Polymorphism & Series: Solid solution with västmanlandite-(Ce), perhaps with perbøeite-(Ce).

Mineral Group: Gatelite supergroup, gatelite group.

Occurrence: In crystal aggregates, largely replacing cerite-(Ce), in a Fe-Cu-REE skarn deposit.

Association: Cerite-(Ce), törnebohmite-(Ce), ferriallanite-(Ce) (Nya Bastnäs); biraite-(Ce), Mg-analogue to biraite-(Ce), ferriallanite-(Ce), monazite-(Ce), winchite, dolomite, calcite, barite (Ren carbonatite sill).

Distribution: From the Nya Bastnäs Fe-Cu-REE skarn deposit, Bergslagen mining region (Skinnskatteberg) and Högfors Fe mines, Riddarhyttan, Västmanland, and the Rödbergsgruvan Fe mine, Nora, Örebro, Sweden. At the Biraya REE-Fe ore deposit, Vitim highland, Irkutskaya Oblast' and Mochalin Log, Potanin Mountains, southern Urals, Chelyabinsk Oblast', Russia. In the Ren carbonatite sill, Monashee Mountains, British Columbia, Canada.

Name: By analogy to IMA nomenclature for the epidote supergroup, it recognizes a member of the epidote-törnebohmite polysomatic series and emphasizes the relationship with *perbøeite-(Ce)*.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden (#52:414).
