Minerals Yearbook

1982

Volume III

AREA REPORTS: INTERNATIONAL

Prepared by staff of the

BUREAU OF MINES

UNITED STATES DEPARTMENT OF THE INTERIOR • William P. Clark, Secretary

BUREAU OF MINES • Robert C. Horton, Director

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities to protect and conserve our land and water, energy and minerals, fish and wildlife, and park and recreation areas, and for the wise use of all those resources. The Department also has a major responsibility for American Indian reservation communities and for the people who live in Island Territories under U.S. administration.

Foreword

With the 1982 Minerals Yearbook, the Federal Government begins its second century of annual reports on the mineral industries. This edition discusses the performance of the worldwide mineral industry during 1982 and provides background information to assist in interpreting developments during the year being reviewed. Content of the individual volumes follows:

Volume I, Metals and Minerals, contains chapters on virtually all metallic and nonmetallic mineral commodities important to the U.S. economy. In addition, it includes a statistical summary chapter and a chapter on mining and quarrying trends.

Volume II, Area Reports: Domestic, contains chapters on the mineral industry of each of the 50 States, the U.S. island possessions in the Pacific Ocean and the Caribbean Sea, and the Commonwealth of Puerto Rico. This volume also has a statistical summary.

Volume III, Area Reports: International, contains the latest available mineral data on more than 130 foreign countries and discusses the importance of minerals to the economies of these nations. A separate chapter reviews the international mineral industry in general and its relationship to the world economy.

The Bureau of Mines continually strives to improve the value of its publications to its users. Therefore, constructive comments and suggestions by readers of the Yearbook will be welcomed.

Robert C. Horton, *Director*

Acknowledgments

The Bureau of Mines, in preparing volume III, utilized extensively statistics and data on mineral production, consumption, and trade provided by various foreign government mineral and statistical agencies through various official publications. The cooperation and assistance of these organizations is gratefully acknowledged. Statistical and informational material was also obtained from reports of the U.S. Department of State, from United Nations publications, and from the domestic and foreign technical and trade press. Of particular assistance were the routine and special reports submitted by the minerals, petroleum, economic, and commercial officers and other members of the Department of State. Their contributions are sincerely appreciated.

The text and tables of this volume were prepared by the staff of the Division of Foreign Data, Assistant Directorate, Minerals Information. Final correlation and checking of this volume was performed by the Division of Publication.

The regimes of some countries reviewed in this volume are not recognized by the U.S. Government. The information contained herein is technical and statistical in nature and is not construed as conflicting with or being contradictory of U.S. policies toward these countries.

Albert E. Schreck, *Chief, Division of Publication*

Contents

Minerals in the World Economy

By Charles L. Kimbell[1] and John Panulas[2]

Virtually every available measure of total world mineral industry activity demonstrated that 1982 was little, if any, better for the industry than 1981 had been. Levels of production, trade, and consumption for virtually every major commodity declined; unit prices for most commodities fell, particularly in terms of constant dollars, and as a result of cutbacks in output and lower prices, capital available for investment within the industry was reduced. These conditions, coupled with the existence of considerable idle capacity, tended to retard investment, although there was an upturn in U.S. oil industry investment overseas.

Despite the overall depressed situation of the world's mineral industry, there were indications of possible improvements in market economy countries near yearend, as output of some materials increased marginally and as prices for some mineral commodities reversed their downward trends. The downturns in total world mineral industry activity were not universal from the viewpoint of individual countries. Indeed, output of a number of commodities increased in centrally planned economy countries, and these gains were insufficient to offset declines in market economy countries, thereby sharply altering the proportion of total world output accounted for by each of these two groups of countries. There was a similar shift in consumption on a percentage basis.

International political events continued to have effects on mineral output and trade, but the influences were not so much upon worldwide levels of activity but rather upon the geographic distribution of these activities. In the Near East, the continuing war between Iran and Iraq served to curtail mineral industry activities in those nations, but there were clear signs that Iran was beginning to increase production from the much reduced levels of 1981 despite continuing hostilities.

Persistent intranational and international political problems in the Eastern Mediterranean countries of Lebanon, Syria, and Israel in 1982 undoubtedly restricted mineral activities below the levels that could have been attained were there peace in the area, but the relatively small contribution that these nations make to total world mineral supplies made the problems of this distressed area minimal to worldwide mineral industry activity.

The continued Soviet presence in Afghanistan undoubtedly had an adverse effect on mineral industry development there, but as in the Eastern Mediterranean, the impact on world mineral supplies was negligible, and the same could be said for continued internal and international strife in the Central American countries of Nicaragua, Costa Rica, Honduras, and Guatemala.

There were some allegations that the British-Argentinian confrontation over the Falkland Islands might be based in part on unproven offshore oil potential of those isolated islands, but it was apparent that far more important were the domestic and international implications to both countries of the basic principles of sovereignty. The main significance of this war to the mineral industry was in the vastly increased fuel consumption for the naval and air arms of the belligerents. If an offshore oil potential exists at all, and its existence seems purely speculative, construction of production facilities in the storm-tossed waters near the Falklands would be even more hazardous and costly than present ventures in the North Sea.

Poland's mineral industry undoubtedly suffered adversely from continued worker dissatisfaction and governmental actions, but partial recovery was evident in some industries.

Interest in a Law of the Sea Treaty in general and in seabed mining in particular remained more a subject for academic consideration through the year.

PRODUCTION

The estimated value of world crude mineral production in 1982 was $540,000 million in terms of 1978 dollars, an amount slightly below the 1981 value and 4.8% below the historical peak of 1979, as shown in the following tabulation on value of world mineral production for selected years:

Year	Billion constant 1978 dollars	
	Value of 53[1] major crude mineral commodities[2]	Value of all crude mineral commodities[3]
1950	67.8	77.2
1953	88.5	101.7
1958	113.6	136.5
1963	125.7	154.0
1968	145.6	176.5
1973	234.0	281.6
1978	478.9	539.7
1979[r]	503.1	567.0
1980[r]	489.5	551.7
1981[r]	482.3	543.6
1982	480.0	540.0

[r]Revised.

[1]The list of commodities included appears in table 3 of this chapter; one commodity covered in 1950-68 (beryl) is excluded from the 1973-81 figures, but the overall impact of this omission is regarded as insignificant.

[2]Data for all years except 1979, 1980, 1981, and 1982 are as reported in Annales des Mines, November-December 1980, p. 173; data for 1979, 1980, and 1981 are extrapolated from the 1978 Annales des Mines figures on the basis of the United Nations index of extractive industry production in the United Nations Monthly Bulletin of Statistics, May 1983, p. xiv, and that for 1982 are estimated from available quarterly data and a variety of other sources of information.

[3]Data extrapolated from values of 53 commodities to compensate for other mineral products. For details on the basis for this extrapolation, see accompanying text under "Value of World Mineral Production."

The estimate of the total world crude mineral output value for 1982 cannot be supported by available United Nations data; these data being incomplete. On the basis of published indices for total world mineral production through the first three-quarters of the year, the value of output would slightly exceed that of 1981, but it is felt that direct extrapolation using such partial data would provide an erroneous result.

The foregoing data on value of crude mineral output do not completely portray the role of the mineral industry in the world economy in that they represent only the value of crude mine output (raw material from mines, quarries, and wells) rather than the considerably enhanced value that results from beneficiation, smelting, refining, and other equivalent downstream processing. If the value added through such processing were included, a 1982 figure of $1,270,000 million (1978 dollars) could be regarded as a conservative estimate of the value of output of mineral industry plants operating from primary materials only. An additional unestimated increment should also be included for the value of those processed materials recovered from secondary sources—scrap and other reclaimed materials.

It should be stressed that crude and processed mineral commodities constitute not only the overwhelmingly dominant share of the total raw material base for all manufacturing operations but also, in the form of fertilizers, are a vital material for the agricultural sector, and the only significant source of energy for all sectors of the world's economy.

PRODUCTION INDEX PATTERNS

The following tabulation summarizes the development pattern in world mineral industry output as reflected by the United Nations indexes for extractive mineral industry components:

Year	Index numbers (1975=100)			
	Coal	Crude petroleum and natural gas	Metals	Extractive industry total
Annual averages:				
1978	100.9	116.4	100.9	112.7
1979	106.1	122.4	103.2	118.4
1980	109.2	117.1	105.1	115.2
1981	108.3	115.0	103.0	113.5
1982[1]	110.2	120.4	100.4	117.3
Quarterly results:				
1981:				
1st quarter	112.8	116.0	102.1	114.8
2d quarter	99.9	122.7	104.4	118.5
3d quarter	108.4	116.3	101.8	114.2
4th quarter	112.2	105.1	103.5	107.0
1982:				
1st quarter	112.6	108.0	102.3	109.2
2d quarter	112.7	127.0	102.5	122.7
3d quarter	105.4	126.1	96.4	120.0
4th quarter	NA	NA	NA	NA

NA Not available.
[1]Average for 1st through 3d quarters, inclusive only, and as such, probably not reflective of full-year activities.

Source: United Nations. Monthly Bulletin of Statistics. V. 37, No. 5, May 1983, p. xiv, except for 1982 annual average, which is calculated from published quarterly data as indicated.

The tabulation demonstrates that while results for the three major components were considerably different from each other through the individual quarters of 1981 and 1982; in aggregate there was a substantial downturn in 1981 and only a modest recovery during the first three-quarters of 1982, with the situation within the fourth quarter still in doubt. Information available on quantitative output of major commodities such as petroleum, coal, and iron ore among others, and upon mineral commodity prices, suggests that fourth-quarter 1982 results will prove to be lower than the average for the first three-quarters of the year, and will reduce the annual indexes to lower levels than those of 1981.

Comparison of world extractive industry production indexes in the foregoing tabulation with indexes for the processing sectors of the mineral industry that are presented in the following tabulation demonstrates that the processing sectors were even more hard hit by the 1981-82 recession than was the extractive sector, with the 1982 averages for the first three-quarters below the yearly averages for 1981 for all three sectors shown.

Year	Index numbers (1975=100)		
	Nonmetallic mineral products	Chemicals, petroleum, coal, and rubber products	Base metals
Annual averages:			
1978	117.4	125.5	115.3
1979	122.0	132.0	120.3
1980	123.1	131.6	117.2
1981	121.6	131.7	116.5
1982[1]	119.1	128.5	110.4
Quarterly results:			
1981:			
1st quarter	117.9	133.8	120.5
2d quarter	127.3	135.4	120.1
3d quarter	122.2	128.6	112.9
4th quarter	119.0	128.9	112.5
1982:			
1st quarter	115.6	130.3	115.1
2d quarter	123.1	129.7	112.8
3d quarter	118.7	125.4	103.3
4th quarter	NA	NA	NA

NA Not available.
[1]Average for 1st through 3d quarters, inclusive only, and as such, probably not reflective of full-year activities.

If fourth-quarter processing results are poorer than those for the first three-quarters, as it is expected that they will be, the overall picture for 1982 will be even poorer than that reflected by the partial figure averages.

Various world areas were far from uniform in their performance, both in mineral extraction and in mineral processing. For region-by-region details, the reader is referred to the source publication for the foregoing tabulations.

QUANTITATIVE COMMODITY OUTPUT

Total world production of 97 distinct mineral commodities and/or specific forms of mineral commodities is given in table 1 for 1978-82. Of these, only 18 registered gains in 1982 relative to the 1981 level, and the remaining 79 recorded declines. These results were far worse than those for 1980-81, when 34 registered gains and 63 recorded declines, and than those for 1979 to 1980, when 55 registered gains and 42 recorded declines. It is significant to note that of the 79 commodities with lower 1982 output than that of 1981, 53 had recorded declines between 1980 and 1981 as well, while of the 18 commodities showing increases in 1982 relative to their 1981 output level, only 9 recorded increases between 1980 and 1981 as well.

Of the 50 listed metallic commodities, only 9 were produced in greater quantities in 1982 than in 1981. The only major commodities recording increases were gold, silver, lead, and zinc, all at the mine stage of production only, and primary smelter and refined lead.

Among the 36 nonmetallic commodities listed, only 6 showed increases between 1981 and 1982, and of these 6, cement and gem and industrial diamond were the only major commodities registering increases. Cement would have declined were it not for a phenomenal 12% growth in the recorded output of China; most major producers reduced output in 1981.

Of the 11 fuel mineral commodities (excluding uranium, which is included under metals), 8 recorded declines in output levels between 1981 and 1982. The continued decline in oil and gains for natural gas and coal were notable.

No viable means exist to sum up the overall performance of the nonfuel mineral industry except on a value basis, and for these commodities, exactitudes on value on a commodity-by-commodity basis are not available for 1979-82. Among the fuel commodities, however, the overall pattern of output change can be demonstrated by United Nations data in which all fuels are reduced to a common energy equivalent basis. The following tabulation summarizes world energy commodity output for 1977-81 on this basis, with estimates for 1982:

Year	Million metric tons of standard coal equivalent[1]				
	Coal	Crude petroleum and natural gas liquids	Natural gas	Hydro and nuclear electricity	Total
1977	2,447	4,482	1,681	249	8,859
1978[r]	2,450	4,524	1,765	275	9,014
1979	[r]2,583	[r]4,718	[r]1,855	288	[r 2]9,445
1980[r]	2,621	4,495	1,874	302	9,292
1981	2,641	4,231	1,903	320	9,095
1982[e]	2,730	4,035	1,880	310	8,955

[e]Estimated. [r]Revised.

[1]Virtually all figures are revised from those published in the 1980 edition of this chapter owing to revisions made by the source agency.

[2]Data do not add to total shown because of independent rounding.

[e]Estimated. [p]Preliminary.

[1]Incorporates numerous revisions from the table corresponding to this table in previous editions of this chapter. Figures generally conform to those published in appropriate commodity chapters of volume I of the Minerals Yearbook, 1982 edition.

[2]Includes bauxite equivalent of nepheline syenite and alunite produced in the U.S.S.R. (the only producer on record of such materials as a source of aluminum).

[3]Excludes data for the United States (withheld to avoid disclosing company proprietary data).

[4]Excludes data for China (no adequate basis for estimation available).

[5]Excludes data for the U.S.S.R. (no adequate basis for estimation available).

[6]Includes all metal clearly identified as primary as well as all metal that cannot be subdivided clearly between primary and secondary (see footnote 7).

[7]Includes only that metal that is clearly identified as secondary. Some countries do not distinguish between primary and secondary, and for some of these, no basis is available for estimating the breakdown of total production. For such countries, the total has been included under primary (see footnote 6).

[8]Excludes data for the United States (withheld to avoid disclosing company proprietary data), which in previous years accounted for approximately 50% of the world total.

[9]Includes leucoxene.

[10]Comprises sulfur produced by the Frasch process plus sulfur mined in the elemental state from ores.

[11]Comprises sulfur recovered from coal gasification, metallurgical operations (except pyrite processing), natural gas, petroleum, tar sands, spent oxides, and gypsum, whether recovered in the elemental state or as a sulfur compound.

[12]Production of coke other than metallurgical by China and the U.S.S.R. is included with metallurgical coke production.

VALUE OF WORLD MINERAL PRODUCTION

The value of world crude mineral output in 1982 was estimated at $540.0 billion constant 1978 dollars as shown in a foregoing tabulation. Details on the methodology employed to prepare this estimate are summarized in the 1980 edition of this chapter, to which the reader is referred.

GEOGRAPHIC DISTRIBUTION OF WORLD MINERAL OUTPUT VALUE

Available information is inadequate to extrapolate to 1982 the 1978 data on geographic distribution of world crude mineral output published in the November-December 1980 edition of Annales des Mines. A summary of the 1978 distribution, together with comparable figures for 1973 and 1950 and additional textual comments on regional distribution of these values, was included in the 1980 edition of this chapter, and the reader is referred to this publication as well as to the original source for further detail.

COMMODITY DISTRIBUTION OF WORLD MINERAL OUTPUT VALUE

As in the case of geographic distribution of world crude mineral output value, the inadequacy of data precludes any reliable extrapolation of the various commodities' shares of the totals shown in the preceding edition of this chapter and in the source publication, Annales des Mines. The reader should refer to these publications for the data for 1978 and prior years.

TRADE

In 1981, the aggregate value of total world trade in mineral commodities totaled an estimated $765,600 million (current dollars), a 3.7% decline from the record high set in 1980 and the first decline registered in a number of years. Comparable data for 1982 were not available in time for inclusion in this chapter, but available partial information suggests a further slight decline, based on lower volumes of material moved and lower unit prices for a number of commodities. This decline would be even more significant if the computations were on the basis of constant rather than current dollars. The following tabulation summarizes the growth pattern in mineral commodity trade value for 1977-81 inclusive, as well as the share of that trade in total commodity trade:

Year	Estimated value of all mineral commodities traded (millions)	Change from previous year (percent)	Mineral commodities' share of all commodities traded (percent)
1977	$387,400	+9.7	34.4
1978	r407,500	r+5.2	31.4
1979r	581,200	+42.6	35.5
1980r	795,200	+36.8	39.9
1981	765,600	-3.7	39.1

rRevised.

Table 2, which serves as the basis for the estimates of total mineral commodity trade that appear in the foregoing tabulation, provides reported data on the value of trade in major mineral commodity groups and total commodity trade for 1977-81. Table 3 shows the percentage share of major mineral commodity groups in the aggregate for these commodities for 1977-81, and table 4 provides individual growth (or, particularly in the case of 1981, decline) rates for each of the major mineral commodity groups as well as for total commodity trade for the same 5 years. Major mineral commodity trade by region (such as tables 8-10 in the 1976 edition of this chapter provide) may be obtained for more recent years directly from the United Nations Monthly Bulletin of Statistics for May 1983.

CONSUMPTION

NONFUEL MINERAL COMMODITIES

From the viewpoint of total world consumption of mineral commodities, 1982 registered declines in virtually every commodity for which data are available. Table 5 provides statistics on iron ore, iron and steel scrap, aluminum, cadmium, copper, lead, magnesium, nickel, tin, zinc, nitrogenous fertilizers, phosphatic fertilizers, potassic fertilizers, and sulfur, and of these 14 commodities, only nitrogenous fertilizers recorded a slight increase in consumption. (Cadmium registered no decline in the table, because both years are recorded as 16,000 tons, but there was a small drop in consumption). Even for copper, phosphatic fertilizers, and potassic fertilizers, which went against the trend in 1981, registering modest consumption gains, the year 1982 was one of diminished demand.

For the two steel industry raw materials listed, the declines in consumption in 1982 were even more pronounced than those in 1981; in contrast, among nonferrous metals, all except cadmium, copper, and zinc recorded greater declines in 1981 than in 1982, reflecting possibly a somewhat stronger fourth-quarter result.

Data on nonferrous metals in table 5 is presented for the first time in this chapter distributed between market economy countries and centrally planned economy countries. This has been done not only to demonstrate the varying pattern in consumption level changes between these two distinct groups of countries, but also because the figures for the centrally planned economy countries as prepared for the source publications incorporate production figures for the U.S.S.R. that for some commodities are at considerable variance with U.S. Bureau of Mines estimates. Utilization of such figures in calculations to estimate consumption levels obviously produce results different from those that would result if Bureau of Mines figures were used. The average differences in centrally planned economy consumption that would result if Bureau of Mines production data were substituted would be as follows: aluminum—lower by 600,000 tons per year; copper—lower by 440,000 tons per year; lead—lower by 150,000 tons per year; nickel—higher by 11,000 tons per year; tin—higher by 19,000 tons per year; and zinc—lower by 200,000 tons per year. There would be no significant change in cadmium or magnesium.

Among the fertilizer nonmetals listed, the particularly poor 1982 showing demonstrated in table 5 is more a function of the years used rather than an actual vast downturn: data listed for 1981 in reality are for the last half of 1980 and the first half of 1981, and thus do not reflect the worsening of conditions in late 1981. The 1982 figures then represent the last half of 1981 and the first half of 1982, and as such do not reflect any recovery that may have begun during those months from July through December 1982. Sulfur's poor showing, on a calendar year basis, is attributed to continued economic problems within some major sulfur-consuming industries in market economy countries.

MINERAL FUEL COMMODITIES

Table 5 also includes data on mineral fuel commodity consumption, with use of each fuel expressed in terms of standard coal equivalent in order to make interfuel comparisons possible. It should be further noted that departing from practice in past issues of this chapter, estimates have been provided for the year of review, 1982 in this case. Previous editions provided information only for the year prior to the year of review. The table demonstrates the continued downturn in liquid fuel use, both quantitatively and on the basis of its share of the total, as well as a slight downturn for natural gas both quantitatively and proportionally, for the first time in several years. Solid fuels and primary electricity registered gains, but these were insufficient to offset the liquid and gaseous fuel losses.

INVESTMENT

Comprehensive world mineral industry investment data do not exist, but available figures generally point to a slightly reduced rate of investment. Data published by the U.S. Department of Commerce germane to U.S. foreign investment in 1982 showed a sharp decline in capital outlays, relative to those of 1981.

Available information on steel industry investment by Organization for Economic Cooperation and Development nations (table 6) shows a modest upturn between 1980 and 1981.

Updated information related to capital expenditures and exploration expenditures for the petroleum industry of market econo-

mies through 1981 are not yet available. For data covering the period 1976-80, the reader is referred to tables 6 and 7 of the 1981 Minerals Yearbook.

Table 7 of this chapter provides some data on U.S. direct foreign investment in mineral industry activities divided between (1) mining, smelting, and refining and (2) petroleum for 1980-82.

TRANSPORTATION

MARINE TRANSPORT

Tankers, bulk carriers, and freighters are the three classes of vessels engaged in transporting mineral commodities. The number, gross tonnage, and deadweight tonnage of these vessels, as well as similar data for other vessels of the world's merchant fleet, as reported by the U.S. Maritime Administration for 1977-78 inclusive, are given in table 8.

It should be noted that vessels in each of the three categories are not devoted wholly to mineral commodity transport. Tankers, although largely engaged in moving crude oil and refinery products, also transport liquid chemicals, wine, molasses, and whale oil. Bulk carriers move agricultural products as well as crude minerals and mineral fertilizers, while freighters, because of their great variety, can be devoted wholly to hauling mineral products or wholly to moving nonmineral goods, as well as carrying mixed mineral and nonmineral cargoes.

Unfortunately, new and revised data on total loadings and unloadings of vessels, divided between tanker-type cargo and dry cargo, such as was presented in table 10 of the previous edition of this chapter for the years 1976-80, was not available in time for inclusion in this edition. Although it is recognized that such figures on loadings and unloadings include goods other than minerals, they nevertheless serve as a reasonable measure of mineral commodity shipments, because the preponderance of total weight of all goods moved is accounted for by minerals. Some measure of the significance of mineral commodity movement to total commodity movement is apparent in data for the world's two major canals, the Panama and the Suez, but it should be noted that figures for these waterways are skewed in favor of nonmineral commodities by both waterways' inability to handle large supertankers and bulk cargo vessels engaged in ore trade. Although exact recent figures are not available, it appears likely that minerals and mineral products account for three-quarters or more of total cargo carried in any single year on a weight basis.

Update information of the geographic breakdown of loadings and unloadings of dry cargo and tanker cargo, respectively, for 1978-80, such as was shown in tables 11-12 of the previous edition of this chapter, also were not available for inclusion in this edition. Again recognizing that both tables include mineral and nonmineral goods, but also recognizing the dominance of mineral materials from the viewpoint of tonnage, the reader is referred to these tables in the 1981 chapter, for some idea of the relative importance of various world areas as origins and destinations for mineral materials.

Although physical characteristics of vessels—size, draft, age, crew requirements, type of propulsion systems, etc.—as well as fuel costs have an undeniable influence on shipping industry performance, problems of the changes in the quantity and type of material being moved also significantly affect the shipping sector of the world economy. Therefore, before detailing changes in composition of the merchant fleet that serves the mineral industry, some observations on major mineral cargoes seem in order.

First in importance because of the volume of material moved was oil. Reflecting a continuing slump that began in 1980, shipments of crude oil and oil products declined 13% from the 1981 level of 1,445 million tons to a level of 1,258 million tons in 1982. Although economic recession and relatively low fuel oil contributed to the reduced demand for seaborne oil transportation, two other factors also exacerbated the problem. The first was the larger shipments of short-haul crude internationally. Of particular significance were the United States purchases of large quantities of Mexican and North Sea crudes in lieu of the higher priced long-haul crudes produced in the Persian Gulf region. The second was the increase in throughput to full capacity at the Ras Tanura-Yanbu (Saudi Arabia) and SUMED (Egypt) pipelines.

Another mineral commodity of considerable importance to seaborne transport was coal, whose shipments fell from 210 million tons in 1981 to 202 million tons (144 million

tons of metallurgical coal and 58 million tons of steam coal) in 1982. In terms of steam coal trade, the United States, Australia, Canada, the Republic of South Africa, and Poland accounted for 86% of exports in 1982. Of this amount, Poland's share was considerable and reflected an increase in its portion of the steam coal market that resulted from cutting steam coal prices to levels below those of the United States and the Republic of South Africa. Consequently, the United States shipped 6 million tons of steam coal less than in 1981, thereby reversing a growth trend in coal exports, and the Republic of South Africa, which has experienced a decline in coal exports in recent years, saw a 2-million-ton reduction in its coal exports. Coal outflows from Australia, Canada, and the U.S.S.R. remained, roughly, at 1981 levels.

On the import side, Japan continued to rank first among the world's coal importers, taking 3.4% more coal in 1982 than in 1981. Responsible for this growth was an increase in the volume of steam coal imported. Australia was Japan's chief coal supplier and was followed by the United States, Canada, and the Republic of South Africa. The other major coal importers were France, Italy, and Canada.

The increasing volume of coal traded over long distances, in 1982, required the use of bulk carriers on the order of 40,000 deadweight tons to an extent that those vessels accounted for 70% of the seaborne coal trade. The remaining 30% were vessels of over 100,000 deadweight tons, used largely in short-haul European movements.

Iron ore ranked first among nonfuel minerals traded, posting total shipments of 272 million tons. However, this amounted to a 31-million-ton decrease from that of 1981, owing primarily to a decline in iron ore demand resulting from reduced steel output. Average haul length, on the other hand, increased from 7,984 ton-kilometers in 1981 to 8,493 ton-kilometers in 1982, a direct effect of more numerous iron ore shipments from Brazil to Japan. Approximately two-thirds of total seaborne iron ore cargoes were transported in bulk carriers of 100,000 deadweight tons, serving the long-haul trades from Australia, South America, and the Republic of South Africa to Europe and Japan. Less than 15% of the total was moved in vessels below 60,000 deadweight tons.

The seaborne bauxite-alumina trades were adversely affected by plant closures in the Federal Republic of Germany, the United States, and Japan by output reductions and by integration of operations, from bauxite mining to aluminum metal production, on the part of developing nations. This was reflected in the 5-million-ton decline in bauxite-alumina shipments, from about 46 million tons in 1981 to roughly 41 million tons in 1982. The preponderance of this total was moved in the short-haul Caribbean-U.S. trades and, consequently, average haul-length remained at its 1981 level of 6,118 ton-kilometers. Approximately 25% was shipped along the long-haul routes from Australia to North America and Europe. Of the total quantity of bauxite-alumina transported, 40% was moved by vessels above 40,000 deadweight tons, 22% by vessels between 40,000 to 60,000 deadweight tons, and 18% by vessels in the 60,000- to 80,000-deadweight-ton category.

Shipments of phosphate rock declined from 41 million tons in 1981 to 39 million tons in 1982. In large measure, reduced phosphate rock exports from the United States and Morocco were the cause of the decrease. Of the cargoes moved, 41% originated from North Africa, of which Morocco's outflows amounted to 36%, 22% from the United States, 16% from the Near East, 8% from the Pacific Islands, and about 7% from West Africa. On the import side, Western Europe took approximately 45% of the total shipped and Eastern Europe took approximately 20%. Of this amount, about 50% was provided by North American producers and about 20% was provided by those of the Near East. Asian imports increased slightly and were chiefly supplied by Jordan. With regard to Latin American imports, it should be noted that Brazil's phosphate rock intake fell from 800,000 tons in 1980 to 400,000 tons in 1982. That precipitous drop impacted most negatively on Morocco, Brazil's principal source of phosphate rock. In terms of haul-length, the average amounted to 5,313 ton-kilometers and the vast majority of vessels employed in the shipment of phosphate rock were of the 40,000-deadweight-ton class.

Bulk Carriers.—In 1981, the world's bulk carrier fleet increased by 189 vessels, compared with an 84-vessel increase in 1980. The 1981 growth represented a 3.9% gain on the basis of number of vessels. There was a very small increase in the average gross tonnage and deadweight tonnage of such

vessels for a second year. The average bulk carriers grossed 22,422 tons and had a deadweight tonnage of 38,975, compared with 1980 figures of 22,286 and 38,622, respectively. The following tabulation shows the distribution of the world's bulk carrier fleet by country of registry for 1981 (it should be noted that the tabulation corresponding to this one in the 1981 edition of this chapter was erroneously captioned as showing 1979 data, when in reality it covered 1980 data):

Country	Number of vessels	Deadweight tonnage (thousand tons)
Liberia	859	42,706
Greece	955	30,843
Japan	504	22,579
Panama	505	14,745
Norway	150	10,472
United Kingdom	198	10,323
Italy	134	6,606
India	105	4,486
Korea, Republic of	134	3,762
Brazil	63	3,719
China	115	3,691
U.S.S.R.	163	3,323
Singapore	77	2,842
France	45	2,645
Germany, Federal Republic of	44	2,537
Spain	71	2,213
Poland	81	2,022
Australia	33	1,650
Belgium	30	1,577
Yugoslavia	51	1,543
Philippines	43	1,447
Romania	44	1,237
Turkey	28	1,004
Netherlands	25	876
Sweden	22	728
Other	508	14,792
Total	4,987	194,368

Freighters.—In 1981, the world's freighter fleet decreased by 41 vessels, a 0.2% decrease. In terms of total gross tonnage and deadweight tonnage, there were 1.9% and 0.2% increases, respectively, over the 1980 levels. The average freighter in 1981 had a gross weight of 6,488 tons (6,367 tons in 1980) and a deadweight tonnage of 8,529 tons (8,514 tons in 1980), a modest increase when the number of vessels involved is considered. The following tabulation shows the distribution of the world's freighter fleet by country of registry for 1981 (the tabulation corresponding to this one in the 1981 edition of this chapter was erroneously captioned as showing 1979 data, when in reality it covered 1980 data):

Country	Number of vessels	Deadweight tonnage (thousand tons)
Panama	1,849	14,669
Greece	1,449	14,550
U.S.S.R.	1,785	11,136
United States	457	6,701
Japan	707	6,631
Liberia	509	5,692
China	529	5,357
United Kingdom	375	4,107
Singapore	400	3,781
Germany, Federal Republic of	314	3,256
India	231	2,862
Netherlands	351	2,470
France	161	1,985
Norway	173	1,976
Yugoslavia	188	1,771
Cyprus	315	1,758
Korea, Republic of	250	1,741
Poland	217	1,722
Denmark	152	1,669
Other	3,789	29,285
Total	14,201	123,119

Tankers.—In 1981, the world's tanker fleet was 158 vessels greater than that of 1980. The average vessel's gross tonnage declined from 34,308 tons in 1980 to 33,451 tons in 1981, and deadweight tonnage similarly declined, from 64,626 tons in 1980 to 62,795 tons in 1981.

The following tabulation distributes the world's tanker fleet by country of registry for 1981 (the tabulation corresponding to this one in the 1981 edition of this chapter was erroneously captioned as showing 1979 data, when in reality it covered 1980 data):

Country	Number of vessels	Deadweight tonnage (thousand tons)
Liberia	845	97,671
Japan	551	33,947
Greece	444	29,094
Norway	257	26,299
United Kingdom	344	22,649
United States	314	16,670
Panama	341	16,231
France	109	13,881
Spain	121	8,790
Italy	229	8,268
U.S.S.R.	452	7,303
Singapore	107	5,293
Denmark	70	5,019
Germany, Federal Republic of	79	4,988
Saudi Arabia	58	4,953
Netherlands	66	4,400
Sweden	72	3,208
Brazil	67	3,201
Other	991	34,574
Total	5,517	346,439

Considering the world's tanker fleet as a whole, there have been some modest changes in the share of the total accounted for by vessels of different size groups over the 5 years, 1978-82, as shown in the following tabulation, based on data published on page 24 in the British Petroleum Co. Ltd. annual publication, BP Statistical Review of the World Oil Industry, 1982:

Size group (deadweight tons)	Percent of total		
	1978	1980	1982
10,000-25,000	4.5	4.3	4.4
25,000-45,000	7.5	7.6	9.0
45,000-65,000	4.9	4.9	5.3
65,000-125,000	15.5	16.2	17.1
125,000-205,000	10.1	10.2	9.9
205,000-285,000	43.4	42.8	39.0
285,000 and over	14.1	14.0	15.3

OCEAN FREIGHT RATES

In 1982, as in 1981, ocean freight rates continued to fall. Tanker rates declined as a result of reduced oil consumption which, in turn, caused cutbacks in oil shipments and a concomitant oversupply of tankers.

Dry cargo rates also fell, the consequence of two factors related directly to the global economic recession. First, steel output dropped considerably and, in turn, demand for iron ore and coal and for the vessels needed to move these commodities also diminished. Second, within this climate of slackened demand for seaborne transportation, the global fleet of bulk and ore carriers expanded by 5.7%. Apparently, deliveries on ships were made on orders that did not anticipate the depressed market conditions of 1982.

PANAMA AND SUEZ CANALS

Summary data on activity at the Panama Canal for the years ending September 30, 1981, and September 30, 1982, are not yet available, and activity for the fiscal year 1980 was summarized in the 1980 edition of this chapter. Readers desiring such information for the more recent years are referred to the annual reports of the Panama Canal Co., when they become available.

At the Suez Canal, a total of 22,545 vessels transited the canal in 1982, an increase of 968 vessels, relative to 1981 transits (up 4.5%). The tonnage passing through the waterway increased from 342,356,000 tons to 363,538,000 tons. Of the total number of vessel transits, tankers accounted for 3,548, a figure 3.2% above that of 1981. The net tonnage credited to tankers dropped from 135,164,000 tons in 1981 to 133,655,000 tons in 1982. The following tabulation indicates the distribution of tankers by number, direction, net tonnage, and status (loaded or in ballast):

Direction	Number		Net tonnage (thousand metric tons)	
	1981	1982	1981	1982
Southbound:				
In ballast	1,168	1,056	89,882	71,148
Laden	806	865	12,254	13,978
Total	1,974	1,921	102,136	85,126
Northbound:				
In ballast	541	465	8,158	8,300
Laden	923	1,162	24,870	40,229
Total	1,464	1,627	33,028	48,529

Freighters ranked next after tankers in terms of number of transits and net tonnage, with bulk carriers following in third rank. The following tabulation summarizes transits by these vessel classes:

Vessel class	Number		Net tonnage (thousand metric tons)	
	1981	1982	1981	1982
Freighters:				
In ballast	1,785	1,860	10,437	11,038

Total	2,809	3,188	44,339	52,187

In terms of goods transported in a northbound direction on the Suez, 124,805,008 tons was shipped in 1982, an increase over the 1981 figure of 93,896,000 tons. Of the total, oil and oil products totaled 63,139,000 tons, a 72.7% increase over the 1981 figure of 36,566,000 tons. In 1982, 11,383,000 tons of metals and ores were carried northbound through the Suez, a 9.7% increase over the 1981 level of 10,377,000 tons. Northbound coal shipments transiting the Suez amounted to 3,996,000 tons in 1982, compared with 3,370,000 tons in 1981.

With regard to southbound movement of commodities through the Suez, 106,588,000 tons were carried in 1982, a 4.0% increase over the 1981 figure. Of the total southbound 1982 commodity volume, crude oil and oil products accounted for 20,312,000 tons or 19%. This constitutes an 11.5% increase over the 1981 figure. Southbound metals and ores moved on the Suez decreased from 7,324,000 tons in 1981 to 6,059,000 tons in 1982. Finally, whereas 333,000 tons of southbound coal and coke transited the Suez in 1981, 446,000 tons did so in 1982.

PIPELINES

Limitations of time and space preclude comprehensive assessment of international pipeline activities. Major projects in individual countries are treated in the various country chapters.

PRICES

Comprehensive data on world prices for crude minerals and for mineral products are not available, nor if they were would international averages be very meaningful. Tables 9-11 summarize prices for selected metals in the United States, the United Kingdom, and Canada, respectively, for 1978-82 inclusive, with monthly data provided for 1982. A brief review of the 1982 average prices on each of the three markets reveals that for every commodity shown except for aluminum and cobalt on the U.S. markets, the average price was below the 1981 average, and for these commodities the prices simply remained unchanged. Examining individual monthly prices shown in the tables, there were 10 series that showed an upturn of some sort in the closing months of the year, 6 that registered downturns in the last half of the year, and 4 that remained stable.

It should be noted that the table on U.S. prices includes three additional commodities, cadmium, cobalt, and nickel, and the United Kingdom series includes one additional commodity—gold. This last-named series may be of specific interest, particularly in connection with the following figures, which, on the London market, represent the record final high and low prices for gold for each of the years noted, in U.S. dollars per troy ounce: 1978—high $277, low $173; 1979—high $455, low $277; 1980—high $675, low $514; 1981—high $577, low $409; and 1982—high, $444, low $315. Although gold prices on other markets differed, in some cases significantly from the London prices, these can serve as a general measure of the pattern of fluctuations.

Comparison of crude oil prices between yearend 1981 and yearend 1982 shows that for most Persian Gulf crude oils, prices per barrel f.o.b. declined from a range of US$31.50 to US$35.70 in December 1981 to a range of US$29.30 to US$34.56 in January 1982. African crudes (including Libyan and Algerian) dropped from a range of US$36.32 to US$37.50 to a range of US$34.52 to

US$35.50 in the same period; North Sea crudes declined from US$35.00 (Britian Forties, 36.5° API) to US$33.50 and from US$37.50 (Norway Ekofisk, 42° API) to US$34.25. Indonesian light (35° API) fell by US$0.047 to US$34.53, while Chinese and Venezuelan crude prices went unchanged. Mexican Isthmas crude (34° API) dropped from US$35.00 to US$32.50, and Mexican Maya crude (24° API) declined from US$28.50 to US$25.00. In the United States, the listed price for sweet crude fell from US$35.00 to US$32.25 per barrel, while that for sour crude declined from US$33.00 to US$31.00 per barrel. Only in the case of Canadian crude oil, where the price in Canadian dollars advanced from Can$21.25 to Can$25.75 was an increase reported between 1981 and 1982, and a small part of this increase was a function of the declining value of the Canadian dollar, rather than an increase in the constant dollar price for crude oil.

STATISTICAL SUMMARY OF WORLD PRODUCTION AND TRADE OF MAJOR MINERAL COMMODITIES

The final 24 tables of this chapter, tables 12-35, extend the statistical series on production that was started in the 1963 edition of the International Area Reports volume of the Minerals Yearbook and was subsequently updated and expanded in the 1965 and 1967-81 editions. They are primarily a supplement to other statistical data within this chapter but also serve as a summary of international production data for major mineral commodities covered in greater detail, on a commodity basis, in volume I of the 1982 Minerals Yearbook and on a country basis in volume III.

In this edition, the data presented in these tables, in most instances, correspond with the data in the individual commodity world production tables appearing in volume I and may differ somewhat from a total that might be obtained by adding figures presented for any single commodity in each of the country chapters of volume III. This apparent disparity results from problems of scheduling compilation of tables in the numerous commodity and country chapters in the two volumes. In an effort to provide the user with the most up-to-date information possible, data received after completion of worldwide commodity production tables (volume I) have been included in many of the individual country production tables (volume III). Limitations of time, however, have prevented the incorporation of these revisions in the abbreviated versions of the world commodity tables included here. Thus, a more precise figure for total world production of any commodity could be obtained by adding figures presented in the individual country chapters. For summary purposes, however, it is felt that tables 12-35 of this chapter are sufficiently correct without the inclusion of these generally minor revisions.

The series of data on world trade in major mineral commodities that has appeared in most previous editions of this chapter (tables 57-69 in the 1976 edition) could not be included owing to scheduling problems.

[r]Revised.

[1]Data presented are for selected major commodity groups of the Standard International Trade Classification Revised (SITC-R) and as such exclude some mineral commodities classified in that data array together with other (nonmineral) commodities. SITC-R categories included are as follows: All ores, concentrates, and scrap—SITC Div. 28; iron and steel—SITC Div. 67; nonferrous metals—SITC Div. 68; nonmetals (crude only)—SITC Div. 27; and mineral fuels—SITC Div. 3. Major items not included are the metals, metalloids, and metal oxides of SITC Group 513; mineral tar and other coal-, petroleum-, and gas-derived crude chemicals of SITC Div. 52; manufactured fertilizers of SITC Div. 56; and nonmetallic mineral manufactures of SITC Groups 661, 662, 663, and 667. Data include special category exports, ship stores and bunkers, and other exports of minor importance, and exclude the intertrade of the centrally planned economy countries of Asia and trade between the Federal Republic of Germany and the German Democratic Republic.

Other	[r]479	[r]422	408	265	291
Grand total	[r]9,255	[r]9,588	9,766	9,057	8,185

[e]Estimated. [p]Preliminary. [r]Revised.

[1]Figures in this table generally conform to the data in the world production table for chromite in volume 1 of the Minerals Yearbook, but the figures for Brazil and for the U.S.S.R. do not because beginning with this year, the referenced table contains crude ore figures for these two countries and not figures representing marketable product as is the case for other countries covered by the table. To use these crude ore figures substantially (and erroneously) inflates the relative importance of these nations in terms of their importance as sources of chromium-bearing materials to the world. Table includes data available through June 8, 1983.

[2]Reported figure.

eEstimated. pPreliminary. rRevised.

[1]Includes all recorded production of sulfur, regardless of the form in which it is recovered. Thus, it includes elemental sulfur, whether mined by conventional methods or by the Frasch process, as well as (1) elemental sulfur and the S content of compounds such as H_2S, SO_2, and H_2SO_4 recovered as a principal product of pyrite mining and as a byproduct of the recovery of crude oil and natural gas and as a byproduct of petroleum refining, coal treatment, and metal smelting and/or refining; and (2) sulfur recovered from tar sands, spent oxides, and other miscellaneous sources. Table includes data available through May 25, 1983.

[2]Includes Frasch process sulfur as follows, in thousand metric tons: Poland: 1979—4,310, 1980—4,667, 1981—4,250, and 1982—4,428; the U.S.S.R. (estimated): 1979—800, 1980—800, 1981—800, and 1982—800; and total of individually listed countries and grand total: 1979—13,790, 1980—14,257, 1981—13,240, and 1982—10,929. The balance is mined elemental sulfur.

[3]Entirely Frasch process sulfur.

[4]Reported figure.

[e]Estimated. [p]Preliminary. [r]Revised.

[1]Every effort has been made to include only those natural gas liquids produced by natural gas processing plants and to exclude natural gas liquids obtained from field treatment facilities including wellhead separators, because the latter are normally blended with crude oil and thus are included in crude oil output statistics. In some cases, however, sources do not clearly specify whether data presented represent only output of natural gas processing plants or if they include field output. Thus, some of the figures may include field condensate. Table includes data available through Sept. 30, 1983.

[2]In addition to the countries listed, China, Czechoslovakia, the German Democratic Republic, the Federal Republic of Germany, and Italy may also produce natural gas liquids in substantial quantities, but available information is inadequate to make reliable estimates of output levels.

[3]Reported figure.

The Mineral Industry of Albania

By Walter G. Steblez[1]

In 1982, Albania's centrally planned economy grew more modestly than in 1981. National income rose by 4.5% and industrial production reportedly increased by 4.7% over that of 1981, but the actual 1981 rate of increase of industrial production was 3.3% higher than that of 1982. The shortfall in the increase planned for 1982 was 3.8%. A number of branches of the mining and metallurgical industries, however, registered relatively high output increases.

To ensure adequate imports of Western technology and know-how, which must be purchased with hard currency, Albania has been forced to export large quantities of raw materials annually. The country's industrialization has been proceeding at a forced, but uneven pace owing to the withdrawal of China's support in 1978 as well as to unrealistically high production plans. To compete in export markets, Albania's investment priority has been focused on the development of heavy industry with mining, fuels, and machine building as the main components. In 1982, the machine-building industry reportedly grew by 17% and was able to supply the mining industry with a wide variety of mining equipment. Albanian mining was labor-intensive but the growth in the supply of domestically manufactured machinery and equipment allowed full mechanization of several mining enterprises.

The Government's exploration plan for 1982 was reported to have been sucessfully met. The goal for increasing industrial reserves of copper was overfulfilled by 7.5%, that of coal by 45.5%, nickeliferous iron by 34.2%, and nickel silicate by 26.7%. The discovery of deposits of asbestos, clays (including kaolin), bituminous coal, pyrite, and polymetallic ores was reported.

PRODUCTION

Chromite remained Albania's most important mineral commodity. The country was a leading world producer of chromite and the mineral was the leading foreign exchange earner.

Albania also produced copper, iron, nickel, and bauxite as well as several nonmetallic industrial minerals. The production of coal and other fossil fuels has made Albania a net exporter of energy.

In 1982, the official production plan was not met for high-grade chromite, steel, and petroleum, and copper mining experienced difficulties for the second straight year. On the other hand, good production results were reported for natural gas, coal, iron concentrates, and high-carbon ferrochrome.

Table 1.—Albania: Production of mineral commodities[1]

(Metric tons unless otherwise specified)

Sodium compounds, n.e.s.: Sodium carbonate, calcined (soda ash)[e]	23,200	23,300	25,000	25,500	25,000

[e]Estimated. [p]Preliminary. NA Not available.

[1]Table includes data available through Sept. 23, 1983.

[2]In addition to the commodities listed, a variety of crude construction materials (common clay, sand and gravel, and stone) are undoubtedly produced, but output is not reported quantitatively and available information is inadequate to make reliable estimates of output levels. Also, metallic nickel production reportedly began in 1978, but data on the level of production are not available.

[3]Includes petroleum-refinery-produced asphalt and bitumen.

[4]Calculated from reported and estimated weight of nickeliferous ore; the amount of cobalt recovered, if any, is conjectural.

[5]Separate data on marketable production are not available, but gross and marketed output are regarded as nearly equal.

[6]Sums of listed products only; no estimates have been made for other products produced.

TRADE

Albania's planned 1982 increase of 16.9% in foreign trade was not realized owing to unrealistic goals in a depressed world market. In 1982, a number of commercial agreements were reported with Albania's main centrally planned economic trading partners—Czechoslovakia, Yugoslavia, and Poland. Heavy producer durables were to be exported to Albania in exchange for chrome ore, asphalt, nickeliferous iron ore, and other mineral raw materials.

Commerce with Yugoslavia, Albania's main trading partner, increased over the import-export levels of 1981. Albanian imports from Yugoslavia were $73.5 million, and exports to Yugoslavia amounted to $74.4 million. Yugoslav exports of iron and steel, nonferrous products, machine-building and metalworking equipment, and electrically driven machines amounted to about 56% of total Yugoslav exports to Albania for 1982. Albania's main export was electric power followed by mineral raw materials and agricultural products.

[5]Excludes exports from West Germany valued at $3,000 and from the Netherlands valued at $1,000.

COMMODITY REVIEW

METALS

Bauxite.—Although data on reserves and grade are not available as yet, Albania reported the addition of bauxite to its exports.

Chromite.—The chrome mine production plan was not met, but ferrochrome output at Albania's only plant, at Burrel, was reported to have increased by 40% in 1982. Reportedly, much of the increase of Albanian ferrochrome arriving on the world market was due to payment in chromite to foreign construction companies for work completed and not to direct sales. Foreign sales of chrome ore were reported to have dropped in recent years and dockside stockpiles were estimated to be about 300,000 tons. Expansion was reported at a number of chromite mines as well as completion of construction of the Kalimash chrome processing plant. The construction of four chromite mines was planned in the Mat, Kukës, and Tropojë districts in 1983.

Copper.—Albania's copper mining industry appeared to have improved its performance after the 1981 shortfall in planned production, although official silence regarding mining output for 1982 suggested that production may have been below the planned goal. The production of blister copper increased 12% in 1982 over that of 1981. Albania reported the completion of the Fushe-Arrez beneficiation plant as well as the start of production at two new copper mines near Kukës, in northern Albania. The plan for 1983 called for expansion of facilities at the Reps copper concentrator and the construction of a new concentrator at Rrëshen.

Iron Ore (Nickeliferous).—Albania's production capacity was about 1.2 million tons of iron ore per year at three mines. The domestic 700,000-ton-per-year iron and steel industry was unable to absorb all of the ore produced and approximately 400,000 tons was shipped to Czechoslovakia.

Iron and Steel.—Albania reported the completion of a new blast furnace, a second coke battery, and a new section of the continuous-casting unit at the Elbasan steelworks. The blast furnace was the second unit at Elbasan. Furnace No. 1 was also relined and restarted during the year. The new section of the casting unit included a newly installed wire drawing facility and extension of the bar-rod mill.

Nickel and Cobalt.—The decision to contract an electrolytic nickel and cobalt oxide unit was announced. The unit would be constructed by the West German Government-owned Salzgitter Industriebau AG; technology, engineering, laboratory services, and training would be provided by Inco Tech, a subsidiary of Inco Ltd. of Canada. The 5,400-ton-per-year project cost was estimated at between $21 million and $25 million and startup was expected by mid-1985. Most of Albania's nickel ore is shipped to the Czechoslovak nickel refinery at Sered, while domestically produced nickel carbonate was sold on the world market.

MINERAL FUELS

Albania's production of mineral fuels and electricity was sufficient for domestic needs and permitted small exports.

Coal.—Coal production rose by 9% in 1982. Reportedly, the mid-1982 production level surpassed the planned level by 10,700 tons. Albanian coal is consumed domestically by the country's powerplants and heavy industries and provides 30% of domestic energy needs.

Petroleum and Natural Gas.—Although gas production increased 17% over that of 1981, meeting the goal, the petroleum production plan was not met. Allegedly, the shortfall was due to faulty drilling techniques as well as dated technology. Consumption of petroleum and natural gas was over 60% of the total primary energy consumption. In 1982, an agreement was signed with Romania for the purchase of a lubricating oil plant from that country.

The Mineral Industry of Algeria

By Suzann C. Ambrosio[1]

Algeria's mineral industry contributed an estimated $14 billion to the 1982 estimated gross domestic product of $43 billion.[2] Less than 1% of the mineral industry's revenues was generated by nonfuel minerals. The nonfuel mineral industry's output, comprised primarily of iron, phosphate, and mercury, and to a lesser extent, steel, cement, fertilizer materials, lead, and zinc, was estimated to be valued at nearly $70 million. The past decade's development budget emphasis on heavy industry, including petroleum, natural gas, iron, and steel, has shifted toward light industry. Production expansion of liquefied gas products—liquefied natural gas (LNG) and liquefied petroleum gas (LPG)—iron, cement, and other value-added mineral products was expected over the near term.

Algeria was the largest African natural gas producer and third largest African oil producer during 1982. Algeria was estimated to have supplied 1.2% of total world crude petroleum output and 2.5% of total commercially marketable natural gas. Algeria ranked eighth in world natural gas production, and reserves represented 3.7% of the world's total resources. The Société pour la Recherche, la Production, le Transport, la Transformation, et la Commercialisation des Hydrocabures (SONATRACH) was projecting an approximate $1 billion increase in 1983 foreign-exchange income owing to revised natural gas contracts.

In line with the Government's decentralization policies, SONATRACH was restructured into four independent oil service companies: Entreprise Nationale des Traveaux aux Puits, Entreprise Nationale des Services aux Puits, Entreprise Nationale de Geophysique, and Entreprise Nationale de Forage. In addition to decentralizing major public enterprises, a new Investment Code was promulgated to stimulate private investment. The new code was based on the December 1982 session of the National Liberation Front central committee and would replace the 1966 Investment Code. The proposed code provided Government financial assistance for both existing private enterprise and promotion of new ventures. Credit availability was expected to be contingent on the project's relationship to priorities of the national development plan. The 1980-84 national investment program placed increased emphasis on agriculture, transport, and infrastructure developments.

Some infrastructure projects, especially railroad and electrification plans, made headway during 1982. Société Algerienne de Electricité et du Gaz, the state corporation for distribution of electricity and gas, planned to allocate $1.5 billion to extend electricity to about 75% of the townships by 1984. Primarily oil and diesel generating stations and electricity transmission lines have been contracted out to a variety of European and U.S. firms.

Algeria's 4,000-kilometer rail network was undergoing a major overhaul. The Transport Ministry estimated that rail freight capacity would increase from 11 to 25 million tons between 1980 and 1984. Of major significance to the mineral industries were ongoing feasibility studies for an east-west rail line from Tebessa to Sidi Bel Abbes and a major southern interior route from La Macta through Sidi Bel Abbes to Gara Djebilit, facilitating phosphate fertilizer and iron ore mining developments, respectively.

PRODUCTION AND TRADE

Algeria's mineral policies continued to focus on enhanced hydrocarbon production and exports, nonfuel mineral import substitution, and enhanced output of materials for domestic consumption. The most recent official trade statistics for 1979 indicated that the value of mineral exports was approximately $10 billion. The reported principal mineral exports were, in descending order of value, crude oil, natural gas, petroleum products, iron, phosphate, and mercury. The principal nonfuel mineral imports during the same period were valued at approximately $1.3 billion and included iron and steel materials and cement. More recent publications have reported that total hydrocarbon exports, including refined products, were valued at nearly $14 billion and accounted for nearly 98% of the nation's exports in 1981.[3] Small amounts of barite, fertilizer materials, base metals, and salt were also exported. Algeria continued to rely on a large variety of mineral imports consisting largely of zinc ore and concentrate, unwrought lead, semimanufactured copper, primary and secondary forms of iron and steel, nitrogenous and potassic fertilizers, other metals, coke, and semicoke.

Since nearly 60% of nonfuel mineral output was consumed locally, the Société Nationale de Recherches et d'Exploitations Minières planned to more than double virtually all mineral production, excluding mercury, between 1978 and 1985. Ambitious targets have been set, and industry reorganizations have been initiated, but the combination of depressed world markets, organizational changes, and the lack of investment capital had inhibited efforts by 1982 to reach the stated goals.

Despite rapidly increased domestic consumption of both oil and gas over the past 5 years, deliberately reduced oil production, and relatively stable or slightly increased natural gas and LNG production, Algeria continued to rely heavily on hydrocarbon revenues for foreign exchange. The average daily exports of crude declined 13.5% between 1979 and 1980 and 24% between 1980 and 1981. Although LNG capacity was increased and flexibility added in terms of product form and storage and transport facilities, actual sales have fallen short of expectations.

Algeria's major trading partners continued to be France, the Federal Republic of Germany, other European nations, and North America. Between 1977 and 1980, the European Economic Community countries' share of Algerian trade went from 58% to approximately 62% for imports and from 36% to 38% for exports. The U.S. share during the same period has increased from 6.5% to 7% for imports, primarily owing to increased hydrocarbon prices. During 1981, the U.S. imported Algerian crude and petroleum products valued at $5.8 billion and $580,000 worth of processed zinc. The U.S. exported iron, steel, zinc chemicals, aluminum, and other nonferrous materials valued at $44 million to Algeria over the same period.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through July 1, 1983.

[2]In addition to the commodities listed, secondary aluminum, secondary lead, and secondary copper may be produced in small quantities; ammonia is produced; and crude construction materials, additional to those listed, presumably are produced for local consumption, but output is not reported, and available information is inadequate to make reliable estimates of output levels.

[3]Includes approximately 50,000 tons of plaster each year.

COMMODITY REVIEW

METALS

Iron Ore.—Mining of iron ore deposits began in 1865 in the Beni-Saf region. Approximately 16 deposits have been worked, and about 6 deposits of the adjacent Ouenza and Bou Khadra areas are currently being mined. To date, the primary ores, siderite and hematite, were being mined, with an iron content of 50% to 64%. Reserves of these replacement deposits of Jurassic, Cretaceous, and Eocene Age were estimated at 120 million tons. If the larger and more recently discovered Gara Djebilit, sedimentary magnetite, deposits are included, the total ore reserves would increase to 820 million tons.

Development of the Gara Djebilit and Mercheri Abudul Aziz deposits in southwestern Algeria will require large infrastructure expenditures. Construction of a railroad from Gara Djebilit near Tindouf to a point near Oran on the Mediterranean coast was being considered as part of the long-term development scenario. The Soviet Union has recently signed an $8 million contract to provide technical mining assistance at Gara Djebilit.

Iron and Steel.—A 2-million-ton-per-year iron and steel complex, originally to be located at Jijel, was expected to meet Algeria's iron and semisteel product needs. The Société Nationale de Siderurgie (SNS) decided to relocate the plantsite from the

coastal town of Jijel to an inland, mountainous site at El Milia. Plant construction, already 3 years behind schedule, was pushed ahead to 1987. Infrastructure requirements and design changes, involving the replacement of the blooming mill with a continuous caster, were expected to add to the project's delay.

The original annual capacity plans included a 3.2-million-ton iron pelletizing plant, a 2.3-million-ton direct reduction plant, eight 150-ton electric arc furnaces, and a 2-million-ton blooming and billet mill.

SNS was considering annual purchases of 2 million tons of Mauritania's Guelbs iron ore to feed the nation's recently expanded 500,000-ton steelmaking capacity. Since steelmaking capacity was expanded and was expected to increase further as El Milia comes onstream, the demand for iron ore will likely exceed domestic production until Gara Djebilit is developed.

Other Metals.—Compagnie Algerian de Zinc continued to produce small amounts of lead and zinc from the El Abed Mine and, to a lesser extent, from the Bou Caid and Ain Barbar Mines. Zinc was smelted at Ghazaout, Algeria, and Oued El Heimer, Morocco.

NONMETALS

Cement.—Cement output increased 23% over that of 1981, to 5.5 million tons. The shortfall of approximately 3 million tons was imported from Europe. An ambitious domestic annual production target of 12 million tons was set for 1984.

F. L. Smidth (France) continued to work on a 1-million-ton-per-year plant at Sour El Ghozlane, 140 kilometers southeast of Algiers. Cimenteries of Belgium was the consulting engineering company for the delayed project. Startup was expected by yearend 1983.

Fertilizer Materials.—*Nitrogenous.*—SONATRACH's refurbished 272,000-ton-per-year ammonia plant at Arzew was back onstream during 1982, but the new 121,000-ton-per-year urea unit was not yet operational by yearend. Although there is no domestic market for urea, the plant's output was expected to be exported to Western Europe.

The proposed 272,000-ton-per-year Skikda ammonia plant remained in the early planning stages. Construction and commissioning of the Annaba fertilizer complex, which was expected to boost output of sulfuric acid and nitrogen and phosphate fertilizers by 1982, were apparently shelved. Technical difficulties reported during 1981 and the lack of any progress during 1982 in combination with SONATRACH's efforts to improve efficiencies at operating plants suggest that the facility was temporarily canceled.

Phosphate.—Algeria's phosphate deposits located at Djebel Onk, Kouif, and Mzaita contain estimated resources of nearly 500 million tons. The largest operating mine at Djebel Onk had an annual capacity of 2.4 million tons of 63% to 65% bone phosphate lime (BPL) concentrates. When upgraded, the mine could yield 0.5 million tons of 75% to 77% BPL products. Current beneficiation and calcination raises the BPl grade to 69.5%.

Output was expected to continue to increase at Djebel Onk, and the proposed Annaba and Tebessa facilities continued to be delayed. The Tebessa fertilizer complex would increase annual output of phosphoric acid by 165,000 tons by 1983. In general, the lack of water, other environmental concerns, and the scale of the proposed facility still needed to be resolved.

MINERAL FUELS

Petroleum and Natural Gas.—Approximately 75 oil and gas fields, located in 5 geologic regions, have produced hydrocarbons since discovery of the first field in 1910. Of the five productive geological areas, the Central Triassic Basin and the Illizi Basin continue to be the most important oil-producing areas. The three major producing fields, Hassi Messaoud, Hassi R'Mel, and Edjelah, are located within these two basins. The first two major fields roughly split the nation's natural gas reserves between them. The major gas condensate fields are located in the Central and Ahnet Basins, south of the major oilfields and north of the Hoggar Mountains, in central Algeria.

Algeria's proven and probable natural gas reserves, larger on a world scale than their crude petroleum reserves, were estimated at nearly 170 trillion cubic feet during 1982. Proved and probable reserves of crude oil were estimated at 12.4 billion barrels from known deposits. The average petroleum recovery factor of 1980 operations was nearly 40%. At least three of the major oil and gas fields in Algeria were undergoing water and/or gas injection operations. Hassi Messaoud was undergoing water and gas injection, and the two other fields, Rhourde-Nouss and Zarzaitine, were undergoing gas injection to improve recovery rates.

Total 1981 installed refinery capacity was 521,000 barrels per day. The facilities were, in descending order of percentage of total 1981 capacity, Skikda, 67.9%; Arzew, 13.4%; Algiers, 11.9%; Hassi Messaoud, 5.4%; and InAmenas, 1.4%. LPG was produced at the Algiers refinery and from associated gas at the Hassi Messaoud and Hassi R'Mel Fields, and LNG was produced at the Arzew and Skikda refineries. The LPG was transported from the oil and gas fields via condensate and two LPG lines to the port of Arzew. The nearly completed Bethioua LPG facility, located near Arzew, was expected to boost LPG export capacity in two stages during 1983-84. Enhanced LPG output was favored over LNG because of cheaper rates associated with gas pipelines when compared to LNG tankers. Once the trans-Mediterranean pipeline from Algeria to Italy is fully operational, natural gas exports were initially expected to reach 1.5 trillion cubic feet per year, with approximately 70% in the form of LNG and 30% as LPG.

Algeria's production strategy was discussed in a SONATRACH paper presented at the October 1982 Gastech Symposium in Paris. A 50% lowered production target of approximately 70 million barrels of LPG was set for 1985. The LPG was to be split into propane and butane in two separation units, the second of which was expected to go onstream during 1983. The completion of the first development phase was expected by 1984, when annual capacity of about 60 million barrels was reached. Tentative plans were made to expand annual LPG production to 80 million barrels.

Sources of LPG extraction included four liquefaction plants in Arzew and Skikda and three refineries at Arzew, Algiers, and Skikda. Exports can be lifted from two major harbors at Arzew and Bethioua. The new Bethioua port can handle the largest ships, from 2.6 to 4.8 million cubic feet.

Various engineering and construction contracts were awarded to facilitate expanded output of LPG and condensate. A $500 million contract was awarded to an unnamed European company to develop plans for a 50-million-barrel-per-year LPG plant at Arzew. In addition, Canadian Bechtel Ltd. was contracted to construct both a 900-million-gallon-per-year condensate facility and a 270,000-gallon-per-year LPG facility at the Rhourde-Nouss Oilfield.

Algeria's natural gas contracts, negotiated with several European countries and the United States, were successful in (1) modifying the gas price upward, (2) linking the gas price index to crude prices, and (3) periodically revising contract clauses to adjust the price of gas and guarantee its purchasing power.

In February 1982, agreement was reached between Algeria and France to link the two previously existing contracts and a new one into a single deal. The total amount of the contract was for the annual supply of 321 billion cubic feet per year over 20 years, at $5.10 per million British thermal units (Btu) of gas. In addition, the French agreed to pay another $0.70 per million Btu for transport, insurance, and regasification. However, Gaz de France was expected to pay only $4.60 per million Btu, with the French Treasury paying the difference. Similar to the agreement made in 1981 with Belgium's Distrigaz, gas prices were indexed 50% to increases in the average official price of crudes imported by the French and 50% to crudes exported by the Organization of Petroleum Exporting Countries gas exporters. The Algerian-Gaz de France $4.60 per million Btu price was reported to be marginally less, by $0.05 per million Btu, than the price France agreed to pay for the Soviet Union's natural gas.

Algeria and Italy made a partial agreement during September 1982 to purchase approximately 425 billion cubic feet per year for 25 years. The gas would be transported via the Transmed pipeline at a price of $4.41 per million Btu, f.o.b. Algerian-Tunisian border. This price was approximately $0.40 per million Btu more than the price of Soviet gas. Italy's state oil group, Ente Nazionale Idrocarburi (ENI), was not satisfied with the September agreement when they calculated the international gas price to be $3.62 per million Btu during October. The Italian Government was seriously considering a decree-law that would authorize a rebate payment to ENI of up to $0.50 per million Btu.

Algerian gas contracts were handled by individual companies in the United States, and they were for the most part inconclusive by yearend. SONATRACH's negotiations with Trunkline LNG Co., in Lake Charles, La., stem from a contract signed in 1975 for the delivery of 165 billion cubic feet per year of gas for 20 years. Deliveries were delayed until October 1982 after Trunkline altered the purchase contract. At that date, Trunkline's LNG price was $3.92 per million Btu, f.o.b. Algeria, subject to semiannual adjustments based on No. 2 and No. 6 fuel oil price index delivered to New York. The Federal Energy Regulatory Commission

granted temporary tariff approval to the imports, but the required additional approval by the U.S. Economic Regulatory Administration (ERA) was not granted by yearend.

Negotiations were still being held between SONATRACH and other U.S. customers, including El Paso Natural Gas Co. and Distrigas of Boston. In a statement filed with ERA, Distrigas proposed an amendment to the original 1976, 20-year supply contract that would increase the base c.i.f. delivered price from $4.95 to $5.47 per million Btu. The LNG was indexed to a basket of six crudes and was expected to change with the world price of the average calorific equivalent of these crudes.

Strong opposition to the tentative U.S. gas supply agreements was expressed by a group of gas distributors, consumers, and a number of Congressional representatives. Trunkline, a subsidiary of Panhandle Eastern Corp., was planning to sell the expensive regasified LNG at $7.18 per million Btu to gas pipeline affiliates, which will in turn distribute the gas to Michigan, Illinois, and Indiana customers. State industry and Congressional representatives were requesting ERA to suspend or revoke Trunkline's 1977 import authorization.

Pipelines.—Algeria's largest 1,070-kilometer, 48-inch Transmed pipeline was still not fully commissioned by yearend 1982 contrary to SONATRACH's sales forecasts. Bechtel Ltd. (United States) was constructing both a 510-kilometer, 24-inch and an 11-kilometer, 14-inch LPG line from Hassi R'Mel to Arzew. Saipem, a subsidiary of ENI, was constructing a 525-kilometer, 30-inch crude line from Ohanet to Haoud El Hamra. Both construction projects were projected to be completed during 1983. Algeria was also considering the construction of a fourth gas pipeline from Tiaret, Hassi R'Mel, to the Arzew port to increase natural gas supplies to LNG-1 and LNG-2.

The Mineral Industry of Angola

By George A. Morgan[1]

Activity in the mining sector remained relatively unchanged in 1982, compared with that of 1981. Goals for production of various mineral commodities were adjusted downward or left at existing levels because of low labor productivity, reduced Government expenditures, and an inefficient transportation sector. Development was also constrained owing to insecurity in a large portion of the country and the unavailability of skilled labor. Basic infrastructure projects such as dam rebuilding were the main areas of planned activity.

Expenditures in the mining, transportation, and industrial sectors were dependent to a large extent on revenues derived from the export of crude oil. However, declining world oil prices resulted in a drop in export receipts of $350 million.[2] Defense costs were reported to be consuming a significant portion of the total budget. By yearend, the Government planned to seek external financing to balance the budget and to continue with major planned investments in the oil and gas sector.

Government Policies and Programs.—Action was taken by the Government to counter the loss of a large portion of export revenues owing to declining oil prices. Production goals were reduced for a number of plants. In addition, a cutback in the granting of import licenses was instituted.

Information regarding a number of organizational changes instituted in the past few years has since become available.[3] A National Directorate of Geology and Mining was created within the Ministry of Industry and was responsible for the mining industry. The National Institute of Geology was also within the Directorate, but was expected to become financially and administratively independent. Separate state companies have been set up for specific mineral commodities and were under the direct control of the National Directorate of Geology and Mining. Empresa Nacional de Diamantes de Angola (ENDIAMA) was created in 1981 and was responsible for prospecting, exploitation, processing, and marketing of diamonds. ENDIAMA represents the state's share in Companhia de Diamantes de Angola. Production goals for diamond and other mineral commodities were set by the Popular Movement for the Liberation of Angola. Empresa Nacional de Ferro was responsible for the exploitation, processing, and marketing of iron and manganese. Empresa Nacional de Rochas Ornamentais was created to oversee activities in the quarrying of granite, marble, and other industrial rocks. Empresa Mineira de Quartzo has control of quartz output. Empresa Mineira de Fosfatos do Zaire has control of exploration and development of phosphate.

PRODUCTION AND TRADE

Information regarding production and trade of mineral commodities continued to be unavailable. Despite the lack of official data, estimates have been provided that reflect the general level of possible mineral output.

Reinjection of natural gas into declining oilfields and other technical changes were affected in 1982, but did not stop the decline in oil output, which was down for the second straight year. Conditions for maintaining efficient operations at the diamond-pro-

ducing areas in the northeast of the country deteriorated further; the production goal was not met, and actual output was estimated to be unchanged from that of 1981.

Crude oil, diamonds, and cement were estimated to be the only mineral commodities exported. The Port of Luanda was reported to be heavily congested, mainly from the unloading of foodstuffs. Much of the material deteriorated owing to excessive delays.

Table 1.—Angola: Production of mineral commodities[1]

Commodity[2]	1978	1979	1980	1981[p]	1982[e]

[1]Table includes data available through July 20, 1983.
[2]In addition to the commodities listed, a variety of crude construction materials (clays, sand and gravel, and broken stone) presumably is produced for local consumption, but information is inadequate to make reliable estimates of output levels.

COMMODITY REVIEW

METALS

Iron Ore.—Austromineral, a subsidiary of Voest-Alpine, sought to obtain both management and marketing rights for iron concentrates produced at Cassinga. Cassinga was located on a railroad line about 520 kilometers from the loading pier at Moçâmedes. Iron ore at Cassinga was classified as a detrital ore derived from banded ironstones in a late Cambrian volcanic series. Although several hundred million tons of currently unminable itabirite type ore was known at Cassinga, proven recoverable detrital ore at Cassinga North (Jamba) area was 21.7 million tons, minable by scrapers.

Iron and Steel.—Siderurgia Nacional operated the country's sole iron and steel plant at Luanda, which had a designed production capacity of 30,000 tons per year of raw steel and 50,000 tons per year of rolled products. However, output was only about one-third of capacity. Voest-Alpine AG of Austria was to reequip and update the plant at a cost of $18 million. Contract specifications reportedly included a new plant, spare parts, and 20 specialists for technical assistance over a period of 36 months. The technicians were to restart steelmaking and rolling operations, and raise output to 30,000 tons per year of billets. Iron and steel scrap recycling centers were also planned.

NONMETALS

Cement.—The cement plant of Empresa

de Cimentos de Angola in Luanda lost an unspecified amount of capacity owing to the breakdown of one of its furnaces. Cia. de Cimento Secil do Ultramar S.A.R.L. continued to refurbish the Luanda plant and to improve shiploading facilities. The project included equipment replacement, technical assistance, and personnel training.

Diamond.—About 40 sites were operated in the Luanda district of northeast Angola for the production of diamond. Output continued to be adversely affected by operational inefficiencies and poor security. Planned output levels were not met. About 5 million cubic meters of ore was treated in 1981, the latest year available. Sales receipts were reported to total $200 million. Attempts continued to be made to limit trade in illegal diamonds.

Phosphate Rock.—Over $600,000 was provided by the United Nations for the development of phosphate rock deposits in Angola. Prospecting continued in the Cabinda Enclave, where numerous occurrences were reported.

MINERAL FUELS

Natural Gas.—The Government had a general policy of prohibiting the flaring of natural gas. Excluding gas in the Cabinda Enclave that was flared owing to its hydrogen sulfide content, all gas produced must be utilized. Associated gas from Texaco Petroleos de Angola's concession in block 2 may be used in an ammonia-urea plant. Estimated consumption would be about 50 million cubic feet per day. Cost for the project was estimated at between $400 million and $600 million. In addition to the associated gas in block 2, the Etele Field, discovered in 1975, was mainly nonassociated gas and had reserves that may total over 2 trillion cubic feet. It has been considered as a backup for the ammonia-urea plant.

Petroleum.—Exploration, production, and processing of oil and gas in Angola were controlled by the Government-owned Sociedade Nacional de Combustiveis de Angola (SONANGOL). Following the results of seismic surveys completed in 1979, 13 exploration blocks were defined offshore Angola. Included in these blocks were concessions already in operation in the Cabinda Enclave and the Kwanza River Basin.[4]

Output in 1982 was about 139,000 barrels per day from four producing areas; two offshore and two onshore. About 85,000 barrels per day was from the offshore fields of Cabinda Gulf Oil Co., and 15,000 barrels per day was from Texaco Petroleos de Angola's offshore concession in block 2. The Congo Basin supplied 34,000 barrels per day and the Kwanza Basin 5,000 barrels per day, both from onshore wells.

An enhanced oil recovery program was instituted in the Cabinda Enclave, and the completely new Takula Oilfield began development for commercial oil production. The enhanced oil recovery program was based on a gas reinjection plan, which was funded at a cost of $200 million by the Import-Export Bank, the Italian Export Credit Agency, and commercial banks in the United States, Europe, and Saudi Arabia. Using both associated and nonassociated gas, the program was to increase oil output by 10,000 barrels per day. The Takula Field, with reserves of 120 million barrels of oil, was to add 70,000 barrels of oil output per day at a capital cost of $600 million. Sweet gas from wellhead separators as well as nonassociated gas was utilized in the injection process. Gas with hydrogen sulfide content was flared. Liquid gasoline was blended into the crude oil stream, while propane and butane were delivered to an offshore storage tanker.

Oil from the onshore fields in the Congo Basin was shipped to the Luanda refinery and to overseas refineries via the Quinfuguena terminal. An offshore extension into deeper water allowed 250,000-ton-deadweight vessels to berth. Output from the Kwanza Basin was from 52 wells, nearly all of which required water injection or gas lift. Output from Quenguela Norte, which was 75% of the total produced, was shipped directly to the Luanda refinery.

Société National Elf Aquitaine's drilling effort in block 3 resulted in five discoveries from six wildcat wells since commencing exploration in 1981. Two were commercial and were being prepared for development. A development plan was submitted to SONANGOL for a $350 million project to produce 30,000 barrels per day. An offshore tanker-loading system was to be used. Another development plan was being readied by Elf Aquitaine for the Pacasso 2 Field, which would add an additional 30,000 barrels of oil output per day.

The Mineral Industry of Argentina

By Pablo Velasco[1]

The economy of Argentina, depressed for 3 years, showed signs of recovery at yearend. However, the economy was impacted by world recession during the year and reflected a decline in the gross domestic product (GDP), high interest rates, and inflation.

The overall GDP in 1982 declined 5.7% to an estimated $66.5 billion[2] at current official prices compared with that of 1981, according to estimates released by the Argentine Central Bank. The inflation rates were 210% (consumer price index) and 311% (wholesale price index). According to the Central Bank, Argentina's total external debt at yearend was $38.7 billion, including arrears of $2.8 billion. Preliminary figures indicated that the merchandise trade surplus was $2.25 billion, owing, not to a good export performance, but to a 43% decline in imports. The mineral industry of Argentina, including mineral fuels (petroleum, natural gas, and coal), fell by 0.9% of GDP compared with that of 1981.

Petroleum and gas exhibited a 1.8% growth of GDP compared with that of 1981, as a result of larger distribution facilities with inauguration of the Western Central Gas Pipeline and greater consumption because of the substitution of fuel oil for natural gas. Petroleum production declined 1.4% owing to the long-lasting renegotiation agreements with the Yacimientos Petrolíferos Fiscales (YPF) contractors. The value of metallic minerals declined to 9.7% of GDP compared with that of 1981, owing to a decrease in production of tin and silver as well as lead and iron ore. A severe drop in domestic demand of industrial materials, mainly for the construction industry, resulted in a 17.8% decline of GDP in nonmetallic minerals output compared with that of 1981.

Major plans for investment in a number of projects were announced during the year. Housing projects were given priority because of their social impact and the need to stimulate the construction industry. The Piedra del Aguila hydroelectric project (1,400 megawatts) was among projects announced. The Inter-American Development Bank (IDB) has already committed $400 million for this project.

The huge Yacyretá-Apipé hydroelectric complex (2,700 megawatts), a joint Argentine-Paraguayan project, will resume construction in the second half of 1983, after a lengthy delay. The International Bank for Reconstruction and Development (World Bank) and IDB have each made a loan of $210 million for the engineering.

Argentina is fortunate in having an excess of natural gas and enough petroleum to be self-sufficient. The Government's policy is to build additional gas pipelines, encourage the use of natural gas by industry, and increase petroleum production by upgrading gas and petroleum processing plants. One large project that was started in 1982 was the conversion of the refineries in La Plata and Luján de Cuyo Provinces to produce lighter grades of refined petroleum products. This $300 million project is being partly financed by a World Bank loan of $200 million.

Exports of minerals, metallics, and nonmetallics, as well as mineral products in 1982 increased 56% and decreased 14% in volume and value, respectively, compared with those of 1981.

The aluminum industry output increased 2% compared with that of 1981. Domestic demand comes mainly from the energy sector (23%) and from the construction

industry (21%), which rose 46% compared with that of 1981.

Because of the declining international prices for aluminum and other export difficulties, exports fell 22% compared with those of 1981. Production of steel increased 15% to 2.9 million tons. Coal consumption was estimated at 900,000 tons, of which 730,000 tons was imported. About 3.2 million tons of iron ore was consumed in 1982, of which 50,000 tons was extracted from the Altos Hornos Zapla Mines in Jujuy and Salta Provinces and 630,000 tons was obtained from the Hierro Patagónico S.A. Minera (HIPASAM) pelletizing plant in Río Negro Province. The remaining 2.5 million tons was imported, mainly from Brazil.

Budget cuts and other factors have led to substantial delays in key projects of the Comisión Nacional de Energía Atómica (CNEA) nuclear power program. The uranium processing plant at Los Gigantes, Córdoba, came onstream at the end of 1982. The country's second nuclear powerplant, at Embalse Río III, Córdoba, was scheduled to come onstream in February 1983. The Arroyito heavy water plant in Neuquén Province, originally scheduled for completion in 1979, has been further delayed owing to budgetary and technical administrative problems. Present plans call for completion by 1984, with a total investment of $300 million. The Sierra Pintada uranium deposit development and processing plant installation was awarded to a French consortium for $150 million.

The Nevados del Famatina molybdenum-copper deposit in La Rioja Province, scheduled for developmental bidding proposals on July 30, 1982, was suspended until further notice by the Argentine Government Resolution No. 54/82. Instead, the Bajo la Alumbrera copper-gold deposit in Catamarca will be opened for bidding in 1983.

Government Policies and Programs.—Government actions related principally to the country's foreign debt, which by the end of 1982 totaled $38.7 billion, and negotiations with the International Monetary Fund (IMF) for $4.75 billion in standby credits. In the mineral area, Decree 836/82, published toward yearend 1982, authorized renegotiation of petroleum contracts with private interests. The Government, by offering tariff incentives in 1982, hoped to promote use of natural gas.

An international symposium for foreign companies and banks interested in investing in Argentine mining projects took place in April 1982 in Buenos Aires. This symposium was sponsored by Government organizations. Discussions were centered on five subjects: legal and tax regulations, large mineral deposits, exploration and/or exploitation tenders, role of national private enterprises, and financing of large-scale mining projects.

PRODUCTION

Preliminary statistics indicated that production of nonfuel minerals decreased 8% in 1982 from the 1981 level. The largest decrease in output took place in metallic ores (22%) while the output of nonmetallic ores decreased by 14%. Among nonmetals, there were increases in asbestos, barite, bentonite, kaolin, feldspar, fluorspar, and talc and decreases in cement, diatomite, gypsum, and salt.

Production of copper, gold, and zinc increased, and the output of iron ore, lead, manganese, silver, and tin decreased. Production of coal increased 3.4% in 1982. Petroleum output fell 1.4% owing to decreased activity by the contractors awaiting contract renegotiation. Natural gas output was up 13%, continuing the upward trend of the decade. Production of uranium concentrate (yellow cake) increased 61% as new concentration capacity came onstream at Los Gigantes, 60 kilometers west of Córdoba.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through July 15, 1983.

[2]In addition to the commodities listed, cadmium, lime, perlite, and carbon black are produced, but output is not reported quantitatively and available information is inadequate to make reliable estimates of output levels.

[3]Revised to not available.

[4]Reported figure.

[5]Hot-rolled semimanufactures only; excludes castings and cold-rolled semimanufactures produced from imported hot-rolled semimanufactures.

[6]Includes plastic, semiplastic, and/or ferruginous clays used totally in the manufacture of portland cement.

[7]Thomas slag production was estimated from the Thomas crude steel reported in the 1980-81 annual publication of La Siderurgia Argentina and from a percentage of slag produced from Thomas crude steel reported during 1974-76; for 1979-81, from the reports published by the Instituto Argentino de Siderurgia in 1982.

TRADE

A series of devaluations in both 1981 and 1982 encouraged exports. There was an improvement in the balance of trade because of a severe cutback in imports, a local industrial depression, and other difficulties.

Total exports, valued at $7.6 billion, declined by an estimated 16%, while total imports of $5.35 billion decreased 43%, leaving a merchandise trade surplus of $2.25 billion. Imports decreased because of a continuation of a severe recession in industrial activity, a substantial real devaluation of the peso against the dollar, the highest inflation rate in the world, swollen import inventories from previous years, a reduction in Government investment levels, a sharp drop in private sector fixed investment, a scarcity of foreign exchange leading to payment delays for imports, and the trade disruption caused by the South Atlantic crisis with Great Britain.

Argentina's mineral imports in 1982 totaled $800 million and exports totaled $47 million. Imports of petroleum, valued at $176.4 million, decreased 45% compared with those of 1981, while imports of natural gas from Bolivia, valued at $378.5 million, increased 16% from those of 1981. Imports of liquefied natural gas (LNG) were reduced to zero compared with 232,000 tons in 1981. Imports of bituminous coal, valued at $65.4 million, remained at the same level as those of 1981; imports were mainly from Colombia, the United States, and Canada. Mineral exports were mainly lead, tin, silver, and borates.

COMMODITY REVIEW

METALS

Aluminum.—The only primary and secondary production of aluminum in Argentina is now done by Aluminios Argentinos S.A.I.C., whose facilities have an annual production capacity of 144,000 tons of ingots. However, in 1982, several foreign companies have shown interest in financing the expansion of three Government mining projects in the Río Gallegos area in the south of the country. Gerald Metals Ltd. was considering investing in a second aluminum smelter at Punta Loyola, using nearby hydroelectric resources. Initially, the proposed aluminum smelter would use natural gas and coal, which are also available locally, but it would use hydroelectric power once generating capacity was installed.

Production of primary aluminum during 1982 increased 2%; domestic sales rose to 50,282 tons, up from 34,463 tons in 1981. Aluminum exports fell to 67,023 tons, down from 85,927 tons in 1981.

Copper.—Argentina continued to show interest in developing its major mineral deposits and in attracting foreign investment.

The main projects that the Government has targeted for development are the Bajo la Alumbrera porphyry copper-molybdenum-gold deposit, the Farallón Negro gold-silver-manganese deposit, both in Catamarca Province, and the Nevados del Famatina molybdenum-copper deposit in La Rioja Province.

The first mining project approved by Decree No. 2234/81 and called for international tenders was the Nevados del Famatina. The bid package covered completion of the first stage of geological exploration of the area, with a right of option in the second stage for its exploitation and beneficiation. This mineral deposit covers 2,200 hectares, and the preliminary estimated ore reserves from one-fourth of the mineralized area amounted to 200 million tons averaging 0.06% molybdenum and 0.17% copper.

Originally the Government had set July 30, 1982, for the opening of bid proposals, but because of the Falklands war, all international bidding in exploration rights on the Nevados del Famatina deposit was suspended until further notice.

El Pachón, a copper mine project in San Juan Province, owned by Cía. Minera Aguilar S.A. (C.M.A.S.A.), a subsidiary of St. Joe Minerals Corp., which is a part of Fluor Corp., was scheduled to begin production of copper and molybdenum by the mid-1980's. It has estimated reserves of 800 million tons averaging 0.67% copper and 0.016% molybdenum. Development of this project has been delayed several times in the past.

In the Government's mining program for 1982, additional technical and economic studies were conducted on the Bajo la Alumbrera porphyry copper deposit in Catamarca Province, under the supervision of the Subsecretaría de Minería de la Nación, the Dirección General de Fabricaciones Militares (DGFM), and the state-owned company Yacimientos Mineros de Agua de Dionisio (YMAD). This mineral deposit contains reserves previously estimated at 350 million tons of ore. The ore averages 0.49% copper, 0.62 gram of gold, 2.5 grams of silver, and 0.008% molybdenum per ton with a 0.2% copper cutoff grade. The contract work being done by the University of San Juan calls for a review of all new data now available, which includes recent drilling results, not only from the main deposits, but also from the satellite ore bodies. These studies are expected to continue in 1983.

In the vicinity of the same copper deposits, the Plan Noroeste Argentino (Plan NOA) was planning in 1983 to open bidding on the Cerro Atajo copper deposit located near Andalgalá, Catamarca Province. The decision was made after the completion of 2,800 meters of core drilling and 3,000 meters of exploration drifting. Preliminary ore reserves showed 105,000 metric tons of ore grading 5% copper, 0.8 ounce of gold per ton, and some wolframite, and an additional 800,000 tons of ore grading 1.5% to 2.0% copper.

Iron Ore.—Argentina is partially dependent on imported iron ore for its steel industry. Domestic ore is processed in the pelletizing plant of HIPASAM. The plant, comprising a differential flotation plant using the dephosphorization process, iron ore slurry pipeline, and four pelletization lines with a 2-million-ton capacity, is located in Río Negro Province, 30 kilometers from the Atlantic coast.

HIPASAM has been supplying up to 40% of the iron ore needs of blast furnace No. 2, the steel plant of Sociedad Mixta Siderúrgia Argentina (SOMISA). HIPASAM pellets will also provide 30% of the requirements of blast furnace No. 1 of SOMISA, scheduled to be completed in 1983. The balance of the

necessary iron ore needs, or about 50%, is met by sinter made by the company from imported ore. When operating at capacity, SOMISA blast furnaces can take all of the pellets produced by HIPASAM. Production of iron ore and pellets decreased 20% compared with that of 1981, owing to the slow recovery of the market and shutdown of the No. 2 blast furnace of SOMISA.

Brazil has been the principal source of imported ore. Current plans are to increase steel production capacity from 5 million tons in 1982 to 11.9 million tons by 1990. The additional iron requirements will be imported from the Carajás deposit in Brazil.

Iron and Steel.—Crude steel production increased 15% in 1982 compared with that of 1981. Installed plant capacity was utilized at a 58% level for blast furnaces and 60% level for direct-reduction plants.

Production of primary iron (pig iron and sponge iron) was up about 12%. Output of hot- and cold-rolled steel increased by 16% and 22%, respectively.

ACINDAR-Industria Argentina de Aceros S.A., Argentina's newly expanded private sector steelmaker, was planning to expand its direct-reduction capacity by uprating its Midrex plant. The plant, with a current rated operating capacity of 400,000 tons per year, announced plans to increase capacity to 600,000 tons. ACINDAR's need for additional iron units dates back to its takeover in 1982 of the Gurmendi S.A., Genaro Grasso S.A., and Santa Rosa S.A. steel plants in a move that was designed to relieve state-owned SOMISA of its role as a supplier of billets to the private sector. ACINDAR operated at full capacity in the second half of 1982, which resulted in a total output for the year of 450,000 tons.

In 1982, Nippon Steel Corp. and other Japanese companies decided not to invest $50 million in a modernization project with SOMISA. The original agreement called for the Japanese consortium to provide funds for modernizing and expanding SOMISA's steel plant in exchange for orders of a hot-strip mill, a blast furnace revamp, and other contracts. The project was suspended for at least 2 years, according to SOMISA's officials, owing to financial problems. Earlier, Nippon Steel had completed upgrading SOMISA's No. 1 blast furnace and had been planning to begin work on the No. 2 furnace. The status of this future modernization is now uncertain.

Altos Hornos Zapla in Jujuy Province, which is self-sufficient in iron ore, announced plans to carry out a program for completing the installation and transformation of three Thomas converters, to be completed in 1984. A sinter plant of 350,000-ton capacity was to be installed in the pig iron section for a total investment of $120 million. Another steel producer, Dalmine Siderca S.A.I.C., announced plans to expand their capacity by 90,000 tons per year of tubing and 175,000 tons per year of steel, for a total investment of $55 million. The expansion should be finished in 1984.

Siderúrgica del Sur, a new private consortium formed with domestic and foreign capital, submitted a proposal to establish a steel plant in San Astonio Oeste, Río Negro Province. The direct-reduction plant will use the Mexican Hyl-III process, and will have an initial production capacity of 550,000 tons per year. Total capital investment for the project was estimated at $330 million. The second stage of the project will include an electric furnace and a continuous hot-roller strip with an output of 350,000 tons of billets per year.

During the year, Sindisa-Siderúrgica Integrada S.A.I.C., the state-owned concern that is a part of DGFM, announced preliminary plans to build a 4-million-ton-per-year steel plant with an initial capital investment of $150 million.

Lead, Silver, and Zinc.—Compared with that of 1981, production of lead concentrates in 1982 declined 15%, zinc concentrates increased a modest 3%, and silver declined 12%.

C.M.A.S.A. mined and milled about 668,000 tons of ore. Reserves at the mine were estimated at 6.6 million metric tons of ore containing 6.2% lead, 7.6% zinc, and 3.7 ounces of silver per ton.

The Government provided a $230,000 loan to Cía. Río Cincel S.A. to further explore and increase reserves in its lead-silver-zinc Pan de Azucar Mine, located in Jujuy Province, 57 kilometers west of the town of Abra Pampa. The project should be completed sometime in 1984.

Cía. Cerro Castillo S.A., the largest gold producer in Argentina, received a $240,000 loan to finance further exploration of the Susana Beatriz and Angela lead-zinc-gold-silver mines located in Chubút Province.

Another exploration prospect for lead-silver-zinc-gold was located near Huemules, Chubút Province. This is a cooperative project between the Government and the United Nations Revolving Fund. Negotiations during the year involved the consideration of a $4 million contribution by the United Nations to further develop the project. At yearend no decision had been reached.

Manganese.—Production of manganese was carried out by Cía. Luis Pedro Cámara in Córdoba Province, YMAD in Catamarca Province, and Sociedad Argentina Minera de Extracción y Transportación S.A. in Santiago del Estero Province. Production of manganese has been decreasing from 18,500 metric tons in 1978 to an estimated 1,800 metric tons in 1982. According to Argentine sources, most of the production of manganese in 1982 came from Córdoba Province, followed by Santiago del Estero and Catamarca Provinces. The most important mine was Farallón Negro because of the additional revenue from gold and silver values in the concentrates. The Farallón Negro Mine is operated by YMAD, a state-owned entity. Current known reserves amount to about 2.5 million tons with an average content of 12% manganese, 7 grams of gold, and 113 grams of silver per ton.

Tungsten.—Production of tungsten, most of which comes from San Luis and Córdoba Provinces, has been declining since 1978. Two loans of $350,000 and $136,000 were approved for Cía. Mincor S.A. in San Luis Province and Cía. Cerro Catedral S.A. in Córdoba Province for further exploration of two tungsten deposits, the Cerro el Morro in San Luis Province and the La Bismutina alluvial deposit in Córdoba Province. As with other loans made for mineral exploration, the Government will assume 80% of the risk.

NONMETALS

Boron Minerals.—Production of borates increased 10% compared with the 1981 output. Exports of borates fell to fourth place among Argentine exports after cement, limestone, and clays. Borates were produced primarily in the Province of Salta and lesser amounts in the Province of Jujuy. In Salta Province, the main producer was Cía. Boroquímica S.A.M.I.C.A.F. from its open pit mine located at Tincalayú II, about 430 kilometers southwest of the city of Salta. Boroquímica S.A.M.I.C.A.F., started mining high-grade borates (30% to 32%) in 1957. In 1971, a pilot plant to treat low-grade ore (18% B_2O_3) was installed, but it did not begin operating until September 1978. The firm currently has two processing plants, one in Campo Quijano and the other in Tincalayú, both fed by low-grade ore averaging 18% B_2O_3.

The open pit mine where high-grade ore was originally mined was expanded in width and depth. Ore extracted from the Tincalayú Mine, Salar del Hombre Muerto, is crushed and ground at the minesite and shipped by truck to a Tincalayú plant and stockpiled. It is then blended to obtain the 18% B_2O_3. The ore is then shipped by truck and train to the Campo Quijano processing plant.

Cement.—Production of cement decreased 16% in 1982 compared with that of 1981. Nineteen cement plants operated during the year. These were located in 11 Provinces and had a total installed annual capacity of almost 11 million tons. They were privately owned. Domestic demand for cement fell, but exports increased in volume and value. Cement plants were running at 54% production capacity.

In 1981-82, Loma Negra Compañía Industrial Argentina S.A. (Loma Negra C.I.A.S.A.) built a new $190 million cement plant at El Alto in Catamarca Province with an installed capacity of 300,000 tons per year. Cementera Santa Cruz S.A. announced plans to build a new $60 million plant at Pico Truncado, Santa Cruz Province, with an annual installed capacity of 600,000 tons. Three cement plants expanded their capacity as follows, in tons per year: Loma Negra C.I.A.S.A. at the Olavarría

plant, 150,000; the Zapala plant in Neuquén Province, 210,000; and Corporación Cementera Argentina S.A. (Corcemar) at the Capdeville plant in Mendoza Province, 100,000. Corcemar was constructing a new plant at Volcán, Jujuy Province, with 330,000 tons per year annual capacity.

Salt.—The Government of La Pampa Province requested the Federal Investment Council to examine and evaluate a proposal for a project to produce numerous salts associated with common salts and sodium sulfate. The proposal also examined the possibility of industrialization of sodium carbonate, synthetic magnesite from magnesium salts, lithium, potassium, iodine, bromine, etc., which are still unexploited domestically. The La Pampa Province prefeasibility study contemplates a future detailed study as to the feasibility of recovering synthetic magnesite from magnesium salts. Such a development would require the calculation of reserves contained in the saltwater from the salt deposit. The synthetic magnesite project would cost $60 million and a plant to extract lithium from the same saltwaters would cost an additional $40 million.

MINERAL FUELS

Coal.—Argentina produced about 515,000 metric tons of bituminous coal from mines in the Río Turbio deposits in the southern region of Santa Cruz Province. The output was up 3.5% compared with that of 1981. Proven reserves at Río Turbio totaled 400 million tons. The coal is not of coking quality.

The Spanish Government's mineral exploration agency, Empressa Nacional Adaro de Investigaciones Mineras S.A., was awarded a $20 million contract by Argentina's Yacimientos Carboníferos Fiscales (YCF), to evaluate coal deposits in the Río Turbio coal-mining region of Patagonia. Early studies indicated that such deposits may contain metallurgical coal.

A 4-year project, initiated in 1982, which is to be financed by the World Bank, calls for expanding coal output at Río Turbio from 500,000 to 6 million tons annually. The project includes construction of a railway link to the minesite and the enlargement of the port facilities at Río Gallegos to unload vessels up to 60,000 tons. The Spanish exploration agency will also explore coal reserves in an area north of the Río Turbio district.

After signing a mutual cooperation agreement with Poland in 1982, Argentina announced plans to purchase more coal and mining equipment from Poland. Metallurgical coal imported from Poland will be mixed

with coal from Río Turbio. Imports of metallurgical coal increased 3.4% to 730,000 tons, with the United States supplying 85%; Poland, 6%; Canada, 6%; and Colombia, 3%.

Natural Gas.—Government agencies reported that in 1982 natural gas transported throughout Argentina was almost 12 million cubic meters, an increase of over 13% compared with that of 1981. It is expected that production of natural gas will increase in 1983. Present flaring losses are estimated at 20% of the gross gas production, but these losses should be reduced to 10% over the next 3 years and contribute to greater production.

Imports of natural gas from Bolivia amounted to $378 million. Reportedly, agreement has been reached on a new contract for purchasing natural gas from Bolivia. Volumes had been about 200 to 220 million cubic feet per day, but it was thought that volumes would be reduced by extending the life of the contract beyond 1992.

During 1982, an Argentine-U.S. group began planning a $2.3 billion natural gas project. The proposal involves exports of 500 million cubic feet per day, or 163 billion cubic feet per year, of LNG from Loma de la Lata Gasfield in the Neuquén Basin to the United States and possibly Japan. The project would generate $800 million per year, making it Argentina's single most important export sale to the United States. Approval for the project from the Government had not been issued at yearend.

The natural gas reserves to be used in the LNG trade are located at Loma de la Lata Field, Neuquén Province. The gas will be transported through a 42-inch pipeline to Puerto Madryn in Chubút Province, a distance of 350 miles, where the gas will be liquefied and loaded aboard LNG carriers to be transported to a U.S. receiving terminal. The capital cost of the project based on 1981 prices for the pipeline, liquefaction plant, and port was estimated at $2.3 billion.

Petroleum.—Petroleum output fell to a reported figure of 28.4 million cubic meters (178.9 million 42-gallon barrels) from 28.9 cubic meters (181.5 million 42-gallon barrels) in 1981, despite improved production at the state oil corporation, YPF. The number of oil wells drilled amounted to 793, of which 588 wells were drilled by YPF and 205 were drilled by private contractors.

Talks over the new terms of the renegotiated contract did not progress well, and the official deadline for contract negotiations to set prices for oil compulsorily sold to YPF was moved to late February 1983. The original agreement was scheduled to be completed by the end of the first week of January 1983. Oil industry sources say YPF had offered to raise top prices to about $130 per cubic meter, roughly equal to 60% of world market levels. These offers were met with a poor response from private sector contractors, who wish to retain some of their gas output. However, at yearend YPF had made no concession on this point.

YPF officials expected the new agreement to spur private sector output by as much as 25%. Argentina petroleum imports in 1982 declined about 43.1% compared with those of 1981. There also was a decrease in imports of oil byproducts.

Occidental Petroleum Corp. announced the discovery of a new oilfield in the Mendoza area of Argentina. It was the first discovery since Occidental began exploratory drilling in Argentina in 1981. Occidental is a contractor operator for two Argentine companies, Bridas S.A.P.I.C. and Cía. Química, and Unión Texas that have contracted with YPF. All exploration and drilling costs are born by the contractors. Occidental has a 37.5% interest in the 500,000-acre tract; Unión Texas, 32.5%; Bridas S.A.P.I.C., 20%; and Cía. Química, 10%. The Total Oil Co., which resumed exploration offshore in the Tierra del Fuego area during the summer of 1982, is said to have discovered a new hydrocarbon field.

Uranium-Nuclear Energy.—CNEA, continuing with its nuclear program, brought online a 150-ton-per-year uranium concentration plant at Los Gigantes, 60 kilometers west of Córdoba. The mining and processing plant began operations in November 1982, under a contract awarded by CNEA to Eduardo Sanchez Granel Obras de Ingeniería S.A.I.C.F.I. The company will continue exploring for uranium in the 100-square kilometers surrounding the plant area and also conduct laboratory analysis under CNEA guidance. According to officials, there are 5 million tons of low-grade ore reserves equivalent to 1,500 tons of uranium oxide (U_3O_8). CNEA believes that resources may total 3,000 tons of U_3O_8. A production contract calls for output of 150 tons per year of U_3O_8 that must be sold to CNEA at a negotiated price. The yellow cake will be transported by rail to CNEA plants in Córdoba and Mendoza for conversion to UO_2 pellets. The plant cost was estimated at $6.5 million at exchange rates prevailing in June 1982.

In 1982, CNEA reportedly was close to an agreement with a French consortium for a $150 million contract to develop the Sierra Pintada uranium ore body that contains an estimated 30,000 metric tons of U_3O_8. The contract would call for construction of a 700-ton-per-year concentrator and mill complex. Output of yellow cake during 1982 was estimated at 326 metric tons, a 61% increase over that of 1981.

According to the Argentine nuclear program, operations at the Malargue and San Rafaél plants continued with an output in 1982 of 180 metric tons of U_3O_8, 9% more than was scheduled.

One hundred and twenty tons of U_3O_8 was exported to the Brazilian company Empresas Nucleares Brasileiras S.A. as part of an agreement signed in 1980 between the two nations.

[2]Where necessary, values have been converted from Argentine pesos (M$N) to U.S. dollars at the average exchange rate as of Mar. 21, 1983, of M$N65,100=US$1.00. The exchange rate as of Dec. 31, 1982, was M$N103,300=US$1.00.

The Mineral Industry of Australia

By Charlie Wyche[1]

The Australian minerals industry again faced depressed worldwide economic conditions, high interest rates, liquidity problems, metal surpluses, and falling prices. Nevertheless, the industry remained intact, new production records were established for a number of major commodities, and the value of output increased to a record level in excess of $9 billion.[2] However, overall industry recovery was seen as gradual, and the outlook for 1983 is for a holding operation rather than an expansion. Considerable excess production capacity existed for most mineral commodities, but can be quickly recommissioned to meet renewed demand.

Despite the poor performance, the mining industry maintained a high level of exploration expenditure of $450 million, compared with $350 million in 1981. The industry employed 81,200 people, an increase of 800 over the 1981 total. The mining industry's earnings represented over 35% of Australia's total export revenue. Some 70% of mining company sales revenue was derived from exports.

Foreign interests in the Australian minerals industry continued at a high level and provided not only capital, but new technology, managerial skills, and export market potential. The Government's foreign investment guidelines call for a 50% Australian equity and at least 50% Australian voting strength on the board of all new resource projects except for uranium where the Australian equity is 75%. There is sufficient flexibility to ensure that projects in the national interest can proceed to development with Australian equity and control below the 50% level.

PRODUCTION

Australia is well endowed with an exceptionally broad mineral and energy resource base and produces approximately 70 minerals. Despite a number of setbacks during 1982, strong growth continued in the coal and uranium industries, and new production records were achieved. Production of lead, nickel, natural gas, silver, tin, and zinc was also at record high levels, and gold output increased significantly. Production of bauxite declined, the result of an 8-week strike at Weipa, Queensland. Iron ore production increased slightly, because of fewer industrial disruptions and some stock accumulation; however, steel and manganese output declined. The economic downturn in the major consumer markets of the United States, Japan, and Europe adversely affected outlets for titaniferous concentrates.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Includes data available through Sept. 27, 1983.

[2]Data are for years ending Nov. 30 of that stated for plants owned by The Broken Hill Pty. Co. Ltd.

[3]Western Australia only. Metal content of nickel ore.

[4]Beginning with 1979, production from Western Australia and Northern Territory is included.

[5]Excludes production from Western Australia.

[6]Data are for years ending June 30 of that stated.

[7]Excludes production from Northern Territory and Australian Capital Territory.

[8]Excludes production from Northern Territory, Australian Capital Territory, and Western Australia.

[9]Excludes natural gasoline and liquefied petroleum gas, which are produced on Barrow Island, off the Western Australia coast. An unspecified portion of the liquefied petroleum gas extracted is apparently marketed locally, but this quantity is limited. The bulk of the liquefied petroleum gas and all of the natural gasoline is blended with crude oil and presumably is counted with crude oil from that area. Gross production of liquefied petroleum gas on Barrow Island was as follows, in thousand barrels: 1980—23; 1981-82—not available; of natural gasoline: 1978—33; 1979—31; 1980—26; 1981-82—not available. Natural gas liquid output from several gasfields in Western Australia is excluded for similar reasons. Condensate production from these fields was as follows, in thousand barrels: 1978—19; 1979—20; 1980—22; 1981-82—not available.

[10]Residual fuel oil equivalent.

[11]Reported figure; detail may not add to totals shown.

TRADE

Although a major producer of a wide range of minerals, Australia is relatively unimportant as a consumer, and much of its production was strongly export oriented. Australia's mineral trade was adversely affected by reduced demand and lower prices for some commodities in 1982, but the value of exports established a new record of $8.1 billion. The principal contributors were coal, iron ore, and the aluminum group, which were responsible for about two-thirds of the total mineral export revenue. In particular, exports of black coal contributed a record export value of about $2.6 billion in 1982.

The value of mineral imports was $3.1 billion, compared with $2.4 billion in 1981. As in previous years, imports of crude oil and other refinery feedstock were by far the largest single category, accounting for about 87% of mineral imports.

Table 2.—Australia: Exports and reexports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS				
Aluminum:

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals: Rare-earth metals	114	149	4	Canada 62; United Kingdom 56.
Aluminum:				
Ore and concentrate	11,088	12,801	(1)	China 9,702; Trinidad and Tobago 3,080.
Oxides and hydroxides	7,390	6,956	1,717	Japan 2,628; China 1,598; United Kingdom 362.
Metal including alloys:				
Scrap	3,473	3,012	1	New Zealand 2,367; Hong Kong 406; Papua New Guinea 110.
Unwrought	8,972	9,261	1,907	Canada 3,311; Bahrain 1,897; China 898.
Semimanufactures	11,638	15,521	3,229	Japan 7,975; New Zealand 1,389; United Kingdom 1,386.
Beryllium: Metal including alloys, all forms value, thousands	$19	$18	$5	United Kingdom $13.
Chromium:				
Ore and concentrate	15,476	7,997	--	Philippines 5,700; Republic of South Africa 2,297.
Oxides and hydroxides	1,317	641	163	West Germany 308; Japan 95; U.S.S.R. 51.
Cobalt: Oxides and hydroxides	11	39	7	United Kingdom 27.
Columbium and tantalum: Metal including alloys, all forms, tantalum value, thousands	$53	$51	$8	Netherlands $25; Japan $9.
Copper:				
Ore and concentrate	93	10,006	(1)	Mainly from Papua New Guinea.
Matte and speiss including cement copper	--	188	--	All from Papua New Guinea.
Metal including alloys:				
Scrap	24,186	13,778	--	New Zealand 13,132.
Unwrought	262	2,158	29	Mexico 2,000.
Semimanufactures[2]	800	54,834	260	Japan 53,516.
Iron and steel:				
Iron ore and concentrate:				
Excluding roasted pyrite	14,888	27,932	3	Canada 27,913.
Pyrite, roasted	19	12	--	Netherlands 11.
Metal:				
Scrap	1,247	673	1	Papua New Guinea 542; Singapore 58; New Zealand 18.
Pig iron, cast iron, related materials	9,682	56,422	1,008	India 25,860; Brazil 17,500.
Ferroalloys:				
Ferromanganese	7,204	3,896	18	Republic of South Africa 2,778; Japan 950.
Unspecified thousand tons	35	5,006	19	Republic of South Africa 4,981.
Steel, primary forms	36,367	1,830	11	Japan 867; Philippines 511; West Germany 222.
Semimanufactures:				
Bars, rods, angles, shapes, sections[2]	29,518	95,108	66,366	Japan 16,568; United Kingdom 11,202.
Universals, plates, sheets[2]	169,628	210,049	1,128	Japan 159,169; Republic of Korea 40,168.
Hoop and strip	22,092	[3]9,758	908	Japan 5,755; United Kingdom 2,128; Sweden 433.
Rails and accessories	7,033	12,227	82	Japan 12,089.
Wire value, thousands	$19,932	$16,385	$918	Japan $8,507; Sweden $1,170; New Zealand $1,020.
Tubes, pipes, fittings[2]	147,508	22	20	United Kingdom 2.
Castings and forgings, rough	491	1,027	25	Philippines 255; China 175.
Lead:				
Ore and concentrate	5,000	25,130	--	Republic of South Africa 14,197; Bolivia 5,929; Argentina 5,001.
Oxides	128	232	5	Mexico 58; Netherlands 54; China 52; Republic of South Africa 31.
Metal including alloys:				
Scrap	1,607	391	--	Fiji 156; New Zealand 128; New Caledonia 72.
Unwrought	363	10	NA	New Caledonia 7; China 2.
Semimanufactures	114	111	33	United Kingdom 65.
Magnesium: Metal including alloys:				
Scrap	16	405	300	Norway 100.
Unwrought	2,923	2,312	897	Norway 1,307.
Semimanufactures value, thousands	$1,642	$1,923	$598	Norway $385; Canada $344; United Kingdom $249.

[3]Unreported quantity valued at $125,540,000.

COMMODITY REVIEW

METALS

Aluminum, Alumina, and Bauxite.—The Australian aluminum industry declined in all categories during 1982. Production of bauxite declined about 8% from the 1981 level as a result of a lengthy industrial dispute at the Weipa Mine as well as a decline in market demand. Alumina output fell about 6% owing to weaker world markets. The decline in bauxite and alumina output in Australia marked the third successive annual decline of these two products since the record year of 1979. Despite the installation of new smelter capacity, aluminum metal production dropped about 5% below the 1981 level. During 1982, Alcoa of Australia Ltd. deferred construction on its Portland, Victoria, smelter project, and The Broken Hill Pty. Co. Ltd. (BHP) dropped plans to build a smelter at Lochinvar, in New South Wales. However, the Boyne smelter in Queensland was commissioned, and construction proceeded on schedule on the Tamago smelter project in New South Wales.

The decline in alumina production was attributed to a drop in demand in the world alumina market. Alcoa's alumina refineries at Pinjarra and Kwinana, located in Western Australia, operated at 85% capacity during most of 1982. The company's newly completed Wagerup refinery remained on care-and-maintenance throughout the year. In midyear, Queensland Alumina Ltd. (QAL) reduced the operating rate of its Gladstone refinery to 85% of the rated annual capacity by closing down one of the three digestion units. However, QAL began expanding its rated annual capacity from 2.03 million to 2.33 million tons.

Production declined at Weipa where Comalco Pty. Ltd. produces about 15% of the Western World's total bauxite output. Comalco is owned 45% by Conzinc Riotinto of Australia Ltd. (CRA), 45% by Kaiser Aluminum and Chemical Corp., and 10% by the Australian public. In October 1982, CRA and AMP Society Ltd. acquired Kaiser's 45% share in Comalco for $361.6 million. As a result, CRA increased its share in Comalco by 30%, and AMP Society increased its share by 15%. Comalco produced and shipped about 7.2 million tons of bauxite, mainly to the alumina refinery operated by QAL at Gladstone. All of Alcoa's bauxite output was converted to alumina at its nearby refineries. At Gove, located in the Northern Territory, Nabalco Pty. Ltd. refined about 2.5 million tons of bauxite, roughly one-half of its output. The remainder was exported to Japan and Europe.

The reduction in Australia's aluminum output was due to Alcan Australia Ltd.'s smelter operating at less than its rated capacity. The annual production capacities at the three established domestic smelters were 165,000 tons at Point Henry (Alcoa), 117,000 tons at Bell Bay (Comalco), and 90,000 tons at Kurri Kurri (Alcan). Boyne Smelter Ltd. (Comalco) began commissioning its Boyne Island plant in February. When stage 1, comprising two potlines, is completed in early 1984, the smelter will have a capacity of 206,000 tons.

Copper.—Despite the depressed demand for copper in the world economy, Australian mine production reached a near record level in 1982. Mine production increased because of higher output from Mount Isa, Queensland, and Teutonic Bore, Western Australia; Cobar and Woodlawn, New South Wales; and Mount Gunson, South Australia. Copper production would have been even higher except for reduced output from the Tennant Creek Mine in Northern Territory and the closure of the Dianne and Mount Chalmers Mines in Queensland.

Mount Isa produced over 95% of Queensland's mine output. Production of copper sulfide ore increased by about 18% to 5.3 million tons. Also, a slightly higher grade of ore milled (3.5%) resulted in an increase in concentrate produced. Mount Isa's copper ore was mined primarily from the 1100 and 1900 ore bodies, which have been the major source of ore at Mount Isa since the late 1960's and contained sufficient recoverable ore to continue as the main source of supply until well into the 1990's.

The slight refinery production increase in 1982 was attributed primarily to production by The Electrolytic Refining and Smelting Co. of Australia Ltd. Production of refined copper by Mount Isa decreased. Production was affected by some internal industrial disruption and interruption to power supply during the year. Blister production increased slightly because of higher output at Mount Isa and Mount Morgan, despite lower production at Port Kembla and the closure of the Tennant Creek smelter late in 1981.

In June 1982, the Roxby Downs Indenture Agreement Act received the assent of the South Australian government. The proposed agreement commits Western Mining Corp. Holdings Ltd. (WMC) and BP Australia Ltd. to spend an additional $50 million on the feasibility study of the Roxby Downs project by 1984. A decision to proceed with the project will be made within 3 years of that date. In a quarterly report for the period ended June 1982, WMC stated that widely spaced drilling has shown the Olympic Dam mineralization, drilled on a 200-meter grid, to be about 2 billion tons at an average grade of 1.6% copper, 0.6 kilogram of uranium oxide per ton, and 0.02 troy ounce of gold per ton. Closer spaced drilling in progress over a part of the area has indicated significant tonnages of higher grade material, but so far drilling density was insufficient to enable the calculation of a firm ore reserve.

Copper concentrate production from the Teutonic Bore open pit mine in Western Australia commenced during the year. Early metallurgical problems experienced with the oxidized upper levels of the ore body resulted in low metal recoveries, but these problems were largely overcome by mid-1982. The planned production rate of 300,000 tons of ore annually was reached by yearend.

In December, The Broken Hill Associated Smelters Pty. Ltd. (BHAS) announced that it would proceed with the construction of a plant at Port Pirie for the production of market-grade copper metal from byproduct materials. The plant would have a capacity to produce 4,000 tons of pure copper annually and would cost about $12.3 million. Commissioning of the plant was planned for the latter half of 1984.

Gold.—Mine production of gold rose substantially in 1982. The bulk of the increase was attributable to Western Australia, where most producers recorded substantially higher ore grades throughout the year. Exploration, new development, and redevelopment continued at a high level with major emphasis in Western Australia and the Northern Territory. Production from Kalgoorlie Mining Associates' Fimiston Mine, which completed its first year of operation since reopening, exceeded 64,301 troy ounces. The Kambalda plant, operated by WMC, produced more than 51,441 troy ounces. Output was also higher from Whim Creek Consolidated NL's Haveluck Mine at Meekatharra and from Kia Ora Gold Corp. NL's Marvel Loch operations. New production came from WMC's Lancefield Mine, which began production during the year, and from North Kalgurli Mines Ltd.'s Fimiston Mine, which was reopened late in 1981. In the Northern Territory, output from Peko-Wallsend Ltd.'s Tennant Creek Mines was also higher, resulting from increased emphasis on gold production during 1982.

Development work proceeded at a number of projects, most in Western Australia. In Kalgoorlie, Gold Resources Pty. Ltd. continued redevelopment of the Paringa Mine and commissioned sections of the treatment plant. A mining rate of 130,000 tons per year is planned by mid-1983. Kalgoorlie Mining Associates announced plans to improve recovery at the Oroya mill

with the installation of a plant to treat oxidized ores and flotation tailings. At Mount Charlotte, work on the Cassidy shaft, which provides access to new ore zones, was ahead of schedule. North Kalgurli Mines embarked on a 2-year plan to reestablish ore production at Fimiston of 350,000 tons annually and to improve mine and mill operating efficiency. Since the mine's reopening in 1981, production was below capacity.

Gold treatment facilities, including a roasting plant, were commissioned at the Windarra nickel plant to process ore from the Lancefield open cut mine. A shaft for underground access at Lancefield was nearing completion at the end of 1982.

Carr Boyd Minerals Ltd. commenced evaluation of ore reserves at Harbour Lights, following completion of a drilling program that intersected extensive mineralization. Metana Minerals NL reported 280,000 tons of ore averaging 0.14 troy ounce of gold per ton, at the Reedy Prospect, near Meekatharra.

In Victoria, BHP restarted production from Gaffneys Creek. CRA began preparation of a detailed technical report for submission to the Victorian government, covering research into the feasibility of extracting gold by solution mining.

In Queensland, Central Coast Exploration NL announced plans for a central 150,000- to 200,000-ton-per-year, heap-leaching operation based on prospects in the Croydon area. In the Northern Territory, Enterprise Gold Mines NL announced resources of 5.1 million tons of ore averaging 0.11 troy ounce of gold per ton at its Pine Creek deposit.

Gold from domestic mines accounted for about 80% of Australia's output in 1982, and refined gold produced from imported crude bullion and domestic and imported scrap accounted for the remainder. The Perth mint produces the bulk of refined gold in Australia from crude bullion produced in Western Australia and the Northern Territory and from imported bullion and scrap. Other gold refiners were Matthey Garrett Pty. Ltd., in Sydney, and Engelhard Industries Pty. Ltd., in Melbourne. Crude bullion from Fiji and Papua New Guinea was refined by Matthey Garrett. Two base metal refineries were also sources of refined gold. Electrolytic Refining and Smelting recovered about 10,000 troy ounces of gold from tankhouse sludges resulting from electrolytic refining of copper at Port Kembla, and BHAS recovered about 7,500 troy ounces from lead concentrates refined at Port Pirie, South Australia.

Iron and Steel.—Australia's iron ore output increased partly because of fewer industrial disruptions. World demand, however, remained depressed, and there was some stock accumulation. Increased output at Paraburdoo, Mount Tom Price, and Pannawonica was partly offset by reduced production at Mount Newman, all located in Western Australia.

Production of pig iron decreased by 13%, reflecting reduced steel requirements as well as reduced export demand. The Kwinana blast furnace, which produced mainly for export, was closed indefinitely in April. Furnaces that supplied steelmaking requirements that were taken out of service in mid-year included numbers 1 and 3 furnaces at Newcastle and numbers 2 and 3 furnaces at Port Kembla. Steel production also showed a significant decline in 1982, with output down at all steelmaking centers. Output at Port Kembla dropped by 19% to 3.6 million tons, at Newcastle by 14% to 1.9 million tons, and at Whyalla by 10% to 0.9 million tons. At Port Kembla, open hearth steel production was reduced by approximately 50%. In addition to basic steelmaking plant reductions, rolling mill cutbacks at all steelworks reduced steel product output by BHP by 17% to 5 million tons.

As in recent years, most of the iron ore was produced in the Pilbara region in northwest Western Australia. In this area, five major companies produced about 90% of Australia's total iron ore output. They were Hamersley Iron Pty. Ltd. (Mount Tom Price and Paraburdoo); Mount Newman Iron Ore Pty. Ltd. (Whaleback Hill); Cliffs Western Australia Mining Co. Pty. Ltd. (Robe River); Goldsworthy Mining Ltd. (Mount Goldsworthy, Shay Gap, Sunrise Hill); and Dampier Mining Co. Ltd. (Koolan Island and Yampi Sound). In addition to the Pilbara region, iron ore was mined at Kollyanobbing by Dampier for use in the Kwinana blast furnace. In South Australia, BHP produced ore from the Middleback Ranges for steel plants in Whyalla, South Australia, and in New South Wales (Newcastle and Port Kembla). In a relatively small project, the iron ore at Savage River, Tasmania, was slurried and pumped to a pelletizing plant at Port Latta for shipment to Japan.

Exports of iron ore increased by 2%

mainly because increased exports to Europe, Taiwan, and the Republic of Korea offset reduced shipments to Japan. Shipments to Taiwan and the Republic of Korea increased as steel output in those countries, in contrast to the world trend, continued to expand. The value of exports increased by over 20% to about $1.4 billion because of higher prices and devaluation of the Australian dollar relative to the U. S. dollar in which prices of most contracts are written. Export of pig iron declined again in 1982 after closure of the Kwinana blast furnace. Exports of marketable steel products by BHP, Australia's only steel producer, fell by 7%. The value of exports of all iron and steel products increased by 4% because of the higher value of products shipped. The value of imports increased by 29% to about $615 million. Increased imports of steel, particularly of certain flat products, pipes, and tubes, caused the Government to introduce tariff quotas for those products in August. Australian iron ore exporters and Japanese steel producers concluded negotiations early in 1982 on prices of iron ore for shipment in the year ending March 31, 1983. Price increases ranged from 9.25% to 19.5%.

Australian resources of iron ore were estimated at 35 billion tons consisting of 25 billion tons of hematite with 54% or more iron content and 10 billion tons of limonite with 50% or more iron content. Most of Australia's reserves occur in the Pilbara region, which accounted for over 90% of the production in 1982.

Table 5.—Australia: Major iron ore production, by company

(Thousand metric tons)

Company	Location	Products	Output	
			1981	1982
The Broken Hill Pty. Co. Ltd	South Australia	Lump and pellets	3,200	4,400
Do	Western Australia	Lump	2,720	2,100
Goldsworthy Mining Ltd	do	do	6,294	5,852
Hamersley Iron Pty. Ltd	do	Lump and pellets	29,219	33,500
Mount Newman Mining Co. Pty. Ltd	do	Lump	27,753	27,500

Lead and Zinc.—Australia produced and processed record tonnages of lead and zinc ore. Significant increases occurred at the Broken Hill Mines, operated by Australian Mining & Smelting Ltd. (AM&S), and at the Mount Isa Mine, operated by Mount Isa Mines Ltd. (MIM). The increase at Broken Hill was attributed to additional concentrator capacity, which permitted the mining of larger quantities of lower grade ore. At Mount Isa, production capacity was increased by 20%. Mine output at North Broken Hill Ltd. and at Mineral Mining & Metallurgy Ltd. mines, also operating at Broken Hill, remained at approximately the same level as in 1981. Production increased at the west coast mines in Tasmania but declined slightly at Cobar and Woodlawn.

Production of lead bullion also increased substantially in 1982. The increase was attributed to Mount Isa's record output resulting from the enhanced operating efficiency of its lead smelter. Production by Sulphide Corp. Pty. Ltd. at Cockle Creek decreased slightly. BHAS, Australia's only producer of primary refined lead, increased production in 1982. Production of secondary refined lead decreased because of the curtailment of production at some plants and closure of others. Production of primary refined zinc decreased slightly; increased output at Risdon was offset by decreases at Cockle Creek and Port Pirie.

MIM remained Australia's largest single producer of lead and zinc. Some 3 million tons of lead and zinc ore was mined that contained 6.7% lead and 6.3% zinc. The record treatment of ore through the concentrator was made possible by improved operating efficiency at the plant, the modernization of the flotation sections, and the conversion of a grinding section previously used to retreat smelter slag to treat ore.

The development program to increase production of contained lead at Mount Isa from 150,000 to 180,000 tons annually was substantially completed at yearend. The record level zinc concentrate production resulted from ore treated and the higher average zinc grade of 6.3%. Additional concentrate filtering and storage facilities were commissioned during the year to treat the additional throughput in 1982 and onwards.

MIM's position as a producer of zinc concentrate was enhanced by increased production from the Teutonic Bore Mine. Production commenced in mid-1981 as an open pit operation. The oxidized upper levels of

the ore body initially presented metallurgical problems resulting in low metal recoveries, but these problems were overcome and concentrate production in 1982 exceeded estimates. Sinking of a decline for proving deeper ore commenced during the year and was proceeding ahead of schedule.

Mine output by AM&S and two subsidiaries—Zinc Corp. Ltd. and New Broken Hill Consolidated Ltd. (NBHC)—increased significantly over the 1981 level. The increase in production reflects the completion in 1981 of the expansion program at the NBHC concentrator to permit the mining and treatment of larger quantities of lower grade ore.

The Woodlawn Mine joint venture, consisting of St. Joe Minerals Corp. and Phelps Dodge Corp. of the United States and CRA, increased its zinc concentrate production slightly, but lead concentrate continued to decline reflecting a lower lead-head grade.

The BHAS refinery operated at capacity in 1982, producing record levels of lead and zinc. Raw materials treated comprised mainly Broken Hill concentrates. In addition, 20,000 tons of lead bullion from Sulphide Corp. was refined at Port Pirie. The study of process technology options available for long-term lead smelting and refining at Port Pirie was being evaluated. The zinc expansion feasibility study was completed. The Rosebery and Hercules Mines on the west coast of Tasmania, operated by EZ Industries Ltd., exceeded the 1981 production level.

Table 6.—Australia: Lead and zinc production, by company

(Metric tons)

Company	1981		1982

The Zinc Corp. Ltd	59,400	52,500	68,800	84,000

rRevised.

Manganese Ore.—Virtually all production of manganese ore was by Groote Eylandt Mining Co. Pty. Ltd. (GEMCO), a wholly owned subsidiary of BHP. A drop in world steel output caused demand for manganese to remain depressed. Output dropped over 15% and was less than 50% of production capacity (about 2.5 million tons annually) in 1982. This was the second year in succession that a substantial reduction in output occurred. Plans to expand production capacity to about 3 million tons annually remains dormant.

Export of manganese ore from GEMCO remained at about the 1981 level. Decreased shipments to the Republic of Korea, Europe, and Japan were more than balanced by increased exports to the United States and a resumption of shipments to Pakistan and Taiwan. Shipments of ore for domestic consumption, mainly in manganese alloy and pig iron production, decreased significantly.

Ferromanganese production at Bell Bay by Tasmanian Electro Metallurgical Co. Pty. Ltd., a wholly owned subsidiary of BHP, decreased by about 15%, but silicomanganese production increased by 25%. Reduced demand for manganese alloys led to closure of one production furnace in midyear.

Australian manganese reserves were estimated at about 889 million tons in 1982; the main part was on Groote Eylandt. The remainder was located principally in the east Pilbara and Peak Hill regions of Western Australia and at Pernatty Lagoon in South Australia. Known deposits in the Northern Territory were subeconomic. Large secondary enrichment deposits along the outcrop of the Marra Mamba iron formation in the Pilbara were being evaluated. These deposits were low in silica and consisted of about equal proportions of high-grade ore (40% manganese) and lower grade ores suitable for beneficiation.

Nickel.—Despite reduced world output, Australian production of nickel increased by about 19% owing to mine expansion, higher ore grades mined, and improved nickel-in-concentrate recoveries. Shaft haulage installations aimed at increasing production and recovery of deeper ore was completed at Mount Windarra and continued at Agnew. Production at Nepean Mine was suspended at yearend because declining

prices caused it to become uneconomical. Production at Kambalda from 13 separate mines including Carnilya Hill and Mount Edward at Widgiemooltha increased substantially owing to higher throughput and grades. At Greenvale, production increased as higher ore grades were mined.

At Windarra, WMC and Shell Co. of Australia Ltd. continued to increase output until the last quarter of the year, following its recommissioning during 1981 in conjunction with gold recovery operations. The concentrator was recommissioned at the beginning of the year. Part of the plant was converted to toll treat gold ore from the nearby Lancefield gold operation. A carbon-in-pulp section was commissioned, and work commenced on the installation of a roasting section.

Production at Agnew declined in early 1982, but improved during the second half of the year to the rate achieved during 1981. Metallurgical performance also improved significantly in the second half of the year with the grade of concentrate increasing from 9% to 14%. The deeper mineralization at Agnew constitutes one of the world's major undeveloped sulfide deposits. Activities associated with the exploration of these deposits including the equipping of the exploration shaft continued during the year.

Lateritic nickel ore and refined metal were produced in Queensland by a joint venture of Metals Exploration Ltd. and Freeport of Australia Pty. Inc. The Greenvale ore body, 175 kilometers west of Townsville, contained about 1.3% nickel, which was railed to a refinery at Yabulu near Townsville for treatment. Output increased as higher ore grades were mined.

Australia's identified nickel resources calculated in 1982 by the Bureau of Mineral Resources (BMR) came to 459 million tons of sulfide ore and 155 million tons of lateritic ore. WMC's proved and inferred reserves of sulfide ore came to 23 million tons at a grade of 2.5% nickel plus 4 million tons of 3.7% nickel at the Carnilya Hill prospect, which was 56% owned by WMC.

Silver.—Most of the silver produced in Australia was recovered as a byproduct of lead-zinc mining at Mount Isa, Broken Hill, Rosebery, and Woodlawn. Mine output increased by about 20% in 1982. High mine output and increasing grades were reported at Mount Isa and Broken Hill. High grades and improved metal recovery rates were reported at Woodlawn.

Australia's largest producer of silver, MIM, accounted for over 50% of the country's production. Some 3 million tons of lead-zinc ore averaging 5.3 troy ounces of silver per ton was treated to produce over 15 million troy ounces of silver. Over 85% of the silver was recovered from lead concentrates, and the remainder, from zinc and copper concentrates. At Mount Isa, most of the lead concentrate was smelted to lead bullion, which was exported to the company's lead refinery at Northfleet, United Kingdom, where the contained silver was recovered. Silver in electrolytic tankhouse slimes from the Townsville copper refinery was recovered by Electrolytic Refining and Smelting at Port Kembalda.

The Broken Hill Mines and the Woodlawn Mine was Australia's second largest source of silver in 1982. The bulk of the silver produced at Broken Hill was contained in lead concentrates, most of which were treated at the BHAS lead refinery. At Woodlawn, the source of silver production was lead, zinc, and copper concentrates. (Electrolytic Zinc Co. of Australia Ltd. (EZ Co.) produced silver as a byproduct of zinc-lead-copper mining at Rosebery.)

About 80% of all silver exported was contained in lead bullion; lead, zinc, and copper concentrates; blister copper; and various slags, mattes, and residues.

Table 7.—Australia: Major silver production, by company

(Thousand troy ounces)

Company	1981	1982
Electrolytic Zinc Co. of Australasia Ltd. (Read-Rosebery)	1,930	2,040
Mount Isa Mines Ltd	11,768	15,600
New Broken Hill Consolidated Ltd	1,837	2,015
North Broken Hill Ltd	2,500	4,000
Zinc Corp. Ltd	1,410	1,779

Tin.—Although mine production of tin-in-concentrates was affected by export quotas imposed by the International Tin Council in late 1982, increased production earlier led to a higher overall output. However, production of primary refined tin declined, as demand for use in tin plate continued to decline. Australia ranks high in the Western World as a producer of tin-in-concentrates, and over 50% of the production was exported.

Renison Ltd., owned by Renison Goldfields Consolidated Ltd., is the world's largest underground tin mine. Tin-in-concen-

trates was produced from mining, milling, and concentrating operations at Renison Bell, on the west coast of Tasmania. Ore production decreased by 2% from 656,400 tons in 1981 to 642,900 tons in 1982.

Ore treatment in the expanded concentrator averaged slightly less than designed rates because mill feed from the mine was below required levels owing to industrial disputes. Despite the loss of 1,233 mill hours because of the problems, throughput decreased by only 1.4% to 642,900 tons of ore compared with that of 1981. Recovery at 71.6% was the best yet achieved from a metallurgically complex ore with a head grade of 1.16%. Improved leaching efficiencies enabled an average concentrate grade of 48.9% to be achieved for 1982.

Aberfoyle Ltd., a major Australian tin producer, operated the Cleveland tin mine at Luina, Tasmania, and the Ardlethan Mine in New South Wales. At the Ardlethan Mine, ore production was 515,200 tons, 23% more than in 1981. The average grade of ore mined was 0.41% tin, compared with 0.54% tin in 1981. Ore treated totaled 481,700 tons, 8% more than in 1981. Average metal recovery at 62.7% was 4% higher than in 1981. This was achieved despite a 19% reduction in the grade of ore treated. The first full year's operation of the tin flotation plant and improvements to the gravity concentrator more than offset the losses in tin recovery that would normally result from a reduction in the grade of ore treated.

Ore production from the Cleveland Mine totaled 366,500 tons compared with 436,000 tons in 1981. Mill throughput was reduced by 20%, but recovery increased by only 9%. This was largely a result of the underground ore sorting procedure, which increased minehead grade and metal recovery with a lower throughput.

Greenbushes Tin NL operated its smelter at 75% of design capacity during 1982. The smelter treated 1,020 tons of concentrate to produce 750 tons of tin and 122 tons of tantalum. The production was significantly above the 1981 total, but failed to reach maximum production only because of the introduction of export quotas in the last quarter. Exploration during the year was confined to delineating high-grade alluvial deposits suitable for economic treatment under current metal prices. Sufficient reserves exist to maintain projected production levels for at least 5 to 8 years.

Associated Tin Smelters Pty. Ltd. (ATS), operating at Alexandria, New South Wales, was the other primary tin smelter. The smelter is owned equally by O. T. Lempriere & Co. Ltd., Consolidated Tin Smelters Pty. Ltd., and Australian Iron & Steel Pty. Ltd. Output of the smelter was limited by the low-average grade of concentrates currently available to it and can effectively produce about 7,000 tons of refined tin. In 1982, production by ATS was affected by industrial disputes and 3,100 tons of primary refined tin was produced. Plants in Sydney, Wollongong, and Melbourne produced nearly 400 tons of secondary tin from tin-plating scrap and wastes.

Titanium and Zirconium.—The economic downturn in the major consumer markets adversely affected the demand for titaniferous concentrates, but demand for zircon remained firm. The oversupply of titanium minerals that became evident in the latter part of 1981 continued in 1982. This resulted in further reduction in both production and shipments of Australian rutile and ilmenite concentrates. Production of zircon concentrates increased substantially in Western Australia and was second only to the record total established in 1980.

Australia produces approximately 80% of the world's natural rutile and zircon, 70% of the world's monazite, and more than 25% of the world's ilmenite. As in recent years, virtually all of the rutile, zircon, and monazite output was exported along with about 80% of the ilmenite concentrates. Exports to the United States accounted for more than 30% of total exports, followed by Japan and the United Kingdom. Ilmenite was consumed domestically to produce titanium dioxide pigments and synthetic rutile.

Production of monazite concentrates was maintained at about the 1981 level, of which almost 95% was recovered as byproduct of mineral sand operations in the Eneabba and Capel areas of Western Australia. World demand for rare earths firmed in early 1982 with a marked shift toward metallurgical applications, particularly in the use of rare earths in high-strength, low-alloy steels. Renewed interest was also shown in xenotime and monazite concentrates as a source of yttria for use of phosphorus for color television tubes.

The east coast deposits in New South Wales and Queensland provided the bulk of the country's output of rutile concentrates, but mines at Capel and Eneabba in Western Australia were the country's major suppliers of ilmenite, zircon, and monazite. On the

east coast, Associated Minerals Consolidated Ltd., Consolidated Rutile Ltd., Mineral Deposits Ltd., and Rutile & Zircon Mines Ltd. accounted for most of the output. On the west coast, Allied Eneabba Pty. Ltd. and Westralian Sands Ltd. supplied most of the output of mineral sands.

Australia has considerable reserves of mineral sands. According to a BMR 1982 assessment, identified resources of ilmenite total about 61.5 million tons. About one-third of these resources has too high of a chromium content or otherwise is not suitable for titanium oxide pigment production by the current sulfate process. Economically recoverable reserves of other mineral sands include about 8.5 million tons of rutile, 13 million tons of zircon, and 383,000 tons of monazite. In keeping with its policies to encourage more domestic processing of local mineral production, the Australian Government has been cooperating with the State governments and the mineral sands industry to study the possible creation of new industries using mineral sands as a raw material.

NONMETALS

Diamond.—In 1982, Australia became a commercial producer of diamonds. The Argyle Diamond Mines Joint Venture, in which CRA group companies hold a 56.8% interest, commenced mining and recovery of alluvial diamonds at Argyle in the north of Western Australia. Argyle Diamond Mines Pty. Ltd. (owned 100% by CRA) is the manager and operator of the joint venture.

A program was undertaken during the year to upgrade the plant to enable it to treat 2,000 tons of alluvial material daily. These modifications included construction of a new diamond final recovery plant. Further modifications to expand the plant's capacity to 4,000 tons annually were in progress. This program, costing about $9 million, was expected to be completed during the second quarter of 1983. The plant would then have the capacity to produce about 5 million carats annually from alluvial deposits. Also during 1982, a 34.5-kilometer pipeline was constructed from Lake Argyle to the minesite to provide water for commercial alluvial production and for construction of the proposed large-scale Kimberlite plant.

At yearend, a cumulative total of 408,392 carats of diamonds had been recovered from 62,846 tons of ore from the Kimberlite pipe AK-1. An additional 362,353 carats were recovered from 86,715 tons of alluvial material taken from Upper Smoke Creek, 17,823 carats from 22,070 tons from Lower Smoke Creek Alluvium, and 21,809 carats from 11,864 tons recovered from Limestone Creek.

In December, CRA and Ashton Mining signed a diamond export sales agreement with the Central Selling Organization for the sale of their respective portions of the Argyle production.

Phosphate Rock.—Production of phosphate rock from Phosphate Hill, about 65 kilometers south of Duchess, Queensland, continued throughout 1982. Shipments from the mine, which resumed operation in November 1981, began in February 1982, and 102,000 tons was supplied to domestic and Southeast Asian markets. WMC, through its 80.2% ownership of BH South Ltd., controls the Duchess deposits.

Mining was in the high-grade deposit areas where rock can be produced with a 30% P_2O_5 content after washing and screening. The bulk of the deposits was of lower grade rock, and investigations into upgrading the lower grade reserves by both physical and chemical methods continued.

A contract was finalized with the Australian fertilizer industry to take 100,000 tons annually of phosphate rock for 3 years commencing in 1982. Negotiations under the terms of the contract regarding price and quality conditions for 1982 and 1983 deliveries were continuing.

A small amount of phosphate rock was also mined in South Australia in the vicinity of Moculta. Output amounted to about 7,500 tons. The reserves there were small, only about 100,000 tons, so activity will continue to be on a small scale.

Salt.—Production of salt is closely tied to the level of world economic activity. Consequently, Australia's production declined in 1982 owing to a recession in the chemical industry of the sector's main market, Japan. Approximately 80% of Australia's output was exported, and nearly three-quarters of the exports went to Japan. Three companies—Dampier Salt Pty. Ltd., Leslie Salt Co., and Shark Bay Salt Pty. Ltd. (all based in Western Australia)—produced more than 80% of the total output. Producers in South Australia, Victoria, and Queensland supplied the remainder. All production in Australia was by solar evaporation, mainly from seawater but also from lake and underground brines.

Western Australia produced about 3.6

million tons of salt and exports totaled 3 million tons. About two-thirds of Western Australia's salt production was by Dampier Salt from operations at Dampier and Lake MacLeod. In response to reduced demand, combined production from both sites declined to 2.7 million tons, compared with 3.3 million tons in 1981. There was a reduction in industrial disputes compared with those of 1981. Total shipments for the year were 2.6 million tons with 1.9 million tons being shipped from Dampier and 0.68 million tons from Lake MacLeod.

Cargill Inc. produced about 700,000 tons of salt at its Port Hedland plant. Export sales were about 620,000 tons, and domestic sales, 2,000 tons. Lefroy Salt Pty. Ltd. harvested 132,000 tons of salt from it Lake Lefroy ponds and exported 77,000 tons from its Esperance stockpile.

Salt requirements for the Australian industry were supplied mainly by producers in Queensland, Victoria, and South Australia. The principal producer in South Australia and Queensland was Imperial Chemical Industries of Australia and New Zealand Ltd., which operated solar evaporation projects. In Victoria, virtually all of the State's output was produced by Cheetham Salt Ltd.

Australia's consumption of salt in 1982 was estimated at 900,000 tons, of which about 600,000 tons was used by the chemical industry for producing sodium hydroxide and sodium carbonate and 260,000 tons were used in industrial applications, in food processing, and in households.

Sulfur.—No deposits of elemental sulfur are known in Australia, and domestic requirements of sulfuric acid were met from imported brimstone. Also, smaller quantities of sulfur were recovered from sulfur-bearing emissions of some metal sulfide smelting operations and from oil refining. About 95% of the sulfur was consumed in the form of sulfuric acid to produce fertilizer, particularly superphosphate.

Sulfur was also obtained from petroleum by Petroleum Refineries Ltd. at Altona, Victoria, and Hallett's Cove, South Australia; Shell Refining Pty. Ltd. at Clyde, New South Wales, and Geelong, Victoria; Australian Oil Refining Pty. Ltd. at Kernell, New South Wales; and Amoco Pty. Ltd. at Bulwer Island, Queensland. The combined capacity of the plants was up to 52,000 tons per year, but the total output from petroleum in 1982 was about 14,000 tons.

Only EZ Co., at Rosebery, and The Mount Lyell Mining and Railway Co. Ltd. produced pyrite for acid production as a byproduct of base metal mining. Acid from this pyrite was produced at Burnie, Tasmania, by North-West Acid Pty. Ltd. in which the mining companies each have a 50% interest. The production by North-West Acid totaled about 273,018 tons of sulfuric acid compared with 281,000 tons in 1981.

MINERAL FUELS

Coal.—Despite the world economic recession that confronted the world coal industry in 1982, Australia expanded its previously established production record. The growth in production can be attributed to increasing contributions by new mines in New South Wales and Queensland as well as greater industrial harmony in the mines. Australia's production capability will increase further in the next couple of years as new mines such as Oky Creek and Riverside (Queensland) come onstream. There were smaller operations in the Collie Field of Western Australia and in Tasmania. Subbituminous coal at Leigh Creek in South Australia was mined for power generation use.

Consumption rose only slightly because of the general economic recession in Australia. Difficulties encountered by the steel industry restricted demand in that sector. Demand for coal for electricity generation was also restricted by the economic decline.

In response to economic difficulties facing coal producers, the Federal Government removed the $1 per ton export levy applied to some coals. The $3.50 per ton export levy applied to some coking coals was retained. The New South Wales government froze royalty rates on coal at $1.70 per ton until June 30, 1983. It was reported that the Queensland government would reduce infrastructure requirements and consider cost problems of new mines in relation to royalties and freight rates.

Production of coal in New South Wales in 1982 rose 7% to 64.9 million tons. Production from underground mines accounted for about 75% of the total output, and open pit mines, the remainder. Despite weaker demand for export coal, particularly in the last half of the year, exports from New South Wales reached the record high total of 25 million tons. Coal-handling capacity at Newcastle has imposed some limitations but is unlikely to improve significantly

until the new Kooragang coal loader becomes operational.

Queensland production of coal increased 6% to 47.8 million tons. In Queensland, most of the coal was won from open cut mines. As a result of lower shipments to Japan, Queensland's exports declined slightly. Japan remains the major buyer of Australian coal. Two open pit coking coal projects continued to progress, and a third one was at the final stage of development. At the end of 1982, coal was being won from 21 open pit and 25 underground mines.

Considerable progress was made with improvement of Australia's export facilities. The New Port Kembla coal loader commenced operations during the year, almost doubling the port's capacity to 14 million tons. At Newcastle, construction of the New Kooragang Island coal loader commenced, and expansion of the Port Waratah Coal Services Ltd. loader was underway. In Queensland, Gladstone Harbor was deepened and construction of the new loaders at Dalymple Bay and Abbot Point was nearing completion.

As a result of continued exploration, Australia's demonstrated resources of black coal total 52.9 billion tons, of which 30.4 billion tons is recoverable. During 1982, 1.3 billion tons was added to the demonstrated resources. Most of the resources were concentrated in the Bowen Basin in Queensland and the Sydney Basin in New South Wales. Although resources are much smaller in Tasmania, South Australia, and Western Australia, they are important energy sources for local use. Exploration in these States was continuing, and in the past year, resulted in further delineation of resources at Woodbury, Tasmania, the Arckaringa Basin, South Australia, and Eneabba, Western Australia.

Lignite.—Victoria was the only State that produced lignite in 1982. The major deposits in Victoria were in the Lathobe Valley, 130 to 200 kilometers southeast of Melbourne, where the State Electricity Commission, at Yallourn and Morwell, produced more than 95% of the State's total output. The remainder was produced from company-owned mines at Anglesea and Bacchus Marsh. Output increased significantly in 1982, as Victoria expanded its generation capacity. Research continued on the future use of coal as feedstock in coal liquefaction schemes.

Australian coal resources are among the largest in the world. Demonstrated and inferred resources of Australian brown coal were listed as 44 billion tons, of which 36.3 billion tons was considered economically recoverable. Total economic and subeconomic brown coal resources were calculated at 126.5 billion tons, of which 116.3 billion tons was considered as potentially recoverable. The brown coal deposits in Australia are more concentrated than those for black coal, with over 95% of the total economic and subeconomic resources located in the Latrobe Valley and adjacent regions.

Petroleum and Natural Gas.—Production of both crude petroleum and natural gas increased compared with that of 1981. Almost 94% of the crude oil production came from the offshore oilfields in the Bass Strait, between Victoria and Tasmania. An additional 5.8% of the total domestic production came from Barrow Island Field off the coast of Western Australia. The small remaining quantity came from the nearly depleted Moonie Field in Queensland. Gas production increased as the gas supply network continued to expand. All of Australia's capital cities, except Darwin, have access to natural gas.

Australia's refineries processed about 200 million barrels of crude oil in 1982. Indigenous crude oil supplied over 65% of this total; the remainder was supplied mainly from the Middle East.

Drilling activity in Australia was at a record level, and a total of 389 wells were drilled for petroleum exploration and development. Of these, 239 were exploratory (187 onshore, 52 offshore) and 150 were development wells (91 onshore, 59 offshore). Highlights of onshore exploration were gas and oil discoveries in the Bowen Basin and gas discoveries in the Cooper, Perth, and Amadeus Basins. Extensions of known fields in the Bowen-Surat, Amadeus, Perth, and Cooper Basins were successfully proven by appraisal drilling. Offshore exploration activity was greatest in the Gippsland and Carnarvon Basins. The only significant oil discoveries were made in the Gippsland Basin, but substantial new discoveries of gas were made in the Browse and Gippsland Basins.

The North West Shelf Natural Gas Development Project moved ahead against excalating costs and delays in export contracts. The project is designed to exploit 8 to 9 trillion cubic feet of gas in the North Rankin and neighboring Goodwyn offshore gasfields, 130 kilometers northwest of Dampier. The first stage of the project was

designed to produce 385 million cubic feet of natural gas per day for the Western Australian domestic market by 1982. The second stage will produce 6 million tons of liquefied natural gas for sale to Japan, 640,000 tons of liquid petroleum gas, and 1.4 million tons of condensate. The total costs for both projects were estimated at $8 billion in 1982 dollars.

Uranium.—Production of uranium oxide in Australia reached a new record high in 1982 increasing more than 50%. The principal reason for the increase in production was that the new Ranger Mine operated throughout the year. With an annual capacity of 3,000 tons of uranium oxide. Ranger was the largest mine operating in the country. Mary Kathleen Uranium Ltd. (MKU) and Nabarlek were other producers.

MKU ceased mining operations in September, and the treatment plant was closed in October. Production by MKU was 858 tons of uranium oxide (727.6 tons of uranium), which was slightly more than in 1981. The company announced that the reserves left unmined and in low-grade stockpiles after the closure would not be adequate to enable the company to continue to operate. Exploration in the vicinity of MKU and elsewhere in the region was unsuccessful. Total production since the mill was recommissioned in 1975 to closure in October 1982 was 4,800.5 tons of U_3O_8 (4,071 tons of uranium).

Energy Resources of Australia Ltd. (ERA) reported production at Ranger exceeded designed capacity. Total production for 1982 was 3,135 tons of U_3O_8 (2,658 tons of uranium). Diamond drilling of the central portion of the No. 3 ore body resulted in a significant upgrading in quantity of ore. ERA reported that the ore reserves, as of July 1982, in the No. 1 and No. 3 ore bodies and in stockpile totaled 51 million tons averaging 0.25% U_3O_8 (125,833 tons of contained U_3O_8).

Production by Queensland Mines Ltd. from stockpiled ore at Nabarlek was less than that for 1981. The company plans to commence an exploration program over its special mineral lease in an effort to locate additional resources.

WMC reported that drilling at Olympic Dam indicated mineralization of 2 billion tons at an average grade of 1.6% copper, 0.6 kilogram of U_3O_8 per ton, and 0.02 troy ounce of gold per ton. Also in September, WMC reported that the feasibility study for the Yeelirrie project was completed and submitted to the joint venture.

The Mineral Industry of Austria

By George A. Rabchevsky[1]

In 1982, the Austrian general economy remained almost immune to recession and inflation stood at 5.4%. Nevertheless, the worldwide recession and inflation affected the mining and mineral industry, as reflected in overall lower production and sales. The mineral industry was small, and the economy continued to depend heavily on tourism for income. A budget deficit of $2.7 billion,[2] or 4% of the gross domestic product (GDP), was caused mainly by the Government's attempt to preserve jobs in the debt-ridden state-owned industries, which included iron and steel. Unemployment was up slightly at 3.7%, in part because of an expanding labor force. Industrial employment continued to decline, 3.5% or 22,000 persons in 1982, mainly because of the international steel crisis in 1981. In 1982, 2,766,350 workers were employed, or 36% of the population, about 10,200 of whom were in the minerals industry. Salaries and wages throughout the economy rose 7.5% and those of miners and of metal workers were considered to be the highest among the labor force.

PRODUCTION

Industrial production, in general, expanded 1% after its fall by 1.2% in 1981. The mining industry and basic materials output, however, declined by 5%. The relatively large Austrian iron and steel industry was beginning to experience problems because of repeated and costly Government-financed bailouts. It was thought that some of the plants might have to be shut down, unable to compete with the cheaper production costs in the lesser developed countries. The high costs of product transportation, labor, and raw materials were a major problem. Nevertheless, labor costs per unit of production rose less in Austria than in most of its European trading partners.

TRADE

Austria's exports rose by 11.3% to $14.8 billion in 1981, in current prices, equal to nearly one-quarter of the GDP. Exports to European Communities (EC) countries increased by about 50%. The foreign trade deficit was thus reduced by more than one-fifth. More than one-half (53%) of all exports went to the EC. The Federal Republic of Germany was Austria's main trading partner. Almost 62% of all imports came from the EC, more than 10% came from the Council for Mutual Economic Assistance (CMEA), and about 7%, mostly oil, came from the Organization of Petroleum Exporting Countries (OPEC). In 1982, 11% of all Austrian imports came from CMEA countries and 11.10% was exported to them. About 4% of Austrian imports came from the United States. The increase in the U.S. market share in recent years was largely due to growing deliveries of coal, aircraft, and office machines. The U.S. share in total Austrian imports was 3.7% in 1982.

Other:				
Ores and concentrates	134	63	--	West Germany 62.
Oxides and hydroxides	r679	395	120	Italy 119; West Germany 43; United Kingdom 38.
Ashes and residues	73,724	92,526	6	Italy 63,027; West Germany 24,717; Spain 1,901.
Waste and sweepings of precious metals value, thousands	$6,221	$1,940	NA	West Germany $1,475; United Kingdom $248; France $212.
Base metals including alloys, all forms	609	603	81	Italy 242; West Germany 159; United Kingdom 78.

See footnotes at end of table.

Table 2.—Austria: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	11	12	--	Yugoslavia 10; West Germany 2.
Artificial: Silicon carbide	8	83	NA	West Germany 38; Yugoslavia 27.
Dust and powder of precious and semiprecious stones including diamond ---- value	$8,656	$3,780	--	Albania $3,000.
Grinding and polishing wheels and stones	14,032	13,475	50	West Germany 1,892; France 1,082; Romania 908.
Asbestos, crude	4	18	--	All to Switzerland.
Boron materials:				
Crude natural borates	--	1	--	All to Yugoslavia.
Oxides and acids	16	23	NA	Yugoslavia 22.
Cement	32,632	22,240	--	West Germany 12,912; Yugoslavia 4,518; Italy 2,858.
Chalk	2,495	2,604	--	Hungary 1,804; Iran 240; Italy 219.
Clays and clay products:				
Crude:				
Bentonite	2	3	--	NA.
Chamotte earth	(1)	25	--	NA.
Dinas earth	273	765	NA	Hungary 396; Poland 119; Finland 117.
Kaolin	29,075	24,987	NA	Hungary 10,743; Italy 10,474; Switzerland 760.
Unspecified	r1,090	135	NA	West Germany 75; India 17.
Products:				
Nonrefractory	79,908	72,384	--	West Germany 65,809; Italy 2,807; Switzerland 2,259.
Refractory including nonclay brick	r356,382	328,992	3,971	West Germany 41,069; France 32,567; Italy 27,103.
Diamond:				
Gem, not set or strung value, thousands	$813	$349	--	West Germany $172; Switzerland $67; United Kingdom $60.
Industrial ---- value	$11,284	$2,951	--	West Germany $1,975; Belgium-Luxembourg $976.
Diatomite and other infusorial earth	1,135	492	--	Yugoslavia 188; Czechoslovakia 161; Hungary 51.
Feldspar, fluorspar, related materials:				
Fluorspar	--	9	--	West Germany 5; Yugoslavia 2.
Fertilizer materials:				
Crude, n.e.s	669	229	--	Switzerland 128; Italy 74.
Manufactured:				
Phosphatic	10,058	16,285	NA	Hungary 13,218; Czechoslovakia 3,039.
Potassic	--	7	--	NA.
Unspecified and mixed	720,738	748,924	15	West Germany 460,850; Italy 57,743; Egypt 40,341.
Graphite, natural	16,576	14,640	15	Poland 6,570; West Germany 4,254; East Germany 1,025.
Gypsum and plaster	136,888	191,836	--	West Germany 175,627; Italy 14,936; Hungary 1,194.
Halogens: Unspecified	(1)	5	--	All to West Germany.
Lime	1,404	1,173	--	West Germany 1,029; Hungary 68; Poland 42.
Magnesium compounds: Magnesite	137,836	96,636	334	West Germany 32,497; France 12,974; Hungary 12,194.
Mica:				
Crude including splittings and waste	230	448	--	Yugoslavia 271; Greece 150; West Germany 21.
Worked including agglomerated splittings	135	136	--	Yugoslavia 33; West Germany 28; Czechoslovakia 27.
Pigments, mineral:				
Natural, crude	5,902	7,047	89	West Germany 2,069; United Kingdom 1,393; Australia 817.
Iron oxides and hydroxides, processed	6,301	500	--	West Germany 304; Netherlands 160; United Kingdom 19.
Precious and semiprecious stones other than diamond:				
Natural ---- thousand carats	3,200	1,025	45	West Germany 690; Finland 45; Italy 15.
Synthetic ---- do	7,465	6,315	1,890	West Germany 690; Japan 425; United Kingdom 360.

See footnotes at end of table.

Table 2.—Austria: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Pyrite, unroasted	19	46	--	Spain 44; Italy 1.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	3	42	NA	Yugoslavia 40.
Sodium carbonate, natural and manufactured	471	1,777	NA	Hungary 1,057; Yugoslavia 602; Egypt 70.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	153,366	107,248	--	West Germany 102,885; Switzerland 4,287.
Worked	23,302	22,760	220	West Germany 12,056; Switzerland 10,096; Hungary 89.
Dolomite, chiefly refractory-grade	6,865	4,965	--	West Germany 3,861; France 443; Iraq 176.
Gravel and crushed rock	441,312	465,493	--	Switzerland 241,081; West Germany 215,266; Hungary 5,140.
Limestone other than dimension	469	971	--	West Germany 956; Switzerland 15.
Quartz and quartzite	57	156	--	Netherlands 69; West Germany 26; East Germany 23.
Sand other than metal-bearing	149,885	187,914	--	Switzerland 96,911; West Germany 26,212; Italy 3,115.
Sulfur: Sulfuric acid	5,486	5,835	NA	Yugoslavia 3,539; Italy 2,039; Switzerland 180.
Talc, steatite, soapstone, pyrophyllite	97,760	101,322	233	West Germany 52,176; Italy 15,515; Switzerland 7,374.
Other:				
Crude	r5,798	5,918	NA	West Germany 4,698; France 557; Netherlands 224.
Slag and dross, not metal-bearing	174,295	108,887	--	West Germany 96,293; Italy 6,372; Czechoslovakia 2,278.
Oxides and hydroxides of barium, magnesium, strontium, kilograms	300	200	--	NA.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	134	35	--	East Germany 30.
Carbon: Carbon black	203	50	--	All to West Germany.
Coal:				
Anthracite and bituminous	80	158	--	Yugoslavia 87; Switzerland 62.
Briquets of anthracite and bituminous coal	18	36	--	Switzerland 28; Yugoslavia 8.
Lignite including briquets	24,071	19,556	--	West Germany 19,485; Switzerland 38.
Coke and semicoke	1,655	546	--	West Germany 280; Sweden 180; Switzerland 83.
Gas, natural, thousand cubic feet	--	424	--	NA.
Hydrogen, helium, rare gases, do.	r33,694	31,862	NA	Hungary 9,375; Romania 7,496; Czechoslovakia 2,780.
Peat including briquets and litter	836	2,087	--	Italy 1,414; West Germany 480; Switzerland 193.
Petroleum and refinery products:				
Crude, 42-gallon barrels	15	51	--	All to Czechoslovakia.
Refinery products:				
Liquefied petroleum gas, do.	673,368	208,916	--	Netherlands 131,579; West Germany 59,972; Italy 9,686.
Gasoline, do.	r69,811	38,395	--	West Germany 17,340; Yugoslavia 6,724; Czechoslovakia 5,236.
Mineral jelly and wax, do.	174,926	141,740	NA	Netherlands 89,269; West Germany 40,680; Italy 6,571.
Kerosine and jet fuel, do.	r6,673	86,924	--	U.S.S.R. 74,594; Hungary 4,224; West Germany 3,108.
Distillate fuel oil, do.	1,574	2,111	--	Yugoslavia 1,358; Czechoslovakia 753.
Lubricants, do.	r538,209	497,119	14	Czechoslovakia 182,833; Hungary 111,867; Yugoslavia 96,712.
Residual fuel oil, do.	959	992	--	Czechoslovakia 553; Switzerland 233; Yugoslavia 153.
Bitumen and other residues, do.	24,525	24,028	--	Yugoslavia 7,139; West Germany 6,405; Algeria 2,745.
Bituminous mixtures, do.	44,808	37,899	--	Algeria 15,077; West Germany 8,387; Libya 4,745.
Petroleum coke, do.	94	--		
Tars and other crude chemicals derived from coal, gas, and petroleum	18,108	19,059	--	West Germany 14,796; Yugoslavia 2,794; France 1,023.

rRevised. NA Not available.

Table 3.—Austria: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals:				
Alkaline-earth metals	(1)	4	NA	NA.
Rare-earth metals	2	3	--	All from West Germany.
Unspecified	81	37	1	West Germany 35; Netherlands 1.
Aluminum:				
Ore and concentrate	41,706	36,655	NA	NA.
Oxides and hydroxides	237,761	274,413	NA	NA.
Metal including alloys:				
Scrap	52,632	68,023	462	U.S.S.R. 47,273; Hungary 8,763; Czechoslovakia 2,816.
Unwrought	35,182	33,160	21	West Germany 19,910; Norway 4,412; France 2,379.
Semimanufactures	38,947	37,352	56	West Germany 17,905; Switzerland 6,068; Italy 3,686.
Antimony:				
Ore and concentrate	467	37	--	All from Canada.
Oxides	NA	98	--	Belgium-Luxembourg 69; West Germany 14; United Kingdom 13.
Metal including alloys, all forms	63	52	NA	Belgium-Luxembourg 47.
Cadmium: Metal including alloys, all forms	5	3	--	France 2.
Chromium:				
Ore and concentrate	77,407	42,334	--	Republic of South Africa 27,924; Philippines 4,598; Turkey 3,928.
Oxides and hydroxides	697	371	--	West Germany 234; U.S.S.R. 121; Italy 15.
Cobalt: Oxides and hydroxides	4	3	1	Belgium-Luxembourg 1; West Germany 1.
Columbium and tantalum: Metal including alloys, all forms, tantalum	37	19	8	Italy 5; Japan 3; Taiwan 3.
Copper:				
Ore and concentrate	(1)	24	--	All from Italy.
Oxides and hydroxides	44	47	NA	West Germany 25; Belgium-Luxembourg 20.
Sulfate	562	613	--	Italy 586; West Germany 26.
Metal including alloys:				
Scrap	20,112	18,074	18	West Germany 8,174; Hungary 4,377; U.S.S.R. 2,658.
Unwrought	15,648	12,975	12	Republic of South Africa 7,463; West Germany 2,455; Chile 1,201.
Semimanufactures	61,579	63,183	65	West Germany 32,616; France 8,353; Belgium-Luxembourg 5,042.
Gold:				
Waste and sweepings value	--	$9,857	--	NA.
Metal including alloys, unwrought and partly wrought troy ounces	27,296	100,953	4,405	Republic of South Africa 37,038; West Germany 36,620; Switzerland 19,966.
Iron and steel:				
Iron ore and concentrate:				
Excluding roasted pyrite thousand tons	3,336	3,423	--	Brazil 1,036; Canada 841; Sweden 789.
Pyrite, roasted	48,448	45,515	--	Yugoslavia 33,178; West Germany 7,179; Italy 5,156.
Metal:				
Scrap	143,216	169,755	82	West Germany 71,169; Bulgaria 38,481; Czechoslovakia 22,902.
Pig iron, cast iron, related materials	103,294	81,995	6	U.S.S.R. 39,334; West Germany 11,634; Canada 10,127.
Ferroalloys:				
Ferrochromium	24,578	16,827	--	Yugoslavia 4,120; U.S.S.R. 3,369; Czechoslovakia 3,423.
Ferromanganese	23,070	21,804	--	Norway 12,390; West Germany 6,622; Yugoslavia 1,802.
Ferromolybdenum	109	31	2	West Germany 14; Spain 5; Sweden 4.
Ferrosilicon	14,020	13,368	--	Yugoslavia 7,824; U.S.S.R. 2,116; West Germany 1,364.
Unspecified	23,081	11,329	--	West Germany 2,304; Czechoslovakia 2,101; France 1,036.

See footnotes at end of table.

Table 3.—Austria: Imports of mineral commodities —Continued

Iron and steel —Continued				
Metal —Continued				
Steel, primary forms	185,941	181,564	(1)	Bulgaria 49,238; West Germany 39,493; Hungary 37,161.
Semimanufactures:				
Bars, rods, angles, shapes, sections	241,153	232,755	16	West Germany 112,732; Italy 67,000; Belgium-Luxembourg 17,519.
Universals, plates, sheets	227,436	223,979	140	West Germany 114,778; Belgium-Luxembourg 20,347; Italy 19,729.
Hoop and strip	75,722	67,802	4	West Germany 49,573; Italy 5,470; France 3,621.
Rails and accessories	4,908	5,725	--	West Germany 2,989; Switzerland 1,580; Belgium-Luxembourg 402.
Wire	27,217	27,158	372	West Germany 10,505; Belgium-Luxembourg 4,917; France 4,848.
Tubes, pipes, fittings	159,224	155,902	75	West Germany 86,453; Italy 21,192; Switzerland 9,120.
Castings and forgings, rough	12,598	12,502	2	West Germany 9,437; Italy 908; Switzerland 780.
Lead:				
Ore and concentrate	4,156	1,728	--	All from Italy.
Oxides	282	1,009	--	West Germany 681; Netherlands 304; Bulgaria 21.
Metal including alloys:				
Scrap	2,628	3,605	--	Switzerland 2,657; Hungary 521; West Germany 385.
Unwrought	32,396	35,740	56	West Germany 16,201; Belgium-Luxembourg 4,857; Denmark 3,685.
Semimanufactures	941	750	--	West Germany 607; United Kingdom 74; Denmark 38.
Magnesium: Metal including alloys:				
Scrap	201	52	--	All from West Germany.
Unwrought	1,823	1,968	381	Italy 819; Norway 423; Canada 162.
Semimanufactures	204	159	22	West Germany 98; Switzerland 14; United Kingdom 14.
Manganese:				
Ore and concentrate, metallurgical-grade	1,726	459	--	Australia 225; Netherlands 156; Belgium-Luxembourg 39.
Oxides	111	34	--	All from West Germany.
Mercury 76-pound flasks	566	441	--	West Germany 334; Spain 52; U.S.S.R. 49.
Metalloids:				
Arsenic, oxides and acids	15	9	--	West Germany 6.
Unspecified	5,502	5,677	--	Netherlands 4,283; Italy 845; West Germany 404.
Molybdenum:				
Oxides and hydroxides	1,527	1,493	NA	NA.
Metal including alloys:				
Scrap	322	182	8	Hong Kong 61; Australia 56; Canada 30.
Unwrought	42	2	NA	Mainly from West Germany.
Semimanufactures	2	5	3	West Germany 1.
Nickel:				
Matte and speiss	1,279	734	314	Netherlands 183; Cuba 176; West Germany 27.
Metal including alloys:				
Scrap	1,597	567	50	West Germany 230; Canada 91; Netherlands 80.
Unwrought	2,378	2,586	234	Canada 465; Republic of South Africa 407; Philippines 261.
Semimanufactures	548	429	155	West Germany 145; Republic of South Africa 48; France 43.
Platinum-group metals: Metal including alloys, unwrought and partly wrought, unspecified troy ounces	26,460	24,274	(1)	West Germany 18,358; Switzerland 2,572; U.S.S.R. 1,736.
Silver:				
Waste and sweepings value, thousands	$1,129	$1,235	--	West Germany $1,112; Yugoslavia $123.
Metal including alloys, unwrought and partly wrought thousand troy ounces	4,347	5,859	244	West Germany 4,622; Switzerland 792; United Kingdom 67.

COMMODITY REVIEW

METALS

The mining tradition in Austria is about 4,000 years old. The copper ore at Muhlbach (Carinthia) for example, had been mined in prehistoric times. The Hallstatt culture of the Bronze Age was also based on the mining of salt in the mountains near Hallstatt, the "Salzkammergut." The Romans mined iron ore and precious metals, and during medieval times and later, mining of copper, lead, and silver was of great importance. Most Austrian deposits, however, are of small size, a consequence of the very complicated tectonics of the Alpine region, causing wedging out of ores and displacements by faulting. In 1982, there were only six operating metal mines in Austria, all located in the Alps. It is said that Austria is rich in poor deposits. Austria nowadays emphasizes the production of hydrocarbons, refractive and industrial minerals, and raw materials for construction purposes.

Iron and Steel.—Iron ore is surface mined at Erzberg, in the northern Greywacke zone of Styria, in central Austria. The mine is the largest surface operation in the country and the most famous iron ore deposit in Europe. The ore is bounded by Paleozoic limestones and occurs as siderite and anhydrite, with about 28% to 32% iron and 1.5% to 2.0% manganese. Proven and probable ore reserves amount to about 27 million and 166 million tons, respectively. At the present rate of mining, the ore may be depleted in 50 to 55 years. The entire yearly production of 3.0 to 3.5 million tons of concentrate is delivered to the Donawitz steel plant nearby. Although there are

many other occurrences of siderite in the Greywacke zone, no other minable deposits exist except for some specular hematite at Waldenstein in Carinthia that is used for rustproofing.

Austria's output of iron and steel continued to decline except for finished products and special steels. Practically all domestic steel companies operated at a loss. To keep the ailing steel industry alive, the Federal and State governments had given the companies about $432 million in aid by 1982; an additional $59 million was to be allocated early in 1983, reportedly to partially compensate the companies' losses in 1982 and 1983.

Voest-Alpine AG (VA), and Vereinigte Edelstahlwerke AG (VEW), both state-owned, were the only two Austrian companies producing specialty steels. VEW was the leading manufacturer of specialty steel, producing the following quantities in the last 5 years (in metric tons): 1978—262,000, 1979—300,000, 1980—242,776, 1981—197,240, and 1982—200,000 (preliminary). Comparable data for VA was not available. However, VA's overall crude steel output, which reportedly included about 90% commercial steel and 5% each of alloyed and unalloyed specialty steel, was as follows (in thousand metric tons): 1978—3,772, 1979—4,285, 1980—4,065, and 1981—4,149.

Of the total 4,258,000 metric tons of crude steel produced in Austria in 1982, 3,695,000 or 86.8%, was produced by the oxygen process, 466,000 or 10.9% was produced by the electric process, and only 97,000 or 2.3% was produced in open-hearth furnaces.

VA drew up a restructuring plan for 1983-84 for its Donawitz steelworks. The plan involved a cutback in raw steel output of about 25%, or to 900,000 tons annually. Two blast furnaces and a Linz-Donawitz (LD) furnace were to continue to operate. The plant was also scheduled to switch entirely to the use of domestic ore from the Eisenerz Mine in Erzberg, 16 miles away, which was scheduled to reduce production but would continue to produce. Although the iron content of the sideritic ore is only 31%, it has a low sulfur and phosphorus content.

Lead and Zinc.—Bleiberg, located west of Villach, is the only lead-zinc mine in Austria and dates back to the 12th century. The stratabound ore bodies are concentrated in a graben and can be traced for over 6 miles in the east-west direction. The ore is made up of galena and sphalerite and has been mined to a depth of 2,700 feet. All mining is underground and the ore is transported underground through an adit to a processing plant at the surface. The two main underground workings are linked by two tunnels, one is 5 miles and the other is 8 miles long. The total length of the underground tunnels, levels, and crosscuts is over 620 miles. The mines supply 50% of the country's lead and 90% of its zinc consumption. Average annual output is about 400,000 tons of ore, grading 6% to 7% in combined metal, with 1.7% to 4.5% lead and 4% to 8% zinc. An extremely low silver content of the galena is characteristic of this deposit.

The daily output of the concentration plant was approximately 24 tons of lead concentrates and 162 tons of zinc concentrates. After crushing, the sulfides were recovered by flotation, at a capacity of 40 tons per hour. The company has also started to rework tailings from the old dumps, which contain about 2.4% to 4.0% zinc. The lead and zinc concentrates are then transported south a short distance by truck to Arnoldstein for smelting. The smelter operates a unique rotary hearth developed by the company for treating the lead concentrates and battery scrap. With concentrates of 74% lead, about 24 tons of lead bullion are produced daily, at a direct-lead recovery of about 89%.

Tungsten.—Mittersill, located southwest of Salzburg, is the only producing mine in Austria, although scheelite occurs at four other localities. The scheelite deposit at Mittersill, discovered only 15 years ago, is the largest in Europe. The deposit is topographically and structurally separated by the Felber Valley (Felbertal) into two fields, the Ostfeld and the Westfeld. Ore is extracted by surface mining in the Ostfeld and by underground operations in the Westfeld. Surface mining in the Ostfeld is to cease in a few years because of ore depletion. The combined mine production in 1982 was about 210,000 tons of ore resulting in 1,400 tons of concentrate at an average grade of 0.65% WO_3 content. Ore reserves were estimated at about 5 million tons, at an average grade of 0.45% WO_3, corresponding with 22,000 tons of WO_3. The ore is processed in a nearby plant and the concentrate is sent to Bergla, south of Graz, for smelting.

NONMETALS

Anhydrite, Gypsum, and Salt.—Considerable reserves of gypsum and anhydrite are known in Austria. They are distributed along the base of the northern Calcareous Alps in the upper Permian evaporite facies. The deposits are genetically closely related to the salt deposits, which occur in the same stratigraphic horizon. Mining of salt in Austria is mostly by underground leaching. Most of the salt-bearing rocks are a mixture of clays and marls, with only a few layers of pure rock salt.

Magnesite.—Until about 1930, Austria had a worldwide monopoly in the mining of magnesite. At present, the magnesite industry is of great importance to the Austrian economy. All deposits are in the Alps and are of the crystalline magnesite type, contained in slightly metamorphosed Paleozoic dolomites. The deposits occur mostly in the Greywacke zone of Lower Paleozoic age. The chief producing mines are Hochfilzen in Tirol, Radenthein in Carinthia, and Breitenau and Veitsch in Styria. The most important deposit and mine are located in Hochfilzen, where mining started in 1960. The Hochfilzen ore is disseminated in fine-grained dolomite and sandstone, soft and in places porous, and exhibits primary sedimentary structures. The ore is surface mined at Burglkopf, crushed on the spot, and through a series of chutes, a conveyor belt, and two ropeways, is transported to the Hochfilzen plant. There it is processed, formed into bricks, and sintered. The company in 1982 exported about 96% of its production, mostly to European countries. It also imported magnesite from Turkey and Greece.

MINERAL FUELS

In 1982, Austria's legislature enacted two amendments to the Energy Management Law of 1976, thus fundamentally altering the law. The Energy Management Law of 1982 authorizes the Federal Government to decree energy control measures in case of an energy crisis. The law is applicable to crude oil, petroleum products, solid mineral fuels, gas, and electric power. It enables the Government to control the production, transportation, and storage of energy; establish quotas; and impose conservation measures. The Petroleum Stockpiling and Reporting Act of 1982, second amendment to the law, set forth stockpiling and reporting requirements for natural gas, bituminous coal and coke, crude oil, and a variety of petroleum products. The 1982 law no longer requires that subsidiary rulings must be published in the official newspaper "Wiener Zeitung" prior to enforcement.

The total primary energy requirements of Austria have been decreasing in recent years, by 0.6% from 1980 to 1981 and by 1.2% from 1979 to 1980. The rising costs of oil and gas imports constituted a major problem for the Austrian economy in 1982. For example, the price of heavy fuel oil consumed by industry from early 1979 to the second quarter of 1982 reportedly increased by 129%, and that of natural gas increased by 71% over the same period. The price of coal increased 31% and electricity increased 27%. Industrial energy use in 1982 was about 40% of total energy consumption.

Coal.—Lignite is the only type of coal mined today in Austria. The last underground brown coal mine, Fohnsdorf in Styria, was shut down in 1979 because it was uneconomical. The most important lignite district is Koflach-Voitsberg in western Styria, which produces about 1.7 million tons annually, or 55% of total production. The other two are the Salzach (Salzburg) and the Wolfsegg-Traunthaler (Upper Austria) districts, each producing about 500,000 tons annually. The latter district is the second largest in Austria, where mining had started in the 18th century; production there has been declining since 1964 and in 1982 was about 600,000 tons.

Oil and Gas.—Hydrocarbons in Austria occur in the Vienna Basin and in some parts of the Molasse zone of Miocene age in Upper Austria. Most of the production came from the area northeast of Vienna. Production of oil has been declining for the past 5 years and now stands at about 11 million barrels annually; production of gas has also been declining for the past 5 years and is now about 51 million cubic feet. Domestic production satisfied little more than 13% of Austria's oil and about 35% of its gas demand. Most of the imported gas came from the U.S.S.R., and oil came from Libya and Saudi Arabia. In addition to providing virtually all natural gas imports, the U.S.S.R. covered over 23% of Austria's crude oil imports in 1982 (against 22.7% in 1981), 37.8% of petroleum product imports (35.8% in 1981), and 57.8% of coal imports (53.6% in 1981). Overall, the centrally planned economy countries provided in 1982 nearly 50% of Austria's energy imports.

Austrian oil and gas deposits occur at a depth of between 1,500 and 18,000 feet. The deepest gas well was drilled in 1979 at Zistersdorf and reached almost 27,000 feet, the deepest well outside the United States. The cumulative production from 1930 to 1982 from the Vienna Basin amounted to about 595 million barrels of oil and 1,556 billion cubic feet of gas. Proven and probable oil reserves were at about 140 million barrels representing approximately 10 to 12 years of production, and the remaining gas reserves represent a mere 5 years' output. The Austrian state oil company, Österreichische Mineralölverwaltungs AG (OMV), operated 138 gas and 1,000 oil wells in 1982. The company produced 77% of all domestic oil and owned and operated the only refinery in Austria at Schwechat.

In 1982, Austria became the fourth country (after the Federal Republic of Germany, France, and Switzerland) to sign an agreement with the U.S.S.R. to import natural gas through the Yamal pipeline from the Urengoi Field in western Siberia. Starting in 1984, 52.9 billion cubic feet of Siberian gas is to be imported over the next 25 years. The agreement is for about one-half of the amount of gas originally considered.

The Mineral Industry of Belgium-Luxembourg

By George A. Rabchevsky[1]

BELGIUM

In 1982, the Belgian economy did not recover from the recession that has plagued the Government for the past several years. In February, Parliament began an economic recovery program by granting emergency powers to the Government to redirect economic resources toward the corporate sector and reduce the budget deficit. Real wages, which had become almost the highest in the world, and consumer buying both fell during the year. Inflation was 8%, lower than expected, but still above the European average. The unemployment rate increased over the year to 11.5%, with 483,000 workers unemployed, the highest percentage in Europe. In Flanders, unemployment reached 20% and in Wallonia it reached 17.5%. Unemployment benefits in 1982 alone exceeded 3% of the gross national product (GNP). Following the February devaluation of the Belgian franc, the first since 1946, the competitiveness of Belgian industry in world markets grew significantly. Nevertheless, the GNP was still down slightly in 1982. Industrial production in 1982 increased by only 0.9% instead of the anticipated 2%. The largest gains were registered in the metalworking industries, with significant increases also in chemicals and textiles.

The ethnolinguistic, regional, and now legal division of the country was another problem for the Belgian economy. The long-underdeveloped (Dutch-speaking) Flanders to the north was surpassing the industrially obsolescent Wallonia (French-speaking) as the center of production and prosperity. Wallonia had therefore been declared a development area, entitling it to certain Government subsidies and incentives.

PRODUCTION

Belgian industrial production in 1982 declined slightly, with the oil and coal sectors declining significantly. The basic metals industry and the metalworking sectors fared less badly.

Production of minerals and metals in Belgium from 1978 to 1981 and estimates for 1982 are given in table 1.

Gravel, dredged do.	5,566	4,976	4,452	4,500	5,229
Sulfur, byproduct:					
Elemental[e] do.	110	110	110	110	110
Other forms[e] do.	157	160	160	160	160
Total[e] do.	267	270	270	270	270
MINERAL FUELS AND RELATED MATERIALS					
Carbon black[e]	2,000	2,000	2,000	2,000	2,000
Coal:					
Anthracite thousand tons	628	511	375	321	262
Bituminous do.	5,963	5,614	5,949	5,815	6,276
Total do.	6,591	6,125	6,324	6,136	6,538
Coke, all types do.	5,748	6,450	6,048	6,004	5,217
Fuel briquets, all kinds do.	125	152	82	53	50
Gas:					
Manufactured million cubic feet	24,554	NA	25,000	25,000	[e]25,000
Natural do.	1,360	1,389	1,352	1,342	1,340
Petroleum refinery products:					
Gasoline thousand 42-gallon barrels	40,928	43,288	46,801	40,571	42,000
Jet fuel do.	11,968	12,120	13,656	14,264	[e]13,500
Kerosine do.	697	1,116	178	256	[e]250
Distillate fuel oil do.	80,038	88,043	75,704	65,469	[e]67,000
Residual fuel oil do.	72,114	62,045	61,672	55,648	[e]56,000
Lubricants do.	616	686	440	280	[e]300
Other do.	27,930	27,207	25,837	28,223	[e]26,000
Refinery fuel and losses do.	13,086	12,096	14,840	14,304	[e]14,000
Total do.	247,377	246,601	239,128	219,015	[e]219,050

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through June 22, 1983.

[2]In addition to the commodities listed, Belgium produces a number of other metals for which only aggregate output figures are available. These aggregates are included under "Other, nonferrous."

[3]Data not reported; derived by taking reported primary lead output plus exports of lead bullion minus imports of lead bullion.

[4]Data represents secondary refined lead output minus remelt lead: as such the figures are probably high, because they include some lead that was sufficiently pure as scrap and did not require resmelting, but data are not adequate to permit differentiation.

[5]Includes remelted lead, as follows in metric tons: 1978—21,000, 1979—21,200, 1980—22,000, 1981—8,000; and 1982—8,000 (estimated).

[6]Known to include gold and silver and may include platinum-group metals.

[7]Derived by subtracting aluminum data from a reported total for unspecified base metals.

TRADE

In the minerals sector, the United States, in 1982, imported $323 million[2] worth of iron, steel, and metals; $844 million worth of diamonds and jewelry; and about $50 million worth of various other mineral products from Belgium. Belgium imported $585 million worth of minerals, $327 million worth of diamonds and jewelry, and $159 million worth of other metals from the United States.

Table 2.—Belgium-Luxembourg: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals:				
Lithium:				
Oxides and hydroxides	20	54	NA	France 25; United Kingdom 20.
Metal including alloys, all forms value	$2,429	$1,893	--	NA.
Alkaline metals	48	1	--	NA.
Rare-earth metals	4	(1)	--	NA.
Unspecified	17	126	--	Nigeria 100; Netherlands 22.
Aluminum:				
Ore and concentrate	1,787	654	--	France 598; West Germany 36.
Oxides and hydroxides	744	660	--	Netherlands 246; United Kingdom 227; France 120.
Ash and residue containing aluminum	7,647	7,457	NA	West Germany 6,533.
Metal including alloys:				
Scrap	36,800	38,469	58	France 17,103; West Germany 9,140; Netherlands 8,277.
Unwrought	19,582	29,666	--	West Germany 17,233; Netherlands 5,709; France 5,316.
Semimanufactures	219,828	228,810	13,017	France 47,777; West Germany 35,158; Netherlands 28,989.
Antimony:				
Ore and concentrate	50	3	--	NA.
Metal including alloys, all forms	10	264	NA	Poland 202; Venezuela 23.
Beryllium: Metal including alloys, all forms	--	3	--	NA.
Cadmium: Metal including alloys, all forms	870	575	68	France 248; West Germany 163; U.S.S.R. 5.
Chromium:				
Ore and concentrate	30	--		
Oxides and hydroxides	185	79	--	France 53; West Germany 10; Netherlands 6.
Metal including alloys, all forms	464	399	26	West Germany 106; France 80; United Kingdom 60.
Columbium and tantalum:				
Ore and concentrate	30	7	--	NA.
Ash and residue containing columbium and/or tantalum	--	2,721	--	West Germany 2,698.
Copper:				
Ore and concentrate	716	727	--	Netherlands 537; West Germany 108; Spain 73.
Oxides and hydroxides	605	1,059	NA	West Germany 328; Denmark 191; France 178.
Sulfate	9,219	8,997	NA	Netherlands 2,962; West Germany 2,401; Denmark 1,523.
Ash and residue containing copper	844	2,918	NA	France 1,716; West Germany 357; Spain 138.
Metal including alloys:				
Scrap	26,355	24,065	--	West Germany 10,583; France 4,646; Netherlands 3,441.
Unwrought	314,035	303,163	3,157	France 118,456; West Germany 80,619; United Kingdom 19,267.
Semimanufactures	278,474	244,364	2,861	West Germany 75,801; France 74,689; Netherlands 32,207.
Gold:				
Waste and sweepings value, thousands	$1,456	$3,484	--	Netherlands $1,755; United Kingdom $1,313.
Metal including alloys, unwrought and partly wrought thousand troy ounces	876	970	NA	Switzerland 526; United Kingdom 265; France 9.
Iron and steel:				
Iron ore and concentrate:				
Excluding roasted pyrite	60,237	18,693	--	France 18,548; Netherlands 79; United Kingdom 33.
Pyrite, roasted	148,865	159,265	--	West Germany 147,078; Spain 10,138; United Kingdom 2,046.
Metal:				
Scrap	536,640	578,431	13	West Germany 209,198; France 126,436; Spain 87,356.
Pig iron, cast iron, related materials	r8,312	9,923	--	Norway 5,146; Denmark 1,434; France 974.
Ferroalloys:				
Ferrochromium	1,544	3,858	NA	West Germany 2,319; France 1,468.
Ferromanganese	37,281	12,129	--	France 5,762; West Germany 4,155; Algeria 900.
Ferromolybdenum	29,659	31,093	NA	NA.
Ferronickel	4	28	18	NA.

Mica:				
Crude including splittings and waste	65	38	--	France 12; West Germany 8; Italy 6.
Worked including agglomerated splittings	66	2	--	Brazil 1.
Nitrates, crude	19,788	12,555	NA	West Germany 6,045; Italy 3,707; France 1,971.
Phosphates, crude	11,291	14,779	NA	France 7,276; West Germany 3,919; Zaire 460.
Pigments, mineral:				
Natural, crude	30	120	NA	NA.
Iron oxides and hydroxides, processed	13,955	8,765	102	France 5,772; West Germany 893; Italy 659.
Potassium salts, crude	1,628	1,484	--	All to Netherlands.

See footnotes at end of table.

Table 2.—Belgium-Luxembourg: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Precious and semiprecious stones other than diamond:				
Natural, gem material _ kilograms	207	353	8	West Germany 114; Switzerland 66; France 60.
Synthetic _____do_____	5,493	3,284	8	Republic of Korea 28; Netherlands 19; United Kingdom 10.
Pyrite, unroasted	32	193	--	France 73; Cuba 9.
Salt and brine	115,385	107,218	18	France 91,394; Netherlands 13,239; West Germany 1,499.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	10,840	10,326	2,245	Netherlands 4,790; Denmark 1,045; Bulgaria 440.
Sodium carbonate, natural and manufactured	54,393	11,862	--	France 6,536; Netherlands 2,914; West Germany 983.
Sodium hydroxide	421,029	548,930	20,247	Netherlands 286,115; France 80,050; West Germany 60,923.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	683,020	593,337	--	Netherlands 580,623; France 6,782; West Germany 4,519.
Worked	19,703	19,909	448	Netherlands 7,788; West Germany 6,348; France 3,430.
Dolomite, chiefly refractory-grade thousand tons	1,569	1,239	--	Netherlands 548; West Germany 447; France 230.
Gravel and crushed rock ___do____	8,910	8,534	(1)	Netherlands 4,166; France 3,895; West Germany 470.
Limestone other than dimension	553,260	550,226	--	Netherlands 314,645; France 234,323.
Quartz and quartzite	12,940	12,627	--	West Germany 7,864; Netherlands 1,804; France 1,680.
Sand other than metal-bearing thousand tons	3,422	2,984	(1)	France 934; Netherlands 741; West Germany 191.
Sulfur:				
Elemental:				
Crude including native and by-product	14,032	9,128	--	France 6,265; West Germany 635; Netherlands 457.
Colloidal, precipitated, sublimed	148	87	--	France 27; Netherlands 21; Venezuela 20.
Sulfuric acid	197,065	122,169	--	France 55,044; Republic of South Africa 11,793; Mexico 11,629.
Talc, steatite, soapstone, pyrophyllite	23,331	28,267	--	West Germany 5,526; France 3,421; United Kingdom 3,180.
Other:				
Crude	571,212	783,489	(1)	Netherlands 745,104; France 26,933; West Germany 787.
Slag and dross, not metal-bearing thousand tons	2,413	1,974	6	France 747; Netherlands 683; West Germany 532.
Oxides and hydroxides of barium, magnesium, strontium	617	171	--	France 78; West Germany 60; Mauritania 10.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	306,547	238,989	1,805	Netherlands 68,292; West Germany 49,661; France 46,945.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	16,435	5,698	--	France 3,598; Norway 1,804; Burundi 155.
Carbon: Carbon black	390	653	--	West Germany 274; France 174; Netherlands 99.
Coal:				
Anthracite and bituminous	538,043	892,933	--	West Germany 567,158; Netherlands 134,678; France 109,172.
Briquets of anthracite and bituminous coal	25,380	16,231	--	France 14,056; Switzerland 950; Iraq 250.
Lignite including briquets	38	31	--	Netherlands 22; United Kingdom 8.
Coke and semicoke	871,067	892,646	14,004	France 362,177; Romania 323,776; West Germany 106,654.
Gas, manufactured_ value, thousands	$1	$1	--	NA.
Hydrogen, helium, rare gases million cubic feet	(3)	1,134	NA	France 628; West Germany 329; Netherlands 58.

See footnotes at end of table.

Table 2.—Belgium-Luxembourg: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
MINERAL FUELS AND RELATED MATERIALS —Continued				
Peat including briquets and litter	2,257	2,476	--	Netherlands 1,351; France 657; United Arab Emirates 259.
Petroleum and refinery products:				
Crude—42-gallon barrels	12	427,437	427,430	Zaire 7.
Refinery products:				
Liquefied petroleum gas thousand 42-gallon barrels	3,115	3,328	--	Netherlands 2,040; United Kingdom 387; West Germany 260.
Gasoline —do—	40,635	33,533	207	West Germany 9,274; Switzerland 5,683; Netherlands 5,133.
Mineral jelly and wax —do—	31	40	3	France 12; Italy 5; United Kingdom 4.
Kerosine and jet fuel —do—	12,299	12,132	9	West Germany 3,756; Netherlands 1,183; Denmark 1,035.
Distillate fuel oil —do—	32,115	26,185	172	West Germany 11,910; Netherlands 4,606; Denmark 2,461.
Lubricants —do—	2,599	2,652	1	Netherlands 762; West Germany 242; France 197.
Residual fuel oil —do—	37,642	43,078	--	Netherlands 10,312; United Kingdom 6,271; West Germany 4,339.
Bitumen and other residues —do—	1,657	1,684	--	Netherlands 1,524; West Germany 61; Norway 57.
Bituminous mixtures —do—	81	88	(1)	Netherlands 37; France 23; Egypt 7.
Petroleum coke —do—	12	10	--	France 7; West Germany 2; Netherlands 1.
Tars and other crude chemicals derived from coal, gas, and petroleum	289,871	277,877	9,594	West Germany 100,509; France 81,296; Netherlands 42,611.

rRevised. NA Not available.
[1]Less than 1/2 unit.
[2]May include other precious metals.
[3]1980 export was 51,432 tons.

Table 3.—Belgium-Luxembourg: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals:				
Cesium and rubidium	--	11	--	NA.
Lithium:				
Oxides and hydroxides	255	133	20	West Germany 87; U.S.S.R. 25.
Metal including alloys, all forms	1	7	--	NA.
Alkaline metals	105	46	NA	France 45.
Rare-earth metals	21	1	--	NA.
Unspecified	33	7	--	NA.
Aluminum:				
Ore and concentrate	35,936	33,050	--	Netherlands 13,439; West Germany 6,948; China 5,454.
Oxides and hydroxides	21,519	23,635	974	West Germany 18,327; Netherlands 2,064; Italy 1,135.
Ash and residue containing aluminum	3,768	682	--	France 563; West Germany 69.
Metal including alloys:				
Scrap	33,316	39,095	1,246	Netherlands 14,170; France 9,703; West Germany 6,548.
Unwrought	252,500	244,955	1,225	Netherlands 118,950; West Germany 35,445; Spain 27,608.
Semimanufactures	86,054	83,911	1,060	West Germany 35,684; France 18,769; Netherlands 18,299.
Beryllium:				
Oxides and hydroxides value, thousands	$1	--		
Metal including alloys, all forms —do—	$27	$5	NA	NA.

			United States	Other (principal)
METALS —Continued				
Cadmium: Metal including alloys, all forms	1,028	1,131	NA	West Germany 293; Netherlands 224; Italy 139.
Chromium:				
Ore and concentrate	1,671	1,832	--	Netherlands 1,465; France 213; Mozambique 104.
Oxides and hydroxides	1,443	822	2	West Germany 742; China 40; Italy 20.
Metal including alloys, all forms	275	219	NA	West Germany 52; France 39; United Kingdom 34.
Cobalt:				
Ore and concentrate kilograms	--	100	--	NA.
Oxides and hydroxides	43	74	--	United Kingdom 49; France 15; West Germany 9.
Columbium and tantalum:				
Ore and concentrate	2,537	2,679	NA	Canada 2,429; West Germany 215.
Ash and residue containing columbium and/or tantalum	--	807	12	West Germany 795.
Metal including alloys, all forms, columbium (niobium)	3	6	--	West Germany 2.
Copper:				
Ore and concentrate	2,628	17,417	NA	Canada 11,975; Morocco 3,551; Peru 1,206.
Oxides and hydroxides	48	125	--	Italy 50; West Germany 39; France 22.
Sulfate	1,190	1,032	NA	Netherlands 356; France 224; West Germany 201.
Ash and residue containing copper	61,791	45,932	9,577	Sweden 12,884; France 6,485; West Germany 4,345.
Metal including alloys:				
Scrap	124,528	104,715	3,660	France 27,287; Netherlands 24,581; West Germany 14,788.
Unwrought	509,756	483,819	2,231	Zaire 289,533; Chile 31,368; Canada 24,945.
Semimanufactures	43,770	40,035	271	West Germany 21,683; France 8,656; Italy 5,211.
Gold:				
Waste and sweepings value, thousands	$4,838	$2,480	NA	Switzerland $1,080; Netherlands $1,048.
Metal including alloys, unwrought and partly wrought thousand troy ounces	1,856	16,983	5,869	West Germany 9,520; Switzerland 923; Netherlands 544.
Iron and steel:				
Iron ore and concentrate:				
Excluding roasted pyrite thousand tons	22,182	21,148	--	West Germany 4,660; Sweden 4,387; Brazil 3,786.
Pyrite, roasted	106,519	95,687	--	West Germany 72,946; Sweden 10,420; Norway 7,754.
Metal:				
Scrap	859,318	955,710	6,130	West Germany 388,411; Netherlands 369,310; France 135,081.
Pig iron, cast iron, related materials	117,389	97,653	31	France 51,388; West Germany 27,010; Canada 5,697.
Ferroalloys:				
Ferrochromium	27,588	25,474	NA	Netherlands 5,262; West Germany 4,527; Albania 3,478.
Ferromanganese	71,291	91,262	--	France 42,178; Norway 36,046; West Germany 12,394.
Ferromolybdenum	260	446	NA	West Germany 170; Netherlands 115; Italy 59.
Ferronickel	2,660	3,226	NA	France 1,468; Austria 688; Netherlands 591.
Ferrosilicochromium	1,340	1,527	NA	West Germany 750; Norway 537; France 240.
Ferrosilicomanganese	23,454	19,956	NA	Norway 13,210; Netherlands 3,770.
Ferrosilicon	32,584	38,202	NA	Norway 14,673; West Germany 13,431.
Unspecified	3,565	3,288	70	Brazil 820; France 804; West Germany 682.
Steel, primary forms thousand tons	1,036	889	4	Netherlands 342; West Germany 212; France 176.

See footnotes at end of table.

[3]Total import for 1980 was 8,880 metric tons.

COMMODITY REVIEW

Metals.—*Copper.*—The most versatile Belgian multimetals smelter and refinery, Métallurgie Hoboken-Overpelt S.A., invested almost $35 million in 1982 in a new plant and equipment. The company planned to invest another $160 million in the next 5 years to upgrade and expand its production. Hoboken-Overpelt's second copper wire rod mill in Olen was expanded to 200,000 tons per year. Reportedly, the company's overall production of copper products increased to approximately 465,000 tons in 1982, from about 410,000 tons in 1981. The 1983 copper output was expected to be lower because of decreasing demand in the European market. The company also installed facilities for treating residues from its lead refinery at Hoboken to recover tellurium and indium, which should become operational in 1983. The rhodium concentrator and the refinery were also modernized in 1982, and two electric ovens were being installed at the Hoboken foundry to be used for the recovery of metals from the smelter residues. Production of cobalt continued to be low, while the production of extra-fine cobalt powder remained the same as that of 1981.

Iron and Steel.—The U.S. concern over foreign government steel subsidies for production and exports caused the U.S. Department of Commerce to initiate action against the steel industries of the European Economic Community (EEC), including Belgium. In its preliminary subsidy ruling Commerce determined that Belgium's Cockerill-Sambre S.A., for example, was subsidized by more than 20%, and Sidérurgie Maritime (Sidmar) was subsidized about 5%. Although the Belgian Government recognized the U.S. concern, it nevertheless felt its incentives to encourage new investments were valid. The EEC defended the expenditures as intended to reduce excess capacities and cut production by 1985, and not to subsidize EEC steel exports. About three quarters of Belgium's steel was exported in 1981, with 51% going to its EEC partners and 26% going to the developing countries. Sales to Eastern Europe had

dropped by more than 50% since 1978, but exports to the United States increased to 7.8% of Belgian steel output. A United States decision on the imposition of tariffs on Belgian and other European steel exporters was reached in October 1982, but was overtaken by an agreement that substantially reduced all European steel imports, including those from Belgium, beginning November 1, 1982, to continue through to the end of 1985.

The Belgian economy had been in a chronic recession since 1974, and its ailing steel industry had been a major drain on the public treasury. Reportedly, the steel industry had a net loss of $450 million in 1981, the equivalent of 18% of sales turnover. Wage costs rose 1.5% to $73 per ton of raw steel; raw materials and energy costs went up by 20%.

Despite early forecasts for improvement, Belgium's raw steel production in 1982 continued to drop for the third year, because of cutbacks in production capacity. The crisis dated back to the mid-1970's when the demand for steel declined as a result of global recession. By late 1975, Belgium's steel companies were in financial difficulties and banks refused to reschedule their loans. The Government intervened, providing temporary relief by buying their shares. The Belgian steel industry did not suffer from lack of modernization or lack of production capacity in 1982, but was afflicted by growing competition from new steel producers in developing countries.

In 1982, Cockerill-Sambre, Belgium's largest steel producer in the south (Wallonia), was in a state of uncertainty. A newly appointed managing director initiated restructuring in May, including a planned decrease in capacity by more than 50% to 6.1 million tons annually by 1985.

Restructuring continued also in the Belgian steel tube industry, with the Federal Republic of Germany's Benteler-Werke AG becoming a minor partner with the Belgian Government in Tubes de la Meuse S.A., a seamless tubemaker. The latter's welded-tube business was incorporated into Tubel S.A., a new company bringing together all of Belgium's producers of small-diameter welded-tube products.

A new Belgian stainless steel foundry was to be inaugurated in 1982. Founderies Mafotteaux S.A. and Société Regionale d'Investissement de Wallonie, were to spend $13 million to build and equip a new stainless steel foundry in Messancy in Luxembourg Province, as part of a $33 million investment plan. The foundry is to produce heavy stainless steel castings for export to foreign cement, coal, nuclear, and oil-processing plants. The Belgian specialty steelmaker, Laminoirs de Jemappes S.A., was turned down by the EEC in their application for state aid. The company, controlled by the Belgian Government and Tubes de la Meuse, wanted to modernize its plant, but assistance was rejected because it would include funds for an increased hot-rolling capacity.

Belgium's newly merged steel company, Cockerill-Sambre, had record losses in 1981. Accumulated debts were more than $1.7 billion, with a $340 million loss in 1981, 40% higher than the loss incurred in 1980. Approximately 56% of the loss was attributed to the Liège operations. The company employed 25,000 workers in 1982. In 1982, Cockerill-Sambre cut its production to less than 7 million tons in a move to avert financial collapse and to qualify for Government aid. The EEC was under pressure to reduce Belgian operating capacity even further because the bulk of the steel is exported, with only 25% being consumed domestically. Cockerill-Sambre was the sixth leading steel producer in the EEC, with a combined total annual capacity of 6.9 million tons of steel, 3.5 million tons of which came from Liège and 3.4 million tons came from the Charleroi region. The 1981 merger was unsatisfactory and various proposed realignments were considered in 1982. These included a revival of the idea of Benelux Steel Co. and a strengthening of the links between the Sambre half of Cockerill-Sambre, Saarstahl A.G., Aciéries Réunies de Burbach-Eich-Dudelange S.A. (Arbed), and Sidmar.

During the year, there were several investigations into Cockerill-Sambre to maintain its profitability. During the year, the McKinsey consulting group, commissioned jointly by the Belgian Government, the EEC, and the management of Cockerill-Sambre, recommended the closure of one of Cockerill-Sambre's two melting shops in Liège in an attempt to restore profitability. The group also recommended that Liège should concentrate on cold-rolled products, which were considered to be more profitable and easier to manage. The recommendations required a substantial investment and concomitant reductions in capacity and employment.

Steelworkers in Liège went on strike in March protesting, among other things, the EEC order to cut back further some of Cockerill-Sambre's lossmaking operations. The commission was refusing to approve the company's plans to maintain its annual raw steel capacity at 8.5 million tons. Financial aid was promised, however, if Cockerill-Sambre would cut its capacity to 6.5 million tons or less. The operation at Charleroi, which was not losing as much money as Liège, apparently accepted the need for further cutbacks, as did the Belgian economic affairs minister. By this time a report requested from the McKinsey firm of consultants on the Belgian steel industry was in its 12th version and recommended the closure of one of Liège's melting shops and a hot-strip mill. The report also recommended negotiations for closer links with the Netherlands Hoogovens Steel in production of wire rod. Charleroi was to close one of its section mills but was to expand hot-coil production in a reciprocal deal with Luxembourg's Arbed. The EEC rejected the company's restructuring plan because of unrealistic costs, but endorsed McKinsey's recommendations; it considered the approval of further financial aid, two-thirds of which would be for Liège.

Restructuring plans were finally announced at the end of May. Cockerill-Sambre's production capacity, which was reduced by more than 50% to 6.1 million tons, was expected to be profitable in 1985. The new plan was to divide the company into four operating units, with flat and nonflat products produced, at Charleroi and Liège. Talks with four foreign steelmakers from the Federal Republic of Germany, Luxembourg, the Netherlands, and France also resulted in a number of cooperative agreements on production sharing.

Late in the year, the Belgian Prime Minister together with Sidmar presented yet another proposal to solve Cockerill-Sambre's problems. In addition to a 10% average wage cut in Liège and a 6% cut in Charleroi, the plan also reduced Cockerill-Sambre's overall annual capacity to 5.5 to 6 million tons, meaning a cut of 5,700 jobs. Cockerill-Sambre was to become a holding company, its affiliates being granted a large measure of autonomy. Given cabinet agreement, the Flemish steel industry was to be guaranteed that no more national funds would go to the Walloon industry.

By the end of the year, Cockerill-Sambre had lost $170 million, which, combined with previous losses, accounted for $370 million out of the $460 million set aside to cover losses through the end of 1984, leaving only $90 million for operations in 1983.

Lead and Zinc.—Vieille-Montagne S.A. (VM) the largest of Belgium's three zinc producers, considered a merger in 1982 with Compagnie Royale Asturienne des Mines of France. Both companies were already linked through Société Générale de Belgique, which had a 28% stake in VM and 26% in Asturienne, and purchased concentrates for both. Their main plants were in France where both companies had large smelters. Neither company was contemplating any closures as a result of the merger. VM usually produces about 187,000 tons of zinc and 643 tons of cadmium.

Belgium's second-largest zinc producer, Hoboken-Overpelt, commissioned a new secondary zinc furnace at Overpelt late in 1981, with an annual capacity of 35,000 tons, treating low-grade copper-zinc scrap. No information was available on the progress and performance of the new smelter in 1982. Hoboken-Overpelt's 5,000-ton-per-year plant at Overpelt operated at no more than 60% of capacity and was reducing its work force by 125. The plant suffered because electricity costs, a major cost element, were 20% to 30% higher than for many of its European competitors.

Belgium's smallest zinc producer, Société Industrielle de Prayon S.A., shut down its unprofitable electrolytic plant at Ehein, near Liège, early in 1982 after it failed to sell the operation.

Nonmetals.—Belgium production of nonmetals in 1982 consisted mainly of barite, limestone, quartz sand, chalcedonic silica (silex), and sulfur. No major developments occurred in 1982 in those commodities, which were mostly exported through joint-venture companies.

Hoboken-Overpelt became one of the world's largest suppliers of germanium in 1982, with a new extraction unit at Olen with an annual capacity of 50 tons based on imported concentrates. Hoboken-Overpelt began production of germanium in 1953, mainly for use as a semiconductor element, but now used in infrared optics.

Mineral Fuels.—Belgium continued to be about 90% dependent on foreign energy resources and was the most vulnerable of the European countries in this regard. Coal is the only indigenous mineral fuel but it is too deep and too expensive to extract without heavy subsidies, and 65% of the supply

is imported. Belgium has, however, reduced its oil dependency to 47% of total energy consumption, a drop of 20% since 1972. Nuclear power generation in Belgium contributed a higher proportion of total energy than in any other European country.

The Belgian Government provided certain energy subsidies, especially to coal enterprises, in an effort to reduce costs of production and to keep the miners working. At the end of 1982, the Belgian Parliament was preparing recommendations for the Government on such matters as energy conservation and use of petroleum products, natural gas, coal, electricity, and nuclear energy. There still was no real energy conservation policy and the 1982 budget for conservation, for example, was reportedly only about $440,000.

Coal.—Because of poor geologic and mining conditions, coal extraction in Belgium was very difficult and unprofitable and continued to be subsidized by the Government. Reportedly, $1.4 billion was invested by the Government in the coal industry from 1981 to 1985 in the form of subsidies. Domestic coal production, mainly in Flanders (northern Belgium, Campine Field), was about 6 million tons in 1982, whereas domestic consumption amounted to about 16 million tons. No coal is exported. Major sources of imported coal, which amounted to about 11 million tons, were the United States, 35% of total imports; the Federal Republic of Germany, 23%; and the Republic of South Africa, 21%. The price of domestic coal was about 75% more than the imported coal, but the mines were kept open to provide employment. Over 50% of the Belgian coal production was consumed by the domestic steel industry. Because of the anticipated cutbacks in steel capacity and production, coal production was also expected to decline in the near future. The poor outlook for the coal industry prompted the coal lobby to support the construction of one or two coal-fired powerplants near the mines.

In addition to its domestic market, Belgium was a major coal-handling center for the rest of Europe. Various projects to modernize and expand coal port terminals have been accomplished and others were being considered.

Natural Gas.—In 1981, Belgium imported gas from three sources: Algeria, the Netherlands, and Norway. Until the expiration of the contract in the 1990's at least 85 billion cubic feet of gas is to be imported annually from the Netherlands; 7 billion cubic feet comes from the Norwegian Ekofisk Field, but these deliveries will cease by 1995-98. From November of 1982 through 1985, Belgium was also to receive 88 billion cubic feet of gas annually from Algeria, and 194 billion cubic feet annually from 1986-2002. Because of high prices and quantities, the Belgian Government attempted unsuccessfully to renegotiate the contract, especially since the estimated annual gas demand was revised downwards, to 283 billion cubic feet from 353 billion cubic feet, through 1990.

Belgium did not purchase any gas from the U.S.S.R. in 1982. The Belgian gas distributor, Distrigaz, was, however, negotiating with the U.S.S.R.'s Soyuzgazexport for import of up to 18 billion cubic feet of gas annually starting in 1985.

Nuclear Power.—Belgium continued to depend heavily on nuclear power for the generation of electricity, amounting to 25% of the total, which was to expand to 50% when the eight power stations were completed. Two older plants and two joint ventures with the French nuclear industry already provided 1,376 megawatts. Two new plants, with a total capacity of 1,880 megawatts, were put online in 1982. By 1985, the last two reactors under construction, with a total capacity of 2,960 megawatts, were scheduled to be operational. Two additional nuclear powerplants were also being planned; the cost of nuclear power was reportedly about 30% cheaper than electricity from coal-fired powerplants.

Petroleum.—In 1982, imports of Saudi Arabian crude accounted for 46% of total Belgian crude oil imports. Libya, Nigeria, and the U.S.S.R. were the other most important suppliers to Belgium with 9%, 8.2%, and 6.9% of total crude imports, respectively.

LUXEMBOURG

The Grand Duchy of Luxembourg is a member of the Belgium-Luxembourg Economic Union and shares exchange rates and customs facilities with Belgium. The country's industrial sector was dominated by steel, but in 1982 was being diversified by new high-technology investments. The country continued to be an active proponent

of free trade. Imports, for example, provided almost 90% of the consumer goods. Most trade was with Belgium, France, and the Federal Republic of Germany. Trade with the United States amounted to only about 4% of total foreign trade, although the United States was an important market for Luxembourg steel.

Metals.—*Aluminum.*—Luxembourg does not produce aluminum. In 1982, however, Luxalum S.A., a subsidiary of the U.S. company, National Aluminum Inc., itself a subsidiary of the fifth largest steel company in the United States, National Steel Corp., was going ahead with the construction of an aluminum sheet plant. The scheduled construction took place despite some opposition expressed by the EEC, in that there was already an excess capacity in the European aluminum sheet sector. The new plant, due to come onstream in January 1984, would be able to produce sheets more than 3 feet wide and with a gage of less than 7 micrometers. Production was expected to reach 15,000 tons by the end of the first year, possibly reaching 30,000 tons in the future. Reportedly, the Luxembourg Government was deciding on the matter and was willing to finance the project under the domestic economic framework law for developing sectors. There would also be a long-term loan from private banks.

In a related development, Luxembourg's Galvalange A.S., a joint venture between Arbed and Belgium's Phoenix Works, began production in July 1982 of aluminum-zinc coated sheets (Aluzinc), developed by Bethlehem Steel Corp. of the United States. Sweden was the only other producer of Aluzinc in Europe. The Galvalange plant, located near the steelworks at Dudelange, had a capacity of 220,000 to 230,000 tons per year. As the sole licensee in the EEC it could take 40% of the market in the future.

Iron and Steel.—The iron and steel industry remained the most important sector in the economy in 1982. Arbed was the sole iron and steel producer. Faced with the same problems as other steel producers throughout the world, Arbed had cut back its production and employment over the last 6 years. Despite the cutbacks, however, the company still employed nearly 25% of the industrial work force and 10% of the total work force, and produced more than 25% of the total domestic product of the country. Although improvements in productivity and costs continued, company losses were still mounting in 1982. In the years since the founding of the company in 1911, Arbed had become the 4th largest steel producer in Europe and the 10th largest in the world.

Nonmetals.—Although Luxembourg imported most of its industrial mineral requirements, and usually in a finished form, the country produced sandstone, limestone, sand and gravel, and small amounts of dolomite, gypsum, and slate.

At the last count, there were eight companies producing sandstone, mainly for aggregate, mostly located to the north and west of the capital. Carrières Feidt Sarl was the largest operator, with quarries at Rockange, Altwies, and Enzen. The greater part of Luxembourg's sand and gravel output was dredged from the Moselle River, near Remerschen and Wintrange. There was also some land-based production at Folschette. There were three sand and gravel companies in operation in 1982.

Dolomitic limestone was produced by three companies; Intermoselle Sarl was the largest. Large quarries were located at Moersdorf, Wasserbillig, near the German border, and at Schengen. Gypsum was produced by Platrieres Irthium Sarl just north of the city of Luxembourg, with an annual capacity of 2,000 tons. Apart from the concrete producers, Luxembourg, in general, had little in the way of large consumers of industrial minerals. Refralux Sarl of Luxembourg is the country's major manufacturer of refractory materials, serving the Arbed steel group. The company's principal product was dolomitic bricks that were made primarily from material imported from Belgium. Production declined 42,146 tons in 1979 to about 40,000 tons in 1982, owing to the fall in demand from Luxembourg's steel industry.

Mineral Fuels.—Luxembourg has practically no indigenous energy resources, and in 1982 the energy policy remained essentially unchanged: diversification of energy sources, fuel switching away from oil, strengthening of the distribution infrastructure, and the continuation of rational use and control of waste.

The steel industry consumed more than one-half of Luxembourg's energy supply, which to a large extent was integrated with the supply system of its neighboring countries. Oil was imported mainly from Belgium (85%), while the rest came from the Federal Republic of Germany, France, and the Netherlands. Natural gas was supplied through long-term contracts with the

Netherlands, the steel industry being the largest consumer. Most of Luxembourg's coal was imported from the EEC countries, predominantly the Federal Republic of Germany. Electricity was supplied by Belgium and the Federal Republic of Germany.

[e]Estimated. [p]Preliminary. [r]Revised.
[1]Table includes data available through June 22, 1983.
[2]In addition to the commodities listed, refractory clays and manufactured phosphatic fertilizers other than Thomas slag are produced, but data are not published, and information is inadequate to make reliable estimates of output levels.
[3]Unit changed to metric tons.
[4]Less than 1/2 unit.

The Mineral Industry of Bolivia

By Pablo Velasco[1]

Bolivia has been experiencing a series of worsening economic crises since 1977. The situation has been made worse by a series of military coups that interrupted two electoral processes intended to return power to civilians. This political instability and labor unrest has combined with the worldwide recession and the adverse conditions in world mineral markets to devastate the Bolivian economy. The gross domestic product (GDP) declined an estimated 7.4% in 1982, compared with that of 1981, to the equivalent of 17,703 million pesos[2] calculated at 1970 prices.

The rate of inflation increased from 52% in 1981 to 300% in 1982, one of the highest in Latin America. The country's foreign exchange earnings from all exports declined 10.3% from $978.2 million in 1981 to $877.7 million in 1982. Foreign debt obligations were estimated to require 60% to 70% of Bolivia's total export earnings, causing a severe shortage of available dollars in the local economy.

Minerals and hydrocarbons led Bolivia's exports with minerals accounting for 48% of the value of the nation's foreign revenue and natural gas, 43%. The production value of tin accounted for 66% of the total value of the nation's mineral exports, a 19% decline compared with the 1981 value. Production of tin as well as most other minerals declined. Total earnings from metal production were $247.5 million in 1982, a 14% decrease compared with that of 1981 and representing 59% of the total minerals export value.

The state-owned Corporación Minera de Bolivia (COMIBOL) was the largest Bolivian tin producer and accounted for 67% of the total tin produced, despite a production drop of 14%, compared with that of 1981. The second largest tin producer in the country was the medium-miner group, which produced 23% of the nation's total tin output; the small-miner group accounted for 10%.

The hydrocarbon sector's share of total Bolivian GDP was 1.4% in 1980, 1.1% in 1981, and an estimated 1.4% in 1982. It also contributed 45% of the total export value, principally because of natural gas exports to Argentina. The contribution of crude oil exports to the Bolivian economy during 1982 was insignificant, with only limited amounts of refined gasoline exported.

The future of the Bolivian economy, over at least the next decade, will depend on the foreign exchange earnings from the two traditional export sectors, the mining and hydrocarbons sectors, primarily natural gas.

Government Policies and Programs.—On February 2, 1981, the Ministry of Mines and Metallurgy presented, for the Government of Bolivia's consideration, the Mining-Metallurgy Policy for 1981-90. After a short analysis, the Supreme Decree No. 18509 was approved by the Government on July 23, 1981, as the policy to be followed over the next decade by the National Planning and Development Council.

The final approved Mining-Metallurgy Policy incorporated 16 policy elements and a 5-year mining development plan (1981-85). The 5-year plan lists a series of needed projects and investments divided into three areas: (1) exploration ($127.0 million); (2) exploitation ($130.0 million); and (3) beneficiation ($380.0 million). The 16 policies approved by the Government covered the entire spectrum of the mining industry.

Early in the year, the Bolivian Government introduced several exchange control

measures to comply with International Monetary Fund (IMF) recommendations that were prerequisites to providing a $120 million loan for balance-of-payment support. The first, on February 5, involved devaluing the Bolivian peso from 25 to 44 pesos to the dollar. The next action, on March 22, involved setting the official exchange rate at 44 pesos to the dollar for Government transactions and a floating exchange rate, determined by supply and demand for all private sector needs. In late 1982, the IMF reviewed the Bolivian economic situation and made further recommendations involving Bolivia's large public deficit and present Government expenditures. On November 6, the new civil Government of Bolivia implemented the proposed IMF package of economic measures, aimed to stimulate the economic recovery of the country. The latest corrective economic measure, recommended by the IMF (Supreme Decree 19250) through the Central Bank, fixed the exchange rate at 195.99 Bolivian pesos for the purchase of U.S. dollars and 200.00 pesos for the sale of U.S. dollars.

Gold regulations were updated to guarantee that all gold output in the country should be delivered to the Central Bank. Export of gold by private concerns was prohibited.

Bolivia decided to become a member of the Association of Tin Producing Countries (ATPC). The aims of ATPC were to foster the marketing of tin, increase research efforts, and defend prices through a special fund and export controls. The private sector in Bolivia has also played a leading role in the area of price protection and is one of the founders of the International Association of Tungsten Producers and a member of the Antimony Producers Committee.

The Servicio Geológico de Bolivia (GEOBOL) continued its program of basic regional geological mapping (1:50,000 maps), which was limited by the funds available to 4,500 square kilometers. The mineral exploration project of eastern Bolivia, known as Proyecto Mineralógico del Pre-Cámbrico, was a bilateral technical cooperation program undertaken by GEOBOL and the British Institute of Geological Science to make a rapid and systematic study of the geology and mineral potential of that part of the Precambrian Brazilian Shield, which covers an area of about 220,000 square kilometers within eastern Bolivia. The project began in July 1976 and was initially divided into two phases: phase 1 (1976-78), south of latitude 16°00; and phase 2 (1980-83), north of it.

The most significant discovery during the exploration survey was made in the Cerro Manomo area, 95 kilometers north-northeast of the village of San Ignacio de Velasco, where important phosphate (apatite), rare earth, thorium, columbium, uranium, barium, tin, molybdenum, and other mineralization occurs. A second major discovery was the Rincón del Tigre Igneous Complex, 100 kilometers northwest of the village of Puerto Suarez, where chromium, copper, and nickel-rich minerals have been found.

PRODUCTION

Tin output dropped to 26,773 tons, its lowest level in 16 years. In this recession, Bolivia's dependence on tin production grew even greater, amounting to 66% of the total Bolivian mineral export value, compared with 63% in 1981 and 61% in 1980. Fundiciones de Estaño Oruro's volatilized tin powder production declined 24% to 52 tons per year, compared with 1981 output. Production of hydrocarbons increased 19% to $398.4 million in export value, compared with 1981 value.

Output of most other minerals also declined compared with that of 1981.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Aug. 8, 1983.

[2]In addition to the commodities listed, a variety of crude construction materials (clays, crushed and broken stone, dimension stone, and sand and gravel) are produced, but available information is inadequate to make reliable estimates of output levels.

[3]Unless otherwise specified, data represent actual production by COMIBOL and small- and medium-scale mines.

[4]Reported figure.

[5]Cadmium contained in zinc concentrates produced by COMIBOL. (Cadmium is not recovered in elemental form in Bolivia.)

[6]COMIBOL output plus sales by placer mines. (Small- and medium-scale mines cannot legally export gold.)

[7]Data represent exports and are regarded as being virtually equal to production.

[8]Includes topped crude (presumably further processed outside of refineries reported in this table or used without further processing) as follows, in thousand 42-gallon barrels: 1979—669 and 1980—481.

[9]Refinery fuel not reported separately, if at all, in recorded data.

Table 2.—Bolivia: Principal minerals produced by COMIBOL and medium and small miners

(Metric tons of fine content, unless otherwise specified)

[1]Includes production of Banco Minero de Bolivia and others plus Empresa Nacional de Fundiciones domestic sales of tin and antimony.
[2]Includes production only of South American Placers Inc.
[3]Exports in February and September 1981.
[4]Includes 15 metric tons preconcentrates of COMIBOL for volatilization.
[5]Includes only wolframite and scheelite.

TRADE

Bolivia's mineral export earnings, which made up 48% of the country's foreign revenue, declined 25% to $419.3 million compared with 1981 earnings. The production value of tin, of which Bolivia is the world's fourth largest producer, fell 19% to $278.3 million.

The production value of natural gas, mainly for export to Argentina, increased 17% to $382 million, compared with 1981 value. The production value of natural gas continued to be second in importance, providing 43% of the country's foreign revenue. The overall export value of the country's traditional and nontraditional exports fell 10.3% to $877.7 million in 1982.

Refined gasoline export earnings have fallen from $163.9 million in 1974 to $3.3 million in 1981 and $4.5 million in 1982. Sales of natural gas to Argentina increased 4.6% to 81,116 million cubic feet compared with that of 1981.

Bolivia, although not a member of the International Tin Agreement, was restricting its exports in agreement with pact members.

COMMODITY REVIEW

METALS

Antimony.—Bolivia, the largest antimony producer in the world, reduced its output to 13,978 tons of metal in concentrates. Empresa Nacional de Fundiciones (ENAF) produced 1,820 tons of metal, a decline of 64% from that of 1981. Bolivia's antimony exports declined 39% in volume and 48% in value, compared with those of 1981. Most of the output was from the private sector with about 300 medium- and small-scale producers. Empresa Minera Unificada S.A. (EMUSA) was the largest Bolivian antimony producer, followed by San Juan Ltda., Churquini Enterprises Inc., Cía. Minera del Sur S.A. (COMSUR), and Bernal Hermanos. The medium-miner group accounted for 73% of national output; the small-miner group, 25%; and COMIBOL, the remainder.

For the last 3 years, antimony prices have experienced a continuous fall owing to increased recycling and the substitution of lower priced metals for antimony. Bolivia's state-run antimony smelter, ENAF, has been going through a process of change. ENAF stopped the production of antimony trioxide because it could no longer compete with other countries, which produced almost pure trioxide (99.9%). The smelter instead produced crude oxides, which it sold to foreign smelters.

The antimony smelter produced almost 5,200 tons in 1981, which was about 80% of capacity. However, in 1982, it ran at a very low capacity because prices had been too low to make full-scale operation worthwhile. The smelter stopped producing early in the year. The only operations conducted for the rest of the year were the treatment of material in the circuit and test runs to check costing. Part of the plant was used for tin smelting.

Copper.—The production of copper in Bolivia was very minor compared with that of the neighboring countries of Chile and Peru. During 1982, the production of copper was limited to COMIBOL'S Empresa Minera Corocoro and two or three small mines located in the Province of Uyuni.

The nation's copper output declined 14% to 2,270 tons compared with that of 1981. Nearly all of this was exported to the United States. Exports of copper totaled 2,139 tons grading 56% copper, valued at $3.1 million.

Gold.—Gold production in Bolivia decreased 40% compared with that of 1981. Small miners produced 88% of the total output. These small miners consisted of mining cooperatives with operations on the Tipuani River, located 120 kilometers north of La Paz. The remainder of the gold output came from the South American Placers Inc. dredge on the Kaka River.

EMUSA and a U.S. company, Westworld of Texas, were planning to start an open pit operation to mine gold and silver from the banks of the Desaguadero River, located near the city of Oruro. The proposed operation was to be a 50-50 joint venture and was one of the new projects underway after a long period of mistrust between the Bolivians and foreign investors. Expected output has been estimated at 32,000 troy ounces of gold and 130,000 troy ounces of silver per year. The total capital investment was estimated at about $4 million, and reserves reportedly were sufficient to allow a 10-year mining operation.

The Government of Bolivia started a project for the evaluation of alluvial gold deposits in the areas of Kaka and Mapiri in Larecaja Province and the Mapiri-Guanay-Challana areas on the Tipuani River, both in the Department of La Paz. The project contemplates technical assistance to the gold cooperatives of Tipuani and Cangalli. Preliminary geophysical studies were carried out in 1982 in the gold cooperatives' areas of Moropampa, Molleterio, Riconada, Unificada VI, and Cotoca.

Iron Ore.—Empresa Siderúrgica Boliviana S.A. (SIDERSA), the state-owned steel company, exported to Sociedad Mixta Siderúrgia Argentina 7,832 tons of iron ore grading 62.5% iron and valued at $97,000, an increase in both volume and in value in 1982 compared with the 1981 export. These iron ore shipments were part of the agreement signed by both nations in 1973. SIDERSA announced in April 1982 that the long-awaited Mutun iron ore-steel project was still waiting to solve financing problems.

Lead, Silver, and Zinc.—Production of lead declined 26% compared with that of 1981. COMIBOL continued to be the largest lead producer in the country with 58% of output. The medium-miner group produced 32%. Exports of lead declined 26% in volume and 43% in value, compared with those of 1981. Silver has been mined in Bolivia for over 500 years; however, today, there are very few native small silver mines. Silver was mainly produced as a byproduct of lead and tin mining. Silver production decreased 14% compared with that of 1981. COMIBOL accounted for 77% of total production. Exports of silver declined 26% in volume and 48% in value compared with those of 1981. Production of zinc fell 3% compared with that of 1981. COMIBOL produced slightly over one-half of the zinc output. Exports of zinc declined 0.3% in volume and 5% in value compared with those of 1981.

Cía. Minera Quioma S.A., a subsidiary of the U.S. firm American Smelting and Refining Co., was the dominant lead producer (92%) in the medium-miner group. Quioma was the second largest zinc and silver producer, and the largest was COMSUR. Among COMIBOL's zinc operations, one of the most important zinc producers was the Matilde Mine, operating at a 1,000-ton-per-day capacity, one of the richest zinc mines in the world. Earlier studies at Matilde indicated ore reserves of 3 million tons grading 18% zinc, 2% lead, and 28 grams of silver per ton. The Matilde mill has a capacity to produce 300 tons per day of zinc concentrate and 30 tons per day of lead concentrate.

COMIBOL and the state smelting corporation, ENAF, were involved in a joint venture for the construction of a new lead-silver smelter and refinery at Karachipampa, Potosí. The smelter was to have the capacity to produce 24,200 tons per year of lead and 200 tons per year of silver and was

expected to cost about $268 million. The contract for the design and construction was awarded in 1980 to a consortium of three Belgian companies and two companies from the Federal Republic of Germany. The facility was expected to become operational in 1983. However, there were problems, principally with regard to securing the 50,000 tons per year of concentrates that would be required to feed the smelter. The nearby María Luisa Chiroma deposit was inadequate, and COMIBOL was concerned that the Bolivar Mine, previously expected to be the prime supplier for the smelter, does not have sufficient reserves. As additional possibilities for sources for the new mill, COMIBOL was evaluating the lead-silver deposits in the Province of Sud Lipez. In Oruro, the Institute of Mining and Metallurgical Investigations was also examining 32 other prospects. In addition, sources of possible feed were being sought outside Bolivia, principally in Argentina and Peru.

Tin.—Bolivia maintained its position as the world's fourth largest producer of tin concentrate and metal following Malaysia, Indonesia, and Thailand. Production of tin ore and concentrate, as well as tin metal, reached 26,773 and 19,032 tons, respectively, a decrease of 10% and 5%, respectively, compared with 1981 output. Tin exports totaled 21,892 metric tons compared with 23,250 metric tons in 1981. ENAF produced 19,032 tons of metallic tin and exported 17,068 tons, primarily to the United States (12,035 tons), the Netherlands (1,950 tons), and the Federal Republic of Germany (955 tons).

Most of the underground mining was done by cut-and-fill and shrinkage-stoping methods with the exception of Catavi, the nation's largest tin operation, which was mined by block-caving methods. Having to use expensive underground hard-rock mining was the principal technical factor for the cost disadvantage of the Bolivian tin industry, compared with cheap alluvial tin dredging elsewhere in the world. Bolivian ore grades were declining in quality every year, and no new deposits had been found. The average ore grade was about 0.7% tin content. Some mines like Catavi's Siglo Veinte Mine had an even lower average mill head content.

Most of the tin concentrates were beneficiated in plants adjoining the mines. Most of these were built in the 1930's and were designed to treat ores above 1.0% tin content with plants running at an average of 50% recovery. COMIBOL's production came from 90 mines, grouped in 12 mining companies, 2 mixed cooperatives, and several leased small mines.

The second largest tin producer in the country was the medium-miner group, composed of 24 private companies, whose total production amounted to 6,026 tons, 23% of the nation's total tin output. Output of tin in this group decreased 5% in 1982 compared with 1981 output.

Smelting of tin and antimony was done by the state-owned corporation ENAF, the operating costs of which were said to be excessive compared with others elsewhere. The high-grade tin smelter was designed and built in 1970 by Klöckner Industrie Anlagen AG of the Federal Republic of Germany. It has been expanded twice, once in 1976 to 11,500 tons per year and the second time in 1978 to its current installed annual capacity of 20,830 tons of metallic tin, using feed averaging 42.1% tin.

A lower grade tin smelter, completed in 1980, was designed and built by Klöckner Humboldt Deutz AG of the Federal Republic of Germany, Machinoexport of the U.S.S.R., and P. Bergsoe and Sons of Denmark. Its design capacity was 10,000 tons of metallic tin, using feeds averaging 10% to 35% tin. Because of technical problems, full capacity has not been reached.

The La Palca tin volatilization plant, located 17 kilometers northwest of the city of Potosí and claimed to be the largest of its kind in the world, was designed and built by the U.S.S.R. in 1981. It was designed to process 400 tons of concentrates per day at about 3.5% to 6.0% tin and to yield 3,500 tons of tin powder to be used as feed at the ENAF Vinto plant. The La Palca plant was experiencing a shortage of feed.

In March 1978 and later in mid-1979, COMIBOL and the Soviet firm, Machinoexport, signed a contract for a second volatilization plant. This volatilization plant, which was also of Soviet design, would be located at Machacamarca, 20 kilometers south of Oruro. The plant would be similar to La Palca's with slight modifications; it should produce 58.8% tin at a processing rate of 400 tons per day of feed using 3% to 6% tin concentrates from the mines of Catavi, Huanuni, Colquiri, San José, and Bolivar. The construction of the Machacamarca plant has been postponed until the results of the La Palca plant were fully analyzed.

The Government of Bolivia announced on June 25, 1982, that Bolivia intends to join the International Tin Producers Association (ITPA) instead of participating in the 6th International Tin Agreement. ITPA was recently organized by the founding members Malaysia, Thailand, and Indonesia, the three largest tin producers in the world. The formal entry into ITPA became effective in October during a meeting of ministers of mines of tin producing countries, which was held in Lagos, Nigeria.

Tungsten.—Bolivia was the leading producer of tungsten in Latin America and ranked fourth with Australia as a world producer after China, the U.S.S.R., and Canada. Output decreased 9% compared with that of 1981, and exports of WO_3 concentrate increased by 6%.

The Bolivian private mining companies (medium miners) continued leading the nation's production of tungsten with 49% of the total, followed by COMIBOL with 39%, and the small miners with 12%.

The International Mining Co. operations at Chojlla, Enramada, and Chambillaya produced 84% of the total medium-miner output. The remainder was produced by San José de Berqué Ltda. According to a recent report by Churquini Enterprises Inc., a subsidiary of the Anschutz Mining Corp. of the United States, a rich tungsten deposit has been discovered at the El Chicote Grande Mine, high in the Bolivian Andes about 150 miles southeast of La Paz. A decision has been made to develop this mine. Detailed design engineering bids were evaluated by Anschutz. The deposit consists of a series of narrow wolframite veins. Reserves were estimated at 4.0 million tons grading 0.8% WO_3. The plans under evaluation were for an output of 1,000 tons per day of 0.6% to 0.65% WO_3. The mining operation and preconcentration stage would be done underground, followed by gravity concentration with jigs and tables. The concentrates would be upgraded to 65% to 70% by magnetic separation. Part of the production, high in arsenic, would be roasted to yield a salable arsenic trioxide product. The project was expected to cost $20 million to $25 million and was to begin production in early 1985.

NONMETALS

Barite and Bentonite.—Production of barite in Bolivia decreased 72% in 1982 compared with that of 1981. There were several small known bentonite and barite deposits on the Bolivian Altiplano.

The Baroid Div. of NL Industries Inc. of the United States, in a joint venture with Cía. Minera Mosamar S.A. of Bolivia, built a barite and bentonite beneficiation plant in Oruro in 1978 with an installed capacity of 10,000 tons per year of barite and 8,000 tons per year of bentonite. Reserves of bentonite were estimated as 30,000 tons of measured, 118,000 tons indicated, and 160,000 tons inferred. According to company officials, the barite meets the 4.2 specific gravity standards of the American Petroleum Institute, which the petroleum industry requires.

Cement.—Production of cement in Bolivia decreased 13% to 324,923 tons compared with 1981 output. The three cement companies operating in the country were Cía Boliviana de Cementos S.A.M. (COBOCE), located in Irpa Irpa, Department of Cochabamba, with a production capacity of 100,000 tons per year; Fábrica Nacional de Cementos S.A. (FANCESA), located at Cal Orko (Mesaverde), Department of Chuquisaca, with a production capacity of 300,000 tons per year; and Sociedad Boliviana de Cementos S.A. (SOBOCE), located at Viacha, Department of La Paz, with a capacity of 225,000 tons per year.

The total capacity of cement production for the country amounted to 625,000 tons per year. The COBOCE and FANCESA plants were basically state-owned companies through the Corporación Boliviana de Fomento, the Bolivian development corporation. The third plant, SOBOCE, was privately owned. Total cement production in 1982 reached 52% of the country's installed capacity, 8% lower than the capacity used in 1981.

FANCESA was planning an expansion by adding one preheater kiln rated at 800 tons per day.

LaFarge Consultoría et Estudos, a subsidiary of LaFarge Conseils et Estudes (LaFarge Group) for Latin America, was awarded a consulting engineering contract for the construction of the Yacuses cement plant in the Province of Chiquitos, Department of Santa Cruz. The new dry-process plant was to have an annual clinker production capacity of 345,000 tons, and the kiln was to be equipped with a cyclone preheater and would cost $105 million.

The U.S.-French consortium, GATX-Fuller S.A. and CGEE Alsthon, was awarded the contract for the design and construction of a small 60,000-ton-per-year cement

plant in El Puente, Province of Mendez, Department of Tarija, at a cost of $19 million.

The French-Canadian consortium, La-Farge-CBPI, was granted the final design contract ($1.96 million) for a new 150,000-ton-per-year cement plant (projected enlargement to 220,000 tons per year) to be located at Sevaruyo, about 100 miles south of the city of Oruro, at a cost of $40 million.

MINERAL FUELS

The Bolivian hydrocarbons sector, compared with other sectors of the nation's economy, had fewer problems and was able to partially meet its 1982 working schedule. The domestic market for refined petroleum products was fully satisfied, despite the internal and worldwide economic recession that decreased demand, mainly in the industrial and transportation sectors.

The hydrocarbon sector contributed 45.0% in value of the total exports, second after mineral exports.

Natural Gas.—The value of natural gas produced increased 17% to $382 million from $326 million in 1981.

In March 1982, Bolivia and Argentina agreed on a price increase for the first 6 months of the year. The new price agreed on for natural gas was $4.12 per thousand cubic feet, an 8% increase over that of 1981. The amount of natural gas imported by Argentina was expected to decrease gradually since more gas has been found in the north and south gasfields of Argentina.

The future of the hydrocarbons sector would depend upon future sales of natural gas. The implementation of the gas pipeline project to Brazil in the near future was the only new viable sales outlet, but it was also dependent on the needs of Brazil and the availability of financing. Production of natural gas increased 7% to 187.8 billion cubic feet compared with that of 1981. The increased output was due to the increased production at Occidental's Porvenir gas and oil field, which increased almost fivefold.

With the limited internal market and fixed export volume, 46.3% of total production was sold, and the remainder was reinjected, flared, or vented. Bolivia's domestic consumption of natural gas at present continues to be minimal at 5.9 billion cubic feet, a decrease of 4.5% compared with that of 1981.

During 1982, the Bolivian-Brazilian Joint Economic and Technical Committee, formed by the two state companies, Yacimientos Petrolíferos Fiscales Bolivianos (YPFB) and Petrolero Brasileiro S.A., had three meetings during which the draft of the gas sales-purchases contract was discussed and most of the technical aspects of it were approved. To go ahead with the project, the requirements are approximately 2.9 trillion cubic feet in proven reserves for the Brazilian market and a little bit less than that amount for internal consumption and exports to Argentina.

The Santa Cruz-São Paulo gas pipeline cost was estimated in 1980 to be $400 million for the Bolivian section and $700 million for the Brazilian section. When completed, the gas pipeline to Brazil would generate as much as $500 million per year in foreign currency.

Petroleum.—Production of crude oil and condensates increased to 8,921,000 barrels compared with 8,091,000 barrels in 1981, thus reversing the downward trend of crude oil production started in 1974. The increase was due to larger outputs by the YPFB contractors.

Crude oil production increased in 1982 to 2,746,000 barrels from 2,726,000 barrels in 1981. A similar increase occurred in lease condensate output, with an increase from 5,365,000 barrels in 1981 to 6,175,000 barrels in 1982. The upward trend developed as a result of increased output from Occidental's Porvenir Oilfield, which became the second largest producer in the country after the YPFB Rio Grande Oilfield. Bolivia had 21 crude oil-producing fields, all belonging to YPFB. Eleven fields decreased production. None of the YPFB fields increased production. Domestic consumption of petroleum products was 9,305,000 barrels, an increase of 4.9% compared with that of 1981.

On June 29, 1982, Bolivia Andina Petroleum Corp., a subsidiary of Anschutz (Denver, Colo., United States), signed an operation contract with YPFB to explore 7 million acres for petroleum in an area known as the Subandino Norte, 80 miles north of the city of La Paz. The contract was valid for 25 years. Anschutz was to invest $2.0 million in each of the first 2 years of the contract, and at the end of the fourth year, it was to have invested at least $14.0 million. Anschutz was planning to use its deep geophysical interpretation system followed by deep drilling (more than 18,000 feet deep) for the exploration.

Occidental continued to be the sole operator in the southeastern region of Bolivia. The southern region of Bolivia continued to

have the second richest oil and gas fields. YPFB, Tesoro Bolivia Petroleum Co. and partners, and Occidental are all operating in this region.

Total crude oil reserves in Bolivia as of December 31, 1982, were estimated at 172.3 million barrels. Of this, YPFB was to have 144.7 million barrels (84%); Occidental, 11 million barrels (6%); and Tesoro, 17 million barrels (10%).

[1]Physical scientist, Division of Foreign Data.

[2]The Central Bank of Bolivia placed 1982 GDP at 17,703 million pesos at 1970 prices. The Bolivian peso was officially converted from Bolivian pesos ($b) to U.S. dollars at the rate of $b25=US$1.00 until Feb. 5, 1982, when it was devaluated to $b44=US$1.00. On March 22, the official rate was limited to state operations and to 40% of exporters' foreign exchange earnings, which were required to be turned over to the Government. By mid-June, the peso was above $b100=US$1.00 and in December, was fluctuating around $b260=US$1.00.

The Mineral Industry of Botswana

By Thomas O. Glover[1]

Botswana's economy in 1982 was generated by two sectors, mining and agriculture. Mining, the largest productive sector in the economy, contributed more than 25% of the gross domestic product (GDP). The diamond industry dominated this sector, accounting for 86% of the value of mineral production. Diamonds were the principal source of foreign exchange.

The economic progress in Botswana continued to be sluggish owing to slackened world demand for diamonds plus depressed prices for copper and nickel. These setbacks reduced GDP growth and resulted in budget and balance-of-payment deficits. The Government of Botswana implemented several austerity measures to deal with the economic downturn including devaluation of the currency, increased domestic interest rates, and a cutback in Government spending. The budget deficit was held to 2%, and Botswana's debt service ratio stood at 4%, which was considered low by developing country standards.

A new power project, costing approximately $250 million, was approved. The project will provide for the country's power needs through 1988 and will develop coal resources to substitute for imported oil in the generation of electricity. Objectives included tapping the country's large coal potential, integrating the existing power systems, and improving Botswana Power Corp.'s tariff policy. A coal-fired, mine mouth, 180-megawatt powerplant at Morupule will be constructed and was expected to be in operation in 1986. Cost of the project was estimated at $230 million.

PRODUCTION

Mineral production for Botswana remained at about the same level as that of 1981, except for increased diamond production. Output of diamonds was up approximately 57%, while mining and smelter output of nickel-copper matte decreased about 2%, and coal production increased about 9%. The contained metal in the matte averaged 38.9% nickel, 40.2% copper, and approximately 0.50% cobalt. Total production of nickel, copper, and cobalt came from the Selebi-Phikwe underground mines. Coal production came from Botswana's only coal operation, the Morupule Colliery.

Table 1.—Botswana: Production of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1978	1979	1980	1981[p]	1982[p]
Coal, not further described	314,486	355,115	370,914	379,270	[2]414,778
Cobalt, Co content of nickel-copper matte[3]	261	294	226	254	[2]254
Copper:					
Mine output, metal content[4]	17,235	17,419	20,841	19,954	[2]21,161
Cu content of nickel-copper matte[3]	14,615	14,563	15,553	17,819	[2]18,375
Diamond:					
Gem[e] thousand carats	420	659	765	740	NA

TRADE

Botswana's two major export commodities were diamonds and nickel-copper matte. In 1982, although diamond production increased approximately 57%, exports remained at about the 1981 level. About 50% of the diamonds produced were stockpiled owing to world market conditions. Bamangwato Concessions Ltd. (BCL) negotiated an agreement with Rio Tinto Mining of Zimbabwe (RTMZ) to process part of their nickel-copper matte at RTMZ's Zimbabwe nickel refinery. This helped reduce pressure on the AMAX Nickel Inc.'s (AMAX) Braithwaite, La., refinery which was being affected by weak nickel demand in the United States. AMAX formerly took all of the BCL matte exports. The nickel-copper matte agreement between Botswana and Zimbabwe was the first agreement between two members of the nine-nation Southern African Development Coordination Conference.

COMMODITY REVIEW

METALS

The BCL Selebi-Phikwe nickel-copper mines and smelter operation was beset with further problems in 1982, that of major supply-and-demand issues. The industrial demands for nickel and copper continued to be weak. AMAX requested major cuts in smelter matte prices and shipped tonnages. A 25% reduction in nickel-copper matte shipments to AMAX was initiated as a result of this request. The reduction of shipments to AMAX amounted to approximately 10,000 tons of matte per year. Of this amount, contracts were undertaken with Zimbabwe and Canada to take the total amount. RTMZ received 4,000 tons with Falconbridge Ltd., of Canada, receiving 6,000 tons for their refinery in Kristianland, Norway. A new process was developed at the Selebi-Phikwe smelter to pelletize the heretofore matte product. RTMZ requested the newly developed pellets, so that the pellets could be introduced directly into their already functioning smelter in Zimbabwe. Comparing 1982 and 1981 production, copper content of the matte increased 3.12% to 18,375 tons, nickel content decreased 2.83% to 17,756 tons, and cobalt content remained at 254 tons. Full production from the Phikwe Mine, through the Phikwe No. 3 shaft, commenced in 1982. Of the total production, approximately one-third was hoisted at the Selebi Mine, 14 kilometers from the Phikwe Mine, and two-thirds was hoisted at the Phikwe Mine.

NONMETALS

Botswana produced approximately 7.7 million carats of diamonds in 1982, up about 2.8 million carats from the 1981 total. The large increase in production was attributed to the opening of the new Jwaneng Mine in January. Exploration for diamonds in Botswana began in the middle 1950's. Production at the first mine, Orapa, began in 1971 and at the Letlhakane Mine in 1977. At Jwaneng, agreement to exploit the deposits and go into production was reached in December 1978, with initial production in 1982. Production was scheduled for 3 million carats in 1982, rising to 4.5 million carats by 1985. The capital cost of the Jwaneng project was put at $288 million,[2] with about 20% of the cost being subscribed to by the Government of Botswana. The three open pit diamond mines employed approximately 4,200 persons in 1982, most of whom were citizens of Botswana.

The new Jwaneng Mine is jointly owned by the De Beers Co. (51%) and the Botswana Government (49%) and was dedicated on August 14. By the end of the year, 1,379 persons were employed, including expatriates, with final employment set at 1,450. Mine life will be 22 years with all employees being Batswana within 15 years. The kimberlite deposit consists of three lobes, one large lobe in the center with one small lobe on each side. The large lobe was 1.5 kilometers long, 800 meters wide, and will be 200 meters deep when mining is completed.

A new diamond sorting center in Gaborone will be opened in 1983. The center will be processing the diamonds mined at all three Botswana mines, which should be 9 million carats by 1984. The new 11-story center had over 300 employees, with approximately 60% being diamond sorters. All 180 diamond sorters are citizens of Botswana who have received professional training in Antwerp, Belgium.

MINERAL FUELS

Botswana contains the largest deposits of coal in Africa outside the Republic of South Africa. Exploration drilling done over the past several years by Shell Coal Botswana Ltd., Charbonnage de France International Botswana, British Petroleum Botswana Ltd., and AMAX Exploration Inc., outlined the country's reserves of technically and economically recoverable bituminous coal at 3.5 billion tons.

The only coal producer in Botswana, Morupule Colliery near Palapye owned by Anglo American Coal Corp. Ltd., produced 414,778 tons of coal in 1982 valued at $4.8 million. Morupule coal was all used for domestic consumption. A new 90-megawatt, air-cooled powerplant, near Morupule, was scheduled for completion by 1986. The Morupule Colliery open pit mine will double coal production to supply the new plant.

Agreements covering the development of a thermal coal mining project at Kgaswe, near Palapye, were signed July 14, 1982, by the Government of Botswana and Shell Coal. The agreements provided for the creation of Kgaswe Coal Development Co. (Pty.) Ltd. The Government of Botswana was to receive 15% of the equity of the company at no cost, and had an option to purchase an additional 10% at a later date. The agreements did not bind Shell Coal to develop the project, but did provide for a study of the field's potential. The study will take 2 years to complete. This would be followed by an additional 2 years of construction, with the first phase of the project to be in production by 1988. This phase would be aimed at producing about 5 million tons per year, with the coal to be transported through Ellisras, the Republic of South Africa, to Richards Bay Port in the Republic of South Africa. The coal, from the Shell Coal area, will be mined using underground mining methods because the coal seam is deeper than 100 meters.

---

The Mineral Industry of Brazil

By Travis Q. Lyday[1]

The Brazilian economy was stagnant throughout 1982, with growth in real terms estimated to be slightly above zero. Brazil's gross domestic product (GDP) in current prices expanded to an estimated $295.3 billion.[2] The accumulated rate of inflation was 99.7%, slightly up from the 95.2% recorded in 1981.

The mineral extraction sector, excluding petroleum, grew by 8.7% in 1982, although this sector continued to contribute less than 3% of the total GDP.

Although agriculture still predominates the economy, Brazil has developed an industrial base of considerable size and diversity, and the mineral sector is an important earner of foreign exchange. Iron ore continued to be the most important mineral mined and exported from Brazil with a production value estimated at $1 billion, second only to petroleum that was estimated at $3 billion. Brazil was also a major producer and exporter of columbium, beryllium, gem stones, manganese, mica, and quartz during the year, as well as an increasingly important exporter of bauxite. Brazil's predominant mineral imports were coal and copper.

In February, the Ministry of Mines and Energy (MME) announced the discovery of a new mineral province containing deposits of cassiterite, gold, monazite, topaz, and tourmaline in the upper Rio Negro River region of northern Amazonas State. The province, named Mapuera for the river of the same name, is located over a 175,000-square-kilometer area in parts of the States of Amazonas and Pará, and the Territory of Roraima.

In midyear, the MME announced the discovery of another new mineral province, located between the Jari River on the Amapá-Pará border and the Paru River in Pará State. The province, appropriately named Novo Carajás because of its proximity to Grande Carajás, includes large areas of mineralization containing chromium, copper, gold, iron ore, lead, manganese, nickel, and zinc.

Brazil continued to lessen its reliance on imported oil in 1982. Nevertheless, nearly 70% of its oil consumption requirements had to be met with foreign oil.

Government Policies and Programs.—The Brazilian Government continued to give high priority to the Grande Carajás Development Project, which in addition to mining included agricultural, forestry, and energy projects. However, at yearend it was announced that development of the iron ore mining and related construction projects was being slowed as a result of a decrease in the 1983 budget of Cia. Vale do Rio Doce (CVRD), the Brazilian state mining company charged with the development of the Carajás iron ore project. It was reported at yearend that the percentage of work completed for the Carajás iron ore mining project and related infrastructure was as follows: construction at the N4E iron ore minesite, 44%; port construction at Ponta da Madeira on the island of São Luis in Maranhão State, 29%; and the railroad connecting the minesite and port, 44%.

Itaipú, the 12,600-megawatt hydroelectric power project located on the Paraná River, approximately 8 miles upriver from the international bridge connecting Ciudad Presidente Stroessner with Foz de Iquazú between Brazil and Paraguay, continued to proceed on schedule. During the year, 12 floodgates were emplaced to seal off the flow of the Paraná River. The first 700,000-kilowatt generating turbine was to be in

operation by March 1983, with 3 to 4 additional turbines being commissioned annually until all 18 are installed. However, at yearend, it was announced that installation of the turbines at the Itaipú project was being slowed owing to an excess of electrical energy generating capacity and to weak markets in such energy-intensive industries as aluminum and copper.

Owing to the continued recession in 1982, as well as the impact of both increased domestic oil production and declining world petroleum prices, Brazil modified its national coal development and nuclear energy development programs during the year. In the initial nuclear plan, Brazil was to build 16 nuclear reactors under a nuclear energy technology exchange agreement with the Federal Republic of Germany by the end of the century. Only eight of the previously scheduled nuclear plants were to be built according to the revised plan. The revised coal plan calls for a lessened rate of production in 1985, 9.5 million tons instead of the originally planned 19.5 million tons per year.

PRODUCTION

According to preliminary estimates, the value of Brazil's 1982 mineral production increased 12% in real terms, to $7.2 billion from the 1981 figure of $6.5 billion. Metals accounted for $1.9 billion; nonmetals, $1.5 billion; and mineral fuels, $3.8 billion. The latest available official data reported by the Departamento Nacional da Produção Mineral (DNPM) (the National Department of Mineral Production)[3] shows that the value of mineral output grew by 4% in real terms in 1981 compared with the substantial 41% increase achieved in 1980.

During 1981, the latest year for which official data are available, 91% of the value of all metallic mineral production was accounted for by five commodities: iron ore, 51.7%; gold, 17.0%; bauxite, 8.3%; tin, 7.1%; and manganese, 6.9%. Almost 76% of the value of all nonmetallic mineral production was comprised of granite, 24.8%; limestone, 23.0%; clay, 11.5%; phosphate rock, 9.6%; and sand, 7.0%. Crude petroleum represented 82.6% of the total fossil fuel value, followed by natural gas, 10.2% and coal, 7.2%.

Fossil fuels contributed 51.1% of the total value of mineral output in 1981, followed by nonmetallic minerals, 24.4%; metallic minerals, 23.4%; and diamond and gems, 1.1%.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Oct. 7, 1983.

[2]In addition to the commodities listed, molybdenite, bismuth, and uranium oxide are produced, but output is not reported and available information is inadequate to make reliable estimates of output levels.

[3]Reported figure.

[4]Figures represent sum of (1) crude material sold directly and (2) production of concentrate. Sale of crude material in any given year may exceed production in that year as a result of the sale of stocks of crude material mined but not sold or beneficiated in previous years. Similarly, output of concentrates in any given year may exceed the amount of crude material mined in that year owing to treatment of previously mined but not yet processed ores.

[5]All figures except those for 1978 differ substantially from those appearing in the latest available official Brazilian sources owing to inclusion of estimates for unreported production by individual prospectors (garimpeiros). Officially reported figures are as follows, in troy ounces: Major mines: 1978—128,860; 1979—107,158; 1980—131,432 (revised); 1981—140,691; 1982—not available; Garimpeiros: 1978—172,038; 1979—36,234; 1980—310,704 (revised); 1981—414,744; 1982—not available.

[6]Includes sponge iron as follows, in thousand metric tons: 1978—270; 1979—324; 1980—275; 1981—226; 1982—226 (estimated).

[7]Smelter and/or refined metal.

[8]Includes baddeleyite-caldasite.

[9]Figures represent officially reported output plus official Brazilian estimates of output by nonreporting miners; officially reported output was as follows, in thousands of carats: 1978—86; 1979—83; 1980—158; 1981—136; 1982—not available.

[10]Includes the following quantities sold directly without beneficiation, in metric tons: 1978—6,051; 1979—5,177; 1980—1,059; 1981—93; 1982—not available.

[11]Exports.

[12]Less than 1/2 unit.

[13]Data on output in gravimetric units are not available for 1980 and later years, but output on a volumetric basis was reported as follows, in cubic meters: 1980—67,844; 1981—66,893; 1982—not available.

[14]Data on output in gravimetric units are not available for 1980 and later years, but output on a volumetric basis was reported as follows, in cubic meters: 1980—483,617; 1981—438,391; 1982—not available.

[15]Data on output in gravimetric units are not available for 1980 and later years, but output on a volumetric basis was reported as follows, in cubic meters: 1980—47,031,817; 1981—49,225,056; 1982—not available.

[16]Apparently includes crude quartz used to produce quartz crystal (listed separately in this table) as well as additional quantities of common quartz.

TRADE

As a result of adverse international market conditions throughout 1982, Brazil was unable to achieve the projected $3 billion trade surplus forecasted, although the country was able to maintain a positive trade balance, estimated to be $800 million, for the second consecutive year.

Total imports of $19.4 million were down 12.2% from those of 1981, while exports fell 13.3% to $20.2 billion. The oil import bill declined $1 billion, from the revised $10.6 billion, to $9.6 billion. According to preliminary estimates, mineral trade, excluding petroleum, declined 0.4% from 1981 although still registering a $1.36 billion surplus. Metallic minerals, dominated by iron ore, accounted for virtually all of the minerals exported from Brazil.

Table 2.—Brazil: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)

COMMODITY REVIEW

METALS

As a result of continued exploration activities by Government agencies and private sector companies, DNPM reported substantial increases in the measured reserves of nickel (40%), zinc (32%), and aluminum (27%).[4] In contrast, measured reserves of gold were reported to have diminished almost 26% during the year. Measured reserve figures published by DNPM are those that are officially approved by the Government on the basis of annual mine reports and final reports on exploration work.

Alumina, Aluminum, and Bauxite.—Negotiations were held toward yearend between CVRD, the state mining company, and its Japanese partner, Nippon Amazon Aluminum Co. (NALCO), a consortium of 32 Japanese firms, concerning the future of Alumina do Norte do Brasil S.A.'s (ALUNORTE) 800,000-ton-per-year alumina refinery due to come onstream in 1984 at Barcarena, Pará State. Earlier in the year, NALCO proposed a 3-year freeze on the construction of the alumina plant, believed to have been 20% completed at yearend, owing to the depressed world market and Brazil's own worsening financial situation. The discussions reportedly included consideration of a reduction in planned capacity, a rescheduling of the timetable, and even a pullout by NALCO. The delay, and possible cancellation of the project, threatened to adversely impact plans being implemented to expand the annual production capacity of the Trombetas bauxite deposits from 3.5 million to 8 million tons. NALCO has a 39% interest in the $214 million refinery project with ALUNORTE, which in turn is a wholly owned subsidiary of CVRD.

Alumínio Brasileiro Ltda. (ALBRAS) was scheduled to bring its aluminum smelter, also located at Barcarena, into production in 1985 with an initial capacity of 40,000 tons per year, adding a further 120,000 tons per year in 1986. NALCO has a 49% interest in the $547 million smelter project with ALBRAS which, like ALUNORTE, is a wholly owned subsidiary of CVRD.

Earlier in the year, ALUNORTE was merged with ALBRAS into a single concern called Consorcio de Alumínio Albras e Alunorte S.A. The linkup will keep the legal structure of the two concerns separate but will allow the management to be run by one board of directors. Both companies will continue to have their own separate capital and investment requirements.

Vereinigte Aluminium Werke AG of the Federal Republic of Germany postponed indefinitely the construction of its 220,000-ton-per-year, two-stage, $800 million Alune aluminum smelter near Recife in the northeastern State of Pernambuco owing to yet-undefined electricity costs, as well as the depressed world market. Construction of the smelter was originally scheduled to begin in late 1983.

Valesul Alumínio S.A.'s aluminum smelter, Brazil's fifth, located 40 kilometers southwest of Rio de Janeiro at Santa Cruz, came onstream in May. Production, originally scheduled to be 40,000 tons of aluminum in 1982 and increasing to the design capacity of 86,000 tons per year in

1983 was estimated to be 30,000 tons owing to the weakness of the world aluminum market.

Work progressed on the 500,000-ton-per-year alumina refinery and 100,000-ton-per-year aluminum smelter complex at São Luis, Maranhão State, during the year. The $1.5 billion project, owned by Alumínio do Maranhão S.A., a joint venture of Alcoa Alumínio do Brasil S.A. (60%), and two subsidiaries of the Royal Dutch/Shell Group, Shell do Brasil S.A. and Billiton International Metals BV, was about 35% complete by yearend. The projected startup date for the processing of bauxite, to be obtained from the Trombetas deposits, was early 1984.

An expansion of Mineração Rio do Norte S.A.'s (MRN) Trombetas bauxite operations in Pará State was being considered throughout the year. The proposed $400 million expansion would increase production from 3.5 million tons per year to 8 million tons per year. MRN, the largest producer and exporter of bauxite in Brazil, was owned by CVRD (46%), Alcan Alumínio da America Latina (24%), Mineração Rio Xingu S.A. (10%), Cia. Brasileira de Alumínio (10%), Norsk Hydro Comércio e Indústria Ltda. (5%), and Reynolds Metals Co. (5%).

Columbium (Niobium).—Cia. Brasileira de Metalurgia e Mineração (CBMM) began experimental production of 99.99% pure columbium metal from columbium oxides of 99% purity at a pilot plant in Lorena, São Paulo State. The metal will be tested against international quality standards before being marketed. CBMM was planning to add a commercial-scale facility to its operations at Araxá, Minas Gerais State.

Copper.—Eluma S.A. Indústria y Comércio, the largest Brazilian copper company, was leading a consortium of six companies in an attempt to purchase the 150,000-ton-per-year Caraiba Metais copper smelter and refinery from the Government at yearend. The proposed sale of the $1.2 billion facility, located in Bahia State, was part of the Government's wide-ranging plan to sell many of its state-owned companies. The nearby La Caraiba mines were to be included in the sale. The Caraiba Metais smelter began production trials in August and was officially inaugurated in October. Commercial production was scheduled to begin early in 1983.

Eluma was also planning to initiate a Government-approved $900 million copper project, including a smelter and refinery in the southern State of Rio Grande do Sul, and a mine in Goiás State. However, to date, the project has not progressed beyond obtaining approval owing to the possibility of purchasing the Caraiba Metais plant.

Exploration for copper in the Carajás region was opened to private company participation late in the year. CVRD's research arm, Rio Doce Geologia e Mineração S.A. (DOCEGEO), began delineation of the reserves at its Salabo deposit in the Carajás region, which were estimated to be 1.2 billion tons grading at 0.83% copper. Sufficient reserves were outlined to warrant the construction of a 3-ton-per-hour pilot plant at a total cost of $4 million. The plant was due to begin processing ore early in 1983.

Gold.—A study conducted by Cia. de Pesquisa de Recursos Minerais identified reserves of ore containing 900 tons of gold in the Tapajós region of Pará State. Reportedly, the find is of sufficient grade to be suitable for commercial operations.

A 19.145-kilogram nugget, containing 17.613 kilograms of gold, was discovered in September at Serra Pelada, the Government-owned mine in Pará State. Gold production at Serra Pelada nearly tripled in 1982 to 219,263 troy ounces, up from 83,333 troy ounces in 1981. Detailed drilling, trenching, and geological mapping at the site have outlined a reserve of 30 tons of gold.

Mineração Morro Velho S.A. commissioned its new Morro do Vento Mine and 20,000-ton-per-month treatment plant at Jacobina, Bahia State, during the year. The mine will produce about 1.4 tons per year of gold.

Iron Ore.—CVRD, the world's largest iron ore producer, shipped for export and domestic consumption iron ore products at a level that was the third highest in 40 years. The total amounted to 73.0 million tons shipped from CVRD's own operations, three pellet plant joint ventures, and two associated companies. This total compares with the levels of iron ore shipments by CVRD to the alltime high records of 80.1 million tons in 1980 and 79.0 million tons in 1979. However, iron ore exports, predominantly to the Federal Republic of Germany, Japan, and the United States, fell from 79.7 million tons in 1981 to 71.5 million tons in 1982, a 10.3% decline.

Brazil's second largest exporter of iron ore, Minerações Brasilieras Reunidas S.A. (MBR), received Government approval for an expansion project to double the current production of 15 million tons per year to 30 million tons per year by the late 1980's at a

cost of $255 million. MBR was owned 49% by St. John d'El Rey Mining Co. Ltd., a subsidiary of the Hanna Mining Co. of the United States.

The Capanema Mine at Ouro Preto, Minas Gerais State, began operations in mid-year. The mine, developed by Cia. de Mineração Serra Gerol S.A., a joint venture company formed by CVRD (51%) and a consortium of eight Japanese companies led by the Kawasaki Steel Corp. (24.5%) at a cost of $125 million, will produce 11.5 million tons per year of ore when full capacity is attained in 1983. The plant at the nearby Timbopeba Mine, which also came on-stream during the year, will treat the ore from both mines. Production at Timbopeba will be 7.5 million tons per year when the mine reaches full capacity.

Manganese.—The concession to mine the 45-million-ton Igarapé Azul manganese deposit in the Carajás region of Pará State was awarded by the Government to state-owned CVRD in September rather than to several interested private enterprises that had submitted proposals. CVRD had made a considerable investment in developing manganese mining in the region and was producing battery-grade ore on a small scale for domestic consumption. DOCEGEO, the CVRD mining and prospecting subsidiary, will operate the mine, export up to 25% of production, and sell the remainder to domestic producers of ferromanganese alloys. Through yearend, $12.5 million of a projected $50 million total was invested in a concentration plant, mining equipment, and vehicles. The mine is scheduled to initially produce 500,000 tons of concentrates per year, increasing to 1.1 million tons per year during the latter part of the decade. The installation of a ferromanganese plant, with an initial capacity of 150,000 tons per year, and hydroelectric facilities were also slated for the region.

Nickel.—Empresa de Desenvolvimento de Recursos Minerais S.A. (CODEMIN) commissioned a $100 million open pit nickel mine and adjacent smelter near Niquelandia, 175 kilometers north of Brasilia in the State of Goiás, near yearend. Average nickel content of the lateritic ores ranges from 1.4% to 1.8% and proven reserves were sufficient for a 20-year mine life. CODEMIN was principally owned by the Hochschild Group (55%), which will also operate as manager, and the Anglo American Corp. do Brasil. The International Finance Corp. of the International Bank for Reconstruction and Development (World Bank) provided a $60 million, long-term loan for the project in 1979 and held a 10% equity interest. The project was designed to produce 5,000 to 5,900 tons of contained nickel per year in the form of ferronickel for sale in the domestic market. Brazil has had a deficit in ferronickel since 1978 and the imbalance was expected to continue increasing for the foreseeable future.

Tin.—Paranapanema S.A. Mineração, Indústria e Construção, Brazil's largest tin producer, announced its intent to double its 1981 production of 3,500 tons by developing a tin deposit located north of Manaus in Amazonas State. Contained reserves are estimated at 60,000 tons. Early in the year Paranapanema began production of 80 tons of concentrates per month at a deposit located east of Xingu in the Carajás region of Pará State.

Mineração Brumadinho S.A., Paranapanema's chief competitor, was planning two expansion projects, a 500-ton-per-year dredging operation in Rondônia, and a 750-ton-per-year primary tin mining operation in Goiás State.

Brascan Recursos Naturais S.A. announced plans to invest $50 million for tin exploration and mining in Rondônia State.

Titanium.—Metais de Minas, a state-owned enterprise, was planning to construct a 3,000-ton-per-year titanium sponge plant, Brazil's first, at Belo Horizonte in Minas Gerais State. The target date for startup was 1984. The $280 million project will include construction of a 50,000-ton-per-year titanium dioxide pigment plant, an ore concentration plant, and a titanium tetrachloride plant for sponge production. A demonstration pilot plant, based on secondary titanium dioxide ore (anatase) mined near Araxá, Minas Gerais, was under construction by Centro Técnico Aeroespacial, an agency under the Ministry of Aeronautics, at São Jose dos Campos, São Paulo State. The center developed a patented process for producing sponge titanium. Titanio do Brasil (TIBRAS), a private Brazilian company, was the only titanium producer in Brazil. TIBRAS' 300,000-ton-per-year pigment plant at Salvador, Bahia State, used Australian ilmenite as feed.

Zinc.—Cia. Mineira de Metais S.A., Brazil's largest producer of zinc, began production of 99% zinc oxide at its plant at Tres Maria. Plant capacity is 1,000 tons per month.

NONMETALS

As of yearend 1981, DNPM reported substantial increases in the measured reserves of fluorite, 55%; vermiculite, 44%; kaolin, 39%; limestone, 22%; and calcite, 12%.[5]

Diamond.—Morro Vermelho Ltda. initiated a pilot alluvial diamond mining project near Cuiabá, Mato Grosso State, in November. Morro Vermelho was the first to use heavy media separation techniques in Brazil. Should the testwork prove successful, diamond output of 60,000 to 70,000 carats annually, 90% of which are estimated to be of gem quality, is anticipated.

Phosphate Rock.—The Bank of America reportedly approved a $20 million loan to Indústria de Fosfatados Catarinense (IFC) to finance the infrastructure for IFC's 600,000-ton-per-year phosphate rock project at Anitápolis, Santa Catarina State. Total investment for the project, scheduled to begin production of phosphate concentrate in early 1985, was estimated to be $120 million, including the construction of an 80-kilometer pipeline to transport the concentrate from the plantsite to the Port of Imbituba.

Mineração do Cerrado S.A. sold its Lager Mine to Trevo S.A., headquartered in Rio Grande do Sul State, for $8 million early in the year. The Lager Mine, located in Minas Gerais State near the Patos de Minas, was reportedly the principal privately held phosphate reserve in Brazil.

Potassium.—The Taquari-Vassouras potash mine and fertilizer processing center, located at Carmópolis in Sergipe State, was officially inaugurated in midyear. Petrobras Mineração S.A. (PETROMISA), a subsidiary of the state-owned oil monopoly Petróleo Brasileiro S.A. (PETROBRÁS), planned to have the potash complex onstream by the beginning of 1984. At full capacity it will produce 500,000 tons per year of potassium chloride extracted from 2 million tons per year of sylvite ore. The $160 million project will initially help to reduce Brazil's huge imports of potash and subsequently bring the country to self-sufficiency. In 1982, Brazil was the world's second largest importer of potash. The Sergipe potassium deposits were discovered by PETROBRÁS during petroleum exploration drilling in 1963-64.

PETROMISA was studying the possibility of constructing a complex for the production of up to 1.5 million tons per year of potassium chloride at its Fazendinha-Uraria deposit, 130 kilometers southeast of Manaus, Amazonas State, in the Amazon Basin. The Amazon deposit, also discovered by PETROBRÁS, continued to be evaluated during the year, with an estimated 134 million tons of ore tentatively identified.

MINERAL FUELS

Alcohol Fuel Program.—Aided by subsidized Government loans to build distilleries and by an administered price advantage over gasoline, the Brazilian National Alcohol Program (PROALCOOL) attained the capacity to produce over 5 billion liters of alcohol per year to fuel a fleet of 1 million vehicles during the year. In addition, alcohol was widely used in vehicles throughout the country in an admixture of up to 20% to extend the gasoline supply. Reportedly, the use of alcohol as a fuel has reduced the imported oil bill by $1.5 billion.

The World Bank released an $80 million parcel of a $250 million, 4-year loan toward yearend, marking the first international source of funding for PROALCOOL.

The first commercial-scale fuel alcohol plant using the Biostil process went onstream in August at the São Luis distillery in southern Brazil. This process was developed by the Swedish firm Alfa-Laval for the continuous fermentation and distillation of alcohol. The plant produced 150,000 liters per day of 96% ethanol from a feedstock of 30% final molasses and 70% cane juice syrup.

Coal.—The goals of PROCARVÃO, the ambitious Brazilian National Coal Program, were reduced during the year, owing principally to the third consecutive year of recession, but also to declining petroleum prices and increased domestic oil production. Instead of the 19.5-million-ton annual production called for by PROCARVÃO by 1985, a more modest 9.5-million-ton goal was projected. Projections for slower economic growth and less rigorous demand for electrical energy were reflected in the reduced goals. The scheduled construction of several coal-powered thermoelectric generating plants was also slowed in keeping with anticipated economic growth.

Official Brazilian figures estimate that the country's coal reserves, 23 billion tons or 4.3 billion tons oil equivalent, are by far the greatest reserves of energy Brazil possesses.[6] In contrast, known Brazilian oilfields contain just under 200 million tons oil equivalent. Over 80% of the coal reserves are in Rio Grande do Sul State.

Estimated coal production during 1982

was 6.2 million tons, of which 1.2 million tons was of metallurgical grade and 5 million tons of steam coal.

Natural Gas.—Natural gas production was 107 billion cubic feet, an increase of more than 21% over that of 1981, for an average production of 293 million cubic feet per day. However, only about two-thirds of the total was used commercially, with the rest being flared. PETROBRÁS was actively engaged in research and feasibility studies in order to increase gas utilization during the year.

Brazil increased its natural gas reserves to 2,554 trillion cubic feet, a 20% increase over that of 1981. The increase was largely due to a doubling of the nonassociated gas, to 350 billion cubic feet, in the Upper Amazon Basin 800 kilometers west of Manaus, Amazonas State. Also contributing to the increase was the delineation of the Juruá and Jaraqui Fields, as well as new discoveries of associated gas in the Campos Basin, off Rio de Janeiro State.

The proposed 1,940-kilometer pipeline to link natural gasfields near Santa Cruz, Bolivia, to São Paulo came closer to fruition during the year. The final engineering study was turned over to PETROBRÁS in late August by Snamprojetos Engenharia S.A., the Brazilian subsidiary of the Italian firm Snamprogetti S.p.A. PETROBRÁS, in turn, presented it to Yacimientos Petrolíferos Fiscales Bolivianos, the Bolivian state oil corporation, in La Paz. The study was accepted by both Bolivia and Brazil, but detailed negotiations were still proceeding at yearend.

The pipeline will provide 390-million-cubic-feet-per-day of natural gas and could begin flowing by 1987. The estimated cost of the project was $1.7 billion. The World Bank has offered to provide $350 million toward construction of the 570 kilometers of 30-inch pipeline from Santa Cruz, Bolivia, to Corumbá and $800 million for the remaining 1,370 kilometers of 28-inch pipeline to São Paulo, provided that international biddings are held for the orders. The Bolivian gasfields are estimated to contain 35.3 trillion cubic feet of reserves.

Petroleum.—PETROBRÁS, the state oil monopoly formed in 1953, continued to concentrate its priorities into exploration and production activities during 1982 with the objective of reducing Brazil's external dependence on oil supplies and improving the balance of payments. As a result, Brazil's crude oil output, including natural gas liquids, increased 21.6% over that of 1981 to an alltime record. Production increased from an average of 220,000 barrels per day in 1981 to a record 268,000 barrels per day in 1982. Offshore fields produced 53% of the total compared with 46% in 1981. A new daily production record of 325,912 barrels was established in late December. PETROBRÁS anticipates reaching 400,000 barrels per day output by yearend 1983. This will be about 358,000 barrels per day on an annual basis. Eventually their objective is to produce 500,000 barrels per day of domestic crude by 1985.

Brazil imported nearly 70% of its 1982 crude oil consumption requirements. Consumption averaged slightly over 1 million barrels per day, a 0.2% increase from the 1981 level.

By directing 81% of its total investments into exploration and production programs, PETROBRÁS increased recoverable liquid hydrocarbon reserves almost 17%, to 1,735 billion barrels. During the year, 97.7 million barrels of crude oil and natural gas liquids was produced. The increase was largely due to the discovery of new fields and the delineation of existing fields in the Campos Basin off the coast of Rio de Janeiro State. The Campos Basin, producing almost 40% of domestic petroleum output, surpassed that of Bahia State during the year to become the country's single leading production area.

The exploration efforts of PETROBRÁS in 1982 included 190 wells drilled onshore and 113 wells drilled on the Continental Shelf. Among the onshore wells, 41 were found to be oil-producing; 6, gas-producing; and 13, both oil- and gas-producing. Of the 113 offshore wells, 33 were found to be oil-producing; 1, gas-producing; and 4, both oil- and gas-producing. Drilling operations were carried out onshore in 11 States and Territories from Roraima Territory to Espírito Santo State and off the coasts of 11 States from Pará State to São Paulo State. Brazilian oil and gas production during the year was from 2,439 wells—2,040 onshore and 399 offshore.

During the year, 26 new drilling rigs, divided evenly between onshore and offshore use, became operational. PETROBRÁS owned 8 and 18 were contracted. At yearend, 94 rigs were in operation, 58 onshore and 36 offshore.

For the second consecutive year, 1 million meters were drilled. Total drilling was 1,524,000 meters, an increase of 43% over

that of 1981, of which 677,000 meters was for exploration and 841,000 meters was for production development. The balance was special well drilling.

Risk contract exploration in 1982 did not lead to any commercially viable discoveries of hydrocarbons. However, the contract discovery made in 1981 off the coast of Bahia State by the Pectin do Brasil-Chevron Oil Co.-Union Oil Co. consortium continued to be evaluated with additional seismic surveys and drilling.

Thirteen private risk contract companies operated under PETROBRÁS authorization during 1982, including one domestic driller. PETROBRÁS had signed 23 new risk contracts by yearend, bringing the total signed since 1976 to 125.

Table 4.—Brazil: Crude oil and natural gas liquids production by Petróleo Brasileiro S.A.

Area	Production (thousand 42-gallon barrels)		Share, percent		Change, percent
	1981	1982	1981	1982	
Alagoas	1,076	1,459	1.3	1.5	+35.6

Uranium-Nuclear Energy.—Brazil's first nuclear powerplant, the 626-megawatt Angra I, located near Rio de Janeiro, began trial operation in April and was inaugurated in May. However, the plant reportedly had design problems in its steam generator preheating system and was shut down following the inaugural tests. It was expected to be online early in 1983.

Initial operation of Angra II, Brazil's second nuclear reactor and the first to be built under accords with the Federal Republic of Germany, was moved back from 1986 to 1987; decelerated work on the Angra III reactor will also delay its operational target date by at least 1 year, to 1989.

Work on the Iquape I and Iquape II reactors, located on the south shore of São Paulo State and originally scheduled to begin operations in 1991, was indefinitely postponed.

The construction of a plant for the conversion of uranium concentrates to uranium hexafluoride, the intermediate stage between concentration and enrichment, was awarded to Uranium Péchiney Ugine Kuhlmann of France at yearend. The new facility, located at Resende, Rio de Janeiro State, was scheduled to be operational by 1985.

The Mineral Industry of Bulgaria

By Tatiana Karpinsky[1]

The industrial production and national income of Bulgaria increased 4.6% and 4%, respectively, in 1982. Almost the entire growth of the national income resulted from increased labor productivity. Capital investment decreased from 6.7 billion lev (L) in 1981 to L6.5 billion in 1982.[2] About 38% of this was used for renovation and development of existing industrial facilities.[3] Output of the power industry increased 9.3%, output of the metallurgy and mineral industry increased 2.4%, and output of the construction industry increased 0.6%. Bulgaria produced more than 70% of its needs in rolled steel and more than 90% of its needs in nonferrous metals and alloys. Major projects put into operation included two electric furnaces at the Lenin iron and steel combine at Pernik, with a total annual production capacity of 500,000 tons of steel; the fourth 440-megawatt block of the Kozloduy atomic powerplant; and a catalytic cracking installation for processing crude oil at the Burgas petrochemical complex. Four coal mines were under development, and two opencast mines were being expanded. An agreement on cooperation in geological exploration for oil and gas on Bulgaria's Continental Shelf was signed with the U.S.S.R. The Assarel copper complex, with a projected capacity of 15 million tons of ore, was under development. This would be one of the largest such complexes in Europe. An additional 450,000 tons of ammonia capacity was added at the Dimitrovgrad plant. Production of nitric acid started in the Stara Zagora plant. Late in 1981 the third and final stage of installations for the ferry service between Bulgaria and the U.S.S.R. was completed at Ilyichevsk.

Government Policies and Programs.—In December, the National Assembly approved the plan for Bulgaria's economic development in 1983. The targets appeared to be scaled slightly higher than those of the 1982 plan but were rather modest as compared with the annual growth during the preceding 5-year period, 1976-80.

PRODUCTION

Bulgaria's plan for overall industrial output was reportedly fulfilled. In comparison with the 1981 figures, production slightly increased in the coal, steel, nitrogen fertilizer, and power industries. Production of steel-rolled products and phosphoric fertilizers was lower than in 1981.

In 1982, 40.2 billion kilowatt-hours of electric energy was produced; the Kozloduy nuclear powerplant generated about 7 billion kilowatt-hours or 17% of the total. The share of electrical energy produced by nuclear plants was expected to be 30% in 1985 and 50% at the end of the century.

At the end of 1982, the population of Bulgaria amounted to 8.9 million. Total industrial employment was about 1.2 million in 1981, of which the coal industry employed 45,700; ferrous metallurgy, including ore mining, 34,600; the engineering and metal-working industry, 235,000; and production of electric energy, 27,100.

[2]In addition to the commodities listed, bismuth, chromite, gold, palladium, platinum, tellurium, uranium, barite, fluorspar, magnesite, and a variety of crude construction materials (common clays, sand and gravel, dimension stone, and crushed stone) are produced, but available information is inadequate to make reliable estimates of output levels.

[3]Reported figure.

TRADE

In 1982, total imports were valued at L10.8 billion and exports at L10.7 billion. Imports of fuels, minerals, and metals accounted for about 46% of total imports, and exports of this group for 12% of total exports. The centrally planned economy countries accounted for 75% of the total trade, and the Soviet Union's share amounted to about 54%. Trade with the developing countries increased considerably. Bulgaria's main interest in trade with the West was import of technology, which will allow it to modernize its industrial base and to utilize raw materials and energy more efficiently.

COMMODITY REVIEW

METALS

Copper.—Copper ore was produced mainly at the Medet, Elatsite, and Tsar Asen opencast mines located in the central part of the Srednogorie Mountains, east of Sofia, and about 10% was produced in the Burgas and Panagyurishte underground mines. In 1982, the Elatsite ore-flotation complex was commissioned. Renovation of underground mines in Burgas and Panagyurishte continued, as did development of the Assarel mining complex. The Medet Mine had a capacity of 8 million tons of ore per year, and the local smelter produced approximately 20,000 tons of fire-refined copper. The mine had reserves of approximately 200 million tons of ore grading 0.4% copper. Bulgaria's copper mining capacity was 50,000 to 60,000 tons per year of metal in 1982 and, according to the planned target, was being expanded to 120,000 tons per year by the mid-1980's. The Medet porphyry copper deposits were of the copper-molybdenum type, with a copper-to-molybdenum ratio grading from 60:1 at the center to 30:1 at the boundary of the ore body. The Elatsite copper deposits also represented porphyry-copper mineralization. The ore from the Panagyurishte underground mines was obtained from massive copper pyrite ore bodies; the main minerals were pyrite, quartz, chalcopyrite, and bornite.

Iron and Steel.—The Kremikovtsi steel plant continued under reconstruction and expansion, with the assistance of the Soviet

Union, to produce 3 million tons of rolled metals per year. Kremikovtsi produced over 80 types of steel and ferrous alloys and over 1,200 different shapes of rolled metal. It met about 80% of the domestic demand, and 30% of its output was allocated for export. The Lenin iron and steel plant at Pernik was also under reconstruction to manufacture up to 1.5 million tons of steel and 1 million tons of rolled stock per year. In May and June two electric furnaces, with total annual capacity of 500,000 tons of steel were put into operation. Work started on the foundation for a 300-millimeter light section mill at Debelt, near Burgas, where a third integrated steel plant was planned. The 800,000-ton-per-year computer-controlled mill, scheduled to start up in 1985, was supplied from the German Democratic Republic. The first stage of the project will include a 750,000-ton-per-year direct-reduction plant, a 900,000-ton-per-year electric melting shop, and a 4-meter plate mill.

The plant, at Septemvri for production of wide-diameter steel pipes for oil and gas, started to produce spirally welded pipes and was to start producing seamless pipes in the near future.

Dravo Engineering Inc. of the United States was negotiating a contract to sell direct-reduction technology (HYL process) for the Burgas metallurgical complex.

Lead and Zinc.—Lead-zinc ores in Bulgaria continued to be mined by underground methods at a depth of more than 400 meters, mainly in the mines of the Gorubso enterprises in the Rhodope Basin; the main mines were located in Madan, Rudozem, Ermorechensk, Likinsk, Madjarovo, and Ustrem. There also was mining in Sedmochislenici in the Stara Planina Mountains. Most Bulgarian ore deposits are of the vein type with small thickness and low metal content. The main ore minerals are galena and sphalerite, which are always accompanied by pyrite, chalcopyrite, arsenopyrite, and marcasite. The complicated structure of the deposits limited the method of exploitation and caused low productivity. In all the Gorubso Mines, except Sedmochislenici, productivity was approximately 4.29 cubic meters per miner per shift and 1.20 cubic meters per underground worker per shift. In the Sedmochislenici Mine the ore body was massive, and productivity was much higher, reaching 6.2 to 7.4 cubic meters of ore per miner per shift and 2.19 to 2.35 cubic meters per underground worker per shift. The cost of production was L9 to L13 per cubic meter, or one-third to one-half the cost of mining the vein deposits. Exploration continued in Ermorechensk, where lead-zinc deposits with high metal content were located at a depth of 700 to 800 meters. The main problem was drainage of hot underground water. Construction of the new mines and concentrating plant in Osogovo, which started in 1980, continued in 1982.

Lead concentrate (65% lead) and zinc concentrate (50% zinc) were processed mainly at the Plovdiv and Kurdjali smelters. Kurdjali, in the eastern Rhodope Basin, is Bulgaria's oldest lead and zinc smelter; it was built with aid from the Soviet Union. It treats complex local ores and has a capacity of 45,000 tons per year of lead and 30,000 tons per year of zinc. Production also includes cadmium, bismuth, and other byproduct metals. Plovdiv is located 150 kilometers southeast of Sofia and processes local lead-zinc ores. Capacity is about 55,000 tons per year of lead and 60,000 tons per year of electrolytic zinc. It also produces cadmium and other byproduct metals.

NONMETALS

Feldspar.—The widespread Bulgarian quartz-feldspar sands were a relatively new prospect for production of feldspar. The main minerals in these sands were quartz, 62%; feldspar, 20%; and clay minerals, 16%; other minerals, such as muscovite, biotite, and tourmaline, were about 2%. Processing of these raw materials by flotation and electrostatic separation yielded a high-grade feldspar concentrate with 13% to 14% $K_2O + Na_2O$, 0.16% to 0.20% Fe_2O_3, 0.03% to 0.08% TiO_2, and a K_2O:Na_2O ratio of 15:1 to 20:1. Sand reserves were estimated at 30 to 40 million tons. In the near future it was planned to build a new processing facility to produce about 50,000 to 60,000 tons per year of potassium feldspar. Feldspar was also produced from pegmatites with a feldspar content of about 65% to 70% and a K_2O:Na_2O ratio of 1:1. Processing of the pegmatites by flotation yielded a feldspar concentrate of 11% to 12% $K_2O + Na_2O$ and 0.16% to 0.18% Fe_2O_3 with a K_2O:Na_2O ratio of 2:1 to 3:1.

Gypsum.—Gypsum reserves were estimated at several hundred million tons,

located in scattered regions of the country. The most important were located at Slanotren and Koshava, 19 kilometers northwest of Vidin in western Bulgaria and at Rodnevo and Gipsovo near Stara Zagora. The gypsum beds, which contained small amounts of carbonates, clay minerals, quartz, and feldspar, occur in western Bulgaria at depths of 225 to 305 meters. The gypsum is mostly white and comprises about 80% to 90% of the raw material. Recovery in the mine was only 15% to 20%. In order to increase this recovery, a new system of hydraulic backfilling for underground mining was developed, which was expected to increase recovery 40% to 50%. About 80% of the raw gypsum was used in the cement industry, and most of the remainder was used for the production of roasted gypsum and gypsum manufactures.

MINERAL FUELS

Coal.—Coal production rose by 2.9 million tons to a total of 32.2 million tons; lignite accounted for most of the increase.

Bulgaria had about 4.4 billion tons of proven lignite reserves, of which 3.7 billion tons were economically recoverable. The largest reserves of lignite were found at the East Maritsa lignite basin, located near the town of Zagora. This basin had over 2.9 billion tons of reserves and accounted for about 64% of total coal production. New deposits of lignite were surveyed at Lom, in the northwest, at Elkhovo in the southeast, and near Sofia. Expected reserves of lignite in these regions were as follows: at Lom 1.2 billion tons, at Elhovo 430 million tons, and near Sofia 800 million tons. Reconstruction, renovation, and amalgamation of existing mines such as Zdravets, Black-Sea 2, the Troyanovo opencast mine, and others continued in 1982, and equipment for them was delivered from the U.S.S.R., the German Democratic Republic, and Romania. Reserves of brown coal were located mainly in the western and southwestern part of the country in the Bobov Dol, Pernic, and Pirin Basins and were estimated at about 327 million tons. Brown coal production accounted for about 17% of total coal production. Hard coking coal reserves were found in the Balkan Coalfield situated in the eastern part of the Balkan Mountains. Coking coal reserves were estimated at 140 million tons. Reserves of bituminous coal in the recently discovered Dobrudja Basin in the northeastern part of Bulgaria were estimated at over 1.5 billion tons. In 1982, drilling at the site of the new mines in Dobrudja reached a depth of 1,250 meters. The seams of high-quality bituminous coal were expected to be at a depth of 1,300 to 1,800 meters. The thickness of the coal seams was estimated to be 1.5 to 2.5 meters. The coal had a calorific value of up to 7,000 kilocalories per kilogram, with good coking qualities and low ash and sulfur content.

The share of solid fuel in the total energy balance will remain steady, but the share of locally produced coal will increase from 18% in 1980 to 22% in 2000. Despite this planned steady rise in output, Bulgaria's coal requirements will not be met from domestic sources alone, and bituminous coal and coke will have to be imported. In 1982 5.5 million tons of bituminous coal and 483,000 tons of coke were imported from the U.S.S.R.

Natural Gas.—Bulgaria's gas industry continued to develop. The main ring of the national grid system was under construction. New gas pipelines and compressor stations as well as an underground gas storage facility were also under construction. Some 1,000 kilometers of long-distance lines and two compressor stations were in operation. Reliance was principally on gas imports from the U.S.S.R. The domestic output, which was small, was utilized to cover the gas producing area's own requirements. About 5 billion cubic meters of gas was imported from the U.S.S.R., and this is expected to increase every year.

Petroleum.—Indigenous production of crude oil was small and came from small oilfields in the northwest part of the country. Prior to 1982 the Soviet Union supplied Bulgaria with a quantity of crude oil in excess of the country's domestic needs, allowing the surplus to be reexported as refined products, or even as crude. However, according to the Director of "Chimprom," Bulgaria was among the East European countries that had their supplies of Soviet petroleum cut 10%. Supplies of oil from Organization of Petroleum Exporting Countries (OPEC) reportedly amounted to about 30 million barrels. The developing petroleum and petrochemical industry was based on the Pleven and Burgas oil refineries, with total capacity of 107 million barrels of crude oil per year. In mid-1982, at the Burgas petrochemical enterprise, a catalytic cracking complex for refining 15 million barrels of fuel oil per year, which included installations for vacuum fuel oil distillation, viscosity breaking of road tar,

hydrogen production, and hydrocleaning of cracking raw material, was brought into operation. This complex increased production of light petroleum products from refined oil by 80%.

Two Soviet research vessels arrived at Varna to take part in a joint expedition for surveying Bulgarian offshore waters.

The Mineral Industry of Burma

By Gordon L. Kinney[1]

Burma was not a major world producer of any mineral commodity in 1982. At least 30 minerals, however, were exploited commercially during the year. Most of these were consumed domestically. The most important minerals or mineral-based commodities to the Burmese economy were crude oil, natural gas, tin, gem stones, tungsten, fertilizer, cement, lead, and silver.

Approximately 71,000 persons were employed in the mining industry at the beginning of 1982. Only 2,000 were employed by the private or joint private-government sector; the remaining 69,000 were employed in state-owned mining operations. Mining personnel were 0.5% of the country's active labor force. They accounted for 2.2% of the net output of goods and services, contributing to one of the most efficient sectors of the economy.[2]

The main objectives set by the Government for the mining sector during the third 4-year plan, fiscal year (FY) 1977 through FY 1980,[3] were to exploit mineral resources to the optimum, extend mineral exploratory surveying, prepare to supply the primary raw materials required for establishing a mineral-based heavy industry, boost crude oil and industrial mineral production to save foreign exchange, and minimize losses and waste. The production of crude oil was given top priority.

The public investment in the mining sector increased annually during the third 4-year plan from $45 million in the base year to $129 million in the final year.[4] The aggregate investment for the third 4-year plan was $415 million, more than double the planned amount, and constituted 12.4% of the public investment during the period. The planned public investment in the mining sector for FY 1982 was $137 million or 11.5% of total investment. Only the processing-manufacturing sector surpassed that percentage in the Government's plan.

Between FY 1975 and FY 1981, Burma's economy grew at an average annual rate of 7%, after over a decade of economic stagnation. Changes in Government policies since 1975 have been instrumental in that growth.

Prior to the mid-1970's, Burma had an isolationist policy with emphasis on import-substituting industrial development, with tight Government control of the marketplace. By the mid-1970's, the Government realized the necessity for increasing international trade, loosening market controls, and increasing agricultural production.

The acceptance of foreign loan capital and expertise promoted growth. From 1977 through 1981, foreign lenders committed over $2 billion to Burma. These loans financed projects that modernized existing capital stock, developed basic infrastructure, and added new industries.

Economic growth has slackened considerably from the recent trend. Gross domestic product (GDP) for FY 1981 was about $5.9 billion, about the same as that of FY 1980.[5] The real increase in GPD for FY 1982 reportedly will be lower than the Government's target of 6%, probably less than 5%.

The turnaround was attributed in part to a substantial drop in export earnings and to a rapidly worsening domestic energy shortage. The 1982 production of domestic crude oil was significantly lower than the target of 16.5 million barrels. The decline, coming at a time of increasing domestic demand, prevented Burma from fulfilling a 1-million-barrel commitment to Japan. Construction of roads and other development projects has been adversely affected because of diesel oil shortages.

The Government's policy for the past several years has been to refrain from importing crude oil mainly because of the drain on foreign exchange reserves. It appears that domestic production cannot meet the country's needs and therefore some imports will be necessary.

PRODUCTION

The performance of the mining sector continued to be satisfactory during FY 1981. The $122 million output of the mining industry increased for the sixth consecutive year.[6] In FY 1981, the mining sector accomplished 83.5% of the Government's planned production goal. While not meeting the goal, the increase in production value still showed a growth rate of 15.8% over the FY 1980 figure and an average growth rate for the third 4-year plan of 8.2% per year. The increase in product value for the mining sector for FY 1982 at constant 1969 prices was set at 13.1%.[7]

The most important mineral in aggregate value was crude oil by far. Also important, but much lower in value, were gem minerals, tin, lead, silver, cement, and natural gas. In the near future, copper concentrate from the Monywa project is expected to take on a prominent position in the value listings and, according to Government plans, refined tin metal was to be produced for the first time in 1982.[8]

The FY 1981 statistics for natural gas, tin, lead, silver, zinc, barite, graphite, feldspar, coal, and limestone showed significant production increases over those of FY 1980. These statistics show the trend of increased mineral output. Crude oil showed an unrealistically high increase for the period reflecting abnormally high water content of the oil resulting from previous overpumping of the wells. The water content at the wellhead was more than 20% of the gross volume.

eEstimated. pPreliminary. rRevised.

[1]Table includes data available through June 17, 1983.

[2]In addition to the commodities listed, pottery clay, common sand, glass sand, other varieties of crude construction stone, and other varieties of gem stones are produced, but available information is inadequate to make reliable estimates of output levels.

[3]Data are for fiscal years beginning Apr. 1 of that stated.

[4]Includes fire clay powder.

[5]Data exclude products used as fuel in refineries.

TRADE

Burma's exports of minerals reflected the worldwide downturn in the mineral commodities market. Export earnings for FY 1982 were $30 million campared with $46 million in FY 1981. Export volume increased for refined lead only, while export earnings from lead dropped from $6.6 million to $3.1 million. Other mineral exports declined in value as well as quantity.[9]

COMMODITY REVIEW

METALS

Copper.—Production of copper concentrate started during 1982 at the Yugoslavian financed Monywa plant that has a designed output of 60,000 tons of 18% copper concentrate per year. Production figures were not released by the Burmese Government's No. 1 Mining Corp., which is the owner and operator of the plant.

At yearend 1982, Burmese officials were considering the development of the nearby Letpadaung ore body. This deposit contains 190 million tons of ore and the planned production is 140,000 tons of concentrate per year. Burmese authorities would like to construct a copper smelter, but domestic financing was questionable because of the depressed world copper market. Alternate sources of capital were not available because of Burma's reluctance to accept foreign equity.[10]

Gold.—A Government official stated that Burma began small-scale manual mining of gold at a number of locations where it appeared to be commercially exploitable. Gold exploration was continuing simultaneously at the mining sites.[11]

Lead, Zinc, and Silver.—Bawdwin Mine was the sole source of lead, zinc, and silver

in 1982. The large production increase shown in table 1 was the result of the refurbishing and expansion project conducted during the last few years. Further expansion of the mine was proceeding with aid from the Federal Republic of Germany. No. 1 Mining Corp. completed procurement of additional equipment and materials to start an open pit operation at Bawdwin.

Since the mine opened in 1905, it has had some of the richest lead-zinc-silver ore in the world. As the grade slowly declined through the decades, a plan was made to convert from underground to open pit mining. The lack of financing and local security problems delayed implementing the plan on several occasions. The increased production of lower grade ore from an open pit would also require expanding the ore dressing plant, rebuilt just 2 years ago. The FY 1986 goals for the Bawdwin operation are 390,000 tons of ore, 7,500 tons of refined lead, 10,500 tons of zinc concentrate, 656,000 ounces of silver, and production of several byproduct minerals.

Tin and Tungsten.—The Government was in the midst of an ambitious program to increase output of tin and tungsten. Several projects were under construction or recently completed and undergoing trial operations.

The No. 2 Mining Corp. completed a test run of the expanded Heinda fossil placer tin mine and mill. Full-scale production at the facility was to begin at 1,000 tons of tin concentrate per year.[12]

Production reportedly started at the Kazat gravel pump operation after a startup period of testing in 1981. Also, the refurbished Tavoy concentration plant apparently began production of tin, wolframite, and scheelite concentrates after a break in test period in 1981.

The new 0.34-cubic-meter-bucket ladder dredge, Heinze, was believed to be operating in the drowned tidal valley of the Heinze River during 1982. This area was an important source of dredged tin ore prior to World War II. The new dredge has an hourly capacity of 378 cubic meters or 1.5 to 2.0 million cubic meters per year. The dredge's output was expected to be about 600 tons of tin-in-concentrate per year.

Late in 1982, the Asian Development Bank approved a $16 million interest-free loan to help rehabilitate Burma's tin industry. The money will finance the foreign exchange component of a group of mining operations in southern Burma. Facilities will be established for mining the alluvial tin deposits in the Tenasserim Div. along the Andaman Sea coastline. Gravel pump mining operations will be started by No. 2 Mining at the following sites: Ahtwin Bokypin, Zadiwin, Kyaukmedaung-Onzin Chaung, Shanthe, and Thithladaw.

In addition, the loan will help pay for a foundry for gravel pump replacement parts, a central ore concentration plant, a central maintenance workshop (at Mergui), detailed deposit delineation, and training for management and technical personnel.

The Government reported that construction of the 1,000-ton-per-year tin smelter at Syriam, near Rangoon, was completed. The FY 1982 Government plan called for production of 750 tons of tin metal. This was the first report of tin metal production by the Government. The tin smelter was built with North Korean technical assistance and financed by a barter arrangement. The Government was reportedly considering having the North Koreans double the smelter capacity.

NONMETALS

Cement Raw Materials.—Clay, limestone, and gypsum production were scheduled to be increased to supply new cement plants either under construction or planned.

Approximately 30% of the new cement plant at Pa-an was completed. The dry-process plant was to have an 840-ton-per-day capacity and be completed in 1983.

Engineering survey work on a 1,400-ton-per-day wet-process plant was completed in FY 1981 at the old Kyangin cement mill. The planned completion date was also in 1983. A second, similarly sized plant was also planned. It was not clear whether the old mill would continue to be operated, refurbished, or scrapped.

Fertilizer Materials.—Much of Burma's natural gas was used to produce ammonia and urea fertilizer at Pagan and Sale. The plant at Sale was being expanded with the help of a loan from Austria. The plant, scheduled for completion in 1982, was to have a new capacity of 83,000 tons of urea fertilizer per year. Construction of the long planned No. 3 fertilizer plant near Prome, financed by a loan from the Federal Republic of Germany, started in FY 1981. The capacity was reported to be 91,000 tons per year of nitrogen content. The plant was to begin production in late 1984. Completion of these projects was expected to make Burma self-sufficient in nitrogenous fertilizer for several years.

Gem Stones.—Burma has historically been an important producer of fine quality gem stones and jade. Rubies and sapphires come mainly from the Mogok area, about

100 kilometers north-northeast of Mandalay. Jade occurs in the northern State of Kachin. Kamaing, in the same State, is the world's only source of the semitransparent, emerald green variety of jadeite known as Imperial Jade. Spinels and amber are also found in northern Burma.[13]

The Government's annual report showed that the gross sales proceeds from the annual gem and pearl emporium have increased each year but one since 1975.

Burma's 20th annual gem emporium held at the end of FY 1982 had sales of $8.6 million worth of jade, gems, and pearls, the largest sale to date. Over 200 gem merchants from 12 countries attended the emporium. The bidding for jade accounted for nearly 59% of the sales. A 33-ton boulder of raw jade, found last year, was displayed but not offered for sale. Sales of ruby, sapphire, and other precious stones brought $375,000, down nearly $200,000 from those of FY 1981. It was reported that a considerable proportion of Burma's gem stones are black marketed into Thailand. The Government may also retain gems as a form of hard currency.[14]

Other Nonmetals.—Production was started at a new sheet glass plant at Bassein, and a bottle glass plant expansion at the Syriam glass factory and a household glasswares plant were completed in FY 1981.

Feldspar and several types of clay minerals were mined for domestic consumption in the ceramics industry. In addition, a sizable amount of crude clay, probably exceeding 90,000 tons per year, was mined for use in local brick kilns.

MINERAL FUELS

Coal.—Coal has never been produced in large tonnages in Burma. There are, however, coal deposits near Kalewa in the Chin Hills and in the vicinity of the Bawdwin complex in northern Shan State. Most of the coal is produced at the Kalewa underground mine. The Ministry of Mines was reportedly striving to increase utilization of coal from these deposits in order to save $10 million in foreign exchange currently spent on coal imports each year, mostly from India and China.

Preliminary Government figures confirm a sizable production increase in the last 2 years. The Government's FY 1982 plan called for production of 44,000 tons. Also, as part of the expansion program, tenders were offered for coal briquetting plants to feed thermal powerplants and coal-fired steam railroad locomotives. The direct-reduction steel plants could also use a significant amount of domestic coal if available.

Petroleum and Natural Gas.—Burma's crude oil production continued to level off at a time when domestic demand for diesel and other petroleum fuels was being stimulated by the growth of the Burmese economy. Shortages in refined products, resulting from the crude oil shortfall, have delayed work on some important development projects.

Reliable current production statistics were not available. The Government's preliminary FY 1981 estimate of 12 million barrels was later revised to 10.4 million barrels; a non-Government estimate was 9.7 million barrels. The Government's production target for FY 1982 was 16.5 million barrels, which appears to be overly optimistic.

Hopes for greatly increased crude oil production were raised in November 1981 when the Prime Minister announced the discovery of three major oilfields. It now appears that the reports were optimistic. The Kyontani Oilfield in the Irrawaddy Delta has good potential but development is difficult because of flooding during the monsoon season between June and November. No oil has been produced from the three wells drilled thus far. Four wells have been completed at the second field located at Tuyintaung, 8 kilometers southeast of Pagan. The Government-owned Myanma Oil Corp. (MOC) reportedly struck oil in the first well. Despite enthusiastic reports, the well produced crude so thick it could not be economically recovered. To find better crude, MOC was drilling several kilometers both south and north of Pagan. The third field, the only successful one to date, is located at Tantabin, near Kyangin. It has the possibility of becoming mainly a natural gasfield. Production in early 1982 was 600 barrels of condensate and 6.7 million cubic feet of gas per day. By yearend 1982, 22 wells had been sunk at Tantabin and development drilling continued.

The production of natural gas has been satisfactory. According to a National Assembly report,[15] natural gas output has risen from 8.5 billion cubic feet in FY 1976 to 14.8 billion cubic feet in FY 1980. A substantial increase in gas was expected in FY 1981 from the new Tantabin Field and from increased utilization of previously flared gas in new gas-turbine-powered gen-

erators at Prome and other installations.

In February 1982, the Tokyo-based Burma Petroleum Development Co. (BPDC) signed a $17 million agreement with MOC for funding two exploration wells in the Gulf of Martaban. BPDC is a joint venture headed by Idemitsu Oil Development Co., Japan National Oil Corp., and 11 Japanese trading houses.

BPDC began drilling in November after the monsoon season. The plan was to drill in exploration blocks previously leased by Esso and Martaban-City Service. However, the initial well was spudded in shallow water off the Irrawaddy Delta in blocks MOC had reserved for itself, which had not been leased previously to a foreign concession holder. A well was drilled to 2,076 meters where natural gas was struck in a Miocene limestone formation. A production test yielded a flow rate equivalent to 39 million cubic feet per day. This was the first gas found offshore Burma in a limestone reservoir. Although encouraging, the discovery did not solve Burma's petroleum shortage. With Burma already producing onshore natural gas sufficient to satisfy domestic needs, the development of the offshore field, which would require a large capital investment, was unlikely. The search for offshore oil, however, was continuing.

MOC was expected to announce new production sharing contracts in early 1983 to enhance foreign participation offshore. The contract terms were said to be favorable. The Government was not expected to release geological or geophysical data on the exploration blocks until a contract is signed.[16]

Mitsubishi Heavy Industries Corp. of Japan completed construction of a 25,000-barrel-per-day oil refinery at Mann and handed it over to Petrochemical Industries Corp. (PIC). As of July 1982, Mitsubishi had not tested the equipment because of the crude oil shortage.

With the Mann refinery, PIC's capacity was 57,000 barrels per day. At yearend 1982, PIC was operating at less than 50% capacity.

Despite PIC's surplus refining capacity, the crude production shortfall, and growing demand for petroleum products for Burma's economic development, Burma has not imported crude oil since 1974. The Government policy has been to remain independent of crude oil imports. No change in this policy has been indicated.[17]

The Mineral Industry of Canada[1]

By Harold R. Newman[2]

In 1982, the Canadian economy was characterized by a decline of the gross national product (GNP) of approximately 4% and a corresponding decline in the gross domestic product of nearly 7%. Unemployment increased sharply and, although there was regional variation, was expected to remain above 10% into 1983. The number of unemployed miners in Canada was estimated at 55,000, and mining communities across Canada were seriously affected. Canada ranked seventh in the world in GNP and was one of the world's largest producers of a wide variety of minerals. The mineral industry has been a major force in Canada's economic development. The combination of weak demand, falling commodity prices, and high interest rates during the current recession has had a severe impact on the Canadian mineral industry. Canada ranked first in the world in mineral exports and third in mineral production, behind the United States and the Soviet Union. Canada was the world's largest producer of asbestos, zinc, silver, and nickel; the second largest producer of potash, gypsum, molybdenum, and sulfur; and a leading producer of uranium, titanium, aluminum, cobalt, gold, lead, copper, iron, and platinum. Mineral deposits are located in all regions of Canada. Therefore, the effect of reduced demand and lower prices for almost all the mineral commodities was felt across all of Canada. Production cutbacks, temporary mine closures, extended mine closures, and, in some instances, permanent closures occurred as the mineral sector sought ways to minimize its losses.

The year was a critical period for the Canadian mining industry, and some companies posted record losses. The associated mineral products industries also encountered similar economic difficulties. Companies reduced capital spending plans, postponed new developments, and reduced expenditures for exploration in attempts to cut costs. Nevertheless, despite a bad year, minerals are essential industrial commodities and will continue to be needed in large quantities, so that the longer term outlook is favorable. Wealthier than most in terms of natural resources, Canada's mining industry's economic condition was expected to improve when increased economic activity occurs in the Western industrialized countries. The United States was the principal customer for Canadian mineral products; therefore, economic recovery in the United States was necessary before a significant upturn occurred in Canada.

Government Policies and Programs.—In 1980, Canada announced a comprehensive National Energy Program (NEP). This program was designed in part to decrease foreign control of the domestic oil industry by allowing a greater degree of Canadian ownership in the energy sector. In addition, the NEP's goal was also to achieve Canadian self-sufficiency in energy, including oil. NEP covers a broad range of issues including price, taxation, ownership, investment, exploration, and development.

In 1982, the Canadian energy sector was in a state of flux, and continual adjustments took place to reflect the situation facing the industry. Domestic energy policies were changing because of poorer economic performance than expected and the peaking and decline of international oil prices. The Alberta government, in April, initiated several changes in the Province's oil and gas royalty structure in an effort to stimulate its energy sector. The Federal Government also took a series of actions to increase the

cash flow of the energy sector: (1) the adjustment of the range of oil and gas eligible for higher output prices, (2) the reduction of the rate of the Petroleum and Gas Resources Tax for 1 year, and (3) set the Incremental Oil Revenue Tax rate at zero for 1 year. It also made other adjustments to strengthen the position of small producers and to encourage development of higher cost oil.

An important event in Canadian history occurred in 1982 when technical British authority over Canada's constitution, the amended British North American Act of 1867, was ceremonially relinquished. This patriation of the constitution occurred after the Federal and Provincial Governments, with the exception of Quebec, agreed on a Charter of Rights and an amending formula. Although the confederation was strenghthened by the constitutional change, debate over Federal-Provincial relations continues. The Western Provinces seek a greater degree of control over natural resources, especially energy resources. The Atlantic Provinces are contesting Federal claims to fishing and mineral rights off their coasts. A Canada-Nova Scotia Offshore Oil and Gas Agreement was announced in March 1982, although a dispute continues between the Province of Newfoundland and the Federal Government over the control and management of offshore mineral rights.

PRODUCTION

According to the Canadian Department of Energy, Mines and Resources, the total value of Canada's mineral production, including fuel and nonfuel minerals, reached an alltime high of $26.9 billion,[3] a slight increase of 2.5% over that of 1981. The increase in value does not reflect the economic weakness of the nonenergy minerals sector. The metal industry suffered a severe decline, dropping to a value of $5.7 billion compared with $7.1 billion in 1981. The performance of nearly all base metals, except gold, was dismal. Nonmetal output values dropped from $2.2 billion in 1981 to $1.7 billion. The value of output of mineral fuel commodities increased 17% from $15.4 billion in 1981 to $18.1 billion.

Performance of the nonfuel minerals industries experienced a pronounced slowdown. The copper market was severely depressed, and production dropped to about 60% of capacity. The decision of the Intergovernmental Council of Copper Exporting Countries to support the policy of maintaining production, in spite of falling prices, further exacerbated Canadian copper producers' problems. Most Canadian copper producers shut down operations for varying periods of time in 1982. Capital equipment or development investments were being deferred. The value of copper production dropped from $1.2 billion in 1981 to $1 billion. Some mines were closed indefinitely waiting for copper prices to increase significantly.

The world glut of iron ore reduced demand for Canadian iron ore exports. Iron ore shipments during the year were valued at $1 billion, a significant decline from the 1981 value of $1.4 billion. The industry was operating at about 50% of capacity. Nickel and molybdenum production ceased almost entirely in the latter part of 1982. The value of nickel dropped from $1 billion in 1981 to $471 million. Molybdenum value increased from $178 million in 1981 to $265 million, although marketing the commodity was difficult for producers. Refined zinc increased about 2% in value and 4% in output. Lead production increased slightly; however, the value of output dropped 20% below that of 1981. Gold value rose slightly to $754 million compared with $748 million in 1981.

Asbestos value declined 31% from $474 million in 1981 to $327 million. Compared with that of 1981, potash output was lower by 20.6% and value declined 36.8% to $508 million. The major structural materials, cement and sand and gravel, fared no better than the mining industry in general. Cement production was off by 20%, gypsum production fell 12%, and mineral aggregates were down by approximately 25%, all compared with those of 1981.

The value of mineral output increased in 5 of the 10 Provinces and both Territories. The Province of Alberta, with its large oil and gas output, accounted for approximately 61% of Canada's total mineral value. Production values of the Provinces and Territories follow:

Province or Territory	Value, billion U.S. dollars	
	1981[r]	1982[p]
Alberta	14.2	16.4
Ontario	3.4	2.6

TRADE

In total volume of trade, Canada ranked sixth in the world. The trade and investment relationship between the United States and Canada was extremely close. In 1981, about 17% of all U.S. exports went to Canada, and Canada supplied about 18% of total U.S. imports. The United States was the largest foreign investor in Canada, with an estimated $42 billion in investments or 80% of total foreign investment in Canada. Similarly, Canada's $14 billion investment in the United States represented about 15% of the total direct investment in the United States. U.S. investments in Canada were primarily in mining and smelting industries, petroleum, chemical, manufacturing, and finance. Canada's investment in the United States was concentrated in petroleum, real estate, manufacturing, and trade.

The Canadian mineral industry is mainly export oriented, and the industry exported an estimated $24 billion worth of crude and fabricated mineral products, or 30% of total domestic commodity exports. The United States received about 70% of these export products. The European Economic Community (EEC) and Japan received about 9.6% and 7.8%, respectively. Since the industry depends heavily on export markets, it is very sensitive to economic conditions in the rest of the world. This was the third year in succession that demand for Canadian minerals fell.

Canada is dependent on other sources of supply for bauxite, phosphate rock, chromium, manganese, and tin. Other minerals are also imported for economic and geographical reasons. Crude mineral imports were valued at $7.8 billion. The energy minerals, crude oil, natural gas, and coal, accounted for about 76% of all mineral imports.

Ore and concentrate	39,541	43,697	38,030	United Kingdom 2,034; France 940; Venezuela 803.
Metal including alloys:				
Scrap	78,616	77,987	61,733	Japan 14,845; Taiwan 398; Spain 352.
Unwrought	784,817	725,440	509,775	Japan 124,629; Thailand 15,075; Hong Kong 9,724.
Semimanufactures[1]	42,264	40,546	27,743	Pakistan 1,750; Indonesia 1,032; Colombia 711.

See footnotes at end of table.

Table 4.—Canada: Exports and reexports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Cadmium: Metal including alloys, all forms	1,096	1,453	913	United Kingdom 531; Italy 5; Netherlands 3.
Cobalt:				
Oxides and hydroxides	1,091	601	--	All to United Kingdom.
Metal including alloys, all forms	327	676	625	Netherlands 27; Brazil 8; Switzerland 7.
Copper:				
Ore and concentrate	286,075	276,810	2,175	Japan 198,396; Norway 24,987; Republic of Korea 19,818.
Ash and residue containing copper	322	677	624	Netherlands 27; Brazil 8; Switzerland 7.
Metal including alloys:				
Scrap	43,115	35,185	27,158	India 1,888; Belgium-Luxembourg 1,221; Republic of Korea 528.
Unwrought	335,196	262,641	84,137	United Kingdom 74,377; West Germany 31,756; Belgium-Luxembourg 17,786.
Semimanufactures	40,436	39,248	27,963	Venezuela 2,516.
Gold:				
Ore and concentrate troy ounces	202,170	176,901	19,352	Japan 105,095; Taiwan 5,841; West Germany 5,187.
Metal including alloys, unwrought and partly wrought thousand troy ounces	1,924	2,677	2,375	NA.
Iron and steel:				
Iron ore and concentrate thousand tons	39,021	40,545	19,237	United Kingdom 5,833; Netherlands 5,093; Japan 4,105.
Metal:				
Scrap do	785	572	451	Italy 57; Spain 49; Japan 9.
Pig iron, cast iron, related materials	740,703	589,619	264,918	Netherlands 141,480; Spain 78,695; Italy 60,856.
Ferroalloys:				
Ferromanganese	11,298	57,039	56,584	Jamaica 92; Philippines 92; Malaysia 37.
Ferrosilicon	52,377	52,410	23,688	Japan 24,717; Republic of Korea 1,102; United Kingdom 774.
Unspecified	r6,234	5,316	3,098	United Kingdom 1,703; Italy 155; Japan 144.
Steel, primary forms	327,139	894,595	714,337	Algeria 76,497; Mexico 22,977; Indonesia 20,589.
Semimanufactures:				
Bars, rods, angles, shapes, sections thousand tons	1,151	880	743	Mexico 43; Egypt 32; Ecuador 13.
Universals, plates, sheets do	1,314	975	723	Argentina 52; Thailand 35; Republic of Korea 21.
Rails and accessories	253,772	192,688	106,561	Mexico 69,753; United Kingdom 8,618; Ivory Coast 4,799.
Wire	96,274	106,857	104,997	Hong Kong 619; China 145.
Tubes, pipes, fittings	409,239	502,915	459,814	Iraq 32,062; United Kingdom 3,432.
Castings and forgings, rough	133,354	143,884	141,606	Ireland 392; Thailand 339; Mexico 318.
Lead:				
Ore and concentrate	147,007	146,090	41,943	Japan 51,715; Belgium-Luxembourg 18,832; West Germany 13,622.
Metal including alloys:				
Scrap	21,106	9,781	2,967	Sweden 2,269; Brazil 1,783; Taiwan 1,328.
Unwrought	126,539	119,815	57,809	United Kingdom 32,534; Italy 6,560; Belgium-Luxembourg 6,003.
Semimanufactures	4,682	6,819	3,325	U.S.S.R. 2,699; Republic of Korea 346; Denmark 273.
Magnesium: Metal including alloys	5,317	6,222	1,254	West Germany 1,515; United Kingdom 1,243; Japan 1,210.
Metalloids: Selenium	307	299	163	United Kingdom 65; Netherlands 20; Spain 16.
Molybdenum: Ore and concentrate[2]	14,584	13,664	1,002	Belgium-Luxembourg 3,470; Japan 2,743; West Germany 2,080.
Nickel:				
Ore and concentrate	42,647	53,840	10	Norway 31,437; United Kingdom 22,393.

See footnotes at end of table.

Table 4.—Canada: Exports and reexports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Nickel —Continued				
Oxides and hydroxides	16,989	14,390	7,678	NA.
Metal including alloys:				
Scrap	2,664	2,777	2,188	West Germany 264; Austria 99; India 50.
Unwrought	92,396	79,934	49,936	NA.
Semimanufactures	19,086	13,380	10,156	Belgium-Luxembourg 1,008; Netherlands 509; India 315.
Platinum-group metals:				
Ore and concentrate troy ounces	397,656	324,546	453	United Kingdom 324,093.
Metal including alloys, unwrought and partly wrought do	[r]37,174	32,148	23,515	Japan 6,500; United Kingdom 1,872; Brazil 256.
Silver:				
Ore and concentrate thousand troy ounces	12,754	17,571	4,160	Japan 7,030; Belgium-Luxembourg 4,415; West Germany 569.
Metal including alloys, unwrought and partly wrought do	28,506	29,415	29,204	United Kingdom 101; Japan 37; Dominican Republic 14.
Tin: Ore and concentrate	870	513	383	Mexico 67; Spain 50; United Kingdom 13.
Titanium: Ore and concentrate[3]	[4]9,239	NA		
Uranium and/or thorium: Ore and concentrate value, thousands	[r]$230,662	$179,384	$152,473	U.S.S.R. $3,182; Norway $2,862; Republic of Korea $2,022.
Zinc:				
Ore and concentrate	434,177	516,209	35,895	Belgium-Luxembourg 191,414; Japan 118,468.
Blue powder	3,645	5,656	5,393	United Arab Emirates 107; Trinidad and Tobago 80; Venezuela 60.
Metal including alloys:				
Scrap	22,195	28,962	18,888	Belgium-Luxembourg 3,520; West Germany 3,287; United Kingdom 2,173.
Unwrought	471,949	453,525	304,438	United Kingdom 31,741; India 10,774; Venezuela 10,039.
Semimanufactures	3,722	2,622	2,238	Venezuela 150; New Zealand 72; Dominican Republic 59.
Other:				
Ores and concentrates	[r]65,004	116,810	17,259	Belgium-Luxembourg 42,753; West Germany 40,705; Austria 10,715.
Oxides and hydroxides	132,879	241,817	122,432	Australia 100,477; Japan 16,959; United Kingdom 648.
Ashes and residues	20,532	47,591	39,131	Taiwan 7,177; West Germany 291; Japan 215.
Base metals including alloys, all forms	[r]1,900	1,727	1,384	Belgium-Luxembourg 127; France 90; Netherlands 33.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	85	332	330	St. Pierre and Miquelon 2.
Artificial:				
Corundum	166,328	157,990	152,959	United Kingdom 4,240.
Silicon carbide	72,416	67,143	65,809	Japan 1,334.
Grinding and polishing wheels and stones value, thousands	[r]$2,323	$3,134	$2,090	New Zealand $185; Australia $146; Finland $114.
Asbestos, crude	--	10	--	All to Turkey.
Barite and witherite	650	405	405	
Cement thousand tons	[r]1,551	1,579	1,513	Saudi Arabia 60; Bermuda 2; St. Pierre and Miquelon 1.
Clays and clay products:				
Crude do	821	631	630	France ([5]).
Products:				
Nonrefractory value, thousands	$2,526	$2,356	$1,652	Nigeria $506; Chile $54; Panama $30.
Refractory including nonclay brick	68,490	47,187	20,543	Venezuela 3,718; Cuba 1,854; Dominican Republic 1,298.
Diamond:				
Gem, not set or strung carats	28,929	60,140	41,601	Belgium-Luxembourg 9,553; Israel 4,385; United Kingdom 1,530.
Industrial, dust and powder do	260,612	338,138	229,076	Australia 87,330; Ireland 10,552; United Kingdom 5,034.

See footnotes at end of table.

Table 4.—Canada: Exports and reexports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Fertilizer materials: Manufactured:				
Ammonia	431,019	467,531	467,530	St. Pierre and Miquelon 1.
Nitrogenous thousand tons	1,317	1,349	1,271	Philippines 31; Mexico 18; India 13.
Potassic do	10,565	10,068	6,797	China 552; Japan 530; Brazil 406.
Gypsum and plaster do	4,960	5,095	5,081	Bahamas 14.
Lime	403,172	432,844	430,960	Honduras 1,244; Barbados 415.
Pigments, mineral: Iron oxides and hydroxides, processed	15,932	19,017	18,936	West Germany 18; Yugoslavia 17; Panama 8.
Precious and semiprecious stones other than diamond value, thousands	r$2,594	$2,715	$1,651	Switzerland $350; Taiwan $176; United Kingdom $129.
Salt and brine thousand tons	r1,656	1,508	1,480	Cuba 14; Zaire 5; Guyana 4.
Sodium and potassium compounds, n.e.s.: Sodium sulfate, natural and manufactured	246,116	284,280	274,630	Egypt 4,091; Portugal 3,567; Venezuela 1,002.
Stone, sand and gravel:				
Dimension stone: Crude and partly worked	72,900	127,965	103,474	Bahamas 15,735; Bermuda 7,167; France 706.
Limestone other than dimension thousand tons	2,215	1,758	1,758	
Quartz and quartzite	63,166	119,347	119,347	
Sand and gravel	386,437	318,635	239,642	Bermuda 78,889; France 49.
Sulfur:				
Elemental thousand tons	6,851	7,309	1,513	Brazil 632; Australia 591; Morocco 519.
Sulfuric acid	323,776	337,518	336,363	Peru 1,143.
Talc, steatite, soapstone, pyrophyllite	[4]3,539	NA		
Other: Crude value, thousands	r$91,655	$117,303	$41,697	West Germany $27,967; Belgium-Luxembourg $19,003; France $16,021.
MINERAL FUELS AND RELATED MATERIALS				
Coke and semicoke	342,276	190,879	166,624	Spain 16,891; Venezuela 7,311; New Zealand 25.
Gas, natural million cubic feet	810,935	765,882	765,882	
Petroleum and refinery products:				
Crude thousand 42-gallon barrels	78,192	59,783	59,782	France ([5]).
Refinery products:				
Liquefied petroleum gas do	40,528	44,063	41,619	Japan 2,423; Mexico 17; St. Pierre and Miquelon 2.
Gasoline do	4,444	3,780	3,553	Zaire 147; Senegal 36; St. Pierre and Miquelon 26.
Distillate fuel oil do	13,821	11,171	6,662	Netherlands 2,322; Zaire 660; Brazil 512.
Lubricants do	85	83	64	West Germany 4; United Kingdom 3; St. Pierre and Miquelon 2.
Residual fuel oil do	13,093	13,025	10,774	Italy 972; Turkey 515; Netherlands 514.
Asphalt do	1,004	1,643	1,632	United Kingdom 6; United Arab Emirates 2; France 1.
Petroleum coke do	831	1,100	252	Japan 451; Netherlands 222; Australia 155.
Tars and other crude chemicals derived from coal, gas, and petroleum	r20,110	24,738	24,271	Italy 145; Netherlands 133; United Kingdom 86.

rRevised. NA Not available.
[1]May include relatively minor quantities of certain shapes not normally included among semimanufactures.
[2]Includes some scrap.
[3]Largely, if not all, used in production of heavy aggregate.
[4]Partial figure; data given are U.S. imports for consumption only.
[5]Less than 1/2 unit.

Table 5.—Canada: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS				
Aluminum:				
Ore and concentrate thousand tons	3,504	2,702	32	Brazil 1,385; Guinea 661; Guyana 503.
Oxides and hydroxides	983,971	1,020,549	247,267	Jamaica 299,843; Australia 289,957; Japan 166,244.
Metal including alloys:				
Scrap	30,724	33,413	33,373	NA.
Unwrought	13,961	2,885	1,983	United Kingdom 462.
Semimanufactures	114,100	122,176	106,539	Belgium-Luxembourg 5,823.
Antimony: Oxides	944	936	215	United Kingdom 543; Belgium-Luxembourg 158.
Chromium:				
Ore and concentrate	28,373	47,625	28,492	Philippines 8,214; Republic of South Africa 6,080; Albania 4,781.
Oxides and hydroxides	1,717	1,791	1,365	United Kingdom 214; Italy 158.
Copper:				
Ore and concentrate	12,744	19,551	6,908	Chile 6,505; Peru 6,130.
Sulfate	142	339	115	Netherlands 144; United Kingdom 80.
Metal including alloys:				
Scrap	35,051	37,973	37,867	Haiti 46; United Kingdom 21; Mexico 18.
Unwrought and semimanufactures	19,937	24,097	17,059	West Germany 2,548; United Kingdom 533.
Gold:				
Ore and concentrate troy ounces	60,877	74,203	40,124	Chile 32,011; Liberia 1,057.
Metal including alloys, unwrought and partly wrought thousand troy ounces	2,249	2,220	1,859	Switzerland 89; United Kingdom 8.
Iron and steel:				
Iron ore and concentrate thousand tons	5,875	5,794	5,537	Brazil 257.
Metal:				
Scrap do	r1,119	835	835	
Pig iron, cast iron, related materials	r11,851	16,735	11,465	Brazil 5,232; West Germany 21; United Kingdom 17.
Ferroalloys:				
Ferrochromium	41,369	31,579	9,839	Republic of South Africa 13,024; Brazil 5,400.
Ferromanganese	26,704	36,656	15,995	Republic of South Africa 16,344; Norway 3,800.
Ferrosilicomanganese	20,901	12,669	4,396	Republic of South Africa 4,563; Norway 2,476.
Ferrosilicon	18,508	18,629	14,422	Norway 3,208.
Ferrotungsten	7	5	5	
Ferrovanadium	520	562	491	Republic of South Africa 33; Austria 17; United Kingdom 15.
Unspecified	10,506	17,804	4,037	West Germany 9,840; France 1,845.
Steel, primary forms	104,647	98,585	76,310	Netherlands 20,657; Italy 1,047.
Semimanufactures:				
Bars, rods, angles, shapes, sections	397,542	577,726	132,083	Japan 225,054; West Germany 78,266.

COMMODITY REVIEW

METALS

Aluminum.—Canadian Reynolds Metals Co. Ltd. and Aluminum Co. of Canada Ltd. (ALCAN) were the two companies reported to be producing primary aluminum metal. Canadian Reynolds operates a smelter at Baie Comeau, Quebec, with a total capacity of 159,000 tons per year. The company was planning a $500 million expansion to 272,000 tons per year. The project was reported to be proceeding after the Quebec government in 1982 agreed to reduce electricity rates by 50% for 5 years.

Péchiney Ugine Kuhlmann Group was also negotiating with the Quebec government for reduced electricity rates for its proposed aluminum smelter at Becancour. Although feasibility studies indicated that the first 110,000-ton-per-year potline could start producing in 1986, with a final expansion to 330,000 tons per year possible, no decision to proceed with the project had been reached at yearend.

ALCAN has five smelters in Quebec, at Jonquiere, Grande Baie, Isle Maligne, Sharigan, and Beauharnois, and one at Kitimat, British Columbia, with a total capacity of 1,018,000 tons per year. ALCAN reduced capital expenditures to conserve cash; however, work continued on the Grande Baie project, which was 99% complete. The proposed $1.25 billion Manitoba smelter and hydroelectric project was postponed. Technical studies were planned to investigate the possibility of a 180,000-ton-per-year aluminum smelter near Vanderhoof, British Columbia, in conjunction with the expansion of ALCAN's Kemano hydroelectric plant, which supplies power to its Kitimat operation. ALCAN purchased a site for the possible construction of an aluminum smelter at Laterriere, near Jonquiere, Quebec. The company feels that three or four new smelters would be required in Canada over the next 20 years to satisfy the expected growth in demand for primary aluminum.

The Canadian companies were able to take advantage of low power cost to maintain production output at an average of 90% of capacity. Production of primary aluminum, at an estimated 1,065,000 tons, fell only about 5% compared with that of 1981, and exports of aluminum ingot and other fabricated forms rose by about 13% over those of 1981. However, profits still suffered because of low ingot prices.

Canada imports all of its aluminum ore requirements in the form of either bauxite or alumina. The bauxite was imported mainly from Brazil, Guinea, and Guyana, and the alumina was imported mainly from the United States, Jamaica, and Australia.

Copper.—Canadian copper producers operated at a loss during 1982. With prices below production costs for most Canadian copper producers, nearly all mines were closed for varying periods of time. Some mines were expected to be closed until the price of copper improves and inventory levels are decreased. Canadian copper production averaged 60% of normal, with a mine production output of 606,202 tons. This was 2% lower than the 1981 output of 619,328 tons. Output in 1983 was expected to be even lower than that of 1982. This situation was expected to continue unless there is a marked improvement in the price of copper.

British Columbia was the largest copper-producing Province in Canada and accounted for about 44% of all Canadian copper produced. Nearly all producing copper mines in the Province suffered losses. Noranda Mines Ltd. closed its Granisle Mine in July, reportedly for 1 year. Substantial losses were reported by the company as a reason for the closure. Subsequently, in October, the company also closed its Bell copper mine for an indefinite period. Bethlehem Copper Corp. closed its Jersey Mine in July because operations were uneconomical at present copper prices. Canada Wide Mines Ltd. continued mining developed ore at its Granduc Mine although production was limited to 50% of its 3,600-ton-per-day capacity.

Westmin Resources Ltd.'s Buttle Mine was one of the few profitable copper producers in Canada. The company was continuing with exploration and development of its H-W ore body, where ore reserves were estimated to be over 12 million tons. The company was also continuing with its project to triple the mill capacity to 2,700 tons per day by 1984.

Ontario was the second largest copper-producing Province in Canada, accounting for 29% of all Canadian copper produced. Interrupted production and reduced work forces were common to copper producers in 1982. Inco Ltd. closed its Ontario operations in midyear and was scheduled to reopen in early 1983. The Kidd Creek Mines Ltd., formerly Texas Gulf Canada Ltd., new Mitsubishi-type copper smelter came on-stream in November. The company closed for 10 days in December and was reducing its work force by 200 employees over several months. Early in the year, Pamour Porcupine Mines Ltd., Schumaker Div., suspended production from its copper zone. Hudson Bay Mining and Smelting Co. Ltd. critically reviewed its Monitoba-Saskatchewan mining operations and decided to defer capital expenditures and development work as much as possible. The company also suspended mining operations for an 8-week period during the summer. Inco closed its Thompson, Manitoba, mines in November and tentatively scheduled production to resume in early 1983.

Gold.—In Canada, gold was produced in every Province and Territory except Prince Edward Island and Nova Scotia and was a major factor in establishing the Canadian mining industry. Canada has ranked third in the world in gold production for nearly 50 years and continues in this position after the Republic of South Africa and the U.S.S.R. Quebec was the leading gold-producing Province, followed by Ontario and British Columbia. In 1982, there were 39 gold mines in Canada. However, a significant amount of gold was produced as a byproduct from base metal mines. One major gold producer came onstream during the year. Echo Bay Mines Ltd.'s new Lupin Mine started operation in October. The deposit is located 265 miles northeast of Yellowknife, Northwest Territories, near the Arctic Circle. The mine has a design capacity of 950 tons per day. Development work was continuing to establish reserves.

The Department of Energy, Mines and Resources of Canada reported that the volume of gold production at 2,008,000 troy ounces was higher than the 1,672,930 troy ounces produced in 1981 and attributed the increase to two factors. First, the lower price of gold required producers to mine higher grade ore, and secondly, a number of new gold mines began production near the end of 1981, making a significant impact on 1982 total output.

The $300 per ounce price level appears to be a profit-loss cutoff point for a number of marginal underground producers in Canada. When the price of gold went below the $300 per ounce level, the high-cost, low-grade gold producers reacted by revising their mining operations and by reducing their work force to lower production costs. No major gold mining operations closed in 1982.

In Ontario, the Detour Lake project, a joint venture between Amoco Canada Petro-

leum Co. Ltd., the company that discovered the ore body, and Campbell Red Lake Mines Ltd., was proceeding. Overburden stripping was begun. The project, expected to become the largest gold mine in Canada, was scheduled to be in operation by late 1983, with a milling rate of 2,000 metric tons per day from open pit operations. Plans called for mill capacity to be increased to 4,000 tons per day in 1987 with the additional ore to be supplied from an underground mine. Mine reserves were reported to be 25.2 million tons to a depth of 1,800 feet grading 4.285 grams of gold per ton, 5.14 grams of silver per ton, and 1.21% copper.

Dome Mines Ltd. was completing the final stages of its $92 million expansion program. Construction of the new 5,400-foot No. 8 shaft was underway; previously existing ore storage, grinding, amalgamation, and thickening facilities were replaced, and new water storage and fire protection facilities were constructed. Mill capacity was to be increased by 50% from 2,000 to 3,000 tons per day, and gold output was to be increased to 119,000 ounces per year by late 1984.

The Hemlo, Ontario, gold rush was the bright spot for Canadian exploration in 1982. The Hemlo Goldfield lies 21 miles east of Marathon on the northeast shore of Lake Superior. An estimated 40 to 50 companies were carrying out intense staking and exploration programs in the area. Major companies such as Noranda Exploration Co. Ltd., Teck Corp., and Long Lac Minerals Ltd. were active in the area. Goliath Gold Mine Ltd. and Gold Sceptre Resources Ltd., the original major players in the Hemlo gold deposit, are now under option to Noranda Exploration. The Hemlo area is estimated to contain over 13 million tons of ore averaging 0.236 ounce of gold; however, the total reserves were still undetermined. There was industry speculation that Hemlo would be a world-class gold deposit. In any case, the Hemlo area was sure to dominate Ontario's exploration scene in the near future.

Placer mining was less active during the year. A base price of $400 per troy ounce was considered essential to the viability of many gold placer operations. With the price of gold below that minimum during the spring, some operators decided it was uneconomical to start production. Others operated at reduced rates. Severe spring ice conditions delayed most startup dates. Queenstake Resources Ltd. continued its bucketline dredging operation on Clear Creek, near Dawson City, Yukon Territory. The company has various placer operations in the Yukon Territory and Northern British Columbia and was expecting annual production to exceed 6,000 troy ounces of fine gold.

Iron Ore.—The iron ore producers of Labrador-Quebec, source of over 85% of Canadian iron ore, had extended shutdowns of 3 to 5 months during the last half of 1982. Production declined sharply from the already depressed level of 1981, and the industry operated at about 50% of annual capacity. Most Ontario producers also closed their iron ore operations for 2 to 3 months during the latter half of the year. These actions reflected the general decrease in demand for steel and attempts by producers to reduce their iron ore inventories.

Western Labrador, the most important iron ore mining area of Canada, was particularly impacted by the depressed market. Iron Ore Co. of Canada (IOC) suspended operations at its Carol Project in Labrador City for 11 weeks. Although operations resumed in September, part of the pellet plant and concentrator remained closed at yearend. IOC also announced in November that it would permanently close its Schefferville operation in the spring of 1983. Direct reduced iron (DRI) plants also were either closed or operated at reduced capacity in 1982. The Sidbec-Normines Inc. DRI plant at Contrecoeur, Quebec, was the only plant operating in North America at yearend. Falconbridge Ltd. announced it was intending to close its Westfrob Mine at Tasu, British Columbia, in 1983 because all economic iron ore reserves were expected to be exhausted.

The Canadian iron ore producers were not expecting the iron ore market to improve in the near future. The world recession had serious effects on the markets Canadian iron ore exporters serve. High inventory levels, increased foreign competition, and reduced consumer demand were expected to inhibit Canadian iron ore production through 1983.

Iron and Steel.—Faced with a shortage of orders for its products and disruption of traditional markets at the close of 1981, the Canadian iron and steel industry entered 1982 in a declining market that continued throughout the year. High inventory levels, low demand, and competition from imports caused Canadian steelmakers to critically reassess their operations and marketing programs. It was reported that at yearend approximately 27% of the labor force had been laid off and the industry was operating at 45% of capacity. Production of crude

steel decreased almost 20% from the 1981 level. Canadian iron and steel producers were investigating various measures to improve efficiency by using the best available technology to lower their costs and were intensifying their export marketing efforts.

Lead and Zinc.—Canada was the world's largest producer of zinc and the third largest producer of lead, after the United States and the U.S.S.R. Declining consumption, rising costs, and low prices contributed to a continuing slack market in 1982. Canadian producers began shutdowns in June and July that lasted for varying periods of time. Lead and zinc prices weakened in an extremely competitive market, and the profits of the Canadian producers that continued to operate were low, and in some cases, losses occurred. Programs to reduce costs and increase efficiency by lead-zinc mines and refineries continued.

Refined lead production was reported to be an estimated 241,876 tons, up 3,768 tons from that of 1981, despite the shutdown during July of Cominco Ltd.'s Trail, British Columbia, facility. Zinc metal production was reported as an estimated 511,870 tons, down from the 618,650 tons produced in 1981. Both the Faro Mine of Cyprus Anvil Mining Corp. and the Elsa Mine of United Keno Hill Mines Ltd. closed indefinitely in June.

Brunswick Mining and Smelting Corp. Ltd. postponed construction of a proposed $360 million zinc reduction plant at Belledune, New Brunswick, until market conditions improve.

The eastern Arctic was one of the few bright spots on the Canadian mining scene. Cominco Ltd.'s Polaris Mine on Little Cornwallis Island, about 80 miles south of the North Magnetic Pole, came onstream in early 1982. At full design capacity, the Polaris concentrator will produce 130,000 tons per year of zinc and 30,000 tons per year of lead in concentrates. Concentrates are stored until the ice retreats and the "Arctic window" shipping season begins in late June or early July. The shipping season usually lasts from 60 to 80 days depending on open-water conditions. The Polaris project was Canada's most northerly mine and considered a masterpiece of Arctic engineering. The Nanisivik Mines Ltd.'s lead and zinc mine on the northern tip of Baffin Island continued production and development. The company was also conducting exploration on the northern part of Baffin Island.

Nickel.—The continuing weak world nickel market forced Canadian producers to operate below capacity and maintain tight controls over production. The low Canadian nickel production of 85,935 tons was the result of extensive shutdowns by both Inco and Falconbridge. Both companies closed their Sudbury operations in June 1982 and were shut down at yearend. Inco's Port Colborne refinery and Shebandowan Mine were also closed for the same period of time. Inco's Thompson operation was closed during November and December and was scheduled to reopen in early 1983. Falconbridge and Inco both announced operations would resume at Sudbury in early 1983.

The Ontario-Canada Task Force report on Sudbury smelters was released in late 1982. The report indicated that technical solutions to substantially reduce sulfur dioxide emissions could be implemented by Inco and Falconbridge. The report also suggested that if Inco was to build a new smelter there would be substantial savings in labor, energy, and maintenance cost. The estimated cost of building a new smelter was $500 million. Methods for raising the necessary capital for construction were not addressed.

The nickel-producing companies were seeking ways to increase efficiency and productivity and were preparing for lower production rates when production begins again. When operations do resume, the work force was expected to be significantly less than it was at the beginning of 1982.

Platinum-Group Metals.—The platinum-group metals produced in Canada were mainly recovered as a byproduct in the treatment of nickel-copper sulfide ores. Inco and Falconbridge were the two major producers of platinum-group metals. When these two companies stopped nickel production in midyear, platinum-group metals recovery was severely limited. Some production was attained through the processing of refinery slimes. However, this supply only lasted until the latter part of the year. Canadian production of platinum-group metals depends directly on the demand and production of nickel as may be seen by the reduced output of 276,189 troy ounces compared with 382,667 troy ounces in 1981.

Silver.—Canada continued to be a major world producer of silver and ranked third after Mexico and Peru. Primary silver production was estimated at 41.3 million troy ounces compared with 36.3 million troy ounces in 1981 and was valued at $378.8 million, compared with $458.1 million in 1981. The decrease in value, despite an increase in production, was the result of the

sharp decline in the price of silver during 1982. Production increased in the Atlantic Provinces, British Columbia and Ontario, and decreased in the remaining Provinces and Territories.

It was reported that a number of mines scheduled for production in the next few years have been placed on hold until the price of silver increases and shows some signs of stability. Low silver prices contributed to the indefinite closure of United Keno Hill and Cyprus Anvil operations in the Yukon Territory. British Columbia continued to be the largest silver-producing Province in Canada. The Equity Silver Mines Ltd.'s mine in north-central British Columbia was the largest silver producer in Canada with an output of 7 million troy ounces.

Other Metals.—Consolidated Durham Mines and Resources Ltd.'s Lake George Mine was Canada's only antimony mine. The mine closed in May 1981 although sales of concentrates continued until mid-1982. The company announced in late 1982 that it would allow the mine to flood until market conditions for antimony improved. Prior to flooding, exploration had outlined a new ore zone containing an estimated 774,000 tons averaging 4.15% antimony. Byproduct antimony is recovered in varying amounts as antimonial lead from lead ores and as sodium antimoniate from the leaching of silver-copper concentrates.

In response to a market that had developed for arsenic-containing products in Canada, Cominco constructed an arsenic trioxide recovery plant at its Con gold mine, Yellowknife, Northwest Territory. The plant will produce 99.5%-pure arsenic trioxide from arseniferous sludge accumulated from roasting arseniferous ores to recover contained gold. The reported capacity of the plant was 15 tons per day with an estimated cost of about $13 million.

Production of cobalt decreased by about 16% from that of 1981. Two companies, Inco and Falconbridge, produced cobalt as a byproduct of domestically produced nickel-copper ores. A third, Sherritt Gordon Mines Ltd. recovered cobalt from nickeliferous materials refined from toll and purchased nickeliferous materials. Inco also produced crude cobalt oxide at its Port Colborne, Ontario, and Thompson, Manitoba, plants, which was shipped to its Clydach, Wales, refinery for manufacturing various oxide and salt compounds. The prolonged shutdown of Inco and Falconbridge's Sudbury operations affected the production of cobalt. Work continued on Inco's electrolytic plant at Port Colborne. The $25 million facility was expected to come onstream in early 1983 and would have a production capacity of 907 tons per year of cobalt metal. In 1982, as a result of weak markets and high inventory levels, major Canadian molybdenum producers instituted extensive production cutbacks. However, molybdenum output rose 28% above that of 1981 to an estimated 16,500 tons. Producers were expected to continue production constraints into early 1983.

QIT-Fer et Titane Inc. (QIT) was the only company that mined titanium ore in Canada. Ilmenite, a titanium-bearing mineral, was mined from QIT's open pit operation near Havre St. Pierre, Quebec. It was then shipped to Sorel, Quebec, for electric-furnace smelting into titania slag (Sorelslag) that grades 70% to 72% titanium dioxide. Also, two manganese pig iron products were produced. QIT was planning to construct a $10 million, dry concentrating plant, which would permit production of a superconcentrate with a high-titanium dioxide content. In 1982, Kennecott Corp. acquired a one-third minority interest in QIT, held by Exploration de Zinc New Jersey (Canada) Limitée.

Canadian production of tungsten came from two companies. Canada Tungsten Mining Corp. Ltd. supplied the major portion and Dimac Resource Corp. accounted for the remainder. Because of the weakness of the tungsten market, both companies reduced production during the year. At year-end, both companies announced indefinite shutdown of operations until there is a significant improvement in the tungsten market.

NONMETALS

Asbestos.—Weak demand and high inventories of asbestos fiber continued. The decline in shipments caused numerous operations to shut down from one to several weeks. Production of asbestos fiber continued to drop for the third consecutive year. Quebec, the major asbestos-producing area in Canada, continued to be impacted by weak markets. In February, Société Asbestos Limitée (SAL) suspended operations at its Asbestos Hill Mine in Ungava for the remainder of the year. SAL also closed its British Canadian II Mine in December for 2 years.

Potash.—The Canadian potash market continued to be disappointing in 1982. Shipments were down 9% compared with those

of 1981. Exports to the United States were also 20% below those of 1981. Producers with high inventory levels at the beginning of 1982 instituted sharp production cuts during the year. At yearend, stocks were still higher than normal levels. Canpotex Ltd., the offshore marketing company for Saskatchewan potash producers, reported exports down almost 14% below 1981 levels. Major Saskatchewan producers were expecting 1983 to be another difficult year with overall capacity utilization to be approximately 65%.

Sulfur.—Canadian production of sulfur in 1982 was from three sources: elemental sulfur from sour natural gas and tar sands; sulfuric acid from smelter gases; and pyrite concentrates. The major source was sour natural gas produced mainly in Alberta from 43 sour gas plants. Canada was the world's largest exporter of sulfur, accounting for 45% of the total world sulfur trade. The world market was very important with exports accounting for 70% of all sales. The United States was the largest customer, consuming 1.3 million tons, or 13%, of elemental sulfur. Demand for Canadian sulfur and sulfuric acid was expected to keep pace with growth in the world economy.

Other Nonmetals.—Cement and gypsum production, down in 1982, was a direct reflection of the construction industry. Cement shipments were reported down an estimated 20% below those of 1981, and capacity, unchanged at 15.9 million tons per year, was slightly more than 50% utilized. Gypsum production was estimated at about 12% less than the 1981 level. There were plant closures and layoffs for varying lengths of time in 1982 in response to high inventories and weak demand.

Canada was the world's foremost producer of nepheline syenite, which was mined by two producers, Indusmin Ltd. and IMC Industry Group (Canada) Ltd., from extensive deposits in Methuen Township near Peterborough, Ontario. Production was lower than that of 1981 by about 15%. Exports to the United States accounted for about 70% of shipments. The glass industry accounted for most of the consumption of nepheline syenite.

Production of salt from all sources in Canada in 1982 was estimated at 8.1 million tons. Most of the rock salt produced in Canada came from Nova Scotia and Ontario, while Alberta, Saskatchewan, and Ontario accounted for salt in brines production. Seleine Mines Inc. brought its 1.25-million-ton-per-year underground salt mine on the Madeleine Islands into production in August. Potash Co. of America began shipping salt in October from its New Brunswick operation near Sussex.

Shipments of talc were up 18% although exports to the United States fell over 50%. Canadian Talc Industries Ltd., near Madoc, Ontario; B.S.Q. Talc Inc. near Broughton Station, Quebec; Bakertalc Inc. near South Bolton, Quebec; and Steetley Talc Ltd. near Timmins, Ontario, were the four companies that produced talc in Canada. Talc is used primarily in paints, paper, ceramics, as a filler and whitener, and also in the production of wallboard. Canadian producers were optimistic about increased production with recovery of the economy and through increased exports. A new talc plant was being considered for construction in Ontario.

MINERAL FUELS

Coal.—The Canadian coal industry continued to grow, with production up an estimated 5% over 1981 production. Development of new mines and expansion of existing facilities were proceeding. There was investment in new mines and also investment and expansion of related infrastructures. Railway and port facilities were being upgraded and expanded.

Canada's one giant coal project, the North East Coal Development Project, in British Columbia was continuing. The gigantic project, consisting of the $850 million Quinette Coal Ltd. project controlled by Denison Mines Ltd. and the $300 million Bullmoose project of Teck Corp., was scheduled to start shipment of metallurgical and thermal coal by the end of 1983. The reported total annual production of North East Coal Development, now under contract to the Japanese steel industry, was 7.2 million tons. The project, which involves the spending of about $2.5 billion for development and related infrastructure, is the largest mining sector development in Canada's history.

Natural Gas.—The supply of natural gas continued to exceed Canada's domestic requirement and authorized export market in 1982. The National Energy Board conducted hearings and was expected to authorize additional gas exports sometime in 1983, to stimulate declining drilling activity. The natural gas industry viewed access to export markets as the key to unlocking Canada's natural gas potential and would welcome additional export allowances. It was felt that the Arctic Islands could hold the

largest gasfields outside the Soviet Union, and Canada was considering methods to bring the gas to market in the United States or Europe. A proposed $2.3 million project would haul a liquefied natural gas (LNG) processing plant by barge to Melville Island. After processing, the gas would be shipped to the United States or Europe via ice-proof LNG tankers. Another possible method of transport would be by LNG-carrying submarines. General Dynamics Corp. reportedly had plans for a submarine that could deliver almost 5 million cubic feet of LNG to the Eastern United States for $3.60 per thousand cubic feet compared with about $5.00 per thousand cubic feet by conventional tanker.

Peat.—Canada, with about 170 million hectares of peatland area, was considered to have the world's largest peat resources. Previously, peat resources were mainly exploited as a horticulture medium. However, it is now believed that peat could provide a significant contribution in terms of energy as an alternative fuel. Provinces with peatland resources were engaged in resource surveys and inventories. Almost 10 million hectares, corresponding to approximately 42 billion tons of peat, was considered available for energy production. This would be equivalent to about 72 billion barrels of oil. Nova Scotia was continuing with its Peatland Inventory Program. Almost 60% of the 16 million tons of peat surveyed was considered fuel peat. New Brunswick was also continuing to evaluate its peat potential. Peat dewatering and processing technology was undergoing development in Canada, and potential applications were being investigated. Some applications being reviewed were sod peat production for residential and nonresidential space heating, industrial-process heat generation, and power generation using a small-scale peat gasifier.

Petroleum.—Falling world energy prices heavily impacted Canadian budgets, which are highly dependent on oil and gas income. Both the Federal and Provincial Governments in 1982 proposed a series of programs that were designed to provide tax relief and increase exploration and development in an effort to stimulate the petroleum industry. The search for oil was further encouraged by higher prices provided for new oil. Sable Island, off Nova Scotia, the Hibernia Field off New Foundland, the Arctic Islands, and the Beaufort Sea continue to be active areas for exploration and development. There was a higher level of oil-related activity in Manitoba, Saskatchewan, and Alberta than in the previous 2 years. Significant discoveries were made, mostly in previously known oil regions.

Uranium.—The uranium market remained depressed in 1982. Canada had seven primary uranium producers until midyear, at which time two ceased operations. Eldorado Nuclear Ltd. closed its Beaverlodge Mine near Uranium City, Saskatchewan, in June. In July, Madawaska Mines Ltd. ceased all mining and milling operations at its mine near Bancroft, Ontario. The Key Lake Mine and mill was expected to be brought into production in 1983, with an annual production capacity of 5,000 tons of uranium. It was expected to be Canada's largest single producer and one of the largest uranium mines in the world. Sixty-four percent of primary uranium output during the year was produced in Ontario, with the remainder from Saskatchewan. Uranium mined and milled in Canada was refined and converted into nuclear fuel material by Eldorado Resources Ltd., the Federal Crown Corp. There was a decrease in exploration activity, reflecting the decline of the spot market price and lower projected short-term sales prospects. Nova Scotia continued its moratorium on new uranium exploration licenses, including renewal of existing licenses. The Federal Government was undertaking a $9.5 million, 5-year research program aimed at speeding the development of technology to determine the harmful effects of wastes resulting from the mining and milling of uranium.

---

[1]For more detailed information on the mineral industry of Canada, see the Canadian Mineral Surveys for 1980 and 1981, both of which were prepared by the Mineral Policy and Energy Policy Sectors, Department of Energy, Mines and Resources, Canada. The U.S. Department of the Interior, Bureau of Mines, has arranged to have these Canadian publications placed in libraries in each of the 50 States and Puerto Rico as follows: University of Alabama, Tuscaloosa; E. E. Rasmuson Library, University of Alaska, Fairbanks; University of Arizona, Tucson; University of Arkansas, Fayetteville; California State Library, Sacramento; A. Lake Library, Colorado School of Mines, Golden; Wilbur Cross Library, University of Connecticut, Storrs; H. M. Morris Library, University of Delaware, Newark; Strozier Library, Florida State Library, Tallahassee; P. The Mineral Industry of Chile

By Pablo Velasco[1]

Chile retained its dominant role as one of the world's leading metal producers in 1982, and for the first time moved up from third to first place in world copper mining production replacing the United States as the leading world copper producer. Chile continued to rank second in world molybdenum and iodine production. In addition, the country was a significant producer of iron ore, natural nitrates, silver, gold, and vanadium.

After growing an average of over 8% per year between 1977 and 1981, Chilean gross domestic product fell 14.1% below that of 1981 because of the world economic recession. This was equivalent to 330.1 billion in 1977 Chilean pesos[2] or $23.61 billion[3] in U.S. currency. The decline in production was felt in all economic sectors except for mining and fishing. Most affected were construction, manufacturing, and commerce, which fell 28.8%, 21.9%, and 14.6%, respectively.

In the mining sector there were increases in copper (14.8%), molybdenum (30.5%), gold (35.7%), and petroleum (3.4%), all relative to 1981. However, because of reduced output in other mineral commodities, the overall sector growth rate was 4% above that of 1981. Both large-scale and the medium- to small-scale mining concerns participated in the sector's growth. Smaller and medium-sized companies, which had been languishing at the beginning of the year, were particularly benefited by Government policy as the year progressed. The devaluation of the peso and pricing policies of the Empresa Nacional de Minería (ENAMI), a state-owned mining company that markets much of the output of smaller producers, combined to create conditions permitting these smaller mining firms to expand. The Corporación Nacional del Cobre de Chile (CODELCO-Chile) reached a record annual production of 1.03 million tons, up 15.6% over that of 1981. Increases were also registered in molybdenum and metal doré. Profitability rose 65% over that of 1981 to $160.6 million.

As a result of world liquidity problems, net inflow of new credits entering Chile declined to $866.5 million from $2.95 billion in 1981. Foreign obligations reached $17.1 billion at the end of 1982 and the balance of payments had a $1.16 billion deficit with reserves falling $1.20 to $2.58 billion to cover the shortfall. One primary cause of Chile's financial problems was the low price of copper, which accounts for nearly 60% of the nation's revenue from mineral exports, which fell to its lowest level in 30 years.

Investments were sharply reduced. There was a 28.8% and 53.3% decline below that of 1981 in construction activity and capital-good imports, both areas of rapid growth in earlier years.

Foreign investment set a new record of $383.8 million for 260 investments that eventually will introduce $529.9 million in foreign capital into Chile. Mining is by far the most significant sector attracting foreign investment. According to Chile's Oficina de Planificación Nacional (ODEPLAN), multinational companies have invested $786.6 million in recent years in the development of five large-scale metal-mining projects in Chile. An additional $140.6 million in investments was approved by yearend. The largest project so far has been the development and operation of La Disputada de Las Condes copper deposit, where Exxon Minerals Chile Inc. has invested more than $450 million since January 1978, including $118 million during 1982. St. Joe International Corp. (Fluor Corp.) has invested $244 million in the El Indio gold mine, which is already in production.

A dramatic improvement occurred in the energy sector when a 3.4% increase over that of 1981 in domestic oil production

raised Chile's output to 15.6 million barrels and domestic consumption dropped imports from 20.1 to 9.12 million barrels. The total crude oil import bill fell 60.6% below that of 1981 to $277.3 million.

Government Policies and Programs.— On January 21, the Chilean law (Organic Law No. 18,907) for the granting of mining concessions was issued. However, it will not go into effect until the new mining code is issued, reportedly in late 1983. The new law replaces the 1932 law and is an amplification of the constitution, hence it is considered to have constitutional force and is titled an "Organic Act." Among important features of the new law are (1) a claim system that grants both foreign and national concession holders real and immovable rights, (2) mining concessions will be issued by ordinary courts of justice rather than Government agencies, which is a significant change from the old law. Exact procedures for the establishment of a mining concession will be outlined in the new mining code, (3) concessions that exist on the date the new code comes into effect will continue to exist. Further amplification of Organic Law No. 18,907 was made in an August 31 meeting conducted by Chilean Government officials. Highlights of this presentation were that (1) CODELCO-Chile will remain state-owned, all other mines will be open to private concession holders, (2) new mining deposits will be exploited by private enterprises, (3) taxation levies for foreign investors will not exceed 49.5%, (4) special case provisions will be made for lithium, whose exploitation will be done by the Government, and (5) the new Organic Law explicitly guarantees a market value compensation for the concession in the event of expropriation. The expropriated party may protest the legality of the expropriation action before the ordinary courts of justice of the country and will, at all times, have the right to indemnization.

The Chilean Constitution enacted in March 1981 established the basis for the development of hydrocarbon deposits. Although all hydrocarbon deposits are the property of the state, exploration and exploitation can be executed by private firms through administrative concessions or by operation contracts. Decree Laws 1089 and 1820 established the regulations for petroleum operation contracts, sometimes referred to as "risk contracts." This type of contract allows for exploration in a specific area within a given time frame. If oil or gas is found, it is extracted with all responsibilities and costs paid for by the contractor. Benefits to the contractor are related to the amount of oil or gas extracted. Two operation contracts have been awarded in the past. Both remain in effect. One is with Atlantic Richfield Corp. and the other is with Phillips Petroleum Co.

PRODUCTION

The mining sector expanded 4% over that of 1981 and, in contrast to the situation in many other countries, was one of the healthiest. Both the large-scale and small- and medium-scale mining companies participated in the sector's growth. Chile's output of 1.24 million tons of fine copper was up 14.8% from that of 1981. Production of both copper and copper's principal byproduct, molybdenum, reached record levels. Molybdenum production rose 30.5% over that of 1981. CODELCO-Chile produced 83.3% of the total Chilean copper production. Medium- and small-scale mining produced the balance. Among the CODELCO-Chile operations, Chuquicamata accounted for 53.5% of the total output followed by El Teniente, 32%; El Salvador, 8.7%; and Andina, 5.3%. Chilean gold production was up by 35.7% over that of 1981, primarily owing to the recently developed El Indio Mine, which completed its first year of full production. The El Indio Mining Co. was the largest privately owned Chilean exporter with sales totaling $126.6 million. St. Joe Minerals Corp. of the United States is the majority owner. Production of silver increased 6% over that of 1981. Production also increased in nearly all other mineral commodities. As for mineral fuels, coal output decreased 14.7% below that of 1981 and output of petroleum crude increased 3.4% over that of 1981 to 15.6 million barrels.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Aug. 15, 1983.

[2]In addition to the commodities listed, pyrite is also produced, but available information is inadequate to make reliable estimates of output levels.

[3]Figures are the nonduplicative copper content of ores, concentrates, precipitate, metal, and other copper-bearing products measured at the last stage of processing as reported in available sources.

[4]Reported figure.

[5]Figures are total blister and equivalent copper output including that blister subsequently refined in Chile and copper produced by electrowinning.

[6]Figures are total refined copper distributed into two classes according to method of refining.

[7]Excludes castings.

[8]Estimated on the basis of reported vanadium content of vanadiferous slags imported by the United States from Chile.

[9]Includes natural sodium sulfate and anhydrous sodium sulfate, coproducts of the nitrate industry.

TRADE

Chile's foreign trade is still dominated by mineral products. However, over the past 10 years industrial production has increased in importance and reduced the total export share of mining from the 80% to 90% range, which was normal prior to 1980, down to less than 60% in the last 3 years. Despite an across-the-board drop in metal prices, the country's total exports, in dollar terms, held up quite well because of the large tonnage increase in copper, molybdenum, and precious metal shipped. As a result of the international and domestic recession, floating of the Chilean peso, and increasing influence of Chile's foreign debt payments, the country had a small positive trade balance and a commercial account surplus. The year ended with a deficit in the balance of payments and reduced international reserves. The trade surplus of $293.0 million was a sharp reversal from that of 1981 when a $2.46 billion deficit was recorded. Imports plunged 44.6% below that of 1981 to $3.53 billion as the Chilean peso was devalued on June 14. It was later allowed to float from 39 Chilean pesos to equal 1 U.S. dollar, the rate that had been fixed since 1979. Overall the peso averaged 50.91 Chilean pesos to 1 U.S. dollar for the year and ended the year at 73.57 Chilean pesos to 1 U.S. dollar. The devaluation, combined with the domestic recession, brought imports of consumer goods down 50.2% to $949.2 million, intermediate goods down 37.8% to $2.0 billion, and capital goods down 53.3% to $583.7 million, all compared

with those of 1981. Also showing a significant drop was imported crude oil, falling 60.6% to $227.3 million. While imports plunged, exports were handicapped by lower prices even as the volume sold overseas climbed. Total exports reached $3.82 billion, only slightly lower than in 1981. The decline was mostly attributable to industrial product exports, which fell 7.9% to $1.18 billion.

Compared with 1981, mining exports rose a slight 0.3% as average prices dropped 15.0% for copper, 18.3% for gold, 24.8% for silver, and 35.8% for molybdenum oxide. These declines were compensated by large volume increases. Copper exports, easily Chile's most significant, rose 16.4% to 1.21 million tons for a small increase in value to $1.73 billion. The United States, Japan, the Federal Republic of Germany, Brazil, Venezuela, and Argentina were Chile's major trading partners. The United States alone accounted for almost one-quarter of the country's total foreign trade.

COMMODITY REVIEW

METALS

Copper.—Chile led the world in copper production with an output of 1.24 million tons. The large-scale mining group led by CODELCO-Chile reached an annual production level of 1.03 million tons of fine copper, up 15.6% over that of 1981. The medium- and small-scale mining group production of copper also increased by 10.8%. A large percentage of the credit for the 1982 growth in output resulted from CODELCO-Chile's aggressive production policy. The company implemented a number of streamlining and cost-reduction policies in addition to curtailing planned investments. CODELCO-Chile benefited from the peso devaluation as its exports became more attractively priced abroad. The increase in production was partly a result of the expansion of the copper concentration plants at the Chuquicamata and El Salvador divisions. Also, the El Teniente division put into operation a new underground primary crusher in October. The new facility permits the processing of hard primary ore, increasing El Teniente's production capacity and enhancing its profitability. The project cost $90 million and took 7 years to complete.

CODELCO-Chile continued its rationalization program to improve efficiency of the production process. The results were a 19% decrease in production costs to $223.8 million compared with those of 1981 and a 13% savings in sales and administrative expenses over that of 1981. CODELCO-Chile's operational income increased by 48%. This improvement was due to the large reduction in production costs. Income after taxes was up $63.3 to $160.6 million. The company also increased taxes paid to the Government from $480.3 to $523.9 million. During the year CODELCO-Chile invested $233.7 million in its four divisions: Chuquicamata, El Teniente, El Salvador, and Andina.

Major foreign-owned investments also advanced during the year. Preliminary exploration was finished on the latest project to receive approval, the $1.5 billion Getty Oil Co.-Utah International Inc. "La Escondida" project. Reserves estimated at 500 million tons of ore with a 2% copper content were discovered. Construction of facilities is slated to begin in 1983. Three other major projects under development will require the potential investment of $3.2 billion. They are mines owned by the Exxon Minerals Co. (La Disputada de Las Condes), The Anaconda Company (Los Pelambres), and a consortium headed by Falconbridge Ltd. (Quebrada Blanca). The Chilean Government was forming a new company to develop the Quebrada Blanca porphyry copper deposit, in which Falconbridge will hold a 10.2% interest. The deposit contains about 440 million tons of 0.81% copper and 0.018% molybdenum. An enriched secondary sulfide zone contains 55 million tons of 1.6% copper and 0.019% molybdenum. However, at present prices, development of the deposit is not considered economically feasible.

Table 2.—Chile: Copper production, by sector and company

(Thousand metric tons of fine copper)

Sector and company	1978	1979	1980	1981	1982

Iron Ore.—Iron ore output declined 24% below 1981 levels to 6.47 million tons. Iron ore sales were valued at $166 million, an 8% decline from that of 1981. Production of iron ore pellets increased 3.4% to 3.28 million tons. During the year, the Compañía de Acero del Pacífico S.A. (CAP) (Pacific Steel Co.) lost $48 million. The main reasons for the company's poor performance were the stagnant iron sales to Japan and a drastic drop in domestic demand for steel. Chile has been exporting iron ore to Japan for more than 20 years. To lessen these losses, CAP has offered for sale three iron ore deposits: Santa Fé, Algarrobo, and El Romeral; the Huasco iron pelletization plant; and the CAP subsidiary, Manganesos de Atacama S.A. Other candidates for sale to the private sector were the steel bar reroller Cía. de Acero de Rengo S.A. and Cía. Minera del Pacífico S.A. Japan, traditionally the major customer for Chilean iron ore, may take a stake in the iron mines and pellet plant that are to be sold to private interests by CAP.

Iron and Steel.—Crude steel and pig iron production declined 24% and 22%, respectively. Despite earlier announcements, Chile's state steelmaker, Cía. Siderúrgica de Huachipato S.A., a subsidiary of CAP, will not be transferred to the private sector according to Government officials. Faced with a dramatic decline in domestic demand for steel, Huachipato has embarked on a severe cost-cutting program in order to stem its losses. In the first 6 months of the year, the steelmaker's sales slumped to 157,000 tons, compared with 277,000 tons in the first half of 1981, while losses on steelmaking increased to the equivalent of $25 million. As a result of the decline, the Huachipato smelter is now operating at one-third of its 600,000-ton-per-year capacity.

Chile's CAP is hoping to get outside help to finance two major capital spending proj-

ects, a new coke plant and a continuous casting line for its Huachipato facility. The company's existing coke plant is worn out and therefore CAP is under some pressure to implement plans for a 550,000-ton-per-year coke plant at an estimated cost of $160 million. CAP's continuous caster is part of a larger project to expand the plant's capacity from 780,000 to 1 million tons per year with the addition of cold-rolling and finishing facilities, a desulfurizing unit, and other improvements. A third project to expand CAP's Huasco pellet plant from 3.5 to 4 million tons per year would require foreign investors, according to Corporación de Fomento de la Producción (CORFO) officials.

Molybdenum.—CODELCO-Chile molybdenum production increased almost 31%, to 20,048 tons. This improvement was a result of higher output at the Chuquicamata mining division. CODELCO-Chile is the only producer of molybdenum as a byproduct of copper in the country and ranks second in the world after the United States. Conversion of one-half of CODELCO's molybdenum is done by Molibdenos y Metales S.A., a private company that for the last 16 years has been the only Chilean facility processing molybdenum concentrates. It also produces all of Chile's output of ferromolybdenum, molybdenum oxide, and part of the rhenium. CODELCO-Chile's $18 million molybdenite roasting plant came onstream in midyear to produce molybdenum oxide from molybdenite concentrate. Its processing capacity is 5,500 tons per year of fine molybdenum with plans to expand the installation to 10,000 tons per year in the future. Molybdenum consumption in Chile is only 200 to 300 tons per year, primarily oxides as alloys in the steel industry's production of grinding balls and wear plates.

Molybdenum sales amounted to $204.3 million for shipment of 21,792 tons of which 53% of the value was for molybdenite concentrates, 42% for oxide of molybdenum, and 5% for ferromolybdenum. Even though the shipments of molybdenum concentrate increased 22% over that of 1981, sale values of these products were 29.0% lower because of lower molybdenum prices. CODELCO-Chile sold 57% of its molybdenum and ferromolybdenum to Western Europe, mainly to the Netherlands, the United Kingdom, and the Federal Republic of Germany, and the remainder to Canada and Japan.

Precious Metals.—Production of gold and silver increased because the El Indio Mine finished its first year at full production. Gold production increased 35.7% over that of 1981 to 543,569 troy ounces, while silver increased 6.0% to 12.3 million troy ounces.

Cía. Minera El Indio (CMEI) is a Chilean contractual mining company; 80.6% of the shares are held by Compañía Minera San José Ltda. (San José) and the balance by private Chilean shareholders. San José is a wholly owned Chilean subsidiary of St. Joe International Corp. (St. Joe), of New York, United States. During 1981, St. Joe merged with the Fluor Corp. of Irvine, Calif. El Indio is the first mine developed with foreign capital under the current foreign investment program of Chile. The total cost of the facilities has been estimated at over $244 million, of which $100 million has been financed in terms of the foreign investment agreement and the rest by the sale of high grade minerals and by export credits. The El Indio Mine has become the largest privately owned exporter in Chile with foreign sales of $126.6 million during the year.

CMEI, in association with domestic and foreign companies, was continuing to explore nearby properties for other gold and silver deposits. The most promising deposits have been discovered by Chevron Resources Co. a few kilometers north of El Indio. One of these is near Sancarrón and another is near La Laguna; both have high gold content possibilities. Other prospective gold deposits includes "Guanaco," in the north, which was estimated to contain 321,500 troy ounces of gold in high-grade ore. Cía. Minera Mantos Blancos S.A., affiliated with the Marvis Corp. and South American Consolidated Enterprises Corp., was conducting feasibility studies on the Río de Oro deposit, located in Chile's southern tip. Sociedad Minera Montaña de los Molles Ltda. has inaugurated a 200-ton-per-day gold and silver mill at Los Molles, 27 kilometers east of Iquique.

NONMETALS

Cement.—Demand for cement in Chile declined sharply during the year because of the poor economic situation, and as a result profits were significantly lower. Production of cement declined 42% relative to that of 1981 to 1.08 million tons, all of which was consumed domestically. The Fábrica de Cemento El Melón S.A. was planning a two-phase expansion to increase annual output from 750,000 tons to 1.25 million tons per year by yearend.

Iodine.—Chile maintained its position as the second largest iodine producer in the

world after Japan. The Sociedad Química y Minera de Chile S.A. (SOQUIMICH) continued as the only producer of iodine as a byproduct of the processing of nitrate ore in Chile. Byproduct iodine is obtained during the production of sodium nitrate from caliche (salitre). Iodine output during the year decreased 3% from that of 1981 to 2,596 tons. During 1981, the iodine plants in Coya Sur and Pedro de Valdivia were expanded to treat lower grade solutions. This increased iodine output significantly. Export earnings from caliche (salitre) and iodine reached $77.4 million, a 2.4% increase over that of 1981.

Lithium.—Fluor Mining and Metals Inc. of Redwood City, Calif., United States, has been awarded a $6.8 million contract by Sociedad Chilena de Litio Ltda. (SCL) of Chile, to annually produce 6,400 tons (14 million pounds) of lithium carbonate. The contract was part of SCL's $61.2 million investment to start production in 1984. In 1980, Foote completed a 6-year negotiation process and signed a 50-year joint venture contract with Chile's CORFO to launch the $61.2 million lithium carbonate and potash project using concentrates from 16,700 hectares of the Salar de Atacama. Foote is the 55% shareholder and CORFO is the 45% minority shareholder in SCL. The Salar de Atacama project began construction in December 1982.

Chile has the equivalent of an estimated 4 million tons of metallic lithium, considered roughly 39% of the world's known reserves. These are contained in brines in the Salar de Atacama and Salar de Pedernales in the Atacama Desert, about 2,000 kilometers from Santiago. Under the Chilean organic mining law, lithium operations were reserved for the state and fall under the jurisdiction of the Comisión Chilena de Energía Nuclear (CCEN), together with uranium and thorium. CCEN, however, is empowered to permit commercial lithium ventures and the negotiations for such ventures are handled by CORFO.

Natural Sodium Nitrates.—SOQUIMICH was the only producer of sodium nitrate in Chile. Production of natural sodium nitrate declined 11% from that of 1981 to 420,750 tons. Natural sodium nitrate, also known in Chile as saltpeter or Chilean nitrate, usually occurs in deposits associated with sodium chloride, sodium sulfate, and other salts. The largest known deposits are located in Chile. All exports from Chile were of two grades: industrial and agricultural. The industrial-grade exports contained approximately 98% by weight of sodium nitrate. The agricultural-grade exports contained approximately 97% by weight of sodium nitrate and was predominantly used as a fertilizer. Exports of sodium nitrate went predominantly to Europe and the United States with lesser amounts to the Far East and Latin American countries.

SOQUIMICH has been able to keep production costs down by running a more efficient operation. During the last few years the company reduced its work force from 8,000 to 4,500 workers while maintaining the same production level. Production capacity changes in the future would depend on the demand for sodium nitrate. Expansion projects have to show an internal rate of return of at least 16% in real terms in order to be considered.

Other Nonmetals.—CORFO also has a second project to exploit potassium and boron from the Salar de Atacama in northern Chile. Details of a feasibility study relating to this second project were made public in the late part of 1982. The project proposes to produce 500,000 tons per year of potassium chloride, 145,000 tons per year of potassium sulfate, and 28,000 tons per year of boric acid. The shallow brines in the area contain reserves of 4.2 million tons of lithium, 57.7 million tons of potassium, 11 million tons of boron, and 26 million tons of magnesium. One of the companies interested in the Salar de Atacama was Israel Chemicals Ltd., according to CORFO officials Israel Chemicals is presently conducting a feasibility study on producing potassium salts from the deposits.

MINERAL FUELS

Coal.—Coal production declined 15% to slightly less than 1 million tons because of a decline in demand for coal in the country. Average national demand leveled off at about 1.1 million tons in 1978 and had remained at that level until 1981. Then the bankruptcy of Chile's sugar industries, the coal industry's largest customer, further aggravated the decline in demand. Chile possesses large amounts of reserves and resources of subbituminous coal in the Valdivia and Magallanes areas in the south, but only a small quantity was being exploited. All known deposits are in southern Chile.

The national coal company, Empresa Nacional del Carbón S.A. (ENACAR) is the country's largest producer. It controls the Lota Mine, plus three other small mines. The Schwager Mine, Chile's second largest coal mine, became an independent subsid-

iary in 1981.

Compañía de Carbones de Chile Ltda. (COCAR), a private consortium formed by Compañía de Petróleos de Chile S.A. (COPEC) and the English firm, Northern Strip Mining Ltd., has bought the rights to develop the Pecket coal deposit northeast of Punta Arenas near the Strait of Magellan. According to COCAR officials, the Pecket coal reserves amounted to almost 5 billion tons distributed as follows: 500 million tons in the Rubens area, 3.2 billion tons in the Islas de Riesgo, and 1.1 billion tons in the Brunswick Peninsula. According to the Chilean Ministry of Mines, the new mining concession, which authorized the binational company to explore for coal in the southern zone of Chile, had given them until the end of June 1983 to begin installation of surface facilities and to start developing the coal deposit. The exploitation rights are for 50 years. An estimated investment of $120 million will be required to exploit the Pecket coal deposit. This will be partly financed by the International Bank for Reconstruction and Development (World Bank). The World Bank has initially approved a $15 million direct loan to COCAR for the development of the Pecket deposits.

Petroleùm and Natural Gas.—Domestic crude oil production reached 15.6 million barrels, the highest level in Chile's history, about 3.4% above the 1981 level. Primarily because of this increase, Chile provided slightly over one-half of its domestic needs. Chilean production of crude oil has risen steadily since 1978 when the only domestic producer, Empresa Nacional del Petróleo (ENAP), the state-owned oil company, began to exploit its offshore reserves. Prior to this, ENAP was totally dependent on onshore production, which was declining. The offshore program, located in the eastern mouth of the Strait of Magellan, now accounts for 75% of total domestic output (table 4).

Table 4.—Chile: Total crude oil production

(Thousand 42-gallon barrels)

Production area	1979	1980	1981	1982
Tierra del Fuego	2,280	1,825	1,472	--
On Land	3,161	2,752	2,578	3,876
Offshore	2,120	7,582	11,054	11,749
Total	7,561	12,159	15,104	15,625
Percent offshore	28	62	73	75

Source: Empresa Nacional del Petróleo (ENAP).

At present, ENAP has 14 platforms in production and 2 conducting drilling operations in the Strait of Magellan. During 1982, four additional platforms were brought into operation in the Strait of Magellan. Three new offshore deposits were discovered and further exploration continued in the Strait of Magellan.

The Government of Chile was also taking other steps in an attempt to raise future hydrocarbon production. Domestic crude consumption increased 1% over that of 1981 to 33.5 million barrels; however imports, mainly from Venezuela, dropped from 20.1 million barrels in 1981 to 9.12 million barrels. The total crude oil import cost fell 60.6%, to $277.3 million. In addition to the areas presently being exploited or explored, other coastal areas of Chile are considered promising for exploration. ENAP and the Comisión Nacional de Energía (CNE), both state-owned, were calling for prequalification of firms interested in bidding in the exploration and exploitation of hydrocarbons. The schedule was to call for final bids at the end of April for 10 to 12 offshore blocks, each approximately 5,000 square kilometers in the central zone of Chile. Additional areas of interest, such as offshore blocks on the southern coast, would be put up for bid later.

ENAP produced almost 179 billion cubic feet of natural gas from wells in the Strait of Magellan area, decreasing slightly from that of 1981. Propane, butane, and gasoline were extracted and the residual gas was reinjected in the fields to enhance recovery. The city of Punta Arenas also uses some of the residual gas as the area's principal energy source. ENAP and CNE representa-

tives began considering on April 5 preliminary bids to use a 15-year supply of natural gas from the Strait of Magellan area at a rate of 7.7 million cubic meters (275 million cubic feet) per day. Among the proposed uses for this large gas supply were a methanol plant, an ammonia-urea plant and a liquefied natural gas plant. Major firms from the United States, France, and Sweden submitted these proposals. Final bids on all projects were due on November 5, 1982.

In 1981, the 300-megawatt Antuco project was brought onstream to join the Abanico and El Toro plants, forming a complex with a total combined capacity of 836 megawatts in the Concepción area. In 1982, the 460-megawatt, $900 million first stage of the Colbún-Machicura-Chiburgo complex in the Talca area was under construction.

---

[1]Physical scientist, Division of Foreign Data

[2]Value and percentage of the 1982 gross domestic product were given as estimated figures in billions of 1977 Chilean pesos (CH$) by the Central Bank. Where necessary, values have been changed from CH$ to U.S. dollars at the rate of CH$27.98 = US$1.00 as of Dec. 31, 1977.

[3]Value of the 1982 gross domestic product was based on an average 1982 exchange rate of CH$51.00 = US$1.00, according to preliminary figures released by the Instituto Nacional de Estadísticas (INE).

The Mineral Industry of China

By E. Chin[1]

After 4 years of deliberation and preparation (1978-82), Government planners proposed an economic objective to quadruple China's gross annual value of industrial and agricultural production in two decades—from 710 billion (US$473 billion) yuan[2] in 1980 to 2,800 billion yuan in the year 2000. The average per capita income was to reach $800 per year. Annual targets in 2000 included coal capacity, 1.2 billion tons; steel, 70 million tons; power generation, 20 million kilowatts; grain, 460 million tons; and textiles, 8.25 million tons. The targets appear to be ambitious. However, based on China's past economic growth of 8.1% from 1953 to 1981, the State Council felt that the goals of its long-term economic plan were achievable.[3]

In December 1982, a constitution was adopted for the People's Republic of China. Article 9 of chapter 1 defined ownership of mineral resources and other natural resources, and article 18, the rights of foreign enterprises operating within China. Chapter 2 dealt with the rights and duties of the citizenry; chapter 3, with the structure of the Government; and chapter 4, with the national flag, emblem, and capital.

In a departure from 30 years of a closed-door policy, the Government was encouraging foreign capital, technology, and ventures to assist its modernization drive. On February 17, the State Council approved a 50-article income tax law concerning foreign enterprises. Included in the articles were definitions for types of venture, taxation schedule, and provisions for expenditures and depreciation of fixed assets. Because of lack of experience, the law was purposefully skeletal and would develop organismically as specific situations arose.

On August 23, a trademark law was adopted. Up to June 30, about 63,000 Chinese trademarks and 9,900 foreign trademarks were registered in China. The new law was to provide provisions for the protection of exclusive use of trademarks, duration, and to update and facilitate registration. Foreign trademark registrations were subject to two conditions. The applicant's country must have a reciprocal trademark agreement with China, and the trademark must have prior registration in the country of origin.[4]

Furthermore, the State Economic Commission, State Scientific and Technological Commission, and the State Bureau of Standardization began supervising industry's adoption of international standards. To become competitive in the world market, China realized the common trend of technical and economic development by using international standards. The Bureau of Standardization had national standards for 4,462 products. In 1982, national standards were set for 1,054 products, of which 400 conformed to international standards.[5]

On February 10, China promulgated regulations on the exploration of offshore petroleum resources in cooperation with foreign companies.[6] The provisions include defining the rights and obligations of the parties to petroleum contracts, taxation, production sharing, and ownership of data. China National Offshore Oil Co. was established to direct and oversee all aspects of offshore oil development. Letters of notification were extended to 46 companies in 12 countries inviting bids for offshore exploration, and 33 companies tendered bids for a total area of 150,000 square kilometers.

China began drafting regulations for its first marine environmental protection law, which was to become effective on March 1,

1983. Stipulations in the law will cover five areas: pollution and damage of coastal projects, offshore petroleum exploration, land-originating pollutants, boats and ships, and dumping of wastes. The law is applicable to all foreign vessels and companies operating within China's territorial waters.

According to the Ministry of Urban and Rural Construction and Environmental Protection, China's program for environmental protection would shift from abatement to prevention. By 1985, the Government was to require operation of pollution-controlled facilities for all new construction projects. Of the 44 chemical and metallurgical projects opened in 1982, 42 operated new antipollution facilities. Environmental impact statements had been completed for 20 projects and 41 more were underway, including impact statements for the Baoshan iron and steel complex in Shanghai, China's first nuclear powerplant in Zhejiang, a copper-producing center in Jiangxi, and a coal-producing center in Shanxi.

According to the State Statistical Bureau, China's total industrial output value in 1982 was $292 billion, a 7.7% increase over that of 1981, which exceeded the planned increase of 4%.[7] The 1982 targets for output of coal, electricity, rolled steel, cement, chemical fertilizers, and sulfuric acid were exceeded. State revenue was estimated at $59 billion, and expenditures, $60 billion. Investment for capital construction reached $29 billion, and for fixed assets, $45 billion. Total foreign trade in 1982 reached $41 billion.

For more efficient planning, the State Statistical Bureau was to conduct a statistical analysis of the industrial production of 40 cities including Anshan, Baotou, Beijing, Chengdu, Dalian, Fushun, Guangzhou, Harbin, Kunming, Nanjing, Shenyang, Tangshan, and Wuhan. These 40 key cities account for 50% of the total national industrial output. Fifteen of the key cities account for 7.8% of the total population, 25% of the nation's industrial fixed assets, 37.1% of the gross value of industrial output, 42.6% of the tax profits, 36% of local revenue, and 18.7% of retail sales. It was reasoned that small investments in key cities would yield the fastest and largest economic return and that the key cities would be the model for reform of the overall industrial base.[8]

In 1982, the mammoth task of conducting a national census was undertaken. According to the State Statistical Bureau, the population of the 29 Provinces, municipalities, and autonomous regions of China totaled 1,008,175,288 on July 1, 1982. Males account for 51.5% and females for 48.5% of the population. In comparison with the second national census taken in 1964, the annual population growth rate averaged 2.1% during the past 18 years. Seven of the twenty-six Provinces and autonomous regions had populations of more than 50 million. The most populous Provinces were Sichuan (99,713,310), Henan (74,422,739), and Shandong (74,419,054).[9]

China was expected to ratify the proposed United Nations (U.N.) treaty on the Law of the Sea. During the third U.N. conference on the Law of the Sea held in Jamaica in early December, the chairman of the Chinese delegation stated reservations concerning the treaty but that the new convention lays down a number of important legal principles and a regime for safeguarding the sea as a common heritage of humankind.

According to the State Oceanography Bureau, China was to conduct a nationwide survey of resources in coastal zones and tidal flats, which was to be completed in 1986. The survey would involve such ministries and commissions as geology and minerals, petroleum, aquatic products, agriculture, and shipping. The area to be investigated stretches from the mouth of the Yalu River in the north to the mouth of the Peicang River in the south. Initial studies have begun in Guangdong, Jiangsu, Liaoning, Shandong, Shanghai, and Zhejiang.

One of the largest deterrents to China's modernization is the limited transportation system. During 1983-85, a total of 1,700 kilometers of new railways was to be built, 1,500 kilometers to be double tracked and 2,000 kilometers to be electrified. Most of the new lines will be in north, southwest, and east China to facilitate shipping mineral resources from these areas, especially coal from Shanxi Province. By 1985, the railways would be able to handle 1.2 billion tons of freight and 1.1 billion passengers per year. Under the sixth 5-year plan, 132 deepwater berths were to be constructed at 15 coastal sites, including Dalian, Huangpu, Lianyungang, Qingdao, Shanghai, and Tianjin. Fifty-four were to be operating by the end of 1985, which would increase loading capacity by 100 million to 317 million tons. Inland navigation was also to be upgraded. Alone, the overall transport capability of the Chang Jiang was to be raised from 47 million to 100 million tons. Also,

the Grand Canal from Hangzhou to Jining and the Nanning-Guangzhou section of the Xijiang River would be opened for navigation.[10]

As part of the modernization plan, China's investment priorities were to emphasize energy, construction materials, iron and steel, chemicals, machinery, light industry, agriculture, and tourism. On December 12, 1982, China announced 400 projects to be completed in 1981-85, which included expanding annual coal output capacity by 80 million tons; expanding total electric power generation by 12.9 million kilowatts, of which 3.2 million kilowatts is to be generated by hydropower; increase crude oil production by 35 million tons; double track and install new railways; construct deepwater berths to increase annual cargo handling capacity; construct 25 cement plants, which would increase national output by 12.4 million tons; complete construction of the Baoshan iron and steel complex; install new capacity for salt processing of 1.03 million tons and increase capacity of existing salt fields by 1.48 million tons; and install new capacity for the chemical industry.[11]

In conjunction with the U.N. Industrial Development Organization, 130 projects were opened to foreign companies for capital investment and introduction of new technology. Terms for investments were to be highly flexible, ranging from joint ventures and cooperative production-compensatory trade to other agreements satisfactory to the parties involved. Among the 130 projects, 5 were for newly established enterprises; the rest were aimed at revamping or expanding existing facilities. It was estimated that over $10 billion would be required to finance the programs with the energy and transport sectors receiving special attention.[12]

Late in 1982, a manufacturing, processing, and technology exhibition was held in Beijing to attract foreign interest for investment in China for long-term manufacturing rather than direct sales.

PRODUCTION

China's total value of industrial output rose by 8% to $292 billion, with heavy industry increasing by 10% and light industry by 6%. The increase in output by heavy industry was led by crude steel, rolled steel, soda ash, caustic soda, cement, and plate glass, which were up by 4% to 14%. According to the State Economic Commission, performance by the energy sectors was equally good. Coal production increased by close to 5% and electric power generation also increased about 6%. However, oil production remained static around the 1981 output level. The production target for nonferrous metals, aluminum, antimony, copper, lead, magnesium, mercury, nickel, tin, titanium, and zinc, was overfulfilled. Refined output of copper, tungsten, zinc, and 15 other metals increased 15.3%, and production of rare metals increased 6.3%.

China is well known as a traditional producer of such commodities as antimony, fluorspar, iron and steel, magnesite, mercury, tin, and tungsten. Moreover, China is becoming a significant source for barite, beryllium, ferroalloys, rare earths, titanium, and vanadium.

Table 1.—China: Estimated[1] production of mineral commodities[2]

(Metric tons unless otherwise specified)

Commodity[3]	1978	1979	1980	1981	1982[p]
METALS					
Aluminum:					
Bauxite, gross weight[4]	1,500,000	1,500,000	1,500,000	1,500,000	1,500,000
Alumina, gross weight	750,000	750,000	750,000	750,000	750,000

Refinery products ____ do	600,000	470,000	470,000	450,000	450,000

[p]Preliminary. [r]Revised.

[1]Except data specifically footnoted as reported.

[2]Table includes data available through July 31, 1983.

[3]In addition to the commodities listed for which quantitative estimates of output have been made, China is known or believed to have produced the following commodities for which no estimates have been prepared, owing to a paucity of general information upon which to base an estimate: arsenic, chromite, titanium minerals, uranium, boron minerals, various clays (including kaolin), feldspar, lime, mica, sand, various industrial and dimension stones, and carbon black. Other unlisted commodities also may be produced.

[4]Diasporic bauxite; includes an estimated 165,000 metric tons per year of production for refractory applications.

[5]In terms of 50% Fe ore.

[6]Reported data.

TRADE

China's foreign trade totaled $41 billion in 1982. Exports were $22 billion, a 7% increase over shipments in 1981. Imports were $19 billion, down about 3% from receipts in 1981. China's major trading partners were Japan, the United States, the European Economic Community, and the Association of Southeast Asian Nations, in that order. In addition, a large but indeterminate volume of China's external trade is conducted through Xianggang (Hong Kong). To expand trade, China has negotiated preferential tariff agreements with Australia, Canada, the European Economic Community, Japan, New Zealand, and the United States.[13]

Over the past 30 years, capital goods accounted for about 80% of the total value of imports. For exports, however, the configuration by types of goods has changed. Apart from increasing exports of traditional agricultural and associated products, China has made efforts to export manufactured goods, with most of the increases made in textiles and light industrial products. In 1973, exports of crude oil started, and shipments of heavy industrial products began to expand. Since 1953, the share of agricultural products of total exports fell from 55.7% to 23.1%; textiles and light industrial products rose from 26.9% to 45%; and heavy industrial products increased from 17.4% to 31.9%.[14]

Beginning in early 1979, there was a reversal of economic priorities shifting import emphasis from costly heavy industrial equipment to energy, infrastructure, and light industry. Undoubtedly, an important factor underlying the change was dwindling foreign exchange reserves. Despite cutbacks in steel purchases and cessation of negotiations for new plants and equipment, imports rose during 1980-81 owing in part to contracts in 1978 for subsequent deliveries of whole-plant purchases. By 1981-82, imports fell 6% as a result of limiting further expenditures for foreign services, goods, and technology.[15]

In July 1979, the Government designated Shantou, Shenzhen, and Zhuhai in Guangdong and Xiamen in Fujian as special economic zones. In turn, Guangdong was to treat Hainan Dao as a free-trade zone to promote the development of resources on the island. In addition, under the sixth 5-year plan, two major economic zones were to be built. The Chang Jiang Delta economic zone will center on Shanghai, China's largest industrial city. The other, to be in Shanxi, will concentrate on the develop-

ment of coal, chemicals, and other heavy industry in the western part of Nei Monggol, northern Shanxi, all of Ningxia, and western Henan.

China exports a wide range of mineral products from crude ore to refined materials. In addition to its traditional exports of antimony, fluorspar, graphite, magnesite, mercury, and tungsten, China exports cement, coal, crude oil, and petroleum refinery products. There were also increasingly significant exports of barite, bauxite, ferroalloys, rare earths, salt, talc, tin, and titanium.

COMMODITY REVIEW

China's largest metals sector is iron and steel. China's nonferrous sector is comprised of 10 metals, and output of these metals collectively was about 1 million tons. China's other metal sectors include precious metals (gold and silver), rare-earth metals, and rare metals (beryllium, columbium (niobium), molybdenum, tungsten, etc.). In regard to nonmetals, China is a large producer of barite, cement, fluorspar, magnesite, salt, and talc. The Ministry of Geology and Minerals continued to direct and coordinate exploration to delineate China's mineral resources. According to the Ministry, prospecting goals for 25 metal and nonmetal mineral reserves—including iron, phosphorus, uranium, coal, oil, and natural gas—were overfulfilled in 1982. Moreover, the newly discovered reserves of antimony, barite, gold, graphite, lead, marble, silver, and sulfur were the largest reported in the past 3 years. In fact, 13 times as much copper and 3 times as much silver was discovered as compared to the target for the year. Further, the proven reserves of silver deposits in China rank third in the world compared to sixth in the past.[16]

The search for energy resources has top priority for the next 3 years. During the second round of the national survey for oil and gas, coal prospecting will be accelerated in Nei Monggol, Heilongjiang, Henan, Guizhou, Sichuan, and Yunnan. An extensive survey of coalfields is also scheduled, focusing on eastern China. Past geologic exploration (1980-82) had been fruitful. The major finds included high-yielding oil wells in Zhuijiang Kou and large reserves of unspec-

ified nonmetallic minerals in east China.[17]

The Ministry of Metallurgical Industry was encouraging foreign investments to import technology to develop China's nonferrous metals. The present production level of this sector was far short of the needs of the national economy.[18] Under the current economic plan, total annual output of 10 nonferrous metals was to reach only 1.5 million tons in 1985. According to the Ministry of Metallurgical Industry, China's reserves of antimony, rare earths, tantalum, tin, titanium, tungsten, and zinc rank first in the world, while reserves of columbium, lead, mercury, molybdenum, and nickel rank second; copper, fourth; and aluminum, sixth.

METALS

Aluminum.—China's newest alumina-aluminum facility at Guiyang, Guizhou, constructed by Nippon Light Metal Co., began trial operations in December 1981. The installation includes an 80,000-ton-per-year aluminum refinery and a 200,000-ton-per-year alumina plant. Construction began in the fall of 1980, and final delivery of equipment for the alumina plant was completed late in 1982. During 1982, about 25,000 tons of metal was produced. Because of delays in equipment delivery and operational difficulties at the alumina plant, full operation of the refinery was not expected until mid-1983. When fully operational, the Guiyang plant will increase China's annual aluminum metal output by 20%.

To increase nonferrous metal production, China proposed expansion of its aluminum sector and was seeking foreign cooperation for technology and assistance. One avenue of approach was to purchase used, surplus Japanese capacity in order to install a 600,000-ton-per-year alumina plant and a 200,000- to 300,000-ton-per-year aluminum refinery at Hejin, Shanxi. A Chinese study mission visited the Chiba smelter of Showa Light Metal Industries K.K. in November 1982. Construction of an aluminum refinery in Hebei and Tianjin was also under consideration. Guangxi was seeking foreign economic cooperation to build an 80,000-ton-per-year aluminum plant and a 200,000-ton-per-year alumina plant, and to develop a bauxite deposit at Pingguo.

On December 25, 1982, the Zhuoxian aluminum processing plant went into operation. Equipment for this plant, designed to produce 12,000 tons per year of aluminum foil, was imported from Japan and the United States. Nanping aluminum refinery has an annual aluminum capacity of 6,000 tons per year. Current processing includes 4,000 tons of ingot for export, 1,000 tons of wire, and 1,000 tons of sheet and pipe. Nanping was seeking foreign participation to install equipment to produce 4,000 tons per year of foil or to expand capacity to produce 13,000 tons per year of sheet, strip, and foil. In August, the Guangdong provincial government awarded a contract to Mass-Global Corp. (United States) to design and build an aluminum anodizing plant. Furthermore, an extrusion plant was subcontracted to Texas Hydraulic Corp. (United States). Completion of the project was scheduled for late 1983. The Hefei aluminum plant was to add an annual capacity of 3,000 tons of shaped aluminum or 5,500 tons of plate and foil.

China has large bauxite deposits located mainly in Guangxi (Pingguo), Guizhou (Huaxi, Wengan, Xiuyi), Fujian (Longyan), Hebei (Cixian and Tangshan), Henan (Baoshan and Huixian), Liaoning (Fuxian, Liaoyang, and Yanji), Sichuan (Leshan), and Yunnan (Kunming). Recent reported bauxite finds (1970-80) include Shandong (over 1 million tons), Henan (several hundred million tons in Luoyang and Sanminxia), Sichuan (large mineral bed in the western part of the Province), Guizhou (new finds in 20 counties), and Guangxi (2 billion tons in Pingguo).

Composition of Chinese bauxite from four areas was characterized as follows:

Area	Percent			
	Al_2O_3	SiO_2	Fe_2O_3	TiO_2
Shanxi, Xiaoyi	79.49	1.01	1.29	3.02
Henan, Xinan	70.38	8.51	1.56	3.27
Guizhou, Xiuwen	70.24	6.44	1.57	3.32
Guangxi, Pingguo:				
Nadou area	55.96	6.18	18.54	3.13
Mining area 1	77.09	2.12	1.22	5.38
Mining area 2	75.98	1.87	2.01	4.19

In addition, alunite, andalusite, and nepheline are also used in China.[19]

Copper.—China's current copper metal production is close to 300,000 tons per year. Domestic output was principally from mines in Anhui, Hubei, Liaoning, and Yunnan, and also from mines in Gansu and Henan. Domestic mine output has been supplemented by imports of concentrates from Canada, Chile, Papua New Guinea, Peru, the Philippines, and Zambia as well as from purchases of copper metal. Annual domestic consumption was about 450,000 tons. In April 1981, under China's economic readjustment policy, development of copper resources by Sumitomo Metal Mining Co. Ltd. and Fluor Corp. in Jiangxi was postponed. However, in early March 1982, China reportedly informed Sumitomo to resume construction of a 90,000-ton-per-year blister copper smelter, which would also produce 360,000 tons per year of sulfuric acid at Guiyang, Jiangxi. Status of the proposed Fluor project at Dexing, Jiangxi, is unknown.

The Overseas Mineral Resources Development Corp. of Japan was reportedly contacted to conduct feasibility studies on developing copper deposits at Anqing, Anhui. The deposit at Anqing was believed to contain 31 million tons of ore grading 1.34% copper.

Gold and Silver.—Because of the need for foreign currency and the high price of gold, China was believed to have increased gold production. However, Government holding of monetary gold reserves of 12.67 million troy ounces remained unchanged for 1981-82 as revealed by official Chinese sources. On September 15, 1982, the People's Bank of China issued four weights of gold commemorative coins (99.9% gold)—1.0, 0.5, 0.25, and 0.1 ounce—to be distributed by Po Sang Bank Ltd. in Hong Kong and Taisei Stamps and Coins Co. Ltd. in Japan. The coins, bearing the image of the giant panda and the Hall of Qinian in Tiantan, commemorate the normalization of Sino-Japanese diplomatic relations. In 1979, China issued commemorative gold coin sets for the 30th anniversary of the founding of China. Gold used in the minting was replaced by purchases in Hong Kong.

China has a centralized policy for state purchase and distribution of gold and silver. Sales of gold and silver ornamental articles were restricted to foreign purchasers. However, the People's Bank of China resumed state sales of gold ornaments in late September 1982, after 30 years of prohibition.

Based on an early news release by the Ministry of Metallurgical Industry, China's mine output of gold may have increased by 12%. China's largest producers are Heilongjiang and Shandong; the latter Province produces about 485,000 troy ounces per year or about 25% of national output. About two-thirds of Shandong's output is from 5 state-owned mines with a processing capacity of 500 tons per day; 7 county-run mines with a 100- to 150-ton-per-day capacity; and 18 county, commune, and brigade mines with a 25- to 50-ton-per-day capacity. Davy McKee Corp. of Great Britain had completed a feasibility study of two mines in Shandong that was to be the basis for significant expansion of mining and production rates using the most current technology in underground operations and gold recovery processing.

On September 22, the largest gold nugget reported in China was found in Huma County, Heilongjiang. The nugget weighed 107 troy ounces. Gold occurrences in Heilongjiang are well known, dating back to the Qing dynasty when output was purportedly about 400 ounces per day in the 1880's. The State Capital Construction Commission and the People's Liberation Army have been active in verifying gold-bearing sites in the Province. Presently, there are three gold-mining vessels in operation dredging for gold. Between August 1 and August 9, 1982, 555 ounces of gold was recovered by the three vessels. A fourth vessel was under construction for gold dredging.

The Hunchun Mine in Jilin produces about 15,000 ounces per year. Annual gold output in Liaoning is about 46,000 ounces compared with about 5,000 ounces for Guangdong. Annual output in Nei Monggol is about 102,000 ounces, mostly from around Qahar Yonyi Zhong. A gold mine at Ankang Xiang, Shanxi, was being developed to recover 19,000 ounces of gold per year. The Tongguan Mine in Shanxi annually produces about 6,500 ounces.

A rich alluvial gold occurrence was reported at the upper reaches of the Minjiang in Sichuan, and a copper deposit in Huli was reported to have high silver values. A large gold-silver find was reported in a metamorphic lode in Lishiu, Zhejiang. The gold mine at Suichang, Zhejiang, was modifying its operation to recover higher gold values.

In addition to native gold and silver, precious metals are recovered from copper anode slimes. For instance, the Tianjin copper refinery produced 18,000 ounces each of gold and silver in 1982. In addition, the Yongsheng waste material refinery recovered 3,600 ounces of gold and 772,000

ounces of silver.

Iron and Steel.—Eleven iron and steel complexes accounted for 86% of China's steel production: Anshan, Baotou, Beijing, Benqi, Maanshan, Panzhihua, Shanghai, Taiyuan, Tanggu, Tianjin, and Wuhan. Collectively, the installed national steel output capacity was 40 million tons. With the exception of Shanghai, all the major complexes are located near indigenous resources of coal and iron ore. The east coast of China contains by far the highest concentration of steelmaking plants.

Since the beginning of China's readjustment program in 1979, attention has been focused on the steel industry to improve steel quality, increase product variety, conserve energy, and increase profits. China's steel sector is outmoded, and equipment and technology date to the early 1950's. During that decade, Anshan and Taiyuan were updated and Baotou and Wuhan were built with technical assistance from the U.S.S.R. By 1958, reforms came to a halt, and by the 1980's, a technology gap of 15 to 20 years was formed.[20]

China's mine production of iron ore may run as high as 110 to 120 million tons per year and consists mostly of low-grade ore (about 30% iron). In 1982, mine construction was underway to produce a designed annual capacity of 22.5 million tons of iron ore, which was still considered insufficient to meet future requirements. Moreover, new annual ore dressing capacity being installed was only 6 million tons. The capacity of mines under development will essentially make up only for losses in capacity of existing mines. In ore dressing, fine screening and regrinding have been promoted to improve magnetic separation for higher quality concentrates.

During 1981, 346 small blast furnaces with high energy consumption were shut down and operation of 152 other small furnaces were discontinued temporarily, collectively representing a capacity of 18,000 cubic meters. Another 120 small ironworks were technically upgraded. These measures were adopted to weed out inefficiency by reducing coke and energy consumption.

Similarly, the nation's key ironworks and steelworks were to improve management and efficiency. The problems of the key ironmakers and steelmakers also included high energy consumption, averaging 1.186 tons of standard coal equivalent per ton of steel with some consuming as much as 1.5 tons. Water consumption was high, and consumption by the major enterprises totaled 3 billion tons each year. Freshwater consumption per ton of steel averaged 89 tons. Moreover, pollution was a serious problem, the incidence of accidents was high, and occupational health hazards were relatively high. Average labor productivity was low (14.7 tons per worker in 1981 for the industry compared with 19.0 tons per worker in 1966). Economic returns were low. The average rate of return on funds did not reach 10% in 1981; for some, the rate did not reach 6%.[21] To remedy the problems, the industry was to carry out major reforms and innovation as well as to focus on obtaining better quality and more variety of products and on practicing energy conservation.

In 1982, China's output of ferroalloys was 880,000 tons and for crude steel, 37 million tons. Specialty steel output was 2.5 million tons in 1982 compared with a high of 3.0 million tons in 1980. Output of high-speed tool steel was 16,000 tons in 1981 compared with 27,000 tons in 1978. Production of rolled steel, wire, sheet, and welded steel pipe in 1980 was 15.51 million tons compared with 9.74 million tons in 1978.

The major ferroalloy plants are near iron and steel complexes, raw material sources, and energy sources. Annual capacity of China's major ferroalloy producers was as follows, in tons:

Plant	Capacity
Jilin ferroalloy	200,000
Xinyu iron and steel (Jiangxi)	150,000
Shanghai ferroalloy	120,000
Hunan ferroalloy	100,000
Hengshan ferroalloy (Zhejiang)	40,000
Jinzhou ferroalloy (Liaoning)	40,000
Xibei ferroalloy (Gansu)	40,000
Zunyi ferroalloy (Guizhou)	30,000
Emei ferroalloy (Sichuan)	20,000

With the exception of chromium, China has ample raw material for ferroalloys. For example, silica is mined in various Provinces including Liaoning, Gansu, and Jiangsu; manganese in Fujian, Jiangsu, Liaoning, Hunan, Jiangxi, and Hebei; vanadium in Sichuan; and tungsten, in Guangdong and Guangxi. Some chromite is mined in Xinjiang but is chiefly for refractory applications. China is dependent on imports for more than one-half of its chromite supply. Foreign sources of chromite probably include the Philippines, Iran, Turkey, Pakistan, and Yugoslavia. In 1982, Sumitomo

signed a conversion contract to ship chromite from the Philippines to China for processing and then to Japan in the form of ferrochrome.

An information network under the aegis of the People's Bank of China was established linking the iron and steel companies in Anshan, Baotou, Beijing, Benxi, Chongging, Fushun, Maanshan, Panzhihua, Taiyuan, Tangshan, and Wuhan and the steel mills in Beijing, Shanghai, and Tianjin. Surveys will be conducted to provide a basis for forecasting marketing needs. Initial studies were to be made on demand forecasts for steel strip, sheet, wire, and plates. Also, present stocks of rolled sheet will be inventoried. At the end of 1981, it was estimated that there was an overstock of 20.6 million tons of rolled steel.

The first-stage construction of Baoshan iron and steel complex proceeded on schedule and was expected to be completed in 1985. The first 350,000-kilowatt, power-generating unit began operating on November 20, 1982, and a second unit was expected to be installed by mid-1983. Installation of the No. 1 blast furnace with an inner volume of 4,063 cubic meters was expected to be completed in early 1983; installation of one of the 300-ton oxygen top-blown converters and six 400-ton mobile cranes was completed, as well as the installation of two 1,300-millimeter blooming mills and the continuous rolling mills for bars. Work continued on the coking and sintering plants.

Construction of a 9-million-cubic-meter water reservoir was to start in 1983 to house water diverted from the Chang Jiang for Baoshan. Beilun, in northern Zhejiang, was being developed as a transshipping port for Baoshan. The deepwater harbor was designed to handle 20 million tons of ore annually and have one berth for 100,000-ton ships and two berths for 25,000-ton vessels. Also, the ship scrapping facility on Chongming was being expanded to increase scrap generation capacity. At the completion of stage one, Baoshan will have the capacity to produce 2.8 million tons of pig iron, 3 million tons of crude steel, and 0.5 million tons of steel products.

Nearby in Jiangsu, the Meishan iron smelting complex was nearing completion. The Meishan complex consists of an iron ore mine, an ore dressing plant with an annual capacity of 2.5 million tons, and two blast furnaces for producing 1.1 million tons of pig iron per year. Meishan was built to supply the needs of Shanghai's steel industry, 300 kilometers to the east.

Innovation and modernization at Shoudu iron and steel complex continued, and in 1982, its profits increased by 23%. Shoudu's current annual production capacity includes 12 million tons of iron ore, 1.3 million tons of coke (four coke ovens), 3 million tons of pig iron (four blast furnaces), 1.5 million tons of crude steel (three furnaces), and 1 million tons of steel products (one rolling mill). Renovation at Shoudu included the powerplant, the ore dressing plant, the No. 2 blast furnace, and the rolling mill. Some of the resulting savings included recovering 180,000 tons of iron ore powder, reduction of coke consumption to 390 kilograms per ton of iron, and reducing energy consumption for each ton of steel produced to 960 kilograms of standard coal.

In early 1982, the Government approved plans for the modernization and expansion of China's leading steel center, the Anshan iron and steel complex, by 1985. Anshan's annual output of steel was to be increased from 6 million to 7 million tons, and of rolled steel, from 4.21 million to 4.53 million tons. About $700 million will be spent to improve iron smelting, steelmaking, steel rolling, energy savings, and environmental protection. Particular emphasis will be given to upgrade the rolling mills to raise the quality and mechanical properties of rolled steel.

The recently installed 1.7-meter rolling production line at Wuhan iron and steel complex produced 1.2 million tons of steel sheets. The main installations for hot-rolling components were imported from Japan, and installations for cold-rolling and continuous casting were imported from the Federal Republic of Germany. Wuhan's product lines include cold- and hot-rolled steel sheet, zinc-coated sheet, tinplate, and cold-rolled silicon sheet.

A 200-ton electroslag furnace was constructed and installed at the Shanghai heavy machinery plant in 1981. The furnace turned out a 127-ton electroslag steel ingot in October 1981 and an 85-ton ingot in May 1982. The furnace will be used to produce large forgings for rotors in generators.

Benxi Iron and Steel Co. announced the discovery of magnetite deposits with an estimated reserve of 150 million tons located northeast of Anshan, Liaoning. Benxi currently operates the open pit Nanfen Mine as a captive source of iron ore. The Hainan Mine produced about 3.6 million

tons of iron ore in 1982. This ore, however, is not locally consumed and is shipped to the mainland for smelting.

Lead-Zinc.—Although China has a long history of lead-zinc mining, metal output by this sector is limited. Installed annual capacity to produce lead and zinc metal was about 175,000 tons and 250,000 tons, respectively. China imports small tonnages of lead ore from Australia and about 25,000 tons of unwrought lead from Australia, Canada, and Mexico. Known imports of zinc are insignificant. The invisible trade with North Korea could conceivably include Chinese receipts of both lead and zinc.

Development of a lead-zinc mine in Chengxian, Gansu, continued and was not expected to be completed until 1985 with an annual output of 110,000 tons of lead-zinc concentrates. Output will be partly for domestic smelters and also for export. The Qinghai Provincial Construction and Development Co. was undertaking the development of a lead-zinc deposit in the Xitie Mountains in the Qaidam Basin. Construction began in May 1982.

Molybdenum.—China planned to develop the Xinhun molybdenite deposit at Xiaojia Yingzi (Kazhuo County, Chaoyang Prefecture), Lianong. The deposit covers an area of 60 square kilometers with proved reserves estimated at 46 million tons averaging 0.228% molybdenum. The skarn deposit is concentrated within an area of 2.4 square kilometers between Xiaogzi and Kangzhangzi. The area is linked by a highway, 25 kilometers from the Gongyingzi railway station on the Jinghou-Chengde railway. Electric power can be supplied by the northeast China power grid—the mine area is 25 kilometers from the Huangtuliangzi transformer stations. Water is available from two rivers within 20 kilometers as well as from ample underground water. Development of the deposit was to cost $15 million and take 3 years. On completion, capacity was to be 330,000 tons of dressed ore per year.

Nickel and Cobalt.—China's nickel output is centered on the Jinchuan nickel sulfide deposits in the Gobi wilderness at the foot of the Longshu Mountains, 50 kilometers north of Yongchang in Gansu. Nickel reserves in Gansu constitute about 68% of the total national reserves. One underground and one surface mine were in operation at Jinchuan. Ore from the underground mine contains up to 5% nickel, and the voilarite from the underground mine has a nickel content of 0.5% to 1.5%. The deposit was discovered in 1958, the first mine (surface) was opened in 1964, and development of the underground mine was completed in 1969. In 1964, an electrolytic plant with an annual designed capacity of 10,000 tons of nickel went into operation. In 1978, a recovery circuit for platinum-group metals, designed by the Kunming Metal Research Institute and the Beijing Central Design and Research Institute, was in place. In 1979, a recovery circuit with a designed annual capacity of 450 tons of cobalt was put into operation. In 1980, the annual capacity for electrolytic nickel was raised to 15,700 tons. Annual output of nickel and cobalt in China, however, was probably close to 10,000 and 15 tons, respectively (cobalt production was reported by a Chinese official at 200 tons per year). Nickel output from Jinchuan was being expanded, and production was expected to be quadrupled in the late 1980's.

In addition, an open pit nickel sulfide mine in Baiyan, Gansu, is currently being exploited. Both a surface and an underground mine (nickel sulfide) were in operation in each of the following: Panshi, Jilin (with associated platinum-group metals), and Huili, Sichuan, since the early 1950's. Nickel sulfide deposits in Xiaonanshan, Nei Monggol, also contain appreciable values of copper, bismuth, titanium, and platinum-group metals.

Cobalt is recovered from converter slag in nickel production. China, however, has cobalt in asbolite and in cobalt-bearing pyrite.

In addition to Jinchuan, China's nickel producers include (1) Beijing rare metal extracting and smelting plant—cobalt, platinum-group metals, and nickel-chromium wire; (2) Baiyin Nonferrous Metal Co. (Gansu)—annual nickel metal capacity of 5,000 tons, however, capacity was less than 1,000 tons because of inadequate electricity supply; (3) Baoji nonferrous metal processing plant (Shaanxi)—treats ore from the Qinling Mountains for nickel and platinum-group metals; (4) Daye Nonferrous Metal Co. (Hubei)—producer of copper, nickel, and cobalt; (5) Gansu Metallurgical Co.—annual designed nickel metal capacity of 5,000 tons; (6) Handan iron and steel plant (Hebei)—recovers nickel as well as cobalt, copper, gallium, selenium, sulfur, tellurium, and vanadium; (7) Luoyang copper processing plant (Henan)—copper and nickel; (8) Jilin smelting plant—nickel, cobalt, and platinum-group metals; (9) Panshi nickel mine and phosphate fertilizer plant (Jilin)—

new enterprise to be opened in 1983 will recover nickel and cobalt; (10) Shanghai facilities—Baohua, Haiguang, and Shanghai metal smelting plants; Hongse, Rongguang, and Xinghuo smelting plants; and Shanghai and Xingfeng nonferrous metal smelting plants; (11) Shenyang smelting plant (Liaoning)—copper and lead as well as nickel, cobalt, and platinum-group metals; (12) Tianjin copper electrolysis plant—copper and nickel; (13) Tongling Nonferrous Metal Co. (Anhui)—copper, nickel, and cobalt; (14) Wuhan nickel electrolysis plant (Hubei)—nickel and cobalt; (15) Xiaosigou nonferrous metal smelting plant (Hebei)—copper, nickel, cobalt, and zinc; (16) Xingtai smelting plant (Hebei)—nickel from Handan Xingtai iron deposits in southern Hebei, which also contain cobalt, copper, gallium, selenium, tellurium, and vanadium; and (17) Zhenjiang smelting plant (Jiangsu)—nickel and cobalt. The following conduct research on recovery of nickel, cobalt, and/or platinum-group metals: Beijing Iron and Steel Technology Institute, Central Institute of Mining and Metallurgy, and Kunming Metallurgical Research Institute.

Rare-Earth Minerals.—The China Rare Earth Co. produces rare earths from the tailings of iron ore beneficiation at Baotou, Nei Monggol. In 1981, China Rare Earth produced 10,000 tons of rare-earth concentrates, 10,000 tons of ferrosilicon rare-earth alloys, 10,000 tons of rare-earth alloys, 2,000 to 3,000 tons of mischmetal, and 1,000 tons of rare-earth chloride.[22] China Rare Earth was seeking foreign assistance in 1982 for technology and funds for the production of anhydrous rare-earth chloride, a mischmetal plant, an individual rare-earth separation plant, and a rare-earth-cobalt permanent magnet plant. The first plant was to be designed for an annual capacity of 3,600 tons of anhydrous rare-earth chloride (1,500 tons available for export) and 1,000 tons of mischmetal (500 to 800 tons for export). The second plant would produce individual rare-earth oxides from 2,200 tons of rare-earth chlorides, of which 30% to 40% would be exported. The third plant would produce 5 tons of samarium-cobalt magnets, 1 ton of samarium-gadolinium-cobalt magnets, 6 tons of praseodynium-samarium-cobalt magnets, and 88 tons of cerium-cobalt-iron magnets, of which 80% to 90% were to be exported.

Airtrust Singapore Pte. Ltd. and its U.S. subsidiary, Airtrust International Corp. (Texas), formed a joint venture with China Rare Earth to market China's rare-earth products. Products available for export include bastnaesite concentrates; rare-earth chlorides, oxides, fluorides, and hydrates; rare-earth ferroalloys; individual rare-earth compounds and metals; mischmetal; and yttrium.

In addition to production in Nei Monggol, other rare-earth producers in China were Jiangxi Rare Earth Corp. in Nanchang, Gansu Rare Earth Corp. in Lanzhou, and the Yao Long chemical plant in Shanghai. All of which produce a wide range of rare-earth products. Gansu Corp. reportedly accounts for 50% of China's export of rare-earth chlorides.

Tin.—China's tin belt extends from Guangdong through Guangxi and Hunan to Yunnan. China's largest tin-producing base is the Yunxi Co. at Gejiu, Yunnan. A national conference on tin production and research was held at Gejiu in early May 1982 under the sponsorship of the State Scientific and Technological Commission and the Ministry of Metallurgical Industry. The conference focused on problems in China's tin industry: lack of well-defined data on reserves, low smelting yields, loss in production capacity, and excessive domestic consumption. Geologic exploration was to be intensified in Gujang and Dianxicheng, Yunnan, as well as in other Provinces; means to increase tin recovery were to be investigated, and research to use substitutes for tin was to be conducted.

A rich occurrence of tin was discovered in Yunnan, but the location was not disclosed. The deposit was reported to have the highest tin content of all known reserves in the Province, and the 30 veins surveyed could be exploited by open pit mining. Fairly rich deposits of tin were reportedly found in 10 counties of Huiyang Prefecture in Guangdong.

China's tin production has been variously estimated from about 15,000 to 30,000 tons per year, mostly from Yunnan and Guangxi. The Dachang Mine in Guangxi reportedly has an installed annual capacity of 10,000 tons of tin.

Titanium.—Ilmenite from dredging operations is produced in Guangdong, Guangxi, and Hainan Dao. Titanium slag is produced at Panzhihua, Sichuan, and at Chengde, Hebei. Small titanium sponge plants are located in Fushun, Liaoning, and in Shanghai. Ilmenite in Guangxi reportedly contains up to 51% titanium oxide, and the

region's import and export committee was inviting foreign participation for technology to construct a 2,000- to 5,000-ton-per-year titanium sponge facility. Also, a 1,000-ton-per-year titanium sponge plant was proposed for Hainan Dao. Guangzhou heavy machinery plant wanted foreign assistance to add 1,000 tons per year capacity for titanium machining and manufacturing technology, and the Shenyang Machinery and Power Equipment Bureau wanted foreign technology to add 1,000 tons per year capacity for the production of titanium pumps and valves.

An ilmenite deposit covering 6 square kilometers was found in Tengxian County, Guangxi. Estimated reserves were 1.3 million tons. Fujian Province proposed the construction of a 50,000-ton-per-day synthetic rutile plant in Fuzhou.

Tungsten.—According to Japan's Ministry of International Trade and Industry, China accounts for 53% of the world's tungsten reserves and 20% of the world's production. China has attended all the organizational producer sessions on tungsten of the United Nations Conference on Trade and Development (UNCTAD) but has not joined other producing nations to establish a tungsten commodity agreement. In early November, China held its second national tungsten science and technology conference in Changsa, Hunan. During the conference, which was attended by 200 technical personnel, there was a review of China's progress in tungsten production of the past year, a summation of collective experiences, proposed solutions to existing problems, and arrangements for new items of work by the tungsten sector. Chinese exports of tungsten were under the direct control of the Ministry of Metallurgical Industry, which also grants export licenses for local and provincial sales.

Other Metals.—China is well known for antimony, and the Xikuangshan antimony mine is famous. The Dachang tin mine in Guangxi produces up to 7,000 tons of antimony per year. Although quantities are small in comparison to production in the United States, China has become a major source of U.S. imports of beryllium. The Zhuzhou nonferrous smelter in Hunan has an annual output capacity of 300 tons of cadmium. The Shaoguan metallurgical plant in Guangdong proposed adding 4 tons per year capacity for germanium recovery. Dachang has an annual installed capacity to recover 3 to 5 tons of indium. China is also well known for mercury production and has rich resources in Guizhou. Production of platinum-group metals is increasing, with most of the recovery a byproduct of nickel refining. Substantial vanadium is recovered from slag generated from the processing of titaniferous magnetite, and significant quantities of vanadium have appeared in the world market. The Qaidam Basin in Qinghai was being developed primarily to harvest minerals in salt lakes. Magnesium salts will be harvested, and possibly, there will be downstream production of magnesium metal because of adequate energy available in the area. Qinghai also has high-quality silica. In 1981, the Province exported 3,000 tons of silicon metal, mostly to Japan, and Qinghai exports accounted for 40% of the national total. The manganese deposit found in Daxin County, Guangxi, has reserves exceeding 100 million tons. Bismuth, selenium, and tellurium are recovered as byproducts of base metal refining at plants such as Guangzhou smelter, Guangdong, and Shenyang smelter, Liaoning.

NONMETALS

Asbestos.—Production of asbestos was reported at 131,700 tons in 1980, and output in 1981-82 was probably in the 100,000- to 110,000-ton range. Because of the wide differences in the characteristics of asbestos mined in China, dressing varies widely. The Chaoyang Xinsheng underground asbestos mine, a small operation, has an annual dressing capacity of 8,000 tons. The plant was redesigned to simplify the separation of asbestos fiber from gangue and powdery dust. The Gansu Geological Survey conducted preliminary studies in an asbestos formation in Hongliugou.

Barite.—China's annual production of barite was estimated to approach 1 million tons. Guangxi is a large producer, and its annual exports reached 600,000 tons including shipments to Japan, Mexico, Romania, Southeast Asian countries, the United States, and the Federal Republic of Germany. The barite deposit in Xiangzhou County has a verified reserve of 5.1 million tons. A barite deposit in Yonfu County was being developed with U.S. assistance. China's resources of barite are mainly in Fujian, Guangxi, Hubei, and Shangdong. Current output satisfies both domestic and export needs.

A large barite occurrence was found in the western mountainous area in Fujian. A

provincial geological prospecting team estimated that the deposit contained 16 million tons of barite. Most of the ore was exposed or covered by a thin layer of red soil. The area has easy access to nearby highways and railways, which is convenient for mining and transportation. Development of the deposit located in Lifang, Dahu, Yongan County will yield an initial annual production of 150,000 tons.

Bentonite.—Heishan County, Liaoning, is one of China's major bentonite-producing areas. The Heishan open pit mine has an annual production capacity of 200,000 tons of ore and 100,000 tons of bentonite powder. Total resources were estimated at 500 million tons, including 39 million tons of proven reserves of calcium bentonite and 30 million tons of sodium bentonite. The mine was planning to import equipment and technology to produce 50,000 tons per year of activated sodium bentonite. A bentonite deposit was found in Guangxi with estimated reserves exceeding 100 million tons. The 11-layer deposit covers 20 square kilometers.

Cement.—China's cement industry is large but is dominated by small producing units. There were 2,469 small cement enterprises, which accounted for 59% of the output, or an average for each of 20,100 tons per year. Forty-nine cement producers with annual capacities over 500,000 tons accounted for the rest of the national output. Because of increasing demand, China was constructing nine new cement plants and expanding eight existing plants to add about 15 million tons of new annual capacity.

In Anhui, preparations were made for the construction of the 1.5-million-ton-per-year plant. A 1- to 1.5-million-ton-per-year plant was planned for Tongling. The 500,000-ton-per-year Baimashan plant outside of Wuhu was put into full operation in March 1982 and was to be expanded by another 500,000 tons. In Fujian, two new cement plants were proposed—a 1.25-million-ton-per-year plant at Dahu, Yonjan County, and a 700,000-ton-per-year plant at Shuinan, Chengguan. The Liuzhou cement plant in Guangxi was being expanded to 1 million tons per year.

Construction continued on the 1-million-ton-per-year Huaihai plant (Maocun, Tongren), Jiangsu. This project includes the development of a limestone deposit with an annual output of 1.2 million tons. Completion was expected at the end of 1983. The Yaoxian cement plant in Shanxi was to purchase kiln capacity of 600,000 tons. This plant has an existing annual capacity of 920,000 tons. Shandong Province proposed the 1.2-million-ton-per-year Lunan plant for Mashan, Tengxian County, Zaozhuang City.

The 460,000-ton-per-year Qujiang plant was under construction in Sichuan as was the 450,000-ton-per-year Changxing plant in Zhejiang. Other major cement plant construction, either planned or underway, included projects in Hebei, Heilongjiang, Henan, Jilin, Shanxi, Xinjiang, and Yunnan.

Over 88% of the energy supply for China's cement industry is provided by coal, the remainder is from oil and natural gas. Efforts were being made to develop and promote the use of large rotary kilns with cyclone preheaters (precalcining burners) to conserve energy. China has identified 500 limestone deposits with estimated reserves of 20 billion tons.

Feldspar.—A feldspar deposit was discovered in Shibeichong, Hengshan Mountain area in Hunan. Ore reserves were estimated at 10 million tons containing high-quality sodium feldspar. The ore bed, at its thickest point, is more than 60 meters wide.

Fertilizer Materials.—China has more than 2,200 fertilizer plants, of which 1,300 are small with an annual capacity each between 5,000 and 20,000 tons of ammonia. Most use anthracite as an energy supply, except for a few that use natural gas or heavy oil. Presently, China is capable of designing and manufacturing small ammonia units with annual capacities ranging from 10,000 to 150,000 tons. During the 1970's, China imported 13 ammonia plants, each with a daily output capacity of 1,000 tons. However, output by small plants collectively accounts for approximately 55% of the national total.

On the other hand, the output of nitrogenous ingredients is disproportionate to the output of phosphate and potassic fertilizers, which is less than 3 million and 30,000 tons, respectively. China's phosphate reserves were estimated at 11.9 billion tons, of which 80% was phosphorite. To balance the national fertilizer ingredient ratio, three large phosphate mines were being developed—Wangi in Hubei, Kaiyang in Guizhou, and Kunyang in Yunnan; two pyrite mines—Yunfu in Guangdong and Tanyaokou in Nei Monggol; and one potash plant—Qarhan in Qinghai. Upon completion of the first stage in 1985, the Qarhan plant will have an annual output of 200,000 tons of potash. The plant will later be expanded to produce 1

million tons per year. The 5,000-square-kilometer Qarhan Salt Lake contains 153 million tons of potassium chloride, 97% of China's potassium reserves.

Fluorspar.—Two fluorspar finds were reported in Guangxi; Yulin County with reserves of 2.28 million tons and Ziyuan County with 1.49 million tons. The Guangde Mine in Anhui has reserves of 1.93 million tons containing 53.99% calcium fluoride. The mine and dressing facility at Guangde was to be expanded to process daily 100 tons of ore to produce 12,000 tons of powdered concentrates per year. Fluorspar production and exports in Guangdong have declined about 46% from 1974 to 1980. Plans to increase output were being studied by provincial authorities. The largest mine in Guangdong is in Heyuan County.

Total annual production of fluorspar in China was estimated at 400,000 to 500,000 tons.

Gem Stones.—According to the Xingiang Geological Department, numerous varieties of jade and gem stones have been discovered in the autonomous region. The finds included garnet, sapphire, emerald, aquamarine, spodumine, tourmaline, ruby, amethyst, amaronite, and jade over a wide range of varieties.

In Shandong, a 96.94-carat diamond was found in the Chenjiafu diamond placer mine near Tanchenq. This is the third largest diamond found in the area; the first, found in 1979, weighed 158.786 carats, and the second, in 1981, weighed 124.27 carats. Other diamonds as well as numerous garnets weighing over 10 carats have been found. The diamonds were believed to have originated from a formation in the Yimeng Mountain range. However, there was also speculation of a primary diamond formation undiscovered in the area.

Graphite.—Heilongjiang has the largest reserves of graphite in China, based on geologic surveying of 14 deposits. The largest occurrence, found near Jixi, was estimated to have reserves of 300 million tons and was suitable for open pit development. Another large deposit occurs in the Heling area of Boli County. Provincial authorities were planning to expand the Liumao Mine, also in Jixi, which has been operating for 40 years. Graphite is also produced in Hunan at Lutang. Current output by the Nanshu Mine in Laixi, Shandong, was close to 16,000 tons. A small mine near Hai Kou, Hainan Dao, was to be expanded to a 2,000-ton-per-year capacity. The Hohhot graphite mine in Nei Monggol was seeking foreign assistance to expand mine output by 5,000 tons per year.

Gypsum.—A gypsum deposit was discovered near Hohhot (Otog, Ih Ju), Nei Monggol, with estimated reserves of 17 million tons. A larger gypsum find was reported near Chongqing, Sichuan, with reserves over 100 million tons. The ore body measured 1,600 by 38 by 80 meters. A deposit containing reportedly more than 2 billion tons of gypsum was found in Tongxin County, Ningxia. The deposit has thick seams near the surface and was suitable for surface mining. The Sihui Mine near Bei Jiang, Guangdong, has estimated gypsum reserves of 90 million tons; annual production, however, is only about 28,000 tons.

Talc.—China's annual talc production was about 900,000 tons. Liaoning, the largest producer, has an annual output capacity of 500,000 tons from seven state-run mines. In the past 30 years, Liaoning's annual export of talc averaged 200,000 tons. The Heicheng Mine in the suburbs of Anshan produces 125,000 tons of talc per year.

Talc deposits are widely distributed in 10 counties in Guangxi including Beilu, Longsheng, Luchuan, and Shangling. Reserves in the Guping and Jizhua Mines alone are estimated to be 26 million tons. The Jizhua Mine produces 130,000 tons of talc per year. In early 1982, China announced the discovery of a talc deposit in Guangxi with reserves equivalent of 25% of the nation's total.

Other Nonmetals.—China is a significant producer of magnesite. Reserves in Liaoning alone are 3 billion tons with provincial output accounting for practically all of China's annual output of 2 million tons. Pyrite production was 4.1 million tons in 1982 compared with 5.9 million tons in 1981. China is a large producer of kaolin and salt. The output of salt, reported at about 16 to 18 million tons per year, is grossly understated considering the enormity of consumption by China's population and its growing industrial needs. In addition to kaolin, attapulgite clay was discovered in Jiangsu. The Ministry of Geology and Minerals disclosed that China's resources of lithium accounted for nearly one-half of the world's total. China's lithium was concentrated primarily in the numerous salt lakes in Xizang.

Wollastonite was considered a rarity in China. According to a preliminary study, however, a wollastonite occurrence in Lishu County, Jilin, may contain reserves of 50

million tons. Foreign purchasers from Australia and Japan have expressed interest and requested samples of the Lishu find. Wollastonite also occurs in the Taye-Yangxin region of Hubei. Construction of the Xiamen soda ash plant in Fujian was inexplicably suspended in 1960 after the leveling of 21 hectares of ground and the installation of 17,000 square meters of building space. Construction of a plant was to resume at the site to produce 80,000 tons of soda ash and 180,000 tons of ammonium chloride annually.

MINERAL FUELS

Coal has historically constituted the major portion of China's energy resources and currently accounts for 70% of the country's primary energy output. The energy sector remains a weak link in the national economy. There are disparities between supply and demand throughout the country. Limited financial resources curtail massive energy development programs. Moreover, the nation's industry is hampered by outdated equipment and outmoded technology. As a result, there is a low rate of utilization and large waste of energy.[23]

Large-scale development along with energy conservation were to be key goals to meet China's long-term energy needs. Under China's economic plans through the end of the century, the energy sector would continue to have priority for investment and development. A forecast of China's energy supply was as follows, in million tons of standard coal equivalent and percent of total:[24]

	Coal	Oil	Natural gas	Hydropower	Total
1979:					
Quantity	454	151	19	20	644
Percent	70	23	3	4	100
1985:					
Quantity	514	157	21	28	720
Percent	71	22	3	4	100
1990:					
Quantity	643	214	27	35	919
Percent	70	23	3	4	100
2000:					
Quantity	1,000	329	46	54	1,429
Percent	70	23	3	4	100

Construction of China's first nuclear powerplant, with an installed capacity of 300,000 kilowatts, was underway at Qinshan, Zhejiang. A second plant was proposed for Guangdong.

The Government estimates that China's hydropower resources rank first in the world with a reserve of 680 million kilowatts. So far, only 3% of this reserve has been tapped. It was believed that 370 million kilowatts could be exploited and harnessed to generate 1.9 trillion kilowatt-hours of electricity per year. Presently, 20 hydropower stations are under construction throughout the country. The 2.71-million-kilowatt Gezhouba station on the middle reaches of the Changjiang is the largest, followed by the 1.3-million-kilowatt Longyang Gorge station on the upper reaches of the Huanghe. The remaining hydropower stations will be able to generate between 100,000 and 900,000 kilowatts. Stations, each with a generating capacity over 100,000 kilowatts, being constructed are Hongshi, Baishan, Louashan, Shuifeng, Taipingwan, Yuzixi, Ankang, Nanyahe, Tongjiezi, Wujiang, Dongjiang, Shaxikou, Wanan, Dahua, Tianshengqiao, and Lubuge.

Coal.—Coal accounts for 70% of China's primary energy source. China has large coal resources, and reserves were estimated at over 640 billion tons. Location of major coal deposits are as follows, in million tons: northeast China, 550; north, 10,662; east, 1,296; central-south, 350; northwest, 1,352; and southwest, 790.

The Government planned an average annual rate of growth of 2.5% in production to 1985. The principal measures taken to achieve this goal were to open new mines, modernize old mines, and mechanize coal tunneling, excavation, and transportation as well as pit prop replacement. For the long term in north China, Shanxi was to increase mine output capacity by 93 million tons, and Hebei, by 15 million tons. In northeast China, mine output capacity was to increase by 50.8 million tons with most of the increase from eastern Nei Monggol, 25 million tons, and Liaoning, 11.4 million

tons. The increase by the east China region was to be 52 million tons, mostly from Shandong, 21.5 million tons, and Anhui, 21.4 million tons. The increase for central-south China was 13 million tons; northwest China, 8.2 million tons; and southwest China, 7.7 million tons.[25]

Shanxi Province is China's leading producer with annual output over 130 million tons, about one-fifth of the national total. About 60% of Shanxi's production is shipped outside of the Province. Verified coal deposits in Nei Monggol exceed 190 billion tons. The open pit mines at Huolinhe and Yiminhe were under construction in 1982. Construction of the open pit mines at Yuanbaoshan and Zhungur were being planned. Also, the coal deposits at Dayan and Zhalainuoer were being studied. Because of its relative proximity to important industrial areas, Nei Monggol was expected to become China's second largest coal base after Shanxi.

China has looked to foreign capital to accelerate the development of its coal resources. Participation by Japan has been the most prominent. Cooperation by Japan has been extended through long-term trade agreement commitments, Export-Import Bank loans, and yen credits. In 1981, three Japanese technical missions visited China to conduct surveys. Currently producing mines visited were Lingxi and Lujiatao in Kailuan for coking coal and Datong for steam coal. New mines visited were Qianjiaying in Kailuan and Xiqu, Zhenchengdi, and Malan in Gujiao for coking coal, and Baodian in Yanzhou, Jiangzhuang in Tenguan, and Sitaigon in Datong for steam coal. The third group of mines visited were those that might possibly export coal to Japan in 1985—Xinglungzhuang in Yanzhou and Fangezhuang in Kailuan for coking coal; local mines in Datong and Yanbei, and Xinglungzhuang in Yanzhou for steam coal.

On September 5, 1979, a cooperative agreement was signed with the Government of Romania relative to the Bailong coking coal mine and washing plant, at Huo, Shanxi. The Romanians were to use export credit to provide equipment and technology. After completion, coal would be exported as compensation. On November 2, 1981, Tenshin Bocki Koshi of Japan agreed to loan the China Coal Development Co. 1 billion yen. Payment of principal and interest was to be made with coal exports over 5 years. On March 25, 1982, an agreement was reached with Occidental Petroleum Co. of the United States to make a feasibility study for an open pit coal mine at Pingshuo, Shanxi, with an annual capacity of 15 million tons. On May 15, an accord was reached with the Paris Development and Export Co. of France to develop the Dangtan coal mine in Yanzhou, Shangdong. Coal will be shipped to France as compensation. Fluor Corp. of the United States was awarded a contract to provide engineering and design service to increase capacity at the Fushun open pit coal mine in Liaoning. The output of the mine will be expanded to 5 million tons per year of coal and 8 million tons per year of oil shale.

Close to 82% of the coal consumed throughout China is unwashed coal. If washed coal were increased to 30% to 40% during the decade, China could save substantially on transportation capacity.[26] Presently, there are 99 coal washing plants with a collective annual designed capacity of 114 million tons. Tighter controls also were instituted to reduce ash and water content. The ash content of commercial coal dropped from 23.91% in 1978 to 21.18% in 1979. About 54% of the national coal output is from state-controlled mines, and the remainder is from local coal mines.

China's reserves of peat were estimated at 27 million tons. Reserves in Heilongjiang alone were 15 billion tons. Peat is also abundant in other areas of the northeast and in Sichuan. The Capital Construction Bureau of the Ministry of Petroleum Industry proposed peat development as an energy source as well as for raw material in fiberboard and light brick.

Petroleum and Natural Gas.—China's major oil-producing basins were Daqing, Jizhong, Liaohe, Dagang, and Karamay. The major gasfields were in Sichuan. Crude oil production stabilized at about 102 million tons in 1981-82.

Onshore, China's efforts to discover new finds will be concentrated on oil prospecting in the Songliao Basin, the Bohai Bay area, the Puyang region of Henan, and the Eren Basin of Nei Monggol. General surveying will also be conducted in the Junggar Basin in Xinjiang and the Qaidam Basin of Qinghai. Surveying and prospecting for natural gas will be concentrated in Sichuan. Offshore, China was cooperating with foreign companies for oil exploration and development.

On February 16 and March 16, 1982, China National Offshore Oil sent letters

of notification for the first round of bidding for joint exploration and development of China's offshore oil resources in the Yellow Sea and the South China Sea. By August 17, the closing day of bidding, 33 foreign oil firms submitted bids, 16 from the United States; 5 from the United Kingdom; 3 from Australia; 2 each from Canada, France, and Japan; and 1 each from Brazil, Italy, and Spain. Evaluation of the bids and contract negotiations was expected to consume most of 1983; drilling was not likely to begin until 1984 (blocks 4 and 5 in the Yellow Sea and blocks 6, 7, 8, 9, and 11 in the South China Sea).

In separate negotiations, Japan National Oil Corp. explored the western corner of Bohai Gulf (block 2) and the southern part of Bohai (block 3), Total S.A. Exploration of France had two exploration-development agreements—central Bohai Gulf (block 1) and northeast Beibu Gulf (block 12). Atlantic Richfield Co. had development rights in the Yinggchai Basin south of Hainan Dao (blocks 9 and 10).[27]

Uranium.—China is rich in uranium resources, and the vein-type deposits in volcanic rocks constitute the most important economic uranium source in China. Mesozoic volcanics are scattered extensively in eastern China, stretching 4,000 kilometers from the Hinggan Mountains in the northeast to Guangdong Province with a width between 200 and 800 kilometers. Other promising areas for uranium occurrences were in the Junggar and Tarim Basins in Xinjiang, Qaidan Basin in Qinghai, Alxa in Nei Monggol, and the Songliao plain and Heilongjiang-Nenjiang-Wusuli River basin in northeast China.[28] China has 10 atomic research reactors and has accumulated sufficient fuel to operate a 1.5-million-kilowatt nuclear powerplant for 30 years.

According to the Ministry of Nuclear Industry, China's first nuclear powerplant will be constructed on the northern shore of Hangzhou Bay, Zhejiang. The pressurized water reactor will have a generating capacity of 300,000 kilowatts. China's second nuclear facility will be at Daya, Dapeng Peninsula in Guangzhou, Guangdong. The Guangzhou installation will be equipped with two 900,000-kilowatt pressurized reactors.[29]

The Mineral Industry of Colombia

By H. Robert Ensminger[1]

Colombia's real gross domestic product growth rate for 1982 dropped 1.3% to $40.9 billion[2] in constant 1970 dollars. This was Colombia's third consecutive year of slowdown. The 25% inflation rate was slightly lower than the 27% rate for 1981.

For the second consecutive year, the mining sector continued to be a bright spot in the Colombian economy. Both oil and gas output saw a significant increase, the result of Government efforts to step up production and regain self-sufficiency. The Eastern Plains Basin was expected to emerge as the most important oil producing region in the next 5 years.

The $400 million Cerro Matoso ferronickel project, near Montelibano, Córdoba Department, was dedicated in June. The facility is jointly owned by Empresa Colombiana de Niquel Ltda., 45%; Hanna Mining Co. of the United States, 20%; and the Royal Dutch/Shell Group of the Netherlands (Billiton Metals and Ores International Ltd.), 35%. The Bechtel Corp.'s Mining and Metals Div. of the United States provided engineering, procurement, and construction management services.

A group of 22 Japanese banks, led by the Export-Import Bank of Japan, signed an agreement to supply credits of $14.44 billion to the coal industry. The credits were to be used to finance the El Cerrejón coal project in northern Colombia.

The recent completion of a nationwide high-tension transmission network has given Colombia a more reliable power system. The grid links the major cities with the Atlantic and Pacific coasts and the southern Ecuadorean and northeastern Venezuelan borders.

An 18-month contract was awarded to a state institute to investigate legal, economic, and technical issues as a basis for a new tax structure to support mining, projection of future domestic and export demand for Colombian minerals, financing of future exploration, development of a mining workforce, the location and extent of specific mineral deposits, and policies to protect small- and medium-sized mines.

PRODUCTION

Oil and natural gas both showed increases in production. Oil output was up about 4% over that of 1981, while natural gas production showed an increase of about 3% over the 1981 figure. The Government has mounted a concerted effort to step up oil and natural gas production to a level of self-sufficiency by 1985. Petroleum refined products rose by approximately 2%. Coal output for 1982 was about 29% above the 1981 figure. This amount was boosted by the mining operation in the central zone of El Cerrejón, which went onstream in midyear.

Gold, the second most important mining activity in Colombia, declined by 11% owing to a drop in world prices during the first half of the year. Nickel became a new contributor to the Colombian economy in mid-1982. The output of 1,000 tons was purposely held at a low level owing to poor market conditions. The cement industry showed less than a 1% increase. Steel production was off slightly, with the best performance coming from the five semi-integrated steel plants serving regional markets.

Table 1.—Colombia: Production of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1978	1979	1980	1981[p]	1982[e]
METALS					
Chromite, gross weight	(2)	(2)	--	--	--
Copper, mine output, metal content	100	84	111	113	[3]113

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.
[1]Table includes data available through Sept. 12, 1983.
[2]Revised to zero.
[3]Reported figure.
[4]Data represent amount registered as Colombian exports.
[5]Treated salt volumes, as reported by the Ministerio de Minas y Energia.

TRADE

Carbones de Colombia (CARBOCOL), the state coal mining company, has signed contracts with Denmark and Ireland involving the sale of 2.2 million tons per year of coal beginning in 1986. CARBOCOL also announced two contracts with Spain. One called for the delivery of 350,000 tons of coal by yearend. The remaining contract with Spain calls for the sale of almost 600,000 tons of coal annually for 10 years beginning in 1986.

Exports of fuel oil and petrochemicals by Empresa Colombiana de Petróleos (ECOPETROL) showed a substantial rise. Indications are that this category represents a growing share of Colombia's mix in both the short and long term.

Cement exports fell 2% from that of 1981 to approximately $52.8 million, most of it going to the Caribbean region.

The value of emerald exports decreased about 19% from that of 1981 to $33.6 million in 1982.

Colombia exported 1,000 tons of nickel from the Cerro Matoso Mine. Two hundred tons was shipped to the United States, and the remaining 800 tons went to the Netherlands.

COMMODITY REVIEW

METALS

Iron and Steel.—Acerías Paz del Río S.A. (APR), Colombia's largest steel producer, reported losses of $12 million. APR, which employs 7,000 workers, has requested a $60 million loan from a pool of international banks to offset its losses. APR expanded capacity from 200,000 to 400,000 tons per year in 1981, but abandoned plans to expand its capacity to 1 million tons per year in 1982.

A 100,000-ton-per-year electric-furnace steelmaking facility was being planned by the owners of Sanclemente Barco y Compañia Ltda., a steel and oilfield equipment trading firm, in Bogotá. The complex would use either direct-reduced iron or iron smelting technology to feed its electric arc furnaces to make raw steel in billets for domestic consumption.

The Government has set up a dumping tribunal to decide on sanctions against alleged unfair competition from such imported products as steel and electronics. The tribunal is comprised of representatives of the Treasury, Economic Development Ministry, and National Planning Department.

Nickel.—The Cerro Matoso nickel mine, located in the Department of Córdoba, produced 1,000 metric tons of nickel. The entire amount was exported. The Cerro Matoso Mine contains proven reserves of 62 million tons, of which 21 million tons grade an average of 2.7% nickel, and the balance grades 1% to 1.5% nickel.

Precious Metals.—Empresa Colombiana de Minas (ECOMINAS), beginning in 1983, was to spend approximately $12 million on a 2-year project to revitalize the bankrupt Compañia Minera del Chocó S.A., an alluvial gold and platinum mining company. The expenditure was to cover repairs of five dredges, labor costs, working capital requirements, and funds needed for delineation of new reserves. Financing was expected to be acquired through the domestic bank, Banco de la Republica.

NONMETALS

Cement.—Two new cement plants began production in 1982, Cementos Samper and Paz del Rio. The cement industry had a total capacity of about 6 million tons per year, but produced 4.5 million tons. This was an increase of less than 1% over 1981 production. Domestic consumption reached 4.0 million tons while cement exports were in the 500,000-ton range.

Emeralds.—Colombian emerald mines faced stiff competition from low-priced stones from Brazil, Zimbabwe, Mozambique, Tanzania, and particularly Zambia in 1982. Despite a 60% to 70% drop in world market prices, Colombian prices were as high as

they were in 1979, before the emerald price slump began. Colombian emeralds continued to dominate the market for investment gems.

ECOMINAS announced the creation of an exchange devoted to fostering trade in Colombia's precious and semiprecious stones, including agates, jade, turquoise, topaz, onyx, and amethysts. Japan was the largest importer of emeralds and other precious and semiprecious stones.

Phosphate Rock.—A feasibility study costing $4 million was carried out by ECOMINAS in the Pesca and Sardinata phosphate fields of central Colombia. The 2-year study was financed by the Inter-American Development Bank and confirmed 1.2 million tons of phosphate rock grading 18% mineral content at Pesca, Boyacá Department, and 3 million tons at Sardinata, Santander Department.

Increased production would help meet domestic demand, currently at 85,000 tons per year.

MINERAL FUELS

Coal.—The huge coal mining project in El Cerrejón's northern zone, a joint venture of CARBOCOL and Exxon, the U.S. corporation, was proceeding toward a target date of late 1985. The initial annual production was projected at 5 million tons with ultimate production to reach 15 million tons annually.

The El Cerrejón central zone coal mining project, operated by CARBOCOL and a Spanish consortium, began coal production in 1982. Beginning in 1985, 1.5 million tons of coal was projected to be produced annually. Although small in comparison to the projected production of the El Cerrejón north zone, the central zone is an important milestone in north coast energy development. Brought online several years before the north zone project, El Cerrejón central will free gas reserves for other uses.

The Stephens-Adamson Div. of Allis-Chalmers Corp. of the United States was awarded a $57 million contract to design, supply, and build the port coal handling system for the El Cerrejón north project. The system, which was to be built at the Bahia Portete, includes conveyors, two stacker-reclaimers, and a shiploader.

Hydroelectric.—Colombia ranked sixth in the world in hydroelectric potential in 1982. Of this potential, the country was only utilizing about 2% in 1976. Since then, 14 new plants have gone into operation, increasing installed capacity by 56%.

The Government has begun 27 new projects, mostly hydroelectric, that will increase future electric power capacity . One of the projects is the giant Urra Dam that alone will provide 1,050 megawatts. After all this development is completed, the country will still be using only 20% of its total potential.

Natural Gas.—Heavy exploration for more natural gas raised hopes that Colombia could export up to 500 million cubic feet per day for 20 years, possibly some to the United States. Current reserves were estimated at about 4.7 trillion cubic feet. In 1982, Colombia supplied its total consumption of natural gas of 285 million cubic feet. New discoveries in the Department of La Guajira have brightened natural gas production prospects.

Petroleum.—Triton Oil and Gas Corp., a U.S. company, was awarded a 400,000-acre onshore parcel in Casanare Department in the western plains region. Triton shot about 135 line miles of seismic survey lines and had plans to drill its first well in 1983. The company is required to drill eight more wells during the succeeding 6 years. The cost will range from $5 to $18 million per well.

Investment for exploration by private companies and by ECOPETROL went from $150 million in 1981 to over $200 million in 1982 according to the Center of Petroleum Industry Information.

When the pipeline between the eastern plains and the refining center of Barrancabermeja is finished in 1985, approximately 50,000 additional barrels should start flowing from newly discovered wells in Arauca, Trinidad, Cano Garza, Tocaria, and Barquena. Colombia's refining capacity was to increase to 205,000 barrels per day by 1984 when the expansion of the Cartagena refinery was scheduled for completion.

The Mineral Industry of Cyprus

By Thomas O. Glover[1]

The Republic of Cyprus has been geopolitically divided since 1974. The northern one-third of the island was controlled by the Federated Turkish Cypriots, while the southern two-thirds of the island was controlled by the Government of Cyprus. Very little, if any, mineral activity took place in the northern one-third of the island. Only information relating to the southern sector is presented in this chapter.

Cyprus remained a small nation without energy resources of its own and only modest economically viable mineral resources. These factors, in conjunction with a high inflation rate, created a deficit in the balance of trade.

The economic recovery of Cyprus after the 1974 Turkish intervention continued at a slow pace. Still, the inflation rate had dropped to approximately 7% in 1982 from 14% in 1981. Unemployment was reduced to approximately 3%. Still, construction materials showed a smaller growth than that of the previous year. Metallic ores production was off owing to exhaustion of deposits and reduced world prices.

Ever increasing crude oil prices contributed to the inflation. Cyprus imported all its crude oil from Iraq, Libya, and Algeria, with the major portion coming from Iraq.

The Cyprus Geological Survey Department carried out prospecting for the location of massive sulfide deposits. Chromite deposits known to exist in the Vaslayia area of Cyprus were explored in collaboration with the Bureau de Recherches Géologiques et Minières (BRGM) of France.

PRODUCTION AND TRADE

Copper and zinc mines were idle during the year; however, a small amount of cement copper was produced from an in situ leaching of the Skouriotissa copper ore body. Chromite production remained down owing to the depressed steel markets of the world. The production of nonmetals remained depressed.

Substantial reserves of asbestos, chromite, gypsum, iron pyrites, marble, and building materials were available for mining when required. The production of cement had been a thriving industry for several years. Umber was produced for the raw mineral pigment industries.

The foreign trade situation deteriorated further during the year, with sluggish export growth contrasting with an accelerated rise in imports. As a result, the trade deficit for the year showed a 25% increase over that of 1981. The value of total exports was forecast by Popular Bank to expand 7.5% over that of 1981.

[5]Unreported quantity valued at $37,000.

COMMODITY REVIEW

METALS

Chromite.—Owing to depressed world steel demand, production of chromite remained low. Most of the production from Cyprus' two operating chromite mines was exported to Europe and the United Kingdom.

NONMETALS

Asbestos.—Only one company, Cyprus Asbestos Mines Ltd., produced asbestos in 1982 from its open pit operation and onsite ore concentration plant at Amiandos. Approximately 19,000 tons of asbestos, equally divided between long and short fiber variety, was mined. Most of the production was shipped to the United Kingdom and Greece.

Bentonite.—Bentonite production was reportedly significantly below that of 1981, owing to reduced demand in its use as an oil well drilling mud.

Cement.—The production of cement remained approximately the same as in 1981, with most of the production being used in Cyprus. Small amounts of the production was exported to nearby Middle East countries.

Fertilizer Materials.—Hellenic Chemical Industries Ltd., a joint venture among four partners, which included the Government of Cyprus, began operating the new sulfuric acid-phosphoric acid fertilizer plant that was completed in 1981. Full production was scheduled at the plant, including 180,000 tons of sulfuric acid, 40,000 tons of phosphoric acid, and 150,000 tons of fertilizer. Approximately one-third of the fertilizer was used locally; the balance was exported.

Umber.—A mineral pigment, umber was produced in large quantities in Cyprus. This naturally occurring brown earth contains ferric oxide, silica, alumina, manganese oxides, and lime. The umber was exported and used locally as paint pigment.

MINERAL FUELS

Petroleum.—Cyprus was fueled almost entirely on petroleum products produced at its sole refinery from imported Iraqi, Libyan, and Saudi Arabian crude petroleum. The refinery, located at Lanarce on the south coast, had a throughput capacity of 16,000 barrels of crude. The refinery produced gasoline, jet fuel, kerosine, distillate fuel oil, residual fuel oil, liquefied petroleum gas, and asphalt.

Like many other countries, Cyprus was caught between worldwide recession and total dependency upon foreign oil and its extremely high cost. Libya, which owed

millions of dollars to Cyprus industry for various products it had purchased, proposed an agreement to settle the debt with oil, at a price 10% higher than the international price. Cyprus also lost about $21.1 million[2] owing to its crude petroleum arrangements with Iraq.

[2]Where necessary, values have been converted from Cyprus pounds (£C) to U.S. dollars at the rate of £C1=US$2.11.

The Mineral Industry of Czechoslovakia

By Tatiana Karpinsky[1]

According to Czechoslovak sources,[2] national income in 1982 increased 3.9% in current prices, compared with the 1981 level. The value of gross industrial production increased 1%. Capital investment declined by 3.2% and totaled approximately 138.7 billion korunas (Kcs),[3] or about 8% below the 1980 level. This decline reflected a major goal to reduce the number of started but unfinished projects. Important projects completed included three 210-megawatt units in the Prunerov powerplant and new capacities in the Maxim Gorki and Vrsany Mines in the North Bohemian coal district and Darkov Mine in Ostrava Karvina district, as well as many new facilities in the iron and steel industry.

In 1981, industrial production totaled Kcs649.4 billion.[4] Mining and quarrying contributed 4% of the total industrial production, of which the share of coal was 3%; crude oil, 0.1%; metallic ore, 0.4%; and other mining, 0.5%. Production of refined petroleum contributed 3.7% of the total industrial output; the iron and steel industry, 9.1%; and the nonferrous industry, 2.3%. The number of industrial workers employed in state enterprises in Czechoslovakia totaled 2.9 million in 1981, and the number of employees totaled 2.1 million. The number of workers and employees in state mineral and energy enterprises in 1981 is shown in the following tabulation, by branch:

Branch	Number of workers (thousands)	Number of other employees (thousands)	Number of enterprises
Fuel extraction and processing industry	180	139	55
Power and heat generation	59	39	28
Ferrous metallurgy including ore mining	170	125	14
Nonferrous metallurgy including ore mining	42	30	19

Czechoslovakia was almost entirely dependent on imports for primary nonferrous metals because the domestic raw material base covered, in the main metals, only 5% to 15% of total consumption. Shortages of domestic raw materials provided a strong economic stimulation for recycling and reclaiming. Secondary raw materials were an important source of nonferrous metals.

Government Policies and Programs.—The targets for the 1983 plan were approved by the seventh plenary session of the Communist Party of Czechoslovakia in November 1982. The plan for 1983 included growth targets of 2% in national income and 1.7% in industrial production, to be achieved by increased labor productivity. The plan called for modernization of the iron and steel and the coal industries. Coal extraction and construction of nuclear powerplants were to receive more than 40% of overall capital investment. Coal output would amount to 124 million tons, including 97 million tons of brown coal and lignite. The plan called for an increase in imports of steam coal from Poland and a rise in natural gas and electrical energy deliveries from the U.S.S.R. About 3.23 million tons of new

capacity was to be opened in 1983 in the Ostrava-Karvina bituminous coal district. Steel production was to stay at approximately the same level as in 1981. Production of aluminum, zinc, and tin was to drop slightly from the 1981 level because of the shortage of raw materials. The planned output of refractories and building materials would meet requirements for consumption in Czechoslovakia and for export deliveries.

PRODUCTION

In 1982, the Czechoslovak mining industry produced over 350 million tons of mineral raw materials. In the coal and lignite industry, the state plan was fulfilled. The output plan was not met by the North Bohemian brown coal district, but other brown coal districts surpassed the plan. Output of nonferrous metals decreased by 2.6% compared with that of 1981; production of nonferrous ores decreased 0.4%. Consumption of ferrous and nonferrous metals decreased about 3%. Output of iron and steel was slightly lower than in 1981. Domestic crude oil and gas production continued to be insignificant. Production of electrical energy increased from 73.5 billion kilowatt-hours in 1981 to 74.7 billion kilowatt-hours in 1982, and 2.2 billion kilowatt-hours was imported from the U.S.S.R.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Jan. 31, 1983. In addition to the commodities listed, arsenic, gold, uranium, feldspar, graphite, and a variety of other petroleum products are produced, but information is inadequate to make reliable estimates of output levels.

[2]Reported figure.

[3]This material, although reported as manganese ore, is believed to be manganiferous iron ore with a manganese content of about 17% and as such is not equivalent to material ordinarily reported as manganese ore, which generally contains 25% or more manganese.

[4]Includes gas produced from coal mines. Gross output of natural gas is not reported, but it is believed to exceed reported marketed output by a relatively inconsequential amount.

[5]Data presented are for those products reported in official Czechoslovak sources and in United Nations publications; no estimates have been included for other products or for refinery fuel and losses.

TRADE

Czechoslovakia accounted for 0.7% of all world trade in 1982; its share of East European trade amounted to 8%. Sharp reductions in imports, especially from market economy countries permitted Czechoslovakia to record a hard-currency trade surplus. Trade with the U.S.S.R. and other centrally planned economy countries was up by more than 13% overall, accounting for about 75% of total trade.

In 1981, exports of fuels, mineral raw materials, and metals contributed 27% of total exports, valued at Kcs95.5 billion. Fuels, mineral raw materials, and metals accounted for 53% of total imports, valued at Kcs94.2 billion. The U.S.S.R. accounted for 93% of Czechoslovak imports of crude oil, 83% of iron ore, almost 100% of natural gas, and a large quantity of nonferrous metals.

The trade agreement between Czechoslovakia and the U.S.S.R. for 1983 was signed in Moscow on December 2, 1982. The volume of the exchange of commodities was to exceed $10.5 billion, an increase of 12% compared with that of 1982. The supplies of the basic types of raw materials such as crude oil, natural gas, hard-coal electrical energy, iron ore, and metals will continue. Czechoslovakia was to export to the U.S.S.R. machinery and equipment and large-diameter steel pipes.

Czechoslovakia and the U.S.S.R. signed an agreement for 1981-85 covering U.S.S.R. exports of 5 million tons of pig iron in exchange for Czechoslovak large-diameter pipes and other steel products. The deal is worth 1,500 million rubles.[5] In October, Czechoslovakia signed a long-term agreement with Brazil for import of Brazilian iron ore, and in December, an agreement was signed for delivery of iron ore from India. During 1981-85, Czechoslovakia will continue to participate in the construction of the Khmelnits nuclear powerplant in the U.S.S.R.

Grinding and polishing wheels and stones[7]	892	506	--	West Germany 150; Italy 85; Canada 55.
Asbestos, crude	--	99	--	United Kingdom 52; Yugoslavia 47.
Barite and witherite	5,487	1,258	--	Austria 1,011; Yugoslavia 215.
Cement[2] thousand tons	341	429	--	West Germany 142; Hungary 103; Yugoslavia 103.
Clays and clay products:				
Crude:				
Andalusite, kyanite, sillimanite	23,494	24,718	--	All to Austria.
Chamotte earth	77,967	145,028	--	Hungary 65,873; West Germany 41,739; Italy 19,703.
Fire clay	36,097	73,160	--	West Germany 37,774; Yugoslavia 35,386.
Kaolin[2] thousand tons	367	347	--	West Germany 132; Poland 65; Austria 46.
Unspecified	166,454	136,659	--	West Germany 60,525; Hungary 53,348; Norway 8,338.
Products:				
Nonrefractory	24,631	21,955	46	West Germany 6,640; Yugoslavia 5,656; Austria 2,310.
Refractory including nonclay brick	49,629	[8]45,014	--	West Germany 20,938; France 2,887; Sweden 2,837.
Diamond:				
Gem, not set or strung value, thousands	$14	$3	--	All to Belgium-Luxembourg.
Industrial do	$361	$91	--	Belgium-Luxembourg $85.
Diatomite and other infusorial earth	996	1,244	--	All to Austria.
Feldspar, fluorspar, related materials, unspecified	20	300	--	All to Yugoslavia.
Fertilizer materials:				
Crude, n.e.s	--	12	--	All to West Germany.
Manufactured:				
Ammonia	16,489	15,771	--	Austria 10,219; West Germany 5,552.
Nitrogenous	90,571	103,918	--	Yugoslavia 50,279; West Germany 25,851; Poland 19,000.
Phosphatic	3,460	NA		
Potassic	5,420	3,146	--	United Kingdom 3,100.
Unspecified and mixed	508	435	--	Yugoslavia 375; Denmark 40.
Graphite, natural	951	1,573	--	Yugoslavia 883; Poland 540; Greece 145.
Gypsum and plaster	27	82	--	All to Austria.
Halogens:				
Chlorine	NA	40	--	All to Yugoslavia.
Unspecified	--	14	--	All to Italy.
Lime	8,349	9,891	--	Hungary 9,291; West Germany 600.
Magnesium compounds: Magnesite[2] thousand tons	385	305	--	Hungary 72; Poland 62; West Germany 57.
Mica: Worked including agglomerated splittings	93	94	--	Yugoslavia 49; Austria 15; United Kingdom 12.
Nitrates, crude	467	NA		
Pigments, mineral: Iron oxides and hydroxides, processed	1,340	1,062	--	All to Italy.

See footnotes at end of table.

Table 2.—Czechoslovakia: Apparent exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981[p]	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Precious and semiprecious stones other than diamond:				
Natural ____ value, thousands	$23	$42	--	Canada $18; West Germany $13; United Arab Emirates $7.
Synthetic ____ do ____	$101	$39	--	Yugoslavia $22; West Germany $17.
Salt and brine	2,029	101	--	All to Yugoslavia.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	654	1,045	--	Yugoslavia 340; Italy 244; West Germany 151.
Sodium carbonate, natural and manufactured	[9]8,200	[9]5,900	--	Mainly to West Germany.
Sodium hydroxide	[9]19,200	[9]23,400	--	Yugoslavia 14,150; West Germany 8,000.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	2,115	1,543	--	West Germany 1,332; Austria 181.
Worked	9,988	7,850	--	West Germany 7,661; Netherlands 144.
Dolomite, chiefly refractory-grade	--	20	--	All to France.
Gravel and crushed rock	2,706	8,949	--	West Germany 6,967; Austria 1,922.
Limestone other than dimension	21,614	20,338	--	All to West Germany.
Sand other than metal-bearing	277,260	262,078	--	Austria 164,565; Hungary 97,316.
Sulfur:				
Elemental, crude including native and byproduct	1,577	26	--	All to Austria.
Sulfuric acid[9]	8,600	9,000	--	NA.
Talc, steatite, soapstone, pyrophyllite	6,627	6,395	--	Poland 6,350; Yugoslavia 25; Italy 20.
Other:				
Crude	25,130	24,368	--	Hungary 13,462; West Germany 5,633; Austria 4,829.
Slag and dross, not metal-bearing	24,300	17,171	--	All to West Germany.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	NA	92,249	--	West Germany 26,268; Yugoslavia 23,720; Poland 13,555.
MINERAL FUELS AND RELATED MATERIALS				
Carbon: Carbon black	10	NA		
Coal:				
Anthracite and bituminous[2] thousand tons	3,728	2,605	--	East Germany 597; Austria 540; Hungary 469.
Briquets of anthracite and bituminous coal	408	100	--	All to Greece.
Lignite including briquets[2] thousand tons	2,160	2,527	--	West Germany 2,464.
Coke and semicoke[2] ____ do ____	1,461	1,263	--	East Germany 500; Austria 401; Romania 161.
Gas, natural ____ million cubic feet	[9]1,607	[9]1,201	--	Hungary 69; undetermined 1,132.
Peat including briquets and litter	20	NA		
Petroleum and refinery products:				
Crude[9] thousand 42-gallon barrels	2,224	1,417	--	NA.
Refinery products:				
Liquefied petroleum gas do ____	926	913	--	West Germany 580; Italy 177; Netherlands 124.
Gasoline ____ do ____	[9]2,440	1,663	--	West Germany 1,071; Netherlands 200; France 199.
Mineral jelly and wax -- do ____	--	1	--	Mainly to Yugoslavia.
Kerosine and jet fuel -- do ____	339	413	--	West Germany 324; Yugoslavia 57; Hungary 16.
Distillate fuel oil ____ do ____	[9]3,999	[9]4,409	--	West Germany 553; Switzerland 488; undetermined 3,281.
Lubricants ____ do ____	[9]75	353	--	Austria 147; Denmark 131; Yugoslavia 73.

See footnotes at end of table.

			United States	Other (principal)
MINERAL FUELS AND RELATED MATERIALS —Continued				
Petroleum and refinery products —Continued				
Refinery products —Continued				
Residual fuel oil thousand 42-gallon barrels	2,458	3,275	--	West Germany 1,653; Austria 1,532.
Bitumen and other residues do	15	14	--	Austria 13.
Tars and other crude chemicals derived from coal, gas, and petroleum	47,874	34,248	--	West Germany 14,648; Italy 8,156; Switzerland 7,837.

[p]Preliminary. NA Not available.

[1]Owing to a lack of official trade data published by Czechoslovakia, this table should not be taken as a complete presentation of this country's mineral trade. Unless otherwise specified, these data have been compiled from various sources, which include United Nations information, data published by the partner trade countries, and partial official trade sources of Czechoslovakia.

[2]Official trade statistics of Czechoslovakia.

[3]Quarterly Bulletin of Steel Statistics for Europe, United Nations, New York.

[4]Less than 1/2 unit.

[5]May include other precious metals.

[6]Excludes quantity valued at $20,000 in 1980 and $46,000 in 1981.

[7]Excludes quantity valued at $284,000 in 1980 and $445,080 in 1981 including imports of United States valued at $93,000 in 1981.

[8]Excludes quantity valued at $66,498.

[9]Statistical Yearbook of Member States of the Council for Mutual Economic Assistance, Moscow, U.S.S.R.

Table 3.—Czechoslovakia: Apparent imports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1980	1981[p]	Sources, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals: Unspecified	22	22	--	West Germany 18; Austria 3.
Aluminum:				
Ore and concentrate[2] thousand tons	466	454	--	Hungary 328; Yugoslavia 126.
Oxides and hydroxides	29,520	32,259	--	Yugoslavia 16,716; Hungary 15,447.
Metal including alloys:				
Scrap	--	518	--	West Germany 314; Austria 200.
Unwrought[2] thousand tons	93	82	--	U.S.S.R. 68; Hungary 5; Yugoslavia 5.
Semimanufactures	18,322	15,988	--	Yugoslavia 14,068; Hungary 964; Austria 453.
Beryllium: Metal including alloys, all forms	(3)	14	--	All from West Germany.
Cadmium: Metal including alloys, all forms[2]	206	228	--	Japan 60; China 40; Finland 40.
Chromium:				
Ore and concentrate[2] thousand tons	182	180	--	U.S.S.R. 130; Albania 24.
Oxides and hydroxides	2	683	--	U.S.S.R. 673.
Metal including alloys, all forms	--	15	--	All from France.
Cobalt:				
Oxides and hydroxides	19	10	--	All from West Germany.
Metal including alloys, all forms	29	40	--	Finland 25; France 15.
Columbium and tantalum: Metals including alloys, all forms, columbium (niobium) kilograms	158	341	--	All from West Germany.
Copper:				
Ore and concentrate	--	2,300	--	Norway 1,300; Morocco 1,000.
Sulfate	(3)	--		
Metal including alloys:				
Scrap	142	632	--	Austria 360; West Germany 272.
Unwrought[2] thousand tons	63	67	--	U.S.S.R. 39; United Kingdom 13; Poland 10.
Semimanufactures	23,529	25,366	--	Poland 19,725; Yugoslavia 4,114; West Germany 641.
Gold: Metal including alloys, unwrought and partly wrought troy ounces	NA	367	--	All from West Germany.
Iron and steel:				
Iron ore and concentrate excluding roasted pyrite[2] thousand tons	12,819	12,166	--	U.S.S.R. 9,657; Brazil 1,346; India 398.

See footnotes at end of table.

Table 3.—Czechoslovakia: Apparent imports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981[p]	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Iron and steel —Continued				
Metal:				
Scrap	228,092	252,097	--	U.S.S.R. 198,758; West Germany 53,339.
Pig iron, cast iron, related materials	809,000	843,000	--	U.S.S.R. 839,000.
Ferroalloys:				
Ferrochromium	NA	6,122	--	Sweden 3,275; West Germany 2,467.
Unspecified	6,496	3,407	--	West Germany 1,153; Belgium-Luxembourg 888; France 873.
Steel, primary forms[4]	36,000	20,000	--	NA.
Semimanufactures:[4]				
Bars, rods, angles, shapes, sections thousand tons	120	172	--	Poland 122; undetermined 39.
Universals, plates, sheets do	136	108	(3)	West Germany 21; Poland 10; undetermined 73.
Hoop and strip do	23	23	--	Yugoslavia 5; West Germany 2; undetermined 12.
Rails and accessories do	4	1	--	NA.
Wire do	3	3	(3)	Yugoslavia 2; West Germany 1.
Tubes, pipes, fittings do	16	16	(3)	West Germany 9; Austria 1; Japan 1.
Castings and forgings, rough do	18	12	--	Yugoslavia 2; Poland 1; undetermined 9.
Lead:				
Oxides	4,007	4,142	--	France 2,218; Austria 1,919.
Metal including alloys:				
Scrap	--	253	--	All from West Germany.
Unwrought[2] thousand tons	40	38	--	U.S.S.R. 20; Yugoslavia 8.
Semimanufactures	4	(3)	--	Mainly from Yugoslavia.
Magnesium: Metal including alloys:				
Scrap	--	(3)	--	All from West Germany.
Unwrought	(5)	254	--	All from France.
Semimanufactures	10	6	--	West Germany 5.
Manganese:				
Ore and concentrate, metallurgical-grade[2] thousand tons	525	480	--	U.S.S.R. 332; Brazil 94; India 16.
Oxides	21	(6)	(6)	
Metal including alloys, all forms	49	22	--	All from Sweden.
Mercury 76-pound flasks	1,363	2,001	--	All from Norway.
Metalloids:				
Silicon	NA	2,239	--	Norway 2,189; West Germany 50.
Unspecified	7,184	4,607	--	France 4,605.
Molybdenum:				
Ore and concentrate	533	716	--	Belgium-Luxembourg 677; West Germany 39.
Metal including alloys, all forms	8	11	(3)	All from United Kingdom.
Nickel: Metal including alloys:				
Unwrought[2]	7,919	8,347	--	U.S.S.R. 4,344; Cuba 1,891; United Kingdom 1,228.
Semimanufactures	51	43	--	West Germany 32; Netherlands 4; Switzerland 3.
Platinum-group metals: Metals including alloys, unwrought and partly wrought, unspecified value, thousands	$8,920	$1,793	--	United Kingdom $1,037; West Germany $668.
Silver: Metal including alloys, unwrought and partly wrought do	$26,411	$10,374	--	Yugoslavia $7,092; Spain $2,009; Netherlands $1,123.
Tin: Metal including alloys:				
Unwrought[2]	4,085	3,646	--	United Kingdom 1,046; Indonesia 899; Bolivia 892.
Semimanufactures	1	(3)	--	Mainly from West Germany and Switzerland.
Titanium:				
Ore and concentrate	400	--		
Oxides	893	678	--	West Germany 663; United Kingdom 15.
Metal including alloys, all forms	1	1	--	All from West Germany.
Tungsten:				
Ore and concentrate	248	52	--	All from Netherlands.
Metal including alloys, all forms	1	(3)	(3)	Mainly from United Kingdom.
Uranium and/or thorium: Metal including alloys, all forms value, thousands	--	$1	--	All from United Kingdom.

See footnotes at end of table.

Table 3.—Czechoslovakia: Apparent imports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981[p]	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Vanadium: Oxides and hydroxides value, thousands	NA	$25,756	--	Finland $25,468; Belgium-Luxembourg $288.
Zinc:				
Oxides	324	645	--	All from United Kingdom.
Metal including alloys:				
Unwrought[2] thousand tons	67	63	--	United Kingdom 14; Yugoslavia 13; U.S.S.R. 9.
Semimanufactures	6,040	7,772	--	Yugoslavia 6,322; Poland 1,449.
Other:				
Ores and concentrates	200,107	50,929	--	Norway 50,724; Netherlands 195.
Oxides and hydroxides	1,805	2,238	33	Sweden 1,294; Austria 799; West Germany 74.
Base metals including alloys, all forms	20	91	--	Austria 44; Finland 40; West Germany 6.
Nonferrous metals and alloys, rolled[2]	19,000	14,000	--	All from U.S.S.R.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	436	725	--	All from Italy.
Artificial: Corundum	1,923	1,524	--	Yugoslavia 1,492; West Germany 25.
Dust and powder of precious and semi-precious stones, including diamond value, thousands	$410	$260	$144	United Kingdom $116.
Grinding and polishing wheels and stones[7]	452	472	3	West Germany 270; Austria 144; United Kingdom 26.
Asbestos, crude[2]	46,197	49,195	--	U.S.S.R. 35,987; Canada 4,461; Botswana 1,858.
Barite and witherite	3,707	2,973	--	All from West Germany.
Boron materials:				
Crude natural borates	13,656	8,871	--	Netherlands 5,208; Italy 3,663.
Oxides and acids	2,153	1,751	--	France 1,523; West Germany 168; Italy 40.
Cement[2] thousand tons	534	58	--	East Germany 42; U.S.S.R. 12.
Chalk	1,552	1,603	--	Belgium-Luxembourg 843; France 606.
Clays and clay products:				
Crude:				
Bentonite	--	1,738	--	All from Hungary.
Chamotte earth	453	399	--	All from Poland.
Kaolin	4,774	5,060	--	Hungary 4,963; Netherlands 97.
Unspecified	3,540	400	--	West Germany 299; France 101.
Products:				
Nonrefractory	2,167	1,506	--	Italy 1,144; West Germany 323.
Refractory including nonclay brick	14,541	15,757	--	West Germany 6,613; Poland 4,332; Austria 1,190.
Diamond:				
Gem, not set or strung value, thousands	$817	$24	$1	Belgium-Luxembourg $22.
Industrial do	$3,405	$3,548	--	Belgium-Luxembourg $2,066; United Kingdom $1,147; Switzerland $327.
Diatomite and other infusorial earth	804	348	--	France 179; Austria 161.
Feldspar, fluorspar, related materials:				
Feldspar	NA	800	--	All from Yugoslavia.
Fluorspar	NA	150	--	All from West Germany.
Unspecified	1,995	1,563	--	Finland 1,113; France 431.
Fertilizer materials:				
Crude, n.e.s	--	8,916	--	Austria 8,896.
Manufactured:				
Ammonia	--	4,952	--	All from Hungary.
Nitrogenous, N_2 content[2] thousand tons	100	112	--	U.S.S.R. 110.
Phosphatic, P_2O_5 content[8] do	153	97	--	NA.
Potassic, K_2O content do	578	639	--	East Germany 471; U.S.S.R. 168.
Unspecified and mixed	2,206	15,174	--	Austria 15,144.
Graphite, natural	209	765	--	Japan 484; West Germany 213; Austria 45.
Gypsum and plaster[2] thousand tons	25	22	--	All from East Germany.
Halogens:				
Iodine	9	13	--	All from France.
Unspecified	40	6	--	All from Netherlands.
Lime	48	67	--	All from West Germany.
Magnesium compounds:				
Oxides and hydroxides	NA	461	--	France 312; West Germany 149.

See footnotes at end of table.

Table 3.—Czechoslovakia: Apparent imports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Magnesium compounds —Continued				
Other	[9]2,203	438	--	Austria 346; Greece 59; West Germany 30.
Mica:				
Crude including splittings and waste	270	195	--	All from France.
Worked including agglomerated splittings	34	33	--	Austria 27; Switzerland 5.
Nitrates, crude	992	NA		
Phosphates, crude P_2O_5 content[2] thousand tons	323	271	--	U.S.S.R. 159; Morocco 39; Tunisia 28.
Pigments, mineral: Iron oxides and hydroxides, processed	2,294	1,525	--	West Germany 1,259; Italy 156; United Kingdom 105.
Precious and semiprecious stones other than diamond:				
Natural value, thousands	$199	$61	--	West Germany $52; France $9.
Synthetic do	$51	$65	--	All from Switzerland.
Pyrite, unroasted	50	110	--	All from Italy.
Salt and brine	178,799	352,808	--	U.S.S.R. 314,189; West Germany 26,787.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassium peroxides	--	30	--	All from United Kingdom.
Sodium carbonate, natural and manufactured[2] thousand tons	287	171	--	East Germany 58; Romania 48; Bulgaria 43.
Sodium hydroxide	[8]100	[10]35	([10])	All from West Germany.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	16,976	14,218	--	Yugoslavia 11,497; Hungary 2,671.
Worked	[11]2,755	[11]490	--	Yugoslavia 447; Italy 33.
Dolomite, chiefly refractory-grade	253	197	--	All from West Germany.
Gravel and crushed rock	3,747	1,639	--	France 1,015; Yugoslavia 393; Denmark 90.
Limestone other than dimension	--	1	--	All from West Germany.
Quartz and quartzite	5,061	3,215	--	Do.
Sand other than metal-bearing[12]	1,900	1,023	--	West Germany 654; Hungary 333.
Sulfur:				
Elemental:				
Crude including native and byproduct[2] thousand tons	485	537	--	Poland 456; West Germany 32.
Colloidal, precipitated, sublimed	57	51	--	Italy 50.
Dioxide	446	632	--	All from West Germany.
Sulfuric acid[2]	66,258	42,122	--	U.S.S.R. 32,711; East Germany 9,411.
Talc, steatite, soapstone, pyrophyllite	262	317	--	Norway 121; West Germany 63; Austria 60.
Other:				
Crude	9,757	8,415	--	Hungary 7,236; West Germany 965; Finland 173.
Slag and dross, not metal-bearing	80	2,278	--	All from Austria.
Oxides and hydroxides of barium, magnesium, strontium	16	5	--	West Germany 3; France 2.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	NA	652	--	West Germany 458; Netherlands 153; Belgium-Luxembourg 22.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	70	44	--	All from West Germany.
Carbon: Carbon black[2]	36,406	31,878	--	U.S.S.R. 18,006; Romania 3,903; Austria 2,489.
Coal:[2]				
Anthracite and bituminous thousand tons	5,058	4,423	--	U.S.S.R. 3,273; Poland 1,086.
Lignite including briquets do	439	570	--	All from East Germany.
Coke and semicoke	360	[8]15,900	--	NA.
Gas, natural million cubic feet	294,099	301,729	--	All from U.S.S.R.
Hydrogen, helium, rare gases	5	[13]6	--	All from Yugoslavia.
Peat including briquets and litter	49	17	--	All from United Kingdom.
Petroleum and refinery products:				
Crude thousand 42-gallon barrels	[2]141,690	[8]135,975	--	Mainly from U.S.S.R.
Refinery products:				
Liquefied petroleum gas do	57	12	--	Austria 11.
Gasoline[6] do	3,417	3,647	--	NA.
Mineral jelly and wax do	11	11	--	West Germany 9; Hungary 1.
Kerosine and jet fuel do	68	93	--	West Germany 56; Greece 27.

See footnotes at end of table.

[P]Preliminary. NA Not available.

[1]Owing to the lack of official trade data published by Czechoslovakia, this table should not be taken as a complete presentation of this country's mineral trade. Unless otherwise specified, these data have been compiled from various sources, which include United Nations information, data published by the partner trade countries, and partial official trade sources of Czechoslovakia.

[2]Official trade statistics of Czechoslovakia.

[3]Less than 1/2 unit.

[4]Source for total imports only: Quarterly Bulletin of Steel Statistics, Europe, United Nations, New York.

[5]1980 imports were valued at $54,000.

[6]1981 imports were valued at $17,000, all of which came from the United States.

[7]Excludes quantity valued at $194,000 from 1980 and $182,000 in 1981.

[8]Statistical Yearbook of Member States of the Council for Mutual Economic Assistance, Moscow, U.S.S.R.

[9]Excludes exports from Canada valued at $17,000.

[10]Excludes exports from United States valued at $17,000.

[11]Excludes exports from Pakistan valued at $200,000 in 1980 and $472,000 in 1981.

[12]In addition, Hungary exported 267,544 cubic meters of construction sand in 1980 and 291,041 cubic meters in 1981.

[13]Excludes exports of 2,780 thousand cubic feet of rare gases from Austria.

COMMODITY REVIEW

METALS

Aluminum.—Czechoslovakia's aluminum reduction plant, with an estimated capacity of 60,000 tons per year, located at Ziar nad Hronom in Central Slovakia, operated on imported bauxite from Hungary and Yugoslavia. In 1982, total imports of bauxite amounted to 450,000 tons. The Bayer-process alumina plant also extracted gallium.

Antimony.—A new antimony installation, with a capacity of 2,000 tons per year, was put on a trial basis at Vazscora in Central Slovakia in April 1982. New equipment will process low-grade concentrates that are mainly byproducts of mercury production; the concentrates also contain copper, antimony, bismuth, mercury, and arsenic that are not recovered. In 1982, the enterprise was producing at the rate of 1,000 tons of antimony per year.

Copper.—Imports of copper metal from the U.S.S.R., the United Kingdom, and Poland supplied the main requirements of Czechoslovakia's industry. Copper consumption in Czechoslovakia was about 90,000 tons per year. In 1982, extraction of copper also continued in the stratiform Bohemian deposits at Zlate Hory and Tisova, as well as in Banska Stiavnica and other deposits in Slovakia. The main copper smelter, the Kropachy copper plant, located about 140 kilometers northeast of Bratislava in Slovakia, produced fire-refined and electrolytic copper. The Poverly copper plant, located near Teplice, produced copper and copper-alloy sheets and strips. The Rokycany copper plant near Pilzen produced copper-alloy sheets, strips, and some wire. The Strakonic copper plant, 60 kilometers southeast of Pilzen in Bohemia, produced copper and copper-alloy wire.

Gallium.—Production of gallium in Czechoslovakia at the Ziar nad Hronom facility was expected to increase to 15% of

the world total. Approximately 90% of output at Ziar was sold abroad. Gallium was a byproduct of treating bauxite.

Gold.—In mid-1982, miners started to drive a gallery at a gold mine in Psi Hory-Celina near Sedlcany to check the results of 3 years of exploration carried out in the region by Geoindustria, Prague. The deposit contained 2 to 3 grams of gold per ton of ore, and estimated ore reserves were 5 million tons, expected to yield to 12.5 tons of gold. Gold mining was to start in 1987. Geoindustria was also exploring around Celina, particularly at Mokrsko where the gold content was slightly lower than at Celina.

Iron and Steel.—Mining of iron ore, mainly siderite, continued at the Rudnany, Nina Slana, and other deposits in Slovakia, but the main steel production was based on imported U.S.S.R. iron ore. The production of steel in 1982 was slightly below the 1981 level. The rate of growth of steel production in Czechoslovakia was to be cut back severely over the next 10 to 15 years, because of fuel shortages, rising only 2.3% per year in 1981 to 1985 and 1.3% in 1986 to 1990. The new coke oven battery at the Trinec iron and steel plant, near Ostrava, went into operation, and a new 200-ton oxygen converter was under construction. At the East Slovak iron and steel complex at Kosice, a 1-million-ton-per-year, U.S.S.R.-built continuous casting machine came onstream, and the converter and coking battery were overhauled.

Renovation and expansion of the new Klement Gottwald steel plant continued. A large coking battery, designed by the U.S.S.R., with a capacity of 1 million tons per year, was put into operation in 1981 and replaced three older batteries. A new 1-million-ton-per-year rolling mill costing Kcs5 billion was under construction in 1982. When completed in 1984, it will replace eight obsolete mills at other enterprises. A general overhaul of the fourth blast furnace was also completed at the plant in November at a cost of more than Kcs500 million. This 80-meter-high, 1,260-cubic-meter furnace was expected to produce 2,000 tons of pig iron per day. The Klement Gottwald plant was the country's biggest industrial enterprise and was producing annually about 3 million tons of coke, almost the same amount of pig iron, 3.7 million tons of steel, and 2.5 million tons of rolled products.

A new billet and logging mill came onstream at the Poldi steelworks in Kladno. The plant was producing annually about 1.8 million tons of special steels and rolled stock. After an 8-month general overhaul and modernization at a cost of Kcs180 million, a 450-millimeter, medium-section rolling mill was put into operation at the Vitkovice iron and steel plant in August 1982.

Lead and Zinc.—The Pribram deposit was exhausted, but mining of lead-zinc ore continued at Horni Benesov in Moravia, Kutna Hara, and Stare Ransko in Bohemia and Banska Stiavnica in Slovakia. Reserves of lead and zinc ore in the recently discovered deposits near Banska Stiavnica were estimated at approximately 50 million tons. In 1982, Czechoslovakia imported zinc mainly from the United Kingdom, Yugoslavia, and the U.S.S.R., and imported lead from the U.S.S.R.

Mercury.—In 1985, extraction of up to 50,000 tons of mercury ore was to begin near Presov, Czechoslovakia. A plant for concentrating the ore was to be built at the site, and the concentrate was to be transported to the processing plants of the Rudne Bane Banska Bystrica National Corp.

Molybdenum.—Deposits of molybdenite (MoS_2) were discovered at the Cista granodiorite massif in West Bohemia. The molybdenite formed a mineralized zone in biotite granite. The deposits reached a thickness of up to 10 meters with an average Mo content of 0.1% to 0.2%. Reserves of molybdenum ore in the operating mine at Hurkz-center amounted to 3 million tons.

Tin and Tungsten.—Cassiterite, SnO_2, and wolframite, (FeMn) WO_4, continued to be supplied from the Horni Slovakov (West Bohemia) and Cinovek (North Bohemia) deposits. New exploration and prospecting for tin and tungsten were proceeding successfully, particularly at the Hnilic-Medvedi Brook deposits in the West Carpathians.

NONMETALS

Fluorite.—Production of fluorite was concentrated in the Ore Mountains (North Bohemia) from several deposits. One flotation plant, at Sobedruhy, near Teplice, was producing fluorite concentrate. The process included separation of pyrite by flotation, followed by a two-stage separation of fluorite from barite, quartz, and other minerals. The fluorite concentrate contained 95% calcium fluoride. In 1982, 25,000 tons of fluorite was imported from Mongolia through the Mongolczechoslovak joint metal enterprise.

Kaolin.—Czechoslovakia was the world's fourth largest producer of kaolin, after the

United States, the United Kingdom, and the U.S.S.R. In 1982, about 350,000 tons of kaolin was exported, mainly to the Federal Republic of Germany, Poland, Austria, and Yugoslavia.

The largest kaolin deposits were located in Western Bohemia in the Karlovy Vary area and near Plzen, Podborang, and Znojmo. Reserves of the highest quality type of kaolin in the Karlovy Vary area were limited; however, deposits of kaolin that were not presently worth exploring, and contained high amounts of iron and titanium, would provide an exceptionally wide basis of raw materials if a proper treatment method was available. Kaolin for the paper industry was processed at Kuznejov.

Salt.—Czechoslovakia consumes about 100,000 tons of table salt per year. Its only domestic deposits were located in Eastern Slovakia, where known deposits of salt were estimated at 1,700 million tons. The mining enterprise at Presov produces 40,000 tons of table salt annually, but plant expansion was to increase salt production in 1984 to 65,000 tons.

MINERAL FUELS

In 1982, total primary energy production from fossil fuels and hydroelectric and nuclear generation in Czechoslovakia was 68 million tons of standard coal equivalent (SCE), including coal, 63 million tons; natural gas, 1 million tons; nuclear energy, 1.9 million tons; and hydroelectric energy, 1.4 million tons. Total primary energy consumption was 103.4 million SCE, and net imports, 35.4 million.

Plans call for nuclear power to account for about two-thirds of generating capacity to be installed by 1990. Installed nuclear generating capacity was to reach 3,520 megawatts, about one-sixth of total capacity, by 1985. This comprises 880 megawatts in block 1 at Jaslovskie Bohunice, in West Slovakia, completed in 1980; 880 megawatts in block 11 at Jaslovskie Bohunice to be completed in 1985; and 1,760 megawatts, in two 880-megawatt blocs, at Dukovany, in Southern Moravia, scheduled for completion in 1985. Construction by 1990 was to include 1,760 megawatts at Mochavce, Central Slovakia, and five 1,000-megawatt units at Mochavce, Malovice, and Temelin.

Coal.—About 85% of Czechoslovak hard-coal reserves were located in Ostrava-Karvina in Northern Moravia, the southernmost part of the Silesian Coalfield. About 75% of the reserves were coking coal. Proven reserves could sustain production at the 1980 level of 24.2 million tons for an estimated 80 years, but only if the industry is able to develop improved technology for mining at depths greater than 1,000 meters. In 1982, the Ostrava Karvina Coalfield accounted for 87% of total hard-coal production. Several exhausted mines were closed and replaced by new ones to maintain production. Coal mining conditions in the basin continued to be very difficult. Production of high-quality coking coal started recently at the Darkov Mine, in the area east of Ostrava-Karvina with projected capacity of 20,000 tons of coal per day. In the future, the center of mining will move to the south, as large reserves of coal have been discovered in the Beskydy Mountains. Bituminous coal deposits were also located at Kladno in Central Bohemia, west of Prague, at Plzen and Rosice. The output at the Kladno mining district accounted for about 8% of the total bituminous coal production. The recently discovered Slany deposits near Kladno were estimated to contain 150 million tons. Development of the Slany Mine, with a shaft diameter of 8.5 meters and a projected depth of 1,300 meters, started in 1982 after 4 years of preparations.

Czechoslovakia was forced to emphasize development of brown coal, mainly for use in power generation, heating, briquets, and manufactured gas. About 70% of brown coal production came from an area roughly 850 square kilometers in extent in North Bohemia, running from Kadan to Usti on Laben; about 20% was mined in the Sokalov district of Western Bohemia.

Production of lignite in the North Bohemia district was about 68 million tons. Priority investments were for development of six major opencast mines and reconstruction of two others, relocation of highways and railroad lines, and supply of excavators, conveyor belts, and machinery for strip mining operations. The principal problem in the lignite area was an increasing amount of overburden. In 1982, the large 6-million-ton-annual-capacity Vrsany surface mine, near Most went into operation and produced 600,000 tons of brown coal; the mine was to supply coal to the Pocerdany electric powerplant.

Gas.—Czechoslovakia was almost completely dependent on gas supplies from the U.S.S.R. Gas imports from the U.S.S.R. amounted to 300 billion cubic feet; the same quantity was to be imported in 1983. Czechoslovakia was expected to receive an

additional 106 to 140 billion cubic feet of gas annually in payment for investment in a new transit pipeline to carry natural gas from the Yamal pipeline to Western Europe. The Czechoslovakia section of the pipeline, linking the Urengoi natural gas deposit in Siberia with Western Europe, will be 860 kilometers long and will run parallel to the existing oil pipeline. It will lead from Velke Kapusany on the U.S.S.R.-Czechoslovak border to Rozvodov on the Czechoslovak-West German border. Because of the pipe's large diameter of 1.42 meters, only three new large compressor stations in Velke, Kapusany, Breslav, and Lveseli nad Lucnici, with total size to 175 megawatts will be needed. The entire pipeline, including the compressor stations, was to be started by 1983 and be in full operation by the end of 1988, carrying 950 billion cubic feet per year. The investment should be returned in 8 years. In 1982, about 3 billion cubic feet of natural gas was extracted in East Slovakia; main gas deposits were in Moravia.

Petroleum.—Crude oil was produced in Czechoslovakia in small quantities, equalling about 0.4% of the country's consumption. Imports of crude oil from the U.S.S.R. reached an estimated 114 million barrels in 1982, and approximately the same amount was scheduled for imports in 1983.

Czechoslovakia was reportedly negotiating for oil deliveries from Iraq, Libya, and Algeria, to be shipped in 1983 through the Adria pipeline; quantities were uncertain but estimated at 30 million barrels. The country's oil deposits and crude oil production were located in the Vienna Basin at the border between Southern Moravia and Western Slovakia. The Moravian state oil enterprise at Hodonin was prospecting for new natural gas and crude oil deposits. In 1982, the enterprise drilled about 120,000 meters, aiming to prepare 406 million cubic feet of natural gas and 19,000 barrels of crude oil for extraction by 1985. Some promising oil deposits were discovered at a depth of 6,500 meters. The new refinery for the processing of U.S.S.R. crude continued under construction at Litvinov in North Bohemia. The new refinery was to process 62,000 tons of oil per day. The first stage of the refinery had been tested in July 1981.

Uranium.—In December 1982, the Government uranium prospecting enterprise completed the boring of 600 meters of prospecting shafts in the Iron Mountains in Bohemia. Uranium mining operations continued at Hamar-na-Jezere. A team of 20 miners at the Hamar No. 1 Mine, east of Ceska Lipa in North Bohemia, working at a depth of 200 meters, produced 10,000 cubic meters of ore in 31 working days.

The Mineral Industry of Denmark and Greenland

By Joseph B. Huvos[1]

DENMARK

In 1982, the Danish economy improved, inflation and interest rates were lower, and the balance-of-payments deficit at current prices was smaller. Denmark's gross national product was about $56 billion,[2] a 13% increase in real terms. Inflation was 10.1%, and unemployment was 9.7%.

Denmark had few known mineral resources of its own and continued to import most fuels and minerals. Mineral production included some oil and gas in the North Sea, and some industrial minerals.

The Government's Raw Materials Act of 1977 continued in force. As a consequence, taxes were levied on exploited or imported raw materials, and also on goods manufactured therefrom. The tax rate in 1982 was $0.042 per cubic meter of material used, but on July 1, 1983, the tax will be raised to $0.06 per cubic meter. In 1981, taxes of $1.2 million were collected on minerals, excluding salt and oil taxes.

Important events in the mineral industry of Denmark in 1982 included doubling of crude oil production in the North Sea, acquisition of a scrap company by Denmark's only steelmaker, disinvestment by Denmark's only fertilizer maker of its foreign ammonia interests, and the resumption of Danish aluminum scrap exports.

[8]Partial figures; excludes an unreported quantity of quartz and quartzite.

TRADE

After 1982, North Sea hydrocarbon production was expected to generate a positive change of about $2 billion in Denmark's trade balance. In 1982, the United States was Denmark's major steam coal and coke supplier with about one-third of the total. U.S. mineral imports from Denmark remained insignificant.

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Tin:				
Ore and concentrate	24	--		
Metal including alloys:				
Scrap	244	(3)	--	All to West Germany.
Unwrought	484	410	--	Netherlands 138; Norway 110; United Kingdom 45.
Semimanufactures	23	134	(3)	Norway 52; Austria 34; Iraq 34.
Titanium: Oxides	746	574	--	Sweden 345; United Kingdom 100; West Germany 81.
Tungsten: Metal including alloys, all forms	6	17	--	West Germany 10; Sweden 6.
Zinc:				
Ore and concentrate	301	615	--	Norway 398; Sweden 118.
Oxides	7	39	--	Malta 15; United Kingdom 13; Qatar 3.
Metal including alloys:				
Scrap	3,387	3,772	--	West Germany 2,590; East Germany 830; Norway 174.
Unwrought	926	165	--	West Germany 39; Greece 37; Bahrain 26.
Semimanufactures	289	326	--	West Germany 235; Saudi Arabia 26; Norway 21.
Other:				
Ores and concentrates	442	521	--	Norway 398; Sweden 109.
Oxides and hydroxides	62	39	--	Japan 14; Iceland 9; United Kingdom 7.
Ashes and residues	5,607	6,675	--	West Germany 2,289; United Kingdom 2,182; Norway 1,727.
Base metals including alloys, all forms	82	7	(3)	Colombia 2; West Germany 2; Norway 1.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	10	14	--	West Germany 8; France 3.
Artificial: Corundum	--	2	--	Italy 1.
Grinding and polishing wheels and stones	1,310	1,548	1	Ethiopia 521; Iran 360; Egypt 154.
Asbestos, crude	48	12	--	West Germany 11; Japan 1.
Barite and witherite	15	36	--	Iceland 12; West Germany 10; Bahrain 9.
Boron materials:				
Crude natural borates	5	5	--	Iceland 4.
Oxides and acids	42	261	--	Sweden 226; Norway 35.
Cement	279,055	374,187	52,166	Venezuela 136,299; Sweden 47,045; Israel 38,620.
Chalk	15,300	21,903	--	Sweden 8,245; Norway 4,624; West Germany 189.
Clays and clay products:				
Crude, unspecified	1,845	2,261	6	Sweden 751; Iran 500; Norway 345.
Products:				
Nonrefractory	88,591	94,481	533	West Germany 73,682; Sweden 10,018; Norway 5,687.
Refractory including nonclay brick	35,500	31,796	434	West Germany 5,015; United Kingdom 4,512; Norway 3,015.
Cryolite and chiolite	22,678	18,321	NA	NA.
Diamond:				
Gem, not set or strung value, thousands	$69	$306	--	Belgium-Luxembourg $171; Switzerland $91; Sweden $20.
Industrial do	$9	$10	--	Switzerland $6; Belgium-Luxembourg $4.
Diatomite and other infusorial earth	56,270	60,027	10	West Germany 22,583; Netherlands 11,789; Switzerland 8,487.
Feldspar, fluorspar, related materials:				
Unspecified	2	2	NA	NA.
Fertilizer materials:				
Crude, n.e.s	324	93	--	All to Sweden.
Manufactured:				
Ammonia	464	439	--	Sweden 362; West Germany 23; Greenland 19.
Nitrogenous	641	68	--	West Germany 29; Iceland 11; Greenland 10.
Phosphatic	105,117	91,192	--	Sweden 214; unspecified 90,937.
Potassic	7	5,004	--	Finland 5,003.
Unspecified and mixed	136,673	189,412	--	Ireland 2,667; Sweden 771; unspecified 185,486.

See footnotes at end of table.

Table 2.—Denmark: Exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Graphite, natural	7	17	--	West Germany 14; Saudi Arabia 2.
Gypsum and plaster	168	956	--	Libya 681; West Germany 130; Sweden 96.
Halogens:				
Chlorine	100	100	--	Iceland 93; West Germany 3.
Unspecified	3	4	--	Ghana 2.
Lime	8,426	6,688	(3)	Norway 3,017; Greenland 1,481; Finland 978.
Magnesium compounds: Magnesite	78	78	--	Indonesia 72; Saudi Arabia 2; Sweden 2.
Mica:				
Crude including splittings and waste	29	12	--	Switzerland 6; Japan 4; Finland 2.
Worked including agglomerated splittings	1	1	--	Mainly to Sweden.
Phosphates, crude	--	2	--	All to Sweden.
Pigments, mineral: Iron oxides and hydroxides, processed	125	226	5	Sweden 57; Finland 45; West Germany 38.
Precious and semiprecious stones other than diamond:				
Natural value, thousands	$89	$387	$1	United Kingdom $224; Norway $51; Sweden $27.
Synthetic do.	$5	$11	--	Sweden $7; West Germany $1; Norway $1.
Salt and brine	45,904	121,021	121	Sweden 61,518; Finland 26,737; Norway 19,473.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	8	23	--	Saudi Arabia 7; Iceland 3; undetermined 10.
Sodium carbonate, natural and manufactured	171	--		
Sodium hydroxide	2,417	14,916	--	Sweden 5,398; West Germany 4,513; Netherlands 2,107.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	67,959	38,691	--	West Germany 38,493; Sweden 97; Norway 50.
Worked	7,641	8,564	1	West Germany 7,819; Netherlands 185; Sweden 175.
Dolomite, chiefly refractory-grade	262	167	--	Iceland 65; United Kingdom 55; Saudi Arabia 20.
Gravel and crushed rock thousand tons	1,184	1,013	--	West Germany 991; Sweden 13.
Limestone other than dimension	73,925	113,012	--	West Germany 65,278; Sweden 33,065; Norway 9,677.
Quartz and quartzite	226	93	--	Sweden 43; West Germany 24.
Sand other than metal-bearing	162,780	129,713	--	Sweden 100,184; West Germany 10,439; Finland 9,575.
Sulfur:				
Elemental:				
Crude including native and by-product	51	212	--	Sweden 170; West Germany 41.
Colloidal, precipitated, sublimed	--	24	--	All to Sweden.
Sulfuric acid	16,245	360	--	Norway 166; Sweden 96; Iceland 34.
Talc, steatite, soapstone, pyrophyllite	68	163	--	West Germany 80; Saudi Arabia 24; Yugoslavia 17.
Other:				
Crude	1,236	1,359	--	West Germany 1,221; Greenland 65; Norway 37.
Slag and dross, not metal-bearing	31,831	31,084	--	France 10,900; Norway 9,458; West Germany 7,252.
Oxides and hydroxides of barium, magnesium, strontium	3	6	--	Switzerland 5; Iceland 1.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	8,804	17,713	--	United Kingdom 5,054; Sweden 3,092; Norway 2,604.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	1,073	190	--	West Germany 76; Sweden 66.
Carbon: Carbon black	33	241	--	Greenland 132; Norway 26; West Germany 24.
Coal:				
Anthracite and bituminous	4,103	3,116	--	Greenland 2,150; Netherlands 931.
Briquets of anthracite and bituminous coal	1	2	--	All to Iceland.
Lignite including briquets	27	--		

See footnotes at end of table.

Table 2.—Denmark: Exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
MINERAL FUELS AND RELATED MATERIALS —Continued				
Coke and semicoke	56,980	40,565	--	Sweden 24,868; Norway 12,907; West Germany 2,057.
Peat including briquets and litter	2,654	1,876	--	Norway 857; United Kingdom 239; Netherlands 225.
Petroleum refinery products:				
Liquefied petroleum gas thousand 42-gallon barrels	141	85	(3)	Sweden 84.
Gasoline do	3,520	3,784	--	Sweden 3,077; United Kingdom 338; Netherlands 139.
Mineral jelly and wax 42-gallon barrels	5,241	5,163	--	Sweden 3,534; United Kingdom 442; Finland 307.
Kerosine and jet fuel do	14,337	3,836	5	Norway 85; Saudi Arabia 54; Portugal 47.
Distillate fuel oil thousand 42-gallon barrels	6,645	4,637	5	Sweden 3,296; West Germany 449; Netherlands 329.
Lubricants do	208	145	(3)	Norway 95; Sweden 13; Greenland 10.
Residual fuel oil do	1,194	496	19	United Kingdom 222; Iceland 127; Norway 64.
Bitumen and other residues do	444	621	--	Sweden 299; Norway 169; Finland 137.
Bituminous mixtures 42-gallon barrels	13,653	10,738	--	Sweden 2,854; West Germany 2,648; Greenland 1,679.
Petroleum coke do	2,728	--		
Tars and other crude chemicals derived from coal, gas, and petroleum	22,306	24,973	--	Norway 10,691; West Germany 6,444; Sweden 4,474.

NA Not available.
[1]Includes Faroe Island.
[2]May include other precious metals.
[3]Less than 1/2 unit.

Table 3.—Denmark: Imports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals: Unspecified	263	316	1	West Germany 310; France 5.
Aluminum:				
Ore and concentrate	90,554	68,507	29	Suriname 40,432; China 20,249; India 4,945.
Oxides and hydroxides	4,018	5,057	1,047	United Kingdom 1,999; West Germany 1,806; Jamaica 62.
Metal including alloys:				
Scrap	2,269	2,623	--	West Germany 1,534; Sweden 706; Norway 361.
Unwrought	21,935	18,566	--	Norway 10,127; West Germany 2,546; United Kingdom 2,366.
Semimanufactures	59,030	53,533	399	West Germany 12,742; Norway 8,171; Sweden 6,248.
Beryllium: Metal including alloys, all forms	1	1	(2)	Mainly from West Germany.
Chromium:				
Ore and concentrate	200	346	100	West Germany 221; Finland 25.
Oxides and hydroxides	370	353	1	West Germany 312; Italy 38.
Cobalt: Oxides and hydroxides	5	6	--	United Kingdom 4; Canada 2.
Columbium and tantalum: Metal including alloys, all forms, tantalum value, thousands	$18	$31	$6	United Kingdom $12; Austria $7; Switzerland $4.

See footnotes at end of table.

Table 3.—Denmark: Imports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Copper:				
Matte and speiss including cement copper	--	8	--	All from Belgium-Luxembourg.
Metal including alloys:				
Scrap	3,124	5,280	129	United Kingdom 1,517; West Germany 1,340; France 966.
Unwrought	3,686	2,183	8	Belgium-Luxembourg 1,252; Sweden 317; Yugoslavia 197.
Semimanufactures	35,211	26,895	83	West Germany 8,368; Sweden 6,233; Belgium-Luxembourg 4,941.
Iron and steel:				
Iron ore and concentrate:				
Excluding roasted pyrite	3,345	127,226	--	Sweden 127,222.
Pyrite, roasted	16,288	18,928	--	Norway 18,884; West Germany 23.
Metal:				
Scrap	216,796	180,077	--	United Kingdom 103,583; West Germany 36,292; U.S.S.R. 21,166.
Pig iron, cast iron, related materials	43,607	51,467	24	West Germany 21,831; Sweden 15,863; Spain 4,727.
Ferroalloys:				
Ferromanganese	6,258	3,698	--	Norway 3,672; West Germany 25.
Unspecified	11,302	6,998	17	Norway 4,923; United Kingdom 606; Sweden 454.
Steel, primary forms	114,113	123,990	--	Finland 29,692; Norway 28,986; West Germany 26,270.
Semimanufactures:				
Bars, rods, angles, shapes, sections	306,414	285,009	422	West Germany 97,059; Sweden 54,639; Belgium-Luxembourg 29,781.
Universals, plates, sheets	716,756	655,980	64	West Germany 250,028; Sweden 66,091; Finland 58,738.
Hoop and strip	56,868	49,455	16	West Germany 29,743; Sweden 7,949; Finland 3,820.
Rails and accessories	12,952	17,283	--	West Germany 8,523; France 5,238; Austria 2,839.
Wire	30,792	29,090	25	Belgium-Luxembourg 11,924; West Germany 9,336; Sweden 5,127.
Tubes, pipes, fittings	183,664	291,220	82	West Germany 134,958; France 60,211; United Kingdom 26,411.
Casting and forgings, rough	6,459	4,482	--	West Germany 2,028; Norway 1,025; Sweden 350.
Lead:				
Oxides	547	647	27	West Germany 309; East Germany 160; France 93.
Metal including alloys:				
Scrap	16,546	18,161	515	Norway 4,613; United Kingdom 3,690; West Germany 3,011.
Unwrought	6,523	3,572	(2)	West Germany 1,365; Sweden 809; Finland 377.
Semimanufactures	3,956	3,482	(2)	West Germany 3,367; France 52; United Kingdom 34.
Magnesium: Metal including alloys:				
Scrap	--	24	--	All from Sweden.
Unwrought	113	34	--	Norway 32; West Germany 1.
Semimanufactures	87	61	26	West Germany 16; Switzerland 10; United Kingdom 4.
Manganese:				
Ore and concentrate, metallurgical-grade	819	611	--	Netherlands 296; West Germany 164; Gabon 150.
Oxides	2,086	1,616	8	Belgium-Luxembourg 1,215; Greece 140; China 114.
Mercury 76-pound flasks	290	261	29	Netherlands 58; Sweden 58; U.S.S.R. 29.
Metalloids: Unspecified	853	792	(2)	Norway 465; France 195; West Germany 64.
Molybdenum: Metal including alloys, all forms	6	5	(2)	France 2; West Germany 2; Austria 1.
Nickel:				
Matte and speiss	21	5	--	All from United Kingdom.
Metal including alloys:				
Scrap	4	15	--	Norway 14.
Unwrought	179	116	--	Finland 47; United Kingdom 34; Sweden 18.
Semimanufactures	213	137	6	West Germany 76; United Kingdom 19; Finland 14.

See footnotes at end of table.

Platinum-group metals: Metal including alloys, unwrought and partly wrought, unspecified ____ value, thousands__	$6,833	$6,938	$83	Netherlands $2,937; West Germany $1,840; Switzerland $1,387.
Silver:				
Waste and sweepings[3] _____do____	$1,521	$573	$1	Sweden $451; Finland $90; Netherlands $22.
Metal including alloys, unwrought and partly wrought _____do____	$35,744	$12,814	$23	United Kingdom $4,394; West Germany $2,879; Netherlands $1,947.
Tin: Metal including alloys:				
Scrap _____	249	143	__	West Germany 49; Singapore 36; Norway 18.
Unwrought _____	246	110	__	China 20; Thailand 20; Malaysia 15.
Semimanufactures _____	74	42	__	West Germany 20; United Kingdom 12; Netherlands 6.
Titanium: Oxides _____	5,821	6,134	29	Norway 2,211; United Kingdom 1,650; Italy 1,159.
Tungsten: Metal including alloys, all forms _____	15	5	(2)	Sweden 2; Austria 1; West Germany 1.
Uranium and/or thorium:				
Ore and concentrate value, thousands__	$85	$11	__	All from Netherlands.
Metal including alloys, all forms do____	$12	$8	__	West Germany $6; United Kingdom $2.
Zinc:				
Ore and concentrate _____	__	5	__	All from Sweden.
Oxides _____	2,802	2,334	(2)	West Germany 1,596; Norway 294; United Kingdom 149.
Metal including alloys:				
Scrap _____	101	128	__	Sweden 117; United Kingdom 11.
Unwrought _____	17,024	14,246	4	Norway 5,813; Finland 5,287; Netherlands 1,981.
Semimanufactures _____	4,949	4,913	3	France 2,527; Norway 942; West Germany 893.
Other:				
Ores and concentrates _____	147	675	__	Finland 575; Norway 66; Sweden 30.
Oxides and hydroxides _____	691	944	(2)	West Germany 522; Belgium-Luxembourg 175; United Kingdom 71.
Ashes and residues _____	7,471	7,755	676	United Kingdom 4,014; West Germany 1,373; Norway 451.
Base metals including alloys, all forms	69	64	8	Sweden 16; Belgium-Luxembourg 11; West Germany 9.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc _____	40,061	22,005	14	Iceland 21,231; Netherlands 463; West Germany 206.
Artificial, corundum _____	477	561	__	West Germany 402; Netherlands 137; Spain 20.
Dust and powder of precious and semiprecious stones, including diamond value, thousands__	$238	$231	$62	Switzerland $158; West Germany $5.
Grinding and polishing wheels and stones _____	1,124	1,012	8	West Germany 360; Austria 272; Sweden 160.
Asbestos, crude _____	13,713	5,136	__	Canada 5,022; West Germany 85; Belgium-Luxembourg 25.
Barite and witherite _____	12,461	16,951	__	Netherlands 14,902; United Kingdom 1,238.
Boron materials:				
Crude natural borates _____	5,414	5,154	4,519	Belgium-Luxembourg 390; West Germany 145.
Oxides and acids _____	350	388	104	France 178; Italy 88; West Germany 12.
Cement _____	6,812	32,572	1	West Germany 17,432; Poland 13,157; France 617.
Chalk _____	9,967	15,073	2	West Germany 11,157; France 2,539; Sweden 919.
Clays and clay products:				
Crude, unspecified _____	50,796	47,568	829	United Kingdom 33,294; West Germany 9,387; Netherlands 1,603.
Products:				
Nonrefractory _____	61,668	40,302	__	West Germany 17,772; Italy 10,172; Spain 3,445.
Refractory including nonclay brick _____	29,718	20,194	140	West Germany 12,083; Austria 3,414; United Kingdom 1,658.

[1]Includes Faroe Island.
[2]Less than 1/2 unit.
[3]May include other precious metals.

COMMODITY REVIEW

Metals.—*Aluminum.*—Exports of aluminum scrap and waste from Denmark to non-European Economic Community countries were again permitted by the Government. In the meantime, exports were halted in November and December because scrap shortages had forced the Danish aluminum scrap processing industry to operate at only about 60% of capacity. There is no primary aluminum industry in Denmark.

Iron and Steel.—Det Danske Stalvalservaerk A/S (DDS), Denmark's only major steelmaker, operated at a moderate profit. In 1981, the Government had taken a 30% equity share in the company, which had previously been entirely privately owned. Most of the plant's equipment was new, including two 200-ton electric arc furnaces supplied by Mannesmann Demag AG. In addition, oxygen-fuel burners were installed to increase the furnace's capacity, and new water-cooled panels made it possible to supply the local community of Frederiksvaerk with hot water for district heating.

To improve DDS's scrap supply, DDS acquired a one-third stake in Uniscrap A/S, Denmark's biggest scrap concern. Uniscrap had been formed years earlier from Levin Jern Metal A/S and Peterson & Albeck A/S.

Nonmetals.—*Ammonia.*—Superfos A/S pulled out of its Brunsbüttel, Federal Republic of Germany, ammonia plant by taking a $43 million writeoff against its 1982 accounts, after the plant had accumulated a $69 million loss since 1978. As part of the disinvestment deal, Superfos has agreed to buy ammonia from the Brunsbüttel plant for 5 years.

Industrial Minerals.—According to the Geological Survey of Denmark, a number of industrial minerals were produced again in 1982, including sand, gravel, pebbles, and stone estimated at 22.7 million cubic meters. There were 939 gravel pits on land with a production of about 19.9 million cubic meters, and 2.7 million cubic meters were produced from offshore. Production of chalk and limestone was estimated at 2.7 million cubic meters; clay, 0.8 million cubic meters; rockwool and expanded clay, about 300,000 cubic meters; and peat, 376,000 cubic meters. Production of granite, sandstone, and slate was about 365,000 cubic meters.

Mineral Fuels.—In 1982, Denmark was 90% dependent on imported fuels, increasingly consisting of coal and coke because of oil-to-coal conversion, while the use of oil continued to decrease. It was expected that North Sea hydrocarbon production will generate a positive change in the trade balance of up to $2 billion before 1986.

Table 4.—Denmark and Greenland: Supply and apparent consumption of fuels and power

In 1982, crude oil production on the Danish Continental Shelf almost doubled at the two commercial oilfields, Dan and Gorm, of the Dansk Undergrunds Consortium (DUC).

Actual oil production at Dan decreased to 5,400 barrels per day in 1982 from 5,900 barrels per day in 1981. Gorm production increased during the same period from 9,000 barrels per day to 28,200 barrels per day. This included oil from Skjøld, which

came onstream in November 1982. Skjøld used Gorm production facilities and its output may reach 3,000 barrels per day in 1983.

There was a significant increase in exploratory drilling offshore as five exploratory wells were drilled in 1982 compared with one in 1981, because of the enlargement of DUC's drilling rig fleet to five. Three exploration rigs obtained disappointing results in the Jens-1 and Mona-1 wells. The remaining two rigs drilled production wells in the Tyra Gasfield, which was scheduled to start up gas deliveries from 36 wells in October 1983. Dansk Olie og Naturgas A/S's gas pipeline has already been laid for this purpose, as has an oil pipeline from Gorm.

GREENLAND

PRODUCTION AND TRADE

In 1982, some lead and zinc concentrates and cryolite were the only mineral products of Greenland, the world's largest island, located in the Arctic Ocean.

Greenland was still debating how to leave the European Economic Community (EEC), but the EEC continued to award funds for a number of Greenland projects. Projects funded included study of phosphates in two major carbonatite deposits on the west coast, a joint project by the Institute of Geological Sciences and the Warren Springs Laboratories, both from the United Kingdom, and exploration of a new columbium-tantalum deposit in southern Greenland by the Technische Universität in Berlin. Both projects are to be in cooperation with the Geological Survey of Greenland. Further EEC funds were earmarked for the Nordisk Mineselskab A/S drilling projects for delineating vein-type tungsten and antimony mineralization in Central East Greenland.

COMMODITY REVIEW

Metals.—*Lead and Zinc.*—Greenex A/S discovered a moderately large high-grade sulfide ore body near the Black Angel Mine in Marmorilik. The company plans to mine the deposit for the next 6 years in summer only.

Tungsten.—Nordisk Mineselskab A/S has finished an EEC supported 3-year field exploration project on tungsten and antimony mineralized veins in the Proterozoic of Eastern Greenland and found promising occurrences. Drilling is to follow.

Nonmetals.—*Cryolite.*— Kriolitselskabet Øresund A/S has announced that the cryolite pit at Ivigtut, southeast Greenland, is to be reopened to quarry the remaining low-grade crude ore, which was considered uneconomic when the pit was closed in 1962. This extends availability of raw materials for the refining plant in Copenhagen.

Graphite.—Kryolitselskabet Øresund A/S has decided to explore the long-known crystalline graphite deposit south of Egedesminde-Aasiaat on the Akuliaruseq Peninsula. The deposit is close to waters that are open year-round. Its development was abandoned after World War I.

Mineral Fuels.—*Coal.*—The Raw Materials Administration of the Ministry for Greenland has commissioned a prefeasibility study for mining coal in Greenland for domestic use only on a scale of 150,000 tons per year. So far negotiations between the Greenland-Danish official representatives and Arco Greenland concerning an exploration permit for Jameson Land just north of Scoresundby-Illoqqortookmiut have not led to a commitment from the oil company to carry out seismic survey and drilling. Besides climatic difficulties, environmental regulations reduce the profitability of any project in the area.

Uranium.—The Danish Energy Ministry financially supported the south Greenland uranium exploration program of the Geological Survey of Greenland. Fieldwork was centered around the Igaliko batholith, a complex alkaline intrusion of late Archean age. A columbium-rich microsyenite has attracted special attention.

The Mineral Industry of Egypt

By Peter J. Clarke[1]

The rapid economic growth that Egypt experienced from the early 1970's through 1981 leveled off rather abruptly in 1982, as a result of the declining value of petroleum exports. Annual growth in the gross domestic product (GDP) had averaged 8% to 9% between 1975 and 1981 but increased by only 5% to $32.5 billion in 1982.[2] Mining and industry contributed about 15% of the GDP, with the primary mineral commodities being petroleum, phosphate rock, fertilizer, aluminum, iron and steel, salt, clays, and construction materials.

In 1982, Egypt's petroleum surplus (exports minus imports) actually declined, from $2.76 billion in 1981 to $2.43 billion in 1982. Even with moderate increases in foreign remittances, Suez Canal receipts, and tourism revenues, Egypt's increasing level of total imports resulted in a $4.2 billion merchandise trade deficit and a $2.4 billion current account deficit.

The Egyptian Government was strongly emphasizing development of the industrial and agricultural sector in order to restore economic health to the country. Also of primary importance was the reduction of the Government's excessive $5.7 billion budget deficit, mainly through cutting back on the expensive subsidies program. Part of the Government's industrial promotion program involved seeking foreign participation for new ventures in the mineral sector.

Mineral development in 1982 centered on further expansion of petroleum and phosphatic fertilizer production capacity and construction of a new direct-reduction-based steel mill at El-Dekheila. The Government also planned to develop new industries in the Sinai Peninsula, among which were the planned reconstruction of the manganese mines and ferromanganese smelter at Abu Zeneima and the reopening of the coal mines at El-Maghara. The U.S. Agency for International Development (AID) was also conducting a multi-billion-dollar assistance program in Egypt, part of which was a $20.7 million mineral, petroleum, and ground water assessment program in cooperation with the Egyptian Geological Survey and Mining Authority (EGSMA) and the Egyptian General Petroleum Corp. (EGPC). Work on the survey should be completed by 1984 and provide information on potential commercial deposits of gold, lead, iron, phosphate, uranium, petroleum, and other minerals.

PRODUCTION AND TRADE

Production of most of Egypt's major mineral commodities increased in 1982, led by petroleum, natural gas, iron ore, cement, barite, and to a lesser extent, phosphate rock. The mineral sector continued to be dominated by oil and gas production, with phosphate being the largest nonfuel mineral foreign exchange earner. Petroleum production averaged 673,000 barrels per day in 1982, a 5% increase above the 1981 level. Production was expected to continue to increase throughout the 1980's as new fields in the Gulf of Suez and Western Desert are brought onstream and the natural-gas-gathering system is implemented.

While production of phosphate rock increased slightly in 1982, the value of phosphate exports declined 2% to $6 million during the year. Also, development plans for the Abu Sheigela and Abu Tartur phos-

phate mines were shelved in 1982 owing to development cost problems and lack of an export market.

Iron ore production continued to increase from the Bahariya Oasis deposit in the Western Desert. All of this production, along with a considerable level of imports, will be necessary to supply the planned El-Dekheila direct-reduction steel mill, which was under construction in 1982. Coal production from the El-Maghara coal deposit in northern Sinai was expected to reduce the coking coal import needs of the country's steel industry; ferromanganese production, also from the Sinai, was expected to provide raw material for the steel mill as well. Total revenues from Egypt's mineral exports, excluding oil and gas, amounted to $6.6 million in 1982, with phosphates accounting for 90% of the total. Total revenues from oil and gas exports amounted to $3.2 billion in 1982, making petroleum the most important commodity in the economy overall.

Egypt's major mineral exports were petroleum, phosphates, aluminum, iron and steel, and salt. Egypt's crude oil was delivered to Italy (35%), Israel (30%), Greece (7%), and the United States (5%). Phosphate rock was exported mainly to China, India, and Romania, while aluminum went mainly to the Netherlands, Japan, and the Republic of Korea. Total Egyptian exports to the United States were valued at $500 million in 1982, composed mostly of petroleum products. U.S. AID operated its largest assistance program worldwide in Egypt, having disbursed $5 billion in aid since 1975, about $1.5 billion of which was released in 1982.

Egypt's overall external trade position was unfavorable in 1982. Merchandise exports totaled $4.2 billion in 1982, while imports reached $9.2 billion. Even with a $500 million surplus in the services sector and the $3.1 billion in aid and transfer payments, Egypt finished 1982 with a $2.4 billion current account deficit.

COMMODITY REVIEW

METALS

Aluminum.—Production from the state-owned Aluminum Co. of Egypt increased 5% in 1982 to 140,000 tons of primary aluminum. Capacity of the plant was expanded in 1981 from 133,000 to 166,000 tons per year through the addition of two new potlines. Production did not increase as much as planned, however, because of a shortage of electricity to operate the new potlines. The Aluminum Co., located at Nag Hammadi 550 kilometers south of Cairo on the Nile River, utilizes electricity produced at the Aswan High Dam. Initially, the plan was for the dam to produce 1,400 megawatts of electricity, only 1,000 megawatts of which could be handled by the transmission lines to Cairo and northern Egypt. The aluminum plant, located between Aswan and Cairo, was to use the surplus. The Aswan High Dam, however, has been producing only 900 to 1,000 megawatts in 1982, owing to problems with the turbine generators, and the aluminum plant has been utilizing fully one-third of that production. Addition of the 9th and 10th potline would raise consumption to 380 to 400 megawatts, leaving northern Egypt with a substantial electricity shortage. Increased production for the plant will have to wait for either a resolution of the conflict between the Ministry of Electricity and the management of The Aluminum Co., or an increase in electricity production from the Aswan High Dam.

Egypt continued to import its alumina for the plant from Australia, via the Red Sea port of Safâga. About 60% of the plant's output is exported, mainly to the Netherlands, Japan, and the Republic of Korea, with the remainder being consumed domestically. Egypt's domestic aluminum manufacturing facilities were the Arab Aluminium Co. facility at Ismailia and the Alsaad extrusion plant at Mostorod.

Columbium-Tantalum.—In 1982, EGSMA was negotiating with a West German company to develop two low-grade columbium-tantalum deposits, at Abu Dabbab and Abu Nuweibi. At Abu Dabbab, located in the Eastern Desert only 20 kilometers from the Red Sea, reserves were estimated at 32 million tons of granitic ore containing 0.025% Ta_2O_5 and 0.011% Cb_2O_5. The Abu Nuweibi deposit, located only 10 to 15 kilometers southeast of Abu Dabbab, contained 32 million tons of "higher grade" 0.015% Ta_2O_5 ore and 83 million tons of "lower grade" ore containing 0.012% Ta_2O_5 or less. While both of these deposits were being considered by EGSMA, the very low grade of the ore and the lack of any infrastructure or fresh water supply in the area make actual development unlikely.

Gold.—EGSMA has continued to express interest in reopening several of Egypt's ancient gold mines. The most promising of these was the Baramya gold mine, which closed when gold was selling for $35 per ounce. The mine, located in the Eastern Desert, reportedly contains 30 million tons of gold-bearing ore which averages 1 ounce of gold per ton. EGSMA also planned to do preliminary fieldwork at four gold mines: Atud, Um El Rus, Dongesh, and Talet Gadalla, beginning in the fall of 1983. EGSMA had no immediate plans to begin commercial operations at any these mines.

Iron and Steel.—Production of iron ore from the Bahariya Oasis deposit, located in the Western Desert 350 kilometers southwest of Cairo, continued to increase in 1982, reaching close to 2 million tons. Iron ore at Bahariya Oasis occurred in four ore bodies, located at Nasser, Gebel Ghorabi, El-Harra, and El-Gedida, all of middle Eocene age. Total reserves in the area were estimated at 250 million tons containing 52% to 54% iron. El-Gedida was currently the only deposit being worked, and reserves there were placed at 129 million tons of 53% iron ore. Production from the deposit began in 1973 and has increased fairly rapidly to close to 2 million tons per year. Maximum ore production capacity from the deposit was about 3 million tons per year, but output will not reach that level until the new steelworks at El-Dekheila is completed in 1986.

A progressively smaller portion of Egypt's iron ore continued to be supplied from Aswan, which for 25 years had been the main source of Egypt's iron ore supply. Reserves at Aswan have dwindled to 14 million tons containing 44% iron and 14% silica. Aside from its lower grade and higher silica content, Aswan was also considerably farther away from the main steelworks at Helwan, making ore transportation more expensive.

In 1982, Egypt's major steelmaking facility was the Egyptian Iron and Steel Co.'s works at Helwan, 33 kilometers south of Cairo, on the Nile River. The plant consisted of four blast furnaces, five Linz-Donawitz converters, and two electric-arc furnaces, with a total crude steelmaking capacity of 1.5 million tons per year. Substandard-quality ore feed kept production to about

60% of capacity. The company had begun research into beneficiation processes to improve the ore quality and reduce coke consumption.

Construction was progressing in 1982 on Egypt's first direct-reduction steel mill, to be located at El-Dekheila, near Alexandria. Equity shares in the project, formed as a joint Egyptian-Japanese venture under the name of the Alexandria National Steel Co., were held 87% by the Egyptian Government through various state-owned companies and 10% by the Japanese consortium composed of Nippon Kokan K.K. (5%), Kobe Steel Ltd. (3%), and Tokyo Menka Kaisha (2%); and the International Finance Corp. (IFC) held a 3% share in the project.

The plant was to have an annual steelmaking capacity of 723,000 tons based on the direct-reduction process. Bids were being accepted in 1982 on the direct-reduction unit, but only Kobe Steel and Kawaski Heavy Industries were expected to bid. Nippon will supply four 70-ton electric-arc furnaces, and Kobe Steel will supply three four-strand continuous casters for the plant, based on their equity participation. Financing for the $835 million plant was to be provided by the International Bank for Reconstruction and Development (World Bank) ($166 million), the IFC ($94 million), the Japanese Overseas Economic Cooperation Fund ($151 million), the Japanese Government ($138 million), and other Japanese, Egyptian, and commercial banks. The plant is expected to start up in mid-1986.

Manganese.—The Egyptian Government allocated close to $100 million to the Sinai Manganese Co. to renovate the mines and to reconstruct the ferromanganese plant at Abu Zeneima in Western Sinai that was destroyed during the Israeli occupation. The mines contained between 1 and 2 million tons of manganese-iron ore containing 22% to 38% Mn and 15% to 36% Fe. Output from the mines was to average 60,000 to 70,000 tons per year and would be used to produce 14,000 to 19,000 tons per year of ferromanganese alloy. The planned ferromanganese operation would more than meet the domestic requirements for ferromanganese in the steel industry until the new Alexandria steelworks comes on-stream. No timetable was established for construction or commissioning of the plant. The operation was expected to save $12 million per year in foreign currency now needed for ferromanganese imports.

Tin.—As part of the U.S. AID assistance program to Egypt, EGSMA planned to construct a small pilot plant at Gebel Igla on the Red Sea coast to process cassiterite ore from a small placer deposit nearby. The deposit contains only about 0.1% tin. EGSMA planned to produce 50 tons per year of tin concentrate, with reserves expected to last about 10 years.

NONMETALS

Cement.—Egypt's cement production increased substantially in 1982, by over 21% above the 1981 level. Total capacity of Egypt's cement plants was 5.4 million tons in 1982 and was scheduled to increase to 6.4 million tons in 1983. The increased production came from the Suez Cement Co.'s new 1.4-million-ton-per-year dry-process facility located at Qattanya, 55 kilometers from Suez City near the Red Sea. Suez Cement was the only privately owned cement plant operating in Egypt since the industry was nationalized in 1960. The new capacity due onstream in 1983 was the National Cement Co.'s 1-million-ton-per-year facility at Nag Hammadi.

Fertilizer Materials.—Egypt has remained virtually self-sufficient in nitrogenous fertilizer production since the Aswan High Dam was built and Egypt began to demand increasing quantities of chemical fertilizer to replace the natural fertilizer from the annual flooding of the Nile River. In 1982, Egypt maintained 1 million tons per year of nitrogen fertilizer capacity, along with 650,000 tons per year of phosphatic fertilizer capacity.

Nitrogen.—Ammonia and urea capacity was boosted to its current level by the 1981 commissioning of the Talkha II fertilizer complex, composed of a 326,000-ton-per-year (N) ammonia plant and a 262,000-ton-per-year (N) urea plant. Talkha I, brought onstream in 1975, and Talkha II both utilize natural gas feedstock pipelined from the Abu Madi Gasfield in the Nile Delta.

Phosphatic Fertilizer.—Construction neared completion at the end of 1982 on Egypt's largest phosphatic fertilizer complex, at Abu Zabal, located 20 kilometers north of Cairo. Up to 1982, Egypt had only produced single superphosphate from its four existing phosphate fertilizer plants. Abu Zabal was to produce 175,000 tons per year of triple superphosphate and 200,000 tons per year of phosphoric acid to be used in the production process. Also to be added to the plant were a 215,000-ton-per-year sulfuric acid unit and a plant to produce

100,000 tons per year of 65% oleum.

Phosphate Rock.—Phosphate rock was by far Egypt's most important nonfuel mineral export, earning approximately $6 million in foreign exchange in 1982. Production of phosphate rock increased only slightly in 1982. Phosphate rock was produced by three companies, from the Red Sea, Nile Valley, and Eastern Desert areas. The Red Sea Phosphate Co. has historically been the country's largest producer, from its two mines in the Red Sea region, at Quseir and Safâga. These two were the country's oldest mines and were to be phased out as a new mine, at Abu Sheigela in the Eastern Desert, was brought onstream. Longstanding plans to develop this deposit were shelved in 1982, however, owing to lack of demand.

The Misr Phosphate Co. of Egypt operated the Hamrawein deposit, also located in the Eastern Desert. Output from Hamrawein has exceeded production from the Red Sea mines, and is expected to remain the dominant producer. Reserves at Hamrawein were estimated at 40 million tons grading 17% to 25% P_2O_5. Total mine output in 1982 was close to 800,000 tons.

The third phosphate rock producer was the Abu Zabal Fertilizer and Chemical Co., which operated the West Sabaya Mine, 31 kilometers north of Idfu on the Nile River. Production from West Sabaya was to be expanded from its current level of about 600,000 tons per year of untreated ore to over 4 million tons of ore in order to supply the new triple superphosphate and phosphoric acid plant at Abu Zabal.

Egypt's longstanding plans to develop the 988-million-ton Abu Tartur phosphate deposit in the Western Desert came to a standstill in 1982 as negotiations with a European consortium were terminated for lack of financing. Egypt has reportedly already spent close to $130 million on an experimental mine and beneficiation plant and a railway linking the deposit with the Red Sea coast. Funds for the initial work were provided by the World Bank. However, a 1982 French-Swiss feasibility study indicated that the project may be uneconomic because of high mining and transportation costs, lack of a readily available export market, and the presence of an unusually high pyrite content, making beneficiation more difficult and costly. The Egyptians planned to produce 7 to 10 million tons per year of phosphate rock from the deposit, destined mainly for export.

Sulfur.—The Government of Egypt was working jointly with Agrico Chemical Co. of the United States in exploring for economic sulfur deposits in the Eastern Desert and Sinai. The Government was planning to enter into a joint venture with Agrico or other foreign firms in order to produce as much as 1 million tons per year of sulfur, 300,000 tons of which would be supplied to the domestic market, mostly for use in the fertilizer plants.

Other Nonmetals.—The Egyptian Government continued to evaluate several nonmetallic mineral projects in 1982, primarily involving gypsum, potash, and salt. The Egyptian Gypsum, Marble, and Quarries Co. was planning to construct a 300,000-ton-per-year gypsum plant in Alexandria, based on nearby deposits. Also, the Government was considering constructing another gypsum plant at Ras Malaab, on the Sinai Peninsula, to use gypsum from a deposit which had been mined in the early 1960's prior to the Israeli occupation. Reserves at Ras Malaab were estimated at 250 million tons.

EGSMA and the U.S. Geological Survey were evaluating the economic potential of a large potash deposit located in the Eastern Desert near the Red Sea. No information on the reserve level of the deposit was available.

Egypt planned to increase its salt production through the addition of a new sodium complex in Al Arish. The Government has allocated $41 million for construction of a 250,000-ton-per-year salt plant, which would satisfy Egypt's domestic requirement for table salt.

MINERAL FUELS

Coal.—A feasibility study by Babcock International and British Mining Corp. on the possibility of reopening the El-Maghara coal mine in northern Sinai was completed in 1982. The study placed reserves at Maghara at 27 million tons of high-volatile subbituminous coal, 21 million tons of which were recoverable. The coal would be used to blend with imported coking coal or possibly to fuel a planned 600-megawatt thermal powerplant to be built on the Sinai Peninsula. Coal was mined at El-Maghara from 1964 to 1967, but mining was suspended after the Israelis occupied the Sinai and removed all the equipment and blocked the shafts. According to the report, the shaft was in excellent condition, but many of the underground workings were flooded.

EGSMA planned to renovate the mine and Babcock Contractors was awarded the

contract for initiating the development work. In full operation, the project was to produce 600,000 to 750,000 tons per year of coal, which would require an investment of $120 million, including $85 million in foreign exchange.

Natural Gas.—The Egyptian Government remains committed both to increasing natural gas production and to utilizing to a greater extent its present gas output, much of which is now being flared, in order to free more crude oil for export. Production of associated and nonassociated gas continued to increase in 1982. Associated gas production increased about 6% in 1982, to 140 million cubic feet per day, driven by increased oil production, especially in the Gulf of Suez. EGPC was using a $75 million World Bank loan to construct a 40-million-cubic-foot-per-day gas-gathering station at Ras Bakr, in the Gulf of Suez, which will be linked by a 16-inch pipeline to the main gas-processing center at Ras Shukair.

Nonassociated gas production in Egypt was from three main fields: Abu Madi, Abu Qir, and Abu Gharadig. Production at the Abu Qir Field increased the most in 1982, by about 10%, from 100 to 110 million cubic feet per day. The expansion was brought about to provide additional feedstock to the Abu Qir fertilizer plant and the 65-million-cubic-foot-per-day gas-processing plant. Production from Abu Madi increased slightly in 1982, while production from Abu Gharadig remained about the same. Total nonassociated gas production in Egypt in 1982 was estimated at 175 million cubic feet per day. All of Egypt's recovered gas production was consumed domestically for industry fuel and feedstock and commercial and household use. The Egyptian Government decreed that no gas exports would be allowed until natural gas reserves reached 12 trillion cubic feet. Current proven gas reserves are placed at 5 to 6 trillion cubic feet.

Petroleum.—*Production.*—Egypt's petroleum production increased almost 5% in 1982, to an average of 673,000 barrels per day, moving gradually closer to the Government's stated goal of producing 1 million barrels per day by the mid to late 1980's. However, because of the worldwide slump in oil prices, Egypt's petroleum revenues declined substantially, from $2.76 billion in 1981 to $2.43 billion in 1982. Despite the decline in revenues, Egypt's petroleum outlook appeared very favorable in 1982. Offshore production from the Gulf of Suez at Ras Burden was expected to begin early in 1983 and reach 40,000 barrels per day by midyear, and onshore production was also expected to increase from the new fields in the Western Desert. The bulk of the increased crude oil production came from the Gulf of Suez oilfields, where the new discovery rate continued to be the highest.

The major oil-producing companies in Egypt were the Gulf of Suez Oil Co. (Gupco), owned by Amoco Oil Co. (United States) and EGPC, whose production averaged about 471,000 barrels per day; the Belayim Petroleum Co. (Petrobel), owned by Azienda Generale Italiana Petroli S.p.A. (Italy) and the Egyptian International Oil Co., whose production level averaged 129,000 barrels per day; the General Petroleum Co., owned by the Government through EGPC, which produced about 21,400 barrels per day; the Western Desert Petroleum Co., also known as Wepco, owned by Phillips Petroleum Corp. (United States), which produced 9,000 barrels per day; and the Suez Oil Co. (SUCO), owned jointly by British Petroleum Ltd. (United Kingdom), Royal Dutch/Shell (Netherlands), and Deminex (Federal Republic of Germany), which produced about 4,000 barrels per day. Epedeco, a Japanese consortium, produced about 5,000 barrels per day, and the Shukair Offshore Co., also known as OSOCO, produced about 1,100 barrels per day. The remaining 30,000 barrels per day was produced from the Sho'ab Ali Field, formerly known as the Alma Field, which was repossessed from Israel along with the return of the Sinai Peninsula. Sho'ab Ali was operated by Gupco.

Exploration.—Exploration activity continued to be centered in the Gulf of Suez region, but recent discoveries in the Western Desert and the offshore Mediterranean have heightened interest in those areas as well. Four new concessions were awarded by EGPC in 1982; three in the Gulf of Suez went to Deminex, Gulf Oil Co. (United States), and the British Petroleum-Société National Elf Aquitaine-Occidental Petroleum Co. consortium, and the fourth, in the Western Desert, went to Shell Winning N.V. (Netherlands). Since 1973, EGPC has entered into 112 concession agreements, nearly all with foreign companies. Five additional concession agreements were scheduled to take effect in 1983.

Refining.—Egypt's energy sector development plan also called for a substantial increase in petroleum refining capacity, from the current level of 292,000 barrels per

day to over 700,000 barrels per day by 1988. Egypt's refineries, along with their current and proposed expanded capacities, are shown in the following table.

Company	Location	1982 capacity (barrels per day)	Planned capacity (barrels per day)	Year of completion
Alexandria Petroleum Cement Co	Alexandria	64,000	159,500	1988
El-Nasr Petroleum Co	do	60,000	75,000	1983
	Suez	50,000	78,500	1985
	Suez (new complex)	XX	125,000	1986
Suez Oil Processing Co	Mostorod	78,000	114,500	1985
	Suez	20,000	42,500	1988
	Tanta	20,000	42,500	1988
Egyptian General Petroleum Corp	Assuit (new complex)	XX	106,000	1986
Total		292,000	743,500	

XX Not applicable.

As is evident from the table, refinery capacity by the end of the decade should approach current crude oil production. By that time, however, Egypt plans to be producing 1 million barrels per day, so even with a high growth rate in consumption, now estimated at 320,000 barrels per day, Egypt should be able to maintain at least its present level of crude oil exports, while substantially increasing its export of refined products. Work had already begun on EGPC's new refinery, at Assuit, which will be the first oil refinery in that area.

Also under construction in 1982 was Egypt's first petrochemical complex, a small-scale operation by recent Middle Eastern standards. The plant, to be owned by Egyptian Petrochemicals, a subsidiary of EGPC, is designed to produce 80,000 tons per year of polyvinyl chloride, 100,000 tons per year of vinyl chloride monomer, 200,000 tons per year of ethylene, 100,000 tons per year of low-density polyethylene, and 40,000 tons per year of high-density polyethylene. The contract for the polyvinyl chloride unit was awarded to Technipetrol, utilizing the BF Goodrich process. The plant should be completed in 1985. Production units for the other four petrochemical products were under study in 1982.

Uranium.—To provide fuel for Egypt's ambitious nuclear energy development program, Egypt has begun to produce uranium from a small research-oriented pilot-scale mining operation in the Eastern Desert, between Qena and Safâga. The mine started production in January 1980 and was producing at the rate of 20 to 30 tons of U_3O_8 per year. Reserves in the area were estimated at 5,000 tons of U_3O_8. The pilot plant was part of a 5-year research project being conducted by the Nuclear Materials Authority. Egypt planned to use the domestically produced uranium as fuel for the eight nuclear power reactors, all in the 900- to 1,200-megawatt range, that it planned to build before the year 2000.

The Mineral Industry of Finland

By Joseph B. Huvos[1]

In 1982, Finland's mining and metallurgical industry experienced a 1% decrease in value of output, brought about by reduced prices owing to the recession in the world economy. Devaluation of the Finnish markka increased prices at yearend. The consumer price index rose by 9%, and unemployment rose to about 6.5%.

Finland continued to be a modest producer of minerals including vanadium, cobalt, copper, nickel, zinc, chromite, apatite, ilmenite, talc, and wollastonite.

Important events in Finland's mineral industry included completion of Rautaruukki Oy's Laurinoja copper mine, Kemira Oy's Siilinjärvi phosphoric acid plant, Oy Partek AB's Lappeenranta wollastonite flotation plant, and expansion of Outokumpu Oy's Harjavalta copper smelter. Construction continued on expanding Outokumpu's cobalt salt plant and stainless steel plant. Mine closings included Outokumpu's Hitura nickel mine and Rautaruukki's Mustavaara vanadium mine.

PRODUCTION

Volume indexes (1980=100) of the country's mineral and related industries in 1981 and 1982 are shown in the following tabulation:

	1981	1982[p]
Mining and quarrying	104	107
Nonmetallic minerals processing	100	101
Iron and steel	96	98
Nonferrous metals	100	114
Petroleum refining	95	83
Industrial chemicals	96	94
All industry	103	101

Other do	1,055	1,241	1,428	631	1,040
Quartz do	145	217	237	255	249
Sulfur:					
S content of pyrites do	87	151	144	184	177
Byproduct:					
Of metallurgy do	232	263	247	234	270
Of petroleum do	30	30	30	[e]30	10
Total do	349	444	421	448	457
Sulfuric acid do	849	1,048	1,039	1,095	1,222
Talc	195,159	267,180	317,901	307,915	325,000
Wollastonite	7,688	10,576	8,782	13,690	15,000
MINERAL FUELS AND RELATED MATERIALS					
Peat:					
For fuel use thousand tons	1,870	1,551	1,841	1,303	5,500
For agriculture and other uses do	203	773	578	204	88
Petroleum refinery products:					
Gasoline thousand 42-gallon barrels	16,737	17,508	16,449	17,434	16,890
Jet fuel do	1,765	1,806	1,944	1,984	1,720
Kerosine do	29	40	2,000	2,046	1,829
Distillate fuel oil do	26,993	28,000	5,505	3,827	2,865
Residual fuel oil do	24,707	24,997	28,372	21,672	16,004
Liquefied petroleum gas do	--	1,188	1,334	1,659	1,438
Other do	8,468	8,477	19,876	17,381	29,254
Refinery fuel and losses do	4,629	5,035	--	--	--
Total do	83,328	87,051	75,480	66,003	70,000

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.
[1]Table includes data available through July 7, 1983.

TRADE

Finland's exports increased about 3%, but the current account deficit deteriorated. The net foreign debt was $5 billion.[2] U.S. share of Finnish exports was about 3%; that of imports was about 6%.

Table 2.—Finland: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals: Unspecified	2	9	--	All to Japan.
Aluminum:				
Oxides and hydroxides	8	175	--	All to Sweden.
Metal including alloys:				
Scrap	102	255	--	Japan 216; Denmark 23; Republic of South Africa 16.
Unwrought	3,887	4,643	--	Japan 3,479; Sweden 835; Denmark 175.
Semimanufactures	28,796	22,758	51	United Kingdom 4,541; West Germany 3,402; Sweden 3,340.
Cadmium: Metal including alloys, all forms	565	554	40	United Kingdom 226; Sweden 76; Netherlands 62.
Chromium: Ore and concentrate	206,547	250,898	73,561	Sweden 157,641; Netherlands 6,472; United Kingdom 5,606.

Table 2.—Finland: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Cobalt:				
Oxides and hydroxides ——— value	$521	$463	NA	NA.
Metal including alloys, all forms ———	1,201	1,564	563	Sweden 281; Netherlands 237; East Germany 113.
Columbium and tantalum: Metals including alloys, all forms, tantalum value, thousands	$7	--		
Copper:				
Ore and concentrate	15	--		
Matte and speiss including cement copper	81	33	--	All to Sweden.
Oxides and hydroxides	387	580	--	United Kingdom 482; Netherlands 40; Portugal 24.
Ash and residue containing copper	1,192	5	--	All to United Kingdom.
Metal including alloys:				
Scrap	234	242	6	Denmark 197; West Germany 20; Sweden 18.
Unwrought	5,945	22,749	37	Belgium-Luxembourg 10,078; United Kingdom 4,595; East Germany 4,017.
Semimanufactures	28,411	27,207	1,880	United Kingdom 5,322; Sweden 3,789; Denmark 3,123.
Gold: Metal including alloys, unwrought and partly wrought ——— troy ounces	19,419	18,294	--	West Germany 18,037; Sweden 161.
Iron and steel:				
Iron ore and concentrate, excluding roasted pyrite	14,628	22,965	22,965	
Metal:				
Scrap	194	206	--	Sweden 139; United Kingdom 53.
Pig iron, cast iron, related materials	17,520	274	--	United Kingdom 264; Iceland 5; Norway 3.
Ferroalloys, unspecified	16,982	25,460	1,051	Netherlands 10,903; Sweden 7,481; United Kingdom 5,003.
Steel, primary forms	129,465	206,169	--	Sweden 71,518; Venezuela 38,591; United Kingdom 25,905.
Semimanufactures:				
Bars, rods, angles, shapes, sections	174,515	149,426	7,680	U.S.S.R. 27,818; West Germany 27,549; United Kingdom 21,058.
Universals, plates, sheets	532,532	474,027	35,628	West Germany 169,011; Denmark 74,715; Sweden 42,646.
Hoop and strip	25,466	20,579	642	Sweden 5,992; West Germany 2,823; U.S.S.R. 2,658.
Rails and accessories	127	44	--	Iraq 10; Sweden 11.
Wire	2,685	2,404	118	Sweden 1,858; U.S.S.R. 109; United Kingdom 95.
Tubes, pipes, fittings	68,653	72,600	(1)	Sweden 22,274; U.S.S.R. 17,675; West Germany 6,852.
Castings and forgings, rough	3,255	3,418	1	Sweden 2,321; U.S.S.R. 609; Norway 335.
Lead:				
Ore and concentrate	2,047	3,135	--	All to West Germany.
Oxides	1	--		
Metal including alloys:				
Scrap	20	321	--	Sweden 195; Denmark 126.
Unwrought	869	853	--	Denmark 377; Sweden 319; Zambia 147.
Semimanufactures	45	104	--	Sweden 95; Iraq 5.
Magnesium: Metal including alloys:				
Scrap	31	33	--	All to West Germany.
Unwrought	--	1	--	All to Sweden.
Semimanufactures	--	49	--	All to U.S.S.R.
Manganese: Oxides	--	5	--	All to Sweden.
Mercury ——— 76-pound flasks	1,595	1,508	--	Belgium-Luxembourg 1,392; Sweden 87.
Metalloids: Unspecified	56	36	--	United Kingdom 21; Libya 6; Netherlands 5.
Molybdenum:				
Ore and concentrate	1	340	--	All to East Germany.
Metal including alloys, all forms	1	--		

See footnotes at end of table.

Table 2.—Finland: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Nickel:				
Ore and concentrate	1,657	--		
Matte and speiss	--	2,691	18	Norway 2,648.
Metal including alloys:				
Unwrought	11,104	11,135	2,969	United Kingdom 1,673; West Germany 1,008; Netherlands 1,005.
Semimanufactures	268	8	--	Greece 4; Sweden 4.
Platinum-group metals: Metals including alloys, unwrought and partly wrought, unspecified troy ounces	354	1,350	--	Sweden 643; Netherlands 257; United Kingdom 257.
Silver:				
Ore and concentrate[2] value, thousands	$156	$465	--	All to United Kingdom.
Waste and sweepings[2] do	$7,509	$8,371	$1,769	United Kingdom $2,704; Sweden $1,655; West Germany $1,634.
Metal including alloys, unwrought and partly wrought thousand troy ounces	1,447	1,800	--	United Kingdom 1,157; West Germany 482.
Tin: Metal including alloys:				
Scrap	47	46	--	Sweden 38; West Germany 6.
Unwrought	5	5	--	Sweden 4; Iraq 1.
Semimanufactures	2	(1)	--	All to Iraq.
Titanium: Oxides	2,634	2,459	205	Hungary 785; East Germany 424; Sweden 378.
Tungsten: Metal including alloys,all forms	15	11	--	Belgium-Luxembourg 4; West Germany 4; Sweden 3.
Vanadium: Oxides and hydroxides value, thousands	$28,716	$25,468	$343	West Germany $8,683; United Kingdom $5,722; U.S.S.R. $3,541.
Zinc:				
Oxides	3	--		
Ash and residue containing zinc	1,469	1,315	--	Belgium-Luxembourg 687; West Germany 597.
Metal including alloys:				
Scrap	1,596	2,427	--	West Germany 1,093; United Kingdom 722; Norway 297.
Unwrought	120,613	116,069	28,453	United Kingdom 28,734; Netherlands 15,946; U.S.S.R. 10,613.
Semimanufactures	18	113	--	West Germany 83; U.S.S.R. 16; United Kingdom 9.
Other:				
Ores and concentrates value, thousands	$135	$463	--	All to United Kingdom.
Oxides and hydroxides	r120	19	--	Sweden 13; Libya 6.
Ashes and residues	r591	117	--	All to Denmark.
Cermets	--	2	--	Sweden 1.
Base metals including alloys, all forms	36	33	(1)	United Kingdom 21; Spain 10.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc. value, thousands	$3	--		
Grinding and polishing wheels and stones	83	129	(1)	U.S.S.R. 115; Iraq 4; Turkey 4.
Asbestos, crude	20	--		
Barite and witherite	18	--		
Boron materials: Crude natural borates	12	--		
Cement	66,129	69,685	--	U.S.S.R. 37,511; Sweden 30,287; Iraq 844.
Chalk	75	234	--	U.S.S.R. 160; Nigeria 73.
Clays and clay products:				
Crude:				
Fire clay	130	216	--	All to Sweden.
Unspecified	268	1,782	--	Norway 1,118; Sweden 611.
Products:				
Nonrefractory	1,963	2,134	11	U.S.S.R. 1,550; Sweden 403; Iraq 73.
Refractory including nonclay brick	4,018	7,028	--	Sweden 2,902; U.S.S.R. 1,877; Saudi Arabia 730.
Diamond: Gem, not set or strung value, thousands	$959	$381	$45	Sweden $182; Spain $57; Belgium-Luxembourg $56.
Diatomite and other infusorial earth	42	31	--	All to Sweden.
Feldspar, fluorspar, related materials:				
Fluorspar	312	1,096	--	Thailand 648; Venezuela 122; Nigeria 100.
Unspecified	46,998	46,725	--	United Kingdom 27,440; West Germany 9,664; Sweden 3,640.

See footnotes at end of table.

Table 2.—Finland: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Fertilizer materials:				
Crude, n.e.s	--	320	--	Saudi Arabia 250; United Arab Emirates 60.
Manufactured:				
Ammonia	12	--		
Nitrogenous	8,644	31,145	--	India 11,999; Nigeria 10,552; Spain 3,578.
Phosphatic	11,425	796	--	U.S.S.R. 795.
Potassic	15,065	13,624	--	Japan 13,611; Sweden 13.
Unspecified and mixed	34,513	50,730	--	Venezuela 22,057; China 10,277; Angola 4,733.
Graphite, natural	1	2	--	All to Mexico.
Gypsum and plaster	--	101	--	West Germany 61; Sweden 25; Norway 15.
Halogens: Chlorine	18,882	32,880	--	U.S.S.R. 32,879.
Lime	1,046	933	--	U.S.S.R. 570; Sweden 219; West Germany 120.
Magnesium compounds: Other	(1)	137	--	Sweden 90; U.S.S.R. 25; Norway 22.
Mica:				
Crude including splittings and waste	1	--		
Worked including agglomerated splittings value, thousands	$2	$1	--	All to Sweden.
Phosphates, crude	1,677	131	--	Sweden 101; Australia 30.
Pigments, mineral: Iron oxides and hydroxides, processed	3	2	--	All to Nigeria.
Precious and semiprecious stones other than diamond:				
Natural value, thousands	$56	$10	--	West Germany $6; Hong Kong $2; Sweden $2.
Synthetic do	$998	$1,080	$1,080	
Pyrite, unroasted	--	69,538	--	Italy 28,986; Sweden 20,252; Turkey 14,678.
Salt and brine	199	242	--	Denmark 196; Sweden 28; Iraq 5.
Sodium and potassium compounds, n.e.s.:				
Sodium hydroxide	6,038	24,024	--	U.S.S.R. 24,013; Algeria 11.
Sodium sulfate, natural and manufactured	3,328	3,969	--	Bulgaria 2,224; United Kingdom 996.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	281,584	432,554	151	Netherlands 238,889; Italy 106,871; France 44,367.
Worked	1,705	2,454	--	U.S.S.R. 1,085; Sweden 780; West Germany 303.
Dolomite, chiefly refractory-grade	40	--		
Gravel and crushed rock	193,848	113,910	1	Netherlands 80,029; Sweden 24,355; U.S.S.R. 8,879.
Limestone other than dimension	14,062	12,442	--	Sweden 10,889; Denmark 1,490.
Quartz and quartzite	10,131	6,253	16	Sweden 2,706; Indonesia 702; United Kingdom 666.
Sand other than metal-bearing	11,413	20,595	--	Sweden 20,093; Japan 406; U.S.S.R. 66.
Sulfur:				
Elemental: Crude including native and byproduct	6	6	--	All to Nigeria.
Dioxide	34	12	--	All to Sweden.
Talc, steatite, soapstone, pyrophyllite	54,044	60,314	--	Sweden 20,621; U.S.S.R. 12,861; West Germany 7,784.
Other:				
Crude	10,326	11,138	--	West Germany 4,029; Italy 1,729; Spain 1,694.
Slag and dross, not metal-bearing	6,507	6,756	--	Sweden 6,632; Belgium-Luxembourg 59.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	5,670	9,166	--	Norway 2,479; U.S.S.R. 2,469; Denmark 1,702.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	1,474	594	--	U.S.S.R. 432; Libya 86; Sweden 56.
Carbon: Carbon black	6,729	9,745	--	Ireland 7,254; United Kingdom 2,455.
Coal: Bituminous	21	3	--	NA.
Coke and semicoke	5,473	7,537	--	Norway 3,793; Iceland 2,950; Sweden 497.
Hydrogen, helium, rare gases	370	508	--	Norway 284; Sweden 163; Denmark 60.

See footnotes at end of table.

Table 2.—Finland: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
MINERAL FUELS AND RELATED MATERIALS —Continued				
Peat including briquets and litter	42,660	74,145	--	Sweden 45,538; Netherlands 9,589; Denmark 5,335.
Petroleum refinery products:				
Liquefied petroleum gas 42-gallon barrels	220	986	--	U.S.S.R. 464; Sweden 313; Denmark 93.
Gasoline thousand 42-gallon barrels	7,263	6,408	--	Sweden 3,222; Netherlands 1,020; United Kingdom 823.
Mineral jelly and wax 42-gallon barrels	102	1,731	--	Norway 1,550; Sweden 150.
Kerosine and jet fuel do	122,334	140	--	U.S.S.R. 116; Norway 24.
Distillate fuel oil thousand 42-gallon barrels	3,645	5,482	--	Sweden 1,718; West Germany 1,528; Denmark 761.
Lubricants 42-gallon barrels	88,634	96,397	154	U.S.S.R. 91,000; Sweden 1,925; Iraq 770.
Residual fuel oil thousand 42-gallon barrels	4,967	2,155	--	Sweden 1,198; Norway 364; Netherlands 362.
Bitumen and other residues 42-gallon barrels	17,313	77,877	--	Sweden 70,720; U.S.S.R. 6,072; Iraq 939.
Bituminous mixtures do	21,646	20,071	--	U.S.S.R. 17,629; Sweden 1,121; Iraq 782.
Petroleum coke do	--	6	--	All to Sweden.
Tars and other crude chemicals derived from coal, gas, and petroleum	3	9	--	U.S.S.R. 8; Iraq 1.

[r] Revised. NA Not available.
[1] Less than 1/2 unit.
[2] May include other precious metals.

Table 3.—Finland: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals: Unspecified	10	9	(1)	West Germany 8.
Aluminum:				
Ore and concentrate	4,131	3,925	--	West Germany 2,645; Denmark 763; Italy 198.
Oxides and hydroxides	29,259	31,414	26	Hungary 12,552; China 9,216; West Germany 7,811.
Metal including alloys:				
Scrap	2,475	6,080	18	U.S.S.R. 2,626; Norway 2,266; Hungary 348.
Unwrought	26,737	28,750	197	U.S.S.R. 10,225; United Kingdom 4,268; Norway 4,254.
Semimanufactures	35,008	26,901	648	Norway 5,268; Sweden 4,553; West Germany 4,418.
Antimony: Metal including alloys, all forms	15	20	--	Denmark 9; Bolivia 5; West Germany 2.
Beryllium: Metal including alloys, all forms value, thousands	$2	$2	--	West Germany $1; United Kingdom $1.
Cadmium: Metal including alloys, all forms do	(1)	$3	--	NA.

See footnotes at end of table.

Table 3.—Finland: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Chromium:				
Ore and concentrate	--	20	--	All from Netherlands.
Oxides and hydroxides	868	737	--	West Germany 421; China 174; U.S.S.R. 50.
Cobalt:				
Oxides and hydroxides	246	(1)	--	Mainly from Canada.
Metal including alloys, all forms	7	252	--	Sweden 249.
Columbium and tantalum: Metals including alloys, all forms, tantalum value, thousands	$9	$4	--	Austria $1; Switzerland $1; United Kingdom $1.
Copper:				
Ore and concentrate	9,934	53,626	7,709	Norway 24,942; Morocco 6,014; Mexico 4,954.
Matte and speiss including cement copper	1	1	--	All from Switzerland.
Oxides and hydroxides	165	245	--	Australia 198; West Germany 36.
Sulfate	1,620	2,084	--	West Germany 766; U.S.S.R. 621; Belgium-Luxembourg 280.
Ash and residue containing copper	30	90	--	All from Sweden.
Metal including alloys:				
Scrap	1,768	2,004	1,287	United Kingdom 349; Sweden 181; Czechoslovakia 67.
Unwrought	23,933	20,420	--	Zambia 7,633; U.S.S.R. 4,888; West Germany 2,351.
Semimanufactures	13,717	15,024	90	Sweden 6,735; West Germany 4,096; Poland 1,605.

COMMODITY REVIEW

METALS

Cobalt.—Construction continued at Outokumpu's cobalt salt plant for a startup at the beginning of 1983, when Outokumpu was to convert some of its cobalt production to cobalt salts; about 1,800 tons of cobalt and nickel salts will be produced. The salts were to be exported to Western Europe, mainly the United Kingdom and the Federal Republic of Germany. In 1981, Outokumpu produced about 6% of the world's cobalt.

Chromium.—Work continued to extend Outokumpu's stainless steelworks. When completed, capacity of the plant will increase 15% to about 90,000 tons per year.

Extraction of ore at the Evijärvi and Viia open pits at Outokumpu's Kemi Mine was cut back because of reduced demand. The Tornio ferrochrome plant, which uses part of Kemi ores, ran at full capacity. The stainless steel plant used nearly two-thirds of the ferrochrome. Both plants set new records for increased production.

Copper.—The development of the Laurinoja copper-bearing iron ore deposit at the Government-owned Rautaruukki Oy's Rautavaara Mine was completed and mining was started as an open-cast operation. The new flotation plant began operations and 4,300 tons of copper concentrates were produced.

Outokumpu completed a modernization program at its Harjavalta east coast copper smelter. As a result, the converter department now has a capacity of 80,000 tons per year.

In 1982, Outokumpu's Keretti, Vuonos, Hammaslahti, Vihanti, Kotalahti, Virtasalmi and Pyhasalmi Mines, all located in the southern half of the country, produced copper concentrates and accounted for virtually the entire domestic output.

Nickel.—Outokumpu plans to close on a temporary basis for the next 1 or 2 years, its Hitura nickel mine and concentrator, as production cost has exceeded the current sales price. In 1982, the mine produced 1,460 tons of nickel in ore. Hitura had provided about 20% of the feedstock supplying the Harjavalta nickel smelter; the capacity of the latter has recently been expanded from 15,000 tons to 16,000 tons per year. Outokumpu produced about 50% of its nickel requirement from ore; the rest was imported.

Outokumpu's Vammala, Kotalahti, and Vuonos Mines produced all its nickel concentrates. In addition, Yht. Paperitethat Oy produced some nickel concentrates at Lahnaslampi, as did Malmikaivos Oy at Repovaara.

Vanadium.—Europe's vanadium output is to drop sharply in 1983, when Government-owned Rautaruukki closes its Mustavaara Mine in north-central Finland because of a drop in the price of vanadium. Rautaruukki's share of world vanadium production has been about 8% but could drop to about 3%. Rautaruukki's other vanadium mine at Otanmäki, central Finland, which produces vanadium, iron, and ilmenite concentrates, will remain in operation.

NONMETALS

Apatite.—Government-owned Kemira has completed the expansion of its phosphoric acid plant at Siilinjärvi, central Finland; capacity was increased from 120,000 to 180,000 tons per year of phosphorus pentoxide (P_2O_5). Expansion of the adjacent apatite mine and that of the sulfuric acid plant has also been completed. Products of the plant are a 30% P_2O_5 phosphoric acid and a gypsum byproduct that is discharged to waste. The mine and the $60 million plant have made Finland self-sufficient in phosphates.

Titanium.—Kemira, Finland's only titanium dioxide producer, has invested about $1.5 million in waste treatment facilities since 1978, when authorities of the Water Court of West Finland decided the company had to reduce ferrous sulfate emissions from its Pori plant into Pihlavalahnti Bay. The 80,000-ton-per-year sulfate-route plant uses domestic ilmenite and acid from a 250,000-ton-per-year captive onsite elemental sulfur plant.

Wollastonite.—Oy Partek has built a second flotation plant for wollastonite near the site of its existing plant at Lappeenranta, doubling capacity to 40,000 tons per year. The plant is now the only one in Europe and the second largest in the world. In the past, hand-sorting of wollastonite was used, but optical sorters are now employed for treating a concentrate from which calcite has previously been removed by flotation.

MINERAL FUELS

Finland remained about 85% dependent on imported fuels, mostly oil, natural gas, and coal; much of the oil and all natural gas being imported from the U.S.S.R. Domestic fuels were hydroelectric power, peat, fuelwood, and waste.

Table 4.—Finland: Supply and apparent consumption of fuels and power

(Million tons of standard coal equivalent)

	Total primary energy	Coal and coke	Natural gas	Petroleum and refinery products	Fuelwood and waste[e]	Peat	Hydroelectric power	Nuclear power[1]
1981:

Sources: Bulletin of Statistics, Foreign trade, Central Statistics Office of Finland, Helsinki.

Coal.—A consortium of four Finnish state-owned companies, Imatran Voima Oy, Neste Oy, Outokumpu, and Rautaruukki started an investigation of coal deposits in Spitsbergen, Norway, with the goal of producing 1 million tons per year.

Natural Gas.—Natural gas came from the U.S.S.R. by a 28-inch pipeline extending 125 kilometers from the border to Kouvola. Conservation measures have lowered consumption below the 1-billion-cubic-meter-per-year import quota. There were negotiations between the Finnish and Swedish Governments to extend the pipeline through Finland to Sweden across the Baltic Sea, making a supply network through Finland a mutual Swedish-Finnish project.

Nuclear Power.—In 1982, Finland had four nuclear powerplants: Loviisa 1 and 2 of 440 megawatts each, operated by Imatran Voima, about 80 kilometers east of Helsinki; and Tellisuuden Voima Oy's Olkiluoto 1 and 2 of 660 megawatts each, located on the west coast. Earlier plans to build a 1,000-megawatt nuclear powerplant near Helsinki have now been postponed indefinitely.

Peat.—In 1982, total thermal output of all peat-fired powerplants was about 2,430 megawatts from about 100 units.

Petroleum.—Government-owned Neste signed a contract with the State Oil Co. of the German Democratic Republic to refine 1,400,000 barrels of East German crude oil. This represented only about 2% of Neste's entire refinery operation, which was about 70 million barrels of product, or two-thirds of capacity. The country's only two refineries were located on the southwest coast at Naantali, and 50 kilometers east of Helsinki at Porvoo. Most crude oil was imported from the U.S.S.R. as part of a barter agreement. Of late, Finland has decreased its use of oil, tilting the U.S.S.R.-Finnish trade balance heavily in favor of Finland.

The Mineral Industry of France

By Roman V. Sondermayer[1]

France, which extracted small quantities and had sizable imports of minerals, remained among the major processors of minerals and crude petroleum in Europe. However, reflecting the general slackening of the French economy, activities of the mineral industry were slower than in previous years. The mineral industry of France was an important sector of the economy. In some areas of the country, it was the sole employer, and in 1982, some mining operations in France were kept in operation for social reasons.

The most prominent minerals and metals produced in France, with production expressed as approximate percentages of the world totals, were arsenic, 13%; gypsum, 9%; potash, 7%; fluorspar, 6%; feldspar, 6%; ferroalloys, 5%; cadmium metal, 4%; magnesium metal, 4%; sulfur, 4%; talc, 4%, alumina, 3%; aluminum, 3%; steel, 3%; and petroleum refinery products, 3%.

Based on French Government figures,[2] the share of the mineral and processing industry in the gross domestic product (produit interieur brut) was around 11% in 1981, the latest year for which complete data were available.

After nationalization of most large industry in 1981-82, the Government of France was implementing various plans for restructuring the mineral industry, including processing. At yearend, many problems persisted and the restructuring of the industry was only partially complete. Almost all of the newly nationalized mineral producing and processing organizations showed significant losses; many requested large amounts of financial assistance for operation, modernization, and restructuring.

The Government, in an effort to revitalize the French mineral industry and ensure supply of raw materials, took a strong stand against monopolism and protectionism in foreign trade; the Government also intended to use its scientific and technologic knowhow and its political influence to ensure minerals supply.

With the formulation of its National Energy Plan (NEP) for 1981-90, the Socialist Government juggled the details of the former national energy consumption mix, notably by stressing conservation efforts, by promoting renewable energy sources to a slightly greater extent, and by emphasizing goals for increased domestic coal production.

The aims of the NEP, to be reached by 1990, were reported as follows:

1. The Government hopes to import only 30% of its total energy needs compared with about 75% in recent years.

2. Nuclear energy will provide the electricity baseload, and its consumption is expected to increase from 20 million to 60 million to 65 million tons of oil equivalent.

3. Total oil consumption was targeted at 70 million to 75 million tons of oil equivalent compared with 87 million tons in 1981.

4. Investments for energy-saving methods and technologies were planned at $5 billion to $6 billion[3] annually during the eighties. Conservation should result in savings of 60 million tons of oil equivalent annually compared with only 20 million tons in 1981.

In 1982, the French Government decided to restructure the collection and dissemination of mineral statistics. A new organization named Observatoire des Matieres Premieres was formed as part of the Ministry of Industry; it incorporated functions of the Bureau de Documentation Minière.

Principal events in the mineral industry

during 1982 included development of a new bauxite mine near Toulon, the end of cobalt metal production, the start of production in two tungsten mines, delineation of the uranium deposit in Gironde, and shutdown of capacity for processing of 126 million barrels per year of crude oil.

PRODUCTION

Large mineral producing and processing companies were Government-controlled operations. Bureau de Récherches Géologiques et Minières (BRGM) remained an important instrument of the French Government in securing raw materials for the French industry.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Oct. 5, 1983.

[2]In addition to the commodities listed, France also produces germanium from domestic ores and has been described as the world's leading producer of this commodity in French sources. Output was reported as 14 metric tons in 1980, all from the Saint-Salvy Mine. Unfortunately, actual output is not regularly reported, and the ore from this mine is not sufficiently uniform in grade to permit estimates of output based on reported concentrate production. In addition, France produces large quantities of stone but statistics on output are not available for 1978-82.

[3]Although output reported is at the smelter stage of production rather than at the mine stage and thus could include metal contained in ores mined in other countries, it is believed that any such production derived from ores from other countries is not duplicative to any significant extent of mine production reported for other countries.

[4]Revised to zero.

[5]Series revised to include blast furnace ferroalloys and silicon metal, both hitherto counted separately.

[6]Series revised to eliminate a small duplication of counting between secondary soft lead and secondary antimonial lead.

[7]Includes smectic clay.

[8]Excludes bituminous material produced by oil refineries.

[9]Includes anthracite.

TRADE

France remained a net importer of minerals in 1981, the latest year for which complete data were available. Roughly 43% of the total value of imports was in minerals, fuels, and related materials. Fuels topped the list of imports and accounted for 28% of total imports. Mineral exports amounted, by value, to 21% of total country exports.

Ferrochromium	1,300	4,742	2,200	Romania 1,000; Italy 596; West Germany 229.
Ferromanganese	321,477	383,596	231,496	Italy 51,907; Belgium-Luxembourg 44,318; West Germany 26,076.
Ferromolybdenum	486	1,115	--	Netherlands 801; West Germany 128; Belgium-Luxembourg 81.
Ferronickel	61,560	48,611	--	West Germany 19,253; Italy 11,561; Sweden 4,092.
Ferrosilicochromium	2,217	2,095	NA	Italy 1,764; Belgium-Luxembourg 306.
Ferrosilicomanganese	9,361	11,507	5,671	West Germany 3,716; Belgium-Luxembourg 1,207; United Kingdom 508.
Ferrosilicon	80,342	70,137	7,014	West Germany 24,630; Italy 15,213; Japan 9,744.
Unspecified	37,055	36,439	6,991	West Germany 6,242; Canada 2,364; United Kingdom 1,997.
Steel, primary forms thousand tons	2,671	3,021	493	Italy 817; Spain 235; West Germany 213.
Semimanufactures:				
Bars, rods, angles, shapes, sections —do	2,844	2,758	257	West Germany 580; Belgium-Luxembourg 328; Italy 263.
Universals, plates, sheets do	3,528	3,314	236	West Germany 627; Italy 413; U.S.S.R. 194.
Hoop and strip	549,471	495,279	4,802	West Germany 164,469; Belgium-Luxembourg 53,691; Italy 48,856.
Rails and accessories	268,348	253,870	31,665	Italy 52,332; Algeria 23,156; Belgium-Luxembourg 23,048.
Wire	185,955	192,575	41,719	West Germany 37,983; United Kingdom 10,875; Belgium-Luxembourg 8,759.
Tubes, pipes, fittings thousand tons	1,521	1,781	184	Iraq 212; Mexico 175; West Germany 135.
Castings and forgings, rough	64,409	64,170	939	West Germany 21,665; Belgium-Luxembourg 20,753; United Kingdom 3,076.

See footnotes at end of table.

Table 2.—France: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Lead:				
Ore and concentrate	69	140	--	United Kingdom 64; Saudi Arabia 56; Singapore 10.
Oxides	16,368	14,187	1	U.S.S.R. 3,504; Romania 2,340; Czechoslovakia 2,218.
Ash and residue containing lead	13,782	11,824	--	Belgium-Luxembourg 6,817; West Germany 4,782.
Metal including alloys:				
Scrap	7,851	10,635	--	Italy 5,416; West Germany 3,747; Belgium-Luxembourg 790.
Unwrought	57,625	62,188	--	Belgium-Luxembourg 17,038; West Germany 12,835; U.S.S.R. 9,126.
Semimanufactures	3,513	2,033	(1)	West Germany 790; Italy 354; Belgium-Luxembourg 175.
Magnesium: Metal including alloys:				
Scrap	588	568	20	Italy 259; West Germany 200; Netherlands 84.
Unwrought	4,195	5,169	813	West Germany 1,510; Turkey 423; Netherlands 360.
Semimanufactures	184	193	--	West Germany 103; Israel 17; Switzerland 16.
Manganese:				
Ore and concentrate, metallurgical-grade	6,390	17,243	--	Belgium-Luxembourg 11,998; Italy 2,388; Netherlands 1,435.
Oxides and hydroxides	991	777	--	United Kingdom 203; Italy 202; Morocco 107.
Metal including alloys, all forms	2,276	2,987	--	Italy 1,262; Sweden 483; West Germany 334.
Mercury 76-pound flasks	1,102	725	--	Belgium-Luxembourg 522; Austria 58.
Metalloids:				
Arsenic:				
Oxides and acids	7,894	7,903	973	United Kingdom 3,071; Australia 612; Israel 419.
Metal including alloys, all forms	104	87	--	NA.
Boron including alloys, all forms value	$1,626	$35,517	NA	NA.
Phosphorus	1,227	1,552	NA	Switzerland 975; Denmark 40; Belgium-Luxembourg 59.
Selenium	(1)	7	NA	NA.
Silicon	24	20	--	NA.
Tellurium	(1)	5	--	United Kingdom 3.
Molybdenum:				
Ore and concentrate	1,180	1,481	--	Netherlands 888; Austria 246; Belgium-Luxembourg 138.
Oxides and hydroxides	21	1	--	NA.
Metal including alloys:				
Scrap	NA	97	12	West Germany 44; United Kingdom 11; Japan 5.
Unwrought	NA	42	--	Netherlands 26; United Kingdom 7; Sweden 4.
Semimanufactures	88	41	--	West Germany 16; United Kingdom 11.
All forms	45	--		
Nickel:				
Ore and concentrate value	$8,282	--		
Matte and speiss	272	3	--	Portugal 2; Switzerland 1.
Oxides and hydroxides	547	235	37	West Germany 44; Yugoslavia 32; Spain 20.
Ash and residue containing nickel	4,634	1,056	--	Sweden 340; Italy 209; United Kingdom 192.
Metal including alloys:				
Scrap	2,179	2,461	362	West Germany 958; United Kingdom 526; Austria 201.
Unwrought	6,757	5,262	366	West Germany 1,855; India 539; Mexico 500.
Semimanufactures	6,301	4,513	549	West Germany 2,436; Italy 242; Belgium-Luxembourg 144.
Platinum-group metals:				
Waste and sweepings value, thousands	$4,822	$7,023	--	Spain $5,056; United Kingdom $1,537; Switzerland $300.
Metal including alloys, unwrought and partly wrought:				
Palladium troy ounces	10,353	21,348	--	Switzerland 10,835; Netherlands 2,765; United Kingdom 2,026.

See footnotes at end of table.

Table 2.—France: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Platinum-group metals —Continued				
Metal including alloys, unwrought and partly wrought —Continued				
Platinum ____ troy ounces	80,072	92,113	--	Switzerland 29,257; United Kingdom 22,666; West Germany 13,407.
Unspecified ____ do	18,099	17,104	NA	West Germany 6,012; Bulgaria 4,373; United Kingdom 2,861.
Rhenium: Metal including alloys, all forms ____ value	$452,674	$46,191	NA	NA.
Silver:				
Ore and concentrate value, thousands	$1,607	$601	--	All to Sweden.
Waste and sweepings ____ do	$56,199	$30,204	--	Spain $24,826; Sweden $4,819; West Germany $324.
Metal including alloys, unwrought and partly wrought thousand troy ounces	30,581	18,717	(1)	United Kingdom 9,619; Switzerland 4,226; Netherlands 1,134.
Tin:				
Ore and concentrate	8	36	--	Spain 35.
Oxides	27	56	NA	West Germany 49; Belgium-Luxembourg 5.
Ash and residue containing tin	180	160	--	West Germany 119; Spain 21.
Metal including alloys:				
Scrap	915	656	--	Netherlands 338; West Germany 172; United Kingdom 116.
Unwrought	643	848	18	United Kingdom 415; Netherlands 319; Italy 25.
Semimanufactures	356	327	1	Nigeria 74; Italy 52; Switzerland 48.
Titanium:				
Ore and concentrate	2,160	1,070	--	West Germany 938.
Oxides	2,502	2,495	--	United Kingdom 748; Italy 565; Belgium-Luxembourg 237.
Metal including alloys:				
Scrap	NA	758	57	United Kingdom 407; West Germany 161; Netherlands 65.
Unwrought	NA	2	NA	NA.
Semimanufactures	250	423	20	Belgium-Luxembourg 178; West Germany 30; United Kingdom 13.
All forms	484	--		
Tungsten:				
Ore and concentrate	846	760	198	West Germany 262; Austria 176; Singapore 72.
Oxides and hydroxides	40	81	--	Sweden 42; Bulgaria 25; Switzerland 5.
Ash and residue containing tungsten	--	66	--	NA.
Metal including alloys:				
Scrap	NA	318	67	West Germany 127; Belgium-Luxembourg 43; Switzerland 38.
Unwrought	NA	75	--	Switzerland 25; West Germany 24; Italy 7.
Semimanufactures	19	43	1	West Germany 10; Belgium-Luxembourg 7; Sweden 5.
All forms	248	--		
Uranium and/or thorium:				
Ore and concentrate	11	--		
Metal including alloys, all forms, uranium	3	4	NA	NA.
Vanadium:				
Oxides and hydroxides	39	50	--	All to Belgium-Luxembourg.
Ash and residue containing vanadium	168	112	--	NA.
Metal including alloys:				
Scrap	NA	53	--	Netherlands 6; unspecified 47.
Unwrought	NA	1	NA	NA.
Semimanufactures ____ value	$21,533	$16,010	NA	NA.
Zinc:				
Ore and concentrate	43,979	50,642	--	Italy 29,982; Belgium-Luxembourg 20,633.
Oxides	19,470	13,830	--	Romania 2,402; West Germany 2,306; Belgium-Luxembourg 1,958.
Blue powder	1,846	2,736	136	West Germany 889; Italy 761; Switzerland 501.
Matte	5,201	2,998	--	Italy 1,656; Belgium-Luxembourg 462; Netherlands 435.

See footnotes at end of table.

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Zinc —Continued				
Ash and residue containing zinc	21,012	23,654	--	Belgium-Luxembourg 15,445; West Germany 7,332; Netherlands 777.
Metal including alloys:				
Scrap	3,209	7,861	--	Italy 2,963; Belgium-Luxembourg 2,347; West Germany 1,550.
Unwrought	35,504	61,929	23,352	West Germany 11,853; Belgium-Luxembourg 5,967; Sweden 5,287.
Semimanufactures	42,047	37,792	29	Belgium-Luxembourg 18,018; West Germany 11,801; Denmark 3,210.
Zirconium:				
Ore and concentrate	260	97	NA	West Germany 13; unspecified 84.
Metal including alloys, all forms	888	--		
Other:				
Ores and concentrates	2,521	368	(1)	Algeria 288.
Oxides and hydroxides	1,908	1,077	48	West Germany 294; United Kingdom 115; Belgium-Luxembourg 57.
Ashes and residues	22,407	16,887	--	Sweden 10,862; West Germany 2,065; Belgium-Luxembourg 1,931.
Pyrophoric alloys	13	82	NA	NA.
Cermets	(1)	48	NA	NA.
Base metals including alloys, all forms	5	83	2	Japan 76; United Kingdom 3.
Waste and sweepings of precious and semiprecious metals value, thousands	$2,285	$3,054	--	United Kingdom $1,432; West Germany $1,013; Belgium-Luxembourg $349.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	1,120	1,165	34	Netherlands 272; West Germany 240; Belgium-Luxembourg 236.
Artificial: Corundum	24,610	21,654	756	Italy 5,069; Austria 2,819; West Germany 2,522.
Dust and powder of precious and semiprecious stones, including diamond kilograms	40	18	NA	NA.
Grinding and polishing wheels and stones	3,949	4,717	97	West Germany 1,092; United Kingdom 784; Spain 342.
Asbestos, crude	1,574	1,334	--	Tunisia 1,147; Spain 46; Guadeloupe 37.
Barite and witherite	98,255	103,858	--	West Germany 82,206; Greece 5,200; Italy 4,209.
Boron materials:				
Crude natural borates	4,583	2,341	--	Spain 1,388; Italy 602; Belgium-Luxembourg 259.
Oxides and acids	40,536	26,570	29	West Germany 8,438; East Germany 5,489; Hungary 2,195.
Cement thousand tons	2,614	2,844	246	Ivory Coast 475; West Germany 366; Cameroon 358.
Chalk	530,633	522,676	5,078	West Germany 205,359; Belgium-Luxembourg 110,147; Switzerland 39,315.
Clays and clay products:				
Crude:				
Andalusite, kyanite, sillimanite	437	318	--	Netherlands 147.
Bentonite	6,880	12,630	--	Nigeria 4,117; Congo 2,062; Belgium-Luxembourg 1,442.
Chamotte earth	211,174	179,859	--	Italy 65,648; West Germany 34,661; Belgium-Luxembourg 17,500.
Dinas earth	53	26	NA	NA.
Kaolin	181,593	167,284	--	West Germany 73,482; Italy 43,740; Switzerland 11,461.
Unspecified	389,543	347,855	66	Italy 178,491; West Germany 88,530; Spain 16,120.
Products:				
Nonrefractory	422,619	393,243	2,375	West Germany 198,269; Belgium-Luxembourg 73,347; Switzerland 50,013.
Refractory including nonclay brick	216,046	215,748	4,213	West Germany 59,333; Belgium-Luxembourg 29,767; Italy 27,569.
Cryolite and chiolite	12	43	--	Iraq 21; Italy 21.
Diamond:				
Gem, not set or strung carats	54,949	43,091	3,905	Switzerland 15,404; Belgium-Luxembourg 13,348; Israel 2,923.

See footnotes at end of table.

Diamond —Continued				
Industrial ____ carats	177,213	155,999	5,497	Ireland 85,961; Belgium-Luxembourg 58,081; United Kingdom 693.
Diatomite and other infusorial earth	25,852	26,978	--	West Germany 8,685; Belgium-Luxembourg 4,614; Italy 2,840.
Feldspar, fluorspar, related materials:				
Feldspar	56,949	58,571	--	Belgium-Luxembourg 25,024; Spain 14,728; West Germany 6,947.
Fluorspar	107,392	84,181	--	West Germany 39,437; Italy 29,181; Sweden 4,354.
Unspecified	136	82	--	NA.
Fertilizer materials:				
Crude, n.e.s	28,694	25,956	--	Switzerland 13,438; Belgium-Luxembourg 2,830; Spain 2,115.
Manufactured:				
Ammonia	159,466	244,117	--	West Germany 98,780; Spain 24,010; Italy 19,059.
Nitrogenous	586,482	661,154	--	Belgium-Luxembourg 111,141; China 84,053; West Germany 79,744.
Phosphatic	254,550	228,121	--	Switzerland 77,650; Austria 43,890; Italy 33,861.
Potassic	335,407	365,959	--	West Germany 83,394; Italy 69,412; Switzerland 54,548.
Unspecified and mixed	513,781	418,521	6	Belgium-Luxembourg 83,073; West Germany 76,895; Ireland 68,743.
Graphite, natural ___ thousand tons	889	810	--	West Germany 376; Spain 153; United Kingdom 87.
Gypsum and plaster ____ do	1,142	1,144	(1)	West Germany 438; Belgium-Luxembourg 350; Netherlands 114.
Halogens:				
Chlorine	9,551	5,189	--	West Germany 3,822; Tunisia 458; Switzerland 365.
Iodine	138	140	NA	West Germany 40; United Kingdom 23; Czechoslovakia 13.
Unspecified	67	2	--	NA.
Lime	240,029	243,095	53	West Germany 133,091; Belgium-Luxembourg 71,433; Guinea 10,321.
Magnesium compounds:				
Magnesite	1,295	1,416	--	West Germany 257; unspecified 1,159.
Oxides and hydroxides	8,216	12,532	--	U.S.S.R. 4,600; Spain 2,206; Italy 1,385.
Mica:				
Crude including splittings and waste	3,816	6,032	22	United Kingdom 2,471; West Germany 995; Belgium-Luxembourg 680.
Worked including agglomerated splittings	840	976	19	West Germany 317; Switzerland 295; Italy 92.
Nitrates, crude	11	1	--	All to Italy.
Phosphates, crude	15,498	3,440	--	Belgium-Luxembourg 3,009; Netherlands 187; Italy 136.
Pigments, mineral:				
Natural, crude	1,262	961	NA	Algeria 250; unspecified 711.
Iron oxides and hydroxides, processed	r8,410	9,794	1,091	Italy 2,035; United Kingdom 770; Belgium-Luxembourg 584.
Potassium salts, crude	13,293	8,807	--	Belgium-Luxembourg 5,985; Switzerland 1,467; Netherlands 1,145.
Precious and semiprecious stones other than diamond:				
Natural:				
Gem material value, thousands	$57,587	$53,350	$2,169	Switzerland $42,601; United Kingdom $1,949; Brazil $1,644.
Quartz crystal, piezoelectric do	$51	$132	NA	Switzerland $113.
Synthetic ____ do	$13,538	$12,795	$1	Switzerland $7,191; West Germany $539; U.S.S.R. $505.
Pyrite, unroasted	121	352	--	Netherlands 230; West Germany 47; Republic of South Africa 45.
Salt and brine	129,735	235,310	215	West Germany 142,311; Italy 50,198; Belgium-Luxembourg 26,296.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	14,542	19,390	667	Netherlands 5,526; Switzerland 1,865; United Kingdom 1,581.

See footnotes at end of table.

Table 2.—France: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Sodium and potassium compounds, n.e.s. —Continued				
Sodium carbonate, natural and manufactured	388,778	254,422	30	Sweden 25,768; West Germany 22,918; Brazil 20,000.
Sodium hydroxide	96,624	97,309	453	Indonesia 19,900; Tunisia 6,932; Ivory Coast 4,695.
Sodium sulfate, natural and manufactured	32,338	30,933	NA	Italy 11,242; West Germany 11,010; Belgium-Luxembourg 1,539.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	160,026	144,180	33	Belgium-Luxembourg 46,702; West Germany 33,602; Netherlands 25,628.
Worked	54,036	48,656	545	Belgium-Luxembourg 21,379; West Germany 12,721; Saudi Arabia 3,654.
Dolomite, chiefly refractory-grade	45,570	32,421	2	Belgium-Luxembourg 10,362; West Germany 4,229; Ivory Coast 3,403.
Gravel and crushed rock thousand tons	11,247	10,419	4	West Germany 6,224; Switzerland 1,456; Belgium-Luxembourg 1,227.
Limestone other than dimension	165,463	209,167	--	West Germany 183,281; Belgium-Luxembourg 23,498; Portugal 1,500.
Quartz and quartzite	4,445	2,343	205	Belgium-Luxembourg 760; Italy 294; West Germany 269.
Sand other than metal-bearing thousand tons	4,232	3,855	(1)	West Germany 2,225; Italy 738; Switzerland 675.
Sulfur:				
Elemental:				
Crude including native and byproduct do	1,100	890	--	United Kingdom 213; Tunisia 150; Netherlands 103.
Colloidal, precipitated, sublimed	2,334	2,117	--	West Germany 482; Belgium-Luxembourg 469; United Kingdom 257.
Dioxide	6,922	2,275	NA	Belgium-Luxembourg 1,404; East Germany 700.
Sulfuric acid	199,150	198,650	--	Belgium-Luxembourg 148,826; Spain 28,193; Portugal 2,767.
Talc, steatite, soapstone, pyrophyllite	81,332	73,913	5,424	West Germany 24,335; Belgium-Luxembourg 9,252; United Kingdom 7,489.
Vermiculite	1,761	573	--	Venezuela 124.
Other:				
Crude thousand tons	r1,177	468	--	Belgium-Luxembourg 250; Switzerland 194; West Germany 20.
Slag and dross, not metal-bearing do	2,279	1,945	--	West Germany 960; Belgium-Luxembourg 798; Netherlands 77.
Oxides and hydroxides of barium, magnesium, strontium	9,363	2,702	76	United Kingdom 694; West Germany 538; U.S.S.R. 398.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	149,526	127,861	1,451	West Germany 24,579; Algeria 18,413; United Kingdom 15,227.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	5,879	8,540	--	United Kingdom 5,192; Belgium-Luxembourg 2,774; Spain 116.
Carbon: Carbon black	68,789	63,978	29	West Germany 17,753; Italy 15,446; Spain 10,221.
Coal:				
Anthracite	100,603	67,402	--	Belgium-Luxembourg 26,235; United Kingdom 16,284; Italy 9,678.
Bituminous	358,726	687,584	6	West Germany 405,008; Austria 83,155; Norway 75,641.
Briquets of anthracite and bituminous coal	50,249	26,443	--	United Kingdom 14,178; Belgium-Luxembourg 10,773; Switzerland 1,415.

See footnotes at end of table.

Lignite including briquets	6,617	6,765	--	Spain 6,492; West Germany 273.
Coke and semicoke	870,906	960,274	604	West Germany 306,429; Romania 110,680; Hungary 97,894.
Gas, natural million cubic feet	8,441	7,373	--	Belgium-Luxembourg 3,203; Switzerland 3,160; Austria 911.
Hydrogen, helium, rare gases	6,040	7,219	106	Spain 377; Switzerland 189; Algeria 157.
Peat including briquets and litter	1,680	496	--	Belgium-Luxembourg 153; Switzerland 117; Libya 56.
Petroleum and refinery products:[r]				
Crude 42-gallon barrels	555	672	--	Austria 621; West Germany 15; Japan 15.
Refinery products:				
Liquefied petroleum gas thousand 42-gallon barrels	8,183	8,944	19	Spain 3,630; Italy 823; United Kingdom 725.
Gasoline:				
Aviation do	9	(1)	--	NA.
Motor do	23,135	19,109	523	Switzerland 3,323; Netherlands 3,011; West Germany 2,975.
Mineral jelly and wax do	346	365	7	West Germany 117; Netherlands 72; Belgium-Luxembourg 35.
Kerosine and jet fuel do	10,962	10,189	(1)	Switzerland 2,502; Greece 1,181; Egypt 1,038.
Distillate fuel oil do	29,067	24,670	338	West Germany 8,066; Switzerland 6,658; Saudi Arabia 3,637.
Lubricants do	5,383	5,078	82	Belgium-Luxembourg 1,013; West Germany 577; Netherlands 321.
Residual fuel oil do	39,335	47,646	808	Italy 18,197; United Kingdom 4,462; West Germany 4,456.
Bitumen and other residues do	1,797	1,580	--	West Germany 677; Switzerland 630; Belgium-Luxembourg 184.
Bituminous mixtures do	329	252	(1)	Algeria 64; Belgium-Luxembourg 50; United Kingdom 24.
Petroleum coke do	49	13	--	West Germany 12.
Tars and other crude chemicals derived from coal, gas, and petroleum	274,096	385,401	45	West Germany 133,086; United Kingdom 74,590; Netherlands 64,793.

[r]Revised. NA Not available.
(1)Less than 1/2 unit.

Table 3.—France: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals:				
Cesium and rubidium value	$3,549	$4,968	NA	NA.
Lithium:				
Oxides and hydroxides	452	467	45	West Germany 242; China 142; U.S.S.R. 32.
Metal including alloys, all forms	27	6	--	Mainly from West Germany.
Alkaline metals	40	92	NA	NA.
Alkaline-earth metals	9	11	NA	NA.
Rare-earth metals	11	64	NA	Austria 52.
Aluminum:				
Ore and concentrate thousand tons	1,358	1,989	--	Guinea 1,544; Australia 222; Guyana 80.
Oxides and hydroxides	44,644	33,968	2,595	West Germany 23,205; Netherlands 4,941; United Kingdom 1,036.
Ash and residue containing aluminum	10,719	12,262	NA	West Germany 5,550; Netherlands 2,149; Italy 2,087.

See footnotes at end of table.

Metal including alloys:				
Scrap	56,671	60,615	360	Belgium-Luxembourg 16,751; West Germany 15,283; Netherlands 14,141.
Unwrought	332,451	300,370	3,604	Netherlands 81,546; West Germany 59,301; Greece 34,564.
Semimanufactures	219,986	200,301	4,310	West Germany 74,821; Belgium-Luxembourg 44,567; Italy 15,484.
Antimony:				
Ore and concentrate	8,823	10,998	NA	Thailand 3,625; Bolivia 2,314; Republic of South Africa 1,566.
Oxides	425	373	--	United Kingdom 191; Belgium-Luxembourg 155; West Germany 12.
Metal including alloys, all forms	348	552	NA	China 185; Spain 173; Bolivia 127.
Beryllium:				
Oxides and hydroxides value	$70,752	$84,091	$82,987	NA.
Metal including alloys, all forms	9	3	2	West Germany 1.
Bismuth: Metal including alloys, all forms	362	288	NA	Peru 76; Belgium-Luxembourg 56; Canada 49.
Cadmium: Metal including alloys, all forms	659	598	1	Belgium-Luxembourg 248; Netherlands 163; Australia 112.
Chromium:				
Ore and concentrate	278,773	146,435	(1)	Republic of South Africa 62,679; Madagascar 40,522; Turkey 19,700.
Oxides and hydroxides	6,970	5,549	2	West Germany 3,100; Italy 854; U.S.S.R. 723.
Metal including alloys, all forms	394	300	1	Japan 43; United Kingdom 42; undetermined 197.
Cobalt:				
Ore and concentrate	5,696	6,460	--	All from Morocco.
Oxides and hydroxides	201	182	5	United Kingdom 92; Belgium-Luxembourg 65; Canada 18.
Metal including alloys, all forms	1,140	1,133	229	Zaire 213; Japan 113; Norway 105.
Columbium and tantalum:				
Ore and concentrate	--	1	--	All from West Germany.
Metal including alloys, all forms:				
Columbium (niobium)	3	3	1	NA.
Tantalum	36	34	16	West Germany 13; United Kingdom 4.
Copper:				
Ore and concentrate	(2)	8	--	United Kingdom 4; Zaire 4.
Matte and speiss including cement copper	1,054	13	--	United Kingdom 10.
Oxides and hydroxides	719	904	NA	Italy 322; Romania 260; Belgium-Luxembourg 178.
Sulfate	2,935	2,993	NA	Italy 1,323; U.S.S.R. 832; Belgium-Luxembourg 187.
Ash and residue containing copper	3,511	4,727	NA	Belgium-Luxembourg 1,814; Netherlands 1,242; Canada 930.
Metal including alloys:				
Scrap	36,740	29,618	305	West Germany 7,693; United Kingdom 5,542; Belgium-Luxembourg 4,541.
Unwrought	434,467	412,108	2,086	Zambia 83,132; Chile 80,709; Belgium-Luxembourg 80,230.
Semimanufactures	206,790	169,953	2,018	Belgium-Luxembourg 73,806; West Germany 42,858; Italy 24,417.
Gallium: Metal including alloys, all forms	250	504	1	Belgium-Luxembourg 502.
Germanium: Metal including alloys, all forms value, thousands	$767	$1,399	$262	Belgium-Luxembourg $776; Japan $184; U.S.S.R. $84.
Gold:				
Waste and sweepings do	$13,318	$34,598	$936	Switzerland $30,222; Netherlands $950; West Germany $482.
Metal including alloys, unwrought and partly wrought:				
For domestic use thousand troy ounces	1,343	992	246	Switzerland 218; Netherlands 185; West Germany 167.
Temporary imports do	1,191	945	29	Switzerland 454; Netherlands 390; United Kingdom 20.

			United States	Other (principal)
METALS —Continued				
Hafnium: Metal including alloys, all forms ____ value	$16,193	$28,337	NA	NA.
Iron and steel:				
Iron ore and concentrate:				
Excluding roasted pyrite ____ thousand tons	18,643	16,511	--	Brazil 4,081; Sweden 2,751; Mauritania 2,511.
Pyrite, roasted	73,924	62,981	--	Italy 43,287; Spain 11,786; West Germany 7,906.
Metal:				
Scrap	455,082	347,429	408	Belgium-Luxembourg 123,125; West Germany 117,882; United Kingdom 77,430.
Pig iron, cast iron, related materials	505,449	433,455	160	West Germany 381,861; Sweden 18,698; Canada 18,460.
Ferroalloys:				
Ferrochromium	113,914	113,284	203	Zimbabwe 41,936; Republic of South Africa 31,332; Turkey 10,780.
Ferromanganese	48,575	33,796	--	Norway 18,933; Belgium-Luxembourg 5,891; West Germany 5,049.
Ferromolybdenum	1,471	1,630	NA	Belgium-Luxembourg 497; Austria 479; Italy 141.
Ferronickel	115,864	83,279	18	New Caledonia 73,552; Greece 3,570; Dominican Republic 2,671.
Ferrosilicochromium	334	157	NA	NA.
Ferrosilicomanganese	33,778	34,275	--	Belgium-Luxembourg 19,111; Norway 14,010; Republic of South Africa 678.
Ferrosilicon	20,647	28,720	--	West Germany 11,514; Norway 7,273; Italy 2,620.
Unspecified	2,693	3,172	110	Brazil 962; Belgium-Luxembourg 539; West Germany 322.
Steel, primary forms ____ thousand tons	2,321	1,940	1	Belgium-Luxembourg 1,249; West Germany 438; Italy 89.
Semimanufactures:				
Bars, rods, angles, shapes, sections ____ do	2,451	2,328	1	Belgium-Luxembourg 718; Italy 627; West Germany 601.
Universals, plates, sheets ____ do	2,830	2,801	1	Belgium-Luxembourg 1,189; West Germany 743; Italy 355.
Hoop and strip	411,483	362,708	213	West Germany 153,905; Belgium-Luxembourg 147,638; Italy 17,437.
Rails and accessories	62,451	46,763	4	Belgium-Luxembourg 35,033; United Kingdom 9,554; West Germany 1,679.
Wire	204,601	186,821	144	Belgium-Luxembourg 67,138; West Germany 52,257; Italy 29,979.
Tubes, pipes, fittings	559,420	601,691	2,484	West Germany 210,228; Italy 170,791; Belgium-Luxembourg 63,420.
Castings and forgings, rough	52,648	49,744	119	West Germany 26,992; Italy 8,759; Belgium-Luxembourg 5,157.
Lead:				
Ore and concentrate	139,029	142,449	--	Republic of South Africa 49,658; Morocco 25,820; Greenland 22,554.
Oxides	1,322	1,886	26	East Germany 607; Belgium-Luxembourg 605; West Germany 431.
Ash and residue containing lead	13,225	16,260	--	Italy 9,133; Belgium-Luxembourg 3,405; United Kingdom 2,382.
Metal including alloys:				
Scrap	31,187	21,055	43	Netherlands 11,563; Belgium-Luxembourg 6,068; West Germany 1,530.
Unwrought	55,088	40,620	2,876	United Kingdom 14,024; West Germany 10,882; Belgium-Luxembourg 8,720.
Semimanufactures	2,270	1,205	88	Belgium-Luxembourg 728; West Germany 333; Netherlands 11.
Magnesium:				
Metal including alloys:				
Scrap	225	329	--	Italy 219; Netherlands 78; West Germany 28.
Unwrought	3,953	4,210	861	Norway 2,678; Canada 223; United Kingdom 144.
Semimanufactures	311	327	24	Italy 154; West Germany 83; Spain 25.

COMMODITY REVIEW

METALS

Aluminum.—Development of the bauxite mine based on the La Brasque deposit near Toulon, in the south of France, was underway during 1982. The mine's recoverable reserves were reported at 1 million tons. Life of the mine was planned for 6 years; the yearly production will peak at 300,000 tons. Development costs were reported at $1.6 million, and the mine will employ 65 persons.

The largest producer of aluminum, Péchiney Ugine Kuhlmann (PUK), showed a deficit after nationalization and was asking for assistance from the Government. High prices for electricity, high interest on loans, and depressed markets have affected the financial results of the company. At the aluminum smelter at Saint-Jean-de-Maurienne, an old potline with a capacity of 14,000 tons per year was closed.

Antimony.—The antimony mine and concentrator at Ty Gardien a Quimpere, owned by Société Cheni, a wholly owned subsidiary of Coframines, was preparing to close during 1983. The company had been aware that reserves at Ty Gardien were small, but the very fast depletion of reserves was not expected. Production had started before complete exploration of the deposit was undertaken in the belief that costs of starting production with a short mine life would be less than to further explore the deposit.

Cobalt.—Metaux Speciaux S.A., a subsidiary of PUK, stopped production of cobalt metal at the plant located at Pompliers-Saint-Marcel, Savoie. Low prices and difficulties obtaining concentrates from the Bou Azzer Mine in Morocco promoted the decision to end production.

Gold.—At the Salsigne gold mine located on the southern flanks of the Montagne Noir near Salsigne, north of Carcassonne in the southwestern part of France, a new shaft, Castan, was commissioned. The shaft was 350 meters deep with 14 levels 45 meters apart and has replaced the old shaft, Bru. With the new shaft in operation, mining of the Salsigne Mine was shifted from all opencast mining to mining equally divided between opencast and underground.

During the summer, production of gold started at a mine near Bourneix, Haute Vienne. The operator was Société Minière Bourneix S.A. Coframines, a subsidiary of BRGM, owned 31.25% of the Bourneix. The new mine had a loss of about $550,000 during the year, resulting from startup problems.

Iron and Steel.—The steel industry, including iron ore mines, had a difficult year, mostly resulting from worldwide recession and difficulties from nationalization. The Government expressed a desire to streamline and make more effective the newly acquired industry, but the restructuring plan was not made public at yearend.

Tungsten.—Two new mines started pro-

duction during 1982. The mine at Favieres, near Frejus, an opencast operation, was the first. It was planned to reach an output of 350 tons per year of finished gravity concentrates averaging 72% WO_3 and 75 tons per year of low-grade concentrates averaging 48% WO_3. The Montbelleux Mine, at Luitre, near Fougères Iles-de-Vilaine, was the other mine. Montbelleux, which was earlier operated until 1956, was owned by the Société des Mines de Montbelleux, which was part of the Hochschild Group. Measured reserves at the mine total 3 million tons with an average content of 0.25% WO_3 and 0.12% Sn. In addition to tungsten, the facilities at the Montbelleux recover modest quantities of tin.

NONMETALS

Barite.—At the Chaillac Mine, the largest barite producer in France, production stopped for several weeks because of a fire that destroyed key elements in the system that provided electrical power to the mine. However, the company, Société Barytine de Chaillac, was able to meet its contractual obligations by sales of barite from its stocks.

At the Lacan a Bertholen Mine at Aveyron, which produced barite with an average content of 70% $BaSO_4$ and was operated by the Société des Produits Chimiques de Viviez, an installation for preconcentration was completed. Capacity of the new installation was estimated at 60,000 tons of product per year.

Clays.—BRGM, under the program, L'Inventaire des Ressources Minières de la France (Inventory of the Mineral Resources of France), discovered a layer of attapulgite in the tertiary basins of the Massif Armoricain in the central part of France. Assessment of preliminary results of the exploration was underway at yearend.

Bentonite.—As part of the French Government's effort to explore minerals on French national territory, the geologist of BRGM located indications of possible bentonite deposits in the sedimentary basin at Malzieu, Lozer, and Forez.

Fluorspar.—At the Fonsant Mine, Var, owned by the Société d'Entreprises Carrieres et Mines d'Esterel, development of a new level was completed. With this operation, reserves to sustain 4 years of production at present levels of output were made ready for use.

At the Montroc Mine, Tarn, owned by the Société General de Recherches et d'Exploration Minières, reclamation of a valley used as a mine dump was complete. The dump was covered with humus and about 5 hectares of land was made usable for agriculture and returned to their owners. At the same mine, the concentrator has been modified so that it can produce a concentrate with 99% CaF_2.

The Compagnie Française de Mokta has closed its mine at l'Argentolle, Saone-et-Loire, because reserves were exhausted. As replacement for l'Argentolle, Mokta started production from the Sommant deposit, located near the existing operation at Reclasen, Saone-et-Loire. Reportedly, the Sommant deposit has limited reserves.

Talc.—At the talc mine at Trimouns near Luzenac, Ariége, operated by Talcs de Luzenac and located at an altitude of 1,800 meters, new equipment for removal of the overburden was purchased and used. Introduction of the new equipment has increased the productivity per man shift from 193 cubic meters in 1981 to 283 cubic meters in 1982.

In the talc mill at Luzenac, which processed ores from the mine at Trimouns, computers were used to control the operation of crushers. Productivity of the plant increased by 50% and the product was more uniform. An experimental optical sorter was tried during the year at Luzenac; results were good, and management decided to introduce the sorter in 1983 and start using it on a full scale basis in 1984.

MINERAL FUELS

Coal.—Targets for domestic production of coal set by the new NEP, developed by the Socialist Government, appeared to be too high for the domestic coal industry at yearend 1982. The desired consumption of about 50 million to 60 million tons per year was to be met by equal shares of domestic and imported coal in France's coal supply. However, adverse mining and geological conditions in most coal mines in France made introduction of mass mining methods difficult. Opencast mining could be introduced in a small number of deposits, mostly lignite. In other deposits, seams are deeplying and steep, with gas and water present.

French ports will have to be ready to handle larger volumes of coal than anticipated. At yearend, planning was underway to modernize major coal ports at Dunkirk, Le Havre, Rouen, and Marseilles and increase their coal-handling capacity.

Expansion of production in the coal mine near Carmaux, Tarn, was underway. The mine, an underground operation, had about 6 million tons of reserves. Exploration was

conducted in the vicinity of present operations, and about 15 million tons of reserves of good coking coal was discovered. Planning was started for development of a new opencast mine based on these reserves, which at planned rates of production should last to the year 2010.

Natural Gas.—France concluded two agreements for imports of natural gas, one with Algeria and the other with the U.S.S.R. The French Government-owned Gaz de France concluded with Soyuzgasexport from the U.S.S.R. an agreement for delivery of 280 billion cubic feet of Soviet natural gas over 25 years, starting in 1984. The price of gas will be determined on an index based on world market prices of other energy sources.

After 2 years of difficult negotiations, Gaz de France and Société Nationale pour la Recherche, la Production, le Transport, la Transformation, et la Commercialisation des Hydrocarbures (SONATRACH) of Algeria concluded an agreement for deliveries of Algerian liquefied natural gas to France. For 20 years, SONATRACH will deliver to France 320 billion cubic feet of natural gas per year at an f.o.b. price of $5.15 per million British thermal unit (Btu). Transportation costs should bring the price of gas delivered to France to $16 per million Btu.

Petroleum.—The declining French domestic crude oil production was small when compared to demand. Results of exploration for oil and gas were disappointing, and no major finds were announced. Exploratory footage was lower, but the number of completions increased when compared with results in 1981 as a result of shallow drilling in Alsace, Lorraine, and Jura.

At yearend 1982, about 102 licenses for exploration were valid in France. Twenty-one new licenses were granted during the year. About 50 wells with an approximate footage of 271,000 feet were drilled. Roughly 50,000 feet was drilled offshore. In the old field, Schebenhard, in Alsace, three wells were completed and all were producers. This field had been abandoned in 1968 as exhausted. However, the present operator, Société National Elf Aquitaine (SNEA), believed that the Schebenhard Field had more crude oil in its reservoir rock. Three additional wells were planned in 1982 to complete the appraisal of the field's capability.

Although France's domestic crude oil production was insignificant by world standards, France was an important processor of imported crude oil. About 98% of the demand for crude oil was met by imports.

The refining capacity in France dropped by 50,000 barrels per day and, at yearend, was reported at 2.82 million barrels per day, the lowest figure since 1971. Although the capacity was low, the refineries operated during the year at 58% of capacity. Three refineries were closed in 1982—Valenciennes, owned by SNEA, with a capacity of 66,000 barrels per day; Haunoncourt, owned by SRL, with a capacity of 100,000 barrels per day; and Dunkerque, with a capacity of 88,000 barrels per day. In addition, old refining units were closed at Notre Dame de Gravenchon, capacity of 10,000 barrels per day, owned by Mobil Oie Francaise S.A.; and Petite Couronne, 96,000 barrels per day, owned by Shell Francaise S.A. However, an increase of capacity by 16,000 barrels per day was recorded at the refinery at Donges, owned by SNEA, where two old units with aggregate annual capacity of 180,000 barrels per day were replaced by one plant with a capacity of 196,000 barrels per day.

Uranium.—The Government-owned Compagnie Générale des Matières Nucleariés (COGEMA) continued exploration on the recently discovered Contras uranium deposit in Gironde. Total reserves at the Contras deposit were set at 20,000 tons of U_3O_8.

The Government-owned Compagnie Française des Pétroles acquired the holdings of PUK in Minatom and also acquired the Dong Trieu Mining Co., previously owned by the Empain Schneider Group.

The Mineral Industry of Gabon

By Ben A. Kornhauser[1]

The gross domestic product (GDP) of Gabon in 1982 was around $3.28 billion, which was 12% greater than the GDP of $2.94 billion in 1981 but stagnant in real terms when inflation is considered.[2] Of the 1982-83 budget, $803 million was for investments, of which the largest portion was allocated to the Trans-Gabon Railroad and infrastructure.[3] Petroleum and mining were expected to provide the base for economic expansion in the future. In May 1982, six Western European countries signed an agreement with the Gabon Government to construct the second phase of the Trans-Gabon Railroad at a cost of $560 million. This 352-kilometer section from Booue to Franceville was to be completed by late 1987.[4] The first phase of 342 kilometers from Libreville to Booue was completed in December 1982 and was to be dedicated in January 1983. In March, France signed an agreement involving $328,000 to aid in funding the vast program of surveying and prospecting for minerals that started in 1981. The program was expected to take 10 years at a total cost of $30 million to survey one-half of the national territory. The mining inventory program would consist of three phases: the first completed phase, financed by Gabon for about $3 million, was the airborne magnetic survey; the second phase, involving airborne geophysical reconnaissance, was to be performed in 1982 with the $6 million cost to be divided between Gabon and the European Development Fund; the third phase would be prospecting and geochemical sampling of up to 15,000 square kilometers per year by three teams of geologists including the Service Géologique Nationale, France's Bureau de Recherches Géologiques et Minières (BRGM), and a third independent team.

PRODUCTION AND TRADE

The depressed world economy discouraged the flow of funds into Gabon's mineral industry development, hindering its future production growth, except for petroleum exploration. In 1982, the value of petroleum production amounted to $1.56 billion and contributed 50% of the GDP, more than 60% of the budget income, and 76% of the country's exports. The value of mine production increased 10% over that of 1981.

Gabon continued as the major supplier of oil to France's Société Nationale Elf-Aquitaine (SNEA), supplying 45 million barrels per year in 1982. Gabonese exports of crude oil in 1982 totaled 47.6 million barrels compared with 45.6 million barrels in 1981 at values of $1.66 billion and $1.45 billion, respectively. This increased value was due in part to the appreciation of the dollar, which also benefited Gabon in its dollar-denominated sales of manganese ore. In 1982, exports amounted to $2.05 billion compared with imports of $830 million, producing a balance-of-trade surplus of $1.22 billion. The Chinese Petroleum Corp. sought to increase its imports of Gabonese crude oil of 10,000 barrels per day from the Société Nationale des Petroles Gabonais, the state-owned company.

COMMODITY REVIEW

METALS

Manganese.—The Compagnie Minière de L'Ogooue S.A. (COMILOG), Gabon's only manganese producer, built a heavy-media classification plant in 1982 to upgrade fines to a 49% to 50% manganese product. In 1982, COMILOG's production dropped to 58% of capacity, equal to 1,511,930 tons of ore with an average grade of 51% manganese. Included in this total was 105,476 tons of battery-grade ore averaging 83% to 85% manganese dioxide. Fifty to seventy percent of the metallurgical-grade ore went to northern and Western Europe; 14% to 25% to North America; and 5% to 14% to Eastern Europe. One-quarter of the battery-grade ore was exported to Europe, and 70%, to other countries, chiefly in the Far East. United States Steel Corp. reduced its interest in COMILOG from 40.76% to 38.7% during the year. The remaining interests were distributed between the Gabon Government (20%), the BRGM subsidiary Compagnie Française des Mines (17.6%), Imetal S.A. (14.8)%, and other French interests (8.9%). Plans to expand mine capacity and to build a new ferromanganese alloy plant were awaiting the construction of the Trans-Gabon Railroad to Moanda and more favorable market conditions. At present, production was limited by the capacity of the aerial tramway that carried the ore from Moanda to M'Binda in the Congo for transport by railroad to Pointe Noire in the Congo for export. The Société Gabonaise des Ferroalliages was still studying the feasibility of a ferromanganese project at Haut-Ogooue, the proposed site of a hydroelectric plant. To be viable, the plant required the construction of the railroad to Moanda and completion of the Poubara II Dam.

The Government of Gabon and COMILOG became major shareholders in the French ferromanganese plant, Société de Ferromanganese de Paris-Outreau (SFPO), located in Boulogne-Sur-Mer, France, to insure a market for their manganese ore. The plant had considered closing owing to a recent financial adversity. SFPO, the largest ferrromanganese operation in Europe and one of the leading producers in the world, had been a major supplier to the U.S. market. Ownership of SFPO was BRGM (35%), COMILOG (35%), state-owned Société Nationale D'Investissement du Gabon (20%), Acieries de Paris et D'Outreau (5.7%), and Compagnie Financiere de Paris et des Pays-Bas (4.3%).

NONMETALS

Barite.—An investment of $13.4 million was considered necessary to exploit the barite deposit at Dourekiki in Nyanga Province, north of the Mayumba region in southwest Gabon. The Nyanga Mining Co. was to be set up by the Government, Essence et Lubrificants de France (ELF)-Gabon Oil Co., COMILOG, BRGM, and a U.S. mining company. Transportation costs will be a major factor in the development of the project. Either a bridge must be built or the ore must be shipped by river barge to the Port of Mayumba where about 5,000 tons would be processed for domestic use and export. The barite deposits were estimated to range from 0.8 to 1.2 million tons with a potential output of 25,000 to 30,000 tons per year.

MINERAL FUELS

Petroleum.—In 1982, an estimated 56.5 million barrels per year were produced compared with 54.4 million barrels per year in 1981. Recent discoveries that resulted from increased petroleum investment stabilized production at this level, but an increase to 58 million barrels per year was expected in the near future.

The reserves discovered in four wells in 1982 were at least equivalent to annual production and were expected to stem the decline in reserves for the time being. Amoco Gabon Exploration Co., an affiliate of Standard Oil Co. of Indiana, found oil in the Gombe Sud Marin Permit. The well tested at a combined rate of 6,000 barrels per day from three intervals. Amoco Gabon also was awarded the Omboue exploration permit.

ELF-Gabon made two oil discoveries offshore central Gabon on sites held jointly with SNEA. One discovery involved the Nord Marine 1 Gonelle extension well, near the Gonelle Field, where the Batanga sandstone contained oil at a depth of 43 meters. The other discovery involved the West Marine 1 Manderos well, near the Manderos Field, where the Batanga sandstone contained oil at a depth of 11 meters. From testing so far, each of these wells had an estimated potential of producing 630 barrels per day.[5]

Amoco Gabon made six operational borings in the area south of Port Gentil, of

which four holes showed commercial possibilities and were producing 10,600 barrels per day. Up to that point, Amoco Gabon had invested $60 million in Gabon, expected to invest more than $99 million by 1984, and intended to increase the Port Gentil production to 33,000 barrels per day in 1983.

ELF-Gabon discovered oil at a well located on the Ndoube Marin prospecting permit, which was owned wholly by ELF-Gabon. The Muruba Marine 2 exploratory well, located 300 kilometers southeast of Port Gentil at a water depth of 65 meters, was about 3,000 meters deep and crossed two sandstone reservoirs that contained oil. Flows of 570 and 1,230 barrels per day were obtained from the two depths.[6]

Amoco Gabon's Gombe Marine Sud-2 well tested between 1,000 and 3,000 barrels per day from three horizons. The well was located about 20 miles from the Inguessi discovery but on a block that was wholly owned by Amoco Gabon. The block is now owned by British Petroleum Co. Ltd. (15%), Wintershall AG (18.5%), Preussag AG and Deutsche Schachtbau (8.25% each), and Amoco Oil Co. (50%), the operator.[7] ELF-Gabon also announced two discoveries. Its Torpille Nord-1 well tested 2,013 barrels per day in its wholly owned Terpille concession, and the Barbier Sud-Ouest-1 well tested 1,667 barrels per day.

Uranium.—The Compagnie des Mines d'Uranium de Franceville (COMUF) dedicated its new uranium processing plant at Mounana in June 1982. Plant capacity was increased by 50% from 300,000 to 450,000 tons of ore per year or 1,500 tons of uranium metal per year. The new plant, which cost $47.6 million, used an acid leach-solvent extraction process to produce a magnesium uranate concentrate containing 75% uranium. In 1982, production decreased to 65% of capacity as COMUF limited output to the level of demand. France continued as the principal purchaser of uranium under a long-term contract to buy 1,000 tons of uranium metal annually. Reasonably assured reserves, as estimated by the International Atomic Energy Agency as of January 1981, were 19,400 tons of uranium based on a $36-per-pound price. This estimate excluded about 5,000 tons of uranium in the Bagombe deposit discovered in 1981.

The Mineral Industry of the German Democratic Republic

By George A. Rabchevsky[1]

The economy of the German Democratic Republic (GDR), in contrast to other Council for Mutual Economic Assistance (CMEA) member countries, continued a relatively high growth rate in 1982, although below the 1981-85 5-year plan, which called for restrained high growth through the mid-1980's. This growth was reflected in all sectors of the mineral industry. Despite the world recession in the fertilizer industry, for example, the GDR managed to maintain its export volume of potash at or close to the levels reached before the recession. The GDR's mineral economy continued to consist primarily of processing. Raw materials were purchased from CMEA partners, especially the U.S.S.R., and converted into semifinished and finished products. Although the country had few indigenous raw materials other than potash and lignite, it did benefit from CMEA pricing policies, which allowed it to purchase raw materials based on the average world price for the past 5 years.

Industrial production increased by 4.3% to $120 billion,[2] versus a planned 4.6%. The growth was reportedly achieved chiefly through the increases in efficiency and labor productivity. In the metallurgical and steel industries, production had been steadily rising for the past decade, and did so again in 1982. This also applied to the oil, gas, and coal industries. Labor productivity indexes for all of the above categories were reported as also on the rise. On the other hand, the number of workers in the metals and energy industries continued to decline, to 136,828 and 215,091, respectively in 1981, representing 0.8% and 1.3% of total workers, respectively. In 1982, there reportedly were 248,000 workers in the mining and energy industry, or 1.5% of the total.

The GDR in the past several years has concentrated its investments on modernization and retooling rather than new plants, especially in the lignite industry, a trend that will most likely continue in 1983. For example, 16% of the 1982 investments were in robotics, microelectronics and the mechanization of raw materials processing.

Government Policies and Programs.—The 1983 economic plan is to focus on research and development. GDR planners are hoping to shorten the transfer time from initial research to product availability to a maximum of 2 years by emphasizing applied research and providing certain limited material incentives. The development of competitive goods for export through research will be priority. Specialty steels, potash, tin, barite, and fluorite are some of the commodities to be emphasized. The national income is to increase by 4.3% and industrial production is to increase by 3.8%, all with reduced energy and raw materials utilization. The shortage of investment capital and hard currency for imports of capital goods, however, will most likely restrain the economic growth.

In contrast to those of its CMEA partners, the 1981-85 5-year plan for the GDR called for high economic growth targets. To reach these optimistic goals, the GDR has embarked on a program of reducing consumption of raw materials and energy. Economic growth was to be achieved by production of high-quality competitive goods and through rapid application of technological advances.

The plan established a goal for reducing energy consumption by the equivalent of 70 million tons of lignite, or 26% annually. According to the plan, petroleum will be used exclusively as a vehicle fuel and not as

a heating fuel, emphasizing instead lignite as boiler and domestic heating fuel. A production of 295 million tons of lignite was planned for 1985, a 6% increase from the 1982 rate.

The 1981-85 5-year plan, in general, called for further integration and cooperation with the CMEA partners, especially the U.S.S.R. Trade was to be extended also with the developing countries, especially those with which the GDR had close political relations. The plan also called for continued trade with the industrialized West.

PRODUCTION

Almost all official sources claimed that production of minerals increased, despite the ever-present shortage of labor and indigenous raw materials. Increased productivity and reduced consumption were supposedly achieved through the application of scientific and technical progress. The 1982 research and development budget was reported to have been $2.7 billion, which amounted to a high of 4.5% of the national income. About 100,000 employees were directly involved in research and development, about three-quarters of which were in the mineral and energy industry. All production in the GDR was planned and coordinated through a network of combines.

Recovery and reuse of secondary raw materials and scrap was stepped up again, including the collection of discarded bottles and paper. Even the general public was encouraged to participate in scrap collection; 30% of aluminum scrap, for example, was gathered by the public. The collection of zinc scrap rose 13% and aluminum 8% from that of 1981.

Because of the paucity of natural raw materials, and in order to resolve the ever-present labor shortage, the GDR continued to introduce a multitude of robots, flexible manufacturing systems, automatic transfer lines, and manipulators of all sorts into the industry. Contrary to the worldwide recessionary trend, the country's large metalworking industry, and other industrial sectors, were attempting to step up production despite a severe labor shortage, thus moving toward automation.

About 150 robots were in operation in the metallurgical industry and 2,000 were planned for 1985, two-thirds of which, however, were single, specific-process type, instead of the more sophisticated multidirectional programmable equipment. The mechanization was also intended to help the industry improve the quality of its exports through greater precision of the manufacturing processes, while saving on wastage of energy and raw materials. In 1983, according to a 450,000-worker mining and power industry trade union, over 4,600 workers are to be reassigned as a result of the introduction of microelectronic and robot technology.

[e]Estimated. [p]Preliminary. [r]Revised.

[1]Includes data available through Sept. 23, 1983.

[2]In addition to the commodities listed, magnesium, peat, and a variety of construction materials are produced, but output is not reported, and available information is inadequate to make estimates of output levels.

[3]Reported figure.

[4]Source indicates that data include "roasted ore."

[5]Total of listed products only; no estimates have been made for unreported products or refinery fuel and losses.

TRADE

The GDR's foreign trade continued to decline, and its foreign debt continued to grow. By some accounts, the GDR reduced its debt to Western banks from more than $10 billion in 1981 to less than $9 billion by the third quarter of 1982. The GDR's foreign trade turnover in 1981 was over $40 billion, a 13% increase from that of 1980, but 2% below the plan. Two-thirds of the GDR's trade was with the U.S.S.R. and other CMEA member countries. The U.S.S.R. was again its largest trading partner, and bilateral trade rose 10% compared with 17% in 1981, mainly due to reduced mineral fuel imports. The industrialized Western countries accounted for 25%, and the developing countries accounted for 5% of the GDR's trade. The GDR improved its trade surplus with the Western countries from $49 million to $1.5 billion, while reducing the imported energy products and other raw materials by 60%. Exports to the Federal Republic of Germany (FRG) increased 10% to almost $1.98 billion and imports rose 15% to $1.92 billion.

Table 2.—German Democratic Republic: Apparent exports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1980	1981[p]	Destinations, 1981	
			United States	Other (principal)
METALS				
Aluminum: Metal including alloys:				
Scrap	4,001	4,059	--	West Germany 3,170; France 626; Finland 152.
Unwrought	22,962	16,965	--	West Germany 15,698; Japan 1,111.
Semimanufactures	14,582	15,779	82	West Germany 9,580; Hungary 3,562; Poland 1,594.
Cadmium: Metal including alloys, all forms	53	NA		
Chromium: Oxides and hydroxides	25	NA		
Cobalt: Metal including alloys, all forms	20	2	--	All to Netherlands.
Copper:				
Sulfate	(2)	NA		
Ash and residue containing copper	NA	455	--	All to West Germany.
Metal including alloys:				
Scrap	2,760	1,805	--	West Germany 1,470; Belgium-Luxembourg 335.
Unwrought	9,166	8,573	--	West Germany 7,207; Italy 553; United Kingdom 536.
Semimanufactures	19,849	22,236	16	West Germany 22,128; Austria 39.
Gold: Metal including alloys, unwrought and partly wrought, value, thousands	NA	$50	--	All to Sweden.
Iron and steel: Metal:				
Scrap	[3]48,941	22,030	--	West Germany 18,295; Thailand 2,704; Spain 1,000.
Pig iron, cast iron, related materials	29,932	34,413	--	West Germany 21,516; Austria 7,991; Denmark 1,333.
Ferroalloys:				
Ferrosilicon	NA	336	--	France 311; Sweden 25.
Unspecified	6,432	9,034	--	West Germany 7,641; United Kingdom 842; Belgium-Luxembourg 528.
Steel, primary forms[4] thousand tons	344	688	--	West Germany 234; Italy 219; Belgium-Luxembourg 74.
Semimanufactures:				
Bars, rods, angles, shapes, sections do	869	876	--	Poland 66; West Germany 48; undetermined 669.
Universals, plates, sheets do	368	359	(2)	West Germany 104; Italy 44; France 35.
Hoop and strip do	359	393	--	West Germany 28; undetermined 358.
Rails and accessories do	6	14	--	West Germany 7.
Wire do	57	61	--	West Germany 36.
Tubes, pipes, fittings do	138	185	--	Poland 26; West Germany 23; Hungary 20.
Castings and forgings, rough do	83	99	--	West Germany 35; Poland 10; undetermined 54.
Lead:				
Oxides	1,833	7,307	--	Japan 5,025; France 607; West Germany 560.
Metal including alloys:				
Scrap	999	NA		
Unwrought	577	250	--	All to Austria.
Semimanufactures	37	51	--	West Germany 48.
Magnesium: Metal including alloys:				
Scrap	29	46	--	All to West Germany.
Unwrought	--	73	--	All to Belgium-Luxembourg.
Semimanufactures	--	(2)	--	All to Yugoslavia.
Manganese:				
Ore and concentrate, metallurgical-grade	2	NA		
Oxides	18	16	--	All to Sweden.
Metalloids:				
Silicon	NA	1	(2)	All to Yugoslavia.
Unspecified	4	(2)	(2)	
Molybdenum: Metal including alloys, all forms kilograms	200	NA		

See footnotes at end of table.

(Metric tons unless otherwise specified)

Commodity	1980	1981[p]	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Nickel: Metal including alloys:				
Unwrought	106	11	--	All to Netherlands.
Semimanufactures	1	(2)	--	All to Yugoslavia.
Platinum-group metals: Metal including alloys, unwrought and partly wrought, unspecified value, thousands	$1,748	$315	--	United Kingdom $293.
Silver:				
Waste and sweepings[5] do	$41	NA		
Metal including alloys, unwrought and partly wrought do	$25,678	$54,054	--	Belgium-Luxembourg $53,696.
Tin: Metal including alloys:				
Unwrought	4	NA		
Semimanufactures	--	17	--	All to Yugoslavia.
Zinc:				
Oxides	425	792	--	West Germany 549; Norway 243.
Metal including alloys:				
Scrap	159	NA		
Unwrought	72	1,886	--	West Germany 1,174; Belgium-Luxembourg 466; Sweden 241.
Semimanufactures	61	(2)	--	All to Denmark.
Other:				
Oxides and hydroxides	974	335	--	All to West Germany.
Ashes and residues	27,236	28,567	--	Austria 18,381; West Germany 10,184.
Base metals including alloys, all forms	2,440	425	--	West Germany 206; Poland 205.
NONMETALS				
Abrasives, n.e.s.:				
Artificial:				
Corundum	3	11	8	All to Hungary.
Silicon carbide	NA	198	--	All to West Germany.
Dust and powder of precious and semi-precious stones, including diamond value, thousands	$1	NA		
Grinding and polishing wheels and stones[6]	593	263	--	Italy 95; Greece 39; United Kingdom 29.
Asbestos, crude	486	NA		
Barite and witherite	9,705	3,168	--	West Germany 2,414; Norway 734.
Boron materials: Oxides and acids	23	NA		
Cement thousand tons	[7]1,226	[7]1,252	--	West Germany 446; Yugoslavia 60; Czechoslovakia 42.
Chalk	[8]43,055	[8]41,042	--	West Germany 11,739; undetermined 29,115.
Clays and clay products:				
Crude:				
Andalusite, kyanite, sillimanite	717	964	--	All to Austria.
Chamotte earth	494	NA		
Fire clay	1,600	NA		
Kaolin	[8]133,984	[8]115,883	--	West Germany 63,519; Yugoslavia 13,098; Netherlands 11,765.
Unspecified	6,281	23,194	--	West Germany 17,531; Hungary 5,318.
Products:				
Nonrefractory[9]	46,819	8,405	--	United Arab Emirates 1,827; Sweden 1,181; Belgium-Luxembourg 994.
Refractory including nonclay brick	8,174	7,594	--	Hungary 5,222; Sweden 1,222; Finland 361.
Diamond:				
Gem, not set or strung value, thousands	$202	$316	--	Belgium-Luxembourg $314.
Industrial do	$22	$274	--	All to Belgium-Luxembourg.
Feldspar, fluorspar, related materials:				
Fluorspar	NA	47,402	--	West Germany 16,735; Poland 9,636; Norway 9,054.
Unspecified	48,939	1,455	--	Yugoslavia 974; France 457.
Fertilizer materials: Manufactured:				
Ammonia	53,626	24,870	--	Spain 20,997.
Nitrogenous	[10]459,033	795,336	--	West Germany 765,346.
Phosphatic	36,064	7,068	--	Netherlands 6,336.
Potassic, K_2O content[8] thousand tons	2,817	2,860	1	Czechoslovakia 478; Poland 239; Brazil 199.
Unspecified and mixed	1,809	851	--	Belgium-Luxembourg 524; United Arab Emirates 255.

See footnotes at end of table.

(Metric tons unless otherwise specified)

Commodity	1980	1981[p]	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Graphite, natural	50	51	--	Yugoslavia 50.
Gypsum and plaster	[8]78,604	[8]103,009	--	Sweden 68,184; West Germany 24,991.
Halogens:				
Bromine	NA	303	--	All to Hungary.
Unspecified	792	986	--	West Germany 472; Switzerland 429.
Lime	39,248	95,536	--	Hungary 65,096; West Germany 30,440.
Magnesium compounds: Magnesite	530	NA		
Mica:				
Crude including splittings and waste	--	1	--	All to Yugoslavia.
Worked including agglomerated splittings	4	1	--	All to Belgium-Luxembourg.
Nitrates, crude	20	NA		
Phosphates, crude	--	37,127	--	Italy 20,101; Bulgaria 17,000.
Pigments, mineral: Iron oxides and hydroxides, processed	--	348	--	All to Yugoslavia.
Potassium salts, crude	139,810	98,501	--	West Germany 84,733; United Kingdom 10,677.
Precious and semiprecious stones other than diamond:				
Natural value, thousands	$10	$6	$6	
Synthetic do.	$17	$3	--	All to Japan.
Pyrite, unroasted	12,725	NA		
Salt and brine[8] thousand tons	1,210	1,272	--	Sweden 79; Hungary 49; Finland 38; undetermined 1,035.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	2,405	1,669	--	Hungary 736; West Germany 419; Austria 243.
Sodium carbonate, natural and manufactured	[8]311,500	[8]373,800	--	Czechoslovakia 58,000; Sweden 35,117; Denmark 27,483.
Sodium hydroxide	[7]137,000	[7]151,000	--	Netherlands 56,584; Sweden 53,185; Finland 19,877.
Sodium sulfate, natural and manufactured	NA	10,425	--	Sweden 9,542; Finland 783.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	17,268	19,312	--	West Germany 17,652; Hungary 881; Norway 479.
Worked	27,013	26,875	--	West Germay 26,468; Netherlands 168.
Gravel and crushed rock	385,296	222,392	--	NA.
Limestone other than dimension	80,154	11,367	--	All to West Germany.
Sand other than metal-bearing	55,176	51,715	--	Hungary 20,952; Yugoslavia 16,924; Austria 6,670.
Sand and gravel[8] thousand tons	2,561	2,388	--	All to West Germany.
Sulfur:				
Elemental:				
Crude including native and by-product	1	NA		
Sulfuric acid	[7]20,500	[7]30,654	--	Czechoslovakia 9,401; Yugoslavia 8,000; Austria 5,094.
Talc, steatite, soapstone, pyrophyllite	21	22	--	United Kingdom 20.
Other:				
Crude	38,783	60,972	--	Denmark 35,490; United Kingdom 7,856; Hungary 4,560.
Slag and dross, not metal-bearing	35,073	67,687	--	Finland 38,689; West Germany 26,371.
Oxides and hydroxides of barium, magnesium, strontium	1,475	1,555	--	Finland 644; Sweden 277; Italy 220.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	NA	6,996	--	Netherlands 6,088; Belgium-Luxembourg 652.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	3	(2)	--	All to Canada.
Carbon:				
Carbon black	10,500	4,165	11	Czechoslovakia 1,012; United Kingdom 594; Yugoslavia 536.
Gas carbon	--	280	--	All to Hungary.

See footnotes at end of table.

Coal:				
Anthracite and bituminous	300,366	310,212	--	Poland 300,000; Ireland 5,661; Denmark 2,588.
Briquets of anthracite and bituminous coal	537,493	525,847	--	Hungary 523,792.
Lignite including briquets[8] thousand tons	2,212	2,789	--	West Germany 603; Czechoslovakia 574; Austria 288.
Coke and semicoke	209,067	229,308	--	West Germany 128,617; Spain 60,580; Austria 23,913.
Gas, manufactured[8] million cubic feet	381	445	--	All to Netherlands.
Hydrogen, helium, rare gases	20	45	--	West Germany 38; Yugoslavia 3.
Peat including briquets and litter	124	262	--	West Germany 217; France 21; Netherlands 13.
Petroleum refinery products:				
Liquefied petroleum gas thousand 42-gallon barrels	--	508	--	West Germany 505
Gasoline do	[8]3,610	[8]3,679	--	West Germany 3,015.
Mineral jelly and wax do	119	79	14	West Germany 24; Austria 10; Yugoslavia 4.
Kerosine and jet fuel do	77	76	--	Hungary 72.
Distillate fuel oil do	[8]8,958	[8]4,743	--	Mainly to West Germany.
Lubricants do	[7]60	[7]76	--	Mainly to Denmark.
Nonlubricating oils do	--	4	--	All to West Germany.
Residual fuel oil do	[7]7,932	[7]18,322	--	West Germany 4,009; Netherlands 2,821; Sweden 1,792.
Bitumen and other residues do	554	481	--	West Germany 479.
Bituminous mixtures do	--	([2])	--	Mainly to Austria.
Petroleum coke do	17	NA		
Unspecified do	211	167	--	Poland 139.
Tars and other crude chemicals derived from coal, gas, and petroleum	93,452	102,990	--	West Germany 88,662; Denmark 1,244; Czechoslovakia 1,012.

[p]Preliminary. NA Not available.

[1]Owing to a lack of official trade data published by the German Democratic Republic (GDR), this table should not be taken as a complete presentation of this country's mineral trade. Unless otherwise specified, these data have been compiled from United Nations information and data published by the partner trade countries.

[2]Less than 1/2 unit.

[3]Excludes imports of Sri Lanka valued at $45,000.

[4]Source for total exports only: Quarterly Bulletin of Steel Statistics for Europe, United Nations, New York.

[5]May include other precious metals.

[6]Excludes quantity valued at $31,000 in 1980 and $324,000 in 1981.

[7]Statistical Yearbook of the Members of the Council for Mutual Economic Assistance, Moscow, U.S.S.R.

[8]Official Trade Statistics of the GDR.

[9]Excludes quantity valued at $15,000 in 1980 and $19,000 in 1981.

[10]Excludes imports of Uruguay valued at $1,078,000.

COMMODITY REVIEW

METALS

The GDR was deficient in all metals, with minimum mining of indigenous ores. Tin and copper were the only significant metallic minerals mined in the GDR. The collection, recycling, and recovery of secondary materials and metal scrap were the only viable activities in the metallurgical industry. To reduce the import of raw materials, the Government also emphasized the conservation of raw materials and research leading to the development of alternative and substitute materials and substances. In 1982, 5.2 million tons of steel scrap was collected, 70% of which was recycled. In addition, about 46% of lead and 37% of copper scrap were recycled, making the GDR a heavy user of industrial scrap. According to some new accounts, by 1985 about 12% of the country's demand for the principal raw materials is to be met from secondary materials. The Brandenburg steel plant, for example, is to operate a new facility for the conversion of 700,000 tons of open-hearth slag into usable concrete-like

material. The Mansfeld combine at Eisleben was also working on a process to use slag from the copper smelters as a cement additive.

Aluminum.—All of the GDR's requirements for bauxite were imported. Alumina was imported also. Aluminum-bearing silicates however, such as clay and kaolin, were plentiful, and research continued on the production of alumina from domestic clays by hydrochloric and sulfuric acid leaching processes. VEB Mansfeld Kombinat Wilhelm Pieck aluminum plant and the Elektrochemisches Kombinat Lauta Werke alumina plant were said to be involved in other development work, and by some accounts Lauta Werke may have a continuous alumina pilot plant in 1983. The GDR also negotiated a contract with the FRG for the purchase and installation of a small aluminum plant to be located at Nechterstedt light metal works.

Copper.—The GDR continued to mine copper at mines near Sangerhausen, even though the ore was of low grade and difficult to extract and was almost depleted. Domestic mining was on the decline and much of the production came from imported materials and the recovery of scrap, which was imported from various available sources. A large quantity of scrap from the FRG, for example, came under a quota agreement, and more was purchased on the spot market on an as-available basis from other Western countries. The U.S.S.R. continued to supply the GDR with cathodes. The GDR also exported some scrap, and by some accounts, a large portion of the copper, cobalt, and molybdenum regained as a result of the recycling was returned as payment for the scrap.

A new copper smelter and refinery was reportedly under consideration to be built at Eisleben, near Halle, where a 25,000-ton-per-year smelter and a 55,000-ton refinery already exist. A sulfuric acid plant was also to be part of the new construction. The plant was to cost about $250 million, and the Government was seeking assistance from a Finish consortium in its construction.

Iron and Steel.—Domestic iron ore mining was negligible and by some accounts ceased in 1980 owing to depletion of reserves. The ore, pig iron, and scrap were imported mainly from the U.S.S.R. to satisfy domestic demand. About 70% to 75% of the GDR's steelmaking was based on scrap, but the steel combines were unable to meet the scrap collection goal. Reportedly, new measures were taken in the reduction of steel consumption and the collection of scrap. The GDR's steel industry was nevertheless expanding according to plan to achieve self-sufficiency. A steel converter plant was, for example, also under construction at the Eisenhutten Kombinat Ost in Eisenhuttenstadt, which eventually is to employ 1,600 to 2,500 workers, 300 of which are to be women. New specialty steel was reportedly being produced at the Delitzsch Kombinat near Leipzig, and VEB Stahl-und Walzwerk Brandenburg operated its new automated rolling mill for the continuous production of rods directly from ingots. Thus, even though the output of steel and pig iron fell, the steel industry as a whole registered a modest growth. This was achieved through the output of higher quality and specialty products, which brought higher prices. The net production of steel reportedly amounted to $24 billion. As part of its policy, the GDR purchased the most up-to-date equipment from Western countries and was planning to modernize its oxygen steelmaking capacity in the near future, whose share in total crude steel production declined to 8%.

Lead and Zinc.—Production was from domestic and imported scrap. Lead scrap was imported from all available sources, the United States and the FRG being the major suppliers; zinc scrap came mostly from the FRG and France. Some ore and concentrate were also imported.

Tin.—Tin, in the form of cassiterite occurring in the Erzgebirge along the country's southeastern border, is one of the few relatively abundant metallic ores in the GDR. By some estimates, both the domestic mine output and the production of metal were on the increase, primarily because of improvements in mining and production technologies. Although the GDR's tin deposits are low grade, reportedly they are large enough to meet the planned increased production. Reportedly, several mines and processing plants have modernized their facilities for more efficient operation. The mining and smelting of ore was carried out by the Albert Funk Mining and Metallurgical Combine in Freiberg, the largest tin smelter in the GDR. Semifinished tin products and concentrate were also imported from market economy countries and the U.S.S.R. to satisfy the growing domestic demand.

NONMETALS

The nonmetals mining and processing industry of the GDR was better off than the metals industry. The country had plentiful supplies of kaolin, potash, rock salt, barite, chalk, and natural building materials. Most of these ores were also mined and processed for export. Barite and fluorite, for example, mined around the Thuringian Forest and the Harz Mountains, were exported. Cement was produced from the plentiful limestone deposits, with various quarries and over 30 plants located throughout the country. The abundant chalk deposits on Rugen Island were the largest in Europe, and were mined by the only company, the VEG Kreidewerke Rugen, located on the island near Sassnitz. Quartz sand, kaolin (china clay), and other clays were also in abundant supply, and kaolin and bentonite were exported mainly for the manufacture of porcelain and industrial ceramics.

Potash.—Potash K_2O output continued its steady rise, and the GDR was the world's third largest producer. VEB Kombinat Kali managed all four combines, producing over 12% of the world total. The GDR was also the third largest exporter of potash, exporting over 80% of production, 43% of which was shipped to CMEA member countries.

Western Europe was the GDR's second largest market area for potash, and despite the continuing recession in the West, sales to this area increased slightly. Great Britain was the GDR's largest Western European importer; long-term potash sales agreements have existed between the two countries for over two decades.

Identified potash reserves were estimated at 300 to 900 million tons of K_2O, and total reserves were extimated at 5 to 7 billion tons. The ore occurs in the Zechstein Formation of Upper Permian Age and the region in the GDR stretches from the Magdeburg in the north to Suhl at the southwest border.

The GDR potash industry produced, in addition to 60% K_2O equivalent potassium chloride, a lower K_2O equivalent, and other potash salts such as "Kamex" with 40% K_2O and 10% magnesium sulfate fertilizer, "Kainit" fertilizer with 13% K_2O equivalent and 20% $MgSO_4$, and potassium sulfate with 50% K_2O equivalent. Another important recent development has been the expansion of the granulation capacity, achieved through the construction of a compaction unit at the Zielitz Mine.

The GDR did not plan to increase the production of potash significantly over the next few years, although production will most likely increase eventually. Many of the mines were old and required renovation and extension of the underground workings. In addition, improvements in the quality of the standard- and granular-grade products continued to be made. Over the next few years, potassium sulfate production is to increase at the Dorndorf plant to about 140,000 tons of K_2O equivalent annually. Some of the increased production is to be directed to the CMEA countries who until now had to import potassium sulfate from West European producers.

MINERAL FUELS

Except for lignite, the GDR depended on imports for all mineral fuels. About 300 commercial power and heating plants and 21,000 industrial furnaces were all essentially run on lignite. The first lignite liquefaction plant was in the planning stages, and will process approximately 10 million tons of lignite annually. The use of nuclear power increased from 8.4% of total in 1976 to about 12% of the present total, and was planned to rise to 14% by 1985.

The GDR continued to increase electrical energy production, which reached 21,367 megawatts in 1981. Sources of the electrical energy for 1980-81 are summarized in the following tabulation:

Source	Million kilowatt hours	
	1980	1981
Brown coal and lignite	77,178	79,910
Brown coal briquets	575	523
Hard coal	447	285
Nuclear fuel	11,889	11,902
Hydroelectric plants	1,658	1,736
Liquid fuels	1,221	926
Other	5,840	5,438
Total	98,808	100,720

Conservation of mineral fuels and energy was of primary concern to the Government, and as in previous years was part of the annual plan. Consumption during 1982 of all fuels except lignite declined, 25% for heating oil, 30% for gasoline, 13% for diesel fuel, 11% for hard coal, and 3% for brown coal briquets. The conservation program was supplemented by the increased usage of domestic natural gas, lignite, and unprocessed brown coal.

Coal.—Lignite production reached its highest level. Domestic lignite continued to

replace imported oil, necessitating high expenditures for plant conversions and future costs for environmental protection. Lignite supplied almost 70% of total energy requirements, from which was produced more than 80% of the electricity, a large quantity of briquets, high- and low-temperature coke, and manufactured gas. An essential portion of the country's capital investment was allocated to the development and maintenance of the lignite industry. VEB Braunkohlen-Kombinat Senftenberg produced almost two-thirds of the country's lignite. There were 34 surface lignite mines, most located in the eastern Elbe Field. About 40% of the lignite was used by heating plants and another 40% was used by briquet factories. Most of the coal briquets were produced for domestic consumption and only 5% were exported. Domestic production of hard coal ceased in 1978, owing to depletion of deposits. Almost 1.25 million tons of coke was produced domestically from imported hard coal, and another 2.1 million tons of coke was imported.

As more lignite was mined, more overburden had to be removed to get to the seams. In large surface mining operations the overburden was stripped and transported by huge excavators, conveyor belts, and dumping machines capable of removing 200,000 cubic meters of overburden per day, reportedly 20% more than the rated capacity. The ratio of overburden to coal was 4.3:1. To move overburden more effeciently, Senftenberg installed four robots to operate the conveyors and three more were planned for 1983. Reportedly, each robot did the work of five people. At the Welzow South Mine, a 3-mile-long conveyor belt was installed, totally controlled by microelectronics and television monitoring systems. This mine was reportedly able to produce almost 10% of the GDR's total lignite output and moved 180,000 cubic meters of overburden daily. During the 1981-85 5-year plan, 152 of the excavators are to be redesigned for self-propulsion to move from mined-out areas. Secondary materials were recovered simultaneously from the overburden; reportedly 4 million tons of sand and gravel, 3.5 million tons of clay, and 88,000 tons of foundry sand were thus conserved and stockpiled.

Natural Gas and Petroleum.—Natural gas and petroleum resources were extremely limited, and over 90% of total natural gas and petroleum requirements were imported. The GDR continued to rely on the U.S.S.R. for 80% to 85% of its oil requirements. Conservation of oil and gas and reliance on alternative energy sources, such as nuclear power, were emphasized by the Government. Natural gas reserves were small and were estimated at 2.3 trillion cubic feet, having a life expectancy of only 8 years and presenting about 0.1% of world reserves.

Exploration in the northern part of the country continued and drilling was to start in the GDR's portion of the Baltic Sea. There were several unconfirmed reports of small onshore discoveries along the Baltic coast. Potential oil reserves were as yet unknown.

The GDR signed an agreement with the U.S.S.R. for the import of about 125 million barrels of crude in 1982, which was 10% less than in the last 2 years. The 1983 imports were planned to be even less because of the increased sales of oil by the U.S.S.R. to the industrialized West and reduced deliveries to CMEA countries. Other sources attributed lower deliveries to the GDR's difficulty in paying for previous crude deliveries. Reportedly, the deliveries of gas were not affected. Most of the oil was delivered by rail to the Schwedt petrochemical combine at Schwedt-am-Oder because the Rostock-Schwedt pipeline had been converted to the transport of diesel fuel in the opposite direction.

Nuclear Power.—The development of nuclear energy in the GDR was closely tied to the U.S.S.R., which provided the enriched nuclear fuel, reactor assembly, and some technical assistance. There were four nuclear powerplants with a total capacity of over 2,800 megawatts and another 3,520 megawatts were in the planning stage, to be located at the Bruno Leuschner plant in Lubin on the Baltic coast. Other plants were located near Rheinsberg, Stendal, and Nord. About 11% of the country's electricity was produced by nuclear powerplants. Reportedly, by 1985 nuclear power was to contribute 12% to 14% of the country's total electricity requirements.

There was some mining of uranium, but all of it was exported to the U.S.S.R. for processing and eventual reimport of the enriched nuclear fuel.

---

[1]Physical scientist, Division of Foreign Data.

[2]The GDR mark (M) is a nonconvertible currency officially fixed at 1:1 with the West German deutsche mark (DM). Western banks, however, exchange the currencies at the rate of 4M-5M=1DM. The GDR mark's relation to the U.S. dollar is based upon the fluctuation of the dollar-DM ratio. Foreign trade figures are denoted in an accounting unit known as the valuta mark (VM). The rate of valuta marks converted to U.S. dollars in 1982 was taken as VM3.34=US$1.00.

The Mineral Industry of the Federal Republic of Germany

By George A. Rabchevsky[1]

The overall economy of the Federal Republic of Germany (FRG) continued the decline that began last year. This was also reflected in the mineral industry, especially in metals production. In nonmetals, such as potash, the stagnation in production and company profits was mostly due to low demand at home and abroad. Rising costs of coke, energy, maintenance, environmental controls on one hand, and falling commodity prices and overcapacity on the other, contributed to the already weakened mineral industry. Metallgesellschaft AG, for example, an industrial giant in the FRG with extensive holdings in mining and minerals processing, was unable in 1982 to pay its shareholders a dividend for the first time in more than 30 years.

The gross national product (GNP) fell by 1.2% in real terms to $653 billion.[2] For the first time in the history of the FRG, the total of all goods and services produced fell in 2 consecutive years. In the steel industry, this was partly due to the cutting of production capacities demanded by the European Economic Community, which included fines for overproduction. Almost 16,000 enterprises went bankrupt, nearly 40% more than in 1981. General unemployment rose from 5.5% to a record of 7.5%, with more than 2 million unemployed. In both the ferrous and nonferrous metals industry, unemployment was high. Wage increases averaged a moderate 3%; I.G. Metall, the largest industrial trade union, with 2.6 million members, tentatively agreed on a 3.2% wage increase in 1982 for 3.6 million workers, which included the metal industry.

PRODUCTION

By the end of 1982, industrial production was approximately 5% below that of 1981. The steel, construction, and gas pipeline industries recorded losses of 10%, as did the minerals energy and nonferrous minerals producing sectors. Production and processing of almost all minerals, including oil and gas, declined during the year.

The FRG continued, however, to be one of the world's major producers, processors, and consumers of minerals and metals. It was a large producer of iron and steel, coal, and lignite. Although there was a plentiful supply of potash and salt, the country is not rich in metallic ore deposits. Much of the metal raw material base had to be imported to maintain the processing industry.

[2]Reported figure.
[3]Preliminary nickel and nickel contained in ferronickel, Monel metal, and nickel oxide directly used by the steel industry.

TRADE

The economy continued to rely heavily on foreign trade, and falling exports in the FRG were to some degree responsible for the decline of overall economic production. For 1982 as a whole, export orders for almost all commodities were down 18%. After an increase in 1981, the volume of exports declined 10%, even though there was a large trade surplus of $21 billion. Traditionally, export revenues have amounted to about 25% of the GNP and have often led the country out of recession. Trade with the German Democratic Republic rose at the high rate of 13%, above all other Council of Mutual Economic Assistance (CMEA) member countries, and rose by 5% with market economy countries. Excluding trade with the German Democratic Republic and the Soviet Union, the FRG's trade with other CMEA countries and China fell by 4%.

METALS —Continued				
Gold:				
Ash and residue containing gold value	$53,914	$97,572	NA	NA.
Waste and sweepings value, thousands	$2,760	$4,131	NA	Switzerland $3,430; Netherlands $602; Spain $59.
Metal including alloys, unwrought and partly wrought thousand troy ounces	882	1,033	8	United Kingdom 276; Belgium-Luxembourg 157; Switzerland 125.
Iron and steel:				
Iron ore and concentrate:				
Excluding roasted pyrite	156,829	76,826	--	Belgium-Luxembourg 57,273; France 7,914; Austria 6,210.
Pyrite, roasted	4,467	6,538	--	Switzerland 2,902; Austria 1,477; East Germany 840.
Metal:				
Scrap thousand tons	3,174	3,514	(1)	Italy 2,399; Belgium-Luxembourg 380; France 119.
Pig iron, cast iron, related materials do	1,077	928	(1)	France 380; Italy 104; Spain 53.
Ferroalloys:				
Ferrochromium	33,524	55,674	4,573	France 25,095; Italy 5,161; Belgium-Luxembourg 4,617.
Ferromanganese	36,762	48,876	4,023	Belgium-Luxembourg 9,328; Italy 8,540; France 4,959.
Ferromolybdenum	1,227	912	NA	Netherlands 252; Belgium-Luxembourg 153; France 112.
Ferronickel	86	555	44	Austria 377; Netherlands 80; Belgium-Luxembourg 21.
Ferrosilicochromium	1,417	1,179	NA	Belgium-Luxembourg 696; France 202; Italy 182.
Ferrosilicomanganese	5,598	7,832	NA	Switzerland 2,853; Italy 1,934; Netherlands 864.
Ferrosilicon	55,714	60,956	400	Belgium-Luxembourg 12,742; France 12,358; Italy 6,604.
Unspecified	12,575	15,820	1,810	Austria 1,537; Romania 1,528; France 1,137.
Steel, primary forms thousand tons	3,722	3,453	325	France 414; Italy 356; United Kingdom 321.
Semimanufactures:				
Bars, rods, angles, shapes, sections do	3,788	3,380	177	France 620; Netherlands 420; Belgium-Luxembourg 242.
Universals, plates, sheets do	6,750	6,519	648	U.S.S.R. 935; France 728; India 384.
Hoop and strip do	1,529	1,462	37	U.S.S.R. 240; France 170; Netherlands 130.
Rails and accessories	219,000	300,131	73,266	Italy 55,010; Netherlands 45,586d Mexico 25,296.
Wire	334,000	310,342	15,748	France 53,369d Netherlands 47,411; Belgium-Luxembourg 33,262.
Tubes, pipes, fittings thousand tons	3,191	4,175	836	U.S.S.R. 718; Netherlands 399; Mexico 240.
Castings and forgings, rough	121,000	116,816	5,113	France 17,991; Belgium-Luxembourg 14,552; Netherlands 14,200.
Lead:				
Ore and concentrate	2,000	300	--	All to Sweden.
Oxides	11,810	15,893	63	Netherlands 3,267; U.S.S.R. 2,890; Italy 2,499.
Ash and residue containing lead	12,101	10,916	NA	Belgium-Luxembourg 5,559; Netherlands 4,098; United Kingdom 639.
Metal including alloys:				
Scrap	20,041	18,550	--	Netherlands 6,800; Italy 3,269; Denmark 3,069.
Unwrought	98,780	96,361	2,501	Italy 40,191; Austria 16,434; France 10,631.
Semimanufactures	18,254	14,928	49	Denmark 3,120; Belgium-Luxembourg 1,559; Switzerland 1,391.
Magnesium:				
Metal including alloys:				
Scrap	2,123	1,774	282	Italy 812; Netherlands 411; Brazil 73.
Unwrought	149	198	--	Austria 79; Belgium-Luxembourg 54; France 27.

See footnotes at end of table.

Table 2.—Federal Republic of Germany: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Magnesium —Continued				
Metal including alloys —Continued				
Semimanufactures	494	857	3	Netherlands 193; Austria 107; Sweden 98.
Manganese:				
Ore and concentrate, metallurgical-grade	1,405	2,174	--	Belgium-Luxembourg 967; France 845; Denmark 101.
Oxides	4,318	355	NA	NA.
Metal including alloys, all forms	123	43	NA	Bulgaria 4; United Kingdom 3; Switzerland 2.
Mercury 76-pound flasks	6,370	3,973	NA	Netherlands 995; Switzerland 510; Austria 368.
Metalloids:				
Arsenic:				
Oxides and acids	1,010	967	116	United Kingdom 562; Yugoslavia 22.
Boron including alloys, all forms kilograms	3,300	3,600	800	France 1,500; Japan 600; Sweden 500.
Phosphorus and selenium	12,073	7,800	29	France 2,734; Denmark 1,683; Netherlands 513.
Silicon	4,094	4,881	418	France 2,720; Italy 447; Netherlands 387.
Tellurium and arsenic	4	21	NA	Yugoslavia 4; United Kingdom 2; Brazil 1.
Molybdenum:				
Ore and concentrate	6,984	5,428	541	Belgium-Luxembourg 2,017; Netherlands 814; Austria 681.
Oxides and hydroxides	2,502	2,480	NA	NA.
Metal including alloys:				
Semimanufactures	52	46	(1)	Japan 12; Brazil 7; Iran 5.
Unspecified	435	273	NA	NA.
Nickel:				
Matte and speiss	302	52	--	Belgium-Luxembourg 32; Netherlands 20.
Oxides and hydroxides	135	95	13	Spain 22; Greece 10; Italy 10.
Ash and residue containing nickel	2,152	1,692	NA	Austria 562; Netherlands 380; Sweden 373.
Metal including alloys:				
Scrap	5,317	7,779	196	Sweden 5,453; Netherlands 632; India 308.
Unwrought	6,436	4,520	73	France 2,790; Netherlands 735; Austria 277.
Semimanufactures	11,728	10,243	2,459	United Kingdom 1,963; France 833; Belgium-Luxembourg 711.
Platinum-group metals:				
Ash and residue value	$84,172	$8,830	NA	NA.
Waste and sweepings value, thousands	$2,150	$990	NA	Netherlands $547; Belgium-Luxembourg $311; Switzerland $112.
Metal including alloys, unwrought and partly wrought:				
Palladium troy ounces	105,045	94,544	3,336	Switzerland 24,293; Netherlands 22,258; Japan 16,850.
Platinum do	279,037	238,912	897	Switzerland 20,632; Japan 17,458; Netherlands 15,959.
Unspecified do	84,344	101,497	971	East Germany 26,460; Japan 15,718; Hong Kong 12,644.
Rhenium: Metal including alloys, all forms value	$15,404	$45,475	NA	NA.
Silver:				
Ash and residue containing silver value, thousands	$2,729	$2,463	NA	France $1,242; Switzerland $512; Belgium-Luxembourg $412.
Waste and sweepings do	$3,960	$20,343	NA	Austria $19,085; Spain $865; Switzerland $315.
Metal including alloys, unwrought and partly wrought thousand troy ounces	64,706	33,519	631	Switzerland 6,772; Sweden 3,681; United Kingdom 2,562.
Tin:				
Ore and concentrate value	--	$1,325	--	All to France.
Ash and residue containing tin	5,247	5,122	NA	United Kingdom 4,617; Netherlands 195; Spain 182.
Metal including alloys:				
Scrap	107	106	--	Netherlands 56; United Kingdom 24; Denmark 19.
Unwrought	3,241	4,785	198	Netherlands 3,301; United Kingdom 339; Belgium-Luxembourg 151.
Semimanufactures	788	722	(1)	Austria 119; Switzerland 78; unspecified 280.

See footnotes at end of table.

Table 2.—Federal Republic of Germany: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Titanium:				
Ore and concentrate	9,262	8,731	1,500	Netherlands 2,340; United Kingdom 1,791; France 661.
Oxides	50,635	52,189	9,312	East Germany 5,272; Italy 4,336; Netherlands 3,246.
Metal including alloys, all forms	2,234	2,132	210	United Kingdom 707; Austria 256; Sweden 234.
Tungsten:				
Ore and concentrate	139	182	--	United Kingdom 117; Netherlands 50; U.S.S.R. 15.
Ash and residue containing tungsten	100	167	NA	Austria 126; United Kingdom 32.
Metal including alloys:				
Scrap	NA	496	NA	NA.
Unwrought	NA	485	NA	NA.
Semimanufactures	60	57	1	France 19; Austria 6; Brazil 5.
Unspecified	645	--	--	
Uranium and/or thorium:				
Ore and concentrate value	--	$3,532	--	All to Switzerland.
Oxides and other compounds	1,974	283	--	France 147; Belgium-Luxembourg 117.
Metal including alloys, all forms, uranium and thorium kilograms	800	1,400	NA	NA.
Vanadium:				
Ash and residue containing vanadium	705	2,175	NA	Belgium-Luxembourg 1,177; Italy 949.
Metal including alloys, all forms	124	193	23	United Kingdom 85; Japan 48; France 35.
Zinc:				
Ore and concentrate	111,130	105,806	--	East Germany 44,240; Netherlands 35,672; France 9,712.
Oxides	15,767	13,550	NA	NA.
Blue powder	5,275	6,293	177	Netherlands 1,149; Romania 1,010; Hungary 820.
Matte	5,270	6,789	NA	Italy 1,612; Netherlands 1,583; Belgium-Luxembourg 1,555.
Ash and residue containing zinc	68,824	90,489	18,568	Belgium-Luxembourg 31,100; Netherlands 11,796; France 11,515.
Metal including alloys:				
Scrap	10,595	7,502	--	Netherlands 3,180; Italy 2,217; Belgium-Luxembourg 1,264.
Unwrought	112,723	126,005	36,111	Italy 20,800; Netherlands 12,423; France 11,149.
Semimanufactures	16,572	17,549	--	East Germany 1,812; unspecified 15,518.
Zirconium:				
Ore and concentrate	11,487	12,372	NA	Netherlands 2,043; Czechoslovakia 1,652; France 1,641.
Metal including alloys, all forms	50	65	NA	France 32; Sweden 13.
Other:				
Ores and concentrates	14	1	--	NA.
Oxides and hydroxides	7,349	8,206	1,276	East Germany 1,114; Italy 326; Brazil 123.
Matte, speiss, similar material	26	11	--	All to East Germany.
Ashes and residues	r59,963	64,660	131	Belgium-Luxembourg 34,768; Netherlands 23,457; Switzerland 4,797.
Pyrophoric alloys	75	55	NA	Hong Kong 13; Bulgaria 5; Nigeria 4.
Cermets	837	261	2	Italy 43; France 37; United Kingdom 36.
Base metals including alloys, all forms	r177	170	--	All to East Germany.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	491,496	310,457	12	United Kingdom 294,430; Belgium-Luxembourg 10,069; France 5,287.
Artificial:				
Corundum	59,294	51,583	2,116	Italy 7,132; Sweden 4,236; East Germany 4,007.
Silicon carbide	26,445	27,752	NA	NA.
Dust and powder of precious and semiprecious stones including diamond kilograms	564	659	76	Brazil 214; Greece 194; Austria 98.
Grinding and polishing wheels and stones	13,202	15,366	659	France 1,806; Netherlands 1,198; Switzerland 944.
Asbestos, crude	27,334	43,033	NA	NA.
Barite and witherite	45,746	54,627	291	Netherlands 16,388; France 9,077; Sweden 4,099.

See footnotes at end of table.

Table 2.—Federal Republic of Germany: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Boron materials:				
Crude natural borates	11,045	4,648	--	Sweden 2,387; Finland 770; Norway 400.
Oxides and acids	42,382	11,573	--	East Germany 10,927; Czechoslovakia 168.
Cement thousand tons	2,216	2,627	(1)	Netherlands 1,483; Nigeria 291; Venezuela 207.
Chalk	27,734	36,549	33	Denmark 11,315; Finland 7,932; Sweden 7,449.
Clays and clay products:				
Crude:				
Andalusite, kyanite, sillimanite	9,490	13,573	NA	Italy 6,265; United Kingdom 2,695; Austria 966.
Bentonite	29,755	23,956	NA	France 12,181; Netherlands 3,030; Belgium-Luxembourg 2,961.
Ceramic clay	843,902	846,033	NA	Italy 343,850; Netherlands 218,656; France 135,992.
Chamotte earth	54,202	47,913	NA	Netherlands 20,922; Italy 8,649; France 6,015.
Dinas earth	65,110	55,771	NA	France 23,795; Switzerland 8,208; Italy 7,177.
Fire clay	302,716	336,259	NA	Italy 133,098; Belgium-Luxembourg 63,456; Netherlands 55,575.
Fuller's earth	5,220	4,485	NA	Netherlands 2,384; France 1,172; East Germany 264.
Kaolin	102,004	92,602	NA	Italy 26,611; Austria 13,835; Belgium-Luxembourg 12,871.
Unspecified	389,858	614,774	200	Netherlands 547,782; Italy 22,799; Austria 19,402.
Products:				
Nonrefractory	829,754	843,179	11,488	France 241,491; Belgium-Luxembourg 122,655; Switzerland 109,017.
Refractory including nonclay brick	669,801	655,251	14,559	Belgium-Luxembourg 89,133; France 88,980; Italy 38,899.
Cryolite and chiolite	38	41	--	Italy 22; Japan 9; Mexico 4.
Diamond:				
Gem, not set or strung carats	r118,523	124,313	12,768	Belgium-Luxembourg 31,533; United Kingdom 22,410; Switzerland 17,445.
Industrial do	r222,053	286,641	2,700	Ireland 91,009; Belgium-Luxembourg 61,824; Netherlands 33,620.
Diatomite and other infusorial earth	3,210	3,542	8	East Germany 1,038; Netherlands 704; United Kingdom 621.
Feldspar, fluorspar, related materials:				
Feldspar	18,124	15,308	NA	France 6,537; Austria 1,749; Netherlands 1,445.
Fluorspar	14,098	16,210	NA	Austria 4,904; Netherlands 4,296; Hungary 3,180.
Unspecified	799	777	15	Belgium-Luxembourg 623.
Fertilizer materials:				
Crude, n.e.s	62,705	59,310	--	Netherlands 50,553; Switzerland 2,292; Belgium-Luxembourg 2,139.
Manufactured:				
Ammonia thousand tons	r238	249	(1)	Denmark 182; France 40; United Kingdom 11.
Nitrogenous do	1,344	1,248	5	Belgium-Luxembourg 443; France 139; India 111.
Phosphatic do	58	40	--	Belgium-Luxembourg 18; Denmark 8; Hungary 5.
Potassic do	2,554	2,348	26	Belgium-Luxembourg 579; India 247; Ireland 183.
Unspecified and mixed do	756	718	(1)	France 155; Belgium-Luxembourg 103; Denmark 79.
Graphite, natural	8,099	8,577	763	Italy 1,748; East Germany 1,360; Iran 556.
Gypsum and plaster	390,963	374,720	136	Netherlands 223,681; Belgium-Luxembourg 46,685; Switzerland 44,001.
Halogens:				
Bromine	11	10	--	NA.
Chlorine	102,688	101,641	--	Netherlands 61,472; France 24,129; Belgium-Luxembourg 6,695.
Iodine	76	73	--	France 31; United Kingdom 10; Belgium-Luxembourg 8.
Unspecified	(1)	1	--	NA.
Lime	473,949	398,157	--	Netherlands 293,333; France 59,917; Switzerland 22,531.

See footnotes at end of table.

Table 2.—Federal Republic of Germany: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Magnesium compounds:				
Magnesite	7,251	12,050	NA	France 7,172; Canada 2,687; Belgium-Luxembourg 888.
Oxides and hydroxides	7,139	6,781	NA	Italy 1,303; Austria 852; U.S.S.R. 800.
Other	4,157	4,095	31	France 1,002; Denmark 768; United Kingdom 529.
Mica:				
Crude including splittings and waste	661	1,091	67	Yugoslavia 277; Netherlands 242; Switzerland 110.
Worked including agglomerated splittings	254	268	--	United Kingdom 43; Italy 31; France 26.
Nitrates, crude	--	2,200	--	All to East Germany.
Phosphates, crude	1,555	49,027	--	East Germany 47,068; Switzerland 1,585.
Pigments, mineral:				
Natural, crude	r1,276	1,424	893	Switzerland 174; United Kingdom 66.
Iron oxides and hydroxides, processed	157,656	150,878	14,896	France 21,389; United Kingdom 12,572; Italy 11,567.
Potassium salts, crude	38,585	39,881	--	Belgium-Luxembourg 21,768; United Kingdom 15,536; Netherlands 1,350.
Precious and semiprecious stones other than diamond:				
Natural:				
Gem material kilograms	258,444	181,706	13,170	Italy 23,190; China 22,517; Hong Kong 17,361.
Quartz crystal, piezoelectric	655	78	NA	NA.
Synthetic kilograms	21,995	28,384	1,472	Japan 20,060; Italy 1,934; Yugoslavia 556.
Pyrite, unroasted	968	2,089	NA	NA.
Salt and brine thousand tons	1,841	2,048	(1)	Belgium-Luxembourg 1,288; Sweden 282; Denmark 106.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	15,000	17,175	NA	NA.
Sodium carbonate, natural and manufactured	215,524	165,273	8	Saudi Arabia 24,021; Belgium-Luxembourg 19,051; Brazil 14,975.
Sodium hydroxide thousand tons	826	1,522	102	Netherlands 408; Australia 208; Belgium-Luxembourg 142.
Sodium sulfate, natural and manufactured	81,138	95,038	NA	Belgium-Luxembourg 15,998; Italy 15,464; Switzerland 8,342.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked thousand tons	874	1,569	(1)	Netherlands 1,466; Switzerland 76; Austria 8.
Worked	36,775	38,717	97	Belgium-Luxembourg 7,729; Austria 6,279; Netherlands 5,081.
Dolomite, chiefly refractory-grade	302,654	296,214	185	Netherlands 141,610; France 119,542; Belgium-Luxembourg 28,890.
Gravel and crushed rock thousand tons	8,923	11,057	(1)	Netherlands 8,921; Switzerland 1,165; Belgium-Luxembourg 628.
Limestone other than dimension	72,917	33,269	--	Netherlands 16,095; Belgium-Luxembourg 13,594; Switzerland 935.
Quartz and quartzite	122,878	150,372	330	Belgium-Luxembourg 75,299; Netherlands 15,902; Austria 12,831.
Sand other than metal-bearing thousand tons	7,744	6,717	(1)	Netherlands 5,270; Belgium-Luxembourg 777; Switzerland 273.
Sulfur:				
Elemental:				
Crude including native and by-product	394,400	448,040	170	Netherlands 147,224; Denmark 76,212; Belgium-Luxembourg 31,861.
Colloidal, precipitated, sublimed	952	454	78	Italy 163; France 61; Netherlands 32.
Dioxide	35,567	14,446	NA	Netherlands 5,506; Belgium-Luxembourg 4,350; Austria 2,136.
Sulfuric acid	624,343	854,928	--	Netherlands 227,365; Belgium-Luxembourg 183,708; France 111,247.
Talc, steatite, soapstone, pyrophyllite	6,137	3,757	--	Yugoslavia 747; Netherlands 460; Belgium-Luxembourg 237.

See footnotes at end of table.

Table 2.—Federal Republic of Germany: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Vermiculite, perlite, chlorite	5,183	6,156	NA	Belgium-Luxembourg 3,701; Netherlands 1,287; Austria 734.
Other:				
Crude thousand tons	1,669	1,859	31	Netherlands 1,128; Belgium-Luxembourg 158; Austria 22.
Slag and dross, not metal-bearing do	3,348	2,973	1	Netherlands 2,428; France 361; Belgium-Luxembourg 111.
Oxides and hydroxides of barium, magnesium, strontium	3,387	4,915	2,182	France 653; Belgium-Luxembourg 303; Netherlands 258.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	168,505	145,201	4,944	Netherlands 44,550; France 23,179; Switzerland 18,001.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	4,104	829	--	Austria 226; Netherlands 145; Sweden 101.
Carbon: Carbon black	138,360	135,106	797	France 21,867; East Germany 17,601; Austria 15,214.
Coal:				
Anthracite and bituminous thousand tons	12,369	11,996	--	France 4,452; Italy 2,591; Belgium-Luxembourg 2,226.
Briquets of anthracite and bituminous coal	357,099	365,241	--	United Kingdom 120,401; France 99,389; Belgium-Luxembourg 79,960.
Lignite including briquets	877,460	848,201	--	Belgium-Luxembourg 199,154; Austria 173,113; France 160,748.
Coke and semicoke thousand tons	8,163	6,515	--	Belgium-Luxembourg 2,468; France 1,771; Netherlands 730.
Gas, natural million cubic feet	345,325	422,643	NA	NA.
Gas, manufactured do	32	59	--	All to Switzerland.
Hydrogen, helium, rare gases do	557	552	(1)	Italy 272; Austria 85; France 63.
Peat including briquets and litter	507,005	510,951	169	Netherlands 336,005; Switzerland 49,440; France 48,800.
Petroleum and refinery products:				
Crude thousand 42-gallon barrels	9,080	7,820	(1)	East Germany 7,819.
Refinery products:				
Liquefied petroleum gas do	4,988	6,278	--	Netherlands 2,410; Italy 1,175; Belgium-Luxembourg 725.
Gasoline:				
Aviation do	80	17	--	Austria 5.
Motor do	r13,349	12,232	43	France 3,272; Netherlands 2,164; Austria 1,801.
Mineral jelly and wax do	r1,271	1,309	60	Netherlands 138; Republic of South Africa 106; Belgium-Luxembourg 74.
Kerosine and jet fuel do	r11,405	10,879	(1)	Switzerland 749; Norway 645; bunkers 8,080.
Distillate fuel oil do	r11,276	8,691	364	Netherlands 1,796; Switzerland 1,621; France 1,075.
Lubricants do	r2,654	3,075	9	Belgium-Luxembourg 502; United Kingdom 364; Netherlands 274.
Nonlubricating oils do	r100	100	NA	Switzerland 16; Republic of South Africa 10; Austria 8.
Residual fuel oil do	20,803	22,392	(1)	Netherlands 4,651; United Kingdom 2,755; Austria 2,249.
Bitumen and other residues do	2,063	2,284	(1)	Austria 851; Switzerland 398; Denmark 383.
Bituminous mixtures do	268	224	(1)	Netherlands 110; Austria 29; Switzerland 22.
Petroleum coke do	1,994	1,654	--	Netherlands 615; France 258; Switzerland 198.
Tars and other crude chemicals derived from coal, gas, and petroleum	r721,392	714,534	12,193	Netherlands 291,597; Belgium-Luxembourg 25,009; unspecified 297,895.

Table 3.—Federal Republic of Germany: Imports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals:				
Cesium and rubidium value	$21,456	$13,245	NA	NA.
Lithium:				
Oxides and hydroxides	568	1,205	319	U.S.S.R. 37; Netherlands 35.
Metal including alloys, all forms	8	7	7	
Rare-earth metals	60	76	NA	NA.
Unspecified	246	356	9	France 173; U.S.S.R. 133; Italy 21.
Aluminum:				
Ore and concentrate thousand tons	4,177	3,911	(1)	Australia 1,531; Guinea 1,379; Sierra Leone 599.
Oxides and hydroxides	440,704	470,529	2,596	Australia 271,700; Italy 143,988; Guinea 48,236.
Ash and residue containing aluminum	43,582	51,037	NA	Austria 17,143; Netherlands 6,892; Norway 6,301.
Metal including alloys:				
Scrap	174,772	160,984	8,034	Netherlands 40,430; Austria 24,239; United Kingdom 22,608.
Unwrought	608,752	478,446	6,414	Norway 205,459; United Kingdom 57,349; Netherlands 51,556.
Semimanufactures	288,045	245,586	3,488	France 71,432; Netherlands 40,478; Belgium-Luxembourg 34,923.
Antimony:				
Ore and concentrate	3,002	1,954	NA	Bolivia 615; Republic of South Africa 525; Peru 161.
Oxides	3,351	3,567	83	Belgium-Luxembourg 1,087; France 1,060; United Kingdom 807.
Metal including alloys, all forms	538	595	NA	Belgium-Luxembourg 298; China 97; Spain 72.
Beryllium: Metal including alloys, all forms kilograms	1,460	578	296	NA.
Bismuth: Metal including alloys, all forms	268	185	NA	United Kingdom 58; Japan 33; Republic of Korea 20.
Cadmium:				
Oxides and hydroxides	550	417	NA	Belgium-Luxembourg 346; United Kingdom 60.
Metal including alloys, all forms	1,198	673	NA	China 211; Belgium-Luxembourg 164; Netherlands 64.
Chromium:				
Ore and concentrate	328,847	268,237	--	Republic of South Africa 186,996; Albania 36,112; Turkey 27,691.
Oxides and hydroxides	969	1,192	108	U.S.S.R. 907; Italy 96; Spain 35.
Metal including alloys, all forms	862	569	25	France 144; United Kingdom 115; Belgium-Luxembourg 109.
Cobalt:				
Oxides and hydroxides	319	239	1	Belgium-Luxembourg 83; France 63; Netherlands 18.
Metal including alloys, all forms	1,703	1,212	39	Finland 214; Zaire 172; Belgium-Luxembourg 122.
Columbium and tantalum:				
Ore and concentrate	NA	553	NA	Malaysia 323; Brazil 116; Australia 31.
Ash and residue containing columbium and/or tantalum	NA	9,214	182	Belgium-Luxembourg 3,292; Singapore 1,667; China 478.
Metal including alloys, all forms:				
Columbium (niobium)	23	32	31	NA.
Tantalum	255	114	79	Belgium-Luxembourg 11; Japan 9; France 6.
Copper:				
Ore and concentrate	537,883	481,142	447	Papua New Guinea 212,722; Mexico 135,672; Republic of South Africa 60,903.
Matte and speiss including cement copper	11,026	4,675	10	Canada 1,978; Morocco 752; Argentina 627.
Oxides and hydroxides	263	668	NA	Belgium-Luxembourg 330; Italy 188; Netherlands 52.
Sulfate	10,759	9,356	NA	France 2,421; Belgium-Luxembourg 2,256; U.S.S.R. 1,909.
Ash and residue containing copper	38,900	34,586	199	Italy 12,460; Switzerland 3,534; France 2,642.
Metal including alloys:				
Scrap	180,971	151,352	3,490	France 38,844; United Kingdom 26,773; Netherlands 23,604.
Unwrought	554,378	492,588	3,032	Chile 125,321; Belgium-Luxembourg 76,532; Poland 75,401.
Semimanufactures	244,465	214,262	2,451	Belgium-Luxembourg 75,348; France 51,258; East Germany 22,128.

See footnotes at end of table.

Table 3.—Federal Republic of Germany: Imports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Gallium: Metal including alloys, all forms ____ kilograms__	5,800	5,600	1,400	France 1,200; Netherlands 500; Hungary 400.
Germanium: Metal including alloys, all forms ____ do____	1,800	1,900	NA	Belgium-Luxembourg 1,400; China 400.
Gold:				
Ash and residue containing gold value, thousands__	$10,566	$14,031	$8,019	Switzerland $2,199; Denmark $909; Canada $511.
Waste and sweepings ____ do____	$97,881	$53,149	$13,787	Sweden $9,139; Peru $8,533; Denmark $6,505.
Metal including alloys, unwrought and partly wrought thousand troy ounces__	4,070	2,945	45	Switzerland 1,066; Spain 516; U.S.S.R. 324.
Hafnium: Metal including alloys, all forms ____ kilograms__	300	600	500	NA.
Iron and steel:				
Iron ore and concentrate:				
Excluding roasted pyrite thousand tons__	47,917	44,288	(1)	Brazil 14,543; Liberia 7,414; Canada 5,952.
Pyrite, roasted ____	561,190	540,462	--	Spain 341,261; Belgium-Luxembourg 146,646; Portugal 22,542.
Metal:				
Scrap ____ thousand tons__	1,535	1,359	12	Netherlands 404; Belgium-Luxembourg 195; United Kingdom 175.
Pig iron, cast iron, related materials ____	324,452	264,285	67	Canada 68,131; Brazil 61,937; France 29,350.
Ferroalloys:				
Ferrochromium ____	301,021	148,161	2,015	Republic of South Africa 35,131; Zimbabwe 31,782; Sweden 23,666.
Ferromanganese ____	136,652	103,111	430	Norway 48,052; France 31,077; United Kingdom 5,137.
Ferromolybdenum ____	4,863	5,111	313	Belgium-Luxembourg 2,853; United Kingdom 692; France 342.
Ferronickel ____	71,714	64,805	NA	Greece 35,714; New Caledonia 16,506; Japan 8,307.
Ferrosilicochromium____	12,844	12,870	NA	Zimbabwe 12,005.
Ferrosilicomanganese ____	129,929	121,177	NA	Norway 78,702; Czechoslovakia 12,840; Republic of South Africa 10,714.
Ferrosilicon ____	221,565	196,904	282	Norway 89,581; France 27,286; Spain 21,171.
Unspecified ____	11,370	9,535	418	France 4,214; Brazil 2,639; United Kingdom 1,821.
Steel, primary forms thousand tons__	r1,943	2,139	(1)	Netherlands 636; East Germany 234; Austria 229.
Semimanufactures:				
Bars, rods, angles, shapes, sections____ do____	r4,102	4,120	1	Belgium-Luxembourg 983; Italy 796; France 594.
Universals, plates, sheets do____	r3,717	3,836	3	Belgium-Luxembourg 1,149; France 713; Netherlands 263.
Hoop and strip____	668,722	600,554	934	Belgium-Luxembourg 235,762; France 159,847; Netherlands 66,928.
Rails and accessories ____	26,859	28,048	7	Netherlands 9,074; East Germany 7,312; Sweden 2,198.
Wire____	250,477	270,507	419	Belgium-Luxembourg 92,740; France 37,297; East Germany 35,864.
Tubes, pipes, fittings ____	782,472	829,066	1,923	Italy 152,297; France 132,792; Netherlands 123,696.
Castings and forgings, rough __	50,379	79,562	61	East Germany 34,807; France 7,849; Netherlands 4,543.
Lead:				
Ore and concentrate____	181,679	214,800	3,129	Sweden 64,427; Canada 35,052; Ireland 20,018.
Oxides ____	7,186	5,609	56	Belgium-Luxembourg 1,279; France 1,084; East Germany 560.
Ash and residue containing lead ____	13,690	14,676	1,409	France 4,855; United Kingdom 2,782; Netherlands 1,342.

See footnotes at end of table.

Table 3.—Federal Republic of Germany: Imports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Lead —Continued				
Metal including alloys:				
Scrap	44,308	34,594	1,799	Netherlands 12,847; United Kingdom 6,845; France 3,972.
Unwrought	160,650	115,786	11,521	United Kingdom 32,547; Belgium-Luxembourg 19,970; France 12,080.
Semimanufactures	4,367	3,279	19	Belgium-Luxembourg 2,168; France 697; Yugoslavia 147.
Magnesium:				
Metal including alloys:				
Scrap	1,250	1,123	3	Sweden 304; France 193; Denmark 174.
Unwrought	31,131	26,639	4,652	Norway 10,950; Italy 5,308; Yugoslavia 1,903.
Semimanufactures	347	682	9	Austria 218; Norway 128; France 109.
Manganese:				
Ore and concentrate, metallurgical-grade	489,548	606,851	--	Republic of South Africa 360,482; Australia 114,424; Congo 51,850.
Oxides	5,059	2,794	46	Belgium-Luxembourg 1,879; Greece 291; Ireland 163.
Metal including alloys, all forms	5,731	5,147	830	Republic of South Africa 2,393; Netherlands 1,044; France 336.
Mercury 76-pound flasks	12,659	6,154	203	China 3,596; Turkey 812; Netherlands 435.
Metalloids:				
Arsenic, oxides and acids	638	781	NA	Belgium-Luxembourg 431; France 171; Sweden 80.
Selenium and phosphorus	32,432	30,014	NA	NA.
Silicon	55,132	52,804	(1)	France 15,867; Norway 12,830; Switzerland 5,312.
Tellurium and arsenic	49	75	7	Sweden 31; U.S.S.R. 20; United Kingdom 10.
Molybdenum:				
Ore and concentrate	18,087	18,139	6,215	Canada 3,279; Belgium-Luxembourg 1,764; Chile 1,614.
Oxides and hydroxides	453	502	69	Netherlands 219; China 100; Belgium-Luxembourg 61.
Metal including alloys:				
Scrap	NA	521	13	Austria 372; Sweden 73; France 35.
Unwrought	NA	131	43	Sweden 58; France 9; Austria 8.
Semimanufactures	354	332	68	Austria 229; France 12; Netherlands 9.
Unspecified	747	--		
Nickel:				
Ore and concentrate	39	70	--	Australia 25; United Kingdom 25.
Matte and speiss	14,116	12,361	--	Australia 7,739; Canada 2,016; Cuba 1,543.
Oxides and hydroxides	391	315	NA	Canada 151; Netherlands 98; France 23.
Ash and residue containing nickel	1,692	2,113	NA	France 406; Netherlands 328; United Kingdom 235.
Metal including alloys:				
Scrap	7,551	5,469	703	France 1,325; United Kingdom 881; Netherlands 620.
Unwrought	39,329	39,928	6,350	U.S.S.R. 6,624; Canada 6,306; Australia 5,547.
Semimanufactures	6,723	5,833	638	France 2,080; Philippines 1,130; United Kingdom 1,103.
Platinum-group metals:				
Ash and residue containing platinum value, thousands	$2,482	$2,093	$536	Switzerland $443; France $391; Israel $233.
Waste and sweepings, platinum do	$71,058	$42,277	$1,548	Netherlands $7,039; Hungary $5,729; Belgium-Luxembourg $5,381.
Metal including alloys, unwrought and partly wrought:				
Palladium troy ounces	367,909	317,128	22,836	U.S.S.R. 178,813; United Kingdom 66,136; Switzerland 21,505.
Platinum do	416,969	473,210	80,471	United Kingdom 122,779; Switzerland 78,380; Republic of South Africa 59,091.
Unspecified do	120,025	106,409	51,227	Switzerland 16,043; United Kingdom 14,523; Republic of South Africa 12,700.
Rhenium: Metal including alloys, all forms value, thousands	$1,005	$267	NA	NA.

See footnotes at end of table.

Table 3.—Federal Republic of Germany: Imports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Silver:				
Ash and residue containing silver value, thousands	$41,125	$19,454	$10,007	Netherlands $2,956; Sweden $2,148; Austria $1,170.
Waste and sweepings do	$78,265	$16,987	$3,959	Sweden $3,560; Yugoslavia $1,734; Denmark $1,284.
Metal including alloys, unwrought and partly wrought thousand troy ounces	35,661	25,957	1,800	Sweden 5,592; Switzerland 5,046; Poland 2,268.
Tin:				
Ore and concentrate	3,343	3,229	18	United Kingdom 2,203; Bolivia 834; Chile 124.
Oxides	36	35	NA	France 14; Italy 11; United Kingdom 5.
Ash and residue containing tin	20,428	4,253	949	Malaysia 1,394; Netherlands 593; United Kingdom 451.
Metal including alloys:				
Scrap	324	344	(1)	Netherlands 96; Belgium-Luxembourg 58; Switzerland 54.
Unwrought	18,304	17,052	45	Thailand 6,230; Indonesia 4,579; Malaysia 1,890.
Semimanufactures	1,541	989	1	Netherlands 886; United Kingdom 55; Belgium-Luxembourg 27.
Titanium:				
Ore and concentrate	484,902	538,968	NA	Norway 340,530; Canada 143,598; India 30,864.
Oxides	18,329	20,691	1,931	Belgium-Luxembourg 11,379; France 2,637; Spain 1,376.
Metal including alloys, all forms	4,878	4,844	306	Japan 2,962; U.S.S.R. 727; United Kingdom 391.
Tungsten:				
Ore and concentrate	2,931	2,698	--	China 894; Australia 588; France 305.
Oxides and hydroxides	127	33	NA	Sweden 22; France 6; China 5.
Ash and residue containing tungsten	324	282	86	France 127; Sweden 40.
Metal including alloys:				
Scrap	NA	781	29	United Kingdom 274; Israel 215; Austria 75.
Unwrought	NA	273	4	Austria 188; Belgium-Luxembourg 24; France 24.
Semimanufactures	109	78	26	Austria 25; Netherlands 9; France 6.
Unspecified	861	--		
Uranium and/or thorium:				
Ore and concentrate value, thousands	--	$8	--	All from Netherlands.
Oxides and other compounds	910	550	12	U.S.S.R. 508; France 2.
Metal including alloys, all forms:				
Uranium value, thousands	$113	$27	NA	NA.
Thorium do	$14	$61	$58	NA.
Vanadium:				
Oxides and hydroxides	1,382	2,224	45	China 474; Belgium-Luxembourg 100.
Ash and residue containing vanadium	44,422	36,685	NA	China 4,944; Belgium-Luxembourg 698.
Metal including alloys, all forms value, thousands	$32	$44	NA	NA.
Zinc:				
Ore and concentrate	618,984	506,148	10,576	Canada 138,406; Sweden 73,127; Republic of South Africa 40,545.
Oxides	7,089	6,377	33	France 2,198; Netherlands 1,493; Italy 937.
Blue powder	14,475	12,009	NA	Belgium-Luxembourg 8,223; Netherlands 1,247; France 1,101.
Matte	3,339	4,986	NA	Netherlands 1,169; Belgium-Luxembourg 955; Hungary 597.
Ash and residue containing zinc	71,732	125,630	11,237	Belgium-Luxembourg 22,325; Peru 17,957; United Kingdom 17,414.
Metal including alloys:				
Scrap	11,128	23,968	959	Netherlands 8,209; United Kingdom 3,763; Denmark 2,436.
Unwrought	161,781	137,964	--	Belgium-Luxembourg 56,972; Netherlands 27,022; Norway 13,669.
Semimanufactures	25,673	24,990	9	France 18,760; Netherlands 3,355; Yugoslavia 1,447.
Zirconium:				
Ore and concentrate	56,086	69,444	1,232	Australia 36,184; Republic of South Africa 24,132; Sri Lanka 3,385.
Metal including alloys, all forms	279	167	36	France 95; Sweden 26; United Kingdom 3.

See footnotes at end of table.

Table 3.—Federal Republic of Germany: Imports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Other:				
Ores and concentrates	8,642	9,852	NA	Chile 8,911; Cyprus 620; Republic of South Africa 150.
Oxides and hydroxides	487	2,447	962	France 810; United Kingdom 322; Netherlands 219.
Ashes and residues	248,407	286,215	7,991	Canada 176,372; East Germany 10,184; Belgium-Luxembourg 1,871.
Pyrophoric alloys	14	30	NA	Austria 22; Netherlands 6.
Cermets	1,011	770	175	Sweden 260; France 67; Austria 52.
Base metals including alloys, all forms	67	206	--	All from East Germany.
NONMETALS				
Abrasives, n.e.s:				
Natural: Corundum, emery, pumice, etc	249,522	133,008	855	Greece 99,986; Italy 23,802; Portugal 6,413.
Artificial:				
Corundum	41,497	41,209	1,272	Netherlands 16,125; Hungary 6,608; Austria 5,245.
Silicon carbide	72,364	67,530	1,380	Norway 12,489; Italy 2,997; U.S.S.R. 2,297.
Dust and powder of precious and semi-precious stones including diamond kilograms	397,430	200,504	68,681	Canada 130,634; Ireland 791; Romania 135.
Grinding and polishing wheels and stones	8,897	8,475	250	Italy 1,770; Austria 1,739; Spain 1,100.

COMMODITY REVIEW

METALS

Iron, lead, and zinc were the only major metallic ores mined, employing 1,825 workers. Productivity in lead-zinc production reportedly fell per worker per shift, with the average metal content per ton of crude ore also declining.

Preussag AG, traditionally a producer of lead and zinc, continued to move into other nonferrous metals. Rationalization of production at its plants in the Harz Mountains and emphasis on secondary lead and zinc smelting were part of this diversification. The metals division of Preussag, Preussag Metall AG, was based in Goslar and managed the Rammelsberg and Grund Mines in the Harz region, the Oker smelter just outside Goslar, and two smelters at Nordenham. The metals division also operated the minor metals plant at Langelsheim, five galvanizing plants, two diecasters, and several other plants in Western Europe and elsewhere. Production at Langelsheim included germanium, gallium, arsenic, selenium, indium, mercury, tellurium, antimony, thallium, and several other metals used in the chemical, electronic, and telecommunications industries, chiefly byproducts from bauxite and zinc, lead, and copper concentrates. The Langelsheim plant also processed residues from the plants at Oker, Nordenham, and elsewhere.

Aluminum.—Total primary aluminum capacity was more than 731,000 tons in 1982, produced by six companies at nine plants. The largest producer, with 45% of total domestic capacity, was Vereinigte Aluminum Werke AG. The company lost over $39 million, but was reported to have initiated a recovery plan for 1983.

Alcan Aluminium Werke GmbH (AAW), the smallest aluminum producer in the FRG, with a capacity of 46,000 tons per year, and a wholly owned subsidiary of Aluminum Co. of Canada Ltd. (Alcan), acquired 95% of Ohler Eisenwerk Theab Pfeiffer AG at Plettenberg-Ohle. The new managing company was to be called Alcan Ohler GmbH and was the largest rigid foil container manufacturer in the FRG with 60% of the country's market. The company produced about 8,000 tons of foil and had more than 600 employees. AAW reportedly

shut down its only aluminum smelter at Ludwigshafen at the end of the year because of the high cost of energy. AAW's decision apparently affected plans for the construction of a 1,300-megawatt atomic reactor at Neupotz.

Giulini Chemie GmbH, the smallest alumina producer, with under 8% of domestic capacity, and a subsidiary of Israel Chemicals Ltd., was reportedly purchased by the Aluminum Co. of America. The purchase included the 140,000-ton-per-year alumina refinery at Ludwigshafen and all stocks and raw materials.

Cobalt.—Herman C. Stark was virtually the only producer of cobalt. The company also produced a wide range of specialty metals and chemical salts at its plants in Goslar and Laufenburg. Production of cobalt metal and salts was running near capacity, in spite of the recession and the generally poor market for refined cobalt. The company specialized in the production of cobalt metal powders, salts, carbonates, hydroxides, and driers. In 1982, it was one of the world's largest producers of cobalt metal powder, with sales throughout the world. Two types of powder were produced, an extra-fine powder with particle size between 1 and 1.5 micrometers and a fine powder in the range of 2 to 4 micrometers.[3]

Copper.—Copper production has been stable for several years. Nevertheless, the smaller of the two major copper producers, Hüttenwerke Kayser AG, had expanded its tankhouse capacity at Lunen from 85,000 tons per year of electrolytic copper in 1981 to more than 105,000 tons in 1982. Almost all production was to be in cathodes, although limited production of wirebar was to continue for awhile until it is phased out. Much of the company's output was sold under long-term contracts that offered some security during the recession, and the rest was sold on the spot market.

The largest copper producer, Norddeutsche Affinerie AG, in Hamburg, with an estimated capacity of 245,000 tons per year, did not do as well in 1982. The company also operated a 180,000-ton-per-year continuously cast rod plant in Hamburg.

The copper industry depended largely on scrap supplies for its feed; only 10% to 30% of its output came from primary domestic production. Copper scrap came from France, the Netherlands, the United States, and increasingly from Great Britain. Mostly because of low prices, U.S. export of scrap to the FRG fell to 26,757 tons in 1980 and to 12,000 tons in 1981.

Because of stringent pollution controls, there was a drastic drop in scrap burning, but a corresponding increase in the number of shredders, which have tripled over the last 10 years to about 15. It was estimated that about 50% of shredded copper consisted of No. 2 granules, which were 98.5% copper.

Iron and Steel.—The steel crisis continued during 1982, owing to worldwide economic recession and competition from developing countries. Steel output fell to the lowest level in 16 years, and low prices depressed company profits. Of the 18 producing companies, Thyssen AG was the largest, with almost 30% of domestic production capacity. The year was marked by restructuring plans for the top producers to consolidate into two steel giants, Thyssen joining Friedrich Krupp Hüttenwerke AG, and Klöckner Werke AG with Stahlwerke Peine-Salzgitter AG and Hoesch Werke AG.

There were five operating iron mines in the country, with a total production of crude ore of 1.3 million tons. In descending order of production, they were Leonie, 581,000 tons; Wohlverwahrt-Nammen, 437,000 tons; Haverlahwiese-Konrad, 238,800 tons; Fortuna, 57,000 tons; and Schottenbach, 5,000 tons. The mines produced 16% less ore than during previous years, and the Haverlahwiese Mine was shut down because of depletion. Employment fell to 675 miners from 807 in 1981, even though productivity rose to an average of 43.2 tons of crude ore per worker per shift with the highest productivity of 72.7 tons per worker at Wohlverwahrt-Nammen.

In 1982, there were 180,000 workers employed by the steel industry. Short-time working hours affected 33,500 steelworkers, or 18.6% of the total, compared with only 7.7% in 1981.

Lead and Zinc.—Two companies operated four lead-zinc mines at about the same output of crude ore as in 1981. Stagnant lead metal production was attributed to insufficient supply of secondary materials at reasonable prices. Stricter environmental regulations impacted detrimentally on the lead and zinc industry by delaying start of new plants.

One-third of smelting was based on domestic and imported concentrates, and the remainder came from recycled materials. Three-quarters of smelted zinc came from domestic and imported concentrates, and the remainder was from scrap, ash, and

slag. Neither lead nor zinc production had kept abreast of the rise of GNP in real terms, and the relative importance of both metals in the total industry of the FRG was diminishing.

One of the oldest mines in Europe was the Rammelsberg lead and zinc mine at Goslar, which in 1982 produced about 30% of the country's domestic lead-zinc requirements. The ore, however, was being depleted rapidly, and Preussag had plans to close the mine in 1988. The company was exploring for new deposits nearby and looking for ways to keep the miners employed after the mine closes. One approach that was considered was to turn the mine into a museum, and another was the reworking of the old dump. The mine produced about 115,000 tons of concentrate containing 28% zinc. It was also virtually the only mine in the FRG that produced copper concentrate. The Grund Mine at Bad Grund was also a significant producer of lead and zinc; it was responsible for about 40% of the country's lead, 20% of the zinc, and 50% of the silver output. The lead and zinc smelter at Oker, just south of Goslar, until a few years ago processed most of the high-grade concentrates produced in the Harz Mines. In 1981, however, primary zinc production was stopped, and the plant in 1982 smelted only secondary lead and zinc. Most of the zinc scrap and slag was imported for the production of zinc slabs, bars, and ingots for the galvanizing industry.

NONMETALS

Bentonite.—Two companies produced bentonite, Sud Chemie AG, the largest, and Erbsloh und Co. The capacity of the latter was 100,000 tons of sodium and calcium bentonite and 150,000 tons of raw clay per year, but capacities for Sud Chemie were unavailable. Sud Chemie operated mines in Bavaria near Freising, Mainburg, and Landshut, and a processing plant at Moosburg in Bavaria. The company produced all kinds of bentonite and had subsidiaries in France, Italy, and Mexico. Erbsloh operated mines near Landshut and two plants at Landshut. All production was principally for foundry applications.

The FRG consumed from 325,000 to 345,000 tons of bentonite, which was a decline of more than 50% since 1974, when a high of 600,000 tons was reached. In 1981, about 150,000 to 160,000 tons was used for foundries, 35,000 tons for bleaching acid-activated clays, 30,000 tons for engineering, 5,000 to 10,000 tons for absorbents, 5,000 to 10,000 tons for agricultural applications, 1,000 tons for organic coated bentonites, and about 18,000 tons for other applications.

Fertilizer Materials.—The fertilizer industry had been experiencing a reduction in production and capacity for the last several years. In mid-1981, the Chemische Werke Huls AG shut down its ammonia units at Bottrop and Herne, which had a total capacity of 300,000 tons per year of nitrogen in ammonia. Complex fertilizer capacity was also cut back considerably in 1982 with the closure of the Gewerkschaft Victor Chemische Werke AG plant at Castrop Rauxel and the Ruhr-Chemie AG plant at Oberhausen Holten with capacity totaling 829,000 tons per year. In addition, other plants have been operating at reduced rates.

Fluorspar.—Three companies accounted for all of the small domestic fluorspar output. Fluss-und Schwerspatwerke Pforzheim GmbH, a subsidiary of Bayer AG of Leverkusen, operated mines at Kaersteige and Gottesehre and processed the ore at company plants at Pforzheim and St. Blasien/Bildstein. Combined acid-grade spar production capacity of the company was about 55,000 tons per year, although the output was supplemented by imported high-grade concentrates. VAW Flusspat-Chemie GmbH, a subsidiary of Vereinigte Aluminum Werke, had a 30,000-ton-per-year production capacity of acid spar at its plant at St. Stulln, from mines in Lissenthan, Stulln, and Wolsendorf. The third company, Sachtleben Bergbau GmbH, a subsidiary of Metallgesellschaft, had a 30,000-ton-per-year capacity of acid spar as a byproduct of its barite operations at Wolfach and Bad Lauterberg.

Potash and Salt.—Kali und Salz AG (K&S) operated all eight domestic potash mines, which are in the Zechstein Basin, and was the largest potash producer in Western Europe and the fourth largest in the world. The company also operated two salt mines in the Zechstein Basin, which stretches from Poland to the northeast of England. The production of potash and salt was lower because of reduced demand both domestically and abroad. More than 50% of the output was exported. K&S suffered a severe decline in profits in 1982, when net earnings fell to $6 million, the lowest since 1972. In 1980 and 1981, the company had managed to hold net profits above $20 million.

Structural geologic conditions in Lower

Saxony, in the north, differ considerably from those in Hesse, in the south. In the north the deposits are steeply folded and faulted, while in the south the beds are horizontal and less deformed. In both regions, the ore is mined by drilling and blasting, except that in the north the ore is extracted by stoping, while in the south it is extracted by the room-and-pillar method. Carnallite, sylvinite, and rock salt were the major ores mined by K&S. The ore refining processes included flotation, thermal dissolution, and electrostatic separation. Electrostatic separation was used for the production of potassium chloride, kieserite (magnesium sulfate), and rock salt from ores of different composition. About 10 million tons per year of potash was processed by electrostatic separation. The actual capacity of K&S was 2.7 million tons of K_2O equivalent, 80% of which was in the form of chlorides and the rest in sulfates. The company was the largest producer of magnesium sulfates and potassium chlorides in Europe.

About 65% of the potassium chloride was upgraded to 60% to 63% K_2O content, mainly in fine or granulated grades. The fine product was produced at mines in Salzdetfurth, Sigmundshall, and Wintershall with a total capacity of 800,000 tons per year of K_2O equivalent. Coarse and granulated chlorides were produced at Bergmannssegen-Hugo, Hattorf, and Salzdetfurth Mines, which had a total annual capacity of 400,000 tons K_2O. Potassium sulfates were produced in the Werra region and in the Hattorf (two-thirds of total) and Wintershall Mines. Total sulfate capacity surpassed 400,000 tons per year of K_2O, which represented 30% of world sulfate production capacity.[4]

The Friedrichshall potash mine, purchased by K&S from Kali Chemie AG in 1981, was joined underground in 1982 to the nearby Bergmannssegen-Hugo shaft. Surface operations of the former were discontinued, and the mine shafts were filled in. This marked the completion of the first stage of a project that will lead to the output of potash and other minerals from both Friedrichshall and Bergmannssegen-Hugo, via the latter's hoisting facilities. Mine workings in the Hugo section were 3,000 feet deep, while those at Friedrichshall were 2,300 feet deep. Two interconnecting tunnels were cleared, one at the lower and another at the higher level. The higher level was used for access by machinery and personnel, and the lower, for ore crushing and conveying.

K&S also produced about 1.1 million tons of rock salt, or 16% of domestic output. About 60% of production was for human and chemical consumption, the rest was used for road deicing.

Refractories.—Owing to changing technology in steelmaking, the production of refractories continued to decline and most likely will continue to do so for at least the next several years. Once the open hearth furnaces disappear, brick consumption may be less than 3 pounds per ton of steel. The steel industry was the main user of refractory bricks, accounting for 50% to 70% of production. The production and use of monolithics, however, continued to increase, reaching 40% of the total. Almost one-half of the monolithics was based on fire clay sand with 90% to 95% SiO_2, a low-cost material for the lining of steel ladles and cupolas.

The FRG possessed only the inexpensive raw materials necessary for the production of refractories—clay, quartzite, and dolomite. Low-flux clay, for example, was imported from England and France, as were all other high alumina and magnesia-chrome products. As previously, there were no import duties on refractory raw materials. High-value materials were imported from Belgium, China, France, South America, and other countries.[5]

MINERAL FUELS

Consumption of primary energy continued the fall that began in 1980, to about 365 million tons of coal equivalent, or 2% less than that of 1981. About 22 million tons of hard coal, approximately one-quarter of annual production, remained stockpiled even though mines in the Ruhr and the Saar produced 22% less coal than in 1970. Oil refineries also operated at barely one-half capacity, with several refineries closed down. The use of gas has continued to fall since 1980, even though consumption went up from 5.6% in 1970 to 17.5% in 1980. The high cost of energy, reduced energy consumption, and the decline of production by the energy-intensive primary industry contributed to the fall.

A new nuclear powerplant became operative, and there were then 11 operating and 4 experimental nuclear powerplants, with a total capacity of 12,000 megawatts. The combined output of the 11 coal and 1 lignite power stations was put at 7,650 megawatts. The Government spent $5.5 billion between

1956 and 1981 on nuclear energy research and development, $3 billion of which was for light-water-reactor technology, $1.4 billion for breeder reactors, and $1.1 billion for high-temperature reactors. In the middle of the year, Spain and the FRG had also agreed to build a solar thermal plant twice as powerful as the "Solar One" plant recently put into service by the Southern California Edison Co. and the Department of Energy at Barstow, Calif. The design and component testing would amount to $39.4 million, leading to the construction of a 20-megawatt plant in the Spanish province of Badajoz on the Portuguese border. Full construction was to cost $396 million, with two-thirds of the cost provided by the FRG. In general, expenditures for energy research were approved to rise to $1.3 billion in 1985 from $816 million in 1981, $490 million of which was intended for coal research, $341 million specifically for coal processing.

Coal.—Anthracite and bituminous coal were mined in four coalfields. The respective share of each coalfield in the total output of 89 million tons was as follows: Ruhr, 79.6%; Saar, 12.3%; Aachen, 5.6%; and Ibbenburen, 2.5%. Longwall mining was almost the only method of mining employed in all the coalfields. The mining techniques and equipment used in each coalfield were virtually identical. The mines in the FRG were the most highly mechanized in the world. Average daily output per colliery working day rose again in 1982, but only in the Ruhr, by about 10%, to an average output of 9,557 tons per day. Collieries in the Aachen Coalfield had the lowest productivity, where the output was 30% below the national average. The average face length was 693 feet, significantly below the national average, and the average working thickness was 30% below the average. The daily advance of faces in Aachen was 10% greater than average, but the average face output was almost 50% lower. In the Ibbenburen Coalfield, both the working thickness and the average face output were also below the national average, by about 20%. Only in the Saar Coalfield were both the working thickness of seams and the average face output well above the national average, by 40% and 20%, respectively.

Power-generating stations were the only ones that used more coal, substituting it for oil and gas. The electric power industry used about 37 million tons of coal and thus surpassed the steel industry's consumption for the first time. In 1982, 15 coal-fired generating plants were under construction, 6 of them in the 350- to 750-megawatt class, with a total capacity of 8,200 megawatts and costing approximately $47 billion. They were scheduled to start operation between 1983 and 1986 and, when completed, will consume about 10 million tons of coal per year.

Ruhrkohle AG completed a 20-foot diameter, 2,000-foot-deep shaft at Voerde in the Lower Rhine. When completed, the shaft is to be almost 3,500 feet deep. The weak beds were reinforced by a refrigeration system freezing the ground for stability. For this purpose, a freezing plant was built on the surface with a total output of 3.5 megawatts.

Over 90% of lignite production came from the Ruhr Basin. Production and employment declined in 1982, mostly owing to mine closures and poor sales. By yearend, about 21,000 workers were employed by the lignite industry, 500 fewer than in 1981.

Petroleum and Natural Gas.—Production of petroleum continued its decline since 1970, owing to depletion of old oilfields. It was anticipated that the trend will be reversed when the first offshore field, Schwedeneck in the Baltic Sea, becomes operational. The fixed offshore drilling platforms were to be completed in 1983 and become the first West German offshore oil producers. The area west of Ems River produced over 34% of the crude, in eight oilfields.

Because of reduced demand, the production of natural gas fell, mostly from the area between the Weser and Ems Rivers, by 13.7% and around Hannover by 4%. The Weser-Ems area produced nearly 400 billion cubic feet of gas, accounting for 60% of total output.

Even though oil and gas drilling increased by 27.3%, there were no significant discoveries. During the year, a total of 144 sites were drilled, of which 72 struck some oil and gas. Production came from 83 small gasfields, making up about 16% of total energy requirements. Natural gas reserves were as follows, in billion cubic feet: proven, 10,500, and recoverable, 6,100.

The Mineral Industry of Ghana

By Ben A. Kornhauser[1]

In 1982, the mineral industry of Ghana continued to deteriorate, albeit more slowly, with no stimulus from a depressed world economy. Imported oil consumed about 40% of Ghana's export earnings. With foreign debt payments requiring an additional 40% of export earnings, very little money remained to purchase parts, equipment, and supplies needed to improve the economy. By yearend 1982, foreign debt amounted to about $2 billion, which was equal to the value of 2 years of exports.[2] The overvalued cedi continued to plague the economy.

With the commissioning of the Kpong hydroelectric project, Ghana's electrical power capacity was increased to 1,060 megawatts. Ghana's Volta River Authority (VRA) and the Nigerian Electric Power Authority were studying the possibilities for linking their power systems through Benin and Togo.[3] Decreasing rainfall over the past 4 years caused the water level at the Akosombo Dam on the Volta River to drop to about 250 feet and compelled a cut in electric power to the Volta Aluminum Co. (VALCO) that curtailed its aluminum smelter production by 80,000 tons. VALCO was owned by Kaiser Aluminum & Chemical Corp. (90%) and Reynolds Metal Co. (10%).

PRODUCTION AND TRADE

In 1982, 80% of imports were from Western Europe, the United States, Canada, and Japan, with the remainder coming from other countries. Ghanaian exports followed the import pattern. Industrial diamond production declined to about 612,000 carats, the lowest level since Ghana gained independence in 1957. Gold production continued its declining trend, having dropped 37% from that of 1978 including an 11% decrease from that of 1981. The decline is attributed to deteriorating plants and equipment, a shortage of spare parts and trained personnel, and the low ore grades at the state mines. The Ghana National Manganese Corp. shipped 130,000 tons of manganese ore from its mine at Nsuta to Belgium, the United Kingdom, Ireland, Norway, Spain, and Japan.[4]

Table 1.—Ghana: Production of mineral commodities[1]

Commodity[2]	1978	1979	1980	1981[p]	1982[e]
Aluminum:

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.
[1]Table includes data available through July 28, 1983.
[2]In addition to the commodities listed, a variety of crude construction materials (clays, sand and gravel, and stone) are produced, but output is not reported, and available information is inadequate to make reliable estimates of output levels.

COMMODITY REVIEW

METALS

Aluminum.—The Ghana Bauxite Co., owned 55% by the Government and 45% by British Aluminum Co. Ltd., had projected 1982 bauxite production at only 200,000 tons, which was far below a potential annual production of 400,000 tons. The reduced production resulted from factors such as depressed world bauxite markets and poor railway transport between the mine at Awaso and the Port of Takoradi and owing to the inability to obtain loans to rehabilitate the transport system.[5] Development of the extensive bauxite deposits at Kibi by a European consortium to produce an estimated 800,000 tons per year of alumina had been delayed.[6] VALCO shut down two of its five potlines around November 1 at the request of VRA because the very low water levels in Lake Volta greatly reduced the hydroelectric power generated at the Akosombo Dam. That power cutback reduced the plant capacity of 200,000 to about 120,000 tons per year.[7] Another 10- to 15-foot drop in water level could force the shutdown of both the aluminum smelter and the hydroelectric generating turbines. VRA also was reducing by 10% the electric power supplied to Togo and Benin, resulting in a loss of much needed revenue.

Gold.—For the year ending September 30, 1982, Ashanti Goldfields Corp. (Ghana) Ltd. (AGC) milled 758,980 tons of mixed quartz, sulfide, and bulk ores with an average grade of 0.35 troy ounce of gold per ton. Metallurgical difficulties with the highly carbonaceous portions of the ore kept overall recovery low at 83.4%. Work continued on underground development to expand gold output by 100,000 ounces per year by 1985. Expansion efforts were concentrated on rehabilitating the South shaft and sinking two new shafts. The new Nyankumasu shaft was down to the 2,600 level and could eventually extend to the 3,200 level. This shaft will open up promising new reserves to the south of the present main workings. The Adansi subvertical shaft from the 4,800 level was completed to the 5,200 level. The

new winder capacity will allow it to ultimately reach the 7,200 level. AGC ore reserves shown in the following table are based on a cutoff grade of 0.20 troy ounce of gold per ton.

The State Gold Mining Corp. (SGMC), which ran three low-grade mines at Prestea, Tarkwa, and Konongo and a dredging operation at Dunkwa, operated at only 25% capacity in 1982. Konongo was placed on a care and maintenance status after a brief operation. The low production level was attributed to a general deterioration of the physical plants and machinery due to age and difficulties in obtaining sufficient foreign exchange to purchase spare parts for the mines. A $57 million, 5-year rehabilitation program was developed to return SGMC to full capacity; however, capital availability constraints continued to be a problem.

Table 2.—Ghana: Gold production and reserves

Mine	Production (troy ounces)			1982 reserves		
	1980	1981	1982[p]	Metric tons	Grade (troy ounces per ton)	Gold (troy ounces)
Ashanti	232,036	252,498	223,733	[1]5,041,400	0.625	3,150,875

Manganese.—The manganese roasting and nodulizing plant for upgrading 30% manganese carbonate ore to a 50% contained manganese product at Nsuta was completed but not operational, owing to electrical problems and to the lack of crude oil to run it. The turnkey plant was constructed in 2-1/2 years by the Fuller Co. of Bethlehem, Pa., at a cost of over $27 million to produce between 1,100 and 1,500 tons of manganese per day. An estimated 2-year stockpile of manganese carbonate ore was set aside awaiting the startup of the plant, which potentially could earn about $24 million per year in exports.

NONMETALS

Cement.—Ghana produced about one-half of the cement that it used in 1982. The grinding plants at Tema and Takoradi with a 1.4-million-ton-per-year capacity obtained their clinker from the regional cement clinker complex, Ciments de l'Afrique de l'Ouest in Togo, which also supplied Togo and the Ivory Coast. The complex was funded primarily by the International Bank for Reconstruction and Development (World Bank).

Diamond.—The Government-owned Ghana Consolidated Diamonds Ltd. experienced a decrease in production of 19% as the original Akwatia Valley placer river gravel deposits essentially were depleted. Current mining was taking place within a thin Akwatia terrace gravel pay zone. The terrace gravels could produce diamonds for the next 10 years at 1981 production levels. However, increasing high production costs could affect the future viability of the operation. Additional resources of lower grade placer deposits averaging from 1.07 to 1.42 carats per cubic meter occur in the Birin Valley. These have been investigated under a United Nations Development Program

and would require substantial new investment to develop.

MINERAL FUELS

Petroleum.—The Ghanaian Government awarded a contract to Tanzer Natural Resources Associates, a consulting firm in New York, to help draft new petroleum legislation and to establish a national oil company that would oversee exploration and development. The Government favored production sharing of service contracts instead of concessions. Previously, concessions permitted a 25-year exclusive contract with two optional 10-year extensions and provided the Government a 20% participation in any commercial discovery, 12.5% royalty payments, and a 50% tax of net profits. Agri-Petco Co. operated the only producing field near Saltpond, in the central basin about 10 miles offshore. The field operator was Agri-Petco International Inc., Tulsa, Okla., a joint venture owned by Texas City Refining Inc., National Cooperative Refinery Association, and Indiana Farm Bureau Cooperative Association Inc. Agri-Petco planned to drill additional wells in the Saltpond area. Elsewhere, ongoing explorations were in the offshore Keta basin lagoon by Agri-Petco's Ghana subsidiary, Texas Pacific Corp.; in the Tano basin by the Phillips Petroleum Co., Ghana, operator for a group consisting of Azienda Generali Italiana Petroli S.p.A. (Agip) and Getty Oil International Ghana Inc.; and in an offshore area near the Ivory Coast by Agip, whose partners were Aracca Petroleum Corp., Oxoco International Inc., Texon Energy Corp., and Zapata Exploration Co. The Agip concession was about 150 miles from an oil discovery in Ivory Coast waters. Phillips found oil in its 1-X South Tano well that flowed 1,475 barrels of oil and 8.2 million cubic feet of gas per day. A second appraisal well drilled nearby found additional gas. The Geophysical Service Inc. of Houston was awarded a contract by Ghana to conduct an offshore seismic survey near the Togo border.

The Mineral Industry of Greece

By Walter G. Steblez[1]

In 1982, the Greek economy continued its downward trend. The gross national product declined by 0.5%, gross fixed investment declined by 10%, and unemployment by yearend was over 6% of the 3.7 million labor force. Although inflation dropped to 21%, from 25% in 1981, it was expected to remain above 20% because of high public sector deficit expenditures.

Greece's mineral industry was adversely affected by decreased demand for metals and ores and rising raw material and wage costs, as well as by underemployment. Only a few mineral industry projects were completed and their primary operating results were reportedly less than satisfactory.

The chief events in the country's mineral industry included the completion of the Tsigeli ferrochromium plant, the proposed expansion of the Bauxites Parnasse Mining Co. S.A.'s mining operation at Ghion, and a Soviet proposal to build an alumina plant near Itea.

Greece produces a wide variety of metallic and nonmetallic minerals, as well as mineral fuels, but is a ranking world producer only of bauxite, barite, and perlite, of which its share of world output was 4%, 1.3%, and 9%, respectively.

Government Policies and Programs.—One of the main policies of the Greek Government was the promotion of the public sector. Unprofitable, as well as marginally profitable, industries were subject to nationalization. The Société Minière Metallurgique de Larymna (Larco), Greece's sole nickel producer, was nationalized for this reason in 1982.

In June, Public Law 1116-81, a legislative package aimed at improving investment incentives in industry (including mining and metallurgy), was repealed and superceded by Public Law 1262, which introduced state participation in private investment programs. The legislation aimed at stimulating capital investment and allowed for maximum state grants for projects dealing with energy conservation, mineral and energy research, and technological improvement.

PRODUCTION

Although the aggregate production increase for mining for the first quarter of 1982 showed a 27.9% increase over that of 1981, yearend results showed production decreases in most areas of mining and mineral fuel extraction. Production of bauxite and alumina, mixed sulfides, magnesite, and nickel was less in 1982 than that of 1981. During the year, labor productivity in industry fell below 1981 levels and underutilized industrial plant capacity reached 23%.

The Greek mineral industry was both privately and publicly owned and operated. The principal private firms that operated mining and processing enterprises were the Bodossakis Group, mixed sulfides, iron and cupreous pyrites, lead and zinc concentrates, and nickel; the Eliopoulos-Kyriacopoulos Group, bauxite, barite, bentonite, perlite, and kaolin; the Scalistiris Group, magnesite, bauxite, chromite, and manganese refractories; Magnomin General Mining Co. S.A., magnesite and dead-burned magnesite; Mykobar S.A., barite, bentonite, and perlite; Aluminium de Grèce S.A., bauxite, alumina, aluminum ; and Helikon Bauxites-G. Barlos S.A., bauxite. Principal

Government agencies involved with mineral production and research were the Hellenic Industrial Development Bank (ETVA), asbestos, chromite, and alumina; the Hellenic Industrial Mining & Investment Co. (HIMIC), ferrochrome and ferronickel; the Institute of Geological and Mining Research (IGME), mineral research; the Public Petroleum Co. (DEP), petroleum research; and the Public Power Corp., power industry and lignite mining.

Two companies were partially nationalized: the Companie Française des Mines du Laurium S.A.F, a lead-silver producer formerly owned by Société Minière et Metallurgique de Peñarroya of France, now Government-owned, and Larco of the Bodossakis Group, a nickel producer, of which the Government of Greece is now the major stockholder. Reportedly, uncertainty generated by the Government's nationalization policy negatively affected investments in the mineral industry and the economy as a whole. Strikes in certain mining sectors also had a negative impact on investment and production.

Residual fuel oil do.	35,418	46,679	41,772	45,841	[3]41,878
Lubricants do.	731	756	535	618	[3]687
Other do.	6,658	11,759	10,240	3,400	[3]3,349
Refinery fuel and losses do.	4,789	5,852	4,060	3,465	[3]4,969
Total do.	85,541	112,633	104,767	109,341	[3]109,150

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Sept. 9, 1983.

[2]In addition to the commodities listed, a variety of other crude construction materials (clays, sand and gravel, and stone) is produced, but output is not reported and available information is inadequate to make reliable estimates of output levels. Cobalt is also produced and is included with "Nickel."

[3]Reported figure.

[4]Ni content is also reported under "Nickel."

[5]Black sheet, galvanized sheet, reinforcing bars, and wire only.

[6]Includes antimonial lead and hard lead.

[7]Also includes Co content.

TRADE

In 1982, Greece's overall trade position actually deteriorated despite an improved balance-of-payment position. Improvement of the country's balance-of-payment deficit was chiefly due to a reduction in fuel imports by about 25%, but this reduction was compensated by a Government policy allowing drawing down of the country's oil stocks.

Although the country's major mineral trading partners were fellow members of the European Economic Community (EEC), Greece, after a trade decline in 1981, continued to maintain and promote commercial interests with the centrally planned economies of the Council for Mutual Economic Assistance (CMEA). Greek firms such as Bauxites Parnasse of the Eliopoulos-Kyriacopoulos Group and the Mamidakis Concern had been conducting long-term business with the U.S.S.R. on bauxite exports and petroleum imports, respectively. In 1982, commercial discussions were conducted with the U.S.S.R. on the extension of the Soviet gas pipeline and electric power grid through Bulgaria to Greece, Soviet assistance for the construction of a nonferrous metallurgical site in Greece, and purchases of Greek alumina. Likewise, commercial agreements that included the sale of Greek mineral commodities were negotiated with Romania, Bulgaria, and several other CMEA countries.

Table 2.—Greece: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS				
Aluminum:				
Ore and concentrate thousand tons	2,340	1,588	--	U.S.S.R. 579; Romania 376; Netherlands 188; Italy 125.
Oxides and hydroxides	203,175	159,000	--	All to Netherlands.
Metal including alloys:				
Scrap	1,013	427	--	France 238; Belgium-Luxembourg 83; Netherlands 43.
Unwrought	60,245	69,225	--	France 28,666; Italy 26,075; Lebanon 8,649.
Semimanufactures	32,786	26,705	120	Saudi Arabia 7,457; West Germany 5,934; Jordan 1,983.
Chromium: Ore and concentrate	32,319	15,885	--	West Germany 12,490; Italy 980; France 840.
Copper:				
Matte and speiss including cement copper	--	20	--	All to Belgium-Luxembourg.
Metal including alloys:				
Scrap	851	1,494	--	France 539; Belgium-Luxembourg 498; West Germany 224.
Unwrought	129	1	--	All to Libya.
Semimanufactures	10,142	12,350	120	West Germany 2,567; Libya 2,210; Iran 1,667.
Iron and steel:				
Iron ore and concentrate, pyrite, roasted	22,603	14,500	--	All to Kenya.
Metal:				
Scrap	859	819	--	Italy 562; Netherlands 174; France 83.
Pig iron, cast iron, related materials	16	20	--	All to Cyprus.
Ferroalloys, ferronickel	49,468	49,350	9,841	West Germany 26,507; Belgium-Luxembourg 6,969; Sweden 2,696.
Steel, primary forms	69,072	3,142	--	India 3,124; Saudi Arabia 17.
Semimanufactures:				
Bars, rods, angles, shapes, sections	167,712	189,725	1	Egypt 51,903; Syria 32,578; Tunisia 26,910.
Universals, plates, sheets	173,120	45,509	15,780	Yugoslavia 15,192; Cyprus 3,080; Albania 2,385.
Hoop and strip	10,788	10,898	--	Syria 6,905; West Germany 1,594; Italy 490.
Rails and accessories	75	1	--	All to Libya.
Wire	4,382	2,337	--	Libya 1,372; Bulgaria 338; Cyprus 204.
Tubes, pipes, fittings	96,164	124,987	58,608	Libya 34,581; Cyprus 15,686; Iran 8,208.
Castings and forgings, rough	11	662	--	West Germany 624; Lebanon 14; Libya 12.

Table 2.—Greece: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Lead:				
Ore and concentrate	39,124	21,580	--	U.S.S.R. 7,300; Bulgaria 5,430; Belgium-Luxembourg 5,000.
Metal including alloys:				
Scrap	235	361	--	All to Belgium-Luxembourg.
Unwrought	r530	1,455	--	Italy 700; Yugoslavia 400; Turkey 354.
Semimanufactures	5	21	--	Saudi Arabia 20.
Manganese:				
Ore and concentrate, metallurgical-grade	750	1,500	--	All to Spain.
Oxides	13,126	9,238	1,431	Belgium-Luxembourg 3,088; U.S.S.R. 1,151; Republic of South Africa 667.
Nickel: Metal including alloys:				
Scrap	90	393	--	Netherlands 376; United Kingdom 17.
Semimanufactures	981	479	--	Netherlands 478.
Silver:				
Waste and sweepings value, thousands	$199	$214	--	All to Belgium-Luxembourg.
Metal including alloys, unwrought and partly wrought do	$2,102	$2,204	--	France $1,990; West Germany $130; Switzerland $82.
Tin:				
Ore and concentrate	30,325	--		
Metal including alloys:				
Unwrought	--	2	--	All to Saudi Arabia.
Semimanufactures	8	--		
Uranium and/or thorium: Ore and concentrate value, thousands	$205	--		
Zinc:				
Ore and concentrate	44,741	42,100	--	France 13,200; Belgium-Luxembourg 11,800; Italy 8,000.
Oxides	7	(1)	--	All to Bulgaria.
Metal including alloys:				
Scrap	629	398	--	West Germany 204; Italy 121; Belgium-Luxembourg 39.
Unwrought	--	2	--	All to Cyprus.
Semimanufactures	42	44	--	Italy 23; Belgium-Luxembourg 21.
Other:				
Ores and concentrates	942	124,288	--	Romania 70,000; Italy 19,138; United Kingdom 17,650.
Ashes and residues	88,208	60,849	--	Saudi Arabia 40,300; Mali 8,924; Egypt 5,772.
Base metals including alloys, all forms	106	72	--	Netherlands 67; Saudi Arabia 5.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	412,923	271,743	92,482	United Kingdom 139,172; West Germany 34,700; Spain 2,000.
Dust and powder of precious and semiprecious stones, including diamond value, thousands	$79	$326	$305	All to West Germany.
Grinding and polishing wheels and stones	55	35	1	France 9; Turkey 9; Egypt 5.
Barite and witherite	55,259	822	--	Libya 802; Egypt 20.
Cement thousand tons	5,222	5,996	--	Saudi Arabia 2,042; Egypt 1,731; Nigeria 740.
Chalk	619	631	--	Saudi Arabia 396; Cyprus 157.
Clays and clay products:				
Crude, unspecified	485,449	768,426	--	Libya 154,255; United Kingdom 113,293; Sweden 110,650.
Products:				
Nonrefractory	18,154	9,503	(1)	Saudi Arabia 2,650; Egypt 2,311; Jordan 1,142.
Refractory including nonclay brick	43,340	37,781	--	France 7,261; West Germany 3,898; Romania 3,741.
Diatomite and other infusorial earth	--	1	--	NA.
Fertilizer materials:				
Crude, n.e.s	943	2,239	--	Saudi Arabia 2,048; Jordan 191.
Manufactured:				
Ammonia	--	1	--	All to Romania.
Potassic	500	18,800	--	Algeria 12,700; Libya 4,700; Cyprus 1,000.
Unspecified and mixed	71,944	40,553	--	China 40,500; Cyprus 40.
Graphite, natural	--	1	--	All to Cyprus.
Gypsum and plaster	19	162	--	Cyprus 106; Cameroon 50.

See footnotes at end of table.

Table 2.—Greece: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Lime	130	234	--	Cameroon 224; Saudi Arabia 10.
Magnesium compounds: Magnesite	423,809	280,863	4,355	West Germany 71,449; Italy 40,841; Yugoslavia 37,502.
Pigments, mineral: Iron oxides and hydroxides, processed	--	1	--	All to Lebanon.
Precious and semiprecious stones other than diamond: Synthetic -- value, thousands	$75	--	--	
Salt and brine	--	1,003	--	Bulgaria 1,000.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	--	(1)	--	All to Libya.
Sodium hydroxide	--	105	--	Sweden 100; Saudi Arabia 5.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	51,452	37,249	380	Lebanon 9,447; Saudi Arabia 7,734; Italy 5,722.
Worked	53,328	57,937	166	Saudi Arabia 28,083; Libya 8,876; Kuwait 4,843.
Gravel and crushed rock	15,804	22,179	--	Libya 21,880; Cyprus 238.
Quartz and quartzite	27,013	2,129	--	Italy 2,000; Cyprus 129.
Sand other than metal-bearing	12	50	--	Libya 25; Iraq 10; Saudi Arabia 6.
Sulfur:				
Elemental, crude including native and byproduct	2,046	5,758	--	Turkey 4,650; Bulgaria 1,000; United Kingdom 72.
Sulfuric acid	162,927	32,839	--	Yugoslavia 17,500; Turkey 6,000; Algeria 5,000.
Talc, steatite, soapstone, pyrophyllite	--	525	--	Israel 500; Cyprus 20.
Other:				
Crude	285,748	215,368	4	West Germany 85,375; France 58,660; United Kingdom 23,176.
Slag and dross, not metal-bearing	9,007	4,228	--	Saudi Arabia 2,230; West Germany 1,500; Netherlands 219.
Oxides and hydroxides of barium, magnesium, strontium	6,126	(1)	--	All to Libya.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	33,572	15,169	--	Saudi Arabia 6,864; Libya 5,583; Cyprus 1,150.
MINERAL FUELS AND RELATED MATERIALS				
Coal: All grades including briquets	45	--		
Coke and semicoke	22,000	320	--	All to Libya.
Peat including briquets and litter	--	337	--	All to Saudi Arabia.
Petroleum refinery products:				
Liquefied petroleum gas thousand 42-gallon barrels	51	366	--	Lebanon 99; Italy 65; France 60.
Gasoline do	1,222	197	--	France 173; Spain 13; Tunisia 9.
Mineral jelly and wax do	130	79	--	West Germany 54; Morocco 25.
Kerosine and jet fuel do	5,113	2,960	1,617	Saudi Arabia 252; Egypt 178; United Kingdom 112.
Distillate fuel oil do	2,904	2,098	1,773	Saudi Arabia 153; Panama 36; United Kingdom 16.
Lubricants do	400	143	2	Egypt 82; Italy 19; Lebanon 9.
Residual fuel oil do	10,528	3,021	117	Italy 1,175; Lebanon 333; Libya 251.
Bitumen and other residues do	--	(1)	--	All to Cyprus.
Bituminous mixtures do	1	13	--	Libya 9; Cyprus 3.
Tars and other crude chemicals derived from coal, gas, and petroleum	--	150	--	Syria 146.

COMMODITY REVIEW

METALS

Aluminum and Bauxite.—Greece's production of bauxite, alumina, and aluminum was cut back from anticipated yearend goals in 1982 because of depressed world market conditions. Major trends in the bauxite mining industry included planned facility expansion at the Bauxites Parnasse mining operations in the Parnassos-Ghion Mountains, 200 kilometers northwest of Athens. The company, which is the largest bauxite producer in the EEC, with approximately 58% of total domestic bauxite mining capacity, anticipated increased alumina demand because of a proposed $500 million,[2] 600,000-ton-per-year alumina plant, Aghra Euthemia, near Itea. The proposed Bauxites Parnasse Mine expansion, if implemented, would raise the company's annual production capacity from 2,000,000 to 3,000,000 metric tons per year, at a cost of $75 million. About 44% of the cost would be earmarked for construction and installation, 36% for infrastructure and transport facilities, 11% for exploration, and 9% for equipment. The project would also increase the company's work force by 40%. The company's 60% to 40% open pit to underground production ratio was expected to be reversed in the near future. Major importers of Greek bauxite, as in past years, were the U.S.S.R. and Romania.

The proposed alumina plant was the subject of a feasibility study contracted to the U.S.S.R. by ETVA and completed by mid-1982. Results of the study were circulated for outside evaluation. The major issues were the disposal of the alumina produced and construction financing. The U.S.S.R. agreed to purchase over 200,000 tons per year of alumina over an unspecified time period, with another 100,000 tons to be taken by Bulgaria. The outstanding question, as in 1981, was the manner in which additional alumina production would be marketed and disposed of.

Other events included an increase in capacity at the Aluminium de Grèce alumina plant by 100,000 tons per year and an EEC loan to the same company through ETVA to improve productivity at the company's aluminum smelter.

Chromite.—Mine development at the Skoumtsa chromium deposits continued. Exploratory work conducted by IGME at Vourinos, 40 kilometers southwest of Kozáni, resulted in finding an additional 300,000 tons of chromite, which brought total proven reserves in the Skoumtsa mining area to 1 million tons, sufficient to last 15 years at a 30,000-ton-per-year ferrochrome production rate. Exploration plans aim at securing chromite reserves for 20 years. A $65 million expansion program was planned at the Skoumtsa underground mine to raise production from 55,000 to 250,000 tons per year, and construction of a new 60,000-ton-per-year concentrator was begun to replace the old 13,000-ton-per-year unit; it would produce 48% Cr_2O_3 grade concentrate with a 3.1:1 chrome to iron ratio. Both facilities were expected to start operations by early 1983. The concentrate was to be fed to the Tsigeli 40,000-ton-per-year ferrochromium plant, owned by the Government-controlled Hellenic Ferroalloy S.A., which was completed in 1982 and scheduled for full operation by early 1983. Interest by the EEC in Greece's chromium mining and metallurgy resulted in a $10 million financing package for development in this area.

Iron and Steel.—Developments included the completion of a feasibility study for the construction of a 60,000-ton-per-year special steel plant. If completed, the plant would cost about $130 million and would draw its raw material base from the country's new ferrochromium plant as well as from ferronickel production. Two-thirds of the special steel would be sold for export and one-third would be sold to the domestic market. The U.S.S.R. also expressed interest in promoting Greek stainless steel operations during the year. Negotiations were reportedly conducted with the Greek company E. Karakikolas Sa-Beky on a cooperative agreement that would establish a $300 million steelworks near Salonika in northern Greece. The plant would have a design capacity of 130,000 to 150,000 tons per year of bars and flat rolled products. A large but unspecified percentage of the plant's output would be sold to the U.S.S.R. for an undetermined length of time. It was also reported that during the year the installed capacity of Hellenic Steel Co. was doubled.

Lead and Zinc.—The Aegean Metallurgical Industries S.A., an ETVA subsidiary, submitted another plan for the construction of a long-proposed lead-zinc smelter. The proposal called for the roughly $500 million integrated sulfide smelter to be built in eastern Chalkidiki on the Gulf of Ierissos, close to the Kassandra mines, the proposed raw material source. The smelter would produce annually about 40,000 tons each of lead and zinc and about 180,000 tons

of sulfuric acid. Additionally, 96,500 troy ounces of gold, 860,000 troy ounces of silver, and 200 tons of cadmium, plus arsenic and other byproducts, would be recovered. In anticipation of the proposed plant's feed requirements, the Kassandra mining operation, owned by the Hellenic Chemical Products and Fertilizers Co. of the Bodossakis Group, proceeded with a $20 million expansion program to raise the capacity of the Olympus Mine from 300,000 to 800,000 metric tons of ore per year. The capacity at the other two Kassandra mines would remain at 550,000 tons per year.

Expansion at the Olympus Mine was to include the development of a 400-meter vertical shaft to the lower part of the ore body, the addition of an underground primary crusher, skip hoisting facilities, and new trackless underground equipment. The ore bodies at the Kassandra mines are a hypothermal to metathermal type with mineralization occurring in veins or concentrations in marble horizons within metamorphic rocks. Measured reserves were about 20 million tons of ore containing 3.5% lead, 4.5% zinc, 17% sulfur, 3.85 troy ounces per ton of silver, and 0.18 troy ounce per ton of gold.

Production results for the year were reportedly poor owing to depressed market prices and the temporary shutdown of the Lavrion mining and metallurgical operations. The production of mixed sulfides at the Kassandra mines declined by 10% in respect to that of 1981.

Nickel.—The Greek nickel mining and processing industry experienced another difficult year because of depressed markets. Adding to this burden was a 4-month-long strike at Larco, Greece's only nickel and ferronickel producer. Production was halted during this period resulting in an output far below that of 1981. Negotiations begun in 1981 between Larco and the Government of Greece on nationalization resulted in majority stock ownership of the nickel producer by the Government.

Table 4.—Greece: Metallic mining and processing industries

Commodity	Major operating companies (ownership)	Location of main facilities	Capacity (thousand tons per year)	Share of domestic capacity (percent)
Alumina	Aluminium de Grèce S.A	Aspra Spritia, Distomon in Boeotia.	400	100

Zinc	Hellenic Chemical Products and Fertilizers Co. (Bodossakis Group).	Kassandra mines, northeast Chalkidiki.	47	100

During the year, Larco, together with other European nickel producers, lodged a complaint with the EEC alleging dumping of cut and uncut cathodes on the European market by the U.S.S.R. The allegation stressed that during the first 9 months of the year the Soviet share of the market increased from 9% to 18.5% and that this resulted in an EEC-wide reduction of output by 34%, a 16% drop in capacity utilization and a loss of 1,440 jobs.

NONMETALS

Asbestos.—Depressed markets and technical difficulties affected considerably the 1982 production schedule at the new 100,000-ton-per-year asbestos mining and processing complex at Zidani. Production for the year amounted to less than 25% of the complex's rated capacity, and operations were conducted on a 5-day instead of a 6-day work basis as planned. The complex was 91% Government-owned and operated by ETVA; 9% was owned by International Finance Corp. When operating at full capacity, about 20% of the output would be consumed domestically and about 80% would be earmarked for export.

Magnesite.—A major event in the magnesite industry was a complaint filed with the EEC by the Financial-Mining Industrial and Shipping Corp. (FIMISCO) and Macedonian Magnesite, magnesite-producing subsidiaries of the Scalistiris Group, on behalf of all EEC magnesite producers concerning alleged dumping practices by China and the Republic of Korea. The complaint alleged that the EEC market share for these countries increased from 21% to 44% and that prices were from 13% to 28% below those of the European producers. Over the same period (1979-80), there was a 40% reduction in the number of employees in this industry.

MINERAL FUELS

Lignite.—The main development in the lignite industry was in the field of policy rather than mining. A 10-year program of the Public Electricity Enterprises was established to use 80% lignite for the production of electric power by 1991. Also, during the year the construction of a coal terminal, which would facilitate imports, was examined.

Petroleum and Natural Gas.—New deposits of petroleum and gas were discovered near Katakolon; however, the offshore find was at too great a depth and too small to be commercially viable under present conditions. Production of both fuels increased during the year, but petroleum's share in electric power production dropped from 37% in 1981 to 26% in 1982.

The Mineral Industry of Guinea

By Suzann C. Ambrosio[1]

Guinea was the second largest producer of bauxite during 1982 and ranked first in the world in terms of bauxite reserves. Bauxite resources were estimated at nearly 6 billion tons and comprised just over 25% of the world's resources. Guinea's mining sector output, comprised of bauxite, alumina, and diamonds, was valued at approximately $462 million.[2] The gross national product (GNP) was estimated at $1.5 billion during 1981 and was projected to increase slightly during 1982. The mining sector's contribution to the GNP decreased slightly between 1981 and 1982, owing largely to depressed world markets and decreased output of all minerals and mineral products. Guinea exported nearly all mineral production.

Guinea's largely state-run economy has increasingly encouraged the private sector. A foreign investment code enacted in 1981 emphasized mining and other industrial enterprises as priority investments. The code offered potential investors relief from custom duties, import and export taxes, and tailored land use and mineral rights to the needs of a particular investment.

Guinea's one major Atlantic Ocean Port, Conakry, which supports total annual traffic volumes of approximately 3 million tons, was affected by congestion, poor infrastructure, and equipment problems. The Government was negotiating a $13 million loan from the International Bank for Reconstruction and Development (World Bank), a $14 million loan from the African Development Bank, and a variety of bilateral aid grants for the rehabilitation and improvement of port facilities.

PRODUCTION AND TRADE

Production of bauxite and alumina have declined slightly over the past 3 years. During 1982, approximately 9.7 million tons of dry basis ore, 98,000 tons of abrasive-quality calcined bauxite, and 549,000 tons of alumina were produced and exported. Bauxite exports to the Soviet Union have been and are expected to remain nearly constant over the years, as the Office des Bauxite de Kindia (OBK) settles arrears on a long-term debt agreement. OBK, one of Guinea's three largest bauxite producers, agreed to export bauxite to the Soviet Union in exchange for financial and technical assistance. Guinea imports all of its crude petroleum and petroleum product needs from the United States, Brazil, and the Soviet Union. Refinery product imports were reported at approximately 3 million barrels.

[e]Estimated. NA Not available.

[1]Owing to a lack of official trade data published by the Government of Guinea, this table should not be taken as a complete presentation of Guinea's exports of bauxite and alumina. These data were gathered from various sources that include United Nations information and official trade data published by the partner trading countries. Table includes data available through July 15, 1983.

[2]Metal Statistics 1971-81, Metallgesellschaft Aktiengesellschaft, 1982, Frankfurt am Main, Federal Republic of Germany.

COMMODITY REVIEW

METALS

Bauxite and Alumina.—The nation's three open pit mines continued to be owned and operated through Government and private sector joint ventures, including the Compagnie des Bauxites de Guinée (CBG), OBK, and the Société d'Economie Mixte Friguia. Billiton Aluminum BV (Netherlands) was negotiating an equity participation deal with CBG minority shareholder Martin Marietta Corp. to assure delivery of roughly 6% of the Boke Mine's output.

Plans continued to be made to develop another open pit mine and refinery at Aye Koye. Alugui, the joint-venture company (participants unknown) planned the $300 million project to produce 9 million tons of bauxite, 1.2 million tons of alumina, and possibly 150,000 tons of aluminum metal annually. The company was concerned with securing power supplies prior to revealing more detailed plans and equity arrangements.

The Government of Guinea was also considering developing a bauxite and alumina open pit and refinery complex at Dabola. Discussions were taking place between the Government, Reynolds Metals Co., and unnamed Yugoslav, Algerian, and Nigerian companies.

Iron Ore.—Plans continued to be made to develop the Mifergui-Nimba iron ore deposit located in southern Guinea. The planned 15-million-ton-per-year open pit mine and concentrator facilities were estimated to cost approximately $1.1 billion. The project cost included a United States Steel Corp. engineering management contract for both the mining and pellet projects and a transport link to Liberian port facilities. A group of international aid organizations and Canadian and European investment institutions were expected to finance the project.

NONMETALS

Diamond.—Diamonds have been produced on a relatively small scale since 1930. Although the Government halted diamond mining operations in 1975 because of speculation and smuggling, two newly formed companies, both 50% state-owned, have renewed hopes for commercial exploitation. Total diamond reserves in the principal diamond deposit areas, a triangle between Kissidougou, Beyla, and Kerouane in south-central Guinea, were estimated at 30 million carats.

The Association pour la Récherche et l'Exploitation du Diamont et de l'Or (AREDOR), originally formed in 1978, was reorganized in 1981 to include Bridge Oil Ltd. of Australia and was called Aredor Guinea Inc. The other less active company, called the Société de Diamant de Guinee, was formed during 1980. The new joint venture, Aredor Guinea, was capitalized at $20 million equally between the Guinean Government and Aredor Holdings Ltd. (Australia). Aredor Holdings' capital was divided among Bridge Oil, 79.2%; Société Financiere Internationale (SFI), 11.3%; Industrial Co. Ltd. (United Kingdom), 5%; Simonius Vischer and Co. (Switzerland), 1%; and the remaining 3.5% shares were expected to be sold.

A strip diamond mine was planned with facilities capable of annually processing approximately 400,000 cubic meters of diamond-bearing gravel. The expected annual production of roughly 175,000 carats of gem-quality diamonds was projected to commence during 1984. At this production rate, reserves were estimated to last approximately 15 years. Mine development costs were estimated at nearly $85 million, not including $30 million already invested.

Guinea became a member of the World Bank group's International Finance Corp. (IFC) during September 1982 and applied for assistance to develop AREDOR. The IFC agreed to a $15.3 million package, including a $13.9 million loan to AREDOR and a $1.4 million AREDOR share subscription. Commercially syndicated loans of approximately $62.5 million were secured through the Bankers Trust Group, 69%, and Bayerische Vereinsbank and other West German industrial supplier institutions, 31%. The Bankers Trust Group was comprised of Continental Illinois National Bank and Trust Co., Chicago, Ill., $13 million; Bankers Trust New York Corp., $10 million; Manufacturers Hanover Trust Co., $10 million; BT Australia (HK) Ltd., $5 million; and Pittsburg National Bank, $5 million. The Overseas Private Investment Corp. agreed to provide approximately $43 million in political-risk insurance for U.S. investors for the approximate 6-year loan contract period. Hermes Versand Service GmbH & Co. (Federal Republic of Germany) was expected to cover the remaining political-risk capital excluding SFI's share.

MINERAL FUELS

Petroleum.—An information meeting was held on December 6 and 7, 1982, in Geneva, for companies interested in obtaining exploration permits. The Guinean Government contracted Petroconsultants S.A. (Switzerland) to organize and conduct the meetings. World Bank officials were present at the meeting and were expected to follow up with a visit to Guinea during 1983 to further discuss hydrocarbon and possibly other mineral exploration projects.

Uranium.—An international consortium for uranium exploration and exploitation in southeastern Guinea was formed at yearend 1982. The Government of Guinea held a 50% share in the project and other interests were divided among Nigerian, Moroccan, Yugoslav, and British companies. Contracts were signed between the Government and the Davy McKee Corp. for the latter to be responsible for technical and financial management as project operator. In addition, a drilling contract was signed with the Yugoslav firm Energoprojek.

The Mineral Industry of Hungary

By Walter G. Steblez[1]

In 1982, Hungary's centrally planned economy, for the second straight year showed stability and displayed modest growth. National income increased by about 1.5% to 2.0%; industrial production registered a 2% increase over that of 1981. Within the latter category, mining and metallurgical industries increased output by 1.4% and 8%, respectively. Raw material and energy supplies were generally viewed as adequate with some shortages occurring in the second half of 1982; these were mainly supplied from hard-currency market economies and caused only minor production bottlenecks. The decline of the mining sector's labor force stabilized, whereas in other industrial sectors, for example, construction, Hungary reported labor force reductions.

Compared with 1981, total industrial employment declined by about 20,800 workers or 2% in 1982. At the same time, however, industrial labor productivity rose by 4.1% over that of 1981. In certain mining sectors the rise in labor productivity was attributed to increased overtime, amounting to an average 18 days per miner. The increase in productivity in this sector resulted in a wage bill increase amounting to 110 million forints.[2]

Government Policies and Programs.—The planned economic objectives, including mining, for the most part were met and in certain cases exceeded the plan. The trend of modest planned growth was expected to continue in 1983; national income and gross industrial output were to rise by 0.5% to 1.0% and 1.0% to 2.0%, respectively. Significant gains in coal mining in 1982 reportedly will permit total energy consumption to rise by 1% in 1983; also, nuclear energy would account for 4% to 5% of the produced electricity.

Streamlining industrial production and increasing product marketability remained chief goals for the 1980's. The profitable operation of decentralized industries and the reduction or elimination of subsidies were to competitively orient Hungarian industry with the economies of the Western World. This would include, to some degree, the transformation of the forint to a convertible currency.

Hungary's mineral industry policy stressed improved efficiency in both mining and processing. Domestic minerals, however, were not to be developed at all costs; mining investment and operations were to be commercially competitive on the world market with higher vertical product integration and correspondingly higher earning for the economy.[3]

PRODUCTION

Despite a depressed world market environment, Hungary's planned economy was able to produce more coal, natural gas, petroleum, and steel than in 1981; there was, however, a decline in the production of some of the country's traditional products of nonferrous metals.

Hungary continued to produce substantial quantities of bauxite and alumina as well as metallurgical-grade manganese ore. Hungary's continued linkage of industrial production-to-export capability to the world market had, to an extent, a dampening effect on bauxite mine production and metallurgy because of a drop in demand for aluminum and other metallurgical goods.

To save raw materials and increase product competitiveness raw material input weights were to be further reduced. In certain metallurgical products, Hungarian studies have shown up to 20% greater input of primary materials than comparable products in the Western World.

[e]Estimated. [p]Preliminary. [r]Revised.

[1]Table includes data available through Sept. 2, 1983.

[2]In addition to the commodities listed, diatomite, gypsum, and a variety of other crude construction materials such as common clays are produced, but available information is inadequate to make reliable estimates of output levels.

[3]Reported figure.

[4]18% to 20% Mn.

[5]Excludes refinery fuel and losses.

[6]Data derived by subtracting reported motor gasoline and white spirit data from reported light refinery products total.

TRADE

Hungary's 1982 foreign trade plan was successfully implemented. The trade volume with centrally planned economy countries increased by 3% with exports rising 4%. Imports of mineral raw materials and fuels, especially from the U.S.S.R., declined noticeably in comparison with those of 1981. Overall imports from hard-currency market economy countries fell and exports to these countries rose in 1982. Together with most other centrally planned economy countries, Hungarian imports of raw materials dropped in comparison with those of 1981.

In midyear Hungary formally joined the International Bank for Reconstruction and Development (World Bank) and International Monetary Fund. It was expected that membership in these organizations would assist in capitalizing Hungarian participation in projects, including mineral projects, sponsored by the World Bank.

The U.S.S.R. remained Hungary's major supplier of industrial mineral and raw materials, including mineral fuels, iron ore, ferroalloys, and asbestos. Late in 1982, Metalimpex of Hungary signed an agreement with the U.S.S.R. to import 98 million rubles[4] worth of nonferrous metal in 1983. Also, agreements were concluded with a number of Latin American countries for Hungarian imports of ferrous and nonferrous metals and ores.

Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	--	162	--	All to West Germany.
Artificial: Corundum	[2]9,173	7,461	--	West Germany 6,608; Italy 582.
Grinding and polishing wheels and stones[2] value, thousands	$2,110	$2,170	$19	Romania $966; East Germany $599; Poland $149.
Asbestos, crude	5,285	2,529	--	All to Belgium-Luxembourg.
Boron materials:				
Cement[2]	186,400	185,448	--	Yugoslavia 132,269; Poland 20,385; U.S.S.R. 19,400.
Clays and clay products:				
Crude:				
Andalusite, kyanite, sillimanite	177	64	--	All to Austria.
Bentonite[2]	15,604	18,218	--	East Germany 11,409; Poland 4,991; Czechoslovakia 1,738.
Chamotte earth	485	472	--	All to Austria.
Kaolin[2]	6,496	6,615	--	Czechoslovakia 4,963; West Germany 1,652.
Unspecified	158	383	--	Austria 186; West Germany 174.
Products:				
Nonrefractory	4,461	4,929	--	West Germany 2,930; Austria 1,408; Egypt 275.
Refractory including nonclay brick[2]	24,757	17,034	--	Romania 5,180; Italy 3,957; Albania 3,167.
Diamond:				
Gem, not set or strung value, thousands	$76	$52	--	All to Belgium-Luxembourg.
Industrial do	$1,018	$1,959	--	Do.
Diatomite and other infusorial earth	3,832	3,125	--	Austria 2,675; Greece 213; West Germany 187.
Feldspar, fluorspar, related materials:				
Unspecified	2,491	2,705	--	All to Switzerland.
Fertilizer materials:				
Crude, n.e.s	--	20	--	All to West Germany.
Manufactured:				
Ammonia[2]	86,500	70,243	--	Yugoslavia 60,909; Czechoslovakia 4,952.
Nitrogenous thousand tons	[2]961	[2]1,306	--	Yugoslavia 168; West Germany 116; Pakistan 21.
Phosphatic[6]	52,222	116,667	--	NA.
Potassic	--	24	--	All to Austria.
Unspecified and mixed	97,998	71,315	--	West Germany 61,107; Yugoslavia 7,326.
Lime	20	NA		
Mica:				
Crude including splittings and waste	--	2	--	France 1; Italy 1.
Worked including agglomerated splittings value, thousands	$5	$8	--	Yugoslavia $6; France $2.
Pigments, mineral: Iron oxides and hydroxides, processed	65	NA		
Precious and semiprecious stones other than diamond:				
Natural value, thousands	$2	$21	--	Italy $19.
Synthetic do	$6	NA		
Sodium and potassium compounds, n.e.s.:				
Sodium carbonate, natural and manufactured	6	NA		
Sodium hydroxide	3,000	576	--	All to Austria.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked[2]	52,521	34,212	--	U.S.S.R. 15,510; Yugoslavia 10,926; East Germany 2,734.
Worked	1,227	388	([4])	Austria 202; Switzerland 146.
Dolomite, chiefly refractory-grade	348	148	--	West Germany 88; Finland 60.
Gravel and crushed rock	43,739	33,107	--	Austria 21,691; Yugoslavia 11,416.
Limestone other than dimension	22,660	14,999	--	All to Yugoslavia.
Quartz and quartzite	9,386	17,468	--	All to Austria.
Sand:[2]				
Industrial	37,752	60,309	--	Austria 43,791; Yugoslavia 16,185.
Construction cubic meters	299,078	321,280	--	Czechoslovakia 291,041; Austria 9,827; U.S.S.R. 7,212.

See footnotes at end of table.

Table 2.—Hungary: Apparent exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981[p]	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Sulfur:				
Elemental: Crude including native and byproduct	1,449	3,046	--	Yugoslavia 1,563; Austria 1,483.
Sulfuric acid[2]	68,411	63,284	--	Austria 63,164.
Talc, steatite, soapstone, pyrophyllite	--	20	--	All to Belgium-Luxembourg.
Vermiculite	NA	19,384	--	All to West Germany.
Other:				
Crude[2]	104,487	106,017	--	East Germany 29,390; Austria 24,110; Poland 15,165.
Slag and dross, not metal-bearing	46,980	969	--	Austria 873; Yugoslavia 96.
Building materals of asphalt, asbestos and fiber cements, unfired nonmetals	NA	14,506	--	Switzerland 5,174; Italy 3,505; Austria 1,946.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	198	319	--	All to Austria.
Coal:				
Anthracite and bituminous[6]	267,000	187,000	--	NA.
Briquets of anthracite and bituminous coal	40	11,215	--	All to Austria.
Lignite including briquets[2]	44,547	42,422	--	Austria 23,164; U.S.S.R. 18,058.
Coke and semicoke	596	NA		
Gas natural ---- million cubic feet	311	408	--	U.S.S.R. 339; Czechoslovakia 69.
Hydrogen, helium, rare gases ---- do	--	3	--	All to Austria.
Peat including briquets and litter[2]	6,340	12,761	--	Austria 7,029; Yugoslavia 3,283; West Germany 1,834.
Petroleum and refinery products:				
Crude[6] thousand 42-gallon barrels	6,000	3,621	--	NA.
Refinery products:				
Liquefied petroleum gas[2] do	840	722	--	Yugoslavia 440; Netherlands 107; Austria 62.
Gasoline do	[2]341	[2]1,094	--	West Germany 266; Switzerland 226.
Mineral jelly and wax[2] do	240	247	--	West Germany 83; Italy 54; Sweden 23.
Kerosine and jet fuel[2] do	408	386	(4)	U.S.S.R. 237; East Germany 20; United Kingdom 20.
Distillate fuel oil[2] do	702	1,482	--	Austria 482; West Germany 462; U.S.S.R. 211.
Lubricants[2] do	305	289	--	Austria 175; Yugoslavia 52; West Germany 28.
Residual fuel oil[2] do	2,738	1,947	--	Austria 1,056; Czechoslovakia 689.
Bitumen and other residues[2] do	604	558	--	Austria 156; United Arab Emirates 143; Libya 81.
Bituminous mixtures do	2	--		
Tars and other crude chemicals derived from coal, gas, and petroleum[2]	150,728	176,671	--	Romania 73,967; Italy 43,844; West Germany 27,713.

[p]Preliminary. NA Not available.

[1]Owing to a lack of official trade data published by Hungary, this table should not be taken as a complete presentation of this country's mineral trade. These data were compiled from various sources, which include United Nations information, data published by the partner trade countries, and partial official trade sources of Hungary.

[2]Official Trade Statistics of Hungary.

[3]Quarterly Bulletin of Steel Statistics for Europe, United Nations, New York.

[4]Less than 1/2 unit.

[5]May include other precious metals.

[6]Statistical Yearbook of Members of Council for Mutual Economic Assistance, Moscow, U.S.S.R.

Table 3.—Hungary: Apparent imports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1980	1981[p]	Sources, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals:				
Unspecified	283	27	--	West Germany 24; Austria 3.
Aluminum:				
Ore and concentrate	156	3	--	Netherlands 2; Switzerland 1.
Oxides and hydroxides	123	265	151	West Germany 102; United Kingdom 11.
Metal including alloys:				
Scrap	--	16	--	All from West Germany.
Unwrought[2]	187,865	154,499	--	U.S.S.R. 151,334; Poland 1,600; Romania 1,260.
Semimanufactures[2]	7,923	5,759	1	East Germany 3,562; Czechoslovakia 1,022; Switzerland 226.
Beryllium: Metal including alloys, all forms	--	5	--	West Germany 4.
Cadmium: Metal including alloys, all forms	12	4	--	All from Yugoslavia.
Chromium:				
Ore and concentrate	19,242	711	--	All from Finland.
Oxides and hydroxides	--	51	--	Italy 50.
Metal including alloys, all forms kilograms	--	3	3	
Cobalt:				
Oxides and hydroxides	5	29	--	France 22; Netherlands 7.
Metal including alloys, all forms	--	28	--	France 27.
Columbium and tantalum: Metals including alloys, all forms: Tantalum	36	(3)	--	All from West Germany.
Copper:				
Sulfate[2]	4,216	3,661	--	All from U.S.S.R.
Metal including alloys:				
Scrap	3,090	2,816	--	Switzerland 1,546; West Germany 694; Belgium-Luxembourg 383.
Unwrought	[2]28,962	[2]61,406	--	West Germany 5,281; Austria 3,170; undetermined 51,916.
Semimanufactures	[2]8,393	[2]35,799	3	West Germany 1,091; Austria 254; undetermined 33,568.
Gold: Metal including alloys, unwrought and partly wrought troy ounces	NA	903	--	West Germany 678; Switzerland 225.
Iron and steel:				
Iron ore and concentrate:				
Excluding roasted pyrite[2] thousand tons	3,286	3,765	--	U.S.S.R. 3,392; Sweden 194; Yugoslavia 90.
Pyrite, roasted[2]	320,799	203,865	--	U.S.S.R. 106,162; Romania 69,902; Yugoslavia 16,215.
Metal:				
Scrap[4]	4,000	144,000	--	NA.
Pig iron, cast iron, related materials[2]	255,823	289,546	--	U.S.S.R. 272,168; Yugoslavia 16,038.
Ferroalloys:				
Ferrochromium[2]	7,662	6,547	--	U.S.S.R. 5,518; Yugoslavia 530; Bulgaria 400.
Ferromanganese[2]	62,023	44,431	--	U.S.S.R. 23,581; Norway 13,500; Czechoslovakia 6,700.
Ferromolybdenum	NA	60	--	All from Sweden.
Ferrosilicon[2]	6,556	6,863	--	U.S.S.R. 6,842.
Unspecified	11,215	15,725	200	U.S.S.R. 13,466; Czechoslovakia 497; France 405.
Steel, primary forms[2]	443,633	433,562	--	U.S.S.R. 412,505; Bulgaria 8,601; Yugoslavia 6,740.
Semimanufactures:				
Bars, rods, angles, shapes, sections[2]	173,187	184,109	--	U.S.S.R. 146,484; Czechoslovakia 17,385; Austria 5,933.
Universals, plates, sheets[2]	340,562	356,708	--	U.S.S.R. 234,919; Czechoslovakia 28,248; East Germany 17,516.
Hoop and strip[2]	9,442	9,970	--	West Germany 2,843; Austria 2,429; Czechoslovakia 1,300.
Rails and accessories	[4]3,000	[4]3,000	--	West Germany 744.
Wire[2]	37,427	35,582	--	Czechoslovakia 15,876; West Germany 4,299; Austria 3,197.
Tubes, pipes, fittings[2]	69,131	89,827	10	West Germany 20,737; East Germany 20,422; Romania 18,612.
Castings and forgings, rough[2]	13,338	15,959	--	Yugoslavia 12,326; West Germany 1,160; Italy 1,153.
Unspecified[2]	1,773	1,087	--	France 1,048; Italy 26.

See footnotes at end of table.

Table 3.—Hungary: Apparent imports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981[p]	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Lead:				
Oxides	2,911	1,817	--	France 1,031; Austria 678; West Germany 101.
Metal including alloys:				
Unwrought	[2]12,868	[2]11,033	--	Austria 151; Denmark 150; undetermined 10,731.
Semimanufactures	23	105	--	Belgium-Luxembourg 73; United Kingdom 31.
Magnesium: Metal including alloys:				
Unwrought	[5]41	569	105	Italy 382; Yugoslavia 82.
Semimanufactures	20	141	--	United Kingdom 93; Austria 18; West Germany 15.
Manganese:				
Ore and concentrate, metallurgical-grade[2]	15,537	150	150	
Oxides	80	--		
Metalloids:				
Silicon	NA	1,548	--	Norway 549; Yugoslavia 549; Italy 450.
Unspecified	9,358	11,304	--	France 11,253.
Molybdenum:				
Ore and concentrate	79	60	--	All from Sweden.
Metal including alloys, all forms	22	136	(3)	West Germany 134.
Nickel:				
Oxides and hydroxides	NA	9	--	All from Netherlands.
Metal including alloys:				
Scrap	134	NA		
Unwrought	4	5	--	All from West Germany.
Semimanufactures	124	77	--	Canada 25; Sweden 13; West Germany 12.
Platinum-group metals: Metals including alloys, unwrought and partly wrought, unspecified, value, thousands	$8,084	$6,097	$253	West Germany $5,555; United Kingdom $287.
Silver:				
Waste and sweepings, do.	--	$2	--	All from West Germany.
Metal including alloys, unwrought and partly wrought, do.	$5,120	$4,415	--	United Kingdom $3,046; West Germany $1,278; Austria $53.
Tin: Metal including alloys:				
Unwrought	[2]1,621	[2]1,369	--	Belgium-Luxembourg 100; undetermined 1,269.
Semimanufactures	11	20	--	Netherlands 19.
Titanium:				
Ore and concentrate	1,687	1,120	--	Netherlands 950; West Germany 170.
Oxides	3,238	2,619	--	United Kingdom 1,058; Finland 785; Belgium-Luxembourg 490.
Metal including alloys, all forms	--	6	--	Belgium-Luxembourg 3; West Germany 3.
Tungsten:				
Ore and concentrate	6	NA		
Metal including alloys, all forms	16	11	(3)	West Germany 9; Netherlands 2.
Zinc:				
Oxides	3,087	2,759	--	Yugoslavia 1,045; Belgium-Luxembourg 889; Austria 625.
Metal including alloys:				
Unwrought	[2]24,319	[2]26,660	--	Poland 7,764; Yugoslavia 5,801; Finland 1,799.
Semimanufactures	[2]7,215	[2]6,927	--	Yugoslavia 1,010; West Germany 823; undetermined 5,091.
Zirconium: Ore and concentrate	NA	2,555	--	Italy 2,535.
Other:				
Ores and concentrates[2]	5,925	16,923	20	U.S.S.R. 15,386; Canada 1,123; China 150.
Oxides and hydroxides	1,078	2,229	33	Sweden 1,294; Austria 799; West Germany 74.
Ashes and residues	10	72	--	Denmark 60; United Kingdom 12.
Base metals including alloys, all forms	88	54	(3)	Austria 31; Belgium-Luxembourg 15; West Germany 7.

See footnotes at end of table.

Table 3.—Hungary: Apparent imports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981[p]	Sources, 1981	
			United States	Other (principal)
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	24	30	--	West Germany 19; Italy 11.
Artificial: Corundum[2]	4,343	2,346	186	Italy 1,086; West Germany 644; Switzerland 275.
Dust and powder of precious and semi-precious stones, including diamond value, thousands	$190	$163	$121	United Kingdom $32; Belgium-Luxembourg $10.
Grinding and polishing wheels and stones[2] do	$6,805	$9,027	$408	Austria $2,422; West Germany $1,812; U.S.S.R. $965.
Asbestos, crude[2]	48,402	33,999	--	U.S.S.R. 31,695; Botswana 1,899.
Barite and witherite	19,879	17,299	--	Yugoslavia 16,200; West Germany 1,099.
Boron materials:				
Crude natural borates	11,920	1,960	--	Netherlands 1,900; France 60.
Oxides and acids	3,634	3,695	--	France 2,195; U.S.S.R. 1,500.
Cement[2]	861,198	695,840	160	U.S.S.R. 501,211; Czechoslovakia 102,865; Romania 70,023.
Chalk	3,221	3,204	--	Austria 1,804; France 1,400.
Clays and clay products:				
Crude:				
Chamotte earth[2]	66,149	72,371	--	Czechoslovakia 65,873; France 2,498; Israel 1,550.
Dinas earth	NA	2,705	--	West Germany 2,310; Austria 395.
Fire clay	NA	22,279	--	Poland 14,034; West Germany 7,122.
Kaolin[2]	34,903	30,868	--	Austria 10,677; Czechoslovakia 9,949.
Unspecified[2]	78,220	58,545	--	Czechoslovakia 53,348.
Products:				
Nonrefractroy	3,904	6,845	--	Yugoslavia 4,462; Austria 1,245; Italy 912.
Refractory including nonclay brick[2]	48,925	64,285	29	Austria 32,980; West Germany 14,397; East Germany 5,222.
Diamond:				
Gem, not set or strung value, thousands	$469	$337	--	West Germany $211; Switzerland $126.
Industrial do	$2,127	$4,521	--	Belgium-Luxembourg $3,323; West Germany $977; United Kingdom $190.
Diatomite and other infusorial earth	828	2,218	--	Iceland 1,745; France 421; Austria 51.
Feldspar, fluorspar, related materials:				
Feldspar	NA	3,320	--	Yugoslavia 1,800; Norway 1,520.
Fluorspar	NA	3,180	--	All from West Germany.
Unspecified	14,042	639	--	Finland 400; Sweden 100; Italy 99.
Fertilizer materials:				
Crude, n.e.s	--	250	--	All from France.
Manufactured:				
Ammonia	5	39	--	West Germany 30; Belgium-Luxembourg 9.
Nitrogenous, N_2 content[2]	96,490	189,694	2,760	U.S.S.R. 162,087; Austria 20,414; Belgium-Luxembourg 3,680.
Phosphatic, P_2O_5 content[2]	129,337	136,041	32,238	Yugoslavia 31,976; U.S.S.R. 25,301; Tunisia 15,286.
Potassic, K_2O content[2]	528,894	558,602	--	U.S.S.R. 361,085; East Germany 190,737.
Unspecified and mixed[2]	96,972	102,273	--	Yugoslavia 58,564; U.S.S.R. 43,084.
Graphite, natural	80	604	5	Austria 500; West Germany 94.
Gypsum and plaster[2]	86,584	22,000	--	All from East Germany.
Halogens:[2]				
Bromine	618	713	--	Israel 309; East Germany 303.
Iodine	34	54	--	Japan 35; U.S.S.R. 19.
Lime[2]	103,219	168,647	--	East Germany 65,096; Yugoslavia 63,099; Romania 19,651.
Magnesium compounds:				
Magnesite[2]	118,258	91,396	--	Czechoslovakia 73,858; North Korea 7,671; U.S.S.R. 6,284.
Oxides and hydroxides	NA	221	--	France 137; West Germany 84.
Other	NA	12,248	--	Austria 12,194.
Mica:				
Crude including splittings and waste	330	163	--	United Kingdom 139; Norway 15.
Worked including agglomerated splittings	33	48	--	Switzerland 35; Austria 11.
Phosphates, crude[2]	671,784	674,150	--	U.S.S.R. 499,382; Morocco 89,827; Algeria 77,080.

See footnotes at end of table.

Table 3.—Hungary: Apparent imports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981[p]	Sources, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Pigments, mineral: Iron oxides and hydroxides, processed	2,887	3,095	(3)	West Germany 2,685; France 200; Belgium-Luxembourg 122.
Potassium salts, crude[2]	2,312	2,719	--	U.S.S.R. 1,608; East Germany 798; Romania 170.
Precious and semiprecious stones other than diamond:				
Natural value, thousands	$59	$122	--	Switzerland $96; West Germany $21.
Synthetic do.	$219	$102	$8	Switzerland $70; Austria $13.
Pyrite, unroasted[2]	89,676	89,237	--	All from U.S.S.R.
Salt and brine[2]	820,520	768,006	--	Romania 497,557; U.S.S.R. 142,920; Poland 76,787.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides[2]	1,754	961	--	East Germany 736; France 225.
Sodium carbonate, natural and manufactured[2]	205,823	189,782	--	Bulgaria 112,207; Romania 62,762; Poland 9,357.
Sodium hydroxide[2]	74,702	24,037	--	Romania 17,485; West Germany 2,903; Italy 1,525.
Sodium sulfate, natural and manufactured	NA	1,875	--	All from West Germany.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked[2]	r9,287	5,214	--	Bulgaria 3,138.
Worked	--	661	--	Italy 541; Austria 89.
Dolomite, chiefly refractory-grade	--	13	--	All from West Germany.
Gravel and crushed rock	7,819	9,422	--	Austria 5,140; Yugoslavia 2,673; Italy 845.
Quartz and quartzite	1,830	2,191	--	West Germany 1,553; Netherlands 595.
Sand other than metal-bearing[2]	112,737	126,208	43	Czechoslovakia 97,316; East Germany 20,952.
Sulfur:				
Elemental:				
Crude including native and byproduct[2]	250,960	183,164	--	Poland 139,596; U.S.S.R. 43,506.
Colloidal, precipitated, sublimed	35	35	--	Italy 30; West Germany 5.
Dioxide	NA	262	--	All from West Germany.

[1]Owing to a lack of official trade data published by Hungary, this table should not be taken as a complete presentation of this country's mineral trade. These data were compiled from various sources which include United Nations information, data published by the partner trade countries and partial official sources of Hungary.

[2]Official Trade Statistics of Hungary.

[3]Less than 1/2 unit.

[4]Quarterly Bulletin of Steel Statistics for Europe, United Nations, New York.

[5]Excludes exports from Norway valued at $148,000.

[6]Quantity in 1980 was 1 ton.

COMMODITY REVIEW

METALS

In 1982, Hungary remained a net importer of most metallic raw materials, except for bauxite and manganese ore. The depressed world market had a negative impact on Hungary's metallurgical industry during the year but the negative effects on other industrial sectors were less pronounced.

Aluminum and Bauxite.—Hungary's aluminum industry suffered serious losses because of stagnant world demand and a sharp drop in prices for aluminum products. Bauxite mine output declined by about 10% and hard-currency export earnings from the industry's sales dropped by 19% from that of 1981. At the same time, electric power consumption associated with dewatering underground workings has been steadily rising.

Table 4.—Dewatering in Hungarian bauxite mining operations

	1970	1975	1980	1981
Bauxite production 1,000 tons	2,020	2,889	2,950	2,914
Bauxite produced under water table percent	71	91	82	74
Bailed water million cubic meters	146.3	189.0	209.5	204.4
Expended energy million kilowatt hours	81.9	135.0	183.7	184.2

Source: Financial Times, Sept. 21, 1982, supplement.

Although revitalization of the industry was expected with improvement in future market conditions, in the meantime, reportedly about 1 million forints would be required to help shore up the bauxite mining. Salient developments in the bauxite mining area were the completion of construction of the Bito II bauxite mine, the expansion of the Halimba III Mine in the Bakony area by 440,000 tons of new capacity, and the construction startup of the Fenyofo Mine.

Important developments in the aluminum industry included the planned completion of the Szekesfehervar light metals works that would cost 7 billion forints and increase the capacity of the plant by 20%. During the year, a furnace explosion was reported at this plant, critically injuring a number of foundry workers and causing several million forints worth of damage.

At the Ajka alumina plant an experimental shop was reported under construction for the production of gallium using a Soviet technology that would make the use of mercury unnecessary and would improve the health conditions of the work force. The plant was to produce 150 kilograms of gallium per year for semiconductor manufacture. A 3,000-kilogram-per-year facility was planned for the future.

The 1983 plans for the industry, as a whole, called for a 3.5% increase in bauxite production and a 7.7% increase in alumina production compared with 1982, and a concurrent shift in exports from market economy countries to centrally planned economy countries.

Copper.—Although mine production of copper ended in 1980, the recently discovered Recsk copper deposit promised to satisfy Hungary's future consumption requirement for copper, as well as part of the country's lead and zinc demands. The deposit, 500 to 1,200 meters beneath the surface, was about 2 kilometers long by 900 meters wide. At 500 to 950 meters deep the deposit is largely porphyritic; at 750 to 1,200 meters deep the ore forms veins and lenses. In 1982, studies of the deposit reportedly continued. Further mine development was to be tied to improvement in world copper price trends.

Iron and Steel.—Hungary maintained some production of sideritic ore at the Rudabanya Mine. Imported ore, as in past years, came from the U.S.S.R.

Hungarian steel industry experts were studying the possibility of reducing imports of Soviet ore, which contained about 54% iron and 18% silica, and replacing it with the more costly but higher quality Swedish product containing 64% iron. The main impediment to this was financing, owing to a high $7.8 billion foreign debt and hard-currency reserves of only $1.85 billion at the end of 1981. Should credit become available, one option could be the construction of a $50 to $100 million rail link for ore freight from a Yugoslav port to Hungary.

Although pig iron and crude steel production remained at the levels of the preceding year, Hungary's steel industry suffered the adverse effects of the worldwide steel market crisis in 1982. Exports declined while production costs were increasing. Between 1979 and 1981, coke costs, for example, increased from 8 billion forints per year to 17 billion forints. Also, labor force shortages were reportedly severe enough to have required the engagement of 2,000 foreign workers.

Important developments in 1982 included the startup of the No. 2 oxygen converter at the Danube Iron and Steel Complex at Dunaujvaros. The project, built with Soviet assistance and costing 9.4 billion forints, was to add 750,000 tons of steel production capacity by 1983, bringing the total capacity of the converter shop to 1.15 million tons per year. Credits of 10.6 billion forints were also granted to the Danube Iron and Steel Complex for the construction of a coking plant; trial runs were scheduled to start in the first quarter of 1986 and the construction completion date was set for March 1987. At the Ozd metallurgical plant it was planned to renovate a blast furnace at a cost of 70 million forints.

In 1982, Hungary's steel exports to the U.S. market consisted largely of about $2 million worth of ball and roller bearings, and negotiations were reported to export flat-rolled steel as well. An important issue was the depressed U.S. steel market and whether subsidized steel products exported to the United States would not be subject to antidumping procedures under GATT rules.

Lead and Zinc.—The country continued to mine and smelt minimal amounts of lead and zinc and the deposits worked by the Gyongyosoroszi Mine were reportedly nearing depletion.

Manganese.—Hungary's only manganese mining operation at Urkut, in the northern Lake Balaton area, was to increase mine output owing to a growth in domestic demand from the Danube Iron and Steel Complex's new oxygen converter shop;

46,000 tons of ore was to be supplied to the converters and an additional 10,000 tons was to be exported during the year.

NONMETALS

Hungary's 12 mines in the Tokaj Mountains had been producing annually about 300,000 tons of nonmetallic industrial minerals such as perlite, zeolite, kaolin, and bentonite. In 1982, investment in the construction industry was substantially curtailed, which resulted in a decline in the demand for a number of these industrial nonmetallic minerals.

Cement.—Cement production dropped for the third straight year because of declines in investment and capital construction.

Perlite.—The perlite industry, located at Palhaza in the Tokaj region, was rated at 100,000 tons per year of which 55,000 were marked for export. The National Ore and Mineral Mine Enterprise, the producing agency, planned to increase output by 35% by 1985. Production capacity of expanded perlite was 500,000 cubic meters; it was produced at plants in Nyirtek, Japolca, and Paszto under the administration of the Konnyubeton es Szigeteloanyagipari Vallalat, a nationalized company.

MINERAL FUELS

Hungary's domestic consumption of energy rose by about 1% in 1982 owing to increased private consumer use, but industrial consumption of all energy carriers actually declined during the year. Domestic production as a share of consumption remained at about 48%. Greater emphasis was placed on domestic coal mining than in the past. Imports of petroleum from hard-currency sources were eliminated, and petroleum imports from the U.S.S.R. were reduced and replaced by increasing imports of natural gas.

Coal.—The Hungarian coal production plan was overfulfilled, with the output of over 26 million tons. The new coal mines, Markushegy and Nagyegyhaza, increased their combined production to 2 million tons of coal. Two new coal mines at Many and Lencsehegy were scheduled to come on-stream by 1985. The estimated total capacity of these four new "Eocene" coal mines would be 6,000,000 metric tons per year. During the year, imports of coking coal, largely from the Council for Mutual Economic Assistance countries, were significantly reduced.

Petroleum and Natural Gas.—Production of petroleum was maintained at the same level as that of 1981. Output of natural gas, however, was increased above the planned level for 1982, and construction of the Vorosfold-Kiskundorozsma section of the Soviet-Hungarian gas pipeline was completed.

Nuclear Power.—The Paks nuclear power station became fully operational during the year. It operated at 20% of capacity during the testing stage and at full capacity will reach 440 megawatts. By 1987, an addition of three more blocks was planned to bring the station's rating to 1,760 megawatts.

---

[1]Foreign mineral specialist, Division of Foreign Data.

[2]The rate of Hungarian forints (Ft) to U.S. dollars was Ft34.98=US$1.00 (official rate, May 26, 1982). The conversion of Hungarian national income and foreign exchange accounts into U.S. dollars was not done owing to different criteria used in determining value in centrally planned economies as opposed to those used in market economies.

[3]Nepszabadsag. Sept. 11, 1982, p. 5.

[4]The relationship of the Soviet ruble, a nonconvertible currency, to the U.S. dollar was based upon the fluctuation of the dollar-ruble ratio. The rate of rubles to dollars was ruble0.73=US$1.00 (official rate, Dec. 31, 1982). See footnote 2 for soft currency conversion rationale.

The Mineral Industry of Iceland

By Joseph B. Huvos[1]

In 1982, Iceland's economy suffered a sharp downturn, the krona fell 90% against the U.S. dollar, inflation was 60%, and the gross national product (GNP) was $2.8 billion,[2] a loss of 3.5% in real terms, but unemployment was maintained at 0.3%. The poor year in Iceland's economy resulted in a foreign trade deficit equivalent to about 5% of the GNP.

The contribution of Iceland's mineral and mineral-related industries to the GNP continued to be mainly by industries supported by inexpensive electric and geothermal power, such as aluminum, ferroalloys, and diatomite. There was also production of minor amounts of other industrial minerals. In 1982, the contribution of the mineral industry to the GNP amounted to 3.2%, of which 70% was aluminum; 25% was ferrosilicon; and most of the rest was diatomite, cement, fertilizer, and salt.

Important events in the mineral industry of Iceland in 1982 were the commissioning of a new hydroelectric plant, record utilization of geothermal heat for space heating, and a continued stalemate in the dispute between the Government and the owners of Icelandic Aluminum Co. Ltd. (ISAL).

PRODUCTION

There was no important change in the production of minerals and related products in 1982, which remained as before aluminum, ferroalloys, cement, diatomite, and pumice. Mineral production for 1978-82 is shown in table 1.

Table 1.—Iceland: Production of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1978	1979	1980	1981	1982[p]
Aluminum metal, primary	73,800	72,145	73,111	74,577	61,500
Cement, hydraulic thousand metric tons	134	127	122	122	28

[e] Estimated. [p] Preliminary.
[1] Table includes data available through June 14, 1983.

TRADE

There was no significant change in Iceland's modest foreign trade in minerals in 1980-81, as shown in tables 2 and 3. Minerals amounted to less than 5% of the total, which was dominated by fish and fish products.

COMMODITY REVIEW

METALS

Aluminum.—Aluminum production at the 85,000-ton-per-year plant of ISAL decreased about 18% compared with that of 1981. However, as aluminum prices declined, the value of exports was expected to be down by 17%, and stocks were up to about 40% of the annual production.

The 2-year-old dispute between the Government and Swiss Aluminium Ltd., owner of ISAL, over charges for bulk electricity to the company's Straumsvik smelter, continued. There was Icelandic concern, across the political spectrum, that the rate should be doubled, even tripled, but a five-member advisory panel was dissolved when it could not agree on a 20% preliminary hike. In 1982, the rate for power to the smelter was 6.45 U.S. mills per kilowatt hour, according to a 1966 contract which stipulates that both parties must agree to any change in the rate.

Ferroalloys.—Marketing prospects for ferrosilicon were poor in 1982, the second full operating year for Icelandic Alloys Ltd., owned by the Government (51%) and Elkem AS, Norway (49%), after the company's plant had reached the agreed capacity of 55,000 tons per year, with two furnaces. In April, the Minister of Energy introduced a bill for bailout measures to keep the compa-

ny viable; raising the state's share capital from $13.2 million to $16 million and underwriting credits for financing operations.

Silicon.—The Althing (Parliament) passed a bill authorizing the Government to build a silicon reduction plant in Reydarfjördur, a village with 700 inhabitants located on Iceland's east coast. The Government's equity share is to be at least 51% and Government appointees must constitute the board's majority. Japanese and Federal Republic of Germany parties were reportedly ready to buy 70% of the plant's output, with 7,500 and 70,000 tons per year, respectively.

NONMETALS

Diatomite.—The recent bankruptcy filing by the Denver, Colo., United States, based Manville Corp. has not affected the operation of the Lake Myvatn diatomite plant jointly owned mainly by the Government (52%) and Manville (39%) under the name of Kislidjan H.F. Feedstock for the plant is diatomaceous earth pumped from the lake and geothermal steam from boreholes is used in the processing.

Fertilizer Materials.—The state fertilizer plant at Gufunes near Reykjavik had financial difficulties with foreign financing, and was seeking Government financing arrangements that could alleviate dependence on foreign banks.

Sodium Chloride.—The Icelandic Steamship Co. delivered seawater to Bio Maris, a Hamburg, Federal Republic of Germany, health food producer, for production of sea salt.

A scheme to develop a sizable common-salt industry on the Reykjanes Peninsula in southwest Iceland was approved by the Government in 1981. Government participation of 25% is a condition of the scheme and both feed-stock and energy are to be obtained from drillholes emitting superheated brine derived from seawater seeping through permeable bedrock strata. A drive was to be launched to raise the private capital component of the venture.

MINERAL FUELS

In 1982, hydroelectric and geothermal energy supplied 64% of Iceland's energy needs; the remainder was supplied by imported petroleum products and some coal, both mainly from the U.S.S.R. and from Western Europe. Supply and consumption of fuel and power in 1981-82 is shown in table 4.

Table 4.—Iceland: Supply and apparent consumption of fuels and power for 1981 and 1982

(Million tons of standard coal equivalent)

	Total energy	Petroleum products	Hydro-electric	Geother-mal[e]
1981:				
Production[1]	1.4	--	0.5	0.9
Imports	.8	0.8	--	--
Apparent consumption	2.2	.8	.5	.9
1982:[p]				
Production[1]	1.4	--	.5	.9
Imports	.8	.8	--	--
Apparent consumption	2.2	.8	.5	.9

[e]Estimated. [p]Preliminary.
[1]Primary energy only.

Source: Central Bank of Iceland, Economic Statistics Quarterly. V. 4, No. 1, 1983, p. 25.

Geothermal Energy.—In 1981, for the second year, more than 75% of Iceland's population had geothermal space heating, with 27 major district heating systems operating in Iceland. Most of these tap low-temperature fields, with boreholes that are 2 kilometers or more below the surface and are away from the main volcanic zone that, as part of the mid-Atlantic ridge, stretches across the country from the northeast to the southwest.

At the end of 1981, Iceland's technically exploitable geothermal energy was estimated at 3,500 peta joules per year, of which only about 0.75% was being utilized.

Hydroelectric Power.—A third unit of the Hrauneyjafoss hydroelectric plant went onstream in January, raising the capacity of the National Power Co. (NPC) to 659 megawatts, compared with 329 megawatts

in 1973. The plant was linked to the west by a 150-kilometer-long transmission line to Hvalfjördur, north of Reykjavik. The cost of the project was $17 million.

According to plans, a transmission line is to be completed in 1983 between the Sigalda powerplant in the west and Höfn on the Hornafjördur in the southeast, closing a 250-kilometer gap, the last in the power grid system encircling Iceland.

At the beginning of the year, NPC formally took over generating and distribution facilities that were formally operated by the State Electric Power Works. According to a separate agreement, NPC and the Laxa River Utility, jointly owned by the Government and the city of Akureyri in Northern Iceland, were to merge in mid-1988. Organized in 1964, NPC was originally a 50-50 partnership of the national Government and the city of Reykjavik. At that time, its distribution network was limited to the southwest region.

Petroleum.—Over the next 5 years, Norway is to spend about $18 million in a project to map the geology of a 50-square-mile ocean area near the Norwegian Island of Jan Mayen, about 300 miles northeast of Iceland. According to a 1980 bilateral agreement, Iceland will have a 25% share of the seabed resources discovered as a result of echo soundings on the Norwegian side of the demarcation line between the Icelandic and Norwegian areas of the Continental Shelf.

The Mineral Industry of India

By Gordon L. Kinney[1]

This year was difficult for the Indian economy. Plagued by drought, stagnant industrial production, labor unrest, and weak export growth, there was little change in gross national product in real terms. During fiscal year (FY) 1980 and FY 1981, the economy had grown at a rate of 8% and 6%, respectively, yielding an average of less than 5% for the first 3 years of the sixth 5-year plan (1980-85). Average per capita income for India's population of 707 million was about $222[2] and was among the lowest in the world.

Industrial growth was sluggish, about 2.8%, substantially less than the 8.6% rate of 1981. The slowdown was caused by a number of factors, including the decline in agricultural income, an extended textile strike, continuing power shortages in many States, a tight credit policy to curb inflation, and the general worldwide recession, which slowed export demand.

Overall, the infrastructure and basic industries performed best. Salable steel production lagged despite deregulation of prices and remained about static for the year. The Government's index of infrastructural industries—electricity, coal, steel, petroleum refinery output, crude oil, and cement—which account for nearly one-quarter of the overall index, recorded an overall growth of 8.4% in FY 1982 compared with 13.7% in FY 1981.[3]

India's public sector corporations dominate many of the basic industries and traditionally have significant losses. In FY 1981, however, they earned an aftertax profit of $503 million and in FY 1982 increased this to $622 million. The turnaround was due to the introduction of more realistic pricing policies. Nevertheless, several of the large public companies engaged in engineering and production of coal, fertilizers, and the nonferrous metals continued to operate at a financial loss.

The FY 1983 annual plan, which specifies the priorities for public investment, called for total expenditures of $26.4 billion, up 21.5% over that of FY 1982. Nearly 30% of the expenditures was allocated to the energy sector, $4.8 billion to power and $2.9 billion to petroleum. Agriculture and irrigation accounted for 21.5%; transport and communications, 15%; and industry and minerals, 13.7%.

In general, India's mineral industry can be characterized by several broad generalizations:

1. Mineral activity in India, including fuels, is predominantly in the public sector. For example, 100% of the coal, oil, copper, lead, zinc, and gold production and a significant proportion of nitrogen fertilizer; bauxite, chromite, iron, and manganese ores; and steel and aluminum metal comes from Government-owned companies. Public sector involvement likely will increase in the future, particularly in bauxite and iron ore production.

2. With the exception of a few minerals that are produced in sufficient quantities for export, India's mineral production is for domestic consumption.

3. Major emphasis in the next few years will be on increasing the production of mineral fuels, with natural gas beginning to increase in relative importance.

4. The major problems facing the nonfuel mineral sector in the next few years will be securing an adequate, reliable source of power and obtaining sufficient financial resources for expansion.

5. In terms of value, coal and petroleum constituted about 88% of Indian mineral production.

Despite a 7% increase in electricity generation, lack of sufficient power in the right places was the principal constraint on Indian economic growth. For the economy as a whole, it was estimated that demand ex-

ceeded electrical supply by over 9% in FY 1982. The situation was particularly serious in Tamil Nadu, Gujarat, and Rajasthan where the State Electric Boards were forced to repeatedly impose power cuts of 50% or more. Industrial operations suffered accordingly. Under these conditions, the mineral industry was inordinately hard hit. The aluminum, copper, zinc, steel, nitrogen fertilizer, and cement sectors were particularly vulnerable to physical damage to capital equipment when confronted by unannounced power outages. Many mineral-based companies have installed or were planning to install their own captive generating plants to ensure a stable power supply and continued production.

Although overall investment in the power industry was adequate, power shortages occurred because of delays in implementing power projects, underinvestment in transmission and distribution systems, and low capacity utilization because of poor management.

In FY 1982, additional generating capacity amounted to 3,060 megawatts compared to a target of 3,500 megawatts, and the average plantload factor was below 50%. To remedy the situation, the Government has taken a number of steps to improve the management and financial performance of the State Electric Boards, which are directly responsible for the power sector, and it has initiated several very large thermal power projects with foreign technology and concessional financing. Even if these measures prove successful, it is unlikely that the situation will improve soon, and power shortages will continue to be a major constraint on industrial growth.

PRODUCTION

The total value of mineral production has risen steadily in recent years, from $3.8 billion in 1980 to $3.9 billion in 1981 to $4.8 billion to $5.0 billion currently. Of the 1982 total, mineral fuels accounted for 88.2%; nonmetallic minerals, 6.3%; and metallic minerals, only 5.5%. In terms of value of output, coal and lignite were foremost, followed by crude oil and natural gas, iron ore, limestone, copper ore, phosphate rock, gold, and manganese ore.

The State of Bihar occupied the leading position in value of mineral production, accounting for 25% of the total. The Bombay High offshore oil and gas fields have moved into a position of second place, surpassing the traditionally important States of Madhya Pradesh, Assam, and West Bengal.

The proportional value of mineral fuels in overall mineral production was likely to rise in the next few years as oil and natural gas output from Bombay High and satellite fields reaches its peak by 1985. To keep production from declining after that period, it is vitally important for India in the next few years to find and develop new oil deposits.

Crude oil production climbed to a new record high and accounted for about 60% of India's needs. Coal output also increased significantly, but transport problems led to a large supply of coal at the minehead awaiting shipment.

In general, production of most of the major minerals changed only modestly during the year, with about as many increasing as decreasing. India continued to be the world's principal source of sheet mica. Among market economy countries, it ranked second or third in production of garnet, kyanite, rare-earth minerals, and nitrogen fertilizer; fourth in zircon; and fifth in barite. In addition, it was among the top nine producers of iron ore, chromite, manganese, magnesite, and cement.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Sept. 20, 1983.

[2]In addition to the commodities listed, other clays (bentonite, fuller's earth, and common clays), other gem stones (aquamarine, ruby, and spinel), and uranium are also produced, but output is not reported, and available information is inadequate to make reliable estimates of output levels. In 1975, production of 6,514 tons of uranium ore containing about 3 tons of U_3O_8 was reported from two mines, which was only a part of total national production. Moreover, reported production of stone and sand and gravel are clearly only partial figures and exclude a number of types of stone; the amounts reported are inadequate to provide sufficient aggregate for production of concrete from domestically produced and consumed cement, nor do they provide for other supplies of aggregate for road metal and other construction uses.

[3]Data are for fiscal year beginning Apr. 1 of that stated.

[4]Data supplied here (exports plus domestic use) are provided in lieu of officially reported production because the latter figures are evidently incomplete. Officially reported production figures are as follows, in metric tons: 1978—14,273; 1979—14,180; 1980—12,355; 1981—12,729; and 1982—12,961.

[5]Partial figures; for details, see footnote 2.

[6]Includes reinjected gas.

TRADE

The balance-of-trade deficit dropped more than 7% to $6 billion as exports increased nearly 12% compared with only a 3.5% increase of imports. The foreign commercial policy was more liberal than in the past, with an emphasis on efficient import substitution and technology transfer.

The value of mineral exports was slightly over $1 billion. Approximately 58% of this was small diamonds that were imported, cut

and polished, and then exported. Iron ore accounted for 30%, and mica, 3%, of mineral exports.[4]

India also exported several dozen minerals; the more important were chromite, manganese, titanium, barite, magnesite, and talc.

Petroleum was a key factor in the overall trade picture. As crude oil production has increased, the need to import less oil has led to reduced pressure on the balance-of-payments position. Petroleum imports as a percentage of total imports dropped to an estimated 33% in FY 1982. Petroleum imports as a percentage of total export earnings declined from 78.5% to 51.5%.

There is no import table in this year's chapter owing to a lack of official published trade data.

COMMODITY REVIEW

METALS

Bauxite, Alumina, and Aluminum.— Electric power shortages continued to be the main constraint on aluminum production. Estimated capacity utilization was 65% for the industry.

Domestic demand for aluminum has slumped since FY 1980. Projected sales for FY 1982 were 235,000 tons. The decline was largely due to the inability of the State Electric Boards, the major consumers of electric conductor-grade metal, to place orders because of financial constraints.

Bharat Aluminium Co. (BALCO), in an effort to increase its capacity utilization, obtained permission from the Indian Government in December, to set up a captive 270-megawatt thermal powerplant (four 67.5-megawatt units) at Risda village adja-

cent to the Korba aluminum complex. The plant will cost $280 million. No funding was available for the powerplant, however, in FY 1982, and only $1 million was allocated in the FY 1983 budget.

Construction of its own power source appeared to be the only way that BALCO could commission its two idle 25,000-ton-per-year potlines. These lines were completed in December 1977 and September 1978 but have never been charged because of the lack of power from the State-owned grid. During the year, BALCO deliberately reduced its production of alumina to keep in balance with its metal production and to avoid excessive stockpiles.

Revamping of the alumina plant at Korba continued but at some escalation of costs. Estimated cost was revised to $6.5 million from the earlier allocation of $5 million. The work was rescheduled for completion in June 1983. The work will increase the operational capacity from 150,000 tons per year to the original capacity of 200,000 tons per year.

Development of the Gandhamardan bauxite deposit in Orissa as a source of raw material for Korba in the late 1980's was officially approved in July, and BALCO began development of the mine, which was scheduled to open in mid-1985.

Work was well underway at four of the five major components of the National Aluminium Co. Ltd.'s new Orissa aluminum complex. The $1.4 billion project was being aided both financially and technically by France. The technical know-how and design package for the work was supplied by the Péchiney Ugine Kuhlmann (PUK) Group. PUK will assist during construction and commissioning of the project and will also provide continued technical assistance for 3 years after commissioning of the project.

Land acquisition was completed and more than one-third of the site was graded at the alumina plant, smelter, and captive powerplant. Foundation work was started at the alumina plant in November. Access to the alumina plantsite at Damanjodi was behind schedule. Movement of heavy equipment could be delayed if this phase is not speeded up.

Two other negative factors were encountered during the year. Preliminary work on the captive coal mine and washery was delayed because of a financial problem. Work on the dedicated railroad between Damanjodi and the smelter at Angul (also referred to as Talcher smelter) was delayed and could cause additional problems with equipment deliveries and later raw material movement if not brought back on schedule.

In a project of this magnitude, spread over several widely scattered sites, management will have to be extremely diligent in preventing further construction delays. Each site of the complex is vital to the success of the overall operation. Any schedule breakdowns not quickly made up will jeopardize the timely startup of aluminum production.

Indian Aluminium Co. Ltd. (INDAL), the country's second largest primary aluminum producer, will merge with Mahindra and Mahindra Co. of Bombay subject to various governmental approvals. The move is designed to make INDAL a national company and allow it to expand its operations. At present, because the company is more than 50% owned by Aluminum Co. of Canada Ltd. (Alcan), it is classified as a foreign firm and is restricted in its activities. If the merger goes through, Alcan's equity in the new company will be reduced to 28%. With the merger, INDAL would become the third largest company in India.[5]

Hindustan Aluminium Co. Ltd. (HINDALCO) applied to the Government for permission to modernize and expand its facilities at Renukoot. Modernization of the existing smelter would be directed at lowering the consumption of electric power per ton of metal substantially below the present 16,500 kilowatts. HINDALCO's goal would also be to reduce consumption to less than 12,000 kilowatts per ton for its new potlines. Aluminum capacity would be increased from 120,000 to 187,500 tons per year.

Alumina capacity, currently at 170,000 tons per year, would be increased with technical assistance from Hungary to 340,000 tons per year at a cost of $40 to $50 million.

A third part of the plan involved the construction of the fifth and sixth generating units at the captive powerplant. The company has three units operating with a combined capacity of 202.5 megawatts. A fourth unit was scheduled to go online by mid-1983. The fifth and sixth units would bring HINDALCO's generating capacity to 375 megawatts, sufficient to operate the smelter at rated capacity.

Chromite.—India continued development of its chromium industry by expanding mine production and adding to its 30,000-ton-per-year ferrochromium production ca-

pacity. Construction of four export-oriented, charge-chrome (high-carbon, low-chromium ferrochromium) plants by three companies was underway.

Farthest along in construction was a 45,000-ton-per-year, charge-chrome plant located at Therubali, Koraput district of Orissa. Initially, it will use friable domestic chromite ore and Albanian chromite ore. This facility was being built by Indian Metals & Ferro Alloys Ltd. (IMFA), which also has applied for six mining leases to develop captive mines. The output will be exported through the Port of Visakhapatnam with marketing handled by Elkem AS of Norway, the company supplying the furnace for the plant.

IMFA has plans for setting up a captive 180-megawatt thermal powerplant. The plant would be built in stages and also supply the company's second plant as well.

Work on IMFA's second plant was in the site-preparation stage at yearend. The $34 million plant will have a capacity of 50,000 tons per year and will be located in Chouduar, Cuttack district, about 20 kilometers from Bhubaneshwar. Chromite for this plant will come from the six captive mines IMFA plans to establish. This plant will be operated as a separate company called Indian Charge Chrome Ltd., which was recently formed. Elkem will reportedly supply much of the equipment and hold about 20% of the equity.

The second company working on a new plant was Ferro Alloys Corp. Ltd. It will have a capacity of 50,000 tons per year and be located at Randia, Balasore district of Orissa. Captive mines at Boula and Kathpal will furnish the chromite raw material. The plant and mines will employ about 5,500 persons. The lower grade and friable ores (about 20% Cr_2O_3 content) will be beneficiated by gravity at Boula Mine. The 48%-Cr_2O_3-content concentrate will then be shipped 40 kilometers to Randia where it will be briquetted before smelting.

The plant will have a 45-megawatt-ampere, semiclosed, submerged arc electric furnace installed by M/s. Tanbe Kakoki Co. Ltd. of Japan. It will be equipped with a computer-controlled automatic raw materials feed system. Total plant cost will be $35 million to $40 million. The company will be dependent on Orissa State for its power supply. The 55%-chromium-content ferrochrome will be marketed mainly in the United States for stainless steel production. Marc Rich and Co. has guaranteed annual purchases of 35,000 tons for 10 years, with the remaining sales dependent on market conditions.

The State-owned Orissa Mining Corp. was the third company with a plant under construction. The plant will have a 50,000-ton-per-year capacity, will be located in Bamnipol in Keonjhar district, Orissa, and will use engineering technology from Outokumpu Oy of Finland. The Austrian firm Voest-Alpine AG will supply the equipment and assist in construction. The Orissa State cabinet has approved Euro-currency loan arrangements for the $38 million plant. The loan reportedly will total $21 million and be obtained from Austria, Finland, and the Federal Republic of Germany.

Copper.—Production of both smelter and refined copper showed encouraging increases compared with 1981 production levels. In addition, demand for copper in the same period continued to rise to the 80,000- to 90,000-ton level, necessitating continued sizable imports. Future demand was expected to reach 115,000 tons by FY 1984.

Production at Hindustan Copper Ltd.'s (HCL) facilities at Khetri in Rajasthan and at Ghatsila in Bihar were both hindered from further increases by electric power shortages, forcing cutbacks in several operations.

Both the Khetri and Ghatsila complexes handled the problem by keeping the smelters and refineries operating at the best efficiency for the power at hand and allowed the mine and concentrate outputs to lag. The overall production loss for the year was estimated by HCL at over 7,000 tons of metal.

The major development in the copper sector was the commissioning in May of the first stage of the Malanjkhand copper project after removal of 7.5 million cubic meters of overburden. The mine is located 90 kilometers northeast of Balaghat in Madhya Pradesh. The $125 million project was the country's first large-scale, open pit, hard-rock mine. The first stage has a design capacity of 1 million tons of ore per year. The mine was designed for production of 2 million tons per year of ore, equivalent to 24,000 tons of metal. After a trial running period, the mine and concentrator were formally inaugurated in November. HCL, the Government-owned copper monopoly, was very optimistic over the possibility of continued future development of this deposit.

The ore body has a strike length of 2,600

meters and an average width of 70 meters. Reserves within the designed pit area were 59 million tons at an average grade of 1.2% copper at 0.45% copper cutoff. The ore body was drilled in detail to 200 meters for the reserves calculations. An ore body of this type often extends to a depth of one-half the strike length. If this is the case at Malanjkhand, then the reserves will be far larger than the official figure. Published estimates run between 200 and 300 million tons.[6]

The concentrator was designed to produce 99,000 tons of 25% copper concentrate per year. A standard sulfide froth flotation circuit with forty-eight 8.5-cubic-meter and sixty-four 1.7-cubic-meter cells will separate the copper mineral from the gangue.

A considerable amount of lower grade primary sulfide must be moved to reach the main ore body. Much of this was being segregated during mining with the idea of extracting the copper values using heap leaching techniques. Studies were underway to assess the amenability of the ore to this process, which would be the first copper leaching operation in India.

The copper concentrate will be shipped to the existing smelter at Khetri, approximately 900 kilometers away, in Rajasthan. This will enable the smelter to operate on a more profitable basis as it has been operating at well under its 31,000-ton-per-year capacity. HCL planned to increase Khetri's capacity to 45,000 tons per year to handle all of the increased supply of concentrate.

The task of moving the concentrate from Malanjkhand to Khetri is illustrative of some of the difficulties of the Indian transport system. Currently, the concentrate is being trucked the entire distance, a journey of 4 days. In spite of the higher cost of road haulage, it was a more reliable mode than by railroad. Transport by rail would average 10 days and include handling the concentrate a second time where the rail gauge changes.

Malanjkhand was receiving about 55% of its power needs at yearend from the State power grid. Accordingly, it was installing two captive 4-megawatt generators, which will provide 60% of its normal requirements.

In other developments, the first-stage expansion of the Mosaboni Mine in Bihar was completed, raising capacity from 50,000 to 60,000 tons of ore per month. The second stage, raising capacity to 68,000 tons per month, was underway and scheduled for completion in April 1983.

HCL has proposed expansion of its smelter capacity at Ghatsila from 16,500 to 20,000 tons per year. It also would like to expand its refinery capacity at Ghatsila from 8,400 to 20,000 tons per year. A feasibility report for these projects has been submitted to the Government for approval.

The recently opened Phase I Rakha copper mine increased its output of ore to over 210,000 tons, well ahead of the year's target. Concentrator output was over 11,000 tons for FY 1982.

Gold.—Because of the need to supplement depleting ore reserves, public sector Bharat Gold Mines Ltd. (BGML) has, in close cooperation with the Geological Survey of India (GSI) and Mineral Exploration Corp. (MEC), continued exploration activities in various areas in search of new gold prospects. MEC has taken over exploratory mine development work at the Mallapakonda and Chigargunta Prospects, Chitoor district, Andhra Pradesh, after these were identified as auriferous ore-bearing areas by GSI. A plan for the speedy development of the Chigargunta prospect was still under consideration by the Government.

The Government approved commercial development and production from the Yeppamana Mine, Ramagiri Goldfield, in Anantpur district, Andhra Pradesh. Construction at the mine and on a 250-ton-per-day mill was progressing satisfactorily at yearend.

BGML's operations showed a small loss in FY 1981 and a much larger estimated loss in FY 1982. The losses were mainly due to lower international gold prices, lower gold yield per ton of ore, and a general increase in mining and materials costs.[7]

GSI was to begin a detailed survey for gold off the coast of northern Kerala. Existence of gold in Kerala's coastal waters, particularly in the river-mouth sediments of the Malabar region, was a recent discovery. GSI had ordered a sophisticated drillship to get a definite idea of the extent of the offshore deposit and to determine if an economically viable mining operation was possible.

Iron and Steel.—The five integrated steel plants under Steel Authority of India Ltd. (SAIL) were expected to produce 7.15 million tons of ingot steel and more than 5.7 million tons of salable steel in FY 1982. This compared very well with the equivalent record high FY 1981 production of 6.64 and 5.65 million tons, respectively. The first

part of the year was plagued by a continuation of severe power shortages in virtually all of SAIL's steel production facilities. There was a considerable improvement in supply of electric power after September, and this immediately resulted in improvement of production performance of the SAIL plants. These plants had a salable steel capacity of 7.20 million tons for a capacity utilization of about 80%, a substantial improvement over that of FY 1979 when only 63% of capacity was used. The SAIL plants that produce specialty and alloy steels added an estimated 60,000 tons of salable alloy steels.

The private sector Tata Iron and Steel Co. (TISCO) continued to operate at slightly over its rated capacity in FY 1981 and was expected to run at a similar rate through the end of FY 1982. The steel miniplants were expected to produce more than 2.1 million tons of ingot during FY 1982.

A slower annual growth rate in domestic steel demand than the projected rate of 9% for the sixth plan period (1980-85) hit the India steel producers in 1981 and 1982. Actual steel consumption in FY 1981, estimated at 9 million tons, was much below the forecast of 10.5 million tons. A mild recession faced by the major end-user industries, resulting from the restrictions on bank credit, sharply reduced internal steel demand in 1981-82. Steel consumption figures in India vary considerably because of the difficulty of determining at what point a steel is consumed. From 20% to 30% of the production of the integrated plants together with the entire output of the steel miniplants goes to the rerolling industry. A great deal of the total finished steel consumed in the country was supplied by the rerolling units, also called secondary producers. It is therefore a significant omission in the Indian consumption statistics that the actual pattern of production of the rerolling units has never been supplied in a meaningful form.[8]

The Indian steel producers raised the prices of steel products between 25% and 40% after the official controls on steel prices were removed in February 1981. As a result of the increases, the profitability of the major producers improved dramatically. The decrease in demand for steel toward the end of 1981 and into 1982, however, changed the price picture once more. By March 1982, the average market price had declined to well below the August 1981 level. The higher profits were reduced in the current year as prices continued to fall through most of the year and surplus stocks began to accumulate. Despite the sharp price fall, domestic producers were still unable to reduce their unsold stocks, which reached almost four times normal levels. This, in turn, tied up large amounts of working capital as the value of unsold stock reached an estimated $422 million.

The unrestricted imports of most varieties of steel permitted in 1981 were discontinued in 1982, and the selective steel imports were routed primarily through SAIL. SAIL's imports for the first half of FY 1982 were over 700,000 tons, but a major portion of this volume was delayed deliveries on 1981 contracts. The original plans to import 1.8 million tons of steel were modified in light of the market conditions and late deliveries. Considering the spillover of imports from the 1981 contracts, actual net imports should reach about 1.1 million tons in 1982.

The recession in the world steel industry and the continuing slump in domestic steel demand has not changed India's original steel development programs for the sixth plan. Planned expansion of steel capacity by an additional 3.5 million tons remained unchanged although the original $4.2 billion cost estimated for expansion during the sixth plan will fall far short of actual construction costs. Cost escalation for Bokaro and Bhilai—the two Soviet-aided integrated steel mills—has alone reached $1.3 billion.

The largest project currently underway was the construction of India's first shore-based integrated steel plant at Visakhapatnam, Andhra Pradesh. Construction was well underway during the year on the 3.4-million-ton-per-year plant, which will employ special coal-handling equipment, dry quenching of coke, and continuous casting of all steel. There was some concern among Indian companies that too many contracts for equipment were going overseas when the contracts could be fulfilled in India. Rashtriya Ispat Nigam Ltd.—the company set up to build and operate the plant—claimed contracts were awarded to best keep the overall project on schedule. The project will need to be fully funded each year for the tight construction schedule to be maintained.

SAIL has recognized the need for modernization and expansion of its 60-year-old Indian Iron and Steel Co. (IISCO) and three other mills built in the 1950's—British-aided Durgapur Steel Plant (DSP), the

German-aided Rourkela Steel Plant (RSP), and the Japanese-aided Alloy Steel Plant (ASP), also at Durgapur.

SAIL has approved the two-phased modernization program of $143 million for DSP recommended by the British consultant. The first phase will include an additional blast furnace complex and a new sintering plant, while phase two will provide a new oxygen steel melting shop with top-blown Linz-Donawitz (LD) converters, continuous casting mill, and a wire and rod mill. Two captive thermal power units of 60 megawatts each were already under construction during the year. Some of the power will be shared with ASP as well. Work on new coke oven batteries was also underway at DSP. A 165-ton-per-day battery was commissioned in November, and a second battery was being trial tested at yearend.

SAIL approved a phased modernization and expansion of RSP at a cost of $184 million. The $65 million first phase called for a new coke oven and sintering plant, plus improved coal preparation and handling to increase efficiency. The second phase will add a blast furnace and convert the open-hearth shop to larger capacity LD converters. Present annual capacity will increase from 1.8 to 2.5 million tons per year.

ASP at Durgapur has completed its first-phase expansion, increasing its annual capacity to 160,000 tons with installation of a new 50-ton electric arc furnace. SAIL has also approved a second-phase expansion at an estimated cost of $75 million, which will increase capacity to 260,000 tons by installation of a vacuum arc degassing unit, a vacuum oxygen decarburization unit, and a continuous slab-bloom caster. Phase two was expected to be completed by 1985. The main purpose of the ASP construction is to furnish a domestic supply of hot-rolled stainless steel for the Salem steel plant, which now imports its hot-rolled strips at a very high and unprofitable price.

A preliminary proposal was being considered for a long-term modernization and development program to double the present 1-million-ton-per-year capacity at IISCO. Soviet consultants have been requested to prepare a feasibility report. The old plant was urgently in need of at least a major modernization, but a shortage of funds has prevented any meaningful updating of equipment for the past several years.

The above projects for modernization and expansion underscore official intentions and immediate needs, but the available domestic investment funds fall far short of requirements. Because of this pressure for funding, the Indian Government was actively seeking offers of external financial aid. The only major commitment of foreign aid has been made with the Soviet Union. If outside funding is not available, implementation of some of the expansion programs could be delayed, possibly into the seventh plan period (1985-90).

Expansion projects have been underway at some of the major plants for several years. Progress in Bokaro steel plant's expansion to 4 million tons was almost 2 years behind schedule and was unlikely to be completed before 1984. Those sections of the $1.6 billion expansion completed during the year were the raw material handling yard, the No. 6 coke oven battery, and the third sintering line. The No. 7 coke oven battery, the 300-ton LD converter shop, and the No. 5 blast furnace were rescheduled for completion in early 1983. The second cold-rolling mill complex, expected to be commissioned in 1984, will complete the second-phase expansion at Bokaro.

Not part of the expansion, but a critical factor in the smooth operation of Bokaro, was the construction of a second captive powerplant consisting of three 60-megawatt generating units. The first unit of the $120 million project was scheduled for commissioning in September 1983. The second and third units would be completed at 4-month intervals thereafter.

The annual ingot capacity of the Bhilai steel plant was being expanded from 2.5 to 4 million tons at a revised cost estimate of $1.6 billion. The first unit of 30 megawatts of the second captive powerplant was commissioned during the year. The heavy-plate section of the plate mill was to be completed in February 1983. This will be the largest plate mill in India. The second unit of the powerplant is to be completed in March 1983. The remainder of the work won't be done before the end of 1984.

Visvesvaraya in Bhadravati, a public sector company owned 60% by the Karnataka State government and 40% by the Government of India, was expanding and modernizing its facilities from 77,000 to 118,000 tons per year of alloy and specialty steels. The project was generally on schedule, and the continuous caster was to be completed by March 1983. An oxygen plant, heat treatment plant, vacuum arc degassing unit, electroslag refining unit, and addi-

tional rolling equipment were scheduled for completion in 1984.

Planning was still underway for a large integrated public sector steel complex in the Daitari region of Orissa. The State government was requested to acquire 6,000 hectares of land for the plant and township. The original plan called for an export-oriented plant at the Port of Paradip. The project has been politically controversial and there was still a question of whether the plant will be started at all in the near future.

In the private sector, TISCO, India's oldest steel mill, was scheduled to complete its first phase of modernization and capacity expansion by March 1983. TISCO has imported British, West German, and Austrian equipment for this $277 million program, which will raise annual crude steel capacity by 10% to 2.2 million tons. The new $28 million oxygen plant was completed 2 months ahead of schedule. The remainder of the phase one construction consisted of a basic oxygen furnace plant with vacuum arc degassing and refining, a six-strand continuous billet caster, a new lime calcining facility, and new forging equipment.

Taking advantage of a liberal tax concession and reinvestment allowance permitted by the Government, TISCO has applied for approval of a $444 million phase two modernization program, which envisages construction of an additional sintering plant, billet caster, an additional captive thermal powerplant, and a bar and rod mill. By yearend, TISCO had received informal confirmation that its request would be granted. TISCO has completed an extensive development program at its captive coal mines in West Bokaro, including a new coal washer, which will give it near self-sufficiency in metallurgical coal requirements.

Lead and Zinc.—Hindustan Zinc Ltd. (HZL), the Government-owned lead and zinc company, showed a 23% increase in total sales over that of FY 1981. The sales increase, however, was offset by a low capacity utilization owing to the chronic electric power shortages. An increase in the price of imported concentrate, electric power, royalty, and other inputs adversely affected the company's profitability. The company expected to lose over $8 million in FY 1982 versus a small profit earned in FY 1981.

HZL has four major projects involving a $500 to $600 million outlay awaiting investment approval by the Government. The company was confident the projects would receive approval because of their technical quality and economic viability. The first was a captive powerplant with three 30-megawatt generators to be built at Chittaurgarh, about 110 kilometers east of Udaipur in Rajasthan. The plant will furnish reliable power to the Rajpura-Dariba Mine, the Rampura-Agucha Mine, and the planned Chittaurgarh smelter. The first unit could be completed 36 months after the company receives approval. In addition, there were plans to install a 15-megawatt, gas turbine-powered generator at the existing smelter at Debari. The turbine can be installed quickly and will be able to supply enough power to operate the plant on an emergency basis and prevent damage to equipment during the frequent unannounced power outages.

The large, high-grade zinc and lead deposit discovered at Rampura-Agucha will be the cornerstone of HZL's plans to eventually produce 60% of India's zinc needs and 70% of its lead needs. Plans call for an open pit mine for the first 20 years, then it would switch to underground workings. Exploration drilling is still continuing, and HZL is confident that the reserves will be higher than the currently published 52 million tons at 13.48% zinc and 1.93% lead. The mine could be commissioned 36 months after final approval and would cost an estimated $137 million. The project will be designed for mostly Indian-made equipment and have a very small foreign exchange component of $10 million. Mine production would initially be 2,400 tons of ore per day with expansion to 3,600 tons per day 2 years later. This should result in 70,000 tons of zinc in concentrate and 13,000 tons of lead in concentrate per year. The feasibility report for the mine and concentrator has been submitted to the Government for final decision.

HZL's third major project will be the country's largest zinc and lead smelter. Originally planned for the Bhilwara area near the Rampura-Agucha deposit, it will now be located at Chittaurgarh where water will be more readily available. The smelter would have a capacity of 70,000 tons of zinc metal and 35,000 tons of lead metal per year. Cost of the plant would be about $200 million. The smelter will use concentrate primarily from the Rampura-Agucha Mine and, in addition, some from the Rajpura-Dariba Mine.

Environmental considerations are becoming more important in the planning of

new projects. An acid plant at the smelter will convert sulfur dioxide waste gases into 600 tons of sulfuric acid per day.

The fourth plan awaiting investment approval was the Baroi Mine in the Zawar area of Rajasthan. This is a small deposit with demonstrated reserves of 4.1 million tons of ore at 3.85% lead and 1.22% zinc, with a further 2.9 million tons listed as possible reserves. Such a small deposit would not ordinarily be developed, but this deposit lies close to the existing mines at Zawar and the smelter at Debari. The mine would be designed for an output of 1,000 tons per day or approximately 8,800 tons of lead per year.

HZL currently has other projects in various stages of construction. The Rajpura-Dariba Mine, located between the Zawar Group and the Rampura-Agucha deposit, was essentially completed by yearend, and formal commissioning was expected in early 1983. Mine production will begin at less than 1,000 tons per day of ore, gradually increasing to 3,000 tons per day when fully developed in 1985. Concentrate will initially go to the Debari smelter.

Work on the Sargipalli Mine in Orissa continued during 1982. The major underground development work was completed by yearend. The 500-ton-per-day concentration plant was scheduled to be completed early in 1983. The project will yield over 10,000 tons of lead concentrate per year and a small amount of copper and silver.

In 1982, HZL completed the expansion of the mine workings at the Agnigundala lead mine in Bandalamottu, Andhra Pradesh. The mine can now produce 240 tons of ore per day. Doubling of the concentrator capacity to the equivalent output was completed in late 1981.

Cominco Binani Zinc Co. obtained permission from the Government to expand its zinc smelter near Cochin in Kerala in 1982. Capacity is to be increased from 15,000 to 20,000 tons per year at a cost of $20 million. The work will include modernizing the facilities and probably the replacement of the old roaster.

The company agreed to expand the smelter only when the Government agreed to reduce the customs duty on imported zinc concentrates from 50% to 15% earlier in the year.[9]

The $6 million project to expand the lead smelting capacity at Vishakhapatnam from 10,000 to 22,000 tons per year had been scheduled for completion in June 1983. Construction progress has slipped however, and the work may not be finished until early 1984.

The Government has also sanctioned the installation of equipment to remove mercury from the stack gases emanating from the roaster. The $2 million job will have technical assistance from a Norwegian firm and is scheduled for completion at yearend 1984.

Work on the slurry pipeline transport system from the Maton phosphate rock mine to the Debari smelter was expected to be completed in 1983. The phosphate rock will be used to make fertilizer at the Debari smelter's byproduct sulfuric acid and fertilizer plant.[10]

Magnesium.—The State-owned Tamil Nadu Industrial Development Corp. planned to set up India's first commercial magnesium metal plant, at Valinokkam in Ramanathapuram district. The plant would have a 600-ton-per-year capacity and be completed by mid-1985. The country's requirements were about 500 tons per year and were met wholly through imports.

The plant is to use technology developed by the electrochemical laboratory in Karaikudi. Process know-how has been licensed by the National Research Development Corp. The plant will use bittern from large saltwater evaporation ponds as its raw material.[11]

NONMETALS

Barite.—In an effort to reverse the downward trend in the export of barite, in May, the Government further liberalized its 1982-83 export trade policy with regard to barite used principally as a weighting agent in oil and gas well drilling operations. According to the trade control notice, export of Oilfield Chemicals and Materials Association and/or American Petroleum Institute (OCMA/API) grade barite lumps and powder is now allowed by all categories of exporters without any quantitative restrictions. The export was to be allowed by port licensing authorities' endorsement of shipping bills.

In addition, the new regulations no longer stipulated floor price restrictions for export of OCMA/API-grade barite powder formerly fixed at $64 per ton. However, a minimum floor price of $40 per ton continued to apply to OCMA/API-grade barite lumps earmarked for all destinations except west Asia where the price was $42 per ton.[12]

Research by the Indian Bureau of Mines on low-grade barite samples from the Man-

gampet deposit in Cuddapah district, Andhra Pradesh, indicated that a +94% barium sulfate ($BaSO_4$) concentrate with 3% silicon dioxide (SiO_2) could be obtained by a relatively simple flotation process. Specific gravity of the concentrate was 4.22, and particle size was 95% through 325 mesh. The collector coating on the concentrate was removable by acid treatment and the resulting concentrate met OCMA/API specifications.[13]

The low-grade barite overlies the high-grade ore at Mangampet and is presently removed as overburden. Commercial development of the flotation process could mean a substantial improvement in the overall mining economics of the Mangampet deposit.

Cement.—Production of cement fulfilled 93% of the country's consumption needs, the balance being provided through imports from other Asian countries. Installed capacity was reported to be about 32 million tons at yearend. The Government's recent policy of partial decontrol has stimulated growth in the industry and several new plants were under construction or on the drawing board.

India ranked 10th in the world in cement production even though most individual plants were operating at below capacity level. The major limiting factors continued to be shortages of coal, electric power, and timely rail transport.

The Government-owned Cement Corp. of India (CCI), which operated nine units and had three others under construction, was the major public sector cement manufacturer in India. CCI reported that with existing expansion plans the company would have an installed capacity of about 7 million tons per year by 1986. Its plans included expansion projects at the existing plants at Tandur, Nayagaon, and Yerrguntla, which will utilize modern technology, instrumentation, and controls including online X-ray analysis, computers for process control, and centralized control systems.

Other new cement manufacturing companies included the Indian Rayon Corp. Ltd., which announced plans for a 500,000-ton-per-year plant at Malkhed, Gubarga district, with the associated development of limestone quarrying operations nearby. The operation will be based on the dry-process technology using a 1,500-ton-per-year rotary kiln with precalciner.

Also planned for construction was a 500,000-ton-per-year plant at Mahua in Rhavnagar district. Originally planned for the Shbrkantha district, the new company will be named Ambuja Cements Pvt. Ltd.

Plans for smaller operations, about 50,000 to 70,000 tons per year each, were approved for at least six other locations in various States.

Also continuing was the development of a type of cement miniplant producing either 10 or 20 tons per day. The plants, some of which are to be exported, utilize a vertical kiln and produce cement that reportedly grades 60% to 70% stronger than the minimum stipulated in the Indian Standard Institute specifications. The inventor and manufacturer, D. P. Saboo, had firm orders for eight plants to be delivered by late 1983.

At yearend 1982, cement production levels provided materials for only the major construction projects and housing in urban areas. If India's economy is to continue to develop at a steady pace throughout the 1980's, an increase in housing construction in villages and small towns would have to be made possible, making ever greater demands on the cement industry. Extensive use of cement in the rural areas for roads, drainage systems, sewerages, grain storage, and tubewells was also forecast.

Fertilizer Materials.—Fertilizer production in India was one of the mineral-based industries that was under a variety of ownerships and managements. Of the more than 5 million tons of nitrogen production capacity in 1982, 58% was publicly owned and under the management of eight different companies. Fertilizer Corp. of India, National Fertilizers Ltd., and Hindustan Fertilizer Corp. Ltd. were the largest of the public sector companies. Ten privately owned companies controlled 32.5% of the installed capacity, and finally, the cooperative sector owned two large complexes, which accounted for 9.5% of capacity.

Production of phosphate fertilizer was similarly broken up but less strongly under Government control. Of the 1.4 million tons of phosphorus pentoxide (P_2O_5) production capacity, the public sector owned 46.4%; private sector, 35.4%; and cooperatives, 18.2%. The public and private sectors were each controlled by five companies, while the cooperative capacity was all under one complex, the large Kandla I and II plants.

Under this complex and varied ownership and management, there was a wide range of plant operating efficiencies. Capacity utilization of typical nitrogen fertilizer plants in FY 1981 ranged from 106% at the Kolol plant to 20% at the expensive new coal-

based Talcher plant. Overall, the average utilization was 61% in FY 1981, and preliminary estimates indicate an improvement to over 67% for FY 1982.

The low capacity utilization has led to substantial operating losses for public sector fertilizer companies as a whole. In the last 3 years, overall losses were $119 million in FY 1979, $215 million in FY 1980, and $111 million in FY 1981. In the last 4 years, only one public sector company has shown a consistent profit, Rashtriya Chemicals and Fertilizers Ltd. By contrast, the new plants at Talcher and Ramagundam, the largest coal-based fertilizer plants in the world, were not operating properly and incurred a combined loss of more than $66 million in FY 1981.[14]

Several factors account for the poor performance of the fertilizer industry; electric power shortages and instability, poor plant maintenance, raw material problems, and inadequate transportation facilities. The raw material and transportation problems of FY 1980 were greatly reduced in FY 1981 and early FY 1982. The main factor inhibiting the smooth operation of most of the plants continued to be the erratic and unpredictable supply of electric power. Another factor was frequent breakdowns of equipment, due in part to design deficiencies, in part to the poor maintenance of highly technical and complex equipment, and partly brought about by the voltage and frequency changes that play havoc with electric motors, pumps, and control equipment.

The increasing demand for fertilizer in India dictates a continuing program of new construction. A number of new projects were underway and more were planned. The emphasis in new construction will be gas-based nitrogen plants using the offshore resources of the Bombay High Oilfield and South Bassein Gasfield.

Preliminary site-preparation work began on a diammonium phosphate (DAP) plant at Kakinada in Andhra Pradesh. Godavari Fertilizers and Chemicals Co. will manage the project, scheduled to go onstream by January 1986. The 315,000-ton-per-year plant will be jointly owned by the government of Andhra Pradesh and the Indian Farmers Fertilizers Cooperative Ltd. The project will cost about $83 million and employ over 750 persons directly. Indirect employment in the area would be several thousand more.[15]

Mangalore Chemicals and Fertilizer Co. planned to build a 150,000-ton-per-year DAP-nitrogen-phosphorus-potassium plant in Mangalore. Contract negotiations were reportedly underway with Toyo Engineering Co. of Japan. The plant will cost about $28 million and use imported liquid ammonia.

Site locations were finally announced for five of six long-planned, natural gas-based nitrogen fertilizer plants. The plants, which were proposed in 1980 but identified by State only, will use the natural gas from the offshore Bassein Gasfield. These will be in addition to the large plants already under construction at Thal-Vaishet and Hajira.

Four plants will be located in Uttar Pradesh, at Badrala, Badaun district; Aonla, Bareilly district; Shahjahanpur, Shahjahanpur district, and Jagdishpur, Sultanpur district. The fifth plant will be in Madhya Pradesh at Bijayapur, Guna district. The location of the sixth plant, planned for Rajasthan, has yet to be announced. The locations were chosen in major fertilizer-consuming regions to minimize transportation bottlenecks and cost.

The Government has reportedly decided to award the right to build and own Bijayapur plant to National Fertilizers. Construction on this, the first of the series, was expected to begin in April 1984.

Bijayapur, and each of the other plants, will be designed to produce 1,350 tons per day of ammonia to be converted into 2,200 tons per day of urea. Each plant was estimated to cost $500 to $600 million. The Government expects the Indian companies that are awarded the plants to finance as much as possible from their own resources. The foreign exchange components will be between 35% and 40% of the total cost. The International Bank for Reconstruction and Development (World Bank) may be asked for assistance in the foreign exchange part of the financing.[16]

A major disappointment to the Indian Government has been the performance of the Talcher and Ramagundam fertilizer plants. These were to be the forerunners of a series of fertilizer plants that would use cheap, high-ash Indian coal to make nitrogenous fertilizer. The capital cost of the plants was at least 1.75 times a conventional gas- or naphtha-based plant, but this was considered to be offset by the much lower long-term raw materials costs.

In 2 1/2 years of production, however, the plants have turned out to be operational and technical nightmares. The ash content

of the coal feed has been a critical factor at the Talcher plant. Designed to handle up to 22% ash, the plant has been supplied with coal averaging 35% ash and a high silica content as well. This has resulted in high rates of wear in the coal preparation equipment and serious clogging problems in the coal gasification section. In addition, the extra ash content has increased the coal to ammonia output ratio from 3 tons of coal per ton of ammonia to as high as 4.5 tons per ton of output.

Unsatisfactory feedstock was only one of several persistent serious problems. Leakage in the coal gasifier unit and in the waste heat boiler have been a constant source of shutdowns. One-half of the breakdowns at Ramagundam were related to the waste heat boiler. Metal chain-type ash extractors in the gasifiers experienced corrosion and erosion and ultimately shattered. The parts were being modified and replaced. Problems in the air separation plant have been so persistent that the entire unit will probably be replaced by redesigned plate-type aluminum regenerators.

Two Government studies have recommended an investment in new equipment at the plants, which would cost about $130 million each, an amount equal to about one-half the original investment.

Plans had been well along for the construction of a third coal-based plant, to be located at Korba in Madhya Pradesh. However, in light of the present problems, it was apparent that this third plant was not likely to be built in the present decade.[17]

Completion of the large Hajira fertilizer complex in Gujarat will reportedly be delayed because of the unexpected presence of hydrogen sulfide gas in its potential natural gas feedstock source. The gas from the South Bassein Gasfield, which is under development, was originally thought to be free of hydrogen sulfide, which is highly corrosive. The presence of the gas will cause delays while scrubbing equipment is designed and built for the offshore gasfield platforms. The other potential customers for the South Bassein gas may also be affected by this development.

India produced no potassium fertilizer from domestic raw materials, but has been exploring in geologically promising areas and researching unconventional sources of potassium that might be commercially exploited. The most promising to date is a process for recovering potassium from the waste obtained in sea-salt evaporation plants.

The Central Salt and Marine Chemicals Research Institute has developed a process to use bittern, the liquid remaining after evaporation of seawater during the production of salt. The mineral schoenite, a double salt of potassium and magnesium sulfate, would be obtained by further solar evaporation of the bittern. It was reported that for each 100,000 tons of sea-salt production, 81 acres of additional evaporation pans would be necessary to recover the schoenite. The Institute estimated that the bittern produced by the large saltworks in Gujarat and Tamil Nadu could be profitably utilized and save up to $2.4 million in foreign exchange each year. A pilot plant using the process was in operation. The Gujarat State government intends to employ the process at plants planned for Jamnagar, Bhavnagar, Kandla, and Kuda. The four plants would recover a total of 11,000 tons of schoenite per year.[18]

Another potential source of potassium was the subsoil brine in the Rann of Kutch, a natural saltpan in Gujarat. This brine contains 1.5 times more potassium than sea brines, averaging 2.17% potassium chloride. Solar evaporation of this brine under controlled conditions could yield a 17% to 19% potassium concentrate.

GSI continued its exploration for potash deposits in the Nagaur Basin of western Rajasthan State and in the adjoining parts of Haryana State. The earlier reconnaissance survey of the area delineated extensive halite beds and areas to be examined in more detail. A limited area of 13,000 square kilometers was under intensive investigation during 1982.

Magnesite.—The Government-owned Tamil Nadu Magnesite Ltd. reportedly was to invest $100 million in a major expansion program at its Salem district deposit, believed to be the best in the country. A $25 million beneficiation plant will provide high-quality feed to a rotary kiln and refractory brick unit, which will account for the remainder of the investment. The estimated reserves of 8 million tons were being extracted at a rate of about 10,000 tons per month, most of which was sold as raw magnesite to industrial users.[19]

At the other end of the country, a large magnesite deposit was reported in Chamoli district of northern Uttar Pradesh. The deposit was being examined to work out its commercial viability.

Salt.—The Gujarat Industrial Investment

Corp. has reportedly awarded design and construction contracts for a 200,000-ton-per-year soda ash plant to be built at Saurashtra on the south coast of Gujarat. Gujarat is the major salt-producing State in India, normally producing 3 million to 4 million tons per year, or more than one-half of India's total supply. Limestone is also available locally. The $93 million plant will have a built-in expansion capability to 375,000 tons per year. Construction was to begin as soon as Government permission was granted.

Talc.—A preliminary geological appraisal has been made of the Dagota Jharna soapstone mines in Jaipur district of Rajasthan. The mines have been worked haphazardly, both as open pit and underground workings, for more than 50 years, but no systematic study of the geology or estimate of reserves had been made. Production in recent years has been about 60 tons per day.

The study indicated that the deposit may be the biggest of its kind in India, with a reserve potential of 5.6 million tons of good-quality soapstone. Measured reserves were put at 1.32 million tons, more than three times the previous Indian total. The study strongly recommended exploratory drilling of the deposit to delineate the known ore bodies, discover any additional ore bodies, and develop a systematic mining plan for the efficient and economical exploitation of the entire deposit.[20]

Wollastonite.—A high-grade deposit of wollastonite was discovered near Totaladoh in the Nagpur district of Maharashtra. This was the first reported occurrence of the calcium silicate mineral in Maharashtra. The deposit reportedly graded over 45% calcium oxide content and was considered to be commercially exploitable.

Indian Bureau of Mines geologists have reported the discovery of another, similarly attractive deposit, in the Tirunelveli district of Tamil Nadu.

The mineral, used in ceramics, paint, rubber, plastics, and electric insulators, was currently produced only in the State of Rajasthan.[21]

MINERAL FUELS

Coal.—The increase in Indian coal output slowed after 2 years of large gains to only 4%. Although still a substantial gain, the production was short of the FY 1982 plan of 135 million tons or even the revised plan of 133 million tons. The plan for FY 1983 showed a modest increase to 142 million tons. To meet the increased production goal and projected demand, the Planning Commission and Ministry of Finance have approved an investment of $894 million for FY 1983. Demand for 1982 and 1983 was projected at slightly higher than production, but there was more than 20 million tons of pithead stocks available to cover any production shortage.

The relative proportion of coal produced in the open pit mines has been increasing steadily for several years and was expected to rise to about 60% from its current level of about 45%. With the increase in open pit coal production, the average output per worker shift (OWS) of the coal miners has also increased. As mechanization in the open pits increased, the OWS has gone from 1.06 tons per shift in 1977 to 1.83 tons per shift by March 1982. During the same period, OWS in the underground mines has declined from 0.61 to 0.55 ton per shift.

India was putting a high priority on the continuing development of its coal industry. This includes both immediate development projects and a long-term exploration program to add to and upgrade the known coal reserves. Counting only coal seams 1.2 meters and above in thickness and down to a depth of 600 meters, the GSI reported reserves at 86 billion tons. However, as mining techniques improve, it has been decided that less stringent cutoffs could be considered for planning purposes. If seams 0.5-meter-thick and above and down to a depth of 1,200 meters are considered, the reserves increase to 112 billion tons.

In the continuing process of coal exploration and utilization of new coal deposits, GSI was responsible for regional drilling and preparation of geological reports. On the basis of these reports, potential blocks are demarcated, and detailed exploration is taken up by the Central Mine Planning and Design Institute Ltd. in conjunction with MEC, keeping in view the regional demand for coal for the forthcoming plan periods. As currently operated, the program provides a lead time of about 10 years for the mines to go into production.

To continue development of coal production through the coming years, 15 coal mines having a combined production capacity of 21.8 million tons per year at a capital outlay of $1.1 billion have been sanctioned by the Government during the year. The planned mines run in size from 420,000 tons per year for an underground expansion of Shrirampur Mine under Singareni Col-

lieries Co. Ltd. to 4 million tons per year for the Amolori open pit mine under Central Coalfields Ltd.

One of the major coal development projects underway was the expansion of the Singrauli coal mines and the simultaneous building of the nation's first pithead superthermal powerplant (STPP). Several other pithead STPPs are under construction in various Indian coalfields, but Singrauli was the first to be started. The first 200-megawatt unit was commissioned during the year.

The first phase of the Singrauli STPP consists of three 200-megawatt turbogenerators, the country's first computer-controlled system, the development of the coal mine, construction of the extensive infrastructure, and the start of a 400-kilovolt transmission system. The second phase will add two more 200-megawatt turbogenerators and additional mine and transmission line development. The third stage will consist of two 500-megawatt turbogenerators, the largest such units in India, and the completion of more than 1,200 kilometers of 400-kilovolt transmission lines.

The coal for the project will be supplied from the Jayant block of the Singrauli Coalfield. The Jayant block has minable reserves of 337 million tons and was being developed for a capacity of 10 million tons per year. The staged development of the mine to 6 million tons was underway at a cost of $80 million.

The planned production stages begin at 1.6 million tons per year in 1983. When the plant is fully operational at a baseload of 7,000 hours per year, the coal requirement will stabilize at 8.26 million tons per year.

The coal will be transported to the power complex by a captive unit train system, which was already established as a part of the first-phase operation.

At least nine other STPPs have been planned, three of which are well along in construction. All of these plants are to be located at the coal mines or as close as economically possible. Each will be over 1,000 megawatts in capacity, and each will require the staged development of huge captive coal mines similar to the Singrauli project. Cost of each of these projects will be over $1 billion, and the ultimate coal consumption of the plants under baseload operation will be more than 40 million tons per year.

Several problems plagued the industry during the year. Labor unrest has caused the loss of considerable production and lost worktime. More than 0.5 million workdays were lost in 381 strikes during FY 1982, and over one-half of the lost workdays were in the Eastern Coalfields Ltd. mines. There was little improvement in the situation, and 429,000 workdays had been lost through December with 3 months of the fiscal year remaining.

Unauthorized absences by the coal miners, other than formal strikes, have been a problem resulting in loss of over 2 million tons of coal production. Conditions improved and the loss had dropped to about 1.75 million tons.

The problem of outright theft of coal has become serious, especially at Eastern Coalfields mines. It was estimated that nearly 2 million tons of coal was pilfered from colliery sidings, depots, and railway yards.

The electric power shortage hits the coal mines possibly more than other industries. Unexpected power cuts in the underground mines cause an immediate evacuation of the workings because of the loss of ventilation and pumping capacity. The delay in returning the workings to production can be extended as the accumulated gases take time to remove after the power is restored. If the power cut has been extended, pumping out the accumulated water can take added days before miners can return to the lower working levels.

Captive powerplants were being installed in several of the major mines. As a short-term expedient, permission to install gas turbine-generator sets was granted in some cases. Two sets of 10 megawatts each were installed in selected Bharat Coking Coal Ltd. mines and two sets of 5 megawatts each at Eastern Coalfields mines.

In summary, at yearend, there were 99 coal mines under construction having a development cost of more than $5 million each with an aggregate investment of $2.42 billion and a final capacity at maturity of 149 million tons per year. In addition, the Moonidih coal washery of Bharat Coking Coal was commissioned, and four other washers were under construction.

Petroleum and Natural Gas.—Indian petroleum production was increasing and will continue to increase rapidly in the next 2 to 3 years as output from the Bombay High offshore fields begins to approach its maximum sustainable level of 150 million barrels per year. Offshore production has gone from 25 million barrels in FY 1978 to over 92.7 million barrels in FY 1982 and a

projected 125 million in FY 1983. Proportionately, the offshore component of India's crude production has gone from less than one-half to about double the onshore output during the same period.

Consumption, which hit about 260 million barrels in 1982, continued to increase as industry, agriculture, and the population growth called for more energy use. The increase, however, has been less than the corresponding production growth, allowing a gradual decrease in both volume and value of petroleum imports. The value of petroleum imports dropped from $5.3 billion in FY 1980 to $4.6 billion in FY 1982 and a further decrease was expected for FY 1983.[22]

Although the short-term situation looks good, the medium term begins to darken somewhat because India's exploration efforts of the last several years have not produced commercial amounts of oil. The recent and projected increase in production has come from Bombay High and its satellite fields. There have been finds in other sedimentary basins, but amounts were not of sufficient size, and subsequent assessment wells have been disappointing. This was true also of the Krishna-Godavari Basin, where hopes had been very high. The possibility of a major field being discovered was still high because there were so many structures that have not yet been properly explored.

The Oil and Natural Gas Commission (ONGC), the major Government-owned oil company, was continuing its vigorous and expensive exploration program, which called for an expenditure of over $6.4 billion in materials and services alone through the end of the 1980's. More than $275 million was to be spent in 1983.

ONGC had 12 rigs operating offshore and on order. In addition, it has extended numerous tenders for additional drill ships and rigs. Also, following a well blowout that destroyed a production platform and India's own drill rig Sagar Vikas in July, ONGC called for bids for a replacement rig.

India's second oil company, Oil India Ltd. (OIL), was conducting its first offshore exploration in the Mahandi Basin 20 kilometers off the coast of Orissa. The 2-year project called for six wells to be drilled by a chartered jack-up rig in shallow water and good seabed conditions. Offshore seismic work in the basin was completed but still underway in the onshore delta area where hydrocarbon prospects were mainly gas.

Hydrocarbon prospects in Mahandi Basin were less promising than Krishna-Godavari's, but the shallow water conditions mean that a discovery doesn't have to be nearly as large to be commercial.

Chevron Oil Co. signed the only oil production-sharing contract between India and a foreign oil company in March. The agreement called for Chevron to drill five wells in a 5-year period and a minimum investment of over $45 million. If no hydrocarbons are discovered in the 18,500-square-kilometer concession block, it reverts to the Government of India. Chevron would share in any profit oil, but until India becomes independent of foreign oil imports; all such oil must be sold to India. During the year, Chevron logged approximately 5,000 kilometers of seismic surveys in its block.

The Mineral Industry of Indonesia

By John C. Wu[1]

Indonesia's real gross domestic product, which measures the country's overall performance of the economy, grew only 3% in 1982 compared with 7.6% (revised) in 1981.[2] A cutback in Government spending; the slowdown in domestic demand because of recession; a substantial drop in output of crude oil because of the implementation of production ceilings imposed by the Organization of Petroleum Exporting Countries (OPEC); a continuous decline in timber and rubber owing to export restrictions; and a smaller increase in agricultural production were cited as the main causes of the slowdown in the Indonesian economy.

The effect of the deepening recession and the soft international oil market on Indonesia's balance of payments, which reflects the balance of ongoing transactions, foreign assistance, and the payment of debt during the year, was severe in 1982. As a result of a sharp drop in export earnings (especially from oil and gas) and a continued high level of imports, Indonesia's current-account deficit increased to $6.8 billion from $2.3 billion in 1981.

According to an annual report on the Indonesian economy prepared by the International Bank for Reconstruction and Development (World Bank),[3] the current-account deficit was equivalent to 8% of Indonesia's gross national product (GNP), which was estimated at $85 billion[4] for 1982. The annual report stressed that to narrow the deficit, the Government of Indonesia must cut back its major industrial projects and borrow $16 billion more from abroad over the next 3 years for payment of interest and service charges on its debt. At the end of the 1982-83 fiscal year (ending March 1983), the total public debt was $20 billion. In addition, an overhaul of Indonesia's tax and trade system and investment incentives were recommended by the World Bank for Indonesia to sustain a more healthy deficit level of 2% of GNP.

Despite the adverse conditions, Indonesia's capability to produce oil and gas was increasing. In 1982, two new oilfields in Riau Province were put into production by P.T. Caltex Pacific Indonesia (CPI). A new crude oil processing facility was brought into operation offshore the Krisna Oilfields by Natomas Co. Several large oilfields were discovered on and offshore Sumatra. Exploration drilling set another record of 284 wells, and 13 more production-sharing contracts were signed between Indonesia and foreign companies. Production capacity of coal was also expanding at the Ombilin and Bukit Asam Mines.

In February, Indonesia's first aluminum smelter came onstream in northern Sumatra. The second phase of the Krakatau Steel project was almost completed by yearend. However, the nickel project of P.T. Pacific Nickel Indonesia (P.T. Inco) on Gag Island was terminated owing to the unfavorable prospects of the world nickel market. Despite the soft international markets for copper and tin, the output of the two metals remained at the 1981 level. In August 1982, a contract was awarded to a West German-Japanese consortium to build the country's first tin-plating plant in West Java.

Indonesia's cement industry continued to grow in 1982. The industry clinker capacity was expected to reach 9.8 million tons per year in 1983. In April, a contract was awarded to a Japanese firm to construct a 1.2-million-ton-per-year capacity cement plant in West Java.

The expansion project of P.T. Petrokimia Gresik to produce superphosphoric acid at Gresik in East Java was almost completed. An ammonia-urea plant was brought into operation by P.T. Pupuk Kalimantan Timur near Bontang in East Kalimantan. Construction of two more ammonia-urea fertilizer plants were well underway in Aceh of North Sumatra and in Bontang of East Kalimantan.

Export earnings of oil and gas continued to contribute 80% of the country's income from exports of goods followed by tin, 2%; other minerals including copper, nickel, bauxite, and other nonmetallic minerals, 2%; coffee, 2%; rubber, 4%; forestry products, 5%; and other, 5%. In fiscal year 1982, export earnings were estimated at $19.1 billion while import bills were estimated at $20.3 billion.

In January, Indonesia began implementing a counter-purchase policy that requires foreign companies to import the same value of Indonesian goods when they export plant machinery, equipment, or materials to Indonesia. By late 1982, several contracts, valued at more than $250 million, reportedly were concluded under this policy between Indonesia and foreign companies from Japan, Singapore, the United States, the Federal Republic of Germany, the German Democratic Republic, Romania, and the Republic of Korea.

PRODUCTION

Despite the worldwide economic recession, most of the mineral production in Indonesia either remained at the same level or increased slightly from that of 1981 except crude oil and bauxite. A significant reduction of bauxite production was due to a substantial cutback of exports to Japan. A 19% drop in the output of crude oil was due to observing the production ceiling imposed by OPEC. The crude oil production of CPI was affected mostly by this production curtailment. However, crude oil production capacity was augmented by operations of two new oilfields in Riau and a new crude processing platform offshore in the Java Sea.

Indonesia began its first aluminum production in February. Because of the soft world market, the first year output fell short of the 50,000 tons planned for 1982. However, production of copper, gold, silver, and iron sand increased slightly while nickel and tin production remained at the same level as that of 1981.

In the nonmetallic sector, the output of cement and fertilizer continued their strong upward trend. Increased construction and the Government policy of self-sufficiency in agricultural production were two major driving forces for the expansions.

In the mineral fuels sector, coal production rose to 480,000 tons. The output of coal from the Ombilin Mine increased by 25% to 300,000 tons, while the Bukit Asam Mine produced 180,000 tons. Although crude oil production was being curtailed at the level of 1.3 million barrels per day in 1982, Indonesia continued to produce 1.1 trillion cubic meters of natural gas and produced about 475 billion cubic feet of liquefied natural gas (LNG).

Table 1.—Indonesia: Production of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1978	1979	1980	1981[p]	1982[e]
METALS					
Aluminum:					
Bauxite, dry equivalent, gross weight thousand tons	1,008	1,052	1,249	1,203	770
Metal, primary	--	--	--	--	30,000
Copper, mine output, metal content	[r]58,947	[r]60,198	59,027	62,516	73,100
Gold metal[2] troy ounces	[r]64,589	[r]61,278	58,383	54,240	54,400

[e]Estimated. [p]Preliminary. [r]Revised.

[1]Table includes data available through July 14, 1983.

[2]Includes Au content of copper ore and output by Government-controlled operations. Gold output by operators of so-called People's mines is not available but may be as much as 30,000 troy ounces per year.

[3]Includes a small amount of cobalt that is not recovered separately.

[4]Data represent limestone used for cement production. Excludes considerable amounts of limestone produced by enterprises under local jurisdictions for building materials, for crushed rock to be used as aggregate, and to burn for lime.

[5]Sulfur produced by other than the Frasch process.

[6]Less than 1/2 unit.

TRADE

Indonesia experienced a significant reduction in its merchandise trade balance because of the continued worldwide economic recession and the glutted international oil market. Exports of oil and nonfuel commodities fell by 15% to $19.8 billion, while imports rose by 19% to $15.9 billion in 1982. As a result, the trade surplus decreased to $3.9 billion in 1982 from $9.9 billion in 1981.

According to a preliminary report of the Central Bank of Indonesia, export earnings of crude oil dropped 19% to $13.5 billion, but exports of LNG rose 6% to $2.4 billion. Furthermore, exports of commodities also fell by 10% to $3.9 billion in 1982. The decline in export earnings of nonfuel commodities was attributed mostly to the continued reduction in exports of timber and rubber owing to export restriction policies. Exports of tin also fell by 19% to $370 million. However, imports rose by 19% to $15.9 billion. The continued high level of imports for machinery, electrical equipment, transportation equipment, and base metals was attributed mainly to the expansion of coal mines and construction of several major industrial projects in Indonesia.

Japan, the United States, and Singapore remained the major trade partners of Indonesia. Based on the value of two-way trade, Japan accounted for 40% of the total merchandise trade followed by the United States, 16.5%; Singapore, 14.6%; and others, 28.9%.

Table 2.—Indonesia: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS				
Aluminum:				
Ore and concentrate thousand tons	1,113	956	--	All to Japan.
Metal including alloys, all forms	582	910	--	Singapore 615; Japan 295.
Chromium: Ore and concentrate	2,750	--		
Copper:				
Ore and concentrate	193,509	197,146	--	Japan 133,690; West Germany 25,593; U.S.S.R. 19,244.
Metal including alloys, all forms	766	296	--	Singapore 151; Thailand 145.
Iron and steel:				
Iron ore and concentrate, excluding roasted pyrite	9,462	2,400	--	NA.
Metal:				
Scrap	849	--		
Pig iron, cast iron, related materials	92,574	82,045	--	India 68,229; Japan 4,954.
Steel, primary forms	--	1	--	All to Singapore.
Semimanufactures:				
Bars, rods, angles, shapes, sections	23,154	24,859	--	India 22,357.
Universals, plates, sheets	223	8	--	Malaysia 6.
Wire	7	58	--	All to Singapore.
Tubes, pipes, fittings	817	1,050	--	Singapore 1,011.
Castings and forgings, rough	14	17	--	Japan 9; Singapore 8.
Lead:				
Ore and concentrate	--	2,435	--	Japan 1,497; Malaysia 539; United Kingdom 399.
Metal including alloys, all forms	--	181	--	Japan 164.
Manganese: Ore and concentrate	9,574	30,062	--	Japan 24,320.
Nickel:				
Ore and concentrate	883,055	842,045	--	Japan 823,947; Switzerland 18,098.
Matte and speiss	42,763	44,947	2,554	Japan 31,540; Netherlands 5,789; United Kingdom 5,064.
Metal including alloys, unwrought	--	221	--	All to Japan.
Tin:				
Ore and concentrate	4,857	1,044	--	Malaysia 574; Singapore 300; United Kingdom 170.
Metal including alloys:				
Scrap	1,404	750	--	Netherlands 450; Singapore 300.
Unwrought	26,169	32,128	--	Singapore 12,169; Netherlands 8,640; Japan 6,350.
Zinc: Metal including alloys, all forms	--	80	--	All to Singapore.
Other: Ashes and residues	1,675	1,667	--	Japan 1,302; Singapore 350.

See footnotes at end of table.

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	9	11	--	All to Hong Kong.
Grinding and polishing wheels and stones	--	6	--	Do.
Barite and witherite	6,451	10,644	--	Singapore 9,284; Philippines 1,360.
Cement	495,203	453,961	--	Bangladesh 190,629; India 117,500; Singapore 98,549.
Chalk	603	383	--	All to Singapore.
Clays and clay products:				
Crude:				
Bentonite	2,946	4,932	--	Singapore 4,705.
Kaolin	5,313	9,310	--	Taiwan 5,818; Philippines 3,150.
Unspecified	--	2	--	All to Italy.
Products, nonrefractory	--	1,488	--	All to Singapore.
Fertilizer materials: Manufactured:				
Ammonia	6,043	22,556	--	Philippines 16,968; Malaysia 3,395.
Nitrogenous	230,526	16,781	--	All to Philippines.
Halogens: Iodine	29	10	--	Mainly to France.
Phosphates, crude	518	300	--	All to Taiwan.
Pigments, mineral: Iron oxides and hydroxides, processed	--	7	--	All to West Germany.
Stone, sand and gravel:				
Dimension stone, crude and partly worked	523,253	935,717	--	Singapore 889,898; Malaysia 44,459.
Gravel and crushed rock	220	45	--	Mainly to Singapore.
Limestone other than dimension	66	260	--	Singapore 250.
Quartz and quartzite	--	801	--	All to Singapore.
Sand other than metal-bearing thousand tons	2,979	4,263	--	Do.
Sulfur:				
Elemental, colloidal, precipitated, sublimed kilograms	155	270	--	Singapore 160; Malaysia 110.
Sulfuric acid	--	26	20	Denmark 3.
Other:				
Oxides and hydroxides of barium, magnesium, strontium	77	--		
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	--	4,511	--	Sri Lanka 3,826.
MINERAL FUELS AND RELATED MATERIALS				
Coal, all grades including briquets	112,487	156,695	--	Malaysia 73,889; Japan 44,352; Thailand 20,668.
Gas, natural[1] million cubic feet	449,011	459,670	--	All to Japan.
Petroleum and refinery products:				
Crude thousand 42-gallon barrels	378,479	373,165	82,591	Japan 167,842; Singapore 31,814; Trinidad and Tobago 25,615.
Refinery products:				
Liquefied petroleum gas[1] do.	18,474	20,602	8,520	New Zealand 7,661; Singapore 2,645.
Gasoline, motor do.	8	--		
Mineral jelly and wax do.	93	20	--	Singapore 14; Hong Kong 6.
Kerosine and jet fuel do.	29	47	--	NA.
Distillate fuel oil do.	23	19	--	NA.
Lubricants do.	(2)	33	--	NA.
Residual fuel oil do.	39,570	37,278	10,475	Japan 22,614; Republic of Korea 2,699.
Tars and other crude chemicals derived from coal, gas, and petroleum	6,984	--		

NA Not available.

[1]Data revised to distinguish between liquefied natural gas (LNG) and liquefied petroleum gas (LPG) which are not separated in the official source publication. Data on LNG obtained from Japanese imports statistics have been subtracted from total Indonesian exports of LPG and LNG.

[2]Less than 1/2 unit.

Table 3.—Indonesia: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals, unspecified	20	31	--	Japan 11; China 10; Singapore 7.
Aluminum:				
Ore and concentrate	929	50	--	All from China.
Oxides and hydroxides	19,316	39,859	60	Australia 19,873; China 3,950; West Germany 2,420.
Metal including alloys:				
Scrap	339	60	--	All from Japan.
Unwrought	14,131	21,161	2,766	Canada 3,619; China 3,302; Australia 2,396.
Semimanufactures	19,918	25,168	1,293	Japan 5,299; Belgium-Luxembourg 1,892; Romania 1,466.
Chromium:				
Ore and concentrate	11	147	--	Philippines 144.

COMMODITY REVIEW

METALS

Aluminum and Bauxite.—Production of bauxite declined to 700,000 tons because of a substantial reduction in exports to Japan. The 1982 production was the lowest since 1966. Mine output from Bintan Island and nearby smaller islands was shipped to the washing plants at Koyang and stockpiled on Kijang Island for export to Japan. In 1982, all exports went to Japan. Exports to European markets have been stopped since 1980 because of the high freight rate.

In April 1982, P.T. Aneka Tambang, a state-owned mining company, signed a contract with Kaiser Aluminum Technical Services and Kaiser Engineering International, both units of Kaiser Aluminum and Chemical Corp. of the United States to supply the process technology, design engineering, and management for the alumina plant on Bintan Island. In November, a separate contract was signed between P.T. Aneka Tambang and a consortium led by Klöckner Industrie Anlagen of the Federal Republic of Germany for civil-engineering work, building the alumina plant, and supplying and installing machinery and other equipment. The cost of the project was estimated at over $900 million. According to the plan, the 600,000-ton-per-year capacity plant was scheduled for completion in mid-1986. About 450,000 tons will be sold to the smelter of P.T. Indonesia Asahan Aluminum (IN-ALUM) in northern Sumatra, and the remainder will be exported.[5]

Production of aluminum by IN-ALUM was about 30,000 tons in 1982. The Asahan smelter came onstream in February. The first exports of aluminum ingots were shipped from the Port of Kuala Tanjung in North Sumatra to Japan in October. The two export shipments scheduled for 1982 totaled 16,000 tons. According to company officials, the export price was $1,500 per ton f.o.b. compared with world spot market prices of $1,050 to $1,100 per ton. By year-end, about 140 potlines reportedly were operational. The plant capacity was expected to reach 150,000 tons per year in 1983 and 225,000 tons per year with a total of 510 potlines in 1984.[6] In 1982, all of the alumina used by the smelter was imported from Australia while the petroleum coke for the electrolysis process was imported from the United States.

Copper.—Mine production by Freeport Indonesia Inc. increased 20% as planned. The increased production was attributed to milling higher grade, block caved ore from the newly developed Ertsberg East underground mine located remotely at an elevation of 3,500 meters in a heavy rain forest. The average ore grade was 2.3% copper, 0.02 ounce of gold, and 0.26 ounce of silver per ton of ore in 1982. The output of concentrate rose to 225,000 tons in 1982 from 188,000 tons in 1981. In 1981, the concentrate contained 62,500 tons of copper, 48,400 troy ounces of gold, and 766,000 troy ounces of silver.

In 1981, 197,000 tons of copper concentrate, valued at $130 million, was exported to Japan, the Federal Republic of Germany, Taiwan, and Romania.

Gold and Silver.—Production of gold and silver by P.T. Aneka Tambang from the Cikotok Mine in southern Banten, West Java, increased in 1982. In addition, gold and silver were produced as a byproduct of copper by Freeport Indonesia at Ertsberg (see copper section). A small amount of gold reportedly was produced by locals using primitive mining methods in various parts of the country. Gold production by these small miners was unrecorded.

Jimberland Minerals NL of Australia, reportedly was to assist Indonesia in the investigation of gold enrichment cap and an underlying porphyry system at Mandor, about 90 kilometers from Pontianak on the west coast of Kalimantan. Jimberland was to provide management and technical services as well as all funds for exploration, development, and exploitation. In return, the company has the right to earn a 60% profit from the production of gold and a 70% profit from the production of the porphyry system. The preliminary sampling results indicate a recoverable grade of 0.3 gram of gold per cubic meter on the surface of the alluvials.[7]

Iron and Steel.—Production of iron sands increased substantially from that of 1981. Iron sands from the Cilacap Mine was for export to Japan and for domestic consumption, and the output from the Palabuhanratu Mine was for domestic consumption. Consumption of iron sands in Indonesia was mainly by the cement industry as an admixture in the manufacturing of portland cement.

Production of direct-reduced iron (DRI) by

P.T. Krakatau Steel dropped slightly in 1982 from that of 1981. The output in 1981-82 represented less than 50% of capacity. The poor export market resulting from the world economic recession was cited as the main reason for the low operating rate. The company exported most of its DRI to India, Singapore, Japan, and the Republic of Korea. Only about 10,000 tons of DRI was sold to a domestic minimill in Surabaya, East Java.

In 1982, P.T. Krakatau was to export 300,000 tons of DRI to India in exchange for iron ore pellets from Mandovi, India, under an agreement signed in 1981. A separate agreement was expected to be signed between Indonesia and India for P.T. Krakatau to receive and reduce iron ore pellets from the Kudremnkh pellet plant of India in 1983.

The second phase of the Krakatau Steel project including a 1-million-ton-per-year hot-strip mill and a slab plant was expected to be operational in the first quarter of 1983. In June 1982, an $808 million contract was awarded to a Franco-Spanish consortium to build an 850,000-ton-per-year capacity cold-rolling mill in Cilegon, West Java. The mill, P.T. Cold Rolling Mill Indonesia is 40% owned by Krakatau, 40% by the Liem Group, and 20% by the Ciputra Group of Indonesia.

Nickel.—Mine production of P.T. Aneka Tambang increased slightly to 1.6 million tons in 1982. Nickel ore production was from the Pomalaa area in Southeastern Sulawesi and Gebe Island, Northern Maluku. P.T. Aneka Tambang exported 1.1 million tons of ore, about 11% less than that of 1981, to Japan. About 70% of the ore exported to Japan was from Gebe Island.

Gebe Island is located near the western end of the bird's head of Irian Jaya. The island has an area of 35,530 acres and the nickel mining concession covers 3,000 acres. According to company officials, the nickel ore reserves in the area were estimated at 20 million tons. The average ore grade was between 1.8% and 2.5% nickel with 0.06% to 0.09% cobalt. The deposits on Gebe Island are between 15 and 30 meters thick. In 1980-82, exports of nickel ore to Japan were from a temporary harbor at a rate of 600,000 to 850,000 tons per year. The island reportedly lacks adequate energy and water supplies.[8]

Production of nickel ore and nickel matte by P.T. Inco at Soroako in South Sulawesi declined in 1982. Production of nickel matte was 13,600 tons in 1982 compared with 19,900 tons in 1981. Because of the low demand for nickel in the world market, P.T. Inco operated only one of three production lines in 1982. The company reportedly suffered a net loss of $61.2 million and was to reduce its work force by 450 to 3,200. The company exported most of its nickel matte to Japan.

The Pomalaa ferronickel plant of P.T. Aneka Tambang received 350,000 tons of wet ore (equivalent to 250,000 tons of dry ore containing 1.8% nickel) from the Pomalaa area and Gebe Island for manufacturing ferronickel. The ferronickel plant produced about 20,000 tons of ferronickel (containing 4,730 tons of nickel). Exports of ferronickel dropped 15% in 1982 from that of 1981.

After investing over $50 million in exploration of Gag Island over the past 10 years, P.T. Inco terminated its contract with the Government of Indonesia in 1981 because of unfavorable prospects for nickel in the world market. P.T. Inco was a joint venture company of United States Steel Corp. of the United States and Hoogovens BV of the Netherlands. The joint venture company originally planned to build a smelter on Gag Island to produce 50,000 tons per year of nickel and 1,400 tons per year of cobalt using a modified Sherritt-Gordon process.

Tin.—In 1982, mine production of tin concentrate remained at the same level as that of 1981. Indonesia was the world's second largest tin producer in 1982. Tin production of Indonesia by company and area for 1978-81 was as follows, in tons:

Company and area	1978	1979	1980	1981
P.T. Tambang Timah:				
Bangka Island	18,214	18,460	19,501	19,609
Belitung Island	4,928	5,390	5,417	6,364
Singkep Island	842	1,250	1,126	1,135
Bangkinang, Sumatra	80	64	72	71
P.T. Koba Tin:				
Koba, Bangka	2,914	3,808	5,262	6,581
P.T. Broken Hill Pty. Indonesia:				
Kelapa Kampit, Belitung	433	469	505	525
P.T. Riau Tin Mining:				
Tujuh Riau Island	--	95	644	1,110
Total	27,411	29,536	32,527	35,395

P.T. Tambang Timah, the state-owned tin mining company, set aside 6% to 7% of its annual budget for exploration in 1982. In the past, most of the company's mining and exploration activities were on and offshore

Sumatra. In an effort to increase tin production, the company planned to explore new tin deposits in Kalimantan.[9]

In 1982, all tin ore produced in Indonesia was refined at the Peltim tin smelter operated by P.T. Tambang Timah at Mentok on Bangka Island. In 1981, tin metal production at Peltim was 33,000 tons, of which 32,000 tons was exported mainly to Japan, the United States, the Federal Republic of Germany, Italy, France, and East European countries. Domestic consumption of tin was between 400 and 500 tons in 1981-82.

In August 1982, a contract was awarded to a consortium of Mannesmann Demag Sack of the Federal Republic of Germany and Hitachi Zosen Co. Ltd. of Japan to build the country's first tin-plating plant at Cilegon in West Java. Construction of the 130,000-ton-per-year capacity plant was expected to start in 1983 and be completed in 1986. The unnamed tin-plating plant would be a joint venture between P.T. Krakatau Steel, P.T. Tambang Timah, and P.T. Nusantara Ampera Bakti of Indonesia. According to a tin industry source, the plant would receive tin mainly from Bangka Island.

In 1982, The Indonesian Government participated in meetings in Bangkok, Jakarta, and Kuala Lumpur to form a tin producers association (see tin section, the Mineral Industry of Malaysia).

NONMETALS

Cement.—Indonesia's annual clinker capacity remained at 8.7 million tons in 1982. The capacity was underutilized because of unexpected machinery overhauls at several plants. Cement production was 7.2 million tons, about 600,000 tons short of the projected output for 1982. As a result of strong domestic demand, 510,000 tons of cement was imported from the Republic of Korea, Taiwan, and the Philippines to cope with shortages in several major cities.

According to the Indonesia Cement Producers Association, Indonesia's annual total clinker capacity will be increased by 1.1 million tons to 9.8 million tons in 1983. Cement production in 1981 and projected installed capacity in 1983 by company were as follows, in thousand tons:

Company	1981 Production	1983 Projected capacity
P.T. Indocement	2,111.1	3,200
P.T. Semen Andas Indonesia	--	1,000
P.T. Semen Baturaja	190.1	500
P.T. Semen Cibinong	1,166.9	1,250
P.T. Semen Gresik	1,293.7	1,500
P.T. Semen Kupang	--	60
P.T. Semen Nusantara	750.8	750
P.T. Semen Padang	925.3	930
P.T. Semen Tonasa	406.2	620
Total	6,844.1	9,810

In April 1982, a contract was awarded to Marubeni Corp. and Kawasaki Heavy Industries Ltd. of Japan for construction of a 1.2-million-ton-per-year capacity cement plant at Palimanan in Ceribong of West Java. P.T. Tridaya Manunggal Perkasa will manage the construction and operate the cement plant when completed in 1985.

Fertilizer Materials.—Production of nitrogen fertilizer in urea and ammonia and production of ammonium sulfate and triple superphosphate increased slightly. The output of urea and ammonia by the three state-owned fertilizer companies was 2 million tons and 25,000 tons, respectively. The combined production of ammonium sulfate and triple superphosphate was about 860,000 tons.

P.T. Pupuk Sriwijaya (PUSRI) operated four plants at Palembang in South Sumatra with an annual total capacity of 1.6 million tons of urea. P.T. Pupuk Kujan operated one plant at Cikompeck (Tjikampek) in West Java with an annual capacity of 590,000 tons of urea. P.T. Petrokimia Gresik, the only chemical and compound fertilizer producer in Indonesia, produced ammonium sulfate, urea, triple superphosphate, diammonium phosphate, and nitrogen-phosphorus-potassium (NPK) at Gresik, near Surabaya in East Java.

The phase I expansion project of P.T. Petrokimia Gresik was almost completed at yearend and was scheduled to produce triple superphosphate in March 1983. The new plant will have an annual capacity of 230,000 tons P_2O_5 of superphosphoric acid. By 1983, P.T. Petrokemia Gresik will have a

total triple superphosphate production capacity of 500,000 tons per year. Construction work on the phase II expansion project was started in February 1982 by Mitsubishi Corp. and Hitachi Shipbuilding and Engineering Co. Ltd. of Japan at Gresik, East Java.

In an effort to be self-sufficient in agricultural production and to become a net exporter of nitrogen fertilizer, Indonesia was building two more ammonia-urea plants. Construction of P.T. Pupuk Kalimantan Timur (Kaltim I) near Bontang, East Kalimantan, was completed and commenced trial operations. The $367 million ammonia-urea plant has an annual capacity of 570,000 tons of urea and 165,000 tons of ammonia. Construction work on the P.T. Asean-Aceh fertilizer plant was well underway for completion in 1983. The $313 million urea plant in Aceh of North Sumatra, will have an annual capacity of 570,000 tons of urea.

In March 1982, a $375 million contract was awarded to Kellogg Overseas Corp. of the United States and Toyo Menka Co. Ltd. and Kobe Steel Ltd. of Japan to construct an ammonia-urea plant. The plant, Kaltim II, also located near Bontang in East Kalimantan, will have an annual capacity of 570,000 tons of urea and 165,000 tons of ammonia. The plant was scheduled for completion in 1985.

Kaolin.—Kaolin production in Indonesia was mainly on Belitung and Bangka Islands. The output of the two areas accounted for 97% of Indonesia's kaolin production in 1981. The major producers were Martapura Co., P.T. Alter Abadi, and P.T. Kaolin Belitung Utama on Belitung Island and P.T. Libra Jaya Murni on Bangka Island. Most kaolin was consumed domestically by the ceramic industry for manufacturing white cement and as filling material in paint, rubber, and cosmetic products.

Indonesia's first kaolin processing plant was completed on Belitung Island and was expected to start operation in November 1982. The 27,000-ton-per-year capacity plant is owned by P.T. Tambang Timah, the state-owned tin mining company. The plant is capable of producing 9,000 tons per year of coating-grade material and 18,000 tons per year of filler grade. According to an industry source, 80% of the output will be distributed to the domestic paper industry and the remainder will be exported to Japan, Taiwan, and the Republic of Korea.

MINERAL FUELS

Coal.—Coal production from two operating mines in Sumatra increased to 480,000 tons in 1982. The Ombilin Mine in West Sumatra produced 300,000 tons while the Bukit Asam Mine in South Sumatra produced 180,000 tons. Both mines were operated by P.N. Tambang Batubara, the state-owned coal company.

Coal from Ombilin's open pit at Tanah Hitan and the underground mine at Sawah Luhung was brought to the new preparation plant near the mouth of the underground mine. The clean coal was transported by rail and conveyor to the town of Sawahlunto for delivery to a cement plant in Indarung, Sumatra, and other end users. In 1982, 143,000 tons of Ombilin coal was consumed domestically and 104,000 tons was exported to Malaysia, Bangladesh, Thailand, and the Republic of Korea. A 12-megawatt powerplant at the Ombilin Mine consumes 18,000 tons of coal per year. The coal reserves at the Ombilin Mine, estimated by P.N. Tambang Batubara, were 185 million tons with measured reserves of 95 million tons, indicated reserves of 66 million tons, and inferred reserves of 24 million tons.[10]

The Bukit Asam Mine produced bituminous coal from an open pit at Air Laya and anthracite coal from another open pit at Suban. The bituminous coal was consumed by the state-owned railroad company and a tin mining company in Bangka while the anthracite was sold to domestic tin and nickel smelters. Some bituminous coal and anthracite from the Bukit Asam Mine was exported to Malaysia.

The Bukit Asam Mine expansion project at Air Laya and at Muara Tiga areas was awarded to Bukit Asam Mine Constructors (BAMCO) in November 1981. BAMCO is a joint venture of Morrison-Knudsen International Co. Inc. of the United States and Rhenraun Consulting GmbH of the Federal Republic of Germany. The three-stage development was scheduled for completion at yearend 1984 and was to start at an annual rate of 750,000 tons in 1985. The $350 million project was financed partially by a $185 million loan from the World Bank and by the Government of Indonesia. The coal reserves of the Bukit Asam (Air Laya) Mine were estimated at 223 million tons with measured reserves of 101 million tons, indicated reserves of 109 million tons, and inferred reserves of 13 million tons.[11]

To develop coal in Kalimantan, P.N. Tambang Batubara signed 3 additional production-sharing contracts with foreign joint venture companies in 1982. The terms of the contract were similar to 1981 contracts between P.N. Tambang Butubara and other foreign companies. P.T. Kaltim Prime Coal, a joint venture of Conzinc Rio Tinto Ltd. of Australia and British Petroleum Ltd. of the United Kingdom, was to develop a coal concession of 7,900 square kilometers near Samarinda in northeastern Kalimantan. A consortium from the Republic of Korea led by Samchuk Consolidated Coal Mining Co. was to develop a coal concession of 2,600 square kilometers near Balikpapan in East Kalimantan. Empresa Nacional Adaro de Investigaciones Minerales S.A. of Spain was to develop a coal concession of 1,500 square kilometers in the Tanjung region of South Kalimantan.

A joint venture firm of Nissho-Iwai Corp. of Japan and Mobil Oil Corp. of the United States as well as a joint venture firm of Tasek Cement Bhd. of Malaysia and Siam Cement Co. of Thailand, are expected to sign similar production-sharing contracts with P.N. Tambang Batubara for coal development near Berau in East Kalimantan and near Enadimsa in South Kalimantan, in 1983.

The Senakin coal mine, operated by P.T. Arutmin Indonesia, a joint venture firm of Atlantic Richfield Co. and Utah Exploration Inc. of the United States, was expected to start production in 1985. The coal concession at Senakin near Banjarmasin in South Kalimantan, where the reserves were estimated at 100 million tons, is the largest coal deposit in Kalimantan.

Petroleum and Natural Gas.—Production of crude petroleum and natural gas declined. The output of crude oil dropped to an average of 1.34 million barrels per day in 1982 from 1.61 million barrels per day in 1981 because of the production ceiling imposed by OPEC for Indonesia effective April 1982. However, the output of natural gas remained at 1.1 trillion cubic feet.

Crude oil was produced by PERTAMINA, the Government oil and gas enterprise; LEMIGAS, the Indonesia Petroleum Institute; three contract-of-work contractors led by CPI; and 16 production-sharing contractors led by Atlantic Richfield Indonesia (ARCO).

CPI remained the largest crude oil producer accounting for 36.0% in 1982, followed by ARCO, 9.6%; Indonesia Petroleum Ltd. (INPEX), 8.6%; Independent Indonesia American Petroleum Co., 8.3%; Total Indonésie (Compagnie Français du Petrol), 6.1%; Mobil Oil Indonesia Inc., 5.7%; and PERTAMINA, 5.6%. The remaining 20.1% was produced by 2 contractors under contract-of-work agreements with Indonesia, 11 contractors under production-sharing agreements, and LEMIGAS. About 57% of the output was from Sumatra, 35% from Lepaspantai (offshore areas), and 8% from the Kalimantan, Irian Jaya, and Java areas.

In 1982, an important contract negotiation was conducted between PERTAMINA and CPI. CPI has been operating in Indonesia under a contract-of-work agreement signed in 1962 and expires in November 1983. Under the 1962 agreement the split of revenue between PERTAMINA and CPI was 60:40. In 1971, a production-sharing agreement was reached between PERTAMINA and CPI to cover 1983 through 2001. Under the 1971 contract, the production split between PERTAMINA and CPI, respectively, was 70:30 for old oilfields and a three-tier system, ranging between 65:35 and 70:30, based on output from new oilfields which need more capital investment. In 1978, the three-tier system for the new oilfields was renegotiated between the two sides when CPI agreed to a single split of 85:15 as the basic terms of the 1971 production-sharing contract. During the second half of 1982, the 1978 agreement was reopened for negotiation by both sides. In October, CPI reportedly rejected a 95:5 split ratio proposed by PERTAMINA.[12] CPI reportedly was continuing renegotiations with PERTAMINA at yearend.

According to PERTAMINA, the three-tier system of production-sharing contracts with other companies have a split ratio of 85:15 for the contractor producing under 150,000 barrels per day, 90:10 for 150,000 to 250,000 barrels per day, and 95:5 for more than 250,000 barrels per day. Crude oil output by CPI averaged over 600,000 barrels per day during the first half of 1982, and the company was producing 737,000 barrels per day during the second half of 1981.[13]

In 1982, natural gas was produced by PERTAMINA, LEMIGAS, three contract-of-work contractors led by P.T. Stanvac Indonesia, and 15 production-sharing contractors led by Mobil Oil Indonesia Inc. The top six natural gas producers were Mobil Oil Indonesia accounting for 40.5%; Roy M. Huffington Inc., 18.2%; PERTAMINA,

16.5%; INPEX, 4.7%; ARCO, 4.2%; and P.T. Stanvac, 4.0%. The remaining 11.9% was produced by 14 companies.

Of the 1.1 trillion cubic feet of natural gas produced in Indonesia in 1982, 16.2% was flared or lost. About 926 billion cubic feet was consumed as follows: 54% for manufacturing LNG; 25% for pressure maintenance in oilfields; 6% for PUSRI's production of urea; 6% for a urea plant at Cikampack, the Krakatau Steel mill at Cilegon, a cement plant at Cibinong, and for city gas in Jakarta and Bogor; and 9%, other.

Oil exploration activities in Indonesia increased as 13 more production-sharing contracts were signed in 1982. Since 1979, PERTAMINA has signed 48 production-sharing contracts with foreign companies primarily from the United States, Canada, the United Kingdom, France, the Netherlands, Japan, and the Republic of Korea. Of these 48 contracts, 21 were for onshore exploration and 27 were for offshore exploration. According to an industry source, 284 exploratory wells were to be drilled in 1982 compared with 244 wells in 1981. The foreign companies were committed to spend about $1.1 billion for exploration in 1982 compared with $976 million in 1981.

Several important new oilfields were discovered in Indonesia. The most significant discovery was made by Asamera Oil Corp. of Canada in the Ramba and Tanjung Laban Oilfields of South-Central Sumatra. Other discoveries included the Sundari Oilfields by Natomas of the United States offshore southeast Sumatra, the Buton I Oilfields by CPI offshore near the east coast of Sumatra in the Strait of Malacca, and the West Yakin Oilfields by Union Oil Co. of Indonesia offshore East Kalimantan.

In December, CPI started oil production from its Waduk Oilfield in Riau of East Sumatra at an initial rate of 10,200 barrels per day. In early May, CPI also began oil production from the Zamrud Oilfield in Riau at the rate of 21,300 barrels per day. In September, Natomas brought a new oil processing facility into operation offshore the Krisna Oilfields in the Java Sea. The new crude processing platform that separates the oil, gas, and water weighs 4,800 tons and has a capacity to process 300,000 barrels of liquid (oil and water) per day.[14]

Exports of crude petroleum dropped 17% to 830,000 barrels per day in 1982, while exports of LNG rose 5% to 9.1 million tons. Japan and the United States remained the main importer of the crude oil, and Japan was still the single buyer of Indonesian LNG.

The Mineral Industry of Iran

By John R. Lewis[1]

Economic and social conditions in Iran showed little change during 1982 from those that first developed in 1978-79 during and immediately after the revolution. Furthermore, the war between Iran and Iraq continued its adverse effects upon the mineral industry of Iran. Mineral exploration and development, even for oil and gas, were virtually at a standstill. Crude oil, crippled as the industry was, still provided Iran with a large percentage of its foreign exchange earnings. Selected industrial installations, such as the steel mill at Ahwaz and oil installations everywhere, were slowly being rehabilitated. Production and/or processing of aluminum, chromite, copper, lead, zinc, and magnesite were mildly improved during the year, with the majority consumed within Iran.

PRODUCTION AND TRADE

The production of mineral commodities required by the nation's economy showed signs of modest increases. In the area of crude petroleum and natural gas, increases in production, export, and domestic refining all made better showings than other minerals, primarily because the wells were in existence and the crude could be sold to other nations.

Expansion of commercial exchanges with friendly nations were actively pursued throughout the year by the Iranian Government. The principal tool in such trade was crude oil, either sold for currency or offered in barter.

Turkey was one of Iran's larger trading partners. Among mineral products imported from Turkey were iron and steel products, plastics, synthetic rubber, and chemicals. Japan was a big buyer of Iranian oil at attractive prices somewhat below the official levels established by the Organization of Petroleum Exporting Countries (OPEC). Controlled economy countries were taking 200,000 barrels of Iranian oil per day during the year, Western Europe took 370,000 barrels per day, Iran's Middle Eastern neighbors took 250,000 barrels per day, and countries in the Far East (other than Japan) took 170,000 barrels per day. Steel products from Japan were imported by Iran. Syria sold phosphate to Iran and bought its crude oil.

Bartering crude for items required by Iran was very common. Barter arrangements were made with Greece for ships and petrochemicals, with Nicaragua and New Zealand for food, and with Brazil for a variety of commodities.

Table 1.—Iran: Production of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity[2]	1978	1979	1980	1981[p]	1982[e]
METALS					
Aluminum metal, primary ingot	[3]25,500	14,000	10,000	25,000	37,500
Chromium: Chromite, gross weight	[3]198,000	136,000	80,000	30,000	40,000
Copper:					
Mine output, metal content	[r]6,000	[r]3,000	1,000	2,000	23,500
Metal:					
Smelter	6,000	700	800	800	13,500
Refined	6,000	3,000	1,000	1,000	--
Iron and steel:					
Iron ore, gross weight thousand tons	[3]1,560	609	600	600	750
Metal:					
Pig iron do	900	800	800	500	600
Steel, crude do	780	700	700	500	550
Lead, mine output, metal content[e]	30,000	15,000	15,000	10,000	11,000
Manganese ore, gross weight	30,000	20,000	([4])	([4])	--
Zinc, mine output, metal content	45,000	25,000	30,000	35,000	34,800
NONMETALS					
Barite	200,000	180,000	150,000	75,000	80,000
Cement, hydraulic thousand tons	12,000	9,000	8,000	8,000	9,500
Clays:					
Bentonite[e]	40,000	20,000	20,000	10,000	11,000
Fire clay	70,000	70,000	50,000	40,000	50,000
Kaolin	180,000	160,000	150,000	100,000	110,000
Feldspar	3,000	3,000	2,500	2,000	2,500
Gem stones: Turquoise, crude	[3]35	NA	NA	20	NA
Gypsum thousand tons	8,000	7,000	7,000	6,000	5,000
Lime[e] do	900	500	500	500	550
Magnesite	5,000	5,000	4,000	4,000	4,000
Nitrogen: N content of ammonia	[3]178,400	[3]183,300	217,800	200,000	210,000
Pigments, mineral, natural	2,000	1,000	500	500	600
Salt, rock[e] thousand tons	700	700	600	600	700
Sodium compounds: Caustic soda	20,000	20,000	NA	10,000	12,000
Stone, sand and gravel:					
Limestone thousand tons	15,000	NA	11,000	11,000	14,000
Marble do	450	NA	NA	200	200
Silica do	NA	NA	NA	200	200
Travertine do	350	NA	NA	100	100
Strontium minerals: Celestite[e]	[r]16,500	[r]8,800	5,500	5,000	4,500
Sulfates, natural:					
Aluminum-potassium sulfate (alum)	8,000	NA	NA	3,000	3,000
Sodium sulfate (mineral not specified)[e]	35,000	NA	NA	20,000	20,000
Sulfur:					
Native thousand tons	150	75	70	50	10
Byproduct of petroleum and natural gas do	300	200	150	6	10
Total do	450	275	220	56	20
Sulfuric acid do	[e]200	[e]100	100	70	100
Talc	[e]400	[e]400	300	200	250
MINERAL FUELS AND RELATED MATERIALS					
Coal thousand tons	900	[e]900	700	600	700
Coke do	500	[e]400	400	350	350
Gas, natural:					
Gross million cubic feet	[3]1,947,595	[r 3]1,402,000	[3]709,115	[3]593,284	600,000
Marketed do	[3]687,397	[r 3]705,940	[3]292,050	[3]254,265	200,000
Natural gas liquids, all forms thousand 42-gallon barrels	16,000	[e]500	2,000	2,000	2,500
Petroleum and refinery products:					
Crude[5] do	[3]1,913,221	[r 3]1,156,300	[3]536,000	[3]480,300	750,000

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Reported data are for years beginning Mar. 21 of that stated, except those for natural gas and petroleum, which are for regular calendar years. Table includes data available through July 21, 1983.

[2]In addition to the commodities listed, other types of crude construction materials (such as common clays, sand and gravel, and other varieties of stone) are produced, but output is not reported, and available information is inadequate to make reliable estimates of output levels.

[3]Reported figure.

[4]Revised to zero.

[5]Excludes petroleum reinjected into fields.

[e]Estimated.

[1]Owing to a lack of official trade data published by Iran, this table should not be taken as a complete presentation of Iran's mineral exports. These data have been compiled from various sources, which include United Nations information and data published by partner trade countries. Unless otherwise specified, data are compiled from trade statistics of individual trading partners.

[2]Excludes imports by Australia valued at $1,349,000.

[3]Annual Statistical Bulletin 1980, published by Organization of Petroleum Exporting Countries, Vienna, Austria.

[4]Less than 1/2 unit.

[5]Excludes imports by New Zealand valued at $17,573,000.

[1]Owing to a lack of official trade data published by Iran, this table should not be taken as a complete presentation of Iran's mineral imports. These data have been compiled from various sources, which include United Nations information and data published by the partner trading countries. Unless otherwise specified, data are compiled from trade statistics of individual trading partners.

[2]Totals exclude unreported quantities exported by Sweden valued at $20,000 in 1980 and $17,000 in 1981.

[3]Total excludes unreported quantity exported by Australia valued at $72,000.

[4]Less than 1/2 unit.

[5]Totals in 1980 exclude unreported quantities of bars, rods, angles, shapes, and sections valued at $2,282,000, hoop and strip valued at $817,000, and wire valued at $1,716,000; all exported by Japan.

[6]Total excludes unreported quantities valued at $4,000 from the Netherlands, $1,000 from Belgium-Luxembourg, and $1,000 from Switzerland.

[7]Total excludes unreported quantities valued at $4,000 from Norway and $2,000 from Switzerland.

[8]Total excludes unreported quantities valued at $46,000 from France, $3,000 from Belgium-Luxembourg, and $1,000 from the Federal Republic of Germany.

[9]Total excludes unreported quantity valued at $737,000 exported by the United Kingdom.

[10]Total excludes unreported quantity valued at $314,000 exported by Japan.

COMMODITY REVIEW

METALS

Aluminum.—The 50,000-ton-per-year aluminum smelter owned by the Iranian Aluminum Co. and located at Arak, in central Iran, was operating at about 75% of capacity during 1982 amid announcements from the Ministry of Mining and Metals of forthcoming expansion activities. The eventual production goal, which had been stated for several years, was 120,000 tons per year. The plant was operating with alumina from the Indian Aluminum Co. Ltd. plant at Mysore, India. Electricity was produced at the site, but problems in the generating plant were reportedly hampering output. A recycling plant capable of handling 37 tons of secondary aluminum per day went into operation during the year.

Copper.—The copper smelter at Sar Cheshmeh in central Kerman Province began producing blister copper about midyear. Construction was assisted by specialists from Yugoslavia's Bor Copper Institute. Capacity was expected eventually to be about 150,000 tons per year, although about 55,000 tons were produced in the first year's operation. At the outset, production was to be absorbed by the domestic market. About 1,000 tons per day of sulfuric acid were to be produced as a copper-smelting byproduct. The refined output of cathode copper was to run about 98% to 99% pure metal. Gold and silver were also to be recovered.

The smelter is part of the Sar Cheshmeh copper complex. About 2.5 million tons of ore has been removed from the deposit since it was first opened in 1978. Rated capacity of the mine was reported to be 145,000 tons of copper per year.

During the 1982-83 winter months, smelter production of blister copper outran the refinery's capability to produce pure metal, and the smelter was shut down. Stockpiled blister copper continued to supply needed material for the refinery.

Iron and Steel.—The steel facility of the National Iranian Steel Industries Corp. at Ahwaz in west-central Iran was back in limited operation during the latter part of the year. Heavy repairs on many parts of the facility had been accomplished and future expansion plans were under consideration. Imports of 1 million tons of iron and steel materials were double those of a year earlier. Bids were to be submitted early in 1983 for a 3.2-million-ton-per-year direct-reduction plant to be added to existing steelmaking facilities at Esfahan. Steel production from this plant in 1982 was about 1,900 tons. Natural gas, to replace about 300 tons of liquefied natural gas used per year in the Esfahan plant, was to be pipelined to the facility via a 60-kilometer-

long pipeline from an existing gas transmission system.

NONMETALS

Barite.—At the barite mining operations, about 30 kilometers west of Aradkn, barite crystals were uncovered and carefully separated and stored away from the excavated barite ore. Barite crystals find wide use in medicinal applications and had previously been imported. Because of decreased oil well-drilling activity, demand for barium additives was off and this commodity was being stockpiled at the mines.

Cement.—Total cement production capacity was between 14 and 16 million tons, but about 9.5 million tons was produced in 1982, owing primarily to market conditions and various problems at the cement plants, including lack of spare parts for machinery. Cembureau, the European Cement Association, listed 18 plants in Iran, but information about their present status was not available. The Iranian Ministry of Industry indicated during the summer that production would top 10 million tons in the next year and should continue upward in the future.

MINERAL FUELS

Natural Gas.—Production of most natural gas in Iran continued to be from associated gas from existing oil wells, primarily because drilling and development for either oil or gas was very limited. As crude oil production rose somewhat during the course of the year, so did natural gas output. Iran's gas reserves were estimated at 485 trillion cubic feet and were second only to those of the U.S.S.R.; almost 20% of the world's gas reserves.

At Kangan, about 700 kilometers south of Tehran on the Persian Gulf, an organization known as Kangan Liquefied Natural Gas was engineering a 400,000-cubic-foot-per-day liquefaction unit to be built by Mitsubishi Heavy Industries Ltd. for completion late in 1983. Presumably, gas would come from several gasfields in the area including the offshore Pars Field and the Kangan onshore gas reservoir.

In September, Turkey announced that it had signed an agreement to build a pipeline from Iranian gasfields that would have sufficient capacity to meet Turkey's entire requirements. Source of this gas apparently was to be fields formerly dedicated to other country customers, some of which refused to pay Iran's asking price of $4 per thousand cubic feet of gas.

Petrochemicals.—The $3.5 to $4.2 billion[2] Iran-Japan petrochemical complex at Bandar Khomeini remained inoperable. The complex was being developed by the Iran-Japan Petrochemical Co. Ltd. representing the Mitsui-Aka International Development Corp. for Japan and the National Petrochemical Co. of Iran. It had been planned to use naphtha feedstocks from the Abadan refinery and make 300,000 tons of ethylene per year for use as a building block for 13 different petrochemical products from 13 different plants within the complex. The Japanese interests held 50% of the ownership and wanted to divorce themselves from further participation in the project on the grounds that the plant, even if rebuilt, would no longer be a commercially feasible project. Depressed markets and oversupply of petrochemicals were also cited as reasons for the disinterest. Nevertheless, the Japanese group offered to furnish technical assistance in the event reconstruction took place. There were indications during the year that scaling down the size of the project might solve some of its commercial problems, and also, that should the Japanese succeed in divesting themselves of their interests, other nations would then be invited to participate.

A new 270-ton urea fertilizer reactor was installed in the petrochemical plant at Shiraz, increasing its output by tenfold. The new facility produced at a rate of 1,500 tons of urea and 750 tons of ammonium nitrate per day. Work was being accomplished entirely by Iranian nationals.

Petroleum.—*Production.*—The proven crude oil reserves of Iran in 1982 were 57 billion barrels, which was 8.5% of the entire world's reserves. In 1982, Iran was fourth among world oil nations in reserves[3] and the country produced about 2.5% of the world's crude supply. Average output was 1,981,000 barrel per day. In January, production averaged 1,100,000 barrels per day, but in nearly every month throughout the year there were increases, culminating in a December production of 2,800,000 barrels per day.

There was little to indicate that an active drilling or development program was being undertaken. Of eight drilling rigs known to be in the country, only three were thought to be in operating order.

Refining.—Refineries, as well as many other oil installations, continued to sustain damage owing to military action.

Despite huge losses of refining capacity, petroleum product supplies were sufficient to permit lifting of rationing of home heating oil. Kerosine and gasoline supplies were increased. Discussions were underway during the year with a view to possibly building a replacement for the Abadan refinery at a different site.

A new refinery was under consideration by the Oil Ministry for future construction near Malayer-Sarband in central Iran. The site would eliminate fuel supply problems in the area.

The People's Democratic Republic of Yemen and Iran signed an agreement at midyear under which about 50,000 barrels per day of Iranian crude oil would be refined in the 175,000-barrel-per-day Aden Refinery Co. plant at Little Aden. Iran was also to sell Yemen an additional 10,000 barrels of crude per day for its own use at an attractive price.

Uranium.—Several sources of information provide sketchy reports of the discovery of uranium in Iran. Reports form OPEC in Vienna indicated that Iran planned either to build a new nuclear powerplant or seek completion of the Bushehr plant located on the Persian Gulf coast, work on which was suspended in January 1979, when the plant was 80% complete. It had been mothballed since that date. If reactivated, output would eventually be 1,200 megawatts in each of two plants. Should a new plant be constructed, very early planning called for the first stage of the work, research, to take 2 years. During the following stage, a test reactor would be built and this would then lead to the building of a nuclear powerplant. Time to complete the overall project was not divulged.[4]

The Mineral Industry of Iraq

By George A. Morgan[1]

The mining sector, dominated by crude oil production, experienced a decline in 1982 owing to war-related damage to transportation facilities and to production facilities. Lower world oil prices reduced Government revenues further. The nonfuels sector was an insignificant portion of the gross national product of $32.1 billion in 1981, the latest year for which reliable statistics were available.[2]

The attempt to maintain an expanding domestic economy while engaged in war with Iran was strained with reports of shortages of some foodstuffs. The 1981-85 5-year plan initially envisaged an investment budget of $135 billion, but this has since been redirected to affect completion of ongoing projects.

Further indication of financing difficulties was the decline in foreign reserves from about $25 billion prior to the war to about $6 billion at yearend 1982. The cost of imports has continued to increase to meet the needs of the expanding domestic economy. Reduced revenues from declining exports were made up by long-term loans at no interest from Saudi Arabia, Kuwait, and other countries.[3]

GOVERNMENT POLICIES AND PROGRAMS

The Government controlled the economy through complete ownership of the principal producing sectors, mainly petroleum. Austerity measures were instituted in 1982 as a reaction to the loss of exports. Among these were a 5% devaluation of the Iraqi dinar, which reduced the drain from foreign worker remittance, estimated at $4 billion per year. Hard currency conversion by contract foreign workers were reduced to 50% from 75% of salary earned. Remittances were also reduced to an estimated 1 million foreigners in the private sector, who were treated separately from contract workers.

A revised industrial investment law was passed in December 1982. The law encouraged private and mixed investment by raising the level of money available for investment and by expanded tax benefits. Collectivization programs have been abolished.

PRODUCTION AND TRADE

Petroleum output declined from 3.4 million barrels per day in 1980 to 850,000 barrels per day at yearend 1982. Oil exports accounted for $10.4 billion of total exports of $11.6 billion in 1981, compared with $26.1 billion for oil exports in 1980. Oil exports were adversely affected by the destruction of the major terminals at Mina al-Bakr and Khor al-Amaya in the south and the closure of two pipelines through Syria in April 1982. The two pipelines transversing Syria had capacities of 300,000 barrels and 400,000 barrels per day The principal means of transport was via a single pipeline through Turkey. Rail and road transport facilities were expanding rapidly to make up for the loss of port facilities.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Includes data available through June 14, 1983.

[2]In addition to the commodities listed, lime and a variety of crude construction materials (clays, stone, and sand and gravel) are also produced, but output is not reported, and available information is inadequate to make reliable estimates of output levels. In addition, limited unreported quantities of phosphate rock may have been produced for test purposes prior to inauguration of commercial production at the Al Kain chemical complex.

[3]Includes reinjected, if any.

COMMODITY REVIEW

METALS

There was no significant activity in the metals sector, which consisted mainly of iron and steel production. Although expansion of the steelworks at Khor Al Zubair was in the planning, it remained practically inoperative owing to its proximity to the war zone.

NONMETALS

Cement.—Kawasaki Heavy Industries (Japan) headed construction of a 1-million-ton-per-year plant at Hit, 90 kilometers west of Baghdad, with startup planned for 1983. A 1-million-ton-per-year extension of the plant at Badoosh was underway. A 2-million-ton-per-year plant was also planned for the southwest at Samawa.

Sulfur.—The Al Kain sulfuric acid plant, with an annual capacity of 1.8 million tons per year of sulfuric acid, went into operation. Sulfur was supplied from the Mishraq Mine near Mosul. Phosphate for the fertilizer plant at Al Kain was to be from the Akashat Mine about 150 kilometers to the southwest.

MINERAL FUELS

Natural Gas.—Iraq continued to flare about 85% of its natural gas production, which was mainly associated gas. Projects to absorb the unused gas were slow in coming to fruition.

Petroleum.—Proven oil reserves were reported at 59 billion barrels, and an additional 46 billion barrels were estimated reserves. Production was about 25% of prewar levels of 3.4 million barrels per day.

Export facilities have been reduced to a

single 980-kilometer-long pipeline through Turkey with a capacity of about 650,000 barrels per day. A 45% to 50% increase in the pipeline's capacity was planned for completion by midyear 1984. Other pipelines were also considered for construction across Saudi Arabia and Kuwait.

Refining.—Refining capacity prior to the war was about 300,000 barrels per day from plants at Basra, 150,000 barrels per day; Daura, 80,000 barrels per day; and several small topping plants at Kirkuk, Baiji, and Samarra. Basra was extensively damaged early in the war. However, several 10,000-barrel-per-day topping plants have been installed in various parts of the country, and the first phase of the new refinery at Baiji was in operation with a capacity of 70,000 barrels per day.

The Mineral Industry of Ireland

By Tatiana Karpinsky[1]

Ireland continued to suffer from economic stagnation and rising unemployment. The gross national product declined by about 1% in 1982, after increases of about 1% in each of the two previous years. Industrial production increased 1%. By the end of 1982, unemployment increased to over 13% of the labor force. It was also a bad year for the mining and mineral industry. Mining operations lost over $3.6 million.[2] Four mines were closed down, leaving only seven still in operation. Three of the fifteen exploration companies ceased operations. Ireland's largest remaining mine was recovering from labor troubles. Foreign companies, which accounted for most of the prospecting and mining activity, were continuing scaled-down exploration and found numerous small deposits, primarily of zinc-lead and copper, together with promising lithium, talc, and magnesite occurrences. The overall number of exploration licenses declined from 924 in 1974 to 600 in 1982. The mining sector employed over 2,000 people with an additional 3,500 active in quarrying.

PRODUCTION

The year was notable for the heavy cutbacks of copper production caused by the poor market and uneconomic price level. The 1981 strike at the major lead-zinc operation, Tara Mines Ltd.'s Novan Mine, held down the level of lead-zinc production. Barite production declined following the recent closures of Milchem Minerals Ltd.'s Lady's Well Mine in County Cork and Tynagh Mine, County Galway.

Ballynoe open pit mine, County Tipperary, was the only remaining barite producer. The severe cutback in the construction industry, which was likely to become more acute, curtailed the production of cement and gypsum.

Offshore drilling was low and uneventful as only four dry wells were sunk off the west coast in the Porcupine Basin.

Total do	4,604	3,666	4,426	5,358	5,279
Peat briquets[7] do	334	325	338	340	406
Petroleum refinery products:					
Gasoline thousand 42-gallon barrels	4,508	4,412	4,152	1,589	960
Jet fuel do	98	252	155	60	NA
Distillate fuel oil do	4,821	4,566	4,019	1,418	1,084
Residual fuel oil do	6,388	7,075	5,981	2,200	1,308
Liquefied petroleum gas do	719	260	238	211	155
Naphtha do	121	126	35	14	3
Refinery fuel and losses do	206	574	408	NA	NA
Total do	16,861	17,265	14,988	5,492	3,510

[e]Estimated. [p]Preliminary. NA Not available.

[1]Table includes data available through Oct. 3, 1983.

[2]In addition to the commodities listed, substantial quantities of stone and sand and gravel are produced by local authorities and road contractors. Ireland also produces significant quantities of manufactured diamond, but output is not quantitatively reported, and available general information is inadequate to make reliable estimates of output levels.

[3]Excludes output by local authorities.

[4]Figures given, as officially reported, include granite, marble, silica, rock, sand, calcspar, fire clay, and slate and clays for cement production.

[5]Includes production by farmers and by Bord Na Mona.

[6]Includes milled peat used for briquet production.

[7]Produced from milled peat.

TRADE

The Irish economy continued to depend on imports of nonferrous metals, fuels, iron, steel, and fertilizers. Metal concentrates were exported to smelters in the United Kingdom and on the European Continent. Mineral exports earned over $108 million or 2.5% of Ireland's total exports. U.S. mineral imports from Ireland were largely nonmetallics, such as barite and manufactured industrial diamonds; U.S. mineral exports to Ireland consisted of superphosphate, bituminous coal, petroleum products, and nonferrous metals.

Table 2.—Ireland: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals:				
Unspecified	10	23	--	All to United Kingdom.
Aluminum:				
Oxides and hydroxides	1,543	1,925	--	United Kingdom 698; Thailand 344; France 245.
Metal including alloys:				
Scrap	3,526	2,365	--	United Kingdom 1,235; Netherlands 603; Belgium-Luxembourg 470.
Unwrought	2,206	2,173	--	United Kingdom 1,736; West Germany 280; Japan 72.
Semimanufactures	2,495	2,140	77	United Kingdom 1,376; West Germany 455; Greece 46.
Chromium: Oxides and hydroxides	10	--		
Copper:				
Ore and concentrate	18,888	17,525	--	West Germany 8,440; Finland 5,485; East Germany 2,083.
Matte and speiss including cement copper	--	(1)	--	All to United Kingdom.
Metal including alloys:				
Scrap	6,698	7,119	--	Belgium-Luxembourg 2,104; United Kingdom 1,813; Netherlands 1,506.
Unwrought	454	759	(1)	Belgium-Luxembourg 333; West Germany 184; United Kingdom 142.
Semimanufactures	1,807	2,122	534	United Kingdom 781; U.S.S.R. 281; Belgium-Luxembourg 231.
Iron and steel:				
Iron ore and concentrate, pyrite, roasted	27,092	17,296	--	All to United Kingdom.
Metal:				
Scrap	84,458	73,307	--	Spain 46,515; United Kingdom 22,666; West Germany 2,803.
Pig iron, cast iron, related materials	178	114	--	United Kingdom 93; West Germany 8; Switzerland 8.
Ferroalloys:				
Ferromanganese	121	50	--	United Kingdom 31; West Germany 19.
Unspecified	21	11	--	Mainly to United Kingdom.
Steel, primary forms	1,813	791	--	United Kingdom 547; Trinidad and Tobago 64; Belgium-Luxembourg 56.
Semimanufactures:				
Bars, rods, angles, shapes, sections	18,636	18,955	(1)	United Kingdom 14,638; West Germany 3,031; Italy 1,098.
Universals, plates, sheets	6,145	7,668	--	United Kingdom 7,040; West Germany 490; Trinidad and Tobago 67.
Hoop and strip	830	603	17	United Kingdom 319; India 77; Italy 55.
Rails and accessories	1,157	131	--	United Kingdom 128; West Germany 2.
Wire	937	483	1	United Kingdom 326; West Germany 87; Finland 18.
Tubes, pipes, fittings	6,736	7,074	(1)	United Kingdom 3,801; West Germany 1,610; Netherlands 443.
Castings and forgings, rough	42	100	--	United Kingdom 88; West Germany 8.
Lead:				
Ore and concentrate	110,238	63,779	--	France 17,669; West Germany 14,430; Spain 11,288.
Oxides	25	42	--	Sweden 25; United Kingdom 17.
Metal including alloys:				
Scrap	1,881	2,226	--	Netherlands 798; United Kingdom 717; Denmark 278.
Unwrought	1,857	3,612	(1)	United Kingdom 2,198; Netherlands 881; Belgium-Luxembourg 303.
Semimanufactures	2,419	2,554	61	United Kingdom 1,716; Netherlands 736; Belgium-Luxembourg 23.
Magnesium: Metal including alloys:				
Scrap	53	15	--	Netherlands 13; United Kingdom 2.
Unwrought	5	15	--	France 14.
Manganese: Oxides	12,374	9,954	344	Singapore 1,638; Nigeria 1,345; U.S.S.R. 1,170.
Mercury 76-pound flasks	64	638	--	All to United Kingdom.
Metalloids: Unspecified	1	41	--	Mainly to United Kingdom.

See footnotes at end of table.

METALS —Continued				
Nickel:				
Matte and speiss	4	--		
Metal including alloys:				
Scrap	95	85	--	United Kingdom 83; West Germany 1.
Unwrought	2	75	--	Mainly to West Germany.
Semimanufactures	238	195	--	Switzerland 85; West Germany 48; United Kingdom 32.
Platinum-group metals: Metal including alloys, unwrought and partly wrought, unspecified troy ounces	r46,490	19,066	--	All to United Kingdom.
Silver:				
Waste and sweepings[2] value, thousands	$2,132	$978	$5	United Kingdom $727; West Germany $231.
Metal including alloys, unwrought and partly wrought troy ounces	105,294	160,369	--	United Kingdom 45,687.
Tin: Metal including alloys:				
Scrap	285	163	--	All to United Kingdom.
Unwrought	--	2	--	All to West Germany.
Semimanufactures	137	23	18	United Kingdom 5.
Titanium: Oxides	21	64	--	All to United Kingdom.
Tungsten: Metal including alloys, unwrought	3	4	--	United Kingdom 3; Libya 1.
Zinc:				
Ore and concentrate	462,096	254,132	--	Belgium-Luxembourg 99,135; West Germany 33,806; France 23,860.
Oxides	39	58	4	United Kingdom 53; Greece 1.
Metal including alloys:				
Scrap	176	114	--	India 35; United Kingdom 35; Spain 17.
Unwrought	3,601	451	--	United Kingdom 430; Belgium-Luxembourg 20.
Semimanufactures	11	114	39	Brazil 50; United Kingdom 23.
Other:				
Oxides and hydroxides	38	31	--	United Kingdom 29.
Ashes and residues	1,350	948	63	Belgium-Luxembourg 326; United Kingdom 317; Italy 242.
Base metals including alloys, all forms	309	160	34	West Germany 60; Belgium-Luxembourg 34; United Kingdom 29.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	53	6	--	Mainly to United Kingdom.
Artificial: Corundum	14	1	--	All to Switzerland.
Grinding and polishing wheels and stones	94	35	8	United Kingdom 18; West Germany 3; Singapore 2.
Asbestos, crude	120	20	--	All to United Kingdom.
Barite and witherite	272,643	260,691	82,950	United Kingdom 72,930; Republic of South Africa 30,450; Norway 19,384.
Boron materials:				
Crude natural borates	15	--		
Oxides and acids	--	(1)	--	All to United Kingdom.
Cement	96,640	130,826	--	United Kingdom 130,718.
Chalk	11	--		
Clays and clay products:				
Crude, unspecified	154	834	--	United Kingdom 800; Japan 3.
Products:				
Nonrefractory	719	789	(1)	United Kingdom 753; Norway 35.
Refractory including nonclay brick	62,735	61,662	--	United Kingdom 18,359; West Germany 15,262; Belgium-Luxembourg 7,799.
Diamond:				
Gem, not set or strung value, thousands	$59	$16	--	All to Israel.
Industrial carats	6,912	--		
Fertilizer materials:				
Crude, n.e.s	1,788	2,828	--	All to United Kingdom.
Manufactured:				
Ammonia	70,376	34,423	--	United Kingdom 18,523; Spain 7,037; Portugal 4,373.
Nitrogenous	64,548	149,017	--	United Kingdom 48,449; Belgium-Luxembourg 31,940; France 23,490.
Phosphatic	74	5	--	All to United Kingdom.
Potassic	221	3,108	--	Do.
Unspecified and mixed	36,084	82,161	--	Do.

See footnotes at end of table.

Table 2.—Ireland: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Graphite, natural	166	61	--	All to United Kingdom.
Gypsum and plaster	57,816	39,992	--	United Kingdom 39,990; France 2.
Halogens:				
Chlorine	344	115	--	All to United Kingdom.
Unspecified	58	19	--	Do.
Lime	1,363	193	--	United Kingdom 192; Netherlands 1.
Magnesium compounds: Other	73,395	77,361	37,035	United Kingdom 15,172; Belgium-Luxembourg 8,882; Austria 6,990.
Mica:				
Crude including splittings and waste	32	--		
Worked including agglomerated splittings	5	(1)	--	All to United Kingdom.
Nitrates, crude	72	177	--	Do.
Phosphates, crude	97	486	--	Do.
Precious and semiprecious stones other than diamond:				
Natural value, thousands	$420	$122	--	United Kingdom $73; Switzerland $43.
Synthetic do.	--	$5	$5	
Salt and brine	689	182	--	United Kingdom 156; Sweden 25.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	1	3	--	All to United Kingdom.
Sodium carbonate, natural and manufactured	2	47	--	Do.
Sodium hydroxide	98	490	--	United Kingdom 486.
Sodium sulfate, natural and manufactured	67	49	NA	NA.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	2,378	3,428	120	United Kingdom 3,286; Italy 1.
Worked	752	1,106	384	United Kingdom 669; Netherlands 19; Italy 10.
Dolomite, chiefly refractory-grade	25	3	--	All to United Kingdom.
Gravel and crushed rock	168,318	221,485	--	United Kingdom 165,933; West Germany 40,360; France 15,192.
Limestone other than dimension	231	1,203	--	All to United Kingdom.
Quartz and quartzite	286	374	--	United Kingdom 298; Netherlands 76.
Sand other than metal-bearing	6,995	5,235	--	United Kingdom 5,113.
Sulfur:				
Elemental:				
Crude including native and byproduct	25	105	--	All to United Kingdom.
Colloidal, precipitated, sublimed kilograms	100	--		
Sulfuric acid	2,729	8,176	--	Netherlands 6,995; Belgium-Luxembourg 991; United Kingdom 189.
Talc, steatite, soapstone, pyrophyllite	35	64	--	Netherlands 41; United Kingdom 22.
Other:				
Crude	19	119	19	United Kingdom 74; Colombia 20.
Slag and dross, not metal-bearing	19	16	--	All to United Kingdom.
Oxides and hydroxides of barium, magnesium, strontium	263	497	--	France 180; United Kingdom 138; Thailand 78.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	8,332	8,297	--	United Kingdom 4,685; Nigeria 3,162; Hong Kong 371.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	27	239	--	All to United Kingdom.
Carbon: Carbon black	630	805	3	Netherlands 611; United Kingdom 182.
Coal:				
Anthracite	795	221	--	All to United Kingdom.
Bituminous	37,651	9,014	--	Finland 5,224; United Kingdom 3,286.
Lignite including briquets	4	--		

See footnotes at end of table.

COMMODITY REVIEW

METALS

Aluminum.—Construction of a new alumina plant on Aughinish Island in the Shannon Estuary continued. The plant was expected to come onstream in 1983.

Copper.—The 200-year-old Avoca copper mine in County Wicklow was closed. Supported by Government subsidies of approximately $14.2 million since 1974, the Irish-owned Avoca Mine ran out of profitable ore and went into receivership in August. Over 200 jobs were lost.

Iron and Steel.—Operation at the modern steel plant at the Haulbowline site near Cork continued; production was unlikely, however, to exceed 40% of capacity in the near future. While production remained low, financial charges and depreciation were high, and the state-owned company reported a loss of $30.8 million compared with $18.4 million in 1981. Irish Steel Ltd. (IS), the operator, got a $35.5 million grant from the Government in May. During the time of plant construction, other countries largely increased their sales to Ireland, and the market was supplied with steel at low prices and on extended credit terms. The Irish steel industry was designed to be export oriented because the domestic market was so small. Exports in 1981 amounted to $7.7 million and were mostly to the United Kingdom; the Belgium, Netherlands, Luxembourg Economic Union; and the Federal Republic of Germany. According to an earlier trade agreement with France's Metallurgique de Normandie, the Irish company IS started delivering steel to France, following the closure of Normandie's section mill.

Lead-Zinc.—At the beginning of 1982 the mining operations at Tara Mines' underground mine at Navan, County Meath, were resumed after a 7-month strike, and normal production of lead-zinc ore was achieved in the second quarter of the year. Daily production reached 9,400 tons of ore. The total output for the year was 1.5 million tons of ore grading 10.8% zinc and 2.2% lead. Total reserves of lead-zinc ore as of December 31, 1981, were estimated at 64.5 million tons. Owing to increasing energy costs, plans for building a zinc smelter in Ireland were canceled, and the concentrates continued to

be processed abroad.

Bula Ltd., after 6 years of negotiation, received planning permission to initiate an underground lead-zinc operation at Navan, County Meath. Among 23 conditions attached to the permit were requirements that Bula strictly limit the water level at its proposed tailings dam to reduce pollution risks to a nearby river, that the company pay for relocating a public water intake, and that Bula finance $548,000 in improvements to a country road that could be damaged by the mining operations. Plans called for Bula to mine 600,000 tons per year of ore, yielding about 120,000 tons of lead concentrate.

The Mogul of Ireland Mine at Silvermines, County Tipperary, was closed in August when reserves were depleted. A loss of $3.6 million was reported, and over 500 jobs were lost.

NONMETALS

Barite.—Milchem Minerals Ltd. ceased operations at its Clonakilty Mine in County Cork, after running out of profitable ore. The closure cost 43 jobs. Milchem Minerals also was reworking the tailings dam of the defunct Tynagh lead-zinc mine in County Galway for barite, but closed this operation until 1983.

The main producer of barite was the Ballynoe open pit mine, located near the village of Silvermines, County Tipperary, and operated by Magcobar (Ireland) Ltd., a wholly owned subsidiary of Dresser Industries Inc. of the United States. The open pit produced about 250,000 tons of barite at 90% to 95% of $BaSO_4$, using a conventional truck and shovel operation. The largest part of the barite produced was exported in crude form to Dresser grinding plants worldwide and was used in oil well drilling muds in the international oil industry. The Ballynoe open pit mine has an estimated life left of 6 to 8 years.

MINERAL FUELS

Ireland was largely dependent on imported oil, which accounted for 58% of total primary energy requirements, and imported coal, which accounted for 10% to 11% of the total. The most significant indigenous energy sources were solid fuel, mainly peat, which accounted for 14% of total primary energy, and indigenous gas, produced offshore, which contributed about 15%. Hydroelectric energy furnished about 2% of the total.

Coal.—Irish coal reserves were small and mainly of a low quality. Recoverable reserves of coal were estimated at 58 million tons, one-half of which was composed of high ash semibituminous coal in Connaught and the other one-half of semianthracite in the Lenister and Tipperary Coalfields.

Flair Resources Ltd. used an investment of $2.6 million and a grant of $1.7 million from Ireland's Industrial Development Authority to redesign and renovate mining and processing of anthracite deposits of Lickfinn, County Tipperary, 100 miles south of Dublin. The main coal seam contained more than 3 million tons of proven recoverable reserves of anthracite, enough to maintain maximum production for the next 25 years. Planned expansion over the next 4 years will lead to the production of 100,000 tons of sized and briquetted anthracite annually. The modernization program will involve the expenditure of more than $1.5 million on new facilities, including a briquetting plant, the latest in underground mining and transport equipment, and washing and screening installations. When the project is complete, anthracite production was expected to rise from 2,000 to 7,000 tons per month.

Natural Gas.—The pipeline from the Kinsale Head Gasfield was extended to Dublin and may be further extended to Northern Ireland, if a deal on the price of the gas is concluded between the governmental departments concerned. Natural gas was used largely for power generation and production of ammonia and fertilizers with a small proportion distributed in the Cork area. With the completion of the Cork-Dublin natural gas pipeline, it was estimated that the ultimate usage of gas will be as follows: 33% for premium markets and industry; 33% for electricity generation; and 29% for fertilizer production.

Petroleum.—In June, the Minister of Industry and Energy allocated 24 offshore blocks under the second licensing round to 10 consortia involving 37 companies, of which 21 were new to exploration of gas and oil in Ireland. After the second round awards, Ireland allocated an additional three blocks. The state-owned oil company, the Irish National Petroleum Corp. (INPC) was not involved.

The level of offshore oil exploration in Ireland declined considerably in 1982. Only three wells were drilled, compared with eight wells in 1981, and no significant hydrocarbon traces were found. Exploration

for oil was expected to continue and companies were planning to spend an estimated $200 million in the next few years. Irish imports of 100,000 barrels of oil per day in 1982 were valued at $1.4 billion or 13% of the value of total imports.

In April 1982, the Government purchased the Whitegate, County Cork, oil refinery, the only refinery in Ireland, which had previously been owned by a consortium of four major oil companies (Esso, Shell, Texaco, and BP) and which had ceased refining in June 1981.

INPC was required under the new law to operate the refinery and supply 35% of national petroleum product requirements therefrom.

Uranium.—Exploration for uranium started in 1975 and in 1982 came to an end. Only relatively small bodies of low-grade ore were discovered. World prices had declined from $45 to $18 per pound.

---

[1]Foreign mineral specialist, Division of Foreign Data.
[2]Official exchange rate during 1982 for the Irish pound (£) to U.S. dollars was 1£ = US$1.42.

The Mineral Industry of Israel

By Suzann C. Ambrosio[1]

As a major world producer of bromine and potash, the mineral industry of Israel contributed approximately 6.3% to the 1981 gross national product (GNP) of $21 billion.[2] Although reexports of diamonds comprised approximately 5% of the GNP, Israel ranked second after the United States in bromine production, providing 18% of the world's supply of bromine and 4% of the world's supply of potash during 1982. Together these two commodities comprised 1% of the 1981 GNP, and the balance of the mineral industry's contribution, in order of descending value, was provided by phosphate, sand and gravel, limestone, clays, and salt. Output of nonmetallics and chemicals, fertilizer materials, and value added to the cut and polished diamond gem stones comprised the bulk of the industry. Israel Chemicals Ltd. (ICL), the Government holding company for all nonmetal mineral output, produced potash, bromine, and periclase from the Dead Sea brines and mined phosphate in the area between Beersheba and the Dead Sea. ICL planned to expand the output of potash, bromine, and phosphate over the next decade, especially since potash and phosphate resources have been increased through recent investigations of additional deposits.

Israel's economy grew 4.6% in real terms between 1980 and 1981, and the Government forecasted similar growth rates for 1982. Resulting in part from declining petroleum prices and tight monetary and fiscal policies, inflation started to decline in 1981, with the increase in the consumer price index falling from 133% in 1980 to 102% at yearend 1981. The proposed 1982 budget was 5% lower in real terms compared with the expanded 1981 budget, with 60% of the budget continuing to go to defense expenditures and debt repayment.

By yearend 1982, the 1983 budget and supplemental request reached $23 billion, representing a 19% increase over the 1981 budget. If implemented, the increased budget could worsen the balance of payments (BOP) deficit. The 1981 current account deficit increased 13% to $4.4 billion, and the trade deficit grew in excess of 100% to approximately $2 billion. The 1982 BOP forecast was for a slight improvement, resulting from increased exports and diminished current account deficits.

Discussions over the Mediterranean-Dead Sea canal project continued, and plans were made to increase the hydroelectric power capacity at the Dead Sea outlet by 40% to 800 megawatts. Similarly, the cost of the project grew 86% to $1.3 billion between 1980 and yearend 1982 in part because of the devalued Israeli currency. In addition, Merkorot Ltd., the national water supply company, proposed the construction of a large-scale seawater desalination plant as part of the project. At planned capacity, 100,000 cubic meters per day of freshwater would be removed, and the residual brine, separated by the reverse osmosis membranes, then returned to the Dead Sea. This would help offset the potentially damaging dilution of the Dead Sea waters through the mixing with less saline Mediterranean waters.

PRODUCTION AND TRADE

During 1981, the industrial production index regained the 4% loss measured during 1980 and resulted in a 10% gain over the 1978 base year. Gains were realized in nonmetallic mineral production. Potash and bromine output led the sector and were

important foreign exchange earners, while increased copper oxide and steel output was important to the domestic economy. Preliminary data available for 1982 indicated stepped-up production of phosphate, potash, and other fertilizer and chemical products. Potash capacity was planned to increase by nearly 25% to 2.1 million tons by 1985. Enhanced production of nitrogenous fertilizers and petrochemicals was planned for 1983. Diversifying fertilizer and chemical products, restructuring the gem stone cutting industry to include emeralds, and acquiring strong market footholds abroad have been some of the strategies successfully employed by the Israeli mineral industry. As the new high-grade phosphate fields, located east of Beersheba, become economically feasible, Israel could become increasingly competitive on a world scale.

[e]Estimated. [p]Preliminary. NA Not available.

[1]Table includes data available through June 30, 1983, provided mostly through the courtesy of the Geological Survey of Israel.

[2]In addition to the commodities listed, Israel reportedly has the capacity to produce 71 tons of U_3O_8 per year, but official data are not reported, and available information is inadequate to make reliable estimates of actual output levels.

[3]Production of copper cement reported in 1980 contained 70%-80% Cu metal.

The diamond sector continued to be one of the Nation's largest industrial export sectors, despite lower 1981 trade volumes, reduced inventories, constricted credit availability, and overall depressed markets. Rough diamond imports declined 39% to approximately 3.1 million carats, valued at $486 million, and exports of polished diamonds declined 4% to 2.2 million carats, valued at $1,067 million. In 1982, the Israeli Central Bureau of Statistics reported an approximate 8% diamond import growth, by value, to $570 million, and a 15% export decline to $908 million. The overall 1981 commodity trade surplus reached $2 million, but the 1982 commodity trade balance slipped back into a deficit of approximately $120 million. The diminished diamond trade, devaluation of the shekel, and the depressed state of world markets contributed to the 1982 trade deficit.

Israel continued to be nearly import dependent for metals and mineral fuels, although Israeli reexports of refined petroleum products, zinc, magnesium, beryllium, and copper products increased. Major trade partners continued to be the European Economic Community (EEC), followed by the United States and Asia. Israel enjoys two favorable trade preference systems including an agreement with the EEC that permits Israeli manufacturers duty-free access to the EEC, and participation in the U.S. Generalized System of Preferences, which allows a large variety of manufacturing categories to enter U.S. markets duty free.

COMMODITY REVIEW

METALS

Copper.—Timna Copper Mines Ltd. invested $6 million to reopen the Timna Mines located north of Eilat. The mines had previously produced 10,000 tons of copper annually in the form of cement copper, but were closed in 1976 because of depressed market prices. The remaining proven reserves, 21 million tons of copper ore, were to be processed into copper oxide, leaving the byproduct magnesium sulfate. Current production capacity was 4,200 tons of copper oxide and 7,000 to 10,000 tons of magnesium sulfate. Approximately 4,000 tons of copper metal was produced during 1981-82.

Iron and Steel.—The Dorot Foundry, located near Beersheba, was expected to receive two induction melting furnaces from Inductotherm Europe Ltd. (United Kingdom) during 1983. The two furnaces were expected to add 1,750 tons to the existing capacity.

Magnesium Compounds.—Production and export of high-grade magnesium oxides by Dead Sea Periclase Ltd. (DSP) remained relatively stable over the past 5 years. The value of periclase exports increased to approximately $21 million in 1981-82. Nearly all of the magnesium compounds were exported, while one of the byproducts, hydrochloric acid, was important to domestic markets. DSP research and development expenditures were aimed at reducing their high energy costs, equivalent to 40% of operating costs.

NONMETALS

Bromine.—The Dead Sea Bromine Group, comprised of Dead Sea Bromine Ltd., Bromine Compounds Ltd. (25% owned by Histadrut Ltd.), and Broomchemie BV (Netherlands), operated three plants in Beersheba and Ramat Hovav in Israel and Terneuzen in the Netherlands. In 1982, nearly 16% of the world production of bromine compounds came from the Ramat Hovav and to a lesser extent from the other two facilities. Of the $60 million sales revenues earned in 1981-82, 84% by value were exports. Future expansion plans focused on the research and development of new bromine products, including enhanced production of fire retardants.

Fertilizer Materials.—*Phosphorus.*—The Negev Phosphates Ltd. (NPL) discovered and commenced drill sampling of a large, relatively pure, high-grade phosphate field in the Negev Desert near Beersheba. The Israeli Geological Survey indicated at year-end 1982 that 100 million tons was proven reserves and total reserves approached 200 million tons. This approximate doubling of phosphate reserves was the basis for plans to double capacity and output of phosphate over the next decade to roughly 6 million tons. Preliminary studies have estimated development costs of $250 million, including the construction of a new $30 million enrichment plant.

Owing to the depressed world markets, NPL announced the closure of one of the

smaller one-half-million-ton phosphate plants at Oran. Losses over the past 2 years were estimated at $12 million by ICL. NPL's largest mine, Nahal Zin, was reported to be operating at 65% of capacity during 1981-82, and in combination with the older Arad and nearly depleted Makhtesh Mines, total phosphate output declined slightly. Consequently, sales revenues declined approximately 10% over that of 1981 to $110 million, and the approximate 90% share of exports was maintained.

ICL has strengthened its share of the phosphate market through the 1981 startup of the Mishor Rotem fertilizer plant and the 1982, $5.5 million purchase of a fertilizer plant in the Netherlands. The plant, located in Amsterdam, is expected to utilize approximately 25%, or 500,000 tons, of Israel's annual phosphate production. The Amsterdam plant will ensure annual Israeli phosphate exports valued at approximately $25 million in the near term and increased marketing and distribution of Israeli mineral products in European countries over the longer term.

Potash.—Dead Sea Works (DSW) contracted out the second-stage expansion of the new Makleff 470,000-ton facility to Bateman Engineering Ltd., a subsidiary of Edward L. Bateman Ltd. (Republic of South Africa). The first-phase expansion was completed in early 1982, and the second phase will add another 470,000 tons to its productive capacity at an approximate cost of $75 million. When completed in 1985, DSW's annual potash capacity will total 2.1 million tons.

Sales revenues reached approximately $145 million during 1981-82, with exports accounting for 88% of sales. The major export markets included Asia, Europe, and the United States. Roughly 12% of the potash output was processed domestically by Haifa Chemicals Ltd. and exported as potassium nitrate. Production and sales were expected to increase as the Makleff second-stage expansion comes onstream. Similarly, if ICL finds the Atacama Salt Flats potash reserves to be economically feasible, production capacity could be expanded.

MINERAL FUELS

Coal.—The second generating unit at the Hadera thermal power station reached full generating capacity of 350 megawatts in November 1982. The two operating units provided 35% of Israel's electricity and have the flexibility to be run on either oil or coal. When running on coal, daily savings were estimated at $275,000. Two more generating units were expected to be put into operation during 1984.

Oil.—The Israeli Energy Ministry reported plans to spend $45 million during 1983-84 on oil exploration. Fifteen wells were expected to be drilled, including 2 deep wells in the Sedom area near the Dead Sea and in the southern coastal plain area. Drilling in 1982, at Tzuq Tamrur near Arad, yielded 30 to 100 barrels daily of commercial quality petroleum. Natural gas has already been discovered and exploited in this Zohar region. Additional indications of commercial quantities of natural gas were identified at Ashdod, Nutra, and Shikma, with resources estimated in excess of 1 billion cubic feet.

The Oil Refineries Ltd. Haifa oil installation was undergoing renovation and modernization. Owing to increased reliance on coal-fired electric generation, the refinery is expected to decrease the output of heavy fuel oil. In addition, plans were made to raise the fluid catalytic cracking capacity from 15,000 to 18,500 barrels per day in 1983 and lubricant capacity from 600 to 1,000 barrels per day in 1984.

Oil Shale.—The Israeli Government, in majority 75% to 25% joint venture participation with three private firms, established Energy Resources Development Ltd. (PAMA). The firm was responsible for conducting research and development of oil shale technologies, including direct combustion and retort methods. The new shale oil deposits discovered in the Rotem Plain in the northern Negev region increased the proven reserves to approximately 5 billion tons. The shale beds' average organic content was 14%, although occurrences of 25% have been identified. In comparison, the quality of the shale oil deposits found in Israel was considered similar to European deposits and of a lower quality than U.S. deposits. The U.S. oil shale leased areas production cutoff ranged from 25 to 35 gallons of oil per ton of rock. PAMA was conducting a feasibility study for an integrated shale mining and retort plant with the capacity to produce 20,000 barrels of oil daily. Startup of a pilot shale plant was planned for 1983.

[2]Where necessary, values have been converted from Israeli shekels (I) to U.S. dollars at the rate of I11.43 = US$1.00 for 1981 and I24.27 = US$1.00 for 1982.

The Mineral Industry of Italy

By Roman V. Sondermayer[1]

During 1982, the activities of the mineral sector, including smelting and refining, were adversely affected by world economic stagnation. Losses by most of the Government-owned companies were significant. However, as in the past, Italy remained an important processor and refiner of imported crude mineral commodities.

A new law regulating mining in Italy was approved by the parliament in the fall. In general, the law strengthens involvement of the Government in the mineral industry. It provides that basic exploration for minerals will be carried out at the state's expense by Ente Nazionale Idrocarburi (ENI), while for operational exploration the state will finance 60% of the total cost. In case exploration leads to production, the concessionaire will have to reimburse the state for its contributions, starting after the property has been in production for 3 years. Strategic mines, like the Monte Amiata mercury mine, will be kept operational at the Government's expense. In addition, ENI will also be reimbursed up to 60% of its expenses for exploration abroad.

During 1982, the major events in the mineral industry included discovery of a bauxite deposit in Sardinia, the beginning of construction of the first large copper refinery in Italy, restructuring of the Government-owned steel industry, reopening of Salafossa's lead and zinc mine, closure of a large petroleum refinery, and signing of a contract for deliveries of natural gas from Algeria through pipelines under the sea between Sicily and Tunisia.

PRODUCTION

The mining and processing sectors were owned by public and private enterprises, but the Government controlled most of the sector. ENI and Finsider, the Government-owned steel holding company, were the principal Government organizations involved in production and processing of minerals. Società Mineraria e Metallurgica di Pertusola S.A. (Pertusola), Acciaierie Ferriere Lombarda Falck (Falck), and major foreign oil and gas companies were the most prominent privately owned companies of the sector.

Pig iron, cast iron, related materials	12,074	6,645	117	France 1,496; Netherlands 1,316.
Ferroalloys:				
Ferrochromium	r10,303	8,805	637	West Germany 5,167; France 613.
Ferromanganese	r1,896	672	--	West Germany 441; France 124.
Ferromolybdenum	r1,273	430	--	Netherlands 340; West Germany 20.
Ferronickel	r73	50	--	Austria 25.
Ferrosilicomanganese	r862	8,380	2,017	West Germany 5,190; Portugal 500.
Ferrosilicon	r5,579	6,626	172	West Germany 2,380; France 2,332.
Unspecified	r3,339	4,378	87	West Germany 1,520; Romania 806.
Steel, primary forms	695,302	963,294	87,524	West Germany 98,369; Netherlands 95,342.
Semimanufactures:				
Bars, rods, angles, shapes, sections ---- thousand tons	3,057	2,953	14	West Germany 787; France 622.
Universals, plates, sheets do	1,193	1,625	156	France 315; U.S.S.R. 275; West Germany 182.
Hoop and strip ---- do	106	107	(1)	U.S.S.R. 20; France 19; Brazil 11.
Rails and accessories do	11	18	(1)	Egypt 7; Switzerland 6.
Wire ---- do	80	95	4	France 25; West Germany 12.
Tubes, pipes, fittings do	1,615	2,465	594	U.S.S.R. 499; France 172; Saudi Arabia 154.
Castings and forgings, rough do	27	47	1	Yugoslavia 12; West Germany 8.
Lead:				
Ore and concentrate	21,353	17,319	--	Greece 8,720; Spain 4,188.
Oxides	21	95	NA	NA.
Ash and residue containing lead	7,758	14,026	--	Belgium-Luxembourg 7,892; France 5,709.
Metal including alloys:				
Scrap	21	180	--	West Germany 158; Denmark 21.
Unwrought	4,199	4,436	5	Libya 1,594; Belgium-Luxembourg 1,130.
Semimanufactures	855	1,266	19	Libya 859; Saudi Arabia 185.
Magnesium: Metal including alloys:				
Scrap	554	856	587	France 198; West Germany 40.
Unwrought	4,285	6,832	36	West Germany 5,080; Austria 740.
Semimanufactures	249	351	90	France 140; West Germany 58.

See footnotes at end of table.

Table 2.—Italy: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Manganese:				
Ore and concentrate, metallurgical-grade	203	1,312	NA	NA.
Oxides	124	107	--	West Germany 46.
Metal including alloys, all forms	73	42	NA	NA.
Mercury 76-pound flasks	6,681	1,421	NA	West Germany 812.
Metalloids:				
Arsenic, oxides and acids	94	125	NA	West Germany 40; Belgium-Luxembourg 39.
Selenium kilograms	700	4,000	NA	NA.
Silicon	r7,345	8,044	213	West Germany 3,313; Romania 1,650.
Tellurium[2]	11	53	--	Netherlands 4.
Molybdenum:				
Ore and concentrate	179	209	--	Austria 208.
Metal including alloys, all forms	10	6	NA	NA.
Nickel:				
Matte and speiss	2	24	--	France 22.
Oxides and hydroxides	(1)	15	NA	NA.
Metal including alloys:				
Scrap	271	318	--	West Germany 186; United Kingdom 87.
Unwrought	168	131	--	United Kingdom 52; Netherlands 40.
Semimanufactures	500	631	6	France 96; United Kingdom 88.
Platinum-group metals: Metals including alloys, unwrought and partly wrought, unspecified thousand troy ounces	162	151	2	West Germany 21; Switzerland 16.
Silver:				
Waste and sweepings value, thousands	$98	$124	$65	United Kingdom $56.
Metal including alloys, unwrought and partly wrought thousand troy ounces	7,912	3,697	--	Switzerland 2,460; United Kingdom 273.
Tin:				
Oxides	176	201	--	Spain 66; France 64.
Metal including alloys, scrap	--	121	--	France 43; Netherlands 35.
Titanium:				
Ore and concentrate	96	54	NA	NA.
Oxides	1,867	1,965	--	Republic of Korea 384; Yugoslavia 348.
Metal including alloys, all forms	118	63	--	West Germany 11; Switzerland 5.
Tungsten:				
Ore and concentrate value	$4,212	--		
Metal including alloys, all forms	65	96	--	West Germany 45; Belgium-Luxembourg 15.
Uranium and/or thorium:				
Oxides and other compounds value	$42,253	$1,759	NA	NA.
Metal including alloys, all forms, uranium	--	1	NA	NA.
Vanadium:				
Oxides and hydroxides	--	9	NA	NA.
Metal including alloys, all forms value	$6,146	[3]3	NA	NA.
Zinc:				
Ore and concentrate	2,908	582	--	Austria 502; Portugal 17.
Oxides	4,756	3,069	--	West Germany 1,048; France 1,045.
Blue powder	114	826	--	France 361; West Germany 343.
Matte	r35	5,274	--	Belgium-Luxembourg 4,600; West Germany 516.
Ash and residue containing zinc	r6,978	8,223	--	Mainly to West Germany.
Metal including alloys:				
Scrap	2,138	3,432	--	West Germany 2,614; Belgium-Luxembourg 515.
Unwrought	20,340	20,569	7,999	France 4,739; Switzerland 2,474.
Semimanufactures	2,016	4,362	--	France 1,281; Portugal 244.
Zirconium:				
Ore and concentrate	487	2,925	--	Hungary 2,535.
Metal including alloys, all forms	(1)	80	NA	France 49.
Other:				
Ores and concentrates	2,746	10,852	--	France 9,889; West Germany 83.
Oxides and hydroxides	664	1,907	NA	NA.
Ashes and residues	18,201	10,438	--	France 5,151; West Germany 3,589.
Cermets	--	5	NA	NA.
Base metals including alloys, all forms	13	(1)	NA	NA.

See footnotes at end of table.

Table 2.—Italy: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	220,100	112,653	--	Algeria 52,487; United Kingdom 37,188.
Artificial: Corundum	2,197	1,410	--	Bulgaria 532; Poland 244.
Dust and powder of precious and semiprecious stones excluding diamond kilograms	92	56	NA	Switzerland 14.
Grinding and polishing wheels and stones	17,667	23,537	379	France 3,551; Saudi Arabia 2,090; West Germany 1,833.
Asbestos, crude	63,815	51,245	--	West Germany 20,420; Japan 5,685.
Barite and witherite	105,358	67,135	--	Egypt 19,427; Netherlands 13,689.
Boron materials:				
Crude natural borates	3,650	7,332	1,752	Czechoslovakia 3,664; Yugoslavia 1,122.
Oxides and acids	5,042	4,048	--	West Germany 1,846; France 750.
Cement thousand tons	821	623	(1)	Libya 170; Nigeria 99; Switzerland 92.
Chalk	554	667	NA	NA.
Clays and clay products:				
Crude:				
Andalusite, kyanite, sillimanite	--	177	NA	NA.
Bentonite	18,967	36,297	--	Norway 18,860; France 7,448.
Chamotte earth	--	3,500	--	Tunisia 3,100.
Dinas earth	--	27	NA	NA.
Kaolin	30,008	20,564	NA	France 17,207.
Unspecified	7,295	4,555	--	France 964; United Kingdom 356.
Products:				
Nonrefractory thousand tons	2,720	2,539	164	West Germany 561; France 454.
Refractory including nonclay brick	133,062	128,556	231	Brazil 29,721; West Germany 13,961.
Cryolite and chiolite	28	25	NA	NA.
Diamond:				
Gem, not set or strung carats	75,586	214,915	4,879	NA.
Industrial do	142,402	232,358	NA	Yugoslavia 217,599.
Diatomite and other infusorial earth	885	1,627	NA	Switzerland 307; Yugoslavia 244.
Feldspar, fluorspar, related materials:				
Feldspar	r37,035	34,501	--	West Germany 15,257; Switzerland 7,553.
Fluorspar	83,753	84,634	29,467	West Germany 21,050; Canada 7,700.
Unspecified	309	2,928	--	Greece 2,836.
Fertilizer materials:				
Crude, n.e.s	r9,987	15,735	--	France 9,830; Austria 1,625.
Manufactured:				
Ammonia	53,160	39,205	--	Israel 30,611; Turkey 3,009.
Nitrogenous thousand tons	1,320	1,014	--	India 319; Greece 87; Egypt 85.
Phosphatic do	2	21	--	Libya 5; Switzerland 2.
Potassic do	72	41	--	Algeria 22; Japan 10.
Unspecified and mixed do	282	369	--	West Germany 56; Nigeria 55.
Graphite, natural	3,414	1,649	--	France 667; West Germany 448.
Gypsum and plaster	13,003	13,800	--	Switzerland 9,861.
Lime	33,639	47,505	--	Switzerland 29,397; France 12,166.
Magnesium compounds: Magnesite	120,812	90,325	90	Austria 21,370; Republic of South Africa 17,620; Netherlands 17,450.
Mica:				
Crude including splittings and waste	1,127	747	NA	NA.
Worked including agglomerated splittings	142	53	NA	NA.
Phosphates, crude	81	213	--	Saudi Arabia 80; Czechoslovakia 62.
Pigments, mineral: Iron oxides and hydroxides, processed	2,901	2,603	--	France 1,082; West Germany 217.
Precious and semiprecious stones other than diamond:				
Natural kilograms	17,732	32,547	NA	West Germany 18,820; Kuwait 5,000.
Synthetic	2,778	14,423	NA	NA.
Pyrite, unroasted	3,797	30,355	--	United Kingdom 12,891; Turkey 8,854.
Salt and brine thousand tons	740	394	33	Sweden 78; Greece 65; United Kingdom 59.

See footnotes at end of table.

Table 2.—Italy: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	17	46,405	--	Turkey 30,212; U.S.S.R. 7,680.
Sodium carbonate, natural and manufactured	14,605	16,506	40	Israel 9,970; Algeria 4,096; Greece 2,277.
Sodium hydroxide	265,212	133,882	3,000	U.S.S.R. 31,785; Turkey 12,106; Yugoslavia 11,277.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	539,083	503,273	12,630	Saudi Arabia 66,228; West Germany 61,622.
Worked thousand tons	1,299	1,217	102	West Germany 408; Saudi Arabia 230; Switzerland 67.
Dolomite, chiefly refractory-grade	58,555	33,466	--	Switzerland 20,416; France 2,964.
Gravel and crushed rock	660,670	648,204	708	Kuwait 115,042; Switzerland 109,528.
Limestone other than dimension	7,336	497	--	Switzerland 395; Israel 36.
Quartz and quartzite	44,779	35,725	--	Switzerland 18,110; France 10,882.
Sand other than metal-bearing	253,140	25,936	NA	Switzerland 17,069; Yugoslavia 2,906.
Sulfur:				
Elemental:				
Crude including native and by-product	r3,817	3,094	--	Yugoslavia 942; France 912; West Germany 835.
Colloidal, precipitated, sublimed	r48	195	NA	NA.
Sulfuric acid	81,931	71,261	--	Republic of South Africa 44,331; Turkey 10,881.
Talc, steatite, soapstone, pyrophyllite	54,015	52,180	11,660	France 11,151; West Germany 10,065.
Other:				
Crude	82,329	42,822	--	United Kingdom 23,538; U.S.S.R. 3,000.
Slag and dross, not metal-bearing	378,133	577,604	--	Greece 359,454; Yugoslavia 161,517.
Oxides and hydroxides of barium, magnesium, strontium	1,887	1,945	396	Japan 366; United Kingdom 317.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	167,438	113,832	3,920	France 48,867; Libya 11,629.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	3,336	3,541	--	Nigeria 2,000; Somalia 907.
Carbon:				
Carbon black	r43,028	44,069	--	Yugoslavia 21,327; Austria 7,009; France 6,143.
Gas carbon	NA	NA		
Coal:				
Anthracite	18,890	19,777	--	France 8,761; Austria 4,891.
Briquets of anthracite and bituminous coal	--	21	--	NA.
Lignite including briquets	--	29	--	All to Austria.
Coke and semicoke	746,530	642,038	--	Romania 358,800; Austria 70,186.
Gas, natural thousand cubic feet	1,373	1,874	NA	NA.
Peat including briquets and litter	277	447	--	Switzerland 206; Romania 70.
Petroleum refinery products:				
Liquefied petroleum gas thousand 42-gallon barrels	3,075	2,041	106	France 584; Egypt 278; Greece 149.
Gasoline, motor do	36,891	35,710	4,084	France 6,268; Netherlands 5,759.
Mineral jelly and wax do	17	48	1	West Germany 12; France 2.
Kerosine and jet fuel do	18,880	16,492	(1)	United Kingdom 2,160; Greece 995.
Distillate fuel oil do	24,056	31,020	174	Libya 5,611; Saudi Arabia 3,938; Egypt 2,039.
Lubricants do	4,331	3,488	236	Belgium-Luxembourg 284; Algeria 262; U.S.S.R. 212.
Residual fuel oil do	28,481	28,004	544	Netherlands 3,755; Algeria 1,783; Malta 1,495.
Bitumen and other residues do	987	1,006	(1)	Austria 480; Switzerland 190; Lebanon 111.
Bituminous mixtures do	51	39	(1)	Netherlands 12; Libya 7; Somalia 4.
Petroleum coke do	132	66	--	Yugoslavia 53.
Tars and other crude chemicals derived from coal, gas, and petroleum	72,122	125,637	2	France 44,526; Yugoslavia 24,450.

rRevised. NA Not available.
[1]Less than 1/2 unit.
[2]Includes arsenic.
[3]Metric tons.

Table 3.—Italy: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals:				
Alkaline-earth metals	5,520	4,728	25	West Germany 3,621; France 781.
Rare-earth metals	138	371	--	Austria 263.
Unspecified value, thousands	$908	$833	--	France $560; Austria $255.
Aluminum:				
Ore and concentrate thousand tons	2,288	1,709	--	Australia 1,162; Guinea 366.
Oxides and hydroxides	180,187	169,811	--	West Germany 1,331; Netherlands 1,124.
Ash and residue containing aluminum	59,147	65,986	--	Austria 47,134; West Germany 3,337.
Metal including alloys:				
Scrap	79,093	56,610	1,405	West Germany 18,131; Switzerland 12,211.
Unwrought	339,185	208,829	1,557	France 51,242; West Germany 47,187.
Semimanufactures	112,642	83,018	6,193	West Germany 35,890; France 21,444.
Antimony:				
Ore and concentrate	3	5	NA	NA.
Metal including alloys, all forms	106	81	NA	NA.
Beryllium: Metal including alloys, all forms kilograms	7,800	--		
Bismuth: Metal including alloys, all forms	62	35	--	United Kingdom 12.
Cadmium: Metal including alloys, all forms	68	85	--	Finland 50; West Germany 27.
Chromium:				
Ore and concentrate	171,045	91,806	--	Republic of South Africa 37,278; Turkey 24,927.
Oxides and hydroxides	1,941	1,840	--	West Germany 1,559; U.S.S.R. 150.
Metal including alloys, all forms	186	175	--	United Kingdom 83; France 48.
Cobalt:				
Oxides and hydroxides	192	190	--	Belgium-Luxembourg 53; United Kingdom 61.
Metal including alloys, all forms	258	209	3	France 66; Belgium-Luxembourg 54; United Kingdom 35.
Columbium and tantalum: Metal including alloys, all forms:				
Columbium (niobium)	1	1	1	
Tantalum	11	7	1	NA.
Copper:				
Ore and concentrate	10,479	11	--	All from Belgium-Luxembourg.
Matte and speiss including cement copper	51	177	--	Austria 150; Belgium-Luxembourg 24.
Sulfate	2,205	8,773	--	Yugoslavia 7,278; Czechoslovakia 772.
Ash and residue containing copper	4,599	6,985	--	Austria 6,365.
Metal including alloys:				
Scrap	99,524	59,336	798	France 19,329; West Germany 15,910.
Unwrought	396,329	329,332	7,601	Spain 19,747; Yugoslavia 10,625.
Semimanufactures	144,188	104,890	679	France 37,116; West Germany 28,602.
Gallium: Metal including alloys, all forms kilograms	1,400	1,400	--	United Kingdom 6; Belgium-Luxembourg 5.
Germanium: Metal including alloys, all forms do	1,200	300	--	Belgium-Luxembourg 200.
Iron and steel:				
Iron ore and concentrate:				
Excluding roasted pyrite thousand tons	16,912	15,196	(1)	Brazil 4,684; Liberia 3,224; Mauritania 1,724.
Pyrite, roasted	762	14,458	--	Mauritania 14,400.
Metal:				
Scrap thousand tons	7,411	5,540	34	West Germany 2,344; France 2,169.
Pig iron, cast iron, related materials do	749	640	(1)	France 158; West Germany 126.

See footnotes at end of table.

Ferroalloys:				
Ferrochromium, thousand tons	87	73	--	Zimbabwe 23; Switzerland 22; Republic of South Africa 11.
Ferromanganese, do	120	100	--	France 54; Republic of South Africa 16.
Ferromolybdenum, do	r1	1	--	NA.
Ferronickel, do	r18	12	(1)	France 7; Dominica 2.
Ferrosilicochromium, do	r4	2	--	Mainly from France.
Ferrosilicomanganese, do	r36	29	--	Norway 16; Republic of South Africa 6.
Ferrosilicon, do	r53	55	--	France 14; Yugoslavia 12.
Unspecified, do	r11	7	--	France 2; Brazil 1; West Germany 1.
Steel, primary forms, do	3,355	2,330	17	France 799; Belgium-Luxembourg 435.
Semimanufactures:				
Bars, rods, angles, shapes, sections, do	960	778	1	France 299; West Germany 164.
Universals, plates, sheets, do	2,087	1,345	37	France 424; West Germany 238.
Hoop and strip, do	199	140	1	West Germany 53; France 51.
Rails and accessories, do	149	78	(1)	Netherlands 20; West Germany 17.
Wire, do	79	57	(1)	Belgium-Luxembourg 24; Austria 7.
Tubes, pipes, fittings, do	335	226	3	West Germany 76; France 75.
Castings and forgings, rough, do	9	9	(1)	West Germany 2; Belgium-Luxembourg 1; France 1.
Lead:				
Ore and concentrate	44,264	24,373	--	Canada 8,259; Greece 5,694.
Oxides	4,514	5,254	--	Netherlands 2,466; West Germany 2,380.
Ash and residue containing lead	2,149	893	--	Hungary 480; West Germany 181.
Metal including alloys:				
Scrap	44,139	15,267	--	France 5,286; Switzerland 3,521.
Unwrought	173,235	132,783	--	West Germany 38,286.
Semimanufactures	1,468	1,458	--	Yugoslavia 638; West Germany 345.
Magnesium: Metal including alloys:				
Scrap	2,558	1,758	--	West Germany 863; Netherlands 219; Austria 205.
Unwrought	1,880	638	72	Norway 297; France 126.
Semimanufactures	309	178	118	United Kingdom 19.
Manganese:				
Ore and concentrate	409,846	354,225	--	Republic of South Africa 147,011; Gabon 107,886.
Oxides	3,082	902	--	Belgium-Luxembourg 564; Netherlands 120.
Metal including alloys, all forms	1,397	1,711	38	France 949; Republic of South Africa 512.
Mercury, 76-pound flasks	5,120	2,350	--	Netherlands 783; China 493.
Metalloids:				
Arsenic, oxides and acids	852	750	--	Belgium-Luxembourg 362; France 295.
Selenium	26	25	--	United Kingdom 11; Japan 7.
Silicon	r8,706	5,771	--	France 1,732; Switzerland 1,501.
Tellurium[2]	57	65	4	Switzerland 32.
Unspecified	14	51	NA	NA.
Molybdenum:				
Ore and concentrate	6,039	4,522	566	Netherlands 3,031; Chile 354.
Metal including alloys, all forms	163	120	42	Austria 34; Netherlands 26.
Nickel:

2Includes arsenic.

COMMODITY REVIEW

METALS

Aluminum.—According to reports from the Ente Mineraria Sarda (EMSA), discovery of a bauxite deposit was made at Almedo, about 20 kilometers from Sassari, Sardinia, on the Monte Rosso Mountain. Total reserves were reported at 70 million tons. The grade of bauxite was not mentioned except to say that 20 million tons have the same characteristics as Australian bauxite. The deposit is near the surface, and the ore is soft. Authorities expect costs not to exceed $20 per ton of bauxite produced.[2] Production was planned for 1984 and when normal production is achieved Italy should be self-sufficient in bauxite, which would save approximately $100 million per year in imports.

During 1982, the Government of Italy approved financial aid to the aluminum industry totaling $160 million. In addition, a long-term plan for restructuring the industry was examined.

Copper.—The first large 45,000-ton-per-year copper refinery will be built in Italy. The Government approved a plan by Societá per Azioni Minero-Metallurgiche (SAMIM) to build a $37 million copper refinery at Porto Marghera, near Venice. The site was chosen to include some of the facilities of the zinc plant closed recently. Employment should reach 200 persons when the plant becomes fully operational.

Iron and Steel.—Financial difficulties persisted in the Government-owned sector of the steel industry; the private segment of the industry was also affected by world recession. Implementation of the Government's 1981 steel plan by Finsider started during 1982. Finsider closed the Bagnoli steel plant near Naples as part of the plan, but later was induced to rescind the closing and make arrangements for modernization of the plant. In the two Teksid Aciai S.p.A. plants, Corso Mortara 7 Works and the Avigliana Works, both near Turin, various facilities were closed. The effect of closures will be to lower steelmaking capacity from 1.1 million to 580,000 tons per year, hot-strip mill capacity by 375,000 tons per year, hot-rolled sheet mill capacity by 50,000 tons per year, cold-reduced strip mill capacity by 110,000 tons per year, and roughing mill hourly capacity from 125 to 65 tons.

The privately owned Bresciani plants were making efforts to alleviate the difficult economic situation in the steel sector. These producers, located generally in northern Italy, began modifying their rolling mill practices and electric-furnace operations. In the effort to economize, computers were being installed to save energy and were used in stock management, deliveries, and in administrative and accounting procedures. A strong movement was begun by the leading Brescianis to consolidate the Italian private sector. The aim was to create a union that could better resist pressures from the Government and from the European Economic Community.

Lead and Zinc.—During 1982, the bulk of mine production of lead and zinc came from mines operated by SAMIM, a subsidiary of the Government-owned ENI, and Pertusola.

In the vicinity of the Masaua Mine in Sardinia, owned by SAMIM, exploration on the Marx and Nebida deposits confirmed important reserves of lead-zinc ores. Development of the San Giovanni Mine continued. Sinking of a shaft was completed and construction of a centrally located flotation

plant was underway.

At the Funtana Raminosa copper-lead-zinc mine in Sardinia, also owned by SAMIM, a test run of all mine facilities was completed and regular production started. At Fenice Campane, development of a mine and construction of a flotation plant was near completion and production of ore and lead and zinc concentrates was scheduled to start in 1983. At the Rajbl Mine, mining is by open pit. However, the Rajbl deposit extends to depth, and development of an underground mine was underway during 1982. Output from the underground mine should eventually replace production of about 300,000 tons of ore per year from the opencast mine.

The Salafossa Mine, operated by Pertusola, became operational again in 1982. The mine had been closed in 1980 after a ground slide damaged the flotation plant.

Mercury.—The Monte Amiata Mines stopped production of mercury again in September because of low demand.

NONMETALS

Asbestos.—The Balangero Mine, owned by Amiantifera Balangero S.p.A., had difficulty in selling its product. At yearend, about 20,000 tons of fiber remained unsold at the processing plant. At the mine, mining was limited to the lower levels, and the movable crusher was transferred from level 580 to level 654.

Potash.—At the Milena Mine in Sicily, a 1,325-meter-long incline was completed. To assure proper ventilation the new incline is connected to the surface with two ventilation shafts. At the Realmonte Mine, drifting continued on the two levels into a richer formation, containing more than 15.5% K_2O. In addition, a new crushing installation was completed underground. Preparations to replace trucks with a conveyor belt for transporting ore to the surface were in an advanced stage at yearend.

Pyrite.—At the Bochegiano Mine, development continued. Ventilation equipment was installed, a skip for moving ores and personnel was operational at yearend, and air-conditioning equipment was installed in the hottest areas of the mine. On the surface all components needed for producing cement fill were completed.

To ensure a uniform grade of pyrite delivered to SAMIM's Casone sulfuric acid plant, a new facility for upgrading the sulfur content of pyrite was commissioned.

Talc.—At the Fontane Mine, Piedmont, owned by Talco Graphite Valchisone S.p.A., a mining method using cement fill was introduced after several years of trial.

MINERAL FUELS

Italy remained largely dependent on imports of fuels to meet its energy demand, although domestic output of lignite and natural gas was of some importance to the country's economy.

Natural Gas and Petroleum.—After long negotiations, agreement was concluded on deliveries of natural gas from Algeria to Italy through underwater pipelines between Tunisia and Sicily. Some reports indicated a price of $4.41 per million British thermal units.

Montedison S.p.A. confirmed an oil discovery in Sicilian waters. The Wega-3 well, located 23 kilometers off the Ragusa coast in southern Sicily, tested at the rate of 10,000 barrels per day of crude oil. The well is at a depth of water of 125 meters and is 2,360 meters deep. The oil formation is of Jurassic age, and of 15.5 API degrees with 2.5% sulfur. Reportedly, reserves total 10 million tons of crude oil.

During 1982, a total of 376,000 meters of holes was drilled; seismic profiles were 17,200 kilometers long onshore and 6,200 meters offshore.

In the spring, Sarnim S.p.A. (75% Gulf and 25% Mobil) announced the closure of the 100,000-barrel-per-day refinery at Retanico near Milan because of serious economic difficulties.

The Mineral Industry of Japan

By John C. Wu[1]

The overall state of the 1982 Japanese economy was characterized by a 3% growth in real gross national product (GNP), a 1.6% increase in labor productivity, a 2.4% unemployment rate, a 2.7% inflation rate, and a $6.9 billion merchandise trade surplus.

Unlike the 1981 growth in GNP, which was boosted by the strength of exports, the 1982 growth in GNP was supported by strong domestic private demand. According to the Economic Planning Agency, Japan's GNP in 1975 constant dollars was estimated at $814.8 billion,[2] and the GNP in current dollars was estimated at $1,060 billion for the year. The 3% growth in GNP was less than the 5.2% anticipated by the Government; nevertheless, the performance was better than the 1.8% growth in GNP for the United States, 1.2% for the Federal Republic of Germany, 0.6% for the United Kingdom, and 1.4% for France, as reported by the International Monetary Fund.[3]

The small increase in labor productivity was due to the modest increase in the output of the manufacturing industry, which was attributed to a substantial increase in production by the electric machinery industry. However, this increase was offset by the lower level of production in steel and stagnant production in the transportation and precision machinery sectors. Because of the lower level of production in major industries, the unemployment rate rose. According to the Labor Ministry, the ratio of job offers to job seekers fell from 0.68 in 1981 to 0.61 in 1982. Japan's total labor force was 57.74 million, of which 1.36 million were unemployed in 1982. Employment in Japan's basic industries, including iron and steel, aluminum, and construction, suffered most of the cutback.

The modest increase in consumer prices reflected a stable price of fresh foods and durable goods. The lower level of foreign trade reflected a reduction in exports owing to a substantial decline in exports of machinery and transport equipment and a reduction in imports because of a significant drop in imports of crude oil and petroleum products.

Although the overall performance of the Japanese economy was impressive when compared with that of other advanced industrial nations in 1982, the Japanese basic-material industries continued to face the problems of high energy costs, stagnant domestic demand, and increased foreign competition. Scaling down output capacity, cutting back employment, and shifting the energy source away from oil remained the major means of coping by the basic-material industries. The involved basic-material industries included aluminum, iron and steel, fertilizer materials, cement manufacturing, petroleum refining, and petrochemical industries.

Following the recommendation of the Ministry of International Trade and Industry (MITI) for the so-called structurally depressed industries, Japan's aluminum smelting capacity was reduced to 740,000 tons per year with one smelter going out of business and reorganization in several aluminum companies. A further cut in output capacity by 510,000 tons per year of ammonia, 800,000 tons per year of urea, 700,000 barrels per day of oil refining, 2 million tons per year of ethylene, and 49,000 tons per year of vinyl chloride became inevitable.

Although Japan's iron and steel industry has made progress in energy savings and productivity increases, the industry remained depressed because of the weak domestic demand and increased competition from the Republic of Korea and Taiwan. For the first time in a decade, Japan's crude steel output was under 100 million tons. More than 20 older and smaller blast furnaces for the production of pig iron were shut down, and crude steel output was at 60% installed

capacity. As a result, more than 7,000 production workers were separated from the industry. The situation in Japan's ferroalloys industry was even more severe because of higher production costs and increased imports of low-priced ferroalloys from the Republic of South Africa, Brazil, Norway, and China.

Japan's cement output was down to 80 million tons for the first time since 1977 because of the reduced domestic demand. However, the industry has completed its conversion of energy source from oil to coal and has added several new suspension preheater kilns.

The activities of nonferrous and minor metals sectors remained stagnant, reflecting weak demand in domestic and world markets with a significant cutback in titanium sponge and cobalt metal production. However, a number of important discoveries of gold, lead, and zinc were made in Japan during 1982.

Japan's mining industry continued to decline in terms of number of employees and number of mines in metal mining and nonmetal mining operations. According to MITI, the number of employees in metal mining operations was reduced from 12,511 in 1979 to 10,499 in 1982, while the number in nonmetal mining operations was reduced from 18,968 in 1979 to 17,869 in 1982. The number of mines in metal mining operations was reduced from 79 in 1979 to 72 in 1982, while the number in nonmetal mining operations was reduced from 730 in 1979 to 700 in 1982.

The output of Japan's mining operations was sufficient only in some nonmetallic minerals such as limestone, dolomite potter stone, silica sand and stone, fire clay, and pyrophyllite. Other nonmetallic minerals and most metallic minerals were heavily dependent on imports. Japan's import dependency of selected minerals and metals was estimated for the year as follows: 100% for antimony, bauxite, cobalt, columbium, fluorspar, graphite, mica, nickel, phosphate rock, potash, strontium, tantalum, and titanium ore; 90% to 99% for asbestos, copper, chromium, gold, iron ore, manganese, molybdenum, platinum-group metals, and tin; 86% for salt; 78% for vanadium; 73% for lead; 68% for silver and tungsten; and for mineral fuels, 99.8% for crude oil and 83% for coal.

To secure short-term supplies of metals vital to Japan's machinery and electronic industries, the actual purchasing of five metals for a 10-day stockpiling program was carried out by the Special Metal Stockpiling Association in December. Of the $46.2 million (Y11.5 billion) budgeted, a total of $30 million was spent in purchasing cobalt, chromium, molybdenum, nickel, and tungsten. About $18.4 million was spent in purchasing nickel from New Caledonia, Indonesia, and the Philippines for 1,148 tons of nickel metal, 1,620 tons of nickel in ferronickel, and 175 tons of nickel in nickel oxide sinter. About $9 million was spent in purchasing chromium from the Republic of South Africa and the Philippines for 14,551 tons of chromium in ferrochromium grading 25% Cr. About $651,000 was spent in purchasing cobalt from Australia and the Philippines for 50 tons of cobalt metal. In addition, about $2.2 million was scheduled to be spent in purchasing 47 tons of tungsten in concentrate from the Republic of Korea and 395 tons of molybdenum in concentrate from Chile by the end of fiscal year 1982.[4]

In November, a 2-day symposium on rare metals sponsored by MITI with delegates from the United States and Japan was held in Tokyo. The symposium resulted in an understanding by both sides for opening of mutual contacts, exchanging data, and possible cooperation in technology and development of resources. According to Japanese sources, a cooperative arrangement was reached between the two countries for establishing a system to supply mineral resources in case of export stoppage by rare metal producers, for Japanese cooperation in developing U.S. mineral resources by providing development funds, and for establishment of an information exchange system concerning national stockpiling of rare metals.[5] Both sides also agreed to hold a second symposium in the United States in 1983.

To further secure supplies of rare metals, MITI planned to expand its exploration and development projects overseas.

PRODUCTION

Production activity of Japanese mining and mineral processing sectors continued the 1981 downward trend and reached the lowest level of output in August 1982. Mining of the metallic minerals was affected by high production cost and low grade ore,

while nonmetallic mining was affected by reduced domestic demand. The deepening of the worldwide economic recession and the lower growth in the Japanese economy forced many industries of the mineral processing sector to cut back production and capacity.

Most of the metal and nonmetal mine production decreased. However, domestic mine production of minerals remained small compared to Japan's raw material requirements of the mineral processing sector.

Japan's aluminum production was cut back further to less than one-half of the 1981 output, while the output of crude steel continued the 3-year downward trend to under 100 million tons. Metal production of copper, gold, and silver increased slightly, while that of lead, zinc, nickel, and magnesium declined slightly. Metal production of titanium and cobalt was cut back substantially. The output of cement and fertilizer materials also declined substantially because of the reduced demand in domestic and export markets.

Japan's production of mineral fuels remained insignificant. The domestic production of coal, oil, and natural gas accounted for 18%, 0.2%, and 0.6%, respectively, of Japan's primary energy supply. Because of the reduced demand for refined petroleum products, Japan's petroleum refining capacity was scaled down further to about 5 million barrels per day of oil.

Despite the low-level activity of the mineral industry, Japan remained the world's second largest producer of crude steel, a leading producer of cement and chemical fertilizer materials, and a major producer of refined copper, refined lead and zinc, titanium sponge, refined petroleum products as well as petrochemical products.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Includes data available through Aug. 1, 1983.

[2]For reasons not evident in sources, these figures are reported as negative numbers. (See also footnote 3.)

[3]Sum of listed detail as reported, but adding quantity bearing footnote 2 as positive numbers. Japanese sources provide the following totals for ferroalloy output in the years indicated: 1978—1,512,791; 1979—1,900,974; 1980—1,866,423; 1981—1,638,955; and 1982—1,548,653. These totals represent the sum of listed detail using the quantities bearing footnote 2 as negative numbers, thereby not only omitting the footnoted numbers, but actually subtracting them from the sum of all other alloys. The reason for this procedure in source publications is not explained.

[4]Includes coking coal and steam coal.

[5]Includes output from gas mines and coal mines.

[6]May include some additional unfinished oils.

TRADE

Japan's total value of two-way merchandise trade dropped 8.3% to $270.8 billion, with reduction in values of both exports and imports reflecting the depressed world market. As a result, merchandise trade surplus fell to $6.9 billion. However, Japan's merchandise trade balance was ranked the best in the world's trade community.

Export earnings fell to $138.8 billion with a significant reduction in exports of machinery, transport equipment, and other manufactured goods. Exports of motor vehicles dropped to $24.6 billion, nonelectric machinery dropped to $20.3 billion, and electric machinery dropped to $19.7 billion. Exports of iron and steel fell to $15.6 billion; nonferrous metals and metal manufactures fell to $5.6 billion; scientific, medical, and optical instruments fell to $4.8 billion; stereo equipment and audio and video tape recorders and players declined to $6.2 billion; and chemicals declined to $6.4 billion.

Total imports also fell 7.9% to $131.9 billion with reduced imports in all categories except chemicals, which rose 5.2% to $6.8 billion. Imports of mineral fuels dropped 9.6% to $65.6 billion with a 4.7% increase in coal to $5.8 billion, a 12.4% drop in crude oil and petroleum products to $51.4 billion, and a slight increase in liquefied natural and petroleum gas to $8.4 billion. Imports of metal ore, concentrate, and scrap materials fell 7.2% to $6.8 billion, of which iron ore and concentrate was $3.6 billion; copper ore and concentrate, $1.4 billion; and other nonferrous ore, concentrate, and scrap, $1.4 billion. Other principal imports were logs and lumber, $4.5 billion; grains and cereal products, $4.0 billion; fish and fish products, $3.9 billion; nonferrous metals, $3.9 billion; and nonelectric machinery, $3.8 billion.

The United States remained the major trade partner of Japan. In 1982, Japanese exports to the United States dropped 5.9% to $36.3 billion, while imports from the United States also dropped 4.4% to $24.2 billion. Other major trade partners, based on the value of two-way trade, were Saudi Arabia, $27.1 billion; Indonesia, $16.3 billion; Australia, $11.5 billion; United Arab Emirates, $9.5 billion; China, $8.9 billion; and the Republic of Korea, $8.1 billion.

Table 2.—Japan: Exports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals	832	902	358	Taiwan 439.
Aluminum:				
Ore and concentrate	--	40	--	All to Republic of Korea.
Oxides and hydroxides	398,544	412,100	1,091	Canada 188,338; Egypt 121,595; Republic of Korea 61,353.
Metal including alloys:				
Scrap	858	453	15	Republic of Korea 215; Taiwan 208.
Unwrought	7,644	12,160	4	Australia 7,780; Republic of Korea 3,175.
Semimanufactures	73,567	114,326	44,199	China 13,618; Indonesia 11,256; Republic of Korea 6,472.
Antimony: Metal including alloys, all forms	30	15	(2)	Mainly to Indonesia.
Beryllium: Metal including alloys, all forms kilograms	5	1	--	Mainly to United Kingdom.
Bismuth: Metal including alloys, all forms	242	253	49	U.S.S.R. 80; West Germany 33; Poland 29.
Cadmium: Metal including alloys, all forms	229	14	1	United Kingdom 6; Saudi Arabia 3.
Chromium:				
Ore and concentrate	5,678	607	--	Republic of Korea 545; Singapore 38.
Oxides and hydroxides	3,368	2,268	471	Republic of Korea 735; Taiwan 576; North Korea 150.
Cobalt: Oxides and hydroxides	85	13	--	Taiwan 4; Republic of Korea 2; Netherlands 2; Vietnam 2.
Columbium and tantalum: Metal including alloys, all forms, tantalum	40	26	11	West Germany 10; Netherlands 3.
Copper:				
Sulfate	254	340	--	Taiwan 274; Indonesia 42.
Metal including alloys:				
Scrap	206,255	38,434	4,918	Taiwan 14,143; Indonesia 8,529; Republic of Korea 4,405.
Unwrought	10,662	4,873	2,035	Republic of Korea 2,291; Taiwan 402.
Semimanufactures	192,441	190,068	34,251	Taiwan 27,985; Hong Kong 26,064; Singapore 18,386.
Iron and steel:				
Iron ore and concentrate:				
Excluding roasted pyrite	99	53	--	Republic of Korea 40.
Pyrite, roasted value	--	$554	--	All to Republic of Korea.
Metal:				
Scrap	159,366	186,783	10,331	Republic of Korea 94,446; Taiwan 29,517; Hong Kong 19,820.
Pig iron, cast iron, related materials	14,571	11,896	2,095	Taiwan 1,973; Republic of Korea 1,468; Australia 1,441.
Ferroalloys:				
Ferromanganese	40,271	34,866	7,000	North Korea 16,549; Republic of Korea 4,480; Malaysia 2,708.
Unspecified	30,268	28,971	15,503	Netherlands 5,488; North Korea 2,069; Republic of Korea 1,391.
Steel, primary forms thousand tons	3,950	2,854	451	Republic of Korea 722; Taiwan 358; China 157.
Semimanufactures:				
Bars, rods, angles, shapes, sections do	7,595	6,808	1,111	Saudi Arabia 1,099; Republic of Korea 539; Hong Kong 421.
Universals, plates, sheets:				
Universals, plates and sheets do	7,492	7,099	606	China 1,131; Taiwan 636; Indonesia 556.
Tinned plates and sheets do	890	746	150	China 132; Singapore 66; Philippines 54.
Other coated plates and sheets do	2,118	2,102	785	Nigeria 115; Saudi Arabia 114; China 87.
Hoop and strip do	692	596	62	China 102; Indonesia 60; Taiwan 42.
Rails and accessories do	144	144	73	Brazil 17; Republic of Korea 9; Iran 6.
Wire do	291	275	104	Saudi Arabia 11; Hong Kong 10; Iraq 8.
Tubes, pipes, fittings do	6,578	6,201	2,565	U.S.S.R. 1,262; Saudi Arabia 414.
Castings and forgings, rough do	26	34	18	Singapore 3.
Lead:				
Ore and concentrate	6,139	7,810	--	U.S.S.R. 5,787; North Korea 2,023.

See footnotes at end of table.

Table 2.—Japan: Exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Lead —Continued				
Oxides	51	108	--	Singapore 58; Republic of Korea 28; Philippines 7.
Metal including alloys, all forms	10,506	4,184	3	Taiwan 2,003; Republic of Korea 1,032.
Magnesium: Metal including alloys, all forms	97	72	--	Republic of Korea 31; Indonesia 13; Taiwan 13.
Manganese:				
Ore and concentrate	1,855	991	--	Republic of Korea 486; Pakistan 375.
Oxides	22,944	27,540	12,077	Indonesia 3,422; Tanzania 1,353; U.S.S.R. 1,261.
Mercury 76-pound flasks	9,340	6,917	2,604	Netherlands 2,319; Republic of Korea 623.
Metelloids:				
Phosphorus	105	59	(2)	Taiwan 18; North Korea 10; Thailand 10; Vietnam 10.
Selenium	342	247	33	Netherlands 71; India 41; United Kingdom 25.
Molybdenum: Metal including alloys, all forms	37	54	(2)	U.S.S.R. 24; Hungary 18.
Nickel:				
Ore and concentrate	--	3,600	--	All to Sweden.
Metal including alloys, all forms	2,031	1,804	603	Taiwan 216; North Korea 213; Republic of Korea 192.
Platinum-group metals: Metals including alloys, unwrought and partly wrought thousand troy ounces	189	178	(2)	Taiwan 129; United Kingdom 20.
Silver:				
Waste and sweepings value, thousands	r$2,218	$9	--	All to Switzerland.
Metal including alloys, unwrought and partly wrought thousand troy ounces	7,084	4,981	256	United Kingdom 2,806; Taiwan 554; Republic of Korea 455.
Tin:				
Oxides	49	24	1	China 15.
Metal including alloys, all forms	1,262	439	--	Taiwan 131; Republic of Korea 110; Hong Kong 40.
Titanium:				
Oxides	16,768	16,353	2,676	Taiwan 3,991; China 3,871; Republic of Korea 2,917.
Metal including alloys, all forms	8,070	10,034	4,291	United Kingdom 2,725; Netherlands 2,219.
Tungsten: Metal including alloys, all forms	216	212	65	U.S.S.R. 51; Taiwan 27.
Zinc:				
Oxides	455	480	--	Thailand 144; Republic of Korea 106; Vietnam 77.
Metal including alloys, all forms	45,157	55,582	5,871	Taiwan 10,459; Philippines 10,374; Republic of Korea 8,797.
Other:				
Ores and concentrates	109	86	--	Republic of Korea 49; Thailand 20; Singapore 16.
Oxides and hydroxides	1,736	2,616	312	Republic of Korea 599; Indonesia 362; Tunisia 340.
Ashes and residues	13,273	46,431	1,808	Singapore 28,918; Bahrain 10,500.
Pyrophoric alloys	76	89	27	France 21; Libya 8; Philippines 8.
Base metals including alloys, all forms	5,852	3,245	1,647	Netherlands 456; West Germany 403; Australia 110.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	2,030	1,916	6	Taiwan 873; Republic of Korea 599; Hong Kong 210.
Artificial: Corundum	15,560	15,138	45	Republic of Korea 8,911; Taiwan 3,382; Australia 1,333.
Dust and powder of precious and semi-precious stones thousand carats	1,045	1,692	1,078	Hong Kong 360; Republic of Korea 125.
Grinding and polishing wheels and stones	6,297	7,336	1,149	Singapore 917; Thailand 778; Hong Kong 701.
Asbestos, crude	428	680	--	Republic of Korea 358; Malaysia 216; China 68.

See footnotes at end of table.

Table 2.—Japan: Exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Barite and witherite	1,902	4,768	--	Cuba 3,888; U.S.S.R. 630; Philippines 250.
Boron materials:				
Crude natural borates	620	1,424	--	Taiwan 945; Republic of Korea 479.
Oxides and acids	219	147	(2)	Republic of Korea 101; Taiwan 25.
Cement thousand tons	8,786	10,011	489	Saudi Arabia 2,498; Kuwait 2,443; Singapore 1,368.
Chalk	--	243	--	Republic of Korea 226.
Clays and clay products:				
Crude, unspecified	77,643	59,961	--	Taiwan 32,362; Republic of Korea 13,195.
Products:				
Nonrefractory[3]	46,470	50,399	8,064	Singapore 12,242; Hong Kong 11,371.
Refractory including nonclay brick	275,797	317,051	3,373	China 81,475; Indonesia 39,239; Republic of Korea 34,228.
Cryolite and chiolite value	$2,381	$1,732	--	All to Republic of Korea.
Diamond:				
Gem, not set or strung carats	450,471	324	5	Republic of Korea 233; Israel 62; Hong Kong 15.
Industrial do	11,562	2,098	1,300	United Kingdom 407; Republic of Korea 216; Philippines 175.
Diatomite and other infusorial earth	1,891	2,321	--	Taiwan 824; Vietnam 750; U.S.S.R. 220.
Feldspar, fluorspar, related materials:				
Feldspar	22,889	18,766	4	Taiwan 16,660; Indonesia 1,363.
Fluorspar	625	326	--	Indonesia 163; Malaysia 80; Taiwan 58.
Fertilizer materials: Manufactured:				
Ammonia	153,578	9,717	--	Philippines 5,013; Republic of Korea 3,014; Hong Kong 826.
Nitrogenous thousand tons	1,554	1,436	10	China 950; Thailand 107; Sri Lanka 61.
Phosphatic	23,477	35,472	--	Bangladesh 16,908; Burma 7,000; Fiji 6,500.
Potassic	6	8,218	4	North Korea 4,000; China 3,908.
Unspecified and mixed	203,188	75,338	592	Thailand 41,300; Nepal 7,285; Indonesia 6,501.
Graphite, natural	1,745	1,620	65	Taiwan 713; Czechoslovakia 484; Republic of Korea 114.
Gypsum and plaster	6,370	7,628	14	Taiwan 2,308; Republic of Korea 2,269; Indonesia 1,062.
Halogens	5,707	5,442	2,078	West Germany 891; United Kingdom 884; France 580.
Lime	20,076	25,079	--	Papua New Guinea 19,593; Australia 3,143; Singapore 2,000.
Magnesium compounds:				
Magnesite	113,440	88,487	8,764	Republic of Korea 19,909; Australia 14,542; Netherlands 10,620.
Oxides and hydroxides	5,822	5,860	1,320	Taiwan 1,047; U.S.S.R. 850; West Germany 764.
Mica, all forms	951	1,145	27	Hong Kong 503; Taiwan 360; Indonesia 61.
Pigments, mineral:				
Natural, crude	40	61	--	Singapore 31; Taiwan 16.
Iron oxides and hydroxides, processed	19,492	14,875	1,648	Taiwan 6,781; Republic of Korea 1,392; Mexico 1,293.
Precious and semiprecious stones other than diamond:				
Natural kilograms	41,033	42,833	532	Republic of Korea 36,347; Taiwan 4,330.
Synthetic do	43,030	43,933	6,139	Malaysia 14,619; Republic of Korea 10,384; Taiwan 2,953.
Salt and brine	2,299	1,173	637	North Korea 198; Republic of Korea 85; Indonesia 72.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	7,083	5,299	168	Australia 1,312; Taiwan 1,207; Republic of Korea 1,078.
Sodium carbonate, natural and manufactured	96,578	61,318	8	Indonesia 25,950; Philippines 18,428; Taiwan 6,243.
Sodium hydroxide	380,677	287,165	20	Australia 251,297; Thailand 19,727; Republic of Korea 8,797.
Stone, sand and gravel:				
Dimension stone	2,202	1,640	251	Republic of Korea 609; Taiwan 345; Hong Kong 207.

See footnotes at end of table.

Table 2.—Japan: Exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Stone, sand and gravel —Continued				
Dolomite, chiefly refractory-grade	6,890	3,446	--	Indonesia 1,510; Taiwan 1,051; Philippines 880.
Gravel and crushed rock	90,797	96,378	12	Australia 92,800.
Limestone other than dimension thousand tons	1,159	1,263	(2)	Australia 1,202.
Quartz and quartzite	1,276	675	NA	Republic of Korea 250; Taiwan 103; Malaysia 92.
Sand other than metal-bearing	3,738	8,018	--	Taiwan 4,677; Saudi Arabia 1,003; Iraq 670.
Sulfur:				
Elemental:				
Crude including native and byproduct	364,268	231,326	--	Republic of Korea 173,246; Taiwan 54,879.
Colloidal, precipitated, sublimed	1,029	174	--	Republic of Korea 58; Iran 32; Indonesia 27.
Dioxide[4]	81	65	--	Republic of Korea 25; Taiwan 19; Philippines 13.
Sulfuric acid	301,751	576,682	11,133	Mexico 229,895; Philippines 143,091; Turkey 59,108.
Talc, steatite, soapstone, pyrophyllite	1,691	1,923	3	Taiwan 507; Iran 500; Republic of Korea 211.
Other:				
Crude	12,080	11,385	34	Republic of Korea 4,084; Taiwan 3,597; Indonesia 536.
Slag and dross, not metal-bearing	417,829	428,622	2,214	Singapore 170,904; Philippines 157,418; Republic of Korea 67,934.
Oxides and hydroxides of barium, magnesium, strontium	14,898	1,713	152	Indonesia 654; Thailand 318; Republic of Korea 161.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	4,396	6,827	3	Republic of Korea 2,167; Saudi Arabia 1,376; Iraq 854.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	31	21	--	Taiwan 19.
Carbon: Carbon black	15,941	13,246	106	Indonesia 3,816; Singapore 1,473; Republic of Korea 1,076.
Coal, all grades including briquets	70,726	55,004	--	Republic of Korea 46,242; Philippines 5,617; Cuba 1,594.
Coke and semicoke thousand tons	2,330	1,961	148	Romania 799; Philippines 151; Brazil 131.
Hydrogen, helium, rare gases	680	1,092	41	Taiwan 276; Iraq 129; Saudi Arabia 102.
Petroleum refinery products:				
Liquefied petroleum gas thousand 42-gallon barrels	2	22	--	Thailand 20.
Gasoline do	56	60	--	Taiwan 33; Philippines 25.
Mineral jelly and wax do	633	592	34	Republic of South Africa 155; India 101; Republic of Korea 73.
Kerosine and jet fuel do	25	51	8	Republic of Korea 28; Australia 14.
Distillate fuel oil do	(2)	(2)	(2)	Mainly to Hong Kong.
Lubricants do	1,909	1,327	80	Republic of Korea 446; Taiwan 217.
Residual fuel oil do	(2)	1,547	16	Thailand 674; Hong Kong 327; Philippines 306.
Bitumen and other residues do	r122	157	--	Vietnam 61; Indonesia 51.
Bituminous mixtures do	--	18	--	Philippines 5; Indonesia 3; Yemen 2.
Petroleum coke do	149	226	151	Netherlands 58.
Unspecified do	116	104	2	Republic of Korea 38; Taiwan 36.
Tars and other crude chemicals derived from coal, gas, and petroleum	133,142	165,177	6,956	U.S.S.R. 66,800; Republic of Korea 40,952; Taiwan 10,574.

rRevised. NA Not available.
[1]Excludes exports under Japanese-U.S. Mutual Defense Agreement or for account of U.S. military forces.
[2]Less than 1/2 unit.
[3]Excludes mosaic tiles valued at $111,235,000 in 1980 and $103,338,000 in 1981.
[4]May contain some arsenic trioxide and pentoxide.

Table 3.—Japan: Imports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals:				
Lithium:				
Oxides and hydroxides	603	631	385	U.S.S.R. 235.
Metal including alloys, all forms	20	30	29	West Germany 1.
Alkaline-earth metals	99	162	148	China 9.
Rare-earth metals	42	8	2	France 3; China 2.
Unspecified	337	447	9	France 337; China 16.
Aluminum:				
Ore and concentrate thousand tons	5,708	4,352	--	Australia 2,562; Indonesia 1,072; Malaysia 631.
Oxides and hydroxides	735	640	2	Australia 636.
Metal including alloys:				
Scrap	275,696	204,863	151,934	Hong Kong 12,951; Canada 12,707; Australia 10,686.
Unwrought	910,085	1,129,322	266,325	Venezuela 161,607; Canada 116,152; New Zealand 108,574.
Semimanufactures	46,173	31,088	10,895	Romania 4,635; France 3,892; Argentina 1,906; Spain 1,306.
Antimony:				
Ore and concentrate	6,996	6,531	--	Bolivia 5,673; China 749.
Metal including alloys, all forms	1,563	2,366	--	China 2,253.
Beryllium:				
Oxides and hydroxides	85	91	90	China 1.
Metal including alloys, all forms kilograms	1,611	1,968	1,968	
Chromium:				
Ore and concentrate	950,039	743,937	--	Republic of South Africa 348,317; Philippines 150,945; India 142,140.
Oxides and hydroxides	2,286	2,379	1,061	West Germany 786; U.S.S.R. 451.
Cobalt:				
Oxides and hydroxides	292	227	7	Belgium 169; Canada 20; China 19.
Metal including alloys, all forms	r1,661	1,132	310	Belgium 246; Zaire 210.
Columbium and tantalum:				
Ore and concentrate	2,073	1,405	--	Canada 1,244.
Metal including alloys, all forms, tantalum	46	19	17	Taiwan 1.
Copper:				
Ore and concentrate thousand tons	3,104	3,338	488	Philippines 862; Canada 767; Papua New Guinea 301.
Matte and speiss including cement copper	2,574	--		
Sulfate	570	377	50	U.S.S.R. 120; China 117.
Metal including alloys:				
Scrap	49,929	51,866	28,314	Hong Kong 14,625; Taiwan 3,472.
Unwrought	290,803	331,425	7,577	Zambia 147,037; Peru 68,872; Chile 45,416.
Semimanufactures	3,330	3,264	2,126	Republic of Korea 572; West Germany 215.
Germanium: Metal including alloys, all forms kilograms	134	2,546	--	China 2,497.
Gold: Metal including alloys, unwrought and partly wrought thousand troy ounces	1,170	5,566	13	United Kingdom 2,112; Switzerland 1,886; U.S.S.R. 1,191.
Indium: Metal including alloys, all forms kilograms	3,017	891	54	Belgium 445; Netherlands 221.
Iron and steel:				
Iron ore and concentrate, excluding roasted pyrite thousand tons	133,721	123,362	--	Australia 54,861; Brazil 27,165; India 15,636.
Metal:				
Scrap do.	2,986	1,791	1,132	Australia 264; U.S.S.R. 155.
Pig iron, cast iron, related materials do.	r782	1,086	--	China 794; Australia 67; North Korea 66.
Ferroalloys	477,293	503,024	5,600	Republic of South Africa 155,828; China 80,754; Brazil 61,361.
Steel, primary forms	522,466	725,616	286	Republic of Korea 617,724; Venezuela 83,962; Philippines 10,291.
Semimanufactures	32,525	27,723	3,335	Republic of Korea 12,866.
Lead:				
Ore and concentrate	258,634	255,765	26,725	Canada 115,155; Peru 54,825; Republic of South Africa 23,297.
Oxides	1,463	2,812	31	Mexico 2,440.

See footnotes at end of table.

Table 3.—Japan: Imports of mineral commodities[1] —Continued

COMMODITY REVIEW

METALS

Aluminum.—The depressed and ailing aluminum industry of Japan took a steeper slide into financial crisis as the cost of production and imports of foreign aluminum continued to increase. Sumikei Aluminum Industries Ltd., the smallest of the six smelters, went out of business in May, while Showa Light Metal Co. Ltd. became a joint venture company of Showa Denko K.K. and Conzinc Riotinto of Australia Ltd. (CRA) (through its subsidiary Comalco Pty. Ltd.) in April. Sumitomo Aluminum Smelting Co. Ltd., the largest smelter, was near total liquidation before it was reorganized and became a member of the Sumitomo Group in September. The industry's annual operating capacity, excluding the shutdown and frozen facilities, was reduced to 761,244 tons in April from 1,136,460 tons in January and was further reduced to 743,304 tons in July. During the last quarter, the industry was operating at 35% of its operating capacity.

By yearend 1982, the following plants were closed or remained shut down: Naoetsu of Mitsubishi Light Metal Industries Co. Ltd.; Niigata of Nippon Light Metal Co. Ltd.; Kitakata and Omachi of Showa Light Metal; Isoura of Sumitomo Aluminum Smelting; and Sakata of Sumikei Aluminum Industries.

According to industry sources, the electric power cost to Japanese smelters was estimated at 80 mills per kilowatt hour compared with a world average of 22 mills. The cost of electric power alone was estimated to be 41% of the total production cost in Japan. During 1982, the price of domestically produced aluminum averaged about $1,250 per ton compared with the world market price of $1,050 to $1,100 per ton. According to Japanese industry sources, the Japanese aluminum industry could remain competitive in the world market only if the electric power cost could be reduced to less than 43 mills per kilowatt hour.[6]

Imports of primary aluminum jumped to a new record of 1,289,671 tons. The major suppliers were the United States, Venezuela, Canada, New Zealand, Australia, the United Arab Emirates, and Bahrain. Imports of primary aluminum were equivalent to 78.8% of Japan's domestic demand for primary aluminum in 1982 compared with 62.6% in 1981, while domestic production was equivalent to only 21.4% in 1982 compared with 49.2% in 1981. Domestic demand for primary aluminum increased to 1.64 million tons in 1982, about the same level as that of 1980, as the rolling mill sector increased its consumption by 7.7% to 1.28 million tons. However, demand for primary aluminum from other major sectors, including aluminum casting and wire and cable, dropped by 6.6% to 166,200 tons. Japan exported only 4,223 tons of aluminum in 1982 compared with 8,319 tons in 1981.

Despite a drastic cutback in domestic production of primary aluminum, the overall stocks of aluminum remained high at 750,015 tons at yearend 1982 compared with 768,166 tons in 1981. Aluminum stocks at producers' plants dropped 36.1% to 196,776 tons; those at dealers' warehouses also dropped 2.9% to 220,306 tons. However, the stocks at fabricators' plants rose 18.6% to 250,804 tons. Aluminum stocks held by the Light Metal Stockpiling Association rose to 29,284 tons in March 1982 from 21,990 tons at the end of 1981. As a result of the Government assistance program, the association purchased an additional 52,845 tons for the stockpile from five smelters at the end of November. At the end of 1982, the aluminum stockpile of the Light Metal Stockpiling Association totaled 82,129 tons.

In September, an emergency loan of $240 to $320 million to rescue the domestic aluminum industry from total collapse was planned by MITI after the Japan Aluminum Federation asked the Government to purchase 150,000 to 200,000 tons of surplus aluminum from the smelters for the Government stockpile. In November, a relief program was approved by the Government. Under the program, a $180 million, Government-guaranteed loan was to be raised from city banks by the Metal Mining Agency of Japan, which in turn would lend the fund to the Light Metal Stockpiling Association for purchasing 110,000 tons of primary aluminum from the five smelters. In addition, the Government would subsidize the interest payment of 2% with the smelter to pay 6.5%. The association purchased 52,845 tons of aluminum from the smelters at a price of $1,514 per ton at the end of November. The remaining 57,155 tons was expected to be purchased by the end of March 1982.[7]

Under a tariff quota system introduced by MITI in 1981, the total primary aluminum imported by Japanese smelters duty free in fiscal year 1982 was 393,000 tons, and the Government approved 424,000 tons for import during fiscal year 1983. Primary aluminum imported by Japanese smelters was all from Japanese overseas smelter projects in New Zealand, Canada, Venezuela, the United States, and Indonesia. A 9% tariff was imposed by the Government for all other imports of primary aluminum in 1982.

In the fiscal year ending in March, all smelters except Mitsui Aluminum Co. Ltd. (which operated a smelter with a coal-fired powerplant at Miike) incurred loss. The combined accumulated deficit of the five smelters excluding Sumikei Aluminum was estimated at $294.3 million. According to the general view of the industry, the 1982 financial crisis was a direct result of rising electric cost and competition from foreign suppliers, especially from new Middle East producers who sold most of their aluminum in the world market at dumping prices. In June, the Japan Aluminum Federation recommended to MITI a survival plan. The recommendations included increases in the Government stockpiling of primary aluminum, readjustment of electric costs, favorable financial aid, and tax incentives to reduce the industry's accumulated deficit and excess capacity.

In 1982, progress was made by Japanese aluminum smelters on downstream processing. According to MITI, for the fiscal year ending in March, capital investments in rolling and other fabricating plants were to increase by 53.6% to $270 million. The collaboration by Showa Aluminum Industries Co. Ltd. and CRA reflected the contin-

uing trend of Japanese smelters to go downstream with a stable supply coming from abroad. Showa Aluminum reportedly had entered into the fabricating business by acquiring a 37.25% interest in Sky Aluminum Co., an aluminum fabricator of the Showa Group, in 1982.

In August, the New Aluminum Refining Research Center was established by the five smelters to develop new aluminum production technology based on a blast furnace process that will consume much less energy. The five smelters reportedly were expected to invest $600,000, while MITI will provide $800,000 as a Government subsidizing fund. The new organization was expected to be reorganized in early 1983 after Ishikawajima-Harima Heavy Industries Co. and Kobe Steel Ltd. agreed to participate in the new research project. A $1 million pilot plant with a capacity of 1 ton per year will be constructed at the Miike plant of Mitsui.[8]

The construction of a 320,000-ton-per-year capacity aluminum smelter at Bancarena in northern Brazil and an 800,000-ton-per-year Alumina do Norte do Brasil S.A. (ALUNORTE) alumina plant reportedly might be delayed or suspended for several years because of the depressed world aluminum market, financial difficulties in Japanese smelters, and Brazil's large financial debt. Nippon Amazon Aluminum Co. of Japan, a consortium of 31 Japanese companies and the Government Overseas Economic Cooperation Fund, reached an agreement with the 2 Brazilian joint venture firms, Alumínio Brasileiro Ltda. and ALUNORTE to lend $124 million to the project in early 1982. The total project cost was estimated at $2.5 to $2.6 billion. By yearend 1982, the Brazilian concern reportedly had invested $473 million in the project, and about 20% of the construction work was completed.

Copper.—Mine production remained at the same level as 1981; however, output of refined copper, including primary and secondary, reached another record. Imports of ore and concentrate also increased to 3.6 million tons in 1982 from 3.3 million tons in 1981. In November, Shimokawa Mining Co. Ltd. reportedly shut down its Shimokawa copper-zinc mine in Hokkaido because of insufficient ore reserves and continuing losses.

The share of domestic ore in overall refined copper production declined further to 3.5% in 1982 from 4.2% in 1981, while the share of imported ore and concentrate rose to 84.7% in 1982 from 84.4% in 1981, and the share of copper scrap and other materials of secondary production also rose to 11.8% in 1982 from 11.4% in 1981.

In 1982, imports of copper ore and concentrate were mainly from the Philippines, Canada, the United States, Papua New Guinea, Chile, and Indonesia. During 1982, Japan also imported 295,794 tons of refined copper in cathodes, mainly from Zambia, Chile, and Peru. Imports of blister totaled 77,880 tons. The major suppliers of blister copper were Peru, Namibia, and the Republic of South Africa.

According to MITI, domestic consumption of refined copper declined 1.8% to 1,330,212 tons in 1982. Consumption by wire and cable fabricators rose 5% to 911,315 tons, while consumption by brass mills dropped 6.4% to 396,696 tons. Exports of refined copper increased by 16.5% to 44,640 tons. The main buyers of Japanese refined copper were China, the Republic of Korea, Taiwan, and Indonesia.

The overall stocks of refined copper rose by 49.7% to 250,453 tons at yearend 1982 over that of 1981. Stocks held by the producers were 114,798 tons; distributors, 45,011 tons; and fabricators, 90,644 tons. Since October 1982, all stocks held by the Japanese Metallic Mineral Stockpiling Association were sold back to the producers.

During the first 9 months, the copper refining industry was operating at an average of 84.3% capacity. However, during the last 3 months of 1982, the average operating rate rose to 90%. The increased operating rate reflected higher output level as well as lower operating capacity because of repair and maintenance in some refineries.

According to the MITI survey, Japanese copper smelting and refining capacities by company and by method of process during April 1981 to September 1982 were as shown in table 4.[9]

The expansion program of Sumitomo Metal Mining Co. Ltd. at Toyo was scheduled for completion in May 1983. Upon completion, Sumitomo's copper refining capacity at Toyo will be increased to 192,000 tons per year. In October 1982, Nippon Mining Co. Ltd. completed its expansion program at Saganoseki in Ooita Prefecture. The refining capacity was increased to 300,000 tons per year.

In September, Mitsubishi Metal Corp. and Kennecott Minerals Co., a wholly owned subsidiary of Standard Oil Co. of Ohio, reached an agreement to spend $100 million for expansion and modernization of the copper smelter at Chino Mines Co. in

Hurley, N. Mex. Upon completion of the project, the smelter's annual capacity was expected to increase to 453,600 tons from 272,200 tons. The overall expansion and modernization program of copper mining, milling, and smelting at Kennecott's Chino Mine was estimated at $380 million. In 1981, Chino Mines was formed by Kennecott, with two-thirds equity, and Mitsubishi, which paid $116 million for one-third equity. Mitsubishi has the right to take one-third of the copper production.

Table 4.—Japan: Copper smelters and refineries

(Metric tons)

Company and plant location	Annual capacity		Process
	Smelting	Refinery	
Dowa Mining Co. Ltd.:			
Kosaka	52,200	60,000	Flash smelting.
Okayama	[1]15,120	[1]12,000	
Furukawa Electric Co. Ltd.:			
Nikko	--	48,000	
Furukawa Mining Co. Ltd.:			
Ashio	50,400	--	Flash smelting.
Hibi Kyodo Smelting Co. Ltd.:			
Tamano	132,000	102,000	Do.
Mitsubishi Metal Corp.:			
Naoshima	168,000	163,200	Reverberatory smelting.
Mitsui Mining & Smelting Co. Ltd.:			
Hibi	62,400	--	Blast furnace smelting.
Takehara	--	87,600	
Nippon Mining Co. Ltd.:			
Hitachi	84,000	192,000	Flash smelting.
Saganoseki	240,000	168,000	Do.

Onahama	188,400	234,000	Reverbatory smelting.
Rasa Industries Co. Ltd.:[2]			
Miyako	31,200	--	Blast furnace smelting.
Sumitomo Metal Mining Co. Ltd.:			
Besshi (Toyo)	168,000	180,000	Flash smelting.
Total	1,191,720	1,246,800	

[1]Shut down.
[2]The smelter was sold to Godo Shigen Sangyo Co. in October 1981.

Gold and Silver.—Mine production of both gold and silver increased in 1982. The increased mine production was due primarily to the higher milling recovery rate. Domestic mine production of gold and silver was equivalent to 8.3% and 23.6%, respectively, of metal refining production. The overall metal refining production, including primary and secondary, by source of raw materials in 1980-82 was as follows:

Year	Production (thousand troy ounces)	Share of production (percent)		
		Domestic ore	Imported ore	Scrap and other
Gold:				
1980	1,217	17.8	72.4	9.8
1981	1,214	15.3	73.3	11.4
1982	1,271	14.2	73.1	12.7
Silver:				
1980	37,828	21.6	50.8	27.6
1981	40,252	23.1	46.8	30.1
1982	41,573	21.8	50.3	27.9

To meet the domestic demand for gold, Japan imported 4.49 million troy ounces of gold in 1982 compared with a record high of 5.38 million troy ounces in 1981. Switzerland, the United Kingdom, and the U.S.S.R. remained the dominant suppliers of Japan's gold imports. The decline in gold imports was attributed mainly to a 20% drop in private hoarding. Despite the opening of the Tokyo Gold Exchange on March 23, demand for gold by private hoarding began to level off in April because of the higher gold prices and delay in the introduction of a new tax system that will prevent bank depositors

from taking advantage of certain tax-free savings accounts in Japanese banks. During 1982, Japan increased its silver imports by 18.6% to 15.8 million troy ounces. The major suppliers were Mexico, 49.5%; Peru, 19.9%; North Korea, 18.8%; and Australia, 9.7%.

Domestic demand for gold fell 11.3% to 6.27 million troy ounces, of which 50% was for private hoarding, 22% for jewelry, 18% for electronic communication apparatus and gold plate, 6% for dental and medical, and 4% for other. Spot sales of gold to nonresidents (foreign gold dealers) amounted to 2.1 million troy ounces, while exports of gold rose sharply to 579,000 troy ounces in 1982 from 239,000 troy ounces in 1981. Domestic demand for silver increased by 5.7% to 63.2 million troy ounces in 1982 from that of 1981. The manufacturers of silver nitrate for photographic film remained the dominant consumer of silver, accounting for 58% of total domestic demand; electrical contact points, 10%; caustic silver, 9%; rolling of tube, sheet, and bar, 5%; brazing alloys (silver solder), 5%; and others, 13%. Exports of silver fell 16% to 2.6 million troy ounces in 1982.

Sumitomo Metal Mining reportedly was expected to start development of the Hishikari gold mine discovered in Kagoshima, Kyushu, in 1981. Based on the samples collected from 18 test borings at the mine, the company estimated the deposit has ore reserves of 1.5 million tons with an average gold content of 80 grams per ton of ore. Sumitomo Metal Mining was expected to spend $16 to $17 million for developing the Hishikari Mine. According to the development plans, when completed, the project would have a daily processing capacity of 200 tons of ore and an annual capacity of 4 to 6 tons of gold metal.[10]

Iron and Steel.—Japan's crude steel production decreased to under 100 million tons as a result of a continuing decline in domestic demand for steel and stagnant exports.

Japan regained second place in world steel output with the production of pig iron and crude steel accounting for 17.5% and 15.4%, respectively, of total world production.

Production of pig iron by blast furnace was 99.8%, and by electric and other furnaces, 0.2%. The output of pig iron by blast furnace represents only 56.8% of the industry's 136.5-million-ton-per-year capacity with only 40 out of 65 existing blast furnaces operating. Production of crude steel by basic oxygen furnace was 73.4%, and by ultra-high-power electric furnace, 26.6%. The output of crude steel by basic oxygen furnace represents only 56.5% of the industry's 129.2-million-ton-per-year capacity, while the output of crude steel by ultra-high-power electric furnace was equivalent to 92.1% of the industry's 28.8-million-ton-per-year capacity. The total output of crude steel represents only 63% of the industry's 158-million-ton-per-year capacity in 1982.

During 1982, four more continuous-casting machines (two for slabs and two for blooms and billets) were put into operation. By yearend, the industry had a total of 152 continuous-casting machines with an annual capacity of 78,918,000 tons. Over the past 10 years, the percentage of crude steel processed by continuous-casting machines increased from 20.7% in 1973 to 78.7% in 1982. The percentage of continuous-casting processing of rolled ordinary steel and rolled specialty steel in 1973 and 1979-82 was as follows:[11]

Year	Continuous-casting ratio		Average
	Ordinary steel	Specialty steel	
1973	22.1	10.1	20.7
1979	55.5	31.7	52.0
1980	63.3	38.3	59.5
1981	74.8	49.9	70.7
1982	82.8	59.0	78.7

Japan's continuous-casting ratio was the highest among the world's major steel producers, followed by the Federal Republic of Germany, 59.8%; France, 59.1%; the United Kingdom, 36.4%; the United States, 27.6%; and the U.S.S.R., 12.2% (1981). According to Japanese industry sources, the increase in the continuous-casting ratio has resulted not only in an increase in product yield rate by about 6% but also in energy savings of about 2% over the past decade.

Mine production of iron ore and pyrite

concentrate remained very small compared to total consumption of iron ore, pellets, and iron sands, which amounted to 109.7 million tons in 1982. To meet the iron and steel industry's requirements, Japan imported 121.8 million tons (wet basis) of iron ore, which included sinters, pellets, and briquets. The principal suppliers were Australia, 44%; Brazil, 22%; India, 13%; the Republic of South Africa, 5%; Chile, 5%; and the Philippines, 3%.

Consumption of raw materials by the iron and steel industry included 97 million tons of iron ore, 10.4 million tons of pellets, 2.3 million tons of iron sand, 38.9 million tons of iron and steel scrap, 62.6 million tons of coking coal, 42.7 million tons of coke, 1.3 million tons of manganese ore, 868,000 tons of ferruginous manganese ore, and 13.4 million tons of limestone. As a result of the industry's energy-saving programs and the decrease in crude steel production, consumption of energy declined further in 1982. Consumption of fuel oil dropped by 19.6% to 13,441,000 barrels, and consumption of electricity also declined from 62.3 billion (revised) kilowatt-hours in 1981 to 60.5 billion kilowatt-hours in 1982. Oxygen consumption dropped 4.7% to 4.9 billion cubic meters.

Because of the cutback in steel production, the industry's production work force was reduced by 7,494 to 184,986 at yearend. In October, under the Japanese Employment Insurance Law, a special subsidy program, the retraining program, was approved by the Labor Ministry to displaced workers mainly from the 24 idle blast furnace sections of the 9 major integrated steel companies. Under the program, the displaced workers were to be rotated off their regular work for 2 to 3 days per month for retraining in nonrelated fields. The Government was to pay one-half of workers' wages up to $24.75 per day as well as $2.38 per day of the training costs. The program was approved for 1 year.[12]

The reduction in steel output and sales coupled with increased labor costs and lower operating rates resulted in a sharp decline in the profits of Japan's major integrated steel manufacturers. Nippon Steel Corp., the world's largest steel producer, which produces about 30 million tons of steel per year, suffered a 57% drop in profits for the first half of the fiscal year ending September 1982. For the fiscal year ending March 1983, Japan's integrated steel companies, which included Nippon Steel, Nippon Kokan K.K., Kawasaki Steel Corp., and Sumitomo Metal Industries Ltd., reportedly were anticipating a total loss of over $160 million.[13]

Japan's estimated apparent steel consumption declined to 69.4 million tons in 1982. The slow pace of private housing and nonresidential construction, a slight decline in automotive and machinery production, and a sharp drop in shipbuilding were the major factors for the continuing downward trend of domestic demand for steel. Domestic orders for ordinary steel declined 2.5% to 48.6 million tons, while orders for specialty steel dropped 1.2% to 7 million tons in 1982.

Exports of iron and steel products totaled 29.5 million tons, of which 26.5 million tons was ordinary rolled steel products, 1.5 million tons was special rolled steel products, 1.5 million tons was pig iron, ferroalloys, cast-iron pipes, clad steel sheets, steel ingots, semimanufactured steel, and wire products of secondary steel. In 1982, exports of iron and steel products to the United States decreased 32.7% to 4.2 million tons, while exports to Saudi Arabia rose 73.1% to 3.2 million tons, and exports to China and the U.S.S.R., rose 32% to 2.9 million tons and 18% to 2.4 million tons, respectively. Other major importers of Japanese iron and steel products were Indonesia, 1.5 million tons; Singapore, 1.3 million tons; and Malaysia, Taiwan, and the Republic of Korea, 1.1 million tons each. Despite a slight increase in export volume, export earnings of iron and steel products decreased 5.9% to $16 billion in 1982, owing to the depreciation of the yen, which caused the average export unit price for all steel products to fall from $582 per ton in 1981 to $542 per ton in 1982.

Japan's imports of iron and steel increased 26.4% to 3.98 million tons, of which 1.89 million tons was ordinary steel products, 1.38 million tons was pig iron, and 710,000 tons was ferroalloys and other steel products. The major suppliers were the Republic of Korea, 37%, and China, 21%. However, the Republic of Korea remained the dominant supplier of heavy and medium plates and hot-rolled coils, followed by Taiwan.

Plant and equipment investments by Japan's steel industry reached $4.4 billion and accounted for 9.2% of all industries' capital investments. Special emphasis of the industry's capital investment was focused on installation of energy-saving facilities, replacement of blast furnaces and rolling mills, and plants and equipment to produce high-value-added steel products.

These high-value-added products include seamless pipes and tubes for oil production, precoated sheets and textured sheets for fabrication, one-side coated sheet for automotive production, galvanized plate for manufacture of electric appliances and steel furniture, and corrosion-resistant, surface-treated steel.

Lead and Zinc.—Mine production of lead decreased but mine production of zinc increased slightly in 1982. Domestic ore production of lead and zinc accounted for 21.7% and 35.3% of overall production of refined lead and zinc, respectively. Production of refined lead and zinc both declined slightly owing to the decrease in domestic demand. However, the industry's lead smelting capacity was increased by 6,000 tons per year at the Naoshima plant of Mitsubishi Cominco Smelting Co. Ltd. During the year, the capacity utilization rate was 78.6% for primary lead and 68.6% for primary zinc.

Imports of lead ore and concentrate decreased 11.8% to 225,650 tons in 1982 from that of 1981. The major suppliers were Canada, 52%; Peru, 25%; the Republic of South Africa, 7%; Thailand, 5%; and Australia, 5%. The remaining 6% was imported from the United States, Bolivia, and others.

Imports of zinc ore and concentrate decreased 8.4% to 813,408 tons in 1982 from that of 1981. The principal suppliers were Australia, 44%; Canada, 27%; and Peru, 21%. The remaining 8% was imported from North Korea and others. To meet the domestic demand for lead and zinc metals, Japan also imported 45,424 tons of refined lead, mainly from Australia, and 44,265 tons of refined zinc, mainly from North Korea.

Domestic demand for primary lead decreased 6.4% to 254,295 tons in 1982 from that of 1981 because of the decrease in demand from storage batteries, inorganic chemicals, and lead pipe and sheet. However, domestic demand for primary zinc increased slightly to 690,904 tons owing to the continuous strong demand from the galvanizing sector for galvanized steel sheet, wire, and tube. Exports of refined lead rose 166% to 7,425 tons, while exports of refined zinc fell 20% to 40,767 tons. The major buyers of Japanese refined lead were Taiwan, North Korea, the Republic of Korea, and the Philippines. The principal buyers of Japanese refined zinc were the Philippines, Taiwan, China, and the Republic of Korea.

By yearend, stocks of primary lead totaled 34,335 tons, of which 16,392 tons was at producers' plants, 2,604 tons at distributors' warehouses, and 15,339 tons was held by consuming manufacturers. Stocks of primary zinc totaled 171,250 tons, of which 84,214 tons was at producers' plants, 3,649 tons at distributors' warehouses, 22,484 tons was held by the consuming manufacturers, and 60,903 tons was held by the Metallic Mineral Stockpiling Association. During 1982, a total of 25,277 tons of primary zinc was sold back to the producers.

Six major zinc smelters led by Mitsui Mining & Smelting Co. Ltd. reportedly were developing a new zinc smelting process to reduce energy consumption. A semicommercial operational plant was expected to be built at a cost of $5.2 million with Government financial assistance over a 3-year period beginning in 1983. A reducing agent, reportedly, would be added to the oxide ore in the new process; the ore is then blown into a blast furnace without the use of electric power as a heat source. It was claimed that the production of refined zinc under the new process could save up to 60% of the production cost of traditional electrolytic refining.[14]

According to the Metal Mining Agency of Japan, four promising lead-zinc deposits were discovered in 1982. The first discovery was at Hokoroku in Akita Prefecture. The black ore deposit has an average ore grade of 3.02% lead, 8.01% zinc, and 4 grams of gold and 760 grams of silver per ton of ore. The mining rights were owned by Dowa Mining Co. Ltd. The second discovery was at Kudoh in Hokkaido. There were two deposits in the Kudoh area. Based on the exploratory drilling, one deposit has an ore grade of 4.16% lead, 9.42% zinc, and 2.2 grams of gold and 149 grams of silver per ton of ore. The other deposit, at Kaminokuni, has an ore grade of 3.54% lead, 6.02% zinc, and 3.9 grams of gold and 1,079 grams of silver per ton of ore. The mining rights to these two deposits belong to Mitsui Mining & Smelting. The third discovery was at Atotsugawa of Hida area in Gifu Prefecture. The deposit has an ore grade of 12.6% zinc and 13.6 grams of silver per ton of ore. The fourth discovery was at Nishikigawa area of Yamaguchi Prefecture. The deposit has an ore grade of 3.02% zinc, 1.17% copper, 0.49% tungsten, and 0.48% tin.[15]

Table 5.—Japan: Lead and zinc, 1982 annual capacity

(Metric tons)

Company	Plant location	Capacity	Electrolytic distillation

[1]Annual capacity of dry smelting was expanded by 6,000 tons in September 1982.
[2]The smelter was sold to Godo Shigen Sangyo Co. in October 1981.
[3]Idle capacity.
[4]A wholly owned subsidiary of Sumitomo Metal Mining Co. Ltd.

Nickel.—Japan remained the world's third largest producer and consumer of nickel metal and continued to import all of its nickel requirements from overseas sources. During 1982, 2,996,755 tons of nickel ore containing 51,400 tons of nickel was imported from New Caledonia, Indonesia, and the Philippines; 40,374 tons of nickel matte containing 30,370 tons of nickel was imported from Australia, Indonesia, New Caledonia, and Guatemala, and 12,930 tons of nickel-cobalt mixed sulfide containing 3,740 tons of nickel and 2,060 tons of cobalt was imported from Australia and the Philippines.

Production of refined nickel by Nippon Mining and Sumitomo Metal Mining decreased slightly. The nickel refining sector was operating at 86.8% of its 26,880-ton-per-year capacity. To meet the domestic demand for nickel, Japan imported 19,689 tons of nickel metal mainly from Canada, 22.2%; the U.S.S.R., 21.5%; the Philippines, 15.4%; Australia, 14.8%; and the United States, 12.5%.

Domestic demand for refined nickel decreased 3.9% to 32,768 tons in 1982. Consumption of nickel by the specialty steel industry, which accounted for 46.6% of domestic demand, increased 17.2%, while consumption of nickel by all other industries decreased. The other major nickel consumers were the manufacture of galvanized sheet, 18.6%; nickel-copper and other nonferrous alloys, 14%; magnetic materials, 7%; rolled sheets, 3.8%; and other, 10%. In 1982, Japan exported only 298 tons of refined nickel, mainly to Taiwan and Indonesia.

In November, a major contract was signed between Sumitomo Metal Mining, Japan's largest producer of refined nickel and ferronickel, and the Western Mining Corp. (WMC) of Australia. The contract calls for WMC to supply a minimum of 15,000 tons of nickel matte per year to Sumitomo Metal Mining over a 10-year period. The nickel matte will be shipped from the Kalgoorlie smelter of Western Australia to Niihama refinery of Sumitomo Metal Mining.

As a result of a 12% increase in imports of ferronickel, which amounted to 29,758 tons in 1982, domestic production of ferronickel dropped 12% to 214,523 tons. In December, Shimura Kako Co. reportedly shut down its 10,200-ton-per-year ferronickel smelter at Date in Hokkaido and dismissed all 135 workers. Tokyo Nickel Co. Ltd., which operated a nickel oxide sinter plant with an annual capacity of 13,200 tons at Matsuzaka, reportedly was to take over

the market share of Shimura Kako starting in 1983.

Tin.—Mine production of tin continued to decline and remained insignificant in 1982. The total mine output was equivalent to about 2% of Japan's tin requirements, while production of primary tin, which used domestic ore and other materials, was about 4.5% of the domestic demand. Over 95% of Japan's tin requirements was dependent on imports. During the year, Japan imported 26,185 tons of tin metal, mainly from Malaysia, 14,895 tons; Indonesia, 6,643 tons; Thailand, 4,254 tons; and others, 393 tons.

Japan was the world's third largest consumer of tin metal. Domestic demand for tin metal decreased 5% to 29,000 tons. Demand for tin by the manufacturer of tinplate remained weak, while demand by the soldering industry fell sharply as a result of reduced production in sound equipment and automobiles.

Titanium.—Production of titanium sponge metal fell sharply after a record high of 24,818 tons was reached by the industry in 1981. A significant decline in demand from the depressed aircraft industry of the United States and Europe and lower domestic demand by the manufacturer of heat exchange tubes and desalination equipment were cited by the industry source as the major causes of the decline. Titanium sponge prices (f.o.b. shipping point) for domestic market range from $5.55 to $7.65 per pound, while export prices dropped sharply to an estimated range of $5 to $6 per pound with a discount in 1982 from the range of $8.85 to $10.03 per pound in 1981.

Osaka Titanium Co. Ltd., the single largest titanium sponge supplier of the Western World, reportedly, was operating at 50% of its 18,000-ton-per-year capacity with only one-third of the old facilities operating and a full capacity operation of the new plant, which was completed at Amagasaki early in 1982. Toho Titanium Co. Ltd. and Nippon Soda Co. Ltd. were also operating at about 50% of their installed capacities with a 1-month suspension of Toho Titanium's sponge production in December.

Imports of rutile and ilmenite for titanium dioxide and sponge metal production remained high at 367,500 tons. The major suppliers were Malaysia, 38%; Australia, 22%; India, 21%; and Sri Lanka, 6%.

According to industry sources, domestic shipments, including internal plant consumption for the production of ingot, dropped to 10,617 tons in 1982 from 14,393 tons in 1981. Exports of titanium sponge metal fell drastically to 3,500 tons from 10,005 tons in 1981. Exports to France rose 131.7% to 1,170 tons. However, exports to the United States fell 81.1% to 812 tons, exports to the United Kingdom dropped by 60.6% to 1,075 tons, and exports to the Netherlands plunged 90.5% to only 210 tons. As a result of a 26% decline in domestic demand and a 65% drop in exports, stocks held by producers rose 152% to 4,560 tons at yearend 1982. Stocks held by Toho Titanium, reportedly, were over 2,000 tons by yearend.

Despite the severely depressed world titanium market and Japan's excess titanium production capacity, a 50:50 joint venture company called Showa Titanium Co. Ltd. was formed by Showa Denko and Ishizuka Research Institute Ltd. to produce titanium sponge using the latest technology from Ishizuka. According to Showa Denko officials, the $20 million plant was expected to be built at Fujiyama in Toyama Prefecture beginning in January 1983 and was scheduled for completion in August 1983 with an annual capacity of 3,000 tons. To reduce the production costs, the electricity for production of titanium sponge at the new plant will be supplied by it own hydroelectric generation system.[16]

Other Metals.—Japan's other metal mine production included chromium, manganese, molybdenum, and tungsten. However, domestic mine output of these metals were of low grade and small quantity relative to the import materials for consumption by Japan's iron and steel industry.

Mine production of chromium ore and concentrate was 11,000 tons compared to 642,000 tons consumed by the Japanese iron and steel industry. Japan imported 694,521 tons of chromium ore and concentrate (all grades) mainly from the Republic of South Africa, India, the U.S.S.R., and the Philippines. To meet the requirements for stainless steel production, an additional 214,313 tons of ferrochromium was imported, primarily from the Republic of South Africa, Brazil, Zimbabwe, China, and India. Chromium metal production by Toyo Soda Industries Co. Ltd. and Nippon Denko Co. Ltd. was 88% of installed capacity in 1982. The metal was used mainly for the manufacture of superalloy steel, 67%; nonferrous alloys, 24%; and welding rod, 8%.

Mine production of manganese ore and concentrate was 81,500 tons compared to 1.2 million tons consumed by the iron and steel industry. Imports of manganese ore and

concentrate containing more than 39% manganese was 1.1 million tons, and ore and concentrate containing 39% or less was 400,000 tons. The Republic of South Africa, Australia, Brazil, Gabon, and Mexico remained the major suppliers. Major contract agreements were reached between Japanese ferromanganese producers and manganese ore suppliers from the Republic of South Africa, Australia, and Gabon in early 1982. The 1982 prices of high-grade ore ranged from $78.50 to $80.00 per ton or about 8% lower than that of 1981. The output of ferromanganese decreased in 1982 as a result of the cutback in Japanese steel production, while production of manganese dioxide continued to increase owing to the increased demand from the manufacturers of electric cells. Mitsui Mining & Smelting, Japan's largest manganese dioxide producer, expanded its annual capacity by 6,000 tons to 25,200 tons at the Takehara plant. In 1982, Japan's manganese dioxide production capacity was 58,200 tons. Production of manganese metal continued to decline, and the industry was operating at 40% of the installed capacity because of further weakening of demand from the manufacturers of nonferrous alloys.

Molybdenum mine production was estimated at 190 tons of ore and concentrate containing 85% MoS_2. Consumption of molybdenum ore by the iron and steel industry totaled 8,728 tons. To meet the requirements of the steel industry and molybdenum metal production, 17,245 tons of molybdenum concentrate was imported from the United States, 38%; Canada, 35%; Chile, 20%; and other, 7%. Production of ferromolybdenum increased slightly. Japan imported 374 tons of ferromolybdenum, of which Austria supplied 240 tons. Consumption of ferromolybdenum for the manufacture of structural alloy, stainless, heat-resistant, and tool steels by the specialty steel industry remained at the same level as that of 1981. Molybdenum metal production for fabrication of fine wire rods and sheet, which were widely used in bulbs and electronics, increased slightly.

Mine production of tungsten ore and concentrate decreased to 1,829 tons containing 43.8% WO_3, while imports of tungsten ore and concentrate totaled 2,297 tons. China and the Republic of Korea remained the dominant overseas suppliers. Because of the reduced demand for ultrahard alloys and tool steel, the output of ferrotungsten declined. Production of tungsten metal, mostly in powder form, also declined owing to the weakened demand from the automobile and heavy electrical sectors.

Both primary and secondary magnesium production declined, primarily owing to a substantial cutback in light-metal rolling and aluminum alloys as well as reduced production of titanium, which uses most of secondary magnesium as a reducing agent.

Other important metal production by the Japanese mineral processing sector includes antimony, bismuth, cadmium, cobalt, indium, palladium, platinum, rare earths, selenium, tantalum, tellurium, and zirconium. These metals were produced mostly from imported materials or produced as a byproduct of domestic ore. Since 1980, production of these metals became vital to the Japanese machinery and electronic industries, as well as to manufacturers of high-value-added products for export and domestic consumption. Because of the slower growth in the Japanese economy and reduced exports of automobiles and industrial machinery and equipment, production of these metals declined slightly in 1982.

NONMETALS

Cement.—Japan remained one of the world's leading cement producers with a high level of technology in energy efficiency, pollution control, and productivity. The industry has an annual capacity of 115 million tons with 24 companies, which operated 59 plants throughout the country. The raw materials, which include limestone, clays, silica sand, and gypsum, are abundant in supply from the domestic nonmetallic mining industry. However, the industry's energy source, coal, was 80% dependent on imports.

Because of the reduction in private construction and in public work projects, cement production and domestic sales decreased. The industry was operating at an average of 69% of capacity, and many companies, reportedly, were involved in laying off workers. However, exports of portland cement and other hydraulic cements rose 13.4% to 11.4 million tons owing to increased demand from the Middle East and Southeast Asia. In 1982, 10.8 million tons of portland cement was exported, mainly to Saudi Arabia, 27%; Kuwait, 24%; Singapore, 16%; Hong Kong, 12%; and Iraq, 6%. Exports of other hydraulic cement totaled 566,584 tons, of which 68.5% was shipped to Kuwait, and 16%, to Saudi Arabia.

According to industry sources, practically all cement plants operated by the 24 companies had converted their energy source from

C-type fuel oil to coal in 1982. After the 1973 oil crisis, the industry began a systematic conversion of its energy source. The ratio of conversion was 2% in 1973; it reached 90% in mid-1981 and 100% in 1982.

To increase energy efficiency and productivity, a precalciner called new suspension preheater (NSP) kiln was introduced to the industry in 1971. The NSP system is not only more energy efficient because of lower energy requirements, but also is less polluting (less nitrogen oxide) because of the low combustion temperature inside the precalciner. In addition, the NSP kiln can easily adapt its energy source from oil to coal. In mid-1980, over 98.2% of the industry capacity used the dry process, of which 66.8% was the NSP dry process. As of 1980, there are 63 NSP kilns in Japan. One plant has more than 9,000-ton-per-day capacity; four plants have 7,000- to 9,000-ton-per-day capacity each; seven plants have 5,000 to 7,000 tons per day each; and the remaining plants were less than 5,000 tons per day each. The average production capacity per NSP plant was 3,790 tons per day.[17]

In 1981, several NSP kilns were installed by the industry. In 1982, two NSP kilns were installed. Nippon Cement Co. Ltd. replaced its No. 4 conventional kiln with an NSP kiln at Saiki plant, while Osaka Cement Co. Ltd. replaced its No. 6 kiln at Kochi plant with an NSP kiln. Of the 80.4 million tons of cement produced in 1982, 74% was by the NSP kiln. The world's largest Loesche roller mill was installed by Osaka Cement at Kochi. The clinker mill, with a daily capacity of 7,200 tons, came onstream as planned.

During 1982, several plants suspended operations because of reduced demand. Niho Cement Co. Ltd. closed two kilns in Hiroshima and in Saitama Prefectures. Onoda Cement Co. Ltd. suspended one kiln in Yumaguchi Prefecture and two kilns in Oita Prefecture. Sumitomo Cement Co. Ltd. reportedly was expected to close up to five kilns in Hyogo and Gifu Prefectures.

Japan's cement producers reportedly were planning to form a cartel to cope with the sluggish cement market. The Cement Association of Japan was to apply for permission from Japan's Fair Trade Commission to form the cartel for 3 to 6 months.

Fertilizer Materials.—Japan remained a significant producer of nitrogen fertilizer in the world. The output of ammonia totaled 2 million tons, and urea, 1.3 million tons. However, the ammonia production represented only 59% of an annual capacity of 3.37 million tons, and urea production, 56% of an annual capacity of 2.32 million tons. By 1981, the production capacity of ammonia and urea had been cut by 26% and 42%, respectively, according to the recommendation of the Industrial Structure Council because of the increased prices of feedstock and reduced demand for nitrogen fertilizer. In June 1982, the Industrial Structure Council recommended a further cut of ammonia and urea capacities by 660,000 tons and 830,000 tons, respectively. The Japan Urea and Ammonium Sulfate Industry Association (JUASIA) reportedly has approved a plan to scale down ammonia annual capacity by 510,000 tons and urea annual capacity by 800,000 tons starting in 1983.

According to the JUASIA, the industry produced 1.7 million tons of ammonium sulfate in 1982, of which 52% was for fertilizer use, 12% for high-analysis compound fertilizer use, 2% for industrial use, and 34% for exports. Production of urea was 1.3 million tons, of which 20% was for fertilizer use, 5% for high-analysis compound fertilizer use, 43% for industrial use, and 32% for exports.

Production of phosphatic and compound fertilizers in Japan was estimated at 3.1 million tons, a slight increase over that of 1981. Most of the high-analysis compound fertilizer and superphosphate was consumed domestically. Domestic demand for compound fertilizers was reduced substantially because of the increased competition from granular mixed fertilizers and the Government policy of reducing the rice-planting area.

Raw material requirements of Japan's phosphatic and compound fertilizer industry were met mostly by imports. Imports of phosphate rock totaled 2.2 million tons. The major suppliers were the United States, 56%; Morocco, 27%; and Jordan, 11%. Imports of potash totaled 1.1 million tons. Canada and the U.S.S.R. remained the two dominant suppliers, accounting for 55.5% and 15%, respectively, of total imports. The United States, the Federal Republic of Germany, and Israel were the other important suppliers of potash to Japan.

In late 1982, three chemical fertilizer manufacturers associations, JUASIA, Japan Phosphatic and Compound Fertilizer Association, and Japan Ammonium Chloride Fertilizer Association, were planning to form a chemical fertilizer export association in mid-1983 to reduce competition in the export markets in China, India, and Southeast Asian countries. The export association

was expected to assist the industry in long-term forecasting, in selecting export markets, and in working out a measurement for a more stable export.

Iodine.—Japan remained the world's largest producer of iodine. Production represented about 73% of the industry's annual capacity of 9,756 tons. Most of the iodine was produced from Chiba, Niigata, and Miyazaki Prefectures. Because of a steady growth in demand for iodine in food and feed additives, X-ray contrast media, industrial chemicals, catalysts, photosensitive materials, and pharmaceuticals, Japan's iodine production increased steadily.

Ise Chemical Industry Co., the largest iodine producer in Japan, reportedly was undertaking a major expansion program that includes development of iodine derivatives, development of new compounds, and a complete technical service to users. The company has expanded its Miyazaki plant capacity from 240 to 700 tons per year in Southern Kyushu and began surveys on production sites in Canada, the United States, and Central and South America. Because of the ground sinking problem in the Chiba Prefecture, where most of the company's iodine production was based, Ise Chemical in 1980 began its search for overseas production sites to expand its capacity, especially in the United States.

Other Nonmetals.—Japan's other important nonmetal production included aplite, feldspar, bentonite, fire clay, gypsum, kaolin, magnesia clinker, pyrites, pyrophyllite, salt, and sulfur. Because of the slowdown in the Japanese economy, most nonmetal production declined in 1982.

Japan remained the world's leading producer of limestone. Most of its output was consumed domestically by the cement and iron and steel industries. Dolomite production was used mainly by the iron and steel industry and for road construction. Magnesia clinker was used for steelmaking and for refractories. Production of synthetic gypsum as a byproduct of phosphoric acid processing was mainly for cement and gypsum wallboard manufacturing. Over the past 2 years, bentonite clays production was increased from 400,000 to 480,000 tons as a result of the increased consumption in foundries, oil well drilling, and pesticides. Fire clays and kaolin were consumed mainly by the paper, ceramics, refractories, and foundry industries. Production of aplite and feldspar was for the ceramics and glass industries. Sulfur and pyrites were for use in the chemical industry, and pyrophyllite was for ceramics, refractories, and pesticides.

Japan remained a major salt consumer in the world. Japan imported about 86% of its salt requirements in 1982. Mexico and Australia were the major overseas suppliers, each accounting for 46% of Japan's total salt imports. Japan's domestic production of salt was estimated at 1.1 million tons. Imports of salt decreased slightly to 6.3 million tons. The total demand was about 8 million tons, of which 1.6 million tons was for general use, and 6.4 million tons was consumed by the soda industry. Production of caustic soda declined from 3 million tons in 1981 to 2.8 million tons in 1982. Most caustic soda was consumed domestically by the chemical industry. The growing users of caustic soda in Japan included paper and pulp, and inorganic and organic petrochemicals, while the other major users in the manufacture of chemical fiber and alumina remained sluggish.

MINERAL FUELS

Japan's primary energy supply, as estimated by the Natural Resources and Energy Agency of MITI, dropped 2.8% to 3,838.6 trillion kilocalories or 7,037,000 barrels per day of oil equivalent in fiscal year 1981 (ending March 31, 1982).

Over the past 2 years, Japan's dependency on imported energy dropped from 85.3% in fiscal year 1980 to 84.8% in fiscal year 1981. The relative importance of oil (99.8% was imported) in Japan's primary energy supply also dropped to 63.7% in fiscal year 1981 from 65.8% in the previous year.[18]

Table 6.—Japan: Primary energy supply

(Thousand 42-gallon barrels per day)

Energy source	Fiscal year 1980	Fiscal year 1981
Petroleum:		
Domestic crude	8	8
Imported crude	4,222	3,893
Imported products	312	347
Imported liquefied petroleum gas	221	232
Coal:		
Domestic	224	215
Imported	1,007	1,079
Hydropower	413	407
Nuclear power	371	394
Imported liquefied natural gas	416	416
Domestic natural gas	43	42
Other[1]	4	4
Total	7,241	7,037

[1]Includes domestic lignite, charcoal, and firewood.

For fiscal year 1981, Japan's energy consumption was estimated at 6,887,000 barrels per day of oil equivalent, of which 13.8% was consumed by the iron and steel sector; 26.8% by other mining and manufacturing sectors; 7.7% by the energy sector; 14.8% by the transportation sector; 2.4% by the agriculture, forestry, and fishery sector; 23.8% by the household and commercial sector; 7.6% by the nonenergy sector; and 3.1% was exported. By the form of energy consumed, oil and liquefied petroleum gas accounted for 52.1%; electricity, 32.5%; coke, 6.8%; city gas, 2.7%; coal, 2.4%; coke oven gas, 1.5%; blast furnace gas, 1.5%; natural gas, 0.3%; and others, 0.2%.

Coal.—Domestic mine production of coal in 1982 declined slightly from that of 1981 owing to the continued shutdown of the Yubari Mine in Hokkaido. The output was equivalent to 18.2% of Japan's coal demand for the year. To meet its coal requirements, Japan imported 78.5 million tons of coal in 1982, of which 64.1 million tons was coking coal, 13.8 million tons was steam coal, and 630,000 tons was anthracite.

Japan's coal mining industry consists of 33 companies and 45 coal mines. In 1982, only 28 of the 45 mines were operating, 20 in Hokkaido, 5 in Kyushu, and 3 in Honshu (the main island). Of the total coal produced, 69.7% was steam coal; 30.1%, coking coal; and 0.2%, anthracite. The average heating value was 6,370 kilocalories per kilogram in 1982 compared with 6,450 kilocalories per kilogram in 1981. The number of mine workers at the end of 1982 dropped 8.9% to 16,343 from that of 1981, but labor productivity rose to 90.5 tons per month of coal per miner in 1982 from 79.4 tons per month of coal per miner in 1981. However, the working days of Japanese coal miners increased to 299.6 days in 1982 from 296.4 days in 1981.

Because of the cutbacks in production of iron and steel, imports of coking coal dropped slightly in 1982. The major suppliers of coking coal were Australia, 39%; the United States, 37%; Canada, 15%; the Republic of South Africa, 5%; and others, 4%. Imports of steam coal continued to increase owing to the growing demand from the utility industry. The major suppliers of steam coal were Australia, 46%; the United States, 12%; China, 11%; and others, 31%. Imports of anthracite mainly for the manufacture of briquet decreased sharply. China and Vietnam remained the two dominant overseas suppliers.

The 1982 average price of imported steam coal was 2% to 4% lower than that of 1981, but the import price of coking coal was 4% to 9% higher than that of 1981. The average c.i.f. prices per ton of steam coal in 1982 range from $64.93 (Australia) to $70.60 (United States), while the average c.i.f. price of coking coal ranged from $68.11 (Australia) to $82.91 (United States).

Demand for coal decreased slightly in 1982 owing to the reduced demand from the manufacturing sector.

Table 7.—Japan: Coal consumption by sector

(Thousand metric tons)

Consuming sector	1981	1982
Manufacturing:		
Coke	5,197	4,330
Domestic	1,291	941
Imported	3,906	3,389
Iron and steel	64,256	62,679
Domestic	3,723	2,979
Imported	60,533	59,700
Cement, ceramics, and other	12,590	12,910
Domestic	3,373	2,718
Imported	9,217	10,192
Utilities:		
Electric power:

Domestic	1,418	1,526
Imported	47	10
Total	1,465	1,536
Grand total	97,480	96,879
Domestic	19,695	18,230
Imported	77,785	78,649

To diversify the Japanese major overseas coal sources away from Australia into the United States, the New Energy Development Organization (NEDO) of Japan, a quasi-governmental agency, awarded a contract to Bechtel Corp. of the United States for conducting a comprehensive survey on steam coal resource development in the United States in mid-1982. According to the contract, Bechtel was to select 11 major coal regions in the States of Alabama, Alaska, Colorado, Illinois, Montana, Utah, and Wyoming, and to analyze the possibility of establishing a coal chain system to handle steam coal from the mine mouth in 11 coal regions to the ocean ports in the United

States. The survey was expected to be completed by March 1983. According to a NEDO official, the survey was expected to serve as a guide for Japan to a joint venture development of steam coal in the United States and importation of steam coal from the United States in the future.[19]

In late 1982, two Japanese concerns reportedly withdrew from two steam coal projects in Australia. The Birds Rock Steam Coal project of New South Wales was a joint venture of the Japan Coal Development Co., Taiheiyo Coal Development Co., Mitsui & Co., and C. Itoh & Co. Ltd. of Japan and the New South Wales State Electricity Commission (SEC) of Australia. The 3-million-ton-per-year coal project was expected to be terminated. The Mount Arthur South steam coal project, also in New South Wales, was a joint venture between the Electric Power Development Co. and Mitsui of Japan and SEC. The 4-million-ton-per-year coal project reportedly was to be postponed indefinitely. The reduced demand for steam coal by the Japanese electric power industry based on a lower projection of electricity requirements in Japan's long-term energy supply and demand forecast was cited as the major reason for the Japanese to drop the steam coal development projects in New South Wales, Australia. However, the coking coal project at the Riverside Mine in central Queensland, Australia, reportedly was expected to start operation in October 1983. Under an agreement signed between Japanese steel mills and the Queensland State government in December 1980, Japan was expected to import a total of 47.5 million tons of coking coal from the Riverside Mine over a 14-1/2-year period beginning in October 1983.

In October, a trade agreement was signed between 13 Japanese companies and McIntyre Mines Ltd. of Canada. The agreement calls for McIntyre Mines to export 1.8 million tons of coking coal to Japan over 1983-84 from its Smokey River coal operation in Grande Cache in Canada.

In September 1982, a revised bilateral trade agreement was signed between Japan and China. The revised agreement calls for a reduction of annual coal imports from China to 4.5 million tons (2 million tons of coking coal and 2.5 million tons of steam coal) in 1983, 6 million tons in 1984, and 7 to 8 million tons in 1985. Under the old agreement, annual coal imports from China were 10 million tons.

Petroleum and Natural Gas.—Domestic production of crude oil increased slightly; however, it remained insignificant in Japan's total crude oil supply. Because of the slowdown in the Japanese economy, the continuing shifting of the country's energy sources away from oil, and the successful energy conservation programs in major oil-consuming industries, Japan's imports of crude oil continued to decrease by 6.8% to 1,350 million barrels in 1982 from that of 1981. Consumption of crude oil (refinery input of crude oil) also declined 7.2% to 1,231 million barrels. The Japanese petroleum refining industry was operating at 56.8% of the installed capacity compared with 61.2% in 1981.

Despite the weakened yen against the U.S. dollar, the total value of crude oil imports decreased to $46.3 billion in 1982 from $53.3 billion in 1981 owing to the reduced import volume and the lower oil price. The average price of imported crude was $34.69 per barrel in 1982 compared with $37.31 per barrel in 1981. Japan also took advantage of the soft international spot crude market in 1982. Imports of crude purchased from the spot market rose to 9% of total imports in 1982 from 5.6% in 1981. The low-priced spot oil reportedly was offered mainly by Iran.

The pattern of Japan's imported crude oil supply remained about the same as 1981. Crude oil supplied by major international oil companies was 43.1% in 1982 compared with 44.7% in 1981. Crude oil supplied by oil-producing countries through direct deals and government-to-government basis was 44.9% in 1982 compared with 44.8% in 1981. Crude oil supplied by other independent international companies was 3.5% in 1982 compared with 3.7% in 1981. However, the share of imports supplied by Japanese producers of overseas oil increased to 8.5% in 1982 from 6.8% in 1981.[20]

In 1982, Japan's import reliance of crude oil remained at 99.8%. The major sources of imported crude oil were the Middle East accounting for 70.6% and Southeast Asia, 19.6%. The principal supplying countries were Saudi Arabia, 35.4%; Indonesia, 15.2%; the United Arab Emirates, 13.4%; Iran, 6.2%; and China, 4.8%. The share of crude oil imports from Africa declined to 1.3% in 1982 from 4.4% in 1981 because of a substantial reduction in imports from Libya. The share of imports from Latin America also declined slightly to 3.7% but with more imports coming from Mexico in 1981 than in 1982.

After Japan and China signed a contract for joint exploration and development of oil

resources in China's Bo Hai Bay in May 1980, the exploratory drilling began in December 1980. Japan China Oil Development Corp., a Tokyo-based company, was assigned as operator for exploration with 100% financing by Japan, and as operator for development with 51% financing by China and 49% by Japan. China will be responsible for oil production with 100% financing by China. The sharing of oil production between Japan and China will be based on 42.5:57.5 ratio in favor of China. By the end of 1982, the total cost of exploration was raised to $600 million from the original estimate of $210 million. According to industry sources, a total of eight oilfields were discovered by the end of 1982.

Because of reduced demand for petroleum products, Japan's refining industry was expected to reduce its total capacity by 11.8% to 5.24 million barrels per day in 1983. The capacity reduction program was in line with the reorganization and restructuring of the oil industry to help streamline the industry's production and market shares, and to stabilize the domestic oil market under low-growth market conditions.

Domestic production of natural gas declined slightly in 1982 and accounted for approximately 0.6% of Japan's primary energy supply and 7.4% of total natural gas and liquefied natural gas (LNG) supply. Natural gas produced from natural gasfields remained at 97.9%; the remainder was produced from oilfields and coalfields. The major producing areas were Niigata Prefecture, accounting for 78% of total output; Chiba Prefecture, 19.8%; and Akita Prefecture and other, 2.2%.

In 1982, Teikoku Oil Co. Ltd., Esso Petroleum Development Co., and East Japan Oil Development Co. reportedly were jointly constructing offshore gas production facilities of the Iwaki Gasfield about 25 miles off the coast of Fukushima Prefecture. The $400 million development project was scheduled for completion in early 1984. The output of natural gas was expected to be at a daily rate of 42.2 million cubic feet in 1984.

Distribution of domestically produced natural gas totaled 70,439 million cubic feet, mainly to the oil and gas mining industry for pressure maintenance, chemical industry for feedstock, utility industry for power generation, and city gas industry for household service. About 93% of Japan's natural gas requirements was met by imports in the form of LNG.

Imports of LNG rose 3.8% to 17.48 million tons in 1982, of which 52% was imported from Indonesia, 29.5% was from Brunei, 13% was from Abu Dhabi, and 5.5% was from Alaska of the United States. Because of the soft international oil market, the average import price of LNG, in dollars per million British thermal units (Btu), declined to $5.74 in 1982 from $5.83 in 1981. Indonesia's price was the lowest at $5.63 per million Btu compared to the highest from Abu Dhabi at $6.27 per million Btu in 1982.

Consumption of imported LNG was for electric power generation, 76%; city gas, 21%; and industrial use, 3%.

In April, an agreement was reached between Japan and the United States for the extension of Alaskan LNG exports to Japan to 1989. The old contract, which allowed exports of LNG from Alaska to Japan, began in 1969 and was expected to expire in May 1984. Japan imported about 1 million tons of LNG from the United States annually.

The Mineral Industry of Jordan

By Peter J. Clarke[1]

Jordan's mineral industry, and its economy in general, continued to expand in 1982, albeit at a somewhat slower rate than in previous years. Jordan's gross domestic product, after having increased 7.6% in real terms from 1980 to 1981, grew about 5% in real terms in 1982 to an estimated $3.9 billion, despite a 7% depreciation of the dinar with respect to the U.S. dollar.[2]

Jordan's mineral industry continued to be one of the fastest growing sectors of the economy. In 1982, commercial production began from the Jordan Fertilizer Industries Co. (JFI) plant at Aqaba and from the Arab Potash Co. (APC) operation on the Dead Sea. The phosphate mining industry was able to increase output in 1982, marking the eighth straight year of production increases. Jordan's other mineral-related industries were cement and construction material production and petroleum refining. Despite continued efforts in 1982, no commercial reserves of oil have been found in the country, and Jordan continued to rely on petroleum imports for its energy requirements.

PRODUCTION

Production of Jordan's major minerals increased slightly in 1982, led by a 3.5% increase in phosphate rock production, and the first commercial production of potash and phosphatic fertilizer. Production of gypsum and cement declined slightly during the year. The production of refined petroleum products increased substantially in 1982, owing to the completion of the expansion project at the country's only refinery, at Zarqa. The expansion made Jordan nearly self-sufficient in refined products, a remarkable achievement for a non-oil-producing country with one of the highest energy consumption growth rates in the world, over 10% per year. Completion of the potash plant, the fertilizer facility, the refinery expansion, and the recent addition of a new cement production line at the Fuheis cement plant represent major advancements in Jordan's goal to develop and use to its advantage all its available domestic resources.

Table 1.—Jordan: Production of mineral commodities[1]

Commodity	1978	1979	1980	1981[p]	1982[e]
Cement, hydraulic metric tons	564,000	[r]767,000	[r]913,000	892,000	[2]795,000

TRADE

Jordan's trade deficit continued to be a problem, growing from $2.4 billion in 1981, to an estimated $2.7 billion in 1982. In 1982, Jordan's trade deficit could not be overcome by remittances from Jordanians working abroad and foreign aid, both of which appeared to decline somewhat from that of 1981, and it ended the year with a moderate balance-of-payments deficit.

The United States maintained its position as Jordan's leading trading partner in 1982, providing the largest percentage of Jordanian imports. Mineral exports were valued at approximately $200 million in 1982, representing 25% of total exports. Saudi Arabia was Jordan's second leading trading partner, mainly by virtue of its being the sole supplier of Jordan's crude oil imports, which are delivered via the Trans-Arabian Pipeline Co. (TAPline). Imports of crude oil were valued at approximately $500 million in 1982.

COMMODITY REVIEW

METALS

Jordan did not produce any raw metals in 1982. Two small steel producers, the Jordan Iron and Steel Co. and the Jordan Pipes Manufacturing Co., were responsible for all of Jordan's steel output of about 100,000 tons per year. The Jordan Iron and Steel plant at Zarqa produced about 50,000 tons per year of steel reinforcing bars, mainly from scrap. Jordan Pipes Manufacturing operated a 120,000-ton-per-year welded pipe plant in Amman. Also, the Arab Aluminum Industry Co. operated a 5,000-ton-per-year aluminum extrusion and anodizing plant in Amman, utilizing imported aluminum ingots.

NONMETALS

Cement.—Output from Jordan's Fuheis cement plant, located 25 kilometers northwest of Amman, declined in 1982 to a level below its new 1.3-million-ton-per-year capacity. The Jordan Cement Factories Co., which owned the Fuheis plant, planned to add two new kilns to the plant, adding 700,000 tons per year to capacity by 1985.

Phosphate Rock.—Production of phosphate rock, Jordan's single largest export commodity, increased slightly in 1982 as the Jordan Phosphate Mines Co. (JPMC) continued to expand and develop the country's vast resources. Phosphate rock was produced in three main areas in Jordan, at Ruseifa, located 14 kilometers north of Amman, Wadi-El-Abyad, 120 kilometers south of Amman, and El-Hasa, 20 kilometers south of Wadi-El-Abyad. A fourth deposit, at Ash-Shidiya, located 50 kilometers northeast of Aqaba in southern Jordan, was being studied for development in the late 1980's. Reserves at Shidiya were estimated at 300 million tons of phosphate rock containing 28% to 34% P_2O_5.

At Ruseifa, the oldest of the country's mines, measured reserves were 50 million tons containing 64.5% bone phosphate of lime (BPL) and an additional 15 million tons indicated reserves containing 65% BPL. Production capacity at Ruseifa was 1 million tons of phosphate rock per year, mined by opencast methods and processed by simple screening and drying. JPMC also oper-

ated a research center at Ruseifa to test various phosphate beneficiation techniques, including hydrocycloning, flotation, and calcining procedures.

The El-Hasa and Wadi-El-Abyad Mines are located on the same concession and are similar geologically. The phosphate occurs in the Belqa series of Upper Cretaceous Age and is found in two main horizons separated by 5 to 20 meters of limestone. Usually the upper horizon contains the higher grade (64% to 72% BPL) phosphate and is the only layer being mined. At El-Hasa, the larger of the two mines, four separate ore bodies are being mined, one of which utilizes a new walking dragline with a 30.6-cubic-meter bucket for overburden stripping. Production capacity at El-Hasa was 3 million tons per year of phosphate rock. The beneficiation process consists of four crushing plants that average 250 to 450 tons per hour each, five beneficiation lines, and eight dryers. Beneficiation is by screening, slurrying and wet screening, hydrocyclone filtering, and then drying. Output from both El-Hasa and Wadi-El-Abyad consists of standard grade 70% to 72% BPL unbeneficiated direct shipping ore, and high grade 73% to 75% BPL beneficiated material produced from 64% to 66% BPL grade ore.

At Wadi-El-Abyad, which began production in 1980, only one of three known ore bodies is being worked. Production capacity was approximately 1.2 million tons per year of phosphate rock, which is processed in two parallel beneficiation lines. A third line was to be added, raising capacity of the mill from 450 to 675 tons per hour of phosphate rock. Measured reserves at Wadi-El-Abyad were 53 million tons of phosphate, containing 65% BPL. Reserves on the combined El-Hasa and Wadi-El-Abyad concession were 158 million tons measured containing 65% BPL, and 40 million tons indicated containing 66% BPL. Phosphate from all three mines was transported by rail and truck to Aqaba for export. Beginning in 1982, some of JPMC's output was delivered to the JFI phosphate fertilizer plant, also located in Aqaba.

JFI's $400 million phosphatic fertilizer complex was brought onstream early in 1982. The plant produces sulfuric acid, phosphoric acid, and diammonium phosphate (DAP) or monoammonium phosphate (MAP) fertilizer from imported sulfur and ammonia and Jordanian phosphate. In 1982, two shipments totaling 35,000 tons of DAP were exported from the plant. The main units of the plant consisted of two identical sulfuric acid units, capable of producing 1,800 tons per day of sulfuric acid utilizing Heurtey Industries' double absorption process; a single 1,250-ton-per-day phosphoric acid unit, which produced three grades of phosphoric acid; two parallel DAP-granulation production units, each capable of producing 1,100 tons per day of either MAP or DAP, and storage facilities for DAP, MAP, and the imported raw materials. Two bagging plants were also operating, used primarily for bagging DAP for export. Attached by conveyor and pipelines to the plant was a newly completed 215-meter pier equipped for double-sided berthing. The operation was capable of simultaneously loading DAP and potash for export and unloading imported solid sulfur and liquid ammonia.

Also under construction at the plantsite was a 20,000-ton-per-year aluminum fluoride plant being built by Davy McKee Corp. (United Kingdom). The plant was to utilize fluorosilicic acid, a byproduct of phosphoric acid production, to produce aluminum fluoride for export to neighboring aluminum-producing countries.

Potash.—Production commenced in 1982 from the APC Dead Sea potash project, located at Ghor-al-Sufi, near the Lisan Peninsula on the banks of the Dead Sea in central Jordan. The APC was a joint venture of the Jordan Government (51%), the Arab Mining Co. (25%), and other Arab Governments and private shareholders. The project was being managed under contract until 1985 by Jacobs Engineering Ltd. of the United States, which was the construction manager for the entire operation.

Potash muriate is recovered from Dead Sea brines, which are pumped from an offshore area in the Dead Sea and conveyed by gravity along a 10-kilometer canal to a large salt pan. Following the first stage of solar evaporation, NaCl is precipitated, leaving a saturated solution of carnallite ($KCl\text{-}MgCl\text{-}6H_2O$). The brine is then pumped into two precarnallite pans, where further NaCl precipitation occurs. Finally, the remaining solution is pumped into three carnallite pans, where carnallite is crystallized just below the water's surface. The carnallite is harvested from one pan each year by using three laser-guided harvesting machines that crawl along semisubmerged on caterpillar tracks. The carnallite is scooped up and pushed into a trailing flexible floating pipeline. The slurry then reaches a booster pump at the edge of the

pan and is pipelined to the refinery.

In the refinery, the slurry is dewatered and MgCl is leached out, leaving a slurry of synthetic sylvinite. The sylvinite is then hot leached and passed through multieffect evaporators to separate the remaining NaCl, leaving a crystal slurry of potassium chloride (KCl). The KCl is then dewatered, washed, dried, cooled, and treated with anticaking agents. The process produces standard, granular, and coarse grades of KCl in about equal quantities, with total production capacity equal to 1.2 million tons per year of KCl of all grades. Full capacity could be reached by 1984. All of the plant's output has been contracted for up through 1987 on a take or pay basis f.o.b. at Aqaba. APC was also planning to construct facilities to recover magnesium, bromine, and potassium sulfate as byproducts from the refinery effluent.

MINERAL FUELS

Despite its continuing exploration efforts, Jordan had yet to locate any commercial quantities of oil or gas. In 1981, the National Resources Authority (NRA) reported an oil strike at 805 meters depth in the al-Azraq region, 70 kilometers east of Amman, by the Yugoslav contractor Naftagas. Following that report, the NRA drew up an $85 million 5-year exploration program to cover the Azraq region and other high potential areas. All exploration work is being carried out by the NRA, with any foreign assistance being provided on a contract basis without any concession rights. Further exploration work in the area has failed to locate any commercial reserves, but new wells were still being drilled in the area at the end of 1982.

All of Jordan's domestic petroleum requirements are supplied by TAPline, and refined in the Jordan Petroleum Refinery Co.'s 60,000-barrel-per-day refinery at Zarqa. Capacity of the refinery was expanded from 35,000 to 60,000 barrels per day crude throughput in 1982, which makes Jordan self-sufficient in refined products. The expansion was achieved through the addition of new hydrocracking and distillation units, along with a new liquefied petroleum gas production unit, at a total cost of $175 million.

Also under construction at the refinery was a small petrochemical plant, capable of producing annually 10,000 tons of polyester, 4,000 tons of plasticizers, and 5,000 tons of polyvinyl chloride. Rio Rodano was constructing the plant, which was scheduled for completion early in 1983.

The Mineral Industry of Kenya

By Thomas O. Glover[1]

In 1982, the growth of the mining and quarrying sector of Kenya's economy remained relatively unchanged. The real gross domestic product (GDP) was estimated to be $3.7 billion,[2] with the mining and quarrying sector accounting for less than 1% of GDP. Balance-of-payment constraints and structural problems continued to dampen economic activity while accelerating inflation. In December, the Kenyan shilling was devalued for a third time in less than 2 years. The economy remained vulnerable to energy costs as energy imports absorbed 57% of foreign exchange. Kenya has moved ahead in diversifying its energy sources by shifting much of its electricity production to hydroelectric and geothermal powerplants. Kenya's main domestic power source was hydroelectric and derived mainly from power stations on the Tana River; however, the potential for expanding domestic hydropower was comparatively limited. Kenya's domestic power requirements were forecast to grow at an annual rate of 7% with plans to increase the use of geothermal energy as the future major power source.

Early in 1982, the International Bank for Reconstruction and Development (World Bank) agreed to provide a $40 million loan for the geothermal project at Olkaria, 100 kilometers northwest of Nairobi, where the Kenya Power Co. believes there is the potential to produce about 700 megawatts of electricity.

In the mineral exploration sector, work was continued on the Samburu-Marsabit mapping and mineral exploration project in north-central Kenya. The 4 year, $55 million program was begun in 1981 and involves staffs from Kenya's Mines and Geological Department and the United Kingdom's Institute of Geological Sciences. In 1980, a technical assistance agreement was signed between the Kenyan Government and Geologinen Tutkimuslaitos of Finland for an industrial minerals development program. A new unit was established in 1982 within the Environment and Natural Resources Ministry with a mission to make a countrywide survey for industrial minerals including limestone, gypsum, asbestos, and diatomite.

PRODUCTION AND TRADE

The principal mineral commodities produced continued to be soda ash and fluorspar. Soda ash was Kenya's leading mineral export, with most going to the Philippines, Indonesia, and Malaysia. Production of soda ash was targeted to reach 300,000 tons in 1982, and was planned to reach 550,000 tons in 1985.

Kenya was Africa's second largest fluorspar producer, with exports mainly to the U.S.S.R., Greece, Japan, and the Federal Republic of Germany. The falling prices of fluorspar created financial difficulties for the new Kerio Valley Mine.

Cement production has continued to rise since 1980, with exports going to Mauritius Oman, and Reunion.

[1]Table includes data available through Aug. 29, 1983.

[2]Less than 1/2 unit.

[3]Quality (gem or industrial) not specified.

[4]Coral for cement manufacture apparently has been included with limestone for cement manufacture.

[5]Probably an incomplete figure.

[6]Includes some fuel oil also described as unfinished oil.

COMMODITY REVIEW

METALS

Production of metallic minerals in Kenya was virtually nil. A small amount of magnetite was produced in 1982.

One small reverse cold-rolling steel mill, constructed in 1978, was operated in Mombasa during 1982. A second mill, with a capacity of 100,000 tons per year, was planned for construction in Mombasa by Kenya Steel Co.

NONMETALS

Cement.—Cement production continued to increase in Kenya. Two large producers, Bamburi Portland Cement Co. and the East African Portland Cement Co., operated plants near Mombasa and Nairobi, respectively. Bamburi upgraded its two rotary kilns by installing precalciners. Both kilns have been converted to coal firing from oil and are scheduled to start up in early 1983. Bamburi exports approximately 75% of its production, most of it to countries in the Arab Gulf. In 1982, Bamburi was encountering stiff competition from other exporting countries. Greece, Japan, the Republic of Korea, and Spain stepped up their production and priced their cement at a level that Bamburi was having trouble meeting.

Fertilizer Materials.—National Agricultural Chemicals & Fertilizers of Kenya Ltd. was building a fertilizer facility at Mombasa. The plant's capacity was 100,000 tons per year of nitrogen in the form of calcium-ammonium nitrate and 130,000 tons per year of diammonium phosphate and monoammonium phosphate. Stamicarbon B.V. was the designer for both units that are scheduled for commissioning in 1984. The new plant should encourage domestic consumption of the fertilizer materials and produce a sizable surplus for export.

Fluorspar.—The Kenya Fluorspar Co. Ltd. (KFC) was a wholly owned Kenyan Government company operating a mine and fluorspar concentrator in the Kerio Valley of Western Kenya. KFC ranked as one of the country's leading foreign exchange earners and was at the forefront of development in this remote area. The mine was situated 400 kilometers by road northwest of Nairobi. The original fluorspar deposits were discovered in 1967, with approximately 737,000 tons of ore having been removed from 1967 through 1981. The majority of the fluorspar was acid grade. The projected life of the open cast mine based on current proven ore reserves was 10 years at an annual production rate of 310,000 tons.

Soda Ash.—Soda ash remained Kenya's principal foreign exchange earner in the minerals sector. The production of soda ash, at Magadi Soda Co. south of Nairobi, was targeted to reach 300,000 tons per year in 1982. Magadi also produced approximately 3,500 tons per month of salt by solar evaporation for the domestic market. The company planned to expand its production capacity for soda ash to 550,000 tons per year. This required improvements to existing infrastructural support facilities including additional power, a new deepwater berth to complement improved handling facilities at the Port of Mombasa, and additional rolling stock for Kenya Railways.

MINERAL FUELS

Kenya, which imported 100% of its petroleum, passed new oil production regulations. The operating regulations were published in the Kenya Gazette in May. The regulations are divided into three parts, nonexclusive exploration license, oil exploration and mining license, and fees and royalties. The regulations cover crude oil, natural gas, and hydrocarbons produced from oil shales and tar sands.

Kenya offered to lease six tracts of land, both onshore and offshore, ranging in size from 12,000 to 27,000 square kilometers. Previous leasing over the past two decades had involved 16 wells drilled, 16,500 line kilometers of onshore seismic, and 5,300 line kilometers of offshore seismic.

The Mombasa refinery was shut down in October for a short period owing to Government cutbacks in foreign exchange for oil imports. The refinery exports to Uganda, Rwanda, Burundi, and parts of Zaire.

The Mineral Industry of the Republic of Korea

By E. Chin[1]

The Republic of Korea's gross national product (GNP) was $60.5 billion in 1981 compared with $64.3 billion in 1982 at current market prices.[2] In constant 1975 prices, the GNP was $30.6 billion in 1981 and $32.2 billion in 1982, reflecting a real growth of 5%. Input by sector to GNP in 1982 was as follows: manufacturing, 34%; wholesale and retail trade, 19%; agriculture, forestry, and fishing, 18%; transport, storage, and communication, 9%; business services, 7%; construction, 7%; and other, 6%. Mining and quarrying accounted for only $386 million in 1982 compared with $398 million in 1981.

In 1982, employment in the mining sector totaled 110,000 persons, and monthly earnings averaged about $367. Monthly earnings in metal mining were $397; followed by coal, $387; and other mining, $267. In comparison, monthly earnings in selected manufacturing sectors were petroleum refining, $734; iron and steel, $379; nonmetallic mineral products, $350; industrial chemicals, $347; nonferrous metals, $263; and fabricated metal products, $262. The national average for monthly earnings was $283 based on 24.9 workdays.

The wholesale price index (1980=100) for all commodities was 126.0 in 1982 compared with 120.4 in 1981. Between 1981 and 1982, the wholesale price index for producer goods increased from 121.3 to 127.5; capital goods, from 111.5 to 119.8; and consumer goods, from 120.4 to 124.8. Wholesale prices for selected commodities in 1982 were compound fertilizers, $254 per ton; cement, $60 per ton; hot-rolled steel coil, $313 per ton; gold, $403 per troy ounce; copper, $2,111 per ton; premium gasoline, $1.24 per liter; and bunker C oil, $0.24 per liter.

Total electric power generated was 43.1 billion kilowatt-hours, of which 96% was from thermal powerplants. Consumption by various industries was as follows, in billion kilowatt-hours: primary metals, 5.1; chemicals, 4.6; nonmetals and metal products, each 2.9; and mining, 0.7. Consumption by the residential sector totaled 6.6 billion kilowatt-hours, and for the public sector, 1.4 billion kilowatt-hours.

Total rail freight transportation was 46.8 million tons. Railway tonnage of selected commodities was as follows, in million tons: anthracite coal, 19.6; cement, 9.5; minerals, 3.9; fertilizers, 1.9; and ferrous materials, 0.4.[3]

During the past two decades, the Republic of Korea has vigorously garnered foreign capital to supplement domestic capital for its industrialization and modernization. During the first economic development plan (1962-66), loans and foreign investments totaled $0.3 billion; during the second development plan (1967-71), $2.3 billion; during the third plan, $6.0 billion; and during the fourth plan (1977-80), $14.0 billion. During the fifth economic development plan (1982-86), the Government projected fixed capital formation at $109 billion. Foreign capital to be induced was estimated as follows, in billion dollars: bank loans, 33.3; foreign currency bonds, 1.7; and short-term loans and other sources, 11.5. During the current economic plan, only 0.7% of the total fixed capital formation was designated, however, for the mining sector.[4] Major projects scheduled for implementation during 1982-86 include expansion of existing shipbuilding capacity and construction of nuclear powerplants, a shipyard, two liquefied natural gas import terminals, and a 3-million-ton-per-year integrated steel complex.[5]

According to the Ministry of Energy and

Resources, seven companies were conducting minerals development in foreign countries. With the exception of Pohang Iron and Steel Co. Ltd. (Posco), the other six companies have established joint ventures with foreign firms. In addition, four companies were planning overseas minerals projects in joint ventures with foreign counterparts. Of the 27 overseas projects planned or in progress, 14 were for bituminous coal, 6 for anthracite, 2 for copper, 2 for iron ore, and 3 for crude oil. Overseas projects in effect during 1982 were in Australia, Canada, Gabon, Indonesia, Paraguay, and the United States.

The Government of the Republic of Korea, a signatory to the International Law of the Sea Treaty, plans to spend $30 million for the exploration of seabed manganese nodules and an additional $30 million for the experimental harvesting of seabed nodules during 1984-89. A 150,000-square-kilometer mining zone in the Pacific was to be set up by the end of 1984. If the mining plan is viable, further investment was to be made for ship procurement and the construction of a coastal receiving terminal and metals refining facilities.

PRODUCTION

In terms of world output, the Republic of Korea is a significant producer of graphite, kaolin, pyrophyllite, talc, and tungsten. Although anthracite coal was the most important sector by volume and value of output, production only averaged 18 million tons annually during the past 10 years. There is limited domestic mine output of copper, fluorite, gold, iron ore, lead, silver, and zinc.

Most of the Republic of Korea's mineral raw materials for its industrial needs are imported. For instance, production of primary metals such as aluminum, copper, and iron and steel is largely from imported ores and concentrates. Significantly, there is no domestic production of oil and natural gas.

The industrial production index (1980=100) for all items in 1982 was 118.1 compared with 96.9 for mining and 119.2 for manufacturing. The index for coal mining was 94.8; for metal mining, 97.9; and for all other mining, 103.7. Other indices included petroleum refining, 99.0; nonmetal mineral products, 107.0; iron and steel, 135.0; nonferrous metals, 174.6; and fabricated metal products, 136.3.

TRADE

During the past 22 years, a spectacular growth occurred in the Republic of Korea's foreign trade. In 1960, total trade was only $0.4 billion; in 1970, $2.8 billion; and in 1980, $39.8 billion. Total trade during 1982 topped $46.1 billion. Throughout the 22-year period, however, an annual trade deficit was incurred in the Republic of Korea's current account because the value of imports exceeded the value of exports.

In 1982, total exports were $21.9 billion. Major destinations were the United States with $6.2 billion; Japan, $3.4 billion; United Kingdom, $1.1 billion; Hong Kong, $0.9 billion; Canada, Indonesia, and Singapore, each with $0.4 billion; and Australia, $0.3 billion. Shipments of machinery and transport equipment totaled $6.0 billion; other manufactured goods, $13.2 billion; food products, $1.1 billion; and other exports, $1.6 billion.

Imports totaled $24.2 billion; major sup-

plying countries were the United States, $6.0 billion; Japan, $5.3 billion; Australia, $0.9 billion; Kuwait, $0.8 billion; Indonesia and the Federal Republic of Germany, each with $0.7 billion; and Malaysia, $0.6 billion. Receipts of mineral fuels and related materials were the largest class, valued at $7.6 billion, followed by machinery and transport equipment, $6.0 billion; crude raw materials and manufactures, each $3.4 billion; chemicals, $2.1 billion; food products, $1.6 billion; and other, $0.1 billion.

The Republic of Korea has established industrial estates that consume raw materials, largely imported, to produce value-added goods for export. The country's major manufacturing cities (type of industrial estate given in parentheses) are Gumi (electronics), Ulsan (petrochemicals and shipbuilding), Onsan (nonferrous metals), Changwon (machinery), Mason (free export zone), Yeocheon (petrochemicals), and Iri (free export zone). Korea Trade Promotion Corp. is a state-run enterprise charged with strengthening economic cooperation and trade relations with foreign countries. The Republic of Korea's general trading companies, which are large and deal with diverse commodities, include Bando Sangsa Co. Ltd., Daewoo Corp., Hyosung Corp., Hyundai Corp., Korea Trading International Inc., Kukje Corp., Kumho & Co. Inc., Samsung Co. Ltd., Ssangyong Corp., and Sunkyong Ltd.[6]

Table 2.—Republic of Korea: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS				
Aluminum:				
Oxides and hydroxides	22	45	--	Bangladesh 23; Indonesia 10; Pakistan 10.
Metal including alloys:				
Unwrought	1,531	935	--	Japan 785; Taiwan 150.
Semimanufactures	11,920	36,053	16	Saudi Arabia 27,819; Kuwait 1,085; Hong Kong 811.
Antimony: Metal including alloys, all forms	4	20	--	India 17.
Cadmium: Metal including alloys, all forms	314	336	310	Japan 26.
Chromium: Oxides and hydroxides	224	--		
Cobalt: Metal including alloys, all forms kilograms	68	--		
Copper:				
Sulfate	68	--		
Metal including alloys:				
Scrap	627	250	--	All to Japan.
Unwrought	5,243	3,387	--	Japan 2,929; Taiwan 350; United Kingdom 108.
Semimanufactures	4,083	12,981	1,084	Taiwan 2,950; Thailand 1,283; Singapore 641.
Gold:				
Ore and concentrate value	--	$10,766	--	All to Japan.
Metal including alloys, unwrought and partly wrought troy ounces	8,512	11,260	11,212	Japan 47.
Iron and steel:				
Pyrite, roasted	--	17	--	All to Japan.
Metal:				
Scrap	9,675	25,109	--	Indonesia 11,500; Thailand 9,997; Japan 3,600.
Pig iron, cast iron, related materials	151,049	1,169,634	28	Indonesia 1,015,750; Japan 150,600; Saudi Arabia 1,153.
Ferroalloys	2,500	167	15	Japan 150.
Steel, primary forms thousand tons	1,209	5,557	85	Taiwan 4,396; Japan 644.
Semimanufactures:				
Bars, rods, angles, shapes, sections do	1,027	1,147	17	Saudi Arabia 536; Japan 107; India 106.
Universals, plates, sheets do	1,530	1,606	236	Japan 594; Indonesia 95; Singapore 81.
Hoop and strip	21,888	72,327	4,635	Saudi Arabia 23,620; Indonesia 8,220; Singapore 4,275.
Rails and accessories	3,825	10,821	1,397	Taiwan 8,707; Japan 211; Saudi Arabia 207.
Wire	75,578	137,189	8,035	Saudi Arabia 92,032; United Arab Emirates 4,688.
Tubes, pipes, fittings	826,112	1,222,759	793,783	Saudi Arabia 221,168; Japan 32,210.
Castings and forgings, rough	11,504	14,648	7,042	Japan 3,671; Singapore 1,826.

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Lead:				
Ore and concentrate	4,000	8,400	--	All to Japan.
Oxides	11	--		
Metal including alloys:				
Scrap	708	18	--	Sri Lanka 14; Saudi Arabia 4.
Unwrought	3,320	93	--	Japan 50; Saudi Arabia 10.
Semimanufactures	143	102	8	Saudi Arabia 47; Spain 24.
Magnesium: Metal including alloys, scrap	30	32	--	All to Japan.
Manganese: Ore and concentrate, battery-grade	165	--		
Metalloids: Arsenic, oxides and acids	116	337	250	Indonesia 40; West Germany 16; Netherlands 16.
Molybdenum:				
Ore and concentrate	322	651	--	Canada 357; United Kingdom 109; West Germany 90.
Metal including alloys, semimanufactures, kilograms	964	--		
Nickel: Metal including alloys:				
Scrap	56	33	--	All to Japan.
Unwrought	18	3	--	Do.
Semimanufactures	7	7	--	Papua New Guinea 3; Japan 2; Libya 1.
Platinum-group metals:				
Waste and sweepings, value	$62,746	$5,542	$5,542	
Metal including alloys, unwrought and partly wrought, troy ounces	4,378	445,477	444,644	Japan 833.
Silver:				
Ore and concentrate, value, thousands	$10,067	$4,773	$4,773	
Waste and sweepings, value	$61,700	--		
Metal including alloys, unwrought and partly wrought, thousand troy ounces	1,137	1,711	1,126	Japan 350.
Tin: Metal including alloys, semimanufactures	18	28	--	Saudi Arabia 8; Libya 7; Burma 5; Nigeria 5.
Tungsten:				
Ore and concentrate	1,712	6,360	61	Sweden 4,989; Japan 690; West Germany 229.
Metal including alloys, all forms	604	656	475	Japan 138; West Germany 24.
Zinc:				
Oxides	1,490	1,829	--	Japan 1,752; Sudan 65.
Blue powder	38	331	--	Australia 306.
Metal including alloys:				
Scrap	255	2,200	--	Japan 1,200; Indonesia 900; Pakistan 100.
Unwrought	11,612	8,391	500	Japan 6,810; Bangladesh 341; Taiwan 265.
Semimanufactures	54	11,107	1	Saudi Arabia 11,046.
Other:				
Ashes and residues	2,006	51,062	--	Japan 51,011.
Pyrophoric alloys	--	23	--	Japan 22.
Base metals including alloys, all forms	9	(1)	(1)	
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	1,000	26	--	Japan 13; Yemen Arab Republic 9; Saudi Arabia 4.
Dust and powder of precious and semiprecious stones, kilograms	1,576	186	--	Canada 110; Japan 76.
Grinding and polishing wheels and stones	226	11,180	11	Saudi Arabia 11,095.
Asbestos, crude	30	40	--	All to Japan.
Cement, thousand tons	4,754	6,635	(1)	United Arab Emirates 1,128; Saudi Arabia 965; India 734.
Chalk	--	1	--	All to Saudi Arabia.

See footnotes at end of table.

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Clays and clay products:				
Crude:				
Bentonite	10	1,600	--	Japan 1,100; Taiwan 500.
Chamotte and dinas earth	29,335	24,099	--	All to Japan.
Kaolin	76,920	88,127	--	Japan 78,902; Taiwan 8,600; Philippines 500.
Unspecified	3,097	1,277	--	Japan 1,270.
Products:				
Nonrefractory	62,747	76,348	37,070	West Germany 7,614; Hong Kong 5,816; Japan 4,383.
Refractory including nonclay brick	15,792	12,453	10,543	Malaysia 790; Japan 221.
Diamond:				
Natural: Gem, not set or strung value	$842,788	$1,850,796	--	Japan $1,727,722; Hong Kong $100,900; Singapore $16,044.
Synthetic and reconstructed: Gem, not set or strung do	$23,233	$348,920	--	Japan $321,036; Malaysia $27,884.
Feldspar, fluorspar, related materials:				
Feldspar	19,672	18,538	--	Taiwan 16,259; Thailand 1,600; Japan 550.
Fluorspar	500	--		
Fertilizer materials: Manufactured:				
Nitrogenous	635,257	393,946	5,000	Indonesia 132,089; Philippines 65,011; Taiwan 48,400.
Phosphatic	33,875	37,350	--	Japan 27,000; Fiji 7,350; Kenya 3,000.
Potassic	--	2,500	--	All to Fiji.
Unspecified and mixed	624,253	316,911	--	Philippines 45,451; Turkey 41,925; Thailand 24,608.
Graphite, natural	45,416	34,348	--	Japan 19,757; Taiwan 7,820; Indonesia 5,283.
Gypsum and plaster	79,819	160,884	--	Japan 97,546; Taiwan 28,469; Hong Kong 19,850.
Lime	10,873	5,866	--	Papua New Guinea 3,217; Indonesia 1,500; Japan 590.
Magnesium compounds: Magnesite	1,000	--		
Mica: Crude including splittings and waste	--	10	--	All to Taiwan.
Pigments, mineral: Iron oxides and hydroxides, processed	26	54	--	All to Japan.
Precious and semiprecious stones other than diamond:				
Natural kilograms	25,469	2,239	156	Japan 2,065.
Synthetic value, thousands	$6,447	$12,422	$8,152	Hong Kong $1,274; Japan $1,148.
Salt and brine	99	11,711	33	Qatar 9,000; Libya 2,607.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	3	--		
Sodium carbonate, natural and manufactured	11,614	1,055	--	Kuwait 900; New Zealand 105; Philippines 50.
Sodium hydroxide	40,307	15,494	--	Japan 10,632; Philippines 1,839; Hong Kong 1,754.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	312,483	255,282	--	Japan 253,154; Taiwan 1,724.
Worked	49,564	54,498	15	Japan 53,867; Saudi Arabia 607.
Dolomite, chiefly refractory-grade	96,400	130,800	--	All to Japan.
Gravel and crushed rock	1,873	1,325	--	Japan 460; Philippines 300; Taiwan 270.
Quartz and quartzite	30,872	123,005	--	Japan 122,855.
Sand other than metal-bearing	5,206	7,400	--	All to Japan.
Sulfur:				
Elemental, crude including native and byproduct	1,603	880	--	Indonesia 765; Singapore 68.
Sulfuric acid	23	1,529	--	Taiwan 1,460.
Talc, steatite, soapstone, pyrophyllite	53,478	50,444	1,430	Japan 26,945; Thailand 7,110; Philippines 6,230.
Other:				
Crude	284,531	189,188	--	Japan 110,430; Taiwan 73,953.
Slag and dross, not metal-bearing	53,500	63,026	--	Japan 62,324.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	5,157	27,308	16	Saudi Arabia 23,806; Kuwait 902; Hong Kong 657.

See footnotes at end of table.

[5]Excludes unreported quantity valued at $223,026 in 1980 and $172,594 in 1981.

COMMODITY REVIEW

METALS

The Republic of Korea's capacity to produce metals is largely limited to iron and steel, the country's largest metal sector, and aluminum, copper, lead, and zinc. Except for domestic mine output of zinc, the Republic of Korea's smelters are dependent on foreign ores and concentrates. For instance, the Republic of Korea imports 100% of its refinery requirements for alumina, close to 100% for copper ores and concentrates, about 96% for iron ore, and close to 40% for zinc. The country is self-sufficient in tungsten and molybdenum, with the former largely exported.

Aluminum.—Aluminum of Korea Ltd. operates the only refinery in the country, a 17,500-ton-per-year plant at Ulsan. All of the refinery's requirement for alumina is imported from Japan. Annual domestic demand for metal is about 100,000 tons. To meet the shortfall in supply, the country imports unwrought metal, primarily from the United States, Canada, and Japan, and semimanufactures, mostly from Europe and Japan.

Copper.—Domestic mine production of copper is small, and virtually all ore is

imported as concentrates from the Philippines, Mexico, and Canada, in order of quantity. There are two copper refineries in the Republic of Korea: Korea Mining & Smelter Co. Ltd. at Changhang with an annual metal capacity of 40,000 tons and Onsan Copper Refinery Co. Ltd. at Onsan with an annual capacity of 80,000 tons. Annual domestic demand for metal is about 150,000 tons. Domestic consumers of copper import metal as scrap and unwrought metal and in the form of semimanufactures. A small amount is received as cement copper. The United States and Japan each contribute about 40% of the Republic of Korea's receipts of copper metal, with the remainder largely from Australia, Canada, Chile, and Peru.

Iron and Steel.—Virtually all of the Republic of Korea's requirements for iron ore are imported from Australia and India. Posco, a state-run enterprise, dominates the steel industry and is the only integrated steelmaking facility in the country. In 1982, Posco completed its phase IV-stage 1 expansion program increasing annual steel production capacity to 8.5 million tons from 5.5 million tons, elevating it from 19th to 12th place in size among world steel producers. Completion of phase IV-stage 2 expansion in 1983 will bring steel capacity to 9 million tons through modification and replacement of ancillary equipment rather than addition of new blast furnace capacity.

Total sales by Posco in 1981 were $2,232 billion, followed by Union Steel Manufacturing Co. Ltd., $311 million; Dong Jin Steel Co. (formerly Illsin Steel Co.), $227 million; Pusan Steel Pipe Industrial Co. Ltd., $194 million; Korea Steel Pipe Co. Ltd., $136 million; Korea Iron & Steel Works Co. Ltd., $91 million; Sam Cheok Industrial Co. Ltd., $63 million; Boo-Kook Steel & Wire Co. Ltd., $49 million; Dong Yang Iron Pipe Industrial Co. Ltd., $45 million; and Korea Cast Iron Pipe Industrial Co. Ltd., $42 million.

Supply-demand configuration for the Republic of Korea's iron and steel and related materials in 1981 was as follows, in thousand tons:

	Production	Imports	Consumption	Exports
Scrap iron	3,295	1,661	4,956	--
Iron ore	426	11,201	11,627	--
Coal	--	6,027	6,027	--
Ferroalloys	127	11	138	--
Pig iron	7,924	64	7,918	70
Steel ingot	10,753	8	10,759	2
Billet	2,227	66	2,158	135
Slab	6,755	--	6,553	202
Hot-roll coil	4,371	962	4,308	1,025

By value, 46% of total exports of steel products was to other Asian countries in 1982; 21%, to North America; 19%, to the Middle East; and the remainder to other areas.

Lead.—Mine output of lead from zinc ore in Kyungsang averages about 11,500 tons per year of contained lead. Lead metal is recovered as a byproduct by the copper smelter of Korea Mining & Smelter in Changhang, which has an annual lead production capacity of 12,000 tons. Annual lead consumption is about 50,000 tons. About 85% of the country's supply was from imports of scrap and unwrought metal. Most of the scrap was imported from the United States with small amounts originating in the Middle East. Imports of unwrought metal were from Peru, Mexico, Japan, and the United States, in order of quantity.

Tungsten.—Asia Hertel Tungsten Co. dedicated its ore-dressing plant at Ssangjon in November. The $4 million plant has the capacity to treat 500 tons of ore per day to produce annually 600 tons of tungsten concentrates. The tungsten will be used by the company's tungsten carbide tool plant in Ansong, Kyongg-do.

NONMETALS

Fertilizer Materials.—Total industry capacity to produce fertilizers in the Republic of Korea is about 3 million tons per year. The industry has been financially weakened because of the high cost of production and sluggish export demand. The Republic of Korea imports all of its fertilizer raw materials needs—phosphate rock, potash, and sulfur. The Economic Planning Board was to implement a plan effective January 1, 1983, whereby total industry output was to

be reduced by 30% to 2.17 million tons per year.

Graphite.—The Republic of Korea produces both crystalline and amorphous graphite, but 98% of the total output is the amorphous type. Crystalline graphite is mined at Kunggi Siheung Gunja and Kyunggi Pyungtaek Osung. Most of the amorphous graphite is mined in various locations at Chungju, Sangju, and Daejeon, in order of output quantity. Small mining operations at Daehung, Honsung Sambo, Shihung, and Yongwon were being phased down or closed.

MINERAL FUELS

The Republic of Korea is a poor country in terms of energy resources and is dependent on imported energy for its industrialization. About 75% of its energy consumption was imported in 1982. There are no proven reserves of petroleum, natural gas, or bituminous coal. For the past decade, domestic mine output of anthracite coal has averaged 18 million tons annually. The largest users of coal were the steel industry, residential sector, cement industry, and the power generation sector, in that order.

The Mineral Industry of Kuwait

By Peter J. Clarke[1]

Kuwait's mineral industry consisted almost entirely of the production and downstream processing of petroleum and natural gas. While 1982 marked a large-scale domestic cutback in oil production, petroleum revenues, Government budget outlays, and overall economic activity, it was also a period of significant growth in the Kuwaiti Government's plan to develop a worldwide integrated energy industry. Also, for the first time in 1982, Kuwait's investment income, estimated at $10.2 billion,[2] surpassed its revenues from oil, which were down sharply from $17.4 billion in 1981 to under $10 billion in 1982.

General oversupply conditions on the world's oil markets combined with the effects of economic recession in the industrial countries served to perpetuate the oil glut that began in 1981. The results for Kuwait were not only a 27% drop in crude oil production, but also a drastic decline in the production and export of liquefied petroleum gas (LPG) due to reduced associated gas output. The loss of this associated gas supply was one of Kuwait's most critical problems in 1982. In addition to forcing the giant gas-processing plant at Shuaiba to run at less than one-half of capacity, the gas shortage adversely affected some of the country's other basic industries, such as fertilizer production, water desalinization, and power generation, leaving them with inadequate supplies of feedstock and fuel.

The Kuwait Petroleum Corp. (KPC), owned by the Government, was the main umbrella organization that controlled all aspects of Kuwait's oil industry. Under KPC's jurisdiction were the subsidiary companies: the Kuwait Oil Co. (KOC), which produced most of Kuwait's oil and operated the Ahmadi refinery; the Kuwait National Petroleum Co. (KNPC), which operated the Mina Abdullah and Shuaiba refineries and other facilities; the Kuwait Petrochemical Industries Co. (PIC), which operated the ammonia-urea fertilizer plant at Shuaiba; the Kuwait Oil Tankers Co., which operated a fleet of crude oil and LPG tankers; the Kuwait International Petroleum Investments Co., which invests in oil-related ventures overseas; and the Kuwait Foreign Petroleum Exploration Co., which explores for and develops petroleum concessions overseas. On June 12, 1982, KPC's capital was increased from $3.5 to $8.7 billion. However, for the fiscal year 1982-83, KPC's net profits fell an estimated 85%, from $1.2 billion to $182 million. Expenditures of the corporation were also trimmed in 1982 by an estimated 30%.

Despite the slump in the oil market, Kuwait continued to forge ahead on its long-term growth plan in several areas. Domestically, Kuwait continued to explore for deep nonassociated gas to meet its LPG export targets and industrial requirements. Kuwait was also rapidly expanding its domestic refinery capacity from 410,000 to 600,000 barrels per day. However, plans to build a $1 billion olefins-aromatics petrochemical plant at Shuaiba were shelved in October 1982, because of the unfavorable market conditions.

Kuwait's emphasis on expansion of exploration, refining, and downstream processing capabilities fit into a larger overall development scheme that was being implemented around the world. Kuwait's foreign activities had a more far-reaching impact than any domestic development during the year. Kuwait's goal is to gradually develop its own overseas integrated petroleum exploration, production, refining, petrochemical

manufacturing, and marketing organization. This will not only provide an outlet for its own crude oil and refined product output, but will also diversify its sources of crude oil, provide a greater flexibility and variety of customers, and ensure a steady flow of income.

As part of the strategy, Kuwait acquired the U.S.-owned Santa Fe International Corp. in 1981 for $2.5 billion. Along with Santa Fe came its C. F. Braun and Co. engineering subsidiary. In 1982, Santa Fe, on behalf of KPC, purchased Andover Oil Co., of Tulsa, Okla., which owns acreage in the United States containing 16 million barrels of proven oil reserves. Kuwait also holds a 23% share of the International Energy Development Corp. B.V., a Netherlands-based holding company for the IEDC Group, which has a direct share in 100 million acres of oil and gas rights around the world. In September 1982, KPC purchased 24.5% of the equity of the West German petrochemical giant Hoechst AG. This follows the recent purchase in 1981 of 22% of Metallgesellschaft AG of the Federal Republic of Germany. The most recent phase of Kuwait's investment strategy was KPC's acquisition of Gulf Oil Co.'s (United States) refining and marketing facilities in Belgium, the Netherlands, and Luxembourg, which include a 75,000-barrel-per-day refinery in Rotterdam along with about 750 retail stations in the three countries. KPC was also involved in a joint venture with AZL Resources Inc., United States, to explore for oil in the United States. With these investments, KPC has become one of the largest and most flexible of the international oil companies.

PRODUCTION AND TRADE

Crude oil production was down sharply in 1982, to approximately 823,000 barrels per day, which is the lowest level since the oil industry began operating in the late 1940's. Exports of crude oil were also at an alltime low. Exports of refined products remained fairly strong during the year, averaging about 250,000 barrels per day. Owing to the low level of oil production, associated gas production was also far below previous years, and Kuwait was unable to fulfill some of its LPG supply contracts. Ammonia and urea production and exports, which also rely on associated gas, were down considerably. Production of nonfuel minerals, namely cement, clays, lime, caustic soda, and sulfur, remained at previous levels. Production of all minerals and mineral fuels is shown in table 1.

Kuwait's total exports, chiefly petroleum and refinery products, in 1982 were valued at approximately $10.1 billion, down 35% from the 1981 level. Imports, excluding gold, were valued at $7.4 billion, which still left Kuwait with a substantial balance-of-trade surplus. Exports of crude oil fluctuated during the year from under 200,000 to over 400,000 barrels per day, ending with a yearly average closer to 300,000 barrels per day. Exports were directed mainly at China, the Republic of Korea, other far eastern nations, Italy, and the United States. LPG exports were sold almost entirely to Japanese contract customers, with smaller volumes going to the United States and Turkey. The latest available trade data are shown in tables 2 and 3.

COMMODITY REVIEW

METALS

Kuwait did not produce any raw metals in 1982, nor were there any known metalliferous deposits in Kuwait. Construction of an aluminum smelter, which had been proposed in 1980 and 1981, was shelved because of the poor aluminum market and the presence of two already operating smelters in Bahrain and Dubai. In Kuwait, the Arab Light Metal Industries Co. produced about 3,000 tons of aluminum manufactured goods from imported aluminum, and the Kuwait Metal Pipe Industry operated a 100,000-ton-per-year spiral-weld pipe mill, which produced pipeline for the oil industry. Kuwait's foreign holdings in the metals industry included a 22% share of Metallgesellschaft, a 30% share of Korf Stahl AG of the Federal Republic of Germany and its U.S. associate Korf Industries, a 28% equity share of Spain's Prereducidos del Suroeste de España S.A. (Presura) direct-reduction iron plant, and shares in the Arab Iron and Steel Co.'s planned 4-million-ton-per-year iron pelletizing plant in Bahrain. Kuwait was also considering a project to extract uranium from phosphate ore in Tunisia.

NONMETALS

Cement.—The Kuwait Cement Co. produced cement from imported gypsum and clinker at a rate of 600,000 to 700,000 tons per year, which fell far short of domestic demand, estimated at 3 million tons annually. Development work continued on the construction of the Saudi-Kuwait Cement Manufacturing Co., to be located in Khursaniyah, Saudi Arabia. The joint project was to produce 2.5 million tons of clinker for the production of portland cement. The plant was being built by Krupp Polysius AG of the Federal Republic of Germany under a $325 million contract. The plant's output was expected to meet the future demands of both Saudi Arabia, which owned 55% of the project, and Kuwait, which owned the other 45%.

Fertilizer Materials.—PIC was the sole producer of ammonia and urea from its petrochemical complex at Shuaiba. PIC's facilities at Shuaiba include three parallel ammonia production trains, each capable of producing 220,000 tons per year of ammonia; three urea plants, with a total capacity of 792,000 tons per year; an ammonium sulfate plant, with a capacity of 165,000 tons per year; and a sulfuric acid plant, which could produce 132,000 tons per year. Another ammonia line was under construction by C. F. Braun in 1982, which would raise total capacity to 1 million tons per year and provide an exportable surplus of nearly 300,000 tons per year of ammonia. Currently all ammonia production is consumed in the production of prilled urea, all of which is bagged at the plant and exported, mainly to China, the Middle East, and Africa. Despite the planned capacity increases, production of ammonia and urea declined about 30% in 1982, owing to the shortage of associated gas feedstock and stiff competition from fertilizer produced in the Far East. With lower oil production ceilings for most of the Organization of Petroleum Exporting Countries (OPEC) and no current supply of nonassociated gas, feedstock supplies for the ammonia-urea fertilizer plant will be limited for the next few years, which may result in the fourth ammonia line remaining inoperative.

A second fertilizer plant was being planned in Kuwait, as a joint venture of the Tunisian state-owned Maghrabia Chemical Industries Co. and PIC. The plant would produce 330,000 tons per year of diammonium phosphate from Kuwait's ammonia and Tunisia's phosphate. PIC already owns a 49% share of the Tunisian Gabes Fertilizer Co., located in Tunisia.

Salt.—PIC operated a salt and chlorine plant that produced caustic soda, chlorine, hydrochloric acid, hydrogen, sodium hypochlorite, and distilled water. The plant utilized seawater from the Arabian Gulf and associated natural gas from Kuwait's crude oil production. PIC was planning a second chlorine plant at Shuaiba that would produce 70 tons per day of chlorine.

MINERAL FUELS

Natural Gas.—Currently, all of Kuwait's gas output is produced in association with crude oil, which meant that gas supplies in 1982 were at an alltime low, down 30% from that of 1981. This drop left the major gas-consuming industries, the Shuaiba LPG plant, the ammonia-urea fertilizer plant, and water desalinization plants without adequate feedstock supplies.

KPC has embarked on an expensive deep gas exploration drilling program, which

they hope will encounter large quantities of nonassociated gas to take up the slack in current production. Results from the drilling program have not been encouraging thus far.

Kuwait's major gas project, the giant LPG plant at Shuaiba, operated at about 40% of capacity for most of 1982, owing to the gas shortage. The plant, operated by KOC, is capable of producing 3.5 million tons per year of LPG, composed of 60% propane and 40% butane. The plant was designed to treat all of the associated gas output from an annual crude oil production of over 1 million barrels per day. With recent production at one-half that level, the plant has never operated above 60% capacity, and in 1982, only one of three parallel production trains was operating. The gas shortage became so acute that in April, KPC notified some of its Japanese customers that f.o.b. contracts for LPG sales were being temporarily suspended for reasons of force majeure.

To alleviate the shortage, KOC was beginning development work on the Southern Gas Project, a gas gathering network designed to collect and transport associated gas production from the Divided Zone, where gas is presently being flared. With the Divided Zone production as low as it was in 1982, however, the cost of building the system began to outweigh the marginal benefits of the increased gas supplies. Several issues also were left unresolved between Kuwait and Saudi Arabia over jurisdiction in the Divided Zone, which made preliminary work more difficult.

Petroleum.—*Production.*—Total production of crude oil in Kuwait fell in response to weak demand to its lowest level in over 30 years in 1982, to an average of 823,000 barrels per day. In March 1982, OPEC producers agreed on an overall production ceiling of 17.5 million barrels per day, of which Kuwait's ceiling was 800,000 barrels per day. The ceiling had little effect, however, because total OPEC production averaged well below the ceiling for much of the year. All of Kuwait's crude oil was sold on a contract basis at the official OPEC price.

Kuwait's oil production is derived mainly from onshore fields in Kuwait proper, where production during the year fluctuated from 600,000 to 800,000 barrels per day, and also from their share of the Kuwait-Saudi Arabian Divided Zone. Kuwait's share of the Divided Zone production ranged from 70,000 to 200,000 barrels per day. All of mainland Kuwait's onshore oil is produced by KOC. Production in the Divided Zone is from both onshore and offshore fields. The Arabian Oil Co., owned 40% by Kuwait and 60% by Saudi Arabia, operates the offshore wells, the production of which is split evenly. Onshore production facilities are operated by KOC on behalf of Kuwait, and Getty Oil Co. on behalf of itself and Saudi Arabia. Getty's concession in the Divided Zone was granted by Saudi Arabia in 1954, but a more recent agreement has put the concession in Kuwait territory. Complicating matters further, KOC has charged that in the late 1950's, Getty overlifted above its entitlement, and KOC is now pressuring for repayment in current value barrels of oil. Late in the year, Getty filed suit against KOC for overlifting above the agreed upon levels. The situation remained stalemated at the end of the year.

Exploration.—Exploration in Kuwait was limited mainly to deep gas exploration wells under the Burghan Field, in the offshore areas, and in the Fars heavy oil formation. One interesting development was the discovery of sweet light crude in northern Kuwait, encountered while drilling for nonassociated gas. The strike of 35.7° API crude in the Marat Formation at 3,550 meters depth, may allow Kuwait to offer light crude on the international market in addition to its traditional heavier, higher sulfur crude oil.

Kuwait's overseas exploration program was expanding rapidly in 1982. In 1981, Kuwait established the Kuwait Foreign Petroleum Exploration Co. (KUFPEC) to undertake oil-related ventures overseas. Since then, KUFPEC has spent well over $100 million in acquiring exploration leases on nearly every continent in the world.

Refining.—Kuwait's domestic expansion objectives are mainly to increase downstream processing of crude oil and offer more refined products and less crude oil for export. In 1982, there were three operating petroleum refineries in Kuwait, the most modern being the 180,000-barrel-per-day (crude throughput) refinery at Shuaiba, which is operated by KNPC. Shuaiba was shut down for a short while in May of 1982 because of a fire in the gas-cooling unit. Expansion of KOC's Ahmadi refinery was underway in 1982. Capacity was to be expanded from 110,000 to 250,000 barrels per day. Expansion plans for the Mina Abdullah refinery were postponed late in 1982 after KPC's purchase of Gulf's Europe-

an refinery facilities. The plan was originally to expand capacity from 120,000 to 300,000 barrels per day, and the contract had already been awarded to KPC's subsidiary, C. F. Braun. Whether the expansion would go through in the future was left unclear at yearend.

Kuwait's production and exports of refined products fell slightly in 1982, continuing the declining trend established in 1979. Of Kuwait's total current rated capacity of 410,000 barrels per day, about 30,000 to 50,000 barrels per day are consumed domestically, leaving the balance for export. Actual refinery production averaged about 280,000 barrels per day in 1982. With all of the planned refinery capacity onstream, Kuwait should be able to process 60% to 70% of its crude oil production domestically and still have a crude surplus to supply its foreign refineries.

Petrochemicals.—Kuwait's plans to develop its own domestic petrochemical industry were postponed in 1982, and it appeared as though it would not be revived in the future. PIC had planned, until late in the year, to build an olefins-aromatics complex at Shuaiba. The complex was to utilize ethane gas from the LPG plant to produce 350,000 tons per year of ethylene, 135,000 tons per year of ethylene glycol, 165,000 tons per year of low-density polyethylene, 340,000 tons per year of styrene, 280,000 tons per year of benzol, 60,000 tons per year of orthoxylene, and 90,000 tons per year of paraxylene. C. F. Braun had already been awarded a $1.3 billion contract for engineering and construction of the plant when KPC decided to shelve the project. This left PIC with only a fertilizer and salt and chemicals division.

Overseas, KPC purchased a 25% equity share in Hoechst, a major petrochemical supplier to Europe. PIC also has foreign holdings that include a 40% interest in the Mediterranean Fertilizer Industries Co. in Turkey, a 50% share in the Bahrain-Kuwait Petrochemical Industries Co., which will produce ammonia and methanol from tail gases of Bahrain's LPG project, and the joint share in the Tunisian fertilizer plant.

The Mineral Industry of Liberia

By Ben A. Kornhauser[1]

The mineral industry continued to be the main support of Liberia's economy, sustained by the production of iron ore, diamonds, and gold. Preliminary 1982 data indicated that the gross domestic product had fallen sharply. Current account balances and budget problems were alleviated substantially by assistance from the International Monetary Fund, the United States, and other donors and an increase in maritime revenues. However, since mid-1982, foreign exchange requirements of the Liberian Government exceeded its capacity to repay financial commitments, causing sharp cutbacks in expenditures, and stopping contributions to its development budget.

In 1982, Liberia remained as Africa's largest producer of iron ore although revenues therefrom declined. The worldwide recession of the steel industry seriously affected the country's three iron ore operations and created financial problems that could reduce their future viability. Gold mining decreased in both production and value compared with that of 1981. However, concessions to prospect for gold were still granted.

Liberia borrowed extensively to pay for its oil imports during fiscal year 1982. In that period, the United States allocated $35 million in economic support funds to Liberia, mostly for oil purchases.

PRODUCTION AND TRADE

Preliminary indications for 1982 were that Liberia would have a balance-of-trade deficit. Exports declined significantly after a respectable first-quarter performance. In fiscal year 1981-82, the majority of the country's trade, both imports and exports, were with developed countries. The largest suppliers were the United States, 27%, and the Federal Republic of Germany, 13%. The purchasers of Liberian exports were the Federal Republic of Germany, 28%; Italy, 15%; the United States, 14%; and France, 12%.

Iron ore continued as Liberia's major export and accounted for more than one-half of its 1982 exports. However, receipts for iron ore were lower in 1982 owing to depressed world economies that caused lower Liberian exports of 16,370,000 metric tons. The drop in oil price was expected to improve the competitiveness of Liberian iron ore because the price of oil is a significant factor in the cost of iron ore production, particularly that of the Bong Mining Co. (BMC). Other major exports were rubber and diamonds.

In 1982, Liberia exported gold valued at $3.75 million and diamonds valued at $26.28 million. Diamonds increased 29% in production and 12% in value over that of 1981 although the value of a carat decreased an average of $9.

COMMODITY REVIEW

METALS

Gold.—Much of Liberia's gold exports were believed to have come from gold smuggled into the country attracted by the local U.S. dollar currency. In 1981, gold exports reached 16,864 troy ounces; however, gold exports dropped in 1982 to 12,656 troy ounces because of price fluctuations on the world market. During 1982, the Bentley International Trading Co. completed its exploration program and expanded its pilot placer operations to include five excavators, eight small dump trucks, and a 2,600-cubic-meter-per-day washing plant. Feasibility studies on developing a hard rock, open pit mining operation were not promising. Other gold mining and exploration were focused in eastern Liberia along the Lofa River.

Iron Ore.—All of the country's operating companies were severely affected by weak iron ore markets. The LAMCO Joint Venture Operating Co. (LJV), the largest iron ore mining company, cut production around midyear to 9.5 million tons; reduced its work force, salaries, and fringe benefits; and instituted a 4-day-production workweek with salaries and wages based on a 48-hour week and no overtime. The inability of the Delta Steel Co. of Nigeria to take delivery on its 1982 contract for 600,000 tons contributed to LJV's problems. In all, its exports in 1982 totaled 7,719,000 tons.[2]

BMC and the Government arrived at an agreement permitting BMC to defer royalty payments and to waive the tax on petroleum products used until BMC's cash flow became positive. BMC exports in 1982 totaled 7,662,000 tons, of which 68% was shipped to Rohstoffhandel GmbH of the Federal Republic of Germany and 32% to Finsider International S.S. (Italsider) of Italy.[3]

Although BMC is owned 50% by the Government, 33.75% by Exploration and Berghau GmbH of the Federal Republic of Germany, and 16.25% by Italsider, BMC operated as a captive mine for the minority shareholders.

A $68 million rehabilitation loan, sponsored by the International Bank for Reconstruction and Development (World Bank) for the National Iron Ore Co. Ltd. (NIOC), was expected to increase production to 3 to 3.5 million metric tons annually from its present capacity of 1.3 million tons. The program involved improvement of operational facilities, particularly the washing plant and its transport infrastructure. The loan participants were the World Bank, the African Development Bank, the Netherlands Finance Co. for Developing Countries, the Organization of Petroleum Exporting Countries Fund, and a consortium of commercial banks. However, on October 6, 1982, a tailings dam burst at its Mano River Mine in Grand Cape Mount County releasing a surge of mud, tailings, water, and debris that engulfed a camp of 1,500 mine workers and their families. Torrential rains caused a hillside to collapse into the rain-swollen tailings dam above the camp as the result of many factors including the removal of vegetative covering by farming. More than 47 persons were reported killed.

NIOC started production in 1957, and in 1981 exported 1.2 million tons of iron ore containing 55% to 59% iron, all produced at the Mano River Mine. As a consequence of this disaster and the downturn in the world's economy, NIOC exported only 771,000 tons in 1982.[4] NIOC was owned 50% by the Government and 50% by private investors.

In 1982, engineering and management contracts were signed between the Mifergui-Nimba Co. of Guinea and the United States Steel Corp. under which United States Steel acquired about 5% of the project for engineering during construction and for management during the first operating years. In a 1976 agreement between Mifergui-Nimba and LJV, LJV agreed to transport the Mifergui ore by rail from the Liberian-Guinea border to the Liberian port of Buchanan for shipment. The consortium involved in the Mifergui project consisted of 11 countries, including Liberia and Nigeria, and United States Steel. The project was expected to produce 15 million tons per year of 66.5% high-grade iron ore.[5]

The Liberian Mining Co. was granted a concession in October 1982 to exploit the Bea Mountain deposits of about 800 million dry tons of indicated reserves. These reserves consisted of 60 million tons of weathered and semiweathered ores and 735 million tons of unweathered magnetite. The company expected initially to mine 4 million tons of weathered and semiweathered ore annually. Because of the worldwide depression in the iron and steel industry, the Liberian Iron and Steel Corp. (LISCO) concession to develop the Wologisi iron ore was extended by the Government through November 1984 with certain conditions including the acquisition of 51% of LISCO by a group of Japanese steel companies led by Kawasaki Steel Corp.

NONMETALS

Cement.—In September 1982, the Liberia Cement Co. (CEMENCO) disclosed production of only 4,000 bags per day, down from 40,000 bags per day. Management stated that delivery of cement to many sections of the country had slowed because of bad road conditions. CEMENCO also believed that production had been affected by large imports of cement by some concessions and agencies. In that period, the Minister of Commerce, Industry, and Transportation began arranging for the import of cement by a local distributor at a price of $1.50 per bag less than locally produced material.[6]

Diamond.—Some of Liberia's diamond exports, as in the case of gold, was believed to come from Guinea and Sierra Leone. Diamond exploration concentrated on allu-

vial sand and gravel deposits with major production coming from the Saniquellie and Bahn districts in the Lofa River Valley. Liberia licensed a large number of small-scale alluvial diamond (gold) prospectors and miners but did not track production from each working. Licensed brokers traveled around the country purchasing diamonds from sellers who either found them locally or brought them in from adjacent counties to sell them for U.S. dollars. The brokers then registered all diamonds exported and paid the Government a 3% royalty. Diamond exports in 1982 increased to $26.4 million—433,000 carats at $61 per carat, while exports in 1981 equaled $23.5 million—336,000 carats at $70 per carat.

MINERAL FUELS

Petroleum.—The Ministry of Lands, Mines and Energy conducted seminars in March and April 1982 to disclose technical data on its available blocks and to discuss the legal, fiscal, and contractual requirements of an exploration venture in Liberia.[7] On March 31, 1982, the Government released a model contract and revised petroleum legislation. The legislation provided for a production-sharing agreement that permitted accelerated recovery of oil company expenditures, followed by an escalation of the Government's share based on increases in the pretax rate of return. The exploration period was for 3 years with two 2-year extensions possible. The production period was established at 25 years. The signature bonus was set at $100,000 and royalties at 12.5%. Production sharing would range up to 80% Government and 20% company on a pretax rate of return above 50%. Income tax was set at 50%.[8]

Uranium.—The Ministry of Lands, Mines and Energy considered the St. John River zone to be too significant a mineralized area to grant sole exploration rights to any company. The Coastal Liberian Uranium Enterprises Inc. of Houston, Tex., which had explored for uranium in Liberia since 1977, relinquished its exploration area and terminated its agreement with the Government in November 1982.[9]

The Mineral Industry of Libya

By John R. Lewis[1]

Financed almost completely by oil export revenues, on the order of $22 billion in 1980-81, Libya was undergoing rapid economic and social development at the beginning of the 1980's. Under the country's 1981-85 $55 to $60 billion development plan, expenditures were to amount to about $11 to $12 billion annually, leaving substantial budget surpluses.[2] As the 1980's began, Libya's gross national product (GNP) was $26 billion, and about two-thirds of the revenue came from oil exports. The year 1982 witnessed continued international economic recession and a severe deterioration in Libya's crude oil market. This was characterized by continued fall in demand and pressure on prices leading to reductions in sales and prices as set by the Organization of Petroleum Exporting Countries (OPEC). Furthermore, the contribution to GNP of exported oil dropped to about 50%, or about $10 to $12 billion in 1982, and many facets of Libya's plans for continued rapid development were cut back while others were temporarily suspended. Minerals other than crude petroleum were produced in small volumes and contributed little or nothing to the balance-of-payments situation.

On March 12, 1982, the President of the United States directed that a ban be imposed on the import of Libyan crude oil into the United States. Just prior to this embargo, U.S. imports of Libyan crude were down to about 120,000 barrels daily, which amounted to about 2% of U.S. daily oil imports and less than 1% of U.S. daily oil consumption. The five U.S. oil companies operating in Libya, Occidental Petroleum Corp., Continental Oil Co., Marathon Oil Co., Amerada-Hess Corp., and Mobil Oil Corp., were not prohibited from operating there as long as they did not ship oil produced in Libya to the United States. The President's order also stated that it would be general policy to deny export licenses for the shipment to Libya of oil and gas technology and equipment of U.S. origin that are not readily available from sources outside the United States.

On June 9, 1982, Mobil gave notice to the Libyan Government that its Libyan affiliate, Mobil Oil Libya, would cease its somewhat limited operations on July 13, 1982. Mobil had operated in Libya since 1955. According to reports, Mobil held a 34% interest in a joint exploration and production venture in which the Libyan Government held 51%. A West German firm held the remaining 15%. At the time of the announcement, Mobil's liftings of Libyan crude were 16,000 barrels daily, down from 30,000 barrels daily in 1980. Negotiations continued throughout the second half of 1982. At yearend 1982, however, an announcement by Mobil stated that the company was withdrawing from exploration and producing activities in response to various actions by the Libyan Government that effectively destroyed the economic value of Mobil's concession agreements in Libya. Mobil had instituted arbitration proceedings to recover damages and compensation.

Government Policies and Programs.—Libya's Second Transformation Plan, which began in 1981 and was to run through 1985, was a victim of the adverse conditions that beset world oil markets in 1982. The Second Plan was based on projected oil revenues of $22 billion per year, coming from sales of about 2 million barrels of oil daily. Production was off by more than one-half the anticipated amount during the first quarter of 1982, but later recovered for an average

of 1.2 million barrels daily for the entire year. Libya's General People's Congress therefore approved expenditures related to the Development Plan that were 5.1% lower than those for 1981. It appeared that the 1983 budget would be even lower.

During the year, Libya made a number of arrangements with other African countries to supply them with needed crude oil. Some of these were in the nature of emergency relief gestures, such as two shipments totaling 500,000 barrels to Ghana early in 1982. These particular shipments were part of an economic agreement between Libya and Ghana under which Libya was to provide 2,730,000 barrels, about 60% of Ghana's annual requirements, during the second half of 1982. The price, $35.28 per barrel, was slightly below the market price for Libyan and Nigerian crude ($36). An arrangement under which Libya was to supply Ghana with all its crude requirements for 15 years was also under negotiation. It was reported that this oil would be delivered to Ghana free of transportation charges.

Another cooperative agreement was made with Mozambique in March 1982 under which Libyan crude would be delivered to Mozambique. Additional details were not available. In still another arrangement, Poland was to get more than 7 million barrels of Libyan crude under a special credit extension.

Turkish firms working in Libya had over $8 billion in contracts from the Libyan Government. Under a plan worked out during the year, Libya was to supply Turkey with 40,000 barrels of crude oil per day. To wipe out about $30 million overdue to Cypriot exporters, Libya agreed to furnish Cyprus with sufficient oil to pay off the debt. This would be about 860,000 barrels, enough to cover Cyprus' imported crude requirements for about 2 months.

PRODUCTION AND TRADE

The production and export of petroleum and its associated products continued to generate almost all of Libya's foreign exchange. In 1980, exports totaled $22.5 billion while imports were $10 billion. In 1981, owing to oil price reductions, exports and imports were about equal at $15.5 billion, but in 1982, export earnings fell to $12 billion, which left a trade surplus of about $275 million. Between reduced oil prices and lower demand for Libyan oil, the country's trade balance was expected to dwindle still further in 1982.

Extensive iron ore reserves await completion of the Misratah iron and steel complex. Construction materials, including cement, gypsum, lime, potash, and salt, were available domestically in varying quantities. Most were only consumed locally. Small amounts of cement were exported.

Crude petroleum production averaged 1.2 million barrels daily in 1982 compared with 1.8 million barrels in 1980. In response to world oversupply and reduced prices, Libyan crude oil production dropped off in February and March 1982 to 600,000 barrels daily. The situation then improved under a slow and modest rise in demand, and by December 1982 production stood at 1.8 million barrels daily, the highest it had been in more than 18 months. The yearly average for 1982, 1.2 million barrels daily, was better than the 1981 average of 1.1 million barrels but still well below that necessary to fund Libya's ambitious Second Transformation Plan.

The daily output at yearend, when production was 1.8 million barrels daily, follows:[3]

Producing company	Barrels
Oasis Oil Co. (Continental Oil Co., Marathon Oil Co., and Amerada-Hess Corp.) in partnership with the Libya National Oil Co. (NOC)	695,000
Umm al Jawabi-Ageco (NOC for crudes from the Amna and Sarir Fields)	485,000

[e]Estimated. [p]Preliminary. [r]Revised.

[1]Table includes data available through June 10, 1983.

[2]In addition to the commodities listed, a variety of construction materials (sand and gravel, crushed stone, brick, and tile) is produced, but available information is inadequate to make reliable estimates of output levels. Natural gas liquids are also produced but are blended with crude petroleum and are reported as part of that total.

[3]Excludes gas reinjected into reservoirs.

[4]Reported figure.

COMMODITY REVIEW

METALS

Aluminum.—The Libyan Secretariat of Heavy Industries and the Yugoslavian firm Energoinvest agreed to set up a jointly owned company to operate the aluminum complex soon to be built at Zuwarah, west of Tripoli. The new company, Libal, was capitalized at $80 million, of which $16 million was contributed by Yugoslavia. Estimates of the cost for the complex had risen to $1.25 billion since 1981 from the original $1 billion, but projected output of aluminum had risen from 110,000 to 120,000 tons annually to 125,000 tons annually. Several West German firms, including Klöckner-Humboldt-Deutz, were among those invited to bid on the project, and Libya was understood to be discussing a financing arrangement with a large United Kingdom bank. There were indications in the summer of 1982 that contracts for work on certain parts of the aluminum project may have been suspended as an austerity measure.

Iron and Steel.—Construction was delayed on phase 1 of the Misratah iron and steel complex, 225 kilometers east of Tripoli on the Mediterranean coast, originally targeted for completion in 1985. When completed, the integrated complex is to produce steel rods, bars, and flat products required by the domestic markets, with later potential export sales aimed at various Southern European and Middle Eastern countries. Iron ore is to be imported initially, but eventually the iron requirements are to come by rail from mines to be developed at Wadi Shati in southwestern Libya.

Work on some ancillary facilities appeared to be moving ahead. Two training schools for future Misratah steelworkers were contracted early in the year. Britain's Ingersoll Engineering Projects, Austria's Voest-Alpine AG, and Italy's Techint were to be involved in a $150 million contract to build the schools at Tripoli and at Misratah. Each is designed to handle 1,000 trainees. Housing for 2,000 and associated facilities for the steelworks' construction workers were to be built during 1982 by the Lamy Co. of Verviers, Belgium, under a $12.5 million subcontract from the Federal Republic of Germany's Friedrich Krupp GmbH, leader of the consortium supplying the steel production facility.

Owing to the austerity program, work was suspended on both the 900-kilometer rail line from the Wadi Shati iron ore deposit to Misratah and the new ore-handling seaport at Misratah.

NONMETALS

Cement.—The new, 1-million-ton-per-year cement plant at Zliten, 160 kilometers east of Tripoli on the Mediterranean, was nearing completion by Kawasaki Heavy Industries Ltd. of Japan. It was to be turned over to the Libyan owners, the Secretariat of Heavy Industries, when fully operational, about mid-1983.

Dernacement's 1-million-ton-per-year cement plant at Derna, east of Benghazi, under construction by Mitsubishi Heavy Industries Co. Ltd., also of Japan, was scheduled for completion in 1982. Owing to problems with a subcontractor, the plant was not expected to produce cement before mid-1983.

MINERAL FUELS

Natural Gas.—Collection and utilization of natural gas, which was formerly flared, was proceeding as rapidly as industrial and agricultural fertilizer project developments would permit. Additional gas was being injected back into producing reservoirs. Natural gas use comprised about 19% of total domestic energy consumption in Libya in 1982, and was expected by the Government to reach 23% by 1985.

Petroleum.—*Exploration.*—On August 9, 1982, two Canadian firms eliminated themselves from further participation some months after they acquired a 10% working interest in exploration and development rights in certain Libyan onshore and offshore acreage blocks held by the French company Société National Elf-Aquitaine. Sceptre Resources Ltd. and Scarboro Resources Ltd., both of Calgary, Alberta, gave as their reason for withdrawing, their decision to restrict their activities to areas offering prospects of near-term cash flow.

In March 1982, the International Court of Justice at The Hague, Netherlands, issued a decision in settlement of the dispute between Libya and Tunisia over an offshore demarcation line on the Continental Shelf between the two nations. The boundary line indicated by the court decision starts in territorial waters 12 miles off the coastal border city of Ras Adjir and runs approximately 26° east of north to the latitude of the most westerly point of the Gulf of Gabés, 34° 10'30" north. At that point the line veers to the east at a bearing of 52°. The decision was said to allow each country an approximately equal share of the offshore territory. Still in dispute were the outer

limits of each nation's share of the shelf because of claims by Malta, whose territorial waters adjoin those of both Libya and Tunisia. Malta and Libya agreed later in the year to refer their demarcation problems to the International Court of Justice.

Following the Court's decision, U.S. and French companies began exploratory drilling in adjudicated areas offshore Libya. Exxon Corp. was using a semisubmersible rig, the *Scarabeo III,* to drill the A-1 well on Block NC87, and Elf-Aquitaine moved the *SEDCO H* semisubmersible rig on a location for a one-hole test.

In November 1982, a long-term economic, scientific, and technical agreement was signed by Libya with Yugoslavia. The document covered joint oil exploration in Libya, Libyan oil to be exported to Yugoslavia, establishment of a joint investment company, and a system for making payments.

Production.—From a first quarter's average daily production of 661,540 barrels, Libya's crude oil output rose steadily throughout 1982 to 845,900 barrels in the second quarter, 1,313,200 barrels in the third quarter, and 1,753,000 barrels in the fourth quarter; average for the year was 1,140,220 barrels daily. As 1982 began, OPEC, including Libya, was operating on a base price for the marker crude (Arabian light, 34° API) of $34 per barrel. Libya's slightly higher gravity crude was listed at $35.15 per barrel. By late in the year, however, spot prices were down to about $29 per barrel, and Libya's production was up. In early 1983, OPEC set the selling price at $29 per barrel and established production quotas, which were not closely observed. Even at December's average production of 1,800,000 barrels daily, Libya's productive capacity was not reached. The country's capability to produce crude was about 1,900,000 barrels daily at yearend 1982, with active plans by the Government to raise it to 2,100,000 barrels daily during 1983, which would be about the same productive capacity Libya possessed in 1979. Libya remained OPEC's sixth most prolific producer.

Refining.—Construction of the Ras Lanuf refining and petrochemical complexes continued throughout 1982 with completion scheduled for March 1983. Crude oil throughput capacity will be 220,000 barrels daily at the outset. Italy's Snamprogetti was the prime contractor. Libya's domestic demand for all petroleum products is expected to double between 1980 and 1985, but with the addition of petroleum products from the Ras Lanuf refinery, the country will still have some products for export, particularly fuel oil, kerosine, liquefied petroleum gas, and possibly naphtha.

Libya's second asphalt plant was under construction at Benghazi. Demand for asphalt for road and airstrip construction in Libya was 1,354,000 barrels in 1979 and is expected to be about 3,400,000 barrels per year by 1985. The Benghazi plant would supplement output of the plant at Al-Zawiya, which is reported at about 600,000 barrels per year. No data were available on the output of the new plant at Benghazi.

Transportation.—Libya's state-owned Brega Oil Marketing Co. dedicated a new petroleum wharf near Tobruk in April 1982. The thoroughly modern facility features a special sprinkler system, radio telephone communication throughout the wharf area, "ship to shore" special tanker guidance equipment, and a backup dumping station. Tankers of up to 25,000 tons of capacity can be fully loaded at the wharf, and tankers of up to 35,000 tons of capacity can be partially loaded. Tankers of these sizes are used to deliver petroleum products to customers along coasts, on deep water estuaries, and via large river systems. Site storage of diesel fuel, kerosine, and benzene was being tripled, making low-cost delivery of these products possible to countries all around the Mediterranean.

Petrochemicals.—Expansion and product diversification continued during 1982 at the Ras Lanuf petrochemical complex. The complex is operated in conjunction with the new 220,000-barrel-per-day oil refinery under construction by the Libyan Government's Azzawiya Oil Refining Co. The Ras Lanuf petrochemical complex receives its ethylene feedstocks from the oil refinery. This feedstock material will also be the key to a wide range of other petrochemical product-making plants in the area. Among these are units to make low- and high-density polyethylenes, diethylene glycol, polypropylene, and synthetic rubber. In addition, a 47,000-ton-per-year monoethylene glycol unit was under construction. All of the above units were scheduled for completion in 1984. Meanwhile, production of urea at the Marsa Brega fertilizer plant of the National Petrochemical Co. continued to increase. Based upon figures for the first half of 1982, close to 245,000 tons were produced during the full year, necessitating

use of three work shifts per day for the first time.

In 1981, it had been reported that construction of a second urea plant that would more than double the existing urea production capacity was underway at Marsa Brega, as was a 1,000-ton-per-day methanol plant addition. It is probable that these plants were among those upon which work had to be suspended in 1982 because of the Government's austerity program.

As construction continued at the partially completed Abu Kamash chemical complex, an analysis of future needs for trained personnel indicated requirements for certain special skills. Accordingly, the Government's General Co. for Chemical Industries engaged the White Young Engineering organization of Great Britain to develop a process simulator that could be used to train workers who will be needed at the complex. The Federal Republic of Germany's Klöckner-Humboldt-Deutz operates the complex. Latest 1982 figures indicate that the complex has annual capacities for 50,000 metric tons of plastics, 49,000 tons of caustic soda, 40,000 tons of table salt, 8,100 tons of sodium hypochlorite solution, 8,000 tons of hydrochloric acid, and 6,000 tons of chlorine. Ultimate cost to complete this project is now expected to be $1.2 billion. Included within the complex will be an adjacent housing estate, school, market, post office, and mosque.

The Mineral Industry of Madagascar

By Kevin Connor[1]

Mineral production and exports were approximately the same as in 1981, with some volume improvement in chromite ore sales. Of significance was an increase in the market price for graphite. These factors resulted in an approximate increase of 15% in mineral trade receipts for the year. In 1982, the Government initiated new foreign exchange regulations allowing exporters to automatically retain a portion of their foreign exchange receipts for capital improvements and equipment part purchases. This was expected to improve output in the mineral industry, which had been suffering for some time from equipment breakdowns and general deterioration. Two of the four petroleum companies that negotiated contracts to search for oil within Madagascar domain during 1981 and early 1982 began seismic and aeromagnetic survey operations. Exploration activities were centering on two basins, Majunga and Morondava, located just onshore and offshore of the island's central west coastal area. During the first half of the year, the Andekaleka hydroelectric dam project was completed and commissioned, with two turbines in-place capable of generating 29 megawatts each. The electrical power generated was to service the Antananarivo and Tamatave areas.

PRODUCTION AND TRADE

Of the three major minerals commercially exploited, the quantities of chromite, graphite, and mica produced were down slightly from those of 1981. Ornamental stone production remained virtually unchanged at 300 tons for the year. Exports from Madagascar's mineral sector made up less than 5% of Madagascar's total export revenue. Of those minerals that were exported, graphite accounted for 45% of the mineral trade receipts, chromite ore, 36%; mica, 11%; and ornamental stones made up the remaining 8%.

For the third consecutive year, exports of chromite ore to the United States increased, reaching 41,000 tons total in 1982. This made the United States Madagascar's biggest export market for chromite ore for the year and represented 8% of U.S. imports of that mineral commodity. Exports of Madagascar's high-grade graphite to the United States were slightly over 2,200 tons and represented 15% of Madagascar's export market for graphite. Although Madagascar exported almost 1,300 tons of mica in 1982, less than 1% was traded to the United States. Mineral export revenues from U.S. trade totaled approximately $4 million,[2] which was 26% of Madagascar's total mineral export receipts for the year.

COMMODITY REVIEW

METALS

Chromite.—Kraomita Malagasy, Madagascar's chromite ore mining and processing agency, finished with construction and testing of its new mill facilities at Andriamena. The mill, which was designed by the French agency, Société General de Recherches et d'Exploitation Minières, produces a chromite ore concentrate with a lower phosphorus content than previously constructed milling facilities. Prior to commissioning of the new mill, Kraomita had consistently produced a lumpy ore with a phosphorus content of 10 parts per thousand by weight, which was unacceptably high for ferrochrome production. Over 20% of Madagascar's processed chromite ore production in 1982 was of low-phosphorus lumpy grade, and this figure was expected to increase in coming years. The low-phosphorus lumpy-grade chromite ore is more marketable and of higher value because of its suitability for ferrochrome production. The new processing mill had a capacity to produce 150,000 tons per year of 40- to 150-millimeter size ore averaging 44% Cr_2O_3 with a chrome to iron ratio of 2.5 to 1.

Iron Ore.—Investigations continued concerning the Soalala iron ore deposit. The research efforts were being conducted by the Bureau de Récherches Géologiques et Minières of France and entailed 2,500 meters of drilling and coring and ore beneficiation tests. The deposits are only 40 kilometers from Madagascar's west coast, near the Bay of Baly. However, there were no port facilities at the Bay of Baly, and the nearest ocean load-out facilities were at the Port of Majunga, 150 kilometers northeast of Soalala. A preliminary study by Italsider S.p.A. of Italy, completed in 1981, estimated ore reserves at 300 million tons with a 48% iron content.

NONMETALS

Graphite.—Madagascar remained the world's leading producer of high-grade crystalline flake graphite. Quality flake and lump graphite were produced by five companies that operated in a 50-kilometer-wide strip about 75 kilometers inland from the eastern coast running from the town of Vatomandry north to approximately the same latitude as the Port of Tamatave. The two major producers in 1982 were Etablissements Gallois, with 50% of the country's total production, and Société Minière de la Grand Ile (SMGI), which accounted for 30% of the total or slightly over 4,600 tons. Late in 1982, SMGI acquired the Sahanavo graphite mine, which had closed in 1978. SMGI officials planned to reopen and operate the mine in 1983 and projected a 20% increase in annual production for the company. SMGI also acquired new Caterpillar mining equipment to facilitate its expansion plans. For the second year in a row, graphite export receipts exceeded chromite sales, making it Madagascar's leading mineral export commodity, accounting for one-half of Madagascar's mineral export trade.

MINERAL FUELS

Heavy Oil.—In November, the International Bank for Reconstruction and Development (World Bank) approved an $11.5 million credit for a second-phase project to further define the commercial development potential of Madagascar's heavy oil deposits at Tsimiroro. The project as outlined would be a 10-well exploratory drilling program to determine deposit characteristics and reserve potential. The previous initial phase, conducted in 1980-81, resulted in estimates of almost 5 billion barrels of heavy oil reserves in place at Tsimiroro. Also envisioned as part of the second-phase project work was an engineering design study for a pilot production plant to optimize heavy oil production techniques. An estimated 12 Malagasian technicians were to be trained overseas in petroleum production technology as part of the second-phase effort. The Organization of Petroleum Exporting Countries had pledged to provide an additional $5 million for the project, which was expected to get underway by mid-spring of 1983.

Petroleum.—In July 1982, the fourth petroleum company to negotiate an exploration agreement with the Government of Madagascar in the 1980's, U.S. AMOCO, signed a contract covering an 8-year maximum period and a minimum of four exploration wells. Subsequent to the signing of the AMOCO contract, a total of three U.S. petroleum companies and one Italian firm, Azienda Generali Italiana Petroli S.p.A. (AGIP), were engaged in partnership agreements with the Government of Madagascar to explore for petroleum. The other two U.S. petroleum companies, the Occidental Petroleum Corp. and Mobil Oil Corp., were engaged in field survey work by early spring of 1982, with Occidental prospecting on land around the Toliara area using aeromagnetic surveys and Mobil investigat-

ing offshore Morondava using seismic techniques from a specially equipped boat. AMOCO's awarded concession was 5.6 million acres in the Bermaraha area of northwest Morondava Basin, just north of the Occidental concession and slightly larger in area. Mobil was also exploring in the Morondava Basin. AGIP was granted a concession northeast of Morondava in the Majunga Basin.

Petroleum Refinery.—Madagascar's sole petroleum refinery at Tamatave, operated by the Madagascar Petroleum Co., produced refined petroleum products at approximately the same level of crude throughput as in 1981. The plant produced 2.6 million barrels of fuel products, of which about 65% was fuel oil, 20% was gasoline, 11% was kerosine, and 4% was butane. The percentage of butane produced from the imported crude was down by almost 50% from production in 1981 and caused a countrywide shortage of bottled fuel gas for the last half of the year. The $30 million modernization and expansion work on the Tamatave refinery that started in late 1980 was nearing completion at the end of 1982.

The Mineral Industry of Malaysia

By John C. Wu[1]

Despite the adverse environment of the world economy, the mineral industry of Malaysia managed to expand by about 4%. The growth in the mining sector was contributed principally by the increases in the output of crude oil. During 1981-82, the value added by the mining sector to Malaysia's gross domestic product (GDP) was about 4%.

According to the Malaysia Ministry of Finance, the growth in real GDP was estimated at 3.9% in 1982 compared with 6.9% in 1981. The weakened domestic demand and reduced foreign demand for the Malaysian exports resulted in slower growth in the Malaysian economy. The Malaysia GDP in millions of 1970 constant Malaysian dollars, by sector of origin for 1981-82, is given in the following table:[2]

Table 1.—Malaysia: Gross domestic product, by sector of origin

(Millions of 1970 constant Malaysian dollars unless otherwise specified)

Sector of origin	1981	Growth rate (percent)	1982[e]	Growth rate (percent)
Agriculture	6,586	5.3	6,711	1.9
Mining	1,131	-3.4	1,175	3.9
Manufacturing	5,069	4.0	5,246	3.5
Construction	1,318	9.0	1,410	7.0
Government services	3,689	15.2	3,817	3.5
Other sectors	10,245	11.3	10,772	5.1
Total GDP	28,038	6.9	29,131	3.9

[e]Estimated.

Source: Malaysia Ministry of Finance.

Malaysia's gross national product was estimated at $12.74 billion compared with $12.28 billion in 1981.[3] Inflation in Malaysia was estimated at about 5% in 1982 compared with 9% in 1981. The total labor force grew from 5.6 million in 1981 to 5.7 million, of which about 5% was unemployed.

Malaysia remained the world's largest tin producer. The output of tin dropped sharply in 1982 as a result of high production costs, low tin prices, and mounting inventory owing to the falling demand for tin on the world markets. The small gravel pump miners were the hardest hit by the overall cutback in tin production. The Government of Malaysia planned to cut tin output by 20% or 15,000 tons per year starting in 1983. However, the development of the Kuala Langat tin deposit in Selangor will not be affected by the future cutback in overall tin production.

In an effort to assist the tin miners to overcome their financial difficulties, the Government of Malaysia revised the threshold price to M$26.40 per kilogram from M$23.15 per kilogram to lower the burden of export duty that the industry was paying in 1982.

During the year several attempts were made by Malaysia, Thailand, Indonesia, and other tin producing countries to form a tin producers association. However, because of differences in arrangements on export controls, buffer stockpilings, and voting rights, the formation of the association did not materialize in 1982.

The plans to build a $152 million copper smelter in Kota Belud of Sabah was dropped by the state Government in 1982. However, the construction work on a 650,000-ton-per-year direct-reduction iron plant on Labuan Island of Sabah and another 600,000-ton-per-year direct-reduction iron plant at Telok Kalong of Terengganu were started.

The construction work on a new cement plant was started in Pulau Langkawi. Kedah Cement Sdn. Bhd., the owner and operator of the 1.2-million-ton-per-year cement plant under construction, planned to expand the capacity to 2.4 million tons.

A $250 million contract for an ammonia-urea project was awarded by the Association of Southeast Asian Nations (ASEAN) Bintulu Fertilizer Sdn. Bhd. to Kobe Steel Ltd. of Japan in midyear. The complex was scheduled to come onstream in mid-1985.

In the mineral fuel sector, the construction work for the first-stage production of the Bintulu liquefied natural gas (LNG) plant was completed at Tanjung Kidurong. The total estimated costs of the Bintulu project including a deep water port, a gas pipeline, and a fleet of five tankers was about $3.1 billion.

For the first time in the history of Malaysia's merchandise trade, a trade deficit of about $320 million was recorded.

PRODUCTION

The mineral industry of Malaysia was dominated by the mineral fuel sector. The increase in petroleum production contributed mostly to the growth in the entire mining sector. Despite the oil glut on the world markets, the output of crude oil rose to an average of 297,000 barrels per day. The upward trend was mainly due to change in the enforcement of the National Petroleum Depletion Policy.

The output of bauxite, iron ore, tin, and other metals, such as columbite, ilmenite, monazite, xenotime, and zircon decreased in 1982. Falling demand, rising production costs, the depletion of higher ore grades, and heavy taxation were cited by the industry sources as the main causes for the decline. The output of antimony and copper remained at about the same level as that of 1981. However, gold and tungsten production increased slightly.

Production of cement and other nonmetallic minerals such as kaolin, limestone, crushed rock, and granite continued its upward trend because of the increased construction activities in various parts of the country.

[1]All production is from peninsular Malaysia (Malaya) unless otherwise specified. Table includes data available through June 16, 1983.

[2]In addition to the commodities listed, a variety of crude construction materials (clays, sand and gravel, and stone), salt, and fertilizers are produced, but output is not reported, and available information is inadequate to make reliable estimates of output levels.

[3]Based on export figures.

[4]Includes production from Malaya, Sarawak, and Sabah.

TRADE

Exports of crude petroleum and tin remained the two major components of Malaysia's major export commodities. Export earnings from crude petroleum rose 6% to $3.1 billion from that of 1981, while export earnings from tin remained at about $980 million in 1982. Petroleum and tin alone contributed about 30% to Malaysia's total foreign exchange earned. Other export minerals included copper concentrate, bauxite, and other minor metals that earned about $90 million.

Imports of machinery, transport equipment, and manufactured goods continued to increase at a rate of about 14% per year during 1981-82. The combined import bills of these capital and manufactured goods were valued at $8.2 billion in 1982 and accounted for about 60% of the total imports. To meet the requirements of domestic oil refineries, Malaysia also imported about $980 million of heavier crude petroleum.

The Malaysian external trade by major component during 1981-82 was as follows, in billion dollars:[4]

Table 3.—Malaysia: Trade by major components

(Billion U.S. dollars)

	1981	1982[e]
Exports:		
Petroleum	2.93	3.09
Manufactured goods	2.87	3.29

COMMODITY REVIEW

METALS

Aluminum.—The mine production of bauxite from the Telok Ramunia Mine in South Johor continued to decline. The monthly output averaged about 50,000 tons. A further reduction in exports of bauxite, particularly to Japan, forced the mine to cutback its output. In 1981, export earnings of bauxite rose slightly to $9.6 million despite an 11% drop in export quantity to 642,450 tons.

Copper.—Production of copper at the Mamut copper mine continued at a monthly average of 500,000 tons of ore and about 11,000 tons of concentrate, grading about 24% copper. Overseas Mineral Resources Development Sabah Bhd., the operator, is jointly owned by Overseas Mineral Resources Development Co. of Japan (51%) and the Sabah state Government (49%). Malaysia exported all of its copper concentrate to Japan.

The Sabah state Government decided to drop plans to build the $152 million copper smelter in Kota Belud, Sabah. According to the state Government officials, low copper prices and insufficient ore supply from the

Mamut Mine were cited as the main reasons for dropping the plans.[5]

A copper-molybdenum deposit was discovered in the Sokor area of Ulu Kelantan, about 168 miles northeast of Kuala Lumpur. Further prospecting was being carried out by the Malaysian Geological Survey and the Canadian Industrial Development Authority.

Iron and Steel.—The mine output of iron ore from eight operating mines declined substantially. The largest iron mine at Gunung Jerain in Kedah, accounted for 21% of the total output. About three out of seven small mines operating in Perak and two out of four small mines operating in Johor were either temporarily shut down or closed down entirely. In 1981, about 31,000 tons of iron ore was exported principally to Singapore and Thailand, and the remainder was shipped to the country's only iron reduction plant, owned and operated by Malayawata Steel Bhd., in the Patani area of South Kedah.

In March 1982, a formal agreement was signed between Malaysia state-owned Heavy Industries Corp. (HICOM) and a Japanese consortium led by Nippon Steel Corp. to build a 600,000-ton-per-year, direct-reduction sponge iron plant and a 560,000-ton-per-year billets plant at Telok Kalong industrial estate on the central Terengganu coast. The construction work of the $449 million complex began in April and was scheduled for completion in 1985.

The project was to be financed by a $108 million capital investment with the Japanese consortium holding 30% and HICOM 70%, a $276 million loan from Japan's Export-Import Bank carrying an annual interest rate of 7.25% for 10 years, and a $65 million credit extended by the Japanese consortium carrying an annual interest rate of 6.5% over a 10-year period.[6]

The first direct-reduction iron plant of Malaysia with an annual capacity of 650,000 tons was being built on Labuan Island of Sabah by Voest-Alpine AG of Austria and Midrex Corp. of the United States for startup in mid-1984. In September 1982, Sabah Gas Industries signed an agreement with Voest-Alpine and Midrex to modify the direct-reduction iron facility. The modification was to use the new hot-briquetting process of Midrex. Because hot briquets are easier to handle, store, and transport in all weather conditions, the modification was of primary importance because the output from the plant will be exported exclusively to the steel industries of ASEAN and other Far East countries.

Malaysia will import about 250,000 tons of iron ore pellets from India annually over a 3-year period starting in 1984 under an agreement signed in March 1982. The iron ore pellets from India will be used by the direct-reduction iron plant on Labuan Island. Other possible sources of raw materials being considered were the Hamersley and Mount Newman Mines of Australia, and the Mutuca Mine of Brazil for lump ore; Luossavaara Kiirunavaara AB of Sweden, Cia. Vale do Rio Doce and Samarco Mineração S.A. of Brazil for pellets, and Australia for coal.[7]

Tin.—Mine production of tin metal dropped 13% to 52,000 tons mainly because of low tin prices, high production costs, and lower ore grades. The average market price of tin metal in Penang, Malaysia, dropped from $14.40 per kilogram in 1981 to $12.80 per kilogram in 1982. According to industry sources, because of the persistently higher energy costs, the average cost of production of tin metal, which excluded export duty and royalties for the dredging sector, rose 16.8% to $8.73 per kilogram during the second half of 1981. If export duty and royalties were included, the average production costs for the dredging sector was $11.60 per kilogram compared with $15.10 per kilogram for the gravel pump sector.[8] Because of increasing difficulty in renewing and obtaining mining leases and permits from the state Government because of state land policies, many alluvial land deposits were being worked up for the fourth time. As a result, the average ore grades gradually declined over the past years.

The total number of active production units declined from 730 units at the end of September 1981 to 671 units at the end of September 1982. Of the 671 units operating in September 1982, 559 units were gravel pumps, 47 were open casts, 42 were dredges, 20 were underground, and 3 were others. Of the total tin concentrates produced in the first 9 months of 1982, 53.0% was mined by gravel pumping, 31.5% was by dredging, 4.8% was by open casting, 1.4% was by underground mining, and 9.3% was by dulang washing, retreatment, and other methods of mining. Production of tin concentrates was mainly in Perak, 55%; Selangor, 34%; and the other 8 States, Pahang, West Persekutuan, Johor, Terengganu, Kedah,

North Sembilan, Melaka, and Perlis, 11%.

The total number of workers employed in the tin mining industry was about 31,000 persons at the end of September 1982 compared with about 35,100 persons at the end of September 1981. Most reduction in employment of the tin industry, reportedly, was in the gravel pump sector. During 1981, 153 gravel pump mines were closed down owing to low tin prices, and about 3,800 workers lost their jobs. During the first 2 months of 1982, an additional 26 gravel pump mines were shut down and 370 workers were laid off.

Exports of tin for the first 9 months in 1982 fell sharply by 25% to 36,942 tons from that of the same period in 1981. Export earnings of tin for the first 9 months in 1982 also dropped drastically by more than 25% to $484 million from that of the same period in 1981.

A feasibility study prepared by Pernas Charter Management Co. on the joint venture project to develop the Kuala Langat tin deposit in Selangor was completed in mid-1982. The estimated cost of developing the most complex alluvial tin mining operation was about $211 million. The alluvial tin ore body is buried up to 300 feet deep with overburden ranging from 100 to 150 feet thick and covers an area of 4,000 acres. Kuala Langat Mining Sdn. Bhd., the operator of the project, is 65% owned by Kumpulan Perangsang Selangor (KPS), a state-owned corporation; 30% by the Malaysia Mining Corp. (MMC); and 5% by the Tronoh Mines Malaysia. The capitalized equity is $25 million.

Because of the weakened demand for tin and the depressed prices on the world markets, the Government of Malaysia planned to reduce its tin production by 15,000 tons per year starting in 1983. According to industry sources, the planned cutback in production, which represents a 22% reduction in Malaysia's annual tin output and about 7% of the world's total output, was aimed to close down the high cost and less-efficient small gravel pump mines. However, the development of Kuala Langat tin deposit by KPS and MMC will not be affected.[9]

After an appeal of the tin industry to the Government to reform the tax structure of the export duty on tin because of the increasing cost of production, the Government of Malaysia decided to increase the so-called threshold price to $11.16 per kilogram beginning in fiscal year 1983 from $9.79 per kilogram in fiscal year 1982. The threshold price is the base price on which a 20% export duty will be imposed.

An attempt to form a tin producers association was first proposed by Malaysia to Thailand in February 1982, and later to Indonesia. Several meetings were held in Bangkok, Jakarta, and Kuala Lumpur among Malaysia, Thailand, and Indonesia. In November, a new proposal was presented by Malaysia to Australia, Bolivia, Indonesia, Nigeria, Thailand, and Zaire at the annual conference held in Lagos, Nigeria. However, a formal agreement was not signed because of a deadlock between Malaysia and Indonesia regarding the voting rights, export control, and buffer stockpiling arrangements. The next meeting was scheduled in London in February 1983. According to Malaysian Government officials, the major activities of the proposed tin producers association include research and development, joint marketing, and other measures to safeguard the tin industry of member countries that were not covered in the Sixth International Tin Agreement.[10]

NONMETALS

Cement.—The combined annual clinker capacity of five cement companies remained at 3.2 million tons. The construction work on a 1.2-million-ton-per-year cement plant in Pulau Langkawi was started early in the year by Ishikawajima-Harima Heavy Industries Co. Ltd. of Japan. The new cement plant was scheduled for completion in late 1982. Kedah Cement Sdn. Bhd., the owner of the plant, planned to add another 1.2-million-ton-per-year capacity to the plant under construction. The estimated cost of the expansion program was about $169 million.

Associated Pan Malaysia Cement Sdn. Bhd. was to spend about $63 million to convert from the existing wet-process plant to the more energy-efficient dry-process plant at Chemor near Rawang, Selangor, between 1982 and 1984.

Fertilizer Materials.—A $250 million contract was awarded by ASEAN Bintulu Fertilizer to Kobe Steel in July. The contract calls for Kobe Steel to build a natural gas-based ammonia-urea plant at Bintulu, Sarawak, on a turn-key basis.

Kobe Steel was to provide the engineering, equipment, construction, and commissioning. The Friedrich Uhde GmbH of the

Federal Republic of Germany and Nichimen Corp. of Japan were to serve as consultants to Kobe Steel. The complex was scheduled for completion in the second half of 1985. It will have a capacity of 1,000 tons per day of ammonia and 1,500 tons per day of granulated urea. The Uhde process of the Federal Republic of Germany would be used for the ammonia production, and Stamicarbon of the Netherlands and Nederlandse Stickstoff Maatschappij process of Belgium, for urea production.

Of the total cost of the project, about $142 million credit would be extended by the Government of Japan through the Overseas Economic Cooperation Fund, a $58 million loan by Japan's Export-Import Bank, and the remainder, $127 million, was to be contributed by Malaysia, 60%; Indonesia, Thailand, and the Philippines, 13% each; and Singapore, 1%.[11]

MINERAL FUELS

Natural Gas.—The construction work for the first-stage production of LNG at Tanjung Kidurong in Bintulu, Sarawak, was completed by the end of 1982. The first-stage production was scheduled to start in January 1983. The Bintulu LNG complex is Malaysia's first and one of the world's largest LNG plants. The construction of the plant involved more than 4,000 workers, and took 3 years to complete; the entire project was estimated to cost nearly $3.1 billion. It included a $1.7 billion LNG plant at Tanjung Kidurong, a $280 million pipeline system connecting the LNG plant and offshore central Luconia Gasfields, a $250 million deepwater port at Bintulu, and an $850 million fleet of five gas-carrying tankers for the transport of LNG between Malaysia and Japan.

Under a 20-year contract, Malaysia was to export to Japan about 1.7 million tons of LNG in 1983, 3 million tons in 1984 increasing to 4.5 million tons in 1985, and 6 million tons in 1986 at full-capacity operation. The Government of Malaysia estimated that export earnings from LNG will be about $450 million dollars in 1983 and will be about $1.6 billion in 1986. The negotiated export price of Malaysian LNG for the 1983 shipments was, reportedly, about $6 per million British thermal units.[12]

In November 1982, a contract was signed between Petroleum National Bhd. (Petronas), the state-owned oil and gas company, and Esso Production Malaysia Inc. (EPMI) for the purchase of associated gas in conjunction with the crude oil production from EPMI's oilfields at Bekok, Pulai, and Tapis, off the east coast of Terengganu. The contract represents the beginning and the first domestic use of gas for the production of liquefied propane gas and for the 450-megawatt, gas-fired power station at Paka in Terengganu.

Under the contract, EPMI was to spend about $170 million for the installation of a gas-gathering network and a pipeline connecting its oilfields to the Petronas Carigali Sdn. Bhd. contract area over the next 2 to 3 years. Petronas was also to spend about $500 million for its own gas project. The gas project included installation of six platforms in the Petronas Carigali contract area, and a 149-mile gas pipeline connecting the Duyong and Sotong Gasfields to the stabilization facilities at Karteh, Terengganu. The Petronas project was scheduled for completion in 1984.[13]

In 1982, Malaysia's nonassociated natural gas reserves were revised to 39 trillion cubic feet from 36 trillion cubic feet in 1981. Associated natural gas reserves were estimated at 10 trillion cubic feet in 1982.[14]

Petroleum.—Malaysian crude oil production increased to an average of 297,000 barrels per day in 1982 from an average of 258,000 barrels per day in 1981. About 42% of the total output was produced by EPMI from the Bekok, Pulai, and Tapis Oilfields off the east coast of Terengganu; 39% was produced by Sarawak Shell Bhd. from Baka, Baram, Baronia, Betty, Fainley-Baram, West Lutong, Temana, and the Tukau Oilfields off Sarawak; and 19% was produced by Sabah Shell Petroleum Co. from the Semarang and South Furious Oilfields off Sabah.

All three companies were operated under production-sharing agreements with Petronas. Under the fourth 5-year plan, the crude oil output will tentatively be increased to 362,000 barrels per day by 1985. To increase export earnings from crude petroleum, the Government of Malaysia began to relax the conservation efforts under the National Petroleum Depletion Policy in 1982.

Export earnings from crude oil rose about 6% to $3.1 billion from that of 1981, and accounted for 27.5% of total export earnings. The major buyers of Malaysian crude oil were Singapore, Japan, and Thailand. Malaysia imported about $980 million of

heavier crude oil principally from Saudi Arabia, the United Arab Emirates, and Iran. The imported heavier crude was mixed with the domestic lighter crude at a ratio of 70% to 30% to meet the designed raw material requirements of the Malaysia refineries.

Two oil wells were discovered in Malaysia. The first discovery was by Petronas Carigali, a wholly owned subsidiary of Petronas, about 78 miles offshore west of Kuala Terengganu. Production tests recorded a total of 5,565 barrels per day of oil and 10 million cubic feet per day of nonassociated natural gas. The second oil well was discovered by Carigali-BP, about 9 miles west of Kudat Peninsula, Sabah. The well flowed 1,740 to 2,050 barrels per day of oil and 8.5 million cubic feet per day of gas. Carigali-BP is a joint venture company, 50% owned by Petronas Carigali, 42.5% by British Petroleum Corp., and 7.5% by Oceanic Exploration Co.

In November, an important joint venture exploration and production-sharing agreement was signed between Petronas and Société National Elf Aquitaine (SNEA) of France. Under the agreement, SNEA was granted a 5-year exploration in a concession area of 12,650-square-kilometers off the coast of Sarawak. SNEA, the fifth foreign driller to enter into a production-sharing agreement, was expected to spend about $50 million and to drill a minimum of six wells over the next 5-year period. The first two foreign companies to enter into the production-sharing agreement with Malaysia were Royal Dutch/Shell and EPMI in 1976, followed by British Petroleum and Oceanic Exploration in 1980.[15]

The construction of Petronas' first refinery with a 30,000-barrel-per-day capacity was started by JGC Corp. (Nikki) of Japan at Kertoh in Terengganu. The refinery was scheduled for completion in 1984. Petronas planned to build another oil refinery with a capacity of 120,000 barrels per day at Tanga Batu, Sungai Udang, in Malacca. Invitations for prequalification of contractors for the refinery was issued in August 1982. The contract was expected to be awarded in 1983. According to the Petronas plans, the refinery was scheduled for completion in 1987.[16]

The Mineral Industry of Malta

By Walter G. Steblez[1]

In 1982, as in previous years, Malta had to largely rely upon imports of mineral raw materials, fuels, and food; the country was only a modest producer of limestone and salt. The economy was based primarily on transshipment and reexport of goods.

Among the largest investment projects during the year was the planned development of the $110 million deepwater Marsaxlokk Port on the southern end of the island. When completed the port would serve as a coal terminal that would accommodate vessels with up to 200,000 deadweight tons, and would have a 4.5- to 5.5-million-ton-per-year coal handling capacity. Other storage and transshipment facilities were to be upgraded at Grand Harbor. These included expanded storage facilities for refined fuel oil bunkering as well as crude oil for eventual transshipment to European refineries.

During the year, the Maltese Government offered offshore petroleum production sharing contracts to foreign oil firms. These firms were to be serviced by the Government-controlled Mediterranean Oilfield Services Co. Ltd.
