Mineral Group: Tsumcorite-group.

Occurrence: A secondary mineral in the oxidized zone of a hydrothermal deposit containing gersdorffite and galena.

Association: Annabergite, nickellotharmeyerite, nickelaustinite, gaspéite, a Ni-dominant serpentine group member (presumably pecoraite), calcite, dolomite, aragonite, quartz, goethite, cerussite, arseniosiderite, mimetite, oxyplumboroméite (bindheimite), a Ca-rich roméite-group mineral (hydroxycalcioroméite?), unspecified manganese oxides/hydroxides.

Distribution: From the dumps of the Km-3 mine, Lavrion mining district, Attikí Prefecture, Greece.

Name: The Ni-dominant analog of tsumcorite.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (94317).
