The Mineral Industry of Mauritania

By Thomas O. Glover[1]

The mining industry has performed a central role in the Mauritanian economy since 1963, when iron ore mining began. Exports of iron ore regularly account for 80% of all exports. The Government derived between one-quarter and one-third of its revenue from the mining industry, which employed one-quarter of the wage and salaried work force.

As a result of its dependence on iron ore exports, the economy has suffered a loss of foreign exchange in recent years from the weakness of the iron ore market.

The El-Rhein Mine, a part of the Guelbs deposit, was partially developed in 1982, with production of iron ore due to commence in 1984-85. The Akjoujt copper mine, closed in 1978, was reopened. An oil refinery built at Nouadhibou in 1977 was refurbished and commenced operation.

The International Bank for Reconstruction and Development (World Bank) and its affiliate, the International Development Association (IDA), approved a $4.6 million IDA credit that will assist the Ministry of Planning in formulating and monitoring macroeconomic policy and reviewing and implementing the fourth 5-year National Investment Plan (1981-85). The project will be completed in 1986. Mauritania was heavily dependent on its ore exports and had allocated 33% of projected investment expenditures in the 1981-85 plan period to the opening of the Guelbs iron ore deposit.

PRODUCTION AND TRADE

Production of Mauritania's major mineral commodity, iron ore, continued to decline for the third year in succession, owing mostly to poor market conditions. Iron ore output was down approximately 6% from that of 1981 but was still well above the low of 7 tons in 1978, when the conflict with Western Sahara was at its peak. The refurbished oil refinery at Nouadhibou received its first shipment of Algerian crude oil in July 1982 and began marketing its first petroleum products from the refinery in October 1982.

Iron ore exports from the Government-owned Société Nationale Industrielle et Minière (SNIM) mines in Zouirat in 1982 totaled 7.65 million tons. The three major countries receiving Mauritanian iron ore were Belgium, France, and Italy.

Table 1.—Mauritania: Production of mineral commodities[1]

[e]Estimated. [p]Preliminary.
[1]Table includes data available through June 14, 1983.
[2]In addition to the commodities listed, modest quantities of unlisted varieties of crude construction materials (clays, stone, and sand and gravel) and salt presumably are produced, but output is not reported quantitatively, and available information is inadequate to make reliable estimates of output levels.
[3]Gypsum mine only operated January through March 1981.

COMMODITY REVIEW

METALS

Copper.—On May 25, 1982, the Akjoujt copper mine was reopened. Until 1978, the mine was worked by the Société Minière de Mauritanie but was forced to shut down when the world market price for copper fell. The mine was reopened by the Société Arabe Minière D'Inchiri with a capital expenditure of $72 million. Mauritania funded 34% of the capital expenditures with the Arab Mining Co., Jordan, Iraq, and Libya funding 66%. The mine was expected to produce 105,300 tons of concentrate per year yielding a 23% copper content by 1985. The Akjoujt deposit had been estimated to contain 20 million tons of ore reserves grading 2.25% copper. The processing of 2.5 million tons of tailings from previous copper operations could net 362,500 ounces of gold.

Iron Ore.—The three open pit mines at the Kedia d'Idjill deposit, Tazadit, F'Derik, and Rouessa, were to be phased out by 1990 and will be replaced by two open pit mines in the Guelbs deposit.

Work had begun on the first phase of the $480 million El-Rhein Mine development project. The deposit contained at least 250 million tons of magnetite ore grading 37% iron. Starting in 1984, approximately 13.8 million tons per year were to be mined at the El-Rhein Mine. The ore was to be crushed at the minesite and run through a dry magnetic separation process to produce 6 million tons per year of 65% iron concentrate. Output was to be in the form of 1.2 million tons per year of magnetic sinter-plant feed, 2.64 million tons per year of oxidized sinter feed, and 2.16 million tons per year of fine-grained magnetic concentrate suitable for later super enrichment.

Work on the Oum Arwagen Mine was to follow the startup of production of the El-Rhein Mine. The mine was to be developed at a cost of $525 million. Production of concentrate from the mine was to be in excess of 6 million tons per year. Plans for the Guelbs project allowed for the possibility of raising total output in the future to 24 million tons per year of iron ore. SNIM had received letters of credit covering more than one-half the output from the El-Rhein Mine.

There are plans to build an iron ore pelletizing plant at Nouadhibou, which would have a capacity of 2 million tons per year. The plant would be built by the Société Arabe des Industries Metalliques, which is jointly owned by SNIM and Kuwait interests.

NONMETALS

Gypsum.—Since 1973, SNIM has mined gypsum at Sebkha de Ndrhamcha, near Nouakchott, exporting the entire production to Senegal for use in its cement plant at Rufisque. Mauritania possessed an estimated 1 billion tons of 98% pure gypsum. To date, approximately 100,000 tons of gypsum have been mined since startup of operations in October 1975.

Phosphate.—Phosphate occurrences in the Aleg-Boghe-Kaedi area, on the southern border, were being studied by SNIM and France's Bureau de Recherches Géologiques et Minières to determine the extent of the deposits and whether they were economically exploitable to meet domestic needs. Reserves were estimated at 30 million to 40 million tons and might be worked at a rate of 500,000 tons per year.

MINERAL FUELS

Petroleum.—National Refining Industries of Mauritania began operations in July 1982. The plant, built in 1977 at a cost of $90 million, had never been able to operate. The plant had been designed for light Algerian crude oil, and the country was unable to obtain this type of oil. Following restoration to full capacity of 23,000 barrels of crude oil per day, the plant will employ 250 to 300 persons and will have expected sales of over $287 million[2] per year.

Uranium.—Mauritania has signed an agreement with Iraq to participate in an exploration program in northern Mauritania for uranium.

The Mineral Industry of Mexico

By Orlando Martino[1]

After a period of remarkable growth, Mexico's economy in 1982 was in severe crisis. Its difficult situation was characterized by a large foreign debt, several sizable devaluations of the peso, a stagnant economy, inflation of almost 100%, rising unemployment, and a sharp reduction in new private sector investment. During 1978-81, Mexico had one of the highest growth rates in the world—an average increase of 8.4% per year. In 1982, the economy experienced no growth; in fact, output fell slightly by 0.2% to an estimated $162 billion at current prices.[2]

At yearend, Mexico's total foreign debt had increased to $84.3 billion, comprised of $62.3 billion for the Government sector and $22.0 billion held privately. Of total debt, Petróleos Mexicanos (PEMEX), the state oil company, owed $20 billion to foreign lenders. A smaller but significant amount of foreign debt was held by a number of Mexican mining companies with Government and private equity participation. To assist Mexico with its international financial difficulties, in August, the United States provided an aid package that included $1 billion advance payment for oil deliveries to the U.S. Strategic Petroleum Reserve.

Foreign exchange controls applied during the year made it difficult for mineral companies to import equipment and materials for mining operations. Consequently, new investment plans were deferred or current expansion projects delayed. The substantial depreciation of the overvalued peso, on the other hand, benefited mineral companies that earned dollars and other hard currencies from mineral exports while operating costs were incurred in local currency. Exporting companies with limited overseas loans were especially advantaged by the several peso devaluations. But these benefits were expected to be short lived as inflation pushes local costs upward.

A positive note in Mexico's depressed situation in 1982 was PEMEX's continued success in expanding the country's crude oil and natural gas output to historic levels. This PEMEX performance confirmed Mexico's position as the world's fourth largest oil producer after the U.S.S.R., the United States, and Saudi Arabia. Oil exports were also at a historic level, as Mexico became the most important foreign oil supplier to the United States.

Output by Mexico's nonfuel mineral industry declined, and earnings from total mineral exports fell because of lower world prices for the majority of mineral products. Because of the key role of silver, the large drop in average price, combined with reduced output, had a serious impact on foreign earnings. Despite this negative picture, Mexico succeeded in achieving record production levels in a number of metallic and nonmetallic products. Mexico continued as a major world producer of silver, fluorspar, strontium minerals, arsenic, natural graphite, antimony, and bismuth, and a significant producer of cadmium, lead, zinc, selenium, natural sodium sulfate, and sulfur. Mexico was the world's largest exporter of salt. Mexico made further progress in its long-term goal of adding value to its mineral output before export with the start-up of a new zinc refinery.

Government Policies and Programs.—The new administration that began its 6-year term in December announced an austerity program for a 24-month period. Exchange controls imposed had an impact on foreign loan servicing, overseas profits

flow, and imports needed for investment projects. To decrease the dependency on oil exports, the Government was studying means to increase exports of agricultural and mineral commodities such as silver, copper, lead, zinc, and others. At yearend, the Government was considering legislation to increase the oil production ceiling from 2.75 million to 3 million barrels per day, but the increase would be linked to domestic demand rather than export prospects.

The Government was considering ways to encourage new foreign investment by a relaxation of the equity participation rules. However, it was felt that these equity changes would exclude the sensitive priority industries of mining and petrochemicals.

In September, the Government nationalized 53 private and mixed capital banks in Mexico. The banks held shares in over 300 companies including those with joint ventures with foreign companies. Since the banks also held shares in mineral companies, nationalization was expected to alter the pattern of Government equity participation in the mineral sector.

The Comisión de Fomento Minero (Fomento Minero), a decentralized Government agency, continued its program of credit and technical assistance to small and medium miners. Mining credit has expanded from the equivalent of $3.7 million in 1971 to $25.4 million in 1979. Fomento Minero operated a number of regional ore beneficiation plants to serve the small and medium miners.

The Consejo de Recursos Minerales (CRM) was involved in an intensive mineral exploration program directed toward minerals essential to Mexico's industrial development plan for 1980-90 but in which the country is deficient. Annual expenditures for nonfuel mineral exploration exceeded $100 million annually in the early 1980's, of which the Government expended 55%, and private mineral companies, 45%. Of this total, CRM was responsible for 37%. Since 1975, CRM's intensified efforts have resulted in major significant new mineral discoveries or increased proven reserves involving copper, iron ore, phosphate rock, and coal. Less significant were the new reserves identified of zinc, sulfur, limestone, and kaolin.

Under the country's National Plan for Industrial Development, Nacional Financiera completed a monograph on the future demand for capital goods by Mexico's mineral industry.[3] It was estimated that the demand for mining equipment and machinery, not including metallurgical plants, for the period 1980-2000 would require $11 billion at 1982 prices. This study was prepared with the collaboration of Fomento Minero, the Cámara Minera de México, and numerous mining companies. Currently, Mexico imports about 70% of its needs for mining equipment.

The new administration was preparing a $2.3 billion investment plan to improve Mexico's roads, railways, seaports, airports, and telecommunications facilities. Of this amount, $1 billion will be allocated to rehabilitate the antiquated rail system that is used to transport a good part of mineral output. The roadbuilding program will include construction of new feeder roads in rural and remote areas where many mining operations are located. The $120 million allocated for seaport development will concentrate on the country's nine largest ports. PEMEX was expanding handling capacity at the Gulf Port of Pajaritos, Mexico's principal oil port, from 900,000 to 1.4 million barrels per day. Storage capacity at Pajaritos will be expanded to 2.6 million barrels.

Despite Mexico's economic difficulties, it was expected that Mexico would extend the San José Agreement with Venezuela for facilitating oil imports by certain countries in Central America and the Caribbean.

PRODUCTION

Despite the country's economic recession, historic highs were achieved in the output of copper, iron ore, ferroalloys, molybdenum, phosphate rock, salt, crude oil, and natural gas. Although industrial output overall was depressed, the fertilizer industry grew by 27% over that of 1981 because of the opening of new plants during the year. The record output level of copper and phosphate rock resulted from increased output of the new mines of La Caridad and San Juan de la Costa, respectively.

Except for the commodities noted above, the level of mineral production was mostly flat or lower relative to 1981. Decreased output was notable in antimony, bismuth, lead, manganese, and crude steel. Among the nonmetallic minerals, output was lower for fluorspar, gypsum, and sulfur.

The Banco de México reported a slow-

down in the rate of employment in the mineral sector from a 9.6% increase in 1981 to a 6.5% increase in 1982.[4] According to the latest data available from the CRM for 1980, out of a total of 8.5 million employed in industry, 2.2% of the total or 182,000 workers were in the mineral sector.[5]

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Aug. 31, 1983.

[2]In addition to the commodities listed, pumice and additional types of crude construction materials are produced, but output is not reported, and available information is inadequate to make reliable estimates of output levels.

[3]Sb content of ores for export plus Sb content of antimonial lead and other smelter products produced.

[4]Calculated white As equivalent of metallic As content of products reported.

[5]Bi content of refined metal, bullion, and alloys produced indigenously, plus recoverable Bi content of ores and concentrates exported for processing.

[6]Calculated from reported Fe content on the basis of concentrate and pellets containing 66% iron.

[7]Calculated from reported Mn content of mine production on the basis of ore and nodules averaging 36% manganese.

[8]Estimates by the International Tin Council.

[9]Reported erroneously as magnesite in previous editions of this chapter.

[10]Beginning in 1981, Petróleos Mexicanos (PEMEX) initiated production of liquid nitrogen, which in that year amounted to 29,540 tons; in 1982, it was 39,009 tons.

[11]Excluding that for cement production.

TRADE

During 1982, Mexico sought to increase exports as a means of rebounding from the recession and to take advantage of the increased competitive position of Mexican products caused by the peso devaluations. Considering the economic recession in Mexico and worldwide, the country succeeded in expanding total exports by 8.4% over those of 1981 to $21 billion. This increase was due primarily to the 17% increase over the 1981 level in the value of crude oil exports, while the value of nonoil exports declined by almost 30%, compared with that of 1981. Crude oil exports generated a foreign income of $15.6 billion despite the almost 14% decrease from that of 1981 in the average price of oil. The volume of crude oil shipments expanded by 36% over that of 1981 from an annual total of 401 million to 545 million barrels. On the other hand, the value of natural gas exports to the United States declined 9% below that of 1981 to $476 million.

The substantial drop in the value of nonfuel mineral exports resulted primarily from the decline in silver exports that dropped 27% below 1981 levels. Normally silver accounts for about 50% of Mexico's nonfuel mineral exports. Exports of gold and silver were valued at $386 million compared with $531 million in 1981. Exports of copper concentrate to the United States increased notably since Mexico did not have smelter and refinery capacity to handle its expanded mine output. Because of reduced domestic demand, steel exports increased to $112 million, compared with $64 million in 1981. The dominance of mineral exports in Mexico's international trade is shown below:

	1980	1981	1982
Total Mexican exports value, millions	$15,308	$19,379	$21,006
Crude oil exports do	$9,449	$13,305	$15,623
Crude oil share percent	61.7	68.7	74.4
Mining, metallurgical exports value, millions	$1,347	$1,256	$887
Mining, metallurgical share percent	8.8	6.5	4.2

Because of the economic recession and restrictions on the availability of foreign exchange, total imports contracted 40% below those of 1981 to $14.4 billion, giving Mexico a substantial surplus of $6.6 billion in its trade balance. Of the total, $9.1 billion represented purchases by the private sector. Imports of steel products fell to $1.1 billion compared with $3.1 billion in 1981.

Imports for the mining, oil, and natural gas sectors as a group declined 48% compared with those of 1981. Overseas purchases, in particular by the nonferrous mineral sector for ore extraction and beneficiation purposes, fell by 65% compared with those of 1981.

The United States continued as the most important market for Mexico's mineral exports. About 50% of crude oil exports went to the United States, and Mexico became the leading foreign oil supplier to the United States. For the first time in many years, the United States ran a trade deficit of $3.7 billion with Mexico. Mexico exported $15.5 billion to the United States, compared with $13.8 billion in 1981, and imported $11.8 billion from the United States, compared with $17.8 billion in 1981. Compared with that of 1981, the U.S. share of Mexican exports decreased from 54.2% to 53.4% and the U.S. share of Mexican imports decreased from 66.3% to 62.2%. Mexico was the third most important trading partner of the United States after Canada and Japan.

COMMODITY REVIEW

METALS

Aluminum.—Mexico planned to increase aluminum productive capacity, with the objective of decreasing dependency on imports from 52% in 1980 to 17% in 1985. In the past, Mexico's aluminum production has been limited by the lack of electrical energy and high operating costs. New projects brought onstream by the Comisión Federal de Electricidad (CFE) now give the country a comparative advantage. Mexico's demand for ingot aluminum has grown significantly during the last decade—from 55,136 tons in 1973 to 105,641 tons in 1980. In 1982, domestic production of ingot covered only 40% of total demand.

Copper.—Since Mexico's installed smelter and refinery capacity did not match its mine capacity, an increased amount of copper concentrate became available for export. Certain U.S. copper producers expressed concern over the increase of copper imports from Mexico during the current depression of the U.S. copper industry. Copper exports to the United States, primarily ore and concentrate, reached a record level of almost 64,500 tons, almost triple 1981 exports. The Mexican copper exports represented a very small part of the total U.S. copper market. Mexico's copper consumption fell to 87,600 tons compared with 131,000 tons in 1981, while copper imports fell to 27,000 tons from 78,000 tons for the same period.[6]

Mexico's high level of mine production reflected expanded output from the new La Caridad Mine, the country's chief copper producer operated by Mexicana de Cobre S.A., which had its third full year of operation. Mexico was in the process of increasing its smelter capacity, currently at 120,000 tons of blister copper per year. The Cía. Minera de Cananea was expanding its rebuilt smelter by 55,000 tons to 125,000 tons per year by 1984, and Caridad was building a new 180,000-ton-per-year smelter near Nacozari, Sonora State, which was scheduled for completion in late 1983 or early 1984. These projects would give Mexico a total smelter capacity of 355,000 tons of copper per year, about equal to its mine-mill capacity. Considering that the Cananea mining district is about 40 miles south of Nogales and Douglas in Arizona, concern was voiced over how air quality would be impacted by sulfur dioxide emissions from the expanded smelter operations.

Mexico had only one copper refinery rated at 120,000 tons per year, operated in Mexico City by Cobre de México S.A. This company was expanding its annual capacity to 150,000 tons. La Caridad decided to build a new 180,000-ton-per-year refinery near the Pacific coast Port of Guaymas. In late 1982, Mexicana de Cobre awarded a $113 million contract to Marubeni Corp. of Japan to design, construct, and supply equipment for the Guaymas electrolytic refinery. Input for the refinery would be supplied from La Caridad's new smelter. These two projects would give Mexico a total refinery capacity of 330,000 tons and provide some capability

of exporting refined copper instead of copper concentrate.

Gold.—Mexico's importance as a gold producer has been diminishing for several decades. In 1980, gold accounted for almost 5% of the value of all nonfuel minerals. Gold has been produced chiefly as a byproduct of lead, zinc, and copper mining. The Pinzón Dorado Mine in Guerrero State represents the only mine worked for gold exclusively with an annual output of about 32,000 troy ounces. In 1981, Industrias Peñoles S.A. de C.V. (PENOLES) and its affiliated companies produced 130,700 troy ounces of gold or about 64% of national output. The leading producing States of Guanajuato, Sonora (Cananea), Durango, Chihuahua, and Zacatecas accounted for 78% of total output.

Mexico was a major world producer of official gold coins, ranking third after the Republic of South Africa and the United Kingdom. For this purpose, it was necessary to import gold, mostly from the United States and the United Kingdom. Coin production in 1980 consumed 740,000 troy ounces of gold. Mexico was the largest industrial user of gold in Latin America. The Government early in 1981 changed a restriction prohibiting the sale of gold abroad in order to stimulate increased investment in gold mining.

Iron Ore.—Production of iron ore by the country's steel companies reached a record high in 1982 of almost 8.2 million tons, capping a long period of steady growth. Although Mexico has modest reserves of iron ore, they have been adequate to meet domestic requirements. Exploration for iron ore has been an important part of the program of the CRM, which has identified 453 million tons of iron ore reserves with an average grade of 54%.

Altos Hornos de México S.A., a subsidiary steel company of State-owned Siderúrgica Mexicana (SIDERMEX), was nearing completion of the ore concentrator at its La Perla iron ore mine. La Perla Mine is located on the Chihuahua-Coahuila border and will be connected together with the Hercules Mine operated by Fundidora de Monterrey S.A. (FMSA) by a 379-kilometer slurry pipeline to a new pellet plant at Monclova, Coahuila. At yearend, the slurry pipeline with a capacity of 4.5 million tons per year was nearing completion and was expected to be operating in 1983. The pipeline will receive 1.5 million tons of ore from La Perla Mine and 3.0 million tons from the Hercules Mine. Since the pellet plant at Monclova will utilize only 3 million tons, the balance of 1.5 million tons will be shipped by rail to the FMSA pellet plant at Monterrey.

In Michoacán, the third subsidiary of SIDERMEX, Siderúrgica Lázaro Cárdenas Las Truchas S.A. (SICARTSA), was expanding its capacity for ore concentration and pelletization by 3 million tons per year to an annual capacity of 4.5 million tons. The iron ore mines in the Las Truchas area, El Volcán and El Mango, with hematite and magnetite-type iron ore, were being expanded to meet SICARTSA's second-phase steel plan requirements. Dravo Corp. was awarded a $26 million contract for the design, engineering, procurement, and construction management of the SICARTSA pellet plant. The plant, scheduled for completion in 1983, will produce 3 million tons per year of direct-reduction-quality iron ore pellets.

Iron and Steel.—After a decade of strong growth with an average increase of 7% per year, Mexico's steel output declined in 1982 for the first time. Steel imports have risen rapidly since 1970 when only 242,000 tons were imported compared with the 3.1 million imported in 1981. The United States, Japan, and the Federal Republic of Germany provided two-thirds of these steel imports, which required $2.2 billion in foreign exchange or almost 10% of the value of Mexico's total 1981 imports. Mexico's apparent consumption of steel in 1981 was 12.5 million tons.

Reduced domestic demand for steel, chiefly by the oil and automobile industries, forced the steel companies to seek overseas markets in 1982. The large devaluation of the Mexican peso also made the country's steel products very competitive. By yearend, SICARTSA exported, for the first time since startup 6 years ago, 135,000 tons of finished products. Because of the company's location on the Pacific coast and the availability of excellent port facilities, Japan and China were expected to provide growth markets for Mexican steel exports.

The country's large debt burden and economic recession were expected to moderate Mexico's ambitious drive toward self-sufficiency in steel. SICARTSA was involved in implementing phase 2 of its long-range, four-phase program to produce 10 million tons of steel. By yearend, SICARTSA's phase 2 project advanced as follows: mine expansion, 52% completed; ore concentrator engineering, 6%; pellet plant,

29%; direct-reduction plant, 70%; and steel plant engineering, 7%.

Mexico's largest private steel company, Hojalata y Lámina S.A. (HYLSA), was involved in a conversion of a second plant at Monterrey rated at 500,000 tons per year to the HyL III process scheduled for completion during the summer. HYLSA completed engineering for a new 750,000-ton-per-year plant using the HyL III process also at Monterrey. The other private steelmaker, Tubos de Acero de México S.A. (TAMSA), Mexico's only producer of seamless steel pipe, was engaged in a major effort to increase seamless pipe output from 300,000 tons per year to 650,000 tons per year to meet increased demand from PEMEX. By yearend, TAMSA increased shipments to PEMEX by 120,000 tons as a result of its first phase expansion.

Lead and Zinc.—As the world's sixth largest zinc producer, and the second leading producer in Latin America after Peru, Mexico benefited from its position as producer of the world's lowest cost zinc. About 20 of the world's 40 lowest cost zinc mines are located in Mexico. The favorable situation was attributable mostly to low wage costs and high values of gold and silver byproducts. Mexico accounted for 31% of total U.S. zinc concentrate imports. The joint holding company, México Desarrollo Industrial Minera S.A. (MEDIMSA), 34% owned by ASARCO Incorporated, was the largest producer of lead and zinc in Mexico, operating 11 mining units and 5 processing plants. The newest plant began operations in October. It is a 113,000-ton-per-year, $175 million electrolytic zinc refinery located in San Luis Potosí, which will be operated by the subsidiary company, Industria Minera México S.A. (IMMSA). MEDIMSA's output of lead dropped 31% below that of 1981 to 59,100 tons and zinc was flat at 128,000 tons.

The new Real de Ángeles silver mine, which started up in mid-1982, will produce at full capacity 31,000 tons per year of byproduct lead and 26,000 tons of zinc per year. This represents about 18% and 14% of national output, respectively.

In 1980, Mexico's apparent consumption was 96,200 tons of lead and 88,900 tons of zinc, representing 66% and 37%, respectively, of total mine output. In 1980, exports of lead and zinc accounted for 5% and 8%, respectively, of the total value of Mexico's nonfuel mineral exports.

Manganese.—Latin America's largest producer of ferroalloys, Cía. Minera Autlán S.A. de C.V., developed long-range plans for possible doubling of both mine and oxide nodule output. Under consideration was expansion of underground production from the existing Tetzintla Mine and development of a new open pit mine at Naopa, both in the Molango district of Hidalgo State.

In 1981, Autlán mined 734,600 tons of ore, a 21% increase over 1980 output, as the company's underground production rose to equal that from its open pit operations. Autlán's production of oxide nodules from carbonate ore was 471,140 tons in 1981, a 38% increase over that of 1980. The expansion program for the Molango nodule unit was completed by yearend 1981, increasing capacity from 425,000 to 525,000 tons per year of nodules. Autlán's ferroalloy capacity was increased by installation at the Tamos plant in Veracruz State of two new furnaces, each rated at 15 megavolt ampere. These furnaces were built to have the flexibility to produce high-carbon ferromanganese and silicomanganese as well as standard grades of ferrosilicon and silicon metal. In 1981, Autlán produced a total of 163,860 tons of ferroalloys in its Mexican plants, of which almost 110,000 tons was ferromanganese.

As of yearend 1981, Autlán's proven reserves of manganese carbonate ore were sufficient for 25 years at current production rates. In addition, there were probable ore reserves for about 150 years capable of being treated with the current metallurgical plant.

Molybdenum.—Mexico has recovered molybdenum as a byproduct from its mining of porphyry copper deposits. The rise in molybdenum production in 1981 to 451 tons was due to the initial full year of operation of the Cumobabi Mine located in La Verde District, Sonora State, 190 kilometers south of Cananea, and operated by Minera Cumobabi S.A. de C.V. The sharp rise in 1982 output to 5,190 tons reflected startup of the $19 million, 4,500-ton-per-year molybdenum byproduct plant at the La Caridad copper mine.

Silver.—Mexico lost first place to Peru as the world's leading silver producer. Mexico's share of world output fell to 13.3%. Despite the drop in output, silver continued as Mexico's most valuable mineral product, excluding petroleum. In 1980, silver represented 36% of all nonfuel minerals production and 50% of the value of mineral exports, not including oil.

The decline in silver prices in 1981 contin-

ued until June 1982 when the price bottomed at $4.89 per troy ounce. Silver prices averaged $7.95 per ounce in 1982 compared with $10.52 per ounce in 1981 and $20.63 in 1980. Lower prices coupled with reduced export volume produced a drop in export earnings compared with the bonanza year of 1980 when Mexico earned $666 million from silver. The United States remained the leading market for export sales, followed by Japan and the United Kingdom. During 1978-81, Mexico accounted for 24% of U.S. imports.

The major event of 1982 was the inauguration of the Real de Ángeles open pit mine and beneficiation plant, completed at a cost of $170 million in Noria de Ángeles, Zacatecas State.

This largest of all silver mines will be operated by Minera Real de Ángeles S.A. de C.V., founded in 1978 with Mexican (private and Government) and Canadian equity. Full operation at 10,000 tons per day of ore will produce 7 million troy ounces of silver in lead concentrate. Zinc concentrate containing cadmium will also be produced. The lead-silver concentrate was shipped to the PENOLES smelter at Torreón, Coahuila, while the zinc concentrate was sent to the Port of Tampico for export to Yugoslavia and Greece.

Other new mines and expansions in addition to Real de Ángeles were expected to increase Mexico's silver mining capacity to the annual level of 70 to 75 million troy ounces. With full output from Real de Ángeles, Zacatecas State will replace Chihuahua as Mexico's chief producing area.

Lacana Mining Corp. reported production of silver at its 30%-owned Torres mining complex in Guanajuato at 4.5 million ounces. The mill processed more than 648,000 tons of ore averaging 7.8 ounces of silver per ton. The Torres complex is composed of a centrally located 2,200-ton-per-day flotation concentrator fed by ore from four mines, the Torres-Cedros, the Peregrina-Triumvirato, the Cebada, and the Bolanitos. Other partners in the mining operations are Cía. Fresnillo S.A. de C.V. and PENOLES.

Lacana owns 40% of Encantada Mining Group, Coahuila, which operated a 1,300-ton-per-day flotation concentrator fed by three mines, the Encantada, the Los Ángeles, and the Plomo. Silver production totaled 2.1 million ounces from 328,000 tons of ore. Lacana's partner in the Encantada Mining Group is PENOLES.

Silver production by MEDIMSA was reported at 16.2 million ounces, a decrease of nearly 2.7 million ounces from that of 1981. PENOLES' output of refined silver was expected to decline to 29 million ounces in 1982.

In September, PENOLES—Mexico's leading silver producer—opened the Cochico Mine in Cochico, Sonora, and La Minita open pit mine in October at Capela, Michoacán. In addition to silver, Cochico will produce some lead and 16,000 tons per year of zinc, and La Minita will produce some lead and 9,000 tons per year of zinc. In March, IMMSA started up its Rosario silver-lead-zinc underground mine at Rosario, Sinaloa.

NONMETALS

Barite.—Production of barite reached a record high relative to the level of the past decade. Output, however, was below the historic high of 369,000 tons in 1965. Barite demand by PEMEX had been projected to increase to 600,000 tons by 1982, but actual exploration activity required only about 300,000 tons. Mexico appears to have been self-sufficient in 1982 with a small surplus for export. A new mine-mill complex was under construction by Barita de Sonora S.A. de C.V. near Mazatán, 98 kilometers east of Hermosillo in Sonora State. This company is a subsidiary of the Government entity, Fideicomiso Minerales No Metálicos Mexicanos. The complex is on land purchased by the Government for a National Barite Reserve. In the first stage, to begin in June 1983, 150,000 tons per year of direct-shipping-grade ore (92% $BaSO_4$) will be produced.

In operation since 1978, Barita de Santa Rosa S.A., located in Musquiz municipality north of Monterrey, Coahuila State, produced at a rate of 77,000 tons of direct-shipping ore and processed concentrate. Rated capacity was 150,000 tons per year. The company was owned 51% by Hugo Martínez of Monterrey and 49% by IMCO Services Div. of Halliburton Co. Reserves were estimated at 5 million tons, of which less than 1 million tons was proven.

Fluorspar.—The Instituto Mexicana de la Florita reported a sharp drop in total sales of all grades of fluorspar by 51% below 1981 sales to 548,000 tons. Sales of acid-grade fluorspar were down only 36% below 1981 sales to 308,000 tons. This was caused by a loss of sales in the United States, its primary market. Mexico's share of the U.S. market fell to 37% compared with the 66% share in 1980. Mexico suffered from price

competition from the Republic of South Africa and China, a relatively new supplier. In addition, U.S. imports of fluorspar declined 34% from those of 1981.

Mexico retained its position as the world's largest fluorspar producer, but by a much smaller margin. Production of both acid- and metallurgical-grade material was down significantly. Cía. Minera Las Cuevas S.A., operating the world's largest fluorspar mine in the State of San Luis Potosí, produced approximately 272,000 tons of fluorspar compared with nearly 408,000 tons in 1981. Las Cuevas was expanding its mill capacity to 300,000 tons per year of acid-grade fluorspar, with an option to increase to 400,000 tons per year if required. The major producing States were San Luis Potosí (almost 50%), followed by Coahuila, Chihuahua, and Guanajuato.

Graphite (Natural).—Mexico is considered to have the most important deposits of amorphous graphite in the Western Hemisphere. Production of mostly amorphous graphite, which is used as a casting lining, has been in a downtrend since 1973 when over 65,000 tons was produced. The significant decline in output to about 34,000 tons reflected the reduction in U.S. imports caused by the economic recession. Consequently, it appears that Mexico fell to 6th rank as a world producer, but continued as a major factor in the international graphite market. In 1980, Mexico initiated output of crystalline flake graphite in Oaxaca State.

The United States has been an important market for Mexico's amorphous graphite. Except for about 7,000 to 10,000 tons per year used chiefly in Mexico's growing steel industry, the balance has been exported to the United States. In 1981, the United States imported 99% of its amorphous graphite from Mexico valued at $2.6 million. U.S. imports of amorphous and flake graphite from Mexico fell from 39,000 tons in 1981 to 31,000 tons in 1982, accounting for 58% of total U.S. imports.

Most of the significant graphite producers in Mexico were associated or affiliated with U.S. companies. Mexico's largest single graphite producer from the Lourdes and Veta Jecho Mines in Sonora State was Grafitos Mexicanos S.A., owned 51% by private Mexican interests and 49% by Cummings Moore Graphite Co., a subsidiary of Asbury Graphite Mills Inc. of New Jersey. Grafitos Mexicanos opened two medium-sized mines 25 kilometers east of Tonichi near Onavas and a small mine near Ciudad Obregón also in Sonora. In 1982, 1,850 tons of crystalline flake graphite was produced by Grafito de México S.A. de C.V., a subsidiary of State-run Fideicomiso Minerales, at an open pit mine at Telixtlahuaca, 30 kilometers north of Oaxaca, Oaxaca State. Reserves of 4.4 million tons contained 4% graphite. Most of the beneficiated product with 95% carbon content was exported to the United States.

Phosphate Rock.—Since production of phosphate rock first began in 1967 at the annual level of 50,000 tons, output has expanded tenfold to a historic high in 1982 of more than 512,000 tons. In 1981, Mexico had to import 1.2 million tons of phosphate rock, of which 72% came from Morocco and 28% from the United States. On the basis of new mining projects underway, Mexico was expected to become self-sufficient in 1985 with a surplus for exports. Domestic demand in that year is projected at 2 million tons.

Mexico's recession in 1982 was not reflected in the fertilizer industry, which grew by almost 24% in 1981 and by 27% in 1982. The recent considerable jump in output is attributed to the second full year of operations of State-owned Roca Fosfórica Mexicana S.A. de C.V. of the San Juan de la Costa Mine in Baja California Sur. Output from this new mine was 295,000 tons of concentrate grading 31% P_2O_5 from its rated annual capacity of 720,000 tons. The output of San Juan was originally to be shipped wet to the new $450 million fertilizer complex at Lázaro Cárdenas under construction by Fertilizantes Mexicanas S.A. and was scheduled for completion in mid-1984. Delayed startup of the complex has meant that drying plants will have to be installed.

Salt.—Exportadora del Sal S.A. (ESSA) prepared a 6-year expansion plan to increase its solar salt capacity from 6 to 8 million tons annually at its evaporative facilities at Guerrero Negro on the west coast of Baja California. ESSA was by far Mexico's largest producer and exporter of salt and the world's largest single salt-producing company. Government policy excluded ESSA from the domestic market because its production costs are far lower than those of the more than 100 small producers that traditionally have supplied the local market. While salt is sold in Mexico for about $50 per ton, ESSA's export price is as low as $12 per ton. ESSA could easily supply Mexico's annual consumption

of 850,000 tons, representing only 15% of its peak production of 5.7 million tons.

Since nationalization of the original Daniel K. Ludwig saltworks in 1976, annual production at Guerrero Negro has increased from 3.7 to 5.7 million tons. Mitsubishi Corp. of Japan has a 49% ownership. ESSA's biggest sales year was in 1980 when it exported 5.7 million tons of salt, mostly to Japan and the United States. ESSA supplied 50% of Japan's needs. The purity of ESSA's salt has been increased through brine control from 99.66% sodium chloride in 1970 to 99.72% in 1980, a high world standard.

Mexico achieved a historic high in its salt output of 8 million tons. While it ranked 6th as a world producer, it was the world's major salt exporter—primarily from ESSA's deepwater port complex on Cedros Island. In 1982, the United States imported 1.2 million tons valued at $16.5 million from Mexico or about 25% of U.S. salt imports.

Sulfur.—As Latin America's largest sulfur producer, Mexico's export sales suffered from reduced demand by the United States and Western Europe. Total sulfur exports fell 20% below those of 1981 to 953,000 tons, of which 690,000 tons valued at $87 million went to the U.S. market. The United States has traditionally been Mexico's most important export market, taking about 80% of Mexico's exports. On the other hand, Mexico is the second most important source after Canada for U.S. imports. During 1978-81, Mexico was the source of 42% of U.S. imports. Sulfur was Mexico's most important nonmetallic mineral, accounting for about 6% of the value of total mineral production and 8% of mineral trade, not including oil. Domestic consumption of sulfur has increased from 655,000 tons in 1979 to 950,000 tons in 1982. Of this amount, 75% was for fertilizer production and 25% was for industrial consumption.

Mexico's largest sulfur producer using the Frasch hot-water process, Azufrera Panamericana S.A. (APSA), had its first full year of operations at its new Coachapa Mine, which is a field of 20 producing wells located near APSA's Jaltipán operation south of Coatzacoalcos Port. Output of the field was estimated at 150,000 tons out of the rated capacity of 600,000 tons per year. The Coachapa Mine is estimated to have 7.3 million tons of sulfur reserves out of the 80 million tons estimated for the whole country. Mexico exported its sulfur from the Gulf Port of Coatzacoalcos. To improve its marketing, APSA operated a terminal in Tampa, Fla., through its subsidiary, Pasco Terminals Ltd.

MINERAL FUELS

At yearend, the new administration was preparing a revised national energy development plan to take into account the less favorable trends in the international and domestic economies. The plan, to be readied by mid-1983, will outline strategy for development of hydrocarbon resources and electrical energy facilities up to the year 2000 rather than the 10-year program covered in the 1980 document. The most critical item to be covered will be the Government's policy regarding the level of oil production and exports.

At yearend 1981, the electrical power system operated by the CFE had an installed capacity of 17,000 megawatts. In 1981, CFE's system was 38% hydroelectric, 59% fuel oil and gas-fired thermal, 2% coal-fired thermal, and 1% geothermal.

The entering administration was expected to scale down the previous Government's ambitious nuclear energy development program, which involved installation of 20,000 megawatts of nuclear generating capacity by the end of the century. The nuclear alternative would be substituted in part by accelerated development of hydroelectric and coal-fired thermal electric plants, and geothermal power programs.

A subministry of energy was created for the first time within the new Secretariat of Energy, Mines, and Parastate Industries to deal exclusively with energy matters. The head of this new subdivision is to be a member of the Board of Directors of PEMEX, CFE, the Nuclear Safety Commission, and several energy-related Government research institutes.

Coal.—The amount of coal produced was about 6% lower than the 1981 peak output of 8 million tons because of reduced demand by the steel industry. About 90% of coal mined in Mexico was metallurgical grade for the production of coke. For this purpose, Mexico was nearly self-sufficient. A small but growing amount of steam coal was mined for coal-fired electrical generating plants. The Government appears committed to diversifying its sources of electric power as a means of conserving oil for export. The resurgence of steam coal extraction has given new impetus to an industry dormant since Mexico switched from coal to oil-burning rail locomotives.

The major steam coal producer was Minera Carbonífera Río Escondido S.A.

(MICARE), set up with Government equity in 1977 to supply steam coal for Mexico's first coal-fired powerplant. MICARE operated both open pit and underground mines for steam coal from deposits in Coahuila State, the country's chief coal-producing area. Mexico's output of steam coal has expanded from 167,000 tons in 1971 to 1.2 million tons in 1981 to supply the Río Escondido electric generating complex at Piedras Negras, Coahuila. In 1982, the first 300-megawatt unit at Río Escondido used about 750,000 tons of steam coal. The second 350-megawatt unit at this site, originally scheduled for completion in 1982, was delayed for budgetary reasons. MICARE brought onstream a large new coal mine to build stockpiles for the complex.

Upon request from the State of Texas, Mexico was studying the possibility of exporting surplus electricity from the Río Escondido complex located on the U.S.-Mexican border to the city of Eagle Pass, Tex.

Natural Gas.—Output of natural gas has doubled since 1977, reaching a level of 4 billion cubic feet per day. The major part of Mexico's output of natural gas was associated with crude oil production. Earlier, a considerable amount had been flared. However, Mexico now has the pipeline network and domestic demand to utilize practically all of its output with a limited amount for export. Gas exports accounted for about 3% of PEMEX's foreign exchange earnings.

There were some indications that Mexico's natural gas reserves, which comprised about 20% of the country's hydrocarbon reserves, were smaller than formerly estimated.

Mexico initiated exports of natural gas to the United States in January 1980 at the delivery rate of 288 million cubic feet per day and at a cost of $3.36 per thousand cubic feet. At yearend 1982, the cost of importing Mexican gas was on the changed basis of $4.94 per million british thermal unit. Natural gas imports from Mexico represented about 12% of all foreign gas entering the United States. As a result, of weak U.S. demand, imports probably would be reduced to the minimum contract level of 180 million cubic feet per day. Mexico's gas income was therefore expected to drop from about $540 million per year to $355 million in 1983. In 1977, it had been projected that exports to the United States would expand to 2 billion cubic feet per day by 1982, earning $1.6 billion per year.

Petroleum.—For the first time since the nationalization of the oil industry in 1938, Mexico's annual output of crude oil surpassed 1 billion barrels. Oil output continued the impressive rate of growth of the last 5 years by increasing 19% over that of 1981, giving an average annual growth of 23% per year since 1977. The average output of 2.75 million barrels per day of crude in 1982 compares dramatically with the daily average of 106,000 barrels in 1938. Peak output occurred in December when 3,023 million barrels per day was produced. Total output includes about 160,000 barrels per day produced from secondary recovery techniques using water-injection schemes primarily at Poza Rica in the Central Zone.

The Gulf of Campeche offshore area continued as the main oil-producing field, having first replaced the Comalcalco area as the main producer in 1981. The Gulf of Campeche development includes 12 large offshore oilfields headed by the Cantarell complex.

PEMEX achieved a record high in exports of crude oil in 1982. Crude oil exports increased from 1,090,000 barrels per day in 1981 to 1,492,000 barrels per day in 1982. Mexico's oil exports have assumed a growing relative importance since 1976. Increasing amounts of oil have become available for export as production exceeded domestic demand. Exports to the United States in 1982 were at the rate of about 700,000 barrels per day. Trade statistics imply a growing dependency of the United States on Mexico as a source of crude oil imports. In 1982, Mexico surpassed Saudi Arabia and Nigeria as the leading U.S. crude oil supplier.

Between 1977 and 1982, PEMEX completed the most intensive oil exploration program in the country's history in the Campeche area. As a result, probable reserves increased from 80 billion to 90 billion barrels. Proved reserves remained the same at 72 billion barrels, and potential reserves, including proved and probable reserves, remained at 250 billion barrels.

Table 5.—Mexico: Salient crude oil statistics[1]

	1978	1979	1980	1981	1982
Production ____ thousand 42-gallon barrels	441,348	533,329	708,454	843,933	1,002,430
Exports:					
Quantity ____ do	133,247	194,488	302,129	400,778	544,617
Value ____ millions	$1,774	$3,811	$9,449	$13,305	$15,623
Share of total Mexican exports ____ percent	29	43	62	69	74
To the United States:[2]					
Total ____ thousand 42-gallon barrels	112,072	162,740	194,172	177,510	264,988
Share of total U.S. imports ____ percent	5	7	10	10	19

[1]Based on annual reports of PEMEX (Memoria de Labores).
[2]Based on U.S. Department of Commerce import data.

Uranium and Nuclear Energy.—At year-end, construction of Mexico's first nuclear powerplant, begun in 1973, Laguna Verde I in Veracruz State, was 70% complete. Laguna Verde II, about 25% complete, was placed in suspended status. The General Electric Co. is supplying the light-water technology. Total cost will be over $2 billion.

Uranio Mexicano S.A. (URAMEX) was completing a $35 million mine project at Peña Blanca, Chihuahua, a uranium deposit discovered in 1960. The Peña Blanca project comprises three mines, which are expected to yield 1,350 tons per year of yellow cake with a mine life of 7 years at full production levels. URAMEX was also constructing a beneficiation plant at Peña Blanca with milling capacity of 650 tons of ore per day scheduled for completion in August.

The Mineral Industry of Morocco

By George A. Morgan[1]

The decline in demand of phosphate rock caused strain on the Moroccan economy. The export value of phosphate rock and phosphate fertilizer derivatives was $916 million, about 6% of a gross domestic product of $15,151 million.[2] The denomination of fertilizer sales in U.S. currency resulted in further weakness in the economy owing to the strength of the dollar. Although production and sales of crude phosphate rock were in decline, the processed fertilizers were up in terms of total export value as new facilities came onstream.

Despite the loss in terms of quantity and value of the mining sector's principal commodity, other mineral products performed well. The Bureau de Recherches et de Participations Minières (BRPM) continued to maintain its position as a catalyst in augmenting output of both metallic and nonmetallic minerals. Several projects advanced by BRPM came into fruition in 1982.

The Government made attempts to correct imbalances in trade as well as to minimize the ill effects of a severe drought. A number of loan agreements were signed involving Saudi Arabia, the World Bank, France, the United States, and Japan. In addition, the investment code was modified to favor foreign investment in Morocco, particularly enterprises that drew employment away from major population centers into rural areas. Although a new mining code has been drafted, it has not been forwarded to parliament; consequently, the 1973 mining investment code remains in effect.

PRODUCTION AND TRADE

Lack of demand led to a substantial reduction in output of crude phosphate rock, which in recent years has exceeded $1 billion in export revenues. However, recent developments and expansions for a number of metallic and nonmetallic minerals led to substantial production increases. The commodities most affected were copper, iron ore, antimony, refined lead, zinc, silver, and barite.

Materials of importance to the Moroccan economy that experienced reduction in output were sulfur, fluorspar, and mine lead. While fluorspar and lead have a limited local market and for the most part were exported, sulfur was of great importance to the phosphate industry. Output ceased at the Kettara Mine, where pyrrhotite was the main product. Imports of sulfur had been increasing rapidly for the production of sulfuric acid for use in the processed fertilizer sector. Imports of crude sulfur were in excess of 800,000 tons at a cost of about $100 million in 1981. Although byproduct sulfur may become available from iron ore mining, further increases in imports were expected upon completion of a 138,000-ton-per-year sulfuric acid plant at Jorf Lasfar.

Table 1.—Morocco: Production of mineral commodities[1]

COMMODITY REVIEW

METALS

Cobalt.—Production by Compagnie de Tifnout Tiranimine (CTT) at the Bou Azzer mining district ceased at yearend owing to depletion of economic reserves. CTT was 40% owned by BRPM and 60% by Omnium Nord Africain. Cobalt has been mined from the region since 1930, with intermittent stoppages owing to slack demand. All output has been exported as a complex arsenic sulfide concentrate, with cobalt content not exceeding 2,000 tons per year. About 600 people were employed at the mines and mill.

Ore at Bou Azzer grades 1.2% to 1.4% cobalt. Cobalt minerals, mainly skutterudite in massive, crystalline, and nodular forms, were found in a quartz carbonate matrix near a serpentinite contact. About 60,000 tons per year of ore was processed to obtain a concentrate grading 10% to 12% cobalt. The cobalt content of about 6 million tons of tailings at the main tailings pond was reported at 0.4%.

Copper.—Commercial production of copper concentrates commenced at the Bleida Mine in March. At yearend, full planned capacity of 50,000 tons per year of copper concentrate grading 32% to 34% copper was reached. A further increase in capacity to 100,000 tons per year of concentrate was planned. The concentrate was shipped by truck to Agadir, about 330 kilometers distant. Mine reserves were reported at 1.4 million tons grading 8% copper and 1.2 million tons grading 7% copper. Cutoff grade for minable ore was 3% copper.

The entire mine was accessed by a decline. Both ore and waste rock were moved via two parallel 4.5-kilometer-long, 40-inch wide conveyor belts. Transport to ore chutes was via load-haul-dump vehicles. The mill was fully automated, and all transport was by conveyor or pipeline slurry. Copper recovery was above 92%. Oxide ores, particularly malachite and azurite, were being stockpiled for possible future treatment.

Iron Ore.—Difficulties encountered in the exploitation and preparation of iron ore in the Province of Nador by Mines de Rif continued to be overcome. Output has increased over fourfold from that of 1981. Production had been as high as 820,000 tons in 1970, but declined to 441,000 tons in 1977 as direct shipping grade hematite ore was exhausted. Throughput capacity of a plant to treat magnetite, commissioned in 1972, was 4,000 tons per day of ore grading about 50% iron, 5% sulfur, and 12% SiO_2. Iron oxide pellet capacity was 2,600 tons per day with a pellet grade of 66% iron, 0.5% sulfur, and 2% SiO_2. Output of pyrite as a byproduct was planned at 240 tons per day. Minable reserves were reported at 33 million tons grading 49.6% iron with high pyrite content. Fine grinding of the magnetite concentrate to 90% minus 325 mesh was required for further liberation of silica and pyrite. Concentrate was shipped to the Port of Melilla by train for export.

Lead and Zinc.—Operations were recommenced at the Sidi Lahcen Mine by Ste. Minière de Sidi Lahcen. BRPM controlled 60% and the Arab Mining Co. of Jordan, 40%. Proved reserves were reported at 1 million tons containing 6% lead, 0.8% zinc, and 3.9 troy ounces of silver per ton. Initial production was to be about 5,600 tons per year of 74% lead concentrate and 1,400 tons per year of zinc concentrate. Silver content of the lead and zinc concentrates was expected to be about 45 troy ounces per ton and 16 troy ounces per ton, respectively.

A $15 million project was underway to expand lead and zinc production by Centrale d'Achat et de Developpment de la Region Minière du Tafilalet et de Figuig (CADETAF), a mining cooperative for small mines and artisanal workers in the Provinces of Errachida, Figuig, and Ouarzazate. The World Bank supplied CADETAF with a $10 million loan repayable at 6% interest over 17 years with a 4-year grace period.

Manganese.—Output by S.A. Cherifienne d'Etudes Minières (SACEM) at the Imini Mine was approaching an end owing to exhaustion of ore reserves. The mines were shallow, having mainly friable ore that was broken by pnuematic drills, lashed into cars, and raised to the surface in sets of two cars. Five grades of ore were mined underground, marked, and recorded at relay points. Wood from northern Morocco and the Anti-Atlas Mountains was used for cribbing and support. A retreat system of mining was employed to salvage as much timber as possible for reuse owing to its limited availability. Mines that were no longer profitable for large-scale mining were leased to small workers. No premixing of ore occurred at the mill. Concentrates

were produced separately, then mixed for three salable products. About 400 people were employed at the operation; 100, underground. Total production has been about 100,000 tons per year of concentrate grading 60% MnO_2.

Silver.—Silver was produced as a byproduct of lead, zinc, and copper ores, and as a primary product from the Imiter Mine in Ouarzazate Province. Mineralization occurred in Precambrian pelite as argentite, tetrahedrite, and native silver, the latter as plates and sheets in dolomite. Production was by the Société Metallurgique d'Imiter at the rate of 150 tons per day of ore averaging 16 troy ounces per ton. Plant operations included two-stage crushing, classification, flotation, countercurrent leaching, precipitation, and pressing. The precipitate was then retorted. Native silver was melted in a crucible and ladled into water to produce granules. Total production was about 800,000 troy ounces per year of 99.99% silver. Known reserves were sufficient for 10 years at current production levels, but proved and probable reserves were large and close to being classified as known.

The Zgounder Mine, located in Taroundant Province, commenced operations at yearend. Mineralization was similar to that of the Imiter Mine, but was predominately argentite and native silver in small sheets. Plant operations were also similar to that at Imiter with the Merrill-Crowe process being used. The treatment plant was furnished by Hungary. The plant was to treat 73,000 tons per year of ore for production of 1,028,800 troy ounces per year of silver metal. Total investment cost was $9.8 million. About 170 people were employed at the site. BRPM owned 60% and Arab Mining owned 40% of Société Metallurgique du Djebel Siroua, which operated the mine and plant.

NONMETALS

Barite.—Barite was produced from numerous areas throughout the country, primarily from vein deposits in Cambrian limestones, schists, and quartzites. Association with lead, zinc, and silver was also common, and barite was produced as a byproduct at Zaida from lead output. Nearly all production was exported, both as crude and ground barite. The United States was the principal recipient, followed by Norway, the United Kingdom, and Mexico.

About 15 companies produced barite from 22 deposits. Total production capacity was about 550,000 tons of barite per year. Cie. Marocaine des Barytes (COMABAR) had a crushing capacity of 100,000 tons per year at Djebel Ighoud and 250,000 tons per year at Zelmou. Other producers included Ste. de Developpment Industriel et Minière de le Haute Moulouya (SODIM), SACEM, and Ste. Minière des Barytines d'Asni. BRPM owned 50% of COMABAR, 50% of SODIM, and 47.1% of SACEM. SACEM had a production capacity of 82,000 tons per year at three areas: Western High Atlas, Near Imini, and at Khenifra. A fourth operation at Taza with 30,000 tons per year capacity was under development. SACEM's stockpile capacity included 10,000 tons at the Sekasaoua Mine in the Western High Atlas, 10,000 tons at the Port of Agadir, and 20,000 tons at an intermediate point. Output from Imini was shipped through the Port of Safi. Loading capacity at the ports of Agadir and Safi was 1,500 tons per day each. Output by SACEM from Khenifra was trucked to Oued Zem for transshipment by rail to Casablanca. Port capacity at Casablanca was 1,000 tons per day of barite.

Cement.—Both production and capacity continued to increase in the cement industry, although the production goal of 7.6 million tons of cement was not met. Total capacity was about 5 million tons. A new cement plant by Société Nouvelle de Casablanca was under construction near Casablanca with a capacity of 1.2 million tons. Eight companies produced cement, the largest being Lafarge Maroc and Cimenterie de l'Oriental. Exports and imports of cement were minimal because Morocco was able to produce and utilize nearly all of its output for local use. Cimenterie de l'Oriental and Ciments d'Agadir were converting from oil- to coal-fired facilities.

Fluorspar.—Société Anonyme des Entreprises Minières was the sole producer of fluorspar and had a capacity of about 70,000 tons per year of flotation concentrates. Output from the El Hamman Mine near Meknes was nearly all exported as acid-grade fluorspar.

Phosphate Rock.—Progress continued in the phosphate sector with full commissioning of Maroc Phosphore II and the tendering of contracts for new phosphoric acid lines at Jorf Lasfar, where Maroc Phosphore III is located. However, full capacity utilization at Maroc Phosphore II was not reached owing to low demand worldwide. The Maroc Phosphore II facility consists of three phosphoric acid units of 550 tons per

day capacity as P_2O_5, four phosphoric acid concentrators with 400 tons per day capacity, and three sulfuric acid plants each with a capacity of 1,750 tons per day. Rock was supplied from the Ben Guerrir Mine, which had a capacity of 2 million tons per year.

Jorf Lasfar was to have six 2,300-ton-per-day sulfuric acid units and eight 500-ton-per-day P_2O_5 phosphoric acid units. Total rock utilization would be about 5 million tons per year at full production, supplied primarily by mines at Khouribga. Phosphoric acid units may eventually be installed at Nador, in northeast Morocco, for Maroc Phosphore IV. Full operation of the three complexes should provide for processing of 10 million tons per year of phosphate rock or about one-third of total rock output.

Production resumed at the Bu Craa Mine in Western Sahara at the rate of about 500,000 tons per year. Production had been intermittent since 1975 owing to insecurity, ceasing completely in 1980. All production was exported for processing.

MINERAL FUELS

Bituminous Shale.—Construction commenced on a pilot retorting plant at Timahadite in the Middle Atlas. The plant represented a scale-up from earlier tests and was to be a semicontinuous batch process with two furnaces having an hourly capacity of up to 4.4 tons of shale.

Natural Gas.—A loan of $75.2 million was obtained from the World Bank for continuation of assessment of the Essaouira Basin where natural gas was discovered in late 1981. Three appraisal wells were underway with a total of nine such wells planned for full testing of the basin's economic potential. Plans for utilization of the gas in powerplants, cement plants, sugar mills, a copper refinery, and other uses were being made.

The Mineral Industry of Namibia

By Miller W. Ellis[1]

Namibia maintained its position as the fourth largest producer of nonfuel minerals, in terms of value, on the African continent. It also remained the world's third largest producer of gem diamonds, after the Republic of South Africa and the U.S.S.R., and ranked fifth in the production of uranium. Most of the country's mineral output was produced by three companies: Consolidated Diamond Mines (Pty.) Ltd. (CDM), a major subsidiary of De Beers Consolidated Mines Ltd.; Rossing Uranium Ltd. (RUL), managed by the British firm Rio Tinto-Zinc Corp. Ltd. (RTZ); and Tsumeb Corp. Ltd. (TCL), managed and 29.6% owned by Newmont Mining Corp. of the United States, with another U.S. company, AMAX Inc., holding 30.2% until August. The fourth largest mineral interest operating in Namibia was the South African Iron and Steel Industrial Corp. Ltd. (Iscor), whose subsidiary companies, Imcor Zinc (Pty.) Ltd. and Industrial Minerals Mining Corp. (Pty.) Ltd., operated the Rosh Pinah lead-zinc mine and the Uis tin mine, respectively.

The gross value of mineral production was approximately $1 billion[2] as compared to a gross domestic product of $1.6 billion. Diamonds accounted for about $450 million, and uranium, $350 million, while TCL's gross sales were reported as $105.6 million. Mineral commodities made up about 65% of the total exports from the country, and the mineral industry taxes provided substantially less than the 60% of public revenue collected in previous years. Tax revenue from the Uis operation was estimated at $220,000 for 1982, and Iscor claimed payment of $1,955,000 in taxes on behalf of Rosh Pinah. CDM continued to be Namibia's largest source of tax revenue, paying a normal rate of 50% on taxable income derived from diamond mining, plus 10% duty on the value of diamonds exported and 15% profit tax on diamonds from specified areas. TCL's normal tax rate was 40%, but the company's carry-forward tax loss of $25 million at yearend 1981 had increased to $27 million during 1982. RUL became liable for tax in 1982 after paying off its loans and recovering the $380 million allowance for startup costs. In all cases, most of the tax revenue has been a direct function of profitability, and, with increasing wage scales and general inflation of production costs, the mineral industry taxes for the year ending March 31, 1982, amounted to approximately $55 million, compared with $170 million paid during 1981.

The makeup of multinational firms operating within the country shifted noticeably from North American to South African ownership. Falconbridge Ltd., formerly Falconbridge Nickel Mines Ltd. of Canada, completed the sale of its 74.9% interest in the Oamites Mining Co. (Pty.) Ltd. to the Metorex Mining Co. of the Republic of South Africa on December 15 for approximately $900,000. Falconbridge recorded a loss of $2.3 million on the sale. Selection Trust Ltd., one of TCL's shareholders, was taken over by British Petroleum Co. Ltd. as a subsidiary, BP Minerals International Ltd. (BPM). On August 12, the TCL directors resolved to increase the company's share capital to 10 million shares. On August 16, a rights issue offered the shareholders new shares at par value on a 1 to 1 basis with existing shares. Gold Fields of South Africa Ltd. (GFSA) and Newmont undertook to purchase all unsubscribed shares. Both Newmont and BPM subscribed

their allocation of the new issue, and, by taking up the unsubscribed remainder, GFSA became a major partner in TCL. At yearend, TCL shareholders were Newmont, 29.6%; GFSA, 27.5%; AMAX, 15.1%; BPM, 14.2%, O'okiep Copper Co. Ltd., 4.7%; and most of the remaining shares were held by companies affiliated with Anglo American Corp. of South Africa Ltd.

GFSA acquired 100% of the British firm Berg Aukas Ltd., whose zinc-lead-vanadium mine of the same name was idle during the year, 52% of Namibia Mines (Pty.) Ltd., and 100% of Trekkopje Exploration and Mining Co. (Pty.) Ltd. and its uranium prospects near Swakopmund. GFSA also maintained its Kiln Products Ltd. subsidiary, renamed Gold Fields Namibia Ltd., which became the holding company for the British firm, South-West Africa Co. Ltd., whose Namibia operations closed down in 1978. In March, Barlow Rand Ltd. (BRL) announced that its wholly owned Namibian subsidiaries would henceforth operate under the name Sonnex. BRL had investments of more than $20 million in Namibia, a local staff of 700, and disbursements that included more than $8 million in salaries and benefits annually.

The mining industry employed nearly 20,000 workers or about 6% of the country's labor force. The migration of skilled and experienced mining and technical staff out of the territory continued. Interviews by recruitment teams from the South African firms were directed chiefly at artisan-grade employees.

[e]Estimated. [p]Preliminary. NA Not available.

[1]Table includes data available through June 30, 1983.

[2]In addition to the commodities listed, Namibia, prior to 1967, produced bismuth concentrates, cesium ore, columbite-tantalite concentrates, gold, manganese ore, molybdenum concentrates, graphite, lime, mica, precious stones, kyanite, sillimanite, and a variety of crude construction materials (clays, stone, and sand and gravel). No official statistics have been published since yearend 1966, and available information is inadequate to ascertain whether production has been continued or not and, if so, at what levels.

[3]Data are compiled from operating company reports as follows: Tsumeb Corp. Ltd. (TCL) (arsenic, white; refined cadmium; mine and refined lead; mine silver; mine zinc; and pyrite concentrate); South-West Africa Co. Ltd. (SWACO) (mine lead, mine tin, mine tungsten, mine vanadium, and mine zinc); South African Iron and Steel Industrial Corp. Ltd. (Iscor) for Imcor Zinc (Pty.) Ltd.'s Rosh Pinah Mine (mine lead and mine zinc) and for Iscor's own Uis Mine (mine tin); General Mining and Finance Corp. Ltd. for Klein Aub Koper Maatskappy Bpk.'s mine near Rehoboth (mine copper and mine silver); Rio Tinto-Zinc Corp. Ltd. (RTZ) for Rossing Uranium Ltd.'s Rossing mine (uranium concentrate); and Falconbridge Nickel Mines Ltd. for Oamites Mining Co. (Pty.) Ltd.'s mines (mine copper). Data from TCL, RTZ, and Falconbridge are for calendar years; data from other companies are for fiscal years ending June 30 of that stated.

[4]White arsenic equivalent of all arsenic products reported as being produced.

[5]Figures comprise reported production of TCL, Oamites and Otjihase plus estimates for Klein Aub.

[6]Figures comprise reported production of TCL plus estimates for Oamites, Rosh Pinah, and Klein Aub.

[7]Figures comprise reported production of TCL, estimate for SWACO for 1978, and estimates for Rosh Pinah.

[8]Total figures reported by De Beers Consolidated Mines Ltd. in company annual reports for calendar years. Detail on gem and industrial diamonds are estimates, assuming output to be 95% gem quality.

[9]Figures reported by the Chamber of Mines of South West Africa/Namibia.

The South African Government announced the inclusion of $923 million in economic aid to Namibia for the financial year ending March 30, 1983. The South West Africa Water and Electricity Corp. continued to operate the Ruacana hydroelectric plant and to supply the national grid with power. The Van Eck thermal power station near Windhoek was able to remain on standby most of the year, with a savings of 1,000 tons of coal per day. Power generation had not been affected by the widespread drought over most of southern Africa, which had reduced the irrigation capability of most of Namibia's water storage reservoirs by 55% to 95%.

PRODUCTION AND TRADE

De Beers reported a 2.5% increase in the prices of uncut gem diamonds in September 1982 following increased demand for small and intermediate sizes of gem stones. Diamonds continued to be marketed through De Beers Central Selling Organization and were exported to the Republic of South Africa and overseas. RUL's uranium production continued to be exported from Walvis Bay in fulfillment of long-term contracts in Western Europe and Japan. TCL's smelter products were transported via the South African Transport Services Railroad to the loading facilities at Walvis Bay. Sales included 36,494 tons of blister copper, 37,804 tons of refined lead, and more than 2.8 million troy ounces of silver. Small quantities of cadmium and arsenic trioxide were also exported, but local inventories of refined lead, cadmium, and arsenic trioxide were in excess of sales commitments at yearend. Mineral imports included petroleum products, steel for construction, and manganese ore for the extraction of U_3O_8 concentrated from RUL's uranium ore, all from the Republic of South Africa.

COMMODITY REVIEW

METALS

Copper.—TCL continued to be the country's largest producer of copper and silver. Ore output at Tsumeb, TCL's oldest mine, was only 385,118 tons in 1982, 22% below 1981 production. The Tsumeb West section and the upper levels of the mine remained dormant, although small quantities of stockpiled ores from these sections were treated. Mining of Tsumeb's lower section was halted in July, but development of a new ore and waste bypass system from 40 level to 44 level was started. The polymetallic ore contained 3.24% copper plus lead, zinc, silver, and minor arsenic and cadmium. The Tsumeb mill output was 16,937 tons of copper concentrate containing 35% copper and 34 troy ounces of silver per ton. The nearby Kombat mill treated 253,364 tons of ore containing 4.10% copper from the Kombat and Asis West Mines and produced 24,720 tons of copper concentrate with 36% copper and 11.3 troy ounces of silver per ton. The Asis West Mine also produced 38,065 tons of 5.15% copper ore on behalf of part owner Tsumeb Exploration Co. Ltd. (TECO), from which the Kombat mill extracted 4,693 tons of copper concentrate with 38% copper and 9.3 troy ounces of silver per ton. TCL's Matchless Mine, 42 kilometers south of Windhoek, produced 122,741 tons of pyritic ore containing 2.25% copper and 12.54% sulfur, from which the Matchless mill extracted 12,397 tons of copper concentrate containing 21% copper, 33% sulfur, and 2.5 ounces of silver per ton.

The Otjihase Mine, 27 kilometers northeast of Windhoek, became TCL's largest ore and copper producer with 769,290 tons of 1.95% copper ore. The Otjihase mill recovered 61,193 tons of copper concentrate containing 23% copper, 34% sulfur, and nearly 2 troy ounces of silver per ton. It also produced 108,818 tons of pyritic concentrate, containing nearly 50% sulfur, which was sold to RUL for its sulfuric acid plant. TCL's No. 1 copper smelter produced 25,562 tons of argentiferous blister copper from TCL concentrate, 438 tons from purchased concentrate, and 4,492 tons from other mines' concentrates smelted on toll. The No. 2 smelter operated largely on Otjihase's concentrate from which 12,778 tons of blister copper was recovered. Copper from other producers' concentrates yielded 6,497 tons of blister copper for a total of 49,767 tons of blister copper output for Namibia in 1982, an increase of 25% over that of 1981.

Falconbridge reported ore reserves for its Oamites at 2,027,000 tons of 1.13% copper ore at yearend 1981. Operations at its Swartmodder Mine were suspended in March 1982, and ore production at the nearby Oamites Mine, 55 kilometers south

of Windhoek, was reduced from 45,000 to 35,000 tons per month. Oamites ore production for 1982 was estimated at 400,000 tons containing about 4,500 tons of copper. This is approximately equal to the amount toll smelted through the Tsumeb No. 1 copper smelter. The silver content was estimated at 200,000 troy ounces. Falconbridge closed its Windhoek exploration office during 1982 and sold Oamites to Metorex of the Republic of South Africa at yearend.

Copper-silver ore and concentrate were also produced by General Mining Union Corp. Ltd.'s subsidiary, Klein Aub Koper Maatskappy Bpk., from its mine and mill located about 100 kilometers south of Rehoboth.

Lead and Zinc.—TCL was the country's largest lead producer and the second largest producer of zinc. Its Tsumeb, Kombat, and Asis ore bodies were complex sulfide deposits containing lead, zinc, copper, cadmium, arsenic, and other valuable constituents as well as silver. TCL's 385,118 tons of ore contained 6.67% lead and 1.84% zinc, from which the Tsumeb mill extracted 63,511 tons of lead concentrate containing 20,774 tons of lead and 520,691 troy ounces of silver. It also produced 1,412 tons of zinc concentrate with 702 tons of zinc and 14,845 troy ounces of silver. The Kombat mill produced 5,414 tons of lead concentrate with 1,476 tons of lead and 15,666 troy ounces of silver from 253,364 tons of 1.98% lead ore produced by the Kombat and Asis West Mines. It also produced 281 tons of lead concentrate from 38,065 tons of 1.46% lead ore from the Asis West Mine on behalf of TECO. The concentrate contained 86 tons of lead and 623 troy ounces of silver. TCL's lead smelter produced 30,609 tons of refined lead from TCL sources, including 6,710 tons derived from various stockpiles of intermediate polymetallic mill and furnace products. The remaining 9,981 tons of refined lead was from concentrates purchased from other operators or smelted on toll. TCL's metallurgical plant also produced 1,895 tons of arsenic and 110 tons of cadmium from smelter flue dust and other metallurgical products.

The Rosh Pinah open pit mine, in the edge of the Namib Desert 27 kilometers north of the Orange River, was the country's largest zinc producer and was second in production of lead. The Rosh Pinah operation was owned and managed by Imcor Zinc, a subsidiary of Iscor. Its concentrator produced 54,500 tons of zinc concentrate and 13,800 tons of lead concentrate in fiscal 1981-82. Both concentrates were trucked 160 kilometers northwest to Aus, and the zinc concentrate was railed to Iscor's Vanderbijlpark steel plant in the Republic of South Africa to be used in the galvanizing section. The lead concentrate was railed to TCL for smelting and refining. The Rosh Pinah concentrates contained an estimated 604,500 troy ounces of silver. Iscor's exploration team reported that promising indications of lead, copper, and zinc, found north of Rosh Pinah, were being examined.

Manganese.—SWA Manganese (Pty.) Ltd.'s Otjosondu Mine, 100 kilometers northeast of Okahandja, failed to attract any bidders when it was offered at auction in Windhoek during late September. However, the buildings, machinery, and equipment were sold for $86,000. The liquidator and trustee for the property was trying to find a buyer for the property. RUL advertized that it had tested 100 tons of Otjosondu manganese ore and found it unsatisfactory for use in its uranium extraction process.

Tantalum, Tin, and Tungsten.—The Uis tin mines, located northeast of Swakopmund and operated by Iscor, produced 1,155 tons of cassiterite, tin concentrate, during the 1981-82 fiscal year, compared with 1,220 tons during fiscal 1980-81. The concentrate was shipped to the electrolytic tinplate section of Iscor's Vanderbijlpark steelworks in the Republic of South Africa. Columbite-tantalite concentrate was shipped overseas, converted to ferrocolumbium, ferrotantalum, and tantalum pentoxide, which were reimported by Iscor as required. The Brandberg and Krantzberg tin and tungsten mines remained closed. Exploration and assessment of tantalite deposits in the southeastern part of the country attracted some attention from subsidiaries of the U.S. firms Utah International and Metallurg Inc. The South African firm Natresco (Pty.) Ltd., was also examining the tantalite deposit and was seeking partners to finance a mining operation.

NONMETALS

Diamond.—CDM's Orangemund operations treated 10,018,000 tons of alluvial ore containing 10.13 carats per 100 tons and recovered 1,014,464 carats of diamonds in 1982, a drop of about 20% in both ore and diamond production. Overburden stripping totaled 18.4 million tons in 1982, less than one-half that stripped in 1981, but the

bucket wheel excavator handled more than 25% of the spoil compared with about 13% in 1981. Mining extended 120 meters seaward of the high-water mark and reached a depth of 13 meters below mean sea level. CDM was awarded the maximum rating for safety by the National Occupational Safety Association for the fourth straight year and also received the intermine shield for improved accident frequency-severity rate from the Chamber of Mines of South West Africa/Namibia.

Fertilizer Material (Guano).—Guano continued to be harvested each year from at least seven of Namibia's offshore islands. The largest, Possession Island, had a permanent staff in residence, but the other islands were uninhabited except for guano scraping crews, which visited them briefly each year. Ownership of some of these islands was claimed by South African companies, whose title goes back to the early 1900's. The annual guano harvest was sold in the Cape Town vicinity where it was eagerly sought. The annual value was estimated at $200,000.

Lithium Minerals.—SWA Lithium Mines (Pty.) Ltd., a subsidiary of Metramco Ltd. of the Republic of South Africa, part of the Klöckner Group of the Federal Republic of Germany, was reportedly continuing to extract about 1,000 tons per year of amblygonite, lepidolite, and petalite from the Rubicon and Helicon Mines near Karibib. Lithium concentrates were shipped to glass and ceramics manufactures in the United Kingdom and Western Europe.

MINERAL FUELS

Coal.—CDM Exploration Ltd. reported that drilling had commenced near Aranos to delineate a coal deposit underlying part of its 9,000-square-kilometer concession area between the Nossob River and the Botswana border. The steam-coal-quality seams were reportedly 2 meters thick and at a depth of about 300 meters.

Petroleum.—Namibia's refined petroleum supplies were imported, mostly from the Republic of South Africa. The Government-owned South West Africa Oil and Exploration Corp. (Pty.) Ltd. was responsible for granting oil exploration concessions, and its affiliated company, Southern Oil Exploration Corp. (Pty.) Ltd., held offshore concessions south of Walvis Bay.

Uranium.—RTZ's Rossing Uranium mine, northeast of Swakopmund, has been called the world's largest open pit uranium mine. It produced 15.69 million tons of ore and recovered 4,454 tons of U_3O_8 concentrate in 1982, slightly less than the comparable figure for 1981. Low operating costs continued to be a feature of the operation, resulting in a pretax profit of $160 million, an increase of 45% over the 1981 profit. Much of the increase was due to the depreciation of the South African rand in respect to the U.S. dollar in which the uranium concentrate price is quoted. Most of RUL's contracts were long term and not liable to be affected by low uranium prices, but one of its largest customers, the United Kingdom Central Electricity Generating Board, stated that it will not renew its contract in 1984. A 1982 study by the Massachusetts Institute of Technology for the U.S. Department of Energy reported that a French contract was for the delivery of 11,080 tons of U_3O_8 from 1977 to 1990 and that Urangesellschaft mbh and Veba AG of the Federal Republic of Germany were committed to buy 6,140 tons from 1975 to 1986. The Chebu and Kansai power utilities of Japan were the largest contractors, with an order for 30,000 tons from 1977 to 1990. The Iranian contract for 10,670 tons from 1978 to 1990 was suspended by the Khomeini Government in 1979 after the delivery of 200 tons. Development of other uranium deposits in the vicinity of Rossing remained in abeyance because of low prices and the uncertain political situation, but no ground was relinquished.

[2]Where necessary, values have been converted from South African rand (R) to U.S. dollars at the rate of R1 = US$1.1490 for 1981 and R1 = US$0.9228 for 1982.

The Mineral Industry of the Netherlands

By George A. Rabchevsky[1]

The recession that started in 1980 continued in the Netherlands through 1982. Consumption and investment were down by 2% in real terms and unemloyment had risen to a new postwar record of 16% in December. In general, the economy had lagged behind many other European industrial countries since the first oil crisis of 1974. Compounding those problems was the Netherlands industrial base, which was heavily oriented towards energy-intensive products, such as oil refining, natural gas, and petrochemicals, in a period when world energy consumption was declining.

Industrial production remained almost unchanged from the previous year, while exports increased. Because of a sharp slowdown in energy demand, there was a decline in the production and export of natural gas, the only natural domestic fuel available to the Netherlands. The gross national product (GNP) dropped by 1.5% in real terms, but because of the strong export market, the country registered a surplus of $4.8 billion[2] in the balance of payments. The generous social welfare system, however, had led to a steady rise in Government expenditures. The control of the burgeoning Government deficit had, in 1982, become the principal focus of Government policy, which was aimed at restructuring the economy. The immediate prospects were gloomy and it was estimated that reforms would take a few years to show positive results. The outlook for 1983 was for unemployment to rise to 13% and GNP to remain the same as in 1982, or perhaps decline slightly. Toward the end of restructuring the economy, a company for industrial projects was established in the fall of 1982 as a means for Government participation in the early stages of innovative projects. Its purpose was to relieve the shortage of investment capital and to direct expansion into promising technological fields. The Government also lowered electricity prices to industry, providing certain tax relief and reduced environmental regulations.

PRODUCTION

The Netherlands in 1982, as in previous years, relied almost totally on imports for natural resources. It was, however, the largest producer of natural gas in Europe. The country was also an active producer of processed commodities such as aluminum, zinc, and steel. Production in the metals and mineral fuels industries was stagnant in both 1981 and 1982, with gains reported only in the generation of nuclear power.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through July 13, 1983.

[2]In addition to the commodities listed, a variety of crude construction materials (clays, stone, and gravel) presumably is also produced, but output is not reported and available information is inadequate to make reliable estimates of output levels.

[3]Reported figure.

[4]Coke oven and blast furnace gas only.

TRADE

Total exports increased in 1982 and made up more than 50% of the Netherlands GNP. The Netherlands, in general, also remained an affluent and attractive market. U.S. exports to the Netherlands were up by about 8% from those of 1981, and the United States fared better in the Netherlands market than in other European markets. The United States had a trade surplus with the Netherlands in 1982, with sales of $8.5 billion; this was the third largest U.S. market in Europe and the sixth largest in the world. The gains were in large part due to U.S. administrative actions and to the Netherlands port trade; U.S. lead, for example, was routed through Rotterdam because British warehouses were filled. Netherlands import of mineral fuels from the United States in 1982 rose 128%, following the lifting of U.S. restrictions on fuel oil exports, and the General Services Administration authorized sales of tin and nickel from the National Defense Stockpiles. U.S. exports of coal to Rotterdam continued at high levels.

Hoop and strip	118,395	113,542	289	West Germany 59,580; Switzerland 20,965; France 7,988.
Rails and accessories	29,916	37,355	--	Italy 25,376; West Germany 8,383; India 1,470.
Wire	42,330	60,064	4,218	France 15,338; West Germany 11,355; Belgium-Luxembourg 10,566.
Tubes, pipes, fittings	488,899	571,927	19,063	West Germany 124,634; Saudi Arabia 116,817; Belgium-Luxembourg 51,164.
Casting and forgings, rough	23,166	28,294	4	Belgium-Luxembourg 22,990; West Germany 3,758; United Kingdom 928.

See footnotes at end of table.

Table 2.—Netherlands: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Lead:				
Oxides	6,302	6,635	--	West Germany 2,621; Italy 2,548; U.S.S.R. 450.
Ash and residue containing lead	2,846	2,682	--	Belgium-Luxembourg 1,270; West Germany 714; United Kingdom 475.
Metal including alloys:				
Scrap	36,153	33,604	--	West Germany 12,906; France 11,894; Belgium-Luxembourg 5,766.
Unwrought	19,696	13,768	101	West Germany 8,435; Spain 3,193; Belgium-Luxembourg 514.
Semimanufactures	1,782	1,774	3	Norway 740; Belgium-Luxembourg 289; United Kingdom 277.
Magnesium: Metal including alloys:				
Scrap	1,421	1,058	595	Italy 204; West Germany 190; France 45.
Unwrought	4,676	4,571	19	West Germany 2,821; United Kingdom 1,206; Belgium-Luxembourg 316.
Semimanufactures	15	16	--	West Germany 12; Belgium-Luxembourg 4.
Manganese:				
Ore and concentrate, metallurgical-grade	39,536	44,921	--	West Germany 17,636; Republic of South Africa 3,719; Belgium-Luxembourg 2,589.
Oxides	88	116	8	Belgium-Luxembourg 24; Denmark 24; Italy 24.
Metal including alloys, all forms	2,487	3,266	NA	West Germany 1,809; United Kingdom 697; France 152.
Mercury 76-pound flasks	5,482	4,350	87	United Kingdom 1,789; West Germany 783; Italy 609.
Metalloids:				
Arsenic, oxides and acids	33	8	--	NA.
Selenium	2	5	--	West Germany 2.
Silicon	3,397	1,827	--	West Germany 1,737; Switzerland 68.
Tellurium and arsenic, metal	61	9	NA	West Germany 6; France 2.
Molybdenum:				
Oxides and hydroxides	2,247	1,546	--	Austria 967; United Kingdom 181; West Germany 107.
Metal including alloys:				
Scrap	NA	6	NA	West Germany 2; United Kingdom 2; France 1.
Unwrought	NA	19	--	Austria 18.
Semimanufactures	146	124	3	Belgium-Luxembourg 100; West Germany 20.
All forms	35	--		
Nickel:				
Matte and speiss	3,686	2,602	--	West Germany 1,445; France 452; Sweden 255.
Oxides and hydroxides	572	264	--	France 86; Belgium-Luxembourg 60; West Germany 51.
Ash and residue containing nickel	1,504	1,604	NA	Sweden 700; Spain 297; Finland 260.
Metal including alloys:				
Scrap	2,168	1,564	68	Belgium-Luxembourg 342; West Germany 327; Spain 271.
Unwrought	4,446	3,088	--	Italy 1,635; West Germany 606; United Kingdom 214.
Semimanufactures	288	1,088	1	West Germany 943; France 39; Belgium-Luxembourg 35.
Platinum-group metals:				
Waste and sweepings value, thousands	NA	$24,218	--	Belgium-Luxembourg $13,408; West Germany $4,439; France $3,290.
Metal including alloys, unwrought and partly wrought, unspecified troy ounces	40,576	31,829	354	West Germany 12,635; Denmark 3,279; Switzerland 3,022.
Silver:				
Waste and sweepings[2] value, thousands	$58,645	$8,035	--	West Germany $5,566; France $2,147; Belgium-Luxembourg $186.
Metal including alloys, unwrought and partly wrought thousand troy ounces	8,127	3,736	3	West Germany 1,129; France 817; Switzerland 649.

Tin:				
Oxides	7	17	--	Belgium-Luxembourg 9; Taiwan 4; West Germany 3.
Ash and residue containing tin	4,645	2,792	700	West Germany 1,030; United Kingdom 589; Belgium-Luxembourg 426.
Metal including alloys:				
Scrap	361	258	--	West Germany 141; Belgium-Luxembourg 67; United Kingdom 47.
Unwrought	1,945	2,949	100	West Germany 1,291; Belgium-Luxembourg 481; United Kingdom 335.
Semimanufactures	795	723	1	West Germany 388; Belgium-Luxembourg 154; Sweden 52.
Titanium:				
Ore and concentrate	26,386	21,746	--	United Kingdom 4,442; Bulgaria 2,670; West Germany 2,616.
Oxides	831	5,127	--	Belgium-Luxembourg 850; France 617; unspecified 3,020.
Metal including alloys:				
Scrap	NA	86	21	Italy 35; United Kingdom 26.
Unwrought	NA	3	--	NA.
Semimanufactures	37	65	--	France 24; Japan 18; Italy 9.
All forms	40	--		
Tungsten:				
Ore and concentrate	1,656	344	--	West Germany 128; U.S.S.R. 80; Czechoslovakia 52.
Ash and residue containing tungsten	26	28	NA	West Germany 22; Austria 2.
Metal including alloys:				
Scrap	NA	138	51	Austria 28; West Germany 26; United Kingdom 23.
Unwrought	NA	11	1	France 3; West Germany 3; United Kingdom 2.
Semimanufactures	148	151	--	Belgium-Luxembourg 131; France 3; India 3.
All forms	54	--		
Uranium and/or thorium:				
Ore and concentrate value	--	$10,821	--	All to Belgium-Luxembourg.
Metal including alloys, all forms, thorium do	--	$1,603	--	All to West Germany.
Vanadium:				
Ore and concentrate	NA	250	--	All to Belgium-Luxembourg.
Ash and residue containing vanadium	17	8	--	NA.
Zinc:				
Ore and concentrate	7,306	15	--	All to Belgium-Luxembourg.
Oxides	13,625	--		
Blue powder	2,933	3,411	--	West Germany 1,383; France 868; Switzerland 728.
Matte	783	1,028	--	West Germany 738; France 146; Belgium-Luxembourg 144.
Ash and residue containing zinc	r11,071	11,811	NA	Belgium-Luxembourg 7,769; West Germany 3,694.
Metal including alloys:				
Scrap	6,576	14,840	--	West Germany 8,920; France 2,885; Belgium-Luxembourg 2,542.
Unwrought	163,201	162,867	19,967	United Kingdom 39,681; West Germany 28,469; France 22,015.
Semimanufactures	3,815	4,684	--	West Germany 3,149; Belgium-Luxembourg 353; Republic of South Africa 309.
Zirconium:				
Ore and concentrate	24,840	24,414	--	West Germany 13,612; France 5,616; Belgium-Luxembourg 3,109.
Metal including alloys, all forms value	$64,383	$8,416	--	NA.
Other:				
Ores and concentrates	29,159	16,768	--	United Kingdom 3,763; Italy 3,460; West Germany 2,596.
Oxides and hydroxides	r2,160	2,160	485	United Kingdom 524; West Germany 298; France 184.
Ashes and residues	r2,582	1,021	4	Belgium-Luxembourg 315; West Germany 240; France 168.
Pyrophoric alloys	--	2	--	NA.
Cermets	11	16	--	United Kingdom 9; Belgium-Luxembourg 4; West Germany 3.
Base metals including alloys, all forms	r3	2	--	France 1; India 1.

			United States	Other (principal)
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	8,002	6,598	20	Thailand 2,097; West Germany 1,079; Denmark 463.
Artificial: Corundum	411	79	10	Australia 30; Belgium-Luxembourg 27; West Germany 10.
Dust and powder of precious and semi-precious stones, including diamond kilograms	171	103	2	United Kingdom 16; West Germany 14; Sweden 14.
Grinding and polishing wheels and stones	4,118	4,018	35	West Germany 870; United Kingdom 676; Belgium-Luxembourg 467.
Asbestos, crude	36	269	--	West Germany 264; Belgium-Luxembourg 4.
Barite and witherite	122,537	86,411	214	United Kingdom 26,396; Denmark 15,653; Norway 14,489.
Boron materials:				
Crude natural borates	400,154	411,759	--	West Germany 96,241; France 72,125; United Kingdom 58,673.
Oxides and acids	603	919	--	West Germany 597; Egypt 106; Belgium-Luxembourg 50.
Cement	391,278	434,173	--	West Germany 205,861; Nigeria 82,575; Belgium-Luxembourg 66,369.
Chalk	26,757	30,897	--	Belgium-Luxembourg 29,855; Saudi Arabia 627; West Germany 259.
Clays and clay products:				
Crude:				
Anadalusite, kyanite, sillimanite	1,896	547	NA	West Germany 180; United Kingdom 159.
Bentonite	35,210	31,619	NA	Belgium-Luxembourg 10,109; United Kingdom 5,150; Norway 4,034.
Chamotte earth	1,242	1,353	NA	West Germany 1,248.
Dinas earth	--	1	--	NA.
Kaolin	79,203	81,526	NA	Belgium-Luxembourg 68,579; West Germany 8,739; France 3,218.
Unspecified	r80,925	67,013	262	West Germany 39,004; Belgium-Luxembourg 21,327; Norway 2,725.
Products:				
Nonrefractory	852,100	788,714	229	West Germany 593,684; Belgium-Luxembourg 115,320; France 47,114.
Refractory including nonclay brick	33,845	37,954	39	West Germany 11,708; Belgium-Luxembourg 6,917; Italy 3,051.
Cryolite and chiolite	--	(1)	--	All to Belgium-Luxembourg.
Diamond:				
Gem, not set or strung carats	254,736	365,219	26,113	United Kingdom 221,017; Belgium-Luxembourg 31,047; Switzerland 21,482.
Industrial do	833,512	677,168	124,063	Belgium-Luxembourg 231,755; United Kingdom 48,414; West Germany 48,285.
Diatomite and other infusorial earth	657	492	--	Nigeria 164; Belgium-Luxembourg 114; Switzerland 61.
Feldspar, fluorspar, related materials:				
Feldspar	3,501	2,791	--	Belgium-Luxembourg 1,654; Greece 809; France 286.
Fluorspar	765	1,176	--	Sweden 575; Jordan 152; Italy 144.
Unspecified	11,430	21,231	--	West Germany 14,380; Belgium-Luxembourg 2,878; France 2,188.

See footnotes at end of table.

NONMETALS —Continued				
Fertilizer materials:				
Crude, n.e.s	106,894	79,985	--	Belgium-Luxembourg 58,674; West Germany 18,424; France 2,234.
Manufactured:				
Ammonia	609,061	408,302	--	Belgium-Luxembourg 284,887; West Germany 63,867; United Kingdom 31,108.
Nitrogenous --thousands tons--	2,882	2,990	184	France 571; India 530; West Germany 408.
Phosphatic	279,071	305,014	--	France 118,157; West Germany 41,136; Belgium-Luxembourg 38,015.
Potassic	5,694	5,684	--	Nigeria 2,442; Sudan 975; Oman 825.
Unspecified and mixed thousand tons--	1,033	1,100	--	France 400; West Germany 145; unspecified 365.
Graphite, natural	515	663	7	West Germany 424; Belgium-Luxembourg 92; East Germany 75.
Gypsum and plaster	2,170	1,500	--	Belgium-Luxembourg 943; United Kingdom 196; West Germany 143.
Halogens:				
Bromine	845	804	--	France 351; Belgium-Luxembourg 203; West Germany 144.
Chlorine	17,592	13,857	--	West Germany 12,727; France 1,117.
Iodine	11	35	--	France 11; Belgium-Luxembourg 9; Egypt 5.
Lime	5,297	3,307	10	West Germany 1,859; Belgium-Luxembourg 508; Saudi Arabia 433.
Magnesium compounds:				
Magnesite	3,738	1,561	NA	Belgium-Luxembourg 577; West Germany 523; Indonesia 139.
Oxides and hydroxides	309	638	NA	West Germany 302; Belgium-Luxembourg 156; France 140.
Other	26,887	26,169	42	West Germany 13,870; France 3,651; Belgium-Luxembourg 1,525.
Mica:				
Crude including splittings and waste	980	3,082	--	Norway 1,544; Oman 450; West Germany 374.
Worked including agglomerated splittings	3	3	--	West Germany 2.
Nitrates, crude	--	255	--	West Germany 227; Belgium-Luxembourg 28.
Phosphates, crude	64,064	26,250	--	Belgium-Luxembourg 19,850; West Germany 5,850.
Pigments, mineral:				
Natural, crude	135	176	93	Saudi Arabia 38; Spain 29.
Iron oxides and hydroxides, processed	7,498	6,637	1,247	West Germany 1,987; France 1,243; Indonesia 622.
Precious and semiprecious stones other than diamond: Natural:				
Gem material kilograms	2,056	6,016	NA	West Germany 4,920; Belgium-Luxembourg 91.
Quartz crystal, piezoelectric do	--	42	--	NA.
Pyrite, unroasted	--	4	--	All to Saudi Arabia.
Salt and brine thousand tons	2,159	2,298	70	Belgium-Luxembourg 609; West Germany 471; Finland 387.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	37,602	1,053	--	France 260; West Germany 246; Denmark 150.
Sodium carbonate, natural and manufactured	154,896	144,501	--	West Germany 44,915; Denmark 14,155; unspecified 68,816.
Sodium hydroxide	37,602	233,206	8,299	Belgium-Luxembourg 42,213; Indonesia 25,484; France 18,493.
Sodium sulfate, natural and manufactured	16,918	14,972	NA	West Germany 4,179; Belgium-Luxembourg 1,899; Denmark 1,789.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	7,408	5,804	43	West Germany 4,728; Belgium-Luxembourg 776; Switzerland 63.
Worked	26,949	34,863	--	West Germany 18,017; Belgium-Luxembourg 16,326; Italy 157.

Ore and concentrate	196,261	145,039	754	Greece 132,796; China 5,487; Guyana 4,452.
Oxides and hydroxides	603,900	622,560	263	Greece 219,112; Suriname 215,031; Spain 23,899.
Ash and residue containing aluminum	4,299	3,778	NA	West Germany 2,853; Cuba 357; United Kingdom 161.
Metal including alloys:				
Scrap	44,713	39,589	667	West Germany 16,761; Belgium-Luxembourg 7,027; France 5,012.
Unwrought	215,831	161,349	661	Norway 104,155; West Germany 25,347; United Kingdom 6,312.
Semimanufactures	116,952	95,716	4,556	West Germany 32,736; Belgium-Luxembourg 17,787; France 10,854.
Antimony:				
Oxides	985	907	--	France 276; United Kingdom 240; Bolivia 221.
Metal including alloys, all forms	112	48	NA	Belgium-Luxembourg 31; China 13.

See footnotes at end of table.

Table 3.—Netherlands: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Beryllium:				
Oxides and hydroxides	4	--		
Metal including alloys, all forms	7	1	(1)	Mainly from West Germany.
Bismuth: Metal including alloys, all forms	62	36	NA	Belgium-Luxembourg 10; Peru 5; unspecified 19.
Cadmium: Metal including alloys, all forms	68	118	NA	West Germany 36; Japan 30; China 25.
Chromium:				
Ore and concentrate	27,176	18,188	--	Republic of South Africa 16,387; Finland 1,067; Mozambique 282.
Oxides and hydroxides	790	906	101	West Germany 649; U.S.S.R. 89; Italy 20.
Metal including alloys, all forms	126	46	--	France 22; West Germany 13; United Kingdom 3.
Cobalt:				
Ore and concentrate	NA	18	--	All from United Kingdom.
Oxides and hydroxides	197	194	48	United Kingdom 82; Belgium-Luxembourg 52; France 11.
Metal including alloys, all forms	180	44	2	Sweden 29; West Germany 5; Finland 4.
Colombium and tantalum:				
Ore and concentrate	--	26	--	NA.
Metal including alloys, all forms:				
Columbium (niobium) value	$243,952	$115,021	$46,088	Belgium-Luxembourg $42,482.
Tantalum	2	3	2	Mainly from France.
Copper:				
Ore and concentrate	--	1	1	
Matte and speiss including cement copper	--	126	--	All from West Germany.
Oxides and hydroxides	618	612	6	Italy 295; West Germany 190; Norway 45.
Sulfate	4,401	4,580	NA	Belgium-Luxembourg 1,933; U.S.S.R. 1,248; France 1,080.
Ash and residue containing copper	882	960	NA	West Germany 878.
Metal including alloys:				
Scrap	29,459	37,746	435	West Germany 16,918; France 8,031; United Kingdom 5,710.
Unwrought	21,616	26,164	2,427	Belgium-Luxembourg 8,875; Peru 4,730; Canada 1,917.
Semimanufactures	104,881	70,549	592	West Germany 34,553; Belgium-Luxembourg 16,057; France 9,141.
Germanium: Metal including alloys, all forms value	$293,245	$196,778	$25,248	Belgium-Luxembourg $159,907.
Gold:				
Waste and sweepings value, thousands	$2,247	$2,740	--	Denmark $2,142; West Germany $571.
Metal including alloys, unwrought and partly wrought thousand troy ounces	762	957	NA	United Kingdom 407; Switzerland 167; Republic of South Africa 153.
Hafnium: Metal including alloys, all forms value	--	$4,408	NA	NA.
Iron and steel:				
Iron ore and concentrate:				
Excluding roasted pyrite thousand tons	7,585	6,659	(1)	Brazil 2,181; Sweden 1,685; Spain 831.
Pyrite, roasted	169	108	--	All from West Germany.
Metal:				
Scrap	153,115	236,805	2,001	West Germany 90,252; United Kingdom 71,883; Belgium-Luxembourg 55,064.
Pig iron, cast iron, related materials	65,005	43,525	4	Brazil 9,998; West Germany 9,129; Belgium-Luxembourg 6,061.

See footnotes at end of table.

			United States	Other (principal)
METALS —Continued				
Iron and steel —Continued				
Metal —Continued				
Ferroalloys:				
Ferrochromium	9,461	19,889	NA	Zimbabwe 8,812; Albania 8,184; Bulgaria 896.
Ferromanganese	19,031	19,565	1	Norway 9,953; France 6,503; West Germany 2,593.
Ferromolybdenum	127	126	--	Sweden 45; France 30; Spain 22.
Ferronickel	61	64	--	Dominican Republic 41; West Germany 23.
Ferrosilicochromium	433	99	--	All from West Germany.
Ferrosilicomanganese	6,536	3,606	NA	Norway 1,973; West Germany 843; Republic of South Africa 350.
Ferrosilicon	9,877	7,884	NA	West Germany 2,284; Spain 1,600; Norway 1,567.
Unspecified	r981	695	38	West Germany 206; Sweden 130; Brazil 124.
Steel, primary forms	298,689	282,164	1	Norway 93,347; Italy 91,083; West Germany 64,839.
Semimanufactures:				
Bars, rods, angles, shapes, sections —thousands tons	1,306	1,135	(1)	West Germany 420; Belgium-Luxembourg 393; France 139.
Universal, plates, sheets do	1,057	954	3	Belgium-Luxembourg 429; West Germany 332; France 74.
Hoop and strip	226,496	185,822	144	West Germany 128,064; Belgium-Luxembourg 35,204; France 12,249.
Rails and accessories	45,863	65,389	38	West Germany 57,792; France 6,990; Belgium-Luxembourg 466.
Wire	75,649	103,467	55	Belgium-Luxembourg 47,907; West Germany 43,536; France 7,689.
Tubes, pipes, fittings	758,235	736,236	2,582	West Germany 395,862; Italy 119,349; France 79,181.
Castings and forgings, rough	21,547	23,139	463	West Germany 11,603; Belgium-Luxembourg 7,805; France 800.
Lead:				
Oxides	6,148	3,806	13	West Germany 2,936; Belgium-Luxembourg 773; Mexico 50.
Ash and residue containing lead	r3,315	2,058	81	West Germany 1,158; Italy 296; France 196.
Metal including alloys:				
Scrap	9,752	11,483	452	West Germany 6,399; Belgium-Luxembourg 1,995; Switzerland 960.
Unwrought	62,620	41,392	87	Belgium-Luxembourg 15,616; West Germany 9,077; France 6,695.
Semimanufactures	5,737	5,642	2	Belgium-Luxembourg 3,373; Ireland 1,148; West Germany 994.
Magnesium: Metal including alloys:				
Scrap	838	783	4	West Germany 416; United Kingdom 217; France 81.
Unwrought	5,580	5,441	4,772	France 355; Norway 182; Yugoslavia 80.
Semimanufactures	298	247	1	West Germany 161; Switzerland 24; United Kingdom 23.
Manganese:				
Ore and concentrate, metallurgical-grade	46,779	53,392	--	Belgium-Luxembourg 5,500; France 2,192; unspecified 45,596.
Oxides	1,151	912	14	Belgium-Luxembourg 659; West Germany 159; China 50.
Metal including alloys, all forms	2,558	3,474	81	Republic of South Africa 2,577; Mozambique 459; France 169.
Mercury 76-pound flasks	5,947	4,553	87	Spain 1,914; Japan 1,218; Turkey 493.
Metalloids:				
Arsenic, oxides and acids	24	89	NA	West Germany 26; United Kingdom 24; South Korea 16.
Phosphorus	147	254	--	West Germany 253.
Selenium	7	10	--	Canada 4.
Silicon	5,455	3,306	--	Republic of South Africa 1,394; France 466; Spain 411.
Tellurium and arsenic, metal	59	68	8	France 41; Sweden 7; U.S.S.R. 5.

See footnotes at end of table.

Table 3.—Netherlands: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Molybdenum:				
Oxides and hydroxides	107	83	69	West Germany 10; Austria 4.
Metal including alloys:				
Scrap	NA	2	NA	NA.
Unwrought	NA	87	--	West Germany 62; France 23.
Semimanufactures	146	59	5	Belgium-Luxembourg 39; United Kingdom 12.
All forms	29	--		
Nickel:				
Ore and concentrate	--	1	--	All from France.
Matte and speiss	3,695	2,633	--	Cuba 2,599; Italy 12; Canada 11.
Oxides and hydroxides	1,127	1,075	45	Canada 657; Cuba 261; Spain 58.
Ash and residue containing nickel	501	429	26	West Germany 361; United Kingdom 42.
Metal including alloys:				
Scrap	1,021	1,377	18	West Germany 484; United Kingdom 288; Belgium-Luxembourg 247.
Unwrought	5,567	3,735	10	Republic of South Africa 1,186; United Kingdom 581; U.S.S.R. 541.
Semimanufactures	1,196	1,512	64	Philippines 670; West Germany 414; United Kingdom 279.
Platinum-group metals:				
Waste and sweepings value, thousands	NA	$811	NA	Belgium-Luxembourg $400; Denmark $198; United Kingdom $111.
Metal including alloys, unwrought and partly wrought, unspecified troy ounces	63,174	51,615	6,070	West Germany 12,650; Switzerland 9,713; Belgium-Luxembourg 5,549.
Rhenium: Metal including alloys, all forms value	$235,401	$60,516	--	France $36,470; West Germany $24,046.
Silver:				
Waste and sweepings[2] value, thousands	$9,727	$683	NA	West Germany $432; United Kingdom $196.
Metal including alloys, unwrought and partly wrought thousand troy ounces	6,949	4,619	16	France 1,471; West Germany 1,306; United Kingdom 984.
Tin:				
Ore and concentrate	3,338	6,053	--	Zaire 2,271; Rwanda 1,672; United Kingdom 769.
Oxides	115	96	--	United Kingdom 66; West Germany 18; Italy 10.
Ash and residue containing tin	3,757	1,861	177	Poland 327; France 290; West Germany 175.
Metal including alloys:				
Scrap	402	242	12	West Germany 157; France 21; Italy 21.
Unwrought	5,761	6,353	144	Thailand 2,596; Malaysia 1,035; West Germany 937.
Semimanufactures	128	149	(1)	West Germany 67; Belgium-Luxembourg 51; Denmark 21.
Titanium:				
Ore and concentrate	37,138	24,286	--	Australia 11,062; Sri Lanka 7,281; Republic of South Africa 3,929.
Oxides	5,886	6,371	991	West Germany 3,328; United Kingdom 709; Finland 478.
Metal including alloys:				
Scrap	NA	156	51	France 65; U.S.S.R. 33.
Unwrought	NA	13	2	Japan 10.
Semimanufactures	100	225	43	United Kingdom 94; West Germany 37; Italy 28.
All forms	139	--		
Tungsten:				
Ore and concentrate	232	121	--	Portugal 60; Spain 36; Brazil 25.
Oxides and hydroxides	9	3	--	United Kingdom 2.
Ash and residue containing tungsten	13	93	NA	Portugal 78.
Metal including alloys:				
Scrap	NA	67	NA	West Germany 45; United Kingdom 21.
Unwrought	NA	262	247	West Germany 11; Switzerland 1.
Semimanufactures	102	99	(1)	Belgium-Luxembourg 65; United Kingdom 28.
All forms	40	--		
Uranium and/or thorium: Ore and concentrate value	$503	$6,412	--	All from West Germany.

See footnotes at end of table.

Table 3.—Netherlands: Imports of mineral commodities —Continued

Vanadium:				
Oxides and hydroxides	14	33	--	China 20; West Germany 8.
Ash and residue containing vanadium	--	308	NA	Republic of South Africa 300.
Metal including alloys, all forms value	$4,024	$15,229	NA	NA.
Zinc:				
Ore and concentrate	346,655	348,713	10,765	Canada 125,779; Ireland 56,447; Australia 54,044.
Oxides	3,836	3,621	23	United Kingdom 1,362; West Germany 1,243; France 557.
Blue powder	2,351	2,350	--	Belgium-Luxembourg 1,196; West Germany 987; Italy 123.
Matte	257	1,536	--	West Germany 1,232; France 284.
Ash and residue containing zinc	17,541	12,449	NA	West Germany 10,409; France 883; Cuba 490.
Metal including alloys:				
Scrap	9,805	6,398	5	West Germany 3,287; Belgium-Luxembourg 1,405; France 891.
Unwrought	25,521	19,710	25	West Germany 8,263; France 3,646; Belgium-Luxembourg 3,480.
Semimanufactures	4,890	4,760	1	West Germany 2,884; Belgium-Luxembourg 1,452; France 288.
Zirconium:				
Ore and concentrate	27,011	34,108	--	Australia 23,744; Republic of South Africa 6,500; Sri Lanka 3,364.
Metal including alloys:				
Scrap	NA	9	--	All from France.
Unwrought	NA	1	(1)	West Germany.[1]
Semimanufactures value	$39,233	$8,416	--	NA.
All forms	6	--		
Other:				
Ores and concentrates	28,247	21,501	16,442	Chile 3,207; Canada 1,043; Peru 307.
Oxides and hydroxides	r72,001	22,500	130	West Germany 11,426; Belgium-Luxembourg 10,400; France 366.
Ashes and residues	r49,518	62,378	NA	Canada 61,413; West Germany 740; Italy 129.
Pyrophoric alloys	70	148	--	United Kingdom 136; Austria 9.
Cermets value	$32,695	$35,268	--	Mainly from West Germany.
Base metals including alloys, all forms	r6	5	(1)	United Kingdom 2.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	449,876	306,051	162	West Germany 295,068; Turkey 9,940; Italy 309.
Artificial:				
Corundum	6,326	5,743	498	West Germany 3,368; France 987; Czechoslovakia 320.
Silicon carbide	1,239	813	211	West Germany 411; France 68; Norway 53.
Dust and powder of precious and semi-precious stones, including diamond kilograms	165	159	5	Belgium-Luxembourg 76; Ireland 44; Switzerland 24.
Grinding and polishing wheels and stones	2,752	2,346	73	West Germany 1,172; Austria 456; Italy 192.
Asbestos, crude	19,042	9,927	27	Canada 2,883; Republic of South Africa 2,517; U.S.S.R. 1,700.
Barite and witherite	81,728	98,928	--	China 43,952; Morocco 21,590; West Germany 16,528.
Boron materials:				
Crude natural borates	426,411	464,480	452,012	Belgium-Luxembourg 7,448; Turkey 4,800.
Oxides and acids	2,382	2,554	91	France 1,479; China 350; Belgium-Luxembourg 346.
Cement thousand tons	3,308	2,964	(1)	West Germany 1,478; Belgium-Luxembourg 1,465; France 17.
Chalk	64,605	65,979	40	France 35,267; West Germany 15,465; Belgium-Luxembourg 14,826.

See footnotes at end of table.

COMMODITY REVIEW

METALS

Aluminum.—The second largest aluminum company of the Netherlands, Aluminum Delfzijl NV, employing 700 workers, was threatened by the Government with a loss of its gas supply contract dating from 1963 that guarantees the company a supply of cheap gas until 1997. The guarantee was, in fact, the major reason for the establishment of the company, a subsidiary of Hoogovens Staal BV, and for its location at Delfzijl, near the gasfields. The Government ordered the company either to renegotiate the contract or to secure an alternative gas source by 1988.

Ferroalloys.—The Netherlands imported all ferroalloys used by its industry, mainly from Norway, France, and the Federal Republic of Germany. Most of the imports were as ferromanganese for use by the steel industry. Imports of ferrochromium from Albania jumped to almost 20,000 tons in 1981 compared with 9,500 tons in 1980.

Iron and Steel.—Two years after a merger of Dutch and West German steel companies, the Netherlands half of Estel-Hoogovens BV (Estel-Hoogovens BV between 1980 and 1982, and Hoogovens IJmuiden BV prior to 1980) broke with its West German partner, Hoesch AG, in 1982. The breakup reflected the general crisis in the European steel industry and possibly the inclusion of the Netherlands as a defendant in the U.S. producers' antidumping suit in 1981; company losses had been accumulating for the past 3 years. The new company, Hoogovens Staal, for the first time since 1980, negotiated independently for iron ore imports from the Peruvian iron ore supplier Minero Perú Comercial (Minpeco). The company negotiated a 15% price cut for pellet feed and for the 450,000 tons of ore contracted for the next year. Hoogovens Staal reportedly used 50% pellets in its blast furnaces, 40% sinter, and 10% lump ore. Its pelletizing plant at IJmuiden had an annual capacity of 3.5 million tons. The Netherlands does not have any direct-reduction plants.

MINERAL FUELS

The Netherlands, because of the fuel crisis in 1979, planned for an alternative fuel program, which in 1982 was still delayed and most likely may not be fully initiated until 1985, or even later.

The slump in domestic and foreign energy demand had an adverse effect on the Netherlands economy in 1982. Gas production was down 15%, the fourth year of declining output. The recently discovered oilfields and gasfields on the Continental Shelf were expected to be put into operation soon. Annual investments in oil- and gas-drilling equipment and related machinery were to reach more than $500 million. Two new North Sea pipelines were planned and were most likely to be constructed in 1983 and 1984 at an estimated cost of $1 billion.

Coal.—Domestic coal consumption rose to about 4.5 million tons, largely owing to increases in the generation of electricity by coal. In the past 2 years, two 600-megawatt coal-fired power stations had come onstream, and several others were under construction or conversion. The rise in coal consumption also necessitated increased imports of coal, mostly from the Federal Republic of Germany and Australia.

Natural Gas.—The Netherlands continued to be Western Europe's largest producer and exporter of natural gas. Gas production, which makes an important contribution to the GNP, fell by 15% because of low demand. Although the Netherlands benefited greatly from its natural gas discoveries, they represent only 1.8% of the world's total supplies and the reserves are expected to run out within the next 55 years. The Geological Survey of the Netherlands estimated the total gas reserves to be 75,700 billion cubic feet as of July 1, 1982. The Director of the Survey felt that the reserves would be insufficient to meet domestic needs in the event of a Soviet gas supply disruption, unless additional gas production and processing facilities were built.

The Mineral Industry of New Zealand

By Charles L. Kimbell[1]

New Zealand's mineral industry remained only a modest contributor to the island nation's economy, despite some gains in output of both domestic crude mineral products and in the mineral processing sector, the latter based on both domestic resources and imported raw materials. The high points of mineral industry activities were the production gains registered by the natural gas-crude oil operations, coal mines, the single aluminum plant, and the single oil refinery, and inauguration of operations at the natural gas-based, ammonia-urea plant. The most significant negative developments were reduced output of iron sand (the nation's only mineral export of world significance) and gold and the announcement that construction of a second aluminum plant was postponed indefinitely.

The Government continued to display considerable interest in the nation's energy supply situation and in encouraging foreign investment in all areas of the economy, including the mineral industry.

PRODUCTION

Detailed information on activities of New Zealand's mineral industry during 1982 was not sufficiently complete to permit estimation of the value of crude domestic production for that year. However, the industry generally had a better year than did the mineral industry of many other market economy nations. The modest decline in output of iron sands for export, which reflected reduced steel industry production in Japan, the principal customer, was evidently more than offset, in terms of crude output value, by substantial gains in production of natural gas and crude oil and by more modest increases in output of coal and raw materials for cement. Output of gold, the nation's second most significant metallic mine product and the only other such commodity of economic significance, declined somewhat, and the lower levels of gold values combined to reduce its contribution to the nation's economy.

From the viewpoint of the nation's mineral processing industries, the aluminum industry, operating wholly on imported alumina, registered a significant gain in a year when the world trend was generally down. The domestic iron and steel industry and cement industry both showed modest upturns in output in response to domestic demand, and a new processing industry, based on domestic natural gas, an ammonia-urea plant, came into operation.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.
[1]Table includes data available through July 21, 1983.
[2]Reported figure.
[3]Revised to zero.
[4]Not used for manufacture of iron; reportedly consumed for gas purification, preparation of stock licks, and manufacture of brick. Because of these uses, iron content is not reported.

TRADE

Complete detailed trade statistics for New Zealand for calendar year 1981, the latest year for which data were available, show that although the nation's total commodity trade was close to being in balance, there was a huge imbalance, proportionally, in terms of mineral commodities, as shown in the following tabulation, in million dollars:

	Value	
	1980	1981
Mineral commodities:		
Exports	$341.1	$338.2
Reexports	75.0	92.3
Total	416.1	430.5
Imports	1,903.7	1,780.1
All commodities:		
Exports	5,262.4	5,331.6
Reexports	191.3	236.4
Total	5,453.7	5,568.0
Imports	3,927.0	5,708.5

Mineral commodity imports accounted for 31.2% of total commodity imports in 1981, compared with 48.5% in 1980; in sharp contrast, mineral commodity exports and reexports represented only 7.7% of total commodity exports and reexports in 1981, compared with 7.6% in 1980.

Aluminum ingots continued to be the dominant single commodity among mineral commodity exports and reexports, accounting for nearly 42% of the total 1981 mineral commodity trade, a slight decline from its 1980 share of over 44%. Petroleum product exports ranked second, accounting for 33.3% of the 1981 total (27.1% in 1980), followed by all forms of iron and steel with 10% of the 1981 total (10.5% in 1980). Aluminum ingots were produced wholly from imported raw materials; the petroleum products and iron and steel were also largely produced from imported raw materials. The nation's iron sand exports ranked fourth, accounting for only 6.1% of the 1981 total, down slightly from the 6.8% level of 1980. Coal, the only other significant mineral commodity export of domestic origin, accounted for 2.6% of the 1981 total, a level about double the 1.3% recorded for 1980, but still only a small part of the total.

Refined petroleum was the dominant single mineral commodity group, accounting for 32.4% of total 1981 imports, down sub-

stantially from the 38.8% recorded for 1980; in contrast, second-ranked crude petroleum accounted for 30.0% of the 1981 total, substantially up from the 26.1% share in 1980. Other major mineral commodity imports were iron and steel (all forms) with 16.1% in 1981 (14.9% in 1980); alumina (the raw material basis for the aluminum export) with 4.3% in 1981 (3.3% in 1980); and mineral fertilizers with 3.2% in 1981 (2.7% in 1980).

Zinc:				
Oxides	NA	16	--	Mainly to Australia.
Metal including alloys:				
Scrap	642	60,764	--	Australia 42,349.
Unwrought	93	74	--	Australia 54; Japan 20.
Semimanufactures	129	1	--	Mainly to Australia.
Other:				
Ashes and residues	1,030	692	--	United Kingdom 172; Australia 122; Japan 83.
Base metals including alloys, all forms value, thousands	$4	--		
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	11	37	--	Fiji 30; Hong Kong 5.
Grinding and polishing wheels and stones value, thousands	$169	$99	--	Australia $33; Fiji $29; Papua New Guinea $20.
Barite and witherite	8	20	--	Australia 13; Fiji 6.
Boron materials: Oxides and acids	--	2	--	All to Fiji.
Cement	89,334	132,710	--	Papua New Guinea 46,555; French Polynesia 41,217; Samoa 11,450.
Chalk	136	88	--	Mainly to Fiji.
Clays and clay products:				
Crude, unspecified	4,609	6,520	--	Japan 4,484; Australia 332; Ireland 270.
Products:				
Nonrefractory value, thousands	$224	$314	$31	Fiji $71; Australia $54; Singapore $37.
Refractory including nonclay brick do	$376	$240	--	Singapore $125; Australia $47; Fiji $27.
Diamond:				
Gem, not set or strung do	$426	$174	$8	United Kingdom $65; Australia $60.
Industrial do	$2	$47	$1	Australia $35; Hong Kong $11.
Diatomite and other infusorial earth	34	21	--	Malaysia 14.
Fertilizer materials: Manufactured:				
Ammonia	5	6	--	Cook Islands 4.
Nitrogenous	123	2,334	--	Samoa 720; Cook Islands 449; Vanuatu 337.
Phosphatic	8,651	3,810	--	Norfolk Island 1,549; Tonga 1,425; Fiji 710.
Potassic	3,935	6,501	--	Fiji 2,630; Australia 2,599; Solomon Islands 95.
Unspecified and mixed	785	2,002	--	Norfolk Island 672; Niue 511; Fiji 186.
Graphite, natural	3	--		
Gypsum and plaster	129	802	--	American Samoa 326; Norfolk Island 265.
Halogens: Chlorine	7	2	--	Mainly to Samoa.
Lime	551	625	--	Papua New Guinea 291; Samoa 160; Fiji 154.
Mica: Crude including splittings and waste value, thousands	$2	$1	--	All to Australia.
Phosphates, crude	--	11	--	Mainly to Niue.
Pigments, mineral: Iron oxides and hydroxides, processed	15	6	--	All to Australia.
Potassium salts, crude	--	200	--	All to Fiji.
Precious and semiprecious stones other than diamond:				
Natural value, thousands	$65	$739	$268	Australia $239; Fiji $143.
Synthetic do	$100	$22	$2	Norfolk Island $7.
Salt and brine	3,482	2,652	--	Australia 1,935; Fiji 309; American Samoa 112.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	2	9	--	Samoa 5.
Sodium hydroxide value, thousands	$356	$379	--	Fiji $237; Hong Kong $117.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	44	48	--	Fiji 32; Australia 14.
Worked value, thousands	$82	$85	--	Cook Islands $27; Samoa $27.
Dolomite, chiefly refractory-grade do	$27	$4	--	Australia $3.
Gravel and crushed rock	1,063	1,087	66	Australia 534; American Samoa 481.
Limestone other than dimension	--	10	--	Samoa 5; Fiji 3.
Quartz and quartzite	2	(1)	--	All to Singapore.
Sand other than metal-bearing	305	430	--	Australia 229; Samoa 120; Fiji 41.

See footnotes at end of table.

COMMODITY REVIEW

METALS

Aluminum.—The Tiwai Point plant of New Zealand Aluminium Smelters Ltd., near Bluff at the southern end of South Island, remained the nation's only operating aluminum smelter through 1982. The addition of a third potline was completed during the year, raising the facility's annual capacity to about 245,000 metric tons. This addition presumably accounted for the 1982 recorded increase in aluminum output, one of the few increases recorded among all world producers.

Although the New Zealand Government approved construction of a second smelter in 1981, establishment of this facility reportedly was deferred by the company for an indefinite time in October 1982 owing to world market conditions. The first 100,000-

ton-per-year-capacity potline of this facility was originally projected to come onstream in 1984 by CSR Ltd., the firm designated to build the facility, but the deferral in construction startup made completion by that time impossible.

Gold.—Relatively high gold prices and prospects of even higher prices in the future provided continued stimulation to gold mining activities in New Zealand, despite the fact that the country's principal existing operation, that of Kanieri Gold Dredging Ltd.'s dredge on the Tara Makau River, South Island, operated on one of the lowest grade alluvial deposits undergoing commercial exploitation in the world. Although actual 1982 output was unavailable, a continued decline was expected. Although other New Zealand gold properties continued to receive some attention as a result of world gold markets, none of these were assessed as potentially significant even by the modest standards of the island nation's small industry.

Iron Sands.—In terms of value, New Zealand's titaniferous magnetite sands remained the foremost crude nonfuel mineral despite a decline in output resulting from reduced demand by the principal export customer, Japan. Through 1982, three deposits, all along the western coast of North Island, were undergoing exploitation. These were the Waverley deposits of Waipipi Ironsands Ltd. and the Taharoa and north Waikato deposits of New Zealand Steel Mining Ltd. Waipipi Ironsands operated solely to meet export demand; New Zealand Steel Mining provided both for exports and for its own direct-reduction steel plant at Glenbrook.

Steel.—The Glenbrook plant of New Zealand Steel Ltd. remained the only plant in the country using iron ore as its raw material base through 1982. This plant, best described as semi-integrated, at the end of 1981 had facilities for the production of pipe, rectangular hollow sections, galvanized products, and billets (including quantities of the latter in excess of its own needs), and, during early 1982, commissioned facilities for production, prepainting and laminating flat steel products. The company's efforts toward plant expansion were expected to provide an annual ingot output capacity of 750,000 tons by project completion.

The nation's second steel plant, that of Pacific Steel Ltd., commenced operations in 1962 utilizing scrap collected by an affiliate, Pacific Scrap Ltd. By 1982, the plant was using collected scrap, as well as billets purchased from New Zealand Steel, to produce wire rod, reinforcing bars, flat bars, angles, and channels.

NONMETALS

Nitrogen.—Construction of an ammonia-urea plant, owned by Petrochem N. Z. Ltd., a Petroleum Corp. of New Zealand Ltd. subsidiary, was completed. The facility, with an annual capacity of 155,000 tons, was expected to provide most of its output to the export market at the outset of operations.

MINERAL FUELS

Coal.—Despite relatively abundant reserves that led to a 1979 decision to develop a coal export program, output of this energy commodity has remained virtually unchanged over the past 5 years, averaging about 2.14 million tons annually. Coal deposits, distributed over both islands, were exploited in 1982 by some 70 individual mines, with about 70% of total output in the recent past being obtained from opencast mines.

Total recoverable coal reserves in all categories are 3.9 billion tons, including lignite reserves rated 50% recoverable. The distribution of these reserves by grade was incorrectly reported in the 1981 chapter; correct quantities are bituminous coal, 0.2 billion tons; subbituminous, 0.8 billion tons; and lignite, 2.9 billion tons. Of the total reserve, almost 0.7 billion tons, all subbituminous, is in the coalfields of North Island; the remainder, including all bituminous, all lignite, and 0.1 billion tons of subbituminous, is in South Island coalfields.

Natural Gas.—Reported natural gas output for the first 9 months of 1982 suggested that production for the full year would more than double that of 1981. A portion of growth was undoubtedly used in the new ammonia-urea plant that came onstream. Projects were still underway to link New Zealand's two natural gasfields, Kapuni and Maui, with domestic consumption centers. The completion of these pipeline systems will permit full utilization of the developed production potential of these fields.

Petroleum.—Reported production data for crude oil for the first 9 months of 1982 indicate an annual production level over 50% higher than that of 1981. The increase was the result of higher output of natural gas from Kapuni and Maui Gasfields, where the oil is obtained in effect as a byproduct.

The growth in crude oil production raised output to a level slightly under 20% of

national refinery throughput and slightly under 10% of national refinery product demand. Thus, although there was a substantial increase in output, it still fell far short of providing domestic oil self-sufficiency.

Efforts continued to reduce this shortfall. The Petroleum Corp. of New Zealand reported a test of its McKee well in North Taranaki on North Island that yielded 1,000 barrels per day of a thick waxy crude oil and an undisclosed quantity of gas from a depth of 2,300 meters. The company also drilled its No. 1 Ohaero wildcat in North Taranaki to a depth of 3,700 meters, with unreported results. Similarly, results of N. Z. Petroleum Co. Ltd.'s activities on its lease off the coast of South Island near Greymount were unreported. The firm, which held a 5-year lease on the tract that had been issued in 1980-81, planned to drill to a 2,100-meter target depth.

Results of another exploratory drilling project, that of Shell-BP-Todd Oil Services off the coast of Taranaki, North Island, using the Sedco 445 drillship, were also unreported at yearend.

Expansion of the country's single oil refinery, the Marsden Point facility near Whangarei, continued in 1982, with completion of the present expansion project slated for 1984. The announced goal of this project was a 700,000-barrel-per-day crude throughput capacity.

A second petroleum product facility was due to be completed in 1985. This facility, the world's first commercial-scale natural gas-to-gasoline plant, would improve New Zealand's self-sufficiency situation only with regard to gasoline, but this in itself would be a significant contribution to improving the country's foreign trade balance.

[1]Senior foreign mineral specialist, Division of Foreign Data.

The Mineral Industry of Nigeria

By Ben A. Kornhauser[1]

Nigeria's economic activity depended primarily on petroleum, which accounted for over 90% of export earnings, 75% of Government revenue, and 25% of gross domestic product (GDP). In fiscal year 1982, the balance of payments changed from a surplus to a $5 billion deficit.[2] Foreign reserves fell from $1.75 billion at yearend 1981 to about $750 million at yearend 1982, a 57% drop. The Federal revenue shortfall also caused Nigeria to draw almost all of its unconditional borrowing rights in the International Monetary Fund. The Government budget also was decreased by 20% to $6.12 billion through large expenditure cuts and stricter control of imports and foreign exchange. Controls included compulsory advance deposits on imports of 25% for spare parts and raw materials, increased customs and excise duties, and placing certain items under specific import license. The GDP decreased 2% from that of 1981 to $20.3 billion. Reduced revenues caused the Government to cut back on projects, obligations, and commitments.

The National Electric Power Authority was building two hydroelectric stations at Shiroro (600 megawatts) and Jebba (540 megawatts). The Kainji power station (760 megawatts) had been in service for over 10 years.

PRODUCTION AND TRADE

The Organization of Petroleum Exporting Countries (OPEC) reduced the crude oil production quotas for its members in order to match world demand. Nigeria's maximum production was set at 1.3 million barrels per day compared with a potential production of 2.1 million barrels per day. This allocation enabled Nigeria largely to maintain its established OPEC crude oil price. In 1982, Nigerian crude oil production was 7% of OPEC's and 2% of world crude oil production.

Nigerian-U.S. trade dropped during 1982 owing to the world oil glut and the resulting decreased revenues and their restrictions on imports. U.S. purchases from Nigeria, mostly oil, fell $2 billion to $7 billion while Nigerian imports fell to $1.25 billion, 15% less than 1981 levels. The country had a $6 billion deficit in short-term trade, a $2 billion per year long-term debt service, and an annual $1.5 billion imported food bill. Accordingly, oil revenues must be in the $8 to $10 billion range to permit the development of new projects and maintenance of necessary equipment.[3] Nigeria was the United Kingdom's largest trading partner in Africa and its largest market outside of the United States and Western Europe.

In 1982, Nigeria produced 1% of the world's tin production and was the eighth largest tin producer in the world. Production was only 72% of that of 1981. The columbite-tantalite production was reduced by 48%, in step with the decreased tin production with which it was associated. The importance of Nigerian columbite as a source of columbium continued to decline with the increased availability of the oxide from pyrochlores.

COMMODITY REVIEW

METALS

Columbium and Tantalum.—The Amalgamated Tin Mines of Nigeria (Holdings) Ltd. and Bisichi-Jantar Nigeria Ltd. accounted for all production of columbium and tantalum in 1982 in relatively equal amounts.

Iron Ore.—Iron ore was discovered on the Agbaja Plateau northeast of Lagos. The reserves, which had not been fully tested, were estimated at 2 billion tons.[4] However, the Itakpe iron ore mine, which contained an estimated 200 million tons of proven reserves of Itabirite ore grading 36% iron, was being prepared to eventually supply all of the iron ore requirements of the Ajaokuta steel complex and one-third of the requirements of the Delta steel complex.

Iron and Steel.—The Government-owned Katsina Steel Rolling Co. started operations. The steel wire, rod, and bar rolling mill had the capacity to produce 170,000 tons of wire and 40,000 tons of reinforcing bar per year and was built by Japan's Kobe Steel Ltd. in northern Nigeria at a cost of about $125 million. The steel was produced from billets shipped from the Delta Steel Co. and produced by the direct-reduction process.[5] The two Midrex direct-reduction plants were started up in 1982. Because of the remoteness of Delta Steel at Warri, oxygen- and nitrogen-producing facilities were installed at the plantsite. Iron ore for the plant was imported from the Liberian Nimba Mine of Lamco Joint Venture. The

limestone came from the Cross River Limestone Co., a national company at Mafamosing near Calabar in the State of Cross River.[6]

Tin.—Nigeria joined in forming the Association of Tin Producing Countries that included Australia, Bolivia, Indonesia, Malaysia, Thailand, and Zaire. During the year, the tin production from the gravel pump and contract tin mining operations at Gùrum, Rafin Jaki, and Banke was 191 tons, about double that of 1981.

NONMETALS

Cement.—The Naira cement plant of northern Nigeria in Sokoto began production after 15 years of inactivity. The factory was expected to be in full operation in 1984. The Benue Cement Co. was unable to meet demands of up to 3,000 tons per day owing to a weak capital base and an inadequate supply of water and electricity. Nigeria has been importing about twice as much cement as it produced.

MINERAL FUELS

Coal.—Coal production at the Nigerian Coal Corp. from the Enugu and Akaba Mines had fallen to less than 3,000 tons per month compared with nearly 9,600 tons per month in 1981. The drop in production resulted from poor equipment, lack of spare parts, and lack of support services and training programs for engineers. There were 270 million tons of proven reserves of subbituminous coal and lignite. The largest reserves were believed to be in Benue State with the main coal body in the Anambra River Basin. Nigeria planned domestic coal production to reach 2.5 million tons of coal by 1985 to be consumed by coal-fired power stations, the Ajaokuta steel mills, and cement plants.[7] Nigeria and Great Britain signed a Memorandum of Understanding to increase the output of the Oji River coal-fired powerplant from 30 to 120 megawatts and to develop the Enugu coal mines.

Natural Gas.—Consumption of gas was expected to rise by 70 million cubic feet per day following the startup of the direct-reduction steelmaking plant at Aladja. The blast furnace-steel complex at Ajaokuta, when finished, would consume 200 million cubic feet per day of gas.[8] The Bonny LNG Ltd. was dissolved in 1982 because Phillips Petroleum Worldwide Gas Ltd. and BP Africa Gas Co. withdrew. The remaining partners, Shell Nederland BV, Azienda Generali Italiana Petroli S.p.A., Elf-Aquitaine du Gaz, and The Nigerian National Petroleum Corp. (NNPC), were attempting to develop an alternative with more limited objectives and different assumptions. Bechtel Petroleum Inc., on its own initiative, studied the feasibility for a 4,000-kilometer pipeline to flow Nigerian gas over the Sahara Desert and under the Mediterranean Sea to Europe. Bechtel informed Nigeria that the pipeline was feasible and would cost $9 billion, $5 billion less than the Bonny project. The proposed 42-inch pipeline could carry 1.5 billion cubic feet per day, close to that of the original Bonny project. Nigeria has been flaring about 1 billion cubic feet per day. Cost estimates for the project did not include distributing the gas in Europe.[9]

From its Ibewa-3 well in the OML 58 onshore permit northwest of Port Harcourt, Elf-Aquitaine tested 18.2 to 21.9 million cubic feet per day with 2,422 to 3,082 barrels per day of condensate from three zones. However, Elf-Aquitaine did not expect to exploit the gasfield unless a liquefied natural gas export plant would come onstream. The possibility of extracting only the condensate and reinjecting the gas was under consideration.[10]

Petroleum.—Nigeria's crude oil production in 1982 was 472 million barrels, 90% of 1981 production. This decline resulted from OPEC's assigned production quotas. Ashland Oil Inc., operating under Nigeria's only production-sharing contract, was completing a six-well development program to increase its onshore output to 15,000 to 20,000 barrels per day by yearend. Izombe, the company's only well, produced 11,928 barrels per day in December. Ashland had three offshore prospects—Alan-1 (4,258 barrels per day), Ebughu-1 (1,163 barrels per day), and Adanga-1 (1,023 barrels per day). In the second half of 1982, Ashland expected to acquire a drilling rig for its offshore development work.[11]

Elf-Nigeria Ltd.'s small Otuo Field on OML 59 was discovered with the Otuo-3 well, which tested 3,938 barrels per day of light oil from a depth of 8,570 to 8,695 feet. Field development would depend on an increase in the official profit margin although the field was located near existing offshore facilities to which it could be connected.[12]

The Exploration and Exploitation Div. of NNPC discovered six petroleum deposits in the northeastern part of Borno State. Texaco Inc. found oil 9 miles offshore Nigeria with its Sengana-3 well that flowed 4,290 barrels per day of high-quality oil from

three zones below 11,800 feet. Tests of two other zones below 12,600 feet flowed 700 to 950 barrels per day of high-quality crude oil. The test confirmed the presence of a 390-foot-thick oil-bearing sand between 11,824 and 12,968 feet. The discovery well was 3 miles from the Funiwa platform and was owned 60% by NNPC, 20% by the Standard Oil Co. of California, and 20% by Texaco, the operator.[13]

Mobil Oil Nigeria Ltd. had drilled six wells at its Edop Field, 40 kilometers off Qua Ibol, which confirmed Edop as a major discovery. The reserves were estimated at 1 billion barrels. Gulf made a discovery with its Inda-1X well, which was drilled 3 miles off the Bonny Estuary.[14]

As a result of the Nigerian Port Authority's holdup in routing an oil pipeline through the Calabar Port to the NNPC Calabar fuel depot, the depot has been idle since its completion 2 years ago. The fuel depots at Gusau in Sokoto State and Gombe in Bauchi State also had been idle for about 2 years since the commissioning of the Kaduna heavy crude oil refining unit. The lack of facilities for receiving imported heavy crude oil for the second distillation unit prevented the production of fuel to supply these depots.[15]

The Mineral Industry of Norway

By Joseph B. Huvos[1]

The Norwegian economy stagnated in 1982. For the first time since 1958, the gross national product (GNP) showed no growth at constant prices compared with that of 1981 and was about $65 billion at current prices.[2] Unemployment rose to 2.5% owing to a 2.6% decline in industrial production, and the consumer price index rose 11.3%. Although the contribution of the petroleum sector to the GNP increased, that of the rest of the mineral sector, consisting of hydropower-based aluminum, magnesium, ferroalloys, copper, zinc, and industrial minerals, decreased.

Important events in the mineral and related industries included commissioning of Amoco Minerals Co.'s Valhall Oilfield, completion of the expansion of one of Norsk Hydro AS's aluminum smelters and continued construction on the expansion of its magnesium smelter, and ongoing merger talks in the ferroalloy and steelmaking industries. Elkem AS's Rødsand vanadium-titanium-iron ore mine was closed, as was its Beremanger pig iron plant, and preparations were made for closing down its Sulitjelma copper mine in 1983.

PRODUCTION

There was no significant change in the pattern of production of Norway's mineral industry in 1982.

Table 1.—Production indexes, metal and mineral industry

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Aug. 26, 1983.

[2]Less than 1/2 unit.

[3]Data represent exports, presented instead of actual production data, which are reported in official sources as not available for publication. A part of these exports may be derived from imported materials.

[4]Excludes nepheline syenite, which is included under "Stone."

TRADE

In 1982, Norway's favorable foreign trade balance fell from about $2.3 billion to $0.9 billion. Crude oil and natural gas exports valued at about $9 billion represented about 47% of all exports.

COMMODITY REVIEW

METALS

Aluminum.—Expansion of metal production capacity at Norsk Hydro's Karmöy smelter from 110,000 to 160,000 tons per year was completed. Construction of a new billet foundry for 80,000 tons per year was also completed on the premises. A second power transmission line was built across the Karmsund Sound to the aluminum plant, to prevent incidents similar to the one that occurred at the end of 1981, when the plant was shut down by a power failure because of a storm.

Aluminum market conditions suffered also under the severe slump in the national economy, with weak demand and low prices, but Elkem's Lista and Mosjöen plants could sell their entire production.

In 1982, five companies continued to operate eight aluminum smelters with a total capacity of 800,000 tons primary metal. The largest producer remained the Årdal og Sunndal Verk AS with plants at Årdal, Sunndalsöra, and Höyanger, with a total capacity of 374,000 tons per year. The second was Mösal Aluminium AS, with plants at Mosjöen and Lista, Farsund, with a 170,000-ton-per-year total capacity. Norsk Hydro's Karmöy plant was next with a capacity of 160,000 tons per year, followed by Sör-Norge Aluminium AS at Husnes, with 72,000 tons per year, and Det Norske Nitrid AS at Tyssedal, with 24,000 tons of aluminum per year.

Copper.—The operating concession for AS Sulitjelma Gruber at Sulitjelma was to expire July 6, 1983, and Elkem stated that it was not going to operate the mines beyond that date. The Norwegian Government also had no plans to operate the mines, and Norwegian courts will decide the question of nonreverting assets according to the Norwegian Concessions Act.

In 1982, Norway had 7 copper and pyrite mines in operation employing 1,221 workers and producing 108,871 tons of copper concentrates valued at about $30 million.

Ferroalloys.—Five of Norway's six ferroalloy producers, who have been negotiating for months about merging their ferroalloy activities, have decided that this is not feasible, because of unbridgeable differences in size, ownership structure, and Norwegian electricity concession laws that make difficult the transfer of power sup-

plies. The companies, Orkla Metall AS, Elkem, Bjölvefossen AS, Ila og Lilleby, and Hafslund AS, had sales of about $280 million and employed 3,500. The sixth company, Tinfos Jernverk AS, took no part in the merger talks.

Nevertheless, the companies, which control about one-fifth of the world's supply of ferroalloys, decided to meet again sometime in the future to strengthen natural collaboration.

Bjölvefossen, Norway's only ferrochrome producer, may be forced to shut down its ferrochrome furnaces in 1983 if the Government goes ahead with enforcing stringent new air pollution regulations that would cost $3 million. In 1982, the company lost $750,000 on sales of $19 million. Recently, the company has produced 11,000 to 12,000 tons of ferrochrome annually, 80% of which was low-carbon type.

Iron and Steel.—Merger talks between Norsk Jernverk AS and Elkem continued through 1982, but no early agreement was expected. After estimated 1982 losses of about $60 million, state-owned Norsk Jernverk released its corporate plan asking the Norwegian Government to provide $280 million in new funding over the next 3 years for paying its debts and to cover future losses and needed investments to make the company profitable again.

Norsk Jernverk's interest payments in 1982 amounted to 15% of its turnover. Items required by the company to become self-supporting included a new quay to help increase ore exports from 500,000 to 900,000 tons per year, adoption of SKF AB's Plasmamelt liquid ironmaking process, closing down the company's section mill, expansion of the cold mill and strip coating plants by 40% to 170,000 tons per year by 1984-85, and various further improvements, all at the Bergen plant. The company has also tried to diversify away from steel; ferroalloy making and aluminum are also being discussed because of the availability of inexpensive hydropower.

In 1982, Norway's iron ore production capacity was about 4 million tons, the largest producers being the Government-owned Sydvaranger's Sör-Varanger Mine near Kirkenes with a capacity of 2.3 million tons per year, Government-owned Norsk Jernverk's Rana Mine near Mo with 1.2 million tons, Fosdalens Bergverks AS's Verran Mine in Nord-Tröndelag with 510,000 tons, and Titania AS's Sokndal Mine, southern Norway, with about 50,000 tons. Elkem's Rødsand Mine at Nesset with a capacity of 150,000 tons per year was closed.

Elkem has phased out pig iron production at its ferroalloy plant at Bremanger Smelterverk, Svelgen.

Magnesium.—Work continued on the expansion from 50,000 to 60,000 tons per year of Government-owned Norsk Hydro's magnesium smelter at Porsgrunn, south of Oslo. Modernization was expected to improve energy efficiency of the plant by 20%. During this time in 1982, and continuing in 1983, production of the plant was less than 60% of its original capacity. In the meantime, the Government allocated the extra power needed by the plant after the expansion.

Titanium.—Norway's only titanium dioxide plant was the 25,000-ton-per-year sulfate processing facility at Frederikstadt, south of Oslo. This plant, built in 1966, was operated by Kronos Tital AS, a subsidiary of NL Industries Inc. of the United States.

During 1982, the plant was operating close to capacity, using 84,000 tons of sulfuric acid of the Borregaard Group's 300,000-ton-per-year pyrite-based plant located in nearby Sarpsborg. Ilmenite from the company's own Tellnes deposit near Sokndal, southwest Norway, was the feedstock. Waste sulfate liquor was pumped mostly into the Glomma River.

Zinc.—The Board of Directors of Norzinc AS, a Boliden AB (Sweden) subsidiary, was to review in 1983 the $50 million remodeling plan at the company's Odda plant, southeast of Bergen, that was to expand capacity from 80,000 to 120,000 tons per year. Norzinc had a serious problem with effluent disposal in the sea causing heavy-metals pollution. The Government has given the company until 1986 to solve the problem.

NONMETALS

Ammonia.—In 1982, Norsk Hydro's domestic ammonia capacity at its Mongstad, west coast plant was 300,000 tons per year, while the company's worldwide capacity remained 2,145,000 tons per year.

Caustic Magnesia.—Norsk Hydro operated a caustic magnesia plant at Porsgrunn, with a capacity of 25,000 tons per year.

Granite.—Norway produced granites of different colors: white (diorite) at Tolga and Stören; grey at Iddefjorden, Fredrikstad, and Hvaler; and red granite at Drammen and Grorud. Black granite (hyperite) was produced at Solör. All granite mines are located in the south of the country. Granite veneer was exported for building-facing

purposes.

Larvikite.—Larvikite was quarried in the Larvik district and near Sanderfjord. It is used as an ornamental stone and for facing buildings because of its blue color and Schiller structure (iridescence).

MINERAL FUELS

In 1982, about 88% of Norway's primary energy output was petroleum and natural gas, 11.5% was hydroelectric power, and an insignificant 0.5% was bituminous coal. More than three-quarters of the oil and all natural gas produced were exported, contributing 47% of all exports.

Coal.—Government-owned Store Norske Spitsbergen Kullkompani continued production of bituminous coal on Svalbard Island. Plans were to increase production from the heavily subsidized Longyearbyen and Svea Mines to 1 million tons per year. About 780 Norwegians were working on the island as part of a 1,500-person colony that supplied the Norwegian Norsk Koksverk, various ferroalloy producers, and Norcem with coal.

The Soviet-owned company, Arktikugol, operated the Barentsburg and Pyramiden Mines on the basis that the U.S.S.R. is a cosignitory of the Svalbard Treaty, which allows free mining to the signatories, with no material advantage to Norway. About 2,500 people live in this community, which produces about 400,000 tons of coal per year.

An expedition of about 20 Finns were drilling a coal deposit in the Gipsdalen Valley of Svalbard. Finland is also a cosignatory of the Svalbard Treaty and can also mine freely on Svalbard. A consortium of 4 Finnish companies, Outokumpu Oy, Rautaruukki Oy, Imatra Power, and Neste Oy, sponsored the venture, whose goal was to produce at least 1 million tons per year, with a colony of 230 people. At present, Finland could use 4 to 5 million tons of coal per year.

Petroleum and Natural Gas.—The 1981 decline in North Sea oil production was reversed, as an increase of almost 5% was recorded. Although the Ekofisk Field continued a fairly steep decline, the output of the Statfjord Field, which straddled the Norwegian-British boundary, exceeded expectations with 233,000 barrels per day overall, of which Norway's share was 196,000 barrels per day. A further rise of up to 50% was expected in 1983, after the November 1982 startup of the B platform. Reserves at Statfjord were estimated at 283 to 470 million tons of oil equivalent; reserves at Ekofisk were less than 3 billion barrels of oil equivalent and depend on the success of a $2 billion water flood and gas lift project for central Ekofisk.

In 1982, Amoco's Vahall Field on the southern border of Ekofisk started production, and British Petroleum Co. decided to develop the Ula Field, north of Ekofisk.

The Gullfaks Field in block 34/10 was scheduled to start production in 1987, with a two-platform development for production of up to 245,000 barrels per day of oil with gas.

The Heimdal Field was expected to start production in 1986 at the rate of 3 billion cubic meters of gas per year.

Heimdal gas was to be pumped through the $2 billion Statpipe system together with the Statfjord gas system to Karstö and from there to Ekofisk and Emden on the mainland. The Statpipe system was on schedule; it was designed for pumping up to 20 billion cubic meters per year through two riser platforms and was to land at Karstö in Norway.

For the future, the Sleipner Field was in the planning stage, with reserves estimated at 300 billion cubic meters of gas and condensate, but carbon dioxide and other problems may delay opening of the field until after 1990.

The operator for the Oseberg Oilfield and Gasfield, operated by Norsk Hydro, in blocks 30/6 and 30/9 was near a declaration of commerciality, as was Shell's nearby Troll Field in 31/2, but the Norwegian Storting (parliament) seemed to favor first developments north of the 62d parallel, such as the Askeladden Gasfield in the Tromsöflaket block 2120/8 that could hold 150 billion cubic meters. Trommeliten, a smaller 24-billion-cubic-meter field, and the Hod Field, both near Ekofisk, were up for appraisal.

In 1982, exploration work in the North Sea resulted in many promising finds, as 49 exploration and appraisal wells were started, of which 25 had hydrocarbons, while 8 were unfinished. Of the total, 31 wells reached unexplored structures, of which 14 found hydrocarbons, for a success rate of 45%. Oseberg accounted for nine wells, and Sleipner, for eight, five wells were on Haltenbanken, and four, on the Tromsöflaket, where three showed substantial gas. The best well in 1982 was Saga Petroleum Co.'s fourth well in block 34/4, flowing at a rate of almost 2,000 tons of oil and 200,000 cubic

meters of gas per day, and this was the first time from Triassic sandstone in the North Sea.

Plenty of areas were available for drilling, but lower oil prices may dampen demand for 46 blocks to be offered soon for licensing. For the first 12 blocks on Traenabanken, located north of the 62d parallel, only 14 bids were received by the Government and several jack-up drills were idle.

In 1982, Norway had nine producing oilfields and gasfields: Ekofisk, West Ekofisk, Cod, Tor, Albuskjell, Edfisk, Edda, Statfjord, and Vallhall. Under development were the Gullfaks and Ula Fields. All of these fields were south of the 62d parallel.

[1]Includes peat.
[2]Includes waste energy and trade of all electric power.
[3]Primary energy only.

The Mineral Industry of Pakistan

By Suzann C. Ambrosio[1]

Pakistan's mineral industry continued to grow and contributed nearly 1% to the 1981-82,[2] $29 billion gross national product (GNP).[3] Despite encouraging growth in the industrial sector, and an approximate 6% growth in the national economy, the balance-of-payments (BOP) situation worsened. The current account deficit nearly doubled to roughly $130 million, owing in large part to diminished export revenues and an increased import bill. Mineral output of fertilizer materials, other nonmetals, iron and steel, and hydrocarbons continued to be oriented toward domestic markets and import substitution. However, petroleum product exports and gem stones comprised nearly 10% of the nation's total exports of roughly $3 billion.

Net capital inflows increased 17% over that of 1981 and the International Monetary Fund (IMF) granted the second year of the Extended Fund Facility to assist in financing the nearly doubled BOP deficit. The outstanding public debt reached approximately $13 billion by yearend 1982, equivalent to approximately 45% of GNP.

Growth in the industrial sector was led by the fertilizer industry. Output increases of 14.4% over the previous fiscal year were attributed to the startup of two new public sector plants, Pak-Arab Fertilizers Ltd. and the Hazara fertilizer complex, and the semipublic Fauji Foundation fertilizer project. Steel production grew 6%, owing largely to the increased availability of iron scrap from the growing Pakistani ship-breaking industry. Cement production increased by 3% during 1981-82, primarily from the Mustehkam cement expansion project. Oil and natural gas output have increased from 1980 levels, but consumption outpaced production growth rates. Enhanced exploration efforts and domestic oil and gas price increases were expected to relieve the supply shortages.

During 1982, power outages were reported at a variety of industrial complexes. The Government was expected to exempt export-oriented industries from the power reductions. The upward trends in mineral output were expected to continue, commensurate with increased private sector financing of mostly nonfuel mineral projects. Pakistan's private sector plan of July 3, 1982, focused on accelerating investments, especially in the infrastructure area, to accomplish the goals of the sixth 5-year development plan (1983-87).

Construction of the third phase of the Tarbela hydropower project was initiated and the two additional 175-megawatt units were expected to be commissioned by 1985. The first four Tarbela units were already producing near capacity of 700 megawatts. The Government planned to expand the power-generating capacity by 17% during 1982-83. The International Energy Development Corp. BV (Netherlands) was contracted to assess the energy needs of the country and to develop a technical, financial, and policy oriented long-term energy plan.

PRODUCTION AND TRADE

Despite increased output of barite, cement, fertilizer materials, hydrocarbons, and iron and steel, Pakistan continued to have a mineral trade deficit. The annual

rate of increase of total imports decreased from the 25% average of recent years to under 5% during 1981-82. Imports during the year reached $5.7 billion and were comprised of petroleum, 30.8%; machinery, 15%; transport equipment, 7.2%; chemicals, 5.4%; iron and steel, 4.5%; fertilizer materials, 1.5%; and other manufactured items, 35.6%. Fertilizer imports declined as the Fauji Fertilizer Co. Ltd. plant was brought up to its daily designed capacity of 1,000 tons of ammonia and 1,750 tons of urea. Cement imports of 1.5 million tons have declined slightly because of increased domestic production.

Total exports declined 17% to $2.3 billion during 1981-82 largely because of depressed world commodity prices. Petroleum products comprised approximately 9% of total exports, while nearly 90% of the nation's petroleum requirements continued to be imported from the Middle East. Expanded output of hydrocarbons, coal, fertilizers, iron and steel, cement, and other mineral products were expected to help alleviate the mineral trade deficit over the next 5-year development period.

Pakistan's commercial policies continued to emphasize export promotion and import substitution. Import liberalization policies continued, as prompted by the IMF, and reflected Government efforts to stimulate industrial investment and output. Private sector involvement in the cement, chemical, and iron and steel industries continued to grow at a slow rate and the Government has given assurances against nationalization of certain industries. The various regional mineral development corporations were seeking joint venture participation in the Saindak copper and iron mining and pellet production projects in Baluchistan, and the lignite mining and thermal power-generation project in Sind.

Pakistan's major export partners, in descending order, included Japan, 8.5%; Saudi Arabia, 7.4%; the United States, 7.2%; China, 5.9%; the United Kingdom, 5.1%; Hong Kong, 4,6%; and Iran, 3.3%. Minerals comprised a small part of the nation's exports during 1981-82.

Table 1.—Pakistan: Production of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1978	1979	1980	1981[p]	1982[e]

COMMODITY REVIEW

METALS

Bauxite.—Development of approximately 70 million tons of bauxite resources was deferred and made part of the nation's sixth 5-year plan efforts.

Chromite.—Output from about 350 small chromite prospects and mines, located just south of Muslimbagh, was increased during 1982. Nearly all of the small workings recovered metallurgical-grade ores averaging 49.5% Cr_2O_3, 9.5% Al_2O_3, 16.2% MgO, 3.5% SiO_2, and 14.5% FeO. Lower grade ores averaging 30% Cr_2O_3 and vein-like ore deposits with high Al_2O_3 content were generally left behind or occasionally blended with other ores.[4] This was largely a result of the difficult mining conditions and a lack of domestic market demands. The Baluchistan Development Authority (BDA) reportedly increased production capacities of the Muslimbagh chrome mines and set a 10,000-ton production target for 1982.

Copper.—The Saindak integrated copper project in western Baluchistan, sponsored by the Government Resource Development Corp., was considering a joint venture proposal submitted by a consortium of Canadian, French, and Yugoslav companies, called Saindak Joint Venture (SJV). Initial discussions were for a Government-SJV equity split of 75% and 25%, respectively, for the estimated $400 million project. SJV was expected to provide the total $234 million foreign exchange component and the local currency component of $165 million was expected to be provided by Pakistani financial institutions. Recoverable quantities of the three Saindak ore bodies were reestimated at 1.69 million tons of copper, 2.24 million ounces of gold, 2.49 million ounces of silver, and 20,374 tons of molybdenum. Plans were made initially to establish a concentrator at the minesite and develop facilities to transport the copper, pyrite, magnetite, and molybdenite concentrates to the smelter, steel billet, and sulfuric acid plants.

A final report was expected to be submitted to the Bankers Equity Ltd. (Pakistan) by yearend 1982. Romania offered an approximate $6 million worth of suppliers credit for the smelter, roaster, acid, and slag flotation plants. Yugoslavia offered $8 million worth of financial and technical assistance for the Saindak project. The Canadian Government had offered and agreed to finance an approximate $8 million engineering requirements study to be completed by yearend 1983. France, the Federal Republic of Germany, Norway, and the United Kingdom offered suppliers credits totaling approximately $30 million.

Iron Ore.—The Pakistan Council of Scientific and Industrial Research (PCSIR) continued to investigate iron ore deposits, primarily in Baluchistan. High-grade concentrates were produced by PCSIR from a pilot plant that was testing Pachinkoh and Chigendik iron ores. Pelletizing and reduction tests on the concentrates were expected to be completed by yearend.

Iron and Steel.—The 800-millimeter billet mill was commissioned at the Pipri steelworks near Karachi, and the second coke oven battery and blast furnace were ready for commissioning by December 1982. Trial commissioning of one of the converters and the bloom caster took place during the same month. The second converter, two slab casters, and the hot-strip mills were expected to be commissioned by yearend 1983. Completion of the steel complex was scheduled for August 1984, after the commissioning of the cold-rolling mills. When operational, the steel complex was projected to employ 15,000 people. The annual output target of 1.1 million tons of steel, 250,000 tons of coke, and 135,000 tons of pig iron was expected to be reached during 1985. During 1982, Pakistan imported 2 million tons of iron ore, 1.3 million tons of coking coal, and 50,000 tons of manganese ore to feed the steel mills. The excess pig iron and coke was exported primarily to India and Romania, respectively. Domestic sources were expected to annually provide 430,000 tons of dolomite, 4,000 tons of fluorite, and 44,000 tons of refractory clay for the steelworks.

The Soviet Union has provided a loan worth approximately $500 million, repayable in 12 years, to assist in financing the project. Approximately $1.7 billion has already been spent on the project, an equivalent of nearly 70% of the total projected cost. In addition, the Soviet Union was expected to supply equipment for a hot-strip mill and a cold-rolling mill sometime during 1983. Pakistani engineers and technicians were expected to replace the Soviet technical team after the completed steelworks have undergone trial commissioning. Soviet assistance was also being considered for the establishment of a metallurgical institute

and hydroelectric power station in Pakistan.

Increased small-scale private participation in the iron and steel industry was exemplified by the establishment of a mini-steelworks to make wire rod and a foundry to manufacture galvanized iron pipe fittings. The first project was being planned by the Chaudhri Group Ltd. with annual output projected initially at 20,000 tons of 5.5- to 12.5-millimeter rods and 14- to 32-millimeter bars, and eventually increasing to 40,000 tons.

The foundry project, established by the Habib Group Ltd., envisioned a design capacity of approximately 7,400 tons of castings with a projected startup date of 1983. Outside of these examples of small-scale private sector involvement, larger scale production of steel remained under Government control. The proposal to sell off the specialty steelmaker, Pakistani People's Steel Mills, to Japanese investors was rejected by the Government. In general, however, downstream projects involving both foreign and local investors have the option to establish their own plants or enter into joint venture arrangements with the Government-owned Pakistan Steel Mills. Two projects involving the production of slag blocks and large-diameter pipes were sanctioned by the Government during 1982.

NONMETALS

Barite.—Bolan Mining Enterprises, a joint venture between the BDA and Pakistan Petroleum Ltd. (PPL) continued to be the largest barite producer. The plant, located at Khazdan, was rated at 24,000 tons annually. BDA was also considering developing a barite mine and grinding plant at Dham Jhal to produce an additional 50,000 tons per year. The Government approved the construction of another grinding plant at Lasbela during the year.

Cement.—Cement output continued to rise, largely because of the 300,000-ton expansion of the Mustehkam cement plant, increased domestic cement prices, and increased duties on imported cement. Three projects commissioned during 1982 had the effect of raising annual cement capacity from approximately 3.7 million tons to 4.3 million tons. In addition to the Mustehkam expansion, there was an expansion of the Javedan plant and a new factory was constructed at Thatta. Other new facilities located at Dandot and at Kohat were expected to be completed by yearend 1983 and expansion of the Dandkhel factory was projected for 1985.

The State Cement Corp. commissioned the new $49 million Thatta plant during August 1982. Limestone originating from Makli Hills in the Thatta district and slag from the Pakistan mills were used to produce 300,000 tons of grey cement and 30,000 tons of slag cement. Two other Government projects at Dandot and Kohat were expected to increase annual capacity by another 300,000 tons.

Five cement facilities, including Asbestos, Gharibiwal, Javedan, Mustehkam, and Zeal Pak, accounted for nearly 70% of the nation's output. The average capacity utilization rate for these plants was 80% during 1982.

New cement projects under consideration at yearend 1982 included a new $71 million plant at Hub with a 2,000-ton-per-day capacity, a slag-based cement plant at Karachi with a 1,000-ton-per-day capacity, and a new factory at Hub-Chowki with a 2,000-ton-per-day capacity. All of these projects were expected to be majority owned and operated by private firms. Despite enhanced output at domestic facilities, Pakistan continued to import approximately 5 million tons of cement during 1981-82. Demand was projected to level off to roughly 6 million tons during 1983.

China Clay.—The Government completed investigations of the Nagar Parker kaolin deposits and planned to establish an elutriation plant near the deposit sites within the Sind Province.

Fertilizer Materials.—The 61,000-ton-per-year Hazara Urea Fertilizer Plant, renamed the Pak-China Fertilizer Plant, was commissioned during October 1982. The Fauji Fertilizer Plant at Goth Machhi was commissioned during June 1982 with annual capacities to produce 272,000 tons of ammonia and 262,000 tons of urea. Fauji Fertilizer made an application to the Government-owned National Fertilizer Corp. to construct and operate an 800- to 1,000-ton-per-day diammonium phosphate plant. All of the nation's diammonium phosphate requirements of approximately 360,000 tons were imported during 1981-82. The only existing nitrophosphate facility was located at the Multan plant, and the annual rated capacity of 70,000 tons met approximately 30% of the nation's requirements.

Fertilizer rehabilitation projects estimated to cost nearly $50 million were underway in 1982. The Multan nitrogen plants were undergoing reconditioning and the ammonia capacity was expected to be increased by

the installation of a purge gas recovery unit. Similarly, the ammonium sulfate plant at Daud Khel was expected to receive a new boiler, a new water treatment plant, and a converter renewal at the sulfuric acid plant. The Government projected that by 1986 domestic fertilizer consumption would rise to 1.8 million tons and imports would comprise approximately 40% of that requirement.

The International Bank for Reconstruction and Development (World Bank) extended a $38.5 million, 20-year loan to finance a macroeconomic study of Pakistan's fertilizer demands. The study was also expected to include the development of a strategy for expansion and an analysis of the Government's fertilizer pricing policies.

Gem Stones.—The Pakistan Investment Promotion Bureau approved a gem stone cutting, processing, and polishing industry for the city of Karachi. Swedish and Belgian entrepreneurs were expected to provide technical and financial assistance for the $2 million project. The gem stones to be processed included Hunza rubies, Swat emeralds, Skarou assorted gem stones, and internationally marketed diamonds. Implementation of the project may be delayed because of the Gemstone Corp. of Pakistan's severe liquidity problem. Feasibility studies of the Swat emerald mines, Charbagh-Alpurai district emerald deposits, Dassu aquamarine and beryl deposits, and Katlang-Mardan district topaz deposits were delayed because of the lack of capital. By yearend 1982, three new emerald deposits had been discovered by Gemstone at Charbagh, Makad, and Gujar Killi in Swat, Pakistan. The Gujar Killi emerald deposits were expected to be one of the first to be developed using open pit mining methods.

Graphite.—Punjab Mineral Development Corp. (PMDC) reported newly discovered graphite deposits in Azad, Jammu, and Kashmir, near the Baluchistan and North-West Frontier Province boundaries. Some of the samples tested were found to be 95% pure and initial resources were estimated at 1.5 million tons.

Gypsum.—Progress was made in the development of Pakistan's 350 million tons of gypsum reserves. A new plant, financed by the private sector, was to be established at Burikhel in the Mian Wali district of Punjab. The plant's planned annual production capacity of 100,000 tons was to be fed by the newly developed quarry. In addition, PMDC was planning to expand mining and processing facilities to produce 500,000 tons of gypsum annually at Daudkhel. The Asian Development Bank offered to finance $30 million, contingent upon a feasibility study being prepared by Kaiser Engineering Co.

Salt.—PMDC completed geological feasibility studies for solution mining rock salt near the Khewra salt mines. New mines with an annual production capacity of 300,000 tons were planned and envisioned for domestic manufacturing of soda ash and table salt.

MINERAL FUELS

Coal.—Efforts continued to be made to explore and develop the country's extensive coal deposits, despite the generally low energy value and high sulfur and ash content. To date, the most viable deposits were located at Sharigh in Baluchistan, and at Thatta and Lakhra in the Sind Province. The Lakhra Coalfields were estimated to contain nearly one-half of the nation's total resources of approximately 500 million tons. The Geological Survey of Pakistan (GSP) was investigating other areas within Pakistan including the higher quality Gonwana coal deposits, located within the Punjab Province.

GSP in conjunction with the U.S. Agency for International Development (AID) and the U.S. Geological Survey were assessing the Lakhra Coalfields and other deposits located in Baluchistan during 1981-82. The coal studies were part of a larger AID-sponsored conventional energy resources assessment program with other main components including sedimentary mineral resources assessment, sedimentary basin analysis, and geothermal and geological hazard studies.

The Survey and AID personnel visited the Thatta and Lakhra Coalfields during 1982 to (1) assess the status of coal resource studies in Pakistan and, (2) determine requirements of coal geochemistry and coal petrology laboratories. Reviews were made of the Pakistani Water and Power Development Authority (WAPDA) proposal to construct a thermal powerplant in the Hyderabad area based on Lakhra coal resources. Preliminary results have indicated the viability of Lakhra coal as an alternative to more expensive imported coal or domestic oil and gas for thermal power generation.

Negotiations for a $7 million International Development Association of the World Bank loan were underway. The coal engineering project to be implemented by WAPDA was expected to focus on geological surveys and feasibility studies of the Duki

area, Baluchistan.

GSP and PMDC approved a coal exploration and Sharigh expansion program for the Baluchistan region. Mining has already occurred in the Sore Range, Digari, and Sharigh Coalfields, where an estimated 83 million tons of resources exist. Additional resources were being explored by PMDC in the Degari Coalfields of the Kalat district. PMDC planned to expand output of the Sharigh cokemaking facilities. A feasibility study recommended a $2 million coal-washing plant to produce 75,000 tons of coking coal for the ultimate manufacture of metallurgical-grade coke.

Natural Gas.—The balance of Pakistan's natural gas reserves stood at 15.9 trillion cubic feet in June 1982. The three commercially exploited gasfields, Sui, Mari, and Sari Hundi, contained 38%, 24%, and 0.3%, respectively, of the remaining reserves. Other sources of natural gas included associated gas, recovered from the Meyal and Toot Oilfields.

By yearend 1982, 34 producing wells had an average output of approximately 700 million cubic feet per day. Domestic demand for natural gas was estimated at 935 million cubic feet per day during 1982, according to the Ministry of Petroleum and Natural Resources 10-year (1981-90) gas plan. The consumption growth rate for natural gas was approximately 11% over the decade. Natural gas sales were divided among industrial, 84%; domestic, 12%; and commercial users, 4%; with 40% of the industrial sector's consumption utilized in thermal power generation.

Output from the Sui Gasfields were fed into the grids of the Sui Gas Transmission Co. Ltd. (SGTC), Sui Northern Gas Pipelines Ltd., and the Gudu Thermal Power Station. Sui reserves were estimated to last another 20 years at the current production rate of approximately 850 million cubic feet per day. An investment of $33 million over the next 10 years was projected for the introduction of compressors to maintain production of the Sui wells. PPL, with assistance from Burmah Oil Public Ltd. Co., completed the conceptual design study for the wellhead gas compression facilities. The first of the four-phase compressor installation was projected to cost $14.5 million. A loan agreement for the project was signed between PPL and the International Finance Corp. on December 30, 1982.

The Pirkoh Gasfield with an estimated 1 to 5 trillion cubic feet of reserves was being developed to supply 72 million cubic feet per day to the SGTC. The Oil and Gas Development Corp. (OGDC), planned to bring the field into maximum production of roughly 120 million cubic feet per day in three phases over a 4-year period. Development has been delayed because of the lack of technical and financial assistance.

A $30 million loan agreement for the first phase was being negotiated with the Asian Development Bank to cover the costs of drilling the first three Pirkoh wells. The first phase of development included drilling six wells, installing two gas dehydration plants, associated gathering facilities, and infrastructure. Tenders for the production materials and consultant services were expected to open in April 1983, and the completion of the first phase was targeted for yearend 1983.

The Mari Gasfield was expected to reach its optimum production level of 387 million cubic feet per day by 1986. The gas would feed WAPDA's new 300-megawatt gas turbine at Gudu. The Kandhkot Gasfield was expected to be developed by 1986, and was also slated for Gadu thermal power generation. Initial investigations of the Dhodak Gasfield revealed that the condensate gas was not likely to be available before 1990. Initial development would require gas reinjection to maintain pressure over several years.

The Southern Transmission System, operated by SGTC and serving the Sind and Baluchistan Provinces, was estimated to be capable of supplying a maximum of 255 million cubic feet per day of purified Sui and Sari Hundi gas for distribution by the Indus Gas Co. and the Karachi Gas Co. Ltd. SGTC approved three gas pipeline projects for completion by December 1983. The 217-mile, 12-inch line from Shikarpur to Quetta began construction during 1982. Construction of the 46-mile, 18-inch line linking the new Pirkoh Gasfield with the Sui Gasfield, and a 34-mile, 14-inch line linking the Lasbela Spur to Bawani in the Lasbela district, was expected to begin during 1983.

Petroleum.—Pakistan produced only 12% of the nation's oil requirements of approximately 100,000 barrels per day and imported the balance from Saudi Arabia, Iraq, and other gulf states. The Petroleum Ministry fell short of their projected 50% increase in output to roughly 16,000 barrels per day during fiscal year 1982. The expected increase was attributed to the recent discovery and exploitation of the Khaskheli

Oilfield, which was producing only 2,600 barrels per day from June through December 1982. The Meyal and Toot Oilfields continued to produce the largest quantities of crude, accounting for nearly 83% of the output. Total production targets were set at 30,000 barrels per day by 1990, in part to accommodate the 5% projected consumption growth rate of petroleum products over the next 10 years.

Khaskheli output began in 1982, and although the crude was transported by trucks, the wellhead pressure was kept below normal. Connecting the field via pipeline to the Karachi refinery was being considered to realize a 6,000-barrel-per-day output level. The second development of the phase of the Toot Oilfield was projected to commence early in 1983 with the inauguration of well No. 16. The recently developed Adhi fields output doubled to approximately 330 barrels per day during fiscal year 1980-81. By December 1982, Adhi well No. 9 was spudded. Drilling activities were expected to continue at Adhi No. 9, a joint venture between OGDC and the operators, PPL. The crude was transported by tankers to the Attock Refinery.

OGDC opened eight onshore blocks to oil exploration bids. The offer included a 2.5% coverage of exploration venture costs and a 50% equity split in any developable finds. Seismic survey results and other technical data were available for $5,000, and the bidding was closed on December 30, 1982. Joint venture proposals were being considered with OGDC retaining the right to increase its participating interest to 50%. OGDC and a Kuwait delegation were negotiating joint exploration in the Bannu, Loralai, and Sukkur districts of central and northwestern Pakistan.

The World Bank granted a 20-year, $12 million loan for the first stage design and basic engineering work for a hydrocracker project and an energy audit and conservation program. The entire cost of the Karachi hydrocracker project was estimated at $350 million.

The Mineral Industry of Peru

By Doris M. Hyde[1]

In 1982, Peru faced severe financial pressures, which, to some extent, were directly attributable to depressed economies worldwide. Demand for Peru's traditional metal exports declined, and already low 1981 market prices progressively worsened throughout the year. An exception was the precious metals prices that began to recover at the end of June, but still averaged for the year well below the average for 1981.

As export earnings continued to decline, the Government was faced with current account deficits, declining foreign reserves, and a continuation of 1981's unprecedented 73% rate of inflation. In 1982, the gross domestic product (GDP) at current prices declined 1% to less than $20 billion.[2] Real growth was less than 1% as a result of declines in the mining and manufacturing sectors. In real terms, the minerals sector contributed slightly more than 9% to the GDP, only a fraction more than that of 1981.

Both the public and private sectors increased foreign borrowing to cope with fiscal deficits, and by the end of 1982, Peru's total external debt had surpassed $11 billion, a 16% increase over the 1981 level. The public sector's share of this foreign debt was about $7 billion, or 36% of the GDP. Debt service as a percentage of export earnings was 44%.

The minerals sector accounted for an estimated 63% of the total value of exports, and of this share, 41% was from the nonfuel minerals. The petroleum sector failed to meet earlier production expectations. Prices for petroleum exports also slumped as large world producers competed for sales in a declining market.

Almost all Peruvian mining companies adopted austerity programs to reduce anticipated losses for 1982. Southern Peru Copper Corp. (SPCC), the largest copper producer, canceled or delayed plans to expand production at its Toquepala and Cuajone Mines. Modifications to the Ilo copper smelter were also postponed.

Empresa Minera del Centro del Perú (CENTROMÍN PERÚ) planned to concentrate its limited 1983 investment funds on the most advanced projects. The Tintaya copper project had been totally financed and was not to be affected by austerity measures. The Toromocho copper project was a casualty of budget considerations and has been temporarily shelved.

The Government determined that 46 state-owned companies could be transferred to the private sector. Nine of these were mineral related. They included three affiliated with CENTROMÍN PERÚ: Consultores Minero Metalúrgicos S.A., Cía. Minera Los Montes S.A., and Reactivos Nacionales S.A. Another three were subsidiaries of Empresa Minera de Hierro del Perú (HIERRO PERÚ): Propiedad Minas Justa S.A., Servicios Transmar S.A., and Agencia Portuaria San Juan S.A. The last three companies were Compañía Minera San Juan de Lucanas S.A., a Banco Minero del Perú affiliate; Compañía Minera Condestable S.A., an Empresa Minera del Perú (MINERO PERÚ) subsidiary; and Minas Aguila S.A., 40% owned by Corporación Financiera de Desarrollo (COFIDE).

There were 54 separate labor strikes in the mining sector during 1982, practically the same as in 1981; however, the number of worker-hours lost decreased by 41% because of the reduced number of miners involved. SPCC suffered the greatest economic loss from 15 days of strike activity at the Toquepala Mine and Ilo smelter. HIER-

RO PERÚ endured a 39-day strike.

Government Policies and Programs.—The medium and small mining sectors were least able to cope with the continuation of 1981's depressed international metal prices. In an effort to help, the Government initiated several assistance programs designed to provide these companies with enough working capital to prevent closures.

An executive decree issued on January 2 established a $40 million Miners Compensation Fund at the Banco Minero. The purpose of the fund was to allow medium- and small-sized producers of copper, lead, silver, tin, tungsten, and zinc to obtain loans up to 20% of the value of their metal sales retroactive to July 1, 1981, whenever the f.o.b. value fell below a specified amount for each metal. The triggering prices were: $0.95 per pound for copper (London Metal Exchange wirebar); $10.50 per troy ounce for silver (Handy and Harman); $0.40 per pound for both lead and zinc (London Metal Exchange, daily average of four prices); $165 per ton for tungsten (London Metal Exchange, ore); and $5 per pound for tin. The loans had an initial 18-month grace period with the interest rate to vary by particular mineral product, after which repayment extended over 4 years at the prevailing interest rate. Each loan also carried an annual 2% commission to be used as a reserve for the fund. A loan could not be used to pay existing company loan debts. In April, the fund was authorized an additional $50 million in capitalization. The Banco Minero was to receive fund monies from the Banco de la Nación.

In July, the Government decided that more immediate relief was imperative and declared the small- and medium-sized mining operations to be in a state of emergency. Several decrees were issued to provide assistance during the remainder of the year. The Mining Compensation Fund was augmented by $120 million, with company loan amounts increased from 20% of metal sales to 50%. For 6 months the companies were exempted from payroll taxes, export taxes, and the special sales tax. For the first time, the importation of used mining equipment was allowed if purchased for the improvement of production capacity. A 6-month freeze was declared on company reductions in their labor forces. Worker salary and wage levels were also frozen, except for adjustments authorized by the Government. Although the Banco Minero failed to receive the entire amount authorized by the funding, it did receive $180 million. During 1982, the bank approved fund loans totaling almost $97 million, of which about 39% went to the small mining sector and the remainder to the medium sector.

The Banco Minero installed five more small concentrators throughout the country in continuation of its program to assist the small mining sector. The first concentrator in this 20-plant assistance project was placed in operation in 1981. The remaining plants were expected to be installed in the near future. The total cost of the 20 concentrators was estimated at over $12 million. The bank also rented MINERO PERÚ's 150-ton-per-day Michiquillay pilot plant in the Cajamarca area and began preparations to make it operative.

PRODUCTION

Preliminary figures from the Ministry of Energy and Mines indicated that the production of Peru's major metallic minerals, except iron ore, increased in relation to newly revised 1981 production figures. Because of low market prices, producers attempted to operate at optimum levels to maintain cash flow, meet financial commitments, and reduce unit costs.

In response to the midyear recovery of precious metal prices, producers increased their total silver production by 14%. The decrease in gold output was generally regarded as an exaggeration because of an apparent increase in smuggling and hoarding by placer operators.

Austerity measures curtailed most new development projects and not even the large companies were expected to show significant production increases in 1983. Although many projects have been postponed, a continuation of the apparent recovery in precious metal prices may be used to compensate for losses from associated metals.

In 1982, petroleum production increased by about 1% over that of 1981, much less than envisioned early in the year. The jungle area contributed 64% to total crude oil production, while the northern coastal area accounted for 22%, and the offshore area 14%. Unfortunately, declining petroleum prices forced both the state-owned Petróleos del Perú (PETROPERÚ) and private companies to be selective in their 1983 exploration budgets.

[e]Estimated. [p]Preliminary. [r]Revised.

[1]Table includes data available through July 15, 1983.

[2]Reported figure.

[3]Output reported by Empresa Minera del Centro del Perú S.A.

[4]Includes electrowon copper cathode production by Empresa Minera del Perú S.A., at Cerro Verde I, as follows: 1978—28,426 tons; 1979—33,111 tons; 1980—33,279 tons; 1981—33,366 tons; and 1982—33,532 tons.

[5]Excludes sponge iron production as follows: 1980—33,826 tons; 1981—53,704 tons; and 1982—42,968 tons.

[6]Includes hexane.

[7]Less than 1/2 unit.

TRADE

Low world mineral prices were responsible for the lessened contribution by the mining industry to Peru's export earnings. In 1981, mining accounted for 48% of total export earnings, but in 1982, its contribution dropped to 41%. The total value of nonfuel mineral exports declined to an estimated $1.3 billion from the already depressed 1981 level of $1.6 billion.

Iron ore was the only commodity among the major nonfuel minerals exported that indicated a gain in both volume and value above that of 1981. Copper, which accounted for 14% of the total value of exports, continued to be the leading Peruvian nonfuel mineral export, followed by zinc, which accounted for almost 7%. Copper exports grew 1% in volume over that of 1981, but lost 14% in value. Zinc exports declined less than 1% in volume and lost 9% in value. Refined silver exports increased 8% in volume but declined 34% in value, and would have shown a greater loss except for the midyear upturn in prices.

Because world silver prices continued to fall during the first 6 months, in July the Government announced a suspension of international sales of refined silver. This was to include as much as 6 million troy ounces not already sold under contract. The ban was lifted in September, but some reports indicated it was never strictly enforced.

Minero Perú Comercial S.A. (MINPECO), the state marketing agency, no longer enjoys a monopoly on Peruvian mineral exports, but it still was responsible for an estimated 87%. MINPECO transactions indicated that in 1982 the value of U.S. purchases declined by almost 57%, while those of Western Europe increased by almost 17%. Peru's exports to other geographic areas of the world also declined in value, although some particular mineral exports to individual countries did increase in volume.

COMMODITY REVIEW

METALS

Cobalt.—Early in 1982, CENTROMÍN PERÚ and the British firm, Programmed Neuro Cybernetics Ltd., conducted a $1 million aerial exploration survey over the Sur Chico area of southern Peru. The project was part of a general exploration program for strategic and precious metals deposits. As a result, Neuro Cybernetics identified a belt of copper-cobalt deposits extending perpendicular to Monterrosas and Comsa Creeks in Ica Department. A CENTROMÍN PERÚ subsidiary, Cía. Minera Los Montes, recently opened a small 1,000-ton-per-day underground copper mine in the same area, about 20 kilometers northeast of Ica. Laboratory tests performed by this company indicated that pyrites contained in the copper tailings produced a concentrate with a 0.4% cobalt content. Samples of the tailings and the pyrite concentrate were sent to an interested Finnish firm, Outokumpu Oy.

HIERRO PERÚ continued to examine the banking feasibility and market study performed by the U.S. Trade and Development Program (TDP) to assist in determining the commercial viability of producing a pyrite concentrate averaging a minimum of 0.58% cobalt from tailings at their San Nicolás iron ore beneficiation plant. A feasibility study for this project was not initiated in 1982, although the TDP recommended that one be undertaken.

Copper.—Peru reversed its downward trend in copper production and registered an 8% increase in output, primarily because of fewer labor problems. SPCC, which endured a 2-month strike in 1981, lost about 20 days because of strike activity at the Toquepala Mine and Ilo smelter. SPCC delayed decisions to expand capacities at the smelter and the Toquepala and Cuajone Mines pending improved copper market conditions. A proposed geothermal power project in the Moquegua area was also postponed. SPCC unit production costs rose 29% in 1982 principally because of high fuel prices. SPCC's toll refining costs, including a 16% sales tax, at the MINERO PERÚ Ilo refinery were $281 per ton, about $100 more than it would have cost SPCC in the United States.

MINERO PERÚ slightly increased copper cathode production from the Cerro Verde I copper oxide mine near Arequipa. About 110,000 tons of sulfuric acid was supplied to the Cerro Verde I operation by MINERO PERÚ's zinc refinery at Cajamarquilla. Copper cathode production at Cerro Verde reached 33,532 tons.

In addition to the main Cerro Verde cathode plant, there were two experimental pilot plants in operation. One was designed to perform short-term investigations for improving copper oxide technology at the main plant. The other pilot operation treated ore from the 1.2 billion tons of copper sulfide reserves, known as Cerro Verde II, which underlies the oxide deposit. The pilot plant produced 3,084 tons of 40% copper concentrate, a 25% increase over that of 1981. The sulfide pilot plant also performed tests to recover molybdenum.

At MINERO PERÚ's electrolytic copper refinery at Ilo, production increased to 140,859 tons, or approximately to the 1980 level. Expansion plans for this refinery have been postponed. In 1982, the company installed a 100-ton-per-year pilot anodic slimes plant to recover gold, silver, and selenium. Also, about 288 tons of byproduct nickel sulfate was obtained from reprocessing 800 tons of cathodes that had accumulated from the electrolytic purification circuit during the 7 years of refinery operation.

Because of a significant increase in

ore production from the Cobriza Mine, CENTROMÍN PERÚ reduced its purchases of copper to supply the La Oroya metallurgical complex from 45% of output in 1981 to about 28% in 1982. Total copper production at La Oroya was 53,555 tons, slightly less than that of 1980.

These three large mining companies accounted for 81% of Peru's copper production in 1982. The medium-sized mining sector produced 12% of the total copper production. Privately owned Cía. Minera Patívilca S.A. was the largest copper producer in this category. The company's concentrate output contained about 5,450 tons of copper, a 14% increase over the 4,800 tons produced in 1981.

Cía. Minera Los Montes brought the Monterrosas copper mine near Ica onstream in March 1982. The mine produced 8,907 tons of concentrate containing slightly over 31% copper and 0.43 ounce of gold per ton. A full year's production was expected to reach 13,000 tons of concentrate.

Some new copper development projects were affected by the depressed international market price and company financial austerity measures. MINERO PERÚ was unable to activate its $290 million development plan for the Cerro Verde II deposit because of unresolved financing problems. After obtaining two loans totaling $92 million from Canada and the United States, MINERO PERÚ negotiated with Japanese interests for a $130 million loan to be repaid by the delivery of 75% of the copper concentrate production. This loan prospect dimmed as the lenders pondered a worst-possible-case scenario which envisoned that the price of copper could drop low enough that even 75% of Cerro Verde II's production would not cover operation costs, interest rates, and amortization. The Japanese wanted the Government to guarantee their loan to MINERO PERÚ, and the Government appeared unwilling to make this commitment. Both MINERO PERÚ and the Government faced considerable financial and political pressures to reach a loan agreement. Cerro Verde I oxide ore was projected to be depleted in mid-1985, and if Cerro Verde II has not come onstream, the company will be forced to dismiss over 1,000 workers. They will also face considerable financial loss associated with prior loan commitments and investments already made in the project. The economic and employment loss to the surrounding area, including the politically powerful nearby city of Arequipa, as well as the projected loss of much needed Government revenue are other important factors that require consideration.

CENTROMÍN PERÚ deferred its planned copper circuit modernization project at La Oroya until at least 1984. The search for partners to develop the 354 million tons of Toromocho copper ore reserves was also deferred. This deposit was located 142 kilometers east of Lima in the District of Morococha. The project cost was estimated at $800 million for a production of 75,000 tons per year of refined copper, plus quantities of silver, molybdenum, and tungsten.

In 1982, Empresa Minera Especial Tintaya S.A., obtained the $215 million in loans necessary to proceed with development of the Tintaya copper deposit, located near Cuzco in southern Peru. The company is 90% jointly owned by MINERO PERÚ and CENTROMÍN PERÚ, with a 10% interest held by the Government financing corporation, COFIDE.

By the end of the year, mine and plant equipment orders were placed and infrastructural construction was well underway. The project was scheduled to go onstream in September 1984, and produce 160,000 tons of 33% copper concentrate annually.

In 1982, MINERO PERÚ was granted special rights to the La Granja copper deposit located in the District of Querecoto, Province of Chota, Department of Cajamarca. La Granja ore reserves were estimated at 320 million tons containing 0.78% copper and 4 grams of gold per ton. A special mining company, similar to Tintaya, was expected to be established. Peruvian interests, including 25% held by MINERO PERÚ, would hold 55% of the equity, and a foreign group represented by the West German company, Kupfer Exploration Metalgesellschaft, would hold the remaining 45% interest. The estimated investment cost was $400 million at 1982 prices. A $12 million feasibility study was to be undertaken by Kupfer during the next 2 years.

MINERO PERÚ, France's Bureau de Recherches Géologiques et Minières, and its subsidiary, Coframines, agreed to create a special mining company to develop the Tambo Grande polymetallic deposit in northern Peru. The deposit lies about 50 kilometers from the Ecuadorean border near Paita. Congressional approval of the venture was expected. Tambo Grande was estimated to contain 42 million tons of reserves grading over 2% copper, 1% zinc,

and 1 troy ounce of silver per ton. Coframines was expected to initially control 75% of the new company.

Other MINERO PERÚ copper projects were dormant in 1982, including Quellaveco Michiquillay, the Bambas, Berenguela, Antamina, and Cañariaco.

Gold.—CENTROMÍN PERÚ continued to be Peru's largest single gold producer. Refined gold at the La Oroya metallurgical complex reached 45,216 troy ounces, a 7% increase over that of 1981, and represented nearly 29% of Peru's total gold production. Minas Ocoña S.A., the largest privately owned gold producer, achieved a 60% increase over that of 1981 when production reached 18,166 troy ounces. Ocoña also began producing refined gold.

These increases did not prevent an overall 10% decrease in Peru's total gold production. The known contribution of placer gold to total production dropped from the revised 1981 level, primarily because of poor weather conditions. Even so, gold recovery from placer deposits represented one-half of total output.

Estimated recoverable gold production is shown by source, in troy ounces, in the following table:

	1981	1982
In ores and concentrates	9,517	9,645
Refined and in blister	55,781	69,606
In placer gravels	r110,759	78,416
Total	r176,057	157,667

rRevised.

A meaningful estimate of Peru's true gold production has proved difficult to ascertain. For the most part, this is because placer gold production estimates depend on purchases made by the Banco Minero through its 20 offices located throughout the country. Six of these offices are located in the southeastern Madre de Dios region, at Mazuko, Huaypetue, Laberinto, Colorado, Puerto Maldonado, and Quincemil. This region accounted for about 60% of all placer purchases. However, it was generally acknowledged that at least 30% of the gold produced from this region may be smuggled out of Peru and sold elsewhere, mainly Brazil. In Brazil, gold could be sold for U.S. dollars and at a higher per troy ounce price than that paid by the Banco Minero. Furthermore, the Banco Minero must pay for its purchases in Peruvian soles, a currency that has been undergoing devaluation.

The Banco Minero purchased 78,416 troy ounces of gold valued at almost $23 million. Gold exports amounted to 157,137 troy ounces, a 13% decrease from that of 1981.

A gold boom on the northern coast began in 1981, about 10 kilometers north of Chimbote, in the delta area of the Santa River. In 1982, through the International Executive Service Corp., the new concession holders engaged the services of a U.S. placer mining engineer. The consultant was to carry out an evaluation study of the Santa Rita beach placer deposit.

The Arias Group subsidiary, Cía. Minera Poderosa S.A., opened the Poderosa Mine in August. The mine was located in Pataz Province, La Libertad Department, in the same general region as the Arias Salpo and Urumalqui Mines. The new Poderosa Mine produced 3,858 troy ounces of gold and 1,190 troy ounces of silver.

The gold boom in the southeastern region continued. CENTROMÍN PERÚ operated its pilot plant at the Bijahual concession on a sporatic basis throughout the year as mechanical adjustments were made. Gold recovery of 85% was achieved at the plant from the black sand concentrate.

In addition to gold, the concentrate contained magnetite, titanium, and, in some places, traces of chromium and tin. A small laboratory was installed to monitor any improvements in gold recovery. An examination of two drill cores revealed that the gold content in the gravel may drop substantially with depth. A complete drilling program for the area was deemed necessary to establish the correct mining technique. However, CENTROMÍN PERÚ's severely curtailed 1983 budget necessitated a postponement of further exploration in this area.

MINERO PERÚ divided its 345-square-kilometer San Antonio de Poto gold deposit into four areas: Arequipa Pampa, Ancocala, Huachani, and Pampa Blanca. Domestic or foreign companies can participate in their development, either on a joint-venture basis or by renting the different areas under contract. Each of the four areas was large enough to be subdivided.

Independent gold panners, grouped in cooperatives, continued to work at the artisan level in parts of the San Antonio de Poto deposit. These cooperatives paid MINERO PERÚ a small royalty on their production. It has not proved to be a completely satisfactory arrangement because

declared production was small and MINERO PERÚ was unable to adequately monitor mining operations.

Aurífera Sur Oriente S.A. (AUSORSA) continued to hold 16 concessions totaling more than 15,000 hectares in the Huaypetue and Puquibe region. Because of low gold prices, the company ceased operating its pilot plant for the active Huaypetue concessions. Production amounted to 1,029 ounces, about one-half of the 1981 output. Through continued exploration, gold deposits exceeding 0.2 gram per cubic meter were located. The company began negotiations with possible investors and an agreement was expected in 1983.

Rio Tinto Finance and Exploration, a subsidiary of Rio Tinto Zinc Corp., began development work on its contracted 24,000-hectare portion of AUSORSA's concessions. Rio Tinto's exploration drilling and bulk sampling program revealed ore grades of over 0.2 gram of gold per cubic meter. Nevertheless, the company closed down the operation. A portion of the former Rio Tinto area was included in the ongoing AUSORSA negotiations with new investors.

Texasgulf Perú S.A., a subsidiary of Texasgulf Minerals and Exploration Co., began a gold exploration program on several concessions around the Madre de Dios and Inambari Rivers.

Several epithermal gold-silver deposits were identified in the southern volcanic fields of Peru. A few claims were filed for the very conspicuous hydrothermally altered zones. One prospect in particular, the Jarguarazo, was thought to be analogous to El Indio in Chile, although the whole southern area was described as characteristically similar to this type of deposit. The Jarguarazo Prospect is located near Puquio in the Department of Ayacucho. Cía. Minera Milpo S.A. and Cía. San Ignacio de Morococha S.A. (SIMSA) joined to have the area investigated by an independent consultant.

Iron Ore.—HIERRO PERÚ continued to operate at about 75% of capacity because of a continued weak market demand. Production by category for 1981-82 is shown in the following table, in thousand metric tons:

	1981	1982
Pellets	1,504	1,422
Low-silica pellets	193	60
High-grade sinter feed	3,359	2,893
Pellet feed in slurry form	202	171
Pellet feed in cake form	811	1,193
Oxide ore	--	35
Total	6,069	5,774

Beneficiated iron ore exports totaled 5.6 million tons valued at almost $108 million, indicating an 8% increase in volume and a 16% increase in value over that of 1981. The Republic of Korea purchased 36% and Japan purchased 34% of the exported iron ore. Yugoslavia was the third largest purchaser with a 19% share. The United States imported 35,284 tons from Peru, less than one-half of the 1981 volume. Other lesser purchasers of iron were the Netherlands, Austria, Czechoslovakia, and Argentina.

HIERRO PERÚ concluded several infrastructural projects including additional employee housing, reconditioning work on the San Nicolás pier, and powerplant repairs. A ground water exploration program was concluded and studies indicated that approximately 500 liters per second of underground water was available from two sources. The company was evaluating data to determine the best methods for utilization.

The feasibility study to develop 300 million tons of transitional ore for export using a gravimetric concentration method was concluded in 1982. It was expected that bids would be invited on the plant design study.

Iron and Steel.—Peru's largest steelmaker, state-owned Empresa Siderúrgica del Perú (SIDERPERÚ) announced a 2-month suspension of operations effective September 1, 1982. About 2,500 employees were to be placed on vacation status. The action resulted from depressed steel market conditions that caused the company to accumulate excess stocks. The plant remained closed during 1982, although a startup was expected in early 1983.

In view of SIDERPERÚ's worsened financial status, final approval was uncertain for the plant modernization project to increase raw steel capacity to about 520,000 tons per year. The feasibility study for the modernization was scheduled for completion in October.

A new private sector ministeelworks was under construction by Empresa Laminadora del Pacífico S.A. Located at Pisco, south of Lima, the plant planned to utilize two 40-ton electric furnaces to produce a capacity of 180,000 tons per year of steel billets. The company expected to export 40% of its output and also supply an affiliated company, Aceros Arequipa S.A., with feedstock for its bar and rod mills.

Lead and Zinc.—MINERO PERÚ's Cajamarquilla zinc refinery completed its first full year of operation. The refinery operated at an estimated $68 million loss because of high energy rates, low mineral prices, a

heavy debt burden, and higher-than-estimated treatment costs. The refinery was responsible for about 70% of MINERO PERÚ's projected total 1982 financial loss of $95 million. The refinery output was estimated at 92,265 tons of zinc despite an equipment breakdown that shut down the roaster for 10 days. The CENTROMÍN PERÚ metallurgical complex at La Oroya produced an estimated 68,489 tons of zinc bars and 76,990 tons of refined lead, slightly less lead than that of 1981.

CENTROMÍN PERÚ continued to be the largest single lead and zinc producer, contributing 40% of the country's total lead output and 43% of the zinc from its own mines. CENTROMÍN PERÚ received approval for a $19 million loan arranged by the Inter-American Development Bank to continue the expansion project at its Andaychagua Mine and develop it as an independent unit from the San Cristóbal Mine. In December 1981, the bank had approved a direct $14 million loan for this project. Primarily considered a silver mine, the associated mineral production was projected to increase to 6,000 tons of 45% lead concentrate and 28,000 tons of 55% zinc concentrate upon completion in 1985.

In the medium mining sector, Cía. Minera Atacocha S.A. was the largest lead producer. Atacocha sought investors for a planned $6.5 million, two-stage expansion of its mine and concentrator from 1,600 tons to 2,200 tons of ore per day. The project was to include increasing the power output from the Marcopampa hydroelectric plant from 350 kilowatts to 1.7 megawatts per hour. The Atacocha Mine is located in the District of Yanacancha, Paso Department, about 18 kilometers north of the town of Cerro de Pasco. Atacocha produced a record 23,685 tons of lead concentrate containing about 15,700 tons of recoverable lead, 1.1 million troy ounces of silver, and 3,000 troy ounces of gold. The 35,501 tons of zinc concentrate production contained about 18,500 tons of recoverable zinc.

The largest private zinc producer was SIMSA, with a concentrate output containing 47,300 tons of zinc and 3,300 tons of lead. SIMSA operated the San Vicente Mine in San Ramón, about 315 kilometers east of Lima. This was the only mine operating in the central jungle region. SIMSA redesigned its flotation circuit and was installing a magnesium leaching plant to increase concentrate content to 60% zinc and less than 1% magnesium oxide.

Cía. Minera del Madrigal continued the normal exploration efforts required to maintain production at its mine located about 192 kilometers north of Arequipa. The Madrigal Mine is 50% owned by Homestake Mining Co. A prefeasibility plan for a new hydroelectric plant was postponed. The company borrowed $2 million from the Banco Minero, adding to a $1.5 million debt owed to the Bank of America. The mine ore contains two troy ounces of silver per ton and accounted for about two-thirds of the company earnings.

Compañía Minera Santo Toribio S.A., a minor lead and zinc producer, planned a 1983 program to increase its flotation mill capacity from 600 to 1,500 tons per day. The $3 to $4 million project was facilitated by the company acquiring two new partners, Cía. de Minas Buenaventura S.A. and Construcciones Villasol S.A. Proven ore reserves at the company's mine, located about 21 kilometers from Huaraz in Ancash Department, were placed at 27 million tons grading 1.6% lead, 4.5% zinc, and 1.5 troy ounces of silver per ton.

Cía. Minera Santa Luisa S.A. announced it would invest over $3 million on a new cone crusher and grinding mill, development work, drilling, and geological studies at its Huanzalá Mine. The mine, located about 320 kilometers west of the town of Huanuco, was 70% owned by Mitsui Mining and Smelting Co. Ltd. of Japan. The mine produced 50,000 tons of concentrate containing about 22,600 tons of recoverable zinc, 18,000 tons of concentrate containing about 10,600 tons of recoverable lead, and a total of 1.3 million troy ounces of silver. All output was purchased by Mitsui for treatment at the Hachinohe Smelting Co. Ltd.'s refinery in Japan.

Silver.—A midyear upturn in the international price of silver enabled some mining companies to decrease their financial losses. A few companies ended the year with a net profit. The Governments of Peru and Mexico believed that their efforts to dissuade the United States from selling 100 million troy ounces of its stockpiled silver prevented market prices from plummeting much below the $5.11 per troy ounce reached on June 25.

Preliminary data indicated that Peru displaced Mexico as the largest silver producer in the world. The large mining sector accounted for about 30% of Peru's total silver production. The medium-sized mines together contributed almost 66%, and the

small mining sector contributed about 4%.

CENTROMÍN PERÚ's austerity program did not affect the $42 million expansion program at the Andaychagua Mine, designed to create a separate mining unit from the nearby San Cristóbal Mine. About $33 million in loans were obtained for this project, and the remainder was to be solicited as advance payment from purchasers. Ore throughput was to be increased from 200 to 1,000 tons per day upon completion of the new flotation plant. After expansion in mid-1985, silver production was expected to reach 1.2 million troy ounces per year contained in lead concentrate.

Buenaventura proceeded with a planned $22 million expansion program at its Uchucchacua, Julcani, and Orcopampa mines. The initial $12 million investment for the program was expected to be completed in 1983. Financing was obtained from the International Finance Corp. and commercial banks in the United States. The remainder of the expansion, not yet financed, was postponed until 1984. Buenaventura remained the largest private producer of silver in Peru, with output estimated at 6.4 million troy ounces, a 53% increase over 1981 production. It was primarily Buenaventura's increased output that enabled Peru to reach its record-high silver production in 1982.

Besides increasing average ore grade, Buenaventura initiated efficiency measures that were estimated to have reduced production costs for silver from $11 per troy ounce to about $7. The company expected to achieve an even lower unit cost in 1983. Exploration efforts, begun in 1981, enabled the company to upgrade ore mined at the Uchucchacua Mine from 11 troy ounces of silver per ton to 17 troy ounces per ton. Ore at Orcopampa was upgraded to average 13 troy ounces of silver per ton instead of 10 troy ounces.

At Minas de Arcata S.A., Peru's second largest private silver producer, silver concentrate output reached 6,985 tons in 1982 and contained about 3 million troy ounces of silver and 6,951 troy ounces of gold, a 19% increase in silver and a 28% increase in gold over that of 1981. Sales revenue from silver concentrate, however, was down 18% from that of 1981. Arcata planned to initiate a 14-month, $6 million expansion program in 1983 to increase ore capacity from 600 to 800 tons per day.

Corp. Minera Nor Perú S.A. completed the $15 million expansion of its Quiruvila copper-lead-silver-zinc mine, located in northern Peru in the Department of La Libertad. As a result, silver contained in the increased concentrate production rose to 2.1 million troy ounces, a 44% increase over that of 1981. This increase moved Nor Perú to rank third among Peru's private silver producers in 1982.

Corporación Minera Castrovirreyna S.A. planned to increase exploration efforts in 1983 because of declining ore grade. Despite a concentrator expansion to 500 tons per day, silver production declined from 1.5 million troy ounces in 1981 to about 1.3 million troy ounces in 1982. Average ore grade has fallen from 18 troy ounces of silver per ton in 1980 to 11 troy ounces per ton in 1982. The company estimated its production costs at $6 per troy ounce of silver.

Tungsten.—Production continued to edge upward, despite market prices that dipped below the producers breakeven points. Fermín Málaga Santolalla e Hijos Negociación Minera S.A. has operated the Pasto Bueno Mine for 41 years and continued to be Peru's largest tungsten producer. An expansion program was completed in 1982 and production reached 530 tons of concentrate containing 74.96% WO_3. CENTROMÍN PERÚ regained its position as second largest producer from increased output at both the Morococha unit and the Mahr Tunnel plant at the San Cristóbal unit.

There were several smaller producers that together accounted for the remainder of production. They were Compañía Minera Turmalina S.A., Piura Department; Compañía Minera San Diego S.A. at the San Judas Tadeo Mine in Juliaca Department; Compañía Minera Unión S.A. from the Mayucayan deposit in Chimbote Department; and Sociedad Minera Puquio Cocha S.A., which continued to recover tungsten concentrate from tailings accumulated at its copper flotation plant in central Peru.

Tungsten production by company was as follows, in metric tons of WO_3 content:

	1979	1980	1981	1982
Málaga Santolalla	192	296	358	397
CENTROMÍN PERÚ	403	209	130	239
Minera Regina	102	145	200	187
Others	58	50	50	45
Total	755	700	738	868

NONMETALS

Phosphate.—A feasibility study for the development of the Bayóvar phosphate deposit in the District of Sechura, south of Piura in northern Peru, was completed early in 1982. The study reportedly proved that a 30% P_2O_5 concentrate could be produced, but questioned the practical economics of a commercial operation. Nevertheless, Empresa Promotora Bayóvar S.A. (PROBAYOVAR), 60% owned by MINERO PERÚ, continued to explore the possibilities of expanding beyond the small pilot plant that has been in operation for several years.

One possible joint venture participant was Peru Phosphate Development Ltd. of New Zealand, which was organized in 1981 by Winstone Ltd. and Dalgety of New Zealand Ltd., to annually import about 100,000 tons of Peruvian phosphate rock concentrate. The Bayóvar concentrate proved particularly interesting to New Zealand because it can be applied directly to acidic soil. The company had proposed a modest $30 million project for Bayóvar that involved the construction of dock facilities and an expansion of phosphate rock concentrate production to 200,000 tons per year by 1990. However, by the end of 1982, the New Zealand company's immediate interest in the project reportedly waned because of low world market prices and a limited interest on the part of Peruvian consumers. PROBAYOVAR sold only 8,000 tons of its concentrate production, stockpiling the remaining 20,000 tons.

MINERAL FUELS

Coal.—Empresa Promotora de Carbón S.A. (PROCARBÓN) assumed responsibility for the development of the Jatunhuasi coal deposit. PROCARBÓN, jointly owned by CENTROMÍN, MINERO PERÚ, COFIDE, and Electricidad del Perú reversed their original decision to borrow $5 million from the Inter-American Development Bank for exploration studies of the Jatunhuasi and other coal deposits. Instead, it was planned to initiate two studies: an evaluation of existing reserves and a market study of projected domestic demand.

The small mining sector has maintained a particular interest in coal development projects. PROCARBÓN was established to promote the development and use of Peru's coal deposits. In 1982, the Government created a commission, chaired by the general manger of PROCARBÓN and partly composed of representatives from the small mining sector, to draft a law entitled, "Law for Substitutes and Complementaries of Petroleum Fuels." One of the main objectives of this legislation was to create conditions encouraging domestic coal consumption that could be supplied by the small mining sector.

The prospects for future development of MINERO PERÚ's Alto Chicama coal project were enhanced when a French company expressed interest in a joint venture. Additional reviews and new evaluation studies were to be undertaken.

Petroleum and Natural Gas.—A separate branch within state-owned PETROPERÚ was created to participate in joint petroleum exploration ventures. The new entity, Servicios Petroleros (SERPETRO), reportedly signed a preliminary agreement to develop Block 50 with a group headed by Hispánica de Petróleos S.A. (HISPANOIL). SERPETRO assumed a 25% interest in the venture. HISPANOIL, with a 30% interest, was seeking new partners after Pennzoil Co., with a 25% interest, and Neste Oy, with a 20% interest, dropped out. Block 50, located in the northern jungle area, abuts the western edge of Superior Oil Co.'s Block 2 concession.

In April, a contract was signed with Hamilton International Oil Co. del Perú (90%) and Petroinca S.A. of Lima (10%) for Block 7, located on the southwestern side of PETROPERÚ's Block 8. Hamilton International planned to drill early in 1983.

Superior drilled a 17,051-foot dry hole in Block 2 after an expenditure estimated at $32 million. A second wildcat was spudded in October and was expected to reach total depth in April 1983.

Belco Petroleum Corp. of Peru contracted for its third offshore area, Block Z-28. The new block encompassed 1 million acres in an irregular elongated pattern along the entire western edge of Blocks Z-1A and Z-2A. Belco completed geophysical surveys in the new acreage and expected to drill the first of two exploratory wells in 1983. Within 6 years Belco will select and relinquish one-half of the acreage in Block Z-28 back to the Government.

Peru's oil companies planned to spend about $600 million in 1983 for exploration and development. Crude oil reserves were estimated at 850 million barrels, which amounted to about 12 years production at current levels. Domestic consumption increased by an estimated 2% in 1982 and

new production capacity must be found to maintain export levels. The jungle area appeared to offer the most opportunity for increasing reserves and production since secondary recovery efforts at the Occidental-Bridas Talara project have not met expectations. Other secondary recovery projects were planned at PETROPERÚ's Zapotal-Laguna and Occidental's Los Organos projects.

During 1982, PETROPERÚ increased production at both its coastal and jungle fields. Secondary recovery from the coastal Talara Field remained at about the 1981 level. Belco's offshore fields increased production despite a platform fire that caused a slight setback. Diminished gas pressure and well rehabilitation projects decreased Occidental's total Peruvian production and lessened the overall positive impact of PETROPERÚ's gains.

---

[2]Where necessary, values have been converted from Peruvian soles (S/) to U.S. dollars at the 1982 average exchange rate of S/697.57 = US$1.00. At the beginning of January 1982, the exchange rate was S/341.17 = US$1.00, and at the end of December 1982, the exchange rate was S/989.67 = US$1.00.

The Mineral Industry of the Philippines

By John C. Wu[1]

The economy grew 2.6% in 1982 compared with 3.1% (revised) in 1981. According to the Central Bank of the Philippines, the growth in the real gross national product (GNP) was attributed mainly to the increased domestic investment by the Government on roads, bridges, and other infrastructure projects. The growth rates for the three major sectors were 3.5% for agriculture, fishery, and forestry; 2.7% for manufacturing; and 2.8% for services. The GNP in 1972 constant dollars was estimated at $12 billion.[2]

Substantially lower export earnings, further depreciation of the Philippine peso, increases in the balance-of-trade deficit, and higher external debt prevented the economy from achieving its 6% growth targeted for 1982. Export earnings were down by 12.7% as prices and volumes of major export commodities fell. The Philippine peso was depreciated by 11.8% against the U.S. dollar. The balance-of-trade deficit rose 75% to $1 billion. The external debt increased 30% to $17 billion. However, the inflation rate decreased to 10%, from 13% in 1981. The labor force in the Philippines was 17.6 million, of which 5.1% was unemployed.

Because of low metal prices and high production costs, the mining industry suffered the worst year in its history. However, the mining industry contributed 2.6% to the Philippine gross domestic product (GDP).

According to the Philippines National Economic Development Authority, the percentage contributed to the GDP at current dollars by sector for the second half of 1982 was as follows, in percent:

Agriculture, fishery, forestry	25.2
Industrial sector:	
Mining and quarrying	2.6
Manufacturing	25.1
Construction	7.7
Electricity, gas, water	1.1
Service sector:	
Transport, communications, storage	5.3
Commerce	20.9
Services	12.1
Gross domestic product, total	100.0

Despite a smaller contribution by the mining sector to the GDP, the industry remained important. The Philippine mining industry was in a state of financial crisis. As a result of depressed metal markets, soaring energy costs, and record high interest rates, the mining industry reportedly suffered the biggest loss in its history. The industry's loss was estimated to be over $300 million.

Marinduque Mining and Industrial Corp. (MMIC), a major producer of cobalt, copper, and nickel, lost about $200 million. Atlas Consolidated Mining and Development Corp., the largest copper producer, was expected to lose $41 million. Marcopper Mining Corp. and Lepanto Consolidated Mining Co. Inc., the other major copper producers, were expected to have a combined loss of $13 million. Most small miners reportedly also suffered losses. Some companies suspended operations for 5 to 6 months and other companies closed their mines entirely. Benguet Corp. and Philex Mining Corp. reportedly were the only profitable companies in 1982.

The Government, in an effort to save the mining industry from further deterioration,

provided loans to financially troubled mining companies. According to the Central Bank of the Philippines, the administrator of the state-aid programs, eight gold and silver producers reportedly applied for assistance. Under the scheme, the company was allowed to borrow funds up to 100% of the value of the company's annual gold production for a maximum of 360 days at an annual interest rate of 14%. A similar program was also provided for copper producers to borrow up to 50% of the value of the company's annual copper production.

In mid-1982, when the world market prices of copper fell below 75 cents per pound, a 6-month special subsidizing program was established by the Government. The state-owned National Development Co. (NDC), the administrator of the program, was to purchase the copper concentrates offered by the producers at 75 cents per pound during July 1 to December 31, 1982. The program was to subsidize the price difference with the world market price and to prevent the Philippine copper industry from shuttering its mining operations.

The proposed aluminum smelter project reportedly was to be dropped because of a refusal of a special low electricity rate by the National Power Corp. of the Philippines. However, the 50,000-ton-per-year-capacity ferrochromium plant at Tagoloan in Misamis Oriental was completed. The construction of a copper smelter at Isabel in Leyte was almost completed in 1982. The smelter was scheduled to be operational in May 1983 with an annual initial production of 110,000 tons of copper and 624,000 troy ounces of gold and silver mixed in doré bars. A $375 million contract was expected to be awarded to a Japanese consortium led by Marubeni Corp. for construction of a direct-iron-reduction complex in Iligan City on Mindanao Island. As part of the modernization and expansion program of the National Steel Corp. (NASCO), a $43 million contract was also expected to be awarded to Davy McKee Ltd. of the United Kingdom.

In 1982, three major cement plants successfully converted their energy source from bunker oil to coal under the cement industry rationalization program. However, the construction of the first 1-million-ton-per-year-capacity cement plant was postponed owing to the financial difficulties of the CDCP Mining Corp. Construction of a $6.7 million phosphoric acid plant was expected to start at Pasig, southeast of Manila. The phosphoric acid plant, to be built by Power Gas of India, will be the first in the Philippines and the largest in Southeast Asia. In June 1982, a $17 million loan was approved by the International Bank for Reconstruction and Development (World Bank) for coal exploration in Samar, eastern and southwestern Mindanao. The Matinloc Oilfield, the third Philippine offshore field, was inaugurated on July 21, 1982.

PRODUCTION

The Philippines mineral production continued to decline in both value and quantity in 1982. The metallic sector was hit hardest by the prolonged low metal prices and high production costs. The mineral production value dropped 12% to $1.5 billion in 1981 from that of 1980. According to the Philippines Bureau of Mines and Geo-Sciences, the value of mineral production dropped by another 12% for the first half of 1982 from that of 1981.

As a result of the depressed demand for raw materials in the world market, production of chromium, cobalt, copper, nickel, silver, and zinc declined in 1982. However, gold production increased slightly owing to the improvement in mill recovery. Production of copper and gold remained the most important industries in the Philippine mining sector. These two industries contributed over 55% of the mineral output value.

A significant improvement was reported in the Philippine mineral fuel industry. Coal production jumped 84% to 587,000 tons in 1982 from that of 1981 because of the increased coal production from the Unong deposit on Semirara Island. The output of crude oil also increased substantially owing to the inauguration of the country's third offshore oilfield, Matinloc, in July 1982.

Table 1.—Philippines: Production of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodities[2]	1978	1979	1980	1981[p]	1982[e]
MINERAL FUELS AND RELATED MATERIALS —Continued					
Petroleum and refinery products —Continued					
Refinery products —Continued					
Distillate fuel oil thousand 42-gallon barrels	14,966	16,532	17,204	16,361	NA
Residual fuel oil do	29,500	29,278	27,333	26,460	NA
Other do	2,542	3,002	3,421	3,251	NA
Refinery fuel and losses do	4,195	3,536	3,203	3,114	NA
Total do	71,826	73,209	68,802	64,176	NA

[e]Estimated. [p]Preliminary. NA Not available.

[1]Table includes data available through June 24, 1983.

[2]In addition to the commodities listed, the Philippines produces platinum-group metals as byproducts of other metals, but output is not reported quantitatively, and no basis is available to make reliable estimates of output levels.

[3]Includes "pebbles" and "soil" not further described.

[4]Excludes limestone for road construction, reported in cubic meters, which totaled 9,687 cubic meters in 1978, 2,932 cubic meters in 1979, 9,741 cubic meters in 1980, and 24,092 cubic meters in 1981; data for 1982 are not available.

[5]Includes materials described as rock, crushed or broken; stones, cobbles, and boulders; rock aggregates; and broken adobe.

TRADE

The merchandise trade balance showed another record deficit in 1982. A substantial drop in export earnings owing to poor world prices of coconut, sugar, copper, and other traditional export commodities resulted in a 12.7% decrease in export earnings. However, imports also fell 1.8% because of a 19% drop in oil imports as a result of a 3.4% drop in import volume and lower world prices of oil.

Philippine merchandise trade during 1980-82 was as follows, in millions of dollars:

	1980	1981	1982
Exports	5,789	5,722	4,995
Imports	7,726	7,946	7,800
Trade balance	-1,937	-2,224	-2,805

According to the Philippines Bureau of Mines and Geo-Sciences, mineral exports in 1981 were valued at $910.6 million compared with $1,155.8 million in 1980. The main buyers of the Philippine minerals were Japan, 60.5%; the United States, 14.7%; the Republic of Korea, 8.7%; Taiwan, 6.2%; and other, 9.9%. The principal purchasers of copper concentrates were Japan, 67%; the Republic of Korea, 13%; Taiwan, 7%; the United States, 7%; and other, 6%.

Oil and petroleum-related products accounted for about 27% of the imports in 1982 compared with 30% in 1981. Imports of machinery, transport equipment, and base metals remained the other major imports in 1982.

In 1982, the United States and Japan continued to be the major trade partners of the Philippines. The Philippine trade with the European Economic Community (EEC) suffered a major setback as a result of growing protectionism by some members of EEC.

Table 2.—Philippines: Exports and reexports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS				
Aluminum: Metal including alloys:				
Scrap	--	2	--	All to Hong Kong.
Unwrought	r588	10	--	Do.
Semimanufactures	2,925	2,879	--	Indonesia 1,859; Hong Kong 752; Singapore 193.
Chromium: Ore and concentrate	484,109	397,382	104,459	Japan 134,393; Sweden 52,551; China 48,605.
Copper:				
Ore and concentrate thousand tons	1,149	1,130	72	Japan 771; Republic of Korea 146; China 30.
Matte and speiss including cement copper	6,703	9	--	All to United Kingdom.
Metal including alloys:				
Scrap	1,730	1,207	--	Japan 457; India 211.
Unwrought	--	1	--	All to Japan.
Semimanufactures	60	34	--	Do.
Iron and steel:				
Iron ore and concentrate:				
Excluding roasted pyrite	4,264	--		
Pyrite, roasted	59,535	35,408	--	Hong Kong 5,415.
Metal:				
Scrap	2,170	1,411	--	Japan 427.
Pig iron, cast iron, related materials	26	--		
Ferroalloys	18,001	31,268	2,117	Japan 26,430; Indonesia 1,500.
Steel, primary forms	--	15,250	--	Japan 10,250.
Semimanufactures:				
Bars, rods, angles, shapes, sections	1,286	1,399	--	Singapore 934; Malaysia 384; Australia 65.
Universals, plates, sheets	120,162	5,143	--	NA.
Hoop and strip	9	1	--	Mainly to Australia.
Tubes, pipes, fittings	1,800	2,145	--	Australia 2,067.
Castings and forgings, rough	851	1,318	493	Australia 700; Japan 96.
Lead:				
Ore and concentrate	3,232	1,801	--	All to Japan.
Metal including alloys, all forms	894	4	--	All to Papua New Guinea.
Manganese: Ore and concentrate	1,000	2,800	--	All to Japan.
Nickel:				
Ore and concentrate	608,824	557,583	--	Do.
Metal including alloys:				
Scrap	125	22	--	Do.
Unwrought	18,823	15,469	8,008	Netherlands 3,950; Japan 2,562; Republic of Korea 800.
Semimanufactures	4,135	2,660	2,000	Netherlands 660.
Silver:				
Ore and concentrate[1] value, thousands	$239,149	$215,183	$36,009	Japan $137,672; Republic of Korea $14,750.
Waste and sweepings troy ounces	--	3,762	--	All to United Kingdom.
Metal including alloys, unwrought and partly wrought value, thousands	$76	$40	--	All to Hong Kong.
Tin: Metal including alloys:				
Scrap	r37	27	10	Japan 10; Singapore 4.
Semimanufactures	--	225	--	All to Kenya.
Zinc:				
Ore and concentrate	14,859	11,873	--	All to Japan.
Metal including alloys:				
Scrap	184	370	--	Japan 310.
Semimanufactures	100	45	--	Japan 35.
Other:				
Ores and concentrates	180	1,247	62	Japan 1,108; Chile 62.
Ashes and residues	r1,817	2,876	--	Japan 2,435; Singapore 35.
Base metals including alloys, all forms	r357	693	60	Japan 385; Hong Kong 159.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	--	11	--	All to Hong Kong.
Grinding and polishing wheels and stones value, thousands	$10	$35	--	All to Singapore.
Cement	767,170	492,734	--	Indonesia 128,640; India 123,305; Hong Kong 103,875.
Clays and clay products:				
Crude, unspecified	241	267	--	All to Singapore.

See footnotes at end of table.

NONMETALS —Continued				
Clays and clay products —Continued				
Products:				
Nonrefractory value, thousands	$8,422	$6,266	$528	Singapore $2,272; Hong Kong $1,838; Malaysia $456.
Refractory including nonclay brick ——do——	$203	$710	$1	Indonesia $289; Japan $221; Singapore $72.
Fertilizer materials: Manufactured:				
Ammonia	2	2	--	All to Hong Kong.
Nitrogenous	550	100	--	Hong Kong 50; Malaysia 50.
Unspecified and mixed	1,000	5	--	All to Saudi Arabia.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	1	--		
Sodium hydroxide	--	3	3	
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	319	2,182	17	Japan 1,191; Malaysia 75.
Worked	3,799	3,934	999	Hong Kong 1,494; Japan 709.
Dolomite, chiefly refractory-grade	--	29,467	--	All to Japan.
Gravel and crushed rock	2,936	7,877	--	Japan 4,655; Guam 2,705; Hong Kong 408.
Limestone other than dimension	120,595	24,100	--	All to Australia.
Sand other than metal-bearing	1,539	1,757	236	Hong Kong 605; Japan 512; United Kingdom 136.
Sulfur: Sulfuric acid	54	50	--	All to Guam.
Other:				
Crude	3,791	1,586	--	Singapore 459; India 67; Australia 36.
Slag and dross, not metal-bearing	153	1,198	--	Japan 1,018.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	784	49	11	Hong Kong 38.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	--	6,000	--	All to Guam.
Carbon: Carbon black	756	774	--	Sri Lanka 360; India 248; Thailand 72.
Coal: Anthracite and bituminous	--	6,800	--	Japan 1,800.
Petroleum refinery products:				
Liquefied petroleum gas 42-gallon barrels	46,539	350,796	--	Thailand 140,998; Bahamas 93,090; Hong Kong 50,889.
Gasoline, motor ——do——	716,448	785,324	--	Australia 381,998; Japan 216,334; Bermuda 186,992.
Distillate fuel oil ——do——	7,162	--		
Lubricants ——do——	12,229	29,722	--	Tanzania 14,189; Republic of Korea 5,614; Singapore 2,842.
Residual fuel oil ——do——	26,360	--		
Bitumen and other residues ——do——	24	--		
Tars and other crude chemicals derived from coal, gas, and petroleum	--	4	--	All to Nigeria.

[r] Revised. NA Not available.

[1] May include some platinum-group ore and concentrate.

COMMODITY REVIEW

METALS

Chromium.—Mine production of refractory and metallurgical chromite ore continued to decline. As a result of rising costs of electric power and weakening demand for the chromite by Japan and the United States, the output of refractory chromite dropped 23% to 107,434 tons for the first 6 months in 1982 from that of the same period in 1981. The output of metallurgical chromite ore and concentrate also dropped 22% to 67,358 tons for the first 6 months in 1982 from that of the same period in 1981.

Consolidated Mines Inc. (CMI) remained the dominant producer of refractory chromite ore, accounting for 87% of the output; followed by Philchrome Mining Corp., 11%; and Purdue Mining Co., 2%. Metallurgical chromite ore and concentrate was produced by Acoje Mining Co. Inc., accounting for 88% of the output followed by Malayan Wood Products Corp., 7%; and Velore Mining Corp., 5%.[3]

Trident Mining and Industrial Corp., the second largest producer of metallurgical chromite ore and concentrate in 1981, suspended mining and milling operations at Narra in Palawan. Despite the completion of its expansion program in February 1981, Trident Mining was not able to resume operations in 1982 because of financial difficulties.

Exports of chromite ore were 125,530 tons for the first 9 months in 1982 compared with about 220,000 tons for the same period in 1981. About 30% of chromite ore was exported to the United States, 26% to Japan, 19% to Sweden, and 25% to other destinations. Exports of metallurgical chromium concentrates were 64,223 tons for the first 9 months in 1982 compared with 77,000 tons for the same period in 1981. About 65% of the chromium concentrates was shipped to Japan and 35% to China.[4]

In April 1982, a low-silica chromite ore body was discovered by Benguet Corp., operator of the Masinloc Mine, which is owned by CMI. The new ore body is located near the Coto open pit in Masinloc, Zambales. According to company officials, the reserves of the low-silica chromite ore will be able to support an additional 10 years of mining in Masinloc.

Island Mining and Industrial Corp. was expected to start developing its metallurgical chromite deposit at Bicobian in northwestern Luzon in late 1982. The project was estimated to cost $230 million. According to plans, annual production will be 2 million tons, with a plant capacity of 150 tons per hour of ore. The plant was scheduled to come onstream in 1984. The reserves are estimated to be 48 to 50 million tons, averaging 48% Cr_2O_3.

The $32 million ferrochrome plant at the Phividec Industrial Estate of Tagoloan in Misamis Oriental Province on Mindanao Island was completed in 1982. Ferrochrome Philippines Inc., the owner and operator of the plant, is a joint venture of the Herdis Group Co. of the Philippines and Voest

Alpine AG of Austria. The plant has an annual capacity of 50,000 tons of ferrochrome and was expected to start operations in 1983.

Ferro-Chemicals Inc., the owner and operator of the country's first ferrochrome plant with an annual capacity of 12,000 tons, operated at full capacity. The plant is located in Manticao, Misamis Oriental Province on Mindanao Island, and has been in operation since 1976. Acoje Mining is the leading supplier of chromium concentrates for both Ferro-Chemicals and Ferrochrome Philippines.

Copper.—The Philippine copper industry suffered the worst year in its history in 1982. As a result of the prolonged low metal prices in the slumped world market and higher production costs, almost every primary copper producer posted a net loss from their copper operations. All of the top 10 primary producers cut their output in 1982 except MMIC and Lepanto. The substantial increase in copper production by MMIC was primarily due to the completion of its expansion program and the commissioning of a new generator, which allowed a higher mill throughput at its Sipalay Mine in Negros Occidental. However, Philippine copper production was down 6.5% for the first 10 months in 1982 from that of the same period in 1981.

According to the Chamber of Mines of the Philippines, production of copper by the top 10 primary producers during 1981-82 was as follows, in thousand tons of copper metal:

Company	1981	10 months	
		1981	1982
Atlas Consolidated Mining and Development Corp	139.0	116.6	110.4
Marcopper Mining Corp	36.3	31.2	30.4
Benguet Corp	28.1	23.4	21.1
Marinduque Mining and Industrial Corp	26.6	21.6	32.0
Philex Mining Corp	22.7	18.9	19.0
Lepanto Consolidated Mining Co. Inc	15.3	12.8	14.5
CDCP Mining Corp	12.2	9.8	6.0
Western Minolco Corp	9.8	8.5	.6
Baguio Gold Mining Co. Inc	5.1	4.4	--
Acoje Mining Co. Inc	2.6	2.2	--
Other primary and secondary producers	3.0	3.5	2.5
Total	300.7	252.9	236.5

Baguio Gold Mining Co. Inc. and Acoje Mining shut down their Santo Niño Mine in Tublay, Benguet, and Mabini Mine in Pangasinan, respectively, after suffering a series of heavy losses. For the same reason, Western Minolco Corp. shut down its Boneng copper operation at Atok in Benguet in March 1982, and CDCP Mining temporarily suspended its open pit operation at Basay, Negros Oriental, in April and July 1982.

Other primary copper producers that operated in 1982 were Hercules Minerals and Oil Inc. at Bully Bueno Mine in Marcos, Ilocos Norte, and Black Mountain Inc. at Kennon Mine in Benguet. Benguet Exploration Inc. was the only secondary copper producer that operated in 1982. The other secondary copper producer, Zambales Base Metals Inc., suspended operations indefinitely because of high production costs and low copper prices.

The copper mining industry, which had financial problems in 1981, had more serious difficulties in 1982 when the world copper price continued its downward trend early in the year. In an effort to assist the industry, the Government established a copper stabilization fund in May 1982 with initial capital of $24.5 million to help the distressed copper mining companies. However, the situation became more serious when the world market price of copper dropped further to about 60 cents per pound in late June 1982. Because of the importance of the copper industry to the Philippine economy (in terms of employment and export earnings), an executive order was issued by the President on July 3, 1982, for the state-owned NDC to rescue the copper producers.

According to the order, NDC was to purchase all copper concentrates produced by the industry from July 1 to December 31, 1982, at 75 cents per pound. If the world price fell below 75 cents per pound, the Government was to absorb the difference as a subsidy. All income above 75 cents per pound was to go to the Government.

Several financially troubled copper mining companies reportedly have taken the Government's offer. The two highest cost copper producers, Atlas Consolidated and Marcopper Mining, reportedly sold their copper to NDC during the second half of 1982.[5] The Government reportedly has appealed to Japan for a $120 million concession loan to help finance the copper subsidy program.[6] Despite this Government aid, Atlas Consolidated, the largest copper producer, was expected to lose about $41 million in 1982. Marcopper Mining and Lepanto, the other major copper producers, were expected to have combined losses of $13 million in 1982.

Because of the bleak future facing the copper industry, the Government tentative-

ly suspended development of the $75 million Hinobaan copper project in Negros Occidental in 1982. The project, originally scheduled to come onstream by 1984, was to have an initial mining capacity of 14,000 tons of ore per day. The project was also to supply about 1,200 tons of pyrite per day to the sulfuric acid plant of the Philippines Phosphate Fertilizer Corp. at Isabel City on Leyte Island. The Hinobaan project is a joint venture between NDC and Lepanto.

Construction work on the $250 million copper smelter at Isabel in southern Leyte was almost completed in 1982. The Philippines Associated Smelting and Refining Corp. (PASAR) planned to commence production in April or May 1983. The output is expected to be 110,000 tons in 1983. The 138,000-ton-per-year full capacity operation was planned for 1984. The smelter also was expected to produce 624,000 troy ounces of gold and silver mixed in doré bars in 1983 and 195,000 troy ounces of gold and 849,000 troy ounces of silver in doré bars in 1984.

The Japanese consortium of Marubeni, Sumitomo Corp., and C. Itoh & Co. Ltd. will distribute 105,000 tons per year of the smelter's output in the world market, except for Japan, in return for its $32 million equity investment in PASAR. The PASAR is 34.3% owned by NDC, 32% by the Japanese consortium, 5% by the International Finance Corp. (a subsidiary of the World Bank), and 28.7% by nine local copper producers. However, Western Minolco ($1.02 million), Black Mountain ($0.29 million), and Sabena Mining Corp. ($2.17 million) reportedly failed to subscribe for their share because of financial problems. Their shares were taken by NDC in late 1982.[7]

Gold.—Gold production increased slightly even though small gold mines and byproduct producers either cut back or shut down their operations. Higher mill recovery of gold from Dizon's Kaine concentrator of Benguet Corp. in Zambales and the Carmen and Biga concentrators of Atlas Consolidated in Toledo City, Cebu, contributed mostly to the increase in Philippine gold production in 1982.

Productivity improvements were also reported by Apex Exploration and Mining Co. Inc. at Apex-Masara Mine in Masara, Maco, Davao del Norte; by Lepanto at La Suerte Mine in Paracale, Camarines Norte; and by North Davao Mining Corp. at Hijo Gold Mine in Mabini, Davao del Norte, in 1982.

According to the Chamber of Mines of the Philippines, gold production of the top 10 companies during 1981-82 was as follows, in thousand troy ounces:

Company	1981	10 months	
		1981	1982
Benguet Corp. (primary and byproduct)	206.4	170.2	185.3
Atlas Consolidated Mining and Development Corp. (primary and byproduct)	194.0	161.6	162.5
Philex Mining Corp. (byproduct)	122.9	102.1	104.9
Lepanto Consolidated Mining Co. Inc. (byproduct)	61.4	52.3	65.2
Apex Exploration and Mining Co. Inc. (primary)	39.0	32.2	39.9
Marcopper Mining Corp. (byproduct)	30.1	26.2	29.1
Western Minolco Corp. (byproduct)	18.5	15.7	--
North Davao Mining Corp. (primary)	14.8	12.3	13.9
Vulcan Industrial and Mining Corp. (primary)	13.1	10.7	4.6
Benguet Exploration Inc. (primary)	12.0	10.0	11.8
Other (primary and byproduct)	40.3	31.4	27.8
Total	752.5	624.7	645.0

Other gold producers in 1982 were Itogon-Suyoc Mines Inc. (primary), Manila Mining Corp. (primary), and MMIC (byproduct). CDCP Mining (byproduct) and Black Mountain (byproduct) suspended operations for a few months while Western Minolco, Baguio Gold, and Sabena Mining (all byproduct) shut down mines in 1982.

The Batong Buhay Gold Mines Inc. copper-gold mine in Kalinga-Apayao of northern Luzon postponed commercial operations owing to an inadequate power supply. The transmission lines were expected to be installed by National Power to the minesite before the end of 1982. The project is owned by Batong Buhay but was to be operated by Philex under a management contract signed in 1980. The mine development cost was estimated to be $200 to $245 million, which made it one of the most expensive mining projects in the Philippines.

Iron and Steel.—Iron ore was produced by San Pio Quinto Mining Corp. and Construction Aggregate Producers Co. San Pio Quinto produced 5,746 tons of lump ore in Bulacan in 1981 and 4,785 tons for the first 6 months of 1982. Construction Aggregate Producers, which started mining magnetite sand in 1981, produced only 88 tons for 1981 and 50 tons for the first 6 months of 1982. According to the Philippines Bureau of Mines and Geo-Sciences, no exports of iron ore or concentrates were made during the past several years.

The Philippines Sinter Corp., a wholly owned subsidiary of Japan's Kawasaki Steel Corp., operated an iron sintering plant at the Phividec Industrial Estate in Misamis

Oriental, Mindanao. The complex, the largest of its kind in Southeast Asia, has a 5-million-ton-per-year-capacity sinter plant, a port, and an ore yard. The plant was commissioned in 1977 with an initial output of 3.7 million tons and was operating at near capacity during 1981-82. Exports of fluxed sinter (iron ore agglomerates) to Japan amounted to 3.6 to 4.2 million tons per year in 1981-82. About 4.6 million tons of required fine ore was imported mainly from Australia, Brazil, and Canada while about 350,000 tons of coke breeze was imported from Japan each year. However, about 480,000 tons of limestone per year was supplied by the company-owned quarry at Garcia-Hernandez on Bohol Island, about 150 kilometers by sea from the sinter plant.[8]

NASCO was expected to sign a $375 million contract with a Japanese consortium of Marubeni, Kawasaki Heavy Industries Ltd., Kobe Steel Ltd., and Ube Industries Ltd. in early 1983. The contract calls for the consortium to construct a direct-reduction plant, a pelletizing plant, and a limestone calcination kiln for a 1.4-million-ton-per-year steel mill in Iligan City of northern Mindanao. Six 230,000-ton-per-year direct-reduction furnaces reportedly will be provided by Kawasaki, an iron ore pelletizing plant by Kobe, and a sintering plant by Ube with a Japanese trade credit.

As part of NASCO's expansion program, $43 million worth of steelmaking equipment including electric arc furnaces and a continuous casting system was to be supplied by Davy McKee of Great Britain with British Government aid.[9]

Nickel.—Nickel production continued to decline in 1982 because of low nickel prices on the world metal market. MMIC's nickel metal production dropped drastically to 10,000 tons for the first 10 months of 1982 from about 20,000 tons for the same period of 1981. The nickel refinery on Nonoc Island, Surigao del Norte, which has a rated annual capacity of 34,000 tons, was operating at only 35% capacity in 1982 compared with 71% in 1981.

The nickel ore output of Rio Tuba Nickel Mining Corp. at Bataraza in southern Palawan Island, increased slightly to 307,200 tons of ore for the first 10 months of 1982 from 297,310 tons for the same period in 1981. The development cost of this mine, which started production in 1977, was estimated to be $28 million. It was financed by a Japanese consortium, which owned 40% of the company. The consortium, led by Pacific Metals Co. Ltd., is one of the major consumers of the nickel ore. Ore reserves of the Guitalunga deposit at Bataraza, Palawan, were estimated at 14.7 million tons averaging 2.3% nickel.

As a result of high production costs and the prolonged low metal prices of cobalt, copper, and nickel, MMIC, a major producer of these metals, was expected to lose about $200 million in 1982 compared with a loss of $113.8 million in 1981 and $36.5 million in 1980. According to the company's annual report for 1981, the interest charges alone amounted to 82% of the net loss for the year. The latest reports by the company indicated that the interest and other financial charges on the loan for the Nonoc refinery would amount to $164.7 million or about 82.4% of the net loss for 1982.[10]

NONMETALS

Cement.—In an effort to cut the energy cost of cement production, 17 cement plants were shifting from bunker oil to coal during 1981-82. Apo Cement Corp. in Naga City, Cebu; Bacnotan Consolidated Industrials Inc. in Bacnotan, La Union; and Pacific Cement Co. Inc. in Surigao, Surigao del Norte, have completed their conversions. Thirteen other cement plants were either converting or were to convert their fuel to coal in the next 3 years.

The first 1-million-ton-per-year-capacity cement plant, approved by the Philippines Board of Investments earlier in 1980, never got off the ground owing to the financial difficulties of CDCP Mining in 1981-82. The $100 million cement plant, to be built at Basay in Negros Oriental, was a joint venture between Philipp Bros. of the United States and CDCP Mining of the Philippines.

In August 1982, the Philippine Government reportedly decided to build another 1-million-ton-per-year-capacity cement plant in Semirara Island with financing from the U.S.S.R. This plant was proposed to be a joint venture between the state-owned NDC and the Government of the U.S.S.R. under a counter trade arrangement. However, the Philippine Government reportedly was seeking 100% financing by the U.S.S.R. Under the plan, the U.S.S.R. was to develop a coal mine in the Himalian area on Semirara Island and build a coal-fired, dry-process cement plant, port facilities, and a cement bag factory. In September, the U.S.S.R. reportedly was conducting a feasibility study on the cement plant.[11]

Fertilizer Materials.—In 1982, Polyphosphates Inc., a joint-venture company of Chemical Industries Corp. of the Philip-

pines and Albright & Wilson Ltd. of the United Kingdom, was established for construction of a $6.7 million phosphoric acid plant at Pasig, Rizal. Construction of the plant, with a capacity of 50,000 tons per year, was expected to begin in November 1982 and to be completed in September 1983. The plant was to be built by Power Gas of India, an affiliate of Davy McKee of the United Kingdom. Under the plan, 85% of the output was to be used as feedstock for manufacturing sodium tripolyphosphate. The phosphoric acid plant will be the first in the Philippines and the third and largest in Southeast Asia.[12]

MINERAL FUELS

Coal.—Because of the continuing drive for self-reliance in energy, the Philippine coal production continued its steep upward trend in 1982. Although coal output jumped 84% to 587,000 tons in 1982, it was 50% of capacity and 40% below the Government's target. There were about 25 coal mines operating mainly in the Cebu, Zamboanga del Sur, Semirara, and Polillo areas.

In mid-1982, Semirara Coal Corp., a subsidiary of Vulcan Industrial and Mining Corp., reportedly started its large-scale mine in the Caluya area on Semirara Island. The daily output capacity from the area's Unong deposit was estimated at 1,000 tons. According to the Government's latest estimate, coal reserves for the two coal deposits on Semirara Island were 75.8 million tons in the Panian area and 32.6 million tons in the Unong area. The combined coal reserves of these two areas represent 46% of the 233 million tons of proven reserves in the Philippines at the end of 1981.[13]

In June, a $17 million long-term loan was approved by the World Bank to finance the Government's $25 million coal exploration projects in Samar, eastern Mindanao, and southwestern Mindanao. The other $8 million will be financed by the Government and the Philippines National Oil Co. The exploration projects will be implemented by the Philippines National Oil Co.-Coal Corp. The World Bank loan was to support the expansion of the Philippine domestic coal supply within the shortest time through private sector development of promising coalfields.

Petroleum and Natural Gas.—The Philippines third offshore oilfield, Matinloc Oilfield, was inaugurated on July 21, 1982. Initial production was 13,000 barrels per day. However, according to industry sources, crude oil production at the Matinloc and Nido Oilfields was temporarily halted during August because of damages in production equipment caused by stormy weather and rough seas.

Philippine crude oil production from the three offshore oilfields totaled 21,000 barrels per day in the third quarter. By yearend, the crude output declined to 16,000 barrels per day, of which 2,000 barrels per day was from Nido Oilfield, 5,000 barrels per day from Cadlao Oilfield, and 9,000 barrels per day from Matinloc Oilfield. The decline was due to technical problems and water intrusion in the three producing oilfields.

A slowdown in oil exploration was reported as the budget dropped to $116 million in 1982 from $151 million in 1981. There were 17 wells scheduled for drilling by the Philippines Bureau of Energy Development for 1982 compared with an average of 30 per year in recent years. According to industry sources, the current oil glut, tight company budgets, and the limited success of exploration in the Philippines were the main reasons for the slowdown.[14]

The Mineral Industry of Poland

By Tatiana Karpinsky[1]

The recession in Poland ended in the first part of 1982, and since August, overall industrial production started to grow, especially in coal and copper mining. However, in 1982, national income decreased 8% and gross industrial production decreased by 2% compared with those of 1981. National income dropped more than 25% from 1979 to 1982. The slower decline in industrial output in 1982 was mainly due to an 11% increase in output in the mining sector. Hard coal production, which was placed under military control, increased 16% to over 189 million tons, owing to the introduction of a 6-day week and additional shifts. Reduced imports of raw materials and semimanufactured products resulted in the utilization of only 60% to 70% capacity in the manufacturing industries. Output declined significantly in the steel industry; however, output of nonferrous metals increased.

The country accounted for approximately 7% of world coal output, 4% of lignite production, 4% of copper, 2.2% of steel, and 8% of sulfur. The electrical and manufacturing industries contributed 23% to Poland's total industrial output. The fuel industry contributed 15%, an increase from 9% in 1981; the metallurgical industry, 8% (down from 9%); the chemical industry, 8%; and the mineral industry, 3.7%.

Poland's net debt to the West was about $25 billion,[2] approximately 45% of which was owed to commercial creditors, with the remainder owed to Western governments. In November, an agreement was reached with Western banks on restructuring that portion of the debt maturing in 1982, which was not backed by government guarantees. Of the total debt of $2.4 billion, 95% was payable over 7 years with a 4-year grace period. The remaining 5% was to be paid in two installments in 1983. Interest arrears totaling $1.1 billion were to be paid in three parts with the last part paid by March 20, 1983.

Principal events related to the mineral industry included the beginning of bituminous coal exploitation at the Bogdanka Mine in the Lublin coal basin and opening of new production levels at the Piast and Suszec Mines. Production also started in new lignite mines at Belchatow and at the Konin-Lubstow opencast mine. Three blocks were added to the power grid, two of 200 megawatts each at the Polaniec powerplant and one of 360 megawatts at the Belchatow plant. Among other projects put into operation was a 197,000-ton-per-year caustic soda lye plant at the nitrogen works at Wloclawek. Modernization of the Beirut plate mill and the Lenon cold mill was completed.

Government Policies and Programs.—Soon after the imposition of martial law in December 1981, which continued through 1982, state officials announced that the program of economic reforms prepared by the Government over the previous 12 to 18 months would be implemented on schedule. The economic reform was accordingly introduced on January 1, 1982. A number of regulations affecting changes in the economic planning and management system had been enacted in the last quarter of 1981, and a number of others were introduced in the first half of 1982. New Year's Day, 1982, was chosen as the official date for introducing economic reforms as a way of demonstrating decisiveness and of making a symbolic break with the past. The Government attached great significance to the economic reforms and planned to implement rapidly reforms that would result in a comprehensive change in the system of economic

planning and management. The main goal of the reform was to make the enterprises self-financing and to give the workers self-government. The 1983 National Annual Plan was ratified by the Council of Ministers on November 26, 1982. The major economic goal was to restore stability to the economy. Further adjustments were planned in industry with the aim of securing a modest recovery. To reduce dependence on imports, emphasis was placed on increasing domestic production and conserving raw materials, semimanufactured goods, and spare parts. The plan envisaged more rapid development of the infrastructure and gave priority to the development of rail and road transportation. In 1983, industrial production was planned to increase 4% and national income about 2.5% compared with those of 1982.

Table 1.—Poland: Planned mineral and energy production for 1983

(Million metric tons unless otherwise specified)

Commodity	1983	As percentage of 1982 production
Bituminous coal	186.0	98.3
Lignite	42.9	112.9
Coke	17.6	101.7
Petroleum products	13.5	102.3
Steel rolled products	11.4	110.1
Copper, thousand tons	350.0	100.5
Cement	17.2	106.8
Electric energy, billion kilowatt-hours	120.5	102.5

PRODUCTION

Coal and lignite production rose considerably compared with those of 1981.[3] Increases were also recorded in the production of electrolytic copper, lime, nitrogen compounds, phosphates, sulfur, and cement. However, production decreased for steel, coke, gas, oil refinery products, zinc, and aluminum. Electric energy production increased by 2.2% and reached 117.6 billion kilowatt-hours. The production of raw steel decreased. In 1982, 4.5 million persons were employed in industry, which was 243,000 less than in 1981. The number of workers and employees in state mineral and energy enterprises by branch for 1982 is given in table 2.[4]

Table 2.—Poland: Industrial workers and employees in 1982

Branch	Workers and employees (thousands)	Percent of total employment in all industry
Coal	435	9.7
Other fuel	51	1.1
Power	53	2.0
Ferrous metals	169	3.8
Nonferrous metals	65	1.5
Building materials	168	3.8

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through July 1, 1983.

[2]In addition to the commodities listed, antimony, cobalt, germanium, gold, a variety of crude nonmetallic construction materials, and carbon black are also produced, but available information is inadequate to make reliable estimates of output levels. Poland may also produce alumina in small quantities, but details of such an operation, if it exists, are not available.

[3]Reported figure.

[4]Includes building gypsum, as well as an estimate for gypsum used in production of cement.

[5]Total of listed commodities only; excludes products not reported individually as well as refinery fuel and losses.

TRADE

In 1982, despite a stagnation in exports to the West, a trade surplus was achieved for the first time in 13 years. Exports to centrally planned economy countries were increased 24%, and imports from developed market economy countries were reduced by 26%, which was the same amount as in 1981. Purchases from the developing countries decreased by 34%. Raw materials, semimanufactured products, and spare parts accounted for 78% of total imports in 1982. The composition of exports also changed, with the share of fuels and energy rising in 1982. Sales of bituminous coal rose by 88% to 28.5 million tons.

COMMODITY REVIEW

METALS

Aluminum.—Production of aluminum was stabilized in the 1970's at an annual level of 100,000 tons. The decline to 66,000 tons in 1981 was due to a decrease in production capacities owing to the shutdown of the metallurgical plant in Konin, which was inadequately supplied with imported alumina and energy. In 1982, aluminum production further declined; demand in the country was 180,000 tons and was met by importing alumina and aluminum mainly from market economy countries and the U.S.S.R.

Copper.—Miners and metallurgy workers from the Lubin copper basin fulfilled the 1982 plan. The output of electrolytic copper was similar to the level achieved in 1980. The copper industry again attained stability. Copper ore was extracted from the Lubin, Polkawice, and Rudna underground mines, with a small amount from the Sieroszowice Mine, which was under development, and from two small, old mines.

Electrolytic copper was an important export item and, as a source of currency, was second to coal among mineral exports. Exports of copper reached 184,000 tons and were more than 10% higher than in 1981. The value of copper exported reached $250 million, and the value of silver obtained as a byproduct in copper production was $100 million. Most of the exported copper was delivered within the framework of long-term contracts; about 60% of copper exports were directed to the Federal Republic of Germany, and the rest, to Belgium, the United Kingdom, Italy, and Switzerland. Polish exports of copper semimanufactures reached about 40,000 tons in 1982, and about 75% of these exports was directed to centrally planned economy countries, and 25%, to developed market economy countries.

Iron and Steel.—Poland faced a further decline in steel output. The main reason for the decline was lack of foreign exchange needed to buy imported raw materials. The U.S.S.R. supplied Poland with iron ore, manganese, chrome, pig iron, and ferroalloys. Construction of a coke oven battery at Kotawice went ahead, along with expansion of the rolling mill. Domestic iron ore production was insignificant. Only one small mine was in operation, producing 38,000 tons per year of siderite ore. Imports of crude iron ore and concentrate totaled 13.5 million tons and were less by 2.4 million tons than that of 1981.

Lead and Zinc.—Lead-zinc ore was extracted in seven underground mines. In 1981, 9,300 persons were employed in this sector of industry. Deposits of zinc and lead ore display a nest-like structure with varying degrees of fragmentation and with variations on the type of ore (oxide and sulfide). Proven reserves of these ores amounted to several hundred million tons, of which approximately 46% was found in active mining areas. Most of the reserve deposits were concentrated in newly discovered deposits in the Zawiercie region. Documented reserves could ensure extraction for about 40 years at the 1982 annual extraction rate of 5 million tons of lead-zinc ore. The main problem in lead-zinc mining was improving ways to exploit reserves located in safety pillars, adapting machinery and equipment to mine deposits less than 2 meters thick, and introducing technologies for better recovery of silver, cadmium, and thalium in the ore.

Other Minerals.—A team from Wroclow Technical University discovered concentrates of ilmenite, zircon, monazite, and garnets in the sand of the Odra and Slupsk riverbanks.

NONMETALS

Fertilizer Materials.—The Government made a decision to continue construction of the Police 2 chemical combine near Szezecin. Construction started at sulfuric and phosphoric acid plants. The sulfuric acid plant, with a projected capacity of 500,000 tons per year, was scheduled to be completed in April 1985, and the phosphoric acid plant, with a capacity of 143,000 tons per year, was scheduled to be completed in November 1985.

Poland produced less nitrogen fertilizers than it consumed. In 1982, exports of nitrogenous fertilizers in terms of nutrient content fell to 5,000 tons from 105,000 tons in 1981 and 365,000 tons in 1979. Imports increased from 55,000 tons in 1981 to 73,000 tons in 1982. Consumption tended to stagnate in recent years at about 1.3 million tons. The chemical plant at Police, founded in 1969, manufactured 800,000 tons of compound fertilizers, and the plan for 1983 called for producing 860,000 tons. Poland produced only 15% of the ammonia needed for fertilizer production, and the remainder was supplied by the Soviet Union. One ton of domestically produced ammonia cost Z18,000, but 1 ton of imported ammonia from the Soviet Union cost only Z11,500.

Kaolin.—The main kaolin deposits were located in the Boleslawski region in the vicinity of Nowogrodzice, where one opencast mine, Maria, with a capacity of 200,000 tons per year, was in operation. The country had only one kaolin processing plant, Surmin, with a capacity of about 45,000 tons per year, located near the mine. Output of enriched kaolin was 20% of the total mined. The types of kaolin produced at the plant were ceramic—used in the production of medium-quality china; paper—kaolin bleached chemically to an 80% degree whiteness; paper—for coating; ground—used in the rubber industry and in the production of glass fibers; and kaolin used in the production of refractory materials. Kaolin consumption of about 350,000 tons greatly surpassed production. About 30% of all kaolin came from the developed market economy countries. Poland's total reserves of kaolin are estimated at 180 million tons.

Salt.—Development of the Moszczemie Mine continued, with a projected capacity of 2 million tons of salt per year. The mine is located near Bochnia in the Tarnov Province, and production was scheduled to start in 1986.

Sulfur.—In 1982, production of sulfur increased compared with that of 1981 but did not reach the 1980 level of 5.1 million tons. Production was concentrated in the Tarnobrzeg region. Sulfur was surface mined at the Machov-Piaseczno Mine with an annual output of 0.3 to 0.4 million tons, and the ore was beneficiated at the nearby Tarnobrzeg complex. The Frasch process was used at the Grzybow and Jezierko Mines where sulfur was obtained from a depth of 120 to 180 meters in beds 10 to 15 meters thick and containing 17% to 21% sulfur. The largest sulfur mine was Jezierko with an annual capacity of 3.5 million tons. The Grzybow Mine was nearly exhausted; it produced about 0.8 million tons. Development of a new opencast mine was planned near Osiek. Deliveries to centrally planned economy countries in Europe and to the domestic market were mostly in liquid form and were transported by rail directly from the mines. Overseas supplies were shipped by rail in tank cars to Gdansk for export.

Sulfur exports in 1982 were 4% higher than the 3.82 million tons shipped in 1981. Sales to the Western World showed a 2% increase, rising to 1.97 million tons. Sales to centrally planned economy countries totaled 2.01 million tons in 1982, which was

an increase of 7% over that of 1981. Shipments to the U.S.S.R. increased from 793,000 tons in 1981 to 818,000 tons in 1982.

MINERAL FUELS

Total primary energy production was 223.2 million tons in standard coal equivalent (SCE). This represents a 21% increase in total primary energy production compared with the 1981 level. Lignite and bituminous coal accounted for 94% of the total primary energy. Total consumption of all types of primary energy reached 224.6 million tons SCE, with coal providing 80%; petroleum, 10.5%; natural gas, 8%; and others (peat, wood, and hydropower), 1.5%. The total apparent consumption of primary energy increased 12%.

Table 6.—Poland: Total primary energy balance

(Million tons of standard coal equivalent)[1]

	Total primary energy	Coal (lignite, bituminous, and coke)	Crude oil and petroleum products	Natural gas	Other
1981:					
Production	184.9	173.5	0.5	8.1	2.8
Imports	33.2	1.0	25.1	7.1	--
Exports	17.9	16.6	1.3	--	--
Apparent consumption	200.2	157.9	24.3	15.2	2.8
1982:					
Production	223.2	209.6	.5	9.8	3.3
Imports	32.7	1.0	24.2	7.5	--
Exports	31.3	30.3	1.0	--	--
Apparent consumption	224.6	180.3	23.7	17.3	3.3

[1]One ton of standard coal equivalent (SCE)=7,000,000 kilocalories. Conversion factors used are from the United Nations as follows: hard coal, 1.0; brown coal, 0.3; coke, 0.9; crude oil, 1.47; petroleum products, 1.54; and natural gas (1,000 cubic meters), 1.33.

Sources: Biuletyn Statystyczny (Statistical Bulletin), Warsaw, No. 5, 1983, pp. 16, 34, and 36. Rocznik Statystyczny (Statistical Yearbook), Warsaw, 1982, p. 177.

Coal.—Traditional miner work discipline was restored. The coal industry worked throughout the year without interruption at a normal level corresponding to the production capacities of the mines. Daily production reached a level of 630,000 tons. The increase in coal production was due primarily to mandatory Saturday work. Despite the intent of the economic reform to make the coal industry self-supporting, the Polish coal industry was steel-subsidized by the state budget. Regardless of the increase in producer and retail prices instituted in early 1982, the price of coal remained too low to cover the cost of production. Polish coal exports totaled 28.3 million tons in 1982, an increase of about 13.5 million tons compared with that of 1981. Exports to centrally planned economy countries totaled 14.1 million tons, and exports to developed market economy countries totaled 14.2 million tons. Polish coal exports to the Soviet Union were 8.7 million tons, representing 61% of Polish exports to the Eastern block. Poland intended to export 33 million tons of bituminous coal in 1983. In an effort to introduce new capacity, about Z21 billion[5] was invested in the coal industry in 1982.

There were 66 mines in operation. Five mines, the Czeczott, Budryk, Suszec, Kaczyce, and Warszowiey, were under construction. The mines under construction were designed to produce a total of almost 100,000 tons of coal per 24 hours. The first mine of the Lublin Field, the K-1 at Bogdanka, came into operation in December. When fully developed, the mine was expected to produce 12,000 tons per day. The initial rate of the Bogdanka Mine was 100 tons per day. The second mine, Stefanow, with a similar projected capacity was under development. About 700 meters of shaft were being driven at the mine.

The country's bituminous coal recoverable reserves were estimated at about 17.8 billion tons, and estimated reserves to a depth of 1,500 meters exceed 100 billion tons, according to the Polish Central Geological Office. About 66% of total proven reserves consist of power coal, 32% of coking coal, and 2% of other types. At the present annual production rate of 190 million tons, the deposits under exploitation would not be exhausted for about 70 years and the total proven reserves would last 130 years.

The plan for lignite production was fulfill-

ed. Lignite extraction was 2.5 million tons more than in 1981. Extraction at Belchatow reached about 2.2 million tons, and at another new opencast mine, Lubstowa near Konin, 0.5 million tons. Development of the Lubstow opencast mine was in progress for 3 years. The mine was planned to produce 6 million tons per year upon attaining full capacity. At Belchatow, the extraction of lignite was planned to reach 38.5 million tons, and the capacity of the electric powerplant was to reach 4,320 megawatts, which could nearly double the current capacity of the entire subsector. A new opencast mine, Szczercow, was planned to be developed near Belchatow in the next few years with a capacity of 20 million tons per year. The country's economic reserves of lignite were estimated at 6.5 billion tons.

Natural Gas.—The natural gas supply amounted to about 459 billion cubic feet, of which roughly 247 billion cubic feet came from indigenous fields and 212 billion cubic feet was imported from the U.S.S.R. However, demand for gas was planned to increase, especially for the production of nitrogenous fertilizers. There were no prospects for increased Soviet deliveries. Efforts were to be made to find and develop new resources, presumably in the Poznan area.

Over 184 million cubic feet of gas, valued at Z3.2 million, was produced at Krosno. Gas was also produced at Karlino and from new deposits at Trzesniow near Lublin. New deposits of natural gas were discovered offshore by the Petrobaltic rig.

Under a new agreement, Poland was to provide the U.S.S.R. during 1983-85 with 427 kilometers of gas pipes with diameters ranging from 530 to 1,420 millimeters and was also to install compressor stations and construct housing and amenities for gas workers. Payment was to be made later by the delivery of natural gas.

Petroleum.—Strict conservation policies were especially urgent with regard to hydrocarbon fuels. As a special concession, the U.S.S.R. had maintained oil deliveries at about the same level as in 1981 at about 119 million barrels of crude oil plus a smaller quantity of products. Poland's own crude oil production was insignificant. Gdansk refinery was operating at 70% of capacity. The entire production at the Gdansk refinery was based on crude oil received from Romashkino deposits in the U.S.S.R. The Plock refinery and petrochemical enterprise supplied 80% of the national requirement for refinery products. The Plock refinery was renovated, and the first catalytic cracking unit was repaired and modernized.

In 1982, the Karlino oil well in the Kosalin region produced about 537,135 barrels of oil. However, the gas pressure decreased and oil production was halted. There were thousands of tons of oil remaining in the deposit. To renew production, it was decided to build a 3.5-kilometer pipeline from Doszewo to the newly discovered gas deposits near Bialogard. The gas was to be injected into the strata to increase the pressure. Oil production started at Krepa near Zielona Gora. Production was expected to be about 370 to 520 barrels every 24 hours. The oil was to be supplied to the Jedlice refinery. New oilfields and gasfields were discovered at Trzesniow near Lublin.

The Mineral Industry of Portugal

By Roman V. Sondermayer[1]

The severity of the international recession and limitations on foreign borrowing capacity were growth restraining factors in Portugal during 1982. Accordingly, the Government's medium-term development goals had to be modified. In general, strategy remained the same but priorities for the allocation of limited resources were reevaluated. Funding was cut for several major mineral-related projects such as Moncorvo iron, Seixal steel, and pyrite, and consequently their implementation was slowed down.

During the year, a major revision of Portugal's Constitution was completed and approved by the legislative bodies. The revision marked the end of the post-revolutionary transition period in Portugal and instituted full civilian control over the military. In addition, the revision altered the constitution's prescription of a collectivist economy to conform to the present mixed economic system. The significance of the Portuguese mineral industry to the world economy was modest, and only production of tungsten, about 3% of the world total, was important to the international market.

Major events related to minerals in Portugal were the continued development of the Neves-Corvo copper mine and modernization of the Panasqueira tungsten mine.

PRODUCTION

The mineral industry is owned by the Government and private entities. Large operations were owned by the Government.

TRADE

As in the past, during 1981, the latest year for which complete data were available, Portugal's mineral trade balance was negative. Total country imports were close to $9.8 billion, of which approximately 33% or $3.3 billion were minerals. Among minerals, the largest item was imports of fuel, mostly petroleum, which accounted for about 73% of the value of imported minerals. During the same year, the value of Portugal's exports was $4.1 billion, of which minerals accounted for about $0.6 billion or 15%. As in imports, fuels, mostly petroleum refinery products, were the most valued item accounting for about 49% of total mineral exports.

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Other:				
Crude	159	112	--	Spain 44; Sao Tome and Principe 31; Guinea-Bissau 16.
Slag and dross, not metal-bearing	--	3,300	--	All to France.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	1,867	2,989	--	France 1,789; Spain 598; Cape Verde 425.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	22	--		
Carbon: Carbon black	11	--		
Coal: Anthracite and bituminous	9	--		
Coke and semicoke	20	26	--	Zaire 15; Angola 10.
Peat including briquets and litter	10	--		
Petroleum refinery products:				
Liquefied petroleum gas thousand 42-gallon barrels	13	14	--	Cape Verde 12; Gibraltar 1.
Gasoline do	r2,030	3,173	--	France 1,112; United Kingdom 818; Netherlands 689.
Mineral jelly and wax do	r13	10	--	West Germany 9.
Kerosine and jet fuel do	r1,629	2,351	--	Iran 512; Netherlands 162; bunkers 1,436.
Distillate fuel oil do	1,583	618	--	Denmark 157; Iceland 156; bunkers 237.
Lubricants do	96	175	(1)	Spain 60; Netherlands 37; Greece 34.
Residual fuel oil do	2,598	548	--	Spain 240; bunkers 308.
Bitumen and other residues do	205	(1)	--	All to Cape Verde.
Bituminous mixtures do	2	(1)	--	Mainly to Cape Verde.
Tars and other crude chemicals derived from coal, gas, and petroleum	621	13	--	Cape Verde 6; Mozambique 3; Angola 2.

rRevised. NA Not available.
1Less than 1/2 unit.
2May include other precious metals.

Table 3.—Portugal: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals:				
Unspecified value, thousands	$7	$5	--	West Germany $4.
Aluminum:				
Ore and concentrate	2,578	48	--	All from Spain.
Oxides and hydroxides	4,576	8,365	28	United Kingdom 4,750; France 1,971; West Germany 1,436.
Metal including alloys:				
Scrap	103	403	3	Spain 360; West Germany 28.
Unwrought	27,403	42,348	222	Spain 25,042; France 4,834; Norway 4,249.
Semimanufactures	15,532	14,087	34	Spain 3,257; Belgium-Luxembourg 2,481; Austria 1,803.
Chromium:				
Ore and concentrate	410	352	--	Republic of South Africa 312; Netherlands 40.
Oxides and hydroxides	198	241	--	West Germany 225; Spain 11.
Cobalt: Oxides and hydroxides	4	6	--	Belgium-Luxembourg 3; United Kingdom 3.

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Columbium and tantalum: Metals including alloys, all forms, tantalum	(1)	1	--	Mainly from France.
Copper:				
Ore and concentrate	10	140	--	Australia 50; Republic of South Africa 50; Netherlands 40.
Matte and speiss including cement copper	1,797	2,565	--	Chile 1,469; Peru 626; Netherlands 209.
Metal including alloys:				
Scrap	244	220	5	Spain 106; Belgium-Luxembourg 39; Italy 30.
Unwrought	12,463	12,757	--	Belgium-Luxembourg 4,287; France 1,511; Canada 1,503.
Semimanufactures	14,711	16,945	(1)	France 3,650; Sweden 2,866; United Kingdom 2,764.
Iron and steel:				
Iron ore and concentrate:				
Excluding roasted pyrite	494,918	524,112	--	Republic of South Africa 127,611; Venezuela 119,206; Mauritania 100,799.
Pyrite, roasted	2	--		
Metal:				
Scrap	149,205	84,537	285	United Kingdom 48,803; Netherlands 21,633; U.S.S.R. 10,018.
Pig iron, cast iron, related materials	41,635	74,681	--	Spain 62,210; West Germany 9,526; Canada 1,524.
Ferroalloys:				
Ferromanganese	132	111	--	West Germany 75; France 32.
Unspecified	1,242	1,259	3	United Kingdom 353; Spain 208; France 191.
Steel, primary forms	254,203	230,680	--	West Germany 80,908; Netherlands 33,173; France 26,517.
Semimanufactures:				
Bars, rods, angles, shapes, sections	125,399	132,801	67	Spain 38,170; West Germany 37,412; France 15,089.
Universals, plates, sheets	272,603	266,484	7,038	West Germany 95,583; Belgium-Luxembourg 38,339; France 37,734.
Hoop and strip	54,072	54,328	111	West Germany 33,728; France 10,447; Belgium-Luxembourg 4,419.
Rails and accessories	1,682	10,082	--	France 5,012; West Germany 4,564; Belgium-Luxembourg 372.
Wire	22,071	26,923	73	Spain 11,476; West Germany 4,344; Belgium-Luxembourg 3,601.
Tubes, pipes, fittings	25,855	24,632	472	West Germany 11,567; Japan 2,650; France 1,846.
Castings and forgings, rough	708	1,168	13	West Germany 385; United Kingdom 262; France 164.
Lead:				
Ore and concentrate	100	1,500	--	Suriname 1,380; Spain 120.
Oxides	81	24	18	United Kingdom 6.
Metal including alloys:				
Scrap	1,050	21	--	United Kingdom 20.
Unwrought	16,469	17,808	2,645	United Kingdom 11,339; Australia 1,995; Canada 759.
Semimanufactures	18	7	--	West Germany 5; Spain 1.
Magnesium: Metal including alloys:				
Unwrought	3	--		
Semimanufactures	8	13	--	United Kingdom 6; Norway 3; Denmark 1.
Manganese:				
Ore and concentrate, metallurgical-grade	173,823	109,916	--	Brazil 65,605; Republic of South Africa 30,238; Gabon 14,044.
Oxides	1,206	847	(1)	United Kingdom 319; Netherlands 134; Ireland 120.
Mercury 76-pound flasks	928	841	--	Spain 638; China 58; Mexico 58.
Metalloids: Unspecified	10	22	--	West Germany 8; Sweden 8; United Kingdom 6.
Molybdenum: Metal including alloys, all forms	2	2	(1)	Belgium-Luxembourg 1; Sweden 1.

Diatomite and other infusorial earth	4,284	3,823	550	Spain 2,544; France 501; West Germany 184.
Feldspar, fluorspar, related materials:				
Unspecified	2,022	2,423	--	France 1,993; United Kingdom 365; Spain 49.
Fertilizer materials: Manufactured:				
Ammonia	27,525	60,077	--	U.S.S.R. 37,215; United Kingdom 6,374; France 6,034.
Nitrogenous	29,767	24,199	--	United Kingdom 10,248; Ireland 4,987; Romania 3,600.
Phosphatic	1,678	900	--	All from France.
Potassic	86,125	90,857	--	Spain 75,250; West Germany 5,607; U.S.S.R. 5,000.
Unspecified and mixed	4,514	8,593	7,978	Belgium-Luxembourg 296; West Germany 152; United Kingdom 90.
Graphite, natural	388	174	(1)	United Kingdom 47; Norway 41; Italy 37.
Gypsum and plaster	35,118	46,958	18	Spain 43,890; Morocco 2,616; West Germany 218.
Halogens:				
Chlorine	395	1,256	--	All from Spain.
Unspecified	56	11	--	Japan 9; France 1; West Germany 1.
Lime	768	810	--	Spain 792; France 18.
Magnesium compounds: Magnesite	5,317	4,868	9	United Kingdom 3,173; Austria 764; West Germany 374.
Mica:				
Crude including splittings and waste	336	464	(1)	Norway 325; United Kingdom 76; France 50.
Worked including agglomerated splittings	19	21	1	France 9; Switzerland 4; Spain 2.
Nitrates, crude	514	1,087	--	Chile 997; West Germany 54; Poland 36.
Phosphates, crude	452,105	342,560	4,925	Morocco 333,431; Ivory Coast 4,178.
Pigments, mineral: Iron oxides and hydroxides, processed	1,982	2,008	--	West Germany 1,441; Spain 500; United Kingdom 34.
Precious and semiprecious stones other than diamond:				
Natural value, thousands	$135	$123	--	Belgium-Luxembourg $51; United Kingdom $35; France $20.
Synthetic do	$30	$9	--	West Germany $3; Switzerland $3; Austria $2.
Pyrite, unroasted	--	2,205	--	All from Spain.
Salt and brine	91,072	51,564	--	Italy 35,817; Spain 15,591.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	396	613	--	Italy 368; France 177; Spain 48.
Sodium carbonate, natural and manufactured	1	(1)	--	All from West Germany.
Sodium hydroxide	20,877	24,433	(1)	Spain 15,538; Belgium-Luxembourg 8,183; France 679.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	73	260	--	France 144; Brazil 82; Italy 25.
Worked	99	153	(1)	Spain 85; Italy 43; France 15.
Dolomite, chiefly refractory-grade	5,936	7,588	--	Italy 2,589; France 2,135; Norway 1,487.
Gravel and crushed rock	44	445	--	Spain 211; Italy 119; France 75.
Limestone other than dimension	1,500	1,500	--	All from France.
Quartz and quartzite	205	663	--	Spain 493; Belgium-Luxembourg 123; Switzerland 20.

See footnotes at end of table.

COMMODITY REVIEW

METALS

Copper.—Development of the complex sulfide lead-zinc-copper deposit at Neves-Corvo in southern Portugal continued. With about 50,000 meters of diamond drilling completed, results have confirmed earlier reports that reserves at Neves-Corvo were over 60 million tons of ore. Of the total, the Neves ore body contained about 21 million tons of zinc ore with an average metal content of 5% zinc, 0.15% copper, and 0.9% lead; 5 million tons of complex ores containing 4.9% copper, 2.8% zinc, and 0.4% lead; and 1 million tons of disseminated cupriferous ore with 1.9% copper, 0.6% zinc, and 0.18% lead. In the Corvo ore body, reserves were reported at 34 million tons with about 13 million tons containing 7% copper, 16 million tons showing 4.8% copper, and about 5 million tons of zinc-lead ore with 5% zinc, 1% lead, and 0.15% copper. In addition, pyrite found in the deposits of Neves-Corvo contains 0.38% copper, 0.4% zinc, and about 10 grams of silver per ton of ore.

Neves-Corvo will consist of an underground mine and a flotation plant. Opening of the new mine will be by a 5-meter-diameter vertical shaft and a 5,000-meter-long ramp, the cross section of which is 22 square meters. Production was scheduled to start in 1986 at a planned 1 million tons per year of ore yielding 200,000 tons of concentrates with 25% copper. The operator was Sociedade Mineira de Neves-Corvo S.A.R.L. (Somincor) in which the Government of Portugal had 51% interest, and the Bureau de Recherches Géologiques et Minières (BRGM) of France and the Sociedade Mineira de Penarroya, 24.5% each. Total investment was planned at $200 million at 1982 prices. Somincor also planned to ask for bids for deliveries of mining and metallurgical equipment during 1983.

Iron Ore.—At the Moncorvo iron ore deposit, development has been slowed because of budgetary restraints. Basic engineering work was completed, including the list of equipment. However, the Government has not announced its decision on building the necessary rail connection between Moncorvo and the rest of the country.

Tungsten.—Modernization of the Panasqueira Mine continued. Tests were completed on a new underground primary crushing plant and a 300-meter-long conveyor belt that brings the ore to the surface.

NONMETALS

The United S.A.R.L. has acquired a majority interest in the Clona salt mines in Algarve. A study was underway to determine if the Clona Mine could be expanded so that its output could meet the country's salt demand.

MINERAL FUELS

Coal.—The Government has announced a decision to form a company that would have exclusive rights to explore for coal and promote production. However, at yearend, name and details on the structure of the new entity were not available.

Uranium.—The Empresa Nacional del Uranio S.A. completed its uranium exploration program in the Nisa area in Alto Alentejo, but at the end of 1982 results were not available.

The Mineral Industry of Romania

By Walter Steblez[1]

In 1982, Romania's centrally planned economy further displayed the declining trends that marked its performance in both 1980 and 1981. Planned targets for most of the major economic indicators were not met. The net material product (gross national product minus services) grew by only 2.6%; investment declined by 2.5%, and industrial production grew by 3%.

Romania's industrial labor force showed no net change from 1981; however, industrial labor productivity reportedly grew by only 1%. The relative share of the mining, fuel, and metallurgical industries remained at over 14% of the gross output of industry.

Although Romania produced a wide variety of both metallic and nonmetallic industrial minerals, it remained a net importer of metalliferous ores, fuels, and a number of nonmetallic minerals.

Several new facilities in the steel industry were put into operation during the year; these included a new 25,000-ton-per-year steel foundry at Medgidia and a 1,000,000-ton-per-year coking battery at the Galati steel complex. In nonferrous mining, reportedly, a new 1,000-ton-per-day copper concentrator was put into operation late in the year at the Rosia Poieni mining complex in the Rosia Montana area. In the transportation field, Romania reported launching its fifth 65,000-deadweight-ton ore carrier. The total capacity of the country's merchant fleet was about 2,700,000 deadweight tons.

Government Policies and Programs.—Government policies were directed at issues that over a number of years served as serious bottlenecks within the mining and processing industries. These included late delivery or nondelivery of allocated capital equipment and the delivery of wrong or faulty components. In the first 5 months of 1982, in the metallurgical sector alone, this problem caused extended startup delays for new capacities that were to produce 5 million tons of iron pellets, about 1.5 million tons of cast iron, and 650,000 tons of rolled steel.[2] During the year, reportedly, 14.4% of the total machinery and equipment deliveries for mining and 43.6% for metallurgy lagged considerably behind schedule. Paradoxically, the situation caused large uninstalled equipment stockpiles to develop at these enterprises because equipment necessary for the installation of these stocks was unavailable. Another difficulty was the inefficient use of labor and machinery. Downtime of scrapers, bulldozers, excavators, etc., was well above 50%. In many cases, labor skills and qualifications were too low to be able to use new machinery and equipment at the minesite efficiently. The ratio of working miners to auxiliary mine personnel was low, ranging from 1:5 to 1:6. Mining engineers were reportedly, in many cases, spending too much time performing administrative office duties and not enough time in the mines.

Planned training programs in mining and equipment operation and the creation of centralized mining machine building and spare parts supply enterprises were to be set up to alleviate these and other problems. The ratio of auxiliary to production workers in mining was planned to be reduced to 2.5:1 to 3:1.

Romania's 1983 national economic plan called for modest increases in the production of steel, crude oil, coal, and electric power. Special emphasis was to be placed on the production of stainless and specialty steel products as well as more efficient secondary recovery of nonferrous metals.

PRODUCTION

Romania's totally nationalized mineral industry produced less bauxite, aluminum, copper, pig iron, and crude steel than in 1981. The production of coal and fossil fuels generally remained the same or slightly exceeded 1981 production levels. Production shortfalls were attributed to structural inefficiency of the mineral industry as well as an increasingly more difficult geological environment for mining. The country's mineral reserve base continued to decline. Attempts were to be made during the 1981-85 5-year plan to mechanize and improve efficiency in mining.

[e]Estimated. [p]Preliminary. [r]Revised.

[1]Includes data available through Oct. 3, 1983.

[2]In addition to the commodities listed, antimony, asbestos, and a variety of crude construction materials are produced, but output is not reported quantitatively, and available information is inadequate to make reliable estimates of output levels.

[3]Reported figure.

[4]Romanian sources do not indicate whether refinery fuel is reported as a part of the listed product yields. Moreover, additional minor products may be produced but are not listed in official sources.

TRADE

In 1982, Romania continued to experience a financial crisis. The country rescheduled its 1981 and 1982 debts with foreign creditors. Total imports and exports declined 24.2% and 9.5%, respectively. Thirty-eight percent of Romania's substantial hard-currency import reduction was accounted for by a drop in crude petroleum purchases designated for reexport as a refinery product, a transaction considered no longer sufficiently profitable. However, imports of petroleum, coal, and nonferrous metals, as a percent of total imports, declined less than other commodities. On balance, Romania's import reductions in 1982 allowed for a $1.5 billion convertible currency surplus.

The inability of Romania's mineral industry to supply raw materials in sufficient quantities to the country's economy required substantial imports of mineral fuels and metallic and nonmetallic ores. The U.S.S.R., a centrally planned economy country, accounted for roughly 18% of Romania's foreign trade and was an important source of iron ore, coke, and a number of other raw materials. In both 1981 and 1982, Romania made appeals to the Council for Mutual Economic Assistance (CMEA),[3] of which it is a member, to play a greater role in supplying raw materials and fuels to its economy.

To diversify its sources of minerals and fuels, in 1982, Romania conducted a wide number of commercial operations with developing countries of Africa, Asia, and Latin America. These operations were conducted by GEOMIN, a foreign trade organization subordinated to the Ministry of Mines. Its broad functions included geological prospecting and exploration, including drilling; mine development, construction, and engineering support; development of cooperative agreements for joint mining and processing of nonferrous metals—especially copper, lead, and zinc—their import and export.

[7]Excludes exports from Norway valued at $112,000 in 1980 and $803,000 in 1981.

[8]Excludes exports from West Germany valued at $112,000.

[9]Exludes exports from Japan valued at $45,000.

[10]Excludes exports from the United Kingdom valued at $64,000.

[11]Excludes exports from Australia valued at $1,483,000.

[12]Excludes exports from Norway valued at $31,000.

[13]Excludes quantity valued at $82,000.

[14]Excludes quantity valued at $1,122,000 in 1980 and $995,000 in 1981.

[15]Excludes exports from the United States valued at $16,000.

[16]Statistical Yearbook of Members of the Council for Mutual Economic Assistance, Moscow, U.S.S.R.

[17]Presumably largely bituminous; of total officially reported coal imports in 1980, 2,557,000 tons was described as washed pit coal for coke manufacture and 1,392,000 tons was not further described.

[18]Excludes portion of Japanese exports valued at $248,000.

COMMODITY REVIEW

METALS

Continuing depletion of Romania's ferrous and nonferrous reserves remained the salient feature of the metallic mining industry in 1982.

Aluminum and Bauxite.—Reportedly, 350 tons per year of new refined aluminum capacity was added at Slatina Aluminum Enterprise. The industry, centered in Slatina in Olt County, mined less bauxite and smelted less aluminum than in 1981. The country continued to import most of its bauxite raw material requirements from

Greece and agreed to import alumina as well, if and when the Soviet-Greek alumina project in Greece becomes operational.

Copper.—Domestic copper production met about 60% of Romania's consumption requirements. Increasingly lower grade ores were used to obtain 1 ton of copper. In 1970, 128 tons of ore had to be mined to obtain 1 ton of copper; in 1982, this ratio was reportedly 297:1.

Facility expansion programs at the Rosia Poieni Mine in the Rosia Montana area and at the Moldova Noua mining complex in the Banat area were reportedly behind schedule. In September, a 1,000-ton-per-day copper concentrator at Rosia Poieni began trial runs.

Gold.—Gold, as a byproduct, was derived from auriferous polymetallic ores in Rosia Montana in the Apuseni Mountains and in the Banat area. In 1983, it was planned to increase the mining of gold ores by 27,000 tons.

Iron and Steel.—New capacities that were installed during the year included coking batteries and a rolling mill at the Galati iron and steel complex and coking and sintering units at the Calan iron and steelworks. At the Cimpia Turzii steel plant, an electric furnace and a vacuum treatment unit were put into operation, and at the Tirgoviste metallurgical complex, a bar and strip mill was also put into production.

Romania relied on imports for over 75% of its iron ore and metallurgical coke requirements; the U.S.S.R., as in previous years, was Romania's chief supplier of iron ore. Domestic production of ore continued to decline owing to the depletion of the country's reserve base.

The industry was criticized during the year for its inability to efficiently produce special steel. The chief reason was reportedly a wide gap between the qualification of workers and engineers at iron and steel complexes such as Galati and Hunedoara and the skills required to operate the new highly sophisticated plant and equipment that was introduced at these facilities in recent years.[4] Other problems included continuing allegations of dumping stainless steel on European and U.S. markets. It was alleged that Romania sold such steel to the U.S. market at prices as low as 41% below market value.

Romania's plan for 1983 was to produce 14,200,000 tons of carbon steel, a 7.5% increase over the planned output goal of 1982. The production of high-quality carbon steel and alloy and special steel was to increase 2% and 9%, respectively.

In 1982, Romania reduced its commitment to buy iron ore from India from 5 million to 3 million tons for the 1982-83 period, reportedly, because of a shortage of hard currency. In other developments, the U.S. Government agreed to suspend its dumping investigation of Romanian steel on the U.S. market in exchange for Romanian compliance to adjust prices in accordance with twice-yearly U.S. Government advice on the U.S. market value of the exported product.

Lead and Zinc.—Lead-zinc ore was mined and processed at the Baia Mare mining complex; the concentrate was smelted at Copsa Mica in central Romania. Domestic mining satisfied about 75% of lead and 70% of zinc requirements. Low-grade, deep-lying ore bodies made mining increasingly more difficult, and to meet industrial needs, attempts were made to increase secondary output.

NONMETALS

Romania mined and processed a wide variety of nonmetallic minerals primarily for domestic use. These included graphite, feldspar, barite, kaolin, bentonite, sulfur, and other nonmetallics. In addition, the country produced industrial diamonds, which met both domestic and export needs.

Clays (Bentonite).—Bentonite was mined at Gura Sada in the Apuseni Mountains, as well as at Orasul Nou in the Eastern Carpathians and in the Transylvanian Basin. The mineral was used primarily in the steel industry and in drilling mud in the petroleum industry. The annual mine output was in excess of 175,000 tons.

Diamond.—Romania had been producing synthetic diamonds since 1979. Using domestic technology, the Romanian industry produced four grades of diamond: 0.25 to 60 micrometers, used in sprays, pastes, and suspensions; 40 to 250 micrometers, used as friables for processing materials with hard surfaces; a "medium" group (size not reported) that was used in treating glass, ceramics, ferrite, graphite, and reinforced plastics; and 250 to 800 micrometers used in treating building materials. Romania planned to begin large-scale production of diamond tool bits and blades.

Feldspar.—Feldspar was obtained from pegmatites mined at Mutele Rece in the Apuseni Mountains and at Voineasa and Armenis in the South Carpathians Range,

using closed-circuit ball mills with pneumatic classifiers; a flotation unit was installed at Mutele Rece to obtain higher feldspar values. Annual output was in excess of 60,000 tons.[5]

Sulfur.—Mine development continued on the Calimani natural sulfur project at Suceava. The opencast mine, under development, will exploit irregular horizontal ore bodies containing as much as 20% to 23% sulfur. A processing plant, which would use autoclaving and flotation for the production of concentrates, was reported to be in the design stage.

MINERAL FUELS

Coal.—Romania's output goal for 1982 was not met. The industry experienced labor unrest in 1981 and equipment and spare parts delivery shortfalls in 1982. The planned 1983 production goal was 52.2 million tons, up 19% from the planned 1982 goal and up 38% from the actual production level for the year. A new lignite field was also to be developed east of Timisoara, near Lugoj, during the 1981-85 5-year plan period. Mine development continued in 1982 with production planned to reach 500,000 tons per year by 1985.

Nuclear Energy.—The Government decided to initiate the Moldavia nuclear plant project by obtaining three VVEhR-1,000 reactors from the U.S.S.R. This policy, if implemented, would allow the parallel operation of two nuclear technologies in the same country, since the first nuclear plant at Cernavoda was under construction using Canadian reactors.

Petroleum and Natural Gas.—The decline in the country's petroleum production stopped but production did not reach the plan target of 95 million barrels. The plan for 1983 was to increase output to 102 million barrels of petroleum and 1,340 billion cubic feet of natural and associated gas.

In 1982, Romania reported the discovery of a light crude oil deposit near Virteju and Stoenita in Gorj County, at a depth of 4,400 meters. The well, in late 1982, was reportedly producing 1,020 barrels of petroleum and 920,000 cubic feet of gas daily. Twenty-four wells were planned to be put into operation to fully exploit the deposit. Also, the shale mine at Anina was reportedly opened during the year. Annual production capacity was rated at about 12 million tons; the shale would supply a thermal power station under construction in the vicinity.

The Mineral Industry of Saudi Arabia

By John R. Lewis[1]

As Saudi Arabia's physical infrastructure began to reach completion, the emphasis on where the development budget was to be spent began to shift. Jubail and Yanbu, new industrial cities built to use indigenous oil and gas feedstocks to produce steel, petrochemicals, fertilizer, and refined petroleum products, absorbed a large share of the development expenditures. Saudi Arabia's gross domestic product in 1981 was $153.9 billion, and the per capita income was $19,481.[2] Population, at 9.32 million persons, was growing at an annual rate of about 3.5%. The Kingdom's budget for the year ending June 1983 was balanced at $91.7 billion. Nearly 65% of this budget was appropriated for development projects, while the remaining 35% was for current expenditures. Income from the sale of crude oil and its products provided about 94% of the country's revenue. The budget reflected a 20% or more decrease in oil revenues, which was to be supplemented by $11.7 billion from the General Reserve. According to the latest available foreign trade statistics, Saudi exports in 1981 totaled $118.2 billion, up 12% from that of 1980, while imports amounted to $37.8 billion, about 19% more than in 1980.

The keystone of Saudi Arabia's economy remained its oil. Proven crude reserves at the end of 1982 were 162 billion barrels, about 28% of reserves in market economy countries, or 24% of the reserves of the entire world. Saudi Arabia had more than twice the crude reserves of any other nation in the world. The 1982 world economic slump had little impact upon the country. Although the decline in oil earnings was enough to eliminate any earnings surplus, the nation's financial reserves made necessary only a very small retrenchment in a few elements of the 1980-85 5-year plan.

Except for some cement, there was little else of nonfuel mineral origin that was produced in 1982. At best, it appears that, despite substantial mineral exploration and determination that there is potential for commercial exploitation of tungsten, nickel, iron ore, phosphate, and bauxite, nonfuel mineral production will only play a marginal role in Saudi development. Commercial gold mining was expected to begin in about 3 years at the ancient mine of Mahd Adh Dhahab. Iron ore production will depend upon a pilot mining and enrichment operation underway at Wadi Sawawin on Saudi Arabia's west coast.

PRODUCTION

The production and refining of Saudi Arabia's crude oil and the processing of byproducts, such as sulfur and nitrogenous fertilizers, continued to dominate the nation's economy. Construction of refineries, petrochemical plants, and lubricating oil plants, which had been started in previous years, were progressing about as planned. One petrochemical plant, however, was shelved for the time being when a major partner withdrew, citing low worldwide demand as its reason. Saudi Arabia's crude oil production was off about one-third from that of 1981. This was due in part to reduced world demand. However, Saudi Arabia's determination to maintain the viabilities of

the production and export quotas of the Organization of Petroleum Exporting Countries (OPEC) prompted the country to reduce its own output well below its proportionate share under the OPEC agreement to counter overproduction and lowered prices by certain other OPEC members.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.
[1]Table includes data available through Sept. 19, 1983.
[2]Data are for the Hejira calendar year, which corresponds closely to the Gregorian calendar year.
[3]Reported figure.
[4]Includes Saudi 1/2 share of production in the Kuwait-Saudi Arabia Partitioned Zone.

TRADE

During 1981, the latest year for which official foreign trade statistics were available, Saudi Arabia's exports totaled $118.2 billion, while imports were $37.8 billion. The estimated trade surplus of $80 billion, represented a 9% increase above the surplus of 1980. However, with drastically reduced petroleum exports in 1982, the surplus was expected to be quite small, and with declining oil income, a deficit was expected in 1983 for the first time since the early 1970's.

In 1981, exports were up 12% over those of 1980. Petroleum and petroleum products constituted 94% of the Kingdom's exports. Japan received 17% of Saudi exports; the United States, 13%; France, 10%; Italy, 7%; and the Netherlands, 6%.

Saudi Arabian imports in 1981 were up 19% over those of 1980. Almost one-half the country's imports came from three countries, the United States, 21%; Japan, 18%; and the Federal Republic of Germany, 10%. Italy, the United Kingdom, and France sold the Kingdom about 19% of its imports. Machinery and electrical equipment made up 25% of 1981 imports, while base metals and their products constituted 15%; transport equipment, 15%; and vegetables and food products, 14%.

Mineral products were the only imports that declined, owing to a decline of 16% in cement imports, reflecting the slowdown in construction activity.

Petroleum was exported in 1981 by three companies. Arabian-American Oil Co.

(Aramco) exported 98% of all crude exported and 95% of refined products. Getty Oil Co. of the United States exported less than 1% of the crude and 3% of the products, and the Arabian Oil Co. (offshore operations—Neutral Zone—Japan-Saudi Arabia) exported 1% of the crude and 2% of the products. Preliminary data for the first half of 1982 indicated that the percentages as reflected by 1981 data were essentially unchanged.

Table 2.—Saudi Arabia: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals	7	41	--	Qatar 25; Bahrain 16.
Aluminum:

NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	51	17	--	All to Yemen (Sanaa).
Grinding and polishing wheels and stones	16	27	--	Yemen (Sanaa) 26.
Asbestos, crude	11	21	--	United Arab Emirates 13; West Germany 6.
Boron materials: Crude natural borates	3	--		
Cement	27,409	7,758	--	Yemen (Sanaa) 5,758; Jordan 630; Iraq 442.
Chalk	2	--		
Clays and clay products:				
Crude	226	51	--	United Arab Emirates 26; Qatar 25.
Products:				
Nonrefractory	374	529	--	United Arab Emirates 346; Yemen (Sanaa) 69; Qatar 45.
Refractory including nonclay brick	756	121	--	United Arab Emirates 105; Iraq 6; Yemen (Sanaa) 6.
Diamond: Gem, not set or strung value, thousands	--	$1	--	All to Hong Kong.
Diatomite and other infusorial earth	1,284	163	--	Qatar 108; United Arab Emirates 55.
Fertilizer materials:				
Crude, n.e.s	111	1,120	--	United Arab Emirates 1,031; Iraq 84.
Manufactured:				
Ammonia	61	92	--	United Arab Emirates 88; Kuwait 3.
Nitrogenous	170,908	288,150	--	Iran 59,000; Bangladesh 50,500; Sudan 23,000.
Phosphatic	41,518	3,680	--	Yemen (Sanaa) 3,085; Jordan 570.
Unspecified and mixed	10,001	7	--	Jordan 5; Iraq 2.
Graphite, natural	--	21	--	Yemen (Sanaa) 20; Jordan 1.
Gypsum and plaster	6,127	20,806	--	Kuwait 19,338; Qatar 434.
Halogens	24	--		
Lime	2,311	2,859	--	Yemen (Sanaa) 2,459; Kuwait 75.
Mica: Worked including agglomerated splittings	148	--		
Nitrates, crude	10,023	5,243	--	Sri Lanka 5,000; Qatar 209.
Pigments, mineral: Iron oxides and hydroxides, processed	7	21	--	Qatar 20.
Precious and semiprecious stones other than diamond:				
Natural value, thousands	--	$23	--	All to India.
Synthetic do.	--	$35	--	Do.
Pyrite, unroasted	--	28	--	United Arab Emirates 16; Yemen (Sanaa) 12.
Salt and brine	3,440	6,646	--	Kuwait 4,547; Jordan 800; Iraq 655.
Sodium and potassium compounds, n.e.s.:				
Sodium carbonate, natural and manufactured	3	--		
Sodium hydroxide	135	93	--	Iraq 41; United Arab Emirates 40; Kuwait 6.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	120	3,512	19	Kuwait 1,781; France 1,052; Italy 407.
Worked	1,406	634	--	Yemen (Sanaa) 418; Qatar 72.
Dolomite, chiefly refractory-grade	--	24	--	United Arab Emirates 21; Bahrain 3.
Gravel and crushed rock	553	123,285	--	Kuwait 123,198.
Limestone other than dimension	--	30	--	All to Jordan.
Quartz and quartzite	--	14	--	United Arab Emirates 11; Kuwait 3.
Sand other than metal-bearing	164	1,656	--	United Arab Emirates 1,520; Yemen (Sanaa) 45.
Sulfur:				
Elemental, all forms	126	312	--	Yemen (Sanaa) 227; Somalia 52; United Arab Emirates 30.
Sulfuric acid	522	142	--	Qatar 77.

COMMODITY REVIEW

METALS

Saudi Arabia's General Petroleum and Mineral Organization (Petromin) was reported[3] by the news agency of OPEC to have contracted with the Royal Dutch/Shell Group to explore zinc deposits in the Umm al-Shalaheeb area, 200 kilometers southwest of Riyadh. The OPEC agency also reported that zinc and copper had been found in the Khanaygiyyat al-Amar region and that tungsten had been discovered at Bayd al-Jimalah, 180 kilometers southwest of Duryadh. Phosphoric sediments were discovered in the Sirhan Turayf Basin, and an extensive layer of bauxite had been found at al-Zabirah, 450 kilometers northwest of Riyadh. The report also added that there were indications of uranium deposits in the northwest Hejaz-Madyan region. At Wadi Oatan, a recent evaluation indicated that a nickel-iron pellet could be produced from the nickeliferous massive sulfides. Further drilling was planned.

India's Royal Corp. was contracted by the Kingdom to set up three silver recovery plants in Saudi Arabia, which were to be financed by private Saudi business interests. The plants will be built in Riyadh, Dammam, and Jedda and will use equipment and technical expertise furnished by the Indian firm. Under a $21 million, 10-year program, each plant will reclaim about 2,400 troy ounces of silver per day from solutions received from the Kingdom's 368 hospitals and 2,800 photographic studios. The silver thus obtained will be refined into pure silver metal and taken to India. The plants were expected to be in operation by the summer of 1983.

Sudan and Saudi Arabia formally signed an agreement early in 1982 to proceed with the joint project to mine minerals, particularly from the muds of the Atlantis II deep in the Red Sea. A pilot mining project will be initiated, based upon technology and equipment already developed. Zinc, copper, and silver worth $3 billion to $3.5 billion are expected to be recovered. Gold, cadmium, and lead also have been found in relatively small quantities in the Atlantis II deep.

Gold.—Petromin continued to press forward on development of the Mahd Adh Dhahab gold project, located 280 kilometers northeast of Jedda. The occurrence of gold, silver, copper, and zinc has been known and sporadically worked at this site since about 1000 B.C. Based upon previous contractual arrangements with Consolidated Gold Fields PLC (Gold Fields) of the United Kingdom, Petromin awarded an interim management contract to Gold Fields to complete the planning of the gold project by late 1983. Under the contract, a wholly owned subsidiary of Gold Fields is to be created bearing the name Gold Fields Mahd Adh Dhahab (GFMAD). GFMAD will make a detailed viability study and prepare engineering designs and contracts for the mine, ore treatment facilities, mine buildings, water and power supplies, and a townsite. Petromin holds the entire equity in the project, and it was reported that Petromin had expressed its intention to conclude a management contract with GFMAD for construction and operation of the mine.[4] Gold Fields stated that proved reserves of ore are sufficient for 10 years of mine operation, with an annual production of 100,000 to 120,000 troy ounces of gold alone. Gold Fields estimated that it would take 4 years to get production underway. GFMAD also had indicated interest in carrying out other mineral development in Saudi Arabia.

Iron and Steel.—Test runs were begun late in 1982, using one module of the newly completed natural gas-based Midrex integrated direct-reduction units at the 800,000-ton-per-year plant of the Saudi Iron and Steel Co. at Jubail. The plant was designated as Hadeed I. The first direct-reduced iron, using Brazilian ore, was produced on December 14, 1982. The second module was expected by its builder to reach the testing stage during the first quarter of 1983. The plant then was planned for onstream operation by March 1983, with both modules of the mill beginning production simultaneously.

Low-grade iron ore was located on the Red Sea coast at Wadi Sawawin, and the contractor, British Steel Corp., was completing a 5-ton-per-day pilot plant at Al Muwaylih, due to start up in October 1983, to examine the economic viability of open pit mining 200 million tons of 42% taconite ore. The plant will also test the U.S. Bureau of Mines selective flocculation-flotation process for enriching oxidized taconites to 65% pelletized iron. It was felt that this process could be competitive with Brazilian iron ore imports.

If the pilot plant operates satisfactorily on the ores available, a 1.8- to 2-million-ton-per-year plant will be built, and the pelletized concentrate from the plant would be shipped to the Jubail steelworks.

Meanwhile, in September 1982, Saudi Arabian steelworkers went to Qatar to receive training in various areas of steel production, marketing, and management at the facilities of the Qatar Steel Co. (Qasco). In all, 120 workers had been trained at Qasco. This activity was in conformance with an agreement between Qasco and the Hadeed management. Another part of the agreement involved exchanges of technical information between the two countries.

NONMETALS

Cement.—Cement production in 1982 was 5,263,000 tons. Several new plants were in various startup phases during the year, and when all were completed, they would add 2,050,000 tons per year to the 6,800,000 tons per year that was in operation before 1982. Other plants under construction and due to be completed in 1984 were expected to add another 3,600,000 tons per year production capacity, making a total capacity by 1984 of just under 12,500,000 tons per year. According to official Saudi Arabian sources,[5] this producing capacity is barely one-half of the Kingdom's requirements for this important construction material. Cement consumption, however, was expected to decline after 1982-84, when many infrastructural projects of the Kingdom reached completion.

The Saudi Kuwait Cement Manufacturing Co., a joint venture with Kuwait, was set up during the year. It will build plants to produce clinker and cement, and it will also participate in cement companies and related projects in other Arab as well as African countries.

Saudi Arabia's planned and operating cement plants are shown in table 4.

Table 4.—Saudi Arabia: Cement industry statistics

Operating company	Plant location	Current capacity (thousand metric tons per year)	Planned capacity (thousand metric tons per year)	Year of completion

Sulfur.—Three plants in the Kingdom produced sulfur by extracting it from sour natural gas. At Berri, cutbacks in crude liftings restricted output to 750 tons of sulfur per day. The plant had a recovery capacity of 1,450 tons per day. At Shedgum, rated at 1,650 tons of sulfur per day, production was down to about 1,000 tons per day. The newest plant, at Uthmaniyah, was ready for commissioning in 1981, but facilities at Yanbu to take the sweetened natural gas were not ready. Uthmaniyah was rated at 1,140 tons of sulfur per day, but during 1982 was producing about 600 tons per day. Interim sales arrangements were used to dispose of the sulfur produced. The ultimate plan calls for Petromin to operate a single Polish-process prilling plant at Jubail to treat all the output from the three plants. Liquid sulfur from Shedgum and Uthmaniyah will be trucked, or eventually hauled by rail, to a receiving terminal at Berri, which will be connected by pipeline to the Port of Jubail, 20 kilometers away. Contracts for the prilling tower were awarded, and completion was expected in 1984. Meanwhile, at least 1.5 million tons of sulfur was in stock at Shedgum and Berri.

Sulfur recovery facilities were also being installed in new oil refineries. The Petromin-Petrola refinery at Rabigh was equipped with a 120-ton-per-day sulfur recovery unit in 1982. An additional unit was planned that would recover another 200 tons of sulfur per day at this refinery. The Petromin-Shell refinery, under construction

at Jubail, included three 150-ton-per-day sulfur recovery units, and the Petromin-Mobil Yanbu refinery was to have two more 150-ton-per-day units. Output from the three refineries was expected to serve the export market.

MINERAL FUELS

Natural Gas.—Proven reserves of natural gas in Saudi Arabia rose to 117 trillion cubic feet from 111 trillion cubic feet in the year 1981.

Saudi Arabia's 8,000-mile Master Gas System (MGS) was virtually completed during the year. The project, begun in 1975, is a complete gas gathering, transporting, and processing network for recovering the bulk of the associated gas produced from several very large oilfields. The gas is used as fuel and feedstocks at the industrial complexes of Jubail and Yanbu. Industrial plants and electrical generation and petrochemical complexes throughout the country were also to use the gas, most of which formerly was vented to the atmosphere and burned. Much was to be compressed or otherwise processed into propane, butane, and natural gasoline for export. Completion of the first stage of the MGS gave Saudi Arabia a liquefied gas capacity of 650,000 barrels per day, which has made Petromin the Persian Gulf's liquefied petroleum gas (LPG) price leader. Capacity of the MGS is 3 billion cubic feet of gas per day, but because of crude oil production cutbacks, resulting in less gas being produced, the system was operated at reduced capacity. Petromin was considering adding offshore fields to the network.

On October 5, 1982, a British LPG ship departed from the Port of Yanbu with Yanbu's first shipment of LPG. The cargo of butane and propane was bound for Italy via the Suez Canal. Even though LPG shipped from Yanbu bore a $6 per ton premium, demand from North American and European buyers appeared strong. The gas-exporting pier, built by Aramco, was designed to handle 200 ships annually. The pier had a delivery-into-ship capacity greater than the receiving flow-rate capacity of any LPG tanker yet designed or built.

At midyear, Aramco, drilling at depths between 12,000 and 15,000 feet, discovered gas in a formation beneath the 6,900-foot-deep Ghawar Oilfield. The discovery tested at 50 million cubic feet of low-sulfur gas per day, and additional wells were to be drilled to determine the extent of the reservoir. Located near Haradh, the well was in the southern end of the Ghawar Field. Petromin hailed the discovery because it eased the need to produce excess oil to meet the country's contractual obligations for natural gas and its derivatives.

Petroleum.—*Exploration.*— Estimated proved crude oil reserves, at 162.4 billion barrels, decreased by 4 billion barrels during 1982. The decline appeared partially responsible for Saudi Arabia's continued very active exploration, drilling, and development activity during the year. Although some Middle East countries had cut back on spending on geophysical activity, Saudi Arabia maintained a high level.

During the year, Aramco operated four full-time onshore seismic crews and for 9 months operated a fifth crew. An offshore survey in tidal waters, which was begun in 1981, was completed during 1982, and some deepwater seismic surveying was done in the latter part of the year. In all, 25 exploratory wildcats were drilled and 4 found new oil. Further appraisals were expected before potential reserves could be established. Step-out wells extended oil production of three onshore and two offshore fields.

Production.—The declining world market for oil and OPEC's price rollback of $5 per barrel for benchmark crude to $29.00 per barrel conspired to create significant impacts upon Saudi Arabia's income in 1982. Total annual production was 2.3 billion barrels. According to Saudi Arabia's Ministry of Finance and National Economy, Aramco produced 98% of the Kingdom's oil; Getty Oil, 1%; and Arabian Oil, 1%. Average daily crude oil production in 1982 was 6,484,000 barrels, down 33% from the 1981 daily average of 9,620,000 barrels. These price reductions and production cutbacks reduced Saudi Arabia's income about $100 million daily.

A few capital projects in the Kingdom were canceled; others were delayed, but exploration and development drilling remained at about 200 wells per year. Between Saudi Arabia and neighboring Abu Dhabi, there were 39 rigs drilling in the Persian Gulf, while another 11 rigs were doing workovers in the offshore area. Nevertheless, the majority of the drilling was onshore. As reported by Aramco, a total of 185 wells was drilled by the company as contractor to Petromin; this included 25 exploratory wells. There were 650 flowing oil wells in the country in 1982. There was a total of 48 commercial oilfields in the

country, although all were not producing and virtually none were fully developed.

Onshore, five new gas-oil separator plants were put into operation, one of which was equipped to handle crude containing saltwater. Saltwater separating facilities were added to four other gas-oil separators; compressor facilities for gas produced with oil were installed at one gas-oil separator, and a gas lift compressor plant was inaugurated at the Khurais Field.

In August, Aramco announced commissioning of its 600,000-barrel-per-day Safaniya water-separating facility located on the Persian Gulf, some 270 miles north of Dhahran. The plant was to remove corrosive saltwater from oil produced from offshore fields, prior to sending it to the Ras Tanura terminal complex.

At Safaniya, construction continued on a 16-compressor facility that will move associated gas from offshore Safaniya and Zuluf Fields to the Shedgum gas plant for use in the Eastern Province's sweet gas system. This facility will be able to handle 930 million cubic feet of gas per day.

A $234 million gas-oil separator was to be built at Marjan, which would service two offshore oilfields—Zuluf, which produced medium and heavy crude, and Marjan, which produced medium crude. Throughput capacity was to be 470,000 barrels per day. The plant was described as part of Aramco's plan to expand output for heavy and medium crudes. This was to help Saudi Arabia realize its target in balancing the export mix between light, medium, and heavy crudes.

Refining.—Total refined petroleum output in Saudi Arabia declined slightly during 1982. Refined product output from the Kingdom's five operating refineries was 322,855,000 barrels, down 1% from that of 1981 but up 43% from the product output of 10 years earlier. Product mix in 1982 consisted of motor gasoline and naphtha, 21%; kerosine, 3%; distillate fuel oil, 21%; residual fuel oil, 29%; LPG, 18%; asphalt, 4%; and the remaining refinery products, 4%.

One more refinery, to add to the five already in operation, was completed in late 1982. The 170,000-barrel-per-day refinery, wholly owned by Petromin and located at Yanbu, was completed and ready for operation early in 1983. Foster-Wheeler Corp. of the United States was contracted for 5 years to assist in startup, operation, maintenance, and management of the refinery.

Petromin's Riyadh refinery, after post-expansion startup difficulties were cleared up, was running crude slightly in excess of its throughput capacity. During midyear, the 120,000-barrel-per-day plant was handling 123,000 barrels per day, and the company expected to exceed 130,000 barrels per day shortly thereafter. The expansion work was done by Chiyoda International S.A., the wholly owned subsidiary of the Chiyoda Chemical Engineering & Construction Co. Ltd. of Tokyo, Japan.

Despite these improvements in Saudi Arabia's petroleum-product-supply picture, the Kingdom still contracted with foreign refineries to meet its domestic requirements. Petromin's Jedda refinery contracted with Greece's Petrola Helas AS to process 92,000 barrels of Saudi crude per day at its Elefis refinery. A second contract went to SARAS S.p.A. Raffinerie Sarde for 38,000 barrels per day at its Sarroch, Italy, facility.

A 150,000-barrel-per-day refinery will be built near Buraydah to serve the central province, and a second 150,000-barrel-per-day plant near Gahama would serve the Red Sea coast. The completion of these two refineries will make Saudi Arabia self-sufficient in refined products.

On the Red Sea, at Rabigh, between Jedda and Yanbu, Petromin and Petrola International of Athens, Greece, continued construction of a 325,000-barrel-per-day export refinery. Completion of the first stage was due in 1984. This unit will make fuel oil, diesel fuel, jet fuel, naphtha, and LPG. Petromin was considering adding a lube oil base stock refinery at Rabigh.

At Yanbu, Petromin and Mobil Oil Corp. made a contract with a Japanese firm to build a 250,000-barrel-per-day export refinery, which was due for completion late in 1984. The facility will produce distillates and other light products.

In addition, a number of lube oil plants were under construction or expansion during the year.

Marketing.—All petroleum products sold at retail within Saudi Arabia to individuals are marketed by Petromin. As of July 1982, prices in U.S. cents per Imperial gallon in Riyadh were premium gasoline, 25 cents; regular gasoline, 18.6 cents; diesel fuel, 8 cents; kerosine, 15.7 cents; and diesel fuel to industry, 4 cents. There were no taxes imposed on the sale of any of these products.

Petrochemicals.—Construction was moving ahead during 1982 on a number of

petrochemical plants at either Jubail, in the heart of the Eastern Province's onshore and offshore oil-associated gasfields, or at Yanbu on the western side of the country close to the Red Sea. The Arab world will soon be a major exporter of methanol. Early in 1983, a 600,000-ton-per-year plant at Jubail was to commence production, and another plant, producing 650,000 tons per year, was scheduled for startup in 1984, also at Jubail.

Citing low worldwide demand, The Dow Chemical Co. of the United States withdrew from its joint venture with Saudi Arabian Basic Industries Corp. (SABIC), known as Petrokemya, under which a $1.5 billion petrochemicals complex was to be built at Jubail. SABIC was seeking new partners and had added two more products to the planned output of the plant, polyvinyl chloride, 150,000 tons per year, and vinyl chloride monomer, 250,000 tons per year.

SABIC let two contracts late in 1982 for construction of a $145 million air separation plant at Jubail. Contracts went to the Chiyoda Chemical Engineering & Construction Co. Ltd. of Japan and to Chiyoda Petrostar Ltd. of Saudi Arabia. The plant will make about 400 tons of nitrogen and 1,200 tons of oxygen daily. The nitrogen plant was scheduled for startup in 1984; the oxygen plant was set for a mid-1985 startup.

More than 225 modules, some weighing nearly 2,000 tons, will go into the ethylene-based petrochemical facility being built by Fluor Corp. of the United States for the Saudi Petrochemical Co. at Jubail. The modules were being fabricated in Japan and then shipped some 6,500 miles to Saudi Arabia. After unloading at the docks, the move to the jobsite will utilize a new handling system of transporters and jacks that were developed by Fluor. The plant will be the largest module plant ever built.

A second modular methanol plant for Jubail was being built by the Mitsubishi Chemical Engineering Center in Japan for Saudi Methanol Co. A total of 80 modules in all were to travel, 10 and 11 at a time, on the decks of a vessel owned by Dock Express Shipping BV.

The Mineral Industry of Sierra Leone

By Ben A. Kornhauser[1]

Sierra Leone's economy continued to deteriorate, and its budget deficits continued to grow owing to factors such as declining income from exports, shortages of foreign exchange and fuel, rising import prices, and a depressed world economy. The principal earners of foreign exchange were mineral exports of which diamonds accounted for over 50% of such earnings. Undocumented diamond mining and sales also contributed to a loss of foreign exchange earnings. The only new boost to the economy came from bauxite exports that increased in value in fiscal year 1982 to about $11.5 million,[2] 17% more than that of fiscal year 1981.

The Bumbuna hydroelectric project on the Seli River received an additional commitment for $50 million from the International Bank for Reconstruction and Development (World Bank), increasing the total estimated project cost to $352 million. Detailed engineering plans were being drawn. The Mano River Union, composed of Sierra Leone, Liberia, and Guinea, sought funds to develop a hydroelectric project on the Mano River to provide energy for all its members. Completion of one or both of these projects would provide reliable, less costly energy to the mining sector, which relied on diesel generators.

Table 1.—Sierra Leone: Production of mineral commodities[1]

[e]Estimated. [p]Preliminary. NA Not available.

[1]Table includes data available through June 30, 1983.

[2]In addition to the commodities listed, a variety of crude construction materials (clays, sand and gravel, and stone) is produced, but output is not reported, and available general information is inadequate to make reliable estimates of output levels. Sierra Leone annually refines 4,000 to 10,000 metric tons of salt from imported crude marine salt, but this is not included in the body of the table because it would represent double counting of materials credited to the country where the salt was originally collected. This output would be in addition to that reported in this table.

PRODUCTION AND TRADE

Sierra Leone's earnings from the export of diamond, bauxite, and agricultural products fell about 22% in the year ending June 30, 1982, from the average annual earnings in the preceeding 2 years. To offset this decline, the International Monetary Fund cleared a $22.5 million loan.[3] Weak diamond prices and a drop of over 20% in recorded diamond production from that of fiscal year 1981 reduced the value of fiscal year 1982 diamond exports to about $50 million, about 30% lower than that in fiscal year 1981. The United States was a major recipient of Sierra Leone's diamond, rutile, coffee, and cocoa, purchasing over 30% of the 1981 exports. In 1982, U.S. exports to Sierra Leone totaled $15 million compared with U.S. imports of $35 million.

COMMODITY REVIEW

METALS

Bauxite.—Production of bauxite ore fell to an estimated 600,000 tons. However, the recently installed drying facilities at the Sierra Leone Ore & Metal Co., a subsidiary of Swiss Aluminium Ltd., improved bauxite quality and were responsible largely for an increase in export earnings to $11.5 million, a 17% increase over that of fiscal year 1981.

Gold.—Eurocan Ventures Ltd. (EVL) of Canada reported two potential gold deposits, one minable by open pit in the East Zone of its property and the other minable by adit access in its Central Zone. EVL was discussing mining the deposits as a joint venture with several major mining companies.

Iron Ore.—The Marampa Iron Ore Mining Co. Ltd., wholly owned by the Government of Sierra Leone, officially reopened the Marampa iron ore mines in December 1982. The mines were reactivated and operated by Austromineral GmbH, a subsidiary of the Austrian state-owned firm of Voest-Alpine AG. Production, based on the exploitation of the primary specularite ore and recovery of secondary tailing pond ore averaging 28.6% Fe, was expected to be about 1 million tons annually. The concentrate contained about 64% total iron, 5.6% SiO_2 and 0.9% Al_2O_3, had excellent metallurgical characteristics as a first class sinter-feed material, and was to be exported to Austria. The project created employment for about 700 people.

Titanium.—The Nord Resources Corp. of Ohio in partnership with Glickenhaus and Co., a U.S. firm, acquired the 85% interest held by the Bethlehem Steel Corp. in Sierra Rutile Ltd. (SRL), a producer of titanium dioxide. Nord already owned a 15% interest in the project with which it had been associated since 1971. Production from the operation would be marketed by Bomar Resources Inc. of New York. Past production had been at 50% or less than the annual capacity of 100,000 tons of rutile owing to depressed world markets. About 700 people were employed by SRL.

NONMETALS

Cement.—The Sierra Leone Cement Works, owned 60% by private Sierra Leonean companies and shareholders and 40% by the French Ciments D'Origny, was scheduled to start production in June. The $8 million project was financed by $2.4 million from the private interests, a $2.4 million loan from the International Finance Corp., and a $3.2 million loan from the French Government. The firm employed 50 Sierra Leoneans plus 3 French experts to manage the plant. Annual production capacity was expected to be 120,000 tons of cement, of which 50,000 was to be exported. Most of the raw materials were imported.[4]

Diamond.—The Government and the Sierra Leone Selection Trust (SLST), a subsidiary of British Petroleum Ltd., signed a memorandum of understanding for the underground mining of the kimberlite deposits in the Kono district of the Eastern Province. The agreement granted SLST a mining license until the year 2010 with a renewal option for another 10 years. Under the agreement, the Government owned 60% of the National Diamond Mining Co. (DIMINCO) and SLST held the remaining 40%. The memorandum required an investment of about $100 million, which was expected to come from SLST, the Government, loans from the European Investment Bank, and through buyer-supplier credits.[5] Management of the company continued to be the responsibility of SLST. The expected completion date was 1985. DIMINCO laid

off about 1,800 employees to cut production from alluvial deposits in a period of depressed diamond prices.

Petroleum.—In 1982, exploratory drilling by Mobil Exploration Sierra Leone Ltd. offshore in Sherbro Straits did not produce positive results. However, other firms and the Government still were interested in onshore and offshore exploration.

The Mineral Industry of the Republic of South Africa

By Miller W. Ellis[1]

The mineral industry of the Republic of South Africa continued to be the mainstay of the country's economy and to provide approximately 50% of its foreign exchange earnings. The gross domestic product showed an increase of 11% in terms of domestic currency but was equivalent to only $67.2 billion,[2] a decline of approximately 11% in terms of U.S. dollars. The devaluation of the South African rand during the year neutralized the effects of the world's depressed mineral prices and maintained a reasonably prosperous mineral-related segment of the country's industry. The value of the domestic and export sales of raw mineral products was $13.3 billion, a decrease of 16% in U.S. dollar terms but an increase of nearly 6% in South African rands. This was augmented by a substantial amount of mineral-related manufactures such as cement, coke, refined and fabricated metal products, cut gem stones, and fertilizer materials.

Six multinational corporations accounted for most of the mining activity, but the state-controlled South African Iron and Steel Industrial Corp. Ltd. (Iscor) operated its own iron, zinc, and tin mines, and its own colliery and dolomite quarries to provide raw material to its three major iron and steel producing and fabricating plants. The Government-owned Industrial Development Corp. of South Africa Ltd. (IDC) indirectly controlled the Phosphate Development Corp. Ltd. (Foskor) and its downstream fertilizer producers at the Palabora carbonatite deposit in eastern Transvaal Province, and the state-run Alluvial Diamond Diggings at Alexander Bay near the mouth of the Orange River in northwestern Cape Province. Public ownership of the state-initiated South African Coal, Oil and Gas Corp. Ltd. (Sasol) was increased by the purchase of shares in its oil-from-coal operations, and its Sasol III plant was completed southeast of Johannesburg.

The Republic of South Africa's mineral industry supported nearly 750,000 workers. Wages for the unskilled and semiskilled categories have increased about tenfold since 1972, despite the fact that union representation for blacks was not recognized until recently. In March 1982, De Beers Consolidated Mines Ltd., Kimberley Div., recognized that blacks should also be represented by a large "mixed" union, which previously was considered to represent Asians and mixed races as well as whites. In September, the Chamber of Mines of South Africa, the employers' official negotiating body, recognized a nonwhite trade union, representing Asian and mixed race employees, for certain job categories in two gold mines. The Chamber agreed to expand this recognition to other job categories and other mines, and also agreed to allow officials of a new black union to recruit additional members in the mines. At the time, less than 50% of the eligible employees of the two mines had agreed to join the union. Recruitment of additional black members to the National Union of Mineworkers has proceeded slowly, partly because of the varied country and tribal groups represented in the work force. Employee representative groups faced many problems in amalgamating eight existing unions, three organizations representing officials and salaried staff, and the new black unions into an efficient bargaining group.

PRODUCTION AND TRADE

The Republic of South Africa maintained its world leadership in the production of chromite, gem diamonds, gold, platinum, and vanadium, and as one of the top three producers of antimony, asbestos, fluorspar, industrial diamond, manganese ore, uranium, and vermiculite. It remained one of the world's major coal exporters and made slight increases in the production of gold, manganese ore, phosphate rock, tin, and tantalite, but production of chromite decreased 25%; hematitic iron ore, 16%; asbestos, 10%; lead, 9%; silver, 8%; and zinc, 5%.

The $8.12 billion value of gold sales was a decrease of 17% from its 1981 value in terms of U.S. dollars, but an overall increase of 2.6% in domestic value, and indicated an average sale price of $380 per troy ounce. Coal continued to be the second most valuable mineral product with total sales of $2.37 billion including exports of $1.09 billion. Japan and the central European countries were major importers of South African coal as well as chromite, manganese ore, vanadium, and uranium. Diamonds and precious metals were exported chiefly to the United Kingdom, Switzerland, and the United States. Crude petroleum continued to be the country's chief mineral import, but the increasing output of domestic refinery products reflects an increasing amount of synthetic crude available from the Sasol plants and not an increase in crude petroleum imports.

Residual fuel oil do	22,178	22,630	23,360	24,090	

See footnotes at end of table.

Table 1.—Republic of South Africa: Production of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1978	1979	1980	1981[p]	1982[p]
MINERAL FUELS AND RELATED MATERIALS —Continued					
Petroleum refinery products —Continued					
Lubricants thousand 42-gallon barrels	2,240	2,555	2,555	2,555	NA
Other do	7,372	6,205	6,205	8,395	
Refinery fuel and losses do	5,700	4,015	4,015	5,475	
Total do	106,326	105,485	108,040	115,705	NA

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.
[1]Table includes data available through Sept. 15, 1983.
[2]Less than 1/2 unit.
[3]Data may not add to totals shown because of independent rounding.
[4]Includes osmiridium from gold ores estimated at 2,500 troy ounces per year.
[5]Domestic sales plus exports.
[6]Sulfuric acid was produced from gases derived from local smelting operations and from burning imported elemental sulfur.

Table 2.—Republic of South Africa: Apparent exports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals:				
Rare-earth metals	351	--	--	
Unspecified value, thousands	--	$2	--	All to Israel.
Aluminum:				
Ore and concentrate	180	72	72	
Oxides and hydroxides	244	31,492	--	All to Venezuela.
Ash and residue containing aluminum	--	92	--	All to Spain.
Metal including alloys:				
Scrap	90	245	--	West Germany 138; Netherlands 71; United Kingdom 36.
Unwrought	7,817	178	--	Japan 99; Norway 44; Taiwan 35.
Semimanufactures	2,672	11,492	--	Sri Lanka 11,450; Israel 33; United Kingdom 5.
Antimony:				
Ore and concentrate	1,937	2,339	533	France 1,566; Belgium-Luxembourg 240.
Oxides	6,393	4,175	4,175	
Beryllium: Ore and concentrate	24	94	94	
Cadmium: Metal including alloys, all forms	--	16	16	
Chromium: Ore and concentrate thousand tons	1,376	1,311	438	Japan 348; West Germany 187; Sweden 104.
Cobalt:				
Oxides and hydroxides	8	14	7	West Germany 7.
Metal including alloys, all forms	35	--		
Columbium and tantalum:				
Ore and concentrate kilograms	[2]4,920	[2]4,061	2,000	NA.
Metal including alloys, all forms, columbium (niobium) do	1	--		
Copper:				
Ore and concentrate	84,909	79,778	--	West Germany 61,903; Japan 17,825.
Matte and speiss including cement copper	88	123	--	All to West Germany.
Ash and residue containing copper	--	2,445	--	West Germany 1,361; Spain 1,084.
Metal including alloys:				
Scrap	1,068	2,848	--	United Kingdom 796; Spain 737; Belgium-Luxembourg 652.
Unwrought	180,423	144,956	66	West Germany 55,176; Belgium-Luxembourg 38,102; Japan 29,549.
Semimanufactures	[3]2,519	1,955	1,204	United Kingdom 218; Israel 124; Netherlands 86.
Gold:				
Waste and sweepings troy ounces	--	[4]1,061	32	West Germany 1,029.
Metal including alloys, unwrought and partly wrought thousand troy ounces	--	963	447	West Germany 226; Netherlands 153; Japan 77.

See footnotes at end of table.

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Iron and steel:				
Iron ore and concentrate, excluding roasted pyrite -- thousand tons	14,286	12,995	--	Japan 5,765; West Germany 4,155.
Metal:				
Scrap	5,974	1,746	--	Netherlands 776; Italy 286; Japan 253.
Pig iron, cast iron, related materials	[5]92,088	[6]111,409	41,719	Japan 21,016; Spain 15,690; Italy 6,184.
Ferroalloys:				
Ferrochromium	691,394	469,067	238,377	Japan 125,823; West Germany 35,131; France 31,332.
Ferromanganese	288,193	303,324	249,006	Canada 16,344; Italy 15,917; West Germany 6,545.
Ferromolybdenum	--	135	--	West Germany 103; France 32.
Ferronickel	--	12	12	
Ferrosilicochromium	16,433	5,218	2,616	Japan 1,981; Spain 621.
Ferrosilicomanganese	56,269	46,610	23,185	West Germany 10,714; Italy 6,517; Canada 4,563.
Ferrosilicon	22,778	12,378	1,695	Japan 8,889; West Germany 1,707.
Unspecified	42,032	77,188	--	United Kingdom 41,530; Japan 19,085.
Steel, primary forms	203,840	43,202	9,718	Taiwan 12,600; Argentina 10,110.
Semimanufactures:				
Bars, rods, angles, shapes, sections	486,986	[7]351,987	128,540	United Kingdom 67,019; Sri Lanka 53,515; Canada 41,678.
Universals, plates, sheets	524,660	[8]447,500	128,093	Taiwan 149,832; Canada 33,220; United Kingdom 32,343.
Hoop and strip	1,885	[9]5,017	--	Sri Lanka 3,976; Taiwan 368.
Rails and accessories	7,702	151	--	Taiwan 150; Argentina 1.
Wire	17,396	[10]10,248	2,551	Sri Lanka 3,623; Israel 1,600; Argentina 692.
Tubes, pipes, fittings	68,849	[11]63,733	49,956	United Kingdom 10,546; Sri Lanka 1,402; United Kingdom 1,315.
Castings and forgings, rough	115	23	3	Canada 8; Netherlands 4; Saudi Arabia 4.
Unspecified	([12])	77,188	--	United Kingdom 41,530; Japan 19,085; Venezuela 3,196.
Lead:				
Ore and concentrate	84,512	145,404	--	France 49,658; Canada 30,080; Japan 23,297.
Oxides	88	131	--	Australia 31; France 17; United Kingdom 13.
Metal including alloys:				
Scrap	735	368	--	West Germany 360; United Kingdom 8.
Unwrought	24,360	18,160	--	Italy 13,818; Japan 4,227.
Semimanufactures	58	80	--	United Kingdom 78.
Magnesium: Metal including alloys:				
Scrap	281	[13]152	19	Austria 133.
Unwrought	1	16	--	All to Norway.
Semimanufactures value, thousands	--	$212	--	All to Australia.
Manganese:				
Ore and concentrate, metallurgical-grade thousand tons	3,428	2,912	206	Japan 1,361; West Germany 360; France 345.
Oxides	500	292	--	Portugal 110; Finland 85.
Metal including alloys, all forms	21,797	24,605	7,480	Canada 9,684; Netherlands 2,577.
Metalloids:				
Arsenic, oxides and acids	--	17	17	
Phosphorus	--	401	--	All to Switzerland.
Silicon	--	9,728	4,193	West Germany 3,378; Netherlands 1,394.
Unspecified	25,321	11,547	--	Japan 6,554; Australia 3,255; Canada 1,122.
Molybdenum: Metal including alloys, all forms	--	47	47	
Nickel:				
Ore and concentrate	48,319	74,095	72,154	Canada 1,936.
Matte and speiss	3,998	3,611	--	Norway 3,430; Spain 70.

See footnotes at end of table.

Table 2.—Republic of South Africa: Apparent exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Nickel —Continued				
Metal including alloys:				
Scrap	1,648	1,989	10	Canada 1,936; United Kingdom 26.
Unwrought	21,815	[14]15,566	3,949	Italy 2,667; West Germany 2,189; France 1,812.
Semimanufactures	1,081	1,116	740	Sweden 310; Argentina 14; Switzerland 14.
Platinum-group metals: Metal including alloys, unwrought and partly wrought:				
Palladium troy ounces	NA	766,461	581,799	Japan 180,032; France 3,633.
Platinum do	NA	1,500,129	868,133	Japan 558,050; West Germany 54,045.
Rhodium do	NA	66,543	52,888	Japan 13,655.
Iridium, osmium, ruthenium do	NA	122,921	105,744	Japan 17,177.
Unspecified value, thousands	$1,099,629	$32,575	$540	United Kingdom $13,771; Switzerland $10,590; Italy $5,135.
Silver:				
Ore and concentrate[15] do	$36,600	$11,614	$301	Canada $8,889; Spain $2,424.
Waste and sweepings[15] do	$275,079	[16]$1	$1	
Metal including alloys, unwrought and partly wrought do	$53,470	$24,538	$306	United Kingdom $22,481; West Germany $1,213.
Tin:				
Ore and concentrate	2,757	2,174	--	United Kingdom 2,172; Australia 2.
Ash and residue containing tin	--	83	--	West Germany 77; Spain 6.
Metal including alloys:				
Scrap	([17])	20	--	All to Sri Lanka.
Unwrought	1,250	759	34	United Kingdom 402; Italy 292.
Semimanufactures	30	[18]3	--	United Kingdom 3.
Titanium:				
Ore and concentrate	54,367	139,611	64,544	France 61,747; Netherlands 3,929.
Oxides	1,142	15	--	All to Hong Kong.
Metal including alloys, ash and residue containing titanium	r44,923	86,680	20,579	Japan 66,086.
Tungsten:				
Ore and concentrate	24	21	--	All to West Germany.
Metal including alloys, scrap	--	3,303	3,303	
Uranium and/or thorium:				
Ore and concentrate value, thousands	--	$52,367	--	Mainly to Canada.
Oxides and other compounds	--	1,533	1,533	
Vanadium:				
Oxides and hydroxides	3,949	3,995	382	Japan 2,848; Belgium-Luxembourg 487.
Ash and residue containing vanadium	--	11,140	10,840	Netherlands 300.
Zinc:				
Ore and concentrate	52,846	42,781	([19])	West Germany 40,545.
Oxides	365	7	--	All to Sri Lanka.
Metal including alloys:				
Unwrought	100	994	994	
Semimanufactures	49	34	12	Portugal 15; Ireland 7.
Zirconium: Ore and concentrate	83,258	85,059	15,186	West Germany 24,132; Japan 20,359.
Other:				
Ores and concentrates	15,636	51,027	7,187	Canada 33,281; Switzerland 3,690; Venezuela 2,013.
Oxides and hydroxides	5,649	--	--	
Ashes and residues	202,771	100,322	1,561	Italy 83,915; Austria 13,118.
Base metals including alloys, all forms	12,662	[20]6,557	308	Sweden 1,761; France 1,169; United Kingdom 912.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	531	1,516	([21])	Canada 1,481; Taiwan 33.
Dust and powder of precious and semi-precious stones, excluding diamond value, thousands	$10,019	$6,869	$2,645	France $3,503; West Germany $441.
Grinding and polishing wheels and stones do	([22])	[23]$31	$2	New Zealand $19; Israel $5.
Asbestos, crude	330,730	194,975	17,114	Japan 51,958; Italy 23,406; Taiwan 11,852.
Barite and witherite	500	3,293	--	Venezuela 3,284; Canada 9.
Cement	115,135	[24]57,220	65	Reunion 57,144.

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Clays and clay products:				
Crude:				
Andalusite, kyanite, sillimanite	r [2]106,786	[2]60,047	4	NA.
Bentonite	[2]1,630	[2]1,798	NA	NA.
Chamotte earth	2,868	NA		
Kaolin	[2]1,798	[2]1,346	NA	NA.
Unspecified	128,378	106,797	--	Japan 45,500; West Germany 21,797; Australia 16,201.
Products:				
Nonrefractory	10,059	1,031	368	Belgium-Luxembourg 352; Hong Kong 291.
Refractory including nonclay brick	30,164	[2]23,886	599	Italy 11,249; Australia 7,639.
Cryolite and chiolite	351	NA		
Diamond:				
Gem, not set or strung value, thousands	$1,362,800	$574,837	$358,623	Hong Kong $65,461; United Kingdom $57,332; Japan $14,603.
Industrial do	$74,404	$63,198	$46,340	West Germany $6,978; Japan $4,982; Australia $2,202.
Feldspar, fluorspar, related materials:				
Unspecified	498,446	399,775	223,326	Japan 77,150; West Germany 28,809; Canada 27,515.
Fertilizer materials:				
Crude, n.e.s	108,346	3,255	--	West Germany 2,702; France 301.
Manufactured:				
Ammonia	1	--		
Nitrogenous	20	197	--	Sri Lanka 175; West Germany 22.
Phosphatic	15,593	10,624	--	West Germany 7,514; Denmark 1,636.
Unspecified and mixed	14,777	422	--	Mainly to West Germany.
Graphite, natural	967	541	219	United Kingdom 322.
Gypsum and plaster	[2]1,092	[2]2,604	NA	NA.
Halogens: Chlorine	--	2	--	All to United Kingdom.
Lime	[2]78,599	[2]68,908	107	NA.
Magnesium compounds: Magnesite	458	2,513	--	West Germany 2,274; Austria 233.
Mica:				
Crude including splittings and waste	--	973	--	United Kingdom 436; West Germany 343.
Worked including agglomerated splittings	1,601	--		
Pigments, mineral:				
Natural, crude	r [2]--	[2]18	NA	NA.
Iron oxides and hydroxides, processed	[2]18	18	--	All to Taiwan.
Precious and semiprecious stones other than diamond:				
Natural value, thousands	$13,691	$11,500	$3,429	Switzerland $3,309; West Germany $1,494; United Kingdom $1,453.
Synthetic do	$69	$17	$13	Canada $2.
Pyrite, unroasted	[2]47,181	7	--	All to Sweden.
Salt and brine	[2]53,745	[2]54,554	NA	NA.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	18	--		
Sodium carbonate, natural and manufactured	NA	--		
Sodium hydroxide	1	--		
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked thousand tons	1,099	753	453	Italy 70; France 68; Japan 38.
Worked do	[2]197	[2]197	NA	NA.
Gravel and crushed rock	5,701	636	133	Mainly to Netherlands.
Limestone other than dimension	NA	54	36	United Kingdom 18.
Quartz and quartzite	3,648	943	1	Netherlands 658; West Germany 167.
Sand other than metal-bearing	11,540	9,661	1,159	Belgium-Luxembourg 6,973; United Kingdom 1,159.
Sulfur:				
Elemental:				
Crude including native and byproduct	138	--		
Colloidal, precipitated, sublimed	NA	--		
Sulfuric acid	5	--		
Talc, steatite, soapstone, pyrophyllite	[2]500	NA		

See footnotes at end of table.

Table 2.—Republic of South Africa: Apparent exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Vermiculite	[2]156,072	[2]184,152	NA	France 26,657; West Germany 12,157.
Other:				
Crude	--	73,114	([26])	United Kingdom 33,252; Italy 10,465.
Slag and dross, not metal-bearing	118,725	66,765	--	Japan 66,086.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	--	173	([27])	All to United Kingdom.
MINERAL FUELS AND RELATED MATERIALS				
Carbon: Carbon black	1,019	2,455	--	Do.
Coal:				
Anthracite and bituminous thousand tons	[2]29,150	[2]29,882	739	France 7,583; Japan 4,277; Italy 4,274.
Briquets of anthracite and bituminous coal	174	86,088	--	All to Italy.
Lignite including briquets	99	7	--	All to West Germany.
Coke and semicoke	194	3,847	--	Belgium-Luxembourg 3,527; Sri Lanka 320.
Peat including briquets and litter	39	64	64	
Petroleum refinery products:				
Liquefied petroleum gas thousand 42-gallon barrels	9	--		
Gasoline do	([21])	NA		
Mineral jelly and wax do	186	184	107	West Germany 36; France 14.
Distillate fuel oil do	206	NA		
Lubricants do	197	3,006	16	Taiwan 2,966; Colombia 14.
Residual fuel oil do	1,038	1,283	--	Switzerland 791; Spain 483.
Bitumen and other residues do	57	60	--	Reunion 55; Italy 4.
Unspecified do	--	41	--	West Germany 14; Colombia 7.
Tars and other crude chemicals derived from coal, gas, and petroleum	7,284	11,707	1,002	United Kingdom 10,521; Argentina 163.

[r]Revised. NA Not available.

[1]Because official South African trade statistics provide data only on the value of total exports of each commodity class (with no data on destinations) and not on quantity of material exported, this table has been compiled from a variety of sources including the quarterly publication "Minerals" issued by the Department of Mines (issues for 1980 and 1981) as well as official trade returns of trading partner countries. Data from "Minerals" is footnoted; other figures are compiled from a variety of sources with specifics on destination obtained from the import statistics of the countries listed. Data presented are exports by the common customs areas of Botswana, Lesotho, the Republic of South Africa, and Swaziland.

[2]"Minerals" Quarterly of the South African Department of Mines. Figures are shipments by producers for export and are not necessarily actual exports.

[3]Total excludes unreported quantities valued at $48,000 to Israel and $15,000 to Uruguay.

[4]Total excludes unreported quantity to Israel valued at $234,000.

[5]Total excludes unreported quantities valued at $58,000 to Uruguay and $16,000 to Israel.

[6]Total excludes unreported quantity to Israel valued at $7,000.

[7]Total excludes unreported quantities to Australia (partial) valued at $1,537,000; Israel—$20,963,000; Japan—$2,000; Switzerland—$1,000; and Sweden—$2,000.

[8]Total excludes partial unreported quantity to Australia valued at $301,000.

[9]Total excludes unreported quantity to Australia valued at $2,000.

[10]Total excludes unreported quantities to Australia (partial) valued at $141,000 and United Kingdom valued at $4,000.

[11]Total excludes unreported quantities to Australia valued at $302,000 and Canada valued at $1,023,000.

[12]Value only reported at $28,023,000.

[13]Total excludes unreported quantity to Israel valued at $99,000.

[14]Total excludes unreported quantity to Australia valued at $223,000.

[15]May include platinum-group metals.

[16]Excludes unreported values of 12,507 troy ounces to Canada and 67,516 troy ounces to France.

[17]Unreported quantity valued at $20,000.

[18]Excludes unreported quantity to Greece valued at $15,000.

[19]Unreported quantity valued at $48,000.

[20]Total excludes unreported quantities to Australia valued at $2,363,000; Canada—$10,031,000; Israel—$8,000; Japan—$3,552,000; and New Zealand—$43,000.

[21]Less than 1/2 unit.

[22]Quantity reported at 76 metric tons.

[23]Excludes unreported values to Canada of 12 metric tons and Australia 5 metric tons.

[24]Excludes unreported quantity to Australia valued at $12,000.

[25]Excludes unreported quantities to Hong Kong valued at $446,000 and to New Zealand valued at $2,089,000.

[26]Value only reported at $4,469.

[27]Value only reported at $768,000.

Table 3.—Republic of South Africa: Imports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981

Aluminum:				
Ore and concentrate	24,742	15,304	--	Australia 10,182; West Germany 2,914; Japan 162.
Oxides and hydroxides	164,725	180,066	288	Australia 167,542; United Kingdom 5,272; Japan 3,012.
Metal including alloys:				
Scrap	1,809	9,160	4,710	United Kingdom 1,529; West Germany 832; Australia 543.
Unwrought	282	2,417	249	West Germany 808; Switzerland 510; United Kingdom 361.
Semimanufactures	12,668	15,574	4,210	West Germany 5,438; Japan 1,537; United Kingdom 1,384.
Beryllium: Metal including alloys, all forms value	$24,121	$487	--	NA.
Chromium:				
Ore and concentrate	7,430	8,147	--	NA.
Oxides and hydroxides	470	566	124	West Germany 350; Italy 52; Japan 11.
Cobalt:				
Oxides and hydroxides	12	15	--	Australia 6; United Kingdom 4; Canada 1.
Metal including alloys, all forms	100	82	25	Belgium 15; Japan 7; Sweden 6.
Columbium and tantalum: Metal including alloys, all forms, tantalum kilograms	1,100	1,200	800	NA.
Copper:				
Ore and concentrate	2,972	2,040	--	Australia 1,984.
Metal including alloys:				
Scrap	286	376	33	United Kingdom 78.
Unwrought	9,013	5,180	(2)	Australia 776; Belgium 573; Chile 200.
Semimanufactures	r5,601	14,878	294	West Germany 8,846; United Kingdom 1,880; Belgium 1,479.
Gold:				
Waste and sweepings value	r$668,806	$988,425	$168,315	United Kingdom $626,871; Australia $175,807.
Metal including alloys, unwrought and partly wrought troy ounces	6,151	8,798	279	United Kingdom 5,659; France 1,910; Switzerland 432.
Iron and steel:				
Iron ore and concentrate:				
Excluding roasted pyrite	(3)	38	--	NA.
Pyrite, roasted	(3)	--		
Metal:				
Scrap	27,922	12,462	(4)	United Kingdom 3,146.
Pig iron, cast iron, related materials	31,136	22,476	1,105	Sweden 2,332; United Kingdom 434; West Germany 180.
Ferroalloys:				
Ferrochromium	6,973	6,027	9	Sweden 55; United Kingdom 20.
Ferromanganese	242	300	--	West Germany 191; United Kingdom 102.
Ferrosilicon	1,824	2,601	15	France 1,265; Brazil 589; West Germany 472.
Unspecified	2,009	968	61	Belgium 325; United Kingdom 214; France 125.
Steel, primary forms	6,836	14,688	17	West Germany 642; France 359.
Semimanufactures:				
Bars, rods, angles, shapes, sections	35,410	48,871	581	United Kingdom 12,045; Japan 5,572; West Germany 4,501.
Universals, plates, sheets	r56,593	59,416	1,286	Japan 30,729; West Germany 14,383; Italy 6,212.
Hoop and strip	14,489	18,078	677	Japan 6,174; West Germany 3,371; United Kingdom 2,189.
Rails and accessories	1,947	1,788	--	West Germany 486.
Wire	25,510	35,333	830	Belgium 3,909; United Kingdom 3,282; Italy 2,283.
Tubes, pipes, fittings	82,380	73,372	1,806	Japan 35,515; West Germany 11,454; United Kingdom 5,588.
Castings and forgings, rough	537	675	190	United Kingdom 218; West Germany 96; Austria 29.

See footnotes at end of table.

Table 3.—Republic of South Africa: Imports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Lead:				
Ore and concentrate	950	17	17	
Oxides	35	27	6	United Kingdom 13; West Germany 5.
Metal including alloys:				
Scrap	6,212	7,752	5,205	United Kingdom 1,611; Sri Lanka 200.
Unwrought	9,303	9,405	2,909	United Kingdom 1,921; Brazil 478; Peru 100.
Semimanufactures	33	85	(2)	United Kingdom 62; West Germany 10.
Magnesium: Metal including alloys:				
Scrap	40	23	--	NA.
Unwrought	600	500	499	Italy 1.
Semimanufactures	87	62	51	Austria 4.
Manganese:				
Ore and concentrate	3,972	7,052	--	United Kingdom 5,821; Belgium 545.
Oxides	4,560	6,213	2	Belgium 5,309; Greece 718.
Mercury 76-pound flasks	2,988	2,735	90	Spain 2,013; Turkey 145; Japan 128.
Metalloids:				
Arsenic:				
Oxides and acids	1	--		
Metal including alloys, all forms	12	12	5	Sweden 7.
Boron including alloys, all forms kilograms	100	100	100	
Phosphorus	50	53	--	All from United Kingdom.
Selenium	1	9	1	United Kingdom 6.
Silicon	16	81	--	United Kingdom 36; France 27; Netherlands 17.
Tellurium value	$114,358	$3,519	--	NA.
Molybdenum:				
Oxides and hydroxides	312	170	--	United Kingdom 57; West Germany 46; Chile 40.
Metal including alloys, all forms	19	10	4	Netherlands 4; Austria 1.
Nickel:				
Ore and concentrate	--	5	--	NA.
Matte and speiss	(3)	150	--	All from Canada.
Metal including alloys:				
Scrap	89	27	24	United Kingdom 2.
Unwrought	542	522	2	Japan 27; United Kingdom 16.
Semimanufactures	850	748	32	West Germany 189; United Kingdom 178; Japan 151.
Platinum-group metals: Metals including alloys, unwrought and partly wrought, unspecified troy ounces	22,977	26,053	390	United Kingdom 12,091; West Germany 6,749; Belgium 3,280.
Silver:				
Waste and sweepings[5] value	r$686,192	$784,158	--	Italy $327,366.
Metal including alloys, unwrought and partly wrought troy ounces	776,060	834,458	(2)	United Kingdom 7,700; West Germany 6,774.
Tin:				
Ore and concentrate	--	89	--	NA.
Metal including alloys:				
Scrap	149	352	--	NA.
Unwrought	225	276	--	United Kingdom 33; Switzerland 18.
Semimanufactures	20	23	1	West Germany 14; United Kingdom 4.
Titanium:				
Ore and concentrate	50	43	--	West Germany 38.
Oxides	1,529	1,731	819	West Germany 428; France 213; Spain 198.
Tungsten:				
Ore and concentrate	2,504	400	18	Canada 143; Australia 108.
Metal including alloys, all forms	176	39	3	Ireland 22; United Kingdom 4.
Zinc:				
Ore and concentrate	(3)	--		
Oxides	391	803	1	West Germany 333; Belgium 226; United Kingdom 116.
Metal including alloys:				
Scrap	132	1,160	NA	West Germany 368; United Kingdom 206.
Unwrought	1,825	8,287	NA	NA.
Semimanufactures	1,522	709	(2)	United Kingdom 209; Belgium 188; France 181.
Zirconium: Ore and concentrate	49	140	--	All from Japan.

See footnotes at end of table.

Table 3.—Republic of South Africa: Imports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Other:				
Ores and concentrates:				
Of precious metals excluding gold value, thousands	$85,045	$45,560	--	All from Norway.
Of base metals	242	147	144	NA.
Oxides and hydroxides	r886	1,027	94	United Kingdom 386; Belgium 125; West Germany 125.
Ashes and residues	3,092	8,455	--	West Germany 2,163; Netherlands 2,117; United Kingdom 1,408.
Pyrophoric alloys	17	9	3	West Germany 2; Austria 1; Japan 1.
Base metals including alloys, all forms	528	437	39	United Kingdom 212; France 78; West Germany 12.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	11,110	3,875	120	Greece 70; Netherlands 44.
Artificial:				
Corundum	6,146	5,285	2,016	West Germany 1,798; United Kingdom 603; France 456.
Silicon carbide	3,390	3,043	204	Norway 1,846; West Germany 483; Netherlands 219.
Dust and powder of precious and semiprecious stones, value	r$353,919	$347,656	(2)	United Kingdom $304,399; Belgium $23,714; West Germany $12,254.
Grinding and polishing wheels and stones	658	657	54	West Germany 113; United Kingdom 92; Spain 77.
Asbestos, crude	19,518	29,231	19	Canada 1,144.
Barite and witherite	r5,672	3,693	--	United Kingdom 863; West Germany 351; Australia 300.
Boron materials:				
Crude natural borates	1,716	4,250	1,520	United Kingdom 1,734; Netherlands 946.
Oxides and acids	1,179	722	69	France 601.
Cement	95,503	124,586	24	Taiwan 29,000; France 11,512; United Kingdom 3,481.
Chalk	7,016	9,877	57	France 7,235; Sweden 2,280.
Clays and clay products:				
Crude, unspecified	29,627	33,072	24,384	United Kingdom 5,500; West Germany 553.
Products:				
Nonrefractory[6]	34,407	39,941	70	Italy 12,324; United Kingdom 7,282.
Refractory including nonclay brick	r22,638	37,377	2,298	West Germany 17,284; Austria 3,751; United Kingdom 3,334.
Cryolite and chiolite	171	160	4	Denmark 78; West Germany 59.
Diamond:				
Gem, not set or strung, thousand carats	159	166	(7)	Belgium 44; Switzerland 37; Israel 20.
Industrial, do	2,344	2,144	18	United Kingdom 1,473; Ireland 362; Belgium 14.
Diatomite and other infusorial earth	6,465	7,544	6,807	Denmark 100.
Feldspar, fluorspar, related materials:				
Unspecified	80	117	--	NA.
Fertilizer materials:				
Crude, n.e.s	963	--		
Manufactured:				
Ammonia	72,191	77,034	39,152	NA.
Nitrogenous	149,875	361,218	77,718	Netherlands 149,545; United Kingdom 49,751; Belgium 48,944.
Phosphatic	9,006	690	497	Israel 177.
Potassic	145,624	197,335	20	Israel 103,474; West Germany 41,928; Canada 37,355.
Unspecified and mixed	34,084	75,968	74,936	Belgium 392; United Kingdom 350; Netherlands 219.
Graphite, natural	1,132	1,261	17	Norway 550; Brazil 53; West Germany 36.
Gypsum and plaster	7,283	8,049	8	West Germany 5,144; United Kingdom 1,545; Spain 1,346.
Halogens:				
Bromine	76	94	--	All from Israel.
Chlorine, value	r$765	$477	--	NA.
Unspecified	9	11	--	Japan 9.
Lime	4,954	7,829	(2)	France 7,514.

See footnotes at end of table.

Table 3.—Republic of South Africa: Imports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Magnesium compounds:				
Magnesite	92,977	92,876	--	Italy 16,550; Republic of Korea 8,239; Greece 6,292.
Magnesia	5,407	1,214	82	United Kingdom 608; West Germany 362.
Mica:				
Crude including splittings and waste	1,187	948	17	United Kingdom 14.
Worked including agglomerated splittings	83	88	24	Belgium 33; United Kingdom 15.
Phosphates, crude	29	20	20	
Pigments, mineral:				
Natural, crude	227	354	--	Austria 264; United Kingdom 35.
Iron oxides and hydroxides, processed	7,891	10,444	7	West Germany 8,255; United Kingdom 1,185; Spain 87.
Potassium salts, crude	98,949	75,548	--	Canada 49,992; West Germany 13,364; Belgium 6,230.
Precious and semiprecious stones other than diamond:				
Natural:				
Gem material value, thousands	r$1,196	$1,529	$157	West Germany $237; Switzerland $225; Hong Kong $158.
Meerschaum, amber, jet value	--	$226	--	NA.
Synthetic value, thousands	r$3,729	$4,593	$559	Ireland $1,100; Taiwan $111; Austria $78.
Pyrite, unroasted	10,772	5,090	15	West Germany 34.
Salt and brine	20,502	25,667	69	Australia 23,285; West Germany 866; Israel 851.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxide	r1,759	1,997	--	West Germany 520; Spain 496; France 457.
Sodium carbonate, natural and manufactured	255,439	215,283	127,242	United Kingdom 51,542; Denmark 1,674; West Germany 1,068.
Sodium hydroxide	5,604	12,307	--	Brazil 6,009; West Germany 2,782; United Kingdom 2,412.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	1,727	1,802	--	Italy 881; Spain 560.
Worked	1,027	1,550	(2)	Italy 1,222; Portugal 207.
Dolomite, chiefly refractory-grade	33	100	--	NA.
Gravel and crushed rock	11,698	2,458	(2)	NA.
Limestone other than dimension	139	72	--	NA.
Quartz and quartzite	405	472	(2)	West Germany 276; Norway 40.
Sand other than metal-bearing	263	151	11	West Germany 89.
Sulfur:				
Elemental:				
Crude including native and byproduct	913,609	764,885	18,658	Canada 745,774; West Germany 342.
Colloidal, precipitated, sublimed	2,431	2,177	2,100	West Germany 40; United Kingdom 36.
Dioxide kilograms	300	200	--	NA.
Sulfuric acid	222,362	158,036	1	West Germany 39,746; Italy 34,889; Japan 22,901.
Talc, steatite, soapstone, pyrophyllite	2,412	2,676	330	Republic of Korea 1,036; Belgium 396; Italy 370.
Other:				
Crude	5,820	8,874	17	Greece 8,393; Australia 138; West Germany 130.
Slag and dross, not metal-bearing	3,662	2,626	331	France 502; United Kingdom 404; Taiwan 287.
Oxides and hydroxides of barium, magnesium, strontium	296	329	52	United Kingdom 102; West Germany 75; Spain 60.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	1,756	3,462	560	Austria 1,183; Italy 1,085; United Kingdom 246.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	790	555	416	Belgium 36.
Carbon: Carbon black and gas carbon	4,309	4,354	632	Canada 1,201; France 1,111; West Germany 727.

See footnotes at end of table.

Table 3.—Republic of South Africa: Imports of mineral commodities[1] —Continued

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
MINERAL FUELS AND RELATED MATERIALS —Continued				
Coal:				
Bituminous	199,470	51,515	20,463	NA.
Briquets of anthracite and bituminous coal	1	1	--	NA.
Coke and semicoke	21	102	1	United Kingdom 100.
Hydrogen, helium, rare gases	45	26	10	Belgium 14.
Peat including briquets and litter	498	363	--	Finland 150; Canada 84; Ireland 62.
Petroleum refinery products:				
Liquefied petroleum gas 42-gallon barrels	374	921	64	France 718; Italy 118.
Mineral jelly and wax do	407,985	406,132	66,827	Japan 155,318; West Germany 103,346; Italy 16,121.
Lubricants do	11,080	16,141	5,305	United Kingdom 5,250; West Germany 4,139.
Bitumen and other residues do	1,595	1,422	1,001	West Germany 96.
Bituminous mixtures do	2,595	2,534	1,142	United Kingdom 770; Netherlands 335.
Petroleum coke do	448,181	512,616	423,009	United Kingdom 72,902; Japan 16,500.
Tars and other crude chemicals derived from coal, gas, and petroleum	r193	496	(2)	West Germany 274; United Kingdom 202.

rRevised. NA Not available.

[1]Data presented are imports by the common customs areas of Botswana, Lesotho, the Republic of South Africa, and Swaziland released by the Commissioner for Customs and Excise of the Republic of South Africa.

[2]Unreported quantity valued under $10,000.

[3]Less than 1/2 unit.

[4]Unreported quantity valued at $18,800.

[5]May include platinum-group metals.

[6]Totals exclude unreported quantities valued at $10,924,300 in 1980 and $22,087,500 in 1981.

[7]Unreported quantity valued at $251,250.

COMMODITY REVIEW

METALS

Antimony.—Consolidated Murchison Ltd. (CML), a subsidiary of Anglovaal Ltd. (AVL), was the world's largest and the country's only antimony producer. AVL's mines in the eastern Transvaal Province produced 405,727 tons of ore from which 78 tons of high-grade (69% antimony) stibnite ore was sorted, and 405,512 tons of ore was milled to produce 15,236 tons of stibnite concentrate containing 55.6% antimony and 14,617 troy ounces of gold. The concentrate and cobbed ore were treated to produce a crude antimony oxide fire retardant in Antimony Products Ltd.'s thermal plant on CML property, jointly owned with other partners including Chemtron Inc. of Chicago. An additional 1,934 troy ounces of gold was recovered from the thermal plant slag. The antimony metal content of the final product was reported as 8,525 tons. CML reported $17.3 million as gross mining income, including $6.2 million for gold sales, against the working cost of $16.4 million for a mining profit of less than $870,000.

Chromite.—The depressed condition of the world's steel industry was reflected in the nation's diminished chromite production, which declined from 2.9 million tons in 1981 to less than 2.2 million tons in 1982. Chromite was produced by Transvaal Mining and Finance Co. Ltd., a subsidiary of General Mining Union Corp. Ltd. (Gencor), from its Montrose, Groothoek, and Tweefontein Mines near Steelpoort, on the eastern limb of the Bushveld Igneous Complex. None of these mines operated at full capacity, as part of cost controlling measures maintained throughout the industry in anticipation of continued low demand for chromite. Several properties owned by Union Carbide Corp. of the United States and by the state were shut down completely, and South African Manganese Amcor Ltd.'s (Samancor) mines in the western part of the Bushveld were put on a care-and-maintenance basis before the yearend.

Copper.—Rio Tinto-Zinc Corp. Ltd.'s Palabora Mining Co. Ltd., in northeastern Transvaal Province, remained one of the most successful among the world copper producers, by actually increasing its pretax profits from $41.4 million in 1981 to $47.7 million, an increase of nearly 44% in terms of local currency. This profit was achieved by cost-cutting operations instituted during past years, such as the trolley-assist installations to provide electric power on the haulage roads out of the pit, and despite the shutdown of the smelter, refinery, and rod casting plant for scheduled maintenance during March. Palabora mined and milled 29.3 million tons of ore containing less than

0.5% copper and produced 331,299 tons of concentrate containing 37% copper. The smelter produced 122,316 tons of anode copper from Palabora concentrate plus 9,982 tons smelted on toll or from purchased material. Refinery production of 126,474 tons of cathode included 10,294 tons toll refined for others and 70,082 tons of refined copper as continuously cast rod. Byproducts included 128,373 tons of sulfuric acid, 91,363 tons of magnetite, 258 tons of U_3O_8 in uranium concentrate, 6,490 tons of ZrO_2 as baddeleyite, 180,992 tons of vermiculite, and 19 tons of precious metal in refinery slimes.

Messina Ltd., formerly The Messina (Transvaal) Development Co. Ltd. operations, near the Zimbabwean border northwest of Palabora, mined and milled 577,000 tons of ore containing 1.32% copper. The concentrate, containing 7,213 tons of copper, was smelted and fire refined to yield 7,001 tons of refined product with an average sales value of $1,500 per ton or about 68 cents per pound. Messina recorded a net loss of about $2.2 million, following a $1.6 million loss at the 1981 average sales price of nearly 75 cents per pound. The company discussed continuation of state financial assistance with officials of the Department of Mineral and Energy Affairs, and planned to discontinue shaft sinking at the Campbell Mine and all mining at the No. 5 and Artonvilla Sections early in 1983.

The Prieska Copper Mines (Pty.) Ltd., owned jointly by AVL and the United States Steel Corp., was continuing to mine about 240,000 tons per month of copper-zinc-pyrite ore from above the 957-meter level. It was estimated that the Prieska ore body would sustain that production rate through 1984 and that mining would cease by yearend 1985.

The O'okiep Copper Co. Ltd. reported ore production for 1982 of 1.67 million tons at an average grade of 1.41% copper derived from its Carolusberg, Hoits, Koperberg, and Spektakel Mines and treated at the Carolusberg and Spektakel concentrators. The Nababeep Mine and mill were idle. The combined concentrator output was 63,000 tons at 32% copper from which the O'okiep smelter recovered 20,746 tons of blister copper. Sales, reported as 20,975 tons at an average price of 74 cents per pound, produced a total revenue of $34.2 million, $4.7 million less than production costs. The vertical crater retreat mining method tested in the Carolusberg "B" ore body has been so successful that the technique was to be extended to the Carolusberg Deep ore body. Development work on this and other ore bodies was continued at a cost of about $17 million, and nearly $1.4 million was expended on exploration of company property, prospecting leases, and optioned prospects in the vicinity. The No. 2 shaft at the Carolusberg Deep ore body was completed at a depth of 1,090 meters and equipping was nearly finished by yearend. Underground development totaled 7,196 meters, and stope drilling was begun. Proven ore reserves were 15.6 million tons of ore containing nearly 2% copper. A new open pit ore body at Schaaprivier yielded 25,000 tons of ore averaging 4.40% copper to the nearby Spektakel concentrator during the year.

The Black Mountain Mineral Development Co. (Pty.) Ltd., jointly owned by Gold Fields of South Africa Ltd. (GFSA) and Phelps Dodge Corp. of the United States, produced and shipped concentrate containing 4,180 tons of copper metal, as well as 118,000 tons of lead and zinc in concentrates. The company declared a profit of nearly $14.6 million.

Gold.—Gold production, at 21,355,111 troy ounces, was slightly higher than in 1981 and, with sales totaling $8.1 billion, the average price realized was $380 per troy ounce. Most of the gold was produced from 33 major mines, of which 32 were managed and partly owned by 1 of 6 multinational mining houses responsible for a large proportion of the mineral production in southern Africa. They were Anglo American Corp. of South Africa Ltd. (AAC), AVL, Barlow Rand Ltd. (BRL), Gencor, GFSA, and Johannesburg Consolidated Investment Co. Ltd. (JCI). Each of the country's major mines produced ingots of gold bullion containing about 88% gold, 10% silver, and 2% base metal impurities, reportedly including some mercury. The ingots were delivered to Rand Refinery Ltd. at Germiston, to be assayed and purchased on behalf of the Reserve Bank of South Africa. The Reserve Bank supplied more than 100 tons of gold to the South African Mint at Pretoria to be minted into coins and sold by International Gold Corp. on behalf of the Chamber of Mines of South Africa. During 1982, the Pretoria Mint reported striking of 2,685,466 of the 1-ounce Krugerrand coins, 429,390 of the 1/2-ounce coins, 1,269,168 of the 1/4-ounce coins, and 1,064,809 of the 1/10-ounce coins, as well as 11,270 each of the 1-rand and 2-rand denominations. The total weight of gold coins minted was 3,328,888 troy ounces.

The average production cost per ton of ore mined and milled decreased slightly to $43.60 equivalent to $193.80 per troy ounce

Table 5.—Republic of South Africa: Gold production and ore reserves, by producer

Sources: Chamber of Mines of South Africa. Quarterly Analysis of Working Results, October-December 1979-81. U.S. Consulate General. Johannesburg, Republic of South Africa. State Department Airgram A-47, July 15, 1980, pp. 45-48. Supplement to the Mining Journal, London, Jan. 29, 1982, p. 15.

of gold recovered. Working revenue averaged $380.20, leaving an average profit of $186.40 per troy ounce. The declining price of gold in the world's markets was offset by the declining value of the South African rand, while operating costs increased by only 13% compared with the 10% increase reported between 1980 and 1981. In 1982, several groups of mines had initiated expansion prospects when the price of gold was substantially higher than $380. Capital spending has slowed or been deferred so it could be offset against higher future profits when a higher gold price or lower production costs allowed greater tax benefits. As an example, AAC's expansion of its Erfdeel and Dankbaarheid properties with its Welkom, Free State Saaiplaas, and Western Holdings Mines in the Orange Free State was highly sensitive to minimized cash flow and maximized tax writeoffs. As a result, the start of the Erfdeel main shaft was delayed for most of the year but commenced near yearend when a rising gold price appeared certain. However, work continued on Erfdeel's No. 1 ventilation shaft, commenced in December 1981. The hoisting capacity at Saaiplaas warranted an increase of 30,000 tons per month in the milling capacity of its gold plant. Earnings from the Western Deep Levels Mine were adversely affected by a drop in ore grade and by refrigeration problems. Production at GFSA's Kloof Mine was disrupted by one surface and two underground fires, and by underground rock bursts.

New carbon-in-pulp gold recovery plants with capacities of 165,000 tons per month

each were being installed at Gencor's Grootvlei and Kinross operations. The equipment was scheduled to increase throughput by 20% at Grootvlei and 25% at Kinross, and to be operational early in 1983.

Iron Ore and Concentrate.—In 1982, Iscor's Sishen iron mine in northern Cape Province produced 19.53 million tons of beneficiated hematite ore, and its Thabazimbi Mine in western Transvaal Province produced 2.23 million tons of iron ore. AAC's Highveld Steel and Vanadium Corp. Ltd. produced about one-half of the country's reported 4.32 million tons of magnetite ore in the form of vanadiferous and titaniferous magnetite from its Mapoch Mine in the Bushveld Igneous Complex. Both the volume and the value of iron ore exports declined in the last half of the year reflecting the continued depression of the world's steel industry.

Iron, Steel, and Ferroalloys.—About one-half of the production from Iscor's Sishen Mine and virtually all of its Thabazimbi Mine output was consumed in Iscor's major iron and steel fabricating plants at Pretoria and Vanderbijlpark in Transvaal Province and at Newcastle in western Natal Province. Crude ore consumption and fabricated steel production were curtailed during the last half of 1982. The country's total production of steel billets and blooms declined to 7 million tons, 7% below 1981 output. Profile products had a gross weight of 2.6 million tons, 12% below that of 1981. Production of both flat products, at 2.5 million tons, and steel pipe, at 518,000 tons, declined 4% below 1981 production. Output of galvanized sheet increased by 15% to 584,000 tons. The degassing plant at Iscor's Pretoria steelworks was the source of much of the country's 265,000 tons of railroad rails and fasteners.

The new Middelburg plant of BRL's Southern Cross Steel Co. (Pty.) Ltd. had the annual capacity to produce 100,000 tons of hot band and slab steel, 25,000 tons of hot-rolled sheet and 42,000 tons of plate, including 20,000 tons of its new low-cost, corrosion-resistant alloy, 3CR12, of which 8,000 tons was sold in 1982. Southern Cross's immediate parent Middelburg Steel & Alloys Holdings (Pty.) Ltd. (MSA), formerly Middelburg Steel & Alloys (Pty.) Ltd., 74% owned by BRL, was the country's sole producer of stainless steel coil, sheet, and strip. MSA operated one of the world's two completely integrated ferrochromium facilities, supplying about one-half of the world's requirement of that alloy and was capable of supplying the complete range of austenitic and ferritic alloys. It planned to expend about $26 million to convert one of the submerged-arc furnaces at its Krugersdorp plant to a 20-megavolt-ampere, direct-current, arc furnace. The converted furnace was to use a new thermal plasma technique to produce ferrochromium from domestic chromite and coke at a rate of 25,000 (increasing to 50,000) tons per year. The new technique was to utilize both coarse and fine chromite and coke and was expected to have a lower cost per ton of product than orthodox methods of ferrochromium production. MSA reported a turnover of $124 million and an aftertax profit of $2.6 million, an increase of 85% over that for 1981 and extraordinary for a ferrous metal company in 1982. The Palmiet Chrome Corp. (Pty.) Ltd. was amalgamated into MSA during the year.

Lead, Silver, and Zinc.—The Black Mountain Mineral Development Co. (Pty). Ltd. was the country's only major producer of lead and silver from its mining complex near Aggeneys in northwestern Cape Province. Depressed lead and silver prices and increased costs of sales and finance charges caused a drop of 50% in Black Mountain's profits to $14.6 million. The mine's complex ores yielded 98,195 tons of lead in argentiferous lead concentrate, which, along with argentiferous copper concentrate, was railed to Saldanha Bay for export. Zinc concentrate containing 19,883 tons of zinc, as well as some silver, was railed to GFSA's Zinc Corp. of South Africa Ltd.'s (Zincor) refinery at Springs east of Johannesburg. The silver content of all three Black Mountain concentrates was nearly 4.5 million troy ounces. About 2.1 million troy ounces of silver was also recovered by Rand Refinery as a byproduct of gold refining, and some 320,000 troy ounces of silver was recovered as a byproduct of copper refining. About 70,000 tons of zinc metal in concentrate was recovered at the Prieska copper-zinc-pyrite mine at Copperton, 65 kilometers southwest of Prieska in north-central Cape Province. The concentrate was shipped to Zincor's plant for refining. Prieska's zinc sales were up substantially, but despite higher prices for both copper and zinc, the increased cost of sales caused an 80% drop in the company's 1982 profits to about $1.5 million.

Manganese.—Despite fears that the manganese industry would undergo the general depression of the ferrous metal industries,

the Republic of South Africa's production of manganese ore increased nearly 4% to 5.2 million tons, the export sales value increased 15% to nearly $125 million, and domestic sales increased by 17% to more than $52 million. The demand for manganese ore, however, was still short of that anticipated by the country's major producers, whose increased production capacity and efficiency have resulted in some stockpiling. AAC sold its Middelplaats underground manganese mine to Samancor for 9 million Samancor shares, increasing AAC's interest to 30%. Samancor provided new equipment for its Wessels underground mine, and Associated Manganese Mines of South Africa Ltd. has also completed a major program to improve efficiency and control costs.

Nickel and Platinum-Group Metals.—The Republic of South Africa produced 61% of the world's platinum and a substantial proportion of the other platinum-group metals from a number of mines operated by three companies along the Merensky Reef of the Bushveld Igneous Complex. The largest, Rustenburg Platinum Mines Ltd., with its associated Matthey Rustenburg Refiners (Pty.) Ltd. plant at Wadesville and a new base metal refinery operated by its associate, Matthey Nickel Ltd., operated four mines on the Merensky Reef and had a capacity for producing 1.3 million troy ounces of platinum-group metals and 18,000 tons of byproduct nickel. Portions of Rustenburg's mines were in the Bophuthatswana Homeland. All Rustenburg properties were owned by Rustenburg Platinum Holdings Ltd., which was managed and 32.9% owned by JCI. AAC held 23.8%, and GFSA about 2%. The market prices for both platinum-group metals and its byproducts remained low. Platinum reached a low of $250 per troy ounce in June and rose to $316 per troy ounce by the end of August. Worldwide demand from the automotive industries continued to decline, and at yearend, Rustenburg's aftertax profit was $38 million, about 34% of that reported in 1981. The Paardekraal and Turffontein mine shafts were closed in 1982, and the labor force was reduced by not replacing employees who resigned or whose contracts expired.

The country's second largest platinum producer, Impala Platinum Mines (Pty.) Ltd., managed and 44% owned by Gencor, operated mines, concentrators, and smelters with a capacity of about 1 million troy ounces of platinum-group metals per year. These operations were mostly within the Bophuthatswana Homeland, but the refinery was at Springs in Transvaal Province.

Western Platinum Ltd. operated its expanded concentrator on stockpiled Merensky Reef ore and was stockpiling chromite-platinum ore from its new mine on the UG2 reef. The UG2 ore was to be milled when the Merensky ore stockpile was depleted early in 1983.

Tin.—Gross revenue from tin mining was up because of higher tin prices in 1982, but net profits showed a slight decrease because of increased sales costs and taxes. Ore throughput at GFSA's Rooiberg Tin Ltd. plant was up, and production of tin metal increased 17% to 2,471 tons. After tax profits were down marginally at nearly $8 million. Both ore grade and volume decreased at GFSA's Union Tin Mines Ltd. to cause a 15% drop in tin-in-concentrate output to 389 tons, and a 35% drop in aftertax profits to less than $750,000. Rooiberg has continued its exploration drilling program and has maintained adequate ore reserves, but Union Tin has again resorted to retreatment of old tailings to augment production. Zaaiplaats Mining Co. Ltd., controlled by a subsidiary of AAC, has completed rehabilitation of its mining and concentrating plant and equipment, but was unable to maintain smelter throughput during the year.

Titanium, Vanadium, and Zirconium.—Quebec Iron and Titanium Ltd. was the parent company of Tisand (Pty.) Ltd. and Richards Bay Iron and Titanium Ltd. (RBIT). Tisand operated a dredge and recovered ilmenite, rutile, zircon, and monazite concentrates from dune sands along the coast north of Richards Bay. RBIT operated an electric furnace to produce 381,000 tons of titanium slag and 200,000 tons of low-manganese pig iron, mostly for the export market. Purified rutile, zircon, and monazite concentrates were also produced for the export market. Additional zirconium was exported in the form of baddeleyite concentrate produced by Palabora and Foskor as byproducts of their copper and phosphate mining operations on the Palabora carbonatite.

Highveld, managed and 50% owned by AAC's subsidiary, Anglo American Investment Corp. Ltd., operated the Mapoch Mine, operating on the world's largest deposit of vanadiferous, titaniferous magnetite ore in the Bushveld Igneous Complex. According to Highveld's annual report for the year, the estimated vanadium pentoxide

production from the Republic of South Africa was 20,400 tons, equivalent to 53% of total world production, and 78% of the country's rated capacity. Despite closures of vanadium pentoxide facilities in the United States, Australia, and Norway, and restricted production from other plants, worldwide consumption declined, and by yearend, the price of vanadium pentoxide was one-half that of yearend 1981. As a result, Highveld continued to operate only portions of its plant and Rand Carbide converted its furnace to the production of ferrosilicon at a cost of $6.5 million. The new furnace was commissioned in September.

NONMETALS

Andalusite and Related Minerals.—Output of andalusite and sillimanite decreased by 14% and 35%, respectively. Andalusite export volume increased 28% to nearly 77,000 tons and the value rose 48% to $8.5 million. Sillimanite export volume and value declined about 30%. Lack of water for washing these minerals clean of residual clay was undoubtedly a factor for the diminished production of both minerals. Andalusite occurs in the metamorphosed contact zone around the Bushveld Igneous Complex, and the lower grade ores, less than 54% Al_2O_3, were produced in the Zeerust area from two mines owned by Cullinan Minerals (Pty.) Ltd. of Lydenburg, central Transvaal. The main producing area for better grade mineral, more than 58% Al_2O_3, was near Lydenburg, where production was from another Cullinan Mine at Krugerspost, BRL's Annesley Mine, and the Havercroft Mine, owned by AAC's Vereeniging Refractories Ltd. Weedons's Minerals Pty. Ltd. operated the Timeball Andalusite Mine near Thabazimbi. Sillimanite production was from mines operated by Pella Refractory Ores S.A. (Pty.) Ltd. and by R.G. Niemoller (Pty.) Ltd. near Pofadder in northwest Cape Province.

Asbestos.—Virtually all crocidolite and amosite asbestos mining was controlled by the Gencor affiliate, Griqualand Exploration and Finance Co. Ltd., and the major chrysotile asbestos producer, Msauli, near the Swaziland border, was administered and 40% owned by Gencor. Despite ongoing mining problems at Msauli, production of crysotile asbestos increased nearly 6% over 1981 output, while production of the chemically resistant amosite asbestos, from the Egnep Mine near Penge, 170 kilometers to the northwest of Swaziland, was 24% lower than in 1981. Production of the longer, stronger, more flexible fibers of Cape blue crocidolite asbestos, from the arid northern part of Cape Province, was 15% lower than in 1981. Crocidolite had been reported to be more carcinogenic than the other asbestos mineral species, but reports of evidence to the contrary were the basis for a 1981 ruling by a committee of the European Economic Community permitting the use of crocidolite for valve packing, in gaskets, and for large-diameter cement asbestos pipe.[3]

Cement, Lime, and Limestone.—Production of limestone and dolomite was 22.4 million tons. Domestic sales of 17.5 million tons had a value of $140 million. A large proportion was used in the production of 8.1 million tons of cement worth about $535 million, slightly less than was made in 1981. Pretoria Portland Cement Ltd. (PPC), owned 62% by BRL, the largest producer, operated factories at Johannesburg, Pretoria, Orkeny, and near Mafeking in Transvaal Province, and Port Elizabeth, De Hoek, and Riebeeck West in Cape Province. Its associate, Northern Lime Ltd., operated one of the world's largest limestone quarry complexes at Lime Acres, north of Kimberley. PPC also operated quarries and a lime plant at Marble Hall, northeast of Pretoria in Transvaal Province.

Anglo-Alpha Ltd., an associate of AVL, operated three cement factories, one each at Roodepoort near Johannesburg, near Lichtenburg in western Transvaal Province, and at Ulco, 80 kilometers north of Kimberley in Cape Province. The British-based Blue Circle Cement Co. Ltd. operated limestone quarries and a cement factory at Lichtenburg and another at Hennenman in Orange Free State Province. Union Lime Co. Ltd. operated quarries and lime kilns at Danielskuil near Postmasburg in Cape Province. Iscor, Samancor, and other companies operated limestone or dolomite quarries for flux in industrial areas of Transvaal Province and elsewhere.

A new 500,000-ton-per-year cement-clinker factory was started at Simuna in the Port Shepstone vicinity, 100 kilometers southwest of Durban by Natal Portland Cement Ltd. as a joint effort of PPC, AVL, and Blue Circle. The cost included $106 million financed by Standard Bank, $12 million as an export credit facility from a French bank, and $29 million from the Government-backed IDC. The three cement companies also jointly operated a factory at

Durban that blended ground cement with ground slag from Iscor's furnaces, and marketed the product under the trade name "Slagment." Anglo-Alpha expanded Umzimkulu lime quarry to include $12.2 million worth of secondary crushing and milling machinery and flotation and scrubbing plants, and to provide finer, whiter calcium carbonate for new industrial applications.

Diamond.—In terms of domestic currency, there was a 5% increase in the volume and 9% in the value of the country's diamond sales in 1982, but in terms of U.S. dollars, the sales value of rough gem and industrial diamonds by De Beers Central Selling Organization decreased 15% to $1.26 billion. Demand for smaller, lower priced gem diamonds remained strong throughout the year and was showing signs of increasing for the larger, better quality, rough stones by yearend. A market research estimate of consumption of new diamond jewelry indicated the volume was comparable with the record breaking 32 million pieces of 1981, and that their sales value of $18 billion was slightly lower than in 1981.

De Beers mines produced 8,754,393 carats or nearly 94% of the country's total output of 9,153,990 carats, and its largest producer in the Republic of South Africa was the Finsch Mine, 150 kilometers northwest of Kimberley in Cape Province. Most of the 4,253,600 tons of Finsch ore came from the 172- to 232-meter levels of the open pit and contained 90.52 carats of diamond per 100 tons to yield 3,850,463 carats. Overburden was stripped above the 112- to 160-meter levels. The main shaft was completed and equipped for underground operation by April, and the west ventilation shaft was completed by mid-September. Underground development, including the ground handling system, was completed and operational in early December. A crosscut from the spiral ramp to the main shaft on the 350-meter level was completed in November, and development of the spiral ramp continued. By yearend, the ventilation crosscuts were completed on the 290-meter level, the east ventilation shaft was at a depth of 120 meters, the shaft offices and change houses were occupied, and additional houses, hostels, and a canteen were completed. At the Koffiefontein Mine, in northwestern Orange Free State Province, 951,500 tons of ore at a grade of 11.42 carats per 100 tons was treated to recover 108,693 carats of diamonds. Mining was stopped in June, and by September, the mining equipment and treatment plant had been mothballed and the mine placed on a care-and-maintenance basis. Many of Koffiefontein's 1,200 employees were transferred to the Finsch operation or to other De Beers or AAC group mines.

Of the Kimberley area mines, 662,800 tons of ore at a grade of 21.26 carats per 100 tons was obtained from the old De Beers Mine yielding 140,942 carats of diamonds. Nearly one-half the ore came from the 620-meter sublevel cave, and the remainder from the 745-meter block cave except for nearly 30,000 tons drawn from the 620-meter-level east cave remnant. The Dutoitspan Mine treated 585,800 tons of 17.15-carat-per-100-ton ore from the 760-meter-level block cave to recover 100,407 carats of diamonds. Drainage holes were drilled from surface and from the underground water diversion tunnels, and the joint ventilation shaft was commissioned in August. At the Bultfontein Mine, ore production was 671,300 tons at a grade of 41.42 carats per 100 tons, and diamond production was 278,056 carats. Ore came from the 580-meter-level block cave and rim-loading sections, and from the 700-meter-level block cave. A rim-loading section was developed east of the 580-meter-level for production in 1983. Drainage holes were drilled from the water tunnels surrounding the pipe early in 1982, and a winze was driven from the 580- to the 640-meter-level in an attempt to divert water from entering the southeast section of the 700-meter block cave.

The Wesselton Mine plant treated 1,383,900 tons of 22.66-carat-per-100-ton ore to produce 313,564 carats of diamonds. More than 50% of the ore came from the 785-meter-level block cave, and the remainder was from remnant blocks on the 635-, 660-, and 713-meter levels. Exploratory drilling and development work have disclosed that substantially more ore can be recovered from remnants than was originally estimated, and an additional ore pass was developed and commissioned during the year to handle the increased production. Bultfontein produced 370,996 carats of diamonds from 1,115,800 tons of ore at a grade of 33.25 carats per 100 tons. Evaluation of sampling results at the Kamfersdam kimberlite indicated that the property was not viable and no further work was contemplated. The only work done at the Kimberley Mine was routine maintenance of the drainage tunnel and measurements to detect movement of the walls of the "Big Hole."

At the Premier Mine northeast of Pretoria, 5,381,000 tons of ore from underground yielded 1,854,137 carats at a grade of 34.46 carats per 100 tons, and 1,197,000 tons of "dump" material yielded 605,859 carats at a grade of 50.61 carats per 100 tons. This allowed an increase of nearly 21% in diamond production from 4% less ore. Improvements made to the crushing circuits contributed to the recovery of larger quantities of fine diamonds and to the overall improvement in apparent ore grades. Capital expenditure on development of access to kimberlite ore below the dolerite sill was suspended at midyear but was to be resumed early in 1983.

Production of beach terrace alluvial diamonds from the Namaqualand Mines was curtailed in 1982. The Annex Kleinzee, Dreyers Pan, and Tweepad plants treated 2,596,000 tons of ore at a grade of 10.88 carats per 100 tons to recover 282,427 carats of diamond, less than 50% of the 1981 output. At the Koingnass Complex, 220,600 tons of gravels from Mitchells Bay and 1,342,000 tons of Koingnass ore yielded 624,365 carats of diamonds, an increase of 14% above 1981 output. The Langhoogte Mine treated 303,000 tons of ore at a grade of 14.66 carats per 100 tons and recovered 44,424 carats of diamonds. The dragline excavator was commissioned in April. It removed 13.6 million tons of overburden and was mothballed along with the other equipment at yearend when Annex Kleinzee operations were suspended.

The Department of Mineral and Energy Affairs managed the State Alluvial Diamond Diggings at Alexander Bay at the mouth of the Orange River, which removed 3,381,940 cubic meters of overburden and produced 137,488 carats of diamond in 1982, an increase of nearly 10% over 1981 output. The average size of diamond sold was 0.35 carat, the same as in 1981, but only 9% of the total weight was in stones larger than 1 carat each, as opposed to 32.5% in 1981. The largest diamond recovered weighed 50 carats, and the total weight of all stones larger than 9.8 carats was 1,201.5 carats, a little more than one-half of the 1981 output. Three boats and three tractor-mounted, land-based pump units were used to recover 671.5 cubic meters of gravel containing more than 13,000 carats of diamonds from the seabed. Prospecting and development drilling continued to explore Orange River terrace deposits and beach terraces in the Port Nolloth Reserve and in the Rietfontein area.

Table 6.—Republic of South Africa: Marketed diamond output, by Province

Province	1980		1981		1982	
	Output (carats)	Price per carat	Output (carats)	Price per carat	Output (carats)	Price per carat
Mine diamond:						
Transvaal	2,342,714	$39.92	1,871,107	$28.08	2,251,168	$18.54
Cape Province	3,902,256	52.04	4,693,074	27.12	4,746,484	21.61
Orange Free State	531,708	167.92	353,082	98.07	211,760	95.11
Total or average	6,776,678	56.94	6,917,263	31.00	7,209,412	22.81
Alluvial diamond:						
Transvaal	26,882	506.93	23,902	282.00	26,689	184.81
Cape Province	1,645,920	189.12	1,171,100	144.59	1,224,818	112.65
Orange Free State	764	115.13	127	544.64	321	372.87
Total or average	1,673,566	194.19	1,195,129	147.38	1,251,828	114.25
Grand total or average[1]	8,450,245	84.13	8,112,392	48.14	8,461,151	36.35

[1]Data may not add to totals shown because of independent rounding.

Sources: Republic of South Africa Department of Mineral and Energy Affairs, Quarterly Information Circular, Minerals, October-December 1981, p. 3, and Monthly Commodity Summaries for 1982. R1=US$1.149 for 1981, and R1=US$0.9228 for 1982.

Fluorspar.—Production of acid-grade fluorspar declined 35% below 1981 output, and metallurgical-grade output was down 30%, while ceramic-grade production increased to nearly 10,000 tons, almost 60% more than the 1981 output. Despite an overall production decline of 33%, the Republic of South Africa remained the second largest of the Western World's fluorspar producers, after Mexico. Most of the country's metallurgical-grade fluorspar was used by Iscor as a flux in steel production, and the ceramic-grade material was used as a flux and a component of glazes and enamels

in the country's glass and ceramics industries. A large proportion of chemical-grade fluorspar was exported to the United States, Japan, and the Federal Republic of Germany to be used in the production of hydrofluoric acid and fluorocarbons. Gencor's Buffalo Mine, in the central part of the Bushveld Igneous Complex, continued to be the country's largest mine with a capacity of 240,000 tons per year. The 67% BRL affiliate Transvaal Consolidated Land and Exploration Co. Ltd. operated the 180,000-ton-per-year Marico Fluorspar (Pty.) Ltd. Mine near Zeerust and the 115,000-ton-per-year Vergenoeg Mining Co. (Pty.) Ltd. operation east of Pretoria was affiliated with Bayer A.G. of the Federal Republic of Germany. The U.S. Phelps Dodge operated the 90,000-ton-per-year Rheunosterfontein fluorspar mine near Zeerust, and Armco Bronne, one of the U.S. steel producers, again contemplated a new operation southeast of Zeerust.

Phosphate Rock.—IDC's Foskor Mine and mill, at the Palabora carbonatite deposit, produced 2.8 million tons of apatite concentrate from its own ore and from tailings pumped from the nearby Palabora copper concentrator. The concentrate contained in excess of 30% P_2O_5, and nearly 2.7 million tons was sold locally to Federale Kunsmis Ltd., Triomf Fertilizer (Pty.) Ltd., and other companies that manufactured phosphoric acid and a wide range of fertilizers. About 125,000 tons of concentrate and larger amounts of phosphoric acid and fertilizers were exported, but most of the production was marketed locally. Glenover Phosphate Ltd., 50% owned by GFSA, produced igneous apatite concentrate from a carbonatite north of Thabazimbi. Samancor operated the Langebaan sedimentary phosphate deposit near Saldanha Bay and produced a raw-rock fertilizer sold as "Langfos" in Cape Province. Samancor also used igneous apatite at its Chemfos Ltd. and Polyfos (Pty.) Ltd. plants, at Meyerton, near Johannesburg, to make Calmafos fertilizer, sodium tripolyphosphate, as well as yellow phosphorus and phosphoric acid for the chemical industry.

MINERAL FUELS

Coal.—The country's coal industry continued to set new records in both production sales and value in terms of local currency. Total coal output of more than 140 million tons was 7.5% higher than in 1981. Total sales of nearly 134 million tons were 4.7% above those in 1981, but export sales at 27.5 million tons were lower by 8% than those of 1981. The Richards Bay coal terminal handled 26.1 million tons of the total exported. The total sales value was an increase of 22% over the 1981 figure in terms of local currency but declined by 2.3% to $2.37 billion in terms of U.S. dollars. Coal-fired steam generating plants supplied nearly 95% of the country's electrical power and consumed more than 60% of the 103 million tons of coal sold domestically. The Government-operated Electricity Supply Commission (Escom) burned 55.2 million tons of coal in its own power stations to meet a demand for 15,532 megawatts from an installed power capacity of 21,749 megawatts. It sent out nearly 103 billion kilowatt-hours of electricity and sold 93 billion kilowatt-hours at a rate slightly under 3 cents (U.S.) per kilowatt-hour. Nearly 28 billion kilowatt-hours was sold to the mining industry, of which 75% was consumed by gold and uranium mining. The engineering, iron, steel, and base metal industries used about 15 billion kilowatt-hours. Coal mining consumed less than 2 billion kilowatt-hours, but many coal mines operated their own powerplants, some fueled with waste or middlings from their coal beneficiating plants. Escom expended $550 million to purchase coal and for its rail transport.

More than $2.4 billion was being spent for capital developments to expand existing mines and to start new collieries. AAC was commissioning one new colliery at Goedehoop for production in early 1983. Its New Denmark colliery was scheduled to commence coal production for Escom's Tutuka power station near Standerton in 1983 and was to achieve full production before commissioning of the first generating unit in 1985. Similarly, its New Vaal open pit mine was scheduled to commence a planned four-dragline operation by 1985, before the neighboring Lethabo power station is completed. BRL was developing a new colliery at its Khutala property and, jointly with British Pretroleum of South Africa Ltd., a property at Middelburg. These five new mines were to have a joint capacity of 43 million tons per year. Planned expansion of existing mines, including Escom's Matla, BRL's Duvha, AAC's Kleinkopje, and Sasol's Secunda, was scheduled to increase their joint output to 68 million tons per year.

In 1982, the Republic of South Africa was

shipping increasing quantities of steam coal to Hong Kong's massive powerplant on Lamma Island, which was scheduled to be supplied with coal from China by 1985. Shipments of more than 2 million tons of steam coal to Japan reportedly accounted for 20% of that country's requirements for thermal coal.

Petroleum.—The state-owned Southern Oil Exploration Corp. (Pty.) Ltd. expended $59 million to continue drilling offshore of Mossel Bay in the western part of the country's south coast. The results of testing three of the nine completed holes were as follows: Hole E-G1, 137 kilometers southwest of Mossel Bay, had an estimated flow rate of 3.8 to 5.7 barrels of oil per day with minor amounts of gas. Hole E-G2, 136 kilometers southwest of Mossel Bay, tested over a combined thickness of 85 meters of sandstone, produced 90,600 cubic meters of gas and 900 barrels of oil per day, at a ratio of 633 to 1. The oil was classed as light, volatile, with API gravity of 52.2°. This was the first offshore drill hole to produce oil at surface during a test. In hole F-AR1, 84 kilometers south of Mossel Bay, tests of more than 61.4 meters of permeable sandstone produced 552,179 cubic meters of gas and 748 barrels of natural gas liquid per day. Hole E-G3 intersected oil and gas in sandstone more than 37 meters thick. Testing was scheduled for 1983.

The Sasol III plant commenced production in 1982 as scheduled, but plans for the construction of a coal gasifier jointly with Westinghouse Electric Corp. of the United States were canceled.

Uranium.—Uranium oxide concentrate production declined 5% below that of 1981 to 6,863 tons, as depressed market conditions caused some operations to curtail or cease production. However, the new uranium recovery plant at AAC's Western Areas and Gencor's Beisa Mines offset most of the cutbacks. Another new uranium recovery plant at AAC's Afrikander Lease operation was completed, but was immediately placed on a care-and-maintenance basis, and its sales commitments taken over by Vaal Reefs.

The Mineral Industry of Spain

By Roman V. Sondermayer[1]

In 1982, by European standards, Spain was an important producer of mercury, pyrite, fluorspar, strontium, gypsum, magnesite, potash, feldspar, and lead. In addition, Spain continued to make efforts to stimulate domestic production of minerals, with an aim to lower imports of raw materials and to cut the trade deficit, which was largely caused by imports of liquid gaseous hydrocarbons. The overall economic situation in the country was affected by the slow world economy, which slowed exports. Unemployment was near 15% and inflation was close to 14%. Including processing and refining, the mineral industry of Spain (gross value of product) contributed about 12% to the gross national product; the extractive segment was only about 1%. The industry employed close to 600,000 persons of which mining provided employment for one-third.

The major events of the mineral industry included development of a new mine at Sotiel, exploration for lead in the Province of León, beginning of mercury production at El Entredicho (a new mine near Almadén), and discovery of a phosphate deposit in the Province of Ciudad Real.

Table 1.—Spain: Principal mineral industry companies and locations, by commodity

Commodity	Major companies	Location of principal facilities
Alumina	Alúmina de España S.A	Plant at San Ciprián.
Aluminum	Alúminio Español S.A	Do.
Do	Endasa S.A	Plant at Avilés and Valladolid.
Do	Alúminio de Galicia S.A	Plant at La Coruña and Sabiñánigo.
Bituminous coal	Hunosa S.A	Mines in Astúrias.
Cement	Asland S.A	7 plants at various locations.
Copper ore	Río Tinto Minero S.A	Mines at Río Tinto.
Copper, refined	do	Refinery at Huelva.
Ferroalloys	Soc. Española de Carburos Metálicos S.A.	Plant at Berga.
	Hidro Nitro Españolas S.A	Plant at Monzón.
	Ferroaleaciones Españolas S.A	Plant at Medina del Campo.
Iron ore	Cía. Andalusa de Minas S.A	Mine at Marquesado.
Lead ores	Sociedad Minera y Metallúrgica de Peñarroya de España.	Mines at Mantas de los Azules, Unión.
Lead smelter	do	Smelter at Santa Lucía.
Mercury	Consejo de Administracion de Minas de Almadén.	Mines and smelter at Almadén.
Petroleum, refined	Empresa Nacional del Petróleo S.A	Refineries at Valle de Escombreras, Puertollano, Tarragona.
Do	Cía. Esp. de Petróleos S.A	Refineries at St. Cruz de Tenerife, Algeciras.
Potash	Potasas de Navarra S.A	Mine near Pamplona.
Do	Minas de Potasas de Suria S.A	Mine near Suria.
Do	Unión Explosivos Río Tinto S.A	Mines at Balsarney-Sallent and Cardona.
Pyrite	Tharsis Sulfur and Copper Co. Ltd	Mines at Tharsis and La Zarza.
Steel	Empresa Nacional Siderúrgica S.A	Works at Avilés, Felguera, Gijón-Moreda, Gijón-Verina.
Do	Altos Hornos de Vizcaya S.A	Work at Baracaldo-Sestao.
Zinc ore	Real Cía. Asturiana de Minas S.A	Mines at Reocín and Rubiales.
Zinc, smelter	do	Electrolytic zinc plant at San Juan de Nieva.

PRODUCTION

The mineral industry of Spain is owned by the Government and by private entities. The Government manages most of its companies through the Instituto Nacional de Industria (INI).

Table 2.—Spain: Production of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1978	1979	1980	1981[p]	1982[e]

Mine output, metal content	146,844	142,745	183,120	182,045	[2]167,000
Metal, primary and secondary	177,000	182,700	151,800	179,500	[2]187,000
NONMETALS					
Barite	71,457	74,700	59,827	52,695	50,000
Bromine[e]	400	400	400	400	350
Cement, hydraulic, other than natural, thousand tons	30,233	27,912	[2]28,010	28,751	29,000

See footnotes at end of table.

Table 2.—Spain: Production of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1978	1979	1980	1981[p]	1982[e]
NONMETALS —Continued					
Clays:					
Attapulgite	39,230	62,423	48,020	NA	NA
Bentonite	108,318	120,678	97,705	117,727	120,000
Kaolin, marketable:					
Crude	57,961	72,425	46,066	71,665	72,000
Washed	193,136	204,106	181,116	189,990	190,000
Refractory, not further described	294,799	427,817	[2]416,114	527,851	528,000
Other thousand cubic meters	8,984	8,590	7,838	NA	NA
Diatomite and tripoli	21,370	27,196	23,460	[e]23,500	20,000
Feldspar	116,283	115,685	103,365	105,000	100,000
Fluorspar:					
Gross weight:					
Acid-grade	201,505	155,278	204,596	275,500	214,000
Metallurgical-grade	99,790	37,620	40,153	40,200	47,000
Total	301,295	192,898	244,749	315,700	261,000
CaF_2 content:					
Acid-grade	195,994	150,327	198,152	259,500	[2]197,595
Metallurgical-grade	76,893	28,600	29,631	31,500	[2]43,548
Total	272,887	178,927	227,783	291,000	[2]241,143
Gypsum and anhydrite, crude thousand tons	5,369	5,275	5,223	5,200	5,300
Kyanite, andalusite, related materials	5,087	5,355	6,471	[e]6,500	6,000
Lime, hydrated and quicklime[e] thousand tons	[r 2]432	[r 2]701	[2]950	1,051	1,100
Magnesite:					
Calcined	128,627	147,761	153,933	150,000	[2]137,500
Crude	306,548	381,867	505,532	500,000	450,000
Mica	3,345	5,169	4,831	3,524	3,300
Nitrogen: N content of ammonia thousand tons	[r 2]1,073	[r]1,006	902	[e]900	750
Pigments, mineral:					
Ocher	12,227	15,078	13,696	14,000	13,000
Red iron oxide[2]	24,000	25,000	25,000	25,000	23,000
Potash salts, K_2O equivalent	612,581	667,560	658,230	705,000	750
Pumice	902,402	779,118	1,086,417	937,851	900,000
Pyrites including cuprous, gross weight thousand tons	2,292	2,366	2,394	2,400	2,200
Salt:					
Rock including byproduct from potash works do	2,092	2,187	2,379	2,300	2,300
Marine and other do	1,277	[r]1,261	1,129	1,411	1,400
Sand and gravel: Silica sand do	[3]2,438	[3]2,178	2,425	1,832	1,800
Sepiolite	131,817	202,810	286,232	320,554	--
Sodium compounds:					
Sodium carbonate, manufactured thousand tons	499	[e]500	[e]505	[e]500	500
Sodium sulfate:					
Natural:					
Glauberite, Na_2SO_4 content	104,492	101,780	37,735	55,374	50,000
Thenardite, Na_2SO_4 content	102,975	106,022	118,324	209,333	200,000
Manufactured	121,704	175,000	[e]175,000	175,000	170,000
Stone:[2 4]					
Calcareous:					
Chalk thousand tons	276	282	278	160	NA
Dolomite do	1,948	1,909	2,043	1,990	NA
Limestone do	89,958	85,379	81,239	78,673	NA

Sandstone do	1,749	1,265	1,633	1,759	NA
Serpentine do	306	409	302	342	NA
Other do	29,308	29,855	29,890	26,819	NA
Strontium minerals:					
Gross weight	14,000	18,000	19,000	36,000	35,000
Sr_2O_4 content	12,320	16,560	17,480	33,120	30,000
Sulfur:					
S content of pyrites thousand tons	1,046	1,091	1,096	1,118	1,100
Byproduct:					
Of metallurgy do	117	120	125	135	130
Of petroleum do	10	10	12	12	10
Of coal (lignite) gasification do	3	3	3	3	3
Total do	1,176	1,224	1,236	1,268	1,243
Talc and steatite	61,892	71,047	73,949	69,068	70,000

See footnotes at end of table.

Table 2.—Spain: Production of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1978	1979	1980	1981[p]	1982[e]
MINERAL FUELS AND RELATED MATERIALS					
Asphalt and bitumen, natural	13,100	8,710	NA	NA	NA
Carbon black	[e]53,000	53,000	54,000	NA	NA
Coal (marketable):					
Anthracite thousand tons	3,831	3,796	4,077	4,863	[2]5,195
Bituminous do.	7,668	8,049	9,070	9,080	[2]10,338
Lignite do.	8,272	10,696	15,390	20,986	[2]23,494
Total do.	19,771	22,541	28,537	34,929	[2]39,027
Coke, metallurgical do.	3,886	3,897	4,000	NA	NA
Fuel briquets:					
Briquets do.	7	6	NA	NA	NA
Ovoids do.	43	40	40	NA	NA
Gas, natural, marketed million cubic feet	531	363	300	NA	NA
Peat	31,519	46,379	44,367	NA	NA
Petroleum and refinery products:					
Crude thousand 42-gallon barrels	7,134	8,383	11,732	11,969	NA
Refinery products:					
Gasoline, motor do.	46,719	46,844	45,452	NA	NA
Jet fuel do.	19,055	17,928	17,091	NA	NA
Kerosine do.	893	473	1,061	NA	NA
Distillate fuel oil do.	78,136	83,272	80,219	NA	NA
Residual fuel oil do.	138,875	139,663	151,365	NA	NA
Lubricants including grease do.	1,706	1,657	2,386	NA	NA
Other do.	44,289	[e]44,000	47,346	NA	NA
Refinery fuel and losses do.	20,848	[e]21,000	21,700	NA	NA
Total do.	350,521	354,837	366,620	NA	NA

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.
[1]Table includes data available through Aug. 18, 1983.
[2]Reported figures.
[3]Includes sand obtained as a byproduct of feldspar and kaolin production.
[4]Units revised.

TRADE

As in the past, Spain's imports of fuels and minerals burdened the country's balance of payments.

Table 3.—Spain: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS				
Alkaline and rare-earth metals:				
Lithium: Oxides and hydroxides	16	--		
Alkaline-earth metals	NA	34	--	All to Italy.
Unspecified	57	--		
Aluminum:				
Ore and concentrate	6,173	1,449	--	All to Portugal.
Oxides and hydroxides	82	23,907	--	France 14,899; Netherlands 9,000.
Metal including alloys:				
Scrap	204	101	--	West Germany 42; Portugal 40; Switzerland 19.
Unwrought	106,782	162,682	1,034	Israel 34,554; Netherlands 32,166; Belgium-Luxembourg 29,137.
Semimanufactures	19,495	18,834	1,386	Portugal 2,985; France 2,582; Japan 2,315.
Antimony:				
Oxides	44	24	--	All to Portugal.
Metal including alloys, all forms	370	568	--	Netherlands 353; France 112; Tunisia 48.

See footnotes at end of table.

Table 3.—Spain: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Beryllium: Oxides and hydroxides	NA	144	--	Netherlands 143.
Cadmium: Metal including alloys, all forms	NA	204	90	Netherlands 110; France 4.
Chromium:				
Ore and concentrate	6,267	41	--	Tunisia 31; Portugal 10.
Oxides and hydroxides	533	64,101	--	France 64,012; West Germany 35; Israel 30.
Cobalt:				
Oxides and hydroxides kilograms	1,000	363	--	Belgium-Luxembourg 250; Iran 113.
Metal including alloys, all forms	NA	3	--	All to France.
Columbium and tantalum:				
Ore and concentrate	56	--		
Metal including alloys, all forms, tantalum	5	1	1	
Copper:				
Ore and concentrate	--	33,471	--	U.S.S.R. 12,942; East Germany 9,583; Peru 3,500.
Matte and speiss including cement copper	233	799	--	West Germany 783; Algeria 15.
Oxides and hydroxides	76	10	10	
Sulfate	88	405	59	France 274; Iran 40; Guatemala 15.
Ash and residue containing copper	NA	311	--	West Germany 295; France 16.
Metal including alloys:				
Scrap	884	978	--	United Kingdom 561; Portugal 297; France 101.
Unwrought	66,294	74,391	(1)	France 28,014; Italy 19,703; Belgium-Luxembourg 13,699.
Semimanufactures	22,505	20,160	255	Iran 6,171; Morocco 3,327; Syria 2,424.
Germanium: Metal including alloys, all forms kilograms	NA	46	--	Venezuela 38; Andorra 8.
Gold:				
Waste and sweepings value	$194,848	$51,289	--	Finland $36,189; West Germany $10,117; Switzerland $4,983.
Metal including alloys, unwrought and partly wrought troy ounces	26,717	611,869	289	United Kingdom 289,359; West Germany 128,604; Switzerland 128,604.
Iron and steel:				
Iron ore and concentrate:				
Excluding roasted pyrite thousand tons	2,088	1,147	--	Netherlands 563; West Germany 153; Romania 131.
Pyrite, roasted	371,653	389,466	--	West Germany 373,215; France 10,725.
Metal:				
Scrap	869	502	--	Belgium-Luxembourg 308; West Germany 94; United Kingdom 34.
Pig iron, cast iron, related materials	47,947	32,249	--	Egypt 9,943; Sweden 7,196; Italy 6,106.
Ferroalloys:				
Ferrochromium	NA	8,927	--	France 3,092; United Kingdom 2,300; West Germany 1,101.
Ferromanganese	31,344	32,031	11,509	Italy 7,330; Romania 5,998; West Germany 4,148.
Ferromolybdenum	NA	291	--	Netherlands 179; Sweden 80; West Germany 17.
Ferrosilicomanganese	NA	6,583	--	Japan 1,995; Sweden 1,500; West Germany 1,250.
Ferrosilicon	NA	42,834	--	West Germany 18,491; United Kingdom 6,303; Italy 3,053.
Unspecified	90,069	1,822	90	Belgium-Luxembourg 900; Denmark 335; Italy 282.
Steel, primary forms	544,839	634,380	43,447	Yugoslavia 82,985; Brazil 75,048; Saudi Arabia 44,090.

See footnotes at end of table.

Semimanufactures:				
Bars, rods, angles, shapes, sections ------ thousand tons	2,799	3,181	248	Algeria 314; Iran 301; Morocco 244.
Universals, plates, sheets	645,371	863,719	188,379	India 91,170; West Germany 63,848; Iran 55,238.
Hoop and strip	29,981	22,085	755	West Germany 4,362; Argentina 4,198; France 3,380.
Rails and accessories	3,760	15,647	--	Venezuela 10,132; Saudi Arabia 4,997; Poland 317.
Wire	42,799	41,722	2,039	Portugal 11,859; France 5,603; Algeria 5,004.
Tube, pipes, fittings	467,226	421,557	143,178	Iran 70,281; Mexico 35,396; France 26,815.
Castings and forgings, rough	11,448	11,219	997	France 2,181; Argentina 1,231; Colombia 1,134.
Lead:				
Ore and concentrate	9,394	32,183	--	Canada 8,947; Romania 8,907; Italy 6,278.
Oxides	1	7	--	Algeria 5.
Ash and residue containing lead	NA	9,420	--	West Germany 7,200; Belgium-Luxembourg 2,162.
Metal including alloys:				
Scrap	240	66	--	All to France.
Unwrought	7,633	23,379	--	Panama 11,200; U.S.S.R. 5,500; Belgium-Luxembourg 4,450.
Semimanufactures	3,286	7,500	108	U.S.S.R. 4,950; Belgium-Luxembourg 1,750; Portugal 404.
Magnesium: Metal including alloys:				
Unwrought ------ kilograms	--	1	--	All to Peru.
Semimanufactures ------ do	NA	5,030	--	United Kingdom 5,000; Venezuela 30.
All forms	2	--		
Manganese:				
Ore and concentrate, metallurgical-grade	68	91	--	Portugal 69; Austria 13; Netherlands 9.
Oxides	3,202	2,538	--	France 1,362; Romania 388; Italy 354.
Metal including alloys, all forms	NA	89	--	Ethiopia 88; Morocco 1.
Mercury ------ 76 pound flasks	19,290	21,518	11,745	France 2,320; Republic of South Africa 1,537; India 1,508.
Metalloids:				
Arsenic:				
Oxides and acids	NA	276	90	Republic of South Africa 140; France 21; Iran 16.
Metal including alloys, all forms	NA	1	--	All to Morocco.
Selenium	5	--		
Silicon	13,667	5,974	200	Japan 3,195; Netherlands 1,562; U.S.S.R. 1,000.
Molybdenum:				
Oxides and hydroxides	NA	1	--	All to Portugal.
Metal including alloys, all forms	10	(1)	--	Mainly to Portugal.
Nickel:				
Ore and concentrate	5	--		
Matte and speiss	--	20	--	Mainly to Portugal.
Oxides and hydroxides	NA	63	--	Netherlands 62.
Ash and residue containing nickel	NA	252	--	Austria 154; West Germany 76.
Metal including alloys:				
Scrap	168	79	--	West Germany 51; United Kingdom 19; France 9.
Unwrought	11	1	--	NA.
Semimanufactures	29	19	8	France 3; Venezuela 3; Austria 1.
Platinum-group metals:				
Metal including alloys, unwrought and partly wrought, unspecified ------ troy ounces	9,999	19,066	8,874	Switzerland 4,308; United Kingdom 2,990; Venezuela 1,929.

See footnotes at end of table.

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Rhenium: Metal including alloys, all forms kilograms	NA	5	--	All to Hungary.
Silver:				
Ore and concentrate[2] value	$7,000	$171,989	--	All to Finland.
Waste and sweepings[2] do	$425,000	$223,386	--	West Germany $207,387; Japan $14,829.
Metal including alloys, unwrought and partly wrought thousand troy ounces	184,002	9,774	--	United Kingdom 3,312; Switzerland 386; West Germany 354.
Tin:				
Ore and concentrate kilograms	--	48	--	All to Venezuela.
Oxides	72	--		
Ash and residue containing tin	NA	2,695	--	Sweden 2,650; United Kingdom 43.
Metal including alloys:				
Scrap	65	91	--	United Kingdom 69; Netherlands 22.
Unwrought	229	248	--	United Kingdom 203; Netherlands 39.
Semimanufactures	259	17	--	Algeria 5; Cuba 5; Iran 3.
Titanium:				
Ore and concentrate	--	25	20	Portugal 5.
Oxides	11,494	22,001	4,619	France 3,843; United Kingdom 2,752; West Germany 2,256.
Metal including alloys, all forms	NA	11	--	United Kingdom 7; Sweden 3.
Tungsten:				
Ore and concentrate	4,216	621	33	West Germany 249; Netherlands 228; United Kingdom 67.
Metal including alloys, all forms	49	23	--	United Kingdom 9; West Germany 7; Switzerland 7.
Uranium and/or thorium: Ore and concentrate	37	--		
Vanadium: Oxides and hydroxides	NA	1	--	All to Portugal.
Zinc:				
Ore and concentrate	54,796	44,376	--	Belgium-Luxembourg 15,532; France 8,831; Italy 8,376.
Oxides	838	1,442	--	Italy 670; Belgium-Luxembourg 504; France 180.
Blue powder	128	893	850	France 43.
Matte	NA	582	--	West Germany 307; Republic of South Africa 255.
Ash and residue containing zinc	NA	2,975	--	Belgium-Luxembourg 1,580; Republic of South Africa 987; West Germany 363.
Metal including alloys:				
Unwrought	93,831	88,203	29,608	Netherlands 15,747; India 15,027; U.S.S.R. 6,498.
Semimanufactures	74	404	--	West Germany 135; France 123; Equatorial Guinea 88.
Zirconium:				
Ore and concentrate	97	75	--	Portugal 57; Italy 18.
Metal including alloys, all forms kilograms	NA	346	--	All to United Kingdom.
Other:				
Ores and concentrates	14	78	23	Netherlands 36; Portugal 18.
Oxides and hydroxides	1,513	3,296	1	West Germany 1,502; Algeria 1,200; France 125.
Ashes and residues	28,068	11,307	22	Sweden 8,666; Belgium-Luxembourg 2,305; United Kingdom 172.
Pyrophoric alloys	32	9	--	Mainly to Portugal.
Cermets	NA	37	--	All to United Kingdom.
Base metals including alloys, all forms	59	--		

See footnotes at end of table.

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS				
Abrasives, n.e.s..				
Natural: Corundum, emery, pumice, etc	1,666	1,582	--	West Germany 747; Portugal 230; France 184.
Artificial:				
Corundum	3,598	4,025	--	West Germany 2,086; Italy 1,328; Belgium-Luxembourg 132.
Silicon carbide	NA	2,415	--	France 985; Libya 500; Japan 414.
Dust and powder of precious and semi-precious stones, including diamond value	$98,000	$162,381	--	Ireland $121,371; Mexico $29,539; Syria $5,806.
Grinding and polishing wheels and stones	3,029	3,838	132	West Germany 1,313; Hungary 387; France 256.
Asbestos, crude	17	12	--	Mexico 9; Cuba 1; Greece 1.
Barite and witherite	52,018	65,827	54	West Germany 28,589; Ivory Coast 11,704; Egypt 8,350.
Boron materials:				
Crude natural borates	69	519	--	Morocco 500; Portugal 16.
Oxides and acids	412	1,232	--	Bulgaria 1,110; Algeria 50; Egypt 50.
Cement thousand tons	10,057	9,226	213	Saudi Arabia 3,059; Nigeria 1,299; Egypt 1,261.
Chalk	32,178	25,709	--	Algeria 12,244; Libya 5,650; Portugal 4,850.
Clays and clay products:				
Crude:				
Andalusite, kyanite, sillimanite	NA	122	--	Netherlands 100; West Germany 22.
Bentonite	32,581	29,689	--	Portugal 18,817; France 3,416; Gabon 2,001.
Chamotte earth	NA	3,916	--	Italy 2,500; Ireland 1,100; Republic of South Africa 316.
Kaolin	79,407	51,809	8	West Germany 17,885; Ireland 6,534; Italy 5,971.
Unspecified	40,097	38,227	--	Netherlands 15,310; United Kingdom 4,098; Egypt 3,035.
Products:				
Nonrefractory	548,932	670,429	27,779	France 148,496; Saudi Arabia 87,990; West Germany 65,116.
Refractory including nonclay brick	29,993	17,665	(1)	Egypt 8,189; Cuba 3,289; France 1,088.
Cryolite and chiolite	--	16	--	All to United Kingdom.
Diamond:				
Gem, not set or strung value, thousands	$1,049	$433	$2	Belgium-Luxembourg $401; Mexico $30.
Industrial do	$250	$400	--	Belgium-Luxembourg $252; Mexico $108; United Kingdom $16.
Diatomite and other infusorial earth	1,673	2,505	--	France 874; United Kingdom 581; Italy 400.
Feldspar, fluorspar, related materials:				
Feldspar	1,582	1,833	--	United Kingdom 1,017; France 635; Cuba 156.
Fluorspar	107,518	152,826	25,209	U.S.S.R. 37,869; Italy 23,226; West Germany 18,636.
Fertilizer materials:				
Crude, n.e.s	8,110	5,266	--	West Germany 3,990; France 1,201.
Manufactured:				
Ammonia	15	24	--	Guinea-Bissau 12; Mauritania 8.
Nitrogenous	65,250	86,492	2,271	West Germany 53,692; Indonesia 10,970; France 9,399.
Phosphatic	7,473	33	--	All to Andorra.
Potassic	574,354	607,518	28,757	Portugal 62,090; Norway 57,040; United Kingdom 48,625.
Unspecified and mixed	254,163	140,467	--	Iran 29,195; Turkey 23,800; Venezuela 19,000.

See footnotes at end of table.

Table 3.—Spain: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Graphite, natural	8	197	--	France 178; Sweden 14.
Gypsum and plaster thousand tons	1,120	1,083	206	Denmark 204; Sweden 178; Finland 110.
Halogens:				
Chlorine	NA	21,177	--	France 10,567; United Kingdom 8,640; Portugal 1,959.
Iodine	1	--		
Lime	3,889	5,497	--	France 2,217; Equatorial Guinea 1,015; Portugal 751.
Magnesium compounds:				
Magnesite	NA	45,899	--	West Germany 15,017; United Kingdom 10,159; France 6,570.
Oxides and hydroxides	NA	4,923	--	United Kingdom 1,884; Sweden 1,300; Ireland 600.
Other	91,165	47,026	--	United Kingdom 11,331; France 9,809; West Germany 9,176.
Mica:				
Crude including splittings and waste	6,059	2,683	--	United Kingdom 2,645; Italy 26; Tunisia 10.
Worked including agglomerated splittings	224	202	--	West Germany 72; Italy 53; Turkey 25.
Nitrates, crude	34	100	--	Oman 60; United Arab Emirates 40.
Phosphates, crude	17	--		
Pigments, mineral:				
Natural, crude	NA	306	19	France 193; Venezuela 25; Portugal 24.
Iron oxides and hydroxides, processed	12,044	10,731	651	United Kingdom 1,002; France 835; Venezuela 809.
Precious and semiprecious stones other than diamond:				
Natural value, thousands	$557	$324	--	Belgium-Luxembourg $141; Switzerland $110; United Kingdom $32.
Gem material do	$556	$558	$7	Switzerland $455; Italy $42; Ireland $15.
Pyrite, unroasted	234,887	378,678	--	Belgium-Luxembourg 263,553; Greece 77,148; Italy 28,358.
Salt and brine	479,733	336,257	53,070	Iceland 57,510; Norway 50,687; Canada 43,331.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	3,876	2,583	120	Republic of South Africa 512; France 289; Brazil 258.
Sodium carbonate, natural and manufactured	71,999	33,097	--	Argentina 23,800; Algeria 8,371; Sweden 860.
Sodium hydroxide	92,459	50,797	--	Portugal 17,778; U.S.S.R. 9,040; Iran 8,180.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	206,761	188,792	196	Italy 144,337; France 14,879; Japan 10,279.
Worked	192,194	200,901	1,731	France 140,867; West Germany 26,597; Saudi Arabia 11,051.
Dolomite, chiefly refractory-grade	75,885	88,810	--	United Kingdom 68,095; West Germany 12,200; Peru 3,625.
Gravel and crushed rock	35,658	45,452	--	Morocco 34,485; Andorra 10,718; Ivory Coast 111.
Limestone other than dimension	5,694	3,300	--	All to Guinea.
Quartz and quartzite	357,702	327,977	--	Norway 254,751; France 40,940; Sweden 28,559.
Sand other than metal-bearing	351,491	285,327	--	Andorra 263,824; Greece 15,210; Portugal 5,999.
Sulfur:				
Elemental:				
Crude including native and byproduct	6,264	2,145	--	France 2,140.
Colloidal, precipitated, sublimed	6,993	10,487	--	Algeria 10,486.
Dioxide	NA	119	--	All to Portugal.
Sulfuric acid	17,417	51,032	--	Republic of South Africa 21,676; Turkey 11,898; Algeria 10,734.

See footnotes at end of table.

Table 3.—Spain: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Talc, steatite, soapstone, pyrophyllite	11,357	7,440	60	United Kingdom 2,343; France 1,838; West Germany 1,475.
Vermiculite	NA	386	--	Italy 316; Brazil 50.
Other:				
Crude	563,549	538,960	1,500	Belgium-Luxembourg 207,999; France 94,681; West Germany 90,620.
Slag and dross, not metal-bearing	77,450	112,099	--	France 63,162; Portugal 45,683.
Oxides and hydroxides of barium, magnesium, strontium	49	257	--	Libya 170; Republic of South Africa 60; Portugal 7.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	41,766	48,467	240	France 14,641; Egypt 13,584; Nigeria 8,807.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	1	12,342	--	Niger 4,951; Nigeria 2,682; Mauritania 1,600.
Carbon: Carbon black	16,221	12,797	--	Portugal 7,146; Morocco 2,309; France 1,265.
Coal:				
Anthracite and bituminous	17,196	14,062	--	Belgium-Luxembourg 10,482; Portugal 3,417; Andorra 155.
Briquets of anthracite and bituminous coal	--	11	--	Egypt 10.
Lignite including briquets	28	--		
Coke and semicoke	3,124	23	--	All to France.
Gas, natural cubic feet	r742	35	--	All to Mauritania.
Hydrogen, helium, rare gases	1,329	2,656	--	Libya 1,965; France 562; Portugal 78.
Peat including briquets and litter	16	101	--	Lebanon 80; Portugal 18.
Petroleum and refinery products:				
Crude thousand 42-gallon barrels	1,057	530	--	Libya 344; Morocco 186.
Refinery products:				
Liquefied petroleum gas 42-gallon barrels	r849	11,435	--	Ivory Coast 8,730; Cape Verde 2,698.
Gasoline do	r625,269	810,178	31,297	Netherlands 387,124; Egypt 84,703; Andorra 62,254.
Mineral jelly and wax do	19,706	13,765	1,409	Colombia 1,968; Nigeria 1,582; Morocco 1,362.
Kerosine and jet fuel do	r981,305	772,032	28,660	India 237,018; United Kingdom 235,809; Egypt 124,256.
Distillate fuel oil thousand 42-gallon barrels	4,707	2,879	73	Iran 375; India 300; bunkers 1,249.
Lubricants do	r1,665	2,242	99	Italy 705; France 592; Mexico 192.
Residual fuel oil do	6,686	13,879	291	Netherlands 2,752; Italy 2,613; Sweden 1,477; bunkers 5,417.
Bitumen and other residues do	r3,501	3,425	--	Libya 1,738; Nigeria 450; Algeria 389.
Bituminous mixtures do	666	767	--	Nigeria 322; Libya 238; Algeria 58.
Petroleum coke do	2,855	8	--	Mainly to Portugal.
Tars and other crude chemicals derived from coal, gas, and petroleum	207,479	210,668	--	Netherlands 87,752; France 56,928; Portugal 38,494.

rRevised. NA Not available.
[1]Less than 1/2 unit.
[2]May include other precious metals.

			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals:				
Lithium:				
Oxides and hydroxides	127	120	39	U.S.S.R. 73; China 3; Italy 2.
Metal including alloys, all forms kilograms	NA	38	31	West Germany 7.
Alkaline metals	328	145	--	West Germany 128; France 15.
Alkaline-earth metals kilograms	NA	4,128	--	Canada 4,125.
Rare-earth metals	46	6	--	West Germany 4; Austria 2.
Unspecified	--	8	(1)	Austria 4; West Germany 4.
Aluminum:				
Ore and concentrate	349,384	825,546	--	Guinea 722,116; Guyana 48,310; Suriname 24,145.
Oxides and hydroxides	706,581	228,727	20,132	Guinea 77,914; Jamaica 54,449; France 46,615.
Ash and residue containing aluminum	NA	7,519	1,407	Cameroon 1,910; Austria 1,880; Venezuela 810.
Metal including alloys:				
Scrap	5,631	5,778	487	Portugal 2,732; France 974; Morocco 597.
Unwrought	3,164	13,642	(1)	Iceland 4,746; France 2,696; Canada 2,046.
Semimanufactures	16,769	14,067	1,997	West Germany 3,979; France 2,925; Italy 1,238.
Antimony:				
Ore and concentrate	657	480	--	Morocco 153; Burma 121; Bolivia 100.
Oxides	210	194	--	France 95; United Kingdom 57; West Germany 24.
Metal including alloys, all forms	35	47	--	Hong Kong 28; France 9; Japan 6.
Beryllium:				
Oxides and hydroxides	NA	213	--	Israel 200; United Kingdom 13.
Metal including alloys, all forms kilograms	12	5	--	All from West Germany.
Bismuth: Metal including alloys, all forms	72	73	(1)	West Germany 29; Mexico 25; United Kingdom 17.
Cadmium: Metal including alloys, all forms	10	10	--	Mainly from West Germany.
Chromium:				
Ore and concentrate	84,558	70,330	--	Albania 26,375; Turkey 25,849; Republic of South Africa 15,476.
Oxides and hydroxides	133	271	1	West Germany 184; United Kingdom 51; U.S.S.R. 30.
Metal including alloys, all forms	19	13	(1)	United Kingdom 4; Zaire 4; West Germany 3.
Cobalt: Oxides and hydroxides	72	95	8	Canada 42; France 18; United Kingdom 16.
Columbium and tantalum:				
Ore and concentrate	10	NA		
Metal including alloys, all forms:				
Columbium (niobium)	NA	101	101	
Tantalum	6	2	1	West Germany 1.
Copper:				
Ore and concentrate	204,097	152,754	(1)	Papua New Guinea 70,395; Mexico 50,000; Chile 16,454.
Matte and speiss including cement copper	3,811	8,660	--	Israel 5,231; Italy 1,082; France 703.
Oxides and hydroxides	383	474	(1)	West Germany 194; Norway 149; Italy 96.
Sulfate	499	223	--	France 220.
Ash and residue containing copper	NA	20,863	2,637	Peru 7,733; Norway 4,200; France 1,720.
Metal including alloys:				
Scrap	35,852	32,236	7,104	France 10,459; West Germany 2,456; Algeria 2,203.
Unwrought	49,521	51,984	2,306	Chile 27,623; Belgium-Luxembourg 13,501; Finland 4,120.
Semimanufactures	100,041	48,728	1,686	France 18,536; Netherlands 5,356; United Kingdom 5,040.

COMMODITY REVIEW

METALS

Aluminum.—The aluminum industry of Spain had a difficult year because of severe financial problems. The industry had expanded in the wake of the first energy crisis; it thus suffered from overcapacity and was burdened with heavy borrowings. Alúminio Español S.A. and Alúmina de España S.A. had an outstanding debt of $900 million, of which $750 million was owed to banks, against assests of $1.4 billion.[2] This led to an application for temporary receivership. When INI, which owns through its largest aluminum company Endasa S.A., 53% of Alúminio Español, agreed to pay the interest due on the loan, imminent bankruptcy was avoided.

Copper Pyrites.—The Aznalcóllar Mine, located near Aznalcóllar in the Province of Seville, remained closed during 1982. Adverse conditions on the metal market forced the management of Sociedad Andalusa de Piritas S.A., owner of the Aznalcóllar Mine, to keep it closed.

Mine development and mill construction at Sotiel were near completion at yearend. Reports indicated possible startup of the mine and mill, owned by Minas de Almagrera S.A., in 1983. The mine was designed to produce 600,000 tons of ore per year; the mill should produce annually 40,000 tons of zinc concentrates with 50% zinc, 10,000 tons of copper concentrates with 20% copper, and 10,000 tons of lead concentrates with 50% lead. In addition, the recovered pyrite was to be used in a 300,000-ton-per-year sulfuric acid plant, to be built in the vicinity of the mine.

Lead and Zinc.—Near the village of Torál de los Vades, area of Ponferrada, Province of León, exploration and evaluation of a lead-zinc deposit continued. Preliminary reports indicated reserves of about 4 million tons of sulfide ores with a combined lead and zinc content ranging between 12% and 14%. Peñarroya and the Government-owned exploration company, Adaro, conducted the exploration. The Adaro involvement was funded through Plan Nacional de Abastecimiento de Materias Primas Minerales (National Plan for Supply of Raw Materials and Minerals). During the exploration Adaro's crews drilled about 50 drill holes with depths ranging between 500 and 1,200 meters. If developed, a new mine could produce annually 10 tons of silver, 15,000 tons of lead, and 20,000 tons of zinc.

Exploration of the Navalmedio lead-zinc deposit near Almaden continued. Reports indicated reserves of lead and zinc ores up to 5 million tons with combined lead and zinc content of 7%. In addition, the ore contains silver. The silver content was said to be significant. Design for a new mine at Navalmedio included a 505-meter-deep shaft with a diameter of 5.5 meters.

Mercury.—With three mines in operation, the Almadén region remained the only producer of mercury in Spain. The region was among the largest world producers of mercury during 1982. Modernization of the Almadén Mine was completed. New excavating and loading equipment was brought into the mine; primary crushing of the ore was transferred underground; the rail transport system was replaced by 5-ton rubber-tired dumpers; rubber-tired shovels were introduced for loading; and a new mining method, roof-caving, replaced the cut-and-fill mining method formerly used. The El Entredicho open cast mine, 17 kilometers east of Almadén, went into regular production in 1982 after starting up operations in 1980. According to reports, the El Entredicho Mine accounted for about 70% of total mercury output of the Almadén enterprise. Reserves, reportedly the richest in the world, should support the present rate of production for another 25 years.

The development continued at Las Cuevas deposit, about 8 kilometers north of Almadén, during 1982. The high-grade ore body lies 60 to 360 meters below the surface. Actual work at the minesite started on a new underground mine in June. The mine will have a ramp over 2 kilometers long, inclined at 14%. In addition, two shafts 2.2 meters wide will be used for ventilation and fill will be transported through a third shaft. Several 24-ton dumpers will be used for transporting ore out of the mine.

Titanium.—The Spanish Government has approved sales of Unión Explosivos Río Tinto S.A.'s 55% stake in Titanio S.A. to Troxide Ltd. of the United Kingdom. The value of the transaction was reported at about $17 million. Titanio's plant, located at Palos de la Frontera, near Huelva, was rated at 45,000 tons of titanium dioxide per year. Unión Explosivos decided to sell its interest because of losses of Titanio. The

new owners believe the performance can be improved by strengthening various aspects of the operation at Palos de la Frontera.

NONMETALS

The activities at facilities for production of nonmetals in Spain were slow. The world economic recession almost completely eliminated exports of nonmetals from Spain.

According to preliminary results of exploration, it appears that an important deposit of phosphate has been discovered in the Fontanarejo area of the Province of Ciudad Real. Without disclosing the formation in which phosphates are found, the report indicated that it extends into the Provinces of Toledo, Cáceres, Badajoz, Sevilla, Córdoba, and Salamanca. The deposits at Ciudad Real are near the surface and open cast mining could be used when production begins sometime in the future. The discovery was significant because Spain is totally dependent on imported phosphate to meet its demand, at a cost of $100 million per year.

MINERAL FUELS

The effort to increase the share of domestic coal, uranium, and natural gas in the total energy consumption of Spain continued during 1982. Spain depended almost totally on imported crude oil and natural gas to meet its energy demand.

Coal.—Evaluation of the lignite deposit at Ginzo de Limia (Orenze) was completed. Reserves of low-grade lignite were reported at 350 million tons.

Petroleum and Natural Gas.—Exploration for liquid and gaseous hydrocarbons continued, mostly offshore in both the Atlantic Ocean and Mediterranean Sea. Results, however, were mixed. The gasfield in the Gulf of Cadiz was too small for profitable production but reserves in the offshore Gaviota Gasfield in the Bay of Biscay and the onshore Sabinánigo Field were reported to be adequate to support profitable production.

Uranium.—Exploration for uranium was concentrated in the granites and in sedimentary deposits of Salamanca, Cáceres, and Badajoz. In addition, areas of Sonia, Molina de Aragón, and the Tagus Basin were targets of operations. With the new discoveries, proven reserves in Spain reportedly totaled 30,000 tons of U_3O_8.

The Mineral Industry of Sudan

By Kevin Connor[1]

Outside of activities in the petroleum area, Sudan's mineral industry was in a state of decline throughout 1982. Commercial mining activities consisted of a few small-scale gold mines and production of chromite ore, gypsum, salt, and mica. The estimated 1982 contribution of mineral production was less than 1% of the country's annual gross domestic product. Sudan's deficit trade balance continued to increase and was assessed at $1 billion for 1982,[2] a 30% increase over 1981's total. Major increases in agricultural production and continued strength in the construction and transportation industries resulted in an estimated 2% real growth in the economy. The country's petroleum supply was bought on credit or donated because of the Government's exhausted reserves of available foreign exchange.

Although no petroleum had yet to be produced commercially, over 200 million barrels of proven reserves were identified in the Unity and Talih Oilfields of southern Sudan. In September 1982, it was announced that Sudan's original plans to build a refinery at Kosti would be deferred. Crude oil production from the fields, which was expected to begin by 1985, would be pumped to the Port of Sudan for export. The change in plans, from refining crude oil for domestic consumption to exporting crude oil for its trade value, was determined to be the best alternative for the Government of Sudan to generate badly needed foreign exchange. Plans called for exporting 50,000 barrels per day of crude oil starting in 1985, with the technical option of expanding the output of the pipeline system to be built up to 100,000 barrels per day if warranted at a later date.

The second phase of the Port Sudan Harbor modernization project began in June. The World Bank, which financed the first phase of improvements completed earlier in the year, was also financing the second phase, which was scheduled for completion by early 1984 at an estimated cost of $30 million. Construction of civil works, upgrading of grain handling facilities, and installation of an electrical generation station were planned to be the focus of the second phase of improvements. The Kenana sugar mill and refinery, located along the White Nile River, helped to alleviate power shortage problems in Sudan in 1982. The plant, commissioned in 1980 as the second largest of its kind in the world, was built with some unique features including the ability to generate electricity from the waste sugar cane stocks. In 1982, the plant generated 42 megawatts of electrical power per day over 6 months of operation. Surplus power, which amounted to 32 megawatts, was fed into the national electrical grid system.

Sudan continued to face a total depletion of petroleum fuel stocks throughout 1982, owing to a chronic shortage of foreign exchange with which to purchase supplies. In January, Saudi Arabia donated 3 months of oil supply to Sudan. Petroleum requirements for the second quarter of the year were financed by various local and foreign banks, with low-interest loans totaling $84 million. Further fuel needs were met in late 1982 through a low interest loan from the Faisal Islamic Bank and a gift of 150,000 barrels of crude petroleum from Egypt.

PRODUCTION AND TRADE

Sudan's mineral industry continued to be an insignificant contributor to the country's economy in 1982. Mineral commodities produced were chromite ore, cement, gypsum, mica, salt, and gold. The total value of mineral exports, chiefly of chromite ore, was approximately $3 million, which was less than 1% of the country's total export revenues for the year. Major mineral export markets were Switzerland, the Federal Republic of Germany, the United Kingdom, Egypt, Italy, and Saudi Arabia. Sudan imported a variety of processed minerals and mineral chemicals from the United States. Major import items were petroleum lubricants and iron and steel materials. Sudan imported all finished metal product requirements, shortfalls of cement, and all petroleum and mineral-based fertilizer needs. Except for a petroleum refinery plant located at the Port of Sudan, the country had no mineral processing industries.

[e]Estimated. [p]Preliminary.

[1]Table includes data available through Aug. 8, 1983.

[2]In addition to the commodities listed, modest quantities of a variety of crude construction materials (including clays, stone, and sand and gravel) presumably were produced, but output is not reported quantitatively, and available information is inadequate to make reliable estimates of output levels. Crude oil was produced from several wells on a testing basis but was not being produced for domestic use or export through yearend 1982.

[3]Reported figure.

Table 2.—Sudan: Exports and reexports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS				
Iron and steel:				
Iron ore and concentrate excluding roasted pyrite	--	2,000	--	All to Netherlands.
Metal, scrap	3,929	230	--	Egypt 226; Ethiopia 4.
Other:				
Ores and concentrates	9,754	10,002	--	Japan 4,500.
Precious metals excluding gold: Scrap, waste, dust value, thousands	$42	--		
Base metals including alloys, scrap	3,981	1,942	--	Egypt 1,378; Japan 397; West Germany 94.
NONMETALS				
Abrasives, n.e.s.:				
Dust and powder of precious and semiprecious stones value, thousands	--	$55	--	All to United Kingdom.
Grinding and polishing wheels and stones	72	--		
Clays and clay products: Crude, unspecified	100	--		
Mica: Crude including splittings and waste	363	20	--	All to Belgium-Luxembourg.
Salt and brine	157	4,002	--	Ethiopia 2,408; Saudi Arabia 1,532; Congo 62.
Sodium and potassium compounds, n.e.s.:				
Sodium carbonate, natural	7,430	--		
Other: Crude value, thousands	$7	$60	--	Egypt $38; Saudi Arabia $22.
MINERAL FUELS AND RELATED MATERIALS				
Petroleum refinery products:				
Lubricants 42-gallon barrels	249,606	413	--	All to Cyprus.
Residual fuel oil do	--	484,095	--	All to Italy.

COMMODITY REVIEW

METALS

Chromite.—Chromite continued to be Sudan's most important mineral export commodity in 1982.[3] Chromite deposits occur principally in the Ingessana Hills area, Kassala Province, and the Red Sea Hills, with reserve estimates at Ingessana Hills about 1 million metric tons of 53% to 57% chromium oxide (Cr_2O_3) content. The Japanese company Mitsubishi Metal Corp., which had helped delineate the Ingessana Hills deposits during the previous few years under an agreement with the Sudanese Government, canceled any further work plans in late 1982. At that time it was reported that the Arab Mining Co. showed an interest in a proposed project to double Sudan's chromite production from the Ingessana Hills deposits, at a preliminary estimated capital investment cost of $10 million. The Kassala and the Red Sea Hills deposits were still considered uneconomical to exploit.

Gold.—After 2 years of exploration efforts, Minex Inc. of the United States in 1982 formed a joint venture with Sudan's Ministry of Energy and Mining to exploit a gold deposit at the location of an old mine-site in the Red Sea Hills near the Jebeit area. Production was scheduled to begin in mid-1983, with a projected annual production of 50,000 troy ounces. Alluvial gold exploration continued in the south near Kapoeta, through a Sudanese-Belgian joint venture.

Tungsten.—The joint pilot project begun in 1980 between the Government agency, Sudanese Mining Corp., the French Bureau de Recherches Géologiques et Minières, and the Saudi Arabian Government to evaluate the commercial potential of Sudan's tungsten deposits in the Red Sea Mountains near Jebel Ayoub, continued throughout 1982. Based on core drilling results, project officials were estimating reserves of 4 million tons of tungsten ore, and plans were underway late in the year to establish a mining company between the three concerns for the commercial exploitation of the deposits. Other tungsten exploration efforts in northern Sudan were planned for early 1983 by Minex, and the Jordan-based concern, Arab Mining.

NONMETALS

Cement.—The Maspio Cement Corp. continued with expansion work on its Atbara plant in northeast Sudan. A 750-ton-per-day rotary kiln with a single-stage cyclone preheater and Unax cooler were planned for installation by early 1983. A 3- by 9-meter raw mill and 3.5- by 11-meter finishing mill were also under erection and expected to be completed by fall of 1983. F. L. Smidth Co. was supplying equipment and technical assistance. A feasibility study began in mid-1982 for a proposed 500,000-ton-per-year cement plant at Derudeb, southwest of Port Sudan.

MINERAL FUELS

Petroleum.—Chevron Oil Co. of Sudan and the Sudanese Government agreed in September to expedite their crude oil export

program with stepped-up development of a 1,400-kilometer pipeline from the Unity Oilfield to a Red Sea port. This replaced earlier plans for a 25,000-barrel-per-day refinery to be built at Kosti with a 500-kilometer pipeline to the oilfields.[4] This major change in oil development policy was dictated by Sudan's problems concerning the country's balance-of-payments crisis and continuing difficulty with servicing its heavy debt burden. The aim of the policy change was to speed up commercial production with exportation of crude oil by 1985, thereby generating much needed foreign exchange for the Government as quickly as possible. The previous plan to construct a refinery at Kosti, about 225 kilometers south of Khartoum, was to refine the Unity Oilfield production for domestic consumption and alleviate expensive petroleum import costs. However, it was estimated that the refinery would take at least 1 year longer to build than the crude pipeline and would take considerably longer to pay for itself. The alternative pipeline would intially carry 50,000 barrels per day and later could be expanded to a 100,000-barrel-per-day flow of crude if warranted. Two pipelines actually proposed to be constructed were: a 22-inch crude pipeline carrying the export product, and an 8-inch return pipeline to carry kerosine or naphtha for dilution to mix with the viscous crude to improve its transport characteristics.

In the near and mid-term future, petroleum consultants estimated Sudan could have its domestic crude petroleum refined in Europe cheaper than doing it in-country. The cost of building the pipeline was estimated at $1 billion, which would be financed by the White Nile Petroleum Co. White Nile in 1982 was a joint venture of Chevron of Sudan, the Sudan Government, International Finance Corp., and the Arab Petroleum Investment Corp. White Nile planned to solicit bids for constructing the pipeline by early 1983 with award of major contracts and construction operations beginning no later than fall of the same year.

Petroleum Products.—Sudan's General Petroleum Corp., which had for some time been considering an expansion of the country's petroleum products service line system, awarded a contract in October 1982 to Omnium Technique des Transports par Pipeline (OTP) of France to study the feasibility of a 550-kilometer extension of the existing system, into Sudan's eastern provinces. The new pipeline would be an addition to the 800-kilometer, 8-inch existing service line from Port Sudan to Khartoum, with proposed branches at Haiya to points south at Kassala and Gedaref. Increasing demand for petroleum products in the eastern Provinces of Kassala and Blue Nile, where an agricultural industrial development program had been ongoing, triggered the study. The preliminary estimated costs of the extension work was $70 million.

Renovation and modernization work continued on the existing pipeline between Port Sudan and Khartoum. Completion of the work would boost the capacity of the line from 600,000 to 1,000,000 tons of petroleum products a year. OTP was responsible for all engineering aspects of the project. Two of the line's four pumping stations were being reequipped with higher capacity pumps, and a new, fifth pumping station was being built. The estimated final cost of the work was $10 million, and the scheduled completion date of the project was July 1983.

The Mineral Industry of Sweden

By Joseph B. Huvos[1]

In 1982, Sweden had only a small mineral industry, but mineral technology was highly advanced. The country was one of the world's largest producers of iron ore and a significant producer of nonferrous metals and minerals. Fossil and nuclear fuels were imported to supplement an ample supply of hydroelectric power.

In 1982, the Swedish economy was still performing poorly. Exports, accounting for over one-quarter of the gross domestic product (GDP) of $98 billion,[2] were still unsatisfactory, mainly because of low economic activity in trading partner countries. In real terms, the GDP was slightly lower than that of 1981. In October, the krona was devalued 16% and during the year the dollar appreciated well over 50% against the krona. While mineral production did not change much, iron ore production decreased drastically.

Important events in Sweden's mineral industry in 1982 included startup of the Luossavaara Kiirunavaara AB (LKAB) Viscaria copper mine, Kiruna iron ore pelletizing plant, and Cementa AB's Filehajdar limestone quarry. Boliden AB's Svardsjö Mine resumed operation, and a new sublevel caving method and so-called olivine-fluxed iron ore pellets were introduced by LKAB at Kiruna. Construction continued at Scandinaviska Raffinaderi AB's Lysekill petroleum cracking plant. AB Statsgruvor closed its Stollberg metal mine.

PRODUCTION

Indices of Swedish mineral industry production in 1981 and 1982 are shown in the following tabulation (1968=100):

Industry sector	1981	1982[P]
Iron ore mining	72	50
Nonmetallic minerals	80	79
Metal industries	112	121
Mining, quarrying, manufacturing	125	125

Table 1.—Sweden: Production of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity[2]	1978	1979	1980	1981	1982[p]
MINERAL FUELS AND RELATED MATERIALS —Continued					
Petroleum refinery products —Continued					
Other —Continued					
White spirit thousand 42-gallon barrels	[r]1,504	807	578	68	[e]42
Asphalt and bitumen do.	3,333	4,012	3,400	3,139	3,030
Unspecified do.	--	182	182	--	[e]749
Refinery fuel and losses do.	[r]2,824	2,171	2,338	2,188	2,498
Total do.	[r]114,463	[r]122,757	[r]133,397	100,280	94,739

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Includes data available through Aug. 23, 1983.

[2]In addition to the commodities listed, cobalt, nickel (as nickel sulfate), and metallic titanium are also produced, but output is not reported, and available information is inadequate to make reliable estimates of output levels.

[3]Revised to zero.

[4]Production of sponge iron is as follows, in thousand tons: 1978—15 (revised); 1979—not available; 1980—not available; and 1981—not available.

[5]Includes clinker as follows, in thousand tons: 1978—15; 1979—1; 1980—nil; 1981—nil; and 1982—nil.

[6]Represents material for sale, not that produced.

[7]Includes strontium minerals, unspecified minerals, and fragments of ceramic materials.

TRADE

In 1982, the United States was Sweden's third largest supplier of all goods after the Federal Republic of Germany and the United Kingdom, and was Sweden's fifth most important market, after the Federal Republic of Germany, Norway, the United Kingdom, and Denmark.

Exports to the United States in 1981 included more than 100,000 tons of ferrochrome, 15,000 tons of ferrosilicon, 300,000 tons of steel in primary forms, and 900,000 tons of steel semimanufactured goods. Also, 90,000 tons of lead ores and 350,000 tons of zinc ores were shipped. The United States delivered some molybdenum ore, barites, crude phosphates, coal and coke, and crude oil.

Oxides and hydroxides	235,062	215,498	520	West Germany 70,377; Jamaica 56,002; Australia 30,138.
Metal including alloys:				
Scrap	3,507	2,960	--	Norway 1,285; Netherlands 554; United Kingdom 459.
Unwrought	36,868	38,687	151	Norway 31,246; United Kingdom 1,854; Denmark 1,801.
Semimanufactures	52,012	60,763	3,899	West Germany 17,571; Norway 5,990; France 4,915.
Antimony: Metal including alloys, all forms	14	25	--	United Kingdom 14; Bolivia 5; China 5.
Beryllium: Metal including alloys, all forms value, thousands	$23	$3	--	West Germany $2; Denmark $1.
Cadmium: Metal including alloys, all forms	268	186	--	Finland 85; Japan 60; Norway 40.

See footnotes at end of table.

Table 3.—Sweden: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Chromium:				
Ore and concentrate	332,328	406,996	--	Finland 158,302; Turkey 50,844; U.S.S.R. 41,391.
Oxides and hydroxides	432	411	(1)	West Germany 326; Poland 60; China 15.
Metal including alloys, all forms	144	200	--	United Kingdom 106; France 77; West Germany 11.
Cobalt:				
Oxides and hydroxides	2	2	(1)	France 1.
Metal including alloys, all forms	487	555	12	Finland 283; Belgium-Luxembourg 189; United Kingdom 22.
Columbium and tantalum:				
Ore and concentrate	--	14	--	Zaire 12; Australia 2.
Metal including alloys, all forms, tantalum value, thousands	$58	$39	$19	Switzerland $10.
Copper:				
Ore and concentrate	46,870	89,062	1,320	Mexico 34,837; Norway 31,999; Chile 10,806.
Matte and speiss including cement copper	8,009	10,830	--	France 10,798; Finland 32.
Oxides and hydroxides	445	375	--	Norway 178; Yugoslavia 106; Belgium-Luxembourg 47.
Sulfate	974	973	--	United Kingdom 526; Czechoslovakia 163; Norway 121.
Ash and residue containing copper	15,029	5,794	--	West Germany 3,923; Norway 1,222; France 429.
Metal including alloys:				
Scrap	4,988	3,339	342	Norway 1,149; France 612; United Kingdom 514.
Unwrought	76,805	65,781	72	Zambia 16,120; Belgium-Luxembourg 11,366; Chile 10,994.
Semimanufactures	36,333	30,466	515	West Germany 9,443; Finland 3,723; Netherlands 2,676.
Gold:				
Waste and sweepings value, thousands	$417	$838	--	Norway $294; Finland $272; United Kingdom $167.
Metal including alloys, unwrought and partly wrought do.	$11,768	$9,715	$155	United Kingdom $5,518; West Germany $3,048; Switzerland $581.
Iron and steel:				
Iron ore and concentrate:				
Excluding roasted pyrite	513	717	121	United Kingdom 300; Netherlands 296.
Pyrite, roasted	5	--		
Metal:				
Scrap	75,605	246,431	3,672	U.S.S.R. 117,308; United Kingdom 51,075; West Germany 25,154.
Pig iron, cast iron, related materials	55,862	46,402	138	U.S.S.R. 10,993; Canada 6,848; West Germany 6,790.
Ferroalloys:				
Ferrochromium	27,798	23,246	--	Finland 8,586; Albania 3,543; Republic of South Africa 3,194.
Ferromanganese	32,686	33,071	--	Norway 28,644; Republic of South Africa 2,170; France 1,091.
Ferromolybdenum	1,681	1,199	5	Austria 352; Belgium-Luxembourg 323; United Kingdom 253.
Ferronickel	17,530	12,210	--	Vanuatu 4,618; Greece 2,696; Dominican Republic 2,694.
Ferrosilicochromium	3,638	634	--	U.S.S.R. 473; Norway 100.
Ferrosilicomanganese	10,291	9,956	--	Norway 9,456; Republic of South Africa 500.
Ferrosilicon	32,538	24,234	18	Norway 20,594; U.S.S.R. 1,348; West Germany 739.
Unspecified	4,596	3,052	98	U.S.S.R. 645; Belgium-Luxembourg 456; West Germany 340.
Steel, primary forms	145,838	143,831	580	Finland 74,682; West Germany 38,480; United Kingdom 14,806.
Semimanufactures:				
Bars, rods, angles, shapes	468,698	414,112	1,075	West Germany 105,335; Norway 54,202; France 38,545.
Universals, plates, sheets	902,637	818,942	718	West Germany 242,424; Belgium-Luxembourg 124,503; France 99,508.

See footnotes at end of table.

Table 3.—Sweden: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Iron and steel —Continued				
Semimanufactures —Continued				
Hoop and strip	153,289	149,517	130	West Germany 56,499; Poland 22,024; Finland 12,625.
Rails and accessories	3,316	4,143	--	West Germany 2,255; United Kingdom 1,163; Austria 219.
Wire	26,030	25,920	72	Belgium-Luxembourg 5,811; United Kingdom 5,691; West Germany 4,797.
Tubes, pipes, fittings	290,660	258,522	1,055	West Germany 70,696; Denmark 30,390; Finland 30,118.
Castings and forgings, rough	12,317	10,447	2	Poland 3,044; West Germany 1,872; Denmark 1,709.
Lead:				
Ore and concentrate	--	300	--	All from West Germany.
Oxides	2,111	2,365	10	West Germany 1,666; East Germany 340; United Kingdom 309.
Metal including alloys:				
Scrap	3,971	4,342	395	Canada 2,174; Norway 1,465; Nigeria 285.
Unwrought	1,768	8,396	1,006	United Kingdom 4,230; Netherlands 1,996; Finland 610.
Semimanufactures	1,106	1,075	1	West Germany 969; Netherlands 67; Belgium-Luxembourg 30.
Magnesium: Metal including alloys:				
Scrap	3	--		
Unwrought	1,963	1,603	151	Norway 1,443.
Semimanufactures	218	307	6	Switzerland 118; West Germany 100; Austria 40.
Manganese:				
Ore and concentrate, metallurgical-grade	354	531	433	Netherlands 96.
Oxides	791	455	(1)	Belgium-Luxembourg 227; Netherlands 76; West Germany 45.
Metal including alloys, all forms	1,459	708	--	Republic of South Africa 584; France 84; China 31.
Mercury 76-pound flasks	464	667	NA	China 348; Netherlands 203; Finland 58.
Metalloids:				
Arsenic: Metal including alloys, all forms	5	11	--	United Kingdom 10.
Phosphorus	119	34	--	West Germany 33.
Selenium	67	9	--	West Germany 4; United Kingdom 4.
Silicon	518	634	--	Norway 403; France 221; West Germany 7.
Unspecified	1	2	(1)	West Germany 1.
Molybdenum:				
Ore and concentrate	6,014	5,648	2,633	Netherlands 953; Chile 770; United Kingdom 360.
Oxides and hydroxides	44	169	19	Netherlands 59; United Kingdom 59; West Germany 31.
Metal including alloys, all forms	103	43	9	Austria 11; West Germany 7; France 6.
Nickel:				
Ore and concentrate	--	3,600	--	All from Vanuatu.
Matte and speiss	4,453	3,113	--	Austria 2,115; U.S.S.R. 792; Cuba 119.
Metal including alloys:				
Scrap	2,614	2,092	212	United Kingdom 954; West Germany 736; Netherlands 108.
Unwrought	10,805	8,031	874	United Kingdom 2,432; Canada 1,127; Republic of South Africa 950.
Semimanufactures	1,044	1,252	144	United Kingdom 346; Republic of South Africa 310; Canada 168.
Platinum-group metals: Unspecified value, thousands	$69,330	$39,848	$9,823	Switzerland $15,219; United Kingdom $5,661; West Germany $4,228.
Silver:				
Ore and concentrate[2] do	$8,422	$5,474	$140	Canada $2,298; Chile $1,915; France $763.
Waste and sweepings[2] do	$33,999	$6,565	$1,747	Finland $2,004; France $1,483; Norway $557.
Metal including alloys, unwrought and partly wrought thousand troy ounces	14,275	13,953	4,115	West Germany 3,633; United Kingdom 2,411; France 1,929.

See footnotes at end of table.

Table 3.—Sweden: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Tin: Metal including alloys:				
Scrap	11	3	--	All from Finland.
Unwrought	475	313	(1)	Malaysia 205; Thailand 35; West Germany 31.
Semimanufactures	211	160	(1)	United Kingdom 57; Netherlands 52; West Germany 48.
Titanium:				
Ore and concentrate	3,592	2,050	--	Australia 1,561; India 404.
Oxides	3,613	2,924	92	Norway 1,052; Finland 828; Italy 245.
Metal including alloys, all forms	548	744	62	Japan 316; West Germany 209; U.S.S.R. 153.
Tungsten:				
Ore and concentrate	3,711	2,417	72	Australia 827; China 579; Brazil 418.
Oxides and hydroxides	31	60	--	All from France.
Metal including alloys, all forms	131	29	1	West Germany 11; United Kingdom 6; Japan 4.
Vanadium: Oxides and hydroxides	517	141	--	All from Finland.
Zinc:				
Oxides	1,197	1,209	--	Netherlands 403; Norway 352; United Kingdom 144.
Blue powder	522	547	--	Norway 523; West Germany 20.
Ash and residue containing zinc	10,444	6,485	--	West Germany 6,443.
Metal including alloys:				
Scrap	31	1	--	All from Canada.
Unwrought	37,763	30,509	--	Norway 13,730; Finland 9,812; France 3,318.
Semimanufactures	356	230	(1)	West Germany 128; Poland 43; Norway 21.
Zirconium:				
Ore and concentrate	1,592	1,151	--	Republic of South Africa 895; Australia 244.
Metal including alloys, all forms	128	176	21	France 135; United Kingdom 12; West Germany 8.
Other:				
Ores and concentrates	5,001	10	--	NA.
Oxides and hydroxides	967	819	45	United Kingdom 402; West Germany 177; Belgium-Luxembourg 82.
Ashes and residues	27,411	24,703	790	Spain 11,335; United Kingdom 2,698; Netherlands 723.
Pyrophoric alloys	159	108	--	Norway 63; Netherlands 25; West Germany 8.
Base metals including alloys, all forms	898	383	88	Republic of South Africa 128; Denmark 32; United Kingdom 25.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc.	2,809	473	53	West Germany 158; Italy 127; India 30.
Artificial:				
Corundum	7,217	6,607	1,109	West Germany 4,263; Austria 356; United Kingdom 306.
Silicon carbide	5,492	3,634	8	Norway 3,083; West Germany 478.
Dust and powder of precious and semiprecious stones, including diamond value, thousands	$2,619	$1,892	$44	Switzerland $1,384; Republic of South Africa $199; Ireland $139.
Grinding and polishing wheels and stones	3,225	2,985	185	Austria 1,002; United Kingdom 519; West Germany 432.
Asbestos, crude	1,195	1,101	36	Canada 1,064.
Barite and witherite	3,992	4,567	--	West Germany 4,135; China 272; France 70.
Boron materials:				
Crude natural borates	26,776	16,847	12,830	Turkey 2,717; Netherlands 1,300.
Oxides and acids	845	556	76	France 365; Netherlands 60; United Kingdom 40.
Cement	175,727	152,708	709	Poland 103,483; Finland 30,414; Denmark 12,436.
Chalk	32,204	21,809	5	Denmark 7,651; West Germany 7,191; Norway 3,306.
Clays and clay products:				
Crude:				
Bentonite	4,462	3,339	2,654	West Germany 294; United Kingdom 169.
Kaolin	273,914	283,762	22,166	United Kingdom 244,024; Czechoslovakia 8,481; Brazil 5,304.

See footnotes at end of table.

Table 3.—Sweden: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Clays and clay products —Continued				
Crude —Continued				
Unspecified	46,899	36,884	6,982	United Kingdom 19,726; West Germany 4,311; France 3,475.
Products:				
Nonrefractory	34,684	32,329	2	Italy 8,063; Denmark 7,340; West Germany 4,905.
Refractory including nonclay brick	102,955	77,414	637	West Germany 25,034; Austria 19,435; United Kingdom 12,179.
Cryolite and chiolite	501	322	--	All from Denmark.
Diamond:				
Gem, not set or strung value, thousands	$25,982	$19,199	$143	Belgium-Luxembourg $11,939; Israel $5,334; United Kingdom $815.
Industrial do	$1,097	$915	$1	Republic of South Africa $321; United Kingdom $297; Netherlands $163.
Diatomite and other infusorial earth	3,805	3,363	1,008	Denmark 1,161; Spain 372; Iceland 320.
Feldspar, fluorspar, related materials:				
Fluorspar	13,008	12,822	--	Mexico 4,408; France 3,674; East Germany 2,176.
Unspecified	12,844	6,709	--	Finland 3,619; Norway 2,881.
Fertilizer materials:				
Crude, n.e.s	1,080	712	--	West Germany 446; U.S.S.R. 118; Denmark 68.
Manufactured:				
Ammonia	154,613	162,789	(1)	Mexico 67,394; Trinidad and Tobago 57,783; U.S.S.R. 24,007.
Nitrogenous	508,944	400,423	NA	Norway 329,132; Netherlands 8,000.
Phosphatic	1,143	121	--	Norway 96; Israel 25.
Potassic value, thousands	$21,480	$20,979	$161	West Germany $9,593; U.S.S.R. $5,197; East Germany $4,648.
Unspecified and mixed	143,891	97,608	192	Norway 87,033; West Germany 6,841; Finland 1,576.
Graphite, natural	911	504	19	West Germany 213; China 125; Austria 52.
Gypsum and plaster	350,445	272,343	88	Spain 153,774; East Germany 68,184; U.S.S.R. 23,121.
Halogens:				
Chlorine	900	1,858	1	Norway 1,857.
Unspecified	11	13	1	Netherlands 6; West Germany 3; Japan 3.
Lime	7,659	4,414	--	West Germany 1,728; Belgium-Luxembourg 1,323; Norway 753.
Magnesium compounds: Magnesite	20,584	21,767	154	Norway 6,101; United Kingdom 2,474; Greece 2,473.
Mica:				
Crude including splittings and waste	408	335	5	Norway 121; France 72; United Kingdom 57.
Worked including agglomerated splittings	79	71	(1)	Switzerland 55; West Germany 8; Belgium-Luxembourg 3.
Nitrates, crude	9,622	3,041	--	Chile 3,018; West Germany 23.
Phosphates, crude	579,657	618,932	114,955	Morocco 262,744; U.S.S.R. 241,185.
Pigments, mineral: Iron oxides and hydroxides, processed	7,096	6,156	56	West Germany 5,341; France 342; United Kingdom 179.
Potassium salts, crude	459	1,026	--	All from West Germany.
Precious and semiprecious stones other than diamond:				
Natural value, thousands	$1,599	$1,111	$101	Sri Lanka $207; Switzerland $204; Thailand $194.
Synthetic do	$881	$3,367	$1,139	Ireland $2,102; West Germany $31; Israel $24.
Pyrite, unroasted	79,938	21,578	20	Finland 21,498; Italy 27; West Germany 26.
Salt and brine thousand tons	1,157	1,056	(1)	Netherlands 350; West Germany 304; Poland 103.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	967	125	1	West Germany 41; France 36; Belgium-Luxembourg 30.
Sodium carbonate, natural and manufactured	119,008	142,372	17,408	East Germany 35,117; France 30,069; United Kingdom 30,051.

See footnotes at end of table.

Table 3.—Sweden: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Sodium and potassium compounds, n.e.s. —Continued				
Sodium hydroxide	217,649	271,975	(1)	West Germany 118,854; East Germany 53,185; Poland 35,067.
Sodium sulfate, natural and manufactured	35,410	36,958	--	Belgium-Luxembourg 16,122; East Germany 9,542; United Kingdom 5,928.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	5,334	6,044	--	Finland 2,854; Norway 1,754; Italy 976.
Worked	9,924	7,863	18	Portugal 2,499; Italy 2,277; Poland 1,776.
Dolomite, chiefly refractory-grade	108,971	115,933	725	United Kingdom 58,431; Norway 37,306; Belgium-Luxembourg 13,429.
Gravel and crushed rock	210,696	115,634	344	Finland 66,235; Denmark 25,890; Italy 9,669.
Limestone other than dimension	97,151	62,937	17	United Kingdom 32,411; Denmark 24,719; West Germany 3,939.
Quartz and quartzite	48,033	34,420	--	Spain 28,606; Finland 3,205; Belgium-Luxembourg 1,368.
Sand other than metal-bearing	343,401	314,831	45	Belgium-Luxembourg 151,145; Denmark 117,844; Finland 10,001.
Sulfur:				
Elemental:				
Crude including native and byproduct	41,424	23,250	--	Poland 21,935; France 850; West Germany 201.
Colloidal, precipitated, sublimed	1,138	4,515	--	Poland 4,347; West Germany 122; Denmark 25.
Dioxide	4,243	6,325	NA	Norway 6,307.
Sulfuric acid	162,128	45,026	--	Norway 19,124; Poland 13,107; West Germany 12,683.
Talc, steatite, soapstone, pyrophyllite	36,717	34,853	26	Finland 20,371; Norway 8,262; Belgium-Luxembourg 4,008.
Other:				
Crude	71,614	88,645	133	Norway 64,283; West Germany 20,683; United Kingdom 1,115.
Slag and dross, not metal-bearing	17,488	33,176	20	Netherlands 10,501; Finland 7,484; United Kingdom 5,808.
Oxides and hydroxides of barium, magnesium, strontium	550	1,450	(1)	Norway 1,050; East Germany 277; West Germany 40.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	11,250	13,113	121	United Kingdom 2,765; Norway 2,420; West Germany 1,995.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	780	952	363	Trinidad and Tobago 586.
Carbon: Carbon black	6,802	5,862	390	West Germany 3,246; Netherlands 1,068; United Kingdom 995.
Coal:				
Anthracite	44,949	10,064	1,539	United Kingdom 6,715; West Germany 1,489.
Bituminous thousand tons	2,137	2,018	1,207	United Kingdom 165; U.S.S.R. 157; Poland 57.
Briquets of anthracite and bituminous coal	137	97	15	West Germany 82.
Lignite including briquets	3,463	2,182	--	All from East Germany.
Coke and semicoke	453,350	237,255	2,360	United Kingdom 79,746; West Germany 62,092; Norway 26,975.
Hydrogen, helium, rare gases	3,899	1,645	9	Netherlands 1,143; United Kingdom 165; Finland 84.
Peat including briquets and litter	10,748	45,139	--	Finland 41,012; U.S.S.R. 3,294; Denmark 797.
Petroleum and refinery products:				
Crude thousand 42-gallon barrels	131,698	108,120	1,018	Saudi Arabia 50,863; United Kingdom 23,112; Nigeria 10,149.
Refinery products:				
Liquefied petroleum gas do	1,517	1,139	(1)	United Kingdom 509; Saudi Arabia 362; Norway 125.
Gasoline:				
Aviation do	90	82	--	Netherlands 56; United Kingdom 18.
Motor do	21,385	18,225	(1)	Belgium-Luxembourg 3,833; Finland 3,438; Denmark 3,206.

See footnotes at end of table.

[1]Less than 1/2 unit.
[2]May include other precious metals.
[3]Import in 1980 was 716,777 barrels.

COMMODITY REVIEW

METALS

Aluminum.—Gränges Aluminium AB, a subsidiary of Gränges AB, operated Sweden's only aluminum smelter, located near Sundsvall on the east coast, at about 96% of capacity. Gränges Aluminium also had a scrap remelting plant at Finspang, central Sweden, producing 35,000 tons of intermediate products. Scandinavia's largest remelting plant at Avesta, central Sweden, produced 15,000 tons of casting alloys for sale to foundries in northern Europe.

Copper.—The Government-owned LKAB mining company started shipping copper concentrates from its new Viscaria Mine in Kiruna. A nominal capacity of 85,000 tons per year of concentrate was to be reached by the end of 1983, and capacity was to be increased to 100,000 tons per year at an unspecified later date. LKAB invested some $50 million in the mine, which has reserves for up to 25 years. Mining is 200 meters below the surface, with ore reaching a depth of 600 meters. About 40% of the ore grades 2.5% to 3% copper.

Boliden has reached an agreement with the Swedish Board of Government Mining Properties for expanding the ore base at the Stekkenjokk Mine, located in northwest Sweden. The two will share the cost of $10 million for the 4-year exploration. Boliden, which leases the mine, will carry two-thirds of the cost. The Swedish Government will contribute 50% of the cost of $2 million for prospecting at Boliden's Skellefteå copper-lead-zinc mine, located near Boliden.

BP Mineral Ltd., a subsidiary of British Petroleum Co. Ltd. (BP), has become the first non-Swedish company in 70 years to get exploration and mining rights in Sweden. The Swedish Government approved BP's application to participate with the LKAB iron ore company in exploring for nonferrous metals on 17,000 hectares in south-central Sweden, between Falun and Derebro. Under Swedish law, the Government has rights to 50% of the ore mined and a further 25% would go to LKAB,

leaving 25% to BP.

Gold.—Development work continued at Boliden's Enåsen gold mine in northern Halsingland, central Sweden, which was to open by 1984. The mine was to produce 300 to 400 kilograms, or about 12,000 troy ounces, of gold per year for 7 years. Exploration and test mining of the Holmtjärn deposit, about 50 kilometers west of Boliden, central Sweden, was begun.

Iron Ore.—Swedish iron ore production decreased about 30% during 1982. Exports of Swedish iron ore were down nearly to the 1949 level. The Lappland mines accounted for 91% of export deliveries. Iron ore production had to be halted for a total of 15 weeks in Kiruna, 13 weeks in Svappavaara, and 10 weeks in Malmberget. At Kiruna, a new pelletizing plant was started, raising LKAB's pelletizing capacity to 9 million tons per year, but only 40% of that capacity was utilized. A new sublevel caving method was introduced at Kiruna, resulting in lower waste rock dilution.

A new type of high-quality, olivine-fluxed iron ore pellets was introduced and about 2 million tons was produced. Reportedly, these pellets have resulted in lower coke consumption and improved pig iron quality in iron blast furnaces.

LKAB operated four iron ore mines in Swedish Lappland: Kiruna, Svappavaara, Tuolluvaara, and Malmberget. Government-owned Svenskst Stål AB (SSAB) operated two iron ore mines in the Bergslagen area in central Sweden at Grängesberg and Dannemora. Total iron ore reserves in the Lappland area totaled about 3.4 billion tons, with about 2 billion tons of recoverable reserves.

Iron and Steel.—Sweden's proposed stainless steel merger was expected to lead to a rapid rationalization within the industry. Avesta Jernverks AB, Fagersta AB, Sandvik AB, and Uddeholm AB would concentrate their production of raw stainless steel, semimanufactures, and plates at one site in the future. Production of stainless billets would be concentrated at Sandvik. Hot rolling would be distributed between Degerfors and Avesta. Avesta's No. 1 cold mill was expected to close, and production was to be shifted to Nyby Uddeholm AB's Torshälla plant. Although the regrouping was planned for January 1, 1984, 1 additional year could be necessary.

After the formation of Fagersta Sandvik Tube AB, combining the stainless tube activities of the two Swedish steelmakers, an agreement was concluded with a third stainless tubemaker, Nyby Uddeholm, to share some of their resources for facilitating rationalization in production and distribution.

Fagersta and Uddeholm merged their high-speed steel operations in a new joint company, Koster Speedsteel, which will produce 15,000 tons per year of high-speed steel, making it possibly the world's largest producer.

SKF Steel, owner of Lesjöfors AB, a steel strip producer, has joined Uddeholm Stripsteel AB of Bangbro, which itself was created a few years back by Uddeholm and Sandvik.

In 1982, the direct reduction process was used by four Swedish steelmakers: Höganäs AB at its Oxelösund plant for 35,000 tons per year, Sandvik at its Sandviken plant for 24,000 tons per year, Uddeholm at Hagfors for 40,000 tons per year, and SKF Steel at Hofors for 30,000 tons per year. SKF also had at Hofors a 70,000-ton-per-year plasma process pilot plant.

SSAB operated three steelworks: Luleå in north Sweden, Oxelösund in south Sweden, both on the Baltic, and Domnarvet in central Sweden. Total capacity was about 5 million tons per year. In the private sector, about 28 companies produced or processed iron, steel, and ferroalloys. There was only a slight increase in crude steel production in 1982, but exports of steel rose 19% in value and about 10% in volume.

Silver.—Boliden intensified exploration activities at the Dammsjö Lake silver deposit in the Garpenberg-Bergslagen area. A test drift was opened for diamond drilling, and beneficiation tests for the ore were performed.

Zinc.—AB Statsgruvor, a wholly owned subsidiary of LKAB, closed its Stollberg, Bergslagen, lead-zinc-pyrite mine. Activities at the mine's Håksberg head office have been transferred to the company's Yxjöberg Mine. A decision was made by Boliden to resume operations in the Svardsjö Mine 20 kilometers northeast of Falun, in central Sweden. Operations at the Svardsjö Mine were suspended in the early 1970's owing to exhaustion of ore. Prospecting has revealed new reserves sufficient until 1986 and further prospecting continues.

NONMETALS

Cement.—A weak Swedish market and increased imports from Eastern Europe caused underutilization of cement capacity at the three plants of Cementa AB, Swe-

den's only cement operator. Plants at Degerhamn, Skövde, and Slite, the former two in central Sweden and the latter on Gotland Island, produced at 77% of capacity. A limestone quarry for cement, providing 25% of consumption at the local plant, started operations on Gotland Island at Filehajdar.

Dolomite.—Deliveries of dolomite for environmental purposes increased in 1982, owing to a greater demand for darker qualities satisfactory only for soil treatment and neutralization of acid in lakes.

Fluorspar.—At Government-owned AB Statsgruvor's Yxjöberg Mine, old stored fluorspar concentrate was reprocessed, yielding acid-grade fluorspar concentrate and off-grade tungsten concentrates.

MINERAL FUELS

In 1982, Sweden derived about 28% of its energy needs from domestic hydroelectric power, black liquor, fuelwood, and waste; 62% from imported oil; and 10% from imported enriched nuclear fuel.

Table 4.—Sweden: Energy balance

(Million tons of oil equivalent)

	Total	Coal and coke	Petroleum and refinery products	Black liquor, fuelwood, waste[e]	Hydroelectric power[1]	Nuclear power[2]
1981

[e]Estimated. [p]Preliminary.
[1]Includes foreign trade of electric power.
[2]Thermal burnoff of imported uranium fuel.
[3]Primary energy only.

Sources: Monthly Digest of Swedish Statistics, Official Statistics of Sweden, Stockholm, and other statistical publications.

Nuclear Power.—In accordance with the Swedish Energy Policy Act of 1980, which prescribed expanding nuclear power to one-half of the nation's generating capacity, work continued on building the necessary spent nuclear fuel and waste storage facility. About 40% of the $2 billion total cost of the waste storage project has been spent to date, mainly on the central storage facility at Oskarshamn. The facility is only temporary, as the final disposal of the waste is to be offshore at Fosmark, north of Stockholm.

In 1982, Sweden had 10 operating nuclear powerplants at 4 locations, with a total capacity of 7,370 megawatts. Two further nuclear powerplants were under construction with a 2,110-kilowatt total capacity for commissioning in 1985 and 1986.

Petroleum.—Ore Prospecting Co. AB, 50% owned by the Government, made a modest profit from about 344 barrels of oil pumped per day on Gotland Island from 23 small holes. Geologic surveys east and southeast of Gotland have indicated a good possibility of oil, but an unresolved border dispute with the U.S.S.R. makes exploration impossible at present. Elsewhere, the Swedish Government was discussing chances for participating in offshore activities in the Soviet sector of the Barents Sea.

In 1982, Sweden had four oil companies operating six oil refineries with a total distillation capacity of 453,000 barrels per day, and a 20,000-barrel-per-day cracking plant was under construction at Scandinaviska Raffinaderi's refinery on the Skagerrak.

The Mineral Industry of Switzerland

By Roman V. Sondermayer[1]

Many mineral occurrences are known in Switzerland, but in 1982, few were in active status. Domestic mineral production was limited to construction minerals and salt. In addition, aluminum, iron and steel, and petroleum refinery products were produced from imported raw materials. Hydroelectric power and fuelwood remained the principal sources of primary energy in the country. All coal, natural gas, and crude oil consumed were imported. In addition, to meet demand, some quantities of petroleum refinery products had to be imported.

During 1982, the overall economy of Switzerland was increasingly under the influence of the downturn in the world economy. The gross national product (GNP) declined by 1.5% when compared with the GNP of 1981, to about $90 billion.[2] The mineral industry, including processing of imported raw materials, which is modest by world standards, contributed only about 1% to 2% to the total GNP.

A discovery of natural gas, the first commercial deposit of hydrocarbons discovered in the country, and modernization of aluminum plants were the significant developments in the mineral industry of Switzerland during 1982.

PRODUCTION

The mineral industry of Switzerland is privately owned, except for salt, which was produced by a Government-owned monopoly. Table 1 shows the latest trends in production during 1978-82.

[1]Table includes data available through July 22, 1983.

[2]In addition to the commodities listed, a variety of crude construction materials (common clay, sand and gravel, and stone) are undoubtedly produced, but output is not reported, and available general information is inadequate to make reliable estimates of output levels.

[3]Included in "Other refinery products."

TRADE

The latest trends in foreign trade in minerals of Switzerland are shown in tables 2 and 3. Based on preliminary reports, Switzerland was a net importer of minerals and related products during 1982.

Natural, crude	4	--		
Iron oxides and hydroxides, processed	22	49	(1)	France 15; Austria 13.
Potassium salts, crude[3]	24	31	--	Italy 18.
Precious and semiprecious stones other than diamond:				
Natural value, thousands	$243,384	$265,688	$26,760	France $59,438; West Germany $33,013.
Synthetic thousand carats	219,585	242,685	4,625	West Germany 63,305; Italy 24,205.
Salt and brine	234	278	--	France 225.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	127	45	--	Italy 21; France 18.
Sodium carbonate, natural and manufactured	64,717	28,873	NA	NA.
Sodium hydroxide	30,687	31,605	(1)	West Germany 17,439; Austria 8,260.
Sodium sulfate, natural and manufactured	793	3,024	--	Italy 2,819; Austria 129; France 57.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	35,218	32,594	--	West Germany 16,029; Italy 11,061.
Worked	20,157	13,777	--	West Germany 11,828; Austria 836.
Dolomite, chiefly refractory-grade	19	11	--	West Germany 6.
Gravel and crushed rock	29,391	26,532	(1)	West Germany 14,337; France 11,117.
Limestone other than dimension	31	--		
Quartz and quartzite	39,356	33,877	(1)	Italy 32,181; West Germany 1,313.
Sand other than metal-bearing	10,375	15,414	--	France 11,592; West Germany 2,540.
Sulfur:				
Elemental:				
Crude including native and byproduct	20	19	--	Mainly to Austria.
Colloidal, precipitated, sublimed	10	8	--	Yugoslavia 3; West Germany 2.
Dioxide	392	454	30	U.S.S.R. 101; West Germany 53.
Sulfuric acid	25,528	20,678	--	West Germany 16,406; Yugoslavia 1,420.
Talc, steatite, soapstone, pyrophyllite	97	152	--	West Germany 53; Austria 38.
Other:				
Crude	3,829	3,883	(1)	West Germany 3,141; Austria 319.
Slag and dross, not metal-bearing	4,009	11,262	--	West Germany 10,632; France 423.
Oxides and hydroxides of barium, magnesium, strontium	17	12	(1)	Argentina 3; Venezuela 2.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	4,481	2,788	21	Austria 1,071; West Germany 339.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	--	4	--	West Germany 3.
Carbon: Carbon black	224	230	--	France 71; Czechoslovakia 62.
Coal: All grades including briquets	415	2	--	Mainly to West Germany.
Coke and semicoke	37	1,006	--	West Germany 981.

See footnotes at end of table.

Table 2.—Switzerland: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
MINERAL FUELS AND RELATED MATERIALS —Continued				
Gas, manufactured	95	105	--	France 103.
Hydrogen, helium, rare gases	39	340	(1)	France 318.
Peat including briquets and litter	1,396	1,495	--	France 843; Austria 534.
Petroleum and refinery products:				
Crude 42-gallon barrels	17	(1)		
Refinery products:				
Liquefied petroleum gas do	r119,195	124,770	--	Italy 69,542; France 27,631.
Gasoline: Motor do	92,185	38,675	--	Austria 38,233.
Mineral jelly and wax do	1,695	1,362	16	Italy 881.
Kerosine and jet fuel do	3,568	528	--	Austria 53.
Distillate fuel oil do	85,198	50,527	--	Austria 50,512.
Lubricants do	37,313	62,944	33	West Germany 15,561; Austria 8,827.
Residual fuel oil do	132,577	122,844	--	Austria 114,572.
Bitumen and other residues do	r15,815	6,408	--	West Germany 1,359; Sweden 772.
Petroleum coke do	7	99	--	Italy 88.
Tars and other crude chemicals derived from coal, gas, and petroleum	1,139	528	7	West Germany 132; Italy 119; France 81.

rRevised. NA Not available.
1Less than 1/2 unit.

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals:				
Alkaline metals	757	494	18	West Germany 466; United Kingdom 4.
Alkaline-earth metals kilograms	r1,090	182	NA	NA.
Rare-earth metals do	r5,718	941	7	Austria 805; United Kingdom 100.
Aluminum:				
Ore and concentrate	5,533	772	--	France 541; West Germany 217.
Oxides and hydroxides	174,010	171,709	262	Australia 136,253; France 17,755; West Germany 16,530.
Metal including alloys:				
Unwrought	54,162	37,574	8	Iceland 10,303; Norway 8,856; France 6,129.
Semimanufactures	50,785	47,482	338	West Germany 20,613; Belgium-Luxembourg 6,720; France 5,813.
Antimony: Metal including alloys, all forms	91	55	--	Bolivia 25; Belgium-Luxembourg 20.
Beryllium: Metal including alloys, all forms	1,250	3,815	3,571	West Germany 220.
Chromium: Oxides and hydroxides	565	498	2	West Germany 385; Italy 77.
Cobalt: Oxides and hydroxides	1	2	--	Belgium-Luxembourg 1.
Columbium and tantalum: Metal including alloys, all forms: Tantalum	1,343	1,102	320	Austria 520; West Germany 148.
Copper:				
Ore and concentrate	21	14	--	All from Belgium-Luxembourg.
Sulfate	733	692	--	France 239; U.S.S.R. 190.

See footnotes at end of table.

METALS —Continued				
Copper —Continued				
Metal including alloys:				
Scrap	3,566	3,762	54	West Germany 1,862; U.S.S.R. 725.
Unwrought	10,565	11,097	169	West Germany 3,821; Belgium-Luxembourg 1,977; Austria 1,522.
Semimanufactures	88,040	78,566	393	West Germany 34,382; France 9,768.
Gold: Metal including alloys, unwrought and partly wrought thousand troy ounces	r20,336	26,392	NA	NA.
Iron and steel:				
Iron ore and concentrate including roasted pyrite	49,431	49,487	3	Mauritania 19,247; West Germany 8,520; Republic of South Africa 7,782.
Metal:				
Scrap	136,853	113,138	--	Mainly from West Germany.
Pig iron, cast iron, related materials	98,961	83,452	1	West Germany 41,103; France 19,184.
Ferroalloys:				
Ferrosilicon	r6,715	5,538	--	France 1,678; West Germany 1,596.
Unspecified	r15,037	11,475	36	West Germany 5,072; Norway 2,839.
Steel, primary forms	r158,027	130,044	--	West Germany 55,427; Belgium-Luxembourg 16,407.
Semimanufactures:				
Bars, rods, angles, shapes, sections	r618,761	593,527	1	West Germany 168,170; Italy 156,266; Belgium-Luxembourg 78,223.
Universals, plates, sheets	r672,195	613,688	218	West Germany 193,603; France 101,625; Belgium-Luxembourg 89,825.
Hoop and strip	r240,143	210,167	367	West Germany 75,399; Belgium-Luxembourg 44,168; France 31,035.
Rails and accessories	53,743	48,571	--	Austria 21,906; West Germany 17,688.
Wire	r38,682	38,328	3	West Germany 7,080; Austria 5,311; Italy 3,613.
Tubes, pipes, fittings	159,601	150,927	166	West Germany 71,484; France 24,965; Italy 18,042.
Castings and forgings, rough	9,006	8,542	10	West Germany 5,061; Romania 839; France 785.
Lead:				
Ore and concentrate	4	--		
Oxides	111	163	--	Mexico 53; United Kingdom 43; Netherlands 15.
Metal including alloys:				
Scrap	2	91	--	West Germany 50; France 40.
Unwrought	17,981	10,155	201	France 3,202; Canada 2,895; United Kingdom 2,173.
Semimanufactures	1,562	1,513	1	West Germany 1,358; Belgium-Luxembourg 110.
Magnesium: Metal including alloys, all forms	2,717	1,436	72	Norway 693; Canada 314; Italy 271.
Manganese: Oxides	786	562	--	Greece 354; Belgium-Luxembourg 134.
Mercury 76-pound flasks	1,106	635	--	West Germany 549; Japan 35.
Metalloids:				
Arsenic: Oxides and acids	6	80	--	Mainly from France.
Phosphorus	2,776	3,157	--	France 923; U.S.S.R. 844; Italy 581.
Silicon	209	22	1	Italy 14; West Germany 7.
Unspecified	6	4	(1)	West Germany 3.

METALS —Continued				
Molybdenum: Metal including alloys, all forms	24	20	1	Austria 14; West Germany 2.
Nickel:				
Ore and concentrate	--	2	--	All from Japan.
Matte and speiss	1,340	1,164	100	United Kingdom 207; West Germany 172; Republic of South Africa 162.
Metal including alloys:				
Scrap	164	240	--	West Germany 109; Austria 73; Italy 16.
Semimanufactures	1,445	1,152	233	West Germany 407; United Kingdom 281.
Platinum-group metals: Metals including alloys, unwrought and partly wrought thousand troy ounces	993	847	112	Netherlands 244; U.S.S.R. 102; West Germany 90.
Silver:				
Waste and sweepings[2] value, thousands	$78,521	$92,184	$16	Sweden $12,757; Spain $11,710.
Metal including alloys, unwrought and partly wrought thousand troy ounces	50,728	28,973	NA	NA.
Tin: Metal including alloys:				
Scrap	11	12	--	Mainly from Italy.
Unwrought	1,026	926	1	Indonesia 520; Thailand 150; Malaysia 120.
Semimanufactures	326	279	1	West Germany 133; France 110.
Titanium: Oxides	3,773	1,826	1	West Germany 725; Finland 297; United Kingdom 279.
Tungsten: Metal including alloys, all forms	113	79	4	West Germany 29; France 26.
Uranium and/or thorium: Oxides and other compounds	14	24	2	France 15; United Kingdom 4.
Zinc:				
Ore and concentrate	10	7	--	All from West Germany.
Oxides	2,596	2,451	21	France 1,268; West Germany 547.
Blue powder	2,806	3,247	(1)	Belgium-Luxembourg 1,252; Netherlands 768; France 646.
Metal including alloys:				
Scrap	21	1	--	Mainly from West Germany.
Unwrought	25,342	21,316	25	West Germany 7,318; Norway 3,604; Netherlands 3,143.
Semimanufactures	1,174	1,011	--	West Germany 495; Belgium-Luxembourg 226.
Other:				
Ores and concentrates	7,650	5,604	--	Republic of South Africa 3,690; West Germany 768.
Oxides and hydroxides	1,384	1,315	4	West Germany 839; France 160.
Ashes and residues	280	439	--	West Germany 336; France 81.
Pyrophoric alloys	4	4	--	Mainly from Austria.
Base metals including alloys, all forms	840	925	300	West Germany 112; France 98.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	979	535	85	Italy 367; West Germany 66.
Artificial:				
Corundum	6,780	6,177	120	West Germany 2,977; Austria 2,240.
Silicon carbide	1,275	863	1	West Germany 471; Norway 346; Italy 32.
Dust and powder of precious and semiprecious stones: Excluding diamond kilograms	3,800	3,950	795	Ireland 2,836; West Germany 143.
Grinding and polishing wheels and stones	1,990	1,716	34	West Germany 940; Austria 204; Italy 177.

See footnotes at end of table.

NONMETALS —Continued				
Asbestos, crude	21,029	16,886	2	Canada 7,410; U.S.S.R. 4,185; Italy 2,283.
Barite and witherite	3,181	2,092	--	West Germany 1,504; France 548.
Boron materials:				
Crude natural borates	11,245	10,729	9,929	Netherlands 441; Turkey 183.
Oxides and acids	532	365	33	France 130; Yugoslavia 79.
Cement	195,527	246,301	51	Italy 114,118; West Germany 50,393; Austria 45,431.
Chalk	23,168	24,299	--	France 20,064; Austria 2,044.
Clays and clay products:				
Crude: Unspecified	180,354	183,161	966	West Germany 82,283; United Kingdom 57,050.
Products:				
Nonrefractory	347,467	381,986	1	Italy 206,532; West Germany 109,403.
Refractory including nonclay brick	47,007	38,035	40	West Germany 22,006; Austria 6,683.
Cryolite and chiolite	618	292	--	Mainly from Denmark.
Diamond:				
Gem, not set or strung thousand carats	191,115	195,245	17,650	Brazil 85,475; West Germany 30,010.
Industrial do	37,630	19,990	530	West Germany 7,560; Brazil 3,440.
Diatomite and other infusorial earth	9,381	11,169	213	Denmark 7,467; Spain 1,781.
Feldspar, fluorspar, related materials:				
Unspecified	12 097	9,754	--	West Germany 3,540; Hungary 2,705.
Fertilizer materials:				
Crude, unspecified	r77	15	NA	NA.
Manufactured:				
Ammonia	21,744	18,166	--	Austria 7,657; France 7,643.
Nitrogenous	89,412	97,885	563	Austria 43,225; West Germany 23,531.
Phosphatic	r143,330	125,954	807	France 83,650; Belgium-Luxembourg 39,784.
Unspecified and mixed	131,245	123,784	9,682	France 47,539; West Germany 22,587.
Graphite, natural	232	149	--	West Germany 80; Austria 27.
Gypsum and plaster	75,344	72,902	--	West Germany 47,434; France 13,836.
Halogens:				
Chlorine	65	435	--	France 385; West Germany 50.
Unspecified	2,008	2,013	--	France 898; East Germany 429.
Lime	56,420	51,030	--	France 27,108; West Germany 23,758.
Magnesium compounds:				
Magnesite	r4,186	4,756	--	Austria 3,221; Spain 1,261.
Oxides and hydroxides	r281	214	28	West Germany 61; France 57.
Mica:				
Crude including splittings and waste	546	655	--	France 206; India 146.
Worked including agglomerated splittings	535	417	(1)	France 247; Belgium-Luxembourg 157.
Phosphates, crude	13,055	9,799	--	Morocco 6,797; Togo 1,052.
Pigments, mineral:				
Natural, crude	357	416	--	West Germany 233; Austria 110.
Iron oxides and hydroxides, processed	2,842	2,572	9	West Germany 2,378; United Kingdom 90.
Potassium salts, crude[3]	87,735	84,517	--	France 53,875; West Germany 23,532.
Precious and semiprecious stones other than diamond:				
Natural value, thousands	$329,400	$329,146	$25,973	Belgium-Luxembourg $118,948; United Kingdom $49,812.
Synthetic thousand carats	136,290	128,225	19,305	France 82,890; West Germany 13,890.

See footnotes at end of table.

COMMODITY REVIEW

METALS

Aluminum.—In spite of the world recession, Swiss Aluminium Ltd. (Alusuisse) completed plans to modernize and expand its Valais works during 1982. Investment of about $115 billion dollars in smelters at Chippis and Steg and the rolling extrusion plant at Siders should transform them into the most modern facilities for production and processing of aluminum in Europe. In 1982, the program to reduce smelter pollution was completed. At Chippis, fumes from the cells were collected directly from a hole in the crust kept open by a crust-breaker; at Steg the cells were completely hooded. At both, a dry absorption unit cleaned fumes from the furnaces. A new 3,500-ton indirect press was the major improvement in the extrusion plant. The press requires about 70% less pressure than indirect extrusion, and power savings range from 20% to 30%.

MINERAL FUELS

Petroleum and Natural Gas.—Switzerland started on the way to becoming a producer of natural gas; a gas find by a subsidiary of Swiss Petrol S.A. in well Entebuch-1 at Finsterwald would be the first indigenous supply of hydrocarbon in the country. It was tested and flowed at an indicated rate of 9 million cubic feet per day. Later in the year, a decision was made to tie the small Finsterwald gasfield to the international transit gasline and start production sometime in 1984 or 1985. Swiss Petrol also continued its 8-year exploration program with Brigitta Elwerater A.G. (Deutsche Shell and Esso A.G.) as operator.

The Mineral Industry of Taiwan

By E. Chin[1]

Taiwan's gross national product (GNP) for 1982 was estimated at $46.7 billion[2] at current market prices and at $29.7 billion at 1976 prices, compared with $45.9 billion and $28.6 billion, respectively, for 1981. The economic growth rate of 4% in 1982 sharply contrasts to Taiwan's historical average growth rate of 9% per year over the past three decades. The downturn in the economy's growth rate resulted from weaker overseas sales of Taiwan goods, inasmuch as exports represented generally about one-half of Taiwan's GNP. To combat the slowdown in growth, the Government relied on easing monetary policy and a moderate devaluation of its currency. Interest rates were lowered eight times between August 1981 and September 1982 with the prime rate falling from 15.25% to 9.75%. The ban on construction loans in effect since 1974 was lifted in 1982. Following a devaluation of the Taiwan dollar in August 1981, the currency was allowed to depreciate by 7% as of November 15, 1982. Because of sluggish export orders, the manufacturing sector was plagued with about 25% excess capacity. Fiscal policies adopted to stimulate the economy included lowering custom duties on selected machinery imports and improving tax incentives in capital- and technology-intensive industries. Also, some public works projects were moved up to start after July 1, 1982.[3]

Except for construction raw materials, Taiwan is dependent on foreign raw materials; i.e., minerals and fuels. In 1982, the mineral processing sector outweighed the domestic mining sector by 21 to 1 in output values compared with 20 to 1 in 1981 and with 13 to 1 in 1971. The value of domestic mine output was down 12% in 1982, reversing the annual growth during 1976-81. By sector, the value of domestic output of mineral fuels was down 10% to $413 million, and metallic ores was down 17% to $66 million. The total value of domestic mining in 1982 represents only about 1% of GNP.

Monthly employment in the mining and quarry sector averaged 50,250 in 1982 compared with 51,900 in 1981. Monthly earnings in the mining sector in 1982 were $394 compared with $310 for manufacturing, $465 for utilities, and $260 for construction. Monthly average working hours in the mining sector were 186 in 1982, down from 190 in 1981.

In April 1982, the Legislative Yuan revised the environmental air pollution law. Under the new amendments, offenders will face daily fines of $1,600 to $7,900 for pollution. Moreover, the change in the law provides for the suspension of operation of polluting facilities in the event that fines were not sufficient to force air quality improvement or the installation of pollution controls. A maximum emission standard for air pollutants was to be enforced in certain areas.

On December 23, 1982, the Executive Yuan approved the economic development plan for 1983, which targets an economic growth rate of 5.5%. Agriculture was to grow by 20%; manufacturing, 5.4%; and services, 5.8%. The current 4-year economic plan (1982-85) stresses short-term economic recovery and long-term improvement of Taiwan's economic structure.[4] During 1983, inflation was not to exceed 5% for commodity prices. The target growth for exports was set at 4.1%, and for imports, 5.4%. GNP was projected at $48.1 billion in 1983, and per capita income was to reach $2,700. The output of key industries—mainly basic metals, machinery, and electronics—was ex-

pected to account for 33% of the 1983 gross industrial product. To attain the overall 5.5% targeted increase in GNP, gross fixed capital formation in the private sector was set at a 10.6% growth rate.

PRODUCTION

Domestic mine production of minerals in Taiwan is of little consequence by world standards. Because of high world prices, the value of mineral fuels output dominates Taiwan's small mining industry. There are small quantities of crude petroleum and natural gas produced from indigenous wells. After oil and natural gas, coal was the second most important mineral mined. However, output of coal has decreased annually since 1967. The principal significance of domestic mineral fuels production was as a very small supplement to Taiwan's imported fuel requirements.

The metallic minerals mined included only small quantities of copper and iron sands. In terms of tonnage, the largest nonmetallic output is of carbonate minerals—limestone, marble, and dolomite, in that order. Other nonmetallic values produced included asbestos, clays, feldspar, gem stones, gypsum, mica, pyrite, salt, serpentine, sulfur, and talc.

The overall value of production by the mining industry was distributed as follows, in millions: crude petroleum and natural gas, $244; coal, $170; metals, $126; and miscellaneous nonmetallic mining and quarrying, $66. All of the metal mining and production of crude petroleum and natural gas was from Government-owned operations. The private sector, however, accounts for about 98% of the annual production of coal. About 85% of the output of miscellaneous mining and quarrying is by the private sector.

The bulk of Taiwan's industrial output of mineral-derived products is from imported materials. Domestic production of finished articles and semimanufactures is primarily for export markets. Metal production includes ingots and manufactures of iron and steel, aluminum, copper, gold, and silver. The value added by secondary and tertiary industries related to minerals and metals was as follows, in millions: petroleum and coal products, $4,551; chemicals and chemical products, $4,548; and nonmetallic mineral products, $2,742. In 1982, the total value of mining and manufacturing in Taiwan was estimated to be about $44 billion comprised as follows, in millions: manufactures of the mineral processing sector, $13,093; mining, $606; and all other manufacturing, $31,301.[5]

TRADE

In 1982, Taiwan's two-way trade totaled $41.1 billion, down $2.7 billion from that in 1981. Exports decreased 2% to $22.2 billion in 1982, while imports decreased 11% to $18.9 billion.

The United States and Japan continued to be Taiwan's major trade partners in 1982, comprising 47% of Taiwan's total value of two-way trade. The value of exports to the United States totaled $8.7 billion in 1982, followed by Japan, $2.4 billion; Hong Kong, $1.6 billion; the Federal Republic of Germany, $0.8 billion; Saudi Arabia, $0.7 billion; and Australia, $0.6 billion. Japan was Taiwan's major supplier of imports, providing $4.8 billion. Receipts from the United States were $4.6 billion; Saudi Arabia, $1.9 billion; Kuwait, $1.3 billion; the Federal Republic of Germany, $0.8 billion; and Australia, $0.6 billion.[6]

Industrial goods, including processed agricultural products, continued to dominate Taiwan's commodity exports. The largest export category was textiles, accounting for about 20% of the total value of exports, followed by electronic products, about 15%. Other major exports by value, in declining order of magnitude, were electrical machinery and appliances, metal products, plastic shoes, wood products, and mechanical and transportation equipment. Crude oil has been the leading commodity import by value since 1977, displacing machinery, which had been the major import prior to the first oil crises in the early 1970's. The other major import categories in 1982 were electrical machinery and appliances, iron and steel, and transportation equipment.

Coal: All grades including briquets	210	30	--	All to Philippines.
Coke and semicoke	10,466	10,281	--	Indonesia 6,380; Malaysia 1,185; Thailand 1,100.
Hydrogen, helium, rare gases kilograms	127,360	40,325	--	Philippines 40,320.
Petroleum and refinery products:				
Crude thousand 42-gallon barrels	--	(2)	--	All to Singapore.
Refinery products:				
Liquefied petroleum gas do	178	91	--	All to Hong Kong.
Gasoline do	62	17	--	All to Thailand.
Mineral jelly and wax do	--	(2)	--	Mainly to Nigeria.
Kerosine and jet fuel do	1,028	2,736	211	Philippines 1,036; Japan 721; India 408.
Distillate fuel oil do	5,037	6,394	--	Japan 1,575; Hong Kong 678; Republic of Korea 585.
Lubricants do	610	464	2	India 304; Republic of Korea 134.
Nonlubricating oils do	11	(2)	--	Mainly to Republic of Korea.
Bitumen and other residues do	--	3	--	Indonesia 2.
Petroleum coke do	--	1	--	All to Singapore.
Tars and other crude chemicals derived from coal, gas, and petroleum	40,441	24,551	--	Japan 11,465; Republic of Korea 8,009; Indonesia 4,490.

[r] Revised.
[1] Unreported quantity valued at $5,833.
[2] Less than 1/2 unit.
[3] May include platinum-group metals.
[4] Unreported quantity valued at $2,746.
[5] Excludes unreported quantity valued at $444.

COMMODITY REVIEW

METALS

Metal mining in Taiwan was insignificant and was inconsequential by world standards as well as for domestic requirements. In 1982, there were mine registrations for small operations for copper, gold, silver, iron, and manganese. Taiwan's primary metals industry was largely limited to aluminum, copper, and iron and steel, all of which required imported ore raw materials. While some gold and silver was produced from domestic mining operations, the bulk was recovered as a byproduct from the processing of imported copper concentrate. Supplementing primary metal production, Taiwan's large shipbreaking industry generated largely iron and steel scrap and indeterminant quantities of copper, lead, and other metal values.

Taiwan has 13 large industrial enterprises that are state-owned. Five of these are metal producers or users—Taiwan Aluminium Corp. (Talco), Taiwan Metal Mining Corp. (TMMCO) (copper), China Steel Corp. (CSC), China Shipbuilding Corp., and Taiwan Machinery Manufacturing Corp. The overall combined earnings of the 13 state-owned firms amounted to about $500 million, or only about one-half of the Government's projected earnings under the annual budget. Firms showing losses during 1982 included Talco, TMMCO, China Shipbuilding, and Taiwan Machinery. Talco was the enterprise with the largest losses, amounting to about $50 million in 1982. High energy costs, the domestic recession, and the weak world market were cited as causes for the poor performance of these enterprises. In early 1982, the Government began studying the possibility of merging or closing down the state-owned firms that have shown consistent losses or marginal performance.

Aluminum.—Talco shut down its old smelter, Kao-Hsiung I, in early 1981 because of its inefficiency and lack of pollution control. Kao-Hsiung II was inaugurated in June 1980 with an annual capacity of 50,000 tons. During 1982, Kao-Hsiung II operated at about 43% of installed capacity compared with 61% in 1981. The high cost of electricity and low metal prices in the international market were cited as the cause in the curtailment in operation capacity. Despite the cutback, Talco produced about 2,500 tons per month of sheet and coil from imported ingot and from its own metal production. If the smelter is shut down, Talco will concentrate on downstream operations. The company was expected to complete the construction in 1983 of an $80 million fabrication plant with a capacity of 83,000 tons per year of sheet, foil, and can stock.

Copper.—During 1981-82, TMMCO operated its 50,000-ton-per-year copper smelter-refinery near Keelung at full capacity. However, the company was financially weak, owing about $275 million in loans that reportedly have been accruing interest at a rate of $75,000 per day. The operation had been hurt by low copper prices as well as from management inefficiency at TMMCO. The Government decided in principle to sell the plant to downstream users of copper, but by yearend 1982 had not settled on the buyers nor the price.

Iron and Steel.—CSC operated the country's only integrated iron and steel mill at Kao-Hsiung. Installation of the second blast furnace was completed in early 1982. The furnace, initially fired on February 19, produced 5,000 tons of molten iron per day and boosted CSC's production of crude steel from 1.5 to 3.25 million tons per year. Two continuous slab casters were commissioned in February, and later in April, CSC began commercial operation of its 1.8-million-ton-per-year hot strip mill. In July, a 700,000-ton-per-year cold roll strip mill was placed into operation, essentially completing the second-stage expansion of CSC. The Kao-Hsiung complex also has a 900,000-ton-per-year billet mill, a 400,000-ton-per-year plate mill, a 300,000-ton-per-year bar mill, and a 300,000-ton-per-year wire rod mill. CSC had planned a stage-three expansion program to raise total steel capacity to 5.7 million tons per year by adding a steel mill in central Taiwan. However, because of the downturn in domestic demand and in the foreign market, the expansion program was indefinitely delayed.

Domestic mine output of iron ore was insignificant and sporadic. Virtually all of Taiwan's requirement for iron ore was met by imports from Australia, Brazil, and the Republic of South Africa. Likewise, coking coal was also imported primarily from Australia, the Republic of South Africa, and the United States. Taiwan, however, has a large shipbreaking industry encompassing

36 wharves at Kao-Hsiung. Shipbreaking in 1979 totaled 2.9 million light displacement tons, 2.0 million light displacement tons in 1980, and 1.8 million light displacement tons in 1981. About 10% of the scrap steel, mostly high-quality plate, was exported directly, and another 10% underwent reworking before being exported. The remainder was used domestically.

The commissioning of Taiwan's first stainless steel plant in May 1982 was postponed because of a delay in delivery of equipment. By November, however, Tang Eng Iron Works Co. Ltd. was completing the final stages of equipment testing, and commercial production from the 50,000-ton-per-year plant was scheduled for early 1983. Inco Ltd. of Toronto, Canada, and Talent Chemical Industrial Corp. planned the construction of a 7,000-ton-per-year nickel plant. Nickel oxide to be imported from Canada will be used to produce nickel shot and pig, which was expected to meet all of Taiwan's needs. Sixty percent of Tang Eng's production capacity was nickel-based stainless steel.

NONMETALS

Domestic mining of nonmetallic minerals centered largely around limestone, dolomite, and marble. Most of the limestone output was from captive mines of cement producers. Some local limestone was also used for sugar refining. The largest dolomite operation at Ch'ing-Ch'ang Shan was worked by CSC for use in its blast furnaces at Kao-Hsiung. Crystalline limestone, quarried in eastern Taiwan, was used by the cement and fertilizer industries. Larger size marble was used as decorative building stone. Other nonmetallic mineral production of only local significance included clays, feldspar, salt, and serpentine.

Cement.—Taiwan's cement industry was comprised of 17 plants operated by 11 companies. Total industry capacity was about 15.3 million tons per year. Taiwan Cement Corp. was the largest producer with a combined capacity of 5.27 million tons per year from four plants, followed by Asia Cement Corp. with 2.8 million tons per year from three plants, and Chia Hsin Cement Corp. with 1.2 million tons per year from one plant. Cement output during the year was about 86% of capacity. Although some cement was exported, most of the production was domestically consumed. In 1982, total construction was down 33% from that of 1981 to about 26 million square meters. Reinforced concrete construction, the largest sector, was down 40% to about 17.5 million square meters. The Government, however, decided to initiate some building programs earlier that were expected to aid the industry.

Fertilizer Materials.—Taiwan's fertilizer industry was dominated by large Government-owned companies with a number of smaller companies operated by the private sector. The Government-owned operations were China Phosphate Industries Corp., CPC, Kao-Hsiung Aluminum Sulphate Corp., TMMCO, and Taiwan Fertilizer Co. Ltd. Depressed demand and excess capacity in the Far East has dampened the industry. In 1982, there was only one expansion in progress; Taiwan Fertilizer was constructing a 99,000-ton-per-year sulfuric acid plant at Kao-Hsiung, scheduled for completion in 1984. This plant was to be the base of a new compound fertilizer complex to be built and operated by the company.

MINERAL FUELS

Taiwan produced only small quantities of coal, petroleum, and natural gas, and domestic energy output from all sources provided less than 15% of the country's total energy supply.

In 1982, electricity accounted for 30% of the commercial energy consumption—thermal power, 19%; nuclear power, 8%; and hydropower, 3%. Petroleum accounted for 41% of commercial energy consumption, with 7% for coal, about 5% for natural gas, and the remaining 17% for other, which included exports and losses. The major consumers of electrical energy by industrial sector were transportation, 12%; nonmetallic mineral products, 10%; chemicals, 9%; metallic products, 8%; energy, 7%; textiles, 6%; agriculture and food processing, 5%; wood products, 4%; and mining, 1%.

CPC conducted 4,421 kilometers of seismic, 4,011 kilometers of gravity, and 2,786 kilometers of magnetic survey for offshore oil and gas in 1982. Over the past decade, CPC had drilled 70 offshore wells singularly and in cooperation with foreign companies. Thirteen wells had commercially exploitable showings of oil and natural gas. However, since early 1981, there have been no significant finds. In 1982, CPC drilled 17 onshore wells: dissolved gas, 7; dry, 7; and completed as gas producers, 3. In 1983, CPC planned to allocate $100 million for exploration activities, which will include five offshore well drillings in an area off the north

coast.[7]

Since 1976, Taiwan's output of coal has declined annually to about 2.4 million tons in 1982. About 98% of the total output was from 169 pits operated by the private sector. The remainder was from two Government-owned pits. Seventy-four mining pits in Taipei prefecture accounted for 58% of the national output, with lesser amounts from Keelung, 14%; Miaoli, 13%; Hsin-Chu, 6%; Tasyuan, 5%; and other areas, 4%. By grade, 95% of the production was dust coal, and the remainder, lump coal. About 20% of the coal produced was classified as coking coal.[8]

The Mineral Industry of Thailand

By Gordon L. Kinney[1]

The mining industry accounted for $550 million[2] or 1.5% of Thailand's gross domestic product (GDP) in 1981. This was a decline from a high of 2.3% in 1979 and 2.1% in 1980. In 1982, the output in the mining sector, excluding natural gas, retracted markedly owing to diminishing demand from industrial countries and a drop in prices of Thailand's more important minerals; namely, tin, tungsten, lead, and tantalum. These factors led to a reduction in production and, in some cases, the temporary closing of some mines.

Even with the decline in output, Thailand ranked high among market economy countries as a producer of tantalum, first; tin, third; fluorite, fifth; barite, sixth; and tungsten, eighth. It also produced domestically important quantities of marl, gypsum, limestone, cement, antimony, lead, manganese, lignite, and natural gas.

In addition to the currently produced minerals, Thailand has one of the world's largest continuous deposits of rock salt. Potash layers have been identified within the salt beds and are being investigated. These are the only known potash deposits in South and Southeast Asia. Thailand has the potential to become a major regional supplier of K_2O fertilizer.

The September 1981 inauguration of natural gas production from the offshore Erawan Gasfield was heralded as the start of an era of low-cost energy. Serious production problems during 1982, however, dampened the enthusiasm and caused the Government to reconsider its industrial development plans.

Several natural gas-based industries were planned for the coastal area southeast of Bangkok where the new pipeline came ashore. A petrochemical complex based on the heavier hydrocarbons from a gas separation plant was one of the larger projects. Another project, a large ammonia-urea complex, was to be Thailand's first nitrogen fertilizer plant. A soda ash plant, a direct-reduction steel plant, and additional electric power capacity were all to be dependent upon the availability of low-cost natural gas. The export of liquefied natural gas (LNG) was also being contemplated.

Some of these plans may be delayed until the gas availability is clarified. The cause of the gas production shortfall was still being disputed. The critical fact remained that the cost of extracting the gas will be higher than originally anticipated. The cost of the delivered gas will be a major factor in the economic feasibility of most of the planned projects. If it is substantially cheaper than imported energy, some of the projects could still be built. The proposed multibillion dollar natural gas export plan is least likely to go forward because of high capital cost, questionable gas reserves, and political sensitivity.

One favorable development in 1982 was the finding of crude oil. Thai-Shell Exploration and Production Co. Ltd. was installing production facilities at its Lan Krabu oil discovery 360 kilometers north of Bangkok. Production was scheduled to start in January 1983 at a modest 5,000 barrels per day in what will be Thailand's first commercial oilfield.

Expansion of the minerals sector was an important objective of Thailand's ambitious fifth 5-year development plan. Existing information indicated that the mining industry potential was high and if properly developed could contribute to lowering Thailand's balance-of-trade deficit. In addition, it would generate rural employment and ex-

tend the infrastructure into remote and underdeveloped areas.

An accurate survey of the country's mineral resources was deemed essential. The Government proposed an airborne geophysical survey of the country to establish a comprehensive mineral resource data base that would be made available to domestic and international mining concerns. The project will include the following: (1) the airborne survey; (2) laboratory and field instruments and equipment for followup ground surveys; (3) construction of workshops, laboratories, and administrative facilities; and (4) provision for foreign consultants to assist project implementation and in-country training of personnel in geoscientific techniques. The project cost would be nearly $64 million. The Asia Development Bank proposed a $39 million loan to finance part of the costs. The airborne survey could be completed in three October-to-April flying seasons.[3]

Despite a slowdown from the more rapid growth of 1981, the Thai economy performed well in 1982, producing a real growth rate of 4.2% and out performing all of its Association of Southeast Asian Nations (ASEAN) economic partners except Singapore. The inflation rate was lowered from 12.7% to below 9% and the balance-of-trade deficit was also reduced. The current account deficit of $1.1 billion was a 57% reduction from the 1981 figure. The most rapid growth in the economy occurred in the business sector, which grew 11.5% in real terms. Agriculture's share of GDP dropped to 20.6%. The manufacturing sector, on the other hand, grew from $7.2 billion to $7.7 billion and in 1982 rivaled agriculture as the leading sector of the economy.

The year 1983 promised a pickup in the rate of economic activity. Real GDP growth was forecast at 5.5% to 6.0%. Agricultural output should expand only slightly although manufacturing could rise by 7%. Inflation was expected to remain moderate.[4]

PRODUCTION

Thai mineral production was down in value. Production of the important minerals dropped, such as antimony, manganese, tantalum, tin, and tungsten. Gypsum output increased in response to higher production of cement. The production of other basic cement ingredients increased as well. Thailand remained the number one producer of tantalum in the form of tin smelter slags, and the third largest producer of tin. The fledgling natural gas industry got off to an inauspicious start with production levels at less than one-half the contracted amount during the first full year of operation. Thailand's first commercial oilfield was tested at Lan Krabu in December. Production was expected to begin at the official dedication of the Sirikit Oilfield in January 1983 at a level of 5,000 barrels per day, increasing to nearly 20,000 barrels per day in 2 years.

[1]Includes data available through Aug. 4, 1983.

[2]Reported figure.

[3]Excludes columbium- and tantalum-bearing tin slags, which make Thailand the world's largest source of newly mined tantalum.

TRADE

The estimated value of trade fell slightly compared with that of 1981. Imports declined $800 million while exports were estimated to have increased $500 million. The balance-of-trade situation improved markedly from a deficit of $2.9 billion in 1981 to an estimated deficit of $1.6 billion in 1982. Imports of heavy oil declined as natural gas replaced some of the oil in Bangkok thermal powerplants. Exports of tin, fluorite, tungsten, and antimony declined in tonnage and value. Cement exports more than tripled as new production capacity gave Thailand a surplus after several years of large imports.

The country continued to import most of its energy needs, mostly in the form of crude oil and refined products. The imports of petroleum were expected to decrease in the coming years as domestic natural gas and crude oil production increases.

Potassic	(1)	20	--	Do.
Unspecified and mixed	2,000	290	--	Saudi Arabia 288.
Graphite, natural	77	--		

See footnotes at end of table.

Table 2.—Thailand: Exports and reexports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Gypsum and plaster	147,169	216,625	--	Malaysia 107,198; Indonesia 61,450; Taiwan 20,890.
Halogens: Chlorine, kilograms	1,210	20	--	All to Vietnam.
Lime	--	33	--	All to Singapore.
Magnesium compounds: Magnesite	--	26	--	All to Taiwan.
Pigments, mineral: Iron oxides and hydroxides, processed	18	--		
Precious and semiprecious stones other than diamond:				
Natural:				
Precious, thousand carats	17,222	27,492	7,441	West Germany 9,212; Switzerland 2,537; Hong Kong 2,086.
Semiprecious, kilograms	539,567	120,391	4,583	Hong Kong 112,756; Taiwan 1,146; Switzerland 1,041.
Synthetic[2], do.	63	49	4	Singapore 30; United Kingdom 9.
Salt and brine	123,989	101,482	(1)	Malaysia 70,977; Singapore 30,011.
Sodium and potassium compounds, n.e.s.:				
Sodium carbonate, natural and manufactured	1	2	--	Mainly to Burma.
Sodium hydroxide	17	--		
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	270	--		
Worked	446	154	(1)	Taiwan 150.
Dolomite, chiefly refractory-grade	--	3,268	--	All to Singapore.
Gravel and crushed rock	58	26	--	Laos 18; Malaysia 8.
Limestone other than dimension	189	2,566	--	Singapore 2,253; Malaysia 103.
Quartz and quartzite	9,600	5,368	--	Japan 5,250; Taiwan 108.
Sand other than metal-bearing	10	37	--	Mainly to Malaysia.
Sulfur:				
Elemental:				
Crude including native and by-product	10	--		
Colloidal, precipitated, sublimed	428	260	--	Indonesia 200; Sri Lanka 60.
Dioxide	--	9	--	All to Hong Kong.
Sulfuric acid	555	--		
Talc, steatite, soapstone, pyrophyllite	3,050	2,384	--	Sri Lanka 1,201; Indonesia 1,025.
Other:				
Crude	10	76	(1)	Malaysia 40; West Germany 15.
Slag and dross, not metal-bearing	3,901	2,880	23	Japan 1,042; India 990; Taiwan 464.
Oxides and hydroxides of barium, magnesium, strontium, kilograms	500	297	--	All to Malaysia.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	r12,878	21,142	--	Malaysia 9,670; Hong Kong 5,328; Singapore 4,643.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	51	150	--	Singapore 86; Malaysia 40; Hong Kong 20.
Carbon: Carbon black	2,003	6,034	--	India 4,496; Indonesia 642; Sri Lanka 341.
Coal:				
Anthracite and bituminous including briquets	1,306	1,148	--	Sri Lanka 358; Pakistan 255; Republic of Korea 234.
Lignite including briquets	1	9,601	--	All to Taiwan.
Coke and semicoke	20	--		
Hydrogen, helium, rare gases, kilograms	600	3,060	--	Laos 3,000; Burma 60.
Petroleum refinery products:				
Liquefied petroleum gas, 42-gallon barrels	151	248	--	Malaysia 190; Indonesia 58.
Gasoline, motor, do.	6	1,093	--	Malaysia 1,090.
Mineral jelly and wax, do.	--	6	--	Taiwan 4.
Kerosine and jet fuel, thousand 42-gallon barrels	1,301	1,105	21	Laos 485; India 79; China 70.
Lubricants, 42-gallon barrels	497	46,077	1	India 7,574; Philippines 6,565; Hong Kong 6,434.
Nonlubricating oils, do.	1,496	764	--	Indonesia 694; Malaysia 69.
Bitumen and other residues, do.	6,427	2,716	--	Singapore 2,436; Malaysia 217; Hong Kong 63.
Bituminous mixtures, do.	2,606	242	--	All to Malaysia.
Tars and other crude chemicals derived from coal, gas, and petroleum, kilograms	56	4,518	--	Singapore 4,500.

rRevised.
[1]Less than 1/2 unit.
[2]Includes reconstructed semiprecious stones.

Table 3.—Thailand: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals:				
Unspecified	44	34	(1)	Mainly from West Germany.
Aluminum:				
Ore and concentrate	205	8,964	--	Malaysia 6,113; Canada 1,500; China 1,350.
Oxides and hydroxides	13,016	9,960	55	China 7,383; Japan 2,055.
Metal including alloys:				
Scrap	81	96	--	Hong Kong 86; Australia 5; France 5.
Unwrought	44,908	51,774	8,773	Canada 19,014; Australia 4,777; Ghana 4,156.
Semimanufactures	3,263	3,031	725	Japan 782; Australia 409; France 310.
Antimony:				
Ore and concentrate	15	3	--	All from Burma.
Metal including alloys, all forms	20	10	--	All from China.
Cadmium: Metal including alloys, all forms kilograms	109	30	5	Australia 20; Switzerland 3.
Chromium:				
Ore and concentrate	56	1,337	--	Philippines 1,300; Belgium-Luxembourg 34.
Oxides and hydroxides	354	530	188	West Germany 215; U.S.S.R. 70.
Metal including alloys, all forms kilograms	692	--		
Cobalt:				
Oxides and hydroxides	92	4	(1)	Canada 2; Japan 1; Netherlands 1.
Metal including alloys, all forms kilograms	--	261	--	Belgium 150; United Kingdom 31; Japan 30.
Columbium and tantalum:				
Ore and concentrate	--	34	--	All from Australia.
Metal including alloys, all forms, tantalum kilograms	--	1	1	
Copper:				
Matte and speiss including cement copper	--	150	--	All from Chile.
Sulfate	245	283	250	United Kingdom 33.
Metal including alloys:				
Scrap	337	373	126	Hong Kong 234.
Unwrought	4,468	5,365	--	Zambia 3,062; Chile 1,163; Japan 1,138.
Semimanufactures	12,782	12,057	148	Japan 8,656; Republic of Korea 1,330.
Gold:				
Metal including alloys, unwrought and partly wrought troy ounces	12,686	12,029	9,042	Singapore 2,954.
Iron and steel:				
Iron ore and concentrate excluding roasted pyrite	r614	164	--	Malaysia 130; Burma 34.
Metal:				
Scrap	337,670	417,183	65,572	Italy 86,315; West Germany 57,623; Taiwan 34,093.
Pig iron, cast iron, related materials	r5,168	27,770	(1)	Australia 12,019; China 7,411; Hong Kong 4,234.
Ferroalloys:				
Ferrochromium	147	15	--	Japan 13; Sweden 2.
Ferromanganese	3,933	2,874	--	Australia 2,176; Japan 438; China 139.
Ferronickel	50	--		
Ferrosilicomanganese	463	1,291	--	Australia 1,229; Taiwan 60.
Ferrosilicon	3,392	3,303	2	China 1,314; Yugoslavia 750; Norway 353.
Unspecified	580	864	9	Australia 627; Taiwan 140; Japan 30.
Steel, primary forms	r512,365	359,831	1,155	Japan 86,851; Republic of Korea 59,147; Australia 52,983.
Semimanufactures:				
Bars, rods, angles, shapes, sections	210,462	274,106	125	Japan 217,937; China 14,361; Bulgaria 10,891.
Universals, plates, sheets	574,359	697,301	28,511	Japan 456,068; Canada 60,752; Republic of Korea 42,405.
Hoop and strip	10,554	11,222	71	Japan 8,180; Republic of Korea 666; West Germany 556.
Rails and accessories	1,014	1,319	--	Austria 609; Belgium-Luxembourg 147; Japan 146.
Wire	16,455	14,267	56	Japan 7,969; Republic of Korea 2,930; China 798.
Tubes, pipes, fittings	21,545	42,284	185	Japan 39,308; United Kingdom 1,488; Sweden 383.
Castings and forgings, rough	1	--		
Unspecified thousand tons	468	--		

See footnotes at end of table.

Table 3.—Thailand: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Lead:				
Oxides	403	336	(1)	Australia 307.
Metal including alloys:				
Scrap	253	25	--	All from Singapore.
Unwrought	16,780	12,650	245	Australia 8,399; Taiwan 2,665.
Semimanufactures	61	179	(1)	Belgium-Luxembourg 87; West Germany 48.
Magnesium: Metal including alloys:				
Unwrought	16	10	8	Australia 1; Japan 1.
Semimanufactures kilograms	163	226	123	United Kingdom 78; West Germany 25.
Manganese:				
Ore and concentrate, chemical-grade	--	3	--	All from Netherlands.
Oxides	160	548	--	Singapore 210; Japan 192; China 115.
Metal including alloys, all forms	15	8	7	France 1.
Mercury 76-pound flasks	365	580	(1)	China 347; Japan 166; West Germany 47.
Metalloids:				
Arsenic:				
Oxides and acids	99	75	--	Belgium-Luxembourg 32; France 28; Australia 10.
Metal including alloys, all forms	15	8	7	France 1.
Phosphorus	34	22	--	Japan 10; Sweden 9; China 3.
Silicon kilograms	19,770	135	--	Australia 125; Taiwan 10.
Unspecified	8	35	1	West Germany 28.
Molybdenum: Metal including alloys, all forms kilograms	972	3,488	--	Taiwan 2,887; United Kingdom 472.
Nickel:				
Matte and speiss	10	--		
Metal including alloys:				
Unwrought	338	415	3	Canada 202; Norway 64; Australia 53.
Semimanufactures	831	1,728	(1)	Republic of Korea 980; West Germany 452; Japan 280.
Platinum-group metals:				
Waste and sweepings[2] value	$1,036	$38	--	All from Japan.
Metal including alloys, unwrought and partly wrought troy ounces	1,222	[3]6,912	--	Japan 4,019; Hong Kong 2,893.
Silver:				
Ore and concentrate[2]	14	1,220	--	Guyana 1,000; China 220.
Waste and sweepings value	--	$335	--	All from United Kingdom.
Metal including alloys, unwrought and partly wrought thousand troy ounces	463	6,207	3	Japan 5,955.
Tin:				
Oxides	8	1	(1)	Mainly from Japan.
Metal including alloys:				
Unwrought	5	3	--	United Kingdom 2; Denmark 1.
Semimanufactures	88	22	5	Japan 10; United Kingdom 3.
Titanium:				
Ore and concentrate	930	955	--	Australia 910.
Oxides	555	602	3	Belgium-Luxembourg 225; Japan 211; West Germany 63.
Tungsten: Metal including alloys, all forms kilograms	1,131	3,246	102	Japan 3,087.
Zinc:				
Oxides	191	489	3	China 200; Japan 127; Taiwan 70.
Blue powder	55	109	--	Norway 40; Singapore 35; United Kingdom 14.
Metal including alloys:				
Scrap	30	150	--	All from Australia.
Unwrought	34,423	38,716	--	Australia 23,794; Canada 5,687; Japan 4,513.
Semimanufactures	245	76	--	Yugoslavia 27; Belgium-Luxembourg 20; West Germany 13.
Other:				
Ores and concentrates	12,466	4,751	--	China 3,580; Japan 1,033; Australia 122.
Pyrophoric alloys	176	51	1	China 50.
Base metals including alloys, all forms	6	5	(1)	Japan 4.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	1,938	3,441	53	Netherlands 1,979; India 949; Spain 169.

See footnotes at end of table.

Artificial:				
Corundum	521	395	--	Japan 386; Italy 9.
Silicon carbide	301	455	--	China 149; West Germany 141; Poland 85.
Dust and powder of precious and semiprecious stones, including diamond kilograms	204	91	e8	Switzerland 10; United Kingdom 10.
Grinding and polishing wheels and stones	1,822	2,024	5	Japan 776; Taiwan 474; China 323.
Asbestos, crude	58,756	57,193	2,813	Canada 13,840; Botswana 12,801; Zimbabwe 11,154.
Barite and witherite	55	36	--	United Kingdom 18; West Germany 16.
Boron materials: Oxides and acids	72	199	161	China 30.
Cement	942	108,532	225	Japan 108,056.
Chalk kilograms	300	754	704	United Kingdom 50.
Clays and clay products:				
Crude:				
Andalusite, kyanite, sillimanite	5	4	(1)	Mainly from Japan.
Bentonite	848	2,563	1,648	China 580; Japan 148; Indonesia 136.
Fire clay	60	40	--	All from Japan.
Kaolin	3,800	4,174	402	Australia 2,070; Japan 846; United Kingdom 469.
Unspecified	10,488	7,495	3,835	United Kingdom 1,277; Japan 955; Netherlands 828.
Products:				
Nonrefractory	68	7	(1)	Mainly from Japan.
Refractory including nonclay brick	r8,632	3,325	99	United Kingdom 673; Japan 590; West Germany 482.
Cryolite and chiolite kilograms	--	1	--	All from Sweden.
Diamond:				
Gem, not set or strung carats	22,506	191,319	234	India 86,734; Belgium-Luxembourg 52,339; Republic of South Africa 17,110.
Industrial do	72,076	73,427	50,000	Ghana 7,300; Netherlands 6,000; Congo 4,300.
Diatomite and other infusorial earth	35	89	34	Republic of Korea 25; Netherlands 18; West Germany 11.
Feldspar, fluorspar, related materials:				
Feldspar	1,877	2,630	(1)	India 2,000; Finland 434; Japan 146.
Fluorspar	879	408	--	Canada 219; Finland 144; Japan 45.
Unspecified	154	18	--	All from Canada.
Fertilizer materials:				
Crude, n.e.s	--	9	9	
Manufactured:				
Ammonia	1,689	1,972	1	Indonesia 731; Japan 609; Belgium-Luxembourg 321.
Nitrogenous	177,338	257,819	--	Japan 93,835; Belgium-Luxembourg 63,925; West Germany 36,480.
Phosphatic	14,736	5,123	3,623	Netherlands 1,500.
Potassic	29,505	34,483	5,000	Canada 10,628; East Germany 5,150; France 5,000.
Unspecified and mixed	473,402	473,125	142,977	Romania 122,743; Norway 52,783; Republic of Korea 39,608.

COMMODITY REVIEW

METALS

Iron and Steel.—Little progress was seen on implementing plans for major new steelmaking facilities in Thailand. Siam Ferro Industry Co. Ltd.'s plans for a large sponge iron complex were suspended indefinitely. In addition, plans for an integrated steelworks are still at the level of feasibility studies.

Energy costs will be high for whatever type plant is chosen and even gas-based direct-reduction may no longer be viable in light of current gas production and pricing problems.

Thailand's major steelmakers have been suffering large monetary losses because of depressed demand and fierce competition in the domestic market. They operated at 40% of capacity during the year.

Tantalum and Columbium.—Thailand Tantalum Industries Co. Ltd. (TTIC) awarded a $1.5 million contract to Chachaval de Weger International Co. for design, project management, and start of construction of the country's first tantalum and columbium processing plant. The plant was designed to process 2,000 tons[5] per year of tantalum and columbium-bearing tin smelter slags. The $45 million plant will be financed through the International Finance Corp. of the International Bank for Reconstruction and Development (World Bank), which will have an equity of up to 10% in the project.

Siteclearing and groundbreaking for the plant were held in 1982, but the pace of construction was very slow at yearend. A revised construction schedule put the plant completion date into 1986. When completed, the plant will allow Thailand to export higher value ferrotantalum and tantalum and columbium oxides. Currently, only low-value tin slags are exported. The Thaisarco smelter and TTIC were reportedly negotiating the price TTIC will pay for the slags. TTIC was awarded the processing monopoly for the tin slags and has the option to embargo slag exports 1 year before the new plant is due to begin production.

Tin.—Tin was again the most important mineral produced in terms of employment, tax revenue, and foreign exchange earnings. Tin accounted for 90% of the nonfuel mineral royalty paid to the Government and over 80% of mineral export earnings.

The tin miner's problems continued, however, as export tin prices declined early and remained low throughout the year. The depressed demand in most industrialized countries and the sale of tin from the U.S.

strategic stockpile in December 1981 were apparently the main causes of the lower prices. The International Tin Council (ITC) imposed export quotas on producing countries since April 1982 and bought tin off the market in May to support prices. These measures stabilized tin prices but at a relatively low level.

Discouraged by low prices, Thai tin production fell again. The export value also declined in the first three quarters of the year. An exacerbating factor was that the quarterly export quota for Thailand did not correspond with offshore mining production, which is dictated by the monsoon climate. The export quota for the last quarter of 1982 of 4,769 tons was 2,000 tons smaller than the output in that quarter.

Thailand, therefore, proposed to set up a tin stockpile to enable miners to sell their output during the 7-month offshore production season, even when it exceeded the ITC quarterly quotas. Reportedly, Government agencies with the help of local banks would buy and sell the tin. The stockpile was to be started by April 1983. The ITC rejected a Thai request for an annual, rather than quarterly, quota.[6]

The Department of Mineral Resources (DMR) proposed an across-the-board cut in the tin royalty of roughly $0.13 per pound. The cut was needed because rising costs and declining ore grades made many of the smaller mining operations barely marginal under the prevailing low prices. It would also encourage increased production and presumably reduce smuggling. The proposed cut was controversial as opponents claimed that only a few would benefit and the Government would not be able to make up the substantial loss of tax revenue produced by the cut. The tax was last reduced in July 1981. The Thai Cabinet was to make the decision on the tax issue in February 1983.

As more of the rich offshore deposits of tin are worked out, mining new deposits conflicts with environmentalists who oppose dredging near unspoiled resort beaches. The Patong Bay at Phuket was closed to dredging in 1981 because of environmental reasons. The environment also became an issue for nearby Karon Bay. Associated Mine (Thailand) Co., an affiliate of Sethasap Karnrae Co., began dredging Karon Bay in May 1981 with Government approval. A silting problem was later encountered when equipment on the dredge malfunctioned and DMR stopped the mining operation. Since the problem affected the stability of the whole area, the matter was referred to the Cabinet for decision. In April 1982, the Cabinet referred the matter to the National Environmental Board for study and policy recommendation.[7]

The drop in tin production and declining reserves has sparked an increase in offshore exploration activity. In 1981, the preliminary survey of the offshore west of Phuket to the Burma border showed encouraging results at water depths of 30 to 45 meters. A detailed drilling program was underway in 1982 to delineate the prospects and estimate the ore reserves. If the results are favorable, a feasibility study will be conducted. At the depth studied, mining would require new dredging technology.

On the eastern side of Phuket, the state-owned Offshore Mining Organization (OMO) was to survey an area of 1,800 hectares at water depths less than 60 meters. This is one of the few virgin areas of the east coast and OMO was confident of finding economic deposits. OMO would reserve the area for its new dredge, Bodan, which would operate in the Andaman Sea during good weather and in sheltered Phuket Bay during the southwest monsoon. The survey was expected to take 2 years and be assisted by experts from the United Nations.

OMO also planned to search for tin along the eastern seaboard of the Gulf of Thailand from Si Racha south to nearly the Kampuchean border. Preliminary surveys indicated tin deposits in the area. If the findings are favorable, OMO will consider building another dredge.[8]

The Thai-Malaysian consortium, Sea Minerals Ltd.[9] received a 6,400-hectare concession off the Thai coast near Takuapa. The company was to begin the 3-year exploration program as soon as possible. The concession was limited to waters deeper than the Government's 30- to 45-meter survey area.[10] Ore deposits at water depths between 45 and 65 meters would be technically difficult to mine but would be free of suction boat poachers.

According to DMR, the Thai Government spent more than $1.4 million between June 1981 and August 1982 combating illegal mining and smuggling of ore, mostly tin and some tungsten. DMR confiscated ore and equipment worth $3 million during the period. Reportedly, during the same period, the number of dredges operating illegally in the Andaman Sea was reduced from 3,000 to 800. The Government has estimated that 70% of the suction boat output was smug-

gled to other countries where the royalty was much lower. The remaining 30% was legally sold to OMO or the Provincial authorities. The legally reported suction boat output in recent years ranged from 33% to 43% of total tin production. If the Government's estimate was even roughly accurate, the loss of revenue and foreign exchange earnings would be a significant portion of the value of the mining sector output.

The Thai Pioneer Enterprise Co. Ltd. smelter closed in May 1982 and did not reopen through yearend. The new plant began operating in February 1981. The smelter was closed because of a shortage of tin concentrate, a declining market for tantalum-bearing tin slag, and tight cash flow. The smelter also had a design problem that required a $400,000 equipment purchase for correction. Two Thai family-owned mining companies were reportedly going to increase the company's registered capital from $3 million to $7 million so the company could resume production.

Tungsten.—Stora Kopparbergs Bergslangs AB, a Swedish mining company, has taken a 45% equity in a tungsten mine at Doi Mok in Chiang Rai Province about 650 kilometers north of Bangkok. Sirithai Scheelite Ltd., a local company, has a 40% interest in the venture. The open pit mine will be designed to yield at least 430 tons per year of tungsten, presumably concentrate, for sale to the Swedish steel industry. Production reportedly could be increased if world market prices increased significantly.[11]

Thai production and exports of tungsten continued declining for the fourth year. Depressed prices, a high fixed royalty, increased costs, the closing of the Khao Soon Mine, and declining ore grade at the Doi Ngom Mine in northern Thailand contributed to the decline.

Zinc.—In June, construction began on the Tak smelter, 400 kilometers north of Bangkok near the Burma border, after 12 years of planning and financial problems. The Thai Government assisted in the formation of the Padaeng Industry Co., which will own and operate the mine and smelter. There was a change in equity after the agreement was approved in late 1981. Mitsui & Co. (Thailand) increased its share to 6% by buying part of Sino-Thai Engineering and Construction Co.'s interest, thereby reducing Sino-Thai's share to 4%. Seventy percent of Padaeng is owned by the Government and private companies of Thailand. The other 30% is owned by foreign companies. Total investment was revised to about $140 million.[12]

The smelter, to be completed by October 1984, will have a capacity of 60,000 tons per year of ingot. The measured ore reserves, located 80 kilometers west of Tak at Mae Sot, are sufficient to supply the smelter for 11 years. Although the Thai Government surveyed the deposit, a Canadian company will reevaluate the reserves. The early work showed the deposit to be an isolated outcrop of 3.5 million tons of zinc silicate ore grading 20% to 25% zinc.

Initially, one-half of the metal will be used domestically and the balance will be exported to the other members of ASEAN. The smelter will require 30,000 tons per year of sulfur to produce sulfuric acid for the electrolytic process.[13]

NONMETALS

Cement.—The Siam Cement Co. and Siam City Cement Co. expansions were completed and clinker capacity was believed to be 8.8 million tons per year for the country at yearend. At least one other kiln was probably under construction.

Siam Cement has a potential problem with natural gas supply. Construction of a new pipeline was progressing well and is scheduled for completion in the spring of 1983. The $56 million pipeline was to supply fuel for two of its cement plants. However, a production shortfall at the Erawan Gasfield made it unlikely that any gas would be available to the line when completed, and the supply is expected to be much less than planned when supply is initiated. Siam Cement was counting on the gas to lower energy costs, which are 50% of the production cost. The Government could sell oil to Siam Cement at a reduced rate to offset the gas-related losses.

A domestic company, Union Thai Industry Co., has applied to the Government for tax privileges to build a 1-million-ton-per-year cement plant in Lopburi Province. Since the country's cement capacity exceeded domestic needs, the application was expected to be rejected.[14]

Fertilizer Materials.—*Nitrogen.*—Negotiations between the Government and a Scandinavian consortium for a $590 million nitrogen fertilizer complex near Rayong were terminated in July. The main points of contention were: (1) an agreement on natural gas price could not be reached, particularly on future price escalations, and an eventual price ceiling; (2) the equity of the consortium; (3) the rate of return on the company's investment; and (4) the condition that the price of fertilizer produced be

substantially lower than that of imported fertilizer.[15] The original Scandinavian proposal was considered by analysts to be the best offer any foreign group could make.

After terminating negotiations, the Government established the National Fertilizer Corp. in which it held 45% equity. Other holders were Thai Central Chemical Co., 22.5%; Fertilizer Traders Association, 21.12%; Fertilizer Producers Association, 1.38%; and a joint holding of 10% by 12 domestic banks.[16] The new corporation, with $2.2 million registered capital, will study whether the fertilizer complex is economical under the terms and conditions established by the Government. If it is decided to build the much needed plant, the Scandinavian group could be chosen for engineering and construction.

The plant would require 65 million cubic feet per day of natural gas. If the gas cannot be furnished reliably and at a price for the fertilizer to be sold at a profit and less than the cost of imported fertilizer, it is doubtful the plant will be built.

Phosphorus.—Thailand produced an insignificant amount of its phosphorus-fertilizer needs from domestic phosphate rock. Although small phosphate deposits have been located in nine Provinces, the only producing areas were in Lamphun, Rat Buri, and Phetchabun Provinces. The phosphate rock was hand sorted to 30% P_2O_5 content, ground, and used locally in this form as fertilizer.

Thailand has, however, reportedly opened the first commercial plant in the world using a new dry-process phosphate fertilizer production system. The plant is owned by the Siam Chemical Co. Ltd., Bangkok, and was built by Polimex-Cekop Ltd. of Poland. The process, a dry treatment of phosphate rock with gaseous sulfur trioxide, was developed by Polimex in cooperation with the Institute of Chemical Engineering of Warsaw Technical University. The process was claimed to be very energy and cost efficient. The cost of production was 10% to 30% lower, and capital investment per unit of P_2O_5 was 60% lower than an equivalent sulfuric acid and triple super phosphate installation. The variable mix of phosphorus compounds produced by the dry process provides a combined short-, medium-, and long-term availability of plant-usable phosphorus. In addition, it is a dry, noncaking powder, easy to granulate, and mixes well with other fertilizer components when made into compound fertilizers. Tests of the effectiveness on crops growing on acidic tropical soils indicated excellent results, particularly on rice.[17]

Potash.—Exploration and development of the Thai potash deposits was expected to increase following the Goverment's agreement to relinquish rights to revoke exploitation concessions for 5 years. This prerogative had been an obstacle to active detailed exploration. Three groups hold concessions to explore and develop the deposits. The first group, Duval Corp., CRA Exploration Pty. Ltd., and Siam Cement in Khon Kaen and Maha Sarakham Provinces; the second, Agrico Chemical Co. and Thai Central Chemical Co. partnership in Udon Thai Province; and the third, Amax Exploration Co. and Siam Cement joint venture in Sakon Nakhon Province. These are the only known major potash deposits in South and East Asia.[18]

Fluorspar.—The fluorite production decline, which started after the peak year of 1977, continued into the first part of 1982, then reversed and, with erratic monthly production, ended the year with a production gain over that of 1981. Acid-grade material made the biggest gains. The value of production increased each year between 1976 and 1982 because of increasing prices. The main cause of the decline in production was the state of the economy in consuming countries, particularly in Japan, which has traditionally been Thailand's main customer. Thailand also had increased competition from other producing countries, particularly acid-grade material from China. The reversal of the downward trend probably reflected the economic recovery in the industrial countries.

Thai fluorite prices have barely kept up with increased costs of production and transport, putting pressure on less efficient operators and those with lower grade ore bodies. The largely buyer-controlled pricing structure has not been conducive to industry expansion or exploration.

Some of the older fluorite mines were approaching depletion, but few new deposits were being developed or examined. A major increase in exploration and deposit development will be needed to sustain significant production increases beyond the next few years, and certainly past the end of the decade.

In order to offset the decline in exports to Japan, Thailand has been courting other consumers. The U.S.S.R. was its second largest customer for metallurgical-grade fluorite in 1981 followed by the Republic of Korea and Taiwan. The U.S.S.R. became Thailand's biggest market for acid-grade fluorite for the first time in 1981. Japan had

held that position prior to 1976.

Despite Thailand's large production, ranking eighth in the world, it still must import fluorine chemicals in the absence of a downstream chemical industry. Because of this the Thai Government began promoting, in 1982, the establishment of a hydrofluoric acid and fluorine chemical industry for domestic consumption and the export market. Special economic privileges would be granted to a company wishing to undertake the project. Some of the major conditions were that (1) the minimum production capacity must satisfy domestic consumption and its projected growth for the next 5 years, (2) Thai nationals must hold not less than 51% of the registered capital after the plant has been in operation for 5 years, and (3) the Government would not license a similar industry for 5 years. It was believed that some domestic companies were looking into the offer.[19]

Salt.—The plans for an ASEAN-backed salt mine and soda ash plant moved another small step forward during the year when shareholders from the five countries signed a joint-venture agreement creating the ASEAN Soda Ash Co. The project was formally accepted as an ASEAN project in 1978 and plans have progressed slowly since then. The delays have increased the proposed cost of the project from $230 million to over $377 million.

According to the plan, at least 600,000 tons of salt per year would be mined in northeast Thailand where some of the largest salt reserves in the world underlie the Khorat Plateau. The salt would be moved by rail to a soda ash plant on the southeast coast, which would produce 400,000 tons per year each of soda ash and ammonium chloride.

Although formation of the company was encouraging progress, a number of factors still had not been settled at yearend. The plant would be directly dependent on natural gas for process heating and indirectly dependent on low-cost electric power. In addition, the ideal situation was for the proposed ammonia-urea fertilizer plant to furnish ammonia to the project. If the ammonia plant is not built then ammonia would be imported from Indonesia, probably at a higher price. The delivered cost of the natural gas and ammonia will be critical to the economic viability of the project.

MINERAL FUELS

Petroleum and Natural Gas.—Twelve private groups hold the major concession blocks laid out both onshore and offshore by DMR. Exploration has been intense during the last few years. As of November, 107 wells had been drilled offshore. The results showed natural gas and condensate in 55 wells, crude oil and natural gas in 4 wells, and crude oil in 2 others. DMR stated that the gas reserves were over 16 trillion cubic feet. Some of the participating companies considered this figure to be sanguine but whatever the realistic total turns out to be, it is apparent that the exploration activities have been very successful. The only disappointment was the failure to find commercial crude oil deposits offshore. Condensate output, however, will become more important as gas production increases in the coming years.

In addition to the offshore gas reserves announced, there were four additional gasfields deemed to be of commercial size for which no reserve estimates were available at yearend. They were the North Pla-dang, Funan, Trat, and Parkarang Gasfields, all in Union Oil Co.'s concession.

Offshore exploration drilling during 1982 was conducted in the Gulf of Thailand by three of the concessionaires, Pecten Thailand Co., Union Oil of Thailand, and Texas Pacific (Thailand) Inc. Of the six wells started, one tested gas and condensate, two were being drilled at yearend, and three were dry holes. Boundary disputes with Kampuchea and Malaysia temporarily prevented exploration by Triton Oil Co. of Thailand, Thailand Sun Oil Co., and AMOCO Thailand Petroleum Co.

Previous surveys and drilling in the Andaman Sea produced no commerical discoveries and the previous concessions have been relinquished.

Onshore exploration was successful in 1982. Thai-Shell completed a well started in 1981 that tested favorable amounts of crude oil. Thai-Shell also started seven wells in 1982, three of which tested oil, three were dry holes, and one was being drilled at yearend. The Thai-Shell discoveries were encouraging enough for the company to announce its intention to begin crude production of 5,000 barrels per day early in 1983. The field is north of Bangkok at Amphoe Lan Krabu, Kamphaeng Phet Province. This will be the first commerical crude oil production in Thailand; a small Government-owned field near Fang in northern Thailand has produced a few hundred barrels of crude oil per day for Thai military forces for many years. Thai-Shell's estimated cost of production reportedly would be about $25.50 per barrel.

Esso Exploration and Production Khorat

Inc. drilled three wells on concessions covering 50,000 square kilometers on the Khorat Plateau in northeastern Thailand. The first was in Namphong district, 27 kilometers north of Khon Khaen. It tested 47 million cubic feet of dry natural gas per day from zones below 3,100 meters. The second well, 100 kilometers south of the first well, encountered extreme pressure at 3,600 meters. Drilling was suspended and the hole was cemented until high-pressure equipment could be obtained to safely complete the well. Esso's third well in Chiayaphoom Province was suspended after finding no petroleum at a depth of 2,350 meters. Because the results of the first wells were encouraging, the geologic structure will be further tested.

The start of natural gas production from the offshore Erawan Gasfield late in 1981 inaugurated an era of industrial expansion along the eastern seaboard, southeast of Bangkok. Unfortunately, initial gas production was much lower than projected and by mid-1982 it was apparent that production would not only be lower than projected but would not be available in the timeframe originally set up. The field produced 120 million cubic feet per day instead of the contracted amount of 250 million cubic feet per day. The cause of the shortfall, inadequate reserves and/or unexpected geological problems, was still under study at yearend. The major concern of Union Oil and the Petroleum Authority of Thailand was getting gas production up to the contracted flow rate as soon as possible.

The Petroleum Authority did not meet commitments to its first two customers, the Electricity Generating Authority of Thailand and Siam Cement, because of the gasfield's inadequate production. The Petroleum Authority counted on these gas revenues to pay for the $500 million pipeline to Bangkok.[20]

As a partial solution to the production problem, Union Oil will drill additional wells to increase gas flow. In addition, Union Oil's concessions have other proven gasfields with reserves totaling 7 trillion cubic feet. Union has proposed accelerated development of one of these, the Banphot Field, to supplement the Erawan gas. The Banphot Field was believed capable of producing 40 million cubic feet per day. A branch pipeline would tie the Banphot Field to the main pipeline.

A critical part of the long-term development of the natural gas resources was construction of a gas separation plant. The plant, to be located at Laem Chabang, northwest of Rayong, would produce ethane, propane, butane, natural gasoline, and liquefied petroleum gas from the wet natural gas. After nearly 2 years of planning, bidding, and negotiating, a $180 million contract was awarded late in 1982. A consortium composed of Toyo Engineering Corp., Mitsui, and C. E. Randal Corp. will build the 350-million-cubic-foot-per-day, first-stage facility on a turnkey basis. A second stage will be built when additional offshore fields are brought into production. Output from the separation plant will be used to feed a planned $870 million petrochemical complex.

Price negotiations for Texas Pacific (Thailand) Inc.'s natural gas discoveries in concessions south of the Erawan Gasfield continued. An agreeable price was not found so Texas Pacific sought permission to export the gas. This was apparently obtained early in the year. Later, in a move that surprised Texas Pacific, the Government set up a Thai-owned company to export LNG from the Texas Pacific concession. The new arrangement took controlling interest in the project from Texas Pacific and apparently remained unchanged at yearend.

The Mineral Industry of Tunisia

By Kevin Connor[1]

Valued at approximately 20% of the gross domestic product (GDP) in 1981, Tunisia's mineral production declined to approximately 18% of the country's GDP in 1982, which was estimated at slightly over $8 billion.[2] The substantial decrease was due to reductions in petroleum and phosphate rock production. Total mineral export receipts were down more than 20% from 1981. One-half of this decrease was attributable to an increase in use of petroleum production for domestic requirements, which in turn decreased petroleum import requirements and costs. The year 1982 was the first year of Tunisia's Sixth Development Plan (1982-86) and a time of stagnant economic growth. The GDP grew by only 1.5% in real terms in 1982, and the inflation rate increased to nearly 14%. External factors of world recession, severe weather, and soft markets were all key factors in the downturn of the Tunisian economy, which had averaged a 6% annual growth rate for the previous Fifth Development Plan years (1977-81). Petroleum production, Tunisia's major export commodity, was down by almost 5% for the year. Total exports were down by over 6% as the increases in manufactured goods shipped were overshadowed by the declines in petroleum, phosphate chemical, and food exports. Import prices continued to rise throughout the year and only through austerity measures was the growth in annual import costs kept slightly under 3.5%.

PRODUCTION AND TRADE

The decline in petroleum production in 1982 was due solely to the temporary shutdown of production equipment in the Ashtart offshore field for installation of gas lifting and collection systems. The decrease in Ashtart's annual production, which was 18% of 1981's total figure, more than offset the unexpected increase from the El Borma onshore petroleum field. The associated natural gas from the Ashtart Field was slated for use in the domestic market starting in 1983. Instability in the petroleum and refined product markets was cause in 1982 for a considerable rearrangement of Tunisian exports and imports of these commodities. To take advantage of lower prices elsewhere, Tunisia imported more refined products, reduced domestic refining, and used more domestically produced crude in refining to replace decreased light crude imports. Therefore, although total petroleum exports for the year were down 12% by volume, the increased use of indigenous production and decrease in energy import costs resulted in an overall 3% increase in petroleum revenues for the year.[3]

The mining sector experienced a significant decline overall for the year. Phosphate rock production was down 9%, and the subsequent phosphate chemical fertilizer industry production was down 15%, owing principally to the decreased demand and depressed prices on the world markets. Tunisia's iron ore production was down 31% for the year because of a major shutdown of the El Fouladh steel mill for maintenance and modernization work. Production of lead concentrate was down 12% and refined lead was off 13%, owing to very competitive market conditions, both domestically and internationally. Also, the lead smelting plants of Société Tunisienne d'Expansion Minère (STEM) were in need of renovation and had been operating ineffi-

ciently.

There was a 4.5% increase in zinc concentrate production, a 5% decrease in fluorspar production, and a 24% increase in barite production during 1982. However, these increases were not of sufficient value to overcome the decreases in the other mineral sectors.

Foreign trade in the minerals sector was generally poor throughout the year owing to the world oil glut and depressed agricultural markets for phosphate chemical fertilizers. Barite sales were a notable exception, increasing throughout the year as Tunisia continued to supply a larger share of the domestic and international market. The European Economic Community continued as the country's major trading partner with 54% of Tunisia's total exports for 1982 shipped to these countries. France, Italy, and the Federal Republic of Germany were the major export recipients with the United States a less significant fourth.

Gasoline do	1,270	1,292	1,085	1,391	1,498
Kerosine do	1,267	1,777	1,684	1,837	2,277
Distillate fuel oil do	2,365	3,166	3,016	3,156	3,024
Residual fuel oil do	3,341	4,294	4,099	4,380	3,545
Other do	399	358	325	414	445
Refinery fuel and losses do	710	150	652	1,336	197
Total do	9,352	11,037	10,861	12,514	10,986

[e]Estimated. [p]Preliminary. [r]Revised.

[1]Table includes data available through June 14, 1983.

[2]In addition to the commodities listed, a variety of crude construction materials (common clays, sand and gravel, and stone) is produced, but output is not reported, and available information is inadequate to make reliable estimates of output levels.

[3]From domestic and imported ores.

METALS				
Aluminum: Metal including alloys:				
Scrap	15	123	--	France 77; Belgium-Luxembourg 45.
Unwrought	133	109	--	Belgium-Luxembourg 84; France 25.
Semimanufactures	253	386	--	Algeria 385; Italy 1.
Copper: Metal including alloys:				
Scrap	832	1,525	--	Spain 680; Belgium-Luxembourg 437; West Germany 68.
Semimanufactures	r1	--		
Iron and steel: Metal:				
Scrap	791	1,717	--	Spain 1,665; Belgium-Luxembourg 52.
Pig iron, cast iron, related materials	197	17	--	All to Italy.
Semimanufactures:				
Bars, rods, angles, shapes, sections	15	2	(1)	Mainly to Italy.
Universals, plates, sheets	741	24	--	Libya 22; Italy 2.
Hoop and strip	1	2,905	--	Greece 2,899; France 5; Libya 1.
Wire	1,019	684	--	Mainly to Algeria.
Tubes, pipes, fittings	482	421	22	Algeria 346; Italy 27; France 16.
Castings and forgings, rough	(1)	1	--	All to Libya.
Unspecified	837	--		
Lead:				
Ore and concentrate	--	17	--	All to Libya.
Metal including alloys:				
Scrap	338	513	--	Denmark 349.
Unwrought	11,943	10,821	--	Algeria 5,614; Italy 5,200; Libya 7.
Semimanufactures	--	5	--	All to Libya.
Silver: Metal including alloys, unwrought and partly wrought value, thousands	$3,462	$1,209	--	All to France.
Tin: Metal including alloys, semimanufactures	4	1	--	All to West Germany.
Zinc:				
Ore and concentrate	20,309	17,073	--	France 12,653; Italy 3,115; Switzerland 1,305.
Oxides	330	--		
Metal including alloys, unwrought	1	--		
Other:				
Ores and concentrates	2	4,156	--	All to Italy.
Ashes and residues	398	538	--	Spain 249; West Germany 205; Belgium-Luxembourg 84.
NONMETALS				
Abrasives, n.e.s.: Grinding and polishing wheels and stones	2	1	1	
Barite and witherite	2,840	1,040	--	All to Algeria.
Cement	4,300	7,260	--	Do.
Clays and clay products:				
Crude, unspecified	36	--		
Products:				
Nonrefractory	36	79,313	--	Libya 79,219; United Arab Emirates 3.
Refractory including nonclay brick	1,595	409	--	All to Algeria.
Diamond:				
Gem, not set or strung value, thousands	$1,979	$1,224	--	All to Belgium-Luxembourg.
Industrial thousand carats	145	--		
Feldspar, fluorspar, related materials:				
Fluorspar	6,025	--		
Fertilizer materials: Manufactured:				
Phosphatic	513,509	586,485	--	Algeria 85,995; France 71,711; Italy 52,275.
Unspecified and mixed	169,801	349,537	--	Iran 82,332; Algeria 22,898; Libya 16,210.
Gypsum and plaster kilograms	250	--		
Phosphates, crude thousand tons	1,317	1,062	--	Turkey 223; Poland 205; France 132.
Pigments, mineral: Iron oxides and hydroxides, processed	--	12	--	All to France.
Salt and brine	272,972	368,823	54,882	Italy 105,762; Yugoslavia 79,548; Norway 43,374.

COMMODITY REVIEW

METALS

Iron and Steel.—In the second half of 1982, the El Fouladh steel production works temporarily shut down for maintenance and modernization work to improve the efficiency of the plant and expand its output. The blast furnace was refitted with higher performance equipment, adding to its capacity by 500 tons of steel per day. The improvements and modernization approximately doubled the plant's output. A second stage of alteration and expansion of plant converters and other plant equipment followed. The estimated $8 million project was scheduled for completion in early 1983. Also underway were $9.5 million in improvements in the steel fabrication works. Upgrading of the existing wire mill, installation of a second wire mill, installation of a new furnace for the existing bar mill, and upgrading of the existing drawing mill were all ongoing projects by late 1982. In addition, the construction of a new drawing mill was being contemplated to meet the increasing demand for hard-drawn steel products. The estimated cost for the new mill was $13 million, with a planned production capacity of 15,000 tons of finished product per year.

Lead and Zinc.—A project to modernize the Megrine lead smelter was being negotiated in 1982 between STEM and several West European and Canadian firms. Technical and cost proposals for both renovation of the existing works and construction of a new plant were being considered. Tunisia's production of both lead concentrate and metal were substantially down in 1982 because of serious plant smelting inefficiencies at the Megrine complex.

Other Metallic Minerals.—Tunisia produced a limited amount of silver and mercury for the domestic market. Silver was produced as a byproduct from the smelting of lead and zinc. A small amount of arsenic for domestic use was obtained from the Tabett Ben Ksouri deposits.

NONMETALS

Cement.—Société Tunisienne de Ciment Blanc continued work during the year on its 100,000-ton-per-year white cement plant, which was expected onstream in early 1984. Société Les Ciments Tunisians continued with construction on its new plant near Jebel Oust. The plant was scheduled for startup in late 1983 with a rated capacity of 1 million tons per year cement production. The consulting engineering firm for both projects was Lafarge Conseils et Etudes. Société des Industries Cimentieres du Centre projected an early 1983 startup for its new $125 million, 1-million-ton-per-year cement plant at Enfida. The plant was being erected by Kawasaki Heavy Industries of Japan in collaboration with Compenon Bernard of France for construction of

the projects' basic civil engineering works. Holderbank Management and Consulting Ltd. was the consulting engineer. An expected 120,000 tons per year of artificial lime was also to be produced at the plant. These projects, if completed on time, would double Tunisia's cement manufacturing capacity by 1984 to 4 million tons per year.

Fertilizer Materials.—Responding to weak world demand for fertilizer, Tunisia implemented a voluntary reduction in phosphate rock production of 9% from 1981's total of 4,596 metric tons. Although annual rock production decreased owing to the depressed market conditions, chemical fertilizer processing technology continued to expand within Tunisia. Industries Chimiques Maghrebines (ICM) began producing additional sulfuric and phosphoric acid in December 1982 from its newly constructed plant located within Gabés, the center of Tunisia's chemical fertilizer industry. Also scheduled for startup in Gabés in 1983 was the Société Arabe des Engrais Phosphates et Azotes new ammonium nitrate plant. The Tunisian agribusiness is expected to consume 40% of this plant's production, with the rest destined for export. In 1983, it was expected that 80% of Tunisia's phosphate rock production would be converted into chemical fertilizer products, with the range covering, triple superphosphate, three concentration grades of phosphoric acid, monoammonium and diammonium phosphate, bicalcium phosphate, trisodium polyphosphate, and ammonium nitrate. Other chemicals related to the manufacture of nutrient products for animals have also been produced.

Construction work by Industries Chimiques de Gafsa began in 1982 on a 400,000-ton-per-year triple superphosphate complex at M'Dilla, near Gafsa. The plant was expected to be completed by the end of 1984. Also to be built at the M'Dilla fertilizer complex was a 500,000-ton-per-year sulfuric acid plant and a 150,000-ton-per-year phosphoric acid plant, both by Société Industrielle d'Acide Phosphorique et d'Engrais.

To transport phosphate rock and products from the M'Dilla complex to Gabés for processing and export, a new railroad line was being built and had neared a first stage of completion at yearend 1982. By the spring of 1983, the line was expected to be partially operable, with total operational capacity expected for the fall of 1984. Also well into the planning stages was a phosphoric acid complex to be built at Skhira on the east coast 40 kilometers north of Gabés. Preliminary plans estimate a $150 million construction cost for the complex, which would include phosphoric and sulfuric acid plants, two seawater desalinization units, an electric generating station, and a 5-kilometer undersea pipeline.

In the mining area, a contract was awarded to Jacobs Engineering of the United States in November 1982 to conduct detailed engineering studies for the development of the Sra Quertane open pit phosphate mine in northwest Tunisia. The Sra Quertane Mine was one of four new operations, all open pit, which were scheduled for development in Tunisia during the 1980's. The other three mines were to be located in the Gafsa Basin where all except one of Tunisia's existing mines are located. The proposed mine locations were Jellabia Mzinaa, Kef Eddour, and Oum el Kecheb. Tunisia hoped to be producing 75% of its phosphate rock by open pit dragline methods by the mid-1990's with total production estimated at over 10 million tons per year. But with depressed market conditions expected at least through 1983, there was uncertainty about when these operations would be brought online.

Potassium.—Feasibility studies to develop the brine deposit at Sebkha el Melah near Zarsis on the southeast coast continued in 1982. Late in the year the French consortium of PEC Engineering, Mines de Potasse D'Alsace, and Spie Batignolles was awarded a contract to do a final feasibility and basic engineering plant design study for extracting potassium from the brine. The potassium extraction was proposed as the first of two stages for recovering minerals from the dry salt lake basin. A second stage of plant construction for extracting magnesium from the brine was also well into planning with both mineral extraction plants slated to be operational by 1987. The potassium extraction, planned at 100,000 tons per year K_2O, would be used both for the domestic and export fertilizer markets. Preliminary cost estimates for the first stage of construction were $22 million, and $92 million for the second stage.

MINERAL FUELS

Petroleum.—The major oilfields under exploitation in Tunisia produced slightly under 40 million barrels of crude petroleum in 1982, a 5% decline from the previous year's production and a 9% decline from the

peak output of 1980. The decrease in crude output was a result of a temporary shutdown in extraction from the Ashtart offshore oilfield. During the late 1970's and early 1980's Tunisia's oil and gas exploration and development efforts steadily increased, with an estimated $400 million invested during 1982. Since the Ashtart offshore oilfield went into production in 1974, Tunisia's exploration efforts have been focused in two offshore zones, the Gulf of Gabés and the Gulf of Hammamet. Major reserve discoveries during that time were the Tazeraka, Halk el Menzel, Isis, Miskar, Didon, and Gabés Ben Gardane Fields. The Tazeraka Field, discovered in 1978, went into production in November 1982 Tazeraka, a relatively small field with an estimated recoverable reserve base of 10 million barrels, was expected to produce approximately 2.5 million barrels per year. Because the field had been assessed to have a short production lifespan, exploitation was being carried out from a supertanker equipped with necessary facilities and installations, which was moored semipermanently over the oilfield.

In February 1982, the International Court of Justice made a ruling regarding the longstanding dispute over offshore territorial borders between Tunisia and Libya. The offshore oil and gas deposits of Didon, Miskar, and Isis were within the disputed territory. If the border indicated by the court in its ruling were to be agreed to and finalized by the two countries, then all three of the petroleum and gas finds would be within Tunisian domain. The Miskar Gasfield, first discovered by the French oil company Société Nationale Elf Aquitaine in 1975, was once again in 1982 determined by Elf to be too expensive to develop. The findings of this third major study of the Miskar gas deposit were released during the latter half of the year. The study showed that the large gas reserves estimated at 30 billion cubic meters were too deep, too high in hydrogen sulfide content, and too low in combustibles to be considered for the approximate $1 billion development costs at that time.

Onshore petroleum exploration efforts looked more profitable during 1982. The Sabria and Franig petroleum and gas discoveries of 1979 and 1980 were evaluated further and were found to have considerably larger reserves than originally estimated. Located in southwest Tunisia about 100 kilometers north of the El Borma Field, testing to determine flow levels at the Franig site were still underway late in 1982. An official decision to produce gas from the Franig Field had not been made as of yearend 1982, although the Government of Tunisia had expected to develop the gas deposits for domestic use. Natural gas production and usage were approximately equal in 1982 at 400 million cubic meters, but domestic demand was expected to increase steadily to 1.5 billion cubic meters per year by 1990.

Another onshore area where successful exploration drilling was conducted during the early 1980's was around the Sfax area. Houston Oil and Minerals Corp. had discovered two fields, the Gremda Field, northwest of Sfax, and the Thyna Field, which was southwest of the town. The commercial development potential of both fields was still undetermined at yearend 1982, with more wells and testing slated for the spring of 1983.

Technical and economic studies for the establishment of a pan-Arab export refinery at Cap Serat on the northwest coast of Tunisia should be completed early in 1983. Based on preliminary studies, the complex would refine up to 70 million barrels per year of crude oil, all of which would be exported. Construction work continued at Tunisia's existing refinery at Bizerte throughout 1982, with plans calling for expansion of the plant from its previous capacity of 11 million barrels to 42 million barrels per year of crude oil feedstock. The expanded refinery was expected to produce more than enough for Tunisia's annual consumption of petroleum products through the 1980's. Tunisia's petroleum consumption was approximately 20 million barrels in 1982.

Uranium.—Construction was well underway by yearend for Tunisia's first uranium recovery plant, being built in Gabés by Société Française d'Uranium Pechiney of France. The pilot plant, which was scheduled for completion in mid-1983, was designed to extract up to 120 tons per year of uranium oxide as byproduct of Tunisian phosphate rock. The plant was also expected to recover annually 35 tons of thorium and 20 tons of rare earths. ICM was expected to operate the plant.

The Mineral Industry of Turkey

By Peter J. Clarke[1]

While Turkey's economy continued to improve under the rigid guidelines of the economic stabilization program adopted in January 1980, the mineral sector has remained stagnant for the past 2 years as a result of both the weak level of world demand for primary minerals and continuing low productivity in the minerals industries. Reflecting a successful effort to spur industrial production, increase exports, and reduce its external debt, Turkey increased its gross national product (GNP) by 4.6% in 1982, which is among the highest GNP growth rates of all Organization for Economic Cooperation and Development (OECD) nations. Industrial production increased 5.5% in 1982 and agricultural output climbed 6.7% during this period. The growth in industrial exports has been most spectacular, however, increasing 50%. Turkey's GNP in 1982 was $53.8 billion,[2] its exports were $5.75 billion, 22% above those of 1981, its imports were $8.7 billion, down 2.2% from those of 1981, and its trade deficit shrunk to $2.9 billion from $4.2 billion in 1981.

Despite its impressive economic growth, the mineral sector did not keep pace during the year. Export revenues from minerals declined from $225 million in 1981 to $207 million in 1982, and the mineral sector's share of total exports declined from 4% in 1981 to 3.6% in 1982. There were significant declines in the production of boron and magnesite, two leading exports, while chromite, copper, and coal production all increased. Weak commodity prices for most minerals, however, resulted in lower export revenues even when production increased, as was the case with chromite. An indication of the unfavorable conditions in the minerals sector was the Government's unwilling takeover of Turkey's only specialty steel manufacturer, Asil Celik Sanayi ve Ticaret AS, owing to excessive foreign debt and unsold inventory.

Several important developments were on the horizon for Turkey's mining industry in 1982. First and foremost was the Government's continuing attempt to reform Law 2127, the Mine Nationalization Law, passed in 1978, that nationalized most boron, lignite, and iron ore mines. A new bill was awaiting passage by the Consultative Assembly that would retain all boron concessions for the Government mining company, Etibank, while returning most iron ore and lignite mines to their former private owners. At the same time, all uranium, thorium, and asphalt deposits would be reserved for Government exploitation. The Turkish National Security Council was also preparing final approval of a new petroleum law that was designed to remove private sector disincentives and encourage foreign investment in the petroleum sector. The law would basically codify a series of decrees issued since 1980 and allow foreign companies to export up to 35% of onshore and 45% of offshore oil production from all wells drilled since January 1, 1980. The law would also limit the number of licenses that the state-owned oil company, Turkiye Petrolleri Anonim Ortakliki (TPAO), can hold at one time, while increasing the number of licenses foreign or private companies can hold. Exploration and acreage fees were also increased considerably.

In combination with the new mining and petroleum laws, the Turkish Government carried out a substantial investment program in the mining sector that allowed for funding of 346 mineral-related projects in 1982. About 40% of the funding was foreign

exchange costs. To finance these costs, Etibank invited interested foreign companies to participate in several mining ventures, for which they would receive up to a 50% equity share. Of the projects available, only two have stimulated international interest; the Marmara Island marble quarrying project and the Rize-Cayeli copper project. In the latter project, Phelps Dodge Corp. of the United States, along with the private Turkish firm, Gama Industrie T.A.S., and Etibank were performing feasibility studies on a 30-million-ton deposit containing up to 3.3% copper and 10.2% zinc. Phelps Dodge was to hold a 49% equity share in the project once development begins. Other major Government investments involved modernization and expansion of Turkey's existing copper facilities, and a large-scale project to reduce energy consumption and increase production and capacity utilization in the country's fertilizer industry.

PRODUCTION

Mineral production in Turkey was stagnant in 1982, with productivity gains in a few commodities being offset by reductions in others. Most affected by the worldwide recession were boron, barite, and magnesite, three of Turkey's primary mineral exports. Magnesite took the steepest plunge, with output dropping almost 50%. Production of boron materials, which are the leading mineral exports, dropped 6% from that of 1981. Turkey retained its position, however, as the world's second largest producer of boron minerals, behind the United States. While chromite production managed to increase in 1982, exports of chromite actually decreased. Most of the private sector's chromite mining operations in Turkey operated sporadically or not at all during the year, owing to the low world market price for chrome concentrate. Etibank's chromite mines operated near capacity, producing chromite concentrate to meet contracts and to supply its two ferrochrome smelters at Antalya and Elazig. Turkey was the world's fifth largest producer of chromite and a minor producer of ferrochromium and ferrosilicon.

Production increases were registered in nitrogenous fertilizer, copper, asbestos, cement, and coal, but only fertilizer and coal had a significant impact on the domestic economy. Fertilizer production continued to respond to the Government's fertilizer rationalization and energy-saving project, which was intended to modernize, expand, and bring up to capacity most of the country's fertilizer plants. Production of hard coal and lignite continued to increase, reaching for the first time in 4 years the level of output attained prior to nationalization of the coal mines in 1978. Production may advance strongly over the next few years if the mines are returned to their former private owners. Copper production, which was the target of a large-scale Government investment program, increased to its highest level in several years in terms of mine output and refined copper. Smelter production, on the other hand, registered a 7% decline in 1982. Production of most other minerals remained at or near the same levels as that of 1981.

TRADE

Turkey's revenues from mineral exports declined from $225 million in 1981 to $207 million in the current year. Mineral exports represented 3.6% of total exports, which amounted to $5.75 billion. Turkey's total exports increased markedly in 1982, up by 22% from the 1981 level, which meant that the mineral sector's share in overall trade declined. As in previous years, boron minerals and products were the leading export, as 460,000 tons was exported. Chromite ranked second with 280,000 tons of chromite ore and concentrate exported; 80% was from the private sector, the majority of which had been held in stocks from past years. Other leading exports were 190,000 tons of marble and 169,000 tons of barite from the private sector, and 88,000 tons of magnesite and 35,000 tons of ferrochrome from Etibank.

On the overall trade account, Turkey's total imports declined slightly from $8.9 billion in 1981 to $8.7 billion, owing mostly to lower prices paid for imported petroleum and also from lower fertilizer imports because of increased domestic production. Turkey paid $3.45 billion for crude oil imports, down from close to $4 billion in 1981. The growth in Turkey's exports was due to a 50% increase in industrial exports, which accounted for 60% of all exports in 1982. Close to 50% of Turkey's exports go to Islamic countries, with Iran being the largest market. The United States received 6% of Turkey's exports, valued at $252 million.

This growth in exports, combined with the 2% drop in imports, resulted in a 29% decline in the trade deficit, from $4.2 billion in 1981 to $3.0 billion in 1982. The current account deficit also shrunk substantially, owing to increased service receipts mainly from Turkish construction contracts overseas, from $2 billion in 1981 to $1 billion. Turkey registered a $118 million surplus in the basic balance, the first such surplus since 1973.

COMMODITY REVIEW

METALS

Aluminum.—Although Turkey possessed about 1.6% of the world's known bauxite reserves, the country remained a net importer of aluminum in 1982. Aluminum

consumption in Turkey was estimated at 75,000 tons per year, about one-half of which is produced domestically. Consumption was expected to exceed 100,000 tons per year by 1987, and even with planned capacity increases, Turkey was expected to remain a net importer of aluminum beyond the 1990's.

Etibank is the major bauxite producer, responsible for 97% of the country's output, with the private sector accounting for the remainder, and Etibank is the only producer of aluminum from the aluminum complex at Seydisehir. Bauxite for the complex is mined from a deposit near Seydisehir, which contained 41 million tons of measured reserves grading 57% Al_2O_3 and 8% SiO_2. Ore production from these mines ranged between 300,000 and 400,000 tons per year of bauxite. About 100,000 tons of refractory-grade diaspore ore is mined annually from a deposit at Milas, in Mugla Province, nearly all of which is directly exported. Turkey continued to export 80,000 tons per year of bauxite to the U.S.S.R. and other centrally planned economy countries as payment for the credit-loan under which the Soviets constructed the Seydisehir plant in 1973.

The Seydisehir plant is capable of treating 460,000 tons per year of bauxite to produce 120,000 tons per year of alumina and 60,000 tons per year of primary aluminum. Capacity utilization in 1982 averaged 60%. The plant was also equipped to produce a variety of semifinished products. Etibank, along with Turk Kablo, a Turkish Government-foreign partner joint venture, were capable of producing 32% of the country's total semifinished aluminum products, although capacity utilization at the two plants has seldom averaged above 45%. About 345 other private sector firms produce the bulk of Turkey's semifinished products. Nearly all of the aluminum plants in Turkey were found to be operating at 50% of their capacity in 1982, owing mostly to energy shortages.

Etibank, which also owns the Milas deposit, has invited any interested foreign companies to form a joint venture to build a second aluminum refinery based on the Milas deposit. The plan was to construct a 250,000-ton-per-year aluminum refinery and then possibly a 120,000-ton-per-year smelter and manufacturing plant. The refinery alone was to cost $265 million. As of 1982, no foreign partner had been found.

Chromite.—Turkish chromite production increased about 9%, mostly as a result of Etibank's increased output. Turkey ranked as the world's fifth largest producer of chromite, behind the Republic of South Africa, the U.S.S.R., Zimbabwe, and Finland, and supplied 4% of the world's total output. Turkey possessed about 3% of the world's total reserves of chromite, or 13 million tons of measured and 4 million tons of indicated reserves, and a total resource base of 36 million tons of chromite. Most of the ore reserves are metallurgical grade. The major chromite mining areas are at Guleman, Mugla-Fethiye, Orhaneli, and Adana, but chromite deposits have been located in all but 27 of the country's 67 Provinces.

Between 30% and 40% of Turkey's chromite production is generally supplied by Etibank from its mines around Mugla, Antalya, and Guleman, with the remainder being supplied by as many as 20 private sector companies. In times of depressed market conditions, as in 1981 and 1982, Etibank's share tends to rise as many private producers stop production. Etibank, which operates three concentrators at Karagedik, Kef Dagi, and Sark, with annual capacities of 30,000 tons, 75,000 tons, and 30,000 tons, respectively, also operates the country's only two ferrochrome smelters, at Antalya and Elazig. The company, which has the financial support of the Government, is able to maintain mine production during weak market periods because it uses the ore to produce ferrochrome, prices for which have held up better than for concentrate.

Most of the smaller private chromite producers were idle in 1982, as the world price for concentrate slipped below their operating cost. Six private companies operated eight chromite concentrators in Turkey: Egemetal Madencilik at Orhaneli and Mersin (10,000 tons per year each), Turk Maadin Sirketi AS at Kavak (75,000 tons per year), Kaycegiz Kromlari (10,000 tons per year), M. Kemal Dedeman at Pinarbasa and Burdar (10,000 tons per year each), Pinas at Karsanti (10,000 tons per year), and Sikti Kocman at Orhaneli (10,000 tons per year). Turk Maadin's Kavak Mine and concentrator was one of the few private sector operations running in 1982, as all mines in the Orhaneli and Mersin region were closed throughout the year.

Etibank's two ferrochrome smelters produced high- and low-carbon ferrochrome, primarily for export. The Antalya Ferro-

chrome Works produced 10,350 tons of low-carbon ferrochrome, 6,450 tons of silicon ferrochrome, 17,360 tons of calcium carbide, 4,300 tons of ferrosilicon, and 2,010 tons of Soderberg paste in 1982. Ferrosilicon was produced for the first time in 1982 through conversion of one of the older carbide furnaces. The Elazig Ferrochrome Works produced 29,516 tons of high-carbon ferrochrome in 1982, although capacity of the plant was 50,000 tons per year. High-carbon ferrochrome capacity was to be raised to 150,000 tons per year through a $33 million expansion project. Elkem AS of Norway was to provide engineering services, and Outokumpu Oy of Finland was to provide the process technology. Outokumpu was also planning to enter into a joint venture with Etibank to market Etibank's ferroalloys and other metals in Scandinavia. The new company would be called Etikumpu. Ultracrest and S.A. des Minerais currently market Etibank's minerals in other Western European countries.

Copper.—Turkey's copper industry continued to operate far below capacity in 1982, despite the Government's efforts to improve productivity and modernize many of the country's copper operations. Copper production in Turkey is centered around Ergani, Murgul, and the eastern coast of the Black Sea. Etibank and Karadeniz Bakir Isletmeleri (KBI), owned 49% by Etibank, accounted for about 98% of all copper ore production and 100% of all blister copper production. All smelter output is sold to domestically owned private sector refining companies, who sell the copper on the domestic market. Turkey's total measured and indicated reserves of copper ore are 125 million tons containing an average of 1.7% copper. Reserves at Turkey's currently operating deposits are 65 million tons containing 1.5% copper. The total resource base in the country was estimated at 315 million tons containing 0.3% copper. The only private sector copper ore producers are Bamas AS, Turk Maadin, and Demir Export Ltd., whose combined contribution to the industry is negligible. Turkey's copper industry is summarized in the following table.

Table 2.—Turkey: Copper industry in 1982

Operating company	Ownership	Location	Date established	Mine capacity (metric tons)	Mill capacity (metric tons)	Smelter capacity (metric tons)	Refinery capacity (metric tons)	Average capacity utilization (percent)
Etibank	Government	Ergani	1939	1,050,000	90,000	16,000	--	38
Do.	do.	Murgul	1951	487,000	65,000	12,000	--	50
Karadeniz Bakir Isletmeleri (KBI).	do.	do.	1973	2,970,000	208,000	--	--	60
Do.	do.	Samsun	1973	--	--	40,800	--	39
Do.	do.	Kure	1972	94,000	--	--	--	40
MKEK (Machinery and Chemicals).	do.	Ankara	1928	--	--	--	3,000	60

Sarkuysan Electrolytic Copper Ltd.	do.	do.	1975	--	--	--	40,000	25
Total				4,601,000	363,000	68,800	103,000	XX

XX Not applicable.

The low-capacity utilization figures are a result of several industrywide problems, including a decrease in the average ore grade, energy and labor force shortages, and severe bottlenecks in the production line. As a result, despite the country's potential to satisfy domestic needs of 65,000 tons of refined copper per year and still provide a surplus for export, Turkey imported about 30,000 tons of copper concentrate and about 5,000 tons of blister copper in 1982, along with 15,000 to 20,000 tons of refined and semimanufactured copper.

To solve the problems of the industry, both Etibank and KBI are embarking on large-scale modernization, expansion, and development projects. At Murgul and Samsun, KBI planned to modernize the mine, concentrator, and sulfuric acid plant, in order to increase ore-mining capacity to 3.8 million tons per year, raise concentrate production to 170,000 tons annually of 17% copper concentrates, raise production of pyrite concentrates containing 45% sulfur

from 15,000 tons to 133,000 tons per year, raise blister production to 33,700 tons per year, raise production of sulfuric acid from Samsun from 130,000 to 270,000 tons per year, and increase the metal recovery rate from 70% to 90%. Cost of the project is estimated at $40.6 million for Murgul and $12.5 million for Samsun. Also, KBI was constructing a new concentrator at Samsun to produce 29,000 tons per year of 12% copper concentrate, and 62,000 tons of pyrite concentrate containing 48% sulfur. The plant was to begin trial runs early in 1983.

Etibank's rehabilitation program at Murgul included raising ore capacity to 900,000 tons per year, raising concentrator output to 55,000 tons per year, and reaching 90% of rated blister capacity. Modernization at Ergani consisted of streamlining in order to reach rated capacity. Etibank also planned to start mining and concentrating copper at Kure-Asikoy. The project was to raise Kure's ore capacity to 1.1 million tons and also produce 105,000 tons per year of concentrate from a plant expected to be completed in 1985.

Meanwhile, KBI was constructing a new concentrator at Kutlular to treat 120,000 tons of ore and produce 16,360 tons per year of copper concentrate and 52,000 tons per year of pyrite concentrate. The project, called the Kutlular Mining Concentration Project, was to be completed in 1984.

At Ergani, Etibank operated an integrated mine-mill-smelter complex. Etibank's Damar and Cakmakkaya Mines at Murgul were operated by Etibank until 1973, when they were leased to KBI. KBI now supplies ore to Etibank's mill and smelter. That portion of the concentrate from Murgul not used in Etibank's smelter is shipped by sea to KBI's smelter at Samsun. Chalcopyrite ore from KBI's Bakibaba Mine in Kure provides the other main feed source for the smelter. Beginning in 1983, Kure ore will be concentrated in a new plant at Samsun before being charged to the smelter.

Perhaps the single most important development in the industry was the joint venture to develop the Rize-Cayeli copper deposit on the Black Sea coast near Samsun. Etibank, in a joint venture with Phelps Dodge, Gama Industrie, and Demir Export, were planning to produce 600,000 tons of ore, 62,000 tons of copper concentrate, and 206,000 tons of pyrite concentrate from the project, provided that feasibility studies proved encouraging. In October 1982, Phelps Dodge reported that its drilling program encountered 295 feet of massive copper sulfide ore containing 3.3% copper, 10.2% zinc, 0.038 ounce of gold per ton, and 1.93 ounces of silver per ton. Preliminary tests indicated reserves of about 30 million tons of ore.

Etibank was also requesting foreign assistance to begin development at the Sirt-Madenkoy copper project, designed to produce 600,000 tons of ore and 64,000 tons of copper concentrate.

Iron and Steel.—Turkey's iron and steel industry remained in the slump precipitated by the collapse of the domestic construction industry and the worldwide downturn in the iron and steel market. The public sector companies, Turkiye Demir ve Celik Isletmeleri (TDCI) or the Turkish Iron and Steel Works, and MKEK, the Government's engineering and chemical company that also controls several steel mills, continued to be plagued by production bottlenecks and inefficiency, while the many private sector producers were beset by the collapse of their export market, a high degree of foreign competition, especially Japanese, and a growing debt burden created by the recent devaluations in the Turkish lira.

Production of iron ore from TDCI's mines at Divrigi and elsewhere around the country declined slightly in 1982 to 2.86 million tons from 2.94 million tons in 1981. Despite its adequate reserves of 1.3 billion tons of iron ore, Turkey imported close to 1 million tons of ore and concentrate in 1981 and 1982. Iron ore production has remained low since 1978, prior to which the private sector iron mines supplied close to one-half of the country's output of 3.4 to 3.6 million tons.

The Turkish Government remained the country's largest steel producer, from its three main steelworks at Eregli, Iskenderun, and Karabuk, the latter two operated by TDCI, and the former operated by Eregli Demir ve Celik Fabrikalari T.A.S., or the Eregli Iron and Steel Works Association, which was also a Government-owned company. Crude annual steelmaking capacity at the three plants was 1.8 million tons, 1 million tons, and 600,000 tons, respectively. Eregli, built in 1960, and modernized by Nippon Kokan K.K. of Japan in 1973, was the only plant operating near capacity in 1982, while the other two suffered from outdated Soviet equipment, low productivity, and generally poor market conditions.

Turkey's private sector steel industry consisted of 9 medium-size steel producers along with several smaller ones, and about

150 steel-rolling operations. Combined capacity of the larger private sector steel producers was 1.27 million tons per year, bringing Turkey's total steelmaking capacity to 4.67 million tons per year, which means that overall, the industry operated below 60% capacity. An indication of the difficulty that the private sector was experiencing in 1982 was the Government's takeover of Asil Celik, the country's only specialty steel manufacturer. Asil Celik was brought onstream in late 1980, having been financed largely by external loans. The subsequent devaluation of Turkey's currency created a total debt of $55 million for the company, which could not pay the interest. The Government, through MKEK, took over in 1982 and began servicing the debt. Other problems faced by the industry were unusually high inventories and a wave of trade protectionism in Western Europe that helped to limit Turkey's export market. Turkey was negotiating with Iran at the end of 1982 to supply about 1.5 million tons of steel, valued at $325 per ton c.i.f. in a barter deal for crude oil, but no agreement was reached.

Tungsten.—Production from Etibank's Uludag tungsten mine, located 42 kilometers south of Bursa, remained low as the company continued to experience difficulties with maintaining the quality of the ore feed and operation of the concentrator. Ore was produced only from the underground mine, the open pit was closed in 1980 because more than enough ore was stockpiled outside the concentrator. The underground mine produced about 120,000 tons of ore in 1982, containing approximately 0.25% WO_3, primarily in scheelite, although some wolframite is produced as well. The deposit contains 9.4 million tons of measured ore reserves with an average grade of 0.35% WO_3 and another 4.9 million tons of indicated reserves.

The concentration process at Uludag was simple gravity separation by tabling. Etibank was developing a pilot flotation concentration plant to increase output from the mill, but results from this experimental project had yet to be applied to the main plant.

When the difficulties with the concentrator are corrected, Etibank planned to increase output from the plant by reopening the open pit to increase the ore feed. Operation at the pit had been contracted out to a Turkish company, Sevkit Uyanit, until 1980 when it closed. Etibank was planning to resume operations sometime in 1983 using its own personnel.

NONMETALS

Barite.—Turkish barite production responded to the downturn in the oil and drilling mud market with a 42% decline in production from the 1981 level. The decrease came at a time when Turkey was embarking on a large-scale expansion of its barite producing and grinding industry. The private sector was the leading producer, with Bastas Barytes Industry and Trading Co. Inc. accounting for the majority of the output with the recent addition of a new grinding mill at its plant in Antalya, raising its total grinding capacity to 240,000 tons per year. Baser Maden Sanayii ve Ticaret AS was also a large producer, with mine and grinding capacity of 60,000 tons and 80,000 tons per year, respectively, at Sarkikaraagic. Baser was considering installing a plant to produce minus 5-micrometer material by 1983. Matosan, a leading industrial mineral producer in Turkey, was acquired by the Altinyildiz Group, and its 150,000-ton-per-year marble grinding plant has been converted to produce about 50,000 to 75,000 tons per year of barite, along with kaolin, talc, and calcite.

Etibank was planning to enter the barite industry along with the major private producers by setting up a 100,000-ton-per-year mine and a 50,000-ton-per-year grinding plant. The mine would be located on deposits at Konya-Beysehir, and the mill at Antalya, nearby. Other barite producers in Turkey were Barit Maadin Turk AS in Marash and Adana, Polbar Baryte Industries AS in Alanya, Kimya Tesisleri Sanayi ve Ticaret AS in Kutahya and Kocaeli, and Emas Industrial Minerals AS in Mas.

Boron.—Despite the impact of the recession on the world's boron market, Turkey continued to press ahead with the expansion of its industry. Turkey possesses the world's largest known reserves of boron minerals, roughly 60% of the world total, and it was the world's largest exporter and second largest producer of boron minerals, behind the United States. Boron was mined from four major areas, at Kirka, Emet, Bigadic, and Kestelek, all in western Turkey. All of the mines have been operated by Etibank since the industry was nationalized in 1978.

Table 3.—Turkey: Boron mining industry in 1982

Deposit	Production capacity		Reserves		Average ore grade (percent)	Ore mineral
	Ore (thousand metric tons)	Concentrate (thousand metric tons)	Ore (thousand metric tons)	B_2O_3 (thousand metric tons)		
Kirka	450	300	500,000	125,000	26	Tincal.
Emet	800	400	500,000	300,000	44	Colemanite.
Bigadic	300	150	300,000	175,000	44	Colemanite-ulexite.
Kestelek	135	110			43	Do.
Total	1,685	960	1,300,000	600,000	XX	

XX Not applicable.

Production from all mines was well below capacity in 1982 owing to the weak market for boron minerals and compounds. Etibank's largest boron refining operation was located at Bandirma in northwest Turkey. Annual capacity of the plant was 35,000 tons of boric acid, 55,000 tons of borax decahydrate, 35,000 tons of borax pentahydrate, 20,000 tons of sodium perborate, and 120,000 tons of sulfuric acid. Etibank was constructing a new boric acid unit at Bandirma to raise total capacity to 135,000 tons per year by 1984. The new plant was also intended to produce 70,000 tons per year of borax decahydrate and 40,000 tons per year of borax pentahydrate. Raw boron material for the plant was supplied from the Emet and Bigadic Mines.

At Kirka, Etibank was constructing a large-scale chemical plant to produce boron compounds from sodium borate ore. The plant was to produce 160,000 tons per year of borax pentahydrate, 17,000 tons per year of borax decahydrate, and 60,000 tons per year of andydrous borax. The plant was to begin production late in 1983. Also under construction during the year was a major storage and loading terminal located about 40 kilometers south of the mine and plant. Eight storage tanks were built to store the boron compounds from the plant, along with tincal concentrate, before being loaded into rail cars from four separate platforms connected to the storage tanks by conveyor. The rail line led directly to the Mediterranean coast, from which most of the output will be exported.

Cement.—Turkey was in the process of expanding its cement production capacity from the current level of 20.1 million to 24.5 million tons per year by 1984. All of this growth was to come from new plants being built by Turkiye Cimento Sanayii T.A.S. (Cisan), the state-owned cement manufacturer. Cisan operated 17 cement plants in 1982, while 19 other plants were operated by the private sector. The private sector operations, which were generally of larger size than the public sector plants, have been responsible for about 70% of Turkey's cement production over the last 5 years. Also, capacity utilization in the private sector plants has been much higher, averaging 70% to 75% over the last 2 years, compared with 30% for the public sector.

Cisan was beginning to improve its performance in 1982 through construction of seven modern cement plants. Each of the new dry-process plants was to have a capacity of 1,750 tons per day. The plants, all being built by Cisan under the management supervision of Dyckerhoff Engineering GmbH of the Federal Republic of Germany, were located in Edirne, Denizli, Ladik, Ergani, Adiyaman, Urfa, and Siirt. The plants at Adiyaman and Siirt were expected onstream early in 1983 with the others commencing production before the end of 1984.

Fertilizer Materials.—Turkey entered the second phase of its fertilizer energy saving and rationalization project in 1982 following a 65% increase in nitrogen fertilizer production in 1981 and an additional 70% increase in 1982. Phosphate fertilizer production, however, declined about 5%, but large-scale modernization and capacity increases in the industry should raise phosphate fertilizer production over the next several years. The fertilizer project began in 1980 with a $110 million International Bank for Reconstruction and Development (World Bank) loan that was to be used for plant modifications and additions, increases in capacity utilization, improvements in energy efficiency, and reduction in pollution.

The first phase of the project, which was completed in 1982, involved modernization and expansion of the Bandirma Gubre Fabrikalari AS (BAGFAS) plant located at Bandirma. The expansion project involved commissioning a new 145,000-ton-per-year phosphoric acid plant, a 15,000-ton-per-year diammonium phosphate (DAP) plant, and a

150,000-ton-per-year compound fertilizer unit. Despite its modernization and expansion, Iskur, the industry union, was threatening to close the plant late in 1982 owing to its accumulated debt and excessive interest payments brought about by the large devaluations of the Turkish lira.

In 1982, the World Bank granted Turkey $44 million in additional loans to support the second phase of the project. A major portion of the loan was to be used to modernize the 650-ton-per-day sulfuric acid plant, the 215-ton-per-day phosphoric acid plant, and the 450-ton-per-day DAP plant at the Akdeniz Gubre Sanayii AS fertilizing facility at Mersin. A new 600-ton-per-day ammonium sulfate unit was also to be installed. In Iskenderun, Gubre Fabrikalari planned to modernize its sulfuric and phosphoric acid plants, and to install a new 600-ton-per-day DAP plant and an ammonium sulfate unit. Ege Gubre was to use a portion of the World Bank loan to modernize its 960-ton-per-day monoammonium phosphate plant at Foca. Finally, KBI, the copper producer, was to rehabilitate its 1,000-ton-per-day sulfuric acid plant at Samsun, which utilizes pyrite produced in association with copper ore in the production of sulfuric acid.

Azot Sanayii T.A.S., the Government-owned fertilizer producer, has finalized its plans to construct a $1.5 billion phosphate fertilizer complex at Iskenderun. Azot Sanayii operates several other fertilizer plants including phosphate fertilizer facilities at Samsun, and ammonia production facilities at Kutahya.

Azot Sanayii was negotiating with the Kuwait Petrochemical Industries Co. (PIC) and the Tunisian fertilizer consortium Industries Chimiques Maghrebines (ICM), itself part owned by PIC, for construction of Turkey's fourth integrated fertilizer complex. Azot was to hold 40% equity in the project, with PIC and ICM holding the remaining 60%. The plan was to produce 1,400 tons per day of DAP and 1,500 tons per day of ammonium nitrite, most likely based on Kuwaiti ammonia and Tunisian phosphate. Mersin was considered to be the most probable site for the project, which was estimated to cost between $350 million and $500 million. The initial timetable scheduled completion of the plant for 1986.

MINERAL FUELS

Turkey's continuing energy crisis eased somewhat in 1982, mostly as a result of lower prices for imported crude oil, but also assisted by the Government's determination to use its plentiful domestic resources of lignite and hydropower to supplant costly imported oil. Turkey's total electric power production amounted to 27.36 billion kilowatt-hours, 24% of which was supplied by lignite-fired thermal powerplants. Petroleum and liquid fuels supplied 27% of the total, while hydropower supplied the largest share, or 47% of the total. The remaining 2% was supplied from powerplants utilizing bituminous coal. While the percentage of total electricity production supplied by petroleum has gradually declined from the late 1970's, lignite and hydropower have both increased, and still maintain tremendous potential for the future. Turkey was constructing or planning 14 additional hydropower plants, to be completed by 1992, which would add 12.5 billion kilowatt-hours of electricity to the current hydropower output of 12.75 billion kilowatt-hours. More importantly, the eight large lignite-fired powerplants now under construction would raise lignite-based energy production from 6.6 billion to 23.9 billion kilowatt-hours by the year 2000. By that time, Turkey planned to have two nuclear powerplants in operation, which will provide an additional source of energy. Despite these strides toward energy independence, Turkey paid approximately $3.45 billion for petroleum imports in 1982, which was the single largest import item for the country.

Coal.—Turkey's production of both hard coal and lignite increased for the third consecutive year. Hard coal was produced from several mines in the Zonguldak Basin on the western Black Sea coast, where reserves are estimated at 1.26 billion tons. Turkiye Komuleri Isletmeri (TKI), the Government-owned coal mining company, was the only producer of hard coal in the country. Production of hard coal fell approximately 650,000 tons short of domestic demand, estimated at 4.85 million tons, all of which had to be made up for by imports. Imports of hard coal have declined, however, from a high of 905,000 tons in 1978 to the 1982 level. Approximately 50% of Turkey's hard coal production is used to produce coke for the domestic steel industry. Coke production was also insufficient to meet demand as imports of high-quality coke have averaged 20,000 tons per year since 1980. The remainder of the hard coal production is used for electricity production and as home heating fuel.

Production of lignite reached an alltime high of 17.25 million tons as TKI expanded

its operations to meet the growing demand of the thermal powerplants. Electricity production accounted for 60% of lignite consumption, while heating and fertilizer's share went down to 27% and 3%, respectively.

TKI was the dominant lignite producer, responsible for 85% of the country's output, with the private sector's share down to 15% since nationalization. Lignite was mined from several areas around the country, with the largest deposits being integrated with onsite thermal power stations. Present lignite mining capacity was well above 25 million tons per year, with total reserves estimated at 7 billion tons. With expansion and development projects being undertaken at 12 major lignite areas, production capacity was to reach close to 95 million tons by the late 1990's.

At most of the lignite operations, TKI was working jointly with the Turkish Electricity Authority (TEK) in establishing the lignite-based powerplants. The largest of these projects was at Afsin-Elbistan, where 20 million tons per year of lignite were to fuel the world's largest lignite-fired thermal powerplant. Afsin-Elbistan is currently producing 1 billion kilowatt-hours of electricity from the first of eight generators. The Soma power project, located in western Turkey, also nearing completion in 1982, was to consume 5 million tons of lignite annually in the production of 550 megawatts of electricity.

Natural Gas.—All of Turkey's production of nonassociated gas was produced by TPAO, the state-owned oil company. Gas was produced from two main areas; in northwest Turkey (Thrace) on the European side of the Bosphorus, and from the southeastern part of the country at Mardin-Camurlu. In the Thrace area, production from the Hamitabat-Kumrular Fields, located 160 kilometers northwest of Istanbul, averaged 2.33 million cubic feet per day. Reserves at Hamitabat were estimated at 408 billion cubic feet. The World Bank was expected to provide Turkey with a $150 million development loan to pay for drilling 12 new wells, and constructing a 400-kilometer pipeline from Hamitabat to a powerplant at Ambarli, and then splitting into two lines going to fertilizer plants at Gemlik and Izmit.

TPAO was also negotiating with the World Bank for development loans to further explore the Umurca-Ormancik area of Thrace for gas reserves. TPAO's exploratory wells at the Umurca-1 Field have produced both oil and gas in limited quantities. The loan would be to determine the extent of reserves in the field.

In southeastern Turkey, natural gas production began in 1976 from Mardin-Camurlu, and is now producing at a rate of 30 million cubic feet per day. Reserves in both an upper and lower formation were estimated at 150 billion cubic feet. TPAO planned to increase production from the five wells in the area to 40 million cubic feet per day by 1983.

The Turkish Government was holding discussions with Iran and the U.S.S.R. in 1982 concerning construction of new pipelines to bring natural gas into Turkey. The Soviet proposal involved supplying gas to Thrace via Bulgaria through a spur line of the Siberian-West European pipeline now under construction. Another option being considered would link the Soviet's North Caucasus Fields to Batum in Turkey near the northeast border with the U.S.S.R. In September, the Iranians agreed to supply Turkey with natural gas through a new pipeline, although the route of the line has yet to be established. The Iranian pipeline was expected to be capable of meeting all of Turkey's domestic gas requirements.

Petroleum.—Turkey's crude oil production declined slightly in 1982 to 45,740 barrels per day from 46,350 barrels per day in 1981; production was divided among four companies. NV Turkse Shell, a subsidiary of Royal Dutch/Shell of the Netherlands, produced about 21,300 barrels per day from nine major oilfields, the largest of which were Kayakoy and Kayakoy West, Kurkan, Beykan, and Barbes. TPAO was the second largest producer with crude output in 1982 averaging 19,900 barrels per day, 35% of which was derived from the country's oldest and still largest field, Raman. TPAO's other large fields were Garzan, Bati Raman, Yenikoy (all older fields), and Guney Dincer, which began production in 1981. Mobil Exploration Mediterranean Inc., a Mobil Oil Corp. (United States) subsidiary, produced 4,800 barrels per day, mainly from its Selmo Field, and finally, Ersan Sanayii, a privately owned Turkish firm, produced under 100 barrels per day.

Turkey's domestic production of crude oil represented only 8% of the country's requirement, which meant that Turkey imported approximately 105 million barrels of crude oil in 1982 at a cost of $3.45 billion. Imports were derived 39% from Iraq, 23% from Iran, 23% from Libya, and 15% from Saudi Arabia. Turkey's crude oil consump-

tion was estimated at 119 million barrels per year.

To spur domestic production, TPAO began to encourage foreign investment in the petroleum sector. In January 1980, the civilian Government in Turkey liberalized the regulations regarding foreign investment by permitting companies to export up to 35% of their onshore and 45% of offshore oil production at market prices from wells drilled after January 1, 1980. Also, the length of time and bureaucratic procedures to obtain exploration and drilling licenses were shortened and simplified. Prior to the 1980 decrees, foreign companies were only allowed to hold concessions that TPAO did not want. Under the current regulations, TPAO may hold up to 12 licenses in each of the country's 18 exploration districts, but it may not hold more than a total of 180 licenses. Foreign companies are now limited to eight licenses in each district, but they compete evenly with TPAO for concession rights. Also, the ceiling on prices of oil sales to domestic refineries was lifted from $5.21 per barrel to closer to market value. These revised regulations, along with other similar changes, were implemented by decree in 1980, and have subsequently been embodied in the new petroleum law, which was nearing final enactment at the end of 1982. The new law was expected to pass by April 1983.

Despite these reforms, exploration activity has not increased as much as expected. One reason was that the new regulations came at a time when the major companies were cutting back on exploration because of the oil surplus. Turkey was not considered a very favorable area for exploration, owing to its complex and highly discontinuous geology. Nevertheless, some foreign companies have begun exploration work in Turkey, among them Italy's Azienda Generali Italiana Petroli S.p.A., Wintershall AG of the Federal Republic of Germany, Salen Energy of Sweden, and Roy M. Huffington Inc. and Union Texas Oil Co., both of the United States.

Turkey's four operating petroleum refineries, all of which were owned by the state through TPAO, processed a total of 15.5 million tons, or approximately 114 million barrels of crude oil in 1982 and obtained close to 15 million tons, or 101 million barrels of petroleum products. Approximate shares of the total output were 57% from the Istanbul Petrol Rafinerisi AS (IPRAS) facility in Istanbul, 25% from TPAO's Izmir refinery at Aliaga, 12% from the Anadolu Tasfiyehanesi AS plant, and 6% from TPAO's Batman refinery.

Expansion projects were underway at the Batman and Izmir refineries, and a fifth refinery was under construction in central Anatolia. At Izmir, throughput capacity was to be expanded from 3 to 5 million tons per year, a new asphalt unit was scheduled to come onstream early in 1983, and capacity of the lubricating oil unit was to be increased from 176,500 to 875,000 tons per year of lubricating oils. Modernization at Batman involved expanding its powerplant and adding water purification systems.

TPAO, in cooperation with Industrialexport of Romania, was in the process of constructing the central Anatolian refinery. The refinery was to be capable of processing 5 million tons per year of Iraqi crude oil lifted from the Yumurtalik marine terminal at the end of the Iraq-to-Iskenderun pipeline. Initial construction work on the plant had already begun, and commissioning was scheduled for 1986. Capacity at the IPRAS refinery was also expanded, from 8 to 18 million tons per year in 1982, making IPRAS the 10th largest refinery in Europe.

Petrochemicals.—Turkey's petrochemical industry was undergoing a rapid expansion in 1982, as the country's second petrochemical complex neared completion. The Turkish Petrochemical Corp. (Petkim) brought its first facility, located at Yarimca, onstream in 1970. The plant produced 397,973 tons of petrochemical products in 1982, including 81,000 tons of ammonium sulfate, 64,000 tons of benzene, 40,000 tons of polyvinyl chloride (PVC), 30,000 tons of caustic soda, 29,000 tons of liquefied petroleum gas (LPG), 26,000 tons of polyethylene, and 26,000 tons of chloralkali.

Petkim's second complex, at Aliaga near Izmir, was scheduled to come onstream in 1983. The plant was to utilize ethylene and LPG feedstock from the increased output of the Izmir refinery, along with imported raw materials to produce annually 105,000 tons of vinyl chloride monomer, 100,000 tons of PVC, 150,000 tons of low-density polyethylene, 40,000 tons of high-density polyethylene, and several other products. Most of the production units for the plant were already in place, but overall commissioning was not scheduled until the end of 1983. Petkim is a subsidiary of TPAO.

[2]Where necessary, values have been converted from Turkish lira (LT) to U.S. dollars at the rate of LT160=US$1.00. Fluctuations in the value of the lira by over 100% against the dollar since 1980 have distorted dollar denominated absolute percentage changes from year to year. All values and changes reported are real and not a result of fluctuating currency values.

The Mineral Industry of the U.S.S.R.[1]

By Richard Levine[2]

In 1982, increases were reported in fuel and energy production, while decreases were reported in steel and cement production. Natural gas production increased at a rapid rate. Coal finally registered an increase after 3 years of declining production, and oil production increased slowly. The economy suffered shortages owing to a decrease in crude steel, rolled steel, and steel pipe production, and construction was hampered by a 3% decrease in cement production. Labor productivity in the ferrous and nonferrous metals sectors again declined.

The national economy grew at its slowest rate in two decades. National income grew 2.6% in comparison with 3.2% in 1981. Gross industrial output increased 2.8% in comparison with a 3.4% growth in 1981. The growth rate of industrial labor productivity, an important factor in achieving economic growth with the current labor shortage, declined. The change in leadership brought with it a call for increased discipline in the workplace along with speculation concerning economic reform.

Owing to the depletion of the richest and most accessible deposits and the transfer of extractive activity to remote areas of the north and east with severe climatic conditions, the cost of mineral production was greatly increasing. Furthermore, according to a member of the State Planning Committee, Soviet productivity was low compared with Western countries for a number of mineral commodities.[3] Owing to the increased difficulty and cost of production, major emphasis was being placed on the efficient use and conservation of fuel and raw materials.

Substantial losses occurred because of transport problems. Railroads, which were the main means of transport for raw materials, were not equipped to adequately support mineral development. Problems also existed in planning and managing the railroads. Development of the extensive Siberian coal resources was hampered by lack of rail transport.

Waste was stimulated by the Soviet practice of measuring production in tonnage terms. In manufacturing, this practice led to the production of heavier machinery and equipment; in mining, to the production of lower grade ores; and in metallurgy, to the production of lower quality products. Replacement of gross output indicators such as tons or rubles of production with indicators that would stimulate the production of higher quality output was recommended.[4] Efforts were being made to refine the ton indicator. Implementation on a small scale was underway in the steel sector of shifting to a weighted ton indicator that took into account the special characteristics of different products.

The net output indicator, a value-added measurement, was being used to replace gross value output indicators. The net output indicator excluded the cost of raw materials and energy purchased outside the enterprise from the value of production to discourage increasing their use to boost the value of output. However, it was not fully introduced into the Ministries of Ferrous and Nonferrous Metallurgy. The net output indicator was also subject to abuse as enterprises could add to the value of output by increasing labor costs, and this could be particularly harmful given the labor shortage.

In an effort to economize on the use of resources and to promote the production of priority resources, new domestic wholesale

prices for raw materials were introduced in January. This was the first revision of wholesale prices since 1967. Wholesale prices were set to account more fully for production costs, to encourage appropriate substitutions, and to increase recovery of byproducts. The new prices maintained territorial differentiation based on cost of development for some commodities, such as coal, gas, and oil, and specified a single national price for other commodities such as ferrous metals. The price of an ore or concentrate was based on the percentage of the useful component. For example, phosphate ore ranged in price from 0.57 ruble[5] to 1.53 rubles per ton based on its P_2O_5 content. Wholesale prices were raised an average 14% for all basic metals produced by the Ministry of Nonferrous Metallurgy including antimony, bismuth, cadmium, cobalt, copper, indium, lead, mercury, molybdenum, nickel, rhenium, tin, and zinc. Increases were said to be particularly sharp for cobalt, lead, tin, and zinc.[6] Actual price increases, however, were not reported for the nonferrous metals. Domestic wholesale price increases reported in the Soviet press in 1982 for selected commodities, are shown in the following tabulation:

Commodity	Average percent increase
Asbestos	53
Cement	26
Chrome ore	82.1
Coal	42
Coke, metallurgical	18.3
Fuel oil	51
Gas, natural	33
Iron and steel:	
Iron ore	69.2
Pig iron:	
For foundry use	34.6
For steelmaking	30
Sheet, cold-rolled	21.5
Sheet, hot-rolled	18.6
Steel pipe, extruded	7
Steel pipe, rolled	18.3
Metal powders	41- 42
Mica	26- 35
Mineral fertilizers	12
Petroleum, crude	130
Phosphate ore	50-100

In April 1982, the Soviet Union issued a decree empowering Soviet enterprises to engage in deep sea mining. Western analysts claimed that the Soviets' major reason for issuing this decree was that it positioned the U.S.S.R. to participate as a pioneer investor in the Preparatory Investment Protection (PIP) clause of the Law of the Sea Treaty. The PIP clause gave mining organizations that had engaged in a specified amount of exploratory work the right to one mining site. Despite the decree, the Soviets lacked the technology and equipment for deep sea mining.

Mineral Industry Labor.—A problem hampering Soviet economic development was the slow growth in the labor force. Labor supply and labor force growth varied considerably in different regions. Many major new mineral development projects were in the already labor-deficient regions of Siberia and the Soviet Far East. There had not been adequate migration of workers to these areas despite numerous wage and benefit incentives, and the Soviets at times had to rely on a costly program of flying in shifts of workers to some mineral development sites. Increased use of Council of Mutual Economic Assistance (CMEA)[7] labor was underway. Approximately 5,000 workers from the German Democratic Republic were working on construction of the trans-Siberian gas export pipeline, and workers from other CMEA countries, including Vietnam, were being employed in the Soviet Union. Poland's largest construction team on Soviet territory was engaged in building pumping stations, utilities, and worker accommodations for the Surgut-Polotsk petroleum pipeline. Polish workers were also helping to construct the gas export pipeline.

Despite the need to increase labor productivity in mining and metallurgy, the Soviets experienced decreasing labor productivity in several mineral production sectors.

Labor productivity in the minerals sector in 1982, as a percent of 1981 productivity, was as follows:

Coal	99.8
Ferrous metallurgy	99.7
Mineral fertilizers	102.0
Natural gas	105.0
Nonferrous metallurgy	99.7
Petroleum	99.0

In the area of technical training, the Soviet Union graduated 10,000 mining engineers annually in all specialities who were taught by a staff of 450 Doctors of Science and 3,500 Candidates of Science.[8] Preparation occurred at 47 mining engineering schools and at a number of other schools with mining engineering departments. In addition, there were over 500,000 employees in geological and prospecting organizations, with over 60,000 employed in West Siberia. Judging solely by numbers, the Soviet Union did not suffer a shortage of trained technical personnel in mining, metallurgy,

and prospecting. Despite the large number of engineering graduates and geological workers, the effectiveness of their preparation and the efficient utilization of personnel in the economy should be evaluated in making comparisons with Western countries.

Mineral Industry Technology.—In mining, reportedly, up to the following amounts of raw materials were left in deposits: coal, 30% to 40%; iron ore, 20%; natural gas, 50%; petroleum, 70%; and phosphates, 25% to 30%. Declining ore quality further increased the need for mechanization and high-technology equipment. It was calculated that during the 1980's the metal content would decrease 10% to 15% in the majority of nonferrous ores and 12% to 15% in iron ores. Improved metal recovery was somewhat offsetting the decline in ore quality. However, only 50% to 60% of the value of ore constituents was recovered with the percentage dropping at times to 10% to 20%.[9]

Capital investment in plants to produce equipment for the metallurgical industries was low. Furthermore, there were no specialized plants for metallurgical equipment, but rather this equipment was produced at a number of general heavy manufacturing plants.[10] Production problems in the steel industry were blamed, in part, on the suppliers' failure to produce needed equipment.[11] There were also insufficient facilities for recycling metals, which resulted in both loss of output and low-quality product.[12]

During the past 20 years, open pit mining for nonferrous metals had increased from 44% to 65% of the total. Underground mining was hindered by lack of self-propelled equipment, but by 1985, the volume of ore extracted with this equipment was to increase by one-third in comparison with that of 1980.

A major problem hindering the development of surface mining was the lack of trucks. The 40-ton dump trucks used in nonferrous mining were considered too small. The 75-ton trucks, reportedly, were poorly designed and were more often in the shop than on the job, and there was a shortage of 120-ton trucks.[13] In 1981, the average capacity of dump trucks in iron ore mining was 42.3 tons, and in 1982, in nonferrous metal mining, 34 tons. Production of large-capacity shovels was insufficient. The average shovel capacity in nonferrous metal mining was 5.6 cubic meters.[14] Furthermore, the trucks, shovels, and other equipment were often unsuitable for the extreme cold in northern regions, causing considerable delays owing to breakdowns. At times, equipment produced specifically for cold climates was sent to other parts of the country.

The Soviet Union was largely dependent on the West for pipelaying equipment capable of handling large-diameter pipe. Domestic pipelaying equipment production was initiated at the Sterlitamak plant in the Bashkir A.S.S.R., which produced 100 pipelaying machines in 1981; plans were to increase production at Sterlitamak to 1,700 units by 1985. The Soviets were also dependent on imports for submersible pumps for oilfields and high-powered turbines for gas compressor stations.

The West Siberian oil and gas complex had suffered electric power shortages since 1978. Prolonged delays in the construction of local powerplants resulted in some well shutdowns.

Secondary material accounted for over one-third of steel and one-fifth of nonferrous metal production in 1982. The Ministry of Ferrous Metallurgy planned to increase scrap processing by 21%. The quantity of nonferrous scrap processed had decreased since 1978. Efforts to economize by using secondary materials often resulted in waste because quotas for scrap were met by scrapping good metal and machinery.

PRODUCTION

Statistics on output, enterprise capacity, and production plans in physical units of output of nonferrous, precious, and rare metals and some nonmetallics are classified as state secrets. Soviet trade data on precious metals had not been available for decades, and in 1976, the Soviets stopped publishing trade statistics for nonferrous metals. Production and trade data were available for ferrous metals and some nonmetallics.

Some information was available on most mineral commodities and could be used in determining the relative size or growth of the mineral industry. However, Soviet information had to be carefully qualified. Comparisons with Western countries were difficult because Soviet statistics showed minerals produced rather than usefully consumed.

[p]Preliminary. [r]Revised. NA Not available.

[1]Production estimated unless otherwise specified.

[2]Includes data available through Oct. 13, 1983.

[3]Reported in Soviet sources.

[4]Reported in United Nations sources.

[5]Estimate based on total of spiegeleisen and blast-furnace ferromanganese reported by United Nations sources.

[6]Data may not add to totals shown because of reporting from different sources.

[7]Run-of-mine coal. The average ash content of coal shipped from mines was 20.2%, and the average calorific value was slightly more than 5,000 kilocalories per kilogram (9,000 British thermal units per pound in 1977).

[8]Not distributed by type and, therefore, not suitable for conversion to volumetric units. Data include all energy products and some nonenergy products as well as refinery fuel and exclude petrochemical feedstocks, paraffin, petroleum coke, white spirit, unspecified minor nonenergy products, and refinery losses.

TRADE

Foreign trade was administered according to the national plan by the Ministry of Foreign Trade and its subordinate foreign trade organizations. Laws of comparative advantage played less of a role in foreign trade than did Government objectives. Two major Soviet objectives were to integrate the economies of Eastern Europe with the Soviet economy and to earn sufficient hard currency to purchase essential commodities, such as grain and advanced technology and equipment.

Mineral exports were used to meet both objectives. The Soviet Union was the chief supplier of fuel and other raw materials to CMEA states, and mineral exports were the chief source of hard currency earnings. The U.S.S.R. provided the great majority of CMEA imports of oil, gas, iron ore, pig iron, rolled ferrous metals, nonferrous metals, phosphate fertilizers, etc. The CMEA states did not pay for these imports with hard currency, but rather supplied the Soviet Union mainly with manufactured and other goods.

Over four-fifths of all Soviet hard currency earnings came from raw materials, and over one-half came from oil. Other significant hard-currency-earning mineral exports included chrome ore, diamonds, gold, natural gas, nickel, platinum-group metals, and uranium compounds. With the completion of the trans-Siberian pipeline to Western Europe in the mid-1980's, gas sales will increase in importance as a source of hard currency.

Many commodities exported were not actually in surplus and could easily have been consumed in the domestic economy. During periods of increased economic need, to gain entry into a market, or for political purposes, the Soviets were willing to sell in a depressed market or below the world market price.

Although a large mineral exporter, the Soviet Union was also an importer of some mineral commodities, such as tin, bauxite, fluorite, and high-quality steel products, of which it did not produce enough to meet its domestic needs. For other commodities, imports served to supply regions far from Soviet sources of supply, to overcome temporary supply breakdowns, or as a political gesture to help friendly countries.

In addition, the Soviet Union assisted in geological exploration and mineral development in a number of developing countries. For example, in Asia, the Soviet Union claimed it was assisting in the development of oil and gas in Afghanistan; gas in Bangladesh; tin in Laos; tin, coal, and oil in Vietnam; coal, copper, molybdenum, fluorspar, gold, and phosphates in Mongolia; iron and steel in North Korea; and coal, iron, steel, and alumina in India.

In the Middle East and Africa, the Soviet Union stated it was assisting development of oil, fluorspar, gas, and other minerals in Algeria; copper, quartz, and other minerals in Angola; oil, gas, and gold in Ethiopia; bauxite in Guinea and Guinea-Bissau; oil in Iraq and Syria; gold in Ghana and Mali; coal, gas, oil, and rare metals in Mozambique; coal, iron, and steel in Nigeria; mixed sulfide ores and gold in the Congo; and oil in Turkey. The Soviets claimed that about 2,000 Soviet engineers and technicians were working in the countries of tropical Africa alone.

The above examples of Soviet assistance are by no means an entire listing of Soviet participation in mineral projects in developing countries, for which the Soviet Union often received minerals in exchange for assistance. In addition, a number of other CMEA countries were participating in mineral development in Africa and Asia.

Soviet oil deliveries to market economy countries increased significantly despite earlier predictions that oil exports to market economy countries would decrease. Increased sales were coupled with decreased deliveries to East Europe. Part of the Soviet increase in oil exports to the West was accounted for by the transshipment of Libyan oil obtained through countertrade.

Estimated Soviet gold sales decreased to 200 tons. Despite large gold sales, the Soviet Union stated that it was experiencing a shortage of gold for domestic needs.[15] Speculation in late 1982 that the Soviet Union was going to reduce palladium sales to the West by at least 25% coincided with a sharp rise in palladium prices.

Increased Soviet nickel sales to the West at reputed low prices were blamed, in part, for the depressed state of the Western nickel industry. In December, European producers filed a dumping complaint regarding Soviet nickel exports with the European Economic Community (EEC). Although the Soviets hoped to export as much as 1.4 trillion cubic feet of natural gas to West Europe through the trans-Siberian

pipeline starting in 1984, at the end of 1982, contracts were concluded for the sale of only about one-half that amount.

Increased trade with West Europe was especially pronounced in the case of Finland. In 1982, the Soviet Union and Finland conducted negotiations regarding a joint venture to develop oil and gas fields in the Arctic Ocean. Discussions with Finland were also underway concerning extending the gas pipeline to increase Finnish gas imports. Greece was also considering constructing a pipeline to import Soviet gas. In late 1982, France reduced imports of oil and petroleum products from the Soviet Union to reduce its trade deficit and presumably to pressure the Soviet Union to purchase more French equipment.

In November 1982, the United States removed sanctions imposed after the imposition of martial law in Poland, and the ban on sales of oil and gas transmission and refining equipment, including pipelines and turbine pumps, was lifted. However, previous controls on oil and gas production equipment remained in effect, and export licenses still had to be processed on a case-by-case basis.

In Latin America and the Caribbean, the U.S.S.R. conducted mineral trade with Argentina, Brazil, Cuba, and Jamaica. The Soviet Union, one of Argentina's largest export customers for grain and beef, supplied Argentina with enriched uranium and heavy water for its nuclear energy industry, after the United States had refused to sell such supplies unless Argentina signed either the international or regional nonproliferation treaties. A trade agreement between the U.S.S.R. and Brazil provided for the U.S.S.R. to supply Brazil with aluminum and nickel, and in 1983, the Soviet Union was to resume bauxite imports from Brazil for its Nikolayevsk alumina plant on the Black Sea. In addition, the Soviet Union concluded a contract for supplies of bauxite from Jamaica. This contract replaced an earlier contract for alumina imports that had not yet gone into effect.

In Cuba, a Caribbean member of CMEA, the U.S.S.R. was assisting in the development of nickel-cobalt facilities with eventual output projected by the Soviets to reach 100,000 tons per year of metal content. The U.S.S.R. was being paid for its assistance with part of the output.

In Asia, the U.S. ban on selling oil and gas equipment to the Soviets affected the joint Japanese-Soviet oil exploration project off the coast of Sakhalin Island. Owing to the sanctions, one of the two rigs involved in the oil and gas exploration could not be used. Japanese firms did benefit, however, from the U.S. ban on export licenses to the Caterpillar Tractor Co. by supplying earth-moving equipment to the Soviet Union. Although Japan was neither providing financing for nor purchasing gas from the trans-Siberian export pipeline, it had good success in selling the Soviet Union steel pipe. Between March 1983 and March 1984, Japan was to supply the U.S.S.R. with 1 million tons of large-diameter steel pipe. Japan imported large amounts of coking coal and nonferrous metals from the U.S.S.R., and gold and precious metals were also major Japanese imports.

The U.S.S.R. was one of India's largest trading partners. The Soviet-Indian 1981-85 trade agreement provided for increased Soviet mica imports. Another agreement provides for increased Soviet exports of oil and petroleum products. The U.S.S.R. was also assisting India in developing metallurgical facilities. The Soviets reportedly increased exports of aluminum to China. A 1982 trade agreement with North Korea provided for North Korean exports to the U.S.S.R. of rolled steel, lead, zinc, and dead-burned magnesite. The U.S.S.R. reported importing tin from Vietnam and Laos.

In Mongolia, along with participation in the large Erdenet copper-molybdenum complex, the U.S.S.R. was assisting in the development of coal and phosphate deposits. Development of the Hubsugul phosphate deposit as well as of the Erdenet complex was being conducted with the participation of other CMEA states. The joint Soviet-Mongolian enterprise, Mongolsovtsvetmet, controlled 92% of Mongolia's mining industry. In 1981 and 1982, the Soviet Union aided in the exploration of Mongolian copper, molybdenum, tungsten, and fluorspar deposits.

The Soviet Union was involved in the exploitation of natural gas and other mineral resources in Afghanistan. In both 1981 and 1982, the U.S.S.R. imported annually 81.2 billion cubic feet of natural gas from Afghanistan. Nevertheless, Soviet imports of natural gas from Afghanistan had declined from their 1978 level, possibly owing to disruptions caused by the war. Of primary importance were the natural gasfields of Gogerdak and Jarq-aduq in northern Afghanistan. The Soviets brought the Jarq-aduq Field onstream in May 1980, increas-

ing Afghan production from about 21.2 to about 38.8 million cubic feet per day. About 95% of Afghanistan's natural gas output was exported to the Soviet Union. In anticipation of the increased output from Jarqaduq, the Soviet Union looped a pipeline from Afghanistan to the Soviet border in 1981. In addition to gas, the Soviets intended to develop the Ainak copper deposit, which contains an estimated 280 million tons of 0.7% to 1.5% copper ore, and infrastructure development had already begun. Development of the 2-billion-ton, 65% iron ore deposits at Hajigak, 100 kilometers northwest of Kabul, was also planned, and the chromite deposits in Nangarher Province near the Pakistan border were under evaluation.

Trade with the CMEA countries was particularly important in the mineral area. The Soviets were providing CMEA countries with minerals in nonhard currency exchanges, which were often considered to be below the world market price. Owing to its need for hard currency and the perceived disparity between ruble prices and world market prices, the Soviet Union was decreasing its oil shipments and increasing the ruble price of oil and gas to CMEA countries. Ruble prices for Soviet crude oil to CMEA countries reportedly increased 28% in 1981, 26% in 1982, and were to increase 19% in 1983. Ruble prices for natural gas to CMEA countries reportedly increased 25% in 1982 and were to increase 17% in 1983. The CMEA states had been negotiating to lessen these price increases owing to falling prices on the world market.

The German Democratic Republic was the Soviet Union's largest trade partner, and raw materials made up a large portion of exports to the German Democratic Republic. According to a 1981-85 trade agreement, the German Democratic Republic was to import annually from the Soviet Union 140 million barrels of petroleum, 230 billion cubic feet of natural gas, 1.7 million tons of iron in iron ore, 960,000 tons of pig iron, 130,000 tons of aluminum, 42,300 tons of copper, 1.3 million tons of coke, and 4.2 million tons of hard coal. The German Democratic Republic imported a number of other minerals from the Soviet Union such as zinc, lead, and magnesium. In 1982, the Soviets reportedly reduced crude oil shipments to the German Democratic Republic. In 1983, crude oil shipments were to decrease to 126 million barrels, and natural gas shipments, to 219 billion cubic feet; iron ore shipments were to increase to 2.3 million tons (iron content).

Poland experienced a decline in production in 1981 in comparison with that of 1980, and some recovery in 1982. The level of Soviet mineral exports to Poland during the past 3 years varied according to the commodity. Crude oil exports declined from 120 million barrels in 1980 to an estimated 94 million barrels in 1982. Natural gas exports decreased from 188 billion cubic feet in 1980 to 186 billion cubic feet in 1981, but were estimated to have increased to 191 billion cubic feet in 1982.

Although Hungary conducted the majority of its trade with market economy countries, it was dependent on the Soviet Union for the most of its raw material imports. Hungary imported approximately 70% of its crude oil, 40% of its natural gas, and a large percentage of its ore and metal requirements from the Soviet Union. Hungary, as part of a continuing exchange, was to export 330,000 tons of alumina to the Soviet Union and was to receive 165,000 tons of aluminum in return. The Soviet Union retained a portion of the primary aluminum as a smelting fee.

Romania was the only CMEA country that did not rely on the Soviet Union for the majority of its imported raw materials. The Soviet Union supplied approximately 45% of Romania's imported iron ore and 20% of its imported phosphate along with pig iron, rolled ferrous and nonferrous metals, and ferroalloys. According to a 1981-85 trade agreement, the Soviet Union was to supply Romania with apatite, asbestos, coke and coking coal, ferroalloys, iron ore, natural gas, pig iron, rolled ferrous and nonferrous metals, and steel. Romania was a large supplier of petroleum industry equipment to the Soviet Union. In 1982, the U.S.S.R. signed a trade agreement with Romania to assist in the construction of a nuclear powerplant. Prior to this agreement, Romania had been developing nuclear power with only Western assistance.

Czechoslovakia imported almost 70% of its fuel and raw materials from CMEA countries, particularly the U.S.S.R. Estimated Soviet exports of crude oil to Czechoslovakia decreased in 1982 in comparison with those of 1981 while exports of natural gas increased slightly. Czechoslovakia's reported imports from the Soviet Union included aluminum, asbestos, carbon black, cement, chromite, hard coal, copper, crude oil, fertilizers (nitrogenous and potassic), iron and steel, lead, manganese, natural

gas, nickel, pyrites, salt, sulfuric acid, and zinc.

Bulgaria was dependent on the Soviet Union for the great majority of its mineral imports. During 1981-85, the Soviet Union was to supply Bulgaria with energy and raw materials including coal, crude oil and oil products, electric energy, iron ore, ferrous and nonferrous metals, and natural gas. In 1982, the Soviet Union signed an agreement with Bulgaria for cooperation in oil and gas exploration on Bulgaria's Black Sea Shelf.

The Soviet Union was engaged in a number of assistance and cooperative programs with the CMEA countries. All of the East European, full-CMEA-member countries and Cuba were developing nuclear power programs with Soviet assistance. Furthermore, a number of CMEA countries were participating in nuclear development projects within the Soviet Union for which they were to receive energy in return. The CMEA countries were cooperating in other mineral development ventures. These included Petrobaltic, an offshore drilling consortium including the U.S.S.R., Poland, and the German Democratic Republic, organized for drilling in Baltic waters, and the Kiyembay asbestos complex in Orenburg Oblast', U.S.S.R., with a projected capacity of 500,000 tons per year, which was being built with a one-third investment of the CMEA countries in return for one-third of the output. The CMEA countries also were providing equipment and workers for gas and oil pipeline projects in the Soviet Union.

Table 2.—U.S.S.R.: Estimated production, trade, and consumption of mineral commodities in 1982

(Thousand metric tons unless otherwise specified)

Commodity	Production	Imports	Exports	Apparent consumption
METALS

(Metric tons unless otherwise specified)

Commodity	1980	1981[p]	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Gold: Metal including alloys, unwrought and partly wrought thousand troy ounces	NA	1,495	--	Japan 1,191; West Germany 297.
Iron and steel:				
Iron ore and concentrate:				
Excluding roasted pyrite[2] thousand tons	46,873	54,429	--	Czechoslovakia 13,211; Poland 10,554; Romania 7,384.
Pyrite, roasted do	93	106	--	All to Hungary.
Metal:				
Scrap[2] do	2,500	2,681	--	East Germany 584; Italy 429; Yugoslavia 296.
Pig iron, cast iron, related materials do	2,968	3,105	--	Poland 1,479; Czechoslovakia 839; Bulgaria 410.
Ferroalloys:				
Ferrochromium do	NA	20	--	Hungary 6; West Germany 5; Austria 3.
Ferromanganese do	NA	24	--	All to Hungary.
Ferrosilicomanganese do	NA	20	--	Romania 15; Finland 5.
Ferrosilicon do	NA	17	--	Hungary 7; West Germany 5; Finland 3.
Unspecified do	117	8	1	Belgium-Luxembourg 4; Sweden 2.
Steel, primary forms do	969	736	(3)	Hungary 413; Yugoslavia 201; West Germany 47.
Semimanufactures:				
Bars, rods, angles, shapes, sections do	1,493	1,166	--	Poland 615; East Germany 269; Hungary 146.
Universals, plates, sheets do	999	1,033	--	East Germany 512; Hungary 235; Bulgaria 167.
Hoop and strip	14,738	20,154	--	Yugoslavia 9,280; Bulgaria 6,382; Jordan 3,626.
Rails and accessories	1,676	1,681	--	Yugoslavia 1,627.
Wire	6,749	3,463	--	Libya 2,189; Hungary 812; Jordan 189.
Tubes, pipes, fittings	45,294	39,919	140	Yugoslavia 9,478; West Germany 8,670; Jordan 4,657.
Castings and forgings, rough	868	936	--	West Germany 717; Egypt 157; Austria 60.
Lead: Metal including alloys:				
Scrap	31	NA		
Unwrought	36,118	27,059	--	Czechoslovakia 20,000; Finland 7,000.
Magnesium: Metal including alloys, unwrought	752	37	--	All to West Germany.
Manganese:				
Ore and concentrate, metallurgical-grade[2] thousand tons	1,255	1,194	--	Poland 493; Czechoslovakia 372; East Germany 130.
Oxides	23	NA		
Mercury 76-pound flasks	2,930	464	--	West Germany 348; Austria 58.
Metalloids:				
Boron and arsenic including alloys, all forms	NA	15	--	All to Japan.
Phosphorus[2]	NA	47,835	--	Poland 10,360; Romania 2,041; Japan 1,683.
Tellurium and arsenic	NA	31	--	West Germany 20; Japan 6; Netherlands 5.
Unspecified	2,425	6,270	5,347	Switzerland 844; Yugoslavia 50.
Molybdenum:				
Ore and concentrate	14	NA		
Metal including alloys, all forms kilograms	--	3	--	All to Japan.
Nickel:				
Ore and concentrate	29	NA		
Matte and speiss	1,206	804	--	Sweden 792.
Metal including alloys:				
Scrap	858	4	--	All to Austria.
Unwrought	32,068	29,245	4,114	West Germany 6,624; France 4,654; Czechoslovakia 4,344.
Semimanufactures	160	229	--	Yugoslavia 212.

See footnotes at end of table.

Table 5.—U.S.S.R.: Apparent exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981[p]	Destinations, 1981	
			United States	Other (principal)
METALS —Continued				
Platinum-group metals: Metal including alloys, unwrought and partly wrought, unspecified ____ value, thousands__	$438,068	$126,918	$50,572	West Germany $38,566; Switzerland $17,386; France $15,817.
Silver:				
Ore and concentrate[5] _____do____	--	$87	$87	
Waste and sweepings[5] _____do____	$665	NA		
Metal including alloys, unwrought and partly wrought _____do____	$2	$5	--	All to West Germany.
Tin: Metal including alloys, unwrought _	1	NA		
Titanium:				
Oxides _____	20	21	--	All to United Kingdom.
Metal including alloys, all forms ___	2,770	1,504	468	West Germany 727; Sweden 153; Italy 68.
Zinc:				
Ore and concentrate _____	83	NA		
Oxides _____	8	(3)	--	All to Spain.
Metal including alloys:				
Scrap _____	--	22	--	All to West Germany.
Unwrought _____	24,875	13,156	--	Czechoslovakia 9,000; Poland 4,116.
Semimanufactures _____	--	55	--	Greece 30; Egypt 22.
Other:				
Ores and concentrates _____	1,292	15,386	--	All to Hungary.
Oxides and hydroxides _____	100,648	435	--	Yugoslavia 135; Japan 125; Italy 80.
Ashes and residues _____	67,341	69,310	--	Austria 68,976.
Base metals including alloys, all forms	21,110	18,187	(3)	Czechoslovakia 14,000; Austria 2,961; Poland 1,110.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc _____	--	17	--	All to France.
Artificial:				
Corundum _____	1,299	745	--	All to West Germany.
Silicon carbide _____	NA	2,297	--	Do.
Dust and powder of precious and semi-precious stones including diamond value, thousands__	$1,674	$1,110	$8	Belgium-Luxembourg $492; Yugoslavia $346; Italy $96.
Grinding and polishing wheels and stones[5] _____	13	1	--	All to Finland.
Asbestos, crude _____	315,780	306,805	--	Poland 77,850; Japan 38,130; Yugoslavia 36,136.
Barite and witherite _____	120	60	--	All to Yugoslavia.
Boron materials:				
Crude natural borates _____	2,778	3,621	--	All to Japan.
Oxides and acids _____	[2]15,355	[2]14,558	--	Japan 3,252; Hungary 1,500; Yugoslavia 500.
Cement[2] _____ thousand tons__	3,245	2,735	--	Hungary 505; Saudi Arabia 503; Yugoslavia 269.
Chalk _____	87	261	--	All to Finland.
Clays and clay products:				
Crude:				
Chamotte earth _____	26,095	1,493	--	Poland 1,463.
Fire clay _____	9,239	5,861	--	All to Poland.
Kaolin _____	32,769	28,662	--	Hungary 17,362; Yugoslavia 8,521; Austria 2,745.
Unspecified _____	79	1,578	--	Hungary 1,512; Netherlands 25; Finland 21.
Products:				
Nonrefractory _____	20,687	14,136	--	Finland 13,536; Jordan 595.
Refractory including nonclay brick[2] _____	120,255	91,356	--	Cuba 24,493; Romania 24,139; Bulgaria 19,739.
Diamond:				
Gem, not set or strung value, thousands__	$1,305,714	$225,660	$1,827	Belgium-Luxembourg $171,860; West Germany $29,531; United Kingdom $11,378.
Industrial _____do____	$253	$13,911	--	Japan $13,217; Belgium-Luxembourg $555; Italy $86.
Diatomite and other infusorial earth ___	--	84	--	West Germany 62; France 22.
Feldspar, fluorspar, related materials:				
Unspecified _____	--	23	--	All to Belgium-Luxembourg.

See footnotes at end of table.

Table 5.—U.S.S.R.: Apparent exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981[p]	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Fertilizer materials:				
Crude, n.e.s	--	153	--	Sweden 118; Italy 35.
Manufactured:				
Ammonia thousand tons	1,825	1,863	722	Italy 381; Spain 186; Finland 167.
Nitrogenous[2] do	2,866	3,401	23	Cuba 544; Czechoslovakia 378; Hungary 328.
Phosphatic[2] do	704	753	--	Cuba 287; Bulgaria 268; Hungary 131.
Potassic do	6,603	5,245	13	Poland 2,312; Hungary 651; Czechoslovakia 286.
Unspecified and mixed do	55	43,809	--	Hungary 43,084.
Graphite, natural	11,536	3,972	310	Japan 2,888; Poland 555; United Kingdom 109.
Gypsum and plaster	35,205	43,917	--	Sweden 23,100;[2] Finland 20,800.[2]
Halogens:				
Bromine	--	101	--	All to Hungary.
Iodine	33	19	--	Do.
Unspecified	101	25	--	All to Belgium-Luxembourg.
Lime	45	NA		
Magnesium compounds:				
Magnesite	29,402	7,505	--	Hungary 6,284; Japan 1,221.
Oxides and hydroxides	NA	10	--	All to Austria.
Other	NA	8,648	--	Finland 5,180; Netherlands 3,458.
Mica: Worked including agglomerated splittings	2	NA		
Phosphates, crude thousand tons	3,780	3,921	--	Bulgaria 914; Poland 857; Hungary 499.
Pigments, mineral: Iron oxides and hydroxides, processed	244	719	--	Yugoslavia 696; France 21.
Potassium salts, crude	1,077	1,608	--	All to Hungary.
Precious and semiprecious stones other than diamond:				
Natural value, thousands	$749	$1,305	$117	Austria $569; Italy $373; Hong Kong $115.
Synthetic do	$438	$611	--	Austria $478; West Germany $52; Switzerland $47.
Pyrite, unroasted[2] thousand tons	911	536	--	Bulgaria 271; Hungary 91; Italy 84.
Salt and brine[2]	480,865	452,843	--	Czechoslovakia 151,476; Hungary 150,000; Denmark 53,346.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	1	NA		
Sodium carbonate, natural and manufactured	43,275	33,742	--	Finland 18,149; Italy 9,938; United Kingdom 3,249.
Sodium hydroxide	745	1,501	--	Yugoslavia 1,478.
Sodium sulfate, natural and manufactured	NA	[2]51,305	--	Yugoslavia 14,400;[2] Sweden 3,785.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	22,162	15,407	--	West Germany 8,382; Italy 4,981; France 1,011.
Worked	1,524	[7]15	([7])	France 8; West Germany 4.
Gravel and crushed rock	394	NA		
Limestone other than dimension	--	2,046	--	All to Finland.
Quartz and quartzite	--	45	--	All to Italy.
Sand other than metal-bearing	228	([3])	--	All to Japan.
Sulfur:				
Elemental, crude including native and byproduct	60,525	43,506	--	All to Hungary.
Sulfuric acid[2]	172,181	179,912	--	Czechoslovakia 167,341.
Vermiculite	NA	64,336	--	Spain 31,600; Belgium-Luxembourg 24,840.
Other:				
Crude	97,412	125,030	--	Spain 36,850; Italy 33,687; Belgium-Luxembourg 24,840.
Slag and dross, not metal-bearing	420	([3])	--	All to Japan.
Oxides and hydroxides of barium, magnesium, strontium	539	469	357	West Germany 94; United Kingdom 18.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	NA	67,357	--	Poland 65,330; Finland 1,382.

See footnotes at end of table.

Table 5.—U.S.S.R.: Apparent exports of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981[p]	Destinations, 1981	
			United States	Other (principal)
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	8	455	--	All to Japan.
Carbon: Carbon black[2]	103,835	107,861	20	Bulgaria 28,644; Hungary 22,341; East Germany 22,225.
Coal:				
Anthracite and bituminous thousand tons	21,334	17,878	--	Bulgaria 5,090; Czechoslovakia 3,273; East Germany 2,615.
Briquets of anthracite and bituminous coal	--	2,078	--	All to Yugoslavia.
Lignite including briquets	79,905	65,875	--	Yugoslavia 57,613; Japan 4,075; Hungary 4,043.
Coke and semicoke thousand tons	2,938	2,792	--	East Germany 1,262; Finland 715; Hungary 503.
Gas, natural million cubic feet	1,406,292	1,463,512	--	Czechoslovakia 301,729; Italy 271,217; East Germany 212,247.
Gas, manufactured do	--	304	--	All to Finland.
Hydrogen, helium, rare gases	2,341	2,507	--	Finland 2,320; Norway 99; Sweden 80.
Peat including briquets and litter	219,511	171,371	--	West Germany 49,560; Austria 24,161; Italy 18,641.
Petroleum and refinery products:				
Crude thousand 42-gallon barrels	651,465	740,561	--	East Germany 139,915; Czechoslovakia 133,256; Poland 96,292.
Refinery products:				
Liquefied petroleum gas do	1,845	933	--	West Germany 505; Hungary 245; Belgium-Luxembourg 136.
Gasoline do	40,140	39,904	529	Netherlands 12,528; West Germany 11,544; Hungary 4,589.
Mineral jelly and wax do	42	23	[3]	Finland 18; Norway 2.
Kerosine and jet fuel do	2,570	2,759	--	Hungary 1,831; West Germany 584; Ireland 176.
Distillate fuel oil do	91,990	101,058	2,280	Netherlands 21,251; Switzerland 17,673; France 11,548.
Lubricants do	2,120	1,467	--	Denmark 635; Italy 327; Finland 130.
Nonlubricating oils do	1	[3]	--	All to Jordan.
Residual fuel oil do	48,621	44,644	188	Finland 9,900; Italy 7,060; France 5,442.
Bitumen and other residues do	56	NA		
Petroleum coke do	--	951	--	Italy 456; Japan 346; Spain 97.
Unspecified do	21,776	21,308	--	All to Poland.
Tars and other crude chemicals derived from coal, gas, and petroleum	242,958	157,338	[8]	Netherlands 44,279; East Germany 24,926; Yugoslavia 15,666.

[p]Preliminary. NA Not available.

[1]Owing to a lack of official trade data published by the U.S.S.R., this table should not be taken as a complete presentation of this country's mineral trade. Unless otherwise specified, these data have been compiled from United Nations information and data published by the partner trade countries.

[2]Official Trade Statistics of the U.S.S.R.

[3]Less than 1/2 unit.

[4]Excludes imports by France valued at $83,732.

[5]May include other precious metals.

[6]Excludes quantity valued at $1,264,000 in 1980 and $1,134,000 in 1981.

[7]Excludes quantity valued at $73,000, of which $63,000 was imported by the United States.

[8]The United States imported 409,146 barrels of naphtha.

COMMODITY REVIEW

METALS

Aluminum.—In 1982, the production plan for aluminum was reportedly fulfilled. The Soviet Union increased exports of unwrought aluminum to the West and exports of rolled aluminum to market economy and centrally planned economy countries. The Soviets were dependent on imported alumina and bauxite for approximately 50% of domestic consumption. Domestic bauxite reserves were being depleted, and the Soviets were faced with increasing purchases from abroad unless greater use was made of other raw materials such as nepheline syenite for aluminum production.[16] Nepheline syenite accounted for approximately 16% of aluminum production. Less than 2% of aluminum production was from alunite.

Jamaica and the Soviet Union concluded a contract for Jamaica to supply the U.S.S.R. with 1 million tons per year of bauxite for 7 years starting in 1984 with a

preliminary shipment of 200,000 tons of bauxite in 1983. The bauxite contract was financially more advantageous for Jamaica than the earlier alumina contract.[17]

Although in 1982 the Soviet Union did not import bauxite from Brazil for the Nikolayevsk plant, in 1983 it was to import 500,000 tons of Brazilian bauxite. The Soviet Union was also engaged in a feasibility study with Greece for the construction of an alumina plant in Greece, providing Soviet technology and equipment in exchange for alumina.

During 1981-85, aluminum production was planned to increase 15% to 20%. The majority of growth was to result from completing construction of the Krasnoyarsk and Regar (Tadzhik) plants. Approximately 20% of the growth in output was to be obtained by increasing the capacity of existing potlines. Long range development plans called for a major increase in alumina production, with 26% of total growth through renovation. New bauxite deposits were also to be developed. Among these was the Severoonezhskoye deposit, which was to supply the Tikhvin alumina plant and to replace the depleted deposits in the Tikhvin area. It was also planned to develop high carbonate bauxite deposits in Kazakhstan, and to increase the pace for putting alumina production capacity into operation at the Achinsk, Kirovabad, and Nikolayevsk alumina plants. It also intended to increase production of nonmetallurgical alumina at the Pavlodar and Boksitogorsk plants.

The following developments were reported in the Soviet aluminum industry in 1982:

The first output was reported from the new potline No. 6 at the Regar (Tadzhik) aluminum plant.

At the Regar plant, along with the primary aluminum facilities, additional facilities to produce aluminum wire and rolled products were to be constructed. However, work was behind schedule for meeting the 1981-85 plan goals.

Renovation of potlines at the Bratsk aluminum plant was reported completed, and a refinery for producing aluminum of 99.99% purity was put into operation.

At the Kanaker aluminum plant, expansion and renovation of foil production facilities were underway. Large-capacity equipment was installed. When completed, 70% of the output at Kanaker was to be foil. The Sayansk aluminum plant was scheduled to go into operation in 1984. Equipment for the Sayansk plant was being supplied from the Federal Republic of Germany. Renovation of potlines was undertaken at the Kandalaksha, Novokuznetsk, and Krasnoyarsk plants.

In 1982, the fourth and final stage of the Nikolayevsk alumina plant was put into operation. Total capacity at the Nikolayevsk plant was 1 million tons per year. Part of the output was to be shipped to France as payment for equipment and technical assistance. The Kirovabad alumina plant was not being adequately supplied with bauxite, causing the plant to produce below capacity. Along with the production of alumina from bauxite, the plant produced alumina from alunite. Renovation of the Kirovabad plant was being conducted.

In Kazakhstan, in 1983, exploitation of the first stage of the Belinskiy bauxite mine and expansion of the alumina production capacity of the Pavlodar aluminum plant were to begin. Renovation of the Pavlodar plant was planned to enable it to process high-carbonate bauxite. In the southern Urals, the new Kurgazakhskaya bauxite mine was under development in the Satkinskiy Rayon in Chelyabinskaya Oblast'. Development of the Sredne-Timan bauxite deposit in the Timan-Pechora region of the European North was planned during the 1980's. The Sredne-Timan deposit was to serve as the raw material base for the planned Ukhta alumina plant in the Komi A.S.S.R. Construction of a rail link from the Sredne-Timan deposit to the site of the Ukhta alumina plant would be necessary.

Antimony.—The Kadamzhay complex in the Kirgiz S.S.R. was the principal antimony center in 1982; integrated facilities produced most of the country's refined products. Owing to technological improvements, production at the Kadamzhay complex, reportedly, more than doubled in recent years. Because of success at Kadamzhay, development of an antimony complex in the eastern part of the country was reportedly no longer necessary.[18]

Bismuth.—In 1982, the Soviet Union imported a large amount of bismuth, with reports circulating of purchases as high as 200 to 300 tons in the autumn. The U.S.S.R. planned to increase recovery of bismuth from tin and tungsten ore.

Chromium.—By 1985, the U.S.S.R. planned to increase chrome ore production to 3.8 million tons. In 1982, the domestic wholesale price of chrome ore increased 82%.

The U.S.S.R. and the Republic of South

Africa were the world's largest producers of chrome ore. The Donskoye mining and concentration complex in Khrom-Tau in western Kazakhstan produced over 90% of Soviet output and was the only supplier of high-quality ore. By 1985, the Donskoye complex was to increase production to 3.6 million tons per year. The first stage of the new Molodezhnaya Mine at Donskoye was reported to have produced its first output in March 1982. The first stage was projected to reach its design capacity of 800,000 tons with a Cr_2O_3 content of 45% to 51% by 1985; total capacity was to reach 2 million tons per year. In addition to the Molodezhnaya Mine, future plans at Donskoye called for putting into operation the Tsentral'naya Mine and a new concentration plant.

Cobalt.—Production of cobalt, along with nickel, during 1981-85 was planned to increase more than 30%. Expansion of domestic output depended greatly on the rate of development of the Noril'sk complex. In 1982, construction of the main shaft was completed at the Taymyr Mine in the Talnakh area of Noril'sk, which was projected to begin operations in the near future. Also, additional capacities were planned in 1983 for the Medvezhiy Ruchey, Oktyabr', and Zapolyarnyy Mines at Noril'sk. A deficiency of cobalt was hindering the development of the production of high-quality instruments.[19] In January 1982, there was a sharp increase in the domestic wholesale price of cobalt.

Copper.—The 1982 plan for copper ore extraction was not fulfilled.[20] During the 11th 5-year plan, 1981-85, copper production was planned to increase 20% to 25% over the 1980 level. Approximately 80% of all ore was mined in open pits.

Kazakhstan contains about one-half of total Soviet copper reserves and accounted for approximately 30% of total Soviet copper output. During 1981-85, output of refined copper in Kazakhstan was planned to increase 15.9%. During the past 10 years, the copper content of ores at mining enterprises in Kazakhstan decreased 17%.[21] Exploration work had not been successful in increasing reserves in the Dzhezkazgan and Sayaksiy regions and in Semipalatinsk Oblast' and western Kazakhstan.[22] With completion of exploration of the Aydarly site, the Aktogayskiy mining region was projected as a new ore base for the Balkhash complex.

In Kazakhstan, during 1981-85, the second stage at the Zhayremsk complex and the Annenskiy and Akchiy-Spassk Mines at the Dzhezkazgan complex were to be put in operation and the ore extraction capacities of the Achisay, East Kazakhstan, Irtysh, and Leninogorsk complexes were to increase.

In Dzhezkazgan Oblast', Kazakhstan, the 1982 plan for copper industry construction was not fulfilled, resulting in delays in mine development. In 1982, the Dzhezkazgan complex began to recover copper from slag. The additional production was declared equivalent to 6 months' output of a large mine. In 1983, extraction at the Yuzhnyy Mine of the Dzhezkazgan complex was to increase to design capacity.

Problems occurred at the Irtysh complex in Kazakhstan where the output of metal in concentrate had decreased 28% since 1970.[23] The complaint was raised that the Irtysh Mine was still not producing at even one-half of its capacity after 20 years of development.[24] At the Irtysh complex in East Kazakhstan, a smelter for producing blister copper was put into operation, but was working far below capacity owing to a number of problems, including a lack of raw materials.[25] Additional raw materials had to be shipped to Irtysh to supply the copper smelter. Three mines were in operation at Irtysh, the Irtysh, Berezov, and Byelousov. Reserves at the Byelousov Mine were being rapidly depleted; the Yabileyno-Snegirikhinsk deposit, which was prospected in 1975, was able to supply the complex, but development had not begun.[26]

Reportedly, in 1982, the capacity of the copper concentration plant at the Almalyk complex in the Uzbek S.S.R. was increased 25%. New flotation equipment was installed, and a process was developed for concentrating ore with less than 0.25% copper. As a result of improvements, production of copper in concentrate was reported to have increased 39.2% since 1970; a further increase of 40% during 1981-85 was planned.

In the Armenian S.S.R. between 1970 and 1980, production of copper concentrate increased 6.7%; copper sulfate, 14.7%; and refined copper, 5%. The Alaverdi copper complex in the Armenian S.S.R. reported having fulfilled its 1976-80 gross output plan by 102.3%. During 1981-85, the Alaverdi complex, which had a small copper powder production facility, planned to construct a much larger copper powder production plant in Akhtala. At the Agara and Zangezur complexes, during 1981-85, extraction of

copper-molybdenum ore was planned to increase approximately 10%.

In the Azerbaidzhan S.S.R., a copper alloy powder plant was to be constructed in Baku. In 1980, an experimental plant was commissioned and trial batches produced.

In the Urals during the past 10 years, copper production capacity had increased through renovating facilities rather than through developing new ones, and additional capacity was to be added in this manner in the future. A number of factors affected copper production in the Urals including depletion of deposits, a decline in ore grade, and aged production facilities. The center of production had shifted from the central Urals to the southern Urals where there was a less developed infrastructure. At the Kirovabad concentration plant, one of the oldest in the Urals, during the past 3 years the copper and zinc content of processed ore had decreased 20% to 50%, and there was an 18% to 25% increase in the amount of sulfur in the ore.[27] At the Kirovabad secondary smelter, renovation of the metallurgical plant was to increase copper production 28%. At the Sredneural'sk copper plant, flash smelting was to increase blister copper production 28%; copper recovery, 2.7%; and sulfur recovery, 19%.

Copper production was being expanded in East Siberia at the Noril'sk complex, the site of a rich copper-nickel deposit. Construction was completed at Noril'sk of the No. 5 shaft at the new Taymyr copper mine near Talnakh. At 1,500 meters, it was the country's deepest vertical shaft. Construction of the first shaft had begun in 1974. Six shafts were planned, and the first four had been put into operation. The No. 5 shaft was to be the main shaft for hoisting raw materials. Work was underway on the sixth and final shaft, and the Taymyr Mine was scheduled to begin production in the near future. New capacities were to be added in 1983 to the Medvezhiy Ruchey, Oktyabr', and Zapolyarnyy Mines at Noril'sk.

In the Soviet Far East, byproduct copper production increased 150% at the Solnechnyy complex, a major tin producer, during 1976-80; copper recovery from the ore increased 6.9% during this period at Solnechnyy. In 1982, ore extraction at the Solnechnyy complex fell short of fulfilling the plan for copper concentrate production.

In Mongolia, the Erdenet copper-molybdenum complex was projected to reach its design capacity in 1983. Erdenet, with reserves estimated at 300 million tons of ore averaging 0.85% copper and 0.0012% molybdenum, was being developed jointly by Mongolia and the U.S.S.R., along with the participation of other CMEA countries. Design capacity was 16 million tons per year of ore with 118,000 to 125,000 tons per year of contained copper and 1,000 to 1,350 tons per year of contained molybdenum. The concentrate was sent to the Soviet Union for processing.

Gold.—In April 1982, a decree was issued creating a new Soviet Oblast', the Navoi Oblast' in Uzbekistan, with the town of Navoi as its center. One of the reasons cited for the decree was the more rapid development of mineral resources. Gold mining was conducted in the Navoi area at the Murantau gold deposit by the Navoi mining and metallurgical complex. Future plans also called for increasing gold recovery from Urals ore.

In Magadan Oblast' in the Soviet Far East, where gold was being mined in the Kolyma River area, gold mining was to begin in the near future in the Chukotka region. The oldest gold-mining region in Magadan Oblast' was in the upper reaches of the Kolyma River with Susuman as the administrative center. Around it were a small group of placer mining settlements consisting of Berelekh, Shirokiy, Udarnik, Burkhala, and Pervomayskiy, where recently Bel AZ-548 trucks of 40-ton capacity had been introduced. Few of the trucks had actually been delivered, and of those delivered, many were not adapted for use in the extremely cold climate. There was also a shortage of transport vehicles for taking miners to their worksites. Freight transport problems, inadequate power supply, and a lack of spare parts were also hampering production.

In Pavlodar Oblast', Kazakhstan, the Maykainzoloto mining enterprise, which had been in operation for 50 years, began mining at an underground mine, which would considerably extend gold mining.

The production association, Soyuzzoloto, which administered national gold production, in recent years had experienced continually decreasing productivity of draglines at its enterprises. The Zabaykalzoloto enterprise was cited as an example.[28]

Gold sales in 1982 were estimated to have decreased to 200 tons. In addition to Zurich, the Soviets shipped gold for sale to London, Hong Kong, and Japan. Although the Soviet Union exported large amounts of gold, it also reported a shortage of gold along with

an increasing domestic industrial demand.[29] Many recently discharged soldiers were working in gold mines.

Iron Ore.—Production of iron ore increased slightly after decreasing in 1981. Iron ore extraction was characterized by concentrated production facilities. Eight open pits, each with a capacity of over 20 million tons per year, accounted for over 50% of output. Open pit mining accounted for about 85% of total production. Iron ore reserves in place in categories $A+B+C_1$[30] were over 60 billion tons, and total iron ore reserves were over 110 billion tons. More than 84% of crude iron ore was beneficiated. Over 95% of Soviet iron ore exports went to CMEA countries; although an iron ore exporter, the Soviet Union had problems supplying its own plants.

The largest iron ore producing region was the Krivoy Rog Basin in the Ukraine, followed by the Kursk region, the Urals, Kazakhstan, Siberia, and the Kola Peninsula. Among iron ore producing regions, the Kursk Magnetic Anomaly (KMA) was of increasing importance both in percentage of reserves and in ore extraction. The Krivoy Rog Basin was declining in importance; during the past 10 years, production there fell by approximately 25% and the metal content of the ore decreased.[31]

Although some growth in iron ore extraction was expected from basins in the Asian part of the country including the Kustanay Basin in Kazakhstan, the Angara-Ilimsk Basin in East Siberia, and the Aldansk Basin in the Soviet Far East, the principal growth in iron ore reserves was expected from the KMA. There were shortages of local iron ore for the metallurgical industry in the Urals, and over 10 million tons of ore was shipped there annually from the KMA.

The KMA produced 16% of the country's iron ore, and 40% of that was produced at the Mikhaylovskiy complex. The KMA occupied first place in iron ore reserves and second place in iron ore production. In the KMA, of total reserves in categories $A+B+C_1$, 33.7% consists of rich ore with an iron content of 59.5%, and 66.3% consists of ore with an average iron content of 35.2%. Iron ore from the KMA supplied the metallurgical industries of the Soviet European Central region and was also shipped to the northwest and the Urals. Despite its large reserves, mining at the KMA presented a number of problems. The rich ore, which is located primarily in the Belgorod region, lies at a great depth with large amounts of water. Exploitation of this rich ore awaited commissioning of mines of the Yakolevskoye deposit. A smaller amount of rich ore nearer the surface was being extracted at open pits at the Lebedi, Mikhaylovskiy, and Stoylensk complexes. The Prioskol'skoye deposit in the KMA was considered a likely candidate for future development owing to its shallow depth and its proximity to the Oskol electrical metallurgical complex.

The chief underground iron ore mining regions were the Krivoy Rog Basin in the Ukraine (approximately 60% of total underground production), and the Gornaya Shoriya in West Siberia and the Tagilo-Kuvshinskiy region of the Urals, which supplied approximately 15% each. Underground mining was conducted at about 40 mines. The majority were in the Ukraine (22), in the Urals (9), and in Siberia (6). Owing to the exhaustion of reserves at the upper levels of a number of surface mines, production would increasingly shift to mixed modes of production.

In 1982, the first stage of the Kostamush mining and beneficiation complex in Karelia was commissioned with a capacity of 8 million tons per year of ore to produce 2.9 million tons per year of pellets. The first pellet shipment was sent to the Chelyabinsk steelworks. The first stage produced 570,000 tons of pellets. The second stage was to be commissioned in 1983, and the third stage, in 1984. Kostamush would then become the country's fourth largest iron ore supplier with a capacity of 9 million tons per year of pellets from 24 million tons per year of ore. The Kostamush complex was being built with the aid of Finnish companies; mining of iron ore on a limited scale had started at Kostamush in 1980. The deposit contains an estimated 1.2 to 1.5 billion tons of ore with an average iron content of 31%. Finland was to buy annually up to 1.2 million tons of pellets during 1983-90.

In 1982, the new concentration plant at the Lebedi complex produced its first output. The Lebedi complex was to be the major raw material supplier to the Oskol electrical metallurgical complex, which was under construction.

Soviet production of marketable iron ore was planned to increase to 274 million tons per year by 1985. The percentage of ore beneficiated was to increase from 84% in 1980 to 90% in 1985. Production of pellets was to increase 40% in comparison with that of 1980 to 72.7 million tons. Facilities

were to be commissioned at the Kachkanar, Kostamush, Stoylensk, Lebedi, and Mikhaylovskiy mining and beneficiation complexes.

Iron and Steel.—In 1982, the Ministry of Ferrous Metallurgy did not meet its planned targets. Production of crude steel, pig iron, rolled steel, and steel pipe decreased in comparison with those of 1981. Although the Soviet Union was the world's largest producer in total quantity of iron ore, coke, refractories, raw steel, and steel pipe, it was dependent on imports for high-quality steel products. Wasteful use of steel also limited resources. During 1981-85, over 40% of the growth in rolled steel production was to be obtained through eliminating waste. Eleven metallurgical enterprises were responsible for more than one-half of the nation's output of raw steel. The largest producer was the Magnitogorsk complex.

In 1985, in comparison with that of 1980, production of raw steel was planned to increase 14% to 169 million tons per year; finished rolled steel, 15% to 118 million tons per year; pig iron, 10% to 118 million tons per year; and steel pipe, 21% to 21.9 million tons per year, with a 50% increase in large-diameter steel pipe. The Ministry planned to increase scrap processing 21%.

During 1981-85, capital investment in iron and steel production was to increase approximately 40% over that of 1976-80. The share of oxygen converter steel was to increase from 28% to 33% of total production. Electric steel, which in 1981 accounted for about 11% of production, was to account for about 14% in 1985. Open-hearth production will remain the mainstay, with its share of output falling to 52% in 1985, compared with 60% in 1980. Long-range plans for the year 2000 envisaged the elimination of open-hearth production.

In 1985, continuous cast steel production was to increase to 23% of total output from 11% in 1980. The Soviet Union, however, had fallen far behind its original plans for the introduction of continuous casting. In 1983, about 1.1 million tons of continuous casting capacity was to be added.

Plans for 1985 called for 70% of the increase in pig iron production to come through technical improvements, notably by higher blast temperatures and better iron ore preparation. The plan called for 93.5% of pig iron production to be converted into steel compared with 91% in 1975.

The 1981-85 plan called for a threefold increase in the production of iron and steel powder. The large increase was to be based on a process to produce powder from scrap. A minimum of three powder plants was to be built. The first, the Tula works, was commissioned in late 1981, with a high proportion of its output being alloy powder. A second powder plant was to go into operation in 1983. The third powder plant was being built in Strezhevoy in Tomsk Oblast', Siberia.

Many metallurgical plants consumed unnecessarily large amounts of pig iron in steelmaking, and this was attributed to scrap shortages.[32] To ensure fuller use of scrap during 1981-85, small-capacity electric steel plants were to be built at scrap collection sites. In 1982, the Soviet Union signed a contract with Voest-Alpine AG of Austria and the Italian firm Danieli S.p.A. for construction of one such turnkey works at Zhlobin in Byelorussia. The works was scheduled to come into operation in December 1984 and was to consist of two ultrahigh power electric arc furnaces of 100 tons each, two six-strand continuous billet casters, and a 500,000-ton-per-year combined bar, rod, and section mill. Many of the facilities for these works were to be supplied by subcontractors.

At the Oskol electric metallurgical complex, the first stage of a pelletizing plant was put into operation with a capacity of 2.43 million tons per year of direct-reduction-process pellets for steelmaking. Raw material was supplied by the Lebedi mining and beneficiation complex via a 27-kilometer slurry pipeline. Steel production was scheduled to begin at the Oskol complex in 1983.

In 1982, the first output was reported from the new No. 5 electric furnace at the Chelyabinsk steel plant. Electric furnace capacity was also being increased at the Kuznetsk complex. At the Orsk-Khalilovo complex in Orenburg Oblast', four electric furnaces were to be installed. Furnace No. 1, with a capacity of 250,000 tons per year, was put into operation in 1981, but in 1982, problems occurred with the operation of this furnace. The Yermak ferroalloy plant in Kazakhstan put electric furnace No. 64 into operation with a capacity of 90,000 tons per year of ferrosilicon. Expansion of ferromanganese capacity was occurring with the purchase of six 120,000-ton-capacity electric furnaces from Japan, which were being installed during 1980-83 at the Nikopol plant in the Ukraine and the Zestafoni plant in Georgia.

In 1982, at the Dneprovskiy steel mill,

named in honor of Dzerzhinskiy, in the city of Dneprodzerzhinsk, a new oxygen converter shop was put into operation. At the Cherepovets steelworks, the No. 5 blast furnace with a volume of 5,500 cubic meters and a capacity of 4.5 million tons per year of pig iron was still under construction. It was planned to go into operation by 1985 and was to be the country's largest blast furnace. In 1982, at the Novolipetsk complex, a cold-rolling shop was put into operation.

At the Nizhniy Tagil complex, the first output was reported from the second stage of a universal beam mill with a capacity of 600,000 tons per year. At the Karaganda complex, the first stage of a tinplate shop was put into operation with a design capacity of 445,000 tons per year. When full capacity production was achieved from the first stage, tinplate output in the U.S.S.R. was planned to increase 50%. Final capacity of the tinplate shop was to be 750,000 tons per year. Projected tinplate output at Karaganda in 1983 was 110,000 tons.[33]

In 1982, at the Khartsyzsk pipe plant in the Ukraine, a new shop, with a capacity of 760,000 tons per year, went into operation for producing corrosion-resistant pipe. Khartsyzsk was to be a major pipe supplier for the trans-Siberian gas export pipeline. The West German firm Mannesman Demag AG assisted in the construction of a new shop at the Vyksa pipe plant for the production of multilayered pipe for gas transport; the first of four identical stages of 250,000 tons per year was put into operation. Despite increased pipe production, the U.S.S.R. will remain a large importer of steel pipe through 1985.

Lead and Zinc.—The lead and zinc industry was troubled by slow construction of new facilities, supply problems, and low metal recovery. Still, the Ministry of Nonferrous Metallurgy declared that there had been a significant increase in lead production in recent years.[34] The 1982 plan for the production of zinc concentrate was reportedly fulfilled. During 1981-85, 100% of the growth in lead production and 65% of the growth in zinc production was planned to come through expanding and renovating existing facilities.

In the U.S.S.R., 51% of lead was consumed in transportation; 17%, in electrical engineering; 8%, in machine building; 15%, in the chemical industry; and 9%, in other branches of industry in 1982.[35] Lead from batteries accounted for about 70% of secondary lead production. The domestic wholesale price of lead and zinc increased sharply.

Kazakhstan produced over 70% of the Soviet lead and approximately 50% of the Soviet zinc. The 1981-85 plan for Kazakhstan called for lead production to increase 11.6% and zinc production, 7.7%. Inadequate investment was faulted for the slow development of lead-zinc resources in Kazakhstan; of a projected 78 million rubles needed to develop these resources since 1977, only 15 million rubles had been allocated.[36] In the last 10 years at mining enterprises in Kazakhstan, the content of lead in ore had decreased 29% and of zinc in ore, 47%.[37] During 1981-85, production of lead was planned to increase 12% and zinc, 12.7%, at the Ust'-Kamenogorsk lead-zinc plant in Kazakhstan. In 1982, shortages of concentrate were reported at Ust'-Kamenogorsk. In Dzhezkazgan Oblast', where the Zhayremsk and Achisay complexes were located, plans were to increase the production of lead-zinc ore 53% during 1981-85. The Dzhezkazgan copper complex produced byproduct lead, and lead-in-concentrate output was to increase 22% during 1981-85. Expansion was underway at the Zyryanovsk and Tekeli lead-zinc complexes. The Zyryanovsk complex was experiencing a shortage of ore.[38] At the Grekhovskiy Mine of the Zyryanovsk complex, which had been in operation more than 25 years, an underground crushing complex was under construction. A surface mine at the same deposit was being developed along with construction of a pipeline to the concentration plant. These improvements were projected to increase ore extraction a minimum of 50% by 1985. The potential exploitation period for the Zyryanovsk deposit was extended 15 to 20 years with the detection of five new mining areas.

The Zhayremsk complex was the newest lead-zinc-producing enterprise in Kazakhstan; at Zhayremsk, output of lead and zinc was to increase 45% and 40%, respectively, during 1981-85 in comparison with that of 1976-80. Extraction of ore at the complex was to increase 50%. Construction was behind schedule at Zhayremsk, and this was foreseen as affecting commissioning of the second stage. At the Zhayremsk complex, capacity was being added at the Dal'nyezapad Mine and development was underway at the new Ushkatyn Mine. An experimental concentration plant was scheduled to begin operations in 1982 to work on methods to solve problems in proc-

essing ore constituents. Construction of a large industrial concentration plant based on the experimental plant was scheduled to begin in 1984. A major problem for ore extraction at Zhayremsk was excess water in the pits, resulting in the ore freezing in winter. Plans to improve operations entailed acquiring more equipment including water pumps, 8-cubic-meter shovels, and 40- and 75-ton dump trucks. By 1985, a concentration plant was to be commissioned at the Zhayremsk complex along with new capacities at the Dal'nyezapad Mine and the Ushkatyn open pit. Failure to commission concentration facilities at the Zhayremsk and Kargayly complexes in Kazkhastan resulted in ore being shipped hundreds of kilometers for processing. The commissioning of concentration facilities at these complexes was deemed essential to overcome this problem.

In the Urals, at the Kirovabad concentration plant, which was one of the oldest in the Urals, during the past 3 years, the copper and zinc content of processed ore decreased 20% to 50%, and the sulfur content increased 18% to 25%.[39] In the Soviet Far East, the first output was reported from the Nikolayevsk lead-zinc mine in the Maritime Kray; this was to be one of the largest and deepest mines of its kind. The first stage of the mine was declared in operation in 1980 and was scheduled for completion in 1984. Ore at the Solnechnyy tin-mining complex in Khabarovsk Kray in the Soviet Far East contains significant quantities of lead and zinc, and byproduct lead and zinc production began during 1976-80. Based on reserves, it was considered feasible to greatly increase production at the Solnechnyy complex.

Magnesium.—The Ust'-Kamenogorsk titanium-magnesium metal complex in Kazakhstan fulfilled its goal for magnesium production in 1982, and production of magnesium was to increase 40.7% at Ust'-Kamenogorsk during 1981-85. For this purpose, new capacities were to be put into operation.

Manganese.—Expansion of the manganese industry during 1981-85 was to occur through expansion of existing enterprises as well as the construction of new enterprises. By 1985, production was to increase to 10.1 million tons of manganese ore.

The Nikopol Basin in the Ukraine was the principal Soviet manganese production region, producing about two-thirds of Soviet manganese ore. The ore, however, has an average grade of only 26.4% manganese, is 2 to 3.5 meters thick, and lies under about 80 meters of overburden. In the Nikopol Basin, the Marganets complex mined the eastern sector and the Ordzhonikidze complex mined the western sector. In the Ukraine, in 1981, the Ordzhonikidze complex was reported to have produced 3.2 million tons of manganese ore, and the Marganets complex, 3.1 million tons. In 1982, at the Grushevskiy open pit at Marganets, a rotary excavator with a capacity of 5,000 cubic meters per hour of material was put into operation.

The richest Soviet manganese ore had been mined at the Chiatura Basin in the Georgian S.S.R., but rich ore from this deposit was mostly depleted. Mining operations were concentrated on leftover and lower grade ore. The Chiatura complex consisted of six mining enterprises and nine concentration plants. The Chiatura complex was reported to have produced about 2.7 million tons of manganese ore in both 1981 and 1982. In 1982, a new open pit with a capacity of 100,000 tons per year was put into operation at the Chiatura complex.

Other areas with some manganese production included Kazakhstan and the Urals. In Dzhezdinskiy Rayon in Dzhezkazgan Oblast', Kazakhstan, development of the new Tsentral'naya Mine at the Dzhezdinskiy mining enterprise was reportedly completed, but the mine had not yet gone into operation. The new mine, with a 250-meter shaft, was connected with the old mine to form one large underground complex. When the new Tsentral'naya Mine reached full capacity, extraction at Dzhezdinskiy was projected to triple. An open pit at Dzhezdinskiy had been depleted for a long time, and an underground mine developed in 1973 was not supplying sufficient ore for the concentration plant to work at full capacity.

Growth in manganese output during 1981-85 was to come from poorer and harder to concentrate carbonate ores. In 1981, development of the Bol'shoy Tokmak carbonate ore deposit in the Ukraine began, and the first shaft was sunk. The Bol'shoy Tokmak deposit was even lower grade and deeper than the Nikopol deposit and was to serve as the base for the construction of the Tavricheskiy mining and concentration complex in Zaporozh'ye Oblast'. The Soviet Union was also greatly expanding its electric furnace ferromanganese capacity based on a contract signed with Japan in 1977 to

supply six 120,000-ton-capacity electric furnaces. Delivery began in 1980 and the last furnace was scheduled to be installed in 1983. The furnaces were to be installed at the Nikopol plant in the Ukraine and the Zestafoni plant in Georgia.

Mercury.—The largest Soviet mercury operation was the Khaydarkan complex in southern Kirgiziya, where mercury was mined by both underground and open pit methods. The Khaydarkan complex comprised four underground mining enterprises, one open pit, a concentration plant, and three metallurgical plants. Development of mining enterprise No. 3 was continuing at the Novoye deposit. At the new Uluu-Too mining enterprise, the 685-meter-deep Glubokaya Mine and the 865-meter-deep Tsentral'naya Mine were being developed with surface facilities for both at Glubokaya. The 1982 plan for expanding reserves at the Khaydarkan complex was successfully fulfilled. In May, Khaydarkan was affected by an earthquake but work was said to have resumed.[40]

The Nikitovskiy complex in the Ukraine was the second largest mercury producer. Approximately 70% of the ore was mined by underground and 30% by surface methods. Two underground mines, Second Novaya and Novozavodskaya, and the Polukupol open pit were in operation. Economic reserves of mercury at Nikitovskiy were located in two 60- to 80-meter seams of sandstone. Mining was conducted simultaneously on five levels at a depth of 210 to 450 meters.

The small Zakarpatskiy complex in Zakarpatskaya Oblast' in the western Ukraine processed ores from the Borkutnoye, Shayanskoye, and other small deposits. In the Tadzhik S.S.R., construction of the new Dzhidzhikrutskiy (Aznob) mercury-antimony complex was underway. Future development was planned of small deposits in the North Caucasus, at Chukotka in Magadan Oblast', and in other regions.

Molybdenum.—The 1982 production plan for molybdenum concentrate was reportedly fulfilled. The United States ceased exports of molybdenum concentrate to the U.S.S.R. The U.S.S.R. was a net importer of molybdenum with the majority of imports coming from Mongolia.

In Armenia, between 1970 and 1980, production of molybdenum concentrate increased 32%. At the Zangezur and Agara complexes in Armenia, during 1981-85, output of copper-molybdenum ore and molybdenum concentrate was planned to increase approximately 10%. Output of molybdenum in Armenia was projected to increase with the renovation of the Zangezur complex. During the first 7 months of 1982, the Zangezur complex reported fulfilling its production goal.

Construction of the Zhireken molybdenum complex in Chita Oblast', north of Mongolia, was being conducted. In Kazakhstan, the Akchatau mining and metallurgical complex produced tungsten-molybdenum ore; mining and processing capacities were reportedly increased, including the new Dzhambul underground mine and concentration plant. The new concentration plant was to employ technology for recovering a range of ore constituents.

The Erdenet open pit copper-molybdenum complex in Mongolia, which was being jointly developed by the U.S.S.R. and Mongolia, had an annual projected capacity of over 1,000 tons of molybdenum metal in concentrate. The ore at Erdenet averaged 0.85% copper and 0.012% molybdenum, and the concentrate from Erdenet was shipped to the U.S.S.R. for processing. In 1983, Erdenet was scheduled to reach design capacity. Workers from East European CMEA countries were also participating in the development of Erdenet, and their countries were probably receiving molybdenum processed in the Soviet Union. The Erdenet project should reduce Soviet dependence on molybdenum from outside the CMEA countries.

Nickel.—The 11th 5-year plan, 1981-85, called for nickel production to increase by not less than 30%. In 1982, the increase in nickel production was mainly attributed to production at the Noril'sk complex. At Noril'sk, the Nadezhda flash smelter, with a capacity of 550,000 tons per year of nickel concentrate and built with Finnish equipment and technology, was put into operation at the beginning of the year.

A new nickel production facility was also put into operation at the Severonikel complex on the Kola Peninsula, which reportedly about doubled the capacity of the complex. Raw material was provided from local mining and beneficiation operations in Murmansk Oblast' and also from Noril'sk via a North Sea route. The new facility would help alleviate the backup in processing Noril'sk ore. Both the Severonikel complex and the Pechenga nickel complex, also on the Kola Peninsula, had accumulated surplus inventories of material from Nor-

il'sk. Efforts to increase ore reserves on the Kola Peninsula had not been successful. In 1982, Pechenga reported exceeding its production goal for 1981 and 1982, the first 2 years of the 11th 5-year plan, for extraction of ore by 0.3% and for production of nickel in concentrate by 1.5%.

In 1982, at the Noril'sk complex, construction was completed of the country's deepest vertical mine shaft at the new Taymyr copper-nickel mine near Talnakh. The new shaft, over 1,500 kilometers deep, was to be the main shaft for hoisting raw materials. Construction of the first shaft at the Taymyr Mine began in 1974. Six shafts were planned, and four shafts had been put into operation. Work was underway on the last shaft, and production was planned in the near future.

The U.S.S.R. again increased its nickel exports to market economy countries. Soviet nickel sales at low prices to hard currency markets were blamed, in part, for depressed nickel prices. The Soviet Union denied the charge that it was increasing nickel exports and selling at low prices, stating that its selling price was in line with world market prices. The level of Soviet nickel exports was not clear, with estimates from various Western sources ranging from 20,000 to 75,000 tons. In 1982, total Soviet nickel exports to market and centrally planned economy countries were estimated by the U.S. Bureau of Mines at 46,000 tons, including production from Cuban matte refined in the U.S.S.R.

In December, the European nickel producers filed a complaint with the EEC charging dumping of refined nickel by the U.S.S.R. in Europe. The complaint stated that Soviet exports to the EEC of cut and uncut cathodes increased from 13,100 tons in 1981 to 19,050 tons in the first 9 months of 1982, representing an increase of from 9% to 18.5% of the EEC market. There was a particularly sharp rise in Soviet shipments of uncut cathodes to the European market; a portion was cut by traders and the remainder used without further processing. The complaint claimed that the impact on the EEC nickel industry was to reduce production by 34%, capacity utilization by 16%, and employment by 1,440 jobs. The Soviets were prepared to counter the charges, and the EEC determined that a further investigation was warranted.

Platinum-Group Metals.—Output of platinum-group metals (PGM) was being steadily expanded. The U.S.S.R. was one of the world's largest producers and exporters of PGM, and Soviet ore reserves are adequate for increasing production and exports for many years. In the U.S.S.R., PGM production was about 67% palladium and 25% platinum, a palladium-to-platinum ratio of 2.7 to 1.

Virtually all PGM were produced as byproducts, with 75% coming from Noril'sk. The major increase in PGM production was to come from Noril'sk and from Krasnoyarsk, the world's largest PGM refinery, which treated electrolytic slimes from Noril'sk. Early in the year, nickel and copper smelting facilities were commissioned at the Nadezhda complex at Noril'sk where mine development was also to accelerate. The No. 5 shaft, the main shaft for hoisting material, was completed at the Taymyr copper-nickel mine near Talnakh. Work was underway on the No. 6 shaft, which was to be the last, and production from the Taymyr Mine was projected to commence in the near future.

Some Western quarters predicted that the Soviets intended to reduce shipments of palladium to the West by 25% or more in 1983, and added that the Soviet Union was changing its contractual arrangements and pricing formulas; the price of palladium consequently rose sharply in the West.

Silver.—The Western press reported that the Soviet Union purchased as much as 10 million troy ounces of silver in late 1982. The Soviets had been a net importer in 1981 with imports estimated at 1 million troy ounces. The amount of the 1982 Soviet purchase, the origin or origins of the shipment, and even whether the purchase actually occurred were subjects of speculation. The reputed Soviet silver purchase was credited, in part, with the increase in the price of silver that occurred at the time. Speculation in the Western press was that the purchases were for strategic reasons or to help boost the price of gold indirectly, thus improving Soviet gold earnings. The Soviet Union reported shortages of silver and an increasing domestic industrial demand.[41]

Tin.—By the mid-1980's, tin output was projected to reach 40,000 tons, based on new production from existing or developing mines in the Soviet Far East and Central Asia. However, a number of tin enterprises were experiencing a shortage of reserves. Despite Soviet policy to achieve self-sufficiency in mineral production, tin output continued to be inadequate, and imports

accounted for over 30% of requirements. The Soviet Union refused to subscribe to the Sixth International Tin Agreement worked out by tin producing and consuming nations, which was to go into effect in July 1982, although the Soviet Union had been a party to earlier accords.

The largest tin producing region was the Soviet Far East. The Solnechnyy mining area in Khabarovsk Kray in the Soviet Far East was undergoing expansion; tin production was to increase 150% based on available reserves. The Pereval'nyy Mine was under development. Newly explored reserves, reportedly, would compensate for those being depleted and would provide for increased production. Areas under exploration included the Sobolinoye site and the Badzhal'skiy region located 40 and 200 kilometers, respectively, from the village of Solnechnyy. Ore at the Solnechnyy complex also contains significant quantities of bismuth, copper, lead, silver, tungsten, zinc, etc. Between 1976 and 1981, recovery of tin in ore at the complex increased 21.7%. In 1982, the Solnechnyy complex was not fulfilling its plan for tin ore extraction, and there was insufficient ore for the concentrator. Delays in construction of surface facilities at the Molodezhnaya Mine were blamed. Problems had been occurring for several years in developing capacities at this mine.[42]

Construction of a tin complex during 1981-85 was being planned in the Kirgiz S.S.R. on the Sary-Dzhar River not far from the village of Inylchek. The Soviet Union was assisting tin development in Vietnam and Laos, and imported tin from these countries as payment.[43]

Titanium.—The 11th 5-year plan, 1981-85, called for an increase in titanium production. The industry continued to be based mainly on Siberian ilmenite and rutile. The ilmenite contains between 50% and 69% TiO_2. The Soviet Union exported titanium to the West. In 1982, the United States imported Soviet titanium sponge, billets and ingots, and waste and scrap, but there had been a sharp decline in U.S. imports during the past 5 years.

The Ust'-Kamenogorsk titanium-magnesium complex was the only titanium producer in Kazakhstan; a 16-year-old enterprise and one of the country's largest, it planned to increase titanium production 27.1% during 1981-85. Ust'-Kamenogorsk was reported in November 1982 as overfulfilling its plan. Still, serious problems were occurring in the raw material supply, which had to be shipped to the plant from the Urals, the Ukraine, and abroad, even though the large Karaotkelsk deposit was located in the same Oblast'. Resources at Karaotkelsk were declared sufficient for operation of Ust'-Kamenogorsk for a century at an expanded rate of production, but development was delayed, owing to lack of investment funds.[44] Failure to extract and process titanium in the Kola Peninsula was criticized because of a stated need for titanium, although the necessary processing technology had been developed. Problems were attributed to lack of coordination among the responsible ministries.[45]

Tungsten.—Soviet tungsten production was again insufficient for domestic needs. Lack of tungsten was blamed, in part, for inhibiting the development of high-quality instruments.[46] The Soviets were rumored to have arranged purchase of 1,750 to 2,000 tons of tungsten concentrate for the first quarter of 1983.

The tungsten-molybdenum capacity was reportedly increased at the Akchatau complex in Kazakhstan. The new Dzhambul underground mine and a concentration plant were put into operation; the new concentration plant was to recover a number of ore constituents.

In 1982, the Tyrny-Auz complex in the North Caucasus performed below its target for overburden removal and recovery of metal in concentrate;[47] the concentration plant was to be renovated.

Tin ore at the Solnechnyy complex in Khabarovsk Kray in the Soviet Far East contains significant quantities of tungsten. During 1976-80, the Solnechnyy complex increased tungsten production 12% and between 1976-81 increased tungsten recovery in ore 7.4%. Newly explored reserves at the Solnechnyy complex were reported to be double the size of those being depleted.

In 1982, the Iul' tin-mining and concentration complex in the Soviet Far East reported fulfilling its plan for tungsten mining, but the complex did not fulfill its annual production plan.

Minor Metals.—The national production plan for rare metals was reportedly fulfilled. The Soviet Union possesses commercial deposits of all the metals that have assumed importance in modern rocketry, aircraft, and nuclear energy. There was a reported substantial increase in the production of rare metals during 1976-80. Explored reserves were considered adequate to ensure

the planned rate of growth for all rare metals during 1981-85. The limiting factor in increasing production of rare metals was construction delays. Discoveries from the exploration of the Verkhne-Kayraktinskoye deposit in central Kazakhstan, reportedly, would greatly increase Kazakhstan's share in rare metal extraction.

During 1981-85, the production of rare metals was to double in East Kazakhstan Oblast'. The Belogorskiy polymetallic complex in East Kazakhstan Oblast' had experienced a decreasing volume of ore production owing to diminishing reserves; it was reported necessary to increase the rate of utilization of capacities and to more rapidly put new capacities into operation. The complaint was raised that the Belogorskiy complex lacked adequate equipment for making planned increases in the production of rare metals.[48]

NONMETALS

The Soviet Union produced a wide variety of nonmetallic minerals and was an exporter of many of these including asbestos, diamonds, and potash. Nevertheless, the Soviet Union was a net importer of nonmetallic minerals such as barite, fluorspar, mica, and talc.

Asbestos.—The Soviet asbestos industry was the largest in the world. Over one-half of the production came from the Uralasbest complex in the central Urals, and over one-fourth of the output came from the Dzhetygara deposit in Kustanay Oblast', Kazakhstan. Other important producers included the Tuvaasbest complex in the Tuva A.S.S.R. in East Siberia and the Kiyembay complex in Orenburg Oblast' in the southern Urals.

At the Uralasbest complex, in 1980, three open pits mined 149 million tons of ore and overburden, producing approximately 1.19 million tons of marketable asbestos. In 1981, ore mining increased to a total of 173 million tons of ore and overburden, but production of marketable asbestos decreased to 1.16 million tons because of reduced ore grades. In 1982, production was estimated to have stayed the same because of the reduced grades. Construction of the No. 7 concentrator, with a capacity of 340,000 tons per year was planned. Three concentrators, Nos. 4, 5, and 6, were in operation. Ore reserves of Uralasbest reportedly contain 56.3 million tons of asbestos fiber in 2,362 million tons of ore and were considered adequate for 70 to 80 years.

Construction of the Kiyembay complex in Orenburg Oblast' in the southern Urals was started in 1968 and continued in 1982. CMEA countries had a one-third interest in the project and were assisting in the construction. Design capacity was 500,000 tons per year of grades III and IV from 24 million tons of ore with an average grade of 4.4%. The project was being developed in two stages of 250,000 tons per year each. The first stage was commissioned in December 1979 and was estimated to have produced 160,000 tons in 1982. The second stage was commissioned in 1980 and was estimated to have produced 100,000 tons in 1982. One-third of the output of the Kiyembay complex was to be exported to the participating CMEA countries in return for their investment.

At the Sayan asbestos deposits on the border of Krasnoyarsk Kray and the Tuva A.S.S.R. in East Siberia, reserves are estimated at 7 million tons of asbestos. The asbestos lies at a comparatively shallow depth and was planned to be mined by open pit methods. Development was underway of the Lenin complex at this deposit, with a capacity of 200,000 tons per year.

Barite.—A large percentage of the country's barite consumption was imported, mainly from North Korea, Yugoslavia, and Bulgaria. As a result of the commissioning of facilities at the Vars lead-zinc complex in Yugoslavia, Yugoslav exports of barite to the U.S.S.R. increased. The Zhayremsk area in Kazakhstan, reportedly, is extremely rich in barium sulfate, with approximately one-fourth of the world's reserves. More than 40% of the barite ore could be surface mined. In addition, rich deposits of barite were reportedly discovered in the Komi A.S.S.R., and development was underway of a 45,000-ton-per-year complex in Khaishi, Georgia. Discussion was underway concerning development of a barite mining and enrichment complex in Abkhaziya in the Georgian S.S.R. Design work had been prepared for renovation of the Uchaly concentration plant in the Urals to obtain barite from copper ore from the Molodezhnoye and Uzelginskoye deposits.

Diamond.—During the first 2 months of 1982, despite depressed diamond prices, reported Soviet exports of polished diamonds by the Soviet-Belgian company Almazyuvelierexport of 97,000 carats were exceeding the rate of 1981 exports. However, in March 1982, the EEC countries reduced Soviet diamond imports by 25%, in line with

sanctions to limit imports of luxury goods from the Soviet Union. Workers at the Yakutsk diamond association, Yakutalmaz, reportedly increased the volume of overburden removal by about 5 million cubic meters during the year.

Fluorspar.—The Soviet Union remained a net importer of fluorspar, with imports providing over one-half of domestic consumption. Mongolia in the past 5 years had doubled its fluorspar exports to the U.S.S.R.[49] In 1982, the Abagaytuy mining directorate and the concentration plant at the Kalaguy fluorspar complex reportedly exceeded their yearly production goal by 1,100 tons of fluorspar.

Mica.—Mica output was inadequate to meet demand, and strategic-grade mica was imported from India. The 1981-85 Soviet-Indian Trade Agreement had provided for increased mica imports. In 1982, the U.S.S.R. signed another agreement for delivery of Indian mica.

The Aldan mica complex in southern Yakutia, which went into operation in the 1960's, had been decreasing in importance owing to the development of the large Kovdor mica complex and the development of synthetic substitutes. However, large-dimension crystals of phlogopite were extracted at the Aldan deposit, and these are not present at Kovdor. Therefore, development of the Aldan mica complex was considered necessary to help satisfy future demand for this material.

The U.S.S.R. suffered a shortage of mica for insulating purposes, for which the demand was projected to increase 20% to 25% every 5 years. The Soviets were utilizing techniques to produce built-up mica from scrap.

The built-up mica was helping to alleviate the mica shortage and was more labor efficient to produce. Owing to the introduction of built-up mica, 21,000 jobs were eliminated in electrical-grade mica production. The built-up mica was considered of better quality than sheet mica for electrical insulation and enabled the U.S.S.R. to reduce mica consumption.

Nitrogen.—During 1981-85, a total of 20 ammonia synthesis plants were to be put into operation with 200,000 and 450,000 tons per year capacities. In 1982, a 450,000-ton-per-year urea unit and a 450,000-ton-per-year ammonium nitrate unit were put into operation at the Kemerovo nitrogen association in West Siberia. In addition, the Soviet Union contracted with Czechoslovakia for four new urea plants, each with a 1,000-ton-per-day capacity. Two of the new plants were to be built at Odessa, and the other two at Grodno and Dzerzhinsk. Soviet urea was very competitive in the U.S. market owing to its low price.

Phosphate Rock.—Plans for 1985 called for extraction of 53.2 million tons of apatite ore to produce 19 million tons of apatite concentrate and for extraction of 32.1 million tons of sedimentary rock ore. The average annual rate of depletion of explored apatite reserves was 11.25% and of sedimentary rock reserves, 7.6%.

The main centers for phosphate production were the Apatit Association on the Kola Peninsula and phosphorite deposits at Karatau in Kazakhstan. The Chilisay phosphorite basin in Aktyubinsk Oblast', Kazakhstan, was under development and was to be a major center of phosphorite production. Generally low-grade deposits of phosphorites also occur in Verkhnekamsk in the Urals, at Yegor'yevsk and Lopatino in Moscow Oblast', Polpinskoye in Bryansk Oblast', Maardu in Estonia, and other regions. Apatite concentrate provided the large majority of all phosphate production. During 1981-85, the output of mineral fertilizers was planned to increase 50%, and the most rapid growth was to be for phosphorus fertilizers.

The largest single phosphate source was the Khibiny apatite-nepheline deposit on the Kola Peninsula. Mined ore averaging about 16% was upgraded to 39.4% to 39.6% P_2O_5.

At Karatau, the other major source of phosphates, there were 46 deposits, only 5 of which were being worked. Four deposits were being surface mined, and at one, the Chulaktauskoye, there was underground mining, and the role of underground mining was to increase.

At the Apatit Association on the Kola Peninsula, 19 million tons of concentrate was to be produced by 1985 from 54 million tons of apatite ore. The Vostochnyy mining enterprise of the association, which was to consist of the Koashva and N'yurkpakhk open pits, was being developed. Production at the Vostochnyy enterprise was planned to switch from surface to underground mining after the upper layers were depleted. Capacity at the Vostochnyy enterprise had reached 5.6 million tons of ore and was planned to exceed 8 million tons by 1985.

At the Apatit Association in 1982, capacity was commissioned at the Tsentral'naya

Mine for extraction of 600,000 tons per year of apatite-nepheline ore, raising total mine capacity to 22.6 million tons per year of ore. Plans were to increase capacity at the Tsentral'naya Mine to 25 to 26 million tons per year. At the Yuksporskiy Mine, capacity was projected to increase to 13.2 million tons per year upon putting the second stage into operation. Capacity was to be 6 million tons per year at the Nizhniy (lower) Yukspor and 7.2 million tons per year at the Verkhniy (upper) Yukspor sites. In the future, capacity of the Rasvumchorskiy Mine was to increase to 6.2 million tons per year, and capacity at the Kirovskiy Mine was to increase to 12 million tons per year.

In 1982, at the Apatit Association, the first stage of the No. 3 concentration plant was under construction, with a capacity of 1.3 million tons per year of concentrate. The first stage was scheduled to go into operation in 1984, with a subsection of the first stage to go into operation in 1983. The full design capacity of the No. 3 concentration plant was to be 28 million tons per year of ore and 8.8 million tons per year of concentrate.

At the Kovdor iron ore complex on the Kola Peninsula, an apatite concentration plant processed tailings from the main iron ore beneficiation operations of the complex. Production at Kovdor in 1982 was reported as 694,000 tons of apatite concentrate. Plans for 1983 called for producing 744,000 tons of apatite concentrate.

In 1982, planned output at the Karatau Association was 8.6 million tons of ore. The majority of the ore was intended for production of elemental phosphorus, but a sizable remainder was ground into phosphate flour for direct application. Future plans called for ore output at the Karatau Association to increase to 30 to 35 million tons per year. Open pit mining at the Karatau Association was to stabilize at about 20 million tons per year. By 1985, the first stage of the Kok-Su open pit was to begin operation.

During 1981-85, development of new underground mines to compensate for decreasing production from the open pits at Karatau was to begin. In addition, the P_2O_5 content of the ore was expected to decrease and the ratio of concentration to increase. Development had begun of an underground level at the Aksay Mine, which was being operated as an open pit with an annual production of 2 million tons per year. The first underground mining was scheduled for 1985. Production from the Aksay underground mine was to be 1 million tons per year of sedimentary rock ore.

At other sedimentary rock deposits, production at Yegoryevsk reached 8.5 million tons per year of ore averaging 12.5% P_2O_5, and at Polpinskoye, 2.3 million tons per year averaging 6.5% P_2O_5. The ore was enriched by washing, and the P_2O_5 content of the phosphate flour averaged 19% to 21%. The average P_2O_5 content of reserves at Verkhnekamsk was 11.9%. Production of ore from open pits at Verkhnekamsk reached 2.3 million tons per year, and annual production of phosphate flour reached 620,000 tons per year of 22% P_2O_5 content. At the Kingisepp Association Fosforit in Leningrad Oblast', open pit extraction reached 6.3 million tons per year of ore. Using flotation concentration, up to 1 million tons per year of concentrate was produced with a P_2O_5 content of over 30%.

During 1981-85, development of phosphorites was planned in the Aktyubinsk Basin in Kazakhstan. At the Chilisay deposit in the Aktyubinsk Basin, development of an open pit mining and concentration complex began in 1974. The first part of the first stage of the complex with a capacity of 700,000 tons per year of concentrate was scheduled to go into operation in 1985. The entire first stage was to have been in operation by then with a capacity of 2.8 million tons per year of concentrate. Reserves were considered adequate for 100 years. A shortage of workers, among other things, had slowed development.[50]

Projected annual capacity of the Seligdar apatite complex in southern Yakutia was 4 to 5 million tons P_2O_5, but work was still underway for developing technology for processing the ore. At Seligdar, a new mine was to be put into operation. Other new mines planned were at the Novopoltavskoye apatite deposit in the Ukraine and at the Rakverskoye site in Estonia.

The most acute shortage of phosphatic fertilizer was in Siberia and the Soviet Far East. When both the Transbaykal complex, which was to be based on the Oshurkovo deposit, and the Belaya Zima deposit are developed, these will provide still only 30% to 35% of the need for phosphatic fertilizer in Siberia and the Soviet Far East. One of the most promising sites for future development was the Okino-Khubsugulskiy phosphorite basin, which consists of adjacent regions of the U.S.S.R. and the Mongolian People's Republic.

Potassium.—In 1982, plans called for pot-

ash production to increase to 9.5 million tons of K_2O equivalent, but this target was not met. The revised 1985 plan called for potassium ore extraction to increase to 80.8 million tons per year and potassium fertilizer production to increase to 11.5 million tons per year of K_2O equivalent. An earlier plan called for potash ore extraction to increase to 92 million tons per year in 1985. Original plan targets for 1976-80 called for ore output to increase to 85 to 90 million tons per year by 1980. The average annual rate of depletion of explored potash reserves was 12.85%. In 1981, potassium fertilizer exports decreased more than 20%, with exports to the West decreasing almost 50%. Exports to CMEA countries decreased by about 10%.

Potash extraction and processing in 1982 occurred at enterprises of the Uralkaliy Association centered in Perm Oblast', the Byeloruskaliy Association centered in Minsk Oblast', and at the Stebnikov potash plant in L'vov Oblast', Ukraine. There were 11 underground mining enterprises and 10 concentration plants at Uralkaliy, Byeloruskaliy, and Stebnikov. Ore extraction ranged from 3 to 10 million tons per year for individual mines. Mining was conducted to a depth of 1,000 meters.

Growth in output was to occur through commissioning the Novosolikamsk and Berezniki No. 4 complexes of the Uralkaliy Association, each with two stages and respective capacities of 18.1 and 16.1 million tons of ore, and by increasing capacity at the Soligorsk No. 4 complex of the Byeloruskaliy Association. During 1981-85, the quality of the national average product content was to be raised from 92.58% to 93.98% potassium chloride, and the output of granulated potassium chloride was to increase from 1.5 to 3.1 million tons per year. The output of coarse product was to be increased at Soligorsk No. 4 and Berezniki No. 4. Plans were to add dissolution and recrystallization circuits for coarse production.

Although production of large-grain, dust-free potassium chloride had been organized, the quality and assortment of potassium fertilizer was still not satisfying agricultural and export requirements. The principal product was grade-three, small-grain potassium chloride, which accounted for 76% of the volume of potassium fertilizers. The percentage of output of potassium chloride in large-grain and granulated forms was low at 15.5%. Plans were to produce a much greater proportion of granulated material, and the Byeloruskaliy Association planned to convert all its facilities to granulated production.

In 1982, the Stebnik potash plant did not fulfill its yearly production plan. Through October, the Byeloruskaliy and Uralkaliy Associations were far behind schedule in fertilizer deliveries.[51] In the past 6 years, the Uralkaliy Association had fallen short in deliveries by an accumulated 8 million tons of K_2O, which was about equal to 1 year's national output.[52] One of the major problems was declared to be lack of railroad rolling stock, causing production backups and work stoppages owing to lack of storage space.

In 1982, at the Novosolikamsk complex, work was delayed on the 900,000-ton-per-year potassium fertilizer facility scheduled for commissioning in 1983. In 1982, a new unit for the sylvinite crushing plant was commissioned at Soligorsk No. 1. The second stage at Soligorsk No. 4 was not yet working to one-half capacity. The first stage of the Soligorsk No. 4 complex, which was put into operation at the beginning of 1979, was still not working to capacity by the end of 1982. Complaints were raised that the second stage was put into operation without adequate preparation, that there were many problems owing to the design of the operation, and that there was a higher than usual accident rate. Further complaints were raised about the proficiency of the labor force.[53]

In the Azerbaidzhan S.S.R., the Kirovabad aluminum plant had commissioned a 60,000-ton-per-year potash facility to produce potassium sulfate from alunites. A detailed study was reported begun of the large Nepskoye potash deposit in Irkutsk Oblast', approximately 300 kilometers north of the Ust'-Kut railroad station on the Baikal-Amur Railway. Owing to improved port facilities at Ventspils, Latvia, the Soviet Union improved its potassium fertilizer shipment capability.

Salt.—The Soviet Union in 1982 was one of the world's leading countries for salt production, reserves, and exports. A salt mine at Khodhaikan in Uzbekistan was under development along with a crushing and storing plant with a capacity of 1 million tons per year. At the Mozyr deposit in Byelorussia, construction was underway of the Ekstra salt plant with a capacity of 360,000 tons per year.

Sulfur.—Native sulfur production, excluding sulfur as a byproduct of natural gas,

pyrites, and other sources, was reported by the Soviets as over 2.8 million tons. Sulfur ore extraction in 1985 was planned to increase to 14.3 million tons. The average annual rate of depletion for explored sulfur reserves was 11.25%. Sulfur ore at enterprises of the Ministry for Mineral Fertilizer was extracted primarily from open pits. The sulfur content of the ore averaged 20% to 24% and was concentrated by flotation. The Soviets reported that approximately 800,000 tons per year of ore was obtained using the Frasch process. Open pit mining was used to a depth of 100 meters, and the Frasch process at greater depths.

At the Yavorov complex in the Ukraine and the Gaurdak complex in Turkmenistan, approximately 30% of the output of native sulfur was produced by the Frasch process.

During 1981-85, open pit extraction was planned to increase. The Yavorov Association intended to achieve full production capacity of 7.25 million tons per year of ore at the Tsentral'naya open pit, to develop the Yuzhnyy open pit, and to increase the capacity of the concentration complex. Using the Frasch process, it planned to begin development of the Zagaypol'skiy Mine and to prepare for development of the Grimnovskiy Mine. When the Yavorov Association reached full capacity, it would produce 1 million tons per year of sulfur. At the Rozdol and Yavorov Associations in the Ukraine, combined sulfur production was reported as 2.1 million tons in 1980 and was planned to increase to 3.2 million tons in 1985.

In 1982, the Yavorov Association failed to fulfill its production plan by 160,000 tons, causing shortages of raw material for processing at the Rozdol Association. The Gaurdak Association also reported low output owing to difficulties in applying the Frasch process. If conditions did not improve, reportedly, there would be a shortage of sulfuric acid for producing superphosphate. Production of sulfur from natural gas was planned to increase 25% during 1981-85, and the large Astrakhan sour gas deposit was to be developed with facilities for sulfur production.

MINERAL FUELS

Crude oil production reportedly rose 0.6%, falling slightly below the target, but natural gas production increased 8%, exceeding the target. Production of coal rose after 3 years of declining production. While the vast majority of recently discovered energy reserves are east of the Urals, three-fourths of the energy consumption was in the European part of the country. The distance and the severe climatic conditions at the new deposits greatly increased energy costs. Nevertheless, the Soviet Union had sufficient combined energy resources to last for centuries.

Natural gas was planned to be of increasing importance as a substitute for oil and as a hard-currency-earning export. Nuclear power was planned to be of increasing importance for domestic electrical energy and by 1985 was to provide 14.2% of electrical energy compared with 5.6% in 1980.

Gas and oil pipelines totaled over 200,000 kilometers, with another 200,000 kilometers of distribution grids and gasfield and other pipelines. During 1981-85, about 60,000 kilometers of pipeline was to be constructed, including approximately 50,000 kilometers for gas transport and 10,000 kilometers for oil transport.

During the winter of 1981-82, there was a shortage of fuel, which caused some enterprises to operate below capacity.[54] Recommendations were made to improve the situation for the winter of 1982-83. In September 1982, the complaint was raised that nonferrous metallurgical enterprises in Kazakhstan were not being supplied with sufficient coal in preparation for the winter.[55]

Table 7.—U.S.S.R.: Estimated primary energy balance in 1982

(Million tons of standard coal equivalent)

	Production	Imports	Exports	Apparent consumption
Coal (lignite, anthracite, bituminous, coke)	480	23	23	480
Crude oil and petroleum products	900	9	263	646
Natural and associated gas	593	5	70	528
Peat	14	--	--	14
Oil shale	13	--	--	13
Hydropower	21	--	2	19
Nuclear power	12	--	--	12
Fuelwood	24	--	--	24
Total	2,057	37	358	1,736

Coal.—Raw coal production in 1982 fell short of the plan, but still registered the first annual increase since 1978. Only a slight growth in output was scheduled for 1983, to 723 million tons. Practically all Soviet coal required beneficiation, but in 1981, only 48% actually was beneficiated. In an attempt to make prices reflect production costs, in 1982, the domestic wholesale price of coal was increased an average of 42%, with prices differentiated by basin and type of coal. The coal industry was faced with decreasing productivity despite increased mechanization. Between 1975 and 1980, average speed of drilling and blasting horizontal development workings decreased 17% and the average speed of mining with tunneling machinery decreased 13%.[56] Soviet coal production was aided by the development of large open pits. Open pits with the largest design capacity included the Bogatyr' (70 million tons per year), Tsentral'naya (20 million tons per year), Irsha-Borodinskiy (20 million tons per year), Nazarovskiy (13 million tons per year), and Azeyskiy (10 million tons per year). In 1981, the average capacity of an open pit was 4.1 million tons per year. Increased coal output in 1982 was attributable, in part, to an increase in production from the Bogatyr' open pit in the Ekibastuz Basin in Kazakhstan. During 1981-85, the output of surface-mined coal was planned to increase to 41% of total output, in comparison with 39% in 1981.

Problems in increasing coal production were occurring in the Donets Basin in the Ukraine. Most mines in the Donets Basin were being developed with considerable delays, and development time often exceeded twice that planned.[57] The largest planned increases in coal production were to be in Kazakhstan, Siberia, and the Soviet Far East at the Ekibastuz, Kansk-Achinsk, Kuznetsk, and Yakutsk Basins where the vast majority of reserves are located. At the Ekibastuz Basin in Kazakhstan, development was underway of the 30-million-ton-per-year Vostochnyy open pit. The Bogatyr open pit, with a planned capacity of up to 70 million tons per year, was already in operation at the Ekibastuz Basin.

At the Kansk-Achinsk Basin in East Siberia, development had begun of the Berezovskiy open pit, with a design capacity of 55 million tons per year. The first stage was planned to go into operation in 1983. Production at the Kansk-Achinsk Basin where two open pits, the Irsha-Borodinskiy and the Nazarovskiy, were in operation was approximately 37 million tons in 1982. With the development of open pits, output at Kansk-Achinsk was planned to increase to 49 million tons per year in 1985. The construction of the large Berezovskiy thermal powerplant was underway to make use of the lignite from Kansk-Achinsk.

In the Kuznetsk Basin in Siberia, the second largest coal producing region after the Donets Basin, output during 1981-85 was planned to increase 10% to 158 million tons. Development was beginning at the Yerunakovskoye and Taldinskoye deposits, and first output was reported from the Severo-Taldinskiy and Karakanskiy open pits. In 1982, there were 68 underground mines in operation in the Kuznetsk Basin. Limited capital investment was faulted for inadequate development in the Kuznetsk Basin during 1981-85. There had been inadequate investment in mine development, in production of coal mining machinery, and in establishment of repair facilities.[58]

The Neryungri coking coal complex in southern Yakutia was being developed jointly by the U.S.S.R. and Japan, and a portion of the beneficiated coal was to be sent to Japan. During 1981-85, construction was to be completed of an open pit, with a capacity of 13 million tons per year, and a concentration plant, with a planned capacity of 9 million tons per year. The open pit was being developed in four stages. The first stage, which was in operation, exceeded its capacity of 2.5 million tons per year. The second stage was also to have a capacity of 2.5 million tons per year, and the third and fourth stages, a capacity of 4 million tons per year each. The third stage was scheduled to go into operation in 1983. Development of the Neryungri complex was behind schedule and was being hampered by problems with inexperienced labor and in maintenance and the supply of spare parts.[59]

Occidental Petroleum Corp. and Bechtel Corp. executives discussed with Soviet officials construction of a trans-Siberian coal slurry pipeline using advanced U.S.-developed methanol slurry technology. This project would make vast Siberian coal reserves available to consumers in the western part of the country; the rail system was not equipped for increased Siberian coal shipments. Whether the Soviets actually planned to go ahead with this project was in doubt as was obtaining the permission of the U.S. Government to allow exports of technology and equipment for the project.

Other proposed solutions for utilizing Siberian lignite included construction of large thermal powerplants near the deposits with long-distance electricity networks and transforming the coal into liquid fuels. Which solution or combination of solutions the Soviets would choose was in doubt and would depend on mastering the necessary technology and the availability of financing and equipment.

The Soviets announced a decision to construct an approximately 200-kilometer slurry pipeline from the Kuznetsk Basin to Novosibirsk. Two coal slurry pipelines under 15 kilometers were in operation in the Kuznetsk Basin. In 1982, production was reported from the first installation for producing synthetic gasoline from coal located near the Bel'kovskay Mine in Tula Oblast'. It could process 7 tons of coal per day.

Natural Gas.—In 1982, natural gas production increased at higher than the planned rate. Production in 1983 was targeted at 18.7 trillion cubic feet. Natural gas was used as a fuel domestically to produce 93% of the steel and pig iron, 95% of the fertilizers, 59% of the cement, 22% of the electricity, and 37% of the thermal energy. Gas exports were to play an increasing role for earning hard currency and supplying energy to East Europe.

According to Soviet data, gas reserves in categories $A+B+C_1$ as of January 1978 were 1,030 trillion cubic feet. Gas reserves are highly concentrated; two-thirds of the gas is in 25 fields and almost one-half is in 10 of these.[60]

In 1983, gas production in West Siberia was planned to increase to 9.5 trillion cubic feet, comprising 51% of national production, in comparison with 46% in 1982. In 1985, gas production in West Siberia was to increase to 12.6 trillion cubic feet, comprising 56% of national output. The large planned increase in natural gas production in West Siberia was to be achieved primarily through a fivefold increase over that of 1980 at the Urengoy Field. South of Urengoy is the Medvezhye deposit, previously the country's largest producer. To the north is the Yamburg deposit, which was planned to yield 3.5 trillion cubic feet per year. Drilling of the first regular production well at Yamburg commenced, and production was scheduled to begin in 1986.

Preparations were underway for the exploitation of the Astrakhan sour gas field, a major deposit located approximately 60 miles north of the city of Astrakhan; the field is one of the largest in the European part of the U.S.S.R. A group headed by the French companies Technip and Creusot Loire S.A. was awarded a contract to supply technical assistance and equipment to develop the Astrakhan Field. In addition, pipe and equipment contracts to develop Astrakhan were awarded to the West German company Mannesmann Anlagebau. The Astrakhan complex was to consist of three plants and to have a final capacity of 636 billion cubic feet. Delivery of equipment for the first plant was scheduled to start in 1984, and the startup was scheduled for 1986. The complex would include a facility for sulfur production.

During 1981-85, six trans-Siberian pipelines from the Urengoi Field were to be constructed, totaling approximately 20,000 kilometers. One of the six, the Urengoi-Uzhgorod pipeline, was intended for gas export to West Europe. By the end of 1982, two of the five domestic pipelines were in operation, and construction was about one-half completed on the export pipeline. Workers from CMEA countries were assisting in the construction of the export pipeline, and Western countries were supplying considerable amounts of pipe and equipment.

In November, the United States removed the trade sanctions against the Soviet Union imposed because of the proclamation of martial law in Poland. The sanctions affected U.S. and foreign companies supplying U.S. equipment or technology directly or indirectly for use on the trans-Siberian export pipeline.

The Soviets announced plans to construct a booster station to increase capacity for the Orenburg gas pipeline, which runs to the Czechoslovak border. The station could enable the Soviets to increase gas shipments to CMEA countries.

Gas treatment capacity for the recovery of natural gas liquids and sulfur was being expanded. The third stage of the Mubarek gas processing plant, put into operation in 1981, achieved its design capacity in early 1982. In 1983, the Lokosovskiy gas processing plant in Tyumen' Oblast' was to be commissioned, with a capacity for processing 35 billion cubic feet of gas per year.

In March 1982, the Soviets reported another commercial gas discovery in the Black Sea. The first gas from this area was to be produced in 1982 from the Golitsyn Field, which was discovered in 1975 about 45 miles west of the Crimea's Tarkhankut Peninsu-

la. In 1980, 2.9% of Soviet gas production came from offshore fields, and 99% of that was from Caspian Sea fields.

Although the Soviets intended to ship up to 1.4 trillion cubic feet of gas to West Europe through the Uzhgorod export pipeline starting in 1984, by the end of 1982, they had long-term contracts for only about one-half that amount. Contracts were with the Federal Republic of Germany for 370 billion cubic feet, France for 280 billion cubic feet, Austria for 53 billion cubic feet, and Switzerland for 13 billion cubic feet. Swiss shipments were to be made indirectly from the Federal Republic of Germany. Italy had still not approved the contract for the sale of 280 billion cubic feet.

Petroleum.—In 1982, Soviet petroleum production continued to increase, although not as rapidly as planned. The reported average annual rate of depletion for explored oil reserves was 7.6%. West Siberia produced 2.6 billion barrels, comprising 58% of total output. Tyumen' Oblast' in West Siberia produced over 97% of the output of West Siberia, with some output also from Tomsk Oblast'. In 1983, oil production in West Siberia was planned to increase to 2.7 billion barrels. However, new production in West Siberia was planned to come from deposits in more northern regions that would be more difficult to develop. In 1982, offshore production in the Caspian Sea, virtually the U.S.S.R.'s only offshore crude oil production area, was at its lowest level since the early 1960's.

Table 8.—U.S.S.R.: Crude petroleum production in 1982, by region

(Billion barrels)

Region	Output
West Siberia	2.59
Ural-Volga	1.23
Caucasus	.22
Kazakhstan and Soviet Central Asia	.21
Komi A.S.S.R.	.15
Other regions including the Ukraine, Byelorussia, Sakhalin and Kalingrad Oblast's, Yakutia, and others	.10
Total	4.50

Source: Ekonomicheskaya gazeta (Economic Gazette), Moscow, No. 8, February 1983, p. 1.

By 1985, output from West Siberia was to increase about 10% in comparison with that of 1982 to 2.8 to 2.9 billion barrels, comprising over 60% of planned output. West Siberia was being termed a "mature" region, indicating that rapid production increases were no longer expected. Still, West Siberia had not been thoroughly explored, and the ratio of meters of exploratory drilling per square kilometer was lower than in the older oil producing regions of the U.S.S.R.

According to Soviet reports, in 1981, production peaked at West Siberia's giant Samotlor Field, producing approximately 3.1 million barrels per day. In addition, production at West Siberia's second largest field, Fedorovo, producing approximately 730,000 barrels per day, and its third largest field, Mamontovo, producing approximately 550,000 barrels per day, was also possibly nearing its peak.

During 1981-85, drilling by the Soviet oil industry was to approximately double the amount drilled during 1976-80. Most of the new drilling would be in West Siberia with increases also in western Kazakhstan, the Komi A.S.S.R., and the European North where it was planned to increase production. In 1983, exploratory drilling totaling 26.7 million meters was planned, which was 3.4 million meters more than was drilled in 1982, and 11,000 new wells were to be put into operation.

During 1981-85, 27 new fields were scheduled to be placed in operation in Tyumen' Oblast', West Siberia. Oil drilling in Tyumen' Oblast' in 1982 was about 13 million meters, a 25% increase compared with that of 1981. Regarding oil recovery, water flooding recovery reportedly had exhausted its potential, and the introduction of tertiary recovery methods was lagging.

Production declines were reported west of Siberia in the Tatar A.S.S.R., the Bashkir A.S.S.R., Kuybyshev Oblast', Perm Oblast', and Orenburg Oblast'. The most severe declines were in the older production areas of the Ukraine, Turkemenistan, Azerbaidzhan, Byelorussia, and the North Caucasus. Failure to discover significant oil reserves in East Siberia during the 1970's was a major disappointment for the Government. Declining oil production was particularly severe in Byelorussia, which was considered to be a good potential producing area in the mid-1970's. In 1982, Byelorussia was producing only 25% of its 1975 output, when production had peaked at over 147,000 barrels per day.

During the past decade, the cost of oil production had increased greatly, and the ratio of output to meters drilled significantly declined.[61] By 1982, increased production in West Siberia was expected to be in areas farther from existing production bases,

which would add to costs. During 1981-85, the national operational well inventory was to increase 50% to about 129,000 wells. Also, construction of about 10,000 kilometers of crude oil pipeline was planned, raising the crude network to about 80,000 kilometers. This would enable 95% of all crude oil to be transported by pipeline.

As part of an effort to make prices reflect costs, in 1982, the Government increased 130% the average wholesale price of crude oil paid to extraction enterprises; the amount paid extraction enterprises was to be differentiated by fields. All refineries were to be charged the same amount for crude oil, depending on its quality. The wholesale price of petroleum products was increased, and there was to be one set of prices for refinery products. The wholesale price of crude oil for refineries was set at 31.5 rubles per ton for oil with 0.5% to 0.6% sulfur, and at 30 rubles per ton for oil with a higher sulfur content.

Contrary to predictions that the Soviet Union was going to decrease oil sales to market economy countries, it instead increased sales markedly. Part of this increase was accounted for by reexported Libyan oil obtained in countertrade. The Soviet Union cut prices to compete for its market share. Increased sales were coupled with decreased deliveries to East Europe.

The Soviet Union began its first offshore Arctic drilling with a test near Arkhangelsk Oblast' in the Pechora Sea, and more offshore Arctic exploration was scheduled. At least two drilling platforms were installed in the Baltic Sea off Kaliningrad Oblast', and additional platforms were planned for the area. The U.S.S.R., the German Democratic Republic, and Polish consortium Petrobaltic reportedly drilled a well that found an undisclosed volume of oil and gas in Polish waters approximately 35 miles north of the Polish city of Gydnia and 60 miles west of the closest Soviet field, off Kaliningrad Oblast'.

The Mineral Industry of the United Arab Emirates

By John R. Lewis[1]

The United Arab Emirates reported a gross domestic product (GDP) in 1982 of $30 billion[2] and a per capita income of over $24,000, one of the highest in the world. The federation's economy was dominated by its exports of crude petroleum and liquefied natural gas (LNG). Abu Dhabi, with a very large share of known oil and gas reserves, together with Dubai, were the major centers of industrialization. Sharjah and Umm al-Qaiwain shared income from several small oilfields and a promising gas condensate field was completed in Sharjah. Other Emirates appeared to have little prospect of natural mineral resources.

The country's growth had been paced by its substantial income from oil, which increased dramatically when prices of crude oil in world markets rose sharply during the late 1970's. Over 70% of the GDP came from the sale of petroleum and its coproducts. Annual rate of growth in 1982 was about 8%.

PRODUCTION

Production of minerals and mineral-based products in the United Arab Emirates was confined to petroleum and its products, dry and liquefied natural gas, cement, aluminum, steel, explosives, and pharmaceuticals. The $20 billion Ruwais complex, center of Abu Dhabi's industrialization, included the 120,000-barrel-per-day refinery of the Abu Dhabi National Oil Co. (ADNOC), which made all the Emirates' requirements for naphtha, high-quality motor and aviation gasolines, jet and diesel fuels, and had some left over for export. In addition to the products listed, the Ruwais complex contained a nitrogen fertilizer plant that produced about 1,000 tons of ammonia and 1,500 tons of urea per day. Construction plans for the near future included a 27,000-barrel-per-day hydrocracker and a 160,000-ton-per-year petroleum coke plant that would meet the needs of Dubai and Bahrain aluminum smelters for coke and hard pitch blocks. Almost every Emirate had a cement plant either operating or under construction. The amount of cement to be produced when all plants were operating was expected to exceed demand.

Table 1.—United Arab Emirates:[1] Production of mineral commodities[2]

Commodity[3]	1978	1979	1980	1981[p]	1982[e]
ABU DHABI					
Cement, hydraulic[e] thousand metric tons	200	200	500	700	780

Condensate thousand 42-gallon barrels	--	--	--	--	4,500
Petroleum, crude do	8,067	4,697	3,586	3,540	[4]2,555

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]In addition to the Emirates listed, Fujarah and Umm al-Qaiwain record no mineral production but presumably produce small quantities of crude construction materials.

[2]Table includes data available through Aug. 25, 1983.

[3]In addition to the commodities listed, crude construction materials such as common clays, stone, and sand and gravel presumably are produced, but output is not recorded quantitatively and general information is inadequate to make reliable estimates of output levels.

[4]Reported figure.

TRADE

Trade in minerals and mineral products was dominated by the exports of about $22 billion in petroleum alone. Major markets included the European Economic Community, Japan, and the United States. This same group of trading partners sent $9.1 billion in machinery, consumer goods, and food to the United Arab Emirates. It was with the trade surplus thus generated that the Emirates were funding their tremendous development programs and other projects.

Table 2.—Abu Dhabi: Exports of crude petroleum, by destination

(Thousand 42-gallon barrels)

Destination	1979	1980	1981

Table 3.—United Arab Emirates: Exports and reexports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1981	Destinations	
		United States	Other (principal)
METALS			
Aluminum:			
Ore and concentrate	83	--	All to Saudi Arabia.
Metal including alloys, semimanufactures	961	--	Pakistan 413; Saudi Arabia 244; Kuwait 210.
Copper: Metal including alloys, semimanufactures	210	--	Iran 109; India 41; Qatar 22.
Iron and steel:			
Iron ore and concentrate, excluding roasted pyrite	16	--	All to Iran.
Metal:			
Scrap	3,836	--	Qatar 2,270; India 1,500; United Kingdom 44.
Pig iron, cast iron, related materials	118	--	All to Iraq.
Ferroalloys, unspecified	4	--	All to Iran.
Semimanufactures:			
Bars, rods, angles, shapes, sections	2,715	--	Saudi Arabia 684; Qatar 536; Yemen Arab Republic 432.
Universals, plates, sheets	3,404	--	Iran 1,196; Bahrain 612; Iraq 427.
Hoop and strip	1	--	All to Kuwait.
Rails and accessories	21	--	Saudi Arabia 20; Kuwait 1.
Wire	227	--	Iran 135; Saudi Arabia 52; Qatar 28.
Tubes, pipes, fittings	5,541	504	Saudi Arabia 1,497; Iraq 807; Bahrain 700.
Lead: Metal including alloys, all forms value, thousands	$1	--	All to Qatar.
Silver: Ore and concentrate do.	$81	$81	
Titanium: Oxides do.	$13	--	All to Qatar.
Zinc: Metal including alloys, semimanufactures	30	--	Mainly to Qatar.
Other: Base metals including alloys, scrap	195	--	Republic of Korea 109; Pakistan 84; Iran 2.
NONMETALS			
Abrasives, n.e.s.: Grinding and polishing wheels and stones	1	--	Mainly to Yemen Arab Republic.
Cement	4,574	--	People's Democratic Republic of Yemen 1,132; Bahrain 881; Somalia 477.
Chalk	36	--	All to Iran.
Clays and clay products:			
Crude, unspecified	25	--	All to Pakistan.
Products:			
Nonrefractory	2,313	--	Qatar 741; Iraq 703; Yemen Arab Republic 278.
Refractory including nonclay brick	66	--	Qatar 54; Bahrain 12.
Diamond: Gem, not set or strung value, thousands	$9,673	--	Belgium-Luxembourg $7,501; United Kingdom $1,934; Singapore $150.

See footnotes at end of table.

COMMODITY REVIEW

METALS

Aluminum.—The $1.4 billion smelter of the Dubai Aluminum Co. (DUBAL) at Jebel Ali performed at its full capacity of 135,000 tons of metal per year during 1982. At times, the 360-pot facility was turning out 99.86% pure aluminum at rates as high as 142,000 tons per year. However, the shadow cast by the slump in worldwide metal markets early in 1982 prompted DUBAL's management to develop a 5-year antirecession strategy that was aimed at cutting costs and increasing production. The announced plan included higher unit returns through greater output at lower costs. Part of the savings would come from a reduction of expatriate workers in the work force. Additional investments were planned for new downstream units, including additional capacity for manufacturing aluminum rods, an aluminum powder plant, a number of projects involving secondary aluminum, and expansion of the plant's water desalinization process by using waste heat from the smelter.

Japan was DUBAL's largest customer, but the company hoped to be able to in-

crease to about 25,000 tons per year the amount sold to neighboring Persian Gulf countries. DUBAL was owned 80% by the Dubai Government, 7.5% by the Southwire Corp. of the United States, 7.5% by Nissho-Iwai Corp. of Japan, and 5% by various local interests within the Emirates.

Chromium.—Discovery of chrome ore deposits was reported in a mountainous area of Fujairah, 350 kilometers east of Abu Dhabi. A contractor, Geoconsult Co., made the announcement during May or June.[3]

NONMETALS

Cement.—Apparently reacting to leveling off in demand for cement, the United Arab Emirates cement producers reduced their output slightly. However, additional production capacity was coming onstream, creating a potential oversupply problem for the country. With production slightly over 2 million tons per year and capacity approaching 4 million tons per year, industry leaders were calling for concessions on the part of the Government so that existing plants would be able to compete in foreign markets. Included among the suggested assistance were subsidized prices for power and fuel and relief from certain customs duties. In 1982, there were six operating cement plants in the seven Emirates, two more were in various stages of construction, and a new cement company was announced in the only Emirate that had not as yet had a plant within its borders. Cement company officials and others were expressing concern that production capacity would go to 10 million tons per year, an amount equal to 10 tons per person in the United Arab Emirates; considered by some of the Emirates' cement producers to be a dangerous state of overproduction that had potential for serious price wars.

At the same time, and following the trend of previous years, plans for even more cement plants were announced. A decree was issued in Umm al-Qaiwain establishing the Umm al-Qaiwain Cement Co., a public joint stock company, with rights to manufacture cement for 25 years. Construction of the 500,000-ton-per-year cement plant of the Ajman Cement Co. at Hamidiyyah continued during the year under a $26.5 million contract with Nissho-Iwai of Japan.

Fertilizer Materials.—Construction of the world-scale ammonia and urea facilities as part of the Ruwais industrial complex in Abu Dhabi continued during the year. A revised estimate indicated that the plant would cost $334 million, about 11% more than originally estimated. Feed stocks will be from associated natural gas collected from Abu Dhabi's oil wells plus gas from the country's onshore natural gasfields. Completion was targeted for November, 1983. The construction contractor was the Chiyoda Chemical Engineering and Construction Co. of Japan. Originally planned to produce 1,000 tons per day of ammonia and 1,500 tons per day of urea, a 100% expansion was already being planned for completion in 1985.

MINERAL FUELS

Natural Gas.—Gas was playing an increasing role in the United Arab Emirates economy, particularly in Abu Dhabi which was steadily developing its gas reserves. Another two major gas-gathering schemes have now been completed so that flaring of associated gas has been virtually eliminated, after being in excess of 80% in 1975. From onshore fields, all available associated gas is gathered and piped to Ruwais for fractionating, liquefied petroleum gas (LPG) is exported, and dry gas is taken to Abu Dhabi City. Recent cutbacks in oil production have caused a shortage of gas supplies for this project that was designed to utilize gas associated with oil production of 980,000 barrels per day. Offshore, additional facilities have been installed to augment the supply of associated gas to Das Island's LNG plant, which was operating at 105% of design capacity. Existing storage was being replaced by seven new steel and concrete tanks due to be completed by 1984. Dubai has an associated gas installation at Jebel Ali that commenced operation in 1980, dry gas was provided as fuel for the aluminum smelter, and LPG was exported to Japan under 5-year offtake agreements. LPG exports from the United Arab Emirates, however, were facing severe competition on world markets.

Abu Dhabi also had large reserves of natural gas, the extent of which had not been fully evaluated although exploration was proceeding, particularly in the very extensive but deep Khuff formation that at one location yielded 80 million cubic feet per day of good-quality, low-sulfur gas. Plans were prepared to develop a natural gas reservoir, Thamama C, for use by 1983-84 when it was expected that the availability of associated gas will be insufficient to meet domestic demand.

Petroleum.—Crude oil was produced by three of the Emirates: Abu Dhabi—883,000 barrels per day, Dubai—357,000 barrels per day, and Sharjah—7,000 barrels per day. At

these rates of production, the United Arab Emirates output was off 17% in 1982 from the 1981 level of 1,502,300 barrels per day and down almost 28% from the 1980 production level of 1,701,900 barrels per day. The Emirates annual production, likewise, was off in 1982. Total crude output was 455,155,000 barrels; in 1981 it was 548,300,000 barrels; and in 1977, the all-time high annual production amounted to 729,500,000 barrels. Thus, 1982 saw oil flowing from Emirates wells at about 63% of the volume produced in their most prolific year. There were a number of reasons for the reductions. Greatly increased prices for oil and conservation measures around the world resulted in reduced demand for all crude oil, and the reductions were sharply felt by the United Arab Emirates as a member of the Organization of Petroleum Exporting Countries (OPEC). Allowables agreed upon by the OPEC members reflected reduced demand, particularly during 1982. Proved reserves were not a factor in the reduced United Arab Emirates crude output. The country's reserves-to-production ratio indicated a 60-year supply in the ground.

Intense exploration efforts, both onshore and offshore throughout the federation, were resulting in upward revisions of proved crude reserves of the United Arab Emirates. Their economies were still heavily oriented to exported petroleum, despite concerted efforts to widen the income-producing base through development of other industries. There were two operating refineries in the Emirates, both in Abu Dhabi. Together, their output was enough to meet all Emirate demands and have a small amount to export.

Exploration.—For the most part, exploration for oil and gas, both onshore and offshore was active and successful. Discovered gas-bearing structures were described as enormous, but quite deep. The prolific Khuff formation was being probed, both onshore and offshore, at a number of points including where the Khuff underlies the Nasr and Abu al-Bukoosh Oilfields, and also at the onshore Bab area.

Two artificial islands, similar to those offshore the North American Arctic, were completed in the Persian Gulf off Abu Dhabi during the year. Costing $11 million, they were designed as bases for exploration and development drilling using less expensive land-type equipment. The two islands, Zubbaya and Halat Hail, were in shallow water. Two hundred seventy thousand cubic meters of fill material were dredged from the floor of the Persian Gulf and combined with 60,000 cubic meters of sand bags, concrete blocks, and protective fabrics to create the two 50,000-square-meter island work areas. Channels were dredged to the islands to provide access by tending vessels. Drilling at first was into proven reservoirs during 1982, but later in the year some exploratory drilling from the islands was begun. The islands were large enough to provide living quarters and material and equipment storage space. The islands were built for the Abu Dhabi Co. for Onshore Operations (ADCO) which conducted the drilling programs from the islands.

In 1981, there were 13 exploratory wells drilled in Abu Dhabi and 122 development wells. In 1982, it was reported that 38 drilling rigs were running in the Emirates, and exploration, development, and workovers were proceeding at a good pace.

Production.—As of July 1, there were 497 producing oil wells in the United Arab Emirates. Abu Dhabi had 352, Dubai had 141, and Sharjah had 4. Total production was 1.247 million barrels daily, which made the Emirates the Middle East's third largest crude producer after Saudi Arabia and Iran. The country was 15th among market economy oil-producing countries. Daily average oil production in 1982 was 17% below the 1981 level of 1.502 million barrels daily. Natural gas reserves, at 28.5 quadrillion cubic feet, put the United Arab Emirates in 15th place among world gas producing nations. Given the active pace of drilling and development, both onshore and offshore, the number of wells, proved reserves, and other data are subject to frequent change.

Front runner among oilfield production projects was Abu Dhabi's development program for the Upper Zakum Field in the Persian Gulf offshore about 70 kilometers from Abu Dhabi City. Costing about $5 billion when completed, the project was expected to be operational during 1983. The huge reservoir was so low in expulsive energy that secondary recovery techniques, notably the injection of about 1 million barrels of water per day, was being instituted at the outset. The field was expected to produce between 350,000 and 500,000 barrels of oil per day. The project involved 266 wells and 92 drilling and production platforms.

Meanwhile, the Emirates second most prolific oil-producing state, Dubai, was ac-

tively engaged in maintaining its output of crude from four offshore fields. The Dubai Petroleum Co. announced plans, under its largest budget ever, to install six new platforms and engage in much primary and secondary recovery drilling and development work. About 12 new wells were to be drilled during the year, some gas-lift facilities were to be completed, and necessary workover projects were underway. Dubai's daily crude production in 1982 was about the same as that of 1981.

In Sharjah, the Amoco Sharjah Oil Co., a subsidiary of Standard Oil Co. (Indiana), announced commencement of its onshore gas condensate field in July. At yearend, Amoco's wholly owned daily production from seven wells was 25,000 barrels of condensate. The product was being processed through facilities completed by Amoco during the year and shipped via company tanker to the Amoco Oil Co. refinery at Yorktown, Va. The natural gas produced in the operation was contracted to a Government-owned gas pipeline and distribution company that was to supply gas to five northern Emirates. Amoco continued exploration on its 600,000-acre onshore concession in Sharjah and performed seismic survey work on the 618,000-acre concession it held in Abu Dhabi, where exploratory drilling was planned.

Refining.—In Abu Dhabi, the ADNOC 120,000-barrel-per-day refinery in the Ruwais industrial complex became fully operational during 1982. Plans were almost immediately announced to install a hydrocracker to upgrade refinery fuel oil residues into lighter products. Added to this were plans to expand the Umm al-Nar refinery from 15,000 to 75,000 barrels per day, with completion scheduled by mid-1983. Cost was put at $200 million. Output of the two refineries was mostly destined for use within the United Arab Emirates.

The Mineral Industry of the United Kingdom

By Tatiana Karpinsky[1]

The gross domestic product (GDP) of the United Kingdom in real terms increased by an estimated 0.7% in 1982, and the inflation rate slowed to 6.5% at the end of the year.

In 1982, industrial output increased 1%, but steel production fell 12%, compared with that of 1981, and amounted to 13.7 million tons; total steel capacity was estimated at 25 million tons. The annual subsidy to state-owned British Steel Corp. (BSC) increased from $599 million to $1 billion.[2] The steel industry was heavily dependent upon imports of iron ore and important alloying metals such as chromium, manganese, columbium, and vanadium. During the year, the Government decided to build up and hold above-average stocks of those metals and minerals deemed to be of critical importance to steel and certain other key industries. The stockpile budget totaled about $82 million, and much of the stockpile had already been purchased by the end of 1982.

Oil development in the North Sea progressed; for the second year the United Kingdom was self-sufficient in crude oil and petroleum products, and about 600,000 barrels per day of crude oil was exported. Oil and gas accounted for 6.5% of the United Kingdom GDP and provided about 6% of all tax revenues in 1982.

Unemployment rose by about 25,000 workers per month through 1982 and reached 12.5% of the total work force.

PRODUCTION

The main factors in 1982 declines in minerals and metals production were additional sales from stocks and the recession in the United Kingdom's industrial activity. The total value of gross industrial production in 1981 amounted to $140 billion.[3] Mining and quarrying contributed an estimated 18% to this and 7.3% to the gross national product.

In 1982, refined production of aluminum, copper, lead, nickel, tin, and zinc was lower than in 1981 by varying amounts. The United Kingdom was self-sufficient in oil, coal, and fluorspar and produced about 27% of its tin requirements. Production of nonmetallic minerals was approximately at the level of 1981. Coal production dropped slightly. Production of oil increased by 16%, and for the first time the annual total topped 750 million barrels. Production of nuclear and hydroelectric energy rose about 15% to 18.3 million tons of standard coal equivalent (SCE).

eEstimated. pPreliminary. rRevised. NA Not available.

[1]Includes data available through June 1, 1983.

[2]Includes wheels, centers, tires, axles, and semimanufactures for immediate sale.

[3]From imported bullion, including Pb content of alloys produced.

[4]From scrap materials. Series revised to comprise all secondary output including Pb content of secondary antimonial lead and to exclude output from domestic ores.

[5]Excludes plasters.

[6]Consists of brick, retorts, molds, and other refractory products made from clays, silica, siliceous materials, magnesite, alumina, and chrome materials.

[7]Gas made at gasworks plus purchased coke oven refinery gas.

TRADE

Trade data in minerals and metals for 1981, the latest year available, are given in tables 2 and 3.

Table 2.—United Kingdom: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981[1]	Destinations, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals:				
Lithium, oxides and hydroxides	NA	7	NA	NA.
Unspecified	172	115	15	Australia 15; Poland 15; Republic of South Africa 14.
Aluminum:				
Ore and concentrate	1,221	883	5	United Arab Emirates 500; Belgium-Luxembourg 218; Sweden 155.
Oxides and hydroxides	42,670	39,622	811	Norway 7,017; Republic of South Africa 4,727; Portugal 3,952.
Metal including alloys:				
Scrap	35,731	38,008	42	West Germany 22,108; Netherlands 4,325; France 3,757.
Unwrought	194,456	168,537	8,044	Netherlands 61,308; West Germany 42,085; Japan 12,820.
Semimanufactures	184,980	81,395	2,164	West Germany 9,956; France 8,222; Ireland 7,295.
Antimony: Metal including alloys, all forms	288	30	NA	NA.
Beryllium:				
Oxides and hydroxides	NA	1	NA	NA.
Metal including alloys, all forms	5	11	1	France 3; India 2; Netherlands 2.
Bismuth: Metal including alloys, all forms	312	311	NA	NA.
Cadmium: Metal including alloys, all forms	133	37	NA	NA.
Chromium:				
Ore and concentrate	891	1,192	--	Turkey 780; Spain 284.
Oxides and hydroxides	4,785	1,773	1,237	Canada 197; France 189.
Metal including alloys, all forms	2,569	2,123	NA	NA.
Cobalt:				
Oxides and hydroxides	289	838	97	Belgium-Luxembourg 166; France 103; Netherlands 81.
Metal including alloys, all forms	623	810	NA	NA.
Columbium and tantalum: Metals including alloys, all forms	34	29	6	Australia 13; West Germany 4.
Copper:				
Ore and concentrate	--	4	--	All to United Arab Emirates.
Matte and speiss including cement copper	4	--		
Oxides and hydroxides	NA	255	NA	NA.
Sulfate	NA	4,803	NA	NA.
Metal including alloys:				
Scrap	82,903	65,562	(2)	West Germany 26,367; Italy 12,598; Belgium-Luxembourg 8,387.
Unwrought	60,540	43,035	2,432	West Germany 12,651; Italy 4,644; Sweden 3,994.
Semimanufactures	119,868	97,747	8,834	West Germany 14,851; Ireland 11,505; Switzerland 8,506.
Gold:				
Waste and sweepings value, thousands	$91,217	$28,480	NA	Spain $18,683; Switzerland $4,125; West Germany $2,312.
Metal including alloys, unwrought and partly wrought thousand troy ounces	10,881	22,213	NA	NA.
Iron and steel:				
Iron ore and concentrate, excluding roasted pyrite	1,156	20,033	--	Switzerland 20,000.
Metal:				
Scrap thousand tons	2,805	3,367	(2)	Spain 2,156; Netherlands 167; India 142.
Pig iron, cast iron, related materials	55,788	38,156	153	Italy 7,830; Belgium-Luxembourg 5,615; Sweden 4,481.
Ferroalloys:				
Ferromanganese	972	21,588	15,768	West Germany 3,823.
Ferrosilicon	1,353	2,889	NA	NA.
Unspecified	15,634	12,774	783	West Germany 4,802; Netherlands 1,165; Sweden 958.
Steel, primary forms	242,678	273,313	53,590	West Germany 47,912; Yugoslavia 35,199; Italy 33,132.
Semimanufactures:				
Bars, rods, angles, shapes, sections thousand tons	r1,236	1,625	302	India 127; West Germany 102; Ireland 101.

See footnotes at end of table.

METALS —Continued				
Iron and steel —Continued				
Metal —Continued				
Semimanufactures —Continued				
Universals, plates, sheets thousand tons	657	1,240	47	West Germany 185; Canada 116; France 77.
Hoop and strip	78,701	98,579	4,668	Ireland 10,954; France 10,773; U.S.S.R. 6,010.
Rails and accessories	103,448	125,781	3,169	Pakistan 21,889; Belgium-Luxembourg 20,505; Sudan 18,583.
Wire	89,475	96,727	16,983	Canada 10,868; Ireland 8,550; Sweden 4,933.
Tubes, pipes, fittings	404,275	795,320	110,746	Sweden 24,645; Abu Dhabi 23,313; Denmark 18,420.
Castings and forgings, rough	95,873	82,342	28,033	Sweden 13,351; France 7,154; Iraq 4,902.
Lead:				
Ore and concentrate	3,535	2,378	--	Belgium-Luxembourg 2,309; Singapore 44.
Oxides	5,855	6,423	--	Ireland 2,668; U.S.S.R. 500; Norway 489.
Metal including alloys:				
Scrap	30,662	18,221	--	West Germany 6,074; Ireland 5,559; Denmark 4,060.
Unwrought	141,825	130,120	1,705	West Germany 32,220; Netherlands 14,775; France 13,633.
Semimanufactures	6,123	2,063	68	Portugal 737; Ireland 163.
Magnesium: Metal including alloys:				
Scrap	111	182	32	Netherlands 125; Belgium-Luxembourg 18.
Unwrought	1,167	757	242	West Germany 154; France 140; Canada 86.
Semimanufactures	659	638	18	Ireland 132; Egypt 112; Hungary 93.
Manganese:				
Ore and concentrate, metallurgical-grade	8,331	6,197	--	Republic of South Africa 2,681; unspecified 3,516.
Oxides	2,133	341	6	Ireland 110; Nigeria 70; West Germany 36.
Metal including alloys, all forms	405	147	NA	NA.
Mercury 76-pound flasks	2,321	2,030	NA	Netherlands 811; Republic of South Africa 522.
Metalloids:				
Arsenic, oxides and acids	2,695	3,603	NA	NA.
Unspecified	2,604	2,409	17	Denmark 1,365; West Germany 79; unspecified 909.
Molybdenum:				
Oxides and hydroxides	1,937	1,086	NA	NA.
Metal including alloys, all forms	175	196	12	Netherlands 54; West Germany 48.
Nickel:				
Ore and concentrate	5	61	--	France 23; West Germany 20; Sweden 18.
Matte and speiss	2,911	4,941	--	Norway 3,579; Belgium-Luxembourg 1,128.
Oxides and hydroxides	58	162	NA	NA.
Metal including alloys:				
Scrap	4,454	4,195	679	West Germany 1,234; Sweden 814; France 276.
Unwrought	10,984	20,379	892	West Germany 4,124; Canada 2,595; Belgium-Luxembourg 2,492.
Semimanufactures	9,136	9,735	879	France 2,115; West Germany 1,223; Japan 1,153.
Platinum-group metals: Metals including alloys, unwrought and partly wrought, unspecified thousand troy ounces	1,768	1,382	354	Japan 225; Switzerland 225; West Germany 193.
Silver:				
Ore and concentrate value, thousands	$1,000	$414	--	West Germany $181; France $121; Hong Kong $81.
Waste and sweepings do	$144,798	$28,159	$509	Spain $12,429; France $4,787; Belgium-Luxembourg $3,872.
Metal including alloys, unwrought and partly wrought thousand troy ounces	82,242	61,312	NA	Switzerland 42,600; France 9,645.
Tin:				
Ore and concentrate	3,035	4,306	40	Spain 1,789; West Germany 1,569; Netherlands 790.
Oxides	451	481	NA	NA.

Oxides and hydroxides	2,101	1,139	NA	NA.
Ashes and residues	46,020	43,371	256	West Germany 19,545; Belgium-Luxembourg 5,439; unspecified 9,659.
Pyrophoric alloys	10,325	11,570	NA	West Germany 5,755; Ireland 1,134; India 572.
Base metals including alloys, all forms	140	215	NA	NA.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	2,203	3,071	NA	NA.
Artificial: Corundum	6,744	5,484	738	Republic of South Africa 1,639; West Germany 902.
Dust and powder of precious and semi-precious stones, including diamond value, thousands	$4,646	$4,390	$204	Belgium-Luxembourg $1,097; Italy $712; unspecified $2,377.
Grinding and polishing wheels and stones	7,281	6,584	395	U.S.S.R. 1,053; France 856; Sweden 666.
Asbestos, crude	1,118	1,758	--	Belgium-Luxembourg 1,365; Malaysia 152.
Barite and witherite	4,050	4,226	--	West Germany 1,124; Republic of South Africa 735; Hong Kong 412.
Boron materials:				
Crude natural borates	1,517	1,167	--	Republic of South Africa 1,123; Ireland 44.
Oxides and acids	1,514	1,142	4	Netherlands 1,086.
Cement thousand tons	1,025	557	66	Nigeria 435; Ireland 14; unspecified 37.
Chalk	57,742	52,615	921	Nigeria 19,575; Australia 8,936; unspecified 23,183.
Clays and clay products:				
Crude, unspecified thousand tons	2,957	5,626	18	Italy 1,927; Finland 1,005; West Germany 980.
Products:				
Nonrefractory	182,521	163,498	11,425	Ireland 56,898; Dubai 8,759; Saudi Arabia 7,449.
Refractory including nonclay brick	249,937	193,236	6,209	Italy 22,288; Sweden 12,612; West Germany 11,853.
Cryolite and chiolite	3	1	--	All to Egypt.
Diamond:				
Gem, not set or strung, value, millions	$6,568	$1,700	$279	Belgium-Luxembourg $525; Switzerland $477; India $186.
Industrial value, thousands	$68,625	$49,976	$8,836	Belgium-Luxembourg $15,079; Romania $4,733; Ireland $3,508.

See footnotes at end of table.

Table 2.—United Kingdom: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981[1]	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Diatomite and other infusorial earth	985	1,367	787	Republic of South Africa 229; Ireland 129.
Feldspar, fluorspar, related materials:				
Unspecified	59,229	30,473	3	Netherlands 13,155; West Germany 9,883; unspecified 7,432.
Fertilizer materials:				
Crude, unspecified	2,481	3,051	59	Ireland 1,981; Syria 316; France 313.
Manufactured:				
Ammonia	102,581	240,349	--	Spain 82,593; Finland 39,875; Ireland 19,529.
Nitrogenous	118,186	206,399	265	Belgium-Luxembourg 105,538; Netherlands 40,467; Peru 16,800.
Phosphatic	25,955	10,251	--	Ireland 8,619; West Germany 1,052.
Potassic	200,695	92,531	163	Norway 25,722; Netherlands 24,044; Brazil 15,000.
Unspecified and mixed	301,952	321,911	1,070	Ireland 143,762; West Germany 50,884; Nigeria 49,774.
Graphite, natural	2,081	2,923	65	West Germany 1,386; unspecified 1,472.
Gypsum and plaster	17,889	18,412	140	Ireland 4,898; unspecified 13,374.
Halogens:				
Chlorine	4,045	2,740	--	Ireland 1,530; unspecified 1,210.
Unspecified	2,026	1,464	22	West Germany 511; France 362; Libya 200.
Lime	32,724	35,980	--	Nigeria 12,992; Iran 4,525; Sweden 3,229.
Magnesium compounds: Other	80,042	71,570	NA	NA.
Mica:				
Crude including splittings and waste	3,773	2,926	36	West Germany 792; Nigeria 390; Portugal 312.
Worked including agglomerated splittings	231	82	1	West Germany 16; Italy 10; Singapore 9.
Nitrates, crude	137	2,098	8	Ireland 1,116; Malta 680; West Germany 180.
Phosphates, crude	94	785	--	Australia 688; New Zealand 62.
Pigments, mineral: Iron oxides and hydroxides, processed	7,208	5,571	559	Republic of South Africa 972; Italy 601; unspecified 3,439.
Potassium salts, crude	35	20	--	All to Ireland.
Precious and semiprecious stones other than diamond:				
Natural value, thousands	$126,653	$139,899	$19,164	Switzerland $83,051; Hong Kong $10,210; France $5,615.
Synthetic do	$440	$1,194	$1	Ireland $730; Japan $175; France $169.
Pyrite, unroasted	20	1,653	--	Ireland 1,640.
Salt and brine	393,323	426,479	17	Ireland 140,117; Nigeria 124,808; Sweden 105,605.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	1,618	1,676	1	Ireland 397; Netherlands 54; unspecified 1,152.
Sodium carbonate, natural and manufactured	149,910	135,482	18	Republic of South Africa 46,176; Sweden 20,001; Ireland 16,616.
Sodium hydroxide	45,891	43,700	19	Nigeria 6,020; Netherlands 4,358; Ireland 3,899.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	8,368	6,443	360	West Germany 1,790; Ireland 1,634; France 963.
Worked	7,746	7,703	858	Australia 1,558; France 1,293; Netherlands 735.
Dolomite, chiefly refractory-grade	30,116	18,580	--	Norway 6,654; Ireland 5,519; unspecified 6,407.
Gravel and crushed rock thousand tons	6,814	3,208	136	Belgium-Luxembourg 1,544; France 866; Netherlands 507.
Limestone other than dimension	799,103	547,907	--	Belgium-Luxembourg 225,231; Norway 157,827; unspecified 164,849.
Quartz and quartzite	277	138	18	United Arab Emirates 79; Romania 29.
Sand other than metal-bearing	48,199	43,026	--	Ireland 17,529; Sweden 11,223; unspecified 12,995.

See footnotes at end of table.

Table 2.—United Kingdom: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981[1]	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Sulfur:				
Elemental:				
Crude including native and byproduct	1,116	1,095	--	Republic of South Africa 428; Belgium-Luxembourg 393.
Colloidal, precipitated, sublimed	133	128	--	Ireland 52; Iran 28; Switzerland 18.
Dioxide	90	91	NA	NA.
Sulfuric acid	228,676	69,679	1	Ireland 27,687; unspecified 41,991.
Talc, steatite, soapstone, pyrophyllite	5,806	6,902	--	Netherlands 2,054; Ireland 1,402; Nigeria 909.
Other:				
Crude	32,620	36,641	105	Netherlands 7,469; West Germany 7,273; unspecified 16,807.
Slag and dross, not metal-bearing	84,878	91,311	120	West Germany 64,716; Denmark 12,505; Sweden 6,805.
Oxides and hydroxides of barium, magnesium, strontium	581	616	76	West Germany 226; Ireland 67; Ghana 62.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	92,298	77,231	3,034	Ireland 14,181; Hong Kong 7,799; West Germany 3,962.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	2,887	1,865	--	Ireland 607; France 400; Nigeria 158.
Carbon: Carbon black	35,195	29,499	383	Ireland 6,264; France 3,465; Nigeria 3,406.
Coal:				
Anthracite and bituminous thousand tons	4,042	9,513	--	France 2,623; Denmark 1,917; West Germany 1,498.
Briquets of anthracite and bituminous coal	118,881	104,019	4	Norway 76,318; Venezuela 11,878; Ireland 9,768.
Lignite including briquets	120	54	--	Norway 53.
Coke and semicoke thousand tons	1,164	3,391	--	Norway 2,224; Romania 404; Netherlands 296.
Hydrogen, helium, rare gases	5,135	5,018	4	Ireland 1,999; Norway 1,174; Spain 575.
Peat including briquets and litter	5,105	4,198	--	France 1,939; Ireland 1,090; Oman 229.
Petroleum and refinery products:				
Crude thousand 42-gallon barrels	291,566	394,036	120,463	West Germany 92,669; Netherlands 64,479; France 22,955.
Refinery products:				
Liquefied petroleum gas do	11,839	12,602	269	Netherlands 3,823; Ireland 1,483; Portugal 1,457.
Gasoline:				
Aviation do	7,035	11,339	NA	Ireland 5,181; West Germany 1,233; Netherlands 1,082.
Motor do	9,847	8,541	140	Netherlands 3,245; Sweden 1,804; Belgium-Luxembourg 1,446.
Mineral jelly and wax do	349	381	20	France 56; Nigeria 49; West Germany 43.
Kerosine and jet fuel do	6,090	4,298	--	Ireland 2,218; Egypt 501; Denmark 323.
Distillate fuel oil do	37,654	38,147	1,034	Ireland 7,518; Netherlands 6,006; Sweden 5,180.
Lubricants do	10,037	5,061	70	Netherlands 597; West Germany 377; Sweden 352.
Residual fuel oil do	35,203	25,803	347	Netherlands 9,516; Ireland 7,188; Belgium-Luxembourg 2,809.
Bitumen and other residues do	634	502	--	Ireland 432; Abu Dhabi 46.
Bituminous mixtures do	276	234	(2)	Ireland 51; Greece 21; Abu Dhabi 19.
Petroleum coke do	2,047	2,054	NA	NA.
Tars and other crude chemicals derived from coal, gas, and petroleum	222,264	382,836	414	Netherlands 217,506; Norway 40,320; France 20,257.

[r]Revised. NA Not available.
[1]May include other precious metals.
[2]Less than 1/2 unit.

Table 3.—United Kingdom: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals: Unspecified	879	142	--	West Germany 47; France 37; unspecified 45.
Aluminum:				
Ore and concentrate	267,634	240,687	35	Ghana 136,706; Greece 70,400; Guinea 19,597.
Oxides and hydroxides	778,909	636,159	5,264	Jamaica 560,349; Suriname 37,728; Guyana 14,100.
Metal including alloys:				
Scrap	5,792	4,040	122	Ireland 2,238; Netherlands 501; Belgium-Luxembourg 218.
Unwrought	171,420	123,347	1,108	Norway 78,713; Iceland 10,893; France 9,930.
Semimanufactures	155,465	169,504	14,725	West Germany 50,277; France 24,895; Belgium-Luxembourg 22,089.
Beryllium: Metal including alloys, all forms	10	3	3	
Bismuth: Metal including alloys, all forms	389	292	NA	NA.
Cadmium: Metal including alloys, all forms	793	982	NA	NA.
Chromium:				
Ore and concentrate	92,573	76,495	--	Republic of South Africa 52,674; Mozambique 6,955; Finland 5,604.
Oxides and hydroxides	2,255	2,309	59	West Germany 1,045; U.S.S.R. 544; Netherlands 231.
Metal including alloys, all forms[1]	25	1	NA	NA.
Cobalt:				
Oxides and hydroxides	1,333	891	1	Canada 846; West Germany 17; France 14.
Metal including alloys, all forms	2,187	1,439	NA	NA.
Columbium and tantalum: Metals including alloys, all forms	59	36	15	West Germany 9; France 7; Belgium-Luxembourg 3.
Copper:				
Ore and concentrate	644	561	(2)	Czechoslovakia 536; Belgium-Luxembourg 20.
Matte and speiss including cement copper	--	9	--	All from Philippines.
Metal including alloys:				
Scrap	9,171	8,142	963	Ireland 1,884; Ghana 680; France 541.
Unwrought	346,703	283,803	2,487	Canada 75,721; Chile 57,085; Peru 35,948.
Semimanufactures	77,817	88,494	3,642	West Germany 27,990; France 18,192; Belgium-Luxembourg 9,928.
Gold:				
Waste and sweepings value, thousands	$269,409	$148,751	$76,578	Sweden $23,889; Kuwait $14,891; Canada $14,420.
Metal including alloys, unwrought and partly wrought thousand troy ounces	19,842	20,643	NA	NA.
Iron and steel:				
Iron ore and concentrate:				
Excluding roasted pyrite thousand tons	8,529	14,582	(2)	Canada 5,434; Brazil 1,845; Sweden 1,789.
Pyrite, roasted	218,087	265,906	--	Sweden 247,951; Ireland 16,146.
Metal:				
Scrap	26,439	20,760	367	Ireland 13,289; Sierra Leone 2,862; West Germany 1,867.
Pig iron, cast iron, related materials	192,038	128,716	358	West Germany 33,901; Norway 33,516; Sweden 20,880.
Ferroalloys:				
Ferromanganese	52,005	56,412	--	Republic of South Africa 31,420; Norway 17,071; France 5,872.
Ferrosilicon	68,997	75,443	NA	NA.
Unspecified	83,378	103,829	46	Norway 26,991; Sweden 26,596; unspecified 31,559.
Steel, primary forms	901,897	739,113	8:5	West Germany 304,499; Netherlands 205,019; Belgium-Luxembourg 55,384.
Semimanufactures:				
Bars, rods, angles, shapes, sections	928,251	769,479	7,586	West Germany 129,782: France 110,922; Belgium-Luxembourg 109,330.

See footnotes at end of table.

Table 3.—United Kingdom: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Iron and steel —Continued				
Metal —Continued				
Semimanufactures —Continued				
Universals, plates, sheets thousand tons	2,126	1,310	48	West Germany 321; Netherlands 240; Belgium-Luxembourg 216.
Hoop and strip	219,143	136,645	3,029	West Germany 74,625; Belgium-Luxembourg 20,498; France 12,642.
Rails and accessories	5,915	3,960	36	West Germany 3,081; Belgium-Luxembourg 311; Ireland 242.
Wire	61,659	54,193	581	Belgium-Luxembourg 14,625; West Germany 12,065; France 11,234.
Tubes, pipes, fittings	468,082	651,610	8,405	West Germany 341,106; Italy 71,382; Netherlands 70,385.
Castings and forgings, rough	21,170	18,346	479	West Germany 5,055; France 2,811; Italy 1,590.
Lead:				
Ore and concentrate	56,060	59,832	--	Australia 26,402; Canada 9,237; Sweden 6,007.
Oxides	672	736	6	West Germany 368; Netherlands 281; Ireland 36.
Metal including alloys:				
Scrap	10,571	788	63	Ireland 267; Nigeria 123; Sweden 62.
Unwrought	204,215	162,443	232	Australia 123,307; Canada 34,824; Ireland 2,126.
Semimanufactures	2,848	2,725	53	Ireland 1,591; West Germany 450; Netherlands 249.
Magnesium: Metal including alloys:				
Scrap	43	39	--	Italy 18; Ireland 10; Australia 4.
Unwrought	4,974	4,900	461	Norway 2,106; Netherlands 1,153; Canada 1,066.
Semimanufactures	245	243	39	Switzerland 63; China 35; France 33.
Manganese:				
Ore and concentrate, metallurgical-grade	126,549	278,055	60	Republic of South Africa 112,898; Brazil 107,261; Australia 43,561.
Oxides	5,576	3,924	290	Belgium-Luxembourg 1,746; Ireland 829; Greece 472.
Metal including alloys, all forms	3,291	1,962	NA	NA.
Mercury 76-pound flasks	6,730	6,003	290	Netherlands 3,248; Spain 1,160; China 406.
Metalloids: Arsenic, oxides and acids	5,454	--		
Molybdenum:				
Ore and concentrate	13,757	15,148	NA	NA.
Metal including alloys, all forms	108	178	33	Austria 40; West Germany 37; France 25.
Nickel:				
Ore and concentrate	--	179	--	All from Netherlands.
Matte and speiss	38,325	41,233	--	Canada 34,454; Indonesia 5,064; Australia 1,241.
Metal including alloys:				
Scrap	2,255	2,432	383	France 500; Netherlands 494; West Germany 232.
Unwrought	18,240	17,160	108	Norway 5,542; Netherlands 3,364; Canada 3,290.
Semimanufactures	4,629	2,570	1,017	West Germany 1,064; France 134; Sweden 103.
Platinum-group metals: Metal including alloys, unwrought and partly wrought, unspecified troy ounces	707,315	385,812	32,151	Switzerland 64,302; France 32,151; Republic of South Africa 32,151.
Silver:				
Ore and concentrate value, thousands	$463,148	$354,386	NA	NA.
Waste and sweepings do	$401,682	$334,393	NA	NA.
Metal including alloys, unwrought and partly wrought thousand troy ounces	139,566	63,241	4,469	Belgium-Luxembourg 10,417; France 9,195; Hong Kong 5,787.
Tin:				
Ore and concentrate	36,656	38,407	NA	Bolivia 28,066; Argentina 6,205; Republic of South Africa 2,172.
Metal including alloys:				
Scrap	940	1,005	297	France 121; Hong Kong 110; Poland 107.

See footnotes at end of table.

Table 3.—United Kingdom: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Tin —Continued				
Metal including alloys —Continued				
Unwrought	r7,129	8,151	66	Netherlands 1,946; Nigeria 1,834; Indonesia 1,365.
Semimanufactures	243	102	4	West Germany 59; Netherlands 12; France 5.
Titanium:				
Ore and concentrate	312,650	288,700	--	NA.
Oxides	5,680	9,636	4,153	Belgium-Luxembourg 1,747; West Germany 1,084; Canada 594.
Metal including alloys, all forms[3]	1,999	2,083	NA	NA.
Tungsten:				
Ore and concentrate	2,622	3,308	--	Bolivia 1,604; Portugal 525; China 500.
Metal including alloys, all forms	298	162	11	Austria 31; West Germany 25; Israel 19.
Uranium and/or thorium:				
Ore and concentrate value, thousands	$412	$1,415	--	All from Australia.
Metal including alloys, all forms do	$38	$85	$4	West Germany $60; Canada $15.
Zinc:				
Ore and concentrate	211,599	131,803	2,687	Peru 49,059; Australia 31,975; Iceland 26,110.
Oxides	2,871	3,015	5	West Germany 1,321; Portugal 715; France 455.
Blue powder value, thousands	$511	$1,586	NA	Belgium-Luxembourg $870; unspecified $716.
Metal including alloys:				
Scrap	1,136	925	--	Netherlands 440; Sweden 126; Finland 75.
Unwrought	134,273	120,278	3	Netherlands 37,786; Canada 32,199; Finland 27,984.
Semimanufactures value, thousands	(4)	$6,142	$248	West Germany $2,763; Belgium-Luxembourg $1,092; France $748.
Zirconium:				
Ore and concentrate	32,426	27,615	NA	NA.
Metal including alloys, all forms	207	112	NA	NA.
Other:				
Ores and concentrates	131	305	NA	NA.
Oxides and hydroxides	267,194	148,724	--	West Germany 21,081; France 18,025; unspecified 81,469.
Ashes and residues	78,583	46,884	14,466	Sweden 7,937; West Germany 5,082; Australia 2,333.
Pyrophoric alloys	3,119	NA		
Base metals including alloys, all forms	367	889	NA	NA.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc value, thousands	$9,691	$7,016	NA	NA.
Artificial: Corundum	17,543	10,687	192	Canada 4,240; Netherlands 2,623; France 1,637.
Dust and powder of precious and semi-precious stones, including diamond value, thousands	$18,638	$13,975	NA	NA.
Grinding and polishing wheels and stones	4,314	4,944	151	West Germany 810; France 797; Netherlands 748.
Asbestos, crude	94,639	67,187	241	Canada 51,224; Republic of South Africa 5,815; Zimbabwe 4,783.
Barite and witherite	143,090	113,007	--	Ireland 72,900; Netherlands 18,333; Morocco 6,007.
Boron materials:				
Crude natural borates	9,246	9,937	3,374	Netherlands 3,936; West Germany 1,813.
Oxides and acids	2,518	3,696	1	Turkey 2,347; U.S.S.R. 400; France 289.
Cement	118,167	188,074	563	Ireland 129,536; Netherlands 33,411; West Germany 10,973.
Chalk	605	801	--	West Germany 585; France 190; Netherlands 22.

See footnotes at end of table.

Table 3.—United Kingdom: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Clays and clay products:				
Crude, unspecified	196,416	160,663	65,043	France 32,573; Greece 24,341; Republic of South Africa 18,113.
Products:				
Nonrefractory	93,270	107,931	66	Italy 49,409; West Germany 10,615; Netherlands 10,062.
Refractory including nonclay brick	45,906	55,909	2,905	Ireland 21,913; West Germany 13,873; Denmark 4,001.
Cryolite and chiolite	1,627	1,651	--	Denmark 1,418; Canada 195.
Diamond:				
Gem, not set or strung value, millions	$6,914	$1,872	$104	Switzerland $1,146; Sierra Leone $64; Republic of South Africa $57.
Industrial value, thousands	$147,829	$53,185	NA	NA.
Diatomite and other infusorial earth	13,602	12,296	3,541	Denmark 5,406; France 1,862; Spain 720.
Feldspar, fluorspar, related materials:				
Unspecified	144,008	118,604	142	Norway 70,235; Finland 25,990; Sweden 9,605.
Fertilizer materials:				
Crude, unspecified	646	1,204	--	Ireland 1,072; Israel 72; Belgium-Luxembourg 41.
Manufactured:				
Nitrogenous	355,567	327,066	1	Netherlands 121,234; Belgium-Luxembourg 117,313; West Germany 29,065.
Phosphatic	75,987	81,336	29	Belgium-Luxembourg 26,751; Netherlands 25,163; Portugal 6,783.
Potassic	554,775	479,784	1	East Germany 224,983; West Germany 108,163; Spain 48,925.
Unspecified and mixed	363,800	407,770	343	Netherlands 137,237; Ireland 81,392; Belgium-Luxembourg 70,492.
Graphite, natural	18,115	15,529	525	Madagascar 4,436; Norway 4,273; China 2,170.
Gypsum and plaster	85,652	48,596	321	Ireland 22,670; France 22,186; West Germany 3,264.
Halogens:				
Bromine	4,642	5,026	NA	NA.
Chlorine	5,208	8,695	1	Spain 8,640; France 38.
Iodine	1,596	1,358	NA	NA.
Lime	1,374	1,029	5	France 619; Ireland 170; Netherlands 162.
Magnesium compounds: Other	94,176	95,709	479	Greece 26,237; Spain 25,708; Ireland 16,101.
Mica:				
Crude including splittings and waste	21,223	13,895	49	China 6,869; Spain 2,645; France 2,414.
Worked including agglomerated splittings	506	456	57	West Germany 120; Belgium-Luxembourg 107; Switzerland 64.
Nitrates, crude	6,921	6,923	--	Chile 4,160; Belgium-Luxembourg 2,751.
Phosphates, crude thousand tons	1,755	1,456	--	Morocco 986; Senegal 381; Netherlands 12.
Pigments, mineral:				
Natural, crude	2,848	1,547	NA	NA.
Iron oxides and hydroxides, processed	22,137	20,014	580	West Germany 16,919; Spain 1,034; Netherlands 511.
Potassium salts, crude	25,453	25,011	--	West Germany 14,334; East Germany 10,677.
Precious and semiprecious stones other than diamond:				
Natural value, thousands	$126,662	$172,646	$23,556	Switzerland $117,146; France $5,029; West Germany $4,212.
Synthetic do	$1,677	$1,241	$932	Austria $133; Switzerland $58; Japan $24.
Salt and brine	434,427	97,923	336	Italy 42,074; West Germany 40,830; Netherlands 7,200.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	2,778	3,206	2	France 1,550; West Germany 527; Italy 255.

See footnotes at end of table.

Table 3.—United Kingdom: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Sodium and potassium compounds, n.e.s. —Continued				
Sodium carbonate, natural and manufactured	34,089	70,892	45,688	Bulgaria 5,982; Poland 4,749; Netherlands 4,700.
Sodium hydroxide	63,952	135,446	14	West Germany 96,155; Netherlands 12,243; Belgium-Luxembourg 11,085.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	21,958	26,345	87	Italy 7,865; Ireland 5,120; Republic of South Africa 3,835.
Worked	40,102	40,299	258	Italy 18,131; Portugal 13,583; India 2,835.
Dolomite, chiefly refractory-grade	64,277	88,312	88	Spain 67,312; Norway 19,162; West Germany 907.
Gravel and crushed rock	311,795	571,609	7	France 239,001; Ireland 152,435; Zimbabwe 97,453.
Limestone other than dimension	2,665	2,735	--	France 2,630; West Germany 53; Denmark 21.
Quartz and quartzite	4,129	3,876	34	West Germany 907; Finland 650; Norway 518.
Sand other than metal-bearing	58,931	56,095	498	Belgium-Luxembourg 43,405; France 3,626; Ireland 3,558.

COMMODITY REVIEW

METALS

Aluminum.—Output of aluminum by Anglesey Aluminum Ltd. at Holyhead, North Wales, jointly owned by the Kaiser Aluminum and Chemical Corp. (67%) and Rio Tinto Zinc Corp. (33%), was 99,000 tons in 1981, and in 1982 output was about 85,000 tons. The smelter had a capacity of 112,000 tons per year of aluminum metal, which was not reached because of the depressed economic conditions. The plant had two potlines with a total of 308 pots, each pot capable of processing about 650 tons per year of alumina. Most of the alumina used in-plant was supplied from Jamaica, Australia, and Suriname.

Up to 230 megawatts of electrical power was supplied to the plant from the United Kingdom National Grid Network via a connection at the nearby Wylfa Head nuclear power station. A contract, under the terms of which Alcan Aluminum (United Kingdom) Ltd. received 20,000 tons per year of primary aluminum from Anglesey, was ended by Kaiser after 12 years because the price was too low; the decision was not expected to affect production at the Anglesey smelter. Anglesey reported a pretax profit of $6.4 million in 1981, down from $8.7 million in 1980.

The British Aluminum Co. Ltd. (BACO) closed its 100,000-ton-per-year Invergordon smelter near Inverness at the beginning of 1982 because of high power costs. Besides four aluminum rolling mills, the company continued to operate an alumina plant at Burntisland and two aluminum smelters: one at Lochaber with a capacity of 37,000 tons per year and one at Kinlochleven with a capacity of 100,000 tons per year. Most of the alumina used in the Lochaber and Kinlochleven plants was supplied from Jamaica.

BACO managed a small trading profit of $1.3 million in the first 6 months of 1982,

but the high level of interest charges kept the company overall in the red, with a loss before tax of $6.1 million compared with a loss of $14.4 million reported in the same period in 1981.

Alcan Lynemouth Ltd., which owned and operated an aluminum smelter about 13 kilometers north of the Port of Blyth, was a wholly owned subsidiary of Alcan United Kingdom. In 1981, the plant produced, at full capacity, about 125,000 tons of aluminum per year, but in 1982 it operated at only about 85% of capacity because of the depressed market conditions. Alumina was supplied from Jamaica, but supplies were expected in the future from the Aughinish alumina plant, which was under construction in Ireland. The National Coal Board's (NCB) nearby Lynemouth-Ellington Mine supplied coal on a long-term contract to Alcan's own 390-megawatt power station, located less than 1-kilometer from the smelter.

In December, BACO and Alcan United Kingdom announced a merger of the two companies. Alcan made a cash offer of nearly $50 million to BACO for all of its ordinary and cumulative preference shares, which was accepted by the directors of BACO. Tube Investments Ltd., which currently owned 58.1% of BACO, agreed to accept this offer. The merger of the two companies could provide a viable and competitive United Kingdom aluminum operation in the long term. The new company would be called British Alcan Aluminum.

Iron and Steel.—BSC's operating loss in the 6-month period ending October 2, 1982, was $253 million after interest payments, better than the $341 million lost in the same period of 1981 but far below the target of breaking even over the business year of 1982-83.

BSC's losses in the financial year ending March 31, 1982, were about one-half of the 1980-81 deficit of $1,096 million. United Kingdom's output of steel for the first 10 months of 1982 averaged 276,500 tons per week, 5.6% below the 292,800 tons per week of the same period in 1981. The worst effects of the lower production were felt by BSC plants in the Teesside and Sheffield areas. British producers were hit by the higher level of imports, particularly from countries outside the European Economic Community (EEC). Non-EEC imports more than doubled from 1981 levels reaching at least 27% of the market, and came mainly from Sweden, Romania, the Republic of South Africa, Canada, and Japan. From mid-1981 to mid-1982 the British steel industry saw jobs cut by 11.7%, more than any of the other major EEC steelmakers.

In December, the British Government confirmed that all five of BSC's main steelmaking plants, Teesside and Scunthorpe in the north of England, Ravenscraig in Scotland, and Llanwern and Port Talbot in Wales, will be kept open for the next 3 years despite expected losses of about $13.6 million per week. Following the announcement, the BSC Chairman, Ian MacGregor, said the decisions will put great strains on the firm and that another 7,000 to 10,000 layoffs will occur. The decision to save the plants did not commit BSC to keep steel capacity at the level of 14.4 million tons.

Nickel.—The refinery at Clydach, Wales, of Inco Europe Ltd., a subsidiary of Inco Ltd. of Canada, has not produced nickel pellets or powder since May 1982 because of lack of demand. This was the biggest nickel metal production plant in Europe, with a capacity of about 54,500 tons per year. The plant produced charge nickel for the steel industry, nickel for the production of nonferrous alloys, and nickel for electroplating. A nickel oxide-matte came from Inco's operations in Canada and nickel sulfide matte came from Indonesia.

Tin.—Reported in situ reserves at South Crofty and Pendarves were 943,373 tons of 0.8% tin. Total annual output from South Crofty in the year ending March 1982 was a little over 260,000 tons of ore, and production of tin was 1,380 tons.

Underground lode mines at South Crofty and Pendarves continued to be the largest British tin producers, owned by Charter Consolidated Ltd. and RTZ Ltd. on a 60:40 basis. South Crofty was located at Pool, between the towns of Redruth and Camborne; it consisted of a group of 12 old mines, including the following: Rockear, Dolocath, Cook's Kitchen, South Crofty, Tincroft, East Pool, Wheal Agar, and Great South Tolgus. Pendarves was a small mine with 80 employees to the southwest of Camborne.

Tin minerals occurred in the South Crofty Mines, mainly in an east-northeast striking series of veins in medium-grained granite. The distribution of cassiterite, within all bodies, was very irregular. Working levels were up to 680 and 730 meters underground (Robinson's and New Cook's Kitchen Mines). A total of 588 persons were em-

ployed in 1982 by the South Crofty and Pendarves Mines including all surface facilities and staff. Tin concentrates were shipped to the Capper Pass smelter in North Ferriby, a wholly owned subsidiary of RTZ.

Capper Pass Ltd. was investing in a modernization program at the works; this included a new electric-arc furnace and a fluidized-bed, coal-fired boiler, together with a number of environmental control plants.

At the Wheal Jane Mine, also in Cornwall, under a new contract Thyssen, Great Britain Ltd. deepened the Clemows shaft to 510 meters; installed a new underground crusher station, loading pockets, and ore passes; equipped the shaft extention; and carried out some development drivage. The principal levels were at depths of 168 and 288 meters. A new level was also opened at a depth of 468 meters. The mine produced 276,000 tons of tin ore and 1,500 tons of tin concentrates in 1981, including both high-grade (35% tin) and low-grade (9% tin) concentrates. In addition, a zinc concentrate (45% zinc) was produced that accounted for 25% of the total annual revenue of approximately $16.4 million. Production of ore restarted in June 1980 following the purchase and refurbishing of the mine and mill by Carnon Consolidated Tin Mines Ltd., a wholly owned subsidiary of RTZ.

At the Geevor Tin Mines Ltd.'s underground lode mines at Pendeen, production of tin ore was 134,233 tons in 1981-82. In situ reserves of tin ore as of January 1, 1982, were estimated to be 940,716 tons containing 0.89% tin. In addition to ore mined from underground, the Geevor mill treated material reclaimed from old dumps estimated at 60,150 tons. Total production of concentrates during 1981-82 was 1,295 tons, an average of 65% tin grade. The weakness in the world tin market hit Geevor in the 6-month period ending September 30, 1982, and the average price the veteran Cornish producer received for its tin was $11,247 per ton, down from $11,468 in the comparable period of 1981.

Wheal Concorde, a small underground tin operation at Blackwater, north of Redruth, Cornwall, was to close temporarily with the loss of 40 jobs. According to a local report, the mine was to remain on a care and maintenance basis while the company seeks further capital to construct its own mill at the mine.

Since opening 18 months ago, the mine had produced 21,000 tons of ore that was treated on a custom-mill basis by Carnon Consolidated at its Wheal Jane operation. However, this was not commercially successful.

Titanium.—A new $41 million titanium granule plant was opened at Deeside, by Deeside Titanium Ltd. The plant had a capacity of 5,000 tons per year of titanium and was the only European producer of titanium granules, after an existing Imperial Chemical Industries Ltd. (ICI) smelter facility closed down at the end of 1982. Deeside Titanium is a joint venture of Billiton (United Kingdom) Ltd. (62.5%), Rolls Royce Ltd. (20%), and Imperial Metal Industries (17.5%).

The present United Kingdom titanium sponge capacity of about 2,700 tons per year was also expected to increase to about 5,000 tons per year in 1982.

Tungsten.—Amax Exploration of the United Kingdom on October 16, 1981, applied for planning permission to opencast the Hemerdon tungsten deposit near Plymouth. A public enquiry, which opened in Plymouth in September 1982, was expected to last 6 weeks, and results were expected sometime during the first quarter of 1983. The deposit could only be economically worked by open pit. Reserves were reported to be 45 million tons carrying 0.18% WO_3 and 0.025% tin.

NONMETALS

Barite.—One of the largest barite operations in the United Kingdom was the Closehouse Mine at Lunedale in County Durham, which had a processing plant at Stockton-on-Tees. This was purchased by Fordamin Co. Ltd., a subsidiary of English China Clays Ltd. (ECC), from Athole G. Allen Ltd. in 1981. In 1982, production of barite at Lunedale was estimated at about 10,000 tons.

The Sanbar Minerals Co. Ltd.'s plant at Dufton Fell in Cumbria came onstream in May 1982 with an initial production capacity of 10,000 to 12,000 tons per year of barite. The feed material, containing 50% to 85% $BaSO_4$, was obtained from extensive high-grade dumps near the plant.

Operational and financial difficulties at the SPO Minerals Ltd. plant at Brassington, in Derbyshire, continued in 1982 and the company intended to sell the plant. The plant was planned to treat barite-lead-fluorspar ores from a number of locations, including dumps, producing 33,600 tons per year of barite. Dresser Industries Inc. was

involved in exploring and investigating a possible barite mining operation near Aberfeldy, Tayside, Scotland.

China Clays.—ECC was the largest producer of china clay in the world, with a capacity of about 3 million tons per year. The company had producing subsidiaries in the United States, France, Australia, Belgium, Sweden, and Italy.

The Cornwall-based group ECC reported that its clay division had commissioned a new processing plant enabling less efficient units to be closed. In October 1982, a new distribution depot was opened at Cliff Vale, Stoke-on-Trent. The depot provided a direct rail link from the center of china clay production in St. Austell, Cornwall, to the center of the country's pottery industry in Stoke-on-Trent, Staffordshire. In the initial phase the rail link will carry up to 150,000 tons of clay per year to the new 6,000-ton-capacity depot.

Fluorspar.—Owing to the recession, the plant of Laporte Industries Ltd. was operating at only 50% of capacity. The company continued to be the United Kingdom's largest fluorspar-producing company with 150,000 tons per year capacity at its Cavendish mill near Stoney Middleton in Derbyshire.

Aberdeen Barytes Co. Ltd. (Dresser Minerals) was the other major producer of fluorspar. In 1982, the company was working only one mining operation at Conksbury Lane, near Youlgreave, where the grade of fluorspar ranged from 20% to 35% CaF_2. The plant, located at Ryder Point near Wirksworth with a capacity of 80,000 tons per year, was virtually shut down owing to the recession.

BSC, which had three mines, operated only the Whiteheaps Mine at Blanchland in Durham County. Two others were held on a care and maintenance basis. The briquetting plant at Blackdene had a capacity of 50,000 tons per year of 90% CaF_2 as briquettes, but owing to decreased demand, it was producing at a reduced rate.

Potash.—The Boulby Mine, owned by Cleveland Potash Ltd. and located in northeast England between the villages of Loftus and Staithes on the North Sea coast, was shut down for 3 weeks in January 1982, owing to the depressed market and imports of potash from the German Democratic Republic.

In the 1981-82 year ending June 30, production of potash decreased by 40,000 tons compared with that of 1980-81, and totaled 277,000 tons. This year marked a very large expansion in domestic sales of home-produced potash. The share of domestic potash sales to total sales increased from 57% in 1980-81 to 82% in 1981-82. Domestic sales in 1981-82 totaled about 207,000 tons of potash and export sales amounted to 45,000 tons.

MINERAL FUELS

The United Kingdom was self-sufficient, overall, in energy requirements, largely as a result of continuing increases in North Sea oil production. In 1982, total primary energy consumption from fossil fuels and hydroelectric and nuclear generation in the United Kingdom was 311 million tons of SCE including coal, 111 million tons; petroleum, also 111 million tons; gas, 71 million tons; nuclear energy, 16 million tons; and hydroelectric energy, 2.3 million tons.

In 1982, the United Kingdom used 1.8% less energy compared with that of 1981. A significant proportion of the decline was due to the continued economic recession. Energy use dropped most sharply in the fourth quarter of 1982, when consumption of primary fuels dropped by 5.1% to 85.3 million tons of SCE.

Coal.—In 1982, there were 197 operational mines, with 209,927 employees. Between March 1974 and June 1982 the employment decreased by 37,455 employees. Among the mines, 63 opencast mines were in production, operated by about 20 different contractors. During 1981-82, 12 sites completed their coal operations and 13 new ones were commissioned.

The importance of opencast coal production was shown by total sales during 1981-82 of $900 million, compared with $6,100 million for deep mined coal. Opencast mines yielded an operating profit of $257 million; in contrast, underground mines recorded a loss of $436 million.

The United Kingdom's recoverable reserves of coal were estimated by the NCB as 15% of the Organization for Economic Cooperation and Development reserves, or 7% of the world total. Offshore exploration by the NCB from 1979-82 included drilling of 126 boreholes totaling approximately 43,000 meters, of which 75% were cored.

Under the Coal Plan (1974), which was recently reaffirmed by the Government, large investments to improve productivity were undertaken as follows, in million

dollars:

	1980-81	1981-82
Capital investments	1,328	1,343
Government subsidy	417	943
Operating grants	287	746
Social grants	130	197

Falling demand, resulting from the economic recession together with resistance from the industry work force to the closure of less efficient mines, required the Government's continued and even increased involvement.

In 1982, the Selby mining complex in North Yorkshire represented one of the most important new underground coal projects in the United Kingdom. The total cost was estimated at $1.6 billion. Five pairs of shafts were being sunk across the 285-square-kilometer coalfield, of which three were completed in 1982.

A 12-year contract was awarded by the NCB for the operation of a new opencast coal site at East Chevington, Northumberland. The contract, awarded to Derek Crouch (contractors), involved the extraction of 3.5 million tons of coal from a 260-hectare site over 10 years.

Coal reserves at the Kinneil colliery in Scotland were found to be unworkable and the mine was to close.

Natural Gas.—Preliminary figures for 1982 showed that 108 billion cubic feet of natural gas was supplied into the public supply system, 2.0% less than in 1981. The British Gas Corp. (BGC) made a promising North Sea gas discovery about 30 miles from the Humber estuary in the southern part of the sea in block 47-9B. The corporation, as operator of an international drilling consortium, said that it tested good-quality natural gas at attractive flow rates. The discovery was the fourth find made by BGC since the beginning of 1981. Three of the potentially commercial discoveries were gas, while the fourth was an oil find onshore. BGC was told by the Government that it must concentrate on gas exploration and production and the Energy Minister stated that any oil discovered was likely to be sold, either to the public or to other oil companies. Participating in the 47-9B discovery were BGC (73-1/3%), Amerada Petroleum Inc. (16-2/3%), and Texas Eastern North Sea (United Kingdom) Ltd. (10%). Further north, North Sea oil companies were expected to develop three new gasfields at a cost of over $1.6 billion as a result of supply contracts negotiated with BGC.

In the Oil and Gas (Enterprise) Act of 1982, the special privileges enjoyed by BGC in the purchase of natural gas were removed, enabling private companies to sell gas direct to large consumers. The Government has encouraged the search for new gasfields by the inclusion of part of the established gas province in the southern North Sea in the areas on offer under the Eighth Licensing Round.

The Far North Liquid and Associated Gas System pipeline, which will bring associated gas from the Brent Oilfield to St. Fergus in Scotland, was commissioned after the investment of $1.64 billion, and first gas deliveries to BGC commenced in June 1982. This pipeline will also collect associated gas from other North Sea oilfields in the future. From St. Fergus another pipeline was under construction linking the terminal to central Scotland and northern England where it was to link up with the existing gas transmission system.

Petroleum.—Production of crude oil reached 2.3 million barrels per day, which was in excess of the United Kingdom's own requirement. It could not be guaranteed that the production rate would continue at that level, however, especially in the 1990's. Some of the larger fields that have been in production for some time have reached their maximum output and some were beginning to decline. During the year, the United Kingdom had 20 producing fields offshore. Total crude oil output amounted to 753 million barrels, an increase of 15.7% over that of 1981.

The Beatrice Field, which came onstream in September 1981, was officially inaugurated in June, a few days after British Petroleum Ltd. agreed to sell its 15% share in the British National Oil Corp. (BNOC) operated group to The Lasmo Co. Lasmo paid about $123 million, backdated to January 1, 1982.

First oil from Shell Ltd. and Esso (United Kingdom) Ltd.'s North Cormorant and Fulmar Fields was produced in February. North Cormorant, which produced an average of 34,200 barrels per day in August, will have a peak production level of 180,000 barrels per day by 1986. Fulmar had a similar peak production level set for 1985.

Marathon Ltd.'s South Brae Field production was expected to start in mid-1983. Reserves were estimated at 300 million barrels.

Marathon is expected to complete its appraisal of the Brae B structure in the fall of 1982. Hamilton Bros. confirmed a discovery, Duncan, 4 miles west of their Argyll Field, following a 90-day production test.

BNOC split its operations into Britoil Ltd. (exploration and production) and a reconstituted BNOC (oil trading activities). The sale of 51% of Britoil to the public would raise about $1,000 million to $1,200 million for the Treasury.

The Government decided not to impose depletion control on United Kingdom oil production, at least until yearend 1984, in a move welcomed by oil companies. The British Government was preparing the way for new tax rules to cover marginal fields in the North Sea, but changes were still under study in the Treasury Department.

The Energy Department approved a $1.6 billion project for development of Clyde Field in the North Sea by Britoil, in partnership with the Shell-Esso group.

Private companies were not interested in many of the oil exploration areas offered by the Government and concentrated their bids on possible gas producing concessions off Yorkshire and Lincolnshire. This became apparent when the Energy Department announced that the number of applications in the eighth round of licensing was well below the previous round; only 60 applications were received for the 184 blocks on offer. Companies also were more interested in gas exploration because under recent legislation they would be allowed to market the fuel themselves. In the past, BGC had the monopoly right to buy North Sea gas.

The Mineral Industry of Venezuela

By H. Robert Ensminger[1]

The Venezuelan economy showed a decline of about 1.5% relative to that of 1981. The gross domestic product decreased from $67.68 billion in 1981 to an estimated $67.58 billion[2] at current prices.

The Government fight against inflation has been modestly successful, reducing the 1981 rate of 11% to 10.5% in 1982, which was much below the 19.6% rate of 1980.

The volume of exported petroleum and refinery products, as well as their value, decreased in 1982 relative to that of 1981. Declining revenues from petroleum exports and persistent capital outflow forced the Government to implement strict austerity measures in 1982.

The expenditures for development of the Orinoco heavy oil belt in the Sixth National Plan (1981-85) originally were to have been $37 billion. Owing to reduced oil revenues, this planned investment was lowered to about $21 billion in 1982. A further reduction, to about $16 billion, is likely in 1983.

At yearend, Corporación Venezolana de Guayana (CVG), the industrial development corporation for the State of Guayana, was seriously considering the sale of its share in several iron, steel, and aluminum companies to Fondo de Inversiones (FIV), the National Government investment fund. CVG has minority shares in the FIV-dominated iron company C.V.G. Ferrominera Orinoco C.A., the steel company Siderúrgica del Orinoco C.A. (SIDOR), the alumina company Interamericana de Alumina C.A. (INTERALUMINA), and the aluminum firms Industria Venezolana de Aluminio C.A. (VENALUM) and Aluminio del Caroni S.A. (ALCASA). CVG will very likely transfer its majority shares in the bauxite company C.V.G. Bauxita Venezolana C.A. (BAUXIVEN) to FIV in 1983.

PRODUCTION

Petroleum continued as the backbone of Venezuela's mineral production, but production declined by about 10% compared with that of 1981.

Aluminum production fell by an estimated 17% or about 54,000 tons from that of 1981. VENALUM's production was off approximately 26% to about 150,000 tons while ALCASA's production declined about 15% to 94,000 tons.

Raw steel production for 1982 reached a record 2.3 million tons, an increase of approximately 6% over that of 1981. Venezuela produced an estimated 2.4 million tons of pig iron in 1982.

Production of iron ore and concentrate fell to an estimated 12 million tons from 15.5 million tons in 1981.

Gold production for 1982 was estimated to be about 28,000 troy ounces.

Table 1.—Venezuela: Production of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1978	1979	1980	1981[p]	1982[p]
METALS					
Aluminum, unalloyed ingot	74,384	227,444	327,900	313,523	e260,000

Unspecified thousand 42-gallon barrels	2,146	3,938	2,292	1,870	1,479
Total do	361,893	368,570	341,467	319,014	317,802

[e]Estimated. [p]Preliminary. NA Not available.
[1]Table includes data available through July 1, 1983.
[2]Total includes sponge iron.
[3]Data prior to 1981 were based on figures taken from the Memoria y Cuenta published annually by the Ministerio de Energia y Minas. Some of this information is not compatible with 1981 figures but will be adjusted when more reliable data become available.
[4]From nonassociated natural gas only.
[5]Includes associated natural gas lease condensate and natural gasoline. Lease condensate is included as follows, in thousand 42-gallon barrels: 1978—1,048; 1979—1,803; 1980—1,227; 1981—1,661; and 1982—1,771. Natural gasoline is included as follows, in thousand 42-gallon barrels: 1978—329; 1979—255; 1980—308; 1981—307; and 1982—293.
[6]Liquid equivalent.

TRADE

Petroleos de Venezuela S.A. (PDVSA) reported the value of exported crude petroleum and refined petroleum products dropped from $19 billion in 1981 to $15.6 billion in 1982. In 1982, 567 million barrels of crude petroleum was exported, of which 55% was heavy oil, less than 22° API gravity. In 1982, Venezuela exported approximately 51 million barrels of crude oil to the United States, which comprised about 10% of total crude oil exports and 3% of U.S. imports.

Export share of crude oil by each PDVSA subsidiary company was as follows: Lagoven S.A., 41%; Maraven S.A., 29%; Meneven S.A., 16%; and Corpoven S.A., 14%.

Iron ore exports for 1982 were off about 30% from those of 1981, which in turn had shown a 5% increase over those of 1980. Much of the decline resulted from the cancellation of a 1.4-million-ton-per-year contract by the Bethlehem Steel Corp. Venezuela exported an estimated 3.6 million tons of iron ore to the United States in 1982, which was about 24% of total U.S. imports.

Venezuela concluded a broad-ranging steel trade agreement with Brazil, Mexico, and Argentina. The agreement allows Venezuela to export surplus steel production to these countries and import steel products on preferential terms. The agreement is to take effect in 1983.

COMMODITY REVIEW

METALS

Aluminum.—The total aluminum production by VENALUM and ALCASA for 1982 was far below that of 1981. The large decrease in production in 1982 was the result of several factors. The damage to 250 pots at the VENALUM facility resulted in a major reduction in production in 1981, which carried over into 1982. The worldwide demand for aluminum decreased dramatically in 1982. Fire swept the anode fabricating plant at the VENALUM facility in March, halting all anode operations for at least 3 months. Damage was estimated at over $3 million.

A 3-year labor contract, valued at approximately $60 million, was agreed to by VENALUM executives and 1,600 workers in October 1982. In December 1982, the Export-Import Bank authorized a direct credit of $12 million toward the expansion of ALCASA's aluminum rolling and foil mill in Guacara, State of Carabobo. VENALUM has firm contracts for the sale of 200,000 tons of aluminum in 1983, of which 170,000 tons will go to Japan. Next year's sales are guaranteed by the 10-year sales contracts agreed upon with Japan and the renegotiated supply contracts with other companies. These provide for the exchange of ingot against supplies of alumina. VENALUM announced the signing of barter agreements with Jamaica to exchange aluminum for alumina. The agreements call for 900,000 tons of alumina to be supplied over 3 years. VENALUM was negotiating with other suppliers for additional barter agreements and was also scheduled to begin negotiations with INTERALUMINA on alumina purchases.

Bauxite.—BAUXIVEN will begin development of the Los Pijiguaos bauxite deposit, which is located in the northwestern part of the State of Bolívar. Mining is scheduled to commence in 1984 with an initial output of 2.65 million tons per year, increasing to 3.3 million tons per year in 1985. The Los Pijiguaos bauxite deposit contains 117 million tons of proven reserves and 500 million tons of potential reserves. The Los Pijiguaos operation will allow Venezuela to realize its aim of having an integrated aluminum industry.

FIV has provided $600 million for the initial phase of the bauxite project, consisting of basic and detailed engineering, preliminary minesite work, and required geological and related technical studies. The preparatory work for the bauxite project will employ 1,600 people during the first phase of construction. The bauxite mining operation itself will employ 500 people with an additional 2,000 people needed for support operations.

Venezuela was negotiating with Guyana to buy a substantial amount of bauxite for its aluminum industry. The original amount discussed was up to 1.8 million tons over 3 years, but after differences on contract terms were negotiated, the volume was reduced to 350,000 to 400,000 tons per year.

INTERALUMINA, Venezuela's new $1.25 billion alumina refinery, was 91% completed at yearend. It is expected to begin production in early 1983 and expects to reach its production capacity of 1 million tons per year by 1985. The plant will initially receive bauxite from Brazil, Sierra Leone, Suriname, and Guyana, if an agreement is reached.

Iron and Steel.—The 1982 revenue from raw steel sales was $965 million. This was an increase of about 7.5% over that of 1981.

At least 5.5 million tons of annual steelmaking capacity, planned to be built through 1995, has been deferred by SIDOR indefinitely because of projected slow growth and the lack of public sector financing. SIDOR, which has been under gradual development for the past 20 years, is to add 1.25 million annual tons of capacity by 1985, which was originally planned for by 1983.

Initial funding of $2.3 billion for the coal and steel project in the State of Zulia was approved by the National Government. The complete project will cost about $5.4 billion over the next 10 to 15 years. Corporación del Zulia C.A. (CORPOZULIA), the state-owned regional development organization, oversees the entire coal and steel project while Siderúrgica del Zulia C.A. manages the steel segment.

Steel wire rod from Venezuela was dumped in the U.S. market at prices 40% below fair value according to the U.S. Department of Commerce.

SIDOR intends to increase its 1983 output to 2.4 million tons while improving productivity; however, losses of $11.1 million are forecast primarily owing to servicing of the firm's debt of $3.25 billion.

In 1982, SIDOR sold 1.5 million tons of steel products to Venezuelan buyers and 240,000 tons to international clients. SIDOR's marketing projections for 1983 are 1.6 million tons to the domestic market and 300,000 tons internationally.

Charges were filed with the European Economic Community (EEC), by the West German and Italian steelmakers, that Venezuela and other countries had dumped steel products in European markets. Should any action be forthcoming from the EEC, Venezuela has threatened to take reciprocal action.

SIDOR's 2.1-million-ton-per-year stage two HYL direct-reduction iron plant underwent modifications in September 1982. It is expected to be ready for problem-free operation in about 6 months time, after more extensive repairs have been carried out.

Minerales Ordaz C.A., owned jointly by CVG and United States Steel Corp., permanently closed its high iron briquet plant at

Puerto Ordaz. Each partner will absorb about a $50 million loss. The plant is to be torn down and the equipment sold.

Ferrominera's iron ore production decreased approximately 19% from 1981 figures. Export figures in 1982 showed a decrease of 30% while domestic sales showed an increase of about 33% over those of 1981.

Ferroalloys.—Ferrosilicio de Venezolana S.A., the Government-owned ferrosilicon producer, was accused of dumping ferrosilicon in the European market at prices 26% or more below its production costs. The complaint was lodged by the Chambre Syndicale del Electrometallurgie of Italy and by Ferrolegierungen Stahl und Leichtmetallveredler of the Federal Republic of Germany on behalf of nine EEC producers representing about 85% of the EEC ferroalloys industry.

MINERAL FUELS

Coal.—An estimated 61,000 tons of coal was mined in Venezuela in 1982, a 25% increase over 1981 production. Semibituminous coal reserves were estimated at 3.6 billion tons by the Ministry of Energy and Mines.

The first phase of the Zulia coal project will be delayed from 1985 until late 1986 or early 1987 as announced by Carbones del Zulia C.A., the coal management arm of CORPOZULIA. The delay was attributed to problems in obtaining financing and to political problems.

Petroleum and Natural Gas.—Venezuela's proven oil reserves for 1982 were increased 1.2 billion barrels to 21.7 billion barrels. The increase in reserves is largely the result of continued delineation of heavy oil deposits in the Orinoco heavy oil belt.

At yearend, the Venezuelan Government was close to concluding a major supply and refining agreement with Veba AG of the Federal Republic of Germany, involving up to 100,000 barrels per day of heavy crude oil from the Orinoco heavy oil belt. Should an agreement be reached, Veba would become the first major long-term client for the heavy crude oil. PDVSA was also exploring a joint venture with Veba concerning a new heavy oil refinery in the Federal Republic of Germany.

The investment most affected by the 18% reduction in 1982 petroleum export revenues was the Desarrollo del Sur de Mongas y Anzoátegui (DSMA) heavy crude petroleum upgrading facility located in the States of Anzoátegui and Mongas. Lagoven, a subsidiary of PDVSA, originated plans for the DSMA project, which called for investments of $7 billion through 1988, to build a 125,000-barrel-per-day facility; however, the projected expenditures were reduced by about $2.3 billion. In addition, PDVSA's operating budget was cut by approximately $460 million.

Venezuela had 1.33 trillion cubic meters of proven natural gas reserves in 1982, an increase of 200 billion cubic meters over that of 1981.

The Mineral Industry of Yugoslavia

By Roman V. Sondermayer[1]

Shortages of fuels, electric power, capital, and foreign exchange, as well as the world economic slowdown, hampered activities of the mineral industry of Yugoslavia during 1982.

Restrictions imposed by the Government on investments and new foreign loans slowed down development. The more prominent minerals, with Yugoslav production expressed as a percentage of 1982 world output, were as follows: antimony, 2% to 3%; bauxite, 3% to 4%; lead (mine), 3% to 4%; bismuth, 2% to 3%; zinc (mine and smelter), 2% to 3%; and copper ore, refined copper, and aluminum, all 1% to 2%.

In 1981, the latest year for which complete data were available, the mineral industry's share of the gross social product was 7.4% and the mineral industry employed 6.1% of the total working labor force. By sectors, the value of production and number of persons employed in the mineral industry are shown in the following tabulation:[2]

Branch	Production value (million dinars)	Employment (thousands)
Coal:		
Production	22,635	56.4
Processing	2,374	3.3
Crude oil:		
Production	15,711	4.1
Processing	14,225	10.1
Iron and steel:		
Iron ore production	1,440	5.0
Steel production	25,957	54.8
Nonferrous metals:		
Production of ores	10,655	29.2
Metal production	7,233	17.4
Metal processing	7,973	14.4
Nonmetallics:		
Production	4,037	12.9
Processing	17,221	51.6
Sand and gravel	7,460	24.2
Construction materials	26,359	76.0
Total	163,280	359.4

The major events in the mineral industry included the completion of a new copper mine and mill at Krivelj, completion of the first nickel-producing facility in the country at Kavadarci, startup of a new coke battery at Zenica, and the awarding of a concession for joint exploration ventures to Industrija Nafte (INA), the Yugoslav Government's petroleum company, and foreign oil companies in Yugoslav territorial waters in the Adriatic Sea.

PRODUCTION

The latest trends in the production of minerals by the mineral industry of Yugoslavia, which is all Government-owned, are shown in table 1.

Petroleum —Continued					
Refinery products[9] —Continued					
Other ____ thousand 42-gallon barrels	--	--	2,458	11,257	NA
Total[9] ____ do ____	99,565	108,525	96,097	95,008	NA

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through June 16, 1983.

[2]In addition to the commodities listed, germanium, bentonite, common clay, and diatomite are also produced, and tellurium may be recovered as a copper refinery byproduct, but available information is inadequate to make reliable estimates of output levels. Mercury production was discontinued because of low prices.

[3]Reported figure.

[4]Includes undetermined quantity of secondary raw material.

[5]Calculated as the difference between reported total and reported primary figure.

[6]Calculated as the difference between reported total and reported secondary figure.

[7]For ore production, see under "Lead."

[8]Calculated from pyrite and pyrrhotite concentrate; using 42% as average sulfur content.

[9]Excludes refinery gas, which was as follows, in million cubic feet: 1978—14,086, 1979—15,050, and 1980 and 1981—not available.

TRADE

Foreign trade in minerals is shown in tables 2 and 3 for the latest years for which complete data are available. During 1981, imports of minerals shared 38% in the total value of the country's imports. Imports of fuels accounted for 63% of total mineral imports. Exports of minerals were 17% of total country exports.

Table 2.—Yugoslavia: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
METALS				
Aluminum:				
Ore and concentrate ____	246,821	266,055	--	Canada 125,253; Romania 76,721; U.S.S.R. 64,057.
Oxides and hydroxides ____	653,424	633,127	--	U.S.S.R. 521,987; Poland 94,424; Czechoslovakia 16,716.
Metal including alloys:				
Scrap ____	276	177	--	West Germany 91; France 86.
Unwrought ____	53,872	58,471	--	East Germany 34,025; Czechoslovakia 5,500; France 4,300.
Semimanufactures ____	57,395	48,210	8,617	Czechoslovakia 14,068; East Germany 5,372; West Germany 2,976.
Antimony: Metal including alloys, regulus ____	1,055	1,220	--	U.S.S.R. 820; Bulgaria 400.
Cadmium: Metal including alloys, all forms ____	105	35	--	Czechoslovakia 30; Hungary 4.
Chromium:				
Ore and concentrate ____	11,537	12,463	--	All to Czechoslovakia.
Oxides and hydroxides ____	4	10	--	All to West Germany.
Cobalt: Oxides and hydroxides ____ value	$1,341	$3,915	--	All to Switzerland.
Columbium and tantalum: Metal including alloys, all forms, tantalum ____ do	--	$41,258	--	All to West Germany.
Copper:				
Ore and concentrate ____	16,131	--		
Matte and speiss including cement copper ____	--	252	--	All to Bulgaria.
Sulfate ____	10,535	7,355	--	Italy 7,208; Tunisia 80; Netherlands 40.
Metal including alloys:				
Scrap ____	6,129	4,035	--	Italy 2,139; West Germany 1,088; Albania 366.
Unwrought ____	14,334	13,801	3,107	Italy 3,991; United Kingdom 3,257; East Germany 2,209.
Semimanufactures ____	34,685	36,211	4,122	Italy 6,568; West Germany 5,275.

MINERAL FUELS AND RELATED MATERIALS —Continued				
Petroleum refinery products —Continued				
Distillate fuel oil -42-gallon barrels	104,589	264,614	2,447	Austria 174,676; West Germany 43,850; Greece 9,370.
Lubricants do	396,620	370,265	--	West Germany 256,123; Czechoslovakia 52,367; Switzerland 19,768.
Residual fuel oil do	46,720	26,094	--	Malta 10,117; U.S.S.R. 4,862; Panama 4,043.
Bitumen and other residues do	r42	64,181	--	Lichtenstein 43,765; Switzerland 18,047; Austria 2,260.
Bituminous mixtures do	2,612	3,254	--	Libya 2,551; U.S.S.R. 400; Bulgaria 158.
Petroleum coke do	23,892	42,906	--	All to West Germany.
Tars and other crude chemicals derived from coal, gas, and petroleum	43,090	44,737	--	Italy 42,193; West Germany 1,215; France 952.

rRevised. NA Not available.
[1]Less than 1/2 unit.
[2]May include other precious metals.

Table 3.—Yugoslavia: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals, unspecified	118	122	3	France 80; Italy 30; West Germany 9.
Aluminum:				
Ore and concentrate	217,595	394,180	--	Guinea 323,146; Greece 32,373; Ghana 14,415.
Oxides and hydroxides	1,285	60,623	14	Guinea 57,429; France 1,961; West Germany 1,148.
Metal including alloys:				
Scrap	[1]	--		
Unwrought	58,638	51,833	9	U.S.S.R. 42,992; Netherlands 2,495; Egypt 2,284.
Semimanufactures	8,592	16,419	2	United Kingdom 5,730; France 3,394; West Germany 2,689.
Antimony:				
Ore and concentrate	4,201	--		
Metal including alloys, regulus	[1]	--		
Beryllium: Metal including alloys, all forms value	$6,310	$8,111	--	Denmark $7,322; West Germany $789.
Bismuth: Metal including alloys, all forms	4	[1]	--	All from Switzerland.
Cadmium: Metal including alloys, all forms	--	12	12	
Chromium:				
Ore and concentrate	278,799	325,498	--	U.S.S.R. 88,388; Philippines 5,078; Albania 223.
Oxides and hydroxides	784	728	--	U.S.S.R. 550; West Germany 115; Switzerland 43.
Cobalt: Oxides and hydroxides	17	53	3	West Germany 39; Netherlands 6; Austria 2.
Columbium and tantalum: Metal including alloys, all forms, tantalum	1	2	1	West Germany 1.
Copper:				
Ore and concentrate	47,817	11,561	--	Peru 10,755; Italy 806.
Sulfate	1,030	1,025	--	U.S.S.R. 1,018; Switzerland 6.
Metal including alloys:				
Scrap	--	88	--	All from Nigeria.
Unwrought	50,412	67,037	2	Zambia 31,023; Chile 16,943; Peru 10,160.
Semimanufactures	2,309	5,544	9	West Germany 2,693; Italy 1,263; Poland 600.

See footnotes at end of table.

Table 3.—Yugoslavia: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Iron and steel:				
Iron ore and concentrate:				
Excluding roasted pyrite thousand tons	1,640	1,360	--	Peru 757; India 231; Mauritania 174.
Pyrite, roasted	50	--		
Metal:				
Scrap	395,759	479,327	(1)	U.S.S.R. 328,597; Bulgaria 37,510; Poland 24,928.
Pig iron, cast iron, related materials	48,677	97,858	1	Venezuela 25,106; West Germany 21,836; Brazil 20,355.
Ferroalloys:				
Ferrochromium	130	118	--	West Germany 85; Sweden 30.
Ferromanganese	903	539	--	West Germany 420; France 70; Norway 21.
Ferromolybdenum	740	522	--	Austria 248; Sweden 114; West Germany 79.
Ferrosilicomanganese	--	15	--	All from France.
Ferrosilicon	1,519	1,556	--	West Germany 1,385; France 141; Norway 23.
Unspecified	3,592	3,225	--	West Germany 1,381; France 1,334; Austria 290.
Steel, primary forms	994,908	925,956	557	Czechoslovakia 313,770; U.S.S.R. 201,026; Spain 66,484.
Semimanufactures:				
Bars, rods, angles, shapes, sections	222,768	271,284	3	Czechoslovakia 64,463; Poland 33,218; U.S.S.R. 30,318.
Universals, plates, sheets	471,182	566,219	54	Czechoslovakia 100,807; Italy 85,038; West Germany 73,282.
Hoop and strip	129,432	111,932	5	Poland 35,659; West Germany 35,382; U.S.S.R. 9,780.
Rails and accessories	28,499	5,795	--	West Germany 2,276; Austria 1,840; U.S.S.R. 1,627.
Wire	43,374	37,464	2	Czechoslovakia 14,775; West Germany 5,516; Austria 3,369.
Tubes, pipes, fittings	69,601	85,357	18	East Germany 18,328; West Germany 15,552; Italy 11,692.
Castings and forgings, rough	2,639	2,722	27	Czechoslovakia 1,015; West Germany 451; Spain 407.
Lead:				
Ore and concentrate	2,731	1,023	--	All from Greece.
Oxides	2,994	2,939	4	Austria 1,028; Bulgaria 822; East Germany 460.
Metal including alloys:				
Unwrought	10,161	12,118	--	Peru 6,588; Mexico 3,445; Bulgaria 994.
Semimanufactures	23	62	10	West Germany 35; France 12; Austria 5.
Magnesium: Metal including alloys:				
Scrap	--	(1)	--	All from United Kingdom.
Unwrought	863	35	--	Norway 24; France 10.
Semimanufactures	14	45	--	Switzerland 25; Austria 12; West Germany 4.
Manganese:				
Ore and concentrate, metallurgical-grade	131,053	87,741	--	U.S.S.R. 41,211; Botswana 28,719; Gabon 15,945.
Oxides	1,176	965	--	Netherlands 200; West Germany 192; Belgium-Luxembourg 158.
Mercury 76-pound flasks	541	1,305	NA	West Germany 522; United Kingdom 435; Netherlands 261.
Metalloids:				
Arsenic:				
Oxides and acids	102	101	(1)	Belgium-Luxembourg 68; West Germany 17; France 8.
Metal including alloys, all forms	85	56	--	Netherlands 25; West Germany 18; Belgium-Luxembourg 12.
Silicon	226	408	(1)	France 309; East Germany 94.
Unspecified	--	126	--	West Germany 76; U.S.S.R. 50.
Molybdenum: Metal including alloys, all forms	15	15	--	Austria 13; United Kingdom 1.
Nickel:				
Matte and speiss	90	109	--	Netherlands 104; West Germany 5.

See footnotes at end of table.

Table 3.—Yugoslavia: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Nickel —Continued				
Metal including alloys:				
Scrap	(1)	(1)	--	All from West Germany.
Unwrought	1,960	2,150	1	U.S.S.R. 1,806; Canada 228; West Germany 106.
Semimanufactures	776	1,084	200	West Germany 382; U.S.S.R. 212; Italy 40.
Platinum-group metals: Metal including alloys, unwrought and partly wrought:				
Platinum value, thousands	$1,329	$1,164	--	U.S.S.R. $364; West Germany $305; Italy $27.
Unspecified do	$1,559	$2	$2	
Silver: Metal including alloys, unwrought and partly wrought thousand troy ounces	16,543	547	(1)	West Germany 322; Sweden 129.
Tin:				
Ore and concentrate	2	--		
Oxides	5	7	--	Mainly from West Germany.
Metal including alloys:				
Scrap	--	(1)	(1)	
Unwrought	1,031	959	(1)	Malaysia 440; Bolivia 165; China 158.
Semimanufactures	36	95	(1)	West Germany 62; East Germany 17; United Kingdom 10.
Titanium:				
Ore and concentrate	52,142	47,232	--	Australia 47,212; West Germany 20.
Oxides	1,961	1,760	120	West Germany 921; Belgium-Luxembourg 339; France 307.
Tungsten: Metal including alloys:				
Unwrought	12	5	--	Austria 4; Poland 1.
Semimanufactures	12	8	(1)	Netherlands 3; West Germany 2; Austria 1.
Uranium and/or thorium: Ore and concentrate	--	2	--	All from United Kingdom.
Zinc:				
Ore and concentrate	65,227	56,385	--	Peru 13,564; North Korea 13,555; Mexico 8,079.
Oxides	808	1,002	(1)	West Germany 725; Austria 156; Netherlands 73.
Metal including alloys:				
Scrap	(1)	--		
Unwrought	7,209	15,818	--	Zambia 6,702; West Germany 2,467; Algeria 2,033.
Semimanufactures	45	175	--	Italy 148; France 18; Belgium-Luxembourg 5.
Other:				
Ores and concentrates	1,832	5,728	--	China 2,516; Australia 1,249; Morocco 914.
Oxides and hydroxides	1,304	1,239	5	West Germany 566; Norway 205; Japan 174.
Ashes and residues	2,022	1,882	--	Austria 1,003; Switzerland 879.
Pyrophoric alloys	4	6	--	France 3; China 2.
Base metals including alloys, all forms	703	441	114	Netherlands 156; West Germany 54; China 35.
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	304	198	--	Denmark 92; Italy 55; West Germany 24.
Artificial: Corundum	1,460	1,510	2	West Germany 1,208; Austria 205; France 68.
Dust and powder of precious and semi-precious stones including diamond value	$572,550	$662,499	$8,899	U.S.S.R. $345,725; Switzerland $235,947; United Kingdom $33,795.
Grinding and polishing wheels and stones	656	667	15	Austria 264; Italy 120; West Germany 96.
Asbestos, crude	60,023	57,762	20	U.S.S.R. 36,136; Canada 10,265; Botswana 7,770.
Barite and witherite	1,146	490	--	Czechoslovakia 215; West Germany 203; U.S.S.R. 60.
Boron materials:				
Crude natural borates	32,717	40,061	21,547	Turkey 17,527; Italy 987.
Oxides and acids	69	879	--	U.S.S.R. 551; France 285; West Germany 22.

See footnotes at end of table.

Cement	793,007	659,971	--	U.S.S.R. 301,936; Hungary 134,731; Czechoslovakia 103,090.
Chalk	1,108	975	--	France 504; United Kingdom 231; Austria 140.
Clays and clay products:				
Crude:				
Bentonite	21	9	--	Austria 4; Italy 4.
Chamotte earth	2,078	2,981	(1)	Czechoslovakia 2,085; France 759; United Kingdom 60.
Fire clay	40,580	37,811	434	Czechoslovakia 35,386; Austria 820; United Kingdom 581.
Kaolin	86,363	76,214	610	Czechoslovakia 38,034; East Germany 13,098; Greece 9,131.
Unspecified	12,030	7,887	(1)	Poland 5,086; Czechoslovakia 2,246; West Germany 496.
Products:				
Nonrefractory	13,814	8,805	--	Czechoslovakia 5,656; Italy 1,430; Austria 1,050.
Refractory including nonclay brick	36,152	29,254	54	West Germany 12,240; France 7,862; Austria 6,651.
Cryolite and chiolite	1,113	200	--	Denmark 199.
Diamond:				
Gem, not set or strung, value	$531,982	$514,616	--	Belgium-Luxembourg $233,469; Switzerland $158,359; West Germany $122,788.
Industrial, value, thousands	$2,988	$1,481	--	United Kingdom $607; Italy $511; West Germany $149.
Diatomite and other infusorial earth	421	544	149	Italy 179; Austria 124; West Germany 44.
Feldspar, fluorspar, related materials:				
Feldspar	1,154	1,094	--	France 1,088; Italy 4.
Fluorspar	--	1	--	All from Netherlands and Italy.
Unspecified	5,716	6,374	(1)	China 3,483; France 1,462; East Germany 974.
Fertilizer materials:				
Manufactured:				
Ammonia	93,562	96,142	(1)	Hungary 60,350; Romania 16,098; U.S.S.R. 11,138.
Nitrogenous	304,050	375,070	1,000	Hungary 168,456; U.S.S.R. 102,268; Czechoslovakia 50,279.
Phosphatic	42,636	30,268	--	Tunisia 25,299; Romania 4,969.
Potassic	461,798	444,941	--	East Germany 265,479; U.S.S.R. 179,390.
Unspecified and mixed	101,355	94,474	53,480	Romania 15,731; Canada 9,935; Hungary 7,326.
Graphite, natural	1,843	1,601	2	Czechoslovakia 883; Austria 395; West Germany 250.
Gypsum and plaster	33	29	2	West Germany 21; Italy 6.
Halogens:				
Bromine	9	3	--	Mainly from Netherlands.
Chlorine	16,422	7,333	--	Bulgaria 6,904; Italy 331; Austria 58.
Iodine	60	86	--	Japan 70; West Germany 9; France 7.
Lime	60	200	--	All from Austria.
Magnesium compounds:				
Magnesite	50,417	58,664	--	Greece 23,210; Turkey 16,446; China 12,750.
Other	26,012	31,506	(1)	Greece 17,880; North Korea 5,000; Norway 4,656.
Mica:				
Crude including splittings and waste	687	539	--	West Germany 319; India 70; Norway 58.
Worked including agglomerated splittings	132	129	(1)	Czechoslovakia 49; Austria 35; Belgium-Luxembourg 21.
Nitrates, crude	2	--	--	
Phosphates, crude, thousand tons	1,383	1,058	--	Togo 471; Morocco 252; U.S.S.R. 108.
Pigments, mineral: Iron oxides and hydroxides, processed	2,154	3,261	--	U.S.S.R. 1,147; Spain 698; United Kingdom 620.
Precious and semiprecious stones other than diamond:				
Natural, value	$103,902	$165,991	--	West Germany $134,026; Sri Lanka $15,827; Belgium-Luxembourg $15,518.
Synthetic, do	$358,420	$144,615	$6,139	Switzerland $51,876; Austria $31,148; Czechoslovakia $22,305.

See footnotes at end of table.

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Pyrite, unroasted	68,413	49,232	--	U.S.S.R. 33,064; Cyprus 7,870; Albania 5,298.
Salt and brine	282,389	337,155	--	Romania 224,144; Tunisia 84,760; U.S.S.R. 19,282.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	211	1,104	--	Italy 371; Czechoslovakia 340; Austria 285.
Sodium carbonate, natural and manufactured	75,391	78,174	--	Romania 28,079; Bulgaria 21,926; East Germany 11,960.
Sodium hydroxide	272,958	199,351	--	France 62,273; Romania 52,741; West Germany 22,840.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	3,545	1,287	--	Italy 404; Austria 363; East Germany 280.
Worked	1,574	(1)	--	All from Italy.
Dolomite, chiefly refractory-grade	25	125	--	West Germany 120; Austria 5.
Gravel and crushed rock	44,493	11,728	--	Hungary 11,416; Belgium-Luxembourg 260; Czechoslovakia 34.
Limestone other than dimension	28,182	17,689	2	Hungary 14,999; Italy 2,688.
Quartz and quartzite	11,750	12,842	133	West Germany 7,890; Greece 4,698; Switzerland 62.
Sand other than metal-bearing	82,062	68,517	306	West Germany 28,373; Hungary 17,050; East Germany 16,924.
Sulfur:				
Elemental:				
Crude including native and byproduct	56,417	59,575	--	Poland 48,107; Mexico 5,472; West Germany 3,239.
Colloidal, precipitated, sublimed	506	479	--	West Germany 253; Poland 160; Italy 50.
Dioxide	529	337	--	All from Italy.
Sulfuric acid	63,913	107,915	(1)	Hungary 70,021; Greece 10,874; East Germany 8,000.
Other:				
Crude	14,728	19,182	1	Hungary 10,236; U.S.S.R. 4,200; Switzerland 2,758.
Slag and dross, not metal-bearing	439,950	255,144	--	Italy 244,841; Canada 4,861; Austria 4,735.
Oxides and hydroxides of barium, magnesium, strontium	64	76	--	East Germany 50; West Germany 21; Italy 2.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	19,855	24,790	--	Czechoslovakia 23,720; Austria 430; U.S.S.R. 405.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	2,615	1,418	807	Albania 600; Denmark 5; Netherlands 5.
Carbon: Carbon black	21,855	29,634	23	Italy 20,541; U.S.S.R. 3,831; France 2,635.
Coal:				
Anthracite	137,465	208,498	--	U.S.S.R. 207,008; West Germany 500.
Bituminous thousand tons	3,421	3,614	1,443	U.S.S.R. 1,633; Czechoslovakia 448; Poland 52.
Briquets of anthracite and bituminous coal	--	2,078	--	All from U.S.S.R.
Lignite including briquets	111,948	157,101	--	East Germany 97,495; U.S.S.R. 57,613.
Coke and semicoke	54,745	35,078	--	Italy 24,071; West Germany 6,493; United Kingdom 3,284.
Gas, natural million cubic feet	63	74	--	All from U.S.S.R.
Hydrogen, helium, rare gases	8	6	(1)	East Germany 2; Austria 1; Belgium-Luxembourg 1.
Peat including briquets and litter	9,722	8,198	--	Hungary 3,419; Poland 2,959; U.S.S.R. 1,713.
Petroleum and refinery products:				
Crude thousand 42-gallon barrels	81,215	69,364	--	U.S.S.R. 33,087; Iraq 10,403; Libya 7,379.
Refinery products:				
Liquefied petroleum gas do	974	1,122	(1)	Hungary 467; West Germany 322; Bulgaria 288.

COMMODITY REVIEW

METALS

Aluminum.—During 1982, a new deposit of bauxite was discovered at Glavica near Loborike in the general area of the city of Pula, Istria, Croatia. Based on preliminary results, reserves of the Glavica deposit were set at 2 million tons of bauxite. One of the largest bauxite producers in the country, Niksic Bauxite Mine, completed its exploration program in the vicinity of its mining areas near Niksic, Montenegro. Newly discovered bauxite reserves put total reserves of the enterprise at 37 million tons or 37% of the country's proven reserves of bauxite.

The new facilities at Titograd and Mostar aluminum smelters were not operating at rated capacities because of the reduced supply of electrical power during 1982.

Copper.—The Veliki Krivelj Mine started production on December 24, 1982. The opencast mine and mill are located in the copper belt of Yugoslavia near the town of Bor, northeastern Serbia. Krivelj is a division of the largest copper producer in the country, Government-owned Rudarsko Topionicarski Bazen Bor.

The yearly output of Krivelj is expected to reach about 8 million tons of ore, about one-half of the present domestic output; between 25,000 and 30,000 tons of copper in concentrates, about 30% of present production; 240,000 tons of pyrite concentrates, about 50% of present domestic output; 250 tons of molybdenum concentrates, new production; and unspecified quantities of gold, silver, platinum-group metals, and selenium.

The output of the new mine is supposed to be used in the country, and imports of copper concentrates are expected to decrease.

Lead and Zinc.—The overall performance of the industry was below normal. Energy problems, decline in grade of ores, and social unrest in Kosovo, the area in which major production is located, adversely affected production of lead and zinc in Trepca, the largest producing facility in the country, and to some extent, production at mines and mills of other producers.

Nickel.—During 1982, Yugoslavia became a producer of nickel. A 16,000-ton-per-year ferronickel plant at Kavadarci, Macedonia, operated by Rudnici i Industrija za Nikel, Celik i Antimon, started production in the

spring. The nickel ore used at the Kavadarci plant came from the Rzanovo opencast mine nearby.

Construction of another ferronickel plant, rated at 12,000 tons per year of contained nickel, continued at Glogovac, Kosovo, Serbia, and the nearby Cikatovo Mine started production. Both facilities were operated by Feronikel, a subsidiary of Rudarsko Hemiski Kombinat Kosovo.

Reportedly, some of the ferronickel produced in Yugoslavia will be exported.

NONMETALS

Asbestos.—The expansion and modernization of the Stragari Mine, an old asbestos mine located west of Kragujevac in Serbia, continued during 1982. The mine and the new mill should have the capacity to produce and process about 1 million tons of ore per year. The Stragari Mine was a division of Rudarsko Energetsko Industrijski Kombinat Kolubara. Yugoslavia has been a net importer of asbestos in the past. When operational in 1984, the new facility at Stragari should lower dependence on imports but apparently will not eliminate it.

Barite.—Development of the barite mine at Mount Bobija in Serbia, rated at 150,000 tons of crude barite and 50,000 tons of concentrates annually, was underway during 1982. According to preliminary results of exploration, proven reserves totaled 1.7 million tons of barite. The grade was unreported.

Cement.—A restriction on investments imposed by the Government led to the decision to cut the number of planned cement plants in Serbia from three to one. At yearend no decision was made where this new plant should be located, although Kosjeric, Golubac, and Kriva Palanka were mentioned.

The cement plant at Kaknj, Bosna i Hercegovina (BiH), lost about 35,000 tons of cement production because of a shortage of fuel oil. The plant should start receiving natural gas from a pipeline supplying the steelworks at Zenica in 1983.

Feldspar.—After exploration was completed, a decision was made to start developing a mine and beneficiation plant near Bujanovac, close to the city of Vranje, Serbia. The new mine and plant are rated to process 37,000 tons per year of ore with a yield of 20,000 tons of feldspar, 8,000 tons of quartzite, and 3,000 tons of mica. The operating organization, Feldspat, is managed by the Nemetali Rudnici i Kopovi Nemetala enterprise of Vranje.

Fluorspar.—During 1982, the first commercial deposit of fluorspar in Yugoslavia, which was discovered at Ravnaja near Krupanj in western Serbia during 1981, was slated for development. The Geological Institute of Serbia conducted additional exploration during 1982 and reported proven reserves of ore at 600,000 tons. Construction of a 50,000-ton-per-year mine and mill, with a capacity to produce 15,000 tons of fluorspar concentrates, was scheduled to start in 1983 and completion was expected in 1984. The mine and mill should employ about 300 persons; the "26 of September," headquartered in Krupanj, Serbia, was designated as the operating enterprise.

Lime.—A new plant for production of about 500,000 tons per year of hydrated lime went onstream at Sirac near Daruvar, Croatia. The new plant, operated by a local enterprise, Kamen Industrija Gradevnog Materijala, was designed to use natural gas for fuel.

Magnesite.—An 85,000-ton-per-year sintered magnesite plant went onstream in the Magnohrom refractory plant in Kraljevo, Serbia. All of its production was to be used for production of refractory bricks.

Quartz Sand.—Development of a new quartz sand quarry was started at Krepoljin near Zagubica, Serbia. Most of its production will be used by foundries in Belgrade and Kikinda.

In the Vrsac area of Vojvodina, Serbia, planning was underway for development of a 500,000-ton-per-year quarry, which should produce quartz sand and feldspar from large deposits of sand discovered near the famous vineyards of Vrsac. According to results of laboratory investigations, the quartz sand size, 0.6 to 0.1 millimeter, is suitable for use in the glass, ceramics, and chemical industries. Feldspar at Vrsac can be compared with the best feldspar in Europe, and mica is of the muscovite type. The Vrsac deposit contains unspecified quantities of ilmenite and some titanium. The new facility should employ 183 workers when in full operation. The production startup date was not made public at yearend 1982.

At the Termit quartz sand mine and plant, located near Domzale, Slovenia, modernization was completed and the capacity of the mine and plant was increased from 400 to 1,000 tons per day. Proven reserves at Domzale could sustain present production for another 200 years.

Salt.—New deposits with reserves of 400 million tons of salt were discovered under Majevica, a mountain near Tuzla in BiH,

the only region in the country producing rock salt.

Stone.—The Granit Industria Granita Jablanica enterprise at Jablanica, BiH, announced plans to increase its production to 13,000 cubic meters of granite and 150,000 square meters of slabs by 1985.

Sulfur.—During the first days of December 1982, a new 160,000-ton-per-year sulfuric acid plant, operated by the Government-owned enterprise Cinkarna-Celje, started production at Celje, Republic of Slovenia. The sulfur was imported, but suppliers were not named. Investments totaled 790.7 million dinars.

MINERAL FUELS

The energy position in Yugoslavia was serious during 1982. Shortages were persistent, and many industrial facilities were forced to shut down because of the lack of energy. Closures usually lasted only a few days, but losses in revenue were important. Shortages of crude oil and petroleum products were so severe that the Government had to introduce rationing for gasoline and diesel fuel. Shortages of foreign exchange caused by interest payments on huge foreign debts limited the country's ability to purchase crude oil.

Coal.—The lack of foreign exchange for crude oil purchases made neglected domestic coal more attractive as a source of energy. In Istria, where the Rasa Mines were the largest producers of bituminous coal in the country, exploration was concentrated in the region of Koromacno, where about 13 million tons of coal reserves was proven. However, further exploration was required to find out whether safe mining was possible in the Karst area near the sea. The Pican Mine, the oldest in the region, was preparing to close sometime during 1983 because reserves were near exhaustion. The Pican Mine should be replaced by a new mine, Tupljak, in 1984. In addition, development work for another mine, the Ripenda Mine, started in 1982 and completion was planned for 1985.

In BiH, exploration for coal was successful during 1982. Near the locality of Maglaj, a deposit named Brezove Dane, with seams 9.5 meters thick and with reserves of about 22 million tons of brown coal, was discovered near a railroad and roads. At yearend no date for starting development was made public.

Near the village of Moscanica, about 20 kilometers from Zenica, BiH, exploration was completed during the year of review. Preliminary results indicated total reserves of 130 million tons of brown coal, of which 60 million tons is proven reserves. Initial planning was completed for development of a 1-million-ton-per-year underground mine. According to reports, if 10 billion dinars for investments in the new mine can be found, the new mine should be operational in 1987.

In Serbia, the largest producer of lignite among the states comprising Yugoslavia, a new opencast mine, Tamnava-Istocno Polje, started production. The new mine should produce about 11.5 million tons of lignite by 1985. In Serbia, the Nis region, reevaluation of old mines continued. The Jerma Mine near Babusnica and the Jankova Klisura Mine near Blace should be reactivated in the near future.

Coke.—During November 1982, a new 720,000-ton-per-year coke battery with 65 ovens started production at Rudarsko Metalurski Kombinat Zenica (RMK Zenica) in Zenica, BiH. RMK Zenica's coke capacity thus reached 1.44 million tons per year; the coke battery ended the second phase of modernization and expansion at RMK Zenica.

Petroleum.—At the beginning of 1982, INA and several foreign companies concluded agreements for joint ventures in exploration and possible production of crude oil and natural gas offshore in the Yugoslav part of the Adriatic. This was the first time that the centrally planned economic Government has permitted investment by foreign private capital in exploration for hydrocarbons in Yugoslavia. Three concessions were granted, each covering 4,000 square kilometers, and three organizations were formed by INA and its foreign partners. A concession near the island of Jabuka was operated by an organization consisting of Chevron USA, Inc., of the United States, with 70% of the 49% that the foreign companies are permitted by the Yugoslav law to invest in joint ventures in Yugoslavia. Azienda Generali Italiana Petroli S.p.A. (AGIP) of Italy provided the other 30%. At a concession near the island of Palagruza, Texaco Inc. of the United States and AGIP each provided 50% of their 49%. At the third concession, near the island of Mijet, the newly created organization consisted of AGIP providing 50% of the 49%, Texaco with 30%, and Empresa Nacional del Petróleo S.A. of Spain with 20%. During 1982, all three joint ventures were behind schedule, but the first exploration results indicated possible discovery of oil or natural gas.

Late in the year a 50,000-barrel-per-day

petroleum refinery went onstream near Skopje, Macedonia. Construction had started in 1979 with U.S.S.R. equipment. Crude oil was delivered by rail from the Port of Thessaloniki in Greece.

The Dow Chemical Co. of the United States withdrew from Dow-INA (DINA), the joint venture company with INA, because of market conditions. DINA was to have invested about $1.2 billion in construction and later operated the petrochemical plant at Islan Krk on the Adriatic coast of Yugoslavia. The arrangement called for Yugoslav participation of 51%, with the rest from Dow Chemical. The venture had been the largest-ever U.S. private participation in Yugoslavia. INA then announced that it would proceed alone in efforts to complete the plant at Krk.

Uranium.—Exploration for uranium was intensive in the region of Bukulja Mountain and the village of Belanovica in Serbia. However, results were not made public by yearend.

---

[1]Physical scientist, Division of Foreign Data.

[2]Dinar (din) is not convertible currency. A meaningful conversion to U.S. currency is impractical. At yearend, the official exchange rate was 45din = US$1.00.

The Mineral Industry of Zaire

By Ben A. Kornhauser[1]

In 1982, Zaire, the world's largest cobalt producer, cut back cobalt production by 60% in response to poor demand although copper output remained the same. Cement output declined, but crude oil production was up 9%. Payments of about $1 billion on a foreign debt of about $5 billion were expected to consume over 60% of export earnings. The debt service obligations were estimated at more than 38% of exports. The Government derived about 15% of its budget revenues from taxes on La Générale des Carrières et des Mines du Zaire (Gécamines). The Zairian economy had been facing a serious economic crisis for several years owing to factors such as the drop in prices for copper, cobalt, industrial diamonds, and coffee; a drop in agricultural output; and a large budgetary deficit. In 1982, the resulting decreased export earnings hindered servicing Zaire's heavy debt burden.

In July, the European Economic Community (EEC) approved a loan of $40 million by its European Development Fund to Gécamines, for the purchase of mining capital equipment such as excavators and cranes, spare parts, metallurgical facilities, and track and commercial vehicles. A loan condition required part of Gécamines' hard currency income to be reinvested in the enterprise in an amount at least equal to the taxes levied by the Government until the production capacity reached 475,000 tons per year of copper and 15,000 tons per year of cobalt.[2] Another EEC condition was that it be informed of all agreements concluded between Gécamines and the Governments' mineral-marketing arm, Société Zairoise de Commercialisation des Minerais (Sozacom). To improve the effectiveness of Gécamines and, in response to the loan requirements, Zaire redefined the relationship between Gécamines and Sozacom. Gécamines' top management also streamlined operations and installed new accounting controls. The revised agreement between Gécamines and Sozacom restored to Gécamines the ownership and exclusive sales rights for its production whose marketing had been handled previously by Sozacom. Sozacom became an agent that only negotiated contracts for Gécamines. The revised relationship and reorganization were expected to cut overhead costs and to reduce the effects of falling prices and earnings for most nonferrous metals.

On October 18, the Swiss Aluminium Co. (Alusuisse), presented to the Government and seven private companies from Europe and Japan a detailed feasibility study for a 210,000-ton-per-year aluminum smelter in Zaire. The projected cost was estimated at $900 million, of which one-third was to be supplied by the consortium and the balance from other sources. The smelter was to be sited by the estuary of the Zaire River, about 160 kilometers from the new Inga-Shaba hydroelectric complex, which would supply power at a very reasonable cost. A decision to proceed with the project had been deferred since Alusuisse's current policy was to concentrate on fabrication and processing instead of primary production and taking an equity position in the smelter was counter to its goals.[3]

PRODUCTION AND TRADE

Sozacom and the China National Metals & Mineral Import & Export Corp. concluded an agreement under which Sozacom would provide China in 1983 with 20,000 tons of blister copper, 300 tons of granules and cathode fragments, and 5,000 tons of zinc at an estimated $30 million. The contract was the first copper transaction of this size between the two countries.[4] Because of the weak demand for Zaire's principal mineral exports of copper, cobalt, and diamond, the International Monetary Fund (IMF) granted temporary financial relief with a special drawing rights loan equal to $109 million. Under a 3-year IMF rescue program of $927 million, Zaire's drawings were still frozen because of failure to maintain debt service payments.[5]

The bulk of mineral products were exported through a lengthy network of road, rail, and river transport to the Port of Matadi. Zaire also reportedly exported through Tanzania via Kigoma, the port on Lake Tanganyika, and the terminus of the Tanzanian railway system. Shipments of 4,000 tons per month each of copper and zinc crossed the lake from Kalemie in Zaire to Kigoma, and then were transported by rail to Dar Es Salaam for shipment.[6]

NA Not available.

[1]Owing to the lack of available official trade data published by Zaire, this table should not be taken as a complete presentation of mineral imports of this country. These data have been compiled from various sources which include United Nations information and data published by the trading partner countries. Unless otherwise specified, data are compiled from trade statistics of individual trading partners.

[2]Reported value of $1,000 from Switzerland.

[3]Less than 1/2 unit.

[4]Excludes exports from Japan valued at $3,000.

[5]Excludes exports from Japan valued at $1,000.

[6]Excludes exports from West Germany valued at $2,000 and Japan, $1,000.

[7]Excludes exports from Belgium-Luxembourg valued at $7,000; West Germany, $3,000; Italy, $1,000; and the Netherlands, $1,000.

[8]Exports from Japan valued at $6,000.

[9]Exports from Belgium-Luxembourg valued at $2,000.

[10]Value only reported at $765.

[11]Excludes portion of exports from Japan valued at $4,000.

[12]Excludes exports from West Germany valued at $1,000 and the Netherlands, $2,000.

[13]Excludes exports from Canada valued at $9,000.

[14]Excludes exports from Belgium-Luxembourg valued at $3,000.

[15]Value reported at $2,270.

[16]Excludes exports from Belgium-Luxembourg valued at $1,000.

[17]Value reported at $12,385.

[18]Excludes exports from Japan valued at $62,000.

[19]Value reported at $6,557.

COMMODITY REVIEW

METALS

Copper, Cobalt, Zinc, and Associated Metals.—Cobalt production in 1982 was estimated at 5,600 tons. About 20,000 tons of cobalt were held in stock, mostly as collateral on loans. In order to regain market share from long-term, large tonnage customers, Sozacom and its U.S. sales agent, Afrimet Indussa Corp., priced cobalt very competitively, causing the price to drop to about $6 per pound in the latter half of the year.

Gécamines' and Sodimiza's copper production for 1982 were essentially the same as that of 1981. Copper exports were expected to be greater because of sales of unrefined copper directly to the customer instead of shipments of unrefined copper first to Belgium for refining. An upturn in copper demand in 1983 plus stable power from the Inga-Shaba complex were expected to stimulate completion of Gécamines' flash smelter and extensions to the Luilu refinery. The depressed world economy apparently stalled plans to restart operations of the Société Minière de Tenke-Fungurume.

Primary electrolytic zinc metal production in 1982 was estimated at 64,400 tons compared with 65,400 tons in 1981.

Table 4.—Zaire: Details of 1981 copper production, by area

(Thousand metric tons)

Area	Ore[1]	Concentrate	Copper content
MINE			
Western Group:			
Open pits	8,480	--	422.2
Kamoto underground	2,715	--	113.5
Central Group:			
Open pits	1,228	--	42.7
Kambove underground	1,142	--	31.4
Kipushi underground[2]	1,358	--	52.3
Sodimiza underground[e]	1,305	--	36.0
Total	16,228	--	698.1
CONCENTRATOR			
Western Group:			
Mutoshi	2,250	47	14.4
Kamoto	5,420	579	214.0
Dima	780	139	33.8
Kolwezi	4,120	694	161.8
Central Group:			
Kambove	1,404	78	34.6
Kakanda	552	79	18.1
Kipushi[2]	1,342	148	43.3
Sodimiza[e]	1,305	93	34.3
Total	17,173	1,857	[3]554.3

[e]Estimated.
[1]Gross weight.
[2]The Kipushi ore also contained 95,100 tons of zinc and the Kipushi concentrator produced 112,000 tons of zinc concentrate containing 63,300 tons of zinc.
[3]The recovered copper production of Gécamines for 1981 was 480,400 tons.

Source: Gécamines, 1981 Annual Report.

Manganese.—The manganese production by Société Minière de Kisenge (SMK), a state-owned company, dropped to only 4,000 tons in 1982 from 10,000 tons in 1981. This drop was attributed to the stockpile overhang of 500,000 tons of crushed and 700,000 tons of uncrushed carbonate ore. The relative unavailability of freight cars that were

used for higher priced materials and the poor state of the Dilolo-Lobito Railway prevented export of these large stocks. SMK was exploring processing the manganese ore into upgraded, less bulky, and more income-producing products to permit shipment of higher priced material whenever possible.

Tin, Tungsten, and Columbium-Tantalum.—A new facility in Zaire provided the United States with about 8,000 pounds of columbium ore.

NONMETALS

Cement.—The country's No. 2 cement plant Cimenterie Nationale (Cinat), shut down temporarily in 1982 because of fuel shortages. Cinat was producing only 10,000 tons of cement per year from an annual production capacity of 300,000 tons.

Diamond.—Since Zaire withdrew from its marketing contract with the De Beers' Central Selling Organization, the principal buyers of Zaire diamonds were the Industrial Diamond Co. of London, the United Kingdom, and two Dutch companies, Caddri Spri and Glasol N.V. These three companies were involved with Sozacom in establishing a Zairian diamond-cutting operation that was estimated to cost $36 million and employ 700 people.

Existing legislation was modified by a November 5, 1982, ordinance to permit holding gold or diamonds won by artisanal workers anywhere within the country without violating any law. Possession of such materials still was prohibited within mining concessions and within exclusive prospecting and proving zones granted as concessions by the Government to individuals and companies. Exporting these goods, except through regulated channels, remained an infraction of the law. Firms were required to be licensed to act as a broker for other than Société Minière de Bakwanga (MIBA) diamonds. By permitting freer ownership and trade between panners of alluvial deposits and authorized traders, prospectors were expected to receive better prices and illegal diamond sales were expected to decrease or disappear.

MIBA was having a new bucket dredge made in Malaysia and Singapore. The dredge would have the capacity to dredge 1 million cubic meters of diamondiferous alluvial deposits annually and was expected to stop MIBA's declining production. The dredge was being financed internally and was expected to be in service by July 1983.

MINERAL FUELS

Petroleum.—Crude oil production from Zaire's coastal zone rose from an average 20,471 barrels per day in 1981 to an average of 23,000 barrels per day or 8,385,000 barrels in 1982. Three of the four wells drilled in the 1982 oil exploration program were unproductive. The fourth and last well was drilled to a depth of 2,760 meters and showed positive signs that warranted drilling one or more additional wells to evaluate its commercial feasibility.

Under oil law 81-013 of April 2, 1981, the rights of the Zaire Gulf Oil Co. were renegotiated to give Zaire 20% participation in the company and 76% of the oil production.

Uranium.—An agreement on the exploitation and mining of uranium in the Gécamines' concession was signed by representatives of Gécamines, and the French Government agencies, Compagnie Générale des Matières Nucléaires, and Commissariat à l'Energie Atomique. The protocol was expected to help in industrializing Zaire and in training Zairians in the field.

The Mineral Industry of Zambia

By Thomas O. Glover[1]

The mineral industry of Zambia provided more than 95% of the country's foreign exchange credit and supported its position as the world's fifth largest producer of copper and the second largest producer, in terms of mine output, of cobalt. Transportation costs for delivering copper and cobalt metals to world markets continued to be a large part of the total cost for Zambian copper and cobalt. Zambia, a landlocked country, must rely on rail transportation through the Republic of South Africa and other East African countries in order to export their copper and cobalt. Zambia utilizes the ports of Dar es Salaam, Tanzania, Maputo, Mozambique, and Richards Bay, Republic of South Africa. In response to an acute shortage of railway cars in 1982, Zambia was to start manufacturing its own railway cars to alleviate the problem. Spare parts and locomotive engines were purchased from China, who built the TAZARA Railroad. Plans were underway to purchase 14 new locomotives from the Federal Republic of Germany.

Zambia finalized negotiations with a consortium of western bankers that secured the renewal of their annual oil operations budget of approximately $175 million.[2]

The mining sector dominates the economy of Zambia, contributing a high percentage to the country's gross domestic product and the bulk of foreign exchange earnings. Zambia's economy, during 1982, continued to be recessionary. Beset by depressed world prices for copper and cobalt and high imported crude oil prices, the country's balance of payments deteriorated. The resulting shortage of foreign exchange had adverse effects in nearly all productive sectors of the economy, which experienced shortages of raw materials and other inputs. Reduced Government revenues contributed to budget deficits, that in turn contributed to inflationary pressures, increased foreign debt, and a decline in access to international commercial credit. Zambia's International Monetary Fund loan of $856 million in 1981 was suspended early in 1982 when the country was unable to meet certain conditions of the loan. Approximately $385 million of the $856 million loan was drawn prior to the suspension for use in replacing declining copper revenues.

The Commonwealth Development Corp. agreed to lend Zambia Consolidated Copper Mines (ZCCM) approximately $26 million to extend the tailings leach plant at Chingola division.

Zambia's two major mining companies, Nchanga Consolidated Copper Mines Ltd. and Roan Consolidated Mines were merged to form ZCCM in March. The merger made ZCCM the world's second largest copper company after Corporación Nacional del Cobre de Chile (CODELCO-Chile).

PRODUCTION AND TRADE

Zambia's production of metallic copper increased 4% during 1982, while the production of cobalt refined metal decreased 5%. Copper ore milled in 1982 increased 26% over that of 1981; however, the grade of the ore decreased from 2.2% in 1981 to 1.8% in 1982. ZCCM production came from 10 underground and 7 open cast sources at the company's seven producing divisions. During 1982, detailed design and site preparation plans were completed for the new Chambishi sulfuric acid plant. The new plant will treat all of the effluent gases from the leach plant roaster and will have a production capacity of approximately 75,000 tons of acid per year.

The lack of foreign exchange and the problems associated with it caused delays in ordering spare parts and new equipment for mining operations. Future production problems are expected because of the shortage of foreign exchange. Seventy-six percent of the copper exported during 1982 went to six major countries. The countries were, in order of importance, Japan, France, Italy, the Federal Republic of Germany, India, and the United Kingdom. The value of exported copper in 1982 was $757 million compared with $1,002 million in 1981.

COMMODITY REVIEW

METALS

Copper, Cobalt, Byproduct Gold, Selenium, and Silver.—ZCCM treated approximately 29.8 million tons of ore yielding about 530,000 tons of copper. Ore reserves as published in the ZCCM annual report for the year ending March 31 were estimated at 26,500,000 tons of contained copper and 688,000 tons of contained cobalt.

The Nchanga division was ZCCM's biggest copper producer as well as the largest copper mine in Zambia. Drilling continued in the Nchanga open pit to investigate the tenor of ore and attitude of the eastern extension of the upper folded cobalt ore body. Boreholes were also drilled at other sections to investigate the cobalt content of the folded upper ore body.

The Mufulira division's production comes from one of the world's largest underground copper mines. Its metallurgical operations span concentrating, smelting, and refining. A precious metals plant was in operation at the Ndola copper refinery that was administered by Mufulira. Ore production was below that scheduled at Mufulira for 1982 owing to strikes, a shortage of drilled reserves, and outages of the underground plant. The low mine output also limited the concentrator operations.

Operations at the precious metals plant were generally satisfactory and all recovered anode slimes from the refineries were accepted for treatment. The selenium removal process continued to be a major constraint and a significant proportion of the total output was exported as decopperized slimes. Total production was 23,234 kilograms of selenium, 887,000 troy ounces of silver, and 13,439 troy ounces of gold. Minor quantities of platinum and palladium were also recovered.

Table 4.—Zambia: ZCCM 1982 copper production and ore reserves, by mine

Mine	Ore mined and treated			Ore reserves		
	Gross weight (thousand metric tons)	Copper grade (percent)	Copper recoverable in copper concentrate (percent)	Gross weight (thousand metric tons)	Copper grade (percent)	Cobalt (percent)

[1]Stockpiled ore was used for Kalengwa mill feed.

Source: Zambia Consolidated Copper Mines Ltd., 1982 Annual Report.

The Nkana division operates the deepest ZCCM mines with two shafts extending to 1,200 meters. There are three open pit operations, a concentrator, a smelter, and a refinery. Nkana's cobalt production capacity was being augmented with the construction of a new 2,500-ton-per-year plant. Production at the existing cobalt plant at Nkana was below forecasts as a result of the lower grade of concentrates treated. Work on the plant's rehabilitation and expansion was continued throughout 1982.

At Baluba, exploration of the eastern part of the center limb was completed, with exploration of the western section in progress. Drilling was also in progress to explore deep into the northern limb in the search for new ore. Successful commissioning of the lower crusher installation and rock handling facilities allow production to be initiated below the 245-meter level. Major development was constrained by rock handling problems.

At the Kalulush division's Chambishi roast-leach-electrowinning, 2,500-ton-per-year plant, production levels were reduced and greater emphasis was placed on the treatment of stockpiled low-grade concen-

trate because of the continued weakness of the cobalt market. The installation of the Chambishi cobalt metal vacuum refining plant was proceeding satisfactorily.

Lead, Zinc, and Byproduct Cadmium.—Ore hoisted totaled 237,133 tons at grades of 9.0% lead and 20.3% zinc. Byproduct cadmium is produced in very small amounts. The Kabwe division includes the Nampundwe Mine and concentrator near Lusaka, where a copper concentrate and pyrite concentrate for acid production was to be produced. Working the Nampundwe expansion project continued throughout the year.

NONMETALS

Fertilizer Materials.—Major phosphate deposits were recently discovered in Zambia's Eastern Province. The full extent of the reserves, unknown as yet, will need further tests before it can be decided whether exploitation is feasible. The deposits at Chilembwe have an average phosphate content of 15% to 20%. Only 200,000 tons of reserves have been identified. The deposits at Kaluwe are estimated to contain reserves of 200 million tons; however the deposits are of low grade and thinly distributed.

Gem Stones (Amethyst and Emerald).—An agreement was reached between International Development and Construction Co. (IDCO) of Saudi Arabia and Reserve Minerals Corp. of Zambia, whereby the former takes up to 49% equity in companies formed to prospect, mine, and market emeralds and other precious minerals. IDCO will provide interest-free loans where necessary for the company's development.

MINERAL FUELS

Coal.—Production of coal at Maamba Collieries increased 14.5% over that of 1981, to 603,934 tons. A loan of $5.7 million in 1981 provided funds to renovate the coal washing plant, and to purchase some small equipment in 1982. Foreign exchange was unavailable to purchase needed new larger equipment or spare parts for the larger old equipment. Maamba Collieries is an open pit operation containing three coal seams totaling 10 meters in thickness. The majority of production was used in Zambia with smaller amounts purchased by Malawi and Zaire.

Petroleum.—Zambia signed an agreement with Exploration Data Consultancy to prospect for oil and natural gas in the Luangwa Valley and west of Lusaka. The 3-year project was funded by the International Bank for Reconstruction and Development (World Bank) and the Government of Zambia.

The Mineral Industry of Zimbabwe

By George A. Morgan[1]

The predominately export-oriented mineral industry continued to be depressed in 1982, experiencing persistently low demand and prices. Total value of minerals produced was estimated at $460 million compared with $547 million in 1981.[2] Expenditures on new mines were virtually halted, and current mineral industry developments were the result of decisions made years ago. Underground development was being retarded at many mines.

Production of iron ore, chromite, and asbestos declined in the face of weak market demand. Gold output increased despite closure of many small mines, mainly owing to the startup of the Renco Mine and the mining of higher grade ore. Output of nickel and copper stabilized.

Government Policy and Programs.—The National Development Plan proposed a $5.54 billion spending program for 1983-85, 41% of which was to come from private companies. The Mining Industry Loan Fund, which receives an annual allocation from the state budget of about $50 million, had a number of loan programs for the mining sector.

The Government initiated measures to cope with the deteriorating balance of trade and rising unemployment. A 32% cut in foreign currency allocations to the private sector was initiated, and at yearend, a 20% devaluation of the Zimbabwe dollar occurred. Any retrenchment, including dismissal, firing, or suspension of a worker, must be approved by the Ministry of Labor and Social Services. Overtime was banned, ostensibly to create more jobs. Bonding was also required of apprentices.

The Minerals Marketing Corp. (MMC) commenced implementation of certain provisions of its charter. Exports of ore were prohibited, except in exceptional cases. The MMC has responsibility for transport of all minerals, as well as for external payments for products.

PRODUCTION

The index of volume of mineral production declined for the sixth consecutive year from 172.2 in 1981 to 168.0 in 1982 (1964=100). The manufacturing sector was also adversely affected. The index of volume of production of nonmetallic mineral products was 252.0 in 1982 compared with 272.4 in 1981 (1964=100), and for metal and metal products 280.8 compared with 323.9. Small mine closures, mainly gold mines, resulted in the loss of about 2,000 positions, and the closure of the Empress nickel mine caused the loss of 1,200 jobs and 2,000 tons per year of nickel metal production capacity.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through June 16, 1983.

[2]Smelter copper includes impure cathodes produced by electrowinning in nickel processing. Output of fire-refined copper by Messina (Transvaal) Development Corp. apparently was terminated in 1972. Refined copper output from that date to 1980 includes only electrolytic copper output by Corsyn Consolidated Mines Ltd. at the Inyati Mine. Output in 1981 and 1982 includes electrolytic copper from the new refinery at Messina.

[3]Includes Ni content of nickel oxide and nickel fonte.

[4]Other gem stones produced are as follows in kilograms: 1981—beryl, 327, and chrysoberyl, 2; and 1982—beryl, 1,080, and aquamarine, 36.

[5]Includes rough and ground quartz as well as silica sand. Quartz crystal was also produced in the amount of 3 metric tons in 1979.

[6]Data represent output by the Wankie Colliery for years ending Aug. 31 of that stated; additional output by the Radcliff plant of Risco Ltd. may total 250,000 metric tons per year of metallurgical coke and coke breeze.

TRADE

Total mineral exports were estimated at $478 million in 1982, about 47% of all exports. Gold was the principal mineral export commodity, followed by ferrochrome and asbestos. Ferrochrome was the principal mineral export item of value in 1981.

Mineral-related imports were estimated at $300 million in 1982, of which 58% was petroleum and refinery products. The principal trade markets were the Republic of South Africa, the United Kingdom, and the United States. Pipeline shipments continued to be subject to disruption owing to sabotage.

The preferential trade agreement was renewed by the Republic of South Africa; it allowed substantial benefits to Zimbabwean exporters owing to its low tariff provisions.

COMMODITY REVIEW

METALS

Chromite.—Zimbabwe Alloys Ltd. (Zimalloys), formerly Rhodall Ltd., an Anglo American Corp. Ltd. subsidiary, acquired full control of Consolidated Minerals Ltd. (Conmin) for $3 million. Conmin was an important supplier of hard lumpy chromite to the Gwelo refinery of Zimalloys. It owned the Netherburn Mine with 930 employees and the Rhonda Mine, which has not produced for 5 years because of war-related damage. Zimalloys reported $1 million in lost production owing to carelessness, lack of effort, and poor timekeeping, as well as $1 million of equipment repair that should have been unnecessary. Labor problems were also encountered owing to new labor legislation and noncooperative worker committees.

Zimbabwe Mining and Smelting Co., a subsidiary of Union Carbide Corp., had a debt of $40 million in 1982. It no longer had control over stockpile levels owing to implementation of the Minerals Marketing Corp. legislation. The high cost of domestic chromite production reportedly made it cheaper to import chromite from the Republic of South Africa than to produce it locally.

Copper.—Messina (Transvaal) Development Corp. of the Republic of South Africa had a $93 million loss on its Zimbabwe operations under M.T.D. (Mangula) Ltd. The company required a loan guarantee of $8.1 million from the Zimbabwe Government to maintain operations at Mangula. Although uneconomic to operate, production was also maintained at the Shackelton Mine at Government request.

Gold.—The Renco Mine, owned and operated by Rio Tinto Zimbabwe Ltd. (RTZ), commenced production with a projected mill throughput of 180,000 tons per year of ore and recovery of about 43,000 troy ounces of gold.

Corsyn Consolidated Mines Ltd. reported a total mill throughput of 363,000 tons of ore from its four operating mines for the year ending September 1982 and a total production of 50,155 troy ounces of gold, down slightly from 1981 output.

To maintain the operations of small workers, who were most affected by costs, low gold prices, and wage legislation, the Government encouraged the creation of cooperatives. The additional problem of poor security caused destruction and theft of machinery and closure of some mines in Matabeleland.

Iron and Steel.—The Zimbabwe Iron and Steel Co. lost $1.5 million per month owing to falling exports and escalating costs. A transport crisis required the financing of a 250,000-ton stockpile compared with a normal 10,000-ton stockpile for its products. Voest-Alpine AG, Austria, was providing technical, professional, and financial assistance.

Lancashire Steel (Pvt.) Ltd. was shut down for 8 weeks owing to an unfavorable price structure for its products. A Government-approved price increase of 20% for rod and 30% for wire allowed the company to restart, but at greatly reduced personnel levels. By yearend about 600 people were laid off.

Platinum.—The Zinca platinum-group metals pilot project of RTZ continued in operation. About $2 million has been spent thus far on the plant, which has yielded higher results than were achieved in the laboratory. A decision on the mine startup was rescheduled for 1983.

NONMETALS

Asbestos.—Shabani and Mashaba (Pvt.) Ltd. had a loss of $38 million in 1982. The Government prevented the company from reducing fiber production from 110,000 tons per year to 33,000 tons per year. Full employment also had to be maintained. Negotiations were underway to sell the Government's 40% of the mining operation.

Graphite.—The Lynx Mine near Karoi was the only graphite producer in Zimbabwe and was a joint venture by Graphitwerk Kropfmuhl Ltd. and the Industrial Development Corp. Employment was 194 people working 2 underground shifts and 3 surface mill shifts. The main ore zone had 20% to 25% graphite. About 4,500 tons per month of ore was processed for about 1,200 tons per month of product. Mine life was 25 years at current production levels. Sulfide content was reduced to below 0.02% for a marketable product. Products included concentrate, flake larger than 160 micrometers, and powder smaller than 160 micrometers. Purity was 91% to 93%, and moisture content was below 1%. Products were trucked to the railhead at Chinhoyi for world export.

Lithium.—Bikita Minerals (Pvt.) Ltd. ceased production of lithium minerals in 1982 owing to low demand. Selection Trust Ltd., a subsidiary of British Petroleum Corp., was the owner of the operation along with AMAX Inc. and American Potash and Chemical Corp. Stocks at the mine were

sufficient for 2 years of sales. About 164 of the 300 workers at the mine resigned in return for a cash gratuity.

Phosphate.—Capacity of the concentrator at Dorowa was 180,000 tons per year. The deposit, which had no overburden, was mined by bulldozers and scrapers. About 10 tons of run-of-mine rock were processed to 1 ton of concentrate. The ore is upgraded from 5.5% P_2O_5 to 35% P_2O_5 in the concentrate. Processed raw material was trucked 65 kilometers to the Nyazura railhead, then railed to the plant at Muasa near Harare for upgrading by Zimbabwe Phosphate Industries (Zimphos). Marketable products were superphosphate and compound fertilizer. Low-fluorine phosphate was produced at Zimphos for stockfeed, and byproduct magnetite was sold for use as heavy media.

MINERAL FUELS

Coal.—The Zimbabwean Government acquired 40% of the equity capital in the Wankie Colliery Co. Ltd., making it the largest shareholder. Other shareholders were Anglo American (Zimbabwe), 20.2%, and Union Minière S.A., 3.3%. About 70% of the coal produced was sold to state-controlled concerns.

The coke ovens at Wankie were in constant need of repair and were to be rebuilt in 1983. They suffered damage from cooling during two labor strikes and from lax operations. Production was about 50% of the rated 20,000-ton-per-month capacity.

Shipment of 9,000 tons per month of coke to Zaire was halted owing to an embargo by Zambia on all rail traffic to Zaire owing to nonpayment of fees by that country. About $1 million in foreign exchange was lost per month.

---

[2]Where necessary, values have been converted from Zimbabwean dollars (Z$) to U.S. dollars at the rate of Z$1.00=US$1.39 in 1981 and Z$1.00=US$1.09 in 1982.

The Mineral Industry of Other Central African Countries

By Suzann C. Ambrosio[1]

CONTENTS

CAMEROON

Cameroon's mining industry continued to be dominated by crude petroleum. The value of petroleum output was estimated at $1 billion.[2] The 1982 gross domestic product (GDP) was approximately $8.4 billion. During 1981, crude oil export revenues increased in value 30%, comprising approximately 56% of Cameroon's total export earnings. The 1982-87 5-year plan emphasized hydrocarbon and agricultural development and targeted the exploitation of bauxite and clay deposits.

New petroleum legislation was promulgated on November 26, 1982. Public Law No. 82-20 detailed hydrocarbon companies' obligations concerning oil and gas discoveries and exploitation. In general, the Cameroon Government has participated in joint ventures with private companies and has levied a 57.5% petroleum tax plus adjustable royalties. Exploration expenses were paid by concession holding companies, and the Government in the past has reimbursed 50% of expenses under certain conditions.

Since 1978, Cameroon has maintained relatively rapid economic growth and relatively low levels of debt service payments. This has largely been achieved through foreign aid development assistance. During 1981, external debts were estimated at $83 million, equivalent to roughly 8% of the national budget. During 1981, donor commitments for ongoing projects were approximately $325 million. The International Bank for Reconstruction and Development (World Bank) was continuing to finance a variety of infrastructure projects and was negotiating a $33 million Douala Port expansion project. Plans included three new wharves, storage facilities, and an access road, doubling handling capacity to 4.5 million tons. The Douala Port also serves Chad and the Central African Republic.

Plans were announced by the Cameroon Government to develop the nation's bauxite and iron ore deposits over the next 3 years. The Société d'Etudes des Bauxites du Cameroon was investigating the feasibility of developing three remote bauxite deposits. Initial plans focused on developing the Rocher du Loup deposit, located approximately 40 kilometers south of Kribi at an annual production rate of 1 to 2 million tons. The other bauxite deposits were located at N'kongsamba in Littoral Province and

Minim-Martrap in the northern Adamaoua District. Minim-Martrap was estimated to contain 1.4 billion tons of demonstrated reserves and an additional 600 million tons of inferred reserves, grading 43% Al_2O_3 and 3.4% SiO_2. Development of the bauxite resources requires significant infrastructure expenditures, and the total project cost was estimated to be in excess of $1 billion.

Although Cameroon imports bauxite ore from Guinea, domestic ores were determined to be adequate to feed the nation's 80,000-ton-per-year alumina smelter. The $400 billion Edea alumina plant, located near Kribi, was operated by Compagnie Camerounaise de l'Aluminium, a joint venture between the Government (42%) and Péchiney Ugine Kuhlman (France) (58%). Another alumina smelter of similar capacity was being planned for Victoria.

The Société d'Etudes de Fer du Cameroon, a joint venture between the Government (35%) and a consortium of European and U.S. investors (65%), investigated the iron ore resources in the area of Kribi during 1981-82. The only information made public as a result of this study was the iron ore resources estimated figure of 120 million tons.

During June 1982, the Société Anonyme de Broyage de Minerai (SABM), a joint venture between the Government (35%) and Milchem Inc. (65%), was formed. SABM was constructing a 50,000-ton-per-year grinding mill for barite and other minerals used in oil drilling, including bentonite and salt water gel. The company was planning to import barite from Morocco, and other raw materials from Europe. Plans were also made to explore for raw materials locally and to develop export markets for finished products in neighboring countries.

Cement output increased by approximately 6% between 1981 and 1982 owing to extensive modernizations at the Bonaberi and Figiul plants. Approximately 500,000 tons was estimated to be imported, and domestic consumption was expected to continue to increase. Construction of a 400,000-ton-per-year cement plant was being considered at yearend.

Proven crude oil reserves were approximately 400 million barrels, and natural gas reserves were reestimated at roughly 3 trillion cubic feet at yearend. Franlab, a French consulting company, concluded that gas reserves were probably not more than one-half of the original 7-trillion-cubic-foot estimate. Consequently, the decision to construct a $2 billion liquefied natural gas complex at Kribi was delayed. Four marine rigs were in operation at yearend, and additional rigs were expected to be put into operation during 1983, at the newly discovered Victoria and Lokele Oilfields.

The Société de Recherches et d'Exploitation des Petroles du Cameroun, or Elf-Serepca, continued to be the operator of the largest Rio del Rey Oilfield. Elf-Serepca was jointly owned by Société National Elf Aquitaine (SNEA) (France) and Pecten Cameroon Co., a subsidiary of the U.S. Division of Shell Oil Co. in association with the Cameroonian Government. The two new oilfields located offshore of Limbe were undergoing development. The Victoria Oilfield, to be operated by Total Exploration and Production Cameroon and Mobil Production Cameroon Inc., was expected to initially produce 15,000 barrels per day and increase to 25,000 barrels per day by 1984. The Lokele Oilfield north of the Victoria Fields was expected to add another 15,000 barrels per day to production capacity.

The new $230 million Victoria oil refinery was constructed at a maximum capacity of 30,000 barrels per day, with potential to be expanded to 40,000 barrels per day. Initial production was expected to be 15,000 barrels per day, divided among heavy fuel oil (50%), diesel oil (20%), gasoline (14%), kerosine (11%), and refinery fuel (5%). Lubricants and asphalt products continued to be imported.

CENTRAL AFRICAN REPUBLIC

Reported mineral production of diamonds and gold was valued at approximately $21 million. Nearly 50% of the diamonds mined were estimated to be illegally exported. Owing to depressed world markets, reported diamond and gold output declined 11% and 28%, respectively, by volume. Consequently, the mineral sector's contribution to the national economy declined from that of 1981 by nearly 30%.

The GDP has fallen an estimated 5% annually since 1977, to roughly $640 million in 1982. In real terms, the GDP declined by less than 1% during 1982, since double-digit inflation outpaced economic expansion. The balance-of-payments (BOP) situation continued to deteriorate. A trade deficit of approximately $33 million and an overall BOP

deficit of roughly $70 million were estimated.

Despite the identification of uranium, limestone, iron, and copper resources, depressed world markets and the lack of available capital have hindered exploration and development. Private companies including Continental Oil Co. (CONOCO) and Total-Afrique Co. formed joint ventures with the Government to prospect for oil, mostly in the northern part of the country. CONOCO and Shell Oil Co. participated as silent financial partners in prospecting for oil during 1981-82. A series of rate-of-flow drilling tests were scheduled to commence during the 1983 dry season, which runs from January to June. CONOCO has been investigating the areas adjacent to the oil-yielding fields in Chad over the past decade.

The Central African Republic continued to depend on petroleum product imports from European, Middle Eastern, and Caribbean refineries. Total Centrafricaine De Gestion, the joint venture between the Government and Total-Afrique, distributed approximately 600,000 barrels per year of petroleum products from import tankers at Pointe Noire, Congo, and/or Matadi, Zaire, via train to Brazzaville, Congo. Materials were then barged up the Zaire and Ubangi Rivers via the Central African River Transport Co. to the nation's capital city, Bangui.

[e]Estimated. [p]Preliminary. NA Not available.

[1]Includes data available through Sept. 1, 1983.

[2]In addition to the countries listed, Equatorial Guinea and São Tomé e Principe, covered textually in this chapter, presumably produce modest quantities of a variety of crude construction materials (clays, stone, and sand and gravel) and may produce minor amounts of other mineral commodities (most notably gypsum, lime, and salt), but output is not reported quantitatively, and available information is inadequate to make reliable estimates of output levels.

[3]In addition to the commodities listed, modest quantities of unlisted varieties of crude construction materials (clays, stone, and sand and gravel) presumably are produced, but output is not reported quantitatively, and available information is inadequate to make reliable estimates of output levels.

[4]Reported figure.

[5]Revised to zero.

CHAD

Sixteen years of civil war have left landlocked Chad in a deteriorated state, both in terms of its infrastructure and its means of production. During November 1982, the United Nations sponsored a Reconstruction Conference on Chad, and approximately $287 million in assistance was pledged from a variety of institutions. The United Nations Development Program (UNDP) has funded approximately $5 million in ongoing projects. Roughly 75% of the aid was allocated for general development, humanitarian aid, and emergency relief. New UNDP project proposals totaled nearly $15 million, and approximately 5% of the aid was targeted for natural resources. Of significance to the mineral industry, UNDP proposed projects included technical assistance for the petroleum sector, a preinvestment study for a cement factory at Mayo-Kebbi, preparation of an industrial development plan, the promotion and use of local building materials (i.e., clay bricks), and logistical support to the trade and transport sectors.

Financial arrangements were being made with the Development Bank of Central African States to resume activities at the Mani stone quarry. Discussions were also taking place between Esso Exploration Co. and CONOCO Chad concerning new exploration ventures and a minirefinery project. Mining in Chad has been restricted to building materials, natron, and petroleum exploration.

CONGO

Although the Congo has mineral deposits of potash, phosphate, lead, zinc, copper, gold, and hydrocarbons, only petroleum has been commercially exploited over the past 5 years. The value of crude oil exports during 1981 was nearly $797 million. Petroleum production increased an estimated 7% between 1981 and 1982, and petroleum tax and royalties comprised roughly 50% of the $750 million national budget. Similarly, oil revenues were projected to comprise 65% of the nation's $2.5 billion, 5-year plan, 1982-86. Owing to falling crude oil prices on a worldwide scale, discussions were being held to revise development expenditures downward in order to stabilize foreign debt payments. As part of the 5-year plan, the manufacture of bricks, lead and zinc pipes, and construction of an ironworks plant were planned.

Other mineral commodities produced on a small scale, including gold, cement, and copper, dropped in excess of 10% from 1981 production. Petroleum, cement, and potash appeared to be the only commercially exploitable minerals by yearend 1982.

The Congo's single cement facility at Loutete improved 1981 production efficiencies after technical assistance was provided by a West German management consultant. However, the facility produced well below its 80,000-ton capacity during 1982.

Initial investigations by French and U.S. companies indicated the possibility of additional carnallite deposits throughout the Bas-Kouilou area.

The Congo's estimated petroleum and natural gas reserves were 1.3 billion barrels and 2.5 billion cubic feet, respectively. The three offshore oilfields—Emeraude, Loango, and Likouala—accounted for the bulk of production. The three other smaller producing fields included Yanga, Koundji, and Pointe Indienne. Production was dominated by the European companies SNEA, Azienda Generali Italiani Petroli S.p.A. (AGIP), and Hydro-Congo. The latter retained the monopoly over national hydrocarbon marketing and distribution. As of late 1982, no exploration drilling was underway, but test drillings were scheduled for 1983.

The National Oil Refinery began test operations during September and officially opened on December 11, 1982. The 1-million-metric-ton facility was designed to produce gasoline, diesel oil, gas, and fuel oils. The nation's first refinery was financed in joint venture between SNEA and Hydro-Congo. The $200 million plant, located at Pointe Noire, was completed by Technip, France, 6 years behind schedule.

The Government continued to support national business investment incentives and infrastructure development expenditures. A new investment code, promulgated on July 7, granted privileged status to indigenous businesses in order to promote Congolization and decentralization policies.

The emphasis of the 1982-86 5-year plan was on infrastructure development. A major expansion project for the Port of Pointe Noire was scheduled for 1984. The port

handled 4 million tons of freight, operating near capacity during 1981. The river port facilities at Brazzaville were underutilized, but increased forestry activity in the northern Congo was expected to raise the traffic level. The Congolese railway handled 3 million tons of freight in 1981, of which 1.5 million was Gabonese manganese ore. Realignment and purchases of new rolling stock during 1982-83 were expected to raise rail capacity considerably. The greatest transport bottleneck continued to be inadequate roads. Work continued during 1982 to connect Brazzaville with Pointe Noire.

EQUATORIAL GUINEA

In April an international donors conference, sponsored by the UNDP and the Equatorial Guinean Government, was held to raise financial pledges for the Government's reconstruction and development program. The UNDP identified the following high-priority project areas, $33 million for agriculture, $33 million for transport and infrastructure, $24 million for water supply and housing, and $20 million for industrial development, mining, and energy.

SÃO TOMÉ E PRINCIPE

The two small islands of São Tomé and Principe were located in the Gulf of Guinea, offshore Equatorial Guinea and Gabon. The islands' mostly agricultural economies continued to rely on assistance from the U.S.S.R., Cuba, and European nations.

A brick factory with annual capacity to produce 19 tons of manufactured clay articles was being planned in São Tomé. Technical and financial assistance was provided by the German Democratic Republic.

The Mineral Industry of Other East African Countries

By Kevin Connor[1]

CONTENTS

BURUNDI

The mineral industry continued to be an almost negligible contributor to the country's economy as the Government continued its 1979 ban on any mineral exploitation for export; a policy initiated at the end of 1979. A national program had been underway since that time to map and inventory all mineral resources so as to permit future exploitation of mineral wealth in the best interests of the country and its inhabitants.

In March 1982, the British Sulphur Corp. Ltd., under contract to the Burundi Government and the International Bank for Reconstruction and Development (World Bank), began a feasibility study of Burundi's phosphate deposits at Matongo-Bandaga for potential commercial exploitation. The 1-year project effort was to define ore reserves, conceptually design mining operations and processing facilities, estimate capital and production cost, and develop a regional market and distribution survey. Work completed during the year comprised geological exploration and reconnaissance and 1,200 meters of core drilling. Reserves in excess of 5 million tons of ore-grade phosphate were estimated available for mining. Rare-earth mineralization was associated with the primary apatite. The associated carbonatite within the rock matrix was preliminarily assessed to be of value as a raw material for the manufacture of cement. The contract effort was valued at $1.2 million.[2] Matongo-Bandaga is located approximately 40 kilometers north of the capital city of Bujumbura and alongside one of the country's few paved roads.

Vanadium deposits, which were delineated through core drilling conducted during the year, looked commercially promising according to a United Nations Development Program (UNDP) report released late in 1982. UNDP-sponsored investigations showed a 100-kilometer-long belt of vanadium-bearing rock extending the width of the country in a north-south direction. Drilling results were given as 5.5 million tons of proven reserves with an average vanadium content of 1.5%. The Finnish mining company Rautaruukki Oy estimated from core sample testing that 85% to 90% of the vanadium was recoverable. More drilling, coring, and lab testing was scheduled for 1983.

In December 1982, Duke University began a second phase of oil exploration and scientific research in Lake Tanganyika. The university-sponsored scientific research team made final preparations to conduct 3 months of seismic experiments to test plate tectonic theory and the origins of the African rift within the lake bottom structure. Data gathered was also scheduled to be analysed for any indications of oil-bearing formations. Both equipment and a specially built research vessel for geologically investigating East Africa's rift lakes was flown to the capital city of Bujumbura early in November. The second-phase project was being funded by a group of 10 multinational oil companies. Aside from the scientific value of the university study to learn more about Africa's ancient climates and geological age, the project was developed out of the promising findings of the phase one efforts concluded in 1981, which showed the possibility of oil and gas deposits under both Lake Tanganyika and Lake Malawi.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Includes data available through Sept. 8, 1983.

[2]In addition to the commodities listed, modest quantities of unlisted varieties of crude construction materials (clays, stone, and sand and gravel) presumably are produced, but output is not reported quantitatively, and available information is inadequate to make reliable estimates of output levels.

[3]Limited quantities of other pegmatite minerals may also be produced, but output is not reported.

[4]Revised to zero.

[5]Reported figure.

[6]Less than 1/2 unit.

[7]Data represent sales; actual production is not reported.

[8]Diamond figures are estimated to represent 50% gem-quality and 50% industrial-quality stones.

[9]Exports.

DJIBOUTI

Djibouti, the former French Territory of Afars and the Issas, remained a minerally poor nation in 1982. Mineral production was limited to locally used construction materials and evaporated salt. Under development study was an Iraq-sponsored cement plant project, proposed to be located near limestone deposits outside the city of Ali-Sabieh. With assistance from Italy, France, and the United States, geothermal field and laboratory studies continued on utilization of geothermal power from the Lake Assal area. The cost-benefit feasibility of constructing an electrical generating station above the steam reserves was being investigated.

ETHIOPIA

Affected by severe drought and continuing civil strife, Ethiopia's economy was in a state of stagnation in 1982. However, some portions of the mineral industry did show developmental progress. The Ethiopia-Libya Mining Co. invited engineering firms to submit proposals for a feasibility study of potash mining prospects in the Danakil

Depression in northern Ethiopia. Based on geological studies conducted in the early 1970's, the Danakil Depression has measured high-grade reserves of 60 million tons of potash with indicated reserves estimated at 150 million tons. Proposal evaluations were almost completed in late 1982, and a contract for the study was expected to be awarded by the spring of 1983.

With financial and technical assistance from the German Democratic Republic, work continued throughout the year on the construction of the Mugher cement factory in the Shoa administrative region of the country. The project, begun in 1980, was scheduled for completion in 1984. The projected final cost of constructing the 300,000-ton-per-year plant was $31.4 million.[3] Expansion work at the existing cement manufacturing facilities at Dire Dawa was expected to be completed in 1983, with assistance from the Soviet Union.

In September 1982, the Chevron Oil Co. signed an oil exploration agreement with the Ethiopian Government to explore for petroleum in the country's western-most Provinces of Illubator and Wollega. These two areas were adjacent to oilfields discovered by Chevron in southern Sudan, and it was a Chevron supposition that the oilfields might extend into Ethiopia. By yearend, a high-resolution aerial survey had been completed, and plans for a gravity study had been drawn up. The gravity study, which would require 2 to 3 months to complete, was scheduled to begin in late January of 1983. In 1982, Ethiopia imported its entire supply of petroleum from the Soviet Union, which amounted to approximately 800,000 tons of crude, and then refined it at the country's sole petroleum refinery at Assab.

A geothermal steam resources project to evaluate the indigenous potential for fueling a powerplant in the Lakes District area, southwest of Addis Ababa, continued throughout the year. The project was funded jointly, through yearend, by the UNDP and the European Economic Community (EEC). Outlined in the project's workplans were nine exploratory drill holes to delineate the geothermal resources of the area. However, only two of the holes had been completed by yearend. Other areas of Ethiopia were also thought to be geothermally promising, and with additional funding expected from UNDP and EEC in early 1983, the project was slated for expansion and extension through the 1985 calendar year.

LESOTHO

With the closure of the Letseng-la-Terai diamond operation in fall of 1982, Lesotho had no active mining operations at yearend. The Lesotho Government and De Beers Consolidated Mines Ltd. of South Africa concluded the closure agreement for the operation in May, and all mining was suspended immediately. However, the operation's processing plant continued with treatment of stockpiled ore and did not shut down until late October. During the 10 months of the year that the Letseng complex was in operation, a total of 1.4 million tons of ore was treated to yield slightly over 42,000 carats at an average grade of approximately 2.95 carats per hundred tons. This rate of recovery was comparable with the 1981 annual production of almost 53,000 carats recovered from the treatment of 1.9 million tons of ore. Completion of final cleanup operations was expected by January 1983.

MALAWI

The Malawian economy showed virtually no growth in real terms in 1982, marking the third consecutive year of economic stagnation. Cement production by Portland Cement Co. Malawi Ltd. fell for the third straight year, reportedly owing to supply problems of coal necessary to the operation of the plant facilities. Imports of almost 30,000 tons of cement were necessary to cover shortfalls experienced in the country. The associated limestone production quarried was also 30% less than that of 1981, with the final total slightly less than 80,000 tons. Problems obtaining coal from neighboring Mozambique stimulated additional interest by the Government in pursuing a pilot-scale program for mining the Ngama Coalfield. Based on drilling completed in 1981, 9 million tons of indicated reserves was estimated. Also during the year, the Malawi Geological Survey Department (MGSD) began investigations on the Livingstonia Coalfield.

Hunting Geology and Geophysics Ltd. carried out an aeromagnetic survey over Lake Malawi and portions of the Shire

Valley under a reconnaissance agreement with Shell Oil Co. of the United States. The survey showed three substantial sedimentary basins, one possibly 4,000 meters thick, under Lake Malawi. Even though the information increased the chances of oil and gas below the lake, the fact that the basins were all located below 500 meters of water led Shell to relinquish its option to negotiate further exploration licenses.

In other areas, a subsidiary of British Gypsum Ltd. exported a trial shipment of lump kyanite to the United Kingdom from the Kapiridimba area and continued with its pilot-scale production project of vermiculite from the extensive deposits at Kapirikamodzi, in the Mwanza District. Union Carbide Corp. submitted to the Malawian Government the results of research carried out in 1981 under three reconnaissance licenses. The research investigations, which were around the Lower Paleozoic Lake Malawi Granites, led to the discovery of significant tin anomalies and the first reported occurrence of tungsten within the country. MGSD finished its assessment of the glass sands at Mchinji and the kaolin clay deposits of Linthipe, and in both cases reported sufficient mineral quality and quantity to support proposed glass and ceramic industries.

MAURITIUS

Mauritius, an island located about 800 kilometers east of Madagascar, remained basically an agricultural nation with sugar production accounting for two-thirds of the country's export earnings for the year. Mineral production on the island was limited to stone and gravel quarrying for local construction, along with small lime- and salt-producing operations, which also supplied domestic markets. A small diamond-cutting operation using imported rough gem stones operated on the island during the year, and a portion of the firm's production of precious and semiprecious gems was exported to the United States. A program was begun to evaluate the island's rivers for hydroelectric potential. Another project was under development to study the potential for generating electricity using waste sugar cane stocks as fuel. Both of these efforts were a direct result of Government concern over petroleum import costs, which absorbed 16% of the country's export earnings for the year.

MOZAMBIQUE

A shortage of foreign exchange and civil strife continued to hamper the Mozambican economy, which overall showed little developmental progress for the year. Production estimates for mineral industry commodities showed no growth over the previous calendar year, although notable progress was registered in project planning for mineral developments for 1983 and beyond. The national coal company, Carbonifera de Mozambique, announced plans for the development of four new mines at Moatize in the northwestern Province of Tete, near the Zimbabwe border. Like existing operations in the area, three of the planned operations would be underground, while the fourth would be a pilot-scale opencast mine intended to evaluate the feasibility of surface mining for the area. An undisclosed portion of the necessary funding for these expansion projects was to be supplied by the Federal Republic of Germany.

Besides further developing the coalfields of Moatize, the Mozambican Government had plans to negotiate with foreign petroleum companies on exploration rights for the Rovuma Basin in the first half of 1983. The basin area located onshore in northeast Mozambique near the Tanzania border was shown to be the most promising of the country's exploration areas by the aeromagnetic survey work completed in 1981 by Compagnie Generale de Geophysique. The survey clearly distinguished a large sedimentary basin, with sedimentary thickness of up to 10,000 meters in some places. Late in 1982, the Government was also making final preparations to facilitate the bidding for petroleum exploration rights on 17 offshore blocks covering the country's entire Continental Shelf. Interested companies would be allowed to negotiate production-sharing contracts on a block-by-block basis. Block sizes were to be either 5,000 or 10,000 square kilometers. Offshore seismic survey work on the shelf was conducted and completed in midyear. No oil or gas exploration drilling has been conducted in Mozambique since the country's independence in 1974, although efforts prior to that time led to the

location of an estimated 57 billion cubic meters of gas reserves in the Pande, Buzi, and Temane areas. Fluor Corp. was awarded a contract during 1982 to conduct a feasibility study on a gas-fed ammonia and urea fertilizer plant based on exploitation of the Pande Field.

A 50-hectare saltpan, which had begun test operations late in 1981, continued throughout the year at Nova Mambone on the coast of the southern Province of Inhambane. The pan, which was built with assistance from North Korea, was expected to reach an output of 7,500 tons per year in 1983, at which time the project was expected to be fully operational. Also during 1982, the Government of Mozambique was considering a proposal, which included financing from the Italian Government, to build an aluminum smelter, refinery, and fabrication plant at Maputo. Operating on imported alumina, the operation was to produce up to 150,000 tons of ingots, with approximately 15% being processed into semifinished and finished products for the domestic market. The remainder of the aluminum ingots would be exported.

REPUBLIC OF COMOROS

No commercially exploitable minerals were yet discovered in the Republic of Comoros, an archipelago situated in the Mozambique Channel off the southeast coast of Africa. Of the four major islands, politically, three of them were composed as an independent republic, while the fourth, Mayotte, was a French territorial community. The agricultural production of ylang-ylang, vanilla, copra, and cloves remained the archipelago's major export commodities. Virtually all mineral-related needs were imported. Mineral production on the islands was almost negligible with only small sand and gravel pits known to have been in operation. The islands have geothermal potential, which was under study for possible use as an energy alternative to costly imported petroleum fuels.

REUNION

The economy of Reunion, an island in the Indian Ocean approximately 640 kilometers east of Madagascar, continued to be heavily dependent on the agricultural sector, primarily sugar. Trade revenues from this commodity were slightly over $80 million.[4] Reported mineral activity on the island was limited to the operation of a 200,000-ton-per-year cement clinker grinding facility at Saint Denis, which manufactured cement mix from imported materials. Construction work began during midyear on the new harbor and port facilities in the Bay of Possession. The project, estimated to cost over $100 million, was scheduled for completion in 1985. The island, which was reported to have a population of slightly over 520,000 people as of July 1982, remained an overseas department of France.

Bituminous mixtures do	594	818	--	All from France.
Tars and other crude chemicals derived from coal, gas, and petroleum	10	9	--	Do.

[1]Less than 1/2 unit.

RWANDA

Rwanda's main sources of export revenue, coffee, tea, and minerals, continued to be subjected to falling world commodity prices. With export earnings down, the country's budget deficit increased 30% to $23 million by yearend.[5] Mineral production totals for beryl, columbium-tantalum, tungsten, gold, and tin remained at approximately the same output levels as 1981 final figures, while export trading of minerals was estimated to have declined appreciably.

The national tin-mining company, Société Minière du Rwanda, which completed its 3,000-ton-per-year smelting operations plant in Kururuma in 1981, operated without major interruption throughout 1982 and produced 908 tons of tin ingots. Rwandan officials had estimated that remaining measured and indicated tin ore reserves in the country were approximately 20,000 tons. Preliminary planning continued on the construction of an iron foundry at Kigali, exploitation of methane gas deposits located under Lake Kivu in cooperation with Burundi and Zaire, and production of 10,000 tons per year of lime at Ruhengeri.

As part of the Rwandan Government's development plans, emphasis continued to be placed on transportation infrastructure. Negotiations neared final stages for construction of a railway between Rwanda and Tanzania, to be built with Chinese assist-

ance. Also, a 150-kilometer asphalt road between the city of Butare in southern Rwanda and Zaire was approved with $8 million in financing provided by the Arab Bank for Economic Development.

SEYCHELLES

In general, the state of the Seychelles economy was repetitious of 1981 recessional conditions, although upturns in the important agricultural export trade and tourism were underway in the last half of the year. Early in 1982, U.S. AMOCO signed an exploration agreement with the Seychelles Government to conduct regional aeromagnetic and seismic surveys along approximately 27,000 kilometers of ocean floor. The company's first exploration program, which ended in 1981, had searched for oil with three subsequently dry wells drilled off the main island of Mahe in the Owens and Topaze Banks. Based on analysis of the aeromagnetic surveys completed in July 1982, plans were being made late in the year for seismic testing to begin in the spring of 1983 off the coast of the Farquhar Islands, a group of small islands located at the southern tip of the Seychelles chain. The only other mineral-related activities on the islands in 1982 were small sand and gravel operations for local construction, and collection and processing of guano for use domestically as fertilizer.

SOMALIA

Somalia's economy changed little during the course of the year, with livestock raising contributing 80% of the country's export earnings and employing 70% of the working population. To alleviate the high cost of petroleum imports for energy-related uses, the Government continued to promote and support petroleum oil exploration and hydroelectric dam development projects within the country. With Chinese assistance, the small 6-megawatt hydroelectric dam project at Fanole was completed in October.

Commercial mining operations were limited to the extraction of meerschaum from deposits in the Mudugh region near El Bur. The material, as mined in previous years, was low-density, high-porosity sepiolite. Exports to the United States and other Western markets were estimated at 9,000 kilograms. Work continued throughout the year on the new 200,000-ton-per-year, dry-process cement plant at Berbera. Lafarge Conseils et Etudes, a division of the French company Lafarge Coppee Corp., was handling the engineering work, and plant equipment was being supplied by the French firm Creusot Loire S.A. Completion of the project, which would be Somalia's first cement plant, was scheduled for late 1983. A second cement manufacturing facility, to support the planned 10-megawatt Bardera Dam construction project on the Jaba River, was estimated to cost $93 million to build and would have a projected output of 250,000 tons per year product.[6] Financing for the plant was expected to come from the Italian Government, and a contract to build the facility was awarded to the Italian consortium of Cogefar, Dravo Construttori, Italeementi, and the Franco Tosi Co.

In September 1982, the Government of Somalia solicited applications for petroleum exploration permits on unconcessioned areas of the country. During the reported year, almost one-half of the nation's 640,000 square kilometers was under concessional contract to five international oil companies and consortia. Oil exploration efforts began in Somalia in 1974, and as of yearend 1982, approximately 60 wellholes had been completed without commercial success. The deepest exploratory drilling for petroleum in Africa to date had occurred in Somalia with completion depths of 5,000 meters being reported by Atlantic Richfield Co. (Arco) in 1980 and Deutsche Texaco in 1981 and 1982. During the month of August, through a partnership arrangement between Arco and Exxon Corp., a new offshore drilling project began some 200 kilometers northeast of the capital of Mogadishu. An exploratory drill hole to a maximum depth of 3,700 meters was planned.

SWAZILAND

Asbestos remained the main mineral-related foreign exchange earner in 1982. Output from the country's sole operation, the Havelock Asbestos Mines, declined approximately 25% from the 1981 level of production owing mainly to poor market conditions. The operation remained profitable as approximately 26,000 tons of product valued at slightly less than $14 million was traded.[7] The Havelock Mine's capacity was rated as 2,800 tons per day of ore, processed into 120 tons per day of asbestos fiber. The mine's reserves were still considered sufficient for several more years of operations at 1982 production levels. As in previous years, the country's coal production was limited to the Anglo-American Corp.-controlled Mpaka Colliery, which produced slightly under 100,000 tons for the year, valued at $2.4 million. This was a 40% decrease from 1981 production and was attributed to a combination of transportation and marketing problems. The possibility of increasing the future output from the Mpaka Mine was stated to be conditional on the improvement program underway for the railway line to the Mozambican Port of Maputo, through which Swaziland's coal was exported to Kenya, the Republic of Korea, and Mozambique.

A consortium of Italian railway equipment companies was carrying out modernization work on the Machava-Matsapa section of the railway at an estimated cost of $42 million, and a Swedish company, Swederail, was commissioned to do a feasibility study on electrification of the railway system. Some of the coal produced in 1982 was used to power the railway locomotives and to fuel two small coal-fired powerplants. Still under consideration by Shell Coal Swaziland was an 800,000-ton-per-year anthracite mine to be located in the Mhlume area in northeast Swaziland. The coal resources of the country were estimated at slightly less than 2 billion tons of economically recoverable steam-grade product and appeared to be the country's mineral resource with the greatest long-term potential. Other companies that were showing interest in exploiting Swaziland's coal were the Korean Coal Corp., the South Korean industrial group—Daewoo Heavy Industries Ltd., and Intercoal Mining & Trading Corp. of Switzerland.

TANZANIA

Tanzania's economy continued to be heavily reliant on agricultural production, with 90% of the working population engaged in farming and over two-thirds of all export earnings derived from agricultural sales. Mineral production of diamonds remained Tanzania's major export product from the minerals sector during the year with rough and polished diamond sales accounting for almost 8% of the country's foreign exchange earnings of $370 million.[8] As in previous years, minor amounts of gold, tin, and mica were exploited for export, and gypsum, lime, salt, and cement were produced for domestic consumption. There were several metal and nonmetal mines in various development stages, with some starting production and some still in planning and construction stages.

The Buck Reef gold mine in the Geita District began production in October and had recovered approximately 550 troy ounces of gold by yearend. The Minjingu phosphate mine also began production operations late in 1982 and was expected to produce 100,000 tons of concentrates during 1983. The mine production was expected to be used for feedstock at the Tanga fertilizer complex, which had been importing concentrates from abroad. The Kone Corp. of Finland and the Finnish Government were the financial backers of the Minjingu operation in 1982. Planning continued on a project to further delineate the coal reserves at the existing Ilima Mine and to continue with exploration of the Kabulo Ridge area, which according to a 1980 survey, contained up to 20 million tons of coal reserves amenable to open pit mining. Financial assistance for the project was being sought from the World Bank. The Mbeya cement factory, which was completed in early 1981, was expected to begin producing cement early in 1983. The 2-year startup

delay was caused by a lack of electrical power to operate the plant's equipment. The factory's power requirement of 7.5 megawatts was to be supplied from a 10-megawatt power station completed in mid-1982 in Mbeya. The cement factory's production capacity was estimated at 250,000 tons per year.

Tanzania's governmental agency for mineral development, the State Mining Corp. (Stamico), was also well into the planning stages for expanding the country's output of both kaolin clay and tin. Pugu Kaolin, a mine on the periphery of Dar-es-Salaam, was expected to double its production to 8,000 tons per year of kaolin by 1985, with the majority of the high-quality clay destined for export. Based on feasibility study work done by the Finns in the 1970's, Stamico had nearly finalized plans at yearend 1982 for initiating a tin-mining operation in the Kyerwa Karagwe District of the Kagera region. Financial assistance and machinery from the United Kingdom were expected to be supplied in early 1983 to get the operation underway. Stamico also announced plans during the year to begin development in 1983 of four new salt-producing facilities, to be located on the coast at Changwahela, Kitame, Lindi, and Mtwara. Salt production in 1982 from existing operations was 41,000 tons, while domestic demand was estimated at 100,000 tons per year.

Sizable gas reserves have been found off the coast of Tanzania since 1973; however, no commercially viable quantities of petroleum oil had been discovered as of yearend 1982. In October, a Canadian drilling ship, working under a $27 million grant from Petro Canada International Assistance Corp., began drilling an exploration well southeast of Dar es Salaam. Seismic data used to select the site was supplied by the Tanzania Petroleum Development Corp. Other petroleum companies involved in petroleum exploration were Sonatrach, Azienda Generali Italiana Petroli S.p.A., AMOCO, International Energy Development Corp., and Shell Oil. In early 1983, an exploration agreement between the Tanzanian Government and Société Nationale Elf Aquitaine was expected to be signed.

UGANDA

The Ugandan economy showed considerable progress under its Recovery Programme in 1982, as agricultural production increased markedly and the gross domestic product for the country grew by 7.5%. Only minor progress was made during the year regarding revitalization of Uganda's mineral industry, owing to the Government's assigned modest priority to the mineral sector. Because of the continued depressed world minerals market, the Government did not emphasize mineral-related export projects. However, both cement and phosphate production projects were emphasized because of their intrinsic value to the country's large construction and agricultural recovery projects. Plans to set up a National Mining Corp. (NAMICO) remained in the formulation stage throughout the year. NAMICO needed to be enacted by legislation and approved by the National Assembly, which was postponed at least until 1983.

The Kilembe copper-cobalt mine continued to operate on a minimal care-and-maintenance basis. Some production of copper concentrates occurred sporadically through the mill's 30-ton-per-hour extension circuit, but the main 90-ton-per-hour milling circuit remained totally inoperative owing to a lack of needed equipment parts. Production of copper concentrates was slightly over 2,000 tons for the year. The smelter, which is located at Jinja near the Owen Falls power station, did not produce any blister copper as the plant's electric furnace remained dismantled. In July, the British Petroleum Corp. subsidiary, Seltrust Engineering, began a feasibility study for rehabilitation of the mines, mill, and smelter. The study's findings were scheduled for completion and submission to the Ugandan Government early in 1983. The effort was funded through a loan from the European Investment Bank. The proposed cobalt project, which was being studied by Sherritt Gordon Mines Ltd. of Canada, was discontinued because of lack of funding.

Under a $4 million credit from the International Development Agency, the Florida-based Bearden Potter Corp. began engineering studies in 1982 on developing a phosphate fertilizer industry utilizing the Sukulu phosphate deposits.[9] A fertilizer factory operated by Tororo Industrial Chemicals and Fertilizer Co. was located there but ceased production operations in the early 1970's. Revitalization of the Kilembe Mine was considered an important factor to this project, as the mine's waste sulfuric acid component could be used in manufacturing

the phosphate fertilizers.

As of the end of 1982, no salt production had been reported from the Lake Kature salt project, which was prematurely commissioned in December 1980. However, a cooperative agreement was signed with the Federal Republic of Germany in April 1982 for a $4.5 million loan and technical assistance to modify the plant for production of table salt.

The Hima cement plant, located in western Uganda, underwent major repairs. The plant's phase-two circuit was put into production and was producing at a rate of 400 tons per day by June. However, output from the plant was severely curtailed during the last half of the year owing to power shortages. The plant's phase-one circuit, which was rated at 300 tons per day capacity, was also scheduled for rehabilitation, but remained inoperative throughout the year. Extensive drilling and analysis of remaining limestone reserves near the Tororo cement complex, in eastern Uganda, showed the quality is borderline for continuance of the manufacture of cement at that plant. The Turkish Cement Corp., which is under contract to the Ugandan Government to evaluate and rehabilitate the facilities, was to make a decision and recommendation to the Government early in 1983. Production of cement from the Tororo plant in 1982 was minimal. Output of asbestos products from the complex faired better, and the plant was reported to have operated at 30% of capacity during the year.

The Mineral Industry of Other West African Countries

By George A. Morgan[1]

CONTENTS

BENIN

Mineral production was confined to output of cement and gravel. However, exploration was being conducted by the U.S.S.R. and the United Nations Development Program. Development of a domestic limestone deposit and crude oil from an offshore oilfield was underway. Benin's currency remained fixed to the French franc. The gross domestic product (GDP) was $977 million in 1981, the latest year for which information was available.[2]

COMMODITY REVIEW

Cement.—Construction of a cement plant with 500,000 tons per year capacity neared completion at Pobé. The operator of the plant, using locally produced limestone, was the Société des Ciments d'Onigbolo, a joint venture between Benin and Nigeria. Nigeria was expected to utilize most of the cement produced. Equipment for the plant included a 1,600-ton-per-day, oil-fired preheater.

Petroleum.—Development of the Seme Oilfield neared completion. Storage facilities and pipelines were completed, and training of Beninese personnel from the Office Beninois des Mines et el'Energie commenced. Five production wells were planned for the field, and total output was expected to reach about 15,000 barrels per day. All production was to be exported because there was no domestic refinery capacity. Benin imported all its liquid fuel requirements and also acted as an entrepôt for inland countries such as Upper Volta and Niger.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Includes data available through Aug. 22, 1983.

[2]In addition to the countries listed, The Gambia, Guinea-Bissau, and Upper Volta, which are covered in the text of this chapter, presumably produce a variety of crude construction materials (clays, stone, and sand and gravel) and may produce gypsum, lime, and salt, but output is not reported quantitatively, and available information is inadequate to make reliable estimates of output levels.

[3]In addition to the commodities listed, a variety of crude construction materials (clays, stone, and sand and gravel) presumably is produced, but output is not reported quantitatively, and available information is inadequate to make reliable estimates of output levels.

[4]Output based entirely on imported clinker.

[5]Reported figure.

[6]Data are for years ending Sept. 30 of that stated.

[7]Products marketed under the trade names "Balifos," "Phospal," and "P 125."

[8]One-third of domestically produced clinker from limestone mined at Tabligbo, Togo, is used domestically for cement production. Ghana and the Ivory Coast each receive one-half of the remaining clinker output. Togo also imports clinker for the production of cement by Ciment du Togo.

[9]Revised to zero.

CAPE VERDE ISLANDS

Output of mineral-related products in 1982 was confined to crude construction materials and salt. Data available on salt indicated that about one-half of the quantity produced yearly was exported. Project study of a proposed cement plant on the Island of Maio continued. If approved, actual first-phase output of 60,000 tons per year of cement would not commence before 1987. Locally produced limestone and pozzolana would be used for feed material.

THE GAMBIA

Excluding output of unknown quantities of crude construction materials, mineral industry activity in The Gambia was insignificant in 1982. Petroleum refinery product requirements were met through imports.

GUINEA-BISSAU

Mineral industry activity was confined to exploitation of unknown quantities of crude construction materials. Detailed trade data was unavailable, but the major portion of both quantity and value of all trade was with Europe, particularly Portugal.

Installation of two of the seven planned generators at Bafata was completed by the U.S.S.R. Electricity from the generators will be used to supply the eastern towns of Gabu, Contuboel, Bamba-Dinca, and Xime.

The U.S.S.R. also continued a feasibility study for the exploitation of bauxite deposits near Boe. Preliminary plans were underway regarding the terms of their development should exploitation prove economical.

IVORY COAST

The only nonfuel mineral product produced in 1982 was cement from imported clinker. A new offshore oilfield came into production and a new petroleum refinery provided local production of refined products, with excess output exported.

Exploration continued, particularly in the west and northwest where uranium and gold have been discovered. The advances made in energy self-sufficiency, both from petroleum and hydroelectric power, were counterbalanced by low prices and a general recession in the agricultural and industrial sectors. The GDP was $7.7 billion in 1982.[3]

The Ministry of Mines was responsible for activities in the mining industry and had 150 professionals, many educated in the United States. Majority ownership by the Government of an enterprise was not required and could be held by a private investor. In addition, exemption from taxes for the first 5 years was possible.

COMMODITY REVIEW

Cement.—Production was reported from three plants using imported clinker; two were located in Abidjan and one in San Pedro. France and Spain were the principal sources for clinker. However, one-third of the clinker produced in Togo from the Tabligbo plant was also imported based on the terms of an agreement reached in 1977 with Togo and Ghana for participation in a regional clinker plant.

Copper-Nickel.—Société pour le Development Minière de la Côte d'Ivoire conducted a drilling program at Samapleu-Obangbapleu that resulted in discovery of a basic-ultra basic igneous complex. Chalcopyrite, pentlandite, and pyrrhotite were found as both massive and disseminated mineralization.

Gold.—Development of the Ity gold deposit remained under study. Mine life was estimated at 13 years at an annual production of 160,000 tons of ore grading 0.27 troy ounce per ton. An initial investment of about $18 million was estimated to be required for development.

Petroleum.—Oil production commenced from the Espoir Field in August 1982 from five wells drilled by Phillips Petroleum Co. Sand problems adversely affected output from the field, which yielded about 18,000 barrels per day of crude oil. Three additional wells may be drilled. Excluding gas used for platform fuel, all associated gas produced was flared, which amounted to over 8 million cubic feet per day. Crude oil was moved from a production gathering platform through a 2-mile-long pipeline to a permanently moored 229,240-deadweight-ton, very large, combination carrier. The carrier served as a storage and loading system for shuttle tankers.

The final stage of a second development phase costing $48 million was being completed on the Belier Field, which commenced production in August 1980. Water injection and gas lift methods were being implemented to maintain pressure.

The hydrocracking unit at a new refinery in Abidjan was to commence operation in early 1983. The refinery had a capacity of 40,000 barrels per day. Parts for the new plant were salvaged from the old refinery. Unused capacity beyond domestic requirements may be contracted to refine petroleum for Upper Volta and Mali.

Uranium.—Exploration took place in the region of Odienne where some 50 anomalies were detected by radiometric survey. Anomalies at Gbahalan and Bougoussa were determined to be uraniferous, and those at Bouendiedoufou, Tiemba, and Farakro were determined to be thorium related. Detailed exploration was also completed at several other localities having uranium mineralization.

MALI

Although small, the mineral industry of Mali improved in terms of the quantity of mineral-related products produced. Extensive activity continued in the areas of mineral exploration and expansion of existing production facilities. A wide range of mineral-related materials were the objects of investigation, including gold, diamonds, phosphate, iron ore, steel, uranium, and oil.

The index of industrial production (1969=100) increased to 540.5 in 1981 from 388.9 in 1980. The Government began to open state corporations to private investors, including foreign partners. The investment code was considered favorable owing to a liberal repatriation system. Executive Order 76-81 offered tax-free privileges for 5 to 10 years for special sectors, such as metallurgical industries, energy, and construction. Manufacturing concerns must offer the Government 10% to 15% ownership. A further liberalization of the investment code was expected in 1983.

Data on economic activity for Mali were generally dated and limited. The gross national product was $1,200 million in 1981, the latest year available.[4] The trade deficit in 1981 was $199 million. France was the principal trading partner in terms of both exports and imports.

COMMODITY REVIEW

The Bureau de Recherches Géologiques et Minières (BRGM) followed up on agreements made for exploration and development in various areas. The potential for gold, copper, tin, and diamond production from the Kenieba region was researched by the Syndicat Franco-Maliende Recherches Minières, composed of Mali, BRGM, and the Société Moderne des Produits Metallurgiques, an affiliate of Compagnie Générale des Matières Nucléaires (COGEMA) of France. Diamond-bearing kimberlites were located in the vicinity of Kenieba prior to 1967 by Selection Trust, but were considered not commercially exploitable. The Power Reactor and Nuclear Fuel Development Corp. of Japan was to spend $2.7 million during the 1982-83 fiscal year for exploration in the vicinity of In Tamat, Gourma, and Chag Gueret. COGEMA also had several permits for uranium exploration in the areas of Kenieba, Taoudeni, and Hambori-Douentza.

Energy.—All hydrocarbon products consumed were imported, as there was no refinery or crude oil production. The total value of imported petroleum products was estimated at $91 million in 1982. The main products were gasoline, diesel fuel, and aviation fuel.

The total thermal electric generating capacity was 40.1 megawatts in 1978, the latest year available. Bamako accounted for 31.9 megawatts. Hydroelectric energy was from three sources: Sotuba, 5.4 megawatts; Felou, 0.5 megawatt; and Selingue, 44.0 megawatts. Construction continued on a dam and power station at Manatali to supply 200 megawatts.

Gold.—The Kalana Mine, operated by the U.S.S.R. in conjunction with the Société Nationale de Recherches Minières, (SONAREM) continued to expand output, although at low levels owing to technical problems. At full capacity, SONAREM's annual production was to be about 57,000 troy ounces of gold and 15,000 troy ounces of silver.

Iron and Steel.—The Krupp Group of the Federal Republic of Germany signed an agreement with the Government for the creation of the Société Malienne de Siderurgie (SOMASID). SOMASID was to promote development of a 30,000-ton-per-year steel production facility, using iron ore from the unexploited Bale deposit. Two small pig iron plants were operated by Entreprise Malienne de Fonderie. Consumption was about 450 tons per year of scrap, and castings produced were used locally.

Phosphate Rock.—Phosphate output from the Tilemsi Valley deposit was small and consumed locally for agricultural use. A crushing plant, representing the areas first industrial investment, commenced at Bourem. It was funded by the Federal Republic of Germany.

NIGER

The Niger mining sector was in general decline in 1982, mainly as a result of lower world demand for uranium, the country's principal foreign exchange earner. Output of uranium fell slightly, and low demand resulted in delays in further development by various consortiums.

Since Government budget expenditures were heavily dependent upon the profitability of the uranium sector, the economy was

in general recession. The GDP was $1,997 million, the second consecutive year of decline from the 1980 high of $2,345 million.[5] Imports exceeded exports by $157 million. Uranium exports, in terms of elemental uranium, were 3,780 tons compared with 4,857 tons in 1981.

COMMODITY REVIEW

Cement.—The Société Nigérienne de Cimenterie operated the country's only cement plant at Malbaza with a capacity of 40,000 tons per year. The company was expected to start up a new 300,000-ton-per-year plant at Malbaza in 1983.

Iron Ore.—KHD Humboldt AG of the Federal Republic of Germany was to evaluate iron ore located at Say, 30 kilometers southeast of Niamey. Reserves were estimated at 650 million tons. A beneficiation procedure was to be developed both for concentrating the ore and for reducing its high phosphorus content to acceptable levels. Pelletizing and direct-reduction potential of the ore was to be evaluated also.

Petroleum.—Société National Elf Aquitaine of France reported the discovery of a small deposit of oil in the extreme eastern part of Niger between Agadem and the border of Chad. Two of three wells drilled gave positive results, and the economic potential of the deposit was being evaluated.

Salt.—Production was from Tidekelt and has amounted to several thousand tons per year. A capacity increase to 8,000 tons per year was planned for 1983.

Uranium.—Output was expected to decline owing to low world demand. Production levels were to match purchase commitments. A reported surplus of 1,000 tons of uranate was nearly eliminated by the purchase of 900 tons by France. The price of uranium was raised to about $31 per pound of uranate, an increase of about $4.10 per pound.

Development of a new open pit mine at Arni by Société Minière de Tassa N'Taghalgue (SMTT) continued. However, owing to anticipated low demand, SMTT planned to mill and process ore at the facility of Société des Mines de l'Aïr, one of two active uranium producers in Niger.

SENEGAL

Nonfuel mineral output increased in 1982, with the exception of calcium phosphate, the mining sector's principal commodity. Exploration and development work continued for several additional minerals, including gold, marble, peat, and uranium.

COMMODITY REVIEW

Clays.—Output of attapulgite was by the Société Sénégalaise des Phosphates de Thies (SSPT), both as a byproduct of phosphate rock production and as a primary product. The Compagnie des Produits Chimiques et Materiaux (Prochimat) also produced attapulgite. Output was about 100,000 tons per year and plans were underway to double capacity.

Gold.—An occurrence of gold at Salbadala in Eastern Senegal was explored by BRGM. Approximately 2 million tons of ore grading 0.184 troy ounce per ton was under evaluation for exploitation.

Iron Ore.—Activity remained intense on development of iron ore resources at Falémé in the extreme southeast of Senegal. Lack of infrastructure and low world demand for iron ore remained as impediments to exploitation. Initial investment, including port and rail facilities at Bargy, was estimated at $877 million.[e] Output was planned to start at 12 million tons per year. Both hematite and magnetite resources have been delineated at Falémé.

Marble.—Proven reserves of 350,000 tons of high-grade marble have been reported in the Ibel region. An additional 1 million tons was considered as possible reserves.

Peat.—A trial peat mining and processing plant in the region of Niayes, near Mboro, was being financed at a cost of $350,000 by the European Economic Community. A significant peat deposit was discovered recently between Mboro and Loumpoul, and its development may partially replace fuelwood consumption. Included in the technical and economic viability of the project was its possible effect on the potential agricultural usage of the land and the land's reclamation subsequent to mining.

Phosphate Rock.—Overall output declined from 1981 despite the varying performance of the country's two producers. The reduced output was attributed to declines in both world and domestic consumption and the existence of adequate stockpiles.

Compagnie Sénégalaise des Phosphates de Taïba (CSPT), the principal producer, operated an open pit mine at Taïba. About 1,300 people were employed on a single 8-hour shift, 5 days per week. The normal workweek was 7 days. Mine capacity was 1.5 million tons per year, but could easily be doubled; the concentrator was the limiting factor. Concentrate was shipped 90 kilometers to the terminal at Dakar via two double ore trains. Sales were 100,000 tons per month, and the stockpile was 800,000 tons. CSPT planned to start a completely new and self-contained operation at Ndolene, 22 kilometers distant, following exhaustion of reserves at Taïba.

SSPT operated two open pit mines, one for calcium phosphate and one for aluminum phosphate. The mines were operated 9 months out of the year and were on care and maintenance for July, August, and September. About 240,000 tons of run-of-mine ore produced 140,000 tons of concentrate, which yielded 100,000 tons of clinker. The P_2O_5 content increased from 28.4% in the ore to 29.5% in the concentrate. Clinker content was 34% P_2O_5. Phosphal, a trade product, was produced from aluminum phosphate. Run-of-mine ore was passed through a jaw crusher, a roll crusher, two screenings, then calcined with No. 2 fuel oil and crushed to a final size of minus 150 micrometers. About 28% of the 34% P_2O_5 in Phosphal was organically active and was sold directly to farmers for local use. Mining of the calcium phosphate horizon by SSPT required loosening of 20 meters of hard laterite overburden through the use of ammonium nitrate. Run-of-mine ore was removed by power shovels and loaded on to 30-ton trucks for the 4-kilometer trip to the plant. Waste rock was then run into the pit behind ore extraction, leveled, and reclaimed with trees and grasses.

TOGO

The mineral industry was dominated by phosphate rock, which suffered from a loss in sales in 1982. Output reportedly increased substantially over 1981, but a stockpile of about 800,000 tons remained.

Most large industrial units in Togo were either wholly or partially owned by the Government, including phosphate rock, petroleum refining, cement, and iron and steel. Owing to the poor performance of the economy, the Government closed six state enterprises, including a salt company, and announced that it would no longer subsidize ailing state enterprises. The future of the state-run iron and steel company and the petroleum company was under study.

Togo's GDP was estimated at $796.8 million.[7] Phosphate exports were 2 million tons, valued at $81.7 million. The value of phosphate exports as a percentage of total exports has been about 50%. The country's largest project for future expansion was associated with further development of the phosphate fertilizer sector.

COMMODITY REVIEW

Cement.—Ciment du Togo (CIMTOGO) was the sole producer of cement in Togo. The company commenced operation in 1971 and its ownership was shared equally between the Government and the Lambert Group of France. Initial capacity was 120,000 tons per year, but has since been increased to 500,000 tons per year. Until 1979, all production of cement had been from imported clinker.

In 1975, the Société des Ciments de l'Afrique de l'Ouest (CIMAO) was created to supply the regional clinker needs of Togo, the Ivory Coast, and Ghana. Production of clinker commenced in 1979 with a capacity of 1.2 million tons, using limestone from Tabligbo, Togo. The three countries were each committed to purchasing one-third of the clinker plant's output. Financial, technical, and management difficulties resulted in unused capacity and an uneconomic product. The International Bank for Reconstruction and Development (World Bank) approved $15 million of a total of $34.8 million restructuring project for CIMAO. The remainder was from Caisse Centrale de Cooperation Economique of France, $12.8 million, and the European Investment Bank, $7 million. Société des Ciments Français of France, as head of a management and technical assistance team, commenced work in October 1982. One-third of clinker output by CIMAO was used by CIMTOGO for cement production.

Iron and Steel.—The Société Nationale de la Siderurgie commenced operation of a single electric furnace in 1979 in Lomé with a capacity of 20,000 tons per year of liquid metal. A rolling mill with 40,000 tons per year capacity using domestic and imported steel was also operated by the company. Electricity for the plants was from a 115 megawatt thermal powerplant. Actual production from the plant has been about 25% of capacity.

Petroleum Refining.—The petroleum refinery operated by Société Togolaise des Hydrocarbures, with a capacity of 1 million tons per year, ceased operation in February 1981. About 80% of refinery production had been supplied to Nigeria.

Phosphate Rock.—Phosphate rock production and marketing was the responsibility of the state-owned Office Togolaise des Phosphates (OTP). Total production capacity at the mines of Kahotoe and Kpogame was 3.4 million tons, about 25% of which was unused owing to depressed demand. OTP contributed about 12% of all Government revenues, and it has also provided subsidies for state enterprises.

A feasibility study was underway, financed by the World Bank, for production of phosphoric acid from currently unexploited low-grade phosphate rock. Construction cost was estimated at $400 million. The second phase of the study was to commence in mid-1983. If feasible, the project would require about 50% foreign equity participation.

UPPER VOLTA

Output of mineral-related materials in 1982 was confined to small quantities of phosphate rock and unknown quantities of construction materials. However, a number of projects continued that were expected to lead to development of small-scale mining. Their startup was part of plans to reduce the country's dependency on agriculture, which suffered during years of drought.

Lack of infrastructure, particularly trans-

portation, were severe impediments to large-scale mineral industry development, in addition to depressed world markets. Plans for production were relegated to gold and other small operations.

COMMODITY REVIEW

Cement.—There was no production of cement in Upper Volta. All cement requirements were met by imports, mainly from Togo. Feasibility studies were underway to assess either the development of an integrated cement plant using limestone from Tambao, or by importing clinker for a clinker grinding plant with a 150,000-ton-per-year capacity.

Diamond.—Exploration was conducted by BGR Hanover of the Federal Republic of Germany. Four diamond structures were located in the northern Barsalogo region.

Gold.—Efforts to reopen the Poura gold mine at a cost of $100 million continued.[8] Reserves were reported to be 740,000 troy ounces of gold in ore grading 0.48 troy ounce per ton. The discovery of nearby gold mineralization has prolonged the expected life of the mine by several years. The manager of the project was the Société de Recherche et d'Exploitation Minière. The Government was the principal shareholder with 60%. Cie. Francaise des Mines of France and the Islamic Development Bank each held 20%. Mine startup was targeted for 1984 at a rate of 80,000 troy ounces per year.

The Société des Mines du Sahel (Somisa) planned production of gold at the Guiso and Bayildjoga Mines in northern Upper Volta near Dori. San Martin Mining of the United States had a 35% interest in Somisa. The remainder was controlled by the Bureau Voltaique de la Geologie et des Mines.

Gold mineralization at Diouga, also near Dori, and at Bouroum was being investigated by BRGM. Gold mineralization at Kwademen, discovered under a United Nations Development Program, continued under evaluation.

Marble.—The Compagnie Voltaique d'Exploitation was developing marble deposits at Tiara. Reserves were put at 60,000 cubic meters.

Phosphate Rock.—Phosphate resources were reported for several areas of Upper Volta. Reserves of 80 million tons grading 18% to 33% P_2O_5 were located at Kodjari. Smaller but higher grade deposits were located at Arly and Aloub Djouna. Ouput from Kodjari has been at low levels for several years and was consumed locally.

The Mineral Industry of the Islands of the Caribbean

By Doris M. Hyde[1]

CONTENTS

Mineral industry activity in many of the smaller Caribbean Island countries has remained minimal. For this reason, specific references to Bermuda, Guadeloupe, Martinique, and the Netherlands Antilles have been removed from textual and trade table presentations. Any significant future developments will be reported as they occur. Readers are referred to earlier Minerals Yearbook editions for previous information. Table 1 production statistics have been modified in some instances. References to certain nonmetal commodities were eliminated because information has often been unreliable. Their inclusion in table 1 was not considered important to either an overview of the area or to compatibility with volume I of the Minerals Yearbook.

Table 1.—Islands of the Caribbean: Production of mineral commodities[1]

[e]Estimated. [p]Preliminary. [r]Revised.

[1]Table includes data available through June 3, 1983.

[2]In addition to the countries listed, Antigua, Bermuda, Dominica, Grenada, Montserrat, and St. Lucia presumably produced crude construction materials (clays, sand and gravel, and stone), but output is not always available, and information is inadequate to make reliable estimates of output levels. Antigua also has a petroleum refinery that was closed in 1976 but became operational again for a short period in 1982.

[3]In addition to the commodities listed, crude construction materials (lime, salt, sand and gravel, etc.) may also be produced, but data on such production are not always available, and information is sometimes inadequate to make reliable estimates of output levels.

[4]Reported figure.

[5]In addition to the commodities listed, iron ore and manganese ore presumably were produced during the period covered by this table, but available information is inadequate to make reliable estimates of output levels.

[6]Annario Estadistico de Cuba provides figures on nickel-cobalt content of granular and powder oxide, oxide sinter, and sulfide production. Using an average cobalt content in these individual products of 0.9% in total granular and powder oxide, 1.1% in total oxide sinter, and 4.5% in total sulfide, the cobalt content of reported Ni-Co production was determined as being 1.16% of granular and powder oxide, 1.21% of oxide sinter, and 7.56% of sulfide. The remainder of reported figures would represent the nickel content.

[7]The Dominican Republic reports gross weight of ferronickel production. When official data are not available, figures for nickel content of mine production is determined from an average of 37.4% Ni contained in ferronickel production. Nickel content of ferronickel shipments is obtained from Falconbridge Dominicana C. por A. annual reports.

[8]Limited quantities of sulfur as a byproduct of natural gas may also be produced.

BAHAMAS

Generally poor worldwide economic conditions had some adverse impact on the Bahamas, but, overall, its economy did not suffer to the extent of some developing countries in the Caribbean. Tourism remained the greatest contributor to the economy, followed by the banking and financial sector. In 1981, the contribution of the mineral and mineral-related sector to the economy declined almost 3% from the 11% reported for 1980, following a trend toward decreased demand for Bahamian export-oriented products.

For the past several years the rate of unemployment has been stable at about 22%. New industrial activities have been slow to develop, despite advantages offered through free trade zones and tax exemptions. The balance-of-trade deficit continued to worsen. In 1981, nonfuel imports totaled about $552 million and increased the balance-of-trade deficit to $375 million, or 12% over that of 1980. The cost of oil imports in 1981 was estimated at $273 million.

In 1982, owing to low product demand in the United States, the Bahamas Oil Refining Co., owned by Charter Oil Co. and Standard Oil Co. of California, reportedly operated considerably below its 500,000-barrel-per-day capacity. The crude oil transshipment terminal, located at South Riding Point on Grand Bahama Island, was also underutilized during 1982.

The Bahamas Cement Co. plant was closed during most of 1981 and 1982. A Swedish construction materials company was reported to be interested in obtaining a 25% interest in the company. Domestic cement requirements were met through imports from Cuba. In 1983, it was reported that the Bahamas would probably import cement from Florida rather than Cuba because of quality and other considerations.

At the end of March 1982, amendments were made to the Petroleum Act of 1971 and the implementing regulations of 1978. The international oil companies were more receptive to this new Petroleum (Amendment) Act of 1982 than they were to the earlier legislation. The new act allowed crude oil prices for the purpose of royalties to be determined by the average of prevailing market prices. For all practical purposes, the previous legislation permitted the price to be set by the Minister of Economic Affairs. The licensee, and not the Government, was given the authority to decide the

commercial prospects of any discovery. Besides monies for application fees, rents, and signature bonuses, the regulation provided for the Government to receive royalties of at least 12.5% after production begins. All production may be exported, except that which the Government may take instead of a cash royalty. Also, the Government may require up to 25% of output be sold to local refiners at prices keyed to U.S. gulf product prices.

A seismic survey permit reportedly cost $5,000, and licenses and leases cost $10,000 per block (one block encompasses about 10 square nautical miles). Signature bonuses have been reported as ranging from $1 million to as much as $9 million.

Getty Oil (Bahamas) Co. Inc. was the first major company awarded a petroleum exploration license under the new Petroleum (Amendment) Act of 1982. Getty expected to conclude its geophysical studies within 30 months. Getty's licenses were in 2 separate areas comprising a total of 50 blocks and encompassing about 4.3 million acres. The two areas were located northwest and southeast of Andros Island.

Breoco Ltd., a Bahamian subsidiary of REO Development Corp. of Tulsa, Okla., was the second company to be awarded exploration rights. Breoco's tract included 1,500 square nautical miles on Little Bahama Bank and extended into the northern onshore coastal area of Grand Bahama Island. Breoco's expected program costs were reported as $15 million, which included the cost of drilling one well.

Natomas Petroleum (Bahamas) Ltd., a subsidiary of Natomas Co., was awarded licenses for two blocks covering about 2,000 square nautical miles of the Grand Bahamas Bank, south of Andros Island and west of Getty's southernmost block. This prospect was established as a joint venture between Natomas Petroleum (67%) and BP Petroleum Development Ltd. (33%).

Exxon Corp. applied for an area lying west of Andros Island and to the north of the Natomas Petroleum and Getty blocks. Standard Oil Co. of California sought two licenses in the Santaren Channel, between the area of Exxon's application and Cay Sal Bank.

BARBADOS

In 1981, the gross domestic product (GDP) reached $819 million,[2] but in real terms represented a decline of almost 3%. The decline was attributed almost entirely to decreased output from the export sectors of sugar and manufactured goods, as well as declining tourism. In 1982, the economic output was expected to fall another 2%. Unemployment during the third quarter of 1982 increased to almost 15% of the work force, 3% higher than during the same period in 1981. Barbados' balance-of-trade deficit continued to deteriorate.

Barbados has not had full participation in the Mexico-Venezuela oil facility program. Petroleum imports were limited to Venezuelan crude oil because Barbados was not able to accommodate the Mexican crude oil in its refinery. In the 1-year period ending August 2, 1981, Barbados imported 581,000 barrels of Venezuelan crude, valued at $18.7 million, with $5.6 million financed by Fondo de Inversiones (FIV), the Venezuelan investment fund. In the 1-year period ending August 2, 1982, Barbados imported 568,000 barrels of crude oil valued at $19.5 million, with almost $5.9 million financed by the FIV.

Two loans for energy programs were granted to Barbados during 1982. A portion of a $2.7 million International Bank for Reconstruction and Development (World Bank) loan was to be used to provide consultant services for energy conservation. A permanent conservation entity was to be created for the purpose of developing local expertise, motivating consumer conservation, and improving the transportation system. The Inter-American Development Bank (IDB) approved a $1.5 million technical cooperation grant to determine the potential for wind-driven electricity generation and included the installation of a 200-kilowatt wind turbine. All data from the pilot project were to be made available to other Caribbean countries.

At the end of July, Mobil Oil Corp. sold its 25,000-acre Woodbourne Field drilling lease, production facilities, and crude oil reserves to the state-owned National Petroleum Co. The $12 million selling price did not include Mobil's refinery and retail operation. Crude oil reserves were estimated at 850,000 barrels. Mobil was to manage the operation for 2 months, until settlement. The Government was unable to secure financing by the September settlement date. In December, it appeared that Barbadc

would negotiate a loan agreement with a banking syndicate headed by Morgan Guaranty Trust Co., but the year ended with Mobil reportedly still operating the field. In November, the Government signed a technical cooperation agreement with Canada's oil development aid agency, Petro-Canada. Petro-Canada was to assume operation responsibilities after financial arrangements were concluded between Barbados and Mobil.

In 1982, crude oil production averaged about 730 barrels per day. By the end of 1982, daily output had reached about 1,000 barrels per day. The Government announced a production target of 1,200 barrels per day by mid-1983.

CUBA

In 1981, Cuba's second 5-year plan (1981-85) projected an average annual growth rate of 5% for the period. By mid-1982, it became apparent that this average growth rate was unachievable in 1982, and new projections set a more realistic 1982 growth rate of 0% to 1%. Cuba was subjected to adverse economic pressures not unlike those endured by neighboring Latin American countries. Inflation, estimated to be as much as 12% in 1981; unemployment, somewhat obscured by underemployment, military service, and technicians serving abroad; production and investment cutbacks; shortages of materials resulting from import curbs; trade and budgetary deficits; and burdensome foreign debts represented some of the problems Cuba faced in 1982.[3]

Cuba's hard currency debt was estimated to be as much as $3.5 billion,[4] of which $1.2 billion in principal was scheduled for repayment between 1982 and 1985. Cuba asked foreign creditors to reschedule the principal payments over 10 years with a 3-year grace period. The lenders, which included Canadian, European, Middle Eastern, and Japanese banks, were still considering the proposal at the end of 1982. Cuban debt to member nations of the Council for Mutual Economic Assistance, principally the U.S.S.R., was reported at an additional $8 billion, with an estimated $5 billion in repayments to start in 1986.

On February 15, 1982, Cuba enacted Decree Law 50, which authorized the Government to enter into joint ventures with foreign investors, including state-owned companies and private capital, regardless of national origin. U.S.-based companies would not be able to participate because of U.S. Government policies. The joint ventures may be located in Cuba or in those countries where Cuba has established favorable political and/or economic relationships. The law provided generous investment incentives, which included the following: foreign partner ownership of up to 49% of the venture, and majority ownership in special cases; possible full repatriation of profits; tax exemption on dividends, gross income, and executive salaries; a lenient policy toward autonomy in personnel staffing; and the importation of supplies when locally produced material is not competitive. The Government stressed a flexible attitude toward negotiating all aspects of business details. Also emphasized was the prospect of a stable, educated work force whose modest official wage levels are determined by the Government.

Cuban benefits from such joint ventures would include an expansion of export opportunities with hard currency countries and the establishment of industries in Cuba that would lessen import needs and increase the availability of hard currency through expanded tourism facilities. Other gains would be increased employment, worker training, transfers of technology, new models of management, an opportunity to expand Cuba's industrial and commercial base, and the establishment of improved relations with the market economy countries. Joint venture companies would pay a social security tax equivalent to 25% of the salaries of local employees and a tax not to exceed 30% on company net profits.

Imports of crude oil and petroleum products accounted for almost 60% of available energy. Crude oil requirements were 97% imported through the U.S.S.R. at a cost considerably less than the world market price. Plans for the country's first nuclear powerplant at Cienfuegos were reportedly approved by Cuban technicians. The first stage of the 850-megawatt facility was expected to go onstream within 5 years; however, this may prove to be an optimistic timeframe.

Construction at the new Punta Gorda nickel plant near Moa was reported to be about 55% complete and it was expected to be operational by 1985. The cost for the 30,000-ton-per-year plant was placed at $570

million, although some reports estimated the cost at $200 million higher. A 20-ton-per-day pilot plant was under construction at the Punta Gorda site. The pilot plant was expected to be completed in mid-1983 and used for laterite processing research studies, the development of control systems, and the testing of new equipment. Another $100 million investment was estimated for the upgrading in progress at the Pedro Sotto Alba nickel plant at Moa. When completed, the Moa plant capacity was expected to increase from 18,000 to 24,000 tons per year. A new lift for moving ore from storage areas to a conveyor has been installed and a new electrostatic filter unit awaited installation.

Initial construction on Cuba's fourth nickel plant, the Las Camariocas project, reportedly began in 1982, but without much progress as the completion of Punta Gorda became the overriding priority. Las Camariocas was designed to add another 30,000 tons per year to Cuba's nickel processing capacity by the end of this decade. Some analysts regarded Cuba's new nickel projects as an indication that it may be expected to seek a larger share of the world market, perhaps placing economic pressure on other producers with higher break-even prices.

Cuba's crude oil production level increased substantially starting in November 1981, from 151,000 barrels per day during October to 195,000 barrels per day. This increase was sustained, and by the end of 1982 accumulated crude oil production was more than double that of 1981. On the other hand, reported natural gas production declined 25% from that of 1981, when it averaged slightly more than 1 million cubic feet per day. Official Cuban figures on natural gas production may represent only marketed production and not include that portion consumed by the producer, vented, or reinjected.

Mexico's state-owned oil company, Petróleos Mexicanos, continued its cooperation with Cuba in exploring for petroleum off the northern coast of Pinar del Río Province. In 1981, it was erroneously reported by the press that a large crude oil deposit had been found in this area. Technicians from the U.S.S.R. have begun exploratory work in western Cuba. It was reported that wells about 2,500 feet deep have been drilled both onshore and offshore.

DOMINICAN REPUBLIC

The economy of the Dominican Republic continued to deteriorate during 1982. The 1982 GDP was estimated at almost $8 billion. As measured in constant 1970 dollars, there was no real growth in the 1982 GDP, which in 1981 had increased more than 3% over that of 1980. The external public debt continued to rise, and in 1982, it approached $2 billion, a 13% increase over the 1981 level. Servicing this debt was estimated to cost over $300 million annually.

The trade deficit worsened as volumes and prices for principal export commodities generally declined. The unemployment level reached 30% in 1982, and the rate of inflation was officially estimated at 15%. Late in 1982, the Government obtained a $455 million loan package from the International Monetary Fund. The Government undertook major tax reforms, tightened import controls, and imposed other stringent measures to combat economic problems.

The export value of the three major mineral products, bauxite, doré, and ferronickel, are shown in the following table, in millions of dollars:

Commodity	1978	1979	1980	1981	1982[e]
Bauxite	$23	$21	$19	$16	$6
Doré	[r]73	128	260	208	161
Ferronickel	[r]73	23	101	111	24
Total	[r]169	272	380	335	191
Share of total exports	25%	31%	[r]40%	28%	25%

[e]Estimated. [r]Revised.

Source: Boletin Mensual, Banco Central de la Republica Dominicana.

Petroleum import costs rose slightly to an estimated $600 million in 1982. The primary export, sugar, lost about 83% in per pound value in 1982, drastically reducing the inflow of foreign exchange. Poor market demand for bauxite and nickel caused producers to severely curtail their Dominican operations. Average precious metal prices declined, but did begin an upward swing toward the end of the year. Nevertheless, the 1982 value of gold and silver sales was 22% less than that received in 1981 for slightly less volumes. The 1982 trade deficit was estimated at $642 million, a 158%

increase over the 1981 deficit. Import controls and other economic measures prevented an even larger trade deficit.

The Dominican Republic placed new legislation under consideration that would eliminate some of the negative aspects of Foreign Investment Law 861 of 1978, which governed all foreign investment registered within the Central Bank, except mineral investments. A mixed private and public sector commission on foreign investment was established in 1982 for the purpose of improving the investment climate. New investment in mining was among the commission's objectives. Exploration activities have indicated that the Dominican Republic has base metal deposits that hold promise as sources of future foreign exchange earnings.

A presidential commission was reviewing the mining sector and expected to issue recommendations for changing mining policy. The recommendations would probably include the creation of a new entity to oversee the Government's own mining activities and renew permission for private sector participation in exploration activities.

Cooperative mineral exploration with the Federal Republic of Germany's Institute of Geosciences and Natural Resources established two areas for further study. Exploration of a copper occurrence at Pedro García in the Cordillera Septentrional of Puerto Plata Province was discontinued in favor of mineral deposits with easier access and possibly more immediate exploitation potential. At Palma Picada, Valverde Province, test drilling was undertaken to ascertain the extent of lead and zinc deposits. Volcanic deposits of pozzolan found in the Imbert area of Puerto Plata Province were under study to determine their possible commercial quality and quantity.

Studies of other mineralized areas included Las Cañitas, Santiago Province, and Los Hojanchos, La Vega Province (base metals); Sabaneta, Santiago Rodríguez Province (copper); Miches, El Seibo Province (gold); the northwest corner of Monte Cristi Province and Punta Santanilla, Peravia Province (iron- and titanium-bearing sands); northeastern Barahona Province (marble); and Puerto Plata Province (amber). Negotiations have been reinitiated with Hullera Vasco-Leonesa S.A. to form a joint venture to exploit base metals in the Yujo River Basin near Jarabacoa, La Vega Province. Negotiations were also underway with a West German firm to exploit the iron and titanium sand near Monte Cristi.

Because of the depressed international aluminum market, the Aluminum Co. of America (Alcoa) curtailed bauxite mining with the objective of only meeting stockpile requirements. At the same time the company increased limestone mining and was able to utilize employees who otherwise would have been laid off. Limestone exports totaled 265,000 tons valued at $1.6 million, down slightly from that of 1981. In 1960, Alcoa obtained 16% of its total bauxite requirements from the Dominican Republic. By 1980, this share had dropped to about 5%, and in 1982, was less than 2%. Alcoa did not expect to export bauxite from the Dominican Republic in 1983.

The United Nations Development Program (UNDP) agreed to initiate a 3-year project to evaluate alluvial gold deposits in the Miches region north of Hato Mayor in El Seibo Province. Work was to include about 750 test holes. If the study proves favorable, the UNDP and the Government planned to jointly develop the deposits using more modern mining methods than those presently employed by local prospectors.

Gold deposits in the Madrigal region of western San Cristóbal Province were also under study, as were the gold prospects surrounding the Pueblo Viejo Mine, especially at Los Cacaos and Jerez No. 1. Gold production has reportedly started at the Monte Negro deposits.

The new gold refinery was scheduled to come onstream in 1982 at a cost of over $5 million, enabling the Dominican Republic to produce gold and silver bullion from its doré that has been refined in New Jersey and Switzerland. However, test runs were delayed until early 1983. Construction of the refinery was controversial because of its high cost, the limited mine life of the Pueblo Viejo oxide ore (estimated at 6 more years), and uncertainty as to whether the sulfide ore at the mine can be processed in this refinery. It was reported that the mining of these sulfide ores would begin in 4 years and extend Pueblo Viejo's mine life by 20 years. In 1982, Rosario Dominicana Mines S.A. received an average of $373 per troy ounce for its gold production.

In mid-January 1982, Falconbridge Dominicana C. por A. (Falcondo) shut down its ferronickel mine and plant because of continued poor market demand and high inventories. The company negotiated a new labor contract that granted a 2-year wage freeze

and reduced fringe benefits. The plant reopened in September and operated at about 50% of capacity for the remainder of the year. Falcondo continued to explore its Cerro de Maimon prospect, located a few kilometers southeast of its Bonao ferronickel plant. The prospect was under study to determine the extent and average grade of a near-surface copper-zinc sulfide mineralization, which also contains some gold and silver.

Preliminary studies indicated the presence of 46 million tons of recoverable lignite reserves at Sánchez, Samaná Province. The lignite was estimated to average 4,680 British thermal units (Btu) per pound and could supply a 50- to 100-megawatt powerplant over a period of 20 years. The lignite resource base was estimated at 86 million tons. Recent work determined that the presence of ground water would not interfere with mining activity. A prefeasibility study, funded by Rosario, was initiated by Carbones S.A. in December. Carbones was an affiliate of Rosario. To the south, across the Bahia del Samaná near Valle in El Seibo Province, geologically older lignite deposits were also under study. The Valle deposits were thought to contain a higher Btu potential than the Sánchez deposits.

Early in 1982, the Italian Government donated funds to evaluate volcanic fields and thermal springs in the southwestern area of the Dominican Republic. In this program, an Italian firm examined geothermal energy potential of the Azua, Constanza, and Barahona areas. A possible geothermal source was found at Las Yayas de Viajama, northwest of Azua, and a prefeasibility study was undertaken to locate drilling sites. The U.S. Geological Survey and the Los Alamos National Laboratory have both expressed interest in conducting a geothermal exploration program in the Dominican Republic.

HAITI

Measurements of Haiti's recent economic growth have been hampered by the lack of adequate data. For fiscal year 1982, the GDP was about $2 billion as measured in current dollars.[5] It was estimated that the rate of real growth was 0.3%, about the same as that of 1981.

In response to severe economic pressures, Haiti operated under a general fiscal austerity program, and in 1982 undertook additional reforms to decrease the outflow of foreign exchange and increase customs and tax receipts. The Government expected a future loss of over $6 million in taxes because of the closure of the bauxite mining operation.

Haiti's new investment code has yet to be completed, but many of the provisions to be incorporated have already been decreed separately. These included tax holidays, duty-free entry of goods that are to be reexported, repatriation of all profits, and import protection measures.

In 1982, Reynolds Haitian Mines Inc. ceased bauxite mining after 25 years of operation in the area of Miragoâne. The depressed state of the aluminum industry and the poor commercial quality of the remaining ore were cited as the primary reasons for closing. It was estimated that during the 1970's the small operation brought about $15 million per year into the Haitian economy through contributions to foreign exchange, taxes, and surplus electricity. For 1982, it was estimated that Reynolds Haitian would pay about $6.5 million in taxes alone. The Government was considering possible alternative actions to keep the mine in operation, but no firm plans were announced.

With the exodus of Reynolds Haitian, the mineral industry in Haiti came to a virtual standstill. No information was available on various ongoing exploration projects, which included coal in the Maissade region of west-central Haiti, gold deposits in northern Haiti, and petroleum in the eastern Plateau Central area.

JAMAICA

In 1982, Jamaica sustained the slight upturn in economic growth registered in 1981. Real growth was estimated at 1% in 1982, as the GDP reached an estimated $3.2 billion[6] at current prices. Failure to meet the targeted growth rate of 4% was primarily attributed to a continued slump in the world aluminum industry, which caused local bauxite and alumina producers to severely curtail production. The rate of

inflation during 1982 was estimated at about 7%, much better than the almost 13% rate for 1981 and quite encouraging compared with the 23% average for the 1976-80 period.

Jamaica's bauxite and alumina companies made downward production adjustments during 1982, which affected foreign exchange and revenue earnings and placed an increased strain on the Government's 1982 and future budgetary planning. The bauxite sector's contributions to fiscal year 1982-83 net foreign exchange inflow from the payment of levies, royalties, and other local costs were expected to amount to about $250 million, a 24% decrease from that of 1981. The share contributed by only the production levy and royalty payments for fiscal year 1982-83 dropped to an estimated $112 million, a 45% decrease from that of 1981.

On the positive side of the economy, the Government continued to emphasize and seek the development of new foreign investment, and suggested that new export incentives would be forthcoming as well as a liberalization of the unofficial currency exchange, or parallel market. It was expected that the Government would officially recognize a two-tiered foreign currency exchange system.

A new state agency, Jamaica National Investment Promotions, was created to encourage and monitor investment. The Government has offered new fiscal incentives to encourage investment, and the new promotion agency was to help expedite processing by acting on the investor's behalf with other Government agencies. Preferred new investments were those that could be earners or net savers of foreign exchange, be significant employers of labor and contributors to domestic income, complement existing industries, and utilize local raw materials.

Early in 1982, Jamaica and the United States signed a taxation agreement that permitted U.S. tax credits on income taxes paid in Jamaica by U.S. businesses operating in that country. The Jamaican Government expected the agreement to bring new foreign investment to Jamaica as well as benefit established U.S. companies, including the bauxite and alumina producers. There appeared to be legal questions as to whether any or a portion of the bauxite levy payments would be considered as income tax. When Jamaica imposed the bauxite levy in 1974, the corporate income tax, as such, was eliminated. Jamaica contended that the new agreement made provisions for a certain portion of the production levy to be treated as income tax and, therefore, would be eligible for foreign tax credits. The bauxite companies were not confident that U.S. tax officials would change the classification of the levy from that of a royalty payment to one that recognized that at least a part of the levy was equivalent to an income tax.

The current bauxite production levy agreement expires in 1983, and both the Government and producers were preparing for a renegotiation. The Government appeared committed to a continuation of the levy in the belief that the companies should focus on achieving economies through expanded output and the development of fuel-efficient operations.

Jamaica sought out new trading opportunities for bauxite and alumina production. An agreement, estimated to be worth $20 million in net foreign exchange earnings, was concluded with the Soviet Union for its purchase of 1 million tons of bauxite per year starting in 1984. A preliminary shipment of 200,000 tons was scheduled for 1983. The new contract replaced an earlier contract for the purchase of 250,000 tons of alumina starting in 1984. In the past, Jamaica's bauxite ore was exported solely to the United States.

After the delivery of 1.6 million tons of bauxite to the U.S. Government strategic mineral stockpile in 1982, Jamaica began negotiating for the sale of an additional 1 million tons for 1983 delivery. An agreement between the United States and Jamaica for this sale was expected to be finalized in early 1983. This sale was anticipated to be on a cash basis, as opposed to the earlier sale, which was a combined cash-barter transaction. Other efforts were underway to increase bauxite and alumina exports while at the same time serving to reduce Jamaica's foreign exchange requirements to finance imports. In November, the Government-owned Bauxite and Alumina Trading Co. of Jamaica Ltd. finalized a countertrade agreement with General Motors Corp. to exchange alumina for motor vehicles, heavy equipment, and machinery. Jamaica was to supply 270,000 tons of alumina over a period of 3 years in return for General Motors products valued at $6 million per year. General Motors reportedly sold the alumina to a Norwegian nonferrous metal producer.

The Government had negotiations underway with Chrysler Corp. to exchange alumina for vehicles. Jamaica planned to utilize the exchange of its share of bauxite and

alumina production to obtain other needed products, such as heavy machinery and, coincidently, stimulate trade opportunities and conserve foreign exchange reserves.

New contracts with the National Workers Union, which represents the bauxite workers, were concluded in February. Strike activity began in early January, and the alumina plants were shut down until settlement.

In October, Jamaica Reynolds Bauxite Partners Ltd. made additional downward adjustments in production, from operating at 60% of its 2.8-million-ton-per-year capacity to only 18%.

Also in October, Kaiser Jamaica Bauxite Co. announced a reduction in its mining and shipping to about 25% of capacity. Kaiser Jamaica, like Jamaica Reynolds, blamed the weak state of the aluminum market. This action followed a Jamaica Reynolds decision in August to invest $2.5 million to rebuild loading docks at Ocho Rios and to initiate the use of 100-metric-ton ore-hauling trucks. Each truck was built using 45,000 pounds of aluminum produced from Jamaican bauxite. Jamaica Reynolds also announced that the Reynolds Mineral Resource Development Center would move to Jamaica and offer training programs to its local professional employees.

In mid-1982, Jamalcan, majority owned and operated by Alcan Jamaica Co., announced it would reduce alumina output to about 800,000 tons for 1982. In May, Alcoa Minerals of Jamaica, majority owner and operator of Jamalco, announced that it would cut 1982 alumina production to about 216,000 tons. Alcoa Minerals allocated capital investments that were expected to increase alumina capacity from 550,000 to 800,000 tons per year by 1985. In 1968, the Aluminum Co. of America obtained 17% of its total bauxite requirements from Jamaica. By 1980, this percentage had dropped to about 12%, and in 1982, amounted to 8% of total requirements.

In 1982, Alumina Partners of Jamaica (ALPART) contracted for the installation of a new 15-kilometer conveyor belt from its mine area in Essex Valley to the alumina plant at Nain. The $45 million conveyor was scheduled to become operational in late 1983 with a rated annual capacity of 6 million tons of bauxite. However, in May, ALPART began reducing alumina capacity at its 1.2-million-ton-per-year plant and expected to produce about 600,000 tons in 1982. Later in the year, there were reports that ALPART intended to close their Jamaica operation entirely. After negotiations with the Government, the company agreed to keep the plant operating at one-half of its rated capacity throughout 1983, after which ALPART's future may be dependent on favorable aluminum market indications.

The Caribbean Cement Co. initiated a $90 million expansion program designed to modernize the plant and double its 400,000-ton-per-year capacity. A fuel conversion from oil to coal was part of the modification program. A $57.2 million loan was obtained from the IDB to help finance this project.

Jamaica continued evaluating the potential benefits of converting electric powerplants and industrial boilers from oil to coal. This study has had special emphasis because of Jamaica's complete dependence on imported oil as a source of commercial energy. Petroleum import costs in 1982 were estimated at almost $500 million, about one-half of total export earnings.

The Petroleum Corp. of Jamaica (PETROJAM) ended the first phase of its petroleum exploration program. PETROJAM had drilled three onshore wells at a cost of $16 million without encountering commercial crude oil deposits. An evaluation of the collected data was underway, and additional drilling was not expected until 1984. With a $7 million grant, which Jamaica received from the Canadian Government, seismic work was initiated off the southern, eastern, and western coasts. The Union Texas Petroleum Co. of the United States joint venture with Azienda Generali Italiana Petroli S.p.A. of Italy was unsuccessful with its first offshore well, drilled in the Arawak block in the Pedro Bank. Reportedly, Union's 6-year exploration contract called for a total of six wells.

Concerned about low profit margins, Esso West Indies Ltd. sold its 35,500-barrel-per-day refinery to the Government for $55 million. PETROJAM assumed operation of the refinery in October.

TRINIDAD AND TOBAGO

In 1982, the economy of Trinidad and Tobago suffered its second downturn since 1973. The country has depended on petroleum exports for about 93% of its foreign currency earnings. A decline in crude oil production and prices coupled with lower production and prices from other economic sectors caused major problems, including budget and balance-of-payments deficits.

The petroleum products, asphalt, and fertilizer facility, which Trinidad and Tobago inaugurated in 1980 as a temporary concessionary financing aid to qualified Caribbean countries, has not been widely used. Given the rather bleak outlook for the petroleum sector and an overall poor economic performance, some analysts observed that Trinidad and Tobago's ability and inclination to continue the facility beyond its authorized life of 3 years was questionable.

The Iron and Steel Co. of Trinidad and Tobago (ISCOTT) experienced technical difficulties that kept production and sales below expectations. In addition, U.S. steelmakers accused ISCOTT of dumping carbon steel wire rod on the U.S market at less than fair value. If an investigation by the U.S. Department of Commerce finds against ISCOTT, the company's exports to the United States could be subject to retroactive duties. In 1981, it was reported that ISCOTT exported about 6,000 tons of rod to the United States, and in the first half of 1982, these exports reached almost 22,000 tons. The U.S. producers claimed ISCOTT's dumping margin was 14%. ISCOTT also faced the problem of storing and shipping the highly explosive direct-reduction sponge iron.

In April, ISCOTT inaugurated its second 420,000-ton-per-year direct-reduction module. At the same time, the first module was

shut down for maintenance. The second module operated only one shaft furnace, and iron output was expected to remain curtailed pending improved market conditions. ISCOTT's electric arc furnaces consumed about 15% of Trinidad and Tobago's total power output.

Construction of Central Trinidad Steel Co.'s new 90,000-ton-per-year section mill was on schedule for a March 1983 startup. Structural sections, produced from steel billets purchased from ISCOTT, were expected to be sold to petroleum companies and to construction industries located in Trinidad and Tobago and elsewhere in the Caribbean.

The National Gas Co. of Trinidad and Tobago expected to start recovering gas from Amoco Trinidad Oil Co. Ltd.'s Poui and Teak Fields by the end of 1982. The fields were located at 10 and 25 miles off Galeota Point. Gas production from the two fields was expected to peak at 100 million cubic feet per day. Amoco Trinidad's 20-slot platform in the Cassia Field, 35 miles southeast of Trinidad, was expected to be inaugurated in January 1983. Future production was estimated at 450 million cubic feet of gas per day, double the 1982 output. The Government was negotiating a $50 million loan to help finance the construction of a 40-mile gas pipeline from Trinidad's east coast to Point Lisas. Line capacity was to be 1 billion cubic feet per day. The total cost of the pipeline was estimated at $140 million.

Crude oil production continued to decline in 1982, and a promising discovery by Amoco Trinidad off Galeota Point was later determined to be noncommercial. Amoco Trinidad's production rate fell 12% in 1982 and was projected to drop an additional 14% in 1983.

In August, it was announced that Tesoro Petroleum Co. proposed to sell the Government its 49.9% interest in the Trinidad-Tesoro Oil Co. Subsequent negotiations regarding price were not successful. Tesoro Petroleum wanted $200 million for its share, but the Government proposed that it would pay only the $50,000 cost of Tesoro Petroleum's original investment in 1969. The Government maintained that Tesoro Petroleum had made no further capital investment in the company but had amassed considerable profit from the operation.

To the consternation of both public and private entities, in August, Texaco Trinidad Inc. (TEXTRIN) announced that it would sell its 275,000-barrel-per-day refinery to the Government. The refinery throughput was declining and had dropped to 45,000 barrels per day in December. TEXTRIN claimed that the refinery was not a viable operation under present purchasing and marketing conditions, and that the company had sustained untenable losses for a period of years. The company proposed to retain its concession areas, which accounted for crude oil production of about 28,000 barrels per day. Negotiations between the Government and TEXTRIN were underway at the end of the year.

The Mineral Industry of Central American Countries

By Doris M. Hyde[1]

CONTENTS

BELIZE

The Government of Belize maintained strict control over spending in 1982 as a means of protecting its import-dependent economy against the effects of a general worldwide recession. The modest economic performance was not expected to differ substantially from the $152 million[2] gross national product (GNP) estimated for 1981. Exports and reexports were expected to decline in 1982, partly as a result of the Mexican peso devaluation. Imports were also expected to decline slightly in 1982, but the overall trade deficit was projected somewhat higher than the $44 million experienced in 1981.

On September 21, 1982, Belize became an independent state. As a result, the new Government became eligible for assistance from international organizations such as the International Monetary Fund, the International Bank for Reconstruction and Development (World Bank), and the United Nations Development Program (UNDP). Belize's independence from its former status as a colony of Great Britain was marred somewhat by the unsettled territorial dispute between Great Britain and Guatemala. Guatemala declared Belize was a part of Guatemala and, therefore, refused to recognize it as an independent state. Negotations between Great Britain and Guatemala continued without resolution.

Mineral resource development in Belize continued to be limited to quantities of limestone, marl, and sand and gravel used in the construction industry. The production of these materials represented only a fraction of the GNP.

An interest in petroleum exploration persisted despite the fact that no deposits considered exploitable have been found. Cities Service Corp. and Occidental Petroleum Corp. were issued a petroleum prospecting license for a total of 1 million acres in the Orange Walk district, near the Mexican and Guatemalan borders. Placid Oil Co. drilled this area in 1981, but the discovery well was not considered commercially viable. Kantana Resources Belize Ltd. was interested in the Cayo district near the Guatemalan border where Anschutz Corp. drilled into noncommercial deposits in 1975.

Technicians from the UNDP as well as the Mexican National Petroleum Institute assisted the Petroleum Office of the Ministry of Natural Resources to monitor onshore and offshore drilling activities.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Includes data available through Aug. 22, 1983.

[2]Ni content of sinter.

[3]Reported figure.

[4]Exports.

[5]In addition to the commodities listed, Nicaragua produced a small but undetermined quantity of cadmium contained in zinc concentrates for export.

[6]Refinery fuel is apparently included as a part of the products listed above; subtraction of the reported detail from the reported total gives a result of -7, indicating a net gain as a result of refining operations, but this cannot allow for refinery fuel.

[7]Detail adds to 7 more than this reported total (see footnote 6).

[8]Excludes approximately 8,000 cubic meters per year, apparently dimension stone.

COSTA RICA

In 1982, the gross domestic product (GDP) was estimated at $3.4 billion,[3] compared with $3.6 billion in 1981. In real terms, the GDP declined by about 6%, the largest single drop since the 1930's. External public debt increased by 17%, and reached almost $3.5 billion. The total private sector external debt was estimated at about $650 million. Inflation averaged about 82% and the official unemployment rate was almost 7%, but the total measured labor force underutilization rate was over 20%.

As part of an economic stabilization program, the Government initiated large price increases for fuels, transportation, and utility rates. Government expenditures were reduced, and revenues were increased through higher direct and indirect taxes. Controls were placed on wage increases and on foreign exchange devaluation.

Exports and imports declined in both volume and value. This reflected shortages of foreign exchange, unfavorable terms of trade, and soft demand within Costa Rica and within the economies of its traditional trading partners. The 1981 trade deficit of $174 million improved to show a $16 million surplus in 1982 but only because the 29% drop in import value exceeded the 15% decrease in exports.

The mineral industry remained of minor importance to the economy. A new mining code was enacted in July that detailed all requirements and restrictions pertaining to securing exploration and mining concessions as applied to foreign and national private individuals or companies and to foreign state-owned enterprises. The code declared all mineral resources to be property of the state, which could grant exploration and exploitation concessions. National or foreign companies may acquire concessions, but foreign state-owned entities must form a joint venture with the Costa Rican Government and be subject to approval by the legislative assembly. The exploitation of hydrocarbons, radioactive minerals, and certain water resources were reserved for the state. Individuals engaged in unmechanized placer mining need not obtain a concession license. The Dirección General de Geología, Minas e Hidrocarburos was given authority to settle conflicting placer claim disputes, maintain a registry of claims, and generally supervise this activity. A new hydrocarbon law was under preparation and was expected to permit foreign companies to search for oil under risk contracts.

Costa Rica was a beneficiary of the Venezuela-Mexico San José Accord for financing crude oil purchases. For the year ending August 2, 1982, Costa Rica purchased 3.8 million barrels of crude oil from the two countries at a cost of about $131 million. About $39 million of the crude oil cost was made available to Costa Rica as low interest loans under the terms of the San José Accord.

In late 1982, Rembrandt Gold Mines sold a 10% interest in its Bella Vista and Montezuma underground gold mines to American Energy Corp. of Canada. The two mines, located on a 2,500-acre concession on the Nicoya Peninsula, were worked intermittently during the last 4 years. American Engery would earn an additional 56% interest after bringing the mines into production and fulfilling other option commitments. Ore vein widths averaged 4 to 6 feet, but some 19-foot wide veins were reported to have been found. Additional exploration work was to be undertaken to verify ore reserve estimates of 78,000 tons proven, 200,000 tons probable, and possible reserves of several million tons. The gold content was reported to average 0.2 to 0.4 troy ounce per ton.

United Hearne Resources Ltd. and Canadian Barranca Corp. planned to expand operations at their jointly owned Santa Clara gold mine, located in Puntarenas Province, 40 miles from San José. Expansion from a reported 350 tons per day of ore milled to 2,000 tons per day was to be accomplished by the installation of a new cyanide carbon-in-pulp mill to treat clays from the Mondongo open pit mine, and also by the construction of additional leaching pads. Ore reserves were estimated at about 5 million tons, averaging 0.05 ounce of gold per ton. Exploration was underway to identify an additional 6 million tons of reserves.

Costa Rican Government officials were concerned about gold smuggling and proposed that a state-owned refinery be constructed. The Government theorized that the availability of such a refinery might encourage increased gold production and reduce the alleged smuggling to Panama.

Several mineral deposits have been under investigation by U.S., Japanese, and other foreign companies. Most of the studies occurred in Guanacaste Province and included copper, nickel, gold, manganese, kaolin, and sulfur.

Private foreign companies have not been permitted to explore for petroleum in Costa Rica, but a change was expected if and when a proposed new hydrocarbon law is enacted. Early in 1982, the Government signed an oil exploration agreement with Petróleos Mexicanos (PEMEX). Plans called for drilling two wells in Limón Province, one in Baja Talamanca in the Uatsi Valley, and the other at Limonal, north of Cahuita. The cost for the two 5,000-meter-plus wells was estimated at about $10 million. Financing was to be provided by loan money available through the petroleum financing facility arrangement between Costa Rica and Mexico.

EL SALVADOR

Negative internal and external forces affected performance in all sectors of El Salvador's economy. The economy suffered from a decline in the production, demand, and price for major commodity exports; strict import controls and a lack of foreign exchange, both of which contributed to shortages of raw materials for manufacturing and company closures; and low private sector confidence, which resulted in reduced investment and the flight of private capital.

The continuation of violent insurgent activity was particularly damaging to economic recovery efforts. There was deliberate destruction of the country's economic infrastructure, including utilities and transportation. These problems were exacerbated by natural flooding. All of these events were costly to repair and caused interruptions in the production and flow of manufactured and agricultural materials for domestic consumption and exportation. Substantial foreign assistance was made available to reinforce El Salvador's own efforts to maintain economic stability.

In real terms, the 1981 GDP represented an economic decline of about 10%, and the continuation of a slowdown that began in 1979. In 1982, a GDP of almost $3.7 billion[4] was expected to show a further downturn in the economy of about 5%. There was no significant change in the fractional contribution by the mining sector to the GDP. The inflation rate for 1982 was estimated at about 15%. During the second year of participation in the Venezuela-Mexico San José Accord, ending August 2, 1982, El Salvador imported 4.5 million barrels of crude oil at a cost of almost $155 million.

Active mining was carried out at the Minas San Cristóbal S.A. gold and silver mines in southern Morazán Department, and the San Sebastián Gold Mines Inc. operations located near Santa Rosa de Lima in western La Unión Department.

The San Cristóbal operation, a wholly owned subsidiary of Javelin International Ltd., was forced to close down in October because of harassment by hostile insurgents and because of an August enforcement of an early 1982 law, which required all gold and silver production to be sold to the Central Reserve Bank. Unfortunately, the bank did not purchase the output from San Cristóbal and the company could not generate cashflow. Some employees were retained to perform maintenance services at the mine and mill, but 300 workers were laid off. When the mine was fully operational, the exported doré earned about $4 million per year in foreign exchange from the production of approximately 3,000 troy ounces of gold and 204,000 troy ounces of silver.

The Commerce Group Corp. of Milwaukee, Wis., acquired a majority 82% ownership of the San Sebastián Mine. Proven reserves at the mine were estimated at over 7 million tons grading 0.1 troy ounce of gold per ton. Potential ore reserves may approximate 50 million tons. The mine had been worked sporadically since 1904.

The San Sebastián ore vein occurs over a 2-square-kilometer area and reportedly has physical characteristics similar to those found at the Pueblo Viejo gold mine in the Dominican Republic. It occurs in a silicified and hydrothermally altered zone of acid volcanics. Gold production was sold domestically. The Commerce Group financed the reopening of the mine, which was last closed in 1978. Like San Cristóbal, mining operations were subject to periodic harassment.

GUATEMALA

Guatemala's three-decade history of sustained economic growth ended in 1982 after a slowdown that began in 1980. In 1982, the GDP, at current prices, reached $9.2 billion,[5] but the real growth rate fell by 3.5%. Throughout the year, Guatemala endured shortages of foreign exchange and recessionary influences caused by a loss of foreign markets for primary exports, fiscal deficits, decreased tourism, reduced foreign private investment, and a reluctance on the part of private commercial banks to provide loans. The balance-of-payments deficit reached about $500 million. The Government initiated corrective measures to tightly control the outflow of foreign exchange and imposed quotas and licensing restrictions on imports.

Interest in Guatemala's future energy potential continued to be optimistic. Total crude oil production remained at about 20% of domestic consumption; nevertheless,

Guatemala continued to export about two-thirds of its crude oil output to the United States. Unexported crude oil was used for national energy needs and was supplemented by locally refined crude oil imports from Venezuela and Mexico and refined product imports.

The possibility of new crude oil discoveries resulting from drilling into extensions of the geological formations shared with Mexico, and the prospect of new petroleum legislation were expected to encourage additional oil exploration investment.

Even though successful petroleum exploration would not provide an immediate relief from energy costs, considerable progress has been made in harnessing Guatemala's geothermal and hydropower potential. The $700 million Rio Chixoy hydroelectic project was scheduled to come onstream in mid-1983, and its full 300-megawatt capacity was expected to be available later that year. The Chixoy project, located about 80 kilometers north of Guatemala City, was expected to result in substantial oil import savings when it brings the nation's total hydroelectric capacity to 850 megawatts. The $1 billion Chulac hydroelectric project was postponed because of economic constraints.

Test drilling in the Zunil geothermal field near Quezaltenango in western Guatemala was reported to have proved the commercial feasibility of a power production of 68 megawatts. Development, however, may be delayed.

Guatemala's 1982 petroleum production rose substantially because of the new Yalpemech Field and secondary recovery efforts in existing fields. Proven crude oil reserves were estimated at 17 million barrels; however, Government officials have projected probable reserves as high as 4 billion barrels.

Present petroleum legislation, considered restrictive, has reportedly been a factor constraining exploration efforts by those foreign companies holding contracts. Among other things, the new petroleum legislation was to create a state oil company, Petróleos de Guatemala, with rather broad authority to regulate the oil industry, including programs and accounting procedures. The Government was consulting with the private petroleum companies to assure that whenever possible the new law would modify objectionable parts of existing legislation.

Basic Resources International S.A. (BRISA) sold 33% of its 57% interest in the central Guatemala Block I concession to Hispánica de Petróleos S.A. (HISPANOIL). It was reported that BRISA planned to sell its remaining 24% interest to Générale Occidental S.A., a major shareholder of BRISA. BRISA reportedly had accounting disagreements with Société Nationale Elf Aquitaine, its partner in Block I.

Texaco Exploration Guatemala Inc. encountered oil in the No. 1 Xan well drilled in 1981 on its Block D concession, located in the northwestern corner of Guatemala next to the Mexican border. In tests, the well pumped 2,300 barrels per day of low-gravity oil from a pay zone below 6,500 feet. Two additional wells drilled in Block D during 1982 were abandoned as dry holes. Texaco planned to study information from a total of four drilled wells before making additional plans.

Texaco joined HISPANOIL and Petrobras International S.A. (BRASPETRO) to explore Block L, a 490,280-acre concession in northern Guatemala. The venture is located to the south of Block D, the Texaco-Amoco Guatemala Petroleum Co. joint venture, and Block E, contracted to HISPANOIL, BRASPETRO, and Elf Aquitaine. The Texaco-HISPANOIL-BRASPETRO Group planned to drill three wells in Block L during the initial 3-year exploration period. Geophysical surveys were expected to last 1 year.

HISPANOIL brought its one-well Yalpemech Field into production early in 1982 for a 5-month test period. After testing, the well was to be reconditioned. The field is located in area AA, a joint venture of HISPANOIL, Elf Aquitaine, and BRASPETRO.

HONDURAS

The Honduran economy continued a downturn begun in 1980, and the 1982 GDP of $2.8 billion[6] represented a decline of 1.1% in real terms. Civil unrest in neighboring countries caused disruptions in normal trade patterns, and when combined with other international recessionary factors resulted in deteriorated terms of trade for traditional Honduran exports. Both export and import levels declined, and the estimated trade deficit of $242 million was 26% less than in 1981.

The Government imposed austere economic measures to reduce the budget deficit, to curb foreign exchange losses, and to tighten domestic credit availability. Both public and private capital investments declined. This, combined with foreign exchange shortages and high interest rates, led to production declines in the manufacturing sector and a number of business closures. By the end of 1982, the unemployment level may have reached 40%. The average rate of inflation was estimated at less than 10%, only a fraction higher than for 1981.

The mining industry contributed about 3% to the GDP for the most part, owing to the operation of the polymetallic El Mochito Mine of Rosario Resources Corp., a subsidiary of AMAX Inc. In mid-1982, a 2-year mine expansion project was completed that increased ore-processing capacity from 1,135 to 2,270 tons per day. However, low international metal prices and high costs threatened the viability of continued mine operation. Closure was avoided by an agreement reached with the local labor union to reduce the work force from 1,500 to about 1,200 and a 1982 revision to the Honduran mining code that provided for reduced royalty and tax commitments.

Under the revised code, new mines pay a royalty of only 2% during the first 5 years of operation. Established mines pay royalties of 5% on annual sales when sales are greater than $1.5 million and 3% when sales are less than that amount. Previously, royalties were assessed on a sliding scale that ranged from 5% to 20% with no specific limit placed on a company's total tax liabilities. The new code, however, limits the total tax liability—royalties, income, and export taxes combined—to 55% of taxable income. This was thought to be a significant factor because it set a mining company's total tax liability at a predictable level. Other favorable features were the inclusion of taxes on the distribution of profits, which encompasses repatriation of dividends within the 55% tax ceiling, and a liberalized definition of sales as the gross value of the metals less production and shipping costs. Any amount collected over the 55% tax limit constitutes a tax credit that may be applied toward royalties due in subsequent years.

Petroleum exploration efforts continued to be unsuccessful. Texaco Inc. and Amerada Hess Corp. abandoned their joint on-

shore exploration program in the Olancho Department after completing a third dry hole.

Petróleos Yojoa S.A. and Compañía Exploradora S.A., both Honduran companies, farmed out over 174,000 acres in west-central Honduras to North American Energy Resources Inc. North American planned to initiate a four-well drilling program. The company expected to penetrate the Cretaceous Atima Formation at a depth of less than 6,000 feet. North American sought partners in the venture. The Honduran companies retained a 15% overriding royalty after payout, and the Government retained a 12.5% royalty in the property.

Other companies holding exploration leases included Welsh Energía y Petróleo S.A. and Anschutz de Honduras S.A. Bids for exploration leases were submitted by Aracca Petroleum Corp. and Compañía Petrolera S.A.

After a 12-month shutdown, Texaco Inc. reinitiated operations at its Puerto Cortés crude oil refinery. The opening followed a September 10 agreement between Texaco Inc. and the Government that set forth operating rules for purchasing, shipping, and refining crude oil obtained by the Government from Mexico and Venezuela under the San José Accord financing mechanism.

NICARAGUA

Nicaragua's efforts to sustain the economic growth attained during 1980 and 1981 were unsuccessful. In 1982, the economy suffered from the combined effects of depressed regional and international demand and prices for Nicaraguan exports, a $2.5 billion[7] public debt, declining levels of additional external financial assistance, and almost no new private capital investment. Adding to the economic problems were a series of natural disasters that devastated agriculture and transportation routes by floods followed by drought. As a result of these adverse influences, principally declining terms of trade and natural disasters, the $2.6 billion GDP and 9% real growth rate achieved in 1981 were expected to decline by about 3% in 1982. Unemployment and the rate of inflation were also expected to show a deteriorated position relative to 1981.

Nicaragua concluded several agreements for technical assistance, including hydraulic power engineering, mining, and petroleum exploration. The countries providing assistance included the U.S.S.R., the Netherlands, Bulgaria, Brazil, and Libya. For a second year, Nicaragua was a beneficiary of the Venezuela-Mexico San José Accord. In the year ending August 2, 1982, Nicaragua imported a total of 4.7 million barrels of crude oil valued at over $164 million, of which $49 million was financed under the terms of the San José Accord.

Nicaragua and Neptune Mining Co. came closer to resolving the problem of compensation for the Government's 1979 nationalization of Neptune's gold and silver properties. Neptune was about 52% owned by ASARCO Incorporated. About 36% of the remaining interest in Neptune was owned by Rosario Resources. Nicaragua agreed to pay Neptune $3.7 million plus interest over a 6-year period for doré confiscated at the time of nationalization. In addition, both parties agreed to submit to international arbitration certain tax and accounting questions related to Neptune's claim for compensation. By some accounts, the properties were valued at as much as $56 million, although lesser values have also been suggested. In addition to the precious metals, the Neptune properties produced quantities of lead, zinc, and copper from sulfide ores.

Discussions were held in 1982 with Rosario Resources regarding compensation for the 1979 nationalization of its La Rosita and Siuna gold and silver properties.

The Ministry of Finance announced that a new foreign investment law was in preparation that would encourage new investment in Nicaragua. Details were not made available, but the announcement indicated that foreign investors would be allowed to own 100% of any companies they established in the country and would be permitted to repatriate profits, probably through a combination of the official exchange rate and the parallel market rate. Prior to nationalization of the mineral and petroleum sectors, exploration efforts in Nicaragua were rather limited in scope. The extent to which these two nationalized sectors might be reopened to investment opportunities if the proposed law is enacted was not clear.

Nicaragua planned to invest $12 million in credits advanced by Bulgaria and Sweden for mining and exploration studies. A Bulgarian firm was appointed to study the El

Vesubio gold mine located on the Atlantic coast. El Vesubio was formerly operated by Neptune, which had experienced caving problems in the mine. Bulgaria was to provide $10 million to study and reactivate the mine.

Sweden was reported to be providing $2 million to finance studies at the recently closed La Rosita Mine, as well as mines at El Limón near León; La Libertad near Chalontes, Chontales Department; and El Topacio in southern Zelaya Department. A feasibility study on the El Topacio Mine was to start early in 1983 by the Brazilian state-owned Cía. de Pequisa de Recursos Minerais. Nicaragua also received $400,000 from the World Bank towards reactivating the El Topacio Mine.

The La Rosita gold mine in northeastern Nicaragua, Department of Zelaya, was closed in 1982. This was formerly a property of Rosario Resources. In 1978, Rosario Resources had determined that the mine did not represent a long-term economic operation, and had begun rehabilitation of the Siuna Mine, located about 45 miles from La Rosita. A U.S. consulting firm, Ernest K. Lehmann & Associates Inc., began exploration studies directed toward a possible reopening of the La Rosita Mine. Lehmann was also involved in exploration studies in other areas of Nicaragua.

The Nicaraguan state-owned oil company, Petróleo Nicaragua (PETRONIC) and the overseas subsidiary of Brazil's Petróleo Brasileiro S.A. (PETROBRAS) signed a petroleum exploration agreement. The agreement was similar to contracts PETROBRAS has entered into for other foreign exploration ventures. If a commercial deposit is found, one-quarter of the output would be used to cover PETROBRAS expenses. PETROBRAS would receive no compensation for unsuccessful exploration; however, Nicaragua exempted the company from taxes during the exploration period.

Brazil has become involved in other phases of Nicaragua's energy development. In 1981, a Brazilian technical mission worked with the Instituto Nicaraguense de Energía to formulate a new energy plan for Nicaragua. Under this plan Nicaragua would substitute other energy sources, such as wood, charcoal, and alcohol, for 60% of its gasoline consumption, 15% of its diesel, and 70% of its fuel oil requirements. Brazil was to lend technical assistance in establishing the energy substitution and conservation programs, as well as in the development of hydropower.

PANAMA

Panama's economic growth continued to decelerate. The GDP of $4.2 billion[8] was 1% higher in real terms than that of 1981. The economy has traditionally been dependent on the service industries, activities at the Colon free trade zone, and agricultural exports. Mining and quarrying have never represented more than a fractional percentage of the GDP.

The generally depressed economies prevalent in Latin America, as well as civil unrest in some Central American countries, severely curtailed Panama's normal commercial activities and lowered revenues derived from tourism. Servicing the public external debt, estimated to have reached $2.8 billion in 1982, has become burdensome. About 50% of this debt falls due within the next 5 years.

Two mineral-related industrial developments received attention in 1982. A U.S. company, Ebasco Services Inc., announced it would initiate a feasibility study on the establishment of a coal gasification and methanol complex in Chiriquí Grande. Ebasco received $500,000 from the U.S. Trade and Development Program to organize investors interested in funding the $10 million planning study. The completed complex was expected to cost $4.5 billion. The facility would gasify about 20 million tons of imported coal annually to produce methanol for export to the Far East. Ecologists protested the complex would pollute waters of the Chiriquí Lagoon and cause other environmental damage.

The other mineral-related project involved the construction of a port for transshipping coal coming from the U.S. east or gulf coasts and destined for Japan and other Pacific coast consumers. A 1982 study by Brown and Root Inc. concluded that such a project was viable and would result in a $6 per ton savings on a delivered cost basis at 1982 prices. The Government was evaluating the Brown and Root assessment.

The transisthmus crude oil pipeline of Petroterminal de Panamá S.A. opened on schedule in October, saving both time and money in moving Alaskan crude oil to U.S. east and gulf coast refineries. To compensate for the loss of an estimated $5 million

per month in Panama Canal revenue, because of the pipeline operation, toll charges on the canal were expected to increase by almost 10%.

In September, Rio Tinto Zinc Corp. Ltd. and its majority partner in the Cerro Colorado copper project, state-owned Corporación de Desarrollo Minero Cerro Colorado, decided against continuing the project feasibility study. This decision was not unexpected and was based on existing world economic conditions and the depressed international copper market. The companies planned to periodically review the project for viability.

An interest in the Sossa Petroleum Corp. onshore and offshore petroleum exploration concessions around the Gulf of San Miguel was equally acquired by Aracca Petroleum Corp. and Oxoco-International Inc. Sossa retained a 12.5% interest in the prospect. The group planned to undertake a seismic survey of the area.

The Mineral Industry of Other Areas of the Far East and South Asia

By E. Chin, Charles L. Kimbell, Gordon L. Kinney, and John C. Wu

CONTENTS

BANGLADESH[1]

The production of crude mineral commodities in Bangladesh was limited to natural gas, a small amount of construction materials, and clay for ceramics and bricks. No metallic minerals were mined.

The only mineral commodity of economic significance was natural gas. Natural gas production has been climbing steadily and becoming an increasingly important source of energy for the country. Proved gas reserves were over 4.5 trillion cubic feet, but the amount has been increasing as exploration discovers large new deposits. Some sources quote reserves at over 10 trillion cubic feet.

Even though production of gas has been increasing, the ratio of gas consumed to recoverable reserves remained one of the lowest in the world. Yearly production was about 0.01% of proved reserves whereas that figure averages about 3% for the rest of the world. This underutilization of a valuable natural resource was mainly because of a limited number of industrial and commercial establishments that can use the gas, a lack of capital to develop the fields, and costly transmission network needed for efficient utilization.

The Bangladesh economy had problems during 1982 because of the international recession, adverse domestic factors, a volatile exchange rate, and high world interest rates. Gross domestic product (GDP) increased by only 0.9% in real terms in fiscal year 1981[2] compared with 6.1% in fiscal year 1980. Production in the industrial sector increased by 2.9% compared with 8.8% a year ago.

On the trade scene both exports and imports failed to meet the targets for the year. Total exports were $615 million[3] while merchandise imports rose to $2.45 billion in fiscal year 1981. The $1.83 billion deficit was one of the worst of the decade. Virtually none of the exports involved minerals or mineral-based commodities. Mineral imports, however, were very important. Crude oil and refined petroleum products were more than 80% of export earnings in fiscal year 1982.

Table 1.—Other Areas of the Far East and South Asia: Production of mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Area and commodity	1978	1979	1980	1981[p]	1982[e]
VIETNAM[8] —Continued					
Zinc:[e]					
Mine output, metal content	8,000	6,000	6,500	6,000	6,000
Metal, smelter, primary	7,200	5,400	5,500	[r]5,000	5,000

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Aug. 3, 1983.

[2]In addition to the commodities listed, other crude construction materials such as sand and gravel and other varieties of stone presumably are produced, but available general information is inadequate to make reliable estimates of output levels.

[3]Data are for years ending June 30 of that stated.

[4]Reported figure.

[5]Gross production is not reported; the quantity vented, flared, or reinjected is believed to be negligible.

[6]Data are for the Nepalese fiscal year ending mid-July of that stated.

[7]Figure includes both gem- and industrial-grade garnet; 4,295 kilograms of gem quality and 37,000 kilograms of industrial quality.

[8]In addition to the commodities listed, iron ore was mined in the past and pig iron was produced at industrial facilities, but the status of these industries under prevailing conditions is not sufficiently clear to allow formulation of reliable estimates of output levels. Similarly, data on output of crude construction materials are not available, and no basis is available to make reliable estimates of output levels.

[9]Nitrogen (N content of ammonia) production capacity of the country's only known plant is 54,000 tons per year; it is not known at what output level the plant is operating.

[10]Revised to zero.

COMMODITY REVIEW

Metals.—*Iron and Steel.*—Bangladesh's Government-owned steel industry consisted of an old four-unit, open-hearth-based plant in Chittagong with a 250,000-ton-per-year capacity, commissioned in 1967. The plant reportedly has never been operated at an efficient capacity level and has lost over 500 million taka since opening.

Plans were drawn up to completely modernize the plant and increase the output capacity to 370,000 tons per year. Two electric arc furnaces and continuous-casting equipment would replace the old furnaces. The Government announced, however, in April 1982 that plans for the modernization were being dropped, at least temporarily. Although opinions differed as to the reasons for dropping the plan, it was speculated that lack of funds was the real reason and that if low-interest financing was offered, the authorization for the work would quickly follow.

Another plan, independent of the aforementioned, was for the establishment of a 600,000-ton-per-year, natural gas-based, direct reduction steel mill also at Chittagong. A Japanese team of technical experts was due to visit Bangladesh in early 1983 to make a preliminary study regarding the facility.

The direct reduction plant would operate on imported raw material except for the gas and electric power; the existing plant used some domestic scrap but in turn was fueled with imported oil.

Nonmetals.—*Fertilizer Materials.*—The new Ashuganj nitrogen fertilizer complex, the largest industrial plant in the country, was renamed the Zia Fertilizer Co. Production at the plant was not up to projected levels. In fiscal year 1981, it produced only about two-thirds of its target production. The plant was closed during part of July and produced only 1,600 tons against a target of 20,000 tons. Zia Fertilizer received natural gas from the adjacent Titas Gasfield and the more distant Habiganj Gasfield. A 33-kilometer, 30.5-centimeter-diameter pipeline was commissioned in 1981, linking Habiganj to the existing Titas Gasfield distribution system to supply 50 million cubic feet per day to Zia Fertilizer.

The combined production of the plants at Ghorasal and Fenchuganj and the new Zia Fertilizer factory should make the country self-sufficient in nitrogen if each plant operated at design capacity. However, projected demand for fiscal year 1984 was put at 1.5 million tons of nitrogenous fertilizer. To meet this demand, new plants were planned using the abundant natural gas reserves as raw material (as do the existing plants).

Two large plants were planned for the Chittagong area and would be served by the Bakhrabad pipeline. Progress apparently was slow during the year. Prequalification documents were submitted by 12 contractors in August 1981, but the tender documents, which were expected to be issued in

February 1982, reportedly had not been sent out by May 1982. The plant was to be designed for 1,000 tons per day of ammonia and 1,700 tons per day of urea. Financing of the more than $300 million cost was to be obtained from seven financing agencies, the majority from the Asian Development Bank and Overseas Economic Fund of Japan. The complicated financial arrangements were believed to be causing at least part of the delay in issuing the tender documents.

The Karnaphuli Fertilizer Co. Ltd. was set up to operate the second plant. It was to be fabricated on a barge by Swedyards Corp. in Sweden and floated to the site in Bangladesh. Formal contracts were to be signed in June 1982, but it was not known if the signing took place on schedule.

Another industry that was to use Bakhrabad natural gas was planned for Chittagong. A 1,250-ton-per-day methanol plant was to be built at a cost of $250 million. Financing was being arranged, and the output would be exported to earn foreign exchange.

Mineral Fuels.—*Coal.*—One potentially important mineral resource was a 33-meter-thick, deep-lying seam of coal at Jamalganj in northern Bangladesh. The coal was of good quality, with a carbon content of 80% and a heat value of 11,870 British thermal units per pound. Reserves were estimated at 1 billion tons. The deposit has been studied intermittently since 1962. One recent recommendation was to sink an exploratory shaft rather than continue test borings and additional detailed seismic surveys. The shaft would generate engineering information on underground conditions to facilitate design and development of the mine. If the findings were favorable, the exploratory shaft could eventually be incorporated into the ventilation system of the mine. If not successful, the project would be abandoned at relatively little cost.

The consumption of coal in Bangladesh was about 200,000 tons per year, with brickmaking, industry, and the railroads being the major consumers. Present consumption could be greatly increased if the coal was available at a favorable price.

Bangladesh officials felt that an active development program was needed now in light of the long leadtime needed for this type of project.[4]

Petroleum and Natural Gas.—Development drilling at the Bakhrabad Gasfield was completed in September. The five wells will have a production capacity of 150 million cubic feet per day. The gas gathering and processing facilities were expected to be completed by June 1983. The 110-kilometer pipeline connecting Bakhrabad with Chittagong was under construction during the year. Satellite hookups will also be made to serve Comilla, Chandpur, Laksham, and Feni along the main pipeline route. Approximately 2,000 kilometers of feeder and service lines will be constructed. The International Bank for Reconstruction and Development (World Bank) and the Organization of Petroleum Exporting Countries (OPEC) were funding the pipeline.

Renovation and expansion of the Titas Gasfield was also underway as part of the overall system to bring gas service to the Chittagong area. Ninety-two kilometers of 41-centimeter pipeline will be added in the Titas area, and gas from both Titas and Bakhrabad reportedly will feed the Chittagong pipeline. The new system will serve 1,000 industrial users, 8,000 commercial customers, and an estimated 300,000 domestic consumers.

Exploration drilling was continuing at several sites around the country by the Bangladesh Oil and Gas Corp. (Petrobangla) or contractors drilling for the Government-owned company. Reports of several new gas discoveries were made during the year. In some cases, however, further development of a potential field was delayed for lack of additional capital investment.

The discovery well at Beanibazar indicated estimated recoverable reserves at 0.8 trillion cubic feet with 20 barrels of condensate per million cubic feet of gas. A West German grant in November 1980 paid for the $13 million cost of the exploratory drilling at this site.

Petrobangla was concentrating on drilling in Sitakund and Patharia Townships where oil seeps have been discovered.

The Royal Dutch/Shell Group was the only foreign company conducting exploration during 1982. It was making a seismic survey in its block 14 contract area adjacent to the Burmese and Indian border. Shell Oil Co. reportedly signed a 25-year, production-sharing contract in May.

To accelerate the search for oil in the country, the Government planned to make an additional 16 blocks available to foreign oil companies under production-sharing contracts. The 16 blocks comprise the entire onshore and offshore area with the exception of the delineated gasfield areas and Shell's block 14. The last time Bangladesh offered foreign oil companies the option to participate in exploration was 1974. The

country currently spends from 70% to 85% of export earnings on imported crude oil and refined products. The Government would like to cut this dependence on expensive imports and decided the quickest and least expensive way was to invite outside exploration via the production-sharing route. Contract terms, other than Shell's, have not been decided.

The possibility of exporting natural gas to India has been raised several times in recent years. The heads of state of both countries met in October, and the question of gas exports was to be discussed. Bangladesh was considering offering from 100 to 150 million cubic feet per day to India. West Bengal State in India, adjacent to the Bangladesh border, has a chronic energy shortage and could readily use the gas. Overall cost, financing, and political considerations appeared to be more important to initiating an agreement than any technical constraints.

Eastern Refinery Ltd. at Chittagong, the country's only oil refinery, closed in October for 2 months for maintenance. The plant had not had a major overhauling since its commissioning in 1968. Its 1.5-million-ton-per-year capacity had slowly declined to an actual output of about 1.2 million tons per year.

Petrobangla planned to expand the refinery and add secondary processing units to increase the output of middle distillates. Funding for the work was expected to come from the World Bank.

BRUNEI[5]

The only mineral industry operations of any world significance in the Independent Sultanate of Brunei were, as in past years, those of the modest petroleum and natural gas industry. These activities, however, although of only modest significance to the world, continued to be the overwhelmingly dominant factor in the economy of the Sultanate, a 5,765-square-kilometer area on the northwest coast of the Island of Kalamantan (Borneo), with a population of somewhat over 210,000. Despite cutbacks in output of both petroleum and natural gas for a second year, chiefly as a result of the world crude oil market glut, Brunei's petroleum and gas industry again accounted for nearly 90% of the GDP and for virtually 100% of foreign exchange earnings.

There has been a general downturn in the output of crude materials for the past 2 years, chiefly because of the worldwide oversupply of crude oil. Presumably, Brunei would have been able to market more natural gas in 1981 and 1982, up at least to the 1980 level, if it had been possible to produce more gas without getting additional oil, but the gas-oil ratios of the producing fields evidently precluded this. Refinery output has only been reported through 1980; estimates for 1981 and 1982 are based on available information on refinery capacity, internal product demand, and external trade data.

The importance of Brunei's exports of petroleum and natural gas to the Sultanate's trade balance is demonstrated by trade value figures for 1980 and 1981, the most recent years for which complete results are available. In 1981, the value of commodity exports and reexports was $4,066 million, of which petroleum and natural gas accounted for 98.9% and was distributed as follows: crude oil, 55.6%; natural gas, 39.5%; and refined oil, 3.8%. All other mineral commodities represented only 0.3% of the total, and all nonmineral commodities, only 0.8%. The 1981 total of exports and reexports was about 10% below the 1980 level of $4,519 million, which was distributed as follows: crude oil, 61.8%; natural gas, 30.9%; refined oil, 5.9%; other minerals, 0.3%; and nonmineral commodities, 1.4%. The 1981 cutback in oil exports and increase in gas shipments are clearly demonstrated in these figures.

Total commodity imports in 1981 were valued at $596 million, a level equivalent to only 14.7% of exports plus reexports, giving the Sultanate a positive trade balance of over $3,470 million. Of the total 1981 commodity imports, all mineral commodity imports accounted for only 18.3% compared with 19.8% of the 1980 total of $566 million. Among mineral commodity imports, iron and steel was the overwhelmingly dominant category in both 1980 and 1981, accounting for 12.6% of total commodity imports in each year, or between 60% and 70% of total mineral commodity imports.

COMMODITY REVIEW

Petroleum and Natural Gas.—Although the output of crude oil and natural gas declined for a second consecutive year, this was not as unfavorable as it might appear for the Sultanate. The decline, principally

caused by the worldwide crude oil glut, fitted well into the plans of the Government to reduce output to levels more in line with the economic needs of the Government, thereby extending the life of the fields.

Although Brunei Shell Petroleum Co. (BSP) remained the only oil and gas producer through 1982, a second firm was moving toward producer status. In May, Jarra Jackson Pte. Ltd., a Brunei company 75% owned by the Texas-based U.S. independent oil firm Jackson Exploration Inc., signed an offshore concession agreement with Brunei's Government. The agreement covers 3,136 square kilometers, in water depths ranging from 18 to 180 meters, for a period of 30 years. The acreage involved was held by BSP until relinquished in 1980 and apparently offers considerable potential to the new concessionaire. Drilling was expected to begin in this area in early 1983.

The Sultanate's long-term traditional producer, BSP, after a period of relative inactivity in the exploration area, was conducting seismic tests in its third offshore concession, acquired in 1981, and was expected to start drilling in this new area in 1984.

BSP's main activity in 1982 was development of secondary recovery facilities in the Champion Field. The secondary recovery process involves water injection and dry gas lift, using gas obtained in this field. Gas from the Champion Field not needed for this purpose is piped to the Brunei liquefied natural gas plant for use as boiler fuel for the liquefaction of the cleaner, more valuable gas from the Southwest Ampa and Fairley Fields.

BSP apparently continued to emphasize production of gas from fields with little or no associated oil to meet the terms of its 20-year contract with Japan for liquefied natural gas.

CHRISTMAS ISLAND[5]

Commercial mineral industry activity on tiny Christmas Island was confined, as in previous years, to mining phosphate rock. The 135-square-kilometer Indian Ocean island, 360 kilometers due south of Java Head, with a population of about 3,000, remained under the control of Australia. Christmas Island ranked 13th among world phosphate rock producers in 1982 on the basis of gross weight of ore, with about 1% of the total and 12th on the basis of P_2O_5 content, with about 1.2% of the total.

The Phosphate Mining Co. of Christmas Island, which replaced the British Phosphate Commission in 1981 as the island's sole producer, continued to operate throughout 1982.

The Union of Christmas Island Workers in late 1982 reportedly lodged a complaint in Australia to the effect that the market in Australia for Christmas Island's product had been unfairly eroded by increased sales of U.S.-produced phosphates at prices virtually one-half of the 1981 level. At yearend, there was no formal response to the complaint nor had any action been taken by the Australian Government.

A reassessment of the island's exploitable phosphate reserves was undertaken during 1982, and as a result, totals were increased

significantly. With the drilling and evaluation process not complete, reserves of "A" grade rock, about 35% P_2O_5, and those of "B" grade rock, somewhat lower in grade, were reported at 14 million tons each. Presumably, the latter figure represents the amount of B-grade material that can be commercially exploited under present conditions of water availability, for this material must be processed by wet desliming to be salable, and the water supply for this purpose at present limits output to about 300,000 tons annually. An earlier assessment of B-grade ore indicated the existence of some 50 million tons of this material. Additionally, the island reportedly has 145 million tons of "C" grade ore, but this material has been marketed only in very limited quantities in Indonesia after crushing, drying, and calcining under the trade names citrophos and calciphos, for direct application. This material is regarded as not being satisfactory for production of superphosphate.

Development plans call for the extraction of about 1 million tons of A-grade ore annually, together with 300,000 to 400,000 tons of B-grade ore, there being no indication of anticipated production of C-grade ore.

Table 4.—Christmas Island: Exports of phosphate rock, by destination

(Thousand metric tons)

Singapore	19	18	--
Total	1,638	1,360	1,367

HONG KONG[6]

Land-use conflict in Hong Kong is a major problem. About 9% of the total land area of 1,064 square kilometers is used for farming and 16% for urban and developed areas, while the remaining 75% is largely land of marginal usefulness. Mining activity is insignificant to Hong Kong's economy with only small quantities of kaolin, feldspar, and quartz produced from open pit operations. At the end of 1982, there were only four mining licenses issued by the Commissioner of Mines in operation.

Hong Kong's largest industrial sector was textiles and clothing, followed by electronics, plastics, watches and clocks, and other light industries. All sectors are export oriented.[7]

Total merchandise trade was $44.5 billion.[8] Imports rose by 3% over that of 1981 to $23.5 billion, domestic exports by 3% to $13.7 billion, and reexports by 6% to $7.3 billion. Hong Kong is almost entirely dependent on imported goods to meet the needs of its population and industries. China and Japan were the principal suppliers of imports, providing 23% and 22%, respectively. The largest export market was the United States, accounting for 38%, followed by the United Kingdom, 9%; the Federal Republic of Germany, 8%; and China, 5%.[9]

Table 6.—Hong Kong: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	576	209	9	United Kingdom 189.
Carbon: Carbon black and gas carbon	749	1,290	108	China 907; Japan 135.
Coal: All grades including briquets	2,851	57,004	9	China 52,403; Vietnam 3,200.
Coke and semicoke	5,571	4,281	--	Japan 2,520; China 1,322.
Hydrogen, helium, rare gases value, thousands	$263	$543	$347	China $105; Singapore $58.
Petroleum refinery products:				
Liquefied petroleum gas thousand 42-gallon barrels	1,224	1,355	--	Singapore 849; Japan 358; Taiwan 91.
Gasoline ---do---	1,707	2,242	--	Singapore 1,589; China 532; Bahrain 121.
Mineral jelly and wax ---do---	110	110	3	China 93; Japan 12.
Kerosine and jet fuel ---do---	6,752	7,496	1	Singapore 5,531; China 1,562.
Distillate fuel oil ---do---	8,470	9,101	--	China 4,908; Singapore 3,822.
Lubricants ---do---	505	485	27	Singapore 140; Japan 115; China 92.
Residual fuel oil ---do---	27,904	29,013	--	Singapore 23,431; China 2,116.
Bitumen and other residues ---do---	178	193	4	Singapore 110; China 54; Republic of Korea 21.
Unspecified ---do---	40	32	2	China 20; United Kingdom 5.
Tars and other crude chemicals derived from coal, gas, and petroleum	1,672	1,753	45	China 1,613; Netherlands 54.

[r] Revised.
[1] Less than 1/2 unit.
[2] Includes ores and concentrates of vanadium, niobium, etc.

KAMPUCHEA[10]

The mineral industry of Kampuchea continued to consist of local mining operations serving only the needs of local immediate users. The only minerals known to have been produced to any significant extent were salt, phosphate rock, gem stones, and nonmetallic construction materials for cement, brick, and tile manufacture.

Few reliable details were available of the Kampuchean economy or infrastructure owing to the unstable political situation and the continuing military activities connected with the Vietnamese occupying forces. Improvements in the farming sector were reported, and total rice production was increased. This improved production probably necessitated corresponding increases in the production of phosphate rock for fertilizer. In Kampuchea, phosphate rock is simply ground to a fine powder and applied directly to a cropland with no attempt at chemical processing or blending.

Salt was produced by evaporation of seawater in the Districts of Kampot and Kampong Trach for domestic consumption. It was reported that the production level in Kampot was 64% above that of 1981, or about 38,000 tons. The 1983 target for Kampot was 45,000 tons. Neither the actual nor target production was available for the Kampong Trach salt industry.

Gem stones were known to occur along the Thai-Kampuchean border but have not been commercially exploited for several years.

NORTH KOREA[11]

The fundamental principle of North Korea's current 7-year economic plan (1978-84) is self-sufficiency and reliance on domestically produced raw materials as much as practical. North Korea's economy is encumbered by debts to China, the U.S.S.R., and market economy countries, principally Japan. The Government sought to stabilize its debt ceiling through expansion of commodity exports primarily of lead, zinc, magnesite, and cement, in addition to machine tools. Because of contraction of world markets, North Korea's exports were sluggish, further reducing foreign exchange

earnings and necessitating external debt rescheduling. Under the current plan, output targets in 1984 included electricity, 56 to 60 billion kilowatt-hours; coal, 70 to 80 million tons; iron ore, 16 million tons; pig iron, 6.4 to 7 million tons; steel, 7.4 to 8 million tons; nonferrous metals, 1 million tons; and cement, 12 to 13 million tons. By the end of the 1980's, the value of exports was to increase fourfold over shipments at the beginning of the decade.

In 1982, Government revenues were estimated at $24.1 billion, an increase of 10% over that of 1981.[12] Total expenditures increased by 9% to $23.6 billion. However, North Korea's estimated debt was close to five times the budget surplus in 1982.

Kim Chaek Iron and Steel Works, North Korea's largest steel producer, was being expanded. Musan Mine, which produces iron ore for Kim Chaek, was likewise being expanded. Other steelworks undergoing expansion included Hwanghae, Kangson, and Songjin. A new 3-million-ton-per-year steel facility was planned for construction at Taedonggang.

Lead and zinc mine output was also to be increased. Production at the Komdok Mine, North Korea's largest lead-zinc mine, was being increased with the installation of a third ore dressing plant, belt conveyors, and construction of new shafts. A new lead-zinc smelting plant was under construction at Tanchon. Other lead-zinc projects included mine expansion programs at Hyesan, Sangnong, and Unhung.

LAOS[13]

During 1982, the second year in Laos' current 5-year plan, the Prime Minister was able to report "modest economic success." The progress was largely in the agricultural sector because Lao society is "a small farmer's natural economy of self-sufficiency and self-support."[14] The socialist idea of collective production has met with little understanding and thus little real success in this landlocked country of 3.5 million people. The mineral wealth remained untapped largely owing to the continuing lack of infrastructure needed for its development. A lack of investment capital and technical expertise also contribute to the underutilization of mineral commodities.

Laos has known deposits of tin, iron ore, salt, potash, gem stones, gypsum, and coal. The Soviet Union was completing surveys of these mineral resources and was expected to publish its findings in the next 2 years.

Most electricity produced in Laos is from the hydroelectric plant expanded in 1981 at the Nam Ngum Dam. Officials of the Lao State Electricity Enterprise stated that nearly 800 million kilowatt-hours were generated there during 1982. About one-eighth of this amount was used domestically, the rest exported to Thailand for foreign exchange. During 1982, electric service was expanding into some new rural areas. Electrification was especially important for economic expansion, standard of living, and development of the mining and manufacturing sectors.

COMMODITY REVIEW

The survey and exploration of the tin resources in the Pa Then Basin, being carried out with assistance of the Soviet Union, apparently neared completion during the year. Once a significant producer of tin, Laos nationalized the French-owned Phonteou Mines in 1978 and has been attempting to reach former production levels ever since. During 1982, the project was reported to be in the "machinery restoration stage" with 80% of the entire plan completed. Conflicting and fragmentary Lao press reports make estimating tin production nearly impossible. It was believed that 77 tons of tin concentrate was exported in the first 6 months of 1982. Another report stated that production increased by 30% over that of 1981.[15]

The largest identified mineral resource in Laos was iron ore, occurring in Siang Khoang Province near Phonlek and Lalbouak. In 1982, Vietnam was assisting Laos in the exploration of this resource, which is known to contain several hundred million tons of high-grade magnetite.

At yearend, the Lao and Vietnamese Ministries of Construction signed an agreement for the construction of a cement factory. No location or size was given.

Gypsum was becoming an important product in the Lao mining sector. A memorandum on construction of gypsum mines in Donghen, Savannakhet Province, was signed between Laos and Vietnam. The output will probably be exported to Vietnam, which is expanding its cement industry. Production continued to increase and may have exceeded 50,000 tons by yearend.

Two new brickworks were operating after being constructed in cooperation with the Vietnamese. The largest, in Vientiane, completed its first full year of operation and the other, in Saravane Province, began operating in mid-1982. Other quarries or plants producing common construction materials were small and produced only enough for local use.

Soviet and Lao geologists prospecting for mineral deposits in Laos, discovered five new coal deposits up to 45 meters thick. This coal was reportedly planned for use as fuel for the construction materials industry in the Bochan region.

The construction of the 500-kilometer-long, petroleum products pipeline between Vientiane and Vinh City in Vietnam continued in the surveying stage. This major project of the 5-year plan was being carried out with Soviet assistance and was to have a capacity of 300,000 tons per year. At the current rate of progress, it will be completed in several years.

[2]Less than 1/2 unit.

[3]Excludes part of Japanese exports valued at $6,000.

MONGOLIA[16]

Mongolia's gross national product, as measured by an aggregate social product, grew 7.6% in 1982 compared with 8.3% in 1981.[17] According to the Central Statistical Bureau of the Mongolian People's Republic, the national income increased by 7.4% in 1982 compared with 7.9% in 1981. An increase in labor productivity contributed mostly to the nation's economic growth in 1981-82. The total value of industrial production was estimated at $1.57 billion[18] in 1982 compared with $1.45 billion in 1981.

Capital investment in 1982, under the seventh 5-year plan, totaled $1.25 billion. About 40% was for industrial development of the fuel and power, mining, and construction industries, and 17% was for the development of nine state farms and other agricultural projects. The total value of industrial and construction projects completed during the year was $800 million. Under the seventh 5-year plan, the Government will spend about $1.45 billion for economic development projects in 1983.

After the sixth 5-year plan (1976-80), the structure of Mongolian export commodities has changed from agricultural materials such as meat and wool to industrial raw materials and consumer goods. In 1982, the major export commodities included finished leather, fur items, rugs, blankets, copper, fluorspar, lumber, and other industrial base products. Mongolian exports reportedly rose 18.7%. Because of the emphasis on the development of industrial projects under the seventh 5-year plan, imports of capital

goods increased substantially in 1981-82. The principal import items included powerplants, machinery, and equipment. Imports of consumer goods reportedly also increased in 1982, especially household electrical appliances and food products. The U.S.S.R. remained the major buyer of Mongolian exports and the dominant supplier of Mongolian imports.

COMMODITY REVIEW

Metals.—Production of copper and molybdenum at the Erdenet Mine increased. The ore deposit and the open pit mining operations were at Mount Erdenetiyn-ovoo, which is about 1,000 meters above sea level, stretches 25 kilometers from southeast to northeast, and is 1.5 to 3 kilometers wide. The ore scooped up by the excavator was dumped into the 27-ton tip trucks, then transported to a conveyor, which carries the ore to the crushing mill. The water used in the flotation plant is piped from the Selenge River, about 50 kilometers away. The electric power is supplied by high-tension line from Gusinoozersk, U.S.S.R. The concentrate produced at the mill contains 33% copper and was exported by rail to Ural, U.S.S.R., for smelting. In 1982, export earnings of copper and molybdenum concentrates from the Erdenet Combine accounted for over one-third of Mongolian total export earnings.[19]

Nonmetals.—A new cement and lime complex reportedly was under construction at Hotol (Belendalay) in northern Mongolia. The limestone deposit at Hotol will be mined by an open pit operation to provide the raw material to the cement plant nearby as well as to supply the existing Darhan cement plant. The Hotol cement complex will have an annual capacity of 500,000 tons of cement and 65,000 tons of lime when construction is completed in 1983 or 1984.

Development of the rich Fluorite Belt in the eastern Gobi Desert was well underway in 1982. The development of an open pit fluorspar mine and the construction of a new ore-dressing plant at Bor-ondor were undertaken by the joint Mongolian-Soviet amalgamation Mongolsovtsvetment. Fluorite production from Berh and two other small mines reportedly increased 12%. The output was valued at $3 million and accounted for 40% of the total value of Mongolian mineral production. Most output from Berh was exported to the U.S.S.R.

Mineral Fuels.—Mongolian coal production capacity reportedly reached 4.8 million tons per year. The coal industry has 10% of all industrial workers and its output value was about 14% of Mongolian industrial production. The Nalayh-Kapital'naya Mine, the leading coal producer in Mongolia, provided most of the fuel (electricity) requirements of the Ulan Bator area. After the renovation and modernization, the coal output increased substantially in 1982.

Coal development at Baga-Nuur, near Kherulen River, was undertaken by Mongolian and Soviet workers in 1982. Under the plan, the output capacity was projected to be 1 million tons per year in 1983.[20]

NEPAL[21]

In Nepal, the contribution of the mineral industry toward the total economy was insignificant. The potential for greatly increased mineral production was considerable, however, as very little of the upland regions has been explored for mineral occurrences by any but the most primitive methods. High-grade copper veins have been mined by hand since ancient times, but no detailed evaluation of the potential has ever been made.

The best prospects for development in the immediate future are zinc, magnesite, cement raw materials, and, optimistically, petroleum.

The main hindrance to industrial development was that 95% of the population was dependent on subsistence farming for its livelihood. This form of economy generates little cash flow and less capital accumulation for investment. Any major mineral development, therefore, requires foreign funding in the form of grants or low-interest loans.

Foreign aid continued to play a critical role in financing the country's development plans and in covering budgetary deficits. Disbursement of foreign aid almost doubled to an estimated $245 million, an important development that demonstrates an increasing ability of Nepal to absorb and quickly utilize foreign assistance. Faster disbursement should help speed development projects and encourage greater aid contribu-

tions from foreign donors.

To improve industrial development and to concentrate its financial resources in other development areas, the Government has put top priority on encouraging the growth of the private sector. There remains an acute shortage of capital, management, and technology that the Government hopes to meet by attracting foreign investors. Nepal passed a new investment law designed to encourage private development and to attract domestic and foreign investment through tax holidays and a variety of other incentives.

As in other developing countries, the consumption of energy in Nepal was growing fast. Of the total energy consumed in the country, over 85% was provided by fuelwood, 6% by petroleum products, 1% by hydropower, and the rest from other sources. Overcutting of timber resources to meet these energy needs has resulted in serious environmental problems and caused the Government to look increasingly to other fuel sources, especially its vast hydroelectric potential. Because of the high capital cost of harnessing this potential and the still limited domestic market for large blocks of power, hydroelectric development has been limited.

The power situation in the Kathmandu area has improved because the 60,000-kilowatt Kulekhani hydroelectric plant was brought online in March for testing and trial operation. Power was furnished most of the year from at least one of the two 30,000-kilowatt generators. In December, the King formally dedicated the $120 million project, which was begun in 1977. A 114-meter-high rockfill dam impounds a reservoir that will store some of the monsoon runoff for low-water periods. Most of the other hydroelectric plants in Nepal are run-of-the-river type and have little or no capacity to store the huge volume of runoff.

Four major hydroelectric projects were under consideration. They would require large amounts of foreign assistance and close cooperation with India, which was expected to be the major consumer of the power generated.

Imports increased 12% in fiscal year 1981 to $375 million,[22] whereas exports declined 7% to $113 million. The value of mineral exports was insignificant to the economy in 1982. A small amount of beryl, garnet, and magnesite was exported, but the tonnages and values were not available.[23]

COMMODITY REVIEW

Progress was made in the infrastructure development that will support the zinc mine at Lari in Ganesh Himal, 58 kilometers north-northwest of Kathmandu. Plans have been revised to begin mining in 1985. According to Nepal Metal Co. Ltd., the mining program is predicated on the completion by 1984 of the 105-kilometer road between Trisuli and Somtang (also referred to as Somdang) and the completion of an electric power transmission line into Somtang. The mine is to be located at an elevation of 4,419 meters. The high-grade ore will be processed into concentrate at Somtang, 5 kilometers south and 1,219 meters lower in elevation. This will be the first modern metal mine in Nepal and will employ about 700 people in mining, transporting, and concentrating the ore. The concentrate will be exported.

Though small by world standards, about 25,000 tons per year of concentrate, the project will be a major industry in an area previously inaccessible by motorized vehicles. The road will open the area also to trade, tourism, and development of forest resources and agriculture.

Cement continued to be in short supply in Nepal throughout 1982. The only domestic source was the Himal Cement Co. Ltd. facility in the southern environs of Kathmandu. The plant has a nominal capacity of 160 tons per day but seldom produces at that rate for any sustained period. Maintenance problems, poor quality of raw materials, and an erratic electric power supply have contributed to the low production. Its present production furnishes 15% to 20% of current demand. The remainder is imported from overseas or India. Despite the low production, the value of cement output probably exceeded the combined total of all other mineral production in Nepal.

To improve the situation, a $4.9 million rehabilitation and expansion program got underway at the plant. The 2-year project will raise the capacity to 400 tons per day and provide a captive electric power supply to prevent the problems caused by the frequent power cuts.

A second cement plant has been under construction at Hetauda since 1978. Work on the 750-ton-per-day, dry-process, rotary kiln plant has progressed with glacial slowness. The Asian Development Bank was considering financing $20 million to cover

part of the cost overruns incurred during construction. Tender notices for important components were still appearing in the local Nepalese press at yearend, therefore no realistic completion date can be estimated. The plant was originally designed to make Nepal self-sufficient in cement, but the long construction delays coupled with a steady rise in demand put this goal in some question.

There have been plans for a 1,500-ton-per-day cement plant in Udaypur in southeastern Nepal since 1978. The plant would be a joint Indian-Nepalese undertaking. An Indian team from Cement Corp. of India Ltd. visited Kathmandu in November 1982 to update the previously completed feasibility report on the project. His Majesty's Government will review the new report and decide on what course of action to pursue.

In April, blasting began for overburden removal at the Kharidhunga magnesite deposit, 87 kilometers northeast of Kathmandu. Exploitation of this deposit has been planned for a number of years, but problems with financing, marketing, and infrastructure have slowed the development process.

A small-scale manual mining operation has been underway at a magnesite outcrop. The Government was permitting the export of up to 10,000 tons of this raw magnesite to India for chemical and beneficiation tests and exploration of market prospects.

An agreement was signed in September for a deutsche mark 14.5 million loan from the International Finance Corp. (IFC) to the Nepal Orind Magnesite Private Ltd. company to cover about 25% of the estimated cost of the project. Orissa Industries Private Ltd. of India and His Majesty's Government would each contribute 15%. The balance was to be met by a number of Nepalese and Indian banks and financial institutions.

The Kharidhunga Mine will be designed to produce 125,000 tons of magnesite and 10,000 tons of talc per year. A concentration plant and kiln will be built at Lamosangu in Sindhupalchok District. The Lamosangu plant will produce 50,000 tons per year of dead-burnt magnesite. The talc will be processed at the company's grinding plant at Lamosangu, which has already started production. The project will employ about 700 people and will be an important foreign exchange earner.

The original plans called for a 20,000-ton-per-year refractory brick plant at Birganj, which would use part of the output of the Lamosangu plant. The IFC, however, was reported to have advised against the Birganj plant because India produced a surplus of refractory brick and the plant would not have a wide enough range of products to compete in the international market. Also, the high cost of transporting the brick through India for overseas export would make them noncompetitive.

A coal seam was reportedly found in Dhanusha District near Hariharpur village. A license for further exploration was granted to an individual following tests by the Department of Mines and Geology.

Some deposits of lignite were being mined in the Kathmandu Valley. The lignite was used locally to fire brick kilns, giving the operators a considerable economic advantage over the kilns in the Terai area, which are fueled with much more expensive imported coal.

The Government was encouraging private sector entrepreneurs to develop the lignite deposits. It was also offering technical mining assistance.

Nepal has no crude oil production and no petroleum refining capability. The cost of imported petroleum products was a major drain on its limited foreign exchange reserves, and the Government was anxious to determine if any domestic supplies could be located.

The Government had an aeromagnetic survey flown in 1980 over the Terai and Thure Ranges that indicated evidence of geologic structures capable of trapping oil and gas. In June 1982, the Government procured a $9.2 million credit with the International Development Association (IDA) to run an 800-line-kilometer seismic survey in the Terai Basin. This work was to start in October and would be the first seismic work ever done in Nepal for oil exploration. If the findings are encouraging, the Government will open blocks to private companies for detailed seismic work and exploration drilling.

Part of the IDA loan will be used for legal consultants to draft relevant legislation and recommend terms and conditions of the contract with the private companies in the future. The consultants will also train members of the Department of Mines and Geology in geophysics and the legal aspects of the petroleum industry.

SINGAPORE[24]

In 1982, the value of total industrial output in Singapore was estimated at $16.9 billion.[25] Mining activity was limited to granite quarrying with an output value of $84 million. The output of cement and concrete products was valued at $137 million compared with nonmetallic mineral products, $50 million; iron and steel, $184 million; and nonferrous metals, $60 million. Petroleum refining by far dominated the country's economy. The value of refinery output was $6.7 billion or close to 40% of the value of total industrial production.[26]

Commodity imports totaled $28.2 billion compared with exports of $20.8 billion. Singapore's major trading partners were Malaysia with trade valued at $7.4 billion, followed by Japan, $7.3 billion, and the United States, $6.2 billion. Imports of crude oil and petroleum products were valued at $9.6 billion or 34% of all commodity receipts. Fifty-seven percent of all imported crude oil was from Saudi Arabia. Principal exports were petroleum products, $6.7 billion; machinery, $2.6 billion; and telecommunications equipment, $1 billion.

Table 13.—Singapore: Exports and reexports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Abrasives, n.e.s. —Continued				
Artificial: Corundum ... kilograms	136	2,512	NA	NA.
Dust and powder of precious and semiprecious stones including diamond ... value	$11,209	--		
Grinding and polishing wheels and stones[3]	374	358	1	Malaysia 301; Brunei 20.
Asbestos, crude	10,461	11,603	--	Malaysia 11,485; Philippines 60; United Arab Emirates 34.
Boron materials:				
Crude natural borates	657	734	--	All to Malaysia.
Oxides and acids	204	213	--	Malaysia 81; North Korea 74; Australia 36.
Cement	466,982	472,667	--	Malaysia 419,419; Australia 10,719.
Chalk	2,104	1,594	--	Brunei 1,385; Malaysia 194.
Clays and clay products:				
Crude:				
Bentonite	25,596	29,853	126	Philippines 9,553; Malaysia 5,791; United Arab Emirates 4,109.
Fuller's earth	9,335	9,266	--	Malaysia 9,239.
Kaolin	1,941	1,840	--	Malaysia 1,765; Vietnam 51.
Unspecified	1,674	1,036	--	Malaysia 671; China 206; Tanzania 136.
Products:				
Nonrefractory[4]	18,815	86,555	--	Malaysia 46,902; Bangladesh 36,949.
Refractory including nonclay brick[5]	609	1,951	--	Malaysia 1,900.
Diamond:				
Gem, not set or strung ... value, thousands	$5,429	$7,818	$107	Hong Kong $2,677; Belgium-Luxembourg $2,390; Israel $889.
Industrial ... do	$520	$999	$108	Belgium-Luxembourg $453; Israel $253; Australia $109.
Diatomite and other infusorial earth	91	79	--	Malaysia 59; Brunei 10.
Feldspar, fluorspar, related materials	5,850	656	--	Malaysia 654.
Fertilizer materials:				
Crude:				
Nitrogenous	8	--		
Phosphatic	18,653	29,988	--	Malaysia 27,840; Taiwan 1,836.
Manufactured:				
Ammonia	377	352	--	Malaysia 229; Sri Lanka 22; Vietnam 17.
Nitrogenous	61,916	124,117	--	China 88,943; Malaysia 30,238; Kampuchea 4,471.
Phosphatic	73,526	3,068	--	Malaysia 1,897; Kampuchea 1,005.
Potassic	188,654	266,514	--	Malaysia 87,838; China 78,330; Philippines 64,291.
Unspecified and mixed	102,547	78,588	--	Malaysia 71,588.
Graphite, natural	126	124	--	Malaysia 120.
Gypsum and plaster	1,251	1,076	--	Malaysia 950; Taiwan 53; Brunei 27.
Halogens:				
Bromine ... value	$1,401	$1,893	NA	NA.
Fluorine ... do	$2,335	$9,940	NA	NA.
Iodine ... do	$13,077	$21,300	NA	NA.
Lime	6,457	19,134	--	Malaysia 11,199; Brunei 7,592.
Magnesium compounds: Magnesite	337	333	--	Pakistan 208; Malaysia 120.
Mica, all forms	274	351	--	Malaysia 157; Bangladesh 55; Papua New Guinea 44.
Pigments, mineral:				
Natural, crude	49	51	--	Thailand 18.
Iron oxides and hydroxides, processed	449	844	--	Malaysia 759; Bangladesh 36.
Precious and semiprecious stones other than diamond ... value, thousands	$27,847	$30,444	$628	Hong Kong $25,999; Thailand $2,431; Japan $657.
Salt and brine	13,695	14,033	--	Malaysia 12,783; Brunei 611.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	249	252	--	Malaysia 197.
Sodium carbonate, natural and manufactured	13,139	8,127	--	Malaysia 7,942.
Sodium hydroxide	3,509	7,699	--	Malaysia 2,216; Japan 1,300; Hong Kong 1,216.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	191	294	--	Malaysia 86; Philippines 21.
Worked	e710	2,043	--	Brunei 835; Malaysia 571; Taiwan 329.
Dolomite, chiefly refractory-grade	40	80	NA	NA.

See footnotes at end of table.

Table 13.—Singapore: Exports and reexports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Destinations, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Stone, sand and gravel —Continued				
Gravel and crushed rock	2,985	1,756	--	Malaysia 1,551.
Limestone other than dimension	627	519	--	Malaysia 135.
Quartz and quartzite kilograms	183	11,081	NA	NA.
Sand other than metal-bearing	583	884	--	Malaysia 403; Brunei 209; Japan 107.
Sulfur:				
Elemental:				
Crude including native and by-product	3,130	9,006	--	India 5,734; Malaysia 2,514; North Korea 613.
Colloidal, precipitated, sublimed	17,451	20,060	--	Malaysia 12,171; Thailand 6,036; India 1,809.
Dioxide kilograms	292	5,676	NA	NA.
Sulfuric acid	782	1,607	--	Sri Lanka 700; Malaysia 553; Brunei 304.
Talc, steatite, soapstone, pyrophyllite	554	1,222	--	Malaysia 1,151.
Other:				
Crude	49,207	31,273	--	Malaysia 28,407; Philippines 1,894.
Slag and dross, not metal-bearing	13,247	7,904	--	Japan 6,731; United Arab Emirates 501; Malaysia 280.
Oxides and hydroxides of barium, magnesium, strontium	11	5	NA	NA.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	17,174	7,250	--	Malaysia 4,766; Brunei 1,574.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural	7,656	7,668	--	Vietnam 3,300; Malaysia 2,162; Burma 1,000; Kampuchea 1,000.
Carbon: Carbon black	687	351	--	Malaysia 349.
Coal: All grades including briquets	1,588	606	--	Thailand 324; Papua New Guinea 101; China 42.
Coke and semicoke	8,486	7,612	--	Malaysia 7,201; Sri Lanka 380.
Hydrogen, helium, rare gases value, thousands	$1,498	$2,566	--	Thailand $889; Malaysia $748.
Petroleum and refinery products:				
Crude thousand 42-gallon barrels	552	368	--	All to Malaysia.
Refinery products:				
Liquefied petroleum gas do	1,699	2,280	--	Thailand 947; Hong Kong 725; Malaysia 465.
Gasoline:				
Aviation do	511	187	--	Australia 71; Papua New Guinea 45; Malaysia 40.
Motor do	13,748	13,855	864	Malaysia 5,375; Hong Kong 1,436; Australia 1,416.
Mineral jelly and wax do	263	85	--	Malaysia 19; Taiwan 15; Thailand 13.
Kerosine do	7,499	10,724	213	India 2,701; Hong Kong 2,233; Malaysia 1,556.
Jet fuel do	15,606	13,745	259	Japan 4,043; Hong Kong 2,708; New Zealand 1,205.
Distillate fuel oil do	33,282	37,622	222	Malaysia 9,778; Thailand 5,579; Australia 3,727.
Lubricants do	3,532	2,666	--	Thailand 762; Malaysia 679; Saudi Arabia 234.
Nonlubricating oils do	472	459	--	Sweden 259; Philippines 89; Malaysia 73.
Residual fuel oil do	62,108	60,810	2,226	Hong Kong 24,140; Japan 14,036; Australia 4,846.
Bitumen and other residues do	1,182	992	--	Malaysia 255; Australia 250; United Arab Emirates 132.
Bituminous mixtures do	10	30	--	Hong Kong 4; Brunei 3.
Naphtha do	19,167	24,406	494	Japan 18,465; New Zealand 1,679; Australia 1,087.
Petroleum coke do	21	--	--	
Unspecified do	978	298	--	Malaysia 92; Hong Kong 86; New Zealand 24.
Tars and other crude chemicals derived from coal, gas, and petroleum	4,439	5,316	--	Malaysia 2,784; Taiwan 2,380.

NA Not available.
[1]Less than 1/2 unit.
[2]May include platinum-group metals.
[3]Excludes unreported quantity valued at $1,868 in 1980 and $7,100 in 1981.
[4]Excludes quantity of ceramic building bricks valued at $75,191 in 1980 and $193,118 in 1981.
[5]Excludes quantity of refractory bricks valued at $299,365 in 1980 and $365,983 in 1981.
[6]Excludes unreported quantity valued at $467.

Table 14.—Singapore: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS				
Alkaline- and rare-earth metals:				
Alkaline-earth metals	121	37	--	Japan 20; West Germany 17.
Rare-earth metals	13	1	NA	NA.
Aluminum:				
Ore and concentrate	400	19	--	All from China.
Oxides and hydroxides	8,185	6,625	301	China 5,270; Japan 964.
Metal including alloys:				
Scrap	433	394	9	Malaysia 323; Brunei 59.
Unwrought and semimanufactures	29,567	35,625	7,153	Japan 7,253; Australia 3,953; Malaysia 3,216.
Antimony: Metal including alloys, all forms	51	31	--	Malaysia 20; China 11.
Beryllium: Metal including alloys, all forms kilograms	20	--		
Bismuth: Metal including alloys, unwrought do	45	--		
Cadmium: Metal including alloys, unwrought	3	1	NA	NA.
Chromium: Oxides and hydroxides	307	266	110	Japan 74; West Germany 24; U.S.S.R. 17.
Cobalt:				
Oxides and hydroxides	3	8	--	Canada 7.
Metal including alloys, unwrought	7	6	--	All from Netherlands.
Columbium and tantalum:				
Ore and concentrate	208	307	--	Thailand 205; Malaysia 59.
Metal including alloys, all forms kilograms	34	80	NA	NA.
Copper:				
Ore and concentrate	(1)	13	--	Japan 10.
Matte and speiss including cement copper	--	1	NA	NA.
Metal including alloys:				
Scrap	5,026	4,551	--	Malaysia 4,175.
Unwrought and semimanufactures	31,716	30,848	988	Japan 18,629; Taiwan 3,377; Australia 2,958.
Indium: Metal including alloys, unwrought kilograms	20	1,921	NA	NA.
Iron and steel:				
Iron ore and concentrate	9,605	30,876	--	Malaysia 30,728.
Metal:				
Scrap	172,028	78,214	26,172	Australia 43,521; Malaysia 7,298.
Pig iron, cast iron, related materials	33,184	63,040	690	Australia 50,984; China 10,112.
Ferroalloys:				
Ferromanganese	3,534	505	36	Australia 151; China 126; Taiwan 55.
Unspecified	4,878	9,070	53	Australia 5,636; China 1,250; New Caledonia 1,161.
Steel, primary forms	96,377	43,693	203	China 37,664; Japan 5,351.
Semimanufactures:				
Bars, rods, angles, shapes, sections	444,187	613,324	3,381	Japan 349,574; West Germany 70,555; Mozambique 40,935.
Universals, plates, sheets	656,724	802,521	7,130	Japan 574,696; Republic of Korea 83,767; Taiwan 54,112.
Hoop and strip	24,991	25,037	589	Japan 15,964; Australia 2,767; Republic of Korea 2,540.
Rails and accessories	25,651	13,323	119	Poland 11,098; Japan 1,469.
Wire	18,858	22,844	228	China 10,177; Japan 7,758; Belgium-Luxembourg 1,132.
Tubes, pipes, fittings	338,602	464,916	20,049	Japan 390,262; Malaysia 10,641; West Germany 5,135.
Castings and forgings, rough	10,691	12,118	2,119	Japan 7,393; Australia 1,550; France 661.
Lead:				
Ore and concentrate	190	5,010	--	Iran 5,000.
Oxides	554	612	--	Australia 340; West Germany 134; Japan 58.
Metal including alloys:				
Scrap	214	167	--	Brunei 117; Malaysia 27.
Unwrought	8,095	3,900	124	Australia 2,546; Burma 750.
Semimanufactures	856	665	16	Australia 372; Japan 71; Belgium-Luxembourg 57.
Magnesium: Metal including alloys, all forms	15	112	99	Japan 7.

See footnotes at end of table.

Table 14.—Singapore: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
METALS —Continued				
Manganese:				
Ore and concentrate	60,468	80,900	NA	NA.
Oxides	3,319	3,103	20	Ireland 2,016; China 583; Japan 251.
Mercury 76-pound flasks	90	415	36	China 324.
Metalloids:				
Arsenic: Oxides and acids	10	--		
Unspecified	92	12	1	Japan 9.
Molybdenum:				
Ore and concentrate	78	30	--	Chile 25.
Metal including alloys, all forms	3	13	12	NA.
Nickel: Metal including alloys:				
Scrap	237	135	--	Malaysia 78; Philippines 33.
Unwrought and semimanufactures	1,357	1,638	26	New Caledonia 1,157.
Platinum-group metals: Metals including alloys, unwrought and partly wrought	19,290	128,249	124,005	Mauritius 2,508.
Silver:				
Ore and concentrate[2] kilograms	434	1,748	1,500	Japan 146.
Waste and sweepings[2] value, thousands	$146	$417	--	Malaysia $286; Taiwan $118.
Metal including alloys, unwrought and partly wrought thousand troy ounces	742	2,228	141	West Germany 1,254; Australia 337; Malaysia 325.
Tin:				
Ore and concentrate	3,370	1,996	--	Burma 1,229; Thailand 729.
Oxides	6	7	NA	NA.
Ash and residue containing tin	12,360	9,343	--	Malaysia 9,288.
Metal including alloys:				
Scrap	1,032	1,503	22	Australia 1,303.
Unwrought and semimanufactures	2,782	1,838	12	Malaysia 1,132; Hong Kong 328.
Titanium:				
Ore and concentrate	541	85	--	Australia 35; Malaysia 10.
Oxides	3,768	4,099	229	Japan 1,489; West Germany 831; Australia 549.
Metal including alloys, unwrought kilograms	684	3,812	3,068	United Kingdom 743.
Tungsten:				
Ore and concentrate	1,346	1,925	(1)	Burma 1,240; Australia 349; China 100.
Metal including alloys, all forms	160	89	6	Austria 35; China 18; Hong Kong 16.
Vanadium: Ore and concentrate	27	1	NA	NA.
Zinc:				
Ore and concentrate	139	75	--	Canada 50; Australia 25.
Oxides	531	494	15	China 152; United Kingdom 117; Malaysia 95.
Metal including alloys:				
Scrap	351	530	--	Malaysia 336; Australia 141.
Unwrought and semimanufactures	18,482	18,732	360	Canada 6,779; Australia 4,250; China 2,256.
Zirconium: Ore and concentrate	1,102	2,081	--	Australia 2,060.
Other:				
Ores and concentrates	304	222	--	Burma 203.
Oxides and hydroxides	754	1,118	82	China 430; Norway 221; West Germany 133.
Ashes and residues	r101,692	183,609	--	Japan 182,501; Malaysia 937.
Pyrophoric alloys	110	27	--	China 14; Austria 12.
Base metals including alloys, all forms	13	--		
NONMETALS				
Abrasives, n.e.s.:				
Natural: Corundum, emery, pumice, etc	298	594	279	China 250.
Artificial: Corundum kilograms	68	5,000	NA	NA.
Dust and powder of precious and semiprecious stones including diamond value	$8,874	$5,206	NA	NA.
Grinding and polishing wheels and stones[3]	2,062	2,063	75	Japan 885; China 311; Italy 258.
Asbestos, crude	16,661	16,824	2,313	Australia 3,978; Canada 1,402; China 825.
Barite and witherite	66,343	29,698	106	Thailand 16,880; China 11,634.
Boron materials:				
Crude natural borates	748	782	782	
Oxides and acids	175	239	71	China 140.
Cement thousand tons	1,831	1,954	2	Japan 1,227; Republic of Korea 316.
Chalk	8,854	5,003	--	Malaysia 3,135; United Kingdom 775; Thailand 714.

See footnotes at end of table.

Table 14.—Singapore: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Clays and clay products:				
Crude:				
Andalusite, kyanite, sillimanite	--	2	NA	NA.
Bentonite	46,778	68,208	67,163	Spain 342; China 330; India 245.
Fuller's earth	4,856	6,280	152	West Germany 4,519; United Kingdom 1,235.
Kaolin	5,286	6,573	--	Malaysia 4,140; Japan 1,162; United Kingdom 737.
Unspecified	13,753	11,404	351	Malaysia 7,074; Japan 2,665; China 574.
Products:				
Nonrefractory[4]	96,682	107,388	237	Italy 53,511; Japan 17,795; Sri Lanka 7,805.
Refractory including nonclay brick[5]	13,181	14,086	257	Japan 5,384; United Kingdom 4,196; Australia 740.
Diamond:				
Gem, not set or strung value, thousands	$69,415	$45,824	$501	India $14,477; Israel $13,879; Belgium-Luxembourg $11,277.
Industrial do	$4,579	$3,509	$49	Israel $1,270; Belgium-Luxembourg $1,038; China $437.
Diatomite and other infusorial earth	619	555	307	Japan 122; Philippines 101.
Feldspar, fluorspar, related materials	8,312	5,550	--	India 2,619; China 1,575; Thailand 666.
Fertilizer materials: Manufactured:				
Ammonia	437	391	78	Malaysia 126; Netherlands 46; Japan 45.
Nitrogenous	52,169	142,635	27	U.S.S.R. 88,951; West Germany 22,599; Netherlands 10,750.
Phosphatic	36,977	48	--	Netherlands 36.
Potassic	307,627	257,315	10,500	Canada 192,690; Israel 26,387; West Germany 21,571.
Unspecified and mixed	139,747	71,192	127	West Germany 50,946; Belgium-Luxembourg 12,320; Malaysia 6,376.
Graphite, natural	572	554	--	China 290; West Germany 110; India 50.
Gypsum and plaster	76,910	83,527	26	Australia 51,351; Japan 21,568; Thailand 9,625.
Halogens:				
Bromine and fluorine value	$38,763	$13,253	NA	NA.
Iodine do	$28,956	$50,173	--	Japan $31,240; West Germany $13,253.
Lime	16,453	13,733	--	China 5,572; Malaysia 5,342; Thailand 1,869.
Magnesium compounds: Magnesite	638	431	34	Norway 240; West Germany 89.
Mica, all forms	1,455	1,275	181	India 613; China 405.
Phosphates, crude	20,393	20,250	--	Christmas Island 18,250; India 797.
Pigments, mineral:				
Natural, crude	--	57	--	Japan 43.
Iron oxides and hydroxides, processed	2,422	3,141	153	West Germany 1,118; Japan 815; China 733.
Precious and semiprecious stones other than diamond:				
Natural value, thousands	$26,775	$26,784	$32	Kenya $20,992; Colombia $1,029; Sri Lanka $1,028.
Synthetic do	$217	$226	--	Japan $155; Thailand $46.
Salt and brine	48,064	41,477	--	Thailand 25,887; Australia 9,515; Israel 3,065.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	482	587	56	Japan 123; Hong Kong 113; Spain 108.
Sodium carbonate, natural and manufactured	28,675	23,433	--	Kenya 18,300; Romania 2,230; East Germany 999.
Sodium hydroxide	30,392	20,696	6,151	East Germany 4,405; China 3,750; West Germany 1,801.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	3,099	3,050	--	Malaysia 2,025; Italy 190; Pakistan 170.
Worked	15,972	19,879	94	Italy 10,264; China 5,344; Taiwan 1,337.
Dolomite, chiefly refractory-grade	2,348	2,763	--	Thailand 2,250; Malaysia 476.

See footnotes at end of table.

SRI LANKA[27]

Sri Lanka's major mineral assets were titanium-bearing beach sands, graphite, gem stones, and the fertilizer mineral apatite. Mica, feldspar, limestone, and several types of clays were produced for domestic consumption. All mineral fuels were imported in 1982. Imported crude oil was refined at Sapugaskanda near Colombo.

Exports of mineral commodities were not an important factor in the economy, generally accounting for 3% to 4% of total value. Titanium minerals, gem stones, graphite, and surplus refinery products account for most of the value. The new fertilizer plant now consumes the naphtha output that had been a major surplus item.

Economic conditions declined somewhat in 1982. There was still a large budget and trade deficit. Real GDP increased less than that of 1981. The industrial output, which suffered from electric power shortages and a shutdown at the oil refinery in 1981, began moving forward again in the first half of 1982. The inflation rate apparently fell to between 10% and 15% in 1982 compared with 18% in 1981 and 26% in 1980.

COMMODITY REVIEW

Nonmetals.—*Cement.*—The country's construction industry was getting a considerable boost with the addition of two new cement kilns at the Sri Lanka Cement Corp. Kankesanturai facility on the northern tip of the island. The kilns will be 4.6 by 70 meters, and each will produce 1,600 tons per day of clinker. The kilns reportedly will be coal fired and save considerably over the cost of oil-fired units. At least one kiln was scheduled for firing in January 1983. The existing equipment at Kankesanturai dates back to 1950, and it was not known if the new units will replace or supplement the older plant.

Fertilizer Materials.—Agrico Chemicals Co. of the United States and the Government-owned State Mining and Mineral Development Corp. have signed a joint-venture agreement to establish a project for apatite mining and the construction of a phosphoric acid, diammonium phosphate, and triple superphosphate complex. The new company was named Eppawala Phosphate Private Ltd. and will mine a planned 600,000 tons per year of apatite from the 25-million-ton Eppawala deposit 190 kilometers north of Colombo. The fertilizer plant will probably be located at Trincomalee on the east coast. Estimated project cost is $350 million.

Gem Stones.—Sri Lanka has been a major gem stone and jewelry producer since before the Christian era. Two of its famous sapphires are the inappropriately named 466-carat "Star of India" and the 400-carat "Blue Belle of Asia" now in the Royal British Crown. A more recently discovered 1,082-carat sapphire will be added to the British Crown. Aquamarine, garnet, cat's eye, amethyst, moonstone, alexandrite, and 10 other types are also produced in quantity. Only diamond, emerald, and opal of the common gem stones are not produced in Sri Lanka.

The Government granted concession areas for mechanized mining to several local and foreign companies in 1981. It wanted to salvage some value from potential gem stone-rich areas that were to be flooded when the large Mahaweli irrigation project was completed. The mining reportedly was not successful as three of the companies pulled out of the operation in 1982 and another was only able to find a small amount of semiprecious stones. Two more firms apparently decided against starting operations at all. The Government had hoped to make a considerable amount of revenue from the gemming areas before they were permanently covered by waters of the reservoirs.

Graphite.—Sri Lanka was a major producer of natural graphite and exported high-quality material for use in lubricants. Production has been decreasing over the last several years, so a program will be implemented to increase production threefold. The industry is to be modernized with an expenditure of $29 million. The Asian Development Bank will be providing $20.7 million. The project will consist of rehabilitation and expansion of operating mines, redevelopment of some abandoned mines, systematic exploration and evaluation of graphite potential, strengthening of the State Mining and Mineral Development Corp. institutional structure, and upgrading of physical facilities.

Mineral Fuels.—*Petroleum.*—Sri Lanka produced no oil or gas during 1982. Its one refinery uses imported crude oil to supply most of the needs of the country but at a high cost in foreign exchange. Ceylon Petroleum Corp. (CPC), the Government-owned oil company, controls the petroleum sector and leases offshore blocks to several overseas companies. Gravity, magnetic, and seismic surveys were done by several compa-

nies during 1981-82.

A new production-sharing contract was signed between CPC and South East Asia Oil & Gas Co. covering blocks 6 and 7 off the country's south coast. The company will spend $5 million to conduct geological studies and seismic surveys on the blocks and is committed to drill one wildcat well.

VIETNAM[27]

Vietnam produced small amounts of a number of minerals, the most important of which were coal, phosphate rock, tin, chromite, hydraulic cement, and clays. It also had its first full year of economically significant production of natural gas.

Mineral exports were not of much significance to the Vietnamese economy. Coal, chromite, and tin were the most valuable. In past years, phosphate rock was an important export item. Since the border hostilities in 1979, production has been greatly reduced and exports have either been stopped altogether or reduced to insignificance.

In 1982, the economy as a whole seemed to be making a recovery from 2 years of serious problems. A record food-grain harvest was the biggest factor, 8% over that of 1981 and a 13% increase over the 1980 crop. The situation in the industrial sector, however, was not so favorable and there was very little comment in the press about achievements in the mineral industry during 1982.

The Government's major priorities in 1982-85 were to be in the agricultural sector, followed by consumer goods and increased overall exports.

The mineral sector's main problems lay not in lack of resources but in a shortage of competent managers and technical staff, woefully inadequate maintenance and spare parts facilities, and an overall transportation system that appeared to be deteriorating rather than improving. Added to the above problems was an electric power sector that, while making excellent increases in power capacity and generation, still cannot keep up with an even faster increase in demand for power from the agricultural and industrial sectors.

COMMODITY REVIEW

Metals.—*Tin.*—Vietnam's small tin industry has been under expansion with Soviet aid for several years. The Government has reported finding "a number of new, rather large deposits"[28] in recent years. One new mine began operation in 1982 at Khuon Phay in Ha Tuyen Province. This was referred to as the tin processing plant. This almost certainly refers to a cassiterite ore concentration plant. The mine was designed to produce 300,000 cubic meters of ore per year. Another mine in the same Son Duong mining area, Bac Lung, was still under development. Also starting operation sometime after mid-1981 was the expanded section of the Tinh Tuc tin mine in Cao Bang Province. If the omnipresent problems with equipment maintenance and transportation can be kept to an acceptable level, the opening of these two projects will mean a substantial increase in Vietnam's tin output.

Nonmetals.—*Cement.*—Vietnam has been constructing major new cement plants in an all-out effort to increase output to meet demand and possibly leave some surplus for export. The project has gone slowly and all of the new construction was behind original schedules. Three large rotary kiln plants are under construction. All were being aided by overseas interests.

Furtherest along was the Bim Son plant about 100 kilometers south of Hanoi near the coast. This was a Soviet-aided project and a showpiece of Soviet-Vietnamese cooperation. One 600,000-ton-per-year kiln was completed in late 1981 after 46 months of construction. The second, similar production line was rescheduled at that time for a November 1982 completion. Construction continued at a slow pace and the November date was not met. In December, the Vietnamese press stated that the second kiln was expected to be completed at the end of 1983, bringing the total capacity to 1.2 million tons per year.

The Hoang Thack plant between Hanoi and Haiphong has been under construction since 1978. The 1-million-ton-per-year plant was being constructed with Danish and Japanese aid. It too was well behind the originally scheduled 1980 completion date. June of 1983 was mentioned in the Danish press as the earliest possible completion date, and cost overruns were 60 million kroner by yearend 1982. Delayed deliveries; a shortage of managers and technicians; lack of fuel, electric power, and supplies; thefts; and damage to equipment have all contributed to the slow progress.

Despite the large reported capacity of the Vietnamese cement industry of 1.5 million tons per year, there were still serious production problems. Both the Haiphong and Ha-tien plants operated well below capacity. By the end of October 1982, the new Bim Son plant produced 160,000 tons of clinker from its 600,000-ton-per-year kiln. Conflicting Vietnamese press and radio reports throughout the year indicated that plant operation was not as smooth as would be expected from a new, high-capacity plant. One reason given was that the plant was still in the breaking-in-and-testing period. Other statements indicate the actual reasons are more likely a failure of the local raw material supply system, frequent electric power shortages and stoppages, and a transportation system unable to distribute the sudden increase in volume of material. With the Bim Son capacity being doubled and two more large plants due online in 1983-84, it is difficult to see much improvement in the short-term raw material and transportation situation. Production of cement is expected to increase at an impressive percentage, but the transport and distribution problems are likely to get worse before they improve over the long term. Shortages of cement, and, in particular, problems of distributing the material that is available, are expected to continue to adversely affect the construction industry and in turn be a major constraint to the entire industrial and agricultural development program.

Fertilizer Materials.—Vietnam produced both nitrogenous and phosphate fertilizers from domestic resources. The small Ha Bac nitrogenous fertilizer factory has had difficulty meeting its production goals for several years and has never operated at a normal capacity-utilization factor. During 1982, the problems were severe enough to be mentioned in the press, a rare occurrence in Vietnam. The output was apparently less than one-third design capacity at a time when agricultural output was receiving the highest Government priority.

The phosphate industry was a major source of foreign exchange earnings before the border hostilities in 1979. Since then, exports of apatite have totally stopped or dropped to an insignificant level. The small amount of production that has been restored from the Lao Cai apatite mine has gone to one of the superphosphate plants or to one of the dozens of small apatite grinding

plants around the country. Some of these small plants also have facilities to roast the ore, thereby increasing its effectiveness as a direct-application phosphate fertilizer.

Phosphate production targets were exceeded for 1982, and more than 200,000 tons of chemical fertilizers[29] was produced. The Lam Thao superphosphate plant has been under a Soviet-sponsored refurbishing and expansion program for several years. Most of the work was apparently completed during 1982, and a high party official ordered production of 400,000 tons of fertilizer per year. The original annual capacity was 200,000 tons, a production figure never reached.

Mineral Fuels.—*Coal.*—A 5th Party Congress resolution emphasized the importance of stepping up coal production in the 1981-85 plan period. The industry was to "strive to bring the 1985 coal production to 8 million to 9 million tons." The goal amounts to an admission of failure on the part of the Government to meet a previous target. As late as mid-1979, the Ministry of Power and Coal announced a goal of 10 million tons for 1980.

The need for increased coal output was greater than ever. As a domestically produced source of energy, it substituted for expensive imported petroleum. It was also a major export item and foreign exchange earner in previous years.

Production problems, however, seem to be increasing significantly. Several new mines have been developed and old ones rebuilt and modernized, and yet goals were not met. An apparent lack of worker incentive causes a high rate of turnover in the underground mines. With fewer experienced miners to teach the newcomers, working conditions become more difficult resulting in further turnover.

The extent and productivity of mechanical equipment in open pit mines was low in 1982 by Vietnamese standards and extremely low by world standards. Maintenance reportedly was not performed on a timely basis because of a critical shortage of skilled mechanics and spare parts. This in turn led to more frequent and serious equipment breakdowns and more extended periods of downtime.

Transportation problems, which were chronic throughout the country, added to the inefficiency in the coal sector. Coal was often stockpiled at the mines for lack of truck or railroad capacity. At yearend 1982, 1.4 million tons of coal was waiting to be moved from the minesites.

Government officials admitted serious management shortcomings, and plans were developed to remedy these and other problems.

The 1983 target for overburden removal was set at 27.5 million cubic meters, nearly double that of 1982. A goal of 5.2 million tons of coal was to be extracted from open pit mines in 1983, and a total of 6.5 million for overall coal production.

Mong Duong, a new coal mine, in Quang Minh Province northeast of Hanoi, began operating in late December. Built with Soviet aid, it will have an initial capacity of 450,000 tons per year.

Oil and Natural Gas.—The Soviet Union became Vietnam's exclusive partner for oil and gas development, following the withdrawal of the last Western oil company in 1981.

Vietnam began commercial natural gas production in Thai Binh Province in mid-1981. The gas fueled the first of five 17,000-kilowatt, gas-turbine-powered generator sets. The second unit was to be installed in 1982. Press reports also indicated that some oil has been located, but no details were available.

The first offshore well was planned for 1982 as part of the joint Soviet-Vietnamese venture. The surveying and preparation for drilling took longer than planned, and the drilling platform was believed to be still under construction at yearend. The Soviets were believed to be planning their drilling from fixed platforms that would be assembled at the petroleum support base at Vung Tau southeast of Ho Chih Minh City. The platforms will be towed out to sea and sunk over favorable geologic structures. Twelve wildcat and twenty experimental development holes will be drilled. Drilling could begin by mid-1983 if no problems are encountered with the platforms.

In 1974, before the end of the hostilities in Vietnam, subsidiaries of Shell Oil Co. and Mobil Oil Corp. each reported favorable oil strikes in their concession areas off the southeast coast. Either of these sites would be logical targets for the first Vietnamese drilling effort.

The Soviet Union was also helping in the construction of a permanent petroleum products pipeline between Vinh in Nghe Tinh Province and Vientiane, the capital of Laos. The pipeline will furnish an alternative supply route for Laos, which presently must get its petroleum imports through Thailand or via expensive tanker truck through Vietnam. Progress on the Viet-

namese section of the line during 1982 consisted of surveying and site preparation. The line will have a capacity of 2.3 million barrels per year. That amount could be moved in a standard 100-millimeter or 150-millimeter pipe depending on the pumping arrangements.

The Mineral Industry of Other Near East Countries

By Peter J. Clarke[1]

CONTENTS

AFGHANISTAN

Afghanistan's mineral industry continued to be dominated by the production and export of natural gas, although several mining and related industrial projects, all under the supervision of Soviet technicians, were in the planning stage in 1982. Afghanistan produced minor quantities of barite, cement, coal, fertilizer materials, iron, and lapis lazuli, all for domestic consumption.[2] Large-scale projects being investigated were a copper mine and concentrating plant at Ainak, extensive mining of the Hajigak iron ore deposit near Kabul, construction of an oil refinery at Angot, increasing production and processing of natural gas, and implementing an intensive geologic prospecting and exploration program for areas of mineral potential.

Afghanistan's gross domestic product (GDP) was estimated at $2.76 billion[3] and has remained stagnant for the past several years. Total exports in 1982 were estimated at $700 million, only a marginal increase from the 1981 figure of $694 million. Exports of natural gas to the U.S.S.R. earned $385 million in 1982, representing just over one-half of Afghanistan's total exports. Natural gas revenues were down approximately 11% from the 1981 level, owing primarily to increased antigovernment activity in the northern part of the country.[4] About 90% of the country's natural gas production was exported to the U.S.S.R.[5] About 38% of Afghanistan's development budget had been earmarked for mining and industrial projects in 1982.[6]

Soviet technical and financial assistance continued to be concentrated on expanding production and export capacity at the natural gasfields of Khawaga Gogerdak and Jarq-aduq located in southwestern Shibarghan Province in northern Afghanistan. Overall gas production capacity increased 65% with the start of commercial flow from the Jarq-aduq Field early in the year. Jarq-aduq is capable of producing close to 200 million cubic feet per day from four gas zones between 2,980 and and 8,270 meters in the Jurassic and Lower Cretaceous.

The field, with natural gas reserves estimated at 1 trillion cubic feet, is high in hydrogen sulfide and carbon dioxide. The Soviets have recently installed a desulfurization and processing plant to make the gas

suitable for industrial uses and for export. Most of the gas from Jarq-aduq was exported by pipeline to the U.S.S.R., but a significant quantity was thought to be delivered to the nitrogen fertilizer facility and powerplant at Mazar-i-Sharif, east of Shibarghan, through a spur gasline.

The Gogerdak Field, located 20 kilometers from Jarq-aduq, has been producing gas since the mid-1960's. Reserves were estimated at 1.45 trillion cubic feet, 800 billion cubic feet of sweet gas from an upper horizon, and 650 billion cubic feet of sour gas from a lower horizon. The export pipeline, a 100-kilometer-long, 81-centimeter-diameter pipe, runs from Gogerdak across the Amu Darya River into the U.S.S.R. A new compressor station was scheduled to be built to accommodate increased gas supplies from Jarq-aduq.[7]

Although Afghanistan does have documented reserves of petroleum totaling 70 million barrels according to a 1978 International Bank for Reconstruction and Development (World Bank) study, no crude oil has been produced in the country. Recent reports of a planned oil refinery at Angot, site of a known petroleum concession, may indicate the beginning of crude oil production.[8] Afghanistan has received its domestic requirement of petroleum products from the U.S.S.R.

Afghanistan's second most important energy resource was coal. Production of coal from the Karkar, Ishpushta, and Darra-i-Suf Mines totaled approximately 60,000 tons in 1982. The Karkar and Ishpushta Mines, the country's oldest, were located in northern Afghanistan, near Pul-i-Khumri and Doab, respectively. Most of the country's production came from the Darra-i-Suf Mine, located 160 kilometers south of Mazar-i-Sharif. The Darra-i-Suf Mine contains 60 million tons of good-quality coal, some of which is suitable for coking. Coal production has rebounded considerably from the immediate postinvasion period but remains below the pre-1978 average.

The largest nonfuel mineral project being planned was the $600 million copper mine and smelter to be located at Ainak, south of Kabul in Logar Province. The Ainak deposit contained approximately 280 million tons of 0.7% to 1.5% copper ore. Machinoexport of the U.S.S.R. was doing preliminary infrastructure work in 1982 for possible commercial production in 1985. The mine and mill was planned to produce 114,000 tons of copper concentrates annually. A smelter was reportedly under construction near Kabul, along with a 17-kilometer road linking the smelter to the mines at Ainak.[9]

Also planned for possible exploitation on a large scale in 1982 was the Hajigak iron ore deposit in the Hindu Kush Mountains, 100 kilometers northwest of Kabul. The deposit contains an estimated 1.7 billion tons of mixed hematite and magnetite iron ore grading 62% iron. A 1977 independent survey concluded that the deposit was large enough and of a sufficient grade to support a major iron and steel industry, although no specific plans to develop the deposit have been put forward by the Afghan authorities.[10] Other minerals being produced on a small scale include cement, barite, marble, fertilizer materials, and semiprecious stones. Production of cement totaled about 120,000 tons in 1982, most of which was produced at the Ghori cement factory. Other plants operating in the country were the Jabel Saraj plant, and a newly completed 210,000-ton-per-year plant in Harat. Capacities at Ghori and Jabel Saraj were 120,000 tons per year and 30,000 tons per year, respectively.

The Sangilyan barite mine, located 65 kilometers northwest of Harat, produced a small quantity of barite. Barite production averaged about 12,000 tons per year in the 2 years prior to the Soviet invasion. The measured and indicated ore reserves of the deposit were 867,000 tons averaging 87.5% $BaSO_4$. Inferred reserves were 310,000 tons containing 81% $BaSO_4$. A recently completed mine road to Harat indicates possible expansion of the mine over the next several years, especially as Afghan oil and gas drilling and exploration increases.

Precious and semiprecious stones were at one time a major industry in Afghanistan, as the country produced 80% of the world's supply of lapis lazuli. Production of this sodalite group mineral from Sare-Sang, a remote area in the high ranges of the Hindu Kush Mountains, has dropped to near zero since the Soviet invasion, although small unreported quantities were possibly being produced.

Other minerals that were produced prior to the Soviet invasion, for which a current status was unavailable, include asbestos, gypsum, rock salt, and talc. Mineral deposits that have been investigated and may hold potential for future development include the Logar Valley chromite deposits, the Bibi Guahar area lead-zinc deposits, the Zarkashan gold deposit, and the Pansher emerald occurrences, along with smaller deposits of fluorspar, magnesite, sulfur, and uranium.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Sept. 1, 1983.

[2]In addition to the commodities listed, a variety of other crude construction materials (clays, stone, and sand and gravel) presumably are produced, but output is not reported quantitatively, and available information is inadequate to make reliable estimates of output levels.

[3]Reported figure.

[4]Diesel oil only.

BAHRAIN

Bahrain's primary petroleum production and processing industry did not fare well in 1982 as output of domestically produced crude oil declined 5% and refinery output declined 25% from their respective 1981 levels. The decline in production and prices for crude and refined petroleum led to a substantial drop in Bahrain's export revenues, from $3.89 billion in 1981 to $3.15 billion in the current year.[11] Petroleum revenues accounted for 87% of the country's total foreign exchange receipts and about 70% of the GDP, estimated at $5.7 billion.

Despite the downturn in the petroleum sector, the Bahraini Government continued to move forward with plans to diversify the financial and industrial base of the country. Among the projects planned to lead Bahrain into a post-oil economy were an expanded aluminum industry, a major iron ore pelletizing plant, and a heavy oil hydrocracking plant. Also expected to be an economic boost in the latter half of the decade was the Saudi-Bahrain Causeway, under construction in 1982, which will link Saudi Arabia and Bahrain by 1986, providing new markets and cheaper transportation for the island nation's inhabitants.

Bahrain's economy has weathered the soft oil market considerably better than some of its Arabian Gulf neighbors. Bahrain's oil income is derived from exporting its domestically produced crude oil and refined products, and also from crude oil exported from the Abu Sa'fah Field, located offshore north of Bahrain. Abu Sa'fah is owned and operated by Saudi Arabia's Petroleum and Minerals Organization (Petromin), but revenues from the field are divided evenly between Bahrain and Saudi Arabia. Revenues from oil and other sources are disbursed according to rigid biennial budgets, which conform to a 6-year development program. This program was stretched from 4 to 6 years in 1982 because of the limited capital absorptive capacity of the economy. Of the $580 million budgeted expenditure for 1982, only $435 million was actually spent, leaving the country with an adequate cushion to protect against further revenue declines.

Production of crude oil from Bahrain's only oilfield, the onshore Awali Field, declined from 46,300 barrels per day in 1980 to 44,000 barrels per day in 1982. Awali production, which began in June 1932, peaked at 77,000 barrels per day in 1977 and has declined rapidly since then. Remaining recoverable reserves in the field were estimated at 430 million barrels, and at the current rate of production, would be exhausted in 25 years. In an attempt to stem the tide of declining oil production, the Bahrain National Oil Co. (Banoco), owned by the Government, was planning to conduct an offshore exploratory drilling program, scheduled to begin early in 1983. The drilling was to be based on the result of a $14 million offshore seismic survey that covered 5,764 square kilometers. The survey, which also covered Kuwait offshore territorial waters, was completed in 1982 and was conducted by Western Geophysical Co. of the United States under a contract awarded by Banoco and the Kuwait Oil Co. in January 1981.

In January 1982, Banoco formally assumed full responsibility for management and operation of all oil production facilities as well as offshore exploration and development. These duties had previously been shared with the Bahrain Petroleum Co. Ltd. (BAPCO), a subsidiary of California-Texas Petroleum Corp. (Caltex), owned jointly by the Standard Oil Co. of California and Texaco Inc., both of the United States. Caltex was responsible for developing the oil industry in Bahrain in the early 1930's and has since cooperated in the orderly transfer of ownership of most of the industry to the Bahraini Government. Caltex's primary remaining asset in the country was a 40% share in the Bahrain Petroleum Co. BSC (BAPCO BSC), which operated the 250,000-barrel-per-day Sitra refinery, Bahrain's only refinery. The remaining 60% share was held by the Government. Output from the refinery averaged 198,200 barrels per day in 1982, down 25% from the previous year's level. Bahrain's domestic crude oil production, even at its peak, could only supply 30% of the refinery's capacity. For the past several years, Bahrain has imported an average of 200,000 barrels per day of Arabian light crude from Saudi Arabia. Part of this supply comes from the Abu Sa'fah Field, which produced about 70,000 barrels per day in 1982, well below its 120,000-barrel-per-day capacity. A total of 54,868,480 barrels of Saudi crude was processed at Sitra during the year, along with 16,039,300 barrels of Bahraini oil and

1,140,300 barrels of other stocks. Refinery output was reduced considerably owing to weakened demand for petroleum products worldwide, and also owing to the high cost of importing Saudi crude, which remained at the $34 per barrel mark throughout the year. Only about 3% of the refinery's full capacity is consumed in Bahrain, with the remaining 97% available for export.

Nearing completion at the Sitra refinery was a $29 million light isomate production unit, designed to convert low-value fuel oil feedstock into lighter and higher value diesel oil. Ralph M. Parsons Co. of the United States was handling construction of the unit, which was to be completed by March 1983.

Bahrain's largest refining project, the Heavy Oil Conversion Co. (HOCC), was in the feasibility study stage in 1982. The company was a joint venture of Banoco (40%), the Kuwait National Petroleum Co. (30%), and Saudi Arabia's Petromin (30%). The $1 billion hydrocracking facility was to convert heavy fuel oil feedstock into lighter products such as naphtha, kerosine, diesel fuel, and jet fuel. The heavy oil feedstock was to be supplied from refineries in Bahrain, Kuwait, and Saudi Arabia. HOCC was formed in December 1981, and in July 1982, a $400,000 contract for the feasibility study was signed with C. E. Lummus of the United States.

A second petroleum related project was under construction in 1982: the Gulf Petrochemical Industries Co. (GPIC) methanol and ammonia plant at Sitra, located adjacent to the refinery. The project, an evenly shared joint venture of Bahrain, Saudi Arabia, and Kuwait, was expected to produce 1,000 tons per day of ammonia and 1,000 tons per day of methanol utilizing natural gas feedstock. Uhde GmbH of the Federal Republic of Germany was contracted to supply engineering services and process technology, and Snamprogetti S.p.A. of Italy was awarded the $80 million construction contract for the facility. The plant was scheduled to go onstream in 1984.

Production and use of natural gas increased an average of 12% from the 1981 level, as the Bahrain Government continued to focus on gas as its energy resource of the future. With associated gas production falling in line with the steady drop in crude oil output, exploration and development of nonassociated gas from the Permian Khuff Formation led to an overall rise in gas output in 1982. During the year, Banoco had 11 operating gas wells in the Khuff zone producing a total of about 337 million cubic feet per day. With two major gas-based industries scheduled to come onstream within the decade; GPIC's ammonia-methanol plant, and the Arab Iron and Steel Co.'s (AISCO) iron ore pelletizing plant, total gas demand was expected to reach 1.2 billion cubic feet per day by 1990. To cope with the increase, Banoco awarded a $4 million contract to Compagnie Générale de Geophysique of France for deep seismic surveys into and below the Khuff zone. Sante Fe International, a subsidiary of the Kuwait National Petroleum Corp., was also contracted to drill six wells into or beneath the Khuff zone for development and testing purposes. The wells were to go as deep as 6,450 meters. Drilling under the $8 million contract was to be completed by late 1983.

Bahrain's estimated gas consumption by use was as follows, with capacity expressed in million cubic feet per day:[12]

Consumer	Consumption	
	Average	Peak
Electricity production	365	643
Oilfield uses	195	195
Aluminum Bahrain	165	170
Petroleum refining	105	113
Gulf Petrochemical Industries Co.	80	80
Arab Iron and Steel Co. (committed)	25	34
Other	65	65
Total	1,000	1,300

Most of Bahrain's current output of associated gas is utilized in the Bahrain National Gas Co.'s (Banagas) natural gas liquids (NGL) processing plant at Jabal. The plant, which began exporting NGL in 1980, was capable of producing 80,000 tons per year of propane, 79,000 tons per year of butane, and 125,000 tons per year of naphtha. Production was near capacity in 1982. In addition to producing NGL for export, tail gas or lean residue gas from the plant was pipelined to the Aluminum Bahrain (ALBA) smelter, where it supplied 80% of the plant's energy requirements. The remaining 20% was supplied by nonassociated Khuff gas. Caltex was responsible for overseas sales of NGL, while Banoco handled domestic distribution. Banagas was a joint venture of Banoco (75%), Caltex (12.5%), and the Arab Petroleum Investments Corp. (12.5%).

Aluminum production from ALBA reached its highest level ever in 1982, following completion of a $120 million expansion

project in 1981, raising capacity from 125,000 to 170,000 tons per year through the addition of a fifth and sixth potline. ALBA was owned 57.9% by the Bahraini Government, 20% by Saudi Arabia, 17% by Kaiser Aluminum Bahrain of the United States, and 5.1% by Breton Investments of the United Kingdom.

In contrast to the record output of ALBA, the Bahrain Aluminum Co. (BALCO), the joint Bahraini-Saudi marketing company for ALBA, posted an estimated $30 million loss in 1982 owing to the weak aluminum market and low prices. ALBA reportedly was maintaining a stockpile of unsold production totaling over 80,000 tons.

Breton and Kaiser, the minority shareholders in ALBA, were responsible for marketing their share of the output, while BALCO handled international sales for the two Governments. Some of this output was delivered to the Bahrain Aluminum Extrusion Co., owned by the Bahraini Government, while a substantial portion was sold to two Arabian Gulf cable manufacturers. Midal Cables, a private Bahraini-based company, produces aluminum rod from hot metal fed directly from the smelter. In 1982, 29% of Midal's stock was purchased by the Saudi Cable Co. of Saudi Arabia, which purchases the rod from Midal for conversion to aluminum wires and cables.

The largest venture to be planned around ALBA was the Gulf Aluminum Rolling Mill Co., a project of the Gulf Cooperation Council (GCC), composed of Bahrain, Kuwait, Saudi Arabia, and Iraq (20% each), and Oman and Qatar (10% each). The project was intended to produce 40,000 tons of rolled and semifinished aluminum products, mainly for the regional market. Bids on the $100 million project were being submitted in 1982, and the contract was to be awarded in 1983. Kaiser Engineers and Contractors of the United States were the project consultants.

Site preparation was completed and initial construction work began on AISCO's 4-million-ton-per-year iron ore pelletizing plant being built on reclaimed land adjacent to the Arab Shipbuilding and Repair Yard. Kobe Steel Ltd. of Japan was awarded the primary $204 million turnkey contract for construction of the pellet plant and associated facilities, which include a 100-megawatt powerplant, a 3,000-cubic-meter-per-day desalinization plant, and a 485-meter-long jetty for unloading ore and loading pellets for export. The plant was designed to produce pellets for the gulf's three major direct-reduction-based steelworks at Jubail in Saudi Arabia, Iraq, and Qatar. Insufficient committments from these steelmakers, however, has led Bahrain to consider constructing a 2-million-ton-per-year direct-reduction plant of its own to utilize a large portion of the available pellets. Plans for Bahrain's direct-reduction plant remained tentative, however, for fear of creating a dispute with Saudi Arabia, whose as yet unfinished 800,000-ton-per-year steelworks at Jubail was less than 50 kilometers away.[13] The pellet plant was scheduled for completion in 1984.

LEBANON

Lebanon's mineral industry, which consisted of the production of refined petroleum products, cement, lime, gypsum, salt, and semimanufactured steel products, continued to be disrupted by the political uncertainty and military activity in the country in 1982. Substantial efforts were made toward the end of the year by the Lebanese and the Israelis to repair and reopen some of the industries, notably the two petroleum refineries at Zahrani and Tripoli.

Lebanon's economy, noted for its resilience, appeared capable of sustaining a small recovery early in the year as industrial exports in the first quarter increased 9.6% over the same period in 1981. The outbreak of war in midyear brought the recovery to a halt, however, as most of the country's revenue sources dried up. Customs receipts, which previously had provided close to 50% of the Government's revenues, declined 7.5% to $108 million[14] from the already depressed 1981 level, representing the worst performance in over 5 years. The Beirut Chamber of Commerce and Industry estimated that the loss of export revenues due to the war amounted to $340 million during the year. Total exports in 1982 were estimated at $820 million, down 37% from the 1981 level.[15] Exports consisted mainly of construction materials, agricultural products, chemicals and textiles, and

were directed toward regional markets. Lebanon's leading trading partners in 1982 were Saudi Arabia and Iraq; the Saudi position was maintained because of its petroleum supply contract for Lebanon's petroleum refineries.

Lebanon's two petroleum refineries, the Mediterranean Refining Co.'s (Medreco) refinery in Zahrani, near Sidon, and the Government-owned Tripoli refinery in northern Lebanon, were both affected by supply disruptions and equipment damage, and operated only intermittently. The 17,000-barrel-per-day Medreco refinery, owned 50% by Mobil Oil Corp. and 50% by Caltex, both of the United States, sustained the worst war damage, which destroyed the pipelines, pumps, and storage tanks around the plant. The core of the refinery, the cracking unit, reportedly remained intact.[16] The refinery operated for a few months early in the year, then was closed from June to November owing to the damage, but resumed operations late in November, albeit at a reduced rate. The refinery, which previously supplied 30% to 40% of the country's domestic requirements, had been receiving its crude oil feedstock from Saudi Arabia via the Trans Arabian Pipeline Co. (TAPline), but the flow was stopped in June owing to damage to the line. The refinery was able to resume operations in November when 50,000 barrels of Saudi crude was delivered via tanker. TAPline, which did not resume operations in 1982, decided that it would permanently discontinue its operations in Lebanon, including deliveries to the refinery and exports from the Zahrani terminal on the Mediterranean coast, effective March 1983. TAPline losses, estimated at $250 million since 1975, resulted in the decision to close the 1,200-kilometer, 500,000-barrel-per-day line running from Saudi Arabia's Eastern Province to Zahrani. Closure of the line would result in the dismissal of 110 TAPline personnel in Lebanon.

The Tripoli refinery, located north of Beirut and away from the center of the conflict, was able to operate with only limited interruptions in 1982. Crude oil feedstock had been supplied by TAPline and then transported via tanker to Tripoli, but closure of TAPline nearly coincided with the reopening of the Iraq Petroleum Co. (IPC) pipeline from Kirkuk, Iraq, through Baniyas, Syria, to Tripoli. The Tripoli spur of the line reopened late in 1981, but was also subject to intermittent sabotage during the year. The IPC pipeline's maximum capacity was 400,000 barrels per day, but 1982 throughput averaged about 50% of the design capacity. The Tripoli refinery had a capacity of 35,000 barrels per day, which supplied about 60% of the domestic requirement. Because of the shortfall in output from the Zahrani refinery, the Lebanese Government was forced to import a significant quantity of petroleum products, incurring a large deficit in the public budget.

Lebanon's nonfuel mineral sector, while not escaping damage entirely, did fare somewhat better than the petroleum industry. Lebanon's three cement plants; the Société des Ciments Libanais, Cimenterie Nationale S.A.L., and Société Libanais des Ciments Blanc, were all located in Chekka, north of Beirut. Capacity of the plants was 1.8 million tons per year, 1 million tons per year, and 160,000 tons per year, respectively. Gypsum and limestone for the plants were quarried domestically. Lebanon also had three operating steel plants, the largest of which was Consolidated Steel Lebanon S.A.L. in Bablos-Amchit, which had an annual capacity of 180,000 tons of reinforcing bars and 60,000 tons of steel sections. In Tripoli, the Lebanon Steel Mill Co. operated a 100,000-ton-per-year electric arc furnace and mill that produced reinforcing bars, and Société Nationale des Tubes S.A.L. produced a limited quantity of galvanized pipe. Steel production in Lebanon was below 50% of national capacity. In addition to those products, small quantities of salt, lime, and other natural crude construction materials were also produced.

OMAN

Despite a sharp decline in petroleum revenues, Oman's heavily oil-based economy continued to grow, although at a considerably more modest rate than in the previous 2 years. Highlights in the petroleum and mineral sector included the commissioning of the Sohar copper mine and smelter and the opening of Oman's first oil refinery at Mina-al-Fahal.

New oil discoveries in southern Oman reversed a 4-year declining production trend in 1981 and 1982. However, petroleum revenues shrunk from $4.42 billion in 1981 to about $3.91 billion in 1982.[17]

Oman is in the second year of its second 5-year development plan. The $21.5 billion plan, drawn up in 1980, projected 5% annual oil price increases through 1985. The drop in spot market oil prices from $40 per barrel in 1980 to below $34 per barrel in 1982 resulted in several project postponements and a general scaling back of development expenditures. Even with total revenues declining, petroleum generated 90% of the total export revenues and 68% of the 1982 GDP, estimated at $5.9 billion. One of Oman's largest development projects, the Sohar copper project, came onstream providing both a new source of income and the beginning of a nonoil industrial base for the country.

Crude oil production in Oman increased slightly more than 2%, to an average of 335,884 barrels per day, although output ranged from a high of near 360,000 barrels per day to under 320,000 barrels per day during the year. Petroleum Development Oman (PDO), owned 60% by the Government, 34% by the Royal Dutch/Shell Group of the Netherlands, 4% by Compagnie Française des Petroles (CFP)-Total of France, and 2% by Participations and Explorations Corp. (Partex) of Portugal, was the dominant producer, responsible for 96% of the country's output. Société National Elf-Aquitaine (SNEA) of France, became Oman's second oil-producing company when it brought its Sahmah Field, located in the Butabul concession in western Oman, onstream in November 1980. Production from Sahmah averaged 11,389 barrels per day in 1982. PDO's concession covers roughly one-half of the country, running northeast-southwest, and encompasses every producing field except Sahmah. PDO's major fields in the northern region were Yiba, Fahud, Natih, Saih Nihayda, and Qarn-Alam, all of which produce between 30° and 40° gravity light crude. In southern Oman, in Dhofar Province, production from PDO's Marmul and Qaharie Fields was supplemented by output from the Rahab and Qatar Fields, both of which came onstream in 1981, and the Birba and Rima Fields, which were brought into production in 1982. The Rima Field, located 140 kilometers northeast of the Marmul Field, began producing 3,000 barrels per day in October and rose to 13,000 barrels per day by yearend. Rima crude, at 33° to 35° API gravity, is considerably lighter than the average 25° to 28° API oil traditionally produced in the southern Dhofar fields. Rima's output was expected to reach 45,000 barrels per day in 1983, bringing the Dhofar Province fields total contribution close to 50% of PDO's total output. The Jalmud Field, located 20 to 30 kilometers northeast of Rima, was also scheduled to come onstream in 1983, further raising PDO's production. Total recoverable crude oil reserves in Oman were increased again in 1982, to 2.9 billion barrels.

Crude oil production from the southern fields was transported into the northern network by a 455-kilometer, 18-inch pipeline running from Marmul to Qarn-Alam. This line then links the northern fields to the main pipeline running from Qarn-Alam to Shibkah to the export terminal at Mina-al-Fahal. Additional lines from Lekhwair, Yibal, and Fahal join the main line at Shibkah. The 400-kilometer segment to Mina-al-Fahal was being looped to handle the increased production, and new lines were under construction linking Fahal to the main terminal. A gas pipeline, linking natural gasfields and the gathering center at Yibal to the coast and then north to the copper mine at Sohar was completed.

Exploration activity has also picked up in Oman, a result of the recent successes of PDO and SNEA in their own prospecting efforts. Most of the country is being actively explored by several international companies and consortia. For PDO, exploration activity continued in southern Oman, while the Government evaluated the feasibility of using enhanced oil recovery techniques to raise an estimated 6 billion barrels of heavy oil discovered in central and southern Oman. At Qarn-Alam and Marmul, pilot projects using hot water injection were planned to raise some of the heavy oil from these two older fields that have been depleted of lighter crude. Although the projects were not scheduled to begin operating until the mid-1980's, secondary and tertiary recovery methods held the potential to extend Oman's recoverable crude oil reserves.

Oman's first oil refinery, the Oman Refinery Co.'s 50,000-barrel-per-day grass roots facility, was brought onstream in November 1982. The refinery was built by Mitsui Engineering and Shipbuilding Co. under a $112 million contract. Ashland Oil Co. of the United States was awarded the management contract for the refinery in June under the direct supervision of the Ministry of Petroleum and Minerals. Output from the refinery was expected to meet domestic demand and relieve the need to import all

of the country's petroleum products. The Oman Refinery Co. was owned 99% by the Ministry of Petroleum and 1% by the Central Bank. The GCC also recommended that a feasibility study be conducted on the possibility of constructing a joint venture export-oriented petroleum refinery and lube oil blending plant in Oman.

Natural gas was becoming an important source of energy in Oman. Production topped 500 million cubic feet per day, 75% of which was associated gas with the remainder being nonassociated gas. PDO was the primary supplier from its oilfields, while nonassociated gas was derived primarily from the Yibal Field. Of the country's total gas production, 187 million cubic feet per day was used for oilfield pressurization and gas lift, 32 million cubic feet per day was consumed directly as fuel for Government power generators and the desalinization plant, 30 million cubic feet per day was delivered to the Government gas system pipeline, and 42 million cubic feet per day was consumed in the production of NGL. The remaining production was flared. The Government's Yibal NGL plant was the only gas-processing plant in Oman. It produced about 2,000 barrels per day of natural gasoline, which was added to PDO's crude oil production to increase its API gravity; 15,000 barrels per day of propane, which is sold domestically; and 125,000 barrels per day of butane, which was sold to the Oman National Gas Co. for bottling and retail sales.

Startup of the Oman Mining Co.'s Sohar copper complex began at the close of 1982. The Oman Mining Co. L.L.C. (OMC) became a 100% Government-owned company in 1981 when the final 25% share of OMC was purchased from Marshall Oman Exploration Ltd. of the United States, the original joint venture partner. OMC is a fully integrated mine, mill, concentrator, smelter, and refinery operation. The copper deposits at Sohar, discovered in 1973, occur as massive pyrite and chalcopyrite in the Semail nappe of the Oman ophiolite sequence. Measured Sohar copper reserves, at the Lasail, Aarja, and Bayda ore bodies, were 8 million, 3 million, and 1 million tons, respectively, containing an average of 2.1% copper. Underground mining, utilizing sublevel caving techniques, began at Lasail and Bayda in 1982, and at full production will reach 2,500 tons per day from Lasail and 1,000 tons per day from Bayda. Production from Aarja will begin when reserves at Bayda are depleted.

Run-of-mine ore is fed to a jaw crusher and then to a concentrator utilizing autogenous grinding and seawater flotation. The concentrator can process 3,000 tons per day of ore and produce 250 tons per day of 24% copper concentrates. The concentrates are pelletized, dried, mixed with a flux and fed to a 7-megavolt ampere electric furnace, and then successively air and gas blown to produce a 99.7% grade blister copper. The copper is cast into anodes utilizing the Outokumpu continuous casting wheel.

The anodes are then transferred to the electrolytic refinery, where copper cathodes of 99.97% purity are produced. Annual cathode production was expected to reach 20,000 tons per year when full capacity is reached in 1984. Power for the plant is supplied by three 18-megawatt industrial gas turbines. Gas for the turbines is supplied by the Ministry of Petroleum via a 227-kilometer, 40-centimeter-diameter pipeline from the Government's gas network to the west. Output from OMC was intended for regional use, possibly by the Jeddah-based Saudi Cable.

Mineral resources in the Oman Mountains were not limited to copper. The Omani Government has also decided to begin producing chromite on a commercial scale. Small-scale extraction of chromite has been taking place near Ramji, and lump ore was being stockpiled at the Majis jetty, 17 kilometers north of Sohar from where copper and chromite will eventually be exported. Reserves were estimated at 5 to 10 million tons of podiform chromite in scattered deposits.

QATAR

Qatar experienced a substantial 18% decrease in crude oil output, a temporary shortage of natural gas, and a considerable drop in petroleum derived revenues, from $5.29 billion in 1981 to an estimated $3.98 billion in 1982.[18] Qatar, however, looked hopefully toward the future development of its giant offshore North Field nonassociated gas deposit. Natural gas reserve estimates for the field range from a conservative 110 trillion cubic feet, to a possible 330 trillion cubic feet, making it among the six largest gasfields ever discovered. While the North Field assured Qatar of a continuing revenue source through the next century, the current revenue picture was not nearly as bright.

Petroleum revenues supplied 90% of the Government's total revenue and 93% of total exports. Even with oil revenues down, and an estimated 18% increase in imports, total exports in 1982 amounted to $4.28 billion, while imports reached approximately $1.8 billion, leaving a substantial merchandise trade surplus.[19]

Despite its assumed hydrocarbon-based future, Qatar continued to develop and strengthen its nonoil industrial sector,

which includes production of petrochemicals, chemical fertilizer, steel, cement, and NGL. The most serious problem Qatar faced in 1982 was the shortage of natural gas, which provided fuel and feedstock to the country's major industries.

Qatar's oil production has declined considerably over the last several years, a result of both the growing surplus in the oil market and the maturity and depletion of its oilfields. The Qatar General Petroleum Corp. (QGPC), owned by the Government, controlled the country's oil industries from exploration and production to refining, marketing, and petrochemical and fertilizer production. The refining, petrochemical, and fertilizer industries were managed by QGPC subsidiaries: National Oil Distribution Co., Qatar Petrochemical Co. (QAPCO), and the Qatar Fertilizer Co. (QAFCO), respectively.

Crude oil production averaged 329,559 barrels per day, of which 171,668 barrels per day was derived from the onshore Dukhan Field, and 157,892 barrels per day was from the three offshore fields, Bul Hanine, Maydan-Mahzam, and Idd al-Shargi. Bul Hanine provided the bulk of the offshore production, about 60%, with Maydan-Mahzam supplying 30% and Idd al-Shargi, the remainder. Qatar's maximum production capacity was estimated at 525,000 barrels per day. Onshore, about 170 wells were operating in three producing zones, Khatiyah, Fahahil, and Jaleha. Seventy wells produced oil, eleven produced gas, and the remainder were for water and pressure control. Recoverable oil reserves at Dukhan are estimated at 2.4 billion barrels, a slight increase over that of 1981 and a result of improved recovery from dump flooding. Reserves at the offshore fields were estimated at 2.3 billion barrels of oil although production here has been slipping more rapidly than at Dukhan, and productivity is expected to decline steadily over the next 10 to 15 years.[20]

Qatar's other potential producing field was the offshore Bunduq Field, straddling the territorial waters of Qatar and the United Arab Emirates. After commencing production in 1976 at 30,000 barrels per day, output slumped to 4,000 barrels per day in 1979, and production was halted in order to implement a secondary recovery procedure. In June 1982, the National Petroleum Construction Co. of Abu Dhabi was awarded a $68 million contract to construct offshore production facilities and water reinjection equipment. The field was scheduled to resume production in June 1983. Bunduq was operated by the Al Bunduq Co., owned equally by British Petroleum (BP), CFP, and United Petroleum Development Co., and its oil was exported via the Das Island terminal in Abu Dhabi.

Qatar's crude oil was exported under contract to the service companies that operate the oilfields under the supervision of QGPC. The Shell Service Co., a subsidiary of Shell International Petroleum Maatschappij, and the Dukhan Service Co., formerly the Qatar Petroleum Co. (QPC), a joint venture of BP, CFP, Royal Dutch/Shell, Mobil, Exxon Corp., and Partex, were the two companies that developed Qatar's oil industry. With the advent of Government ownership, these companies became service organizations to operate the fields and market the crude oil on behalf of QGPC. Shell's contract was for 145,000 barrels per day of offshore production, while the former QPC shareholders were to receive 130,000 barrels per day, although owing to Qatar's reduced output, these companies were not able to lift the full amount in 1982. The remaining crude oil output, except for that used in the refinery, was sold under contract to the Japanese companies, Mitsubishi Corp. (30,000 barrels per day), Sumitomo Petroleum Development Co. Ltd. (10,000 barrels per day), and Idemitsu (40,000 barrels per day). Mitsubishi and Sumitomo renewed their contracts at these levels in 1982, while Idemitsu's two contracts, each for 20,000 barrels per day, were scheduled to end on December 31, 1982, and in June 1983, respectively.

QGPC's existing 10,000-barrel-per-day petroleum refinery at Umm Said was scheduled to be integrated with its new 50,000-barrel-per-day facility, now under construction, by October 1983. Demand for refined petroleum products in Qatar has recently outstripped domestic production capacity, and the new refinery was expected to restore production self-sufficiency to Qatar, as well as provide a surplus for export. A refined products pipeline was also under construction from the new plant to Doha, the capital. The 48-kilometer, 25-centimeter line, under construction by Technip of France, who is also building the Umm Said refinery, was to be completed by mid-1983.

Although Qatar's oil industry and economy continued to be affected by the changing nature of the world oil markets, its future as a wealthy energy supplier was guaran-

teed by the tremendous reserves of natural gas under its offshore waters. Qatar moved forward in its plans to develop the field in 1982, pressed more by its need to maintain adequate gas supplies for its own industries than by its revenue requirements. Qatar currently produces both associated and nonassociated gas, all of which is consumed by domestic industries. Natural gas production averaged about 521 million cubic feet per day, one-half of which came from the nonassociated Khuff Field located onshore beneath the Dukhan Oilfield. Khuff gas was used to make up for the shortfall in supply of associated gas from the onshore and offshore oilfields. Gas demand from Qatar's two NGL plants (NGL I and NGL II), QAPCO, Qatar Steel Co. (QASCO), QAFCO, and power and water desalinization plants, was close to 800 million cubic feet per day. Reserves in the Khuff Field were estimated at 780 billion cubic feet, and were insufficient to fully supply the industrial needs of Qatar for any extended period.

The Qatari Government responded to this temporary gas crisis by pushing ahead plans to develop the North Field. QGPC selected BP and CFP to become minority partners in a $6 billion venture to develop, process, and export gas from the North Field. Each partner was to hold a 7.5% equity share, with maximum foreign shareholding amounting to 30%. BP and CFP may be able to increase their shares in the project, or the remaining 15% may go to Japanese marketing and transportation companies, who appeared destined to receive the bulk of the liquefied natural gas (LNG) output.

The overall plan to develop the field envisioned a total output of 2 billion cubic feet per day, of which 760 million cubic feet per day would be directed for local consumption, and the remaining amount would be earmarked for export in the form of LNG. The LNG plant, now scheduled to be located at Umm Said, was to produce 6 million tons per year of LNG, 50,000 to 700,000 barrels per day of condensate, 120,000 barrels per day of NGL, and 40,000 tons per year of sulfur. BP and CFP were to each hold a 7.5% stake in LNG production, with another 15% set aside for future participants. QGPC was to fully own the condensate and NGL portion of the project. BP's and CFP's first task, according to QGPC, was to find purchasers of LNG on a 20-year-contract basis, a process that was expected to take 2 to 7 years. Contracts would have to be finalized prior to commencing development work on the export project. The domestic development stage, however, was scheduled to begin in late 1983 or early in 1984. Wintershall AG (Federal Republic of Germany), which holds the only non-Government concession on the southern fifth of the North Field, proposed a scaled down project to develop its concession to only supply Qatar's domestic needs.

In other gas-related development, Royal Dutch/Shell agreed to pay $15 million for replacement of a 30-kilometer, 61-centimeter pipeline linking the offshore oilfields to NGL I and II and QAPCO at Umm Said. The existing pipeline had been blocked by unidentified black sediment since its commissioning in 1978, a problem that had further reduced gas supplies to Qatar. The sediment led to a dispute between Royal Dutch/Shell, which operates the offshore fields, and Ente Nazionale Idrocarburi of Italy, which laid the pipelines, over who was responsible for fixing or replacing line. A parallel crude oil line was also in need of similar repairs.

Qatar continued to be a Middle East leader in downstream petroleum and gas processing, despite the detrimental effect of the gas shortage. Production of ethylene and other basic petrochemicals from the QAPCO facility at Umm Said was below capacity in 1982 because of the gas shortage and the blockage in the gas pipeline. QAPCO, a joint venture of QGPC (84%) and Charbonnages de France-Chemie (16%), was designed to produce 280,000 tons per year of ethylene, 140,000 tons per year of low-density polyethylene, and 46,000 tons per year of sulfur, utilizing ethane-rich gas from the NGL plants. QGPC decided to suspend construction of a 70,000-ton-per-year, high-density polyethylene unit at the plant, and canceled a letter of intent for construction of the $80 million project that had been awarded to Mitsui Engineering in June 1982. The $770 million QAPCO plant came onstream in February 1981 and output has yet to reach design capacity.

QAFCO, also a gas dependent industry, operated at about 85% of total capacity in 1982. QAFCO consists of two parallel ammonia-urea trains, QAFCO 1 and 2, that came onstream in 1976 and 1979, respectively. QAFCO 2 reportedly operated at 99% of rated capacity throughout 1982, while output from the No. 1 unit was substantially lower. QAFCO, a joint venture of the Government of Qatar (70%), Norsk Hydro AS of

Norway (25%), and Hambros Bank (2%) and Davy Powergas Ltd. (1%), both of the United Kingdom, was planning to build a gas sweetening plant to desulfurize associated gas from the offshore oilfields. This unit was designed to ensure a total output of 110 to 115 million cubic feet per day of gas feedstock derived mostly from onshore associated gas and some Khuff gas, with a small portion coming from offshore. The new gas plant should enable the QAFCO facility to operate at rated capacity when it is completed.

Qatar's other major gas-consuming industry was QASCO's 900,000-ton-per-year Midrex direct-reduction-based steel mill. The direct-reduction mill feeds two 70-ton electric arc furnaces supplied by Nippon Kokan K.K. of Japan, which in turn supply two 4-strand continuous billet casters, and a 20-strand bar mill. Shares in QASCO were held 70% by the Qatar Industrial Development Agency, 20% by Kobe Steel of Japan, which supplied the billet casters and bar mill, and 10% by Tokyo Boeki, also of Japan. Production from the plant substantially exceeded its design capacity of 440,000 tons of semimanufactured steel for the third year in a row by producing an estimated 452,000 metric tons of steel. About 10% to 15% of QASCO's output was consumed domestically, with the remainder being exported locally, mainly to Saudi Arabia and the United Arab Emirates.

Finally, Qatar's cement industry was preparing for a large-scale expansion in 1982. The National Cement Co., which operated the country's only cement plant, a 900-ton-per-day facility at Umm Bab, awarded a $128 million contract to Hyundai Heavy Industries Co. Ltd. of Korea for construction of a new plant, 18 kilometers from Umm Bab, that would produce 7,000 tons of cement per day bringing Qatar's total annual capacity to over 1 million tons. Demand was estimated at nearly that level.

SYRIA

Syria's diverse resources, including oil, gas, phosphates, and agricultural products, along with relatively high rates of investment, have enabled it to maintain a positive economic growth rate over the past several years. Syria's GDP, estimated at $18 billion[21] in 1982, has increased 9% annually in real terms from 1978 to 1980, another 8% from 1980 to 1981, before slowing to about 5% in 1982. Among the problems for Syria's economy, however, were the recent decline in the price of oil, its large balance-of-trade deficit, estimated at $2 billion in 1982, and a continuing high rate of inflation, about 15%.

Syria's budget was cut to $8.4 billion, slightly lower in real terms than that of 1981. Among the cuts made were investment allocations to the various ministries including the mineral and petroleum sector.

Despite the cutbacks in project financing, recent accomplishments in Syria's mineral sector include the first full year of operation of the country's two new fertilizer complexes, both located at Homs, the 1981 commissioning of Syria's second petroleum refinery, the completion of the first and second production lines of the huge Tartous cement plant, and the fifth consecutive year of production increases from the phosphate mining industry. On the negative side, production of petroleum declined in 1982 for the third consecutive year as reserves were depleted and recovery of Syria's heavy crude became more difficult. Syria closed the IPC pipeline, halting Iraqi exports via the Mediterranean and terminating Syria's refinery supply agreement, while it negotiated a new supply agreement with Iran.

Syria derived roughly 50% of its total export revenues of $2.1 billion and 6% of its GDP from oil production. Production in 1982 averaged 152,400 barrels per day, down 7% from that of 1981. Proven oil reserves at yearend 1982 were placed at 1.89 billion barrels, but most of the oil was heavy 20° API gravity or lower, with a sulfur content ranging from 4.5% to 9.5%. Syria's major oilfields were Suweidiyah, Rumeilan, Karatchok, Al-Hayane, Jebisseh, and Hamza, all of which were discovered between 1950 and 1974. In 1982, the Syrian Petroleum Co., owned by the Government, was the only oil producer in Syria.

With oil reserves in Syria expected to last only about 25 years and consumption, estimated at 39 million barrels in 1982 and expected to rise 7% per year, the Syrian Government was actively encouraging exploration efforts, mainly by foreign firms. Since 1974, Syria has been following an open door policy for foreign exploration. Among the companies still active in Syria were the Syrian-American Oil Co. (SAMOCO), a subsidiary of Coastal States Corp. of Houston, Tex.; Pecten Syria Co., owned 50%

by Shell International and 50% by Shell Oil Co., Marathon Oil Co. of the United States, and Challenger Desert Oil Co. of Panama. The most active companies in exploration were SAMOCO, which has been drilling in the Deir el-Zor area for the last 2 years; Marathon, whose drilling has centered around Homs and Palmyra; and Pecten Syria, which has reportedly discovered gas in an undisclosed area.

There were two oil refineries operating in Syria in 1982: The 120,000-barrel-per-day Baniyas refinery that was brought into commercial production in 1981 and the older 100,000-barrel-per-day refinery at Homs. The Baniyas refinery was able to operate at only 75% of capacity in 1982 owing to the irregularity of oil supplies, first from Iraq and then from Iran. Previously, Syria had purchased about 100,000 barrels per day from Iraq delivered via the Kirkuk to Baniyas to Tripoli pipeline for mixing with heavier Syrian crude oil to process in the country's two refineries. Syria consumed approximately 110,000 barrels per day of refined petroleum products in 1982, and the remainder of the country's output was exported. In April, Syria stopped the flow of oil through the IPC pipeline, effectively eliminating about 40% of Iraq's exports of crude oil. A month earlier, Syria had concluded an agreement whereby Iran would supply Syria with 180,000 barrels per day of crude oil, basically the precise amount needed for Syria's refineries. Iraq and Syria have both estimated Syria's annual loss of transit fees from Iraqi pipeline exports at $100 million and $20 million, respectively, with a more realistic figure being about $50 million. The effect on Iraq was more serious, however, because the Kirkuk-Baniyas-Tripoli pipeline and the Kirkuk to Ceyhan, Turkey, pipeline were Iraq's only means of exporting oil while its export facilities on the Arabian Gulf remain inoperable. Syria's supply agreement with Iran was to cover a period of 10 years.

In the nonfuel mineral sector, phosphate rock and fertilizer materials were Syria's most significant products. Phosphate rock was produced from two areas in Syria; Al-Shargiya and Khunayfis, both located about 50 kilometers south of Palmyra and 160 kilometers southwest of Homs. Both deposits were operated by the state-owned General Co. for Phosphates and Mines. Annual production capacity was about 500,000 tons containing 24% to 29% P_2O_5 or 52% to 63% bone phosphate of lime (BPL), which is concentrated by dry selected crushing and screening to a product of 69% to 73.5% BPL. The Shargiya A and B deposits supply over 1 million tons per year of 58% to 62% BPL ore, with the capacity of Eastern A at 600,000 tons per year of phosphate concentrate, and Eastern B at 400,000 tons per year of concentrate. Total reserve at both deposits were estimated at 65 million tons of recoverable ore containing 59% to 61% BPL.

Although Syria's production of phosphate rock increased in 1982, exports of phosphate were down 2.2% to about 700,000 tons. Phosphate was exported to Romania (60%), China (15%), Czechoslovakia (13%), Bulgaria (11%), and Italy (1%).

Exports also declined because some of the mine output was delivered to the new $180 million triple superphosphate fertilizer complex at Homs. The plant, commissioned in March 1981, was designed to produce 150,000 tons of phosphoric acid and 450,000 tons of triple superphosphate annually from a phosphate input of 800,000 tons per year of concentrated ore. The plant was undergoing test runs throughout 1982, and commercial production was scheduled to begin early in 1983.

Syria's General Establishment of Chemical Industries operated two ammonia-urea fertilizer plants located in Homs. The older plant, commissioned in the late 1960's, was capable of producing 110,000 tons per year of nitrogenous fertilizer, while the new plant, commissioned in July 1981, could produce 1,000 tons per day of ammonia and 1,000 tons per day of urea. Both plants utilize naphtha feedstock from Syria's two refineries. Production of nitrogenous fertilizer exceeded domestic consumption in 1982, and the surplus was shipped by rail to the Port of Tartous for export.

Syria's cement production capacity has increased rapidly over the past several years, from about 2 million tons in 1980 to over 4 million tons in 1982. Production increased 32% from the 1981 level, and further increases were expected in the coming years. The reason for the increase was the completion of two new plants in 1981, the Al-Muslimiyah and Skiekh Said plants, both located in Aleppo; and the startup of three additional plants in 1982 at Hamah, Adra, and Tartous. The Tartous plant, when fully operational, was to be the Middle East's largest cement plant, with a total annual capacity of 2.34 million tons. The first two 1,600-ton-per-day finished cement

lines were brought onstream in 1982, with the next two expected to follow in 1983. Cement consumption in Syria was approximately 3 to 3.5 million tons per year, which meant Syria still imported roughly one-third of its domestic requirement. By the end of 1983, Syria was expected to switch from a net importer to a net exporter of cement.

Steel production from Syria's General Co. for Iron and Steel Products (Gecosteel) 120,000-ton-per-year electric steelmaking plant remained at around the 100,000-ton-per-year mark in 1982. The plant, commissioned in 1977, produced steel billets, merchant bars, and galvanized and welded pipe, all from imported direct-reduced iron and scrap. Capacity of the wire rod mill, located in Hama, was to be raised to 200,000 tons per year by 1985. Several companies from the Federal Republic of Germany and the German Democratic Republic were being considered by Gecosteel to perform the expansion project.

Other developments in the nonmetallic minerals sector included the opening of two marble dressing plants, at Al-Zobar near Latakkia and at Damascus, and a planned 15-ton-per-day sulfur recovery plant to be operated by the Syrian Petroleum Co. at Roumelan.

PEOPLE'S DEMOCRATIC REPUBLIC OF YEMEN

The economy of the People's Democratic Republic of Yemen (PDRY) continued to grow at a slow, measured pace in 1982. The high point of the year was the announcement by Azienda Generale Italiani Petroli S.p.A. (AGIP) of Italy that it had discovered oil in the offshore waters of PDRY, after years of unsuccessful exploration by a host of international companies.

Since achieving independence from Great Britain in 1967, PDRY's economy has remained fairly stagnant, a result of the paucity of domestic resources, and more importantly, the declining economic contribution of its oil bunkering and refining facility at Aden. This port, prior to the closure of the Suez Canal in 1967, was the sixth largest oil bunkering port in the world and the main port on the Arabian Peninsula. Despite the reopening of the canal, oil bunkering and refining remain at about 20% of their pre-1967 levels.

The influence of petroleum on the domestic economy was beginning to increase in 1982, however, as a result of new supply agreements for the Aden refinery and the new potential for domestic production. Yemen's total exports were estimated at about $900 million, 95% of which were refined oil products, for which all the crude input had to be imported, at a cost of between $700 and $800 million.[22] Total imports exceeded $1 billion, leaving the country with a current account deficit in excess of $225 million. As part of the Government's revised second 5-year development plan (1981-85), about $1.5 billion was to be allocated for investment over the plan period, or roughly 31% of the gross national product.

The oil discovered in April at AGIP's 1-X Sharmah wildcat well in 135 meters of water 5 miles offshore in the Gulf of Aden flowed at 3,000 barrels per day of 43° API gravity crude through a 1/2-inch choke, from a pay zone at 2,200 meters depth. The discovery was located on AGIP's Mukalla offshore concession, on which six wells had already been drilled. Throughout 1982, AGIP was in the process of evaluating the recoverable reserves in the field and determining its commercial potential. AGIP, through two separate concession agreements, held approximately 15,000 square kilometers of oil and gas exploration acreage, on the area offshore around the Mukalla coast, and the other onshore in the Qamar region. In addition to AGIP, a 42,000-square-kilometer concession onshore in the Hawarim-Gheida region, was held by Braspetro, a subsidiary of the Brazilian state oil company Petróbras Brasileira S.A. (80%) and by Spain's Hispanol (20%). Technoexport of the U.S.S.R., under contract to PDRY's Petroleum and Minerals Board (PMB) was conducting seismic surveys and drilling exploratory wells in Hadhramaut and Shabwah Provinces. The World Bank was also financing seismic surveys to attract companies interested in taking new concessions in PDRY. Finally, the Independent Petroleum Group (IPG) of Kuwait began exploration on a 13,000-square-kilometer concession, one-half onshore and one-half offshore in the Balhaf region of Shabwah Province. The concession was located about 150 kilometers west of AGIP's 1-X Sharmah discovery. Terms of the concession agreement involved initial seismic work, followed by exploratory drilling and

production sharing with PMB. The agreement covers 3 years.

Kuwait's IPG was also taking an active role in reviving the Aden refinery and oil bunkering facility. IPG concluded an agreement in March 1982 with PMB that allows IPG to process and blend products in the Aden refinery for marketing to the Middle East and Africa. IPG was also to construct product storage tanks, arrange shipping services, and prepare a feasibility study on modernizing the refinery. The 150,000-barrel-per-day refinery operated at about 50% of its design capacity, mainly by processing crude on behalf of third parties. Domestic consumption in PDRY averaged 10,000 barrels per day, which was imported and refined at Aden by PMB. Third party customers using the refinery included Iran's National Iranian Oil Co. (50,000 barrels per day), the Kuwait National Petroleum Corp. (10,000 barrels per day), the U.S.S.R. (10,000 barrels per day), and France's CFP-Total (5,000 barrels per day). Despite the relatively small volumes of products, these reexports constituted a major revenue source for PDRY.

PDRY's nonfuel mineral sector consisted of the production of unrefined marine salt from the General Salt Organization's evaporation pans of Khawr Maksior. Output from the plant averaged 50,000 to 75,000 tons per year.

YEMEN ARAB REPUBLIC

Economic and mineral development in the Yemen Arab Republic (YAR) remained sluggish in 1982. The YAR was considered 1 of the world's 10 least developed nations, while boasting the highest population density on the Arabian Peninsula. The Yemeni economy was still primarily based on agriculture, although attempts to make the country self-sufficient in food production have failed, mostly as a result of the availability of cheaper imports and the effect of domestic inflation.

The Government's efforts to promote industrial development in YAR have not met with particular success to date owing to the Government's lack of investment capital. The one Government agency, based in the capital of Sanaa, that has been the most active was the Yemen Oil and Minerals Co. (Yominco), which has entered into several oil exploration agreements with foreign firms and has recently cooperated in the discovery of a potential copper-nickel-iron cobalt deposit near Taiz. This deposit may provide a basis for a new mineral industry to add to the current production of rock salt, cement, and gypsum.

YAR's GDP in 1982, in constant 1975 prices, was estimated at $1.54 billion,[23] a 5% real growth rate from the 1981 level. Approximately 40% of YAR's labor force was employed in other countries, and those emigrant workers were responsible for YAR's largest inflow of revenue, foreign remittances, which totaled $1.17 billion in 1982. The major economic problem in Yemen was its balance-of-payments situation. Because of its high population and low domestic productivity, legal documented imports totaled $1.95 billion while exports only reached $4.7 million. Even with worker remittances and a substantial level of foreign aid, Yemen's overall balance-of-payments recorded a $347 million deficit. Combine this economic strain with a devastating earthquake that struck the Dhamar Province in 1982 causing close to $1 billion worth of damage, YAR's economic problems will continue for several years to come.

The most important development in the mineral fuel sector in 1982 was the continuing exploration effort of Yominco, mainly in association with the Yemen Hunt Oil Co., a subsidiary of Hunt Oil Co. of the United States. Yemen Hunt completed its seismic exploration in the Wadi Jawf region and was evaluating its results before committing itself to a drilling program. Yominco was also seeking foreign partners to follow up on Shell Oil (United States) seismic exploration of the Tihama coastal plain. YAR imported 6,526,000 barrels of refined products mainly from Kuwait in 1982, along with 25,570 tons of liquefied petroleum gas, all for domestic consumption.

In other fuel-related areas, an unnamed Japanese company signed an agreement with Yominco to build a gas bottling plant with a capacity of 24,000 cylinders per day in Al-Hudaydah.[24] Gas supply for the plant was to be imported, but the plant was expected to significantly reduce the cost of gas for home fuel and heating. The project was to be completed in mid-1984.

Yominco also awarded a contract to Omnium Technique des Transports of France for construction of a petroleum products pipeline from Salif to Mabar and then north

to Sanaa. The two parallel, 272-kilometer, 25-centimeter lines were planned to distribute refined products around the country. This $150 million project was in the design stage in 1982. The World Bank was also active in financing oil exploration in YAR, as well as in encouraging foreign oil companies to take up the search based on exploration data already available.

In the nonfuel minerals sector, Yominco announced the discovery of a potentially exploitable deposit containing copper, nickel, iron, and cobalt in an estimated 10 to 15 million tons of metal-bearing ore. The deposit, located near Al-Hamoura in the Haifan region 290 kilometers south of Sanaa was being further investigated to determine the best means of extraction.[25] The Bureau de Récherches Géologiques et Minières of France won a contract late in the year to continue its feasibility study on the possible exploitation of mineral resources in the Nihm region, located northeast of Sanaa. A team of geologists from the U.S.S.R. was also discussing the possibility of technical cooperation with YAR's Ministry of Energy and Mineral Resources, as part of an existing agreement.[26]

The increase in cement production was one of YAR's bright spots in the mineral industry in 1982. The U.S.S.R. expanded a cement plant in 1981 that it originally built in 1961, raising capacity from 80,000 to 300,000 tons per year. Increased production from the plant, located at Banjil, north of Hodeida, was responsible for YAR's almost 200% increase in production. A second 500,000-ton-per-year cement plant was under construction at Amran, 50 kilometers north of Sanaa, in 1982 by Ishikawajima-Harima Heavy Industries Co. Ltd. and Nissho-Iwai Corp., both of Japan, at a cost of $110 million. Status of the plant was unavailable at yearend.

YAR's only other mineral product was rock salt from the Yemen Salt Mining Co.'s open pit rock salt deposit adjacent to the Port of Salif. Gypsum for the cement industry was recovered in association with rock salt from Salif.

The Mineral Industry of Other Areas of South America

By Travis Q. Lyday[1]

CONTENTS

ECUADOR

Ecuador's economy continued to slow in 1982 due, in part, to declining foreign demand for oil, depressed world oil prices, and high international interest rates. Real growth of the gross domestic product (GDP) was estimated to be in the 2% to 3% range, down from the revised 4.3% recorded in 1981 and the 4.5% anticipated officially. In current prices, the GDP in 1982 was estimated at $12.1 billion.[2] Inflation abated slightly from that of 1981 to an estimated 13.9% annual rate. The sucre was devalued in May by 32%, the first time in more than a decade, as a result of the pervasive flow of capital abroad.

Ecuador's production of petroleum increased an estimated 1.9% in 1982 compared with that of 1981. The consortium of Corporación Estatal Petrolera Ecuatoriana (CEPE), the state oil company holding a 62.5% interest, and Texaco Inc. (37.5%) produced an estimated 98%, or approximately 211,000 barrels per day, of the total from the northern part of El Oriente, the eastern jungle region, where a Texaco-Gulf Oil Corp. partnership discovered oil in 1967. Gulf subsequently sold out to CEPE in 1977 for $117 million. Remaining production was from the Santa Elena Peninsula Fields on the Pacific coast where production has been steadily declining for several years.

The volume of crude petroleum exports decreased an estimated 10% from the revised 44.6 million barrels in 1981 to 40 million barrels in 1982. Crude petroleum export revenues were estimated to have decreased over $400 million in 1982 to about $1.1 billion.

In August, the Ecuadorean President signed into law two hydrocarbons reform bills amending the Hydrocarbons Law of 1971 (as amended) and establishing the new Income Tax Law relating to hydrocarbons contracts. However, the Ministry of Natural Resources and Energy must prepare implementing regulations and other documents outlining procedures before the Government can announce an international call for tenders. An early implementation was not expected at yearend.

The principal reform introduced by the amendments to the hydrocarbons law is the establishment of "risk-sharing" contracts for the exploration and exploitation of petroleum and natural gas. Under this provision, contractors exploring for hydrocar-

bons would be reimbursed for their expenses, and entitled to receive a service fee, by CEPE only if hydrocarbons were discovered and produced in quantities commercially feasible to exploit.

Other major provisions in the reform legislation provide reimbursement to CEPE by contractors or other components of the Government for its production, transportation, and selling costs; a permanent fund for hydrocarbons exploration blocks; the restriction that a contractor, once granted exploration rights for a block in the Oriente, can bid for rights to a second block only in the Pacific coast region or offshore; minimum annual investments per hectare that a contractor must make; that contractors make a major effort to train Ecuadorean personnel; the affirmation that contractors will not be assessed royalties, signature bonuses, or surface charges, or be required to undertake complementary works; and the earmarking of 12.5% of production from hydrocarbons deposits to the Eucadorean military.

The Hydrocarbons Income Tax Law provides that contractors receiving service fees will be subject to two types of taxes, Ecuador's regular corporate income tax and a production tax based on average production levels. However, the production tax would not be applicable to the production of heavy crude (below 15° API) or less than 30,000 barrels per day of light crude. The law also reaffirms that companies that are paid service fees will be required to distribute 15% of their profits to their workers.

The lengthy delays in starting the project to expand the principal refinery, owned by CEPE and located at Esmeraldas, Esmeraldas Province, through revamping will apparently delay its completion until at least mid-1984. CEPE's plans for the construction of a new 75,000-barrel-per-day refinery in Atahualpa, Guayas Province, have apparently been deferred indefinitely.

CEPE announced in June that its Gulf of Guayaquil contractor, the Panamanian drilling company Permargo Internacional S.A., a unit of Perforaciones Marinas del Golfo S.A. de Mexico, which signed a contract in October 1981 for hydrocarbons exploration in the gulf, discovered oil in its first test well Golfo-Uno at a depth of 3,871 meters. Although the well yielded minimal flow and subsequently proved noncommercial, the discovery was significant in that only natural gas deposits had been known in the gulf previously. At yearend, CEPE was negotiating with Permargo for a reduction of its $60,000-per-day leasing agreement of Parmargo's jack-up drilling rig Uxmal.

During the year, CEPE also began exploration drilling in the southeastern Amazon region of Conambo, Pastaza Province, near the Peruvian border, where seismic surveys have indicated similar geologic structures to those in the producing Peruvian fields. Texaco's first wildcat well, the Rumiyaku, was spudded in Texaco's concession in this area in August.

Texaco's $54-million, secondary-recovery-by-water-flooding project was also launched during the year at the Shushufindi Field, the country's largest, enabling an estimated additional 300 million barrels of crude oil to be recovered.

Toward the end of 1982, CEPE brought four of its wholly owned fields in the Oriente into production, adding 25,000 barrels per day to current production. Three additional fields in the Oriente, adding an additional 15,000 barrels per day to production, were scheduled to start producing in early 1983.

Reportedly, the CEPE-Texaco consortium budgeted $400 million for its petroleum exploration activities in 1982, compared with the $133.3 million and $42.3 million spent in 1981 and 1980, respectively. This helps to underscore the fact that Ecuador could become a net importer of petroleum by 1985, or 1987 at the latest, unless successful exploration is undertaken quickly. Proven reserve figures range from CEPE's 500 million barrels to Texaco's 2 billion barrels of oil.

In October, as part of a larger package of economic stabilization, the Government doubled the price of all grades of gasoline. The price of premium (92 octane) rose to the equivalent of $1.21 per gallon, almost seven times the 1980 price. The Government hoped the increases would stem growing domestic consumption, which increased an estimated 12% in 1982.

In sharp contrast to the development of the petroleum sector over the past decade, development of the Ecuadorean minerals sector has remained negligible despite continued geological reconnaissance and mineral exploration programs. Ecuador's most important mine was the La Plata copper-lead-zinc-gold underground operation near Santo Domingo de los Colorados, Cotopaxi Province, operated by Minera Toachi S.A. The mine is 70.94% owned by foreign companies including Outokumpu Oy of Finland (39%), Lakehurst Investment of the Baha-

mas, Cía. de Minas Buenaventura S.A. of Peru, and ANCOMIN Ltd. of Bermuda, plus private sector Ecuadoreans (29.06%). Earlier plans called for more than doubling ore production in a $5.2-million, 2-year investment program that was announced in 1980. Apparently, however, the project was delayed indefinitely. Metallgesellschaft AG of the Federal Republic of Germany and the International Bank for Reconstruction and Development, a component of the World Bank, were each to provide financing of $1 million for the expansion from the present 24,000 tons per year to 60,000 tons per year.

Reportedly, as a result of work carried out in Ecuador since 1972 under a technical assistance project, the Institute of Geological Sciences discovered a bed of sedimentary phosphate rock, 1 to 1.5 meters thick, in the Upper Cretaceous Napo Formation in the Oriente. Copper and copper-molybdenum mineralization was also reported.

Also, the Dirección General de Geología y Minas announced in midyear the discovery of an anthracite coal deposit, containing up to 100 million tons, near the town of Tena in Napo Province.

A $1.6-million, 3-year uranium exploration project, sponsored by the United Nations and the International Atomic Energy Commission, was approved early in the year by the Government through the Comision Ecuatoriana de Energia Atomica, the Ecuadorean Atomic Energy Commission.

The expansion of Empresa Cemento Chimborazo C.A.'s cement plant in Riobamaba, Chimborazo Province, was approved early in the year by the company's board of directors. Lafarge Consultants Ltd. of Canada was awarded the project definition and design study. The expansion will consist of a 500,000-ton-per-year precalciner line complete with new raw grinding, finish grinding, and quarry departments. The company was in the process of adding a precalciner to an existing kiln and doubling its stone-crushing facility during the year.

Plans to double the capacity of Cemento Selvalegre's 345,000-ton-per-year plant near Otavalo were still under consideration at yearend. A feasibility study was performed and submitted to the company during the year but apparently a decision was not announced.

Table 1.—Other Areas of South America: Production of mineral commodities[1]

Area and commodity	1978	1979	1980	1981[p]	1982[e]

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Includes data available through July 25, 1983.

[2]In addition to the commodities listed, a variety of crude construction materials (common clays, sand and gravel, and stone) undoubtedly were also produced, but output was not reported, and available information was inadequate to make reliable estimates of output levels.

[3]Reported figure.

[4]Gem and industrial diamond production was estimated based upon reported total production.

[5]Data represent exports.

[6]Less than 1/2 unit.

[7]Refinery fuel apparently included with products for sale, mainly residual fuel oil and liquefied petroleum gas.

FRENCH GUIANA

The mineral industry of French Guiana, an Overseas Department of Metropolitan France since 1946, was limited in 1982 to the production of small quantities of construction materials used for domestic consumption and a minor quantity of placer gold. This sector has never had a very significant role in the Department's economy, where the shrimp, fishing, timber, rum, and sugar cane industries have been the

mainstays, along with substantial subsidies by the French Government.

In the petroleum sector, Eurafrep S.A., Esso Exploration Guyane S.A.R.L., Société Shell de Recherches et d'Exploration de Guyane, and Société Nationale Elf Aquitaine were reported to have applied for a 5,666-square-kilometer, deep-water concession during the year although no drilling was planned for 1982.

GUYANA

The Guyanese economy continued to decline in 1982 due principally to depressed prices and reduced markets for its principal exports: bauxite, rice, and sugar. Because of a 40% decrease in targeted export earnings, imports fell by 30% causing severe shortages of raw materials and spare parts and fueling a thriving parallel, or black, market.

The production of bauxite and its processing into alumina accounted for about 20% of the GDP, estimated at $416 million,[a] and about 45% of the total annual export earnings, estimated at $94 million.

The Guyanese Government had targeted 1982 bauxite production at 1.8 million tons, 21% below the 2.3-million-ton target of 1981, but 8% above actual 1981 production.

As Guyana's petroleum import bill was approximately 35% to 40% of total merchandise imports, the Government increased its efforts to develop alternative energy sources. Ways to use charcoal, rice husks, and wood waste were studied during the year. For the long term, the Government was planning a 750-megawatt hydroelectric project to be located on the Upper Mazaruni River. Along with the dam and power generating stations, a 150,000-ton-per-year aluminum smelter would be built to use the energy in excess of anticipated domestic consumption. Although the World Bank had determined that the project was technically feasible, its $2 billion cost and its location in the Essequibo area, the territory claimed by Venezuela, make its implementation in the foreseeable future increasingly improbable.

A 45-megawatt hydropower project at Tumatamari has also been proposed to meet Guyana's short-term energy needs. Montreal Engineering Consultants was contracted to carry out both the feasibility study and the final design of the project. However, no portion of the project has been financed beyond the initial design stage. Implementing this project also seems unlikely as the cost has apparently escalated beyond the probability of obtaining necessary financing.

The alumina plant at Linden, owned by the state-owned Guyana Mining Enterprise, was closed in February for rehabilitation and modification to improve quality and obtain better prices. Kaiser Aluminum Technical Service, a unit of Kaiser Aluminum and Chemical Co., was contracted to supervise the work. The work was not completed by yearend, and reportedly, the plant was unlikely to reopen in 1983 because of a shortage of foreign-exchange earnings.

Negotiations were completed near yearend for Guyana to supply bauxite to Venezuela for Interamericana de Alumina S.A.'s new alumina refinery being built at Puerto Ordaz, on the Orinoco River near Ciudad Guayana. The plant was scheduled to start up early in 1983. The bauxite reportedly would not come from the disputed Essequibo region and would be supplanted by Venezuelan bauxite beginning in 1986.

The French Compagnie Generale des Matieres Nucleaires (COGEMA), wholly owned by the French Atomic Energy Authority and engaged in uranium exploration in Guyana since 1979, began exploration drilling in the Mazaruni. Previously, basic geochemical work and aerial and ground surveys were conducted in preliminary exploration. An agreement providing for the payment of royalties, waste disposal, and Guyanese participation in a joint venture was signed early in the year with COGEMA, if uranium is discovered in commercial quantities.

Gold and diamond continued to be mined by small miners—dubbed "pork knockers" because of their method of clearing flies from their dried provisions—during the year in the Essequibo region using hand methods and small diesel-powered suction dredges. Reportedly, while all the resources gleaned from the area were supposed to be sold to or exported through the Government, only about 10% of the gold and perhaps one-half the diamond output actually passed to the state. This continued to lure increasing numbers of foreign prospectors to the area during the year.

Home Oil Co. Ltd. of Canada announced in April the discovery of high-grade oil at its second wildcat well, Karanambo I, in its Takatu Basin concession near the border

with Brazil. However, the unorthodox geology of the field plus Home's inability to obtain financial partners forced the company to shut down in midyear. Home began its wildcat drilling program in the region in November 1981. The first wildcat, Lethem I, was abandoned as dry.

Subsequent to Home's pullout, the Government extended an invitation to Petrobrás Internacional S.A., Petróleo Brasileiro S.A.'s (PETROBRÁS) foreign exploration subsidiary, to drill in the area. PETROBRÁS is Brazil's state oil monopoly, owned 75% by the Government and 25% by private interests.

PARAGUAY

After achieving the highest rate of real GDP growth in Latin America in 1981, the Paraguayan economy experienced a contraction unprecedented for three decades. Official preliminary data indicate that the country's rate of real growth during 1982 fell by 11% from 8.2% to a -2.5%, a performance well below the average attained by Latin American countries as a whole. The decline was primarily caused by the stagnant world economy, low prices for Paraguay's leading exports, currency devaluations in neighboring Argentina and Brazil, and a consequent decline of expenditures in Paraguay owing to the phasing down of construction on the large binational Itaipú hydroelectric project located on the Parana River. The prospects for growth in 1983 appeared little. However, the mining industry, comprising 0.4% of the GDP, expanded 2% in 1982.

Inflation, according to official preliminary figures, decreased to an annual rate of 5.1%, almost two-thirds lower than that of 1981.

The trade gap widened for the eighth consecutive year in 1982, rising 19.5% to $251.7 million.[4] Exports rose 11.6% to $329.8 million on a free-on-board (FOB) basis while imports climbed 14.9% to $581.5 million FOB.

The basic spur for Paraguayan prosperity and the keystone for optimism about the future of its economy was the development of the enormous hydroelectric potential of the Parana River along Paraguay's eastern frontier with Argentina and Brazil.

Construction of the Itaipú powerplant, a binational venture between Paraguay and Brazil, began in 1974 after many years of preparation. The floodgates of the dam were closed October 13, commencing the filling of the 1,350-square-kilometer reservoir. The dam was officially inaugurated in a November 5 ceremony, attended by the Presidents of both countries, in which the 14 spillway gates were opened to mark the culminating stage of construction of the civil works.

By yearend, sources close to the project were indicating that, contrary to the provisions of the original treaty signed in 1973, both countries would be able to sell any excess power that Paraguay does not consume and that Brazil does not want to buy. A treaty revision was expected to be negotiated during 1983. Itaipú's first 700-megawatt turbine was scheduled to be operating at reduced capacity early in 1983, with a second unit becoming operational in midyear. All the power generated was to go initially to Paraguay since completion of transmission lines to São Paulo, Brazil, were about 6 months behind schedule. However, there were indications that the first turbine would not become operational until October or November 1983. Once in full operation, postponed for a year and now scheduled for 1989, Itaipú will be the world's largest hydroelectric power generating plant.

Construction of the main civil works of the binational Yacyretá hydroelectric dam, also located on the Parana River, was delayed throughout the year, thus falling 4 years behind the original schedule. The Ente Binacional Yacyretá, the binational entity that will operate the Yacyretá plant through joint ownership, was negotiating on a joint bid proposal submitted by Argentine and Paraguayan construction firms at yearend.

Reportedly, negotiations were underway at yearend between Reynolds Aluminum International Services Inc., an operating subsidiary of Reynolds Metals Co., and the Government concerning a proposal to build a 140,000-ton-per-year aluminum smelter. The smelter, if built, would use electrical energy generated at Itaipú.

The state-owned Industria Nacional del Cemento signed a contract with the Argentine consulting firm of Insuisa to design the conversion of its two existing wet-process kilns to the dry-process. GATX-Fuller S.A., the Spanish subsidiary of Fuller Co., was awarded a $6-million contract to supply the process equipment, to cut and modify the two existing kilns, and to add four-stage suspension preheaters to each.

SURINAME

The bauxite industry continued to be the mainstay of the Surinamese economy in 1982, contributing about 80% of total export earnings and accounting for about 20% of the GDP, estimated at $1.2 billion.[5] Economic growth continued to decline owing to a steep fall in world demand for bauxite and its derivatives, after sustaining an average annual real growth rate of 5% over the 6-year period ending in 1980. Inflation decreased slightly to an estimated annual rate of 8% from the 14% and 10% annual rates in 1980 and 1981, respectively.

Suriname Aluminum Co. (SURALCO), a wholly owned subsidiary of the Aluminum Co. of America, and N.V. Billiton Maatschappij Suriname, a subsidiary of the Royal Dutch/Shell Group, accounted for an estimated 56% and 38%, respectively, of domestic bauxite production, estimated at 3.1 million tons in 1982. SURALCO's mines are located at Moengo and Lelydorp, whereas Billiton's mines are at Kankantrie and Para. In addition, SURALCO has established an integrated aluminum industry within the country, owning and operating the country's only alumina refinery and aluminum smelter, located in Paranam, based on cheap energy supplied by the 180-megawatt Afobaka hydropower facility near Brokopondo.

Suriname's bauxite exports decreased more than 60%, to 500,485 tons in 1982 compared with 1,281,018 tons in 1981. Total alumina shipments also decreased by almost 10% to 1,055,905 tons compared with 1,171,883 tons in 1981. Exports of aluminum, however, increased more than 90% to 60,294 tons, compared with 31,705 tons in 1981. The United States remained the largest purchaser of Surinamese bauxite and alumina, whereas Europe remained the principal buyer of Suriname's aluminum.

A Governmental decision was deferred on constructing the West Suriname Development Project, despite an estimated $75-million expenditure to date. This project is a multiphased development effort including the building of two large dams to produce more than 500 megawatts of hydroelectricity, a 72-kilometer railroad for transporting bauxite from the presently unexploited deposits in the Bakhuys Mountains to the Corantijn (Courantyne) River Port of Apoera, and a new aluminum smelter at Apoera. Almost two-thirds of the $75 million already expended was used in constructing the railroad, which was inaugurated in 1980 but has not yet been used.

Reportedly, a $15.3-million contract was awarded to Bos Kalis International by Billiton for the removal of 13 million cubic meters of overburden to develop additional bauxite reserves and enable Billiton to continue bauxite production for the remainder of the decade.

Negotiations were successfully concluded during the last quarter for Suriname to supply bauxite to Interamericana de Alumina S.A.'s new alumina refinery under construction at Puerto Ordaz, near Ciudad Guayana, in Venezuela. The refinery was scheduled for startup in early 1983 using imported bauxite from Brazil and Guyana, in addition to that from Suriname. Reportedly, the plant will use bauxite entirely from Venezuela, from the Los Pijiguaos deposits in the east-central region.

URUGUAY

The Uruguayan economy continued to decline in 1982. The GDP decreased an estimated 9% in real terms compared with the 1.3% decline in 1981. Uruguay's economy was expected to remain depressed in 1983. The inflation rate continued to drop for the fourth consecutive year to approximately 20% in 1982 compared with 29% in 1981.

A 33% reduction in imports and a corresponding 22% reduction in exports resulted in a trade deficit of $150 million,[6] a 66% decline from the $437 million deficit registered in 1981.

The mineral industry, limited to the nonmetallic sector, continued to be of minor importance. No significant mineral resources were developed, although studies were in progress on the possibility of exploiting the 30-million-ton iron ore deposit at Arroyo Valentin in the northeastern part of the Department of Florida.

Uruguay's natural resources were mainly limited to hydroelectric power. The Salto Grande hydroelectric plant, a binational venture with Argentina on the Rio Uruguay 338 kilometers north of Buenos Aries, Argentina, began producing energy in 1979. In

August, the 13th of 14 generating turbines became operational. With all turbines installed, the plant will have a total generating capacity of 1,980 megawatts. Work on the 330-megawatt Palmar hydroelectric plant on the Rio Negro was completed during the year. Proposals for two dams on the Rio Yaguaron, as part of a program of developmental and technological cooperation with Brazil, were under study at year-end.

Petroleum exploration in Uruguay remained unsuccessful during the year. Reportedly, Argentina's National Atomic Energy Commission signed an agreement to build a nuclear powerplant in Pando, 30 kilometers northeast of Montevideo. Argentina was to supply the plant with fuel from its uranium mines and processing plants.

The Mineral Industry of Other South Pacific Islands

By Charlie Wyche[1]

CONTENTS

FIJI

The principal minerals produced in the Dominion of Fiji in 1982 were unrefined gold, silver, and tellurium. The combined value of these commodities was about $16 million,[2] representing over 85% of the total value of mineral output. Cement, sand and gravel, and quarry products were the other minerals produced in Fiji.

Despite the small part played by minerals in Fiji's economy, exploration on land and in the coastal areas was carried out by several international mining companies representing Australian, British, Canadian, West German, and U.S. interests. At the end of 1982, 30 prospecting licenses covering 2,300 square kilometers were issued. Most licenses were for copper, zinc, gold, and silver. Total expenditure on mineral exploration was $3.5 million.

Anglo Pacific Exploration Ltd. holds several prospecting licenses and was the operator of others held by its joint venture partner, Barringer Fiji Ltd. These companies searched for massive sulfide occurrences on Viti Levu Island. Small deposits of copper-zinc-silver mineralization have been discovered, but no orebodies of economic size have been found.

Anglo Pacific's other main exploration program was in the Mount Kasi gold prospecting area of Vanua Levu. Since this exploration program first began in 1978, 47 holes totaling 5,000 meters were drilled. These data were being compiled and evaluated. Exploratory drilling began in a new licensed area at the mouth of the Yanawai River where the potential for placer gold discovery looked promising.

In the Tavua Basin licensed area, Emperor Gold Mining Co. Ltd. continued its exploration program by drilling four holes at the Big Hill prospect. The area lies adjacent to the Emperor Mining Mine and has been a focus for gold exploration for many years. Several gold occurrences have been located in the area, but no economic deposits have been found.

The intensified gold exploration survey by Goldfield Mines Ltd. in the Vunda prospecting area, which began in 1978, was continued. During 1982, over 20 holes were drilled in several areas up to depths of 150 meters. A deposit with grades of up to 0.24 troy ounce of gold per ton was discovered.

Exploration for porphyry copper deposits led to the discovery of the Waisoi deposit in the Namosi District of southeast Viti Levu. Prefeasibility investigations of the deposit

demonstrated the existence of 475 million tons of minable reserves at a grade of 0.48% copper together with minor amounts of recoverable gold and molybdenum.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]Table includes data available through Aug. 26, 1983.

[2]Produced from an unreported amount of domestically quarried limestone.

[3]In addition to the commodities listed, crude construction materials (common clays, sand and gravel, and stone) are produced, but output is not reported quantitatively, and available general information is inadequate to make reliable estimates of output levels.

[4]Reported figure.

[5]Total cobalt content of nickel ores mined based on average nickel-cobalt ratio in metallurgical products for 1880-1972.

[6]Cobalt actually recovered for use as cobalt; excludes cobalt content of nickel-cobalt alloys and/or included in ferronickel.

[7]Nickel-cobalt content of ore produced as reported by New Caledonia's Mines Service. Of the total, about 97.323% is nickel; the balance is cobalt (based on average nickel-cobalt ratio in metallurgical products for 1880-1972).

COMMODITY REVIEW

Metals.—Emperor Mining produced sulfotelluride gold ores at Vatukoula throughout 1982. The company employed about 750 workers to mine and treat 370,000 tons of ore and recovered 35,000 troy ounces of gold and 9,500 troy ounces of silver. The increased output over that of 1981 was attributed to a new telluride plant, a carbon-in-pulp circuit in the mill, the absence of labor disputes, and an increase in the underground workforce. Since 1933, the mine at Vatukoula has produced 3.8 million troy ounces of gold and 1.3 million troy ounces of silver.

Emperor Mining's ore reserves at yearend, using a cutoff grade of 0.2 ounce of gold per ton, totaled 600,000 tons of measured ore at an average grade of 0.29 ounce of gold per ton. Indicated ore reserves totaled 187,000 tons at an average grade of 0.25 ounce of gold per ton.

Nonmetals.—Emperor Mining continued to produce burnt lime from its limestone quarry at Tau.

Fiji Industries Ltd. dredged 300,000 tons of coral sand from Suva Harbor and 100,000 tons of common sand and gravel from the Rewa River and its tributaries. Several tons of quarried stone was also recovered.

The Government's Mineral Resources Div. continued evaluating a phosphate clay deposit on Tuvutha Island where 1.5 million tons of 10% P_2O_5 was reported.

Mineral Fuels.—Fiji has no known deposits of oil or gas. However, Mapco Ltd. and Pacific Energy and Minerals Ltd. were drilling for oil and gas in Bligh Waters and Yasawa. The country possesses large offshore platform areas with water depths of less than 250 meters.

[2]Totals exclude unreported quantities valued at $1,732,800 in 1980 and $1,449,579 in 1981.

NAURU AND KIRIBATI

The Republic of Nauru and Kiribati lie just south of the equator, halfway between Honolulu, Hawaii, and Melbourne, Australia. Kiribati won independence from the United Kingdom in 1979 and is composed of Ocean, Gilbert, Line, and Phoenix Islands.

Phosphate rock produced in Nauru by Nauru Phosphate Corp. was 1.36 million tons, whereas Kiribati reported no production. Nauru exported 68% of its output to Australia, 24% to New Zealand, and the remainder to Japan and the Republic of Korea. The phosphate rock was mined on land between limestone pinnacles using grab buckets. Reserves of phosphate rock in Nauru were estimated at 32 million tons.

NEW CALEDONIA

Output of nickel ore, the principal mineral produced on the French territory island of New Caledonia, declined. Production of nickel matte by Société Métallurgique le Nickel (SLN), New Caledonia's only nickel operator, declined significantly, but output of ferronickel remained at about the 1981 level. Cobalt matte, a byproduct of nickel smelting operations, was also produced. Other minerals produced included chromite and construction materials.

The nickel laterite ore of New Caledonia was among the richest in the world with a minimum grade of 2.4%. Four major mines, located at Kouaoua, Poro, Thio, and Népoui, and a number of small mines supplied ore to the Doniambo smelter complex, which produced ferronickel and nickel matte. Most of the matte was shipped to SLN's refinery at Sandouville, France.

About 150 tons of byproduct cobalt was produced in New Caledonia in 1982. The cobalt, in nickel matte, was recovered as cobalt metal or as a compound. A significant quantity of the cobalt remained in the nickel products.

Inco Ltd. of Canada, in partnership with two French companies, began mining and processing chromite at Tiebaghi in the northern part of New Caledonia. During the year, 49,800 tons of chromite concentrate with an average Cr_2O_3 content of 48% to 56% was produced. The French companies, Banque de Paris and Compagnie Minière Dong-Trieu, have 45% of the equity in the operation, and Inco holds the rest. The initial plan was to produce 450 tons of ore per day to feed a nearby processing plant with an annual capacity of 110,000 tons. The reduction plant has an annual capacity of 85,000 tons of chromite products. The development cost of the project was $14 million.[3]

Inco continued to consider the development of lateritic nickel deposits in the southern part of the island. In accordance

with Government policy, Inco will be required to have a French partner before development begins.

Over 85% of the electric power generated in New Caledonia was consumed by SLN in its mining and smelting operations. New Caledonia has no domestic energy resources. Light fuels were imported from Singapore; fuel oil, from Australia; and industrial fuel, from Bahrain. The Plaine des Lacs region was considered to have hydroelectric development potential.

Table 5.—New Caledonia: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1980	1981	Sources, 1981	
			United States	Other (principal)
NONMETALS —Continued				
Precious and semiprecious stones other than diamond value, thousands	$168	$128	$1	France $95; Belgium-Luxembourg $10; Uruguay $5.
Salt and brine	518	440	--	Australia 160; France 137; West Germany 136.
Sodium and potassium compounds, n.e.s.:				
Potassium hydroxide including sodic and potassic peroxides	(1)	2	--	Italy 1.
Sodium hydroxide	81	55	--	France 53.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	173	108	--	France 84; Italy 18.
Worked	60	55	--	Republic of South Africa 33; France 11.
Gravel and crushed rock	22	80	--	France 52; Italy 27.
Sand other than metal-bearing	59	21	5	Australia 8; France 8.
Sulfur:				
Elemental, crude including native and byproduct	--	5,445	--	All from Canada.
Sulfuric acid	50	39	--	France 22; Australia 17.
Talc, steatite, soapstone, pyrophyllite	1	1	--	All from France.
Other:				
Crude	115	81	--	New Zealand 77.
Slag and dross, not metal-bearing	22	--		
Oxides and hydroxides of barium, magnesium, strontium	--	1	--	All from France.
Building materials of asphalt, asbestos and fiber cements, unfired nonmetals	410	536	--	France 492; Austria 22; Italy 17.
MINERAL FUELS AND RELATED MATERIALS				
Coal: All grades excluding briquets	119,799	82,351	--	Republic of South Africa 57,783; Australia 24,568.
Coke and semicoke	36	--		
Peat including briquets and litter	22	7	--	All from New Zealand.
Petroleum refinery products:				
Liquefied petroleum gas 42-gallon barrels	58,742	55,692	--	Australia 55,610.
Gasoline do	806,939	747,099	NA	NA.
Mineral jelly and wax do	8	8	--	Mainly from France.
Kerosine and jet fuel do	30,380	30,814	NA	NA.
Lubricants do	24,395	17,990	406	Australia 16,646.
Residual fuel oil thousand 42-gallon barrels	2,949	1,924	344	Bahrain 1,579.
Bitumen, other residues, bituminous mixtures do	21	11	(1)	Mainly from Singapore.
Tars and other crude chemicals derived from coal, gas, and petroleum	54	77	--	Australia 68.

PAPUA NEW GUINEA

The mining industry, particularly the Panguna Mine on the Island of Bougainville, has been one of the mainstays of the economy of Papua New Guinea. Although extensive exploration has been underway in Papua New Guinea for many years, Bougainville Copper Ltd. (BCL) remained essentially the country's only metal producing mining company. Gold and copper from the Panguna Mine were major sources of foreign exchange, accounting for over 40% of export earnings in 1982. Values of mineral output were as follows: copper, $185 million;[4] gold, $120 million; and silver, $7 million. These values represented 20% of the gross domestic product. Despite the mineral industry's financial importance, it employed only 10,000 of Papua New Guinea's workforce of 370,000.

The production of small quantities of

alluvial gold, by panning, and sand in the Bulolo Wau area was the only other major mineral activity. This was expected to change by 1985, as development of several major mines was scheduled for completion. One of these was the $1.6 billion Ok Tedi copper and gold mine in the Star Mountains in western Papua New Guinea. The first stage was scheduled for completion in July 1984 when gold production commences. Other mines scheduled to be producing later this decade are the Porgera gold mine, the Frieda River copper mine, and the Ramu River chromite and nickel mine.

The investment climate in Papua New Guinea has been favorable, and the Government promised even greater cooperation in the future. A new department, specifically responsible for industrial development, was created to assist investors with Government policies and new legislation affecting the mining industry. In the future, potential investors will quickly know the investment climate and opportunities where a majority of foreign equity is required. In general, the basic policies related to exploitation of minerals, including petroleum, were as follows: mineral resources belong to the Papua New Guinean people and the Government, and they must receive a fair return on extraction of minerals; foreign enterprises exploiting Papua New Guinea's mineral resources deserve a reasonable return on investment but gains beyond this will go to the Government; and the Government can regulate extractive enterprises to maximize benefits for local communities while minimizing harmful social and economic costs.

COMMODITY REVIEW

Metals.—*Chromite.*—The joint venture company of Nord Resources (69.5%) and MIM Holdings Ltd. (30.5%) completed prefeasibility studies at its Ramu River chromite-nickel-cobalt deposit. The three-layer lateritic deposit with the chromite layer overlying the cobalt and nickel layers has reserves of 225 million tons. The 10-foot-thick upper layer contains 107 million tons of sandy clay, 9% metallurgical-grade chromite.

The second layer, a 9-foot-thick limonitic laterite, has reserves of 82 million tons grading 1.12% nickel, 0.16% cobalt, and 6% chromite. The third layer, a 15-foot saprolite zone, has reserves of 35 million tons grading 1.46% nickel and 0.06% cobalt. Studies were being undertaken to determine a millsite.

Amax Exploration Australia Inc., a subsidiary of AMAX Inc., was evaluating chromite and other minerals found in beach sands along the Marobe coast (north Papua New Guinea), between the towns of Salamaua and Salua.

Copper.—The major copper deposits, Bougainville, Ok Tedi, and Frieda River, are with associated gold, silver, and/or molybdenum. The 1982 output of copper, gold, and silver at the Panguna Mine (Bougainville) was above the 1981 level. However, the mine encountered problems of declining grade and higher production cost. Since 1972, the grade of copper has decreased from 0.75% to less than 0.45%, gold has halved to 0.015 ounce per ton, and silver has declined from 0.066 ounce per ton to 0.043 ounce per ton. To offset the decreasing grade, the company installed an additional ball mill in 1982, which increased productivity. The ball mill was scheduled for 1983. About 43 million tons of ore was mined from the Panguna open pit in 1982, and the waste-to-ore ratio rose to 1.15:1. In 1982, sales totaled 159,000 tons of copper, 560,000 ounces of gold, and 1.4 million ounces of silver. Concentrates were shipped under long-term contracts to Japan, the Federal Republic of Germany, and Spain.

Ore reserves at Panguna were placed at 580 million tons averaging 0.40% copper and 0.015 ounce of gold per ton. Reserves are sufficient for the next two decades, but the company was actively exploring for new deposits.

Development work at the Ok Tedi copper-gold mine continued. Gold production was expected to commence in late 1984, and copper production in 1986. A joint venture of The Broken Hill Pty. Co. Ltd., Amoco Minerals Ltd., and three West German companies own and will operate the mine, which is located in the Star Mountain in the western highlands of Papua New Guinea near the border of Indonesia. The mine is 800 kilometers from the southern coast via the Fly River. Ok Tedi reserves are comprised of 34 million tons of gold ore having an average grade of 0.09 ounce of gold per ton, 315 million tons of porphyry copper ore averaging 0.7% copper with some molybdenum, and 25 million tons of skarn containing 1.17% copper. The gold ore is principally leached cap rock above the porphyry copper.

Exploration continued on the Frieda River porphyry orebody located in the Western Sepik Province, about 80 kilometers

northwest of the Ok Tedi Mine. Mineral reserves were estimated at 500 million tons of ore averaging 0.5% copper. A consortium of MIM Holdings of Australia (30%), Furukawa Mining Co. Ltd. and Metal Mining Agency of Japan (25%), Norddeutsche Affinerie AG of the Federal Republic of Germany (5%), Conzinc Riotinto of Australia Ltd. (20%), and the Papua New Guinean Government (20%) have been exploring the deposit. ASARCO Incorporated of the United States has a 49% interest in MIM Holdings.

A high-grade, massive sulfide deposit has been discovered and was being delineated a few kilometers away from the Frieda River orebody. This deposit is called the Nena project.

Exploration by Exoil NL and Transoil NL on Manus Island has indicated 160 million tons of 0.32% copper ore with associated gold, silver, and molybdenum mineralization. The existing infrastructure and good accessibility relative to the mainland deposits favor the prospects for developing the Manus Island deposit.

Gold and Silver.—Essentially all of Papua New Guinea's gold and silver was produced at BCL's Panguna copper mine. Gold production totaled 564,000 troy ounces and silver recovery totaled 1.4 million troy ounces.

Placer Development Ltd., MIM Holdings, and Consolidated Goldfields of Australia were jointly exploring and developing an alluvial gold deposit at Porgera in Papua New Guinea's central mountain range. Two zones were being explored. One zone was 250 meters long, 150 meters wide, and 250 meters deep, with an average of 0.07 ounce of gold and 0.13 ounce of silver per ton. The other zone has a length of 420 meters, a width of 250 meters, a depth of 240 meters, and an average of 0.08 ounce of gold and 0.13 ounce of silver per ton. The joint venture partners commissioned Fluor Mining & Metals Inc. to assess the potential for an economic operation based on gold mineralization only. Fluor reported that, because of the complexity of the ore, an expensive plant would be required for an acceptable recovery. Also, the cost of development in this isolated location may make it uneconomical. Exploration was continuing with the hope of finding higher grade mineralization.

Mineral Fuels.—Papua New Guinea reported no significant production of oil or gas, but exploration work was started in 1982. Recent survey results indicated that some geological structures had potential for substantial hydrocarbon reserves. Three exploration concession licenses were awarded during the year, and 11 licenses were being reviewed. Canada Superior Oil Co. Ltd. won Petroleum Prospecting License (PPL) 25, covering 60 blocks both onshore and offshore in the Gulf Province, to drill two wells with an option for drilling a third one.

Another concession was PPL 19, covering 110 blocks onshore and offshore at Madang and East Sepik, which will be worked jointly by Coastal Papua New Guinea Exploration Inc., Memmont New Guinea Oil Co., and St. Joe Petroleum Corp. The third concession was PPL 27, covering 94 blocks onshore in the southern highlands in Western and West Sepik Provinces. It will be operated by Amoco Papua New Guinea Exploration Co.

Australia's Broken Hill became involved in the search for oil through its subsidiary, Hematite Petroleum Pty. Ltd., which acquired a 25% interest in Australasian Petroleum Co. Pty. Ltd. (APC) and Island Exploration Co. Pty. Ltd. (IEC). Both APC and IEC are committed to drill three exploration wells at a cost of $17 million.

The Government's petroleum policy entitles it to receive 60% to 80% of future revenues from oil and gas production. The revenues will be derived from 1.25% royalty on wellhead values, a 50% tax on income, a tax on profits over an agreed upon rate of return, and a Government equity of up to 22.5%.

Table 6.—Papua New Guinea: Exports of copper, by destination

(Metric tons of copper content)

Destination	1980	1981
China	5,884	2,961
Germany, Federal Republic of	47,302	56,150
Japan	77,178	85,019
Korea, Republic of	--	2,741
Spain	11,877	18,474
Unspecified	--	2,720
Total	142,241	168,065

SOLOMON ISLANDS

Mineral output of the Solomon Islands consisted mainly of small quantities of alluvial gold and silver valued at $700,000.[5] Lime was recovered from marine shells, but the production quantity was not reported.

Substantial progress was made in geological mapping of the country. The data suggest a great diversity in the country's mineral resources. However, the quantity and quality of minerals was too low to interest mining companies at present metal prices.

Prospecting by companies in recent years was concentrated on bauxite. Mitsui Mining and Smelting Co. prospected on Rennell Island and Pacific Aluminium Ltd. prospected on Vaghena Island. Bauxite reserves in the western part of Rennell were estimated at 25 million tons with an alumina content of 48%, and those on Vaghena, at 30 million tons with an alumina content of 47%.

Other minerals prospected were nickel and copper. Nickel laterite was known to occur on the Islands of Santa Isabel, San Jorge, and southern Choiseul. Copper ore occurred in several parts of Guadalcanal, Florida, New Georgia, and Santa Isabel Islands. Other minerals found were gold, chromite, manganese, phosphate rock, and limestone.

The Government was actively seeking foreign investors for several mining projects. Investment may be made independently or jointly with local private firms or the Government.

TONGA

Tonga's mineral output consisted essentially of sand and gravel, coral, and other building material obtained from the beach and inland coral quarries. Production of coral and sand was 150,000 tons and 25,000 tons, respectively.

The Ministry of Land, Survey, and Natural Resources imposed stringent licensing and supervisory controls on sand mining. The escalation of sand mining to meet an increasing demand for locally manufactured concrete and concrete blocks caused severe coastal erosion.

Samuel Gary Oil Producers Inc. commenced offshore drilling between the Islands of Tongatapu and Eua. Data interpretation revealed promising prospects for hydrocarbons, but no significant quantities were encountered.

VANUATU

Vanuatu's only mine remained closed in 1982. The manganese mine located at Forari, 55 kilometers northwest of Port Vita on Vate (Efate) Island, is owned by Southland Mining Ltd. of Australia (87.5%) and public shareholders (12.5%) and was operated by Le Manganese de Vate. Some 120,000 tons of reserves remain in the Forari Mine; production is expected to resume in the future. The company employed some 100 native Vanuatuans and shipped 40% to 42% metallurgical-grade manganese, primarily to Japan.
