Polymorphism & Series: Related to foitite through the substitution ^YAl³⁺ + ^WO₂ → ^YFe²⁺ + ^W(OH)¹⁻.

Mineral Group: Tourmaline supergroup, X-site vacant group.

Occurrence: From granitic pegmatite in high-grade migmatitic gneisses of pelitic composition. The oxy-foitite formation is related to the partial melting of these gneisses.

Association: Muscovite, K-feldspar, quartz.

Distribution: From the Cooma metamorphic Complex, New South Wales, Australia.

Name: Honors Franklin F. Foit Jr. (b. 1942), Washington State University, Pullman, Washington, USA, for his work on the tourmaline-supergroup. The prefix indicates OH⁻ dominance in the W-site.

Type Material: Museum of Earth Sciences, Department of Earth Sciences, Sapienza University of Rome, Italy (8829/84).
