17,623; Italy 6,022.
Soda ash	r33,871	31,025	299	Bulgaria 18,687; Belgium-Luxembourg 7,406; France 2,101.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	r10,709	2,843	(1)	Italy 1,074; Pakistan 914; Bulgaria 435.
Worked	r593	336	--	Italy 281; Mexico 33.
Dolomite, chiefly refractory-grade	r1,372	2,372	--	Italy 2,250; Austria 32; West Germany 31.
Gravel and crushed rock	665	791	--	France 341; Belgium-Luxembourg 297; West Germany 61.
Limestone other than dimension	--	30	--	West Germany 22; United Kingdom 8.
Quartz and quartzite	449	36	--	West Germany 25; United Kingdom 9.
Sand other than metal-bearing	111,930	126,993	59	Belgium-Luxembourg 108,921; Bulgaria 10,411.
Sulfur:				
Elemental:				
Other than colloidal	r58,503	41,187	--	Poland 24,712; Canada 16,182; Kuwait 189.
Colloidal	r339	49	--	West Germany 18; France 16; Italy 15.
Sulfuric acid	r15,712	58	--	Netherlands 28; West Germany 21; Italy 9.
Talc, steatite, soapstone, pyrophyllite	r1,776	2,267	4	France 882; Belgium-Luxembourg 473; Italy 197.
Other:				
Crude	r502	1,496	31	Gabon 66; Finland 173; Australia 149.
Slag, dross, and similar waste, not metal-bearing	r2,865	121,174	--	Italy 116,544; Turkey 2,640; United Kingdom 1,181.
Oxides, hydroxides, peroxides of barium, magnesium, strontium	r155	57	12	Italy 21; West Germany 11; France 6.
Halogens excluding chlorine	3	2	--	West Germany 1; United Kingdom 1.
Building materials of asphalt, asbestos and fiber cements, unfired non-metals	r2,874	2,528	10	France 938; Italy 925; Romania 407.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	20	22	5	France 17.
Carbon black	1,437	798	12	West Germany 481; France 108; Italy 91.
Coal and briquets:				
Anthracite and bituminous coal	r454,440	480,684	47,874	Canada 311,952; Poland 99,071; U.S.S.R. 20,137.
Briquets of anthracite and bituminous coal	180	408	--	All from Czechoslovakia.
Coke and semicoke	r72,313	31,732	--	Italy 21,515; Czechoslovakia 5,505; Yugoslavia 2,844.
Hydrogen, helium, rare gases	r504	NA		
Peat including briquets and litter	r3,502	3,337	--	U.S.S.R. 1,942; Netherlands 1,083.

See footnotes at end of table.

COMMODITY REVIEW

METALS

Metallic and nonmetallic mining and metallurgy, in no small way, helped shape the life and development of Greece for over 3,000 years; the earliest European treatise on minerals and metallurgy "Peri Lithon" (On Stones) had been attributed to Theophrastos, a pupil of Aristotle.

In 1981, out of occurrences of approximately 50 known mineral ores, about 20 were mined and underwent varying degrees of processing. The country produced both metallic and nonmetallic ores and mineral fuels, that for the first time included petroleum and natural gas. Private and Government-controlled producers of ores, fuels, and metallurgical products remained, for the most part, the same in 1981 as they were in 1980. The two notable exceptions were the virtual nationalization of Larco S.A. (Bodossakis Foundation), the country's chief nickel producer, and the proposed sale to the Greek Government of the Laurium mining operations (Companie Française des Mines du Laurium S.A.F.) by the controlling French firm, Penarroya.

Aluminum.—Greece remained the world's eighth largest producer of bauxite. The mineral was mined primarily in the mountainous regions of the central part of the country. According to the latest published sources, the proved and possible reserve base was about 650 million tons of ore, although other estimates have indicated a reserve base of up to 1 billion tons. The ore was of good quality, and was graded at an average of 56% Al_2O_3 and 4% SiO_2.

The Bauxite Parnasse Mining Co. S.A. of the Eliopolos Kyriacopoulos Group, the largest bauxite producer in Greece, came close to its planned 2-million-ton output for 1981 with a reported actual production of 1.8 million tons. The company's underground mine expansion program continued in 1981 with the objective of underground mining output reaching 50% of the total by 1982. Elsewhere, the second largest bauxite producer, Eleusis Bauxite Mines of the Scalistiris Group, was reported to have begun the development of a new mine at Lamia. Elikon Bauxite (G. Barlos S.A.) and the three mining subsidiaries of Aluminium de Grece S.A. (AG) remained the other leading producers, with a combined annual

capacity of over 900,000 tons, and were reported to have continued with their facility upgrading programs in 1981.

Despite a depressed world metals market and reduced domestic aluminum sales in 1981, demand for Greek bauxite increased owing reportedly to a rise in its use in steel production, as well as to reported Soviet stockpiling. Prices per ton of bauxite were expected to rise 25% in 1981 over those of 1980. As in previous years, most of the Greek bauxite was shipped to the Soviet Union and Romania; a substantially smaller amount was exported to the EEC. The remaining bauxite was used domestically by Aluminium de Grece S.A. (AG) to produce alumina and aluminum.

In April 1981, an agreement was concluded between the Soviet firm Tsvetmetexport and the Hellenic Industrial Development Bank (ETVA) for a Soviet feasibility study for the construction of a new 600,000-ton-per-year alumina plant in Greece. The Soviet plan to build this plant called for payment in alumina over a period of years. The issue of market guarantees for the plant's alumina production after the investment was repaid had reportedly caused some concern to the Greek authorities. A counter proposal from the Government of Iraq called for the construction of an integrated alumina-aluminum facility, which would be powered by Iraqi oil. Payment would be in primary metal. Iraq would also have a share of the sales to third parties in the event it could not domestically absorb the aluminum. No decision or firm commitment was reported on these proposals during the year.

The Greek primary aluminum industry, established in 1965 at Aspra Spitia, was wholly owned and operated by Aluminium de Grece S.A. (AG), a subsidiary of the nationalized Pechiney Group of France. The industry, adversely affected by a depressed world aluminum market in 1981 and by a 20,000-ton decrease in domestic sales with respect to that of 1980, was nevertheless able to increase output by 1,000 tons and exports as a percent of sales by 13%. This was largely owing to increased sales to the Middle East and to the EEC. Reportedly, Syria, Saudi Arabia, Jordan, and the United Arab Emirates contracted for about 50% of the exported aluminum.

Chromite.—Greek chromite ranges from 18% to 20% Cr_2O_3 at Xeralivado to 35% Cr_2O_3 in scattered podiform deposits. In 1981, work sponsored by the Greek Government, through ETVA and the Hellenic Industrial and Mining Co. (HIMIC), included groundbreaking in March for the 30,000-ton-per-year Tsigeli ferrochromium plant, near Volos.

The Tsigeli plant was planned to undergo scheduled trial runs by the end of 1982, and full startup of operations would begin in early 1983. Technology would be provided by Outokumpu Oy of Finland at a cost of $23 million to $28 million. The Hellenic Ferro-Alloy S.A., a HIMIC subsidiary in charge of Greek ferrochromium development, in parallel with the Tsigeli ferrochrome plant project, planned to begin construction of a chromium concentrator at Skoumtsa in late 1981 to produce concentrate with a 50% Cr_2O_3 content. The project was planned for completion at the beginning of the trial runs of the Tsigeli plant in 1982. United States and Swedish companies were reported as the main bidders for supplying equipment for this plant.

Iron and Steel.—Salient developments in the industry concerned the Metallurghiki Halyps Co. Facility expansion and improvement was begun that would eventually raise the company's plant capacity to 600,000 tons. This company also concluded an agreement through the Swiss firm Sytco to sell 100,000 tons of construction steel and 100,000 tons per year of pipe to the U.S.S.R. in 1981-85; the value of this sale was in excess of $300 million.

Lead and Zinc.—The Aegean Metallurgical Industries S.A., the former Hellenic Metals S.A. and a subsidiary of ETVA, did not proceed with its investment plans for the development of the lead-zinc sector in 1981 owing to the depressed world prices for lead, zinc, and silver. The firm was to produce a smelting facility in northern Greece for the production of lead and zinc as well as associated gold, silver, and other metals. Although the project was not abandoned, the Greek Government would require fuller study prior to its implementation.

The Kassandra lead and zinc mines on the Chalkidiki Peninsula reported on overall production increase for the year. Also, new but unspecified lead-zinc deposits were reported to have been discovered by the Kassandra mining operations, which are owned by Hellenic Chemical Products and Fertilizers Co.

At the end of 1981, Greece's oldest lead-zinc-silver mining operation, Companie

Française des Mines du Laurium S.A.F., a subsidiary of Penarroya of France, suspended its lead-silver operations, and offered to sell its assets to the Greek Government. Negotiations were reportedly conducted for Government acquisition of this firm. The company asked about $10 million in foreign exchange of which about $2.7 million would be used to settle outstanding debts.

Nickel.—Owing to very adverse international nickel market conditions, Larco S.A. of the Bodossakis Group, the country's largest nickel producer, suffered a 20% production cutback and inccurred a debt of over 800 million drachmas for the year. Late in 1981, Government banks foreclosed on the company and took about 80% of the company's equity to settle the debts, including a sum of $30.4 million that was borrowed at the beginning of the year at a 4% annual interest rate. Negotiations between the Government and Larco S.A. were reported to have begun in 1981 to create a new industrial concern with predominant Government financial control.

NONMETALS

Asbestos.—The ETVA-sponsored 5-million-ton-per-year open pit mine and 100,000-ton-per-year processing plant at Zidani in northern Greece were put into operation. The cost of the project exceeded $60 million. The asbestos reserves were estimated at 95 million tons with a 2.6% chrysotile fiber content. The export of the Greek asbestos fibers will be conducted through a Greek company working jointly with the PETROW Co., a firm specializing in world asbestos trade.

Magnesite.—The magnesite industry, as most other domestic mining industries, was hurt by adverse market conditions. The downward business trend began in the second half of 1980, and continued through the end of 1981. The depressed steel market as well as competition from North Korean and Chinese lower quality and lower priced products were some of the causes of this condition. In 1980, Larco S.A. of the Bodossakis Group closed its magnesite processing and sintering facilities at Troupi in northern Euboea. The industry's plan to lower production in 1981 was largely carried out. Furthermore, this trend was forecast to continue at least through 1982.

MINERAL FUELS

Lignite.—Greek authorities announced plans to increase the production of domestic lignite, as well as oil and gas, to reduce the country's reliance on imported sources of primary energy.

By yearend the Public Power Corp. had increased Greek lignite output by nearly 4 million tons per year. Exploration for new deposits continued at Ptolemais, Pyrgos, Aliveri, Megalopolis, and in Crete (Kandanos Area).

Petroleum and Natural Gas.—The Prinos offshore oilfields and gasfields began Greece's first production during the year. Production was expected to reach 30,000 barrels per day of crude oil and 18 million cubic feet of gas.

During the year the Greek Government awarded a license to the Italian firm AGIP S.p.A. that would allow this firm to conduct exploratory drilling in the Paxi area. Petroleum exploration during the year had mainly negative results.

Uranium.—Reportedly, a new uranium deposit was discovered at Arkoudorema. The deposit is apparently larger than the Paranestion deposit, also in the same area. The exploration of uranium in the Maramena lignite deposits was moderately successful with reserves there estimated at 4,000 tons.

e Estimated.
[1]One ton of standard coal equivalent (SCE)=7,000,000 kilocalories. Conversion factors used are hard coal, 1.0; lignite and brown coal, 0.5; briquets 0.67; coke, 0.9; crude oil, 1.47; refinery products, 1.53; natural gas, 1.33 (per thousand cubic meters); manufactured gas, 0.6; and hydroelectric power, 0.125 (per thousand kilowatt-hours).

The Mineral Industry of Hungary

By Walter G. Steblez[1]

In 1981, Hungary's centrally planned economy showed signs of overall improvement compared with that of 1980. Although the planned 1981 targets for all major economic indicators were not met, actual performance shortfalls, in most cases, varied by narrow margins from their respective plans.

National income (gross national product less services) increased 1.8% versus the planned 2.5%, and industry's share of generated national income amounted to 49%. Industrial production rose 2.3% in 1981 versus the planned 3.0% to 3.5%. The mining sector's share of gross industrial production was 6.0% and that of metallurgy was 9.9%. The mining industry's labor force declined by about 8% in 1981 to approximately 113,000 workers, of which 17% were nonmanual and technical personnel; the country's labor productivity in the mining sector was reported to have dropped by about 2.4%; however, the wage scale remained the highest in industry and amounted to an average monthly earning of 6,642 forints.[2] The metallurgical sector's wage scale was the second highest in industry at 5,054 forints per month.

Government Policies and Programs.—The general aim of the Hungarian state planning bodies in recent years has been to increase the production of marketable industrial goods in accordance with Western quality standards. The often-stated ultimate aim of this program was the creation of some degree of currency convertibility of the forint with other Western convertible currencies. This would require the upgrading of Hungarian technology and industrial efficiency to Western European standards. Two of the problems that Hungarian industry had to face during the year were the need for increased energy conservation and alignment of its output with the depressed market conditions for a number of products, including metallurgical production. During the year, prices for petroleum increased 12%. The price of natural gas rose 15%, and that of coal and coke increased by 10% and 5%, respectively. The price of electricity went up 9%, and that of thermal energy increased by 11%.

Wage-incentive plans for 1982 included a stricter linkage of wage with measurable increases in productivity; wage increases would apparently be smaller than in the past but would also be less arbitrary. The existing wage rates, however, would still apply to coal and ore mining, ferrous metallurgy, and a number of other industrial areas.

The Hungarian national economic plan for 1982 called for a 1.0% to 1.5% increase of the national income compared with that of 1981. Industrial production was to grow by 2.0% to 2.5% over the same period. Per capita income and consumption would remain at approximately the same level as in 1981. It was also expected that the industrial labor force would decrease in 1982, but that production increases would stem from increases in productivity.

Major investments in the mining and metallurgical fields would continue in 1982 with ongoing new mine development and facility expansion in the bauxite mining industry. Industrial development was planned in both light and heavy metal production, in coking coal production, and in the nuclear energy field.

PRODUCTION

Owing to limited markets, production dropped in the mining, smelting, and construction-materials industries. The output of the Hungarian steel industry declined by 4% in the first half of 1981 compared with output during the corresponding period in 1980. Some production bottlenecks were allegedly caused by inadequate transportation, which caused inventories to rise excessively.

Also, shortfalls by the country's machine industry was reportedly one of the reasons only a moderate increase in industrial production was achieved during the year. Transportation manufacturing facilities were reportedly allowed to stagnate, while the branches producing communication equipment developed at a faster pace.

In 1981, Hungary's mineral industry continued to produce substantial quantities of bauxite and manganese ore, as well as some lead-zinc ores and uranium.

[e]Estimated. [p]Preliminary. [r]Revised.

[1]Table includes data available through Sept. 2, 1982.

[2]In addition to the commodities listed, diatomite, gypsum, and a variety of other crude construction materials such as common clays are produced, but available information is inadequate to make reliable estimates of output levels.

[3]Reported figure.

[4]18% to 20% Mn.

[5]Excludes refinery fuel and losses.

[6]Data derived by subtracting reported motor gasoline and white spirit data from reported light refinery products total.

TRADE

The Hungarian foreign trade position showed overall improvement in 1981 compared with that of 1980, although the plan was not fulfilled. Total exports for the year rose by 6.4% compared with those of 1980, and imports increased by 4.7%. The country's incurred foreign trade deficit was reduced to 15 billion forints in 1981 from 19 billion forints in 1980. Trade with the Council for Mutual Economic Assistance (CMEA) bloc[3] increased by about 7.4%, and, reportedly, trade with the Soviet Union achieved the first surplus since 1974. On the other hand, exports to market economy countries dropped 3.0% compared with those of 1980, and imports were reduced by 0.9%; the percentage of total trade that was conducted with market economy countries in convertible currency declined by 2% to 45%.

In the CMEA bloc, the Soviet Union remained Hungary's largest trading partner; the second most important trading partner was the German Democratic Republic. In convertible currency trade, the Federal Republic of Germany remained Hungary's largest trading partner, followed by Austria.

In mineral commodity trade, depressed world prices in 1981 allowed Hungary to purchase metallurgical products, with the exception of zinc, at substantially lower prices than in 1980 but the same market conditions also reduced the export price of Hungarian rolled steel by 12% and foundry aluminum by 21% on the world market in 1981. However, in CMEA soft-currency trade, the export values for Hungarian-produced bauxite, alumina, and foundry aluminum as well as finished aluminum products and rolled steel increased from 19% to 27%, which, in part, reflected the import price increases for petroleum and gas as well as coal briquets. On the whole, Hungary's raw and other material import bill was about 12% higher in 1981 than in 1980.

Unwrought	81,915	85,886	--	Poland 18,955; Czechoslovakia 17,807; East Germany 12,427.
Semimanufactures	27,241	28,861	--	East Germany 8,111; Sweden 3,708; France 2,061.
Cadmium metal including alloys, all forms	10	NA	--	NA.
Chromium:				
Ore and concentrate	2,918	NA	--	NA.
Oxides and hydroxides	[r]337	105	--	Italy 63; Finland 25; Yugoslavia 15.
Cobalt oxides and hydroxides	3	NA	--	NA.
Copper:				
Sulfate	560	414	--	West Germany 194; France 160; Austria 50.
Metal including alloys:				
Scrap	6,616	5,195	--	Austria 3,459; West Germany 1,611.
Unwrought	6,935	3,857	--	All to West Germany.
Semimanufactures	[r]2,421	3,566	144	West Germany 1,866; Austria 887; Italy 293.

See footnotes at end of table.

Table 2.—Hungary: Apparent exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980[p]	Destinations, 1980	
			United States	Other (principal)
METALS —Continued				
Iron and steel:				
Ore and concentrate	1,616	NA	--	NA.
Metal:				
Scrap	[3]37,000	[3]31,000	--	Italy 18,554; West Germany 8,911; Austria 3,285.
Pig iron, cast iron, powder, shot[2]	15,477	2,149	--	All to Yugoslavia.
Ferroalloys[3]	2,000	2,000	--	NA.
Steel, primary forms[2]	9,239	13,119	--	Turkey 5,585; West Germany 4,486; Switzerland 2,002.
Semimanufactures:				
Bars, rods, angles, shapes, sections[2]	[r]839,827	714,070	41	Iran 146,701; West Germany 116,049; U.S.S.R. 88,783.
Universals, plates, sheets[2]	384,234	311,345	--	Italy 53,236; Iran 39,585; India 30,655.
Hoop and strip[2]	18,750	15,608	--	Romania 6,489; Iran 1,539; Czechoslovakia 1,512.
Rails and accessories	--	327	--	West Germany 169; Austria 107; Yugoslavia 46.
Wire[2]	20,707	19,204	--	Iran 5,514; West Germany 3,990; Austria 2,209.
Tubes, pipes, fittings[2]	72,287	67,622	--	U.S.S.R. 12,922; West Germany 5,679; Finland 4,994.
Castings and forgings, rough[2]	25,378	20,088	--	India 4,121; West Germany 3,708; Italy 2,695.
Unspecified[2]	43,365	36,787	--	West Germany 19,898; Iraq 3,190; Sweden 2,882.
Lead:				
Oxides	3	NA	--	NA.
Metal including alloys:				
Scrap	1,226	7,974	--	Italy 5,689; West Germany 1,258; Austria 1,027.
Unwrought	286	NA	--	NA.
Semimanufactures	2	75	--	Saudi Arabia 74.
Manganese ore and concentrate[3]	56,795	37,745	--	Poland 28,841; Czechoslovakia 8,904.
Molybdenum metal including alloys, all forms kilograms	--	715	--	Yugoslavia 707.
Nickel:				
Matte and speiss	185	21	--	All to Austria.
Metal including alloys:				
Scrap	220	474	--	West Germany 461; Austria 10.
Unwrought	476	261	48	Austria 150; West Germany 51.
Semimanufactures	134	158	--	Yugoslavia 89; West Germany 21; Italy 15.
Platinum-group metals including alloys, unwrought and partly wrought value, thousands	$95	$2,063	--	West Germany $1,817; Italy $246.
Silver:				
Waste and sweepings[4] do	$5,315	$6,365	--	West Germany $6,146; United Kingdom $198.
Metal including alloys, wrought or partly wrought do	$1,304	$1,578	$207	West Germany $503; Austria $360; United Kingdom $243.
Tantalum metal including alloys, all forms	1	NA	--	NA.
Tin metal including alloys, scrap	62	18	--	All to United Kingdom.
Tungsten metal including alloys, all forms	2	1	--	Mainly to Yugoslavia.
Zinc metal including alloys:				
Scrap	599	738	--	West Germany 421; Austria 317.
Semimanufactures	5	NA	--	NA.
Zirconium metal including alloys, all forms kilograms	400	NA	--	NA.
Other metals:				
Ores and concentrates	55	NA	--	NA.
Ash and residues	19,766	22,671	--	Austria 18,543; West Germany 3,141.
Oxides and hydroxides	134	17	11	Switzerland 5.
Metalloids	--	3	--	Belgium-Luxembourg 2; Indonesia 1.
Alkali, alkaline-earth, rare-earth metals	10	NA	--	NA.
Base metals including alloys, all forms	58	196	(5)	West Germany 127; Austria 68.
NONMETALS				
Abrasives:[2]				
Artificial: Corundum	8,512	9,173	--	West Germany 6,600; Romania 1,040; Italy 601.
Grinding and polishing wheels and stones value, thousands	$2,118	$2,110	$60	Romania $1,084; East Germany $550; Poland $41.

See footnotes at end of table.

Table 2.—Hungary: Apparent exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980[p]	Destinations, 1980	
			United States	Other (principal)
NONMETALS —Continued				
Asbestos, crude	5,078	5,285	--	All to Belgium-Luxembourg.
Boron materials: Oxides and acids	39	NA	--	NA.
Cement[2]	299,231	186,400	--	Yugoslavia 136,713; Poland 25,001; U.S.S.R. 15,237.
Clays and clay products:				
Crude:				
Andalusite, kyanite, sillimanite, etc	--	177	--	All to Austria.
Bentonite[2]	14,797	15,604	--	East Germany 11,004; Poland 4,499.
Chamotte earth	--	485	--	All to Austria.
Kaolin[2]	6,791	6,496	--	Czechoslovakia 4,748; West Germany 1,748.
Unspecified	2,459	158	--	Italy 120; Netherlands 25; Greece 13.
Products:				
Nonrefractory	r901	4,461	--	Austria 1,901; West Germany 1,401; Italy 371.
Refractory[2]	32,265	24,757	--	Romania 8,432; Italy 3,665; West Germany 2,953.
Diamond:				
Gem, not set or strung value, thousands	$58	$76	--	Belgium-Luxembourg $52; Switzerland $22.
Industrial do	$1,726	$1,018	--	Belgium-Luxembourg $1,011.
Diatomite and other infusorial earth	2,663	3,832	--	Austria 3,663; Switzerland 147.
Feldspar, fluorspar, etc	--	2,491	--	All to Switzerland.
Fertilizer materials:				
Crude, nitrogenous	137	NA	--	NA.
Manufactured:				
Nitrogenous	r 2748,015	2960,839	--	Yugoslavia 138,090; West Germany 97,274; undetermined 622,653.
Potassic	431	NA	--	NA.
Other including mixed	39,705	97,998	--	West Germany 53,131; Yugoslavia 28,324; Turkey 7,689.
Ammonia[2]	104,052	86,500	--	Yugoslavia 69,737; Poland 11,077; Austria 2,279.
Lime	--	20	--	All to Switzerland.
Magnesite	24	NA	--	NA.
Mica, worked including agglomerated splittings value, thousands	--	$5	--	All to Italy.
Pigments, mineral: Iron oxides and hydroxides, processed	911	65	--	Yugoslavia 40; Greece 15.
Precious and semiprecious stones:				
Natural value, thousands	$82	$2	--	All to Switzerland.
Synthetic do	--	$6	--	All to West Germany.
Sodium and potassium compounds:				
Caustic potash	72	NA	--	NA.
Caustic soda	27,817	3,000	--	All to Yugoslavia.
Soda ash	--	6	--	All to Egypt.
Stone, sand and gravel:				
Dimension stone, worked	204	1,227	--	Switzerland 889; Austria 187; West Germany 118.
Dolomite, chiefly refractory-grade	r333	348	--	West Germany 248; Finland 100.
Gravel and crushed rock[2]	213,274	96,260	--	Yugoslavia 72,900; U.S.S.R. 15,905.
Limestone excluding dimension	74,017	22,660	--	All to Yugoslavia.
Quartz and quartzite	4,660	9,386	--	Austria 9,325.
Sand:[2]				
Industrial	35,801	37,752	--	Yugoslavia 19,616; Austria 16,549.
Construction cubic meters	329,314	299,078	--	Czechoslovakia 267,544; Austria 26,728.
Sulfur:				
Elemental, crude	4,850	1,449	--	All to Austria.
Sulfuric acid[2]	79,323	68,411	--	Yugoslavia 58,041; Austria 5,444; Poland 4,902.
Talc, steatite, soapstone, pyrophyllite	r220	NA	--	NA.
Other nonmetals:				
Crude[3]	104,714	104,487	(5)	East Germany 28,318; Austria 27,329; Poland 12,540.
Slag and dross, not metal-bearing	1,168	46,980	--	Yugoslavia 45,452; West Germany 1,062.
Halogens	2,548	NA	--	NA.
Halides[2]	3,067	--		
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	842	198	--	All to Tunisia.
Carbon black	40	NA	--	NA.

See footnotes at end of table.

Table 2.—Hungary: Apparent exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980[p]	Destinations, 1980	
			United States	Other (principal)
MINERAL FUELS AND RELATED MATERIALS —Continued				
Coal and briquets:				
Anthracite and bituminous coal[6]	43,500	267,000	--	NA.
Briquets of anthracite and bituminous coal	--	40	--	All to Austria.
Lignite including briquets[2]	20,983	44,547	--	Austria 24,221; U.S.S.R. 20,326.
Coke and semicoke	[2]23	596	--	All to Austria.
Gas, natural—million cubic feet	271	311	--	All to U.S.S.R.
Peat including briquets[2]	4,547	6,340	--	Austria 2,215; West Germany 1,847; Yugoslavia 1,579.
Petroleum and refinery products:				
Crude[6] thousand 42-gallon barrels	8,304	6,752	--	NA.
Refinery products:				
Gasoline do	[2]1,172	341	--	Mainly to West Germany.
Kerosine and jet fuel[2] do	374	408	--	U.S.S.R. 237; East Germany 48; West Germany 18.
Distillate fuel oil[2] do	971	702	--	Austria 268; Poland 224; U.S.S.R. 166.
Residual fuel oil[2] do	550	2,738	--	Austria 1,419; West Germany 543; Czechoslovakia 457.
Lubricants[2] do	261	305	--	Austria 129; Yugoslavia 87; Vietnam 26.
Other:				
Liquefied petroleum gas[2] do	1,327	840	--	Yugoslavia 340; West Germany 171; Italy 105.
Mineral jelly and wax[2] do	196	240	--	West Germany 88; Italy 46; Austria 38.
Bitumen and other residues[2] do	485	604	--	Austria 196; Lebanon 105; West Germany 61.
Bituminous mixtures do	6	2	--	Mainly to Yugoslavia.
Mineral tar and other coal-, petroleum-, and gas-derived crude chemicals[2]	78,500	150,728	--	Italy 61,383; Romania 34,284; West Germany 31,453.

[p]Preliminary. [r]Revised. NA Not available.

[1]Owing to the lack of official trade data published by Hungary, this table should not be taken as a complete presentation of this country's mineral trade. These data are compiled from various sources, which include United Nations information, data published by the partner trade countries, and partial official trade sources of Hungary.

[2]Official Trade Statistics of Hungary.

[3]Quarterly Bulletin of Steel Statistics for Europe, United Nations, New York.

[4]May include other precious metals.

[5]Less than 1/2 unit.

COMMODITY REVIEW

METALS

Hungary remained a net importer of most industrial ores and raw materials. In 1981, the country was still a ranking world producer of bauxite and continued to exploit its reserves of iron, manganese, and lead-zinc ores.

Aluminum and Bauxite.—In 1981, Hungary produced about 2% of the world's aluminum and was the world's seventh largest bauxite producer. Hungarian bauxite reserves, reportedly, were estimated to be sufficiently large to last 30 years at

current or even increased consumption levels. Bauxite was mined at five underground and two open pit mines and had an average Al_2O_3 content of over 50% and an SiO_2 content of 7%.

Hungarian bauxite deposits were typically pocket-shaped lenticular bodies with an average thickness of about 20 meters and were associated with Mesozoic carbonate rock formations. The underground mining of Hungarian bauxite has, over the years, presented a number of technical problems. The first problem was that both the footwalls and hanging walls were unstable, requiring the use of closely spaced props and caps for mine support. Rockbolting, used elsewhere in Europe, was found impractical. The second and more serious problem was ground water. Approximately 80% to 90% of Hungary's proved reserves under exploitation were situated at a depth of 100 to 500 meters below the water table. Reportedly, in the Transdanubian area, near Budapest, 10% to 20% of the total production costs were related to water control.

Mine dewatering, in some instances, was reported to have dried up surrounding agricultural wells and aquifers, requiring compensation by the mining authorities and the provision of alternate sources of water to the farmers.

The bauxite industry drilled about 100,000 meters of dewatering wells in 1981. The wells were primarily in the Bakony mining area, where contained water was about 3% of the volume of the dolomite. The drilling and pumping equipment used in this region were manufactured in the Federal Republic of Germany. The submersible pumps ranged in capacity from 9.1 to 10.1 tons of water per minute, and the water, directly pumped from the aquifer, was often sold as drinking water to outlying populated areas. Reportedly, in 1979, 200 million metric tons of water was pumped out in this manner. Despite this well planned dewatering effort, Hungarian bauxite was mined with about an 18% moisture content.

In 1981, two new bauxite mines were put into operation, the Bito II and the Halimba III. Reportedly, the Halimba III Mine would eventually add about one-third more to the country's bauxite output. The ore had a significant content of gallium and vanadium. In recent years, Hungary reported the extraction of gallium from bauxite ore and sales of up to 1.5 tons per year. Hungary also announced the start of the Fenyofo bauxite mine development program in the Bakony area. When completed in 1988, the mine would reportedly have a 650,000-ton-per-year capacity, of which 450,000 tons would be produced from underground workings. In 1981, bauxite output remained at about the level of 1980.

Hungary's production of alumina declined slightly in 1981 compared with that of 1980. Alumina was produced at three plants: the Ajka plant, with about a 400,000-ton-per-year capacity; the Almasfuzito plant, with an annual capacity of 330,000 tons; and the Masonmagyarovar plant, with a capacity of 70,000 tons. Approximately 75% of Hungary's alumina was exported, with the Soviet Union as the main importer. Other new capacities that were added in 1981 were a 2,700-ton-per-year aluminum castings foundry at the Ajka alumina plant and a 5,600-ton-per-year aluminum rolling facility at the Kobanya light metal works. The Szekesfehervar light metal works was reported to have stepped up the production of aluminum semimanufactures to 143,000 tons and was successful in both domestic and foreign markets.

In late 1981, it was announced that a new smelter was under construction at the Inota primary aluminum works. The capacity of the smelter would be 100,000 tons per year, and production startup would be in 1985. In 1981, the Inota plant produced about 50% of Hungary's total primary aluminum output. Also the Aluker aluminum works ordered five 360° hydraulically controlled rotating furnace chargers from Manns Mechanical Equipment Ltd. of Dunstable, United Kingdom.

Hungary exported alumina mostly to other CMEA countries. The Soviet Union was the largest importer of Hungarian alumina. According to a long-standing agreement, the Soviet Union would import Hungarian alumina in exchange for primary aluminum metal. In 1980, Hungary shipped 330,000 tons of alumina to the Soviet Union and received, in turn, 165,000 tons of primary metal; the price differential was to be compensated by finished Hungarian products. Similar transactions were made with other CMEA countries. According to an agreement reached in 1980 with Poland, Hungary would annually supply Poland with 80,000 tons of alumina in exchange for 18,000 tons of primary metal. The agreement with the German Democratic Republic called for supplies of bauxite to the German Democratic Republic Laute alumina plant for anodes used in Hungarian aluminum plants, and the agreement with

Czechoslovakia provided for Czechoslovakian shipments of machines and equipment for Hungarian mines and aluminum plants in exchange for medium-grade bauxite that would be used at the Zhar-nad-Gronom alumina plant.

Copper.—Copper production was reported to have ended owing to the depletion of the Lahocahegy Mine at Recsk. The recently discovered larger copper ore deposits at Recsk were not yet exploited in 1981. Studies continued of suitable mining methods and ventilation requirements to extract the deep-lying sulfide ore bodies.

Gold.—Some gold may have been produced as a byproduct of lead-zinc ore mining; however, it appeared that with the termination of copper mining operations at Recsk most of the gold produced in Hungary came from secondary sources as well as from small-scale prospecting of alluvial deposits in areas such as the Komarom branch of the Danube.

Iron and Steel.—In 1981, the Rudabanya Mine continued to produce sideritic ore. Mine output decreased slightly compared with that of 1980, and amounted to just over 400,000 tons. The country also continued to process large quantities of Soviet ore and concentrate. The capacity of the steel industry was increased during the year. At the Danube ironworks the new No. 1 500,000-ton-per-year oxygen-converter shop was commissioned at midyear. Furthermore, the combined steelworks at Dyosgyor, under construction in 1981, could be completed in 1982. The new facility was expected to add 350,000 tons of capacity to the existing facilities.

At the other end of the spectrum, the decline in the world market negatively affected the three major Hungarian steel producers. The situation was especially serious for the Lenin metallurgical works and the Ozd metallurgical plant. Both plants reportedly operated at a loss during the year. At the Csepel steel and tube works, a rod mill in service for 7 years was decommissioned when its losses reached 2,000 forints per ton.

In 1981, a 5-year agreement was reported between the United States Steel Corp. and the Ozd metallurgical plants that provided for the training of Hungarian specialists in state-of-the-art techniques of high-alloy steel production, as well as forging and rolling.

Lead and Zinc.—In 1981, lead-zinc ore deposits that were worked at the Gyongyosoroszi Mine in the Matra Mountains were reported nearing depletion. The mine output during the year amounted to just over 100,000 tons of ore, which was used to produce about 1 ton of lead and 2.5 tons of zinc concentrate. Hungary had to rely heavily upon imports to meet its industrial requirements for these metals and continued to sell battery scrap in exchange for part of the recovered lead.

Manganese.—Hungary's manganese reserves, after the Soviet Union, were estimated to be the largest in Europe. Carbonate reserves were estimated at 100 million tons with an 11% to 20% manganese content, while the oxide reserve base was estimated at 25 to 30 million tons with 37% to 40% manganese content. In 1981, the Urkut Mines, the chief producer, produced around 120,000 tons of oxide ore. A small amount of carbonate ore was reportedly also produced.

The industry lacked domestic capacity for the production of ferromanganese. Hungary had to import its entire ferromanganese requirements, both in 1981 and in prior years. For this reason, tentative plans were announced to develop the country's ferromanganese capacity to satisfy a projected annual consumption rate of 50,000 tons.

NONMETALS

Most of Hungary's industrial nonmetallic minerals were produced in the Tokaj Mountains. Twelve operating mines, located in this region, have been producing about 300,000 tons per year of various nonmetallic industrial mineral commodities, including perlite, zeolite, kaolin, diatomite, and bentonite. Production of most of these commodities remained at the level of 1980, and no new capacity was added during the year. In some instances, the production of several commodities, such as perlite, declined compared with that of 1980. Apart from these commodities, the country continued to produce sand, gravel, and limestone in sufficient amounts to satisfy domestic as well as export requirements.

Cement.—In 1981, the overall volume of construction declined by 3.5% compared with that of 1980. Correspondingly, the 1981 output of cement dropped during the year, and no new capacity was added during the period.

Fertilizer Materials.—Hungarian fertilizer output was centered around the Pat nitrogen works in Petfurdo and the Borsod and Tisza chemical complexes located near Miscolc. The country continued to produce

both compound as well as nitrogenous fertilizer material. In 1981, no major investments in this field were undertaken.

MINERAL FUELS

Hungary was able to increase domestic supplies of energy and to reduce consumption requirements by 0.7%, which resulted in a 3.5% decrease in energy imports. Domestic production of energy as a share of consumption was 48.5% in 1981 and was expected to increase to 50% in 1982. Energy conservation measures were claimed to be sufficiently successful to warrant a reduction of petroleum imports in 1982 by 2 million tons.

Coal.—The major events in the industry were the discovery of new reserves and the production startup of two new mines.

New coal reserves were discovered at the Dorog colliery near Esztergom. The discovery could extend the operations at this mine for another 10 years. A new face was prepared at the mine to allow access to about 1 million tons of coal. An additional 100 tons per day would be produced at the mining complex.

Two coal mines were put onstream during the year. The first was the Markushegy Mine of the Orszlany mining complex. Trial runs were started, and the mine was scheduled to produce 300,000 tons of coal in 1981 and 800,000 tons in 1982. The mine's reserves were reported to be 50 million tons, and operating at maximum capacity, it would produce 8,000 tons of coal per day. The second mine was at Nagyegyhaza in the Tata Coalfield. The 55-million-ton deposit was said to be situated on top of a 10-million-ton deposit of bauxite, which would also be mined after 1985. The maximum coal-producing capacity of this mine would eventually reach 2 million tons per year.

Petroleum and Natural Gas.—The most significant event during the year was the discovery of a new gasfield in the Drava Valley near the Yugoslav border. Full exploration was to be conducted during the year.

Uranium and Nuclear Energy.—Uranium deposits were discovered after World War II in the Mecsk Mountains. In the early 1960's, detailed surveys were conducted and mine development was begun with Soviet assistance. The uranium deposits were found to be connected with weathered Paleozoic granites and sandstones. Shaft sinking, drifting, and equipping the mines were carried out with Soviet help.

In 1981, uranium mine output was shipped to the U.S.S.R. for enrichment and was used to fuel the Paks nuclear reactor power station, which became operational for the first time with the installation of the first Novo-Voronezh 440-megawatt reactor blocks.

---

[1]Foreign mineral specialist, Division of Foreign Data.

[2]The relation of the Hungarian forint (Ft), a nonconvertible currency, to the U.S. dollar is based upon the fluctuation of the dollar-forint ratio. The rate of dollars to forints was US$1.00=Ft34.05 (official rate, June 1981). The conversion of Hungarian national income and foreign exchange accounts into U.S. dollars was not done owing to different criteria used in determining value in centrally planned economies as opposed to those used in market economies.

[3]Council for Mutual Economic Assistance (CMEA). Its membership includes Bulgaria, Cuba, Czechoslovakia, the German Democratic Republic, Hungary, Mongolia, Poland, Romania, the U.S.S.R., and Vietnam. Yugoslavia obtained permanent observer status in 1965.

Table 4.—Hungary: Primary energy balance for 1980 and 1981

(Million tons of standard coal equivalent[1])

Year	Total primary energy	Coal (lignite, anthracite, bituminous), coke, and briquets	Crude oil and petroleum products	Natural and associated gas	Fuelwood	Hydroelectric power
1980:						
Production	26.4	14.5	3.0	8.2	0.7	--
Exports	3.1	.05	3.0	.01	--	--
Imports	23.8	2.9	14.5	5.4	--	1.0
Apparent consumption	47.1	17.3	14.5	13.6	.7	1.0
1981:						
Production	27.9	14.6	3.0	8.6	.7	1.0
Exports	2.6	.05	2.5	.01	--	--
Imports	22.3	2.6	14.0	5.0	--	.7
Apparent consumption	47.6	17.1	14.5	13.6	.7	1.7

[1]One ton of standard coal equivalent (SCE)=7,000,000 kilocalories. Conversion factors used are hard coal, 1.0; lignite and brown coal, 0.5; briquets, 0.67; coke, 0.9; crude oil, 1.47; refinery products, 1.53; natural gas, 1.33 (per thousand cubic meters); manufactured gas, 0.6; and hydroelectric power, 0.125 (per thousand kilowatt-hours).

The Mineral Industry of Iceland

By Joseph B. Huvos[1]

Although Iceland's mineral resources remained insignificant in 1981, there was an abundance of inexpensive hydroelectric power, allowing the establishment of energy-intensive industries for the processing of imported raw materials. Manufacturing and processing industries again suffered from low demand in export markets and from temporary power shortages caused by a lack of rainfall during the year.

Iceland's economy continued its trend of high inflation at 50.6%, a slow rate of real-term growth at 1%, and a policy of full employment, with unemployment at 0.4%. In 1981, Iceland's gross national product (GNP) was 2.8 billion dollars.[2] Contribution of the mineral and related industries to the national economy continued to be mainly hydroelectric and geothermal power, aluminum, and ferroalloys, the latter two contributing about 5% of the total.

The balance of foreign trade was slightly negative. The krona was devalued twice, first by 3.8% and later by 6.5%.

Important events in Iceland's mineral industry in 1981 included commissioning of two new hydroelectric powerplants on the Hrauneyjafoss River, and continued construction of the State Fertilizer Co.'s nitric acid plant at Gufunes and a southwest Iceland geothermal heating utility.

PRODUCTION

In 1981, there was no significant change in the production pattern of minerals and metals in Iceland, which consisted largely of aluminum, ferroalloys, cement, and pumice. Mineral production for 1977-81 is shown in table 1.

Table 1.—Iceland: Production of mineral commodities[1]

[1]Table includes data available through July 7, 1982.

TRADE

There was no significant change in Iceland's modest foreign trade in minerals in 1979 and 1980, as shown in tables 2 and 3. Minerals amounted to only 4% of the country's total export trade, which was dominated by fish and fish products.

COMMODITY REVIEW

METALS

Aluminum.—In 1981, aluminum production increased slightly in spite of a shortage of electric power, caused by a lack of precipitation.

Disagreement continued between the Icelandic Government and Swiss Aluminum Ltd. (Alusuisse) over the latter's Icelandic Aluminum Co. Ltd. subsidiary. The Government had accused Alusuisse of avoiding Icelandic taxes by buying alumina from its Australian subsidiary, Swiss Aluminum of Australia Ltd., at a price at least $35.5 million higher than the average market price during a period from 1975 to 1980. Alusuisse denied the charges. Talks to settle the difference were delayed repeatedly during the year. In the meantime, the Government was reviewing its energy deal with Alusuisse, on the basis of which it had supplied the electric power needed by the company, and as an alternative, it was also considering the possibility of taking over the company's operations.

The Icelandic Government had been preparing a feasibility study, aided by the Norwegian company, Aardal og Sunndal Verk AS, to create further aluminum capacity in Iceland, depending on the state of the world aluminum market. It had planned to hold at least 51% of this and any major industrial venture in the future.

Ferroalloys.—Icelandic Alloys Ltd. continued to produce ferrosilicon north of Reykjavik at Grundartangi. Equipment continued to be two 30-megawatt semiopen rotary Elkem furnaces. As in 1980, repeated shortages of electric power and ferroalloy markets determined production, which was well below the 1981 targeted 44,000 tons of 75% ferrosilicon, and a net loss was recorded by the company.

NONMETALS

Cement.—The Sementsverksmidja Rikisins (state-owned cement works) operated at Akranes, north of Reykjavik, a single-kiln, oil-fired cement plant. Capacity of the plant was 100,000 tons per year of cement or 95,000 tons of clinker.

Nitrogen.—Aburdarverksmidja Rikisins (state-owned fertilizer company) was building a new 35,000-ton-per-year nitric acid plant at Gufunes, near Reykjavik, to replace the existing unit built in 1952. The Société Chimique de la Grande Paroisse was awarded a $4 million contract to supply the equipment and startup services, financed 85% by an export loan from France. The Gufunes fertilizer complex produced 45,000 tons of compound fertilizers of a dozen different grades, including 7,000 tons of ammonium nitrate. The new nitric acid plant was to expand the compound fertilizer plant's capacity to 70,000 tons per year. At the same location, there was also an electrolytic plant to produce 8,000 tons per year of ammonia. An additional 8,000 tons of ammonia was to be imported each year in the future. Iceland also imported monoammonium phosphates and potash.

MINERAL FUELS

Coal.—A draft resolution introduced in

the Althing (Parliament) has focused attention on the possibility of exploiting lignite deposits found at several locations in the fjords of northwest Iceland. The bill called for preliminary studies by the National Energy Authority and the power utilities.

The lignite at Stalfjall Mountain, West-Barda-Strada, Sysla County, was estimated previously at 180 million tons, sufficient to supply a 680-megawatt powerplant for 60 years. Lignite was mined in Iceland during World War I, but mining was abandoned, as strata were thin and poor in quality.

Geothermal Energy.—The Geothermal Energy Department of the Energy Institute sponsored a study of geothermal energy in Iceland. It was revealed that only about one thousandth of all of the geothermal energy resources of Iceland have been developed. In 1981, total thermal energy used for home heating amounted to 1,200 megawatts, which was the maximum output of existing installations. Other uses, including generation of electric power, amounted to about 500 megawatts.

In 1981, there were 19 proven high-temperature geothermal areas in Iceland and 9 possible new ones. The largest of all areas was that around the Torfa Glacier in central Iceland, estimated to cover 140 square kilometers. Next came the Helgill area, followed by the Krafla and Krisovik areas. All geothermal areas were located within the eruption and disintegration belt, an extension of the mid-Atlantic Rift, that crosses Iceland from the southwest to the northeast.

Work continued on completing a new southwestern Iceland geothermal heating utility to pump hot water from what is said to be the world's biggest natural hot spring, in Bogarfjordur County near Deildartunga. A pipeline system was built to distribute the hot water at a temperature of 97° C.

Hydroelectric Power.—In October, the first turbine of a new hydroelectric powerplant of the National Power Co. (Landvirksjun) went onstream at Hrauneyjafoss in southern Iceland, and a second unit went onstream by yearend. The plant was not far from existing plants at Burfell and Sigalda. All three facilities harness the glacial rivers in the Thjorsa drainage basin. They should contribute to avoiding power shortages such as those experienced in early 1981. During the winter of 1981, there was a power shortage when the country's total electrical output had to be cut back by 110 megawatts for an extended period.

The State Electric Power Works signed an agreement with five rural communities in Hunavatnssysla County to cut the planned size of the Blanda River reservoir in the northwest of the country to 220 gigaliters, from the original 400 gigaliters. This will limit the capacity of the planned Blanda River powerplant to 177 megawatts. The generating capacity of the Burfell plant was to be increased from 210 to 350 megawatts.

The Mineral Industry of India

By Gordon L. Kinney[1] and Francis E. Shafer[2]

India's gross national product (GNP) increased an estimated 4.7% in real terms during fiscal year (FY) 1981-82[3] compared with a 7.5% increase in FY 1980-81 and a 4.5% decline in FY 1979-80. Foodgrain production, the key factor in the highly agricultural Indian economy, reached a record level of 133 million tons, but fell short of the FY 1981-82 target of 138.5 million tons. GNP at current prices was estimated at $156 billion[4] in FY 1981-82, compared with $140 billion (revised) in FY 1980-81. Current per capita income was about $226, one of the lowest in the world. Complicating the planning and executing of economic development was the formidable population problem—approaching 700 million—which added over 6 million persons to the labor force in 1980 and again in 1981.[5]

Industrial production in FY 1981-82 increased 8.5%, more than doubling the previous year's growth. This was largely because of improvement in the performance of infrastructural industries, particularly coal, electric power, and railroad. Significant growth was recorded in coal, crude steel, cement, aluminum, and nitrogenous fertilizers. During 1981, the Government of India introduced a series of measures to promote industrial production including liberalization of capital goods and raw materials imports for export-oriented industries, simplification of industrial licensing procedures, and provision of institutional financing for modernization extended to all industries.

Power generation, the major limiting factor in recent industrial performance, increased more than 10% over the FY 1980-81 level and exceeded its target by a modest 0.7%. A total of 123 billion kilowatt-hours was produced but even with the increase, this fell considerably short of the 137 billion kilowatt-hours required. Thermal capacity utilization increased from 45% in FY 1980-81 to 47% in FY 1981-82. An achievable goal for the Indian system would be about 58% capacity utilization, still much lower than most electrical systems.

Several industries in the Bihar-West Bengal steel producing belt continued to be hampered by power shortages despite a 40% increase in power output by the local electric company. Acute power shortages were also experienced in the States of Rajasthan, Madhya Pradesh, Tamil Nadu, and Orissa. The addition of 2,300 megawatts to generating capacity during FY 1981-82 fell considerably short of the 3,212-megawatt target because of shortages of steel and cement as well as delays in delivery of equipment.

The target for FY 1982-83 was to add 3,500 megawatts of capacity and to generate a total of 132 billion kilowatt-hours of electrical power. Power transmission losses for the overall system were estimated at 15% to 20%, which contributed significantly to the power shortages. Considering the record of slippage between targets and achievement, the sixth 5-year plan (FY 1980-81 through FY 1984-85) target of 20,000 megawatts in added generating capacity appears unlikely to be realized. This suggests that Indian industry is likely to continue facing power shortages for the foreseeable future.

In order to circumvent additional shortages, the Government had decided to approve construction of captive powerplants for major public sector corporations such as steel, fertilizers, and aluminum. Other industrial users may also construct captive powerplants provided they set up a consortium.

The Government's public sector FY 1982-

83 annual plan called for an expenditure of $23.5 billion, a 21% increase over that of the previous year.

The energy sector development was assigned highest priority in the plan and was to receive 32% of total expenditures. This was mainly intended to increase domestic petroleum production from about 40% of the requirements in FY 1981-82 to roughly 70% in FY 1984-85. Other major expenditures included $960 million for expansion of existing steel plants and construction of a 3.4-million-ton-per-year integrated plant at Visakhapatnam, $560 million for the fertilizer and chemicals sector, and $1.26 billion for the railroads.

The Indian railroad system increased freight traffic during 1981, thereby helping to sustain the higher level of industrial production. Inadequacies in railroad freight movement have been strong contributors to coal and electric power shortages in recent years. The amount of freight moved in 1981 reached a record high of over 220 million tons, up nearly 13% over that of 1980, and exceeded the annual target by 5 million tons. The freight target for 1982 was 230 million tons. The FY 1982-83 budget allocated $1.26 billion for capital expenditures on the railroad system. That figure was unchanged from the previous year and was claimed to be seriously inadequate to meet the growing need to modernize the system. Given the modest funding and the past problems, it was anticipated that the traffic bottlenecks would reemerge in 1982.

Research and development activities under the science and technology program were given major emphasis under the public sector organizations controlled by the Department of Mines; i.e., the Geological Survey of India (GSI), the India Bureau of Mines (IBM), the Mineral Exploration Corp., Ltd. (MEC), and the Government-owned nonferrous metals companies. Geology, exploration, mining, beneficiation, and nonferrous metals research were being given priority.

The planned outlay for science and technology during the sixth 5-year plan (FY 1980-81 through FY 1984-85) has been increased to $18 million from $3.8 million during the previous 5-year plan, GSI and IBM research funding are not included. The major programs being implemented included research on rock bursts, scheelite recovery from gold ore, ore dressing, recovery of cobalt from copper-converter slag, recovery of tellurium from electrolytic copper refinery slime, recovery of copper by dump-leaching, and long-hole raising in mines.

GSI has acquired a vessel to be remodeled into a research ship for geoscientific cruises. The research facilities were to be ready for offshore surveys in 1982. Two small launches will be purchased for survey work in coastal waters. These ships will strengthen considerably the marine geology section of GSI. GSI was also strengthening its aerial survey and deep exploration-drilling capability.

IBM has received a new charter enlarging its scope of activities, particularly in the fields of mineral conservation and environmental protection. Facilities for beneficiation of minerals in IBM were being expanded, and as part of this program, an ore dressing laboratory was completed at Ajmer in October 1981. The existing laboratory and pilot plant facilities at Nagpur were also being strengthened and another new ore dressing laboratory was being built at Bangalore.

PRODUCTION

According to preliminary data, overall value of Indian mineral production in 1981 rose 63% over that of the previous year to $3.78 billion. Most of the increase was attributed to a sharp rise in production and price increases of the mineral fuels. The value of coal production rose 33% to $1.93 billion. In the case of crude oil, the 1981 wellhead value rose 226% to $1.33 billion based on a more than 50% increase in production, coupled with increased domestic crude oil prices at the wellhead.

In contrast, the value of nonfuel minerals totaled only $456 million in 1981 compared with $417 million in 1980. With few exceptions, production levels remained nearly unchanged from those of 1980. Even in value terms, most of the increases were marginal, stemming primarily from upward price revisions.[6]

Among key minerals, production of iron ore, a major export commodity, rose marginally but the pithead value rose 11% to $144 million. Production of manganese ore declined but the value increased slightly to $26.6 million. The values of some other

important metallic ores were copper, $39.9 million; gold, $29.4 million; chromite, $15.9 million; and zinc, $14.2 million. Limestone was by far the major nonmetallic mineral and was valued at $83.2 million. The next most valuable nonmetallic minerals were apatite and phosphorite with combined values less than one-third that of limestone.

Despite the performance of the nonfuel mineral sector, India remained the world's principal source of sheet mica. Among the market economy countries, it was second in garnet and kyanite production, third in rare-earth minerals, tied for third in ammonia for nitrogen fertilizer, fourth in zircon, and fifth in world barite production. In addition, India was among the top nine producers of iron ore, chromite, manganese, magnesite, and cement.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Sept. 29, 1982.

[2]In addition to the commodities listed, other clays (bentonite, fuller's earth, and common clays), other gem stones (aquamarine, ruby, and spinel), and uranium are also produced, but output is not reported and available information is inadequate to make reliable estimates of output levels. In 1975, production of 6,514 tons of uranium ore containing about 3 tons of U_3O_8 was reported from 2 mines, which was only a part of total national production. Moreover, reported production of stone and sand and gravel are clearly only partial figures and exclude a number of types of stone; the amounts reported are inadequate to provide sufficient aggregate for production of concrete from domestically produced and consumed cement, nor do they provide for other supplies of aggregate for road metal and other construction uses.

[3]Data are for fiscal year beginning Apr. 1 of that stated.

[4]Data supplied here (exports plus domestic use) are provided in lieu of officially reported production because the latter figures are evidently incomplete. Officially reported production figures are as follows, in metric tons: 1977—14,671; 1978—14,273; 1979—14,180; 1980—12,355; and 1981—12,729. Data presented in this table for exports for the years 1978-81 inclusive and domestic consumption for all years are significantly revised from those appearing in the 1981 Mica commodity chapter in Volume I of the Minerals Yearbook, owing to the receipt of additional information subsequent to the preparation of that chapter.

[5]Partial figures; for details see footnote 2.

[6]Includes reinjected gas.

TRADE

Even though faced with a $6 to $7 billion trade deficit, the Government framed a FY 1982-83 trade policy aimed at liberalizing the import regulations. The policy recognized the need to assure basic inputs to industry and also to update Indian technology as preliminary steps to developing the slowly growing export market. Nearly 100 new items of raw materials and components have been brought under the Open General License (OGL) for imports. At the same time, in order to protect domestic manufactures and to encourage growing industries, 5 items of capital goods and 33 items of raw materials were removed from the OGL list. The intent throughout has been to attempt to make each import liberalization relate to a potential export increase. The new policy removes 100% export-oriented companies and free trade zones from licensing, and allows them duty-free imports.

One mineral-related change was the transfer of aluminum extrusions from OGL to the restricted list. Several new aluminum extrusion projects have been set up to meet India's projected demand of over 40,000 tons per year in the near future. Another change was that brass and copper scrap were replaced on the OGL list.[7]

COMMODITY REVIEW

METALS

Bauxite, Alumina, and Aluminum.—The situation in the aluminum industry changed substantially during the past year. In 1980, there were severe shortages, forcing the importation of well over 100,000 tons of aluminum. In 1981, the industry faced a surplus of unsold stock. There were several factors that contributed to this new problem.

One important problem was the failure of the state electricity boards to honor their financial commitment to purchase domestic electric-conductor-grade aluminum. The smelters were required by law to produce 50% of their output as electric-conductor-grade wire rod or ingot. The massive electrification plan for the nation was considerably behind schedule, causing long delays in purchase of the aluminum transmission cables. The situation would not be serious in most other countries such as the United States or the Federal Republic of Germany, but 55% of Indian aluminum consumption was electric-conductor-grade, compared with 11% and 6%, respectively, for the other two countries. Further complicating the problem was a Government ban on export of electric-conductor-grade aluminum imposed in 1980. As the surplus metal stocks built up, the Government found it necessary to lift the export ban in late summer of 1981.

Because of the depressed state of the world aluminum markets, price competition was very keen. Costs of production have risen steadily, but the retention price allowed the aluminum producers was strictly controlled by the Government. In addition, the domestic sale of aluminum was subject to an excise duty of 44% ad valorem. This was much higher than the per-ton duty on other common metals. The ultimate high

prices charged the consumers contributed to the increasing sales resistance and build-up in the level of unsold aluminum stocks. The sales potential for commercial-grade aluminum would be much larger in India if its price were more competitive with other materials, especially in the canning and packaging, transportation, and construction sectors.

The Government attempted to relieve some of the aluminum problems by adjusting its pricing structure to maintain equality with imported material and to adjust the excise duty to a more equitable level.

Effective December 3, 1981, basic prices for aluminum ingots and wire rods were raised by nearly $267 per ton to compensate producers for the continuing increase in raw material prices. At the same time the excise duty was reduced from 44% to 22%. After the excise duty and the 4% sales tax was added, the final price payable by consumers for ingots went up to $2,173 per ton, an increase of $19 per ton. Following the retail price increase, the Government raised retention prices at all Indian smelters by an average of $274 per ton. By raising retention prices, the Government felt it had provided suitable incentives to smelters to keep up production rates despite the spiraling costs. Some aluminum industry spokespersons, however, claimed that the subsequent steep rise in the prices of pitch and calcined petroleum coke offset the increase in the aluminum prices.

Work was underway at the Government-owned Bharat Aluminium Co., Ltd. (BALCO), plant in Korba to bring the alumina capacity up to the original design level of 200,000 tons per year. Operational problems have consistently limited the output to about 150,000 tons per year. The $5 million revamping was expected to be completed by yearend 1982.

BALCO's source of bauxite, the Amarkantak and Phutkapahar Mines in Andhra Pradesh, was running out of ore faster than planned. Therefore, BALCO investigated alternate ore sources for the post-1985 period. The Gandhamardan deposit in Orissa was found to be suitable for the Korba plant. A feasibility report was prepared for a 600,000-ton-per-year mine at an estimated cost of $31 million. The project was awaiting governmental approval at yearend 1981.

Also at Korba, the new 40,000-ton-per-year, cold-rolling mills were reported under commissioning during 1981. A new extrusion press, rated at 3,150 tons, was completed during the year and was to be commissioned by March 1982. The new unit supplements the capability and output of the existing 800- and 2,500-ton presses.

BALCO continued to have severe power shortages during the year and was only able to operate two of its four potlines at about 60% capacity. The remaining two potlines, which were completed in December 1977 and September 1978, comprise one-half of the plant's 100,000-ton-per-year capacity and have never been in operation because of the power shortage. The power available has been highly erratic, with voltage and frequency changes commonplace. There were also 87 total power outages from April to November 1981. The effect on smelting equipment, and on the cost and quality of the product is obvious and will not be detailed here.

The prospects for improvement in the power situation were fair. The Madhya Pradesh Electric Board (MPEB) had not been able to honor its power contracts in the preceding years and was not able to supply the minimum peak-load demand promised by October 1981. BALCO was hopeful, however, that this would change with the completion of new MPEB generating units in 1981 and 1982—Satpura VI and VII and Korba IV.

Another development was the imminent completion of the power grid link between Andhra Pradesh and Madhya Pradesh. This link was sanctioned specifically to meet the power requirements of BALCO.

The Andhra Pradesh alumina project continued in the planning stage. The main problem has been financing the 600,000-ton-per-year plant. The Soviet Union originally proposed financing 15% of the cost but reconsidered in 1981 and offered to supply up to 40% of the cost. Final arrangements for financing and exporting the alumina were under discussion between the two Governments.

On March 29, 1981, Prime Minister Gandhi laid the foundation stone for the alumina plant at Damanjodi in Koraput district of Orissa. The action formally began construction of the giant $1.4 billion French-aided Orissa aluminum complex.

In October 1981, the Union Energy Minister inaugurated the Bharatpur open pit coal mine, about 15 kilometers from the smelter site at Talcher. The mine will supply coal exclusively to the aluminum project's captive thermal electric powerplant.

The contract for the 600-megawatt powerplant, to be set up at Talcher near the smelter, was expected to be awarded to Bharat Heavy Electricial, Ltd., the lowest of only two bidders. The contract was to call for the installation and commissioning of the first 120-megawatt unit 39 months from the date the letter of intent is issued. Subsequent 120-megawatt units are to be installed at 5-month intervals until the full 600-megawatt capacity is reached.[8]

By yearend 1981, the chairman of the National Aluminium Co., Ltd., indicated that the project was ahead of schedule and planned commissioning was to be moved up by several months. Commercial production of aluminum was set for October 1985.

Chromite.—Of the three companies recently licensed to produce charge chrome, the private sector firm, Ferroalloy Corp., reportedly was the furthest along. The 50,000-ton-per-year export-oriented plant near Baudpur in Orissa will use the company's own technology, developed entirely by its research and development department. Although the technology will be Indian, much of the plant and equipment will be contracted to Japan because domestic machine tool companies did not have the fabricating technology required. Civil construction work was reported to be underway in 1981, and delivery of both imported and domestic machinery was scheduled to be completed in October 1982.

The Orissa Mining Corp. signed a contract in July 1981 with Vöest-Alpine AG of Austria and Outokumpu Oy of Finland to build a 50,000-ton-per-year charge chrome plant. The plant will be located in Koenjhar District of Orissa State. Work on the infrastructure and site preparation may have begun during 1981, but reportedly there were complications with financing arrangements and import of foreign equipment. Financing problems could delay the start of work on the main plant by several months.

Indian Metals and Ferroalloys, Ltd., held the third license to produce charge chrome. It already produces ferroalloys at its plant at Therubali near Bhubaneswar. This project, also with a 50,000-ton-per-year capacity, was planned for a late 1984 completion date.[9]

Copper.—The Khetri copper complex of the Government-owned Hindustan Copper, Ltd. (HCL), was again hit by severe electric power shortages throughout the year. In order to minimize damage to the smelter and refinery, which must operate continuously, the power was allocated mainly to the smelter and refinery. Power to the mines, concentrator, and byproduct fertilizer plant was cut back and production was affected accordingly. Triple-superphosphate production was not maintained at all. The resulting shortfall of concentrates had to be made up by increased imports.

The Government had been considering expanding the Khetri smelter from 31,000 to 45,000 tons per year to help meet the country's projected copper demand. However, it appears that the project will be deferred in favor of a new 40,000- to 50,000-ton-per-year smelter in the vicinity of the Rakha or Malanjkhand Mines.[10]

The possibility of putting a smelter at Rakha was brought about by HCL's plans for a major expansion at the Rakha copper mines in Bihar. The first stage of the Rakha Mine was operating and produced about 200,000 tons of ore during 1981.

If foreign financing can be arranged, HCL planned to contract the development work for a second-stage exploitation of the deposit that contains about 100 million tons of ore averaging 1.13% copper. The project will call for construction of mine shafts, ore passes, haulage ways, underground crusher chambers, and related work. Exploration drilling and a feasibility report have already been completed by HCL.

Three years from the date the project is approved, the mine should be producing 3,000 tons per day of ore. Until the shafts are completed, ore will be removed by trucks using an inclined ramp. A third phase was planned to bring the mine to a production level of 6,000 tons per day. It is estimated that 6 to 7 years will be required to complete the project at a cost of $150 million including a 100,000-ton-per-year concentrator near the mine.

To increase the long-term copper production further, HCL was seeking an engineering consultant to prepare a feasibility report for the integrated development of the Singhbhum copper belt in Bihar. The belt stretches over 120 kilometers, but development has been limited to about a 20-kilometer section that includes the Rakha Mine. Exploration has identified a number of potential mining sites with an aggregate reserve of 130 million tons of copper ore. An investment of $300 million was proposed over the next 10 years.

The proposed study calls for evaluating the reliability of the geologic mapping and exploration work already completed; identi-

fying the best areas for immediate mining; determining the optimal location for ore processing facilities, the most suitable ore transport systems, and the best locations for waste and tailings disposal; and drawing up long-term plans for maximizing the use of the resources in the Singhbhum copper belt.[11]

The largest copper development project under construction was the Malanjkhand open pit, located 90 kilometers northeast of Balaghat in Madhya Pradesh. This was the first large-scale open pit copper mine in India and will produce about 24,000 tons per year of metal from 2 million tons of ore. Over 3 million cubic meters of overburden were removed in 1980 and slightly more than that was removed in 1981. Directly minable reserves were measured at 59 million tons of 1.2% copper at a 0.45% copper cutoff. A further 44 million tons of low-grade primary ore averaging 0.22% copper and 5.5 million tons of oxidized ore averaging 0.58% copper occur within the pit limits. Much of this material will be segregated and the copper values recovered by India's first application of heap-leaching extraction from low-grade material.

Both mine development and concentrator construction were on schedule during 1981. Work on the tailing disposal and water reclamation systems was delayed, but apparently was started in 1981. The first-stage capacity of 1 million tons per year was expected to be commissioned in July 1982. The full capacity of 2 million tons per year was to be achieved 2 years later.

Present plans call for the concentrate to be shipped to the Khetri complex for smelting and refining. HCL was to expand the capacity of the Khetri smelter to handle the increased concentrates or to build a new smelter near the Malanjkhand site. The final decision apparently had not been made at yearend 1981.

Gold.—The public sector company that operates the Kolar gold mines, Bharat Gold Mines, Ltd. (BGML), completed the extensive preinvestment exploratory mining and level development work at the Yeppamana Mine in the old Ramagiri Goldfield in Andhra Pradesh. The exploration revealed 350,000 tons of measured and indicated ore grading 5.70 grams of gold per ton. Possible reserves total almost 750,000 tons of ore grading 5.56 grams of gold per ton. Further development work for commercial production was awaiting the investment decision from the Government, which was expected in early 1982. When production resumes, it will be at a planned rate of about 300 kilograms of gold per year.

BGML's Kolar gold mines returned a profit in 1979 for the first time since the 1972 formation of the company, and continued operating profitably in 1980. The financial outcome for 1981 was not known but would have been more strongly dependent on world gold prices than on the mining operations.

To maintain profitability, BGML was engaged in updating its mining, ore processing, and shaft sinking methods. A plan was drawn up using foreign technological aid for the secondary recovery of gold from the 47 million tons of tailings. A significant proportion of the tailings was believed to be suitable for heap-leaching recovery of most of the residual gold values.

GSI has been conducting a major exploration effort of old gold-producing areas and trying to locate new deposits in India. Several sites at the old Hutti Goldfields in Raichur district of Karnataka looked promising for reopening. GSI reported that the Porojarna Mine in Singhbhum district of Bihar could be reopened profitably if mined properly. Reserves there and in other parts of the district were described as high grade. The mine was abandoned in 1916 because of financial and operational problems.

Promising gold discoveries were made at Mallappakonda and Chigargunta in Chittoor district of Andhra Pradesh along a southern extension of the Kolar Shist Belt. The gold at Mallappakonda is disseminated in arsenopyrite-rich layers of a banded iron-sulfide formation. Ore reserves were estimated at 300,000 tons with an average grade of 4 grams of gold per ton.

The Chigargunta gold mineralization occurs with quartz and mica in a highly faulted zone. The ore occurs in several distinct ore blocks that range in grade from 4 to 8 grams of gold per ton. Estimated ore reserves were put at 350,000 tons to a depth of 100 meters.

Placer gold deposits were reported in Nainital and Pauri Garhwal districts of Uttar Pradesh. The gold occurs along a 2- to 5-kilometer-wide zone about 60 kilometers long.

Iron Ore.—Iron ore exports accounted for nearly 5% of India's foreign exchange earnings. Earnings for FY 1981-82 were estimated at $477 million, about 26% higher than the earnings of the previous year.

More than one-half of ore production was exported. About 23.5 million tons was shipped during 1981. National Mineral Development Corp., Ltd., the public sector corporation that operates the big mechanized mines at Bailadila and Donimalai, produced 7.7 million tons and exported 7.3 million tons in 1981. Most of the private sector exports originated around Goa and were exported through the Port of Marmogoa.

The iron ore industry, as it presently exists, will be able to supply the domestic steel industry and the current export market with little additional investment. However, with the construction of the Visakhapatnam steel complex by the end of the sixth 5-year plan, a new 6-million-ton-per-year mine will be required in the Bailadila area to supply the plant. Another new facility will be needed to supply the other coastal plant planned for the Daitari area. The most likely deposit to be exploited for the Daitari project would be the high-grade Gandhamardan deposit in Keonjhar district of Orissa where high-density drilling by Orissa Mining Corp. has shown a reserve of 250 million tons with a low overburden thickness.

The Kudremukh Iron Ore Co., Ltd., project has been causing considerable concern to Indian officials since the political and military situation in Iran caused the postponement of completing Iran's direct-reduction based steelworks for an indefinite period. Iran was to use 7.5 million tons per year of Kudremukh concentrate to feed two planned steel plants. One of these was canceled outright, and the other was located near the combat zone where construction was at a standstill during 1981.

Iranian and Indian officials were negotiating the renewal of the ore purchase agreement but at a reduced rate and much later starting date. Iran could still take around 4 million tons per year if the steel complex can be successfully and quickly completed. In light of the present Iranian situation, that seems rather doubtful. The Kudremukh Mine, concentrator, and slurry pipeline have only been operating at a level sufficient to keep the machinery in good working order.

During the year, India was actively seeking arrangements for selling at least some of the ore concentrate. Small batches of 50,000 tons were shipped for testing purposes to the Republic of Korea and to Romania. Czechoslovakia ordered 40,000 tons. Nigeria, Mexico, Bahrain, Trinidad and Tobago, Malaysia, and Indonesia were also considering testing some of the concentrate.

To increase the salability of the Kudremukh product, the Public Investments Board of the Government of India approved a $100 million expenditure for a 3-million-ton-per-year pellet plant to be built at Mangalore, the terminal of the 67-kilometer-long ore slurry pipeline. A Romanian firm signed a contract with Kudremukh on September 12, 1981, to build the plant. Lurgi Chemie & Huttentechnik of Frankfurt am Main and Lurgi S.A. Paris will supply technology, equipment, and initial startup under a separate contract with Lurgi. Fuel will be high-ash domestic coal. The contract called for completion of the plant in September 1984.

A separate contract, signed on the same day, provided for the export of 3 million tons of concentrate to Romania. The Kudremukh concentrate will be mixed with iron ore fines in sinter feed. The total Romanian imports up to FY 1984-85 would be limited to the value of the pellet plant contract.

The Mandovi pellet plant in Goa was forced to shut down in April 1981 because of increasing costs of production, particularly for fuel oil. The plant was under a long-term contract to Japanese steelmakers to supply 1.8 million tons per year of high-grade pellets.

Steel.—The five integrated steel plants under Steel Authority of India, Ltd. (SAIL), reportedly closed 1981 with a record production of 5.53 million tons of salable steel. The previous record was set in 1977 when 5.42 million tons was produced. All of the SAIL plants exceeded the 1980 levels for crude and salable steel. SAIL production was combined with 1.6 million tons of production anticipated from private sector Tata Iron and Steel Co. (TISCO) plus another 1.7 million tons from ministeel plants for a total salable production of about 9 million tons. The performance of the Indian steel industry during 1981 gained special significance against the background of declining steel production the world over—747 million tons in 1979, 718 million tons in 1980, and 705 million tons in 1981. The public sector plants could have done better, but the SAIL target of 5.73 million tons proved to be difficult because the electric power situation in Orissa and Madhya Pradesh and the shortage of railroad cars continued

to limit production. The Bhilai steel plant in Madhya Pradesh and Rourkela steel plant in Orissa, two of the more efficiently operated plants, were the hardest hit by the power shortage. Both plants were served by state electricity boards in contrast to SAIL's plants at Bokaro, Durgapur, and Burnpur, which benefited from higher power output from the Damodar Valley Corp. Persistent railcar shortages have resulted in alarmingly low coking coal stocks at these plants. The high ash content, exceeding 20.5% in some shipments has also adversely affected the performance of the steel mills.

For FY 1982-83, Indian salable steel production from all sources was projected to increase about 10% to 10 million tons with integrated steel plants accounting for nearly 8 million tons and steel miniplants accounting for about 2 million tons. SAIL's target was 6.49 million tons out of an installed capacity of 7.2 million tons. Demand was put at 11 million tons with the difference to be met from imports. The performance of the steel sector, however, will continue to depend heavily on the availability of electric power and coal.[12]

The demand for steel was estimated by the Ministry of Steel and Mines at 12.7 million tons by FY 1984-85 and 18.4 million tons by FY 1989-90. The main increase in demand will be for bars, rods, structurals, plates, and hot- and cold-rolled sheets. The Government planned to raise the installed capacity of crude steel in the integrated steel plants to nearly 20 million tons per year by 1990 to meet the demand. This was to be achieved through a blend of modernizing and expanding existing plants and construction of new plants. The major projects will be the expansion of Bhilai and Bokaro steel plants to 4 million tons each and the construction of new plants at Visakhapatnam and near Paradip. The sixth plan, FY 1980-85, envisioned an outlay of $4.14 billion for the steel industry.

There were several developments during the year. At Visakhapatnam, construction on the water and electric power supply, storage buildings, offices, approach roads, and railways was either completed or generally on schedule. The foundation of blast furnace No. 1 was completed at yearend. Foundation work on other sections was underway. An agreement for the supply of equipment worth approximately $245 million was signed with the U.S.S.R. in November 1981. Firms from the Federal Republic of Germany, Czechoslovakia, Japan, and India were among bidders to build four rolling mills at the site. The Ministry of Steel hoped to split the contract, assigning two mills to one company and one each to the other main contenders. The revised estimated cost of the project was $3.26 billion, and the first phase was to be completed by early 1986. A new company, Rashtriya Ispat Nigam, was formed during the year by the Government to implement this project. The 3.4-million-ton-per-year plant will employ several firsts for Indian steel, including selective crushing and pneumatic separation of coal, dry quenching of coke and conveyor charging, and bell-less top operation of the blast furnaces. All steel will be continuously cast.

A second grass-roots steel complex was being planned for an east coast location. A consortium headed by Davy McKee Corp. of the United Kingdom won the right to build a 3-million-ton-per-year integrated steel mill at the Orissa Port of Paradip. Davy was to be the prime contractor but will work with French and West German firms as well. A complicated series of loans and financing will be arranged through foreign banks for the project. The final contract was not to be signed until India and Davy complete negotiations over details in mid-1982, but these companies were to build the plant barring some major change.

The plan to expand the Bokaro steel plant to 4.0 million tons per year has been plagued by delays of 4 to 5 years on major components. The fifth coke oven battery and the fourth blast furnace were commissioned during 1981 several years late. Progress on the raw material handling system, the third ore sinter line, the sixth and seventh coke oven batteries, the fifth blast furnace, and the cold-rolling mill has been slow, reportedly because of slippages in the supply of critical equipment, both from domestic and foreign suppliers.[13] Management and delivery sequencing problems also contributed to delays. The three-unit captive powerplant that was recently ordered has already fallen behind schedule by about 6 months. With the recent history of power shortages, delay in completion of the powerplant will directly affect the performance of the operation of the Bokaro complex.

The long delays in construction have also caused a large increase in construction costs, up to 50% over the plan in some cases.

The operational part of the plant, despite record production for the year, was facing

raw material shortages that could limit the 1982 output if not solved. There were ample stocks available at the captive mines at Kiriburu, Bhawanthpur, and Kuteshwar, but few railway cars were available to move them to the plant.

Expansion of the Bhilai steel plant from 2.5 to 4.0 million tons per year has been proceeding with fewer problems than encountered at Bokaro. Over 270,000 cubic meters (9.5 million cubic feet) of concrete was poured, 23,600 tons of structural steel was erected, and nearly 19,000 tons of equipment was installed during 1981. Construction of the second sintering line was completed, but completion of the plate mill, to be the largest in India, was delayed until late in 1982. Work on the powerplant, blast furnace No. 7, and coke oven battery No. 9, has dropped several months behind schedule. The reasons given for the slippages were inadequate resources applied to civil works, structural, and equipment erection; repairs needed on equipment delivered by domestic and foreign contractors; a shortage of cement; and delays in equipment delivery.

Commercial production of cold-rolled stainless steel sheet began at the Salem steel plant on September 13, 1981. This marked completion of the 32,000-ton-per-year first stage of the $170 million plant. Plans called for the capacity to be doubled in the near future at a cost of $33 to $56 million.

The plant used imported stainless hot-rolled coil as feedstock, but it was intended that the alloy steel plant at Durgapur would supply feedstock when improvements underway there were completed.

When the plant began operating, it was found that the high duty levied on the imported coil made the operation uncompetitive. Finally, in January 1982, the duty was reduced from 325% to 125% ad valorem. The plant was expected to produce about 11,000 tons of product during FY 1982-83 if the chronic power shortage in Tamil Nadu does not restrict operations.

The direct-reduction iron plant at Kothagudam in Andhra Pradesh, completed in late 1980, began a highly successful trial operation in 1981. Sponge Iron India, Ltd.'s 30,000-ton-per-year coal-based pilot plant ran the 120-day guarantee run at 110% of design capacity at a plant availability of 98%. Quality of product was within design specifications using a 23% ash domestic coal. The sponge iron was tested during the year in several electric arc furnace plants with excellent results.

Since the contract for the Kothagudam plant was announced, there has been a plethora of plans for new sponge iron facilities around the country. At least eight additional plants of various types and sizes were under consideration during the year.

Furthest along was the Orissa Sponge Iron, Ltd., 150,000-ton-per-year plant in Keonjhar district of Orissa. This was to be the first commercial-size plant in India and utilized an Allis-Chalmers Corp. ported rotary kiln design that can use a variety of fuel and Indian lump iron ore. The plant was scheduled for completion in 1982, and plans were underway to double the capacity to 300,000 tons per year. With existing infrastructure and equipment, the cost of expansion should be considerably less than the $25 million cost of the original plant.

Other proposals for sponge iron plants include the following:

(1) Gujarat State Industrial Investment Corp. has applied for a license to build a 400,000-ton-per-year direct-reduction plant in the vicinity of Hajira, Surat district, based on natural gas from offshore wells.

(2) Maharashtra State Industrial Development Corp. has applied for a license to build a 300,000-ton-per-year plant, also based on offshore natural gas. Site and process technology for the proposed plant were yet to be selected.

(3) Bihar State Industrial Development Corp. has been issued a letter of intent for a 120,000-ton-per-year plant at Ranchi or Chandi. Process knowhow based on noncoking coal was likely to be supplied by Lurgi of the Federal Republic of Germany.

(4) TISCO has applied for a license to build a 100,000- to 160,000-ton-per-year plant based on its process of using noncoking coal. The proposed plant site was near Joda in Keonjhar district of Orissa.

(5) The Government was considering building a natural gas-based plant at Mangalore that would use feedstock from the pellet plant under construction there.

(6) Salem Steel, Ltd., in Tamil Nadu was looking into the possibility of using a direct-reduction plant and an electric arc furnace as the basis for integration of the present stainless steel rolling mill. The intention would be to use the nearby Neyveli lignite as the solid reductant.

Lead and Zinc.—Hindustan Zinc, Ltd. (HZL), the public sector company that operates most of the country's lead and zinc

mining and smelting activity, has been engaged in an active program to increase production. The long-term goal of HZL was to produce 60% of India's zinc needs and 70% of its lead needs. Current production of zinc concentrate furnishes less than one-half of the material needed to operate the company's 75,000-ton-per-year installed capacity smelter at design output.

Several developments occurred during the year that will affect production. Deepening of the Mochia Mine's main and auxiliary shafts, as well as the main shaft at Balaria Mine, continued during the year. A shortage of electric power set the development schedule back several months. Completion of these shafts was critical for the maintenance of production levels because the upper ore bodies were nearing depletion. Work on the lower level drifts cannot begin until the two main shafts are operational.

At the Agnigundala lead mine, expansion of the beneficiation plant from 100 to 240 tons per day was completed during 1981. Expansion of the mine workings to the same capacity was in progress and was expected to be completed in early 1982.

Work on the new 3,000-ton-per-day lead and zinc mine at Rajpura-Dariba was delayed by a shortage of cement and electric power. Installation of the hoisting system in the shaft was delayed more than a year by labor disputes. The delay will further set back the drift development and the overall project schedule at the mine.[14]

Exploration has revealed evidence of ancient mine workings at Rajpura-Dariba. Isotope-dating of wood recovered by diamond drilling to a depth of 265 meters indicated mining may have been underway at this site 1,800 to 2,500 years ago.

There were construction delays reported at the Sargipalli lead mine in Orissa during 1981. The 500-ton-per-day mine and concentration plant was scaled to supply about 10,000 tons of lead concentrate per year to the Visakhapatnam smelter.

Planning continued for the development of the large lead and zinc deposit at Rampura-Agucha in Bhelwara district of Rajasthan. Tenders were issued in 1981 for a consulting report and 20 international companies responded with offers. Of these, seven were prequalified by HZL. The final choice of contractors had not been announced at yearend.

Based on surface drilling to a depth of 275 meters over a 1.1-kilometer strike length, lead and zinc ore reserves were put at 44 million tons. In 19 boreholes drilled to a depth of 175 meters, mineralization averaged 1.9% lead, 13.7% zinc, and 9.9% iron. Grade of ore was reported to be increasing with depth in the central area. Initial plans call for an open pit mine and a concentration plant scaled to handle 3,000 tons per day of ore. Also in the planning stage was the possibility of building a new smelter nearby with a capacity of 100,000 tons per year of zinc and an appropriately sized lead-smelting capacity.

Detailed engineering was started in January 1981 for the leach residue treatment plant at the Debari zinc smelter in Rajasthan. Orders for equipment were placed in June 1981. Construction at the site was scheduled to begin in early 1982 with commissioning to be in late 1983. Treatment of the previously lost zinc values will increase the overall zinc recovery rate from 84% to about 93%. In addition to the increased zinc recovery, the new plant will incorporate equipment for the recovery of silver, cadmium, and gold.

Expansion of the lead smelter at Visakhapatnam was sanctioned by the Government in March 1981. Capacity will be increased from 10,000 to 22,000 tons per year at an estimated cost of $6.9 million. Contractors were appointed to provide engineering services. Expansion work was scheduled for completion in June 1983.

Manganese.—A new ferromanganese plant was brought into production at Tumsar by Uniferro International, a subsidiary of Universal Ferro & Allied Chemicals, Bombay. The additional capacity, rated at 65,000 tons per year for ferromanganese, increased the concentration of ferromanganese production facilities in Maharashtra State. In line with a Government relaxation of restrictions on ferromanganese exports, the new plant was export oriented. Philbro Corp. of the United States provided a production loan and had about a 40% share in the plant's equity.

Manganese Ore (India), Ltd. (MOIL), the Government-owned company that produces most of the high-grade manganese ore, continued with plans for beneficiation plants at the Balaghat and Ukwa Mines. The plants would utilize the high-grade fines that are currently wasted. The company also continued with its plans to set up a 60,000-ton-per-year ferromanganese plant at Balaghat.

Exports of manganese ore of various grades rose, according to preliminary fig-

ures, to a total of 705,000 tons in 1981, compared with 653,000 tons in 1980. Japan's share of ore exports continued to be the largest, although it decreased to about two-thirds of the total in 1981. Exports to East Europe were up significantly, with Romania and Bulgaria the chief recipients. Domestic ore requirements were projected to double by 1990. As part of the effort to meet growth in internal demand, MOIL was expanding its exploration activities to include searching in Orissa for high-grade, low-phosphorous ore that could be blended with the already known deposits of higher phosphorous ore.

NONMETALS

Barite.—Effective November 10, 1981, the Government reduced minimum export prices of American Petroleum Institute-grade, oil well drilling specifications, barite powder from $67 to $64 per ton and lumps from $42 to $38 per ton f.o.b. Indian exports of barite have dropped from 342,000 tons in FY 1979-80 to 283,000 tons in FY 1980-81 and to about 220,000 tons in FY 1981-82. This downward trend prompted the price reduction in an effort to stimulate sales. The drop in sales has been attributed to several factors, but the underlying reason was the slump in oil exploration caused by the worldwide drop in oil demand. Also, Indian sales to Iran and Iraq were strongly affected by the conflict between the two countries, which are normally India's major customers. Competition with sales from China and Thailand was also a factor. It has also been claimed that Indian regulations on barite trade tend to restrict or limit export sales. Port congestion has also contributed to the problem.

During FY 1981-82, barite production continued to decline and internal consumption remained about 100,000 tons. Exports of lump and powder, combined, came to about 220,000 tons.[15]

Cement.—During 1981, India's cement industry again fell short of supplying domestic needs and had to rely on imports for the deficit. Nearly 2 million tons of cement were supplied by the Republic of Korea, the Philippines, Indonesia, and North Korea.

At least five new Indian units began operation and three existing plants expanded their operations in 1981. A number of other units were reportedly expected to come into production by early 1982.

The major factor in the below-capacity output of India's cement plants was the continuing acute shortages of coal and electric power.

In March 1981, the Government appointed a committee to review the development of the cement industry. The committee made recommendations concerning measures to accelerate production, including incentives and fair prices. The cement industry has been under rigid price and distribution controls since India became independent in 1947.

India has approached some U.S. cement companies for technical assistance and certain countries in the Middle East for financing. The Government was offering incentives for the expansion of existing plants and construction of new cement plants, both large and small scale. In order to increase cement production rapidly, the Government was encouraging the production of pozzolan, slag, and fly ash cements by existing companies. The Cement Research Institute of India has reported development of a technology for minicement plants with vertical-shaft kilns.

The institute reported at yearend that 57 cement plants were in operation, 12 of which were managed by the Cement Corp. of India. Sixty-seven percent used the wet process and 90% used coal as fuel. The new cement plants beginning operation during 1981 included Narmada Cements, Ltd., at Jafarabad with a 1-million-ton-per-year capacity. Fuller and Co. of the United States provided the latest coal-based precalcinator technology for the plant that has a 4.57- by 60.96-meter kiln. Also commencing production were Mangalam Cement Co. of Rajasthan with an installed capacity of 400,000 tons per year, Raasi Cement Co. of Andhra Pradesh with a 300,000-ton-per-year capacity, J and K Cement Co. of Jammu and Kashmir with a 200,000-ton-per-year capacity, and Uttar Pradesh State Cement Corp., Ltd., of Chunar with a first-phase capacity of 840,000 tons per year.

Completing expansion of their plants were Mysora Cements of Karnataka, Desoram Cement of Andhra Pradesh, and Dalmia Cement (Bharat) of Tamil Nadu. In addition to those mentioned, at least 16,000 tons per day of additional capacity was under construction or in the final planning stage at yearend 1981.[16]

Diamond and Gem Stones.—The diamond industry in India was based on the import of rough diamonds and the export of cut and polished gems. Total turnover in the diamond trade reached a record of

$1,500 million in FY 1981-82. Export earnings from diamonds and jewelry rose 26% to a record $867 million. About 94% of the value was in cut and polished diamonds. The rise in demand for small diamonds, 1/2 carat and less, from the United States and Japan was largely responsible for the large growth in earnings. The U.S. share of Indian sales increased from 25% in FY 1980-81 to 33% in 1981-82. The Gem and Jewelry Export Promotion Council (GJEPC) set a target of $1,030 million in FY 1982-83.

Although export earnings were up, the industry was experiencing a profit squeeze due to recessionary conditions in the world diamond trade. While small and inferior quality diamonds have a good market potential, stocks of other varieties priced above $300 per carat were reported on the increase. Exporters anticipated competition from China and Australia by 1985 that could further depress trade prospects. To improve the quality and increase exports, GJEPC proposed a gem and jewelry design and development center in Bombay. The application of mechanization to the industry was also being stressed to increase the volume of higher quality products.

India imported rough diamonds valued at $633 million in FY 1981-82 compared with a value of $433 million in FY 1980-81. Over 90% of the imports came from the Diamond Trading Co. (DTC) of the United Kingdom and spot market purchases in Belgium. In an effort to break DTC's monopolistic control, the Government-owned Minerals and Metals Trading Corp. of India, Ltd., was seeking to enter the diamond import business by arranging supplies on a government-to-government basis from countries like Ghana, Zaire, the Central African Republic, and Sierra Leone. An agreement has already been signed with Ghana.

Domestic production of diamonds remained relatively insignificant. The Majhgawan Mine in Panna district of Madhya Pradesh produced all the diamonds in 1981. The second mine, Ramkheri, had been closed since July 1980.

Meanwhile the geological search for new diamond sources continued. GSI recovered 54 diamonds weighing a total of 19.1 carats from deposits in Andhra Pradesh. The Andhra Pradesh government, working with GSI, has identified the Anantapur, Karnool, Krishna, and Guntur districts for diamond prospecting. The capacity of the processing plant at Wajrakarur has been increased from 10 to 20 tons per day to handle the new material.

Fertilizer Materials.—In FY 1981-82, nitrogenous fertilizer capacity in India was increased by 21% to over 5.5 million tons. Production increased at more than double that rate. Production of phosphatic fertilizer (P_2O_5) also increased but at a much lower rate. An overall improvement in the country's infrastructure system, along with the more timely supply of raw materials and feedstock to the fertilizer plants, contributed to the improved performance. Capacity utilization was about 68% for both nitrogen and P_2O_5 during FY 1981-82.

Major highlights of the year included the installation of an additional naphtha reformer at the Rourkela plant and removal of mechanical and equipment problems at the Cochin, Namrup, and Barauni projects. The modernized Sindri plant reached 80% utilization. Reportedly, the industry's performance during 1981 could have been even higher had it not been for power shortages and other restrictions in Punjab and Uttar Pradesh. In addition to Kandla and Kanpur, both undergoing expansion, three new plants—Trombay V, Bharuch, and Haldia—began commercial production. In addition, seven more projects were scheduled for completion, including Namrup III and Thal-Vaishet in the public sector, and Deepak Fertilizers and Petro-chemicals Corp., Ltd. (Taloja in Maharashtra), in the private sector. The Taloja project, with a capacity of 90,000 tons per year of anhydrous liquid ammonia, is based on Bombay High (BH) gas as the feedstock.

The Government fertilizer feedstock policy was to exploit gas and coal, supplemented by naphtha in the event of a long-term disposal problem. An outlay of $2.3 billion was earmarked for setting up 19 new nitrogenous and phosphatic fertilizer plants during the sixth 5-year plan period. Among 11 proposed phosphatic projects, the Government has already approved the $204 million joint-venture project to be established at Paradip, Orissa, with an annual capacity of 117,000 tons of nitrogen and 300,000 tons of diammonium phosphate.

In addition to two gas-based projects scheduled for both Thal-Vaishet in Maharashtra and Hazera in Gujarat, at least six additional ammonia-based fertilizer plants using natural gas piped from the offshore South Bassein Gasfield were being planned. These include one each in Rajasthan and Madhya Pradesh and four in Uttar Pradesh. The capacity at each plant was

expected to be about 1,350 tons per day of ammonia with matching urea capacity. Meanwhile, owing to project delays, the cost of the Thal-Vaishet project has nearly doubled the original planned price. There were also plans for additional coal-based nitrogenous fertilizer plants, providing the recently completed Ramagundam and Talcher plants perform satisfactorily.

Consumption of fertilizer in India rose 10% to 6.13 million tons during FY 1981-82. The anticipated 4% annual growth in the agricultural sector during 1980-85 should raise demand for nitrogen fertilizer to 4.3 million tons, P_2O_5 to 1.37 million tons, and K_2O to 680,000 tons in FY 1982-83 for a total of 6.36 million tons. The Indian Government projected fertilizer demand to reach 6 million tons of nitrogen and 2.3 million tons of P_2O_5 by the end of the current sixth 5-year plan period.

Despite the increased production, India continued to be a major importer of fertilizers. Imports amounted to 2.08 million tons in FY 1981-82 valued at $667 million. This was a significant reduction from the previous year when total imports were valued at about $1 billion. In addition to the United States, a major source of diammonium phosphate and urea, suppliers included Poland, the Federal Republic of Germany, the U.S.S.R., Belgium, Romania, Qatar, Italy, Norway, Hungary, Bulgaria, France, the German Democratic Republic, and Canada.

Mica.—Mica production and processing in India was basically an export-oriented cottage industry. Export earnings totaled $60 million in FY 1981-82, up significantly from that of the previous year. Production of crude mica also improved for the first time in several years. Minehead value rose to $3.33 million compared with $3.0 million a year earlier. Production of scrap mica remained roughly constant. Official statistics continue to be somewhat misleading, generally on the low side, due to false reporting to avoid taxation and royalties. Substantial quantities also come from existing stockpiles. Bihar continued to be the leading producer, accounting for nearly 57% of the country's total production, followed by Andhra Pradesh and Rajasthan.

The highly labor-intensive mica mining was almost entirely in the private sector. However, the Government continued to regulate the industry through the Mica Trading Corp. of India, Ltd. (MITCO), which shared with the private sector all exports of crude and processed mica on a 50:50 basis.

While the total value of exports was notably higher in FY 1981-82, trade with the free convertible currency areas declined. Increasing competition from Spain, the Republic of South Africa, and China; inconsistency in the quality of Indian mica; and procedural delays were among the factors contributing to the 36% drop to $5 million in exports to market economy countries.

Indian mica exports to centrally controlled economy countries, on the other hand, rose 62% to $26.7 million with the U.S.S.R. the principal customer. The combined exports to centrally controlled economy countries, consisting mainly of expensive, larger size mica above grade 5, accounted for 84% of the total in FY 1981-82.

In addition, exports of fabricated and manufactured mica, which fall entirely in the private sector, earned India another $21.7 million and $6.7 million, respectively, in FY 1981-82, nearly double the FY 1980-81 total.

The present emphasis in the mica industry was on development of various value added products, including mica powder, mica paper, mica capacitors, silvered mica, and micanite products. A number of Indian firms were seeking to set up mica-based manufacturing facilities. More than 20 private companies have reportedly a combined annual capacity of 27,000 tons but utilization was limited to about 30%, mainly because of poor product quality. MITCO also plans to invest $44.4 million to promote a 3,000-ton-per-year mica powder plant, a 1,200-ton-per-year mica paper plant, a mica paper-based products plant, a wet-ground 1,200-ton-per-year mica powder plant, and a glass-bonded mica plant, all in Bihar. Two mica-based product plants were proposed for Rajasthan.

Mineral Sands.—The scheduled completion of the $100 million first phase of the Orissa mineral sands complex continued to slip owing to delays in delivery of equipment by fabrication contractors and to problems of cost escalation by the contractors. The new target date for completion of the plant was moved back 1 year to December 1983. The plant's design parameters, which call for an annual production of 220,000 tons of ilmenite to be processed into 100,000 tons of synthetic rutile, 30,000 tons of sillimanite, 2,000 tons of zircon, 4,000 tons of monazite, and 10,000 tons of natural rutile, remained unchanged. Work on the 25,000-ton-per-year titanium dioxide pigment plant by the state sector Kerala Minerals

and Metals, Ltd., has also slipped behind schedule and was expected to be ready by mid-1983. Travancore Titanium Products, Ltd.'s proposal to set up a titanium dioxide plant in Kerala was also facing problems, although press reports indicated that negotiations with a British company for process know-how were at an advanced stage.

Development plans of Indian Rare Earths, Ltd. (IREL), call for the renovation of its rare earths plants at Alwaye in Kerala. Additional equipment was also proposed for the minerals division to meet an increased demand for rutile and sillimanite. IREL has prepared a preliminary report for setting up a thorium plant at Trombay for production of mantle-grade thorium nitrate and thorium oxide. Meanwhile, thorium hydroxide continued to be stockpiled for future use. IREL achieved some success in its efforts to diversify production by producing compounds of rare earths, zirconium chemicals, and zircon-based products.

Production of titanium and rare-earth minerals was higher in FY 1981-82 than in FY 1980-81. The value of production rose 26% to $16.1 million. Production was handicapped by power constraints and a prolonged transport strike in Kerala during April-July 1981.

Export earnings from the sale of heavy minerals and compounds increased 11% to $589,000, over that of 1980. Exports of ilmenite, chiefly to Japan and West Europe, declined 15% in FY 1981-82 owing to port labor problems. These two market areas also became the main buyers of garnet in FY 1981-82. A spurt in domestic demand from the electrodes industry resulted in discontinuing rutile exports in FY 1981-82.

MINERAL FUELS

Coal.—Indian coal output increased significantly for the second year after a 5-year period of nearly constant production levels. Despite the increased production, transportation bottlenecks continued to plague coal producers and consumers alike, resulting in regional shortages and further buildup of record pithead stocks. In addition, consumers had to cope with a deterioration in quality and sizing of coal. Deliveries to consumers amounted to 118 million tons with power stations, steel plants, and railroads accounting for over 60% of the consumption.

To meet a projected demand of 137 million tons in FY 1982-83, the coal target was raised 8% to 135 million tons. Imports of high-grade coking coal were planned at 1.2 to 1.5 million tons. A demand of roughly 165 million tons was projected for 1985, the end of the current 5-year plan.

GSI, the Central Mine Planning and Design Institute, Ltd., and MEC were all concentrating their efforts on upgrading existing coal reserves from indicated to measured and establishing additional reserves, particularly in coking coals. Of the 112 billion tons of existing reserves, coking coal accounted for only 14 billion tons or about 50 years' supply at the present rate of consumption. The Government was taking into account the long lead time required to develop a coalfield, and a large increase in exploration activities employing the latest technology was planned. The allocation for coal exploration was put at $83.3 million during the sixth 5-year plan period.

Although coal production targets were met in 1981, nearly one-half of the increase in FY 1981-82 resulted in merely raising pithead stocks to a record 24 million tons. This occurred in spite of a 9% increase in average daily wagon loadings to 9,500. That number, however, was still far short of the 12,500 loadings per day reportedly needed. Because of the rail loading problem, 21% or 26 million tons of coal was delivered to consumers by truck in FY 1981-82 at a greatly increased delivery cost.

The rail situation did improve with a significant reduction in wagon turnaround time to 12 days in 1981 from a 16-day average in 1980. The Indian railways were beginning to introduce new coal wagons to replace the huge fleet of inoperative wagons, but this was not going to make an immediate increase in coal-carrying capacity of the railroads, as old railcars continued to break down as fast as they could be repaired or replaced.

Thus, the outlook for improved coal movement during 1982 was not encouraging. Another factor that will compound the present coal transport situation is the large increase in production planned for the mid-1980's and later. A very determined and costly effort will have to be made to improve the entire railroad network if the larger volumes of coal are to be moved efficiently.

In addition to infrastructure bottlenecks, the Indian coal industry continued to suffer from bureaucratic delays, management problems, and cost overruns. A Government source stated that 11 out of 79 Coal India, Ltd. (CIL), projects were 3 years behind

schedule. The Indian press attributed project delays and cost overruns exceeding 100% to management inefficiency, delays in delivery by domestic and foreign suppliers, conceptual shortcomings, and scanty geological data. Labor problems were also a factor as over 500,000 workerdays were lost owing to absenteeism and strikes during FY 1981-82.

Planned developments for FY 1982-83 focus on the needs of the priority consumers, namely power and steel plants. Their main needs are dependable delivery and a marked improvement in the quality of coal. Additional coal handling facilities, washers, and railroad sidings were high on the list of projects to be implemented. The annual outlay for the coal sector for FY 1982-83 was increased 30% over that of the previous year to total $978 million. Existing mines, accounting for over 50% of the coal production, were to receive about one-fifth of the outlay. An estimated 40% was also allocated for new mines, some now in production and others under investigation, in order to meet the increased production targets in the coming years.

At the same time, in order to redress consumer complaints on coal quality, over $44 million was expected to be spent on washers and coal-handling facilities. Plans called for setting up 14 additional washers with a combined annual capacity of 28.4 million tons. These would bring the total washer capacity to 49 million tons by the end of the decade, and presumably introduce the latest methods and equipment for coal beneficiation. Approximately 10 million tons of the planned increase was to be operational by the end of 1984-85. That target appeared to be optimistic as several plants under construction were already 1 to 2 years behind schedule.

Despite the substantial capital outlay in 1980-81 and the planned increase for 1982, the goal of a 165-million-ton capacity in 1985 will not be met without a further large increase in funding. This has prompted the Ministry of Energy to seek an additional $1.78 billion for coal sector programs during the remaining 2 years of the plan period. Over 80% of the allocation would be earmarked for coal mining and exploration projects, 5% for washers, and the remaining for captive powerplants, fire control, and research. Development of open pit mines would be emphasized during this period because of their shorter construction time and higher productivity.

Under a long-term investment program valued at $6.11 billion for a 20-year master development plan, reconstruction of the Jharia Coalfield, the only source of prime coking coal, was underway by Bharat Coking Coalfields, Ltd., a CIL subsidiary. Coal production was to be raised from the present 23 million tons to 90 million tons per year by the year 2000. This ambitious development program covering 258 square kilometers was to be divided into several phases. The first phase, expected to be completed by 1990, will attempt to modernize existing underground mines with the objective of freeing around 800 million tons of coal in pillars left standing by older mining techniques. Another aim was to control underground fires affecting about 40 colleries that have destroyed or denied access to an estimated 85 million tons of prime coking coal. A master plan prepared with the help of Polish experts call for the reconstruction of the Jharia Coalfield into 21 underground and 9 open pit mines. Later phases of the program, with assistance from Poland and the U.S.S.R., will provide for a number of additional high-efficiency underground mines and several large open pit mines.

Lignite.—The Neyveli Lignite Corp. (NLC) in Tamil Nadu remained India's largest producer of lignite. Production increased substantially in FY 1980-81 and again in FY 1981-82. Most of the lignite mined was consumed locally by power and fertilizer plants operated by NLC. NLC has proposed further expansion of the first mine pit to 8.5 million tons at a cost of $100 million to support either a 100- or 210-megawatt unit that will be an addition to the existing 610-megawatt powerplant.

In August 1981, the Minister of Energy laid the foundation stone for the second thermal electric power station at Neyveli. Plans are to have three 210-megawatt units, the first to be commissioned in September 1984, the second in April 1985, and the third in September 1985. Work on the second mine, which will supply lignite to the new powerplant, continued satisfactorily during the year. The total cost of the expansion program was to be about $450 million.

Aiding in the technology and construction of the mine and powerplant were companies from the Federal Republic of Germany (lignite handling system), Italy (boiler feed pumps and turbogenerators), and Hungary (boilers). An Indian company will supply the control and instrumentation system. The Federal Republic of Germany has sup-

plied most of the financing for the project at Neyveli. Plans for a third large mine and accompanying powerplant at Neyveli were being reviewed by the Government.

The Government's Central Electricity Authority has approved setting up lignite-based powerplants of 120 megawatts each at Bikaner, Rajasthan, and Kutch, Gujarat, where lignite reserves were estimated at 24 million and 200 million tons, respectively. The Federal Republic of Germany has offered technical assistance to develop the Rajasthan reserves. In addition, the Central Electricity Authority has recommended establishing a lignite mine and powerplant at Palna, Rajasthan.

Petroleum and Natural Gas.—FY 1981-82 saw a major increase in the activity of the Indian petroleum sector. Following the large rise in international crude oil prices that created a difficult balance of payments position, the Government intensified its efforts in oil exploration and development. The main effort was offshore, producing new oil and gas discoveries and higher production from the BH Oilfield. Total crude oil production for the year rose over 50%, about one-half of which came from BH.

Augmenting domestic production, India imported an average of 307,000 barrels per day of crude oil and 99,500 barrels per day of refined products during FY 1981-82 at a cost of $5.7 billion. This was a welcome drop from the record high of roughly $7 billion the previous year.

To help in the search for hydrocarbons with the ultimate aim of achieving self-sufficiency, the Government took a bold step in 1981 by inviting foreign oil companies to explore once again for oil in India on production-sharing terms. Seventeen offshore and fifteen onshore blocks were opened to foreign companies. By the end of FY 1981-82, following extended negotiations, the Government signed an agreement with Chevron Oil Co., the first oil exploration contract in about 5 years. Another round of bidding was to be invited with the number of blocks being greatly increased. Supplementing this effort, the Oil and Natural Gas Commission (ONGC) and Oil India, Ltd. (OIL), both public sector companies, have tendered for onshore contract drilling calling for the use of helicopter-transportable rigs and deep drilling equipment, which neither company currently possesses.

Under ONGC's accelerated plan of production for BH and satellite fields, crude oil was targeted to reach close to 420,000 barrels per day in FY 1982-83, with most of the increase from offshore. The goal of 600,000 barrels per day was set for 1985.

To implement the planned increases, the FY 1982-83 annual plan provides for a 92% increase in expenditures amounting to $2.16 billion for the petroleum sector. Of this amount, $1.69 billion is earmarked for oil exploration and development by ONGC. The large planned increases should enable the Government to raise the domestic proportion of crude oil requirements to 70% by 1985. Meanwhile, India's import bill should decline even further than in 1981.

Long-term ONGC plans called for expenditures as high as $33.3 billion to reach an annual production of 1.2 million barrels per day by 1990. OIL was also drawing up long-term plans that envision an outlay of $667 million and a crude output of 160,000 barrels per day by 1990. The massive proposed expenditures depend on the success ONGC and OIL have in establishing the new crude reserves needed to justify the development costs.

The increased exploration activity produced several new oil and gas discoveries during 1981. Among these, oil was found at the B-57 Structure off the west coast and gas at well PH-91 in the northern Palk Straits in the offshore Cauvery Basin. Onshore oil was struck at Kadasa and gas was struck at Daheu in Gujarat and in the Razole Structure in the Krishna-Godavari Basin. During the year, favorable oil signs were also noted at a number of sites in upper Assam and Arunachal Pradesh.

Seven rigs operated offshore India during 1981 that drilled 12 wildcat and 34 developmental wells. As of March 31, 1981, ONGC drilled a total of 155 wells offshore. Of these, 97 were oil-producing, 17 were gas wells, and 41 were dry.

Roughly 35 rigs operated onshore during 1981 and drilled 95 wells. These included 66 wells in Gujarat, 23 wells in eastern Assam, and 6 wells in the central region, which covers Tripura, West Bengal, and the Krishna-Godavari Basin.

Refinery developments were highlighted by the partial commissioning of the 120,000-barrel-per-day Soviet Union-aided Mathura refinery. India's 12 refineries, all in the public sector, now have a combined capacity of 656,000 barrels per day. By FY 1984-85, Indian refinery capacity was scheduled to be increased to 911,000 barrels per day. With the help of a $200 million Interna-

tional Bank for Reconstruction and Development (World Bank) loan, four refineries—Madras, Visakhapatnam, Cochin, and Bharat Petroleum Corp. at Bombay—were to be expanded and upgraded with secondary processing facilities. Fluid catalytic-cracker units are to be installed by Universal Oil Products Co. of the United States in each of these refineries to optimize recovery of middle distillates, which make up close to 50% of the product requirement. Total cost of the refinery expansions was to be over $1 billion. Two new refineries of 120,000 barrels per day each, plus expansion of the Haldia refinery from 50,000 to 110,000 barrels per day were proposed for the seventh 5-year plan, FY 1985-86 to 1989-90. Karnal in Haryana and Mangalore in Karnataka have been the designated locations of the new refineries. Completion of these projects would bring Indian refinery capacity close to the country's projected refined product demand in 1990.

Pipeline developments were highlighted by the completion of a 349-kilometer refined-products pipeline from the new Mathura refinery through New Delhi to Ambala. Work continued on the 164-kilometer last leg between Ambala and Jullundur.

A 156-kilometer product pipeline was proposed between Bombay and Pune. Tender orders have been issued for this project, which is to be completed by August 1984.

Other pipeline plans include the expansion of the Salaya-Viramgam section of the Salaya-Mathura crude oil pipeline by December 1982; modernization of the Barauni-Kanpur pipeline; and installation of storage tanks in the New Delhi, Ambala, and Jullundur areas following completion of the pipeline from Mathura.

A major project was the 106-centimeter undersea pipeline planned between the offshore South Bassein Gasfield and Umbhrat on the Gujarat coast, a distance of 236 kilometers. From Umbhrat, the pipeline will continue overland to Hazira. ONGC was seeking World Bank financing for the first development stage of the South Bassein Gasfield that includes the pipeline. Global tender for the pipeline was to be issued in 1982. The cost was estimated at $150 million. About 1,000 to 1,500 kilometers of pipeline will also be needed to supply gas to at least six more fertilizer plants planned for Rajasthan, Uttar Pradesh, and Madhya Pradesh.[17]

Indian gas production in 1981 was derived only in association with crude oil production, with one-third of the total coming from offshore BH. The production increased 37% over that of 1980 but utilization remained a problem, with a major share of the gas being flared at a substantial loss financially. According to the Ministry of Petroleum, between 1975 and 1981, about 155 billion cubic feet of natural gas, valued at nearly $100 million, was flared in Assam. Although the problem was being studied, the Government had no comprehensive policy that provided a rational utilization of this energy resource, estimated at 29.5 trillion cubic feet.

Only about one-half of the offshore associated gas production was used during the year. Until the $1 billion Thal Vaishet nitrogen fertilizer project comes online in 1984, disposal of the increasing amounts of BH associated gas will continue to be a problem.

Some gas was to be diverted to the Maharashtra State Electricity Board to operate a 240-megawatt powerplant being set up near Uran in 60-megawatt units. In Assam, the Government was studying a way to increase gas supplies to the Namrup fertilizer plant, and to the State Electricity Board where additional gas turbines are to be installed. Despite these efforts, flaring appears unavoidable for some time.

The South Bassein Gasfield, with reserves of 9.5 trillion cubic feet, was expected to start production by early 1985. First phase output was to be 350 million cubic feet per day rising to 700 million cubic feet per day before the end of the decade. Plans call for the gas to be used in fertilizer production and the petrochemical industry. A 180,000-ton-per-year gas-fractionation plant was to be set up at Hazira, Gujarat, along with the first two gas-based fertilizer plants.

The Mineral Industry of Indonesia

By John C. Wu[1]

In 1981, Indonesia continued to sustain a high rate of growth in the real gross domestic product (GDP) and maintained a modest rate of inflation. Under the Indonesian 5-year development plan (1979-84), the target real economic growth was 6.5% per year. However, the country's real growth in GDP was 8.2% in 1981 compared with 9.6% (revised) in 1980. For 2 years in a row, Indonesia's real economic growth was ranked the second highest after Singapore among the five members of the Association of Southeast Asian Nations (ASEAN). Indonesia's GDP in 1973 constant dollars was estimated at $18.4 billion in 1981 compared with $17 billion in 1980. The country's GDP in current prices was about $85 billion in 1981 compared with $70 billion in 1980.[2] The inflation rate was brought down from the two-digit level of 15.4% in 1980 to the one-digit level of 8.4% in 1981.

The high growth in the Indonesian economy was contributed mainly by the higher level of production in foodstuff and manufactured goods stimulated by the expanding domestic demand. However, a relatively slower growth in 1981 was caused by a slowdown in demand for light manufactured goods, smaller increases in export earnings of oil and liquefied natural gas (LNG), a sharp drop in exports of nonoil commodities owing to a worldwide oil glut and economic recession, and a fall in investment because of the higher interest rates.

In 1981, the oil and gas sector remained the most important industry of the Indonesian economy. The output of oil reversed its downward trend and averaged 1.6 million barrels per day, while the output of natural gas continued its upward trend. During 1981, the industry's exports of oil and LNG, valued at $17.7 billion, were about 21% of the country's GDP and about 81% of total export earnings, which were valued at $21.9 billion. Indonesia remained one of the top 10 oil exporters and became the world's largest LNG exporter in 1981. Despite the worldwide oil glut, Indonesia continued its high level of oil and gas exploration. During 1981, over 300 exploratory wells were drilled, 40 new oil and gas wells were discovered, and 12 oil-exploration contracts were signed between Indonesia and foreign companies, which were committed to spend more than $900 million dollars over the next 3 to 6 years.

To increase exports of LNG to Japan, expansion programs for the LNG plants at Arun in Aceh and Bontang in East Kalimantan were started in 1981. Upon completion of the expansion programs in 1984, LNG production capacity of Indonesia will be increased from 407 billion cubic feet to 762 billion cubic feet. In line with the Government energy policy, the expansion program of coal production at the Ombilin Mine in West Sumatra also began in 1981. The projected coal output from the Ombilin Mine will reach 725,000 tons per year in 1985. In addition, the expansion program at the Bukit Asam Mine secured funds from the World Bank, Canada, and several Western European countries.

In the nonfuel minerals sector, production of most of the country's mineral products increased in 1981, except gold and silver. However, because of the weakened world market for metals, export earnings of Indonesian mineral products dropped substantially. In 1981, Indonesian tin output continued to advance because one additional dredge, Belitung I, operated offshore Belitung Island. Indonesia displaced Thailand and became the world's third largest

tin producer. The expansion program of Freeport's Ertsberg East underground copper mine in Irian Jaya was completed and brought into production in June 1981 at a total cost of only $87 million (originally estimated at $101.5 million). A 600,000-ton-per-year alumina project is expected to be initiated in the spring of 1982 with Kaiser Aluminum and Chemical Corp. of the United States and Klöckner INA of the Federal Republic of Germany as the contractors to build the plant on Bintan Island.

The first-phase construction of the Asahan hydroelectric powerplant and aluminum smelting facility was completed in December 1981. Inauguration of the complex was scheduled for January 20, 1982. Production of aluminum was expected to begin in February 1982 with a projected output of about 50,000 tons of aluminum for 1982. Indonesia's production of bauxite and nickel ore remained unchanged. However, the production of nickel matte by P.T. International Nickel Indonesia at Soroako in South Sulawesi suffered from depressed nickel prices and rising costs. The company planned to cut back its output by 50% in 1982.

Indonesia's cement industry continued to grow in 1981. The total clinker capacity reached over 8 million tons per year at the end of 1981. The country's first white cement plant was put into operation at Cibinong in West Java. A 500,000-ton-per-year new cement plant owned by P.T. Semen Baturaja at Baturaja in South Sumatra was also put into operation in 1981. Construction work on the 1-million-ton-per-year cement plant owned by a joint-venture company, P.T. Semen Andalas Indonesia at Lhoknga, Aceh, began in mid-1981 and was scheduled for completion in 1983. In addition, Indonesia planned to build a 3-million-ton-per-year cement plant at Citeureup, West Java, and a 120,000-ton-per-year cement plant at Kupang on Timor Island. Contracts for the construction were awarded in 1981. Construction of the two cement plants was expected to start in 1982 and be completed by 1984-85.

An ammonia-urea plant (Kaltim I) owned by P.T. Pupuk Kaltim at Bontang, East Kalimantan, was expected to come on-stream in 1982. The company had awarded another contract for a second plant, to be called Kaltim II, to expand the output capacity of Kaltim I. Construction of Kaltim II is expected to start in mid-1983 by Kellogg Overseas Corp. of the United States and two Japanese companies. A contract was also awarded to two Japanese companies by P.T. Petrokimia Gresik for the construction of a fertilizer complex at Gresik, East Java. Construction of the fertilizer complex was expected to start in 1982 and was scheduled for completion in 1984.

PRODUCTION

Indonesia's mineral industry continued to be dominated by the oil and natural gas sector in 1981. The output of crude oil rose by 1.3% as a result of six new oilfields put into production by P.T. Caltex Pacific Indonesia in Sumatra and three new platforms brought into operation by Independent Indonesia American Petroleum Co. in the Krisna Oilfield offshore southeastern Sumatra. The output of natural gas reached 1.1 trillion cubic feet. Production of LNG remained high at about 423 billion cubic feet. Coal output was still at an insignificant level of about 350,000 tons in 1981.

In 1981, tin production rose to about 35,000 tons with increasing output by new dredges, Bima and Belitung I, operated offshore around Pulang Tujuh and Belitung Island, respectively. Copper production also rose by about 5%, owing primarily to the newly completed expansion program of the Ertsberg East underground mine. Production of bauxite and nickel remained at the 1980 level, while production of gold and silver by the state-owned P.T. Aneka Tambang at Cikotok Mine declined. Gold and silver production by P.T. Freeport Indonesia, Inc., as a byproduct of the copper operations at Ertsberg also decreased slightly.

Cement output went over 6 million tons owing to additional output of the newly operated plant owned by P.T. Semen Baturaja. Production of urea was slightly higher than the 1980 level, while the output of ammonia sulfate and triple superphosphate jumped by 24% in 1981.

Table 1.—Indonesia: Production of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1977	1978	1979	1980[p]	1981[e]
METALS					
Aluminum: Bauxite, dry equivalent, gross weight thousand tons	1,301	1,008	1,052	1,249	1,203
Copper, mine output, metal content	57,120	58,952	60,210	57,985	58,360

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Aug. 2, 1982.

[2]Includes Au content of copper ore and output by Government-controlled operations. Gold output by operators of so-called People's mines is not available but may be as much as 30,000 troy ounces per year.

[3]Includes a small amount of cobalt that is not recovered separately.

[4]Data represent limestone used for cement production. Excludes considerable amounts of limestone produced by enterprises under local jurisdictions for building materials, for crushed rock to be used as aggregate, and to burn for lime.

[5]Sulfur produced by other than the Frasch process.

[6]Less than 1/2 unit.

TRADE

Despite the softened world oil market and worldwide economic recession, Indonesia continued to maintain a merchandise trade surplus of about $9.4 billion in 1981. According to Indonesia's Central Bank, total export earnings were about $21.9 billion in 1981, only 1% higher than that of 1980. Export earnings of oil and LNG were $17.7 billion, a 12% increase in 1981, compared with a 62% surge in 1980. However, export earnings of nonoil commodities dropped by 29.5% in 1981. Sharp drops in prices of Indonesia's major nonoil commodities and recent Government policies restricting exports of timber and palm products were cited as the main causes of the decline.[3] Indonesia's imports were estimated at about $12.5 billion in 1981, slightly less than that of 1980. Machinery and electrical equipment, base metals, mineral products, vehicles and transport equipment, and chemical products remained the major import commodities.

In 1981, exports of crude oil and petroleum products were valued at $15.2 billion. Japan and the United States remained the two major importing countries. Exports of LNG were valued at $2.5 billion, of which $1.4 billion was exported from the Arun Gasfield, and $1.1 billion from the Badak Gasfield. Japan was the only buyer of Indonesia's LNG in 1981.

Tin, nickel, and copper along with timber, rubber, and coffee remained Indonesia's principal nonoil export commodities. Because of a sharp drop in prices of these commodities in the world market, export earnings from these commodities dropped significantly. In 1981, export earnings from timber dropped by 50% to $948 million; rubber, by 22% to $847 million; tin, by 8% to $424 million; coffee, by 43% to $372 million; nickel matte, by 19% to $108 million; and copper, by 10% to $99 million. Other export earnings of mineral products also dropped substantially. For example, cement dropped 27% to $14.8 million, and fertilizer dropped by 84% to $4.8 million in 1981.

During 1981, the major trading partners of Indonesia, based on the value of two-way trade, were Japan, the United States, Singapore, and the Federal Republic of Germany.

Table 2.—Indonesia: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1979[r]	1980	Destinations, 1980	
			United States	Other (principal)

COMMODITY REVIEW

METALS

Aluminum and Bauxite.—In 1981, bauxite production by P.T. Aneka Tambang was about 4% lower than that of 1980. Most of the output was exported to Japan under a 10-year contract that will expire in 1984. Total exports of bauxite in 1981 were 1.15 million tons.

In July 1981, a Japanese consortium of five leading aluminum smelters withdrew from a joint bauxite-alumina project to develop a 600,000-ton-per-year-capacity alumina plant in Indonesia. Based on the feasibility studies completed by the Japanese consortium, the quality of the below export-grade bauxite on Bintan Island was lower than anticipated, and the production cost of alumina would be too high. However, the Government of Indonesia decided to finance the entire project after the Japanese consortium pulled out from the project. Kaiser Aluminum Technical Services and Kaiser Engineers International, both units of Kaiser Aluminum and Chemical Corp. of the United States, and Klöckner INA of the Federal Republic of Germany were expected to sign a contract with the Government to build an alumina plant on Bintan Island starting in April 1982.

The total cost of the 600,000-ton-per-year alumina plant was estimated at $725 million, and it was expected to be completed by mid-1986. Kaiser would be responsible for designing and managing the project as well as providing the technology, and Klöckner would be responsible for building the plant. According to Indonesia's Ministry of Mines and Energy, bauxite deposits on Bintan Island and at Kuala Tangung in North Sumatra were considered as raw material sources for the plant; however, Bintan Island was selected mainly because of its larger deposits, with estimated bauxite reserves of 75 million tons averaging 49.4% Al_2O_3 and 8.2% SiO_2, and projected lower operating costs.[4]

The first-phase construction work on Indonesia's Asahan hydroelectric powerplant and aluminum smelting complex was completed before yearend. The first 170 reduction pots of a new 75,000-ton-per-year aluminum smelter being built at Kuala Tangung was scheduled for inauguration on January 20, 1982. The smelter is powered by a 286-megawatt power station located at Singuragura, 74 miles away. Production of aluminum is expected to start in late February 1982. Based on production plans, the first year output of aluminum ingot was estimat-

ed at 50,000 tons, of which 75% is expected to be exported to Japan at a price about 11% to 12% lower than the Alcan Aluminum Ltd. export price of $1,750 per ton, and the remaining 25% is to be marketed in Indonesia.[5]

The second-phase construction of the smelter is to have an annual capacity of 150,000 tons and is scheduled for completion in 1983. When the third-phase construction is completed at the end of 1984, the smelter will have an annual capacity of 225,000 tons of aluminum ingot, and a second powerplant with a 317-megawatt capacity will also be completed at Tangga, about 4 miles from the Sigura-gura powerplant. During the early stage of operation, Indonesia will import the required alumina for the smelters from Japan and Australia until the alumina plant on Bintan Island is completed in mid-1986.

Copper.—Production of copper by P.T. Freeport Indonesia, Inc., increased slightly in 1981. The increase in the output was due to the opening of the new underground mines at Ertsberg East. During 1981, by combining the output of the old open pit mine and the new underground mine (the ratio was about 50:50), the company produced 188,260 tons of copper concentrates (averaging 31.87% copper), 46,072 troy ounces of gold, and 686,996 troy ounces of silver.

The new underground mine at Ertsberg East was brought onstream in June 1981 with a total project cost of only $87 million, about $14.5 million less than the original budget. The initial mining capacity of the new underground mine was 4,500 tons of ore per day, increasing to 6,000 tons per day by yearend. At yearend, Freeport's total milling capacity reached 9,500 tons of ore per day (the ratio of new mines output to the old was 60:40). During 1981, 75% of the copper concentrate was exported to Japan, and the remaining 25% was sold to Marc Rich, an international trader, under a 10-year contract.[6]

Gold and Silver.—Gold and silver production by the state-owned P.T. Aneka Tambang declined in 1981. The mine output of gold from the Cikotok Mine area dropped 31% to 4,571 troy ounces for the first 9 months in 1981 from 6,635 troy ounces for the same period in 1980. The mine output of silver also declined by 18% to 49,145 troy ounces for the first 9 months of 1981 from 59,802 troy ounces for the same period in 1980. The low prices of gold and silver and declining ore grade were the primary causes of this significant reduction in the output of gold and silver in 1981. The output of gold and silver as a byproduct of Freeport's copper operation at Ertsberg in 1981 was about 45,935 troy ounces of gold and 685,977 troy ounces of silver in 1981, compared with 51,906 troy ounces of gold and 606,690 troy ounces of silver in 1980.

During 1981, a joint-venture company, P.T. Sungai Dandai, was formed by P.T. Karang Sulah of Indonesia and Kajuara Mining Corp. (Pty.) Ltd. of Australia. The company was to bring onstream a gold and silver mine in the Lebong Tandai, Bengkulu Province, in Sumatra. The production is expected to start at the rate of 32,100 troy ounces of gold and 288,900 troy ounces of silver per year in 1983. The total cost of the project was estimated at $12 to $13 million.[7]

Iron Sands.—Indonesia's mine production of iron sand concentrates from the Cilacap and the Palabuhanratu Mines increased slightly in 1981. During the first 10 months of 1981, the total monthly output of the two mines averaged 6,500 tons, with the Palabuhanratu Mine accounting for about 55% of the total production in 1981. Since 1979, the average output from the Cilacap Mine had been reduced to about 3,000 tons per month and was maintained at that level during 1981 because of the continued dispute over export price and quantity with the Japanese company, Nippon Kokan Co., Ltd.

P.T. Krakatau Steel, Indonesia's state-owned steel producer, was operating at a loss during 1979-81, mainly owing to the high cost of financing and underutilization of capacity. The first phase of the company's steel mill complex began operating in October 1979. It includes a HYL-process, direct-reduction plant with an annual capacity of 1.1 million tons and electric arc furnaces with an annual capacity of 500,000 tons. However, according to company officials, the output of raw steel was only 250,000 tons, about 50% of the installed capacity, in 1981. Problems in operation training, steel pellets importing, and marketing of the steel products were cited as reasons for the underutilization of capacity in 1981.[8]

By yearend, the second phase of the company's steel mill project, which included a hot-strip mill and a slab plant, was about 60% completed and was expected to be finished in early 1983. The construction of the second phase was financed by the Government of the Federal Republic of Germany. The total investment in the compa-

ny's steel complex, which includes phases one and two, was estimated at about $3.8 billion.

In 1981, Indonesia's total demand for raw steel was estimated at about 2.9 million tons, of which about 2.3 million tons was imported, mainly from Japan and the Republic of Korea.

Nickel.—P.T. Aneka Tambang, the state-owned mining company, and P.T. International Nickel Indonesia (P.T. Inco), a subsidiary of International Nickel Co., Ltd., of Canada, remained the two Indonesian nickel producers in 1981. The combined output of nickel ore produced by P.T. Aneka Tambang from two mining operations remained at about 1.5 million tons in 1981. Nickel ore production from the Moluccas area on Gebe Island, accounting for about 51% of the company's total output, was exported to Japan. The exports of nickel ore from Gebe Island to Japan increased slightly to about 800,000 tons in 1981 from 775,000 tons in 1980. The nickel ore output from the Pomalaa area in southeast Sulawesi, accounting for 49% of the total ore output, was partially exported to Japan and partially (about 400,000 tons) shipped to the company's ferronickel smelter at Pomalaa for the production of high- and low-carbon ferronickel ingot, containing 22.4% nickel. During 1980-81, about 16,000 tons of ferronickel ingots were exported annually.

In 1981, a feasibility study for expanding the capacity of the ferronickel smelter from 20,000 to 75,000 tons per year was completed. According to Indonesia's Ministry of Mines and Energy, construction of the expansion project was expected to start in 1982 and was scheduled for completion in 1985.

P.T. Inco produced about 19,900 tons of nickel matte containing 75% nickel from its nickel mine and smelting facility at Soroako, South Sulawesi, in 1981. Because of the continuing depressed world market conditions, the company planned to cut production of nickel matte by 50% in 1982. Since 1977, the company had suffered from a series of mechanical and technical difficulties. During 1980-81, most of the difficulties reportedly had been resolved, and the second production line was also completed and put into operation. However, because of the depressed world metals market, the company had suffered a loss of about $70 million on sales of $122 million in 1981, compared with a loss of $59.4 million on sales of $140 million in 1980.

In early 1981, the Government reportedly had acquired 4% of the equity in P.T. Inco. A consortium of six Japanese companies, which also had a 2% stake in P.T. Inco, imports 14,000 tons of nickel matte from the company annually.[9]

In August 1981, P.T. Aneka Tambang announced that a large nickel deposit was discovered in the Buli Bay region following exploration work around the Halmahera area. Samples of the Buli Bay nickel ore were sent to Jakarta and Japan for further study. The quality and quantity of the deposits were unknown. However, it was reported that the quality of the ore was similar to that of Gebe Island, and ore reserves may be quite large.[10]

Tin.—Despite a 9% drop in tin prices, Indonesia's output of tin concentrates continued to increase and reached another high in 1981. The increased output resulted largely from a new large offshore dredge, Belitung I, owned and operated by P.T. Tambang Timah, and the continuing growth of tin output achieved by P.T. Koba Tin. In 1981, Indonesia became the world's third largest tin producer. Its exports of tin rose by 3.6% to 31,879 tons, but the export earnings of tin dropped by 8% to $424 million because of the lower price of tin. However, tin exports displaced coffee as Indonesia's fourth largest export commodity after oil, timber, and rubber.

For the past 4 years, Indonesia had put three new large dredges (Bangka II, Bima, and Belitung I) into operation. As a result, the tin dredging sector had become more important than gravel pumping. During 1977-80, Indonesia's production of tin concentrates by mining method was as follows, in tons:

Mining method	1977	1978	1979	1980
Dredging	12,694	13,568	15,362	15,434
Gravel pumping	12,098	12,107	12,932	12,789
Opencasting	11	75	324	519
Others	1,123	1,661	917	3,785
Total	25,926	27,411	29,535	32,527

In 1981, production of tin in Indonesia was by P.T. Tambang Timah, accounting for about 77% of the country's output; P.T. Koba Tin, about 17%; P.T. Broken Hill Proprietary Indonesia, about 1.5%; and P.T. Riau Tin Mining, 4.5%.

P.T. Tambang Timah, the state-owned tin company, produced tin concentrates mainly from inland and offshore around the islands

of Bangka, Belitung, Singkep, Kundur, and Karimun. The output from inland and offshore Bangka Island was about 55% of the company's tin production. The output from Belitung Island was about 17%. In June 1981, the company began operation of Belitung I off Tanjungpandan on the west coast of Belitung Island. Beginning in November, Belitung I was operating on the east coast of Belitung near Mangaar.

Belitung I, delivered by Mining and Transport Engineering NV of Amsterdam, is the first tin dredge built in Indonesia. The 202-meter-long dredge has 151 buckets, each with a capacity of 22 cubic feet. It can dig to a depth of 164 feet and is capable of producing about 1,100 tons of tin concentrates per year. Another planned new dredge, Singkep I, scheduled to be built during 1981-83, was reportedly being postponed.[11]

P.T. Koba Tin, 75% owned by Kajuara Mining Corp. Pty., Ltd. (equally owned by CSR, Ltd., and BMI, Ltd. of Australia), and 25% by P.T. Tambang Timah, operated 3 dredges, 13 gravel-pump mines, and 1 dry-strip mine in the southeastern areas of Bangka Island. The company's output of tin concentrates had grown from 3,803 tons in 1979 to over 6,000 tons in 1981. As of mid-1980, the proven tin reserves of the company's concession areas were estimated at 14,000 tons with a cutoff grade of almost 14 ounces per cubic meter of gravel.[12] Additional probable and possible reserves were estimated at 9,400 tons and 23,000 tons, respectively.

P.T. Broken Hill Proprietary Indonesia, a subsidiary of Australia's Broken Hill Proprietary Co., Ltd., operated a high-cost, low-grade underground mine at Kelapa Kampit on Belitung Island. The company's tin concentrates were shipped to Datuk Keramat Smelting at Georgetown in Penang, Malaysia, for refining. The annual output of tin concentrates at Kelapa Kampit was between 400 to 500 tons.

P.T. Riau Tin Mining, 90% owned by Billiton International B.V. and 10% by P.T. Tambang Timah, began operation of its new dredge, Bima, offshore Pulang Tujuh between Singkep and Bangka Islands in September 1979. During 1979-80, the technical problems caused by overheating of the top bearing left Bima underutilized. However, in 1981, all of the technical problems reportedly had been corrected. The dredge was expected to produce about 1,500 tons of tin concentrates in 1981. The tin concentrates produced by P.T. Riau Tin Mining were sold to P.T. Tambang Timah for further processing.

In mid-1981, a large tin deposit was discovered offshore Bangka Island at a depth of 30 to 40 meters. The estimated tin ore reserves were 1 million tons.[13]

NONMETALS

Cement.—In 1981, Indonesia's cement production continued its upward trend and surpassed the 6-million-ton level. The country's cement industry, which consisted of eight plants operated by seven companies, had an annual total clinker capacity of 8.7 million tons at the end of 1981. Indonesia will become the largest cement producer among the five members of ASEAN after several new cement plants are completed by the end of the third 5-year development plan (1979-84).

The Government continued to encourage the expansion of the cement industry by offering a 4-year tax holiday to any new company that established a cement plant with an annual capacity of 500,000 tons or more on the island of Java and a 5-year tax holiday for those outside Java. These tax benefits are to support the strong growing need for infrastructure and housing developments in various parts of the country. Most of the raw materials for cement manufacturing, including limestone, clays, and silica sand, as well as the iron-correcting materials, are in abundance throughout the country. To support the cement industry, gypsum is the only raw material that is being imported, and it comes from India, Thailand, and Australia. Indonesia also possesses enough required energy resources, including oil, natural gas, and coal, for the growth of the cement industry.

In March 1981, Indonesia began operating its first white cement plant at Cibinong, south of Jakarta. The 200,000-ton-per-year white cement plant, valued at $42 million, was completed in 16 months by Nihon Cement Co. and Kawasaki Heavy Industries, Ltd., using Japanese technical know-how and modern equipment. The cement plant is owned and operated by P.T. Indocement. According to company officials, of the total output of white cement produced, about 160,000 tons was for domestic consumption, and the remaining 40,000 tons would be exported to Malaysia and Singapore. In the past, all of Indonesia's white cement requirements were met by imports from Japan. Beginning in April 1982, imports of white cement were to be banned.

In 1981, P.T. Semen Baturaja started operation of its 500,000-ton-per-year, dry-process suspension preheater plant at Baturaja in South Sumatra.

In mid-1981, construction of a new $200 million cement plant with an annual capacity of 1 million tons was started at Lhoknga, Aceh, in North Sumatra. P.T. Semen Andalas Indonesia, a joint-venture company owned by Blue Circle Industries, Ltd., Cementia Holding AG (Swiss company), and P.T. Rencong Aceh Semen, was to develop and manage the project. The International Finance Corp. reportedly was to lend $48 million to the project. The project includes development of limestone, shale, and marl quarries, installation of port facilities and a power station at Lhoknga, and building of cement storage and packaging facilities at Belawan and a bulk-cement depot near Medan. All of this was scheduled for completion at the end of 1982.

A $97.3 million contract for construction of a 3-million-ton-per-year cement plant was expected to be awarded to Krupp Polysius S.A., a subsidiary of Krupp Polysius AG of the Federal Republic of Germany, in early 1982 by P.T. Perkasa Ini Abadi Indonesia Cement. The new cement plant will have two 1.5-million-ton-per-year production lines to be located at Citeureup, West Java. Construction was scheduled to start in late 1982 and was expected to be completed in mid-1984. P.T. Perkasa Ini Abadi, a member company of P.T. Indocement, was formed in late 1981 to carry out the project.[14]

P.T. Semen Kupang, another new cement company established in 1981, awarded a contract to Loesche GmbH of the Federal Republic of Germany to build a coal-fired, vertical-kiln cement plant at Kupang on Timor Island. The new cement plant, with an annual capacity of 120,000 tons, was scheduled to come onstream in 1985. P.T. Semen Kupang is jointly owned by P.T. Semen Gresik, the Provincial government of Timor, and the Indonesia State Development Bank.

Fertilizer Materials.—In 1981, Indonesia's total output of fertilizers by three companies operating six plants increased slightly over that of 1980. According to Indonesia's Central Bureau of Statistics, the production of urea remained at the 2-million-ton level, while the production of ammonia sulfate and triple superphosphate increased to about 800,000 tons in 1981 from 646,000 tons in 1980.

P.T. Pupuk Sriwijaya, the largest state-owned fertilizer company, operated four urea plants at its Palembang complex in South Sumatra. During the first half of 1981, production capacity was underutilized because of a natural gas feedstock shortage. P.T. Pupuk Kujan, the second largest state-owned fertilizer company, began production of urea at Tjikampek, West Java, in 1980. The natural gas feedstock of the 570,000-ton-per-year urea plant was from the offshore Arun Gasfield. The state-owned fertilizer company, P.T. Petrokimia Gresik, operated a phosphate and ammonium sulfate plant at Gresik, East Java. It also operated an ammonium sulfate plant and a small Italian-built urea plant at Surabaja, East Java. Both use petroleum feedstock as raw material. Indonesia's demand for fertilizer continued to grow at about 20% per year. The total demand for 1981 was estimated at 2.8 million tons. Because of a long-term agreement between Indonesia and the Philippines, Indonesia continued to export small amounts of fertilizer, valued at $4.8 million in 1981 compared with $28.7 million in 1980. During 1981, Indonesia also imported about 200,000 tons of urea from the Republic of Korea, the German Democratic Republic, and the U.S.S.R. to keep up with the growing domestic demand for fertilizer.

In an effort to meet the rapidly growing demand for fertilizer and to ultimately become an exporting country of nitrogen fertilizer, Indonesia continued to expand its fertilizer production capacity in 1981.

Construction of an ammonia-urea plant called Kaltim I, about 17 kilometers north of Bontang, East Kalimantan, was proceeding on schedule. The plant, owned by the state-owned P.T. Pupuk Kaltim, will have an annual capacity of 165,000 tons of ammonia and 570,000 tons of urea when it is completed in 1982. The Kaltim I project, valued at $300 million, was awarded to Lummus and Coppee Rust of Belgium in 1979.

In late 1981, P.T. Pupuk Kaltim signed a $406 million contract with Kellogg Overseas Corp. of the United States and two Japanese companies for construction of another ammonia-urea plant called Kaltim II at Bontang, East Kalimantan, with the same annual capacity as that of Kaltim I. Construction of Kaltim II is expected to start in mid-1983 and was scheduled for completion in 1985. Kellogg will design and build the plant with equipment and materials to be supplied by Toyo Menka Co., Ltd., and Kobe Steel Ltd. of Japan.[15]

On December 1, 1981, a $180 million contract was signed between P.T. Petrokimia Gresik, and Mitsubishi Corp. and Hitachi Shipbuilding & Engineering Co., Ltd., of Japan. The contract calls for construction of a fertilizer complex to be built at Gresik, about 30 kilometers north of Surabaja, East Java. The complex will have a 594,000-ton-per-year, brimstone-based sulfuric acid plant, a 200,000-ton-per-year phosphoric acid plant, a 250,000-ton-per-year ammonium sulfate plant, and a 500,000-ton-per-year cement retarder plant. Construction was scheduled to start in early 1982 and to be completed at the end of 1984. In December 1981, an expansion project was started to increase the company's triple superphosphate capacity from 330,000 to 514,000 tons per year. The plant is at Gresik, East Java, and the expansion program is expected to come onstream in 1983.[16]

MINERAL FUELS

Coal.—In 1981, coal exploration and development in Indonesia were intensified by a series of new contracts signed between the Government and foreign companies, and coal production by the two existing mines in Sumatra continued to increase.

The Ombilin Mine, owned and operated by P.N. Tambang Batubara (Indonesia's state-owned coal company), had added more mining equipment and completed the transport system near Sawahlunto in West Sumatra. As a result, the output of coal increased sharply by 69% to 242,000 tons in 1981. The Ombilin Mine, once proposed to be shut down in 1973, emerged as one of the most important coal production centers in Indonesia. According to the plan of Indonesia's Ministry of Mines and Energy, the Ombilin Mine is expected to be capable of producing about 400,000 tons per year of coal by 1983, about 725,000 tons per year of coal by 1985, and 1,350,000 tons per year of coal by 1990. This will require an additional mine to be opened in the Warigin region. During the expansion period, about $100 million, mainly for mining equipment, will be invested in the coal mine, and the funds will be provided by the Inter-Governmental Group of Indonesia in the form of export credits. The coal reserves at the Ombilin Mine were stated to be 187.3 million tons with measured reserves of 92.3 million tons, indicated reserves of about 10 million tons, and inferred reserves of about 85 million tons.[17]

The Bukit Asam Mine, another coal mine owned and operated by P.N. Tambang Batubara near Tanjungenim, South Sumatra, produced about 110,000 tons of coal in 1981 compared with about 160,000 tons in 1980. A significant increase in coal production will not be achieved until the major expansion program is completed in 1986. Under Indonesia's National Energy Plan, the Bukit Asam Mine is projected to produce about 500,000 tons of coal in 1984, increasing to 3.2 million tons in 1986. The total cost of the expansion project was estimated at about $850 million. Indonesia reportedly had secured a greater portion of the financing from the International Bank for Reconstruction and Development, Canada, the Federal Republic of Germany, France, and the Netherlands.

In 1981, most of the domestically produced coal was consumed by cement plants, tin and nickel smelters, the state-owned railroad company, and other private industry users. Indonesia exported about 100,000 tons of coal to the Republic of Korea, Taiwan, Bangladesh, and Singapore. According to Indonesia's Ministry of Mines and Energy, Indonesia may have to import about 1.7 million tons of coal in 1985 to meet the projected requirements of about 3.7 million tons for the coal-fired powerplant at Suralaya in West Java and cement plants in various parts of the country.[18]

During 1978-79, the Government invited 22 foreign companies to bid on the reopening of coal mines in East and South Kalimantan. Since mid-1979, the Government, through P.N. Tambang Batubara, had been negotiating with a number of successful bidders. In November 1981, three cooperative agreements on development of coal mines in Kalimantan were signed between P.N. Tambang Batubara and three foreign joint-venture firms. The contracts were based on a 30-year production-sharing system with 13.5% of the future output to the Indonesian state-owned coal company and 86.5% to the contractor. The signed production-sharing contracts are as follows:[19]

Contractor	Contract location and area (square kilometers)
P.T. Arutmin Indonesia (a 50:50 joint venture of Atlantic Richfield Co. and Utah Exploration, Inc., of the United States).	A coal concession area near Banjarmasin in South Kalimantan (12,600).
P.T. Utah Indonesia (a wholly owned subsidiary of Utah Exploration, Inc.).	A coal concession area in East Kalimantan (8,000).
P.T. Agip Consolidated Indonesia (a 50:50 joint venture of Agip Overseas, Ltd., of Italy and Consolidation Coal Co. of the United States).	Two coal concession areas: One tract (2,432) in northeast Kalimantan, another (5,310) in east Central Kalimantan.

Three more similar production-sharing contracts for exploration and development of coal mines in Kalimantan are expected to be signed between P.N. Tambang Batubara and foreign companies in early 1982. The foreign companies involved are a joint-venture firm of Conzinc Rio Tinto of Australia and British Petroleum, Ltd., of the United Kingdom, a joint-venture firm of Tasek Cement Bhd. of Malaysia and Siam Cement Co. of Thailand, and a joint-venture firm of companies from the Republic of Korea led by Samchuk Consolidated Coal Mining Co.

Petroleum and Natural Gas.—Despite relatively unchanged prices of oil caused by the worldwide oil glut and economic recession, the output of crude oil and natural gas in Indonesia increased moderately in 1981. The high level of oil and gas exploration was also maintained by the new exploration contracts signed in 1980-81.

Indonesia reversed a 3-year declining trend of its crude oil output in 1981. The output of crude oil averaged 1.61 million barrels per day in 1981 compared with 1.58 million barrels per day in 1980. Natural gas production totaled 1.1 trillion cubic feet in 1981 compared with 1.046 trillion cubic feet in 1980. A continuous upward trend in the output of oil and natural gas was projected for the coming years. This projection was based on additional new wells that came onstream in 1981 as well as the continuous high level of exploration sustained by new production-sharing and exploration contracts signed during 1979-81.

In 1981, crude oil in Indonesia was produced by PERTAMINA, the state-owned oil company, 3 companies led by P.T. Caltex Pacific Indonesia (CPI) under a contract-of-work agreement with the Government of Indonesia, and 14 companies led by Atlantic Richfield Indonesia, Inc. (ARCO), as contractors to PERTAMINA under a production-sharing agreement. The top five crude oil producers accounting for about 74% of the total oil output in 1981 were CPI, 43%; Indonesia Petroleum, Ltd. (INPEX), 9%; ARCO, 8%; Independent Indonesia American Petroleum Co. (Iiapco), 7.5%; and Total Indonesia (Compagnie Francais du Petrol), 6.5%. In 1981, the crude oil production by PERTAMINA accounted for only 5% of the total output. CPI and Iiapco contributed most to the increased level of the total oil output in 1981.

CPI, the largest oil producer in Indonesia, produced an average of 775,000 barrels per day of oil during the first half of 1981. The output level dropped to an average of 737,000 barrels per day during the second half of 1981. The company started six new oilfields: Beruk N.E., Bungsu, and Gatam in the coastal plains area and Garuk, Pemburu, and Puncak in Riau Province, in February 1981. However, the output from the Minas and Duri Fields continued to decline. The company reportedly was planning to invest about $1.8 billion for a secondary recovery (steamflood-enhanced oil recovery) program to increase the output from Duri Oilfield in Riau Province, Sumatra. The program was scheduled to begin in 1982 and to boost the output level of Duri Field from 40,000 barrels per day in 1981 to a peak level of 300,000 barrels per day in 1990.[20]

Iiapco, a division of Natomas International Co. of the United States, brought three new platforms into production in its Krisna Oilfield in the Java Sea offshore southeastern Sumatra during 1981. The output level of Krisna Fields was increased from 20,000 barrels per day in February to 57,000 barrels per day in October 1981.

In 1981, a total of 319 exploratory wells were drilled, and more than 40 new discoveries were made. Twelve new oil exploration contracts were also signed during 1981, and a total of about $900 million dollars was to be invested by the foreign companies in Indonesia over the next 3 to 6 years.

Indonesia's natural gas was produced by PERTAMINA, Lemigas (the Indonesian Petroleum Institute), 3 foreign companies, operating under a work contract agreement with the Government, and 17 foreign companies as PERTAMINA's contractors. The top five natural gas producers in 1981 were Mobil Oil at Arun, accounting for 34% of the total output; Roy M. Huffington at Badak, 20%; PERTAMINA, 13%; ARCO, 8%; and INPEX, 6%. Of the total natural

gas produced, about 22.5% was flared, about 45% was for manufacture of LNG, about 15% was for pressure maintenance, about 5% was for manufacture of fertilizer, about 4.5% was sold to Krakatau Steel Mills Ltd. and several cement plants, and the remaining 8% was for other uses.

An expansion program was started in late 1981 to increase the annual capacity of the LNG plant at Arun in Aceh, North Sumatra, from 238 to 423 billion cubic feet. This followed the signing of the agreements between PERTAMINA and the Japanese buyers group in mid-1981. Under the agreements, two additional trains, with a combined annual capacity of 169 billion cubic feet of LNG, are to be built by PERTAMINA with Chiyoda Chemical Engineering Co. of Japan as the main contractor. The construction of two trains was scheduled to be completed in early 1984. In June 1981, the Japanese buyers formed Indonesia Arun LNG Co., Ltd. (60% owned by Tohoku Electric Power Co.; 30%, by Tokyo Electric Power Co.; and 10%, by Mitsubishi Corp.), to finance the program by providing a $942 million loan. Under a separate sales contract signed by PERTAMINA and the Indonesia Arun LNG Co., Ltd., in August 1981, Indonesia is to repay the loan in the form of LNG from the Arun plant for 20 years beginning in 1984. Indonesia Arun LNG Co., Ltd., of Japan will be the distributor for Japan's import of 175 billion cubic feet of LNG annually from the Arun Plant.[21]

The expansion program to boost annual capacity from 169 to 338 billion cubic feet of LNG at the plant at Bontang, East Kalimantan, was proceeding according to schedule. The Bechtel Corp. of the United States was awarded the $850 million contract to build two additional trains, each able to produce 79 billion cubic feet of LNG annually. The expansion program at Bontang was scheduled for completion in mid-1983. In April 1981, PERTAMINA and four Japanese buyers signed a sales contract that called for Indonesia to deliver 169 billion cubic feet of LNG per year beginning in 1983 for a 20-year period. The four Japanese buyers are Chubu Electric Co., Kansai Electric Co., Osaka Gas Industrial Co., and Toho Gas Industrial Co.

Indonesia's exports of crude oil and refined products were valued at $15.2 million in 1981 compared with $13.4 billion in 1980. The main buyers of Indonesia's crude oil were Japan, accounting for 55% of Indonesia's total exports, and the United States, 30%. Indonesia overtook Algeria as the world's largest exporter of LNG in 1981. Export earnings from LNG also increased to $2.5 billion in 1981 from $2.3 billion in 1980. Japan was the sole importing country of Indonesia's LNG.

The Mineral Industry of Iran

By George A. Morgan[1]

Output from the minerals sector of the economy was inconsequential in 1981, accounting for a small percentage of the gross national product (GNP). Many non-oil-related concerns including mining concerns were probably operating at less than one-third capacity. Primary reasons for the severe decline were the continuing war with Iraq and the deliberate policy of the revolutionary Government to alter economic development in light of new goals. Actual production of metals and nonmetals from active mining operations was reduced virtually to nil for part of the year, and several projects involving new smelters and reactivation of mine production were only announced at yearend.

The creation of a Ministry of Mines and Metallurgy, reported in 1980, has yet to be realized. Plans affecting the mining industry must originate in or be reviewed by the Revolutionary Council. Problems crippling the industry include severe shortages of skilled technicians, parts shortages, restriction of imports to war-related items and essential foodstuffs, and deficient transport from customs warehouses to user sites. A new Government policy considered mines as national resources only for domestic consumption.

Further studies to identify all mine deposits and resources were planned. By yearend 1981, foreign expertise, mainly from the U.S.S.R., Romania, and Yugoslavia, was used on large industry projects. Some of this expertise was provided in fulfillment of barter agreements and was utilized at powerplants, harbors, railways, steel plants, and oil refineries.

The oil industry was the backbone of the Iranian economy in 1981. It held this position despite 3 years of political and economic strife, coupled with war-related damage and outright destruction of production facilities. The oil industry assumed a larger portion of GNP in 1981 than that of previous years. In the period 1978-80, the Government claimed achievement of its stated goal of reducing the oil sector's share of GNP by 10%. By yearend 1980, war with Iraq forced Iran to rely upon its most developed and organized industry to acquire foreign exchange. Changes in petroleum laws were effected that terminated existing contracts, most of which were long term. Short-term contracts, generally at reduced prices, were the norm for most of 1981. The sharp drop in crude production in the first quarter was due to the war with Iraq.

Total GNP has declined for 4 consecutive years, while money in circulation has nearly doubled to $20 billion in 3 years.[2] Inflation has continued to rise and was estimated at 35% in 1981 compared with 10% in 1978. Foreign exchange reserves of $14 billion in 1979 were reduced to about $650 million by yearend 1981. The budget for 1981-82 was $44 billion, of which $7.3 billion was directly for the war effort and $14 billion for general defense allocation. A revision in the previous year's budget was necessitated by a decline in oil revenue from the predicted $33 billion to about $12 billion. The current budget deficit was to be made up from oil sales at more flexible prices.

PRODUCTION AND TRADE

Primary emphasis on production in the metals sector was placed on iron and steel. Demand for crude steel and steel products remained high. Failure to complete steel mill projects has forced Iran to import large tonnages of iron and steel, particularly coils

and plates. Existing production facilities used both domestically produced and imported iron ore. Limitations on output were due to the quantity and grade of ore available, as well as the availability of coke.

Output of all other metals was estimated to have declined substantially because of their limited local utilization and export-oriented nature. Transport capacity was limited, and mines in general were considered to be national resources for domestic use only. Foreign exchange was to be earned mainly from sales of petroleum. However, if production of metals was achieved in excess of local demand, it may be made available for export sale.

Nonmetal commodities experienced generally less severe declines in output than metals, mainly because of local use. Byproducts from the petrochemical and metals sector, such as barite, sulfur, and nitrogen, were affected adversely, regardless of demand. Nonavailability of parts limited production of cement. Poor transport facilities also adversely affected distribution of imported equipment to the industry.

Output of crude oil declined for the fourth consecutive year. As nearly all gas produced was associated with oil production, natural gas production and flaring declined accordingly. There were no reports of exports of natural gas to the U.S.S.R. Planned increases in gas utilization in the country will probably be from nonassociated gasfields. Such production was originally prevented while most of the associated gas was flared. Gathering lines for utilization of associated gas were being laid, but the decline in oil output and the war have resulted in earlier-than-planned production from nonassociated gasfields.

Electric generation plants experienced many of the same difficulties of the mining and petroleum sector. Power supply problems also affected the aluminum smelter at Arak.

In early 1981, a bill was approved providing for the nationalization of all foreign trade. The Government had 2 months in which to work out proposals for public control of import trade, which amounted to about $12.2 billion in 1980. The Iranian Central Bank limited imports to about $900 million per month, of which $300 million was for military hardware for direct war use. An 80% increase in the value of imports through four northern points of entry was reported to be nearly all from eastern bloc countries. Goods from the U.S.S.R. made up 20% of the total in the first 6 months. By yearend 1981, the U.S.S.R. and other eastern bloc nations were providing 60% of foreign trade. The sharp rise in barter agreements substantiated reports of exhaustion of foreign reserves. Oil was the principal barter commodity. A barter agreement with Romania provided for the exchange of $1.1 billion worth of Iranian goods, mainly crude oil, for the services of oil and gas industry experts. Romania was also to supply the industry with spare parts and to process about 30,000 barrels per day of crude oil in Romanian refineries. Similar agreements were made with Yugoslavia.

Table 1.—Iran: Production of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity[2]	1977	1978	1979	1980[p]	1981[e]
METALS					
Aluminum metal, primary ingot	21,100	25,500	[e]14,000	10,000	5,000
Chromium: Chromite, gross weight	233,300	198,000	[e]136,000	80,000	30,000

COMMODITY REVIEW

METALS

Aluminum.—Capacity of the smelter at Arak was 50,000 tons per year. Production began in 1972 at 6,500 tons and continues to be based on imports of alumina. The plant operated at peak capacity in 1974 and 1975 but in recent years has suffered power shortages and greatly reduced alumina feed supply. Only 1% of the smelter production was controlled by the Government of Pakistan; the remainder was owned by Iran. Expansion of capacity to 120,000 tons per year was planned for 1981 but was not achieved.

Copper.—The Government of Iran requested a consortium of three Japanese firms to relinquish all remaining shares in Sherkate Sahami Khos Minakan Co. The joint Japanese-Iranian copper mining company was formed in May 1975. Japanese firms and their percentage share of ownership were Nittetsu Mining Co., 17%; Toko Zinc Co., 5%; and C. Itoh and Co., 11.3%.

In late 1981, plans were announced to complete the Sar Cheshmeh copper project, with limited production to start in 1982. All output was destined for the home market. Originally planned for completion in 1978 with an ultimate capacity of 150,000 tons per year of metal, the project was terminated and neither concentrator nor smelter was commissioned, although mining reportedly began. Delivery contracts to the United States, Japan, and Western Europe for 1979 were canceled. Yugoslavian and East German specialists were assisting in the project's completion, which has thus far cost $1.4 billion.

Iron Ore.—Discussions aimed at completing Iran's financial share in the Kundremukh iron ore project in India continued. Iran has paid only $255 million of the $630 million loan for the project. Recently, Iran has said it will take 2.5 million tons per year of concentrate. If Iran could not con-

sume the concentrate, India would be able to sell it and charge any price differential to Iran. Shipment would depend upon the war with Iraq and ultimate completion of the sponge iron plant at Ahwaz, for which the ore was originally intended.

Iron and Steel.—Production of steel in Iran came from the Aryamehr steel plant in Esfahan, built by the U.S.S.R. Ore for the blast furnaces was supplied from the Choghart deposit near Bafq, about 540 kilometers distant. Coal for the coking ovens at Aryamehr was limited because of mining problems and the necessity of blending with coal from the Federal Republic of Germany.

No work occurred on the direct-reduction plant at Ahwaz, which was about 65% complete in 1978. The pipe and rolling mill at Ahwaz, which was making 56-inch-diameter pipe for gas transport, was not operational because of the war.

The second direct-reduction plant, originally planned for a coastal site and then canceled, was now reported planned for construction at Mobarakeh, about 30 kilometers from Esfahan. Export of production has been abandoned; output is now intended solely for home use. The industry had expected to expand production to 15 million tons per year in the 10-year period beginning in 1974 with the construction of three steel centers. Delays and cancellations continue to cause heavy dependence on iron and steel imports, which accounted for about 18% of all imports in 1980. About 1.5 million tons was imported in 1980, and high import levels were expected to persist for several years.

Lead and Zinc.—The Ravaiye Mine, operated by Sogemiran S.A., experienced 130 days of concentrator downtime owing to a lack of reagents and spare parts in the year ending March 1980. Production was 3,159 tons of concentrate grading 51.3% lead and has declined since that time.

The Kouchk Mine and concentrator, located 170 kilometers northeast of Yazd in central Iran, had a plant design capacity of 600 tons per day. Lead-zinc mineralization was in a fine-grained bedded deposit that required fine grinding to minus 200 mesh. A rod and ball mill were employed in line following primary and secondary grinding to minus 0.5 inch in order to maintain maximum mineral recovery and concentrate grade. Ore grading 4.5% lead and 16% zinc was concentrated to 40% lead and 52% zinc in concentrates. Combined metal recovery ranged from 60% to 75%. Prior to the revolution, concentrates were trucked in bulk 700 kilometers to Bandar 'Abbas for export.

NONMETALS

Cement.—Total production was about 57% of the country's capacity of 14 million tons. Principal reasons cited for the low level of utilization were lack of expertise, efficiency, spare parts, and management. Cost of production was actually 25% higher than the sale price fixed by the Ministry of Commerce, which made it uneconomic to produce.

The Neka's Cement Factory, operated by Gorgan and Mazandaran Cement Co., started production in September at 75% of the rated capacity of 2,000 tons per day of portland cement. Equipment for the plant had been purchased in 1975-76 from the Humboldt Co. of the Federal Republic of Germany. One kiln was on site with crusher, loading dock, and clay dryer. Limestone and clay were mined nearby, and iron ore was supplied from Mashhad. The company began negotiations with the Industry and Mine Bank to obtain credit for spare parts, equipment, fuel, and wages.

Fertilizer Materials.—Nitrogen fertilizer in the form of urea and ammonium nitrate was produced from ammonia at petrochemical plants using natural gas feedstocks. The Iran Fertilizer Co. and the Razi Chemical Co. were the principal producers. Product capacities by Razi Chemical in tons per year follow: Ammonia, 300,000; sulfur, 375,000; urea, 710,000; sulfuric acid, 50,000; phosphoric acid, 80,000; and diammonium and monoammonium phosphate, 455,000.[3]

Iran Fertilizer had a reported capacity of 225,000 tons per year of urea, ammonium nitrate, nitric acid, and other chemicals, including mixed fertilizers. All phosphate and potash used was imported as there was no domestic production. Several phosphate rock discoveries continued to be under investigation.

MINERAL FUELS

Natural Gas.—Nearly all natural gas output in Iran was associated with crude oil production, which has declined sharply. In 1977, about 48% of associated gas produced was flared. Of the remainder, 31% was reinjected and 30% was exported to the U.S.S.R. Exports to the U.S.S.R. had been interrupted and finally terminated in 1980. Plans to eliminate all flaring by 1978 were postponed until 1980 and then mooted with the change in Government policy and the war with Iraq.

Emphasis has been placed on tapping nonassociated wells in the gulf coast for the petrochemical industry and public use. A project to expand gas distribution to 220,000 private users annually was announced. The project would take 16 years, would cost $11 billion, and was intended to reduce dependence on kerosine as a heating fuel. In conjunction with this plan, an agreement was made with an Italian company to complete a 56-inch-diameter pipeline extending from the Port of Kangan to Esfahan. There it would be joined with the main trunkline, permitting possible export to the U.S.S.R. Much of the equipment has been imported and about 50 kilometers of pipeline was completed in 1977. No further activity occurred in the past 5 years. Reserves at the Kangan Gasfield were 28 trillion cubic feet.

Petroleum.—The sharp decline in foreign exchange reserves placed new emphasis on oil exports. Authority was given to a special oil contract committee allowing it to declare null and void any agreement that it considered in conflict with the goals of nationalization of the oil industry. All oil contracts made prior to 1979 were canceled, with redress and compensation dependent upon the committee's recommendations. Short-term contracts were introduced at reduced prices to overcome the cost of higher insurance rates for vessels using the Persian Gulf and to increase sales. At yearend 1981, some prices for crude had dropped almost $8 to $30 per barrel. A surplus of oil in the international market and the Iranian Government's need to meet its budget requirements also led to a higher volume of exports and lower prices. Exports were expected to increase to about 2 million barrels per day in 1982 from 1.1 million barrels per day in 1981.

About 75% of crude oil exported was through Kharg Island, despite earlier war damage. The remainder was through the Lavan and Sirri terminals in the south. Damage in October to a major pumping station supplying Kharg Island was bypassed with the use of electric pumps. Exports to Italy, Romania, Turkey, the U.S.S.R., and Yugoslavia were the result of recent agreements. Several of these agreements involved barter of Iranian crude oil for the use of foreign refinery capacity, oil and gas specialists, and spare parts, for the industry. Romania was to receive 80,000 barrels per day in 1982, of which about 30,000 barrels per day was to be processed in Romanian refineries for Iran. The sale was to be split evenly between hard currency and the barter of crude oil.

Exploration drilling in Iran for oil and gas has virtually ceased because of equipment breakdowns, personnel shortages, and low Government priority.

The oil refineries at Tehran, Shiraz, and Esfahan with about 465,000 barrels per day total capacity appeared to be the principal operational refineries. Abadan, the largest refinery with a capacity of 610,000 barrels per day, was totally destroyed along with its 70,000-ton-per-year lubricants plant. Kermanshah, with a 20,000-barrel-per-day capacity, was also completely destroyed, and damage to the refinery at Tabriz significantly reduced its installed capacity of 90,000 barrels per day.

Nonavailability of sufficient lubricants necessitated the importation of large quantities. Several re-refiners produced a total of 20,000 tons per year, and the 100,000-ton-per-year plant at the Tehran refinery was also in operation. Of the two topping plants in the country, only the Lavan Island plant with a 20,000-barrel-per-day capacity was operational.

The Mineral Industry of Iraq

By Harold R. Newman[1]

Despite the continuation of the Iran-Iraq war since September 1980, industry and development in Iraq was experiencing a high degree of progress with an overall estimated budget increase of 39% in 1981. The industrial sector had a budget allocation of $4.3 billion, which represented a 6.2% increase over that of 1980.[2] The Industrial Development Bank encouraged private sector investment through the expansion of loans that covered 60% of total project costs. Most foreign firms, whose personnel left the country immediately after the war broke out, have renegotiated contracts and resumed work.

The petroleum sector continued to dominate the mineral industry, although crude oil exports were reduced to about 1 million barrels per day because of the ongoing war with Iran. Although most of Iraqi petroleum exports were halted by yearend 1980, the country's economic strength lies primarily with petroleum reserves. Agricultural and industrial sectors continued to make increasing contributions to the overall economy. The transportation sector was receiving increasing attention from the Government, particularly railway transportation. One of the significant strategic railway projects is the Akashat Railroad, designed to provide a direct line between the phosphate mines of Akashat and Baghdad via Ramadi, Haditha, and the chemical fertilizers complex at Al-Qaim. Other strategically significant projects are the Baghdad-Maquel (Bashora) line running parallel to the Euphrates River and the line to link Marbed station (Bashra) with Kuwait. This last project would provide a railway linking Mediterranean ports with the Arab gulf ports.

Iraq has signed a $1.6 billion contract with two international firms to construct a major multiple-purpose dam across the Tigris River in northern Iraq by 1986. This will be one of the biggest in the Middle East and represents a major transition in the use of land for agriculture. It will have a water storage capacity of 11.3 billion cubic meters and 1,034 megawatts of hydroelectric power capability and will greatly improve farmland irrigation and navigation on the Tigris River. Other dams and irrigation projects, such as the Hamrin Dam, the Haditha Dam, and the Tharthar-Euphrates Canal, have improved agricultural capabilities of the country.

Iraq proposed expenditures of more than $130 billion in the Government's new 5-year national development plan and continued to place a high priority on economic development. To continue this development, the Government resorted to large loans from Saudi Arabia, Kuwait, the United Arab Emirates, and Qatar. Estimates of these loans range from $8 million to $20 million. Iraqi foreign exchange reserves at the end of 1981 were estimated at $9 billion to $14 billion, down from about $35 billion a year earlier. No official figures are available because the Government has stopped publishing any economic data since the war started.

Oil exploration and drilling projects that were delayed, after the war started in 1980, are being revived. Mobil Oil Corp. was requested by the Iraqi National Oil Co. (INOC) to reevaluate results of seismic surveys and stratigraphic drilling conducted by INOC in the Abu Jir-Kifl area. Negotiations were underway with French and Brazilian oil companies and with the Soviet Union for exploration assistance in other areas of Iraq.

PRODUCTION AND TRADE

Crude oil output continued to decline during 1981 as a result of the Iran-Iraq war. The war also caused delays in implementing planned production increases in both the fuel and nonfuel mineral sectors. However, the Government continued with its plans for expanded facilities and greater production efficiencies. Cement, steel, and refined products continue to be imported to meet the country's domestic needs. Iraq imported about 4 million tons of cement, supplementing its own production, to complete various development projects.

Mobil Oil renewed contracts for 60,000 barrels of crude oil per day. Crude exports, expected to begin in January 1982, were projected to comprise roughly 2% of U.S. crude oil imports in 1982. United States-Iraqi volume of trade continues to increase. Iraq imported almost $1 billion worth of goods from the United States in 1981 and is the fourth largest purchaser of U.S. goods among the Arab states of the Near East and North Africa.

COMMODITY REVIEW

METALS

Aluminum.—Iraq has signed a joint-venture agreement with other Arab Gulf States for a 20% share of the Gulf Aluminum Rolling Mill Co. The plant, whose recommended location is in Bahrain, will have a capacity of 40,000 tons per year of semiprefabricated aluminum products and is scheduled for completion in 1983. The estimated cost of the venture is $64 million.[3]

Iron and Steel.—The Khor Al Zubair steelworks operated near its capacity of 400,000 tons per year until September 1980, when it was shut down in the early stages of the Iran-Iraq war. The plant, situated not far from the war zone, seems unlikely to resume any significant production while hostilities continue. However, the Government continued its development program with the awarding of an $85 million contract to a West German-Turkish consortium, including Thyssen Rheinstahl and Kutlutas Holding, to set up a steel foundry at Taji, 40 kilometers south of Baghdad. The plant is estimated to be completed in 1984. Also, a $10.2 million contract was concluded with Kawasaki Heavy Industries (Japan) to set up a new steel pipe factory at Um Qasr, near Baghdad. The production capacity is estimated at 50,000 tons of rolled steel per year.

NONMETALS

Cement.—Iraqi plans for the cement industry call for a 10-million-ton-per-year increase in the country's annual cement production by 1982-83. Currently, Iraq is producing about 5.5 million tons per year and is importing about 4 million tons per year. Construction work has resumed by Kawasaki and the Marubeni Corp. on two cement plants. Work was halted at the outbreak of the Iran-Iraq war. A 1-million-ton-per-year plant is to be built at Hit, west of Baghdad, and Kawasaki will also be building a new 1-million-ton-per-year plant at Al Tanim.[4] The State Organization for Industrial Design and Construction has agreements underway for building three brick factories, two thermostone projects, and two ready-made concrete projects.[5]

Fertilizer Materials.—*Nitrogenous.*—The Khor Al Zubair and the Basrah fertilizer complexes were damaged soon after the outbreak of the war with Iran. The former site has capacity for 544,000 tons per year of nitrogenous (N) ammonia and 484,000 tons per year of N urea units. The site at Basrah has capacity for 410,000 tons per year of N ammonia, 221,000 tons per year of N urea, and 27,000 tons per year of N ammonia sulfate as well as a sulfuric acid plant. Iraq is reported to be negotiating with Mitsubishi Heavy Industries (Japan) to repair the damaged fertilizer units. Exports of urea ceased in September 1980.[6]

Phosphorous.—The Akashat phosphate mine has been relatively unaffected by the war, and construction and exploration are continuing. The State Organization for Minerals (SOM) has estimated that there are reserves of about 400,000 metric tons of sedimentary phosphate rock. Two open pits will be developed initially with an estimated production of 1.7 million tons of ore per year. The average grade of the ore is 21% P_2O_5. The ore body has an average thickness

of 10.7 meters, and the limestone overburden ranges from 5 to 20 meters in thickness. The mines' output will be sent by rail to the Al-Qaim chemical complex for processing. The Al-Qaim chemical complex has a capacity to produce 600,000 tons per year of triple superphosphate, 250,000 tons per year of monoammonium phosphate, and 200,000 tons per year of other phosphate fertilizers, as well as sulfuric and phosphorate acid.[7]

Salt.—Construction and development of a salt-producing complex in southern Iraq continued through 1981. When the project reaches capacity, it is expected to supply 525,000 tons per year of industrial salt and 75,000 tons per year of packaged table salt for domestic consumption.

Sulfur.—Iraq continues as the largest producer of sulfur in the Middle East, although export shipments were halted when the war began in September 1980. The SOM has awarded a $45 million contract to a Japanese consortium, involving Kobe Steel and Marubeni Corp., to build a sulfur recovery and sulfuric acid plant in northern Iraq. The plant has a planned capacity for recovering 153,000 tons per year of sulfur from sulfur residues and for producing 60,000 tons per year of sulfuric acid. The sulfur residues will be provided by the sulfur refineries in northern Iraq. A process for treating these residues was developed by the Japanese consortium and Nissau Chemical Industries and produces a 99.9%-pure sulfur. The plant is expected to be in operation by 1984.

MINERAL FUELS

Natural Gas.—Iraq has been slow to develop its gas potential and continues to flare a major portion of natural gas produced in association with crude petroleum. However, a large development program has been initiated with 41 projects underway to allow a better utilization of associated gas. One such project is the $137.7 million contract by the Japanese Mitsubishi Corp. and Chiyoda Chemical Engineering Construction Co. to build a natural gas liquids plant at North Rumaila as part of the Southern Gas Project. The plant is due for completion in mid-1982. Total liquefied petroleum gas plant capacity was approximately 4.3 billion barrels in 1980.

Commercial production of natural gas in 1981 was 62.1 billion cubic feet, with 338.9 billion cubic feet flared. Proven reserves of gas in Iraq are put at 22,209.9 billion cubic feet.[8]

Rapid development of the Rumaila Oilfields allowed for a 30% expansion of the original Southern Gas Project contract that was signed in 1978. The new plant was expected to produce approximately 4 million tons per year of propane and butane and 1.5 million tons per year of condensate.

Petroleum.—Proven oil reserves were estimated at 30 billion barrels in 1980. Crude oil production capacity was rated at over 4 million barrels per day, and the total oil refinery capacity was projected to reach 200,000 barrels per day. Actual crude oil output was reported to be between 3 million and 3.5 million barrels per day through August 1980. Production of crude oil was not reported for 1981; however, it has been estimated at 1.5 to 2.0 million barrels per day. There were approximately 250 producing wells for most of the year. Iraq's major operating and projected oilfields are listed in table 3.

Table 3.—Major oilfields in Iraq in 1981[1]

Oilfield	Capacity[e] (millions of barrels per day)	Discovery date[2]	API gravity	Depth (feet)
Kirkuk	1.45	1927	36.0	2,800- 4,200
Northern Rumaila and Rumaila	.90	1958 (1972)	34.0	10,000-10,800
Zubair	.55	1949	34.2	11,000
Laheis	.51	(1978)	NA	NA
Bai Hasen		1953	34.0	4,800- 5,400
Jambur	.30	1954	38.0	5,500-12,500
Abu Ghurab:				
Buzurgan and Jabal Faugui	.20	(1976)	27.7	NA
Majnoon:				
Phase 1	.35	(1982)	NA	NA
Phase 2	.75	(1983)	NA	NA

[e]Estimated. NA Not available.
[1]Based on published figures prior to the Iran-Iraq war.
[2]Startup date is in parentheses.

Iraqi crude oil exports were averaging about 1 million barrels per day from Mediterranean terminals after the Iran-Iraq war started in September 1980, and it is estimated that crude exports would not exceed 1 million barrels per day while the war was ongoing. In 1981, Iraqi crude oil supplies, at its three Mediterranean terminals in Turkey, Syria, and Lebanon, were not considered to be secure because of possible guerrilla activities in the area.

Iraq has planned development of five new oilfields to increase production from a prewar level of about 4 million barrels per day to about 6 million barrels per day. The fields scheduled for development are Majnoon, Nahr Umr, and West Qurnah in the Basrah Province of southern Iraq, Halfaya in the eastern part of Amarah Province, and East Baghdad. Development of Majnoon has been postponed because of its close proximity to the Iranian border.

Refining.—Iraq continued plans to expand its refinery capacity to supply domestic transport and the growing demands of commercial industries for middle distillates.

Construction continued on the Baiji plant, which was expected to add 220,000 barrels per day to existing capacity. The Basrah refinery suffered damage by bombing in September 1980, which resulted in Iraq being a heavy importer of refined products. The Government was planning a 200,000-barrel-per-day export refinery in the southern part of Iraq that was scheduled to reach completion in 1985. Another refinery is planned in the northern part of the country to produce 250,000 tons per year of motor lubricating oil.

Petrochemicals.—C. E. Lummus and Thyssen Rheinstahl Technik (Netherlands) have basically completed work on the petrochemical complex in Basrah. The plant was to produce 150,000 tons per year of polyvinyl chloride, 135,000 tons per year of ethylene, 40,000 tons per year of caustic soda, and small amounts of other assorted organic chemicals. Startup for the plant was scheduled for 1981; however, the plantsite was heavily bombed in September 1980.

Pipelines.—The Iraqi Government was planning a 745 mile-long, large-diameter pipeline running from the southern Rumaila Field across Saudi Arabia to a Red Sea terminal somewhere near Yanbu. The capacity of the pipeline was estimated at 800,000 barrels per day. This pipeline would significantly increase the amount of crude oil being diverted from the Persian Gulf. The two main export terminals at Khor al-Amaya, Min al Bakr, and the ancillary installations at Fao, at the head of the Persian Gulf, were heavily damaged by Iranian air and naval action. Prior to that time it was estimated that 3 million barrels per day were being exported through these facilities.

Iraq was pumping all its exports through its pipeline system to the Mediterranean Sea, which includes a two-way reversible flow north-south pipeline. Crude oil was being moved from the northern oilfields at Kirkuk across Turkey to the Turkish Port of Ceyhen. Crude from the Basrah Oilfields in the south was being moved through the trans-Syria pipeline to Banias. Exports through these pipelines were estimated at about 1 million barrels per day.

The gulf terminals were expected to take up to a year to repair after the war has ended; however, Iraq was intending to use four single-bouy moorings to begin liftings as soon as possible. Each mooring was estimated to handle about 250,000 barrels per day so that the Government should be able to resume exporting about 1 million barrels per day via the gulf within a few months after a cease-fire.

The Mineral Industry of Ireland

By Tatiana S. Karpinsky[1]

The Irish economy showed slow overall growth in 1981. The 1981 gross national product increased 1.5% over that of 1980. Industrial production recovered somewhat early in 1981 from the decline of 1980, and for 1981 showed an increase of about 1% over 1980 production. Investment in industry increased 6%. Export levels showed only marginal improvement. The Irish economy was small and heavily dependent on trade and external economic factors.

In 1981, economic growth for most of Ireland's major trading partners was limited. Inflation in Ireland was at an annual rate of 19% in the first three-quarters of 1981. The most serious economic problem was the steady rise in unemployment, which reached about 11% of the labor force.

In 1981, exploration for additional hydrocarbons offshore was unsuccessful, but it was planned to continue deep drilling. The Government remained interested in stimulating new exploration and promised to be flexible on leasing agreements where necessary to promote the exploitation of deepwater or marginal fields. Ireland's metal mining industry produced at lower rates in 1981, owing to the low economic activity of its prime consumer, the United Kingdom.

PRODUCTION

Copper, lead, and zinc production declined in 1981, but output of most other mineral products was approximately at the 1980 level. In the lead-zinc industry, operations were curtailed because of strikes at the major mine, Tara. The opening of a new lead-zinc mine near Navan by Bula Mines continued to be under discussion. Production of petroleum products declined considerably, and the refinery was shut down as uneconomic in the second half of the year.

Production of minerals in 1977-81 is given in table 1.

Table 1.—Ireland: Production of mineral commodities[1]

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Aug. 11,1982.

[2]In addition to the commodities listed, substantial quantities of stone and sand and gravel are produced by local authorities and road contractors. Ireland also produces significant quantities of manufactured diamond, but output is not quantitatively reported and available general information is inadequate to make reliable estimates of output levels.

[3]Excludes output by local authorities.

[4]Figures given as reported in source; includes granite, marble, silica rock, sand, calcspar, fire clay, and slate and clays for cement production.

[5]Includes production by farmers and by Bord Na Mona.

[6]Includes milled peat used for briquet production.

[7]Produced from milled peat.

[8]Output was recorded for the first half year; no production was reported for the third quarter, and presumably there was none in the fourth quarter.

TRADE

In 1981, the Irish economy continued to depend on imports of nonferrous metals, fuels, iron and steel, and fertilizers. Metal concentrates were exported to smelters in the United Kingdom and on the Continent.

Imports of metals and minerals came mainly from the United Kingdom, the Federal Republic of Germany, and Belgium-Luxembourg.

In 1980, the total value of exports was $8.4 billion,[2] and the value of imports was $11.1 billion. Mineral exports were valued at about $407 million, or 4.8% of the total exports; mineral imports including fuels were valued at $2.4 billion, or 21.4% of the total.

Commodity	1979	1980	Destinations, 1980	
			United States	Other (principal)
NONMETALS —Continued				
Mica:				
Crude including splittings and waste	46	32	--	All to United Kingdom.
Worked including agglomerated splittings	--	5	--	All to Italy.
Precious and semiprecious stones excluding diamonds value, thousands	$303	$420	--	United Kingdom $235; Switzerland $174; West Germany $11.
Salt and brine	233	689	--	All to United Kingdom.
Sodium and potassium compounds, n.e.s.:				
Caustic potash	29	1	--	Do.
Caustic soda	536	98	--	Do.
Soda ash	7	2	--	NA.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	1,290	2,378	--	All to United Kingdom.
Worked	425	752	22	United Kingdom 581; Netherlands 98.
Dolomite, chiefly refractory-grade	1	25	--	All to United Kingdom.
Gravel and crushed rock	272,442	168,318	--	West Germany 103,227; United Kingdom 47,116; France 17,975.
Limestone excluding dimension	387	231	--	United Kingdom 224.
Quartz and quartzite	84	286	--	United Kingdom 268; West Germany 18.
Sand excluding metal-bearing	5,376	6,995	--	United Kingdom 6,975.
Sulfur:				
Elemental:				
Colloidal kilograms	17,500	100	NA	NA.
Other than colloidal	2,901	25	--	All to United Kingdom.
Sulfuric acid, oleum	3,596	2,729	--	All to Netherlands.
Talc, steatite, soapstone, pyrophyllite	19	35	--	Netherlands 16; Switzerland 14; United Kingdom 3.
Other:				
Crude	4	19	--	All to United Kingdom.
Slag, dross, similar waste, not metal-bearing	3	19	--	Do.
Oxides, hydroxides, peroxides of barium, magnesium, strontium	425	263	--	United Kingdom 57; France 51; Thailand 50.
Bromine, fluorine, iodine	24	58	--	All to United Kingdom.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	14,301	8,332	--	United Kingdom 6,575; Hong Kong 1,673.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	8	27	--	All to United Kingdom.
Carbon black	509	630	32	Netherlands 446; United Kingdom 88; West Germany 43.
Coal, all grades including briquets	65,760	38,450	--	United Kingdom 38,432.
Coke and semicoke	17,352	8,719	--	Sweden 8,686; United Kingdom 33.
Hydrogen, helium, rare gases	808	819	--	Mainly to United Kingdom.
Peat including briquets and litter	145,355	129,826	3	United Kingdom 126,840; Saudi Arabia 534.
Petroleum refinery products:				
Gasoline 42-gallon barrels	7,948	23,672	--	United Kingdom 17,323.
Kerosine do	140	--	--	
Distillate fuel oil do	2,835	70,863	186	United Kingdom 45,155; Denmark 20,388.
Residual fuel oil do	576,616	66,773	--	All to Portugal.
Lubricants do	39,158	1,289,071	21	United Kingdom 875,217; Netherlands 153,937.
Other:				
Liquefied petroleum gas do	36,505	20,648	12	United Kingdom 20,636.
Mineral jelly wax do	1,472	1,204	--	United Kingdom 645; Netherlands 268; France 118.
Bitumen and other residues do	3,703	558	--	All to United Kingdom.
Bituminous mixtures do	582	139	--	United Kingdom 109; Republic of South Africa 30.
Mineral tar and other coal-, petroleum-, and gas-derived crude chemicals	384	144	--	United Kingdom 143; Greece 1.

COMMODITY REVIEW

METALS

Aluminum.—Construction of a new alumina plant with projected capacity of 800,000 tons per year, located on Aughinish Island in the Shannon Estuary, continued in 1981. The labor problems that had delayed schedules by 1 year were solved. The chief partner, Alcan, expected the refinery to come onstream at the end of 1983. The output was expected to be shared among partners Alcan, Shell-Billiton, and The Anaconda Company in proportion to their shareholdings of 40%, 35%, and 25%, respectively.

The refinery was estimated to cost over $1 billion, compared with initial estimates of $45 million. Cost increases were mainly due to higher interest rates and to inflation. Bauxite was to be imported from Brazil and West Africa.

Copper.—Production of copper in 1981 was by the Canadian-based consortium operating at Avoca and was subsidized by the Irish Government at a cost of more than $1.6 million.

Iron and Steel.—Irish Steel Ltd. asked the Government, which was sole owner of the company, for a $80 million subsidy to help balance its budget after the commissioning of a modern steel plant at the Haulbowline site in County Cork. The construction of the new plant cost $90 million, compared with a projected cost approved by the Government in 1978 of $57 million. The plant went into operation in 1981. The company said the new plant should ensure a profit in 1985.

The new plant was to produce 300,000 tons of steel per year and 281,000 tons of

rolled products from reinforcing bars to 8 by 5 1/4 inch structural sections. A new melting shop constructed on the island site was equipped with a 90-ton 40-megavolt-ampere Tagliaferri electric arc furnace and with a continuous-casting machine, the first in Ireland. For almost 12 months from June 1980, the company produced no steel of its own but maintained customer contracts through import and resale of French steel worth about $10 million. During this period the company showed a loss of $21 million, and a similar loss was expected in the next year.

Lead and Zinc.—Workers at Ireland's major lead-zinc operation, Tara Mines Ltd., at Navan, went on strike at the beginning of July 1981, and the mine was closed for 6 1/2 months. Tara declared force majeure on July 6 on shipments of lead and zinc concentrates.

In 1980, the last full year of production, Tara produced 354,000 tons and 52,000 tons, respectively, of zinc and lead concentrates. Tara reported total losses for the first 9 months of 1981 at $4.9 million, compared with a 1980 9-month loss of $709,000. The loss of output during the second half of 1981 from the Tara Mine, the largest zinc mine in Europe and an important supplier of concentrates to many European smelters, caused difficulties for French, West German, Belgian, Spanish, and Dutch smelters.

All the company's workers had returned to work following their acceptance of the Irish Labor Court's settlement proposals in January 1982, but shipments to Tara's customers were slow to be resumed. Cost of a full production startup was estimated at $16 million. Banks, to which Tara owed $120 million already, were reluctant to make further loans, and it was likely that most of the funds would be raised from other institutions and shareholders.

Bula Mines reapplied to the Irish Government in September 1981 for permission to exploit its lead-zinc deposit near Navan, this time as an underground mine. The Irish Planning Board had rejected Bula's original request for an opencast mine in December 1979 as well as its appeal in May. Bula Mines estimated that immediate underground exploitation of the ore body (rather than after 6 years of opencast mining, as in the original plan) would increase its capital costs about 25% to about $73 million. Bula's application to develop an underground operation was subjected to 52 questions posed by the Meath County Council. The questions concerned the mine's impact on environment, health, drainage, etc. The Council's decision was expected within 2 months of receipt of Bula's answers to the questions.

The mine had a proven ore body of 20 million tons and would produce about 1 million tons per year of ore. Bula said this would yield 130,000 tons of zinc in concentrate and 20,000 tons of lead in concentrate.

Silver.—At the Tynagh Mine, operated by Northgate Exploration and Development Ltd. of Toronto, Canada, modification of the concentrator was carried out for the treatment of a surface stockpile containing 110,000 tons of silver ore from early open pit mining. Operations began in late February 1981 at a treatment rate of 600 tons per day. Expected silver recovery in concentrates was approximately 600,000 troy ounces over a 10-month period, plus flotation byproduct recovery of significant quantities of lead and copper.

NONMETALS

Barite.—Ireland continued to be the world's fourth largest producer of barites (behind the United States, U.S.S.R., and China). Major barite production continued to come from Dresser Minerals International Inc. and Milchem Minerals Ltd. Production at the Glencarbury barite mine, Ballintrillick, County Sligo, ceased in 1980.

Dresser Mineral's Silvermines deposit in Tipperary was the main center of barite production. The Silvermines deposit was a shallow-dipping, suboutcropping deposit of massive barite 10 to 16 feet thick.

In 1978, total barite production was expected to reach about 300,000 tons, but by 1980 production had fallen to 260,000 tons. The grade of barite continued at 89% $BaSO_4$ with reserves expected to last 6 to 10 years. The entire output was used for mud for drilling in the North Sea, African, and offshore Ireland oilfields.

The other major barite company in Ireland, Milchem, based at Clonakilty, County Cork, reopened the Lady's Well barite mine in 1979. Production of barite in the mine increased from 1,520 tons in 1979 to 12,650 tons in 1980 and 22,060 tons in 1981. Two grades of product were shipped through the Port of Cork, one with a specific gravity of 4.2 in crude form, and the other with varying specific gravity below 4.2. Milchem's other Irish barite operation extracted barite from the tailings pond at Northgate's closed lead-zinc mine at Ty-

nagh, County Galway. Annual capacity was about 40,000 tons. Actual production in 1981 was 33,336 tons (working 7 days a week). Production in 1982 was expected to be 32,000 tons (5 days a week). The product was mainly shipped to Egypt and West Africa, although it initially went to the North Sea market.

Diamonds.—The new General Electric Co. (GE) synthetic industrial diamond plant in Dublin continued under construction in 1981. The plant was to be the second of its type in Ireland. The first, in the Shannon Industrial Estate, was the central plant for all De Beers Ltd.'s synthetic industrial diamonds. The Shannon site also manufactured synthetic diamond cutting-tool material.

GE's plant in Dublin will produce at least 10 million carats annually. De Beers, the world's largest supplier of industrial diamonds, had about 60% of the world market of 100 million carats of synthetic diamonds, with plants in the Republic of South Africa, Sweden, and Ireland.

MINERAL FUELS

In 1981, Ireland depended largely on imported oil and coal for its primary energy supplies. Production of indigenous energy was limited to small amounts of semibituminous coal, plus peat and hydroelectric power. About 60% of Ireland's electrical energy production was oil based, but this share was expected to decrease to 40% in 1990 with the expected increase in offshore gas production and the emphasis being placed on constructing new coal-fired units.

There was still no decision as to the utilization of nuclear power in Ireland.

Coal.—Coal production continued to be insignificant. Most of the domestic coal production came from semibituminous coal deposits of the Connaught Coalfield and was used at local powerplants. About 50,000 tons of anthracite came from the Kealy Mine in Tipperary County, and some came from opencast mines in the Leinster Coalfield.

Greater future imports of coal were foreseen by the Government. The Electricity Supply Board (ESB), Ireland's state electricity monopoly, was to become a significant importer of U.S. steam coal when its first coal-fired powerplant comes online. In mid-1984, the ESB was to begin importing 300,000 tons of coal per year for the facility, already under construction in 1981 at Moneypaint on the Shannon Estuary. Imports were to increase to 2 million tons per year in 1988, when the plant becomes fully operational.

In 1981, long-term contracts for coal imports were signed with Consolidated Coal Inc. of Pittsburgh, Utah International Inc., and Freeman United Coal of Chicago, with deliveries to begin in 1984. Utah International's contract called for the delivery of more than 7 million tons of thermal coal over a period of 20 years.

Natural Gas.—The Irish Government announced that the official estimate of total recoverable reserves in the Kinsale Head Gasfield, off the southern coast, Ireland's only producing hydrocarbon resource, had been revised upward by 35% to 1.4 trillion cubic feet. Marathon Oil, discoverer and developer of the Kinsale Head Field, announced new plans to drill for oil and gas in the Celtic Sea, off Ireland's southern coast. A new important gasfield straddling the border with northern Ireland was reported, but the size could be confirmed only by further drilling.

The Irish Gas Board invited selected firms to submit bids for construction of a gas pipeline from the Kinsale Head Field, via the city of Cork, to Dublin and possibly other towns. The pipeline would be adequate to handle a projected peak of 73 million cubic feet per day (mcfd) in 1986 and 162 mcfd in 1992 and thereafter. Bidders were to submit proposals on the basis of completion of the pipeline by December 1982.

Peat.—Peat was the main indigenous source of energy in Ireland. Production was based on mechanical strip extraction and was located mainly in the flat midlands. About 16% of the electrical energy generated in 1980 was produced with peat fuel, a decline from 23% in 1975. Peat was produced mainly by the Bord Na Mona, the Irish Government Peat Board. Eleven powerplants in Eire used peat as a fuel exclusively—seven of these plants were Bord Na Mona. State-owned reserves of peat were equivalent to 40 million tons of coal, and it was anticipated that they would last about 35 years.

Petroleum.—Overall 1981 drilling results were considered disappointing, especially in view of the high hopes raised by British Petroleum's (BP) 1979 and 1980 wells in the offshore Porcupine Basin. In 1981, BP drilled two dry holes adjacent to the location of promising 1979 and 1980 wells. The most positive find was a Phillips Petroleum Co. well on block 35-8 in the center of the

Porcupine Basin, which flowed 924 barrels per day. The Phillips wells were in a large uniform structure which could hold considerable reserves. Several other wells, for a total of eight, were drilled; they contained hydrocarbon traces or showed geological potential. The overall results were just interesting enough for exploration to continue at about the same level in 1982. The Irish Government offered 108 new offshore tracts located in the Donegal Basin, Kish area, Porcupine Basin, Celtic Sea, and Slyne trough.

Ireland's Aran Energy Co. in December applied for full planning permission to build a 120,000-barrel-per-day refinery at Tarbert on the Shannon Estuary, County Kerry. Aran estimated that construction work on the $500 to $570 million project could start in 1983 and be completed in 1986. In 1980, oil consumption in Ireland totaled 42 million barrels, while capacity of the country's only refinery, the Irish Refining Co.'s plant at Whitegate, was only 18 million barrels per year. The refinery ceased operation in June 1981 when the participating companies (Esso, 40%; Shell, 24%; Texaco, 20%; and BP, 16%) decided that it was cheaper to supply their Irish markets with production from their large refineries elsewhere in Europe. The Government responded by threatening to nationalize Whitegate.

Ireland remained heavily dependent on imported oil. In 1981, the country imported about 44 million barrels of petroleum and products. The country had a stockpiling target of 11 million barrels, partly in product form, maintained by private companies and the Government.

Uranium.—A number of anomalies were identified as a result of the aeromagnetic study done in cooperation with the European Communities. Encouraging anomalies were discovered, particularly in County Donegal near Tintown, south of the Gweebarra River, where Anglo United Development Corp. Ltd. of Canada did some drilling in primary uraninite in granite. Uranium exploration was hampered in Ireland by growing environmentalist resistance to nuclear power.

[2]Official exchange rate during 1981 for the Irish pound (£) to U.S. dollars was 1£=US$1.62.

The Mineral Industry of Israel

By Suzann C. Ambrosio[1]

Israel's mineral industry consisted primarily of nonmetal chemicals, fertilizers, cement, and polished diamonds. Israel Chemicals Ltd. (ICL), the Government holding company for all nonmetal mineral production, estimated the 1981 sales value of nonmetals and chemicals (excluding diamonds) at $300 million.[2] Diamond exports were estimated at $950 million, reflecting an approximate 60% decline from 1980 net revenues. Depressed world markets in the diamond and fertilizer industries resulted in a decline in the value of Israeli mineral production relative to the national income. However, an increased proportion of the total mineral-derived income was attributed to fertilizers and chemicals, particularly phosphate and potash.

Economic policies initiated in 1980-81 resulted in a slowing down of the real growth rate of Israel's gross national product (GNP) to 2.3% in 1980 and an estimated 1.5% in 1981. The GNP was estimated at $4.5 billion during 1981.[3] Slight improvements in the balance of payments (BOP) were made at the cost of decreased domestic demand, sustained high rates of triple-digit inflation, and increased unemployment. As the emphasis of economic priorities was shifted from BOP improvement to inflation reduction, consequent monetary and fiscal policies during 1980-81 had the effect of (1) increasing the estimated BOP deficit by $500 million, (2) increasing unemployment to approximately 5.2% (70,000 people), (3) reducing and stabilizing the devaluation rate of the Israeli shekel against the U.S. dollar to an average of 22% per quarter during 1981, and (4) holding inflation relatively stable at an approximate annual rate of 120%.

Despite attempts to continue tight monetary and fiscal policies, including holding down the Government budget, trade subsidies, import duties, and tax benefits, the 1981 budget increased 120% over the previous fiscal year's budget to $17 billion. Approximately two-thirds of the allocations continued to go into defense ($5.5 billion) and debt service ($5.1 billion). The budget was expected to be financed by domestic sources (78%) and by receipts from abroad (22%). Foreign revenues were expected to come primarily from U.S. loans, Israeli bond sales, and loans secured in the free market.

Israel continued to import 99% of its fuel requirements, primarily oil, at a cost of $2.1 billion. The country's electricity-generating capacity was 2,600 megawatts and demand was approximately 2,300 megawatts at yearend 1981. National priorities to diversify from oil to coal and nuclear energy made some headway during the year. The first unit of the Hadera coal-fired power station was commissioned in 1981, and the three other units, each with a 350-megawatt capacity, were expected to become operational during 1982-83. Israel's first coal project, estimated to cost $750 million for the powerplant alone, experienced delays. Construction of the $87 million offshore coal-import terminal was about 1 year behind schedule. The Republic of South Africa, the United States and Australia were the major coal suppliers.

The route for the Mediterranean-Dead Sea canal was approved by the Israeli Cabinet to pass through the southern part of the Gaza Strip. However, the proposed hydroelectric complex could be potentially damaging to potash and bromine operations at the Dead Sea Works (DSW) if uncontrolled spillwater was permitted to raise the salt-lake level and flood the production facilities. Political and economic considerations of the project continued to be discussed through 1981.

Several improvements were made in the country's transportation sector. Of major

importance to the mineral industry was the construction of a new railroad line stretching 21 kilometers from Kiray Gat to Ashkelon and another 27 kilometers to the Ashdod Port. The main purpose of the line was to facilitate fertilizer material and chemical exports from the Negev via Ashdod. Approximately 2.5 million tons of mineral freight was hauled from the Negev in 1981, and the volume was expected to double over the next 4 years. The Yuval Gad cement works will also benefit from the new line, as a link to the national rail network. Minerals were estimated to comprise one-half of the total freight along the new line.

PRODUCTION AND TRADE

The industrial production index declined by approximately 4% in 1980, after a decade of 6% average annual increases. In the aggregate, nonmetal production increased and metal product output was stagnant in 1980. According to statistics, the metals, machinery, and electronics sector improved, owing primarily to large increases in the electronics industry, and the entire sector accounted for 33% of total industrial production and 35% of total industrial exports in 1980.

Israel's Central Bureau of Statistics reported that industrial production (measured in constant prices) experienced a slight recovery during the first half of 1981 owing in part to moderate increases (4% each) in the mining-quarrying and rubber-plastic product sectors. Conversely, a 4% decline was noted in the fields of basic metals and metal products. However, metals and electronics continued to become larger components of industrial exports because of declines in domestic demands, availability of labor, and the Israeli currency devaluation.

Israel continued to have an overall trade deficit in 1981, despite substantial gains in some export sectors. Between November 1980 and November 1981, total exports increased by 23.2%. The largest mineral industry gains were exhibited in quarries and nonmetallic products (up 170% to $260 million), metals, machinery, and electronics (up 75% to $1.7 billion), and chemical, rubber, and plastics (up 30% to $960 million). Diamond-export revenues for the same period declined 25% to $1 billion dollars.

The diamond industry continued to be one of the nation's largest industrial export sectors, despite substantial export and price declines since 1979. Rough-diamond imports decreased 50% and polished-diamond exports dropped 20% in the first half of 1981 compared with those of the same period in 1980. Discouraging signs evident in 1981 included an employment drop to roughly 50% of the 1978 diamond industry level and drastic reductions in the Bank of Israel's credit ceilings used by the industry to finance inventories. Israel has responded to market conditions by stepping up the cutting and polishing of small gem stones, partially relieving unemployment in the diamond industry during 1981.

Nonmetals and chemicals continued to be the bright spot in Israel's mineral production and trade. ICL increased exports in financial year 1981 (ending in March) by 45% to $340 million. The largest exporter was Negev Phosphates Ltd. (NPL) and DSW with $127 million and $108 million in sales, respectively. Despite the slump in world markets for phosphate, NPL planned to proceed with its 5-year development program. NPL annual production targets were 7 million tons of phosphate rock and 250,000 tons of phosphoric acid. DSW planned to produce 2.5 million tons per year of potash by 1985.

Owing to the incomplete nature of trade statistics, import and export tables have been temporarily omitted until more complete data become available. Some general observations on metal imports, however, were gleaned from available statistics. Israel's mineral imports continued to be largely dominated by metals and mineral fuels. Imports of precious metals, ferrous metals, semimanufactured iron and steel products, bauxite, nickel, titanium, tungsten, and mercury have increased between 1978 and 1980. There was a decline in base metal imports during 1980, most notably in lead and zinc metals. Fuel imports also declined slightly, owing to decreased consumption. For the first half of 1981, imports of rough diamonds decreased by 51%, reflecting depressed world market conditions.

The European Economic Community (EEC) continued to be Israel's largest export partner followed by the United States with 50% and 11% shares, respectively, of Isra-

el's total export market in 1980. For the first time, Israel achieved a trade surplus with the United Kingdom. The 1981 trade account with the EEC was estimated to have declined owing to stagnating European import markets. Conversely, trade with the United States increased, with Israeli exports increasing approximately 32% to $1.2 billion and U.S. exports to Israel increasing approximately 23% to $2.5 billion. Diamonds accounted for nearly one-half of the U.S. imports from Israel in 1980-81, and large increases were reported in mineral-derived products; reexported basic metals used in aircraft were up 95%, mining products and fertilizers were up 69%, and chemicals were up 39%.

Israel's exports to industrialized countries in general have been declining, while those to developing countries have been increasing. A bilateral trade agreement with Egypt was signed in March 1981. Trade progressed slowly, as expected, with the most significant impact of the agreement being the increased variety of exported products. Trade with Latin America grew to approximately 3% of Israel's total 1981 export trade. Israeli-African trade continued to increase, and Israel enjoyed a trade surplus with most African countries, except Gabon. African exports to Israel consisted primarily of cacao, cotton, and wood. Gabon supplied some of Israel's mineral fuel needs in 1981.

COMMODITY REVIEW

METALS

Copper.—Revitalization of the Timna copper mines continued to be discussed throughout the year. Timna Copper Mines Ltd. recommended small-scale production of copper oxide and an annual output level of 10,000 tons of copper sulfate and 7,000 tons of manganese sulfate. It was estimated that a $10 million investment was needed to start production by yearend 1982.

Iron and Steel.—Israeli Steel Mills, a subsidiary of Koor Industries, completed the first-phase modernization at the Haifa steel rolling mill. Output of 110,000 tons in 1981 was expected to be expanded over the next 3 years at a cost of $10 million.

Magnesium Compounds.—Production of periclase (MgO) from the magnesia-rich Dead Sea brines continued to increase slightly. Dead Sea Periclase Ltd. was considering doubling capacity through the addition of a second 50,000-ton-per-year refractory magnesia plant.

The Israeli-United States Binational Industrial Research and Development Foundation financed a joint-venture project with ICL and General Refractories of Philadelphia. The project involved development of a low-energy process for making high-purity magnesium oxide (periclase) from Dead Sea salts. The end-use product, refractory brick, was for lining steel-producing furnaces.

NONMETALS

Bromine.—Dead Sea Bromine Ltd. succeeded in expanding plant capacity to 70,000 tons per year early in 1981. Exports of over one-half the 1980-81 production were valued at $45 million. Bromine production and bromine reserve estimates (1 billion tons) may be adversely affected if the Mediterranean-Dead Sea canal is built. Extraction would be more difficult and costly with the mixing of the less saline Mediterranean waters and mineral-rich Dead Sea waters.

Fertilizer Materials.—*Phosphorous.*—Although 1980 phosphate rock production proceeded at a rate slower than expected by NPL, total annual capacity increased to 3 million tons between 1980 and yearend 1981. The 4-year-old Zin Mine operated at 75% capacity and produced approximately one-half of the 1981 output. The remainder of the production by NPL was from the Arad, Makhtesh, and Oron Mines.

Total investments worth $44 million were slated for a capital expansion project at the Arad Mine ($25 million) and for various projects in the other phosphate fields. Expanded capacity at Arad was expected to be completed by 1982 and replace declining output from the Makhtesh Mine. Trial production of semicalcined phosphate at the Oron Mine was successful. The new prod-

uct, compared with conventionally produced calcined phosphate, had virtually identical properties and end-use potentials and required only 30% of the energy cost to produce. Expanded output of partially calcined phosphate is expected to occur at Oron.

The Mishor Rotem fertilizer plant, located near the Arad Mine, began operations in October 1981. The $90 million fertilizer complex (including infrastructure and plant facilities) has an annual capacity of 500,000 tons of washed phosphate rock, 500,000 tons of sulfuric acid, and 120,000 tons of phosphoric acid. Most of the elemental sulfur was expected to be imported. Expansion plans were made to produce 250,000 tons per year of triple superphosphate by yearend 1981 and 250,000 tons per year of granular phosphoric fertilizer by mid-1982.

NPL exported approximately 90% of its output and 10% was used for domestic fertilizer production in 1981. The value of phosphate rock exports increased by approximately 40% in 1980 to $124 million and 1981-82 sales were expected to increase only slightly. The 1981 forecast is for 2.4 million tons valued at $131 million. A new marketing office was opened in Paris during 1981 and was expected to function as a focal point of marketing and distribution operations in Western Europe. Other NPL marketing centers were located in the United States, the Netherlands, and Brazil. Transportation between Israel and the centers was assured by Negev Star, the shipping outfit established in 1979. Facilities at Israel's Port of Ashdod were improved to handle 4 million tons of phosphate rock annually and store 200,000 tons.

Potash.—DSW raised its annual potash production capacity in July 1981 by 470,000 tons. Construction of the second-phase expansion of another 560,000-ton facility was underway. A new process was successfully employed that was expected to conserve energy. The process involves separating potassium salt (sylvite) from common salt (halite) by first producing low-sodium carnallite and then processing this to remove the sodium and magnesium chlorides.

Total annual potash production capacity by yearend 1982 was expected to reach 2.1 million tons. Expansion plans were being reexamined at yearend 1981 because of the decline in world potash prices. Despite a decrease in 1981 sales revenue due to depressed prices, production increased and had a net positive effect on company profits. Marginal increases in production at the existing Sedom plant required no capital expenditures. DSW was expected to maintain production levels even at the cost of financing increased inventories.

MINERAL FUELS

Coal.—The first stage of the Israeli offshore coal-import terminal was completed in 1981, 1 year behind schedule. The first 300- by 24-meter pier and one-fourth of the 1,700-meter jetty were constructed. Adverse storm and soil conditions delayed the project and resulted in a 16% cost overrun. By yearend 1981, 40,000 tons of coal was barged to shore to feed the newly constructed 1,400-megawatt coal-fired Hadera power station. When completed, the mooring space was expected to handle ships of 130,000-to-170,000-ton capacity.

A memorandum of agreement was signed between Israel's National Company for Coal Supply and General Mining Union Corp. Group of the Republic of South Africa, making the Republic of South Africa Israel's largest coal supplier. Other supply agreements were signed with Australia and the United States, but details were not published. A contract for maximum supply of 750,000 tons of United Kingdom coal over a 5-year period was signed in May 1981.

Petroleum.—The Israeli Energy Ministry allocated $150 million over the next 3 years to carry out a program of over 100 shallow drill holes. Targeted drilling sites were located mostly in the Dead Sea area and along the southern section of the Mediterranean coastal plain. Despite attractive terms offered to foreign investors interested in participating, raising the necessary capital for the drilling has been a consistent problem.

The Israel National Oil Co. (INOC) anticipated that 50% of the drilling costs would be raised through limited partnerships with foreign investors. Approximately $40 million was allocated for seismic surveys, for a total projected investment of nearly $190 million. By yearend 1981, seismic tests confirmed the presence of favorable structures in western Galilee.

Hanah, the Government oil investment company, gave the initial approval for eight drill holes near the Dead Sea Works at Sedom. Three of the eight approved drill holes were planned for natural gas; one was

to be located in the Negev and two in the Judean Desert. By yearend 1981, pumping tests began at the 3-kilometer-deep (Notera III) gas well located in the Hula Valley. Technical assistance by the United States and Japan was expected to help produce the gas, which was reported to be mixed with water. Gas had already been discovered in two of the previous wells in the Notera series, one of which has been producing commercially.

Israel Dead Sea Oil Project (IDSOP), a U.S. limited partnership, entered into a joint operating agreement with Oil Exploration Investments Ltd. (OEL), a subsidiary of INOC, to explore and possibly drill a potential oil and gas field in the Sedom area. The $16 million project was split 40% IDSOP and 60% OEL, with OEL expected to be the project operator.

Oil Shale.—Israel and a firm from the Federal Republic of Germany were negotiating a joint-venture scheme for a $2.5 million oil shale research project. U.S. assistance was requested to construct a plant that could process shale into 40,000 barrels of oil per day by 1990. The increased interest in developing Israeli oil shale reserves was due in part to the near doubling of the Nahal Zin reserves to 4 billion tons and recent discoveries of an additional deposit north of Eilat. The UM-Barek deposit was reported to contain approximately 3 million cubic meters (18.9 million barrels) of oil.[4]

The Mineral Industry of Italy

By Roman V. Sondermayer[1]

Italy remained a significant processor and consumer of imported minerals, metals, and fuels during 1981. The mining and mineral processing industry shared an estimated 11% in the country's gross national product of about $400 billion.[2]

Indexes for industry as a whole and for the mineral industry's activities all showed downward trends, as shown in the following tabulation:

	1977	1978	1979	1980	1981
All industries	123	126	134	142	138
Extractive industry	94	94	101	97	93
Mining of metals	49	45	39	r36	28
Mining of nonmetals	99	100	107	104	100

rRevised.

Employment in the mineral industry had declined during recent years. The following tabulation shows the latest data on employment in the mineral industry.

	1977	1978	1979	1980	1981
Mining of metals	5,198	4,285	3,725	3,099	2,818
Mining of nonmetals	8,061	7,104	7,001	6,550	6,033
Total	13,259	11,389	10,726	r9,649	8,851
Production of fuels	NA	NA	NA	2,289	2,304

rRevised. NA Not available.

Most of the minerals produced in Italy were of local significance. Minerals produced in the country with some importance to the world economy were ornamental stone, pumice, feldspar, pyrite, fluorspar, barite, asbestos, and zinc. As in the past, Italy was without a large copper smelter and depended almost completely on imports of copper metal to meet its demand.

The major events in the mineral industry of Italy during 1981 included, among others, (1) completion of the reorganization of the state-owned steel producer, Finsider, (2) completion of the reconstruction of the zinc smelter at Ponte Nossa, (3) resumption of mercury production, (4) closure of the Gavorrano pyrite mine, (5) development and construction of a silica sand producing facility, and (6) ratification of the new National Energy Plan by the Council of Ministers.

PRODUCTION

During 1981, private and public companies owned facilities for production and processing of minerals, metals, fuels, and products derived from them. The Government, through Ente Nazionale Idrocarburi and its affiliates, Societa per Azioni Minero-Metallurgiche (SAMIM) and Azienda Generale Italiana Petroli S.p.A.; Finsider with its subsidiaries, Nuovo Italsider and Acciaieria Piombino; and the Government-owned potash mines controlled most of the mineral producing and processing sector. Societa Mineraria e Metallurgica di Pertusola S.A. in lead-zinc, Assiaierie Ferriere Lombarde Falck in steel, and major foreign oil and gas companies were the principal privately owned companies in the sector.

During 1981, the mineral industry of the country showed mixed results. The extraction industry, mostly metals, declined. Table 1 shows the production trends for 1977-81.

[5]Less than 1/2 unit.

TRADE

During 1981, Italy remained dependent on imports of large quantities of raw materials and fuels. Tables 2 and 3 show Italy's foreign trade in minerals and related commodities for 1979-80.

Steel, primary forms	675,319	695,302	18,842	France 107,256; West Germany 90,000; Lebanon 76,110.
Semimanufactures:				
Bars, rods, angles, shapes, sections thousand tons	3,282	3,057	3	West Germany 714; France 512; Libya 368.
Universals, plates, sheets do	1,206	1,193	18	France 271; West Germany 172; U.S.S.R. 167.
Hoop and strip do	112	106	--	France 24; Greece 13; U.S.S.R. 13.
Rails and accessories do	20	11	(1)	Switzerland 4; Egypt 2.
Wire do	84	80	1	France 18; Algeria 14; West Germany 9.
Tubes, pipes, fittings do	1,515	1,615	117	U.S.S.R. 344; Libya 162; West Germany 115.
Castings and forgings, rough do	10	27	--	West Germany 3; France 2.
Lead:				
Ore and concentrate	19,359	21,353	--	Greece 10,900; Austria 4,094; U.S.S.R. 2,500.

See footnotes at end of table.

Table 2.—Italy: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980	Destinations, 1980	
			United States	Other (principal)
METALS —Continued				
Lead —Continued				
Ash and residue containing lead	12,862	7,758	--	France 7,368.
Oxides and hydroxides	720	21	NA	NA.
Metal including alloys:				
Scrap	257	21	NA	NA.
Unwrought	20,505	4,199	--	Turkey 1,522; Libya 1,196.
Semimanufactures	377	855	--	Switzerland 268; Libya 231.
Magnesium metal including alloys:				
Scrap	596	554	318	France 143.
Unwrought	5,375	4,285	--	West Germany 3,634; Austria 331.
Semimanufactures	193	249	--	France 122; Israel 40.
Manganese:				
Ore and concentrate	5	203	NA	NA.
Oxides and hydroxides	177	124	--	West Germany 115.
Metal including alloys, all forms	12	73	NA	NA.
Mercury 76-pound flasks	9,512	6,681	--	Spain 6,536.
Molybdenum:				
Ore and concentrate	184	179	--	Austria 144.
Metal including alloys, all forms	36	10	NA	NA.
Nickel:				
Matte, speiss, similar materials	10	2	NA	NA.
Metal including alloys:				
Scrap	299	271	--	India 117; Switzerland 79.
Unwrought	226	168	--	France 74; Netherlands 50.
Semimanufactures	493	500	--	Tunisia 107; Yugoslavia 39; France 38.
Platinum-group metals including alloys, unwrought and partly wrought thousand troy ounces	2,201	162	13	Israel 34; West Germany 17; United Kingdom 15.
Rare earths:				
Oxides and other compounds value	$7,579	$4,793	NA	NA.
Metals including alloys, all forms	106	26	NA	NA.
Selenium, elemental kilograms	1,700	700	--	All to Togo.
Silicon, elemental	10,246	25,064	10,492	West Germany 3,811; Japan 1,418.
Silver metal including alloys, unwrought and partly wrought thousand troy ounces	3,890	7,912	10	Switzerland 5,064; United Kingdom 1,765.
Tellurium and arsenic metals	5	11	NA	NA.
Thorium: Thoria value	--	$42,253	NA	NA.
Tin metal including alloys, all forms	376	444	--	France 111; Denmark 69; West Germany 61.
Titanium:				
Ore and concentrate	--	96	NA	NA.
Oxides and hydroxides	23,278	1,867	--	China 180; Yugoslavia 159; Switzerland 114.
Metal including alloys, all forms	125	118	2	France 26; United Kingdom 25.
Tungsten:				
Ore and concentrate value	$4,212	--		
Metal including alloys, all forms	98	65	--	West Germany 45.
Vanadium:				
Oxides and hydroxides	1	--		
Metal including alloys, all forms value	--	$6,146	NA	NA.
Zinc:				
Ore and concentrate	2,364	2,908	--	Austria 2,822.
Matte, ash, residue containing zinc	14,473	7,013	--	West Germany 5,865; Austria 583.
Oxides and hydroxides	3,105	4,756	--	West Germany 1,361; Hungary 1,022; France 910.
Metal including alloys:				
Scrap	1,418	2,138	--	West Germany 2,001.
Blue powder	288	114	--	France 48; Austria 20.
Unwrought	16,558	20,340	1,999	U.S.S.R. 4,996; France 4,355.
Semimanufactures	830	2,016	--	East Germany 360; France 300; Portugal 283.
Zirconium:				
Ore and concentrate	3,862	487	--	Algeria 75.
Metal including alloys, all forms	92	(1)	NA	NA.
Other:				
Ores and concentrates	1,379	2,746	--	France 1,172; Austria 795.
Ash and residue containing nonferrous metals	12,432	18,201	--	West Germany 9,186; France 7,860.
Oxides, hydroxides, peroxides	332	664	--	France 94; Spain 72.
Metal:				
Metalloids	2	(1)	NA	NA.
Alkali and alkaline-earth metals	440	96	--	Yugoslavia 35.
Base metals including alloys, all forms	13	13	NA	NA.

See footnotes at end of table.

Table 2.—Italy: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980	Destinations, 1980	
			United States	Other (principal)
NONMETALS				
Abrasives, n.e.s.:				
Natural: Pumice, emery, corundum, etc	210,292	220,100	36,500	United Kingdom 113,834; Algeria 40,753.
Artificial: Corundum	2,614	2,197	--	Austria 804; Bulgaria 442; France 280.
Dust and powder of precious and semiprecious stone, kilograms	108	92	NA	NA.
Grinding and polishing wheels and stones	18,435	17,667	2	France 1,982; West Germany 1,843; Saudi Arabia 652.
Asbestos, crude	74,478	63,815	--	West Germany 24,490; Nigeria 5,444; France 5,256.
Barite and witherite	88,736	105,358	--	Algeria 33,816; Egypt 20,475; Libya 9,500.
Boron materials:				
Crude natural borates	1,998	3,650	--	West Germany 2,952; Yugoslavia 441.
Oxide and acid	6,300	5,042	872	West Germany 2,439; France 740.
Cement, thousand tons	1,695	821	7	Saudi Arabia 159; Israel 156; Libya 129.
Chalk	567	554	NA	NA.
Clays and clay products:				
Crude:				
Bentonite	31,246	18,967	--	Libya 7,575; France 5,924.
Kaolin	29,490	30,008	--	France 21,757; Greece 5,324.
Other	9,485	7,295	--	Tunisia 2,650; Hungary 1,206.
Products:				
Refractory including nonclay brick	99,942	133,062	--	West Germany 14,470; Egypt 11,969; Romania 9,187.
Nonrefractory, thousand tons	2,878	2,720	123	West Germany 596; France 508; Saudi Arabia 153.
Cryolite and chiolite	(2)	28	NA	NA.
Diamond:				
Gem, not set or strung, carats	3 1,186	75,586	--	Netherlands Antilles 39,033.
Industrial, do.	82,808	142,402	NA	NA.
Diatomite and other infusorial earth	1,866	885	NA	NA.
Feldspar	37,601	37,344	--	West Germany 15,348; Switzerland 6,584; Algeria 4,120.
Fertilizer materials:				
Crude	6,797	10,070	--	France 4,885; Austria 2,012.
Manufactured:				
Nitrogenous, thousand tons	1,458	1,320	--	Turkey 285; India 259; China 238.
Phosphatic, do.	2	2	--	Mainly to Switzerland.
Potassic, do.	105	72	--	Algeria 26; Japan 10; Turkey 9.
Other including mixed, do.	335	282	--	West Germany 42; Venezuela 35; France 25.
Ammonia	16,927	53,160	--	Israel 23,744; Greece 12,023; Switzerland 11,611.
Fluorspar	55,080	83,753	46,945	Canada 9,500; Romania 6,541; Norway 5,450.
Graphite, natural	3,854	3,414	--	France 2,644.
Gypsum and plasters	11,931	13,003	--	Switzerland 6,532.
Lime	96,437	33,639	--	Switzerland 29,466.
Magnesite	151,740	120,812	--	Austria 30,474; West Germany 25,344; Netherlands 16,120.
Mica:				
Crude including splittings and waste	661	1,127	--	France 312.
Worked including agglomerated splittings	11	142	NA	NA.
Pigments, mineral including processed iron oxides	2,936	2,901	--	France 1,381; Belgium-Luxembourg 268.
Precious and semiprecious stone, except diamond:				
Natural, kilograms	11,457	17,732	NA	NA.
Manufactured, do.	548	2,778	NA	NA.
Pyrites (gross weight)	3,375	3,797	--	West Germany 1,686; Austria 631; France 579.
Salt, all forms, thousand tons	1,241	740	--	United Kingdom 313; Sweden 147; Greece 67.
Sodium and potassium compounds, n.e.s.:				
Caustic soda	175,384	265,212	--	Yugoslavia 79,864; U.S.S.R. 31,217; Egypt 19,878.
Caustic potash	8	17	NA	NA.
Soda ash	20,190	14,605	--	Israel 7,496; Greece 3,220; Lebanon 2,474.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked:				
Calcareous	372,621	425,539	605	Saudi Arabia 58,278; Spain 53,150; Japan 29,205.

See footnotes at end of table.

Table 2.—Italy: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1979	1980	Destinations, 1980	
			United States	Other (principal)
NONMETALS —Continued				
Stone, sand and gravel —Continued				
Dimension stone —Continued				
Crude and partly worked —Continued				
Slate	3,320	4,050	--	France 1,155; Switzerland 863; Belgium-Luxembourg 795.
Other	118,988	109,494	564	West Germany 45,747; Switzerland 13,567; Austria 13,281.
Worked:				
Slate	40,244	39,479	22,407	Australia 2,167; Canada 1,015; France 898.
Paving and flagstone	131,317	161,316	--	West Germany 73,628; Switzerland 53,216.
Other thousand tons	1,121	1,099	63	West Germany 480; Saudi Arabia 215; France 91.
Dolomite, chiefly refractory-grade	47,317	58,555	--	France 24,979; Switzerland 15,704.
Gravel and crushed rock	620,069	660,670	--	West Germany 103,967; Kuwait 91,961; Switzerland 72,704.
Limestone, except dimension	10,995	7,336	NA	NA.
Quartz and quartzite	36,220	44,779	--	Switzerland 28,292; France 7,207; West Germany 3,068.
Sand excluding metal-bearing	420,108	253,140	--	Switzerland 220,636.
Sulfur:				
Elemental, all forms	190	107	NA	NA.
Sulfuric acid	36,043	81,931	--	Turkey 45,738; Greece 16,853.
Talc, steatite, soapstone	55,181	54,015	8,792	West Germany 10,584; United Kingdom 8,295; France 8,247.
Other:				
Crude	51,289	82,329	140	United Kingdom 62,733.
Slag, dross, similar waste, not metal-bearing	354,707	378,133	--	Yugoslavia 205,652; Greece 127,502.
Oxides, hydroxides, peroxides of strontium, magnesium, barium	2,099	1,887	639	Japan 234; United Kingdom 199; Denmark 158.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	152,787	167,438	3,071	France 57,114; Libya 27,705; Tunisia 13,650.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	2,385	3,336	--	Cameroon 1,436; Yemen Sana 416; Ivory Coast 406.
Carbon black and gas carbon	44,989	42,998	--	Yugoslavia 14,930; Austria 10,054; France 6,341.
Coal, all grades including briquets	13,074	18,890	--	Switzerland 6,923; France 5,334.
Coke and semicoke	645,114	746,530	--	Romania 336,936; Hungary 67,080; Algeria 55,285.
Gas, natural thousand cubic feet	1,426	1,373	NA	NA.
Peat including briquets and litter	664	277	NA	NA.
Petroleum refinery products:				
Gasoline thousand 42-gallon barrels	59,882	36,891	953	Netherlands 10,345; France 4,028; United Kingdom 3,663.
Kerosine do	22,951	18,880	--	Netherlands 2,661; United Kingdom 1,606; Greece 1,480.
Distillate fuel oil do	47,197	24,056	--	Syria 3,308; Tunisia 1,923; Netherlands 1,564.
Residual fuel oil do	49,311	28,481	1,223	Turkey 1,910; Algeria 1,425; Malta 714.
Lubricants do	3,648	4,331	1	Belgium-Luxembourg 545; Algeria 394; Netherlands 299.
Other:				
Liquefied petroleum gas do	4,544	3,075	--	Egypt 657; Algeria 467; France 375.
Mineral jelly and wax do	25	17	--	Poland 5; West Germany 2.
Bitumen and other residues do	904	987	--	Austria 373; Tunisia 193; Switzerland 181.
Bituminous mixtures, n.e.s do	42	51	--	Libya 13; Somalia 11.
Petroleum coke do	234	132	--	Egypt 110.
Mineral tar and other coal-, petroleum-, and gas-derived crude chemicals	62,587	72,122	--	France 53,790.

NA Not available.
[1]Less than 1/2 unit.
[2]Unreported quantity valued at $1,388.
[3]Excludes unreported quantity valued at $1,384.

Table 3.—Italy: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1979	1980	Sources, 1980	
			United States	Other (principal)
METALS				
Aluminum:				
Bauxite and concentrate thousand tons	2,287	2,288	--	Australia 1,623; Guinea 404.
Ash and residue containing aluminum	62,260	59,147	--	Austria 38,406; West Germany 4,143.
Oxides and hydroxides	179,690	180,187	--	France 74,837; Yugoslavia 39,159; Guinea 25,660.
Metal including alloys:				
Scrap	57,754	79,093	14,645	West Germany 19,961; France 13,269; Switzerland 12,481.
Unwrought	276,281	339,185	18,152	West Germany 72,914; France 55,191; Netherlands 26,542.
Semimanufactures	92,114	112,642	6,670	West Germany 39,302; France 25,797; Belgium-Luxembourg 13,801.
Antimony:				
Ore and concentrate	--	3	NA	NA.
Metal including alloys, all forms	121	106	NA	NA.
Arsenic trioxide, pentoxide, acids	820	852	--	Belgium-Luxembourg 387; France 308.
Beryllium metal including alloys, all forms kilograms	1,400	7,800	NA	NA.
Bismuth metal including alloys, all forms	55	62	--	United Kingdom 26.
Cadmium metal including alloys, all forms	85	68	--	West Germany 42.
Chromium:				
Chromite	232,445	171,045	--	Turkey 56,547; Republic of South Africa 39,560; Albania 39,102.
Oxides and hydroxides	2,202	1,941	--	West Germany 1,523.
Metal including alloys, all forms	206	186	--	United Kingdom 63; West Germany 59.
Cobalt:				
Oxides and hydroxides	189	192	--	Belgium-Luxembourg 80; West Germany 55; France 45.
Metal including alloys, all forms	338	258	--	Belgium-Luxembourg 77; France 72; United Kingdom 45.
Columbium and tantalum metals including alloys, all forms	26	12	5	Austria 1.
Copper:				
Ore and concentrate	10	10,479	--	Australia 10,460.
Cement copper kilograms	400	51,300	NA	NA.
Sulfate	3,063	2,205	--	Yugoslavia 1,022; Czechoslovakia 640; United Kingdom 314.
Ash and residue containing copper	670	4,599	--	Austria 4,089.
Metal including alloys:				
Scrap	76,310	99,524	881	France 27,449; West Germany 25,137; United Kingdom 21,425.
Unwrought:				
Blister	6,802	2,240	--	Chile 1,298; United Kingdom 220.
Refined, unalloyed	338,464	372,834	--	Chile 109,500; Zambia 77,387; Peru 39,322.
Alloys	17,067	21,255	--	United Kingdom 5,783; West Germany 5,522; Yugoslavia 3,564.
Semimanufactures	107,552	144,188	4,837	France 49,689; West Germany 36,069; Belgium-Luxembourg 12,656.
Gallium, indium, thallium metals including alloys, all forms kilograms	1,200	1,400	--	Canada 400; Belgium-Luxembourg 300.
Germanium metal including alloys, all forms do	200	1,200	NA	NA.
Iron and steel:				
Ore and concentrate thousand tons	17,318	16,912	--	Brazil 4,989; Liberia 3,116; Mauritania 1,897.
Roasted pyrites	2,800	762	--	France 698.
Metal:				
Scrap thousand tons	6,891	7,411	1,142	France 2,605; West Germany 2,322.
Pig iron including cast iron and spiegeleisen do	517	672	--	West Germany 168; France 147; Brazil 127.
Sponge iron, powder, shot do	119	77	--	Canada 29; France 14.
Ferroalloys:				
Ferromanganese do	122	120	--	France 50; Republic of South Africa 27; Norway 12.
Other do	220	210	1	Norway 32; France 25; Yugoslavia 21.
Steel, primary forms do	3,061	3,355	2	France 693; Belgium-Luxembourg 569; West Germany 438.

See footnotes at end of table.

METALS —Continued				
Iron and steel —Continued				
Metal —Continued				
Semimanufactures:				
Bars, rods, angles, shapes, sections thousand tons	768	960	(1)	France 329; West Germany 197; Austria 87.
Universals, plates, sheets do	1,822	2,087	154	France 558; West Germany 295; Belgium-Luxembourg 274.
Hoop and strip do	209	199	1	France 70; West Germany 67; Belgium-Luxembourg 22.
Rails and accessories do	139	149	6	Canada 47; West Germany 27; France 16.
Wire do	66	79	(1)	Belgium-Luxembourg 31; West Germany 14; France 11.
Tubes, pipes, fittings do	282	335	2	West Germany 168; France 82.
Castings and forgings, rough do	8	9	--	West Germany 3; Switzerland 2.
Lead:				
Ore and concentrate	45,365	44,264	--	Greece 11,473; Canada 10,997.
Ash and residue containing lead	4,038	2,149	216	Hungary 565; Lebanon 504; West Germany 459.
Oxides and hydroxides	4,829	4,514	--	West Germany 1,523; France 171.
Metal including alloys:				
Scrap	48,707	44,139	3,007	United Kingdom 12,082; West Germany 7,512; France 5,709.
Unwrought	151,411	173,235	1,807	West Germany 38,331; Republic of South Africa 19,235; Morocco 17,311.
Semimanufactures	1,538	1,468	--	Yugoslavia 683; France 437.
Magnesium metal including alloys:				
Scrap	1,746	2,558	--	West Germany 1,155; Netherlands 483.
Unwrought	1,649	1,880	841	Norway 400; Netherlands 373; France 156.
Semimanufactures	263	309	234	United Kingdom 19.
Manganese:				
Ore and concentrate	424,230	409,846	--	Republic of South Africa 188,452; Gabon 155,700; Brazil 26,539.
Oxides and hydroxides	3,219	3,082	--	Belgium-Luxembourg 1,077; Spain 718; France 457.
Metal including alloys, all forms	1,886	1,397	56	Republic of South Africa 718; France 463.
Mercury 76-pound flasks	2,321	5,120	--	Spain 2,881; Netherlands 482.
Molybdenum:				
Ore and concentrate	5,866	6,039	892	Netherlands 3,764; Belgium-Luxembourg 611.
Metal including alloys, all forms	240	163	75	Austria 47.
Nickel:				
Matte, speiss, similar materials	5,727	2,710	--	Cuba 1,180; Australia 713.
Metal including alloys:				
Scrap	314	677	36	Norway 308; Austria 49.
Unwrought	16,595	18,738	3,529	Republic of South Africa 4,081; Netherlands 3,170; Canada 2,742.
Semimanufactures	2,811	2,835	326	United Kingdom 816; West Germany 780; France 259.
Platinum-group metals including alloys, unwrought and partly wrought thousand troy ounces	580	570	3	West Germany 332; Republic of South Africa 66; Switzerland 50.
Rare-earth metals:				
Oxides and other compounds value, thousands	$966	$908	--	France $848.
Metals, all forms	117	138	--	West Germany 76; Austria 40.
Selenium, elemental	39	26	--	Japan 11.
Silicon, elemental	17,701	29,855	--	Republic of South Africa 14,450; France 9,488; Yugoslavia 2,108.
Silver metal including alloys, unwrought and partly wrought thousand troy ounces	25,068	18,782	5,993	Switzerland 3,292; West Germany 2,479; United Kingdom 1,878.
Tellurium and arsenic metals	63	57	16	Sweden 40.

COMMODITY REVIEW

METALS

Antimony.—At the Manciano Mine, owned by SAMIM, exploration continued in the San Martino sul Fiora and Salaioli concessions. At yearend, results were inconclusive. Furthermore, negative results stopped exploration for antimony near the Villasalt Mine, operated by SAMIM.

The antimony smelter at Manciano remained the only producer of antimony metal in Italy.

Iron and Steel.—Restructuring and economic difficulties were the highlights of the Italian steel industry.

During 1981, the Government of Italy through its Comitato Intra-Ministeriale per la Politica Industriale (CIPI) (Interministerial Committee for Industrial Policy) had approved restructuring of Government-owned Finsider, the largest producer of iron and steel in the country.

Three operating companies, organized according to products, Nuovo Italsider, Acciaieria Piombino, and Societa Italiana Acciai Speciali (SAIS), replaced Italsider. Nuovo Italsider, with plants at Taranto, Cornigliano, Bagnoli, and Campi, became the largest producer of pig iron, steel, and flat-rolled products in the country; Piombino, with plants at Piombino, San Giovanni Valdarno, and Marghera, became the largest producer of rails and sections in Italy; SAIS took over management of the specialty steelworks of Breda and Cogne and became the country's largest producer of specialty steels.

The economic situation of steel producers was serious, and most of the accounts closed in 1981 with large losses. The main causes for the difficulties were the high cost of credit, excessive borrowing, rising labor costs, high absenteeism, payment in revalued U.S. dollars for almost all raw materials used in the industry, increased prices for electricity, a small increase in steel prices, and payment for exports to other European Communities countries in currencies that had a fixed parity with the lira.

In April 1981, a major agreement between United States Steel Corp. and Finsider was signed. United States Steel will buy 120,000 tons per year of oilfield drill pipe through 1985, having a total value of $600 million, from Dalmine, a subsidiary of Finsider. In addition, a $400 million rolling mill for production of pipe in the United States was to be purchased in Italy. The technology for the rolling mill will be wholly Italian.

Nippon Steel Corp. and Finsider concluded an 18-month agreement on technical cooperation. The principal aim of the contract was to improve the operations at Taranto iron and steel works. About 100 professionals from Japan started to work at Taranto. During the summer of 1981, their target was to lower production costs by 8%.

Lead and Zinc.—Mines owned by SAMIM accounted for most of the lead and zinc mine production in Italy because the Salafossa Mine, operated by Pertusola, remained closed; mines owned by Piombo Zincifera Sarda were acquired by SAMIM in May 1981.

Miniera di Masua, owned by SAMIM and located in Sardinia, produced about 650,000 tons of complex lead-zinc sulfide ore from the Marx ore body. In addition, at Masua, preparation continued for production from a deeper sulfide ore body, Nebida. Exploration near the two ore bodies and in the general area of the mine have led to an increase of ore reserves, but quantities and grades were not made public. Reconstruction of the beneficiation plant at Masua started, but details were lacking.

At Mineria di Monteponi in Sardinia, owned by SAMIM, work on restructuring the mine was underway during 1981, and the new pumping station on level 200 became operational. Modernization of the flotation plant at Campo Pisano continued without interrupting production of concentrates. Monteponi and San Giovanni Mines supplied ore for the Campo Pisano plant.

At Miniera Funtana Raminosa, also a SAMIM mine in Sardinia, production stopped awaiting completion of construction of a new flotation plant.

SAMIM and Pertusola produced lead and zinc metal in Italy. About 52% of the lead and 23% of the zinc metal smelted in Italy were produced from domestic concentrates. Pertusola produced zinc at its Crotone plant. SAMIM produced zinc and lead at the Porto Vesme plant and lead at the San Garino plant, and at the Porto Marghera plant, zinc was the principal product. During 1981, at the Ponte Nossa plant, construction was completed to treat residues containing zinc and copper for recovery of

those metals.

Mercury.—At the Monte Amiata Mine, Province of Siena, owned by SAMIM, production started in 1981 after 5 years of closure. The Ministry for Industry had fixed production at 5,500 flasks per year of mercury metal.

NONMETALS

Asbestos.—The Balangero Mine, Province of Turin, owned by Amiantifera Balangero S.p.A. remained the only producer of asbestos in Italy during 1981. At the Balangero Mine, exploratory drilling was resumed to determine asbestos reserves up to a depth of 500 meters. In addition, the company improved air cleaning in its asbestos plant near the mine. Air tests made during 1981 showed two fibers per milliliter of air, which was within the limit set by Italian authorities.

Barite.—Three companies, Bariosarda Co., Edem Co., and Mineraria Baritina S.p.A., produced most of the barite in the country during 1981 from mines in Sardinia. Bariosarda was state owned, and the other two were privately owned. The largest mine was the Miniera di Barega e Mont'Ega, operated by Bariosarda Co. in Sardinia, accounting for about 30% of the country's output.

Fluorspar.—In the Gennas Tres Montes and Muscadroxiu Mines in Sardinia, owned by Mineraria Silius, work on a central shaft for both mines continued. Completion of this shaft was planned for 1984.

Potash.—During 1981, Italkali S.p.A. operated a mine at Pasquasia and a plant at Campofranco, both in Sicily. No major events related to Italy's potash industry were noted during 1981. Ore mined in Sicily was largely kainite. The latest trends in output of potash are shown in table 1.

Pyrites.—During 1981, the Gavorrano Mine, Province of Grosseto, owned by Solmine S.p.A., was closed because the reserves were exhausted.

Development of the Bocheggiano Mine, Province of Grosseto, also owned by Solmine S.p.A., continued during 1981. The mine should make up for production lost by the closure of the Gavorrano Mine. Startup was planned for 1983.

At the Niccioleta Mine, Province of Grosseto, owned by SAMIM, work continued on improving ventilation, concurrent with the introduction of diesel-powered equipment in underground workings. At yearend, three new fans were taking air out of the mine at the rate of 140 cubic meters per second.

Silica Sand.—A 100-ton-per-year silica-sand mining and processing facility was near completion at yearend 1981. The facility was located in Termoli, region of Campobasso, southern Italy, and was owned by Siro Sud S.p.A. The processing facility, with a Boxmag-Rapid H1W4 magnetic separator that had a throughput of 40 tons per hour, was expected to reduce the iron oxide content from 0.26% to 0.17%.

Talc.—Talco Graphite Valchisone S.p.A., with mines in Piedmont and Sardinia, produced more than 50% of the talc in the country. The rest was produced by a number of small operations in the Alps in central Italy.

MINERAL FUELS

Italy's new National Energy Plan was presented by the Government to the CIPI in August 1981 and was ratified by the CIPI in December 1981.

The new plan emphasized increasing the use of coal, natural gas, and nuclear power to meet growing energy demands in 1980-90, while reducing the relative share of oil from about two-thirds of total energy use in 1980 to one-half in 1990. According to the plan, 185 million tons of oil-equivalent should be used in Italy by 1990 compared with about 150 million tons in 1980.

In February, Law No. 22 expanding Italy's mandatory strategic stocks was passed after being in Parliament for over 1 year. The new law provides for the increase of Italian reserves of crude oil and its products from a 90- to 100-day supply, to be handled and financed by refinery and large storage tank owners. In addition, the bill states that operators of commercial oil storage facilities, used in internal trade, must increase their reservoir reserves from 20% to 30% of capacity.

Italy remained dependent on imports of high-grade coal, crude oil, and natural gas to meet its energy demand. Nuclear power, hydropower, and geothermal energy were the energy sources that should lower the country's dependence on imports.

Coal.—Lignite remained the only domestic solid fuel of significance as a source of energy. Two mines, Miniera Santa Barbara and Miniera Pietrafitta, both owned by the Government-owned electricity-producing Ente Nazionale Elettrica, produced all of the lignite in the country.

Work to start production in the Sulcis

Coalfield in Sardinia continued but slower than anticipated. The delay resulted from complaints by the City Hall of Porto Scuso over the location of an access road. Redesigning the road and obtaining necessary permits delayed the actual work. Activities in the Sulcis Coalfield reflect the efforts of the Italian Government to use coal, domestic and foreign, for production of energy in larger quantities than in the past.

Natural Gas.—Although gas remained the largest primary energy source produced in the country during 1981, imports of natural gas were needed to meet one-half of the country's gas demand.

Exploratory drilling led to discovery of natural gas at various locations, any of which could become commercially significant. Bonaccia, offshore Adriatic Zone B, and Falco, offshore Adriatic Zone F, appeared to be the most promising.

Italy experienced difficulties with its gas supplies during 1981. Deliveries from Libya ceased, deliveries from Algeria did not start as scheduled, and imports from the U.S.S.R. were below amounts stipulated in the contracts.

Contacts with representatives of the U.S.S.R. on Italy's purchases of natural gas from the U.S.S.R. continued during 1981. At yearend, it appeared that an agreement on delivery of 210 to 250 billion cubic feet of natural gas per year, for 25 years, at a price of about $4.65 per million British thermal units, was near conclusion.

Petroleum.—In spite of poor results in exploratory drilling, the area covered by permits for petroleum exploration increased by 14% when compared with permits granted in 1980. In addition, about 123 wells were drilled during 1981, about one-third more than that of 1980. About 20 onshore and 6 offshore rigs operated in Italy. The results of oil exploration were less successful than those for natural gas. A number of wells were positive, but only one, Vega, offshore Sicily, was thought to be of commercial value.

The petroleum refining industry had a poor year during 1981. Although Italy had the largest refining capacity in Europe, most of the refineries were obsolete. The estimated utilization of petroleum refineries was about 60% of capacity. A drop in foreign demand and internal problems of the domestic private sector were mentioned in company annual reports as the principal reasons for the lower throughput. Refineries in Sicily and Sardinia, which had a high concentration of service refineries, were affected far more than refineries in other parts of Italy because local demand could not absorb surpluses generated by low exports.

The Mineral Industry of Japan

By John C. Wu[1]

Japan's economy continued to achieve a positive growth in real gross national product (GNP). However, the 2.9% real economic growth in 1981 was less than that of 1980 and was below the 4.1% predicted by the Government. According to the Economic Planning Agency, Japan's real GNP in 1975 constant yen was 194,218.4 billion yen (U.S. $880.7 billion) in 1981 compared with 188,733.6 billion yen (U.S. $832.3 billion) in 1980.[2] The slower growth in 1981 was attributed primarily to the lower level of personal consumption expenditure, private plant and equipment investment, and private housing investment. Exports, which increased 16.4% compared with the 1980 figure, remained the source of basic strength in Japan's economy in 1981. During 1981, Japan's wholesale price index increased only 1.7%, while the consumer price index rose 4.9%. Japan's unemployment rate remained between 2.0% and 2.4% of the 56.3 million labor force.

The activities of most mining and mineral-related industries were at a relatively low level in 1981 owing to the sluggish domestic demand. Two industries, aluminum smelting and petroleum refining, were experiencing serious financial difficulties. According to Japan's Productivity Research Institute, the levels of output as measured by production index (1975=100) for all industries and selected mining and mineral-related manufacturing industries for the 1978-81 period were as follows:

Industry	1978	1979	1980	1981
All industries	122.7	132.8	142.0	146.1
Mining	105.9	101.0	99.7	96.2
Coal	100.0	92.9	94.9	93.1
Metal	99.8	86.2	80.2	80.1
Nonmetal	119.1	125.5	126.6	119.2
Crude petroleum and natural gas	104.5	95.1	86.3	81.8
Manufacturing	122.9	133.3	142.9	147.2
Iron and steel	110.1	122.6	124.8	117.4
Nonferrous metals	135.0	142.9	143.5	138.9
Stone, clay, glass products	121.0	129.0	132.3	124.1
Petroleum and coal products	104.0	106.5	101.2	95.3

Despite the worldwide economic recession, Japan's foreign trade improved substantially in 1981. Two-way merchandise trade totaled $295.3 billion in 1981 compared with $270.3 billion in 1980. Japan's merchandise trade balance swung from a deficit of $10.7 billion in 1980 to a surplus of $8.7 billion in 1981 as a result of the higher export earnings from high-value-added products such as numerically controlled machine tools, energy-efficient automobiles, electronic copiers, computers, video tape recorders, and other electronic appliances.

Following the development of heavy and chemical industries during the 1950's and 1960's and two energy crises in the 1970's, the Japanese industry began to undergo a new industrial revolution in 1980. During 1980-81, many industries directly or indirectly related to petroleum were experiencing drastic structural changes. Japan's alu-

minum industry reduced output capacity by more than 50% in 1981 because of higher energy costs and competitive foreign suppliers. The Japanese ferroalloy industry was facing the same problems and was operating at 60% capacity. Japan's cement industry had converted about 84% of the industry's energy sources from C-type fuel oil to coal. The fertilizer industry scaled down its output capacity because of the reduced exports. As a result of the depreciation of the Japanese yen and reduced oil consumption, Japan's petroleum refining industry was in a serious financial situation. The industry planned to shut down about 11% of its 5.45-million-barrel-per-day capacity and to transfer crude oil stocks from private companies to the public company, the Japan National Oil Corp.

Japan's steel and nonferrous industries, however, continued their steady increase in capital equipment investment in 1981. According to the Japan Development Bank, capital equipment investment by the steel industry increased 35% to about $3.94 billion in 1981, mainly for the purposes of increasing labor productivity, conserving energy, preventing pollution, and developing new high-value-added products. Capital equipment investment by the nonferrous metal industry rose 33.2% to about $1.1 billion in 1981, mainly for new smelting facilities for copper and titanium.

Japan's total overseas economic assistance in fiscal year (FY) 1980 totaled $6.8 billion compared with $7.6 billion in FY 1979. However, Japan's Official Development Assistance (ODA) continued to increase by 25.3% to $3,303.7 million in FY 1980, of which $1,960.8 million was for bilateral official development assistance including financial grants, technical assistance, and development lending and capital to developing countries; $1,342.9 million was for contributions to multilateral institutions. According to the Ministry of International Trade and Industry (MITI), Japan's economic assistance was provided to the development needs of the recipient countries by integrating ODA with trade and investment programs into a comprehensive development package.

In the early 1970's, Japan's expenditure for research and development (R&D) increased steadily at an annual rate of about 11%, but since 1979 the rate of increase has been about 14%. In FY 1980, Japan's total expenditure for R&D increased 14.5% and reached $23.1 billion, which was about 2% of Japan's GNP. Japan ranked second, following the United States, in the amount of R&D expenditures, and accounted for about 10% of the world's total R&D expenditures. In FY 1980, of the total R&D expenditures, about 60% was by private companies, 25.5% by universities, and 14.5% by the governmental research institutes. By source of funds, 72% was from the private sector and 28% was from the Government. By types of research for the expenditures by private companies, 75.5% was for developmental research, 5% for basic research, and 19.5% for applied research; for the expenditure by universities, 57.9% was for basic research, 35.3% for applied research, and 6.8% for developmental research; and for the expenditures by the governmental research institutes, 43.9% was for developmental research, 40.7% for applied research, and 15.4% for basic research.[3]

Japan planned to raise the level of R&D expenditures from about 2% of GNP to about 3% of GNP and to raise the proportion of R&D expenditures by the governmental research institutes in the coming years. To achieve these goals, four measures were expected to be taken: (1) to strengthen coordination among industry, university, and Government; (2) to develop the program by MITI to promote home-grown technology; (3) to train sufficient numbers of R&D personnel and to provide the environment for the full utilization of personnel; and (4) to expand international cooperation in R&D. The accelerated rate of increase in R&D expenditures over the past few years was in line with a shift of Japanese industry from heavy reliance on foreign technology to heavy investment in original invention by Japanese private companies and public institutions and is one of the most important aspects in the process of the new industrial revolution in the 1980's.

In December 1981, the Government of Japan approved a Government-supported stockpile program for chromium, cobalt, molybdenum, nickel, and tungsten for a goal of about 10 days' consumption. The Special Metal Stockpiling Association is expected to administer the program, which was scheduled to begin in July 1982. To finance the program, the association planned to borrow about $53 million from the Japanese city banks, and the Government was to provide about $2.3 million through the Metal Mining Agency of Japan for the payment of about two-thirds of the interest on the fund.[4] In FY 1980, the Government

also provided the Metallic Mineral Stockpiling Association with an $80 million loan for the stockpile program of copper, zinc, and aluminum. At the end of 1981, the Metallic Mineral Stockpiling Association held 4,781 tons of copper, 86,180 tons of zinc, and 21,990 tons of aluminum. The Government of Japan was also considering a plan to set up a 60-day stockpile program for chromium, nickel, cobalt, tungsten, molybdenum, manganese, palladium, columbium, strontium, antimony, and vanadium. The program is expected to be introduced in 1983.

PRODUCTION

Japan's domestic mine production of barite, lead, manganese, silver, and tin was at a slightly higher level than in 1980, but production of chromium, copper, gold, iron ore, molybdenum, limestone, perlite, pyrophyllite, sulfur, coal, crude oil, and natural gas declined. The continuing high cost of domestic mine production and the lower ore grades were the primary causes of the decline in most of Japan's mineral output.

Production of metals in general was at a lower level than that of 1980. The output of aluminum dropped to under 800,000 tons because of high energy costs and mounting imports. Crude steel output also dropped to about 102 million tons owing to sluggish domestic demand and reduced exports. Other metal production that suffered from lower level domestic activities, high cost of production, and/or high level of imports included cobalt, gold, ferroalloys, primary magnesium, refined nickel, selenium, tin, tungsten, and primary zinc. Production of cement and fertilizer also declined in 1981 because of sluggish domestic demand and reduced exports. However, metal production of high-purity aluminum, antimony metal, bismuth, chromium metal, refined copper, primary lead, silver, and titanium increased in 1981 owing to the growing demand from domestic markets for these metals.

Japan remained among the world's top 10 producers of aluminum, cobalt, copper, zinc, cement, and fertilizer. It dropped to third place in world steel production but maintained second place in world production of titanium sponge. Japan also was a major world producer of bismuth, indium, selenium, and tellurium metal and was the world's leading producer of iodine, lime, and magnesia.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Aug. 23, 1982.

[2]For reasons not evident in sources, these figures are reported as negative numbers. (See also footnote 3.)

[3]Sum of listed detail as reported, but adding quantity bearing footnote 2 as positive numbers. Japanese sources provide the following totals for ferroalloy output in the years indicated: 1978, 1,512,791; 1979, 1,900,974; 1980, 1,866,423; and 1981, 1,638,955. These totals represent the sum of listed detail using the quantities bearing footnote 2 as negative numbers, thereby not only omitting the footnoted numbers, but actually subtracting them from the sum of all other alloys. The reason for this procedure in source publications is not explained.

[4]Revised to zero.

[5]Includes coking coal and steam coal.

[6]Includes output from gas mines and coal mines.

[7]May include some additional unfinished oils.

TRADE

Japan's merchandise trade balance rebounded to an $8.7 billion surplus from a record high deficit of $10.7 billion in 1980. This substantial improvement in trade balance was a result of a much larger increase in export earnings compared with the increase in import bills.

Export earnings totaled $152 billion compared with $129.8 billion in 1980. The 17% increase in export earnings was contributed largely by exports of machinery and equipment, which increased to $100.2 billion in 1981 from $81.5 billion in 1980. Exports of iron and steel products increased to $16.7 billion in 1981 from $15.5 billion in 1980 despite a 4% drop in volume. Other exports of mineral products, including metal products, rose 9% to $4.3 billion, and exports of nonmetallic mineral products rose 13.9% to $2.11 billion. However, exports of fertilizers dropped 5.8% to $355 million because of lower world prices and reduced exports to China. Japan's export earnings were about 14% of its GNP in 1981 and accounted for about 8.4% of the total exports in the Western World.

Japan's total 1981 imports were $143.2 billion compared with $140.5 billion in 1980. The 2% increase was mainly due to a smaller increase in imports of mineral fuels and a substantial drop in the import price of metal ores and other raw materials. Imports of crude petroleum and refined petroleum products rose only 1.4% to $58.7 billion in 1981, mainly owing to a 10.4% drop in the import volume of crude oil. However, imports of coal rose sharply by 23.8% to $5.5 billion as a result of a slight increase in the coal price and a 13.7% increase in import volume. Imports of nonferrous metal ores dropped 19.3% to $3 billion, while imports of iron ore remained at about $3.5 million.

In 1981, the United States remained the major customer for Japanese exports. Ja-

pan's exports to the United States rose 23% to $38.6 billion, about 25.4% of Japan's total exports. Other principal customers of Japan's exports in 1981 were the Federal Republic of Germany, $6 billion; the Republic of Korea, $5.7 billion; Taiwan, $5.4 billion; Hong Kong, $5.3 billion; and China, $5.3 billion. In terms of the increase in exports in 1981, Japan's exports to Australia jumped 41% to $4.8 billion, those to Indonesia increased 19% to $4.1 billion, those to the U.S.S.R. increased 17% to $3.3 billion, and those to Singapore increased 14% to $4.5 billion.

The United States remained the principal supplier of Japanese imports in 1981. Japan's imports from the United States rose 3.6% to $25.3 billion and accounted for about 18% of Japan's total imports. Other major suppliers to Japan were Saudi Arabia, $21.5 billion; Indonesia, $13.3 billion; Australia, $7.4 billion; and China, $5.3 billion.

The United States was a major buyer of Japanese motor vehicles, steel and metal products, machinery and equipment, and nonmetallic mineral products and was a principal supplier of agricultural products, machinery and equipment, coal, chemicals, metal ores and scrap, and wood. Saudi Arabia and Indonesia remained the principal suppliers of crude oil and major purchasers of Japanese machinery and equipment as well as other manufactured consumer goods. Other major trade partners included Australia, the Federal Republic of Germany, the Republic of South Africa, Taiwan, the Republic of Korea, and China.

Quartz and quartzite	1,209	1,276	18	Saudi Arabia 364; Republic of Korea 275; China 205.
Sand excluding metal-bearing	4,667	3,738	14	Kuwait 1,230; Taiwan 927; Saudi Arabia 463.
Sulfur:				
Elemental:				
Other than colloidal	414,884	364,268	--	Republic of Korea 267,784; Taiwan 86,532.
Colloidal	221	1,029	--	Republic of Korea 768; Cuba 115.
Sulfur dioxide[4]	33	81	34	Taiwan 26; Philippines 10.
Sulfuric acid	362,387	301,751	--	Philippines 74,923; Peru 64,246; Turkey 62,855.
Talc, steatite, soapstone	1,145	1,691	16	Taiwan 619; Vietnam 352; Republic of Korea 210.
Other:				
Crude	12,335	12,080	49	Taiwan 3,329; Republic of Korea 2,915; Burma 1,133.
Slag, dross, and similar waste, not metal-bearing	528,972	417,829	1,500	Singapore 117,400; Republic of Korea 108,693; Philippines 96,497.
Oxides, hydroxides, peroxides of magnesium, strontium, barium, n.e.s	27,019	14,898	249	Poland 10,502; Philippines 2,255.
Fluorine, bromine, iodine	5,524	5,707	2,304	West Germany 847; United Kingdom 708; France 683.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	3	31	--	Taiwan 27.
Carbon black	26,883	15,941	139	Indonesia 3,240; India 1,618; China 1,534.
Coal, all grades, including briquets	59,563	70,726	--	Republic of Korea 62,161; Philippines 4,120.
Coke and semicoke thousand tons	2,081	2,330	198	Romania 415; Brazil 364; Philippines 204.
Hydrogen, helium, rare gases	1,008	680	17	Taiwan 413; Singapore 84; Malaysia 71.
Petroleum refinery products:				
Gasoline thousand 42-gallon barrels	62	56	--	Taiwan 47; Republic of Korea 8.
Kerosine do	56	25	17	Republic of Korea 8.
Distillate fuel oil do	(2)	(2)	--	Mainly to Republic of Korea.
Residual fuel oil do	452	(2)	(2)	
Lubricants do	1,889	1,909	272	Republic of Korea 671; Taiwan 302.
Other:				
Mineral jelly and wax do	554	633	8	Republic of South Africa 174; Republic of Korea 90; Taiwan 54.
Liquefied petroleum gas do	367	2	--	Burma 1.
Petroleum coke do	37	149	53	Italy 74; Netherlands 17.
Bitumen do	7	100	--	Vietnam 80.
Unspecified do	101	116	(2)	Republic of Korea 67; Taiwan 24.
Mineral tar and other coal-, petroleum-, and gas-derived crude chemicals	163,991	133,142	7,657	U.S.S.R. 45,100; Taiwan 17,711; Vietnam 8,227.

[r] Revised.

[1] Excludes exports under the Japanese-United States Mutual Defense Agreement or for account of the U.S. military forces.

[2] Less than 1/2 unit.

[3] Excludes mosaic tiles valued at $82,918,000 in 1979 and $111,235,000 in 1980.

[4] May contain some arsenic trioxide and pentoxide.

Table 3.—Japan: Imports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1979	1980	Sources, 1980	
			United States	Other (principal)

COMMODITY REVIEW

METALS

Aluminum.—In 1981, Japan's aluminum industry experienced the worst year in its history. The industry's capacity was reduced from 1.64 million tons per year in 1979 to 1.3 million tons per year in 1980. During 1981, almost every primary producer except Sumikei Aluminum Industries, Ltd., either temporarily reduced capacity or closed down its plants. As a result, primary capacity was reduced to 1.14 million tons by yearend. Annual capacity of primary aluminum in 1979-81 and capacity and output in 1981 by company and by plant are shown in table 4.[5]

Because of high energy costs, rising imports, falling domestic demand, and growing stocks, Japan's aluminum industry was forced to cut back its primary production to the 770,000-ton level in 1981. During 1981, Nippon Light Metal Co., Ltd., was operating at 77.5% of capacity, Showa Light Metal Co., Ltd., at 56.4%, Sumitomo Aluminum Smelting Co., Ltd., at 68.6%, Mitsubishi Light Metal Industries Co., Ltd., at 53.2%, Mitsui Aluminum Co., Ltd., at 71.8%, and Sumikei Aluminum at 93.9%. The industry as a whole was operating at 67.8% of capacity.

High energy costs had weakened the competitiveness of Japanese aluminum not only in the world market but also in the domestic market. Because of cheap foreign

aluminum, Japan's imports of primary aluminum surged again by 16.6% and reached another record of 980,921 tons in 1981. Imports of aluminum and aluminum alloy ingots totaled 1,129,322 tons in 1981 compared with 910,085 tons in 1980. Of the total imports in 1981, 23.6% were from the United States, 14.3% from Venezuela, 10.3% from Canada, 9.6% from New Zealand, 6.2% from Australia, 5.8% from the U.S.S.R., 5.1% from Argentina, and 25.1% from other countries.

Japan's domestic demand for primary aluminum fell further, to 1.57 million tons in 1981 from 1.64 million tons in 1980. Demand for primary aluminum from rolling mills, accounting for 76% of total consumption, dropped 6.4%, and demand from wire and cable mills dropped 10%. The decline in demand was a result of reduced manufacturing of sash, wire, and cable caused by sluggish housing construction.

Japan's primary aluminum stocks were at an alltime high of 768,166 tons at the end of 1981 compared with 470,446 tons in 1980. Aluminum stocks at producers' plants rose 32.9% to 307,760 tons, those at dealers' warehouses, 370.5% to 226,895 tons; and those at fabricators' plants, 10.9% to 211,521 tons. A stockpile of 21,990 tons held by the Japanese Light Metal Stockpiling Association was reported in 1981 for the first time since 1978.

To save Japan's aluminum industry from further deterioration, several measures were proposed by MITI and approved by the Aluminum Committee of the Industry Structure Council in October 1981. These measures included plans to curtail the industry's smelting capacity to 712,000 tons per year, to introduce a tariff quota system for imports of aluminum ingots, and to lighten electric power costs within the limits of the current power rate system. In December 1981, an understanding was obtained by MITI from the Ministry of Finance on a tariff quota system for aluminum imports. According to the plan proposed by MITI, a 9% tariff will not be imposed on aluminum ingots imported by Japanese smelters under the development-and-import scheme for 3 years beginning in April 1982. However, a 9% tariff will be imposed on aluminum ingots imported under long-term contract and on a spot basis. The aluminum ingot to be imported by Japanese smelters duty free in FY 1982 was estimated at between 400,000 and 450,000 tons. An estimated $136 million fund was to be appropriated and raised by the tax exemption in 3 years for helping the industry to slash its capacity to 700,000 tons per year.

According to industry sources, the cumulative deficit of the six primary aluminum smelters was about $450 million and the combined loan amounted to over $4.5 billion in 1981. The industry's financial difficulty was a direct result of weakened international competitiveness caused by higher energy costs. In 1981, only about 200,000 tons per year of the industry's 1.14-million-ton-per-year capacity was considered low cost and remained profitable and competitive in the world market. In an effort to reduce deficits and to survive, three measures were taken by the Japanese aluminum smelters: (1) increased investment in overseas smelting operations, (2) acceleration of the conversion of smelting energy from oil- to coal-fired generating plants, and (3) increasing the added value of aluminum products of the smelters through additional downstream fabrication.

For the past year, the Japanese major aluminum smelters had gone overseas to expand their aluminum smelting operations in New Zealand, Canada, Venezuela, the United States, Indonesia, Australia, and Brazil. A summary of these overseas smelting projects is shown in table 5.[6]

The energy source for projects in Brazil, Canada, Indonesia, New Zealand, and Venezuela will be from hydropower plants, while coal will provide the energy for the projects in Australia and the United States.

In 1982, the Asahan project in Indonesia and the Gladston project in Australia will start to operate their smelters, and the Japanese smelters will import portions of the aluminum output from these two countries duty free for 3 years.

Of the 12 smelters operated by 6 primary aluminum producers in 1981, only 2 plants were not using oil as a smelting energy source. Nippon Light Metal used hydropower at Kambara, and Mitsui Aluminum used coal at Miike, which had converted the powerplant at Omata to coal in 1980. During 1981, Sumitomo Aluminum invested over $260 million in a joint venture with Kokuriku Power Co. to build a new coal-fired powerplant for its smelter at Kikumoto, which had been shut down since 1975. Other smelters were either planning or seriously considering conversion from oil to other energy sources; e.g., coal in the short run and nuclear power in the long run.

Mitsui Aluminum reportedly succeeded in experiments with a new aluminum process that involves direct smelting of bauxite

with coking coal and chemical additives in a blast furnace at about 2,000° C. In an effort to cut down energy cost of aluminum smelting, six smelters have joined MITI in an industry-Government research program on developing the new aluminum process. According to Mitsui Aluminum, the new process could reduce the energy consumption per ton of aluminum to 10,000 kilowatt-hours from 15,000 kilowatt-hours required currently. Showa Aluminum and Mitsubishi Light Metal Industries reportedly have developed independently a new low-cost process to produce superpurity aluminum. Mitsubishi Light Metal planned to build a new production facility with the new process to produce 3,000 tons per year of superpurity aluminum (99.999%) by mid-1982, while Showa Aluminum planned to expand its pilot plant capacity from 250 to 1,000 tons per year.[7]

In becoming further vertically integrated, Nippon Light Metal had completed its entry into aluminum fabricating in 1981. Other aluminum smelters were expected to follow suit in the coming years.

Table 4.—Japan: Primary aluminum annual capacity and production

(Metric tons)

Company and plant location	Annual installed capacity		1981 shutdown capacity	1981

[1]Shut down in October 1981.

Table 5.—Japan: Overseas aluminum smelting projects

Country and project name	Annual capacity (thousand tons)	Japanese output share (thousand tons)	Status of project
New Zealand: Bluff	152	75	Completed in 1977.
Canada: Kitimat	90	45	Do.
Venezuela: Venalum	280	160	Completed in 1979.
United States: Alumax, Mount Holly, S.C.	180	45	Completed in 1980.
Indonesia: Asahan	225	170	Scheduled for partial completion in 1982.
Australia: Gladston	203	101	Scheduled for completion in 1982.
Australia: Hunter Valley	232	([1])	Scheduled for completion in 1984.
Brazil: Albras	320	160	Scheduled for partial completion in 1984.

[1]Undetermined.

Antimony.—Production of antimony was by Nihon Mining and Concentrating Co., Ltd. (metal and trioxide), Sumitomo Metal (trioxide), Hibino Metal Industries Co., Ltd. (metal and trioxide), Sankoku Refinery Co., Ltd. (metal and trioxide), and Nippon Mining (trioxide).

Japan imported 6,531 tons of antimony ores and concentrates, principally from Bolivia (87%) and China (11%) for the production of antimony metal and trioxide. Imports of 2,366 tons of antimony metal were mainly from China (95%). Japan also imported 1,048 tons of antimony trioxide, principally from China, 49%; the U.S.S.R., 28%; and the United Kingdom, 22%.

About 1,400 tons of antimony metal was consumed by the manufacturers of storage batteries, 60%; in antifriction alloys, 8%; for hard lead casting, 5%; for printing type, lead pipe and sheet, plating, and other uses, 27%. Consumption of antimony trioxide was estimated at 5,500 tons; about 85% was for the production of flame retardants, and the remaining 15% was for manufacturing glass, enamel, and other.

Cadmium and Bismuth.—Japan was the world's second largest producer of cadmium metal, following the U.S.S.R., and the fourth largest producer of bismuth metal in 1980. Cadmium was produced as a byproduct of zinc smelting, while bismuth was produced as a byproduct of lead refining. According to industry sources, the output share by producer for the two metals in 1980 was as follows in percent:[8]

Company	Output share	
	Cadmium	Bismuth
Dowa Mining Co., Ltd	15.5	23.3
Furukawa Mining Co., Ltd	—	3.0
Mitsubishi Metal Corp	18.8	11.5
Mitsui Mining and Smelting Co., Ltd.	22.5	28.2
Nippon Mining Co., Ltd	19.0	15.8
Nisso Metal Co., Ltd	2.8	--
Sumitomo Metal Smelting Co., Ltd.	9.3	7.0
Toho Zinc Co., Ltd	12.1	11.2
Total	100.0	100.0

In 1981, the production of cadmium declined slightly, reflecting the reduction in exports. About 1,000 tons of cadmium was consumed in 1981, about 46% for nickel-cadmium batteries, 31% for pigments and paints, 9% for alloys, and 14% for others. During 1981, 938 tons of cadmium metal was exported, mainly to the German Democratic Republic, 36%; the United Kingdom, 15%; Taiwan, 10%; and other East European countries, 28%.

Production of bismuth rose sharply, reflecting increased demand for the metal in both domestic and foreign markets. Domestic consumption of bismuth in 1981 was about 300 tons, of which about 31% was for metallurgical additives, 22% for ferrites, 21% for low-melting alloys, 10% for pharmaceuticals, and 16% for other. During 1981, Japan exported 252 tons of bismuth metal, principally to the U.S.S.R., the United States, the Federal Republic of Germany, Poland, and the Netherlands.

Chromium.—Domestic output of chromite ores and concentrates dropped to the 11,000-ton level in 1981, and the average chromium content of the concentrates was about 33%. Japan continued to import over 97% of its requirements for chromium. Japan imported 743,937 tons of chromium ores and concentrates from the Republic of South Africa, 47%; the Philippines, 20%; India, 19%; the U.S.S.R., 6%; Albania, 4%; and 4% from China, Vietnam, Pakistan, Turkey, Cuba, and Finland.

Consumption of chromium ores and concentrates was mainly by the iron and steel industry for the manufacture of high- and low-carbon ferrochromium. In 1981, total consumption of chromite for the production of ferroalloys was 593,888 tons compared with 798,066 tons in 1980. About 50,000 tons of chromite was also consumed by the steel producers as refractory materials, and 189,928 tons of ferrochromium was imported for the manufacture of stainless steel. The major overseas suppliers were the Republic of South Africa, 66%; Brazil, 15%; Zimbabwe, 11%; and 8% from China, India, the United States, the Philippines, Yugoslavia, Sweden, and the Federal Republic of Germany.

A relatively smaller quantity of chromium ores and concentrates was consumed by the manufacturers of chromium metal and chromium compounds. Chromium metal was produced by Toyo Soda Manufacturing Co., Ltd., and Nippon Denko Co., Ltd. The annual capacity of Toyo Soda at its Yamagata plant was expanded from 3,000 to 3,600 tons of chromium metal in October 1981. Nippon Denko's annual capacity was about 700 tons. According to industry sources, about 2,000 to 2,500 tons of high-purity chromium metal was exported, and about 1,300 tons was consumed domestically for the manufacture of superalloys, 55%; aluminum-copper alloys, 24%; welding rods, 19%; and other, 2%. Consumption of chro-

mium compounds estimated at 35,000 to 40,000 tons of sodium dichromate was mainly for metal surface treatment, 37%; paints, 22%; leathers, 19%; ceramics, 6%; and other, 16%. Exports of sodium dichromate totaled 66,193 tons in 1981, of which about 66% went to China, 11% to the Republic of Korea, 9% to Taiwan, 8% to the United States, and 6% to other countries in Southeast Asia.

Cobalt.—Production of cobalt was by Sumitomo Metal with an annual production capacity of 1,600 tons and Nippon Mining with an annual capacity of 1,200 tons. The two companies received all of their raw material from overseas. Sumitomo Metal imported mixed nickel-cobalt sulfides from Marinduque's Surigao nickel refinery of the Philippines for cobalt refining at its Niihama plant, and Nippon Mining received mixed nickel-cobalt sulfides from Greenvale of Australia for cobalt refining at its Hitachi plant.

Cobalt production dropped 16% as a result of a 21% reduction in domestic demand. Imports of 886 tons of cobalt were principally from Belgium, 28%; Zaire, 24%; the United States, 16%; and Finland, 11%.

Consumption of cobalt was for the manufacture of magnetic alloys, 30%; specialty steels (including high-speed, heat-resistant, and other alloy steels), 17%; ultra-hard alloys (cemented carbides), 10%; catalysts, 8%; and other, 31%. Stocks of cobalt at the end of 1981 were 617.5 tons in 1981 compared with 679.5 tons in 1980.

Copper.—Japan's copper mine output declined further in 1981; however, production of refined copper reached another record high. The share of imported ores and concentrates in Japan's refined copper production has increased from 82.0% in 1977 to 84.4% in 1981, while the share of domestic ore decreased from 8.9% to 4.2%.

Japan's refined copper production by sources of raw materials in 1977-81 was as follows:

Year	Share of production (percent)		
	Domestic ore	Imported ore	Scrap and others
1977	8.9	82.0	9.1
1978	5.9	83.2	10.9
1979	5.2	81.6	13.2
1980	4.8	82.9	12.3
1981	4.2	84.4	11.4

During 1981, Japan's imported ores and concentrates totaled 3,338,326 tons. The supplying countries were the Philippines, accounting for 25.8%; Canada, 23.0%; the United States, 14.6%; Papua New Guinea, 9.0%; Chile, 6.0%; Indonesia, 4.4%; Malaysia, 4.0%; Australia, 3.7%; Zaire, 3.1%; and others, 6.4%.

According to MITI's annual report, the substantial increase in imports of copper concentrate from the United States was the main contributing factor for the increase in production of refined copper in 1981. Imports of copper concentrates from the United States rose 65.5% to 488,462 tons in 1981, of which about 390,000 tons of copper concentrates containing 25% to 28% copper was supplied by Anaconda Copper Co. under a 7-year contract signed in December 1980. During 1981, Japan also imported 241,146 tons of refined copper, of which 61.0% was imported from Zambia, 15.2% from Chile, 14.5% from Peru, and 9.3% from other countries.

Japan's domestic demand for refined copper rose 2.2% to 1,354,000 tons in 1981. The increased demand was due to a 5% increase in consumption of refined copper by the manufacturers of electric wire. During 1981, about 906,700 tons was consumed by the electric wire sector, 424,900 tons by the brass mill sector, and 23,300 tons by manufacturers of cast copper alloys, coins, and others. For the past decade, as a result of the positive Government investment policy and active private investment, consumption of refined copper by the manufacturers of electric wire increased from 666,000 tons to over 900,000 tons, while consumption by brass mills increased from 255,000 tons to over 420,000 tons. The increased use of telecommunication and increased activities in electrical machinery and electrical power industries contributed to the strong growth in demand from the electric wire sector, while increased production of automobiles and electrical machinery and equipment were the major driving forces for the continuing growth in demand from the brass mill sector.

Japan's exports of refined copper were only 38,301 tons in 1981, an 81% drop from those of 1980. The importers of Japanese refined copper in 1981 were Taiwan, accounting for 36.8%; Indonesia, 22.3%; the United States, 12.8%; the Republic of Korea, 11.5%; the U.S.S.R., 10.5%; and others, 6.1%. The worldwide economic recession was the primary cause of the decline in exports.

The total stocks of refined copper at the end of 1981 declined slightly from those of

1980. Stocks at producer plants fell from 53,851 tons at the end of 1980 to 50,591 tons at the end of 1981. Stocks held by consumers (wire manufacturers and brass mills) also dropped, from 88,457 tons in 1980 to 71,481 tons in 1981; however, stocks held by dealers rose from 18,606 tons in 1980 to 40,484 tons in 1981.

During 1981, Japan's copper refining industry was operating at about 84% of its 1.25-million-ton-per-year capacity. Because of increasing imports of ores and concentrates from Anaconda, Nippon Mining Co., Ltd., and Sumitomo Metal Mining Co., Ltd., were reportedly expanding their refining capacities at Nippon Mining's Saganoseiki plant and at Sumitomo Metal's Toyo plant. Upon completion of the expansion programs by September 1982, refining capacity of Nippon Mining at Saganoseiki will be increased from 168,000 to 204,000 tons per year, and capacity at the Toyo plant of Sumitomo Metal will increase from 48,000 to 84,000 tons per year. In September 1981, Hibi Kyodo Smelting Co., Ltd., reportedly had increased its refining capacity at Tamano from 102,000 to 134,000 tons per year. The cost of this expansion program was estimated at $7.3 million.

In September 1981, Rasa Industries Co., Ltd., sold its smelter at Miyoko to Godo Shigen Sangyo. Beginning in October 1981, Godo was operating the smelter to toll smelt copper ore for Mitsui Mining and Smelting Co., Ltd., under a long-term agreement. Sumitomo Metal was planning to expand its smelting capacity of blister copper from 168,000 to 180,000 tons per year at Toyo and to expand its refining capacity from 132,000 to 153,000 tons per year at Niihama.

The Metal Mining Agency of Japan reportedly is expected to extend loans of about $9 million to China for developing the Anquin copper mine during 1982-86. The formal joint-venture agreement was signed between the two Governments in November 1981. According to the agreement, a Japanese technological assistance team is expected to arrive in China in April 1982. Exploration activities will include shaft sinking, diamond drilling, underground mapping, and data analysis. Based on preliminary exploration, the Anquin copper deposit has potential ore reserves of about 31 million tons, grading 1.34% copper.[9]

In October 1981, Japan extended a $475,800 loan to develop the Kutcho copper mine in Canada. The mine was being developed by a consortium in which Sumitomo Metal has a stake. The estimated ore reserves were 15.7 million tons, grading 1.6% copper and 2.16% zinc.

Gold and Silver.—Mine production of gold declined, while mine production of silver increased in 1981. Domestic mine output of gold supplied only about 7% of gold metal refining production, while mine output of silver supplied about 21% of silver metal refining production in 1980-81. Metal production of gold and silver was by eight companies. Their output shares for FY 1981 by company were as follows, in percent:[10]

Company	Output share	
	Gold	Silver
Dowa Mining Co., Ltd	7.7	18.0
Furukawa Mining Co., Ltd	5.1	5.2
Mitsubishi Metal Corp	32.4	19.2
Mitsui Mining and Smelting Co., Ltd	18.8	22.1
Nippon Mining Co., Ltd	21.4	15.6
Nittetsu Mining Co., Ltd	1.5	.8
Sumitomo Metal Mining Co., Ltd	12.5	11.6
Toho Zinc Co., Ltd	.6	7.5
Total	100.0	100.0

During 1981, imports of gold reached an alltime record of 5.38 million troy ounces, which was about five times that of 1980. The sharp increase in 1981 gold imports was attributable partially to the lower price of gold but was largely due to a shift of investment from savings accounts to gold hoarding by the Japanese bank depositors as an investment alternative motivated by a proposed tax bill that will prevent depositors from taking advantage of certain tax-free savings accounts in Japanese banks. The major overseas gold suppliers were the United Kingdom, 39%; Switzerland, 35%; and the U.S.S.R., 22%. Japan imported 14.3 million troy ounces of silver, mainly from Mexico, 63%; Peru, 17%; and Australia, 11%.

Demand for gold and silver by end user in 1981 remained about the same as in 1980 except that gold purchases for private hoarding increased very sharply by about 280% in 1981.

According to the Metal Mining Agency of Japan, a new gold deposit was discovered at Hishikari, Isa County of Kaogoshima, in southern Kyushu. The property is owned by Taio Mining Co., Ltd., a subsidiary of Sumitomo Metal. According to an interim report prepared by Sumitomo Metal following the agency's earlier exploration, the gold deposit is about 600 meters long from east to west and 100 to 150 meters in depth. Sumitomo

Metal was expected to spend $18 million for detailed exploration.[11]

Iron and Steel.—Japan's crude steel production fell 8.7% in 1981 from that of 1980. The total crude steel output, accounting for 14.4% of the world's total output in 1981, was the lowest since 1972, and Japan slipped back to third place in world steel production, following the U.S.S.R. and the United States. Japan's production of pig iron also dropped by 8% to just a little over 80 million tons in 1981. The cutback in production of iron and steel was due to a sharp fall in domestic demand, a slower liquidation of steel inventory, and a decrease in exports of steel in 1981.

Japan's production of crude steel was principally by five integrated steelmakers. Their combined output of crude steel accounted for 72.4% of Japan's total steel production in 1981. The crude steel production of these steelmakers and their ranking among the world's top 35 crude steel producers in 1980-81 were as follows:[12]

Company	World ranking		Output (million tons)	
	1980	1981	1980	1981
Nippon Steel Corp	1	1	32.93	29.64
Nippon Kokan K.K	3	4	16.15	14.55
Kawasaki Steel Corp	8	8	12.68	11.40
Sumitomo Metal Industries, Ltd.	7	9	12.70	11.38
Kobe Steel Ltd	18	23	7.43	6.70

The output, capacity, and capacity utilization of the iron and steel industry in 1981 are shown in table 6.

Table 6.—Japan: Output, capacity, and capacity utilization of the iron and steel industry

Facility	Number of units	Output (thousand tons)	Capacity (thousand tons)	Utilization (percent)
Production of pig iron:				
Blast furnaces	65	79,884	135,959.00	58.8
Electric furnaces	10	35	93.96	37.2
Other furnaces	2	129	191.90	67.2
Total	77	80,048	136,244.86	58.8
Production of crude steel:				
Open hearth	--	--	--	--
Basic oxygen furnaces	94	76,479	130,012.00	58.8
Ultrahigh power electric furnaces	604	25,197	28,378.37	88.8
Total	698	101,676	158,390.37	64.2

Production of pig iron by blast furnaces remained at 99.8% in 1981, while production of crude steel by basic oxygen furnaces was 75.2% and by ultra-high-power electric furnace, 24.8%. The ratio of pig iron to crude steel was 78.7% in 1981 compared with 78.1% in 1980.

In processing the crude steel, six new continuous-casting machines were added during 1981. By yearend, there were 147 continuous-casting machines operating with a capacity of 75,294,000 tons per year. The capacity utilization of continuous-casting machines by the steel mill producers was 95.4% in 1981. The percentage of continuous-casting processing of crude steel output was 70.7 in 1981 compared with 59.5 in 1980. The percentage of rolled ordinary steel was 74.8 in 1981 compared with 63.3 in 1980, while the percentage of rolled specialty steel was 49.9 in 1981 compared with 38.3 in 1980. As a result of these increases, substantial improvements in energy saving and product yield were made in 1981.

Japan's mine production of iron ore and concentrate continued to decline and remained insignificant in 1981. Almost all of the iron ore, pellets, iron sand, and ferruginous manganese ore required by the Japanese iron and steel industry were imported. Japan imported 123.4 million tons of iron ore in 1981, of which 44.5% was from Australia, 22.0% from Brazil, 12.7% from India, 5% from Chile, 4.7% from the Republic of South Africa, 3.6% from Canada, 2.9% from the Philippines, 2.2% from New Zealand, and 2.4% from other countries.

In 1981, Japan's iron and steel industry consumed 101.3 million tons of iron ore, 2.5 million tons of iron sand, 10.3 million tons of pellets, and 2.9 million tons of sinter. The industry also consumed 39.6 million tons of iron and steel scrap, 63.8 million tons of coking coal (92.7% imported), 43.8 million tons of coke, 1.4 million tons of manganese ore, 933,000 tons of ferruginous manganese ore, and 14.1 million tons of limestone. Consumption of fuel oil declined 44.2% to

16,711,000 barrels in 1981 as a result of oil-free blast furnace operations by all integrated steel mills. The industry also consumed 5,170 million cubic meters of oxygen and 68.6 billion kilowatt-hours of electricity in 1981.

Japan's iron and steel industry employed about 270,000 workers in 1981, of whom about 194,000 were production workers. The average hourly earnings of the Japanese steelworkers were $9.02 in 1981 compared with $8.13 in 1980.

Because of the decrease in demand for steel from the domestic civil engineering and construction sector caused by reduced public investment and housing starts, Japan's estimated apparent steel consumption dropped to 71 million tons of crude steel equivalent in 1981 from 79 million tons in 1980. Domestic orders for ordinary and special steel products by end use for 1980-81 were as follows in thousand tons:

End use	Ordinary steel products		Specialty steel products	
	1980	1981	1980	1981
Automobiles	9,470	8,805	1,487	1,493
Construction and repairing	14,845	13,084	441	489
Conversion and processing	3,770	3,064	2,797	2,778
Electrical machinery and equipment	2,524	2,257	73	73
Home and office appliances	752	688	199	159
Industrial machinery and equipment	2,435	2,008	1,079	1,043
Rolling stocks	245	202	69	45
Shipbuilding and marine equipment	3,802	3,896	73	77
Steel dealers	15,084	13,712	845	777
Tanks and containers	1,841	1,780	130	110
Other	350	316	85	78
Total	55,118	49,812	7,278	7,122

Japan's exports of ordinary steel dropped 2.4% to 21.5 million tons, while exports of specialty steel rose 11.7% to 4.5 million tons. Japan's exports of iron and steel products were 29.1 million tons in 1981 compared with 30.3 million tons in 1980. The 4% drop in exports was primarily caused by a 31% decline in exports to China and a significant drop in exports to Southeast Asian countries. The major importers of Japanese iron and steel products were the United States, 6.2 million tons; China, 2.2 million tons; the U.S.S.R., 2 million tons; Saudi Arabia, 1.8 million tons; the Republic of Korea, 1.6 million tons; Taiwan, 1.5 million tons; and Indonesia, 1.3 million tons. Despite a drop in the volume of exports, export earnings of iron and steel rose 6.7% to a record $17 billion in 1981, owing to the increase in the average export unit value for all steel products from $524 per ton in 1980 to $582 per ton in 1981.

During 1981, Japan's imports of iron and steel, including pig iron and ferroalloys, totaled 3.1 million tons, a 29.7% increase over those of 1980; 1.1 million tons was pig iron, 503,024 tons was ferroalloys, 1.3 million tons was ordinary steel, and 200,000 tons was other. Imports of plates and hot coil accounted for the major portion of the imported steel products with the Republic of Korea supplying over 80%.

Because of the increasing cost of production and the sluggish steel market, most of Japan's integrated steelmakers suffered losses from sales of ordinary steel products. However, the major steel producers were able to offset their deficit by the profit made from sales of seamless steel pipe and other high-value-added products such as single-surface galvanized steel sheet, electrolytic galvanized steel sheet, and zinc-nickel alloy-coated steel sheet. In an effort to overcome their financial difficulties, Japan's steelmakers planned to restructure production facilities and to develop new products such as seamless pipe, surface-treated sheets, stainless steel for extra-low-temperature service, heat-resistant steel, and electrical sheets. Japan's five integrated steelmakers invested a total of about $2.9 billion during 1981, a 43% increase over that of 1980. The bulk of the investment was in expanding seamless pipe production capacity, increasing the efficiency of existing production facilities, advancing steelmaking technology, and increasing the continuous-casting ratio.

Nippon Steel Corp. was to spend about $950 million for the expansion of its seamless pipe facility at Yawata, which was scheduled for completion by March 1983, and for a continuous-casting plant at Nagoya. Nippon Kokan K.K. was to spend about $474 million for the construction of a 600,000-ton-per-year seamless pipe facility at Keihin, which was to be completed in 1983-84, and for the expansion of its existing plant's seamless pipe capacity from 88,000 to 138,000 tons per year. Sumitomo Metal, the leading seamless pipe producer with a capacity of 135,000 tons per year, was to spend $616 million for building a new 20,000-ton-per-year seamless pipe mill at Kainan and for increasing its continuous-casting capacity. Kawasaki Steel Corp. was

to spend about $567 million for expanding its small-diameter seamless pipe capacity from 25,000 to 32,000 tons per year at Chiba by September 1981 and its medium-diameter pipe capacity from 204,000 to 384,000 tons per year by March 1982. Kobe Steel Ltd. was to spend $498 million for construction of a continuous annealing and pickling line at Kakogawa and for relining its No. 3 blast furnace and providing gas treatment facilities at Kobe.[13]

Lead and Zinc.—Japan's lead and zinc ore production was by Mitsui Mining and Smelting, Dowa Mining Co., Ltd., Syakanai Mining Co., Ltd., Hosokura Mining Co., Ltd., Toyoha Mining Co., Ltd., and Nippon Zinc Mining Co., Ltd. In 1981, domestic mine output of both lead and zinc increased slightly and supplied 21.6% of the refined lead production and 35.5% of the refined zinc production. For the past 4 years, Japan's refined lead and zinc production by sources of raw materials was as follows:[14]

Year	Production of metal (thousand tons)	Share of production (percent)		
		Ore		
		Domestic	Imported	Scrap and other
Lead:				
1978	228.4	26.0	55.5	18.5
1979	221.2	22.6	57.1	20.3
1980	220.9	22.8	56.5	20.7
1981	226.2	21.6	55.9	22.5
Zinc:				
1978	767.9	33.8	55.2	11.0
1979	789.4	30.3	56.9	12.8
1980	735.2	32.5	53.2	14.3
1981	670.2	35.5	50.4	14.1

Japan imported 255,765 tons of lead ore and concentrate containing 145,705 tons of lead metal in 1981, principally from Canada (45%), Peru (21.4%), the United States (10.4%), the Republic of South Africa (9.1%), Australia (4%), Thailand (3.9%), and the Republic of Korea (3.3%); and 887,995 tons of zinc ore and concentrate containing 429,092 tons of zinc metal mainly from Canada (31.1%), Australia (29.8%), Peru (28.8%), and North Korea (5.7%). Japan's imports of refined lead dropped 23.4% to 49,179 tons, and imports of refined zinc dropped 27.2% to 30,439 tons because of weakened domestic demand. The principal suppliers were Australia, Peru, North Korea, and Mexico for refined lead and North Korea, the Republic of Korea, and China for refined zinc.

Primary production of refined lead in 1981 was at a slightly higher level than in 1980; the eight producers were operating at about 76% of their 297,240-ton-per-year capacity. Primary production of refined zinc was at a much lower level than in 1980, and the eight producers were operating at only 65.7% of their 1,019,640-ton-per-year capacity.

Dowa Mining Co. expanded the capacity of its electrolytic lead smelter at Kosaka from 20,800 to 25,200 tons per year. Mitsui Mining and Smelting shut down its 21,600-ton-per-year electrolytic zinc smelting plant at Miike in February 1981 and planned to further scale down its 116,400-ton-per-year distillation zinc smelting plant at Miike to 58,000 tons per year. It was reported that the Miike smelter will be separated from Mitsui Mining and Smelting and will become an independent company in July 1982.

Domestic consumption of primary lead dropped 2.8% to 271,151 tons in 1981. Of the total consumption of primary lead, 44.5% was for the manufacture of storage batteries, 25.0% for inorganic chemicals, 9.3% for cable sheathing, 6.9% for pipe and sheet, and 14.3% for manufacturing solder, bearing metals, tubes, casting, plating, and other lead products. Consumption of primary zinc dropped 6.4% to 687,909 tons in 1981, mainly because of a decline in the demand for galvanized steel sheet. By end use, 39.6% was for sheet galvanizing; 16.4% for wire, tube, and general galvanizing; 17.6% for diecasting; 13.7% for brass; and 12.7% for manufacturing rolled zinc, galvanic anodes, inorganic chemicals, copper-alloy castings, and other zinc products.

During 1981, Japan exported 2,791 tons of refined lead, mainly to Taiwan (1,263 tons) and the Republic of Korea (1,005 tons), and exported 51,278 tons of refined zinc principally to the Philippines, 10,303 tons; the Republic of Korea, 8,117 tons; Taiwan, 7,904 tons; the United States, 5,850 tons; Thailand, 4,782 tons; Nigeria, 3,198 tons; and Indonesia, 3,152 tons.

Stocks of primary lead at producer plants were 15,556 tons at the end of 1981 compared with 13,081 tons for 1980. Stocks of primary zinc at producer plants were 94,324 tons at the end of 1981 compared with 108,371 tons for 1980.

According to the Metal Mining Agency of Japan, in August 1981, a new lead and zinc deposit was discovered between Tochibora and Mozumi near the Kamioka Mine in Gifu Prefecture. The property is owned by Mitsui Mining and Smelting. The estimated ore reserves were 3 to 5 million tons, averaging 18.9% lead and 14.5% zinc, as well as 2.96 troy ounces of silver per ton of ore.[15]

Magnesium.—Production of primary magnesium metal continued to drop during 1981, while production of secondary magnesium increased. The drastically reduced demand for primary magnesium from the manufacture of aluminum alloys and nodular cast iron, the high cost of energy, and the high level of stocks forced the two primary producers—Furukawa Magnesium Co. and Ube Industries, Ltd.—to cut back their production. The industry operated at about 44% of its 13,000-ton-per-year installed capacity.

Imports of magnesium metal also dropped by 12.2% to 10,952 tons in 1981. The major supplying countries were the United States, 6,927 tons; Norway, 2,517 tons; and Canada, 1,178 tons.

Consumption of primary magnesium metal in 1981 was by light metal rolling, 7,822 tons; aluminum alloys, 4,717 tons; nodular cast iron, 1,571 tons; powder, 1,055 tons; light metal casting and diecasting, 979 tons; and other, 1,902 tons. Consumption of secondary magnesium as a reducing agent for titanium and zirconium smelting totaled 31,342 tons. Exports of magnesium metal also dropped 53% to 42 tons. The major buyers of the Japanese magnesium metal were the Republic of Korea (25 tons) and Taiwan (12 tons).

Manganese.—Production of manganese ores increased 9.6%. However, over 95% of the requirement for manganese was met by imports. Japan imported about 1.5 million tons of manganese ores and concentrates principally from the Republic of South Africa, 54.6%; Australia, 28.2%; Brazil, 7.3%; and Mexico, 4.4%. Japan also imported 959,870 tons of ferruginous manganese ores and concentrates, mainly from the Republic of South Africa, 55.4%, and India, 40.7%.

The major overseas supplying companies of manganese ores and concentrates were Broken Hill Proprietary Co., Ltd., of Australia; South African Manganese, Amcor, Ltd., and Associated Manganese Mines of South Africa, Ltd., of the Republic of South Africa; and Industria e Comercio de Minerios, S.A., of Brazil.

Consumption of manganese ores and concentrates by the iron and steel industry was 980,000 tons, of which 962,084 tons was imported ore and 17,916 tons was domestic ore. Consumption of manganese ores and concentrates for the manufacture of electrolytic manganese for welding rod and chemical use and others totaled 40,004 tons, of which 23,395 tons was domestic ore and 16,609 tons was imported ore. Consumption of ferruginous manganese ores and concentrates was 707,200 tons, of which 316,077 tons was for manufacturing sinter, 216,511 tons was for making pig iron, and 174,612 tons was for manufacturing ferroalloys and steel products.

Production of manganese dioxide rose 12% in 1981. The increase in output was due to the increased capacity of Toyo Soda Industries Co., Ltd., at Hinata and the 6,000-ton-per-year capacity of the Japan Metal and Chemical Industries Co. at Takaoka stimulated by the continued growth in demand for the metal. The expansion program of Mitsui Mining and Smelting at its Takehara plant from a 19,200- to a 25,000-ton-per-year capacity was rescheduled for completion by mid-1982. Japan's annual production capacity of manganese dioxide by company and plant location was as follows in tons:[16]

Company	Location	Capacity
Daiichi Carbon Co	Yokohama	3,000
Japan Metal and Chemical Industries Co.	Takaoka	6,000
Mitsui Mining and Smelting Co., Ltd.	Takehara	19,200
Toyo Soda Industries Co., Ltd	Hinata	24,000
Total		52,200

Production of manganese metal by Chuo Denki Kagyo and Toyo Soda declined slightly in 1981. The combined output was about 44% of installed capacity of 9,600 tons per year.

Japan imported 10,872 tons of manganese dioxide ores and concentrates from Australia, 4,443 tons; Gabon, 4,200 tons; and China, 2,229 tons for the production of manganese dioxide and manganese metal.

Molybdenum.—Production of molybdenum ores and concentrates by Taenaka Mining Co. at the Higashiyama Mine was insignificant at less than 100 tons. Almost all requirements for molybdenum were met by imports. Japan imported 16,276 tons of molybdenum oxides (roasted concentrates) principally from the United States, 52.2%; Canada, 29%; and Chile, 14.8%. Imports of unroasted molybdenum ore and concentrate were only 14 tons in 1981 compared with 101 tons in 1980. Imports of molybdenum trioxide were 660 tons in 1981 compared with 826 tons in 1980. The United States remained the most important supplier of molybdenum trioxide.

Consumption of molybdenum was by briquet clinkers, about 48%; the manufacturers of ferromolybdenum, about 35%; inorganic pharmaceutical, 5%; molybdenum

metal, about 3%; and other products, 9%.

Production of ferromolybdenum dropped 30% owing to the high cost of energy and the lower level of specialty steel production. Imports of ferromolybdenum also dropped 39% to 273 tons in 1981 because of reduced demand from the specialty steel industry.

Nickel.—Production of refined nickel declined slightly. The reduced output was mainly due to an operation curtailment of Sumitomo Metal at its Niihama nickel refinery for plant remodeling. The other refined nickel producer was Nippon Mining, which operated a refinery at Hitachi. The nickel refining industry operated at about 89% of its installed capacity. The annual capacity of nickel refining in tons and its overseas sources of raw materials by company were as follows:

Company and plant	Capacity	Overseas source
Nippon Mining Co., Ltd.: Hitachi.	4,100	Mixed nickel-cobalt sulfides from Greenvale nickel-cobalt project of Metal Exploration Ltd. and Freeport-McMoran Co. of Australia.
Sumitomo Metal Mining Co., Ltd.: Niihama.	22,780	Nickel matte from P. T. International Nickel Co. of Indonesia and Western Mining Ltd. of Australia.
		Mixed nickel-cobalt sulfides from Marinduque Mining and Industrial Corp. of the Philippines.
Total	26,880	

Japan's requirements for nickel were 100% dependent on overseas sources. During 1981, Japan imported 3,462,801 tons of nickel ores and concentrates from New Caledonia, 48%; Indonesia, 33.6%; and the Philippines, 18.4%. Imports of nickel matte and speiss totaled 36,608 tons, of which 18,648 tons was from Indonesia, 15,408 tons from Australia, and 2,552 tons from New Caledonia. Japan also imported 17,732 tons of refined nickel principally from Canada, 29%; the U.S.S.R., 18%; Australia, 16%; the Philippines, 11%; the United States, 8.5%; and Zimbabwe, 6%.

Consumption of refined nickel dropped 6.6% to 34,114 tons. The reduced demand was caused mainly by a 23% drop in the manufacture of nonferrous alloys. Of the total refined nickel consumed, 38% was for the manufacture of specialty steel, 20% for plating, 17% for nonferrous alloys, 7% for magnetic materials, 7% for fabricated products, 3% for storage batteries, 1% for catalysts, and 7% for others.

The ferroalloy industry consumed about 2.4 million tons of nickel ore compared with 2.9 million tons in 1980. Production of ferronickel was by Nippon Mining at Saganoseki; Nippon Yakin Kogyo Co. at Miyazu and Toyama; Pacific Metal Co. at Hachinohe; Shimura Kako Co. at Date, Hokkaido; and Sumitomo Metal at Hyuga. Japan imported 26,493 tons of ferronickel from New Caledonia, 49%; Indonesia, 36%; Dominica, 14%; and the United States, 1%.

Selenium and Tellurium.—Japan is the world's largest producer of selenium and tellurium, accounting for 30% and 29%, respectively, in 1980. According to industry sources, the output share of selenium and tellurium by company in 1980 was as follows in percent:

Company	Output share	
	Selenium	Tellurium
Asia Bussei Zairyo	7.4	--
Mitsubishi Metal Corp.	41.2	50.2
Mitsui Metal Mining Co., Ltd.	10.0	18.9
Nippon Mining Co., Ltd.	24.1	18.5
Shinko Chemical Co., Ltd.	3.6	--
Sumitomo Metal Mining Co., Ltd.	13.7	12.4
Total	100.0	100.0

Consumption of selenium was about 200 tons, mainly by dry photocopiers, which use selenium in the light-sensitive drum. About 250 tons of selenium was exported. Consumption of tellurium was as an additive to enhance the effectiveness of free-cutting steel, as a catalyst for use in the chemical industry, as a vulcanizing agent in synthetic rubber, in tellurium-copper, and as a coloring agent for glass.

Japan also produced other metals and compounds of high purity and of significant quality by world standards. These metals included cerium, germanium, germanium oxide, indium, lanthanum oxide, silicon, tantalum, and uranium. Most of the output of these metals was from imported materials.

Titanium.—Japan remained the world's second largest titanium sponge producer. Production of titanium sponge reached another record high of 25,000 tons owing to the expanded capacity of Osaka Titanium Co., Ltd. The industry's installed annual capacity was 26,000 tons in 1980 and 27,400 tons in 1981; by early 1982, another 5,000 tons of annual capacity will be added by Osaka Titanium. The installed annual capacity of titanium sponge by company for 1981 and projected 1982 capacity was as follows in tons:[17]

Company	Location	Installed capacity	
		1981	1982
Nippon Soda Co., Ltd	Nihongi	2,200	2,200
Osaka Titanium Co., Ltd.	Amagasaki	13,200	18,200
Toho Titanium Co., Ltd.	Chigasaki	12,000	12,000
Total		27,400	32,400

Osaka Titanium and Toho Titanium Co., Ltd., produced titanium sponge by the magnesium reduction process (Kroll method), while Nippon Soda Co., Ltd., used the sodium reduction process (Hunter method). The industry operated at about 90% of its installed capacity.

Japan's requirements of titanium ores and concentrates were 100% dependent on imports. Imports of 323,057 tons of rutile and ilmenite were mainly from Malaysia, 48%; Australia, 22%; India, 17%; and Sri Lanka, 12%.

According to the Japan Titanium Society, domestic sales of titanium sponge, including internal plant consumption, surged by 31% over those of 1980 to 14,483 tons in 1981, while exports of titanium sponge rose 25% over those of 1980 to 10,005 tons in 1981. The major importing countries were the United States, 4,291 tons; the United Kingdom, 2,725 tons; and the Netherlands, 2,219 tons.

Because of the worldwide economic recession, particularly the slump in the aviation industry, Japan's titanium industry planned to cut back its output by 5% to 10% in 1982. During 1981, several importers of Japanese titanium sponge requested deferred shipments as well as a reduction in the long-term contract price. However, according to the president of Osaka Titanium, the program to boost capacity by 5,000 tons per year at the Amagasaki plant remained unchanged.

Tungsten.—Output of tungsten ores and concentrates continued to decline because of the rising cost of extraction and lower ore grades. The important producers were Kaneuchi Mining Co., Ltd., accounting for 32% of output; Awaniura Mining Co., Ltd., 25%; Yaguki Mining Co., Ltd., 16%; Tanaka Mining Co., Ltd., 14%; Chitose Mining Co., Ltd., 7%; and two small producers, 6%. In 1980-81, the requirements for tungsten ores and concentrates were 75% to 80% dependent on overseas sources, primarily the Republic of Korea, Portugal, Australia, Bolivia, and China.

Imports of tungsten ores and concentrates totaled 2,256 tons. Japan also imported 155 tons of tungsten powder and flakes mainly from the Republic of Korea (86%) and the Federal Republic of Germany (8%).

Consumption of tungsten was mainly for the manufacture of tungsten metal, 65%; calcium tungsten acid, 18%; ferrotungsten, 15%; and inorganic chemicals and other, 2%. The estimated consumption of tungsten ores and concentrates was 2,900 tons.

NONMETALS

Cement.—Production of cement continued to decline because of the reduced demand caused by the Government's policy to hold zero growth in public works projects. However, exports of cement increased to 10 million tons in 1981 from 8.7 million tons in 1980.

The industry continued its efforts to reduce the costs of production by switching its energy source from C-type fuel oil to coal. According to the Japan Cement Association, as of March 1981, 83.6% of the heat used in calcining was from coal. Among the 24 cement producers, Ube Industries, Chichibu Cement Co., and Mitsui Mining and Cement used only coal for calcination. Others had remodeled their kilns, crushers, and dryers and set up coal depots to receive and store coal for the cement plants.

In 1981, Sumitomo Cement Co., Ltd., completed a 4,800-ton-per-day kiln conversion at its Ako plant and a 2,100-ton-per-day precalcining system at its Tochigi plant. Chichibu Cement completed a 4,800-ton-per-day kiln conversion to precalcining at its Chichibu No. 1 plant and a 2,000-ton-per-day kiln conversion at Chichibu No. 2 plant. Nittetsu Cement Co., Ltd., also had completed a 2,900-ton-per-day kiln conversion at its Muroran plant. Osaka Cement Co., Ltd., was expected to install the world's largest roller mill at its Kochi plant. The new line has a clinker capacity of 7,200 tons per day and was scheduled for startup in 1982.[18]

Domestic consumption of cement remained at about the 80-million-ton level. The domestic market share by major cement producers in 1981 was Onoda Cement Co., Ltd., 16.1%; Nippon Cement Co., Ltd., 15.9%; Sumitomo Cement, 12.6%; Mitsubishi Mining and Cement, 11.5%; and 43.9% by 20 other companies. The ready-mix concrete industry remained the dominant end user, accounting for about 60% of the total demand. Other significant end users included manufacturers of cement products,

accounting for about 13.6%; public and private buildings, 3.4%; civil engineering, 2.6%; and all others, 20.4%. Exports totaled 10,011,391 tons of portland cement. The major importing countries were Saudi Arabia, 2.5 million tons; Kuwait, 2.3 million tons; Singapore, 1.4 million tons; and Taiwan, 1.1 million tons. Because of the build-up of cement output capacity in the Southeast Asian countries, future exports of cement to these developing countries were expected to decline.

Fertilizer Materials.—Production of ammonium sulfate remained at 1.8 million tons in 1981, while the output of urea continued its downward trend to 1.5 million tons in 1981. In the past year, about 80% to 90% of Japan's urea production was exported to China. Since 1979, China has emerged as one of the leading urea producers in the world and has cut back imports of urea from Japan and turned to other countries such as Kuwait and Saudi Arabia for supply. It was reported that during 1981 the price of urea from Kuwait and Saudi Arabia fell 41% to about $150 to $160 per ton, while the Japanese price was about $200 per ton.

Because of reduced exports and domestic consumption of nitrogen fertilizer, Japan continued to cut its surplus capacity. As of July 1980, 26% of ammonia production capacity and 42% of urea capacity was eliminated. During 1981, the output of urea dropped 23.5% owing to a 25.7% decline in domestic demand and a 16.5% drop in exports. Consumption of urea in Japan was for fertilizer use (266,000 tons) and industrial use (482,000 tons). In 1981, exports of urea totaled only 788,000 tons compared with 944,000 tons in 1980. Although the output of ammonium sulfate remained relatively unchanged in 1981, domestic consumption by the manufacturers of fertilizer dropped to 1.0 million tons in 1981 from 1.2 million tons in 1980 owing to bad weather and reduced exports of ammonium sulfate. As a result, stocks at the end of 1981 rose 84% to 283,000 tons.

In 1981, Japan's production of ammonium chloride was about 560,000 tons, of which 217,000 tons was for the manufacture of fertilizer, 21,000 tons was for industrial use, and about 300,000 tons was exported. The output of calcium cyanamide in 1981 was about 143,000 tons. Of the total demand, 133,000 tons was for the manufacture of fertilizer, 13,000 tons was for industrial use, and 1,000 tons was exported.

The estimated supply and demand for high-analysis fertilizer and superphosphate for FY 1981 were as follows in thousand tons:

Item	High-analysis fertilizer	Super phosphate
Stocks at the beginning	664.3	65.3
Production	2,735.7	497.9
Shipments	2,700.0	492.9
Exports	130.0	5.0
Stocks at the end	570.0	65.3

Requirements for phosphate ore were 100% dependent on imports. Japan imported about 2.3 million tons of natural calcium phosphates, natural aluminum-calcium phosphates, and apatite and phosphatic chalk. Major suppliers were the United States, 1.3 million tons; Morocco, 606,200 tons; and Jordan, 220,000 tons.

Iodine.—Japan remained the world's largest producer of iodine in 1981. Production of iodine in Japan was mainly from subsurface brine accompanied by wet-type natural gas in the southern Kanto Gasfield in Chiba, Tokyo, and Kanagawa Prefectures. The output from these areas accounted for about 80% of Japan's total output of iodine. The remaining 20% of iodine production was from the Niigata and Nakajo Gasfields in Niigata Prefecture and the Sadowara Gasfield in Miyazaki Prefecture in southern Kyushu. Southern Okinawa and Oshamanbe in southern Hokkaido were the other areas proven to have occurrences of iodine.

Annual capacity and production of iodine by company and plant location in 1980 were as follows in tons:

Company	Location (Prefecture)	Output	Capacity
Ise Chemical Industry Co	Chiba	2,174	3,000
	Niigata	651	960
	Miyazaki	146	240
Kanto Natural Gas Development Co.	Chiba	662	720
Nippon Chemical Co	do	311	360
Nippon Halogen Chemical Co.	Niigata	324	360
Nippon Natural Gas Industry Co.	Chiba	936	1,260
United Resources Industry Co.	do	1,321	1,800
Total		6,525	8,700

According to a 1976 estimate, the recoverable iodine reserves in Japan were about 10 million tons.[19]

Japan exported about 90% of its 1981 output, principally to the United States, Western European countries, and India.

Because of the increase in extraction costs caused by the dispersion of wells drilled in early 1981, the export price for iodine rose 23% to $16 per kilogram of iodine.

The first Japanese-United States joint venture project for the production of iodine from oil brine in Kingfisher County, Okla., was started in September 1981. The cost was estimated at $2.3 million, and the project was scheduled to come onstream in the second quarter of 1982 with an annual capacity of 120 to 160 tons of iodine using newly developed advanced technology. North American Brine Resources Co., the joint venture company, is owned 50% by Godoe (U.S.A.), Inc., a subsidiary of Japan's United Resources Industry Co.; 40% by Beard Oil Co. of the United States; and 10% by Inorgchem Development, Inc., a subsidiary of Japan's Mitsui and Co. (U.S.A.), Inc.[20]

Limestone.—Japan's mine production of limestone dropped slightly by 4.4% to the 177-million-ton level because of the reduced demand from cement and iron and steel industries. Japan is self-sufficient in limestone and remained a leading producer and exporter of limestone in the world. The industry employed about 9,300 workers, or about 54% of the total labor force in Japan's nonmetal mining sector in 1981. The major limestone mining companies were Ube Industrial Co., Ltd.; Mitsubishi Mining Cement Co., Ltd.; Nittetsu Mining Co., Ltd.; Todaka Mining Co., Ltd.; Onoda Cement; and Nippon Cement Co., Ltd.

Consumption of limestone was mainly by the cement industry, iron and steel industry, and civil engineering sector. Limestone consumed by major end users for 1980-81 was as follows in thousand tons:

Industry	1980	1981
Cement	104,583	98,976
Civil engineering	36,875	37,578
Iron and steel	22,205	20,274
Lime	12,211	10,707
Other	10,589	11,718
Total	186,463	179,253

Other industries consuming limestone in 1981 included soda and glass, ceramic wares, tile, inorganic chemicals, pesticides, paper manufacturing, and the manufacture of construction materials.

During 1981, Japan exported about 1.3 million tons of limestone, principally to Australia, 1.2 million tons; and Singapore, 49,200 tons.

Salt.—Salt production from evaporates was estimated at 1.0 million tons in 1981, while imports of salt were 6.5 million tons. Major overseas suppliers in 1981 were Mexico, 3.0 million tons; Australia, 2.9 million tons; and China, about 550,000 tons. Consumption of salt for general use was estimated at 1.6 million tons, and about 6.3 million tons was consumed by the manufacturers of caustic soda.

The estimated production of caustic soda by the chlor-alkali industry was about 3 million tons in 1981. During 1981, Japan imported about 53,000 tons of caustic soda in aqueous solution, principally from the Republic of Korea, 24,353 tons; and Canada, 22,800 tons. Japan also imported about 280 tons of caustic soda in solid form as follows: the United States, 125 tons; the Federal Republic of Germany, 98 tons; and Sweden, 55 tons.

Consumption of caustic soda remained at about 2.9 million tons in 1981. A total of 287,500 tons of caustic soda was exported, mainly to Australia, 251,300 tons; Thailand, 19,000 tons; and the Republic of Korea, 7,200 tons.

Sulfur.—Because of the reduced oil imports and a slowdown in petroleum refining in Japan, the output of recovered sulfur from petroleum refining declined in 1981, while domestic consumption remained at 855,000 tons. Exports of sulfur decreased owing to the tight supply situation in the domestic market. The output of sulfuric acid remained at 6.7 million tons in 1981, while domestic consumption and exports increased slightly. The demand and supply situation of sulfur and sulfuric acid for FY 1980 and FY 1981 were as follows in thousand tons:

	FY 1980[r]	FY 1981
Sulfur:		
Production	1,132	1,092
Demand:		
Sulfuric acid	568	573
Other	286	282
Exports	312	235
Sulfuric acid:		
Production	6,684	6,676
Demand:		
Fertilizer	2,072	2,087
Industrial use	4,170	4,194
Exports	352	436

[r]Revised.

The Republic of Korea and Taiwan were the major importing countries of Japanese sulfur, while Australia and the Philippines

were the major importing countries of Japanese sulfuric acid.

Other Nonmetals.—Other nonmetallic minerals produced in significant quantities included dolomite, magnesia clinker, gypsum, pyrites, and pyrophyllite. Other nonmetallics in less significant quantities were feldspar, clays, barite, and talc.

MINERAL FUELS

Coal.—Domestic production of coal declined to 17.7 million tons. The October coal mine accident at the Yubari Mine in Hokkaido, the third worst mine disaster in Japan's history, reduced coal output from the Hokkaido area. Increased imports of cheap foreign coal and the high production cost of domestic coal prevented the domestic coal producers from achieving the 20-million-ton target set by the Government's national policy in 1981.

About 20 coal companies were operating 45 coal mines, of which 30 were located in Hokkaido, 9 in Kyushu, and 6 in Honshu, the main island. Of the total coal produced in 1981, 35% was coking and 65% was steam coal. By coal district, 59.7% of the total coal output was from Hokkaido, 39.7% was from Kyushu, and 0.6% was from Honshu. During 1981, the industry employed about 18,200 coal miners, about 11,700 in Hokkaido, 6,400 in Kyushu, and 90 in Honshu. Labor productivity was about 81 tons of coal per month per miner in 1981.

Domestic coal supplied about 20% of demand for coal, which was about 97.1 million tons, and the remaining 80% was imported. Japan imported about 65 million tons of coking coal to help meet requirements of about 71 million tons. The major foreign countries supplying coking coal were Australia, 29.1 million tons; the United States, 21.5 million tons; Canada, 9.2 million tons; and the Republic of South Africa, 2.7 million tons. Because of a drastic increase in demand for steam coal to 25.5 million tons in 1981 from 17.2 million tons in 1980, imports of steam coal rose sharply to 11.8 million tons in 1981 from 5.2 million tons in 1980. This surge in demand was due to sharply increased uses in the cement and utility industries. The major foreign steam coal suppliers were Australia, 5.4 million tons; the United States, 2.1 million tons; and China, 1.2 million tons. Japan also imported 797,000 tons of anthracite from the following suppliers: China, 419,000 tons; Vietnam, 196,000 tons; and other countries, 182,000 tons.

The demand for coal rose 10% in 1981 compared with that of 1980 as a result of a sharp increase in demand from cement and utility industries, which were shifting their energy source from oil to coal. Coal demand by consuming sector and by source for 1981 was as follows:

Consuming sector	Quantity (thousand tons)	Source of coal (percent)	
		Domestic	Imports
Manufacturing:			
Coke	5,135	25.1	74.9
Cement and ceramic	10,305	24.5	75.5
Iron and steel	63,999	5.8	94.2
Other	2,269	37.4	62.6
Total	81,708	10.3	89.7
Utilities:			
Electric power	12,471	73.9	26.1
Gas	1,442	46.4	53.6
Total	13,913	71.1	28.9
Other	1,465	96.8	3.2
Grand total	97,086	20.3	79.7

Taikey Otanko was rehabilitating its coal mine in Hokkaido after a 10-year period of shutdown. The mine was scheduled to come onstream in 1983 with an annual output of about 350,000 tons of coal.

According to information provided for the 1980 World Energy Conference, Japan's coal reserves were estimated at 8,532 million tons, of which about 1,050 million tons, mostly bituminous coal, was economically recoverable.[21]

According to the latest MITI projections on the long-term energy supply and demand forecast for FY 1990, Japan's coal requirements were estimated at 153 million tons. The domestic coal supply was estimated at 18 to 20 million tons, and the remaining 133 to 135 million tons of coal requirements were to be met by imports. In an effort to secure and diversify the sources of the future coal requirements, Japan continued to seek overseas coal resources, particularly in the Western United States, Canada, and China.

In mid-1981, the Foreign Coal Problems Council, a private advisory organ of the MITI Natural Resources and Energy Agency, published an interim report in which it encouraged Japanese-United States joint development of coal resources in the Western United States.[22] During 1981, a feasibility study was conducted by the Rocky Mountain Energy Co., a subsidiary of Union Pacific Railroad Co., to develop the Coral

Canyon Mine in Wyoming as a joint-development proposal. Japan Coal Development Co. (JCDC) reportedly expressed interest in the project. Other projects reportedly have been proposed to the JCDC for the joint development of coal in Colorado and other states in western regions of the United States.

A major coal agreement was signed in early 1981 between a consortium of Japanese steel producers and two Canadian mining companies for Japan to import a total of 95 million tons of coking coal and 15 million tons of steam coal over a 15-year period from the Peace River Coalfield (new mines to be developed) in northeast British Columbia. The first delivery is expected to start in October 1983. The two Canadian mining companies involved were Denison Mines, Ltd.; and Teck Corp. Denison will supply 70 million tons of coking coal and 15 million tons of steam coal, while Teck will supply 25 million tons of coking coal.

Another coal agreement between a group of Japanese major steel producers and Manalta Coal, Ltd., of Calgary, Alberta's largest coal producer, was also signed in early 1981. The agreement calls for Manalta to supply Japanese steel producers with a total of 31.5 million tons of coking coal over a 15-year period starting in 1983 with 2.1 million tons per year. The Japanese reportedly agreed to have a 40% equity participation in the coal development. The coal mine to be developed is located in the Hinton area of Alberta.

Japan will extend about $200 million in loans for the development of coal in China. In FY 1980, about $90 million in loans was extended to three coal projects in Hebei and Shanxi Provinces and related shipping facilities in Qinhuangdao. According to an agreement signed in September 1980, China promised to export 10 million tons per year of coal to Japan starting in 1985, of which 6.5 million tons will be steam coal and 3.5 million tons will be coking coal.

A coal trade agreement between 16 Japanese companies and the Chinese Government was signed in mid-1981 for the Japanese companies to import 1.5 million tons of coking coal from China during FY 1982.

In November 1981, construction work on the coal liquefaction pilot plant was started in the Morwell district of the Latrobe Valley, about 150 kilometers southeast of Melbourne in Victoria, Australia. The brown coal liquefaction project was promoted as a national project of Japan and Australia. The total construction cost of the plant was estimated at $205 million. Japan was to provide the financing for the construction, while Australia will provide the coal, the plant site, and related facilities.

Petroleum and Natural Gas.—Japan's domestic crude oil output was equivalent to about 0.2% of its requirements for crude oil in 1981. Production of crude oil dropped 9.5% to 2.87 million barrels in 1981 compared with that of 1980. Imports of crude oil also dropped by 10.4% to 1,448 million barrels in 1981. Overall consumption of crude oil declined 9.7% to 1,327 million barrels in 1981 as a result of Japan's continuing efforts on energy conservation and shifting of energy sources from oil to coal, liquefied natural gas (LNG), and nuclear power.

Imported crude oil remained significant in Japan's overall energy supply, however, representing about 66% of the 1981 energy supply. According to MITI's latest long-term energy supply and demand forecast, the share of imported oil was to be reduced to 49.1% of total energy supply in FY 1990 from 66.4% in FY 1980. Japan's imports of crude oil were about 3,967,000 barrels per day in 1981 compared with 4,414,000 barrels per day in 1980.

By regional source, the Middle East accounted for 69% of the total imports in 1981 compared with 73.2% in 1980; Asia, 24.6% in 1981 compared with 23.4% in 1980; Latin America, 3.9% in 1981 compared with 1.8% in 1980; and Africa, 2.4% in 1981 compared with 1.5% in 1980. The major supplying countries were Saudi Arabia, 34.2% in 1981 compared with 31.6% in 1980; Indonesia, 15.7% in 1981 compared with 14.3% in 1980; the United Arab Emirates, 13.6% in both 1980 and 1981; other Middle East countries (Oman, Kuwait, Qatar, Iran, Iraq, Bahrain, and Neutral Zone), 21.2% in 1981 compared with 28.0% in 1980; and China, 4.6% in 1981 compared with 3.6% in 1980.

Two supplying countries nearly tripled their exports of crude oil to Japan in 1981: Mexico exported 74,000 barrels per day in 1981 compared with 25,000 in 1980, and Nigeria exported 21,000 barrels per day in 1981 compared with 7,000 in 1980. Three countries increased by more than 50% their exports to Japan: Egypt exported 5,000 barrels per day in 1981 versus 3,000 barrels per day in 1980, Algeria exported 46,000 barrels per day in 1981 versus 28,000 barrels per day in 1980, and Ecuador exported 26,000 barrels per day in 1981 versus 17,000 barrels per day in 1980.

According to the report released by MITI in mid-1981, Japan saved 125.8 million barrels in oil consumption in FY 1980, which represented a 10.1% drop from the FY 1979 level. Energy conservation by industry and households, shifting from oil to coal and LNG, and greater use of hydro and nuclear power were cited as the major contributing factors to the drop in oil consumption. MITI had set a goal of savings in oil consumption by another 157 million barrels for FY 1981.

Domestic production of natural gas dropped 4.3% to 74,245 million cubic feet in 1981. The output of gas from natural gasfields was 98%, and the remaining 2% was produced from oilfields and coalfields. About 75% of the country's natural gas output was from the Niigata Gasfields and 20% was from the Chiba Gasfields. The total output of natural gas accounted for about 0.6% of Japan's total energy supply in 1981.

Consumption of domestically produced natural gas was estimated at 95,400 million cubic feet in 1981. About 28.8% was consumed by the chemical industry, 21.0% by the oil and gas mining industries, 23.5% by the electric industry, 22.8% by the gas industry, 3.2% by other manufacturing industries, and 0.7% by others.

During 1981, Japan imported 16,832,000 tons of LNG as follows: Indonesia, 51%; Brunei, 31%; Abu Dhabi, 12%; and the United States, 6%. Consumption of LNG in Japan was by electric utilities, 76.4%; city gas companies, 20.3%; and the manufacturing industry, 3.3%. By 1986, Japan will import an additional 18.5 million tons of LNG from Indonesia, Malaysia, and Australia. The signed contracts for the additional LNG imports by country are as follows:[23]

Country	Shipments	
	Beginning	Million tons per year
Malaysia (Sarawak)	1983	6.0
Indonesia (Badak)	1983	3.2
Indonesia (Arun)	1984	3.3
Australia	1986	6.0

Uranium.—In August 1981, the Metal Mining Agency of Japan started construction of the world's first pilot plant to extract uranium from seawater at the town of Nio in Kagawa Prefecture on Shikoku Island. The $11 million plant was scheduled for completion in 1983 and to begin test operations in 1984. The technology of extracting uranium from seawater, which uses titanic acid absorbent, was jointly developed by the Industrial Science and Technology Agency of MITI, the Institute of Industrial Science of the University of Tokyo, and the Mitsubishi Chemical Industries Research Institute. According to the agency's plan, the pilot plant will be capable of producing 10 kilograms of uranium per year. The plant is expected to collect data for the development of full-scale extraction in the future. The operating costs were budgeted at about $7.7 million.[24]

The Mineral Industry of Kenya

By Thomas O. Glover[1]

In 1981, the growth of the mining and quarrying sector of Kenya's economy remained relatively unchanged. Although the real gross domestic product (GDP) was up approximately 2.5% at $4.3 billion,[2] the mining and quarrying sector accounted for less than 1% of GDP, or $10.8 million. The economy was very vulnerable to energy costs as the country imported the majority of its energy-producing materials. Kenya had no known resources of oil, coal, gas, or nuclear fuel. It was estimated that known hydroelectric resources will be fully developed within the next 15 or 20 years. Geothermal energy was still in its early stages of development, and the potential was estimated to be between 170 and 1,000 megawatts. Kenya's various natural resources are depleting rapidly, and with the demand for energy growing steadily owing to increased population and higher industrialization and modernization of the rural sector of the economy, the country faces a potential energy shortage that has no easy solution.

Kenya opened a major hydroelectric dam in December 1981 that was built with West European aid and designed to avert further crises such as the crippling power reductions of 1980. The powerplant is located on the Tana River, 161 kilometers northeast of Nairobi, and will produce 40 megawatts, which will be a 10% addition to Kenya's national grid. The European Economic Community, the Federal Republic of Germany, and the United Kingdom put up loans and grants of $90 million of the $110 million required for the plant. Kenya furnished the final $20 million.

Toward the end of 1980, two technical cooperation agreements were signed. The first was between the Kenyan and British Governments in which the Kenyan Mines and Geological Department and the British Institute of Geological Sciences will undertake a 4-year joint geological mapping and mineral exploration program. The project, known as the Samburu-Marsabit Geological Mapping and Mineral Exploration Project, aims at producing geological maps on the scale 1:250,000 of an area of approximately 100,000 square kilometers in north-central Kenya. A geochemical exploration program, which will contribute to the compilation of a preliminary inventory of mineral occurrences in the area, will be undertaken as well.

The second agreement was signed with the Finnish Government. In this agreement, the Mines and Geological Department of the Finnish Geological Survey will undertake a joint industrial minerals assessment program. The project aims at carrying out a countrywide assessment of industrial minerals, offering specialized services to the private sector, creating awareness of the importance of the industries that are related to industrial minerals, and eventually beginning mining and processing of the deposits.

Also toward the end of 1980, a team from the United Nations Revolving Fund for Natural Resources Exploration undertook a mineral exploration program for any economic minerals in the Lolgorien-Migori Belt on the southwestern border with Tanzania near Lake Victoria.

PRODUCTION AND TRADE

The principal mineral commodities produced continued to be soda ash and fluorspar. Soda ash was Kenya's leading mineral export, with most going to Southeast Asian countries.

Magadi Soda Co., a major foreign-exchange earner, was expanding its soda ash production capacity from 220,000 to 300,000 tons per year. Plans were under way to expand rail- and port-handling facilities to cope with the increased production. Production of fluorspar and barite decreased slightly in 1981 after a considerable increase in 1980. Most other mineral production was on a low-volume basis, with local markets predominating as the primary users. Cement capacity was increased as demand was up in the major cities. The value of gem stone exports amounted to over $18 million in foreign exchange. Active prospecting for gem stones, particularly garnet and ruby, continued in the Taita-Taveta districts.

(Metric tons unless otherwise specified)

Commodity	1979	1980	Destinations, 1980	
			United States	Other (principal)
METALS —Continued				
Magnesium metal including alloys:				
Waste and scrap	18	20	10	Italy 10.
Unwrought	--	17	--	All to Italy.
Manganese:				
Ore and concentrate kilograms	--	5	--	All to Uganda.
Oxides and hydroxides do	--	500	--	All to Burundi.
Mercury do	43	12	--	Uganda 10; Burundi 2.
Nickel metal including alloys:				
Waste and scrap	--	63	--	India 33; Belgium 30.
Semimanufactures	8,050	53	--	All to Sudan.
Platinum-group metals including alloys, unwrought and partly wrought:				
Platinum troy ounces	161	--		
Unspecified do	64	2,954	7	United Kingdom 2,947.
Silver metal including alloys:				
Waste and sweepings[2] value	$34,631	--		
Unwrought and partly wrought troy ounces	7,298	249	3	Japan 151; West Germany 95.
Tin:				
Oxides and hydroxides	500	4	--	All to Uganda.
Metal including alloys:				
Waste and scrap	1,625	22	--	All to India.
Unwrought kilograms	5,503	100	--	Do.
Semimanufactures do	66,123	10	--	All to Tanzania.
Titanium: Oxides and hydroxides	8	30	--	Uganda 17; Burundi 12; Rwanda 1.
Uranium and thorium: Compounds kilograms	--	40	--	All to Zaire.
Zinc:				
Ore and concentrate do	--	400	--	All to Burundi.
Oxides and hydroxides	30	37	--	Zambia 30; Tanzania 6.
Metal including alloys:				
Waste and scrap	185	150	--	India 135; Spain 15.
Blue powder	--	37	--	All to India.
Semimanufactures	166	1	--	Mainly to Zaire.
Other:				
Ash and residue containing nonferrous metals	580	272	--	India 245; Netherlands 15; Spain 12.
Metalloids kilograms	3,377	470	--	NA.
Metal including alloys, unwrought and waste and scrap including cermets	62	112	--	Belgium 63; India 35; West Germany 14.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Pumice, emery, corundum, etc	154	1	--	Mainly to Uganda.
Artificial: Corundum	120	--		
Dust and powder of precious and semiprecious stones	142	80	--	All to Swaziland.
Grinding and polishing wheels and stones	4	1	--	Mainly to Uganda.
Asbestos, crude	(1)	35	--	Do.
Barite and witherite	18	4,140	--	United Arab Emirates 4,114.
Boron materials:				
Borates and perborates kilograms	--	101	--	Burundi 50; Uganda 46; Rwanda 5.
Oxides and acids do	3	30	--	All to Tanzania.
Cement	526,721	530,529	--	Mauritius 175,425; Oman 94,850; Reunion 59,494.
Chalk	331	777	--	Somalia 328; Uganda 265; Yemen Arab Republic 100.
Clays and clay products:				
Crude	70	172	(1)	Zambia 140; Burundi 20.
Products:				
Nonrefractory	188	68	--	Tanzania 41; Uganda 18.
Refractory including nonclay brick	1	1	--	Mainly to Somalia.
Diamond:				
Gem, worked or partly worked, not set or strung carats	177,000	32,500	27,500	Canada 5,000.
Unsorted and unworked do	--	179,940	52,070	India 49,000; West Germany 33,600; United Kingdom 27,500.
Diatomite and other infusorial earth	296	581	--	Swaziland 430; Republic of South Africa 60; India 31.
Feldspar, leucite, nepheline, nepheline syenite	37,788	43,804	10,051	U.S.S.R. 19,100; Netherlands 11,179; Greece 3,145.

See footnotes at end of table.

(Metric tons unless otherwise specified)

Commodity	1979	1980	Destinations, 1980	
			United States	Other (principal)
NONMETALS —Continued				
Fertilizer materials:				
Manufactured:				
Nitrogenous	231	7	--	Uganda 5.
Phosphatic	42	--		
Potassic	261	3	--	Mainly to Tanzania.
Other including mixed	7	11	--	Zaire 10.
Ammonia	24	62	--	Uganda 54.
Fluorspar	21,564	56,870	--	U.S.S.R. 25,235; Netherlands 13,412; Japan 11,603.
Gypsum and plasters	270	607	--	Madagascar 600.
Lime	333	453	--	Uganda 318; Djibouti 100; Sudan 33.
Mica:				
Crude including splittings and waste kilograms	--	200	--	All to Burundi.
Worked including agglomerated splittings do	261	1,349	--	Tanzania 740; Uganda 500.
Pigments, mineral:				
Crude, natural	6	1	--	All to Netherlands.
Iron oxides, processed	(1)	1	--	All to Burundi.
Precious and semiprecious stones except diamond:				
Natural kilograms	646	1,420	531	United Kingdom 473; Thailand 156.
Synthetic and reconstituted grams	112,030	472	--	All to West Germany.
Pyrite, unroasted	--	10	--	All to Greece.
Salt and brine	150	35	--	Zambia 18; Sudan 6; Uganda 4.
Sodium and potassium compounds, n.e.s.:				
Caustic potash kilograms	28,349	37	--	Uganda 27; Rwanda 10.
Caustic soda	9,982	69	--	Burundi 40; Tanzania 20; Somalia 8.
Soda ash[3]	219,969	192,832	--	Philippines 26,965; Indonesia 22,200; Malaysia 21,500.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	3	27	--	Uganda 26.
Worked	31	1	--	Mainly to West Germany.
Dolomite, chiefly refractory-grade	205	20	--	All to Swaziland.
Gravel and crushed rock	997	700	--	All to Uganda.
Limestone excluding dimension	--	1,020	--	Uganda 1,010.
Quartz and quartzite kilograms	--	168	--	All to Uganda.
Sand excluding metal-bearing	22	34	--	France 14.
Sulfur:				
Elemental:				
Other than colloidal	5,969	3,520	--	Tanzania 3,510.
Colloidal	520	340	--	Tanzania 200; Somalia 140.
Dioxide kilograms	15,500	20	--	All to Zaire.
Sulfuric acid	92	47	--	Uganda 27; Somalia 6; Burundi 4; Sudan 4.
Other:				
Crude: Meerschaum and jet	--	10	--	All to Tanzania.
Halogens				
Oxides, hydroxides, peroxides of barium, magnesium, strontium	61	4	--	Ethiopia 3.
Slag and dross:				
From iron and steel manufactures kilograms	10	4	--	NA.
Unspecified	--	16	--	Belgium 9; United Kingdom 6.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	4	2	--	Mainly to Uganda.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	28	538	--	Burundi 420; Sudan 78; Tanzania 35.
Carbon black	1	1	--	All to Mozambique.
Hydrogen, helium, rare gases	85	100	--	Somalia 58; Uganda 10; Tanzania 7.
Petroleum and refinery products:				
Crude 42-gallon barrels	7	7	--	All to Sudan.
Refinery products:				
Gasoline:				
Aviation thousand 42-gallon barrels	941	1,696	--	NA.
Motor do	1,123	1,182	--	Uganda 777; Rwanda 204; Burundi 125.
Jet fuel do	369	516	--	Uganda 108; Rwanda 31; Comoros 27.
Kerosine do	442	440	--	Uganda 424.
Distillate fuel oil do	1,477	1,387	--	Uganda 568; Rwanda 92; Burundi 74.

See footnotes at end of table.

[2]May include oxygen and nitrogen.

COMMODITY REVIEW

METALS

Production of metallic minerals in Kenya was virtually nil. About 14,000 tons of magnetite was produced in 1981.

Steel.—A group of international interests, including Marubeni Corp. of Japan and Chandaria and Sha of India, formed the Kenya Steel Co. They planned to construct a reversing cold-rolling steel mill in Mombasa with a capacity of 100,000 tons per year of sheet steel. The mill was to be installed by the end of 1981. This was the second such mill constructed in East Africa. The first was constructed in 1978 in Tanzania.

NONMETALS

Cement.—Two cement plants were operated in 1981—the Bamburi plant of the Bamburi Cement Co., near Mombasa, with a capacity of 1.25 million tons per year, and the Athi River plant of the East African Cement Co., near Nairobi, with a capacity of 450,000 tons per year. The plants operated at 76% capacity in 1981. A third plant was being considered for western Kenya, provided sufficient raw materials are available.

The principal producer continued to experience transportation problems because of a shortage of railroad cars. The shortage has persisted since production capacity was expanded several years ago at the two cement plants to meet increased local demand. Most of the supply was destined for construction in Nairobi.

Bamburi Cement Co.'s portland cement factory in Mombasa was to begin importing coal from Swaziland to replace oil as its fuel. The move was designed to reduce production costs by one-half. An agreement had not yet been reached, but talks were taking place between factory management and the Minister of Labor in hopes of being able to substitute coal for oil by the end of 1981.

Fertilizer Materials.—National Agricultural Chemicals & Fertilizers of Kenya Ltd. has an agreement with a Netherlands company for the design and construction of Kenya's first nitrogen fertilizer project. A previous plan to erect an ammonia synthesis plant using naphtha feedstock was abandoned. Products to be produced at the Mombasa project will be nitric acid, calcium ammonium nitrate and nitrophosphate, and monoammonium and diammonium phosphate. Port facilities would be built to handle imports of ammonia and phosphoric acid. Commissioning of the facilities was scheduled for late 1981.

Soda Ash.—Magadi Soda Co., a subsidiary of Imperial Chemical Industries, Inc., of the United Kingdom, produced soda ash at Lake Magadi. Production of an estimated 250,000 tons of soda ash in 1981 was a 23% increase over 1980 production. Expansion plans call for a total capacity of 500,000 tons per year by 1983. Mining and crushing of soda ash or trona was done by a pontoon-mounted dredge. The material was pumped in slurry form, via a flexible pipe, to an onsite treatment plant. Treatment included washing, screening, dewatering, and calcination, to yield a product having a total alkalinity as Na_2CO_3 of 97.4%. Shipment from Lake Magadi was by way of a 146-kilometer branch line to the Kenya-Uganda railroad at Konza. Warehouses and a deep-water pier for bulk handling of soda ash are owned and operated by Magadi Soda Co. at Kilindini Harbor. The soda ash was shipped principally to Thailand, Indonesia, Malaysia, and Singapore.

Vermiculite.—Production of vermiculite remained nearly the same in 1981 as it was in 1980. Approximately 2,600 tons was produced. Several deposits were worked for vermiculite, with most of it being exported. The vermiculite consumed locally was used in the production of lightweight concrete products and acoustic plaster.

The open pit mine at Kenze, east of Nairobi, had reserves of 0.5 million tons of vermiculite. Crude vermiculite, crushed and screened at the minesite, was shipped to Nairobi for use in the building and construction industry.

The Wasini Mine near Lodosoit was the principal vermiculite mining operation. Reserves have not been assessed but are considered substantial. Production was by the Iwatania-Lonata Vermiculite Co. of Kenya, Ltd. Output was geared to specific customer requirements.

MINERAL FUELS

Petroleum.—Kenya was dependent upon imports of crude oil for the major portion of total energy consumed. Approximately 12% of all energy consumed in Kenya was derived internally, all of which was from hydro-

electric powerplant generation. About 4% of the total energy consumption was in the form of electricity imported from Uganda. The country's only refinery is located at Mombasa. A prefeasibility study has been made concerning the expansion of the Mombasa refinery by Shell Oil Co., but there was no action taken by yearend. This expansion would allow the refinery to convert a large portion of the residuals, now exported at lower prices, into distillates. Kenya would require fewer crude imports to produce the same amount of domestic product and could export more distilled product. The result would be a sizable foreign exchange savings.

Kenya-Cities Service, Inc., has given assurances that its company would cease operations in Kenya and that oil exploration was being done, as planned and in comformity with the agreement with the Government. A concession was acquired by Kenya-Cities Service in 1979, but only one well has been drilled to date.

The Kenyan Government, in November 1981, increased by 18% the prices oil companies will charge for all their petroleum products. The Government has also established the Kenya National Oil Corp., which will now be responsible for the purchase of all foreign oil. Kenya spent 37% of its foreign exchange currency in 1981 on oil.

The Mineral Industry of the Republic of Korea

By E. Chin[1]

Under the 5-year economic development plan, the Republic of Korea's gross national product (GNP) was to grow at an annual rate of 9.2% between 1977 and 1981. In constant 1975 prices, GNP was estimated at $30.6 billion[2] in 1981 compared with $28.6 billion in 1980, reflecting a real growth of 7%.[3] Input by sector to GNP in 1981 was as follows, in billion dollars: manufacturing, 10.5; agriculture, forestry, and fishing, 5.6; sales and services, 4.7; transport, storage, and communications, 2.6; social services, 1.9; finance and business services, 1.3; and other, 4.0.[4] Mining and quarrying accounted for only $367 million of GNP in 1981. Projected growth in 1982 was 5%, or a GNP of $32.2 billion.

Between 1974 and 1979, the South Korean currency (won) was convertible to U.S. currency at the rate of 484 won to $1.00. In January 1980, the South Korean currency was devalued by 20% and allowed to float. At yearend 1980, the rate was 659.9 won. By the end of February 1981, the won equivalence was 670.5; thereafter, the Bank of Korea posted monthly devaluations. At yearend 1981, the won conversion was 700.5, representing a devaluation of about 6% for the year.

In 1981, employment in the mining sector totaled 124,000 persons, and monthly earnings averaged about $345. Monthly earnings in metal mining were $449, followed by coal, $361, and other mining, $274. In comparison, monthly earnings in selected manufacturing sectors were petroleum refining, $691; iron and steel, $356; nonmetallic mineral products, $288; nonferrous metals, $252; and fabricated metal products, $240. The national average for monthly earnings in 1981 was $258 based on 24.8 workdays.

The wholesale price index (1975=100) for all commodities was 275.8 in 1981 compared with 225.2 in 1980. Between 1980 and 1981, the wholesale price index for producer goods increased from 235.5 to 290.1; capital goods, from 150.9 to 167.5; and consumer goods, from 221.8 to 271.9. In the same period, the export price index rose from 168.7 to 177.8, and for imports, 175.2 to 185.6. Wholesale prices for selected major commodities in 1981 were nitrogenous fertilizers, $316 per ton, up 45%; phosphatic fertilizer, $119 per ton, up 45%; compound fertilizer, $264 per ton, up 44%; cement, $63 per ton, up 19%; electrolytic copper, $2,553 per ton, up 4%; bunker C oil, $0.26 per liter, up 35%; and anthracite coal, $42 per ton, up 40%.

On August 21, 1981, the Economic Planning Board released the final version of the fifth 5-year economic and social development plan for 1982-86. The three major goals of the plan were to establish price stability, continue high economic growth, and promote equity in income distribution. Targets under the plan included real annual GNP growth of 7.6%, per capita GNP growth of 5.9%, export growth of 11.4%, imports growth of 8.4%, and an unemployment level of 4.0% by 1986.[5]

Expanding exports will continue to be the basis for growth of the economy. Exports were to rise from $21 billion at current prices in 1981 to $53 billion in 1986. To strengthen the competitiveness of export industries, the Government was to encourage joint ventures between foreign and domestic firms and to upgrade technical skills of workers by providing educational opportunities. Product quality of domestic manufacturers was to be stimulated by increasing competition through import liberalization.

Nineteen major development projects were to be expedited during the plan period. Projects related to the minerals sector were expansion of the Pohang iron and steel complex, construction of a second iron and steel complex, and construction of a lead smelter. The proposed construction of a third petrochemical complex was deleted from the final version of the economic plan.

The new economic plan placed heavy emphasis on developing ocean transport. The Korean Maritime and Port Administration (KMPA) set a target of transporting 50% of the total seaborne cargo by using national-flag vessels by 1986. Based on an estimated arrival and departure of a total of 190 million tons of seaborne cargo annually by 1986, earnings would increase to $5 billion from the current $1.8 billion. To this end, KMPA planned to increase the total tonnage of the country's vessels from 5.4 million tons presently to 12 million tons in 1986 and to increase stevedoring capabilities of seaborne cargo from 82 to 150 million tons.

To secure mineral resources, the Government relaxed measures for domestic companies investing in overseas projects. Clearance for overseas projects were to be approved only by the Ministry of Energy and Resources (MER) and the Bank of Korea. In 1981, 10 companies were involved in overseas resource development projects, 5 projects in the United States, 4 in Australia, 2 in Indonesia, and 1 in Canada for coal; 1 project each for zinc and tin in Thailand; 1 project for limestone in the Philippines, and 1 for oil in Indonesia.

Under a proposed revision of a long-term power development program, MER was planning to expand the role of nuclear energy generation, thereby reducing South Korean dependence on foreign oil. Eleven nuclear plants were to be completed by the end of 1991. The United States was to supply five reactors; France, two; Canada, one; and suppliers for the remaining three had not yet been chosen. In another measure to reduce the country's dependence on oil, 12 power generating plants were to be converted to coal and liquefied natural gas. Conversion of the plants were to be completed by 1987.

The Ministry of Construction announced the formation of the Overseas Construction Association of Korea, which will fund the development of new markets and technology to enhance South Korean construction exports. The Association plans to establish an automated data bank for information on overseas construction activities. In 1981, South Korean construction companies won a total of $13.6 billion in overseas contracts, 2.5 times the value of domestic construction projects.

PRODUCTION

Anthracite coal was the most important South Korean mine product. The country was also a significant world producer of graphite, kaolin, pyrophyllite, talc, and tungsten. Although mineral raw materials for most of the industrial needs were imported, there was limited domestic mine output of copper, lead, zinc, fluorite, gold, silver, and iron ore. Most of the country's production of primary metals, such as aluminum, copper, and iron and steel, was from imported ores and concentrates. There was no domestic production of oil and natural gas. In 1981, shipments exceeded mine production for agalmatolite, anthracite coal, fluorite, kaolin, lead, and zinc. On the other hand, production levels exceeded shipments for copper, gold, silver, iron ore, molybdenum, talc, and tungsten.

The industrial production index (1975=100) for all items in 1981 was 231.7 compared with 119.1 for mining and 238.8 for manufacturing. The 1981 index for coal mining was 113.7; for metal mining, 111.3; and for all other mining, 146.3. The 1981 index for petroleum refining was 146.9; nonmetal mineral products, 185.6; iron and steel, 382.8; nonferrous metals, 581.4; and fabricated metal products, 299.2.[e]

TRADE

During the past decade, there was a fourteenfold increase in the Republic of Korea's two-way trade. In 1970, total trade was valued at $2.8 billion, and in 1980 had reached $39.8 billion. Total trade in 1981 was $47.4 billion. Because of rapid industrialization, the Republic of Korea largely relies on imports of raw materials. For instance, imports of petroleum and petroleum products were only $0.1 billion in 1970 but grew to $7.8 billion in 1981. Receipts of other major mineral commodities included coal, iron ore, manganese, aluminum, and copper. The country's largest imports in 1981 by commodity group were as follows, in billion dollars: mineral fuels and related materials, 7.8; machinery and transportation equipment, 6.0; crude, inedible materials, 3.6; manufactured goods, 2.9; materials chiefly for food, 2.7; and chemicals and related products, 2.1. On the other hand, exports of the two largest South Korean commodity groups—manufactured goods and machinery and transport equipment—totaled $18.6 billion, or 87% of the total value of all exports.

In 1981, imports by principal supplying country were as follows, in billion dollars: Japan, 6.3; the United States, 6.0; Saudi Arabia, 3.6; Kuwait, 1.6; Australia, 0.9; the Federal Republic of Germany, 0.7; Malaysia, 0.6; and Canada, 0.5. The principal export destinations were as follows, in billion dollars: the United States, 5.7; Japan, 3.5; Hong Kong, 1.2; Saudi Arabia, 1.1; the Federal Republic of Germany, 0.8; the United Kingdom, 0.7; and Canada, 0.5.[7]

The Republic of Korea's total trade value was expected to surpass $100 billion by 1986, consisting of $53 billion in exports and $55.5 billion in imports. To accomplish this goal, the Government has scheduled ambitious development projects under the fifth 5-year economic and social development plan. More immediately, a new annual trade plan for July 1, 1982, to June 30, 1983, was to be released in May 1982 announcing the gradual liberalization of trade restrictions. The criteria for foreign trading licenses were to be eased, and current trade restrictions were to be revised in favor of minimal controls on exports and imports.

On February 1, 1982, the import deposit system required for certain commodities under deferred or installment payment terms was to be abolished. Moreover, all commodities were to be freely imported on a deferred payment basis unless included on the list of exceptions. In addition, a revised customs law was to be effective on January 1, 1982, adjusting tariff rates on 340 items.
