(1) Foveaux Formation, Bluff Peninsula, New Zealand; electron microprobe analysis; corresponds to Na_{2.51}K_{1.13}Ca_{0.17}Mg_{0.02}(Al_{4.08}Si_{7.93})O₂₄·nH₂O. (2) Biggest ‘Faraglione’ facing Aci Trezza, Sicily, Italy; corresponds to Na_{3.11}K_{1.05}Ca_{0.19}Mg_{0.06}(Al_{4.53}Si_{7.40})O₂₄·11.47H₂O.

Mineral Group: Zeolite group, chabazite series.

Occurrence: In volcanic rocks as basalts, andesite; rarer in limestones and schists; hydrothermally deposited in cavities and joints in ore veins. In tuff in lake deposits, altered from volcanic glass.

Association: Zeolites, nepheline, melilite, olivine, pyroxenes, amphiboles, axinite, epidote, calcite, tridymite, dolomite.

Distribution: Biggest ‘Faraglione’ facing Aci Trezza, Sicily, Italy [TL]. Analytically confirmed material from Foveaux Formation, Bluff Peninsula, New Zealand.

Name: From the Greek *chabazios*, an ancient name of a stone. A suffix indicates the most abundant extra-framework cation. Chabazite without a suffix is the correct name for a member of the chabazite series that is not specifically identified on compositional grounds.
