To the Student

With the hope that this work will stimulate an interest in Engineering Mechanics and provide an acceptable guide to its understanding.

PREFACE

The main purpose of this book is to provide the student with a clear and thorough presentation of the theory and application of engineering mechanics. To achieve this objective, this work has been shaped by the comments and suggestions of hundreds of reviewers in the teaching profession, as well as many of the author's students. The twelfth edition of this book has been significantly enhanced from the previous edition and it is hoped that both the instructor and student will benefit greatly from these improvements.

New Features

Fundamental Problems. These problem sets are located just after the example problems. They offer students simple applications of the concepts and, therefore, provide them with the chance to develop their problem-solving skills before attempting to solve any of the standard problems that follow.You may consider these problems as extended examples since they *all have partial solutions and answers* that are given in the back of the book. Additionally, the fundamental problems offer students an excellent means of studying for exams; and they can be used at a later time as a preparation for the Fundamentals in Engineering Exam.

Content Revisions. Each section of the text was carefully reviewed and, in many areas, the material has been redeveloped to better explain the concepts. This has included adding or changing several of the examples in order to provide more emphasis on the applications of the important concepts.

Conceptual Problems. Throughout the text, usually at the end of each chapter, there is a set of problems that involve conceptual situations related to the application of the mechanics principles contained in the chapter. These analysis and design problems are intended to engage the students in thinking through a real-life situation as depicted in a photo. They can be assigned after the students have developed some expertise in the subject matter.

Additional Photos. The relevance of knowing the subject matter is reflected by the real world applications depicted in over 120 new and updated photos placed throughout the book. These photos are generally used to explain how the principles of mechanics apply to real-world situations. In some sections, photographs have been used to show how engineers must first make an idealized model for analysis and then proceed to draw a free-body diagram of this model in order to apply the theory.

New Problems. There are approximately 50%, or about 1600, new problems added to this edition including aerospace and petroleum engineering, and biomechanics applications. Also, this new edition now has approximately 17% more problems than in the previous edition.

Hallmark Features

Besides the new features mentioned above, other outstanding features that define the contents of the text include the following.

Organization and Approach. Each chapter is organized into well-defined sections that contain an explanation of specific topics, illustrative example problems, and a set of homework problems. The topics within each section are placed into subgroups defined by boldface titles.The purpose of this is to present a structured method for introducing each new definition or concept and to make the book convenient for later reference and review.

Chapter Contents. Each chapter begins with an illustration demonstrating a broadrange application of the material within the chapter. A bulleted list of the chapter contents is provided to give a general overview of the material that will be covered.

Emphasis on Free-Body Diagrams. Drawing a free-body diagram is particularly important when solving problems, and for this reason this step is strongly emphasized throughout the book. In particular, special sections and examples are devoted to show how to draw free-body diagrams. Specific homework problems have also been added to develop this practice.

Procedures for Analysis. A general procedure for analyzing any mechanical problem is presented at the end of the first chapter. Then this procedure is customized to relate to specific types of problems that are covered throughout the book.This unique feature provides the student with a logical and orderly method to follow when applying the theory. The example problems are solved using this outlined method in order to clarify its numerical application. Realize, however, that once the relevant principles have been mastered and enough confidence and judgment have been obtained, the student can then develop his or her own procedures for solving problems.

Important Points. This feature provides a review or summary of the most important concepts in a section and highlights the most significant points that should be realized when applying the theory to solve problems.

Conceptual Understanding. Through the use of photographs placed throughout the book, theory is applied in a simplified way in order to illustrate some of its more important conceptual features and instill the physical meaning of many of the terms used in the equations. These simplified applications increase interest in the subject matter and better prepare the student to understand the examples and solve problems.

Homework Problems. Apart from the Fundamental and Conceptual type problems mentioned previously, other types of problems contained in the book include the following:

• Free-Body Diagram Problems. Some sections of the book contain introductory problems that only require drawing the free-body diagram for the specific problems within a problem set. These assignments will impress upon the student the importance of mastering this skill as a requirement for a complete solution of any equilibrium problem.

• General Analysis and Design Problems. The majority of problems in the book depict realistic situations encountered in engineering practice. Some of these problems come from actual products used in industry. It is hoped that this realism will both stimulate the student's interest in engineering mechanics and provide a means for developing the skill to reduce any such problem from its physical description to a model or symbolic representation to which the principles of mechanics may be applied.

Throughout the book, there is an approximate balance of problems using either SI or FPS units. Furthermore, in any set, an attempt has been made to arrange the problems in order of increasing difficulty except for the end of chapter review problems, which are presented in random order.

• Computer Problems. An effort has been made to include some problems that may be solved using a numerical procedure executed on either a desktop computer or a programmable pocket calculator.The intent here is to broaden the student's capacity for using other forms of mathematical analysis without sacrificing the time needed to focus on the application of the principles of mechanics. Problems of this type, which either can or must be solved using numerical procedures, are identified by a "square" symbol (\bullet) preceding the problem number.

With so many homework problems in this new edition, they have now been placed in three different categories. Problems that are simply indicated by a problem number have an answer given in the back of the book. If a bullet (•) proceeds the problem number, then a suggestion, key equation, or additional numerical result is given along with the answer. Finally, an asterisk (*) before every fourth problem number indicates a problem without an answer.

Accuracy. As with the previous editions, apart from the author, the accuracy of the text and problem solutions has been thoroughly checked by four other parties: Scott Hendricks, Virginia Polytechnic Institute and State University; Karim Nohra, University of South Florida; Kurt Norlin, Laurel Tech Integrated Publishing Services; and finally Kai Beng, a practicing engineer, who in addition to accuracy review provided content development suggestions.

Contents

Statics

The subject of Statics is covered in the first 11 chapters, in which the principles are first applied to simple, then to more complicated situations. In a general sense, each principle is applied first to a particle, then a rigid body subjected to a coplanar system of forces, and finally to three-dimensional force systems acting on a rigid body.

Chapter 1 begins with an introduction to mechanics and a discussion of units. The vector properties of a concurrent force system are introduced in Chapter 2.This theory is then applied to the equilibrium of a particle in Chapter 3. Chapter 4 contains a general discussion of both concentrated and distributed force systems and the methods used to simplify them.The principles of rigid-body equilibrium are developed in Chapter 5 and then applied to specific problems involving the equilibrium of trusses, frames, and machines in Chapter 6, and to the analysis of internal forces in beams and cables in Chapter 7.Applications to problems involving frictional forces are discussed in Chapter 8, and topics related to the center of gravity and centroid are treated in Chapter 9. If time permits, sections involving more advanced topics, indicated by stars (★), may be covered. Most of these topics are included in Chapter 10 (area and mass moments of inertia) and Chapter 11 (virtual work and potential energy). Note that this material also provides a suitable reference for basic principles when it is discussed in more advanced courses. Finally, Appendix A provides a review and list of mathematical formulas needed to solve the problems in the book.

Alternative Coverage. At the discretion of the instructor, some of the material may be presented in a different sequence with no loss of continuity. For example, it is possible to introduce the concept of a force and all the necessary methods of vector analysis by first covering Chapter 2 and Section 4.2 (the cross product). Then after covering the rest of Chapter 4 (force and moment systems), the equilibrium methods of Chapters 3 and 5 can be discussed.

Dynamics

The kinematics of a particle is discussed in Chapter 12, followed by a discussion of particle kinetics in Chapter 13 (Equation of Motion), Chapter 14 (Work and Energy), and Chapter 15 (Impulse and Momentum). The concepts of particle dynamics contained in these four chapters are then summarized in a "review" section, and the student is given the chance to identify and solve a variety of problems. A similar sequence of presentation is given for the planar motion of a rigid body: Chapter 16 (Planar Kinematics), Chapter 17 (Equations of Motion), Chapter 18 (Work and Energy), and Chapter 19 (Impulse and Momentum), followed by a summary and review set of problems for these chapters.

If time permits, some of the material involving three-dimensional rigid-body motion may be included in the course. The kinematics and kinetics of this motion are discussed in Chapters 20 and 21, respectively. Chapter 22 (Vibrations) may be included if the student has the necessary mathematical background. Sections of the book that are considered to be beyond the scope of the basic dynamics course are indicated by a star (\star) and may be omitted. Note that this material also provides a suitable reference for basic principles when it is discussed in more advanced courses. Finally, Appendix A provides a list of mathematical formulas needed to solve the problems in the book, Appendix B provides a brief review of vector analysis, and Appendix C reviews application of the chain rule.

Alternative Coverage. At the discretion of the instructor, it is possible to cover Chapters 12 through 19 in the following order with no loss in continuity: Chapters 12 and 16 (Kinematics), Chapters 13 and 17 (Equations of Motion), Chapter 14 and 18 (Work and Energy), and Chapters 15 and 19 (Impulse and Momentum).

Acknowledgments

The author has endeavored to write this book so that it will appeal to both the student and instructor. Through the years, many people have helped in its development, and I will always be grateful for their valued suggestions and comments. Specifically, I wish to thank the following individuals who have contributed their comments relative to preparing the twelfth edition of this work.

Yesh P. Singh, *University of Texas–San Antonio* Manoj Chopra, *University of Central Florida* Kathryn McWilliams, *University of Saskatchewan* Daniel Linzell, *Penn State University* Larry Banta, *West Virginia University* Manohar L. Arora, *Colorado School of Mines* Robert Rennaker, *University of Oklahoma* Ahmad M. Itani, *University of Nevada* Per Reinhall, *University of Washington* Faissal A. Moslehy, *University of Central Florida* Richard R. Neptune, *University of Texas at Austin* Robert Rennaker, *University of Oklahoma*

There are a few people that I feel deserve particular recognition. Vince O'Brien, Director of Team-Based Project Management, and Rose Kernan, my production editor for many years, have both provided me with their encouragement and support. Frankly, without their help, this totally revised and enhanced edition would not be possible. Furthermore a long-time friend and associate, Kai Beng Yap, was of great help to me in checking the entire manuscript and helping to prepare the problem solutions.A special note of thanks also goes to Kurt Norlin of Laurel Tech Integrated Publishing Services in this regard. During the production process I am thankful for the assistance of my wife, Conny, and daughter, Mary Ann, with the proofreading and typing needed to prepare the manuscript for publication.

Lastly, many thanks are extended to all my students and to members of the teaching profession who have freely taken the time to e-mail me their suggestions and comments. Since this list is too long to mention, it is hoped that those who have given help in this manner will accept this anonymous recognition.

I would greatly appreciate hearing from you if at any time you have any comments, suggestions, or problems related to any matters regarding this edition.

Resources to Accompany Engineering Mechanics: Statics, Twelfth Edition

MasteringENGINEERING

MasteringEngineering is the most technologically advanced online tutorial and homework system. It tutors students individually while providing instructors with rich teaching diagnostics.

MasteringEngineering is built upon the same platform as MasteringPhysics, the only online physics homework system with research showing that it improves student learning. A wide variety of published papers based on NSF-sponsored research and tests illustrate the benefits of MasteringEngineering. To read these papers, please visit **<www.masteringengineering.com>**.

MasteringEngineering for Students

MasteringEngineering improves understanding. As an Instructor-assigned homework and tutorial system, MasteringEngineering is designed to provide students with customized coaching and individualized feedback to help improve problem-solving skills. Students complete homework efficiently and effectively with tutorials that provide targeted help.

V Immediate and specific feedback on wrong answers coach students individually. Specific feedback on common errors helps explain why a particular answer is not correct.

MasteringEngineering for Instructors

Incorporate dynamic homework into your course with automatic grading and adaptive tutoring. Choose from a wide variety of stimulating problems, including free-body diagram drawing capabilities, algorithmically-generated problem sets, and more.

MasteringEngineering emulates the instructor's office-hour environment, coaching students on problem-solving techniques by asking students simpler sub-questions.

Color-coded gradebook instantly identifies students in difficulty, or challenging areas for your class.

 One click compiles all your favorite teaching diagnostics the hardest problem, class grade distribution, even which students are spending the most or the least time on homework.

Contact your Pearson Prentice Hall representative for more information.

Resources for Instructors

• Instructor's Solutions Manuals. These supplements provide complete solutions supported by problem statements and problem figures. The twelfth edition manuals were revised to improve readability and was triple accuracy checked.

• Instructor's Resource CD-ROM. Visual resources to accompany the text are located on this CD as well as on the Pearson Higher Education website: [www.pearsonhighered.com.](www.pearsonhighered.com) If you are in need of a login and password for this site, please contact your local Pearson representative.Visual resources include all art from the text, available in PowerPoint slide and JPEG format.

• Video Solutions. Developed by Professor Edward Berger, University of Virginia, video solutions are located on the Companion Website for the text and offer step-by-step solution walkthroughs of representative homework problems from each section of the text. Make efficient use of class time and office hours by showing students the complete and concise problem-solving approaches that they can access any time and view at their own pace. The videos are designed to be a flexible resource to be used however each instructor and student prefers. A valuable tutorial resource, the videos are also helpful for student self-evaluation as students can pause the videos to check their understanding and work alongside the video. Access the videos at <www.prenhall.com/hibbeler> and follow the links for the *Engineering Mechanics: Statics and Dynamics*, Twelfth Edition text.

Resources for Students

• Statics and Dynamics Study Packs. These supplements contains chapter-by-chapter study materials, a Free-Body Diagram Workbook and access to the Companion Website where additional tutorial resources are located.

• Companion Website. The Companion Website, located at [www.prenhall.com/hibbeler,](www.prenhall.com/hibbeler) includes opportunities for practice and review including:

- **Video Solutions**—Complete, step-by-step solution walkthroughs of representative homework problems from each section. Videos offer:
	- **Fully worked Solutions**—Showing every step of representative homework problems, to help students make vital connections between concepts.
	- **Self-paced Instruction**—Students can navigate each problem and select, play, rewind, fast-forward, stop, and jump-tosections within each problem's solution.
	- **24/7 Access**—Help whenever students need it with over 20 hours of helpful review. An access code for the *Engineering Mechanics: Statics and Dynamics*,Twelfth Edition website is included inside the *Statics Study Pack* or the *Dynamics Study Pack*. To redeem the code and gain access to the site, go to<www.prenhall.com/hibbeler> and follow the directions on the access code card. Access can also be purchased directly from the site.
- Statics and Dynamics Practice Problems Workbooks. These workbooks contain additional worked problems. The problems are partially solved and are designed to help guide students through difficult topics.

Ordering Options

The *Statics Study Pack* and MasteringEngineering resources are available as stand-alone items for student purchase and are also available packaged with the texts. The ISBN for each valuepack is as follows:

- *Engineering Mechanics: Statics* with Study Pack: 0-13-246200-1
- *Engineering Mechanics: Statics* with Study Pack and MasteringEngineering Student Access Card: 0-13-701629-8

The *Dynamics Study Pack* and MasteringEngineering resources are available as stand-alone items for student purchase and are also available packaged with the texts. The ISBN for each valuepack is as follows:

- *Engineering Mechanics: Dynamics* with Study Pack: 0-13-700239-4
- *Engineering Mechanics: Dynamics* with Study Pack and MasteringEngineering Student Access Card: 0-13-701630-1

Custom Solutions

New options for textbook customization are now available for *Engineering Mechanics*,Twelfth Edition. Please contact your local Pearson/Prentice Hall representative for details.

ENGINEERING MECHANICS

STATICS

TWELFTH EDITION

The design of this rocket and gantry structure requires a basic knowledge of both statics and dynamics, which form the subject matter of engineering mechanics.

[General Principles](#page-11-0)

[CHAPTER OBJECTIVES](#page-11-0)

• To provide an introduction to the basic quantities and idealizations of mechanics.

1

- To give a statement of Newton's Laws of Motion and Gravitation.
- To review the principles for applying the SI system of units.
- To examine the standard procedures for performing numerical calculations.
- To present a general guide for solving problems.

1.1 [Mechanics](#page-11-0)

Mechanics is a branch of the physical sciences that is concerned with the state of rest or motion of bodies that are subjected to the action of forces. In general, this subject can be subdivided into three branches:*rigid-body mechanics, deformable-body mechanics*, and *fluid mechanics*. In this book we will study rigid-body mechanics since it is a basic requirement for the study of the mechanics of deformable bodies and the mechanics of fluids. Furthermore, rigid-body mechanics is essential for the design and analysis of many types of structural members, mechanical components, or electrical devices encountered in engineering.

Rigid-body mechanics is divided into two areas: statics and dynamics. *Statics* deals with the equilibrium of bodies, that is, those that are either at rest or move with a constant velocity; whereas *dynamics* is concerned with the accelerated motion of bodies. We can consider statics as a special case of dynamics, in which the acceleration is zero; however, statics deserves separate treatment in engineering education since many objects are designed with the intention that they remain in equilibrium.

Historical Development. The subject of statics developed very early in history because its principles can be formulated simply from measurements of geometry and force. For example, the writings of Archimedes (287–212 B.C.) deal with the principle of the lever. Studies of the pulley, inclined plane, and wrench are also recorded in ancient writings—at times when the requirements for engineering were limited primarily to building construction.

Since the principles of dynamics depend on an accurate measurement of time, this subject developed much later. Galileo Galilei (1564–1642) was one of the first major contributors to this field. His work consisted of experiments using pendulums and falling bodies. The most significant contributions in dynamics, however, were made by Isaac Newton (1642–1727), who is noted for his formulation of the three fundamental laws of motion and the law of universal gravitational attraction. Shortly after these laws were postulated, important techniques for their application were developed by such notables as Euler, D'Alembert, Lagrange, and others.

1.2 [Fundamental Concepts](#page-11-0)

Before we begin our study of engineering mechanics, it is important to understand the meaning of certain fundamental concepts and principles.

Basic Quantities. The following four quantities are used throughout mechanics.

Length. *Length* is used to locate the position of a point in space and thereby describe the size of a physical system. Once a standard unit of length is defined, one can then use it to define distances and geometric properties of a body as multiples of this unit.

Time. *Time* is conceived as a succession of events. Although the principles of statics are time independent, this quantity plays an important role in the study of dynamics.

Mass. *Mass* is a measure of a quantity of matter that is used to compare the action of one body with that of another. This property manifests itself as a gravitational attraction between two bodies and provides a measure of the resistance of matter to a change in velocity.

Force. In general, *force* is considered as a "push" or "pull" exerted by one body on another. This interaction can occur when there is direct contact between the bodies, such as a person pushing on a wall, or it can occur through a distance when the bodies are physically separated. Examples of the latter type include gravitational, electrical, and magnetic forces. In any case, a force is completely characterized by its magnitude, direction, and point of application.

Idealizations. Models or idealizations are used in mechanics in order to simplify application of the theory. Here we will consider three important idealizations.

Particle. A *particle* has a mass, but a size that can be neglected. For example, the size of the earth is insignificant compared to the size of its orbit, and therefore the earth can be modeled as a particle when studying its orbital motion. When a body is idealized as a particle, the principles of mechanics reduce to a rather simplified form since the geometry of the body *will not be involved* in the analysis of the problem.

Rigid Body. A *rigid body* can be considered as a combination of a large number of particles in which all the particles remain at a fixed distance from one another, both before and after applying a load. This model is important because the material properties of any body that is assumed to be rigid will not have to be considered when studying the effects of forces acting on the body. In most cases the actual deformations occurring in structures, machines, mechanisms, and the like are relatively small, and the rigid-body assumption is suitable for analysis.

Concentrated Force. A *concentrated force* represents the effect of a loading which is assumed to act at a point on a body. We can represent a load by a concentrated force, provided the area over which the load is applied is very small compared to the overall size of the body.An example would be the contact force between a wheel and the ground.

Three forces act on the hook at *A*. Since these forces all meet at a point, then for any force analysis, we can assume the hook to be represented as a particle.

Steel is a common engineering material that does not deform very much under load.Therefore, we can consider this railroad wheel to be a rigid body acted upon by the concentrated force of the rail.

Newton's Three Laws of Motion. Engineering mechanics is formulated on the basis of Newton's three laws of motion, the validity of which is based on experimental observation. These laws apply to the motion of a particle as measured from a *nonaccelerating* reference frame. They may be briefly stated as follows.

First Law. A particle originally at rest, or moving in a straight line with constant velocity, tends to remain in this state provided the particle is *not* subjected to an unbalanced force, Fig. 1–1*a*.

Second Law. A particle acted upon by an *unbalanced force* **F** experiences an acceleration **a** that has the same direction as the force and a magnitude that is directly proportional to the force, Fig. 1–1*b*.* If **F** is applied to a particle of mass *m*, this law may be expressed mathematically as

Third Law. The mutual forces of action and reaction between two particles are equal, opposite, and collinear, Fig. 1–1*c*.

*Stated another way, the unbalanced force acting on the particle is proportional to the time rate of change of the particle's linear momentum.

Newton's Law of Gravitational Attraction. Shortly after formulating his three laws of motion, Newton postulated a law governing the gravitational attraction between any two particles. Stated mathematically,

$$
F = G \frac{m_1 m_2}{r^2} \tag{1-2}
$$

where

 $F =$ force of gravitation between the two particles

 $G =$ universal constant of gravitation; according to force of gravitation between the two particles

universal constant of gravitation; according to

experimental evidence, $G = 66.73(10^{-12}) \text{ m}^3/(\text{kg} \cdot \text{s}^2)$

 m_1 , m_2 = mass of each of the two particles

 $r =$ distance between the two particles

Weight. According to Eq. 1–2, any two particles or bodies have a mutual attractive (gravitational) force acting between them. In the case of a particle located at or near the surface of the earth, however, the only gravitational force having any sizable magnitude is that between the earth and the particle. Consequently, this force, termed the *weight*, will be the only gravitational force considered in our study of mechanics.

From Eq. 1–2, we can develop an approximate expression for finding the From Eq. 1–2, we can develop an approximate expression for finding the weight *W* of a particle having a mass $m_1 = m$. If we assume the earth to be a nonrotating sphere of constant density and having a mass $m_2 = M$ then weight *W* of a particle having a mass $m_1 = m$. If we assume the earth to be
a nonrotating sphere of constant density and having a mass $m_2 = M_e$, then
if *r* is the distance between the earth's center and the particle we if *r* is the distance between the earth's center and the particle, we have

$$
W = G \frac{m M_e}{r^2}
$$

Letting $g = GM_e/r^2$ yields

$$
W = mg \tag{1-3}
$$

By comparison with $\mathbf{F} = m\mathbf{a}$, we can see that *g* is the acceleration due to gravity. Since it depends on *r*, then the weight of a body is *not* an absolute gravity. Since it depends on *r*, then the weight of a body is *not* an absolute quantity. Instead, its magnitude is determined from where the measurement was made. For most engineering calculations, however, *g* is determined at sea level and at a latitude of 45°, which is considered the "standard location."

1.3 [Units of Measurement](#page-11-0)

The four basic quantities—length, time, mass, and force—are not all independent from one another; in fact, they are *related* by Newton's second independent from one another; in fact, they are *related* by Newton's second
law of motion, $\mathbf{F} = m\mathbf{a}$. Because of this, the *units* used to measure these
quantities cannot all be selected arbitrarily. The equality law of motion, $\mathbf{F} = m\mathbf{a}$. Because of this, the *units* used to measure these quantities cannot *all* be selected arbitrarily. The equality $\mathbf{F} = m\mathbf{a}$ is maintained only if three of the four units called hase maintained only if three of the four units, called *base units*, are *defined* and the fourth unit is then *derived* from the equation.

The astronaut is weightless, for all practical purposes, since she is far removed from the gravitational field of the earth.

SI Units. The International System of units, abbreviated SI after the French "Système International d'Unités," is a modern version of the metric system which has received worldwide recognition. As shown in Table 1–1, the SI system defines length in meters (m), time in seconds (s), and mass in kilograms (kg). The unit of force, called a newton (N), is *derived* from kilograms (kg). The unit of force, called a newton (N), is *derived* from $\mathbf{F} = m\mathbf{a}$. Thus, 1 newton is equal to a force required to give 1 kilogram of mass an acceleration of 1 m/s^2 ($\mathbf{N} = \mathbf{k} \mathbf{a} \cdot \mathbf{m$ kilograms (kg). The unit of force, called a ne
 F = *m***a**. Thus, 1 newton is equal to a force req

mass an acceleration of 1 m/s^2 (N = kg·m/s²).

If the weight of a body located at the "standard location" is to be determined in newtons, then Eq. 1–3 must be applied. Here measurements determined in newtons, then Eq. 1–3 must be applied. Here measurement
give $g = 9.806 65$ m/s²; however, for calculations, the value $g = 9.81$ m/s
will be used Thus will be used.Thus, 2 rmined in newton:
 $g = 9.806 65 \text{ m/s}$
pe used Thus 2

$$
W = mg \t(g = 9.81 \text{ m/s}^2)
$$
 (1-4)

Therefore, a body of mass 1 kg has a weight of 9.81 N, a 2-kg body weighs 19.62 N, and so on, Fig. 1–2*a*.

U.S. Customary. In the U.S. Customary system of units (FPS) length is measured in feet (ft), time in seconds (s), and force in pounds (lb), is measured in feet (ft), time in seconds (s), and force in pounds (lb),
Table 1–1. The unit of mass, called a *slug*, is *derived* from $\mathbf{F} = m\mathbf{a}$. Hence,
1 slug is equal to the amount of matter accelerated at 1 ft 1 slug is equal to the amount of matter accelerated at 1 ft/s^2 when acted Table 1–1. The unit of mass, called a *slug*,
1 slug is equal to the amount of matter a
upon by a force of 1 lb (slug = lb \cdot s²/ft).

Therefore, if the measurements are made at the "standard location," Therefore, if the measurements are n
where $g = 32.2$ ft/s², then from Eq. 1–3, 2

$$
m = \frac{W}{g} \qquad (g = 32.2 \text{ ft/s}^2) \tag{1-5}
$$

And so a body weighing 32.2 lb has a mass of 1 slug, a 64.4-lb body has a mass of 2 slugs, and so on, Fig. 1–2*b*.

Fig. 1–2

Conversion of Units. Table 1–2 provides a set of direct conversion factors between FPS and SI units for the basic quantities. Also, in the FPS system, recall that 1 ft = 12 in. (inches), 5280 ft = 1 mi (mile), 1000 lb = 1 kip (kilo-pound), and 2000 lb = 1 ton.

1.4 [The International System of Units](#page-11-0)

The SI system of units is used extensively in this book since it is intended to become the worldwide standard for measurement. Therefore, we will now present some of the rules for its use and some of its terminology relevant to engineering mechanics.

Prefixes. When a numerical quantity is either very large or very small, the units used to define its size may be modified by using a prefix. Some of the prefixes used in the SI system are shown in Table 1–3. Each represents a multiple or submultiple of a unit which, if applied successively, moves the decimal point of a numerical quantity to every third place.* For example, $4000000N = 4000kN$ (kilo-newton) = $4MN$ (mega-newton), or 0.005 m = 5 mm (milli-meter). Notice that the SI system does not include the multiple deca (10) or the submultiple centi (0.01), which form part of the metric system. Except for some volume and area measurements, the use of these prefixes is to be avoided in science and engineering.

* The kilogram is the only base unit that is defined with a prefix.

Rules for Use. Here are a few of the important rules that describe the proper use of the various SI symbols:

- Quantities defined by several units which are multiples of one another are separated by a *dot* to avoid confusion with prefix notation, as Quantities defined by several units which are multiples of one another
are separated by a *dot* to avoid confusion with prefix notation, as
indicated by $N = kg \cdot m/s^2 = kg \cdot m \cdot s^{-2}$. Also, $m \cdot s$ (meter-second), whereas ms (milli-second).
- The exponential power on a unit having a prefix refers to both the unit *and* its prefix. For example, μ N² = $(\mu$ N)² = μ N· μ N. Likewise, mm^2 represents $(mm)^2 = mm \cdot mm$. power on a unit h:
x. For example, μ N²
(mm)² = mm · mm it having a prefix refers t
 μ N² = $(\mu$ N)² = μ N· μ N
- With the exception of the base unit the kilogram, in general avoid the use of a prefix in the denominator of composite units. For example, do not write N/m m, but rather k N/m ; also, m/mg should be written as Mm/kg .
- When performing calculations, represent the numbers in terms of their *base or derived units* by converting all prefixes to powers of 10. The final result should then be expressed using a *single prefix*. Also, after calculation, it is best to keep numerical values between 0.1 and 1000; otherwise, a suitable prefix should be chosen. For example,

 $(50 \text{ kN})(60 \text{ nm}) = [50(10^3) \text{ N}][60(10^{-9}) \text{ m}]$ = $[50(10^3) \text{ N}][60(10^{-9}) \text{ m}]$
= $3000(10^{-6}) \text{ N} \cdot \text{m} = 3(10^{-3}) \text{ N} \cdot \text{m} = 3 \text{ mN} \cdot \text{m}$

1.5 [Numerical Calculations](#page-11-0)

Numerical work in engineering practice is most often performed by using handheld calculators and computers. It is important, however, that the answers to any problem be reported with both justifiable accuracy and appropriate significant figures. In this section we will discuss these topics together with some other important aspects involved in all engineering calculations.

Dimensional Homogeneity. The terms of any equation used to describe a physical process must be *dimensionally homogeneous;* that is, each term must be expressed in the same units. Provided this is the case, all the terms of an equation can then be combined if numerical values are substituted for the variables. Consider, for example, the equation are substituted for the variables. Consider, for example, the equation $s = vt + \frac{1}{2}at^2$, where, in SI units, s is the position in meters, m, t is time in seconds s v is velocity in m/s and a is acceleration in m/s². Beg seconds, s, v is velocity in m/s and a is acceleration in m/s^2 . Regardless of how this equation is evaluated it maintains its dimensional homogeneity. how this equation is evaluated, it maintains its dimensional homogeneity. In the form stated, each of the three terms is expressed in meters In the form stated, each of the three terms is expressed in meters $[m,(m/s) \, \varepsilon, (m/s^2) \, \varepsilon^2]$ or solving for a, $a = 2s/t^2 - 2v/t$, the terms are each expressed in units of $m/s^2 \, \ln/s^2 \, m/s^2 \, (m/s)/s$ each expressed in units of m/s^2 [m/s², m/s², (m/s)/s].

Computers are often used in engineering for advanced design and analysis.

Keep in mind that problems in mechanics always involve the solution of dimensionally homogeneous equations, and so this fact can then be used as a partial check for algebraic manipulations of an equation.

Significant Figures. The number of significant figures contained in any number determines the accuracy of the number. For instance, the number 4981 contains four significant figures. However, if zeros occur at the end of a whole number, it may be unclear as to how many significant figures the number represents. For example, 23 400 might have three (234), four (2340), or five (23 400) significant figures. To avoid these ambiguities, we will use *engineering notation* to report a result. This requires that numbers be rounded off to the appropriate number of significant digits and then expressed in multiples of (10^3) , such as (10^3) , (10^6) , or (10^{-9}) . For instance, if 23 400 has five significant figures, it is written as 23.400(103), but if it has only three significant figures, it is written as $23.4(10^3)$.

If zeros occur at the beginning of a number that is less than one, then the zeros are not significant. For example, 0.00821 has three significant figures. Using engineering notation, this number is expressed as $8.21(10^{-3})$. Likewise, 0.000582 can be expressed as $0.582(10^{-3})$ or $582(10^{-6})$.

Rounding Off Numbers. Rounding off a number is necessary so that the accuracy of the result will be the same as that of the problem data. As a general rule, any numerical figure ending in five or greater is rounded up and a number less than five is rounded down. The rules for rounding off numbers are best illustrated by examples. Suppose the number 3.5587 is to be rounded off to *three* significant figures. Because the fourth digit (8) is *greater than* 5, the third number is rounded up to 3.56. Likewise 0.5896 becomes 0.590 and 9.3866 becomes 9.39. If we round off 1.341 to three significant figures, because the fourth digit (1) is *less than* 5, then we get 1.34. Likewise 0.3762 becomes 0.376 and 9.871 becomes 9.87. There is a special case for any number that has a 5 with zeroes following it. As a general rule, if the digit preceding the 5 is an *even number*, then this digit is *not* rounded up. If the digit preceding the 5 is an *odd number*, then it is rounded up. For example, 75.25 rounded off to three significant digits becomes 75.2, 0.1275 becomes 0.128, and 0.2555 becomes 0.256.

Calculations. When a sequence of calculations is performed, it is best to store the intermediate results in the calculator. In other words, do not round off calculations until expressing the final result. This procedure maintains precision throughout the series of steps to the final solution. In this text we will generally round off the answers to three significant figures since most of the data in engineering mechanics, such as geometry and loads, may be reliably measured to this accuracy.

When solving problems, do the work as neatly as possible. Being neat will stimulate clear and orderly thinking, and vice versa.

1.6 [General Procedure for Analysis](#page-11-0)

The most effective way of learning the principles of engineering mechanics is to *solve problems*. To be successful at this, it is important to always present the work in a *logical* and *orderly manner*, as suggested by the following sequence of steps:

- Read the problem carefully and try to correlate the actual physical situation with the theory studied.
- Tabulate the problem data and draw any necessary diagrams.
- Apply the relevant principles, generally in mathematical form.When writing any equations, be sure they are dimensionally homogeneous.
- Solve the necessary equations, and report the answer with no more than three significant figures.
- Study the answer with technical judgment and common sense to determine whether or not it seems reasonable.

Important Points

- Statics is the study of bodies that are at rest or move with constant velocity.
- A particle has a mass but a size that can be neglected.
- A rigid body does not deform under load.
- Concentrated forces are assumed to act at a point on a body.
- Newton's three laws of motion should be memorized.
- Mass is measure of a quantity of matter that does not change from one location to another.
- Weight refers to the gravitational attraction of the earth on a body or quantity of mass. Its magnitude depends upon the elevation at which the mass is located.
- In the SI system the unit of force, the newton, is a derived unit. The meter, second, and kilogram are base units.
- Prefixes G, M, k, m, μ , and n are used to represent large and small numerical quantities. Their exponential size should be known, along with the rules for using the SI units.
- Perform numerical calculations with several significant figures, and then report the final answer to three significant figures.
- Algebraic manipulations of an equation can be checked in part by verifying that the equation remains dimensionally homogeneous.
- Know the rules for rounding off numbers.

$EXAMPLE$ 1.1

Convert 2 km/h to m/s How many ft/s is this?

SOLUTION

SOLUTION
Since $1 \text{ km} = 1000 \text{ m}$ and $1 \text{ h} = 3600 \text{ s}$, the factors of conversion are arranged in the following order, so that a cancellation of the units can be applied:

$$
2 \text{ km/h} = \frac{2 \text{ km}}{\text{h}} \left(\frac{1000 \text{ m}}{\text{ km}} \right) \left(\frac{1 \text{ h}}{3600 \text{ s}} \right)
$$

$$
= \frac{2000 \text{ m}}{3600 \text{ s}} = 0.556 \text{ m/s} \qquad \text{Ans.}
$$

From Table 1–2, 1 ft = 0.3048 m. Thus,

$$
0.556 \text{ m/s} = \left(\frac{0.556 \text{ m}}{\text{s}}\right) \left(\frac{1 \text{ ft}}{0.3048 \text{ m}}\right)
$$

$$
= 1.82 \text{ ft/s} \qquad \qquad \text{Ans.}
$$

NOTE: Remember to round off the final answer to three significant figures.

EXAMPLE 1.2

CONVILLET **1.2**
Convert the quantities 300 lb \cdot s and 52 slug/ft³ to appropriate SI units.

SOLUTION

 $1 lb = 4.4482 N$

Using Table 1–2, 1 lb = 4.448 2 N.
\n
$$
300 \text{ lb} \cdot \text{s} = 300 \text{ lb} \cdot \text{s} \left(\frac{4.448 \text{ N}}{1 \text{ lb}} \right)
$$
\n
$$
= 1334.5 \text{ N} \cdot \text{s} = 1.33 \text{ kN} \cdot \text{s} \qquad \text{Ans.}
$$

Since 1 slug = 14.5938 kg and 1 ft = 0.304 8 m, then

$$
52 \text{ slug/ft}^3 = \frac{52 \text{ sky}}{\text{ft}^3} \left(\frac{14.59 \text{ kg}}{1 \text{ sky}} \right) \left(\frac{1 \text{ ft}}{0.304 \text{ 8 m}} \right)^3
$$

= 26.8(10³) kg/m³
= 26.8 Mg/m³ Ans.

$EXAMPLE$ 1.3

1

Evaluate each of the following and express with SI units having an appropriate prefix: (a) $(50 \text{ mN})(6 \text{ GN})$, (b) $(400 \text{ mm})(0.6 \text{ MN})^2$, (c) $45 \text{ MN}^3/900 \text{ Gg}.$

SOLUTION

First convert each number to base units, perform the indicated operations, then choose an appropriate prefix.

Part (a)

$$
(50 \text{ mN})(6 \text{ GN}) = [50(10^{-3}) \text{ N}][6(10^{9}) \text{ N}]
$$

= 300(10⁶) N²
= 300(10⁶) N² $\left(\frac{1 \text{ kN}}{10^{3} \text{ N}}\right) \left(\frac{1 \text{ kN}}{10^{3} \text{ N}}\right)$
= 300 kN² Ans.

NOTE: Keep in mind the convention $kN^2 = (kN)^2 = 10^6 N^2$.

Part (b)

$$
(400 \text{ mm})(0.6 \text{ MN})^2 = [400(10^{-3}) \text{ m}][0.6(10^6) \text{ N}]^2
$$

= [400(10^{-3}) \text{ m}][0.36(10^{12}) \text{ N}^2]
= 144(10^9) \text{ m} \cdot \text{N}^2
= 144 \text{ Gm} \cdot \text{N}^2 *Ans.*

We can also write

so write
\n
$$
144(10^9) \text{ m} \cdot \text{N}^2 = 144(10^9) \text{ m} \cdot \text{N}^2 \left(\frac{1 \text{ MN}}{10^6 \text{ N}}\right) \left(\frac{1 \text{ MN}}{10^6 \text{ N}}\right)
$$
\n
$$
= 0.144 \text{ m} \cdot \text{MN}^2
$$

Ans.

Part (c)

$$
\frac{45 \text{ MN}^3}{900 \text{ Gg}} = \frac{45(10^6 \text{ N})^3}{900(10^6) \text{ kg}}
$$

= 50(10⁹) N³/kg
= 50(10⁹) N³ $\left(\frac{1 \text{ kN}}{10^3 \text{ N}}\right)^3 \frac{1}{\text{ kg}}$
= 50 kN³/kg *Ans.*

PROBLEMS **The Contract of Contract Contrac**

1–1. Round off the following numbers to three significant figures: (a) 4.65735 m, (b) 55.578 s, (c) 4555 N, and (d) 2768 kg.

1–2. Represent each of the following combinations of units in the correct SI form using an appropriate prefix: (a) μ MN, (b) N/μ m, (c) MN/kg^2 , and (d) kN/ms .

1–3. Represent each of the following quantities in the correct SI form using an appropriate prefix: (a) 0.000431 kg, (b) $35.3(10^3)$ N, and (c) 0.00532 km.

***1–4.** Represent each of the following combinations of units in the correct SI form: (a) Mg/ms , (b) N/mm , and (c) $mN/(kg \cdot \mu s)$. **4.** Represents in the cord mN/(kg $\cdot \mu$ s) Mg/ms , (b) N/mm

1–5. Represent each of the following combinations of units in the correct SI form using an appropriate prefix: **1–5.** Represent each of the following counits in the correct SI form using an app (a) $kN/\mu s$, (b) Mg/mN, and (c) MN/(kg·ms).

1–6. Represent each of the following to three significant figures and express each answer in SI units using an appropriate prefix: (a) $45\,320\,kN$, (b) $568(10^5)$ mm, and (c) 0.005 63 mg.

1–7. A rocket has a mass of $250(10^3)$ slugs on earth. Specify (a) its mass in SI units and (b) its weight in SI units. If the rocket is on the moon, where the acceleration due to If the rocket is on the moon, where the acceleration due to

1–13. Convert each of the following to three significant **1–13.** Convert each of the following to three significant figures: (a) 20 lb \cdot ft to N \cdot m, (b) 450 lb/ft³ to kN/m³, and (c) 15 ft/h to mm/s.

1–14. The density (mass/volume) of aluminum is 5.26 slug/ft³. Determine its density in SI units. Use an appropriate prefix.

1–15. Water has a density of 1.94 slug/ft³. What is the density expressed in SI units? Express the answer to three significant figures.

***1–16.** Two particles have a mass of 8 kg and 12 kg, respectively. If they are 800 mm apart, determine the force of gravity acting between them. Compare this result with the weight of each particle.

1–17. Determine the mass in kilograms of an object that has a weight of (a) 20 mN , (b) 150 kN , and (c) 60 MN . Express the answer to three significant figures.

1–18. Evaluate each of the following to three significant figures and express each answer in SI units using an appropriate prefix: (a) $(200 \text{ kN})^2$, (b) $(0.005 \text{ mm})^2$, and (c) (400 m)³.

1–19. Using the base units of the SI system, show that Eq. 1–2 is a dimensionally homogeneous equation which gives *F* in newtons. Determine to three significant figures the gravitational force acting between two spheres that are touching each other. The mass of each sphere is 200 kg and the radius is 300 mm.

***1–20.** Evaluate each of the following to three significant figures and express each answer in SI units using an appropriate prefix: (a) $(0.631 \text{ Mm})/(8.60 \text{ kg})^2$, and (b) $(35 \text{ mm})^2 (48 \text{ kg})^3$.

1–21. Evaluate (204 mm)(0.00457 kg)/(34.6 N) to three significant figures and express the answer in SI units using an appropriate prefix.

This bridge tower is stabilized by cables that exert forces at the points of connection. In this chapter we will show how to express these forces as Cartesian vectors and then determine the resultant force.

[Force Vectors](#page-11-0)

[CHAPTER OBJECTIVES](#page-11-0)

- To show how to add forces and resolve them into components using the Parallelogram Law.
- To express force and position in Cartesian vector form and explain how to determine the vector's magnitude and direction.
- To introduce the dot product in order to determine the angle between two vectors or the projection of one vector onto another.

2.1 [Scalars and Vectors](#page-11-0)

All physical quantities in engineering mechanics are measured using either scalars or vectors.

Scalar. A *scalar* is any positive or negative physical quantity that can be completely specified by its *magnitude*. Examples of scalar quantities include length, mass, and time.

Vector. A *vector* is any physical quantity that requires both a *magnitude* and a *direction* for its complete description. Examples of vectors encountered in statics are force, position, and moment. A vector is shown graphically by an arrow. The length of the arrow represents the *magnitude* of the vector, and the angle θ between the vector and a fixed axis defines the *direction of its line of action*.The head or tip of the arrow indicates the *sense of direction* of the vector, Fig. 2–1.

In print, vector quantities are represented by bold face letters such as **A**, and its magnitude of the vector is italicized, *A*. For handwritten work, it is often convenient to denote a vector quantity by simply drawing an arrow on top of it, \overrightarrow{A} .

Scalar multiplication and division

Fig. 2–2

2.2 [Vector Operations](#page-11-0)

Multiplication and Division of a Vector by a Scalar. If a vector is multiplied by a positive scalar, its magnitude is increased by that amount. When multiplied by a negative scalar it will also change the directional sense of the vector. Graphic examples of these operations are shown in Fig. 2–2.

Vector Addition. All vector quantities obey the *parallelogram law of addition*. To illustrate, the two "*component*" *vectors* **A** and **B** in =*of addition*. To illustrate, the two "*component*" *vectors* **A** and **B** in Fig. 2–3*a* are added to form a "*resultant*" *vector* $\mathbf{R} = \mathbf{A} + \mathbf{B}$ using the following procedure:

- First join the tails of the components at a point so that it makes them concurrent, Fig. 2–3*b*.
- From the head of **B**, draw a line parallel to **A**. Draw another line from the head of **A** that is parallel to **B**. These two lines intersect at point *P* to form the adjacent sides of a parallelogram.
- The diagonal of this parallelogram that extends to *P* forms **R**, which then represents the resultant vector $\mathbf{R} = \mathbf{A} + \mathbf{B}$, Fig. 2–3*c*.

We can also add **B** to **A**, Fig. 2–4*a*, using the *triangle rule*, which is a special case of the parallelogram law, whereby vector **B** is added to vector **A** in a "head-to-tail" fashion, i.e., by connecting the head of **A** to the tail of **B**, Fig. 2–4*b*. The resultant **R** extends from the tail of **A** to the head of **B**. In a similar manner, **R** can also be obtained by adding **A** to **B**, Fig. 2–4*c*. By comparison, it is seen that vector addition is commutative; in other words, the vectors can be added in either order, i.e., $\mathbf{R} = \mathbf{A} + \mathbf{B} = \mathbf{B} + \mathbf{A}$.

As a special case, if the two vectors **A** and **B** are *collinear*, i.e., both have the same line of action, the parallelogram law reduces to an *algebraic* or *scalar addition* $R = A + B$, as shown in Fig. 2–5.

Addition of collinear vectors

Fig. 2–5

Vector Subtraction. The resultant of the *difference* between two vectors **A** and **B** of the same type may be expressed as

$$
\mathbf{R}' = \mathbf{A} - \mathbf{B} = \mathbf{A} + (-\mathbf{B})
$$

This vector sum is shown graphically in Fig. 2–6. Subtraction is therefore defined as a special case of addition, so the rules of vector addition also apply to vector subtraction.

F*R* \mathbf{F}_1 \mathbf{F}_2 \mathbf{F}_2

The parallelogram law must be used to determine the resultant of the two forces acting on the hook.

2.3 [Vector Addition of Forces](#page-11-0)

Experimental evidence has shown that a force is a vector quantity since it has a specified magnitude, direction, and sense and it adds according to the parallelogram law. Two common problems in statics involve either finding the resultant force, knowing its components, or resolving a known force into two components. We will now describe how each of these problems is solved using the parallelogram law.

Finding a Resultant Force. The two component forces \mathbf{F}_1 and \mathbf{F}_2 acting on the pin in Fig. 2–7*a* can be added together to form the resultant force $\mathbf{F}_R = \mathbf{F}_1 + \mathbf{F}_2$, as shown in Fig. 2–7*b*. From this construction, or using the triangle rule, Fig. 2–7*c*, we can apply the law of cosines or the law of sines to the triangle in order to obtain the magnitude of the resultant force and its direction.

Using the parallelogram law force **F** caused by the vertical member can be resolved into components acting along the suspension cables *a* and *b*.

Finding the Components of a Force. Sometimes it is necessary to resolve a force into two *components* in order to study its pulling or pushing effect in two specific directions. For example, in Fig. 2–8*a*, **F** is to be resolved into two components along the two members, defined by the u and v axes. In order to determine the magnitude of each component, a parallelogram is constructed first, by drawing lines starting from the tip of **F**, one line parallel to *u*, and the other line parallel to v . These lines then intersect with the v and u axes, forming a parallelogram. The force components \mathbf{F}_u and \mathbf{F}_v are then established by simply joining the tail of $\mathbf F$ to the intersection points on the u and v axes, Fig. 2–8*b*. This parallelogram can then be reduced to a triangle, which represents the triangle rule, Fig. 2–8*c*. From this, the law of v sines can then be applied to determine the unknown magnitudes of the components.

Addition of Several Forces. If more than two forces are to be added, successive applications of the parallelogram law can be carried out in order to obtain the resultant force. For example, if three forces \mathbf{F}_1 , \mathbf{F}_2 , \mathbf{F}_3 act at a point *O*, Fig. 2–9, the resultant of any two of the forces is found, say, $\mathbf{F}_1 + \mathbf{F}_2$ —and then this resultant is added to the third force, yielding the resultant of all three forces; i.e., $\mathbf{F}_R = (\mathbf{F}_1 + \mathbf{F}_2) + \mathbf{F}_3$. Using the parallelogram law to add more than two forces, as shown here, often requires extensive geometric and trigonometric calculation to determine the numerical values for the magnitude and direction of the resultant. Instead, problems of this type are easily solved by using the "rectangularcomponent method," which is explained in Sec. 2.4.

The resultant force \mathbf{F}_R on the hook
requires the addition of $\mathbf{F}_r + \mathbf{F}_r$ then this The resultant force \mathbf{F}_R on the hook
requires the addition of $\mathbf{F}_1 + \mathbf{F}_2$, then this resultant is added to \mathbf{F}_3 .

Fig. 2–10

Procedure for Analysis

Problems that involve the addition of two forces can be solved as follows:

Parallelogram Law.

- Two "component" forces \mathbf{F}_1 and \mathbf{F}_2 in Fig. 2–10*a* add according to the parallelogram law, yielding a *resultant* force \mathbf{F}_R that forms the diagonal of the parallelogram.
- If a force **F** is to be resolved into *components* along two axes *u* and v, Fig. $2-10b$, then start at the head of force **F** and construct lines parallel to the axes, thereby forming the parallelogram. The sides of the parallelogram represent the components, \mathbf{F}_u and \mathbf{F}_v .
- Label all the known and unknown force magnitudes and the angles on the sketch and identify the two unknowns as the magnitude and direction of \mathbf{F}_R , or the magnitudes of its components.

Trigonometry.

- Redraw a half portion of the parallelogram to illustrate the triangular head-to-tail addition of the components.
- From this triangle, the magnitude of the resultant force can be determined using the law of cosines, and its direction is determined from the law of sines. The magnitudes of two force components are determined from the law of sines. The formulas are given in Fig. 2–10*c*.

Important Points

- A scalar is a positive or negative number.
- A vector is a quantity that has a magnitude, direction, and sense.
- Multiplication or division of a vector by a scalar will change the magnitude of the vector.The sense of the vector will change if the scalar is negative.
- As a special case, if the vectors are collinear, the resultant is formed by an algebraic or scalar addition.

The screw eye in Fig. 2–11*a* is subjected to two forces, \mathbf{F}_1 and \mathbf{F}_2 . Determine the magnitude and direction of the resultant force.

SOLUTION

Parallelogram Law. The parallelogram is formed by drawing a line from the head of \mathbf{F}_1 that is parallel to \mathbf{F}_2 , and another line from the head of \mathbf{F}_2 that is parallel to \mathbf{F}_1 . The resultant force \mathbf{F}_R extends to where these lines intersect at point *A*, Fig. 2–11*b*. The two unknowns are the magnitude of \mathbf{F}_R and the angle θ (theta).

Trigonometry. From the parallelogram, the vector triangle is constructed, Fig. 2–11*c*. Using the law of cosines

$$
F_R = \sqrt{(100 \text{ N})^2 + (150 \text{ N})^2 - 2(100 \text{ N})(150 \text{ N}) \cos 115^\circ}
$$

= $\sqrt{10\,000 + 22\,500 - 30\,000(-0.4226)} = 212.6 \text{ N}$
= 213 N

Ans.

Applying the law of sines to determine θ ,

$$
\frac{150 \text{ N}}{\sin \theta} = \frac{212.6 \text{ N}}{\sin 115^{\circ}}
$$

$$
\sin \theta = \frac{150 \text{ N}}{212.6 \text{ N}} (\sin 115^{\circ})
$$

$$
\theta = 39.8^{\circ}
$$

Thus, the direction ϕ (phi) of \mathbf{F}_R , measured from the horizontal, is

$$
\phi = 39.8^{\circ} + 15.0^{\circ} = 54.8^{\circ}
$$
 Ans.

NOTE: The results seem reasonable, since Fig. 2–11*b* shows F_R to have a magnitude larger than its components and a direction that is between them.

Fig. 2–11

Resolve the horizontal 600-lb force in Fig. 2–12*a* into components acting along the u and v axes and determine the magnitudes of these components components.

SOLUTION

The parallelogram is constructed by extending a line from the *head* of the 600-lb force parallel to the v axis until it intersects the u axis at point *B*, Fig. 2–12*b*. The arrow from *A* to *B* represents \mathbf{F}_u . Similarly, the line extended from the head of the 600-lb force drawn parallel to the *u* axis intersects the *v* axis at point *C*, which gives \mathbf{F}_v .

The vector addition using the triangle rule is shown in Fig. 2–12*c*. The two unknowns are the magnitudes of \mathbf{F}_u and \mathbf{F}_v . Applying the law of sines,

$$
\frac{F_u}{\sin 120^\circ} = \frac{600 \text{ lb}}{\sin 30^\circ}
$$

\n
$$
F_u = 1039 \text{ lb}
$$
Ans.
\n
$$
\frac{F_v}{\sin 30^\circ} = \frac{600 \text{ lb}}{\sin 30^\circ}
$$

\n
$$
F_v = 600 \text{ lb}
$$
Ans.

NOTE: The result for F_u shows that sometimes a component can have a greater magnitude than the resultant.

Determine the magnitude of the component force **F** in Fig. 2–13*a* and the magnitude of the resultant force \mathbf{F}_R if \mathbf{F}_R is directed along the positive *y* axis.

Fig. 2–13

SOLUTION

The parallelogram law of addition is shown in Fig. 2–13*b*, and the triangle rule is shown in Fig. 2–13*c*. The magnitudes of \mathbf{F}_R and \mathbf{F} are the two unknowns. They can be determined by applying the law of sines.

$$
\frac{F}{\sin 60^\circ} = \frac{200 \text{ lb}}{\sin 45^\circ}
$$

$$
F = 245 \text{ lb}
$$

$$
\frac{F_R}{\sin 75^\circ} = \frac{200 \text{ lb}}{\sin 45^\circ}
$$

$$
F_R = 273 \text{ lb}
$$
Ans.

Ans.

It is required that the resultant force acting on the eyebolt in Fig. 2–14*a* be directed along the positive *x* axis and that \mathbf{F}_2 have a *minimum* magnitude. Determine this magnitude, the angle θ , and the corresponding resultant force.

SOLUTION

SOLUTION
The triangle rule for $\mathbf{F}_R = \mathbf{F}_1 + \mathbf{F}_2$ is shown in Fig. 2–14*b*. Since the
magnitudes (lengths) of **F**_n and **F**_n are not specified than **F**_n can actually magnitudes (lengths) of \mathbf{F}_R and \mathbf{F}_2 are not specified, then \mathbf{F}_2 can actually be any vector that has its head touching the line of action of \mathbf{F}_R , Fig. 2–14*c*. However, as shown, the magnitude of \mathbf{F}_2 is a *minimum* or the shortest length when its line of action is *perpendicular* to the line of action of \mathbf{F}_R , that is, when

$$
\theta = 90^{\circ}
$$
 Ans.

Since the vector addition now forms a right triangle, the two unknown magnitudes can be obtained by trigonometry.

$$
F_R = (800 \text{ N})\cos 60^\circ = 400 \text{ N}
$$
 Ans.

$$
F_2 = (800 \text{ N})\sin 60^\circ = 693 \text{ N}
$$
 Ans.

FUNDAMENTAL PROBLEMS*

F2–1. Determine the magnitude of the resultant force acting on the screw eye and its direction measured clockwise from the *x* axis.

F2–2. Two forces act on the hook. Determine the magnitude of the resultant force.

> 30° 40° 500 N 200 N **F2–2**

F2–3. Determine the magnitude of the resultant force and its direction measured counterclockwise from the positive *x* axis.

F2–4. Resolve the 30-lb force into components along the u and v axes, and determine the magnitude of each of these components.

F2–5. The force $F = 450$ lb acts on the frame. Resolve
this force into components acting along members AB and this force into components acting along members *AB* and *AC*, and determine the magnitude of each component.

F2–6. If force **F** is to have a component along the *u* axis of **F2–6.** If force **F** is to have a component along the *u* axis of $F_u = 6$ kN, determine the magnitude of **F** and the magnitude of its component **F** along the 2 axis magnitude of its component \mathbf{F}_v along the v axis.

the positive *x* axis. Set $\theta = 50^{\circ}$.

2–19. The truck is to be towed using two ropes. If the resultant force is to be 950 N, directed along the positive *x* axis, determine the magnitudes of forces \mathbf{F}_A and \mathbf{F}_B acting on each rope and the angle θ of \mathbf{F}_B so that the magnitude of \mathbf{F}_B is a *minimum*. \mathbf{F}_A acts at 20° from the *x* axis as shown.

Prob. 2–18/19

***2–20.** If $\phi = 45^{\circ}$, $F_1 = 5$ kN, and the resultant force is 6 kN directed along the positive varis determine the required 6 kN directed along the positive *y* axis, determine the required magnitude of \mathbf{F}_2 and its direction θ .

•2–21. If $\phi = 30^\circ$ and the resultant force is to be 6 kN directed along the positive *y* axis, determine the magnitudes of \mathbf{F}_1 and \mathbf{F}_2 and the angle θ if F_2 is required to be a minimum.

2–22. If $\phi = 30^\circ$, $F_1 = 5$ kN, and the resultant force is to the directed along the positive *y* axis determine the be directed along the positive *y* axis, determine the magnitude of the resultant force if $F₂$ is to be a minimum. Also, what is F_2 and the angle θ ?

***2–24.** If the resultant force \mathbf{F}_R is directed along a line measured 75° clockwise from the positive *x* axis and the magnitude of \mathbf{F}_2 is to be a minimum, determine the magnitudes of \mathbf{F}_R and \mathbf{F}_2 and the angle $\theta \le 90^\circ$.

Probs. 2–23/24

•2–25. Two forces \mathbf{F}_1 and \mathbf{F}_2 act on the screw eye. If their lines of action are at an angle θ apart and the magnitude lines of action are at an angle θ apart and the magnitude
of each force is $F_1 = F_2 = F$, determine the magnitude of
the resultant force **F**_n and the angle between **F**_n and **F**_n the resultant force \mathbf{F}_R and the angle between \mathbf{F}_R and \mathbf{F}_1 .

Probs. 2–20/21/22

Prob. 2–25

2–26. The log is being towed by two tractors *A* and *B*. Determine the magnitudes of the two towing forces **F***^A* and \mathbf{F}_B if it is required that the resultant force have a magnitude \mathbf{F}_B if it is required that the resultant force have a magnitude $F_R = 10 \text{ kN}$ and be directed along the *x* axis. Set $\theta = 15^\circ$.

y **2–27.** The resultant \mathbf{F}_R of the two forces acting on the log is to be directed along the positive *x* axis and have a magnitude of 10 kN, determine the angle θ of the cable, attached to *B* such that the magnitude of force \mathbf{F}_B in this cable is a minimum. What is the magnitude of the force in each cable for this situation?

Probs. 2–26/27

***2–28.** The beam is to be hoisted using two chains. Determine the magnitudes of forces \mathbf{F}_A and \mathbf{F}_B acting on each chain in order to develop a resultant force of 600 N directed along the positive *y* axis. Set $\theta = 45^{\circ}$.

•2–29. The beam is to be hoisted using two chains. If the resultant force is to be 600 N directed along the positive *y* axis, determine the magnitudes of forces \mathbf{F}_A and \mathbf{F}_B acting on each chain and the angle θ of \mathbf{F}_B so that the magnitude of \mathbf{F}_B is a *minimum*. \mathbf{F}_A acts at 30° from the *y* axis, as shown.

Probs. 2–28/29

2–30. Three chains act on the bracket such that they create a resultant force having a magnitude of 500 lb. If two of the chains are subjected to known forces, as shown, determine the angle θ of the third chain measured clockwise from the positive *x* axis, so that the magnitude of force \bf{F} in this chain is a *minimum*. All forces lie in the *x*–*y* plane. What is the magnitude of **F**? *Hint*: First find the resultant of the two known forces. Force **F** acts in this direction.

2–31. Three cables pull on the pipe such that they create a resultant force having a magnitude of 900 lb. If two of the cables are subjected to known forces, as shown in the figure, determine the angle θ of the third cable so that the magnitude of force **F** in this cable is a *minimum*. All forces lie in the *x*–*y* plane. What is the magnitude of **F**? *Hint*: First find the resultant of the two known forces.

2.4 [Addition of a System of Coplanar](#page-11-0) Forces

When a force is resolved into two components along the *x* and *y* axes, the components are then called *rectangular components*. For analytical work we can represent these components in one of two ways, using either scalar notation or Cartesian vector notation.

Scalar Notation. The rectangular components of force **F** shown in **Scalar Notation.** The rectangular components of force **F** shown in Fig. 2–15*a* are found using the parallelogram law, so that $\mathbf{F} = \mathbf{F}_x + \mathbf{F}_y$.
Because these components form a right triangle their magnitudes can Because these components form a right triangle, their magnitudes can be determined from

$$
F_x = F \cos \theta
$$
 and $F_y = F \sin \theta$

Instead of using the angle θ , however, the direction of **F** can also be defined using a small "slope" triangle, such as shown in Fig. 2–15*b*. Since this triangle and the larger shaded triangle are similar, the proportional length of the sides gives

or

and

or

Fig. 2–15

$$
\frac{F_x}{F} = \frac{a}{c}
$$

$$
F_x = F\left(\frac{a}{c}\right)
$$

$$
\frac{F_y}{F} = \frac{b}{c}
$$

 $F_y = -F\left(\frac{b}{c}\right)$

Here the *y* component is a negative scalar since \mathbf{F}_y is directed along the negative *y* axis.

It is important to keep in mind that this positive and negative scalar notation is to be used only for computational purposes, not for graphical representations in figures. Throughout the book, the *head of a vector arrow* in any figure indicates the sense of the vector *graphically*; algebraic signs are not used for this purpose. Thus, the vectors in Figs. 2–15*a* and 2–15*b* are designated by using boldface (vector) notation.* Whenever italic symbols are written near vector arrows in figures, they indicate the *magnitude* of the vector, which is *always* a *positive* quantity.

x

^{*}Negative signs are used only in figures with boldface notation when showing equal but opposite pairs of vectors, as in Fig. 2–2.

Cartesian Vector Notation. It is also possible to represent the *x* and *y* components of a force in terms of Cartesian unit vectors **i** and **j**. Each of these unit vectors has a dimensionless magnitude of one, and so they can be used to designate the *directions* of the *x* and *y* axes, respectively, Fig. 2–16. *

Since the *magnitude* of each component of **F** is *always a positive quantity*, which is represented by the (positive) scalars F_x and F_y , then we can express **F** as a *Cartesian vector*,

$$
\mathbf{F} = F_x \mathbf{i} + F_y \mathbf{j}
$$

Coplanar Force Resultants. We can use either of the two methods just described to determine the resultant of several *coplanar forces*. To do this, each force is first resolved into its *x* and *y* components, and then the respective components are added using *scalar algebra* since they are collinear. The resultant force is then formed by adding the resultant components using the parallelogram law. For example, consider the three concurrent forces in Fig. 2–17*a*, which have *x* and *y* components shown in Fig. 2–17*b*. Using *Cartesian vector notation*, each force is first represented as a Cartesian vector, i.e.,

$$
\mathbf{F}_1 = F_{1x} \mathbf{i} + F_{1y} \mathbf{j}
$$

\n
$$
\mathbf{F}_2 = -F_{2x} \mathbf{i} + F_{2y} \mathbf{j}
$$

\n
$$
\mathbf{F}_3 = F_{3x} \mathbf{i} - F_{3y} \mathbf{j}
$$

The vector resultant is therefore

$$
\mathbf{F}_R = \mathbf{F}_1 + \mathbf{F}_2 + \mathbf{F}_3
$$

= $F_{1x}\mathbf{i} + F_{1y}\mathbf{j} - F_{2x}\mathbf{i} + F_{2y}\mathbf{j} + F_{3x}\mathbf{i} - F_{3y}\mathbf{j}$
= $(F_{1x} - F_{2x} + F_{3x})\mathbf{i} + (F_{1y} + F_{2y} - F_{3y})\mathbf{j}$
= $(F_{Rx})\mathbf{i} + (F_{Ry})\mathbf{j}$

If *scalar notation* is used, then we have

$$
F_{Rx} = F_{1x} - F_{2x} + F_{3x}
$$

$$
F_{Rx} = F_{1x} - F_{2x} + F_{3x}
$$

(+)
$$
F_{Ry} = F_{1y} + F_{2y} - F_{3y}
$$

These are the *same* results as the **i** and **j** components of \mathbf{F}_R determined above.

^{*}For handwritten work, unit vectors are usually indicated using a circumflex, e.g., \hat{i} and \hat{i} . These vectors have a dimensionless magnitude of unity, and their sense (or arrowhead) will be described analytically by a plus or minus sign, depending on whether they are pointing along the positive or negative *x* or *y* axis.

We can represent the components of the resultant force of any number of coplanar forces symbolically by the algebraic sum of the *x* and *y* components of all the forces, i.e.,

$$
\begin{aligned} F_{Rx} &= \Sigma F_x \\ F_{Ry} &= \Sigma F_y \end{aligned} \tag{2-1}
$$

Once these components are determined, they may be sketched along the *x* and *y* axes with their proper sense of direction, and the resultant force can be determined from vector addition, as shown in Fig. 2–17. From this sketch, the magnitude of \mathbf{F}_R is then found from the Pythagorean theorem; that is,

$$
F_R = \sqrt{F_{Rx}^2 + F_{Ry}^2}
$$

Also, the angle θ , which specifies the direction of the resultant force, is determined from trigonometry:

$$
\theta = \tan^{-1} \left| \frac{F_{Ry}}{F_{Rx}} \right|
$$

The above concepts are illustrated numerically in the examples which follow.

Important Points

- The resultant of several coplanar forces can easily be determined if an *x, y* coordinate system is established and the forces are resolved along the axes.
- The direction of each force is specified by the angle its line of action makes with one of the axes, or by a sloped triangle.
- The orientation of the *x* and *y* axes is arbitrary, and their positive direction can be specified by the Cartesian unit vectors **i** and **j**.
- The *x* and *y* components of the *resultant force* are simply the algebraic addition of the components of all the coplanar forces.
- The magnitude of the resultant force is determined from the Pythagorean theorem, and when the components are sketched on the *x* and *y* axes, the direction can be determined from trigonometry.

The resultant force of the four cable forces acting on the supporting bracket can be determined by adding algebraically the separate *x* and *y* components of each cable force. This resultant **F***^R* produces the *same pulling effect* on the bracket as all four cables.

Fig. 2–17

x

Determine the *x* and *y* components of \mathbf{F}_1 and \mathbf{F}_2 acting on the boom shown in Fig. 2–18*a*. Express each force as a Cartesian vector.

SOLUTION

Scalar Notation. By the parallelogram law, \mathbf{F}_1 is resolved into *x* and *y* components, Fig. 2–18*b*. Since \mathbf{F}_{1x} acts in the –*x* direction, and \mathbf{F}_{1y} acts in the +*y* direction, we have

$$
F_{1x} = -200 \sin 30^\circ \text{ N} = -100 \text{ N} = 100 \text{ N} \leftarrow
$$
 Ans.

$$
F_{1y} = 200 \cos 30^\circ \text{ N} = 173 \text{ N} = 173 \text{ N} \text{ }
$$
 Ans.

The force \mathbf{F}_2 is resolved into its *x* and *y* components as shown in Fig. 2–17*c*. Here the *slope* of the line of action for the force is indicated. From this "slope triangle" we could obtain the angle θ , e.g., indicated. From this "slope triangle" we could obtain the angle θ , e.g., $\theta = \tan^{-1}(\frac{5}{12})$, and then proceed to determine the magnitudes of the components in the same manner as for \mathbf{F}_1 . The easier method, however, consists of using proportional parts of similar triangles, i.e.,

$$
\frac{F_{2x}}{260 \text{ N}} = \frac{12}{13}
$$
 $F_{2x} = 260 \text{ N} \left(\frac{12}{13}\right) = 240 \text{ N}$

Similarly,

$$
F_{2y} = 260 \text{ N} \left(\frac{5}{13}\right) = 100 \text{ N}
$$

Notice how the magnitude of the *horizontal component*, F_{2x} , was obtained by multiplying the force magnitude by the ratio of the *horizontal leg* of the slope triangle divided by the hypotenuse; whereas the magnitude of the *vertical component*, F_{2v} , was obtained by multiplying the force magnitude by the ratio of the *vertical leg* divided by the hypotenuse. Hence,

$$
F_{2x} = 240 \text{ N} = 240 \text{ N} \rightarrow
$$
Ans.

$$
F_{2y} = -100 \text{ N} = 100 \text{ N} \downarrow
$$
Ans.

Cartesian Vector Notation. Having determined the magnitudes and directions of the components of each force, we can express each force as a Cartesian vector.

$$
\mathbf{F}_1 = \{-100\mathbf{i} + 173\mathbf{j}\} \text{ N} \qquad \qquad \text{Ans.}
$$

$$
\mathbf{F}_2 = \{240\mathbf{i} - 100\mathbf{j}\} \text{ N} \qquad \qquad \text{Ans.}
$$

The link in Fig. 2–19*a* is subjected to two forces \mathbf{F}_1 and \mathbf{F}_2 . Determine the magnitude and direction of the resultant force.

SOLUTION I

Scalar Notation. First we resolve each force into its *x* and *y* components, Fig. 2–19*b*, then we sum these components algebraically. +

$$
\Rightarrow F_{Rx} = \Sigma F_x; \qquad F_{Rx} = 600 \cos 30^\circ \text{ N} - 400 \sin 45^\circ \text{ N}
$$

= 236.8 N \rightarrow
+ $\uparrow F_{Ry} = \Sigma F_y; \qquad F_{Ry} = 600 \sin 30^\circ \text{ N} + 400 \cos 45^\circ \text{ N}$
= 582.8 N \uparrow

The resultant force, shown in Fig. 2–18*c*, has a *magnitude* of

$$
F_R = \sqrt{(236.8 \text{ N})^2 + (582.8 \text{ N})^2}
$$

= 629 N *Ans.*

From the vector addition,

$$
\theta = \tan^{-1} \left(\frac{582.8 \text{ N}}{236.8 \text{ N}} \right) = 67.9^{\circ}
$$
 Ans.

SOLUTION II

Cartesian Vector Notation. From Fig. 2–19*b*, each force is first expressed as a Cartesian vector.

$$
\mathbf{F}_1 = \{600 \cos 30^\circ \mathbf{i} + 600 \sin 30^\circ \mathbf{j}\} \text{ N}
$$

$$
\mathbf{F}_2 = \{-400 \sin 45^\circ \mathbf{i} + 400 \cos 45^\circ \mathbf{j}\} \text{ N}
$$

Then,

 $\mathbf{F}_R = \mathbf{F}_1 + \mathbf{F}_2 = (600 \cos 30^\circ \text{ N} - 400 \sin 45^\circ \text{ N})\mathbf{i}$

 $+$ (600 cos 50⁻¹N + 400 sin 45⁻¹N)**i**
+ (600 sin 30° N + 400 cos 45° N)**j**

$$
= \{236.8\mathbf{i} + 582.8\mathbf{j}\} \text{ N}
$$

The magnitude and direction of \mathbf{F}_R are determined in the same manner as before.

NOTE: Comparing the two methods of solution, notice that the use of scalar notation is more efficient since the components can be found *directly*, without first having to express each force as a Cartesian vector before adding the components. Later, however, we will show that Cartesian vector analysis is very beneficial for solving three-dimensional problems.

The end of the boom *O* in Fig. 2–20*a* is subjected to three concurrent and coplanar forces. Determine the magnitude and direction of the resultant force.

SOLUTION

Each force is resolved into its *x* and *y* components, Fig. 2–20*b*. Summing the *x* components, we have

the *x* components, we have
\n
$$
\Rightarrow
$$
 $F_{Rx} = \sum F_x$; $F_{Rx} = -400 \text{ N} + 250 \sin 45^\circ \text{ N} - 200(\frac{4}{5}) \text{ N}$
\n $= -383.2 \text{ N} = 383.2 \text{ N} \leftarrow$

The negative sign indicates that F_{Rx} acts to the left, i.e., in the negative *x* direction, as noted by the small arrow. Obviously, this occurs because F_1 and F_3 in Fig. 2–20*b* contribute a greater pull to the left than F_2 which pulls to the right. Summing the *y* components yields

$$
+ \uparrow F_{Ry} = \Sigma F_y; \qquad F_{Ry} = 250 \cos 45^\circ \text{ N} + 200 \left(\frac{3}{5}\right) \text{ N}
$$

= 296.8 N \uparrow

The resultant force, shown in Fig. 2–20*c*, has a *magnitude* of
\n
$$
F_R = \sqrt{(-383.2 \text{ N})^2 + (296.8 \text{ N})^2}
$$
\n
$$
= 485 \text{ N}
$$
Ans.

From the vector addition in Fig. 2–20c, the direction angle θ is

$$
\theta = \tan^{-1} \left(\frac{296.8}{383.2} \right) = 37.8^{\circ}
$$
 Ans.

NOTE: Application of this method is more convenient, compared to using two applications of the parallelogram law, first to add \mathbf{F}_1 and \mathbf{F}_2 then adding \mathbf{F}_3 to this resultant.

FUNDAMENTAL PROBLEMS

y **F2–7.** Resolve each force acting on the post into its *x* and *y* components.

F2–8. Determine the magnitude and direction of the resultant force.

F2–8

F2–9. Determine the magnitude of the resultant force acting on the corbel and its direction θ measured counterclockwise from the *x* axis.

F2–10. If the resultant force acting on the bracket is to be 750 N directed along the positive *x* axis, determine the magnitude of F and its direction θ .

F2–11. If the magnitude of the resultant force acting on the bracket is to be 80 lb directed along the *u* axis, determine the magnitude of F and its direction θ .

F2–12. Determine the magnitude of the resultant force and its direction θ measured counterclockwise from the positive *x* axis.

PROBLEMS

***2–32.** Determine the magnitude of the resultant force acting on the pin and its direction measured clockwise from the positive *x* axis.

Prob. 2–32

•2–33. If $F_1 = 600 \text{ N}$ and $\phi = 30^\circ$, determine the magnitude of the resultant force acting on the evelodt and magnitude of the resultant force acting on the eyebolt and its direction measured clockwise from the positive *x* axis.

2–34. If the magnitude of the resultant force acting on the eyebolt is 600 N and its direction measured clockwise the eyebolt is 600 N and its direction measured clockwise from the positive *x* axis is $\theta = 30^{\circ}$, determine the magnitude of \mathbf{F}_1 and the angle ϕ .

2–35. The contact point between the femur and tibia bones of the leg is at *A*. If a vertical force of 175 lb is applied at this point, determine the components along the *x* and *y* axes. Note that the *y* component represents the normal force on the load-bearing region of the bones. Both the *x* and *y* components of this force cause synovial fluid to be squeezed out of the bearing space.

***2–36.** If $\phi = 30^{\circ}$ and $F_2 = 3$ kN, determine the magnitude of the resultant force acting on the plate and its direction θ of the resultant force acting on the plate and its direction θ

•2–37. If the magnitude for the resultant force acting on the plate is required to be 6 kN and its direction measured the plate is required to be 6 kN and its direction measured clockwise from the positive *x* axis is $\theta = 30^{\circ}$, determine the magnitude of \mathbf{F}_2 and its direction ϕ .

measured clockwise from the positive *x* axis.

2–38. If $\phi = 30^\circ$ and the resultant force acting on the gusset plate is directed along the positive *x* axis, determine the magnitudes of \mathbf{F}_2 and the resultant force.

Probs. 2–33/34

Probs. 2–36/37/38

2–39. Determine the magnitude of \mathbf{F}_1 and its direction θ **2–43.** If $\phi = 30^\circ$ and $F_1 = 250$ lb not the resultant force is directed vertically unward and magnitude of the resultant force acting so that the resultant force is directed vertically upward and has a magnitude of 800 N.

***2–40.** Determine the magnitude and direction measured counterclockwise from the positive *x* axis of the resultant force of the three forces acting on the ring *A*. Take $F_1 = 500$ N and $\theta = 20^\circ$.

Probs. 2–39/40

•2–41. Determine the magnitude and direction θ of \mathbf{F}_B so that the resultant force is directed along the positive *y* axis and has a magnitude of 1500 N.

2–42. Determine the magnitude and angle measured counterclockwise from the positive *y* axis of the resultant force acting on the bracket if $F_B = 600$ N and $\theta = 20^{\circ}$.

2–43. If $\phi = 30^{\circ}$ and $F_1 = 250$ lb, determine the magnitude of the resultant force acting on the bracket and its direction measured clockwise from the positive *x* axis.

***2–44.** If the magnitude of the resultant force acting on the bracket is 400 lb directed along the positive *x* axis, determine the magnitude of \mathbf{F}_1 and its direction ϕ .

•2–45. If the resultant force acting on the bracket is to be directed along the positive *x* axis and the magnitude of \mathbf{F}_1 is required to be a minimum, determine the magnitudes of the resultant force and \mathbf{F}_1 .

2–46. The three concurrent forces acting on the screw eye **2–46.** The three concurrent forces acting on the screw eye produce a resultant force $\mathbf{F}_R = 0$. If $F_2 = \frac{2}{3} F_1$ and \mathbf{F}_1 is to be 90° from \mathbf{F}_2 as shown determine the required magnitude be 90 \degree from \mathbf{F}_2 as shown, determine the required magnitude of \mathbf{F}_3 expressed in terms of F_1 and the angle θ .

Prob. 2–46

2–47. Determine the magnitude of \mathbf{F}_A and its direction θ so that the resultant force is directed along the positive *x* axis and has a magnitude of 1250 N.

***2–48.** Determine the magnitude and direction measured counterclockwise from the positive *x* axis of the resultant force acting on the ring at *O* if $F_A = 750$ N and $\theta = 45^\circ$.

2–50. The three forces are applied to the bracket. Determine the range of values for the magnitude of force **P** so that the resultant of the three forces does not exceed 2400 N.

Prob. 2–50

Probs. 2–47/48

•2–49. Determine the magnitude of the resultant force and its direction measured counterclockwise from the positive *x* axis.

2–51. If $F_1 = 150$ N and $\phi = 30^{\circ}$, determine the magnitude of the resultant force acting on the bracket and its direction of the resultant force acting on the bracket and its direction measured clockwise from the positive *x* axis.

***2–52.** If the magnitude of the resultant force acting on the bracket is to be 450 N directed along the positive *u* axis, determine the magnitude of \mathbf{F}_1 and its direction ϕ .

•2–53. If the resultant force acting on the bracket is required to be a minimum, determine the magnitudes of **F**¹ and the resultant force. Set $\phi = 30^{\circ}$.

2–54. Three forces act on the bracket. Determine the magnitude and direction θ of \mathbf{F}_2 so that the resultant force is directed along the positive *u* axis and has a magnitude of 50 lb.

2–55. If $F_2 = 150$ lb and $\theta = 55^\circ$, determine the
magnitude and direction measured clockwise from the magnitude and direction measured clockwise from the positive *x* axis of the resultant force of the three forces acting on the bracket.

•2–57. Determine the magnitude of force **F** so that the resultant force of the three forces is as small as possible. What is the magnitude of this smallest resultant force?

2–58. Express each of the three forces acting on the bracket in Cartesian vector form with respect to the *x* and *y* axes. Determine the magnitude and direction θ of \mathbf{F}_1 so that axes. Determine the magnitude and direction θ of \mathbf{F}_1 so that
the resultant force is directed along the positive x' axis and
has a magnitude of $F_2 = 600 \text{ N}$ has a magnitude of $F_R = 600$ N.

Probs. 2–54/55

***2–56.** The three concurrent forces acting on the post ***2–56.** The three concurrent forces acting on the post produce a resultant force $\mathbf{F}_R = \mathbf{0}$. If $F_2 = \frac{1}{2} F_1$, and \mathbf{F}_1 is to be 90° from **F**₂ as shown determine the required magnitude be 90 \degree from \mathbf{F}_2 as shown, determine the required magnitude of F_3 expressed in terms of F_1 and the angle θ .

Prob. 2–56

2.5 [Cartesian Vectors](#page-11-0)

The operations of vector algebra, when applied to solving problems in *three dimensions*, are greatly simplified if the vectors are first represented in Cartesian vector form. In this section we will present a general method for doing this; then in the next section we will use this method for finding the resultant force of a system of concurrent forces.

Right-Handed Coordinate System. We will use a righthanded coordinate system to develop the theory of vector algebra that follows. A rectangular coordinate system is said to be *right-handed* if the thumb of the right hand points in the direction of the positive ζ axis when the right-hand fingers are curled about this axis and directed from the positive *x* towards the positive *y* axis, Fig. 2–21.

Rectangular Components of a Vector. A vector **A** may have one, two, or three rectangular components along the *x, y, z* coordinate axes, depending on how the vector is oriented relative to the axes. In general, though, when **A** is directed within an octant of the *x, y, z* frame, Fig. 2–22, then by two successive applications of the parallelogram law, Fig. 2–22, then by two successive applications of the parallelogram law,
we may resolve the vector into components as $\mathbf{A} = \mathbf{A}' + \mathbf{A}_z$ and then
 $\mathbf{A}' = \mathbf{A} + \mathbf{A}$. Combining these equations to eliminate \mathbf{A}' we may resolve the vector into components as $\mathbf{A} = \mathbf{A}' + \mathbf{A}_z$ and then $\mathbf{A}' = \mathbf{A}_x + \mathbf{A}_y$. Combining these equations, to eliminate \mathbf{A}' , \mathbf{A} is represented by the vector sum of its *three* rectangula represented by the vector sum of its *three* rectangular components,
 $\mathbf{A} = \mathbf{A}_x + \mathbf{A}_y + \mathbf{A}_z$

$$
\mathbf{A} = \mathbf{A}_x + \mathbf{A}_y + \mathbf{A}_z \tag{2-2}
$$

Cartesian Unit Vectors. In three dimensions, the set of Cartesian unit vectors, **i**, **j**, **k**, is used to designate the directions of the *x, y, z* axes, respectively. As stated in Sec. 2.4, the *sense* (or arrowhead) of these vectors will be represented analytically by a plus or minus sign, depending on whether they are directed along the positive or negative *x, y,* or *z* axes. The positive Cartesian unit vectors are shown in Fig. 2–23.

Cartesian Vector Representation. Since the three components of **A** in Eq. 2–2 act in the positive **i**, **j**, and **k** directions, Fig. 2–24, we can write **A** in Cartesian vector form as

$$
\mathbf{A} = A_x \mathbf{i} + A_y \mathbf{j} + A_z \mathbf{k}
$$
 (2-3)

There is a distinct advantage to writing vectors in this manner. Separating the *magnitude* and *direction* of each *component vector* will simplify the operations of vector algebra, particularly in three dimensions.

Magnitude of a Cartesian Vector. It is always possible to obtain the magnitude of **A** provided it is expressed in Cartesian vector form. As shown in Fig. 2–25, from the blue right triangle, , and from the gray right triangle, $A' = \sqrt{A_x^2 + A_y^2}$.
equations to eliminate A', yields Combining these equations to eliminate A' , yields e right triangle
 $A' = \sqrt{A_x^2 + A_y^2}$ 2 form. As s
 $A = \sqrt{A'^2 + A}$ $+A_z^2$

$$
A = \sqrt{A_x^2 + A_y^2 + A_z^2}
$$
 (2-4)

Hence, the magnitude of **A** *is equal to the positive square root of the sum of the squares of its components.*

Direction of a Cartesian Vector. We will define the *direction* of **A** by the *coordinate direction angles* α (alpha), β (beta), and *g* (gamma), measured between the *tail* of **^A** and the *positive x, y, z* axes provided they are located at the tail of **A**, Fig. 2–26. Note that regardless of where **A** is directed, each of these angles will be between 0° and 180°.

To determine α , β , and γ , consider the projection of **A** onto the *x*, *y*, *z* axes, Fig. 2–27. Referring to the blue colored right triangles shown in each figure, we have

$$
\cos \alpha = \frac{A_x}{A} \qquad \cos \beta = \frac{A_y}{A} \qquad \cos \gamma = \frac{A_z}{A}
$$
 (2-5)

These numbers are known as the *direction cosines* of **A**. Once they have been obtained, the coordinate direction angles α , β , γ can then be determined from the inverse cosines.

Fig. 2–26

An easy way of obtaining these direction cosines is to form a unit vector \mathbf{u}_A in the direction of **A**, Fig. 2–26. If **A** is expressed in Cartesian vector \mathbf{u}_A in the direction of **A**, Fig. 2–26. If **A** is expressed in Cartesian vector form, $\mathbf{A} = A_x \mathbf{i} + A_y \mathbf{j} + A_z \mathbf{k}$, then \mathbf{u}_A will have a magnitude of one and be dimensionless provided **A** is divided one and be dimensionless provided **A** is divided by its magnitude, i.e.,

$$
\mathbf{u}_A = \frac{\mathbf{A}}{A} = \frac{A_x}{A}\mathbf{i} + \frac{A_y}{A}\mathbf{j} + \frac{A_z}{A}\mathbf{k}
$$
 (2-6)

where $A = \sqrt{A_x^2 + A_y^2 + A_z^2}$. By comparison with Eqs. 2–7, it is seen that the *i* i k components of **u**, represent the direction cosines of **A** i e *the* **i**, **j**, **k** *components of* **u**_{*A*} *represent the direction cosines of* **A**, i.e., $\mathbf{u}_A = \cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}$ $+ A_y^2 + A_z^2$ z

$$
\mathbf{u}_A = \cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k} \tag{2-7}
$$

Since the magnitude of a vector is equal to the positive square root of the sum of the squares of the magnitudes of its components, and \mathbf{u}_A has a magnitude of one, then from the above equation an important relation between the direction cosines can be formulated as

$$
\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1 \qquad (2-8)
$$

Here we can see that if only *two* of the coordinate angles are known, the third angle can be found using this equation.

Finally, if the magnitude and coordinate direction angles of **A** are known, then **A** may be expressed in Cartesian vector form as

> $(2-9)$ $= A \mathbf{u}_A$
= $A \cos \alpha \mathbf{i} + A \cos \beta \mathbf{j} + A \cos \gamma \mathbf{k}$ $= A_x \mathbf{i} + A_y \mathbf{j} + A_z \mathbf{k}$ $\mathbf{A} = A\mathbf{u}_A$

2

Fig 2–27

Fig. 2–28

$$
A_z = A \cos \phi
$$

and

$$
A' = A \sin \phi
$$

Now applying trigonometry to the other shaded right triangle,

$$
A_x = A' \cos \theta = A \sin \phi \cos \theta
$$

$$
A_y = A' \sin \theta = A \sin \phi \sin \theta
$$

Therefore **A** written in Cartesian vector form becomes

 $A = A \sin \phi \cos \theta \mathbf{i} + A \sin \phi \sin \theta \mathbf{j} + A \cos \phi \mathbf{k}$

You should not memorize this equation, rather it is important to understand how the components were determined using trigonometry.

2.6 [Addition of Cartesian Vectors](#page-11-0)

The addition (or subtraction) of two or more vectors are greatly simplified if the vectors are expressed in terms of their Cartesian components. For if the vectors are expressed in terms of their Cartesian components. For
example, if $\mathbf{A} = A_x \mathbf{i} + A_y \mathbf{j} + A_z \mathbf{k}$ and $\mathbf{B} = B_x \mathbf{i} + B_y \mathbf{j} + B_z \mathbf{k}$, Fig. 2–29,
then the resultant vector **R** has components which are then the resultant vector, **R**, has components which are the scalar sums of the **i**, **j**, **k** components of **A** and **B**, i.e.,

$$
\mathbf{R} = \mathbf{A} + \mathbf{B} = (A_x + B_x)\mathbf{i} + (A_y + B_y)\mathbf{j} + (A_z + B_z)\mathbf{k}
$$

If this is generalized and applied to a system of several concurrent forces, then the force resultant is the vector sum of all the forces in the system and can be written as

$$
\mathbf{F}_R = \Sigma \mathbf{F} = \Sigma F_x \mathbf{i} + \Sigma F_y \mathbf{j} + \Sigma F_z \mathbf{k}
$$
 (2-10)

Here ΣF_x , ΣF_y , and ΣF_z represent the algebraic sums of the respective *x*, *y, z* or **i**, **j**, **k** components of each force in the system.

Important Points

- Cartesian vector analysis is often used to solve problems in three dimensions.
- The positive directions of the *x, y, z* axes are defined by the Cartesian unit vectors **i**, **j**, **k**, respectively.
- The *magnitude* of a Cartesian vector is $A = \sqrt{A_x^2 + A_y^2 + A_z^2}$.
- The *direction* of a Cartesian vector is specified using coordinate direction angles α , β , γ which the tail of the vector makes with the positive *x, y, z* axes, respectively. The components of the unit positive x, y, z axes, respectively. The components of the unit
vector $\mathbf{u}_A = \mathbf{A}/A$ represent the direction cosines of α , β , γ . Only
two of the angles α , β , γ have to be specified. The third angle i two of the angles α , β , γ have to be specified. The third angle is two of the angles α , β , γ have to be specified. The third angle is determined from the relationship $\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1$.
- Sometimes the direction of a vector is defined using the two angles θ and ϕ as in Fig. 2–28. In this case the vector components
are obtained by vector resolution using trigonometry are obtained by vector resolution using trigonometry.
- To find the *resultant* of a concurrent force system, express each force as a Cartesian vector and add the **i**, **j**, **k** components of all the forces in the system.

The resultant force acting on the bow the ship can be determined by first representing each rope force as a Cartesian vector and then summing the **i**, **j**, and **k** components.

$EXAMPLE$ 2.8

Express the force **F** shown in Fig. 2–30 as a Cartesian vector.

SOLUTION

Since only two coordinate direction angles are specified, the third angle α must be determined from Eq. 2–8; i.e.,
 $cos^2 α + cos^2 β + cos^2 γ = 1$

$$
\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1
$$

$$
\cos^2 \alpha + \cos^2 60^\circ + \cos^2 45^\circ = 1
$$

$$
\cos \alpha = \sqrt{1 - (0.5)^2 - (0.707)^2} = \pm 0.5
$$

Hence, two possibilities exist, namely,

 $\alpha = \cos^{-1}(0.5) = 60^{\circ}$ or $\alpha = \cos^{-1}(-0.5) = 120^{\circ}$

By inspection it is necessary that $\alpha = 60^\circ$, since **F**_{*x*} must be in the +*x* direction. $F = 200 \text{ N}$

Using Eq. 2–9, with
$$
F = 200
$$
 N, we have
\n
$$
\mathbf{F} = F \cos \alpha \mathbf{i} + F \cos \beta \mathbf{j} + F \cos \gamma \mathbf{k}
$$
\n= (200 cos 60° N) \mathbf{i} + (200 cos 60° N) \mathbf{j} + (200 cos 45° N) \mathbf{k}
\n= {100.0 \mathbf{i} + 100.0 \mathbf{j} + 141.4 \mathbf{k} } N *Ans.*

Show that indeed the magnitude of $F = 200$ N.

x

Determine the magnitude and the coordinate direction angles of the resultant force acting on the ring in Fig. 2–31*a*.

SOLUTION

Since each force is represented in Cartesian vector form, the resultant force, shown in Fig. 2–31*b*, is

$$
\mathbf{F}_R = \Sigma \mathbf{F} = \mathbf{F}_1 + \mathbf{F}_2 = \{60\mathbf{j} + 80\mathbf{k}\} \text{ lb} + \{50\mathbf{i} - 100\mathbf{j} + 100\mathbf{k}\} \text{ lb}
$$

$$
= \{50\mathbf{i} - 40\mathbf{j} + 180\mathbf{k}\} \text{ lb}
$$

The magnitude of \mathbf{F}_R is

$$
F_R = \sqrt{(50 \text{ lb})^2 + (-40 \text{ lb})^2 + (180 \text{ lb})^2} = 191.0 \text{ lb}
$$

= 191 lb *Ans.*

The coordinate direction angles α , β , γ are determined from the components of the unit vector acting in the direction of **F***R*.

$$
\mathbf{u}_{F_R} = \frac{\mathbf{F}_R}{F_R} = \frac{50}{191.0} \mathbf{i} - \frac{40}{191.0} \mathbf{j} + \frac{180}{191.0} \mathbf{k}
$$

= 0.2617**i** - 0.2094**j** + 0.9422**k**

so that

$$
\cos \alpha = 0.2617 \qquad \alpha = 74.8^{\circ} \qquad Ans.
$$

$$
\cos \theta = -0.2017 \qquad \alpha = 74.6 \qquad \text{Ans.}
$$

$$
\cos \beta = -0.2094 \qquad \beta = 102^{\circ} \qquad \text{Ans.}
$$

$$
\[\rho = 102\]
$$
 7.17.8.
\n $\[\cos \gamma = 0.9422\]$ $\gamma = 19.6^{\circ}$ Ans.

These angles are shown in Fig. 2–31*b*.

NOTE: In particular, notice that $\beta > 90^\circ$ since the **j** component of \mathbf{u}_{F_n} is negative. This seems reasonable considering how \mathbf{F}_1 and \mathbf{F}_2 add according to the parallelogram law.

Ans.

EXAMPLE 2.10

Express the force **F** shown in Fig. 2–32*a* as a Cartesian vector.

SOLUTION

The angles of 60° and 45° defining the direction of **F** are *not* coordinate direction angles. Two successive applications of the parallelogram law direction angles. Two successive applications of the parallelogram law
are needed to resolve **F** into its *x*, *y*, *z* components First **F** = **F**^{\prime} + **F**_z,
then **F**^{\prime} = **F** + **F**, Fig. 2, 32b, By trigonometry t are needed to resolve **F** into its x, y, z components First $\mathbf{F} = \mathbf{F}' + \mathbf{F}_z$, then $\mathbf{F}' = \mathbf{F}_x + \mathbf{F}_y$, Fig. 2–32*b*. By trigonometry, the magnitudes of the components are components are

$$
F_z = 100 \sin 60^\circ \text{ lb} = 86.6 \text{ lb}
$$

$$
F' = 100 \cos 60^\circ \text{ lb} = 50 \text{ lb}
$$

$$
F_x = F' \cos 45^\circ = 50 \cos 45^\circ \text{ lb} = 35.4 \text{ lb}
$$

$$
F_y = F' \sin 45^\circ = 50 \sin 45^\circ \text{ lb} = 35.4 \text{ lb}
$$

Realizing that \mathbf{F}_v has a direction defined by $-\mathbf{j}$, we have

$$
\mathbf{F} = \{35.4\mathbf{i} - 35.4\mathbf{j} + 86.6\mathbf{k}\} \text{ lb}
$$

To show that the magnitude of this vector is indeed 100 lb, apply Eq. 2–4,

$$
F = \sqrt{F_x^2 + F_y^2 + F_z^2}
$$

= $\sqrt{(35.4)^2 + (-35.4)^2 + (86.6)^2} = 100 \text{ lb}$

If needed, the coordinate direction angles of **F** can be determined from the components of the unit vector acting in the direction of **F**. Hence,

$$
\mathbf{u} = \frac{\mathbf{F}}{F} = \frac{F_x}{F} \mathbf{i} + \frac{F_y}{F} \mathbf{j} + \frac{F_z}{F} \mathbf{k}
$$

= $\frac{35.4}{100} \mathbf{i} - \frac{35.4}{100} \mathbf{j} + \frac{86.6}{100} \mathbf{k}$
= 0.354**i** - 0.354**j** + 0.866**k**

so that

$$
\alpha = \cos^{-1}(0.354) = 69.3^{\circ}
$$

$$
\beta = \cos^{-1}(-0.354) = 111^{\circ}
$$

$$
\gamma = \cos^{-1}(0.866) = 30.0^{\circ}
$$

These results are shown in Fig. 2–31*c*.

Fig. 2–33

Two forces act on the hook shown in Fig. 2–32*a*. Specify the magnitude of \mathbf{F}_2 and its coordinate direction angles of \mathbf{F}_2 that the resultant force **F***^R* acts along the positive *y* axis and has a magnitude of 800 N.

SOLUTION

To solve this problem, the resultant force \mathbf{F}_R and its two components, \mathbf{F}_1 and \mathbf{F}_2 , will each be expressed in Cartesian vector form. Then, as **F**₁ and **F**₂, will each be expressed in Cartesian vector shown in Fig. 2–33*a*, it is necessary that $\mathbf{F}_R = \mathbf{F}_1 + \mathbf{F}_2$. Applying Eq. 2–9,

$$
\mathbf{F}_1 = F_1 \cos \alpha_1 \mathbf{i} + F_1 \cos \beta_1 \mathbf{j} + F_1 \cos \gamma_1 \mathbf{k}
$$

= 300 cos 45° **i** + 300 cos 60° **j** + 300 cos 120° **k**
= {212.1**i** + 150**j** - 150**k**} N

$$
\mathbf{F}_2 = F_{2x} \mathbf{i} + F_{2y} \mathbf{j} + F_{2z} \mathbf{k}
$$

Since **F**_R has a magnitude of 800 N and acts in the +**j** direction,
 F_R = (800 N)(+**j**) = {800**j**} N

$$
\mathbf{F}_R = (800 \text{ N})(\mathbf{+j}) = \{800j\} \text{ N}
$$

We require

$$
\mathbf{F}_R = \mathbf{F}_1 + \mathbf{F}_2
$$

\n800j = 212.1i + 150j - 150k + F_{2x}i + F_{2y}j + F_{2z}k
\n800j = (212.1 + F_{2x})i + (150 + F_{2y})j + (-150 + F_{2z})k

To satisfy this equation the **i**, **j**, **k** components of \mathbf{F}_R must be equal to

the corresponding **i**, **j**, **k** components of
$$
(\mathbf{F}_1 + \mathbf{F}_2)
$$
. Hence,
\n
$$
0 = 212.1 + F_{2x} \qquad F_{2x} = -212.1 \text{ N}
$$
\n
$$
800 = 150 + F_{2y} \qquad F_{2y} = 650 \text{ N}
$$
\n
$$
0 = -150 + F_{2z} \qquad F_{2z} = 150 \text{ N}
$$

The magnitude of \mathbf{F}_2 is thus

$$
F_2 = \sqrt{(-212.1 \text{ N})^2 + (650 \text{ N})^2 + (150 \text{ N})^2}
$$

= 700 N *Ans.*

We can use Eq. 2–9 to determine
$$
\alpha_2
$$
, β_2 , γ_2 .
\n
$$
\cos \alpha_2 = \frac{-212.1}{700}; \qquad \alpha_2 = 108^\circ
$$
 Ans.

$$
\cos \beta_2 = \frac{650}{700};
$$
 $\beta_2 = 21.8^\circ$ *Ans.*

$$
\cos \gamma_2 = \frac{150}{700};
$$
 $\gamma_2 = 77.6^\circ$ Ans.

These results are shown in Fig. 2–32*b*.

2.7 [Position Vectors](#page-11-0)

In this section we will introduce the concept of a position vector. It will be shown that this vector is of importance in formulating a Cartesian force vector directed between two points in space.

^x, y, ^z Coordinates. Throughout the book we will use a *righthanded* coordinate system to reference the location of points in space.We will also use the convention followed in many technical books, which requires the positive *z* axis to be directed *upward* (the zenith direction) so that it measures the height of an object or the altitude of a point. The *x, y* axes then lie in the horizontal plane, Fig. 2–34. Points in space are located relative to the origin of coordinates, *O*, by successive measurements along the *x, y, z* axes. For example, the coordinates of point *A* are obtained by starting at *O* and measuring $x_A = +4$ m along the *x* axis, then $y_A = +2$ m along the *y* axis, and finally $z_A = -6$ m along the *z* axis. Thus, $A(4 \text{ m}, 2 \text{ m},$ –6 m). In a similar manner, measurements along the *x, y, z* axes from *O* to *B* yield the coordinates of *B*, i.e., $B(6 \text{ m}, -1 \text{ m}, 4 \text{ m})$.

Position Vector. A *position vector* **r** is defined as a fixed vector which locates a point in space relative to another point. For example, if **r** extends from the origin of coordinates, *O*, to point *P*(*x, y, z*), Fig. 2–35*a*, then **r** can be expressed in Cartesian vector form as

$$
\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}
$$

Note how the head-to-tail vector addition of the three components yields vector **r**, Fig. 2–35*b*. Starting at the origin *O*, one "travels" *x* in the $+i$ direction, then *y* in the $+i$ direction, and finally *z* in the $+k$ direction to arrive at point *P*(*x, y, z*).

Fig. 2–35

In the more general case, the position vector may be directed from point *A* to point *B* in space, Fig. 2–36*a*. This vector is also designated by the symbol **r**. As a matter of convention, we will *sometimes* refer to this vector with *two subscripts* to indicate from and to the point where it is directed. Thus, **r** can also be designated as \mathbf{r}_{AB} . Also, note that \mathbf{r}_A and \mathbf{r}_B in Fig. 2–36*a* are referenced with only one subscript since they extend from the origin of coordinates.

From Fig. 2–36*a*, by the head-to-tail vector addition, using the triangle rule, we require

$$
\mathbf{r}_A + \mathbf{r} = \mathbf{r}_B
$$

Solving for **r** and expressing \mathbf{r}_A and \mathbf{r}_B in Cartesian vector form yields

$$
\mathbf{r} = \mathbf{r}_B - \mathbf{r}_A = (x_B \mathbf{i} + y_B \mathbf{j} + z_B \mathbf{k}) - (x_A \mathbf{i} + y_A \mathbf{j} + z_A \mathbf{k})
$$

or

$$
\mathbf{r} = (x_B - x_A)\mathbf{i} + (y_B - y_A)\mathbf{j} + (z_B - z_A)\mathbf{k}
$$
 (2-11)

Thus, the **i**, **j**, **k** *components of the position vector* **r** *may be formed by* taking the coordinates of the tail of the vector $A(x_A, y_A, z_A)$ and
subtracting them from the corresponding coordinates of the head *subtracting them from the corresponding coordinates of the head* $B(x_B, y_B, z_B)$. We can also form these components *directly*, Fig. 2–36*b*, by starting at A and moving through a distance of $(x_B - x_A)$ along the starting at *A* and moving through a distance of $(x_B - x_A)$ along the positive *x* axis (+**i**), then $(y_B - y_A)$ along the positive *y* axis (+**j**), and finally $(z_B - z_A)$ along the positive *z* axis (+**k**) to get to *B*.

If an *x*, *y*, *z* coordinate system is established, then the coordinates of points *A* and *B* can be determinded. From this the position vector **r** acting along the cable can be formulated. Its magnitude represents the length of the cable, and its unit vector, $\mathbf{u} = \mathbf{r}/r$, gives the direction defined by α , β , γ .

2

An elastic rubber band is attached to points *A* and *B* as shown in Fig. 2–37*a*. Determine its length and its direction measured from *A* toward *B*.

SOLUTION

We first establish a position vector from *A* to *B*, Fig. 2–37*b*. In accordance with Eq. 2–11, the coordinates of the tail $A(1 \text{ m}, 0, -3 \text{ m})$ are subtracted from the coordinates of the head $B(-2 \text{ m}, 2 \text{ m}, 3 \text{ m})$, which yields

$$
\mathbf{r} = [-2 \text{ m} - 1 \text{ m}] \mathbf{i} + [2 \text{ m} - 0] \mathbf{j} + [3 \text{ m} - (-3 \text{ m})] \mathbf{k}
$$

$$
= \{-3\mathbf{i} + 2\mathbf{j} + 6\mathbf{k}\} \text{ m}
$$

These components of **r** can also be determined *directly* by realizing that they represent the direction and distance one must travel along each axis in order to move from A to B, i.e., along the x axis $\{-3i\}$ m, along the *y* axis $\{2\}$ m, and finally along the *z* axis $\{6k\}$ m.

The length of the rubber band is therefore

$$
r = \sqrt{(-3 \text{ m})^2 + (2 \text{ m})^2 + (6 \text{ m})^2} = 7 \text{ m}
$$
 Ans.

The components of this unit vector give the coordinate direction angles

$$
\alpha = \cos^{-1}\left(-\frac{3}{7}\right) = 115^{\circ}
$$
 Ans.

$$
\beta = \cos^{-1}\left(\frac{2}{7}\right) = 73.4^{\circ}
$$
 Ans.

$$
\gamma = \cos^{-1}\left(\frac{6}{7}\right) = 31.0^{\circ}
$$
 Ans.

NOTE: These angles are measured from the *positive axes* of a localized coordinate system placed at the tail of **r**, as shown in Fig. 2–37*c*.

2.8 [Force Vector Directed Along a Line](#page-11-0)

Quite often in three-dimensional statics problems, the direction of a force is specified by two points through which its line of action passes. Such a situation is shown in Fig. 2–38, where the force **F** is directed along the cord *AB*. We can formulate **F** as a Cartesian vector by realizing that it has the *same direction* and *sense* as the position vector **r** directed from point *A* to point *B* on the cord. This common direction is specified by the *unit vector* $\mathbf{u} = \mathbf{r}/r$. Hence, $\mathbf{u} = \mathbf{r}/r$. Hence,

$$
\mathbf{F} = F\mathbf{u} = F\left(\frac{\mathbf{r}}{r}\right) = F\left(\frac{(x_B - x_A)\mathbf{i} + (y_B - y_A)\mathbf{j} + (z_B - z_A)\mathbf{k}}{\sqrt{(x_B - x_A)^2 + (y_B - y_A)^2 + (z_B - z_A)^2}}\right)
$$

Although we have represented **F** symbolically in Fig. 2–38, note that it has *units of force*, unlike **r**, which has units of length.

r

F u

The force **F** acting along the chain can be represented as a Cartesian vector by establishing *x*, *y*, *z* axes and first forming a position vector **r** along the length of the chain. Then the corresponding unit vector $\mathbf{u} = \mathbf{r}/r$ that defines the direction of both the chain and the force can be determined. Finally, the magnitude of the force is combined with its direction, $\mathbf{F} = F\mathbf{u}$.

Important Points

- A position vector locates one point in space relative to another point.
- The easiest way to formulate the components of a position vector is to determine the distance and direction that must be traveled along the *x, y, z* directions—going from the tail to the head of the vector.
- A force **F** acting in the direction of a position vector **r** can be represented in Cartesian form if the unit vector **u** of the position vector is determined and it is multiplied by the magnitude of the force, i.e., $\mathbf{F} = F\mathbf{u} = F(\mathbf{r}/r)$.

2

The man shown in Fig. 2–39*a* pulls on the cord with a force of 70 lb. Represent this force acting on the support *A* as a Cartesian vector and determine its direction.

SOLUTION

Force **F** is shown in Fig. 2–39*b*. The *direction* of this vector, **u**, is determined from the position vector **r**, which extends from *A* to *B*. Rather than using the coordinates of the end points of the cord, **r** can be determined *directly* by noting in Fig. 2–39*a* that one must travel from \overline{A} {–24**k**} ft, then {–8**j**} ft, and finally {12**i**} ft to get to *B*. Thus,

$$
\mathbf{r} = \{12\mathbf{i} - 8\mathbf{j} - 24\mathbf{k}\}\,\mathrm{ft}
$$

The magnitude of **r**, which represents the *length* of cord *AB*, is

$$
r = \sqrt{(12 \text{ ft})^2 + (-8 \text{ ft})^2 + (-24 \text{ ft})^2} = 28 \text{ ft}
$$

Forming the unit vector that defines the direction and sense of both **r** and **F**, we have

$$
\mathbf{u} = \frac{\mathbf{r}}{r} = \frac{12}{28}\mathbf{i} - \frac{8}{28}\mathbf{j} - \frac{24}{28}\mathbf{k}
$$

 $\mathbf{u} = \frac{\mathbf{r}}{r} = \frac{12}{28}\mathbf{i} - \frac{8}{28}\mathbf{j} - \frac{24}{28}\mathbf{k}$
Since **F**, has a *magnitude* of 70 lb and a *direction* specified by **u**, then

$$
\mathbf{F} = F\mathbf{u} = 70 \text{ lb} \left(\frac{12}{28} \mathbf{i} - \frac{8}{28} \mathbf{j} - \frac{24}{28} \mathbf{k} \right)
$$

= {30\mathbf{i} - 20\mathbf{j} - 60\mathbf{k}} lb *Ans.*

The coordinate direction angles are measured between **r** (or **F**) and the *positive axes* of a localized coordinate system with origin placed at *A*, Fig. 2–39*b*. From the components of the unit vector:

$$
\alpha = \cos^{-1}\left(\frac{12}{28}\right) = 64.6^{\circ}
$$
 Ans.

$$
\beta = \cos^{-1}\left(\frac{-8}{28}\right) = 107^\circ
$$
 Ans.

$$
\gamma = \cos^{-1}\left(\frac{-24}{28}\right) = 149^\circ
$$
 Ans.

NOTE: These results make sense when compared with the angles identified in Fig. 2–39*b*.

The force in Fig. 2–40*a* acts on the hook. Express it as a Cartesian vector.

SOLUTION

As shown in Fig. 2–40*b*, the coordinates for points *A* and *B* are

 $A(2 \text{ m}, 0, 2 \text{ m})$

and

$$
B\left[-\left(\frac{4}{5}\right)5\sin 30^\circ \text{ m}, \left(\frac{4}{5}\right)5\cos 30^\circ \text{ m}, \left(\frac{3}{5}\right)5 \text{ m}\right]
$$

or

$$
B(-2 \text{ m}, 3.464 \text{ m}, 3 \text{ m})
$$

Therefore, to go from *A* to *B*, one must travel $\{4i\}$ m, then $\{3.464$ **j** $\}$ m, and finally {1 **k**} m. Thus,

$$
\mathbf{u}_B = \left(\frac{\mathbf{r}_B}{r_B}\right) = \frac{\{-4\mathbf{i} + 3.464\mathbf{j} + 1\mathbf{k}\} \text{ m}}{\sqrt{(-4 \text{ m})^2 + (3.464 \text{ m})^2 + (1 \text{ m})^2}}
$$

$$
= -0.7428\mathbf{i} + 0.6433\mathbf{j} + 0.1857\mathbf{k}
$$

Force **F**_{*B*} expressed as a Cartesian vector becomes

$$
\mathbf{F}_B = F_B \mathbf{u}_B = (750 \text{ N})(-0.74281\mathbf{i} + 0.6433\mathbf{j} + 0.1857\mathbf{k})
$$

$$
= \{-557\mathbf{i} + 482\mathbf{j} + 139\mathbf{k}\} \text{ N} \qquad \qquad \text{Ans.}
$$

The roof is supported by cables as shown in the photo. If the cables The roof is supported by cables as shown in the photo. If the cables
exert forces $F_{AB} = 100 \text{ N}$ and $F_{AC} = 120 \text{ N}$ on the wall hook at *A* as
shown in Fig. 2–40*a* determine the resultant force acting at *A* Express shown in Fig. 2–40*a*, determine the resultant force acting at *A*. Express the result as a Cartesian vector.

SOLUTION

The resultant force \mathbf{F}_R is shown graphically in Fig. 2–41*b*. We can express this force as a Cartesian vector by first formulating \mathbf{F}_{AB} and \mathbf{F}_{AC} as Cartesian vectors and then adding their components.The directions of \mathbf{F}_{AB} and \mathbf{F}_{AC} are specified by forming unit vectors \mathbf{u}_{AB} and \mathbf{u}_{AC} along the cables.These unit vectors are obtained from the associated position vectors \mathbf{r}_{AB} and \mathbf{r}_{AC} . With reference to Fig. 2–41*a*, to go from *A* to *B*, we vectors \mathbf{r}_{AB} and \mathbf{r}_{AC} . With reference to Fig. 2–41*a* must travel $\{-4\mathbf{k}\}$ m and, then $\{-4\mathbf{i}\}$ m . Thus,

$$
\mathbf{r}_{AB} = \{4\mathbf{i} - 4\mathbf{k}\} \text{ m}
$$

\n
$$
r_{AB} = \sqrt{(4 \text{ m})^2 + (-4 \text{ m})^2} = 5.66 \text{ m}
$$

\n
$$
\mathbf{F}_{AB} = \mathbf{F}_{AB} \left(\frac{\mathbf{r}_{AB}}{r_{AB}}\right) = (100 \text{ N}) \left(\frac{4}{5.66} \mathbf{i} - \frac{4}{5.66} \mathbf{k}\right)
$$

\n
$$
\mathbf{F}_{AB} = \{70.7\mathbf{i} - 70.7\mathbf{k}\} \text{ N}
$$

To go from *A* to *C*, we must travel $\{-4\mathbf{k}\}\text{ m}$, then $\{2\mathbf{j}\}\text{ m}$, and finally $\{4j\}$. Thus,

$$
\mathbf{r}_{AC} = \{4\mathbf{i} + 2\mathbf{j} - 4\mathbf{k}\} \text{ m}
$$

\n
$$
r_{AC} = \sqrt{(4 \text{ m})^2 + (2 \text{ m})^2 + (-4 \text{ m})^2} = 6 \text{ m}
$$

\n
$$
\mathbf{F}_{AC} = \mathbf{F}_{AC} \left(\frac{\mathbf{r}_{AC}}{r_{AC}}\right) = (120 \text{ N}) \left(\frac{4}{6} \mathbf{i} + \frac{2}{6} \mathbf{j} - \frac{4}{6} \mathbf{k}\right)
$$

\n
$$
= \{80\mathbf{i} + 40\mathbf{j} - 80\mathbf{k}\} \text{ N}
$$

The resultant force is therefore

$$
\mathbf{F}_R = \mathbf{F}_{AB} + \mathbf{F}_{AC} = \{70.7\mathbf{i} - 70.7\mathbf{k}\} \text{ N} + \{80\mathbf{i} + 40\mathbf{j} - 80\mathbf{k}\} \text{ N}
$$

$$
= \{151\mathbf{i} + 40\mathbf{j} - 151\mathbf{k}\} \text{ N} \qquad \text{Ans.}
$$

2.9 [Dot Product](#page-11-0)

Occasionally in statics one has to find the angle between two lines or the components of a force parallel and perpendicular to a line.In two dimensions, these problems can readily be solved by trigonometry since the geometry is easy to visualize. In three dimensions, however, this is often difficult, and consequently vector methods should be employed for the solution.The dot product, which defines a particular method for "multiplying" two vectors, will be is used to solve the above-mentioned problems.

The *dot product* of vectors **A** and **B**, written $\mathbf{A} \cdot \mathbf{B}$, and read " \mathbf{A} dot \mathbf{B} " is defined as the product of the magnitudes of **A** and **B** and the cosine of the angle θ between their tails, Fig. 2–41. Expressed in equation form,
 $\mathbf{A} \cdot \mathbf{B} = AB \cos \theta$ (2–

$$
\mathbf{A} \cdot \mathbf{B} = AB \cos \theta \tag{2-12}
$$

where $0^{\circ} \le \theta \le 180^{\circ}$. The dot product is often referred to as the *scalar product* of vectors since the result is a *scalar* and not a vector.

Laws of Operation.

- **1.** Commutative law: $\mathbf{A} \cdot \mathbf{B} = \mathbf{B} \cdot \mathbf{A}$
- **2.** Multiplication by a scalar: $a(\mathbf{A} \cdot \mathbf{B}) = (a\mathbf{A}) \cdot \mathbf{B} = \mathbf{A} \cdot (a\mathbf{B})$
 2. $\mathbf{B}^{\dagger} \cdot (a\mathbf{B} + b\mathbf{A} \cdot (b\mathbf{B}) = (a\mathbf{A}) \cdot (b\mathbf{B}) + (b\mathbf{A} \cdot \mathbf{B})$ **2.** Multiplication by a scalar: $a(\mathbf{A} \cdot \mathbf{B}) = (a\mathbf{A}) \cdot \mathbf{B} = A$
 3. Distributive law: $\mathbf{A} \cdot (\mathbf{B} + \mathbf{D}) = (\mathbf{A} \cdot \mathbf{B}) + (\mathbf{A} \cdot \mathbf{D})$
-

It is easy to prove the first and second laws by using Eq. 2–12. The proof of the distributive law is left as an exercise (see Prob. 2–111).

Cartesian Vector Formulation. Equation 2–12 must be used to find the dot product for any two Cartesian unit vectors. For example, $\mathbf{i} \cdot \mathbf{i} = (1)(1) \cos 0^\circ = 1$ and $\mathbf{i} \cdot \mathbf{j} = (1)(1) \cos 90^\circ = 0$. If we want to find find the dot product for any two Cartesian unit vectors. For example, $\mathbf{i} \cdot \mathbf{i} = (1)(1) \cos 0^\circ = 1$ and $\mathbf{i} \cdot \mathbf{j} = (1)(1) \cos 90^\circ = 0$. If we want to find the dot product of two general vectors **A** and **B** that are expressed in

Cartesian vector form, then we have
\n
$$
\mathbf{A} \cdot \mathbf{B} = (A_x \mathbf{i} + A_y \mathbf{j} + A_z \mathbf{k}) \cdot (B_x \mathbf{i} + B_y \mathbf{j} + B_z \mathbf{k})
$$
\n
$$
= A_x B_x (\mathbf{i} \cdot \mathbf{i}) + A_x B_y (\mathbf{i} \cdot \mathbf{j}) + A_x B_z (\mathbf{i} \cdot \mathbf{k})
$$
\n
$$
+ A_y B_x (\mathbf{j} \cdot \mathbf{i}) + (A_y B_y (\mathbf{j} \cdot \mathbf{j}) + A_y B_z (\mathbf{j} \cdot \mathbf{k})
$$
\n
$$
+ A_z B_x (\mathbf{k} \cdot \mathbf{i}) + A_z B_y (\mathbf{k} \cdot \mathbf{j}) + A_z B_z (\mathbf{k} \cdot \mathbf{k})
$$

Carrying out the dot-product operations, the final result becomes
\n
$$
\mathbf{A} \cdot \mathbf{B} = A_x B_x + A_y B_y + A_z B_z
$$
\n(2-13)

Thus, to determine the dot product of two Cartesian vectors, multiply their corresponding x, y, z components and sum these products algebraically. Note that the result will be either a positive or negative *scalar*.

2

The angle θ between the rope and the connecting beam can be determined by formulating unit vectors along the beam and rope and then using the dot product **formulating unit vector**
rope and then usi
 $\mathbf{u}_b \cdot \mathbf{u}_r = (1)(1) \cos \theta.$

Applications. The dot product has two important applications in mechanics.

• *The angle formed between two vectors or intersecting lines.* The angle θ between the tails of vectors **A** and **B** in Fig. 2–41 can be determined from Eq. 2–12 and written as
 $A = \arctan A \cdot \mathbf{B}$

$$
\theta = \cos^{-1}\left(\frac{\mathbf{A} \cdot \mathbf{B}}{AB}\right) \qquad 0^{\circ} \le \theta \le 180^{\circ}
$$

 $\theta = \cos^{-1}(\overline{AB})$ $0^{\circ} \le \theta \le 180^{\circ}$
Here $\mathbf{A} \cdot \mathbf{B}$ is found from Eq. 2–13. In particular, notice that if Here $\mathbf{A} \cdot \mathbf{B}$ is found from Eq. 2–13. In particular, notice that $\mathbf{A} \cdot \mathbf{B} = 0$, $\theta = \cos^{-1} 0 = 90^{\circ}$ so that **A** will be *perpendicular* to **B**.

• *The components of a vector parallel and perpendicular to a line.* The component of vector **A** parallel to or collinear with the line **line.** The component of vector **A** parallel to or collinear with the line aa' in Fig. 2–43 is defined by A_a where $A_a = A \cos \theta$. This component is sometimes referred to as the *projection* of **A** onto the line since a is sometimes referred to as the *projection* of **A** onto the line, since a *right angle* is formed in the construction. If the *direction* of the line is specified by the unit vector \mathbf{u}_a , then since $u_a = 1$, we can determine the magnitude of \mathbf{A}_a directly from the dot product (Eq. 2–12); i.e.,
 $A_a = A \cos \theta = \mathbf{A} \cdot \mathbf{u}_a$

$$
A_a = A \cos \theta = \mathbf{A} \cdot \mathbf{u}_a
$$

Hence, the scalar projection of **A** *along a line is determined from the dot product of* **A** *and the unit vector* **u***^a which defines the direction of the line.* Notice that if this result is positive, then A_a has a directional sense which is the same as \mathbf{u}_a , whereas if A_a is a negative scalar, then A_a has the opposite sense of direction to \mathbf{u}_a

The component **A***^a* represented as a *vector* is therefore

$$
\mathbf{A}_a = A_a \, \mathbf{u}_a
$$

The component of **A** that is perpendicular to line *aa* can also be The component of **A** that is perpendicular to line *aa* can also be obtained, Fig. 2–43. Since $\mathbf{A} = \mathbf{A}_a + \mathbf{A}_{\perp}$, then $\mathbf{A}_{\perp} = \mathbf{A} - \mathbf{A}_a$.
There are two possible ways of obtaining Λ . One way would be There are two possible ways of obtaining A_{\perp} . One way would be to There are two possible ways of obtaining A_{\perp} . One way would be to
determine θ from the dot product, $\theta = \cos^{-1}(A \cdot u_A/A)$, then termine θ from the dot product, $\theta = \cos^{-1}(\mathbf{A} \cdot \mathbf{u}_A/A)$, then $\theta = A \sin \theta$. Alternatively, if A_a is known, then by Pythagorean's agreem we can also write $A = \sqrt{A^2 - A^2}$ $A_{\perp} = A \sin \theta$. Alternatively, if A_a is known, the theorem we can also write $A_{\perp} = \sqrt{A^2 - A_a^2}$. $A_{\perp} = A \sin \theta$. Alternatively, if A_a is known, the
theorem we can also write $A_{\perp} = \sqrt{A^2 - A^2}$ Fig. 2–43. Since $\mathbf{A} = \mathbf{A}_a + \mathbf{A}_\perp$, then $\mathbf{A}_\perp = \mathbf{A}$
wo possible ways of obtaining A_\perp . One way would
 θ from the dot product, $\theta = \cos^{-1}(\mathbf{A} \cdot \mathbf{u}_A/A)$
a θ Alternatively if A is known then by Py

Fig. 2–43

The projection of the cable force **F** along the beam can be determined by first finding the unit vector \mathbf{u}_b that defines this direction. Then apply the dot product, $F_b = \mathbf{F} \cdot \mathbf{u}_b$.

Important Points

- The dot product is used to determine the angle between two vectors or the projection of a vector in a specified direction.
- If vectors **A** and **B** are expressed in Cartesian vector form, the dot product is determined by multiplying the respective *x, y, z* scalar components and algebraically adding the results, i.e., dot product is determined by r
scalar components and algebra
 $\mathbf{A} \cdot \mathbf{B} = A_x B_x + A_y B_y + A_z B_z$.
- From the definition of the dot product, the angle formed between From the definition of the dot product, the angle form

EXAMPLE 2.16

Determine the magnitudes of the projection of the force **F** in Fig. 2–44 onto the u and v axes.

SOLUTION

Projections of Force. The graphical representation of the *projections* is shown in Fig. 2–44. From this figure, the magnitudes of the projections of **F** onto the *u* and *v* axes can be obtained by trigonometry:

$$
(F_u)_{\text{proj}} = (100 \text{ N})\cos 45^\circ = 70.7 \text{ N}
$$
 Ans.

$$
(F_v)_{\text{proj}} = (100 \text{ N})\cos 15^\circ = 96.6 \text{ N}
$$
Ans.

NOTE: These projections are not equal to the magnitudes of the components of force \bf{F} along the *u* and *v* axes found from the parallelogram law. They will only be equal if the u and v axes are *perpendicular* to one another.

SOLUTION

The magnitude of the component of **F** along *AB* is equal to the dot product of **F** and the unit vector **u***B*, which defines the direction of *AB*, Fig. 2–44*b*. Since

$$
\mathbf{u}_B = \frac{\mathbf{r}_B}{r_B} = \frac{2\mathbf{i} + 6\mathbf{j} + 3\mathbf{k}}{\sqrt{(2)^2 + (6)^2 + (3)^2}} = 0.286\mathbf{i} + 0.857\mathbf{j} + 0.429\mathbf{k}
$$

then

$$
F_{AB} = F \cos \theta = \mathbf{F} \cdot \mathbf{u}_B = (300\mathbf{j}) \cdot (0.286\mathbf{i} + 0.857\mathbf{j} + 0.429\mathbf{k})
$$

= (0)(0.286) + (300)(0.857) + (0)(0.429)
= 257.1 N
Ans.

Since the result is a positive scalar, \mathbf{F}_{AB} has the same sense of direction as **u***B*, Fig. 2–45*b*.

Expressing
$$
\mathbf{F}_{AB}
$$
 in Cartesian vector form, we have
\n
$$
\mathbf{F}_{AB} = F_{AB}\mathbf{u}_B = (257.1 \text{ N})(0.286\mathbf{i} + 0.857\mathbf{j} + 0.429\mathbf{k})
$$
\n
$$
= \{73.5\mathbf{i} + 220\mathbf{j} + 110\mathbf{k}\} \text{N}
$$
\nAns.

The perpendicular component, Fig. 2–45*b*, is therefore

$$
\mathbf{F}_{\perp} = \mathbf{F} - \mathbf{F}_{AB} = 300\mathbf{j} - (73.5\mathbf{i} + 220\mathbf{j} + 110\mathbf{k})
$$

= $\{-73.5\mathbf{i} + 80\mathbf{j} - 110\mathbf{k}\} \text{ N}$

Its magnitude can be determined either from this vector or by using the Pythagorean theorem, Fig. 2–45*b*:

$$
F_{\perp} = \sqrt{F^2 - F_{AB}^2} = \sqrt{(300 \text{ N})^2 - (257.1 \text{ N})^2}
$$

= 155 N *Ans.*

The pipe in Fig. 2–46*a* is subjected to the force of $F = 80$ lb. Determine the angle θ between **F** and the pipe segment *BA* and the projection of **F** along this segment.

SOLUTION

Angle θ . First we will establish position vectors from B to A and B to *C;* Fig. 2–46*b*. Then we will determine the angle θ between the tails of these two vectors.

$$
\mathbf{r}_{BA} = \{-2\mathbf{i} - 2\mathbf{j} + 1\mathbf{k}\} \text{ ft}, \ r_{BA} = 3 \text{ ft}
$$

$$
\mathbf{r}_{BC} = \{-3\mathbf{j} + 1\mathbf{k}\} \text{ ft}, \ r_{BC} = \sqrt{10 \text{ ft}}
$$

Thus,

$$
\mathbf{r}_{BC} = \sqrt{3} \mathbf{J} + \mathbf{R}_{f} \mathbf{R}_{i}, \, r_{BC} = \sqrt{10} \mathbf{R}
$$
\n
$$
\cos \theta = \frac{\mathbf{r}_{BA} \cdot \mathbf{r}_{BC}}{\mathbf{r}_{BA} \mathbf{r}_{BC}} = \frac{(-2)(0) + (-2)(-3) + (1)(1)}{3\sqrt{10}} = 0.7379
$$
\n
$$
\theta = 42.5^{\circ}
$$

Components of F. The component of **F** along *BA* is shown in Fig. 2–46*b*.We must first formulate the unit vector along *BA* and force **F** as Cartesian vectors.

$$
\mathbf{u}_{BA} = \frac{\mathbf{r}_{BA}}{r_{BA}} = \frac{(-2\mathbf{i} - 2\mathbf{j} + 1\mathbf{k})}{3} = -\frac{2}{3}\mathbf{i} - \frac{2}{3}\mathbf{j} + \frac{1}{3}\mathbf{k}
$$

$$
\mathbf{F} = 80 \text{ lb} \left(\frac{\mathbf{r}_{BC}}{r_{BC}}\right) = 80 \left(\frac{-3\mathbf{j} + 1\mathbf{k}}{\sqrt{10}}\right) = -75.89\mathbf{j} + 25.30\mathbf{k}
$$

Thus,

$$
F_{BA} = \mathbf{F} \cdot \mathbf{u}_{BA} = (-75.89\mathbf{j} + 25.30\mathbf{k}) \cdot \left(-\frac{2}{3}\mathbf{i} - \frac{2}{3}\mathbf{j} + \frac{1}{3}\mathbf{k} \right)
$$

= $0 \left(-\frac{2}{3} \right) + (-75.89) \left(-\frac{2}{3} \right) + (25.30) \left(\frac{1}{3} \right)$
= 59.0 lb

Fig. 2–46

NOTE: Since θ is known, then also, $F_{BA} = F \cos \theta = 80$ lb cos $42.5^\circ = 59.0$ lb.

[Equilibrium of a](#page-11-0) Particle

3

[CHAPTER OBJECTIVES](#page-11-0)

- To introduce the concept of the free-body diagram for a particle.
- To show how to solve particle equilibrium problems using the equations of equilibrium.

3.1 [Condition for the Equilibrium](#page-11-0) of a Particle

A particle is said to be in *equilibrium* if it remains at rest if originally at rest, or has a constant velocity if originally in motion. Most often, however, the term "equilibrium" or, more specifically, "static equilibrium" is used to describe an object at rest.To maintain equilibrium, it is *necessary* to satisfy Newton's first law of motion, which requires the *resultant force* acting on a particle to be equal to *zero*.This condition may be stated mathematically as

$$
\Sigma \mathbf{F} = \mathbf{0} \tag{3-1}
$$

where Σ **F** is the vector *sum of all the forces* acting on the particle.

Not only is Eq. 3–1 a necessary condition for equilibrium, it is also a sufficient condition. This follows from Newton's second law of motion, sufficient condition. This follows from Newton's second law of motion,
which can be written as $\Sigma \mathbf{F} = m\mathbf{a}$. Since the force system satisfies Eq. 3–1,
then $m\mathbf{a} = \mathbf{0}$ and therefore, the particle's acceleration which can be written as $\Sigma \mathbf{F} = m\mathbf{a}$. Since the force system satisfies Eq. 3-1, then $m\mathbf{a} = \mathbf{0}$, and therefore the particle's acceleration $\mathbf{a} = \mathbf{0}$.
Consequently the particle indeed moves with constant Consequently, the particle indeed moves with constant velocity or remains at rest.

3.2 [The Free-Body Diagram](#page-11-0)

To apply the equation of equilibrium, we must account for *all* the known To apply the equation of equilibrium, we must account for *all* the known and unknown forces $(\Sigma \mathbf{F})$ which act *on* the particle. The best way to do this is to think of the particle as isolated and "free" from its surroundings. A drawing that shows the particle with *all* the forces that act on it is called a *free-body diagram (FBD).*

Before presenting a formal procedure as to how to draw a free-body diagram, we will first consider two types of connections often encountered in particle equilibrium problems.

Springs. If a *linearly elastic spring* (or cord) of undeformed length l_o is used to support a particle, the length of the spring will change in direct proportion to the force **F** acting on it, Fig. 3–1. A characteristic that defines the "elasticity" of a spring is the *spring constant* or *stiffness k*.

The magnitude of force exerted on a linearly elastic spring which has a stiffness *k* and is deformed (elongated or compressed) a distance stiffness k and is deformed (elongated or cor
 $s = l - l_o$, measured from its *unloaded* position, is

$$
F = ks \tag{3-2}
$$

If *s* is positive, causing an elongation, then **F** must pull on the spring; whereas if *s* is negative, causing a shortening, then **F** must push on it. For example, if the spring in Fig. 3–1 has an unstretched length of 0.8 m and a example, if the spring in Fig. 3–1 has an unstretched length of 0.8 m and a
stiffness $k = 500$ N/m and it is stretched to a length of 1 m, so
that $s = l - l = 1$ m – 0.8 m = 0.2 m then a force $F = k s =$ stiffness $k = 500$ N/m and it is stretched to a length of 1 m, so that $s = l - l_o = 1$ m $- 0.8$ m $= 0.2$ m, then a force $F = ks = 500$ N/m(0.2 m) = 100 N is needed. $500 \text{ N/m}(0.2 \text{ m}) = 100 \text{ N}$ is needed.

Cables and Pulleys. Unless otherwise stated, throughout this book, except in Sec. 7.4, all cables (or cords) will be assumed to have negligible weight and they cannot stretch. Also, a cable can support *only* a tension or "pulling" force, and this force always acts in the direction of the cable. In Chapter 5, it will be shown that the tension force developed in a *continuous cable* which passes over a frictionless pulley must have a *constant* magnitude to keep the cable in equilibrium. Hence, for any angle θ , shown in Fig. 3–2, the cable is subjected to a constant tension *T* throughout its length.

Fig. 3–1

Procedure for Drawing a Free-Body Diagram

Since we must account for *all the forces acting on the particle* when applying the equations of equilibrium, the importance of first drawing a free-body diagram cannot be overemphasized.To construct a freebody diagram, the following three steps are necessary.

Draw Outlined Shape.

Imagine the particle to be *isolated* or cut "free" from its surroundings by drawing its outlined shape.

Show All Forces.

Indicate on this sketch *all* the forces that act *on the particle*. These forces can be *active forces*, which tend to set the particle in motion, or they can be *reactive forces* which are the result of the constraints or supports that tend to prevent motion. To account for all these forces, it may be helpful to trace around the particle's boundary, carefully noting each force acting on it.

Identify Each Force.

The forces that are *known* should be labeled with their proper magnitudes and directions. Letters are used to represent the magnitudes and directions of forces that are unknown.

The bucket is held in equilibrium by the cable, and instinctively we know that the force in the cable must equal the weight of the bucket. By drawing a free-body diagram of the bucket we can understand why this is so. This diagram shows that there are only two forces *acting on the bucket*, namely, its weight **W** and the force **T** of the cable. For equilibrium, the resultant of these forces must be equal to zero, and so $T = W$.

The spool has a weight *W* and is suspended from the crane boom. If we wish to obtain the forces in cables *AB* and *AC*, then we should consider the free-body diagram of the ring at *A*.Here the cables *AD* exert a resultant force of **W** on the ring and the condition of equilibrium is used to obtain T_B
and T_B and \mathbf{T}_C .

3

$EXAMPLE$ 3.1

(c)

The sphere in Fig. 3–3*a* has a mass of 6 kg and is supported as shown. Draw a free-body diagram of the sphere, the cord *CE*, and the knot at *C*.

SOLUTION

Sphere. By inspection, there are only two forces acting on the **Sphere.** By inspection, there are only two forces acting on the sphere, namely, its weight, 6 kg (9.81 m/s²) = 58.9 N, and the force of cord *CE*. The free-body diagram is shown in Fig. 3–3*b*.

Cord CE. When the cord *CE* is isolated from its surroundings, its free-body diagram shows only two forces acting on it, namely, the force of the sphere and the force of the knot, Fig. 3–3*c*. Notice that \mathbf{F}_{CE} shown here is equal but opposite to that shown in Fig. 3–3*b*, a consequence of Newton's third law of action reaction. Also \mathbf{F} and consequence of Newton's third law of action–reaction. Also, \mathbf{F}_{CE} and \mathbf{F}_{C} and the cord and keep it in tension so that it doesn't collapse \mathbf{F}_{EC} pull on the cord and keep it in tension so that it doesn't collapse.
For equilibrium $\mathbf{F}_{C} = \mathbf{F}_{C}$ \mathbf{F}_{EC} pull on the cord and kee
For equilibrium, $F_{CE} = F_{EC}$.

Knot. The knot at *C* is subjected to three forces, Fig. 3–3*d*. They are caused by the cords *CBA* and *CE* and the spring *CD*. As required, the free-body diagram shows all these forces labeled with their magnitudes and directions. It is important to recognize that the weight of the sphere does not directly act on the knot. Instead, the cord *CE* subjects the knot to this force.

3.3 [Coplanar Force Systems](#page-11-0)

If a particle is subjected to a system of coplanar forces that lie in the *x–y* plane as in Fig. 3–4, then each force can be resolved into its **i** and **j** components. For equilibrium, these forces must sum to produce a zero force resultant, i.e.,

$$
\Sigma \mathbf{F} = \mathbf{0}
$$

$$
\Sigma F_x \mathbf{i} + \Sigma F_y \mathbf{j} = \mathbf{0}
$$

For this vector equation to be satisfied, the force's *x* and *y* components must both be equal to zero. Hence,

$$
\Sigma F_x = 0
$$

\n
$$
\Sigma F_y = 0
$$
\n(3-3)

These two equations can be solved for at most two unknowns, generally represented as angles and magnitudes of forces shown on the particle's free-body diagram.

When applying each of the two equations of equilibrium, we must account for the sense of direction of any component by using an *algebraic sign* which corresponds to the arrowhead direction of the component along the *x* or *y* axis. It is important to note that if a force has an *unknown magnitude*, then the arrowhead sense of the force on the free-body diagram can be *assumed*. Then if the *solution* yields a *negative scalar*, this indicates that the sense of the force is opposite to that which was assumed.

For example, consider the free-body diagram of the particle subjected to the two forces shown in Fig. 3–5. Here it is *assumed* that the *unknown force* **F** acts to the right to maintain equilibrium. Applying the equation of equilibrium along the *x* axis, we have

$$
\Rightarrow \Sigma F_x = 0; \qquad \qquad +F + 10 \text{ N} = 0
$$

Both terms are "positive" since both forces act in the positive *x* direction. Both terms are "positive" since both forces act in the positive x direction.
When this equation is solved, $F = -10$ N. Here the *negative sign*
indicates that **F** must act to the left to hold the particle in equilibrium indicates that **must act to the left to hold the particle in equilibrium,** Fig. 3–5. Notice that if the $+x$ axis in Fig. 3–5 were directed to the left, both terms in the above equation would be negative, but again, after solving, $F = -10$ N, indicating that **F** would be directed to the left.

y

F1

x

Procedure for Analysis

Coplanar force equilibrium problems for a particle can be solved using the following procedure.

Free-Body Diagram.

- Establish the *x, y* axes in any suitable orientation.
- Label all the known and unknown force magnitudes and directions on the diagram.
- The sense of a force having an unknown magnitude can be assumed.

Equations of Equilibrium.

- Apply the equations of equilibrium, $\Sigma F_x = 0$ and $\Sigma F_y = 0$.
- Components are positive if they are directed along a positive axis, and negative if they are directed along a negative axis.
- If more than two unknowns exist and the problem involves a spring, If more than two unknowns exist and the problem involves a spring,
apply $F = ks$ to relate the spring force to the deformation *s* of the
spring spring.
- Since the magnitude of a force is always a positive quantity, then if the solution for a force yields a negative result, this indicates its sense is the reverse of that shown on the free-body diagram.

 $\mathbf{T}_\mathcal{C}$

x

T*^D*

y

 \mathbf{T}_B

The chains exert three forces on the ring at *A*, as shown on its free-body diagram. The ring will not move, or will move with constant velocity, provided the summation of these forces along the *x* and along the *y* axis is zero. If one of the three forces is known, the magnitudes of the other two forces can be obtained from the two equations of equilibrium.

$EXAMPLE$ 3.2

Determine the tension in cables *BA* and *BC* necessary to support the 60-kg cylinder in Fig. 3-6*a*.

SOLUTION

Free-Body Diagram. Due to equilibrium, the weight of the cylinder **Free-Body Diagram.** Due to equilibrium, the weight of the cylinder causes the tension in cable *BD* to be $T_{BD} = 60(9.81)$ N, Fig. 3-6*b*. The forces in cables *BA* and *BC* can be determined by investigating forces in cables *BA* and *BC* can be determined by investigating the equilibrium of ring B . Its free-body diagram is shown in Fig. 3-6 c . The magnitudes of \mathbf{T}_A and \mathbf{T}_C are unknown, but their directions are known.

Equations of Equilibrium. Applying the equations of equilibrium

along the *x* and *y* axes, we have
\n
$$
\Rightarrow \Sigma F_x = 0; \qquad T_C \cos 45^\circ - \left(\frac{4}{5}\right) T_A = 0 \tag{1}
$$

$$
+ \uparrow \Sigma F_y = 0; \quad T_C \sin 45^\circ + \left(\frac{3}{5}\right) T_A - 60(9.81) \text{ N} = 0 \tag{2}
$$

Equation (1) can be written as $T_A = 0.8839T_C$. Substituting this into Eq. (2) yields

$$
T_C \sin 45^\circ + \left(\frac{3}{5}\right)(0.8839T_C) - 60(9.81) N = 0
$$

So that

$$
T_C = 475.66 \text{ N} = 476 \text{ N}
$$
Ans.

Substituting this result into either Eq. (1) or Eq. (2), we get
 $T_A = 420 \text{ N}$

$$
T_A = 420 \text{ N}
$$
 Ans.

NOTE: The accuracy of these results, of course, depends on the accuracy of the data, i.e., measurements of geometry and loads. For most engineering work involving a problem such as this, the data as measured to three significant figures would be sufficient.

Fig. 3–6
The 200-kg crate in Fig. $3\text{-}7a$ is suspended using the ropes AB and AC. Each rope can withstand a maximum force of 10 kN before it breaks. If *AB* always remains horizontal, determine the smallest angle θ to which the crate can be suspended before one of the ropes breaks the crate can be suspended before one of the ropes breaks.

(b)

Fig. 3–7

(a)

SOLUTION

Free-Body Diagram. We will study the equilibrium of ring A . There are three forces acting on it, Fig. 3-7*b*. The magnitude of \mathbf{F}_D is equal to the weight of the crate i.e. $\mathbf{F}_D = 200.0831 \text{ N} - 1062 \text{ N} < 10 \text{ kN}$ are three forces acting on it, Fig. 3-7*b*. The magnitude of \mathbf{F}_D is equal the weight of the crate, i.e., $F_D = 200 (9.81) \text{ N} = 1962 \text{ N} < 10 \text{ kN}$.

Equations of Equilibrium. Applying the equations of equilibrium along the *x* and *y* axes,

$$
\Rightarrow \Sigma F_x = 0; \qquad -F_C \cos \theta + F_B = 0; \quad F_C = \frac{F_B}{\cos \theta} \tag{1}
$$

$$
F_C \cos \theta + T_B = 0, \quad F_C = \cos \theta
$$

+ $\uparrow \Sigma F_y = 0;$ $F_C \sin \theta - 1962 \text{ N} = 0$ (2)

From Eq. (1), F_C is always greater than F_B since $\cos \theta \le 1$.
Therefore rone AC will reach the maximum tensile force of 10 kN Therefore, rope *AC* will reach the maximum tensile force of 10 kN hefore rope *AR* Substituting $F_0 = 10$ kN into Eq. (2), we get *before* rope *AB*. Substituting $F_C = 10 \text{ kN}$ into Eq. (2), we get
 $[10(10^3) \text{ N}] \sin \theta - 1962 \text{ N} = 0$ ope *AC* will reach the maxim
AB. Substituting $F_C = 10 \text{ kN}$

$$
[10(103) N] \sin \theta - 1962 N = 0
$$

$$
\theta = \sin^{-1}(0.1962) = 11.31^{\circ} = 11.3^{\circ}
$$
Ans.

The force developed in rope AB can be obtained by substituting the values for θ and \overline{F}_C into Eq. (1).

$$
10(103) N = \frac{F_B}{\cos 11.31^{\circ}}
$$

$$
F_B = 9.81 \text{ kN}
$$

Determine the required length of cord *AC* in Fig. 3–8*a* so that the 8-kg lamp can be suspended in the position shown. The *undeformed* 8-kg lamp can be suspended in the position shown. The *undeformed*
length of spring *AB* is $l'_{AB} = 0.4$ m, and the spring has a stiffness of
 $k_{AB} = 300$ N/m $k_{AB} = 300$ N/m.

SOLUTION

If the force in spring *AB* is known, the stretch of the spring can be If the force in spring *AB* is known, the stretch of the spring can be found using $F = ks$. From the problem geometry, it is then possible to calculate the required length of *AC* calculate the required length of *AC*.

Free-Body Diagram. The lamp has a weight $W = 8(9.81) = 78.5$ N
and so the free-body diagram of the ring at A is shown in Fig. 3–8b and so the free-body diagram of the ring at *A* is shown in Fig. 3–8*b*.

$$
T_{AB} = 135.9 \text{ N}
$$

 $T_{AB} = k_{AB} s_{AB}$; 135.9 N = 300 N/m(s_{AB})

$$
s_{AB} = 0.453 \text{ m}
$$

so the stretched length is

so the stretched length is
\n
$$
l_{AB} = l'_{AB} + s_{AB}
$$
\n
$$
l_{AB} = 0.4 \text{ m} + 0.453 \text{ m} = 0.853 \text{ m}
$$
\nThe horizontal distance from *C* to *B*, Fig. 3–8*a*, requires
\n
$$
2 \text{ m} = l_{AC} \cos 30^{\circ} + 0.853 \text{ m}
$$
\n
$$
l_{AC} = 1.32 \text{ m}
$$
\n*Ans.*

FUNDAMENTAL PROBLEMS

All problem solutions must include an FBD.

F3–1. The crate has a weight of 550 lb. Determine the force in each supporting cable.

C

F3–2. The beam has a weight of 700 lb. Determine the shortest cable *ABC* that can be used to lift it if the maximum force the cable can sustain is 1500 lb.

F3–3. If the 5-kg block is suspended from the pulley *B* and the sag of the cord is $d = 0.15$ m, determine the force in cord *ABC*. Neglect the size of the pulley.

F3–4. The block has a mass of 5 kg and rests on the smooth plane. Determine the unstretched length of the spring.

F3–5. If the mass of cylinder *C* is 40 kg, determine the mass of cylinder *A* in order to hold the assembly in the position shown.

F3–6. Determine the tension in cables *AB*, *BC*, and *CD*, necessary to support the 10-kg and 15-kg traffic lights at *B* and *C*, respectively. Also, find the angle θ .

PROBLEMS

All problem solutions must include an FBD.

•3–1. Determine the force in each cord for equilibrium of the 200-kg crate. Cord BC remains horizontal due to the the 200-kg crate. Cord *BC* remains horizontal due to the roller at *C*, and *AB* has a length of 1.5 m. Set $y = 0.75$ m.

3–2. If the 1.5-m-long cord AB can withstand a maximum force of 3500 N, determine the force in cord *BC* and the distance y so that the 200-kg crate can be supported distance *y* so that the 200-kg crate can be supported.

3–3. If the mass of the girder is 3 Mg and its center of mass is located at point *G*, determine the tension developed in cables AB, BC , and BD for equilibrium.

***3–4.** If cables *BD* and *BC* can withstand a maximum tensile force of 20 kN, determine the maximum mass of the girder that can be suspended from cable AB so that neither exteed will fail. The center of mass of the girder is located at point G .

•3–5. The members of a truss are connected to the gusset plate. If the forces are concurrent at point *O*, determine the plate. If the forces are concurrent at point *O*, determinagnitudes of **F** and **T** for equilibrium. Take $\theta = 30^{\circ}$.

3–6. The gusset plate is subjected to the forces of four members. Determine the force in member *B* and its proper orientation θ for equilibrium. The forces are concurrent at point *O*. Take $F = 12$ kN.

3–7. The towing pendant *AB* is subjected to the force of 50 kN exerted by a tugboat. Determine the force in each of the bridles, *BC* and *BD*, if the ship is moving forward with constant velocity.

Probs. 3–3/4

*3–8. Members *AC* and *AB* support the 300-lb crate. Determine the tensile force developed in each member.

 \bullet **3–9.** If members AC and AB can support a maximum tension of 300 lb and 250 lb, respectively, determine the largest weight of the crate that can be safely supported.

3

Probs. 3–8/9

3–10. The members of a truss are connected to the gusset plate. If the forces are concurrent at point *O*, determine the plate. If the forces are concurrent at point *O*, determinagnitudes of **F** and **T** for equilibrium. Take $\theta = 90^\circ$.

3–11. The gusset plate is subjected to the forces of three members. Determine the tension force in member *C* and its angle θ for equilibrium. The forces are concurrent at point O . Take $F = 8$ kN.

***3–12.** If block B weighs 200 lb and block C weighs 100 lb, determine the required weight of block D and the angle B determine the required weight of block D and the angle θ for equilibrium for equilibrium.

•3–13. If block *D* weighs 300 lb and block *B* weighs 275 lb, determine the required weight of block C and the angle $\hat{\theta}$ for equilibrium for equilibrium.

Probs. 3–12/13

3–14. Determine the stretch in springs *AC* and *AB* for equilibrium of the 2-kg block. The springs are shown in the equilibrium position.

3–15. The unstretched length of spring *AB* is 3 m. If the block is held in the equilibrium position shown, determine the mass of the block at *D*.

Probs. 3–10/11

 $*3-16$. Determine the tension developed in wires CA and required for equilibrium of the 10 -kg cylinder. Take CB requ $\theta = 40^{\circ}$.

•3–17. If cable *CB* is subjected to a tension that is twice that of cable CA, determine the angle θ for equilibrium of the 10-kg cylinder. Also what are the tensions in wires CA the 10-kg cylinder. Also, what are the tensions in wires CA and CR ?

Probs. 3–16/17

3–18. Determine the forces in cables *AC* and *AB* needed **3–18.** Determine the forces in cables AC and AB needed
to hold the 20-kg ball D in equilibrium. Take $F = 300$ N
and $d = 1$ m to hold the 2
and $d = 1$ m.

3–19. The ball *D* has a mass of 20 kg. If a force of $F = 100$ N is applied, borizontally, to the ring at *A* determine the is applied horizontally to the ring at *A*, determine the dimension *d* so that the force in cable *AC* is zero.

•3–21. If the tension developed in each of the four wires is not allowed to exceed 600 N, determine the maximum mass of the chandelier that can be supported.

Prob. 3–20/21

3–22. A vertical force $P = 10$ lb is applied to the ends of the 2-ft cord AB and spring AC. If the spring has an the 2-ft cord *AB* and spring *AC*. If the spring has an unstretched length of 2 ft, determine the angle θ for unstretched length of 2 ft, equilibrium. Take $k = 15$ lb/ft.

3–23. Determine the unstretched length of spring *AC* if a **3–23.** Determine the unstretched length of spring AC if a force $P = 80$ lb causes the angle $\theta = 60^{\circ}$ for equilibrium.
Cord AB is 2 ft long Take $k = 50$ lb/ft Cord *AB* is 2 ft long. Take $k = 50$ lb/ft.

***3–24.** If the bucket weighs 50 lb, determine the tension developed in each of the wires.

•3–25. Determine the maximum weight of the bucket that the wire system can support so that no single wire develops a tension exceeding 100 lb.

***3–28.** Two spheres *A* and *B* have an equal mass and are electrostatically charged such that the repulsive force acting between them has a magnitude of 20 mN and is directed along line AB . Determine the angle θ , the tension in cords *AC* and *BC*, and the mass *m* of each sphere.

Prob. 3–28

•3–29. The cords *BCA* and *CD* can each support a maximum load of 100 lb. Determine the maximum weight of the crate that can be hoisted at constant velocity and the angle θ for equilibrium. Neglect the size of the smooth pulley at *C*.

 $D \setminus A$

 45°

 30°

A B E C \sum_{D} 3 5 30° 30°

Probs. 3–24/25

3–26. Determine the tensions developed in wires CD, CB , and *BA* and the angle θ required for equilibrium of the 30-lb cylinder *E* 30-lb cylinder E and the 60-lb cylinder F .

3–27. If cylinder E weighs 30 lb and $\theta = 15^{\circ}$, determine the weight of cylinder F .

Prob. 3–29

•3–30. The springs on the rope assembly are originally •3–30. The springs on the rope assembly are originally unstretched when $\theta = 0^\circ$. Determine the tension in each unstretched when $\theta = 0^{\circ}$. Determine the tension in each rope when $F = 90$ lb. Neglect the size of the pulleys at *B* and *D* and *D*.

3–31. The springs on the rope assembly are originally **3–31.** The springs on the rope assembly are originally stretched 1 ft when $\theta = 0^{\circ}$. Determine the vertical force F that must be applied so that $\theta = 30^{\circ}$.

Probs. 3–30/31

 $*3-32$. Determine the magnitude and direction θ of the equilibrium force F_{AB} exerted along link AB by the tractive apparatus shown. The suspended mass is 10 kg . Neglect the size of the pulley at *A*.

•3–33. The wire forms a loop and passes over the small

pulleys at *A*, *B*, *C*, and *D*. If the maximum *resultant force* that the wire can exert on each pulley is 120 N, determine the greatest force *P* that can be applied to the wire as shown.

Probs. 3–33/34

3–35. The picture has a weight of 10 lb and is to be hung over the smooth pin *B*. If a string is attached to the frame at points *A* and *C*, and the maximum force the string can support is 15 lb, determine the shortest string that can be safely used.

***3–36.** The 200-lb uniform tank is suspended by means of a 6-ft-long cable, which is attached to the sides of the tank and passes over the small pulley located at *O*. If the cable can be attached at either points *A* and *B* or *C* and *D*, determine which attachment produces the least amount of tension in the cable. What is this tension?

3

Prob. 3–36

•3–37. The 10-lb weight is supported by the cord *AC* and •3–37. The 10-lb weight is supported by the cord AC and
roller and by the spring that has a stiffness of $k = 10$ lb/in.
and an unstretched length of 12 in Determine the distance and an unstretched length of 12 in. Determine the distance *d* to where the weight is located when it is in equilibrium.

3–38. The 10-lb weight is supported by the cord *AC* and roller and by a spring. If the spring has an unstretched length of 8 in. and the weight is in equilibrium when $d = 4$ in., determine the stiffness k of the spring.

•3–39. A "scale" is constructed with a 4-ft-long cord and the 10-lb block *D*. The cord is fixed to a pin at *A* and passes over two *small* pulleys at *B* and *C*. Determine the weight of the suspended block at B if the system is in equilibrium.

•*3–40. The spring has a stiffness of $k = 800$ N/m and an unstretched length of 200 mm. Determine the force in cables unstretched length of 200 mm. Determine the force in cables *BC* and *BD* when the spring is held in the position shown.

Probs. 3–37/38

•3–43. The pail and its contents have a mass of 60 kg. If the cable BAL is 15 m long, determine the distance *y* of the

•3–41. A continuous cable of total length 4 m is wrapped around the *small* pulleys at *A, B, C*, and *D*. If each spring is stretched 300 mm, determine the mass *m* of each block. Neglect the weight of the pulleys and cords. The springs are unstretched when $d = 2$ m.

2 m *B y A* WIII -10_m

Prob. 3–43

Prob. 3–41

3–42. Determine the mass of each of the two cylinders if **3–42.** Determine the mass of each of the two cylinders if
they cause a sag of $s = 0.5$ m when suspended from the
rings at A and B. Note that $s = 0$ when the cylinders are they cause a sag of $s = 0.5$ m when suspended from the rings at *A* and *B*. Note that $s = 0$ when the cylinders are removed removed.

•*3–44. A scale is constructed using the 10-kg mass, the 2-kg pan *P*, and the pulley and cord arrangement. Cord 2-kg pan *P*, and the pulley and cord arrangement. Cord *BCA* is 2 m long. If $s = 0.75$ m, determine the mass *D* in the pan Neglect the size of the pulley pan. Neglect the size of the pulley.

Prob. 3–42

CONCEPTUAL PROBLEMS

P3–1. The concrete wall panel is hoisted into position using the two cables *AB* and *AC* of equal length. Establish appropriate dimensions and use an equilibrium analysis to show that the longer the cables the less the force in each cable.

P3–2. The truss is hoisted using cable *ABC* that passes through a very small pulley at *B*. If the truss is placed in a tipped position, show that it will always return to the horizontal position to maintain equilibrium.

P3–3. The device *DB* is used to pull on the chain *ABC* so as to hold a door closed on the bin. If the angle between *AB* and the horizontal segment *BC* is 30º, determine the angle between *DB* and the horizontal for equilibrium.

P3–4. The two chains *AB* and *AC* have equal lengths and are subjected to the vertical force **F**. If *AB* is replaced by a are subjected to the vertical force **F**. If AB is replaced by a shorter chain AB' , show that this chain would have to support a larger tensile force than AB in order to maintain support a larger tensile force than AB in order to maintain equilibrium equilibrium.

 $(3-4)$

 $(3-5)$

3.4 [Three-Dimensional Force Systems](#page-11-0)

In Section 3.1 we stated that the necessary and sufficient condition for particle equilibrium is

$$
\Sigma \mathbf{F} = \mathbf{0}
$$

In the case of a three-dimensional force system, as in Fig. 3–9, we can resolve the forces into their respective **i**, **j**, **k** components, so that ©solve the forces into their respective **i**, **j**, **k** component F_x **i** + ΣF_y **j** + ΣF_z **k** = **0**. To satisfy this equation we require

F3 \mathbf{F}_2 **F**1 *x y z*

These three equations state that the *algebraic sum* of the components of all the forces acting on the particle along each of the coordinate axes must be zero. Using them we can solve for at most three unknowns, generally represented as coordinate direction angles or magnitudes of forces shown on the particle's free-body diagram.

Procedure for Analysis

Three-dimensional force equilibrium problems for a particle can be solved using the following procedure.

Free-Body Diagram.

- Establish the *x, y, z* axes in any suitable orientation.
- Label all the known and unknown force magnitudes and directions on the diagram.
- The sense of a force having an unknown magnitude can be assumed.

Equations of Equilibrium.

- Use the scalar equations of equilibrium,
 $\Sigma F_z = 0$, in cases where it is easy to resol

x y z components ΣF _z = 0, in cases where it is easy to resolve each force into its *x, y, z* components. $F_x = 0$, $\Sigma F_y = 0$,
each force into its
- If the three-dimensional geometry appears difficult, then first express each force on the free-body diagram as a Cartesian vector, ©express each force on the free-body diagram as a Cartesian vector, substitute these vectors into $\Sigma \mathbf{F} = \mathbf{0}$, and then set the **i**, **j**, **k** components equal to zero.
- If the solution for a force yields a negative result, this indicates that its sense is the reverse of that shown on the free-body diagram.

The ring at *A* is subjected to the force from the hook as well as forces from each of the three chains. If the electromagnet and its load have a weight *W*, then the force at the hook will be **W**, and the three scalar equations of equilibrium can be applied to the free-body diagram of the ring in order to determine the chain forces, \mathbf{F}_B , \mathbf{F}_C , and \mathbf{F}_D .

(a)

A 90-lb load is suspended from the hook shown in Fig. 3–10*a*. If the load is supported by two cables and a spring having a stiffness load is supported by two cables and a spring having a stiffness $k = 500$ lb/ft, determine the force in the cables and the stretch of the spring for equilibrium Cable *AD* lies in the x-y plane and cable *AC* spring for equilibrium. Cable *AD* lies in the *x–y* plane and cable *AC* lies in the *x–z* plane.

SOLUTION

The stretch of the spring can be determined once the force in the spring is determined.

Free-Body Diagram. The connection at *A* is chosen for the equilibrium analysis since the cable forces are concurrent at this point. The free-body diagram is shown in Fig. 3–10*b*.

Equations of Equilibrium. By inspection, each force can easily be resolved into its *x, y, z* components, and therefore the three scalar equations of equilibrium can be used. Considering components directed along each positive axis as "positive," we have

$$
\Sigma F_x = 0; \tF_D \sin 30^\circ - \left(\frac{4}{5}\right) F_C = 0 \t(1)
$$

$$
\Sigma F_x = 0, \qquad T_D \sin 30^\circ - (\frac{1}{5})T_C = 0 \tag{1}
$$

$$
\Sigma F_y = 0, \qquad -F_D \cos 30^\circ + F_B = 0 \tag{2}
$$

$$
\Sigma F_y = 0, \qquad T_D \cos 30 + T_B = 0 \tag{2}
$$

$$
\Sigma F_z = 0; \qquad \left(\frac{3}{5}\right)F_C - 90 \text{ lb} = 0 \tag{3}
$$

Solving Eq. (3) for F_C , then Eq. (1) for F_D , and finally Eq. (2) for F_B , vields yields

$$
F_C = 150 \text{ lb}
$$
Ans.

$$
F_D = 240 \text{ lb}
$$
Ans.

$$
F_B = 207.8 \text{ lb}
$$
\n
$$
Ans. \text{Ans.}
$$

The stretch of the spring is therefore

$$
F_B = ks_{AB}
$$

207.8 lb = (500 lb/ft)(s_{AB})

$$
s_{AB} = 0.416
$$
 ft
Ans.

NOTE: Since the results for all the cable forces are positive, each cable is in tension; that is, it pulls on point *A* as expected, Fig. 3–10*b*.

The 10-kg lamp in Fig. 3-11*a* is suspended from the three equal-length cords. Determine its smallest vertical distance *s* from the ceiling if the force developed in any cord is not allowed to exceed 50 N.

(b)

SOLUTION

Free-Body Diagram. Due to symmetry, Fig. 3-11*b*, the distance **Free-Body Diagram.** Due to symmetry, Fig. 3-11*b*, the distance $DA = DB = DC = 600$ mm. It follows that from $\Sigma F_x = 0$ and $\Sigma F_x = 0$ the tension *T* in each cord will be the same. Also the angle $DA = DB = DC = 600$ mm. It follows that from $\Sigma F_x = 0$ and $\Sigma F_y = 0$, the tension *T* in each cord will be the same. Also, the angle between each cord and the *z* axis is γ between each cord and the z axis is γ .

Equation of Equilibrium. Applying the equilibrium equation along **Equation of Equilibrium.** Apply the z axis, with $T = 50$ N, we have

 $\sum F_z = 0$; 3[(50 N) cos γ] - 10(9.81) N = 0

$$
\gamma = \cos^{-1} \frac{98.1}{150} = 49.16^{\circ}
$$

From the shaded triangle shown in Fig. 3-11*b*,

$$
\tan 49.16^\circ = \frac{600 \text{ mm}}{s}
$$

s = 519 mm
Ans.

Determine the force in each cable used to support the 40-lb crate shown in Fig. 3–12*a*.

SOLUTION

Free-Body Diagram. As shown in Fig. 3–12*b*, the free-body diagram of point *A* is considered in order to "expose" the three unknown forces in the cables.

Equations of Equilibrium. First we will express each force in Cartesian vector form. Since the coordinates of points *B* and *C* are Cartesian vector form. Since the coordinates of p
 $B(-3 \text{ ft}, -4 \text{ ft}, 8 \text{ ft})$ and $C(-3 \text{ ft}, 4 \text{ ft}, 8 \text{ ft})$, we have

$$
\mathbf{F}_B = F_B \bigg[\frac{-3\mathbf{i} - 4\mathbf{j} + 8\mathbf{k}}{2 \overline{(-3)^2 + (-4)^2 + (8)^2}} \bigg]
$$

= -0.318F_B\mathbf{i} - 0.424F_B\mathbf{j} + 0.848F_B\mathbf{k}

$$
\mathbf{F}_C = F_C \bigg[\frac{-3\mathbf{i} + 4\mathbf{j} + 8\mathbf{k}}{2 \overline{(-3)^2 + (4)^2 + (8)^2}} \bigg]
$$

= -0.318F_C\mathbf{i} + 0.424F_C\mathbf{j} + 0.848F_C\mathbf{k}

$$
\mathbf{F}_D = F_D\mathbf{i}
$$

$$
\mathbf{W} = \{-40\mathbf{k}\} \text{ lb}
$$

Equilibrium requires

$$
\Sigma \mathbf{F} = \mathbf{0}; \qquad \qquad \mathbf{F}_B + \mathbf{F}_C + \mathbf{F}_D + \mathbf{W} = \mathbf{0}
$$

$$
-0.318F_B \mathbf{i} - 0.424F_B \mathbf{j} + 0.848F_B \mathbf{k}
$$

$$
- 0.318F_C \mathbf{i} + 0.424F_C \mathbf{j} + 0.848F_C \mathbf{k} + F_D \mathbf{i} - 40\mathbf{k} = \mathbf{0}
$$

Equating the respective **i**, **j**, **k** components to zero yields

$$
\Sigma F_x = 0; \t -0.318F_B - 0.318F_C + F_D = 0 \t (1)
$$

$$
\Sigma F_y = 0; \qquad \qquad -0.424F_B + 0.424F_C = 0 \tag{2}
$$

$$
\Sigma F_z = 0; \qquad \qquad 0.848F_B + 0.848F_C - 40 = 0 \tag{3}
$$

$$
iF_z = 0; \t\t 0.848F_B + 0.848F_C - 40 = 0 \t\t (3)
$$

Equation (2) states that $F_B = F_C$. Thus, solving Eq. (3) for F_B and F_C
and substituting the result into Eq. (1) to obtain F_B , we have and substituting the result into Eq. (1) to obtain F_D , we have

$$

Determine the tension in each cord used to support the 100-kg crate shown in Fig. 3–13*a*.

SOLUTION

Free-Body Diagram. The force in each of the cords can be determined by investigating the equilibrium of point *A*.The free-body diagram is shown in Fig. 3–13*b*. The weight of the crate is $W = 100(9.81) = 981$ N.

Equations of Equilibrium. Each force on the free-body diagram is first expressed in Cartesian vector form. Using Eq. 2–9 for \mathbf{F}_C and noting point $D(-1, m, 2, m, 2, m)$ for \mathbf{F}_C we have ed in Cartesian vector for $D(-1 \text{ m}, 2 \text{ m}, 2 \text{ m})$ for \mathbf{F}_D ,

noting point
$$
D(-1 \text{ m}, 2 \text{ m}, 2 \text{ m})
$$
 for \mathbf{F}_D , we have
\n
$$
\mathbf{F}_B = F_B \mathbf{i}
$$
\n
$$
\mathbf{F}_C = F_C \cos 120^\circ \mathbf{i} + F_C \cos 135^\circ \mathbf{j} + F_C \cos 60^\circ \mathbf{k}
$$
\n
$$
= -0.5F_C \mathbf{i} - 0.707F_C \mathbf{j} + 0.5F_C \mathbf{k}
$$
\n
$$
\mathbf{F}_D = F_D \left[\frac{-1\mathbf{i} + 2\mathbf{j} + 2\mathbf{k}}{2(1 - 1)^2 + (2)^2 + (2)^2} \right]
$$
\n
$$
= -0.333F_D \mathbf{i} + 0.667F_D \mathbf{j} + 0.667F_D \mathbf{k}
$$
\n
$$
\mathbf{W} = \{-981\mathbf{k}\} \mathbf{N}
$$

Equilibrium requires ©

$$
\mathbf{F} = \mathbf{0}; \qquad \qquad \mathbf{F}_B + \mathbf{F}_C + \mathbf{F}_D + \mathbf{W} = \mathbf{0}
$$

$$
F_B \mathbf{i} - 0.5F_C \mathbf{i} - 0.707F_C \mathbf{j} + 0.5F_C \mathbf{k}
$$

$$
- 0.333F_D \mathbf{i} + 0.667F_D \mathbf{j} + 0.667F_D \mathbf{k} - 981 \mathbf{k} = \mathbf{0}
$$

Equating the respective **i**, **j**, **k** components to zero,
\n
$$
\Sigma F_x = 0;
$$
 $F_B - 0.5F_C - 0.333F_D = 0$ (1)
\n $\Sigma F_y = 0;$ $-0.707F_C + 0.667F_D = 0$ (2)

$$
\Sigma F_z = 0; \qquad 0.5F_C + 0.667F_D - 981 = 0 \qquad (3)
$$

Solving Eq. (2) for F_D in terms of F_C and substituting this into Eq. (3) yields F_C . F_D is then determined from Eq. (2). Finally, substituting the results into Eq. (1) gives F_B . Hence,

$$
F_C = 813 \text{ N}
$$
 Ans.

$$
F_D = 862 \text{ N}
$$
Ans.

$$
F_B = 694 \text{ N}
$$
 Ans.

Application of forces to the handles of these wrenches will produce a tendency to rotate each wrench about its end. It is important to know how to calculate this effect and, in some cases, to be able to simplify this system to its resultants.

[Force System](#page-11-0) **Resultants**

[CHAPTER OBJECTIVES](#page-11-0)

- To discuss the concept of the moment of a force and show how to calculate it in two and three dimensions.
- To provide a method for finding the moment of a force about a specified axis.
- To define the moment of a couple.
- To present methods for determining the resultants of nonconcurrent force systems.
- To indicate how to reduce a simple distributed loading to a resultant force having a specified location.

4.1 [Moment of a Force—](#page-11-0) Scalar Formulation

When a force is applied to a body it will produce a tendency for the body to rotate about a point that is not on the line of action of the force. This tendency to rotate is sometimes called a *torque*, but most often it is called the moment of a force or simply the *moment*. For example, consider a wrench used to unscrew the bolt in Fig. 4–1*a*. If a force is applied to the handle of the wrench it will tend to turn the bolt about point *O* (or the *z* axis). The magnitude of the moment is directly proportional to the magnitude of **F** and the perpendicular distance or *moment arm d.* The larger the force or the longer the moment arm, the greater the moment or larger the force or the longer the moment arm, the greater the moment or turning effect. Note that if the force **F** is applied at an angle $\theta \neq 90^{\circ}$, Fig. 4–1*b*, then it will be more difficult to turn the bolt since the moment Fig. 4–1*b*, then it will be more difficult to turn the bolt since the moment arm $d' = d \sin \theta$ will be smaller than *d*. If **F** is applied along the wrench, Fig. 4–1*c* its moment arm will be zero since the line of action o Fig. 4–1*c*, its moment arm will be zero since the line of action of **F** will intersect point O (the *z* axis). As a result, the moment of **F** about O is also zero and no turning can occur.

Fig. 4–2

We can generalize the above discussion and consider the force **F** and point *O* which lie in the shaded plane as shown in Fig. 4–2*a*. The moment M_O about point *O*, or about an axis passing through *O* and perpendicular to the plane is a vector quantity since it has a specified magnitude and to the plane, is a *vector quantity* since it has a specified magnitude and direction.

Magnitude. The magnitude of M_O is

$$
M_O = Fd \tag{4-1}
$$

where *d* is the *moment arm* or *perpendicular distance* from the axis at point *O* to the line of action of the force. Units of moment magnitude consist of force times distance, e.g., $N \cdot m$ or $lb \cdot ft$. r*pendicular dis*
e force. Units
N · m or lb · ft.

Direction. The direction of M_O is defined by its *moment axis*, which is **perpendicular** to the plane that contains the force **F** and its moment is perpendicular to the plane that contains the force **F** and its moment arm *d*. The right-hand rule is used to establish the sense of direction of M_O . According to this rule, the natural curl of the fingers of the right hand, as they are drawn towards the palm, represent the tendency for rotation caused by the moment. As this action is performed, the thumb of the right hand will give the directional sense of M_O , Fig. 4–2*a*. Notice that the moment vector is represented three dimensionally by a curl that the moment vector is represented three-dimensionally by a curl around an arrow. In two dimensions this vector is represented only by the curl as in Fig. 4–2*b*. Since in this case the moment will tend to cause a counterclockwise rotation, the moment vector is actually directed out of the page.

Resultant Moment. For two-dimensional problems, where all the forces lie within the *x–y* plane, Fig. 4–3, the resultant moment (\mathbf{M}_R)
obout point *O* (the *z* axis) can be determined by finding the algebraic sum about point *O* (the *z* axis) can be determined by *finding the algebraic sum* of the moments caused by all the forces in the system. As a convention, we will generally consider *positive moments* as *counterclockwise* since they are directed along the positive *z* axis (out of the page). *Clockwise moments* will be *negative*. Doing this, the directional sense of each moment can be represented by a *plus or minus* sign. Using this sign convention, the resultant moment in Fig. 4–3 is therefore

 ζ $+(M_R)_{\scriptscriptstyle O} = \Sigma Fd;$ $(M_R)_{\scriptscriptstyle O} = F_1d_1 - F_2d_2 + F_3d_3$

If the numerical result of this sum is a positive scalar, (\mathbf{M}_R) _o will be a counterclockwise moment (out of the page); and if the result is peoptive. counterclockwise moment (out of the page); and if the result is negative, (M_R) will be a clockwise moment (into the page).

(a)

EXAMPLE 4.2

Determine the resultant moment of the four forces acting on the rod shown in Fig. 4–5 about point *O*.

SOLUTION

 ζ

Assuming that positive moments act in the $+{\bf k}$ direction, i.e., counterclockwise, we have

$$
+M_{R_O} = \Sigma Fd;
$$

\n
$$
M_{R_O} = -50 \text{ N} (2 \text{ m}) + 60 \text{ N} (0) + 20 \text{ N} (3 \sin 30^\circ \text{ m})
$$

\n
$$
-40 \text{ N} (4 \text{ m} + 3 \cos 30^\circ \text{ m})
$$

\n
$$
M_{R_O} = -334 \text{ N} \cdot \text{m} = 334 \text{ N} \cdot \text{m} \geq Ans.
$$

For this calculation, note how the moment-arm distances for the 20-N and 40-N forces are established from the extended (dashed) lines of action of each of these forces.

As illustrated by the example problems, the moment of a force does not always cause a rotation. For example, the force **F** tends to rotate the beam clockwise about its support at *A* with a moment $M_A = F d_A$. The actual rotation would occur **F** tends to rotate the beam clockw
with a moment $M_A = Fd_A$. The acif the support at *B* were removed.

The ability to remove the nail will require the moment of \mathbf{F}_H about point *O* to be larger than the moment of
the force \mathbf{F}_h shout *O* that is needed to pull the noil out the force \mathbf{F}_N about O that is needed to pull the nail out.

4.2 [Cross Product](#page-11-0)

The moment of a force will be formulated using Cartesian vectors in the next section. Before doing this, however, it is first necessary to expand our knowledge of vector algebra and introduce the cross-product method of vector multiplication.

The *cross product* of two vectors **A** and **B** yields the vector **C**, which is written

$$
\mathbf{C} = \mathbf{A} \times \mathbf{B} \tag{4-2}
$$

and is read "**C** equals **A** cross **B**."

Magnitude. The *magnitude* of **C** is defined as the product of the magnitudes of **A** and **B** and the sine of the angle θ between their tails magnitudes of **A** and **B** and the sine $(0^{\circ} \le \theta \le 180^{\circ})$. Thus, $C = AB \sin \theta$.

Direction. Vector **C** has a *direction* that is perpendicular to the plane containing **A** and **B** such that **C** is specified by the right-hand rule; i.e., curling the fingers of the right hand from vector **A** (cross) to vector **B**, the thumb points in the direction of **C**, as shown in Fig. 4–6.

Knowing both the magnitude and direction of **C**, we can write

$$
\mathbf{C} = \mathbf{A} \times \mathbf{B} = (AB \sin \theta) \mathbf{u}_C \tag{4-3}
$$

where the scalar $AB \sin \theta$ defines the *magnitude* of **C** and the unit vector \mathbf{u}_c defines the *direction* of **C**. The terms of Eq. 4–3 are illustrated \mathbf{u}_c defines the *direction* of **C**. The terms of Eq. 4–3 are illustrated araphically in Fig. 4.6 graphically in Fig. 4–6.

Fig. 4–6

 $C = A \times B$ **B A**

Fig. 4–9

Laws of Operation.

• The commutative law is *not* valid; i.e., $\mathbf{A} \times \mathbf{B} \neq \mathbf{B} \times \mathbf{A}$. Rather,

$$
\mathbf{A} \times \mathbf{B} = -\mathbf{B} \times \mathbf{A}
$$

This is shown in Fig. 4–7 by using the right-hand rule. The cross This is shown in Fig. 4–7 by using the right-hand rule. The cross product $\mathbf{B} \times \mathbf{A}$ yields a vector that has the same magnitude but acts product **B** \times **A** yields a vector that has the same in the opposite direction to **C**; i.e., **B** \times **A** = -**C**.

If the cross product is multiplied by a scalar a , it obeys the associative law;

$$
a(\mathbf{A} \times \mathbf{B}) = (a\mathbf{A}) \times \mathbf{B} = \mathbf{A} \times (a\mathbf{B}) = (\mathbf{A} \times \mathbf{B})a
$$

This property is easily shown since the magnitude of the resultant This property is easily shown since the magnitude of the resulvector ($|a|AB \sin \theta$) and its direction are the same in each case.

The vector cross product also obeys the distributive law of addition,

$$
\mathbf{A} \times (\mathbf{B} + \mathbf{D}) = (\mathbf{A} \times \mathbf{B}) + (\mathbf{A} \times \mathbf{D})
$$

The proof of this identity is left as an exercise (see Prob. 4–1). It is important to note that *proper order* of the cross products must be maintained, since they are not commutative.

Cartesian Vector Formulation. Equation 4–3 may be used to find the cross product of any pair of Cartesian unit vectors. For to find the cross product of any pair of Cartesian unit vectors. For example, to find $\mathbf{i} \times \mathbf{j}$, the magnitude of the resultant vector is example, to find $\mathbf{i} \times \mathbf{j}$, the magnitude of the resultant vector is $(i)(j)(\sin 90^\circ) = (1)(1)(1) = 1$, and its direction is determined using the right-hand rule. As shown in Fig. 4–8, the resultant vector points in the right-hand rule. As shown in Fig. 4–8, the resultant vector points in the right-hand rule. As shown in Fig. 4–8, the resultant v
the $+\mathbf{k}$ direction. Thus, $\mathbf{i} \times \mathbf{j} = (1)\mathbf{k}$. In a similar manner,

$$
\mathbf{i} \times \mathbf{j} = \mathbf{k} \quad \mathbf{i} \times \mathbf{k} = -\mathbf{j} \quad \mathbf{i} \times \mathbf{i} = 0
$$

$$
\mathbf{j} \times \mathbf{k} = \mathbf{i} \quad \mathbf{j} \times \mathbf{i} = -\mathbf{k} \quad \mathbf{j} \times \mathbf{j} = 0
$$

$$
\mathbf{k} \times \mathbf{i} = \mathbf{j} \quad \mathbf{k} \times \mathbf{j} = -\mathbf{i} \quad \mathbf{k} \times \mathbf{k} = 0
$$

These results should *not* be memorized; rather, it should be clearly understood how each is obtained by using the right-hand rule and the definition of the cross product. A simple scheme shown in Fig. 4–9 is helpful for obtaining the same results when the need arises. If the circle is constructed as shown, then "crossing" two unit vectors in a *counterclockwise* fashion around the circle yields the *positive* third unit *counterclockwise* fashion around the circle yields the *positive* third unit vector; e.g., $\mathbf{k} \times \mathbf{i} = \mathbf{j}$. "Crossing" *clockwise*, a *negative* unit vector is obtained; e.g., $\mathbf{i} \times \mathbf{k} = -\mathbf{j}$.

Let us now consider the cross product of two general vectors **A** and **B** which are expressed in Cartesian vector form. We have

$$
\mathbf{A} \times \mathbf{B} = (A_x \mathbf{i} + A_y \mathbf{j} + A_z \mathbf{k}) \times (B_x \mathbf{i} + B_y \mathbf{j} + B_z \mathbf{k})
$$

= $A_x B_x (\mathbf{i} \times \mathbf{i}) + A_x B_y (\mathbf{i} \times \mathbf{j}) + A_x B_z (\mathbf{i} \times \mathbf{k})$
+ $A_y B_x (\mathbf{j} \times \mathbf{i}) + A_y B_y (\mathbf{j} \times \mathbf{j}) + A_y B_z (\mathbf{j} \times \mathbf{k})$
+ $A_z B_x (\mathbf{k} \times \mathbf{i}) + A_z B_y (\mathbf{k} \times \mathbf{j}) + A_z B_z (\mathbf{k} \times \mathbf{k})$

Carrying out the cross-product operations and combining terms yields

$$
\mathbf{A} \times \mathbf{B} = (A_y B_z - A_z B_y)\mathbf{i} - (A_x B_z - A_z B_x)\mathbf{j} + (A_x B_y - A_y B_x)\mathbf{k}
$$
 (4-4)

This equation may also be written in a more compact determinant form as

$$
\mathbf{A} \times \mathbf{B} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ A_x & A_y & A_z \\ B_x & B_y & B_z \end{vmatrix}
$$
 (4-5)

Thus, to find the cross product of any two Cartesian vectors **A** and **B**, it is necessary to expand a determinant whose first row of elements consists of the unit vectors **i**, **j**, and **k** and whose second and third rows represent the *x, y, z* components of the two vectors **A** and **B**, respectively.*

*A determinant having three rows and three columns can be expanded using three minors, each of which is multiplied by one of the three terms in the first row. There are four elements in each minor, for example,

By *definition*, this determinant notation represents the terms $(A_{11}A_{22} - A_{12}A_{21})$, which is
simply the product of the two elements intersected by the arrow slapting downward to the simply the product of the two elements intersected by the arrow slanting downward to the right $(A_{11}A_{22})$ minus the product of the two elements intersected by the arrow slanting right $(A_{11}A_{22})$ minus the product of the two elements intersected by the arrow slanting
downward to the left $(A_{12}A_{21})$. For a 3 × 3 determinant, such as Eq. 4–5, the three minors
can be generated in accordance with can be generated in accordance with the following scheme:

Adding the results and noting that the **j** element *must include the minus sign* yields the expanded form of $A \times B$ given by Eq. 4–4.

Fig. 4–10

4.3 [Moment of a Force—Vector](#page-11-0) Formulation

The moment of a force \bf{F} about point *O*, or actually about the moment axis passing through *O* and perpendicular to the plane containing *O* and **F**, Fig. 4–10*a*, can be expressed using the vector cross product, namely,

$$
\mathbf{M}_O = \mathbf{r} \times \mathbf{F} \tag{4-6}
$$

Here **r** represents a position vector directed *from O* to *any point* on the line of action of **F**. We will now show that indeed the moment M_O , when
determined by this cross product has the proper magnitude and direction determined by this cross product, has the proper magnitude and direction.

Magnitude. The magnitude of the cross product is defined from **Magnitude.** The magnitude of the cross product is defined from
Eq. 4–3 as $M_O = rF \sin \theta$, where the angle θ is measured between the
tails of **r** and **F**. To establish this angle **r** must be treated as a sliding *tails* of **r** and **F**. To establish this angle, **r** must be treated as a sliding vector so that θ can be constructed properly, Fig. 4–10*b*. Since the moment arm $d = r \sin \theta$, then moment arm $d = r \sin \theta$, then

$$
M_O = rF \sin \theta = F(r \sin \theta) = Fd
$$

which agrees with Eq. 4–1.

Direction. The direction and sense of M_O in Eq. 4–6 are determined
by the right hand rule as it applies to the cross product. Thus sliding **x** to by the right-hand rule as it applies to the cross product. Thus, sliding **r** to the dashed position and curling the right-hand fingers from **r** toward **F**,"**r** cross **F**," the thumb is directed upward or perpendicular to the plane containing **r** and **F** and this is in the *same direction* as M_O , the moment of the force about point O . Fig. 4, 10b. Note that the "curl" of the finance of the force about point *O*, Fig. 4–10*b*. Note that the "curl" of the fingers, like the curl around the moment vector, indicates the sense of rotation caused by the force. Since the cross product does not obey the caused by the force. Since the cross product does not obey the commutative law, the order of $\mathbf{r} \times \mathbf{F}$ must be maintained to produce the correct sense of direction for M_O .

Principle of Transmissibility. The cross product operation is often used in three dimensions since the perpendicular distance or moment arm from point *O* to the line of action of the force is not needed. In other words, we can use any position vector **r** measured from point *O* to any point on the line of action of the force **F**, Fig. 4–11. Thus,

$$
\mathbf{M}_O = \mathbf{r}_1 \times \mathbf{F} = \mathbf{r}_2 \times \mathbf{F} = \mathbf{r}_3 \times \mathbf{F}
$$

Since **F** can be applied at any point along its line of action and still create this *same moment* about point *O*, then **F** can be considered a *sliding vector*. This property is called the *principle of transmissibility* of a force.

Cartesian Vector Formulation. If we establish *x, y, z* coordinate axes, then the position vector **r** and force **F** can be expressed as Cartesian vectors, Fig. 4–12*a*. Applying Eq. 4–5 we have

$$
\mathbf{M}_O = \mathbf{r} \times \mathbf{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ r_x & r_y & r_z \\ F_x & F_y & F_z \end{vmatrix}
$$
 (4-7)

where

represent the *x, y, z* components of the position vector drawn from point *O* to *any point* on the line of action of the force r_x, r_y, r_z

 F_x, F_y, F_z represent the *x*, *y*, *z* components of the force vector

If the determinant is expanded, then like Eq. 4–4 we have

$$
\mathbf{M}_O = (r_y F_z - r_z F_y)\mathbf{i} - (r_x F_z - r_z F_x)\mathbf{j} + (r_x F_y - r_y F_x)\mathbf{k}
$$
 (4-8)

The physical meaning of these three moment components becomes evident by studying Fig. 4–12*b*. For example, the **i** component of M_O
can be determined from the moments of \mathbf{F} , \mathbf{F} and \mathbf{F} about the x axis can be determined from the moments of \mathbf{F}_x , \mathbf{F}_y , and \mathbf{F}_z about the *x* axis.
The component \mathbf{F}_x does not create a moment or tendency to cause The component \mathbf{F}_x does *not* create a moment or tendency to cause
turning about the x axis since this force is nagallel to the x axis. The line turning about the *x* axis since this force is *parallel* to the *x* axis. The line of action of \mathbf{F}_y passes through point *B*, and so the magnitude of the moment of \mathbf{F}_y about point *A* on the *x* exis is \mathbf{F}_y . By the right hand moment of \mathbf{F}_y about point *A* on the *x* axis is r_zF_y . By the right-hand
rule this component acts in the *negative* **i** direction I ikewise **F** passes rule this component acts in the *negative* **i** direction. Likewise, \mathbf{F}_z passes through point C and so it contributes a moment component of $\mathbf{r} \in \mathbf{F}$ through point *C* and so it contributes a moment component of r_yF_z **i**
about the axis Thus $(M_o) = (r F - r F)$ as shown in Eq. 4–8. As an through point C and so it contributes a moment component of r_yF_z about the axis. Thus, $(M_O)_x = (r_yF_z - r_zF_y)$ as shown in Eq. 4–8. As an exercise establish the **i** and **k** components of **M**₀ in this manner and exercise, establish the **j** and **k** components of M_O in this manner and show that indeed the expanded form of the determinant. Eq. 4.8 show that indeed the expanded form of the determinant, Eq. 4–8, represents the moment of **F** about point *O*. Once M_O is determined, realize that it will always be negatively to the shaded plane realize that it will always be *perpendicular* to the shaded plane containing vectors **r** and **F**, Fig. 4–12*a*.

Resultant Moment of a System of Forces. If a body is acted upon by a system of forces, Fig. 4–13, the resultant moment of the forces about point *O* can be determined by vector addition of the moment of each force. This resultant can be written symbolically as

$$
\mathbf{M}_{R_O} = \Sigma(\mathbf{r} \times \mathbf{F}) \tag{4-9}
$$

$EXAMPLE$ 4.3

(a)

Determine the moment produced by the force **F** in Fig. 4–14*a* about point *O*. Express the result as a Cartesian vector.

SOLUTION

As shown in Fig. 4–14*a*, either \mathbf{r}_A or \mathbf{r}_B can be used to determine the moment about point O. These position vectors are moment about point *O*. These position vectors are

 $\mathbf{r}_A = \{12\mathbf{k}\}\$ m and $\mathbf{r}_B = \{4\mathbf{i} + 12\mathbf{j}\}\$ m

Force **F** expressed as a Cartesian vector is

$$
\mathbf{F} = F \mathbf{u}_{AB} = 2 \text{ kN} \left[\frac{\{4\mathbf{i} + 12\mathbf{j} - 12\mathbf{k}\} \text{ m}}{\sqrt{(4 \text{ m})^2 + (12 \text{ m})^2 + (-12 \text{ m})^2}} \right]
$$

$$
= \{0.4588\mathbf{i} + 1.376\mathbf{j} - 1.376\mathbf{k}\} \text{ kN}
$$

Thus

$$
\mathbf{M}_O = \mathbf{r}_A \times \mathbf{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & 0 & 12 \\ 0.4588 & 1.376 & -1.376 \end{vmatrix}
$$

= $[0(-1.376) - 12(1.376)]\mathbf{i} - [0(-1.376) - 12(0.4588)]\mathbf{j}$
+ $[0(1.376) - 0(0.4588)]\mathbf{k}$
= $\{-16.5\mathbf{i} + 5.51\mathbf{j}\} \mathbf{k}N \cdot m$ *Ans.*

or

$$
\mathbf{M}_O = \mathbf{r}_B \times \mathbf{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 4 & 12 & 0 \\ 0.4588 & 1.376 & -1.376 \end{vmatrix}
$$

= [12(-1.376) - 0(1.376)]**i** - [4(-1.376) - 0(0.4588)]**j**
+ [4(1.376) - 12(0.4588)]**k**
= {-16.5**i** + 5.51**j**} **kN**·m *Ans.*

NOTE: As shown in Fig. 4–14*b*, M_O acts perpendicular to the plane
that contains $\mathbf{F} \cdot \mathbf{r}$ and \mathbf{r} . Had this problem been worked using that contains \mathbf{F}, \mathbf{r}_A , and \mathbf{r}_B . Had this problem been worked using $M - Ed$, potion the difficulty that would arise in obtaining the that contains **F**, **r**_A, and **r**_B. Had this problem been worked using $M_O = Fd$, notice the difficulty that would arise in obtaining the moment arm d moment arm *d*.

$EXAMPLE$ 4.4

Two forces act on the rod shown in Fig. 4–15*a*. Determine the resultant moment they create about the flange at *O*. Express the result as a Cartesian vector.

SOLUTION

Position vectors are directed from point *O* to each force as shown in Fig. 4–15*b*. These vectors are

$$
\mathbf{r}_A = \{5\mathbf{j}\} \text{ ft}
$$

$$
\mathbf{r}_B = \{4\mathbf{i} + 5\mathbf{j} - 2\mathbf{k}\} \text{ ft}
$$

The resultant moment about *O* is therefore

$$
\mathbf{M}_{R_0} = \Sigma(\mathbf{r} \times \mathbf{F})
$$

= $\mathbf{r}_A \times \mathbf{F}_1 + \mathbf{r}_B \times \mathbf{F}_3$
= $\begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & 5 & 0 \\ -60 & 40 & 20 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 4 & 5 & -2 \\ 80 & 40 & -30 \end{vmatrix}$
= $[5(20) - 0(40)]\mathbf{i} - [0]\mathbf{j} + [0(40) - (5)(-60)]\mathbf{k}$
+ $[5(-30) - (-2)(40)]\mathbf{i} - [4(-30) - (-2)(80)]\mathbf{j} + [4(40) - 5(80)]\mathbf{k}$
= $\{30\mathbf{i} - 40\mathbf{j} + 60\mathbf{k}\}$ lb·ft
Ans.

NOTE: This result is shown in Fig. 4–15*c*. The coordinate direction angles were determined from the unit vector for M_{R_0} . Realize that the two forces tend to cause the rod to rotate about the moment axis in two forces tend to cause the rod to rotate about the moment axis in the manner shown by the curl indicated on the moment vector.

Fig 4–16

M*^O* **F***x* \mathbf{F}_y **F** *O d x y*

Fig. 4–17

The moment of the applied force **F** about point *O* is easy to determine if we use the principle of moments. It is simply $M_O = F_x d$.

4.4 [Principle of Moments](#page-11-0)

A concept often used in mechanics is the *principle of moments*, which is sometimes referred to as *Varignon's theorem* since it was originally developed by the French mathematician Varignon (1654–1722). It states that *the moment of a force about a point is equal to the sum of the moments of the components of the force about the point*.This theorem can be proven easily using the vector cross product since the cross product obeys the distributive law. For example, consider the moments of the force \bf{F} and distributive law. For example, consider the moments of the force **F** and two of its components about point *O*. Fig. 4–16. Since $\mathbf{F} = \mathbf{F}_1 + \mathbf{F}_2$ we have

$$
\mathbf{M}_O = \mathbf{r} \times \mathbf{F} = \mathbf{r} \times (\mathbf{F}_1 + \mathbf{F}_2) = \mathbf{r} \times \mathbf{F}_1 + \mathbf{r} \times \mathbf{F}_2
$$

For two-dimensional problems, Fig. 4–17, we can use the principle of moments by resolving the force into its rectangular components and then determine the moment using a scalar analysis. Thus,

$$
M_O = F_x y - F_y x
$$

This method is generally easier than finding the same moment using $M_O = Fd$.

Important Points

- The moment of a force creates the tendency of a body to turn about an axis passing through a specific point *O*.
- Using the right-hand rule, the sense of rotation is indicated by the curl of the fingers, and the thumb is directed along the moment axis, or line of action of the moment.
- The magnitude of the moment is determined from $M_O = Fd$,
where d is called the moment arm which represents the where *d* is called the moment arm, which represents the perpendicular or shortest distance from point *O* to the line of action of the force.
- In three dimensions the vector cross product is used to determine In three dimensions the vector cross product is used to determine
the moment, i.e., $\mathbf{M}_O = \mathbf{r} \times \mathbf{F}$. Remember that **r** is directed *from*
point *O* to any point on the line of action of **F**. point *O to any point* on the line of action of **F**.
- The principle of moments states that the moment of a force about a point is equal to the sum of the moments of the force's components about the point. This is a very convenient method to use in two dimensions.

Determine the moment of the force in Fig. 4–18*a* about point *O*.

SOLUTION I

The moment arm *d* in Fig. 4–18*a* can be found from trigonometry.

 $d = (3 \text{ m}) \sin 75^\circ = 2.898 \text{ m}$

Thus,

$$
M_O = Fd = (5kN)(2.898 \text{ m}) = 14.5 \text{ kN} \cdot \text{m} \sqrt{a}
$$
 Ans.

Since the force tends to rotate or orbit clockwise about point *O*, the moment is directed into the page.

SOLUTION II

The *x* and *y* components of the force are indicated in Fig. 4–18*b*. Considering counterclockwise moments as positive, and applying the principle of moments, we have

$$
\zeta + M_O = -F_x d_y - F_y d_x
$$

= -(5 cos 45° kN)(3 sin 30° m) - (5 sin 45° kN)(3 cos 30° m)
= -14.5 kN·m = 14.5 kN·m2 Ans.

SOLUTION III

The *x* and *y* axes can be set parallel and perpendicular to the rod's axis as shown in Fig. 4-18*c*. Here \mathbf{F}_x produces no moment about point *O* since its line of action passes through this point. Therefore since its line of action passes through this point. Therefore,

$$
\zeta + M_O = -F_y d_x
$$

= -(5 sin 75° kN)(3 m)
= -14.5 kN·m = 14.5 kN·m \gtrless Ans.

0.2 m

 30°

(a) $F = 400 \text{ N}$

$EXAMPLE$ 4.6

O

y

0.4 m

SOLUTION I (SCALAR ANALYSIS)

The force is resolved into its *x* and *y* components as shown in Fig. 4–19*b*, then

$$
\begin{aligned} \n\zeta + M_O &= 400 \sin 30^\circ \, \text{N} (0.2 \, \text{m}) \, - \, 400 \cos 30^\circ \, \text{N} (0.4 \, \text{m}) \\ \n&= -98.6 \, \text{N} \cdot \text{m} \, = \, 98.6 \, \text{N} \cdot \text{m} \, \sqrt{3} \n\end{aligned}
$$

or

 \overline{a}

$$
\mathbf{M}_O = \{-98.6\mathbf{k}\} \text{ N} \cdot \text{m}
$$
Ans.

SOLUTION II (VECTOR ANALYSIS)

Using a Cartesian vector approach, the force and position vectors shown in Fig. 4–19*c* are

$$
\mathbf{r} = \{0.4\mathbf{i} - 0.2\mathbf{j}\} \text{ m}
$$

$$
\mathbf{F} = \{400 \sin 30^\circ \mathbf{i} - 400 \cos 30^\circ \mathbf{j}\} \text{ N}
$$

$$
= \{200.0\mathbf{i} - 346.4\mathbf{j}\} \text{ N}
$$

The moment is therefore

$$
\mathbf{M}_O = \mathbf{r} \times \mathbf{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0.4 & -0.2 & 0 \\ 200.0 & -346.4 & 0 \end{vmatrix}
$$

= 0**i** - 0**j** + [0.4(-346.4) - (-0.2)(200.0)]**k**
= {-98.6**k**} N · m
Ans.

NOTE: It is seen that the scalar analysis (Solution I) provides a more *convenient method* for analysis than Solution II since the direction of the moment and the moment arm for each component force are easy to establish. Hence, this method is generally recommended for solving problems displayed in two dimensions, whereas a Cartesian vector analysis is generally recommended only for solving three-dimensional problems.

4.5 [Moment of a Force about a](#page-11-0) Specified Axis

Sometimes, the moment produced by a force about a *specified axis* must be determined. For example, suppose the lug nut at *O* on the car tire in Fig. 4–20*a* needs to be loosened. The force applied to the wrench will create a tendency for the wrench and the nut to rotate about the *moment axis* passing through *O*; however, the nut can only rotate about the *y* axis. Therefore, to determine the turning effect, only the *y* component of the moment is needed, and the total moment produced is not important. To determine this component, we can use either a scalar or vector analysis.

Scalar Analysis. To use a scalar analysis in the case of the lug nut in Fig. 4–20*a*, the moment arm perpendicular distance from the axis to the line of action of the force is $d_y = d \cos \theta$. Thus, the moment of **F** about the *y* of action of the force is $d_y = d \cos \theta$. Thus, the moment of **F** about the y
axis is $M_y = F d_y = F(d \cos \theta)$. According to the right-hand rule, M_y is
directed along the positive y axis as shown in the figure. In general for any directed along the positive *y* axis as shown in the figure. In general, for any axis *a*, the moment is

$$
M_a = F d_a \tag{4-10}
$$

F $x = \sqrt{M_0}$ *d* (a) Ĭ *O dy* **M***^O* **M***^y* Moment Axis θ **Fig. 4–20** 4

If large enough, the cable force **F** on the boom of this crane can cause the crane to topple over. To investigate this, the moment of the force must be calculated about an axis passing through the base of the legs at *A* and *B*.

4 **Fig. 4–20**

(b)

Vector Analysis. To find the moment of force **F** in Fig. 4–20*b* about the *y* axis using a vector analysis, we must first determine the moment of the force about *any point O* on the *y* axis by applying Eq. 4–7, the force about *any point O* on the *y* axis by applying Eq. 4–7,
 $\mathbf{M}_O = \mathbf{r} \times \mathbf{F}$. The component \mathbf{M}_y along the *y* axis is the *projection* of \mathbf{M}_O

onto the *y* axis It can be found using the *dot* onto the *y* axis. It can be found using the *dot product* discussed in Chapter 2, so that $M_v = \mathbf{j} \cdot \mathbf{M}_0 = \mathbf{j} \cdot (\mathbf{r} \times \mathbf{F})$, where **j** is the unit vector for the *y* axis. omponent **M**_y along the y i

t can be found using the
 $M_y = \mathbf{j} \cdot \mathbf{M}_O = \mathbf{j} \cdot (\mathbf{r} \times \mathbf{F}),$

We can generalize this approach by letting \mathbf{u}_a be the unit vector that equities the direction of the *a* axis shown in Fig. 4, 21. Then the moment specifies the direction of the a axis shown in Fig. 4–21. Then the moment We can generalize this approach by letting \mathbf{u}_a be the unit vector that specifies the direction of the *a* axis shown in Fig. 4–21. Then the moment of **F** about the axis is $M_a = \mathbf{u}_a \cdot (\mathbf{r} \times \mathbf{F})$. This combinat as the *scalar triple product*. If the vectors are written in Cartesian form, we have a

$$
M_a = [u_{a_x}\mathbf{i} + u_{a_y}\mathbf{j} + u_{a_z}\mathbf{k}] \cdot \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ r_x & r_y & r_z \\ F_x & F_y & F_z \end{vmatrix}
$$

= $u_{a_x}(r_yF_z - r_zF_y) - u_{a_y}(r_xF_z - r_zF_x) + u_{a_z}(r_xF_y - r_yF_x)$

This result can also be written in the form of a determinant, making it easier to memorize.*

$$
M_a = \mathbf{u}_a \cdot (\mathbf{r} \times \mathbf{F}) = \begin{vmatrix} u_{a_x} & u_{a_y} & u_{a_z} \\ r_x & r_y & r_z \\ F_x & F_y & F_z \end{vmatrix}
$$
 (4-11)

where

represent the *x*, *y*, *z* components of the unit vector defining the direction of the a axis $u_{a_x}, u_{a_y}, u_{a_z}$

- represent the *x*, *y*, *z* components of the position vector extended from *any point O* on the axis to *any point A* on the line of action of the force r_x , r_y , r_z
- represent the *x*, *y*, *z* components of the force vector. F_x, F_y, F_z

When M_a is evaluated from Eq. 4–11, it will yield a positive or negative scalar. The sign of this scalar indicates the sense of direction of M_a along
the *a* axis If it is positive than M_a will have the same sense as μ_a wherease the *a* axis. If it is positive, then M_a will have the same sense as \mathbf{u}_a , whereas if it is negative then M_a will act opposite to \mathbf{u}_a if it is negative, then M_a will act opposite to \mathbf{u}_a .
Once M, is determined we can then express

Once M_a is determined, we can then express M_a as a Cartesian vector, namely,

$$
\mathbf{M}_a = M_a \mathbf{u}_a \tag{4-12}
$$

The examples which follow illustrate numerical applications of the above concepts.

^{*}Take a moment to expand this determinant, to show that it will yield the above result.

Important Points

- The moment of a force about a specified axis can be determined provided the perpendicular distance d_a from the force line of provided the perpendicular distance d_a from t
action to the axis can be determined. $M_a = F d_a$.
- If vector analysis is used, $M_a = \mathbf{u}_a \cdot (\mathbf{r} \times \mathbf{F})$, where \mathbf{u}_a defines the direction of the axis and **r** is extended from *any point* on the axis direction of the axis and **r** is extended from *any point* on the axis to *any point* on the line of action of the force.
- If M_a is calculated as a negative scalar, then the sense of direction of \mathbf{M}_a is opposite to \mathbf{u}_a .
- The moment M_a expressed as a Cartesian vector is determined
from $M_a = M_B$ from $M_a = M_a u_a$.

$EXAMPLE$ | 4.7

Determine the resultant moment of the three forces in Fig. 4–22 about the *x* axis, the *y* axis, and the *z* axis.

SOLUTION

A force that is *parallel* to a coordinate axis or has a line of action that passes through the axis does *not* produce any moment or tendency for turning about that axis. Therefore, defining the positive direction of the $F_3 = 40$ lb moment of a force according to the right-hand rule, as shown in the figure, we have

$$
M_x = (60 \text{ lb})(2 \text{ ft}) + (50 \text{ lb})(2 \text{ ft}) + 0 = 220 \text{ lb} \cdot \text{ft} \qquad \text{Ans.}
$$

$$
M_y = 0 - (50 \text{ lb})(3 \text{ ft}) - (40 \text{ lb})(2 \text{ ft}) = -230 \text{ lb} \cdot \text{ft} \quad \text{Ans.}
$$

$$
M_{\rm z} = 0 + 0 - (40 \,\text{lb})(2 \,\text{ft}) = -80 \,\text{lb} \cdot \text{ft}
$$
Ans.

The negative signs indicate that M_y and M_z act in the $-y$ and $-z$ directions respectively directions, respectively.

4

Determine the moment M_{AB} produced by the force **F** in Fig. 4–23*a*, which tends to rotate the rod about the *AB* axis which tends to rotate the rod about the *AB* axis.

SOLUTION

SOLUTION
A vector analysis using $M_{AB} = \mathbf{u}_B \cdot (\mathbf{r} \times \mathbf{F})$ will be considered for the solution rather than trying to find the moment arm or perpendicular solution rather than trying to find the moment arm or perpendicular distance from the line of action of **F** to the *AB* axis. Each of the terms in the equation will now be identified.

Unit vector \mathbf{u}_B defines the direction of the *AB* axis of the rod, Fig. 4–23*b*, where

$$
u_B = \frac{\mathbf{r}_B}{\mathbf{r}_B} = \frac{\{0.4\mathbf{i} + 0.2\mathbf{j}\} \text{ m}}{\sqrt{(0.4 \text{ m})^2 + (0.2 \text{ m})^2}} = 0.8944\mathbf{i} + 0.4472\mathbf{j}
$$

Vector **r** is directed from *any point* on the *AB* axis to *any point* on the line of action of the force. For example, position vectors \mathbf{r}_C and \mathbf{r}_D are suitable. Fig. 4.23b. (Although not shown, \mathbf{r}_C or \mathbf{r}_C can also be suitable, Fig. 4–23*b*. (Although not shown, \mathbf{r}_{BC} or \mathbf{r}_{BD} can also be used.) For simplicity we choose **r**, where used.) For simplicity, we choose **r**_D, where
 r_D = {0.6**i**} m

$$
\mathbf{r}_D = \{0.6\mathbf{i}\} \text{ m}
$$

The force is

$$
\mathbf{F} = \{-300\mathbf{k}\} \mathbf{N}
$$

Substituting these vectors into the determinant form and expanding, we have

$$
M_{AB} = \mathbf{u}_B \cdot (\mathbf{r}_D \times \mathbf{F}) = \begin{vmatrix} 0.8944 & 0.4472 & 0 \\ 0.6 & 0 & 0 \\ 0 & 0 & -300 \end{vmatrix}
$$

= 0.8944[0(-300) - 0(0)] - 0.4472[0.6(-300) - 0(0)]
+ 0[0.6(0) - 0(0)]

 $= 80.50 N \cdot m$

This positive result indicates that the sense of M_{AB} is in the same direction as **W** direction as \mathbf{u}_B .

Expressing
$$
\mathbf{M}_{AB}
$$
 as a Cartesian vector yields
\n
$$
\mathbf{M}_{AB} = M_{AB}\mathbf{u}_B = (80.50 \text{ N} \cdot \text{m})(0.8944\mathbf{i} + 0.4472\mathbf{j})
$$
\n
$$
= \{72.0\mathbf{i} + 36.0\mathbf{j}\} \text{ N} \cdot \text{m}
$$
\n*Ans.*

The result is shown in Fig. 4–23*b*.

NOTE: If axis *AB* is defined using a unit vector directed from *B* toward -*A*, then in the above formulation $-\mathbf{u}_B$ would have to be used. This would
lead to $M = -80.50$ N i.m. Consequently $\mathbf{M} = M$ ($-\mathbf{u}$) and **NOTE:** If axis *AB* is defined using a unit vector directed from *B* toward *A*, then in the above formulation $-\mathbf{u}_B$ would have to be used. This would lead to $M_{AB} = -80.50 \text{ N} \cdot \text{m}$. Consequently, $\mathbf{M}_{AB} = M_{AB}(-\$ the same result would be obtained.

Determine the magnitude of the moment of force **F** about segment *OA* of the pipe assembly in Fig. 4–24*a*.

SOLUTION

The moment of **F** about the *OA* axis is determined from The moment of **F** about the *OA* axis is determined from $M_{OA} = \mathbf{u}_{OA} \cdot (\mathbf{r} \times \mathbf{F})$, where **r** is a position vector extending from any point on the *OA* axis to any point on the line of action of **F** As point on the *OA* axis to any point on the line of action of **F**. As indicated in Fig. 4–24*b*, either \mathbf{r}_{OD} , \mathbf{r}_{OC} , \mathbf{r}_{AD} , or \mathbf{r}_{AC} can be used; 0.5 m
however \mathbf{r}_{CD} will be considered since it will simplify the calculation however, \mathbf{r}_{OD} will be considered since it will simplify the calculation.
The unit vector **u** which specifies the direction of the OA axis is

The unit vector \mathbf{u}_{OA} , which specifies the direction of the OA axis, is

$$
\mathbf{u}_{OA} = \frac{\mathbf{r}_{OA}}{r_{OA}} = \frac{\{0.3\mathbf{i} + 0.4\mathbf{j}\} \text{ m}}{\sqrt{(0.3 \text{ m})^2 + (0.4 \text{ m})^2}} = 0.6\mathbf{i} + 0.8\mathbf{j}
$$

and the position vector **r**_{OD} is

$$
\mathbf{r}_{OD} = \{0.5\mathbf{i} + 0.5\mathbf{k}\}\mathbf{m}
$$

The force **F** expressed as a Cartesian vector is

$$
\mathbf{F} = F\left(\frac{\mathbf{r}_{CD}}{r_{CD}}\right)
$$

= (300 N)
$$
\left[\frac{\{0.4\mathbf{i} - 0.4\mathbf{j} + 0.2\mathbf{k}\} \text{ m}}{\sqrt{(0.4 \text{ m})^2 + (-0.4 \text{ m})^2 + (0.2 \text{ m})^2}}\right]
$$

= {200\mathbf{i} - 200\mathbf{j} + 100\mathbf{k}} N

Therefore,

$$
M_{OA} = \mathbf{u}_{OA} \cdot (\mathbf{r}_{OD} \times \mathbf{F})
$$

=
$$
\begin{vmatrix} 0.6 & 0.8 & 0 \\ 0.5 & 0 & 0.5 \\ 200 & -200 & 100 \end{vmatrix}
$$

=
$$
0.6[0(100) - (0.5)(-200)] - 0.8[0.5(100) - (0.5)(200)] + 0
$$

=
$$
100 \text{ N} \cdot \text{m}
$$
Ans.

Fig. 4–25

Fig. 4–26

Fig. 4–27

4.6 [Moment of a Couple](#page-11-0)

A *couple* is defined as two parallel forces that have the same magnitude, but opposite directions, and are separated by a perpendicular distance *d*, Fig. 4–25. Since the resultant force is zero, the only effect of a couple is to produce a rotation or tendency of rotation in a specified direction. For example, imagine that you are driving a car with both hands on the steering wheel and you are making a turn. One hand will push up on the wheel while the other hand pulls down, which causes the steering wheel to rotate.

The moment produced by a couple is called a *couple moment*. We can determine its value by finding the sum of the moments of both couple forces about *any* arbitrary point. For example, in Fig. 4–26, position vectors \mathbf{r}_A and \mathbf{r}_B are directed from point *O* to points *A* and *B* lying on the line of action of $-\mathbf{F}$ and **F**. The couple moment determined about *O* the line of action of $-F$ and **F**. The couple moment determined about O is therefore

$$
\mathbf{M} = \mathbf{r}_B \times \mathbf{F} + \mathbf{r}_A \times -\mathbf{F} = (\mathbf{r}_B - \mathbf{r}_A) \times \mathbf{F}
$$

However $\mathbf{r}_B = \mathbf{r}_A + \mathbf{r}$ or $\mathbf{r} = \mathbf{r}_B - \mathbf{r}_A$, so that
 $\mathbf{M} = \mathbf{r} \times \mathbf{F}$ $\mathbf{r}_B = \mathbf{r}_A + \mathbf{r}$ or $\mathbf{r} = \mathbf{r}_B - \mathbf{r}_A$

$$
\mathbf{M} = \mathbf{r} \times \mathbf{F} \tag{4-13}
$$

This result indicates that a couple moment is a *free vector*, i.e., it can act at *any point* since **M** depends *only* upon the position vector **r** directed *between* the forces and *not* the position vectors \mathbf{r}_A and \mathbf{r}_B , directed from the arbitrary point O to the forces. This concent is unlike the moment of the arbitrary point *O* to the forces. This concept is unlike the moment of a force, which requires a definite point (or axis) about which moments are determined.

Scalar Formulation. The moment of a couple, **M**, Fig. 4–27, is defined as having a *magnitude* of

$$
M = Fd \tag{4-14}
$$

where *F* is the magnitude of one of the forces and *d* is the perpendicular distance or moment arm between the forces. The *direction* and sense of the couple moment are determined by the right-hand rule, where the thumb indicates this direction when the fingers are curled with the sense of rotation caused by the couple forces. In all cases, **M** will act perpendicular to the plane containing these forces.

Vector Formulation. The moment of a couple can also be expressed by the vector cross product using Eq. 4–13, i.e.,
 $\mathbf{M} = \mathbf{r} \times \mathbf{F}$

$$
\mathbf{M} = \mathbf{r} \times \mathbf{F} \tag{4-15}
$$

Application of this equation is easily remembered if one thinks of taking the moments of both forces about a point lying on the line of action of one of the forces. For example, if moments are taken about point *A* in -Fig. 4–26, the moment of $-F$ is *zero* about this point, and the moment of **F** is defined from Eq. 4–15.Therefore, in the formulation **r** is crossed with the force **F** to which it is directed.

Fig. 4–28

Equivalent Couples. If two couples produce a moment with the *same magnitude and direction*,then these two couples are *equivalent*.For example, the two couples shown in Fig. 4–28 are *equivalent* because each couple moment has a magnitude of $M = 30$ N(0.4 m) = 40 N(0.3 m) = 12 N · m , and each is directed into the plane of the page. Notice that larger forces are required in the second case to create the same turning effect because the hands are placed closer together. Also, if the wheel was connected to the shaft at a point other than at its center, then the wheel would still turn when each couple is applied since the $12 \text{ N} \cdot \text{m}$ couple is a free vector. if the w
er, then $12 N \cdot m$ i these two couples are *equivalent*. For example,
Fig. 4–28 are *equivalent* because each couple $M = 30$ N(0.4 m) = 40 N(0.3 m) = 12 N · m
is plane of the page. Notice that larger forces

Resultant Couple Moment. Since couple moments are vectors, their resultant can be determined by vector addition. For example, consider the couple moments M_1 and M_2 acting on the pipe in Fig. 4–29*a*. Since each couple moment is a free vector, we can join their tails at any Since each couple moment is a free vector, we can join their tails at any arbitrary point and find the resultant couple moment, $M_R = M_1 + M_2$
as shown in Fig. 4, 206 as shown in Fig. 4–29*b*.

If more than two couple moments act on the body, we may generalize this concept and write the vector resultant as

$$
\mathbf{M}_R = \Sigma(\mathbf{r} \times \mathbf{F}) \tag{4-16}
$$

These concepts are illustrated numerically in the examples that follow. In general, problems projected in two dimensions should be solved using a scalar analysis since the moment arms and force components are easy to determine.

Steering wheels on vehicles have been made smaller than on older vehicles because power steering does not require the driver to apply a large couple moment to the rim of the wheel.

Important Points

- A couple moment is produced by two noncollinear forces that are equal in magnitude but opposite in direction. Its effect is to produce pure rotation, or tendency for rotation in a specified direction.
- A couple moment is a free vector, and as a result it causes the same rotational effect on a body regardless of where the couple moment is applied to the body.
- The moment of the two couple forces can be determined about *any point*. For convenience, this point is often chosen on the line of action of one of the forces in order to eliminate the moment of this force about the point.
- In three dimensions the couple moment is often determined using the vector formulation, $M = r \times F$, where **r** is directed using the vector formulation, $M = r \times F$, where **r** is directed from *any point* on the line of action of one of the forces to *any point* on the line of action of the other force **F**.
- A resultant couple moment is simply the vector sum of all the couple moments of the system.

$EXAMPLE$ 4.10

Fig. 4–30

Determine the resultant couple moment of the three couples acting on the plate in Fig. 4–30.

SOLUTION

As shown the perpendicular distances between each pair of couple forces are $d_1 = 4$ ft, $d_2 = 3$ ft, and $d_3 = 5$ ft. Considering counterclockwise couple moments as positive we have are $d_1 = 4$ ft, $d_2 = 3$ ft, and $d_3 = 5$ ft. Considering counterclockwise couple moments as positive, we have

$$
\zeta + M_R = \Sigma M; \ M_R = -F_1 d_1 + F_2 d_2 - F_3 d_3
$$

= (-200 lb)(4 ft) + (450 lb)(3 ft) - (300 lb)(5 ft)
= -950 lb \cdot ft = 950 lb \cdot ft
Ans.

The negative sign indicates that M_R has a clockwise rotational sense.

Determine the magnitude and direction of the couple moment acting on the gear in Fig. 4–31*a*.

SOLUTION

The easiest solution requires resolving each force into its components as shown in Fig. 4–31*b*. The couple moment can be determined by summing the moments of these force components about any point, for example, the center *O* of the gear or point *A*. If we consider counterclockwise moments as positive, we have

$$
\zeta + M = \Sigma M_O; \ M = (600 \cos 30^\circ \text{ N})(0.2 \text{ m}) - (600 \sin 30^\circ \text{ N})(0.2 \text{ m})
$$

= 43.9 N·m
or

$$
\zeta + M = \Sigma M_A; \ M = (600 \cos 30^\circ \text{ N})(0.2 \text{ m}) - (600 \sin 30^\circ \text{ N})(0.2 \text{ m})
$$

= 43.9 N·m
Ans.

This positive result indicates that **M** has a counterclockwise rotational sense, so it is directed outward, perpendicular to the page.

NOTE: The same result can also be obtained using $M = Fd$, where *d* is the perpendicular distance between the lines of action of the couple is the perpendicular distance between the lines of action of the couple forces, Fig. 4–31*c*. However, the computation for *d* is more involved. Realize that the couple moment is a free vector and can act at any point on the gear and produce the same turning effect about point *O*.

Replace the two couples acting on the pipe column in Fig. 4–33*a* by a resultant couple moment.

SOLUTION (VECTOR ANALYSIS)

The couple moment M_1 , developed by the forces at *A* and *B*, can easily be determined from a scalar formulation.
 $M_1 = Fd = 150 \text{ N}(0.4 \text{ m}) = 60 \text{ N} \cdot \text{m}$

$$
M_1 = Fd = 150 \text{ N}(0.4 \text{ m}) = 60 \text{ N} \cdot \text{m}
$$

By the right-hand rule, M_1 acts in the +**i** direction, Fig. 4–33*b*. Hence,
 $M_1 = \{60\mathbf{i}\} \text{ N} \cdot \text{m}$ \mathbf{M}_1 acts in the +**i**

$$
\mathbf{M}_1 = \{60\mathbf{i}\} \; \mathrm{N} \cdot \mathrm{m}
$$

Vector analysis will be used to determine M_2 , caused by forces at C and *D*. If moments are computed about point *D*, Fig. 4–33*a*, and *D*. If moments
M₂ = **r**_{DC} \times **F**_C, then

$$
\mathbf{M}_2 = \mathbf{r}_{DC} \times \mathbf{F}_C = (0.3\mathbf{i}) \times [125(\frac{4}{5})\mathbf{j} - 125(\frac{3}{5})\mathbf{k}]
$$

= (0.3\mathbf{i}) \times [100\mathbf{j} - 75\mathbf{k}] = 30(\mathbf{i} \times \mathbf{j}) - 22.5(\mathbf{i} \times \mathbf{k})
= {22.5\mathbf{j} + 30\mathbf{k}} \text{ N} \cdot \text{m}

Since M_1 and M_2 are free vectors, they may be moved to some arbitrary point and added vectorially, Fig. 4–33*c*. The resultant couple moment becomes **M**_R = **M**₁ + **M**₂ = {60**i** + 22.5**j** + 30**k**} N · m *Ans.*

$$
\mathbf{M}_R = \mathbf{M}_1 + \mathbf{M}_2 = \{60\mathbf{i} + 22.5\mathbf{j} + 30\mathbf{k}\}\,\mathrm{N\cdot m} \qquad Ans.
$$

4.7 [Simplification of a Force and Couple](#page-11-0) System

Sometimes it is convenient to reduce a system of forces and couple moments acting on a body to a simpler form by replacing it with an *equivalent system*, consisting of a single resultant force acting at a specific point and a resultant couple moment.A system is equivalent if the *external effects* it produces on a body are the same as those caused by the original force and couple moment system. In this context, the external effects of a system refer to the *translating and rotating motion* of the body if the body is free to move, or it refers to the *reactive forces* at the supports if the body is held fixed.

For example, consider holding the stick in Fig. 4–34*a*, which is subjected to the force \bf{F} at point \bf{A} . If we attach a pair of equal but opposite forces **F** and –**F** at point *B*, which is *on the line of action* of **F**, Fig. 4–34*b*, we observe that –**F** at *B* and **F** at *A* will cancel each other, leaving only **F** at *B*, Fig. 4–34*c*. Force **F** has now been moved from *A* to *B* without modifying its *external effects* on the stick; i.e., the reaction at the grip remains the same. This demonstrates the *principle of transmissibility*, which states that a force acting on a body (stick) is a *sliding vector* since it can be applied at any point along its line of action.

We can also use the above procedure to move a force to a point that is *not* on the line of action of the force. If **F** is applied perpendicular to the stick, as in Fig. 4–35*a*, then we can attach a pair of equal but opposite forces **F** and –**F** to *B*, Fig. 4–35*b*. Force **F** is now applied at *B*, and the other two forces,**F** at *A* to *B*, Fig. 4–35*b*. Force **F** is now applied at *B*, and the other two forces, **F** at *A* and $-F$ at *B*, form a couple that produces the couple moment $M = Fd$, Fig. 4–35*c*. Therefore, the force **F** can be moved from *A* Fig. 4–35*c*. Therefore, the force **F** can be moved from *A* to *B* provided a couple moment **M** is added to maintain an equivalent system. This couple moment is determined by taking the moment of **F** about *B*. Since **M** is actually a *free vector*, it can act at any point on the stick. In both cases the systems are equivalent which causes a downward force **F** and clockwise couple moment $M = Fd$ to be felt at the grip.

(a)

(b)

System of Forces and Couple Moments. Using the above method, a system of several forces and couple moments acting on a body can be reduced to an equivalent single resultant force acting at a point *O* and a resultant couple moment. For example, in Fig. 4–36*a*, *O* is not on the line of action of \mathbf{F}_1 , and so this force can be moved to point not on the line of action of \mathbf{F}_1 , and so this force can be moved to point *O* provided a couple moment $\mathbf{M}_1 = \mathbf{r}_1 \times \mathbf{F}$ is added to the body. O provided a couple moment $M_1 = r_1 \times F$ is added to the body.
Similarly, the couple moment $M_2 = r_2 \times F_2$ should be added to the body when we move \mathbf{F}_2 to point *O*. Finally, since the couple moment **M** is a free vector, it can just be moved to point *O*. By doing this, we obtain the equivalent system shown in Fig. 4–36*b*, which produces the same external effects (support reactions) on the body as that of the force and couple system shown in Fig. 4–36*a*. If we sum the forces and couple couple system shown in Fig. 4–36*a*. If we sum the forces and couple
moments, we obtain the resultant force $\mathbf{F}_R = \mathbf{F}_1 + \mathbf{F}_2$ and the resultant
couple moment (**M**) $\Delta = \mathbf{M} + \mathbf{M} + \mathbf{M}$. Fig. 4, 36*c* moments, we obtain the resultant force $\mathbf{F}_R = \mathbf{F}_1 + \mathbf{F}$
couple moment $(\mathbf{M}_R)_O = \mathbf{M} + \mathbf{M}_1 + \mathbf{M}_2$, Fig. 4–36*c*.
Notice that **F**_i is independent of the location of point

Notice that \mathbf{F}_R is independent of the location of point *O*; however, $(\mathbf{M}_R)_{\text{O}}$ depends upon this location since the moments M_1 and M_2 are determined using the position vectors \mathbf{r}_1 and \mathbf{r}_2 . Also note that $(\mathbf{M}_R)_O$ is a free vector and can act at *any point* on the body, although point *O* is generally chosen as its point of application.

We can generalize the above method of reducing a force and couple system to an equivalent resultant force \mathbf{F}_R acting at point *O* and a resultant couple moment (**M**) by using the following two equations resultant couple moment $(M_R)_O$ by using the following two equations.

$$
\mathbf{F}_R = \Sigma \mathbf{F}
$$

$$
(\mathbf{M}_R)_O = \Sigma \mathbf{M}_O + \Sigma \mathbf{M}
$$
(4-17)

The first equation states that the resultant force of the system is equivalent to the sum of all the forces; and the second equation states that the resultant couple moment of the system is equivalent to the sum that the resultant couple moment of the system is equivalent to the sum
of all the couple moments ΣM plus the moments of all the forces ΣM_O
about point O. If the force system lies in the x y plane and any couple about point *O*. If the force system lies in the *x*–*y* plane and any couple moments are perpendicular to this plane, then the above equations reduce to the following three scalar equations.

$$
(F_R)_x = \Sigma F_x
$$

\n
$$
(F_R)_y = \Sigma F_y
$$

\n
$$
(M_R)_O = \Sigma M_O + \Sigma M
$$
\n(4-18)

Here the resultant force is determined from the vector sum of its two components $(F_R)_x$ and $(F_R)_y$.

The weights of these traffic lights can be replaced by their equivalent resultant force The weights of these traffic lights can be replaced by their equivalent resultant force $W_R = W_1 + W_2$ and a couple moment $(M_R)_0 = W_1 d_1 + W_2 d_2$ at the support, *O*. In hoth cases the support must provide the same resistance both cases the support must provide the same resistance to translation and rotation in order to keep the member in the horizontal position.

Procedure for Analysis

The following points should be kept in mind when simplifying a force and couple moment system to an equivalent resultant force and couple system.

• Establish the coordinate axes with the origin located at point *O* and the axes having a selected orientation.

Force Summation.

- If the force system is *coplanar*, resolve each force into its *x* and *y* components. If a component is directed along the positive *x* or *y* axis, it represents a positive scalar; whereas if it is directed along the negative *x* or *y* axis, it is a negative scalar.
- In three dimensions, represent each force as a Cartesian vector before summing the forces.

Moment Summation.

- When determining the moments of a *coplanar* force system about point *O*, it is generally advantageous to use the principle of moments, i.e., determine the moments of the components of each force, rather than the moment of the force itself.
- In three dimensions use the vector cross product to determine the moment of each force about point *O*. Here the position vectors extend from *O* to any point on the line of action of each force.

Replace the force and couple system shown in Fig. 4–37*a* by an equivalent resultant force and couple moment acting at point *O*.

SOLUTION

Force Summation. The 3 kN and 5 kN forces are resolved into their *x* and *y* components as shown in Fig. 4–37*b*. We have +

$$
\Rightarrow (F_R)_x = \Sigma F_x; \quad (F_R)_x = (3 \text{ kN}) \cos 30^\circ + \left(\frac{3}{5}\right) (5 \text{ kN}) = 5.598 \text{ kN} \rightarrow
$$
\n
$$
+ \uparrow (F_R)_y = \Sigma F_y; \quad (F_R)_y = (3 \text{ kN}) \sin 30^\circ - \left(\frac{4}{5}\right) (5 \text{ kN}) - 4 \text{ kN} = -6.50 \text{ kN} = 6.50 \text{ kN} \downarrow
$$
\nUsing the Pythagorean theorem, Fig. 4.27a, the magnitude of **F**, is

Using the Pythagorean theorem, Fig. 4–37*c*, the magnitude of \mathbf{F}_R is

$$
F_R = \sqrt{(F_R)_x^2 + (F_R)_y^2} = \sqrt{(5.598 \text{ kN})^2 + (6.50 \text{ kN})^2} = 8.58 \text{ kN}
$$
 Ans.

Its direction θ is

$$
\theta = \tan^{-1}\left(\frac{(F_R)_y}{(F_R)_x}\right) = \tan^{-1}\left(\frac{6.50 \text{ kN}}{5.598 \text{ kN}}\right) = 49.3^{\circ}
$$
 Ans. **Moment Summation.** The moments of 3 kN and 5 kN about

point *O* will be determined using their *x* and *y* components. Referring to Fig. 4–37*b*, we have

$$
\zeta + (M_R)_O = \Sigma M_O;
$$

\n
$$
(M_R)_O = (3 \text{ kN})\sin 30^\circ (0.2 \text{ m}) - (3 \text{ kN})\cos 30^\circ (0.1 \text{ m}) + (\frac{3}{5}) (5 \text{ kN}) (0.1 \text{ m})
$$

\n
$$
- (\frac{4}{5}) (5 \text{ kN}) (0.5 \text{ m}) - (4 \text{ kN}) (0.2 \text{ m})
$$

\n
$$
= -2.46 \text{ kN} \cdot \text{m} = 2.46 \text{ kN} \cdot \text{m} \qquad \text{Ans.}
$$

This clockwise moment is shown in Fig. 4–37*c*.

NOTE: Realize that the resultant force and couple moment in Fig. 4–37*c* will produce the same external effects or reactions at the supports as those produced by the force system, Fig 4–37*a*.

Replace the force and couple system acting on the member in Fig. 4–38*a* by an equivalent resultant force and couple moment acting at point *O*.

Fig. 4–38

SOLUTION

Force Summation. Since the couple forces of 200 N are equal but opposite, they produce a zero resultant force, and so it is not necessary to consider them in the force summation. The 500-N force is resolved into its x and y components, thus,

$$
\Rightarrow (F_R)_x = \sum F_x; \ (F_R)_x = \left(\frac{3}{5}\right)(500 \text{ N}) = 300 \text{ N} \rightarrow
$$

+ $\uparrow (F_R)_y = \sum F_y; \ (F_R)_y = (500 \text{ N})(\frac{4}{5}) - 750 \text{ N} = -350 \text{ N} = 350 \text{ N}$

From Fig. 4–15*b*, the magnitude of \mathbf{F}_R is

$$
F_R = \sqrt{(F_R)_x^2 + (F_R)_y^2}
$$

= $\sqrt{(300 \text{ N})^2 + (350 \text{ N})^2} = 461 \text{ N}$ Ans.

And the angle θ is

$$
\theta = \tan^{-1}\left(\frac{(F_R)_y}{(F_R)_x}\right) = \tan^{-1}\left(\frac{350 \text{ N}}{300 \text{ N}}\right) = 49.4^{\circ} \qquad \text{Ans.}
$$

Moment Summation. Since the couple moment is a free vector, it can act at any point on the member. Referring to Fig. 4–38*a*, we have

$$
\zeta + (M_R)_O = \Sigma M_O + \Sigma M_c;
$$

\n
$$
(M_R)_O = (500 \text{ N})(\frac{4}{5})(2.5 \text{ m}) - (500 \text{ N})(\frac{3}{5})(1 \text{ m})
$$

\n
$$
- (750 \text{ N})(1.25 \text{ m}) + 200 \text{ N} \cdot \text{m}
$$

\n
$$
= -37.5 \text{ N} \cdot \text{m} = 37.5 \text{ N} \cdot \text{m} \ \sqrt{M}.
$$

This clockwise moment is shown in Fig. 4–38*b*.

The structural member is subjected to a couple moment **M** and forces \mathbf{F}_1 and \mathbf{F}_2 in Fig. 4–39*a*. Replace this system by an equivalent resultant force and couple moment acting at its base, point *O*.

SOLUTION (VECTOR ANALYSIS)

The three-dimensional aspects of the problem can be simplified by using a Cartesian vector analysis. Expressing the forces and couple moment as Cartesian vectors, we have

$$
\mathbf{F}_1 = \{-800\mathbf{k}\} \mathbf{N}
$$

$$
\mathbf{F}_2 = (300 \text{ N})\mathbf{u}_{CB}
$$

$$
= (300 \text{ N}) \left(\frac{\mathbf{r}_{CB}}{r_{CB}} \right)
$$

= 300 N \left[\frac{\{-0.15\mathbf{i} + 0.1\mathbf{j}\} \text{ m}}{\sqrt{(-0.15 \text{ m})^2 + (0.1 \text{ m})^2}} \right] = \{-249.6\mathbf{i} + 166.4\mathbf{j} \} \text{ N}
 $\mathbf{M} = -500 \left(\frac{4}{5} \right) \mathbf{j} + 500 \left(\frac{3}{5} \right) \mathbf{k} = \{-400\mathbf{j} + 300\mathbf{k}\} \text{ N} \cdot \text{m}$

$$
\mathbf{M} = -500(\frac{4}{5})\mathbf{j} + 500(\frac{3}{5})\mathbf{k} = \{-400\mathbf{j} + 300\mathbf{k}\} \text{ N} \cdot \text{m}
$$

Force Summation.

$$
\mathbf{F}_R = \Sigma \mathbf{F};
$$
 $\mathbf{F}_R = \mathbf{F}_1 + \mathbf{F}_2 = -800\mathbf{k} - 249.6\mathbf{i} + 166.4\mathbf{j}$
= $\{-250\mathbf{i} + 166\mathbf{j} - 800\mathbf{k}\}\text{ N}$ Ans.

Moment Summation.

$$
\mathbf{M}_{R_O} = \Sigma \mathbf{M} + \Sigma \mathbf{M}_O
$$
\n
$$
\mathbf{M}_{R_O} = \mathbf{M} + \mathbf{r}_C \times \mathbf{F}_1 + \mathbf{r}_B \times \mathbf{F}_2
$$
\n
$$
\mathbf{M}_{R_O} = (-400\mathbf{j} + 300\mathbf{k}) + (1\mathbf{k}) \times (-800\mathbf{k}) + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -0.15 & 0.1 & 1 \\ -249.6 & 166.4 & 0 \end{vmatrix}
$$
\n
$$
= (-400\mathbf{j} + 300\mathbf{k}) + (0) + (-166.4\mathbf{i} - 249.6\mathbf{j})
$$
\n
$$
= \{-166\mathbf{i} - 650\mathbf{j} + 300\mathbf{k} \} \text{ N} \cdot \text{m}
$$
\nAns.

The results are shown in Fig. 4–39*b*.

4.8 [Further Simplification of a Force and](#page-11-0) Couple System

In the preceding section, we developed a way to reduce a force and couple moment system acting on a rigid body into an equivalent resultant force \mathbf{F}_R acting at a specific point *O* and a resultant couple moment $(\mathbf{M}_R)_O$. The force system can be further reduced to an equivalent single resultant force force system can be further reduced to an equivalent single resultant force provided the lines of action of \mathbf{F}_R and (\mathbf{M}_R) _O are *perpendicular* to each other. Because of this condition only concurrent conlapse and parallel other. Because of this condition, only concurrent, coplanar, and parallel force systems can be further simplified.

Concurrent Force System. Since a *concurrent force system* is one in which the lines of action of all the forces intersect at a common point *O*, Fig. 4–40*a*, then the force system produces no moment about this point. As a result, the equivalent system can be represented by a single resultant force $\mathbf{F}_R = \Sigma \mathbf{F}$ acting at O, Fig. 4–40*b*.

Coplanar Force System. In the case of a *coplanar force system*, the lines of action of all the forces lie in the same plane, Fig. 4–41*a*, and the lines of action of all the forces lie in the same plane, Fig. 4–41*a*, and
so the resultant force $\mathbf{F}_R = \Sigma \mathbf{F}$ of this system also lies in this plane.
Furthermore, the moment of each of the forces about any poin Furthermore, the moment of each of the forces about any point *O* is directed perpendicular to this plane. Thus, the resultant moment (M_R) and resultant force \mathbf{F}_R will be *mutually perpendicular*,
Fig. 4.41b. The resultant moment can be replaced by moving the Fig. 4–41*b*. The resultant moment can be replaced by moving the resultant force \mathbf{F}_R a perpendicular or moment arm distance *d* away
from point *Q* such that **F**, produces the same moment (**M**), about from point *O* such that \mathbf{F}_R produces the *same moment* $(\mathbf{M}_R)_O$ about point *O*. Fig. 4.41c. This distance *d* can be determined from the scalar point *O*, Fig. 4–41*c*. This distance *d* can be determined from the scalar equation $(M_R)_{\text{O}} = F_R d = \Sigma M_{\text{O}}$ or $d = (M_R)_{\text{O}}/F_R$.

Parallel Force System. The *parallel force system* shown in Fig. 4–42*a* consists of forces that are all parallel to the *z* axis. Thus, the resultant consists of forces that are all parallel to the *z* axis. Thus, the resultant force $\mathbf{F}_R = \Sigma \mathbf{F}$ at point *O* must also be parallel to this axis, Fig. 4–42*b*. The moment produced by each force lies in the plane of The moment produced by each force lies in the plane of the plate, and so the resultant couple moment, $(\mathbf{M}_R)_O$, will also lie in this plane, along the moment oxis a since \mathbf{F} , and (\mathbf{M}_A) , are mutually perpendicular. As a moment axis *a* since \mathbf{F}_R and $(\mathbf{M}_R)_O$ are mutually perpendicular. As a result the force system can be further reduced to an equivalent single result, the force system can be further reduced to an equivalent single resultant force \mathbf{F}_R , acting through point *P* located on the perpendicular *b* axis. Fig. 4, 42c. The distance *d* along this axis from point *O* requires axis, Fig. 4–42*c*. The distance *d* along this axis from point *O* requires $(M_R)_{\text{O}} = F_R d = \Sigma M_{\text{O}}$ or $d = \Sigma M_{\text{O}}/F_R$.

4

The four cable forces are all concurrent at point *O* on this bridge tower. Consequently they produce no resultant moment there, only a resultant force \mathbf{F}_R . Note that the designers have positioned
the cables so that \mathbf{F}_R is directed along the bridge tower directly to the cables so that \mathbf{F}_R is directed *along* the bridge tower directly to the support so that it does not cause any bending of the tower the support, so that it does not cause any bending of the tower.

Procedure for Analysis

The technique used to reduce a coplanar or parallel force system to a single resultant force follows a similar procedure outlined in the previous section.

• Establish the *x*, *y*, *z*, axes and locate the resultant force \mathbf{F}_R and orbitrary distance away from the origin of the coordinates arbitrary distance away from the origin of the coordinates.

Force Summation.

- The resultant force is equal to the sum of all the forces in the system.
- For a coplanar force system, resolve each force into its *x* and *y* components. Positive components are directed along the positive *x* and *y* axes, and negative components are directed along the negative *x* and *y* axes.

Moment Summation.

- The moment of the resultant force about point O is equal to the sum of all the couple moments in the system plus the moments of all the forces in the system about *O*.
- This moment condition is used to find the location of the resultant force from point *O*.

Here the weights of the traffic lights are replaced by their resultant force $W_R = W_1 + W_2$
which acts at a distance $d = (W_1 d_1 + W_2 d_2) / W_R$ from O. Both systems are equivalent. $W_R = W_1 + W_2$
s are equivalent

Reduction to a Wrench In general, a three-dimensional force and couple moment system will have an equivalent resultant force \mathbf{F}_R
acting at point Q and a resultant couple moment (\mathbf{M}) , that are not acting at point *O* and a resultant couple moment $(M_R)_O$ that are *not*
perpendicular to one another as shown in Fig. 4.43g. Although a force *perpendicular* to one another, as shown in Fig. 4–43*a*. Although a force system such as this cannot be further reduced to an equivalent single resultant force, the resultant couple moment $(M_R)_O$ can be resolved into
components parallel and perpendicular to the line of action of \mathbf{F} components parallel and perpendicular to the line of action of \mathbf{F}_R , \mathbf Fig. 4–43*a*. The perpendicular component M_{\perp} can be replaced if we move \mathbf{F}_R to point *P*, a distance *d* from point *O* along the *b* axis,
Fig. 4.43b, As seen this axis is perpendicular to both the *a* axis and the Fig. 4–43*b*. As seen, this axis is perpendicular to both the *a* axis and the line of action of \mathbf{F}_R . The location of *P* can be determined from $d = M / F$. Finally because **M** is a free vector it can be moved to line of action of \mathbf{F}_R . The location of P can be determined from $d = M_{\perp}/F_R$. Finally, because \mathbf{M}_{\parallel} is a free vector, it can be moved to point P Fig. 4.43c This combination of a resultant force \mathbf{F}_P and point *P*, Fig. 4–43*c*. This combination of a resultant force \mathbf{F}_R and collinear couple moment **M**, will tend to translate and rotate the body about its couple moment M_{\parallel} will tend to translate and rotate the body about its axis and is referred to as a *wrench* or *screw*. A wrench is the simplest system that can represent any general force and couple moment system acting on a body.

Fig. 4–43

Replace the force and couple moment system acting on the beam in Fig. 4–44*a* by an equivalent resultant force, and find where its line of action intersects the beam, measured from point *O*.

SOLUTION

Force Summation. Summing the force components,

$$
\Rightarrow (F_R)_x = \Sigma F_x; \quad (F_R)_x = 8 \text{ kN} \left(\frac{3}{5}\right) = 4.80 \text{ kN} \rightarrow
$$

$$
+ \hat{ } (F_R)_y = \Sigma F_y; \quad (F_R)_y = -4 \text{ kN} + 8 \text{ kN} \left(\frac{4}{5}\right) = 2.40 \text{ kN} \hat{ }
$$

From Fig. 4–44*b*, the magnitude of \mathbf{F}_R is

$$
F_R = \sqrt{(4.80 \text{ kN})^2 + (2.40 \text{ kN})^2} = 5.37 \text{ kN}
$$
 Ans.

The angle θ is

$$
\theta = \tan^{-1} \left(\frac{2.40 \text{ kN}}{4.80 \text{ kN}} \right) = 26.6^{\circ}
$$
 Ans.

Moment Summation. We must equate the moment of \mathbf{F}_R about point *O* in Fig. 4.44b to the sum of the moments of the force and point *O* in Fig. 4–44*b* to the sum of the moments of the force and couple moment system about point *O* in Fig. 4–44*a*. Since the line of action of $(\mathbf{F}_R)_x$ acts through point *O*, *only* $(\mathbf{F}_R)_y$ *produces a moment* about this point. Thus about this point. Thus,

about this point. Thus,
\n
$$
\zeta + (M_R)_O = \Sigma M_O;
$$
 2.40 kN(*d*) = -(4 kN)(1.5 m) - 15 kN·m
\n-[8 kN($\frac{3}{5}$)] (0.5 m) + [8 kN($\frac{4}{5}$)](4.5 m)
\n*d* = 2.25 m *Ans.*

y

 $3 ft$ 5 ft

 $\frac{B}{C}$ $\frac{C}{C}$ $\frac{1}{C}$ $\frac{C}{C}$

$EXAMPLE$ 4.18

The jib crane shown in Fig. 4–45*a* is subjected to three coplanar forces. Replace this loading by an equivalent resultant force and specify where the resultant's line of action intersects the column *AB* and boom *BC*.

SOLUTION

Force Summation. Resolving the 250-lb force into *x* and *y* components and summing the force components yields

$$
\Rightarrow F_{R_x} = \Sigma F_x; \ \ F_{R_x} = -250 \text{ lb} \left(\frac{3}{5}\right) - 175 \text{ lb} = -325 \text{ lb} = 325 \text{ lb} \leftarrow
$$

$$
+ \uparrow F_{R_y} = \Sigma F_y; \ \ F_{R_y} = -250 \text{ lb} \left(\frac{4}{5}\right) - 60 \text{ lb} = -260 \text{ lb} = 260 \text{ lb}
$$

As shown by the vector addition in Fig. 4–45*b*,

$$
F_R = \sqrt{(325 \text{ lb})^2 + (260 \text{ lb})^2} = 416 \text{ lb}
$$
Ans.

$$
\theta = \tan^{-1} \left(\frac{260 \text{ lb}}{325 \text{ lb}}\right) = 38.7^\circ \theta \, \text{V}
$$
Ans.

Moment Summation. Moments will be summed about point *A*. Assuming the line of action of \mathbf{F}_R intersects AB at a distance *y* from *A*, Fig. 4.45b, we have Fig. 4–45*b*, we have

$$
\zeta + M_{R_A} = \Sigma M_A; \qquad 325 \text{ lb } (y) + 260 \text{ lb } (0)
$$

= 175 lb (5 ft) - 60 lb (3 ft) + 250 lb($\frac{3}{5}$)(11 ft) - 250 lb($\frac{4}{5}$)(8 ft)
 $y = 2.29 \text{ ft}$ Ans.

By the principle of transmissibility, \mathbf{F}_R can be placed at a distance *x* where it intersects *BC*. Fig. 4, 45b, In this case we have where it intersects *BC*, Fig. 4–45*b*. In this case we have

$$
\zeta + M_{R_A} = \Sigma M_A;
$$
 325 lb (11 ft) – 260 lb (*x*)
= 175 lb (5 ft) – 60 lb (3 ft) + 250 lb($\frac{3}{5}$)(11 ft) – 250 lb($\frac{4}{5}$)(8 ft)
x = 10.9 ft *Ans.*

The slab in Fig. 4–46*a* is subjected to four parallel forces. Determine the magnitude and direction of a resultant force equivalent to the given force system and locate its point of application on the slab.

Fig. 4–46

SOLUTION (SCALAR ANALYSIS)

x

Force Summation. From Fig. 4–46*a*, the resultant force is
\n
$$
+ \uparrow F_R = \Sigma F; \qquad -F_R = -600 \text{ N} + 100 \text{ N} - 400 \text{ N} - 500 \text{ N}
$$
\n
$$
= -1400 \text{ N} = 1400 \text{ N} \downarrow
$$
\nAns.

Moment Summation. We require the moment about the *x* axis of the resultant force, Fig. 4–46*b*, to be equal to the sum of the moments about the *x* axis of all the forces in the system, Fig. 4–46*a*.The moment arms are determined from the *y* coordinates since these coordinates represent the *perpendicular distances* from the *x* axis to the lines of

action of the forces. Using the right-hand rule, we have

\n
$$
(M_R)_x = \Sigma M_x;
$$
\n
$$
-(1400 \text{ N})y = 600 \text{ N}(0) + 100 \text{ N}(5 \text{ m}) - 400 \text{ N}(10 \text{ m}) + 500 \text{ N}(0) -1400y = -3500 \qquad y = 2.50 \text{ m}
$$
\nIn a similar manner, a moment equation can be written about the y

axis using moment arms defined by the *x* coordinates of each force.
\n
$$
(M_R)_y = \Sigma M_y;
$$
\n
$$
(1400 \text{ N})x = 600 \text{ N}(8 \text{ m}) - 100 \text{ N}(6 \text{ m}) + 400 \text{ N}(0) + 500 \text{ N}(0)
$$
\n
$$
1400x = 4200
$$
\n
$$
x = 3 \text{ m}
$$
\nAns.

NOTE: A force of $F_R = 1400$ N placed at point $P(3.00 \text{ m}, 2.50 \text{ m})$ on
the slab Fig. 4–46b is therefore equivalent to the parallel force system the slab, Fig. 4–46*b*, is therefore equivalent to the parallel force system acting on the slab in Fig. 4–46*a*.

Ans.

EXAMPLE 4.20

Replace the force system in Fig. 4–47*a* by an equivalent resultant force and specify its point of application on the pedestal.

SOLUTION

Force Summation. Here we will demonstrate a vector analysis. Summing forces,

$$
\mathbf{F}_R = \Sigma \mathbf{F}; \quad \mathbf{F}_R = \mathbf{F}_A + \mathbf{F}_B + \mathbf{F}_C
$$

= \{-300k\} lb + \{-500k\} lb + \{100k\} lb
= \{-700k\} lb
Ans.

Location. Moments will be summed about point *O*. The resultant force \mathbf{F}_R is assumed to act through point *P* (*x*, *y*, 0), Fig. 4–47*b*. Thus

$$
(\mathbf{M}_R)_O = \Sigma \mathbf{M}_O;
$$

\n
$$
\mathbf{r}_P \times \mathbf{F}_R = (\mathbf{r}_A \times \mathbf{F}_A) + (\mathbf{r}_B \times \mathbf{F}_B) + (\mathbf{r}_C \times \mathbf{F}_C)
$$

\n
$$
(\mathbf{x} \mathbf{i} + \mathbf{y} \mathbf{j}) \times (-700 \mathbf{k}) = [(4\mathbf{i}) \times (-300 \mathbf{k})]
$$

\n
$$
+ [(-4\mathbf{i} + 2\mathbf{j}) \times (-500 \mathbf{k})] + [(-4\mathbf{j}) \times (100 \mathbf{k})]
$$

\n
$$
-700x(\mathbf{i} \times \mathbf{k}) - 700y(\mathbf{j} \times \mathbf{k}) = -1200(\mathbf{i} \times \mathbf{k}) + 2000(\mathbf{i} \times \mathbf{k})
$$

\n
$$
- 1000(\mathbf{j} \times \mathbf{k}) - 400(\mathbf{j} \times \mathbf{k})
$$

\n
$$
700x\mathbf{j} - 700y\mathbf{i} = 1200\mathbf{j} - 2000\mathbf{j} - 1000\mathbf{i} - 400\mathbf{i}
$$

Equating the **i** and **j** components,

$$
-700y = -1400
$$
 (1)

Ans. $y = -14$
 $y = 2$ in.

$$
y = 2 \text{ in.} \qquad \qquad \text{Ans.}
$$

700x = -800 (2)

$$
y0x = -800
$$
 (2)

$$
x = -1.14 \text{ in.}
$$
 Ans.

The negative sign indicates that the *x* coordinate of point *P* is negative.

NOTE: It is also possible to establish Eq. 1 and 2 directly by summing moments about the *x* and *y* axes. Using the right-hand rule, we have

(a)

4.9 [Reduction of a Simple Distributed](#page-11-0) Loading

Sometimes, a body may be subjected to a loading that is distributed over its surface. For example, the pressure of the wind on the face of a sign, the pressure of water within a tank, or the weight of sand on the floor of a storage container, are all *distributed loadings*.The pressure exerted at each point on the surface indicates the intensity of the loading. It is measured using pascals Pa (or N/m^2) in SI units or lb/ft² in the U.S. Customary system.

Uniform Loading Along a Single Axis. The most common type of distributed loading encountered in engineering practice is generally uniform along a single axis.* For example, consider the beam (or plate) in Fig. 4–48*a* that has a constant width and is subjected to a pressure loading that varies only along the *x* axis. This loading can be pressure loading that varies only along the x axis. This loading can be
described by the function $p = p(x) N/m^2$. It contains only one variable
x and for this reason, we can also represent it as a conlapar distributed *x*, and for this reason, we can also represent it as a *coplanar distributed load*. To do so, we multiply the loading function by the width *b* m of *load*. To do so, we multiply the loading function by the width *b* m of
the beam, so that $w(x) = p(x)b \text{ N/m}$, Fig. 4-48*b*. Using the methods of
Sec. 4.8, we can replace this coplanar parallel force system with a Sec. 4.8, we can replace this coplanar parallel force system with a single equivalent resultant force \mathbf{F}_R acting at a specific location on the heart Fig. 4.48c beam, Fig. 4–48*c*.

Magnitude of Resultant Force. From Eq. 4–17 $(F_R = \Sigma F)$, the magnitude of \mathbf{F}_R is equivalent to the sum of all the forces in the the magnitude of \mathbf{F}_R is equivalent to the sum of all the forces in the system. In this case integration must be used since there is an infinite system. In this case integration must be used since there is an infinite number of parallel forces *d***F** acting on the beam, Fig. 4–48*b*. Since *d***F** is acting on an element of length dx, and $w(x)$ is a force per unit length,
then $dF = w(x) dx = dA$. In other words, the magnitude of $d\mathbf{F}$ is
determined from the colored differential *area* dA under the loading then $dF = w(x) dx = dA$. In other words, the magnitude of $d\mathbf{F}$ is determined from the colored differential *area dA* under the loading curve. For the entire length *L*,

$$
+\downarrow F_R = \Sigma F; \qquad F_R = \int_L w(x) \, dx = \int_A dA = A \qquad (4-19)
$$

Therefore, the magnitude of the resultant force is equal to the total area A under the loading diagram, Fig. 4–48*c*.

^{*}The more general case of a nonuniform surface loading acting on a body is considered in Sec. 9.5.

Location of Resultant Force. Applying Eq. 4–17 $(M_{R_O} = \Sigma M_O)$, the location \overline{x} of the line of action of \mathbf{F}_P can be determined by equating the the location \bar{x} of the line of action of \mathbf{F}_R can be determined by equating the moments of the force resultant and the parallel force distribution about moments of the force resultant and the parallel force distribution about moments of the force resultant and the parallel force distribution about
point *O* (the *y* axis). Since *d***F** produces a moment of $x dF = xw(x) dx$
about *O* Fig. 4–48b, then for the entire length Fig. 4–48c about *O*, Fig. 4–48*b*, then for the entire length, Fig. 4–48*c*,

$$
\zeta + (M_R)_O = \Sigma M_O; \quad -\overline{x}F_R = -\int_L xw(x) dx
$$

Solving for \bar{x} , using Eq. 4–19, we have

$$
\overline{x} = \frac{\int_L xw(x) dx}{\int_L w(x) dx} = \frac{\int_A x dA}{\int_A dA}
$$
 (4-20)

This coordinate \bar{x} , locates the geometric center or *centroid* of the *area* under the distributed loading *In other words the resultant force has a line* under the distributed loading.*In other words, the resultant force has a line of action which passes through the centroid C (geometric center) of the area under the loading diagram*, Fig. 4–48*c*. Detailed treatment of the integration techniques for finding the location of the centroid for areas is given in Chapter 9. In many cases, however, the distributed-loading diagram is in the shape of a rectangle, triangle, or some other simple geometric form. The centroid location for such common shapes does not have to be determined from the above equation but can be obtained directly from the tabulation given on the inside back cover.

Once \bar{x} is determined, \mathbf{F}_R by symmetry passes through point $(\bar{x}, 0)$ on Once \bar{x} is determined, \mathbf{F}_R by symmetry passes through point $(\bar{x}, 0)$ on the surface of the beam, Fig. 4–48*a*. *Therefore, in this case the resultant force has a magnitude equal to the volume under the loading curve force has a magnitude equal to the volume under the loading curve* $p = p(x)$ and a line of action which passes through the centroid (geometric center) of this volume *(geometric center) of this volume*.

The beam supporting this stack of lumber is subjected to a uniform loading of w_0 . The resultant force is therefore equal to the area resultant force is therefore equal to the area
under the loading diagram $F_R = w_0 b$. It acts
trough the centroid or geometric center of trough the centroid or geometric center of this area, $b/2$ from the support.

Important Points

- Coplanar distributed loadings are defined by using a loading Coplanar distributed loadings are defined by using a loading function $w = w(x)$ that indicates the intensity of the loading along the length of a member. This intensity is measured in N/m along the length of a member. This intensity is measured in N/m or lb/ft.
- The external effects caused by a coplanar distributed load acting on a body can be represented by a single resultant force.
- This resultant force is equivalent to the *area* under the loading diagram, and has a line of action that passes through the *centroid* or geometric center of this area.

Determine the magnitude and location of the equivalent resultant force acting on the shaft in Fig. 4–49*a*.

SOLUTION

SOLUTION
Since $w = w(x)$ is given, this problem will be solved by integration.

The differential element has an area $dA = w dx = 60x^2 dx$. Applying

Eq. 4-19,
\n
$$
+
$$
 $F_R = \Sigma F$;
\n $F_R = \int_A dA = \int_0^{2m} 60x^2 dx = 60 \left(\frac{x^3}{3}\right) \Big|_0^{2m} = 60 \left(\frac{2^3}{3} - \frac{0^3}{3}\right)$
\n= 160 N

The location \bar{x} of \mathbf{F}_R measured from *O*, Fig. 4–49*b*, is determined from \mathbf{F}_R 4–20 Eq. 4–20.

$$
\overline{x} = \frac{\int_A x \, dA}{\int_A dA} = \frac{\int_0^{2\,\text{m}} x(60x^2) \, dx}{160\,\text{N}} = \frac{60\left(\frac{x^4}{4}\right)\Big|_0^{2\,\text{m}}}{160\,\text{N}} = \frac{60\left(\frac{2^4}{4} - \frac{0^4}{4}\right)}{160\,\text{N}}
$$
\n
$$
= 1.5\,\text{m} \qquad \text{Ans.}
$$

NOTE: These results can be checked by using the table on the inside back cover, where it is shown that for an exparabolic area of length *a*, height *b*, and shape shown in Fig. 4–49*a*, we have

$$
A = \frac{ab}{3} = \frac{2 \text{ m} (240 \text{ N/m})}{3} = 160 \text{ N and } \bar{x} = \frac{3}{4}a = \frac{3}{4}(2 \text{ m}) = 1.5 \text{ m}
$$

A distributed loading of $p = (800x)$ Pa acts over the top surface of the beam shown in Fig. 4–50*g*. Determine the magnitude and location the beam shown in Fig. 4–50*a*. Determine the magnitude and location of the equivalent resultant force.

SOLUTION

Since the loading intensity is uniform along the width of the beam (the *y* axis), the loading can be viewed in two dimensions as shown in Fig. 4–50*b*. Here

$$
w = (800x \text{ N/m}^2)(0.2 \text{ m})
$$

$$
= (160x) \text{ N/m}
$$

At $x = 9$ m, note that $w = 1440$ N/m. Although we may again apply
Eqs. 4–19 and 4–20 as in the previous example it is simpler to use the Eqs. 4–19 and 4–20 as in the previous example, it is simpler to use the table on the inside back cover.

The magnitude of the resultant force is equivalent to the area of the triangle.

$$
F_R = \frac{1}{2}(9 \text{ m})(1440 \text{ N/m}) = 6480 \text{ N} = 6.48 \text{ kN}
$$
 Ans.

The line of action of \mathbf{F}_R passes through the *centroid C* of this triangle.
Hance Hence,

$$
\overline{x} = 9 \text{ m} - \frac{1}{3}(9 \text{ m}) = 6 \text{ m}
$$
Ans.

The results are shown in Fig. 4–50*c*.

NOTE: We may also view the resultant \mathbf{F}_R as *acting* through the control of the volume of the looding discrepance $\mathbf{F}_R = \mathbf{F}(\mathbf{x})$ in Fig. 4, 50g. **NOTE:** We may also view the resultant \mathbf{F}_R as *acting* through the *centroid* of the *volume* of the loading diagram $p = p(x)$ in Fig. 4–50*a*.
Hence \mathbf{F}_P intersects the *x*-*x* plane at the point (6 m 0) Eurther Hence \mathbf{F}_R intersects the *x*–*y* plane at the point (6 m, 0). Furthermore, the meanitude of \mathbf{F}_R is equal to the volume under the loading the magnitude of \mathbf{F}_R is equal to the volume under the loading diagram i.e. diagram; i.e.,

$$
F_R = V = \frac{1}{2}(7200 \text{ N/m}^2)(9 \text{ m})(0.2 \text{ m}) = 6.48 \text{ kN}
$$
 Ans.

(b)

Fig. 4–50

The granular material exerts the distributed loading on the beam as shown in Fig. 4–51*a*. Determine the magnitude and location of the equivalent resultant of this load.

SOLUTION

The area of the loading diagram is a *trapezoid*, and therefore the solution can be obtained directly from the area and centroid formulas for a trapezoid listed on the inside back cover. Since these formulas are not easily remembered, instead we will solve this problem by using "composite" areas. Here we will divide the trapezoidal loading into a rectangular and triangular loading as shown in Fig. 4–51*b*. The into a rectangular and triangular loading as shown in Fig. 4–51*b*. The 50 lb_{/ft}
magnitude of the force represented by each of these loadings is equal $\frac{1}{50 \text{ lb}}$ to its associated *area*,

$$
F_1 = \frac{1}{2}(9 \text{ ft})(50 \text{ lb/ft}) = 225 \text{ lb}
$$

$$
F_2 = (9 \text{ ft})(50 \text{ lb/ft}) = 450 \text{ lb}
$$

The lines of action of these parallel forces act through the *centroid* of their associated areas and therefore intersect the beam at

$$
\overline{x}_1 = \frac{1}{3}(9 \text{ ft}) = 3 \text{ ft}
$$

 $\overline{x}_2 = \frac{1}{2}(9 \text{ ft}) = 4.5 \text{ ft}$

The two parallel forces \mathbf{F}_1 and \mathbf{F}_2 can be reduced to a single resultant \mathbf{F}_R . The magnitude of \mathbf{F}_R is

$$
+\sqrt[k]{F_R} = \sqrt[5]{2F};
$$
 $F_R = 225 + 450 = 675 \text{ lb}$ *Ans.*

We can find the location of \mathbf{F}_R with reference to point *A*, Fig. 4–51*b* and *A*, 51*c*. We require and 4–51*c*. We require +

$$
\zeta + M_{R_A} = \Sigma M_A
$$
; $\overline{x}(675) = 3(225) + 4.5(450)$
 $\overline{x} = 4 \text{ ft}$

NOTE: The trapezoidal area in Fig. 4–51*a* can also be divided into two triangular areas as shown in Fig. 4–51*d*. In this case

$$
F_3 = \frac{1}{2}(9 \text{ ft})(100 \text{ lb/ft}) = 450 \text{ lb}
$$

$$
F_4 = \frac{1}{2}(9 \text{ ft})(50 \text{ lb/ft}) = 225 \text{ lb}
$$

and

$$
\overline{x}_3 = \frac{1}{3}(9 \text{ ft}) = 3 \text{ ft}
$$

 $\overline{x}_4 = 9 \text{ ft} - \frac{1}{3}(9 \text{ ft}) = 6 \text{ ft}$

NOTE: Using these results, show that again $F_R = 675$ lb and $\bar{x} = 4$ ft.

CHAPTER REVIEW

Moment of Force—Scalar Definition

A force produces a turning effect or moment about a point O that does no on its line of action. In scalar form, moment *magnitude* is the product of force and the moment arm perpendicular distance from point *Q* the line of action of the force.

The *direction* of the moment is defined using the right-hand rule. M_O always acts
along an axis perpendicular to the plane along an axis perpendicular to the pl containing \bf{F} and \bf{d} , and passes through the point *O*.

Rather than finding d , it is norm easier to resolve the force into its *x* and components, determine the momen each component about the point, then sum the results. This is called principle of moments.

Moment of a Force–Vector Definition

Since three-dimensional geometry generally more difficult to visualize, the vector cross product should be used to determine the moment. Here to determine the moment. Here $M_O = r \times F$, where **r** is a position vector
that extends from point O to any point that extends from point *O* to any point *A*, *B*, or *C* on the line of action of **F**.

If the position vector **r** and force **F** are expressed as Cartesian vectors, then the cross product results from the expansion of a determinant.

MO ⁼ Fd ⁼ Fxy - Fyx MO ⁼ Fd **F** *y O ^d ^x*

 $M_O = r_A \times F = r_B \times F = r_C \times F$

$$
\mathbf{M}_O = \mathbf{r} \times \mathbf{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ r_x & r_y & r_z \\ F_x & F_y & F_z \end{vmatrix}
$$

4

y

Moment about an Axis

If the moment of a force **F** is to be determined about an arbitrary axis *a*, then the projection of the moment onto the axis must be obtained. Provided the distance d_a that is perpendicular to *both* the line of action of the force and the axis can be found, then the moment of the force about the axis can be determined from a scalar equation.

Note that when the line of action of **F** intersects the axis then the moment of **F** about the axis is zero.Also, when the line of action of **F** is parallel to the axis, the moment of **F** about the axis is zero.

In three dimensions, the scalar triple product should be used. Here \mathbf{u}_a is the unit vector that specifies the direction of the axis, and **r** is a position vector that is directed from any point on the axis to any point on the line of action of the force. If M_a is calculated as a negative scalar, then the sense of direction of M_a is opposite to \mathbf{u}_a .

Couple Moment

A couple consists of two equal but opposite forces that act a perpendicular distance *d* apart. Couples tend to produce a rotation without translation.

The magnitude of the couple moment is The magnitude of the couple moment is $M = Fd$, and its direction is established using the right-hand rule.

If the vector cross product is used to determine the moment of a couple, then **r** extends from any point on the line of action of one of the forces to any point on the line of action of the other force **F** that is used in the cross product.

Simplification of a Force and Couple System

Any system of forces and couples can be reduced to a single resultant force and resultant couple moment acting at a point. The resultant force is the sum of point. The resultant force is the sum of
all the forces in the system, $\mathbf{F}_R = \Sigma \mathbf{F}$,
and the resultant couple moment is and the resultant couple moment is equal to the sum of all the moments of the forces about the point and couple moments. $M_{R_0} = \Sigma M_O + \Sigma M$.

Further simplification to a single resultant force is possible provided the force system is concurrent, coplanar, or parallel. To find the location of the resultant force from a point, it is necessary to equate the moment of the resultant force about the point to the moment of the forces and couples in the system about the same point.

If the resultant force and couple moment at a point are not perpendicular to one another, then this system can be reduced to a wrench, which consists of the resultant force and collinear couple moment.

Coplanar Distributed Loading

A simple distributed loading can be represented by its resultant force, which is equivalent to the *area* under the loading curve. This resultant has a line of action that passes through the *centroid* or geometric center of the area or volume under the loading diagram.

The crane is subjected to its weight and the load it supports. In order to calculate the support reactions on the crane, it is necessary to apply the principles of equilibrium.

[Equilibrium of a](#page-11-0) Rigid Body

5

[CHAPTER OBJECTIVES](#page-11-0)

- To develop the equations of equilibrium for a rigid body.
- To introduce the concept of the free-body diagram for a rigid body.
- To show how to solve rigid-body equilibrium problems using the equations of equilibrium.

5.1 [Conditions for Rigid-Body Equilibrium](#page-11-0)

In this section, we will develop both the necessary and sufficient conditions for the equilibrium of the rigid body in Fig. 5–1*a*. As shown, this body is subjected to an external force and couple moment system that is the result of the effects of gravitational, electrical, magnetic, or contact forces caused by adjacent bodies. The internal forces caused by interactions between particles within the body are not shown in this figure because these forces occur in equal but opposite collinear pairs and hence will cancel out, a consequence of Newton's third law.

Using the methods of the previous chapter, the force and couple moment system acting on a body can be reduced to an equivalent resultant force and resultant couple moment at any arbitrary point *O* on or off the body, Fig. 5–1*b*. If this resultant force and couple moment are both equal to zero, then the body is said to be in *equilibrium*. Mathematically, the equilibrium of a body is expressed as

$$
\mathbf{F}_R = \Sigma \mathbf{F} = \mathbf{0}
$$

$$
(\mathbf{M}_R)_O = \Sigma \mathbf{M}_O = \mathbf{0}
$$
 (5-1)

The first of these equations states that the sum of the forces acting on the body is equal to *zero*. The second equation states that the sum of the moments of all the forces in the system about point *O*, added to all the couple moments, is equal to *zero*. These two equations are not only necessary for equilibrium, they are also sufficient. To show this, consider summing moments about some other point, such as point *A* in Fig. 5–1*c*. We require

$$
\Sigma \mathbf{M}_A = \mathbf{r} \times \mathbf{F}_R + (\mathbf{M}_R)_O = \mathbf{0}
$$

Since $\mathbf{r} \neq \mathbf{0}$, this equation is satisfied only if Eqs. 5–1 are satisfied, Since $\mathbf{r} \neq \mathbf{0}$, this equation is namely $\mathbf{F}_R = \mathbf{0}$ and $(\mathbf{M}_R)_{\scriptstyle\text{O}} = \mathbf{0}$.

When applying the equations of equilibrium, we will assume that the body remains rigid. In reality, however, all bodies deform when subjected to loads. Although this is the case, most engineering materials such as steel and concrete are very rigid and so their deformation is usually very small. Therefore, when applying the equations of equilibrium, we can generally assume that the body will remain *rigid* and *not deform* under the applied load without introducing any significant error. This way the direction of the applied forces and their moment arms with respect to a fixed reference remain unchanged before and after the body is loaded.

EQUILIBRIUM IN TWO DIMENSIONS

Fig. 5–2

In the first part of the chapter, we will consider the case where the force system acting on a rigid body lies in or may be projected onto a *single* plane and, furthermore, any couple moments acting on the body are directed perpendicular to this plane.This type of force and couple system is often referred to as a two-dimensional or *coplanar* force system. For example, the airplane in Fig. 5–2 has a plane of symmetry through its center axis, and so the loads acting on the airplane are symmetrical with respect to this plane. Thus, each of the two wing tires will support the same load **T**, which is represented on the side (two-dimensional) view of the plane as 2**T**.

5.2 [Free-Body Diagrams](#page-11-0)

Successful application of the equations of equilibrium requires a complete specification of *all* the known and unknown external forces that act *on* the body. The best way to account for these forces is to draw a free-body diagram.This diagram is a sketch of the outlined shape of the body, which represents it as being *isolated* or "free" from its surroundings, i.e., a "free body." On this sketch it is necessary to show *all* the forces and couple moments that the surroundings exert *on the body* so that these effects can be accounted for when the equations of equilibrium are applied. *A thorough understanding of how to draw a free-body diagram is of primary importance for solving problems in mechanics*.

Support Reactions. Before presenting a formal procedure as to how to draw a free-body diagram, we will first consider the various types of reactions that occur at supports and points of contact between bodies subjected to coplanar force systems. As a general rule,

- If a support prevents the translation of a body in a given direction, then a force is developed on the body in that direction.
- If rotation is prevented, a couple moment is exerted on the body.

For example, let us consider three ways in which a horizontal member, such as a beam, is supported at its end. One method consists of a *roller* or cylinder, Fig. 5–3*a*. Since this support only prevents the beam from *translating* in the vertical direction, the roller will only exert a *force* on the beam in this direction, Fig. 5–3*b*.

The beam can be supported in a more restrictive manner by using a *pin,* Fig. 5–3*c*. The pin passes through a hole in the beam and two leaves which are fixed to the ground. Here the pin can prevent *translation* of the beam in *any direction* ϕ , Fig. 5–3*d*, and so the pin must exert a *force* **F** on the beam in this direction. For purposes of analysis, it is generally easier to represent this resultant force **F** by its two rectangular components \mathbf{F}_x and \mathbf{F}_y Fig. 5, 3e If F_y and F_y are known than F_y and ϕ can be calculated. **F**_y, Fig. 5–3*e*. If F_x and F_y are known, then *F* and ϕ can be calculated.
The most restrictive way to support the beam would be to use a

The most restrictive way to support the beam would be to use a *fixed support* as shown in Fig. 5–3*f*. This support will prevent both *translation and rotation* of the beam. To do this a *force and couple moment* must be developed on the beam at its point of connection, Fig. 5–3*g*. As in the case of the pin, the force is usually represented by its rectangular components \mathbf{F}_x and \mathbf{F}_y .
Table 5, 1 lists other

Table 5–1 lists other common types of supports for bodies subjected to coplanar force systems. (In all cases the angle θ is assumed to be known.) Carefully study each of the symbols used to represent these supports and the types of reactions they exert on their contacting members.

Fig. 5–3

5

Typical examples of actual supports are shown in the following sequence of photos. The numbers refer to the connection types in Table 5–1.

The cable exerts a force on the bracket in the direction of the cable. (1)

The rocker support for this bridge girder allows horizontal movement so the bridge is free to expand and contract due to a change in temperature. (5)

This utility building is pin supported at the top of the column. (8)

This concrete girder rests on the ledge that is assumed to act as a smooth contacting surface. (6)

The floor beams of this building are welded together and thus form fixed connections. (10)

Internal Forces. As stated in Sec. 5.1, the internal forces that act between adjacent particles in a body always occur in collinear pairs such that they have the same magnitude and act in opposite directions (Newton's third law). Since these forces cancel each other, they will not create an *external effect* on the body. It is for this reason that the internal forces should not be included on the free-body diagram if the entire body is to be considered. For example, the engine shown in Fig. 5–4*a* has a free-body diagram shown in Fig. 5–4*b*. The internal forces between all its connected parts such as the screws and bolts, will cancel out because they form equal and opposite collinear pairs. Only the external forces \mathbf{T}_1 and \mathbf{T}_2 , exerted by the chains and the engine weight **W**, are shown on the free-body diagram.

Weight and the Center of Gravity. When a body is within a gravitational field, then each of its particles has a specified weight. It was shown in Sec. 4.8 that such a system of forces can be reduced to a single resultant force acting through a specified point. We refer to this force resultant as the *weight* **W** of the body and to the location of its point of application as the *center of gravity*. The methods used for its determination will be developed in Chapter 9.

In the examples and problems that follow, if the weight of the body is important for the analysis, this force will be reported in the problem statement. Also, when the body is *uniform* or made from the same material, the center of gravity will be located at the body's *geometric center* or *centroid*; however, if the body consists of a nonuniform distribution of material, or has an unusual shape, then the location of its center of gravity *G* will be given.

Idealized Models. When an engineer performs a force analysis of any object, he or she considers a corresponding analytical or idealized model that gives results that approximate as closely as possible the actual situation. To do this, careful choices have to be made so that selection of the type of supports, the material behavior, and the object's dimensions can be justified. This way one can feel confident that any design or analysis will yield results which can be trusted. In complex

cases this process may require developing several different models of the object that must be analyzed. In any case, this selection process requires both skill and experience.

The following two cases illustrate what is required to develop a proper model. In Fig. 5–5*a*, the steel beam is to be used to support the three roof joists of a building. For a force analysis it is reasonable to assume the material (steel) is rigid since only very small deflections will occur when the beam is loaded. A bolted connection at *A* will allow for any slight rotation that occurs here when the load is applied, and so a *pin* can be considered for this support. At *B* a *roller* can be considered since this support offers no resistance to horizontal movement. Building code is used to specify the roof loading \vec{A} so that the joist loads \vec{F} can be calculated. These forces will be larger than any actual loading on the beam since they account for extreme loading cases and for dynamic or vibrational effects. Finally, the weight of the beam is generally neglected when it is small compared to the load the beam supports. The idealized model of the beam is therefore shown with average dimensions *a, b, c*, and *d* in Fig. 5–5*b*.

As a second case, consider the lift boom in Fig. 5–6*a*. By inspection, it is supported by a pin at *A* and by the hydraulic cylinder *BC*, which can be approximated as a weightless link. The material can be assumed rigid, and with its density known, the weight of the boom and the location of its center of gravity *G* are determined.When a design loading **P** is specified, the idealized model shown in Fig. 5–6*b* can be used for a force analysis. Average dimensions (not shown) are used to specify the location of the loads and the supports.

Idealized models of specific objects will be given in some of the examples throughout the text. It should be realized, however, that each case represents the reduction of a practical situation using simplifying assumptions like the ones illustrated here.

Fig. 5–6

(a)

Procedure for Analysis

To construct a free-body diagram for a rigid body or any group of bodies considered as a single system, the following steps should be performed:

Draw Outlined Shape.

Imagine the body to be *isolated* or cut "free" from its constraints and connections and draw (sketch) its outlined shape.

Show All Forces and Couple Moments.

Identify all the known and unknown *external forces* and couple moments that *act on the body*. Those generally encountered are due to (1) applied loadings, (2) reactions occurring at the supports or at points of contact with other bodies (see Table 5–1), and (3) the weight of the body. To account for all these effects, it may help to trace over the boundary, carefully noting each force or couple moment acting on it.

Identify Each Loading and Give Dimensions.

The forces and couple moments that are known should be labeled with their proper magnitudes and directions. Letters are used to represent the magnitudes and direction angles of forces and couple moments that are unknown. Establish an *x*, *y* coordinate system so that these unknowns, A_x , A_y , etc., can be identified. Finally, indicate
the dimensions of the body necessary for calculating the moments the dimensions of the body necessary for calculating the moments of forces.

Important Points

- No equilibrium problem should be solved without *first drawing the free-body diagram*, so as to account for all the forces and couple moments that act on the body.
- If a support *prevents translation* of a body in a particular direction, then the support exerts a *force* on the body in that direction.
- If *rotation is prevented*, then the support exerts a *couple moment* on the body.
- Study Table 5–1.
- Internal forces are never shown on the free-body diagram since they occur in equal but opposite collinear pairs and therefore cancel out.
- The weight of a body is an external force, and its effect is represented by a single resultant force acting through the body's center of gravity *G*.
- *Couple moments* can be placed anywhere on the free-body diagram since they are *free vectors. Forces* can act at any point along their lines of action since they are *sliding vectors*.

Draw the free-body diagram of the uniform beam shown in Fig. 5–7*a*. The beam has a mass of 100 kg.

SOLUTION

The free-body diagram of the beam is shown in Fig. 5–7*b*. Since the support at *A* is fixed, the wall exerts three reactions *on the beam*, denoted as \mathbf{A}_x , \mathbf{A}_y , and \mathbf{M}_A . The magnitudes of these reactions are *a*ximal their sense has been *assumed*. The weight of the beam *unknown*, and their sense has been *assumed*. The weight of the beam, unknown, and their sense has been *assumed*. The weight of the beam,
 $W = 100(9.81) N = 981 N$, acts through the beam's center of gravity
G which is 3 m from A since the beam is uniform *G*, which is 3 m from *A* since the beam is uniform.

Draw the free-body diagram of the foot lever shown in Fig. 5–8*a*. The operator applies a vertical force to the pedal so that the spring is stretched 1.5 in. and the force in the short link at *B* is 20 lb.

Fig. 5–8

SOLUTION

By inspection of the photo the lever is loosely bolted to the frame at *A*. The rod at *B* is pinned at its ends and acts as a "short link." After making the proper measurements, the idealized model of the lever is shown in Fig. 5–8*b*. From this, the free-body diagram is shown in Fig. 5–8*c*. The pin support at *A* exerts force components A_x and A_y on the lever. The link at *B* exerts a force of 20 lb, acting
in the direction of the link. In addition the spring also exerts a in the direction of the link. In addition the spring also exerts a horizontal force on the lever. If the stiffness is measured and found horizontal force on the lever. If the stiffness is measured and found
to be $k = 20$ lb/in., then since the stretch $s = 1.5$ in., using Eq. 3–2,
 $F = k s = 20$ lb/in. $(1.5 \text{ in.}) = 30$ lb. Finally, the operator's shoe to be $k = 20$ lb/in., then since the stretch $s = 1.5$ in., using Eq. 3–2,
 $F_s = ks = 20$ lb/in. (1.5 in.) = 30 lb. Finally, the operator's shoe applies a vertical force of **F** on the pedal. The dimensions of the lever are also shown on the free-body diagram, since this information will be useful when computing the moments of the forces. As usual, the senses of the unknown forces at *A* have been assumed. The correct senses will become apparent after solving the equilibrium equations.

Two smooth pipes, each having a mass of 300 kg, are supported by the forked tines of the tractor in Fig. 5–9*a*. Draw the free-body diagrams for each pipe and both pipes together.

SOLUTION

The idealized model from which we must draw the free-body diagrams is shown in Fig. 5–9*b*. Here the pipes are identified, the dimensions have been added, and the physical situation reduced to its simplest form.

The free-body diagram for pipe *A* is shown in Fig. 5–9*c*. Its weight is The free-body diagram for pipe A is shown in Fig. 5–9c. Its weight is
 $W = 300(9.81) N = 2943 N$. Assuming all contacting surfaces are

smooth the reactive forces **T F R** act in a direction normal to the *smooth*, the reactive forces **T**, **F**, **R** act in a direction *normal* to the tangent at their surfaces of contact.

The free-body diagram of pipe *B* is shown in Fig. 5–9*d*. Can you identify each of the three forces acting *on this pipe*? In particular, note that **R**, representing the force of *A* on *B*, Fig. 5–9*d*, is equal and opposite to **R** representing the force of *B* on *A*, Fig. 5–9*c*. This is a consequence of Newton's third law of motion.

The free-body diagram of both pipes combined ("system") is shown in Fig. 5–9*e*. Here the contact force **R**, which acts between *A* and *B*, is considered as an *internal* force and hence is not shown on the freebody diagram. That is, it represents a pair of equal but opposite collinear forces which cancel each other.

Draw the free-body diagram of the unloaded platform that is suspended off the edge of the oil rig shown in Fig. 5–10*a*.The platform has a mass of 200 kg.

Fig. 5–10

SOLUTION

The idealized model of the platform will be considered in two dimensions because by observation the loading and the dimensions are all symmetrical about a vertical plane passing through its center, Fig. 5–10*b*.The connection at *A* is considered to be a pin, and the cable supports the platform at *B*. The direction of the cable and average dimensions of the platform are listed, and the center of gravity *G* has been determined. It is from this model that we have drawn the free-body diagram shown in Fig. 5–10*c*. The platform's weight is free-body diagram shown in Fig. 5–10c. The platform's weight is
200(9.81) = 1962 N. The force components \mathbf{A}_x and \mathbf{A}_y along with the
cable force **T** represent the reactions that both pipe and both cables cable force **T** represent the reactions that *both* pins and *both* cables exert on the platform, Fig. 5–10*a*. Consequently, after the solution for these reactions, half their magnitude is developed at *A* and half is developed at *B*.

PROBLEMS

•5–1. Draw the free-body diagram of the 50-kg paper roll which has a center of mass at *G* and rests on the smooth blade of the paper hauler. Explain the significance of each force acting on the diagram. (See Fig. 5–7*b*.)

5–2. Draw the free-body diagram of member *AB*, which is supported by a roller at *A* and a pin at *B*. Explain the significance of each force on the diagram. (See Fig. 5–7*b*.)

Prob. 5–2

5–3. Draw the free-body diagram of the dumpster *D* of the truck, which has a weight of 5000 lb and a center of gravity at *G*. It is supported by a pin at *A* and a pin-connected hydraulic cylinder *BC* (short link). Explain the significance of each force on the diagram. (See Fig. 5–7*b*.)

Prob. 5–3

***5–4.** Draw the free-body diagram of the beam which supports the 80-kg load and is supported by the pin at *A* and a cable which wraps around the pulley at *D*. Explain the significance of each force on the diagram. (See Fig. 5–7*b*.)

•5–5. Draw the free-body diagram of the truss that is supported by the cable *AB* and pin *C*. Explain the significance of each force acting on the diagram. (See Fig. 5–7*b*.)

Prob. 5–5

5–6. Draw the free-body diagram of the crane boom *AB* which has a weight of 650 lb and center of gravity at *G*. The boom is supported by a pin at *A* and cable *BC*. The load of 1250 lb is suspended from a cable attached at *B*. Explain the significance of each force acting on the diagram. (See Fig. 5–7*b*.)

Prob. 5–6

5–7. Draw the free-body diagram of the "spanner wrench" subjected to the 20-lb force. The support at *A* can be considered a pin, and the surface of contact at *B* is smooth. Explain the significance of each force on the diagram. (See Fig. 5–7*b*.)

***5–8.** Draw the free-body diagram of member *ABC* which is supported by a smooth collar at *A*, roller at *B*, and short link *CD*. Explain the significance of each force acting on the diagram. (See Fig. 5–7*b*.)

•5–9. Draw the free-body diagram of the bar, which has a negligible thickness and smooth points of contact at *A*, *B*, and *C*. Explain the significance of each force on the diagram. (See Fig. 5–7*b*.)

Prob. 5–9

5–10. Draw the free-body diagram of the winch, which consists of a drum of radius 4 in. It is pin-connected at its center *C*, and at its outer rim is a ratchet gear having a mean radius of 6 in. The pawl *AB* serves as a two-force member (short link) and prevents the drum from rotating. Explain the significance of each force on the diagram. (See Fig. 5–7*b*.)

Prob. 5–10

CONCEPTUAL PROBLEMS

P5–1. Draw the free-body diagram of the uniform trash bucket which has a significant weight. It is pinned at *A* and rests against the smooth horizontal member at *B*. Show your result in side view. Label any necessary dimensions.

P5–1

P5–3. Draw the free-body diagram of the wing on the passenger plane. The weights of the engine and wing are

P5–3

P5–2. Draw the free-body diagram of the outrigger *ABC* used to support a backhoe. The top pin *B* is connected to the hydraulic cylinder, which can be considered to be a short link (two-force member), the bearing shoe at *A* is smooth, and the outrigger is pinned to the frame at *C*.

***P5–4.** Draw the free-body diagram of the wheel and member *ABC* used as part of the landing gear on a jet plane. The hydraulic cylinder *AD* acts as a two-force member, and there is a pin connection at *B*.

P5–4

F*R*

5.3 [Equations of Equilibrium](#page-11-0)

In Sec. 5.1 we developed the two equations which are both necessary and In Sec. 5.1 we developed the two equations which are both necessary and sufficient for the equilibrium of a rigid body, namely, $\Sigma \mathbf{F} = \mathbf{0}$ and fficient for the equilibrium of a rigid body, namely, $\Sigma \mathbf{F} = \mathbf{0}$ and $\mathbf{M}_O = \mathbf{0}$. When the body is subjected to a system of forces, which all lie the x y plane then the forces can be resolved into their x and in the *x*–*y* plane, then the forces can be resolved into their *x* and *y* components. Consequently, the conditions for equilibrium in two dimensions are

$$
\Sigma F_x = 0
$$

\n
$$
\Sigma F_y = 0
$$

\n
$$
\Sigma M_O = 0
$$
\n(5-2)

Here ΣF_x and ΣF_y represent, respectively, the algebraic sums of the *x* and *y* components of all the forces acting on the body and ΣM and *y* components of all the forces acting on the body, and ΣM_O represents the algebraic sum of the couple moments and the moments of all the force components about the *z* axis, which is perpendicular to the *x–y* plane and passes through the arbitrary point *O*.

Alternative Sets of Equilibrium Equations. Although Eqs. 5–2 are *most often* used for solving coplanar equilibrium problems, two *alternative* sets of three independent equilibrium equations may also be used. One such set is

$$
\Sigma F_x = 0
$$

\n
$$
\Sigma M_A = 0
$$

\n
$$
\Sigma M_B = 0
$$
\n(5-3)

When using these equations it is required that a line passing through points *A* and *B* is *not parallel* to the *y* axis.To prove that Eqs. 5–3 provide the *conditions* for equilibrium, consider the free-body diagram of the plate shown in Fig. 5–11*a*. Using the methods of Sec. 4.8, all the forces on the free-body diagram may be replaced by an equivalent resultant force the free-body diagram may be replaced by an equivalent resultant force
 $\mathbf{F}_R = \Sigma \mathbf{F}$, acting at point *A*, and a resultant couple moment
 $\mathbf{M} = \Sigma \mathbf{M}$. Fig. 5, 11b, If $\Sigma M = 0$ is estisfied, it is necessary tha $\mathbf{F}_R = \Sigma \mathbf{F}$, acting at point *A*, and a resultant couple moment $\mathbf{M}_{R_A} = \Sigma \mathbf{M}_A$, Fig. 5–11*b*. If $\Sigma M_A = 0$ is satisfied, it is necessary that $\mathbf{M}_{R_A} = 0$ Eurthermore in order that \mathbf{F}_R satisfy $\Sigma F =$ $M_{R_A} = \Sigma M_A$, Fig. 5–11*b*. If $\Sigma M_A = 0$ is satisfied, it is necessary that $M_{R_A} = 0$. Furthermore, in order that \mathbf{F}_R satisfy $\Sigma F_x = 0$, it must have *no* component along the *x* axis and therefore \mathbf{F}_R must b *component* along the *x* axis, and therefore \mathbf{F}_R must be parallel to the *y* axis, Fig. 5–11*c*. Finally, if it is required that $\Sigma M_B = 0$, where *B* does not lie on the line of action of \mathbf{F}_R , then $\mathbf{F}_R =$ axis, Fig. 5–11*c*. Finally, if it is required that $\Sigma M_B = 0$, where *B* does not axis, Fig. 5–11*c*. Finally, if it is required that $\Sigma M_B = 0$, where *B* does not lie on the line of action of \mathbf{F}_R , then $\mathbf{F}_R = 0$. Since Eqs. 5–3 show that both of those resultants are zero, indeed the hody in F of these resultants are zero, indeed the body in Fig. 5–11*a* must be in equilibrium.

A second alternative set of equilibrium equations is

$$
\Sigma M_A = 0
$$

\n
$$
\Sigma M_B = 0
$$

\n
$$
\Sigma M_C = 0
$$
\n(5-4)

Here it is necessary that points *A, B*, and *C* do not lie on the same line.To prove that these equations, when satisfied, ensure equilibrium, consider ©prove that these equations, when satisfied, ensure equilibrium, consider
again the free-body diagram in Fig. 5–11*b*. If $\Sigma M_A = 0$ is to be satisfied,
then $\mathbf{M}_D = 0$ $\Sigma M_C = 0$ is satisfied if the line of action of \mathbf again the free-body diagram in Fig. 5–11*b*. If $\Sigma M_A = 0$ is to be satisfied, then $\mathbf{M}_{R_A} = \mathbf{0}$. $\Sigma M_C = 0$ is satisfied if the line of action of \mathbf{F}_R passes through point C as shown in Fig. 5–11*c*. Finally if through point *C* as shown in Fig. 5–11*c*. Finally, if we require it is necessary that $\mathbf{F}_R = \mathbf{0}$, and so the plate in Fig. 5–11*a* must equilibrium it is necessary that $F_R = 0$, and so the plate in Fig. 5–11*a* must then be in equilibrium. N_R passes
 $M_B = 0$,
nen be in

Procedure for Analysis

Coplanar force equilibrium problems for a rigid body can be solved using the following procedure.

Free-Body Diagram.

- Establish the *x, y* coordinate axes in any suitable orientation.
- Draw an outlined shape of the body.
- Show all the forces and couple moments acting on the body.
- Label all the loadings and specify their directions relative to the *x* or *y* axis. The sense of a force or couple moment having an *unknown* magnitude but known line of action can be *assumed*.
- Indicate the dimensions of the body necessary for computing the moments of forces.

Equations of Equilibrium.

- Apply the moment equation of equilibrium, $\sum M_O = 0$, about a
noint (O) that lies at the intersection of the lines of action of two point (*O*) that lies at the intersection of the lines of action of two unknown forces. In this way, the moments of these unknowns are zero about *O*, and a *direct solution* for the third unknown can be determined.
- When applying the force equilibrium equations, $\Sigma F_x = 0$ and $\Sigma F_x = 0$ orient the x and y axes along lines that will provide the Then applying the force equilibrium equations, $\Sigma F_x = 0$ and $F_y = 0$, orient the *x* and *y* axes along lines that will provide the molest resolution of the forces into their *x* and *y* components simplest resolution of the forces into their *x* and *y* components.
- If the solution of the equilibrium equations yields a negative scalar for a force or couple moment magnitude, this indicates that the sense is opposite to that which was assumed on the free-body diagram.

Determine the horizontal and vertical components of reaction on the beam caused by the pin at *B* and the rocker at *A* as shown in Fig. $5-12a$. Neglect the weight of the beam.

y

SOLUTION

Free-Body Diagram. Identify each of the forces shown on the freebody diagram of the beam, Fig. 5–12*b*. (See Example 5.1.) For simplicity, the 600-N force is represented by its *x* and *y* components as shown in Fig. 5–12*b*.

Equations of Equilibrium. Summing forces in the *x* direction yields
\n
$$
\Rightarrow \Sigma F_x = 0; \qquad 600 \cos 45^\circ \text{ N} - B_x = 0
$$
\n
$$
B_x = 424 \text{ N} \qquad \qquad \text{Ans.}
$$

A direct solution for \mathbf{A}_y can be obtained by applying the moment
equation $\sum M_y = 0$ about point B A direct solution for \mathbf{A}_y can be equation $\Sigma M_B = 0$ about point *B*.

 $\zeta + \Sigma$ *Ans.* $A_v = 319 \text{ N}$ $M_B = 0;$ 100 N(2 m) + (600 sin 45° N)(5 m) $- (600 \cos 45^\circ \text{ N})(0.2 \text{ m}) - A_y(7 \text{ m}) = 0$

Summing forces in the *y* direction, using this result, gives

$$
+ \hat{\Gamma} \Sigma F_y = 0; \qquad 319 \text{ N} - 600 \sin 45^\circ \text{ N} - 100 \text{ N} - 200 \text{ N} + B_y = 0
$$

$$
B_y = 405 \text{ N} \qquad \qquad \text{Ans.}
$$

NOTE: We can check this result by summing moments about point A.
\n
$$
\zeta + \Sigma M_A = 0;
$$
 $-(600 \sin 45^\circ N)(2 m) - (600 \cos 45^\circ N)(0.2 m)$
\n $-(100 N)(5 m) - (200 N)(7 m) + B_y(7 m) = 0$
\n $B_y = 405 N$

The cord shown in Fig. 5–13*a* supports a force of 100 lb and wraps over the frictionless pulley. Determine the tension in the cord at *C* and the horizontal and vertical components of reaction at pin *A*.

SOLUTION

Free-Body Diagrams. The free-body diagrams of the cord and pulley are shown in Fig. 5–13*b*. Note that the principle of action, equal but opposite reaction must be carefully observed when drawing each of these diagrams: the cord exerts an unknown load distribution *p* on the pulley at the contact surface, whereas the pulley exerts an equal but opposite effect on the cord. For the solution, however, it is simpler to *combine* the free-body diagrams of the pulley and this portion of the cord, so that the distributed load becomes *internal* to this "system" and is therefore eliminated from the analysis, Fig. 5–13*c*.

Equations of Equilibrium. Summing moments about point *A* to

eliminate
$$
\mathbf{A}_x
$$
 and \mathbf{A}_y , Fig. 5-13*c*, we have
\n $\zeta + \Sigma M_A = 0;$ 100 lb (0.5 ft) - T(0.5 ft) = 0
\n $T = 100$ lb

Using the result,

 $A_x = 50.0$ lb $\Rightarrow \Sigma F_x = 0;$ $-A_x + 100 \sin 30^\circ \, \text{lb} = 0$

$$
+\hat{\Gamma}\Sigma F_y = 0;
$$
 $A_y - 100 \text{ lb} - 100 \cos 30^\circ \text{ lb} = 0$
 $A_y = 187 \text{ lb}$

NOTE: It is seen that the tension remains *constant* as the cord passes over the pulley. (This of course is true for *any angle* θ at which the cord is directed and for *any radius r* of the pulley.)

Ans.

Ans.

The member shown in Fig. 5–14*a* is pin-connected at *A* and rests against a smooth support at *B*. Determine the horizontal and vertical components of reaction at the pin *A*.

SOLUTION

Free-Body Diagram. As shown in Fig. 5–14*b*, the reaction N_B is
perpendicular to the member at B. Also, horizontal and vertical perpendicular to the member at *B*. Also, horizontal and vertical components of reaction are represented at *A.*

Equations of Equilibrium. Summing moments about *A*, we obtain a direct solution for N_B ,
 $(1+\sum M_A = 0)$ -90

a NB ⁼ 200 N MA ⁼ 0; -90 N # ^m - 60 N11 m² ⁺ NB10.75 m² ⁼ ⁰

Using this result,

Using this result,
\n
$$
\Rightarrow \Sigma F_x = 0; \qquad A_x - 200 \sin 30^\circ \text{ N} = 0
$$
\n
$$
A_x = 100 \text{ N} \qquad \qquad \text{Ans.}
$$
\n
$$
+\hat{\Gamma} \Sigma F_y = 0; \qquad A_y - 200 \cos 30^\circ \text{ N} - 60 \text{ N} = 0

5

$EXAMPLE$ 5.8

The box wrench in Fig. 5–15*a* is used to tighten the bolt at *A*. If the wrench does not turn when the load is applied to the handle, determine the torque or moment applied to the bolt and the force of the wrench on the bolt.

SOLUTION

Free-Body Diagram. The free-body diagram for the wrench is shown in Fig. 5–15*b*. Since the bolt acts as a "fixed support," it exerts force components \mathbf{A}_x and \mathbf{A}_y and a moment \mathbf{M}_A on the wrench at A.

Equations of Equilibrium.

$$
\Rightarrow \Sigma F_x = 0; \qquad A_x - 52(\frac{5}{13})N + 30 \cos 60^\circ N = 0
$$

$$
A_x = 5.00 N \qquad \text{Ans.}
$$

$$
+ \uparrow \Sigma F_y = 0; \qquad A_y - 52 \left(\frac{12}{13}\right) N - 30 \sin 60^\circ N = 0
$$

$$
A_y = 74.0 N \qquad \qquad \text{Ans.}
$$

$$
\zeta + \Sigma M_A = 0; M_A - [52(\frac{12}{13}) N] (0.3 m) - (30 \sin 60^\circ N)(0.7 m) = 0
$$

$$
M_A = 32.6 N \cdot m
$$
Ans.

Note that M_A must be *included* in this moment summation. This couple moment is a free vector and represents the twisting resistance couple moment is a free vector and represents the twisting resistance of the bolt on the wrench. By Newton's third law, the wrench exerts an equal but opposite moment or torque on the bolt. Furthermore, the resultant force on the wrench is

$$
F_A = \sqrt{(5.00)^2 + (74.0)^2} = 74.1 \text{ N}
$$
Ans.

NOTE: Although only *three* independent equilibrium equations can be written for a rigid body, it is a good practice to *check* the calculations using a fourth equilibrium equation. For example, the above computations may be verified in part by summing moments about point *C*:

about point C:
\n
$$
\zeta + \Sigma M_C = 0
$$
; $[52(\frac{12}{13})N] (0.4 m) + 32.6 N \cdot m - 74.0 N(0.7 m) = 0$
\n19.2 N·m + 32.6 N·m - 51.8 N·m = 0

Determine the horizontal and vertical components of reaction on the member at the pin *A*, and the normal reaction at the roller *B* in Fig. 5–16*a*.

SOLUTION

Free-Body Diagram. The free-body diagram is shown in Fig. 5–16*b*. The pin at A exerts two components of reaction on the member, \mathbf{A}_x and \mathbf{A}_v .

Fig. 5–16

Equations of Equilibrium. The reaction N_B can be obtained *directly* by summing moments about point A since A_x and A_y produce no moment about *A*.

$$
\zeta + \Sigma M_A = 0;
$$

\n $[N_B \cos 30^\circ](6 \text{ ft}) - [N_B \sin 30^\circ](2 \text{ ft}) - 750 \text{ lb}(3 \text{ ft}) = 0$
\n $N_B = 536.2 \text{ lb} = 536 \text{ lb}$ *Ans.*

Using this result,

Using this result,
\n
$$
\Rightarrow \sum F_x = 0;
$$
 $A_x - (536.2 \text{ lb}) \sin 30^\circ = 0$
\n $A_x = 268 \text{ lb}$
\n $+ \uparrow \sum F_y = 0;$ $A_y + (536.2 \text{ lb}) \cos 30^\circ - 750 \text{ lb} = 0$
\n $A_y = 286 \text{ lb}$
\nAns.

The uniform smooth rod shown in Fig. 5–17*a* is subjected to a force and couple moment. If the rod is supported at *A* by a smooth wall and at *B* and *C* either at the top or bottom by rollers, determine the reactions at these supports. Neglect the weight of the rod.

SOLUTION

Free-Body Diagram. As shown in Fig. 5–17*b*, all the support reactions act normal to the surfaces of contact since these surfaces are smooth. The reactions at *B* and *C* are shown acting in the positive v' direction. This assumes that only the rollers located on the bottom of the rod are used for support.

Equations of Equilibrium. Using the *x, y* coordinate system in Fig. 5–17*b*, we have

Fig. 5–17*b*, we have
\n
$$
\Rightarrow \Sigma F_x = 0; \quad C_{y'} \sin 30^\circ + B_{y'} \sin 30^\circ - A_x = 0
$$
\n(1)

$$
Z_{1x} = 0, \quad C_{y'} \sin 30^\circ + B_{y'} \sin 30^\circ \quad A_x = 0 \tag{1}
$$

+ \uparrow $\Sigma F_y = 0; \quad -300 \text{ N} + C_{y'} \cos 30^\circ + B_{y'} \cos 30^\circ = 0 \tag{2}$

$$
+ \hat{\Gamma} \Sigma F_y = 0; \quad -300 \text{ N} + C_{y'} \cos 30^\circ + B_{y'} \cos 30^\circ = 0 \tag{2}
$$

$$
\zeta + \Sigma M_A = 0; \quad -B_{y'} (2 \text{ m}) + 4000 \text{ N} \cdot \text{m} - C_{y'} (6 \text{ m})
$$

$$
+ (300 \cos 30^\circ \text{ N}) (8 \text{ m}) = 0 \tag{3}
$$

When writing the moment equation, it should be noted that the line of action of the force component 300 sin 30° N passes through point *A*, and therefore this force is not included in the moment equation.

Solving Eqs. 2 and 3 simultaneously, we obtain
 $B_{y'} = -1000.0 \text{ N} = -1 \text{ kN}$

$$
B_{v'} = -1000.0 \text{ N} = -1 \text{ kN} \qquad \qquad \text{Ans.}
$$

$$
C_{y'} = 1346.4 \text{ N} = 1.35 \text{ kN}
$$
Ans. Ans.

Since $B_{y'}$ is a negative scalar, the sense of $\mathbf{B}_{y'}$ is opposite to that shown
on the free-body diagram in Fig. 5–17b. Therefore, the top roller at B on the free-body diagram in Fig. 5–17*b*. Therefore, the top roller at *B* serves as the support rather than the bottom one. Retaining the negative $B_{y'}$

sign for
$$
B_y
$$
 (Why?) and substituting the results into Eq. 1, we obtain
1346.4 sin 30° N + (-1000.0 sin 30° N) - $A_x = 0$
 $A_x = 173$ N
Ans.

5

(a)

The uniform truck ramp shown in Fig. 5–18*a* has a weight of 400 lb and is pinned to the body of the truck at each side and held in the position shown by the two side cables. Determine the tension in the cables.

SOLUTION

The idealized model of the ramp, which indicates all necessary dimensions and supports, is shown in Fig. 5–18*b*. Here the center of gravity is located at the midpoint since the ramp is considered to be uniform.

Free-Body Diagram. Working from the idealized model, the ramp's free-body diagram is shown in Fig. 5–18*c*.

Equations of Equilibrium. Summing moments about point *A* will yield a direct solution for the cable tension. Using the principle of moments, there are several ways of determining the moment of **T** about *A*. If we use *x* and *y* components, with **T** applied at *B*, we have

 $\zeta + \sum M_A = 0;$ $-T \cos 20^\circ (7 \sin 30^\circ \text{ ft}) + T \sin 20^\circ (7 \cos 30^\circ \text{ ft})$

 $+400$ lb $(5 \cos 30^\circ \text{ ft}) = 0$

$$
T = 1425 \text{ lb}
$$

The simplest way to determine the moment of **T** about *A* is to resolve it into components along and perpendicular to the ramp at *B*.Then the moment of the component along the ramp will be zero about *A*, so that

$$
\zeta + \Sigma M_A = 0;
$$
 $-T \sin 10^\circ (7 \text{ ft}) + 400 \text{ lb } (5 \cos 30^\circ \text{ ft}) = 0$
 $T = 1425 \text{ lb}$

Since there are two cables supporting the ramp,

$$
T' = \frac{T}{2} = 712 \text{ lb}
$$
Ans.

NOTE: As an exercise, show that $A_x = 1339$ lb and $A_y = 887.4$ lb.

Determine the support reactions on the member in Fig. 5–19*a*. The collar at *A* is fixed to the member and can slide vertically along the vertical shaft.

SOLUTION

Free-Body Diagram. The free-body diagram of the member is shown in Fig. 5–19 b . The collar exerts a horizontal force \mathbf{A}_x and moment \mathbf{M}_A on the member. The reaction N_B of the roller on the member is vertical.

Equations of Equilibrium. The forces A_x and N_B can be determined

The moment M_A can be determined by summing moments either about point *A* or point *B*.

$$
\zeta + \Sigma M_A = 0;
$$

\n
$$
M_A - 900 \text{ N}(1.5 \text{ m}) - 500 \text{ N} \cdot \text{m} + 900 \text{ N} [3 \text{ m} + (1 \text{ m}) \cos 45^\circ] = 0
$$

\n
$$
M_A = -1486 \text{ N} \cdot \text{m} = 1.49 \text{ kN} \cdot \text{m} \rangle
$$
 Ans.

or

 $\zeta + \sum M_B = 0$; $M_A + 900 \text{ N} [1.5 \text{ m} + (1 \text{ m}) \cos 4$
 $M_A = -1486 \text{ N} \cdot \text{m} = 1.49 \text{ kN} \cdot \text{m}$ $+ \Sigma M_B = 0$; $M_A + 900 \text{ N} [1.5 \text{ m} + (1 \text{ m}) \cos 45^\circ] - 500 \text{ N} \cdot \text{m} = 0$

$$
M_A = -1486 \text{ N} \cdot \text{m} = 1.49 \text{ kN} \cdot \text{m} \sqrt{3} \qquad \qquad \text{Ans.}
$$

The negative sign indicates that M_A has the opposite sense of rotation to that shown on the free-body diagram.

The bucket link *AB* on the back-hoe is a typical example of a two-force member since it is pin connected at its ends and, provided its weight is neglected, no other force acts on this member.

The link used for this railroad car brake is a three-force member. Since the force \mathbf{F}_B in the tie rod at *B* and \mathbf{F}_C from the link at *C* are parallel then for link at *C* are parallel, then for equilibrium the resultant force \mathbf{F}_A at the
F_A must also be parallel with these pin *A* must also be parallel with these two forces.

The boom on this lift is a three-force member, provided its weight is neglected. Here the lines of action of the weight of the worker, **W**, and the force of the two-force member (hydraulic cylinder) at *B*, \mathbf{F}_B ,
intercect at *O* For moment equilibrium the intersect at *O*. For moment equilibrium, the resultant force at the pin A , \mathbf{F}_A , must also
be directed towards Ω be directed towards *O*.

5.4 [Two- and Three-Force Members](#page-11-0)

The solutions to some equilibrium problems can be simplified by recognizing members that are subjected to only two or three forces.

Two-Force Members As the name implies, a *two-force member* has forces applied at only two points on the member. An example of a twoforce member is shown in Fig. $5-20a$. To satisfy force equilibrium, \mathbf{F}_A and \mathbf{F}_B must be equal in magnitude, $F_A = F_B = F$, but opposite in direction ($\Sigma \mathbf{F} = \mathbf{0}$), Fig. 5–20*b*. Furthermore, moment equilibrium requires that \mathbf{F}_A $(\Sigma \mathbf{F} = \mathbf{0})$, Fig. 5–20*b*. Furthermore, moment equilibrium requires that \mathbf{F}_A and \mathbf{F}_B share the same line of action, which can only happen if they are and \mathbf{F}_B share the same line of action, which can only happen if they are directed along the line joining points *A* and *B* ($\Sigma \mathbf{M}_A = \mathbf{0}$ or $\Sigma \mathbf{M}_B = \mathbf{0}$), Fig. 5–20*c*. Therefore, for any two-force member to be in equilibrium, the two forces acting on the member *must have the same magnitude, act in opposite directions, and have the same line of action, directed along the line joining the two points where these forces act.* force member is shown in Fig. 5–20*a*. To satisfy \mathbf{F}_B must be equal in magnitude, $F_A = F_B = F_B$

Three-Force Members If a member is subjected to only *three forces*, it is called a *three-force member*. Moment equilibrium can be satisfied only if the three forces form a *concurrent* or *parallel* force system. To illustrate, consider the member subjected to the three forces \mathbf{F}_1 , \mathbf{F}_2 , and \mathbf{F}_3 , shown in Fig. 5–21*a*. If the lines of action of \mathbf{F}_1 and \mathbf{F}_2 intersect at point *O*, then the line of action of \mathbf{F}_3 must *also* pass through intersect at point *O*, then the line of action of \mathbf{F}_3 must *also* pass through point *O* so that the forces satisfy $\Sigma \mathbf{M}_O = 0$. As a special case, if the three forces are all parallel, Fig. 5–21*b*, the location of the point of intersection, *O,* will approach infinity.

The lever *ABC* is pin supported at *A* and connected to a short link *BD* as shown in Fig. 5–22*a*. If the weight of the members is negligible, determine the force of the pin on the lever at *A*.

SOLUTION

Free-Body Diagrams. As shown in Fig. 5–22*b*, the short link *BD* is a *two-force member*, so the *resultant forces* at pins *D* and *B* must be equal, opposite, and collinear. Although the magnitude of the force is unknown, the line of action is known since it passes through *B* and *D*.

Lever *ABC* is a *three-force member*, and therefore, in order to satisfy moment equilibrium, the three nonparallel forces acting on it must be concurrent at *O*, Fig. 5–22*c*. In particular, note that the force **F** on the lever at *B* is equal but opposite to the force **F** acting at *B* on the link. Why? The distance *CO* must be 0.5 m since the lines of action of **F** and the 400-N force are known.

Equations of Equilibrium. By requiring the force system to be concurrent at O, since $\Sigma M_O = 0$, the angle θ which defines the line of action of **F**, can be determined from trigonometry concurrent at *O*, since $\Sigma M_O = 0$, the angle θ which defines the line of action of \mathbf{F}_A can be determined from trigonometry,

$$
\theta = \tan^{-1}\!\left(\frac{0.7}{0.4}\right) = 60.3^{\circ}
$$

Using the *x*, *y* axes and applying the force equilibrium equations,

 $+\uparrow \Sigma F_y = 0;$ $F_A \sin 60.3^\circ - F \sin 45^\circ = 0$ $\Rightarrow \sum F_x = 0;$ $F_A \cos 60.3^\circ - F \cos 45^\circ + 400 \text{ N} = 0$

Solving, we get

$$
F_A = 1.07 \text{ kN}
$$

$$
F = 1.32 \text{ kN}
$$

Ans.

NOTE: We can also solve this problem by representing the force at *A* **NOTE:** We can also solve this problem by representing the force at A by its two components \mathbf{A}_x and \mathbf{A}_y and applying $\Sigma M_A = 0$, $\Sigma F_x = 0$, $\Sigma F = 0$ to the lever. Once A and A are determined we can get F. *t* its two components \mathbf{A}_x and \mathbf{A}_y and applying $\Sigma M_A = 0$, $\Sigma F_x = 0$, $F_y = 0$ to the lever. Once A_x and A_y are determined, we can get F_A and θ .

FUNDAMENTAL PROBLEMS

All problem solutions must include an FBD.

F5–1. Determine the horizontal and vertical components of reaction at the supports. Neglect the thickness of the beam.

F5–1

F5–2. Determine the horizontal and vertical components of reaction at the pin *A* and the reaction on the beam at *C*.

F5–3. The truss is supported by a pin at *A* and a roller at *B*. Determine the support reactions.

$$
F5-3
$$

F5–4. Determine the components of reaction at the fixed support *A*. Neglect the thickness of the beam.

F5–4

F5–5. The 25-kg bar has a center of mass at *G*. If it is supported by a smooth peg at *C*, a roller at *A*, and cord *AB*, determine the reactions at these supports.

F5–6. Determine the reactions at the smooth contact points *A*, *B*, and *C* on the bar.

PROBLEMS

All problem solutions must include an FBD.

5–11. Determine the normal reactions at *A* and *B* in Prob. 5–1.

***5–12.** Determine the tension in the cord and the horizontal and vertical components of reaction at support *A* of the beam in Prob. 5–4.

•5–13. Determine the horizontal and vertical components of reaction at *C* and the tension in the cable *AB* for the truss in Prob. 5–5.

5–14. Determine the horizontal and vertical components of reaction at *A* and the tension in cable *BC* on the boom in Prob. 5–6.

5–15. Determine the horizontal and vertical components of reaction at *A* and the normal reaction at *B* on the spanner wrench in Prob. 5–7.

***5–16.** Determine the normal reactions at *A* and *B* and the force in link *CD* acting on the member in Prob. 5–8.

•5–17. Determine the normal reactions at the points of contact at *A*, *B*, and *C* of the bar in Prob. 5–9.

5–18. Determine the horizontal and vertical components of reaction at pin *C* and the force in the pawl of the winch in Prob. 5–10.

5–19. Compare the force exerted on the toe and heel of a 120-lb woman when she is wearing regular shoes and stiletto heels. Assume all her weight is placed on one foot and the reactions occur at points *A* and *B* as shown.

***5–20.** The train car has a weight of 24 000 lb and a center of gravity at *G*.It is suspended from its front and rear on the track by six tires located at *A*, *B*, and *C*. Determine the normal reactions on these tires if the track is assumed to be a smooth surface and an equal portion of the load is supported at both the front and rear tires.

•5–21. Determine the horizontal and vertical components of reaction at the pin *A* and the tension developed in cable

BC used to support the steel frame.

Prob. 5–19

5–22. The articulated crane boom has a weight of 125 lb and center of gravity at *G*. If it supports a load of 600 lb, determine the force acting at the pin *A* and the force in the hydraulic cylinder *BC* when the boom is in the position shown.

•5–25. The 300-lb electrical transformer with center of gravity at *G* is supported by a pin at *A* and a smooth pad at *B*. Determine the horizontal and vertical components of reaction at the pin *A* and the reaction of the pad *B* on the transformer.

5–23. The airstroke actuator at *D* is used to apply a force of $F = 200$ N on the member at *B*. Determine the horizontal and vertical components of reaction at the pin *A* and the force of the smooth shaft at *C* on the member.

***5–24.** The airstroke actuator at *D* is used to apply a force of **F** on the member at *B*. The normal reaction of the smooth shaft at *C* on the member is 300 N. Determine the magnitude of **F** and the horizontal and vertical components of reaction at pin *A*.

5–26. A skeletal diagram of a hand holding a load is shown in the upper figure. If the load and the forearm have masses of 2 kg and 1.2 kg, respectively, and their centers of mass are located at G_1 and G_2 , determine the force developed in the biceps CD and the horizontal and vertical components of reaction at the elbow joint *B*. The forearm supporting system can be modeled as the structural system shown in the lower figure.

5

5–27. As an airplane's brakes are applied, the nose wheel exerts two forces on the end of the landing gear as shown. Determine the horizontal and vertical components of reaction at the pin *C* and the force in strut *AB*.

•5–29. The mass of 700 kg is suspended from a trolley •5–29. The mass of 700 kg is suspended from a trolley
which moves along the crane rail from $d = 1.7$ m to
 $d = 3.5$ m. Determine the force along the pin-connected which moves along the crane rail from $d = 1.7$ m to $d = 3.5$ m. Determine the force along the pin-connected knee strut *BC* (short link) and the magnitude of force at nin knee strut *BC* (short link) and the magnitude of force at pin *A* as a function of position *d*. Plot these results of F_{BC} and F_A
(vertical avis) versus *d* (horizontal avis) (vertical axis) versus *d* (horizontal axis).

5–30. If the force of $F = 100$ lb is applied to the handle of the bar bender, determine the horizontal and vertical components of reaction at pin *A* and the reaction of the roller *B* on the smooth bar.

5–31. If the force of the smooth roller at *B* on the bar bender is required to be 1.5 kip, determine the horizontal and vertical components of reaction at pin *A* and the required magnitude of force **F** applied to the handle.

***5–28.** The 1.4-Mg drainpipe is held in the tines of the fork lift. Determine the normal forces at *A* and *B* as functions of the blade angle θ and plot the results of force (vertical axis)
versus θ (horizontal axis) for $0 \le \theta \le 90^{\circ}$.

Prob. 5–28

***5–32.** The jib crane is supported by a pin at *C* and rod *AB*. If the load has a mass of 2 Mg with its center of mass located at *G*, determine the horizontal and vertical components of reaction at the pin *C* and the force developed in rod *AB* on the crane when $x = 5$ m.

•5–33. The jib crane is supported by a pin at *C* and rod *AB*. The rod can withstand a maximum tension of 40 kN. If the load has a mass of 2 Mg, with its center of mass located at *G*, determine its maximum allowable distance *x* and the corresponding horizontal and vertical components of reaction at *C*.

5–34. Determine the horizontal and vertical components of reaction at the pin *A* and the normal force at the smooth peg *B* on the member.

5–35. The framework is supported by the member *AB* which rests on the smooth floor. When loaded, the pressure distribution on *AB* is linear as shown. Determine the length *d* of member *AB* and the intensity *w* for this case.

***5–36.** Outriggers *A* and *B* are used to stabilize the crane from overturning when lifting large loads. If the load to be lifted is 3 Mg, determine the *maximum* boom angle θ so that the crane does not overturn. The crane has a mass of 5 Mg and center of mass at G_C , whereas the boom has a mass of 0.6 Mg and center of mass at G_B .

Prob. 5–34

Prob. 5–36

 $-2.3 m$

0.7 m

•5–37. The wooden plank resting between the buildings deflects slightly when it supports the 50-kg boy. This deflection causes a triangular distribution of load at its ends, having maximum intensities of w_A and w_B . Determine w_A
and w_A each measured in N/m when the boy is standing and w_B , each measured in N/m , when the boy is standing
³ m from one and as shown. Neglect the mass of the plank 3 m from one end as shown. Neglect the mass of the plank.

***5–40.** The platform assembly has a weight of 250 lb and center of gravity at G_1 . If it is intended to support a
maximum load of 400 lb placed at point G_2 determine the maximum load of 400 lb placed at point G_2 , determine the
smallest counterweight W that should be placed at B in smallest counterweight *W* that should be placed at *B* in order to prevent the platform from tipping over.

Prob. 5–37

5–38. Spring *CD* remains in the horizontal position at all times due to the roller at *D*. If the spring is unstretched times due to the roller at *D*. If the spring is unstretched when $\theta = 0^{\circ}$ and the bracket achieves its equilibrium when $\theta = 0^{\circ}$ and the bracket achieves its equilibrium position when $\theta = 30^{\circ}$, determine the stiffness *k* of the spring and the horizontal and vertical components of reaction at pin *A*.

5–39. Spring *CD* remains in the horizontal position at all times due to the roller at *D*. If the spring is unstretched times due to the roller at D. If the spring is unstretched
when $\theta = 0^{\circ}$ and the stiffness is $k = 1.5 \text{ kN/m}$, determine
the smallest angle θ for equilibrium and the horizontal and the smallest angle θ for equilibrium and the horizontal and vertical components of reaction at pin *A*.

•5–41. Determine the horizontal and vertical components of reaction at the pin *A* and the reaction of the smooth collar *B* on the rod.

5

5–42. Determine the support reactions of roller *A* and the smooth collar *B* on the rod. The collar is fixed to the rod *AB*, but is allowed to slide along rod *CD*.

***5–44.** Determine the horizontal and vertical components of force at the pin *A* and the reaction at the rocker *B* of the curved beam.

5–43. The uniform rod *AB* has a weight of 15 lb. Determine the force in the cable when the rod is in the position shown.

•5–45. The floor crane and the driver have a total weight of 2500 lb with a center of gravity at *G*. If the crane is required to lift the 500-lb drum, determine the normal reaction on *both* the wheels at *A* and *both* the wheels at *B* when the boom is in the position shown.

5–46. The floor crane and the driver have a total weight of 2500 lb with a center of gravity at *G*. Determine the largest weight of the drum that can be lifted without causing the crane to overturn when its boom is in the position shown.

Probs. 5–45/46

5

5–47. The motor has a weight of 850 lb. Determine the force that each of the chains exerts on the supporting hooks at *A, B*, and *C*. Neglect the size of the hooks and the thickness of the beam.

Prob. 5–47

P5–6. The man attempts to pull the four wheeler up the incline and onto the truck bed. From the position shown, is it more effective to keep the rope attached at *A*, or would it be better to attach it to the axle of the front wheels at *B*? Draw a free-body diagram and do an equilibrium analysis to explain your answer.

P5–7. Like all aircraft, this jet plane rests on three wheels. Why not use an additional wheel at the tail for better support? (Can you think of any other reason for not including this wheel?) If there was a fourth tail wheel, draw a free-body diagram of the plane from a side (2 D) view, and show why one would not be able to determine all the wheel reactions using the equations of equilibrium.

***P5–8.** Where is the best place to arrange most of the logs in the wheelbarrow so that it minimizes the amount of force on the backbone of the person transporting the load? Do an equilibrium analysis to explain your answer.

EQUILIBRIUM IN THREE DIMENSIONS

5.5 [Free-Body Diagrams](#page-11-0)

The first step in solving three-dimensional equilibrium problems, as in the case of two dimensions, is to draw a free-body diagram. Before we can do this, however, it is first necessary to discuss the types of reactions that can occur at the supports.

Support Reactions. The reactive forces and couple moments acting at various types of supports and connections, when the members are viewed in three dimensions, are listed in Table 5–2. It is important to recognize the symbols used to represent each of these supports and to understand clearly how the forces and couple moments are developed. As in the two-dimensional case:

- A force is developed by a support that restricts the translation of its attached member.
- A couple moment is developed when rotation of the attached member is prevented.

For example, in Table 5–2, item (4), the ball-and-socket joint prevents any translation of the connecting member; therefore, a force must act on the member at the point of connection.This force has three components having unknown magnitudes, F_x , F_y , F_z . Provided these components are having unknown magnitudes, F_x , F_y , F_z . Provided these components are
known, one can obtain the magnitude of force, $F = \sqrt{F_x^2 + F_y^2 + F_z^2}$,
and the force's orientation defined by its coordinate direction angles α and the force's orientation defined by its coordinate direction angles α , β , γ , Eqs. 2–7.* Since the connecting member is allowed to rotate freely about *any* axis, no couple moment is resisted by a ball-and-socket joint.

It should be noted that the *single* bearing supports in items (5) and (7), the *single* pin (8), and the *single* hinge (9) are shown to resist both force and couple-moment components. If, however, these supports are used in conjunction with *other* bearings, pins, or hinges to hold a rigid body in equilibrium and the supports are *properly aligned* when connected to the body, then the *force reactions* at these supports *alone* are adequate for supporting the body. In other words, the couple moments become redundant and are not shown on the free-body diagram. The reason for this should become clear after studying the examples which follow.

^{*} The three unknowns may also be represented as an unknown force magnitude *F* and two unknown coordinate direction angles. The third direction angle is obtained using the identity $\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1$, Eq. 2–8.

Typical examples of actual supports that are referenced to Table 5–2 are shown in the following sequence of photos.

This ball-and-socket joint provides a connection for the housing of an earth grader to its frame. (4)

This journal bearing supports the end of the shaft. (5)

This thrust bearing is used to support the drive shaft on a machine. (7)

This pin is used to support the end of the strut used on a tractor. (8)

Free-Body Diagrams. The general procedure for establishing the free-body diagram of a rigid body has been outlined in Sec. 5.2. Essentially it requires first "isolating" the body by drawing its outlined shape. This is followed by a careful *labeling* of *all* the forces and couple moments with reference to an established *x*, *y*, *z* coordinate system. It is suggested to show the unknown components of reaction as acting on the free-body diagram in the *positive sense*. In this way, if any negative values are obtained, they will indicate that the components act in the negative coordinate directions.

5.6 [Equations of Equilibrium](#page-11-0)

As stated in Sec. 5.1, the conditions for equilibrium of a rigid body subjected to a three-dimensional force system require that both the *resultant* force and *resultant* couple moment acting on the body be equal to *zero*.

Vector Equations of Equilibrium. The two conditions for equilibrium of a rigid body may be expressed mathematically in vector form as ©

$$
\Sigma \mathbf{F} = 0
$$

$$
\Sigma \mathbf{M}_O = 0
$$
 (5-5)

where Σ **F** is the vector sum of all the external forces acting on the body and ΣM_O is the sum of the couple moments and the moments of all the forces about any point O located either on or off the body forces about any point *O* located either on or off the body.

Scalar Equations of Equilibrium. If all the external forces and couple moments are expressed in Cartesian vector form and substituted into Eqs. 5–5, we have

$$
\Sigma \mathbf{F} = \Sigma F_x \mathbf{i} + \Sigma F_y \mathbf{j} + \Sigma F_z \mathbf{k} = \mathbf{0}
$$

$$
\Sigma \mathbf{M}_O = \Sigma M_x \mathbf{i} + \Sigma M_y \mathbf{j} + \Sigma M_z \mathbf{k} = \mathbf{0}
$$

Since the **i**, **j**, and **k** components are independent from one another, the above equations are satisfied provided

$$
\Sigma F_x = 0
$$

\n
$$
\Sigma F_y = 0
$$

\n
$$
\Sigma F_z = 0
$$
\n(5-6a)

and

$$
\Sigma M_x = 0
$$

\n
$$
\Sigma M_y = 0
$$

\n
$$
\Sigma M_z = 0
$$
\n(5-6b)

These *six scalar equilibrium equations* may be used to solve for at most six unknowns shown on the free-body diagram. Equations 5–6*a* require the sum of the external force components acting in the *x, y*, and *z* directions to be zero, and Eqs. 5–6*b* require the sum of the moment components about the *x, y*, and *z* axes to be zero.

5.7 [Constraints and Statical Determinacy](#page-11-0)

To ensure the equilibrium of a rigid body, it is not only necessary to satisfy the equations of equilibrium, but the body must also be properly held or constrained by its supports. Some bodies may have more supports than are necessary for equilibrium, whereas others may not have enough or the supports may be arranged in a particular manner that could cause the body to move. Each of these cases will now be discussed.

Redundant Constraints. When a body has redundant supports, that is, more supports than are necessary to hold it in equilibrium, it becomes statically indeterminate. *Statically indeterminate* means that there will be more unknown loadings on the body than equations of equilibrium available for their solution. For example, the beam in Fig. 5–24*a* and the pipe assembly in Fig. 5–24*b*, shown together with their free-body diagrams, are both statically indeterminate because of additional (or redundant) support reactions. For the beam there are five unknowns, M_A , A_x , A_y , B_y , and C_y , for which only three equilibrium
equations can be written $(\Sigma F = 0, \Sigma F = 0, \text{ and } \Sigma M_0 = 0, \text{Eqs } 5-2)$ unknowns, M_A , A_x , A_y , B_y , and C_y , for which only three equilibrium
equations can be written $(\Sigma F_x = 0, \Sigma F_y = 0, \text{ and } \Sigma M_O = 0, \text{Eqs. 5-2}).$
The pine assembly has eight unknowns for which only six equilibrium The pipe assembly has eight unknowns, for which only six equilibrium equations can be written, Eqs. 5–6.

The additional equations needed to solve statically indeterminate problems of the type shown in Fig. 5–24 are generally obtained from the deformation conditions at the points of support.These equations involve the physical properties of the body which are studied in subjects dealing with the mechanics of deformation, such as "mechanics of materials."*

* See R. C. Hibbeler, *Mechanics of Materials*, 7th edition, Pearson Education/Prentice Hall, Inc.

5

Improper Constraints. Having the same number of unknown reactive forces as available equations of equilibrium does not always guarantee that a body will be stable when subjected to a particular loading. For example, the pin support at *A* and the roller support at *B* for the beam in Fig. 5–25*a* are placed in such a way that the lines of action of the reactive forces are *concurrent* at point *A*. Consequently, the applied loading ${\bf P}$ will cause the beam to rotate slightly about $A,$ and so the beam loading **P** will cause the beam to rotat
is improperly constrained, $\Sigma M_A \neq 0$.

In three dimensions, a body will be improperly constrained if the lines of action of all the reactive forces intersect a common axis. For example, the reactive forces at the ball-and-socket supports at *A* and *B* in Fig. 5–25*b* all intersect the axis passing through *A* and *B*. Since the moments of these forces about *A* and *B* are all zero, then the loading **P** will rotate the member about the *AB* axis, $\sum M_{AB} \neq 0$.

Fig. 5–25

Fig. 5–26

Another way in which improper constraining leads to instability occurs when the *reactive forces* are all *parallel*. Two- and threedimensional examples of this are shown in Fig. 5–26. In both cases, the summation of forces along the *x* axis will not equal zero.

In some cases, a body may have *fewer* reactive forces than equations of equilibrium that must be satisfied. The body then becomes only *partially constrained*. For example, consider member *AB* in Fig. 5–27*a* with its ©*constrained*. For example, consider member *AB* in Fig. 5–27*a* with its corresponding free-body diagram in Fig. 5–27*b*. Here $\Sigma F_y = 0$ will not be satisfied for the loading conditions and therefore equilibrium will not be satisfied for the loading conditions and therefore equilibrium will not be maintained.

To summarize these points, a body is considered *improperly constrained* if all the reactive forces intersect at a common point or pass through a common axis, or if all the reactive forces are parallel. In engineering practice, these situations should be avoided at all times since they will cause an unstable condition.

Important Points

- Always draw the free-body diagram first when solving any equilibrium problem.
- If a support *prevents translation* of a body in a specific direction, then the support exerts a *force* on the body in that direction.
- If a support *prevents rotation about an axis*, then the support exerts a *couple moment* on the body about the axis.
- If a body is subjected to more unknown reactions than available equations of equilibrium, then the problem is *statically indeterminate*.
- A stable body requires that the lines of action of the reactive forces do not intersect a common axis and are not parallel to one another.

Procedure for Analysis

Three-dimensional equilibrium problems for a rigid body can be solved using the following procedure.

Free-Body Diagram.

- Draw an outlined shape of the body.
- Show all the forces and couple moments acting on the body.
- Establish the origin of the *x, y, z* axes at a convenient point and orient the axes so that they are parallel to as many of the external forces and moments as possible.
- Label all the loadings and specify their directions. In general, show all the *unknown* components having a *positive sense* along the *x, y, z* axes.
- Indicate the dimensions of the body necessary for computing the moments of forces.

Equations of Equilibrium.

- If the *x*, *y*, *z* force and moment components seem easy to determine, then apply the six scalar equations of equilibrium; otherwise use the vector equations.
- It is not necessary that the set of axes chosen for force summation coincide with the set of axes chosen for moment summation. Actually, an axis in any arbitrary direction may be chosen for summing forces and moments.
- Choose the direction of an axis for moment summation such that it intersects the lines of action of as many unknown forces as possible. Realize that the moments of forces passing through points on this axis and the moments of forces which are parallel to the axis will then be zero.
- If the solution of the equilibrium equations yields a negative scalar for a force or couple moment magnitude, it indicates that the sense is opposite to that assumed on the free-body diagram.

Ans. (1)

$EXAMPLE$ 5.15

The homogeneous plate shown in Fig. 5–28*a* has a mass of 100 kg and is subjected to a force and couple moment along its edges. If it is supported in the horizontal plane by a roller at *A*, a ball-and-socket joint at *B*, and a cord at *C*, determine the components of reaction at these supports.

SOLUTION (SCALAR ANALYSIS)

Free-Body Diagram. There are five unknown reactions acting on the plate, as shown in Fig. 5–28*b*. Each of these reactions is assumed to act in a positive coordinate direction.

Equations of Equilibrium. Since the three-dimensional geometry is rather simple, a *scalar analysis* provides a *direct solution* to this problem. A force summation along each axis yields ©

$$
\Sigma F_y = 0; \qquad B_y = 0
$$

 $\Sigma F_z = 0$; $A_z + B_z + T_C - 300 \text{ N} - 981 \text{ N} = 0$

Recall that the moment of a force about an axis is equal to the product of the force magnitude and the perpendicular distance (moment arm) from the line of action of the force to the axis. Also, forces that are parallel to an axis or pass through it create no moment about the axis. Hence, summing moments about the positive *x* and *y* axes, we have

$$
\Sigma M_x = 0; \qquad T_C(2 \text{ m}) - 981 \text{ N} (1 \text{ m}) + B_z(2 \text{ m}) = 0 \tag{2}
$$

\n
$$
\Sigma M_y = 0; \qquad 300 \text{ N} (1.5 \text{ m}) + 981 \text{ N} (1.5 \text{ m}) - B_z(3 \text{ m}) - A_z(3 \text{ m}) - 200 \text{ N} \cdot \text{m} = 0 \tag{3}
$$

The components of the force at *B* can be eliminated if moments are The components of the force at B can be element about the x' and y' axes. We obtain

$$
\Sigma M_{x'} = 0; \quad 981 \text{ N} (1 \text{ m}) + 300 \text{ N} (2 \text{ m}) - A_z (2 \text{ m}) = 0 \tag{4}
$$

\n
$$
\Sigma M_{y'} = 0; \quad -300 \text{ N} (1.5 \text{ m}) - 981 \text{ N} (1.5 \text{ m}) - 200 \text{ N} \cdot \text{m} + T_C (3 \text{ m}) = 0 \tag{5}
$$

$$
-300 N(1.5 m) - 981 N(1.5 m) - 200 N \cdot m + T_C(3 m) = 0
$$
 (5)

Solving Eqs. 1 through 3 or the more convenient Eqs. 1, 4, and 5 yields
 $A_z = 790 \text{ N}$ $B_z = -217 \text{ N}$ $T_C = 707 \text{ N}$ Ans.

$$
A_z = 790 \text{ N}
$$
 $B_z = -217 \text{ N}$ $T_C = 707 \text{ N}$ Ans.

The negative sign indicates that \mathbf{B}_z acts downward.

NOTE: The solution of this problem does not require a summation of moments about the *z* axis. The plate is partially constrained since the supports cannot prevent it from turning about the *z* axis if a force is applied to it in the *x*–*y* plane.

Determine the components of reaction that the ball-and-socket joint at *A*, the smooth journal bearing at *B*, and the roller support at *C* exert on the rod assembly in Fig. 5–29*a*.

SOLUTION

Free-Body Diagram. As shown on the free-body diagram, Fig. 5–29*b*, the reactive forces of the supports will prevent the assembly from rotating about each coordinate axis, and so the journal bearing at *B* only exerts reactive forces on the member.

Equations of Equilibrium. A direct solution for A_y can be obtained by summing forces along the *y* axis.
 $\Sigma F_y = 0;$ $A_y = 0$

$$
\Sigma F_{\nu} = 0; \qquad A_{\nu} = 0 \qquad \qquad \text{Ans.}
$$

The force F_C can be determined directly by summing moments about the *y* axis. ©

$$
\Sigma M_y = 0;
$$
 $F_C(0.6 \text{ m}) - 900 \text{ N}(0.4 \text{ m}) = 0$
 $F_C = 600 \text{ N}$ *Ans.*

Using this result, B_z can be determined by summing moments about the *x* axis.

$$
\Sigma M_x = 0; \qquad B_z(0.8 \text{ m}) + 600 \text{ N}(1.2 \text{ m}) - 900 \text{ N}(0.4 \text{ m}) = 0
$$

$$
B_z = -450 \text{ N} \qquad \qquad \text{Ans.}
$$

The negative sign indicates that \mathbf{B}_z acts downward. The force B_x can

be found by summing moments about the z axis.
\n
$$
\Sigma M_z = 0;
$$
 $-B_x(0.8 \text{ m}) = 0$ $B_x = 0$ *Ans.*

Thus, ©

Thus,

$$
\Sigma F_x = 0; \qquad A_x + 0 = 0 \qquad A_x = 0
$$
Ans.

Finally, using the results of
$$
B_z
$$
 and F_C .
\n $\Sigma F_z = 0;$ $A_z + (-450 \text{ N}) + 600 \text{ N} - 900 \text{ N} = 0$
\n $A_z = 750 \text{ N}$ *Ans.*

The boom is used to support the 75-lb flowerpot in Fig. 5–30*a*. Determine the tension developed in wires *AB* and *AC*.

SOLUTION

Free-Body Diagram. The free-body diagram of the boom is shown in Fig. 5–30*b*.

Equations of Equilibrium. We will use a vector analysis.

$$
\mathbf{F}_{AB} = F_{AB} \left(\frac{\mathbf{r}_{AB}}{r_{AB}} \right) = F_{AB} \left(\frac{\{2\mathbf{i} - 6\mathbf{j} + 3\mathbf{k}\} \text{ ft}}{2 \left(2 \text{ ft}\right)^2 + \left(-6 \text{ ft}\right)^2 + \left(3 \text{ ft}\right)^2} \right)
$$

$$

SOLUTION (VECTOR ANALYSIS)

Free-Body Diagram. Fig. 5–31*b*.

Equations of Equilibrium. Representing each force on the free-body diagram in Cartesian vector form, we have
 $\mathbf{F}_A = A_x \mathbf{i} + A_y \mathbf{j} + A_z \mathbf{k}$

$$
\mathbf{F}_A = A_x \mathbf{i} + A_y \mathbf{j} + A_z \mathbf{k}
$$

\n
$$
\mathbf{T}_E = T_E \mathbf{i}
$$

\n
$$
\mathbf{T}_D = T_D \mathbf{j}
$$

\n
$$
\mathbf{F} = \{-200\mathbf{k}\} \mathbf{N}
$$

$$
\begin{aligned}\n\Sigma F_y &= 0; & A_y + I_D &= 0 \\
\Sigma F_z &= 0; & A_z - 200 &= 0\n\end{aligned} \tag{2}
$$

Summing moments about point *A* yields
\n
$$
\mathbf{M}_A = \mathbf{0}; \qquad \mathbf{r}_C \times \mathbf{F} + \mathbf{r}_B \times (\mathbf{T}_E + \mathbf{T}_D) = \mathbf{0}
$$

Since $\mathbf{r}_C = \frac{1}{2} \mathbf{r}_B$, then

$$
(0.5\mathbf{i} + 1\mathbf{j} - 1\mathbf{k}) \times (-200\mathbf{k}) + (1\mathbf{i} + 2\mathbf{j} - 2\mathbf{k}) \times (T_E \mathbf{i} + T_D \mathbf{j}) = 0
$$

Expanding and rearranging terms gives

$$
(2T_D - 200)\mathbf{i} + (-2T_E + 100)\mathbf{j} + (T_D - 2T_E)\mathbf{k} = \mathbf{0}
$$

$$
\Sigma M_x = 0; \qquad 2T_D - 200 = 0 \tag{4}
$$

$$
2M_x = 0;
$$

\n
$$
\Sigma M_y = 0;
$$

\n
$$
\Sigma M_z = 0;
$$

\n
$$
T_D - 2T_E = 0
$$

\n
$$
T_D - 2T_E = 0
$$

\n(4)

$$
2M_y = 0;
$$

\n
$$
2M_z = 0;
$$

\n
$$
T_D - 2T_E = 0
$$

\nSolving Eqs. 1 through 5, we get

Ans. The get $T_D = 100 \text{ N}$

$$
TD = 100 N
$$
Ans.
\n
$$
TE = 50 N
$$
Ans.

$$
I_E = 50 \text{ N} \qquad \qquad \text{Ans.}
$$

$$
A_x = -50 \text{ N} \qquad \qquad \text{Ans.}
$$

$$
A_x = -30 \text{ N} \qquad \qquad \text{Ans.}
$$

$$
A_y = -100 \text{ N} \qquad \qquad \text{Ans.}
$$

$$
A_y = -100 \text{ N}
$$

$$
A_z = 200 \text{ N}
$$

Ans.

NOTE: The negative sign indicates that \mathbf{A}_x and \mathbf{A}_y have a sense which is opposite to that shown on the free body diagram. Fig. 5, 31b is opposite to that shown on the free-body diagram, Fig. 5–31*b*.

$EXAMPLE$ 5.19

The bent rod in Fig. 5–32*a* is supported at *A* by a journal bearing, at *D* by a ball-and-socket joint, and at *B* by means of cable *BC*. Using only *one equilibrium equation*, obtain a direct solution for the tension in cable *BC*. The bearing at *A* is capable of exerting force components only in the *z* and *y* directions since it is properly aligned on the shaft.

SOLUTION (VECTOR ANALYSIS)

Free-Body Diagram. As shown in Fig. 5–32*b*, there are six unknowns.

Equations of Equilibrium. The cable tension T_B may be obtained directly by summing moments about an axis that passes through *directly* by summing moments about an axis that passes through points *D* and *A*. Why? The direction of this axis is defined by the unit vector **u**, where

$$
\mathbf{u} = \frac{\mathbf{r}_{DA}}{r_{DA}} = -\frac{1}{\sqrt{2}}\mathbf{i} - \frac{1}{\sqrt{2}}\mathbf{j}
$$

$$
= -0.7071\mathbf{i} - 0.7071\mathbf{j}
$$

Hence, the sum of the moments about this axis is zero provided ©

moments about this axis is
$$
z \Sigma M_{DA} = \mathbf{u} \cdot \Sigma(\mathbf{r} \times \mathbf{F}) = 0
$$

Here **r** represents a position vector drawn from *any point* on the axis *DA* to any point on the line of action of force **F** (see Eq. 4–11). With **EXECUTE:** The distribution of the set of $\mathbf{u} \cdot (\mathbf{r}_B \times \mathbf{T}_B + \mathbf{r}_E \times \mathbf{W}) = 0$

$$
\mathbf{u} \cdot (\mathbf{r}_B \times \mathbf{T}_B + \mathbf{r}_E \times \mathbf{W}) = 0
$$

\n
$$
(-0.7071\mathbf{i} - 0.7071\mathbf{j}) \cdot [(-1\mathbf{j}) \times (T_B\mathbf{k}) + (-0.5\mathbf{j}) \times (-981\mathbf{k})] = 0
$$

\n
$$
(-0.7071\mathbf{i} - 0.7071\mathbf{j}) \cdot [(-T_B + 490.5)\mathbf{i}] = 0
$$

\n
$$
- 0.7071(-T_B + 490.5) + 0 + 0 = 0
$$

\n
$$
T_B = 490.5 \text{ N}
$$
Ans.

Since the moment arms from the axis to T_B and **W** are easy to obtain, we can also determine this result using a scalar analysis. As shown in Fig. 5–32*b*, ©

$$
\Sigma M_{DA} = 0;
$$
 $T_B(1 \text{ m} \sin 45^\circ) - 981 \text{ N}(0.5 \text{ m} \sin 45^\circ) = 0$
 $T_B = 490.5 \text{ N}$ Ans.

FUNDAMENTAL PROBLEMS

All problem solutions must include an FBD.

F5–7. The uniform plate has a weight of 500 lb. Determine the tension in each of the supporting cables.

F5–8. Determine the reactions at the roller support *A*, the ball-and-socket joint *D*, and the tension in cable *BC* for the plate.

F5–8

F5–9. The rod is supported by smooth journal bearings at *A*, *B* and *C* and is subjected to the two forces. Determine the reactions at these supports.

F5–10. Determine the support reactions at the smooth journal bearings *A*, *B,* and *C* of the pipe assembly.

F5–11. Determine the force developed in cords *BD*, *CE*, and *CF* and the reactions of the ball-and-socket joint *A* on the block.

F5–12. Determine the components of reaction that the thrust bearing *A* and cable *BC* exert on the bar.

All problem solutions must include an FBD.

5–63. The cart supports the uniform crate having a mass of 85 kg. Determine the vertical reactions on the three casters at *A*, *B*, and *C*. The caster at *B* is not shown. Neglect the mass of the cart.

***5–64.** The pole for a power line is subjected to the two cable forces of 60 lb, each force lying in a plane parallel to cable forces of 60 lb, each force lying in a plane parallel to
the $x - y$ plane. If the tension in the guy wire *AB* is 80 lb,
determine the x y z components of reaction at the fixed determine the *x*, *y*, *z* components of reaction at the fixed base of the pole, *O*.

5–66. Determine the location *x* and *y* of the point of application of force **P** so that the tension developed in cables *AB, CD*, and *EF* is the same. Neglect the weight of the plate.

Probs. 5–65/66

5–67. Due to an unequal distribution of fuel in the wing tanks, the centers of gravity for the airplane fuselage *A* and wings *B* and *C* are located as shown. If these and wings *B* and *C* are located as shown. If these
components have weights $W_A = 45\,000 \text{ lb}$, $W_B = 8000 \text{ lb}$,
and $W_c = 6000 \text{ lb}$, determine the normal reactions of the components have weights $W_A = 45,000$ lb, $W_B = 8000$ lb,
and $W_C = 6000$ lb, determine the normal reactions of the
wheels D_F and F on the ground wheels *D, E*, and *F* on the ground.

Prob. 5–64

Prob. 5–67

***5–68.** Determine the magnitude of force **F** that must be exerted on the handle at \tilde{C} to hold the 75-kg crate in the position shown. Also, determine the components of reaction at the thrust bearing *A* and smooth journal bearing *B*.

5–70. Determine the tension in cables *BD* and *CD* and the *x, y, z* components of reaction at the ball-and-socket joint at *A*.

•5–69. The shaft is supported by three smooth journal bearings at *A, B*, and *C*. Determine the components of reaction at these bearings.

5–71. The rod assembly is used to support the 250-lb cylinder. Determine the components of reaction at the ball-andsocket joint *A*, the smooth journal bearing *E,* and the force developed along rod *CD*. The connections at *C* and *D* are ball-and-socket joints.

5–74. If the load has a weight of 200 lb, determine the *x, y, z* components of reaction at the ball-and-socket joint *A* and the tension in each of the wires.

•5–73. Determine the force components acting on the balland-socket at *A*, the reaction at the roller *B* and the tension on the cord *CD* needed for equilibrium of the quarter circular plate.

5–75. If the cable can be subjected to a maximum tension of 300 lb, determine the maximum force *F* which may be applied to the plate. Compute the *x, y, z* components of reaction at the hinge *A* for this loading.

***5–76.** The member is supported by a pin at *A* and a cable *BC*. If the load at *D* is 300 lb, determine the *x, y, z* components of reaction at the pin *A* and the tension in cable *B C*.

5–83. Member *AB* is supported at *B* by a cable and at *A* by a smooth fixed *square* rod which fits loosely through the square hole of the collar. Determine the tension in cable *BC* if the force $\mathbf{F} = \{-45\mathbf{k}\}\$ lb.

***5–84.** Determine the largest weight of the oil drum that the floor crane can support without overturning. Also, what are the vertical reactions at the smooth wheels *A, B,* and *C* for this case. The floor crane has a weight of 300 lb, with its center of gravity located at *G*.

•5–85. The circular plate has a weight *W* and center of gravity at its center. If it is supported by three vertical cords tied to its edge, determine the largest distance *d* from the center to where any vertical force **P** can be applied so as not to cause the force in any one of the cables to become zero.

5–86. Solve Prob. 5–85 if the plate's weight *W* is neglected.

5–87. A uniform square table having a weight *W* and sides *a* is supported by three vertical legs. Determine the smallest vertical force **P** that can be applied to its top that will cause it to tip over.

Prob. 5–87

CHAPTER REVIEW **Equilibrium** A body in equilibrium does not rotate but can translate with constant velocity, or it does not move at all. $\Sigma \mathbf{F} = \mathbf{0}$ $\Sigma M = 0$ \mathbf{F}_3 *y x* ĩ **F**4 \mathbf{F}_2 **F**₁ *O*

Two Dimensions

Before analyzing the equilibrium of a body, it is first necessary to draw its free-body diagram. This is an outlined shape of the body, which shows all the forces and couple moments that act on it.

Couple moments can be placed anywhere on a free-body diagram since they are free vectors. Forces can act at any point along their line of action since they are sliding vectors.

Angles used to resolve forces, and dimensions used to take moments of the forces, should also be shown on the free-body diagram.

Some common types of supports and their reactions are shown below in two dimensions.

Remember that a support will exert a force on the body in a particular direction if it prevents translation of the body in that direction, and it will exert a couple moment on the body if it prevents rotation.

The three scalar equations of equilibrium can be applied when solving problems in two dimensions, since the geometry is easy to visualize.

smooth pin or hinge

fixed support

For the most direct solution, try to sum forces along an axis that will eliminate as many unknown forces as possible. Sum moments about a point *A* that passes through the line of action of as many unknown forces as possible.

fixed support

Three Dimensions

Some common types of supports and their reactions are shown here in three dimensions.

ball and socket

In three dimensions, it is often advantageous to use a Cartesian vector analysis when applying the equations of equilibrium. To do this, first express each known and unknown force and couple moment shown on the free-body diagram as a Cartesian vector. Then set the force summation equal to zero. Take moments about a point *O* that lies on the line of action of as many unknown force components as possible. From point *O* direct position vectors to each force, and then use the cross product to determine the moment of each force.

The six scalar equations of equilibrium are established by setting the respective **i**, **j**, and **k** components of these force and moment summations equal to zero.

Determinacy and Stability

If a body is supported by a minimum number of constraints to ensure equilibrium, then it is statically determinate. If it has more constraints than required, then it is statically indeterminate.

To properly constrain the body, the reactions must not all be parallel to one another or concurrent.

at each end *A* and *A'* and by the symmetrical brace arms,
which bear against the smooth wall on both sides at *B* and which bear against the smooth wall on both sides at *B* and which bear against the smooth wall on both sides at B and B' . Determine the force resisted by each bolt at the wall and the normal force at B for equilibrium and the normal force at *B* for equilibrium.

Prob. 5–94

Prob. 5–96

The forces within the members of each truss bridge must be determined if the members are to be properly designed.

[Structural Analysis](#page-12-0)

[CHAPTER OBJECTIVES](#page-12-0)

- To show how to determine the forces in the members of a truss using the method of joints and the method of sections.
- To analyze the forces acting on the members of frames and machines composed of pin-connected members.

6.1 [Simple Trusses](#page-12-0)

A *truss* is a structure composed of slender members joined together at their end points. The members commonly used in construction consist of wooden struts or metal bars. In particular, *planar* trusses lie in a single plane and are often used to support roofs and bridges.The truss shown in Fig. 6–1*a* is an example of a typical roof-supporting truss. In this figure, the roof load is transmitted to the truss *at the joints* by means of a series of *purlins*. Since this loading acts in the same plane as the truss, Fig. 6–1*b*, the analysis of the forces developed in the truss members will be two-dimensional.

6

Fig. 6–1

Fig. 6–2

In the case of a bridge, such as shown in Fig. 6–2*a*, the load on the deck is first transmitted to *stringers*, then to *floor beams*, and finally to the *joints* of the two supporting side trusses. Like the roof truss, the bridge truss loading is also coplanar, Fig. 6–2*b*.

When bridge or roof trusses extend over large distances, a rocker or roller is commonly used for supporting one end, for example, joint *A* in Figs. 6–1*a* and 6–2*a*. This type of support allows freedom for expansion or contraction of the members due to a change in temperature or application of loads.

Assumptions for Design. To design both the members and the connections of a truss, it is necessary first to determine the *force* developed in each member when the truss is subjected to a given loading. To do this we will make two important assumptions:

- *All loadings are applied at the joints.* In most situations, such as for bridge and roof trusses, this assumption is true. Frequently the weight of the members is neglected because the force supported by each member is usually much larger than its weight. However, if the weight is to be included in the analysis, it is generally satisfactory to apply it as a vertical force, with half of its magnitude applied at each end of the member.
- *The members are joined together by smooth pins.* The joint connections are usually formed by bolting or welding the ends of the members to a common plate, called a *gusset plate*, as shown in Fig. 6–3*a*, or by simply passing a large bolt or pin through each of the members, Fig. 6–3*b*.We can assume these connections act as pins provided the center lines of the joining members are *concurrent*, as in Fig. 6–3.

(a)

Because of these two assumptions, *each truss member will act as a twoforce member*, and therefore the force acting at each end of the member will be directed along the axis of the member. If the force tends to *elongate* the member, it is a *tensile force* (T), Fig. 6–4*a*; whereas if it tends to *shorten* the member, it is a *compressive force* (C), Fig. 6–4*b*. In the actual design of a truss it is important to state whether the nature of the force is tensile or compressive. Often, compression members must be made *thicker* than tension members because of the buckling or column effect that occurs when a member is in compression.

Simple Truss. If three members are pin connected at their ends they form a *triangular truss* that will be *rigid*, Fig. 6–5. Attaching two more members and connecting these members to a new joint *D* forms a larger truss, Fig. 6–6. This procedure can be repeated as many times as desired to form an even larger truss. If a truss can be constructed by expanding the basic triangular truss in this way, it is called a *simple truss*.

6

The use of metal gusset plates in the construction of these Warren trusses is clearly evident.

6.2 [The Method of Joints](#page-12-0)

In order to analyze or design a truss, it is necessary to determine the force in each of its members. One way to do this is to use the method of joints. This method is based on the fact that if the entire truss is in equilibrium, then each of its joints is also in equilibrium. Therefore, if the free-body diagram of each joint is drawn, the force equilibrium equations can then be used to obtain the member forces acting on each joint. Since the members of a *plane truss* are straight two-force members lying in a single plane, each joint is subjected to a force system that is *coplanar and concurrent*. As a result, only $\Sigma F_x = 0$ and $\Sigma F_y = 0$ need to be satisfied for equilibrium *concurrent*. As a result, only $\Sigma F_x = 0$ and $\Sigma F_y = 0$ need to be satisfied for equilibrium.

For example, consider the pin at joint *B* of the truss in Fig. 6–7*a*. Three forces act on the pin, namely, the 500-N force and the forces exerted by members *BA* and *BC.* The free-body diagram of the pin is shown in Fig. 6–7*b*. Here, \mathbf{F}_{BA} is "pulling" on the pin, which means that member BA is in tanglour whereas \mathbf{F}_{AB} is "pushing" on the pin, and member *BA* is in *tension*; whereas \mathbf{F}_{BC} is "pushing" on the pin, and consequently member *BC* is in compression. These effects are clearly consequently member *BC* is in *compression.* These effects are clearly demonstrated by isolating the joint with small segments of the member connected to the pin, Fig. 6–7*c*. The pushing or pulling on these small segments indicates the effect of the member being either in compression or tension.

When using the method of joints, always start at a joint having at least one known force and at most two unknown forces, as in Fig. 6–7*b*. In this ©one known force and at most two unknown forces, as in Fig. 6–7b. In this
way, application of $\Sigma F_x = 0$ and $\Sigma F_y = 0$ yields two algebraic
equations which can be solved for the two unknowns. When applying equations which can be solved for the two unknowns. When applying these equations, the correct sense of an unknown member force can be determined using one of two possible methods.

- The *correct* sense of direction of an unknown member force can, in many cases, be determined "by inspection." For example, \mathbf{F}_{BC} in Fig. 6. 7b must push on the pin (compression) since its horizontal Fig. 6–7*b* must push on the pin (compression) since its horizontal Fig. 6–7b must push on the pin (compression) since its horizontal
component, F_{BC} sin 45°, must balance the 500-N force ($\Sigma F_x = 0$).
Likewise \mathbf{F}_{BC} is a tensile force since it balances the vertical Likewise, \mathbf{F}_{BA} is a tensile force since it balances the vertical component F_{AB} cos 45° ($\Sigma F_{AB} = 0$). In more complicated cases the Likewise, \mathbf{F}_{BA} is a tensile force since it balances the vertical
component, F_{BC} cos 45° ($\Sigma F_y = 0$). In more complicated cases, the
sense of an unknown member force can be *assumed*: then after sense of an unknown member force can be *assumed;* then, after applying the equilibrium equations, the assumed sense can be verified from the numerical results. A *positive* answer indicates that the sense is *correct*, whereas a *negative* answer indicates that the sense shown on the free-body diagram must be *reversed.*
- *Always assume* the *unknown member forces* acting on the joint's free-body diagram to be in *tension;* i.e., the forces "pull" on the pin. If this is done, then numerical solution of the equilibrium equations will yield *positive scalars for members in tension and negative scalars for members in compression.* Once an unknown member force is found, use its *correct* magnitude and sense (T or C) on subsequent joint free-body diagrams.

The forces in the members of this simple roof truss can be determined using the method of joints.

Procedure for Analysis

The following procedure provides a means for analyzing a truss using the method of joints.

- Draw the free-body diagram of a joint having at least one known force and at most two unknown forces. (If this joint is at one of the supports, then it may be necessary first to calculate the external reactions at the support.)
- Use one of the two methods described above for establishing the sense of an unknown force.
- Orient the *x* and *y* axes such that the forces on the free-body diagram can be easily resolved into their *x* and *y* components and ©diagram can be easily resolved into their x and y components and
then apply the two force equilibrium equations $\Sigma F_x = 0$ and
 $\Sigma F_x = 0$. Solve for the two unknown member forces and verify en apply the two force equilibrium equations $\Sigma F_x = 0$ and $F_y = 0$. Solve for the two unknown member forces and verify eix correct sense their correct sense.
- Using the calculated results, continue to analyze each of the other joints. Remember that a member in *compression* "pushes" on the joint and a member in *tension* "pulls" on the joint.Also, be sure to choose a joint having at most two unknowns and at least one known force.

$EXAMPLE$ 6.1

Determine the force in each member of the truss shown in Fig. 6–8*a* and indicate whether the members are in tension or compression.

SOLUTION

Since we should have no more than two unknown forces at the joint and at least one known force acting there, we will begin our analysis at joint *B*.

Joint B. The free-body diagram of the joint at *B* is shown in Fig. 6–8*b*. Applying the equations of equilibrium, we have

$$
\Rightarrow \Sigma F_x = 0; \quad 500 \text{ N} - F_{BC} \sin 45^\circ = 0 \qquad F_{BC} = 707.1 \text{ N (C) } Ans.
$$

$$
+ \hat{E} F_y = 0; \qquad F_{BC} \cos 45^\circ - F_{BA} = 0 \qquad F_{BA} = 500 \text{ N (T) } Ans.
$$

Since the force in member *BC* has been calculated, we can proceed to analyze joint *C* to determine the force in member *CA* and the support reaction at the rocker.

Joint C. From the free-body diagram of joint *C*, Fig. 6–8*c*, we have

$$
\Rightarrow \Sigma F_x = 0; \ -F_{CA} + 707.1 \cos 45^\circ \text{ N} = 0 \quad F_{CA} = 500 \text{ N (T)} \text{ Ans.}
$$

$$
+ \hat{\Gamma} \Sigma F_y = 0; \qquad C_y - 707.1 \sin 45^\circ \text{ N} = 0 \quad C_y = 500 \text{ N} \qquad \text{Ans.}
$$

Joint A. Although it is not necessary, we can determine the components of the support reactions at joint *A* using the results of F_{CA} and F_{BA} . From the free-body diagram, Fig. 6–8*d*, we have

$$
\Rightarrow \Sigma F_x = 0; \quad 500 \text{ N} - A_x = 0 \quad A_x = 500 \text{ N}
$$

$$
+ \hat{ } \Sigma F_y = 0; \quad 500 \text{ N} - A_y = 0 \quad A_y = 500 \text{ N}
$$

NOTE: The results of the analysis are summarized in Fig. 6–8*e*. Note that the free-body diagram of each joint (or pin) shows the effects of all the connected members and external forces applied to the joint, whereas the free-body diagram of each member shows only the effects of the end joints on the member.

EXAMPLE 6.2

Determine the force in each member of the truss in Fig. 6–9*a* and indicate if the members are in tension or compression.

SOLUTION

Since joint C has one known and only two unknown forces acting on it, it is possible to start at this joint, then analyze joint D , and finally joint \overrightarrow{A} . This way the support reactions will not have to be determined prior to starting the analysis.

Joint C. By inspection of the force equilibrium, Fig. 6–9*b*, it can be seen that both members BC and CD must be in compression.

$$
+ \hat{\Gamma} \Sigma F_y = 0;
$$
 $F_{BC} \sin 45^\circ - 400 \text{ N} = 0$
\n $F_{BC} = 565.69 \text{ N} = 566 \text{ N (C)}$ Ans.
\n $\Rightarrow \Sigma F_x = 0;$ $F_{CD} - (565.69 \text{ N}) \cos 45^\circ = 0$
\n $F_{CD} = 400 \text{ N (C)}$ Ans.

Joint D. Using the result $F_{CD} = 400 \text{ N (C)}$, the force in members RD and AD can be found by analyzing the equilibrium of joint D. We BD and *AD* can be found by analyzing the equilibrium of joint D. We *BD* and *AD* can be found by analyzing the equilibrium of joint *D*. We will assume \mathbf{F}_{AD} and \mathbf{F}_{BD} are both tensile forces, Fig. 6–9*c*. The *x'*, *y'* coordinate system will be established so that the *x'* ax will assume \mathbf{F}_{AD} and \mathbf{F}_{BD} are both tensile forces, Fig. 6–9*c*. The *x'*, *y'* coordinate system will be established so that the *x'* axis is directed along \mathbf{F}_{DB} . This way we will eliminate the need to s along \mathbf{F}_{BD} . This way, we will eliminate the need to solve two equations simultaneously. Now \mathbf{F}_{BD} can be obtained directly by applying simultaneously. Now \mathbf{F}_{AD} can be obtained *directly* by applying $\Sigma F = 0$ multane
 $F_{y'} = 0.$

$$
+ \mathcal{I} \Sigma F_{y'} = 0;
$$
 $- F_{AD} \sin 15^{\circ} - 400 \sin 30^{\circ} = 0$
 $F_{AD} = -772.74 \text{ N} = 773 \text{ N (C)} \qquad Ans.$

The negative sign indicates that \mathbf{F}_{AD} is a compressive force. Using this result result,
+ $\sqrt{\Sigma}$

$$
+\Delta \Sigma F_{x'} = 0; \quad F_{BD} + (-772.74 \cos 15^\circ) - 400 \cos 30^\circ = 0
$$

$$
F_{BD} = 1092.82 \text{ N} = 1.09 \text{ kN (T)} \quad \text{Ans.}
$$

Joint A. The force in member *AB* can be found by analyzing the

equilibrium of joint *A*, Fig. 6–9*d*. We have
\n
$$
\Rightarrow \Sigma F_x = 0;
$$
 (772.74 N) cos 45° - $F_{AB} = 0$
\n $F_{AB} = 546.41 \text{ N (C)} = 546 \text{ N (C)}$ Ans.

6

(b)

$EXAMPLE$ 6.3

Determine the force in each member of the truss shown in Fig. 6–10*a*. Indicate whether the members are in tension or compression.

SOLUTION

Support Reactions. No joint can be analyzed until the support reactions are determined, because each joint has more than three unknown forces acting on it.A free-body diagram of the entire truss is given in Fig. 6–10*b*. Applying the equations of equilibrium, we have

$$
\begin{aligned}\n&\Rightarrow \Sigma F_x = 0; & 600 \text{ N} - C_x = 0 & C_x = 600 \text{ N} \\
&\zeta + \Sigma M_C = 0; & -A_y(6 \text{ m}) + 400 \text{ N}(3 \text{ m}) + 600 \text{ N}(4 \text{ m}) = 0 \\
& A_y = 600 \text{ N} \\
&+ \uparrow \Sigma F_y = 0; & 600 \text{ N} - 400 \text{ N} - C_y = 0 & C_y = 200 \text{ N}\n\end{aligned}
$$

The analysis can now start at either joint *A* or *C*. The choice is arbitrary since there are one known and two unknown member forces acting on the pin at each of these joints.

Joint A. (Fig. 6–10*c*). As shown on the free-body diagram, \mathbf{F}_{AB} is assumed to be compressive and \mathbf{F}_{AB} is tensile. Applying the equations assumed to be compressive and \mathbf{F}_{AD} is tensile. Applying the equations of equations of equilibrium, we have

$$
+\uparrow \Sigma F_y = 0; \qquad 600 \text{ N} - \frac{4}{5} F_{AB} = 0 \qquad F_{AB} = 750 \text{ N} \quad \text{(C)} \qquad \text{Ans.}
$$

\n
$$
\Rightarrow \Sigma F_x = 0; \qquad F_{AD} - \frac{3}{5} (750 \text{ N}) = 0 \qquad F_{AD} = 450 \text{ N} \quad \text{(T)} \qquad \text{Ans.}
$$

Joint D. (Fig. $6-10d$). Using the result for F_{AD} and summing forces in the horizontal direction, Fig. $6-10d$, we have

$$
\Rightarrow \Sigma F_x = 0; \qquad -450 \text{ N} + \frac{3}{5} F_{DB} + 600 \text{ N} = 0 \quad F_{DB} = -250 \text{ N}
$$

The negative sign indicates that \mathbf{F}_{DB} acts in the *opposite sense* to that shown in Fig. 6, 10*d* $*$ Hence shown in Fig. 6–10*d*.* Hence,

$$
F_{DB} = 250 \text{ N (T)}
$$
Ans.

To determine \mathbf{F}_{DC} , we can either correct the sense of \mathbf{F}_{DB} on the free-
body diagram, and then apply $\Sigma F = 0$, or apply this equation and To determine \mathbf{F}_{DC} , we can either correct the sense of \mathbf{F}_{DB} on the free-
body diagram, and then apply $\Sigma F_y = 0$, or apply this equation and
retain the negative sign for F_{DB} i.e. retain the negative sign for F_{DB} , i.e.,

Ans. $+\uparrow \Sigma F_y = 0; \quad -F_{DC} - \frac{4}{5}(-250 \text{ N}) = 0 \quad F_{DC} = 200 \text{ N} \quad \text{(C)}$

Joint C. (Fig. 6–10*e*).

 $\Rightarrow \Sigma F_x = 0;$ $F_{CB} - 600 \text{ N} = 0$ $F_{CB} = 600 \text{ N}$ (C) Ans. $+\uparrow \Sigma F_v = 0;$ 200 N - 200 N = 0 (check)

NOTE: The analysis is summarized in Fig. 6–10*f*, which shows the free-body diagram for each joint and member.

6

6.3 [Zero-Force Members](#page-12-0)

Truss analysis using the method of joints is greatly simplified if we can first identify those members which support *no loading.* These *zero-force members* are used to increase the stability of the truss during construction and to provide added support if the loading is changed.

The zero-force members of a truss can generally be found *by inspection* of each of the joints. For example, consider the truss shown in Fig. 6–11*a*. If a free-body diagram of the pin at joint *A* is drawn, Fig. 6–11*b*, it is seen that members *AB* and *AF* are zero-force members. (We could not have come to this conclusion if we had considered the free-body diagrams of joints *F* or *B* simply because there are five unknowns at each of these joints.) In a similar manner, consider the freebody diagram of joint *D*, Fig. 6–11*c*. Here again it is seen that *DC* and *DE* are zero-force members. From these observations, we can conclude that *if only two members form a truss joint and no external load or support reaction is applied to the joint, the two members must be zeroforce members.* The load on the truss in Fig. 6–11*a* is therefore supported by only five members as shown in Fig. 6–11*d*.

Fig. 6–11

Now consider the truss shown in Fig. 6–12*a*. The free-body diagram of the pin at joint *D* is shown in Fig. 6–12*b*. By orienting the *y* axis along members *DC* and *DE* and the *x* axis along member *DA*, it is seen that *DA* is a zero-force member. Note that this is also the case for member *CA*, Fig. 6–12*c*. In general then, *if three members form a truss joint for which two of the members are collinear, the third member is a zero-force member provided no external force or support reaction is applied to the joint.* The truss shown in Fig. 6–12*d* is therefore suitable for supporting the load **P**.

$$
(\mathrm{a})
$$

F*DE*

 $\Sigma F_x = 0$; $F_{CA} \sin \theta = 0$; $F_{CA} = 0$ since $\sin \theta \neq 0$; $\Sigma F_y = 0$; $F_{CB} = F_{CD}$

(c)

6

(e)

Using the method of joints, determine all the zero-force members of the *Fink roof truss* shown in Fig. 6–13*a*. Assume all joints are pin connected.

SOLUTION

Look for joint geometries that have three members for which two are collinear. We have

Realize that we could not conclude that *GC* is a zero-force member by considering joint *C*, where there are five unknowns. The fact that *GC* is a zero-force member means that the 5-kN load at *C* must be supported by members *CB*, *CH*, *CF*, and *CD.*

Joint D. (Fig. 6-13*c*).
\n
$$
+ \sqrt{2}F_x = 0;
$$
 $F_{DF} = 0$ *Ans.*
\n**Joint F.** (Fig. 6-13*d*).
\n $+ \uparrow \Sigma F_y = 0;$ $F_{FC} \cos \theta = 0$ Since $\theta \neq 90^\circ$, $F_{FC} = 0$ *Ans.*
\n**NOTE:** If joint *B* is analyzed, Fig. 6-13*e*,
\n $+ \sqrt{\Sigma}F_x = 0;$ $2 \text{ kN} - F_{BH} = 0$ $F_{BH} = 2 \text{ kN}$ (C)

$$
+\Delta\Sigma F_x = 0; \t 2 \text{ kN} - F_{BH} = 0 \t F_{BH} = 2 \text{ kN} \t (C)
$$

Also, F_{HC} must satisfy $\Sigma F_y = 0$, Fig. 6–13*f*, and therefore *HC* is *not* a zero-force member.

FUNDAMENTAL PROBLEMS

F6–1. Determine the force in each member of the truss. State if the members are in tension or compression.

F6–2. Determine the force in each member of the truss. State if the members are in tension or compression.

F6–2

F6–3. Determine the force in members *AE* and *DC*. State if the members are in tension or compression.

F6–4. Determine the greatest load *P* that can be applied to the truss so that none of the members are subjected to a force exceeding either 2 kN in tension or 1.5 kN in compression.

F6–4

F6–5. Identify the zero-force members in the truss.

F6–6. Determine the force in each member of the truss. State if the members are in tension or compression.

PROBLEMS

•6–1. Determine the force in each member of the truss, and state if the members are in tension or compression.

6–2. The truss, used to support a balcony, is subjected to the loading shown. Approximate each joint as a pin and determine the force in each member. State whether the determine the force in each member. State whether the
members are in tension or compression. Set $P_1 = 600$ lb,
 $P_2 = 400$ lb $P_2 = 400$ lb.

6–3. The truss, used to support a balcony, is subjected to the loading shown. Approximate each joint as a pin and determine the force in each member. State whether the determine the force in each member. State whether the
members are in tension or compression. Set $P_1 = 800$ lb,
 $P_2 = 0$ $P_2 = 0.$

Prob. 6–27

Fig. 6–14

6.4 [The Method of Sections](#page-12-0)

When we need to find the force in only a few members of a truss, we can analyze the truss using the *method of sections*. It is based on the principle that if the truss is in equilibrium then any segment of the truss is also in equilibrium. For example, consider the two truss members shown on the left in Fig. 6–14. If the forces within the members are to be determined, then an imaginary section, indicated by the blue line, can be used to cut each member into two parts and thereby "expose" each internal force as "external" to the free-body diagrams shown on the right. Clearly, it can be seen that equilibrium requires that the member in tension (T) be subjected to a "pull," whereas the member in compression (C) is subjected to a "push."

The method of sections can also be used to "cut" or section the members of an entire truss. If the section passes through the truss and the free-body diagram of either of its two parts is drawn, we can then apply the equations of equilibrium to that part to determine the member forces at the "cut ©of equilibrium to that part to determine the member forces at the "cut
section." Since only *three* independent equilibrium equations ($\Sigma F_x = 0$,
 $\Sigma F_y = 0$, $\Sigma M_y = 0$) can be applied to the free-body diagram of any ction." Since only *three* independent equilibrium equations ($\Sigma F_x = 0$, $F_y = 0$, $\Sigma M_O = 0$) can be applied to the free-body diagram of any oment then we should try to select a section that in general passes segment, then we should try to select a section that, in general, passes through not more than *three* members in which the forces are unknown. For example, consider the truss in Fig. 6–15*a*. If the forces in members *BC*, *GC*, and *GF* are to be determined, then section *aa* would be appropriate. The free-body diagrams of the two segments are shown in Figs. 6–15*b* and 6–15*c*. Note that the line of action of each member force is specified from the *geometry* of the truss, since the force in a member is along its axis.Also, the member forces acting on one part of the truss are equal but opposite to those acting on the other part—Newton's third law. Members *BC* and *GC* are assumed to be in *tension* since they are subjected to a "pull," whereas *GF* in *compression* since it is subjected to a "push."

The three unknown member forces \mathbf{F}_{BC} , \mathbf{F}_{GC} , and \mathbf{F}_{GF} can be obtained
Lapplying the three equilibrium equations to the free body diagram in by applying the three equilibrium equations to the free-body diagram in Fig. 6–15*b*. If, however, the free-body diagram in Fig. 6–15*c* is considered, the three support reactions \mathbf{D}_x , \mathbf{D}_y and \mathbf{E}_x will have to be known, because only three equations of equilibrium are available. (This, of course, is done in the usual manner by considering a free-body diagram of the *entire truss.*)

When applying the equilibrium equations, we should carefully consider ways of writing the equations so as to yield a *direct solution* for each of the unknowns, rather than having to solve simultaneous equations. For example, using the truss segment in Fig. 6–15*b* and summing moments about *C* would yield a direct solution for \mathbf{F}_{GF} since \mathbf{F}_{EG} and \mathbf{F}_{EG} reate zero moment about *C*. Likewise, \mathbf{F}_{EG} can be directly \mathbf{F}_{BC} and \mathbf{F}_{GC} create zero moment about *C*. Likewise, \mathbf{F}_{BC} can be directly obtained by summing moments about *G*. Finally, \mathbf{F}_{CC} can be found obtained by summing moments about *G*. Finally, \mathbf{F}_{GC} can be found
directly from a force summation in the vertical direction since \mathbf{F}_{CE} and directly from a force summation in the vertical direction since \mathbf{F}_{GF} and \mathbf{F}_{GE} have no vertical components. This ability to *determine directly* the \mathbf{F}_{BC} have no vertical components. This ability to *determine directly* the force in a particular truss member is one of the main advantages of using force in a particular truss member is one of the main advantages of using the method of sections.*

As in the method of joints, there are two ways in which we can determine the correct sense of an unknown member force:

- The correct sense of an unknown member force can in many cases be determined "by inspection." For example, \mathbf{F}_{BC} is a tensile
force as represented in Fig. 6, 15b since moment equilibrium force as represented in Fig. 6–15*b* since moment equilibrium about *G* requires that \mathbf{F}_{BC} create a moment opposite to that of the 1000 N force Also \mathbf{F}_{C} is tensile since its vertical component the 1000-N force. Also, \mathbf{F}_{GC} is tensile since its vertical component
must belance the 1000 N force which acts downward. In more must balance the 1000-N force which acts downward. In more complicated cases, the sense of an unknown member force may be *assumed.* If the solution yields a *negative* scalar, it indicates that the force's sense is *opposite* to that shown on the free-body diagram.
- *Always assume* that the unknown member forces at the cut section are *tensile* forces, i.e., "pulling" on the member. By doing this, the numerical solution of the equilibrium equations will yield *positive scalars for members in tension and negative scalars for members in compression.*

*Notice that if the method of joints were used to determine, say, the force in member *GC*, it would be necessary to analyze joints *A*, *B*, and *G* in sequence.

The forces in selected members of this Pratt truss can readily be determined using the method of sections.

Simple trusses are often used in the construction of large cranes in order to reduce the weight of the boom and tower.

Procedure for Analysis

The forces in the members of a truss may be determined by the method of sections using the following procedure.

Free-Body Diagram.

- Make a decision on how to "cut" or section the truss through the members where forces are to be determined.
- Before isolating the appropriate section, it may first be necessary to determine the truss's support reactions. If this is done then the three equilibrium equations will be available to solve for member forces at the section.
- Draw the free-body diagram of that segment of the sectioned truss which has the least number of forces acting on it.
- Use one of the two methods described above for establishing the sense of the unknown member forces.

Equations of Equilibrium.

- Moments should be summed about a point that lies at the intersection of the lines of action of two unknown forces, so that the third unknown force can be determined directly from the moment equation.
- If two of the unknown forces are *parallel*, forces may be summed *perpendicular* to the direction of these unknowns to determine *directly* the third unknown force.

Determine the force in members *GE*, *GC*, and *BC* of the truss shown in Fig. 6–16*a*. Indicate whether the members are in tension or compression.

SOLUTION

Section *aa* in Fig. 6–16*a* has been chosen since it cuts through the *three* members whose forces are to be determined. In order to use the method of sections, however, it is *first* necessary to determine the external reactions at *A* or *D*. Why? A free-body diagram of the entire truss is shown in Fig. 6–16*b*. Applying the equations of equilibrium, we have

we have
\n
$$
\Rightarrow \Sigma F_x = 0; \qquad 400 \text{ N} - A_x = 0 \qquad A_x = 400 \text{ N}
$$
\n
$$
\zeta + \Sigma M_A = 0; \qquad -1200 \text{ N} (8 \text{ m}) - 400 \text{ N} (3 \text{ m}) + D_y (12 \text{ m}) = 0
$$
\n
$$
D_y = 900 \text{ N}
$$
\n
$$
+ \hat{\Gamma} \Sigma F_y = 0; \qquad A_y - 1200 \text{ N} + 900 \text{ N} = 0 \qquad A_y = 300 \text{ N}
$$

Free-Body Diagram. For the analysis the free-body diagram of the left portion of the sectioned truss will be used, since it involves the least number of forces, Fig. 6–16*c*.

Equations of Equilibrium. Summing moments about point *G* eliminates \mathbf{F}_{GE} and \mathbf{F}_{GC} and yields a direct solution for F_{BC} .

$$
\zeta + \Sigma M_G = 0;
$$
 $-300 \text{ N} (4 \text{ m}) - 400 \text{ N} (3 \text{ m}) + F_{BC} (3 \text{ m}) = 0$
 $F_{BC} = 800 \text{ N} \quad (\text{T})$ Ans.

In the same manner, by summing moments about point *C* we obtain a direct solution for F_{GE} .

$$
\zeta + \Sigma M_C = 0;
$$
 $-300 \text{ N} (8 \text{ m}) + F_{GE} (3 \text{ m}) = 0$
 $F_{GE} = 800 \text{ N} \quad (\text{C})$ Ans.

Since \mathbf{F}_{BC} and \mathbf{F}_{GE} have no vertical components, summing forces in the v direction directly vields F_{G} i.e. the *y* direction directly yields F_{GC} , i.e.,

$$
+\uparrow \Sigma F_y = 0; \qquad 300 \text{ N} - \frac{3}{5} F_{GC} = 0
$$

$$
F_{GC} = 500 \text{ N} \quad (\text{T}) \qquad \qquad \text{Ans.}
$$

NOTE: Here it is possible to tell, by inspection, the proper direction ©**NOTE:** Here it is possible to tell, by inspection, the proper direction
for each unknown member force. For example, $\Sigma M_C = 0$ requires
K_{ges} to be *compressive* because it must balance the moment of the \mathbf{F}_{GE} to be *compressive* because it must balance the moment of the 300 N force about C 300-N force about *C*.

Determine the force in member *CF* of the truss shown in Fig. 6–17*a*. Indicate whether the member is in tension or compression. Assume each member is pin connected.

SOLUTION

Free-Body Diagram. Section *aa* in Fig. 6–17*a* will be used since this section will "expose" the internal force in member *CF* as "external" on the free-body diagram of either the right or left portion of the truss. It is first necessary, however, to determine the support reactions on either the left or right side. Verify the results shown on the freebody diagram in Fig. 6–17*b*.

The free-body diagram of the right portion of the truss, which is the easiest to analyze, is shown in Fig. 6–17*c*. There are three unknowns, F_{FG} , F_{CF} , and F_{CD} .

Equations of Equilibrium. We will apply the moment equation about point *O* in order to eliminate the two unknowns F_{FG} and F_{CD} . The location of point O measured from E can be determined from The location of point O measured from E can be determined from
proportional triangles, i.e., $4/(4 + x) = 6/(8 + x)$, $x = 4$ m. Or,
stated in another manner the slope of member GE has a drop of 2 m stated in another manner, the slope of member *GF* has a drop of 2 m to a horizontal distance of 4 m. Since *FD* is 4 m, Fig. 6–17*c*, then from *D* to *O* the distance must be 8 m.

An easy way to determine the moment of \mathbf{F}_{CF} about point *O* is to use
the principle of transmissibility and slide **F**_C to point *C* and then the principle of transmissibility and slide \mathbf{F}_{CF} to point *C*, and then resolve **F**_c into its two rectangular components We have

resolve
$$
\mathbf{F}_{CF}
$$
 into its two rectangular components. We have
\n $\zeta + \Sigma M_O = 0;$
\n $-F_{CF} \sin 45^{\circ} (12 \text{ m}) + (3 \text{ kN})(8 \text{ m}) - (4.75 \text{ kN})(4 \text{ m}) = 0$
\n $F_{CF} = 0.589 \text{ kN} \quad \text{(C)}$ Ans.

Determine the force in member *EB* of the roof truss shown in Fig. 6–18*a*. Indicate whether the member is in tension or compression.

SOLUTION

Free-Body Diagrams. By the method of sections, any imaginary section that cuts through *EB*, Fig. 6–18*a*, will also have to cut through three other members for which the forces are unknown. For example, section *aa* cuts through *ED, EB, FB*, and *AB*. If a free-body diagram of the left side of this section is considered, Fig. 6–18*b*, it is possible to obtain \mathbf{F}_{ED} by summing moments about *B* to eliminate the other
three unknowns: however, **F** cannot be determined from the three unknowns; however, \mathbf{F}_{EB} cannot be determined from the remaining two equilibrium equations One possible way of obtaining remaining two equilibrium equations. One possible way of obtaining \mathbf{F}_{EB} is first to determine \mathbf{F}_{ED} from section *aa*, then use this result on section *bb*. Fig. 6, 18*g*, which is shown in Fig. 6, 18*g*. Here the force section *bb*, Fig. 6–18*a*, which is shown in Fig. 6–18*c*. Here the force system is concurrent and our sectioned free-body diagram is the same as the free-body diagram for the joint at *E*.

Equations of Equilibrium. In order to determine the moment of \mathbf{F}_{ED} about point *B*, Fig. 6–18*b*, we will use the principle of the principle of the principle is the principle transmissibility and slide the force to point *C* and then resolve it into its rectangular components as shown. Therefore,

$$
\zeta + \Sigma M_B = 0; \qquad 1000 \text{ N} (4 \text{ m}) + 3000 \text{ N} (2 \text{ m}) - 4000 \text{ N} (4 \text{ m}) + F_{ED} \sin 30^\circ (4 \text{ m}) = 0 F_{ED} = 3000 \text{ N} \quad \text{(C)}
$$

Considering now the free-body diagram of section *bb*, Fig. 6–18*c*, we have
\n
$$
\Rightarrow \Sigma F_x = 0; \qquad F_{EF} \cos 30^\circ - 3000 \cos 30^\circ \text{ N} = 0
$$
\n
$$
F_{EF} = 3000 \text{ N} \quad \text{(C)}
$$
\n
$$
+ \hat{\Sigma} F_y = 0; \qquad 2(3000 \sin 30^\circ \text{ N}) - 1000 \text{ N} - F_{EB} = 0
$$
\n
$$
F_{EB} = 2000 \text{ N} \quad \text{(T)} \qquad \qquad \text{Ans.}
$$

Fig. 6–19

Typical roof-supporting space truss. Notice the use of ball-andsocket joints for the connections

For economic reasons, large electrical transmission towers are often constructed using space trusses.

*6.5 [Space Trusses](#page-12-0)

A *space truss* consists of members joined together at their ends to form a stable three-dimensional structure.The simplest form of a space truss is a *tetrahedron*, formed by connecting six members together, as shown in Fig. 6–19. Any additional members added to this basic element would be redundant in supporting the force **P**. A *simple space truss* can be built from this basic tetrahedral element by adding three additional members and a joint, and continuing in this manner to form a system of multiconnected tetrahedrons.

Assumptions for Design The members of a space truss may be treated as two-force members provided the external loading is applied at the joints and the joints consist of ball-and-socket connections. These assumptions are justified if the welded or bolted connections of the joined members intersect at a common point and the weight of the members can be neglected. In cases where the weight of a member is to be included in the analysis, it is generally satisfactory to apply it as a vertical force, half of its magnitude applied at each end of the member.

Either the method of joints or the method of sections can be used to determine the forces developed in the members of a simple space truss.

Method of Joints.

If the forces in *all* the members of the truss are to be determined, then the method of joints is most suitable for the analysis. Here it is the method of joints is most suitable for the analysis. Here it is
necessary to apply the three equilibrium equations $\Sigma F_x = 0$,
 $\Sigma F_x = 0$, $\Sigma F_y = 0$ to the forces acting at each joint Remember that ecessary to apply the three equilibrium equations $\Sigma F_x = 0$,
 $F_y = 0$, $\Sigma F_z = 0$ to the forces acting at each joint. Remember that

is equation of many simultaneous equations can be avoided if the the solution of many simultaneous equations can be avoided if the force analysis begins at a joint having at least one known force and at most three unknown forces.Also, if the three-dimensional geometry of the force system at the joint is hard to visualize, it is recommended that a Cartesian vector analysis be used for the solution.

Method of Sections.

If only a *few* member forces are to be determined, the method of sections can be used. When an imaginary section is passed through a truss and the truss is separated into two parts, the force system acting on one of the segments must satisfy the *six* equilibrium equations: (Eqs. 5–6). By proper choice of the section and axes for summing forces and moments, many of the unknown member forces in a space truss can be computed *directly*, using a single equilibrium equation. $\Sigma F_x = 0$, $\Sigma F_y = 0$, $\Sigma F_z = 0$, $\Sigma M_x = 0$, $\Sigma M_y = 0$, $\Sigma M_z = 0$

B

$EXAMPLE$ 6.8

Determine the forces acting in the members of the space truss shown in Fig. 6–20*a*. Indicate whether the members are in tension or compression.

SOLUTION

Since there are one known force and three unknown forces acting at joint *A*, the force analysis of the truss will begin at this joint.

Joint A. (Fig. 6–20*b*). Expressing each force acting on the free-body diagram of joint *A* as a Cartesian vector, we have

$$
\mathbf{P} = \{-4\mathbf{j}\} \text{ kN}, \qquad \mathbf{F}_{AB} = F_{AB}\mathbf{j}, \quad \mathbf{F}_{AC} = -F_{AC}\mathbf{k},
$$

$$
\mathbf{F}_{AE} = F_{AE}\left(\frac{\mathbf{r}_{AE}}{r_{AE}}\right) = F_{AE}(0.577\mathbf{i} + 0.577\mathbf{j} - 0.577\mathbf{k})
$$

For equilibrium,

$$
\Sigma \mathbf{F} = \mathbf{0}; \qquad \mathbf{P} + \mathbf{F}_{AB} + \mathbf{F}_{AC} + \mathbf{F}_{AE} = \mathbf{0}
$$

\n
$$
-4\mathbf{j} + F_{AB}\mathbf{j} - F_{AC}\mathbf{k} + 0.577F_{AE}\mathbf{i} + 0.577F_{AE}\mathbf{j} - 0.577F_{AE}\mathbf{k} = \mathbf{0}
$$

\n
$$
\Sigma F_x = 0; \qquad 0.577F_{AE} = 0
$$

\n
$$
\Sigma F_y = 0; \qquad -4 + F_{AB} + 0.577F_{AE} = 0
$$

\n
$$
\Sigma F_z = 0; \qquad -F_{AC} - 0.577F_{AE} = 0
$$

\n
$$
F_{AC} = F_{AE} = 0 \qquad \text{Ans.}
$$

Since F_{AB} is known, joint *B* can be analyzed next.

Joint ^B. (Fig. 6–20*c*).

$$
\Sigma F_x = 0; \t -R_B \cos 45^\circ + 0.707 F_{BE} = 0
$$

\n
$$
\Sigma F_y = 0; \t -4 + R_B \sin 45^\circ = 0
$$

\n
$$
\Sigma F_z = 0; \t 2 + F_{BD} - 0.707 F_{BE} = 0
$$

\n
$$
R_B = F_{BE} = 5.66 \text{ kN} \quad (\text{T}), \t F_{BD} = 2 \text{ kN} \quad (\text{C}) \t Ans.
$$

The *scalar* equations of equilibrium may also be applied directly to the forces acting on the free-body diagrams of joints *D* and *C* since the force components are easily determined. Show that

$$
F_{DE} = F_{DC} = F_{CE} = 0
$$
 Ans.

Probs. 6–65/66

This large crane is a typical example of a framework.

Common tools such as these pliers act as simple machines. Here the applied force on the handles creates a much larger force at the jaws.

6.6 [Frames and Machines](#page-12-0)

Frames and machines are two types of structures which are often composed of pin-connected *multiforce members*, i.e., members that are subjected to more than two forces. *Frames* are used to support loads, whereas *machines* contain moving parts and are designed to transmit and alter the effect of forces. Provided a frame or machine contains no more supports or members than are necessary to prevent its collapse, the forces acting at the joints and supports can be determined by applying the equations of equilibrium to each of its members. Once these forces are obtained, it is then possible to *design* the size of the members, connections, and supports using the theory of mechanics of materials and an appropriate engineering design code.

Free-Body Diagrams. In order to determine the forces acting at the joints and supports of a frame or machine, the structure must be disassembled and the free-body diagrams of its parts must be drawn.The following important points *must* be observed:

- Isolate each part by drawing its *outlined shape* Then show all the forces and/or couple moments that act on the part. Make sure to *label* or *identify* each known and unknown force and couple moment with reference to an established *x*, *y* coordinate system. Also, indicate any dimensions used for taking moments. Most often the equations of equilibrium are easier to apply if the forces are represented by their rectangular components. As usual, the sense of an unknown force or couple moment can be assumed.
- Identify all the two-force members in the structure and represent their free-body diagrams as having two equal but opposite collinear forces acting at their points of application. (See Sec. 5.4.) By recognizing the two-force members, we can avoid solving an unnecessary number of equilibrium equations.
- Forces common to any two *contacting* members act with equal magnitudes but opposite sense on the respective members. If the two members are treated as a *"system" of connected members*, then these forces are *"internal"* and are *not shown* on the *free-body diagram of the system*; however, if the free-body diagram of *each member* is drawn, the forces are *"external"* and *must* be shown on each of the free-body diagrams.

The following examples graphically illustrate how to draw the freebody diagrams of a dismembered frame or machine. In all cases, the weight of the members is neglected.

For the frame shown in Fig. 6–21*a*, draw the free-body diagram of (a) each member, (b) the pin at *B*, and (c) the two members connected together.

Fig. 6–21

SOLUTION

Part (a). By inspection, members *BA* and *BC* are *not* two-force members. Instead, as shown on the free-body diagrams, Fig. 6–21*b*, *BC* is subjected to a force from the pins at *B* and *C* and the external force **P**. Likewise, *AB* is subjected to a force from the pins at *A* and *B* and the external couple moment **M**. The pin forces are represented by their *x* and *y* components.

Part (b). The pin at *B* is subjected to only *two forces*, i.e., the force of member *BC* and the force of member *AB*. For *equilibrium* these forces or their respective components must be equal but opposite, Fig. 6–21*c*. Realize that Newton's third law is applied between the pin and its connected members, i.e., the effect of the pin on the two members, Fig. 6–21*b*, and the equal but opposite effect of the two members on the pin, Fig. 6–21*c*.

Part (c). The free-body diagram of both members connected together, yet removed from the supporting pins at *A* and *C*, is shown in Fig. 6–21*d*. The force components \mathbf{B}_x and \mathbf{B}_y are *not shown* on this diagram since they are *internal* forces (Fig. 6.21b) and therefore diagram since they are *internal* forces (Fig. 6–21*b*) and therefore cancel out. Also, to be consistent when later applying the equilibrium equations, the unknown force components at *A* and *C* must act in the *same sense* as those shown in Fig. 6–21*b*.

A constant tension in the conveyor belt is maintained by using the device shown in Fig. 6–22*a*. Draw the free-body diagrams of the frame and the cylinder that the belt surrounds. The suspended block has a weight of *W*.

(b)

Fig. 6–22

SOLUTION

The idealized model of the device is shown in Fig. 6–22*b*. Here the angle θ is assumed to be known. From this model, the free-body diagrams of the cylinder and frame are shown in Figs. 6–22*c* and 6–22*d*, respectively. Note that the force that the pin at *B* exerts on the cylinder can be represented by either its horizontal and vertical components \mathbf{B}_x
and \mathbf{B}_x which can be determined by using the force equations of and \mathbf{B}_y , which can be determined by using the force equations of equilibrium applied to the cylinder or by the two components T which equilibrium applied to the cylinder, or by the two components *T*, which provide equal but opposite moments on the cylinder and thus keep it from turning. Also, realize that once the pin reactions at *A* have been determined, half of their values act on each side of the frame since pin connections occur on each side, Fig. 6–22*a*.

For the frame shown in Fig. 6–23*a*, draw the free-body diagrams of (a) the entire frame including the pulleys and cords, (b) the frame without the pulleys and cords, and (c) each of the pulleys.

SOLUTION

Part (a). When the entire frame including the pulleys and cords is considered, the interactions at the points where the pulleys and cords are connected to the frame become pairs of *internal* forces which cancel each other and therefore are not shown on the free-body diagram, Fig. 6–23*b*.

Part (b). When the cords and pulleys are removed, their effect *on the frame* must be shown, Fig. 6–23*c*.

Part (c). The force components \mathbf{B}_x , \mathbf{B}_y , \mathbf{C}_x , \mathbf{C}_y of the pins on the pullave Eq. 6.23*d*, are equal but opposite to the force components pulleys, Fig. 6–23*d*, are equal but opposite to the force components exerted by the pins on the frame, Fig. 6–23*c*. Why?

F*BC*

 \mathbf{D}_x \mathbf{D}_x

F*x*

F*BE*

F*y*

F*HI*

(c)

Draw the free-body diagrams of the bucket and the vertical boom of the backhoe shown in the photo, Fig. 6–24*a*. The bucket and its contents have a weight *W*. Neglect the weight of the members.

SOLUTION

The idealized model of the assembly is shown in Fig. 6–24*b*. By inspection, members *AB*, *BC*, *BE*, and *HI* are all two-force members since they are pin connected at their end points and no other forces act on them. The free-body diagrams of the bucket and the boom are shown in Fig. 6–24*c*. Note that pin *C* is subjected to only two forces, whereas the pin at *B* is subjected to three forces, Fig. 6–24*d*. These three forces are related by the two equations of force equilibrium applied to each pin. The free-body diagram of the entire assembly is shown in Fig. 6–24*e*.

D*^y*

W

F*BA*

(e)

Draw the free-body diagram of each part of the smooth piston and link mechanism used to crush recycled cans, which is shown in Fig. 6–25*a*.

SOLUTION

By inspection, member *AB* is a two-force member. The free-body diagrams of the parts are shown in Fig. 6–25*b*. Since the pins at *B* and *D connect only two parts together*, the forces there are shown as equal but opposite on the separate free-body diagrams of their connected members. In particular, four components of force act on the piston: \mathbf{D}_x
and \mathbf{D}_x represent the effect of the pin (or lever *ERD*). Notice the and \mathbf{D}_y represent the effect of the pin (or lever *EBD*), \mathbf{N}_w is the resultant force of the support and **P** is the resultant compressive force *resultant force* of the support, and **P** is the resultant compressive force caused by the can *C*.

NOTE: A free-body diagram of the entire assembly is shown in Fig. 6–25*c*. Here the forces between the components are internal and are not shown on the free-body diagram.

Before proceeding, it is highly recommended that you cover the solutions to the previous examples and attempt to draw the requested freebody diagrams. When doing so, make sure the work is neat and that all the forces and couple moments are properly labeled.When finished, challenge yourself and solve the following four problems.

CONCEPTUAL PROBLEMS

P6–1. Draw the free-body diagrams of each of the crane boom segments *AB*, *BC*, and *BD*. Only the weights of *AB* and *BC* are significant. Assume *A* and *B* are pins.

P6–1

6

P6–2. Draw the free-body diagrams of the boom *ABCD* and the stick *EDFGH* of the backhoe. The weights of these two members are significant. Neglect the weights of all the other members, and assume all indicated points of connection are pins.

P6–2

P6–3. Draw the free-body diagrams of the boom *ABCDF* and the stick *FGH* of the bucket lift. Neglect the weights of the member. The bucket weighs *W*. The two force members are *BI*, *CE*, *DE* and *GE*. Assume all indicated points of connection are pins.

P6–3

P6–4. To operate the can crusher one pushes down on the lever arm *ABC* which rotates about the fixed pin at *B*. This moves the side links *CD* downward, which causes the guide plate *E* to also move downward and thereby crush the can. Draw the free-body diagrams of the lever, side link, and guide plate. Make up some reasonable numbers and do an equilibrium analysis to shown how much an applied vertical force at the handle is magnified when it is transmitted to the can.Assume all points of connection are pins and the guides for the plate are smooth.

Procedure for Analysis

The joint reactions on frames or machines (structures) composed of multiforce members can be determined using the following procedure.

Free-Body Diagram.

- Draw the free-body diagram of the entire frame or machine, a portion of it, or each of its members. The choice should be made so that it leads to the most direct solution of the problem.
- When the free-body diagram of a group of members of a frame or machine is drawn, the forces between the connected parts of this group are internal forces and are not shown on the free-body diagram of the group.
- Forces common to two members which are in contact act with equal magnitude but opposite sense on the respective free-body diagrams of the members.
- Two-force members, regardless of their shape, have equal but opposite collinear forces acting at the ends of the member.
- In many cases it is possible to tell by inspection the proper sense of the unknown forces acting on a member; however, if this seems difficult, the sense can be assumed.
- Remember that a couple moment is a free vector and can act at any point on the free-body diagram. Also, a force is a sliding vector and can act at any point along its line of action.

Equations of Equilibrium.

- Count the number of unknowns and compare it to the total number of equilibrium equations that are available. In two dimensions, there are three equilibrium equations that can be written for each member.
- Sum moments about a point that lies at the intersection of the lines of action of as many of the unknown forces as possible.
- If the solution of a force or couple moment magnitude is found to be negative, it means the sense of the force is the reverse of that shown on the free-body diagram.

C*x*

(b) 2000 N

Determine the horizontal and vertical components of force which the pin at *C* exerts on member *BC* of the frame in Fig. 6–26*a*.

SOLUTION I

Free-Body Diagrams. By inspection it can be seen that *AB* is a two-force member. The free-body diagrams are shown in Fig. 6–26*b*.

Equations of Equilibrium. The *three unknowns* can be determined

by applying the three equations of equilibrium to member *CB*.
\n
$$
\zeta + \Sigma M_C = 0
$$
; 2000 N(2 m) – $(F_{AB} \sin 60^\circ)(4 \text{ m}) = 0$ $F_{AB} = 1154.7 \text{ N}$
\n $\Rightarrow \Sigma F_x = 0$; 1154.7 cos 60° N – $C_x = 0$ $C_x = 577 \text{ N}$ Ans.
\n $+ \hat{\Sigma} F_y = 0$; 1154.7 sin 60° N – 2000 N + $C_y = 0$ $C_y = 1000 \text{ N}$ Ans.

SOLUTION II

Free-Body Diagrams. If one does not recognize that *AB* is a twoforce member, then more work is involved in solving this problem. The free-body diagrams are shown in Fig. 6–26*c*.

Equations of Equilibrium. The *six unknowns* are determined by applying the three equations of equilibrium to each member.

The results for C_x and C_y can be determined by solving these

equations in the following sequence: $4, 1, 5$, then 6. The results are

Fig. 6–26*b* be equal, opposite, and collinear at the ends of member *AB* automatically satisfies Eqs. 1, 2, and 3 above and therefore eliminates the need to write these equations. *As a result, save yourself some time and effort by always identifying the two-force members before starting the analysis!*

 \mathbf{F}_{AB}

The compound beam shown in Fig. 6–27*a* is pin connected at *B*. Determine the components of reaction at its supports. Neglect its weight and thickness.

SOLUTION

Free-Body Diagrams. By inspection, if we consider a free-body diagram of the *entire beam ABC*, there will be three unknown reactions at *A* and one at *C*. These four unknowns cannot all be obtained from the three available equations of equilibrium, and so for the solution it will become necessary to dismember the beam into its two segments, as shown in Fig. 6–27*b*.

Equations of Equilibrium. The six unknowns are determined as follows:

Solving each of these equations successively, using previously

lculated results, we obtain
 $A_x = 6 \text{ kN}$ $A_y = 12 \text{ kN}$ $M_A = 32 \text{ kN} \cdot \text{m}$ Ans. calculated results, we obtain

A 500-kg elevator car in Fig. 6–28*a* is being hoisted by motor *A* using the pulley system shown. If the car is traveling with a constant speed, determine the force developed in the two cables. Neglect the mass of the cable and pulleys.

SOLUTION

Free-Body Diagram. We can solve this problem using the freebody diagrams of the elevator car and pulley *C*, Fig. 6–28*b*.The tensile forces developed in the cables are denoted as T_1 and T_2 .

Equations of Equilibrium. For pulley *C*,

 $\mathcal{L}\left\{ \sum F_y = 0; \right.$ $T_2 - 2T_1 = 0 \text{ or } T_2 = 2T_1$ (1)

For the elevator car,

$$
+ \hat{\uparrow} \Sigma F_y = 0; \qquad 3T_1 + 2T_2 - 500(9.81) \,\mathrm{N} = 0 \tag{2}
$$

Substituting Eq. (1) into Eq. (2) yields

$$
3T_1 + 2(2T_1) - 500(9.81) N = 0
$$

$$
T_1 = 700.71 N = 701 N
$$
 Ans.

Substituting this result into Eq. (1),

$$
T_2 = 2(700.71) N = 1401 N = 1.40 kN
$$
 Ans.

The smooth disk shown in Fig. 6–29*a* is pinned at *D* and has a weight of 20 lb. Neglecting the weights of the other members, determine the horizontal and vertical components of reaction at pins *B* and *D*.

SOLUTION

Free-Body Diagrams. The free-body diagrams of the entire frame and each of its members are shown in Fig. 6–29*b*.

Equations of Equilibrium. The eight unknowns can of course be obtained by applying the eight equilibrium equations to each member—three to member *AB*, three to member *BCD*, and two to the disk. (Moment equilibrium is automatically satisfied for the disk.) If this is done, however, all the results can be obtained only from a simultaneous solution of some of the equations. (Try it and find out.) To avoid this situation, it is best first to determine the three support reactions on the *entire* frame; then, using these results, the remaining five equilibrium equations can be applied to two other parts in order to solve successively for the other unknowns.

Entire Frame

Determine the tension in the cables and also the force **P** required to support the 600-N force using the frictionless pulley system shown in Fig. 6–30*a*.

SOLUTION

Free-Body Diagram. A free-body diagram of each pulley *including* its pin and a portion of the contacting cable is shown in Fig. 6–30*b*. Since the cable is *continuous*, it has a *constant tension P* acting throughout its length. The link connection between pulleys *B* and *C* is a two-force member, and therefore it has an unknown tension *T* acting on it. Notice that the *principle of action, equal but opposite reaction* must be carefully observed for forces **P** and **T** when the *separate* free-body diagrams are drawn.

Equations of Equilibrium. The three unknowns are obtained as follows:

The two planks in Fig. 6–31*a* are connected together by cable *BC* and a smooth spacer *DE*. Determine the reactions at the smooth supports *A* and *F*, and also find the force developed in the cable and spacer.

(b)

Fig. 6–31

SOLUTION

Free-Body Diagrams. The free-body diagram of each plank is shown in Fig. 6–31*b*. It is important to apply Newton's third law to the interaction forces as shown.

Equations of Equilibrium. For plank *AD*,

 $\zeta + \sum M_A = 0$; $F_{DE}(6 \text{ ft}) - F_{BC}(4 \text{ ft}) - 100 \text{ lb} (2 \text{ ft}) = 0$

For plank *CF*,

 $\zeta + \sum M_F = 0$; $F_{DE}(4 \text{ ft}) - F_{BC}(6 \text{ ft}) + 200 \text{ lb} (2 \text{ ft}) = 0$

Solving simultaneously,

$$
F_{DE} = 140 \text{ lb}
$$
 $F_{BC} = 160 \text{ lb}$ Ans.

Using these results, for plank *AD*, +

Using these results, for plant AD,
+
$$
\uparrow \Sigma F_y = 0
$$
; $N_A + 140 \text{ lb} - 160 \text{ lb} - 100 \text{ lb} = 0$
 $N_A = 120 \text{ lb}$ *Ans.*

And for plank *CF*,

And for plant C*P*,
\n
$$
+\uparrow \Sigma F_y = 0;
$$
 $N_F + 160 \text{ lb} - 140 \text{ lb} - 200 \text{ lb} = 0$
\n $N_F = 180 \text{ lb}$ *Ans.*
$EXAMPLE$ 6.20

The 75-kg man in Fig. 6–32*a* attempts to lift the 40-kg uniform beam off the roller support at *B*. Determine the tension developed in the cable attached to *B* and the normal reaction of the man on the beam when this is about to occur.

SOLUTION

Free-Body Diagrams. The tensile force in the cable will be denoted as T_1 . The free-body diagrams of the pulley E , the man, and the beam as Y_1 . The free-body diagrams of the puney E , the mail, and the beam
are shown in Fig. 6–32*b*. The beam has no contact with roller B , so are shown in Fig. 6–32*b*. The beam has no contact with roller *B*, so $N_B = 0$. When drawing each of these diagrams, it is very important to apply Newton's third law apply Newton's third law.

Equations of Equilibrium. Using the free-body diagram of pulley *E*,
+ \uparrow $\Sigma F_y = 0$; $2T_1 - T_2 = 0$ or $T_2 = 2T_1$ (1)

$$
+ \int \Sigma F_y = 0; \qquad 2T_1 - T_2 = 0 \qquad \text{or} \qquad T_2 = 2T_1 \tag{1}
$$

Referring to the free-body diagram of the man using this result,

$$
+\uparrow \Sigma F_y = 0; \qquad N_m + 2T_1 - 75(9.81) \,\mathrm{N} = 0 \tag{2}
$$

Summing moments about point *A* on the beam,

$$
\zeta + \Sigma M_A = 0; \ T_1(3 \text{ m}) - N_m(0.8 \text{ m}) - [40(9.81) \text{ N}](1.5 \text{ m}) = 0 \tag{3}
$$

Solving Eqs. 2 and 3 simultaneously for T_1 and N_m , then using Eq. (1) for T_2 we obtain Eq. (1) for T_2 , we obtain

$$
T_1 = 256 \text{ N}
$$
 $N_m = 224 \text{ N}$ $T_2 = 512 \text{ N}$ Ans.

SOLUTION II

A direct solution for T_1 can be obtained by considering the beam, the A direct solution for T_1 can be obtained by considering the beam, the man, and pulley E as a *single system*. The free-body diagram is shown in Fig. 6–32*c*. Thus, E

$$
\zeta + \Sigma M_A = 0; \quad 2T_1(0.8 \text{ m}) - [75(9.81) \text{ N}](0.8 \text{ m}) - [40(9.81) \text{ N}](1.5 \text{ m}) + T_1(3 \text{ m}) = 0
$$

$$
T_1 = 256 \text{ N} \qquad \qquad \text{Ans.}
$$

With this result Eqs. 1 and 2 can then be used to find N_m and T_2 .

EXAMPLE 6.21

The frame in Fig. 6–33*a* supports the 50-kg cylinder. Determine the horizontal and vertical components of reaction at *A* and the force at *C*.

Fig. 6–33

SOLUTION

Free-Body Diagrams. The free-body diagram of pulley *D*, along with the cylinder and a portion of the cord (a system), is shown in Fig. 6–33*b*. Member *BC* is a two-force member as indicated by its free-body diagram.The free-body diagram of member *ABD* is also shown.

Equations of Equilibrium. We will begin by analyzing the equilibrium of the pulley. The moment equation of equilibrium is

automatically satisfied with
$$
T = 50(9.81)
$$
 N, and so
\n $\Rightarrow \Sigma F_x = 0;$ $D_x - 50(9.81)$ N = 0 $D_x = 490.5$ N
\n $+ \hat{\Sigma} F_y = 0;$ $D_y - 50(9.81)$ N = 0 $D_y = 490.5$ N *Ans.*

Using these results, F_{BC} can be determined by summing moments about point *A* on member *ABD*.
 $\mathcal{C} + \Sigma M_A = 0$: $F_{\text{BC}}(0.6 \text{ m}) + 490$

about point *A* on member *ABD*.
\n
$$
\zeta + \Sigma M_A = 0; F_{BC} (0.6 \text{ m}) + 490.5 \text{ N} (0.9 \text{ m}) - 490.5 \text{ N} (1.20 \text{ m}) = 0
$$
\n
$$
F_{BC} = 245.25 \text{ N} \qquad \qquad \text{Ans.}
$$

Now A_x and A_y can be determined by summing forces.

Ans. $A_v + \hat{\Delta} E_v = 0;$ $A_v - 490.5 \,\text{N} = 0$ $A_v = 490.5 \,\text{N}$ Ans. $\Rightarrow \Sigma F_x = 0$; $A_x - 245.25 N - 490.5 N = 0$ $A_x = 736 N$

FUNDAMENTAL PROBLEMS

F6–13. Determine the force *P* needed to hold the 60-lb weight in equilibrium.

F6–14. Determine the horizontal and vertical components of reaction at pin *C*.

CHAPTER REVIEW

Simple Truss

A simple truss consists of triangular elements connected together by pinned joints. The forces within its members can be determined by assuming the members are all two-force members, connected concurrently at each joint. The members are either in tension or compression, or carry no force.

Method of Joints

The method of joints states that if a truss is in equilibrium, then each of its joints is also in equilibrium. For a plane truss, the concurrent force system at each joint must satisfy force equilibrium.

To obtain a numerical solution for the forces in the members, select a joint that has a free-body diagram with at most two unknown forces and one known force. (This may require first finding the reactions at the supports.)

Once a member force is determined, use its value and apply it to an adjacent joint.

Remember that forces that are found to *pull* on the joint are *tensile forces*, and those that *push* on the joint are *compressive forces*.

To avoid a simultaneous solution of two equations, set one of the coordinate axes along the line of action of one of the unknown forces and sum forces perpendicular to this axis.This will allow a direct solution for the other unknown.

The analysis can also be simplified by first identifying all the zero-force members.

 $\Sigma F_r = 0$

$$
\Sigma F_y = 0
$$

Method of Sections

The method of sections states that if a truss is in equilibrium, then each segment of the truss is also in equilibrium. Pass a section through the truss and the member whose force is to be determined.Then draw the free-body diagram of the sectioned part having the least number of forces on it.

Sectioned members subjected to *pulling* are in *tension*, and those that are subjected to *pushing* are in *compression*.

Three equations of equilibrium are available to determine the unknowns.

If possible, sum forces in a direction that is perpendicular to two of the three unknown forces. This will yield a direct solution for the third force.

Sum moments about the point where the lines of action of two of the three unknown forces intersect, so that the third unknown force can be determined directly.

 $F_{GF} = 2 kN (C)$ $1000 \text{ N}(4 \text{ m}) - F_{GF} (2 \text{ m}) = 0$

Space Truss

A space truss is a three-dimensional truss built from tetrahedral elements, and is analyzed using the same methods as for plane trusses. The joints are assumed to be ball and socket connections.

Frames and Machines

Frames and machines are structures that contain one or more multiforce members, that is, members with three or more forces or couples acting on them. Frames are designed to support loads, and machines transmit and alter the effect of forces.

The forces acting at the joints of a frame or machine can be determined by drawing the free-body diagrams of each of its members or parts. The principle of action–reaction should be carefully observed when indicating these forces on the free-body diagram of each adjacent member or pin. For a coplanar force system, there are three equilibrium equations available for each member.

To simplify the analysis, be sure to recognize all two-force members. They have equal but opposite collinear forces at their ends.

These reinforcing rods will be encased in concrete in order to create a building column. The internal loadings developed within the material resist the external loading that is to be placed upon the column.

[Internal Forces](#page-12-0) 7

[CHAPTER OBJECTIVES](#page-12-0)

- To show how to use the method of sections to determine the internal loadings in a member.
- To generalize this procedure by formulating equations that can be plotted so that they describe the internal shear and moment throughout a member.
- To analyze the forces and study the geometry of cables supporting a load.

7.1 [Internal Forces Developed in](#page-12-0) Structural Members

To design a structural or mechanical member it is necessary to know the loading acting within the member in order to be sure the material can resist this loading. Internal loadings can be determined by using the *method of sections*.To illustrate this method, consider the cantilever beam in Fig. 7–1*a*. If the internal loadings acting on the cross section at point *B* are to be determined, we must pass an imaginary section *a–a* perpendicular to the axis of the beam through point *B* and then separate the beam into two segments. The internal loadings acting at *B* will then be exposed and become *external* on the free-body diagram of each segment, Fig. 7–1*b*.

Fig. 7–1

In each case, the link on the backhoe is a two-force member. In the top photo it is subjected to both bending and an axial load at its center. By making the member straight, as in the bottom photo, then only an axial force acts within the member.

The force component N_B that acts *perpendicular* to the cross section, is
rmed the *normal force*. The force component N_{τ} that is tangent to the termed the *normal force*. The force component V_B that is tangent to the cross section is called the *shear force* and the couple moment M_A is cross section is called the *shear force*, and the couple moment M_B is
referred to as the *hending moment*. The force components prevent the referred to as the *bending moment*. The force components prevent the relative translation between the two segments, and the couple moment prevents the relative rotation. According to Newton's third law, these loadings must act in opposite directions on each segment, as shown in Fig. 7–1*b*. They can be determined by applying the equations of equilibrium to the free-body diagram of either segment. In this case, however, the right segment is the better choice since it does not involve the unknown support reactions at *A*. A direct solution for N_B is obtained
by applying $\Sigma F = 0$, **V** is obtained from $\Sigma F = 0$ and **M**, can be the unknown support reactions at A. A direct solution for N_B is obtained
by applying $\Sigma F_x = 0$, V_B is obtained from $\Sigma F_y = 0$, and M_B can be
obtained by applying $\Sigma M_B = 0$ since the moments of N_B and V_B about by applying $\Sigma F_x = 0$, V_B is obtained from $\Sigma F_y = 0$, and M_B can be obtained by applying $\Sigma M_B = 0$, since the moments of N_B and V_B about R are zero. *B* are zero.

In two dimensions, we have shown that three internal loading resultants exist, Fig. 7–2*a*; however in three dimensions, a general internal force and couple moment resultant will act at the section. The *x, y, z* components of these loadings are shown in Fig. 7–2*b*. Here N_y is the normal force, and N_y and N_y are shear force components. M is a *normal force*, and V_x and V_z are *shear force components*. M_y is a *torsional or twisting moment* and M and M are *bending moment torsional or twisting moment*, and M_x and M_z are *bending moment* components For most applications these resultant loadings will get at the *components*. For most applications, these *resultant loadings* will act at the geometric center or centroid (*C*) of the section's cross-sectional area. Although the magnitude for each loading generally will be different at various points along the axis of the member, the method of sections can always be used to determine their values.

Sign Convention. Engineers generally use a sign convention to report the three internal loadings **N**, **V**, and **M**. Although this sign convention can be arbitrarily assigned, the one that is widely accepted will be used here, Fig. 7–3. The normal force is said to be positive if it creates *tension*, a positive shear force will cause the beam segment on which it acts to rotate clockwise, and a positive bending moment will tend to bend the segment on which it acts in a concave upward manner. Loadings that are opposite to these are considered negative.

If the member is subjected to a three-dimensional external loading, then the internal loadings are usually expressed as positive or negative, in accordance with an established *x*, *y*, *z* coordinate system such as shown in Fig. 7–2.

The method of sections can be used to determine the internal loadings on the cross section of a member using the following

• Before the member is sectioned, it may first be necessary to determine its support reactions, so that the equilibrium equations can be used to solve for the internal loadings only after the

where the internal loadings are to be determined.

Procedure for Analysis

Fig. 7–3

Equations of Equilibrium.

established sign convention.

procedure.

Support Reactions.

member is sectioned.

Free-Body Diagram.

- Moments should be summed at the section. This way the normal and shear forces at the section are elminated, and we can obtain a direct solution for the moment.
- If the solution of the equilibrium equations yields a negative scalar, the sense of the quantity is opposite to that shown on the free-body diagram.

The designer of this shop crane realized the need for additional reinforcement around the joint in order to prevent severe internal bending of the joint when a large load is suspended from the chain hoist.

Determine the normal force, shear force, and bending moment acting just to the left, point B , and just to the right, point C , of the 6-kN force on the beam in Fig. 7–4*a*.

SOLUTION

Support Reactions. The free-body diagram of the beam is shown in Fig. 7–4*b*. When determining the *external reactions*, realize that the 9-kN \cdot m couple moment is a free vector and therefore it can be in Fig. 7–4*b*. When determining the *external reactions*, realize that the $9-kN \cdot m$ couple moment is a free vector and therefore it can be placed *anywhere* on the free-body diagram of the entire beam. Here we will only determine \mathbf{A}_y , since the left segments will be used for the analysis analysis.

analysis.
\n
$$
\zeta + \sum M_D = 0
$$
; 9 kN·m + (6 kN)(6 m) - A_y(9 m) = 0
\n $A_y = 5$ kN

Free-Body Diagrams. The free-body diagrams of the left segments AB and AC of the beam are shown in Figs. 7–4c and 7–4d. In this case the 9-kN \cdot m couple moment is *not included* on these diagrams since it *AB* and *AC* of the beam are shown in Figs. 7–4*c* and 7–4*d*. In this case the $9-kN \cdot m$ couple moment is *not included* on these diagrams since it must be kept in its *original position* until *after* the section is made and the appropriate segment is isolated.

Equations of Equilibrium.

\n
$$
\zeta + \Sigma M_C = 0; \quad -(5 \text{ kN})(3 \text{ m}) + M_C = 0 \qquad M_C = 15 \text{ kN} \cdot \text{m} \quad \text{Ans.}
$$

NOTE: The negative sign indicates that V_C acts in the opposite sense to that shown on the free-body diagram.Also, the moment arm for the 5-kN force in both cases is approximately 3 m since *B* and *C* are "almost" coincident.

Fig. 7–4

Determine the normal force, shear force, and bending moment at *C* of the beam in Fig. 7–5*a*.

SOLUTION

Free-Body Diagram. It is not necessary to find the support reactions at *A* since segment *BC* of the beam can be used to determine the internal loadings at *C*. The intensity of the triangular distributed load at *C* is determined using similar triangles from the geometry shown in Fig. 7–5*b*, i.e.,

$$
w_C = (1200 \text{ N/m}) \left(\frac{1.5 \text{ m}}{3 \text{ m}}\right) = 600 \text{ N/m}
$$

The distributed load acting on segment *BC* can now be replaced by its resultant force, and its location is indicated on the free-body diagram, Fig. 7–5*c*.

Equations of Equilibrium
\n
$$
\Rightarrow \Sigma F_x = 0; \qquad N_C = 0
$$
\n
$$
+ \hat{\Sigma} F_y = 0; \qquad V_C - \frac{1}{2} (600 \text{ N/m}) (1.5 \text{ m}) = 0
$$
\n
$$
V_C = 450 \text{ N} \qquad \text{Ans.}
$$

$$
\zeta + \Sigma M_C = 0;
$$
 $-M_C - \frac{1}{2}(600 \text{ N/m})(1.5 \text{ m})(0.5 \text{ m}) = 0$
 $M_C = -225 \text{ N}$ *Ans.*

The negative sign indicates that M_C acts in the opposite sense to that shown on the free-body diagram.

 \mathbf{F}_{DC}

 \mathbf{F}_{DC}

3 4 5

(b)

Fig. 7–6

Determine the normal force, shear force, and bending moment acting at point *B* of the two-member frame shown in Fig. 7–6*a*.

SOLUTION

Support Reactions. A free-body diagram of each member is shown in Fig. 7–6*b*. Since *CD* is a two-force member, the equations of equilibrium need to be applied only to member *AC*.

$$
\zeta + \Sigma M_A = 0; \ -400 \text{ lb (4 ft)} + \left(\frac{3}{5}\right) F_{DC} (8 \text{ ft}) = 0 \qquad F_{DC} = 333.3 \text{ lb}
$$

\n
$$
\Rightarrow \Sigma F_x = 0; \qquad \qquad -A_x + \left(\frac{4}{5}\right) (333.3 \text{ lb}) = 0 \qquad A_x = 266.7 \text{ lb}
$$

$$
+\uparrow \Sigma F_y = 0;
$$
 $A_y - 400 \text{ lb} + (\frac{3}{5})(333.3 \text{ lb}) = 0$ $A_y = 200 \text{ lb}$

Free-Body Diagrams. Passing an imaginary section perpendicular to the axis of member *AC* through point *B* yields the free-body diagrams of segments *AB* and *BC* shown in Fig. 7–6*c*. When constructing these diagrams it is important to keep the distributed loading where it is until *after the section is made*. Only then can it be replaced by a single resultant force.

Equations of Equilibrium. Applying the equations of equilibrium to segment *AB*, we have

$$
\Rightarrow \Sigma F_x = 0; \qquad N_B - 266.7 \text{ lb} = 0 \qquad N_B = 267 \text{ lb} \qquad Ans. \n+ \hat{Z}F_y = 0; \qquad 200 \text{ lb} - 200 \text{ lb} - V_B = 0 \qquad V_B = 0 \qquad Ans. \n\zeta + \Sigma M_B = 0; \qquad M_B - 200 \text{ lb} (4 \text{ ft}) + 200 \text{ lb} (2 \text{ ft}) = 0 \nM_B = 400 \text{ lb} \cdot \text{ ft} \qquad Ans.
$$

$$
M_B = 400 \text{ lb} \cdot \text{ft}
$$
Ans.

NOTE: As an exercise, try to obtain these same results using segment *BC*.

 \mathbf{F}_{D}

Determine the normal force, shear force, and bending moment acting at point *E* of the frame loaded as shown in Fig. 7–7*a*.

SOLUTION

Support Reactions. By inspection, members *AC* and *CD* are twoforce members, Fig. 7–7*b*. In order to determine the internal loadings at *E*, we must first determine the force **R** acting at the end of member *AC*.To obtain it, we will analyze the equilibrium of the pin at *C*.

Summing forces in the vertical direction on the pin, Fig. 7–7*b*, we have

 $+\hat{\uparrow} \Sigma F_y = 0;$ $R \sin 45^\circ - 600 \text{ N} = 0$ $R = 848.5 \text{ N}$

Free-Body Diagram. The free-body diagram of segment *CE* is shown in Fig. 7–7*c*.

Equations of Equilibrium.

NOTE: These results indicate a poor design. Member *AC* should be *straight* (from *A* to *C*) so that bending within the member is *eliminated*. If *AC* were straight then the internal force would only create tension in the member.

2.5 m

 $\overline{1}$

4 m

6 m

The uniform sign shown in Fig. 7–8*a* has a mass of 650 kg and is supported on the fixed column. Design codes indicate that the expected maximum uniform wind loading that will occur in the area where it is located is 900 Pa. Determine the internal loadings at *A*.

SOLUTION

The idealized model for the sign is shown in Fig. 7–8*b*. Here the necessary dimensions are indicated. We can consider the free-body diagram of a section above point *A* since it does not involve the support reactions.

Free-Body Diagram. The sign has a weight of $W = 650(9.81)$ N = 6.376 kN and the wind creates a resultant force of $F =$ **Free-Body Diagram.** The sign has a weight of $W = 650(9.81)$ N = 6.376 kN, and the wind creates a resultant force of $F_w = 900$ N/m²(6 m)(2.5 m) = 13.5 kN, which acts perpendicular to the 6.376 kN, and the wind creates a resultant force of $F_w = 900 \text{ N/m}^2 (6 \text{ m}) (2.5 \text{ m}) = 13.5 \text{ kN}$, which acts perpendicular to the face of the sign. These loadings are shown on the free-body diagram, Fig. 7–8*c*.

Equations of Equilibrium. Since the problem is three dimensional, a vector analysis will be used.

$$
F = 0;
$$
 $F_A - 13.5i - 6.376k = 0$

$$
\mathbf{F}_A = \{13.5\mathbf{i} + 6.38\mathbf{k}\} \text{ kN}
$$
Ans.

$$
\Sigma \mathbf{M}_A = \mathbf{0}
$$

 $\mathbf{M}_A + \mathbf{r} \times (\mathbf{F}_w + \mathbf{W}) = 0$

$$
\mathbf{M}_{A} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & 3 & 5.25 \\ -13.5 & 0 & -6.376 \end{vmatrix} = \mathbf{0}
$$

$$
-13.5 \t0 -6.376
$$

$$
\mathbf{M}_A = \{19.1\mathbf{i} + 70.9\mathbf{j} - 40.5\mathbf{k}\} \text{ kN} \cdot \text{m}
$$
Ans.

NOTE: Here $\mathbf{F}_{A_z} = \{6.38\mathbf{k}\}\,\text{kN}$ represents the normal force, whereas is the shear force. Also, the torsional moment is $M_{A_1} = \{-40.5k\}$ kN \cdot m, and the bending moment is determined from $\mathbf{M}_{A_x} = \{13.51\} \text{ kN} \cdot \text{m}$, and the bending moment is determined from

its components $\mathbf{M}_{A_x} = \{19.1\} \text{ kN} \cdot \text{m}$ and $\mathbf{M}_{A_y} = \{70.9\} \text{ kN} \cdot \text{m}$; i.e., $(M_b)_A = \sqrt{(M_A)_x^2 + (M_A)_y^2} = 73.4 \text{ kN} \cdot \text{m}$. 2 $\frac{a_x - \{19.11\}}{a_x^2 + (M_A)}$ $\frac{2}{y}$ kN · m and
 $\frac{2}{y}$ = 73.4 kN · m **MOTE:** Here $\mathbf{F}_{A_x} = \{0.35\}$ kN is the $\mathbf{M}_{A_z} = \{-40.5\mathbf{k}\}$ kN·m,

*7.2 [Shear and Moment Equations and](#page-12-0) **Diagrams**

Beams are structural members designed to support loadings applied perpendicular to their axes. In general, they are long and straight and have a constant cross-sectional area.They are often classified as to how they are supported. For example, a *simply supported beam* is pinned at one end and roller supported at the other, as in Fig. 7–9*a*, whereas a *cantilevered beam* is fixed at one end and free at the other.The actual design of a beam requires a detailed knowledge of the *variation* of the internal shear force *V* and bending moment *M* acting at *each point* along the axis of the beam.*

These *variations* of *V* and *M* along the beam's axis can be obtained by using the method of sections discussed in Sec. 7.1. In this case, however, it is necessary to section the beam at an arbitrary distance *x* from one end and then apply the equations of equilibrium to the segment having the length *x*. Doing this we can then obtain *V* and *M* as functions of *x*.

In general, the internal shear and bending-moment functions will be discontinuous, or their slopes will be discontinuous, at points where a distributed load changes or where concentrated forces or couple moments are applied. Because of this, these functions must be determined for *each segment* of the beam located between any two discontinuities of loading. For example, segments having lengths x_1 , x_2 , and x_3 will have to be used to describe the variation of V and M along and x_3 will have to be used to describe the variation of *V* and *M* along the length of the beam in Fig. $7-9a$. These functions will be valid *only* the length of the beam in Fig. $7-9a$. These functions will be valid *only* within regions from *O* to *a* for x_1 , from *a* to *b* for x_2 , and from *b* to *L* for x_2 . If the resulting functions of *x* are plotted, the graphs are termed the x_3 . If the resulting functions of *x* are plotted, the graphs are termed the shear diggram and bending moment diggram. Fig. 7–9b and Fig. 7–9c. *shear diagram* and *bending-moment diagram*, Fig. 7–9*b* and Fig. 7–9*c*, respectively.

To save on material and thereby produce an efficient design, these beams, also called girders, have been tapered, since the internal moment in the beam will be larger at the supports, or piers, than at the center of the span.

*The internal normal force is not considered for two reasons. In most cases, the loads applied to a beam act perpendicular to the beam's axis and hence produce only an internal shear force and bending moment. And for design purposes, the beam's resistance to shear, and particularly to bending, is more important than its ability to resist a normal force.

This extended towing arm must resist both bending and shear loadings throughout its length due to the weight of the vehicle.The variation of these loadings must be known if the arm is to be properly designed.

Procedure for Analysis

The shear and bending-moment diagrams for a beam can be constructed using the following procedure.

Support Reactions.

• Determine all the reactive forces and couple moments acting on the beam and resolve all the forces into components acting perpendicular and parallel to the beam's axis.

Shear and Moment Functions.

- Specify separate coordinates *x* having an origin at the beam's left end and extending to regions of the beam *between* concentrated forces and/or couple moments, or where the distributed loading is continuous.
- Section the beam at each distance x and draw the free-body diagram of one of the segments. Be sure **V** and **M** are shown acting in their *positive sense*, in accordance with the sign convention given in Fig. 7–10.
- The shear *V* is obtained by summing forces perpendicular to the beam's axis.
- The moment M is obtained by summing moments about the sectioned end of the segment.

Shear and Moment Diagrams.

- Plot the shear diagram (*V* versus *x*) and the moment diagram (*M* versus *x*). If computed values of the functions describing *V* and *M* are *positive*, the values are plotted above the *x* axis, whereas *negative* values are plotted below the *x* axis.
- Generally, it is convenient to plot the shear and bending-moment diagrams directly below the free-body diagram of the beam.

(4)

$EXAMPLE$ 7.6

Draw the shear and moment diagrams for the shaft shown in Fig. 7–11*a*. The support at *A* is a thrust bearing and the support at *C* is a journal bearing.

SOLUTION

Support Reactions. The support reactions are shown on the shaft's free-body diagram, Fig. 7–11*d*.

Shear and Moment Functions. The shaft is sectioned at an arbitrary distance *x* from point *A*, extending within the region *AB*, and the free-body diagram of the left segment is shown in Fig. 7–11*b*. The unknowns **V** and **M** are assumed to act in the *positive sense* on the right-hand face of the segment according to the established sign

convention. Applying the equilibrium equations yields

+ \uparrow $\Sigma F_y = 0$; $V = 2.5 \text{ kN}$ (1) $\begin{align*}\n\mathcal{L}F_y &= 0; & V &= 2.5 \text{ kN} \\
\zeta + \sum M &= 0; & M &= 2.5x \text{ kN} \cdot \text{m} \\
\text{A free-body diagram for a left segment of the shaft extending a}\n\end{align*}$ $+\uparrow \Sigma F_y = 0;$
 $\zeta + \Sigma M = 0;$

 $M = 2.5x \text{ kN} \cdot \text{m}$ (2)

distance *x* within the region *BC* is shown in Fig. 7–11*c*. As always, **V**

and **M** are shown acting in the positive sense. Hence,
\n
$$
+ \hat{\ } \Sigma F_y = 0; \qquad 2.5 \text{ kN} - 5 \text{ kN} - V = 0
$$
\n
$$
V = -2.5 \text{ kN} \qquad (3)
$$
\n
$$
\zeta + \Sigma M = 0; \qquad M + 5 \text{ kN} (x - 2 \text{ m}) - 2.5 \text{ kN} (x) = 0
$$
\n
$$
M = (10 - 2.5x) \text{ kN} \cdot \text{m} \qquad (4)
$$

Shear and Moment Diagrams. When Eqs. 1 through 4 are plotted within the regions in which they are valid, the shear and moment diagrams shown in Fig. 7–11*d* are obtained. The shear diagram indicates that the internal shear force is always 2.5 kN (positive) within segment AB. Just to the right of point B, the shear force changes sign and remains at a constant value of -2.5 kN for segment *BC*. The moment diagram
starts at zero, increases linearly to point *B* at $x = 2$ m, where
 $M = 2.5$ kN(2 m) = 5 kN·m and thereafter decreases back to zero starts at zero, increases linearly to point *B* at $x = 2$ m, where at a constant value of -2.5 kN for segment *BC*. The moment diagram
starts at zero, increases linearly to point *B* at $x = 2$ m, where
 $M_{\text{max}} = 2.5$ kN(2 m) = 5 kN·m, and thereafter decreases back to zero.

NOTE: It is seen in Fig. 7–11*d* that the graphs of the shear and moment diagrams are discontinuous where the concentrated force acts, i.e., at points *A, B*, and *C*. For this reason, as stated earlier, it is necessary to express both the shear and moment functions separately for regions between concentrated loads. It should be realized, however, that all loading discontinuities are mathematical, arising from the *idealization of a concentrated force and couple moment*. Physically, loads are always applied over a finite area, and if the actual load variation could be accounted for, the shear and moment diagrams would then be continuous over the shaft's entire length.

Draw the shear and moment diagrams for the beam shown in Fig. 7–12*a*.

SOLUTION

Support Reactions. The support reactions are shown on the beam's free-body diagram, Fig. 7–12*c*.

Shear and Moment Functions. A free-body diagram for a left segment of the beam having a length *x* is shown in Fig. 7–12*b*. Due to proportional triangles, the distributed loading acting at the end of this proportional triangles, the distributed loading acting at the end of this
segment has an intensity of $w/x = 6/9$ or $w = (2/3)x$. It is replaced by
a resultant force *after* the segment is isolated as a free-body diagram a resultant force *after* the segment is isolated as a free-body diagram. The *magnitude* of the resultant force is equal to $\frac{1}{2}(x)(\frac{2}{3}x) = \frac{1}{3}x^2$. This The *magnitude* of the resultant force is equal to $\frac{1}{2}(x)(\frac{1}{3}x) = \frac{2}{3}x^2$. This force *acts through the centroid* of the distributed loading area, a distance $\frac{1}{3}x$ from the right end. Applying the two equations of $\frac{3x}{3}$ if $\frac{10}{10}$ equilibrium yields $(\frac{2}{3}x) = \frac{1}{3}x^2$.

$$
+ \uparrow \Sigma F_y = 0; \qquad 9 - \frac{1}{3}x^2 - V = 0
$$

$$
V = \left(9 - \frac{x^2}{3}\right)kN \qquad (1)
$$

$$
\zeta + \Sigma M = 0; \qquad M + \frac{1}{2}x^2\left(\frac{x}{2}\right) - 9x = 0
$$

$$
M = 0; \qquad M + \frac{1}{3}x^2\left(\frac{x}{3}\right) - 9x = 0
$$

$$
M = \left(9x - \frac{x^3}{9}\right)kN \cdot m \tag{2}
$$

Shear and Moment Diagrams. The shear and moment diagrams shown in Fig. 7–12*c* are obtained by plotting Eqs. 1 and 2.

The point of *zero shear* can be found using Eq. 1:

$$
V = 9 - \frac{x^2}{3} = 0
$$

$$
x = 5.20 \text{ m}
$$

NOTE: It will be shown in Sec. 7–3 that this value of *x* happens to represent the point on the beam where the *maximum moment* occurs. Using Eq. 2, we have

$$
M_{\text{max}} = \left(9(5.20) - \frac{(5.20)^3}{9}\right) \text{kN} \cdot \text{m}
$$

= 31.2 kN ⋅ m

*7.3 [Relations between Distributed](#page-12-0) Load, Shear, and Moment

If a beam is subjected to several concentrated forces, couple moments, and distributed loads, the method of constructing the shear and bendingmoment diagrams discussed in Sec. 7–2 may become quite tedious. In this section a simpler method for constructing these diagrams is discussed—a method based on differential relations that exist between the load, shear, and bending moment.

Distributed Load. Consider the beam *AD* shown in Fig. 7–13*a*, **Distributed Load.** Consider the beam *AD* shown in Fig. 7–13*a*, which is subjected to an arbitrary load $w = w(x)$ and a series of concentrated forces and counle moments In the following discussion the concentrated forces and couple moments. In the following discussion, the *distributed load* will be considered *positive* when the *loading acts upward* as shown. A free-body diagram for a small segment of the beam having a length Δx is chosen at a point x along the beam which is *not* subjected to a concentrated force or couple moment, Fig. 7–13*b*. Hence any results obtained will not apply at these points of concentrated loading. The internal shear force and bending moment shown on the free-body diagram are assumed to act in the *positive sense* according to the established sign convention. Note that both the shear force and moment acting on the right-hand face must be increased by a small, finite amount in order to keep the segment in equilibrium. The distributed loading has ¢in order to keep the segment in equilibrium. The distributed loading has
been replaced by a resultant force $\Delta F = w(x) \Delta x$ that acts at a
fractional distance $k(\Delta x)$ from the right end where $0 \le k \le 1$ [for been replaced by a resultant force $\Delta F = w(x) \Delta x$ that acts at a fractional distance $k(\Delta x)$ from the right end, where $0 < k < 1$ [for fractional distance $k(\Delta x)$ from 1
example, if $w(x)$ is *uniform*, $k = \frac{1}{2}$.

Relation Between the Distributed Load and Shear. If we apply the force equation of equilibrium to the segment, then

$$
f_{\rm{max}}(x)
$$

$$
+\uparrow \Sigma F_y = 0; \qquad V + w(x)\Delta x - (V + \Delta V) = 0
$$

$$
\Delta V = w(x)\Delta x
$$

Dividing by Δx , and letting $\Delta x \rightarrow 0$, we get

$$
\frac{dV}{dx} = w(x)
$$

slope of
shear diagram = distributed load (7-1)

Fig. 7–13

If we rewrite the above equation in the form $dV = w(x)dx$ and perform an integration between any two points *B* and *C* on the beam, we see that

$$
\Delta V = \int w(x) dx
$$

Change in
shear =
$$
\begin{cases}\n\text{Area under} \\
\text{loading curve}\n\end{cases}
$$
 (7–2)

Relation Between the Shear and Moment. If we apply the moment equation of equilibrium about point *O* on the free-body diagram in Fig. 7–13*b*, we get

$$
\zeta + \Sigma M_0 = 0; \quad (M + \Delta M) - [w(x)\Delta x] k\Delta x - V\Delta x - M = 0
$$

$$
\Delta M = V\Delta x + k w(x)\Delta x^2
$$

Dividing both sides of this equation by Δx , and letting $\Delta x \rightarrow 0$, yields

$$
\frac{dM}{dx} = V
$$

Slope of
moment diagram = Shear (7-3)

In particular, notice that the absolute maximum bending moment In particular, notice that the absolute maximum bending moment $|M|_{max}$ occurs at the point where the slope $dM/dx = 0$, since this is where the shear is equal to zero. where the shear is equal to zero.

If Eq. 7–3 is rewritten in the form $dM = \int V dx$ and integrated between any two points *B* and *C* on the beam, we have $dM = \int V dx$
eam, we have

$$
\Delta M = \int V dx
$$

Change in
moment = Area under
shear diagram (7-4)

As stated previously, the above equations do not apply at points where a *concentrated* force or couple moment acts. These two special cases create *discontinuities* in the shear and moment diagrams, and as a result, each deserves separate treatment.

Force. A free-body diagram of a small segment of the beam in Fig. 7–13*a*, taken from under one of the forces, is shown in Fig. 7–14*a*. Here force equilibrium requires

$$
+ \uparrow \Sigma F_y = 0; \qquad \Delta V = F \qquad (7-5)
$$

Since the *change in shear is positive*, the shear diagram will "jump" *upward when* **F** *acts upward* on the beam. Likewise, the jump in shear (ΔV) is downward when **F** acts downward.

Fig. 7–14

Couple Moment. If we remove a segment of the beam in Fig. $M + \Delta M$ 7–13*a* that is located at the couple moment M_0 , the free-body diagram shown in Fig. 7–14*b* results. In this case letting $\Delta x \rightarrow 0$, moment equilibrium requires equilibrium requires

$$
\zeta + \Sigma M = 0; \qquad \Delta M = M_0 \qquad (7-6)
$$

Thus, the *change in moment is positive*, or the moment diagram will Thus, the *change in moment is positive*, or the moment diagram will
"jump" *upward if* M_0 *is clockwise*. Likewise, the jump ΔM is downward when M_0 is counterclockwise when M_0 is counterclockwise.

The examples which follow illustrate application of the above equations when used to construct the shear and moment diagrams. After working through these examples, it is recommended that you solve Examples 7.6 and 7.7 using this method.

Important Points

- The slope of the shear diagram at a point is equal to the intensity of the distributed loading, where positive distributed loading is of the distributed loading, v
upward, i.e., $dV/dx = w(x)$.
- If a concentrated force acts upward on the beam, the shear will jump upward by the same amount. ¢
- The change in the shear ΔV between two points is equal to *the* area under the distributed-loading curve between the points.
- The slope of the moment diagram at a point is equal to the shear, The slope of the i
i.e., $dM/dx = V$.
- The change in the moment ΔM between two points is equal to the *area* under the shear diagram between the two points.
- If a *clockwise* couple moment acts on the beam, the shear will not be affected; however, the moment diagram will jump *upward* by the amount of the moment.
- Points of *zero shear* represent points of *maximum or minimum* Points of *zero shear* repres
 moment since $dM/dx = 0$.
- Because two integrations of $w = w(x)$ are involved to first
 • Because two integrations of $w = w(x)$ are involved to first

determine the change in shear $\Delta V = \int w(x) dx$ then to determine the change in shear, $\Delta V = \int w(x) dx$, then to determine the change in moment, $\Delta M = \int V dx$, then if the determine the change in moment, $\Delta M = \int V dx$, then if the loading curve $w = w(x)$ is a polynomial of degree *n*, $V = V(x)$ will be a curve of degree *n* + 1 and $M = M(x)$ will be a curve of will be a curve of degree $n + 1$, and $M = M(x)$ will be a curve of degree $n + 2$. is a polynomial of deg
 $n + 1$, and $M = M(x)$ $W = \int w(x)$

 $M = \int V dx$, t

This concrete beam is used to support the deck. Its size and the placement of steel reinforcement within it can be determined once the shear and moment diagrams have been established.

EXAMPLE 7.8

Draw the shear and moment diagrams for the cantilever beam in Fig. 7–15*a*.

SOLUTION

The support reactions at the fixed support *B* are shown in Fig. 7–15*b*.

Shear Diagram. The shear at end *A* is -2 kN. This value is plotted at $x = 0$, Fig. 7–15*c*. Notice how the shear diagram is constructed by following the slopes defined by the loading *w*. The shear at $x = 4$ m is –5 kN, the reaction on the beam. This value can be verified by finding the area under the distributed loading; i.e.,

$$
V|_{x=4\,\mathrm{m}} = V|_{x=2\,\mathrm{m}} + \Delta V = -2\,\mathrm{kN} - (1.5\,\mathrm{kN/m})(2\mathrm{m}) = -5\,\mathrm{kN}
$$

Moment Diagram. The moment of zero at $x = 0$ is plotted in Fig. 7–15*d*. Construction of the moment diagram is based on knowing its slope which is equal to the shear at each point. The change of moment from $x = 0$ to $x = 2$ m is determined from the area under the shear diagram. Hence, the moment at $x = 2$ m is

$$
M|_{x=2 m} = M|_{x=0} + \Delta M = 0 + [-2 \text{ kN}(2 m)] = -4 \text{ kN} \cdot \text{m}
$$

This same value can be determined from the method of sections, Fig. 7–15*e*.

 4 m \leftarrow 2 m $A_y = 2 \text{ kN}$ $B_y = 10 \text{ kN}$

EXAMPLE 7.9

Draw the shear and moment diagrams for the overhang beam in Fig. 7–16*a*.

SOLUTION

The support reactions are shown in Fig. 7–16*b*.

Shear Diagram. The shear of -2 kN at end *A* of the beam is plotted at $x = 0$, Fig. 7–16*c*. The slopes are determined from the loading and from this the shear diagram is constructed, as indicated in the figure. In particular, notice the positive jump of 10 kN at $x = 4$ m due to the force B_y , as indicated in the figure.

Moment Diagram. The moment of zero at $x = 0$ is plotted, Fig. 7–16*d*, then following the behavior of the slope found from the shear diagram, the moment diagram is constructed. The moment at shear di $x = 4$ m

4 m is found from the area under the shear diagram.
\n
$$
M|_{x=4 \text{ m}} = M|_{x=0} + \Delta M = 0 + [-2 \text{ kN}(4 \text{ m})] = -8 \text{ kN} \cdot \text{m}
$$

We can also obtain this value by using the method of sections, as shown in Fig. 7–16*e*.

EXAMPLE 7.10

The shaft in Fig. 7–17*a* is supported by a thrust bearing at *A* and a journal bearing at *B*. Draw the shear and moment diagrams.

SOLUTION

The support reactions are shown in Fig. 7–17*b*.

Shear Diagram. As shown in Fig. 7–17*c*, the shear at $x = 0$ is +240. Following the slope defined by the loading, the shear diagram is constructed, where at *B* its value is -480 lb. Since the shear changes sign, the point where $V = 0$ must be located. To do this we will use the method of sections. The free-body diagram of the left segment of the …shaft, sectioned at an arbitrary position *x* within the region $0 \le x <$ 9 ft, is shown in Fig. 7–17*e*. Notice that the intensity of the distributed load at *x* is $w = 10x$, which has been found by proportional triangles, load at *x* is $w = 10$.
i.e., $120/12 = w/x$.

Thus, for $V = 0$,

$$
+\uparrow \Sigma F_y = 0;
$$
 240 lb $-\frac{1}{2}(10x)x = 0$
 $x = 6.93$ ft

Moment Diagram. The moment diagram starts at 0 since there is no moment at *A*, then it is constructed based on the slope as determined from the shear diagram. The maximum moment occurs at $x = 6.93$ ft, where the shear is equal to zero, since $dM/dx = V = 0$, Fig. 7–17*e*,

$$
\zeta + \Sigma M = 0;
$$
 $M_{\text{max}} + \frac{1}{2} [(10)(6.93)] 6.93 (\frac{1}{3}(6.93)) - 240(6.93) = 0$
 $M_{\text{max}} = 1109 \text{ lb} \cdot \text{ft}$

Finally, notice how integration, first of the loading *w* which is linear, produces a shear diagram which is parabolic, and then a moment diagram which is cubic.

Flexible cables and chains combine strength with lightness and often are used in structures for support and to transmit loads from one member to another. When used to support suspension bridges and trolley wheels, cables form the main load-carrying element of the structure. In the force analysis of such systems, the weight of the cable itself may be neglected because it is often small compared to the load it carries. On the other hand, when cables are used as transmission lines and guys for radio antennas and derricks, the cable weight may become important and must be included in the structural analysis.

Three cases will be considered in the analysis that follows. In each case we will make the assumption that the cable is *perfectly flexible* and *inextensible*. Due to its flexibility, the cable offers no resistance to bending, and therefore, the tensile force acting in the cable is always tangent to the cable at points along its length. Being inextensible, the cable has a constant length both before and after the load is applied.As a result, once the load is applied, the geometry of the cable remains unchanged, and the cable or a segment of it can be treated as a rigid body.

Cable Subjected to Concentrated Loads. When a cable of negligible weight supports several concentrated loads, the cable takes the form of several straight-line segments, each of which is subjected to a constant tensile force. Consider, for example, the cable shown in Fig. 7–18, where the distances h, L_1, L_2 , and L_3 and the loads P_1 and P_2
are known. The problem here is to determine the *nine unknowns* are known. The problem here is to determine the *nine unknowns* consisting of the tension in each of the *three* segments, the *four* components of reaction at *A* and *B*, and the *two* sags y_c and y_p at points C and D . For the solution we can write *two* equations of force equilibrium at each of points *A, B, C*, and *D*.This results in a total of *eight equations*.* To complete the solution, we need to know something about the geometry of the cable in order to obtain the necessary ninth equation. For example, if the cable's total *length L* is specified, then the Pythagorean theorem can be used to relate each of the three segmental lengths, written in terms of *h*, y_C , y_D , L_1 , L_2 , and L_3 , to the total length *L*.
Linfortunately this type of problem cannot be solved easily by hand Unfortunately, this type of problem cannot be solved easily by hand. Another possibility, however, is to specify one of the sags, either y_C or y_D , instead of the cable length. By doing this, the equilibrium equations
are then sufficient for obtaining the unknown forces and the remaining are then sufficient for obtaining the unknown forces and the remaining sag. Once the sag at each point of loading is obtained, the length of the cable can then be determined by trigonometry. The following example illustrates a procedure for performing the equilibrium analysis for a problem of this type.

Each of the cable segments remains approximately straight as they support the weight of these traffic lights.

Fig. 7–18

^{*}As will be shown in the following example, the eight equilibrium equations *also* can be written for the entire cable, or any part thereof. But *no more* than *eight* equations are available.

EXAMPLE 7.11

Determine the tension in each segment of the cable shown in Fig. 7–19*a*.

A 12 m *C B yB D* 15 kN 4 kN 3 kN *E* 3 m 2 m $5 \text{ m} \rightarrow -8 \text{ m}$ (a) *yD*

SOLUTION

By inspection, there are four unknown external reactions $(A_x, A_y, E_x, A_y, E_x)$ and E_v) and four unknown cable tensions, one in each cable segment. These eight unknowns along with the two unknown sags y_B and can be determined from *ten* available equilibrium equations. One can be determined from *ten* available equilibrium equations. One
method is to apply the force equations of equilibrium ($\Sigma F_x = 0$,
 $\Sigma F_y = 0$) to each of the five points 4 through F. Here however we ethod is to apply the force equations of equilibrium ($\Sigma F_x = 0$, $F_y = 0$) to each of the five points *A* through *E*. Here, however, we ill take a more direct approach will take a more direct approach.

Consider the free-body diagram for the entire cable, Fig. 7–19b. Thus,
\n
$$
\Rightarrow \Sigma F_x = 0;
$$
 $-A_x + E_x = 0$
\n $\zeta + \Sigma M_E = 0;$ $-A_y(18 \text{ m}) + 4 \text{ kN} (15 \text{ m}) + 15 \text{ kN} (10 \text{ m}) + 3 \text{ kN} (2 \text{ m}) = 0$
\n $A_y = 12 \text{ kN}$
\n $+ \hat{\Sigma} F_y = 0;$ $12 \text{ kN} - 4 \text{ kN} - 15 \text{ kN} - 3 \text{ kN} + E_y = 0$
\n $E_y = 10 \text{ kN}$

Since the sag $y_C = 12$ m is known, we will now consider the leftmost
section which cuts cable *BC* Fig. 7–19c section, which cuts cable *BC*, Fig. 7–19*c*.
 $(1.5 \times 10^{-9}) = 72 \text{ kN} (8 \text{ m})$

$$
\zeta + \Sigma M_C = 0; A_x(12 \text{ m}) - 12 \text{ kN (8 m)} + 4 \text{ kN (5 m)} = 0
$$

\n
$$
A_x = E_x = 6.33 \text{ kN}
$$

\n
$$
\Rightarrow \Sigma F_x = 0; \qquad T_{BC} \cos \theta_{BC} - 6.33 \text{ kN} = 0
$$

\n
$$
+ \hat{L} E_y = 0; \qquad 12 \text{ kN} - 4 \text{ kN} - T_{BC} \sin \theta_{BC} = 0
$$

\nThus,
\n
$$
\theta_{BC} = 51.6^\circ
$$

\n
$$
T_{BC} = 10.2 \text{ kN} \qquad Ans.
$$

Fig. 7–19

Proceeding now to analyze the equilibrium of points *A, C*, and *E* in sequence, we have

Point ^A (Fig. 7–19*d*).

Point A (Fig. 7-19*d*).
\n
$$
\Rightarrow \Sigma F_x = 0; \t T_{AB} \cos \theta_{AB} - 6.33 \text{ kN} = 0
$$
\n
$$
+ \hat{\Sigma} F_y = 0; \t -T_{AB} \sin \theta_{AB} + 12 \text{ kN} = 0
$$
\n
$$
\theta_{AB} = 62.2^{\circ}
$$
\n
$$
T_{AB} = 13.6 \text{ kN} \t Ans.
$$

Point C (Fig. 7–19*e*).

Ans. $T_{CD} = 9.44 \text{ kN}$ $\theta_{CD} = 47.9^\circ$ $\Rightarrow \Sigma F_x = 0;$ $f + \int \Sigma F_y = 0$; $T_{CD} \sin \theta_{CD} + 10.2 \sin 51.6^\circ \text{ kN} - 15 \text{ kN} = 0$ $T_{CD} \cos \theta_{CD} - 10.2 \cos 51.6^{\circ} \text{ kN} = 0$

Point **E** (Fig. 7–19f).
\n
$$
\Rightarrow \Sigma F_x = 0; \qquad 6.33 \text{ kN} - T_{ED} \cos \theta_{ED} = 0
$$
\n
$$
+ \hat{\ } \Sigma F_y = 0; \qquad 10 \text{ kN} - T_{ED} \sin \theta_{ED} = 0
$$
\n
$$
\theta_{ED} = 57.7^\circ
$$
\n
$$
T_{ED} = 11.8 \text{ kN}
$$
\nAns.

NOTE: By comparison, the maximum cable tension is in segment *AB* since this segment has the greatest slope (θ) and it is required that for since this segment has the greatest slope (θ) and it is required that for
any cable segment the horizontal component $T \cos \theta = A_x = E_x$
(a constant). Also since the slope angles that the cable segments make (a constant).Also, since the slope angles that the cable segments make with the horizontal have now been determined, it is possible to determine the sags y_B and y_D , Fig. 7–19*a*, using trigonometry.

The cable and suspenders are used to support the uniform load of a gas pipe which crosses the river.

Fig. 7–20

Cable Subjected to a Distributed Load. Let us now consider the weightless cable shown in Fig. 7–20*a*, which is subjected to a consider the weightless cable shown in Fig. 7–20*a*, which is subjected to a distributed loading $w = w(x)$ that is *measured in the x direction*. The free-hody diagram of a small segment of the cable having a length Λs i free-body diagram of a small segment of the cable having a length Δs is shown in Fig. 7–20*b*. Since the tensile force changes in both magnitude and direction along the cable's length, we will denote this change on the ¢free-body diagram by ΔT . Finally, the distributed load is represented by
its resultant force $w(r)(\Delta r)$ which acts at a fractional distance $k(\Delta r)$ free-body diagram by ΔT . Finally, the distributed load is represented by
its resultant force $w(x)(\Delta x)$, which acts at a fractional distance $k(\Delta x)$
from point O where $0 \le k \le 1$. Applying the equations of equilibrium its resultant force $w(x)(\Delta x)$, which acts at a fractional distance $k(\Delta x)$ from point *O*, where $0 \le k \le 1$. Applying the equations of equilibrium, we have we have

$$
\Rightarrow \Sigma F_x = 0; \qquad -T \cos \theta + (T + \Delta T) \cos(\theta + \Delta \theta) = 0
$$

+ $\uparrow \Sigma F_y = 0; \qquad -T \sin \theta - w(x)(\Delta x) + (T + \Delta T) \sin(\theta + \Delta \theta) = 0$
 $\zeta + \Sigma M_O = 0; \qquad w(x)(\Delta x)k(\Delta x) - T \cos \theta \Delta y + T \sin \theta \Delta x = 0$

Dividing each of these equations by Δx and taking the limit as $\Delta x \rightarrow 0$,
and therefore $\Delta y \rightarrow 0$, $\Delta \theta \rightarrow 0$, and $\Delta T \rightarrow 0$, we obtain Dividing each of these equations by Δx and taking the and therefore $\Delta y \rightarrow 0$, $\Delta \theta \rightarrow 0$, and $\Delta T \rightarrow 0$, we obtain

$$
\frac{d(T\cos\theta)}{dx} = 0\tag{7-7}
$$

$$
\frac{d(T\sin\theta)}{dx} - w(x) = 0\tag{7-8}
$$

$$
\frac{dy}{dx} = \tan \theta \tag{7-9}
$$

Integrating Eq. 7–7, we have

$$
T\cos\theta = \text{constant} = F_H \tag{7-10}
$$

where F_H represents the horizontal component of tensile force at *any point* along the cable.

Integrating Eq. 7–8 gives

$$
T\sin\theta = \int w(x) \, dx \tag{7-11}
$$

Dividing Eq. 7–11 by Eq. 7–10 eliminates *T*. Then, using Eq. 7–9, we can obtain the slope of the cable.

$$
\tan \theta = \frac{dy}{dx} = \frac{1}{F_H} \int w(x) \, dx
$$

Performing a second integration yields

$$
y = \frac{1}{F_H} \int \left(\int w(x) \, dx \right) dx \tag{7-12}
$$

This equation is used to determine the curve for the cable, $y = f(x)$. The horizontal force component F_{12} and the additional two constants say C_1 horizontal force component F_H and the additional two constants, say C_1 and C_2 , resulting from the integration are determined by applying the
houndary conditions for the curve boundary conditions for the curve.

The cables of the suspension bridge exert very large forces on the tower and the foundation block which have to be accounted for in their design.

$EXAMPLE$ 7.12

The cable of a suspension bridge supports half of the uniform road surface between the two towers at *A* and *B*, Fig. 7–21*a*. If this distributed loading is w_0 , determine the maximum force developed in the cable and the cable's required length. The span length *L* and sag *h* are known.

SOLUTION

We can determine the unknowns in the problem by first finding the equation of the curve that defines the shape of the cable using Eq. 7–12. For reasons of symmetry, the origin of coordinates has been placed at For reasons of symmetry, the origin of coordinates
the cable's center. Noting that $w(x) = w_0$, we have

$$
y = \frac{1}{F_H} \int \bigg(\int w_0 \, dx \bigg) \, dx
$$

Performing the two integrations gives

$$
y = \frac{1}{F_H} \left(\frac{w_0 x^2}{2} + C_1 x + C_2 \right)
$$
 (1)

The constants of integration may be determined using the boundary The constants of integration may be determined using the boundary
conditions $y = 0$ at $x = 0$ and $dy/dx = 0$ at $x = 0$. Substituting into
Eq. 1 and its derivative vields $C_x = C_2 = 0$. The equation of the curve conditions $y = 0$ at $x = 0$ and $dy/dx = 0$ at $x = 0$. Substituting into Eq. 1 and its derivative yields $C_1 = C_2 = 0$. The equation of the curve then becomes then becomes

$$
y = \frac{w_0}{2F_H} x^2 \tag{2}
$$

This is the equation of a *parabola*. The constant F_H may be obtained This is the equation of a *parabola*. The constant F_H m
using the boundary condition $y = h$ at $x = L/2$. Thus,

$$
F_H = \frac{w_0 L^2}{8h} \tag{3}
$$

Therefore, Eq. 2 becomes

$$
y = \frac{4h}{L^2}x^2\tag{4}
$$

Since F_H is known, the tension in the cable may now be determined Since F_H is known, the tension in the cable may now be determined
using Eq. 7–10, written as $T = F_H/\cos \theta$. For $0 \le \theta < \pi/2$, the
maximum tension will occur when θ is maximum i.e. at point B maximum tension will occur when θ is *maximum*, i.e., at point *B*, Fig. 7–21*a*. From Eq. 2, the slope at this point is

$$
\left. \frac{dy}{dx} \right|_{x=L/2} = \tan \theta_{\text{max}} = \left. \frac{w_0}{F_H} x \right|_{x=L/2}
$$

or

$$
\theta_{\text{max}} = \tan^{-1} \left(\frac{w_0 L}{2F_H} \right) \tag{5}
$$

Therefore,

$$
T_{\text{max}} = \frac{F_H}{\cos(\theta_{\text{max}})}\tag{6}
$$

Using the triangular relationship shown in Fig. 7–21*b*, which is based on Eq. 5, Eq. 6 may be written as

$$
T_{\text{max}} = \frac{\sqrt{4F_H^2 + w_0^2 L^2}}{2}
$$

Substituting Eq. 3 into the above equation yields

$$
T_{\text{max}} = \frac{w_0 L}{2} \sqrt{1 + \left(\frac{L}{4h}\right)^2}
$$

$$
ds = \sqrt{(dx)^2 + (dy)^2} = \sqrt{1 + \left(\frac{dy}{dx}\right)^2} dx
$$

Hence, the total length of the cable can be determined by integration. Using Eq. 4, we have

$$
\mathcal{L} = \int ds = 2 \int_0^{L/2} \sqrt{1 + \left(\frac{8h}{L^2} x\right)^2} dx \tag{7}
$$

Integrating yields

$$
\mathcal{L} = \frac{L}{2} \bigg[\sqrt{1 + \left(\frac{4h}{L} \right)^2} + \frac{L}{4h} \sinh^{-1} \left(\frac{4h}{L} \right) \bigg] \qquad \text{Ans.}
$$

Ans.

Cable Subjected to Its Own Weight. When the weight of a cable becomes important in the force analysis, the loading function along the cable will be a function of the arc length *s* rather than the projected length *x*. To analyze this problem, we will consider a generalized loading length x. To analyze this problem, we will consider a generalized loading
function $w = w(s)$ acting along the cable as shown in Fig. 7–22*a*. The free-
body diagram for a small segment As of the cable is shown in body diagram for a small segment Δs of the cable is shown in Fig. 7–22*b*. Applying the equilibrium equations to the force system on this diagram, one obtains relationships identical to those given by Eqs. 7–7 through 7–9, but with *ds* replacing *dx*.Therefore, we can show that

$$
T \cos \theta = F_H
$$

$$
T \sin \theta = \int w(s) ds
$$
 (7-13)

$$
\frac{dy}{dx} = \frac{1}{F_H} \int w(s) \, ds \tag{7-14}
$$

To perform a direct integration of Eq. 7–14, it is necessary to replace dy/dx by ds/dx . Since

$$
ds = \sqrt{dx^2 + dy^2}
$$

then

$$
\frac{dy}{dx} = \sqrt{\left(\frac{ds}{dx}\right)^2 - 1}
$$

Therefore,

$$
\frac{ds}{dx} = \left[1 + \frac{1}{F_H^2} \left(\int w(s) \, ds\right)^2\right]^{1/2}
$$

Separating the variables and integrating we obtain

$$
x = \int \frac{ds}{\left[1 + \frac{1}{F_H^2} \left(\int w(s) \, ds\right)^2\right]^{1/2}}
$$
(7-15)

The two constants of integration, say C_1 and C_2 , are found using the boundary conditions for the curve boundary conditions for the curve.

Electrical transmission towers must be designed to support the weights of the suspended power lines.The weight and length of the cables can be determined since they each form a catenary curve.

EXAMPLE^{7.13}

Determine the deflection curve, the length, and the maximum tension in the uniform cable shown in Fig. 7–23.The cable has a weight per unit in the uniform cable sh
length of $w_0 = 5 \text{ N/m}$.

SOLUTION

For reasons of symmetry, the origin of coordinates is located at the For reasons of symmetry, the origin of coordinates is located at the center of the cable. The deflection curve is expressed as $y = f(x)$. We can determine it by first applying Eq. 7–15, where $w(s) = w_0$. center of the cable. The deflection curve is expressed as $y = j$
can determine it by first applying Eq. 7–15, where $w(s) = w_0$.

$$
x = \int \frac{ds}{\left[1 + (1/F_H^2) \left(\int w_0 ds\right)^2\right]^{1/2}}
$$

Integrating the term under the integral sign in the denominator,

Fig. 7–23

we have

$$
x = \int \frac{ds}{[1 + (1/F_H^2)(w_0s + C_1)^2]^{1/2}}
$$

Substituting $u = (1/F_H)(w_0s + C_1)$ so that $du = (w_0/F_H) ds$, as second integration yields

$$
x = \frac{F_H}{w_0} \left(\sinh^{-1} u + C_2 \right)
$$

or

$$
x = \frac{F_H}{w_0} \left\{ \sinh^{-1} \left[\frac{1}{F_H} (w_0 s + C_1) \right] + C_2 \right\}
$$
 (1)

To evaluate the constants note that, from Eq. 7–14,

$$
\frac{dy}{dx} = \frac{1}{F_H} \int w_0 ds \quad \text{or} \quad \frac{dy}{dx} = \frac{1}{F_H} (w_0 s + C_1)
$$

Since $dy/dx = 0$ at $s = 0$, then $C_1 = 0$. Thus,

$$
\frac{dy}{dx} = \frac{w_0 s}{F_H} \tag{2}
$$

The constant C_2 may be evaluated by using the condition $s = 0$ at $x = 0$ in Eq. 1 in which case $C_2 = 0$. To obtain the deflection curve. The constant C_2 may be evaluated by using the condition $s = 0$ at $x = 0$ in Eq. 1, in which case $C_2 = 0$. To obtain the deflection curve, solve for s in Eq. 1 which vields solve for *s* in Eq. 1, which yields

$$
s = \frac{F_H}{w_0} \sinh\left(\frac{w_0}{F_H}x\right) \tag{3}
$$

Now substitute into Eq. 2, in which case

$$
\frac{dy}{dx} = \sinh\left(\frac{w_0}{F_H}x\right)
$$

Hence,

$$
y = \frac{F_H}{w_0} \cosh\left(\frac{w_0}{F_H}x\right) + C_3
$$

If the boundary condition $y = 0$ at $x = 0$ is applied, the constant
 $C_2 = -F_H/w_2$ and therefore the deflection curve becomes If the boundary condition $y = 0$ at $x = 0$ is applied, the $C_3 = -F_H/w_0$, and therefore the deflection curve becomes

$$
y = \frac{F_H}{w_0} \left[\cosh\left(\frac{w_0}{F_H} x\right) - 1 \right]
$$
 (4)

This equation defines the shape of a *catenary curve*. The constant This equation defines the shape of a *catenary curve*. The constant F_H is obtained by using the boundary condition that $y = h$ at $x = L/2$, in which case which case

$$
h = \frac{F_H}{w_0} \left[\cosh\left(\frac{w_0 L}{2F_H}\right) - 1 \right]
$$
 (5)

Since $w_0 = 5 \text{ N/m}, h = 6 \text{ m}, \text{ and } L = 20 \text{ m}, \text{Eqs. 4 and 5 become}$

$$
y = \frac{F_H}{5 \text{ N/m}} \left[\cosh\left(\frac{5 \text{ N/m}}{F_H} x\right) - 1 \right] \tag{6}
$$

$$
6 \text{ m} = \frac{F_H}{5 \text{ N/m}} \left[\cosh \left(\frac{50 \text{ N}}{F_H} \right) - 1 \right] \tag{7}
$$

Equation 7 can be solved for F_H by using a trial-and-error procedure.
The result is The result is

$$
F_H = 45.9 \text{ N}
$$

and therefore the deflection curve, Eq. 6, becomes
 $y = 9.19[\cosh(0.109x) - 1]$ m

 $\frac{\mathcal{L}}{2} = \frac{45.9 \text{ N}}{5 \text{ N/m}} \sinh \left[$

$$
y = 9.19[\cosh(0.109x) - 1] \,\text{m}
$$
 Ans.

 $\left[\frac{5 \text{ N/m}}{45.9 \text{ N}} (10 \text{ m})\right] = 12.1 \text{ m}$

Using Eq. 3, with $x = 10$ m, the half-length of the cable is

Hence,

$$
\mathcal{L} = 24.2 \text{ m}
$$
 Ans.

Since $T = F_H/\cos \theta$, the maximum tension occurs when θ is
aximum i.e. at $s = \frac{\varphi}{2} = 12.1 \text{ m}$ Using Eq. 2 yields Since $T = F_H / \cos \theta$, the maximum tension occumaximum, i.e., at $s = \mathcal{L}/2 = 12.1$ m. Using Eq. 2 yields

$$
\left. \frac{dy}{dx} \right|_{s=12.1 \text{ m}} = \tan \theta_{\text{max}} = \frac{5 \text{ N/m} (12.1 \text{ m})}{45.9 \text{ N}} = 1.32
$$

$$
\theta_{\text{max}} = 52.8^{\circ}
$$

And so,

$$
T_{\text{max}} = \frac{F_H}{\cos \theta_{\text{max}}} = \frac{45.9 \text{ N}}{\cos 52.8^\circ} = 75.9 \text{ N} \qquad \text{Ans.}
$$

PROBLEMS

Neglect the weight of the cable in the following problems, unless specified.

•7–89. Determine the tension in each segment of the •7–89. Determine the tension in each segm cable and the cable's total length. Set $P = 80$ lb.

7–90. If each cable segment can support a maximum tension of 75 lb, determine the largest load *P* that can be applied.

7–91. The cable segments support the loading shown. Determine the horizontal distance x_B from the force at *B* to point *A*. Set $P = 40$ lb Determine the horizon
point *A*. Set $P = 40$ lb.

***7–92.** The cable segments support the loading shown. Determine the magnitude of the horizontal force **P** so that $x_B = 6$ ft.

•7–93. Determine the force *P* needed to hold the cable in the position shown, i.e., so segment *BC* remains horizontal. Also, compute the sag y_B and the maximum tension in the cable. tension in the cable.

7–94. Cable *ABCD* supports the 10-kg lamp *E* and the 15-kg lamp *F*. Determine the maximum tension in the cable and the sag y_B of point B .

Probs. 7–91/92

Prob. 7–94

7–95. The cable supports the three loads shown. Determine **7–95.** The cable supports the three loads shown. Determine the sags y_B and y_D of points *B* and *D*. Take $P_1 = 400$ lb, $P_2 = 250$ lb $P_2 = 250$ lb.

***7–96.** The cable supports the three loads shown. ***7–96.** The cable supports the three loads shown.
Determine the magnitude of P_1 if $P_2 = 300$ lb and $y_B = 8$ ft.
Also find the sag y_B Also find the sag y_D .

7–99. Determine the maximum uniform distributed loading w_0 N/m that the cable can support if it is capable of

Prob. 7–99

•7–97. The cable supports the loading shown. Determine the horizontal distance x_B the force at point *B* acts from *A*.
Set $P = 40$ lb. Set $P = 40$ lb.

7–98. The cable supports the loading shown. Determine the magnitude of the horizontal force **P** so that $x_B = 6$ ft.

***7–100.** The cable supports the uniform distributed load ***7-100.** The cable supports the uniform distributed load of $w_0 = 600$ lb/ft. Determine the tension in the cable at each support *A* and *B*.

7

•7–101. Determine the maximum uniform distributed load w_0 the cable can support if the maximum tension the cable can sustain is 4000 lb.

A w_0 *B* -25 ft 10 ft 15 ft

Probs. 7–97/98

7–102. The cable is subjected to the triangular loading. If the slope of the cable at point *O* is zero, determine the the slope of the cable at point O is zero, determine the equation of the curve $y = f(x)$ which defines the cable
shape OB and the maximum tension developed in the cable shape *OB*, and the maximum tension developed in the cable.

 -15 ft 15 ft 500 lb/ft 500 lb/ft 8 ft *y x A O B*

Prob. 7–102

7–103. If cylinders *C* and *D* each weigh 900 lb, determine the maximum sag *h*, and the length of the cable between the smooth pulleys at *A* and *B*. The beam has a weight per unit length of 100 lb/ft.

***7–104.** The bridge deck has a weight per unit length of 80 kN/m . It is supported on each side by a cable. Determine the tension in each cable at the piers *A* and *B*.

•7–105. If each of the two side cables that support the bridge deck can sustain a maximum tension of 50 MN, determine the allowable uniform distributed load w_0 caused by the weight of the bridge deck.

7–106. If the slope of the cable at support *A* is 10°, determine the deflection curve $y = f(x)$ of the cable and the maximum tension developed in the cable.

7–107. If $h = 5$ m, determine the maximum tension developed in the chain and its length. The chain has a mass per unit length of 8 kg/m .

Prob. 7–107

***7–108.** A cable having a weight per unit length of 5 lb/ft is suspended between supports *A* and *B*. Determine the equation of the catenary curve of the cable and the cable's length.

•7–109. If the 45-m-long cable has a mass per unit length of 5 kg/m , determine the equation of the catenary curve of the cable and the maximum tension developed in the cable.

7–110. Show that the deflection curve of the cable discussed in Example 7–13 reduces to Eq. 4 in Example 7–12 when the *hyperbolic cosine function* is expanded in terms of a series and only the first two terms are retained. (The answer indicates that the *catenary* may be replaced by a parabola in the analysis of problems in which the sag is small. In this case, the cable weight is assumed to be uniformly distributed along the horizontal.)

7–111. The cable has a mass per unit length of 10 kg/m . Determine the shortest total length *L* of the cable that can be suspended in equilibrium.

Prob. 7–111

***7–112.** The power transmission cable has a weight per unit length of 15 lb/ft . If the lowest point of the cable must be at least 90 ft above the ground, determine the maximum tension developed in the cable and the cable's length between *A* and *B*.

Prob. 7–112

•7–113. If the horizontal towing force is $T = 20$ kN and the chain has a mass per unit length of 15 kg/m , determine the maximum sag *h*. Neglect the buoyancy effect of the water on the chain. The boats are stationary.

CHAPTER REVIEW

Internal Loadings

If a coplanar force system acts on a member, then in general a resultant internal *normal force* **N***, shear force* **V**, and *bending moment* **M** will act at any cross section along the member. The positive directions of these loadings are shown in the figure.

The resultant internal normal force, shear force, and bending moment are determined using the method of sections. To find them, the member is sectioned at the point *C* where the internal loadings are to be determined. A free-body diagram of one of the sectioned parts is then drawn and the internal loadings are shown in their positive directions.

The resultant normal force is determined by summing forces normal to the cross section. The resultant shear force is found by summing forces tangent to the cross section, and the resultant bending moment is found by summing moments about the geometric center or centroid of the crosssectional area.

If the member is subjected to a threedimensional loading, then, in general, a *torsional moment* will also act on the cross section. It can be determined by summing moments about an axis that is perpendicular to the cross section and passes through its centroid.

 $\sum F_x = 0$ $\sum F_y = 0$ $\Sigma M_C = 0$

 $\Sigma F_x = 0$

Shear and Moment Diagrams

To construct the shear and moment diagrams for a member, it is necessary to section the member at an arbitrary point, located a distance *x* from the left end.

If the external loading consists of changes in the distributed load, or a series of concentrated forces and couple moments act on the member, then different expressions for *V* and *M* must be determined within regions between any load discontinuities.

The unknown shear and moment are indicated on the cross section in the positive direction according to the established sign convention, and then the internal shear and moment are determined as functions of *x*.

Each of the functions of the shear and moment is then plotted to create the shear and moment diagrams.

Relations between Shear and Moment

It is possible to plot the shear and moment diagrams quickly by using differential relationships that exist between the distributed loading *w* and *V* and *M*.

The slope of the shear diagram is equal to the distributed loading at any point. The slope is positive if the distributed load acts upward, and vice-versa.

The slope of the moment diagram is equal to the shear at any point. The slope is positive if the shear is positive, or vice-versa.

The change in shear between any two points is equal to the area under the distributed loading between the points.

The change in the moment is equal to the area under the shear diagram between the points.

Cables

When a flexible and inextensible cable is subjected to a series of concentrated forces, then the analysis of the cable can be performed by using the equations of equilibrium applied to free-body diagrams of either segments or points of application of the loading.

If external distributed loads or the weight of the cable are to be considered, then the shape of the cable must be determined by first analyzing the forces on a differential segment of the cable and then integrating this result. The two constants, say C_1 and this result in the constants, say C_1 and
 C_2 , resulting from the integration are

determined by applying the boundary determined by applying the boundary conditions for the cable.

$$
\frac{dV}{dx} = w
$$

$$
\frac{dM}{dx} = V
$$

$$
\Delta V = \int w \, dx
$$

$$
\Delta M = \int V dx
$$

The effective design of a brake system, such as the one for this bicycle, requires an efficient capacity for the mechanism to resist frictional forces. In this chapter, we will study the nature of friction and show how these forces are considered in engineering analysis and design.

Friction

[CHAPTER OBJECTIVES](#page-12-0)

• To introduce the concept of dry friction and show how to analyze the equilibrium of rigid bodies subjected to this force.

[8](#page-12-0)

- To present specific applications of frictional force analysis on wedges, screws, belts, and bearings.
- To investigate the concept of rolling resistance.

8.1 [Characteristics of Dry Friction](#page-12-0)

Friction is a force that resists the movement of two contacting surfaces that slide relative to one another. This force always acts *tangent* to the surface at the points of contact and is directed so as to oppose the possible or existing motion between the surfaces.

In this chapter, we will study the effects of *dry friction*, which is sometimes called *Coulomb friction* since its characteristics were studied extensively by C. A. Coulomb in 1781. Dry friction occurs between the contacting surfaces of bodies when there is no lubricating fluid.*

The heat generated by the abrasive action of friction can be noticed when using this grinder to sharpen a metal blade.

*Another type of friction, called fluid friction, is studied in fluid mechanics.

been designed so that the small roller holds the handle in equilibrium due to frictional forces that develop at the

points of contact, *A*, *B*, *C*.

Regardless of the weight of the rake or shovel that is suspended, the device has

Theory of Dry Friction. The theory of dry friction can be explained by considering the effects caused by pulling horizontally on a block of uniform weight **W** which is resting on a rough horizontal surface that is *nonrigid or deformable,* Fig. 8–1*a*. The upper portion of the block, however, can be considered rigid. As shown on the free-body diagram of the block, Fig. 8–1*b*, the floor exerts an uneven *distribution* of both ¢the block, Fig. 8–1*b*, the floor exerts an uneven *distribution* of both *normal force* $\Delta \mathbf{N}_n$ and *frictional force* $\Delta \mathbf{F}_n$ along the contacting surface. For equilibrium, the normal forces must act *upward* to balance the block's weight **W**, and the frictional forces act to the left to prevent the applied force **P** from moving the block to the right. Close examination of the contacting surfaces between the floor and block reveals how these frictional and normal forces develop, Fig. 8–1*c*. It can be seen that many microscopic irregularities exist between the two surfaces and, as a result, ¢reactive forces $\Delta \mathbf{R}_n$ are developed at each point of contact.* As shown, each reactive force contributes both a frictional component $\Delta \mathbf{F}_n$ and a normal component $\Delta \mathbf{N}$ normal component ΔN_n .

Equilibrium. The effect of the *distributed* normal and frictional loadings is indicated by their *resultants* **N** and **F** on the free-body diagram, Fig. 8–1*d*. Notice that **N** acts a distance *x* to the right of the line of action of **W**, Fig. 8–1*d*. This location, which coincides with the centroid or geometric center of the normal force distribution in Fig. 8–1*b*, is necessary in order to balance the "tipping effect" caused by **P**. For example, if **P** is applied at a height *h* from the surface, Fig. 8–1*d*, then moment equilibrium about point *O* is satisfied if $Wx = Ph$ or $x = Ph/W$.

^{*}Besides mechanical interactions as explained here, which is referred to as a classical approach, a detailed treatment of the nature of frictional forces must also include the effects of temperature, density, cleanliness, and atomic or molecular attraction between the contacting surfaces. See J. Krim, *Scientific American*, October, 1996.

Impending Motion. In cases where the surfaces of contact are rather "slippery," the frictional force **F** may *not* be great enough to balance **P**, and consequently the block will tend to slip. In other words, as *P* is slowly increased, *F* correspondingly increases until it attains a certain *maximum value* F_s , called the *limiting static frictional force*, Fig. 8–1*e*.
When this value is reached the block is in *unstable equilibrium* since When this value is reached, the block is in *unstable equilibrium* since any further increase in *P* will cause the block to move. Experimentally, it has been determined that this limiting static frictional force F_s is *directly proportional* to the resultant normal force *N*. Expressed mathematically,

$$
F_s = \mu_s N \tag{8-1}
$$

where the constant of proportionality, μ_s (mu "sub" *s*), is called the coefficient of static friction *coefficient of static friction*.

Thus, when the block is on the *verge of sliding*, the normal force **N** and frictional force \mathbf{F}_s combine to create a resultant \mathbf{R}_s , Fig. 8–1*e*. The angle ϕ (phi "sub" s) that \mathbf{P}_s makes with \mathbf{N} is called the *angle of static friction* ϕ_s (phi "sub" *s*) that \mathbf{R}_s makes with **N** is called the *angle of static friction*.
From the figure From the figure,

$$
\phi_s = \tan^{-1}\left(\frac{F_s}{N}\right) = \tan^{-1}\left(\frac{\mu_s N}{N}\right) = \tan^{-1}\mu_s
$$

Typical values for μ_s are given in Table 8–1. Note that these values can
were given experimental testing was done under variable conditions of vary since experimental testing was done under variable conditions of roughness and cleanliness of the contacting surfaces. For applications, therefore, it is important that both caution and judgment be exercised when selecting a coefficient of friction for a given set of conditions.When a more accurate calculation of F_s is required, the coefficient of friction should be determined directly by an experiment that involves the two materials to be used.

Motion. If the magnitude of **P** acting on the block is increased so that it becomes slightly greater than F_s , the frictional force at the contacting
surface will drop to a smaller value F_s , called the *kinetic frictional force* surface will drop to a smaller value F_k , called the *kinetic frictional force*.
The block will begin to slide with increasing speed. Fig. 8–2*g*. As this The block will begin to slide with increasing speed, Fig. 8–2*a*. As this occurs, the block will "ride" on top of these peaks at the points of contact, as shown in Fig. 8–2*b*. The continued breakdown of the surface is the dominant mechanism creating kinetic friction.

Experiments with sliding blocks indicate that the magnitude of the kinetic friction force is directly proportional to the magnitude of the resultant normal force, expressed mathematically as

$$
F_k = \mu_k N \tag{8-2}
$$

Here the constant of proportionality, μ_k , is called the *coefficient of* linguistic friction. Timinal values for μ_k are approximately 25 percent. *kinetic friction*. Typical values for μ_k are approximately 25 percent smaller than those listed in Table 8, 1 for *u smaller* than those listed in Table 8–1 for μ_s .

As shown in Fig. 8–2*a*, in this case, the resultant force at the surface of contact, \mathbf{R}_k , has a line of action defined by ϕ_k . This angle is referred to as the *angle of kinetic friction*, where

$$
\phi_k = \tan^{-1}\left(\frac{F_k}{N}\right) = \tan^{-1}\left(\frac{\mu_k N}{N}\right) = \tan^{-1}\mu_k
$$

The above effects regarding friction can be summarized by referring to the graph in Fig. 8–3, which shows the variation of the frictional force *F* versus the applied load *P*. Here the frictional force is categorized in three different ways:

- *F* is a *static frictional force* if equilibrium is maintained.
- F is a *limiting static frictional force* F_s when it reaches a maximum value needed to maintain equilibrium.
- *F* is termed a *kinetic frictional force* F_k when sliding occurs at the contacting surface contacting surface.

Notice also from the graph that for very large values of *P* or for high speeds, aerodynamic effects will cause F_k and likewise μ_k to begin to decrease decrease.

Characteristics of Dry Friction. As a result of *experiments* that pertain to the foregoing discussion, we can state the following rules which apply to bodies subjected to dry friction.

- The frictional force acts *tangent* to the contacting surfaces in a direction *opposed* to the *motion* or tendency for motion of one surface relative to another.
- The maximum static frictional force F_s that can be developed is independent of the area of contact, provided the normal pressure is not very low nor great enough to severely deform or crush the contacting surfaces of the bodies.
- The maximum static frictional force is generally greater than the kinetic frictional force for any two surfaces of contact. However, if one of the bodies is moving with a *very low velocity* over the surface of another, F_k becomes approximately equal to F_s ,
i.e., $\mu_s \approx \mu_k$. i.e., $\mu_s \approx \mu_k$.
- When *slipping* at the surface of contact is *about to occur*, the maximum static frictional force is proportional to the normal force, maximum static fric
such that $F_s = \mu_s N$.
- When *slipping* at the surface of contact is *occurring*, the kinetic frictional force is proportional to the normal force, such that $F_k = \mu_k N$.

Fig. 8–4

8.2 [Problems Involving Dry Friction](#page-12-0)

If a rigid body is in equilibrium when it is subjected to a system of forces that includes the effect of friction, the force system must satisfy not only the equations of equilibrium but *also* the laws that govern the frictional forces.

Types of Friction Problems. In general, there are three types of mechanics problems involving dry friction. They can easily be classified once free-body diagrams are drawn and the total number of unknowns are identified and compared with the total number of available equilibrium equations.

No Apparent Impending Motion. Problems in this category are strictly equilibrium problems, which require the number of unknowns to be *equal* to the number of available equilibrium equations. Once the frictional forces are determined from the solution, however, their numerical values must be checked to be sure they satisfy the inequality numerical values must be checked to be sure they satisfy the inequality $F \leq \mu_s N$; otherwise, slipping will occur and the body will not remain in equilibrium. A problem of this type is shown in Fig. 8–4*a*. Here we must equilibrium. A problem of this type is shown in Fig. 8–4*a*. Here we must determine the frictional forces at *A* and *C* to check if the equilibrium position of the two-member frame can be maintained. If the bars are uniform and have known weights of 100 N each, then the free-body diagrams are as shown in Fig. 8–4*b*. There are six unknown force components which can be determined *strictly* from the six equilibrium equations (three for each member). Once F_A , N_A , F_C , and N_C are determined then the bars will remain in equilibrium provided determined, then the bars will remain in equilibrium provided determined, then the bars will remark $F_A \leq 0.3N_A$ and $F_C \leq 0.5N_C$ are satisfied.

Impending Motion at All Points of Contact. In this case the total number of unknowns will *equal* the total number of available equilibrium equations *plus* the total number of available frictional equilibrium equations *plus* the total number of available frictional equations, $F = \mu N$. When *motion is impending* at the points of contact, then $F = \mu N$ whereas if the body is *slinning* then $F = \mu N$ For equations, $F = \mu N$. When *motion is impending* at the points of contact,
then $F_s = \mu_s N$; whereas if the body is *slipping*, then $F_k = \mu_k N$. For
example consider the problem of finding the smallest angle θ at which example, consider the problem of finding the smallest angle θ at which the 100-N bar in Fig. 8–5*a* can be placed against the wall without slipping. The free-body diagram is shown in Fig. 8–5*b*. Here the *five* unknowns are determined from the *three* equilibrium equations and *two* static frictional determined from the *three* equilibrium equations and *two* static frictional equations which apply at *both* points of contact, so that $F_A = 0.3N_A$ and $F_B = 0.4N_B$ $F_B = 0.4 N_B.$

Impending Motion at Some Points of Contact. Here the number of unknowns will be *less* than the number of available equilibrium equations plus the number of available frictional equations or conditional equations for tipping. As a result, several possibilities for motion or impending motion will exist and the problem will involve a determination of the kind of motion which actually occurs. For example, consider the two-member frame in Fig. 8–6*a*. In this problem we wish to determine the horizontal force *P* needed to cause movement. If each member has a weight of 100 N, then the free-body diagrams are as shown in Fig. 8–6*b*. There are *seven* unknowns. For a unique solution we must satisfy the *six* equilibrium equations (three for each member) and only *one* of two possible static frictional equations. This means that as *P* increases it will either cause slipping at *A* and no slipping at *C*, so that increases it will either cause slipping at *A* and no slipping at *C*, so that $F_A = 0.3N_A$ and $F_C \le 0.5N_C$; or slipping occurs at *C* and no slipping at *A* in which case $F_C = 0.5N_C$ and $F_L \le 0.3N$. The actual situation $F_A = 0.3N_A$ and $F_C \le 0.5N_C$; or slipping occurs at C and no slipping at A, in which case $F_C = 0.5N_C$ and $F_A \le 0.3N_A$. The actual situation can be determined by calculating P for each case and then choosing the case for determined by calculating *P* for each case and then choosing the case for which *P* is *smaller*. If in both cases the *same value* for *P* is calculated, which in practice would be highly improbable, then slipping at both points occurs simultaneously; i.e., the *seven unknowns* would satisfy *eight equations*.

Consider pushing on the uniform crate that has a weight *W* and sits on the rough surface. As shown on the first free-body diagram, if the magnitude of **P** is small, the crate will remain in equilibrium.As *P* increases the crate will either be on the verge of slipping on the the magnitude of **P** is small, the crate will remain in equilibrium. As P increases the crate will either be on the verge of slipping on the surface $(F = \mu_s N)$, or if the surface is very rough (large μ_s) then the result on the second free-body diagram.At this point the crate will begin to tip over.The crate also has a greater chance of tipping if **P** is applied at a greater height *h* above the surface, or if its width *b* is smaller.

The applied vertical force **P** on this roll must be large enough to overcome the resistance of friction at the contacting surfaces *A* and *B* in order to cause surfaces A and B in order to cause **Procedure for Analysis** rotation.

Equilibrium Versus Frictional Equations. Whenever we solve problems where the friction force *F* is to be an "equilibrium force" and problems where the friction force F is to be an "equilibrium force" and
satisfies the inequality $F \leq \mu_s N$, then we can assume the sense of
direction of F on the free-body diagram. The correct sense is made direction of *F* on the free-body diagram. The correct sense is made known *after* solving the equations of equilibrium for *F*. If *F* is a negative scalar the sense of **F** is the reverse of that which was assumed. This convenience of *assuming* the sense of **F** is possible because the equilibrium equations equate to zero the *components of vectors* acting in the *same direction*. However, in cases where the frictional equation in the *same direction*. However, in cases where the frictional equation $F = \mu N$ is used in the solution of a problem, the convenience of assuming the sense of **F** is *lost* since the frictional equation relates *assuming* the sense of **F** is *lost*, since the frictional equation relates only the *magnitudes* of two *perpendicular* vectors. Consequently, **F** *must always* be shown acting with its *correct sense* on the free-body diagram, *whenever* the frictional equation is used for the solution of a problem.

Equilibrium problems involving dry friction can be solved using the following procedure.

Free-Body Diagrams.

- Draw the necessary free-body diagrams, and unless it is stated in the problem that impending motion or slipping occurs, *always* show the problem that impending motion or slipping occurs, *always* st
the frictional forces as unknowns (i.e., *do not assume* $F = \mu N$).
- Determine the number of unknowns and compare this with the number of available equilibrium equations.
- If there are more unknowns than equations of equilibrium, it will be necessary to apply the frictional equation at some, if not all, points of contact to obtain the extra equations needed for a complete solution.
- If the equation $F = \mu N$ is to be used, it will be necessary to show
 F acting in the correct sense of direction on the free-body diagram **F** acting in the correct sense of direction on the free-body diagram.

Equations of Equilibrium and Friction.

- Apply the equations of equilibrium and the necessary frictional equations (or conditional equations if tipping is possible) and solve for the unknowns.
- If the problem involves a three-dimensional force system such that it becomes difficult to obtain the force components or the necessary moment arms, apply the equations of equilibrium using Cartesian vectors.

$EXAMPLE **8.1**$

The uniform crate shown in Fig. 8–7*a* has a mass of 20 kg. If a force The uniform crate shown in Fig. 8–7*a* has a mass of 20 kg. If a force $P = 80$ N is applied to the crate, determine if it remains in equilibrium.
The coefficient of static friction is $\mu = 0.3$ The coefficient of static friction is $\mu_s = 0.3$.

SOLUTION

Free-Body Diagram. As shown in Fig. 8–7*b*, the *resultant* normal force N_C must act a distance *x* from the crate's center line in order to counterest the tipping effect caused by **P**. There are three unknowns counteract the tipping effect caused by **P**. There are *three unknowns,* F , N_C , and *x*, which can be determined strictly from the *three*
equations of equilibrium equations of equilibrium.

Equations of Equilibrium.

Solving,

$$
F = 69.3 \text{ N}
$$

$$
N_C = 236 \text{ N}
$$

$$
x = -0.00908 \text{ m} = -9.08 \text{ mm}
$$

Since *x* is negative it indicates the *resultant* normal force acts (slightly) to the *left* of the crate's center line. No tipping will occur since to the *left* of the crate's center line. No tipping will occur since $x < 0.4$ m. Also, the *maximum* frictional force which can be developed at the surface of contact is $F = u N_c = 0.3(236 \text{ N}) = 70.8 \text{ N}$ $x < 0.4$ m. Also, the *maximum* frictional force which can be developed
at the surface of contact is $F_{\text{max}} = \mu_s N_C = 0.3(236 \text{ N}) = 70.8 \text{ N}$.
Since $F = 69.3 \text{ N} < 70.8 \text{ N}$, the crate will not slip although it is very at the surface of contact is $F_{\text{max}} = \mu_s N_C = 0.3(236 \text{ N}) = 70.8 \text{ N}$.
Since $F = 69.3 \text{ N} < 70.8 \text{ N}$, the crate will *not slip*, although it is very close to doing so. close to doing so.

8

(a)

It is observed that when the bed of the dump truck is raised to an It is observed that when the bed of the dump truck is raised to an angle of $\theta = 25^{\circ}$ the vending machines will begin to slide off the bed, Fig. 8–8*a*. Determine the static coefficient of friction between a vending machine and the surface of the truckbed.

SOLUTION

An idealized model of a vending machine resting on the truckbed is shown in Fig. 8–8*b*. The dimensions have been measured and the center of gravity has been located. We will assume that the vending machine weighs *W*.

Free-Body Diagram. As shown in Fig. 8–8*c*, the dimension *x* is used to locate the position of the resultant normal force **N**. There are four unknowns, N , F , μ_s , and x .

Equations of Equilibrium.

$$
W \sin 25 = 1
$$
 (1)

$$
N - W \cos 25^\circ = 0
$$
 (2)

$$
\zeta + \sum M_O = 0; \quad -W \sin 25^\circ (2.5 \text{ ft}) + W \cos 25^\circ (x) = 0 \tag{3}
$$

Since slipping impends at $\theta = 25^{\circ}$, using Eqs. 1 and 2, we have

$$
F_s = \mu_s N; \qquad W \sin 25^\circ = \mu_s (W \cos 25^\circ)
$$

$$
\mu_s = \tan 25^\circ = 0.466 \qquad \text{Ans.}
$$

The angle of $\theta = 25^\circ$ is referred to as the *angle of repose*, and by The angle of $\theta = 25^{\circ}$ is referred to as the *angle of repose*, and by comparison, it is equal to the angle of static friction, $\theta = \phi_s$. Notice from the calculation that θ is independent of the weight of the vendin from the calculation that θ is independent of the weight of the vending machine, and so knowing θ provides a convenient method for determining the coefficient of static friction.

NOTE: From Eq. 3, we find $x = 1.17$ ft. Since 1.17 ft $\lt 1.5$ ft, indeed the vending machine will slip before it can tip as observed in Fig. 8–8*a*. the vending machine will slip before it can tip as observed in Fig. 8–8*a*.

The uniform 10-kg ladder in Fig. 8–9*a* rests against the smooth wall at *B*, and the end *A* rests on the rough horizontal plane for which the B, and the end A rests on the rough horizontal plane for which the coefficient of static friction is $\mu_s = 0.3$. Determine the angle of inclination 4 of the ladder and the normal reaction at B if the ladder is inclination θ of the ladder and the normal reaction at B if the ladder is on the verge of slipping.

SOLUTION

Free-Body Diagram. As shown on the free-body diagram, Fig. 8–9*b*, the frictional force \mathbf{F}_A must act to the right since impending motion at *A* is to the left is to the left.

Equations of Equilibrium and Friction. Since the ladder is on the **Equations of Equilibrium and Friction.** Since the ladder is on the verge of slipping, then $F_A = \mu_s N_A = 0.3 N_A$. By inspection, N_A can be obtained directly obtained directly.

 $r + \hat{\Delta} \Sigma F_y = 0;$ $N_A - 10(9.81) \,\text{N} = 0$ $N_A = 98.1 \,\text{N}$

 $F_A = 0.3(98.1 \text{ N}) = 29.43 \text{ N}$. Now N_B

Using this result,
$$
F_A = 0.3(98.1 \text{ N}) = 29.43 \text{ N}
$$
. Now N_B can be found.
\n $\Rightarrow \Sigma F_x = 0;$ 29.43 N - $N_B = 0$
\n $N_B = 29.43 \text{ N} = 29.4 \text{ N}$ Ans.

Finally, the angle θ can be determined by summing moments about point *A*.
C + ∑ *M*

$$
\zeta + \Sigma M_A = 0; \qquad (29.43 \text{ N})(4 \text{ m}) \sin \theta - [10(9.81) \text{ N}](2 \text{ m}) \cos \theta = 0
$$

$$
\frac{\sin \theta}{\cos \theta} = \tan \theta = 1.6667
$$

$$
\theta = 59.04^{\circ} = 59.0^{\circ}
$$
 Ans.

Beam AB is subjected to a uniform load of 200 N/m and is supported at *B* by post *BC*, Fig. 8–10*a*. If the coefficients of static friction at *B* at *B* by post *BC*, Fig. 8–10*a*. If the coefficients of static friction at *B* and *C* are $\mu_B = 0.2$ and $\mu_C = 0.5$, determine the force **P** needed to pull the post out from under the beam. Neglect the weight of the pull the post out from under the beam. Neglect the weight of the members and the thickness of the beam.

SOLUTION

Free-Body Diagrams. The free-body diagram of the beam is shown **Free-Body Diagrams.** The free-body diagram of the beam is shown
in Fig. 8–10*b*. Applying $\Sigma M_A = 0$, we obtain $N_B = 400$ N. This result
is shown on the free-body diagram of the post-Fig. 8–10*c*. Referring to is shown on the free-body diagram of the post, Fig. 8–10*c*. Referring to this member, the *four* unknowns F_B , P , F_C , and N_C are determined
from the *three* equations of equilibrium and *one* frictional equation from the *three* equations of equilibrium and *one* frictional equation applied either at *B* or *C*.

$$
\Rightarrow \Sigma F_x = 0; \qquad P - F_B - F_C = 0 \tag{1}
$$

+ $\uparrow \Sigma F_y = 0; \qquad N_C - 400 \text{ N} = 0 \tag{2}$

$$
P_{C} - 400 \text{ N} = 0
$$
\n
$$
\zeta + \Sigma M_{C} = 0; \qquad P(0.25 \text{ m}) + F_{B}(1 \text{ m}) = 0
$$
\n(2)\n(3)

(Post Slips at B and Rotates about C.) This requires $F_C \leq \mu_C N_C$ and

 $F_B = \mu_B N_B;$ $F_B = 0.2(400 \text{ N}) = 80 \text{ N}$

 F_B Using this result and solving Eqs. 1 through 3, we obtain
 $P = 320 \text{ N}$

$$
P = 320 \text{ N}
$$

$$
F_C = 240 \text{ N}
$$

$$
N_C = 400 \text{ N}
$$

Since $F_C = 240 \text{ N} > \mu_C N_C = 0.5(400 \text{ N}) = 200 \text{ N}$, slipping at *C*
occurs Thus the other case of movement must be investigated occurs. Thus the other case of movement must be investigated.

$F_B \leq \mu_B N_B$

(Post Slips at C and Rotates about B.) Here
$$
F_B \le \mu_B N_B
$$
 and
 $F_C = \mu_C N_C;$ $F_C = 0.5 N_C$ (4)

Solving Eqs. 1 through 4 yields

$$
P = 267 \text{ N}
$$
Ans.

$$
P = 267 \text{ N}
$$

$$
N_C = 400 \text{ N}
$$

$$
F_C = 200 \text{ N}
$$

$$
F_B = 66.7 \text{ N}
$$

Obviously, this case occurs first since it requires a *smaller* value for *P*.

Blocks *A* and *B* have a mass of 3 kg and 9 kg, respectively, and are connected to the weightless links shown in Fig. 8–11*a*. Determine the largest vertical force **P** that can be applied at the pin *C* without causing any movement. The coefficient of static friction between the causing any movement. The coefficient of star
blocks and the contacting surfaces is $\mu_s = 0.3$.

SOLUTION

Free-Body Diagram. The links are two-force members and so the free-body diagrams of pin *C* and blocks *A* and *B* are shown in Fig. 8–11*b*. Since the horizontal component of \mathbf{F}_{AC} tends to move
block A to the left **F**_c must act to the right Similarly **F**_c must act to block *A* to the left, \mathbf{F}_A must act to the right. Similarly, \mathbf{F}_B must act to the left to oppose the tendency of motion of block *B* to the right. the left to oppose the tendency of motion of block *B* to the right, caused by \mathbf{F}_{BC} . There are seven unknowns and six available force equilibrium equations, two for the pin and two for each block, so that *only one* frictional equation is needed.

Equations of Equilibrium and Friction. The force in links *AC* and

Using the result for
$$
F_{AC}
$$
, for block A,
\n
$$
\Rightarrow \Sigma F_x = 0; \qquad F_A - 1.155P \sin 30^\circ = 0; \qquad F_A = 0.5774P \tag{1}
$$

$$
Z_{1x} = 0, \t A = 1.155P \cos 30^\circ - 3(9.81 \text{ N}) = 0;
$$

+ $\uparrow \Sigma F_y = 0;$ $N_A - 1.155P \cos 30^\circ - 3(9.81 \text{ N}) = 0;$
 $N_A = P + 29.43 \text{ N}$
Using the result for F_{BC} , for block *B*,

$$
N_A = P + 29.43 \text{ N} \tag{2}
$$

(3) $\begin{aligned} N \geq T_x = 0; & (0.5774T)^{-1}T_B = 0; & T_B = 0.5774T \end{aligned}$
+ $\begin{cases} \sum F_y = 0; & N_B = 9(9.81) \text{ N} = 0; & N_B = 88.29 \text{ N} \end{cases}$ Using the result for F_{BC} , for block B,
 $\Rightarrow \Sigma F_x = 0;$ (0.5774P) - $F_B = 0;$ $F_B = 0.5774P$

Movement of the system may be caused by the initial slipping of *either* block *A* or block *B*. If we assume that block *A* slips first, then

$$
F_A = \mu_s N_A = 0.3 N_A
$$
 (4)

Substituting Eqs. 1 and 2 into Eq. 4,

$$
0.5774P = 0.3(P + 29.43)
$$

\n
$$
P = 31.8 \text{ N}
$$
Ans.

 $P = 31.8 \text{ N}$
Substituting this result into Eq. 3, we obtain $F_B = 18.4 \text{ N}$.
Since the maximum static frictional force at B is Since the maximum static frictional force at *B* is Since the maximum static frictional force at *B* is
 $(F_B)_{\text{max}} = \mu_s N_B = 0.3(88.29 \text{ N}) = 26.5 \text{ N} > F_B$, block *B* will not

slin Thus the above assumption is correct Notice that if the slip. Thus, the above assumption is correct. Notice that if the inequality were not satisfied, we would have to assume slipping of block *B* and then solve for *P*.

FUNDAMENTAL PROBLEMS

F8–1. If $P = 200 \text{ N}$, determine the friction developed between the 50-kg crate and the ground. The coefficient of between the 50-kg crate and the ground. The coefficient of static friction between the crate and the ground is $\mu_s = 0.3$.

F8–1

F8–2. Determine the minimum force *P* to prevent the 30-kg rod *AB* from sliding. The contact surface at *B* is smooth, whereas the coefficient of static friction between the rod and the wall at *A* is $\mu_s = 0.2$.

F8–3. Determine the maximum force *P* that can be applied without causing the two 50-kg crates to move. The coefficient of static friction between each crate and the ground is $\mu_s = 0.25$.

F8–4. If the coefficient of static friction at contact points *A* **F8-4.** If the coefficient of static friction at contact points A and B is $\mu_s = 0.3$, determine the maximum force P that can be applied without causing the 100 kg spool to move be applied without causing the 100-kg spool to move.

CONCEPTUAL PROBLEMS

P8–1. Is it more effective to move the load forward at constant velocity with the boom fully extended as shown, or should the boom be fully retracted? Power is supplied to the rear wheels. The front wheels are free to roll. Do an equilibrium analysis to explain your answer.

P8–1

P8–2. The lug nut on the free-turning wheel is to be removed using the wrench. Which is the most effective way to apply force to the wrench? Also, why is it best to keep the car tire on the ground rather than first jacking it up? Explain your answers with an equilibrium analysis.

P8–3. The rope is used to tow the refrigerator. Is it best to pull slightly up on the rope as shown, pull horizontally, or pull somewhat downwards? Also, is it best to attach the rope at a high position as shown, or at a lower position? Do an equilibrium analysis to explain your answer.

P8–4. The rope is used to tow the refrigerator. In order to prevent yourself from slipping while towing, is it best to pull up as shown, pull horizontally, or pull downwards on the rope? Do an equilibrium analysis to explain your answer.

P8–3/4

P8–5. Is it easier to tow the load by applying a force along the tow bar when it is in an almost horizontal position as shown, or is it better to pull on the bar when it has a steeper slope? Do an equilibrium analysis to explain your answer.

P8–2

P8–5

Wedges are often used to adjust the elevation of structural or mechanical parts. Also, they provide stability for objects such as this pipe.

8.3 [Wedges](#page-12-0)

A *wedge* is a simple machine that is often used to transform an applied force into much larger forces, directed at approximately right angles to the applied force. Wedges also can be used to slightly move or adjust heavy loads.

Consider, for example, the wedge shown in Fig. 8–12*a*, which is used to *lift* the block by applying a force to the wedge. Free-body diagrams of the block and wedge are shown in Fig. 8–12*b*. Here we have excluded the weight of the wedge since it is usually *small* compared to the weight **W** of the block. Also, note that the frictional forces \mathbf{F}_1 and \mathbf{F}_2 must oppose the motion of the wedge. Likewise, the frictional force \mathbf{F}_3 of the wall on the block must act downward so as to oppose the block's upward motion. The locations of the resultant normal forces are not important in the force analysis since neither the block nor wedge will "tip." Hence the moment equilibrium equations will not be considered. There are seven unknowns, consisting of the applied force **P**, needed to cause motion of the wedge, and six normal and frictional forces. The seven available equations consist of four force equilibrium equations, $\Sigma F_y = 0$ applied to the wedge and block, and three frictional $F = \mu N$, applied at the surface of contact. equations, $F = \mu N$, applied at the surface of contact. ven available equ
 $F_x = 0$, $\Sigma F_y = 0$

uuations $F = uN$

If the block is to be *lowered*, then the frictional forces will all act in a sense opposite to that shown in Fig. 8–12*b*. Provided the coefficient of friction is very *small* or the wedge angle θ is *large*, then the applied force **P** must act to the right to hold the block. Otherwise, **P** may have a reverse sense of direction in order to *pull* on the wedge to remove it. If **P** is *not applied* and friction forces hold the block in place, then the wedge is referred to as *self-locking*.

Fig. 8–12

The uniform stone in Fig. 8–13*a* has a mass of 500 kg and is held in the horizontal position using a wedge at *B*. If the coefficient of static horizontal position using a wedge at *B*. If the coefficient of static friction is $\mu_s = 0.3$ at the surfaces of contact, determine the minimum force *B* needed to remove the wedge. Assume that the stone does not force *P* needed to remove the wedge. Assume that the stone does not slip at *A*.

Fig. 8–13

SOLUTION

SOLUTION
The minimum force *P* requires $F = \mu_s N$ at the surfaces of contact
with the wedge The free-body diagrams of the stone and wedge are with the wedge. The free-body diagrams of the stone and wedge are shown in Fig. 8–13*b*. On the wedge the friction force opposes the shown in Fig. 8–13*b*. On the wedge the friction force opposes the impending motion, and on the stone at *A*, $F_A \leq \mu_s N_A$, since slipping does not occur there. There are five unknowns. Three equilibrium does not occur there. There are five unknowns. Three equilibrium equations for the stone and two for the wedge are available for solution. From the free-body diagram of the stone,

$$
\zeta + \Sigma M_A = 0;
$$
 -4905 N(0.5 m) + $(N_B \cos 7^\circ N)(1 \text{ m})$
+ $(0.3N_B \sin 7^\circ N)(1 \text{ m}) = 0$
 $N_B = 2383.1 N$

Using this result for the wedge, we have

$$
+ \uparrow \Sigma F_y = 0; \qquad N_C - 2383.1 \cos 7^\circ \text{ N} - 0.3(2383.1 \sin 7^\circ \text{ N}) = 0
$$

\n
$$
N_C = 2452.5 \text{ N}
$$

\n
$$
\Rightarrow \Sigma F_x = 0; \qquad 2383.1 \sin 7^\circ \text{ N} - 0.3(2383.1 \cos 7^\circ \text{ N}) +
$$

\n
$$
P - 0.3(2452.5 \text{ N}) = 0
$$

\n
$$
P = 1154.9 \text{ N} = 1.15 \text{ kN}
$$

NOTE: Since *P* is positive, indeed the wedge must be pulled out. If *P* were zero, the wedge would remain in place (self-locking) and the frictional forces developed at *B* and *C* would satisfy $F_B < \mu_s N_B$ and $F_C < \mu_s N_C$. pcking) and $F_B < \mu_s N_B$

Square-threaded screws find applications on valves, jacks, and vises, where particularly large forces must be developed along the axis of the screw.

8.4 [Frictional Forces on Screws](#page-12-0)

In most cases screws are used as fasteners; however, in many types of machines they are incorporated to transmit power or motion from one part of the machine to another.A *square-threaded screw* is commonly used for the latter purpose, especially when large forces are applied along its axis. In this section we will analyze the forces acting on square-threaded screws.The analysis of other types of screws, such as the V-thread, is based on these same principles.

For analysis, a square-threaded screw, as in Fig. 8–14, can be considered a cylinder having an inclined square ridge or *thread* wrapped around it. If we unwind the thread by one revolution, as shown in Fig. 8–14*b*, the slope we unwind the thread by one revolution, as shown in Fig. 8–14b, the slope
or the *lead angle* θ is determined from $\theta = \tan^{-1}(l/2\pi r)$. Here *l* and $2\pi r$
are the vertical and horizontal distances between A and B where are the vertical and horizontal distances between *A* and *B,* where *r* is the mean radius of the thread. The distance *l* is called the *lead* of the screw and it is equivalent to the distance the screw advances when it turns one revolution.

Upward Impending Motion. Let us now consider the case of a square-threaded screw that is subjected to upward impending motion caused by the applied torsional moment **M**, Fig. 8–15.* A free-body diagram of the *entire unraveled thread* can be represented as a block as shown in Fig. 8–14*a*. The force **W** is the vertical force acting on the thread or the axial force applied to the shaft, Fig. 8–15, and M/r is
the resultant horizontal force produced by the couple moment M about the resultant horizontal force produced by the couple moment *M* about the axis of the shaft. The reaction **R** of the groove on the thread, has the axis of the shaft. The reaction **R** of the groove on the thread, has
both frictional and normal components, where $F = \mu_s N$. The angle of
static friction is $A = \tan^{-1}(F/N) = \tan^{-1} \mu$. Applying the force both frictional and normal components, where $F = \mu_s N$. The angle of static friction is $\phi_s = \tan^{-1}(F/N) = \tan^{-1}\mu_s$. Applying the force equations of equilibrium along the horizontal and vertical axes we have equations of equilibrium along the horizontal and vertical axes, we have

 $+ \hat{\ }$ $\Sigma F_y = 0;$ $R \cos (\phi_s + \theta) - W = 0$ \Rightarrow $\Sigma F_r = 0$; $M/r - R \sin{(\phi_s + \theta)} = 0$

Eliminating *R* from these equations, we obtain

B

l

 2π

 θ

(b)

$$
M = rW \tan \left(\phi_s + \theta \right) \tag{8-3}
$$

(a)

*For applications, **M** is developed by applying a horizontal force **P** at a right angle to the end of a lever that would be fixed to the screw.

Fig. 8–15

Self-Locking Screw. A screw is said to be *self-locking* if it remains in place under any axial load **W** when the moment **M** is removed. For this to occur, the direction of the frictional force must be reversed so that **R** acts on the other side of **N**. Here the angle of static friction ϕ_s becomes
greater than or equal to θ . Fig. 8, 16d, If $\phi = \theta$. Fig. 8, 16b, then **P** will get acts on the other side of **N**. Here the angle of static friction ϕ_s becomes
greater than or equal to θ , Fig. 8–16*d*. If $\phi_s = \theta$, Fig. 8–16*b*, then **R** will act
wertically to belance **W**, and the screw will be on vertically to balance **W**, and the screw will be on the verge of winding downward.

Downward Impending Motion. $(\phi_s > \theta)$. If a screw is self-
locking a couple moment M' must be applied to the screw in the **Downward Impending Motion.** $(\phi_s > \theta)$. If a screw is self-locking, a couple moment **M**^{*'*} must be applied to the screw in the locking, a couple moment **M'** must be applied to the screw in the opposite direction to wind the screw downward $(\phi_s > \theta)$. This causes a reverse borizontal force *M'*/ κ that pushes the thread down as indicated opposite direction to wind the screw downward $(\phi_s > \theta)$. This causes a reverse horizontal force M'/r that pushes the thread down as indicated in Fig. 8–16c. Using the same procedure as before we obtain in Fig. 8–16*c*. Using the same procedure as before, we obtain

$$
M' = rW \tan (\theta - \phi_s)
$$
 (8-4)

Downward Impending Motion. $(\phi_s < \theta)$. If the screw is not self-locking, it is necessary to apply a moment \mathbf{M}'' to prevent the screw **Downward Impending Motion.** $(\phi_s \leq \theta)$. If the screw is not self-locking, it is necessary to apply a moment **M**^{π} to prevent the screw self-locking, it is necessary to apply a moment **M**^{*n*} to prevent the screw
from winding downward ($\phi_s < \theta$). Here, a horizontal force *Mⁿ*/*r* is
required to push against the thread to prevent it from sliding down th required to push against the thread to prevent it from sliding down the required to push against the thread to prevent it from sliding down the plane, Fig. 8–16*d*. Thus, the magnitude of the moment **M**^{*r*} required to prevent this unwinding is

$$
M'' = Wr \tan (\phi_s - \theta)
$$
 (8-5)

If *motion of the screw* occurs, Eqs. 8–3, 8–4, and 8–5 can be applied by simply replacing ϕ_s with ϕ_k .

Self-locking screw ($\theta = \phi_s$) (on the verge of rotating downward)

Downward screw motion ($\theta > \phi_s$)

8

(d)

Fig. 8–16
EXAMPLE 8.7

The turnbuckle shown in Fig. 8–17 has a square thread with a mean radius of 5 mm and a lead of 2 mm. If the coefficient of static friction radius of 5 mm and a lead of 2 mm. If the coefficient of static friction
between the screw and the turnbuckle is $\mu_s = 0.25$, determine the
moment M that must be applied to draw the end screws closer moment **M** that must be applied to draw the end screws closer together.

SOLUTION

The moment can be obtained by applying Eq. 8–3. Since friction at *two screws* must be overcome, this requires

$$
M = 2[Wr\tan(\theta + \phi)]
$$
 (1)

Here $W = 2000$ N, $r = 5$ mm, $\phi_s = \tan^{-1} \mu_s = \tan^{-1}(0.25) = 14.04^{\circ}$,
and $\theta = \tan^{-1}(1/2\pi r) = \tan^{-1}(2 \text{ mm}/[2\pi(5 \text{ mm})]) = 3.64^{\circ}$. Substituting Here $W = 2000 \text{ N}$, $r = 5 \text{ mm}$, $\phi_s = \tan^{-1} \mu_s = \tan^{-1}(0.25) = 14.04^\circ$,
and $\theta = \tan^{-1}(l/2\pi r) = \tan^{-1}(2 \text{ mm}/[2\pi(5 \text{ mm})]) = 3.64^\circ$. Substituting
these values into Eq. 1 and solving gives these values into Eq. 1 and solving gives

$$
M = 2[(2000 \text{ N})(5 \text{ mm}) \tan(14.04^{\circ} + 3.64^{\circ})]
$$

= 6374.7 N \cdot mm = 6.37 N \cdot m
Ans.

NOTE: When the moment is *removed*, the turnbuckle will be selflocking; i.e., it will not unscrew since $\phi_s > \theta$.

8.5 [Frictional Forces on Flat Belts](#page-12-0)

Whenever belt drives or band brakes are designed, it is necessary to determine the frictional forces developed between the belt and its contacting surface. In this section we will analyze the frictional forces acting on a flat belt, although the analysis of other types of belts, such as the V-belt, is based on similar principles.

Consider the flat belt shown in Fig. 8–18*a*, which passes over a fixed curved surface. The total angle of belt to surface contact in radians is $\beta,$ and the coefficient of friction between the two surfaces is μ . We wish to determine the tension T_2 in the belt, which is needed to pull the belt counterclockwise over the surface, and thereby overcome both the frictional forces at the surface of contact and the tension T_1 in the other
end of the belt. Obviously $T_2 > T_1$ frictional forces at the surface of co
end of the belt. Obviously, $T_2 > T_1$.

Frictional Analysis. A free-body diagram of the belt segment in contact with the surface is shown in Fig. 8–18*b*.As shown, the normal and frictional forces, acting at different points along the belt, will vary both in magnitude and direction. Due to this *unknown* distribution, the analysis of the problem will first require a study of the forces acting on a differential element of the belt.

A free-body diagram of an element having a length *ds* is shown in Fig. 8–18*c*. Assuming either impending motion or motion of the belt, Fig. 8–18*c*. Assuming either impending motion or motion of the belt, the magnitude of the frictional force $dF = \mu dN$. This force opposes the sliding motion of the belt, and so it will increase the magnitude the sliding motion of the belt, and so it will increase the magnitude of the tensile force acting in the belt by *dT*. Applying the two force equations of equilibrium, we have

$$
\Delta + \Sigma F_x = 0; \qquad T \cos\left(\frac{d\theta}{2}\right) + \mu \, dN - (T + dT) \cos\left(\frac{d\theta}{2}\right) = 0
$$

$$
+ \mathcal{D}\Sigma F_y = 0; \qquad dN - (T + dT) \sin\left(\frac{d\theta}{2}\right) - T \sin\left(\frac{d\theta}{2}\right) = 0
$$

Since $d\theta$ is of *infinitesimal size*, $sin(d\theta/2) = d\theta/2$ and $cos(d\theta/2) = 1$.
So the *product* of the two infinitesimals dT and $d\theta/2$ may be neglected Also, the *product* of the two infinitesimals dT and $d\theta/2$ may be neglected when compared to infinitesimals of the first order. As a result, these two when compared to infinitesimals of the first order. As a result, these two equations become

$$
\mu\,dN = dT
$$

and

$$
dN = T \, d\theta
$$

Eliminating *dN* yields

$$
\frac{dT}{T} = \mu \, d\theta
$$

Flat or V-belts are often used to transmit the torque developed by a motor to a wheel attached to a pump, fan or blower.

Integrating this equation between all the points of contact that the belt Integrating this equation between all the points of contact that the belt
makes with the drum, and noting that $T = T_1$ at $\theta = 0$ and $T = T_2$ at $\theta = B$ yields makes with t
 $\theta = \beta$, yields

$$
\int_{T_1}^{T_2} \frac{dT}{T} = \mu \int_0^{\beta} d\theta
$$

$$
\ln \frac{T_2}{T_1} = \mu \beta
$$

Solving for T_2 , we obtain

$$
T_2 = T_1 e^{\mu \beta} \tag{8-6}
$$

where

- T_2, T_1 = belt tensions; T_1 opposes the direction of motion (or impending motion) of the belt measured relative to the i in tensions, i_1 opposes the unection of motion (or impending motion) of the belt measured relative to the surface, while T_2 acts in the direction of the relative belt surface, while T_2 acts in the direction of the relative belt
motion (or impending motion); because of friction,
 $T_2 > T_1$
coefficient of static or kinetic friction between the belt
	- $T_2 > T_1$
 μ = coefficient of static or kinetic friction between the belt and the surface of contact
	- β = angle of belt to surface contact, measured in radians
	- $e = 2.718...$, base of the natural logarithm

Note that T_2 is *independent* of the *radius* of the drum, and instead it is Find that T_2 is *independent* of the *radius* of the drum, and instead it is
a function of the angle of belt to surface contact, β . As a result, this equation is valid for flat belts passing over any curved contacting surface.

EXAMPLE 8.8

The maximum tension that can be developed in the cord shown in Fig.8–19*a* is 500 N. If the pulley at *A* is free to rotate and the coefficient Fig. 8–19*a* is 500 N. If the pulley at *A* is free to rotate and the coefficient
of static friction at the fixed drums *B* and *C* is $\mu_s = 0.25$, determine the
largest mass of the cylinder that can be lifted by the cord largest mass of the cylinder that can be lifted by the cord.

SOLUTION

SOLUTION
Lifting the cylinder, which has a weight $W = mg$, causes the cord to
move counterclockwise over the drums at B and C; hence the move counterclockwise over the drums at *B* and *C*; hence, the move counterclockwise over the drums at *B* and *C*; hence, the maximum tension T_2 in the cord occurs at *D*. Thus, $F = T_2 = 500$ N.
A section of the cord passing over the drum at *B* is shown in A section of the cord passing over the drum at *B* is shown in A section of the cord passing over the drum at *B* is shown in Fig. 8–19*b*. Since $180^\circ = \pi$ rad the angle of contact between the drum Fig. 8–19*b*. Since $180^\circ = \pi$ rad the angle of contact between the drum and the cord is $\beta = (135^\circ/180^\circ)\pi = 3\pi/4$ rad. Using Eq. 8–6, we have

$$
T_2 = T_1 e^{\mu_s \beta}; \qquad 500 \text{ N} = T_1 e^{0.25[(3/4)\pi]}
$$

Hence,

$$
T_1 = \frac{500 \text{ N}}{e^{0.25[(3/4)\pi]}} = \frac{500 \text{ N}}{1.80} = 277.4 \text{ N}
$$

Since the pulley at *A* is free to rotate, equilibrium requires that the tension in the cord remains the *same* on both sides of the pulley.

The section of the cord passing over the drum at *C* is shown in The section of the cord passing over the drum at *C* is shown in Fig. 8–19*c*. The weight $W < 277.4$ N. Why? Applying Eq. 8–6, we obtain

 $W = 153.9 N$ $T_2 = T_1 e^{\mu_s \beta}$; $277.4 \text{ N} = We^{0.25[(3/4)\pi]}$

so that

$$
m = \frac{W}{g} = \frac{153.9 \text{ N}}{9.81 \text{ m/s}^2}
$$

= 15.7 kg *Ans.*

PROBLEMS

***8–88.** Blocks *A* and *B* weigh 50 lb and 30 lb, respectively. Using the coefficients of static friction indicated, determine the greatest weight of block *D* without causing motion.

•8–89. Blocks *A* and *B* weigh 75 lb each, and *D* weighs 30 lb. Using the coefficients of static friction indicated, determine the frictional force between blocks *A* and *B* and between block *A* and the floor *C*.

*8.6 [Frictional Forces on Collar Bearings,](#page-12-0) Pivot Bearings, and Disks

Pivot and *collar bearings* are commonly used in machines to support an *axial load* on a rotating shaft. Typical examples are shown in Fig. 8–20. Provided these bearings are not lubricated, or are only partially lubricated, the laws of dry friction may be applied to determine the moment needed to turn the shaft when it supports an axial force.

Frictional Analysis. The collar bearing on the shaft shown in Fig. 8–21 is subjected to an axial force **P** and has a total bearing or contact
2rea $\pi(R^2 - R^2)$. Provided the bearing is new and evenly supported area $\pi (R_2^2 - R_1^2)$. Provided the bearing is new and evenly supported,
then the normal pressure n on the bearing will be *uniformly distributed* then the normal pressure p on the bearing will be *uniformly distributed* then the normal pressure *p* on the bearing will be *uniformly distributed*
over this area. Since $\Sigma F_z = 0$, then *p*, measured as a force per unit area,
is $n = P/\pi (R^2 - R^2)$ over this area. Since Σ
is $p = P/\pi (R_2^2 - R_1^2)$.
The moment needed $\binom{2}{1}$

 $p = T/m(N_2 - N_1)$.
The moment needed to cause impending rotation of the shaft can be determined from moment equilibrium about the *z* axis. A differential determined from moment equilibrium about the z axis. A differential
area element $dA = (r d\theta)(dr)$, shown in Fig. 8–21, is subjected to both a
normal force $dN = n dA$ and an associated frictional force area element $dA = (r \, d\theta)(dr)$, shown in Fig. 8–21, is subject
normal force $dN = p \, dA$ and an associated frictional force,

$$
dF = \mu_s dN = \mu_s p dA = \frac{\mu_s P}{\pi (R_2^2 - R_1^2)} dA
$$

Fig. 8–21

Fig. 8–21 (Repeated)

The normal force does not create a moment about the *z* axis of the The normal force does not create a moment about the z axis of the shaft; however, the frictional force does; namely, $dM = r dF$. Integration is needed to compute the applied moment **M** needed to overcome all the is needed to compute the applied moment **M** needed to overcome all the frictional forces. Therefore, for impending rotational motion,

$$
\Sigma M_z = 0; \qquad \qquad M - \int_A r \, dF = 0
$$

Substituting for *dF* and *dA* and integrating over the entire bearing area yields

$$
M = \int_{R_1}^{R_2} \int_0^{2\pi} r \left[\frac{\mu_s P}{\pi (R_2^2 - R_1^2)} \right] (r \, d\theta \, dr) = \frac{\mu_s P}{\pi (R_2^2 - R_1^2)} \int_{R_1}^{R_2} r^2 \, dr \int_0^{2\pi} d\theta
$$

or

$$
M = \frac{2}{3}\mu_s P \left(\frac{R_2^3 - R_1^3}{R_2^2 - R_1^2} \right) \tag{8-7}
$$

The moment developed at the end of the shaft, when it is *rotating* at constant speed, can be found by substituting μ_k for μ_s in Eq. 8–7.
In the case of a pivot begins Fig. 8–20*g* then $B = B$ and $B =$

In the case of a pivot bearing, Fig. 8–20*a*, then $R_2 = R$ and $R_1 = 0$, and an $R_2 = R_1$ and $R_2 = R_2$. Eq. 8–7 reduces to

$$
M = \frac{2}{3}\mu_s PR \tag{8-8}
$$

Remember that Eqs. 8–7 and 8–8 apply only for bearing surfaces subjected to *constant pressure*. If the pressure is not uniform, a variation of the pressure as a function of the bearing area must be determined before integrating to obtain the moment. The following example illustrates this concept.

The motor that turns the disk of this sanding machine develops a torque that must overcome the frictional forces acting on the disk.

EXAMPLE 8.9

The uniform bar shown in Fig. 8–22*a* has a weight of 4 lb. If it is assumed that the normal pressure acting at the contacting surface varies linearly along the length of the bar as shown, determine the couple moment **M** required to rotate the bar. Assume that the bar's width is negligible in comparison to its length. The coefficient of static width is negligible in compa
friction is equal to $\mu_s = 0.3$.

SOLUTION

A free-body diagram of the bar is shown in Fig. 8–22*b*. The intensity A free-body diagram of the bar is shown in Fig. 8–22*b*. The intensity w_0 of the distributed load at the center $(x = 0)$ is determined from vertical force equilibrium. Fig. 8–22*a* vertical force equilibrium, Fig. 8–22*a*.

$$
+\uparrow \Sigma F_z = 0;
$$
 $-4 \text{ lb} + 2 \left[\frac{1}{2} \left(2 \text{ ft} \right) w_0 \right] = 0$ $w_0 = 2 \text{ lb/ft}$

Since $w = 0$ at $x = 2$ ft, the distributed load expressed as a function of *x* is of *x* is

$$
w = (2 \text{ lb/ft}) \left(1 - \frac{x}{2 \text{ ft}} \right) = 2 - x
$$

The magnitude of the normal force acting on a differential segment of area having a length *dx* is therefore

$$
dN = w dx = (2 - x)dx
$$

The magnitude of the frictional force acting on the same element of area is

$$
dF = \mu_s dN = 0.3(2 - x)dx
$$

Hence, the moment created by this force about the *z* axis is

$$
dM = x dF = 0.3(2x - x^2)dx
$$

The summation of moments about the *z* axis of the bar is determined by integration, which yields

$$
\Sigma M_z = 0; \quad M - 2 \int_0^2 (0.3)(2x - x^2) dx = 0
$$

$$
M = 0.6 \left(x^2 - \frac{x^3}{3} \right) \Big|_0^2
$$

$$
M = 0.8 \text{ lb} \cdot \text{ft}
$$
Ans. Fig. 8-22

requires overcoming friction from the supporting shaft.

Fig. 8–23

8.7 [Frictional Forces on Journal Bearings](#page-12-0)

When a shaft or axle is subjected to lateral loads, a *journal bearing* is commonly used for support. Provided the bearing is not lubricated, or is only partially lubricated, a reasonable analysis of the frictional resistance on the bearing can be based on the laws of dry friction.

Frictional Analysis. A typical journal-bearing support is shown in Fig. 8–23*a*.As the shaft rotates, the contact point moves up the wall of the bearing to some point *A* where slipping occurs. If the vertical load acting at the end of the shaft is **P**, then the bearing reactive force **R** acting at *A* will be equal and opposite to **P**, Fig. 8–23*b*. The moment needed to maintain constant rotation of the shaft can be found by summing moments about the *z* axis of the shaft; i.e.,

$$
L_1
$$
 University University University University University University University M − (*R sin φ_k*)*r* = 0
Equives overcoming friction from the
surporting shaft.

$$
M = Rr \sin \phi_k \tag{8-9}
$$

where ϕ_k is the angle of kinetic friction defined by $\tan \phi_k = F/N = u \cdot N/N = u$. In Fig. 8.23c it is seen that $r \sin \phi = r \cdot$ The where ϕ_k is the angle of kinetic friction defined by $\tan \phi_k = F/N = \mu_k N/N = \mu_k$. In Fig. 8–23*c*, it is seen that $r \sin \phi_k = r_f$. The dashed circle with radius r_s is called the friction circle and as the shaft dashed circle with radius r_f is called the *friction circle*, and as the shaft rotates, the reaction **R** will always be tangent to it. If the bearing is partially rotates, the reaction **R** will always be tangent to it. If the bearing is partially lubricated, μ_k is small, and therefore $\sin \phi_k \approx \tan \phi_k \approx \mu_k$. Under these conditions a reasonable approximation to the moment needed to conditions, a reasonable *approximation* to the moment needed to overcome the frictional resistance becomes

$$
M \approx R r \mu_k \tag{8-10}
$$

In practice, this type of journal bearing is not suitable for long service since friction between the shaft and bearing will wear down the surfaces. Instead, designers will incorporate "ball bearings" or "rollers" in journal bearings to minimize frictional losses.

$EXAMPLE **8.10**$

The 100-mm-diameter pulley shown in Fig. 8–24*a* fits loosely on a 10-mm-diameter shaft for which the coefficient of static friction is 10-mm-diameter shaft for which the coefficient of static friction is $\mu_s = 0.4$. Determine the minimum tension *T* in the belt needed to (a) raise the 100 kg block and (b) lower the block. Assume that no (a) raise the 100-kg block and (b) lower the block. Assume that no slipping occurs between the belt and pulley and neglect the weight of the pulley.

SOLUTION

Part (a). A free-body diagram of the pulley is shown in Fig. 8–24*b*. When the pulley is subjected to belt tensions of 981 N each, it makes contact with the shaft at point P_1 . As the tension *T* is *increased*, the contact point will move around the shaft to point P_2 before motion contact point will move around the shaft to point P_2 before motion EQUALIZED FOR THE FIGURE TO BE THE FIGURE TO DETERMIND THE SHALL OF POINT $\frac{1}{2}$ before motion impends. From the figure, the friction circle has a radius $r_f = r \sin \phi_s$. Using the simplification that $\sin \phi_s \approx \tan \phi_s \approx \mu_s$ then $r_s \approx r\mu = (5 \text{ mm})(0.4) = 2 \text{ mm}$ so that summing moments about $r_f = r \sin \phi_s$. Using the simplification that $\sin \phi_s \approx \tan \phi_s \approx \mu_s$ then $r_f \approx r\mu_s = (5 \text{ mm})(0.4) = 2 \text{ mm}$, so that summing moments about P_s gives

$$
P_2 \text{ gives}
$$
\n
$$
\zeta + \sum M_{P_2} = 0; \qquad 981 \text{ N} (52 \text{ mm}) - T (48 \text{ mm}) = 0
$$
\n
$$
T = 1063 \text{ N} = 1.06 \text{ kN} \qquad \text{Ans.}
$$
\nIf a more exact analysis is used, then $\phi_s = \tan^{-1} 0.4 = 21.8^\circ$. Thus, the radius of the friction, yield, by $r = r \sin t - 5 \sin 21.8^\circ - 1.0^\circ$.

If a more exact analysis is used, then $\phi_s = \tan^{-1} 0.4 = 21.8^\circ$. Thus, the radius of the friction circle would be $r_f = r \sin \phi_s = 5 \sin 21.8^\circ = 1.86$ mm. Therefore 1.86 mm. Therefore,

$$
\zeta + \sum M_{P_2} = 0;
$$

\n981 N(50 mm + 1.86 mm) - T(50 mm - 1.86 mm) = 0
\n
$$
T = 1057 \text{ N} = 1.06 \text{ kN}
$$
\n20.06 km
\nPart (b). When the block is lowered, the resultant force **R** acting

on the shaft passes through point as shown in Fig. 8–24*c*. Summing

moments about this point yields
\n
$$
\zeta + \sum M_{P_3} = 0
$$
; 981 N(48 mm) - T(52 mm) = 0
\nT = 906 N
\nAns.

NOTE: The difference between raising and lowering the block is thus 157 N.

(a) Rigid surface of contact

(b) Soft surface of contact

or

Fig. 8–25

*8.8 [Rolling Resistance](#page-12-0)

When a *rigid* cylinder rolls at constant velocity along a *rigid* surface, the normal force exerted by the surface on the cylinder acts perpendicular to the tangent at the point of contact, as shown in Fig. 8–25*a*. Actually, however, no materials are perfectly rigid, and therefore the reaction of the surface on the cylinder consists of a distribution of normal pressure. For example, consider the cylinder to be made of a very hard material, and the surface on which it rolls to be relatively soft. Due to its weight, the cylinder compresses the surface underneath it, Fig. 8–25*b*.As the cylinder rolls, the surface material in front of the cylinder *retards* the motion since it is being *deformed*, whereas the material in the rear is *restored* from the deformed state and therefore tends to *push* the cylinder forward. The normal pressures acting on the cylinder in this manner are represented in Fig. 8–25*b* by their resultant forces N_d and N_r . Because the magnitude of the force of *deformation* N_r and its horizontal component is *always greater* than that $deformation, \mathbf{N}_d$, and its horizontal component is *always greater* than that α restoration \mathbf{N} , and consequently a horizontal driving force **P** must be of *restoration*, N_r , and consequently a horizontal driving force **P** must be applied to the cylinder to maintain the motion. Fig. 8, 256 $*$ applied to the cylinder to maintain the motion. Fig. 8–25*b*.*

Rolling resistance is caused primarily by this effect, although it is also, to a lesser degree, the result of surface adhesion and relative microsliding between the surfaces of contact. Because the actual force **P** needed to overcome these effects is difficult to determine, a simplified method will be developed here to explain one way engineers have analyzed this phenomenon. To do this, we will consider the resultant of analyzed this phenomenon. To do this, we will consider the resultant of
the *entire* normal pressure, $N = N_d + N_r$, acting on the cylinder,
Fig. 8, 25c, As shown in Fig. 8, 25d, this force acts at an angle 4 with the Fig. 8–25*c*. As shown in Fig. 8–25*d*, this force acts at an angle θ with the vertical. To keep the cylinder in equilibrium, i.e., rolling at a constant rate, it is necessary that **N** be *concurrent* with the driving force **P** and the rate, it is necessary that **N** be *concurrent* with the driving force **P** and the weight **W**. Summing moments about point *A* gives $Wa = P(r \cos \theta)$.
Since the deformations are generally very small in relation to the Since the deformations are generally very small in relation to the Since the deformations are genergy
linder's radius, $\cos \theta \approx 1$; hence,

 $Wa \approx Pr$

$$
P \approx \frac{Wa}{r} \tag{8-11}
$$

The distance *a* is termed the *coefficient of rolling resistance*, which
is the dimension of length. For instance, $a \approx 0.5$ mm for a wheel
alling on a rail both of which are made of mild steel. For hardened has the dimension of length. For instance, $a \approx 0.5$ mm for a wheel rolling on a rail, both of which are made of mild steel. For hardened

N

N*^d*

(c)

N*r*

^{*}Actually, the deformation force N_d causes *energy* to be stored in the material as its
contrude is increased whereas the restoration force N_d as its magnitude is degreeed magnitude is increased, whereas the restoration force N_r , as its magnitude is decreased, allow some of this energy to be released. The remaining energy is lest since it is used to allows some of this energy to be released. The remaining energy is *lost* since it is used to heat up the surface, and if the cylinder's weight is very large, it accounts for permanent deformation of the surface. Work must be done by the horizontal force **P** to make up for this loss.

steel ball bearings on steel, $a \approx 0.1$ mm. Experimentally, though, this factor is difficult to measure since it depends on such parameters as factor is difficult to measure, since it depends on such parameters as the rate of rotation of the cylinder, the elastic properties of the contacting surfaces, and the surface finish. For this reason, little reliance is placed on the data for determining *a*. The analysis presented here does, however, indicate why a heavy load (*W*) offers greater resistance to motion (*P*) than a light load under the same conditions. Furthermore, since Wa/r is generally very small compared to $\mu_k W$, the force needed to *roll* a cylinder over the surface will be much less than force needed to *roll* a cylinder over the surface will be much less than that needed to *slide* it across the surface. It is for this reason that a roller or ball bearings are often used to minimize the frictional resistance between moving parts.

Rolling resistance of railroad wheels on the rails is small since steel is very stiff. By comparison, the rolling resistance of the wheels of a tractor in a wet field is very large.

$EXAMPLE$ 8.11

A 10-kg steel wheel shown in Fig. 8–26*a* has a radius of 100 mm and rests on an inclined plane made of soft wood. If θ is increased so that the wheel begins to roll down the incline with constant velocity when $\theta = 1.2^{\circ}$, determine the coefficient of rolling resistance.

SOLUTION

As shown on the free-body diagram, Fig. 8–26*b*, when the wheel has impending motion, the normal reaction **N** acts at point *A* defined by the dimension *a*. Resolving the weight into components parallel and perpendicular to the incline, and summing moments about point *A*, yields

 ζ -+ $\Sigma M_A = 0;$

$$
-(98.1 \cos 1.2^{\circ} \text{ N})(a) + (98.1 \sin 1.2^{\circ} \text{ N})(100 \cos 1.2^{\circ} \text{ mm}) = 0
$$

Solving, we obtain

$$
a = 2.09 \text{ mm}
$$

CHAPTER REVIEW

Dry Friction

Frictional forces exist between two rough surfaces of contact. These forces act on a body so as to oppose its motion or tendency of motion.

A static frictional force approaches a A static frictional force approaches a
maximum value of $F_s = \mu_s N$, where μ_s
is the coefficient of static friction. In this is the *coefficient of static friction*. In this case, motion between the contacting surfaces is *impending*.

If slipping occurs, then the friction force remains essentially constant and equal remains essentially constant and equal
to $F_k = \mu_k N$. Here μ_k is the *coefficient*
of kinetic friction *of kinetic friction*.

The solution of a problem involving friction requires first drawing the freebody diagram of the body. If the unknowns cannot be determined strictly from the equations of equilibrium, and the possibility of slipping occurs, then the friction equation should be applied at the appropriate points of contact in order to complete the solution.

It may also be possible for slender objects, like crates, to tip over, and this situation should also be investigated.

Impending motion **P W** θ **F**3 **N**3 **W** \mathbf{F}_2 **N**2 **P** \mathbf{F}_2 **N**2 \mathbf{F}_1 **N**₁ θ **W** *r* **M** Motion or impending motion of belt relative to surface $\beta \sim r$ \mathbf{T}_2 \mathbf{T}_1 θ **Wedges** Wedges are inclined planes used to increase the application of a force. The two force equilibrium equations are used to relate the forces acting on the wedge. An applied force **P** must push on the wedge to move it to the right. If the coefficients of friction between the surfaces are large enough, then **P** can be removed, and the wedge will be self-locking and remain in place. **Screws** Square-threaded screws are used to move heavy loads. They represent an inclined plane, wrapped around a cylinder. The moment needed to turn a screw depends upon the coefficient of friction and the screw's lead angle θ . If the coefficient of friction between the surfaces is large enough, then the screw will support the load without tending to turn, i.e., it will be self-locking. **Flat Belts** The force needed to move a flat belt over a rough curved surface depends only on the angle of belt contact, β , and the coefficient of friction. Upward Impending Screw Motion Downward Impending Screw Motion Downward Screw Motion $\phi_{\rm s} > \theta$ $M'' = Wr \tan(\phi - \theta_s)$ $\theta > \phi$ $M' = Wr \tan(\theta - \phi_s)$ $M = Wr \tan(\theta + \phi_s)$ $T_2 > T_1$ $T_2 = T_1 e^{\mu \beta}$ $\Sigma F_x = 0$ $\Sigma F_v = 0$

Probs. 8–149/150

When a water tank is designed, it is important to be able to determine its center of gravity, calculate its volume and surface area, and reduce three-dimensional distributed loadings caused by the water pressure to their resultants. All of these topics are discussed in this chapter.

[Center of Gravity and](#page-12-0) Centroid

9

[CHAPTER OBJECTIVES](#page-12-0)

- To discuss the concept of the center of gravity, center of mass, and the centroid.
- To show how to determine the location of the center of gravity and centroid for a system of discrete particles and a body of arbitrary shape.
- To use the theorems of Pappus and Guldinus for finding the surface area and volume for a body having axial symmetry.
- To present a method for finding the resultant of a general distributed loading and show how it applies to finding the resultant force of a pressure loading caused by a fluid.

9.1 [Center of Gravity, Center of Mass,](#page-12-0) and the Centroid of a Body

In this section we will first show how to locate the center of gravity for a body, and then we will show that the center of mass and the centroid of a body can be developed using this same method.

Center of Gravity. A body is composed of an infinite number of particles of differential size, and so if the body is located within a gravitational field, then each of these particles will have a weight *dW*, Fig. 9–1*a*. These weights will form an approximately parallel force system, and the resultant of this system is the total weight of the body, which passes through a single point called the *center of gravity, G*, Fig. 9–1*b*.*

^{*}This is true as long as the gravity field is assumed to have the same magnitude and direction everywhere. That assumption is appropriate for most engineering applications, since gravity does not vary appreciably between, for instance, the bottom and the top of a building.

Using the methods outlined in Sec. 4.8, the weight of the body is the sum of the weights of all of its particles, that is

$$
+\bigdownarrow F_R = \Sigma F_z; \qquad \qquad W = \int dW
$$

The location of the center of gravity, measured from the *y* axis, is determined by equating the moment of *W* about the *y* axis, Fig. 9–1*b*, to the sum of the moments of the weights of the particles about this same axis. If *dW* is located at point $(\tilde{x}, \tilde{y}, \tilde{z})$, Fig. 9–1*a*, then

$$
(M_R)_y = \Sigma M_y; \qquad \overline{x}W = \int \widetilde{x}dW
$$

Similarly, if moments are summed about the *x* axis,

$$
(M_R)_x = \Sigma M_x; \qquad \qquad \overline{y}W = \int \widetilde{y}dW
$$

Finally, imagine that the body is fixed within the coordinate system and this system is rotated 90° about the *y* axis, Fig. 9–1*c*. Then the sum of the moments about the *y* axis gives

$$
(M_R)_y = \Sigma M_y; \qquad \overline{z}W = \int \widetilde{z}dW
$$

Therefore, the location of the center of gravity *G* with respect to the *x*, *y*, *z* axes becomes

$$
\overline{x} = \frac{\int \widetilde{x} \, dW}{\int dW} \qquad \overline{y} = \frac{\int \widetilde{y} \, dW}{\int dW} \qquad \overline{z} = \frac{\int \widetilde{z} \, dW}{\int dW} \qquad (9-1)
$$

Here

 \overline{x} , \overline{y} , \overline{z} are the coordinates of the center of gravity *G*, Fig. 9–1*b*.

 $\widetilde{x}, \widetilde{y}, \widetilde{z}$ are the coordinates of each particle in the body, Fig. 9–1*a*.

Center of Mass of a Body. In order to study the *dynamic response* or accelerated motion of a body, it becomes important to locate the body's center of mass C_m , Fig. 9–2. This location can be determined by substituting $dW = g \ dm$ into Eqs. 9–1. Since *g* is constant, it cancels out, and so

$$
\overline{x} = \frac{\int \widetilde{x} \, dm}{\int dm} \qquad \overline{y} = \frac{\int \widetilde{y} \, dm}{\int dm} \qquad \overline{z} = \frac{\int \widetilde{z} \, dm}{\int dm} \qquad (9)
$$

Centroid of a Volume. If the body in Fig. 9–3 is made from a homogeneous material, then its density ρ (rho) will be constant. homogeneous material, then its density ρ (rho) will be constant.
Therefore, a differential element of volume *dV* has a mass $dm = \rho dV$.
Substituting this into Eqs. 9–2 and canceling out a we obtain formulas Substituting this into Eqs. 9–2 and canceling out ρ , we obtain formulas that locate the *centroid C* or geometric center of the body; namely

$$
\overline{x} = \frac{\int_{V} \widetilde{x} \, dV}{\int_{V} dV} \qquad \overline{y} = \frac{\int_{V} \widetilde{y} \, dV}{\int_{V} dV} \qquad \overline{z} = \frac{\int_{V} \widetilde{z} \, dV}{\int_{V} dV} \qquad (9-3)
$$

These equations represent a balance of the moments of the volume of the body. Therefore, if the volume possesses two planes of symmetry, then its centroid must lie along the line of intersection of these two planes. For example, the cone in Fig. 9–4 has a centroid that lies on the *y* axis so that $\bar{x} = \bar{z} = 0$. The location \bar{y} can be found using a single integration by choosing a differential element represented by a *thin disk* integration by choosing a differential element represented by a *thin dis*
having a thickness dy and radius $r = z$. Its volume is $dV = \pi r^2 dv = \pi z^2 dv$ and its centroid is at $\tilde{\gamma} = 0$, $\tilde{\gamma} = v$, $\tilde{\gamma} = 0$ and its centroid is at $\tilde{x} = 0$, $\tilde{y} = y$, $\tilde{z} = 0$. having a thickness dy and radius $r = z$. Its volunt $\pi r^2 dy = \pi z^2 dy$ and its centroid is at $\tilde{x} = 0$, $\tilde{y} = y$, $\tilde{z} = 0$ cample, the
 $\overline{x} = \overline{z} = 0$

Fig. 9–4

Integration must be used to determine the location of the center of gravity of this goal post due to the curvature of the supporting member.

Centroid of an Area. If an area lies in the *x–y* plane and is bounded **Centroid of an Area.** If an area lies in the x-y plane and is bounded
by the curve $y = f(x)$, as shown in Fig. 9–5*a*, then its centroid will be in
this plane and can be determined from integrals similar to Eqs. 9–3. this plane and can be determined from integrals similar to Eqs. 9–3, namely,

$$
\overline{x} = \frac{\int_{A} \widetilde{x} dA}{\int_{A} dA} \qquad \overline{y} = \frac{\int_{A} \widetilde{y} dA}{\int_{A} dA} \qquad (9-4)
$$

These integrals can be evaluated by performing a *single integration* if we use a *rectangular strip* for the differential area element. For example, if a use a *rectangular strip* for the differential area element. For example, if a
vertical strip is used, Fig. 9–5*b*, the area of the element is $dA = y dx$, and
its controid is located at $\tilde{a} = x$ and $\tilde{a} = y/2$. If we con its centroid is located at $\tilde{x} = x$ and $\tilde{y} = y/2$. If we consider a horizontal strip, Fig. 9–5*c*, then $dA = x dy$, and its centroid is located at $\tilde{x} = x/2$ and $\tilde{y} = y$ $\widetilde{y} = y.$ ed at $\tilde{x} = x$ and $\tilde{y} = y/2$. If we consider a horize $dA = x dy$, and its centroid is located at $\tilde{x} = x/2$ 9–5*b*, the area of th
 $\widetilde{x} = x$ and $\widetilde{y} = y/2$
 $\widetilde{y} = x \, dy$ and its centri-

Centroid of a Line. If a line segment (or rod) lies within the *x–y* **Centroid of a Line.** If a line segment (or rod) lies within the $x-y$ plane and it can be described by a thin curve $y = f(x)$, Fig. 9–6*a*, then its centroid is determined from centroid is determined from

$$
\overline{x} = \frac{\int_L \widetilde{x} \, dL}{\int_L dL} \qquad \overline{y} = \frac{\int_L \widetilde{y} \, dL}{\int_L dL} \qquad (9-5)
$$

Here, the length of the differential element is given by the Pythagorean Here, the length of the differential element is given by the Pythagorean theorem, $dL = \sqrt{(dx)^2 + (dy)^2}$, which can also be written in the form

$$
dL = \sqrt{\left(\frac{dx}{dx}\right)^2} dx^2 + \left(\frac{dy}{dx}\right)^2 dx^2
$$

$$
= \left(\sqrt{1 + \left(\frac{dy}{dx}\right)^2}\right) dx
$$

or

$$
dL = \sqrt{\left(\frac{dx}{dy}\right)^2 dy^2 + \left(\frac{dy}{dy}\right)^2 dy^2}
$$

$$
= \left(\sqrt{\left(\frac{dx}{dy}\right)^2 + 1}\right) dy
$$

Either one of these expressions can be used; however, for application, the one that will result in a simpler integration should be selected. For the one that will result in a simpler integration should be selected. For
example, consider the rod in Fig. 9–6*b*, defined by $y = 2x^2$. The length of
the element is $dI = 2\sqrt{1 + (du/dx)^2} dx$ and since $du/dx = 4x$, then the element is $dL = \sqrt{1 + (dy/dx)^2} dx$, and since $dy/dx = 4x$, then $= \sqrt{1 + (4x)^2} dx$. The centroid for this element is located at \tilde{x} and $\widetilde{y} = y$. y the element is $dL = \sqrt{1 + (dy/dx)^2} dx$, and since $dy/dx = 4x$, then
 $dL = \sqrt{1 + (4x)^2} dx$. The centroid for this element is located at $\tilde{x} = x$ er the rod in Fig. 9–6b, defined by $y = 2x^2$. The len
 $dL = \sqrt{1 + (dy/dx)^2} dx$, and since $dy/dx = 4x$

Important Points

- The centroid represents the geometric center of a body. This point coincides with the center of mass or the center of gravity only if the material composing the body is uniform or homogeneous.
- Formulas used to locate the center of gravity or the centroid simply represent a balance between the sum of moments of all the parts of the system and the moment of the "resultant" for the system.
- In some cases the centroid is located at a point that is not on the object, as in the case of a ring, where the centroid is at its center. Also, this point will lie on any axis of symmetry for the body, Fig. 9–7.

Procedure for Analysis

The center of gravity or centroid of an object or shape can be determined by single integrations using the following procedure.

Differential Element.

- Select an appropriate coordinate system, specify the coordinate axes, and then choose a differential element for integration.
- For lines the element is represented by a differential line segment of length *dL* .
- For areas the element is generally a rectangle of area *dA*, having a finite length and differential width.
- For volumes the element can be a circular disk of volume *dV*, having a finite radius and differential thickness.
- Locate the element so that it touches the arbitrary point (x, y, z) on the curve that defines the boundary of the shape.

Size and Moment Arms.

- Express the length *dL*, area *dA*, or volume *dV* of the element in terms of the coordinates describing the curve.
- Express the moment arms \tilde{x} , \tilde{y} , \tilde{z} for the centroid or center of oray of the coordinates describing gravity of the element in terms of the coordinates describing the curve.

Integrations.

- Substitute the formulations for \tilde{x} , \tilde{y} , \tilde{z} and *dL*, *dA*, or *dV* into the appropriate equations (Eqs. 9–1 through 9–5) appropriate equations (Eqs. 9–1 through 9–5).
- Express the function in the integrand in terms of the *same variable as the differential thickness of the element*.
- The limits of the integral are defined from the two extreme locations of the element's differential thickness, so that when the elements are "summed" or the integration performed, the entire region is covered.*

^{*}Formulas for integration are given in Appendix A.

Ans.

EXAMPLE 9.1

Locate the centroid of the rod bent into the shape of a parabolic arc as shown in Fig. 9–8.

SOLUTION

Differential Element. The differential element is shown in Fig. 9-8. It is located on the curve at the *arbitrary point* (*x, y*).

Area and Moment Arms. The differential element of length *dL* can be expressed in terms of the differentials *dx* and *dy* using the Pythagorean theorem.

$$
dL = \sqrt{(dx)^2 + (dy)^2} = \sqrt{\left(\frac{dx}{dy}\right)^2 + 1} dy
$$

Since $x = y^2$, then $dx/dy = 2y$. Therefore, expressing dL in terms of y and dy we have *y* and *dy*, we have

$$
dL = \sqrt{(2y)^2 + 1} dy
$$

As shown in Fig. 9–8, the centroid of the element is located at \tilde{x}
 $\tilde{y} = y$ $\widetilde{y} = y.$ \sim $= x,$

Integrations. Applying Eqs. 9–5, using the formulas in Appendix A to evaluate the integrals, we get

$$
\overline{x} = \frac{\int_L \widetilde{x} \, dL}{\int_L dL} = \frac{\int_0^{1m} x \sqrt{4y^2 + 1} \, dy}{\int_0^{1m} \sqrt{4y^2 + 1} \, dy} = \frac{\int_0^{1m} y^2 \sqrt{4y^2 + 1} \, dy}{\int_0^{1m} \sqrt{4y^2 + 1} \, dy}
$$

$$
= \frac{0.6063}{1.479} = 0.410 \text{ m}
$$

$$
\overline{y} = \frac{\int_{L} \widetilde{y} \, dL}{\int_{L} dL} = \frac{\int_{0}^{1m} y \sqrt{4y^2 + 1} \, dy}{\int_{0}^{1m} \sqrt{4y^2 + 1} \, dy} = \frac{0.8484}{1.479} = 0.574 \text{ m}
$$
Ans.

NOTE: These results for *C* seem reasonable when they are plotted on Fig. 9–8.

Locate the centroid of the circular wire segment shown in Fig. 9–9.

SOLUTION

Polar coordinates will be used to solve this problem since the arc is circular.

Differential Element. A differential circular arc is selected as shown in the figure. This element intersects the curve at $(R,\theta).$

Length and Moment Arm. The length of the differential element is $dL = R d\theta$, and its centroid is located at $\tilde{x} = R \cos \theta$ and $\widetilde{y} = R \sin \theta.$ **ngth and Moment Arm.** The length of the differential ele
 $dL = R d\theta$, and its centroid is located at $\tilde{x} = R \cos \theta$
 $= R \sin \theta$

Integrations. Applying Eqs. 9–5 and integrating with respect to θ , we obtain

$$
\overline{x} = \frac{\int_L \widetilde{x} \, dL}{\int_L dL} = \frac{\int_0^{\pi/2} (R \cos \theta) R \, d\theta}{\int_0^{\pi/2} R \, d\theta} = \frac{R^2 \int_0^{\pi/2} \cos \theta \, d\theta}{R \int_0^{\pi/2} d\theta} = \frac{2R}{\pi} \quad \text{Ans.}
$$
\n
$$
\overline{y} = \frac{\int_L \widetilde{y} \, dL}{\int_L dL} = \frac{\int_0^{\pi/2} (R \sin \theta) R \, d\theta}{\int_0^{\pi/2} R \, d\theta} = \frac{R^2 \int_0^{\pi/2} \sin \theta \, d\theta}{R \int_0^{\pi/2} d\theta} = \frac{2R}{\pi} \quad \text{Ans.}
$$

NOTE: As expected, the two coordinates are numerically the same due to the symmetry of the wire.

Determine the distance \overline{v} measured from the *x* axis to the centroid of the area of the triangle shown in Fig. $9-10$.

SOLUTION

Differential Element. Consider a rectangular element having a thickness *dy,* and located in an arbitrary position so that it intersects the boundary at (x, y) , Fig. 9–10.

Area and Moment Arms. The area of the element is $dA = x dy$ and its centroid is located a distance $\tilde{y} = y$ from the *x* axis. $=\frac{b}{h}(h - y) dy$, and its centroid is located a distance $\tilde{y} = y$ $\frac{b}{h}(h - y) dy$,

Integration. Applying the second of Eqs. 9–4 and integrating with respect to *y* yields

$$
\overline{y} = \frac{\int_A \widetilde{y} dA}{\int_A dA} = \frac{\int_0^h y \left[\frac{b}{h} (h - y) dy \right]}{\int_0^h \frac{b}{h} (h - y) dy} = \frac{\frac{1}{6}bh^2}{\frac{1}{2}bh}
$$

$$
= \frac{h}{3}
$$
Ans.

NOTE: This result is valid for any shape of triangle. It states that the centroid is located at one-third the height, measured from the base of the triangle.

Fig. 9–11

SOLUTION

Differential Element. Polar coordinates will be used, since the boundary is circular. We choose the element in the shape of a *triangle*, Fig. 9–11. (Actually the shape is a circular sector; however, neglecting higher-order differentials, the element becomes triangular.) The element intersects the curve at point (R, θ) .

Area and Moment Arms. The area of the element is

$$
dA = \frac{1}{2}(R)(R\,d\theta) = \frac{R^2}{2}d\theta
$$

and using the results of Example 9.3, the centroid of the (triangular) element is located at $\widetilde{x} = \frac{2}{3}R\cos\theta$, $\widetilde{y} = \frac{2}{3}$ y of Example 9.3, the centroi
 $\widetilde{x} = \frac{2}{3}R \cos \theta$, $\widetilde{y} = \frac{2}{3}R \sin \theta$.

Integrations. Applying Eqs. 9–4 and integrating with respect to θ , we obtain

$$
\overline{x} = \frac{\int_A \widetilde{x} dA}{\int_A dA} = \frac{\int_0^{\pi/2} \left(\frac{2}{3} R \cos \theta\right) \frac{R^2}{2} d\theta}{\int_0^{\pi/2} \frac{R^2}{2} d\theta} = \frac{\left(\frac{2}{3} R\right) \int_0^{\pi/2} \cos \theta d\theta}{\int_0^{\pi/2} d\theta} = \frac{4R}{3\pi}
$$
Ans.

$$
\overline{y} = \frac{\int_A \widetilde{y} dA}{\int_A dA} = \frac{\int_0^{\pi/2} \left(\frac{2}{3} R \sin \theta\right) \frac{R^2}{2} d\theta}{\int_0^{\pi/2} \frac{R^2}{2} d\theta} = \frac{\left(\frac{2}{3} R\right) \int_0^{\pi/2} \sin \theta d\theta}{\int_0^{\pi/2} d\theta} = \frac{4R}{3\pi}
$$
Ans.

Locate the centroid of the area shown in Fig. 9–12*a*.

SOLUTION I

Differential Element. A differential element of thickness *dx* is shown in Fig. 9–12*a*. The element intersects the curve at the *arbitrary point* (*x, y*), and so it has a height *y*.

point (x, y), and so it has a height y.
 Area and Moment Arms. The area of the element is $dA = y dx$,

and its centroid is located at $\tilde{x} = x, \tilde{y} = y/2$ and its centroid is located at $\tilde{x} = x, \tilde{y}$ The area of th
 $\widetilde{x} = x, \widetilde{y} = y/2.$

Integrations. Applying Eqs. 9–4 and integrating with respect to *x* yields

$$
\overline{x} = \frac{\int_{A} \widetilde{x} dA}{\int_{A} dA} = \frac{\int_{0}^{\text{1m}} xy \, dx}{\int_{0}^{\text{1m}} y \, dx} = \frac{\int_{0}^{\text{1m}} x^{3} \, dx}{\int_{0}^{\text{1m}} x^{2} \, dx} = \frac{0.250}{0.333} = 0.75 \text{ m}
$$

$$
\overline{y} = \frac{\int_{A} \widetilde{y} dA}{\int_{A} dA} = \frac{\int_{0}^{\text{1m}} (y/2) y dx}{\int_{0}^{\text{1m}} y dx} = \frac{\int_{0}^{\text{1m}} (x^{2}/2) x^{2} dx}{\int_{0}^{\text{1m}} x^{2} dx} = \frac{0.100}{0.333} = 0.3 \text{ m} Ans.
$$

SOLUTION II

Differential Element. The differential element of thickness *dy* is shown in Fig. 9–12*b*. The element intersects the curve at the *arbitrary* shown in Fig. 9–12*b*. The element intersec
point (x, y) , and so it has a length $(1 - x)$.

Area and Moment Arms. The area of the element is **Area** and **Mo**
 $dA = (1 - x) dy$,

$$
\tilde{x}
$$
, and its centroid is located at
\n
$$
\tilde{x} = x + \left(\frac{1-x}{2}\right) = \frac{1+x}{2}, \tilde{y} = y
$$

Integrations. Applying Eqs. 9–4 and integrating with respect to *y*, we obtain

$$
\widetilde{x} = \frac{\int_{A} \widetilde{x} dA}{\int_{A} dA} = \frac{\int_{0}^{1m} [(1+x)/2](1-x) dy}{\int_{0}^{1m} (1-x) dy} = \frac{\frac{1}{2} \int_{0}^{1m} (1-y) dy}{\int_{0}^{1m} (1-y) dy} = \frac{0.250}{0.333} = 0.75 \text{ m} \qquad \text{Ans.}
$$

$$
\overline{y} = \frac{\int_{A} \widetilde{y} dA}{\int_{A} dA} = \frac{\int_{0}^{1m} y(1-x) dy}{\int_{0}^{1m} (1-x) dy} = \frac{\int_{0}^{1m} (y - y^{3/2}) dy}{\int_{0}^{1m} (1-y) dy} = \frac{0.100}{0.333} = 0.3 \text{ m} \qquad \text{Ans.}
$$

L L NOTE: Plot these results and notice that they seem reasonable. Also, for this problem, elements of thickness *dx* offer a simpler solution.

 \int_0

 \int_0

SOLUTION I

Differential Element. The rectangular differential element parallel to the *y* axis shown shaded in Fig. 9–13*a* will be considered. This element has a thickness of *dx* and a height of *y*.

Area and Moment Arms. Thus, the area is $dA = y dx$, and its
centroid is located at $\tilde{x} = x$ and $\tilde{y} = y/2$ centroid is located at $\tilde{x} = x$ and \tilde{y} y **Arms.** Thus, the $\widetilde{x} = x$ and $\widetilde{y} = y/2$.

 $\overline{x} = 0$

Integration. Since the area is symmetrical about the *y* axis,

Ans.

Applying the second of Eqs. 9–4 with
$$
y = \sqrt{1 - \frac{x^2}{4}}
$$
, we have

$$
\overline{y} = \frac{\int_{A} \widetilde{y} dA}{\int_{A} dA} = \frac{\int_{-2 \text{ ft}}^{2 \text{ ft}} \frac{y}{2} (y dx)}{\int_{-2 \text{ ft}}^{2 \text{ ft}}} = \frac{\frac{1}{2} \int_{-2 \text{ ft}}^{2 \text{ ft}} \left(1 - \frac{x^{2}}{4} \right) dx}{\int_{-2 \text{ ft}}^{2 \text{ ft}} \sqrt{1 - \frac{x^{2}}{4}} dx} = \frac{4/3}{\pi} = 0.424 \text{ ft} \quad Ans.
$$

SOLUTION II

Differential Element. The shaded rectangular differential element of thickness *dy* and width 2*x,* parallel to the *x* axis, will be considered, Fig. 9–13*b*.

Area and Moment Arms. The area is $dA = 2x dy$, and its centroid is at $\widetilde{x} = 0$ and $\widetilde{y} = y$ is at $\widetilde{x} = 0$ and $\widetilde{y} = y$. **a and Moment A**
 $\widetilde{x} = 0$ and $\widetilde{y} = y$

Integration. Applying the second of Eqs. 9–4, with $x = 2\sqrt{1-y^2}$, we have we have

$$
\overline{y} = \frac{\int_{A} \widetilde{y} dA}{\int_{A} dA} = \frac{\int_{0}^{1 \text{ ft}} y(2x \, dy)}{\int_{0}^{1 \text{ ft}} 2x \, dy} = \frac{\int_{0}^{1 \text{ ft}} 4y \sqrt{1 - y^2} \, dy}{\int_{0}^{1 \text{ ft}} 4 \sqrt{1 - y^2} \, dy} = \frac{4/3}{\pi} \text{ ft} = 0.424 \text{ ft} \, \text{Ans.}
$$

Locate the \bar{y} centroid for the paraboloid of revolution, shown in Fig. 9–14. y

SOLUTION

Differential Element. An element having the shape of a *thin disk* is chosen. This element has a thickness *dy*, it intersects the generating chosen. This element has a thickness dy , it intersects the generic at the *arbitrary point* $(0, y, z)$, and so its radius is $r = z$.

Volume and Moment Arm. The volume of the element is $dV = (\pi z^2) dy$ and its centroid is located at $\tilde{v} = v$ and its centroid is located at \tilde{y} **Volume and Moment Arm.** The volume $(\pi z^2) dy$, and its centroid is located at $\tilde{y} = y$.

Integration. Applying the second of Eqs. 9–3 and integrating with respect to *y* yields

$$
\overline{y} = \frac{\int_{V} \widetilde{y} \, dV}{\int_{V} dV} = \frac{\int_{0}^{100 \, \text{mm}} y(\pi z^2) \, dy}{\int_{0}^{100 \, \text{mm}} (\pi z^2) \, dy} = \frac{100 \pi \int_{0}^{100 \, \text{mm}} y^2 \, dy}{100 \pi \int_{0}^{100 \, \text{mm}} y \, dy} = 66.7 \, \text{mm} \quad \text{Ans.}
$$

Determine the location of the center of mass of the cylinder shown in Fig. 9–15 if its density varies directly with the distance from its base, Fig. 9–15 if its densit
i.e., $\rho = 200z \text{ kg/m}^3$.

SOLUTION

For reasons of material symmetry,

$$
\overline{x} = \overline{y} = 0
$$
 Ans.

Differential Element. A disk element of radius 0.5 m and thickness *dz* is chosen for integration, Fig. 9–15, since the *density of the entire element is constant* for a given value of *z*. The element is located along the *z* axis at the *arbitrary point* $(0, 0, z)$.

Volume and Moment Arm. The volume of the element is **Volume and Moment Arm.** The volume of $dV = \pi (0.5)^2 dz$, and its centroid is located at $\tilde{z} = z$.

Integrations. Using an equation similar to the third of Eqs. 9–2 and **Integrations.** Using an equation similar to the third of Equinomental integrating with respect to *z*, noting that $\rho = 200z$, we have

$$
\overline{z} = \frac{\int_{V} \widetilde{z}\rho \,dV}{\int_{V} \rho \,dV} = \frac{\int_{0}^{1 \, \text{m}} z(200z) [\pi (0.5)^{2} \,dz]}{\int_{0}^{1 \, \text{m}} (200z) \pi (0.5)^{2} \,dz}
$$
\n
$$
= \frac{\int_{0}^{1 \, \text{m}} z^{2} \,dz}{\int_{0}^{1 \, \text{m}} z \,dz} = 0.667 \, \text{m} \qquad \qquad \text{Ans.}
$$

Prob. 9–40

9.2 [Composite Bodies](#page-12-0)

A *composite body* consists of a series of connected "simpler" shaped bodies, which may be rectangular, triangular, semicircular, etc. Such a body can often be sectioned or divided into its composite parts and, provided the *weight* and location of the center of gravity of each of these parts are known, we can then eliminate the need for integration to determine the center of gravity for the entire body.The method for doing this follows the same procedure outlined in Sec. 9.1. Formulas analogous to Eqs. 9–1 result; however, rather than account for an infinite number of differential weights, we have instead a finite number of weights. Therefore,

$$
\overline{x} = \frac{\Sigma \widetilde{x}W}{\Sigma W} \qquad \overline{y} = \frac{\Sigma \widetilde{y}W}{\Sigma W} \qquad \overline{z} = \frac{\Sigma \widetilde{z}W}{\Sigma W} \qquad (9-6)
$$

Here

- $\overline{x}, \overline{y}, \overline{z}$ represent the coordinates of the center of gravity *G* of the composite body.
- z $\tilde{\chi}, \tilde{y}, \tilde{z}$ represent the coordinates of the center of gravity of each composite part of the body. \overline{a} composite part of the body.
- ΣW is the sum of the weights of all the composite parts of the body, or simply the total weight of the body.

When the body has a *constant density or specific weight*, the center of gravity *coincides* with the centroid of the body.The centroid for composite lines, areas, and volumes can be found using relations analogous to Eqs. 9–6; however, the *W*'s are replaced by *L*'s, *A*'s, and *V*'s, respectively. Centroids for common shapes of lines, areas, shells, and volumes that often make up a composite body are given in the table on the inside back cover.

In order to determine the force required to tip over this concrete barrier it is first necessary to determine the location of its center of gravity *G*. Due to symmetry, *G* will lie on the vertical axis of symmetry.

Procedure for Analysis

The location of the center of gravity of a body or the centroid of a composite geometrical object represented by a line, area, or volume can be determined using the following procedure.

Composite Parts.

- Using a sketch, divide the body or object into a finite number of composite parts that have simpler shapes.
- If a composite body has a *hole*, or a geometric region having no material, then consider the composite body without the hole and consider the hole as an *additional* composite part having *negative* weight or size.

Moment Arms.

• Establish the coordinate axes on the sketch and determine the coordinates \widetilde{x} , \widetilde{y} , \widetilde{z} of the center of gravity or centroid of each part. y

Summations.

- Determine \bar{x} , \bar{y} , \bar{z} by applying the center of gravity equations,
Eqs. 9–6 or the analogous centroid equations Eqs. 9–6, or the analogous centroid equations.
- If an object is *symmetrical* about an axis, the centroid of the object lies on this axis.

If desired, the calculations can be arranged in tabular form, as indicated in the following three examples.

The center of gravity of this water tank can be determined by dividing it into composite parts and applying Eqs. 9–6.

Locate the centroid of the wire shown in Fig. 9–16*a*.

SOLUTION

Composite Parts. The wire is divided into three segments as shown in Fig. 9–16*b*.

Moment Arms. The location of the centroid for each segment is
determined and indicated in the figure. In particular, the centroid of determined and indicated in the figure. In particular, the centroid of segment (1) is determined either by integration or by using the table on the inside back cover.

Summations. For convenience, the calculations can be tabulated as follows:

Thus,

$$
\overline{x} = \frac{\Sigma \widetilde{x}L}{\Sigma L} = \frac{11\,310}{248.5} = 45.5 \text{ mm}
$$
Ans.

$$
\overline{y} = \frac{\Sigma \widetilde{y}L}{\Sigma L} = \frac{-5600}{248.5} = -22.5 \text{ mm}
$$
 Ans.

$$
\overline{z} = \frac{\Sigma \widetilde{z}L}{\Sigma L} = \frac{-200}{248.5} = -0.805 \text{ mm}
$$
Ans.

Locate the centroid of the plate area shown in Fig. 9–17*a*.

SOLUTION

Composite Parts. The plate is divided into three segments as shown in Fig. 9–17*b*. Here the area of the small rectangle (3) is
considered "negative" since it must be subtracted from the larger considered "negative" since it must be subtracted from the larger one (2).

Moment Arms. The centroid of each segment is located as indicated **Moment Arms.** The centroid of each segment is located as indicate
in the figure. Note that the \tilde{x} coordinates of \mathbb{Q} and \mathbb{G} are *negative*.

Summations. Taking the data from Fig. 9–17*b*, the calculations are tabulated as follows:

Thus,

$$
\overline{x} = \frac{\Sigma \widetilde{x} A}{\Sigma A} = \frac{-4}{11.5} = -0.348 \text{ ft}
$$

$$
\overline{y} = \frac{\Sigma \widetilde{y}A}{\Sigma A} = \frac{14}{11.5} = 1.22 \text{ ft}
$$
Ans.

NOTE: If these results are plotted in Fig. 9–17, the location of point *C* seems reasonable.

Ans.

9

Fig. 9–18

Locate the center of mass of the assembly shown in Fig. 9–18*a*. The Locate the center of mass of the assembly shown in Fig. 9–18*a*. The conical frustum has a density of $\rho_c = 8 \text{ Mg/m}^3$, and the hemisphere has a density of $r = 4 \text{ Mg/m}^3$. There is a 25 mm redive which friend conical frustum has a density of $\rho_c = 8 \text{ Mg/m}^3$, and the hemisphere
has a density of $\rho_h = 4 \text{ Mg/m}^3$. There is a 25-mm-radius cylindrical
hole in the center of the frustum hole in the center of the frustum.

SOLUTION

Composite Parts. The assembly can be thought of as consisting of four segments as shown in Fig. 9–18*b*. For the calculations, $\textcircled{3}$ and $\textcircled{4}$ four segments as shown in Fig. $9-18b$. For the calculations, (3) and (4) must be considered as "negative" segments in order that the four segments, when added together, yield the total composite shape shown in Fig. 9–18*a*.

Moment Arm. Using the table on the inside back cover, the computations for the centroid \tilde{z} of each piece are shown in the figure.

Summations. Because of *symmetry*, note that

$$
\overline{x} = \overline{y} = 0
$$
 Ans.

Since $W = mg$, and *g* is constant, the third of Eqs. 9–6 becomes
 $\overline{z} = \sum \tilde{z}m/\sum m$. The mass of each piece can be computed from $m = qV$ Since $W = mg$, and g is constant, the third of Eqs. 9–6 becomes $\overline{z} = \Sigma \widetilde{z}m/\Sigma m$. The mass of each piece can be computed from $m = \rho V$
and used for the calculations Also $1 \text{ Ma/m}^3 = 10^{-6} \text{ kg/mm}^3$ so that $\overline{z} = \Sigma \overline{z}m/\Sigma m$. The mass of each piece can be computed from $m = \rho$
and used for the calculations. Also, 1 Mg/m³ = 10⁻⁶ kg/mm³, so that
 m (kg) $\widetilde{z}(mm)$ $\widetilde{z}m$ (kg·mm)

Thus,
$$
\widetilde{z} = \frac{\Sigma \widetilde{z}m}{\Sigma m} = \frac{45.815}{3.142} = 14.6 \text{ mm}
$$
 Ans.

*9.3 [Theorems of Pappus and Guldinus](#page-12-0)

The two *theorems of Pappus and Guldinus* are used to find the surface area and volume of any body of revolution.They were first developed by Pappus of Alexandria during the fourth century A.D. and then restated at a later time by the Swiss mathematician Paul Guldin or Guldinus (1577–1643).

The amount of roofing material used on this storage building can be estimated by using the first theorem of Pappus and Guldinus to determine its surface area.

Surface Area. If we revolve a *plane curve* about an axis that does not intersect the curve we will generate a *surface area of revolution*. For example, the surface area in Fig. 9–19 is formed by revolving the curve of length *L* about the horizontal axis.To determine this surface area, we will first consider the differential line element of length *dL.* If this element is revolved 2π radians about the axis, a ring having a surface area of revolved 2π radians about the axis, a ring having a surface area of $dA = 2\pi r dL$ will be generated. Thus, the surface area of the entire body is $A = 2\pi \int r dL$ Since $\int r dL = \overline{r}L$ (Eq. 9–5) then $A = 2\pi \overline{r}L$ if the is $A = 2\pi \int r dL$. Since $\int r dL = \bar{r}L$ (Eq. 9–5), then $A = 2\pi \bar{r}L$. If the curve is revolved only through an angle θ (radians), then $A = 2\pi r dL$ will be generated. Thus, the surface area of the entir $A = 2\pi \int r dL$. Since $\int r dL = \overline{r}L$ (Eq. 9–5), then $A = 2\pi \overline{r}L$.
rve is revolved only through an angle θ (radians), then

$$
A = \theta \overline{r}L \tag{9-7}
$$

where

 $A =$ surface area of revolution

- θ = angle of revolution measured in radians, $\theta \leq 2\pi$
- \bar{r} = perpendicular distance from the axis of revolution to the centroid of the generating curve
- $L =$ length of the generating curve

Therefore the first theorem of Pappus and Guldinus states that *the area of a surface of revolution equals the product of the length of the generating curve and the distance traveled by the centroid of the curve in generating the surface area.*

Fig. 9–20

Volume. A *volume* can be generated by revolving a *plane area* about an axis that does not intersect the area. For example, if we revolve the shaded area *A* in Fig. 9–20 about the horizontal axis, it generates the volume shown. This volume can be determined by first revolving the differential element of area dA 2π radians about the axis, so that a ring differential element of area dA 2π radians about the axis, so that a ring
having the volume $dV = 2\pi r dA$ is generated. The entire volume is then
 $V = 2\pi r dA$ However, $r dA = \bar{r} A$ Eq. 9–4 so that $V = 2\pi \bar{r} A$. If th However, $\int r dA = \overline{r} A$, Eq. 9–4, so that $V = 2\pi \overline{r} A$. If the area is only revolved through an angle θ (radians), then having the volume $dV = 2\pi r dA$ is generated. The entire volume $V = 2\pi \int r dA$. However, $\int r dA = \overline{r}A$, Eq. 9–4, so that $V = 2\pi \overline{r}A$ area is only revolved through an angle θ (radians), then

$$
V = \theta \overline{r} A \tag{9-8}
$$

where

 $V =$ volume of revolution

 θ = angle of revolution measured in radians, $\theta \leq 2\pi$

 \bar{r} = perpendicular distance from the axis of revolution to the centroid of the generating area

 $A =$ generating area

Therefore the second theorem of Pappus and Guldinus states that *the volume of a body of revolution equals the product of the generating area and the distance traveled by the centroid of the area in generating the volume.*

Composite Shapes. We may also apply the above two theorems to lines or areas that are composed of a series of composite parts. In this case the total surface area or volume generated is the addition of the surface areas or volumes generated by each of the composite parts. If the perpendicular distance from the axis of revolution to the centroid of each composite part is \tilde{r} , then

$$
A = \theta \Sigma (\widetilde{r}L) \tag{9-9}
$$

and

$$
V = \theta \Sigma(\widetilde{r}A) \tag{9-10}
$$

Application of the above theorems is illustrated numerically in the following examples.

The volume of fertilizer contained within this silo can be determined using the second theorem of Pappus and Guldinus.

SOLUTION

Surface Area. The surface area of the sphere in Fig. 9–21*a* is generated by revolving a semicircular *arc* about the *x* axis. Using the table on the inside back cover, it is seen that the centroid of this arc is table on the inside back cover, it is seen that the centroid of this arc is
located at a distance $\bar{r} = 2R/\pi$ from the axis of revolution (*x* axis).
Since the centroid moves through an angle of $\theta = 2\pi$ rad to generat located at a distance $\bar{r} = 2R/\pi$ from the axis of revolution (*x* axis).
Since the centroid moves through an angle of $\theta = 2\pi$ rad to generate the sphere, then applying Eq. 9–7 we have

$$
A = \theta \overline{r} L; \qquad A = 2\pi \left(\frac{2R}{\pi}\right) \pi R = 4\pi R^2 \qquad \text{Ans.}
$$

Volume. The volume of the sphere is generated by revolving the semicircular *area* in Fig. 9–21*b* about the *x* axis. Using the table on the semicircular *area* in Fig. 9–21*b* about the *x* axis. Using the table on the inside back cover to locate the centroid of the area, i.e., $\bar{r} = 4R/3\pi$, and applying Eq. 9–8, we have and applying Eq. 9–8, we have

$$
V = \theta \overline{r} A; \qquad V = 2\pi \left(\frac{4R}{3\pi}\right) \left(\frac{1}{2}\pi R^2\right) = \frac{4}{3}\pi R^3 \qquad \text{Ans.}
$$

Determine the surface area and volume of the full solid in Fig. 9–22*a*.

SOLUTION

Surface Area. The surface area is generated by revolving the four line segments shown in Fig. $9-22b$, 2π radians about the *z* axis. The distances from the centroid of each segment to the *z* axis are also shown in the figure. Applying Eq. 9–7, yields

$$
A = 2\pi \Sigma \bar{r}L = 2\pi [(2.5 \text{ in.})(2 \text{ in.}) + (3 \text{ in.}) \left(\sqrt{(1 \text{ in.})^2 + (1 \text{ in.})^2}\right) + (3.5 \text{ in.})(3 \text{ in.}) + (3 \text{ in.})(1 \text{ in.})]
$$

= 143 in² Ans.

Volume. The volume of the solid is generated by revolving the two area segments shown in Fig. $9-22c$, 2π radians about the *z* axis. The distances from the centroid of each segment to the *z* axis are also shown in the figure. Applying Eq. 9–10, we have

$$
V = 2\pi \Sigma \bar{r} A = 2\pi \left\{ (3.1667 \text{ in.}) \left[\frac{1}{2} (1 \text{ in.})(1 \text{ in.}) \right] + (3 \text{ in.}) [(2 \text{ in.})(1 \text{ in.}) \right\}
$$

= 47.6 in³ Ans.

FUNDAMENTAL PROBLEMS

F9–13. Determine the surface area and volume of the solid formed by revolving the shaded area 360° about the z axis.

F9–15. Determine the surface area and volume of the solid

F9–14. Determine the surface area and volume of the solid formed by revolving the shaded area 360° about the z axis.

F9–16. Determine the surface area and volume of the solid formed by revolving the shaded area 360° about the z axis.

9–102. Determine the volume of the thin-wall storage tank.

Probs. 9–101/102

***9–100.** Determine the surface area and volume of the wheel formed by revolving the cross-sectional area 360° about the *z* axis.

9–103. Determine the height *h* to which liquid should be poured into the conical paper cup so that it contacts half the surface area on the inside of the cup.

*9.4 [Resultant of a General Distributed](#page-12-0) Loading

In Sec. 4.9, we discussed the method used to simplify a two-dimensional distributed loading to a single resultant force acting at a specific point. In this section we will generalize this method to include flat surfaces that have an arbitrary shape and are subjected to a variable load distribution. Consider, for example, the flat plate shown in Fig. 9–23*a*, which is subjected Consider, for example, the flat plate shown in Fig. 9–23*a*, which is subjected
to the loading defined by $p = p(x, y)$ Pa, where 1 Pa (pascal) = 1 N/m².
Knowing this function, we can determine the resultant force **F**_p ac Knowing this function, we can determine the resultant force \mathbf{F}_R acting on the plate and its location $(\overline{\mathbf{F}} \ \overline{\mathbf{F}})$. Fig. 0. 23b the plate and its location $(\overline{x}, \overline{y})$, Fig. 9–23*b*.

Magnitude of Resultant Force. The force *d***F** acting on the differential area dA m² of the plate, located at the arbitrary point (x, y) ,
has a magnitude of $dF = [n(x, y) N/m^2](dA m^2) = [n(x, y) dA]N$ differential area dA m² of the plate, located at the arbitrary point (x, y) ,
has a magnitude of $dF = [p(x, y) N/m^2](dA m^2) = [p(x, y) dA] N$.
Notice that $p(x, y) dA = dV$ the colored differential volume element has a magnitude of $dF = [p(x, y) N/m^2](dA m^2) = [p(x, y) dA] N$.
Notice that $p(x, y) dA = dV$, the colored differential *volume element*
shown in Fig. 9–23*a*. The *magnitude* of **F**_p is the sum of the differential shown in Fig. 9–23*a*. The *magnitude* of \mathbf{F}_R is the sum of the differential forces acting over the plate's *arting surface area* A. Thus: forces acting over the plate's *entire surface area A*. Thus:

$$
F_R = \Sigma F;
$$
 $F_R = \int_A p(x, y) dA = \int_V dV = V$ (9-11)

This result indicates that the *magnitude of the resultant force is equal to the total volume under the distributed-loading diagram*.

Location of Resultant Force. The location $(\overline{x}, \overline{y})$ of \mathbf{F}_R is determined by setting the moments of \mathbf{F}_R equal to the moments of all the determined by setting the moments of \mathbf{F}_R equal to the moments of all the differential forces $d\mathbf{F}$ about the respective y and x axes: From Figs. 0, 23*a* differential forces *d***F** about the respective *y* and *x* axes: From Figs. 9–23*a* and 9–23*b*, using Eq. 9–11, this results in

$$
\overline{x} = \frac{\int_A x p(x, y) dA}{\int_A p(x, y) dA} = \frac{\int_V x dV}{\int_V dV} \qquad \overline{y} = \frac{\int_A y p(x, y) dA}{\int_A p(x, y) dA} = \frac{\int_V y dV}{\int_V dV} \qquad (9-12)
$$

Hence, the *line of action of the resultant force passes through the geometric center or centroid of the volume under the distributed-loading diagram*.

The resultant of a wind loading that is

distributed on the front or side walls of this building must be calculated using integration in order to design the framework that holds the building together.

9

*9.5 [Fluid Pressure](#page-12-0)

According to Pascal's law, a fluid at rest creates a pressure *p* at a point that is the *same* in *all* directions.The magnitude of *p*, measured as a force per unit area, depends on the specific weight γ or mass density ρ of the fluid and the depth *z* of the point from the fluid surface.* The relationship can be expressed mathematically as

$$
p = \gamma z = \rho g z \tag{9-13}
$$

where *g* is the acceleration due to gravity. This equation is valid only for fluids that are assumed *incompressible*, as in the case of most liquids. Gases are compressible fluids, and since their density changes significantly with both pressure and temperature, Eq. 9–13 cannot be used.

To illustrate how Eq. 9–13 is applied, consider the submerged plate shown in Fig. 9–24. Three points on the plate have been specified. Since point *B* is at depth z_1 from the liquid surface, the *pressure* at this point point *B* is at depth z_1 from the liquid surface, the *pressure* at this point
has a magnitude $p_1 = \gamma z_1$. Likewise, points *C* and *D* are both at depth z_2 ;
hence $p_2 = \gamma z_2$. In all cases the pressure acts *norma* has a magnitude $p_1 = \gamma z_1$. Likewise, points *C* and *D* are both at depth z_2 ;
hence, $p_2 = \gamma z_2$. In all cases, the pressure acts *normal* to the surface area
dA located at the specified point *dA* located at the specified point.

Using Eq. 9–13 and the results of Sec. 9.4, it is possible to determine the resultant force caused by a liquid and specify its location on the surface of a submerged plate. Three different shapes of plates will now be considered.

Fig. 9–24

*In particular, for water $\gamma = 62.4 \text{ lb/ft}^3$, or $\gamma = \rho g = 9810 \text{ N/m}^3$ since $\rho = 1000 \text{ kg/m}^3$ *In particular, f
and $g = 9.81$ m/s 2 .

Flat Plate of Constant Width. A flat rectangular plate of constant width, which is submerged in a liquid having a specific weight $\gamma,$ is shown in Fig. 9–25*a*. Since pressure varies linearly with depth, Eq. 9–13, the distribution of pressure over the plate's surface is represented by a the distribution of pressure over the plate's surface is represented by a
trapezoidal volume having an intensity of $p_1 = \gamma z_1$ at depth z_1 and
 $p_2 = \gamma z_2$ at depth z_2 . As noted in Sec. 9.4, the magnitude of the *re* trapezoidal volume having an intensity of $p_1 = \gamma z_1$ at depth z_1 and $p_2 = \gamma z_2$ at depth z_2 . As noted in Sec. 9.4, the magnitude of the *resultant* force **F**_p is equal to the *volume* of this loading diagram and *force* \mathbf{F}_R is equal to the *volume* of this loading diagram and \mathbf{F}_R has a *line* of *action* that passes through the volume's centroid C. Hence \mathbf{F}_r does *of action* that passes through the volume's centroid *C*. Hence, \mathbf{F}_R does not act at the centroid of the plate; rather it acts at point *P* called the *not* act at the centroid of the plate; rather, it acts at point *P*, called the *center of pressure*.

Since the plate has a *constant width*, the loading distribution may also be viewed in two dimensions, Fig. 9–25*b*. Here the loading intensity is be viewed in two dimensions, Fig. 9–25*b*. Here the loading intensity is
measured as force/length and varies linearly from $w_1 = bp_1 = byz_1$ to
 $w_2 = bn_2 = bvz_2$. The magnitude of \mathbf{F}_2 in this case equals the measured as force/length and varies linearly from $w_1 = bp_1 = b\gamma z_1$ to $w_2 = bp_2 = b\gamma z_2$. The magnitude of \mathbf{F}_R in this case equals the tranezoidal *area* and \mathbf{F}_R has a *line of action* that passes through trapezoidal *area*, and \mathbf{F}_R has a *line of action* that passes through the area and location the area's *centroid C*. For numerical applications, the area and location of the centroid for a trapezoid are tabulated on the inside back cover.

The walls of the tank must be designed to support the pressure loading of the liquid that is contained within it.

Fig. 9–25

9

Curved Plate of Constant Width. When a submerged plate of constant width is curved, the pressure acting normal to the plate continually changes both its magnitude and direction, and therefore calculation of the magnitude of \mathbf{F}_R and its location *P* is more difficult
than for a flat plate. Three, and two dimensional views of the loading than for a flat plate. Three- and two-dimensional views of the loading distribution are shown in Figs. 9–26*a* and 9–26*b*, respectively. Although integration can be used to solve this problem, a simpler method exists. This method requires separate calculations for the horizontal and vertical *components* of \mathbf{F}_R .
For example, the distri

For example, the distributed loading acting on the plate can be represented by the *equivalent loading* shown in Fig. 9–26*c*. Here the plate supports the weight of liquid W_f contained within the block BDA . This supports the weight of liquid W_f contained within the block *BDA*. This force has a magnitude $W_f = (\gamma b)(\text{area}_{BDA})$ and acts through the centroid of *BDA*. In addition, there are the pressure distributions caused by the of *BDA*. In addition, there are the pressure distributions caused by the liquid acting along the vertical and horizontal sides of the block.Along the vertical side *AD*, the force \mathbf{F}_{AD} has a magnitude equal to the area of the transcript I note through the centroid C_{tot} of this area. The distributed the trapezoid. It acts through the centroid C_{AD} of this area. The distributed loading along the horizontal side \overrightarrow{AB} is *constant* since all points lying in this plane are at the same depth from the surface of the liquid. The magnitude of \mathbf{F}_{AB} is simply the area of the rectangle. This force acts
through the centroid C_{AB} or at the midnoint of *AB* Summing these three through the centroid C_{AB} or at the midpoint of AB . Summing these three forces yields $\mathbf{F}_R = \Sigma \mathbf{F} = \mathbf{F}_{AD} + \mathbf{F}_{AB} + \mathbf{W}_f$. Finally, the location of the center of pressure P on the plate is determined by applying $M_R = \Sigma M$, which states that the moment of the resultant force about a co center of pressure *P* on the plate is determined by applying $M_R = \Sigma M$, which states that the moment of the resultant force about a convenient reference point such as *D* or *B*, in Fig. 9–26*b*, is equal to the sum of the moments of the three forces in Fig. 9–26*c* about this same point. **F**_R = $\Sigma \mathbf{F} = \mathbf{F}_{AD} + \mathbf{F}_{AB} + \mathbf{W}_{f}$.

F_R = $\Sigma \mathbf{F} = \mathbf{F}_{AD} + \mathbf{F}_{AB} + \mathbf{W}_{f}$.

Flat Plate of Variable Width. The pressure distribution acting on the surface of a submerged plate having a variable width is shown in Fig. 9–27. If we consider the force *d***F** acting on the differential area strip Fig. 9–27. If we consider the force $d\mathbf{F}$ acting on the differential area strip dA , parallel to the *x* axis, then its magnitude is $dF = p dA$. Since the denth of dA is *z* the pressure on the element is $n = \gamma z$. Th dA, parallel to the x axis, then its magnitude is $dF = p dA$. Since the depth of dA is z, the pressure on the element is $p = \gamma z$. Therefore, $dF = (\gamma z) dA$ and so the resultant force becomes depth of dA is z, the pressure on the element $dF = (\gamma z)dA$ and so the resultant force becomes

$$
F_R = \int dF = \gamma \int z \, dA
$$

If the depth to the centroid C' of the area is \overline{z} , Fig. 9–27, then, $\int z dA = \overline{z}A$ Substituting we have . Substituting, we have If the depth
 $\int z dA = \overline{z}A$

$$
F_R = \gamma \bar{z} A \tag{9-14}
$$

In other words, *the magnitude of the resultant force acting on any flat plate is equal to the product of the area A of the plate and the pressure plate is equal to the product of the area A of the plate and the pressure* $p = \gamma \bar{z}$ *at the depth of the area's centroid* C'. As discussed in Sec. 9.4, this force is also equivalent to the volume under the pressure di force is also equivalent to the volume under the pressure distribution. Realize that its line of action passes through the centroid *C* of this *volume* and intersects the plate at the center of pressure *P*, Fig. 9–27. Notice that the location of $C[']$ does not coincide with the location of P.

The resultant force of the water pressure and its location on the elliptical back plate of this tank truck must be determined by integration.

EXAMPLE 9.14

(b)

(c)

Fig. 9–28

Determine the magnitude and location of the resultant hydrostatic force acting on the submerged rectangular plate *AB* shown in Fig. 9–28*a*. The acting on the submerged rectangular plate A plate has a width of 1.5 m; $\rho_w = 1000 \text{ kg/m}^3$.

SOLUTION I

The water pressures at depths *A* and *B* are

$$
p_A = \rho_w g z_A = (1000 \text{ kg/m}^3)(9.81 \text{ m/s}^2)(2 \text{ m}) = 19.62 \text{ kPa}
$$

$$
p_B = \rho_w g z_B = (1000 \text{ kg/m}^3)(9.81 \text{ m/s}^2)(5 \text{ m}) = 49.05 \text{ kPa}
$$

Since the plate has a constant width, the pressure loading can be viewed in two dimensions as shown in Fig. 9–28*b*. The intensities of the load at *A* and *B* are

$$
w_A = bp_A = (1.5 \text{ m})(19.62 \text{ kPa}) = 29.43 \text{ kN/m}
$$

$$
w_B = bp_B = (1.5 \text{ m})(49.05 \text{ kPa}) = 73.58 \text{ kN/m}
$$

From the table on the inside back cover, the magnitude of the

resultant force
$$
\mathbf{F}_R
$$
 created by this distributed load is
\n F_R = area of a trapezoid = $\frac{1}{2}(3)(29.4 + 73.6) = 154.5 \text{ kN}$ Ans.

This force acts through the centroid of this area,
 $h = \frac{1}{2}(2(29.43) + 73.58)_{(2) = h}$

$$
h = \frac{1}{3} \left(\frac{2(29.43) + 73.58}{29.43 + 73.58} \right) (3) = 1.29 \text{ m}
$$
 Ans.

measured upward from *B*, Fig. 9–31*b*.

SOLUTION II

The same results can be obtained by considering two components of \mathbf{F}_R , defined by the triangle and rectangle shown in Fig. 9–28*c*. Each force acts through its associated control and has a magnitude of

force acts through its associated centroid and has a magnitude of
\n
$$
F_{Re} = (29.43 \text{ kN/m})(3 \text{ m}) = 88.3 \text{ kN}
$$
\n
$$
F_t = \frac{1}{2}(44.15 \text{ kN/m})(3 \text{ m}) = 66.2 \text{ kN}
$$

Hence,

$$
F_R = F_{Re} + F_t = 88.3 + 66.2 = 154.5 \text{ kN} \qquad \text{Ans.}
$$

The location of \mathbf{F}_R is determined by summing moments about *B*,
Fig. 0.28b and a i.e. Fig. 9–28*b* and *c*, i.e., +

$$
\zeta + (M_R)_B = \sum M_B; (154.5)h = 88.3(1.5) + 66.2(1)
$$

$$
h = 1.29 \text{ m}
$$
 Ans.

NOTE: Using Eq. 9–14, the resultant force can be calculated as **NOTE:** Using Eq. 9–14, the resultant force can be called $F_R = \gamma \bar{z}A = (9810 \text{ N/m}^3)(3.5 \text{ m})(3 \text{ m})(1.5 \text{ m}) = 154.5 \text{ kN}$.

9

EXAMPLE 9.15

Determine the magnitude of the resultant hydrostatic force acting on the surface of a seawall shaped in the form of a parabola as shown in the surface of a seawall shaped in the form of a p
Fig. 9–29*a*. The wall is 5 m long; $\rho_w = 1020 \text{ kg/m}^3$.

Fig. 9–29

SOLUTION

The horizontal and vertical components of the resultant force will be calculated, Fig. 9–29*b*. Since

$$
p_B = \rho_w g z_B = (1020 \text{ kg/m}^3)(9.81 \text{ m/s}^2)(3 \text{ m}) = 30.02 \text{ kPa}
$$

then

$$
w_B = bp_B = 5 \text{ m} (30.02 \text{ kPa}) = 150.1 \text{ kN/m}
$$

Thus,

$$
F_h = \frac{1}{2}(3 \text{ m})(150.1 \text{ kN/m}) = 225.1 \text{ kN}
$$

The area of the parabolic sector *ABC* can be determined using the table on the inside back cover. Hence, the weight of water within this 5 m long region is

$$
F_v = (\rho_w g b)(\text{area}_{ABC})
$$

= (1020 kg/m³)(9.81 m/s²)(5 m)[$\frac{1}{3}$ (1 m)(3 m)] = 50.0 kN

The resultant force is therefore

$$
F_R = \sqrt{F_h^2 + F_v^2} = \sqrt{(225.1 \text{ kN})^2 + (50.0 \text{ kN})^2}
$$

= 231 kN *Ans.*

EXAMPLE 9.16

Determine the magnitude and location of the resultant force acting on the triangular end plates of the water trough shown in Fig. 9–30*a*; on the triangular $\rho_w = 1000 \text{ kg/m}^3$.

SOLUTION

The pressure distribution acting on the end plate *E* is shown in Fig.9–30*b*. The magnitude of the resultant force is equal to the volume of this loading distribution. We will solve the problem by integration. Choosing the differential volume element shown in the figure, we have
 $dF = dV = p dA = \rho_w gz(2x dz) = 19620zx dz$

$$
dF = dV = p dA = \rho_w g z (2x dz) = 19620 z x dz
$$

The equation of line *AB* is

$$
x = 0.5(1 - z)
$$

Hence, substituting and integrating with respect to *z* from $z = 0$ to $z = 1$ m yields Hence, substit
 $z = 1$ m yields

$$
F = V = \int_{V} dV = \int_{0}^{1 \text{ m}} (19\,620)z[0.5(1 - z)] dz
$$

= 9810 $\int_{0}^{1 \text{ m}} (z - z^2) dz = 1635 \text{ N} = 1.64 \text{ kN}$ Ans.

Fig. 9–30

(b)

This resultant passes through the *centroid of the volume*. Because of L symmetry, etry,
 $\overline{x} = 0$
 $\widetilde{z} = z$ for the volume element the

$$
= 0
$$
 Ans.

Since $\tilde{z} = z$ for the volume element, then z

$$
\overline{z} = \frac{\int_{V} \widetilde{z} \, dV}{\int_{V} dV} = \frac{\int_{0}^{1 \, \text{m}} z (19620) z [0.5(1 - z)] \, dz}{1635} = \frac{9810 \int_{0}^{1 \, \text{m}} (z^2 - z^3) \, dz}{1635}
$$
\n
$$
= 0.5 \, \text{m} \qquad \qquad \text{Ans.}
$$

NOTE: We can also determine the resultant force by applying Eq. 9–14, **NOTE:** We can also determine the resultant force by apple
 $F_R = \gamma \bar{z}A = (9810 \text{ N/m}^3)(\frac{1}{3})(1 \text{ m})[\frac{1}{2}(1 \text{ m})(1 \text{ m})] = 1.64 \text{ kN}.$

CHAPTER REVIEW

Center of Gravity and Centroid

The *center of gravity G* represents a point where the weight of the body can be considered concentrated. The distance from an axis to this point can be determined from a balance of moments, which requires that the moment of the weight of all the particles of the body about this axis must equal the moment of the entire weight of the body about the axis.

The center of mass will coincide with the center of gravity provided the acceleration of gravity is constant.

The *centroid* is the location of the geometric center for the body. It is determined in a similar manner, using a moment balance of geometric elements such as line, area, or volume segments. For bodies having a continuous shape, moments are summed (integrated) using differential elements.

The center of mass will coincide with the centroid provided the material is homogeneous, i.e., the density of the material is the same throughout. The centroid will always lie on an axis of symmetry.

Composite Body is a composite of several	$x = \frac{\sum \overline{x}W}{\sum \overline{W}}$
If the body is a composite of several liscenter of gravity or centroid, then the location of the center of gravity or location of the electric certroid of the body can be determined from a discrete summation using its composite parts.	
From a discrete summation using its composite parts.	$\overline{z} = \frac{\sum \overline{W}}{\sum W}$
The theorem of Pappus and Guldinus can be used to determine the surface area and volume of a body of revolution. are a and volume of a body of revolution.	
The surface area equals the product of the distance traveled by the centroid of the curve needed to generate the area.	
The volume of the body equals the distance traveled by the centroid of this area needed to generate the volume.	$V = \theta \overline{r}A$

General Distributed Loading

The magnitude of the resultant force is equal to the total volume under the distributed-loading diagram. The line of action of the resultant force passes through the geometric center or centroid of this volume.

$$
F_R = \int_A p(x, y) dA = \int_V dV
$$

$$
\overline{x} = \frac{\int_V x dV}{\int_V dV}
$$

$$
\overline{y} = \frac{\int_V y dV}{\int_V dV}
$$

Fluid Pressure

The pressure developed by a liquid at a point on a submerged surface depends upon the depth of the point and the density of the liquid in accordance with density of the liquid in accordance with
Pascal's law, $p = \rho gh = \gamma h$. This
pressure will create a linear distribution pressure will create a *linear distribution* of loading on a flat vertical or inclined surface.

If the surface is horizontal, then the loading will be *uniform*.

In any case, the resultants of these loadings can be determined by finding the volume under the loading curve or the volume under the loading curve or
using $F_R = \gamma \bar{z}A$, where \bar{z} is the depth to
the centroid of the plate's area. The line the centroid of the plate's area. The line of action of the resultant force passes through the centroid of the volume of the loading diagram and acts at a point *P* on the plate called the center of pressure.

The design of a structural member, such as a beam or column, requires calculation of its cross-sectional moment of inertia. In this chapter, we will discuss how this is done.

[Moments of Inertia](#page-12-0)

[CHAPTER OBJECTIVES](#page-12-0)

- To develop a method for determining the moment of inertia for an area.
- To introduce the product of inertia and show how to determine the maximum and minimum moments of inertia for an area.
- To discuss the mass moment of inertia.

10.1 [Definition of Moments of Inertia](#page-12-0) for Areas

Whenever a distributed loading acts perpendicular to an area and its intensity varies linearly, the computation of the moment of the loading distribution about an axis will involve a quantity called the *moment of inertia of the area*. For example, consider the plate in Fig. 10–1, which is subjected to a fluid pressure *p*. As discussed in Sec. 9.5, this pressure *p* subjected to a fluid pressure p. As discussed in Sec. 9.5, this pressure p
varies linearly with depth, such that $p = \gamma y$, where γ is the specific
weight of the fluid Thus the force acting on the differential area d 4 o weight of the fluid. Thus, the force acting on the differential area dA of weight of the fluid. Thus, the force acting on the differential area dA of
the plate is $dF = p dA = (\gamma y)dA$. The moment of this force about the
r axis is therefore $dM = y dF = \gamma y^2 dA$ and so integrating dM over the the plate is $dF = p dA = (\gamma y) dA$. The moment of this force about the
x axis is therefore $dM = y dF = \gamma y^2 dA$, and so integrating dM over the
entire area of the plate vialds $M = \gamma \int y^2 dA$. The integral $\int y^2 dA$ is called entire area of the plate yields $M = \gamma \int y^2 dA$. The integral $\int y^2 dA$ is called the *moment of inertia* I_x of the area about the *x* axis. Integrals of this form often arise in formulas used in fluid mechanics, mechanics of materials, structural mechanics, and mechanical design, and so the engineer needs to be familiar with the methods used for their computation. $W = \gamma y^2 dA$, and so integrating dM
 $M = \gamma \int y^2 dA$. The integral $\int y^2 dA$

the area about the x axis. Integral

Fig. 10–1

Moment of Inertia. By definition, the moments of inertia of a **Moment of Inertia.** By definition, the moments of inertia of a differential area *dA* about the *x* and *y* axes are $dI_x = y^2 dA$ and $dI = x^2 dA$ respectively Fig. 10–2. For the entire area *A* the moments differential area *dA* about the *x* and *y* axes are $dI_x = y^2 dA$ and $dI_y = x^2 dA$, respectively, Fig. 10–2. For the entire area *A* the *moments* of *inertia* are determined by integration; i.e. *of inertia* are determined by integration; i.e.,

$$
I_x = \int_A y^2 dA
$$

\n
$$
I_y = \int_A x^2 dA
$$
\n(10-1)

We can also formulate this quantity for *dA* about the "pole" *O* or *z* axis, Fig. 10–2. This is referred to as the *polar moment of inertia*. It is z axis, Fig. 10–2. This is referred to as the *polar moment of inertia*. It is
defined as $dJ_O = r^2 dA$, where *r* is the perpendicular distance from the
pole (z axis) to the element dA. For the entire area the *polar momen* pole (*z* axis) to the element *dA*. For the entire area the *polar moment of inertia* is

$$
J_O = \int_A r^2 dA = I_x + I_y \tag{10-2}
$$

This relation between J_Q and I_x , I_y is possible since $r^2 = x^2 + y^2$, Fig. 10–2.

From the above formulations it is seen that I_x , I_y , and J_Q will *always*
In positive since they involve the product of distance squared and area be *positive* since they involve the product of distance squared and area. Furthermore, the units for moment of inertia involve length raised to the fourth power, e.g., m^4 , mm⁴, or ft⁴, in⁴.

10.2 [Parallel-Axis Theorem for an Area](#page-12-0)

The *parallel-axis theorem* can be used to find the moment of inertia of an area about *any axis* that is parallel to an axis passing through the centroid and about which the moment of inertia is known.To develop this theorem, we will consider finding the moment of inertia of the shaded area shown in Fig. 10–3 about the *x* axis.To start, we choose a differential element *dA* in Fig. 10–3 about the *x* axis. To start, we choose a differential element dA
located at an arbitrary distance y' from the *centroidal* x' axis. If the
distance between the parallel x and x' axes is determined the located at an arbitrary distance y' from the *centroidal x'* axis. If the distance between the parallel *x* and *x'* axes is d_y , then the moment of inertia of dA about the *x* axis is $dI = (y' + d)^2 dA$. For the entire ar distance between the parallel x and x' axes is d_y , then the moment of inertia of dA about the x axis is $dI_x = (y' + d_y)^2 dA$. For the entire area,

$$
I_x = \int_A (y' + d_y)^2 dA
$$

=
$$
\int_A y'^2 dA + 2d_y \int_A y' dA + d_y^2 \int_A dA
$$

y

10

Fig. 10–3

The first integral represents the moment of inertia of the area about the The first integral represents the moment of inertia of the area about the centroidal axis, $\overline{I}_{x'}$. The second integral is zero since the x' axis passes through the area's centroid C i.e. $\int y' dA = \overline{y'} \int dA = 0$ sin through the area's centroid *C*; i.e., $\int y' dA = \overline{y'} \int dA = 0$ since Since the third integral represents the total area *A*, the final result is therefore egral is zero since the x' axis passes
 $\int y' dA = \overline{y}' \int dA = 0$ since $\overline{y}' = 0$.

the total area A, the final result is

$$
I_x = \overline{I}_{x'} + Ad_y^2 \tag{10-3}
$$

A similar expression can be written for I_y ; i.e.,

$$
I_y = \overline{I}_{y'} + Ad_x^2 \tag{10-4}
$$

And finally, for the polar moment of inertia, since $\overline{J}_C = \overline{I}_{x'} + \overline{I}_{y'}$ and $d^2 = d^2 + d^2$ we have And finally, for the pol
 $d^2 = d_x^2 + d_y^2$, we have \overline{a}

$$
J_O = \overline{J}_C + Ad^2 \tag{10-5}
$$

The form of each of these three equations states that *the moment of inertia for an area about an axis is equal to its moment of inertia about a parallel axis passing through the area's centroid plus the product of the area and the square of the perpendicular distance between the axes*.

In order to predict the strength and deflection of this beam, it is necessary to calculate the moment of inertia of the beam's cross-sectional area.

10.3 [Radius of Gyration of an Area](#page-12-0)

The *radius of gyration* of an area about an axis has units of length and is a quantity that is often used for the design of columns in structural mechanics. Provided the areas and moments of inertia are *known*, the radii of gyration are determined from the formulas

$$
k_x = \sqrt{\frac{I_x}{A}}
$$

\n
$$
k_y = \sqrt{\frac{I_y}{A}}
$$

\n
$$
k_O = \sqrt{\frac{J_O}{A}}
$$
\n(10-6)

The form of these equations is easily remembered since it is similar to that for finding the moment of inertia for a differential area about that for finding the moment of inertia for a differential area about
an axis. For example, $I_x = k_x^2 A$; whereas for a differential area,
 $dI = v^2 dA$ $dI_x = y^2 dA$. ${}^{2}_{x}A;$

Procedure for Analysis

In most cases the moment of inertia can be determined using a single integration. The following procedure shows two ways in which this can be done.

- If the curve defining the boundary of the area is expressed as If the curve defining the boundary of the area is expressed as
 $y = f(x)$, then select a rectangular differential element such that
it has a finite length and differential width it has a finite length and differential width.
- The element should be located so that it intersects the curve at the *arbitrary point* (*x, y*).

Case 1

• Orient the element so that its length is *parallel* to the axis about which the moment of inertia is computed. This situation occurs when the rectangular element shown in Fig. $10-4a$ is used to determine I_x for the area. Here the entire element is at a distance y from the x axis since it has a thickness dy. Thus $I_x = \int y^2 dA$. To find I_y , the element is oriented as shown in Fig. 10–4*b*. This element lies at the *same* distance *x* from the *y* axis so that $I_y = \int x^2 dA$. 4*b*. This $I_y = \int x$ 2 ment is at a distance y fr
 $I_x = \int y^2 dA$. To find I_y
 $-4b$. This element lies 2

Case 2

• The length of the element can be oriented *perpendicular* to the axis about which the moment of inertia is computed; however, Eq. 10–1 *does not apply* since all points on the element will *not* lie at the same moment-arm distance from the axis. For example, if the rectangular element in Fig. 10–4*a* is used to determine I_{v} , it will first be necessary to calculate the moment of inertia of the *element* about an axis parallel to the *y* axis that passes through the element's centroid, and then determine the moment of inertia of the *element* about the *y* axis using the parallel-axis theorem. Integration of this result will yield I_v . See Examples 10.2 and 10.3.

Determine the moment of inertia for the rectangular area shown in Determine the moment of inertia for the rectangular area shown in
Fig. 10–5 with respect to (a) the centroidal x' axis, (b) the axis x_b
passing through the base of the rectangle and (c) the pole or z' axis Fig. 10–5 with respect to (a) the centroidal x' axis, (b) the axis x_b passing through the base of the rectangle, and (c) the pole or z' axis perpendicular to the $x'-y'$ plane and passing through the centroid C passing through the base of the rectangle, and (c) the pole or z' axis perpendicular to the $x'-y'$ plane and passing through the centroid *C*.

SOLUTION (CASE 1)

Part (a). The differential element shown in Fig. 10–5 is chosen for integration. Because of its location and orientation, the *entire element* integration. Because of its location and orientation, the *entire element*
is at a distance y' from the x' axis. Here it is necessary to integrate
from $y' = -h/2$ to $y' = h/2$ Since $dA = h dv'$ then is at a distance y' from the x' axis. Here it is necess
from $y' = -h/2$ to $y' = h/2$. Since $dA = b dy'$, then

$$
\overline{I}_{x'} = \int_{A} y'^2 dA = \int_{-h/2}^{h/2} y'^2 (b \, dy') = b \int_{-h/2}^{h/2} y'^2 \, dy'
$$
\n
$$
\overline{I}_{x'} = \frac{1}{12} b h^3
$$
\nAt

Part (b). The moment of inertia about an axis passing through the base of the rectangle can be obtained by using the above result of part (a) and applying the parallel-axis theorem, Eq. 10–3.

$$
I_{x_b} = \overline{I}_{x'} + Ad_y^2
$$

=
$$
\frac{1}{12}bh^3 + bh\left(\frac{h}{2}\right)^2 = \frac{1}{3}bh^3
$$
 Ans.

Part (c). To obtain the polar moment of inertia about point *C*, we must first obtain $\overline{I}_{y'}$, which may be found by interchanging the dimensions h and h in the result of part (a) i.e. dimensions *b* and *h* in the result of part (a), i.e.,

$$
\overline{I}_{y'} = \frac{1}{12} hb^3
$$

Using Eq. 10–2, the polar moment of inertia about *C* is therefore

$$
\overline{J}_C = \overline{I}_{x'} + \overline{I}_{y'} = \frac{1}{12}bh(h^2 + b^2)
$$
Ans.

$$
\frac{1}{\frac{1}{y'}}
$$

Determine the moment of inertia for the shaded area shown in Fig. 10–6*a* about the *x* axis.

SOLUTION I (CASE 1)

A differential element of area that is *parallel* to the *x* axis, as shown in Fig. 10–6*a*, is chosen for integration. Since this element has a thickness *dy* and intersects the curve at the *arbitrary point* (*x, y*), its area is dy and intersects the curve at the *arbitrary point* (x, y) , its area is $dA = (100 - x) dy$. Furthermore, the element lies at the same distance v from the x axis Hence integrating with respect to y from distance *y* from the *x* axis. Hence, integrating with respect to *y*, from $y = 0$ to $y = 200$ mm, yields

$$
I_x = \int_A y^2 dA = \int_0^{200 \text{ mm}} y^2 (100 - x) dy
$$

= $\int_0^{200 \text{ mm}} y^2 \left(100 - \frac{y^2}{400} \right) dy = \int_0^{200 \text{ mm}} \left(100y^2 - \frac{y^4}{400} \right) dy$
= $107(10^6) \text{ mm}^4$ Ans.

SOLUTION II (CASE 2)

x y 200 mm *x y* 100 mm *dx* $- x[′]$ $y^2 = 400x$ $\widetilde{y} = \frac{y}{2}$

A differential element *parallel* to the *y* axis, as shown in Fig. 10–6*b*, is chosen for integration. It intersects the curve at the *arbitrary point* (*x, y*). In this case, all points of the element do *not* lie at the same distance from the *x* axis, and therefore the parallel-axis theorem must be used to determine the *moment of inertia of the element* with respect to this axis. For a rectangle having a base *b* and height *h*, the moment of inertia about its centroidal axis has been determined in part (a) of inertia about its centroidal axis has been determined in part (a) of
Example 10.1. There it was found that $\overline{I}_{x'} = \frac{1}{12}bh^3$. For the differential
element shown in Fig. 10–6b $h = dx$ and $h = y$ and thus Example 10.1. There it was found that $I_{x'} = \frac{1}{12}bh^3$. For the differential element shown in Fig. 10–6*b*, $b = dx$ and $h = y$, and thus $d\overline{I} = \frac{1}{2}dx y^3$. Since the centroid of the element is $\tilde{v} = v/2$ from the Since the centroid of the element is $\tilde{y} = y/2$ from the *x* axis, the moment of inertia of the element about this axis is element shown in Fig. 10–6*b*, $b = dx$ and $h = y$, $d\overline{I}_{x'} = \frac{1}{12} dx y^3$. Since the centroid of the element is $\tilde{y} = y/2$
x axis the moment of inertia of the element about this axis is

$$
dI_x = d\overline{I}_{x'} + dA \widetilde{y}^2 = \frac{1}{12} dx y^3 + y dx \left(\frac{y}{2}\right)^2 = \frac{1}{3} y^3 dx
$$

(This result can also be concluded from part (b) of Example 10.1.) (This result can also be concluded from part (b) of Example Integrating with respect to *x*, from $x = 0$ to $x = 100$ mm, yields

$$
I_x = \int dI_x = \int_0^{100 \text{ mm}} \frac{1}{3} y^3 dx = \int_0^{100 \text{ mm}} \frac{1}{3} (400x)^{3/2} dx
$$

= 107(10⁶) mm⁴ Ans.

10

Fig. 10–6

(b)

Determine the moment of inertia with respect to the *x* axis for the circular area shown in Fig. 10–7*a*.

SOLUTION I (CASE 1)

SOLUTION I (CASE 1)
Using the differential element shown in Fig. 10–7*a*, since $dA = 2x dy$,
we have we have

$$
I_x = \int_A y^2 dA = \int_A y^2 (2x) dy
$$

=
$$
\int_{-a}^a y^2 (2\sqrt{a^2 - y^2}) dy = \frac{\pi a^4}{4}
$$
 Ans.

SOLUTION II (CASE 2)

When the differential element shown in Fig. 10–7*b* is chosen, the centroid for the element happens to lie on the *x* axis, and since centroid for the element happens
 $\overline{I}_{x'} = \frac{1}{12}bh^3$ for a rectangle, we have

$$
dI_x = \frac{1}{12} dx (2y)^3
$$

$$
= \frac{2}{3} y^3 dx
$$

Integrating with respect to *x* yields

$$
I_x = \int_{-a}^{a} \frac{2}{3} (a^2 - x^2)^{3/2} dx = \frac{\pi a^4}{4}
$$
Ans.

NOTE: By comparison, Solution I requires much less computation. Therefore, if an integral using a particular element appears difficult to evaluate, try solving the problem using an element oriented in the other direction.

10.4 [Moments of Inertia for](#page-12-0) Composite Areas

A composite area consists of a series of connected "simpler" parts or shapes, such as rectangles, triangles, and circles. Provided the moment of inertia of each of these parts is known or can be determined about a common axis, then the moment of inertia for the composite area about this axis equals the *algebraic sum* of the moments of inertia of all its parts.

Procedure for Analysis

The moment of inertia for a composite area about a reference axis can be determined using the following procedure.

Composite Parts.

• Using a sketch, divide the area into its composite parts and indicate the perpendicular distance from the centroid of each part to the reference axis.

Parallel-Axis Theorem.

If the centroidal axis for each part does not coincide with the If the centroidal axis for each part does not coincide with the
reference axis, the parallel-axis theorem, $I = \overline{I} + Ad^2$, should be
used to determine the moment of inertia of the part about the used to determine the moment of inertia of the part about the reference axis. For the calculation of I , use the table on the inside back cover.

Summation.

- The moment of inertia of the entire area about the reference axis is determined by summing the results of its composite parts about this axis.
- If a composite part has a "hole," its moment of inertia is found by "subtracting" the moment of inertia of the hole from the moment of inertia of the entire part including the hole.

For design or analysis of this Tee beam, engineers must be able to locate the centroid of its cross-sectional area, and then find the moment of inertia of this area about the centroidal axis.

Determine the moment of inertia of the area shown in Fig. 10–8*a* about the *x* axis.

SOLUTION

Composite Parts. The area can be obtained by *subtracting* the circle from the rectangle shown in Fig. 10–8*b*. The centroid of each area is located in the figure.

Parallel-Axis Theorem. The moments of inertia about the *x* axis are determined using the parallel-axis theorem and the data in the table on the inside back cover.

Circle

$$
I_x = \overline{I}_{x'} + Ad_y^2
$$

= $\frac{1}{4}\pi (25)^4 + \pi (25)^2 (75)^2 = 11.4(10^6) \text{ mm}^4$

Rectangle

$$
I_x = \overline{I}_{x'} + Ad_y^2
$$

= $\frac{1}{12}(100)(150)^3 + (100)(150)(75)^2 = 112.5(10^6) \text{ mm}^4$

Summation. The moment of inertia for the area is therefore

$$
I_x = -11.4(10^6) + 112.5(10^6)
$$

= 101(10⁶) mm⁴ Ans.
100 mm

300 mm

y

Determine the moments of inertia for the cross-sectional area of the member shown in Fig. 10–9*a* about the *x* and *y* centroidal axes.

SOLUTION

Composite Parts. The cross section can be subdivided into the three rectangular areas *A, B*, and *D* shown in Fig. 10–9*b*. For the calculation, the centroid of each of these rectangles is located in the figure.

Parallel-Axis Theorem. From the table on the inside back cover, or Example 10.1, the moment of inertia of a rectangle about its Example 10.1, the moment of inertia of a rectangle about its
centroidal axis is $\overline{I} = \frac{1}{12}bh^3$. Hence, using the parallel-axis theorem
for rectangles A and D the calculations are as follows: for rectangles *A* and *D*, the calculations are as follows:

Rectangles A and D

$$
I_x = \overline{I}_{x'} + Ad_y^2 = \frac{1}{12}(100)(300)^3 + (100)(300)(200)^2
$$

= 1.425(10⁹) mm⁴

$$
I_y = \overline{I}_{y'} + Ad_x^2 = \frac{1}{12}(300)(100)^3 + (100)(300)(250)^2
$$

= 1.90(10⁹) mm⁴

Rectangle B

200 mm

 250 mm

D

 250 mm

200 mm

A

B

 -100 mm

300 mm

x

 $I_y = \frac{1}{12} (100)(600)^3 = 1.80(10^9) \text{ mm}^4$ $I_x = \frac{1}{12} (600)(100)^3 = 0.05(10^9) \text{ mm}^4$

Summation. The moments of inertia for the entire cross section are thus

$$
I_x = 2[1.425(10^9)] + 0.05(10^9)
$$

= 2.90(10⁹) mm⁴ Ans.

$$
I_y = 2[1.90(10^9)] + 1.80(10^9)
$$

= 5.60(10⁹) mm⁴ Ans.

*10.5 [Product of Inertia for an Area](#page-12-0)

It will be shown in the next section that the property of an area, called the product of inertia, is required in order to determine the *maximum* and *minimum* moments of inertia for the area.These maximum and minimum values are important properties needed for designing structural and mechanical members such as beams, columns, and shafts.

The *product of inertia* of the area in Fig. $10-10$ with respect to the x and y axes is defined as y

$$
I_{xy} = \int_{A} xy \, dA \tag{10-7}
$$

If the element of area chosen has a differential size in two directions, as shown in Fig. 10–10, a double integration must be performed to evaluate I_{xy} . Most often, however, it is easier to choose an element having a differential size or thickness in only one direction in which case the differential size or thickness in only one direction in which case the evaluation requires only a single integration (see Example 10.6).

Like the moment of inertia, the product of inertia has units of length raised to the fourth power, e.g., m^4 , mm^4 or ft^4 , in^4 . However, since *x* or *y* may be negative, the product of inertia may either be positive, negative, or zero, depending on the location and orientation of the coordinate axes. For example, the product of inertia I_{xy} for an area will be *zero* if either the *x* or *y* axis is an axis of *symmetry* for the area, as in Fig. 10–11. Here every element *dA* located at point (*x, y*) has a corresponding element *dA* located at $(x, -y)$. Since the products of inertia for these elements are, respectively, *xy* dA and $-xy$ dA, the algebraic sum or integration of all the elements that are chosen in this way will cancel integration of all the elements that are chosen in this way will cancel each other. Consequently, the product of inertia for the total area becomes zero. It also follows from the definition of I_{xy} that the "sign" of this quantity depends on the quadrant where the area is located. As shown in Fig. 10–12, if the area is rotated from one quadrant to another, the sign of I_{xy} will change.

y

x

dA

Fig. 10–10

The effectiveness of this beam to resist bending can be determined once its moments of inertia and its product of inertia are known.

Fig. 10–12

Parallel-Axis Theorem. Consider the shaded area shown in **Parallel-Axis Theorem.** Consider the shaded area shown in Fig. 10–13, where x' and y' represent a set of axes passing through the centraid of the area and x and y represent a corresponding set of parallel *centroid* of the area, and *x* and *y* represent a corresponding set of parallel axes. Since the product of inertia of *dA* with respect to the *x* and *y* axes is axes. Since the product of inertia of dA with respect to the $dI_{xy} = (x' + d_x)(y' + d_y) dA$, then for the entire area,

$$
I_{xy} = \int_A (x' + d_x)(y' + d_y) dA
$$

=
$$
\int_A x'y' dA + d_x \int_A y' dA + d_y \int_A x' dA + d_x d_y \int_A dA
$$

The first term on the right represents the product of inertia for the area with respect to the centroidal axes, $\overline{I}_{x'y'}$. The integrals in the second and third terms are zero since the moments of the area are taken about the centroidal axis. Realizing that the fourth integral represents the entire area *A*, the parallel-axis theorem for the product of inertia becomes

$$
I_{xy} = \overline{I}_{x'y'} + Ad_x d_y \tag{10-8}
$$

It is important that the *algebraic signs* for d_x and d_y be maintained
hen applying this equation when applying this equation.

Determine the product of inertia I_{xy} for the triangle shown in Fig. 10–14*g* Fig. 10–14*a*.

SOLUTION I

A differential element that has a thickness *dx*, as shown in Fig. 10–14*b*, A differential element that has a thickness dx, as shown in Fig. 10–14b,
has an area $dA = y dx$. The product of inertia of this element with
respect to the x and y axes is determined using the parallel-axis theorem respect to the *x* and *y* axes is determined using the parallel-axis theorem.

$$
dI_{xy} = d\overline{I}_{x'y'} + dA \widetilde{x} \widetilde{y}
$$

where \tilde{x} and \tilde{y} locate the *centroid* of the element or the origin of the where \tilde{x} and \tilde{y} locate the *centroid* of the element or the origin of the x' , y' axes. (See Fig. 10–13.) Since $d\overline{I}_{x'y'} = 0$, due to symmetry, and $\tilde{x} = x \tilde{y} = y/2$ then $\widetilde{y} = y/2$, then x', y' axes. (See
 $\widetilde{x} = x, \widetilde{y} = y/2,$

$$
dI_{xy} = 0 + (y dx)x\left(\frac{y}{2}\right) = \left(\frac{h}{b}x dx\right)x\left(\frac{h}{2b}x\right)
$$

$$
= \frac{h^2}{2b^2}x^3 dx
$$

Integrating with respect to *x* from $x = 0$ to $x = b$ yields

$$
I_{xy} = \frac{h^2}{2b^2} \int_0^b x^3 dx = \frac{b^2 h^2}{8}
$$
Ans.

SOLUTION II

The differential element that has a thickness *dy*, as shown in Fig. 10–14*c*, The differential element that has a thickness dy , as shown in Fig. 10–14*c*,
can also be used. Its area is $dA = (b - x) dy$. The *centroid* is located
at point $\tilde{x} = x + (b - x)/2 = (b + x)/2$, $\tilde{y} = y$ so the product of at point $\tilde{x} = x + (b - x)/2 = (b + x)/2$, $\tilde{y} = y$, so the product of inertia of the element becomes inertia of the element becomes be used. Its area is $dA = (b - x) dy$. The
 $\widetilde{x} = x + (b - x)/2 = (b + x)/2$, $\widetilde{y} = y$,

$$
dI_{xy} = d\overline{I}_{x'y'} + dA \widetilde{x}\widetilde{y}
$$

= 0 + (b - x) dy $\left(\frac{b + x}{2}\right)y$
= $\left(b - \frac{b}{h}y\right)dy \left[\frac{b + (b/h)y}{2}\right]y = \frac{1}{2}y\left(b^2 - \frac{b^2}{h^2}y^2\right)dy$

Integrating with respect to *y* from $y = 0$ to $y = h$ yields

$$
I_{xy} = \frac{1}{2} \int_0^h y \left(b^2 - \frac{b^2}{h^2} y^2 \right) dy = \frac{b^2 h^2}{8}
$$
Ans.

(b)

Determine the product of inertia for the cross-sectional area of the member shown in Fig. 10–15*a*, about the *x* and *y* centroidal axes.

Fig. 10–15

SOLUTION

As in Example 10.5, the cross section can be subdivided into three composite rectangular areas *A, B*, and *D*, Fig. 10–15*b*.The coordinates for the centroid of each of these rectangles are shown in the figure. Due to symmetry, the product of inertia of *each rectangle* is *zero* about Due to symmetry, the product of inertia of *each rectangle* is *zero* about
a set of x' , y' axes that passes through the centroid of each rectangle.
Using the parallel-axis theorem we have Using the parallel-axis theorem, we have

Rectangle A

$$
I_{xy} = \overline{I}_{x'y'} + Ad_x d_y
$$

= 0 + (300)(100)(-250)(200) = -1.50(10⁹) mm⁴

Rectangle B

$$
I_{xy} = \overline{I}_{x'y'} + Ad_x d_y
$$

$$
= 0 + 0 = 0
$$

Rectangle D

$$
I_{xy} = \overline{I}_{x'y'} + Ad_x d_y
$$

= 0 + (300)(100)(250)(-200) = -1.50(10⁹) mm⁴

The product of inertia for the entire cross section is therefore

 $I_{xy} = -1.50(10^9) + 0 - 1.50(10^9) = -3.00(10^9)$ mm⁴ Ans.

NOTE: This negative result is due to the fact that rectangles *A* and *D* have centroids located with negative *x* and negative *y* coordinates, respectively.

*10.6 [Moments of Inertia for an Area](#page-12-0) about Inclined Axes

In structural and mechanical design, it is sometimes necessary to calculate the moments and product of inertia I_u , I_v , and I_{uv} for an area with respect
to a set of inclined u and v ayes when the values for θ , I, I, and I, are to a set of inclined *u* and *v* axes when the values for θ , I_x , I_y , and I_{xy} are
known To do this we will use *transformation equations* which relate the *x known*.To do this we will use *transformation equations* which relate the *x, y* and *u*, *v* coordinates. From Fig. $10-16$, these equations are

> $v = y \cos \theta - x \sin \theta$ $u = x \cos \theta + y \sin \theta$

With these equations, the moments and product of inertia of *dA* about the u and v axes become

$$
dI_u = v^2 dA = (y \cos \theta - x \sin \theta)^2 dA
$$

$$
dI_v = u^2 dA = (x \cos \theta + y \sin \theta)^2 dA
$$

$$
dI_{uv} = uv dA = (x \cos \theta + y \sin \theta)(y \cos \theta - x \sin \theta) dA
$$

Expanding each expression and integrating, realizing that and $I_{xy} = \int xy \, dA$, we obtain Expanding each expression and in
 $I_y = \int x^2 dA$, and $I_{xy} = \int xy dA$, $I_x = \int y^2 dA$,

$$
I_u = I_x \cos^2 \theta + I_y \sin^2 \theta - 2I_{xy} \sin \theta \cos \theta
$$

\n
$$
I_v = I_x \sin^2 \theta + I_y \cos^2 \theta + 2I_{xy} \sin \theta \cos \theta
$$

\n
$$
I_{uv} = I_x \sin \theta \cos \theta - I_y \sin \theta \cos \theta + I_{xy} (\cos^2 \theta - \sin^2 \theta)
$$

Using the trigonometric identities $\sin 2 \theta = 2 \sin \theta \cos \theta$ and $\cos 2 \theta$ Using the trigonometric identities $\sin 2 \theta = 2 \sin \theta \cos \theta$ and $\cos 2 \theta - \cos^2 \theta - \sin^2 \theta$ we can simplify the above expressions, in which case

$$
I_u = \frac{I_x + I_y}{2} + \frac{I_x - I_y}{2} \cos 2\theta - I_{xy} \sin 2\theta
$$

\n
$$
I_v = \frac{I_x + I_y}{2} - \frac{I_x - I_y}{2} \cos 2\theta + I_{xy} \sin 2\theta
$$

\n
$$
I_{uv} = \frac{I_x - I_y}{2} \sin 2\theta + I_{xy} \cos 2\theta
$$
 (10-9)

Notice that if the first and second equations are added together, we can show that the polar moment of inertia about the *z* axis passing through point *O* is, as expected, *independent* of the orientation of the *u* and axes; i.e.,

$$
J_O = I_u + I_v = I_x + I_y
$$

Principal Moments of Inertia. Equations 10–9 show that I_u , I_v , and I_v depend on the angle of inclination θ of the u , v axes We will and I_{uv} depend on the angle of inclination, θ , of the *u*, *v* axes. We will now determine the orientation of these axes about which the moments now determine the orientation of these axes about which the moments of inertia for the area are maximum and minimum. This particular set of axes is called the *principal axes* of the area, and the corresponding moments of inertia with respect to these axes are called the *principal moments of inertia*. In general, there is a set of principal axes for every chosen origin *O*. However, for structural and mechanical design, the origin *O* is located at the centroid of the area.

The angle which defines the orientation of the principal axes can be found by differentiating the first of Eqs. 10–9 with respect to θ and setting the result equal to zero. Thus,

$$
\frac{dI_u}{d\theta} = -2\left(\frac{I_x - I_y}{2}\right)\sin 2\theta - 2I_{xy}\cos 2\theta = 0
$$

Therefore, at $\theta = \theta_p$,

$$
\tan 2\theta_p = \frac{-I_{xy}}{(I_x - I_y)/2}
$$
 (10-10)

The two roots θ_{p_1} and θ_{p_2} of this equation are 90° apart, and so they each specify the inclination of one of the principal axes. In order to substitute specify the inclination of one of the principal axes. In order to substitute them into Eq. 10–9, we must first find the sine and cosine of $2\theta_{p_1}$ and $2\theta_{p_2}$.
This can be done using these ratios from the triangles shown in This can be done using these ratios from the triangles shown in Fig. 10–17, which are based on Eq. 10–10.

Substituting each of the sine and cosine ratios into the first or second of Eqs. 10–9 and simplifying, we obtain

$$
I_{\min} = \frac{I_x + I_y}{2} \pm \sqrt{\left(\frac{I_x - I_y}{2}\right)^2 + I_{xy}^2}
$$
 (10-11)

Depending on the sign chosen, this result gives the maximum or minimum moment of inertia for the area. Furthermore, if the above trigonometric relations for θ_{p_1} and θ_{p_2} are substituted into the third of trigonometric relations for θ_{p_1} and θ_{p_2} are substituted into the third of Eqs. 10–9, it can be shown that $I_{uv} = 0$; that is, the *product of inertia with* respect to the *principal axes is zero*. Since it was *respect to the principal axes is zero*. Since it was indicated in Sec. 10.6 that the product of inertia is zero with respect to any symmetrical axis, it therefore follows that *any symmetrical axis represents a principal axis of inertia for the area*.

Fig. 10–18

Determine the principal moments of inertia and the orientation of the principal axes for the cross-sectional area of the member shown in Fig. 10–18*a* with respect to an axis passing through the centroid.

SOLUTION

The moments and product of inertia of the cross section with respect to the *x, y* axes have been determined in Examples 10.5 and 10.7. The results are

$$
I_x = 2.90(10^9) \text{ mm}^4
$$
 $I_y = 5.60(10^9) \text{ mm}^4$ $I_{xy} = -3.00(10^9) \text{ mm}^4$

Using Eq. 10–10, the angles of inclination of the principal axes *u* and v are

$$
\tan 2\theta_p = \frac{-I_{xy}}{(I_x - I_y)/2} = \frac{-[-3.00(10^9)]}{[2.90(10^9) - 5.60(10^9)]/2} = -2.22
$$

$$
2\theta_p = -65.8^\circ \text{ and } 114.2^\circ
$$

Thus, by inspection of Fig. 10–18*b*,

$$
\theta_{p_2} = -32.9^{\circ}
$$
 and $\theta_{p_1} = 57.1^{\circ}$ Ans.

The principal moments of inertia with respect to these axes are

determined from Eq. 10-11. Hence,
\n
$$
I_{\min} = \frac{I_x + I_y}{2} \pm \sqrt{\left(\frac{I_x - I_y}{2}\right)^2 + I_{xy}^2}
$$
\n
$$
= \frac{2.90(10^9) + 5.60(10^9)}{2}
$$
\n
$$
\pm \sqrt{\left[\frac{2.90(10^9) - 5.60(10^9)}{2}\right]^2 + [-3.00(10^9)]^2}
$$
\n
$$
I_{\min}^{\max} = 4.25(10^9) \pm 3.29(10^9)
$$
\nor

or

$$
I_{\text{max}} = 7.54(10^9) \text{ mm}^4
$$
 $I_{\text{min}} = 0.960(10^9) \text{ mm}^4$ Ans.

NOTE: The maximum moment of inertia, $I_{\text{max}} = 7.54(10^9) \text{ mm}^4$, occurs with respect to the *u* axis since by inspection most of the crossoccurs with respect to the *u* axis since *by inspection* most of the crosssectional area is farthest away from this axis. Or, stated in another manner, I_{max} occurs about the *u* axis since this axis is located within anner, I_{max} occurs about the *u* axis since this axis is located within 45° of the *y* axis, which has the larger value of $I(I_y > I_x)$. Also, this \pm 45° of the *y* axis, which has the larger value of $I(I_y > I_x)$. Also, this can be concluded by substituting the data with $\theta = 57.1^\circ$ into the first of Eqs. 10–9 and solving for I_u .

*10.7 [Mohr's Circle for Moments](#page-12-0) of Inertia

Equations 10–9 to 10–11 have a graphical solution that is convenient to use and generally easy to remember. Squaring the first and third of Eqs. 10–9 and adding, it is found that

$$
\left(I_u - \frac{I_x + I_y}{2}\right)^2 + I_{uv}^2 = \left(\frac{I_x - I_y}{2}\right)^2 + I_{xy}^2
$$

Here I_x , I_y , and I_{xy} are *known constants*. Thus, the above equation may be written in compact form as be written in compact form as

$$
(I_u - a)^2 + I_{uv}^2 = R^2
$$

When this equation is plotted on a set of axes that represent the respective moment of inertia and the product of inertia, as shown in Fig. 10–19, the resulting graph represents a *circle* of radius

$$
R = \sqrt{\left(\frac{I_x - I_y}{2}\right)^2 + I_{xy}^2}
$$

and having its center located at point $(a, 0)$, where $a = (I_x + I_y)/2$. The circle so constructed is called *Mohr's circle*, named after the German circle so constructed is called *Mohr's circle*, named after the German engineer Otto Mohr (1835–1918).

Fig. 10–19

Axis for major principal moment of inertia, I_{max}

(a)

Fig. 10–19

Procedure for Analysis

The main purpose in using Mohr's circle here is to have a convenient means for finding the principal moments of inertia for an area. The following procedure provides a method for doing this.

Determine l_x , l_y , and l_{xy}

• Establish the *x*, *y* axes and determine I_x , I_y , and I_{xy} , Fig. 10–19*a*.

Construct the Circle.

- Construct a rectangular coordinate system such that the abscissa represents the moment of inertia *I*, and the ordinate represents the product of inertia I_{xy} , Fig. 10–19*b*.
- Determine the center of the circle, *O*, which is located at a Determine the center of the circle, O, which is located at a distance $(I_x + I_y)/2$ from the origin, and plot the reference point A having coordinates (I, I_x) Remember I is always positive *A* having coordinates (I_x, I_{xy}) . Remember, I_x is always positive, whereas I_x can be either positive or negative whereas I_{xy} can be either positive or negative. λ y
- Connect the reference point *A* with the center of the circle and determine the distance *OA* by trigonometry. This distance represents the radius of the circle, Fig. 10–19*b*. Finally, draw the circle.

Principal Moments of Inertia.

The points where the circle intersects the I axis give the values of the principal moments of inertia I_{min} and I_{max} . Notice that,
as expected, the product of inertia will be zero at these points as expected, the *product of inertia will be zero at these points*, Fig. 10–19*b*.

Principal Axes.

• To find the orientation of the major principal axis, use trigonometry to find the angle $2\theta_{p_1}$, *measured from the radius*
 OA to the positive Laxis Fig. 10, 10b This angle represents twice *OA to the positive I axis*, Fig. 10–19*b*. This angle represents *twice* the angle from the *x* axis to the axis of maximum moment of inertia I_{max} , Fig. 10–19*a*. Both the angle on the circle, $2\theta_{p_1}$, and the angle θ *must be measured in the same sense* as shown in the angle θ_{p_1} , must be measured in the same sense, as shown in
Fig. 10, 19. The axis for minimum moment of inertia I_{eff} is Fig. 10–19. The axis for minimum moment of inertia I_{min} is
perpendicular to the axis for I perpendicular to the axis for I_{max} .

Using trigonometry, the above procedure can be verified to be in accordance with the equations developed in Sec. 10.6.

Using Mohr's circle, determine the principal moments of inertia and the orientation of the major principal axes for the cross-sectional area of the member shown in Fig. 10–20*a*, with respect to an axis passing through the centroid. *y*

SOLUTION

Determine I_{x} , I_{y} , I_{xy} . The moments and product of inertia have been determined in Examples 10.5 and 10.7 with respect to the *x, y* been determined in Examples 10.5 and 10.7 with respect to the x, y axes shown in Fig. 10–20*a*. The results are $I_x = 2.90(10^9)$ mm⁴, $I_y = 5.60(10^9)$ mm⁴ and $I_y = -3.00(10^9)$ mm⁴ axes shown in Fig. 10–20*a*. The results are $I_y = 5.60(10^9) \text{ mm}^4$, and $I_{xy} = -3.00(10^9) \text{ mm}^4$.

Construct the Circle. The *I* and I_{xy} axes are shown in Fig. 10–20*b*. The **Construct the Circle.** The *I* and I_{xy} axes are shown in Fig. 10–20b. The center of the circle, *O*, lies at a distance $(I_x + I_y)/2 = (2.90 + 5.60)/2 = 4.25$ from the crigin When the reference point $A(I - I_x)$ or $A(2.90 - 3.00)$ center of the circle, O, lies at a distance $(I_x + I_y)/2 = (2.90 + 5.60)/2 = 4.25$
from the origin. When the reference point $A(I_x, I_{xy})$ or $A(2.90, -3.00)$ is
connected to point O, the radius OA is determined from the triangle connected to point *O*, the radius *OA* is determined from the triangle *OBA* using the Pythagorean theorem.

$$
OA = \sqrt{(1.35)^2 + (-3.00)^2} = 3.29
$$

The circle is constructed in Fig. 10–20*c*.

Principal Moments of Inertia. The circle intersects the *I* axis at

points (7.54, 0) and (0.960, 0). Hence,
\n
$$
I_{\text{max}} = (4.25 + 3.29)10^9 = 7.54(10^9) \text{ mm}^4
$$
\n
$$
I_{\text{min}} = (4.25 - 3.29)10^9 = 0.960(10^9) \text{ mm}^4
$$
\nAns.

Principal Axes. As shown in Fig. 10–20*c*, the angle $2\theta_{p_1}$ is determined from the girals by measuring counterclockwise from OA determined from the circle by measuring counterclockwise from *OA*

to the direction of the *positive I* axis. Hence,
\n
$$
2\theta_{p_1} = 180^\circ - \sin^{-1}\left(\frac{|BA|}{|OA|}\right) = 180^\circ - \sin^{-1}\left(\frac{3.00}{3.29}\right) = 114.2^\circ
$$
\nThe *principal axis for I* = -7.54(10°) must be the *neff* as the *neff* are *inert* and *in in the right*.

The principal axis for $I_{\text{max}} = 7.54(10^9) \text{ mm}^4$ is therefore oriented at
an angle $\theta = 57.1^\circ$ measured counterclockwise from the positive r The principal axis for $I_{\text{max}} = 7.54(10^9) \text{ mm}^4$ is therefore oriented at an angle $\theta_{p_1} = 57.1^{\circ}$, measured *counterclockwise*, from the *positive x* axis to the *positive x* axis The *x* axis is perpendicular to axis to the *positive u* axis. The v axis is perpendicular to this axis. The results are shown in Fig. 10–20*d*.

 $A(2.90, -3.00)$

10.8 [Mass Moment of Inertia](#page-12-0)

The mass moment of inertia of a body is a measure of the body's resistance to angular acceleration. Since it is used in dynamics to study rotational motion, methods for its calculation will now be discussed.*

Consider the rigid body shown in Fig. 10–21. We define the *mass moment of inertia* of the body about the *z* axis as

$$
I = \int_{m} r^2 dm \qquad (10-12)
$$

Here r is the perpendicular distance from the axis to the arbitrary element *dm*. Since the formulation involves *r*, the value of *I* is *unique* for each axis about which it is computed. The axis which is generally chosen, however, passes through the body's mass center *G*. Common units used for its measurement are $k \cdot m^2$ or slug \cdot ft². is computed. The a
the body's mass c
kg \cdot m² or slug \cdot ft².

If the body consists of material having a density ρ , then $dm = \rho dV$,
 α 10–22*a*. Substituting this into Eq. 10–12, the body's moment of Fig. 10–22*a*. Substituting this into Eq. 10–12, the body's moment of inertia is then computed using *volume elements* for integration; i.e.

$$
I = \int_{V} r^2 \rho \, dV \tag{10-13}
$$

For most applications, ρ will be a *constant*, and so this term may be factored out of the integral, and the integration is then purely a function of geometry.

$$
I = \rho \int_{V} r^2 dV \qquad (10-14)
$$

Procedure for Analysis

If a body is symmetrical with respect to an axis, as in Fig. 10–22, then its mass moment of inertia about the axis can be determined by using a single integration. Shell and disk elements are used for this purpose.

Shell Element.

- If a *shell element* having a height *z*, radius *y*, and thickness *dy* is chosen for integration, Fig. 10–22*b*, then its volume is $dV = (2\pi y)(z) dy.$
- This element can be used in Eq. 10–13 or 10–14 for determining the moment of inertia I_z of the body about the *z* axis since the entire element, due to its "thinness," lies at the *same* perpendicular entire element, due to its "thinness," lies at the *same* p distance $r = y$ from the *z* axis (see Example 10.10).

Disk Element.

- If a disk element having a radius *y* and a thickness *dz* is chosen If a disk element having a radius y and a thickness dz is chosen for integration, Fig. 10–22*c*, then its volume is $dV = (\pi y^2) dz$.
- In this case the element is *finite* in the radial direction, and consequently its points *do not* all lie at the *same radial distance r* from the *z* axis. As a result, Eqs. 10–13 or 10–14 *cannot* be used to determine I_z . Instead, to perform the integration using this
element it is first necessary to determine the moment of inertia element, it is first necessary to determine the moment of inertia *of the element* about the *z* axis and then integrate this result (see Example 10.11).

Determine the mass moment of inertia of the cylinder shown in Fig. $10-23a$ about the *z* axis. The density of the material, ρ , is constant.

SOLUTION

Shell Element. This problem will be solved using the *shell element* in Fig. 10–23*b* and thus only a single integration is required. The in Fig. 10–23*b* and thus only a single integration is required. The volume of the element is $dV = (2\pi r)(h) dr$, and so its mass is $dm = \rho dV = \rho(2\pi hr dr)$. Since the entire element lies at the same volume of the element is $dV = (2\pi r)(h) dr$, and so its mass is $dm = \rho dV = \rho(2\pi hr dr)$. Since the *entire element* lies at the same distance *r* from the *z* axis the moment of inertia of the element is distance *r* from the *z* axis, the moment of inertia *of the element* is

$$
dI_z = r^2 dm = \rho 2\pi h r^3 dr
$$

Integrating over the entire cylinder yields

$$
I_z = \int_m r^2 dm = \rho 2\pi h \int_0^R r^3 dr = \frac{\rho \pi}{2} R^4 h
$$

Since the mass of the cylinder is

$$
m = \int_m dm = \rho 2\pi h \int_0^R r dr = \rho \pi h R^2
$$

then

$$
I_z = \frac{1}{2}mR^2
$$
Ans.

A solid is formed by revolving the shaded area shown in Fig. 10–24*a* about the *y* axis. If the density of the material is 5 slug/ft^3 , determine the mass moment of inertia about the *y* axis.

SOLUTION

Disk Element. The moment of inertia will be determined using this *disk element*, as shown in Fig. 10–24*b*. Here the element intersects the curve at the arbitrary point (x, y) and has a mass

$$
dm = \rho \, dV = \rho(\pi x^2) \, dy
$$

Although all points on the element are *not* located at the same distance from the *y* axis, it is still possible to determine the moment of inertia dI_y of the element about the *y* axis. In the previous example it was shown that the moment of inertia of a homogeneous cylinder was shown that the moment of inertia of a homogeneous cylinder
about its longitudinal axis is $I = \frac{1}{2} mR^2$, where *m* and *R* are the mass
and radius of the cylinder. Since the height of the cylinder is not and radius of the cylinder. Since the height of the cylinder is not involved in this formula, we can also use this result for a disk.Thus, for the disk element in Fig. 10–24*b*, we have

$$
dI_y = \frac{1}{2}(dm)x^2 = \frac{1}{2}[\rho(\pi x^2) dy]x^2
$$

Substituting $x = y^2$, $\rho = 5$ slug/ft³, and integrating with respect to *y*, from $y = 0$ to $y = 1$ ft vields the moment of inertia for the entire solid Substituting $x = y^2$, $\rho = 5$ slug/ft³, and integrating with respect to y, from $y = 0$ to $y = 1$ ft, yields the moment of inertia for the entire solid.

$$
I_y = \frac{5\pi}{2} \int_0^{1\text{ft}} x^4 \, dy = \frac{5\pi}{2} \int_0^{1\text{ft}} y^8 \, dy = 0.873 \, \text{slug} \cdot \text{ft}^2 \quad \text{Ans.}
$$

Parallel-Axis Theorem. If the moment of inertia of the body about an axis passing through the body's mass center is known, then the moment of inertia about any other *parallel axis* can be determined by using the *parallel-axis theorem*.To derive this theorem, consider the body using the *parallel-axis theorem*. To derive this theorem, consider the body shown in Fig. 10–25. The z' axis passes through the mass center *G*, whereas the corresponding *parallel* z *axis* lies at a constant distan whereas the corresponding *parallel z axis* lies at a constant distance *d* away. Selecting the differential element of mass *dm*, which is located at away. Selecting the differential element of mass dm , which is located a
point (x', y') , and using the Pythagorean theorem, $r^2 = (d + x')^2 + y'$
the moment of inertia of the body about the z axis is the moment of inertia of the body about the *z* axis is 2 Selecting the differential element of mass dm, which is located at x' , y'), and using the Pythagorean theorem, $r^2 = (d + x')^2 + y'^2$, whent of inertia of the body about the z axis is

$$
I = \int_m r^2 dm = \int_m [(d + x')^2 + y'^2] dm
$$

=
$$
\int_m (x'^2 + y'^2) dm + 2d \int_m x' dm + d^2 \int_m dm
$$

Since $r'^2 = x'^2 + y'^2$, the first integral represents I_G . The second integral is equal to zero since the z' axis passes through the body's mass Since $r'^2 = x'^2 + y'^2$, the first integral represents I_G . The second
integral is equal to *zero*, since the *z'* axis passes through the body's mass
center i.e. $\int x' dm = \overline{x} \int dm = 0$ since $\overline{x} = 0$. Finally the third integ center, i.e., $\int x' dm = \overline{x} \int dm = 0$ since $\overline{x} = 0$. Finally, the third integral is the total mass *m* of the body. Hence, the moment of inertia about the *z* axis becomes qual to *zero*, since the *z'* axis passes
 $\int x' dm = \overline{x} \int dm = 0$ since $\overline{x} = 0$.
mass *m* of the body. Hence, the mon 2 ,

$$
I = I_G + md^2
$$
 (10-15)

where

$$
I_G
$$
 = moment of inertia about the z' axis passing through the mass center G

- $m =$ mass of the body
- $d =$ distance between the parallel axes

Radius of Gyration. Occasionally, the moment of inertia of a body about a specified axis is reported in handbooks using the *radius of gyration, k*. This value has units of length, and when it and the body's mass *m* are known, the moment of inertia can be determined from the equation

$$
I = mk^2 \quad \text{or} \quad k = \sqrt{\frac{I}{m}} \tag{10-16}
$$

Note the *similarity* between the definition of *k* in this formula and *r* in Note the *similarity* between the definition of k in this formula and r in
the equation $dI = r^2 dm$, which defines the moment of inertia of a
differential element of mass dm of the body about an axis differential element of mass *dm* of the body about an axis.

Composite Bodies. If a body is constructed from a number of simple shapes such as disks, spheres, and rods, the moment of inertia of the body about any axis *z* can be determined by adding algebraically the moments of inertia of all the composite shapes computed about the same axis. Algebraic addition is necessary since a composite part must be considered as a negative quantity if it has already been included within another part—as in the case of a "hole" subtracted from a solid plate. Also, the parallel-axis theorem is needed for the calculations if the center of mass of each composite part does not lie on the *z* axis. In this regard, formulas for the mass moment of inertia of some common shapes, such as disks, spheres, and rods, are given in the table on the inside back cover.

This flywheel, which operates a metal cutter, has a large moment of inertia about its center. Once it begins rotating it is difficult to stop it and therefore a uniform motion can be effectively transferred to the cutting blade.

If the plate shown in Fig. $10-26a$ has a density of 8000 kg/m^3 and a thickness of 10 mm, determine its mass moment of inertia about an axis perpendicular to the page and passing through the pin at *O*.

SOLUTION

The plate consists of two composite parts, the 250-mm-radius disk *minus* a 125-mm-radius disk, Fig. 10–26*b*.The moment of inertia about *O* can be determined by finding the moment of inertia of each of these parts about *O* and then *algebraically* adding the results. The computations are performed by using the parallel-axis theorem in conjunction with the data listed in the table on the inside back cover.

Disk. The moment of inertia of a disk about an axis perpendicular **Disk.** The moment of inertia of a disk about an axis perpendicular
to the plane of the disk and passing through *G* is $I_G = \frac{1}{2}mr^2$. The mass
center of both disks is 0.25 m from point *O*. Thus center of both disks is 0.25 m from point *O*. Thus,

$$
m_d = \rho_d V_d = 8000 \text{ kg/m}^3 [\pi (0.25 \text{ m})^2 (0.01 \text{ m})] = 15.71 \text{ kg}
$$

\n
$$
(I_O)_d = \frac{1}{2} m_d r_d^2 + m_d d^2
$$

\n
$$
= \frac{1}{2} (15.71 \text{ kg}) (0.25 \text{ m})^2 + (15.71 \text{ kg}) (0.25 \text{ m})^2
$$

\n
$$
= 1.473 \text{ kg} \cdot \text{m}^2
$$

Hole. For the smaller disk (hole), we have

$$
m_h = \rho_h V_h = 8000 \text{ kg/m}^3 [\pi (0.125 \text{ m})^2 (0.01 \text{ m})] = 3.93 \text{ kg}
$$

(*I_O)_h* = $\frac{1}{2} m_h r_h^2 + m_h d^2$
= $\frac{1}{2} (3.93 \text{ kg}) (0.125 \text{ m})^2 + (3.93 \text{ kg}) (0.25 \text{ m})^2$
= 0.276 kg·m²

The moment of inertia of the plate about the pin is therefore
\n
$$
I_O = (I_O)_d - (I_O)_h
$$
\n
$$
= 1.473 \text{ kg} \cdot \text{m}^2 - 0.276 \text{ kg} \cdot \text{m}^2
$$
\n
$$
= 1.20 \text{ kg} \cdot \text{m}^2
$$
\nAns.

Fig. 10–27

The pendulum in Fig. 10–27 consists of two thin rods each having a weight of 10 lb. Determine the pendulum's mass moment of inertia about an axis passing through (a) the pin at *O*, and (b) the mass center *G* of the pendulum.

SOLUTION

Part (a). Using the table on the inside back cover, the moment of inertia of rod *OA* about an axis perpendicular to the page and passing mdicular to $I_O = \frac{1}{3}ml^2$.

through the end point *O* of the rod is
$$
I_O = \frac{1}{3}ml^2
$$
. Hence,
\n
$$
(I_{OA})_O = \frac{1}{3}ml^2 = \frac{1}{3}\left(\frac{10 \text{ lb}}{32.2 \text{ ft/s}^2}\right)(2 \text{ ft})^2 = 0.414 \text{ slug} \cdot \text{ft}^2
$$

Realize that this same value may be computed using $I_G = \frac{1}{12}ml^2$ and
the parallel-axis theorem: i.e. the parallel-axis theorem; i.e.,

$$
(I_{OA})_O = \frac{1}{12}ml^2 + md^2 = \frac{1}{12} \left(\frac{10 \text{ lb}}{32.2 \text{ ft/s}^2}\right) (2 \text{ ft})^2 + \frac{10 \text{ lb}}{32.2 \text{ ft/s}^2} (1 \text{ ft})^2
$$

$$
= 0.414 \text{ slug} \cdot \text{ft}^2
$$

For rod *BC* we have

$$
(I_{BC})_O = \frac{1}{12}ml^2 + md^2 = \frac{1}{12} \left(\frac{10 \text{ lb}}{32.2 \text{ ft/s}^2}\right) (2 \text{ ft})^2 + \frac{10 \text{ lb}}{32.2 \text{ ft/s}^2} (2 \text{ ft})^2
$$

$$
= 1.346 \text{ slug} \cdot \text{ft}^2
$$

The moment of inertia of the pendulum about *O* is therefore
 $I_O = 0.414 + 1.346 = 1.76$ slug \cdot ft²

$$
I_O = 0.414 + 1.346 = 1.76 \text{ slug} \cdot \text{ft}^2
$$
Ans.

Part (b). The mass center *G* will be located relative to the pin at *O*. Assuming this distance to be \bar{y} , Fig. 10–27, and using the formula for determining the mass center we have

determining the mass center, we have
\n
$$
\overline{y} = \frac{\Sigma \widetilde{y}m}{\Sigma m} = \frac{1(10/32.2) + 2(10/32.2)}{(10/32.2) + (10/32.2)} = 1.50 \text{ ft}
$$

The moment of inertia I_G may be computed in the same manner as I_O , which requires successive applications of the parallel-axis theorem
in order to transfer the moments of inertia of rods OA and BC to G . in order to transfer the moments of inertia of rods *OA* and *BC* to *G*.A more direct solution, however, involves applying the parallel-axis $\overline{}$

theorem using the result for
$$
I_O
$$
 determined above; i.e.,
\n $I_O = I_G + md^2$; 1.76 slug · ft² = $I_G + \left(\frac{20 \text{ lb}}{32.2 \text{ ft/s}^2}\right) (1.50 \text{ ft})^2$
\n $I_G = 0.362 \text{ slug} \cdot \text{ft}^2$ Ans.

CHAPTER REVIEW

Area Moment of Inertia

The *area moment of inertia* represents the second moment of the area about an axis. It is frequently used in formulas related to the strength and stability of structural members or mechanical elements.

If the area shape is irregular but can be described mathematically, then a differential element must be selected and integration over the entire area must be performed to determine the moment of inertia.

Parallel-Axis Theorem

If the moment of inertia for an area is known about a centroidal axis, then its moment of inertia about a parallel axis can be determined using the parallel-axis theorem.

Composite Area

If an area is a composite of common shapes, as found on the inside back cover, then its moment of inertia is equal to the algebraic sum of the moments of inertia of each of its parts.

Product of Inertia

The *product of inertia* of an area is used in formulas to determine the orientation of an axis about which the moment of inertia for the area is a maximum or minimum.

If the product of inertia for an area is If the product of inertia for an area is

known with respect to its centroidal x' , y'

axes then its value can be determined axes, then its value can be determined with respect to any *x, y* axes using the parallel-axis theorem for the product of inertia.

Principal Moments of Inertia

Provided the moments of inertia, I_x and I_y , and the product of inertia, I_{xy} , are known, then the transformation formulas, or Mohr's circle, can be used to determine the maximum and minimum or *principal moments of inertia* for the area, as well as finding the orientation of the principal axes of inertia.

Mass Moment of Inertia

The *mass moment of inertia* is a property of a body that measures its resistance to a change in its rotation. It is defined as the "second moment" of the mass elements of the body about an axis.

For homogeneous bodies having axial symmetry, the mass moment of inertia can be determined by a single integration, using a disk or shell element.

The mass moment of inertia of a composite body is determined by using tabular values of its composite shapes found on the inside back cover, along with the parallel-axis theorem.

Equilibrium and stability of this articulated crane boom as a function of the boom position can be analyzed using methods based on work and energy, which are explained in this chapter.

Virtual Work

[11](#page-13-0)

[CHAPTER OBJECTIVES](#page-13-0)

- To introduce the principle of virtual work and show how it applies to finding the equilibrium configuration of a system of pin-connected members.
- To establish the potential-energy function and use the potentialenergy method to investigate the type of equilibrium or stability of a rigid body or system of pin-connected members.

11.1 [Definition of Work](#page-13-0)

The *principle of virtual work* was proposed by the Swiss mathematician Jean Bernoulli in the eighteenth century. It provides an alternative method for solving problems involving the equilibrium of a particle, a rigid body, or a system of connected rigid bodies. Before we discuss this principle, however, we must first define the work produced by a force and by a couple moment.

F –**F** *A A*¿ *B*– *d***r**¿ d **r**_{*A*} *d***r***^A* d **r**_{*B*} $\begin{array}{|c|c|c|}\nB & d\mathbf{r}_A & \mathbf{r}_B \\
\hline\n\end{array}$ $r \mid d\theta$

Fig. 11–2

Work of a Force. A force does work when it undergoes a displacement in the direction of its line of action. Consider, for example, the force **F** in Fig. 11–1*a* that undergoes a differential displacement $d\mathbf{r}$. If θ is the angle between the force and the displacement then the θ is the angle between the force and the displacement, then the component of **F** in the direction of the displacement is $F \cos \theta$. And so the work produced by **F** is the work produced by **F** is

$$
dU = F dr \cos \theta
$$

Notice that this expression is also the product of the force *F* and the component of displacement in the direction of the force, dr cos θ ,
Fig. 11–1b. If we use the definition of the dot product (Eq. 2–14) the Fig. 11–1*b*. If we use the definition of the dot product (Eq. 2–14) the work can also be written as

$$
dU = \mathbf{F} \cdot d\mathbf{r}
$$

As the above equations indicate, work is a *scalar*, and like other scalar quantities, it has a magnitude that can either be *positive* or *negative*.

In the SI system, the unit of work is a *joule* (J), which is the work produced by a 1-N force that displaces through a distance of 1 m in the direction of the force $(1 J = 1 N \cdot m)$. The unit of work in the FPS system is the foot-pound (ft \cdot lb), which is the work produced by a 1-lb force that displaces through a distance of 1 ft in the direction of the force. (N force
(ft \cdot lb) he unit of wor

rce that displac
 $(1 J = 1 N \cdot m)$

The moment of a force has this same combination of units; however, the concepts of moment and work are in no way related. A moment is a vector quantity, whereas work is a scalar.

Work of a Couple Moment. The rotation of a couple moment also produces work. Consider the rigid body in Fig. 11–2, which is acted upon by the couple forces **F** and **–F** that produce a couple moment **M** upon by the couple forces **F** and $-F$ that produce a couple moment **M** having a magnitude $M = Fr$. When the body undergoes the differential displacement shown points A and B move dr , and dr to their final displacement shown, points A and B move $d\mathbf{r}_A$ and $d\mathbf{r}_B$ to their final
positions A' and B' respectively Since $d\mathbf{r}_B = d\mathbf{r}_A + d\mathbf{r}'$ this movement displacement shown, points A and B move $d\mathbf{r}_A$ and $d\mathbf{r}_B$ to their final positions A' and B', respectively. Since $d\mathbf{r}_B = d\mathbf{r}_A + d\mathbf{r}'$, this movement can be thought of as a *translation* $d\mathbf{r}_A$, where A positions A' and B', respectively. Since $d\mathbf{r}_B = d\mathbf{r}_A + d\mathbf{r}'$, this movement
can be thought of as a *translation* $d\mathbf{r}_A$, where A and B move to A' and
B'' and a *rotation* about A' where the body rotates throug can be thought of as a *translation* $d\mathbf{r}_A$, where A and B move to A' and B'', and a *rotation* about A', where the body rotates through the angle $d\theta$ about A. The counle forces do no work during the translation $d\$ about *A*. The couple forces do no work during the translation $d\mathbf{r}_A$ because
each force undergoes the same amount of displacement in opposite each force undergoes the same amount of displacement in opposite directions, thus canceling out the work. During rotation, however, **F** is displaced $dr'' = r d\theta$, and so it does work $dU = F dr'' = F r d\theta$. Since $M = Fr$ the work of the counle moment **M** is therefore displaced $dr'' = r d\theta$, and so it does work $dU = F dr'' = F r d\theta$. Since displaced $dr'' = r d\theta$, and so it does work $dU = F dr'$
 $M = Fr$, the work of the couple moment **M** is therefore

$$
dU = Md\theta
$$

If **M** and $d\theta$ have the same sense, the work is *positive*; however, if they we the opposite sense, the work will be *negative* have the opposite sense, the work will be *negative*.

Virtual Work. The definitions of the work of a force and a couple have been presented in terms of *actual movements* expressed by differential displacements having magnitudes of dr and $d\theta$. Consider $\cos \theta$ an *imaginary* or *virtual movement* of a body in static equilibrium now an *imaginary* or *virtual movement* of a body in static equilibrium, which indicates a displacement or rotation that is *assumed* and *does not actually exist*.These movements are first-order differential quantities and will be denoted by the symbols δr and $\delta \theta$ (delta *r* and delta θ), will be denoted by the symbols δr and $\delta \theta$ (delta r and delta θ), respectively. The *virtual work* done by a force having a virtual displacement δr is

$$
\delta U = F \cos \theta \, \delta r \tag{11-1}
$$

Similarly, when a couple undergoes a virtual rotation $\delta\theta$ in the plane of the couple forces, the *virtual work* is

$$
\delta U = M \,\delta\theta \tag{11-2}
$$

11.2 [Principle of Virtual Work](#page-13-0)

The principle of virtual work states that if a body is in equilibrium, then the algebraic sum of the virtual work done by all the forces and couple moments acting on the body, is zero for any virtual displacement of the body. Thus,

$$
\delta U = 0 \tag{11-3}
$$

For example, consider the free-body diagram of the particle (ball) that rests on the floor, Fig. 11–3. If we "imagine" the ball to be displaced downwards a virtual amount δy , then the weight does positive virtual
work W δy and the normal force does negative virtual work $-N \delta y$ downwards a virtual amount δy , then the weight does positive virtual
work, $W \delta y$, and the normal force does negative virtual work, $-N \delta y$.
For equilibrium, the total virtual work, must be zero, so that For equilibrium the total virtual work must be zero, so that $\delta U = W \delta y - N \delta y = (W - N) \delta y = 0$. Since $\delta y \neq 0$, then $N = W$ as required by applying $\Sigma F = 0$ $\delta U = W \, \delta y - N \, \delta y = (W - N) \, \delta y = 0$. Since $\delta y \neq 0$, then $N = W$ as required by applying $\Sigma F_v = 0$.

Fig. 11–3

In a similar manner, we can also apply the virtual-work equation In a similar manner, we can also apply the virtual-work equation $\delta U = 0$ to a rigid body subjected to a coplanar force system. Here, separate virtual translations in the x and y directions and a virtual separate virtual translations in the *x* and *y* directions and a virtual rotation about an axis perpendicular to the *x*–*y* plane that passes through an arbitrary point O , will correspond to the three equilibrium equations, an arbitrary point O, will correspond to the three equilibrium equations, $\Sigma F_x = 0$, $\Sigma F_y = 0$, and $\Sigma M_O = 0$. When writing these equations, it is not necessary to include the work done by the *internal forces* acting *not necessary* to include the work done by the *internal forces* acting within the body since a rigid body *does not deform* when subjected to an external loading, and furthermore, when the body moves through a virtual displacement, the internal forces occur in equal but opposite collinear pairs, so that the corresponding work done by each pair of forces will cancel.

To demonstrate an application, consider the simply supported beam in Fig. 11–4*a*. When the beam is given a virtual rotation $\delta\theta$ about point *B*, Fig. 11–4*a*. When the beam is given a virtual rotation $\delta\theta$ about point *B*, Fig. 11–4*b*, the only forces that do work are **P** and A_y . Since $\delta y = l \delta\theta$ and $\delta y' = (l/2) \delta\theta$ the virtual work equation for this case i Fig. 11–4*b*, the only forces that do work are **P** and A_y . Since $\delta y = l \delta \theta$ and $\delta y' = (l/2) \delta \theta$, the virtual work equation for this case is $\delta l = A (l \delta \theta) - P(l/2) \delta \theta = (A l - Pl/2) \delta \theta = 0$ Since $\delta \theta \neq 0$ then and $\delta y' = (l/2) \delta \theta$, the virtual work equation for this case is $\delta U = A_y(l \delta \theta) - P(l/2) \delta \theta = (A_y l - Pl/2) \delta \theta = 0$. Since $\delta \theta \neq 0$, then $A = P/2$. Excluding $\delta \theta$ notice that the terms in parantheses actually $\delta U = A_y (l \,\delta\theta) - P(l/2) \,\delta\theta = (A_y l - Pl/2) \,\delta\theta = 0$. Since $\delta\theta \neq 0$, then $A_y = P/2$. Excluding $\delta\theta$, notice that the terms in parentheses actually represent the application of $\Sigma M_x = 0$ $A_y = P/2$. Excluding $\delta\theta$, notice that the represent the application of $\Sigma M_B = 0$.
As seen from the above two example

As seen from the above two examples, no added advantage is gained by solving particle and rigid-body equilibrium problems using the principle of virtual work. This is because for each application of the virtual-work equation, the virtual displacement, common to every term, factors out, leaving an equation that could have been obtained in a more *direct manner* by simply applying an equation of equilibrium.

Fig. 11–4

11.3 Principle of Virtual Work for a [System of Connected Rigid Bodies](#page-13-0)

The method of virtual work is particularly effective for solving equilibrium problems that involve a system of several *connected* rigid bodies, such as the ones shown in Fig. 11–5.

Each of these systems is said to have only one degree of freedom since the arrangement of the links can be completely specified using only one coordinate θ . In other words, with this single coordinate and the length of the members, we can locate the position of the forces **F** and **P**.

In this text, we will only consider the application of the principle of virtual work to systems containing one degree of freedom*. Because they are less complicated, they will serve as a way to approach the solution of more complex problems involving systems with many degrees of freedom. The procedure for solving problems involving a system of frictionless connected rigid bodies follows.

Important Points

- A force does work when it moves through a displacement in the direction of the force. A couple moment does work when it moves through a collinear rotation. Specifically, positive work is done when the force or couple moment and its displacement have the same sense of direction.
- The principle of virtual work is generally used to determine the equilibrium configuration for a system of multiply connected members.
- A virtual displacement is imaginary; i.e., it does not really happen. It is a differential displacement that is given in the positive direction of a position coordinate.
- Forces or couple moments that do not virtually displace do no virtual work.

*This method of applying the principle of virtual work is sometimes called the *method of virtual displacements* because a virtual displacement is applied, resulting in the calculation of a real force. Although it is not used here, we can also apply the principle of virtual work as a *method of virtual forces*. This method is often used to apply a virtual force and then determine the displacements of points on deformable bodies. See R. C. Hibbeler, *Mechanics of Materials*, 7th edition, Pearson/Prentice Hall, 2007.

Fig. 11–5

This scissors lift has one degree of freedom. Without the need for dismembering the mechanism, the force in the hydraulic cylinder AB required to provide the lift can be determined *directly* by using the principle of virtual work.

Procedure for Analysis

Free-Body Diagram.

- Draw the free-body diagram of the entire system of connected bodies and define the *coordinate q*.
- Sketch the "deflected position" of the system on the free-body diagram when the system undergoes a *positive* virtual displacement δq .

Virtual Displacements.

- Indicate *position coordinates s*, each measured from a *fixed point*
on the free-body diagram. These coordinates are directed to the on the free-body diagram. These coordinates are directed to the forces that do work.
- Each of these coordinate axes should be *parallel* to the line of action of the force to which it is directed, so that the virtual work along the coordinate axis can be calculated.
- Relate each of the position coordinates s to the coordinate q ; then *differentiate* these expressions in order to express each virtual displacement δs in terms of δq .

Virtual-Work Equation.

- Write the *virtual-work equation* for the system assuming that, whether possible or not, each position coordinate s undergoes a positive virtual displacement δs . If a force or couple moment is in the same direction as the positive virtual displacement, the work the same direction as the positive virtual displacement, the work is positive. Otherwise, it is negative.
- Express the work of *each* force and couple moment in the equation in terms of δq .
- Factor out this common displacement from all the terms, and solve for the unknown force, couple moment, or equilibrium position *q*.

Determine the angle θ for equilibrium of the two-member linkage shown in Fig. 11–6*a*. Each member has a mass of 10 kg.

SOLUTION

Free-Body Diagram. The system has only one degree of freedom since the location of both links can be specified by the single since the location of both links can be specified by the single coordinate $(q =) \theta$. As shown on the free-body diagram in Fig. 11–6*b*, when θ has a nositive (clockwise) virtual rotation $\delta\theta$ only the force **E** when θ has a *positive* (clockwise) virtual rotation $\delta\theta$, only the force **F** and the two 98.1-N weights do work. (The reactive forces \mathbf{D}_x and \mathbf{D}_y
are fixed and **B**, does not displace along its line of action.) are fixed, and \mathbf{B}_y does not displace along its line of action.)

Virtual Displacements. If the origin of coordinates is established at the *fixed* pin support *D*, then the position of **F** and **W** can be specified by the *position coordinates* x_B and y_w . In order to determine the work, by the *position coordinates* x_B and y_w . In order to determine the work, note that, as required, these coordinates are parallel to the lines of action of their associated forces. Expressing these position coordinates in terms of θ and taking the derivatives yields
 $x_B = 2(1 \cos \theta) \text{ m}$ $\delta x_B = -2 \sin \theta \delta \theta \text{ m}$

$$
x_B = 2(1 \cos \theta) \text{ m} \qquad \delta x_B = -2 \sin \theta \, \delta \theta \text{ m} \tag{1}
$$

$$
x_B = 2(1 \cos \theta) \text{ m} \qquad \delta x_B = -2 \sin \theta \delta \theta \text{ m} \qquad (1)
$$

$$
y_w = \frac{1}{2}(1 \sin \theta) \text{ m} \qquad \delta y_w = 0.5 \cos \theta \delta \theta \text{ m} \qquad (2)
$$

It is seen by the *signs* of these equations, and indicated in Fig. 11–6*b*, that an *increase* in θ (i.e., $\delta\theta$) causes a *decrease* in x_B and an *increase* in y_w .
Withink Warks Equation 16 the virtual displacements δw , and δ

Virtual-Work Equation. If the virtual displacements δx_B and δy_w
were both positive then the forces **W** and **F** would do positive work were *both positive*, then the forces **W** and **F** would do positive work since the forces and their corresponding displacements would have the same sense. Hence, the virtual-work equation for the displacement $\delta\theta$ is
 $\delta U = 0$; $W \delta y_w + W \delta y_w + F \delta x_B = 0$ (3)

$$
\delta U = 0; \qquad W \, \delta y_w + W \, \delta y_w + F \, \delta x_B = 0 \tag{3}
$$

Substituting Eqs. 1 and 2 into Eq. 3 in order to relate the virtual displacements to the common virtual displacement $\delta\theta$ yields
98.1(0.5 cos $\theta \delta\theta$) + 98.1(0.5 cos $\theta \delta\theta$) + 25(-2 sin $\theta \delta\theta$) = 0

$$
98.1(0.5\cos\theta\,\delta\theta) + 98.1(0.5\cos\theta\,\delta\theta) + 25(-2\sin\theta\,\delta\theta) = 0
$$

Notice that the "negative work" done by **F** (force in the opposite sense to displacement) has actually been *accounted for* in the above equation by the "negative sign" of Eq. 1. Factoring out the *common* $displacement \delta\theta$ and solving for θ , noting that $\delta\theta \neq 0$, yields
 $(98.1 \cos \theta - 50 \sin \theta) \delta\theta = 0$ the "negative sign" of Eq. 1. Factoring $\delta\theta$ and solving for θ , noting that $\delta\theta \neq 0$,

$$
(98.1 cos θ – 50 sin θ) δθ = 0
$$

$$
θ = tan^{-1} \frac{98.1}{50} = 63.0°
$$
 Ans.

NOTE: If this problem had been solved using the equations of equilibrium, it would be necessary to dismember the links and apply three scalar equations to *each* link. The principle of virtual work, by means of calculus, has eliminated this task so that the answer is obtained directly.

Fig. 11–7

Determine the required force *P* in Fig. 11–7*a*, needed to maintain Determine the required force *P* in Fig. 11–7*a*, needed to maintain equilibrium of the scissors linkage when $\theta = 60^{\circ}$. The spring is equilibrium of the scissors linkage when $\theta = 60^{\circ}$. T
unstretched when $\theta = 30^{\circ}$. Neglect the mass of the links.

SOLUTION

Free-Body Diagram. Only \mathbf{F}_s and **P** do work when θ undergoes a positive virtual displacement $\delta\theta$. Fig. 11–7b. For the arbitrary position $positive$ virtual displacement $\delta\theta$, Fig. 11–7*b*. For the arbitrary position positive virtual displacement $\delta\theta$, Fig. 11–7b. For the arbitrary p θ , the spring is stretched (0.3 m) sin θ – (0.3 m) sin 30°, so that

 $F_s = ks = 5000 \text{ N/m } [(0.3 \text{ m}) \sin \theta - (0.3 \text{ m}) \sin 30^\circ]$ $= (1500 \sin \theta - 750) N$

Virtual Displacements. The position coordinates, x_B and x_D , measured from the *fixed point A*, are used to locate \mathbf{F}_s and **P**. These coordinates are parallel to the line of action of their corresponding forces. Expressing x_B and x_D in terms of the angle θ using
trigonometry trigonometry,

$$
x_B = (0.3 \text{ m}) \sin \theta
$$

$$
x_D = 3[(0.3 \text{ m}) \sin \theta] = (0.9 \text{ m}) \sin \theta
$$

Differentiating, we obtain the virtual displacements of points *B* and *D*.
 $\delta x_B = 0.3 \cos \theta \delta\theta$ (1)

$$
\delta x_B = 0.3 \cos \theta \, \delta \theta \tag{1}
$$

$$
\delta x_B = 0.9 \cos \theta \, \delta \theta \tag{1}
$$

$$
\delta x_D = 0.9 \cos \theta \, \delta \theta \tag{2}
$$

Virtual-Work Equation. Force **P** does positive work since it acts in the positive sense of its virtual displacement. The spring force \mathbf{F}_s does negative work since it acts opposite to its positive virtual displacement. Thus, the virtual-work equation becomes

$$
\delta U = 0; \qquad -F_s \delta x_B + P \delta x_D = 0
$$

- [1500 sin θ - 750] (0.3 cos θ $\delta \theta$) + P (0.9 cos θ $\delta \theta$) = 0
[0.9P + 225 - 450 sin θ] cos θ $\delta \theta$ = 0

Since $\cos \theta \, \delta\theta \neq 0$, then this equation requires

$$
P = 500 \sin \theta - 250
$$

When $\theta = 60^{\circ}$,

$$
P = 500 \sin 60^{\circ} - 250 = 183 \text{ N}
$$
Ans.

If the box in Fig. 11–8*a* has a mass of 10 kg, determine the couple If the box in Fig. 11–8*a* has a mass of 10 kg, determine the couple moment *M* needed to maintain equilibrium when $\theta = 60^\circ$. Neglect the mass of the members.

SOLUTION

Free-Body Diagram. When θ undergoes a positive virtual displacement $\delta\theta$, only the couple moment **M** and the weight of the box do work, Fig. 11–8*b*.

Virtual Displacements. The position coordinate y_F , measured from the *fixed point B*, locates the weight, 10(9.81) N. Here,
 $y_E = (0.45 \text{ m}) \sin \theta + b$

$$
y_E = (0.45 \text{ m}) \sin \theta + b
$$

where *b* is a constant distance. Differentiating this equation, we obtain
 $\delta y_E = 0.45 \text{ m} \cos \theta \delta \theta$ (1)

$$
\delta y_E = 0.45 \text{ m} \cos \theta \ \delta \theta \tag{1}
$$

Virtual-Work Equation. The virtual-work equation becomes

 $\delta U = 0;$ $M\delta\theta - [10(9.81) \text{ N}] \delta y_E = 0$

Substituting Eq. 1 into this equation

$$
M\delta\theta - 10(9.81) \text{ N}(0.45 \text{ m} \cos \theta \,\delta\theta) = 0
$$

$$
\delta\theta(M - 44.145\cos\theta) = 0
$$

Since $\delta\theta \neq 0$, then

$$
M-44.145\cos\theta=0
$$

Since it is required that $\theta = 60^{\circ}$, then

that
$$
\theta = 60^{\circ}
$$
, then
\n $M = 44.145 \cos 60^{\circ} = 22.1 \text{ N} \cdot \text{m}$ *Ans.*

The mechanism in Fig. 11–9*a* supports the 50-lb cylinder. Determine the angle θ for equilibrium if the spring has an unstretched length of the angle θ for equilibrium if the spring has an uns
2 ft when $\theta = 0^{\circ}$. Neglect the mass of the members.

SOLUTION

Free-Body Diagram. When the mechanism undergoes a positive virtual displacement $\delta\theta$, Fig. 11–9*b*, only \mathbf{F}_s and the 50-lb force do work.
Since the final langth of the spring is 2(1 ft cos θ), then Since the final length of the spring is $2(1 \text{ ft} \cos \theta)$, then

$$
F_s = ks = (200 \text{ lb/ft})(2 \text{ ft} - 2 \text{ ft} \cos \theta) = (400 - 400 \cos \theta) \text{ lb}
$$

Virtual Displacements. The position coordinates x_D and x_E are established from the *fixed point A* to locate \mathbf{F}_s at *D* and at *E*.
The coordinate y_p also measured from *A* specifies the position of the The coordinate y_B , also measured from *A*, specifies the position of the 50-lb force at *B*. The coordinates can be expressed in terms of *A* using 50-lb force at *B*. The coordinates can be expressed in terms of θ using trigonometry.

$$
x_D = (1 \text{ ft}) \cos \theta
$$

\n
$$
x_E = 3[(1 \text{ ft}) \cos \theta] = (3 \text{ ft}) \cos \theta
$$

\n
$$
y_B = (2 \text{ ft}) \sin \theta
$$

Differentiating, we obtain the virtual displacements of points D, E , and R as and B as

$$
\delta x_D = -1 \sin \theta \, \delta \theta \tag{1}
$$

$$
\delta x_E = -3 \sin \theta \, \delta \theta \tag{2}
$$

$$
\delta y_B = 2 \cos \theta \, \delta \theta \tag{3}
$$

Virtual-Work Equation. The virtual-work equation is written as if all virtual displacements are positive, thus

$$
\delta U = 0; \qquad F_s \delta x_E + 50 \delta y_B - F_s \delta x_D = 0
$$

(400 - 400 cos θ)(-3 sin θ $\delta \theta$) + 50(2 cos θ $\delta \theta$)

$$
-(400 - 400 \cos \theta)(-1 \sin \theta \,\delta\theta) = 0
$$

$$
\delta\theta \left(800 \sin \theta \cos \theta - 800 \sin \theta + 100 \cos \theta\right) = 0
$$

Since $\delta\theta \neq 0$, then

$$
800 \sin \theta \cos \theta - 800 \sin \theta + 100 \cos \theta = 0
$$

Solving by trial and error,

$$
\theta = 34.9^{\circ}
$$
 Ans.

*11.4 [Conservative Forces](#page-13-0)

If the work of a force only depends upon its initial and final positions, and is *independent* of the path it travels, then the force is referred to as a *conservative force*.The weight of a body and the force of a spring are two examples of conservative forces.

Weight. Consider a block of weight **W** that travels along the path in Fig. $11-10a$. When it is displaced up the path by an amount $d\mathbf{r}$, then the work is $dU = \mathbf{W} \cdot d\mathbf{r}$ or $dU = -W(dr \cos \theta) = -Wdv$, as shown in Fig. 11–10*b*. In this case, the work is *negative* since **W** acts in the opposite sense of dy . Thus, if the block moves from A to B, through the vertical displacement h , the work is **it.** Consider a block of weight **W** that travels 10*a*. When it is displaced up the path by an am $dU = \mathbf{W} \cdot d\mathbf{r}$ or $dU = -W(dr \cos \theta) = -Wdy$
In this case, the work is *negative* since **W** acts $rac{d\mathbf{r}}{d\alpha}$

$$
U = -\int_0^h W \, dy = -Wh
$$

The weight of a body is therefore a conservative force, since the work done by the weight depends only on the *vertical displacement* of the body, and is independent of the path along which the body travels.

Spring Force. Now consider the linearly elastic spring in Fig. 11–11, which undergoes a displacement *ds*. The work done by the spring force which undergoes a displacement ds. The work done by the spring force
on the block is $dU = -F_s ds = -ks ds$. The work is *negative* because \mathbf{F}_s
acts in the opposite sense to that of ds. Thus the work of **F**, when the acts in the opposite sense to that of ds. Thus, the work of \mathbf{F}_s when the block is displaced from $s = s$, to $s = s$ is acts in the opposite sense to that of ds.
block is displaced from $s = s_1$ to $s = s_2$ is

$$
U = -\int_{s_1}^{s_2} ks \, ds = -\left(\frac{1}{2} \, ks_2^2 - \frac{1}{2} \, ks_1^2\right)
$$

Here the work depends only on the spring's initial and final positions, s_1 Fiere the work depends only on the spring's initial and final positions, s_1 and s_2 , measured from the spring's unstretched position. Since this result and s₂, measured from the spring's unstretched position, since this result
is independent of the path taken by the block as it moves, then a spring force is also a *conservative force*.

Fig. 11–11

(b)

Friction. In contrast to a conservative force, consider the force of *friction* exerted on a sliding body by a fixed surface. The work done by the frictional force depends on the path; the longer the path, the greater the work. Consequently, frictional forces are *nonconservative*, and most of the work done by them is dissipated from the body in the form of heat.

*11.5 [Potential Energy](#page-13-0)

When a conservative force acts on a body, it gives the body the capacity to do work. This capacity, measured as *potential energy*, depends on the location of the body relative to a fixed reference position or datum.

Gravitational Potential Energy. If a body is located a distance *y above* a fixed horizontal reference or datum as in Fig. 11–12, the weight of the body has *positive* gravitational potential energy V_e since **W** has the capacity of doing positive work when the body is moved back down to the datum. Likewise, if the body is located a distance *y below* the datum, V_{φ} is *negative* since the weight does negative work when the body is V_g is *negative* since the weight does negative wor
moved back up to the datum. At the datum, $V_g = 0$.
Measuring v as *nositive unward*, the gravitational

Measuring *y* as *positive upward*, the gravitational potential energy of the body's weight **W** is therefore

$$
V_g = Wy \tag{11-4}
$$

Elastic Potential Energy. When a spring is either elongated or compressed by an amount *s* from its unstretched position (the datum), the energy stored in the spring is called *elastic potential energy*. It is determined from

$$
V_e = \frac{1}{2} \, k s^2 \tag{11-5}
$$

This energy is always a positive quantity since the spring force acting on the attached body does *positive* work on the body as the force returns the body to the spring's unstretched position, Fig. 11–13.

Potential Function. In the general case, if a body is subjected to *both* gravitational and elastic forces, the *potential energy or potential function V* of the body can be expressed as the algebraic sum

$$
V = V_g + V_e \tag{11-6}
$$

where measurement of *V* depends on the location of the body with respect to a selected datum in accordance with Eqs. 11–4 and 11–5.

In particular, if a *system* of frictionless connected rigid bodies has a *single degree of freedom,* such that its vertical position from the datum is defined by the coordinate q , then the potential function for the system defined by the coordinate q, then the potential function for the system
can be expressed as $V = V(q)$. The work done by all the weight and
spring forces acting on the system in moving it from q, to q, is measured spring forces acting on the system in moving it from q_1 to q_2 , is measured
by the *difference* in V i e by the *difference* in *V*; i.e.,

$$
U_{1-2} = V(q_1) - V(q_2)
$$
 (11-7)

For example, the potential function for a system consisting of a block of weight **W** supported by a spring, as in Fig. 11–14, can be expressed in weight **W** supported by a spring, as in Fig. 11–14, can be expressed in
terms of the coordinate $(q =)$ y, measured from a fixed datum located at
the unstretched length of the spring Here the unstretched length of the spring. Here

$$
V = V_g + V_e
$$

= $-Wy + \frac{1}{2}ky^2$ (11-8)

If the block moves from y_1 to y_2 , then applying Eq. 11–7 the work of **W** and **F** is and \mathbf{F}_s is

$$
U_{1-2} = V(y_1) - V(y_2) = -W(y_1 - y_2) + \frac{1}{2}ky_1^2 - \frac{1}{2}ky_2^2
$$

Fig. 11–14

*11.6 [Potential-Energy Criterion for](#page-13-0) **Equilibrium**

If a frictionless connected system has one degree of freedom, and its position is defined by the coordinate *q*, then if it displaces from *q* to position is defined by the $q + dq$, Eq. 11–7 becomes

$$
dU = V(q) - V(q + dq)
$$

or

$$
dU = -dV
$$

If the system is in equilibrium and undergoes a *virtual displacement* δq , rather than an actual displacement da, then the above equation becomes rather than an actual displacement *dq*, then the above equation becomes rather than an actual displacement dq, then the above equation becomes $\delta U = -\delta V$. However, the principle of virtual work requires that $\delta U = 0$, and therefore $\delta V = 0$ and so we can write $\delta V = (dV/da)\delta a = 0$. Since and therefore, $\delta V = 0$, and so we can write $\delta V = (dV/dq)\delta q = 0$. Since $\delta q \neq 0$, this expression becomes $\delta q \neq 0$, this expression becomes owever, the principle of virtual work requires that $\delta \delta V = 0$, and so we can write $\delta V = (dV/dq)\delta q = 0$
pression becomes

$$
\frac{dV}{dq} = 0\tag{11-9}
$$

Hence, *when a frictionless connected system of rigid bodies is in equilibrium, the first derivative of its potential function is zero*. For example, using Eq. 11–8 we can determine the equilibrium position for the spring and block in Fig. 11–14*a.* We have

$$
\frac{dV}{dy} = -W + ky = 0
$$

Hence, the equilibrium position $y = y_{eq}$ is

$$
y_{\text{eq}} = \frac{W}{k}
$$

Of course, this *same result* can be obtained by applying $\Sigma F_y = 0$ to the forces acting on the free-body diagram of the block. Fig. 11–14b forces acting on the free-body diagram of the block, Fig. 11–14*b*.

*11.7 [Stability of Equilibrium](#page-13-0) **Configuration**

The potential function *V* of a system can also be used to investigate the stability of the equilibrium configuration, which is classified as *stable*, *neutral*, or *unstable*.

Stable Equilibrium. A system is said to be *stable* if a system has a tendency to return to its original position when a small displacement is given to the system. The potential energy of the system in this case is at its *minimum*. A simple example is shown in Fig. 11–15*a*. When the disk is given a small displacement, its center of gravity *G* will always move (rotate) back to its equilibrium position, which is at the *lowest point* of its path. This is where the potential energy of the disk is at its *minimum*.

Neutral Equilibrium. A system is said to be in *neutral equilibrium* if the system still remains in equilibrium when the system is given a small displacement away from its original position. In this case, the potential energy of the system is *constant*. Neutral equilibrium is shown in Fig. 11–15*b*, where a disk is pinned at *G*. Each time the disk is rotated, a new equilibrium position is established and the potential energy remains unchanged.

Unstable Equilibrium. A system is said to be *unstable* if it has a tendency to be *displaced further away* from its original equilibrium position when it is given a small displacement. The potential energy of the system in this case is a *maximum*. An unstable equilibrium position of the disk is shown in Fig. 11–15*c*. Here the disk will rotate away from its equilibrium position when its center of gravity is slightly displaced. At this *highest point*, its potential energy is at a *maximum*.

The counterweight at A balances the weight of the deck B of this simple lift bridge. By applying the method of potential energy we can study the stability of the structure for various equilibrium positions of the deck.

Fig. 11–15

One-Degree-of-Freedom System. If a system has only one degree of freedom, and its position is defined by the coordinate *q*, then the potential function *V* for the system in terms of *q* can be plotted, Fig. 11–16. Provided the system is in *equilibrium*, then dV/dq , which represents the slope of this function must be equal to zero. An investigation of stability slope of this function, must be equal to zero. An investigation of stability at the equilibrium configuration therefore requires that the second derivative of the potential function be evaluated.

If d^2V/dq^2 is greater than zero, Fig. 11-16*a*, the potential energy of the stem will be a *minimum*. This indicates that the equilibrium system will be a *minimum*. This indicates that the equilibrium configuration is *stable*. Thus,

$$
\frac{dV}{dq} = 0, \qquad \frac{d^2V}{dq^2} > 0 \qquad \text{stable equilibrium} \qquad (11-10)
$$

If d^2V/dq^2 is less than zero, Fig. 11-16*b*, the potential energy of the stem will be a *maximum*. This indicates an *unstable* equilibrium system will be a *maximum*. This indicates an *unstable* equilibrium configuration. Thus,

$$
\frac{dV}{dq} = 0, \qquad \frac{d^2V}{dq^2} < 0 \qquad \text{unstable equilibrium} \qquad (11-11)
$$

Finally, if d^2V/dq^2 is equal to zero, it will be necessary to investigate
e higher order derivatives to determine the stability. The equilibrium the higher order derivatives to determine the stability. The equilibrium configuration will be *stable* if the first non-zero derivative is of an *even* order and it is *positive*. Likewise, the equilibrium will be *unstable* if this first non-zero derivative is odd or if it is even and negative. If all the higher order derivatives are *zero*, the system is said to be in *neutral equilibrium*, Fig 11-16*c*. Thus,

$$
\frac{dV}{dq} = \frac{d^2V}{dq^2} = \frac{d^3V}{dq^3} = \dots = 0
$$
 neutral equilibrium (11-12)

This condition occurs only if the potential-energy function for the system is constant at or around the neighborhood of q_{eq} .

During high winds and when going around a curve, these sugar-cane trucks can become unstable and tip over since their center of gravity is high off the road when they are fully loaded.

Procedure for Analysis

Using potential-energy methods, the equilibrium positions and the stability of a body or a system of connected bodies having a single degree of freedom can be obtained by applying the following procedure.

Potential Function.

- Sketch the system so that it is in the *arbitrary position* specified by the coordinate *q*.
- Establish a horizontal *datum* through a *fixed point** and express the gravitational potential energy V_e in terms of the weight *W* of each member and its vertical distance y from the datum, $V_{\varrho} = W y$.
- Express the elastic potential energy V_e of the system in terms of the stretch or compression, *s*, of any connecting spring, the stretc
 $V_e = \frac{1}{2}k s^2$.
- Formulate the potential function $V = V_g + V_e$ and express the novel coordinate and s in terms of the single coordinate a *position coordinates y* and *s* in terms of the single coordinate *q*.

Equilibrium Position.

• The equilibrium position of the system is determined by taking The equilibrium position of the system is determined by taking the first derivative of *V* and setting it equal to zero, $dV/dq = 0$.

Stability.

- Stability at the equilibrium position is determined by evaluating the second or higher-order derivatives of *V*.
- If the second derivative is greater than zero, the system is stable; if all derivatives are equal to zero, the system is in neutral equilibrium; and if the second derivative is less than zero, the system is unstable.

*The location of the datum is *arbitrary*, since only the *changes* or differentials of *V* are required for investigation of the equilibrium position and its stability.

The uniform link shown in Fig. 11–17*a* has a mass of 10 kg. If the spring The uniform link shown in Fig. 11–17*a* has a mass of 10 kg. If the spring is unstretched when $\theta = 0^{\circ}$, determine the angle θ for equilibrium and investigate the stability at the equilibrium position.

SOLUTION

Potential Function. The datum is established at the bottom of the link, Fig. $11-17b$. When the link is located in the arbitrary position θ , the spring increases its potential energy by stretching and the weight decreases its potential energy. Hence,

$$
V = V_e + V_g = \frac{1}{2}k s^2 + W y
$$

Since $l = s + l \cos \theta$ or $s = l(1 - \cos \theta)$, and $y = (l/2) \cos \theta$, then

$$
V = \frac{1}{2}kl^2(1 - \cos\theta)^2 + W\left(\frac{l}{2}\cos\theta\right)
$$

Equilibrium Position. The first derivative of *V* is

$$
\frac{dV}{d\theta} = kl^2(1 - \cos \theta) \sin \theta - \frac{Wl}{2} \sin \theta = 0
$$

or

This equation is satisfied provided
 $\sin \theta = 0$ $\theta = 0^{\circ}$

$$
\sin \theta = 0 \qquad \theta = 0^{\circ} \qquad \qquad \text{Ans.}
$$

$$
\theta = \cos^{-1}\left(1 - \frac{W}{2kl}\right) = \cos^{-1}\left[1 - \frac{10(9.81)}{2(200)(0.6)}\right] = 53.8^{\circ} Ans.
$$

Stability. The second derivative of *V* is

$$
\frac{d^2V}{d\theta^2} = kl^2(1 - \cos\theta)\cos\theta + kl^2\sin\theta\sin\theta - \frac{Wl}{2}\cos\theta
$$

$$
= kl^2(\cos\theta - \cos 2\theta) - \frac{Wl}{2}\cos\theta
$$

Substituting values for the constants, with $\theta = 0^{\circ}$ and $\theta = 53.8^{\circ}$, yields

$$
\left. \frac{d^2 V}{d\theta^2} \right|_{\theta=0^\circ} = 200(0.6)^2(\cos 0^\circ - \cos 0^\circ) - \frac{10(9.81)(0.6)}{2}\cos 0^\circ
$$

= -29.4 < 0 (unstable equilibrium at $\theta = 0^\circ$) Ans

Datum

If the spring *AD* in Fig. 11–18*a* has a stiffness of 18 kN/m and is If the spring *AD* in Fig. 11–18*a* has a stiffness of 18 kN/m and is unstretched when $\theta = 60^{\circ}$, determine the angle θ for equilibrium. The load has a mass of 1.5 Mg. Investigate the stability at the equilibrium position.

SOLUTION

Potential Energy. The gravitational potential energy for the load with respect to the fixed datum, shown in Fig. 11–18*b*, is

 $V_g = mgy = 1500(9.81)$ N[(4 m) sin $\theta + h$] = 58 860 sin $\theta + 14$ 715h

where *h* is a constant distance. From the geometry of the system, the elongation of the spring when the load is on the platform is elongation of the spring when the load is on th
 $s = (4 \text{ m}) \cos \theta - (4 \text{ m}) \cos 60^\circ = (4 \text{ m}) \cos \theta - 2 \text{ m}$.

Thus the elastic potential energy of the system is

Thus, the elastic potential energy of the system is

 $V_e = \frac{1}{2} k s^2 = \frac{1}{2} (18\ 000\ \text{N/m}) (4\ \text{m}\cos\theta - 2\ \text{m})^2 = 9000 (4\ \cos\theta - 2)^2$

The potential energy function for the system is therefore

(1) $V = V_g + V_e = 58 860 \sin \theta + 14 715h + 9000(4 \cos \theta - 2)^2$

Equilibrium. When the system is in equilibrium,

$$
\frac{dV}{d\theta} = 58\,860\cos\theta + 18\,000(4\cos\theta - 2)(-4\sin\theta) = 0
$$

58\,860\cos\theta - 288\,000\sin\theta\cos\theta + 144\,000\sin\theta = 0

Since $\sin 2\theta = 2 \sin \theta \cos \theta$,

$$
58\,860\cos\theta - 144\,000\sin 2\theta + 144\,000\sin\theta = 0
$$

Solving by trial and error,

$$
\theta = 28.18^{\circ} \text{ and } \theta = 45.51^{\circ}
$$

Ans.

Stability. Taking the second derivative of Eq. 1,

$$
\frac{d^2V}{d\theta^2} = -58\ 860\sin\theta - 288\ 000\cos 2\theta + 144\ 000\cos\theta
$$

 $\frac{u\theta}{\text{Substituting }\theta} = 28.18^\circ \text{ yields}$

$$
\frac{d^2V}{d\theta^2} = -58860 \sin \theta - 288000 \cos 2\theta + 144000 \cos \theta
$$

ting $\theta = 28.18^\circ$ yields

$$
\frac{d^2V}{d\theta^2} = -60409 < 0
$$
 Unstable *Ans.*

And for $\theta = 45.51^{\circ}$,

 d^2V

$$
\frac{d\theta^2}{d\theta^2} = -00409 < 0
$$
 Distance *Ans.*

$$
\theta = 45.51^\circ,
$$

$$
\frac{d^2V}{d\theta^2} = 64.073 > 0
$$
Stable *Ans.*

The uniform block having a mass *m* rests on the top surface of the half cylinder, Fig. 11–19*a*. Show that this is a condition of unstable cylinder, Fig. 11–19*a*.
equilibrium if $h > 2R$.

SOLUTION

Potential Function. The datum is established at the base of the cylinder, Fig. 11–19 b . If the block is displaced by an amount θ from the equilibrium position, the potential function is
 $V = V_e + V_g$

$$
V = V_e + V_g
$$

$$
= 0 + mgy
$$

From Fig. 11–18*b*,

$$
y = \left(R + \frac{h}{2}\right)\cos\theta + R\theta\sin\theta
$$

Thus,

$$
V = mg \bigg[\bigg(R + \frac{h}{2} \bigg) \cos \theta + R\theta \sin \theta \bigg]
$$

Fig 11–19

Equilibrium Position.

$$
\frac{dV}{d\theta} = mg \bigg[-\bigg(R + \frac{h}{2}\bigg) \sin \theta + R \sin \theta + R\theta \cos \theta \bigg] = 0
$$

$$
= mg \bigg(-\frac{h}{2} \sin \theta + R\theta \cos \theta \bigg) = 0
$$

Note that $\theta = 0^{\circ}$ satisfies this equation.

Stability. Taking the second derivative of *V* yields

$$
\frac{d^2V}{d\theta^2} = mg\left(-\frac{h}{2}\cos\theta + R\cos\theta - R\theta\sin\theta\right)
$$

At $\theta = 0^{\circ}$,

$$
\left. \frac{d^2 V}{d\theta^2} \right|_{\theta=0^\circ} = -mg\left(\frac{h}{2} - R\right)
$$

Since all the constants are positive, the block is in unstable Since all the constants are positive, the block is i
equilibrium provided $h > 2R$, because then $d^2V/d\theta^2 < 0$.

CHAPTER REVIEW

Principle of Virtual Work

The forces on a body will do *virtual work* when the body undergoes an *imaginary* differential displacement or rotation.

For equilibrium, the sum of the virtual work done by all the forces acting on the body must be equal to zero for any virtual displacement. This is referred to as the *principle of virtual work*, and it is useful for finding the equilibrium configuration for a mechanism or a reactive force acting on a series of connected members.

If the system of connected members has one degree of freedom, then its position can be specified by one independent coordinate such as θ .

To apply the principle of virtual work, it is first necessary to use *position coordinates* to locate all the forces and moments on the mechanism that will do work when the mechanism undergoes a virtual movement $\delta\theta$

The coordinates are related to the independent coordinate θ and then these expressions are differentiated in order to relate the *virtual* coordinate displacements to the virtual displacement $\delta\theta$.

Finally, the equation of virtual work is written for the mechanism in terms of the common virtual displacement $\delta\theta$, and then it is set equal to zero. By factoring $\delta \theta$ out of the equation, it is then possible to determine either the unknown force or couple moment, or the equilibrium position θ .

 $\delta\theta$ –virtual rotation δy , $\delta y'$ –virtual displacements

 $\delta U = 0$

When a system is subjected only to conservative forces, such as weight and spring forces, then the equilibrium configuration can be determined using the *potential-energy function V* for the system.

The potential-energy function is established by expressing the weight and spring potential energy for the system in terms of the independent coordinate *q*.

Once the potential-energy function is formulated, its first derivative is set equal to zero. The solution yields the equilibrium position q_{eq} for the system.

APPENDIX A

[Mathematical Review](#page-13-0) and Expressions

Geometry and Trigonometry Review

The angles θ in Fig. A–1 are equal between the transverse and two parallel lines.

For a line and its normal, the angles θ in Fig. A–2 are equal.

For the circle in Fig. A–3 $s = \theta r$, so that when $\theta = 360^\circ = 2\pi$ rad then
the circumference is $s = 2\pi r$. Also, since $180^\circ = \pi$ rad, then For the circle in Fig. A–3 $s = \theta r$, so that when $\theta = 360^\circ = 2\pi$ rad, then
the circumference is $s = 2\pi r$. Also, since $180^\circ = \pi$ rad, then
 θ (rad) = $(\pi/180^\circ)\theta^\circ$. The area of the circle is $A = \pi r^2$. θ (rad) = $(\pi/180^\circ)\theta^\circ$. The area of the circle is $A = \pi r^2$.

The sides of a similar triangle can be obtained by proportion as in Fig. A–4, where $\frac{a}{4}$ $\frac{a}{A} = \frac{b}{B} = \frac{c}{C}.$

For the right triangle in Fig. A–5, the Pythagorean theorem is

$$
h = \sqrt{(o)^2 + (a)^2}
$$

The trigonometric functions are

$$
\sin \theta = \frac{\theta}{h}
$$

$$
\cos \theta = \frac{a}{h}
$$

$$
\tan \theta = \frac{a}{a}
$$

This is easily remembered as "soh, cah, toa", i.e., the sine is the opposite over the hypotenuse, etc. The other trigonometric functions follow from this.

$$
\csc \theta = \frac{1}{\sin \theta} = \frac{h}{o}
$$

$$
\sec \theta = \frac{1}{\cos \theta} = \frac{h}{a}
$$

$$
\cot \theta = \frac{1}{\tan \theta} = \frac{a}{o}
$$

 $\sqrt{1 - \cos 2\theta}$

Trigonometric Identities

$$
\sin^2 \theta + \cos^2 \theta = 1
$$

$$
\sin(\theta \pm \phi) = \sin \theta \cos \phi \pm \cos \theta \sin \phi

\sinh x = x + \frac{x^3}{3!} + \cdots, \cosh x = 1 + \frac{x^2}{2!} + \cdots
$$

 $\sin x = x - \frac{x^3}{3!} + \cdots$, $\cos x = 1 - \frac{x^2}{2!} + \cdots$

 $+ \cdots,$

Derivatives

$$
\cos \theta = \pm \sqrt{\frac{1 + \cos 2\theta}{2}}, \sin \theta = \pm \sqrt{\frac{1 - \cos 2\theta}{2}}
$$
\n
$$
\frac{d}{dx}(u^n) = nu^{n-1} \frac{du}{dx} \qquad \frac{d}{dx}(\sin u) = \cos u \frac{du}{dx}
$$
\n
$$
\tan \theta = \frac{\sin \theta}{\cos \theta}
$$

$$
1 + \tan^2 \theta = \sec^2 \theta \qquad 1 + \cot^2 \theta = \csc^2 \theta \qquad \qquad \frac{d}{dx}(uv) = u\frac{dv}{dx} + v\frac{du}{dx} \qquad \frac{d}{dx}(\cos u) = -\sin u\frac{du}{dx}
$$

Quadratic Formula

If
$$
ax^2 + bx + c = 0
$$
, then $x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$
$$
\frac{d}{dx} \left(\frac{u}{v}\right) = \frac{v\frac{du}{dx} - u\frac{dv}{dx}}{v^2} \qquad \frac{d}{dx}(\tan u) = \sec^2 u \frac{du}{dx}
$$

Hyperbolic Functions

$$
\frac{d}{dx}(\cot u) = -\csc^2 u \frac{du}{dx} \qquad \frac{d}{dx}(\sinh u) = \cosh u \frac{du}{dx}
$$

$$
\sinh x = \frac{e^x - e^{-x}}{2},
$$

$$
\cosh x = \frac{e^x + e^{-x}}{2},
$$

 $\tanh x = \frac{\sinh x}{\cosh x}$

$$
\frac{d}{dx}(\sec u) = \tan u \sec u \frac{du}{dx} \frac{d}{dx}(\cosh u) = \sinh u \frac{du}{dx}
$$

 $\frac{1}{\sqrt{2}}$ $\frac{d}{dx}(\csc u) = -\csc u \cot u$ $\frac{1}{\sqrt{2}}$

 \overline{C}

 $a > 0$

Integrals

$$

Chapter 2

F2–1.

F_R = √(2 kN)² + (6 kN)² – 2(2 kN)(6 kN) cos 105°
\n= 6.798 kN = 6.80 kN
\n
$$
\frac{\sin A}{6 kN} = \frac{\sin 105^{\circ}}{6.798 kN}, \quad \phi = 58.49^{\circ}
$$
\n
$$
\theta = 45^{\circ} + \phi = 45^{\circ} + 58.49^{\circ} = 103^{\circ}
$$
\nAns.
\nF2-2. $F_R = \sqrt{200^2 + 500^2 - 2(200)(500) \cos 140^{\circ}}$
\n= 666 N
\nF2-3. $F_R = \sqrt{600^2 + 800^2 - 2(600)(800) \cos 60^{\circ}$
\n= 721.11 N = 721 N
\n
$$
\frac{\sin \alpha}{800} = \frac{\sin 60^{\circ}}{721.11}; \quad \alpha = 73.90^{\circ}
$$
\n
$$
\phi = \alpha - 30^{\circ} = 73.90^{\circ} - 30^{\circ} = 43.9^{\circ}
$$
\nAns.
\nF2-4. $\frac{F_u}{\sin 45^{\circ}} = \frac{30}{\sin 105^{\circ}}; \quad F_u = 22.0 \text{ lb}$ \nAns.
\nF2-5. $\frac{F_{AB}}{\sin 105^{\circ}} = \frac{450}{\sin 30^{\circ}}$
\nF_{AB} = 869 lb
\nF2-6. $\frac{F_{AC}}{\sin 30^{\circ}} = \frac{450}{\sin 105^{\circ}}$ F = 3.11 kN
\nAns.
\nF₂ – 6. $\frac{F}{\sin 30^{\circ}} = \frac{6}{\sin 105^{\circ}}$ F = 4.39 kN
\nF2-7. $(F_1)_x = 0$ $(F_1)_y = 300 \text{ N}$ \nAns.
\n(F₂)_x = -(450 N) cos 45° = -318 N
\nAns.
\n(F₂)_x =

F2–9.

$$
{}_{-4}^{+}F_{R} = \Sigma F_{x};
$$

\n
$$
{}_{-4}^{+}F_{R} = -(700 \text{ lb}) \cos 30^{\circ} + 0 + \left(\frac{3}{5}\right) (600 \text{ lb})
$$

\n
$$
= -246.22 \text{ lb}
$$

\n
$$
{}_{+}^{+} (F_{R})_{y} = \Sigma F_{y};
$$

\n
$$
F_{R} = -(700 \text{ lb}) \sin 30^{\circ} - 400 \text{ lb} - \left(\frac{4}{5}\right) (600 \text{ lb})
$$

\n
$$
= -1230 \text{ lb}
$$

\n
$$
F_{R} = \sqrt{(246.22 \text{ lb})^{2} + (1230 \text{ lb})^{2}} = 1254 \text{ lb}
$$
 Ans.
\n
$$
\phi = \tan^{-1}\left(\frac{1230 \text{ lb}}{246.22 \text{ lb}}\right) = 78.68^{\circ}
$$

\n
$$
\theta = 180^{\circ} + \phi = 180^{\circ} + 78.68^{\circ} = 259^{\circ}
$$
 Ans.

F2-10.
$$
\rightarrow (F_R)_x = \Sigma F_x;
$$

\n750 N = F cos θ + $(\frac{5}{13})(325 \text{ N})$ + (600 N)cos45°

[Kinematics of a Particle](#page-13-0)

12

[CHAPTER OBJECTIVES](#page-13-0)

- To introduce the concepts of position, displacement, velocity, and acceleration.
- To study particle motion along a straight line and represent this motion graphically.
- To investigate particle motion along a curved path using different coordinate systems.
- To present an analysis of dependent motion of two particles.
- To examine the principles of relative motion of two particles using translating axes.

12.1 [Introduction](#page-13-0)

Mechanics is a branch of the physical sciences that is concerned with the state of rest or motion of bodies subjected to the action of forces. Engineering mechanics is divided into two areas of study, namely, statics and dynamics. *Statics* is concerned with the equilibrium of a body that is either at rest or moves with constant velocity. Here we will consider *dynamics,* which deals with the accelerated motion of a body.The subject of dynamics will be presented in two parts: *kinematics*, which treats only the geometric aspects of the motion, and *kinetics*, which is the analysis of the forces causing the motion. To develop these principles, the dynamics of a particle will be discussed first, followed by topics in rigid-body dynamics in two and then three dimensions.

Historically, the principles of dynamics developed when it was possible to make an accurate measurement of time. Galileo Galilei (1564–1642) was one of the first major contributors to this field. His work consisted of experiments using pendulums and falling bodies. The most significant contributions in dynamics, however, were made by Isaac Newton (1642–1727), who is noted for his formulation of the three fundamental laws of motion and the law of universal gravitational attraction. Shortly after these laws were postulated, important techniques for their application were developed by Euler, D'Alembert, Lagrange, and others.

There are many problems in engineering whose solutions require application of the principles of dynamics. Typically the structural design of any vehicle, such as an automobile or airplane, requires consideration of the motion to which it is subjected. This is also true for many mechanical devices, such as motors, pumps, movable tools, industrial manipulators, and machinery. Furthermore, predictions of the motions of artificial satellites, projectiles, and spacecraft are based on the theory of dynamics. With further advances in technology, there will be an even greater need for knowing how to apply the principles of this subject.

Problem Solving. Dynamics is considered to be more involved than statics since both the forces applied to a body and its motion must be taken into account. Also, many applications require using calculus, rather than just algebra and trigonometry. In any case, the most effective way of learning the principles of dynamics is *to solve problems*. To be successful at this, it is necessary to present the work in a logical and orderly manner as suggested by the following sequence of steps:

- **1.** Read the problem carefully and try to correlate the actual physical situation with the theory you have studied.
- **2.** Draw any necessary diagrams and tabulate the problem data.
- **3.** Establish a coordinate system and apply the relevant principles, generally in mathematical form.
- **4.** Solve the necessary equations algebraically as far as practical; then, use a consistent set of units and complete the solution numerically. Report the answer with no more significant figures than the accuracy of the given data.
- **5.** Study the answer using technical judgment and common sense to determine whether or not it seems reasonable.
- **6.** Once the solution has been completed, review the problem. Try to think of other ways of obtaining the same solution.

In applying this general procedure, do the work as neatly as possible. Being neat generally stimulates clear and orderly thinking, and vice versa.

12.2 [Rectilinear Kinematics: Continuous](#page-13-0) 12 **Motion**

We will begin our study of dynamics by discussing the kinematics of a particle that moves along a rectilinear or straight line path. Recall that a *particle* has a mass but negligible size and shape.Therefore we must limit application to those objects that have dimensions that are of no consequence in the analysis of the motion. In most problems, we will be interested in bodies of finite size, such as rockets, projectiles, or vehicles. Each of these objects can be considered as a particle, as long as the motion is characterized by the motion of its mass center and any rotation of the body is neglected.

Rectilinear Kinematics. The kinematics of a particle is characterized by specifying, at any given instant, the particle's position, velocity, and acceleration.

Position. The straight-line path of a particle will be defined using a single coordinate axis *s*, Fig. $12-1a$. The origin *O* on the path is a fixed point, and from this point the *position coordinate s* is used to specify the location of the particle at any given instant. The magnitude of *s* is the distance from *O* to the particle, usually measured in meters (m) or feet (ft), and the sense of direction is defined by the algebraic sign on *s*. Although the choice is arbitrary, in this case *s* is positive since the coordinate axis is positive to the right of the origin. Likewise, it is negative if the particle is located to the left of *O*. Realize that position is a vector quantity since it has both magnitude and direction. Here, however, it is being represented by the algebraic scalar *s* since the direction always remains along the coordinate axis.

Displacement. The *displacement* of the particle is defined as the *change* in its *position*. For example, if the particle moves from one point to another, Fig. 12–1*b*, the displacement is

$$
\Delta s = s' - s
$$

In this case Δs is *positive* since the particle's final position is to the *right* In this case Δs is *positive* since the particle's final position is to the *right* of its initial position, i.e., $s' > s$. Likewise, if the final position were to the *left* of its initial position. As would be *negati left* of its initial position, Δs would be *negative*.

The displacement of a particle is also a *vector quantity*, and it should be s distinguished from the distance the particle travels. Specifically, the *distance traveled* is a *positive scalar* that represents the total length of path over which the particle travels.

12 Velocity. If the particle moves through a displacement Δs during the time interval Δt the *average velocity* of the particle during this time time interval Δt , the *average velocity* of the particle during this time interval is

$$
v_{\text{avg}} = \frac{\Delta s}{\Delta t}
$$

If we take smaller and smaller values of Δt , the magnitude of Δs
becomes smaller and smaller Consequently the instantaneous velocity is becomes smaller and smaller. Consequently, the *instantaneous velocity* is becomes smaller and smaller. Consequen
a vector defined as $v = \lim_{\Delta t \to 0} (\Delta s / \Delta t)$, or $\overline{}$ $t\rightarrow0$. Consequ $(\Delta s/\Delta t)$,

$$
v = \frac{ds}{dt}
$$
 (12-1)

Since Δt or *dt* is always positive, the sign used to define the *sense* of the velocity is the same as that of Δs or ds . For example, if the particle is moving to the *right*, Fig. 12–1*c*, the velocity is *positive;* whereas if it is s moving to the *left*, the velocity is *negative*. (This is emphasized here by the arrow written at the left of Eq. 12–1.) The *magnitude* of the velocity is known as the *speed*, and it is generally expressed in units of m/s or ft/s.

Occasionally, the term "average speed" is used. The *average speed* is always a positive scalar and is defined as the total distance traveled by a always a positive scalar and is defined as the to particle, s_T , divided by the elapsed time Δt ; i.e.,

$$
(v_{\rm sp})_{\rm avg} = \frac{s_T}{\Delta t}
$$

For example, the particle in Fig. 12–1*d* travels along the path of length For example, the particle in Fig. 12–1*d* travels along the path of length s_T
in time Δt , so its average speed is $(v_{sp})_{avg} = s_T/\Delta t$, but its average
velocity is $v = -\Delta s/\Delta t$ velocity is $v_{\text{avg}} = -\Delta s/\Delta t$.

Acceleration. Provided the velocity of the particle is known at two points, the *average acceleration* of the particle during the time interval Δt is defined as

$$
a_{\text{avg}} = \frac{\Delta v}{\Delta t}
$$

Here Δv represents the difference in the velocity during the time Here Δv represents the difference in
interval Δt , i.e., $\Delta v = v' - v$, Fig. 12–1*e*.
The *instantaneous acceleration* at time

The *instantaneous acceleration* at time *t* is a vector that is found by ¢taking smaller and smaller values of Δt and corresponding smaller and taking smaller and smaller values of Δt and correspondent values of Δv , so that $a = \lim_{\Delta t \to 0} (\Delta v/\Delta t)$, or ¢smaller values of Δt and co
 v , so that $a = \lim_{\Delta t \to 0} (\Delta v / \Delta t)$

$$
\overline{a} = \frac{dv}{dt} \tag{12-2}
$$

Substituting Eq. 12–1 into this result, we can also write

$$
(x + b) \t a = \frac{d^2s}{dt^2}
$$

Both the average and instantaneous acceleration can be either positive or negative. In particular, when the particle is *slowing down*, or its speed or negative. In particular, when the particle is *slowing down*, or its speed
is decreasing, the particle is said to be *decelerating*. In this case, v' in
Fig. 12–14, is *less* than v and so $\Delta v = v' - v$ will be negative is decreasing, the particle is said to be *decelerating*. In this case, v' in
Fig. 12–1*f* is *less* than v, and so $\Delta v = v' - v$ will be negative.
Consequently *a* will also be negative and therefore it will act to the *lef* Consequently, *a* will also be negative, and therefore it will act to the *left*, in the *opposite sense* to v. Also, note that when the *velocity* is *constant*, the *acceleration* is *zero* since $\Delta v = v - v = 0$. Units commonly used to in the *opposite sense* to v. Also, note that when the *velocity* is *constant*, the *acceleration* is zero since $\Delta v = v - v = 0$. Units commonly used to express the magnitude of acceleration are m/s² or ft/s² express the magnitude of acceleration are m/s² or ft/s².

Finally, an important differential relation involving the displacement, velocity, and acceleration along the path may be obtained by eliminating the time differential *dt* between Eqs. 12–1 and 12–2, which gives

$$
(\stackrel{\pm}{\rightarrow}) \qquad \qquad \boxed{a \, ds = v \, dv} \tag{12-3}
$$

Although we have now produced three important kinematic equations, realize that the above equation is not independent of Eqs. 12–1 and 12–2.

12

Constant Acceleration, $a = a_c$. When the acceleration is **Constant Acceleration,** $a = a_c$. When the acceleration is constant, each of the three kinematic equations $a_c = dv/dt$, $v = ds/dt$, and a , $ds = v$ dy can be integrated to obtain formulas that relate $a - v$, s constant, each of the three kinematic equations $a_c = dv/dt$, $v = ds/dt$,
and $a_c ds = v dv$ can be integrated to obtain formulas that relate a_c , v, s,
and t and *t*.

Velocity as a Function of Time. Integrate $a_c = dv/dt$, assuming that initially $v = v_0$ when $t = 0$ **Velocity as a Function of** that initially $v = v_0$ when $t = 0$.

$$
\int_{v_0}^{v} dv = \int_0^t a_c dt
$$
\n
$$
\frac{v = v_0 + a_c t}{\text{Constant Acceleration}}
$$
\n(12-4)

Position as a Function of Time. Integrate $v = ds/dt = v_0 + a_c t$, assuming that initially $s = s_0$ when $t = 0$ **Position as a Function of Time.**
assuming that initially $s = s_0$ when $t = 0$.

$$
\int_{s_0}^{s} ds = \int_0^t (v_0 + a_c t) dt
$$
\n
$$
(3) \quad s = s_0 + v_0 t + \frac{1}{2} a_c t^2
$$
\n
$$
\text{Constant Acceleration} \tag{12-5}
$$

Velocity as a Function of Position. Either solve for *t* in Eq. 12–4 **Velocity as a Function of Position.** Either solve for t in Eq. 12–4 and substitute into Eq. 12–5, or integrate $v dv = a_c ds$, assuming that initially $v = v_0$ at $s = s_0$ and substitute into Eq.
initially $v = v_0$ at $s = s_0$.

$$
\int_{v_0}^{v} v dv = \int_{s_0}^{s} a_c ds
$$
\n
$$
\frac{v^2 = v_0^2 + 2a_c(s - s_0)}{\text{Constant Acceleration}}
$$
\n(12–6)

The algebraic signs of s_0 , v_0 , and a_c , used in the above three equations,
e-determined from the positive direction of the s axis as indicated by are determined from the positive direction of the *s* axis as indicated by the arrow written at the left of each equation. Remember that these equations are useful *only when the acceleration is constant and when*
 $t = 0$, $s = s_0$, $v = v_0$. A typical example of constant accelerated motion

occurs when a body falls freely toward the earth. If air resistance is $t = 0$, $s = s_0$, $v = v_0$. A typical example of constant accelerated motion occurs when a body falls freely toward the earth. If air resistance is neglected and the distance of fall is short, then the *downward* acceleration of the body when it is close to the earth is constant and approximately 9.81 m/s² or 32.2 ft/s². The proof of this is given in Example 13.2.

Important Points

- Dynamics is concerned with bodies that have accelerated motion.
- Kinematics is a study of the geometry of the motion.
- Kinetics is a study of the forces that cause the motion.
- Rectilinear kinematics refers to straight-line motion.
- Speed refers to the magnitude of velocity.
- Average speed is the total distance traveled divided by the total time. This is different from the average velocity, which is the displacement divided by the time.
- A particle that is slowing down is decelerating.
- A particle can have an acceleration and yet have zero velocity.
- A particle can have an acceleration and yet have zero velocity.
• The relationship $a ds = v dv$ is derived from $a = dv/dt$ and $v = ds/dt$ by eliminating dt $v = ds/dt$, by eliminating dt.

During the time this rocket undergoes rectilinear motion, its altitude as a function of time can be motion, its altitude as a function of time can be
measured and expressed as $s = s(t)$. Its velocity
can then be found using $v = ds/dt$ and its measured and expressed as $s = s(t)$. Its velocity
can then be found using $v = ds/dt$, and its
acceleration can be determined from $a = dv/dt$. acceleration can be determined from $a = dv/dt$.

Procedure for Analysis

Coordinate System.

- Establish a position coordinate *s* along the path and specify its *fixed origin* and positive direction.
- Since motion is along a straight line, the vector quantities position, velocity, and acceleration can be represented as algebraic scalars. For analytical work the sense of *s*, *v*, and *a* is then defined by their algebraic signs *algebraic signs*.
- The positive sense for each of these scalars can be indicated by an arrow shown alongside each kinematic equation as it is applied.

Kinematic Equations.

- If a relation is known between any *two* of the four variables *a*, *v*, *s* and *t*, then a third variable can be obtained by using one of the kinematic equations $a = dv/dt$, $v = ds/dt$ or $a ds = v dv$ since each If a relation is known between any *two* of the four variables *a*, *v*, *s* and *t*, then a third variable can be obtained by using one of the kinematic equations, $a = dv/dt$, $v = ds/dt$ or $a ds = v dv$, since each equation relates equation relates all three variables.*
- Whenever integration is performed, it is important that the position and velocity be known at a given instant in order to evaluate either the constant of integration if an indefinite integral is used, or the limits of integration if a definite integral is used.
- Remember that Eqs. 12–4 through 12–6 have only limited use. These equations apply *only* when the *acceleration is constant* and the initial conditions are $s = s_0$ and $v = v_0$ when $t = 0$.

12

^{*}Some standard differentiation and integration formulas are given in Appendix A.

12 $EXAMPLE$ 12.1

The car in Fig. 12–2 moves in a straight line such that for a short time The car in Fig. 12–2 moves in a straight line such that for a short time
its velocity is defined by $v = (3t^2 + 2t)$ ft/s, where t is in seconds.
Determine its position and acceleration when $t = 3$ s. When $t = 0$. Determine its position and acceleration when $t = 3$ s. When $s = 0$. + 2*t*) ft/s, where *t* is in seconds.
ation when $t = 3$ s. When $t = 0$,

Fig. 12–2

SOLUTION

Coordinate System. The position coordinate extends from the fixed origin *O* to the car, positive to the right.

Position. Since $v = f(t)$, the car's position can be determined from $v = ds/dt$ since this equation relates v_s s and t. Noting that $s = 0$ **Position.** Since $v = f(t)$, the car's position can be determined from $v = ds/dt$, since this equation relates *v*, *s*, and *t*. Noting that $s = 0$ when $t = 0$ we have* $v = ds/dt$, since this when $t = 0$, we have*

$$
(x + 1) \t\t v = \frac{ds}{dt} = (3t^2 + 2t)
$$

$$
\int_0^s ds = \int_0^t (3t^2 + 2t)dt
$$

$$
s \Big|_0^s = t^3 + t^2 \Big|_0^t
$$

$$
s = t^3 + t^2
$$

When $t = 3$ s,

$$
s = (3)^3 + (3)^2 - 36 \text{ ft}
$$

$$
s = (3)^3 + (3)^2 = 36 \text{ ft}
$$
 Ans.

Acceleration. Since $v = f(t)$, the acceleration is determined from $a = dv/dt$ since this equation relates a x and t **Acceleration.** Since $v = f(t)$, the acceleration $a = dv/dt$, since this equation relates *a*, *v*, and *t*.

$$
(x + 1)
$$
\n
$$
a = \frac{dv}{dt} = \frac{d}{dt}(3t^2 + 2t)
$$
\n
$$
= 6t + 2
$$

When $t = 3$ s,

$$
a = 6(3) + 2 = 20 \text{ ft/s}^2 \rightarrow
$$
Ans.

NOTE: The formulas for constant acceleration *cannot* be used to solve this problem, because the acceleration is a function of time.

*The *same result* can be obtained by evaluating a constant of integration *C* rather *The *same result* can be obtained by evaluating a constant of integration *C* rather
than using definite limits on the integral. For example, integrating $ds = (3t^2 + 2t)dt$
vields $s = t^3 + t^2 + C$. Using the condition that at than using definite limits on the integral. For example, integrating $ds = (3t² \text{ yields } s = t³ + t² + C$. Using the condition that at $t = 0$, $s = 0$, then $C = 0$.

EXAMPLE 12.2 The state of the sta

A small projectile is fired vertically *downward* into a fluid medium with an initial velocity of 60 m/s . Due to the drag resistance of the fluid the an initial velocity of 60 m/s. Due to the drag resistance of the fluid the
projectile experiences a deceleration of $a = (-0.4v^3)$ m/s², where v is in
m/s. Determine the projectile's velocity and position 4 s after it is m/s . Determine the projectile's velocity and position 4 s after it is fired.

SOLUTION

Coordinate System. Since the motion is downward, the position coordinate is positive downward, with origin located at *O*, Fig. 12–3.

coordinate is positive downward, with origin located at *O*, Fig. 12–3.
 Velocity. Here $a = f(v)$ and so we must determine the velocity as a function of time using $a = dv/dt$ since this equation relates *y*, *a* and *t* **Velocity.** Here $a = f(v)$ and so we must determine the velocity as a function of time using $a = dv/dt$, since this equation relates *v*, *a*, and *t*. (Why not use $v = v_0 + a t$) Separating the variables and integrating function of time using $a = dv/dt$, since this equation relates v, a, and t.
(Why not use $v = v_0 + a_c t$?) Separating the variables and integrating,
with $v_0 = 60$ m/s when $t = 0$ yields (Why not use $v = v_0 + a_c t$?) Separa
with $v_0 = 60$ m/s when $t = 0$, yields

$$
(+) \qquad a = \frac{dv}{dt} = -0.4v^3
$$

$$
\int_{60 \text{ m/s}}^v \frac{dv}{-0.4v^3} = \int_0^t dt
$$

$$

EXAMPLE 12.3

During a test a rocket travels upward at 75 m/s , and when it is 40 m from the ground its engine fails. Determine the maximum height s_B reached by the rocket and its speed just before it hits the ground. While in motion the rocket is subjected to a constant downward acceleration of 9.81 m/s^2 due to gravity. Neglect the effect of air resistance.

SOLUTION

Coordinate System. The origin *O* for the position coordinate *s* is taken at ground level with positive upward, Fig. 12–4.

Maximum Height. Since the rocket is traveling *upward*, **Maximum Height.** Since the rocket is traveling *upward*,
 $v_A = +75$ m/s when $t = 0$. At the maximum height $s = s_B$ the velocity
 $v_A = 0$. For the entire motion, the acceleration is $a = -9.81 \text{ m/s}^2$ 75 m/s when $t = 0$. At the maximum height $s = s_B$ the velocity
For the entire motion, the acceleration is $a_c = -9.81$ m/s
since it acts in the *opposite* sense to positive velocity of (negative since it acts in the *opposite* sense to positive velocity or positive displacement). Since a_c is *constant* the rocket's position may be related to its velocity at the two points A and B on the path by using Eq. 12–6, namely,
 $(t+\uparrow)$ $v^2 =$ 2 $v_A = +$
 $v_B = 0.$

(negativ

$$
(+ \uparrow) \qquad v_B^2 = v_A^2 + 2a_c(s_B - s_A)
$$

\n
$$
0 = (75 \text{ m/s})^2 + 2(-9.81 \text{ m/s}^2)(s_B - 40 \text{ m})
$$

\n
$$
s_B = 327 \text{ m}
$$

Velocity. To obtain the velocity of the rocket just before it hits the

ground, we can apply Eq. 12–6 between points *B* and *C*, Fig. 12–4.
\n
$$
(+ \uparrow) \qquad v_C^2 = v_B^2 + 2a_C(s_C - s_B)
$$
\n
$$
= 0 + 2(-9.81 \text{ m/s}^2)(0 - 327 \text{ m})
$$
\n
$$
v_C = -80.1 \text{ m/s} = 80.1 \text{ m/s} \downarrow
$$
\nAns.

The negative root was chosen since the rocket is moving downward.

Similarly, Eq. 12–6 may also be applied between points *A* and *C*, i.e.,
\n
$$
(+ \uparrow) \qquad v_C^2 = v_A^2 + 2a_C(s_C - s_A)
$$
\n
$$

$$
v_C = -80.1 \text{ m/s} = 80.1 \text{ m/s} \downarrow
$$
\nAns.

NOTE: It should be realized that the rocket is subjected to a *deceleration* from *A* to *B* of 9.81 m/s², and then from *B* to *C* it is *accelerated* at this rate. Furthermore, even though the rocket *accelerated* at this rate. Furthermore, even though the rocket momentarily comes to *rest* at *B* ($v_B = 0$) the acceleration at *B* is still 9.81 m/s^2 downward! 9.81 m/s² downward!

s

EXAMPLE 12.4 **12.4** 12 and 12

A metallic particle is subjected to the influence of a magnetic field as it travels downward through a fluid that extends from plate *A* to plate *B*, Fig. 12–5. If the particle is released from rest at the midpoint *C*, the particle is released from rest at the midpoint *C*,
and the acceleration is $a = (4s)$ m/s², where *s* is in
aine the velocity of the particle when it reaches plate *B* meters, determine the velocity of the particle when it reaches plate *B*, meters, determine the velocity of the particle when it re $s = 200$ mm, and the time it takes to travel from *C* to *B*. 2 Fig. 12–5. If the particle is released from rest at the s = 100 mm, and the acceleration is $a = (4s)$ m/s², meters determine the velocity of the particle when it to

SOLUTION

Coordinate System. As shown in Fig. 12–5, *s* is positive downward, measured from plate *A*.

measured from plate A.
Velocity. Since $a = f(s)$, the velocity as a function of position can
be obtained by using $y \, dy = a \, ds$. Realizing that $y = 0$ at $s = 0.1$ m. **Velocity.** Since $a = f(s)$, the velocity as a function of position can be obtained by using $v dv = a ds$. Realizing that $v = 0$ at $s = 0.1$ m, we have we have

$$
(+\downarrow)
$$
\n
$$
v dv = a ds
$$
\n
$$
\int_0^v v dv = \int_{0.1 \text{ m}}^s 4s ds
$$
\n
$$
\frac{1}{2} v^2 \Big|_0^v = \frac{4}{2} s^2 \Big|_{0.1 \text{ m}}^s
$$
\n
$$
v = 2(s^2 - 0.01)^{1/2} \text{ m/s}
$$
\n(1)

At $s = 200$ mm = 0.2 m,

$$
v_B = 0.346 \text{ m/s} = 346 \text{ mm/s} \downarrow \qquad Ans.
$$

At $s = 200$ mm = 0.2 m,
 $v_B = 0.346$ m/s = 346 mm/s \downarrow Ans.

The positive root is chosen since the particle is traveling downward, i.e., in the $+s$ direction.

Time. The time for the particle to travel from *C* to *B* can be obtained **Time.** The time for the particle to travel from C to B can be obtained using $v = ds/dt$ and Eq. 1, where $s = 0.1$ m when $t = 0$. From Appendix A Appendix A, Appendix A,
 $(+ \sqrt{2})$ $ds = v dt$

$$
(+\downarrow)
$$

$$
ds = v dt
$$

= 2(s² - 0.01)^{1/2}dt

$$
\int_{0.1}^{s} \frac{ds}{(s^{2} - 0.01)^{1/2}} = \int_{0}^{t} 2 dt
$$

$$
\ln(\sqrt{s^{2} - 0.01} + s) \Big|_{0.1}^{s} = 2t \Big|_{0}^{t}
$$

$$
\ln(\sqrt{s^{2} - 0.01} + s) + 2.303 = 2t
$$

 $ds = v dt$

At $s = 0.2$ m,

$$
t = \frac{\ln(\sqrt{(0.2)^2 - 0.01} + 0.2) + 2.303}{2} = 0.658 \text{ s} \quad \text{Ans.}
$$

Note: The formulas for constant acceleration cannot be used here because the acceleration changes with position, i.e., $a = 4s$.

$EXAMPLE$ 12.5

A particle moves along a horizontal path with a velocity of A particle moves along a horizontal path with a velocity of $v = (3t^2 - 6t)$ m/s, where t is the time in seconds. If it is initially located at the origin O determine the distance traveled in 3.5 s and the $v = (3t^2 - 6t)$ m/s, where t is the time in seconds. If it is initially located at the origin *O*, determine the distance traveled in 3.5 s, and the particle's average velocity and average speed during the time interval.

SOLUTION

Coordinate System. Here positive motion is to the right, measured from the origin *O*, Fig. 12–6*a*.

Distance Traveled. Since $v = f(t)$, the position as a function of time may be found by integrating $v = ds/dt$ with $t = 0$, $s = 0$. $f(t)$, the position as a function $v = ds/dt$ with $t = 0$, $s = 0$.

time may be found by integrating
$$
v = ds/dt
$$
 with $t = 0$, $s = 0$.
\n
$$
(\Rightarrow) \qquad ds = v dt
$$
\n
$$
= (3t^2 - 6t)dt
$$
\n
$$
\int_0^s ds = \int_0^t (3t^2 - 6t) dt
$$
\n
$$
s = (t^3 - 3t^2) \text{m}
$$
\n(1)

In order to determine the distance traveled in 3.5 s, it is necessary to investigate the path of motion. If we consider a graph of the velocity function, Fig. 12–6*b*, then it reveals that for $0 < t < 2$ s the velocity is *negative*, which means the particle is traveling to the *left*, and for $t > 2$ s the velocity is *nositive* and hence the particle is traveling *negative*, which means the particle is traveling to the *left*, and for $t > 2$ s the velocity is *positive*, and hence the particle is traveling to the *right*. the velocity is *positive*, and hence the particle is traveling to the *right*.
Also, note that $v = 0$ at $t = 2$ s. The particle's position when $t = 0$,
 $t = 2$ s and $t = 3.5$ s can now be determined from Eq. 1. This yield Also, note that $v = 0$ at $t = 2$ s. The particle's position when $t = t = 2$ s, and $t = 3.5$ s can now be determined from Eq. 1. This yields der a graph
 $0 < t < 2$ s
 $\frac{1}{2}$ o the *left*

$$
s|_{t=0} = 0 \t s|_{t=2 \text{ s}} = -4.0 \text{ m} \t s|_{t=3.5 \text{ s}} = 6.125 \text{ m}
$$

The path is shown in Fig. 12–6*a*. Hence, the distance traveled in 3.5 s is
 $s_T = 4.0 + 4.0 + 6.125 = 14.125 \text{ m} = 14.1 \text{ m}$ Ans.

$$
s_T = 4.0 + 4.0 + 6.125 = 14.125 \text{ m} = 14.1 \text{ m}
$$
 Ans.

Velocity. The *displacement* from $t = 0$ to $t = 3.5$ s is

$$
\Delta s = s|_{t=3.5 \text{ s}} - s|_{t=0} = 6.125 \text{ m} - 0 = 6.125 \text{ m}
$$

and so the average velocity is

$$
v_{\text{avg}} = \frac{\Delta s}{\Delta t} = \frac{6.125 \text{ m}}{3.5 \text{ s} - 0} = 1.75 \text{ m/s} \rightarrow
$$
 Ans.

The average speed is defined in terms of the *distance traveled* s_T . This positive scalar is positive scalar is

$$
(v_{\rm sp})_{\rm avg} = \frac{s_T}{\Delta t} = \frac{14.125 \text{ m}}{3.5 \text{ s} - 0} = 4.04 \text{ m/s}
$$
Ans.

Note: In this problem, the acceleration is $a = dv/dt = (6t - 6)$ m/s
which is not constant which is not constant. 2 ,

F12–1. Initially, the car travels along a straight road with a speed of 35 m/s . If the brakes are applied and the speed of the car is reduced to 10 m/s in 15 s, determine the constant deceleration of the car.

F12–1

F12–2. A ball is thrown vertically upward with a speed of 15 m/s . Determine the time of flight when it returns to its original position.

F12–6. A particle travels along a straight line with an **F12–6.** A particle travels along a straight line with an acceleration of $a = (10 - 0.2s)$ m/s², where *s* is measured in meters Determine the velocity of the particle when $s = 10$ m acceleration of $a = (10 - 0.2s)$ m/s², where s is measured in
meters. Determine the velocity of the particle when $s = 10$ m
if $v = 5$ m/s at $s = 0$ if $v = 5$ m/s at $s = 0$. 2 ,

F12–3. A particle travels along a straight line with a velocity **F12-3.** A particle travels along a straight line with a velocity
of $v = (4t - 3t^2)$ m/s, where t is in seconds. Determine the
position of the particle when $t = 4$ s $s = 0$ when $t = 0$ position of the particle when $t = 4$ s. $s = 0$ when $t = 0$.

F12–4. A particle travels along a straight line with a speed **F12-4.** A particle travels along a straight line with a speed $v = (0.5t^3 - 8t)$ m/s, where t is in seconds. Determine the acceleration of the particle when $t = 2$ s acceleration of the particle when $t = 2$ s.

F12–7. A particle moves along a straight line such that its **F12-7.** A particle moves along a straight line such that its acceleration is $a = (4t^2 - 2)$ m/s², where t is in seconds.
When $t = 0$, the particle is located 2 m to the left of the acceleration is $a = (4t^2 - 2)$ m/s², where t is in seconds.
When $t = 0$, the particle is located 2 m to the left of the origin and when $t = 2$ s it is 20 m to the left of the origin When $t = 0$, the particle is located 2 m to the left of the origin, and when $t = 2$ s, it is 20 m to the left of the origin.
Determine the position of the particle when $t = 4$ s Determine the position of the particle when $t = 4$ s. 2 ,

F12–8. A particle travels along a straight line with a **F12-8.** A particle travels along a straight line with a velocity of $v = (20 - 0.05s^2)$ m/s, where *s* is in meters. Determine the acceleration of the particle at $s = 15$ m.

12 **PROBLEMS**

•12–1. A car starts from rest and with constant acceleration achieves a velocity of $15 \,\mathrm{m/s}$ when it travels a distance of 200 m. Determine the acceleration of the car and the time required.

12–2. A train starts from rest at a station and travels with a constant acceleration of 1 m/s^2 . Determine the velocity of the constant acceleration of 1 m/s^2 . Determine the velocity of the train when $t = 30 \text{ s}$ and the distance traveled during this time.

12–3. An elevator descends from rest with an acceleration of 5 ft/s^2 until it achieves a velocity of 15 ft/s . Determine the time required and the distance traveled.

 $*12-4$. A car is traveling at 15 m/s , when the traffic light 50 m ahead turns yellow. Determine the required constant deceleration of the car and the time needed to stop the car at the light.

•12–5. A particle is moving along a straight line with the •**12–5.** A particle is moving along a straight line with the acceleration $a = (12t - 3t^{1/2})$ ft/s², where t is in seconds.
Determine the velocity and the position of the particle as a Determine the velocity and the position of the particle as a Determine the velocity and the position of the paration of time. When $t = 0$, $v = 0$ and $s = 15$ ft.

12–6. A ball is released from the bottom of an elevator which is traveling upward with a velocity of 6 ft/s . If the ball strikes the bottom of the elevator shaft in 3 s, determine the height of the elevator from the bottom of the shaft at the instant the ball is released. Also, find the velocity of the ball when it strikes the bottom of the shaft.

12–7. A car has an initial speed of 25 m/s and a constant deceleration of 3 m/s^2 . Determine the velocity of the car deceleration of 3 m/s^2 . Determine the velocity of the car
when $t = 4$ s. What is the displacement of the car during the
4-s time interval? How much time is needed to stop the car? 4-s time interval? How much time is needed to stop the car?

***12–8.** If a particle has an initial velocity of $v_0 = 12$ ft/s to the right at $s_0 = 0$ determine its position when $t = 10$ s if ***12–8.** If a particle has an initial velocity of $v_0 = 12$ ft/s to the right, at $s_0 = 0$, determine its position when $t = 10$ s, if $a = 2$ ft/s² to the left the right, at $s_0 = 0$, do
 $a = 2$ ft/s² to the left. 2

•12–9. The acceleration of a particle traveling along a **•12–9.** The acceleration of a particle traveling along a straight line is $a = k/v$, where k is a constant. If $s = 0$, $v = v_0$ when $t = 0$, determine the velocity of the particle as a straight line is $a = k/v$, where k is a constant. If $s = 0$, $v = v_0$
when $t = 0$, determine the velocity of the particle as a
function of time t function of time *t*.

12–10. Car *A* starts from rest at $t = 0$ and travels along a straight road with a constant acceleration of 6 ft/s^2 until it reaches a speed of 80 ft/s. Afterwards it maintains this reaches a speed of 80 ft/s. Afterwards it maintains this speed. Also, when $t = 0$, car *B* located 6000 ft down the road is traveling towards *A* at a constant speed of 60 ft/s road is traveling towards A at a constant speed of 60 ft/s . Determine the distance traveled by car *A* when they pass each other.

Prob. 12–10

12–11. A particle travels along a straight line with a velocity **12–11.** A particle travels along a straight line with a velocity $v = (12 - 3t^2)$ m/s, where *t* is in seconds. When $t = 1$ s, the particle is located 10 m to the left of the origin. Determine particle is located 10 m to the left of the origin. Determine particle is located 10 m to the left of the origin. Determine
the acceleration when $t = 4$ s, the displacement from $t = 0$
to $t = 10$ s, and the distance the particle travels during this the acceleration when $t = 4$ s, the displacement from $t = 0$ to $t = 10$ s, and the distance the particle travels during this time period time period.

***12–12.** A sphere is fired downwards into a medium with an initial speed of 27 m/s . If it experiences a deceleration of an initial speed of 27 m/s. If it experiences a deceleration of $a = (-6t)$ m/s², where t is in seconds, determine the distance traveled before it stops distance traveled before it stops. 2 ,

•12–13. A particle travels along a straight line such **12–13.** A particle travels along a straight line such that in 2 s it moves from an initial position $s_A = +0.5$ m to a position $s_C = -1.5$ m. Then in another A s it moves from that in 2 s it moves from an initial position $s_A = +0.5$ m to
a position $s_B = -1.5$ m. Then in another 4 s it moves from
 s_B , to $s_B = +2.5$ m. Determine, the particle's average a position $s_B = -1.5$ m. Then in another 4 s it moves from s_B to $s_C = +2.5$ m. Determine the particle's average velocity and average speed during the 6-s time interval velocity and average speed during the 6-s time interval.

12–14. A particle travels along a straight-line path such **12–14.** A particle travels along a straight-line path such that in 4 s it moves from an initial position $s_A = -8$ m to a position $s_2 = \pm 3$ m. Then in another 5 s it moves from s. to that in 4 s it moves from an initial position $s_A = -8$ m to a
position $s_B = +3$ m. Then in another 5 s it moves from s_B to
 $s_B = -6$ m. Determine the particle's average velocity and position $s_B = +3$ m. Then in another 5 s it moves from s_B to $s_C = -6$ m. Determine the particle's average velocity and average speed during the 9-s time interval.

12–15. Tests reveal that a normal driver takes about 0.75 s before he or she can *react* to a situation to avoid a collision. It takes about 3 s for a driver having 0.1% alcohol in his system to do the same. If such drivers are traveling on a straight road at 30 mph (44 ft/s) and their cars can decelerate at 2 ft/s², determine the shortest stopping distance *d* for each from the moment they see the pedestrians. *Moral*: If you must drink, please don't drive!

Prob. 12–15

***12–16.** As a train accelerates uniformly it passes successive kilometer marks while traveling at velocities of 2 m/s and then 10 m/s . Determine the train's velocity when it passes the next kilometer mark and the time it takes to travel the 2-km distance.

•12–17. A ball is thrown with an upward velocity of 5 m/s from the top of a 10-m high building. One second later another ball is thrown vertically from the ground with a velocity of 10 m/s . Determine the height from the ground where the two balls pass each other.

12–18. A car starts from rest and moves with a constant acceleration of 1.5 m/s² until it achieves a velocity of 25 m/s. It then travels with constant velocity for 60 seconds. Determine the average speed and the total distance traveled.

12–19. A car is to be hoisted by elevator to the fourth floor of a parking garage, which is 48 ft above the ground. If the elevator can accelerate at 0.6 ft/s^2 , decelerate at 0.3 ft/s^2 , and reach a maximum speed of 8 ft/s , determine the shortest time to make the lift, starting from rest and ending at rest.

***12–20.** A particle is moving along a straight line such that ***12–20.** A particle is moving along a straight line such that
its speed is defined as $v = (-4s^2)$ m/s, where *s* is in meters.
If $s = 2$ m, when $t = 0$, determine, the velocity and its speed is defined as $v = (-4s^2)$ m/s, where s is in meters.

 $v = 0$ at $s = 0$ determine the velocity of the particle at straight line is $a = (8 - 2s)$ m/s², where s is in meters. If
 $v = 0$ at $s = 0$, determine the velocity of the particle at
 $s = 2$ m and the position of the particle when the velocity $v = 0$ at $s = 0$, determine the velocity of the particle at $s = 2$ m, and the position of the particle when the velocity is maximum. 2

•**12–37.** Ball *A* is thrown vertically upwards with a velocity of v_0 . Ball *B* is thrown upwards from the same point with of v_0 . Ban *B* is thrown upwards from the same point with the same velocity t seconds later. Determine the elapsed the same velocity *t* seconds later. Determine the elapsed
time $t < 2v_{0/g}$ from the instant ball *A* is thrown to when the
halls nass each other and find the velocity of each ball at balls pass each other, and find the velocity of each ball at this instant.

12–38. As a body is projected to a high altitude above the earth's *surface,* the variation of the acceleration of gravity with respect to altitude *y* must be taken into account. Neglecting air resistance, this acceleration is determined Neglecting air resistance, this acceleration is determined
from the formula $a = -g_0[R^2/(R + y)^2]$, where g_0 is the
constant gravitational acceleration at sea level R is the constant gravitational acceleration at sea level, *R* is the radius of the earth, and the positive direction is measured radius of the earth, and the positive direction is measured
upward. If $g_0 = 9.81 \text{ m/s}^2$ and $R = 6356 \text{ km}$, determine the
minimum initial velocity (escape velocity) at which a minimum initial velocity (escape velocity) at which a projectile should be shot vertically from the earth's surface so that it does not fall back to the earth. *Hint:* This requires so that it does not fall θ that $v = 0$ as $y \rightarrow \infty$. 2 ssitive direction
 $R = 6356$ km 2]

12–39. Accounting for the variation of gravitational acceleration *a* with respect to altitude *y* (see Prob. 12–38), derive an equation that relates the velocity of a freely falling particle to its altitude. Assume that the particle is released from rest at an altitude y_0 from the earth's surface. With what velocity does the particle strike the earth if it is With what velocity does the particle strike the earth if it is
released from rest at an altitude $y_0 = 500 \text{ km}$? Use the
numerical data in Prob 12–38 numerical data in Prob. 12–38.

***12–40.** When a particle falls through the air, its initial ***12–40.** When a particle falls through the air, its initial acceleration $a = g$ diminishes until it is zero, and thereafter it falls at a constant or terminal velocity v_1 . If thereafter it falls at a constant or terminal velocity v_f . If thereafter it falls at a constant or terminal velocity v_f . It this variation of the acceleration can be expressed as this variation of the acceleration can be expressed as
 $a = (g/v_f^2)(v_f^2 - v^2)$, determine the time needed for the

velocity to become $v = v_f/2$. Initially the particle falls $a = (g/v_f^2)(v_f^2 - v^2)$, determine the time needed for the velocity to become $v = v_f/2$. Initially the particle falls from rest from rest.

•12–41. A particle is moving along a straight line such that its position from a fixed point is $s = (12 - 15t^2 + 5t^3)$ m **•12–41.** A particle is moving along a straight line such that
its position from a fixed point is $s = (12 - 15t^2 + 5t^3)$ m,
where t is in seconds Determine the total distance traveled its position from a fixed point is $s = (12 - 15t^2 + 5t^3)$ m, where *t* is in seconds. Determine the total distance traveled where *t* is in seconds. Determine the total distance traveled
by the particle from $t = 1$ s to $t = 3$ s. Also, find the average
speed of the particle during this time interval speed of the particle during this time interval. 3) m

When a particle has erratic or changing motion then its position, velocity, and acceleration *cannot* be described by a single continuous mathematical function along the entire path. Instead, a series of functions will be required to specify the motion at different intervals. For this reason, it is convenient to represent the motion as a graph. If a graph of the motion that relates any two of the variables s, v, a, t can be drawn, then this graph can be used to construct subsequent graphs relating two other variables can be used to construct subsequent graphs relating two other variables can be used to construct subsequent graphs relating two other variables
since the variables are related by the differential relationships $v = ds/dt$,
 $a = dy/dt$ or $a ds = v dv$. Several situations occur frequently since the variables are related by the differential relationships $v = dv/dt$, or $a ds = v dv$. Several situations occur frequently.

The s–t, v–t, and a–t Graphs. To construct the v –t graph given
the s–t graph, Fig. 12–7*a*, the equation $v = ds/dt$ should be used, since it
relates the variables s and t to v. This equation states that the *s–t* graph, Fig. 12–7*a*, the equation $v = ds/dt$ should be used, since it relates the variables *s* and *t* to *v*. This equation states that

For example, by measuring the slope on the *s–t* graph when $t = t_1$, the locity is v_1 , which is plotted in Fig. 12–7b. The $v-t$ graph can be velocity is v_1 , which is plotted in Fig. 12–7*b*. The $v-t$ graph can be constructed by plotting this and other values at each instant constructed by plotting this and other values at each instant.

The $a-t$ graph can be constructed from the $v-t$ graph in a similar anner Fig. 12–8 since manner, Fig. 12–8, since

$$
\frac{dv}{dt} = a
$$

slope of
 $v-t$ graph = acceleration

Examples of various measurements are shown in Fig. 12–8*a* and plotted in Fig. 12–8*b*.

If the *s*–*t* curve for each interval of motion can be expressed by a If the *s*-*t* curve for each interval of motion can be expressed by a mathematical function $s = s(t)$, then the equation of the *v*-*t* graph for the same interval can be obtained by differentiating this function with the same interval can be obtained by differentiating this function with the same interval can be obtained by differentiating this function with
respect to time since $v = ds/dt$. Likewise, the equation of the *a*–*t* graph
for the same interval can be determined by differentiating $v = g(t)$ since respect to time since $v = ds/dt$. Likewise, the equation of the *a-t* graph
for the same interval can be determined by differentiating $v = v(t)$ since
 $a = dv/dt$. Since differentiation reduces a polynomial of degree *n* to for the same interval can be determined by differentiating $v = v(t)$ since $a = dv/dt$. Since differentiation reduces a polynomial of degree *n* to that of degree *n* 1 then if the *s* t graph is parabolic (a second degree that of degree $n-1$, then if the $s-t$ graph is parabolic (a second-degree curve), the $v-t$ graph will be a sloping line (a first-degree curve), and the a t graph will be a constant or a horizontal line (a zero degree curve). *a*–*t* graph will be a constant or a horizontal line (a zero-degree curve).

Fig. 12–9

Fig. 12–10

If the *a*–*t* graph is given, Fig. 12–9*a*, the *v*–*t* graph may be constructed
using $a = dy/dt$ written as If the *a*-*t* graph is given, F
using $a = dv/dt$, written as

$$
\Delta v = \int a \, dt
$$
\nchange in = area under
\nvelocity = $a-t$ graph

Hence, to construct the v-t graph, we begin with the particle's initial
velocity v_0 and then add to this small increments of area (Av) Hence, to construct the *v*-*t* graph, we begin with the particle's initial velocity v_0 and then add to this small increments of area (Δv) determined from the *a*-*t* graph. In this manner successive points determined from the *a*–*t* graph. In this manner successive points, determined from the *a*-*t* graph. In this manner successive points,
 $v_1 = v_0 + \Delta v$, etc., for the *v*-*t* graph are determined, Fig. 12–9*b*. Notice

that an algebraic addition of the area increments of the *a*-*t* graph that an algebraic addition of the area increments of the *a*–*t* graph is necessary, since areas lying above the *t* axis correspond to an increase in v ("positive" area), whereas those lying below the axis indicate a decrease in v ("negative" area).

Similarly, if the v-t graph is given, Fig. 12–10*a*, it is possible to
termine the s-t graph using $v = ds/dt$ written as Similarly, if the $v-t$ graph is given, Fig. 12–1 determine the *s*–*t* graph using $v = ds/dt$, written as

$$
\Delta s = \int v \, dt
$$

displacement = area under
 $v-t$ graph

In the same manner as stated above, we begin with the particle's initial In the same manner as stated above, we begin with the particle's initial
position s_0 and add (algebraically) to this small area increments Δs
determined from the $v-t$ graph Fig. 12–10b determined from the *v*-*t* graph, Fig. 12–10*b*.
If segments of the *a*-*t* graph can be descri-

If segments of the *a*–*t* graph can be described by a series of equations, then each of these equations can be *integrated* to yield equations describing the corresponding segments of the $v-t$ graph. In a similar
manner, the s-t graph can be obtained by integrating the equations manner, the *s–t* graph can be obtained by integrating the equations which describe the segments of the $v-t$ graph. As a result, if the $a-t$ graph
is linear (a first-degree curve) integration will yield a $v-t$ graph that is is linear (a first-degree curve), integration will yield a $v-t$ graph that is
parabolic (a second-degree curve) and an s-t graph that is cubic (thirdparabolic (a second-degree curve) and an *s–t* graph that is cubic (thirddegree curve).

The v–s and a–s Graphs. If the *a*–*s* graph can be constructed, **The v–s and a–s Graphs.** If the *a–s* graph can be constructed, then points on the *v–s* graph can be determined by using $v dv = a ds$.
Integrating this equation between the limits $v = v_0$ at $s = s_0$ and $v = v_0$. then points on the $v-s$ graph can be determined by using $v dv = a ds$.
Integrating this equation between the limits $v = v_0$ at $s = s_0$ and $v = v_1$
at $s = s_0$ we have Integrating this equat $s = s_1$, we have,

$$
\frac{1}{2}(v_1^2 - v_0^2) = \int_{s_0}^{s_1} a \, ds
$$

area under
 $a-s$ graph

Therefore, if the red area in Fig. 12–11*a* is determined, and the initial Therefore, if the red area in Fig. 12–11*a* is determined, and the initial velocity v_0 at $s_0 = 0$ is known, then $v_1 = (2 \int_{s_0}^{s_1} a \, ds + v_0^2)^{1/2}$, Fig. 12–11*b*. Successive points on the *v*-*s* graph can be const s1 Successive points on the $v-s$ graph can be constructed in this manner. etermined
a ds + v_0^2 $\binom{2}{0}^{1/2}$ incomposite the red area in Fig. 12–11*a* is determined, and v_0 at $s_0 = 0$ is known, then $v_1 = (2 \int_{s_0}^{s_1} a \, ds + v_0^2)^{1/2}$,

If the $v-s$ graph is known, the acceleration *a* at any position *s* can be If the *v*-*s* graph is known, the accelerated determined using $a ds = v dv$, written as

Thus, at any point (s, v) in Fig. 12–12*a*, the slope dv/ds of the *v*-*s* graph is measured. Then with v and dv/ds known, the value of *a* can be calculated Fig. 12–12*b* calculated, Fig. 12–12*b*. v) in Fig. 12–12a, the slope dv/ds of the v
b v and dv/ds known the value of

The *–s* graph can also be constructed from the *a–s* graph, or vice versa, by approximating the known graph in various intervals with mathematical by approximating the known graph in various intervals with mathematical functions, $v = f(s)$ or $a = g(s)$, and then using $a ds = v dv$ to obtain the other graph other graph.

12

12 EXAMPLE 12.6

A bicycle moves along a straight road such that its position is described by the graph shown in Fig. 12–13*a*. Construct the $v-t$ and $a-t$ graphs for $0 \le t \le 30$ s *a*–*t* graphs for $0 \le t \le 30$ s.

SOLUTION

SOLUTION
v-t Graph. Since $v = ds/dt$, the $v-t$ graph can be determined by differentiating the graph can be set or and Fig. 12–13*a*. We have differentiating the equations defining the *s*–*t* graph, Fig. 12–13*a*.We have

$$
0 \le t < 10 \text{ s};
$$
 $s = (t^2) \text{ ft}$ $v = \frac{ds}{dt} = (2t) \text{ ft/s}$
\n $10 \text{ s} < t \le 30 \text{ s};$ $s = (20t - 100) \text{ ft}$ $v = \frac{ds}{dt} = 20 \text{ ft/s}$

The results are plotted in Fig. 12–13*b*. We can also obtain specific values of v by measuring the *slope* of the *s*–*t* graph at a given instant. values of v by measuring the *slope* of the *s*–*t* graph at a given instant.
For example, at $t = 20$ s, the slope of the *s*–*t* graph is determined from
the straight line from 10 s to 30 s i e

the straight line from 10 s to 30 s, i.e.,
\n
$$
t = 20
$$
 s; $v = \frac{\Delta s}{\Delta t} = \frac{500 \text{ ft} - 100 \text{ ft}}{30 \text{ s} - 10 \text{ s}} = 20 \text{ ft/s}$

a–t Graph. Since $a = dv/dt$, the *a–t* graph can be determined by differentiating the equations defining the lines of the *n–t* graph differentiating the equations defining the lines of the $v-t$ graph.
This vields This yields

$$
0 \le t < 10 \text{ s};
$$
 $v = (2t) \text{ ft/s}$ $a = \frac{dv}{dt} = 2 \text{ ft/s}^2$
 $10 < t \le 30 \text{ s};$ $v = 20 \text{ ft/s}$ $a = \frac{dv}{dt} = 0$

The results are plotted in Fig. 12–13*c*.

NOTE: Show that $a = 2$ ft/s² when $t = 5$ s by measuring the slope of the $v-t$ graph.

EXAMPLE 12.7 The contract of the

The car in Fig. 12–14*a* starts from rest and travels along a straight track such that it accelerates at 10 m/s^2 for 10 s, and then decelerates track such that it accelerates at 10 m/s^2 for 10 s , and then decelerates
at 2 m/s^2 . Draw the $v-t$ and $s-t$ graphs and determine the time t'
needed to stop the car. How far has the car traveled? needed to stop the car. How far has the car traveled?

SOLUTION

v–t Graph. Since $dv = a dt$, the $v-t$ graph is determined by integrating the straight-line segments of the *a*–*t* graph. Using the *initial condition* the straight-line segments $v = 0$ when $t = 0$, we have $dv = a dt$, the v-t

$$
0 \le t < 10
$$
 s; $a = (10) \text{ m/s}^2$; $\int_0^v dv = \int_0^t 10 dt$, $v = 10t$
When $t = 10$ s, $v = 10(10) = 100$ m/s. Using this as the *initial*

When $t = 10$ s, $v = 10(10) = 100$ m/s. Using this as the *initial*
condition for the next time period we have *condition* for the next time period, we have

$$
10 \text{ s} < t \le t'; \ a = (-2) \text{ m/s}^2; \ \int_{100 \text{ m/s}}^v dv = \int_{10 \text{ s}}^t -2 \, dt, \ v = (-2t + 120) \text{ m/s}
$$
\n
$$
\text{When } t = t' \text{ we require } v = 0. \text{ This yields, Fig. 12-14b,}
$$
\n
$$
t' = 60 \text{ s} \qquad \text{Ans.}
$$
\nA more direct solution for t' is possible by realizing that the area 10 .

 $t' = 60$ s and Ans.
A more direct solution for t' is possible by realizing that the area
under the $a-t$ graph is equal to the change in the car's velocity. under the *a*-*t* graph is equal to the change in the car's velocity. We require $\Delta v = 0 = A_1 + A_2$, Fig. 12–14*a*. Thus
 $0 = 10 \text{ m/s}^2 (10 \text{ s}) + (-2 \text{ m/s}^2)$ *x a*-*t* graph is equal
 $v = 0 = A_1 + A_2,$

$$
0 = A_1 + A_2
$$
, Fig. 12-14*a*. Thus
\n
$$
0 = 10 \text{ m/s}^2 (10 \text{ s}) + (-2 \text{ m/s}^2)(t' - 10 \text{ s})
$$
\n
$$
t' = 60 \text{ s}
$$
\nAns.

 $t' = 60 \text{ s}$
 s–t Graph. Since $ds = v dt$, integrating the equations of the v-t

graph vields the corresponding equations of the s-t graph Using the graph yields the corresponding equations of the *s*–*t* graph. Using the graph yields the corresponding equations of $initial$ condition $s = 0$ when $t = 0$, we have

$$
0 \le t \le 10 \text{ s};
$$
 $v = (10t) \text{ m/s};$ $\int_0^s ds = \int_0^t 10t \, dt,$ $s = (5t^2) \text{ m}$
When $t = 10 \text{ s}, s = 5(10)^2 = 500 \text{ m}.$ Using this *initial condition*,

$$
10 s \le t \le 60 s; \ v = (-2t + 120) \text{ m/s}; \ \int_{500 \text{ m}}^{s} ds = \int_{10 s}^{t} (-2t + 120) dt
$$

$$
s - 500 = -t^2 + 120t - [-(10)^2 + 120(10)]
$$

$$
s = (-t^2 + 120t - 600) \text{ m}
$$
When $t' = 60$ s, the position is

s =
$$
-(60)^2 + 120(60) - 600 = 3000
$$
 m *Ans.*

The *s–t* graph is shown in Fig. 12–14*c*.

NOTE: A direct solution for *s* is possible when $t' = 60$ s, since the triangular area under the *x*-t graph would yield the displacement *triangular area* under the v-t graph would yield the displacement $\Delta s = s - 0$ from $t = 0$ to $t' = 60$ s. Hence iangular area under the $v-t$ graph woul
 $s = s - 0$ from $t = 0$ to $t' = 60$ s. Hence,

$$
\Delta s = \frac{1}{2}(60 \text{ s})(100 \text{ m/s}) = 3000 \text{ m}
$$
 Ans.

12 EXAMPLE 12.8

The *–s* graph describing the motion of a motorcycle is shown in Fig. 12–15 a . Construct the a –*s* graph of the motion and determine the Fig. 12–15*a*. Construct the *a*-*s* graph of the motion and determine needed for the motorcycle to reach the position $s = 400$ ft.

SOLUTION

a–s Graph. Since the equations for segments of the *–s* graph are **a–s Graph.** Since the equations for segments of the *v*-given, the *a*–*s* graph can be determined using *a* $ds = v dv$.

$$
0 \le s < 200 \text{ ft}; \qquad v = (0.2s + 10) \text{ ft/s}
$$
\n
$$
a = v \frac{dv}{ds} = (0.2s + 10) \frac{d}{ds} (0.2s + 10) = 0.04s + 2
$$

 ds ds ds ds ds ds ds ds $s \le 400 \text{ ft}$; $v = 50 \text{ ft/s}$

$$
a = v \frac{dv}{ds} = (50) \frac{d}{ds}(50) = 0
$$

The results are plotted in Fig. 12–15*b*.

(b) 200 400 *^s* (ft) $\int_a^a (ft/s^2)$ 10 2 $a = 0.04s + 2$ $a = 0$

Time. The time can be obtained using the *v*-*s* graph and $v = ds/dt$,
because this equation relates *v*, *s* and *t*. For the first segment of because this equation relates *v*, *s*, and *t*. For the first segment of motion $s = 0$ when $t = 0$ so because this equation relate
motion, $s = 0$ when $t = 0$, so

$$
0 \le s < 200 \text{ ft}; \qquad v = (0.2s + 10) \text{ ft/s}; \qquad dt = \frac{ds}{v} = \frac{ds}{0.2s + 10}
$$
\n
$$
\int_0^t dt = \int_0^s \frac{ds}{0.2s + 10}
$$
\n
$$
t = (5 \ln(0.2s + 10) - 5 \ln 10) \text{ s}
$$

At $s = 200$ ft, $t = 5 \ln[0.2(200) + 10] - 5 \ln 10 = 8.05$ s. Therefore, using these initial conditions for the second segment of motion,

200 ft
$$
\lt s \le 400
$$
 ft; $v = 50$ ft/s; $dt = \frac{ds}{v} = \frac{ds}{50}$

$$
\int_{8.05 \text{ s}}^{t} dt = \int_{200 \text{ m}}^{s} \frac{ds}{50};
$$
 $t - 8.05 = \frac{s}{50} - 4; \quad t = \left(\frac{s}{50} + 4.05\right)s$
Therefore, at $s = 400$ ft,

Therefore, at

$$
t = \frac{400}{50} + 4.05 = 12.0 \text{ s}
$$
 Ans.

NOTE: The graphical results can be checked in part by calculating slopes. **NOTE:** The graphical results can be checked in part by calculating slope
For example, at $s = 0$, $a = v(dv/ds) = 10(50 - 10)/200 = 2$ m/s
Also, the results can be checked in part by inspection. The v_{max} grap Also, the results can be checked in part by inspection. The $v-s$ graph indicates the initial increase in velocity (acceleration) followed by constant velocity $(a = 0)$. 2 ical results can be checked in part by calculating slopes.
 $s = 0$, $a = v(dv/ds) = 10(50 - 10)/200 = 2 \text{ m/s}^2$.

12 12.4 [General Curvilinear Motion](#page-13-0)

Curvilinear motion occurs when a particle moves along a curved path. Since this path is often described in three dimensions, vector analysis will be used to formulate the particle's position, velocity, and acceleration.* In this section the general aspects of curvilinear motion are discussed, and in subsequent sections we will consider three types of coordinate systems often used to analyze this motion.

Position. Consider a particle located at a point on a space curve defined by the path function *s*(*t*), Fig. 12–16*a*.The position of the particle, measured from a fixed point *O*, will be designated by the *position vector* measured from a fixed point O, will be designated by the *position vector* $\mathbf{r} = \mathbf{r}(t)$. Notice that both the magnitude and direction of this vector will change as the particle moves along the curve change as the particle moves along the curve.

Displacement. Suppose that during a small time interval Δt the particle moves a distance Δs along the curve to a new position, defined particle moves a distance Δs along the curve to a new position, defined
by $\mathbf{r}' = \mathbf{r} + \Delta \mathbf{r}$, Fig. 12–16*b*. The *displacement* $\Delta \mathbf{r}$ represents the change in the particle's position and is determined by vector subtraction; i.e., ¢ Δ **r** = **r**^{\prime} - **r**.

Velocity. During the time Δt , the *average velocity* of the particle is
 $\mathbf{v}_{\text{avg}} = \frac{\Delta \mathbf{r}}{\Delta t}$

$$
\mathbf{v}_{\text{avg}} = \frac{\Delta \mathbf{r}}{\Delta t}
$$

The *instantaneous velocity* is determined from this equation by letting The *instantaneous velocity* is determined from this equation by letting $t \rightarrow 0$, and consequently the direction of $\Delta \mathbf{r}$ approaches the *tangent* to be curve. Hence $\mathbf{v} = \lim_{\Delta \mathbf{r}} (\Delta \mathbf{r}/\Delta t)$ or $\Delta t \rightarrow 0$, and consequently the direction
the curve. Hence, $\mathbf{v} = \lim_{\Delta t} (\Delta \mathbf{r}/\Delta t)$ or $t\rightarrow 0$ the dired
 $(\Delta \mathbf{r}/\Delta t)$

$$
\mathbf{v} = \frac{d\mathbf{r}}{dt} \tag{12-7}
$$

Since *d***r** will be tangent to the curve, the *direction* of **v** is also *tangent to the curve*, Fig. 12–16*c*. The *magnitude* of **v**, which is called the *speed*, is ¢obtained by realizing that the length of the straight line segment Δ **r** in obtained by realizing that the length of the straight line segment $\Delta \mathbf{r}$ in Fig. 12–16*b* approaches the arc length Δs as $\Delta t \rightarrow 0$, we have $v = \lim (\Delta r/\Delta t) = \lim (\Delta s/\Delta t)$ or Fig. 12–16*b* approaches the arc
 $v = \lim_{\Delta t \to 0} (\Delta r / \Delta t) = \lim_{\Delta t \to 0} (\Delta s / \Delta t)$, or $\overline{}$ $t\rightarrow 0$ 16*b* approache
($\Delta r/\Delta t$) = $\lim_{\Delta t \to 0}$ $\overline{}$ $t\rightarrow 0$ the ar $(\Delta s/\Delta t)$,

$$
v = \frac{ds}{dt} \tag{12-8}
$$

Thus, the *speed* can be obtained by differentiating the path function *s* with respect to time.

12

Acceleration. If the particle has a velocity **v** at time *t* and a velocity **Acceleration.** If the particle has a velocity **v** at time *t* and a velocity $\mathbf{v}' = \mathbf{v} + \Delta \mathbf{v}$ at $t + \Delta t$, Fig. 12–16*d*, then the *average acceleration* of the particle during the time interval Δt is particle during the time interval Δt is

$$
\mathbf{a}_{\text{avg}} = \frac{\Delta \mathbf{v}}{\Delta t}
$$

where $\Delta v = v' - v$. To study this time rate of change, the two velocity vectors in Fig. 12–16*d* are plotted in Fig. 12–16*e* such that their tails are vectors in Fig. 12–16*d* are plotted in Fig. 12–16*e* such that their tails are located at the fixed point O' and their arrowheads touch points on a curve. This curve is called a *hodograph* and when constructed it curve. This curve is called a *hodograph*, and when constructed, it describes the locus of points for the arrowhead of the velocity vector in the same manner as the *path s* describes the locus of points for the arrowhead of the position vector, Fig. 12–16*a*.

To obtain the *instantaneous acceleration*, let $\Delta t \rightarrow 0$ in the above unation In the limit Δy will approach the *tangent to the hodograph* and equation. In the limit Δv will approach the *tangent to the hodograph*, and equation. In the limit Δ so $\mathbf{a} = \lim_{h \to 0} (\Delta \mathbf{v}/\Delta t)$, or i. In the limit
 $\lim_{t\to 0} (\Delta \mathbf{v}/\Delta t),$

$$
\mathbf{a} = \frac{d\mathbf{v}}{dt}
$$

Substituting Eq. 12–7 into this result, we can also write

$$
\mathbf{a} = \frac{d^2 \mathbf{r}}{dt^2}
$$

By definition of the derivative, **a** acts *tangent to the hodograph*, Fig. 12–16*f*, and, *in general it is not tangent to the path of motion*, ¢Fig. 12–16g. To clarify this point, realize that Δv and consequently **a** must account for the change made in *both* the magnitude *and* direction of the velocity **v** as the particle moves from one point to the next along the path, Fig. 12–16*d*. However, in order for the particle to follow any curved path, the directional change always "swings" the velocity vector toward the "inside" or "concave side" of the path, and therefore **a** *cannot* remain tangent to the path. In summary, **v** is always tangent to the *path* and **a** is always tangent to the *hodograph*.

 $(12-9)$

(a)

12 12.5 [Curvilinear Motion: Rectangular](#page-13-0) **Components**

Occasionally the motion of a particle can best be described along a path that can be expressed in terms of its *x, y, z* coordinates.

Position. If the particle is at point (x, y, z) on the curved path *s* shown in Fig. 12–17*a*, then its location is defined by the *position vector*

$$
\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k} \tag{12-10}
$$

When the particle moves, the *x, y, z* components of **r** will be functions of When the particle moves, the x, y, z components of **r** with
time; i.e., $x = x(t)$, $y = y(t)$, $z = z(t)$, so that $\mathbf{r} = \mathbf{r}(t)$.
At any instant the *magnitude* of **r** is defined for

At any instant the *magnitude* of **r** is defined from Eq. C–3 in Appendix C as

$$
r = \sqrt{x^2 + y^2 + z^2}
$$

And the *direction* of **r** is specified by the unit vector $\mathbf{u}_r = \mathbf{r}/r$.

Velocity. The first time derivative of **r** yields the velocity of the particle. Hence,

$$
\mathbf{v} = \frac{d\mathbf{r}}{dt} = \frac{d}{dt}(x\mathbf{i}) + \frac{d}{dt}(y\mathbf{j}) + \frac{d}{dt}(z\mathbf{k})
$$

When taking this derivative, it is necessary to account for changes in *both* the magnitude and direction of each of the vector's components. For example, the derivative of the **i** component of **r** is

$$
\frac{d}{dt}(x\mathbf{i}) = \frac{dx}{dt}\mathbf{i} + x\frac{d\mathbf{i}}{dt}
$$

The second term on the right side is zero, provided the *x, y, z* reference frame is *fixed*, and therefore the *direction* (and the *magnitude*) of **i** does not change with time. Differentiation of the **j** and **k** components may be carried out in a similar manner, which yields the final result,

$$
\mathbf{v} = \frac{d\mathbf{r}}{dt} = v_x \mathbf{i} + v_y \mathbf{j} + v_z \mathbf{k}
$$
 (12-11)

where

$$
v_x = \dot{x} \quad v_y = \dot{y} \quad v_z = \dot{z}
$$
 (12-12)

12

The "dot" notation \dot{x} , \dot{y} , \dot{z} represents the first time derivatives of The "dot" notation \dot{x} , \dot{y} , \dot{z} represents
 $x = x(t)$, $y = y(t)$, $z = z(t)$, respectively.

The velocity has a *magnitude* that is four \dot{x} , \dot{y} ,
= $z($

The velocity has a *magnitude* that is found from

$$
v = \sqrt{v_x^2 + v_y^2 + v_z^2}
$$

and a *direction* that is specified by the unit vector $\mathbf{u}_v = \mathbf{v}/v$. As discussed
in Sec. 12–4, this direction is *always tangent to the nath* as shown in in Sec. 12–4, this direction is *always tangent to the path*, as shown in Fig. 12–17*b*.

Acceleration. The acceleration of the particle is obtained by taking the first time derivative of Eq. 12–11 (or the second time derivative of Eq. 12–10). We have

 $\mathbf{a} = \frac{d\mathbf{v}}{dt} = a_x \mathbf{i} + a_y \mathbf{j} + a_z \mathbf{k}$

Ĺ

where

$$
a_x = \dot{v}_x = \ddot{x} \n a_y = \dot{v}_y = \ddot{y} \n a_z = \dot{v}_z = \ddot{z}
$$
\n(12-14)

Here a_x , a_y , a_z represent, respectively, the first time derivatives of the $a_y = a_y(t)$, $a_y = a_y(t)$ or the second time derivatives of the Here a_x , a_y , a_z represent, respectively, the first time derivatives of the $v_x = v_x(t)$, $v_y = v_y(t)$, $v_z = v_z(t)$, or the second time derivatives of the functions $v_y = v(t)$, $v_y = v(t)$, $z = v_z(t)$ $v_x = v_x(t), v_y = v_y(t), v_z = v_z(t)$, or the
functions $x = x(t), y = y(t), z = z(t)$.
The acceleration has a magnitude

The acceleration has a *magnitude*

$$
a=\sqrt{a_x^2+a_y^2+a_z^2}
$$

and a *direction* specified by the unit vector $\mathbf{u}_a = \mathbf{a}/a$. Since **a** represents the time rate of *change* in both the magnitude and direction of the the time rate of *change* in both the magnitude and direction of the velocity, in general **a** will *not* be tangent to the path, Fig. 12–17*c*.

Important Points

- Curvilinear motion can cause changes in *both* the magnitude and direction of the position, velocity, and acceleration vectors.
- The velocity vector is always directed *tangent* to the path.
- In general, the acceleration vector is *not* tangent to the path, but rather, it is tangent to the hodograph.
- If the motion is described using rectangular coordinates, then the components along each of the axes do not change direction, only their magnitude and sense (algebraic sign) will change.
- By considering the component motions, the change in magnitude and direction of the particle's position and velocity are automatically taken into account.

Procedure for Analysis

Coordinate System.

• A rectangular coordinate system can be used to solve problems for which the motion can conveniently be expressed in terms of its *x, y, z* components.

Kinematic Quantities.

- Since *rectilinear motion* occurs along *each coordinate axis*, the Since *rectilinear motion* occurs along *each coordinate axis*, the motion along each axis is found using $v = ds/dt$ and $a = dv/dt$; or in cases where the motion is not expressed as a function of or in cases where the motion is not expressed as a function of or in cases where the motion is not expre
time, the equation $a ds = v dv$ can be used.
- In two dimensions, the equation of the path $y = f(x)$ can be used
to relate the x and y components of velocity and acceleration by to relate the *x* and *y* components of velocity and acceleration by applying the chain rule of calculus. A review of this concept is given in Appendix C.
- Once the *x, y, z* components of **v** and **a** have been determined, the magnitudes of these vectors are found from the Pythagorean theorem, Eq. B–3, and their coordinate direction angles from the components of their unit vectors, Eqs. B–4 and B–5.

EXAMPLE 12.9 The state of the st

At any instant the horizontal position of the weather balloon in At any instant the horizontal position of the weather balloon in
Fig. 12–18*a* is defined by $x = (8t)$ ft, where *t* is in seconds. If the
equation of the path is $y = x^2/10$ determine the magnitude and Fig. 12–18*a* is defined by $x = (8t)$ ft, where *t* is in seconds. If the equation of the path is $y = x^2/10$, determine the magnitude and direction of the velocity and the acceleration when $t = 2s$ equation of the path is $y = x^2/10$, determine the magnification of the velocity and the acceleration when $t = 2$ s.

SOLUTION

Velocity. The velocity component in the *x* direction is |
|
|

$$
v_x = \dot{x} = \frac{d}{dt}(8t) = 8 \text{ ft/s} \rightarrow
$$

To find the relationship between the velocity components we will use the chain rule of calculus. (See Appendix A for a full explanation.)

$$
v_y = \dot{y} = \frac{d}{dt}(x^2/10) = 2x\dot{x}/10 = 2(16)(8)/10 = 25.6 \text{ ft/s} \uparrow
$$

When $t = 2$ s, the magnitude of velocity is therefore

$$
v = \sqrt{(8 \text{ ft/s})^2 + (25.6 \text{ ft/s})^2} = 26.8 \text{ ft/s}
$$
 Ans.

The direction is tangent to the path, Fig. 12–18*b*, where

$$
\theta_v = \tan^{-1} \frac{v_y}{v_x} = \tan^{-1} \frac{25.6}{8} = 72.6^{\circ}
$$
 Ans.

Acceleration. The relationship between the acceleration components is determined using the chain rule. (See Appendix C.) We have

$$
a_x = \dot{v}_x = \frac{d}{dt}(8) = 0
$$

$$
a_y = \dot{v}_y = \frac{d}{dt}(2x\dot{x}/10) = 2(\dot{x})\dot{x}/10 + 2x(\ddot{x})/10
$$

$$
= 2(8)^2/10 + 2(16)(0)/10 = 12.8 \text{ ft/s}^2 \uparrow
$$

Thus,

$$
a = \sqrt{(0)^2 + (12.8)^2} = 12.8 \text{ ft/s}^2
$$
 Ans.

The direction of **a**, as shown in Fig. 12–18*c*, is

$$
\theta_a = \tan^{-1} \frac{12.8}{0} = 90^\circ
$$
 Ans.

NOTE: It is also possible to obtain v_y and a_y by first expressing **NOTE:** It is also possible to obtain v_y and a_y by first expressing $y = f(t) = (8t)^2/10 = 6.4t^2$ and then taking successive time derivatives. $\frac{2}{3}$ and then taking succes

12 EXAMPLE 12.10

For a short time, the path of the plane in Fig. 12–19*a* is described by For a short time, the path of the plane in Fig. 12–19*a* is described by
 $y = (0.001x^2)$ m. If the plane is rising with a constant velocity of 10 m/s,

determine the magnitudes of the velocity and acceleration of the plan determine the magnitudes of the velocity and acceleration of the plane determine the magnitud
when it is at $y = 100$ m.

SOLUTION

SOLUTION
When $y = 100$ m, then $100 = 0.001x^2$ or $x = 316.2$ m. Also, since
 $y = 10$ m/s then When $y = 100 \text{ m}$
 $v_y = 10 \text{ m/s, then}$

$$
y = v_y t
$$
; 100 m = (10 m/s) t $t = 10$ s

Velocity. Using the chain rule (see Appendix C) to find the relationship between the velocity components, we have

$$
v_y = \dot{y} = \frac{d}{dt}(0.001x^2) = (0.002x)\dot{x} = 0.002xv_x \tag{1}
$$

Thus

x

x

 \mathbf{v}_y **v** $\frac{a}{v_x}$

$$
10 \text{ m/s} = 0.002(316.2 \text{ m})(v_x)
$$

$$
v_x = 15.81 \text{ m/s}
$$

The magnitude of the velocity is therefore

$$
v = \sqrt{v_x^2 + v_y^2} = \sqrt{(15.81 \text{ m/s})^2 + (10 \text{ m/s})^2} = 18.7 \text{ m/s}
$$
 Ans.

Acceleration. Using the chain rule, the time derivative of Eq. (1) gives the relation between the acceleration components.

$$
a_y = \dot{v}_y = 0.002 \dot{x} v_x + 0.002 x \dot{v}_x = 0.002 (v_x^2 + x a_x)
$$

When $x = 316.2 \text{ m}$, $v_x = 15.81 \text{ m/s}$, \dot{v} $y_y = a_y = 0,$

$$
0 = 0.002((15.81 \text{ m/s})^2 + 316.2 \text{ m}(a_x))
$$

$$
a_x = -0.791 \text{ m/s}^2
$$

The magnitude of the plane's acceleration is therefore

(b)

y

100 m

Fig. 12–19

$$
a = \sqrt{a_x^2 + a_y^2} = \sqrt{(-0.791 \text{ m/s}^2)^2 + (0 \text{ m/s}^2)^2}
$$

= 0.791 m/s² Ans.

These results are shown in Fig. 12–19*b*.

(a)

12.6 [Motion of a Projectile](#page-13-0) 12 August 2018

The free-flight motion of a projectile is often studied in terms of its rectangular components. To illustrate the kinematic analysis, consider a projectile launched at point (x_0, y_0) , with an initial velocity of \mathbf{v}_0 , having
components (\mathbf{v}_0) and (\mathbf{v}_1) . Fig. 12–20 When air resistance is neglected. components $(v_0)_x$ and $(v_0)_y$, Fig. 12–20. When air resistance is neglected, the only force acting on the projectile is its weight, which causes the projectile to have a *constant downward acceleration* of approximately constant downward or $g = 32.2$ ft/s².* 2 projectile to have a *constant downw*
 $a_c = g = 9.81 \text{ m/s}^2$ or $g = 32.2 \text{ ft/s}^2$. 2

Horizontal Motion. Since $a_x = 0$, application of the constant acceleration equations 12–4 to 12–6 yields

$$
\begin{array}{ll}\n(\rightarrow) & v = v_0 + a_c t; & v_x = (v_0)_x \\
(\rightarrow) & x = x_0 + v_0 t + \frac{1}{2} a_c t^2; & x = x_0 + (v_0)_x t\n\end{array}
$$

$$
(x + y) \qquad x = x_0 + v_0 t + \frac{1}{2} a_c t^2; \qquad x = x_0 + t^2
$$

$$
(x + y) \qquad x^2 = v_0^2 + 2a_c(x - x_0); \qquad v_x = (v_0)_x
$$

The first and last equations indicate that *the horizontal component of velocity always remains constant during the motion*.

Vertical Motion. Since the positive *y* axis is directed upward, then **Vertica**l
 $a_y = -g.$

$$
a_y = -g.
$$
 Applying Eqs. 12-4 to 12-6, we get
\n(+ \uparrow)
\n $v = v_0 + a_c t;$
\n $y = y_0 + v_0 t + \frac{1}{2} a_c t^2;$
\n $v_y = (v_0)_y - gt$
\n $y = y_0 + (v_0)_y t - \frac{1}{2} gt^2$
\n(+ \uparrow)
\n $v^2 = v_0^2 + 2a_c(y - y_0);$
\n $v_y^2 = (v_0)_y^2 - 2g(y - y_0)$

Recall that the last equation can be formulated on the basis of eliminating the time *t* from the first two equations, and therefore *only two of the above three equations are independent of one another*.

* This assumes that the earth's gravitational field does not vary with altitude.

Each picture in this sequence is taken after the same time interval. The red ball falls from rest, whereas the yellow ball is given a horizontal velocity when released. Both balls accelerate downward at the same rate, and so they remain at the same elevation at any instant.This acceleration causes the difference in elevation between the balls to increase between successive photos.Also, note the horizontal distance between successive photos of the yellow ball is constant since the velocity in the horizontal direction remains constant.

To summarize, problems involving the motion of a projectile can have at most three unknowns since only three independent equations can be written; that is, *one* equation in the *horizontal direction* and *two* in the *vertical direction.* Once \mathbf{v}_x and \mathbf{v}_y are obtained, the resultant velocity \mathbf{v} , which is always tangent to the path can be determined by the vector sum which is *always tangent* to the path, can be determined by the *vector sum* as shown in Fig. 12–20.

Procedure for Analysis

Coordinate System.

- Establish the fixed *x*, *y* coordinate axes and sketch the trajectory of the particle. Between any *two points* on the path specify the given problem data and identify the *three unknowns*. In all cases the acceleration of gravity acts downward and equals 9.81 m/s^2 or 32.2 ft/s². The particle's initial and final velocities should be represented in terms of their *x* and *y* components.
- Remember that positive and negative position, velocity, and acceleration components always act in accordance with their associated coordinate directions.

Kinematic Equations.

• Depending upon the known data and what is to be determined, a choice should be made as to which three of the following four equations should be applied between the two points on the path to obtain the most direct solution to the problem.

Horizontal Motion.

• The *velocity* in the horizontal or *x* direction is *constant*, i.e., The *velocity* in
 $v_x = (v_0)_x$, and

$$
x = x_0 + (v_0)_x t
$$

Vertical Motion.

• In the vertical or *y* direction *only two* of the following three equations can be used for solution.

$$
v_y = (v_0)_y + a_c t
$$

\n
$$
y = y_0 + (v_0)_y t + \frac{1}{2} a_c t^2
$$

\n
$$
v_y^2 = (v_0)_y^2 + 2a_c (y - y_0)
$$

For example, if the particle's final velocity v_v is not needed, then the first and third of these equations will not be useful.

Gravel falling off the end of this conveyor belt follows a path that can be predicted using the equations of constant acceleration. In this way the location of the accumulated pile can be determined. Rectangular coordinates are used for the analysis since the acceleration is only in the vertical direction.

EXAMPLE $\begin{bmatrix} 12.11 \end{bmatrix}$

A sack slides off the ramp, shown in Fig. 12–21, with a horizontal velocity of 12 m/s . If the height of the ramp is 6 m from the floor, determine the time needed for the sack to strike the floor and the range *R* where sacks begin to pile up.

SOLUTION

Coordinate System. The origin of coordinates is established at the beginning of the path, point *A*, Fig. 12–21.The initial velocity of a sack has beginning of the path, point *A*, Fig. 12–21. The initial velocity of a sack has
components $(v_A)_x = 12$ m/s and $(v_A)_y = 0$. Also, between points *A* and components $(v_A)_x = 12$ m/s and $(v_A)_y = 0$. Also, between points *A* and
 B the acceleration is $a_y = -9.81$ m/s². Since $(v_B)_x = (v_A)_x = 12$ m/s,

the three unknowns are (v_A) . *B* and the time of flicht t. Here we do the three unknowns are $(v_B)_y$, R, and the time of flight t_{AB} . Here we do not need to determine (x) not need to determine $(v_B)_y$. 2 .

Vertical Motion. The vertical distance from *A* to *B* is known, and

therefore we can obtain a direct solution for
$$
t_{AB}
$$
 by using the equation
\n
$$
(*)\hat{f} + \hat{f}
$$
\n
$$
y_B = y_A + (v_A) y_{AB} + \frac{1}{2} a_c t_{AB}^2
$$
\n
$$
-6 m = 0 + 0 + \frac{1}{2} (-9.81 \text{ m/s}^2) t_{AB}^2
$$
\n
$$
t_{AB} = 1.11 \text{ s}
$$
\nAns.

Horizontal Motion. Since t_{AB} has been calculated, *R* is determined as follows: as follows:

(
$$
\Rightarrow
$$
)
\n $x_B = x_A + (v_A)_x t_{AB}$
\n $R = 0 + 12 \text{ m/s} (1.11 \text{ s})$
\n $R = 13.3 \text{ m}$ *Ans.*

NOTE: The calculation for t_{AB} also indicates that if a sack were released *from rest* at A , it would take the same amount of time to strike the floor at *C*, Fig. 12–21.

12 EXAMPLE 12.12

The chipping machine is designed to eject wood chips at $v_O = 25$ ft/s
as shown in Fig. 12–22. If the tube is oriented at 30° from the as shown in Fig. 12–22. If the tube is oriented at 30° from the horizontal, determine how high, *h*, the chips strike the pile if at this instant they land on the pile 20 ft from the tube.

SOLUTION

Coordinate System. When the motion is analyzed between points *O* and *A*, the three unknowns are the height *h*, time of flight t_{OA} , and vertical component of velocity (v_1) . Note that $(v_2) = (v_2)$, With O and A, the three unknowns are the height h, time of flight t_{OA} , and
vertical component of velocity $(v_A)_y$. [Note that $(v_A)_x = (v_O)_x$.] With
the origin of coordinates at O. Fig. 12–22, the initial velocity of a chin the origin of coordinates at *O*, Fig. 12–22, the initial velocity of a chip has components of

$$
(v_O)_x = (25 \cos 30^\circ) \text{ ft/s} = 21.65 \text{ ft/s} \rightarrow
$$

 $(v_O)_y = (25 \sin 30^\circ) \text{ ft/s} = 12.5 \text{ ft/s} \uparrow$

Also, $(v_A)_x = (v_O)_x = 21.65$ ft/s and $a_y = -32.2$ ft/s². Since we do not need to determine $(v_A)_y$, we have

Horizontal Motion. +

(3)
\n
$$
x_A = x_O + (v_O)_x t_{OA}
$$

\n $20 \text{ ft} = 0 + (21.65 \text{ ft/s}) t_{OA}$
\n $t_{OA} = 0.9238 \text{ s}$

Vertical Motion. Relating t_{OA} to the initial and final elevations of a chin we have chip, we have

$$
y_A = y_O + (v_O)_{y}t_{OA} + \frac{1}{2}a_ct_{OA}^2
$$

(h - 4 ft) = 0 + (12.5 ft/s)(0.9238 s) + $\frac{1}{2}$ (-32.2 ft/s²)(0.9238 s)²
h = 1.81 ft
Ans.

NOTE: We can determine $(v_A)_y$ by using $(v_A)_y = (v_O)_y + a_c t_{OA}$.

EXAMPLE $\begin{bmatrix} 12.13 \end{bmatrix}$

The track for this racing event was designed so that riders jump off the slope at 30°, from a height of 1 m. During a race it was observed that the rider shown in Fig. 12–23*a* remained in mid air for 1.5 s. Determine the speed at which he was traveling off the ramp, the horizontal distance he travels before striking the ground, and the maximum height he attains. Neglect the size of the bike and rider.

(a) SOLUTION

Coordinate System. As shown in Fig. 12–23*b*, the origin of the coordinates is established at *A*. Between the end points of the path *AB* the three unknowns are the initial speed v_A , range *R*, and the vertical component of velocity $(v_B)_y$.

Vertical Motion. Since the time of flight and the vertical distance

between the ends of the path are known, we can determine
$$
v_A
$$
.
\n(+ \uparrow) $y_B = y_A + (v_A)_y t_{AB} + \frac{1}{2} a_c t_{AB}^2$
\n-1 m = 0 + $v_A \sin 30^\circ (1.5 \text{ s}) + \frac{1}{2} (-9.81 \text{ m/s}^2)(1.5 \text{ s})^2$
\n $v_A = 13.38 \text{ m/s} = 13.4 \text{ m/s}$

Horizontal Motion. The range *R* can now be determined.
\n
$$
(x + 1) \qquad x = x_A + (v_A)_x t_{AB}
$$
\n
$$
R = 0 + 13.38 \cos 30^\circ \text{ m/s} (1.5 \text{ s})
$$
\n
$$
= 17.4 \text{ m}
$$
\n*Ans.*

In order to find the maximum height *h* we will consider the path *AC*, Fig. 12–23*b*. Here the three unknowns are the time of flight t_{AC} , the horizontal distance from A to C and the height h. At the the horizontal distance from *A* to *C*, and the height *h*. At the the horizontal distance from A to C, and the height h. At the maximum height $(v_C)_y = 0$, and since v_A is known, we can determine h directly without considering t c using the following equation *h directly* without considering t_{AC} using the following equation.
 $(v_0)^2 = (v_0)^2 + 2a [v_0 - v_0]$ tAC

$$
(v_C)_y^2 = (v_A)_y^2 + 2a_c[y_C - y_A]
$$

\n
$$
0^2 = (13.38 \sin 30^\circ \text{ m/s})^2 + 2(-9.81 \text{ m/s}^2)[(h - 1 \text{ m}) - 0]
$$

\n
$$
h = 3.28 \text{ m}
$$
Ans.

NOTE: Show that the bike will strike the ground at *B* with a velocity having components of

$$
(v_B)_x = 11.6 \text{ m/s} \rightarrow, \quad (v_B)_y = 8.02 \text{ m/s} \downarrow
$$

12 FUNDAMENTAL PROBLEMS

F12–15. If the x and y components of a particle's velocity
are $v_1 = (32t)$ m/s and $v_2 = 8$ m/s, determine the equation **F12-15.** If the x and y components of a particle's velocity
are $v_x = (32t)$ m/s and $v_y = 8$ m/s, determine the equation
of the path $v = f(x)$, $x = 0$ and $y = 0$ when $t = 0$ are $v_x = (32t)$ m/s and $v_y = 8$ m/s, determine the α of the path $y = f(x)$. $x = 0$ and $y = 0$ when $t = 0$.

F12–16. A particle is traveling along the straight path. If its **F12–16.** A particle is traveling along the straight path. If its position along the *x* axis is $x = (8t)$ m, where *t* is in seconds determine its speed when $t = 2$ s seconds, determine its speed when $t = 2$ s.

F12–17. A particle is constrained to travel along the path. **F12–17.** A particle is constrained to travel along the path.
If $x = (4t^4)$ m, where t is in seconds, determine the
magnitude of the particle's velocity and acceleration when magnitude of the particle's velocity and acceleration when $t = 0.5$ s.

F12–18. A particle travels along a straight-line path **F12-18.** A particle travels along a straight-line path $y = 0.5x$. If the x component of the particle's velocity is $y = (2t^2)$ m/s, where t is in seconds determine the $y = 0.5x$. If the x component of the particle's velocity is
 $v_x = (2t^2)$ m/s, where t is in seconds, determine the

magnitude of the particle's velocity and acceleration magnitude of the particle's velocity and acceleration when $t = 4$ s. 2) m/s,

If he strikes the ground at B determine his initial speed as and the time of flight t at *B*, determine his initial speed v_A and the time of flight t_{AB} .

12.7 [Curvilinear Motion: Normal and](#page-13-0) 12 Tangential Components

When the path along which a particle travels is *known*, then it is often convenient to describe the motion using *n* and *t* coordinate axes which act normal and tangent to the path, respectively, and at the instant considered have their *origin located at the particle*.

Planar Motion. Consider the particle shown in Fig. 12–24*a*, which moves in a plane along a fixed curve, such that at a given instant it is at position *s*, measured from point *O*. We will now consider a coordinate system that has its origin at a *fixed point* on the curve, and at the instant considered this origin happens to *coincide* with the location of the particle. The *t* axis is *tangent* to the curve at the point and is positive in the direction of *increasing s*.We will designate this positive direction with the unit vector \mathbf{u}_t . A unique choice for the *normal axis* can be made by noting that *geometrically* the *curve* is constructed from a series of noting that geometrically the curve is constructed from a series of differential arc segments *ds*, Fig. 12–24*b*. Each segment *ds* is formed from the arc of an associated circle having a *radius of curvature* ρ (rho) and the arc of an associated circle having a *radius of curvature* ρ (rho) and *center of curvature* O' . The normal axis *n* is perpendicular to the *t* axis with its positive sense directed *toward* the center of curvat *center of curvature O'*. The normal axis *n* is perpendicular to the *t* axis with its positive sense directed *toward* the center of curvature O', Fig. 12–24*a*. This positive direction which is *always* on the concave This positive direction, which is *always* on the concave side of the curve, will be designated by the unit vector \mathbf{u}_n . The plane which contains the *n* and *t* axes is referred to as the embracing or osculating plane and in this and *t* axes is referred to as the embracing or *osculating plane*, and in this case it is fixed in the plane of motion.*

Velocity. Since the particle moves, *s* is a function of time. As indicated in Sec. 12.4, the particle's velocity **v** has a *direction* that is *always tangent to the path*, Fig. 12–24*c*, and a *magnitude* that is always tangent to the path, Fig. 12–24c, and a *magnitude* that is determined by taking the time derivative of the path function $s = s(t)$, i.e. $v = ds/dt$ (Eq. 12–8). Hence determined by taking the time d
i.e., $v = ds/dt$ (Eq. 12–8). Hence

where

 $v = \dot{s}$ (12–16)

Fig. 12–24

*The osculating plane may also be defined as the plane which has the greatest contact with the curve at a point. It is the limiting position of a plane contacting both the point and the arc segment *ds*. As noted above, the osculating plane is always coincident with a plane curve; however, each point on a three-dimensional curve has a unique osculating plane.

Acceleration. The acceleration of the particle is the time rate of change of the velocity. Thus,

$$
\mathbf{a} = \dot{\mathbf{v}} = \dot{v} \mathbf{u}_t + v \dot{\mathbf{u}}_t \tag{12-17}
$$

In order to determine the time derivative \mathbf{u}_t , note that as the particle moves along the arc ds in time dt **u**, preserves its magnitude of unity moves along the arc *ds* in time *dt*, \mathbf{u}_t preserves its magnitude of unity;
however its direction changes and becomes \mathbf{u}' . Fig. 12, 24d, As shown in moves along the arc *ds* in time *dt*, \mathbf{u}_t preserves its magnitude of unity;
however, its *direction* changes, and becomes \mathbf{u}'_t , Fig. 12–24*d*. As shown in
Fig. 12–24*e* we require $\mathbf{u}' = \mathbf{u} + d\mathbf{u}$. Her however, its *direction* changes, and becomes \mathbf{u}'_t , Fig. 12–24*d*. As shown in Fig. 12–24*e*, we require $\mathbf{u}'_t = \mathbf{u}_t + d\mathbf{u}_t$. Here $d\mathbf{u}_t$ stretches between the arrowheads of **u**, and \mathbf{u}'_t which lie Fig. 12–24e, we require $\mathbf{u}'_t = \mathbf{u}_t + d\mathbf{u}_t$. Here $d\mathbf{u}_t$ stretches between the arrowheads of \mathbf{u}_t and \mathbf{u}'_t , which lie on an infinitesimal arc of radius $u_t = 1$.
Hence $d\mathbf{u}_t$ has a *magnitude* of arrowheads of \mathbf{u}_t and \mathbf{u}'_t , which lie on an infinitesimal arc of radius $u_t = 1$.
Hence, $d\mathbf{u}_t$ has a *magnitude* of $du_t = (1) d\theta$, and its *direction* is defined by
u Consequently $d\mathbf{u}_t = d\theta \mathbf{u}$ and Hence, $d\mathbf{u}_t$ has a *magnitude* of $du_t = (1) d\theta$, and its *direction* is defined by \mathbf{u}_n . Consequently, $d\mathbf{u}_t = d\theta \mathbf{u}_n$, and therefore the time derivative becomes Since $ds = \rho d\theta$, Fig. 12–24*d*, then $\theta = \dot{s}/\rho$, and therefore .
. **u**_{*n*}. Consequently, $d\mathbf{u}_t = d\theta \mathbf{u}_n$, and therefore the tim
 $\dot{\mathbf{u}}_t = \dot{\theta} \mathbf{u}_n$. Since $ds = \rho d\theta$, Fig. 12–24*d*, then $\dot{\theta} = \dot{s}/\rho$, ## θ **u**_n.

$$
\dot{\mathbf{u}}_t = \dot{\theta}\mathbf{u}_n = \frac{\dot{s}}{\rho}\mathbf{u}_n = \frac{v}{\rho}\mathbf{u}_n
$$

Substituting into Eq. 12–17, **a** can be written as the sum of its two components,

$$
\boxed{\mathbf{a} = a_t \mathbf{u}_t + a_n \mathbf{u}_n}
$$
 (12–18)

where

$$
a_t = \dot{v}
$$
 or
$$
a_t ds = v dv
$$

and

$$
a_n = \frac{v^2}{\rho} \tag{12-20}
$$

or $a_t ds = v dv$ (12–19)

These two mutually perpendicular components are shown in Fig. 12–24*f*. Therefore, the *magnitude* of acceleration is the positive value of

$$
a = \sqrt{a_t^2 + a_n^2} \tag{12-21}
$$

$$
\begin{array}{c}\n\begin{array}{c}\n\bullet \\
\bullet \\
\hline\n\end{array}\n\end{array}
$$

Acceleration

(f)

To better understand these results, consider the following two special cases of motion.

- **1.** If the particle moves along a straight line, then $\rho \rightarrow \infty$ and from If the particle moves along a straight line, then $\rho \rightarrow \infty$ and from
Eq. 12–20, $a_n = 0$. Thus $a = a_t = \dot{v}$, and we can conclude that the
tangential component of acceleration represents the time rate of *tangential component of acceleration represents the time rate of change in the magnitude of the velocity.* icle moves along a straig
 $a_n = 0$. Thus $a = a_t = \dot{v}$,

component of acceleration
- 2. If the particle moves along a curve with a constant speed, then If the particle moves along a curve with a constant speed, then $a_t = \dot{v} = 0$ and $a = a_n = v^2/\rho$. Therefore, the *normal component* of *acceleration represents the time rate of change in the direction of of acceleration represents the time rate of change in the direction of the velocity*. Since a_n *always* acts towards the center of curvature, this component is sometimes referred to as the *centrinatal* (or center this component is sometimes referred to as the *centripetal* (or center seeking) *acceleration*. .
.

As a result of these interpretations, a particle moving along the curved path in Fig. 12–25 will have accelerations directed as shown.

Three-Dimensional Motion. If the particle moves along a space curve, Fig. 12–26, then at a given instant the *t* axis is uniquely specified; however, an infinite number of straight lines can be constructed normal to the tangent axis. As in the case of planar motion, we will choose the to the tangent axis. As in the case of planar motion, we will choose the positive *n* axis directed toward the path's center of curvature O' . This axis is referred to as the *principal pormal* to the curve With the *n* is referred to as the *principal normal* to the curve.With the *n* and *t* axes so defined, Eqs. 12–15 through 12–21 can be used to determine **v** and **a**. Since \mathbf{u}_t and \mathbf{u}_n are always perpendicular to one another and lie in the osculation plane for spatial motion a third unit vector \mathbf{u}_t defines the osculating plane, for spatial motion a third unit vector, \mathbf{u}_b , defines the hinermal axis h which is perpendicular to **u**, and **u**. Fig. 12.26 *binormal axis b* which is perpendicular to \mathbf{u}_t and \mathbf{u}_n , Fig. 12–26.
Since the three unit vectors are related to one another by

Since the three unit vectors are related to one another by the vector Since the three unit vectors are related to one another by the vector cross product, e.g., $\mathbf{u}_b = \mathbf{u}_t \times \mathbf{u}_n$, Fig. 12–26, it may be possible to use this relation to establish the direction of one of the axes if t relation to establish the direction of one of the axes, if the directions of the other two are known. For example, if no motion occurs in the \mathbf{u}_b
direction and this direction and \mathbf{u}_b are known, then \mathbf{u}_b can be direction, and this direction and \mathbf{u}_t are known, then \mathbf{u}_n can be determined where in this case $\mathbf{u}_t = \mathbf{u} \times \mathbf{u}$. Fig. 12.26, Bemember direction, and this direction and \mathbf{u}_t are known, then \mathbf{u}_n can be determined, where in this case $\mathbf{u}_n = \mathbf{u}_b \times \mathbf{u}_t$, Fig. 12–26. Remember, though that \mathbf{u}_i is always on the concave side of the curv though, that \mathbf{u}_n is always on the concave side of the curve.

12

Motorists traveling along this cloverleaf interchange experience a normal acceleration due to the change in direction of their velocity. A tangential component of acceleration occurs when the cars' speed is increased or decreased.

Procedure for Analysis

Coordinate System.

- Provided the *path* of the particle is *known*, we can establish a set of *n* and *t* coordinates having a *fixed origin,* which is coincident with the particle at the instant considered.
- The positive tangent axis acts in the direction of motion and the positive normal axis is directed toward the path's center of curvature.

Velocity.

- The particle's *velocity* is always tangent to the path.
- The magnitude of velocity is found from the time derivative of the path function. **.**

 $v = \dot{s}$

Tangential Acceleration.

- The tangential component of acceleration is the result of the time rate of change in the *magnitude* of velocity. This component acts in the positive *s* direction if the particle's speed is increasing or in the opposite direction if the speed is decreasing.
- The relations between a_t , v , t and s are the same as for rectilinear motion namely motion, namely,

$$
a_t = \dot{v} \quad a_t ds = v dv
$$

• If a_t is constant, $a_t = (a_t)_c$, the above equations, when integrated, yield

$$
s = s_0 + v_0 t + \frac{1}{2}(a_t)_c t^2
$$

\n
$$
v = v_0 + (a_t)_c t
$$

\n
$$
v^2 = v_0^2 + 2(a_t)_c (s - s_0)
$$

Normal Acceleration.

- The normal component of acceleration is the result of the time rate of change in the *direction* of the velocity. This component is *always* directed toward the center of curvature of the path, i.e., along the positive *n* axis.
- The magnitude of this component is determined from

$$
a_n = \frac{v^2}{\rho}
$$

• If the path is expressed as $y = f(x)$, the radius of curvature ρ at any point on the path is determined from the equation any point on the path is determined from the equation

$$
\rho = \frac{[1 + (dy/dx)^2]^{3/2}}{|d^2y/dx^2|}
$$

The derivation of this result is given in any standard calculus text.

y

EXAMPLE <mark>12.14</mark> 12.14 12:00 12

When the skier reaches point *A* along the parabolic path in Fig. 12–27*a*, he has a speed of 6 m/s which is increasing at 2 m/s^2 . Determine the direction of his velocity and the direction and magnitude of his acceleration at this instant. Neglect the size of the skier in the calculation.

SOLUTION

Coordinate System. Although the path has been expressed in terms of its *x* and *y* coordinates, we can still establish the origin of the *n, t* axes at the fixed point *A* on the path and determine the components of **v** and **a** along these axes, Fig. 12–27*a*.

Velocity. By definition, the velocity is always directed tangent to the **Velocity.** By definition, the velocity is always directed tangent to the path. Since $y = \frac{1}{20}x^2$, $dy/dx = \frac{1}{10}x$, then at $x = 10$ m, $dy/dx = 1$.
Hence at A y makes an angle of $\theta = \tan^{-1}1 = 45^\circ$ with the x axis path. Since $y = \frac{1}{20}x^2$, $dy/dx = \frac{1}{10}x$, then at $x = 10$ m, $dy/dx = 1$.
Hence, at *A*, **v** makes an angle of $\theta = \tan^{-1}1 = 45^{\circ}$ with the *x* axis, Fig. 12–27*a*. Therefore,

$$
v_A = 6 \text{ m/s} \qquad 45^{\circ} \mathcal{F} \qquad \qquad \text{Ans.}
$$

 $v_A = 6 \text{ m/s}$ $45^{\circ}Z$ *Ans.*
The acceleration is determined from $\mathbf{a} = v \mathbf{u}_t + (v^2/\rho) \mathbf{u}_n$. However,
it is first necessary to determine the radius of curvature of the path at it is first necessary to determine the radius of curvature of the path at it is first necessary to determine the rad
 A (10 m, 5 m). Since $d^2y/dx^2 = \frac{1}{10}$, then

$$
\rho = \frac{\left[1 + \left(\frac{dy}{dx}\right)^2\right]^{3/2}}{\left|\frac{d^2y}{dx^2}\right|} = \frac{\left[1 + \left(\frac{1}{10}x\right)^2\right]^{3/2}}{\left|\frac{1}{10}\right|}\bigg|_{x=10 \text{ m}} = 28.28 \text{ m}
$$

The acceleration becomes

$$
\mathbf{a}_A = \dot{v}\mathbf{u}_t + \frac{v^2}{\rho}\mathbf{u}_n
$$

= $2\mathbf{u}_t + \frac{(6 \text{ m/s})^2}{28.28 \text{ m}}\mathbf{u}_n$
= $\{2\mathbf{u}_t + 1.273\mathbf{u}_n\}\text{m/s}^2$

As shown in Fig. 12–27*b*,

$$
a = \sqrt{(2 \text{ m/s}^2)^2 + (1.273 \text{ m/s}^2)^2} = 2.37 \text{ m/s}^2
$$

$$
\phi = \tan^{-1} \frac{2}{1.273} = 57.5^\circ
$$

Thus, $45^{\circ} + 90^{\circ} + 57.5^{\circ} - 180^{\circ} = 12.5^{\circ}$ so that,

$$
a = 2.37 \text{ m/s}^2 \qquad 12.5^{\circ} \mathcal{F} \qquad \qquad \text{Ans.}
$$

NOTE: By using *n, t* coordinates, we were able to readily solve this problem through the use of Eq. 12–18, since it accounts for the separate changes in the magnitude and direction of **v**.

5 m -10_m *x* $\sqrt{\frac{1}{A}}$ *t n* (a) θ $y = \frac{1}{20}x^2$ 20 $\frac{1.273 \text{ m/s}^2}{\log 2}$ *n*

12 EXAMPLE **12.15**

A race car *C* travels around the horizontal circular track that has a radius of 300 ft, Fig. 12–28. If the car increases its speed at a constant rate of 7 ft/s², starting from rest, determine the time needed for it to reach an acceleration of 8 ft/s^2 . What is its speed at this instant?

SOLUTION

Coordinate System. The origin of the *n* and *t* axes is coincident with the car at the instant considered. The *t* axis is in the direction of motion, and the positive *n* axis is directed toward the center of the circle. This coordinate system is selected since the path is known.

Acceleration. The magnitude of acceleration can be related to its **Acceleration.** The magnitude of acceleration can be related to its
components using $a = \sqrt{a_t^2 + a_n^2}$. Here $a_t = 7$ ft/s². Since $a_n = v^2/\rho$,
the velocity as a function of time must be determined first the velocity as a function of time must be determined first.
 $v = v_0 + (a_t)_c t$ 2 e magnitude of acceleration can
 $a = \sqrt{a_t^2 + a_n^2}$. Here $a_t = 7$ ft/s².

action of time must be determined f

$$
v = v_0 + (a_t)_c t
$$

$$
v = 0 + 7t
$$

Thus

$$
a_n = \frac{v^2}{\rho} = \frac{(7t)^2}{300} = 0.163t^2 \,\text{ft/s}^2
$$

The time needed for the acceleration to reach 8 ft/s² is therefore

$$
a = \sqrt{a_t^2 + a_n^2}
$$

8 ft/s² = $\sqrt{(7 \text{ ft/s}^2)^2 + (0.163t^2)^2}$

Solving for the positive value of *t* yields
 $0.163t^2 = \sqrt{(8 \text{ ft/s}^2)}$

0.163*t*² =
$$
\sqrt{(8 \text{ ft/s}^2)^2 - (7 \text{ ft/s}^2)^2}
$$

\n*t* = 4.87 s
\nAns.

 $t = 4.87$ s
Velocity. The speed at time $t = 4.87$ s is

$$
v = 7t = 7(4.87) = 34.1 \text{ ft/s}
$$
Ans.

NOTE: Remember the velocity will always be tangent to the path, whereas the acceleration will be directed within the curvature of the path.

EXAMPLE <mark>12.16 12.16 12:00 12:</mark>

The boxes in Fig. 12–29*a* travel along the industrial conveyor. If a box as in Fig. 12–29*b* starts from rest at *A* and increases its speed such that as in Fig. 12–29b starts from rest at A and increases its speed such that $a_t = (0.2t)$ m/s², where t is in seconds, determine the magnitude of its acceleration when it arrives at point R acceleration when it arrives at point *B*. 2 ,

SOLUTION

Coordinate System. The position of the box at any instant is defined from the fixed point *A* using the position or path coordinate *s*, Fig. 12–29*b*. The acceleration is to be determined at *B*, so the origin of the *n, t* axes is at this point.

Acceleration. To determine the acceleration components $a_t = \dot{v}$
and $a_t = \dot{v}^2/a$ it is first necessary to formulate *n* and *i* so that they and $a_n = v^2/\rho$, it is first necessary to formulate v and v so that they may be evaluated at R Since $v_t = 0$ when $t = 0$ then and $a_n = v^2/\rho$, it is first necessary to formulate v and
may be evaluated at *B*. Since $v_A = 0$ when $t = 0$, then #**eleration.** To determine the acceleration $a_n = v^2/\rho$, it is first necessary to formulate v
be evaluated at *R* Since $v_t = 0$ when $t = 0$ 1

$$
a_t = \dot{v} = 0.2t \tag{1}
$$

$$
\int_0^v dv = \int_0^t 0.2t \, dt
$$

$$
v = 0.1t^2
$$
 (2)

The time needed for the box to reach point *B* can be determined by The time needed for the box to reach point *B* can be determined by
realizing that the position of *B* is $s_B = 3 + 2\pi(2)/4 = 6.142$ m,
Fig. 12–29*b* and since $s_A = 0$ when $t = 0$ we have realizing that the position of *B* is $s_B = 3 + 2$
Fig. 12–29*b*, and since $s_A = 0$ when $t = 0$ we have

$$
v = \frac{ds}{dt} = 0.1t^2
$$

$$
\int_0^{6.142 \text{ m}} ds = \int_0^{t_B} 0.1t^2 dt
$$

$$
6.142 \text{ m} = 0.0333t_B^3
$$

$$
t_B = 5.690 \text{s}
$$

Substituting into Eqs. 1 and 2 yields |
|

$$
(aB)t = \dot{v}B = 0.2(5.690) = 1.138 \text{ m/s}^2
$$

$$
vB = 0.1(5.69)^2 = 3.238 \text{ m/s}
$$

 v_B = 2 m, so that

$$
(a_B)_n = \frac{v_B^2}{\rho_B} = \frac{(3.238 \text{ m/s})^2}{2 \text{ m}} = 5.242 \text{ m/s}^2
$$

The magnitude of \mathbf{a}_B , Fig. 12–29*c*, is therefore

$$
a_B = \sqrt{(1.138 \text{ m/s}^2)^2 + (5.242 \text{ m/s}^2)^2} = 5.36 \text{ m/s}^2
$$
 Ans.

12.8 [Curvilinear Motion: Cylindrical](#page-13-0) **Components**

Sometimes the motion of the particle is constrained on a path that is best described using cylindrical coordinates. If motion is restricted to the plane, then polar coordinates are used.

Polar Coordinates. We can specify the location of the particle shown in Fig. 12–30*a* using a *radial coordinate r*, which extends outward from the fixed origin O to the particle, and a *transverse coordinate* θ , which is the counterclockwise angle between a fixed reference line and the *r* axis. The angle is generally measured in degrees or radians, where the *r* axis. The angle is generally measured in degrees or radians, where 1 rad = $180^{\circ}/\pi$. The positive directions of the *r* and θ coordinates are defined by the unit vectors \mathbf{u}_r , and \mathbf{u}_θ , respectively. Here \mathbf{u}_r is in the direction of increasing r when θ is held fixed and **u** is in a direction of direction of increasing r when θ is held fixed, and \mathbf{u}_{θ} is in a direction of increasing θ when r is held fixed. Note that these directions are perpendicular to one another.

 θ

(a)

Position. At any instant the position of the particle, Fig. 12–30*a*, is defined by the position vector

$$
\mathbf{r} = r\mathbf{u}_r \tag{12-22}
$$

Velocity. The instantaneous velocity **v** is obtained by taking the time derivative of **r**. Using a dot to represent the time derivative, we have .
.
. #

$$
\mathbf{v} = \dot{\mathbf{r}} = \dot{r} \mathbf{u}_r + r \dot{\mathbf{u}}_r
$$

To evaluate \mathbf{u}_r , notice that \mathbf{u}_r only changes its direction with respect to time since by definition the magnitude of this vector is always one unit. time, since by definition the magnitude of this vector is always one unit. ¢Hence, during the time Δt , a change Δr will not cause a change in the Hence, during the time Δt , a change Δr will not cause a change in the direction of \mathbf{u}_r ; however, a change $\Delta \theta$ will cause \mathbf{u}_r to become \mathbf{u}'_r , where $\mathbf{u}' = \mathbf{u}_r + \Delta \mathbf{u}_r$. Fig. 12, 306. The t direction of \mathbf{u}_r ; however, a change $\Delta\theta$ will cause \mathbf{u}_r to become \mathbf{u}'_r , where $\mathbf{u}'_r = \mathbf{u}_r + \Delta\mathbf{u}_r$, Fig. 12–30*b*. The time change in \mathbf{u}_r is then $\Delta\mathbf{u}_r$. For small angles $\Delta\theta$ this $\mathbf{u}_r' = \mathbf{u}_r + \Delta \mathbf{u}_r$, Fig. 12–30*b*. The time change in \mathbf{u}_r is then $\Delta \mathbf{u}_r$. For small angles $\Delta \theta$ this vector has a magnitude $\Delta u_r \approx 1(\Delta \theta)$ and acts in the \mathbf{u}_θ direction Therefore $\Delta \mathbf{u}_r =$ angles $\Delta \theta$ this vector has a magnitude Δ
direction. Therefore, $\Delta \mathbf{u}_r = \Delta \theta \mathbf{u}_\theta$, and so ne magnitude c
t, a change Δr

$$
\dot{\mathbf{u}}_r = \lim_{\Delta t \to 0} \frac{\Delta \mathbf{u}_r}{\Delta t} = \left(\lim_{\Delta t \to 0} \frac{\Delta \theta}{\Delta t} \right) \mathbf{u}_\theta
$$
\n
$$
\dot{\mathbf{u}}_r = \dot{\theta} \mathbf{u}_\theta \tag{12-23}
$$

Substituting into the above equation, the velocity can be written in component form as

$$
\mathbf{v} = v_r \mathbf{u}_r + v_\theta \mathbf{u}_\theta \tag{12-24}
$$

where

$$
v_r = \dot{r}
$$

\n
$$
v_{\theta} = r\dot{\theta}
$$
 (12-25)

These components are shown graphically in Fig. 12–30*c*. The *radial component* \mathbf{v}_r is a measure of the rate of increase or decrease in the langth of the radial coordinate i.e. is whereas the *transverse component* length of the radial coordinate, i.e., *i*; whereas the *transverse component* \mathbf{v}_{θ} can be interpreted as the rate of motion along the circumference of a circle having a radius *r*. In particular, the term $\theta = d\theta/dt$ is called the angle *n* angular velocity since it indicates the time rate of change of the angle θ *angular velocity*, since it indicates the time rate of change of the angle θ . Common units used for this measurement are rad/s . ##

Since \mathbf{v}_r and \mathbf{v}_θ are mutually perpendicular, the *magnitude* of velocity or speed is simply the positive value of .
.
.

$$
v = \sqrt{(\dot{r})^2 + (\dot{r}\dot{\theta})^2}
$$
 (12–26)

and the *direction* of **v** is, of course, tangent to the path, Fig. 12–30*c*.

Fig. 12–30 (cont.)

Acceleration. Taking the time derivatives of Eq. 12–24, using Eqs. 12–25, we obtain the particle's instantaneous acceleration,

$$
\mathbf{a} = \dot{\mathbf{v}} = \ddot{r} \mathbf{u}_r + \dot{r} \dot{\mathbf{u}}_r + \dot{r} \dot{\theta} \mathbf{u}_\theta + r \dot{\theta} \mathbf{u}_\theta + r \dot{\theta} \dot{\mathbf{u}}_\theta
$$

To evaluate $\dot{\mathbf{u}}_{\theta}$, it is necessary only to find the change in the direction of \mathbf{u}_{θ} To evaluate $\dot{\mathbf{u}}_{\theta}$, it is necessary only to find the change in the direction of \mathbf{u}_{θ} since its magnitude is always unity. During the time Δt , a change Δr will not change the direction of \mathbf{u}_{θ} , since its magnitude is always unity. During the time Δt , a change Δr will not change the direction of \mathbf{u}_{θ} , however, a change $\Delta \theta$ will cause \mathbf{u}_{θ} to become change the direction of \mathbf{u}_{θ} , however, a change $\Delta\theta$ will cause \mathbf{u}_{θ} to become \mathbf{u}'_{θ} , where $\mathbf{u}'_{\theta} = \mathbf{u}_{\theta} + \Delta\mathbf{u}_{\theta}$. Fig. 12–30*d*. The time change in \mathbf{u}_{θ} is thus $\Delta\mathbf{u}_{\theta}$. \mathbf{u}'_{θ} , where $\mathbf{u}'_{\theta} = \mathbf{u}_{\theta} + \Delta \mathbf{u}_{\theta}$, Fig. 12–30*d*. The time change in \mathbf{u}_{θ} is thus $\Delta \mathbf{u}_{\theta}$.
For small angles this vector has a magnitude $\Delta u_{\theta} \approx 1(\Delta \theta)$ and acts in the $-\mathbf{u}$ directi For small angles this vector has a magni
 $-\mathbf{u}_r$, direction; i.e., $\Delta \mathbf{u}_\theta = -\Delta \theta \mathbf{u}_r$. Thus,

$$
\dot{\mathbf{u}}_{\theta} = \lim_{\Delta t \to 0} \frac{\Delta \mathbf{u}_{\theta}}{\Delta t} = -\left(\lim_{\Delta t \to 0} \frac{\Delta \theta}{\Delta t}\right) \mathbf{u}_{r}
$$
\n
$$
\dot{\mathbf{u}}_{\theta} = -\dot{\theta} \mathbf{u}_{r} \tag{12-27}
$$

Substituting this result and Eq. 12–23 into the above equation for **a**, we can write the acceleration in component form as

$$
\boxed{\mathbf{a} = a_r \mathbf{u}_r + a_\theta \mathbf{u}_\theta}
$$
 (12–28)

where

$$
\begin{vmatrix} a_r = \ddot{r} - r\dot{\theta}^2 \\ a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta} \end{vmatrix}
$$
 (12-29)

The term $\theta = d^2\theta/dt^2 = d/dt(d\theta/dt)$ is called the *angular acceleration* since it measures the change made in the angular velocity during an instant of time. Units for this measurement are rad/ s^2 . $\mathbb{R}^{\mathbb{Z}_2}$ = $d^2\theta/dt^2 = d/dt(d\theta/dt)$
sures the change made

Since \mathbf{a}_r , and \mathbf{a}_θ are always perpendicular, the *magnitude* of coloration is simply the positive value of acceleration is simply the positive value of

$$
a = \sqrt{(\ddot{r} - r\dot{\theta}^2)^2 + (r\ddot{\theta} + 2\dot{r}\dot{\theta})^2}
$$
 (12-30)

The *direction* is determined from the vector addition of its two components. In general, **a** will *not* be tangent to the path, Fig. 12–30*e*.

12

(d) **u***r* **u**¿u \mathbf{u}_{θ} Δ u_{θ} Δ θ

Fig. 12–31

The spiral motion of this boy can be followed by using cylindrical components. Here the radial coordinate *r* is constant, the transverse coordinate θ will increase with time as the boy rotates about the vertical, and his altitude *z* will decrease with time.

12 **Cylindrical Coordinates.** If the particle moves along a space
12 **Cylindrical Coordinates.** If the particle moves along a space curve as shown in Fig. 12–31, then its location may be specified by the three *cylindrical coordinates,* r, θ, z *. The <i>z* coordinate is identical to that used for rectangular coordinates. Since the unit vector defining its direction, \mathbf{u}_z , is constant, the time derivatives of this vector are zero, and therefore the position velocity and acceleration of the particle can be therefore the position, velocity, and acceleration of the particle can be written in terms of its cylindrical coordinates as follows:

$$
\mathbf{r}_P = r\mathbf{u}_r + z\mathbf{u}_z
$$

$$
\mathbf{v} = r\mathbf{u}_r + r\dot{\theta}\mathbf{u}_\theta + \dot{z}\mathbf{u}_z
$$
 (12-31)

$$
\mathbf{a} = (\ddot{r} - r\dot{\theta}^2)\mathbf{u}_r + (r\ddot{\theta} + 2\dot{r}\dot{\theta})\mathbf{u}_\theta + \ddot{z}\mathbf{u}_z
$$
(12-32)

Time Derivatives. The above equations require that we obtain the time derivatives \dot{r} , \ddot{r} , $\dot{\theta}$, and $\dot{\theta}$ in order to evaluate the r and θ components of **x** and **a**. Two types of problems generally oc time derivatives \dot{r} , \ddot{r} , θ , and θ in order to evaluate the *r* and θ components of **v** and **a**. Two types of problems generally occur:

- **1.** If the polar coordinates are specified as time parametric equations, If the polar coordinates are specified as time parametric equations,
 $r = r(t)$ and $\theta = \theta(t)$, then the time derivatives can be found directly.
- **2.** If the time-parametric equations are not given, then the path If the time-parametric equations are not given, then the path $r = f(\theta)$ must be known. Using the chain rule of calculus we can then find the relation between \dot{r} and $\dot{\theta}$, and between \ddot{r} and $\ddot{\theta}$.
Applicat then find the relation between \dot{r} and θ , and between \ddot{r} and θ . Application of the chain rule, along with some examples, is explained in Appendix C. |
|
|

Procedure for Analysis

Coordinate System.

- Polar coordinates are a suitable choice for solving problems when data regarding the angular motion of the radial coordinate *r* is given to describe the particle's motion.Also, some paths of motion can conveniently be described in terms of these coordinates.
- To use polar coordinates, the origin is established at a fixed point, and the radial line *r* is directed to the particle.
- The transverse coordinate θ is measured from a fixed reference line to the radial line.

Velocity and Acceleration.

- Once *r* and the four time derivatives \dot{r} , \ddot{r} , $\dot{\theta}$, and $\ddot{\theta}$ have been evaluated at the instant considered, their values can be substituted into Eqs. 12–25 and 12–29 to obtain the radial and transverse components of **v** and **a**. \dot{r} , \ddot{r} , $\dot{\theta}$, their
- If it is necessary to take the time derivatives of $r = f(\theta)$, then the
chain rule of calculus must be used. See Appendix C chain rule of calculus must be used. See Appendix C.
- Motion in three dimensions requires a simple extension of the above procedure to include \dot{z} and \ddot{z} . above procedure to include \dot{z} and \dddot{z}

EXAMPLE $\begin{bmatrix} 12.17 \end{bmatrix}$

The amusement park ride shown in Fig. 12–32*a* consists of a chair that \$is rotating in a horizontal circular path of radius *r* such that the arm OB has an angular velocity θ and angular acceleration θ . Determine the radial and transverse components of velocity and acceleration of the passenger. Neglect his size in the calculation. own in Fig. 12–52*a* consists of
reular path of radius *r* such t
 $\hat{\theta}$ and angular acceleration $\hat{\theta}$.

SOLUTION

Coordinate System. Since the angular motion of the arm is reported, polar coordinates are chosen for the solution, Fig. 12–32*a*. Here θ is not related to *r*, since the radius is constant for all θ .

Velocity and Acceleration. It is first necessary to specify the first and second time derivatives of r and θ . Since r is *constant*, we have tives of *r* and θ . Since *r*:
 $r = r$ $\dot{r} = 0$ $\dddot{r} =$

 $= 0$

Thus,

$$
v_r = \dot{r} = 0
$$
 Ans.

$$
v_{\theta} = r\dot{\theta}
$$
Ans.

$$
a_r = \ddot{r} - r\dot{\theta}^2 = -r\dot{\theta}^2
$$
Ans.

$$
a_{\theta} = r\ddot{\theta} + 2\dot{r}\dot{\theta} = r\ddot{\theta}
$$
Ans.

These results are shown in Fig. 12–32*b*.

NOTE: The *n, t* axes are also shown in Fig. 12–32*b*, which in this special case of circular motion happen to be *collinear* with the r and θ special case of circular motion happen to be *collinear* with the *i* axes, respectively. Since $v = v_{\theta} = v_t = r\dot{\theta}$, then by comparison, #|
|
| ,

$$
-a_r = a_n = \frac{v^2}{\rho} = \frac{(r\dot{\theta})^2}{r} = r\dot{\theta}^2
$$

$$
a_\theta = a_t = \frac{dv}{dt} = \frac{d}{dt}(r\dot{\theta}) = \frac{dr}{dt}\dot{\theta} + r\frac{d\dot{\theta}}{dt} = 0 + r\ddot{\theta}
$$

EXAMPLE 12.18

The rod *OA* in Fig. 12–33*a* rotates in the horizontal plane such that $\theta = (t^3)$ rad. At the same time, the collar *B* is sliding outward along *OA* so that $r = (100t^2)$ mm. If in both cases *t* is in seconds determined $\theta = (t^3)$ rad. At the same time, the collar *B* is sliding outward along *OA* so that $r = (100t^2)$ mm. If in both cases *t* is in seconds, determine the velocity and acceleration of the collar when $t = 1$ s *OA* so that $r = (100t^2)$ mm. If in both cases *t* is in seconthe velocity and acceleration of the collar when $t = 1$ s. **SOLUTION** Coordinate System. Since time-parametric equations of the path are given, it is not necessary to relate r to θ . Velocity and Acceleration. Determining the time derivatives and **Velocity and Acceleration.** Determinevaluating them when $t = 1$ s, we have As shown in Fig. 12–33*b*, The magnitude of **v** is *Ans. Ans.* As shown in Fig. 12–33*c*, \$The magnitude of **a** is *Ans. NOTE: The velocity is tangent to the path; however, the acceleration is directed within the curvature of the path, as expected.

The rod *OA* in Fig. 12–33*a* rotates in the horizontal plane such that

Ans.

Ans.

EXAMPLE <mark>12.19 12.</mark> The second state of the second state of the second state of the second state of the second sta

The searchlight in Fig. 12–34*a* casts a spot of light along the face of a wall that is located 100 m from the searchlight. Determine the magnitudes of the velocity and acceleration at which the spot appears to travel across the velocity and acceleration at which the spot appears to travel across
the wall at the instant $\theta = 45^{\circ}$. The searchlight rotates at a constant rate of $\theta = 4$ rad/s.

SOLUTION

Coordinate System. Polar coordinates will be used to solve this problem since the angular rate of the searchlight is given. To find the necessary time derivatives it is first necessary to relate r to θ . From Fig. 12–34*a*,

$$
r = 100/\cos \theta = 100 \sec \theta
$$

Velocity and Acceleration. Using the chain rule of calculus, noting **Velocity and Acceleration.** Using the chain rule of calculus, nother that $d(\sec \theta) = \sec \theta \tan \theta d\theta$, and $d(\tan \theta) = \sec^2 \theta d\theta$, we have # $\frac{1}{2}$ #

$$
\dot{r} = 100(\sec \theta \tan \theta) \dot{\theta}
$$

\n
$$
\ddot{r} = 100(\sec \theta \tan \theta) \dot{\theta} (\tan \theta) \dot{\theta} + 100 \sec \theta (\sec^2 \theta) \dot{\theta} (\dot{\theta})
$$

\n
$$
+ 100 \sec \theta \tan \theta (\dot{\theta})
$$

\n
$$
= 100 \sec \theta \tan^2 \theta (\dot{\theta})^2 + 100 \sec^3 \theta (\dot{\theta})^2 + 100(\sec \theta \tan \theta) \dot{\theta}
$$

Since $\theta = 4$ rad/s = constant, then $\theta = 0$, and the above equations, Since $\theta = 4 \text{ rad/s} = \text{cc}$
when $\theta = 45^{\circ}$, become = 100 sec θ tan² θ (θ)² + 100 sec³ θ (
 $\dot{\theta}$ = 4 rad/s = constant, then $\dddot{\theta}$ = 0,

45°, become
\n
$$
r = 100 \text{ sec } 45^\circ = 141.4
$$

\n $\dot{r} = 400 \text{ sec } 45^\circ \text{ tan } 45^\circ = 565.7$
\n $\ddot{r} = 1600 (\text{sec } 45^\circ \text{ tan}^2 45^\circ + \text{sec}^3 45^\circ) = 6788.2$

As shown in Fig. 12–34*b*,
 $\mathbf{v} = \dot{r} \mathbf{u}_r$ |
|
|

g. 12-34b,
\n
$$
\mathbf{v} = \dot{r} \mathbf{u}_r + r \dot{\theta} \mathbf{u}_\theta
$$
\n
$$
= 565.7 \mathbf{u}_r + 141.4(4) \mathbf{u}_\theta
$$
\n
$$
= \{565.7 \mathbf{u}_r + 565.7 \mathbf{u}_\theta\} \text{ m/s}
$$
\n
$$
v = \sqrt{v_r^2 + v_\theta^2} = \sqrt{(565.7)^2 + (565.7)^2}
$$
\n
$$
= 800 \text{ m/s}
$$

#

As shown in Fig. 12-34*c*,
\n
$$
\mathbf{a} = (\ddot{r} - r\dot{\theta}^2)\mathbf{u}_r + (r\ddot{\theta} + 2\dot{r}\dot{\theta})\mathbf{u}_\theta
$$
\n
$$
= [6788.2 - 141.4(4)^2]\mathbf{u}_r + [141.4(0) + 2(565.7)4]\mathbf{u}_\theta
$$
\n
$$
= {4525.5\mathbf{u}_r + 4525.5\mathbf{u}_\theta} \text{ m/s}^2
$$
\n
$$
a = \sqrt{a_r^2 + a_\theta^2} = \sqrt{(4525.5)^2 + (4525.5)^2}
$$
\n
$$
= 6400 \text{ m/s}^2
$$

NOTE: It is also possible to find *a* without having to calculate \ddot{r} (or a_r). **NOTE:** It is also possible to find *a* without having to calculate \ddot{r} (or a_r).
As shown in Fig. 12–34*d*, since $a_\theta = 4525.5 \text{ m/s}^2$, then by vector resolution $a = 4525.5/\cos 45^\circ = 6400 \text{ m/s}^2$ As shown in Fig. 12–34*d*, since $a_{\theta} = 45$
resolution, $a = 4525.5/\cos 45^{\circ} = 6400$ m/s 2 . 2 , then by vector

EXAMPLE 12.20

Due to the rotation of the forked rod, the ball in Fig. 12–35*a* travels around the slotted path, a portion of which is in the shape of a around the slotted path, a portion of which is in the shape of a
cardioid, $r = 0.5(1 - \cos \theta)$ ft, where θ is in radians. If the ball's
velocity is $x = 4$ ft/s and its acceleration is $a = 30$ ft/s² at the instant cardioid, $r = 0.5(1 - \cos \theta)$ ft, where θ is in radians. If the ball's
velocity is $v = 4$ ft/s and its acceleration is $a = 30$ ft/s² at the instant determine the angular velocity θ and angular acceleration θ of the fork. velocity is
 $\theta = 180^{\circ},$ 2 $v = 0.5(1$
 $v = 4$ ft/s

SOLUTION

Coordinate System. This path is most unusual, and mathematically it is best expressed using polar coordinates, as done here, rather than rectangular coordinates. Also, since θ and θ must be determined, then r, θ coordinates are an obvious choice. |
|
|

Velocity and Acceleration. The time derivatives of r and θ can be determined using the chain rule.

$$
r = 0.5(1 - \cos \theta)
$$

\n
$$
\dot{r} = 0.5(\sin \theta)\dot{\theta}
$$

\n
$$
\ddot{r} = 0.5(\cos \theta)\dot{\theta}(\dot{\theta}) + 0.5(\sin \theta)\ddot{\theta}
$$

Evaluating these results at $\theta = 180^{\circ}$, we have |
|
|

$$
r = 1 \text{ ft} \qquad \dot{r} = 0 \qquad \ddot{r} = -0.5\dot{\theta}^2
$$

Since $v = 4$ ft/s, using Eq. 12–26 to determine θ yields \overline{a} $v = 4$ ft/s,

$$
v = \sqrt{(r)^2 + (r\theta)^2}
$$

4 = $\sqrt{(0)^2 + (1\theta)^2}$
 $\dot{\theta} = 4 \text{ rad/s}$ Ans.

In a similar manner, θ can be found using Eq. 12–30. .
.
. #

$$
a = \sqrt{(\ddot{r} - r\dot{\theta}^2)^2 + (r\ddot{\theta} + 2\dot{r}\dot{\theta})^2}
$$

30 = $\sqrt{[-0.5(4)^2 - 1(4)^2]^2 + [1\ddot{\theta} + 2(0)(4)]^2}$
(30)² = $(-24)^2 + \ddot{\theta}^2$
 $\ddot{\theta} = 18 \text{ rad/s}^2$ Ans.

Vectors **a** and **v** are shown in Fig. 12–35*b*.

NOTE: At this location, the θ and t (tangential) axes will coincide. The $+n$ (normal) axis is directed to the right, opposite to $+r$.

Probs. 12–190/191

12.9 [Absolute Dependent Motion](#page-13-0) Analysis of Two Particles

In some types of problems the motion of one particle will *depend* on the corresponding motion of another particle. This dependency commonly occurs if the particles, here represented by blocks, are interconnected by inextensible cords which are wrapped around pulleys. For example, the movement of block *A* downward along the inclined plane in Fig. 12–36 will cause a corresponding movement of block *B* up the other incline.We can show this mathematically by first specifying the location of the blocks using *position coordinates* s_A and s_B . Note that each of the coordinate axes
is (1) measured from a *fixed* point (*O*) or *fixed* datum line. (2) measured is (1) measured from a *fixed* point (*O*) or *fixed* datum line, (2) measured along each inclined plane *in the direction of motion* of each block, and (3) has a positive sense from *C* to *A* and *D* to *B*. If the total cord length is l_T , the two position coordinates are related by the equation
 $s_A + l_{CD} + s_B = l_T$

$$
s_A + l_{CD} + s_B = l_T
$$

Here l_{CD} is the length of the cord passing over arc *CD*. Taking the time derivative of this expression, realizing that l_{CD} and l_T remain constant, while s_A and s_B measure the segments of the cord that change in length.
We have We have $\frac{1}{\text{cord that}}$

$$
\frac{ds_A}{dt} + \frac{ds_B}{dt} = 0 \qquad \text{or} \qquad v_B = -v_A
$$

The negative sign indicates that when block *A* has a velocity downward, i.e., in the direction of positive s_A , it causes a corresponding upward velocity of block R i.e. R moves in the negative s-direction velocity of block B ; i.e., B moves in the negative s_B direction.

In a similar manner, time differentiation of the velocities yields the relation between the accelerations, i.e.,

$$
a_B = -a_A
$$

A more complicated example is shown in Fig. 12–37*a*. In this case, the position of block *A* is specified by s_A , and the position of the *end* of the cord from which block *B* is suspended is defined by s_B . As above we cord from which block *B* is suspended is defined by s_B . As above, we have chosen position coordinates which (1) have their origin at fixed have chosen position coordinates which (1) have their origin at fixed points or datums, (2) are measured in the direction of motion of each block, and (3) are positive to the right for s_A and positive downward for S_B . During the motion, the length of the red colored segments of the cord
in Fig. 12–37*a remains constant*. If *I* represents the total length of cord in Fig. 12–37*a remains constant*. If *l* represents the total length of cord minus these segments, then the position coordinates can be related by the equation

$$
2s_B + h + s_A = l
$$

Since *l* and *h* are constant during the motion, the two time derivatives yield
 $2v_B = -v_A$ $2a_B = -a_A$

$$
2v_B = -v_A \qquad 2a_B = -a_A
$$

Hence, when *B* moves downward $(+s_B)$, *A* moves to the left $(-s_A)$ with twice the motion.

12

Fig. 12–37

Fig. 12–37 (cont.)

The motion of the traveling block on this oil rig depends upon the motion of the cable connected to the winch which operates it. It is important to be able to relate these motions in order to determine the power requirements of the winch and the force in the cable caused by any accelerated motion.

This example can also be worked by defining the position of block *B* from the center of the bottom pulley (a fixed point), Fig. 12–37*b*. In this case

$$
2(h - s_B) + h + s_A = l
$$

Time differentiation yields

 $2v_B = v_A$ 2a_B = a_A

Here the signs are the same. Why?

Procedure for Analysis

The above method of relating the dependent motion of one particle to that of another can be performed using algebraic scalars or position coordinates provided each particle moves along a rectilinear path. When this is the case, only the magnitudes of the velocity and acceleration of the particles will change, not their line of direction.

Position-Coordinate Equation.

- Establish each position coordinate with an origin located at a *fixed* point or datum.
- It is *not necessary* that the *origin* be the *same* for each of the coordinates; however, it is *important* that each coordinate axis selected be directed along the *path of motion* of the particle.
- Using geometry or trigonometry, relate the position coordinates to the total length of the cord, l_T , or to that portion of cord, l , which *excludes* the segments that do not change length as the which *excludes* the segments that do not change length as the particles move—such as arc segments wrapped over pulleys.
- If a problem involves a *system* of two or more cords wrapped around pulleys, then the position of a point on one cord must be related to the position of a point on another cord using the above procedure. Separate equations are written for a fixed length of each cord of the system and the positions of the two particles are then related by these equations (see Examples 12.22 and 12.23).

Time Derivatives.

- Two successive time derivatives of the position-coordinate equations yield the required velocity and acceleration equations which relate the motions of the particles.
- The signs of the terms in these equations will be consistent with those that specify the positive and negative sense of the position coordinates.

EXAMPLE 12.21 **12.21** 12 December 12.21 12.21 12.21 12.22 12.22 12.22 12.22 12.22 12.22 12.22 12.22 12.22 12.22

Determine the speed of block *A* in Fig. 12–38 if block *B* has an upward speed of $6 \frac{\text{ft}}{\text{s}}$.

Fig. 12–38

SOLUTION

Position-Coordinate Equation. There is *one cord* in this system having segments which change length. Position coordinates s_A and s_B will be used since each is measured from a fixed point $(C \text{ or } D)$ and extends along each block's *path of motion*. In particular, s_B is directed to point *E* since motion of *B* and *E* is the *same*. \overline{B}

The red colored segments of the cord in Fig. 12–38 remain at a constant length and do not have to be considered as the blocks move. The remaining length of cord, *l*, is also constant and is related to the changing position coordinates s_A and s_B by the equation

$$
s_A + 3s_B = l
$$

Time Derivative. Taking the time derivative yields

$$
v_A + 3v_B = 0
$$

so that when $v_B = -6$ ft/s (upward),

$$
v_A = 18 \text{ ft/s} \downarrow \qquad \qquad \text{Ans.}
$$

12 **EXAMPLE** 12.22

Determine the speed of *A* in Fig. 12–39 if *B* has an upward speed of 6 ft/s.

SOLUTION

Position-Coordinate Equation. As shown, the positions of blocks *A* and *B* are defined using coordinates s_A and s_B . Since the system has two cords with segments that change length it will be necessary to use *two cords* with segments that change length, it will be necessary to use a third coordinate, s_c , in order to relate s_A to s_B . In other words, the length of one of the cords can be expressed in terms of s_s, and s_s, and length of one of the cords can be expressed in terms of s_A and s_C , and the length of the other cord can be expressed in terms of sp and sq. the length of the other cord can be expressed in terms of s_B and s_C .
The red colored segments of the cords in Fig. 12–39 do not have

The red colored segments of the cords in Fig. 12–39 do not have to be considered in the analysis. Why? For the remaining cord lengths, say l_1 and l_2 , we have

$$
s_A + 2s_C = l_1 \qquad s_B + (s_B - s_C) = l_2
$$

Time Derivative. Taking the time derivative of these equations yields
 $v_A + 2v_C = 0$ $2v_B - v_C = 0$

$$
v_A + 2v_C = 0 \t 2v_B - v_C = 0
$$

Eliminating v_C produces the relationship between the motions of each cylinder cylinder.

$$
v_A + 4v_B = 0
$$

so that when $v_B = -6$ ft/s (upward),

$$
v_A = +24 \text{ ft/s} = 24 \text{ ft/s} \downarrow \qquad \qquad \text{Ans.}
$$

EXAMPLE 12.23

Determine the speed of block *B* in Fig. 12–40 if the end of the cord at *A* is pulled down with a speed of 2 m/s .

SOLUTION

Position-Coordinate Equation. The position of point *A* is defined by s_A , and the position of block *B* is specified by s_B since point *E* on the pulley will have the *same motion* as the block. Both coordinates the pulley will have the *same motion* as the block. Both coordinates are measured from a horizontal datum passing through the *fixed* pin at pulley *D*. Since the system consists of *two* cords, the coordinates s_A and s_B cannot be related directly. Instead, by establishing a third position coordinate, s_C , we can now express the length of one of the cords in terms of sp and sq and the length of the other cord in terms cords in terms of s_B and s_C , and the length of the other cord in terms of s_C , s_B and s_C of s_A , s_B , and s_C .
Excluding the

Excluding the red colored segments of the cords in Fig. 12–40, the remaining constant cord lengths l_1 and l_2 (along with the hook and link dimensions) can be expressed as link dimensions) can be expressed as

$$
s_C + s_B = l_1
$$

(s_A - s_C) + (s_B - s_C) + s_B = l₂

Time Derivative. The time derivative of each equation gives
 $v_C + v_B = 0$

$$
v_C + v_B = 0
$$

$$
v_A - 2v_C + 2v_B = 0
$$

Eliminating v_C , we obtain

$$
v_A + 4v_B = 0
$$

so that when $v_A = 2$ m/s (downward),

$$
v_B = -0.5 \text{ m/s} = 0.5 \text{ m/s} \text{ ?}
$$
 Ans.

12

A man at *A* is hoisting a safe *S* as shown in Fig. 12–41 by walking to A man at A is hoisting a safe S as shown in Fig. 12–41 by walking to
the right with a constant velocity $v_A = 0.5$ m/s. Determine the
velocity and acceleration of the safe when it reaches the elevation of velocity and acceleration of the safe when it reaches the elevation of 10 m. The rope is 30 m long and passes over a small pulley at *D*.

SOLUTION

Position-Coordinate Equation. This problem is unlike the previous examples since rope segment *DA* changes *both direction and magnitude*. However, the ends of the rope, which define the positions of *S* and *A*, are specified by means of the *x* and *y* coordinates since they must be measured from a fixed point and *directed along the paths of motion* of the ends of the rope.

The *x* and *y* coordinates may be related since the rope has a fixed The x and y coordinates may be related since the rope has a fixed
length $l = 30$ m, which at all times is equal to the length of segment *DA*
plus *CD*. Using the Pythagorean theorem to determine l_{B} , we have plus *CD*. Using the Pythagorean theorem to determine l_{DA} , we have lus CD. Using the Pythagorean theorem
 $l_{DA} = \sqrt{(15)^2 + x^2}$; also, $l_{CD} = 15 - y$.

+
$$
x^2
$$
; also, $l_{CD} = 15 - y$. Hence,
\n
$$
l = l_{DA} + l_{CD}
$$
\n
$$
30 = \sqrt{(15)^2 + x^2} + (15 - y)
$$
\n
$$
y = \sqrt{225 + x^2} - 15
$$
\n(1)

Time Derivatives. Taking the time derivative, using the chain rule **Time Derivatives.** Taking the time derivative, using the c
(see Appendix C), where $v_s = dy/dt$ and $v_A = dx/dt$, yields

$$
v_S = \frac{dy}{dt} = \left[\frac{1}{2}\frac{2x}{\sqrt{225 + x^2}}\right] \frac{dx}{dt}
$$

$$
= \frac{x}{\sqrt{225 + x^2}} v_A
$$
(2)

At $y = 10$ m, x is determined from Eq. 1, i.e., $x = 20$ m. Hence, from
Eq. 2 with $y_i = 0.5$ m/s At $y = 10$ m, x is detern
Eq. 2 with $v_A = 0.5$ m/s,

$$
v_S = \frac{20}{\sqrt{225 + (20)^2}} (0.5) = 0.4 \text{m/s} = 400 \text{mm/s} \text{ ?} \quad \text{Ans.}
$$

The acceleration is determined by taking the time derivative of Eq. 2. Since v_A is constant, then $a_A = dv_A/dt = 0$, and we have

Since
$$
v_A
$$
 is constant, then $a_A = dv_A/dt = 0$, and we have
\n
$$
a_S = \frac{d^2y}{dt^2} = \left[\frac{-x(dx/dt)}{(225 + x^2)^{3/2}}\right]xv_A + \left[\frac{1}{\sqrt{225 + x^2}}\right] \left(\frac{dx}{dt}\right)v_A + \left[\frac{1}{\sqrt{225 + x^2}}\right]x\frac{dv_A}{dt} = \frac{225v_A^2}{(225 + x^2)^{3/2}}
$$
\nAt $x = 20$ m, with $v_A = 0.5$ m/s, the acceleration becomes

$$
a_S = \frac{225(0.5 \text{ m/s})^2}{[225 + (20 \text{ m})^2]^{3/2}} = 0.00360 \text{ m/s}^2 = 3.60 \text{ mm/s}^2 \text{ }^2 \text{ A} \text{ns.}
$$

NOTE: The constant velocity at *A* causes the other end *C* of the rope to have an acceleration since v_A causes segment *DA* to change its
direction as well as its length direction as well as its length.

12.10 [Relative-Motion of Two Particles](#page-13-0) 12 Using Translating Axes

Throughout this chapter the absolute motion of a particle has been determined using a single fixed reference frame. There are many cases, however, where the path of motion for a particle is complicated, so that it may be easier to analyze the motion in parts by using two or more frames of reference. For example, the motion of a particle located at the tip of an airplane propeller, while the plane is in flight, is more easily described if one observes first the motion of the airplane from a fixed reference and then superimposes (vectorially) the circular motion of the particle measured from a reference attached to the airplane.

In this section *translating frames of reference* will be considered for the analysis. Relative-motion analysis of particles using rotating frames of reference will be treated in Secs. 16.8 and 20.4, since such an analysis depends on prior knowledge of the kinematics of line segments.

Position. Consider particles *A* and *B*, which move along the arbitrary paths shown in Fig. 12–42. The *absolute position* of each particle, \mathbf{r}_A and \mathbf{r}_B , is measured from the common origin *O* of the *fixed x*,
y, *z* reference frame. The origin of a second frame of reference *x'*, *y'*, *z'* is
attached to and moves with particle *A*. *y*, *z* reference frame. The origin of a second frame of reference x' , y' , z' is attached to and moves with particle *A*. The axes of this frame are *only permitted to translate* relative to the fixed frame. The position of *B* measured relative to *A* is denoted by the *relative-position vector* $\mathbf{r}_{B/A}$. Using vector addition, the three vectors shown in Fig. 12–42 can be related by the equation

$$
\mathbf{r}_B = \mathbf{r}_A + \mathbf{r}_{B/A} \tag{12-33}
$$

Velocity. An equation that relates the velocities of the particles is determined by taking the time derivative of the above equation; i.e.,

$$
\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A} \tag{12-34}
$$

Here $\mathbf{v}_B = d\mathbf{r}_B/dt$ and $\mathbf{v}_A = d\mathbf{r}_A/dt$ refer to *absolute velocities*, since they are observed from the fixed frame; whereas the *relative velocity* they are observed from the fixed frame; whereas the *relative velocity* they are observed from the fixed frame; whereas the *relative velocity* $\mathbf{v}_{B/A} = d\mathbf{r}_{B/A}/dt$ is observed from the translating frame. It is important to note that since the $\mathbf{r}' \cdot \mathbf{v}'$ are translate the *components* $\mathbf{v}_{B/A} = d\mathbf{r}_{B/A}/dt$ is observed from the translating frame. It is important
to note that since the x', y', z' axes translate, the *components* of $\mathbf{r}_{B/A}$
will *not* change direction and therefore the time derivati will *not* change direction and therefore the time derivative of these components will only have to account for the change in their magnitudes. Equation 12–34 therefore states that the velocity of *B* is equal to the velocity of *A* plus (vectorially) the velocity of "*B* with respect to *A*," as measured by the *translating observer* fixed in the z¿ reference frame. with x', y' ,

Acceleration. The time derivative of Eq. 12–34 yields a similar vector relation between the *absolute* and *relative accelerations* of particles *A* and *B*.

$$
\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A} \tag{12-35}
$$

Here $\mathbf{a}_{B/A}$ is the acceleration of *B* as seen by the observer located at *A* and translating with the *x'*, *y'*, *z'* reference frame.*

Procedure For Analysis

- When applying the relative velocity and acceleration equations, it is first necessary to specify the particle *A* that is the origin for it is first necessary to specify the particle A that is the origin for
the translating x' , y' , z' axes. Usually this point has a *known*
velocity or acceleration velocity or acceleration.
- Since vector addition forms a triangle, there can be at most *two unknowns*, represented by the magnitudes and/or directions of the vector quantities.
- These unknowns can be solved for either graphically, using trigonometry (law of sines, law of cosines), or by resolving each of the three vectors into rectangular or Cartesian components, thereby generating a set of scalar equations.

The pilots of these jet planes flying close to one another must be aware of their relative positions and velocities at all times in order to avoid a collision.

EXAMPLE $\begin{bmatrix} 12.25 \end{bmatrix}$

A train travels at a constant speed of 60 mi/h , crosses over a road as shown in Fig. $12-43a$. If the automobile A is traveling at 45 mi/h along the road, determine the magnitude and direction of the velocity of the train relative to the automobile.

SOLUTION I

Vector Analysis. The relative velocity $\mathbf{v}_{T/A}$ is measured from the *translating* \mathbf{v}' *,* \mathbf{v}' *axes attached to the automobile. Fig. 12, 43g. It is* **Vector Analysis.** The relative velocity $\mathbf{v}_{T/A}$ is measured from the translating x', y' axes attached to the automobile, Fig. 12–43*a*. It is determined from $\mathbf{v}_T = \mathbf{v}_A + \mathbf{v}_{T/A}$. Since \mathbf{v}_T and \mathbf{v}_A translating x', y' axes attached to the automobile, Fig. 12–43*a*. It is
determined from $\mathbf{v}_T = \mathbf{v}_A + \mathbf{v}_{T/A}$. Since \mathbf{v}_T and \mathbf{v}_A are known in *both*
magnitude, and direction, the unknowns become the x a magnitude and direction, the unknowns become the *x* and *y*

components of
$$
\mathbf{v}_{T/A}
$$
. Using the *x*, *y* axes in Fig. 12–43*a*, we have
\n
$$
\mathbf{v}_T = \mathbf{v}_A + \mathbf{v}_{T/A}
$$
\n
$$
60\mathbf{i} = (45 \cos 45^\circ \mathbf{i} + 45 \sin 45^\circ \mathbf{j}) + \mathbf{v}_{T/A}
$$
\n
$$
\mathbf{v}_{T/A} = \{28.2\mathbf{i} - 31.8\mathbf{j}\} \text{ mi/h}
$$
\nAns.

The magnitude of $\mathbf{v}_{T/A}$ is thus

$$
v_{T/A} = \sqrt{(28.2)^2 + (-31.8)^2} = 42.5 \text{ mi/h}
$$
 Ans.

From the direction of each component, Fig. 12–43*b*, the direction of $\mathbf{v}_{T/A}$ is

$$
\tan \theta = \frac{(v_{T/A})_y}{(v_{T/A})_x} = \frac{31.8}{28.2}
$$

$$
\theta = 48.5^\circ \quad \text{S} \qquad \text{Ans.}
$$

Note that the vector addition shown in Fig. 12–43*b* indicates the correct sense for $\mathbf{v}_{T/A}$. This figure anticipates the answer and can be used to check it used to check it.

SOLUTION II

Scalar Analysis. The unknown components of $\mathbf{v}_{T/A}$ can also be determined by applying a scalar analysis. We will assume these determined by applying a scalar analysis. We will assume these

components act in the *positive x* and y directions. Thus,
\n
$$
\mathbf{v}_T = \mathbf{v}_A + \mathbf{v}_{T/A}
$$
\n
$$
\begin{bmatrix}\n60 \text{ mi/h} \\
\rightarrow\n\end{bmatrix} = \begin{bmatrix}\n45 \text{ mi/h} \\
\measuredangle^{45^\circ}\n\end{bmatrix} + \begin{bmatrix}\n(v_{T/A})_x \\
\rightarrow\n\end{bmatrix} + \begin{bmatrix}\n(v_{T/A})_y \\
\uparrow\n\end{bmatrix}
$$

Resolving each vector into its *x* and *y* components yields
 $(\stackrel{\pm}{\Rightarrow})$ 60 = 45 cos 45° + $(v_{T/A})_x$ + 0

(\Rightarrow)

(+) 60 = 45 cos 45° + $(v_{T/A})_x + 0$

(+) 0 = 45 sin 45° + 0 + $(v_{T/A})_y$

$$
(+\mid)
$$

Solving, we obtain the previous results,
\n
$$
(v_{T/A})_x = 28.2 \text{ mi/h} = 28.2 \text{ mi/h} \rightarrow
$$
\n
$$
(v_{T/A})_y = -31.8 \text{ mi/h} = 31.8 \text{ mi/h} \downarrow
$$

(b)

 $v_A = 700 \text{ km/h}$ $v_B = 600 \text{ km/h}$

^v*B*/*^A*

Plane *A* in Fig. 12–44*a* is flying along a straight-line path, whereas plane *B* is flying along a circular path having a radius of curvature of plane *B* is flying along a circular path having a radius of curvature of $\rho_B = 400$ km. Determine the velocity and acceleration of *B* as measured by the pilot of *A* measured by the pilot of *A*.

SOLUTION

Velocity. The origin of the *x* and *y* axes are located at an arbitrary fixed point. Since the motion relative to plane *A* is to be determined, fixed point. Since the motion relative to plane *A* is to be determined, the *translating frame of reference* x' , y' is attached to it, Fig. 12–44*a*. Applying the relative-velocity equation in scalar form since the v Applying the relative-velocity equation in scalar form since the velocity

vectors of both planes are parallel at the instant shown, we have
\n
$$
v_B = v_A + v_{B/A}
$$
\n
$$
600 \text{ km/h} = 700 \text{ km/h} + v_{B/A}
$$
\n
$$
v_{B/A} = -100 \text{ km/h} = 100 \text{ km/h} \downarrow
$$
\n*Ans.*

The vector addition is shown in Fig. 12–44*b*.

Acceleration. Plane *B* has both tangential and normal components of acceleration since it is flying along a *curved path*. From Eq. 12–20, the magnitude of the normal component is

$$
(a_B)_n = \frac{v_B^2}{\rho} = \frac{(600 \text{ km/h})^2}{400 \text{ km}} = 900 \text{ km/h}^2
$$

Applying the relative-acceleration equation gives
 $\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$

$$
\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}
$$

900**i** - 100**j** = 50**j** + $\mathbf{a}_{B/A}$

Thus,

$$
\mathbf{a}_{B/A} = \{900\mathbf{i} - 150\mathbf{j}\} \text{ km/h}^2
$$

From Fig. 12–44*c*, the magnitude and direction of $\mathbf{a}_{B/A}$ are therefore

$$
a_{B/A} = 912 \text{ km/h}^2
$$
 $\theta = \tan^{-1} \frac{150}{900} = 9.46^{\circ}$ $\sqrt{2}$ Ans.

NOTE: The solution to this problem was possible using a translating frame of reference, since the pilot in plane *A* is "translating." Observation of the motion of plane *A* with respect to the pilot of plane *B*, however, must be obtained using a *rotating* set of axes attached to plane *B*. (This assumes, of course, that the pilot of *B* is fixed in the rotating frame, so he does not turn his eyes to follow the motion of *A*.) The analysis for this case is given in Example 16.21.

12

EXAMPLE <mark>12.27 Particularly and the set of the</mark>

At the instant shown in Fig. 12–45*a*, cars *A* and *B* are traveling with speeds of 18 m/s and 12 m/s, respectively. Also at this instant, *A* has a decrease in speed of 2 m/s², and *B* has an increase in speed of 3 m/s². Determine the velocity and acceleration of *B* with respect to *A*.

SOLUTION

Velocity. The fixed *x*, *y* axes are established at an arbitrary point on **Velocity.** The fixed x, y axes are established at an arbitrary point on the ground and the translating x', y' axes are attached to car A , Fig. 12–45 a Why? The relative velocity is determined from 12–45*a*. Why? The relative velocity is determined from 12–45*a*. Why? The relative velocity is determined from $\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$. What are the two unknowns? Using a Cartesian vector analysis we have vector analysis, we have

$$
\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}
$$

-12j = (-18 cos 60°i - 18 sin 60°j) + $\mathbf{v}_{B/A}$
 $\mathbf{v}_{B/A} = \{9\mathbf{i} + 3.588\mathbf{j}\} \text{ m/s}$

Thus,

$$
v_{B/A} = \sqrt{(9)^2 + (3.588)^2} = 9.69 \text{ m/s}
$$
 Ans.

Noting that $\mathbf{v}_{B/A}$ has $+\mathbf{i}$ and $+\mathbf{j}$ components, Fig. 12–45*b*, its direction is

$$
\tan \theta = \frac{(v_{B/A})_y}{(v_{B/A})_x} = \frac{3.588}{9}
$$

$$
\theta = 21.7^\circ \quad \text{and} \quad \text{Ans.}
$$

Acceleration. Car *B* has both tangential and normal components of acceleration. Why? The magnitude of the normal component is

$$
(a_B)_n = \frac{v_B^2}{\rho} = \frac{(12 \text{ m/s})^2}{100 \text{ m}} = 1.440 \text{ m/s}^2
$$

Applying the equation for relative acceleration yields
\n
$$
\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}
$$
\n
$$
(-1.440\mathbf{i} - 3\mathbf{j}) = (2 \cos 60^\circ \mathbf{i} + 2 \sin 60^\circ \mathbf{j}) + \mathbf{a}_{B/A}
$$
\n
$$
\mathbf{a}_{B/A} = \{-2.440\mathbf{i} - 4.732\mathbf{j}\} \text{ m/s}^2
$$

Here $\mathbf{a}_{B/A}$ has $-\mathbf{i}$ and $-\mathbf{j}$ components. Thus, from Fig. 12–45*c*,

$$
a_{B/A} = \sqrt{(2.440)^2 + (4.732)^2} = 5.32 \text{ m/s}^2
$$
 Ans.
\n
$$
\tan \phi = \frac{(a_{B/A})_y}{(a_{B/A})_x} = \frac{4.732}{2.440}
$$
 Ans.
\n
$$
\phi = 62.7^\circ \quad \text{R}
$$
 Ans.

NOTE: Is it possible to obtain the relative acceleration of $\mathbf{a}_{A/B}$ using
this method? Peter to the comment mode at the end of Example 12.26 this method? Refer to the comment made at the end of Example 12.26.

CHAPTER REVIEW

Rectilinear Kinematics

Rectilinear kinematics refers to motion along a straight line.A position coordinate *s* specifies the location of the particle on the line, and the displacement Δs is the change in this position.

The average velocity is a vector quantity, defined as the displacement divided by the time interval.

The average speed is a scalar, and is the total distance traveled divided by the time of travel.

The time, position, velocity, and acceleration are related by three differential equations.

If the acceleration is known to be constant, then the differential equations relating time, position, velocity, and acceleration can be integrated.

Graphical Solutions

If the motion is erratic, then it can be described by a graph. If one of these graphs is given, then the others can be established using the differential relations between *^a*, v, *^s*, and *t*.

s

12

Curvilinear Motion, *x* **,** *y***,** *z*

Curvilinear motion along the path can be resolved into rectilinear motion along the *x, y, z* axes.The equation of the ation is used to relate the motion along

each axis.
 $v_z = \dot{z}$ $a_z = \dot{v}$

Projectile Motion

Free-flight motion of a projectile follows a parabolic path. It has a constant velocity in the horizontal direction, and a constant downward acceleration of or 32.2 ft/s² in the vertical direction.Any two of the three equations for constant acceleration apply in the vertical direction, and in the horizontal direction only one equation applies. constant do

Curvilinear Motion *n***,** *t*

If normal and tangential axes are used for the analysis, then **v** is always in the positive *t* direction.

The acceleration has two components. The tangential component, a_t , accounts
for the change in the magnitude of the for the change in the magnitude of the velocity; a slowing down is in the negative *t* direction, and a speeding up is in the positive *t* direction. The normal component \mathbf{a}_n accounts for the change in
the direction of the velocity. This the direction of the velocity. This component is always in the positive *n* direction.

Curvilinear Motion r, θ

If the path of motion is expressed in polar coordinates, then the velocity and acceleration components can be related to the time derivatives of r and θ .

To apply the time-derivative equations, it
is necessary to determine $r, \dot{r}, \ddot{r}, \dot{\theta}, \dot{\theta}$ at
the instant considered. If the nath is necessary to determine $r, \dot{r}, \ddot{r}, \theta, \theta$ at the instant considered. If the path the instant considered. If the path $r = f(\theta)$ is given, then the chain rule of calculus must be used to obtain time calculus must be used to obtain time derivatives. (See Appendix C.) #

Once the data are substituted into the equations, then the algebraic sign of the results will indicate the direction of the components of **v** or **a** along each axis.

$$
a_t = \dot{v} \qquad \text{or} \qquad a_t ds = v dv
$$

$$
a_n=\frac{v^2}{\rho}

$$

$$
a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta}
$$

12

Absolute Dependent Motion of Two Particles

The dependent motion of blocks that are suspended from pulleys and cables can be related by the geometry of the system. This is done by first establishing position coordinates, measured from a fixed origin to each block. Each coordinate must be directed along the line of motion of a block.

Using geometry and/or trigonometry, the coordinates are then related to the cable length in order to formulate a position coordinate equation.

The first time derivative of this equation gives a relationship between the velocities of the blocks, and a second time derivative gives the relation between their accelerations.

Relative-Motion Analysis Using Translating Axes

If two particles *A* and *B* undergo independent motions, then these motions can be related to their relative motion using a *translating set of axes* attached to one of the particles (*A*).

For planar motion, each vector equation produces two scalar equations, one in the *x*, and the other in the *y* direction. For solution, the vectors can be expressed in Cartesian form, or the *x* and *y* scalar components can be written directly.

The design of conveyors for a bottling plant requires knowledge of the forces that act on them and the ability to predict the motion of the bottles they transport.

Kinetics of a Particle: [Force and Acceleration](#page-13-0)

13

[CHAPTER OBJECTIVES](#page-13-0)

- To state Newton's Second Law of Motion and to define mass and weight.
- To analyze the accelerated motion of a particle using the equation of motion with different coordinate systems.
- To investigate central-force motion and apply it to problems in space mechanics.

13.1 [Newton's Second Law of Motion](#page-13-0)

Kinetics is a branch of dynamics that deals with the relationship between the change in motion of a body and the forces that cause this change.The basis for kinetics is Newton's second law, which states that when an *unbalanced force* acts on a particle, the particle will *accelerate* in the direction of the force with a magnitude that is proportional to the force.

This law can be verified experimentally by applying a known unbalanced force **F** to a particle, and then measuring the acceleration **a**. Since the force and acceleration are directly proportional, the constant of proportionality, *m*, may be determined from the ratio constant of proportionality, m, may be determined from the ratio $m = F/a$. This positive scalar m is called the *mass* of the particle.
Being constant during any acceleration m provides a quantitative Being constant during any acceleration, *m* provides a quantitative measure of the resistance of the particle to a change in its velocity, that is its inertia.

If the mass of the particle is *m*, Newton's second law of motion may be written in mathematical form as

$\mathbf{F} = m\mathbf{a}$

The above equation, which is referred to as the *equation of motion*, is one of the most important formulations in mechanics.* As previously stated, its validity is based solely on *experimental evidence*. In 1905, however, Albert Einstein developed the theory of relativity and placed limitations on the use of Newton's second law for describing general particle motion. Through experiments it was proven that *time* is not an absolute quantity as assumed by Newton; and as a result, the equation of motion fails to predict the exact behavior of a particle, especially when the particle's speed approaches the speed of light (0.3 Gm/s) . Developments of the theory of quantum mechanics by Erwin Schrödinger and others indicate further that conclusions drawn from using this equation are also invalid when particles are the size of an atom and move close to one another. For the most part, however, these requirements regarding particle speed and size are not encountered in engineering problems, so their effects will not be considered in this book.

Newton's Law of Gravitational Attraction. Shortly after formulating his three laws of motion, Newton postulated a law governing the mutual attraction between any two particles. In mathematical form this law can be expressed as

$$
F = G \frac{m_1 m_2}{r^2} \tag{13-1}
$$

where

 $F =$ force of attraction between the two particles

 $F =$ force of attraction between the two particles
 $G =$ universal constant of gravitation; according to

experimental evidence $G = 66.73(10^{-12})$ m³/ force of attraction between the two particles

universal constant of gravitation; according to

experimental evidence $G = 66.73(10^{-12}) \text{ m}^3/(\text{kg} \cdot \text{s}^2)$

experimental evidence $G = 66$.
 $m_1, m_2 = \text{mass of each of the two particles}$

 $r =$ distance between the centers of the two particles

^{*}Since *m* is constant, we can also write $\mathbf{F} = d(m\mathbf{v})/dt$, where *m***v** is the particle's linear comentum. Here the unbalanced force acting on the particle is proportional to the time momentum. Here the unbalanced force acting on the particle is proportional to the time rate of change of the particle's linear momentum.

In the case of a particle located at or near the surface of the earth, the only gravitational force having any sizable magnitude is that between the earth and the particle. This force is termed the "weight" and, for our purpose, it will be the only gravitational force considered.

From Eq. 13–1, we can develop a general expression for finding the From Eq. 13–1, we can develop a general expression for finding the
weight *W* of a particle having a mass $m_1 = m$. Let $m_2 = M_e$ be the mass
of the earth and *r* the distance between the earth's center and the of the earth and *r* the distance between the earth's center and the of the earth and *r* the distance bety
particle. Then, if $g = GM_e/r^2$, we have

$$
W = mg
$$

By comparison with $F = ma$, we term *g* the acceleration due to gravity.
For most engineering calculations *g* is a point on the surface of the earth For most engineering calculations *g* is a point on the surface of the earth at sea level, and at a latitude of 45°, which is considered the "standard" Here the values $q = 9.81 \text{ m/s}^2 = 32.2 \text{ ft/s}^2$ will be used for at sea level, and at a latitude of 45° , which is considered the "standard
location." Here the values $g = 9.81 \text{ m/s}^2 = 32.2 \text{ ft/s}^2$ will be used for
calculations calculations.

In the SI system the mass of the body is specified in kilograms, and the weight must be calculated using the above equation, Fig. 13–1*a*. Thus,

$$
W = mg (N) \t(g = 9.81 m/s2)
$$
 (13–2)

As a result, a body of mass 1 kg has a weight of 9.81 N; a 2-kg body weighs 19.62 N; and so on.

In the FPS system the weight of the body is specified in pounds. The mass is measured in slugs, a term derived from "sluggish" which refers to the body's inertia. It must be calculated, Fig. 13–1*b*, using

$$
m = \frac{W}{g}
$$
 (slug) (g = 32.2 ft/s²)

Therefore, a body weighing 32.2 lb has a mass of 1 slug; a 64.4-lb body has a mass of 2 slugs; and so on.

 $(13-3)$

13.2 [The Equation of Motion](#page-13-0)

When more than one force acts on a particle, the resultant force is When more than one force acts on a particle, the resultant force is
determined by a vector summation of all the forces; i.e., $\mathbf{F}_R = \Sigma \mathbf{F}$. For
this more general case the equation of motion may be written as this more general case, the equation of motion may be written as

$$
\Sigma \mathbf{F} = m\mathbf{a} \tag{13-4}
$$

To illustrate application of this equation, consider the particle shown in Fig. 13–2*a*, which has a mass *m* and is subjected to the action of two forces, \mathbf{F}_1 and \mathbf{F}_2 . We can graphically account for the magnitude and direction of each force acting on the particle by drawing the particle's *free-body diagram*, Fig. 13–2*b*. Since the *resultant* of these forces *produces* the vector *m***a**, its magnitude and direction can be represented graphically on the *kinetic diagram*, shown in Fig. 13–2*c*.* The equal sign written between the diagrams symbolizes the *graphical* equivalency ©written between the diagrams symbolizes the *graphical* equivalency
between the free-body diagram and the kinetic diagram; i.e., $\Sigma \mathbf{F} = m\mathbf{a}$.[†]
In particular, note that if $\mathbf{F}_p = \Sigma \mathbf{F} = \mathbf{0}$, then the accel between the free-body diagram and the kinetic diagram; i.e., $\Sigma \mathbf{F} = m\mathbf{a}$.[†]
In particular, note that if $\mathbf{F}_R = \Sigma \mathbf{F} = \mathbf{0}$, then the acceleration is also
zero, so that the particle will either remain at res zero, so that the particle will either remain at *rest* or move along a straight-line path with *constant velocity*. Such are the conditions of *static equilibrium*, Newton's first law of motion.

Inertial Reference Frame. When applying the equation of motion, it is important that the acceleration of the particle be measured with respect to a reference frame that is *either fixed or translates with a constant velocity*. In this way, the observer will not accelerate and measurements of the particle's acceleration will be the *same* from *any reference* of this type. Such a frame of reference is commonly known as a *Newtonian* or *inertial reference frame*, Fig. 13–3.

When studying the motions of rockets and satellites, it is justifiable to consider the inertial reference frame as fixed to the stars, whereas dynamics problems concerned with motions on or near the surface of the earth may be solved by using an inertial frame which is assumed fixed to the earth. Even though the earth both rotates about its own axis and revolves about the sun, the accelerations created by these rotations are relatively small and so they can be neglected for most applications.

*Recall the free-body diagram considers the particle to be free of its surrounding supports and shows all the forces acting on the particle.The kinetic diagram pertains to the particle's motion as caused by the forces.

% otion as caused by the forces.

†The equation of motion can also be rewritten in the form $\Sigma \mathbf{F} - m\mathbf{a} = \mathbf{0}$. The vector
 F and is referred to as the *inertia force vector*. If it is tracted in the same way as *ma* is referred to as the *inertia force vector*. If it is treated in the same way as a "force vector" than the state of "equilibrium" created is referred to as *dynamic equilibrium*. This vector," then the state of "equilibrium" created is referred to as *dynamic equilibrium*. This method of application is often referred to as the *D'Alembert principle*, named after the French mathematician Jean le Rond d'Alembert.

We are all familiar with the sensation one feels when sitting in a car that is subjected to a forward acceleration. Often people think this is caused by a "force" which acts on them and tends to push them back in their seats; however, this is not the case. Instead, this sensation occurs due to their inertia or the resistance of their mass to a change in velocity.

Consider the passenger who is strapped to the seat of a rocket sled. Provided the sled is at rest or is moving with constant velocity, then no force is exerted on his back as shown on his free-body diagram.

When the thrust of the rocket engine causes the sled to accelerate, then the seat upon which he is sitting exerts a force **F** on him which pushes him forward with the sled. In the photo, notice that the inertia of his head resists this change in motion (acceleration), and so his head moves back against the seat and his face, which is nonrigid, tends to distort backward.

Upon deceleration the force of the seatbelt \mathbf{F}' tends to pull his body to a stop, but his head leaves contact with the back of the seat and his face distorts forward, again due to his inertia or tendency to continue to move forward. No force is pulling him forward, although this is the sensation he receives.

13.3 [Equation of Motion for a System of](#page-13-0) **Particles**

The equation of motion will now be extended to include a system of particles isolated within an enclosed region in space, as shown in Fig. 13–4*a*. In particular, there is no restriction in the way the particles are connected, so the following analysis applies equally well to the motion of a solid, liquid, or gas system.

At the instant considered, the arbitrary *i*-th particle, having a mass m_i , subjected to a system of internal forces and a resultant external force is subjected to a system of internal forces and a resultant external force. The *internal force*, represented symbolically as f_i , is the resultant of all the forces the other particles gyert on the *i*th particle. The *resultant* the forces the other particles exert on the *i*th particle. The *resultant external force* \mathbf{F}_i represents, for example, the effect of gravitational, electrical magnetic or contact forces between the *i*th particle and electrical, magnetic, or contact forces between the *i*th particle and adjacent bodies or particles *not* included within the system.

The free-body and kinetic diagrams for the *i*th particle are shown in Fig. 13–4*b*. Applying the equation of motion,

$$
\Sigma \mathbf{F} = m \mathbf{a}; \qquad \qquad \mathbf{F}_i + \mathbf{f}_i = m_i \mathbf{a}_i
$$

When the equation of motion is applied to each of the other particles of the system, similar equations will result. And, if all these equations are added together *vectorially*, we obtain

$$
\Sigma \mathbf{F}_i + \Sigma \mathbf{f}_i = \Sigma m_i \mathbf{a}_i
$$

The summation of the internal forces, if carried out, will equal zero, since internal forces between any two particles occur in equal but opposite collinear pairs. Consequently, only the sum of the external forces will remain, and therefore the equation of motion, written for the system of particles, becomes

$$
\Sigma \mathbf{F}_i = \Sigma m_i \mathbf{a}_i \tag{13-5}
$$

If \mathbf{r}_G is a position vector which locates the *center of mass G* of the **r**ticles Fig. 13.4*g*, then by definition of the center of mass particles, Fig. 13–4*a*, then by definition of the center of mass, particles, Fig. 13–4*a*, then by definition of the center of mass,
 $mr_G = \sum m_i \mathbf{r}_i$, where $m = \sum m_i$ is the total mass of all the particles.

Differentiating this equation twice with respect to time assuming that no Differentiating this equation twice with respect to time, assuming that no mass is entering or leaving the system, yields

$$
m\mathbf{a}_G = \sum m_i \mathbf{a}_i
$$

Substituting this result into Eq. 13–5, we obtain

$$
\Sigma \mathbf{F} = m \mathbf{a}_G \tag{13-6}
$$

Hence, the sum of the external forces acting on the system of particles is equal to the total mass of the particles times the acceleration of its center of mass *G*. Since in reality all particles must have a finite size to possess mass, Eq. 13–6 justifies application of the equation of motion to a *body* that is represented as a single particle.

Important Points

- The equation of motion is based on experimental evidence and is valid only when applied within an inertial frame of reference.
- The equation of motion states that the *unbalanced force* on a particle causes it to *accelerate*.
- An inertial frame of reference does not rotate, rather its axes either translate with constant velocity or are at rest.
- Mass is a property of matter that provides a quantitative measure of its resistance to a change in velocity. It is an absolute quantity and so it does not change from one location to another.
- Weight is a force that is caused by the earth's gravitation. It is not absolute; rather it depends on the altitude of the mass from the earth's surface.

y

13.4 [Equations of Motion: Rectangular](#page-13-0) **Coordinates**

When a particle moves relative to an inertial *x, y, z* frame of reference, the forces acting on the particle, as well as its acceleration, can be expressed in terms of their **i**, **j**, **k** components, Fig. 13–5. Applying the equation of motion, we have

$$
\Sigma \mathbf{F} = m\mathbf{a}; \quad \Sigma F_x \mathbf{i} + \Sigma F_y \mathbf{j} + \Sigma F_z \mathbf{k} = m(a_x \mathbf{i} + a_y \mathbf{j} + a_z \mathbf{k})
$$

For this equation to be satisfied, the respective **i**, **j**, **k** components on the left side must equal the corresponding components on the right side. Consequently, we may write the following three scalar equations: ©

$$
\Sigma F_x = ma_x
$$

\n
$$
\Sigma F_y = ma_y
$$

\n
$$
\Sigma F_z = ma_z
$$
\n(13-7)

In particular, if the particle is constrained to move only in the *x*–*y* plane, then the first two of these equations are used to specify the motion.

Procedure for Analysis

The equations of motion are used to solve problems which require a relationship between the forces acting on a particle and the accelerated motion they cause.

Free-Body Diagram.

- Select the inertial coordinate system. Most often, rectangular or *x, y, z* coordinates are chosen to analyze problems for which the particle has *rectilinear motion*.
- Once the coordinates are established, draw the particle's freebody diagram. Drawing this diagram is *very important* since it provides a graphical representation that accounts for *all the* forces (Σ **F**) which act on the particle, and thereby makes it *forces* $(\Sigma \mathbf{F})$ which act on the particle, and thereby makes it possible to resolve these forces into their *x, y, z* components.
- The direction and sense of the particle's acceleration **a** should also be established. If the sense is unknown, for mathematical convenience assume that the sense of each acceleration component acts in the *same direction* as its *positive* inertial coordinate axis.
- The acceleration may be represented as the *m***a** vector on the kinetic diagram.*
- Identify the unknowns in the problem.

*It is a convention in this text always to use the kinetic diagram as a graphical aid when developing the proofs and theory. The particle's acceleration or its components will be shown as blue colored vectors near the free-body diagram in the examples.

Equations of Motion.

- If the forces can be resolved directly from the free-body diagram, apply the equations of motion in their scalar component form.
- If the geometry of the problem appears complicated, which often occurs in three dimensions, Cartesian vector analysis can be used for the solution.
- *Friction*. If a moving particle contacts a rough surface, it may be necessary to use the *frictional equation*, which relates the frictional and normal forces \mathbf{F}_f and **N** acting at the surface of contact by using the coefficient of kinetic friction i.e. $F_r = \mu_r N$ frictional and normal forces \mathbf{F}_f and N acting at the surface of contact by using the coefficient of kinetic friction, i.e., $F_f = \mu_k N$.
Remember that \mathbf{F}_c always acts on the free-body diagram such Remember that \mathbf{F}_f always acts on the free-body diagram such that it opposes the motion of the particle relative to the surface if that it opposes the motion of the particle relative to the surface it contacts. If the particle is *on the verge* of relative motion, then the coefficient of static friction should be used.
- *Spring*. If the particle is connected to an *elastic spring* having negligible mass, the spring force F_s can be related to the negligible mass, the spring force F_s can be related to the deformation of the spring by the equation $F_s = ks$. Here *k* is the spring's stiffness measured as a force per unit length and s is spring's stiffness measured as a force per unit length, and *s* is the stretch or compression defined as the difference between the deformed length *l* and the undeformed length l_0 , i.e., $s = l - l_0$ $s = l - l_0$.

Kinematics.

- If the velocity or position of the particle is to be found, it will be necessary to apply the necessary kinematic equations once the necessary to apply the necessary kinematic equation
particle's acceleration is determined from $\Sigma \mathbf{F} = m\mathbf{a}$.
- If *acceleration* is a function of time, use $a = dv/dt$ and $v = ds/dt$
which when integrated yield the particle's velocity and position which, when integrated, yield the particle's velocity and position, respectively.
- If *acceleration* is a function of displacement, integrate $a \, ds = v \, dv$
to obtain the velocity as a function of position to obtain the velocity as a function of position.
- If *acceleration is constant*, use $v = v_0 + a_c t$, $s = s_0 + v_0 t + \frac{1}{2}$
 $v^2 = v^2 + 2a (s s_0)$ to determine the velocity or position of If acceleration is constant, use $v = v_0 + a_c t$, $s = s_0 + v_0 t + \frac{1}{2} a_c t^2$,
 $v^2 = v_0^2 + 2a_c(s - s_0)$ to determine the velocity or position of the particle. 2 $v = v_0 + a_c t$, $s = s_0 + v_0 t + \frac{1}{2} a_c t^2$,

rmine the velocity or position of the
- If the problem involves the dependent motion of several particles, use the method outlined in Sec. 12.9 to relate their accelerations. In all cases, make sure the positive inertial coordinate directions used for writing the kinematic equations are the same as those used for writing the equations of motion; otherwise, simultaneous solution of the equations will result in errors.
- If the solution for an unknown vector component yields a negative scalar, it indicates that the component acts in the direction opposite to that which was assumed.

(a)

The 50-kg crate shown in Fig. 13–6*a* rests on a horizontal surface for The 50-kg crate shown in Fig. 13–6*a* rests on a horizontal surface for which the coefficient of kinetic friction is $\mu_k = 0.3$. If the crate is subjected to a 400 N towing force as shown determine the velocity of subjected to a 400-N towing force as shown, determine the velocity of the crate in 3 s starting from rest.

SOLUTION

Using the equations of motion, we can relate the crate's acceleration to the force causing the motion. The crate's velocity can then be determined using kinematics.

Free-Body Diagram. The weight of the crate is $W = mg =$
50 kg (9.81 m/s²) = 490.5 N. As shown in Fig. 13–6b, the frictional **Free-Body Diagram.** The weight of the crate is $W = mg = 50 \text{ kg } (9.81 \text{ m/s}^2) = 490.5 \text{ N}$. As shown in Fig. 13–6*b*, the frictional 50 kg (9.81 m/s²) = 490.5 N. As shown in Fig. 13–6b, the frictional force has a magnitude $F = \mu_k N_C$ and acts to the left, since it opposes the motion of the crate. The acceleration **a** is assumed to act horizontally in motion of the crate. The acceleration **a** is assumed to act horizontally, in the positive *x* direction. There are two unknowns, namely N_c and a .

Equations of Motion. Using the data shown on the free-body diagram, we have \cdot ¹C

diagram, we have
\n
$$
\Rightarrow \Sigma F_x = ma_x;
$$
 400 cos 30° − 0.3 $N_C = 50a$ (1)

$$
\Rightarrow \Sigma F_x = ma_x; \qquad \qquad 400 \cos 30^\circ - 0.3N_C = 50a \qquad (1)
$$

+ $\uparrow \Sigma F_y = ma_y; \qquad N_C - 490.5 + 400 \sin 30^\circ = 0 \qquad (2)$

Solving Eq. 2 for N_C , substituting the result into Eq. 1, and solving r *a* vields for *a* yields

$$
N_C = 290.5 \text{ N}
$$

$$
a = 5.185 \text{ m/s}^2
$$

Kinematics. Notice that the acceleration is *constant*, since the applied force **P** is constant. Since the initial velocity is zero, the velocity of the crate in 3 s is

velocity of the crate in 3 s is
\n
$$
(x + 2) \qquad v = v_0 + a_c t = 0 + 5.185(3)
$$
\n
$$
= 15.6 \text{ m/s} \rightarrow \text{Ans.}
$$

NOTE: We can also use the alternative procedure of drawing the crate's free-body *and* kinetic diagrams, Fig. 13–6*c*, prior to applying the equations of motion.

y

a

Fig. 13–6

A 10-kg projectile is fired vertically upward from the ground, with an initial velocity of 50 m/s, Fig. $13-7a$. Determine the maximum height to which it will travel if (*a*) atmospheric resistance is neglected; and to which it will travel if (*a*) atmospheric resistance is neglected; and (*b*) atmospheric resistance is measured as $F_D = (0.01v^2)$ N, where *v* is the speed of the projectile at any instant measured in m/s the speed of the projectile at any instant, measured in m/s .

SOLUTION

In both cases the known force on the projectile can be related to its acceleration using the equation of motion. Kinematics can then be used to relate the projectile's acceleration to its position.

Part (a) Free-Body Diagram. As shown in Fig. 13–7*b*, the projectile's **Part (a) Free-Body Diagram.** As shown in Fig. 13–7*b*, the projectile's weight is $W = mg = 10(9.81) = 98.1$ N. We will assume the unknown acceleration a acts unward in the *nositive* z direction unknown acceleration **a** acts upward in the *positive z* direction.

Equation of Motion.

Equation of Motion.
 $+\uparrow \Sigma F_z = ma_z;$ $-98.1 = 10a,$ $a = -9.81 \text{ m/s}^2$

The result indicates that the projectile, like every object having free-Equation of Motion.
 $+ \hat{i} \Sigma F_z = ma_z;$ $-98.1 = 10a,$ $a = -9.81 \text{ m/s}^2$

flight motion near the earth's surface, is subjected to a *constant* downward acceleration of 9.81 m/s².

Kinematics. Initially, $z_0 = 0$ and $v_0 = 50$ m/s, and at the maximum height $z = h$, $v = 0$. Since the acceleration is *constant*, then height $z = h$, $v = 0$. Since the acceleration is *constant*, then $z_0 = 0$ and $v_0 = 50$ m/s,

not the acceleration is contained

$$
(+ \uparrow) \qquad \qquad v^2 = v_0^2 + 2a_c(z - z_0)
$$
\n
$$

$$
\n
$$
h = 127 \text{ m} \qquad \qquad \text{Ans.}
$$

Part (b) Free-Body Diagram. Since the force $F_D = (0.01v^2)$ N
tends to retard the unward motion of the projectile it acts downward tends to retard the upward motion of the projectile, it acts downward as shown on the free-body diagram, Fig. 13–7*c*.

Equation of Motion.

Equation of Motion.
+
$$
\uparrow \Sigma F_z = ma_z
$$
; -0.01 $v^2 - 98.1 = 10a$, $a = -(0.001v^2 + 9.81)$

Kinematics. Here the acceleration is *not constant* since F_D depends on the velocity. Since $a = f(v)$, we can relate a to position using $\frac{D}{119}$

on the velocity. Since
$$
a = f(v)
$$
, we can relate a to position using
\n $(+\uparrow)$ a $dz = v dv$; \n $-(0.001v^2 + 9.81) dz = v dv$

Separating the variables and integrating, realizing that initially $z_0 = 0$,
 $v_0 = 50$ m/s (positive upward) and at $z = h$, $y = 0$, we have Separating the variables and integrating, realizing that initiall $v_0 = 50$ m/s (positive upward), and at $z = h$, $v = 0$, we have

$$
\int_0^h dz = -\int_{50}^0 \frac{v dv}{0.001v^2 + 9.81} = -500 \ln(v^2 + 9810) \Big|_{50 \text{ m/s}}^0
$$

 $h = 114 \text{ m}$ Ans.

NOTE: The answer indicates a lower elevation than that obtained in part (*a*) due to atmospheric resistance or drag.

The baggage truck *A* shown in the photo has a weight of 900 lb and tows a 550-lb cart *B* and a 325-lb cart *C*. For a short time the driving tows a 550-lb cart *B* and a 325-lb cart *C*. For a short time the driving
frictional force developed at the wheels of the truck is $F_A = (40t)$ lb,
where *t* is in seconds If the truck starts from rest determine its speed where *t* is in seconds. If the truck starts from rest, determine its speed in 2 seconds. Also, what is the horizontal force acting on the coupling between the truck and cart *B* at this instant? Neglect the size of the truck and carts.

SOLUTION

Free-Body Diagram. As shown in Fig. 13–8*a*, it is the frictional driving force that gives both the truck and carts an acceleration. Here we have considered all three vehicles as a single system.

Equation of Motion. Only motion in the horizontal direction has to be considered.

to be considered.
\n
$$
\angle \Sigma F_x = ma_x; \qquad 40t = \left(\frac{900 + 550 + 325}{32.2}\right)a
$$
\n
$$
a = 0.7256t
$$
\n**Kinematics.** Since the acceleration is a function of time, the velocity

Kinematics. Since the acceleration is a function of time, the velocity of the truck is obtained using $a = dv/dt$ with the initial condition that $v_0 = 0$ at $t = 0$. We have of the truck is obtained u
 $v_0 = 0$ at $t = 0$. We have

$$
\int_0^v dv = \int_0^{2s} 0.7256t \, dt; \quad v = 0.3628t^2 \bigg|_0^{2s} = 1.45 \, \text{ft/s} \qquad \qquad \text{Ans.}
$$

Free-Body Diagram. In order to determine the force between the truck and cart *B*, we will consider a free-body diagram of the truck so that we can "expose" the coupling force **T** as external to the free-body diagram, Fig. 13–8*b*.

diagram, Fig. 13–8*b*.
Equation of Motion. When $t = 2$ s, then

$$

$$

$$
T = 39.4 \text{ lb}
$$
Ans.

NOTE: Try and obtain this same result by considering a free-body diagram of carts *B* and *C* as a single system.

A smooth 2-kg collar *C*, shown in Fig. 13–9*a*, is attached to a spring A smooth 2-kg collar C, shown in Fig. 13–9a, is attached to a spring
having a stiffness $k = 3$ N/m and an unstretched length of 0.75 m. If
the collar is released from rest at A determine its acceleration and the the collar is released from rest at *A*, determine its acceleration and the the collar is released from rest at A, determine its acceleration
ormal force of the rod on the collar at the instant $y = 1$ m.

SOLUTION

Free-Body Diagram. The free-body diagram of the collar when it is located at the arbitrary position *y* is shown in Fig. 13–9*b*. Furthermore, the collar is *assumed* to be accelerating so that "**a**" acts downward in the *positive y* direction. There are four unknowns, namely, N_C , F_s , a, and θ .

Equations of Motion.

$$
+ \downarrow \Sigma F_y = ma_y; \qquad 19.62 - F_s \sin \theta = 2a \qquad (2)
$$

From Eq. 2 it is seen that the acceleration depends on the magnitude and direction of the spring force. Solution for N_C and *a* is possible
once *F* and *a* are known once F_s and θ are known.

The magnitude of the spring force is a function of the stretch *s* of the The magnitude of the spring force is a function of the stretch s of the spring; i.e., $F_s = ks$. Here the unstretched length is $AB = 0.75$ m, Fig. 13–9*a*; therefore, $s = CB - AB = \sqrt{y^2 + (0.75)^2} - 0.75$.
Since $k = 3$ N/m then Fig. 13–9*a*; therefor
Since $k = 3$ N/m, then

$$
F_s = ks = 3(\sqrt{y^2 + (0.75)^2} - 0.75)
$$
 (3)

From Fig. 13–9*a*, the angle θ is related to *y* by trigonometry.

$$
\tan \theta = \frac{y}{0.75} \tag{4}
$$

Substituting $y = 1$ m into Eqs. 3 and 4 yields $F_s = 1.50$ N and $\theta = 53.1^{\circ}$. Substituting these results into Eqs. 1 and 2, we obtain $\theta = 53.1^{\circ}$. Substituting these results into Eqs. 1 and 2, we obtain

$$
N_C = 0.900 \text{ N}
$$
 Ans.

$$
a = 9.21 \text{ m/s}^2 \downarrow
$$
Ans.

NOTE: This is not a case of constant acceleration, since the spring force changes both its magnitude and direction as the collar moves downward.

13

The 100-kg block *A* shown in Fig. 13–10*a* is released from rest. If the masses of the pulleys and the cord are neglected, determine the speed of the 20-kg block *B* in 2 s.

SOLUTION

Free-Body Diagrams. Since the mass of the pulleys is *neglected*, **Free-Body Diagrams.** Since the mass of the pulleys is *neglected*, then for pulley *C*, $ma = 0$ and we can apply $\Sigma F_y = 0$ as shown in Fig. 13–10b. The free-body diagrams for blocks *A* and *B* are shown Fig. 13–10*b*. The free-body diagrams for blocks *A* and *B* are shown in Fig. 13–10*c* and *d*, respectively. Notice that for *A* to remain in Fig. 13–10c and *d*, respectively. Notice that for *A* to remain stationary $T = 490.5$ N, whereas for *B* to remain static $T = 196.2$ N.
Hence *A* will move down while *B* moves up Although this is the Hence *A* will move down while *B* moves up. Although this is the case, we will assume both blocks accelerate downward, in the +case, we will assume both blocks accelerate downward, in the direction of $+s_A$ and $+s_B$. The three unknowns are *T*, a_A , and a_B .

Equations of Motion. Block A,

(1) $+\sqrt{2}F_v = ma_v;$ 981 - 2T = 100a_A

Block *B*,

(2) $+\sqrt{2}F_v = ma_v;$ 196.2 – $T = 20a_B$

Kinematics. The necessary third equation is obtained by relating a_A to a_B using a dependent motion analysis, discussed in Sect. 12.9. The coordinates s_A and s_B in Fig. 13–10*a* measure the positions of *A* and *B* from the fixed datum. It is seen that

$$
2s_A + s_B = l
$$

from the fixed datum. It is seen that
 $2s_A + s_B = l$

where *l* is constant and represents the total vertical length of cord. Differentiating this expression twice with respect to time yields
 $2a_A = -a_B$

$$
2a_A = -a_B \tag{3}
$$

Notice that when writing Eqs. 1 to 3, the *positive direction was always assumed downward*. It is very important to be *consistent* in this assumption since we are seeking a simultaneous solution of equations. The results are

$$
T = 327.0 \text{ N}
$$

\n
$$
a_A = 3.27 \text{ m/s}^2
$$

\n
$$
a_B = -6.54 \text{ m/s}^2
$$

 $a_A = 3.2 / \text{ m/s}^2$

Hence when block *A* accelerates *downward*, block *B* accelerates *upward* as expected. Since a_B is constant, the velocity of block *B* in 2 s is thus \overline{B}

s thus
\n
$$
(+ \downarrow) \qquad v = v_0 + a_B t
$$
\n
$$
= 0 + (-6.54)(2)
$$
\n
$$
= -13.1 \text{ m/s} \qquad \text{Ans.}
$$

The negative sign indicates that block *B* is moving upward.

FUNDAMENTAL PROBLEMS

F13–1. The motor winds in the cable with a constant acceleration, such that the 20-kg crate moves a distance acceleration, such that the 20-kg crate moves a distance $s = 6$ m in 3 s, starting from rest. Determine the tension developed in the cable. The coefficient of kinetic friction developed in the cable. The coefficient of kinetic friction between the crate and the plane is $\mu_k = 0.3$.

F13–1

F13–2. If motor *M* exerts a force of $F = (10t^2 + 100)$ N on the cable where t is in seconds determine the velocity of on the cable, where *t* is in seconds, determine the velocity of on the cable, where *t* is in seconds, determine the velocity of
the 25-kg crate when $t = 4$ s. The coefficients of static and
kinetic friction, between, the crate and the plane are kinetic friction between the crate and the plane are kinetic friction between the crate and the plane are $\mu_s = 0.3$ and $\mu_k = 0.25$, respectively. The crate is initially at rest.

F13–3. A spring of stiffness $k = 500$ N/m is mounted against the 10-kg block. If the block is subjected to the force against the 10-kg block. If the block is subjected to the force
of $F = 500$ N, determine its velocity at $s = 0.5$ m. When
 $s = 0$, the block is at rest and the spring is uncompressed of $F = 500$ N, determine its velocity at $s = 0.5$ m. When $s = 0$, the block is at rest and the spring is uncompressed.
The contact surface is smooth The contact surface is smooth.

F13–4. The 2-Mg car is being towed by a winch. If the winch **F13-4.** The 2-Mg car is being towed by a winch. If the winch exerts a force of $T = (100s)$ N on the cable, where *s* is the displacement of the car in meters determine the speed of the displacement of the car in meters, determine the speed of the displacement of the car in meters, determine the speed of the car when $s = 10$ m, starting from rest. Neglect rolling resistance of the car resistance of the car.

F13–5. The spring has a stiffness $k = 200$ N/m and is unstretched when the 25-kg block is at 4. Determine the unstretched when the 25-kg block is at *A*. Determine the unstretched when the 25-kg block is at A. Determine the acceleration of the block when $s = 0.4$ m. The contact surface between the block and the plane is smooth surface between the block and the plane is smooth.

If the *r* is the distance from the particle to the earth's center. If the particle is fired vertically with a velocity v_0 from the earth's particle is fired vertically with a velocity v_0 from the earth's surface, determine its velocity as a function of position r . What is the smallest velocity v_0 required to escape the earth's gravitational field, what is r_{max} , and what is the time required to reach this altitude? required to reach this altitude? $\frac{v_0}{\sqrt{2}}$

13.5 [Equations of Motion: Normal and](#page-13-0) Tangential Coordinates

When a particle moves along a curved path which is known, the equation of motion for the particle may be written in the tangential, normal, and binormal directions, Fig. 13–11. Note that there is no motion of the particle in the binormal direction, since the particle is constrained to move along the path. We have

$$
\Sigma \mathbf{F} = m\mathbf{a}
$$

$$
\Sigma F_t \mathbf{u}_t + \Sigma F_n \mathbf{u}_n + \Sigma F_b \mathbf{u}_b = m\mathbf{a}_t + m\mathbf{a}_n
$$

This equation is satisfied provided

$$
\Sigma F_t = ma_t
$$

\n
$$
\Sigma F_n = ma_n
$$

\n
$$
\Sigma F_b = 0
$$
\n(13-8)

Recall that a_t (= dv/dt) represents the time rate of change in the agentude of velocity. So if Σ **F** acts in the direction of motion, the magnitude of velocity. So if ΣF_t acts in the direction of motion, the proposite particle's speed will increase whereas if it acts in the opposite particle's speed will increase, whereas if it acts in the opposite particle's speed will increase, whereas if it acts in the opposite
direction, the particle will slow down. Likewise, $a_n (= v^2/\rho)$ represents
the time rate of change in the velocity's direction. It is caused by Σ **F** the time rate of change in the velocity's direction. It is caused by $\Sigma \mathbf{F}_n$, which *always* acts in the positive *n* direction i.e., toward the path's which *always* acts in the positive *n* direction, i.e., toward the path's center of curvature. From this reason it is often referred to as the *centripetal force*.

The centrifuge is used to subject a passenger to a very large normal acceleration caused by rapid rotation. Realize that this acceleration is *caused by* the unbalanced normal force exerted on the passenger by the seat of the centrifuge.

Fig. 13–11

Procedure for Analysis

When a problem involves the motion of a particle along a *known curved path*, normal and tangential coordinates should be considered for the analysis since the acceleration components can be readily formulated. The method for applying the equations of motion, which relate the forces to the acceleration, has been outlined in the procedure given in Sec. 13.4. Specifically, for *t, n, b* coordinates it may be stated as follows:

Free-Body Diagram.

- \bullet Establish the inertial *t, n, b* coordinate system at the particle and draw the particle's free-body diagram.
- The particle's normal acceleration \mathbf{a}_n *always* acts in the positive *n* direction direction.
- If the tangential acceleration \mathbf{a}_t is unknown, assume it acts in the positive *t* direction positive *t* direction.
- There is no acceleration in the *b* direction.
- Identify the unknowns in the problem.

Equations of Motion.

• Apply the equations of motion, Eqs. 13–8.

Kinematics.

- Formulate the tangential and normal components of Formulate the tangential and normal components
acceleration; i.e., $a_t = dv/dt$ or $a_t = v dv/ds$ and $a_n = v^2/\rho$.
- If the path is defined as $y = f(x)$, the radius of curvature at the point where the particle is located can be obtained from point where the particle is located can be obtained from point where the pair $\rho = [1 + (dy/dx)^2]^{3/2}$ rticle is lo
 $/ |d^2y/dx^2|$.

EXAMPLE 13.6

Determine the banking angle θ for the race track so that the wheels of the racing cars shown in Fig. 13–12*a* will not have to depend upon friction to prevent any car from sliding up or down the track. Assume the cars have negligible size, a mass *m*, and travel around the curve of radius ρ with a constant speed v.

SOLUTION

Before looking at the following solution, give some thought as to why it should be solved using *t, n, b* coordinates.

Free-Body Diagram. As shown in Fig. 13–12*b*, and as stated in the problem, no frictional force acts on the car. Here N_C represents the resultant of the ground on all four wheels. Since a can be calculated *resultant* of the ground on all four wheels. Since a_n can be calculated, the unknowns are N_c and θ the unknowns are N_C and θ .

Equations of Motion. Using the *n, b* axes shown,

$$
\Rightarrow \Sigma F_n = ma_n; \qquad N_C \sin \theta = m \frac{v^2}{\rho} \tag{1}
$$

$$
+ \uparrow \Sigma F_b = 0; \qquad N_C \cos \theta - mg = 0
$$

Eliminating N_C and *m* from these equations by dividing Eq. 1 by Eq. 2, we obtain we obtain

$$
\tan \theta = \frac{v^2}{g\rho}
$$

$$
\theta = \tan^{-1}\left(\frac{v^2}{g\rho}\right)
$$
Ans.

NOTE: The result is independent of the mass of the car. Also, a force summation in the tangential direction is of no consequence to the summation in the tangential direction is of no consequence to the solution. If it were considered, then $a_t = dv/dt = 0$, since the car
moves with constant speed. A further analysis of this problem is moves with *constant speed*. A further analysis of this problem is discussed in Prob. 21–47.

The 3-kg disk *D* is attached to the end of a cord as shown in Fig. 13–13*a*. The other end of the cord is attached to a ball-and-socket joint located at the center of a platform. If the platform rotates rapidly, and the disk is placed on it and released from rest as shown, determine the time it takes for the disk to reach a speed great enough to break the cord.The maximum tension the cord can sustain is 100 N, and the coefficient of kinetic friction between the disk and the platform is $\mu_k = 0.1$.

SOLUTION

Free-Body Diagram. The frictional force has a magnitude **Free-Body Diagram.** The frictional force has a magnitude $F = \mu_k N_D = 0.1 N_D$ and a sense of direction that opposes the *relative* motion of the disk with respect to the platform It is this force that *motion* of the disk with respect to the platform. It is this force that gives the disk a tangential component of acceleration causing v to increase, thereby causing T to increase until it reaches 100 N. The increase, thereby causing T to increase until it reaches 100 N. The weight of the disk is $W = 3(9.81) = 29.43$ N. Since a_n can be related to *n* the unknowns are N_2 and *n* to v, the unknowns are N_D , a_t , and v.

Equations of Motion.

$$
F_t = ma_t; \t\t 0.1N_D = 3a_t \t\t (2)
$$

(3) $\Sigma F_b = 0;$ $N_D - 29.43 = 0$

Setting $T = 100$ N, Eq. 1 can be solved for the critical speed v_{cr} of the disk needed to break the cord. Solving all the equations we obtain disk needed to break the cord. Solving all the equations, we obtain
 $N_D = 29.43 \text{ N}$

$$
N_D = 29.43 \text{ N}
$$

$$
a_t = 0.981 \text{ m/s}^2
$$

$$
v_{\text{cr}} = 5.77 \text{ m/s}
$$

Kinematics. Since
$$
a_t
$$
 is *constant*, the time needed to break the cord is
\n
$$
v_{cr} = v_0 + a_t t
$$
\n
$$
5.77 = 0 + (0.981)t
$$
\n
$$
t = 5.89 \text{ s}
$$
\nAns.

 $F = 0.1 N_D$ **T**

29.43 N

b

Fig. 13–13

Design of the ski jump shown in the photo requires knowing the type of forces that will be exerted on the skier and her approximate trajectory. If in this case the jump can be approximated by the parabola shown in Fig. 13–14*a*, determine the normal force on the 150-lb skier the instant she arrives at the end of the jump, point *A*, where her velocity is 65 ft/s. Also, what is her acceleration at this point?

SOLUTION

Why consider using *n*, *t* coordinates to solve this problem?

Free-Body Diagram. Since $dy/dx = x/100 |_{x=0} = 0$, the slope at *A* is horizontal. The free-body diagram of the skier when she is at *A* is is horizontal. The free-body diagram of the skier when she is at *A* is shown in Fig. 13–14*b*. Since the path is *curved*, there are two components of acceleration, \mathbf{a}_n and \mathbf{a}_t . Since a_n can be calculated, the unknowns are a_n and N . unknowns are a_t and N_A .

Equations of Motion.

$$
+\uparrow \Sigma F_n = ma_n; \qquad N_A - 150 = \frac{150}{32.2} \left(\frac{(65)^2}{\rho}\right) \tag{1}
$$

$$
\stackrel{\text{d}}{\Leftarrow} \Sigma F_t = ma_t; \qquad \qquad 0 = \frac{150}{32.2} a_t \tag{2}
$$

The radius of curvature ρ for the path must be determined at point The radius of curvature ρ for the path must be determined at point $A(0, -200 \text{ ft})$. Here $y = \frac{1}{200}x^2 - 200$, $dy/dx = \frac{1}{100}x$, $d^2y/dx^2 = \frac{1}{100}$, so that at $x = 0$, so that at $x = 0$,

$$
\rho = \frac{[1 + (dy/dx)^2]^{3/2}}{|d^2y/dx^2|}\bigg|_{x=0} = \frac{[1 + (0)^2]^{3/2}}{|100|} = 100 \text{ ft}
$$

Substituting this into Eq. 1 and solving for N_A , we obtain
 $N_A = 347$ lb

$$
N_A = 347 \, \text{lb}
$$
 Ans.

Kinematics. From Eq. 2,

 $a_t = 0$

Thus,

$$
a_n = \frac{v^2}{\rho} = \frac{(65)^2}{100} = 42.2 \text{ ft/s}^2
$$

$$
a_A = a_n = 42.2 \text{ ft/s}^2 \uparrow
$$
Ans.

NOTE: Apply the equation of motion in the *y* direction and show that when the skier is in midair her acceleration is 32.2 ft/s^2 .

(a)

The 60-kg skateboarder in Fig.13–15*a* coasts down the circular track. The 60-kg skateboarder in Fig.13–15*a* coasts down the circular track.
If he starts from rest when $\theta = 0^{\circ}$, determine the magnitude of the If he starts from rest when $\theta = 0^{\circ}$, determine the magnitude of the normal reaction the track exerts on him when $\theta = 60^{\circ}$. Neglect his size for the calculation.

SOLUTION

Free-Body Diagram. The free-body diagram of the skateboarder when he is at an *arbitrary position* θ is shown in Fig. 13–15*b*. At when he is at an *arbitrary position* θ is shown in Fi
 $\theta = 60^{\circ}$ there are three unknowns, N_s , a_t , and a_n (or v).

Equations of Motion.

$$
\sqrt{\sum F_n} = ma_n; \ N_S - [60(9.81)N] \sin \theta = (60 \text{ kg}) \left(\frac{v^2}{4m}\right)
$$

$$
\sqrt{\sum F_t} = ma_t; \ [60(9.81)N] \cos \theta = (60 \text{ kg}) a_t
$$

$$
a_t = 9.81 \cos \theta
$$
 (1)

Kinematics. Since a_t is expressed in terms of θ , the equation must be used to determine the speed of the
when $\theta = 60^{\circ}$. Using the geometric relation $s = \theta r$,
 $d\theta = (4 \text{ m}) d\theta$ Fig. 13–15c and the initial condition skateboarder when $\theta = 60^{\circ}$. Using the geometric relation $s = \theta r$, skateboarder when $\theta = 60^{\circ}$. Using the geometric relation $s = \theta r$,
where $ds = r d\theta = (4 \text{ m}) d\theta$, Fig. 13–15*c*, and the initial condition
 $v = 0$ at $\theta = 0^{\circ}$ we have where $ds = r d\theta = (4 \text{ m})$
 $v = 0$ at $\theta = 0^{\circ}$, we have, **Kinematics.** Since a_t is expressed in terms of θ
 $v dv = a_t ds$ must be used to determine the
skateboarder when $\theta = 60^\circ$ Using the geometric

Substituting this result and $\theta = 60^{\circ}$ into Eq. (1), yields

 $N_s = 1529.23 \text{ N} = 1.53 \text{ kN}$ Ans.

 $x^2 - N_z$

13.6 [Equations of Motion: Cylindrical](#page-13-0) **Coordinates**

When all the forces acting on a particle are resolved into cylindrical components, i.e., along the unit-vector directions \mathbf{u}_r , \mathbf{u}_θ , \mathbf{u}_z , Fig. 13–16, the equation of motion can be expressed as

$$
\Sigma \mathbf{F} = m\mathbf{a}
$$

$$
\Sigma F_r \mathbf{u}_r + \Sigma F_\theta \mathbf{u}_\theta + \Sigma F_z \mathbf{u}_z = ma_r \mathbf{u}_r + ma_\theta \mathbf{u}_\theta + ma_z \mathbf{u}_z
$$

To satisfy this equation, we require

$$
\Sigma F_r = ma_r
$$

\n
$$
\Sigma F_{\theta} = ma_{\theta}
$$

\n
$$
\Sigma F_z = ma_z
$$
\n(13-9)

If the particle is constrained to move only in the $r-\theta$ plane, then only the first two of Eqs. 13–9 are used to specify the motion first two of Eqs. 13–9 are used to specify the motion.

Tangential and Normal Forces. The most straightforward type of problem involving cylindrical coordinates requires the determination ©of problem involving cylindrical coordinates requires the determination
of the resultant force components ΣF_r , ΣF_θ , ΣF_z which cause a particle
to move with a *known* acceleration If however the particle's accele to move with a *known* acceleration. If, however, the particle's accelerated motion is not completely specified at the given instant, then some information regarding the directions or magnitudes of the forces acting on the particle must be known or computed in order to solve Eqs. 13–9. For example, the force **P** causes the particle in Fig. 13–17*a* to move along For example, the force **P** causes the particle in Fig. 13–17*a* to move along
a path $r = f(\theta)$. The *normal force* **N** which the path exerts on the particle
is always *nernendicular to the tangent of the nath* whereas the is always *perpendicular to the tangent of the path*, whereas the frictional force **F** always acts along the tangent in the opposite direction of motion. The *directions* of **N** and **F** can be specified relative to the radial coordinate by using the angle ψ (psi), Fig. 13–17*b*, which is defined between the *extended* radial line and the tangent to the curve.

This angle can be obtained by noting that when the particle is displaced a distance *ds* along the path, Fig. 13–17*c*, the component of displacement in the radial direction is *dr* and the component of displacement in the transverse direction is $r d\theta$. Since these two
components are mutually perpendicular the angle ψ can be determined components are mutually perpendicular, the angle ψ can be determined components are mutually
from $\tan \psi = r \, d\theta/dr$, or

$$
\tan \psi = \frac{r}{dr/d\theta}
$$
 (13-10)

If ψ is calculated as a positive quantity, it is measured from the *extended radial line* to the tangent in a counterclockwise sense or in the positive direction of θ . If it is negative, it is measured in the opposite direction direction of θ . If it is negative, it is measured in the opposite direction
to positive θ . For example, consider the cardioid $r = a(1 + \cos \theta)$,
shown in Fig. 13–18. Because $dr/d\theta = -a \sin \theta$, then when $\theta = 30^{\circ}$ to positive θ . For example, consider the cardioid $r = a(1 + \cos \theta)$,
shown in Fig. 13–18. Because $dr/d\theta = -a \sin \theta$, then when $\theta = 30^{\circ}$,
tan $u = a(1 + \cos 30^{\circ})/(-a \sin 30^{\circ}) = -3.732$ or $u = -75^{\circ}$ measured shown in Fig. 13–18. Because $dr/d\theta = -a \sin \theta$, then when $\theta = 30^{\circ}$, $\tan \psi = a(1 + \cos 30^{\circ})/(-a \sin 30^{\circ}) = -3.732$, or $\psi = -75^{\circ}$, measured clockwise opposite to $+\theta$ as shown in the figure clockwise, opposite to $+\theta$ as shown in the figure.

Procedure for Analysis

Cylindrical or polar coordinates are a suitable choice for the analysis of a problem for which data regarding the angular motion of the radial line *r* are given, or in cases where the path can be conveniently expressed in terms of these coordinates. Once these coordinates have been established, the equations of motion can then be applied in order to relate the forces acting on the particle to its acceleration components. The method for doing this has been outlined in the procedure for analysis given in Sec. 13.4. The following is a summary of this procedure.

Free-Body Diagram.

- Establish the r , θ , z inertial coordinate system and draw the particle's free-body diagram.
- Assume that \mathbf{a}_r , \mathbf{a}_θ , \mathbf{a}_z act in the *positive directions* of r , θ , z if they are unknown are unknown.
- Identify all the unknowns in the problem.

Equations of Motion.

• Apply the equations of motion, Eqs. 13–9.

Kinematics.

- Use the methods of Sec. 12.8 to determine r and the time derivatives \dot{r} , \ddot{r} , $\dot{\theta}$, $\ddot{\theta}$, \ddot{z} , and then evaluate the acceleration derivatives \dot{r} , \ddot{r} , θ , θ , \ddot{z} , and then evaluate to
components $a_r = \ddot{r} - r\dot{\theta}^2$, $a_\theta = r\dot{\theta} + 2\dot{r}\theta$, $a_z = \ddot{z}$
If any of the exceleration components is computed and then evaluate t
 $a_{\theta} = r\ddot{\theta} + 2\dot{r}\dot{\theta}, a_{z} = \ddot{z}.$ \vec{r} , \vec{r} , $\dot{\theta}$, $\ddot{\theta}$, \ddot{z} , and then .
. .
.
. \dot{r} , \ddot{r} , θ , θ , \ddot{z}
 $a_r = \ddot{r} - r\dot{\theta}^2$

cocoloration #
- If any of the acceleration components is computed as a negative quantity, it indicates that it acts in its negative coordinate direction.
- quantity, it indicates that it acts in its negative coordinate direction.

 When taking the time derivatives of $r = f(\theta)$, it is very important

to use the chain rule of calculus which is discussed at the end of to use the chain rule of calculus, which is discussed at the end of Appendix C.

Fig. 13–18

C r tangent **N***^C* **F** a_{θ} **a***r* 45° θ

(b) **Fig. 13–19**

The smooth 0.5-kg double-collar in Fig. 13–19*a* can freely slide on arm AB and the circular guide rod. If the arm rotates with a constant angular velocity of $\theta = 3$ rad/s, determine the force the arm exerts on angular velocity of $\theta = 3$ rad/s, determine the force the arm exerts
the collar at the instant $\theta = 45^{\circ}$. Motion is in the horizontal plane. #

SOLUTION

Free-Body Diagram. The normal reaction N_C of the circular guide rod and the force **F** of arm *AB* act on the collar in the plane of motion, Fig. 13–19*b*. Note that **F** acts perpendicular to the axis of arm *AB*, that is, in the direction of the θ axis, while N_C acts perpendicular to the tangent of the circular path at $\theta = 45^\circ$. The four unknowns are tangent of the circular path at $\theta = 45^{\circ}$. The four unknowns are $N_C, F, a_r, a_\theta.$

Equations of Motion.

$$
+ \mathcal{P}\Sigma F_r = ma_r; \qquad -N_C \cos 45^\circ = (0.5 \text{ kg}) a_r \tag{1}
$$

$$
+5\sum F_{\theta} = ma_{\theta}; \qquad F - N_C \sin 45^{\circ} = (0.5 \text{ kg}) a_{\theta}
$$
 (2)

Kinematics. Using the chain rule (see Appendix C), the first and **Kinematics.** Using the chain rule (see Appendix C), the first an second time derivatives of *r* when $\theta = 45^{\circ}$, $\dot{\theta} = 3$ rad/s, $\dot{\theta} = 0$, are $\theta = 3 \text{ rad/s}, \theta = 0,$ \overline{a} $\frac{2}{1}$

$$
r = 0.8 \cos \theta = 0.8 \cos 45^{\circ} = 0.5657 \text{ m}
$$

$$
\dot{r} = -0.8 \sin \theta \dot{\theta} = -0.8 \sin 45^{\circ} (3) = -1.6971 \text{ m/s}
$$

$$
\ddot{r} = -0.8 [\sin \theta \dot{\theta} + \cos \theta \dot{\theta}^2]
$$

$$
= -0.8 [\sin 45^{\circ} (0) + \cos 45^{\circ} (3^2)] = -5.091 \text{ m/s}^2
$$

We have

$$
a_r = \ddot{r} - r\dot{\theta}^2 = -5.091 \text{ m/s}^2 - (0.5657 \text{ m})(3 \text{ rad/s})^2 = -10.18 \text{ m/s}^2
$$

\n
$$
a_\theta = r\ddot{\theta} + 2r\dot{\theta} = (0.5657 \text{ m})(0) + 2(-1.6971 \text{ m/s})(3 \text{ rad/s})
$$

\n
$$
= -10.18 \text{ m/s}^2
$$

Substituting these results into Eqs. (1) and (2) and solving, we get

$$
N_C = 7.20 \text{ N}
$$

$$
F = 0
$$
 Ans.

(2)

EXAMPLE 13.11

The smooth 2-kg cylinder *C* in Fig. 13–20*a* has a pin *P* through its center which passes through the slot in arm *OA*. If the arm is forced to =rotate in the *vertical plane* at a constant rate $\theta = 0.5$ rad/s, determine rotate in the *vertical plane* at a constant rate $\theta = 0.5$ rad/s, det the force that the arm exerts on the peg at the instant $\theta = 60^{\circ}$.

SOLUTION

Why is it a good idea to use polar coordinates to solve this problem?

Free-Body Diagram. The free-body diagram for the cylinder is shown in Fig. 13–20*b*. The force on the peg, \mathbf{F}_P , acts perpendicular to the slot in the arm. As usual a and a are assumed to act in the the slot in the arm. As usual, \mathbf{a}_r and \mathbf{a}_θ are assumed to act in the directions of positive r and θ respectively Identify the four unknowns directions of *positive r* and θ , respectively. Identify the four unknowns.

Equations of Motion. Using the data in Fig. $13-20b$, we have

(1) $+\angle \Sigma F_r = ma_r;$ $19.62 \sin \theta - N_C \sin \theta = 2a_r$

 $F = \sqrt{\sum F_\theta} = ma_\theta$; 19.62 cos $\theta + F_P - N_C \cos \theta = 2a_\theta$

Kinematics. From Fig. $13-20a$, *r* can be related to θ by the equation

$$
r = \frac{0.4}{\sin \theta} = 0.4 \csc \theta
$$

Since $d(\csc \theta) = -(\csc \theta \cot \theta) d\theta$ and $d(\cot \theta) = -(\csc^2 \theta) d\theta$, then
r and the necessary time derivatives become \mathbf{u}

$$
\begin{aligned}\n\vec{\theta} &= 0.5 & r &= 0.4 \csc \theta \\
\vec{\theta} &= 0.5 & r &= 0.4 \csc \theta \\
\vec{\theta} &= 0 & \vec{r} &= -0.4(\csc \theta \cot \theta)\vec{\theta} \\
&= -0.2 \csc \theta \cot \theta \\
\vec{r} &= -0.2(-\csc \theta \cot \theta)(\vec{\theta}) \cot \theta - 0.2 \csc \theta(-\csc^2 \theta)\vec{\theta} \\
&= 0.1 \csc \theta(\cot^2 \theta + \csc^2 \theta)\n\end{aligned}
$$

valuating these formulas at $\theta = 60^{\circ}$,

Evaluating these formulas at
$$
\theta = 60^{\circ}
$$
, we get
\n $\dot{\theta} = 0.5$ $r = 0.462$
\n $\dddot{\theta} = 0$ $\dot{r} = -0.133$
\n $\dddot{r} = 0.192$
\n $a_r = \ddot{r} - r\dot{\theta}^2 = 0.192 - 0.462(0.5)^2 = 0.0770$
\n $a_\theta = r\dot{\theta} + 2\dot{r}\dot{\theta} = 0 + 2(-0.133)(0.5) = -0.133$

 $a_{\theta} = r\theta + 2r\theta = 0 + 2(-0.133)(0.5) = -0.133$
Substituting these results into Eqs. 1 and 2 with $\theta = 60^{\circ}$ and solving yields

$$
N_C = 19.5 \text{ N} \t F_P = -0.356 \text{ N} \t Ans.
$$

The negative sign indicates that \mathbf{F}_P acts opposite to the direction shown in Fig. 13, 20*b* shown in Fig. 13–20*b*.

13

A can *C*, having a mass of 0.5 kg, moves along a grooved horizontal slot shown in Fig. 13–21*a*. The slot is in the form of a spiral, which is slot shown in Fig. 13–21*a*. The slot is in the form of a spiral, which is
defined by the equation $r = (0.1\theta)$ m, where θ is in radians. If the arm
 Ω ⁴ redices with a sonstant rate $\dot{\theta} = 4$ red/s in the horizonta *OA* rotates with a constant rate $\theta = 4$ rad/s in the horizontal plane, *OA* rotates with a constant rate $\theta = 4$ rad/s in the horizontal plane, determine the force it exerts on the can at the instant $\theta = \pi$ rad. Neglect friction and the size of the can.

SOLUTION

Free-Body Diagram. The driving force \mathbf{F}_C acts perpendicular to the arm OA whereas the normal force of the wall of the slot on the can arm *OA*, whereas the normal force of the wall of the slot on the can, arm *OA*, whereas the normal force of the wall of the slot on the can,
 N_C , acts perpendicular to the tangent to the curve at $\theta = \pi$ rad,

Fig. 13, 21b, As usual a and a are assumed to act in the nositive Fig. 13–21*b*. As usual, \mathbf{a}_r and \mathbf{a}_θ are assumed to act in the *positive* directions of r and θ respectively. Since the path is specified, the angle $directions$ of r and θ , respectively. Since the path is specified, the angle ψ which the extended radial line r makes with the tangent, Fig. 13–21 $c,$ ψ which the extended radial line *r* makes with the tangent, Fig. 13–21*c*, can be determined from Eq. 13–10. We have $r = 0.1\theta$, so that $dr/d\theta = 0.1$ and therefore can be determined from
 $dr/d\theta = 0.1$, and therefore

$$
\tan \psi = \frac{r}{dr/d\theta} = \frac{0.1\theta}{0.1} = \theta
$$

When $\theta = \pi$, $\psi = \tan^{-1} \pi = 72.3^{\circ}$, so that $\phi = 90^{\circ} - \psi = 17.7^{\circ}$, as shown in Fig. 13–21*c*. Identify the four unknowns in Fig. 13–21*b*.

Equations of Motion. Using $\phi = 17.7^\circ$ and the data shown in Fig. 13–21*b*, we have

Fig. 13–21*b*, we have
\n
$$
\sum F_r = ma_r; \qquad N_C \cos 17.7^\circ = 0.5a_r
$$
\n(1)

$$
\sum F_r = ma_r; \qquad N_C \cos 17.7^\circ = 0.5a_r
$$

+ $\sqrt{2}F_\theta = ma_\theta; \qquad F_C - N_C \sin 17.7^\circ = 0.5a_\theta$ (2)

nematics. The time derivatives of r and θ

Kinematics. The time derivatives of *r* and
$$
\theta
$$
 are
\n $\dot{\theta} = 4 \text{ rad/s}$ $r = 0.1\theta$
\n $\dot{r} = 0.1\dot{\theta} = 0.1(4) = 0.4 \text{ m/s}$
\n $\ddot{r} = 0.1\dot{\theta} = 0$

At the instant $\theta = \pi$ i $\theta = \pi$ rad,

$$
a_r = \ddot{r} - r\dot{\theta}^2 = 0 - 0.1(\pi)(4)^2 = -5.03 \text{ m/s}^2
$$

$$
a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta} = 0 + 2(0.4)(4) = 3.20 \text{ m/s}^2
$$

Substituting these results into Eqs. 1 and 2 and solving yields
 $N_C = -2.64 \text{ N}$

$$
N_C = -2.64 \text{ N}
$$

$$
F_C = 0.800 \text{ N}
$$
Ans.

What does the negative sign for N_c indicate?

*13.7 [Central-Force Motion and Space](#page-13-0) **Mechanics**

If a particle is moving only under the influence of a force having a line of action which is always directed toward a fixed point, the motion is called *central-force motion*. This type of motion is commonly caused by electrostatic and gravitational forces.

In order to analyze the motion, we will consider the particle *P* shown in Fig. 13–22*a*, which has a mass *m* and is acted upon only by the central force **F**. The free-body diagram for the particle is shown in Fig. 13–22*b*. Using polar coordinates (r, θ) , the equations of motion, Eqs. 13–9, become

$$
\Sigma F_r = ma_r; \qquad -F = m \left[\frac{d^2 r}{dt^2} - r \left(\frac{d\theta}{dt} \right)^2 \right]
$$

$$
\Sigma F_\theta = ma_\theta; \qquad 0 = m \left(r \frac{d^2 \theta}{dt^2} + 2 \frac{dr}{dt} \frac{d\theta}{dt} \right)
$$

(13-11)

The second of these equations may be written in the form

$$
\frac{1}{r} \left[\frac{d}{dt} \left(r^2 \frac{d\theta}{dt} \right) \right] = 0
$$

so that integrating yields

$$
r^2 \frac{d\theta}{dt} = h \tag{13-12}
$$

Here *h* is the constant of integration.

 $\overline{1}$ $\overline{10}$

From Fig. 13–22*a* notice that the shaded area described by the radius *r*, From Fig. 13–22*a* notice that the shaded area described by the radius *r*, as *r* moves through an angle $d\theta$, is $dA = \frac{1}{2}r^2 d\theta$. If the *areal velocity* is defined as defined as

$$
\frac{dA}{dt} = \frac{1}{2}r^2\frac{d\theta}{dt} = \frac{h}{2}
$$
 (13-13)

then it is seen that the areal velocity for a particle subjected to centralforce motion is *constant*. In other words, the particle will sweep out equal segments of area per unit of time as it travels along the path. To obtain segments of area per unit of time as it travels along the path. To obtain
the *path of motion*, $r = f(\theta)$, the independent variable *t* must be
eliminated from Eqs. 13–11. Using the chain rule of calculus and eliminated from Eqs. 13–11. Using the chain rule of calculus and Eq. 13–12, the time derivatives of Eqs. 13–11 may be replaced by

$$
\frac{dr}{dt} = \frac{dr}{d\theta} \frac{d\theta}{dt} = \frac{h}{r^2} \frac{dr}{d\theta}
$$
\n
$$
\frac{d^2r}{dt^2} = \frac{d}{dt} \left(\frac{h}{r^2} \frac{dr}{d\theta}\right) = \frac{d}{d\theta} \left(\frac{h}{r^2} \frac{dr}{d\theta}\right) \frac{d\theta}{dt} = \left[\frac{d}{d\theta} \left(\frac{h}{r^2} \frac{dr}{d\theta}\right)\right] \frac{h}{r^2}
$$

or

This satellite is subjected to a central force and its orbital motion can be closely predicted using the equations developed in this section.

Fig. 13–23

Substituting a new dependent variable (xi) $\xi = 1/r$ into the second
equation we have equation, we have

$$
\frac{d^2r}{dt^2} = -h^2\xi^2 \frac{d^2\xi}{d\theta^2}
$$

Also, the square of Eq. 13–12 becomes

$$
\left(\frac{d\theta}{dt}\right)^2 = h^2 \xi^4
$$

Substituting these two equations into the first of Eqs. 13–11 yields

$$
-h^2 \xi^2 \frac{d^2 \xi}{d\theta^2} - h^2 \xi^3 = -\frac{F}{m}
$$

$$
\frac{d^2\xi}{d\theta^2} + \xi = \frac{F}{mh^2\xi^2}
$$
 (13-14)

This differential equation defines the path over which the particle travels when it is subjected to the central force **F**.*

For application, the force of gravitational attraction will be considered. Some common examples of central-force systems which depend on gravitation include the motion of the moon and artificial satellites about the earth, and the motion of the planets about the sun. As a typical problem in space mechanics, consider the trajectory of a space satellite or space vehicle launched into free-flight orbit with an initial velocity \mathbf{v}_0 , Fig. 13–23. It will be assumed that this velocity is initially *parallel* to the tangent at the surface of the earth, as shown in the figure.† Just after the satellite is released into free flight, the only force acting on it is the gravitational force of the earth. (Gravitational attractions involving other bodies such as the moon or sun will be neglected, since for orbits close to the earth their effect is small in comparison with the earth's gravitation.) According to Newton's law of gravitation, force **F** will always act between the mass centers of the earth and the satellite, Fig. 13–23. From Eq. 13–1, this force of attraction has a magnitude of

$$
F = G \frac{M_e m}{r^2}
$$

where M_e and m represent the mass of the earth and the satellite, respectively, G is the gravitational constant, and r is the distance between

^{*}In the derivation, **F** is considered positive when it is directed toward point *O*. If **F** is oppositely directed, the right side of Eq. 13–14 should be negative.

[†]The case where \mathbf{v}_0 acts at some initial angle θ to the tangent is best described using the conservation of angular momentum (see Prob. 15–100).

the mass centers. To obtain the orbital path, we set $\xi = 1/r$ in the foregoing equation and substitute the result into Eq. 13–14. We obtain foregoing equation and substitute the result into Eq. 13–14. We obtain

$$
\frac{d^2\xi}{d\theta^2} + \xi = \frac{GM_e}{h^2} \tag{13-15}
$$

This second-order differential equation has constant coefficients and is nonhomogeneous. The solution is the sum of the complementary and particular solutions given by

$$
\xi = \frac{1}{r} = C \cos (\theta - \phi) + \frac{GM_e}{h^2}
$$
 (13-16)

This equation represents the *free-flight trajectory* of the satellite. It is the equation of a conic section expressed in terms of polar coordinates.

A geometric interpretation of Eq. 13–16 requires knowledge of the equation for a conic section. As shown in Fig. 13–24, a conic section is defined as the locus of a point *P* that moves in such a way that the ratio of its distance to a *focus*, or fixed point *F*, to its perpendicular distance to a fixed line *DD* called the *directrix*, is constant. This constant ratio will be denoted as *e* and is called the *eccentricity*. By definition

$$
e=\frac{FP}{PA}
$$

From Fig. 13–24,

$$
FP = r = e(PA) = e[p - r\cos(\theta - \phi)]
$$

or

$$
\frac{1}{r} = \frac{1}{p}\cos(\theta - \phi) + \frac{1}{ep}
$$

Comparing this equation with Eq. 13–16, it is seen that the fixed distance from the focus to the directrix is

$$
p = \frac{1}{C} \tag{13-17}
$$

And the eccentricity of the conic section for the trajectory is

$$
e = \frac{Ch^2}{GM_e} \tag{13-18}
$$

Fig. 13–24

Provided the polar angle θ is measured from the *x* axis (an axis of symmetry since it is perpendicular to the directrix), the angle ϕ is zero, Fig. 13–24, and therefore Eq. 13–16 reduces to

$$
\frac{1}{r} = C\cos\theta + \frac{GM_e}{h^2} \tag{13-19}
$$

The constants *h* and *C* are determined from the data obtained for the position and velocity of the satellite at the end of the *power-flight trajectory.* For example, if the initial height or distance to the space vehicle is r_0 , measured from the center of the earth, and its initial
speed is r_0 at the beginning of its free flight. Fig. 13–25, then the speed is v_0 at the beginning of its free flight, Fig. 13–25, then the speed is v_0 at the beginning of its free flight, Fig. 13–25, then the constant *h* may be obtained from Eq. 13–12. When $\theta = \phi = 0^{\circ}$, the velocity \mathbf{v}_0 has no radial component; therefore, from Eq. 12–25, velocity **v**₀ has no r
 $v_0 = r_0(d\theta/dt)$, so that

$$
h = r_0^2 \frac{d\theta}{dt}
$$

or

$$
h = r_0 v_0 \tag{13-20}
$$

To determine *C*, use Eq. 13–19 with $\theta = 0^\circ, r = r_0$, and substitute Eq. 13–20 for *h*: Eq. 13–20 for *h:*

$$
C = \frac{1}{r_0} \left(1 - \frac{GM_e}{r_0 v_0^2} \right)
$$
 (13-21)

The equation for the free-flight trajectory therefore becomes

$$
\frac{1}{r} = \frac{1}{r_0} \left(1 - \frac{GM_e}{r_0 v_0^2} \right) \cos \theta + \frac{GM_e}{r_0^2 v_0^2} \tag{13-22}
$$

The type of path traveled by the satellite is determined from the value of the eccentricity of the conic section as given by Eq. 13–18. If

Parabolic Path. Each of these trajectories is shown in Fig. 13–25. From the curves it is seen that when the satellite follows a parabolic path, it is "on the border" of never returning to its initial starting point. The initial launch velocity, \mathbf{v}_0 , required for the satellite to follow a parabolic path is called the *escape velocity*. The speed, v_e , can be determined by using the second of Eqs. 13–23, $e = 1$ with Eqs. 13–18, 13–20, and 13–21. It is left called the *escape velocity*. The speed, v_e , can be determined by using the second of Eqs. 13–23, $e = 1$, with Eqs. 13–18, 13–20, and 13–21. It is left as an exercise to show that as an exercise to show that

$$
v_e = \sqrt{\frac{2GM_e}{r_0}}
$$
 (13–24)

Circular Orbit. The speed v_c required to launch a satellite into a *circular orbit* can be found using the first of Eqs. 13–23, $e = 0$. Since e is related to h and C Eq. 13–18. C must be zero to satisfy this e *circular orbit* can be found using the first of Eqs. 13–23, $e = 0$. Since e is related to *h* and *C,* Eq. 13–18, *C* must be zero to satisfy this equation (from Eq. 13–20, *h* cannot be zero); and therefore, using Eq. 13–21, we have

$$
v_c = \sqrt{\frac{GM_e}{r_0}}\tag{13-25}
$$

Provided r_0 represents a minimum height for launching, in which frictional resistance from the atmosphere is neglected, speeds at launch frictional resistance from the atmosphere is neglected, speeds at launch which are less than v_c will cause the satellite to reenter the earth's atmosphere and either burn up or crash, Fig. 13–25.

Fig. 13–25

Elliptical Orbit. All the trajectories attained by planets and most satellites are elliptical, Fig. 13–26. For a satellite's orbit about the earth, the *minimum distance* from the orbit to the center of the earth *O* (which is located at one of the foci of the ellipse) is r_p and can be found using Eq. 13–22 with $\theta = 0^{\circ}$. Therefore; Eq. 13–22 with $\theta = 0^\circ$. Therefore;

$$
r_p = r_0 \tag{13-26}
$$

This minimum distance is called the *perigee* of the orbit. The *apogee* or This minimum distance is called the *perigee* of the orbit. The *apogee* or maximum distance r_a can be found using Eq. 13–22 with $\theta = 180^\circ$.* Thus,

$$
r_a = \frac{r_0}{(2GM_e/r_0v_0^2) - 1}
$$
 (13–27)

With reference to Fig. 13–26, the half length of the major axis of the ellipse is

$$
a = \frac{r_p + r_a}{2} \tag{13-28}
$$

Using analytical geometry, it can be shown that the half length of the minor axis is determined from the equation

$$
b = \sqrt{r_p r_a} \tag{13-29}
$$

*Actually, the terminology perigee and apogee pertains only to orbits about the *earth.* If any other heavenly body is located at the focus of an elliptical orbit, the minimum and maximum distances are referred to respectively as the *periapsis* and *apoapsis* of the orbit. Furthermore, by direct integration, the area of an ellipse is

$$
A = \pi ab = \frac{\pi}{2} (r_p + r_a) \sqrt{r_p r_a}
$$
 (13-30)

The areal velocity has been defined by Eq. 13–13, $dA/dt = h/2$.
tegrating vields $A = hT/2$ where T is the *period* of time required to The areal velocity has been defined by Eq. 13–13, $dA/dt = h/2$.
Integrating yields $A = hT/2$, where *T* is the *period* of time required to make one orbital revolution From Eq. 13–30 the period is make one orbital revolution. From Eq. 13–30, the period is

$$
T = \frac{\pi}{h}(r_p + r_a)\sqrt{r_p r_a} \tag{13-31}
$$

In addition to predicting the orbital trajectory of earth satellites, the theory developed in this section is valid, to a surprisingly close approximation, at predicting the actual motion of the planets traveling around the sun. In this case the mass of the sun, M_s , should be substituted
for M, when the appropriate formulas are used for M_e when the appropriate formulas are used.

The fact that the planets do indeed follow elliptic orbits about the sun was discovered by the German astronomer Johannes Kepler in the early seventeenth century. His discovery was made *before* Newton had developed the laws of motion and the law of gravitation, and so at the time it provided important proof as to the validity of these laws. Kepler's laws, developed after 20 years of planetary observation, are summarized as follows:

- **1.** Every planet travels in its orbit such that the line joining it to the center of the sun sweeps over equal areas in equal intervals of time, whatever the line's length.
- **2.** The orbit of every planet is an ellipse with the sun placed at one of its foci.
- **3.** The square of the period of any planet is directly proportional to the cube of the major axis of its orbit.

A mathematical statement of the first and second laws is given by Eqs. 13–13 and 13–22, respectively. The third law can be shown from Eq. 13–31 using Eqs. 13–19, 13–28, and 13–29. (See Prob. 13–116.)

600 km

rp

 $v_0 = 30 \text{ Mm/h}$

A satellite is launched 600 km from the surface of the earth, with an initial velocity of $30\ \text{Mm/h}$ acting parallel to the tangent at the surface of the earth, Fig. 13–27.Assuming that the radius of the earth is 6378 km and that its mass is $5.976(10^{24})$ kg, determine (a) the eccentricity of the orbital path, and (b) the velocity of the satellite at apogee.

SOLUTION

Part (a). The eccentricity of the orbit is obtained using Eq. 13–18. The constants *h* and *C* are first determined from Eqs. 13–20 and 13–21. Since

$$
r_p = r_0 = 6378 \text{ km} + 600 \text{ km} = 6.978(10^6) \text{ m}
$$

$$
v_0 = 30 \text{ Mm/h} = 8333.3 \text{ m/s}
$$

Fig. 13–27

O

en
\n
$$
h = r_p v_0 = 6.978(10^6)(8333.3) = 58.15(10^9) \text{ m}^2/\text{s}
$$
\n
$$
C = \frac{1}{r_p} \left(1 - \frac{GM_e}{r_p v_0^2} \right)
$$
\n
$$
= \frac{1}{6.978(10^6)} \left\{ 1 - \frac{66.73(10^{-12})[5.976(10^{24})]}{6.978(10^6)(8333.3)^2} \right\} = 25.4(10^{-9}) \text{ m}^{-1}
$$

Hence,

then

ra

$$
e = \frac{Ch^2}{GM_e} = \frac{2.54(10^{-8})[58.15(10^9)]^2}{66.73(10^{-12})[5.976(10^{24})]} = 0.215 < 1 \quad \text{Ans.}
$$

From Eq. 13–23, observe that the orbit is an *ellipse*.

Part (b). If the satellite were launched at the apogee A shown in Fig. 13–27, with a velocity \mathbf{v}_A , the same orbit would be maintained provided

$$
h = r_p v_0 = r_a v_A = 58.15(10^9) \text{ m}^2/\text{s}
$$

Using Eq. 13–27, we have

 \mathbf{v}_A

A

$$
r_a = \frac{r_p}{\frac{2GM_e}{r_p v_0^2} - 1} = \frac{6.978(10^6)}{\frac{2[66.73(10^{-12})][5.976(10^{24})]}{6.978(10^6)(8333.3)^2} - 1} = 10.804(10^6)
$$

Thus,

$$
v_A = \frac{58.15(10^9)}{10.804(10^6)} = 5382.2 \text{ m/s} = 19.4 \text{ Mm/h}
$$
 Ans.

NOTE: The farther the satellite is from the earth, the slower it moves, which is to be expected since *h* is constant.

PROBLEMS

In the following problems, except where otherwise indicated, assume that the radius of the earth is 6378 km, the earth's mass is $5.976(10^{24})$ kg, the mass of the sun is $1.99(10^{30})$ kg, and the gravitational constant is sun is $1.99(10^{30})$ kg

Using numerical values, show how to determine the resultant force the seat exerts on the passenger located in the top car *A*. The passengers are seated towards the center of the wheel. Also, list the assumptions for your analysis.

CHAPTER REVIEW

Kinetics

Kinetics is the study of the relation between forces and the acceleration they cause. This relation is based on Newton's second law of motion, expressed mathematically as Σ **F** = *ma*.

Before applying the equation of motion, it is important to first draw the particle's *free-body diagram* in order to account for all of the forces that act on the particle. Graphically, this diagram is equal to the *kinetic diagram*, which shows the result of the forces, that is, the *m***a** vector.

Inertial Coordinate Systems

When applying the equation of motion, it is important to measure the acceleration from an inertial coordinate system. This system has axes that do not rotate but are either fixed or translate with a constant velocity. Various types of inertial coordinate systems can be used to apply © Σ **F** = *m***a** in component form.

Rectangular *x, y, z* axes are used to describe rectilinear motion along each of the axes.

Normal and tangential *n, t* axes are often used when the path is known. Recall that \mathbf{a}_n
is always directed in the $+\mathbf{r}$ direction. It is always directed in the $+n$ direction. It indicates the change in the velocity n direction. Also recall that \mathbf{a}_t is tangent to the path It indicates the change in the the path. It indicates the change in the velocity magnitude.

Cylindrical coordinates are useful when angular motion of the radial line *r* is specified or when the path can conveniently be described with these is specified or when the path can

conveniently be described with these

coordinates. $\Sigma F_z = m\ddot{z}$

#

 $\Sigma F_{\theta} = m(r\ddot{\theta} +$ \$ $+ 2\dot{r}\theta$ # $\Sigma F_r = m(\ddot{r} - r\dot{\theta}^2$)

Central-Force Motion

When a single force acts upon a particle, such as during the free-flight trajectory of a satellite in a gravitational field, then the motion is referred to as central-force motion. The orbit depends upon the eccentricity e ; and as a result, the trajectory can either be circular parabolic elliptical or hyperbolic can either be circular, parabolic, elliptical, or hyperbolic.

In order to properly design the loop of this roller coaster it is necessary to ensure that the cars have enough energy to be able to make the loop without leaving the tracks.

[Kinetics of a Particle:](#page-13-0) Work and Energy

[CHAPTER OBJECTIVES](#page-13-0)

- To develop the principle of work and energy and apply it to solve problems that involve force, velocity, and displacement.
- To study problems that involve power and efficiency.
- To introduce the concept of a conservative force and apply the theorem of conservation of energy to solve kinetic problems.

14.1 [The Work of a Force](#page-13-0)

In this chapter, we will analyze motion of a particle using the concepts of work and energy. The resulting equation will be useful for solving problems that involve force, velocity, and displacement. Before we do this, however, we must first define the work of a force. Specifically, a force **F** will do *work* on a particle only when the particle undergoes a *displacement in the direction of the force*. For example, if the force **F** in Fig. 14–1 causes the particle to move along the path *s* from position **r** to Fig. 14–1 causes the particle to move along the path *s* from position **r** to a new position **r**^{*'*}, the displacement is then $d\mathbf{r} = \mathbf{r}' - \mathbf{r}$. The magnitude of $d\mathbf{r}$ is $d\mathbf{s}$ the length of the differentia of *d***r** is *ds*, the length of the differential segment along the path. If the angle between the tails of $d\mathbf{r}$ and \mathbf{F} is θ , Fig. 14–1, then the work done by **F** is a *scalar quantity*, defined by

By definition of the dot product (see Eq. B–14) this equation can also be written as duct (see Eq.)

$$
dU = \mathbf{F} \cdot d\mathbf{r}
$$

This result may be interpreted in one of two ways: either as the product of *F* and the component of displacement $ds \cos \theta$ in the direction of the force or as the product of ds and the component of force direction of the force, or as the product of *ds* and the component of force, direction of the force, or as the product of ds and the component of force,
F cos θ , in the direction of displacement. Note that if $0^{\circ} \le \theta < 90^{\circ}$, then
the force component and the displacement have the *same sens* the force component and the displacement have the *same sense* so that the force component and the displacement have the *same sense* so that the work is *positive*; whereas if $90^{\circ} < \theta \le 180^{\circ}$, these vectors will have the work is *positive*; whereas if $90^{\circ} < \theta \le 180^{\circ}$, these vectors will have *opposite sense*, and therefore the work is *negative*. Also, $dU = 0$ if the force is *perpendicular* to displacement since $\cos 90^{\circ} = 0$ *opposite sense*, and therefore the work is *negative*. Also, $dU = 0$ if the force is *perpendicular* to displacement, since $\cos 90^\circ = 0$, or if the force is applied at a *fixed point*, in which case the displacement is zero.

The unit of work in SI units is the joule (J), which is the amount of work done by a one-newton force when it moves through a distance of one meter in the direction of the force $(1 J = 1 N \cdot m)$. In the FPS work done by a one-newton force when it moves through a distance of one meter in the direction of the force $(1 J = 1 N \cdot m)$. In the FPS system, work is measured in units of foot-pounds (ft·lb), which is the work done by a one-pound force acting through a distance of one foot in the direction of the force.* (J), which is the
moves through
 $(1 J = 1 N \cdot m)$

Work of a Variable Force. If the particle acted upon by the force **F** undergoes a finite displacement along its path from \mathbf{r}_1 to \mathbf{r}_2 or s_1 to s_2 . Fig. 14–2*a* the work of force **F** is determined by integration to s_2 , Fig. 14–2*a*, the work of force **F** is determined by integration.
Provided **F** and θ can be expressed as a function of position then Provided **F** and θ can be expressed as a function of position, then

$$
U_{1-2} = \int_{\mathbf{r}_1}^{\mathbf{r}_2} \mathbf{F} \cdot d\mathbf{r} = \int_{s_1}^{s_2} F \cos \theta \, ds \qquad (14-1)
$$

Sometimes, this relation may be obtained by using experimental data to plot a graph of F cos θ vs. *s*. Then the *area* under this graph bounded
by s, and s_p represents the total work. Fig. 14–2b by s_1 and s_2 represents the total work, Fig. 14–2*b*.

 $*$ By convention, the units for the moment of a force or torque are written as $lb \cdot ft$, to distinguish them from those used to signify work, $ft \cdot lb$.

Work of a Constant Force Moving Along a Straight Line.

If the force \mathbf{F}_c has a constant magnitude and acts at a constant angle θ from its straight line path. Fig. 14, 3*a*, then the component of **F** in the from its straight-line path, Fig. 14–3*a*, then the component of \mathbf{F}_c in the direction of displacement is always $F_c \cos \theta$. The work done by \mathbf{F}_c when direction of displacement is always $F_c \cos \theta$. The work done by \mathbf{F}_c when
the particle is displaced from s. to s. is determined from Eq. 14–1 in the particle is displaced from s_1 to s_2 is determined from Eq. 14–1, in which case which case

$$
U_{1-2} = F_c \cos \theta \int_{s_1}^{s_2} ds
$$

or

$$
U_{1-2} = F_c \cos \theta (s_2 - s_1)
$$
 (14-2)

Here the work of \mathbf{F}_c represents the *area of the rectangle* in Fig. 14–3*b*.

Work of a Weight. Consider a particle of weight **W**, which moves up along the path *s* shown in Fig. 14–4 from position s_1 to position s_2 . At an intermediate point, the displacement $d\mathbf{r} = d\mathbf{r}\mathbf{i} + d\mathbf{v}\mathbf{i} + d\mathbf{z}\mathbf{k}$. Since up along the path *s* shown in Fig. 14–4 from position s_1 to position s_2 . At an intermediate point, the displacement $d\mathbf{r} = dx\mathbf{i} + dy\mathbf{j} + dz\mathbf{k}$. Since $\mathbf{W} = -W\mathbf{i}$ applying Eq. 14–1 we have an intermediate point, the displacement **W** = $-Wj$, applying Eq. 14–1 we have

$$
U_{1-2} = \int \mathbf{F} \cdot d\mathbf{r} = \int_{\mathbf{r}_1}^{\mathbf{r}_2} (-W\mathbf{j}) \cdot (dx\mathbf{i} + dy\mathbf{j} + dz\mathbf{k})
$$

=
$$
\int_{y_1}^{y_2} -W \, dy = -W(y_2 - y_1)
$$

or

$$
U_{1-2} = -W \Delta y
$$

 $(14-3)$

Thus, the work is independent of the path and is equal to the magnitude of the particle's weight times its vertical displacement. In the case shown in Fig. 14–4 the work is *negative*, since *W* is downward and Δy is upward. in Fig. 14–4 the work is *negative*, since *W* is downward and Δy is upward.
Note, however, that if the particle is displaced *downward* $(-\Delta y)$, the work of the weight is *nositive* Why? work of the weight is *positive*. Why?

Work of a Spring Force. If an elastic spring is elongated a distance *ds*, Fig. 14–5*a*, then the work done by the force that acts on the distance ds, Fig. 14–5a, then the work done by the force that acts on the attached particle is $dU = -F_s ds = -ks ds$. The work is *negative* since \mathbf{F}_s acts in the opposite sense to ds. If the particle displaces from s, to s acts in the opposite sense to *ds*. If the particle displaces from s_1 to s_2 , the work of **F** is then work of \mathbf{F}_s is then

$$
U_{1-2} = \int_{s_1}^{s_2} F_s ds = \int_{s_1}^{s_2} -ks ds
$$

$$
U_{1-2} = -(\frac{1}{2}ks_2^2 - \frac{1}{2}ks_1^2) \qquad (14-4)
$$

This work represents the trapezoidal area under the line $F_s = ks$,
Fig. 14–5b Fig. 14–5*b*.

A mistake in sign can be avoided when applying this equation if one simply notes the direction of the spring force acting on the particle and compares it with the sense of direction of displacement of the particle if both are in the *same sense, positive work* results; if they are *opposite* to one another, the *work is negative.*

The forces acting on the cart as it is pulled a distance *s* up the incline, are shown on its free-body diagram. The constant towing force **T** does positive work of towing force **T** does positive work of
 $U_T = (T \cos \phi)s$, the weight does $U_T = (T \cos \phi)s$, the weight does
negative work of $U_W = -(W \sin \theta)s$, and the normal force **N** does no work since there is no displacement of this force along its line of action.

The 10-kg block shown in Fig. 14–6*a* rests on the smooth incline. If the spring is originally stretched 0.5 m, determine the total work done by spring is originally stretched 0.5 m, determine the total work done by
all the forces acting on the block when a horizontal force $P = 400$ N
pushes the block up the plane $s = 2$ m all the forces acting on the block when
pushes the block up the plane $s = 2$ m.

SOLUTION

First the free-body diagram of the block is drawn in order to account for all the forces that act on the block, Fig. 14–6*b*.

Horizontal Force P. Since this force is *constant*, the work is determined using Eq. 14–2. The result can be calculated as the force times the component of displacement in the direction of the force; i.e.,

$$
U_P = 400 \text{ N} (2 \text{ m} \cos 30^\circ) = 692.8 \text{ J}
$$

or the displacement times the component of force in the direction of displacement, i.e.,

$$
U_P = 400 \text{ N} \cos 30^\circ (2 \text{ m}) = 692.8 \text{ J}
$$

Spring Force F_s **.** In the initial position the spring is stretched **Spring Force** F_s **.** In the initial position the spring is stretched $s_1 = 0.5$ m and in the final position it is stretched $s_2 = 0.5$ m $+ 2$ m = 2.5 m. We require the work to be negative since the force and 2.5 m. We require the work to be negative since the force and displacement are opposite to each other. The work of \mathbf{F}_s is thus

$$
U_s = -\left[\frac{1}{2}(30 \text{ N/m})(2.5 \text{ m})^2 - \frac{1}{2}(30 \text{ N/m})(0.5 \text{ m})^2\right] = -90 \text{ J}
$$

Weight W. Since the weight acts in the opposite sense to its vertical displacement, the work is negative; i.e.,

$$
U_W = -(98.1 \text{ N}) (2 \text{ m} \sin 30^\circ) = -98.1 \text{ J}
$$

Note that it is also possible to consider the component of weight in the direction of displacement; i.e.,

$$
U_W = -(98.1 \sin 30^\circ \text{ N}) (2 \text{ m}) = -98.1 \text{ J}
$$

Normal Force N_B. This force does *no work* since it is *always* perpendicular to the displacement.

Total Work. The work of all the forces when the block is displaced 2 m is therefore

$$
U_T = 692.8 \text{ J} - 90 \text{ J} - 98.1 \text{ J} = 505 \text{ J}
$$
Ans.

$F_R = \Sigma F$, is subjected
 $F_R = \Sigma F$, direction **v** 1 2 *n* $\mathbf{F}_R =$ **F** $\sum \mathbf{F}_t = t$ Σ **F***n*_{*n*} *ds* θ **Fig. 14–7**

Consider the particle in Fig. 14–7, which is located on the path defined relative to an inertial coordinate system. If the particle has a mass *m* and is subjected to a system of external forces represented by the resultant then the equation of motion for the particle in the tangential $\mathbf{F}_R = \Sigma \mathbf{F}$, then the equation of motion for the particle in the tangential
direction is $\Sigma F_t = ma_t$. Applying the kinematic equation $a_t = v dv/ds$
and integrating both sides assuming initially that the particle has a po and integrating both sides, assuming initially that the particle has a position and integrating both sides, assuming initially that the particle has $s = s_1$ and a speed $v = v_1$, and later at $s = s_2$, $v = v_2$, we have

14.2 [Principle of Work and Energy](#page-13-0)

$$
\sum \int_{s_1}^{s_2} F_t ds = \int_{v_1}^{v_2} m v dv
$$

$$
\sum \int_{s_1}^{s_2} F_t ds = \frac{1}{2} m v_2^2 - \frac{1}{2} m v_1^2
$$
 (14-5)

From Fig. 14–7, note that $\Sigma F_t = \Sigma F \cos \theta$, and since work is defined
om Eq. 14–1, the final result can be written as from Eq. 14–1, the final result can be written as

$$
\Sigma U_{1-2} = \frac{1}{2} m v_2^2 - \frac{1}{2} m v_1^2 \tag{14-6}
$$

This equation represents the *principle of work and energy* for the particle.The term on the left is the sum of the work done by *all* the forces acting on the particle as the particle moves from point 1 to point 2. The two terms on the right side, which are of the form $T = \frac{1}{2}mv^2$, define the particle's final and initial *kinetic energy*, respectively. Like work, kinetic energy is a *scalar* and has units of joules (J) and ft · lb. H particle's final and initial *kinetic energy*, respectively. Like work, kinetic energy is a *scalar* and has units of joules (J) and $ft·lb$. However, unlike work, which can be either positive or negative, the kinetic energy is *always positive*, regardless of the direction of motion of the particle. voint 1 to p
 $T = \frac{1}{2}mv^2$,

aly 1 ike we

When Eq. 14–6 is applied, it is often expressed in the form

$$
T_1 + \Sigma U_{1-2} = T_2 \tag{14-7}
$$

which states that the particle's initial kinetic energy plus the work done by all the forces acting on the particle as it moves from its initial to its final position is equal to the particle's final kinetic energy.

As noted from the derivation, the principle of work and energy represents an integrated form of $\Sigma F_t = ma_t$, obtained by using the kinematic equation $a_t = v \, dv/ds$. As a result, this principle will provide a convenient *substitution* for $\Sigma F = ma$, when solving those types of kinematic equation $a_t = v dv/ds$. As a result, this principle will provide a kinematic equation $a_t = v \, dv/ds$. As a result, this principle will provide a
convenient *substitution* for $\Sigma F_t = ma_t$ when solving those types of
kinetic problems which involve force velocity and displacement since kinetic problems which involve *force*, *velocity*, and *displacement* since these quantities are involved in Eq. 14–7. For application, it is suggested that the following procedure be used. e princip
 $F_t = ma_t$,
result thin

Procedure for Analysis

Work (Free-Body Diagram).

• Establish the inertial coordinate system and draw a free-body diagram of the particle in order to account for all the forces that do work on the particle as it moves along its path.

Principle of Work and Energy.

- Apply the principle of work and energy, $T_1 + \Sigma U_{1-2} = T_2$.
- The kinetic energy at the initial and final points is *always positive*, The kinetic energy at the initial and final points is
since it involves the speed squared $(T = \frac{1}{2}mv^2)$.
- A force does work when it moves through a displacement in the direction of the force.
- Work is *positive* when the force component is in the *same sense of direction* as its displacement, otherwise it is negative.
- Forces that are functions of displacement must be integrated to obtain the work. Graphically, the work is equal to the area under the force-displacement curve.
- The work of a weight is the product of the weight magnitude and The work of a weight is the product of the weight magnitude and
the vertical displacement, $U_W = \pm Wy$. It is positive when the
weight moves downwards weight moves downwards.
- The work of a spring is of the form $U_s = \frac{1}{2} k s^2$, where *k* is the spring stiffness and *s* is the stretch or compression of the spring spring stiffness and *s* is the stretch or compression of the spring.

Numerical application of this procedure is illustrated in the examples following Sec. 14.3.

If an oncoming car strikes these crash barrels, the car's kinetic energy will be transformed into work, which causes the barrels, and to some extent the car, to be deformed. By knowing the amount of energy that can be absorbed by each barrel it is possible to design a crash cushion such as this.

14.3 [Principle of Work and Energy for a](#page-13-0) System of Particles

The principle of work and energy can be extended to include a system of particles isolated within an enclosed region of space as shown in Fig. 14–8. Here the arbitrary *i*th particle, having a mass m_i , is subjected to a resultant external force \bf{F} , and a resultant internal force \bf{f} , which all the other external force \mathbf{F}_i and a resultant internal force \mathbf{f}_i which all the other
particles exert on the *i*th particle. If we apply the principle of work and particles exert on the *i*th particle. If we apply the principle of work and energy to this and each of the other particles in the system, then since work and energy are scalar quantities, the equations can be summed algebraically, which gives

$$
\Sigma T_1 + \Sigma U_{1-2} = \Sigma T_2 \tag{14-8}
$$

In this case, the initial kinetic energy of the system plus the work done by all the external and internal forces acting on the system is equal to the final kinetic energy of the system.

If the system represents a *translating rigid body*, or a series of connected translating bodies, then all the particles in each body will undergo the *same displacement*. Therefore, the work of all the internal forces will occur in equal but opposite collinear pairs and so it will cancel out. On the other hand, if the body is assumed to be *nonrigid*, the particles of the body may be displaced along *different paths*, and some of the energy due to force interactions would be given off and lost as heat or stored in the body if permanent deformations occur. We will discuss these effects briefly at the end of this section and in Sec. 15.4.Throughout this text, however, the principle of work and energy will be applied to problems where direct accountability of such energy losses does not have to be considered.

Inertial coordinate system

Fig. 14–8

v v

Work of Friction Caused by Sliding. A special class of problems will now be investigated which requires a careful application of Eq. 14–8. These problems involve cases where a body slides over the surface of another body in the presence of friction. Consider, for example, a block which is translating a distance *s* over a rough surface as shown in Fig. 14–9*a*. If the applied force **P** just balances the *resultant* frictional force $\mu_k N$, Fig. 14–9*b*, then due to equilibrium a constant velocity **v** is maintained and one would expect Eq. 14–8 to be applied as velocity **v** is maintained, and one would expect Eq. 14–8 to be applied as follows:

$$
\frac{1}{2}mv^2 + Ps - \mu_k Ns = \frac{1}{2}mv^2
$$

Indeed this equation is satisfied if $P = \mu_k N$; however, as one realizes from experience the sliding motion will *generate heat* a form of energy from experience, the sliding motion will *generate heat*, a form of energy which seems not to be accounted for in the work-energy equation. In order to explain this paradox and thereby more closely represent the nature of friction, we should actually model the block so that the surfaces of contact are *deformable* (nonrigid).* Recall that the rough portions at the bottom of the block act as "teeth," and when the block slides these teeth *deform slightly* and either break off or vibrate as they pull away from "teeth" at the contacting surface, Fig. 14–9*c*. As a result, frictional forces that act on the block at these points are displaced slightly, due to the localized deformations, and later they are replaced by other frictional forces as other points of contact are made. At any instant, the *resultant* **F** of all these frictional forces remains essentially constant, i.e., $\mu_k N$; however, due to the many *localized deformations*, the actual displacement s' of $\mu_i N$ is *not* the same as the displacement s the actual displacement *s'* of $\mu_k N$ is *not* the same as the displacement *s* of the applied force **P**. Instead, *s'* will be *less* than *s* (*s'* < *s*), and therefore the *external work* done by the resultant fricti of the applied force **P**. Instead, s' will be *less* than s ($s' < s$), and therefore the *external work* done by the resultant frictional force will therefore the *external work* done by the resultant frictional force will
be $\mu_k Ns'$ and not $\mu_k Ns$. The remaining amount of work, $\mu_k N(s - s')$,
manifests itself as an increase in *internal energy* which in fact causes manifests itself as an increase in *internal energy*, which in fact causes the block's temperature to rise. ever, due
s' of μ_kN
Instead

In summary then, Eq. 14–8 can be applied to problems involving sliding friction; however, it should be fully realized that the work of the resultant frictional force is not represented by $\mu_k N s$; instead, this term
represents both the external work of friction ($\mu_k N s'$) and internal work resultant frictional force is not represented by $\mu_k N s$; instead, this term
represents *both* the external work of friction $(\mu_k N s')$ *and* internal work
 $[\mu, N(s - s')]$ which is converted into various forms of internal energy represents *both* the external work of friction $(\mu_k N s')$ *and* internal work $[\mu_k N(s - s')]$ which is converted into various forms of internal energy, such as heat $\ddot{\tau}$ such as heat.†

(a)

 10° (b) *^s* 3500 lb $10⁵$ **F***^A* **N***^A*

Fig. 14–10

The 3500-lb automobile shown in Fig. 14–10*a* travels down the 10° inclined road at a speed of 20 ft/s. If the driver jams on the brakes, causing his wheels to lock, determine how far *s* the tires skid on the road. The coefficient of kinetic friction between the wheels and the road. The coeffic
road is $\mu_k = 0.5$.

SOLUTION

This problem can be solved using the principle of work and energy, since it involves force, velocity, and displacement.

Work (Free-Body Diagram). As shown in Fig. 14–10*b*, the normal force N_A does no work since it never undergoes displacement along its
line of action. The weight 3500 lb is displaced s sin 10° and does line of action. The weight, 3500 lb, is displaced *s* sin 10° and does positive work. Why? The frictional force \mathbf{F}_A does both external and internal work when it undergoes a displacement s. This work is negative internal work when it undergoes a displacement *s*.This work is negative since it is in the opposite sense of direction to the displacement. Applying the equation of equilibrium normal to the road, we have
+ $\Sigma F_n = 0$; $N_A - 3500 \cos 10^\circ$ lb = 0 $N_A = 3446.8$ lb

$$
+\sqrt{\Sigma}F_n = 0;
$$
 $N_A - 3500 \cos 10^\circ \text{ lb} = 0$ $N_A = 3446.8 \text{ lb}$

Thus,

$$
F_A = \mu_k N_A = 0.5 (3446.8 \text{ lb}) = 1723.4 \text{ lb}
$$

Principle of Work and Energy.

$$
T_1 + \Sigma U_{1-2} = T_2
$$

$$
\frac{1}{2} \left(\frac{3500 \text{ lb}}{32.2 \text{ ft/s}^2} \right) (20 \text{ ft/s})^2 + 3500 \text{ lb} (s \sin 10^\circ) - (1723.4 \text{ lb}) s = 0
$$

Solving for *s* yields

$$
s = 19.5 \text{ ft}
$$
 Ans.

NOTE: If this problem is solved by using the equation of motion, *two steps* are involved. First, from the free-body diagram, Fig. 14–10*b*, the equation of motion is applied along the incline. This yields

$$
+ \angle \Sigma F_s = ma_s
$$
; 3500 sin 10° lb - 1723.4 lb = $\frac{3500 \text{ lb}}{32.2 \text{ ft/s}^2}$
 $a = -10.3 \text{ ft/s}^2$

Then, since *a* is constant, we have
\n
$$
(+\swarrow)
$$
 $v^2 = v_0^2 + 2a_c(s - s_0);$
\n $(0)^2 = (20 \text{ ft/s})^2 + 2(-10.3 \text{ ft/s}^2)(s - 0)$
\n $s = 19.5 \text{ ft}$

For a short time the crane in Fig. 14–11*a* lifts the 2.50-Mg beam with a For a short time the crane in Fig. 14–11*a* lifts the 2.50-Mg beam with a
force of $F = (28 + 3s^2)$ kN. Determine the speed of the beam when
it has risen $s = 3$ m. Also, how much time does it take to attain this force of $F = (28 + 3s^2)$ kN. Determine the speed of the beam when
it has risen $s = 3$ m. Also, how much time does it take to attain this
height starting from rest? height starting from rest?

SOLUTION

We can solve part of this problem using the principle of work and energy since it involves force, velocity, and displacement. Kinematics energy since it involves force, velocity, and displacement. Kinematics
must be used to determine the time. Note that at $s = 0$,
 $F = 28(10^3)N > W = 250(10^3)(9.81)N$ so motion will occur must be used to determine the time. Note that at $F = 28(10^3)$ N > $W = 2.50(10^3)(9.81)$ N, so motion will occur.

Work (Free-Body Diagram). As shown on the free-body diagram, Fig. 14–11*b*, the lifting force **F** does positive work, which must be determined by integration since this force is a variable. Also, the weight is constant and will do negative work since the displacement is upwards.

Principles of Work and Energy.

$$
T_1 + \Sigma U_{1-2} = T_2
$$

\n
$$
0 + \int_0^s (28 + 3s^2)(10^3) ds - (2.50)(10^3)(9.81)s = \frac{1}{2}(2.50)(10^3)v^2
$$

\n
$$
28(10^3)s + (10^3)s^3 - 24.525(10^3)s = 1.25(10^3)v^2
$$

\n
$$
v = (2.78s + 0.8s^3)^{\frac{1}{2}}
$$
 (1)

When $s = 3$ m,

$$
v = 5.47 \text{ m/s}
$$
Ans.

Kinematics. Since we were able to express the velocity as a function of displacement, the time can be determined using function of displacer
 $v = ds/dt$. In this case,

$$
(2.78s + 0.8s3)1/2 = \frac{ds}{dt}
$$

$$
t = \int_0^3 \frac{ds}{(2.78s + 0.8s3)1}
$$

The integration can be performed numerically using a pocket calculator. The result is

$$
t = 1.79 \text{ s}
$$
 Ans.

NOTE: The acceleration of the beam can be determined by **NOTE:** The acceleration of the beam can be determined by integrating Eq. (1) using $v dv = a ds$, or more directly, by applying the equation of motion $\Sigma F = ma$ the equation of motion, $\Sigma F = ma$.

The platform *P*, shown in Fig. 14–12*a*, has negligible mass and is tied down so that the 0.4-m-long cords keep a 1-m-long spring compressed 0.6 m when *nothing* is on the platform. If a 2-kg block is placed on the platform and released from rest after the platform is pushed down 0.1 m, Fig. 14–12*b*, determine the maximum height *h* the block rises in the air, measured from the ground.

SOLUTION

Work (Free-Body Diagram). Since the block is released from rest and later reaches its maximum height, the initial and final velocities are zero. The free-body diagram of the block when it is still in contact with the platform is shown in Fig. 14–12*c*. Note that the weight does negative work and the spring force does positive work. Why? In particular, the work and the spring force does positive work. Why? In particular, the *initial compression* in the spring is $s_1 = 0.6$ m + 0.1 m = 0.7 m. Due to the cords the spring's *final compression* is $s_2 = 0.6$ m (after the block *the cords*, the spring's *final compression* is $s_1 = 0.6$ m + 0.1 m = 0.7 m. Due to the cords, the spring's *final compression* is $s_2 = 0.6$ m (after the block leaves the platform). The bottom of the block rises from a leaves the platform). The bottom of the block rises from a height of leaves the platform). The bottom of the blo $(0.4 \text{ m} - 0.1 \text{ m}) = 0.3 \text{ m}$ to a final height *h*.

Principle of Work and Energy.

$$
T_1 + \Sigma U_{1-2} = T_2
$$

$$
\frac{1}{2}mv_1^2 + \left\{-\left(\frac{1}{2}ks_2^2 - \frac{1}{2}ks_1^2\right) - W \Delta y\right\} = \frac{1}{2}mv_2^2
$$

Note that here $s_1 = 0.7 \text{ m} > s_2 = 0.6 \text{ m}$ and so the work of the spring
as determined from Eq. 14–4 will indeed be positive once the as determined from Eq. 14–4 will indeed be positive once the calculation is made. Thus,

$$
0 + \left\{-\left[\frac{1}{2}(200 \text{ N/m})(0.6 \text{ m})^2 - \frac{1}{2}(200 \text{ N/m})(0.7 \text{ m})^2\right] - (19.62 \text{ N})[h - (0.3 \text{ m})]\right\} = 0
$$

Solving yields

$$
h = 0.963 \text{ m}
$$
Ans.

The 40-kg boy in Fig. 14–13*a* slides down the smooth water slide. If he starts from rest at *A*, determine his speed when he reaches *B* and the normal reaction the slide exerts on the boy at this position.

SOLUTION

Work (Free-Body Diagram). As shown on the free-body diagram, Fig. 14–13*b*, there are two forces acting on the boy as he goes down the slide. Note that the normal force does no work.

Principle of Work and Energy.

$$
T_A + \Sigma U_{A-B} = T_B
$$

0 + (40(9.81)N)(7.5 m) = $\frac{1}{2}$ (40 kg) v_B^2
 v_B = 12.13 m/s = 12.1 m/s *Ans.*

Equation of Motion. Referring to the free-body diagram of the boy when he is at *B*, Fig. 14–13*c*, the normal reaction N_B can now be obtained by applying the equation of motion along the *n* axis. Here obtained by applying the equation of motion along the *n* axis. Here the radius of curvature of the path is

$$
\rho_B = \frac{\left[1 + \left(\frac{dy}{dx}\right)^2\right]^{3/2}}{|d^2y/dx^2|} = \frac{\left[1 + (0.15x)^2\right]^{3/2}}{|0.15|}\bigg|_{x=0} = 6.667 \text{ m}
$$

Thus,

$$
+ \hat{\Delta} E_n = ma_n; \qquad N_B - 40(9.81) \text{ N} = 40 \text{ kg} \left(\frac{(12.13 \text{ m/s})^2}{6.667 \text{ m}} \right)
$$

$$
N_B = 1275.3 \text{ N} = 1.28 \text{ kN} \qquad \qquad Ans.
$$

(c) **N***^B*

Fig. 14–13

t

Blocks *A* and *B* shown in Fig. 14–14*a* have a mass of 10 kg and 100 kg, respectively. Determine the distance *B* travels when it is released from rest to the point where its speed becomes 2 m/s .

SOLUTION

This problem may be solved by considering the blocks separately and applying the principle of work and energy to each block. However, the work of the (unknown) cable tension can be eliminated from the analysis by considering blocks *A* and *B* together as a *single system*.

Work (Free-Body Diagram). As shown on the free-body diagram of the system, Fig. 14–14*b*, the cable force **T** and reactions **R**₁ and **R**₂ do *no work*, since these forces represent the reactions at the supports and consequently they do not move while the blocks are displaced. The weights both do positive work if we *assume* both move downward, in the positive sense of direction of s_A and s_B . $A \stackrel{B}{\longrightarrow} B$

Principle of Work and Energy. Realizing the blocks are released from rest, we have

$$
\Sigma T_1 + \Sigma U_{1-2} = \Sigma T_2
$$

\n
$$
\left\{ \frac{1}{2} m_A (v_A)_1^2 + \frac{1}{2} m_B (v_B)_1^2 \right\} + \left\{ W_A \Delta s_A + W_B \Delta s_B \right\} =
$$

\n
$$
\left\{ \frac{1}{2} m_A (v_A)_2^2 + \frac{1}{2} m_B (v_B)_2^2 \right\}
$$

\n
$$
\left\{ 0 + 0 \right\} + \left\{ 98.1 \text{ N } (\Delta s_A) + 981 \text{ N } (\Delta s_B) \right\} =
$$

\n
$$
\left\{ \frac{1}{2} (10 \text{ kg}) (v_A)_2^2 + \frac{1}{2} (100 \text{ kg}) (2 \text{ m/s})^2 \right\}
$$
 (1)

Kinematics. Using the methods of kinematics discussed in Sec. 12.9, it may be seen from Fig. 14–14*a* that the total length *l* of all the vertical segments of cable may be expressed in terms of the position coordinates s_A and s_B as

$$
s_A + 4s_B = l
$$

Hence, a change in position yields the displacement equation
 $\Delta s_A + 4 \Delta s_B = 0$

$$
\Delta s_A + 4 \Delta s_B = 0
$$

$$
\Delta s_A = -4 \Delta s_B
$$

Here we see that a downward displacement of one block produces an Here we see that a downward displacement of one block produces an upward displacement of the other block. Note that Δs_A and Δs_B must have the same sign convention in both Eqs. 1 and 2. Taking the time have the *same* sign convention in both Eqs. 1 and 2. Taking the time derivative yields

$$
v_A = -4v_B = -4(2 \text{ m/s}) = -8 \text{ m/s}
$$
 (2)

Retaining the negative sign in Eq. 2 and substituting into Eq. 1 yields $\Delta s_B = 0.883 \text{ m} \downarrow$ *Ans.*

$$
s_B = 0.883 \text{ m} \downarrow \qquad \qquad \text{Ans.}
$$

FUNDAMENTAL PROBLEMS

F14–1. The spring is placed between the wall and the 10-kg **F14-1.** The spring is placed between the wall and the 10-kg
block. If the block is subjected to a force of $F = 500$ N,
determine its velocity when $s = 0.5$ m. When $s = 0$, the block. If the block is subjected to a force of $F = 500$ N, determine its velocity when $s = 0.5$ m. When $s = 0$, the block is at rest and the spring is uncompressed. The contact block is at rest and the spring is uncompressed. The contact surface is smooth.

 $s = 10$ m up the plane, starting from rest. The coefficient of

kinetic friction between the crate and the plane is $u_1 = 0.3$ kinetic friction between the crate and the plane is $\mu_k = 0.3$.

F14–2

F14–2
F14–3. If the motor exerts a force of $F = (600 + 2s^2)$ N
on the cable, determine the speed of the 100-kg crate when on the cable, determine the speed of the 100-kg crate when on the cable, determine the speed of the 100-kg crate when
it rises to $s = 15$ m. The crate is initially at rest on the
ground ground.

F14–4. The 1.8-Mg dragster is traveling at 125 m/s when the engine is shut off and the parachute is released. If the drag force of the parachute can be approximated by the graph, determine the speed of the dragster when it has traveled 400 m.

F14–5. When $s = 0.6$ m, the spring is unstretched and the space of 5 m/s down the smooth plane 10-kg block has a speed of 5 m/s down the smooth plane. Determine the distance *s* when the block stops.

F14–5

F14–6. The 5-lb collar is pulled by a cord that passes around a small peg at *C*. If the cord is subjected to a constant around a small peg at *C*. If the cord is subjected to a constant
force of $F = 10$ lb, and the collar is at rest when it is at *A*,
determine its speed when it reaches *B*. Neglect friction determine its speed when it reaches *B*. Neglect friction.

PROBLEMS

•**14–1.** A 1500-lb crate is pulled along the ground with a constant speed for a distance of 25 ft, using a cable that makes an angle of 15° with the horizontal. Determine the tension in the cable and the work done by this force. The coefficient of kinetic friction between the ground and coefficient of kinetic
the crate is $\mu_k = 0.55$.

14

14–2. The motion of a 6500-lb boat is arrested using a bumper which provides a resistance as shown in the graph. Determine the maximum distance the boat dents the bumper if its approaching speed is 3 ft/s .

***14–4.** When a 7-kg projectile is fired from a cannon barrel that has a length of 2 m, the explosive force exerted on the projectile, while it is in the barrel, varies in the manner shown. Determine the approximate muzzle velocity of the projectile at the instant it leaves the barrel. Neglect the effects of friction inside the barrel and assume the barrel is horizontal.

Prob. 14–2

14–3. The smooth plug has a weight of 20 lb and is pushed against a series of Belleville spring washers so that the against a series of Belleville spring washers so that the compression in the spring is $s = 0.05$ ft. If the force of the spring on the plug is $F = (3s^{1/3})$ lb where s is given in feet compression in the spring is $s = 0.05$ ft. If the force of the spring on the plug is $F = (3s^{1/3})$ lb, where *s* is given in feet, determine the speed of the plug after it moves away from determine the speed of the plug after it moves away from the spring. Neglect friction.

•**14–5.** The 1.5-kg block slides along a smooth plane and **•14–5.** The 1.5-kg block slides along a smooth plane and strikes a *nonlinear spring* with a speed of $v = 4$ m/s. The spring is termed "nonlinear" because it has a resistance of spring is termed "nonlinear" because it has a resistance of spring is termed "nonlinear" because it has a resistance of $F_s = ks^2$, where $k = 900 \text{ N/m}^2$. Determine the speed of the block after it has compressed the spring $s = 0.2 \text{ m}$ block after it has compressed the spring $s = 0.2$ m.

Prob. 14–5

14–6. When the driver applies the brakes of a light truck traveling 10 km/h , it skids 3 m before stopping. How far will the truck skid if it is traveling 80 km/h when the brakes are applied?

Prob. 14–6

14–7. The 6-lb block is released from rest at *A* and slides down the smooth parabolic surface. Determine the maximum compression of the spring.

***14–8.** The spring in the toy gun has an unstretched length of 100 mm. It is compressed and locked in the position shown. When the trigger is pulled, the spring unstretches 12.5 mm, and the 20-g ball moves along the barrel. Determine the speed of the ball when it leaves the gun. Neglect friction.

•14–9. Springs *AB* and *CD* have a stiffness of $k = 300$ N/m and $k' = 200$ N/m respectively and both springs have an •14–9. Springs *AB* and *CD* have a stiffness of $k = 300$ N/m
and $k' = 200$ N/m, respectively, and both springs have an
unstretched length of 600 mm If the 2-kg smooth collar starts unstretched length of 600 mm. If the 2-kg smooth collar starts from rest when the springs are unstretched, determine the speed of the collar when it has moved 200 mm.

14–10. The 2-Mg car has a velocity of $v_1 = 100 \text{ km/h}$ when the driver sees an obstacle in front of the car. If it takes 0.75 s the driver sees an obstacle in front of the car. If it takes 0.75 s for him to react and lock the brakes, causing the car to skid, determine the distance the car travels before it stops. The coefficient of kinetic friction between the tires and the road coefficient of
is $\mu_k = 0.25$.

14–11. The 2-Mg car has a velocity of $v_1 = 100 \text{ km/h}$
when the driver sees an obstacle in front of the car. It takes when the driver sees an obstacle in front of the car. It takes 0.75 s for him to react and lock the brakes, causing the car to skid. If the car stops when it has traveled a distance of 175 m, determine the coefficient of kinetic friction between the tires and the road.

***14–12.** The 10-lb block is released from rest at *A*. Determine the compression of each of the springs after the block strikes the platform and is brought momentarily to rest. Initially both springs are unstretched. Assume the platform has a negligible mass.

14–13. Determine the velocity of the 60-lb block *A* if the two blocks are released from rest and the 40-lb block *B* moves 2 ft up the incline. The coefficient of kinetic friction between both blocks and the inclined planes is $\mu_k = 0.10$.

14–15. The force **F**, acting in a constant direction on the 20-kg block, has a magnitude which varies with position *s* of the block. Determine the speed of the block after it slides
3 m. When $s = 0$ the block is moving to the right at 2 m/s.
The coefficient of kinetic friction between the block and 3 m. When $s = 0$ the block is moving to the right at 2 m/s. The coefficient of kinetic friction between the block and surface is $\mu_k = 0.3$.

14–16. A rocket of mass *m* is fired vertically from the **14–16.** A rocket of mass *m* is fired vertically from the surface of the earth, i.e., at $r = r_1$. Assuming no mass is lost as it travels unward determine the work it must do against as it travels upward, determine the work it must do against gravity to reach a distance r_2 . The force of gravity is $F = GM \, m/r^2$ (Eq. 13–1) where M is the mass of the earth gravity to reach a distance r_2 . The force of gravity is $F = GM_e m/r^2$ (Eq. 13–1), where M_e is the mass of the earth and r the distance between the rocket and the center of and *r* the distance between the rocket and the center of the earth.

Prob. 14–13

Determine the angle θ at which the box leaves the cylinder.

Probs. 14–37/38

14.4 [Power and Efficiency](#page-14-0)

Power. The term "power" provides a useful basis for chosing the type of motor or machine which is required to do a certain amount of work in a given time. For example, two pumps may each be able to empty a reservoir if given enough time; however, the pump having the larger power will complete the job sooner.

The *power* generated by a machine or engine that performs an amount of work *dU* within the time interval *dt* is therefore

$$
P = \frac{dU}{dt} \tag{14-9}
$$

 $(14–10)$

 $dU = \mathbf{F} \cdot d\mathbf{r},$

If the work dU is expressed as
$$
dU = \mathbf{F} \cdot d\mathbf{r}
$$
, then

$$
P = \frac{dU}{dt} = \frac{\mathbf{F} \cdot d\mathbf{r}}{dt} = \mathbf{F} \cdot \frac{d\mathbf{r}}{dt}
$$

 $P = \mathbf{F} \cdot \mathbf{v}$

or

Hence, power is a *scalar*, where in this formulation **v** represents the velocity of the paticle which is acted upon by the force **F**.

The basic units of power used in the SI and FPS systems are the watt (W) and horsepower (hp), respectively. These units are defined as
 $1 \text{ W} = 1 \text{ J/s} = 1 \text{ N} \cdot \text{m/s}$

$$
1 \text{ W} = 1 \text{ J/s} = 1 \text{ N} \cdot \text{m/s}
$$

$$
1 \text{ hp} = 550 \text{ ft} \cdot \text{lb/s}
$$

For conversion between the two systems of units, $1 hp = 746 W$.

Efficiency. The *mechanical efficiency* of a machine is defined as the ratio of the output of useful power produced by the machine to the input of power supplied to the machine. Hence,

$$
\epsilon = \frac{\text{power output}}{\text{power input}} \tag{14-11}
$$

The power output of this locomotive comes from the driving frictional force **F** developed at its wheels. It is this force that overcomes the frictional resistance of the cars in tow and is able to lift the weight of the train up the grade.

If energy supplied to the machine occurs during the *same time interval* at which it is drawn, then the efficiency may also be expressed in terms of the ratio

$$
\epsilon = \frac{\text{energy output}}{\text{energy input}} \tag{14-12}
$$

Since machines consist of a series of moving parts, frictional forces will always be developed within the machine, and as a result, extra energy or power is needed to overcome these forces. Consequently, power output will be less than power input and so *the efficiency of a machine is always less than 1*.

The power supplied to a body can be determined using the following procedure.

Procedure for Analysis

- First determine the external force **F** acting on the body which causes the motion. This force is usually developed by a machine or engine placed either within or external to the body.
- If the body is accelerating, it may be necessary to draw its free-If the body is accelerating, it may be necessary to draw its free-
body diagram and apply the equation of motion $(\Sigma \mathbf{F} = m\mathbf{a})$ to
determine **F** determine **F**.
- Once **F** and the velocity **v** of the particle where **F** is applied have been found, the power is determined by multiplying the force magnitude with the component of velocity acting in the direction been found, the power is deter
magnitude with the component of **F**, (i.e., $P = \mathbf{F} \cdot \mathbf{v} = Fv \cos \theta$).
- In some problems the power may be found by calculating the work done by **F** per unit of time $(P_{\text{avg}} = \Delta U/\Delta t)$.

The power requirements of this elevator depend upon the vertical force **F** that acts on the elevator and causes it to move upwards. If the velocity of the elevator is **v**, then the power output is $P = \mathbf{F} \cdot \mathbf{v}$.
The man in Fig. 14–15*a* pushes on the 50-kg crate with a force of The man in Fig. 14–15*a* pushes on the 50-kg crate with a force of $F = 150$ N. Determine the power supplied by the man when $t = 4$ s.
The coefficient of kinetic friction between the floor and the crate is The coefficient of kinetic friction between the floor and the crate is μ_k = 0.2. Initially the create is at rest.

SOLUTION

To determine the power developed by the man, the velocity of the 150-N force must be obtained first. The free-body diagram of the crate is shown in Fig. 14–15*b*. Applying the equation of motion,

$$
+ \uparrow \Sigma F_y = ma_y; \qquad N - \left(\frac{3}{5}\right)150 \text{ N} - 50(9.81) \text{ N} = 0
$$

$$
N = 580.5 \text{ N}
$$

$$
\pm \Sigma F_x = ma_x; \qquad \left(\frac{4}{5}\right)150 \text{ N} - 0.2(580.5 \text{ N}) = (50 \text{ kg})a
$$

$$
a = 0.078 \text{ m/s}^2
$$

The velocity of the crate when $t = 4$ s is therefore

$$
\stackrel{+}{\longleftrightarrow} \qquad \qquad v = v_0 + a_c t
$$

$$
v = 0 + (0.078 \text{ m/s}^2)(4 \text{ s}) = 0.312 \text{ m/s}
$$

 $t = 4$ s

The power supplied to the crate by the man when
$$
t = 4
$$
 s is therefore
\n
$$
P = \mathbf{F} \cdot \mathbf{v} = F_x v = \left(\frac{4}{5}\right) (150 \text{ N})(0.312 \text{ m/s})
$$
\n
$$
= 37.4 \text{ W}
$$
\nAns.

The motor *M* of the hoist shown in Fig. 14–16*a* lifts the 75-lb crate *C* so that the acceleration of point *P* is 4 ft/s^2 . Determine the power that must be supplied to the motor at the instant *P* has a velocity of 2 ft/s.
Neglect the mass of the pulley and cable and take $\epsilon = 0.85$. Neglect the mass of the pulley and cable and take $\epsilon = 0.85$.

SOLUTION

In order to find the power output of the motor, it is first necessary to determine the tension in the cable since this force is developed by the motor.

From the free-body diagram, Fig. 14–16*b*, we have

$$
+\sqrt{ } \sum F_y = ma_y; \qquad -2T + 75 \text{ lb} = \frac{75 \text{ lb}}{32.2 \text{ ft/s}^2} a_c \tag{1}
$$

The acceleration of the crate can be obtained by using kinematics to relate it to the known acceleration of point *P*, Fig. 14–16*a*. Using the methods of Sec. 12.9, the coordinates s_c and s_p can be related to a constant portion of cable length *l* which is changing in the vertical and constant portion of cable length *l* which is changing in the vertical and
horizontal directions. We have $2s_C + s_P = l$. Taking the second time
derivative of this equation yields derivative of this equation yields

$$
2a_C = -a_P
$$
 (2)

Since $a_p = +4$ ft/s², then $a_c = -(4$ ft/s²)/2 = -2 ft/s². What does
the negative sign indicate? Substituting this result into Eq. 1 and the negative sign indicate? Substituting this result into Eq. 1 and *retaining* the negative sign since the acceleration in *both* Eq. 1 and Eq. 2 was considered positive downward, we have $^{2})/2 = -2 \text{ ft/s}^{2}$ $a_P = +4$ ft/s², then $a_C = -(4 \text{ ft/s}^2)/2 = -2 \text{ ft/s}^2$.
easily sign indicate? Substituting this result into

$$
-2T + 75 \text{ lb} = \left(\frac{75 \text{ lb}}{32.2 \text{ ft/s}^2}\right) (-2 \text{ ft/s}^2)
$$

$$
T = 39.83 \text{ lb}
$$

The power output, measured in units of horsepower, required to draw the cable in at a rate of 2 ft/s is therefore
 $P = \mathbf{T} \cdot \mathbf{v} = (39.83 \text{ lb})(2 \text{ ft/s})[1 \text{ hp}/(550 \text{ ft} \cdot \text{ lb/s})]$

$$
P = \mathbf{T} \cdot \mathbf{v} = (39.83 \text{ lb})(2 \text{ ft/s})[1 \text{ hp}/(550 \text{ ft} \cdot \text{lb/s})]
$$

$$
= 0.1448 \text{ hp}
$$

This *power output* requires that the motor provide a *power input* of

power input =
$$
\frac{1}{\epsilon}
$$
 (power output)
= $\frac{1}{0.85}$ (0.1448 hp) = 0.170 hp *Ans.*

NOTE: Since the velocity of the crate is constantly changing, the power requirement is *instantaneous*.

14

FUNDAMENTAL PROBLEMS

F14–7. If the contact surface between the 20-kg block and the ground is smooth, determine the power of force **F** when $t = 4$ s. Initially, the block is at rest.

F14–8. If $F = (10s)$ N, where *s* is in meters, and the contact surface between the block and the ground is contact surface between the block and the ground is contact surface between the block and the ground is
smooth, determine the power of force **F** when $s = 5$ m.
Initially the 20-kg block is at rest Initially, the 20-kg block is at rest.

F14–8

F14–9. If the motor winds in the cable with a constant **F14-9.** If the motor winds in the cable with a constant
speed of $v = 3$ ft/s, determine the power supplied to the
motor. The load weighs 100 lb and the efficiency of the motor. The load weighs 100 lb and the efficiency of the motor is $\epsilon = 0.8$. Neglect the mass of the pulleys.

F14–10. The coefficient of kinetic friction between the **F14-10.** The coefficient of kinetic friction between the 20-kg block and the inclined plane is $\mu_k = 0.2$. If the block is traveling up the inclined plane with a constant velocity is traveling up the inclined plane with a constant velocity $v = 5$ m/s, determine the power of force **F**.

F14–10

F14–11. If the 50-kg load *A* is hoisted by motor *M* so that the load has a constant velocity of 1.5 m/s , determine the power input of the motor, which operates at an efficiency $\epsilon = 0.8$ $\epsilon = 0.8$.

F14–11

F14–12. At the instant shown, point *P* on the cable has a **F14-12.** At the instant shown, point P on the cable has a velocity $v_P = 12$ m/s, which is increasing at a rate of $a_R = 6$ m/s². Determine the power input of motor M at this velocity $v_P = 12$ m/s, which is increasing at a rate of $a_P = 6$ m/s². Determine the power input of motor *M* at this instant if it operates with an efficiency $\epsilon = 0.8$. The mass of instant if it operates with an efficiency $\epsilon = 0.8$. The mass of block *A* is 50 kg. 2 .

PROBLEMS

14–42. The diesel engine of a 400-Mg train increases the train's speed uniformly from rest to 10 m/s in 100 s along a horizontal track. Determine the average power developed.

14–70. The 50-kg crate is hoisted up the 30° incline by the pulley system and motor *M*. If the crate starts from rest and, by constant acceleration, attains a speed of 4 m/s after traveling 8 m along the plane, determine the power that must be supplied to the motor at the instant the crate has moved 8 m. Neglect friction along the plane. The motor has moved 8 m. Neglect fricti
an efficiency of $\epsilon = 0.74$.

14–71. Solve Prob. 14–70 if the coefficient of kinetic friction between the plane and the crate is $\mu_k = 0.3$.

Probs. 14–70/71

14.5 [Conservative Forces and](#page-14-0) Potential Energy

Conservative Force. If the work of a force is *independent of the path* and depends only on the force's initial and final positions on the path, then we can classify this force as a *conservative force*. Examples of conservative forces are the weight of a particle and the force developed by a spring. The work done by the weight depends *only* on the *vertical displacement* of the weight, and the work done by a spring force depends *only* on the spring's *elongation* or *compression*.

In contrast to a conservative force, consider the force of friction exerted *on a sliding object* by a fixed surface. The work done by the frictional force *depends on the path*—the longer the path, the greater the work. Consequently, *frictional forces are nonconservative*. The work is dissipated from the body in the form of heat.

Energy. Energy is defined as the capacity for doing work. For example, if a particle is originally at rest, then the principle of work and example, if a particle is originally at rest, then the principle of work and
energy states that $\Sigma U_{1\rightarrow 2} = T_2$. In other words, the kinetic energy is
equal to the work that must be done on the particle to bring it from equal to the work that must be done on the particle to bring it from a state of rest to a speed v . Thus, the *kinetic energy* is a measure of the particle's *capacity to do work*, which is associated with the *motion* of the particle. When energy comes from the *position* of the particle, measured from a fixed datum or reference plane, it is called potential energy. Thus, *potential energy* is a measure of the amount of work a conservative force will do when it moves from a given position to the datum. In mechanics, the potential energy created by gravity (weight) or an elastic spring is important.

Gravitational Potential Energy. If a particle is located a distance *y above* an arbitrarily selected datum, as shown in Fig. 14–17, the particle's weight **W** has positive *gravitational potential energy*, V_g , since **W** has the canacity of doing positive work when the particle is moved **W** has the capacity of doing positive work when the particle is moved back down to the datum. Likewise, if the particle is located a distance *y below* the datum, V_g is negative since the weight does negative work below the datum, V_g is negative since the weight does negative worlds
when the particle is moved back up to the datum. At the datum $V_g = 0$.
In general if y is nositive unward, the gravitational potential energy of

In general, if *y* is *positive upward*, the gravitational potential energy of the particle of weight *W* is*

Gravitational potential energy

Fig. 14–17

14

Elastic Potential Energy. When an elastic spring is elongated or compressed a distance *s* from its unstretched position, elastic potential energy V_e can be stored in the spring. This energy is

$$
V_e = +\frac{1}{2}ks^2 \tag{14-14}
$$

Here V_e is *always positive* since, in the deformed position, the force of the spring has the *capacity* or "potential" for always doing positive work on the particle when the spring is returned to its unstretched position, Fig. 14–18.

Elastic potential energy

Fig. 14–18

The weight of the sacks resting on this platform causes potential energy to be stored in the supporting springs.As each sack is removed, the platform will *rise* slightly since some of the potential energy within the springs will be transformed into an increase in gravitational potential energy of the remaining sacks. Such a device is useful for removing the sacks without having to bend over to pick them up as they are unloaded.

Potential Function. In the general case, if a particle is subjected to both gravitational and elastic forces, the particle's potential energy can be expressed as a *potential function*, which is the algebraic sum

$$
V = V_g + V_e \tag{14-15}
$$

Measurement of *V* depends on the location of the particle with respect to a selected datum in accordance with Eqs. 14–13 and 14–14.

The work done by a conservative force in moving the particle from one point to another point is measured by the *difference* of this function, i.e.,

$$
U_{1-2} = V_1 - V_2 \tag{14-16}
$$

For example, the potential function for a particle of weight *W* suspended from a spring can be expressed in terms of its position, *s*, measured from a datum located at the unstretched length of the spring, Fig. 14–19. We have

$$
V = V_g + V_e
$$

$$
= -Ws + \frac{1}{2}ks^2
$$

If the particle moves from s_1 to a lower position s_2 , then applying Eq. 14–16 it can be seen that the work of **W** and **F** is Eq. 14–16 it can be seen that the work of **W** and \mathbf{F}_s is

$$
U_{1-2} = V_1 - V_2 = \left(-Ws_1 + \frac{1}{2}ks_1^2\right) - \left(-Ws_2 + \frac{1}{2}ks_2^2\right)
$$

= $W(s_2 - s_1) - \left(\frac{1}{2}ks_2^2 - \frac{1}{2}ks_1^2\right)$

Fig. 14–19

When the displacement along the path is infinitesimal, i.e., from point When the displacement along the path is infinitesimal
(*x*, *y*, *z*) to (*x* + *dx*, *y* + *dy*, *z* + *dz*), Eq. 14–16 becomes

$$
dU = V(x, y, z) - V(x + dx, y + dy, z + dz)
$$

= $-dV(x, y, z)$ (14-17)

If we represent both the force and its displacement as Cartesian

vectors, then the work can also be expressed as
\n
$$
dU = \mathbf{F} \cdot d\mathbf{r} = (F_x \mathbf{i} + F_y \mathbf{j} + F_z \mathbf{k}) \cdot (dx \mathbf{i} + dy \mathbf{j} + dz \mathbf{k})
$$
\n
$$
= F_x dx + F_y dy + F_z dz
$$

Substituting this result into Eq. 14–17 and expressing the differential $dV(x, y, z)$ in terms of its partial derivatives yields

$$
F_x dx + F_y dy + F_z dz = -\left(\frac{\partial V}{\partial x} dx + \frac{\partial V}{\partial y} dy + \frac{\partial V}{\partial z} dz\right)
$$

Since changes in *x, y*, and *z* are all independent of one another, this equation is satisfied provided

$$
F_x = -\frac{\partial V}{\partial x}, \qquad F_y = -\frac{\partial V}{\partial y}, \qquad F_z = -\frac{\partial V}{\partial z} \qquad (14-18)
$$

Thus,

$$
\mathbf{F} = -\frac{\partial V}{\partial x}\mathbf{i} - \frac{\partial V}{\partial y}\mathbf{j} - \frac{\partial V}{\partial z}\mathbf{k}
$$

$$
= -\left(\frac{\partial}{\partial x}\mathbf{i} + \frac{\partial}{\partial y}\mathbf{j} + \frac{\partial}{\partial z}\mathbf{k}\right)V
$$

or

$$
\mathbf{F} = -\nabla V \tag{14-19}
$$

where ∇ (del) represents the vector operator $\nabla = (\partial/\partial x)\mathbf{i} + (\partial/\partial z)\mathbf{k}$ $(\partial/\partial y)\mathbf{i} + (\partial/\partial z)\mathbf{k}$.

Equation 14–19 relates a force **F** to its potential function *V* and thereby provides a mathematical criterion for proving that **F** is conservative. For example, the gravitational potential function for a conservative. For example, the gravitational potential function for a
weight located a distance *y* above a datum is $V_g = Wy$. To prove that
W is conservative it is necessary to show that it satisfies Eq. 14–18 (or **W** is conservative, it is necessary to show that it satisfies Eq. 14–18 (or Eq. 14–19), in which case

$$
F_y = -\frac{\partial V}{\partial y}; \qquad F_y = -\frac{\partial}{\partial y}(Wy) = -W
$$

The negative sign indicates that **W** acts downward, opposite to positive *y*, which is upward.

14.6 [Conservation of Energy](#page-14-0)

When a particle is acted upon by a system of *both* conservative and nonconservative forces, the portion of the work done by the *conservative forces* can be written in terms of the difference in their potential energies forces can be written in terms of the difference in their potential energies
using Eq. 14–16, i.e., $(\Sigma U_{1-2})_{\text{cons.}} = V_1 - V_2$. As a result, the principle of
work and energy can be written as work and energy can be written as

$$
T_1 + V_1 + (\Sigma U_{1-2})_{\text{noncons.}} = T_2 + V_2 \tag{14-20}
$$

Here $(\Sigma U_{1-2})_{\text{noncons.}}$ represents the work of the nonconservative forces
ting on the particle If *only conservative forces* do work then we have acting on the particle. If *only conservative forces* do work then we have

$$
T_1 + V_1 = T_2 + V_2 \tag{14-21}
$$

This equation is referred to as the *conservation of mechanical energy* or simply the *conservation of energy*. It states that during the motion the sum of the particle's kinetic and potential energies remains *constant*. For this to occur, kinetic energy must be transformed into potential energy, and vice versa. For example, if a ball of weight **W** is dropped from a height *h* above the ground (datum), Fig. 14–20, the potential energy of the ball is maximum before it is dropped, at which time its kinetic energy is zero. The total mechanical energy of the ball in its initial position is thus

$$
E = T_1 + V_1 = 0 + Wh = Wh
$$

When the ball has fallen a distance $h/2$, its speed can be determined by When the ball has fallen a distance $h/2$, its speed can be determined by
using $v^2 = v_0^2 + 2a_c(y - y_0)$, which yields $v = \sqrt{2g(h/2)} = \sqrt{gh}$. The energy of the ball at the mid-height position is therefore

$$
E = T_2 + V_2 = \frac{1}{2} \frac{W}{g} (\sqrt{gh})^2 + W\left(\frac{h}{2}\right) = Wh
$$

Just before the ball strikes the ground, its potential energy is zero and its Just before the ball strikes the ground, its potential energy is z
speed is $v = \sqrt{2gh}$. Here, again, the total energy of the ball is

$$
E = T_3 + V_3 = \frac{1}{2} \frac{W}{g} \left(\sqrt{2gh} \right)^2 + 0 = Wh
$$

Note that when the ball comes in contact with the ground, it deforms somewhat, and provided the ground is hard enough, the ball will somewhat, and provided the ground is hard enough, the ball will
rebound off the surface, reaching a new height h', which will be *less* than
the height h from which it was first released Neglecting air friction the the height *h* from which it was first released. Neglecting air friction, the the height h from which it was first released. Neglecting air friction, the difference in height accounts for an energy loss, $E_l = W(h - h')$, which occurs during the collision. Portions of this loss produce noise, localized occurs during the collision. Portions of this loss produce noise, localized deformation of the ball and ground, and heat.

System of Particles. If a system of particles is *subjected only to conservative forces*, then an equation similar to Eq. 14–21 can be written for the particles.Applying the ideas of the preceding discussion, Eq. 14–8 for the particles. Applying the ide
 $(\Sigma T_1 + \Sigma U_{1-2} = \Sigma T_2)$ becomes

$$
\Sigma T_1 + \Sigma V_1 = \Sigma T_2 + \Sigma V_2 \tag{14-22}
$$

Here, the sum of the system's initial kinetic and potential energies is equal to the sum of the system's final kinetic and potential energies. In other words, $\Sigma T + \Sigma V = \text{const.}$

Procedure for Analysis

The conservation of energy equation can be used to solve problems involving *velocity, displacement*, and *conservative force systems*. It is generally *easier to apply* than the principle of work and energy because this equation requires specifying the particle's kinetic and potential energies at only *two points* along the path, rather than determining the work when the particle moves through a *displacement*. For application it is suggested that the following procedure be used.

Potential Energy.

- Draw two diagrams showing the particle located at its initial and final points along the path.
- If the particle is subjected to a vertical displacement, establish the fixed horizontal datum from which to measure the particle's gravitational potential energy V_g .
- Data pertaining to the elevation *y* of the particle from the datum and the stretch or compression *s* of any connecting springs can be determined from the geometry associated with the two diagrams.
- Recall $V_g = Wy$, where *y* is positive upward from the datum
and negative downward from the datum; also for a spring and negative downward from the datum; also for a spring, and negative downward from th
 $V_e = \frac{1}{2} k s^2$, which is *always positive*.

Conservation of Energy.

- Apply the equation $T_1 + V_1 = T_2 + V_2$.
- Apply the equation $Y_1 + Y_1 = Y_2 + Y_2$.

 When determining the kinetic energy, $T = \frac{1}{2}mv^2$, remember that the particle's speed v must be measured from an inertial the particle's speed v must be measured from an inertial reference frame reference frame.

The gantry structure in the photo is used to test the response of an airplane during a crash. As shown in Fig. 14–21*a*, the plane, having a airplane during a crash. As shown in Fig. 14–21*a*, the plane, having a mass of 8 Mg, is hoisted back until $\theta = 60^{\circ}$, and then the pull-back cable *AC* is released when the plane is at rest. Determine the speed of cable *AC* is released when the plane is at rest. Determine the speed of the plane just before it crashes into the ground, $\theta = 15^{\circ}$. Also, what is the maximum tension developed in the supporting cable during the motion? Neglect the size of the airplane and the effect of lift caused by the wings during the motion.

SOLUTION

Since the force of the cable does *no work* on the plane, it must be obtained using the equation of motion. First, however, we must determine the plane's speed at *B*.

Potential Energy. For convenience, the datum has been established at the top of the gantry, Fig. 14–21*a*.

Conservation of Energy.

$$
T_A + V_A = T_B + V_B
$$

\n
$$
0 - 8000 \text{ kg } (9.81 \text{ m/s}^2)(20 \cos 60^\circ \text{ m}) =
$$

\n
$$
\frac{1}{2}(8000 \text{ kg})v_B^2 - 8000 \text{ kg } (9.81 \text{ m/s}^2)(20 \cos 15^\circ \text{ m})
$$

\n
$$
v_B = 13.52 \text{ m/s } = 13.5 \text{ m/s}
$$
Ans.

Equation of Motion. From the free-body diagram when the plane

is at *B*, Fig. 14–21*b*, we have
\n
$$
+\sqrt{ } \sum F_n = ma_n;
$$

\n $T - (8000(9.81) N) \cos 15^\circ = (8000 \text{ kg}) \frac{(13.52 \text{ m/s})^2}{20 \text{ m}}$
\n $T = 149 \text{ kN}$

The ram *R* shown in Fig. 14–22*a* has a mass of 100 kg and is released from rest 0.75 m from the top of a spring, *A*, that has a stiffness from rest 0.75 m from the top of a spring, A, that has a stiffness $k_A = 12 \text{ kN/m}$. If a second spring B, having a stiffness $k_B = 15 \text{ kN/m}$ is "nested" in A determine the maximum $k_A = 12 \text{ kN/m}$. If a second spring *B*, having a stiffness $k_B = 15 \text{ kN/m}$, is "nested" in *A*, determine the maximum displacement of *A* needed to stop the downward motion of the ram displacement of *A* needed to stop the downward motion of the ram. The unstretched length of each spring is indicated in the figure. Neglect the mass of the springs.

SOLUTION

Potential Energy. We will *assume* that the ram compresses *both* springs at the instant it comes to rest. The datum is located through the center of gravity of the ram at its initial position, Fig. 14–22*b*.
When the kinetic energy is reduced to zero $(v_2 = 0)$, *A* is compressed
a distance s, and *R* compresses s_p = s, - 0.1 m When the kinetic energy is reduced to zero $(v_2 = 0)$, *A* is compressed When the kinetic energy is reduced to zero (v_2 = a distance s_A and *B* compresses $s_B = s_A - 0.1$ m.

Conservation of Energy.

$$
T_1 + V_1 = T_2 + V_2
$$

\n
$$
0 + 0 = 0 + \left\{ \frac{1}{2} k_A s_A^2 + \frac{1}{2} k_B (s_A - 0.1)^2 - Wh \right\}
$$

\n
$$
0 + 0 = 0 + \left\{ \frac{1}{2} (12\ 000\ N/m) s_A^2 + \frac{1}{2} (15\ 000\ N/m) (s_A - 0.1\ m)^2 - 981\ N (0.75\ m + s_A) \right\}
$$

Rearranging the terms,

$$
13\,500s_A^2 - 2481s_A - 660.75 = 0
$$

Using the quadratic formula and solving for the positive root, we have

$$
s_A = 0.331 \text{ m}
$$
Ans.

Since $s_B = 0.331 \text{ m} - 0.1 \text{ m} = 0.231 \text{ m}$, which is positive, the assumption that *hoth* springs are compressed by the ram is correct. assumption that *both* springs are compressed by the ram is correct.

NOTE: The second root, $s_A = -0.148$ m, does not represent the physical situation. Since positive s is measured downward, the physical situation. Since positive *s* is measured downward, the negative sign indicates that spring *A* would have to be "extended" by an amount of 0.148 m to stop the ram.

A smooth 2-kg collar, shown in Fig. 14–23*a*, fits loosely on the vertical shaft. If the spring is unstretched when the collar is in the position *A*, shaft. If the spring is unstretched when the collar is in the position A, determine the speed at which the collar is moving when $y = 1$ m, if (a) it is released from rest at A and (b) it is released at A with an (a) it is released from rest at *A*, and (b) it is released at *A* with an (a) it is released from rest a
 upward velocity $v_A = 2 \text{ m/s}$.

SOLUTION

Part (a) Potential Energy. For convenience, the datum is established through *AB*, Fig. 14–23*b*. When the collar is at *C*, the gravitational potential energy is $-(mg)y$, since the collar is *below* the datum, and
the electic potential energy is $\frac{1}{2}ke^2$. Here $s_2 = 0.5$ m, which potential energy is $-(mg)y$, since the collar is *below* the datum, and
the elastic potential energy is $\frac{1}{2}k s_{CB}^2$. Here $s_{CB} = 0.5$ m, which represents the *stretch* in the spring as shown in the figure.

Conservation of Energy.

$$
T_A + V_A = T_C + V_C
$$

\n
$$
0 + 0 = \frac{1}{2} m v_C^2 + \left\{ \frac{1}{2} k s_{CB}^2 - m g y \right\}
$$

\n
$$
0 + 0 = \left\{ \frac{1}{2} (2 \text{ kg}) v_C^2 \right\} + \left\{ \frac{1}{2} (3 \text{ N/m}) (0.5 \text{ m})^2 - 2 (9.81) \text{ N} (1 \text{ m}) \right\}
$$

\n
$$
v_C = 4.39 \text{ m/s}
$$

force must be taken into account (see Example 13.4). Here, _{Datum} This problem can also be solved by using the equation of motion or the principle of work and energy. Note that for *both* of these methods the variation of the magnitude and direction of the spring however, the above solution is clearly advantageous since the calculations depend *only* on data calculated at the initial and final points of the path.

Part (b) Conservation of Energy. If $v_A = 2$ m/s, using the data in
Fig. 14–236 we have Fig. 14–23*b*, we have

$$
T_A + V_A = T_C + V_C
$$

\n
$$
\frac{1}{2}mv_A^2 + 0 = \frac{1}{2}mv_C^2 + \left{\frac{1}{2}ks_{CB}^2 - mgy\right}
$$

\n
$$
\frac{1}{2}(2 \text{ kg})(2 \text{ m/s})^2 + 0 = \frac{1}{2}(2 \text{ kg})v_C^2 + \left{\frac{1}{2}(3 \text{ N/m})(0.5 \text{ m})^2 - 2(9.81) \text{ N} (1 \text{ m})\right}
$$

\n
$$
v_C = 4.82 \text{ m/s}
$$
 Ans.

NOTE: The kinetic energy of the collar depends only on the *magnitude* of velocity, and therefore it is immaterial if the collar is moving up or down at 2 m/s when released at A.

FUNDAMENTAL PROBLEMS

F14–13. The 2-kg pendulum bob is released from rest when it is at *A*. Determine the speed of the bob and the tension in the cord when the bob passes through its lowest position, *B*.

F14–14. The 2-kg package leaves the conveyor belt at *A* **F14-14.** The 2-kg package leaves the conveyor belt at A with a speed of $v_A = 1$ m/s and slides down the smooth ramp. Determine the required speed of the conveyor belt at ramp. Determine the required speed of the conveyor belt at *B* so that the package can be delivered without slipping on the belt. Also, find the normal reaction the curved portion of the ramp exerts on the package at *B* if $\rho_B = 2$ m.

F14–15. The 2-kg collar is given a downward velocity of 4 m/s when it is at *A*. If the spring has an unstretched length 4 m/s when it is at A. If the spring has an unstretched length
of 1 m and a stiffness of $k = 30$ N/m, determine the velocity
of the collar at $s = 1$ m of the collar at $s = 1$ m.

F14–16. The 5-lb collar is released from rest at *A* and travels along the frictionless guide. Determine the speed of the collar when it strikes the stop *B*. The spring has an unstretched length of 0.5 ft.

F14–16

F14–17. The 75-lb block is released from rest 5 ft above the plate. Determine the compression of each spring when the block momentarily comes to rest after striking the plate. Neglect the mass of the plate. The springs are initially unstretched.

F14–18. The 4-kg collar *C* has a velocity of $v_A = 2$ m/s
when it is at *A*. If the quide rod is smooth determine the when it is at *A*. If the guide rod is smooth, determine the speed of the collar when it is at *B*. The spring has an unstretched length of $l_0 = 0.2$ m.

CHAPTER REVIEW

Work of a Force

A force does work when it undergoes a displacement along its line of action. If the force varies with the displacement, then the work is with the displace
 $U = \int F \cos \theta \, ds.$

Graphically, this represents the area under the $F-s$ diagram.

If the force is constant, then for a displacement Δs in the direction of the displacement Δs in the direction of the
force, $U = F_c \Delta s$. A typical example of
this case is the work of a weight this case is the work of a weight, this case is the work of a weight,
 $U = -W \Delta y$. Here, Δy is the vertical

displacement displacement.

The work done by a spring force, $F = ks$, depends upon the stretch or compression depends upon the stretch or compression *s* of the spring.

The Principle of Work and Energy

If the equation of motion in the If the equation of motion in the
tangential direction, $\Sigma F_t = ma_t$, is
combined with the kinematic equation combined with the kinematic equation, combined with the kinematic equation,
 $a_t ds = v dv$, we obtain the principle of

work and energy This equation states work and energy. This equation states that the initial kinetic energy T , plus the work done ΣU_{1-2} is equal to the final kinetic energy.

Impulse and momentum principles are required to predict the motion of this golf ball.

[Kinetics of a Particle:](#page-14-0) Impulse and Momentum

15

[CHAPTER OBJECTIVES](#page-14-0)

- To develop the principle of linear impulse and momentum for a particle and apply it to solve problems that involve force, velocity, and time.
- To study the conservation of linear momentum for particles.
- To analyze the mechanics of impact.
- To introduce the concept of angular impulse and momentum.
- To solve problems involving steady fluid streams and propulsion with variable mass.

15.1 [Principle of Linear Impulse and](#page-14-0) Momentum

In this section we will integrate the equation of motion with respect to time and thereby obtain the principle of impulse and momentum. The resulting equation will be useful for solving problems involving force, velocity, and time.

Using kinematics, the equation of motion for a particle of mass *m* can be written as

$$
\Sigma \mathbf{F} = m\mathbf{a} = m \frac{d\mathbf{v}}{dt} \tag{15-1}
$$

where **a** and **v** are both measured from an inertial frame of reference. where **a** and **v** are both measured from an inertial frame of reference.
Rearranging the terms and integrating between the limits $\mathbf{v} = \mathbf{v}_1$ at Rearranging the terms and integrentle $t = t_1$ and $\mathbf{v} = \mathbf{v}_2$ at $t = t_2$, we have

$$
\sum \int_{t_1}^{t_2} \mathbf{F} dt = m \int_{\mathbf{v}_1}^{\mathbf{v}_2} d\mathbf{v}
$$

The impulse tool is used to remove the dent in the trailer fender.To do so its end is first screwed into a hole drilled in the fender, then the weight is gripped and jerked upwards, striking the stop ring.The impulse developed is transferred along the shaft of the tool and pulls suddenly on the dent.

or

$$
\sum \int_{t_1}^{t_2} \mathbf{F} dt = m\mathbf{v}_2 - m\mathbf{v}_1 \tag{15-2}
$$

This equation is referred to as the *principle of linear impulse and momentum*. From the derivation it can be seen that it is simply a time integration of the equation of motion. It provides a *direct means* of obtaining the particle's final velocity \mathbf{v}_2 after a specified time period when the particle's initial velocity is known and the forces acting on the particle are either constant or can be expressed as functions of time. By comparison, if v_2 was determined using the equation of motion, a twocomparison, if \mathbf{v}_2 was determined using the equation of motion, a two-
step process would be necessary; i.e., apply $\Sigma \mathbf{F} = m\mathbf{a}$ to obtain **a**, then
integrate $\mathbf{a} = d\mathbf{v}/dt$ to obtain \mathbf{v}_2 step process would be necessary
integrate $\mathbf{a} = d\mathbf{v}/dt$ to obtain \mathbf{v}_2 .

Linear Momentum. Each of the two vectors of the form $\mathbf{L} = m\mathbf{v}$
in Eq. 15–2 is referred to as the particle's linear momentum. Since *m* is a in Eq. 15–2 is referred to as the particle's linear momentum. Since *m* is a positive scalar, the linear-momentum vector has the same direction as **v**, and its magnitude *mv* has units of mass–velocity, e.g., kg·m/s, or positive s
and its r
slug \cdot ft/s. d to as the particle's linear momentum. Since *m*
near-momentum vector has the same direction *a*
mv has units of mass-velocity, e.g., kg·m/s,

Linear Impulse. The integral $I = \int \mathbf{F} dt$ in Eq. 15–2 is referred to as **Linear Impulse.** The integral $I = \int \mathbf{F} dt$ in Eq. 15–2 is referred to as the *linear impulse*. This term is a vector quantity which measures the effect of a force during the time the force acts. Since time is a positive scalar, the impulse acts in the same direction as the force, and its magnitude has units of force–time, e.g., $N \cdot s$ or $lb \cdot s.*$ orce acts. Sin
direction as
N \cdot s or lb \cdot s.

If the force is expressed as a function of time, the impulse can be determined by direct evaluation of the integral. In particular, if the force is constant in both magnitude and direction, the resulting impulse becomes

$$
\mathbf{I} = \int_{t_1}^{t_2} \mathbf{F}_c dt = \mathbf{F}_c(t_2 - t_1).
$$

Graphically the magnitude of the impulse can be represented by the 1 shaded area under the curve of force versus time, Fig. 15–1. A constant force creates the shaded rectangular area shown in Fig. 15–2.

*Although the units for impulse and momentum are defined differently, it can be shown that Eq. 15–2 is dimensionally homogeneous.

Principle of Linear Impulse and Momentum. For problem

solving, Eq. 15–2 will be rewritten in the form

$$
m\mathbf{v}_1 + \Sigma \int_{t_1}^{t_2} \mathbf{F} dt = m\mathbf{v}_2
$$
 (15-3)

which states that the initial momentum of the particle at time t_1 plus the sum of all the impulses applied to the particle from t_1 to t_2 is equivalent to the final momentum of the particle at time t_2 . These three terms are
to the final momentum of the particle at time t_2 . These three terms are
illustrated graphically on the *impulse and momentum diagrams* shown in illustrated graphically on the *impulse and momentum diagrams* shown in Fig. 15–3.The two *momentum diagrams* are simply outlined shapes of the particle which indicate the direction and magnitude of the particle's initial and final momenta, mv_1 and mv_2 . Similar to the free-body
diagram the *impulse diagram* is an outlined shape of the particle diagram, the *impulse diagram* is an outlined shape of the particle showing all the impulses that act on the particle when it is located at some intermediate point along its path.

If each of the vectors in Eq. 15–3 is resolved into its *x, y, z* components, we can write the following three scalar equations of linear impulse and momentum.

$$
m(v_x)_1 + \sum \int_{t_1}^{t_2} F_x dt = m(v_x)_2
$$
\n
$$
m(v_y)_1 + \sum \int_{t_1}^{t_2} F_y dt = m(v_y)_2
$$

Fig. 15–3

Procedure for Analysis

The principle of linear impulse and momentum is used to solve problems involving *force, time*, and *velocity*, since these terms are involved in the formulation. For application it is suggested that the following procedure be used.*

Free-Body Diagram.

- Establish the *x, y, z* inertial frame of reference and draw the particle's free-body diagram in order to account for all the forces that produce impulses on the particle.
- The direction and sense of the particle's initial and final velocities should be established.
- If a vector is unknown, assume that the sense of its components is in the direction of the positive inertial coordinate(s).
- As an alternative procedure, draw the impulse and momentum diagrams for the particle as discussed in reference to Fig. 15–3.

Principle of Impulse and Momentum.

- In accordance with the established coordinate system, apply the principle of linear impulse and momentum, If motion occurs in the $x-y$ plane, the two scalar component equations can be formulated by either resolving the vector components of **F** from the free-body diagram, or by using the data on the impulse and momentum diagrams. linate syste
 $m\mathbf{v}_1 + \sum \int_l$

two scalar $\frac{1}{2}$ **F** $dt = m\mathbf{v}_2$.
Component
- Realize that every force acting on the particle's free-body diagram will create an impulse, even though some of these forces will do no work.
- Forces that are functions of time must be integrated to obtain the impulse. Graphically, the impulse is equal to the area under the force–time curve.

 $\mathbf{W}\Delta t$ -**N***dt* \int **N**¿*dt* \int **F**¿*dt* -**F***dt*

*This procedure will be followed when developing the proofs and theory in the text.

As the wheels of the pitching machine rotate, they apply frictional impulses to the ball, thereby giving it a linear momentum.These impulses are shown on the impulse diagram. Here both the frictional and normal impulses vary with time. By comparison, the weight impulse is constant and is very small since the time Δt the ball is in contact with the wheels is very small.

15

The 100-kg stone shown in Fig. 15–4*a* is originally at rest on the smooth horizontal surface. If a towing force of 200 N, acting at an angle of 45°, is applied to the stone for 10 s, determine the final velocity and the normal force which the surface exerts on the stone during this time interval.

SOLUTION

This problem can be solved using the principle of impulse and momentum since it involves force, velocity, and time.

Free-Body Diagram. See Fig. 15–4*b*. Since all the forces acting are *constant*, the impulses are simply the product of the force magnitude constant, the impulses are simply the product of the force magnitude
and 10 s $[\mathbf{I} = \mathbf{F}_c(t_2 - t_1)]$. Note the alternative procedure of drawing
the stone's impulse and momentum diagrams Fig. 15–4c the stone's impulse and momentum diagrams, Fig. 15–4*c*.

Principle of Impulse and Momentum. Applying Eqs. 15–4 yields

$$
\begin{aligned}\n(\Rightarrow) & m(v_x)_1 + \sum \int_{t_1}^{t_2} F_x \, dt = m(v_x)_2 \\
0 + 200 \text{ N} \cos 45^\circ (10 \text{ s}) &= (100 \text{ kg})v_2 \\
v_2 &= 14.1 \text{ m/s} \n\end{aligned}
$$
\nAns.

$$
m(v_y)_1 + \sum \int_{t_1}^{t_2} F_y dt = m(v_y)_2
$$

$$
0 + N_C(10 \text{ s}) - 981 \text{ N}(10 \text{ s}) + 200 \text{ N} \sin 45^\circ (10 \text{ s}) = 0
$$

$$
N_C = 840 \text{ N}
$$
Ans.

NOTE: Since no motion occurs in the *y* direction, direct application of the equilibrium equation $\Sigma F_y = 0$ gives the same result for N_C .

The 50-lb crate shown in Fig. 15–5*a* is acted upon by a force having a The 50-lb crate shown in Fig. 15–5*a* is acted upon by a force having a variable magnitude $P = (20t)$ lb, where *t* is in seconds. Determine the crate's velocity 2 s after **P** has been applied. The initial velocity is crate's velocity 2 s after **P** has been applied. The initial velocity is crate's velocity 2 s after **P** has been applied. The initial velocity is $v_1 = 3$ ft/s down the plane, and the coefficient of kinetic friction between the crate and the plane is $u_1 = 0.3$ $v_1 = 3$ ft/s down the plane, and the coeff
between the crate and the plane is $\mu_k = 0.3$.

SOLUTION

Free-Body Diagram. See Fig. 15–5*b*. Since the magnitude of force $P = 20t$ varies with time, the impulse it creates must be determined by integrating over the 2-s time interval $P = 20t$ varies with time, the impulse it creates must be determined by integrating over the 2-s time interval.

Principle of Impulse and Momentum. Applying Eqs. 15–4 in the *x* direction, we have

$$
(\pm \swarrow) \qquad m(v_x)_1 + \sum \int_{t_1}^{t_2} F_x dt = m(v_x)_2
$$

$$
\frac{50 \text{ lb}}{32.2 \text{ ft/s}^2} (3 \text{ ft/s}) + \int_0^{2 \text{ s}} 20t dt - 0.3N_C(2 \text{ s}) + (50 \text{ lb}) \sin 30^\circ (2 \text{ s}) = \frac{50 \text{ lb}}{32.2 \text{ ft/s}^2} v_2
$$

$$
4.658 + 40 - 0.6N_C + 50 = 1.553v_2
$$

The equation of equilibrium can be applied in the *y* direction. Why?
+ $\Sigma F_y = 0$; $N_C - 50 \cos 30^\circ$ lb = 0

$$
+\sqrt{2}F_v = 0;
$$
 $N_C - 50 \cos 30^\circ 1b = 0$

Solving,

$$
N_C = 43.30 \text{ lb}
$$

$$
v_2 = 44.2 \text{ ft/s } \angle
$$
Ans.

NOTE: We can also solve this problem using the equation of motion. From Fig. 15–5*b*,

$$
+\angle \Sigma F_x = ma_x; \ 20t - 0.3(43.30) + 50 \sin 30^\circ = \frac{50}{32.2}a
$$

$$
a = 12.88t + 7.734
$$

Using kinematics

$$
+\angle dv = a dt; \qquad \int_{3 \text{ ft/s}}^{v} dv = \int_{0}^{2s} (12.88t + 7.734) dt
$$

$$
v = 44.2 \text{ ft/s} \qquad \qquad \text{Ans.}
$$

By comparison, application of the principle of impulse and By comparison, application of the principle of impulse and
momentum eliminates the need for using kinematics $(a = dv/dt)$ and
thereby vields an easier method for solution thereby yields an easier method for solution.

Fig. 15–5

Blocks *A* and *B* shown in Fig. 15–6*a* have a mass of 3 kg and 5 kg, respectively. If the system is released from rest, determine the velocity of block *B* in 6 s. Neglect the mass of the pulleys and cord.

SOLUTION

Free-Body Diagram. See Fig. 15–6*b*. Since the weight of each block is constant, the cord tensions will also be constant. Furthermore, since is constant, the cord tensions will also be constant. Furthermore, since
the mass of pulley *D* is neglected, the cord tension $T_A = 2T_B$. Note
that the blocks are both assumed to be moving downward in the that the blocks are both assumed to be moving downward in the positive coordinate directions, s_A and s_B .

Principle of Impulse and Momentum.

Block A:

$$
m(v_A)_1 + \sum \int_{t_1}^{t_2} F_y dt = m(v_A)_2
$$

0 - 2T_B(6 s) + 3(9.81) N(6 s) = (3 kg)(v_A)_2 (1)

Block B:

$$
m(v_B)_1 + \sum \int_{t_1}^{t_2} F_y dt = m(v_B)_2
$$

0 + 5(9.81) N(6 s) - T_B(6 s) = (5 kg)(v_B)_2 (2)

Kinematics. Since the blocks are subjected to dependent motion, the velocity of *A* can be related to that of *B* by using the kinematic analysis discussed in Sec. 12.9. A horizontal datum is established through the fixed point at *C*, Fig. 15–6*a*, and the position coordinates, s_A and s_B , are related to the constant total length *l* of the vertical segments of the cord by the equation segments of the cord by the equation

$$
2s_A + s_B = l
$$

Taking the time derivative yields

$$
2v_A = -v_B \tag{3}
$$

As indicated by the negative sign, when *B* moves downward *A* moves upward. Substituting this result into Eq. 1 and solving Eqs. 1 and 2 yields

$$
(v_B)_2 = 35.8 \text{ m/s} \downarrow
$$
Ans.

$$
T_B = 19.2 \text{ N}
$$

NOTE: Realize that the *positive* (downward) direction for \mathbf{v}_A and \mathbf{v}_B
is appriximately Figs. 15.6g, and 15.6b, and in Figs. 1 to 2. This is is *consistent* in Figs. 15–6*a* and 15–6*b* and in Eqs. 1 to 3. This is important since we are seeking a simultaneous solution of equations.

15.2 Principle of Linear Impulse and [Momentum for a System of Particles](#page-14-0)

The principle of linear impulse and momentum for a system of particles moving relative to an inertial reference, Fig. 15–7, is obtained from the equation of motion applied to all the particles in the system, i.e.,

$$
\Sigma \mathbf{F}_i = \Sigma m_i \frac{d\mathbf{v}_i}{dt} \tag{15-5}
$$

The term on the left side represents only the sum of the *external forces* acting on the particles. Recall that the internal forces f_i acting between
particles do not appear with this summation since by Newton's third law particles do not appear with this summation, since by Newton's third law they occur in equal but opposite collinear pairs and therefore cancel out. Multiplying both sides of Eq. 15–5 by *dt* and integrating between the Multiplying both sides of Eq. 15–5 by dt and int limits $t = t_1$, $\mathbf{v}_i = (\mathbf{v}_i)_1$ and $t = t_2$, $\mathbf{v}_i = (\mathbf{v}_i)_2$ yields

$$
\Sigma m_i(\mathbf{v}_i)_1 + \Sigma \int_{t_1}^{t_2} \mathbf{F}_i dt = \Sigma m_i(\mathbf{v}_i)_2
$$
 (15–6)

This equation states that the initial linear momenta of the system plus the impulses of all the *external forces* acting on the system from t_1 to t_2 is equal to the system's final linear momenta equal to the system's final linear momenta.

Since the location of the mass center *G* of the system is determined Since the location of the mass center G of the system is determined
from $m\mathbf{r}_G = \sum m_i \mathbf{r}_i$, where $m = \sum m_i$ is the total mass of all the particles,
Fig. 15–7 then taking the time derivative we have Fig. 15–7, then taking the time derivative, we have

$$
m\mathbf{v}_G = \sum m_i \mathbf{v}_i
$$

which states that the total linear momentum of the system of particles is equivalent to the linear momentum of a "fictitious" aggregate particle of equivalent to the linear momentum of a "fictitious" aggregate particle of mass $m = \sum m_i$ moving with the velocity of the mass center of the system Substituting into Eq. 15–6 vields system. Substituting into Eq. 15–6 yields

$$
m(\mathbf{v}_G)_1 + \Sigma \int_{t_1}^{t_2} \mathbf{F}_i dt = m(\mathbf{v}_G)_2
$$
 (15–7)

Here the initial linear momentum of the aggregate particle plus the external impulses acting on the system of particles from t_1 to t_2 is equal to External impulses acting on the system of particles from t_1 to t_2 is equal to the aggregate particle's final linear momentum. As a result, the above equation justifies application of the principle of linear impulse and momentum to a system of particles that compose a rigid body.

FUNDAMENTAL PROBLEMS

F15–1. The 0.5-kg ball strikes the rough ground and rebounds with the velocities shown. Determine the magnitude of the impulse the ground exerts on the ball. Assume that the ball does not slip when it strikes the ground, and neglect the size of the ball and the impulse produced by the weight of the ball.

F15–1

F15–2. If the coefficient of kinetic friction between the **F15-2.** If the coefficient of kinetic friction between the 150-lb crate and the ground is $\mu_k = 0.2$, determine the grood of the grote when $t = 4$ g. The grote starts from rest 150-lb crate and the ground is $\mu_k = 0.2$, determine the speed of the crate when $t = 4$ s. The crate starts from rest and is towed by the 100-lb force and is towed by the 100-lb force.

F15–2

F15–3. The motor exerts a force of $F = (20t^2)$ N on the **F15–6.** The 10-lb block A attains a velocity of 1 ft/s cable where t is in seconds. Determine the speed of the 5 seconds starting from rest. Determine the tension cable, where t is in seconds. Determine the speed of the cable, where t is in seconds. Determine the speed of the 25-kg crate when $t = 4$ s. The coefficients of static and the plane are kinetic friction between the crate and the plane are $\mu_s = 0.3$ and $\mu_k = 0.25$, respectively. 2) N

F15–4. The wheels of the 1.5-Mg car generate the traction force **F** described by the graph. If the car starts from rest, determine its speed when $t = 6$ s.

F15–5. The 2.5-Mg four-wheel-drive SUV tows the 1.5-Mg trailer. The traction force developed at the wheels is trailer. The traction force developed at the wheels is $F_D = 9 \text{ kN}$. Determine the speed of the truck in 20 s, starting from rest Also determine the tension developed in starting from rest. Also, determine the tension developed in the coupling between the SUV and the trailer. Neglect the mass of the wheels.

F15–6. The 10-lb block A attains a velocity of 1 ft/s in 5 seconds, starting from rest. Determine the tension in the cord and the coefficient of kinetic friction between block A and the horizontal plane. Neglect the weight of the pulley. A Block *B* has a weight of 8 lb.

The hammer in the top photo applies an impulsive force to the stake. During this extremely short time of contact the weight of the stake can be considered nonimpulsive, and provided the stake is driven into soft ground, the impulse of the ground acting on the stake can also be considered nonimpulsive. By contrast, if the stake is used in a concrete chipper to break concrete, then two impulsive forces act on the stake: one at its top due to the chipper and the other on its bottom due to the rigidity of the concrete.

15.3 [Conservation of Linear Momentum](#page-14-0) for a System of Particles

When the sum of the *external impulses* acting on a system of particles is *zero*, Eq. 15–6 reduces to a simplified form, namely,

$$
\Sigma m_i(\mathbf{v}_i)_1 = \Sigma m_i(\mathbf{v}_i)_2 \qquad (15-8)
$$

This equation is referred to as the *conservation of linear momentum*. It states that the total linear momentum for a system of particles remains states that the total linear momentum for a system of particles remains
constant during the time period t_1 to t_2 . Substituting $m\mathbf{v}_G = \sum m_i \mathbf{v}_i$ into
Eq. 15–8, we can also write Eq. 15–8, we can also write

$$
(\mathbf{v}_G)_1 = (\mathbf{v}_G)_2 \tag{15-9}
$$

which indicates that the velocity \mathbf{v}_G of the mass center for the system of particles does not change if no external impulses are applied to the particles does not change if no external impulses are applied to the system.

The conservation of linear momentum is often applied when particles collide or interact. For application, a careful study of the free-body diagram for the *entire* system of particles should be made in order to identify the forces which create either external or internal impulses and thereby determine in what direction(s) linear momentum is conserved. As stated earlier, the *internal impulses* for the system will always cancel out, since they occur in equal but opposite collinear pairs. If the time period over which the motion is studied is *very short*, some of the external impulses may also be neglected or considered approximately equal to zero. The forces causing these negligible impulses are called *nonimpulsive forces*. By comparison, forces which are very large and act for a very short period of time produce a significant change in momentum and are called *impulsive forces*. They, of course, cannot be neglected in the impulse–momentum analysis.

Impulsive forces normally occur due to an explosion or the striking of one body against another, whereas nonimpulsive forces may include the weight of a body, the force imparted by a slightly deformed spring having a relatively small stiffness, or for that matter, any force that is very small compared to other larger (impulsive) forces. When making this distinction between impulsive and nonimpulsive forces, it is important to realize that this only applies during the time t_1 to t_2 . To illustrate, consider the effect of striking a tennis ball with a racket as shown in the consider the effect of striking a tennis ball with a racket as shown in the photo. During the *very short* time of interaction, the force of the racket on the ball is impulsive since it changes the ball's momentum drastically. By comparison, the ball's weight will have a negligible effect on the change in momentum, and therefore it is nonimpulsive. Consequently, it can be neglected from an impulse–momentum analysis during this time. If an impulse–momentum analysis is considered during the much longer time of flight after the racket–ball interaction, then the impulse of the ball's weight is important since it, along with air resistance, causes the change in the momentum of the ball.

Procedure for Analysis

Generally, the principle of linear impulse and momentum or the conservation of linear momentum is applied to a *system of particles* in order to determine the final velocities of the particles *just after* the time period considered. By applying this principle to the entire system, the internal impulses acting within the system, which may be unknown, are *eliminated* from the analysis. For application it is suggested that the following procedure be used.

Free-Body Diagram.

- Establish the *x, y, z* inertial frame of reference and draw the freebody diagram for each particle of the system in order to identify the internal and external forces.
- The conservation of linear momentum applies to the system in a direction which either has no external forces or the forces can be considered nonimpulsive.
- Establish the direction and sense of the particles' initial and final velocities. If the sense is unknown, assume it is along a positive inertial coordinate axis.
- As an alternative procedure, draw the impulse and momentum diagrams for each particle of the system.

Momentum Equations.

- Apply the principle of linear impulse and momentum or the conservation of linear momentum in the appropriate directions.
- If it is necessary to determine the *internal impulse* $\int F dt$ acting on only one particle of a system, then the particle must be *isolated* (free-body diagram), and the principle of linear impulse and momentum must be applied *to this particle*.
- After the impulse is calculated, and provided the time Δt for which the impulse acts is known, then the *average impulsive force* t F_{avg} can be determined from $F_{\text{avg}} = \int F \, dt / \Delta t$.

The 15-Mg boxcar *A* is coasting at 1.5 m/s on the horizontal track when it encounters a 12-Mg tank car *B* coasting at 0.75 m/s toward it as shown in Fig. 15–8*a*. If the cars collide and couple together, determine (a) the speed of both cars just after the coupling, and (b) the average force between them if the coupling takes place in 0.8 s.

SOLUTION

Part (a) Free-Body Diagram.* Here we have considered *both* cars as a single system, Fig. 15–8*b*. By inspection, momentum is conserved in the *x* direction since the coupling force **F** is *internal* to the system and will therefore cancel out. It is assumed both cars, when coupled, move at \mathbf{v}_2 in the positive *x* direction.

Conservation of Linear Momentum. +

$$
m_A(v_A)_1 + m_B(v_B)_1 = (m_A + m_B)v_2
$$

(15 000 kg)(1.5 m/s) - 12 000 kg(0.75 m/s) = (27 000 kg)v_2
 $v_2 = 0.5$ m/s \rightarrow Ans.

Part (b). The average (impulsive) coupling force, \mathbf{F}_{avg} , can be determined by applying the principle of linear momentum to *either one* of the cars.

Free-Body Diagram. As shown in Fig. 15–8*c*, by isolating the boxcar the coupling force is *external* to the car.

Principle of Impulse and Momentum. Since $= F_{\text{avg}}(0.8 \text{ s})$, we have Principle of Impulse and Momentum. Since $\int F dt = F_{\text{avg}} \Delta t$
= $F_{\text{avg}}(0.8 \text{ s})$, we have

$$
m_A(v_A)_1 + \sum \int F \, dt = m_A v_2
$$

(15 000 kg)(1.5 m/s) - F_{avg}(0.8 s) = (15 000 kg)(0.5 m/s)
F_{avg} = 18.8 kN *Ans.*

NOTE: Solution was possible here since the boxcar's final velocity was obtained in Part (a). Try solving for F_{avg} by applying the principle
of impulse and momentum to the tank car of impulse and momentum to the tank car.

*Only horizontal forces are shown on the free-body diagram.

Fig. 15–8

The 1200-lb cannon shown in Fig. 15–9*a* fires an 8-lb projectile with a muzzle velocity of 1500 ft/s relative to the ground. If firing takes place in 0.03 s, determine (a) the recoil velocity of the cannon just after firing, and (b) the average impulsive force acting on the projectile.The cannon support is fixed to the ground, and the horizontal recoil of the cannon is absorbed by two springs.

SOLUTION

Part (a) Free-Body Diagram.* As shown in Fig. 15–9*b*, we will consider the projectile and cannon as a single system, since the impulsive forces, **F**, between the cannon and projectile are *internal* to the system and will therefore cancel from the analysis. Furthermore, ¢the system and will therefore cancel from the analysis. Furthermore,
during the time $\Delta t = 0.03$ s, the two recoil springs which are attached
to the support each exert a *nonimpulsive force* **F**, on the cannon This to the support each exert a *nonimpulsive force* \mathbf{F}_s on the cannon. This is because At is very short so that during this time the cannon only is because Δt is very short, so that during this time the cannon only is because Δt is very short, so that during this time the cannon only
moves through a very small distance *s*. Consequently, $F_s = ks \approx 0$,
where *k* is the spring's stiffness. Hence it can be concluded that where k is the spring's stiffness. Hence it can be concluded that momentum for the system is conserved in the *horizontal direction*.

Conservation of Linear Momentum. +

$$
m_c(v_c)_1 + m_p(v_p)_1 = -m_c(v_c)_2 + m_p(v_p)_2
$$

\n
$$
0 + 0 = -\left(\frac{1200 \text{ lb}}{32.2 \text{ ft/s}^2}\right)(v_c)_2 + \left(\frac{8 \text{ lb}}{32.2 \text{ ft/s}^2}\right)(1500 \text{ ft/s})
$$

\n
$$
(v_c)_2 = 10 \text{ ft/s} \leftarrow
$$
 Ans.

Part (b). The average impulsive force exerted by the cannon on the projectile can be determined by applying the principle of linear impulse and momentum to the projectile (or to the cannon). Why?

Principle of Impulse and Momentum. From Fig. 15–9*c*, with we have **Principle of Impulse and**
 $\int F dt = F_{\text{avg}} \Delta t = F_{\text{avg}} (0.03),$

$$
(x + 3) \t m(v_p)_1 + \sum \int F \, dt = m(v_p)_2
$$

$$
0 + F_{avg}(0.03 \text{ s}) = \left(\frac{8 \text{ lb}}{32.2 \text{ ft/s}^2}\right) (1500 \text{ ft/s})
$$

$$
F_{avg} = 12.4(10^3) \text{ lb} = 12.4 \text{ kip}
$$
Ans.

NOTE: If the cannon is firmly fixed to its support (no springs), the reactive force of the support on the cannon must be considered as an external impulse to the system, since the support would allow no movement of the cannon.

$$
2F_s \xrightarrow{\mathbf{v}_c} \xrightarrow{\mathbf{v}_p} x
$$

15

^{*}Only horizontal forces are shown on the free-body diagram.

The bumper cars *A* and *B* in Fig. 15–10*a* each have a mass of 150 kg and are coasting with the velocities shown before they freely collide head on. If no energy is lost during the collision, determine their velocities after collision.

SOLUTION

Free-Body Diagram. The cars will be considered as a single system. The free-body diagram is shown in Fig. 15–10*b*.

Conservation of Momentum. +

$$
m_A(v_A)_1 + m_B(v_B)_1 = m_A(v_A)_2 + m_B(v_B)_2
$$

(150 kg)(3 m/s) + (150 kg)(-2 m/s) = (150 kg)(v_A)_2 + (150 kg)(v_B)_2
(v_A)_2 = 1 - (v_B)_2
(1)

$$
(v_A)_2 = 1 - (v_B)_2 \tag{1}
$$

Conservation of Energy. Since no energy is lost, the conservation of energy theorem gives

$$
T_1 + V_1 = T_2 + V_2
$$

\n
$$
\frac{1}{2}m_A(v_A)_1^2 + \frac{1}{2}m_B(v_B)_1^2 + 0 = \frac{1}{2}m_A(v_A)_2^2 + \frac{1}{2}m_B(v_B)_2^2 + 0
$$

\n
$$
\frac{1}{2}(150 \text{ kg})(3 \text{ m/s})^2 + \frac{1}{2}(150 \text{ kg})(2 \text{ m/s})^2 + 0 = \frac{1}{2}(150 \text{ kg})(v_A)_2^2 + \frac{1}{2}(150 \text{ kg})(v_B)_2^2 + 0
$$

\n
$$
(v_A)_2^2 + (v_B)_2^2 = 13
$$
\n(2)

Substituting Eq. (1) into (2) and simplifying, we get
 $(y_0)_2^2 = (y_0)_2 = 6 = 0$

$$
(v_B)^2_2 - (v_B)^2 - 6 = 0
$$

Solving for the two roots,

$$
(v_B)_2 = 3 \text{ m/s}
$$
 and $(v_B)_2 = -2 \text{ m/s}$

Since $(v_B)_2 = -2$ m/s refers to the velocity of *B* just *before* collision, then the velocity of *B* just *after* the collision must be then the velocity of *B* just after the collision must be

$$
(v_B)_2 = 3 \text{ m/s} \rightarrow
$$
Ans.

Substituting this result into Eq. (1) , we obtain

$$
(v_A)_2 = 1 - 3 \text{ m/s} = -2 \text{ m/s} = 2 \text{ m/s} \leftarrow
$$
 Ans.

An 800-kg rigid pile shown in Fig. 15–11*a* is driven into the ground using An 800-kg rigid pile shown in Fig. 15–11*a* is driven into the ground using
a 300-kg hammer. The hammer falls from rest at a height $y_0 = 0.5$ m and
strikes the top of the pile Determine the impulse which the pile exerts strikes the top of the pile. Determine the impulse which the pile exerts on the hammer if the pile is surrounded entirely by loose sand so that after striking, the hammer does *not* rebound off the pile.

SOLUTION

Conservation of Energy. The velocity at which the hammer strikes the pile can be determined using the conservation of energy equation applied

to the hammer. With the datum at the top of the pile, Fig. 15–11*a*, we have
\n
$$
T_0 + V_0 = T_1 + V_1
$$
\n
$$
\frac{1}{2}m_H(v_H)_0^2 + W_Hy_0 = \frac{1}{2}m_H(v_H)_1^2 + W_Hy_1
$$
\n
$$
0 + 300(9.81) N(0.5 m) = \frac{1}{2}(300 \text{ kg})(v_H)_1^2 + 0
$$
\n
$$
(v_H)_1 = 3.132 \text{ m/s}
$$

Free-Body Diagram. From the physical aspects of the problem, the free-body diagram of the hammer and pile, Fig. 15–11*b*, indicates that during the *short time* from *just before* to *just after* the *collision*, the weights of the hammer and pile and the resistance force \mathbf{F}_s of the sand
are all *nonimalising*. The impulsive force **P** is internal to the system are all *nonimpulsive*. The impulsive force **R** is internal to the system and therefore cancels. Consequently, momentum is conserved in the vertical direction during this short time.

Conservation of Momentum. Since the hammer does not rebound had the hammer does $(v_H)_2 = (v_P)_2 = v_2$.

off the pile just after collision, then
$$
(v_H)_2 = (v_P)_2 = v_2
$$
.
\n
$$
m_H(v_H)_1 + m_P(v_P)_1 = m_H v_2 + m_P v_2
$$
\n
$$
(300 \text{ kg})(3.132 \text{ m/s}) + 0 = (300 \text{ kg})v_2 + (800 \text{ kg})v_2
$$
\n
$$
v_2 = 0.8542 \text{ m/s}
$$

Principle of Impulse and Momentum. The impulse which the pile imparts to the hammer can now be determined since v_2 is known. From the free-body diagram for the hammer, Fig. 15–11*c*, we have

$$
m_H(v_H)_1 + \sum \int_{t_1}^{t_2} F_y dt = m_H v_2
$$

(300 kg)(3.132 m/s) - $\int R dt = (300 \text{ kg})(0.8542 \text{ m/s})$
 $\int R dt = 683 \text{ N} \cdot \text{s}$ Ans.

NOTE: The equal but opposite impulse acts on the pile. Try finding this impulse by applying the principle of impulse and momentum to the pile.

 $F \leftarrow F$ $\frac{\mathbf{v}_c}{\mathbf{v}_c/b} = 4 \text{ m/s}$ **v***b x*

(b)

Fig. 15–12

The 1.5-Mg car in Fig. 15–12*a* moves on the 10-Mg barge to the left with a constant speed of 4 m/s, measured relative to the barge. Neglecting water resistance, determine the velocity of the barge and the displacement of the barge when the car reaches point *B*. Initially, the car and the barge are at rest relative to the water.

SOLUTION

Free-Body Diagram. If the car and the barge are considered as a single system, the traction force between the car and the barge becomes internal to the system, and so linear momentum will be conserved along the *x* axis, Fig. 15–12*b*.

Conservation of Momentum. When writing the conservation of momentum equation, it is important that the velocities be measured from the same inertial coordinate system, assumed here to be fixed. We will also assume that as the car goes to the left the barge goes to the right, as shown in Fig. 15–12*b*.

Applying the conservation of linear momentum to the car and barge system,

$$
0 + 0 = m_c v_c - m_b v_b
$$

\n
$$
0 = (1.5(10^3) \text{ kg})v_c - (10(10^3) \text{ kg})v_b
$$

\n
$$
1.5v_c - 10v_b = 0
$$
 (1)

Kinematics. Since the velocity of the car relative to the barge is known, then the velocity of the car and the barge can also be related using the relative velocity equation. +

 $\mathbf{v}_c = \mathbf{v}_b + \mathbf{v}_{c/b}$

$$
(\leftarrow)
$$

$$
v_c = v_b + v_{cb}
$$

$$
v_c = -v_b + 4 \text{ m/s}
$$
 (2)

Solving Eqs. (1) and (2) ,

$$
v_b = 0.5217 \text{ m/s} = 0.522 \text{ m/s} \rightarrow
$$

\n $v_c = 3.478 \text{ m/s} \leftarrow$ Ans.

The car travels $s_{c/b} = 20$ m on the barge at a constant relative speed of 4 m/s . Thus the time for the car to reach point *R* is 4 m/s. Thus, the time for the car to reach point *B* is
 $s_{cb} = v_{c/b} t$

$$
s_{c/b} = v_{c/b} t
$$

20 m = (4 m/s) t

$$
t = 5 s
$$

The displacement of the barge is therefore
\n
$$
\text{(*)} \qquad s_b = v_b t = 0.5217 \text{ m/s} (5 \text{ s}) = 2.61 \text{ m} \rightarrow \qquad \text{Ans.}
$$

FUNDAMENTAL PROBLEMS

F15–7. The freight cars A and B have a mass of 20 Mg and 15 Mg respectively. Determine, the velocity of A after 15 Mg, respectively. Determine the velocity of \vec{A} after collision if the cars collide and repound such that \vec{B} moves collision if the cars collide and rebound, such that B moves to the right with a speed of 2 m/s . If \overline{A} and \overline{B} are in contact for 0.5 s, find, the average impulsive force which acts for 0.5 s, find the average impulsive force which acts between them.

F15–8. The cart and package have a mass of 20 kg and 5 kg, respectively. If the cart has a smooth surface and it is initially at rest, while the velocity of the package is as shown, determine the final common velocity of the cart and

F15–8

F15–9. The 5-kg block A has an initial speed of 5 m/s as it solides down the smooth ramp after which it collides with slides down the smooth ramp, after which it collides with the stationary block B of mass 8 kg. If the two blocks couple
together after collision, determine their common velocity together after collision, determine their common velocity immediately after collision.

F15–11. Blocks A and B have a mass of 15 kg and 10 kg, respectively. If A is stationary and B has a velocity of 15 m/s
inst before collision, and the blocks counle together after just before collision, and the blocks couple together after impact, determine the maximum compression of the spring.

F15–12. The cannon and support without a projectile have a mass of 250 kg. If a 20-kg projectile is fired from the cannon with a velocity of 400 m/s, measured *relative* to the cannon, determine the speed of the projectile as it leaves the barrel of the cannon. Neglect rolling resistance.

PROBLEMS

***15–32.** The 10-lb cannon ball is fired horizontally by a 500-lb cannon as shown. If the muzzle velocity of the ball is 2000 ft/s, measured relative to the ground, determine the recoil velocity of the cannon just after firing. If the cannon rests on a smooth support and is to be stopped after it has recoiled a distance of 6 in., determine the required stiffness *k* of the two identical springs, each of which is originally unstretched.

Prob. 15–32

15–35. The two blocks *A* and *B* each have a mass of 5 kg and are suspended from parallel cords. A spring, having a and are suspended from parallel cords. A spring, having a stiffness of $k = 60$ N/m, is attached to *B* and is compressed 0.3 m against *A* as shown. Determine the maximum angles *A* 0.3 m against *A* as shown. Determine the maximum angles θ and ϕ of the cords when the blocks are released from rest and the spring becomes unstretched.

***15–36.** Block *A* has a mass of 4 kg and *B* has a mass of ***15–36.** Block *A* has a mass of 4 kg and *B* has a mass of 6 kg. A spring, having a stiffness of $k = 40$ N/m, is attached to *B* and is compressed 0.3 m against *A* as shown to *B* and is compressed 0.3 m against *A* as shown. Determine the maximum angles θ and ϕ of the cords after the blocks are released from rest and the spring becomes unstretched.

Probs. 15–35/36

•15–37. The winch on the back of the Jeep *A* is turned on and pulls in the tow rope at 2 m/s measured relative to the Jeep. If both the 1.25-Mg car *B* and the 2.5-Mg Jeep *A* are free to roll, determine their velocities at the instant they meet. If the rope is 5 m long, how long will this take?

15–34. The car *A* has a weight of 4500 lb and is traveling to the right at 3 ft/s. Meanwhile a 3000-lb car B is traveling at 6 ft/s to the left. If the cars crash head-on and become entangled, determine their common velocity just after the collision. Assume that the brakes are not applied during collision.

Probs. 15–33/34

5 m

15.4 [Impact](#page-14-0)

Impact occurs when two bodies collide with each other during a very *short* period of time, causing relatively large (impulsive) forces to be exerted between the bodies. The striking of a hammer on a nail, or a golf club on a ball, are common examples of impact loadings.

In general, there are two types of impact. *Central impact* occurs when the direction of motion of the mass centers of the two colliding particles is along a line passing through the mass centers of the particles. This line is called the *line of impact*, which is perpendicular to the plane of contact, Fig. 15–13*a*. When the motion of one or both of the particles make an angle with the line of impact, Fig. 15–13*b*, the impact is said to be *oblique impact*.

Central Impact. To illustrate the method for analyzing the mechanics of impact, consider the case involving the central impact of the two particles *A* and *B* shown in Fig. 15–14.

- The particles have the initial momenta shown in Fig. 15–14*a*. The particles have the initial momenta shown in 1
Provided $(v_A)_1 > (v_B)_1$, collision will eventually occur.
- During the collision the particles must be thought of as *deformable* or nonrigid. The particles will undergo a *period of deformation* such that they exert an equal but opposite deformation impulse $\int \mathbf{P} dt$
on each other, Fig. 15–14*b*. on each other, Fig. 15–14*b*.
- Only at the instant of *maximum deformation* will both particles move with a common velocity **v**, since their relative motion is zero, Fig. 15–14*c*.
- Afterward a *period of restitution* occurs, in which case the particles will either return to their original shape or remain permanently deformed. The equal but opposite *restitution impulse* $\int \mathbf{R} dt$ pushes the particles The equal but opposite *restitution impulse* $\int \mathbf{R} dt$ pushes the particles apart from one another, Fig. 15–14*d*. In reality, the physical properties of any two bodies are such that the deformation impulse with *always be greater* than that of restitution, i.e., eformation impul
 $\int P dt > \int R dt$.

will have the fi
- Just after separation the particles will have the final momenta shown in Fig. 15–14*e*, where $(v_B)_2 > (v_A)_2$.

Fig. 15–14

In most problems the initial velocities of the particles will be *known*, and it will be necessary to determine their final velocities $(v_A)_2$ and $(v_B)_2$. In this regard, *momentum* for the *system of particles* is *conserved*
since during collision the internal impulses of deformation and since during collision the internal impulses of deformation and restitution *cancel*. Hence, referring to Fig. 15–14*a* and Fig. 15–14*e* we require $\frac{(v_A)_2}{\cos\theta}$

$$
(\stackrel{\pm}{\to}) \qquad m_A(v_A)_1 + m_B(v_B)_1 = m_A(v_A)_2 + m_B(v_B)_2 \qquad (15-10)
$$

In order to obtain a second equation necessary to solve for $(v_A)_2$ and $(v_B)_2$, we must apply the principle of impulse and momentum to *each narticle* For example, during the deformation phase for particle A *particle*. For example, during the deformation phase for particle *A*, Figs. 15–14*a*, 15–14*b*, and 15–14*c*, we have $\frac{(v_A)_2}{\ln 10}$

$$
m_A(v_A)_1 - \int P dt = m_A v
$$

For the restitution phase, Figs. 15–14*c*, 15–14*d*, and 15–14*e*,

$$
m_A v - \int R dt = m_A (v_A)_2
$$

The ratio of the restitution impulse to the deformation impulse is called the *coefficient of restitution*, *e*. From the above equations, this value for particle *A* is

$$
e = \frac{\int R \, dt}{\int P \, dt} = \frac{v - (v_A)_2}{(v_A)_1 - v}
$$

In a similar manner, we can establish *e* by considering particle *B*, Fig. 15–14. This yields

$$
e = \frac{\int R \, dt}{\int P \, dt} = \frac{(v_B)_2 - v}{v - (v_B)_1}
$$

If the unknown v is eliminated from the above two equations, the coefficient of restitution can be expressed in terms of the particles' initial and final velocities as

$$
e = \frac{(v_B)_2 - (v_A)_2}{(v_A)_1 - (v_B)_1}
$$
 (15-11)

The quality of a manufactured tennis ball is measured by the height of its bounce, which can be related to its coefficient of restitution. Using the mechanics of oblique impact, engineers can design a separation device to remove substandard tennis balls from a production line.

Provided a value for *e* is specified, Eqs. 15–10 and 15–11 can be solved simultaneously to obtain (v_A) and (v_B) . In doing so, however, it is simultaneously to obtain $(v_A)_2$ and $(v_B)_2$. In doing so, however, it is important to carefully establish a sign convention for defining the positive direction for both v_A and v_B and then use it *consistently* when
writing both equations. As noted from the application shown and writing *both* equations. As noted from the application shown, and indicated symbolically by the arrow in parentheses, we have defined the positive direction to the right when referring to the motions of both *A* and *B*. Consequently, if a negative value results from the solution of either $(v_A)_2$ or $(v_B)_2$, it indicates motion is to the left.

Coefficient of Restitution. From Figs. 15–14*a* and 15–14*e*, it is seen that Eq. 15–11 states that *e* is equal to the ratio of the relative seen that Eq. 15–11 states that *e* is equal to the ratio of the relative
velocity of the particles' separation *just after impact*, $(v_B)_2 - (v_A)_2$, to
the relative velocity of the particles' approach *just before impact* the relative velocity of the particles' approach *just before impact*, the relative velocity of the particles' approach *just before impact*, $(v_A)_1 - (v_B)_1$. By measuring these relative velocities experimentally, it has been found that *e* varies appreciably with impact velocity as well it has been found that *e* varies appreciably with impact velocity as well as with the size and shape of the colliding bodies. For these reasons the coefficient of restitution is reliable only when used with data which closely approximate the conditions which were known to exist when measurements of it were made. In general *e* has a value between zero and one, and one should be aware of the physical meaning of these two limits.

Elastic Impact (e = 1). If the collision between the two particles is *perfectly elastic*, the deformation impulse $(\int \mathbf{P} dt)$ is equal and opposite to the restitution impulse $(\int \mathbf{P} dt)$. Although in reality this can never be the restitution impulse $(\int \mathbf{R} dt)$. Although in reality this can never be the restitution impulse $(\int \mathbf{R} dt)$. Althachieved, $e = 1$ for an elastic collision.

when $e = 0$. In this case there is no restitution impulse $(f \mathbf{R} dt = \mathbf{0})$, so that after collision both particles couple or stick *together* and move with a common velocity. ic **Impact (e = 0).** The impact is said to be *inelastic or plase* $e = 0$. In this case there is no restitution impulse $(\int \mathbf{R} dt = 0)$, fter collision both particles couple or stick *together* and move w Plastic Impact (e = 0). The impact is said to be *inelastic or plastic*

From the above derivation it should be evident that the principle of work and energy cannot be used for the analysis of impact problems since it is not possible to know how the *internal forces* of deformation and restitution vary or displace during the collision. By knowing the particle's velocities before and after collision, however, the energy loss during collision can be calculated on the basis of the difference in the during collision can be calculated on the basis of the difference in the particle's kinetic energy. This energy loss, $\Sigma U_{1-2} = \Sigma T_2 - \Sigma T_1$, occurs because some of the initial kinetic energy of the particle is transforme because some of the initial kinetic energy of the particle is transformed into thermal energy as well as creating sound and localized deformation of the material when the collision occurs. In particular, if the impact is *perfectly elastic*, no energy is lost in the collision; whereas if the collision is *plastic*, the energy lost during collision is a maximum.

Procedure for Analysis (Central Impact)

In most cases the *final velocities* of two smooth particles are to be determined *just after* they are subjected to direct central impact. Provided the coefficient of restitution, the mass of each particle, and each particle's initial velocity *just before* impact are known, the solution to this problem can be obtained using the following two equations:

- The conservation of momentum applies to the system of The conservation of m
particles, $\Sigma mv_1 = \Sigma mv_2$.
- particles, $\ge mv_1 = \ge mv_2$.

 The coefficient of restitution, $e = [(v_B)_2 (v_A)_2]/[(v_A)_1 (v_B)_1]$,

relates the relative velocities of the particles along the line of relates the relative velocities of the particles along the line of impact, just before and just after collision.

When applying these two equations, the sense of an unknown velocity can be assumed. If the solution yields a negative magnitude, the velocity acts in the opposite sense.

Oblique Impact. When oblique impact occurs between two smooth particles, the particles move away from each other with velocities having unknown directions as well as unknown magnitudes. Provided the initial velocities are known, then four unknowns are present in the problem. As shown in Fig. 15–15*a*, these unknowns may be represented either as $(v_A)_2, (v_B)_2, \theta_2$, and ϕ_2 , or as the *x* and *y* components of the final velocities velocities.

Procedure for Analysis (Oblique Impact)

If the *y* axis is established within the plane of contact and the *x* axis along the line of impact, the impulsive forces of deformation and restitution act *only in the x direction*, Fig. 15–15*b*. By resolving the velocity or momentum vectors into components along the *x* and *y* axes, Fig. 15–15*b*, it is then possible to write four independent scalar equations in order to determine $(v_{Ax})_2$, $(v_{Ay})_2$, $(v_{Bx})_2$, and $(v_{By})_2$.

- independent scalar equations in order to determine $(v_{Ax})_2$, $(v_{Ay})_2$, $(v_{Bx})_2$, and $(v_{By})_2$.

Momentum of the system is conserved *along the line of impact*, x axis, so that $\sum m(v_x)_1 = \sum m(v_x)_2$.
- Momentum of the system is conserved *along the line of impact*, x axis, so that $\sum m(v_x)_1 = \sum m(v_x)_2$.
• The coefficient of restitution, $e = \frac{[(v_{Bx})_2 (v_{Ax})_2]}{[(v_{Ax})_1 (v_{Bx})_1]}$, relates the relative-velocity components o *components* of the particles *along the line of impact* (*x* axis).
- If these two equations are solved simultaneously, we obtain $(v_{Ax})_2$ and $(v_{Bx})_2$.
- Momentum of particle *A* is conserved along the *y* axis, perpendicular to the line of impact, since no Momentum of particle *A* is conserved along the *y* axis, perpendicular to the line of impact impulse acts on particle *A* in this direction. As a result $m_A(v_{Ay})_1 = m_A(v_{Ay})_2$ or $(v_{Ay})_1 = (v_{Ay})_2$
- Momentum of particle *B* is conserved along the *y* axis, perpendicular to the line of impact, since no Momentum of particle *B* is conserved along the *y* axis, perpendicular impulse acts on particle *B* in this direction. Consequently $(v_{By})_1 = (v_{By})_2$.

Application of these four equations is illustrated in Example 15.11.

Just after impact (c)

Fig. 15–16

The bag *A*, having a weight of 6 lb, is released from rest at the position The bag *A*, having a weight of 6 lb, is released from rest at the position $\theta = 0^{\circ}$, as shown in Fig. 15–16*a*. After falling to $\theta = 90^{\circ}$, it strikes an 18-lb box *B*. If the coefficient of restitution between the bag and box 18-lb box *B*. If the coefficient of restitution between the bag and box
is $e = 0.5$, determine the velocities of the bag and box just after
impact What is the loss of energy during collision? impact. What is the loss of energy during collision?

SOLUTION

This problem involves central impact. Why? Before analyzing the mechanics of the impact, however, it is first necessary to obtain the velocity of the bag *just before* it strikes the box.

velocity of the *bag just before* it strikes the box.

\nAns.

NOTE: The energy loss occurs due to inelastic deformation during the collision.

Ball *B* shown in Fig. 15–17*a* has a mass of 1.5 kg and is suspended from the ceiling by a 1-m-long elastic cord. If the cord is *stretched* downward 0.25 m and the ball is released from rest, determine how far the cord stretches after the ball rebounds from the ceiling. The far the cord stretches after the ball rebounds from the ceiling. The stiffness of the cord is $k = 800 \text{ N/m}$, and the coefficient of restitution between the ball and ceiling is $e = 0.8$ The ball makes a central stiffness of the cord is $k = 800$ N/m, and the coefficient of restitution
between the ball and ceiling is $e = 0.8$. The ball makes a central
impact with the ceiling impact with the ceiling.

SOLUTION

First we must obtain the velocity of the ball *just before* it strikes the ceiling using energy methods, then consider the impulse and momentum between the ball and ceiling, and finally again use energy methods to determine the stretch in the cord.

Conservation of Energy. With the datum located as shown in **Conservation of Energy.** With the datum located as shown in Fig. 15–17*a*, realizing that initially $y = y_0 = (1 + 0.25)$ m = 1.25 m, we have we have

have
\n
$$
T_0 + V_0 = T_1 + V_1
$$
\n
$$
\frac{1}{2}m(v_B)_0^2 - W_By_0 + \frac{1}{2}ks^2 = \frac{1}{2}m(v_B)_1^2 + 0
$$
\n
$$
0 - 1.5(9.81)N(1.25 m) + \frac{1}{2}(800 N/m)(0.25 m)^2 = \frac{1}{2}(1.5 kg)(v_B)_1^2
$$
\n
$$
(v_B)_1 = 2.968 m/s
$$

The interaction of the ball with the ceiling will now be considered using the principles of impact.* Since an unknown portion of the mass of the ceiling is involved in the impact, the conservation of momentum for the ball–ceiling system will not be written. The "velocity" of this portion of ceiling is zero since it (or the earth) are assumed to remain at rest both before and after impact.

Coefficient of Restitution. Fig. 15–17*b*.
\n
$$
(*) = \frac{(v_B)_2 - (v_A)_2}{(v_A)_1 - (v_B)_1}; \qquad 0.8 = \frac{(v_B)_2 - 0}{0 - 2.968 \text{ m/s}}
$$
\n
$$
(v_B)_2 = -2.374 \text{ m/s} = 2.374 \text{ m/s} \downarrow
$$
\n**Conservation of Energy.** The maximum stretch s_3 in the cord can

Conservation of Energy. The maximum stretch δ_3 in the cord can
be determined by again applying the conservation of energy equation be determined by again applying the conservation of energy equation
to the ball just after collision. Assuming that $y = y_3 = (1 + s_3)$ m,
Fig. 15–17c then Fig. 15–17*c*, then

ig. 15–17*c*, then
\n
$$
T_2 + V_2 = T_3 + V_3
$$
\n
$$
\frac{1}{2}m(v_B)_2^2 + 0 = \frac{1}{2}m(v_B)_3^2 - W_By_3 + \frac{1}{2}ks_3^2
$$
\n
$$
\frac{1}{2}(1.5 \text{ kg})(2.37 \text{ m/s})^2 = 0 - 9.81(1.5) \text{ N}(1 \text{ m} + s_3) + \frac{1}{2}(800 \text{ N/m})s_3^2
$$
\n
$$
400s_3^2 - 14.715s_3 - 18.94 = 0
$$

Solving this quadratic equation for the positive root yields
 $s_3 = 0.237 \text{ m} = 237 \text{ mm}$ *Ans.*

$$
.237 \text{ m} = 237 \text{ mm}
$$

* The weight of the ball is considered a nonimpulsive force.

(a)

A A \leftarrow \equiv $(A$ $m_A(\mathbf{v}_{Ax})_2$ m_A (**v**_A) $-\int \mathbf{F}dt$

(b)

Two smooth disks *A* and *B*, having a mass of 1 kg and 2 kg, respectively, collide with the velocities shown in Fig. 15–18*a*. If the respectively, collide with the velocities shown in Fig. 15–18*a*. If the coefficient of restitution for the disks is $e = 0.75$, determine the *x* and *y* components of the final velocity of each disk just after collision *y* components of the final velocity of each disk just after collision.

SOLUTION

This problem involves *oblique impact*. Why? In order to solve it, we have established the *x* and *y* axes along the line of impact and the plane of contact, respectively, Fig. 15–18*a*.

Resolving each of the initial velocities into *x* and *y* components, we have

$$
(v_{Ax})_1 = 3 \cos 30^\circ = 2.598 \text{ m/s}
$$
 $(v_{Ay})_1 = 3 \sin 30^\circ = 1.50 \text{ m/s}$
 $(v_{Bx})_1 = -1 \cos 45^\circ = -0.7071 \text{ m/s}$ $(v_{By})_1 = -1 \sin 45^\circ = -0.7071 \text{ m/s}$

The four unknown velocity components after collision are *assumed to act in the positive directions*, Fig. 15–18*b*. Since the impact occurs in the *x* direction (line of impact), the conservation of momentum for *both* disks can be applied in this direction. Why?

Conservation of "x" Momentum. In reference to the momentum diagrams, we have

$$
m_A(v_{Ax})_1 + m_B(v_{Bx})_1 = m_A(v_{Ax})_2 + m_B(v_{Bx})_2
$$

1 kg(2.598 m/s) + 2 kg(-0.707 m/s) = 1 kg(v_{Ax})_2 + 2 kg(v_{Bx})_2

$$
(v_{Ax})_2 + 2(v_{Bx})_2 = 1.184
$$
 (1)

Coefficient of Restitution (x).

$$
\begin{aligned} \text{Coefficient of Resulation (x),} \\ \text{(4)} \qquad e &= \frac{(v_{Bx})_2 - (v_{Ax})_2}{(v_{Ax})_1 - (v_{Bx})_1}; \ \ 0.75 = \frac{(v_{Bx})_2 - (v_{Ax})_2}{2.598 \text{ m/s} - (-0.7071 \text{ m/s})} \end{aligned}
$$

$$
(v_{Bx})_2 - (v_{Ax})_2 = 2.479
$$
 (2)

Solving Eqs. 1 and 2 for $(v_{Ax})_2$ and $(v_{Bx})_2$ yields

$$
(v_{Ax})_2 = -1.26 \text{ m/s} = 1.26 \text{ m/s} \leftarrow \qquad (v_{Bx})_2 \text{ y} \leftarrow \qquad \text{(v}_{Bx})_2 = 1.22 \text{ m/s} \rightarrow \text{Ans.}
$$

Conservation of "y" Momentum. The momentum of *each disk* is *conserved* in the *y* direction (plane of contact), since the disks are smooth and therefore *no* external impulse acts in this direction. From Fig. 15–18*b*,

$$
(\pm \uparrow) \ m_A(v_{Ay})_1 = m_A(v_{Ay})_2; \ (v_{Ay})_2 = 1.50 \text{ m/s } \uparrow
$$
 Ans.

$$
m_B(v_{By})_1 = m_B(v_{By})_2; (v_{By})_2 = -0.707 \text{ m/s} = 0.707 \text{ m/s} \downarrow Ans.
$$

NOTE: Show that when the velocity components are summed vectorially, one obtains the results shown in Fig. 15–18*c*.

FUNDAMENTAL PROBLEMS

F15–13. Determine the coefficient of restitution e between ball A and ball B. The velocities of A and B before and after the collision are shown after the collision are shown.

F15–13

F15–14. The 15-Mg tank car A and 25-Mg freight car B travel towards each other with the velocities shown. If the travel towards each other with the velocities shown. If the coefficient of restitution between the bumpers is $e = 0.6$, determine the velocity of each car just after the collision determine the velocity of each car just after the collision.

F15–15. The 30-lb package A has a speed of 5 ft/s when it enters the smooth ramp. As it slides down the ramp, it enters the smooth ramp. As it slides down the ramp, it strikes the 80-lb package B which is initially at rest. If the strikes the 80-lb package *B* which is initially at rest. If the coefficient of restitution between *A* and *B* is $e = 0.6$, determine the velocity of *B* just after the impact determine the velocity of B just after the impact.

F15–15

F15–16. Blocks A and B weigh 5 lb and 10 lb, respectively. After striking block B , A slides 2 in. to the right, and B slides 3 in, to the right. If the coefficient of kinetic friction slides 3 in. to the right. If the coefficient of kinetic friction slides 3 in. to the right. If the coefficient of kinetic friction
between the blocks and the surface is $\mu_k = 0.2$, determine
the coefficient of restitution between the blocks Block B is the coefficient of restitution between the blocks. Block B is originally at rest.

F15–17. The ball strikes the smooth wall with a velocity of **F15–17.** The ball strikes the smooth wall with a velocity of $(v_b)_1 = 20$ m/s. If the coefficient of restitution between the hall and the wall is $e = 0.75$ determine the velocity of the $(v_b)_1 = 20$ m/s. If the coefficient of restitution between the ball and the wall is $e = 0.75$, determine the velocity of the hall just after the impact ball just after the impact.

F15–18. Disk A weighs 2 lb and slides on the smooth horizontal plane with a velocity of 3 ft/s. Disk B weight horizontal plane with a velocity of 3 ft/s . Disk B weighs
11 lb and is initially at rest. If after impact A has a velocity 11 lb and is initially at rest. If after impact A has a velocity
of 1 ft/s, parallel to the positive x axis, determine the speed of 1 ft/s, parallel to the positive x axis, determine the speed
of disk R after impact of disk B after impact.

PROBLEMS

15–55. A 1-lb ball A is traveling horizontally at 20 ft/s when it strikes a 10-lb block *B* that is at rest. If the when it strikes a 10-lb block *B* that is at rest. If the coefficient of restitution between *A* and *B* is $e = 0.6$, and the coefficient of kinetic friction between the plane and the the coefficient of kinetic friction between the plane and the the coefficient of kinetic friction between the plane and the block is $\mu_k = 0.4$, determine the time for the block *B* to stop sliding stop sliding.

***15–56.** A 1-lb ball \vec{A} is traveling horizontally at 20 ft/s when it strikes a 10-lb block *B* that is at rest. If the when it strikes a 10-lb block *B* that is at rest. If the coefficient of restitution between *A* and *B* is $e = 0.6$, and the coefficient of kinetic friction between the plane and the the coefficient of kinetic friction between the plane and the the coefficient of kinetic friction between the plane and the block is $\mu_k = 0.4$, determine the distance block *B* slides on the plane before it stops sliding. the plane before it stops sliding.

•15–57. The three balls each have a mass *m*. If *A* has a speed v just before a direct collision with B , determine the speed of *C* after collision. The coefficient of restitution between each ball is *e.* Neglect the size of each ball.

15–58. The 15-lb suitcase *A* is released from rest at *C*. After it slides down the smooth ramp, it strikes the 10-lb suitcase *B*, which is originally at rest. If the coefficient of suitcase *B*, which is originally at rest. If the coefficient of restitution between the suitcases is $e = 0.3$ and the coefficient of kinetic friction between the floor *DF* and coefficient of kinetic friction between the floor *DE* and coefficient of kinetic friction between the floor *DE* and each suitcase is $\mu_k = 0.4$, determine (a) the velocity of *A* intertainty before impact (b) the velocities of *A* and *B* inst after just before impact, (b) the velocities of *A* and *B* just after impact, and (c) the distance *B* slides before coming to rest.

Prob. 15–58

15–59. The 2-kg ball is thrown at the suspended 20-kg block with a velocity of 4 m/s. If the coefficient of restitution block with a velocity of 4 m/s. If the coefficient of restitution
between the ball and the block is $e = 0.8$, determine the
maximum height h to which the block will swing before it maximum height *h* to which the block will swing before it momentarily stops.

***15–60.** The 2-kg ball is thrown at the suspended 20-kg block with a velocity of 4 m/s. If the time of impact between the ball and the block is 0.005 s, determine the average normal force exerted on the block during this time. Take $e = 0.8$.

•15–61. The slider block *B* is confined to move within the smooth slot. It is connected to two springs, each of which smooth slot. It is connected to two springs, each of which
has a stiffness of $k = 30 \text{ N/m}$. They are originally stretched
0.5 m when $s = 0$ as shown. Determine the maximum has a stiffness of $k = 30 \text{ N/m}$. They are originally stretched
0.5 m when $s = 0$ as shown. Determine the maximum
distance s block *R* moves after it is hit by block *A* which distance, s_{max} , block *B* moves after it is hit by block *A* which distance, s_{max} , block *B* moves after it is hit by block *A* which
is originally traveling at $(v_A)_1 = 8$ m/s. Take $e = 0.4$ and
the mass of each block to be 1.5 kg the mass of each block to be 1.5 kg.

15–62. In Prob. 15–61 determine the average net force between blocks *A* and *B* during impact if the impact occurs in $0.005 s$.

Probs. 15–61/62

15–63. The pile *P* has a mass of 800 kg and is being driven into *loose sand* using the 300-kg hammer *C* which is dropped a distance of 0.5 m from the top of the pile. Determine the initial speed of the pile just after it is struck by the hammer. The coefficient of restitution between the by the hammer. The coefficient of restitution between the hammer and the pile is $e = 0.1$. Neglect the impulses due to the weights of the pile and hammer and the impulse due to the weights of the pile and hammer and the impulse due to the sand during the impact.

***15–64.** The pile *P* has a mass of 800 kg and is being driven into *loose sand* using the 300-kg hammer *C* which is dropped a distance of 0.5 m from the top of the pile. Determine the distance the pile is driven into the sand after one blow if the sand offers a frictional resistance against the pile of 18 kN. The coefficient of restitution between the hammer and the The coefficient of restitution between the hammer and the pile is $e = 0.1$. Neglect the impulses due to the weights of the pile and hammer and the impulse due to the sand during the pile and hammer and the impulse due to the sand during the impact.

•15–65. The girl throws the ball with a horizontal velocity •15–65. The girl throws the ball with a horizontal velocity
of $v_1 = 8$ ft/s. If the coefficient of restitution between the
ball and the ground is $e = 0.8$ determine (a) the velocity of of $v_1 = 8$ ft/s. If the coefficient of restitution between the ball and the ground is $e = 0.8$, determine (a) the velocity of the ball just after it rebounds from the ground and (b) the the ball just after it rebounds from the ground and (b) the maximum height to which the ball rises after the first bounce.

Prob. 15–65

15–66. During an impact test, the 2000-lb weight is **15–66.** During an impact test, the 2000-lb weight is released from rest when $\theta = 60^{\circ}$. It swings downwards and strikes the concrete blocks, rebounds and swings back up to strikes the concrete blocks, rebounds and swings back up to $\theta = 15^{\circ}$ before it momentarily stops. Determine the coefficient of restitution between the weight and the blocks. Also, find the impulse transferred between the weight and blocks during impact. Assume that the blocks do not move after impact.

Prob. 15–66

15–67. The 100-lb crate *A* is released from rest onto the smooth ramp. After it slides down the ramp it strikes the 200-lb crate *B* that rests against the spring of stiffness 200-lb crate *B* that rests against the spring of stiffness $k = 600$ lb/ft. If the coefficient of restitution between the crates is $e = 0.5$ determine their velocities just after $k = 600$ lb/ft. If the coefficient of restitution between the crates is $e = 0.5$, determine their velocities just after impact. Also what is the spring's maximum compression? impact. Also, what is the spring's maximum compression? The spring is originally unstretched.

Prob. 15–67

***15–68.** A ball has a mass *m* and is dropped onto a surface from a height *h.* If the coefficient of restitution is *e* between the ball and the surface, determine the time needed for the ball to stop bouncing.

15

15.5 [Angular Momentum](#page-14-0)

The *angular momentum* of a particle about point *O* is defined as the "moment" of the particle's linear momentum about *O*. Since this concept is analogous to finding the moment of a force about a point, the angular momentum, H_O , is sometimes referred to as the *moment of momentum*.

Scalar Formulation. If a particle moves along a curve lying in the *x–y* plane, Fig. 15–19, the angular momentum at any instant can be determined about point *O* (actually the *z* axis) by using a scalar formulation. The *magnitude* of \mathbf{H}_O is

$$
(H_O)_z = (d)(mv)
$$
 (15–12)

Here *d* is the moment arm or perpendicular distance from *O* to the line Here *d* is the moment arm or perpendicular distance from *O* to the line of action of *m***v**. Common units for $(H_O)_z$ are kg·m²/s or slug · ft²/s. The direction of **H** is defined by the right hand rule. As *direction* of H_O is defined by the right-hand rule. As shown, the curl of the right hand indicates the cance of rotation of my about the fingers of the right hand indicates the sense of rotation of *m***v** about *O*, so that in this case the thumb (or H_O) is directed perpendicular to the \star uplane along the $\pm \tau$ axis $x-y$ plane along the $+z$ axis.

Vector Formulation. If the particle moves along a space curve, Fig. 15–20, the vector cross product can be used to determine the *angular momentum* about *O*. In this case

$$
\mathbf{H}_O = \mathbf{r} \times m\mathbf{v}
$$
 (15–13)

Here **r** denotes a position vector drawn from point *O* to the particle. As shown in the figure, H_O is *perpendicular* to the shaded plane containing \mathbf{H}_O and \mathbf{H}_O **r** and *m***v**.

In order to evaluate the cross product,**r** and *m***v** should be expressed in terms of their Cartesian components, so that the angular momentum can be determined by evaluating the determinant:

$$
\mathbf{H}_O = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ r_x & r_y & r_z \\ mv_x & mv_y & mv_z \end{vmatrix}
$$
 (15-14)

Fig. 15–20

15.6 [Relation Between Moment of a](#page-14-0) Force and Angular Momentum

The moments about point *O* of all the forces acting on the particle in Fig. 15–21*a* can be related to the particle's angular momentum by applying the equation of motion. If the mass of the particle is constant, we may write #

$$
\Sigma \mathbf{F} = m\dot{\mathbf{v}}
$$

The moments of the forces about point *O* can be obtained by performing a cross-product multiplication of each side of this equation by the position vector **r**, which is measured from the *x, y, z* inertial frame of reference. We have

$$
\Sigma \mathbf{M}_O = \mathbf{r} \times \Sigma \mathbf{F} = \mathbf{r} \times m\dot{\mathbf{v}}
$$

From Appendix B, the derivative of $\mathbf{r} \times m\mathbf{v}$ can be written as

$$
\dot{\mathbf{H}}_O = \frac{d}{dt}(\mathbf{r} \times m\mathbf{v}) = \dot{\mathbf{r}} \times m\mathbf{v} + \mathbf{r} \times m\dot{\mathbf{v}}
$$

The first term on the right side, $\dot{\mathbf{r}} \times m\mathbf{v} = m(\dot{\mathbf{r}} \times \dot{\mathbf{r}}) = \mathbf{0}$, since the cross product of a vector with itself is zero. Hence, the above equation becomes $\dot{\mathbf{r}} \times m\mathbf{v} = m(\dot{\mathbf{r}} \times \mathbf{v})$ **r** $) = 0,$

$$
\Sigma \mathbf{M}_O = \dot{\mathbf{H}}_O \tag{15-15}
$$

which states that *the resultant moment about point O of all the forces acting on the particle is equal to the time rate of change of the particle's angular momentum about point O*. This result is similar to Eq. 15–1, i.e.,

$$
\Sigma \mathbf{F} = \dot{\mathbf{L}} \tag{15-16}
$$

Here $\mathbf{L} = m\mathbf{v}$, so that *the resultant force acting on the particle is equal to* the time rate of change of the particle's linear momentum *the time rate of change of the particle's linear momentum*.

From the derivations, it is seen that Eqs. 15–15 and 15–16 are actually another way of stating Newton's second law of motion. In other sections of this book it will be shown that these equations have many practical applications when extended and applied to problems involving either a system of particles or a rigid body.

System of Particles. An equation having the same form as Eq. 15–15 may be derived for the system of particles shown in Fig. 15–21*b*. The forces acting on the arbitrary *i*th particle of the system consist of a resultant *external force* \mathbf{F}_i and a resultant *internal force* \mathbf{f}_i .
Expressing the moments of these forces about point O using the form Expressing the moments of these forces about point *O*, using the form of Eq. 15–15, we have

$$
(\mathbf{r}_i \times \mathbf{F}_i) + (\mathbf{r}_i \times \mathbf{f}_i) = (\dot{\mathbf{H}}_i)_{\scriptstyle O}
$$

Here $(\mathbf{H}_i)_O$ is the time rate of change in the angular momentum of the *i*th particle about O . Similar equations can be written for each of the *i*th particle about *O*. Similar equations can be written for each of the other particles of the system. When the results are summed vectorially, the result is

$$
\Sigma(\mathbf{r}_i \times \mathbf{F}_i) + \Sigma(\mathbf{r}_i \times \mathbf{f}_i) = \Sigma(\dot{\mathbf{H}}_i)_{\scriptstyle O}
$$

The second term is zero since the internal forces occur in equal but opposite collinear pairs, and hence the moment of each pair about point *O* is zero. Dropping the index notation, the above equation can be written in a simplified form as

$$
\Sigma \mathbf{M}_O = \dot{\mathbf{H}}_O \tag{15-17}
$$

which states that *the sum of the moments about point O of all the external forces acting on a system of particles is equal to the time rate of change of the total angular momentum of the system about point O*.Although *O* has been chosen here as the origin of coordinates, it actually can represent any *fixed point* in the inertial frame of reference.

Fig. 15–21 (cont.)

The box shown in Fig. 15–22*a* has a mass *m* and travels down the smooth circular ramp such that when it is at the angle θ it has a speed v. Determine its angular momentum about point *O* at this instant and the rate of increase in its speed i.e. q . the rate of increase in its speed, i.e., a_t .

SOLUTION

Since **v** is tangent to the path, applying Eq. 15–12 the angular momentum is

$$
H_O = rmv \lambda
$$
 Ans.

The rate of increase in its speed (dv/dt) can be found by applying The rate of increase in its speed (dv/dt) can be found by applying Eq. 15–15. From the free-body diagram of the box, Fig. 15–22*b*, it can Eq. 15–15. From the free-body diagram of the box, Fig. 15–22*b*, it can
be seen that only the weight $W = mg$ contributes a moment about
point *O* We have point *O*. We have

point *O*. we have
\n
$$
\zeta + \Sigma M_O = \dot{H}_O;
$$
 $mg(r \sin \theta) = \frac{d}{dt}(rmv)$

Since *r* and *m* are constant,

$$
mgr \sin \theta = rm \frac{dv}{dt}
$$

$$
\frac{dv}{dt} = g \sin \theta
$$
Ans.

15.7 [Principle of Angular Impulse and](#page-14-0) Momentum

Principle of Angular Impulse and Momentum. If Eq. 15–15 ©**Principle of Angular Impulse and Momentum.** If Eq. 15–15 is rewritten in the form $\sum M_O dt = dH_O$ and integrated, assuming that at time $t = t$. H_o = (H_o), and at time $t = t_0$, H_o = (H_o), we have is rewritten in the form $\sum \mathbf{M}_O dt = d\mathbf{H}_O$ and integrated, assuming t
time $t = t_1$, $\mathbf{H}_O = (\mathbf{H}_O)_1$ and at time $t = t_2$, $\mathbf{H}_O = (\mathbf{H}_O)_2$, we have

$$
\Sigma \int_{t_1}^{t_2} \mathbf{M}_O dt = (\mathbf{H}_O)_2 - (\mathbf{H}_O)_1
$$

$$
(\mathbf{H}_O)_1 + \Sigma \int_{t_1}^{t_2} \mathbf{M}_O dt = (\mathbf{H}_O)_2
$$
 (15-18)

This equation is referred to as the *principle of angular impulse and momentum*. The initial and final angular momenta (\mathbf{H}_0) ₁ and (\mathbf{H}_0) ₂ are defined as the moment of the linear momentum of the particle defined as the moment of the linear momentum of the particle defined as the moment of the linear momentum of the particle $(\mathbf{H}_O = \mathbf{r} \times m\mathbf{v})$ at the instants t_1 and t_2 , respectively. The second term on the left side $\Sigma / \mathbf{M}_O dt$ is called the *angular impulse* It is de on the left side, $\Sigma / M_O dt$, is called the *angular impulse*. It is determined on the left side, $\Sigma / M_O dt$, is called the *angular impulse*. It is determined
by integrating, with respect to time, the moments of all the forces acting on the particle over the time period t_1 to t_2 . Since the moment of a force
about point O is $\mathbf{M}_0 = \mathbf{r} \times \mathbf{F}$ the appular impulse may be expressed in on the particle over the time period t_1 to t_2 . Since the moment of a force about point *O* is $M_O = r \times F$, the angular impulse may be expressed in wetter form as vector form as

angular impulse =
$$
\int_{t_1}^{t_2} \mathbf{M}_O dt = \int_{t_1}^{t_2} (\mathbf{r} \times \mathbf{F}) dt
$$
 (15–19)

Here **r** is a position vector which extends from point *O* to any point on the line of action of **F**.

In a similar manner, using Eq. 15–18, the principle of angular impulse and momentum for a system of particles may be written as

$$
\Sigma(\mathbf{H}_O)_1 + \Sigma \int_{t_1}^{t_2} \mathbf{M}_O dt = \Sigma(\mathbf{H}_O)_2
$$
 (15–20)

15

Here the first and third terms represent the angular momenta of all the Here the first and third terms represent the angular momenta of all the particles $[\Sigma H_O = \Sigma (r_i \times mv_i)]$ at the instants t_1 and t_2 . The second term is the sum of the angular impulses given to all the particles from t_1 is the sum of the angular impulses given to all the particles from t_1 to t_2 .
Recall that these impulses are created only by the moments of the external Recall that these impulses are created only by the moments of the external Recall that these impulses are created only by the moments of the ext
forces acting on the system where, for the *i*th particle, $\mathbf{M}_O = \mathbf{r}_i \times \mathbf{F}_i$.

Vector Formulation. Using impulse and momentum principles, it is therefore possible to write two equations which define the particle's motion, namely, Eqs. 15–3 and Eqs. 15–18, restated as

$$
m\mathbf{v}_1 + \sum \int_{t_1}^{t_2} \mathbf{F} dt = m\mathbf{v}_2
$$

\n
$$
(\mathbf{H}_O)_1 + \sum \int_{t_1}^{t_2} \mathbf{M}_O dt = (\mathbf{H}_O)_2
$$
\n(15-21)

Scalar Formulation. In general, the above equations can be expressed in *x, y, z* component form, yielding a total of six scalar equations. If the particle is confined to move in the *x*–*y* plane, three scalar equations can be written to express the motion, namely,

$$
m(v_x)_1 + \sum \int_{t_1}^{t_2} F_x dt = m(v_x)_2
$$

\n
$$
m(v_y)_1 + \sum \int_{t_1}^{t_2} F_y dt = m(v_y)_2
$$

\n
$$
(H_O)_1 + \sum \int_{t_1}^{t_2} M_O dt = (H_O)_2
$$
\n(15-22)

The first two of these equations represent the principle of linear impulse and momentum in the *x* and *y* directions, which has been discussed in Sec. 15.1, and the third equation represents the principle of angular impulse and momentum about the *z* axis.

Fig. 15–23

Provided air resistance is neglected, the passengers on this amusement-park ride are subjected to a conservation of angular momentum about the axis of rotation. As shown on the free-body diagram, the line of action of the normal force **N** of the seat on the passenger passes through the axis,and the passenger's weight **W** is parallel to it. Thus, no angular impulse acts around the *z* axis.

Conservation of Angular Momentum. When the angular impulses acting on a particle are all zero during the time t_1 to t_2 , Eq. 15–18
reduces to the following simplified form: reduces to the following simplified form:

$$
(\mathbf{H}_O)_1 = (\mathbf{H}_O)_2 \tag{15-23}
$$

This equation is known as the *conservation of angular momentum*. It states that from t_1 to t_2 the particle's angular momentum remains constant. Obviously, if no external impulse is applied to the particle, both linear and angular momentum will be conserved. In some cases, however, the particle's angular momentum will be conserved and linear momentum may not. An example of this occurs when the particle is subjected *only* to a *central force* (see Sec. 13.7). As shown in Fig. 15–23, the impulsive central force **F** is always directed toward point *O* as the particle moves along the path. Hence, the angular impulse (moment) created by **F** about the *z* axis is always zero, and therefore angular momentum of the particle is conserved about this axis.

From Eq. 15–20, we can also write the conservation of angular momentum for a system of particles as

$$
\Sigma(\mathbf{H}_O)_1 = \Sigma(\mathbf{H}_O)_2 \tag{15-24}
$$

In this case the summation must include the angular momenta of all particles in the system.

Procedure for Analysis

When applying the principles of angular impulse and momentum, or the conservation of angular momentum, it is suggested that the following procedure be used.

Free-Body Diagram.

- Draw the particle's free-body diagram in order to determine any axis about which angular momentum may be conserved. For this to occur, the moments of all the forces (or impulses) must either be parallel or pass through the axis so as to create zero moment throughout the time period t_1 to t_2 .
- The direction and sense of the particle's initial and final velocities should also be established.
- An alternative procedure would be to draw the impulse and momentum diagrams for the particle.

Momentum Equations.

• Apply the principle of angular impulse and momentum, or if appropriate, the conservation of angular momentum, $(\mathbf{H}_O)_{1} = (\mathbf{H}_O)_{2}$. Apply the
 $(\mathbf{H}_O)_1 + \Sigma \int_t$

of angular mo $\frac{1}{2}$ principle of an
 $\sum_{t_1}^{t_2} \mathbf{M}_O dt = (\mathbf{H}_O)_2,$

principle $(\mathbf{H}_O)_2$,

ĩ

EXAMPLE 15.13

The 1.5-Mg car travels along the circular road as shown in Fig. 15–24*a*. The 1.5-Mg car travels along the circular road as shown in Fig. 15–24*a*.
If the traction force of the wheels on the road is $F = (150t^2)$ N, where
t is in seconds, determine the speed of the car when $t = 5$ s. The car If the traction force of the wheels on the road is $F = (150t^2)$ N, where
t is in seconds, determine the speed of the car when $t = 5$ s. The car
initially travels with a speed of 5 m/s. Negect the size of the car initially travels with a speed of $\frac{5}{3}$ m/s. Negect the size of the car. $^{2})$ N

SOLUTION

Free-Body Diagram. The free-body diagram of the car is shown in Fig. 15–24*b*. If we apply the principle of angular impulse and momentum about the *z* axis, then the angular impulse created by the weight, normal force, and radial frictional force will be eliminated since they act parallel to the axis or pass through it.

Principle of Angular Impulse and Momentum.

$$
(Hz)_1 + \sum \int_{t_1}^{t_2} M_z dt = (Hz)_2

$$
 Ans. Fig. 15-24

EXAMPLE 15.14

(a)

The 0.8-lb ball *B*, shown in Fig. 15–25*a*, is attached to a cord which passes through a hole at *A* in a smooth table. When the ball is passes through a hole at A in a smooth table. When the ball is $r_1 = 1.75$ ft from the hole, it is rotating around in a circle such that its speed is $v_1 = 4$ ft/s. By applying the force **F** the cord is pulled $r_1 = 1.75$ ft from the hole, it is rotating around in a circle such that its
speed is $v_1 = 4$ ft/s. By applying the force **F** the cord is pulled
downward through the hole with a constant speed $v_1 = 6$ ft/s speed is $v_1 = 4$ ft/s. By applying the force **F** the cord is pulled
downward through the hole with a constant speed $v_c = 6$ ft/s.
Determine (a) the speed of the hall at the instant it is $r_0 = 0.6$ ft from downward through the hole with a constant speed $v_c = 6$ ft/s.
Determine (a) the speed of the ball at the instant it is $r_2 = 0.6$ ft from
the hole and (b) the amount of work done by **F** in shortening the the hole, and (b) the amount of work done by **F** in shortening the radial distance from r_1 to r_2 . Neglect the size of the ball.

SOLUTION

Part (a) Free-Body Diagram. As the ball moves from r_1 to r_2 ,
Fig. 15–25*b* the cord force **F** on the ball always passes through the z axis Fig. 15–25*b*, the cord force **F** on the ball always passes through the *z* axis, and the weight and N_B are parallel to it. Hence the moments, or angular impulses created by these forces are all zero about this axis. Therefore impulses created by these forces, are all *zero* about this axis. Therefore, angular momentum is conserved about the *z* axis.

Conservation of Angular Momentum. The ball's velocity \mathbf{v}_2 is r esolved into two components. The radial component, 6 ft/s, is known; however, it produces zero angular momentum about the *z* axis. Thus,

$$
r_1 m_B v_1 = r_2 m_B v_2'
$$

1.75 ft $\left(\frac{0.8 \text{ lb}}{32.2 \text{ ft/s}^2}\right)$ 4 ft/s = 0.6 ft $\left(\frac{0.8 \text{ lb}}{32.2 \text{ ft/s}^2}\right) v_2'$

$$
v_2' = 11.67 \text{ ft/s}
$$

 $H_1 = H_2$

The speed of the ball is thus

Part (b). The only force that does work on the ball is **F**. (The normal force and weight do not move vertically.) The initial and final kinetic energies of the ball can be determined so that from the principle of work and energy we have

$$
T_1 + \Sigma U_{1-2} = T_2
$$

$$
\frac{1}{2} \left(\frac{0.8 \text{ lb}}{32.2 \text{ ft/s}^2} \right) (4 \text{ ft/s})^2 + U_F = \frac{1}{2} \left(\frac{0.8 \text{ lb}}{32.2 \text{ ft/s}^2} \right) (13.1 \text{ ft/s})^2
$$

$$
U_F = 1.94 \text{ ft} \cdot \text{lb}
$$
Ans.

NOTE: The force *F* is not constant because the normal component of **NOTE:** The force *F* is not constant because the acceleration, $a_n = v^2/r$, changes as *r* changes.

O

Ī

 $k_c = 20 \text{ N/m}$

EXAMPLE 15.15

The 2-kg disk shown in Fig. 15–26*a* rests on a smooth horizontal surface and is attached to an elastic cord that has a stiffness surface and is attached to an elastic cord that has a stiffness $k_c = 20$ N/m and is initially unstretched. If the disk is given a velocity $(n_{\rm b})_t = 1.5$ m/s, perpendicular to the cord determine the rate at $k_c = 20$ N/m and is initially unstretched. If the disk is given a velocity $(v_D)_1 = 1.5$ m/s, perpendicular to the cord, determine the rate at which the cord is being stretched and the speed of the disk at the which the cord is being stretched and the speed of the disk at the instant the cord is stretched 0.2 m.

SOLUTION

Free-Body Diagram. After the disk has been launched, it slides along the path shown in Fig. 15–26*b*. By inspection, angular momentum about point *O* (or the *z* axis) is *conserved*, since none of the forces produce an angular impulse about this axis. Also, when œthe distance is 0.7 m, only the transverse component $(v'_D)_2$ produces angular momentum of the disk about *O*.

Conservation of Angular Momentum. The component $(v'_D)_2$ can
be obtained by applying the conservation of angular momentum be obtained by applying the conservation of angular momentum about *O* (the *z* axis).

axis).
\n
$$
(\mathbf{H}_O)_1 = (\mathbf{H}_O)_2
$$
\n
$$
r_1 m_D(v_D)_1 = r_2 m_D(v'_D)_2
$$
\n
$$
0.5 \text{ m } (2 \text{ kg})(1.5 \text{ m/s}) = 0.7 \text{ m} (2 \text{ kg})(v'_D)_2
$$
\n
$$
(v'_D)_2 = 1.071 \text{ m/s}
$$

Conservation of Energy. The speed of the disk can be obtained by applying the conservation of energy equation at the point where the disk was launched and at the point where the cord is stretched 0.2 m.

$$
T_1 + V_1 = T_2 + V_2
$$

\n
$$
\frac{1}{2}m_D(v_D)_1^2 + \frac{1}{2}kx_1^2 = \frac{1}{2}m_D(v_D)_2^2 + \frac{1}{2}kx_2^2
$$

\n
$$
\frac{1}{2}(2 \text{ kg})(1.5 \text{ m/s})^2 + 0 = \frac{1}{2}(2 \text{ kg})(v_D)_2^2 + \frac{1}{2}(20 \text{ N/m})(0.2 \text{ m})^2
$$

\n
$$
(v_D)_2 = 1.360 \text{ m/s} = 1.36 \text{ m/s}
$$
Ans.

Having determined $(v_D)_2$ and its component $(v'_D)_2$, the rate of stretch of
the cord or radial component $(v''_2)_2$ is determined from the Pythagorean Having determined $(v_D)_2$ and its component $(v_D)_2$, the rate of stretch of
the cord, or radial component, $(v_D'')_2$ is determined from the Pythagorean
theorem theorem,

$$
(v''_D)_2 = \sqrt{(v_D)_2^2 - (v'_D)_2^2}
$$

= $\sqrt{(1.360 \text{ m/s})^2 - (1.071 \text{ m/s})^2}$
= 0.838 m/s *Ans.*

the car is moving on a horizontal circular path with a speed the car is moving on a horizontal circular path with a speed of 30 ft/s. If the boom is shortened at a rate of 3 ft/s , of 30 ft/s. If the boom is shortened at a rate of 3 ft/s,
determine the speed of the car when $r = 10$ ft. Also, find
the work done by the axial force **F** along the boom Neglect the work done by the axial force **F** along the boom. Neglect the size of the car and the mass of the boom.

15–107. When the 2-kg bob is given a horizontal speed of 1.5 m/s , it begins to rotate around the horizontal circular path *A*. If the force **F** on the cord is increased, the bob rises and then rotates around the horizontal circular path *B*. Determine the speed of the bob around path *B*. Also, find the work done by force **F**.

15.8 [Steady Flow of a Fluid Stream](#page-14-0)

Up to this point we have restricted our study of impulse and momentum principles to a system of particles contained within a *closed volume*. In this section, however, we will apply the principle of impulse and momentum to the steady mass flow of fluid particles entering into and then out of a *control volume*. This volume is defined as a region in space where fluid particles can flow into or out of a region. The size and shape of the control volume is frequently made to coincide with the solid boundaries and openings of a pipe, turbine, or pump. Provided the flow of the fluid into the control volume is equal to the flow out, then the flow can be classified as *steady flow*.

Principle of Impulse and Momentum. Consider the steady flow of a fluid stream in Fig. 15–27*a* that passes through a pipe. The region within the pipe and its openings will be taken as the control volume. As shown, the fluid flows into and out of the control volume with velocities \mathbf{v}_A
and \mathbf{v}_A respectively. The change in the direction of the fluid flow within the and \mathbf{v}_B , respectively. The change in the direction of the fluid flow within the control volume is caused by an impulse produced by the resultant external control volume is caused by an impulse produced by the resultant external force exerted on the control surface by the wall of the pipe. This resultant force can be determined by applying the principle of impulse and momentum to the control volume.

Fig. 15–27

The conveyor belt must supply frictional forces to the gravel that falls upon it in order to change the momentum of the gravel stream, so that it begins to travel along the belt.

The air on one side of this fan is essentially at rest, and as it passes through the blades its momentum is increased. To change the momentum of the air flow in this manner, the blades must exert a horizontal thrust on the air stream.As the blades turn faster, the equal but opposite thrust of the air on the blades could overcome the rolling resistance of the wheels on the ground and begin to move the frame of the fan.

As indicated in Fig. 15–27*b*, a small amount of fluid having a mass *dm* is about to enter the control volume through opening *A* with a velocity is about to enter the control volume through opening A with a velocity
of \mathbf{v}_A at time *t*. Since the flow is considered steady, at time $t + dt$, the
same amount of fluid will leave the control volume through opening B same amount of fluid will leave the control volume through opening *B* with a velocity \mathbf{v}_B . The momenta of the fluid entering and leaving the control volume are therefore due \mathbf{v}_B , and due \mathbf{v}_B , respectively. Also control volume are therefore $dm \mathbf{v}_A$ and $dm \mathbf{v}_B$, respectively. Also, during the time dt the momentum of the fluid mass within the control during the time *dt*, the momentum of the fluid mass within the control volume remains constant and is denoted as *m***v**. As shown on the center diagram, the resultant external force exerted on the control volume diagram, the resultant external force exerted on the control volume produces the impulse $\sum \mathbf{F} dt$. If we apply the principle of linear impulse and momentum we have and momentum, we have

$$
dm\,\mathbf{v}_A + m\mathbf{v} + \Sigma\mathbf{F}\,dt = dm\,\mathbf{v}_B + m\mathbf{v}
$$

If **r**, \mathbf{r}_A , \mathbf{r}_B are position vectors measured from point *O* to the geometric centers of the control volume and the openings at *A* and *B*. Fig. 15, 27b centers of the control volume and the openings at *A* and *B*, Fig. 15–27*b*, then the principle of angular impulse and momentum about *O* becomes

$$
\mathbf{r}_A \times dm \mathbf{v}_A + \mathbf{r} \times m\mathbf{v} + \mathbf{r}' \times \Sigma \mathbf{F} dt = \mathbf{r} \times m\mathbf{v} + \mathbf{r}_B \times dm \mathbf{v}_B
$$

Dividing both sides of the above two equations by *dt* and simplifying, we get

$$
\Sigma \mathbf{F} = \frac{dm}{dt} (\mathbf{v}_B - \mathbf{v}_A)
$$
 (15–25)

$$
\Sigma \mathbf{M}_O = \frac{dm}{dt} (\mathbf{r}_B \times \mathbf{v}_B - \mathbf{r}_A \times \mathbf{v}_A)
$$
 (15–26)

The term dm/dt is called the *mass flow*. It indicates the constant amount of I he term *am/at* is called the *mass flow*. It indicates the constant amount of fluid which flows either into or out of the control volume per unit of time. If the cross-sectional areas and densities of the fluid at the entrance *A* are A_A , ρ_A and at exit B, A_B , ρ_B , Fig. 15–27*c*, then for an incompressible fluid,
the *continuity of mass requires* $dm = \rho dV = \rho_A (ds, A_A) = \rho_B (ds, A_B)$ A_A , ρ_A and at exit B , A_B , ρ_B , Fig. 15–27c, then for an incompressible fluid,
the *continuity of mass* requires $dm = \rho dV = \rho_A(ds_A A_A) = \rho_B(ds_B A_B)$.
Hence during the time dt since $v_A = ds_A/dt$ and $v_B = ds_B/dt$ we have Hence, during the time *dt*, since $v_A = ds_A/dt$ and $v_B = ds_B/dt$, we have $dm/dt = \rho_A v_A A_A = \rho_B v_B A_B$ or in general, $dm/dt = \rho_A v_A A_A = \rho_B v_B A_B$ or in general, $m = \rho dV = \rho_A(ds_A A_A) = \rho_B$
 $v_A = ds_A/dt$ and $v_B = ds_B/dt$,

in general

$$
\frac{dm}{dt} = \rho v A = \rho Q \qquad (15-27)
$$

The term $Q = vA$ measures the volume of fluid flow per unit of time and is referred to as the discharge or the volumetric flow is referred to as the *discharge* or the *volumetric flow*.

Procedure for Analysis

Problems involving steady flow can be solved using the following procedure.

Kinematic Diagram.

- Identify the control volume. If it is *moving*, a *kinematic diagram* may be helpful for determining the entrance and exit velocities of the fluid flowing into and out of its openings since a *relativemotion analysis* of velocity will be involved.
- The measurement of velocities v_A and v_B must be made by an observer fixed in an inertial frame of reference.
- Once the velocity of the fluid flowing into the control volume is determined, the mass flow is calculated using Eq. 15–27.

Free-Body Diagram.

• Draw the free-body diagram of the control volume in order to ©establish the forces $\Sigma \mathbf{F}$ that act on it. These forces will include the support reactions, the weight of all solid parts and the fluid contained within the control volume, and the static gauge pressure forces of the fluid on the entrance and exit sections.* The gauge pressure is the pressure measured above atmospheric pressure, and so if an opening is exposed to the atmosphere, the gauge pressure there will be zero.

Equations of Steady Flow.

• Apply the equations of steady flow, Eqs. 15–25 and 15–26, using the appropriate components of velocity and force shown on the kinematic and free-body diagrams.

^{*} In the SI system, pressure is measured using the pascal (Pa), where $1Pa = 1 N/m²$.

EXAMPLE 15.16

0.125 m 0.3 m *B A* $O \qquad \qquad \bullet G$ 20(9.81) N *y x* **M***^O* **F***^A* **F***x* **F***y*

(b)

Fig. 15–28

Determine the components of reaction which the fixed pipe joint at *A* exerts on the elbow in Fig. 15–28*a*, if water flowing through the pipe is subjected to a static gauge pressure of 100 kPa at *A*. The discharge at subjected to a static gauge pressure of 100 kPa at *A*. The discharge at *B* is $Q_B = 0.2 \text{ m}^3/\text{s}$. Water has a density $\rho_w = 1000 \text{ kg/m}^3$, and the water-filled elbow has a mass of 20 kg and center of mass at *G* water-filled elbow has a mass of 20 kg and center of mass at *G*.

SOLUTION

We will consider the control volume to be the outer surface of the elbow. Using a fixed inertial coordinate system, the velocity of flow at *A* and *B* and the mass flow rate can be obtained from Eq. 15–27. Since A and B and the mass flow rate can be obtained from E
the density of water is constant, $Q_B = Q_A = Q$. Hence,

$$
\frac{dm}{dt} = \rho_w Q = (1000 \text{ kg/m}^3)(0.2 \text{ m}^3/\text{s}) = 200 \text{ kg/s}
$$

$$
v_B = \frac{Q}{A_B} = \frac{0.2 \text{ m}^3/\text{s}}{\pi (0.05 \text{ m})^2} = 25.46 \text{ m/s} \downarrow
$$

$$
v_A = \frac{Q}{A_A} = \frac{0.2 \text{ m}^3/\text{s}}{\pi (0.1 \text{ m})^2} = 6.37 \text{ m/s} \rightarrow
$$

Free-Body Diagram. As shown on the free-body diagram of the control volume (elbow) Fig. 15–28*b*, the *fixed* connection at *A* exerts a resultant couple moment M_O and force components \mathbf{F}_x and \mathbf{F}_y on the elbow. Due to the static pressure of water in the pipe the pressure elbow. Due to the static pressure of water in the pipe, the pressure elbow. Due to the static pressure of water in the pipe, the pressure
force acting on the open control surface at *A* is $F_A = p_A A_A$. Since
 $1 \text{ kPa} = 1000 \text{ N/m}^2$ force acting on the
1 kPa = 1000 N/m^2 ,

1000 N/III ,
\n
$$
F_A = p_A A_A = [100(10^3) N/m^2][\pi (0.1 m)^2] = 3141.6 N
$$

There is no static pressure acting at *B*, since the water is discharged at atmospheric pressure; i.e., the pressure measured by a gauge at *B* is atmospheric pressure
equal to zero, $p_B = 0$.

Equations of Steady Flow.

Equations of Steady Flow.
\n
$$
\Rightarrow \Sigma F_x = \frac{dm}{dt} (v_{Bx} - v_{Ax}); -F_x + 3141.6 \text{ N} = 200 \text{ kg/s} (0 - 6.37 \text{ m/s})
$$
\n
$$
F_x = 4.41 \text{ kN}
$$
\nAns.

$$
+ \uparrow \Sigma F_y = \frac{dm}{dt} (v_{By} - v_{Ay}); -F_y - 20(9.81) \text{ N} = 200 \text{ kg/s} (-25.46 \text{ m/s} - 0)
$$

$$
F_y = 4.90 \text{ kN} \qquad \text{Ans.}
$$

If moments are summed about point *O*, Fig. 15–28*b*, then \mathbf{F}_x , \mathbf{F}_y , and the static pressure **F**, are eliminated as well as the moment of the static pressure \mathbf{F}_A are eliminated, as well as the moment of momentum of the water entering at A. Fig. 15, 28g. Hence momentum of the water entering at *A*, Fig. 15–28*a*. Hence,

$$
\zeta + \Sigma M_O = \frac{dm}{dt} (d_{OB}v_B - d_{OA}v_A)
$$

\n
$$
M_O + 20(9.81) N (0.125 m) = 200 kg/s[(0.3 m)(25.46 m/s) - 0]
$$

\n
$$
M_O = 1.50 kN \cdot m
$$
 Ans.

 $v_w = 25 \text{ ft/s}$

2 in.

A

(a)

EXAMPLE 15.17

A 2-in.-diameter water jet having a velocity of 25 ft/s impinges upon a single moving blade, Fig. 15–29*a*. If the blade moves with a constant velocity of 5 ft/s away from the jet, determine the horizontal and vertical components of force which the blade is exerting on the water. What power does the water generate on the blade? Water has a specific weight power does the water of $\gamma_w = 62.4 \text{ lb/ft}^3$.

SOLUTION

Kinematic Diagram. Here the control volume will be the stream of water on the blade. From a fixed inertial coordinate system, Fig. 15–29*b*, the rate at which water enters the control volume at *A* is
 $\mathbf{v}_A = \{25\mathbf{i}\}$ ft/s

$$
\mathbf{v}_A = \{25\mathbf{i}\} \text{ ft/s}
$$

The *relative-flow velocity* within the control volume is The relative-flow velocity within the control volume is $\mathbf{v}_{w/cv} = \mathbf{v}_w - \mathbf{v}_{cv} = 25\mathbf{i} - 5\mathbf{i} = \{20\mathbf{i}\}$ ft/s. Since the control volume is moving with a valentity of $\mathbf{v}_v = (5\mathbf{i})$ ft/s the valentity of flow a $\mathbf{v}_{w/cv} = \mathbf{v}_w - \mathbf{v}_{cv} = 25\mathbf{i} - 5\mathbf{i} = \{20\mathbf{i}\}$ ft/s. Since the control volume is
moving with a velocity of $\mathbf{v}_{cv} = \{5\mathbf{i}\}$ ft/s, the velocity of flow at *B*
measured from the fixed x, y axes is the vector measured from the fixed *x, y* axes is the vector sum, shown in Fig. 15–29*b*. Here,

$$
\mathbf{v}_B = \mathbf{v}_{cv} + \mathbf{v}_{w/cv}
$$

= {5\mathbf{i} + 20\mathbf{j} } ft/s

Thus, the mass flow of water *onto* the control volume that undergoes a momentum change is

$$
\frac{dm}{dt} = \rho_w(v_{w/cv})A_A = \left(\frac{62.4}{32.2}\right)(20)\left[\pi\left(\frac{1}{12}\right)^2\right] = 0.8456 \text{ slug/s}
$$

Free-Body Diagram. The free-body diagram of the control volume is shown in Fig. 15–29*c*. The weight of the water will be neglected in the calculation, since this force will be small compared to the reactive components \mathbf{F}_x and \mathbf{F}_y .

Equations of Steady Flow.

$$
\Sigma \mathbf{F} = \frac{dm}{dt} (\mathbf{v}_B - \mathbf{v}_A)
$$

$$
-F_x \mathbf{i} + F_y \mathbf{j} = 0.8456(5\mathbf{i} + 20\mathbf{j} - 25\mathbf{i})
$$

Equating the respective **i** and **j** components gives

$$
F_x = 0.8456(20) = 16.9 \text{ lb} \leftarrow
$$
 Ans.

$$
F_y = 0.8456(20) = 16.9 \text{ lb}^{\text{A}} \qquad \text{Ans.}
$$

Ans.

The water exerts equal but opposite forces on the blade.

Since the water force which causes the blade to move forward Since the water force which causes the blade to move forward
horizontally with a velocity of 5 ft/s is $F_x = 16.9$ lb, then from Eq. 14–10
the power is the power is

the power is
\n
$$
P = \mathbf{F} \cdot \mathbf{v}
$$
; $P = \frac{16.9 \text{ lb}(5 \text{ ft/s})}{550 \text{ hp/(ft} \cdot \text{lb/s})} = 0.154 \text{ hp}$

 $v_{bl} = 5$ ft/s

*15.9 [Propulsion with Variable Mass](#page-14-0)

A Control Volume That Loses Mass. Consider a device such as a rocket which at an instant of time has a mass *m* and is moving forward with a velocity **v**, Fig. 15–30*a*. At this same instant the amount of mass m_e is expelled from the device with a mass flow velocity \mathbf{v}_e . For the analysis, the control volume will include both the mass m of the device and the the control volume will include *both the mass m of the device and the expelled mass* m_e . The impulse and momentum diagrams for the control volume are shown in Fig. 15–30*b*. During the time *dt* its velocity is volume are shown in Fig. 15–30*b*. During the time *dt*, its velocity is volume are shown in Fig. 15–30*b*. During the time *dt*, its velocity is
increased from **v** to **v** + *d***v** since an amount of mass dm_e has been ejected
and thereby gained in the exhaust. This increase in forward velocit and thereby gained in the exhaust. This increase in forward velocity, however, does not change the velocity \mathbf{v}_e of the expelled mass, as seen by
a fixed observer since this mass moves with a constant velocity once it has a fixed observer, since this mass moves with a constant velocity once it has ©been ejected. The impulses are created by $\Sigma \mathbf{F}_{cv}$, which represents the resultant of all the external forces such as drag or weight, that *act* on the resultant of all the external forces, such as drag or weight, that *act on the control volume* in the direction of motion. This force resultant *does not include* the force which causes the control volume to move forward, since this force (called a *thrust*) is *internal to the control volume*; that is, the thrust acts with equal magnitude but opposite direction on the mass *m* of the device and the expelled exhaust mass m_e .^{*} Applying the principle of impulse and momentum to the control volume. Fig. 15–30*b* we have impulse and momentum to the control volume, Fig. 15–30*b*, we have

Control
Volume
$$
(\Rightarrow)
$$
 mv - $m_e v_e + \Sigma F_{cv} dt = (m - dm_e)(v + dv) - (m_e + dm_e)v_e$

or

m

(a)

v

$$
\Sigma F_{cv} dt = -v dm_e + m dv - dm_e dv - v_e dm_e
$$

 $* \Sigma \mathbf{F}$ represents the external resultant force *acting on the control volume*, which is different from \mathbf{F} , the resultant force acting only on the device.

 m

 $\overline{}$

 $\overline{}$ $\overline{}$ $\overline{}$

v*e*

Without loss of accuracy, the third term on the right side may be neglected since it is a "second-order" differential. Dividing by *dt* gives

$$
\Sigma F_{cv} = m\frac{dv}{dt} - (v + v_e)\frac{dm_e}{dt}
$$

The velocity of the device as seen by an observer moving with the The velocity of the device as seen by an observer moving with the particles of the ejected mass is $v_{D/e} = (v + v_e)$, and so the final result can be written as can be written as

$$
\Sigma F_{cv} = m \frac{dv}{dt} - v_{D/e} \frac{dm_e}{dt}
$$
 (15–28)

Here the term dm_e/dt represents the rate at which mass is being ejected.

ere the term dm_e/dt represents the rate at which mass is being ejected.
To illustrate an application of Eq. 15–28, consider the rocket shown in Fig. 15–31, which has a weight **W** and is moving upward against an atmospheric drag force \mathbf{F}_D . The control volume to be considered consists
of the mass of the rocket and the mass of ejected ass m_A . Applying of the mass of the rocket and the mass of ejected gas m_e . Applying F_0 15–28 gives Eq. 15–28 gives

$$
(-\uparrow) \qquad \qquad -F_D - W = \frac{W}{g} \frac{dv}{dt} - v_{D/e} \frac{dm_e}{dt}
$$

The last term of this equation represents the *thrust* **T** which the engine The last term of this equation represents the *thrust* **T** which the engine exhaust exerts on the rocket, Fig. 15–31. Recognizing that $dv/dt = a$, we can therefore write can therefore write

$$
(+ \uparrow) \qquad \qquad T - F_D - W = \frac{W}{g}a
$$

If a free-body diagram of the rocket is drawn, it becomes obvious that If a free-body diagram of the rocket is drawn, it becomes obvious this equation represents an application of $\Sigma \mathbf{F} = m\mathbf{a}$ for the rocket.

A Control Volume That Gains Mass. A device such as a scoop or a shovel may gain mass as it moves forward. For example, the device shown in Fig. 15–32*a* has a mass *m* and moves forward with a velocity **v**. At this instant, the device is collecting a particle stream of mass m_i . The flow velocity **v**, of this injected mass is constant and independent of the flow velocity \mathbf{v}_i of this injected mass is constant and independent of the velocity \mathbf{v}_i such that $v_i > v_j$. The control volume to be considered here flow velocity \mathbf{v}_i of this injected mass is constant and independent of the velocity \mathbf{v} such that $v > v_i$. The control volume to be considered here includes both the mass of the device and the mass of the inject includes both the mass of the device and the mass of the injected particles. Control Volume

Fig. 15–32

W v v_e T

 \mathbf{F}_D

Control Volume

Fig. 15–31

The impulse and momentum diagrams are shown in Fig. 15–32*b*.Along with an increase in mass dm_i gained by the device, there is an assumed increase in velocity $d\mathbf{v}$ during the time interval dt . This increase is caused by the impulse created by $\Sigma \mathbf{F}_{cv}$, the resultant of all the external forces *acting on the control volume* in the direction of motion. The force summation does not include the retarding force of the injected mass acting on the device. Why? Applying the principle of impulse and momentum to the control volume, we have

$$
(\stackrel{+}{\rightarrow}) \quad mv + m_i v_i + \Sigma F_{cv} dt = (m + dm_i)(v + dv) + (m_i - dm_i)v_i
$$

Using the same procedure as in the previous case, we may write this equation as

$$
\Sigma F_{cv} = m\frac{dv}{dt} + (v - v_i)\frac{dm_i}{dt}
$$

Since the velocity of the device as seen by an observer moving with the Since the velocity of the device as seen by an observer moving with the particles of the injected mass is $v_{D/i} = (v - v_i)$, the final result can be written as written as

$$
\Sigma F_{cv} = m \frac{dv}{dt} + v_{D/i} \frac{dm_i}{dt}
$$
 (15–29)

where dm_i/dt is the rate of mass injected into the device. The last term in where dm_i/dt is the rate of mass injected into the device. The last term in this equation represents the magnitude of force \bf{R} , which the injected this equation represents the magnitude of force **R**, which the injected mass *exerts on the device*, Fig. 15–32*c*. Since $dv/dt = a$, Eq. 15–29 becomes becomes

$$
\Sigma F_{cv} - R = ma
$$

This is the application of $\Sigma \mathbf{F} = m\mathbf{a}$.
As in the case of steady flow pr

As in the case of steady flow, problems which are solved using Eqs. 15–28 and 15–29 should be accompanied by an identified control volume and the necessary free-body diagram. With this diagram one can then determine ΣF_{cr} and isolate the force exerted on the device by the $particle stream.$

Fig. 15–32 (cont.)

The scraper box behind this tractor represents a device that gains mass. If the tractor maintains a constant velocity v,
then $dv/dt = 0$ and because the soil tractor maintains a constant velocity v,
then $dv/dt = 0$ and, because the soil
is originally at rest, $v_{\text{max}} = v$. Applying then $dv/dt = 0$ and, because the soil
is originally at rest, $v_{D/i} = v$. Applying
Eq. 15–29, the horizontal towing force Eq. 15–29, the horizontal towing force on the scraper box is then on the scraper box is then
 $T = 0 + v(dm/dt)$, where dm/dt is the

rate of soil accumulated in the box rate of soil accumulated in the box.

EXAMPLE 15.18

The initial combined mass of a rocket and its fuel is m_0 . A total mass m_0 of fuel is consumed at a constant rate of $dm/dt = c$ and expelled The initial combined mass of a rocket and its fuel is m_0 . A total mass m_f of fuel is consumed at a constant rate of $dm_e/dt = c$ and expelled at a constant speed of u relative to the rocket. Determine the at a constant speed of *u* relative to the rocket. Determine the maximum velocity of the rocket, i.e., at the instant the fuel runs out. Neglect the change in the rocket's weight with altitude and the drag resistance of the air. The rocket is fired vertically from rest.

SOLUTION

Since the rocket loses mass as it moves upward, Eq. 15–28 can be used for the solution. The only *external force* acting on the *control volume* consisting of the rocket and a portion of the expelled mass is the weight **W**, Fig. 15–33. Hence,

$$
+\uparrow\Sigma F_{cv} = m\frac{dv}{dt} - v_{D/e}\frac{dm_e}{dt}; \qquad -W = m\frac{dv}{dt} - uc \tag{1}
$$

The rocket's velocity is obtained by integrating this equation.

At any given instant *t* during the flight, the mass of the rocket can be At any given instant *t* during the flight, the mass of the rocket can be expressed as $m = m_0 - (dm_e/dt)t = m_0 - ct$. Since $W = mg$, Eq. 1 becomes becomes

$$
-(m_0 - ct)g = (m_0 - ct)\frac{dv}{dt} - uc
$$

Separating the variables and integrating, realizing that $v = 0$ at $t = 0$, we have

$$
\int_0^v dv = \int_0^t \left(\frac{uc}{m_0 - ct} - g \right) dt
$$

 $v = -u \ln(m_0 - ct) - gt \Big|_0^t = u \ln \left(\frac{m_0}{m_0 - ct} \right) - gt$ (2)

Note that liftoff requires the first term on the right to be greater than Note that liftoff requires the first term on the right to be greater than the second during the initial phase of motion. The time t' needed to consume all the fuel is consume all the fuel is

$$
m_f = \left(\frac{dm_e}{dt}\right)t' = ct'
$$

Hence,

$$
t' = m_f/c
$$

Substituting into Eq. 2 yields

$$
v_{\text{max}} = u \ln \left(\frac{m_0}{m_0 - m_f} \right) - \frac{gm_f}{c}
$$
 Ans.

EXAMPLE 15.19

A chain of length *l*, Fig. 15–34*a*, has a mass *m*. Determine the magnitude of force **F** required to (a) raise the chain with a constant speed v_c , starting from rest when $v = 0$; and (b) lower the chain with a constant of force **F** required to (a) raise the chain with a constant speed v_c , starting from rest when $y = 0$; and (b) lower the chain with a constant speed v starting from rest when $y = l$ starting from rest when $y = 0$; and (b) speed v_c , starting from rest when $y = l$.

SOLUTION

Part (a). As the chain is raised, all the suspended links are given a sudden downward impulse by each added link which is lifted off the ground.Thus, the *suspended portion* of the chain may be considered as a device which is *gaining mass*.The control volume to be considered is the length of chain *y* which is suspended by **F** at any instant, including the next link which is about to be added but is still at rest, Fig. 15–34*b*. The forces acting on the control volume exclude the internal forces **P** and $-P$, which act between the added link and the suspended **P** and $-P$, which act between the added link a
portion of the chain. Hence, $\Sigma F_{cv} = F - mg(y/l)$.
To apply Eq. 15–29 it is also necessary to find the r

To apply Eq. 15–29, it is also necessary to find the rate at which mass is being added to the system. The velocity \mathbf{v}_c of the chain is equivalent to $\mathbf{v}_c = \mathbf{W} \mathbf{v}$ is constant dv $/dt = 0$ and $d\nu/dt = v$. Integrating being added to the system. The velocity \mathbf{v}_c of the chain is equivalent to $\mathbf{v}_{D/i}$. Why? Since v_c is constant, $dv_c/dt = 0$ and $dy/dt = v_c$. Integrating, using the initial condition that $y = 0$ when $t = 0$ gives $y = y$ $\mathbf{v}_{D/i}$. Why? Since v_c is constant, $dv_c/dt = 0$ and $dy/dt = v_c$. Integrating, using the initial condition that $y = 0$ when $t = 0$, gives $y = v_c t$. Thus, the mass of the control volume at any instant is $m_a = m(y/l) = m(y t/l)$ using the initial condition that $y = 0$ when $t = 0$, gives $y = v_c t$. Thus, the mass of the control volume at any instant is $m_{cv} = m(y/l) = m(v_c t/l)$, and therefore the *rate* at which mass is *added* to the suspended chain is and therefore the *rate* at which mass is *added* to the suspended chain is

$$
\frac{dm_i}{dt} = m\left(\frac{v_c}{l}\right)
$$

 $\frac{dV}{dt} = m(\frac{V}{l})$
Applying Eq. 15–29 using this data, we have

$$
+\uparrow \Sigma F_{cv} = m\frac{dv_c}{dt} + v_{D/i}\frac{dm_i}{dt}
$$

$$
F - mg\left(\frac{y}{l}\right) = 0 + v_c m\left(\frac{v_c}{l}\right)
$$

Hence,

$$
F = (m/l)(gy + v_c^2)
$$
Ans.

Part (b). When the chain is being lowered, the links which are expelled (given zero velocity) *do not* impart an impulse to the *remaining* suspended links. Why? Thus, the control volume in Part (*a*) will not be considered. Instead, the equation of motion will be used to obtain the solution.At time *t* the portion of chain still off the floor is *y*. The free-body diagram for a suspended portion of the chain is shown in Fig. 15–34*c*. Thus,

$$
F - mg\left(\frac{y}{l}\right) = 0
$$

$$
F = mg\left(\frac{y}{l}\right)
$$
Ans.

PROBLEMS

***15–108.** A scoop in front of the tractor collects snow at a rate of 200 kg/s. Determine the resultant traction force **T** that must be developed on all the wheels as it moves forward on level ground at a constant speed of 5 km/h . The tractor has a mass of 5 Mg.

•15–109. A four-engine commercial jumbo jet is cruising at a constant speed of 800 km/h in level flight when all four engines are in operation. Each of the engines is capable of discharging combustion gases with a velocity of 775 m/s relative to the plane. If during a test two of the engines, one on each side of the plane, are shut off, determine the new cruising speed of the jet.Assume that air resistance (drag) is cruising speed of the jet. Assume that air resistance (drag) is
proportional to the square of the speed, that is, $F_D = cv^2$,
where c is a constant to be determined. Neglect the loss of where *c* is a constant to be determined. Neglect the loss of mass due to fuel consumption.

15–111. The 150-lb fireman is holding a hose which has a nozzle diameter of 1 in. and hose diameter of 2 in. If the velocity of the water at discharge is 60 ft/s , determine the resultant normal and frictional force acting on the man's feet at the ground. Neglect the weight of the hose and the water within it. $\gamma_w = 62.4 \text{ lb/ft}^3$.

Prob. 15–109

15–110. The jet dragster when empty has a mass of 1.25 Mg and carries 250 kg of solid propellent fuel. Its engine is capable of burning the fuel at a constant rate of 50 kg/s, while ejecting it at 1500 m/s relative to the dragster. Determine the maximum speed attained by the dragster starting from rest. Assume air resistance is dragster starting from rest. Assume air resistance is $F_D = (10v^2)$ N, where v is the dragster's velocity in m/s.
Neglect rolling resistance Neglect rolling resistance.

Prob. 15–110

Prob. 15–111

***15–112.** When operating, the air-jet fan discharges air ***15–112.** When operating, the air-jet fan discharges air
with a speed of $v_B = 20$ m/s into a slipstream having a
diameter of 0.5 m. If air has a density of 1.22 kg/m³ diameter of 0.5 m. If air has a density of 1.22 kg/m³, determine the horizontal and vertical components of reaction at *C* and the vertical reaction at each of the two wheels, *D*, when the fan is in operation. The fan and motor have a mass of 20 kg and a center of mass at *G.* Neglect the weight of the frame. Due to symmetry, both of the wheels support an equal load. Assume the air entering the fan at *A* is essentially at rest.

•15–113. The blade divides the jet of water having a diameter of 3 in. If one-fourth of the water flows downward while the other three-fourths flows upwards, and the total while the other three-fourths flows upwards, and the total
flow is $Q = 0.5$ ft³/s, determine the horizontal and vertical
components of force exerted on the blade by the jet components of force exerted on the blade by the jet, components of $\gamma_w = 62.4 \text{ lb/ft}^3$.

15–115. The fire boat discharges two streams of seawater, each at a flow of $0.25 \text{ m}^3/\text{s}$ and with a nozzle velocity of 50 m/s . Determine the tension developed in the anchor chain, needed to secure the boat. The density of seawater is $\rho_{sw} = 1020 \text{ kg/m}^3$.

15–114. The toy sprinkler for children consists of a 0.2-kg cap and a hose that has a mass per length of 30 g/m . Determine the required rate of flow of water through the 5-mm-diameter tube so that the sprinkler will lift 1.5 m from the ground and hover from this position. Neglect the weight of the water in the tube. $\rho_w = 1 \text{ Mg/m}^3$.

***15–116.** A speedboat is powered by the jet drive shown. Seawater is drawn into the pump housing at the rate of $20 \text{ ft}^3\text{/s}$ through a 6-in.-diameter intake *A*. An impeller accelerates the water flow and forces it out horizontally through a 4-in.- diameter nozzle *B*. Determine the horizontal and vertical components of thrust exerted on the speedboat. The specific weight of seawater is $\gamma_{sw} = 64.3 \text{ lb/ft}^3$.

•15–117. The fan blows air at $6000 \text{ ft}^3/\text{min}$. If the fan has a weight of 30 lb and a center of gravity at *G*, determine the smallest diameter *d* of its base so that it will not tip over. The specific weight of air is $\gamma = 0.076$ lb/ft³.

Prob. 15–117

15–118. The elbow for a 5-in-diameter buried pipe is subjected to a static pressure of 10 lb/in^2 . The speed of the subjected to a static pressure of 10 lb/in². The speed of the water passing through it is $v = 8$ ft/s. Assuming the pipe connections at A and B do not offer any vertical force connections at *A* and *B* do not offer any vertical force resistance on the elbow, determine the resultant vertical force **F** that the soil must then exert on the elbow in order to hold it in equilibrium. Neglect the weight of the elbow and the water within it. $\gamma_w = 62.4 \text{ lb/ft}^3$.

15–119. The hemispherical bowl of mass *m* is held in equilibrium by the vertical jet of water discharged through a nozzle of diameter *d*. If the discharge of the water through the nozzle is *Q*, determine the height *h* at which the bowl is suspended. The water density is ρ_w . Neglect the weight of the water jet.

Prob. 15–119

***15–120.** The chute is used to divert the flow of water, ***15–120.** The chute is used to divert the flow of water,
 $Q = 0.6 \text{ m}^3/\text{s}$. If the water has a cross-sectional area of
 0.05 m^2 determine the force components at the pin D and 0.05 m², determine the force components at the pin *D* and roller *C* necessary for equilibrium. Neglect the weight of the chute and weight of the water on the chute. $\rho_w = 1 \text{ Mg/m}^3$.

Prob. 15–118

Prob. 15–120

•15–121. The bend is connected to the pipe at flanges *A* and *B* as shown. If the diameter of the pipe is 1 ft and it carries a discharge of 50 ft³/s, determine the horizontal and vertical components of force reaction and the moment reaction exerted at the fixed base *D* of the support. The total weight of the bend and the water within it is 500 lb, with a mass center at point *G*. The gauge pressure of the water at the flanges at *A* and *B* are 15 psi and 12 psi, respectively. Assume that no force is transferred to the flanges at *A* and *B*. The specific weight of water is flanges at *A* a
 $\gamma_w = 62.4 \text{ lb/ft}^3.$

Prob. 15–121

15–122. The gauge pressure of water at *C* is 40 lb/in². If water flows out of the pipe at *A* and *B* with velocities water flows out of the pipe at A and B with velocities
 $v_A = 12$ ft/s and $v_B = 25$ ft/s, determine the horizontal and

vertical components of force exerted on the elbow vertical components of force exerted on the elbow necessary to hold the pipe assembly in equilibrium. Neglect the weight of water within the pipe and the weight of the pipe.The pipe has a diameter of 0.75 in. at *C*, and at *A* and *B* the diameter is 0.5 in. $\gamma_w = 62.4 \text{ lb/ft}^3$.

15–123. A missile has a mass of 1.5 Mg (without fuel). If it consumes 500 kg of solid fuel at a rate of 20 kg/s and ejects it with a velocity of 2000 m/s relative to the missile, determine the velocity and acceleration of the missile at the instant all the fuel has been consumed. Neglect air resistance and the variation of its weight with altitude. The missile is launched vertically starting from rest.

***15–124.** The rocket has a weight of 65 000 lb including the solid fuel. Determine the constant rate at which the fuel must be burned so that its thrust gives the rocket a speed of 200 ft/sin 10 s starting from rest. The fuel is expelled from the rocket at a relative speed of 3000 ft/s relative to the rocket. Neglect the effects of air resistance and assume that *g* is constant.

Prob. 15–124

•15–125. The 10-Mg helicopter carries a bucket containing 500 kg of water, which is used to fight fires. If it hovers over the land in a fixed position and then releases 50 kg/s of water at 10 m/s, measured relative to the helicopter, determine the initial upward acceleration the helicopter experiences as the water is being released.

Prob. 15–122

Prob. 15–125

15–126. A plow located on the front of a locomotive scoops up snow at the rate of $10 \text{ ft}^3\text{/s}$ and stores it in the train. If the locomotive is traveling at a constant speed of 12 ft/s, determine the resistance to motion caused by the 12 ft/s, determine the resistance to motion caused b
shoveling. The specific weight of snow is $\gamma_s = 6$ lb/ft³.

15–127. The boat has a mass of 180 kg and is traveling forward on a river with a constant velocity of 70 km/h , measured *relative* to the river. The river is flowing in the opposite direction at 5 km/h. If a tube is placed in the water, as shown, and it collects 40 kg of water in the boat in 80 s, determine the horizontal thrust *T* on the tube that is required to overcome the resistance due to the water collection and yet maintain the constant speed of the boat. collection and y
 $\rho_w = 1 \text{ Mg/m}^3$.

•15–129. The tractor together with the empty tank has a total mass of 4 Mg. The tank is filled with 2 Mg of water. The water is discharged at a constant rate of 50 kg/s with a constant velocity of 5 m/s , measured relative to the tractor. If the tractor starts from rest, and the rear wheels provide a resultant traction force of 250 N, determine the velocity and acceleration of the tractor at the instant the tank becomes empty.

***15–128.** The bin deposits gravel onto the conveyor belt at the rate of 1500 lb/min. If the speed of the belt is 5 ft/s, determine how much greater the tension in the top portion of the belt must be than that in the bottom portion in order to pull the belt forward.

Prob. 15–128

15–130. The second stage *B* of the two-stage rocket has a mass of 5 Mg (empty) and is launched from the first stage *A* with an initial velocity of 600 km/h . The fuel in the second stage has a mass of 0.7 Mg and is consumed at the rate of 4 kg/s . If it is ejected from the rocket at the rate of 3 km/s , measured relative to *B*, determine the acceleration of *B* at the instant the engine is fired and just before all the fuel is consumed. Neglect the effects of gravitation and air resistance.

15–131. The 12-Mg jet airplane has a constant speed of 950 km/h when it is flying along a horizontal straight line. Air enters the intake scoops *S* at the rate of $50 \text{ m}^3/\text{s}$. If the engine burns fuel at the rate of 0.4 kg/s and the gas (air and fuel) is exhausted relative to the plane with a speed of 450 m/s , determine the resultant drag force exerted on the plane by air resistance. Assume that air has a constant density of 1.22 kg/m^3 . *Hint:* Since mass both enters and exits the plane, Eqs. 15–28 and 15–29 must be combined to yield
 $\Sigma F_s = m \frac{dv}{dt} - v_{D/e} \frac{dm_e}{dt} + v_{D/i} \frac{dm_i}{dt}$. $\frac{1}{1}$ $^{\frac{1}{\cdot}}$ + $v_{D/i} \frac{1}{dt}$.

Prob. 15–131

***15–132.** The cart has a mass *M* and is filled with water that has a mass m_0 . If a pump ejects the water through a $\frac{1}{2}$ and $\frac{1}{2}$ and $\frac{1}{2}$ and $\frac{1}{2}$ and $\frac{1}{2}$ area *A* at a constant rate of v_0 relative to the cart, determine the velocity of the cart or v_0 relative to the cart, determine the velocity of the cart
as a function of time. What is the maximum speed of the cart assuming all the water can be pumped out? The frictional resistance to forward motion is *F.* The density of the water is ρ .

Prob. 15–133

15–134. The truck has a mass m_0 and is used to tow the smooth chain having a total length *l* and a mass per unit of smooth chain having a total length l and a mass per unit of length m' . If the chain is originally piled up, determine the tractive force \bf{F} that must be supplied by the rear wheels of tractive force **F** that must be supplied by the rear wheels of the truck necessary to maintain a constant speed v while the chain is being drawn out.

Prob. 15–134

15–135. The chain has a total length $L < d$ and a mass per unit length of m'. If a portion h of the chain is suspended **15–135.** The chain has a total length $L < d$ and a mass per unit length of m' . If a portion *h* of the chain is suspended over the table and released determine the velocity of its over the table and released, determine the velocity of its end *A* as a function of its position *y.* Neglect friction.

Prob. 15–132

***15–136.** A commercial jet aircraft has a mass of 150 Mg and is cruising at a constant speed of 850 km/h in level flight and is cruising at a constant speed of 850 km/h in level flight $(\theta = 0^{\circ})$. If each of the two engines draws in air at a rate of $1000\,\mathrm{kg/s}$ and ejects it with a velocity of $900\,\mathrm{m/s}$, relative to the aircraft, determine the maximum angle of inclination θ at which the aircraft can fly with a constant speed of 750 km/h. Assume that air resistance (drag) is proportional 750 km/h. Assume that air resistance (drag) is proportional
to the square of the speed, that is, $F_D = cv^2$, where *c* is a
constant to be determined. The engines are operating with constant to be determined. The engines are operating with the same power in both cases. Neglect the amount of fuel consumed.

Prob. 15–136

•15–137. A coil of heavy open chain is used to reduce the stopping distance of a sled that has a mass *M* and travels at a speed of v_0 . Determine the required mass per unit length of the chain needed to slow down the sled to $(1/2)v_0$ within
a distance $x = s$ if the sled is hooked to the chain at $x = 0$ of the chain needed to slow down the sled to $(1/2)v_0$ within

CONCEPTUAL PROBLEMS

P15–1. The baseball travels to the left when it is struck by the bat. If the ball then moves horizontally to the right, determine which measurements you could make in order to determine the net impulse given to the ball. Use numerical values to give an example of how this can be done.

P15–1

P15–2. The steel wrecking "ball" is suspended from the boom using an old rubber tire A . The crane operator lifts the ball then allows it to drop freely to break up the the ball then allows it to drop freely to break up the concrete. Explain, using appropriate numerical data, why it is a good idea to use the rubber tire for this work.

P15–3. The train engine on the left, A , is at rest, and the one on the right. B is coasting to the left. If the engines are one on the right, B , is coasting to the left. If the engines are identical use numerical values to show how to determine identical, use numerical values to show how to determine the maximum compression in each of the spring bumpers that are mounted in the front of the engines. Each engine is free to roll.

P15–3

P15–4. Three train cars each have the same mass and are rolling freely when they strike the fixed bumper. Legs AB and \overrightarrow{BC} on the bumper are pin-connected at their ends and the angle *BAC* is 30° and *BCA* is 60°. Compare the average impulse in each leg needed to stop the motion if the cars impulse in each leg needed to stop the motion if the cars have no bumper and if the cars have a spring bumper. Use appropriate numerical values to explain your answer.

P15–4

CHAPTER REVIEW

Impulse

An impulse is defined as the product of force and time. Graphically it represents the area under the $F-t$ Graphically it represents the area under the $F-t$ diagram. If the force is constant, then the impulse becomes $I = F_c(t_2 - t_1)$.

F

Principle of Impulse and Momentum ©

Frincipie of impulse and Momentum
When the equation of motion, $\Sigma \mathbf{F} = m\mathbf{a}$, and the
kinematic equation $a = dv/dt$ are combined we When the equation of motion, $\Sigma \mathbf{F} = m\mathbf{a}$, and the kinematic equation, $a = dv/dt$, are combined, we obtain the principle of impulse and momentum This is a obtain the principle of impulse and momentum.This is a vector equation that can be resolved into rectangular components and used to solve problems that involve force, velocity, and time. For application, the free-body diagram should be drawn in order to account for all the impulses that act on the particle.

Conservation of Linear Momentum

If the principle of impulse and momentum is applied to a *system of particles*, then the collisions between the particles produce internal impulses that are equal, opposite, and collinear, and therefore cancel from the equation. Furthermore, if an external impulse is small, that is, the force is small and the time is short, then the impulse can be classified as nonimpulsive and can be neglected. Consequently, momentum for the system of particles is conserved.

The conservation-of-momentum equation is useful for finding the final velocity of a particle when internal impulses are exerted between two particles and the initial velocities of the particles is known. If the internal impulse is to be determined, then one of the particles is isolated and the principle of impulse and momentum is applied to this particle.

Impact

When two particles *A* and *B* have a direct impact, the internal impulse between them is equal, opposite, and collinear. Consequently the conservation of momentum for this system applies along the line of impact.

$$
m\mathbf{v}_1 + \sum \int_{t_1}^{t_2} \mathbf{F} dt = m\mathbf{v}_2
$$

$$
\Sigma m_i(\mathbf{v}_i)_1 = \Sigma m_i(\mathbf{v}_i)_2
$$

 $m_A(v_A)_1 + m_B(v_B)_1 = m_A(v_A)_2 + m_B(v_B)_2$

If the final velocities are unknown, a second equation is needed for solution. We must use the coefficient of restitution, *e*. This experimentally determined coefficient depends upon the physical properties of the colliding particles. It can be expressed as the ratio of their relative velocity after collision to their relative velocity before collision. If the collision is elastic, no energy is lost and $e = 1$. For a plastic collision $e = 0$.

If the impact is oblique, then the conservation of momentum for the system and the coefficient-ofrestitution equation apply along the line of impact.Also, conservation of momentum for each particle applies perpendicular to this line (plane of impact) because no impulse acts on the particles in this direction.

Principle of Angular Impulse and Momentum

The moment of the linear momentum about an axis (z) is called the angular momentum.

The principle of angular impulse and momentum is often used to eliminate unknown impulses by summing the moments about an axis through which the lines of action of these impulses produce no moment. For this reason, a free-body diagram should accompany the solution.

Steady Fluid Streams

Impulse-and-momentum methods are often used to determine the forces that a device exerts on the mass flow of a fluid—liquid or gas. To do so, a free-body diagram of the fluid mass in contact with the device is drawn in order to identify these forces. Also, the velocity of the fluid as it flows into and out of a control volume for the device is calculated. The equations of steady flow involve summing the forces and the moments to determine these reactions.

Propulsion with Variable Mass

Some devices, such as a rocket, lose mass as they are propelled forward. Others gain mass, such as a shovel. We can account for this mass loss or gain by applying the principle of impulse and momentum to a control volume for the device. From this equation, the force exerted on the device by the mass flow can then be determined.

$$
e = \frac{(v_B)_2 - (v_A)_2}{(v_A)_1 - (v_B)_1}
$$

Kinematics and [Kinetics of a Particle](#page-14-0)

The topics and problems presented in Chapters 12 through 15 have all been *categorized* in order to provide a *clear focus* for learning the various problem-solving principles involved. In engineering practice, however, it is most important to be able to *identify* an appropriate method for the solution of a particular problem. In this regard, one must fully understand the limitations and use of the equations of dynamics, and be able to recognize which equations and principles to use for the problem's solution. For these reasons, we will now summarize the equations and principles of particle dynamics and provide the opportunity for applying them to a variety of problems.

Kinematics. Problems in kinematics require a study of the geometry of motion, and do not account for the forces causing the motion. When the equations of kinematics are applied, one should clearly establish a fixed origin and select an appropriate coordinate system used to define the position of the particle. Once the positive direction of each coordinate axis is established, then the directions of the components of position, velocity, and acceleration can be determined from the algebraic sign of their numerical quantities.

Rectilinear Motion. *Variable Acceleration.* If a mathematical (or graphical) relation is established between *any two* of the *four* variables , \overline{a} , and *t*, then a *third* variable can be determined by using one of the following equations which relates all three variables.

$$
v = \frac{ds}{dt} \quad a = \frac{dv}{dt} \quad a \, ds = v \, dv
$$

Constant Acceleration. Be *absolutely* certain that the acceleration is constant when using the following equations:

$$
s = s_0 + v_0 t + \frac{1}{2} a_c t^2 \qquad v = v_0 + a_c t \qquad v^2 = v_0^2 + 2 a_c (s - s_0)
$$

Curvilinear Motion. *x*, *y*, *z Coordinates.* These coordinates are often used when the motion can be resolved into rectangular components.They are also useful for studying projectile motion since the acceleration of the projectile is *always* downward.

$$
v_x = \dot{x} \qquad a_x = \dot{v}_x
$$

\n
$$
v_y = \dot{y} \qquad a_y = \dot{v}_y
$$

\n
$$
v_z = \dot{z} \qquad a_z = \dot{v}_z
$$

n, *t*, *b Coordinates.* These coordinates are particularly advantageous for studying the particle's *acceleration* along a known path. This is because the t and n components of **a** represent the separate changes in the the t and n components of **a** represent the separate changes in the magnitude and direction of the velocity, respectively, and these components can be readily formulated. :
:

$$
v = \dot{s}
$$

\n
$$
a_t = \dot{v} = v \frac{dv}{ds}
$$

\n
$$
a_n = \frac{v^2}{\rho}
$$

where

$$
\rho = \left| \frac{[1 + (dy/dx)^2]^{3/2}}{d^2y/dx^2} \right|
$$

when the path $y = f(x)$ is given.

 r, θ, z Coordinates. These coordinates are used when data regarding the narricle's angular motion of the radial coordinate r is given to describe the particle's motion. Also, some paths of motion can conveniently be described using these coordinates.

$$
v_r = \dot{r} \qquad a_r = \ddot{r} - r\dot{\theta}^2
$$

\n
$$
v_{\theta} = r\dot{\theta} \qquad a_{\theta} = r\ddot{\theta} + 2\dot{r}\dot{\theta}
$$

\n
$$
v_z = \dot{z} \qquad a_z = \ddot{z}
$$

Relative Motion. If the origin of a *translating* coordinate system is established at particle A , then for particle B , \overline{A}

$$
\mathbf{r}_B = \mathbf{r}_A + \mathbf{r}_{B/A}
$$

$$
\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}
$$

$$
\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}
$$

Here the relative motion is measured by an observer fixed in the translating coordinate system.

Kinetics. Problems in kinetics involve the analysis of forces which cause the motion. When applying the equations of kinetics, it is absolutely necessary that measurements of the motion be made from an *inertial coordinate system,* i.e., one that does not rotate and is either fixed or translates with constant velocity. If a problem requires *simultaneous solution* of the equations of kinetics and kinematics, then it is important that the coordinate systems selected for writing each of the equations define the *positive directions* of the axes in the *same* manner.

Equations of Motion. These equations are used to solve for the particle's acceleration or the forces causing the motion. If they are used to determine a particle's position, velocity, or time of motion, then kinematics will also have to be considered to complete the solution. Before applying the equations of motion, always draw a free-body diagram to identify all the forces acting on the particle. Also, establish the direction of the particle's acceleration or its components. (A kinetic diagram may accompany the solution in order to graphically account for the *ma* vector.)

$$
\Sigma F_x = ma_x \qquad \Sigma F_n = ma_n \qquad \Sigma F_r = ma_r
$$

$$
\Sigma F_y = ma_y \qquad \Sigma F_t = ma_t \qquad \Sigma F_\theta = ma_\theta
$$

$$
\Sigma F_z = ma_z \qquad \Sigma F_b = 0 \qquad \Sigma F_z = ma_z
$$

Work and Energy. The equation of work and energy represents an integrated form of the tangential equation of motion, $\Sigma F_t = ma_t$,
combined with kinematics $(a_t ds = v dv)$. It is used to solve problems
involving force velocity and displacement Before applying this equation combined with kinematics $(a_t ds = v dv)$. It is used to solve problems *involving force, velocity, and displacement.* Before applying this equation, *always draw a free-body diagram* in order to identify the forces which do work on the particle. resents and $F_t = ma_t$
problem

 $T_1 + \Sigma U_{1-2} = T_2$

where

$$
T = \frac{1}{2}mv^2
$$
 (kinetic energy)
\n
$$
U_F = \int_{s_1}^{s_2} F \cos \theta \, ds
$$
 (work of a variable force)
\n
$$
U_{F_c} = F_c \cos \theta (s_2 - s_1)
$$
 (work of a constant force)
\n
$$
U_W = -W \Delta y
$$
 (work of a weight)
\n
$$
U_s = -(\frac{1}{2}ks_2^2 - \frac{1}{2}ks_1^2)
$$
 (work of an elastic spring)

If the forces acting on the particle are *conservative forces,* i.e., those that *do not* cause a dissipation of energy, such as friction, then apply the conservation of energy equation. This equation is easier to use than the equation of work and energy since it applies at only *two points* on the path and *does not* require calculation of the work done by a force as the particle moves along the path.

$$
T_1 + V_1 = T_2 + V_2
$$

where $V = V_g + V_e$ and

 $V_g = Wy$ (gravitational potential energy) $V_e = \frac{1}{2}k s^2$ (elastic potential energy)

If the *power* developed by a force is to be determined, use
 $P = \frac{dU}{dt} = \mathbf{F} \cdot \mathbf{v}$

$$
P = \frac{dU}{dt} = \mathbf{F} \cdot \mathbf{v}
$$

where **v** is the velocity of the particle acted upon by the force \bf{F} .

Impulse and Momentum. The equation of linear impulse and **Impulse and Momentum.** The equation of *linear impulse and momentum* is an integrated form of the equation of motion, $\Sigma \mathbf{F} = m\mathbf{a}$, combined with kinematics $(\mathbf{a} = d\mathbf{v}/dt)$. It is used to solve problems momentum is an integrated form of the equation of motion, $\Sigma \mathbf{F} = m\mathbf{a}$, combined with kinematics $(\mathbf{a} = d\mathbf{v}/dt)$. It is used to solve problems involving force velocity and time. Before applying this equation one *involving force, velocity, and time.* Before applying this equation, one should *always draw the free-body diagram,* in order to identify all the forces that cause impulses on the particle. From the diagram the impulsive and nonimpulsive forces should be identified. Recall that the nonimpulsive forces can be neglected in the analysis during the time of impact. Also, establish the direction of the particle's velocity just before and just after the impulses are applied. As an alternative procedure, impulse and momentum diagrams may accompany the solution in order to graphically account for the terms in the equation.

$$
m\mathbf{v}_1 + \sum_{t_1}^{t_2} \mathbf{F} dt = m\mathbf{v}_2
$$

If several particles are involved in the problem, consider applying the *conservation of momentum* to the system in order to eliminate the internal impulses from the analysis. This can be done in a specified direction, provided no external impulses act on the particles in that direction.

$$
\Sigma m \mathbf{v}_1 = \Sigma m \mathbf{v}_2
$$

If the problem involves impact and the coefficient of restitution e is
ven then apply the following equation given, then apply the following equation.

$$
e = \frac{(v_B)_2 - (v_A)_2}{(v_A)_1 - (v_B)_1}
$$
 (along line of impact)
Remember that during impact the principle of work and energy cannot be used, since the particles deform and therefore the work due to the internal forces will be unknown.The principle of work and energy can be used, however, to determine the energy loss during the collision once the particle's initial and final velocities are determined.

The *principle of angular impulse and momentum* and the *conservation of angular momentum* can be applied about an axis in order to *eliminate* some of the unknown impulses acting on the particle during the period when its motion is studied. Investigation of the particle's free-body diagram (or the impulse diagram) will aid in choosing the axis for application.

$$
(\mathbf{H}_O)_1 + \Sigma \int_{t_1}^{t_2} \mathbf{M}_O dt = (\mathbf{H}_O)_2
$$

$$
(\mathbf{H}_O)_1 = (\mathbf{H}_O)_2
$$

The following problems provide an opportunity for applying the above concepts. They are presented in *random order* so that practice may be gained in identifying the various types of problems and developing the skills necessary for their solution.

REVIEW PROBLEMS

R1–1. The ball is thrown horizontally with a speed of **R1–1.** The ball is thrown horizontally with a speed of 8 m/s . Find the equation of the path, $y = f(x)$, and then determine the ball's velocity and the normal and tangential determine the ball's velocity and the normal and tangential components of acceleration when $t = 0.25$ s.

R1–2. Cartons having a mass of 5 kg are required to move along the assembly line with a constant speed of 8 m/s . Determine the smallest radius of curvature, ρ , for the conveyor so the cartons do not slip.The coefficients of static and kinetic friction between a carton and the conveyor are $\mu_s = 0.7$ and $\mu_k = 0.5$, respectively.

Prob. R1–1

R1–3. A small metal particle travels downward through a fluid medium while being subjected to the attraction of a fluid medium while being subjected to the attract
magnetic field such that its position is $s = (15t^3 -$
where t is in seconds. Determine (a) the where t is in seconds. Determine (a) the particle's where t is in seconds. Determine (a) the particle's
displacement from $t = 2$ s to $t = 4$ s, and (b) the velocity
and acceleration of the particle when $t = 5$ s displacement from $t = 2$ s to $t = 4$ s, and (and acceleration of the particle when $t = 5$ s. $-3t)$ mm,
particle's

***R1–4.** The flight path of a jet aircraft as it takes off is ***R1-4.** The flight path of a jet aircraft as it takes off is
defined by the parametric equations $x = 1.25t^2$ and
 $y = 0.03t^3$ where t is the time after take-off measured in defined by the parametric equations $x = 1.25t^2$ and $y = 0.03t^3$, where t is the time after take-off, measured in seconds and x and y are given in meters. If the plane starts seconds, and x and y are given in meters. If the plane starts seconds, and x and y are given in meters. If the plane starts
to level off at $t = 40$ s, determine at this instant (a) the
horizontal distance it is from the airport (b) its altitude horizontal distance it is from the airport, (b) its altitude, (c) its speed, and (d) the magnitude of its acceleration. 2

Prob. R1–4

R1–5. The boy jumps off the flat car at \vec{A} with a velocity of **R1–5.** The boy jumps off the flat car at A with a velocity of $v' = 4$ ft/s relative to the car as shown. If he lands on the second flat car B determine the final speed of both cars second flat car B , determine the final speed of both cars after the motion. Each car has a weight of 80 lb. The boy's weight is 60 lb. Both cars are originally at rest. Neglect the mass of the car's wheels.

Prob. R1–5

R1-6. The man \vec{A} has a weight of 175 lb and jumps from **R1-6.** The man *A* has a weight of 175 lb and jumps from rest at a height $h = 8$ ft onto a platform *P* that has a weight of 60 lb. The platform is mounted on a spring which has a of 60 lb. The platform is mounted on a spring, which has a of 60 lb. The platform is mounted on a spring, which has a stiffness $k = 200$ lb/ft. Determine (a) the velocities of *A* and *P* just after impact and (b) the maximum compression and *P* just after impact and (b) the maximum compression imparted to the spring by the impact.Assume the coefficient imparted to the spring by the impact. Assume the coefficient
of restitution between the man and the platform is $e = 0.6$,
and the man holds himself rigid during the motion and the man holds himself rigid during the motion.

R1–7. The man A has a weight of 100 lb and jumps from rest onto the platform P that has a weight of 60 lb. The rest onto the platform P that has a weight of 60 lb. The platform is mounted on a spring which has a stiffness platform is mounted on a spring, which has a stiffness platform is mounted on a spring, which has a stiffness $k = 200$ lb/ft. If the coefficient of restitution between the man and the platform is $e = 0.6$ and the man holds himself $k = 200 \text{ lb/ft}$. If the coefficient of restitution between the man and the platform is $e = 0.6$, and the man holds himself rigid during the motion determine the required height h of rigid during the motion, determine the required height h of the jump if the maximum compression of the spring is 2 ft.

Probs. R1–6/7

***R1–8.** The baggage truck A has a mass of 800 kg and is used to pull each of the 300-kg cars. Determine the tension used to pull each of the 300-kg cars. Determine the tension in the couplings at B and C if the tractive force **F** on the truck is $F = 480$ N. What is the speed of the truck when in the couplings at *B* and *C* if the tractive force **F** on the truck is $F = 480$ N. What is the speed of the truck when $t = 2$ s starting from rest? The car wheels are free to roll truck is $F = 480$ N. What is the speed of the truck when $t = 2$ s, starting from rest? The car wheels are free to roll.
Neglect the mass of the wheels Neglect the mass of the wheels.

R1–9. The baggage truck A has a mass of 800 kg and is
used to pull each of the 300-kg cars. If the tractive force **F** used to pull each of the 300-kg cars. If the tractive force **F** used to pull each of the 300-kg cars. If the tractive force **F** on the truck is $F = 480$ N, determine the acceleration of the truck if the the truck. What is the acceleration of the truck if the coupling at C suddenly fails? The car wheels are free to roll. Neglect the mass of the wheels.

Probs. R1–8/9

R1–10. A car travels at 80 ft/s when the brakes are suddenly applied, causing a constant deceleration of 10 ft/s². Determine the time required to stop the car and the distance traveled before stopping.

R1–11. Determine the speed of block \hat{B} if the end of the cable at C is pulled downward with a speed of 10 ft/s. What is the relative velocity of the block with respect to $C²$ is the relative velocity of the block with respect to C ?

Prob. R1–11

 $*R1-12$. The skier starts fom rest at A and travels down the ramp. If friction and air resistance can be neglected, determine his speed v_B when he reaches B . Also, compute the distance s to where he strikes the ground at C , if he makes the jump traveling horizontally at *B*. Neglect the skier's size He has a mass of 70 kg skier's size. He has a mass of 70 kg. $\overline{\text{Im}}$ n traveling horizontally at R Negle

Prob. R1–12

R1–13. The position of a particle is defined by **R1–13.** The position of a particle is defined by $\mathbf{r} = \{5(\cos 2t)\mathbf{i} + 4(\sin 2t)\mathbf{j}\}$ m, where t is in seconds and the arguments for the sine and cosine are given in radians the arguments for the sine and cosine are given in radians. Determine the magnitudes of the velocity and acceleration Determine the magnitudes of the velocity and acceleration
of the particle when $t = 1$ s. Also, prove that the path of the
particle is elliptical particle is elliptical.

R1–14. The 5-lb cylinder falls past A with a speed **R1–14.** The 5-lb cylinder falls past A with a speed $v_A = 10$ ft/s onto the platform. Determine the maximum displacement of the platform caused by the collision. The displacement of the platform, caused by the collision. The spring has an unstretched length of 1.75 ft and is originally kept in compression by the 1-ft-long cables attached to the platform. Neglect the mass of the platform and spring and any energy lost during the collision.

Prob. R1–14

R1–15. The block has a mass of 50 kg and rests on the surface of the cart having a mass of 75 kg. If the spring which is attached to the cart and not the block is compressed 0.2 m and the system is released from rest, determine the speed of the block after the spring becomes undeformed. Neglect the mass of the cart's wheels and the spring in the calculation. Also neglect friction. Take $k = 300$ N/m.

***R1–16.** The block has a mass of 50 kg and rests on the surface of the cart having a mass of 75 kg . If the spring which is attached to the cart and not the block is compressed 0.2 m and the system is released from rest, determine the speed of the block with respect to the cart after the spring becomes undeformed. [Planar Kinematics](#page-14-0) of a Rigid Body

16

Planar

[CHAPTER OBJECTIVES](#page-14-0)

- To classify the various types of rigid-body planar motion.
- To investigate rigid-body translation and angular motion about a fixed axis.
- To study planar motion using an absolute motion analysis.
- To provide a relative motion analysis of velocity and acceleration using a translating frame of reference.
- To show how to find the instantaneous center of zero velocity and determine the velocity of a point on a body using this method.
- To provide a relative-motion analysis of velocity and acceleration using a rotating frame of reference.

16.1 [Planar Rigid-Body Motion](#page-14-0)

In this chapter, the planar kinematics of a rigid body will be discussed. This study is important for the design of gears, cams, and mechanisms used for many mechanical operations. Once the kinematics is thoroughly understood, then we can apply the equations of motion, which relate the forces on the body to the body's motion.

The *planar motion* of a body occurs when all the particles of a rigid body move along paths which are equidistant from a fixed plane. There are three types of rigid body planar motion, in order of increasing complexity, they are

- *Translation*. This type of motion occurs when a line in the body remains parallel to its original orientation throughout the motion. When the paths of motion for any two points on the body are parallel lines, the motion is called *rectilinear translation*, Fig. 16–1*a*. If the paths of motion are along curved lines which are equidistant, the motion is called *curvilinear translation*, Fig. 16–1*b*.
- *Rotation about a fixed axis.* When a rigid body rotates about a fixed axis, all the particles of the body, except those which lie on the axis of rotation, move along circular paths, Fig. 16–1*c*.
- *General plane motion*. When a body is subjected to general plane motion, it undergoes a combination of translation *and* rotation, Fig. 16–1*d*. The translation occurs within a reference plane, and the rotation occurs about an axis perpendicular to the reference plane.

In the following sections we will consider each of these motions in detail. Examples of bodies undergoing these motions are shown in Fig. 16–2.

16.2 [Translation](#page-14-0)

Consider a rigid body which is subjected to either rectilinear or curvilinear translation in the *x–y* plane, Fig. 16–3.

Position. The locations of points *A* and *B* on the body are defined with respect to fixed *x*, *y* reference frame using *position vectors* \mathbf{r}_A and \mathbf{r}_B . The translating \mathbf{r}' *y'* coordinate system is *fixed in the hody* and has its with respect to fixed x, y reference frame using *position vectors* \mathbf{r}_A and \mathbf{r}_B . The translating x',y' coordinate system is *fixed in the body* and has its origin at A hereafter referred to as the *hase noint* origin at *A*, hereafter referred to as the *base point*.The position of *B* with respect to *A* is denoted by the *relative-position vector* $\mathbf{r}_{B/A}$ ("**r** of *B* with respect to *A*"). By vector addition respect to *A*"). By vector addition,

$$
\mathbf{r}_B = \mathbf{r}_A + \mathbf{r}_{B/A}
$$

Velocity. A relation between the instantaneous velocities of *A* and *B* is obtained by taking the time derivative of this equation, which yields is obtained by taking the time derivative of this equation, which yields $\mathbf{v}_B = \mathbf{v}_A + d\mathbf{r}_{B/A}/dt$. Here \mathbf{v}_A and \mathbf{v}_B denote *absolute velocities* since these vectors are measured with respect to the x, y a these vectors are measured with respect to the *x, y* axes. The term these vectors are measured with respect to the *x*, *y* axes. The term $d\mathbf{r}_{B/A}/dt = \mathbf{0}$, since the *magnitude* of $\mathbf{r}_{B/A}$ is *constant* by definition of a rigid body and because the body is translating the *direct* rigid body, and because the body is translating the *direction* of $\mathbf{r}_{B/A}$ is also *constant*. Therefore,

$$
\mathbf{v}_B = \mathbf{v}_A
$$

Acceleration. Taking the time derivative of the velocity equation yields a similar relationship between the instantaneous accelerations of *A* and *B*:

$$
\mathbf{a}_B = \mathbf{a}_A
$$

The above two equations indicate that *all points in a rigid body subjected to either rectilinear or curvilinear translation move with the same velocity and acceleration*. As a result, the kinematics of particle motion, discussed in Chapter 12, can also be used to specify the kinematics of points located in a translating rigid body.

Riders on this amusement ride are subjected to curvilinear translation, since the vehicle moves in a circular path yet it always remains in an upright position.

16.3 [Rotation about a Fixed Axis](#page-14-0)

When a body rotates about a fixed axis, any point *P* located in the body travels along a *circular path*. To study this motion it is first necessary to discuss the angular motion of the body about the axis.

Angular Motion. Since a point is without dimension, it cannot have angular motion. *Only lines or bodies undergo angular motion*. For example, consider the body shown in Fig. 16–4*a* and the angular motion of a radial line *r* located within the shaded plane.

Angular Position. At the instant shown, the *angular position* of *r* is defined by the angle θ , measured from a *fixed* reference line to r .

Angular Displacement. The change in the angular position, which can be measured as a differential $d\theta$, is called the *angular displacement*.^{*}
This vector has a *magnitude* of $d\theta$ measured in degrees radians or This vector has a *magnitude* of $d\theta$, measured in degrees, radians, or revolutions where 1 rev = 2π rad. Since motion is about a *fixed qxis* the This vector has a *magnitude* of $d\theta$, measured in degrees, radians, or revolutions, where 1 rev = 2π rad. Since motion is about a *fixed axis*, the direction of $d\theta$ is *always* along this axis. Specifically, the *direction* is
determined by the right-hand rule: that is the fingers of the right hand are determined by the right-hand rule; that is, the fingers of the right hand are curled with the sense of rotation, so that in this case the thumb, or $d\theta$, currently not the top with results. points upward, Fig. 16–4*a*. In two dimensions, as shown by the top view of the shaded plane, Fig. 16–4*b*, both θ and $d\theta$ are counterclockwise, and so the thumb points outward from the page the thumb points outward from the page.

Angular Velocity. The time rate of change in the angular position is called the *angular velocity* $\boldsymbol{\omega}$ (omega). Since $d\boldsymbol{\theta}$ occurs during an instant of time dt then instant of time *dt*, then,

$$
\omega = \frac{d\theta}{dt} \tag{16-1}
$$

This vector has a *magnitude* which is often measured in rad/s. It is expressed here in scalar form since its *direction* is also along the axis of rotation, Fig. 16–4*a*. When indicating the angular motion in the shaded plane, Fig. 16–4*b*, we can refer to the sense of rotation as clockwise or counterclockwise. Here we have *arbitrarily* chosen counterclockwise rotations as *positive* and indicated this by the curl shown in parentheses next to Eq. 16–1 Realize, however, that the directional sense of $\boldsymbol{\omega}$ is actually outward from the page.

(b)

Fig. 16–4

*It is shown in Sec. 20.1 that finite rotations or finite angular displacements are *not* vector quantities, although differential rotations $d\theta$ are vectors.

Angular Acceleration. The angular acceleration **a** (alpha) measures the time rate of change of the angular velocity. The *magnitude* of this vector is

$$
(\zeta +) \qquad \qquad \alpha = \frac{d\omega}{dt} \qquad (16-2)
$$

Using Eq. 16–1, it is also possible to express α as

$$
(\zeta +) \qquad \alpha = \frac{d^2 \theta}{dt^2} \qquad (16-3)
$$

The line of action of α is the same as that for ω , Fig. 16–4*a*; however, its sense of *direction* depends on whether $\boldsymbol{\omega}$ is increasing or decreasing. If $\boldsymbol{\omega}$ is decreasing, then α is called an *angular deceleration* and therefore has a sense of direction which is opposite to ω .

By eliminating *dt* from Eqs. 16–1 and 16–2, we obtain a differential relation between the angular acceleration, angular velocity, and angular displacement, namely,

$$
(\zeta +)
$$
 $\alpha d\theta = \omega d\omega$ (16-4)

The similarity between the differential relations for angular motion
ad those developed for rectilinear motion of a particle $(v = ds/dt,$
= dv/dt and $a ds = v dv$) should be apparent. and those developed for rectilinear motion of a particle $(v = ds/dt,$ and those developed for rectilinear motion of $a = dv/dt$, and $a ds = v dv$ should be apparent.

Constant Angular Acceleration. If the angular acceleration of **Constant Angular Acceleration.** If the angular acceleration of the body is *constant*, $\alpha = \alpha_c$, then Eqs. 16–1, 16–2, and 16–4, when integrated viald a set of formulas which relate the body's appular integrated, yield a set of formulas which relate the body's angular velocity, angular position, and time. These equations are similar to Eqs. 12–4 to 12–6 used for rectilinear motion. The results are

$$
(\zeta +)
$$
\n
$$
\omega = \omega_0 + \alpha_c t
$$
\n
$$
(\zeta +)
$$
\n
$$
\theta = \theta_0 + \omega_0 t + \frac{1}{2} \alpha_c t^2
$$
\n
$$
\omega^2 = \omega_0^2 + 2\alpha_c (\theta - \theta_0)
$$
\n(16-6)\nConstant Angular Acceleration\n(16-7)

Here θ_0 and ω_0 are the initial values of the body's angular position and angular velocity, respectively.

Motion of Point P. As the rigid body in Fig. 16–4*c* rotates, point *P* travels along a *circular path* of radius *r* with center at point *O*. This path is contained within the shaded plane shown in top view, Fig. 16–4*d*.

Position and Displacement. The position of *P* is defined by the position vector **r**, which extends from *O* to *P*. If the body rotates $d\theta$ then *P* will displace $ds = r d\theta$ position vector **r**, which e
 P will displace $ds = r d\theta$.

Velocity. The velocity of *P* has a magnitude which can be found by **Velocity.** The velocity of *P* dividing $ds = r d\theta$ by *dt* so that

$$
v = \omega r \tag{16-8}
$$

As shown in Figs. 16–4*c* and 16–4*d*, the *direction* of **v** is *tangent* to the circular path.

Both the magnitude and direction of **v** can also be accounted for by using the cross product of $\boldsymbol{\omega}$ and \mathbf{r}_P (see Appendix B). Here, \mathbf{r}_P is directed from any point on the axis of rotation to point P. Fig. 16, 4c. We have from *any point* on the axis of rotation to point *P*, Fig. 16–4*c*. We have

$$
\mathbf{v} = \boldsymbol{\omega} \times \mathbf{r}_P \tag{16-9}
$$

The order of the vectors in this formulation is important, since the cross The order of the vectors in this formulation is important, since the cross
product is not commutative, i.e., $\boldsymbol{\omega} \times \mathbf{r}_P \neq \mathbf{r}_P \times \boldsymbol{\omega}$. Notice in Fig. 16–4*c*
how the correct direction of **x** is established by t how the correct direction of **v** is established by the right-hand rule. The fingers of the right hand are curled from $\boldsymbol{\omega}$ toward $\mathbf{r}_P(\boldsymbol{\omega}$ "cross" \mathbf{r}_P). The thumb indicates the correct direction of **x**, which is to recent to the path in thumb indicates the correct direction of **v**, which is tangent to the path in the direction of motion. From Eq. B–8, the magnitude of **v** in Eq. 16–9 is
 $v = \omega r_p \sin \phi$, and since $r = r_p \sin \phi$, Fig. 16–4c, then $v = \omega r$, which

agrees with Eq. 16–8. As a special case, the position yetter **r** can be $v = \omega r_p \sin \phi$, and since $r = r_p \sin \phi$, Fig. 16–4*c*, then $v = \omega r$, which agrees with Eq. 16–8. As a special case, the position vector **r** can be chosen for \mathbf{r}_P . Here \mathbf{r} lies in the plane of motion and again the velocity of point P is point *P* is

Acceleration. The acceleration of *P* can be expressed in terms of its **Acceleration.** The acceleration of P can be expressed in terms of its normal and tangential components. Since $a_t = dv/dt$ and $a_n = v^2/\rho$, where $a = r, v = \omega r$ and $\alpha = d\omega/dt$ we have normal and tangential components. Since a_i
where $\rho = r, v = \omega r$, and $\alpha = d\omega/dt$, we have

$$
a_t = \alpha r \tag{16-11}
$$

$$
a_n = \omega^2 r \tag{16-12}
$$

The *tangential component of acceleration*, Figs. 16–4*e* and 16–4*f*, represents the time rate of change in the velocity's magnitude. If the speed of *P* is increasing, then a_t acts in the same direction as **v**; if the same disdependence of **v**; and finally if speed is decreasing, \mathbf{a}_t acts in the opposite direction of **v**; and finally, if the speed is constant, \mathbf{a}_t is zero.
The *normal* component of a

The *normal component of acceleration* represents the time rate of change in the velocity's direction. The *direction* of \mathbf{a}_n is always toward *O*, the center of the circular path. Figs. 16, 4e and 16, 4f the center of the circular path, Figs. 16–4*e* and 16–4*f*.

Like the velocity, the acceleration of point *P* can be expressed in terms of the vector cross product. Taking the time derivative of Eq. 16–9 we have

$$
\mathbf{a} = \frac{d\mathbf{v}}{dt} = \frac{d\boldsymbol{\omega}}{dt} \times \mathbf{r}_P + \boldsymbol{\omega} \times \frac{d\mathbf{r}_P}{dt}
$$

Recalling that $\alpha = d\omega/dt$, and using Eq. 16–9 $(d\mathbf{r}_P/dt = \mathbf{v} = \omega \times \mathbf{r}_P)$, wields yields

$$
\mathbf{a} = \boldsymbol{\alpha} \times \mathbf{r}_P + \boldsymbol{\omega} \times (\boldsymbol{\omega} \times \mathbf{r}_P) \tag{16-13}
$$

From the definition of the cross product, the first term on the right has a From the definition of the cross product, the first term on the right has a
magnitude $a_t = \alpha r_P \sin \phi = \alpha r$, and by the right-hand rule, $\alpha \times r_P$ is in
the direction of **a**. Fig. 16–4e, I ikewise, the second term has a magnit the direction of \mathbf{a}_t , Fig. 16–4*e*. Likewise, the second term has a magnitude $a_t = \omega^2 r$ sin $\phi = \omega^2 r$ and applying the right hand rule twice first to *r*, and applying the right-hand rule twice, first to $\mathbf{v}_P = \boldsymbol{\omega} \times \mathbf{r}_P$ then $\boldsymbol{\omega} \times \mathbf{v}_P$, it can be seen that this direction as a shown in Fig. 16.4a. Noting that this determine the result $\mathbf{v}_p = \boldsymbol{\omega} \times \mathbf{r}_p$ then $\boldsymbol{\omega} \times \mathbf{v}_p$, it can be seen that this result is in the same direction as \mathbf{a}_n , shown in Fig. 16–4*e*. Noting that this is also the *same* direction as $-\mathbf{r}$, which lies in the plane of motion, we can is also the *same* direction as $-r$, which lies in the plane of motion, we can is also the *same* direction as $-\mathbf{r}$, which lies in the plane of motion, we can express \mathbf{a}_n in a much simpler form as $\mathbf{a}_n = -\omega^2 \mathbf{r}$. Hence, Eq. 16–13 can be identified by its two components as be identified by its two components as the direction of \mathbf{a}_t , Fig.
 $a_n = \omega^2 r_p \sin \phi = \omega^2 r$,

determine the result **v**

$$
\begin{array}{c|c}\n\mathbf{a} = \mathbf{a}_t + \mathbf{a}_n \\
\hline\n\mathbf{a} \times \mathbf{r} - \omega^2 \mathbf{r}\n\end{array}
$$
\n(16-14)

Since \mathbf{a}_t and \mathbf{a}_n are perpendicular to one another, if needed the **meanitude** of acceleration can be determined from the **Puthecorean** magnitude of acceleration can be determined from the Pythagorean magnitude of acceleration can be determ
theorem; namely, $a = \sqrt{a_n^2 + a_t^2}$, Fig. 16–4*f*. \overline{a} 2 ,

The gears used in the operation of a crane all rotate about fixed axes. Engineers must be able to relate their angular motions in order to properly design this gear system.

Important Points

- A body can undergo two types of translation. During rectilinear translation all points follow parallel straight-line paths, and during curvilinear translation the points follow curved paths that are the same shape and are equidistant from one another.
- All the points on a translating body move with the same velocity and acceleration.
- Points located on a body that rotates about a fixed axis follow circular paths.
- The relation $\alpha d\theta = \omega d\omega$ is derived from $\alpha = d\omega/dt$ and $\omega = d\theta/dt$ by eliminating dt The relation $\alpha d\theta = \omega d\omega$
 $\omega = d\theta/dt$ by eliminating dt.
- Once angular motions ω and α are known, the velocity and acceleration of any point on the body can be determined.
- The velocity always acts tangent to the path of motion.
- The acceleration has two components.The tangential acceleration measures the rate of change in the magnitude of the velocity and measures the rate of change in the magnitude of the velocity and
can be determined from $a_t = \alpha r$. The normal acceleration
measures the rate of change in the direction of the velocity and measures the rate of change in the direction of the velocity and measures the rate of change in th
can be determined from $a_n = \omega^2 r$.

Procedure for Analysis

The velocity and acceleration of a point located on a rigid body that is rotating about a fixed axis can be determined using the following procedure.

Angular Motion.

- Establish the positive sense of rotation about the axis of rotation and show it alongside each kinematic equation as it is applied.
- If a relation is known between any *two* of the four variables α , ω , θ , and t , then a third variable can be obtained by using one of the following kinematic equations which relates all three variables.

$$
\omega = \frac{d\theta}{dt} \qquad \alpha = \frac{d\omega}{dt} \qquad \alpha \, d\theta = \omega \, d\omega
$$

• If the body's angular acceleration is *constant*, then the following equations can be used:

$$
ω = ω0 + αct
$$

\n
$$
θ = θ0 + ω0t + \frac{1}{2}αct2
$$

\n
$$
ω2 = ω02 + 2αc(θ - θ0)
$$

• Once the solution is obtained, the sense of θ , ω , and α is determined from the algebraic signs of their numerical quantities.

Motion of Point P.

• In most cases the velocity of *P* and its two components of acceleration can be determined from the scalar equations
 $v = \omega r$

$$
v = \omega r
$$

$$
a_t = \alpha r
$$

$$
a_n = \omega^2 r
$$

• If the geometry of the problem is difficult to visualize, the

following vector equations should be used:
\n
$$
\mathbf{v} = \boldsymbol{\omega} \times \mathbf{r}_P = \boldsymbol{\omega} \times \mathbf{r}
$$
\n
$$
\mathbf{a}_t = \boldsymbol{\alpha} \times \mathbf{r}_P = \boldsymbol{\alpha} \times \mathbf{r}
$$
\n
$$
\mathbf{a}_n = \boldsymbol{\omega} \times (\boldsymbol{\omega} \times \mathbf{r}_P) = -\boldsymbol{\omega}^2 \mathbf{r}
$$

• Here \mathbf{r}_P is directed from any point on the axis of rotation to point P , whereas \mathbf{r} lies in the plane of motion of P . Either of point *P*, whereas **r** lies in the plane of motion of *P*. Either of these vectors, along with $\boldsymbol{\omega}$ and $\boldsymbol{\alpha}$, should be expressed in terms of its **i**, **j**, **k** components, and, if necessary, the cross products determined using a determinant expansion (see Eq. B–12).

Fig. 16–5

A cord is wrapped around a wheel in Fig. 16–5, which is initially at rest A cord is wrapped around a wheel in Fig. 16–5, which is initially at rest when $\theta = 0$. If a force is applied to the cord and gives it an when $\theta = 0$. If a force is applied to the cord and gives it an acceleration $a = (4t)$ m/s², where t is in seconds, determine, as a function of time (a) the angular velocity of the wheel and (b) the function of time, (a) the angular velocity of the wheel, and (b) the angular position of line *OP* in radians. 2 ,

SOLUTION

Part (a). The wheel is subjected to rotation about a fixed axis passing through point *O*. Thus, point *P* on the wheel has motion about a circular path, and the acceleration of this point has *both* tangential and circular path, and the acceleration of this point has *both* tangential an
normal components. The tangential component is $(a_P)_t = (4t)$ m/s
since the cord is wrapped around the wheel and moves *tangent* to since the cord is wrapped around the wheel and moves *tangent* to it. Hence the angular acceleration of the wheel is 2 ,

$$
(\zeta +)
$$
\n
$$
(aP)t = \alpha r
$$
\n
$$
(4t) \text{ m/s}^2 = \alpha (0.2 \text{ m})
$$
\n
$$
\alpha = (20t) \text{ rad/s}^2 \lambda
$$

Using this result, the wheel's angular velocity ω can now be Using this result, the wheel's angular velocity ω can now be
determined from $\alpha = d\omega/dt$, since this equation relates α , t, and ω .
Integrating with the initial condition that $\omega = 0$ when $t = 0$ yields determined from $\alpha = d\omega/dt$, since this equation relates α , t, and Integrating, with the initial condition that $\omega = 0$ when $t = 0$, yields

$$
\alpha = \frac{d\omega}{dt} = (20t) \text{ rad/s}^2
$$

$$
\int_0^\omega d\omega = \int_0^t 20t \, dt
$$

$$
\omega = 10t^2 \text{ rad/s } 2
$$
Ans.

Part (b). Using this result, the angular position θ of OP can be **Part (b).** Using this result, the angular position θ of OP can be found from $\omega = d\theta/dt$, since this equation relates θ , ω , and *t*. Integrating with the initial condition $\theta = 0$ when $t = 0$, we have found from $\omega = d\theta/dt$, since this equation relates θ , ω , as Integrating, with the initial condition $\theta = 0$ when $t = 0$, we have

$$
\frac{d\theta}{dt} = \omega = (10t^2) \text{ rad/s}
$$

$$
\int_0^{\theta} d\theta = \int_0^t 10t^2 dt
$$

$$
\theta = 3.33t^3 \text{ rad}
$$
Ans.

NOTE: We cannot use the equation of constant angular acceleration, since α is a function of time.

The motor shown in the photo is used to turn a wheel and attached blower contained within the housing. The details of the design are shown in Fig. 16–6*a*. If the pulley *A* connected to the motor begins to shown in Fig. 16–6*a*. If the pulley *A* connected to the motor begins t
rotate from rest with a constant angular acceleration of $\alpha_A = 2$ rad/s
determine the magnitudes of the velocity and acceleration of point determine the magnitudes of the velocity and acceleration of point *P* on the wheel, after the pulley has turned two revolutions. Assume the transmission belt does not slip on the pulley and wheel. 2 ,

SOLUTION

Angular Motion. First we will convert the two revolutions to radians. Since there are 2π rad in one revolution, then

$$
\theta_A = 2 \text{ rev} \left(\frac{2\pi \text{ rad}}{1 \text{ rev}} \right) = 12.57 \text{ rad}
$$

Since α_A is constant, the angular velocity of pulley *A* is therefore

(ζ +) $\omega^2 = \omega_0^2 + 2\alpha_c(\theta - \theta_0)$

 ω_A = 7.090 rad/s ω_A^2 $\frac{2}{4}$ = 0 + 2(2 rad/s²)(12.57 rad - 0)

The belt has the same speed and tangential component of acceleration as it passes over the pulley and wheel. Thus,

$$
v = \omega_A r_A = \omega_B r_B; \ 7.090 \text{ rad/s } (0.15 \text{ m}) = \omega_B (0.4 \text{ m})
$$

$$
\omega_B = 2.659 \text{ rad/s}
$$

$$
a_t = \alpha_A r_A = \alpha_B r_B; \ 2 \text{ rad/s}^2 (0.15 \text{ m}) = \alpha_B (0.4 \text{ m})
$$

$$
\alpha_B = 0.750 \text{ rad/s}^2
$$

Motion of P. As shown on the kinematic diagram in Fig. 16–6*b*, we have

$$
v_P = \omega_B r_B = 2.659 \text{ rad/s } (0.4 \text{ m}) = 1.06 \text{ m/s}
$$
Ans.
\n
$$
(a_P)_t = \alpha_B r_B = 0.750 \text{ rad/s}^2 (0.4 \text{ m}) = 0.3 \text{ m/s}^2
$$

\n
$$
(a_P)_n = \omega_B^2 r_B = (2.659 \text{ rad/s})^2 (0.4 \text{ m}) = 2.827 \text{ m/s}^2
$$

Thus

$$
a_P = \sqrt{(0.3 \text{ m/s}^2)^2 + (2.827 \text{ m/s}^2)^2} = 2.84 \text{ m/s}^2
$$
 Ans.

FUNDAMENTAL PROBLEMS

F16–1. When the gear rotates 20 revolutions, it achieves an **F16-1.** When the gear rotates 20 revolutions, it achieves an angular velocity of $\omega = 30 \text{ rad/s}$, starting from rest. Determine its constant angular acceleration and the time required.

F16–1

F16–2. The flywheel rotates with an angular velocity of **F16-2.** The flywheel rotates with an angular velocity of $\omega = (0.005\theta^2)$ rad/s, where θ is in radians. Determine the angular acceleration when it has rotated 20 revolutions.

F16–2

F16–3. The flywheel rotates with an angular velocity of **F16-3.** The flywheel rotates with an angular velocity of $\omega = (4 \theta^{1/2})$ rad/s, where θ is in radians. Determine the time $\omega = (4 \theta^{1/2}) \text{ rad/s}, \text{ where } \theta \text{ is in radians.}$ Determine the time it takes to achieve an angular velocity of $\omega = 150 \text{ rad/s}.$ When $t = 0$, $\theta = 0$.

F16–3

F16–4. The bucket is hoisted by the rope that wraps around a drum wheel. If the angular displacement of the wheel is a drum wheel. If the angular displacement of the wheel is $\theta = (0.5t^3 + 15t)$ rad, where t is in seconds, determine the velocity and acceleration of the bucket when $t = 3$ s velocity and acceleration of the bucket when $t = 3$ s.

F16–5. A wheel has an angular acceleration of **F16-5.** A wheel has an angular acceleration of $\alpha = (0.5 \theta)$ rad/s², where θ is in radians. Determine the magnitude of the velocity and acceleration of a point P located on its rim after the wheel has rotated 2 revolutions. The wheel has a radius of 0.2 m and starts from rest.

F16–6. For a short period of time, the motor turns gear A **F16-6.** For a short period of time, the motor turns gear
with a constant angular acceleration of $\alpha_A = 4.5$ rad/s
starting from rest. Determine the velocity of the cylinder an starting from rest. Determine the velocity of the cylinder and the distance it travels in three seconds. The cord is wrapped around pulley D which is rigidly attached to gear B . s^2

PROBLEMS

•**16–1.** A disk having a radius of 0.5 ft rotates with an initial angular velocity of 2 rad/s and has a constant angular acceleration of 1 rad/s^2 . Determine the magnitudes of the velocity and acceleration of a point on the rim of the disk velocity and $t = 2$ s.

16–2. Just after the fan is turned on, the motor gives the **16–2.** Just after the fan is turned on, the motor gives the blade an angular acceleration $\alpha = (20e^{-0.6t})$ rad/s², where *t* is in seconds Determine the speed of the tip *P* of one of the is in seconds. Determine the speed of the tip *P* of one of the is in seconds. Determine the speed of the tip P of one of the
blades when $t = 3$ s. How many revolutions has the blade
turned in 3 s? When $t = 0$ the blade is at rest turned in 3 s? When $t = 0$ the blade is at rest.

Prob. 16–2

16–3. The hook is attached to a cord which is wound around the drum. If it moves from rest with an acceleration of 20 ft/s², determine the angular acceleration of the drum and its angular velocity after the drum has completed 10 rev. How many more revolutions will the drum turn after it has first completed 10 rev and the hook continues to move downward for 4 s?

***16–4.** The torsional pendulum (wheel) undergoes oscillations in the horizontal plane, such that the angle of rotation, measured from the equilibrium position, is given rotation, measured from the equilibrium position, is given
by $\theta = (0.5 \sin 3t)$ rad, where *t* is in seconds. Determine the
maximum velocity of point *A* located at the periphery of maximum velocity of point *A* located at the periphery of the wheel while the pendulum is oscillating. What is the acceleration of point *A* in terms of *t*?

Prob. 16–4

Prob. 16–5

16–6. The mechanism for a car window winder is shown in the figure. Here the handle turns the small cog *C*, which rotates the spur gear *S*, thereby rotating the fixed-connected lever *AB* which raises track *D* in which the window rests. The window is free to slide on the track. If the handle is wound at 0.5 rad/s, determine the speed of points A and E and the speed v_w of the window at the instant $\theta = 30^{\circ}$.

Prob. 16–6

16–7. The gear *A* on the drive shaft of the outboard motor **16–7.** The gear *A* on the drive shaft of the outboard motor
has a radius $r_A = 0.5$ in and the meshed pinion gear *B* on the
propeller shaft has a radius $r_B = 1.2$ in Determine the has a radius $r_A = 0.5$ in. and the meshed pinion gear B on the propeller shaft has a radius $r_B = 1.2$ in. Determine the angular velocity of the propeller in $t = 1.5$ s if the drive shaft propeller shaft has a radius $r_B = 1.2$ in. Determine the angular velocity of the propeller in $t = 1.5$ s, if the drive shaft rotates, with an angular acceleration $\alpha = (400t^3) \text{ rad/s}^2$ angular velocity of the propeller in $t = 1.5$ s, if the drive shaft
rotates with an angular acceleration $\alpha = (400t^3)$ rad/s²,
where t is in seconds. The propeller is originally at rest and where *t* is in seconds. The propeller is originally at rest and the motor frame does not move. 3) rad/s²

***16–8.** For the outboard motor in Prob. 16–7, determine the magnitude of the velocity and acceleration of point *P* located on the tip of the propeller at the instant $t = 0.75$ s.

•**16–9.** When only two gears are in mesh, the driving gear *A* and the driven gear *B* will always turn in opposite directions. In order to get them to turn in the *same direction* an idler gear *C* is used. In the case shown, direction an idler gear C is used. In the case shown,
determine the angular velocity of gear B when $t = 5$ s, if
gear A starts from rest and has an angular acceleration of gear *A* starts from rest and has an angular acceleration of $\alpha_A = (3t + 2)$ rad/s², where *t* is in seconds.

16–10. During a gust of wind, the blades of the windmill **16–10.** During a gust of wind, the blades of the windmill are given an angular acceleration of $\alpha = (0.2\theta)$ rad/s², where θ is in radians. If initially the blades have an angular velocity of 5 rad/s , determine the speed of point P , located at the tip of one of the blades, just after the blade has turned

two revolutions.

16.4 [Absolute Motion Analysis](#page-14-0)

A body subjected to *general plane motion* undergoes a *simultaneous* translation and rotation. If the body is represented by a thin slab, the slab translates in the plane of the slab and rotates about an axis perpendicular to this plane.The motion can be completely specified by knowing *both* the angular rotation of a line fixed in the body and the motion of a point on the body. One way to relate these motions is to use a rectilinear position coordinate *s* to locate the point along its path and an angular position coordinate θ to specify the orientation of the line. The two coordinates are then related using the geometry of the problem. By *direct application* of then related using the geometry of the problem. By *direct application* of
the time-differential equations $v = ds/dt$, $a = dv/dt$, $\omega = d\theta/dt$, and
 $\alpha = d\omega/dt$ the motion of the point and the *appular motion* of the line can the time-differential equations $v = ds/dt$, $a = dv/dt$, $\omega = d\theta/dt$, and $\alpha = d\omega/dt$, the *motion* of the point and the *angular motion* of the line can then be related. This procedure is similar to that used to solve dependent then be related.This procedure is similar to that used to solve dependent motion problems involving pulleys, Sec. 12.9. In some cases, this same procedure may be used to relate the motion of one body, undergoing either rotation about a fixed axis or translation, to that of a connected body undergoing general plane motion.

Procedure for Analysis

The velocity and acceleration of a point *P* undergoing rectilinear motion can be related to the angular velocity and angular acceleration of a line contained within a body using the following procedure.

Position Coordinate Equation.

- Locate point *P* on the body using a position coordinate *s*, which is measured from a *fixed origin* and is *directed along the straight-line path of motion* of point *P*.
- Measure from a fixed reference line the angular position θ of a line lying in the body.
- From the dimensions of the body, relate *s* to θ , $s = f(\theta)$, using
neometry and/or trigonometry geometry and/or trigonometry.

Time Derivatives.

- Take the first derivative of $s = f(\theta)$ with respect to time to get a relation between 2 and ω . relation between v and ω .
- Take the second time derivative to get a relation between *a* and α .
- In each case the chain rule of calculus must be used when taking the time derivatives of the position coordinate equation. See Appendix C.

The dumping bin on the truck rotates about a fixed axis passing through the pin at *A*. It is operated by the extension of the hydraulic cylinder *BC*. The angular position of the bin can be specified using the angular position coordinate θ , and the position of point *C* on the bin is specified using the rectilinear position coordinate *s*. Since *a* and *b* are fixed lengths, then the two coordinates can be related by the cosine coordinates can be related by the cosine

law, $s = \sqrt{a^2 + b^2 - 2ab \cos \theta}$. The

time derivative of this equation relates time derivative of this equation relates the speed at which the hydraulic cylinder extends to the angular velocity of the bin.

The end of rod *R* shown in Fig. 16–7 maintains contact with the cam by means of a spring. If the cam rotates about an axis passing through point O with an angular acceleration α and angular velocity ω , determine the velocity and acceleration of the rod when the cam is in the arbitrary position θ .

Fig. 16–7

SOLUTION

Position Coordinate Equation. Coordinates θ and x are chosen in order to relate the *rotational motion* of the line segment *OA* on the cam to the *rectilinear translation* of the rod. These coordinates are measured from the *fixed point O* and can be related to each other measured from the *fixed point O* and can be related to ead using trigonometry. Since $OC = CB = r \cos \theta$, Fig. 16–7, then

$$
x = 2r\cos\theta
$$

Time Derivatives. Using the chain rule of calculus, we have

$$
\frac{dx}{dt} = -2r(\sin \theta) \frac{d\theta}{dt}
$$
\n
$$
v = -2r\omega \sin \theta
$$
\n
$$
\frac{dv}{dt} = -2r\left(\frac{d\omega}{dt}\right) \sin \theta - 2r\omega(\cos \theta) \frac{d\theta}{dt}
$$
\n
$$
a = -2r(\alpha \sin \theta + \omega^2 \cos \theta)
$$
\nAns.

NOTE: The negative signs indicate that v and a are opposite to the direction of positive x . This seems reasonable when you visualize the motion.

At a given instant, the cylinder of radius *r*, shown in Fig. 16–8, has an angular velocity ω and angular acceleration α . Determine the velocity and acceleration of its center *G* if the cylinder rolls without slipping.

Fig. 16–8

SOLUTION

Position Coordinate Equation. The cylinder undergoes general plane motion since it simultaneously translates and rotates. By plane motion since it simultaneously translates and rotates. By
inspection, point *G* moves in a *straight line* to the left, from *G* to *G'*, as
the cylinder rolls Fig. 16–8. Consequently its new position *G'* will be inspection, point G moves in a *straight line* to the left, from G to G', as
the cylinder rolls, Fig. 16–8. Consequently its new position G' will be
specified by the *horizontal* position coordinate s_G , which is measure specified by the *horizontal* position coordinate s_G , which is measured
from G to G' Also as the cylinder rolls (without slipping) the arc specified by the *horizontal* position coordinate s_G , which is measured
from *G* to *G'*. Also, as the cylinder rolls (without slipping), the arc
length $A'B$ on the rim which was in contact with the ground from from G to G'. Also, as the cylinder rolls (without slipping), the arc
length $A'B$ on the rim which was in contact with the ground from
A to B is equivalent to see Consequently, the motion requires the A to B, is equivalent to s_G . Consequently, the motion requires the arc radial line GA to rotate θ to the position $G'A'$. Since the arc *A* to *B*, is equivalent to s_G . Consequently, the motion requires the radial line *GA* to rotate θ to the position *G'A'*. Since the arc *A'B* = *r* θ then *G* travels a distance radial line *GA* to rotate θ to th
 $A'B = r\theta$, then *G* travels a distance

$$
s_G = r\theta
$$

Time Derivatives. Taking successive time derivatives of this **Time Derivatives.** Taking successive time derivatives of this equation, realizing that *r* is constant, $\omega = d\theta/dt$, and $\alpha = d\omega/dt$, gives the necessary relationships: the necessary relationships:

$$
s_G = r\theta
$$

$$
v_G = r\omega
$$

$$
a_G = r\alpha \qquad \qquad \text{Ans.}
$$

Ans.

NOTE: Remember that these relationships are valid only if the cylinder (disk, wheel, ball, etc.) rolls *without* slipping.

The large window in Fig. 16–9 is opened using a hydraulic cylinder *AB*. If the cylinder extends at a constant rate of 0.5 m/s , determine the angular velocity and angular acceleration of the window at the instant $\theta = 30^\circ$.

SOLUTION

Position Coordinate Equation. The angular motion of the window can be obtained using the coordinate θ , whereas the extension or motion *along the hydraulic cylinder* is defined using a coordinate *s*, which measures its length from the fixed point *A* to the moving point *B*. These coordinates can be related using the law of cosines, namely,

$$
s2 = (2 m)2 + (1 m)2 - 2(2 m)(1 m) cos \theta
$$

$$
s2 = 5 - 4 cos \theta
$$
 (1)

When $\theta = 30^{\circ}$,

 $s = 1.239 \text{ m}$

Time Derivatives. Taking the time derivatives of Eq. 1, we have

$$
2s\frac{ds}{dt} = 0 - 4(-\sin\theta)\frac{d\theta}{dt}
$$

$$
s(v_s) = 2(\sin\theta)\omega
$$
 (2)

Since $v_s = 0.5$ m/s, then at $\theta = 30^\circ$,

$$
(1.239 \text{ m})(0.5 \text{ m/s}) = 2 \sin 30^{\circ} \omega
$$

$$
\omega = 0.6197 \text{ rad/s} = 0.620 \text{ rad/s}
$$
Ans.

Taking the time derivative of Eq. 2 yields

$$
\frac{ds}{dt}v_s + s\frac{dv_s}{dt} = 2(\cos\theta)\frac{d\theta}{dt}\omega + 2(\sin\theta)\frac{d\omega}{dt}
$$

$$
v_s^2 + sa_s = 2(\cos\theta)\omega^2 + 2(\sin\theta)\alpha
$$

Since $a_s = dv_s/dt = 0$, then

$$
(0.5 \text{ m/s})^2 + 0 = 2 \cos 30^{\circ} (0.6197 \text{ rad/s})^2 + 2 \sin 30^{\circ} \alpha
$$

$$
\alpha = -0.415 \text{ rad/s}^2
$$
Ans.

Because the result is negative, it indicates the window has an angular deceleration.

16.5 [Relative-Motion Analysis: Velocity](#page-14-0)

The general plane motion of a rigid body can be described as a *combination* of translation and rotation. To view these "component" motions *separately* we will use a *relative-motion analysis* involving two sets of coordinate axes. The *x, y* coordinate system is fixed and measures the *absolute* position of two points *A* and *B* on the body, here represented the *absolute* position of two points A and B on the body, here represented
as a bar, Fig. 16–10*a*. The origin of the x', y' coordinate system will be
attached to the selected "base point" A which generally has a known attached to the selected "base point" *A*, which generally has a *known* motion. The axes of this coordinate system *translate* with respect to the fixed frame but do not rotate with the bar.

Position The position vector \mathbf{r}_A in Fig. 16–10*a* specifies the location of the "base point" A and the relative-position vector \mathbf{r}_A . locates point of the "base point" *A*, and the relative-position vector $\mathbf{r}_{B/A}$ locates point *B* with respect to point *A*. By vector addition, the nosition of *B* is then *B* with respect to point *A*. By vector addition, the *position* of *B* is then

$$
\mathbf{r}_B = \mathbf{r}_A + \mathbf{r}_{B/A}
$$

Displacement During an instant of time *dt*, points *A* and *B* undergo displacements $d\mathbf{r}_A$ and $d\mathbf{r}_B$ as shown in Fig. 16–10*b*. If we consider the *general* plane motion by its component parts then the *entire har* first general plane motion by its component parts then the *entire bar* first *translates* by an amount $d\mathbf{r}_A$ so that *A*, the base point, moves to its *final* nosition and point *B* moves to *B'*. Fig. 16–10c. The bar is then *rotated position* and point *B* moves to *B'*, Fig. 16–10*c*. The bar is then *rotated* about *A* by an amount $d\theta$ so that *B'* undergoes a *relative displacement* $d\mathbf{r}_{\text{max}}$ and thus moves to its final position *B*. Due t about *A* by an amount $d\theta$ so that *B'* undergoes a *relative displacement* $d\mathbf{r}_{B/A}$ and thus moves to its final position *B*. Due to the rotation about *A*,
 $d\mathbf{r}_{B/A} = \mathbf{r}_{B/A} d\theta$ and the displacement of *B* is $d\mathbf{r}_{B/A}$ and thus moves to its final position *B*. D
 $dr_{B/A} = r_{B/A} d\theta$, and the displacement of *B* is that
B',
at

^A ^x¿ *y*¿ *y x* **r***B* **r***A* **^r***^B*/*^A ^O* Fixed reference Translating reference (a)

Fig. 16–10

As slider block *A* moves horizontally to the left with a velocity \mathbf{v}_A , it causes crank *CR* to rotate counterclockwise, such that \mathbf{v}_A is it causes crank *CB* to rotate counterclockwise, such that \mathbf{v}_B is
directed tangent to its circular path i.e. upward to the left The directed tangent to its circular path, i.e., upward to the left. The connecting rod *AB* is subjected to general plane motion, and at the instant shown it has an angular velocity ω .

Velocity To determine the relation between the velocities of points *A* and *B*, it is necessary to take the time derivative of the position equation, or simply divide the displacement equation by *dt*. This yields

$$
\frac{d\mathbf{r}_B}{dt} = \frac{d\mathbf{r}_A}{dt} + \frac{d\mathbf{r}_{B/A}}{dt}
$$

The terms $d\mathbf{r}_B/dt = \mathbf{v}_B$ and $d\mathbf{r}_A/dt = \mathbf{v}_A$ are measured with respect to e fixed x *v* axes and represent the *absolute velocities* of points *A* and *R* the fixed *x, y* axes and represent the *absolute velocities* of points *A* and *B*, respectively. Since the relative displacement is caused by a rotation, the magnitude of the third term is $dr_{B/A}/dt = r_{B/A} \frac{d\theta}{dt} = r_{B/A} \theta$
where ω is the angular velocity of the body at the instant consider where ω is the angular velocity of the body at the instant considered. We will denote this term as the *relative velocity* $\mathbf{v}_{B/A}$, since it represents the velocity of *B* with respect to *A* as measured by an observer fixed to the velocity of *B* with respect to *A* as measured by an observer fixed to the translating x' , y' axes. In other words, the bar appears to move as if it were rotating with an angular velocity ω about the z' axis nas translating x', y' axes. In other words, *the bar appears to move as if it were translating x'*, y' axes. In other words, *the bar appears to move as if it were*
rotating with an angular velocity ω *about the z' axis passing through A*.
Consequently, \mathbf{v}_{rel} has a magnitude of $v_{\text{rel}} = \omega r_{$ *rotating with an angular velocity* ω *about the z' axis passing through A.*
Consequently, $\mathbf{v}_{B/A}$ has a magnitude of $v_{B/A} = \omega r_{B/A}$ and a *direction*
which is perpendicular to $\mathbf{r}_{B/A}$. We therefore have which is perpendicular to $\mathbf{r}_{B/A}$. We therefore have #displacement is caused by a rotation, the
 $dr_{B/A}/dt = r_{B/A} d\theta/dt = r_{B/A} \dot{\theta} = r_{B/A} \omega$, of the body at the instant considered We

$$
\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A} \tag{16-15}
$$

where

 $\mathbf{v}_B = \text{velocity of point } B$
 $\mathbf{v}_B = \text{velocity of the base}$ \mathbf{v}_A = velocity of point *B*
 \mathbf{v}_A = velocity of the base point *A*
 \mathbf{v}_A = velocity of *B* with respect to **= velocity of** *B* **with respect to** *A*

What this equation states is that the velocity of *B*, Fig. 16–10*d*, is determined by considering the entire bar to translate with a velocity of \mathbf{v}_A ,
Fig. 16, 10e, and rotate about A with an angular velocity ω . Fig. 16, 106 Fig. 16–10*e*, and rotate about A with an angular velocity $\boldsymbol{\omega}$, Fig. 16–10*f*. Vector addition of these two effects, applied to *B*, yields \mathbf{v}_B , as shown in
Fig. 16, 10g Fig. 16–10*g*.

Since the relative velocity $\mathbf{v}_{B/A}$ represents the effect of *circular* at the term can be expressed by the cross product *motion*, about *A*, this term can be expressed by the cross product *motion*, about *A*, this term can be expressed by the cross product $\mathbf{v}_{B/A} = \boldsymbol{\omega} \times \mathbf{r}_{B/A}$, Eq. 16–9. Hence, for application using Cartesian vector applyies we can also write Eq. 16, 15 as vector analysis, we can also write Eq. 16–15 as

$$
\boxed{\mathbf{v}_B = \mathbf{v}_A + \boldsymbol{\omega} \times \mathbf{r}_{B/A}}
$$
 (16–16)

where

 ω = angular velocity of the body
 r_{B/A} = position vector directed from A to B \mathbf{v}_A = velocity of the base point *A*
 $\boldsymbol{\omega}$ = angular velocity of the body **= velocity of** *B*

The velocity equation 16–15 or 16–16 may be used in a practical manner to study the general plane motion of a rigid body which is either pin connected to or in contact with other moving bodies. When applying this equation, points *A* and *B* should generally be selected as points on the body which are pin-connected to other bodies, or as points in contact with adjacent bodies which have a *known motion*. For example, point *A* on link *AB* in Fig. 16–11*a* must move along a horizontal path, whereas point *B* moves on a circular path. The *directions* of \mathbf{v}_A and \mathbf{v}_B can
therefore be established since they are always *tangent* to their paths of therefore be established since they are always *tangent* to their paths of motion, Fig. 16–11*b*. In the case of the wheel in Fig. 16–12, which rolls *without slipping*, point *A* on the wheel can be selected at the ground. Here *A* (momentarily) has zero velocity since the ground does not move. Furthermore, the center of the wheel, *B*, moves along a horizontal path so that \mathbf{v}_B is horizontal.

Fig. 16–12

16

Procedure for Analysis

The relative velocity equation can be applied either by using Cartesian vector analysis, or by writing the *x* and *y* scalar component equations directly. For application, it is suggested that the following procedure be used.

Vector Analysis

Kinematic Diagram.

- Establish the directions of the fixed *x, y* coordinates and draw a kinematic diagram of the body. Indicate on it the velocities \mathbf{v}_A , \mathbf{v}_B of points A and B the angular velocity $\boldsymbol{\epsilon}_A$ and the relative of points A and B , the angular velocity $\boldsymbol{\omega}$, and the relativeposition vector $\mathbf{r}_{B/A}$.
- If the magnitudes of \mathbf{v}_A , \mathbf{v}_B , or $\boldsymbol{\omega}$ are unknown, the sense of direction of these vectors can be assumed direction of these vectors can be assumed.

Velocity Equation.

- To apply $\mathbf{v}_B = \mathbf{v}_A + \boldsymbol{\omega} \times \mathbf{r}_{B/A}$, express the vectors in Cartesian vector form and substitute them into the equation. Evaluate the vector form and substitute them into the equation. Evaluate the cross product and then equate the respective **i** and **j** components to obtain two scalar equations.
- If the solution yields a *negative* answer for an *unknown* magnitude, it indicates the sense of direction of the vector is opposite to that shown on the kinematic diagram.

Scalar Analysis

Kinematic Diagram.

• If the velocity equation is to be applied in scalar form, then the magnitude and direction of the relative velocity $\mathbf{v}_{B/A}$ must be
established. Draw a kinematic digaram such as shown in established. Draw a kinematic diagram such as shown in Fig. 16–10*g*, which shows the relative motion. Since the body is considered to be "pinned" momentarily at the base point *A*, the considered to be "pinned" momentarily at the base point A, the magnitude of $\mathbf{v}_{B/A}$ is $v_{B/A} = \omega r_{B/A}$. The sense of direction of $\mathbf{v}_{B/A}$ is always perpendicular to $\mathbf{r}_{B/A}$ in accordance with the $\mathbf{v}_{B/A}$ is always perpendicular to $\mathbf{r}_{B/A}$ in accordance with the rotational motion ω of the body.^{*} rotational motion $\boldsymbol{\omega}$ of the body. *

Velocity Equation.

• Write Eq. 16–15 in symbolic form, $\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$, and
underneath each of the terms represent the vectors graphically underneath each of the terms represent the vectors graphically by showing their magnitudes and directions. The scalar equations are determined from the *x* and *y* components of these vectors.

^{*} The notation $\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A(pin)}$ may be helpful in recalling that A is "pinned."

The link shown in Fig. 16–13*a* is guided by two blocks at *A* and *B*, which move in the fixed slots. If the velocity of A is 2 m/s downward, which move in the fixed slots. If the velocity of *A* determine the velocity of *B* at the instant $\theta = 45^{\circ}$.

SOLUTION (VECTOR ANALYSIS)

Kinematic Diagram. Since points *A* and *B* are restricted to move along the fixed slots and \mathbf{v}_A is directed downward, the velocity \mathbf{v}_B must
be directed borizontally to the right. Fig. 16, 13b, This motion causes be directed horizontally to the right, Fig. 16–13*b*. This motion causes the link to rotate counterclockwise; that is, by the right-hand rule the angular velocity $\boldsymbol{\omega}$ is directed outward, perpendicular to the plane of motion. Knowing the magnitude and direction of v_A and the lines of action of v_A and ω , it is possible to apply the velocity equation action of \mathbf{v}_B and $\boldsymbol{\omega}$, it is possible to apply the velocity equation
v $\mathbf{v}_B = \mathbf{v}_B + \boldsymbol{\omega} \times \mathbf{v}_B$, to points *A* and *B* in order to solve for the two action of \mathbf{v}_B and $\boldsymbol{\omega}$, it is possible to apply the velocity equation $\mathbf{v}_B = \mathbf{v}_A + \boldsymbol{\omega} \times \mathbf{r}_{B/A}$ to points *A* and *B* in order to solve for the two unknown magnitudes *x*, and $\boldsymbol{\omega}$ Since **r**, is ne unknown magnitudes v_B and ω . Since $\mathbf{r}_{B/A}$ is needed, it is also shown
in Fig. 16–13b in Fig. 16–13*b*.

Velocity Equation. Expressing each of the vectors in Fig. 16–13*b* in terms of their **i**, **j**, **k** components and applying Eq. 16–16 to *A*, the base point, and *B*, we have

$$
\mathbf{v}_B = \mathbf{v}_A + \boldsymbol{\omega} \times \mathbf{r}_{B/A}
$$

\n
$$
v_B \mathbf{i} = -2\mathbf{j} + [\boldsymbol{\omega}\mathbf{k} \times (0.2 \sin 45^\circ \mathbf{i} - 0.2 \cos 45^\circ \mathbf{j})]
$$

\n
$$
v_B \mathbf{i} = -2\mathbf{j} + 0.2\boldsymbol{\omega} \sin 45^\circ \mathbf{j} + 0.2\boldsymbol{\omega} \cos 45^\circ \mathbf{i}
$$

Equating the **i** and **j** components gives

$$
v_B = 0.2\omega \cos 45^\circ
$$
 $0 = -2 + 0.2\omega \sin 45^\circ$

Thus,

$$
\omega = 14.1 \text{ rad/s}^5
$$

$$
v_B = 2 \text{ m/s} \rightarrow
$$
Ans.

Since both results are *positive*, the *directions* of \mathbf{v}_B and $\boldsymbol{\omega}$ are indeed *correct* as shown in Fig. 16–13*b*. It should be emphasized that these *correct* as shown in Fig. 16–13*b*. It should be emphasized that these results are *valid only* at the instant $\theta = 45^{\circ}$. A recalculation for results are *valid only* at the instant $\theta = 45^{\circ}$. A recalculation for $\theta = 44^{\circ}$ yields $v_B = 2.07$ m/s and $\omega = 14.4$ rad/s; whereas when $\theta = 46^{\circ}$ $v_B = 1.93$ m/s and $\omega = 13.9$ rad/s etc. $\theta = 44^{\circ}$ yields $v_B = 2.07 \text{ m/s}$ and $\omega = 14.4 \text{ m/s}$
 $\theta = 46^{\circ}$, $v_B = 1.93 \text{ m/s}$ and $\omega = 13.9 \text{ rad/s}$, etc.

NOTE: Once the velocity of a point (*A*) on the link and the angular velocity are *known*, the velocity of any other point on the link can be determined. As an exercise, see if you can apply Eq. 16–16 to points *A* determined. As an exercise, see if you can apply Eq. 16–16 to points *A* and *C* or to points *B* and *C* and show that when $\theta = 45^{\circ}$, $v_C = 3.16$ m/s, directed at an angle of 18.4° up from the horizontal.

The cylinder shown in Fig. 16–14*a* rolls without slipping on the surface of a conveyor belt which is moving at 2 ft/s . Determine the velocity of of a conveyor belt which is moving at 2 ft/s. Determine the velocity of point *A*. The cylinder has a clockwise angular velocity $\omega = 15$ rad/s at the instant shown.

SOLUTION I (VECTOR ANALYSIS)

Kinematic Diagram. Since no slipping occurs, point *B* on the cylinder has the same velocity as the conveyor, Fig. 16–14*b*. Also, the angular velocity of the cylinder is known, so we can apply the velocity equation to *B*, the base point, and *A* to determine v_A .

Velocity Equation.

equation.
\n
$$
\mathbf{v}_A = \mathbf{v}_B + \boldsymbol{\omega} \times \mathbf{r}_{A/B}
$$
\n
$$
(v_A)_x \mathbf{i} + (v_A)_y \mathbf{j} = 2\mathbf{i} + (-15\mathbf{k}) \times (-0.5\mathbf{i} + 0.5\mathbf{j})
$$
\n
$$
(v_A)_x \mathbf{i} + (v_A)_y \mathbf{j} = 2\mathbf{i} + 7.50\mathbf{j} + 7.50\mathbf{i}
$$

so that

$$
(v_A)_x = 2 + 7.50 = 9.50 \text{ ft/s} \tag{1}
$$

$$
(v_A)_x = 2 + 7.50 = 9.50 \text{ ft/s}
$$

(v_A)_y = 7.50 ft/s (2)

Thus,

$$
v_A = \sqrt{(9.50)^2 + (7.50)^2} = 12.1 \text{ ft/s}
$$
 Ans.

$$
\theta = \tan^{-1} \frac{7.50}{9.50} = 38.3^{\circ} \quad \angle Z
$$
 Ans.

SOLUTION II (SCALAR ANALYSIS)

SOLUTION II (SCALAR ANALYSIS)
As an alternative procedure, the scalar components of $\mathbf{v}_A = \mathbf{v}_B + \mathbf{v}_{A/B}$
can be obtained directly. From the kinematic diagram showing the can be obtained directly. From the kinematic diagram showing the relative "circular" motion which produces $\mathbf{v}_{A/B}$, Fig. 16–14*c*, we have

$$
v_{A/B} = \omega r_{A/B} = (15 \text{ rad/s}) \left(\frac{0.5 \text{ ft}}{\cos 45^\circ} \right) = 10.6 \text{ ft/s}
$$

Thus,

Relative motion (c)

Fig. 16–14

$$
\mathbf{v}_A = \mathbf{v}_B + \mathbf{v}_{A/B}
$$

$$
\begin{bmatrix} (v_A)_x \\ \rightarrow \end{bmatrix} + \begin{bmatrix} (v_A)_y \\ \uparrow \end{bmatrix} = \begin{bmatrix} 2 \text{ ft/s} \\ \rightarrow \end{bmatrix} + \begin{bmatrix} 10.6 \text{ ft/s} \\ \text{at } 45^\circ \end{bmatrix}
$$

Equating the *x* and *y* components gives the same results as before, namely,

- (\pm) $(v_A)_x = 2 + 10.6 \cos 45^\circ = 9.50 \text{ ft/s}$
(+ \uparrow) $(v_A)_y = 0 + 10.6 \sin 45^\circ = 7.50 \text{ ft/s}$ $(v_A)_x = 2 + 10.6 \cos 45^\circ = 9.50 \text{ ft/s}$
-

The collar *C* in Fig. 16–15*a* is moving downward with a velocity of 2 m/s . Determine the angular velocity of *CB* at this instant.

SOLUTION I (VECTOR ANALYSIS)

Kinematic Diagram. The downward motion of *C* causes *B* to move to the right along a curved path. Also, *CB* and *AB* rotate counterclockwise.

Velocity Equation. Link CB (general plane motion): See Fig. 16–15*b*.

 v_B **i** = -2 **j** + $0.2\omega_{CB}$ **i** + $0.2\omega_{CB}$ **i** v_B **i** = -2**j** + ω_{CB} **k** \times (0.2**i** - 0.2**j**) $\mathbf{v}_B = \mathbf{v}_C + \boldsymbol{\omega}_{CB} \times \mathbf{r}_{B/C}$

$$
v_B = 0.2\omega_{CB} \tag{1}
$$

$$
0 = -2 + 0.2\omega_{CB}
$$
 (1)
(2)

d *Ans.*

$$
\omega_{CB} = 10 \text{ rad/s}^2
$$

$$
v_B = 2 \text{ m/s} \rightarrow
$$

SOLUTION II (SCALAR ANALYSIS)

SOLUTION II (SCALAR ANALYSIS)
The scalar component equations of $\mathbf{v}_B = \mathbf{v}_C + \mathbf{v}_{B/C}$ can be obtained
directly. The kinematic digaram in Fig. 16, 15c shows the relative directly. The kinematic diagram in Fig. 16–15*c* shows the relative "circular" motion which produces $\mathbf{v}_{B/C}$. We have

$$
\mathbf{v}_B = \mathbf{v}_C + \mathbf{v}_{B/C}
$$

$$
\begin{bmatrix} v_B \\ \rightarrow \end{bmatrix} = \begin{bmatrix} 2 \text{ m/s} \\ \downarrow \end{bmatrix} + \begin{bmatrix} \omega_{CB} (0.2 \sqrt{2} \text{ m}) \\ \mathcal{L}45^\circ \end{bmatrix}
$$

Resolving these vectors in the *x* and *y* directions yields

(\pm) $v_B = 0 + \omega_{CB} (0.2\sqrt{2} \cos 45^\circ)$

(+)
$$
0 = -2 + \omega_{CB} (0.2 \sqrt{2} \sin 45^\circ)
$$

which is the same as Eqs. 1 and 2.

NOTE: Since link *AB* rotates about a fixed axis and v_B is known, **NOTE:** Since link *AB* rotates about a fixed axis and v_B is known,
Fig. 16–15*d*, its angular velocity is found from $v_B = \omega_{AB}r_{AB}$ or
 $2 \text{ m/s} = \omega_{AB} (0.2 \text{ m}) \omega_{AB} = 10 \text{ rad/s}$ $2 m/s = \omega_{AB} (0.2 m), \omega_{AB} = 10 rad/s.$

The bar *AB* of the linkage shown in Fig. 16–16*a* has a clockwise The bar *AB* of the linkage shown in Fig. 16–16*a* has a clockwise angular velocity of 30 rad/s when $\theta = 60^{\circ}$. Determine the angular velocities of member *BC* and the wheel at this instant.

SOLUTION (VECTOR ANALYSIS)

Kinematic Diagram. By inspection, the velocities of points *B* and *C* are defined by the rotation of link *AB* and the wheel about their fixed axes. The position vectors and the angular velocity of each member are shown on the kinematic diagram in Fig. 16–16*b*. To solve, we will write the appropriate kinematic equation for each member.

(a)

Velocity Equation. Link AB (rotation about a fixed axis):

Fig. 16–16

 $= \{5.20\mathbf{i} - 3.0\mathbf{j}\} \text{ m/s}$ $= (-30\mathbf{k}) \times (0.2 \cos 60^\circ \mathbf{i} + 0.2 \sin 60^\circ \mathbf{j})$ $\mathbf{v}_B = \boldsymbol{\omega}_{AB} \times \mathbf{r}_B$

Link BC (general plane motion):

$$
\mathbf{v}_C = \mathbf{v}_B + \boldsymbol{\omega}_{BC} \times \mathbf{r}_{C/B}
$$

\n
$$
v_C \mathbf{i} = 5.20 \mathbf{i} - 3.0 \mathbf{j} + (\boldsymbol{\omega}_{BC} \mathbf{k}) \times (0.2 \mathbf{i})
$$

\n
$$
v_C \mathbf{i} = 5.20 \mathbf{i} + (0.2 \boldsymbol{\omega}_{BC} - 3.0) \mathbf{j}
$$

\n
$$
v_C = 5.20 \text{ m/s}
$$

\n
$$
0 = 0.2 \boldsymbol{\omega}_{BC} - 3.0
$$

\n
$$
\boldsymbol{\omega}_{BC} = 15 \text{ rad/s}^2
$$
Ans.

Wheel (rotation about a fixed axis):

$$
\mathbf{v}_C = \boldsymbol{\omega}_D \times \mathbf{r}_C
$$

5.20**i** = $(\omega_D \mathbf{k}) \times (-0.1\mathbf{j})$
5.20 = 0.1 ω_D
 ω_D = 52.0 rad/s⁵ Ans.

FUNDAMENTAL PROBLEMS

F16–7. If roller A moves to the right with a constant **F16-7.** If roller A moves to the right with a constant velocity of $v_A = 3$ m/s, determine the angular velocity of the link and the velocity of roller B at the instant $\theta = 30^\circ$ the link and the velocity of roller B at the instant $\theta = 30^{\circ}$.

16.6 [Instantaneous Center of Zero](#page-14-0) **Velocity**

The velocity of any point *B* located on a rigid body can be obtained in a very direct way by choosing the base point *A* to be a point that has *zero very* direct way by choosing the base point *A* to be a point that has *zero velocity* at the instant considered. In this case, $\mathbf{v}_A = \mathbf{0}$, and therefore the velocity equation $\mathbf{v}_A = \mathbf{v}_A + \mathbf{\Omega} \times \mathbf{r}_B$, b *velocity* at the instant considered. In this case, $\mathbf{v}_A = \mathbf{0}$, and therefore the velocity equation, $\mathbf{v}_B = \mathbf{v}_A + \boldsymbol{\omega} \times \mathbf{r}_{B/A}$, becomes $\mathbf{v}_B = \boldsymbol{\omega} \times \mathbf{r}_{B/A}$. For a hody having general plane motion, body having general plane motion, point *A* so chosen is called the *instantaneous center of zero velocity (IC)*, and it lies on the *instantaneous axis of zero velocity*. This axis is always perpendicular to the plane of motion, and the intersection of the axis with this plane defines the location motion, and the intersection of the axis with this plane defines the location
of the *IC*. Since point *A* coincides with the *IC*, then $\mathbf{v}_B = \boldsymbol{\omega} \times \mathbf{r}_{B/IC}$ and
so point *B* moves momentarily about the *IC* in a so point *B* moves momentarily about the *IC* in a *circular path;* in other words, the body appears to rotate about the instantaneous axis. The words, the body appears to rotate about the instantaneous axis. The *magnitude* of \mathbf{v}_B is simply $v_B = \omega r_{B/IC}$, where ω is the angular velocity of the body. Due to the circular motion, the *direction* of \mathbf{v}_B the body. Due to the circular motion, the *direction* of \mathbf{v}_B must always be
parameterized to \mathbf{v}_B *perpendicular* to $\mathbf{r}_{B/IC}$.
For example, the *IC*.

For example, the *IC* for the bicycle wheel in Fig. 16–17 is at the contact point with the ground. There the spokes are somewhat visible, whereas at the top of the wheel they become blurred. If one imagines that the wheel is momentarily pinned at this point, the velocities of various points can be is momentarily pinned at this point, the velocities of various points can be
found using $v = \omega r$. Here the radial distances shown in the photo,
Fig. 16–17 must be determined from the geometry of the wheel Fig. 16–17, must be determined from the geometry of the wheel.

Fig. 16–17

Fig. 16–18

(d)

Location of *IC* knowing \mathbf{v}_A and \mathbf{v}_B

Location of the IC. To locate the *IC* we can use the fact that the *velocity* of a point on the body is *always perpendicular* to the *relativeposition vector* directed from the *IC* to the point. Several possibilities exist:

- *The velocity* \mathbf{v}_A *of a point A on the body and the angular velocity* $\boldsymbol{\omega}$ *of the body are known*. Fig. 16, 18*g*, In this case, the *IC* is located *of the body are known*, Fig. 16–18*a*. In this case, the *IC* is located along the line drawn perpendicular to \mathbf{v}_A at *A*, such that the distance
from *A* to the *IC* is $\mathbf{v}_A = v_A/\omega$. Note that the *IC* lies up and to the along the line drawn perpendicular to \mathbf{v}_A at *A*, such that the distance
from *A* to the *IC* is $r_{A/IC} = v_A/\omega$. Note that the *IC* lies up and to the
right of *A* since **v**, must cause a clockwise angular velocity right of *A* since v_A must cause a clockwise angular velocity $\boldsymbol{\omega}$ about the *IC* the *IC*.
- *The lines of action of two nonparallel velocities* \mathbf{v}_A and \mathbf{v}_B are
known Fig. 16, 18b Construct at points A and B line segments that *known*, Fig. 16–18*b*. Construct at points *A* and *B* line segments that are perpendicular to \mathbf{v}_A and \mathbf{v}_B . Extending these perpendiculars to their noint of intersection as shown locates the *IC* at the instant their *point of intersection* as shown locates the *IC* at the instant considered.
- *The magnitude and direction of two parallel velocities* \mathbf{v}_A and \mathbf{v}_B are
known Here the location of the *IC* is determined by proportional *known*. Here the location of the *IC* is determined by proportional triangles. Examples are shown in Fig. 16–18*c* and *d*. In both cases and $r_{B/IC} = v_B/\omega$. If *d* is a known distance between
 B , then in Fig. 16–18*c*, $r_{A/IC} + r_{B/IC} = d$ and in points *A* and *B*, then in Fig. 16–18*c*, $r_{A/IC} + r_{B/IC} = d$ and in Fig. 16–18*d*, $r_{B/IC} - r_{A/IC} = d$. triangles. Examples are shown i
 $r_{A/IC} = v_A/\omega$ and $r_{B/IC} = v_B/\omega$.

points A and B then in Fig.

As the board slides downward to the left it is subjected to general plane motion. Since the directions of the velocities of its ends *A* and *B* are known, the *IC* is located as shown. At this instant the board will momentarily rotate about this point. Draw the board in several other positions and establish the *IC* for each case.

Realize that the point chosen as the instantaneous center of zero velocity for the body *can only be used at the instant considered* since the body changes its position from one instant to the next. The locus of points which define the location of the *IC* during the body's motion is called a *centrode*, Fig. 16–18*a*, and so each point on the centrode acts as the *IC* for the body only for an instant.

Although the *IC* may be conveniently used to determine the velocity of any point in a body, it generally *does not have zero acceleration* and therefore it *should not* be used for finding the accelerations of points in a body.

Procedure for Analysis

The velocity of a point on a body which is subjected to general plane motion can be determined with reference to its instantaneous center of zero velocity provided the location of the *IC* is first established using one of the three methods described above.

- As shown on the kinematic diagram in Fig. 16–19, the body is imagined as "extended and pinned" at the *IC* so that, at the instant considered, it rotates about this pin with its angular velocity $\boldsymbol{\omega}$.
- The *magnitude* of velocity for each of the arbitrary points *A, B*, and *C* on the body can be determined by using the equation and *C* on the body can be determined by using the equation $v = \omega r$, where *r* is the radial distance from the *IC* to each point.
- The line of action of each velocity vector **v** is *perpendicular* to its associated radial line **r**, and the velocity has a *sense of direction* which tends to move the point in a manner consistent with the angular rotation ω of the radial line, Fig. 16–19.

Show how to determine the location of the instantaneous center of zero velocity for (a) member *BC* shown in Fig. 16–20*a*; and (b) the link *CB* shown in Fig. 16–20*c*.

(b)

SOLUTION

Part (a). As shown in Fig. 16–20*a*, point *B* moves in a circular path such that \mathbf{v}_B is perpendicular to *AB*. Therefore, it acts at an angle θ from the horizontal as shown in Fig. 16, 20b. The motion of point *B* from the horizontal as shown in Fig. 16–20*b*. The motion of point *B* causes the piston to move forward *horizontally* with a velocity \mathbf{v}_C .
When lines are drawn perpendicular to \mathbf{v}_C and \mathbf{v}_C . Fig. 16, 20b, they When lines are drawn perpendicular to \mathbf{v}_B and \mathbf{v}_C , Fig. 16–20*b*, they intersect at the *IC*.

Part (b). Points *B* and *C* follow circular paths of motion since links *AB* and *DC* are each subjected to rotation about a fixed axis, Fig. 16–20*c*. Since the velocity is always tangent to the path, at the instant considered, \mathbf{v}_C on rod *DC* and \mathbf{v}_B on rod *AB* are both directed vertically downward, along the axis of link *CB*, Fig. 16–20*d*. Radial lines drawn perpendicular to these two velocities form parallel lines which intersect at "infinity;" to these two velocities form parallel lines which intersect at "infinity;"
i.e., $r_{C/IC} \rightarrow \infty$ and $r_{B/IC} \rightarrow \infty$. Thus, $\omega_{CB} = (v_C/r_{C/IC}) \rightarrow 0$. As a
result link CB momentarily translates. An instant later however CB will result, link *CB* momentarily *translates*.An instant later, however,*CB* will move to a tilted position, causing the *IC* to move to some finite location.

Block *D* shown in Fig. $16-21a$ moves with a speed of 3 m/s. Determine the angular velocities of links *BD* and *AB*, at the instant shown.

SOLUTION

As *D* moves to the right, it causes *AB* to rotate clockwise about point *A*. Hence, \mathbf{v}_B is directed perpendicular to *AB*. The instantaneous center of zero velocity for *BD* is located at the intersection of the line center of zero velocity for *BD* is located at the intersection of the line segments drawn perpendicular to \mathbf{v}_B and \mathbf{v}_D , Fig. 16–21*b*. From the geometry,

$$
r_{B/IC} = 0.4 \tan 45^\circ \text{ m} = 0.4 \text{ m}
$$

 $r_{D/IC} = \frac{0.4 \text{ m}}{\cos 45^\circ} = 0.5657 \text{ m}$

Since the magnitude of \mathbf{v}_D is known, the angular velocity of link BD is

$$
\omega_{BD} = \frac{v_D}{r_{D/IC}} = \frac{3 \text{ m/s}}{0.5657 \text{ m}} = 5.30 \text{ rad/s}
$$
 Ans.

The velocity of *B* is therefore

$$
v_B = \omega_{BD}(r_{B/IC}) = 5.30 \text{ rad/s} (0.4 \text{ m}) = 2.12 \text{ m/s}
$$
 $\sqrt{45^\circ}$

From Fig. 16–21*c*, the angular velocity of *AB* is

$$
\omega_{AB} = \frac{v_B}{r_{B/A}} = \frac{2.12 \text{ m/s}}{0.4 \text{ m}} = 5.30 \text{ rad/s} \lambda
$$
 Ans.

NOTE: Try and solve this problem by applying $\mathbf{v}_D = \mathbf{v}_B + \mathbf{v}_{D/B}$ to member BD. member *BD*.

The cylinder shown in Fig. 16–22*a* rolls without slipping between the two moving plates *E* and *D*. Determine the angular velocity of the cylinder and the velocity of its center *C*.

SOLUTION

Since no slipping occurs, the contact points *A* and *B* on the cylinder have the same velocities as the plates *E* and *D*, respectively. Furthermore, the velocities \mathbf{v}_A and \mathbf{v}_B are *parallel*, so that by the **proportionality** of right triangles the *IC* is located at a point on line *AB* proportionality of right triangles the *IC* is located at a point on line *AB*, Fig. 16–22*b*.Assuming this point to be a distance *x* from *B*, we have

$$
v_B = \omega x; \qquad \qquad 0.4 \text{ m/s} = \omega x
$$

 $v_A = \omega(0.25 \text{ m} - x);$ 0.25 m/s = $\omega(0.25 \text{ m} - x)$

Fig. 16–22

Dividing one equation into the other eliminates ω and yields

$$
0.4(0.25 - x) = 0.25x
$$

$$
x = \frac{0.1}{0.65} = 0.1538 \text{ m}
$$

Hence, the angular velocity of the cylinder is

$$
\omega = \frac{v_B}{x} = \frac{0.4 \text{ m/s}}{0.1538 \text{ m}} = 2.60 \text{ rad/s} \lambda
$$
 Ans.

The velocity of point *C* is therefore

 0.0750 m>s ; *Ans.* vC ⁼ ^vrC>IC ⁼ 2.60 rad>^s ¹0.1538 m - 0.125 m²

The crankshaft AB turns with a clockwise angular velocity of 10 rad/s, Fig. 16–23*a*. Determine the velocity of the piston at the instant shown.

SOLUTION

The crankshaft rotates about a fixed axis, and so the velocity of point *B* is

$$
v_B = 10 \text{ rad/s} (0.25 \text{ ft}) = 2.50 \text{ ft/s } \measuredangle 45^\circ
$$

Since the directions of the velocities of *B* and *C* are known, then the location of the *IC* for the connecting rod *BC* is at the intersection of the lines extended from these points, perpendicular to \mathbf{v}_B and \mathbf{v}_C , Fig. 16–23*b*. The magnitudes of $\mathbf{r}_{B/IC}$ and $\mathbf{r}_{C/IC}$ can be obtained from the geometry of the triangle and the law of sines, i.e.,

$$
\frac{0.75 \text{ ft}}{\sin 45^\circ} = \frac{r_{B/IC}}{\sin 76.4^\circ}
$$

$$
r_{B/IC} = 1.031 \text{ ft}
$$

$$
\frac{0.75 \text{ ft}}{\sin 45^\circ} = \frac{r_{C/IC}}{\sin 58.6^\circ}
$$

$$
r_{C/IC} = 0.9056 \text{ ft}
$$

The rotational sense of ω_{BC} must be the same as the rotation caused
by v, about the *IC* which is counterclockwise Therefore by \mathbf{v}_B about the *IC*, which is counterclockwise. Therefore,

$$
\omega_{BC} = \frac{v_B}{r_{B/IC}} = \frac{2.5 \text{ ft/s}}{1.031 \text{ ft}} = 2.425 \text{ rad/s}
$$

Using this result, the velocity of the piston is

$$
v_C = \omega_{BC}r_{C/IC} = (2.425 \text{ rad/s})(0.9056 \text{ ft}) = 2.20 \text{ ft/s}
$$
 Ans.

FUNDAMENTAL PROBLEMS

F16–13. Determine the angular velocity of the rod and the velocity of point C at the instant shown.

> *A C* 5 m 2.5 m 4 m *B* $v_A = 6 \text{ m/s}$

F16–13

16.7 [Relative-Motion Analysis:](#page-14-0) Acceleration

An equation that relates the accelerations of two points on a bar (rigid body) subjected to general plane motion may be determined by body) subjected to general plane motion may be detern
differentiating $\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$ with respect to time. This yields

$$
\frac{d\mathbf{v}_B}{dt} = \frac{d\mathbf{v}_A}{dt} + \frac{d\mathbf{v}_{B/A}}{dt}
$$

The terms $d\mathbf{v}_B/dt = \mathbf{a}_B$ and $d\mathbf{v}_A/dt = \mathbf{a}_A$ are measured with respect to get of *fixed x, y axes* and represent the *absolute accelerations* of points *R* a set of *fixed x, y axes* and represent the *absolute accelerations* of points *B* and *A*.The last term represents the acceleration of *B* with respect to *A* as and A. The last term represents the acceleration of B with respect to A as
measured by an observer fixed to translating x' , y' axes which
have their origin at the base point A. In Sec. 16.5 it was shown that to this have their origin at the base point *A*. In Sec. 16.5 it was shown that to this observer point *B* appears to move along a *circular arc* that has a radius of curvature $r_{B/A}$. Consequently, $\mathbf{a}_{B/A}$ can be expressed in terms
of its tangential and pormal components: i.e., $\mathbf{a}_{B/A} = (\mathbf{a}_{B/A}) + (\mathbf{a}_{B/A})$ a radius of curvature $r_{B/A}$. Consequently, $\mathbf{a}_{B/A}$ can be expressed in terms of its tangential and normal components; i.e., $\mathbf{a}_{B/A} = (\mathbf{a}_{B/A})_t + (\mathbf{a}_{B/A})_n$, of its tangential and normal components; i.e., $\mathbf{a}_{B/A} = (\mathbf{a}_{B/A})_t + (\mathbf{a}_{B/A})_n$,
where $(a_{B/A})_t = \alpha r_{B/A}$ and $(a_{B/A})_n = \omega^2 r_{B/A}$. Hence, the relative-
acceleration equation can be written in the form acceleration equation can be written in the form

$$
\boxed{\mathbf{a}_B = \mathbf{a}_A + (\mathbf{a}_{B/A})_t + (\mathbf{a}_{B/A})_n}
$$
 (16–17)

where

 \mathbf{a}_B = acceleration of point B

 \mathbf{a}_A = acceleration of point A

- \mathbf{a}_A = acceleration of point *A*
 $(\mathbf{a}_{B/A})_t$ = tangential acceleration component of *B* with respect
 \mathbf{a}_A The magnitude is $(a_1) = \alpha \mathbf{r}$ and the tangential acceleration component of *B* with respect
to *A*. The *magnitude* is $(a_{B/A})_t = \alpha r_{B/A}$, and the
direction is perpendicular to $\mathbf{r}_{\text{N/A}}$. *direction* is perpendicular to $\mathbf{r}_{B/A}$.
- attection is perpendicular to $\mathbf{r}_{B/A}$.
 $(\mathbf{a}_{B/A})_n = \text{normal acceleration component of } B$ with respect to A . The *magnitude* is $(a_n) = a^2r$, and the normal acceleration component of *B* with respect to *A*. The *magnitude* is $(a_{B/A})_n = \omega^2 r_{B/A}$, and the *direction* is always from *R* towards *A direction* is always from B towards A.

The terms in Eq. 16–17 are represented graphically in Fig. 16–24. Here it is seen that at a given instant the acceleration of *B*, Fig. 16–24*a*, is determined by considering the bar to translate with an acceleration a_A , F_a , a_A and a_B impliented with a photon the base point A with an Fig. 16–24*b*, and simultaneously rotate about the base point *A* with an instantaneous angular velocity $\boldsymbol{\omega}$ and angular acceleration $\boldsymbol{\alpha}$, Fig. 16–24*c*. Vector addition of these two effects, applied to *B*, yields \mathbf{a}_B , as shown in
Fig. 16, 24d, It should be noted from Fig. 16, 24d that since points A and *B* Fig. 16–24*d*. It should be noted from Fig. 16–24*a* that since points *A* and *B* move along *curved paths*, the accelerations of these points will have *both tangential and normal components*. (Recall that the acceleration of a point is *tangent to the path only* when the path is *rectilinear* or when it is an inflection point on a curve.)

Fig. 16–24

16

Fig. 16–25

Since the relative-acceleration components represent the effect of *circular motion* observed from translating axes having their origin at the circular motion observed from translating axes having their origin at the base point *A*, these terms can be expressed as $(\mathbf{a}_{B/A})_t = \boldsymbol{\alpha} \times \mathbf{r}_{B/A}$ and base point A, these terms can be expressed as $(\mathbf{a}_{B/A})_t =$
 $(\mathbf{a}_{B/A})_n = -\omega^2 \mathbf{r}_{B/A}$, Eq. 16–14. Hence, Eq. 16–17 becomes

$$
\mathbf{a}_B = \mathbf{a}_A + \boldsymbol{\alpha} \times \mathbf{r}_{B/A} - \omega^2 \mathbf{r}_{B/A}
$$
 (16-18)

where

 \mathbf{a}_B = acceleration of point *B*

 \mathbf{a}_A = acceleration of point *B*
 \mathbf{a}_A = acceleration of the base point *A*

 a_A = acceleration of the base point *A*
 α = angular acceleration of the body

 α = angular acceleration of the body
 ω = angular velocity of the body

 ω = angular velocity of the body
 r_{B/A} = position vector directed from *A* to *B*

If Eq. 16–17 or 16–18 is applied in a practical manner to study the accelerated motion of a rigid body which is *pin connected* to two other bodies, it should be realized that points which are *coincident at the pin* move with the *same acceleration*, since the path of motion over which they travel is the *same*. For example, point *B* lying on either rod *BA* or *BC* of the crank mechanism shown in Fig. 16–25*a* has the same acceleration, since the rods are pin connected at *B*. Here the motion of *B* is along a *circular path*, so that \mathbf{a}_B can be expressed in terms of its
tangential and normal components. At the other and of rod *BC* point C tangential and normal components. At the other end of rod *BC* point *C* moves along a *straight-lined path*, which is defined by the piston. Hence, \mathbf{a}_C is horizontal, Fig. 16–25*b*.

If two bodies contact one another *without slipping*, and the *points in contact* move along *different paths*, then the *tangential components* of acceleration of the points will be the *same*; however, the *normal components* will generally *not* be the same. For example, consider the two meshed gears in Fig. 16–26*a*. Point *A* is located on gear *B* and a two meshed gears in Fig. 16–26*a*. Point *A* is located on gear *B* and a coincident point *A'* is located on gear *C*. Due to the rotational motion, $(a_1) = (a_1)$: however since both points follow different circular paths coincident point A' is located on gear C. Due to the rotational motion,
 $(\mathbf{a}_A)_t = (\mathbf{a}_{A'})_t$; however, since both points follow different circular paths, $(\mathbf{a}_A)_t = (\mathbf{a}_{A'})_t$; however, since both points follow dif $(\mathbf{a}_A)_n \neq (\mathbf{a}_{A'})_n$ and therefore $\mathbf{a}_A \neq \mathbf{a}_{A'}$, Fig. 16–26*b*.

Procedure for Analysis

The relative acceleration equation can be applied between any two points *A* and *B* on a body either by using a Cartesian vector analysis, or by writing the *x* and *y* scalar component equations directly.

Velocity Analysis.

• Determine the angular velocity $\boldsymbol{\omega}$ of the body by using a velocity analysis as discussed in Sec. 16.5 or 16.6. Also, determine the velocities \mathbf{v}_A and \mathbf{v}_B of points *A* and *B* if these points move along
curved paths *curved paths*.

Vector Analysis

Kinematic Diagram.

- Establish the directions of the fixed *x, y* coordinates and draw the kinematic diagram of the body. Indicate on it \mathbf{a}_A , \mathbf{a}_B , $\boldsymbol{\omega}$, $\boldsymbol{\alpha}$, and $\mathbf{r}_{B/A}$.
- If points *A* and *B* move along *curved paths*, then their accelerations should be indicated in terms of their tangential and normal should be indicated in terms of their tangential and norr components, i.e., $\mathbf{a}_A = (\mathbf{a}_A)_t + (\mathbf{a}_A)_n$ and $\mathbf{a}_B = (\mathbf{a}_B)_t + (\mathbf{a}_B)_n$.

Acceleration Equation.

- Acceleration Equation.

 To apply $\mathbf{a}_B = \mathbf{a}_A + \alpha \times \mathbf{r}_{B/A} \omega^2 \mathbf{r}_{B/A}$, express the vectors in

Cartesian vector form and substitute them into the equation Cartesian vector form and substitute them into the equation. Evaluate the cross product and then equate the respective **i** and **j** components to obtain two scalar equations.
- If the solution yields a *negative* answer for an *unknown* magnitude, it indicates that the sense of direction of the vector is opposite to that shown on the kinematic diagram.

Scalar Analysis

Kinematic Diagram.

• If the acceleration equation is applied in scalar form, then the magnitudes and directions of the relative-acceleration components $(\mathbf{a}_{B/A})_t$ and $(\mathbf{a}_{B/A})_n$ must be established. To do this draw a kinematic
diagram such as shown in Fig. 16, 24g. Since the hody is considered diagram such as shown in Fig. 16–24*c*. Since the body is considered to be momentarily "pinned" at the base point *A*, the *magnitudes* of to be momentarily "pinned" at the base point A, the *magnitudes* of
these components are $(a_{B/A})_t = \alpha r_{B/A}$ and $(a_{B/A})_n = \omega^2 r_{B/A}$.
Their sense of direction is established from the diagram such that Their *sense of direction* is established from the diagram such that $(a_{B/A})_t$ acts perpendicular to $\mathbf{r}_{B/A}$, in accordance with the rotational
motion as of the hody and $(a_{B/A})$ is directed from *B* towards A^* motion α of the body, and $(\mathbf{a}_{B/A})_n$ is directed from *B* towards A ^{*}

Acceleration Equation.

Acceleration Equation.

• Represent the vectors in $\mathbf{a}_B = \mathbf{a}_A + (\mathbf{a}_{B/A})_t + (\mathbf{a}_{B/A})_n$ graphically

by chowing their meanitudes and directions underneath each by showing their magnitudes and directions underneath each term. The scalar equations are determined from the *x* and *y* components of these vectors.

*The notation $\mathbf{a}_B = \mathbf{a}_A + (\mathbf{a}_{B/A(pin)})_t + (\mathbf{a}_{B/A(pin)})_n$ may be helpful in recalling that *A* is assumed to be pinned.

The mechanism for a window is shown. Here *CA* rotates about a fixed axis through *C*, and *AB* undergoes general plane motion. Since point *A* moves along a curved path it has two components of acceleration, whereas point *B* moves along a straight track and the direction of its acceleration is specified.

The rod *AB* shown in Fig. 16–27*a* is confined to move along the inclined planes at *A* and *B*. If point *A* has an acceleration of 3 m/s^2 and a velocity of 2 m/s , both directed down the plane at the instant the rod is horizontal, determine the angular acceleration of the rod at this instant.

SOLUTION I (VECTOR ANALYSIS)

We will apply the acceleration equation to points *A* and *B* on the rod. To do so it is first necessary to determine the angular velocity of the To do so it is first necessary to determine the angular velocity of the rod. Show that it is $\omega = 0.283 \text{ rad/s}$ using either the velocity equation or the method of instantaneous centers.

Kinematic Diagram. Since points *A* and *B* both move along straight-line paths, they have *no* components of acceleration normal to the paths. There are two unknowns in Fig. 16–27*b*, namely, a_B and α .

Acceleration Equation.

$$
\mathbf{a}_B = \mathbf{a}_A + \alpha \times \mathbf{r}_{B/A} - \omega^2 \mathbf{r}_{B/A}
$$

$$
a_B \cos 45^\circ \mathbf{i} + a_B \sin 45^\circ \mathbf{j} = 3 \cos 45^\circ \mathbf{i} - 3 \sin 45^\circ \mathbf{j} + (\alpha \mathbf{k}) \times (10 \mathbf{i}) - (0.283)^2 (10 \mathbf{i})
$$

Carrying out the cross product and equating the **i** and **j** components yields

$$
a_B \cos 45^\circ = 3 \cos 45^\circ - (0.283)^2(10) \tag{1}
$$

$$
a_B \sin 45^\circ = -3 \sin 45^\circ + \alpha(10) \tag{2}
$$

Solving, we have

$$
a_B = 1.87 \text{ m/s}^2 \angle 45^\circ
$$

\n
$$
\alpha = 0.344 \text{ rad/s}^2 \text{ }
$$
Ans.

SOLUTION II (SCALAR ANALYSIS)

From the kinematic diagram, showing the relative-acceleration components $(\mathbf{a}_{B/A})_t$ and $(\mathbf{a}_{B/A})_n$, Fig. 16–27*c*, we have

$$
\mathbf{a}_B = \mathbf{a}_A + (\mathbf{a}_{B/A})_t + (\mathbf{a}_{B/A})_n
$$

\n
$$
\begin{bmatrix} a_B \\ \angle 45^\circ \end{bmatrix} = \begin{bmatrix} 3 \text{ m/s}^2 \\ 3 \text{ m/s}^2 \end{bmatrix} + \begin{bmatrix} \alpha(10 \text{ m}) \\ \uparrow \end{bmatrix} + \begin{bmatrix} (0.283 \text{ rad/s})^2(10 \text{ m}) \\ \leftarrow \end{bmatrix}
$$

Equating the *x* and *y* components yields Eqs. 1 and 2, and the solution proceeds as before.

At a given instant, the cylinder of radius *r*, shown in Fig. 16–28*a*, has an angular velocity ω and angular acceleration α . Determine the velocity and acceleration of its center *G* and the acceleration of the contact point at *A* if it rolls without slipping.

SOLUTION (VECTOR ANALYSIS)

Velocity Analysis. Since no slipping occurs, at the instant *A* **Velocity Analysis.** Since no slipping occurs, at the instant A contacts the ground, $v_A = 0$. Thus, from the kinematic diagram in Fig. 16.28b we have Fig. 16–28*b* we have

$$
\mathbf{v}_G = \mathbf{v}_A + \boldsymbol{\omega} \times \mathbf{r}_{G/A}
$$

\n
$$
v_G \mathbf{i} = \mathbf{0} + (-\boldsymbol{\omega}\mathbf{k}) \times (r\mathbf{j})
$$

\n
$$
v_G = \boldsymbol{\omega}r
$$
 (1) Ans.

This same result can also be obtained directly by noting that point *A* represents the instantaneous center of zero velocity.

Kinematic Diagram. Since the motion of *G* is always along a *straight line*, then its acceleration can be determined by taking the time derivative of its velocity, which gives

$$
a_G = \frac{dv_G}{dt} = \frac{d\omega}{dt}r
$$

\n
$$
a_G = \alpha r
$$
 (2) Ans.

Acceleration Equation. The magnitude and direction of a_A is
unknown Fig. 16.28c unknown, Fig. 16–28*c*.

$$
\mathbf{a}_G = \mathbf{a}_A + \boldsymbol{\alpha} \times \mathbf{r}_{G/A} - \omega^2 \mathbf{r}_{G/A}
$$

or $\mathbf{i} = (a_A)_x \mathbf{i} + (a_A)_y \mathbf{j} + (-\alpha \mathbf{k}) \times (r\mathbf{j}) - \omega^2(r\mathbf{j})$

Evaluating the cross product and equating the **i** and **j** components yields

$$
(a_A)_x = 0
$$
 Ans.

$$
(a_A)_y = \omega^2 r
$$
 Ans.

NOTE: The results, that $v_G = \omega r$ and $a_G = \alpha r$, can be applied to any circular object, such as a ball cylinder disk etc. that rolls without circular object, such as a ball, cylinder, disk, etc., that rolls *without* slipping. Also, the fact that $a_A = \omega^2 r$ indicates that the instantaneous circular object, such as a ball, cylinder, disk, etc., that rolls *with* slipping. Also, the fact that $a_A = \omega^2 r$ indicates that the instantane center of zero velocity, point *A*, is *not* a point of zero acceleration.

(a)

(b)

Fig. 16–29

The spool shown in Fig. 16–29*a* unravels from the cord, such that at the instant shown it has an angular velocity of 3 rad/s and an angular acceleration of 4 rad/s². Determine the acceleration of point *B*.

SOLUTION I (VECTOR ANALYSIS)

The spool "appears" to be rolling downward without slipping at point *A*. Therefore, we can use the results of Example 16.15 to determine the acceleration of point *G*, i.e.,

$$
a_G = \alpha r = (4 \text{ rad/s}^2)(0.5 \text{ ft}) = 2 \text{ ft/s}^2
$$

we will apply the acceleration equation to points *G* and *B*.
We will apply the acceleration equation to points *G* and *B*.

Kinematic Diagram. Point *B* moves along a *curved path* having an *unknown* radius of curvature.* Its acceleration will be represented by its unknown *x* and *y* components as shown in Fig. 16–29*b*.

Acceleration Equation.

$$
\mathbf{a}_B = \mathbf{a}_G + \boldsymbol{\alpha} \times \mathbf{r}_{B/G} - \omega^2 \mathbf{r}_{B/G}
$$

$$
(a_B)_x \mathbf{i} + (a_B)_y \mathbf{j} = -2\mathbf{j} + (-4\mathbf{k}) \times (0.75\mathbf{j}) - (3)^2 (0.75\mathbf{j})
$$

Equating the **i** and **j** terms, the component equations are
\n
$$
(a_B)_x = 4(0.75) = 3 \text{ ft/s}^2 \rightarrow
$$
\n(1)

$$
(aB)x = -(0.75) = -8.75 \text{ ft/s}^2 = 8.75 \text{ ft/s}^2 \downarrow (2)
$$

The magnitude and direction of \mathbf{a}_B are therefore

$$
a_B = \sqrt{(3)^2 + (8.75)^2} = 9.25 \text{ ft/s}^2
$$
 Ans.

$$
\theta = \tan^{-1} \frac{8.75}{3} = 71.1^{\circ}
$$

SOLUTION II (SCALAR ANALYSIS)

This problem may be solved by writing the scalar component equations directly. The kinematic diagram in Fig. 16–29*c* shows the

relative-acceleration components
$$
(\mathbf{a}_{B/G})_t
$$
 and $(\mathbf{a}_{B/G})_n$. Thus,
\n
$$
\mathbf{a}_B = \mathbf{a}_G + (\mathbf{a}_{B/G})_t + (\mathbf{a}_{B/G})_n
$$
\n
$$
\begin{bmatrix}\n(a_B)_x \\
\rightarrow\n\end{bmatrix} + \begin{bmatrix}\n(a_B)_y \\
\uparrow\n\end{bmatrix}
$$
\n
$$
= \begin{bmatrix}\n2 \text{ ft/s}^2 \\
\downarrow\n\end{bmatrix} + \begin{bmatrix}\n4 \text{ rad/s}^2 (0.75 \text{ ft}) \\
\rightarrow\n\end{bmatrix} + \begin{bmatrix}\n(3 \text{ rad/s})^2 (0.75 \text{ ft}) \\
\downarrow\n\end{bmatrix}
$$

The *x* and *y* components yield Eqs. 1 and 2 above.

*Realize that the path's radius of curvature ρ is not equal to the radius of the spool since the spool is not rotating about point G . Furthermore, ρ is not defined as the distance from *A* (*IC*) to *B*, since the location of the *IC* depends only on the velocity of a point and not the geometry of its path.

The collar *C* in Fig. 16–30*a* moves downward with an acceleration of 1 m/s^2 . At the instant shown, it has a speed of 2 m/s which gives links 1 m/s². At the instant shown, it has a speed of 2 m/s which gives links
 CB and *AB* an angular velocity $\omega_{AB} = \omega_{CB} = 10 \text{ rad/s}$. (See Example 16.8.) Determine the angular accelerations of *CB* and *AB* at this instant.

SOLUTION (VECTOR ANALYSIS) (a)

Kinematic Diagram. The kinematic diagrams of *both* links *AB* and *CB* are shown in Fig. 16–30*b*. To solve, we will apply the appropriate kinematic equation to each link.

Acceleration Equation.

Link AB (rotation about a fixed axis):
\n
$$
\mathbf{a}_B = \mathbf{\alpha}_{AB} \times \mathbf{r}_B - \omega_{AB}^2 \mathbf{r}_B
$$
\n
$$
\mathbf{a}_B = (\alpha_{AB} \mathbf{k}) \times (-0.2 \mathbf{j}) - (10)^2(-0.2 \mathbf{j})
$$
\n
$$
\mathbf{a}_B = 0.2 \alpha_{AB} \mathbf{i} + 20 \mathbf{j}
$$

Note that \mathbf{a}_B has *n* and *t* components since it moves along a *circular path*.

Link BC (general plane motion): Using the result for \mathbf{a}_B and applying \mathbf{a}_B and \mathbf{a}_B and \mathbf{a}_B Eq. 16–18, we have

$$
\mathbf{a}_B = \mathbf{a}_C + \alpha_{CB} \times \mathbf{r}_{B/C} - \omega_{CB}^2 \mathbf{r}_{B/C}
$$

\n
$$
0.2\alpha_{AB}\mathbf{i} + 20\mathbf{j} = -1\mathbf{j} + (\alpha_{CB}\mathbf{k}) \times (0.2\mathbf{i} - 0.2\mathbf{j}) - (10)^2(0.2\mathbf{i} - 0.2\mathbf{j})
$$

\n
$$
0.2\alpha_{AB}\mathbf{i} + 20\mathbf{j} = -1\mathbf{j} + 0.2\alpha_{CB}\mathbf{j} + 0.2\alpha_{CB}\mathbf{i} - 20\mathbf{i} + 20\mathbf{j}
$$

Thus,

$$
0.2\alpha_{AB} = 0.2\alpha_{CB} - 20
$$

20 = -1 + 0.2\alpha_{CB} + 20

Solving,

$$
\alpha_{CB} = 5 \text{ rad/s}^2 \text{)}
$$

\n
$$
\alpha_{AB} = -95 \text{ rad/s}^2 = 95 \text{ rad/s}^2 \text{)}
$$

\nAns.

 13.6° 45° (b) *B A C* $0.75 \cos 13.6^\circ$ ft *x y* 0.25 cos 45° ft **^r***C*/*^B* **a***C* ω_{BC} = 2.43 rad/s $\omega_{AB} = 10 \text{ rad/s}$
 $\omega_{AB} = 20 \text{ rad/s}$ $\alpha_{AB} = 20 \text{ rad/s}^2$ α_{BC}

Fig. 16–31

The crankshaft *AB* turns with a clockwise angular acceleration of 20 rad/s^2 , Fig. 16–31*a*. Determine the acceleration of the piston at the 20 rad/s², Fig. 16–31*a*. Determine the acceleration of the piston at the instant *AB* is in the position shown. At this instant $\omega_{AB} = 10 \text{ rad/s}$ instant *AB* is in the position shown. At the and $\omega_{BC} = 2.43 \text{ rad/s}$ (See Example 16.13.)

SOLUTION (VECTOR ANALYSIS)

Kinematic Diagram. The kinematic diagrams for both *AB* and *BC* are shown in Fig. 16–31*b*. Here \mathbf{a}_C is vertical since *C* moves along a straight line path straight-line path.

Acceleration Equation. Expressing each of the position vectors in Cartesian vector form

$$
\mathbf{r}_B = \{-0.25 \sin 45^\circ \mathbf{i} + 0.25 \cos 45^\circ \mathbf{j}\} \text{ ft} = \{-0.177\mathbf{i} + 0.177\mathbf{j}\} \text{ ft}
$$

$$
\mathbf{r}_{C/B} = \{0.75 \sin 13.6^{\circ} \mathbf{i} + 0.75 \cos 13.6^{\circ} \mathbf{j}\} \text{ ft} = \{0.177 \mathbf{i} + 0.729 \mathbf{j}\} \text{ ft}
$$

Crankshaft AB (rotation about a fixed axis):

$$
\mathbf{a}_B = \boldsymbol{\alpha}_{AB} \times \mathbf{r}_B - \omega_{AB}^2 \mathbf{r}_B
$$

= (-20k) × (-0.177i + 0.177j) - (10)²(-0.177i + 0.177j)
= {21.21i - 14.14j} ft/s²

Connecting Rod BC (general plane motion): Using the result for \mathbf{a}_B
and noting that \mathbf{a}_B is in the vertical direction, we have and noting that \mathbf{a}_C is in the vertical direction, we have

 $\mathbf{a}_C = \mathbf{a}_B + \boldsymbol{\alpha}_{BC} \times \mathbf{r}_{C/B} - \omega_{BC}^2 \mathbf{r}_{C/B}$ $a_C = a_B + \alpha_{BC} \times r_{C/B} - \omega_{BC} r_{C/B}$
 a_C **j** = 21.21**i** - 14.14**j** + (α_{BC} **k**) × (0.177**i** + 0.729**j**) - (2.43)²(0.177**i** + 0.729**j**) $a_C = 0.177\alpha_{BC} - 18.45$ $0 = 20.17 - 0.729\alpha_{BC}$ a_{C} **j** = 21.21**i** - 14.14**j** + 0.177 α_{BC} **j** - 0.729 α_{BC} **i** - 1.04**i** - 4.30**j**

Solving yields

$$
\alpha_{BC} = 27.7 \text{ rad/s}^2 \text{ }^2
$$

$$
a_C = -13.5 \text{ ft/s}^2
$$
Ans.

NOTE: Since the piston is moving upward, the negative sign for a_C **NOTE:** Since the piston is moving upward, the negative sign for a_C indicates that the piston is decelerating, i.e., $\mathbf{a}_C = \{-13.5\}$ ft/s². This causes the speed of the piston to decrease until *AB* becomes vertica causes the speed of the piston to decrease until *AB* becomes vertical, at which time the piston is momentarily at rest. $2.$ This

16.8 [Relative-Motion Analysis using](#page-14-0) Rotating Axes

In the previous sections the relative-motion analysis for velocity and acceleration was described using a translating coordinate system. This type of analysis is useful for determining the motion of points on the *same* rigid body, or the motion of points located on several pin-connected bodies. In some problems, however, rigid bodies (mechanisms) are constructed such that *sliding* will occur at their connections.The kinematic analysis for such cases is best performed if the motion is analyzed using a coordinate system which both *translates* and *rotates*. Furthermore, this frame of reference is useful for analyzing the motions of two points on a mechanism which are *not* located in the *same* body and for specifying the kinematics of particle motion when the particle moves along a rotating path.

In the following analysis two equations will be developed which relate the velocity and acceleration of two points, one of which is the origin of a moving frame of reference subjected to both a translation and a rotation in the plane.*

Position. Consider the two points *A* and *B* shown in Fig. 16–32*a*. Their location is specified by the position vectors \mathbf{r}_A and \mathbf{r}_B , which are measured with respect to the fixed *Y*, *Y*, *Z* coordinate system. As shown measured with respect to the fixed *X, Y, Z* coordinate system. As shown in the figure, the "base point" *A* represents the origin of the *x, y, z* coordinate system, which is assumed to be both translating and rotating with respect to the *X, Y, Z* system. The position of *B* with respect to *A* is specified by the relative-position vector $\mathbf{r}_{B/A}$. The components of this vector may be expressed either in terms of unit vectors along the *Y Y* vector may be expressed either in terms of unit vectors along the *X, Y* axes, i.e.,**I** and **J**, or by unit vectors along the *x, y* axes, i.e., **i** and **j**. For the development which follows, $\mathbf{r}_{B/A}$ will be measured with respect to the moving \mathbf{r} w frame of reference. Thus, if *B* has coordinates $(\mathbf{r} - \mathbf{v})$. Fig. moving *x*, *y* frame of reference. Thus, if *B* has coordinates (x_B, y_B) , Fig. 16–32*a* then 16–32*a*, then

$$
\mathbf{r}_{B/A} = x_B \mathbf{i} + y_B \mathbf{j}
$$

Using vector addition, the three position vectors in Fig. 16–32*a* are related by the equation

$$
\mathbf{r}_B = \mathbf{r}_A + \mathbf{r}_{B/A} \tag{16-19}
$$

At the instant considered, point *A* has a velocity v_A and an acceleration a_A , while the angular velocity and angular acceleration of the *x*, *y* axes \mathbf{a}_A , while the angular velocity and angular as
are Ω (omega) and $\dot{\Omega} = d\Omega/dt$, respectively. #

*The more general, three-dimensional motion of the points is developed in Sec. 20.4.

Velocity. The velocity of point *B* is determined by taking the time derivative of Eq. 16–19, which yields

$$
\mathbf{v}_B = \mathbf{v}_A + \frac{d\mathbf{r}_{B/A}}{dt} \tag{16-20}
$$

The last term in this equation is evaluated as follows:

$$
\frac{d\mathbf{r}_{B/A}}{dt} = \frac{d}{dt}(x_B \mathbf{i} + y_B \mathbf{j})
$$

$$
= \frac{dx_B}{dt} \mathbf{i} + x_B \frac{d\mathbf{i}}{dt} + \frac{dy_B}{dt} \mathbf{j} + y_B \frac{d\mathbf{j}}{dt}
$$

$$
= \left(\frac{dx_B}{dt} \mathbf{i} + \frac{dy_B}{dt} \mathbf{j}\right) + \left(x_B \frac{d\mathbf{i}}{dt} + y_B \frac{d\mathbf{j}}{dt}\right) \qquad (16-21)
$$

The two terms in the first set of parentheses represent the components of velocity of point *B* as measured by an observer attached to the moving *x, y, z* coordinate system. These terms will be denoted by vector $(\mathbf{v}_{B/A})_{xyz}$. In the second set of parentheses the instantaneous time rate of change of the unit vectors **i** and **j** is measured by an observer located in the fixed *X, Y, Z* coordinate system. These changes, *d***i** and *d***j**, are due in the fixed X, Y, Z coordinate system. These changes, di and dj, are due
 only to the *rotation* $d\theta$ of the *x*, y, z axes, causing i to become i' = i + di

and i to become i' = i + di Fig 16–32b. As shown the *magni* only to the rotation $d\theta$ of the x, y, z axes, causing **i** to become $\mathbf{i}' = \mathbf{i} + d\mathbf{j}$ and \mathbf{j} to become $\mathbf{j}' = \mathbf{j} + d\mathbf{j}$, Fig. 16–32*b*. As shown, the *magnitudes* of hoth *d* and *d* equal 1 *d* θ since and **j** to become $\mathbf{j}' = \mathbf{j} + d\mathbf{j}$, Fig. 16–32*b*. As shown, the *magnitudes* of both *d***i** and *d***j** equal 1 *d* θ , since *i* = *i'* = *j* = *j'* = 1. The *direction* of *d***i** is defined by $+\mathbf{i}$, since *d***i** is defined by $+j$, since di is tangent to the path described by the is defined by $+\mathbf{j}$, since *d***i** is tangent to the path described by the arrowhead of **i** in the limit as $\Delta t \rightarrow dt$. Likewise, *d***j** acts in the $-\mathbf{i}$ direction Fig. 16–32*b*. Hence direction, Fig. 16–32*b*. Hence,

$$
\frac{d\mathbf{i}}{dt} = \frac{d\theta}{dt}(\mathbf{j}) = \Omega \mathbf{j} \qquad \frac{d\mathbf{j}}{dt} = \frac{d\theta}{dt}(-\mathbf{i}) = -\Omega \mathbf{i}
$$

Viewing the axes in three dimensions, Fig. $16-32c$, and noting that **k**, we can express the above derivatives in terms of the cross product as

$$
\frac{d\mathbf{i}}{dt} = \mathbf{\Omega} \times \mathbf{i} \qquad \frac{d\mathbf{j}}{dt} = \mathbf{\Omega} \times \mathbf{j} \tag{16-22}
$$

Substituting these results into Eq. 16–21 and using the distributive property of the vector cross product, we obtain

$$
\frac{d\mathbf{r}_{B/A}}{dt} = (\mathbf{v}_{B/A})_{xyz} + \mathbf{\Omega} \times (x_B \mathbf{i} + y_B \mathbf{j}) = (\mathbf{v}_{B/A})_{xyz} + \mathbf{\Omega} \times \mathbf{r}_{B/A} \ (16-23)
$$

Fig. 16–32 (cont.)

Hence, Eq. 16–20 becomes

$$
\mathbf{v}_B = \mathbf{v}_A + \mathbf{\Omega} \times \mathbf{r}_{B/A} + (\mathbf{v}_{B/A})_{xyz}
$$
 (16–24)

where

- \mathbf{v}_B = velocity of *B*, measured from the *X*, *Y*, *Z* reference
- \mathbf{v}_A = velocity of the origin *A* of the *x, y, z* reference, measured from the *X, Y, Z* reference
- $(\mathbf{v}_{B/A})_{xyz}$ = velocity of "*B* with respect to *A*," as measured by an observer attached to the rotating x y z reference observer attached to the rotating *x, y, z* reference
	- Ω = angular velocity of the *x*, *y*, *z* reference, measured from the *X, Y, Z* reference
	- $\mathbf{r}_{B/A}$ = position of B with respect to A

Comparing Eq. 16–24 with Eq. 16–16 ($\mathbf{v}_B = \mathbf{v}_A + \mathbf{\Omega} \times \mathbf{r}_{B/A}$), which is valid for a translating frame of reference it can be seen that the only valid for a translating frame of reference, it can be seen that the only difference between these two equations is represented by the term $(\mathbf{v}_{B/A})_{xyz}$.

When applying Eq. 16–24 it is often useful to understand what each of the terms represents. In order of appearance, they are as follows:

v_B	absolute velocity of B from the X, Y, Z frame (equals)		
v_A	\n $\begin{cases}\n \text{absolute velocity of theorigin of x, y, z frame(plus)\n \end{cases}$ \n	\n $\begin{cases}\n \text{absolute velocity of theorigin of x, y, z frame(plus)\n \end{cases}$ \n	\n $\begin{cases}\n \text{motion of } X, y, z \text{ frame}\n \end{cases}$ \n
$\Omega \times r_{B/A}$	\n $\begin{cases}\n \text{angular velocity effect causedby rotation of x, y, z frame(plus)\n \end{cases}$ \n	\n $\begin{cases}\n \text{average to the velocity of thediscrete force in thex, y, z framevalues\n \end{cases}$ \n	

Acceleration. The acceleration of *B*, observed from the *X, Y, Z* coordinate system, may be expressed in terms of its motion measured with respect to the rotating system of coordinates by taking the time derivative of Eq. 16–24.

$$
\frac{d\mathbf{v}_B}{dt} = \frac{d\mathbf{v}_A}{dt} + \frac{d\Omega}{dt} \times \mathbf{r}_{B/A} + \Omega \times \frac{d\mathbf{r}_{B/A}}{dt} + \frac{d(\mathbf{v}_{B/A})_{xyz}}{dt}
$$
\n
$$
\mathbf{a}_B = \mathbf{a}_A + \dot{\Omega} \times \mathbf{r}_{B/A} + \Omega \times \frac{d\mathbf{r}_{B/A}}{dt} + \frac{d(\mathbf{v}_{B/A})_{xyz}}{dt} \tag{16-25}
$$

Here $\Omega = d\Omega/dt$ is the angular acceleration of the *x*, *y*, *z* coordinate system. Since Ω is always perpendicular to the plane of motion, then a measures *only the change in magnitude* of Ω . The derivative $d\mathbf{r}_{B/A}/dt$ is defined by Eq. 16–23, so that defined by Eq. 16–23, so that = $d\Omega/dt$

$$
\Omega \times \frac{d\mathbf{r}_{B/A}}{dt} = \Omega \times (\mathbf{v}_{B/A})_{xyz} + \Omega \times (\Omega \times \mathbf{r}_{B/A})
$$
 (16–26)

Finding the time derivative of $(\mathbf{v}_{B/A})_{xyz} = (v_{B/A})_{x}\mathbf{i} + (v_{B/A})_{y}\mathbf{j}$,

$$
\frac{d(\mathbf{v}_{B/A})_{xyz}}{dt} = \left[\frac{d(v_{B/A})_x}{dt}\mathbf{i} + \frac{d(v_{B/A})_y}{dt}\mathbf{j}\right] + \left[(v_{B/A})_x\frac{d\mathbf{i}}{dt} + (v_{B/A})_y\frac{d\mathbf{j}}{dt}\right]
$$

The two terms in the first set of brackets represent the components of acceleration of point *B* as measured by an observer attached to the rotating coordinate system. These terms will be denoted by $(\mathbf{a}_{B/A})_{xyz}$. The terms in the second set of brackets can be simplified using Eqs. 16.22 terms in the second set of brackets can be simplified using Eqs. 16–22.

$$
\frac{d(\mathbf{v}_{B/A})_{xyz}}{dt} = (\mathbf{a}_{B/A})_{xyz} + \mathbf{\Omega} \times (\mathbf{v}_{B/A})_{xyz}
$$

Substituting this and Eq. 16–26 into Eq. 16–25 and rearranging terms,

$$
\mathbf{a}_B = \mathbf{a}_A + \dot{\Omega} \times \mathbf{r}_{B/A} + \Omega \times (\Omega \times \mathbf{r}_{B/A}) + 2\Omega \times (\mathbf{v}_{B/A})_{xyz} + (\mathbf{a}_{B/A})_{xyz}
$$
\n(16–27)

where

æ

 \mathbf{a}_B = acceleration of *B*, measured from the *X*, *Y*, *Z* reference reference

- reference
 \mathbf{a}_A = acceleration of the origin *A* of the *x, y, z*

reference measured from the *X V Z* reference reference, measured from the *X, Y, Z* reference
- Free tence, measured from the *A*, *I*, *Z* reference
 $(\mathbf{a}_{B/A})_{xyz}$, $(\mathbf{v}_{B/A})_{xyz}$ = acceleration and velocity of *B* with respect to *A*,

as measured by an observer attached to the as measured by an observer attached to the *rotating x, y, z* reference æ
	- Ω , Ω = angular acceleration and angular velocity of the *x, y, z* reference, measured from the *X, Y, Z* reference , $\Omega =$

 $\mathbf{r}_{B/A}$ = position of *B* with respect to *A*

If Eq. 16–27 is compared with Eq. 16–18, written in the form If Eq. 16–27 is compared with Eq. 16–18, written in the form $\mathbf{a}_B = \mathbf{a}_A + \dot{\mathbf{\Omega}} \times \mathbf{r}_{B/A} + \mathbf{\Omega} \times (\mathbf{\Omega} \times \mathbf{r}_{B/A})$, which is valid for a translating from a of reference it can be seen that the difference between frame of reference, it can be seen that the difference between these two frame of reference, it can be seen that the difference between these two
equations is represented by the terms $20 \times (\mathbf{v}_{B/A})_{xyz}$ and $(\mathbf{a}_{B/A})_{xyz}$. In
particular $20 \times (\mathbf{v}_{B/A})$ is called the *Coriolis acceleration* nam equations is represented by the terms $2\Omega \times (\mathbf{v}_{B/A})_{xyz}$ and $(\mathbf{a}_{B/A})_{xyz}$. In particular, $2\Omega \times (\mathbf{v}_{B/A})_{xyz}$ is called the *Coriolis acceleration*, named after the Franch opening or G. C. Coriolis who was the first to the French engineer G. C. Coriolis, who was the first to determine it. This term represents the difference in the acceleration of *B* as measured from nonrotating and rotating *x, y, z* axes. As indicated by the vector cross æproduct, the Coriolis acceleration will *always* be perpendicular to both and $(\mathbf{v}_{B/A})_{xyz}$. It is an important component of the acceleration which must be considered whenever rotating reference frames are used. This must be considered whenever rotating reference frames are used. This often occurs, for example, when studying the accelerations and forces which act on rockets, long-range projectiles, or other bodies having motions whose measurements are significantly affected by the rotation of the earth.

The following interpretation of the terms in Eq. 16–27 may be useful when applying this equation to the solution of problems.

\mathbf{a}_B	Substitute acceleration of B	motion of B observed from the X, Y, Z frame
\mathbf{a}_A	$\left\{\text{absolute acceleration of the}$	from the X, Y, Z frame
\mathbf{a}_A	$\left\{\text{absolute acceleration of the}$	from the X, Y, Z frame
\mathbf{a}_A	$\left\{\text{absolute acceleration effect}$	from the X, Y, Z frame
\mathbf{a}_B	$\left\{\text{angular acceleration effect}$	from the X, Y, Z frame
\mathbf{a}_B	$\left\{\text{angular velocity effect caused by rotation of } X, y, z \text{ frame}$	observed from the X, Y, Z frame
\mathbf{a}_B	$\left\{\text{output of } X, y, z \text{ frame}\right\}$	from the X, Y, Z frame
$\left\{\text{exists}$	$\left\{\text{probability of the } X, Y, Z \text{ frame}\right\}$	from the X, Y, Z frame
$\left\{\text{exists of } X, Y, Z \text{ frame}\right\}$	from the X, Y, Z frame	
$\left\{\text{exists of } X, Y, Z \text{ frame}\right\}$	from the X, Y, Z frame	
$\left\{\text{exists of } X, Y, Z \text{ frame}\right\}$	from the X, Y, Z frame	

Procedure for Analysis

Equations 16–24 and 16–27 can be applied to the solution of problems involving the planar motion of particles or rigid bodies using the following procedure.

Coordinate Axes.

- Choose an appropriate location for the origin and proper orientation of the axes for both fixed *X*, *Y*, *Z* and moving *x*, *y*, *z* reference frames.
- Most often solutions are easily obtained if at the instant considered:
	- 1. the origins are coincident
	- 2. the corresponding axes are collinear
	- 3. the corresponding axes are parallel
- The moving frame should be selected fixed to the body or device along which the relative motion occurs.

Kinematic Equations.

• After defining the origin *A* of the moving reference and specifying the moving point *B*, Eqs. 16–24 and 16–27 should be written in symbolic form

 $\mathbf{v}_B = \mathbf{v}_A + \mathbf{\Omega}$
 $\mathbf{a}_B = \mathbf{a}_A + \dot{\mathbf{\Omega}}$ $\mathbf{v}_B = \mathbf{v}_A + \mathbf{\Omega} \times \mathbf{r}_{B/A} + (\mathbf{v}_{B/A})_{xyz}$

 $\mathbf{a}_B = \mathbf{a}_A + \dot{\mathbf{\Omega}} \times \mathbf{r}_{B/A} + \mathbf{\Omega} \times (\mathbf{\Omega} \times \mathbf{r}_{B/A}) + 2\mathbf{\Omega} \times (\mathbf{v}_{B/A})_{xyz} + (\mathbf{a}_{B/A})_{xyz}$

- The Cartesian components of all these vectors may be expressed along either the *X, Y, Z* axes or the *x, y, z* axes. The choice is arbitrary provided a consistent set of unit vectors is used. æ
- Motion of the moving reference is expressed by v_A , a_A , Ω , and and and motion of *B* with respect to the moving reference is expressed by $\mathbf{r}_{B/A}$, $(\mathbf{v}_{B/A})_{xyz}$, and $(\mathbf{a}_{B/A})_{xyz}$. **v**_A, **a**_A, Ω , and $\dot{\Omega}$;
reprocess is expressed

The rotation of the dumping bin of the truck about point *C* is operated by the extension of the hydraulic cylinder *AB*.To determine the rotation of the bin due to this extension, we can use the equations of relative motion and fix the *x, y* axes to the cylinder so that the relative motion of the cylinder's extension occurs along the *y* axis.

EXAMPLE 16.19

At the instant $\theta = 60^{\circ}$, the rod in Fig. 16–33 has an angular velocity of 3 rad/s and an angular acceleration of 2 rad/s^2 . At this same instant, 3 rad/s and an angular acceleration of 2 rad/s². At this same instant,
collar *C* travels outward along the rod such that when $x = 0.2$ m the
velocity is 2 m/s and the acceleration is 3 m/s² both measured velocity is 2 m/s and the acceleration is 3 m/s^2 , both measured relative to the rod. Determine the Coriolis acceleration and the velocity and acceleration of the collar at this instant.

SOLUTION

Coordinate Axes. The origin of both coordinate systems is located at point *O*, Fig. 16–33. Since motion of the collar is reported relative to the rod, the moving *x, y, z* frame of reference is *attached* to the rod.

Kinematic Equations.
\n
$$
\mathbf{v}_C = \mathbf{v}_O + \mathbf{\Omega} \times \mathbf{r}_{C/O} + (\mathbf{v}_{C/O})_{xyz}
$$
\n
$$
\mathbf{a}_C = \mathbf{a}_O + \dot{\mathbf{\Omega}} \times \mathbf{r}_{C/O} + \mathbf{\Omega} \times (\mathbf{\Omega} \times \mathbf{r}_{C/O}) + 2\mathbf{\Omega} \times (\mathbf{v}_{C/O})_{xyz} + (\mathbf{a}_{C/O})_{xyz}
$$
\n(1)

It will be simpler to express the data in terms of **i**, **j**, **k** component vectors rather than **I**, **J**, **K** components. Hence,

The Coriolis acceleration is defined as

a_{Cor} = 2 Ω × ($\mathbf{v}_{C/O}$)_{*xyz*} = 2(-3**k**) × (2**i**) = {-12**j**} m/s² *Ans.* 2

This vector is shown dashed in Fig. 16–33. If desired, it may be resolved into **I**, **J** components acting along the *X* and *Y* axes, respectively.

The velocity and acceleration of the collar are determined by substituting the data into Eqs. 1 and 2 and evaluating the cross products, which yields

which yields
\n
$$
\mathbf{v}_C = \mathbf{v}_O + \mathbf{\Omega} \times \mathbf{r}_{C/O} + (\mathbf{v}_{C/O})_{xyz}
$$
\n
$$
= \mathbf{0} + (-3\mathbf{k}) \times (0.2\mathbf{i}) + 2\mathbf{i}
$$
\n
$$
= \{2\mathbf{i} - 0.6\mathbf{j}\} \text{ m/s}
$$
\n
$$
\mathbf{a}_C = \mathbf{a}_O + \dot{\mathbf{\Omega}} \times \mathbf{r}_{C/O} + \mathbf{\Omega} \times (\mathbf{\Omega} \times \mathbf{r}_{C/O}) + 2\mathbf{\Omega} \times (\mathbf{v}_{C/O})_{xyz} + (\mathbf{a}_{C/O})_{xyz}
$$
\n
$$
= \mathbf{0} + (-2\mathbf{k}) \times (0.2\mathbf{i}) + (-3\mathbf{k}) \times [(-3\mathbf{k}) \times (0.2\mathbf{i})] + 2(-3\mathbf{k}) \times (2\mathbf{i}) + 3\mathbf{i}
$$
\n
$$
= \mathbf{0} - 0.4\mathbf{j} - 1.80\mathbf{i} - 12\mathbf{j} + 3\mathbf{i}
$$
\n
$$
= \{1.20\mathbf{i} - 12.4\mathbf{j}\} \text{ m/s}^2
$$
\nAns.

$$
\n
$$
(v_{C/D})_{xyz} = 1.2 \text{ m/s}
$$
\n
$$
\omega_{DE} = 3 \text{ rad/s} \sqrt{a}
$$
\n
$$
\mathbf{a}_C = \mathbf{a}_D + \mathbf{\Omega} \times \mathbf{r}_{C/D} + \mathbf{\Omega} \times (\mathbf{\Omega} \times \mathbf{r}_{C/D}) + 2\mathbf{\Omega} \times (\mathbf{v}_{C/D})_{xyz} + (\mathbf{a}_{C/D})_{xyz}
$$
\n
$$
-2\mathbf{i} - 5.2\mathbf{j} = \mathbf{0} + (-\alpha_{DE}\mathbf{k}) \times (0.4\mathbf{i}) + (-3\mathbf{k}) \times [(-3\mathbf{k}) \times (0.4\mathbf{i})]
$$
\n
$$
+ 2(-3\mathbf{k}) \times (1.2\mathbf{i}) + (a_{C/D})_{xyz}\mathbf{i}
$$
\n
$$
-2\mathbf{i} - 5.2\mathbf{j} = -0.4\alpha_{DE}\mathbf{j} - 3.6\mathbf{i} - 7.2\mathbf{j} + (a_{C/D})_{xyz}\mathbf{i}
$$
\n
$$
(a_{C/D})_{xyz} = 1.6 \text{ m/s}^2
$$
\n
$$
\alpha_{DE} = -5 \text{ rad/s}^2 = 5 \text{ rad/s}^2 \sqrt{a}
$$
\n*Ans.*

EXAMPLE 16.21

Planes *A* and *B* fly at the same elevation and have the motions shown in Fig. 16–35. Determine the velocity and acceleration of *A* as measured by the pilot of *B*.

SOLUTION

Coordinate Axes. Since the relative motion of *A* with respect to the pilot in *B* is being sought, the *x, y, z* axes are attached to plane *B*, Fig. 16–35. At the *instant* considered, the origin *B* coincides with the origin of the fixed *X, Y, Z* frame.

Kinematic Equations.
\n
$$
\mathbf{v}_A = \mathbf{v}_B + \mathbf{\Omega} \times \mathbf{r}_{A/B} + (\mathbf{v}_{A/B})_{xyz}
$$
\n
$$
\mathbf{a}_A = \mathbf{a}_B + \dot{\mathbf{\Omega}} \times \mathbf{r}_{A/B} + \mathbf{\Omega} \times (\mathbf{\Omega} \times \mathbf{r}_{A/B}) + 2\mathbf{\Omega} \times (\mathbf{v}_{A/B})_{xyz} + (\mathbf{a}_{A/B})_{xyz}
$$
\n(2)

Motion of Moving Reference:
\n
$$
\mathbf{v}_B = \{600\mathbf{j}\} \text{ km/h}
$$
\n
$$
(a_B)_n = \frac{v_B^2}{\rho} = \frac{(600)^2}{400} = 900 \text{ km/h}^2
$$
\n
$$
\mathbf{a}_B = (\mathbf{a}_B)_n + (\mathbf{a}_B)_t = \{900\mathbf{i} - 100\mathbf{j}\} \text{ km/h}^2
$$
\n
$$
\Omega = \frac{v_B}{\rho} = \frac{600 \text{ km/h}}{400 \text{ km}} = 1.5 \text{ rad/h} \quad \Omega = \{-1.5\mathbf{k}\} \text{ rad/h}
$$
\n
$$
\dot{\Omega} = \frac{(a_B)_t}{\rho} = \frac{100 \text{ km/h}^2}{400 \text{ km}} = 0.25 \text{ rad/h}^2 \quad \dot{\Omega} = \{0.25\mathbf{k}\} \text{ rad/h}^2
$$

Motion of A with Respect to Moving Reference:

for the connecting arm when $\theta = 0^{\circ}, 90^{\circ}, 180^{\circ}$, and 270°. Also, how was the curvature of the head at E determined, and why is it curved in this way?

P16–3. The bi-fold hangar door is opened by cables that move upward at a constant speed. Determine the position θ of panel BC when the angular velocity of BC is equal but opposite to the angular velocity of \overrightarrow{AB} . Also, what is this angular velocity? Panel BC is pinned at C and has a height which is different from the height of BA . Use appropriate numerical values to explain your result numerical values to explain your result.

P16–4. If the tires do not slip on the pavement, determine the points on the tire that have a maximum and minimum speed and the points that have a maximum and minimum acceleration. Use appropriate numerical values for the car's speed and tire size to explain your result.

P16–2 P16–4

CHAPTER REVIEW

Rigid-Body Planar Motion

A rigid body undergoes three types of planar motion: translation, rotation about a fixed axis, and general plane motion.

Translation

When a body has rectilinear translation, all the particles of the body travel along parallel straight-line paths. If the paths have the same radius of curvature, then curvilinear translation occurs. Provided we know the motion of one of the particles, then the motion of all of the others is also known.

Rotation about a Fixed Axis

For this type of motion, all of the particles move along circular paths. Here, all line segments in the body undergo the same angular displacement, angular velocity, and angular acceleration.

Once the angular motion of the body is known, then the velocity of any particle a distance *r* from the axis can be obtained.

The acceleration of any particle has two components. The tangential component accounts for the change in the magnitude of the velocity, and the normal component accounts for the change in the velocity's direction.

General Plane Motion

When a body undergoes general plane motion, it simultaneously translates and rotates. There are several methods for analyzing this motion.

Absolute Motion Analysis

If the motion of a point on a body or the angular motion of a line is known, then it may be possible to relate this motion to that of another point or line using an absolute motion analysis. To do so, linear position coordinates *s* or angular position coordinates θ are established (measured from a fixed point or line). These position coordinates are then related using the geometry of the body. The time derivative of this equation gives the relationship between the velocities and/or the angular velocities. A second time derivative relates the accelerations and/or the angular accelerations.

Relative-Motion using Translating Axes

General plane motion can also be analyzed using a relative-motion analysis between two points *A* and *B* located on the body. This method considers the motion in parts: first a translation of the selected base point *A*, then a relative "rotation" of the body about point *A*, which is measured from a translating axis. Since the relative motion is viewed as circular motion about the base point, point *B* will have a velocity $\mathbf{v}_{B/A}$ that is tangent to the circle. It also has two components of acceleration, $(\mathbf{a}_{B/A})_t$ and $(\mathbf{a}_{B/A})_n$. It is also important to reaching that $\mathbf{a}_{B/A}$ by will have to rescribe and realize that \mathbf{a}_A and \mathbf{a}_B will have tangential and \mathbf{a}_B **a** $\mathbf{$ normal components if these points move along curved paths.

Instantaneous Center of Zero Velocity

If the base point *A* is selected as having zero velocity, then the relative velocity equation velocity, then the relative velocity equation
becomes $\mathbf{v}_B = \boldsymbol{\omega} \times \mathbf{r}_{B/A}$. In this case, motion appears as if the body rotates about an instantaneous axis passing through A .

The instantaneous center of rotation (*IC*) can be established provided the directions of the velocities of any two points on the body are known, or the velocity of a point and the angular velocity are known. Since a radial line *r* will always be perpendicular to each velocity, then the *IC* is at the point of intersection of these two radial lines. Its measured location is determined from the geometry of the body. Once it is established, then the velocity of any point *P* on the body can be determined from $v = \omega r$, where *r* extends from the *IC* to point *P*.

Relative Motion using Rotating Axes

Problems that involve connected members that slide relative to one another or points not located on the same body can be analyzed using a relative-motion analysis referenced from a rotating frame. This gives rise to the from a rotating frame. This gives rise to the
term $2\Omega \times (\mathbf{v}_{B/A})_{xyz}$ that is called the Coriolis
assolution acceleration.

 $\mathbf{a}_B = \mathbf{a}_A + \boldsymbol{\alpha} \times \mathbf{r}_{B/A} - \omega^2 \mathbf{r}_{B/A}$ $\mathbf{v}_B = \mathbf{v}_A + \boldsymbol{\omega} \times \mathbf{r}_{B/A}$

 $\mathbf{v}_B = \mathbf{v}_A + \mathbf{\Omega} \times \mathbf{r}_{B/A} + (\mathbf{v}_{B/A})_{xyz}$

$$
\mathbf{a}_B = \mathbf{a}_A + \dot{\Omega} \times \mathbf{r}_{B/A} + \Omega \times (\Omega \times \mathbf{r}_{B/A}) + 2\Omega \times (\mathbf{v}_{B/A})_{xyz} + (\mathbf{a}_{B/A})_{xyz}
$$

The forces acting on this dragster as it begins to accelerate are quite severe and must be accounted for in the design of its structure.

Planar Kinetics of a [Rigid Body: Force and](#page-14-0) Planar Kinetics of a
Rigid Body: Force and
Acceleration

[CHAPTER OBJECTIVES](#page-14-0)

- To introduce the methods used to determine the mass moment of inertia of a body.
- To develop the planar kinetic equations of motion for a symmetric rigid body.
- To discuss applications of these equations to bodies undergoing translation, rotation about a fixed axis, and general plane motion.

17.1 [Mass Moment of Inertia](#page-14-0)

Since a body has a definite size and shape, an applied nonconcurrent force system can cause the body to both translate and rotate. The translational aspects of the motion were studied in Chapter 13 and are governed by the aspects of the motion were studied in Chapter 13 and are governed by the equation $\mathbf{F} = m\mathbf{a}$. It will be shown in the next section that the rotational aspects caused by a moment **M** are governed by an equation of th aspects, caused by a moment **M**, are governed by an equation of the form **M** = $I\alpha$. The symbol *I* in this equation is termed the mass moment of inertia By comparison the moment of inertia is a measure of the resistance $M = I\alpha$. The symbol *I* in this equation is termed the mass moment of inertia. By comparison, the *moment of inertia* is a measure of the resistance inertia. By comparison, the *moment of inertia* is a measure of the resistance
of a body to *angular acceleration* ($\mathbf{M} = I\boldsymbol{\alpha}$) in the same way that *mass* is
a measure of the body's resistance to *acceleration* ($\$ a measure of the body's resistance to *acceleration* ($\mathbf{F} = m\mathbf{a}$).

The flywheel on the engine of this tractor has a large moment of inertia about its axis of rotation. Once it is set into motion, it will be difficult to stop, and this in turn will prevent the engine from stalling and instead will allow it to maintain a constant power.

We define the *moment of inertia* as the integral of the "second moment" about an axis of all the elements of mass *dm* which compose the body.* For example, the body's moment of inertia about the *z* axis in Fig. 17–1 is

$$
I = \int_{m} r^2 dm \qquad (17-1)
$$

Here the "moment arm" *r* is the perpendicular distance from the *z* axis to the arbitrary element *dm*. Since the formulation involves *r*, the value of *I* is different for each axis about which it is computed. In the study of planar kinetics, the axis chosen for analysis generally passes through the body's mass center *G* and is always perpendicular to the plane of motion. The moment of inertia about this axis will be denoted as I_G . Since *r* is some and in Eq. 17–1, the mass moment of inertia is always a *nositive* squared in Eq. 17–1, the mass moment of inertia is always a *positive* quantity. Common units used for its measurement are kg \cdot m² or s
If the body consists of material having a variable density, $\rho = \rho$ ed as I_G . Since r is
always a *positive*
kg \cdot m² or slug \cdot ft².

If the body consists of material having a variable density, $\rho = \rho(x, y, z)$, the elemental mass *dm* of the body can be expressed in terms of its the elemental mass dm of the body can be expressed in terms of its
density and volume as $dm = \rho dV$. Substituting dm into Eq. 17–1, the
hody's moment of inertia is then computed using *volume elements* for body's moment of inertia is then computed using *volume elements* for integration; i.e.,

$$
I = \int_{V} r^2 \rho \, dV \tag{17-2}
$$

*Another property of the body, which measures the symmetry of the body's mass with respect to a coordinate system, is the product of inertia.This property applies to the threedimensional motion of a body and will be discussed in Chapter 21.

In the special case of ρ being a *constant*, this term may be factored out of the integral, and the integration is then purely a function of geometry,

$$
I = \rho \int_{V} r^2 \, dV \tag{17-3}
$$

When the volume element chosen for integration has infinitesimal dimensions in all three directions, Fig. 17–2*a*, the moment of inertia of the body must be determined using "triple integration." The integration process can, however, be simplified to a *single integration* provided the chosen volume element has a differential size or thickness in only *one direction*. Shell or disk elements are often used for this purpose.

To obtain the moment of inertia by integration, we will consider only symmetric bodies having volumes which are generated by revolving a curve about an axis.An example of such a body is shown in Fig. 17–2*a*. Two types of differential elements can be chosen.

Shell Element.

- If a *shell element* having a height *z*, radius $r = y$, and thickness *dy*
is chosen for integration Fig. 17–2b, then the volume is is chosen for integration, Fig. 17–2*b*, then the volume is $dV = (2\pi y)(z)dy$.
- This element may be used in Eq. 17–2 or 17–3 for determining the moment of inertia I_z of the body about the *z* axis, since the *entire element*, due to its "thinness," lies at the *same* perpendicular *element*, due to its "thinness," lies at the *same* distance $r = y$ from the *z* axis (see Example 17.1).

Disk Element.

- If a disk element having a radius *y* and a thickness *dz* is chosen If a disk element having a radius y and a thickness dz is chosen for integration, Fig. 17–2*c*, then the volume is $dV = (\pi y^2)dz$.
- This element is *finite* in the radial direction, and consequently its parts *do not* all lie at the *same radial distance r* from the *z* axis. As a result, Eq. 17–2 or 17–3 *cannot* be used to determine I_z directly. Instead, to perform the integration it is first necessary to determine the moment of inertia *of the element* about the *z* axis and then integrate this result (see Example 17.2).

Fig. 17–2

$EXAMPLE$ 17.1

Determine the moment of inertia of the cylinder shown in Fig. 17–3*a* about the *z* axis. The density of the material, ρ , is constant.

SOLUTION

Shell Element. This problem can be solved using the *shell element* in Fig. 17–3*b* and a single integration. The volume of the element is Fig. 17–3*b* and a single integration. The volume of the element is $dV = (2\pi r)(h) dr$, so that its mass is $dm = \rho dV = \rho(2\pi hr dr)$.
Since the *entire element* lies at the same distance *r* from the *z* axis the Since the *entire element* lies at the same distance *r* from the *z* axis, the moment of inertia *of the element* is

$$
dI_z = r^2 dm = \rho 2\pi h r^3 dr
$$

Integrating over the entire region of the cylinder yields

$$
I_z = \int_m r^2 dm = \rho 2\pi h \int_0^R r^3 dr = \frac{\rho \pi}{2} R^4 h
$$

The mass of the cylinder is

$$
m = \int_m dm = \rho 2\pi h \int_0^R r dr = \rho \pi h R^2
$$

so that

$$
I_z = \frac{1}{2} mR^2
$$
Ans.

EXAMPLE 17.2

If the density of the material is $5 \frac{\text{slug}}{\text{ft}^3}$, determine the moment of inertia of the solid in Fig 17–4*a* about the *y* axis.

SOLUTION

Disk Element. The moment of inertia will be found using a *disk element*, as shown in Fig. 17–4*b*. Here the element intersects the curve at the arbitrary point (x, y) and has a mass

$$
dm = \rho \, dV = \rho(\pi x^2) \, dy
$$

Although all portions of the element are *not* located at the same distance from the *y* axis, it is still possible to determine the moment of inertia dI_v of the element about the *y* axis. In the preceding example it was shown that the moment of inertia of a cylinder about its was shown that the moment of inertia of a cylinder about its
longitudinal axis is $I = \frac{1}{2}mR^2$, where *m* and *R* are the mass and radius
of the cylinder. Since the height is not involved in this formula the of the cylinder. Since the height is not involved in this formula, the disk itself can be thought of as a cylinder.Thus, for the disk element in Fig. 17–4*b*, we have

$$
dI_y = \frac{1}{2}(dm)x^2 = \frac{1}{2}[\rho(\pi x^2) dy]x^2
$$

Substituting $x = y^2$, $\rho = 5$ slug/ft³, and integrating with respect to *y*, from $y = 0$ to $y = 1$ ft yields the moment of inertia for the entire solid Substituting $x = y^2$, $\rho = 5$ slug/ft³, and integrating with respect to y, from $y = 0$ to $y = 1$ ft, yields the moment of inertia for the entire solid.

$$
I_y = \frac{\pi (5 \text{ slug/ft}^3)}{2} \int_0^{1 \text{ ft}} x^4 dy = \frac{\pi (5)}{2} \int_0^{1 \text{ ft}} y^8 dy = 0.873 \text{ slug} \cdot \text{ft}^2 Ans.
$$

Parallel-Axis Theorem. If the moment of inertia of the body about an axis passing through the body's mass center is known, then the moment of inertia about any other *parallel axis* can be determined by using the *parallel-axis theorem*. This theorem can be derived by using the *parallel-axis theorem*. This theorem can be derived by considering the body shown in Fig. 17–5. Here the z' axis passes through the mass center G whereas the corresponding *parallel* z *axis* lies at a the mass center *G*, whereas the corresponding *parallel z axis* lies at a constant distance *d* away. Selecting the differential element of mass *dm*, constant distance d away. Selecting the differential element of mass dm,
which is located at point (x', y') , and using the Pythagorean theorem,
 $x^2 = (d + x')^2 + y'^2$ we can express the moment of inertia of the body which is located at point (x', y') , and using the Pythagorean theorem,
 $r^2 = (d + x')^2 + y'^2$, we can express the moment of inertia of the body

about the z axis as about the *z* axis as 2 ,

$$
I = \int_{m}^{R} I d m = \int_{m} [(d + x')^{2} + y'^{2}] dm
$$

=
$$
\int_{m} (x'^{2} + y'^{2}) dm + 2d \int_{m} x' dm + d^{2} \int_{m} dm
$$

Since $r'^2 = x'^2 + y'^2$, the first integral represents I_G . The second tegral equals zero, since the z' axis passes through the body's mass Since $r'^2 = x'^2 + y'^2$, the first integral represents I_G . The second
integral equals *zero*, since the *z'* axis passes through the body's mass
center i.e. $\int r' dm = \overline{r}' m = 0$ since $\overline{r}' = 0$. Finally the third integral center, i.e., $\int x' dm = \overline{x}' m = 0$ since $\overline{x}' = 0$. Finally, the third integral als *zero*, since the *z'* axis passes
 $\int x'dm = \overline{x}'m = 0$ since $\overline{x}' = 0$. 2 ,

represents the total mass *m* of the body. Hence, the moment of inertia about the *z* axis can be written as

$$
I = I_G + md^2
$$
 (17-4)

where

- I_G = moment of inertia about the z' axis passing through the mass center G center *G*
- center G
 $m = \text{mass of the body}$
 $d = \text{perpendicular dis}$
- $m =$ mass of the body
 $d =$ perpendicular distance between the parallel z and z' axes

Radius of Gyration. Occasionally, the moment of inertia of a body about a specified axis is reported in handbooks using the *radius of gyration, k*. This is a geometrical property which has units of length. When it and the body's mass *m* are known, the body's moment of inertia is determined from the equation

$$
I = mk^2 \quad \text{or} \quad k = \sqrt{\frac{I}{m}}
$$
 (17-5)

Note the *similarity* between the definition of *k* in this formula and *r* in Note the *similarity* between the definition of k in this formula and r in
the equation $dI = r^2 dm$, which defines the moment of inertia of an
elemental mass dm of the body about an axis elemental mass *dm* of the body about an axis.

Composite Bodies. If a body consists of a number of simple shapes such as disks, spheres, and rods, the moment of inertia of the body about any axis can be determined by adding algebraically the moments of inertia of all the composite shapes computed about the axis. Algebraic addition is necessary since a composite part must be considered as a negative quantity if it has already been counted as a piece of another part—for example, a "hole" subtracted from a solid plate. The parallelaxis theorem is needed for the calculations if the center of mass of each composite part does not lie on the axis. For the calculation, then, each composite part does not lie on the axis. For the calculation, then,
 $I = \Sigma (I_G + md^2)$. Here I_G for each of the composite parts is determined

by integration or for simple shapes, such as rods and disks it can be by integration, or for simple shapes, such as rods and disks, it can be found from a table, such as the one given on the inside back cover of this book. 2).

EXAMPLE 17.3

If the plate shown in Fig. 17–6*a* has a density of 8000 kg/m^3 and a thickness of 10 mm, determine its moment of inertia about an axis directed perpendicular to the page and passing through point *O*.

SOLUTION

The plate consists of two composite parts, the 250-mm-radius disk *minus* a 125-mm-radius disk, Fig. 17–6*b*. The moment of inertia about *O* can be determined by computing the moment of inertia of each of these parts about *O* and then adding the results *algebraically*. The calculations are performed by using the parallel-axis theorem in conjunction with the data listed in the table on the inside back cover.

Disk. The moment of inertia of a disk about the centroidal axis **Disk.** The moment of inertia of a disk about the centroidal axis
perpendicular to the plane of the disk is $I_G = \frac{1}{2}mr^2$. The mass center
of the disk is located at a distance of 0.25 m from point O. Thus of the disk is located at a distance of 0.25 m from point *O*. Thus,

$$
m_d = \rho_d V_d = 8000 \text{ kg/m}^3 [\pi (0.25 \text{ m})^2 (0.01 \text{ m})] = 15.71 \text{ kg}
$$

(*I_d*)₀ = $\frac{1}{2} m_d r_d^2 + m_d d^2$
= $\frac{1}{2} (15.71 \text{ kg}) (0.25 \text{ m})^2 + (15.71 \text{ kg}) (0.25 \text{ m})^2$
= 1.473 kg·m²

Hole. For the 125-mm-radius disk (hole), we have
\n
$$
m_h = \rho_h V_h = 8000 \text{ kg/m}^3 [\pi (0.125 \text{ m})^2 (0.01 \text{ m})] = 3.927 \text{ kg}
$$
\n
$$
(I_h)_O = \frac{1}{2} m_h r_h^2 + m_h d^2
$$
\n
$$
= \frac{1}{2} (3.927 \text{ kg}) (0.125 \text{ m})^2 + (3.927 \text{ kg}) (0.25 \text{ m})^2
$$
\n
$$
= 0.276 \text{ kg} \cdot \text{m}^2
$$

The moment of inertia of the plate about point *O* is therefore
\n
$$
I_O = (I_d)_O - (I_h)_O
$$
\n
$$
= 1.473 \text{ kg} \cdot \text{m}^2 - 0.276 \text{ kg} \cdot \text{m}^2
$$
\n
$$
= 1.20 \text{ kg} \cdot \text{m}^2
$$
\nAns.

EXAMPLE 17.4

The pendulum in Fig. 17–7 is suspended from the pin at *O* and consists of two thin rods, each having a weight of 10 lb. Determine the moment of inertia of the pendulum about an axis passing through (a) point *O*, and (b) the mass center *G* of the pendulum.

SOLUTION

Part (a). Using the table on the inside back cover, the moment of inertia of rod *OA* about an axis perpendicular to the page and passing inertia of rod *OA* about an axis perpendicular to
through point *O* of the rod is $I_O = \frac{1}{3}ml^2$. Hence,

a point *O* of the rod is
$$
I_O = \frac{1}{3}ml^2
$$
. Hence,
\n
$$
(I_{OA})_O = \frac{1}{3}ml^2 = \frac{1}{3}\left(\frac{10 \text{ lb}}{32.2 \text{ ft/s}^2}\right)(2 \text{ ft})^2 = 0.414 \text{ slug} \cdot \text{ft}^2
$$

This same value can be obtained using $I_G = \frac{1}{12}ml^2$ and the parallel-
axis theorem axis theorem.

$$
(I_{OA})_O = \frac{1}{12}ml^2 + md^2 = \frac{1}{12} \left(\frac{10 \text{ lb}}{32.2 \text{ ft/s}^2}\right) (2 \text{ ft})^2 + \left(\frac{10 \text{ lb}}{32.2 \text{ ft/s}^2}\right) (1 \text{ ft})^2
$$

= 0.414 slug \cdot ft²

For rod *BC* we have

$$
(I_{BC})_O = \frac{1}{12}ml^2 + md^2 = \frac{1}{12} \left(\frac{10 \text{ lb}}{32.2 \text{ ft/s}^2}\right) (2 \text{ ft})^2 + \left(\frac{10 \text{ lb}}{32.2 \text{ ft/s}^2}\right) (2 \text{ ft})^2
$$

= 1.346 slug·ft²

The moment of inertia of the pendulum about *O* is therefore
 $I_O = 0.414 + 1.346 = 1.76$ slug \cdot ft²

$$
I_O = 0.414 + 1.346 = 1.76 \text{ slug} \cdot \text{ft}^2
$$
Ans.

Part (b). The mass center *G* will be located relative to point *O*. Assuming this distance to be \bar{y} , Fig. 17–7, and using the formula for determining the mass center we have determining the mass center, we have

$$
\overline{y} = \frac{\Sigma \widetilde{y}m}{\Sigma m} = \frac{1(10/32.2) + 2(10/32.2)}{(10/32.2) + (10/32.2)} = 1.50 \text{ ft}
$$

The moment of inertia I_G may be found in the same manner as I_O ,
which requires successive applications of the parallel-axis theorem to which requires successive applications of the parallel-axis theorem to transfer the moments of inertia of rods *OA* and *BC* to *G*. A more

direct solution, however, involves using the result for
$$
I_O
$$
, i.e.,
\n
$$
I_O = I_G + md^2; \quad 1.76 \text{ slug} \cdot \text{ft}^2 = I_G + \left(\frac{20 \text{ lb}}{32.2 \text{ ft/s}^2}\right) (1.50 \text{ ft})^2
$$
\n
$$
I_G = 0.362 \text{ slug} \cdot \text{ft}^2
$$
\n*Ans.*

•17–9. Determine the mass moment of inertia I_y of the solid formed by revolving the shaded area around the y axis. The density of the material is ρ . Express the result in terms of the mass m of the solid.

17–11. Determine the moment of inertia of the assembly about an axis that is perpendicular to the page and passes through the center of mass *G*. The material has a specific through the center of 1
weight of $\gamma = 90 \text{ lb/ft}^3$.

***17–12.** Determine the moment of inertia of the assembly about an axis that is perpendicular to the page and passes through point *O*. The material has a specific weight of through poin
 $\gamma = 90$ lb/ft³.

17–10. Determine the mass moment of inertia I_v of the solid formed by revolving the shaded area around the y axis. The density of the material is ρ . Express the result in terms of the mass m of the semi-ellipsoid.

•17–13. If the large ring, small ring and each of the spokes weigh 100 lb, 15 lb, and 20 lb, respectively, determine the mass moment of inertia of the wheel about an axis perpendicular to the page and passing through point *A*.

Prob. 17–10

Prob. 17–13

***17–16.** The pendulum consists of a plate having a weight of 12 lb and a slender rod having a weight of 4 lb. Determine the radius of gyration of the pendulum about an axis perpendicular to the page and passing through point *O*.

•17–17. Determine the moment of inertia of the solid steel assembly about the *x* axis. Steel has a specific weight of G assembly about $\gamma_{st} = 490 \text{ lb/ft}^3$.

17–15. Each of the three slender rods has a mass *m*. Determine the moment of inertia of the assembly about an axis that is perpendicular to the page and passes through the center point *O*.

17–18. Determine the moment of inertia of the center crank about the *x* axis.The material is steel having a specific weight of $\gamma_{st} = 490$ lb/ft³.

Prob. 17–15

Prob. 17–18

17–19. Determine the moment of inertia of the overhung crank about the *x* axis. The material is steel for which the crank about the *x* axis. The density is $\rho = 7.85 \text{ Mg/m}^3$.

***17–20.** Determine the moment of inertia of the overhung *17–20. Determine the moment of inertia of the overhung
crank about the x' axis. The material is steel for which the
density is $\rho = 7.85 \text{ Me/m}^3$ density is $\rho = 7.85$ Mg/m³.

17–22. Determine the mass moment of inertia of the thin plate about an axis perpendicular to the page and passing through point *O*. The material has a mass per unit area of 20 kg/m^2 .

•17–21. Determine the mass moment of inertia of the pendulum about an axis perpendicular to the page and passing through point *O*.The slender rod has a mass of 10 kg and the sphere has a mass of 15 kg.

17–23. Determine the mass moment of inertia of the thin plate about an axis perpendicular to the page and passing through point *O*. The material has a mass per unit area of 20 kg/m^2 .

17.2 [Planar Kinetic Equations of Motion](#page-14-0)

In the following analysis we will limit our study of planar kinetics to rigid bodies which, along with their loadings, are considered to be *symmetrical* with respect to a fixed reference plane.* Since the motion of the body can be viewed within the reference plane, all the forces (and couple moments) acting on the body can then be projected onto the plane. An example of an arbitrary body of this type is shown in Fig. 17–8*a*. Here the *inertial frame of reference x, y, z* has its origin *coincident* with the arbitrary point *P* in the body. By definition, *these axes do not rotate and are either fixed or translate with constant velocity*

Equation of Translational Motion. The external forces acting on the body in Fig. 17–8*a* represent the effect of gravitational, electrical, magnetic, or contact forces between adjacent bodies. Since this force system has been considered previously in Sec. 13.3 for the analysis of a system of particles, the resulting Eq. 13–6 can be used here, in which case
 $\Sigma \mathbf{F} = m \mathbf{a}_G$

$$
\Sigma \mathbf{F} = m \mathbf{a}_G
$$

This equation is referred to as the *translational equation of motion* for the mass center of a rigid body. It states that *the sum of all the external forces acting on the body is equal to the body's mass times the acceleration of its mass center G.*

For motion of the body in the *x–y* plane, the translational equation of motion may be written in the form of two independent scalar equations, namely,

$$
\Sigma F_x = m(a_G)_x
$$

$$
\Sigma F_y = m(a_G)_y
$$

*By doing this, the rotational equation of motion reduces to a rather simplified form. The more general case of body shape and loading is considered in Chapter 21.

17

(b) Particle free-body diagram

 $\overline{}$

y P x \sum_i m_i **a***i* \mathbf{r} \mathbf{y}

(c)

Equation of Rotational Motion. We will now determine the effects caused by the moments of the external force system computed about an axis perpendicular to the plane of motion (the *z* axis) and passing through point *P*. As shown on the free-body diagram of the *i*th particle, Fig. $17-8b$, \mathbf{F}_i represents the *resultant external force* acting on the **particle** and **f**, is the *resultant of the internal forces* caused by interactions particle, and \mathbf{f}_i is the *resultant of the internal forces* caused by interactions
with adjacent particles If the particle has a mass m, and its acceleration with adjacent particles. If the particle has a mass m_i and its acceleration is a_i , then its kinetic diagram is shown in Fig. 17–8*c*. Summing moments about point *P*, we require

$$
\mathbf{r} \times \mathbf{F}_i + \mathbf{r} \times \mathbf{f}_i = \mathbf{r} \times m_i \mathbf{a}_i
$$

or

$$
(\mathbf{M}_P)_i = \mathbf{r} \times m_i \mathbf{a}_i
$$

The moments about *P* can also be expressed in terms of the acceleration of point *P*, Fig. 17–8*d*. If the body has an angular acceleration α and angular velocity ω , then using Eq. 16–18 we have

$$
(\mathbf{M}_P)_i = m_i \mathbf{r} \times (\mathbf{a}_P + \boldsymbol{\alpha} \times \mathbf{r} - \omega^2 \mathbf{r})
$$

= $m_i [\mathbf{r} \times \mathbf{a}_P + \mathbf{r} \times (\boldsymbol{\alpha} \times \mathbf{r}) - \omega^2 (\mathbf{r} \times \mathbf{r})]$

The last term is zero, since $\mathbf{r} \times \mathbf{r} = 0$. Expressing the vectors with Cartesian components and carrying out the cross-product operations yields

$$
(M_P)_i \mathbf{k} = m_i \{ (\mathbf{x} \mathbf{i} + \mathbf{y} \mathbf{j}) \times [(a_P)_x \mathbf{i} + (a_P)_y \mathbf{j}]
$$

+
$$
(\mathbf{x} \mathbf{i} + \mathbf{y} \mathbf{j}) \times [\alpha \mathbf{k} \times (\mathbf{x} \mathbf{i} + \mathbf{y} \mathbf{j})] \}
$$

$$
(M_P)_i \mathbf{k} = m_i [-y(a_P)_x + x(a_P)_y + \alpha x^2 + \alpha y^2] \mathbf{k}
$$

$$
\zeta (M_P)_i = m_i [-y(a_P)_x + x(a_P)_y + \alpha r^2]
$$

Letting $m_i \rightarrow dm$ and integrating with respect to the entire mass *m* of the hody we obtain the resultant moment equation body, we obtain the resultant moment equation

$$
\zeta \Sigma M_P = -\bigg(\int_m y \, dm\bigg)(a_P)_x + \bigg(\int_m x \, dm\bigg)(a_P)_y + \bigg(\int_m r^2 dm\bigg)\alpha
$$

Here $\sum M_p$ represents only the moment of the *external forces* acting on the body about point P . The resultant moment of the internal forces is zero, since for the entire body these forces occur in equal and opposite collinear pairs and thus the moment of each pair of forces about *P* cancels. The integrals in the first and second terms on the right are used to locate the body's center of mass *G* with respect to *P*, since and $\bar{x}m = \int x \, dm$, Fig. 17–8*d*. Also, the last integral represents the body's moment of inertia about the *z* axis, i.e., Thus, represents the $I_P = \int r^2 dm$. to locate the body's center of $\overline{y}m = \int y dm$ and $\overline{x}m = \int x dm$, represents the body's moment

$$
\int \sum M_P = -\overline{y}m(a_P)_x + \overline{x}m(a_P)_y + I_P \alpha \qquad (17-6)
$$

It is possible to reduce this equation to a simpler form if point *P* coincides with the mass center *G* for the body. If this is the case, then coincides with the mass ce
 $\overline{x} = \overline{y} = 0$, and therefore*

$$
\Sigma M_G = I_G \alpha \tag{17-7}
$$

This rotational equation of motion states that the sum of the moments of all the external forces about the body's mass center G is equal to the product of the moment of inertia of the body about an axis passing through G and the body's angular acceleration.

Equation 17–6 can also be rewritten in terms of the *x* and *y* components of \mathbf{a}_G and the body's moment of inertia I_G . If point *G* is located at $(\overline{x}, \overline{y})$,
Fig. 17–8*d* then by the parallel-axis theorem $I_D = I_G + m(\overline{x}^2 + \overline{y}^2)$ of \mathbf{a}_G and the body's moment of inertia I_G . If point G is located at (\bar{x}, \bar{y}) ,
Fig. 17–8*d*, then by the parallel-axis theorem, $I_P = I_G + m(\bar{x}^2 + \bar{y}^2)$.
Substituting into Eq. 17–6 and rearranging terms we get Substituting into Eq. $17–6$ and rearranging terms, we get

$$
\zeta \Sigma M_P = \overline{y}m[-(a_P)_x + \overline{y}\alpha] + \overline{x}m[(a_P)_y + \overline{x}\alpha] + I_G\alpha \quad (17-8)
$$

From the kinematic diagram of Fig. $17-8d$, \mathbf{a}_P can be expressed in terms of $\mathbf{a} \cdot \mathbf{a}$ of \mathbf{a}_G as

or
$$
\mathbf{a}_G
$$
 as
\n
$$
\mathbf{a}_G = \mathbf{a}_P + \boldsymbol{\alpha} \times \mathbf{\bar{r}} - \omega^2 \mathbf{\bar{r}}
$$
\n
$$
(a_G)_x \mathbf{i} + (a_G)_y \mathbf{j} = (a_P)_x \mathbf{i} + (a_P)_y \mathbf{j} + \alpha \mathbf{k} \times (\overline{x} \mathbf{i} + \overline{y} \mathbf{j}) - \omega^2 (\overline{x} \mathbf{i} + \overline{y} \mathbf{j})
$$

Carrying out the cross product and equating the respective **i** and **j** components yields the two scalar equations

$$
(a_G)_x = (a_P)_x - \overline{y}\alpha - \overline{x}\omega^2
$$

$$
(a_G)_y = (a_P)_y + \overline{x}\alpha - \overline{y}\omega^2
$$

From these equations, $[-(a_P)_x + \overline{y}_\alpha] = [-(a_G)_x - \overline{x}_\alpha^2]$ and
 $[(a_{-}) + \overline{x}_\alpha] = [(a_{-}) + \overline{y}_\alpha^2]$ Substituting these results into Eq. 17–8 From these equations, $[-(a_P)_x + \overline{y}\alpha] = [-(a_G)_x - \overline{x}\omega^2]$ and $[(a_P)_y + \overline{x}\alpha] = [(a_G)_y + \overline{y}\omega^2]$. Substituting these results into Eq. 17–8 and simplifying gives and simplifying gives

$$
\zeta \Sigma M_P = -\overline{y}m(a_G)_x + \overline{x}m(a_G)_y + I_G \alpha \qquad (17-9)
$$

This important result indicates that when moments of the external forces shown on the free-body diagram are summed about point P, Fig. 17–8e, *they are equivalent to the sum of the "kinetic moments" of the components of ma_G about P plus the "kinetic moment" of* $I_G \alpha$ *, Fig. 17–8f.* In other words when the "kinetic moments" $\Sigma(M_1)_{\text{R}}$ are computed Fig. 17–8f. words, when the "kinetic moments," $\Sigma(\mathcal{M}_k)_p$, are computed, Fig. 17–8*f*,
the vectors $m(\mathbf{e}_p)$, and $m(\mathbf{e}_p)$, are treated as sliding vectors; that is they the vectors $m(\mathbf{a}_G)_x$ and $m(\mathbf{a}_G)_y$ are treated as sliding vectors; that is, they
can act at *any noint along their line of action*. In a similar manner $I_{\alpha} \alpha$ can act at *any point along their line of action*. In a similar manner, $I_G \alpha$
can be treated as a free vector and can therefore act at *any point*. It is can be treated as a free vector and can therefore act at *any point.* It is important to keep in mind, however, that ma_G and $I_G \alpha$ are not the same
as a force or a couple moment. Instead, they are caused by the external as a force or a couple moment. Instead, they are caused by the external effects of forces and couple moments acting on the body. With this in mind we can therefore write Eq. 17–9 in a more general form as

$$
\Sigma M_P = \Sigma (\mathcal{M}_k)_P \tag{17-10}
$$

* It also reduces to this same simple form $\sum M_P = I_P \alpha$ if point P is a *fixed point* (see
a 17–16) or the acceleration of point P is directed along the line PG Eq. 17–16) or the acceleration of point *P* is directed along the line *PG*.

Kinetic diagram

(f)

(f)

Fig. 17–8 (cont.)

General Application of the Equations of Motion. To summarize this analysis, *three* independent scalar equations can be written to describe the general plane motion of a symmetrical rigid body.

$$
\Sigma F_x = m(a_G)_x
$$

\n
$$
\Sigma F_y = m(a_G)_y
$$

\n
$$
\Sigma M_G = I_G \alpha
$$

\nor
\n
$$
\Sigma M_P = \Sigma (M_k)_P
$$
\n(17-11)

When applying these equations, one should *always* draw a free-body diagram, Fig. 17–8*e*, in order to account for the terms involved in ΣF_x , ΣM_{\odot} or ΣM_{\odot} . In some problems it may also be helpful to draw agram, Fig. 17–8e, in order to account for the terms involved in ΣF_x , F_y , ΣM_G , or ΣM_p . In some problems it may also be helpful to draw
extending to a some problems it may also be helpful to draw the *kinetic diagram* for the body, Fig. 17–8*f*. This diagram graphically accounts for the terms $m(\mathbf{a}_G)_x$, $m(\mathbf{a}_G)_y$, and $I_G\boldsymbol{\alpha}$. It is especially
convenient when used to determine the components of $m\mathbf{a}_G$ and the convenient when used to determine the components of ma_G and the moment of these components in $\Sigma(M_1)$ \ast moment of these components in $\Sigma(\mathcal{M}_k)_P.*$

17.3 [Equations of Motion: Translation](#page-14-0)

When the rigid body in Fig. 17–9*a* undergoes a *translation*, all the particles When the rigid body in Fig. 17–9*a* undergoes a *translation*, all the particles of the body have the *same acceleration*. Furthermore, $\alpha = 0$, in which case the rotational equation of motion applied at point G reduces to a case the rotational equation of motion applied at point G reduces to a
simplified form, namely, $\Sigma M_G = 0$. Application of this and the force
equations of motion will now be discussed for each of the two types of equations of motion will now be discussed for each of the two types of translation.

Rectilinear Translation. When a body is subjected to *rectilinear translation*, all the particles of the body (slab) travel along parallel straightline paths. The free-body and kinetic diagrams are shown in Fig. 17–9*b*. line paths. The free-body and kinetic diagrams are shown in Fig. 17–9*b*.
Since $I_G \alpha = 0$, only $m a_G$ is shown on the kinetic diagram. Hence, the equations of motion which apply in this case become equations of motion which apply in this case become

$$
\Sigma F_x = m(a_G)_x
$$

\n
$$
\Sigma F_y = m(a_G)_y
$$

\n
$$
\Sigma M_G = 0
$$
\n(17-12)

* For this reason, the kinetic diagram will be used in the solution of an example problem whenever $\Sigma M_P = \Sigma (M_k)_P$ is applied.

It is also possible to sum moments about other points on or off the body, in which case the moment of ma_G must be taken into account. For example if point A is chosen which lies at a perpendicular distance d example, if point *A* is chosen, which lies at a perpendicular distance *d* from the line of action of ma_G , the following moment equation applies:

$$
\zeta + \Sigma M_A = \Sigma (M_k)_A; \qquad \Sigma M_A = (m a_G) d
$$

Here the sum of moments of the external forces and couple moments about *A* (ΣM_A , free-body diagram) equals the moment of $m\mathbf{a}_G$ about *A* ($\Sigma (M_A)$), kinetic diagram) $(\Sigma(\mathcal{M}_k)_A)$, kinetic diagram).

Curvilinear Translation. When a rigid body is subjected to *curvilinear translation*, all the particles of the body travel along *parallel curved paths*. For analysis, it is often convenient to use an inertial coordinate system having an origin which coincides with the body's mass center at the instant considered, and axes which are oriented in the normal and tangential directions to the path of motion, Fig. 17–9*c*. The three scalar equations of motion are then

$$
\Sigma F_n = m(a_G)_n
$$

\n
$$
\Sigma F_t = m(a_G)_t
$$

\n
$$
\Sigma M_G = 0
$$
\n(17-13)

If moments are summed about the arbitrary point B , Fig. 17–9 c , then it is necessary to account for the moments, $\Sigma(M_k)_B$, of the two
components $m(\mathbf{a})$ and $m(\mathbf{a})$ about this point. From the kinetic components $m(\mathbf{a}_G)_n$ and $m(\mathbf{a}_G)_t$ about this point. From the kinetic
diagram *h* and *e* represent the perpendicular distances (or "moment diagram, *h* and *e* represent the perpendicular distances (or "moment arms") from *B* to the lines of action of the components. The required moment equation therefore becomes

$$
\zeta + \Sigma M_B = \Sigma (M_k)_B; \qquad \Sigma M_B = e[m(a_G)_t] - h[m(a_G)_n]
$$

17

The free-body and kinetic diagrams for this boat and trailer are drawn first in order to apply the equations of motion. Here the forces on the free-body diagram cause the effect shown on the kinetic diagram. If moments are summed about the mass center, G, summed about the mass center, G ,
then $\Sigma M_G = 0$. However, if moments
are summed about point *R* then are summed about point *B* then ζ + $\sum M_B = ma_G(d)$.

Procedure for Analysis

Kinetic problems involving rigid-body *translation* can be solved using the following procedure.

Free-Body Diagram.

- Establish the *x, y* or *n*, *t* inertial coordinate system and draw the free-body diagram in order to account for all the external forces and couple moments that act on the body.
- The direction and sense of the acceleration of the body's mass center \mathbf{a}_G should be established.
- Identify the unknowns in the problem.
- If it is decided that the rotational equation of motion ©it is decided that the rotational equation of motion $M_P = \Sigma(\mathcal{M}_k)_P$ is to be used in the solution, then consider rawing the kinetic diagram since it graphically accounts for the drawing the kinetic diagram, since it graphically accounts for the components $m(\mathbf{a}_G)_x$, $m(\mathbf{a}_G)_y$ or $m(\mathbf{a}_G)_t$, $m(\mathbf{a}_G)_n$ and is therefore convenient for "visualizing" the terms needed in the moment convenient for "visualizing" the terms needed in the moment sum $\Sigma(\mathcal{M}_k)_P$.

Equations of Motion.

- Apply the three equations of motion in accordance with the established sign convention.
- To simplify the analysis, the moment equation $\Sigma M_G = 0$ can be
replaced by the more general equation $\Sigma M_R = \Sigma (M_A)$, where To simplify the analysis, the moment equation $\Sigma M_G = 0$ can be replaced by the more general equation $\Sigma M_P = \Sigma (M_k)_P$, where noint *P* is usually located at the intersection of the lines of action point *P* is usually located at the intersection of the lines of action of as many unknown forces as possible.
- If the body is in contact with a *rough surface* and slipping occurs, If the body is in contact with a *rough surface* and slipping occurs,
use the friction equation $F = \mu_k N$. Remember, **F** always acts on
the body so as to oppose the motion of the body relative to the the body so as to oppose the motion of the body relative to the surface it contacts.

Kinematics.

- Use kinematics to determine the velocity and position of the body.
- For rectilinear translation with *variable acceleration* $a_G = dv_G/dt$ $a_Gds_G = v_Gdv_G$ $v_G = ds_G/dt$
- For rectilinear translation with *constant acceleration*
- $s_G = (s_G)_0 + (v_G)_0 t + \frac{1}{2} a_G t^2$ For recturnear translation w
 $v_G = (v_G)_0 + a_G t$ $v_G^2 =$ $=(v_G)_{0}^{\sim}$ nstant acceleration
 $a_0^2 + 2a_G[s_G - (s_G)_0]$
- For curvilinear translation $(a_G)_t = dv_G/dt$, $(a_G)_t ds_G = v_G dv_{G_s}(a_G)_t = \alpha \rho$ For curvilinear trans
 $(a_G)_n = v_G^2/\rho = \omega^2 \rho$

The car shown in Fig. 17–10*a* has a mass of 2 Mg and a center of mass at *G*. Determine the acceleration if the rear "driving" wheels are always slipping, whereas the front wheels are free to rotate. Neglect the mass of the wheels. The coefficient of kinetic friction between the the mass of the wheels. The coeffiveneds and the road is $\mu_k = 0.25$.

SOLUTION I

Free-Body Diagram. As shown in Fig. 17–10*b*, the rear-wheel frictional force \mathbf{F}_B pushes the car forward, and since *slipping occurs*,
 $\mathbf{F}_B = 0.25N$. The frictional forces acting on the front wheels are zero. frictional force \mathbf{F}_B pushes the car forward, and since *slipping occurs*,
 $F_B = 0.25N_B$. The frictional forces acting on the *front wheels* are *zero*,

since these wheels have negligible mass *. There are three unk since these wheels have negligible mass.* There are three unknowns in the problem, N_A , N_B , and a_G . Here we will sum moments about the mass
center. The car (point G) accelerates to the left i.e., in the negative r center. The car (point G) accelerates to the left, i.e., in the negative x direction, Fig. 17–10*b*.

Equations of Motion.
 $\pm \nabla F = m(a_1)$.

Solving,

$$
a_G = 1.59 \text{ m/s}^2 \leftarrow
$$

\n
$$
N_A = 6.88 \text{ kN}
$$

\n
$$
N_B = 12.7 \text{ kN}
$$

SOLUTION II

Free-Body and Kinetic Diagrams. If the "moment" equation is applied about point A, then the unknown N_A will be eliminated from the equation. To "visualize" the moment of ma_G about *A*, we will include the kinetic diagram as part of the analysis, Fig. 17–10*c*.

Equation of Motion.
C + $\Sigma M_A = \Sigma (M_L)_A$:

$$
\zeta + \Sigma M_A = \Sigma (M_k)_A; \qquad N_B(2 \text{ m}) - [2000(9.81) \text{ N}](1.25 \text{ m}) =
$$

(2000 kg) $a_G(0.3 \text{ m})$

Solving this and Eq. 1 for a_G leads to a simpler solution than that obtained from Eqs. 1 to 3 obtained from Eqs. 1 to 3.

^{*} With negligible wheel mass, $I\alpha = 0$ and the frictional force at *A* required to turn the held is zero. If the wheels' mass were included then the solution would be more involved. wheel is zero. If the wheels' mass were included, then the solution would be more involved, since a general-plane-motion analysis of the wheels would have to be considered (see Sec. 17.5).

The motorcycle shown in Fig. 17–11*a* has a mass of 125 kg and a center of mass at G_1 , while the rider has a mass of 75 kg and a center of mass at G_2 . Determine the minimum coefficient of static friction between
the wheels and the payement in order for the rider to do a "wheely" the wheels and the pavement in order for the rider to do a "wheely," i.e., lift the front wheel off the ground as shown in the photo. What acceleration is necessary to do this? Neglect the mass of the wheels and assume that the front wheel is free to roll. $G_1,$ ern

Fig. 17–11

SOLUTION

Free-Body and Kinetic Diagrams. In this problem we will consider both the motorcycle and the rider as a single *system*. It is possible first to determine the location of the center of mass for this "system" by using determine the location of the center of mass for this "system" by using
the equations $\bar{x} = \sum \tilde{x}m/\sum m$ and $\bar{y} = \sum \tilde{y}m/\sum m$. Here, however, we
will consider the weight and mass of the motorcycle and rider seperate will consider the weight and mass of the motorcycle and rider seperate as shown on the free-body and kinetic diagrams, Fig. 17–11*b*. Both of these parts move with the *same* acceleration.We have assumed that the front wheel is *about* to leave the ground, so that the normal reaction front wheel is *about* to leave the ground, so that the normal read $N_A \approx 0$. The three unknowns in the problem are N_B , F_B , and a_G . location of the center of mass for th
 $\overline{x} = \sum \widetilde{x}m/\sum m$ and $\overline{y} = \sum \widetilde{y}m/\sum m$.

De weight and mass of the motorcycle

Equations of Motion.
 $\pm \nabla F = m(a_1)$.

$$
\Rightarrow \Sigma F_x = m(a_G)_x; \qquad F_B = (75 \text{ kg} + 125 \text{ kg})a_G \tag{1}
$$
\n
$$
+ \hat{\Sigma} F_y = m(a_G)_y; \qquad N_B - 735.75 \text{ N} - 1226.25 \text{ N} = 0
$$
\n
$$
\zeta + \Sigma M_B = \Sigma (M_k)_B; \quad -(735.75 \text{ N})(0.4 \text{ m}) - (1226.25 \text{ N})(0.8 \text{ m}) = -(75 \text{ kg } a_G)(0.9 \text{ m}) - (125 \text{ kg } a_G)(0.6 \text{ m}) \tag{2}
$$

Solving,

$$
a_G = 8.95 \text{ m/s}^2 \rightarrow
$$
 Ans.
\n $N_B = 1962 \text{ N}$
\n $F_B = 1790 \text{ N}$
\nThus the minimum coefficient of static friction is

$$
(\mu_s)_{\text{min}} = \frac{F_B}{N_B} = \frac{1790 \text{ N}}{1962 \text{ N}} = 0.912
$$
Ans.

(1) (2)

EXAMPLE 17.7

A uniform 50-kg crate rests on a horizontal surface for which the A uniform 50-kg crate rests on a horizontal surface for which the coefficient of kinetic friction is $\mu_k = 0.2$. Determine the acceleration if a force of $P = 600$ N is applied to the crate as shown in Fig. 17, 12a. if a force of $P = 600$ N is applied to the crate as shown in Fig. 17–12*a*.

SOLUTION

Free-Body Diagram. The force **P** can cause the crate either to slide or to tip over. As shown in Fig. 17–12*b*, it is assumed that the crate or to tip over. As shown in Fig. 17–12*b*, it is assumed that the crate
slides, so that $F = \mu_k N_C = 0.2 N_C$. Also, the resultant normal force N_C
acts at O a distance x (where $0 \le x \le 0.5$ m) from the crate's center slides, so that $F = \mu_k N_C = 0.2 N_C$. Also, the resultant normal force N_C acts at *O*, a distance *x* (where $0 < x \le 0.5$ m) from the crate's center line *. The three unknowns are N_C , *x* and g_C . line.* The three unknowns are N_C , x, and a_G .

Equations of Motion.
 $\pm \nabla F = m(a_1)$.

$$
\Rightarrow \Sigma F_x = m(a_G)_x; \quad 600 \text{ N} - 0.2N_C = (50 \text{ kg})a_G
$$

$$
2T_x - m(a_G)_x, \t 600 \text{ N} - 0.2N_C - (30 \text{ kg})a_G
$$

+ \uparrow $\Sigma F_y = m(a_G)_y; \t N_C - 490.5 \text{ N} = 0$

$$
\zeta + \sum M_G = 0; \quad -600 \text{ N}(0.3 \text{ m}) + N_C(x) - 0.2N_C(0.5 \text{ m}) = 0 \quad (3)
$$

Solving,

$$
N_C = 490.5 \text{ N}
$$

$$
x = 0.467 \text{ m}
$$

$$
a_G = 10.0 \text{ m/s}^2 \rightarrow
$$
Ans.

Since $x = 0.467$ m < 0.5 m, indeed the crate slides as originally assumed assumed.

NOTE: If the solution had given a value of $x > 0.5$ m, the problem would have to be reworked since tinning occurs If this were the case. would have to be reworked since tipping occurs. If this were the case, N_C would act at the *corner point A* and $F \leq 0.2N_C$.

* The line of action of N_C does not necessarily pass through the mass center $G(x = 0)$,
nee N_n must, counteract, the tendency for tinning caused by P. See, Sec. 8.1, of since N_C must counteract the tendency for tipping caused by **P**. See Sec. 8.1 of *Engineering Mechanics: Statics*.

The 100-kg beam *BD* shown in Fig.17–13*a* is supported by two rods having negligible mass. Determine the force developed in each rod if having negligible mass. Determine
at the instant $\theta = 30^{\circ}, \omega = 6$ rad/s.

SOLUTION

Free-Body Diagram. The beam moves with *curvilinear translation* since all points on the beam move along circular paths, each path having the same radius of 0.5 m. Using normal and tangential coordinates, the free-body diagram for the beam is shown in Fig. 17–13*b*. Because of the *translation, G* has the *same* motion as the pin at *B*, which is connected to both the rod and the beam. Note that the tangential component of acceleration acts downward to the left due to the clockwise direction of α , Fig. 17–13*c*. Furthermore, the normal component of acceleration is *always* directed toward the center of curvature (toward point *A* for rod *AB*). Since the angular center of curvature (toward point *A* for rod
velocity of *AB* is 6 rad/s when $\theta = 30^{\circ}$, then

$$
(a_G)_n = \omega^2 r = (6 \text{ rad/s})^2 (0.5 \text{ m}) = 18 \text{ m/s}^2
$$

The three unknowns are T_B , T_D , and $(a_G)_t$. The directions of $(a_G)_n$ and $(a_G)_t$ and are indicated on the coordinate axes $(a_G)_t$ have been established, and are indicated on the coordinate axes.

Equations of Motion.

$$
+\sqrt{2}F_n = m(a_G)_n; T_B + T_D - 981 \cos 30^\circ \text{ N} = 100 \text{ kg}(18 \text{ m/s}^2) \text{ (1)}
$$

$$
+2\Sigma F_t = m(a_G)_t; \qquad 981 \sin 30^\circ = 100 \text{ kg}(a_G)_t \tag{2}
$$

$$
\zeta + \Sigma M_G = 0; \quad -(T_B \cos 30^\circ)(0.4 \text{ m}) + (T_D \cos 30^\circ)(0.4 \text{ m}) = 0 \quad (3)
$$

Simultaneous solution of these three equations gives
\n
$$
T_B = T_D = 1.32 \text{ kN}
$$
\n
$$
(a_G)_t = 4.905 \text{ m/s}^2
$$
\nAns.

NOTE: It is also possible to apply the equations of motion along horizontal and vertical *x*, *y* axes, but the solution becomes more involved.

FUNDAMENTAL PROBLEMS

F17–1. The cart and its load have a total mass of 100 kg. Determine the acceleration of the cart and the normal reactions on the pair of wheels at A and B . Neglect the mass of the wheels mass of the wheels.

F17–2. If the 80-kg cabinet is allowed to roll down the inclined plane, determine the acceleration of the cabinet and the normal reactions on the pair of rollers at A and B
that have negligible mass that have negligible mass.

F17–3. The 20-lb link AB is pinned to a moving frame at A
and held in a vertical position by means of a string BC and held in a vertical position by means of a string BC which can support a maximum tension of 10 lb. Determine the maximum acceleration of the frame without breaking the string. What are the corresponding components of reaction at the pin *A*?

F17–3

F17–4. Determine the maximum acceleration of the truck without causing the assembly to move relative to the truck. Also what is the corresponding normal reaction on legs A and B? The 100-kg table has a mass center at G and the coefficient of static friction between the legs of the table coefficient of static friction between the legs of the table and the bed of the truck is $\mu_s = 0.2$.

F17–5. At the instant shown both rods of negligible mass swing with a counterclockwise angular velocity of swing with a counterclockwise angular velocity of $\omega = 5$ rad/s, while the 50-kg bar is subjected to the 100-N horizontal force. Determine the tension developed in the rods and the angular acceleration of the rods at this instant.

F17–6. At the instant shown, link CD rotates with an angular velocity of $\omega = 6$ rad/s. If it is subjected to a couple moment $M = 450 \text{ N} \cdot \text{m}$, determine the force developed in link AB, the horizontal and vertical component of reaction
on pin D , and the appular acceleration of link CD at this on pin D, and the angular acceleration of link CD at this instant. The block has a mass of 50 kg and center of mass at instant. The block has a mass of 50 kg and center of mass at G. Neglect the mass of links AB and CD . At the instant shown, link *CD*
elocity of $\omega = 6$ rad/s. If it is sub
 $M = 450$ N·m, determine the for-
the horizontal and vertical comm

PROBLEMS

***17–24.** The 4-Mg uniform canister contains nuclear waste material encased in concrete. If the mass of the spreader beam *BD* is 50 kg, determine the force in each of the links *AB*, *CD*, *EF*, and *GH* when the system is lifted with an *AB*, *CD*, *EF*, and *GH* when the system is lifted waveleration of $a = 2 \text{ m/s}^2$ for a short period of time. 2

•17–25. The 4-Mg uniform canister contains nuclear waste material encased in concrete. If the mass of the spreader beam *BD* is 50 kg, determine the largest vertical acceleration **a** of the system so that each of the links *AB* and *CD* are not subjected to a force greater than 30 kN and links *EF* and *GH* are not subjected to a force greater than 34 kN.

17–26. The dragster has a mass of 1200 kg and a center of mass at *G*. If a braking parachute is attached at *C* and mass at G. If a braking parachute is attached at C and
provides a horizontal braking force of $F = (1.6v^2)$ N,
where v is in meters per second determine the critical speed where v is in meters per second, determine the critical speed the dragster can have upon releasing the parachute, such that the wheels at *B* are on the verge of leaving the ground; i.e., the normal reaction at *B* is zero. If such a condition occurs, determine the dragster's initial deceleration. Neglect the mass of the wheels and assume the engine is disengaged so that the wheels are free to roll.

17–27. When the lifting mechanism is operating, the 400-lb load is given an upward acceleration of 5 ft/s^2 . Determine the compressive force the load creates in each of the columns, *AB* and *CD*.What is the compressive force in each of these columns if the load is moving upward at a constant velocity of 3 ft/s ? Assume the columns only support an axial load.

Prob. 17–27

***17–28.** The jet aircraft has a mass of 22 Mg and a center of mass at *G*. If a towing cable is attached to the upper portion mass at G. If a towing cable is attached to the upper portion
of the nose wheel and exerts a force of $T = 400$ N as shown,
determine the acceleration of the plane and the normal determine the acceleration of the plane and the normal reactions on the nose wheel and each of the two wing wheels located at *B*. Neglect the lifting force of the wings and the mass of the wheels.

Prob. 17–28

•17–29. The lift truck has a mass of 70 kg and mass center at *G*. If it lifts the 120-kg spool with an acceleration of 3 m/s^2 , determine the reactions on each of the four wheels. The loading is symmetric. Neglect the mass of the movable arm *CD*.

17–30. The lift truck has a mass of 70 kg and mass center at *G*. Determine the largest upward acceleration of the 120-kg spool so that no reaction on the wheels exceeds 600 N.

Probs. 17–29/30

17–31. The dragster has a mass of 1500 kg and a center of mass at *G*. If the coefficient of kinetic friction between the mass at G. If the coefficient of kinetic friction between the
rear wheels and the pavement is $\mu_k = 0.6$, determine if it is
possible for the driver to lift the front wheels A, off the possible for the driver to lift the front wheels, *A*, off the ground while the rear drive wheels are slipping. Neglect the mass of the wheels and assume that the front wheels are free to roll.

***17–32.** The dragster has a mass of 1500 kg and a center of mass at *G*. If no slipping occurs, determine the frictional force \mathbf{F}_B which must be developed at each of the rear drive
whools B in order to greate an acceleration of $a = 6 \text{ m/s}^2$ force \mathbf{F}_B which must be developed at each of the rear drive
wheels *B* in order to create an acceleration of $a = 6$ m/s².
What are the normal reactions of each wheel on the What are the normal reactions of each wheel on the ground? Neglect the mass of the wheels and assume that the front wheels are free to roll. 2

Probs. 17–31/32

•17–33. At the start of a race, the rear drive wheels *B* of the 1550-lb car slip on the track. Determine the car's acceleration and the normal reaction the track exerts on the front pair of wheels *A* and rear pair of wheels *B*. The front pair of wheels A and rear pair of wheels B. The coefficient of kinetic friction is $\mu_k = 0.7$, and the mass center of the car is at G. The front wheels are free to roll. center of the car is at *G*. The front wheels are free to roll. Neglect the mass of all the wheels.

17–34. Determine the maximum acceleration that can be achieved by the car without having the front wheels *A* leave the track or the rear drive wheels *B* slip on the track. The the track or the rear drive wheels B slip on the track. The coefficient of static friction is $\mu_s = 0.9$. The car's mass center is at C and the front whools are free to roll. Neglect the is at *G*, and the front wheels are free to roll. Neglect the mass of all the wheels.

17–35. The sports car has a mass of 1.5 Mg and a center of mass at *G*. Determine the shortest time it takes for it to reach a speed of 80 km/h, starting from rest, if the engine only drives the rear wheels, whereas the front wheels are free rolling. The coefficient of static friction between the free rolling. The coefficient of static friction between the
wheels and the road is $\mu_s = 0.2$. Neglect the mass of the
wheels for the colculation. If driving power could be wheels for the calculation. If driving power could be supplied to all four wheels, what would be the shortest time for the car to reach a speed of 80 km/h ?

Prob. 17–35

***17–36.** The forklift travels forward with a constant speed of 9ft/s. Determine the shortest stopping distance without causing any of the wheels to leave the ground. The forklift has a weight of 2000 lb with center of gravity at G_1 , and the load weighs 900 lb with center of gravity at G_2 . Neglect the weight of the wheels weight of the wheels. U1

17.4 [Equations of Motion: Rotation](#page-14-0) about a Fixed Axis

Consider the rigid body (or slab) shown in Fig. 17–14*a*, which is constrained to rotate in the vertical plane about a fixed axis perpendicular to the page and passing through the pin at *O*. The angular velocity and angular acceleration are caused by the external force and couple moment system acting on the body. Because the body's center of mass *G* moves around a *circular path*, the acceleration of this point is best represented by its tangential and normal components.The *tangential component of acceleration* tangential and normal components. The *tangential component of acceleration*
has a *magnitude* of $(a_G)_t = \alpha r_G$ and must act in a *direction* which is
consistent with the body's angular acceleration α . The *magnitude* of *consistent* with the body's angular acceleration α . The *magnitude* of the *consistent* with the body's angular acceleration α . The *magnitude* of the *normal component of acceleration* is $(a_G)_n = \omega^2 r_G$. This component is *always directed* from point *G* to *O* regardless of the rotational se *always directed* from point *G* to *O*, regardless of the rotational sense of ω .

426 CHAPTER 17 PLANAR KINETICS OF A RIGID BODY: FORCE AND ACCELERATION

The free-body and kinetic diagrams for the body are shown in Fig. 17–14*b*. The two components $m(\mathbf{a}_G)_t$ and $m(\mathbf{a}_G)_n$, shown on the kinetic diagram are associated with the tangential and normal components kinetic diagram, are associated with the tangential and normal components of acceleration of the body's mass center. The $I_G \alpha$ vector acts in the same
direction as α and has a *magnitude* of $I_{\alpha} \alpha$ where I_{α} is the body's moment *direction* as α and has a *magnitude* of $I_G\alpha$, where I_G is the body's moment of inertia calculated about an axis which is perpendicular to the page and of inertia calculated about an axis which is perpendicular to the page and passes through *G*. From the derivation given in Sec. 17.2, the equations of motion which apply to the body can be written in the form

$$
\Sigma F_n = m(a_G)_n = m\omega^2 r_G
$$

\n
$$
\Sigma F_t = m(a_G)_t = m\alpha r_G
$$

\n
$$
\Sigma M_G = I_G \alpha
$$
\n(17-14)

The moment equation can be replaced by a moment summation about any arbitrary point *P* on or off the body provided one accounts for the any arbitrary point P on or off the body provided one accounts for the
moments $\Sigma(M_k)_P$ produced by $I_G\alpha$, $m(\mathbf{a}_G)_t$, and $m(\mathbf{a}_G)_n$ about the
point Often it is convenient to sum moments about the pin at O in order point. Often it is convenient to sum moments about the pin at *O* in order to eliminate the *unknown* force \mathbf{F}_0 . From the kinetic diagram,
Fig. 17, 14b this requires Fig. 17–14*b*, this requires

$$
\zeta + \Sigma M_O = \Sigma (M_k)_O; \qquad \Sigma M_O = r_G m(a_G)_t + I_G \alpha \qquad (17-15)
$$

Note that the moment of $m(\mathbf{a}_G)_n$ is not included here since the line of action of this vector passes through O Substituting $(a_G) = r_G \alpha$ we may Note that the moment of $m(\mathbf{a}_G)_n$ is not included here since the line of action of this vector passes through *O*. Substituting $(a_G)_t = r_G\alpha$, we may rewrite the above equation as $(1-\Sigma M - (I_+ + mr^2)\alpha$. From the rewrite the above equation as $\zeta + \sum M_O = (I_G + mr_G^2)\alpha$. From the rewrite the above equation as $\zeta + \Sigma M_O = (I_G + mr_G^2)\alpha$. From the parallel-axis theorem, $I_O = I_G + md^2$, and therefore the term in parentheses represents the moment of inertia of the body about the fixed parentheses represents the *moment of inertia of the body about the fixed axis of rotation passing through O*.* Consequently, we can write the three equations of motion for the body as

$$
\Sigma F_n = m(a_G)_n = m\omega^2 r_G
$$

\n
$$
\Sigma F_t = m(a_G)_t = m\alpha r_G
$$

\n
$$
\Sigma M_O = I_O \alpha
$$
\n(17-16)

When using these equations, remember that " $I_0\alpha$ " accounts for the "moment" of both $m(\mathbf{a}_\alpha)$ and $I_0\alpha$ about point O Fig. 17–14b. In other "moment" of *both* $m(\mathbf{a}_G)_t$ and $I_G \alpha$ about point *O*, Fig. 17–14*b*. In other words $\sum M_G = \sum (M_t)_G = I_G \alpha$ as indicated by Eqs. 17–15 and 17–16 words, $\sum M_O = \sum (M_k)_O = I_O \alpha$, as indicated by Eqs. 17–15 and 17–16.

* The result $\Sigma M_O = I_O \alpha$ can also be obtained *directly* from Eq. 17–6 by selecting point to coincide with O realizing that $(a_0) = (a_0) = 0$ *P* to coincide with *O*, realizing that $(a_P)_x = (a_P)_y = 0$.

Procedure for Analysis

Kinetic problems which involve the rotation of a body about a fixed axis can be solved using the following procedure.

Free-Body Diagram.

- **•** Establish the inertial *n, t* coordinate system and specify the direction and sense of the accelerations $(a_G)_n$ and $(a_G)_t$ and the angular acceleration α of the body. Recall that $(a_G)_t$ must act in a direction which is in accordance with the rotational sense of α direction which is in accordance with the rotational sense of α , whereas $(\mathbf{a}_G)_n$ always acts toward the axis of rotation, point *O*.
- **•** Draw the free-body diagram to account for all the external forces and couple moments that act on the body.
- Determine the moment of inertia I_G or I_O .
- **•** Identify the unknowns in the problem.
- If it is decided that the rotational equation of motion it is decided that the rotational equation of motion $M_P = \Sigma(\mathcal{M}_k)_P$ is to be used, i.e., *P* is a point other than *G* or *O*, en consider drawing the kinetic diagram in order to help then consider drawing the kinetic diagram in order to help "visualize" the "moments" developed by the components $m(\mathbf{a}_G)_n, m(\mathbf{a}_G)_t$, and $I_G \alpha$ when writing the terms for the moment
sum $\Sigma(M_t)_R$ sum $\Sigma(\mathcal{M}_k)_P$.

Equations of Motion.

- **•** Apply the three equations of motion in accordance with the established sign convention.
- If moments are summed about the body's mass center, G, then moments are summed about the body's mass center, G, then $M_G = I_G \alpha$, since $(m\mathbf{a}_G)_n$ and $(m\mathbf{a}_G)_n$ create no moment about G.
- **•** If moments are summed about the pin support *O* on the axis of rotation, then $(m\mathbf{a}_G)_n$ creates no moment about *O*, and it can be shown that $\sum M_G = I_G \alpha$ rotation, then $(m\mathbf{a}_G)_n$ cr
shown that $\Sigma M_O = I_O \alpha$.

Kinematics.

- **•** Use kinematics if a complete solution cannot be obtained strictly from the equations of motion.
- **•** If the angular acceleration is variable, use

$$
\alpha = \frac{d\omega}{dt} \qquad \alpha \, d\theta = \omega \, d\omega \qquad \omega = \frac{d\theta}{dt}
$$

• If the angular acceleration is constant, use
 $\omega = \omega_0 + \alpha_c t$

$$
\omega = \omega_0 + \alpha_c t
$$

\n
$$
\theta = \theta_0 + \omega_0 t + \frac{1}{2} \alpha_c t^2
$$

\n
$$
\omega^2 = \omega_0^2 + 2\alpha_c(\theta - \theta_0)
$$

The crank on the oil-pumping rig undergoes rotation about a fixed axis which is caused by a driving torque **M** of the motor.The loadings shown on the free-body diagram cause the effects shown on the kinetic diagram. If moments are summed about the mass center, moments are summed about the mass center,
 G, then $\Sigma M_G = I_G \alpha$. However, if moments

are summed about point *Q* noting are summed about point *O*, noting are summed about point *O*, noting
that $(a_G)_t = \alpha d$, then $\zeta + \sum M_O = I_G \alpha +$
 $m(a_G) d + m(a_G)$ (0) = $(I + md^2) \alpha = I_G$ $m(a_G)_id + m(a_G)_n(0) = (I_G + md^2)\alpha = I_O\alpha.$

(a)

=

$$
(\mathrm{b})
$$

Fig. 17–15

The unbalanced 50-lb flywheel shown in Fig. 17–15*a* has a radius of The unbalanced 50-lb flywheel shown in Fig. 17–15*a* has a radius of gyration of $k_G = 0.6$ ft about an axis passing through its mass center G. If it is released from rest, determine the horizontal and vertical *G*. If it is released from rest, determine the horizontal and vertical components of reaction at the pin *O*.

SOLUTION

Free-Body and Kinetic Diagrams. Since *G* moves in a circular path, it will have both normal and tangential components of acceleration. Also, since α , which is caused by the flywheel's weight, acts clockwise, the tangential component of acceleration must act acts clockwise, the tangential component of acceleration must act
downward. Why? Since $\omega = 0$, only $m(a_G)_t = mar_G$ and $I_G\alpha$ are
shown on the kinematic diagram in Fig. 17–15b. Here the moment of shown on the kinematic diagram in Fig. 17–15*b*. Here, the moment of inertia about *G* is

bout *G* is

$$
I_G = mk_G^2 = (50 \text{ lb}/32.2 \text{ ft/s}^2)(0.6 \text{ ft})^2 = 0.559 \text{ slug} \cdot \text{ft}^2
$$

The three unknowns are O_n , O_t , and α .

Equations of Motion.
\n
$$
\pm \Sigma F_n = m\omega^2 r_G; \qquad O_n = 0 \qquad \text{Ans.}
$$
\n
$$
+\sqrt{2}F_t = m\alpha r_G; \quad -O_t + 50 \text{ lb} = \left(\frac{50 \text{ lb}}{32.2 \text{ ft/s}^2}\right)(\alpha)(0.5 \text{ ft}) \qquad (1)
$$

$$
+\sqrt{2}F_t = m\alpha r_G; \quad -O_t + 50 \text{ lb} = \left(\frac{25 \text{ cm}}{32.2 \text{ ft/s}^2}\right) (\alpha)(0.5 \text{ ft})
$$

$$
\zeta + \sum M_G = I_G \alpha; \quad O_t(0.5 \text{ ft}) = (0.5590 \text{ slug} \cdot \text{ ft}^2) \alpha
$$

Solving,

$$
\alpha = 26.4 \text{ rad/s}^2 \qquad O_t = 29.5 \text{ lb} \qquad \qquad \text{Ans.}
$$

Moments can also be summed about point *O* in order to eliminate \mathbf{O}_n
and \mathbf{O}_n and thereby obtain a *direct solution* for α . Fig. 17, 15b. This can and \mathbf{O}_t and thereby obtain a *direct solution* for α , Fig. 17–15*b*. This can be done in one of two ways be done in one of *two* ways.

$$
\zeta + \Sigma M_O = \Sigma (M_k)_O;
$$

(50 lb)(0.5 ft) = (0.5590 slug·ft²) α + $\left[\left(\frac{50 \text{ lb}}{32.2 \text{ ft/s}^2} \right) \alpha (0.5 \text{ ft}) \right]$ (0.5 ft)
50 lb(0.5 ft) = 0.9472 α (2)

$$
50 \text{ lb} (0.5 \text{ ft}) = 0.9472 \alpha \tag{2}
$$

 $50 \text{ lb}(0.5 \text{ ft}) = 0.9472\alpha$ (2)
If $\Sigma M_O = I_O \alpha$ is applied, then by the parallel-axis theorem the
moment of inertia of the flywheel about O is moment of inertia of the flywheel about *O* is

nt of inertia of the flywheel about *O* is
\n
$$
I_O = I_G + mr_G^2 = 0.559 + \left(\frac{50}{32.2}\right)(0.5)^2 = 0.9472 \text{ slug} \cdot \text{ft}^2
$$

Hence,

Hence,
\n
$$
\zeta + \Sigma M_O = I_O \alpha
$$
; (50 lb)(0.5 ft) = (0.9472 slug·ft²) α

which is the same as Eq. 2. Solving for α and substituting into Eq. 1 yields the answer for O_t obtained previously.

EXAMPLE 17.10

At the instant shown in Fig. 17–16*a*, the 20-kg slender rod has an At the instant shown in Fig. 17–16*a*, the 20-kg slender rod has an angular velocity of $\omega = 5$ rad/s. Determine the angular acceleration and the horizontal and vertical components of reaction of the pin on the rod at this instant.

SOLUTION

Free-Body and Kinetic Diagrams. Fig. 17–16*b*. As shown on the kinetic diagram, point *G* moves around a circular path and so it has two components of acceleration. It is important that the tangential two components of acceleration. It is important that the tangential
component $a_t = \alpha r_G$ act downward since it must be in accordance
with the rotational sense of α . The three unknowns are Ω , Ω , and α . with the rotational sense of α . The three unknowns are O_n , O_t , and α .

Equation of Motion.

Equation of Motion.
\n
$$
\begin{aligned}\n&\pm \Sigma F_n = m\omega^2 r_G; & O_n &= (20 \text{ kg})(5 \text{ rad/s})^2 (1.5 \text{ m}) \\
&+ \sqrt{\Sigma F_t} = m\alpha r_G; & -O_t + 20(9.81)N &= (20 \text{ kg})(\alpha)(1.5 \text{ m}) \\
&\zeta + \Sigma M_G &= I_G \alpha; & O_t(1.5 \text{ m}) + 60 \text{ N} \cdot \text{m} &= \left[\frac{1}{12}(20 \text{ kg})(3 \text{ m})^2\right]\alpha\n\end{aligned}
$$
\nSolving

Ans. $O_n = 750 \text{ N}$ $O_t = 19.05 \text{ N}$ $\alpha = 5.90 \text{ rad/s}$ 2

A more direct solution to this problem would be to sum moments about point *O* to eliminate \mathbf{O}_n and \mathbf{O}_t and obtain a *direct solution* for α . Here,

$$
\alpha. Here,\n\zeta + \Sigma M_O = \Sigma (M_k)_O; \quad 60 \text{ N} \cdot \text{m} + 20(9.81) \text{ N}(1.5 \text{ m}) =\n\left[\frac{1}{12} (20 \text{ kg})(3 \text{ m})^2 \right] \alpha + [20 \text{ kg}(\alpha)(1.5 \text{ m})](1.5 \text{ m})\n\alpha = 5.90 \text{ rad/s}^2
$$
Ans.

 $I_O = \frac{1}{3}ml^2$

Also, since
$$
I_O = \frac{1}{3}ml^2
$$
 for a slender rod, we can apply
\n
$$
\zeta + \Sigma M_O = I_O \alpha; 60 \text{ N} \cdot \text{m} + 20(9.81) \text{ N}(1.5 \text{ m}) = \left[\frac{1}{3}(20 \text{ kg})(3 \text{ m})^2\right] \alpha
$$
\n
$$
\alpha = 5.90 \text{ rad/s}^2
$$
Ans.

NOTE: By comparison, the last equation provides the simplest solution for α and *does not* require use of the kinetic diagram.

 $0.4 m$ (c) **O***^x* **O***^y* 60 (9.81) N *O* $=$ $\int_{0.4 \text{ m}v}$ 20(9.81) N (20 kg)**a** I_O a **Fig. 17–17**

The drum shown in Fig. 17–17*a* has a mass of 60 kg and a radius of The drum shown in Fig. 17–17*a* has a mass of 60 kg and a radius of
gyration $k_O = 0.25$ m. A cord of negligible mass is wrapped around the
periphery of the drum and attached to a block having a mass of 20 kg If periphery of the drum and attached to a block having a mass of 20 kg. If the block is released, determine the drum's angular acceleration.

SOLUTION I

Free-Body Diagram. Here we will consider the drum and block separately, Fig. 17–17*b*. Assuming the block accelerates *downward* at **a**, it creates a *counterclockwise* angular acceleration α of the drum.
The moment of inertia of the drum is
 $I_O = mk_O^2 = (60 \text{ kg})(0.25 \text{ m})^2 = 3.75 \text{ kg} \cdot \text{m}^2$ The moment of inertia of the drum is
 $I_O = mk_O^2 = (60 \text{ kg})(0.50 \text{ m})$

$$
I_O = mk_O^2 = (60 \text{ kg})(0.25 \text{ m})^2 = 3.75 \text{ kg} \cdot \text{m}^2
$$

There are five unknowns, namely O_x , O_y , T , a , and α .

Equations of Motion. Applying the translational equations of **Equations of Motion.** Applying the translational equations of motion $\Sigma F_x = m(a_G)_x$ and $\Sigma F_y = m(a_G)_y$ to the drum is of no consequence to the solution since these equations involve the consequence to the solution, since these equations involve the unknowns O_x and O_y . Thus, for the drum and block, respectively,
 $\zeta + \sum M_O = I_O \alpha$; $T(0.4 \text{ m}) = (3.75 \text{ kg} \cdot \text{m}^2) \alpha$

$$
\zeta + \Sigma M_O = I_O \alpha; \qquad T(0.4 \text{ m}) = (3.75 \text{ kg} \cdot \text{m}^2) \alpha \tag{1}
$$

$$
T(0.4 \text{ m}) = (3.75 \text{ kg/m})a
$$

+ \uparrow $\Sigma F_y = m(a_G)_y$; -20(9.81)N + T = -(20 kg)a (2)

Kinematics. Since the point of contact *A* between the cord and

drum has a tangential component of acceleration **a**, Fig. 17–17*a*, then

\n
$$
\zeta + a = \alpha r; \qquad a = \alpha (0.4 \, \text{m}) \tag{3}
$$

Solving the above equations,

ations,
\n
$$
T = 106 \text{ N } a = 4.52 \text{ m/s}^2
$$

\n $\alpha = 11.3 \text{ rad/s}^2$ *Ans.*

SOLUTION II

Free-Body and Kinetic Diagrams. The cable tension *T* can be eliminated from the analysis by considering the drum and block as a *single system*, Fig. 17–17*c*. The kinetic diagram is shown since moments will be summed about point *O*.

Equations of Motion. Using Eq. 3 and applying the moment equation about *O* to eliminate the unknowns O_x and O_y , we have
 $(1 + \Sigma M_0) = \Sigma (M_1)_0$; [20(9.81)N] (0.4 m) =

$$
\zeta + \Sigma M_O = \Sigma (M_k)_O; \quad [20(9.81)N] (0.4 m) =
$$

$$
(3.75 \text{ kg} \cdot m^2) \alpha + [20 \text{ kg}(\alpha \ 0.4 m)] (0.4 m)
$$

$$
\alpha = 11.3 \text{ rad/s}^2
$$
Ans.

NOTE: If the block were *removed* and a force of 20(9.81) N were **NOTE:** If the block were *removed* and a force of 20(9.81) N were applied to the cord, show that $\alpha = 20.9$ rad/s². This value is larger since the block has an inertia, or resistance to acceleration.

The slender rod shown in Fig. 17–18*a* has a mass *m* and length *l* and is The slender rod shown in Fig. 17–18*a* has a mass *m* and length *l* and is released from rest when $\theta = 0^{\circ}$. Determine the horizontal and vertical components of force which the pin at *A* exerts on the rod at vertical component
the instant $\theta = 90^{\circ}$.

SOLUTION

Free-Body Diagram. The free-body diagram for the rod in the general position θ is shown in Fig. 17–18*b*. For convenience, the force components at *A* are shown acting in the *n* and *t* directions. Note that α acts clockwise and so $(a_G)_t$ acts in the + *t* direction.
The moment of inertia of the rod about point A is

acts clockwise and so $(\mathbf{a}_G)_t$ acts in the + *t* direction.
The moment of inertia of the rod about point *A* is $I_A = \frac{1}{3}ml^2$.

Equations of Motion. Moments will be summed about *A* in order to eliminate A_n and A_t .

$$
+ \angle 2F_t = max_G;
$$
 $A_t + mg \cos \theta = max(I/\angle)$

$$
\zeta + \Sigma M_A = I_A \alpha; \qquad mg \cos \theta (l/2) = \left(\frac{1}{3}ml^2\right) \alpha \tag{3}
$$

Kinematics. For a given angle θ there are four unknowns in the above three equations: A_n , A_t , ω , and α . As shown by Eq. 3, α is *not*
constant rather it depends on the position θ of the rod. The necessary *constant;* rather, it depends on the position θ of the rod. The necessary fourth equation is obtained using kinematics, where α and ω can be related to θ by the equation

related to *θ* by the equation
\n(
$$
\zeta
$$
 +) $\omega d\omega = \alpha d\theta$ (4)
\nNote that the positive clockwise direction for this equation *agrees* with

that of Eq. 3. This is important since we are seeking a simultaneous solution.

lution.
In order to solve for ω at $\theta = 90^{\circ}$, eliminate α from Eqs. 3 and 4, which yields

$$
\omega \, d\omega = (1.5g/l) \cos \theta \, d\theta
$$

Since $\omega = 0$ at $\theta = 0^{\circ}$, we have

$$
\int_0^\omega \omega \, d\omega = (1.5g/l) \int_0^{90^\circ} \cos \theta \, d\theta
$$

$$
\omega^2 = 3g/l
$$

Substituting this value into Eq. 1 with $\theta = 90^\circ$ and solving Eqs. 1 to 3 yields $\alpha = 0$

$$
\alpha = 0
$$

$$
A_t = 0 \quad A_n = 2.5mg
$$
 Ans.

NOTE: If $\Sigma M_A = \Sigma (M_k)_A$ is used, one must account for the moments of $L_0 \alpha$ and $m(\alpha_0)$ about A moments of $I_G \alpha$ and $m(\mathbf{a}_G)$ about A.

considering the "system" consisting of the block and spool. considering the "system" consisting of the block and spool, and then by considering the block and spool separately.

17.5 [Equations of Motion: General Plane](#page-14-0) **Motion**

The rigid body (or slab) shown in Fig. 17–19*a* is subjected to general plane motion caused by the externally applied force and couple-moment system. The free-body and kinetic diagrams for the body are shown in Fig. 17–19*b*. If an *x* and *y* inertial coordinate system is established as shown, the three equations of motion are

$$
\Sigma F_x = m(a_G)_x
$$

\n
$$
\Sigma F_y = m(a_G)_y
$$

\n
$$
\Sigma M_G = I_G \alpha
$$
\n(17-17)

In some problems it may be convenient to sum moments about a point *P* other than *G* in order to eliminate as many unknown forces as possible from the moment summation. When used in this more general case, the three equations of motion are

$$
\Sigma F_x = m(a_G)_x
$$

\n
$$
\Sigma F_y = m(a_G)_y
$$

\n
$$
\Sigma M_P = \Sigma (\mathcal{M}_k)_P
$$
\n(17-18)

-

F3

y

 \mathbf{F}_2

x

M₂

Here $\Sigma(\mathcal{M}_k)$ represents the moment sum of $I_G \alpha$ and $m\mathbf{a}_G$ (or its components) about P as determined by the data on the kinetic diagram components) about *P* as determined by the data on the kinetic diagram.

There is a particular type of problem that involves a uniform cylinder, or body of circular shape, that rolls on a rough surface *without slipping*. If we sum the moments about the instantaneous center of zero velocity, we sum the moments about the instantaneous center of zero velocity,
then $\Sigma(M_k)_{IC}$ becomes $I_{IC}\alpha$. The proof is similar to $\Sigma M_O = I_O \alpha$
(Eq. 17–16) so that (Eq. 17–16), so that

Fig. 17–19

$$
\Sigma M_{IC} = I_{IC}\alpha \tag{17-19}
$$

This result compares with $\Sigma M_O = I_O \alpha$, which is used for a body pinned
at point O. Eq. 17–16, See Prob. 17–91 at point *O*, Eq. 17–16. See Prob. 17–91.

F4

Procedure for Analysis

Kinetic problems involving general plane motion of a rigid body can be solved using the following procedure.

Free-Body Diagram.

- **•** Establish the *x, y* inertial coordinate system and draw the freebody diagram for the body.
- **•** Specify the direction and sense of the acceleration of the mass center, \mathbf{a}_G , and the angular acceleration α of the body.
Determine the magnetic finantia I
- Determine the moment of inertia I_G .
- Identify the unknowns in the problem.
- If it is decided that the rotational equation of motion it is decided that the rotational equation of motion $M_P = \Sigma(\mathcal{M}_k)_P$ is to be used, then consider drawing the kinetic agram in order to belo "visualize" the "moments" developed by diagram in order to help "visualize" the "moments" developed by the components $m(\mathbf{a}_G)_x$, $m(\mathbf{a}_G)_y$, and $I_G \alpha$ when writing the terms in the moment sum $\Sigma(M_x)_x$. in the moment sum $\Sigma(\mathcal{M}_k)_P$.

Equations of Motion.

- **•** Apply the three equations of motion in accordance with the established sign convention.
- When friction is present, there is the possibility for motion with no slipping or tipping. Each possibility for motion should be considered.

Kinematics.

- **•** Use kinematics if a complete solution cannot be obtained strictly from the equations of motion.
- **•** If the body's motion is *constrained* due to its supports, additional If the body's motion is *constrained* due to its supports, additional
equations may be obtained by using $\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$, which
relates the accelerations of any two points A and B on the body. relates the accelerations of any two points *A* and *B* on the body.
- When a wheel, disk, cylinder, or ball *rolls without slipping*, then $a_G = \alpha r$.

As the soil compactor, or "sheep's foot roller" moves forward, the roller has general plane motion. The forces shown on its free-body diagram cause the effects shown on the kinetic diagram. If moments are summed about the mass center, G, are summed about the mass center, G,
then $\Sigma M_G = I_G \alpha$. However, if moments
are summed about point A (the IC) then are summed about point A (the IC) then are summed about point A (the IC)
 $\zeta + \sum M_A = I_G \alpha + (ma_G)d = I_A \alpha$.

Determine the angular acceleration of the spool in Fig. 17–20*a*. The Determine the angular acceleration of the spool in Fig. 17–20a. The spool has a mass of 8 kg and a radius of gyration of $k_G = 0.35$ m.
The cords of negligible mass are wrapped around its inner bub and The cords of negligible mass are wrapped around its inner hub and outer rim.

SOLUTION I

Free-Body Diagram. Fig. $17-20b$. The $100-N$ force causes \mathbf{a}_G to act unward. Also α acts clockwise since the spool winds around the cord upward. Also, α acts clockwise, since the spool winds around the cord at *A*.

There are three unknowns *T*, a_G , and α . The moment of inertia of e spool about its mass center is $I_G = mk_G^2 = 8 \text{ kg}(0.35 \text{ m})^2 = 0.980 \text{ kg} \cdot \text{m}^2$ the spool about its mass center is
 $I_G = mk_G^2 = 8$ kg

$$
I_G = mk_G^2 = 8 \text{ kg}(0.35 \text{ m})^2 = 0.980 \text{ kg} \cdot \text{m}^2
$$

Equations of Motion.

Equations of Motion.
\n
$$
+ \hat{\Gamma} \Sigma F_y = m(a_G)_y;
$$
 $T + 100 \text{ N} - 78.48 \text{ N} = (8 \text{ kg})a_G$ (1)
\n $\hat{\Gamma} + \Sigma M_G = I_G \alpha;$ $100 \text{ N}(0.2 \text{ m}) - T(0.5 \text{ m}) = (0.980 \text{ kg} \cdot \text{m}^2) \alpha$ (2)

Kinematics. A complete solution is obtained if kinematics is used to relate a_G to α . In this case the spool "rolls without slipping" on the cord
at A. Hence, we can use the results of Example 16.4 or 16.15, so that at *A*. Hence, we can use the results of Example 16.4 or 16.15, so that
 $(\zeta +) a_G = \alpha r$. $a_G = \alpha (0.5 \text{ m})$ (

$$
(\zeta +) a_G = \alpha r. \qquad a_G = \alpha (0.5 \,\mathrm{m}) \tag{3}
$$

Solving Eqs. 1 to 3, we have

$$
\alpha = 10.3 \text{ rad/s}^2
$$

\n
$$
a_G = 5.16 \text{ m/s}^2
$$

\n
$$
T = 19.8 \text{ N}
$$

\nAns.

SOLUTION II

Equations of Motion. We can eliminate the unknown *T* by summing moments about point *A*. From the free-body and kinetic diagrams Figs. 17–20*b* and 17–20*c*, we have
 $C + \sum M_A = \sum (M_A)_A$: 100 N

$$
\zeta + \Sigma M_A = \Sigma (M_k)_A; \qquad 100 \text{ N} (0.7 \text{ m}) - 78.48 \text{ N} (0.5 \text{ m})
$$

$$
= (0.980 \text{ kg} \cdot \text{m}^2) \alpha + [(8 \text{ kg}) a_G] (0.5 \text{ m})
$$

Using Eq. (3) ,

$$
\alpha = 10.3 \text{ rad/s}^2
$$
 Ans.

SOLUTION III

Equations of Motion. The simplest way to solve this problem is to

realize that point *A* is the *IC* for the spool. Then Eq. 17–19 applies.
\n
$$
\zeta + \Sigma M_A = I_A \alpha
$$
; (100 N)(0.7 m) – (78.48 N)(0.5 m)
\n= [0.980 kg·m² + (8 kg)(0.5 m)²]α
\n α = 10.3 rad/s²

G (8 kg) **a***^G* $(0.980 \text{ kg} \cdot \text{m}^2)$ (c) $\int_{0.5~\mathrm{m}}$ \uparrow A

Fig. 17–20

The 50-lb wheel shown in Fig. 17–21*a* has a radius of gyration $k_G = 0.70$ ft. If a 35-lb ft couple moment is applied to the wheel, determine the acceleration of its mass center *G*. The coefficients of static and kinetic friction between the wheel and the plane at *A* are static and kinetic friction between the $\mu_s = 0.3$ and $\mu_k = 0.25$, respectively. The 50-lb wheel shown
 $k_G = 0.70$ ft. If a 35-lb ft
determine the acceleration

SOLUTION

Free-Body Diagram. By inspection of Fig. 17–21*b*, it is seen that the couple moment causes the wheel to have a clockwise angular acceleration of α . As a result, the acceleration of the mass center, a_G , is directed to the right. The moment of inertia is

is directed to the right. The moment of inertia is

$$
I_G = mk_G^2 = \frac{50 \text{ lb}}{32.2 \text{ ft/s}^2} (0.70 \text{ ft})^2 = 0.7609 \text{ slug} \cdot \text{ft}^2
$$

The unknowns are N_A , F_A , a_G , and α .

Equations of Motion.
-

$$
\Rightarrow \Sigma F_x = m(a_G)_x; \qquad F_A = \left(\frac{50 \text{ lb}}{32.2 \text{ ft/s}^2}\right) a_G \tag{1}
$$

$$
\langle 32.2 \, \text{It/s} \rangle
$$

+ $\uparrow \Sigma F_y = m(a_G)_y;$ $N_A - 50 \, \text{lb} = 0$ (2)
 $\tilde{\zeta} + \Sigma M_G = I_G \alpha;$ 35 lb·ft - 1.25 ft(F_A) = (0.7609 slug·ft²) α (3)

A fourth equation is needed for a complete solution.

Kinematics (No Slipping). If this assumption is made, then

$$
a_G = (1.25 \text{ ft})\alpha \tag{4}
$$

Solving Eqs. 1 to 4,

$$
N_A = 50.0 \text{ lb} \qquad F_A = 21.3 \text{ lb}
$$

$$
\alpha = 11.0 \text{ rad/s}^2 \qquad a_G = 13.7 \text{ ft/s}^2
$$

This solution requires that no slipping occurs, i.e., $F_A \le \mu_s N_A$.
However, since 21.3 lb > 0.3(50 lb) = 15 lb, the wheel slips as it rolls. However, since $21.3 \text{ lb} > 0.3(50 \text{ lb}) = 15 \text{ lb}$, the wheel slips as it rolls.

(Slipping). Equation 4 is not valid, and so $F_A = \mu_k N_A$, or
 $F_A = 0.25 N_A$ $F_A = \mu_k N_A,$

$$
F_A = 0.25N_A \tag{5}
$$

Solving Eqs. 1 to 3 and 5 yields

$$
N_A = 50.0 \text{ lb} \qquad F_A = 12.5 \text{ lb}
$$

\n
$$
\alpha = 25.5 \text{ rad/s}^2
$$

\n
$$
a_G = 8.05 \text{ ft/s}^2 \rightarrow
$$
Ans.

17

The uniform slender pole shown in Fig. 17–22*a* has a mass of 100 kg. If the coefficients of static and kinetic friction between the end of the the coefficients of static and kinetic friction between the end of the pole and the surface are $\mu_s = 0.3$ and $\mu_k = 0.25$, respectively, determine the pole's appular acceleration at the instant the 400 N determine the pole's angular acceleration at the instant the 400-N horizontal force is applied. The pole is originally at rest.

SOLUTION

Free-Body Diagram. Figure 17–22*b*.The path of motion of the mass center *G* will be along an unknown curved path having a radius of curvature ρ , which is initially on a vertical line. However, there is no normal or *y* component of acceleration since the pole is originally at normal or y component of acceleration since the pole is originally at rest, i.e., $\mathbf{v}_G = \mathbf{0}$, so that $(a_G)_y = v_G^2/\rho = 0$. We will assume the mass center accelerates to the right and that the pole has a clockwise center accelerates to the right and that the pole has a clockwise angular acceleration of α . The unknowns are N_A , F_A , a_G , and α .

Equation of Motion.
\n
$$
\Rightarrow \Sigma F_x = m(a_G)_x; \quad 400 \text{ N} - F_A = (100 \text{ kg})a_G \tag{1}
$$

$$
T_A = (100 \text{ kg})u_G
$$

+ \uparrow $\Sigma F_y = m(a_G)_y$; $N_A - 981 \text{ N} = 0$ (2)

$$
\zeta + \sum M_G = I_G \alpha; F_A(1.5 \text{ m}) - (400 \text{ N})(1 \text{ m}) = (\frac{1}{12}(100 \text{ kg})(3 \text{ m})^2) \alpha (3)
$$

A fourth equation is needed for a complete solution.

Kinematics (No Slipping). With this assumption, point *A* acts as a "pivot" so that α is clockwise, then a_G is directed to the right.

$$
a_G = \alpha r_{AG}; \qquad a_G = (1.5 \text{ m}) \alpha \tag{4}
$$

Solving Eqs. 1 to 4 yields

$$
N_A = 981 \text{ N} \qquad F_A = 300 \text{ N}
$$

$$
a_G = 1 \text{ m/s}^2 \qquad \alpha = 0.667 \text{ rad/s}^2
$$

The assumption of no slipping requires $F_A \le \mu_s N_A$. However,
300 N > 0.3(981 N) = 294 N and so the pole slips at A. $300 \text{ N} > 0.3(981 \text{ N}) = 294 \text{ N}$ and so the pole slips at *A*.

(Slipping). For this case Eq. 4 does *not* apply. Instead the frictional equation $F_A = \mu_k N_A$ must be used. Hence,
 $F_A = 0.25 N_A$ **).** For this $F_A = \mu_k N_A$

$$
F_A = 0.25N_A \tag{5}
$$

Solving Eqs. 1 to 3 and 5 simultaneously yields

$$
N_A = 981 \text{ N} \qquad F_A = 245 \text{ N} \qquad a_G = 1.55 \text{ m/s}^2
$$

$$
\alpha = -0.428 \text{ rad/s}^2 = 0.428 \text{ rad/s}^2 \qquad \text{Ans.}
$$

Fig. 17–22

The uniform 50-kg bar in Fig. 17–23*a* is held in the equilibrium position by cords *AC* and *BD*. Determine the tension in *BD* and the angular acceleration of the bar immediately after *AC* is cut.

SOLUTION

Free-Body Diagram. Fig. 17–23*b*. There are four unknowns, T_B , $(a₀)$, $(a₀)$, and α $(a_G)_x, (a_G)_y$, and α .

Equations of Motion.

$$
\Rightarrow \Sigma F_x = m(a_G)_x; \qquad 0 = (50 \text{ kg } a_G)_x
$$

$$
(a_G)_x = 0
$$

$$
+ \hat{\Gamma} \Sigma F_y = m(a_G)_y; \quad T_B - 50(9.81)N = -(50 \text{ kg } a_G)_y
$$
(1)

$$
\zeta + \Sigma M_G = I_G \alpha; \qquad T_B(1.5 \text{ m}) = \left[\frac{1}{12}(50 \text{ kg})(3 \text{ m})^2\right] \alpha
$$
 (2)

Kinematics. Since the bar is at rest just after the cable is cut, then its angular velocity and the velocity of point *B* at this instant are equal to angular velocity and the velocity of point *B* at this instant are equal to zero. Thus $(a_B)_n = v_B^2/\rho_{BD} = 0$. Therefore, a_B only has a tangential component which is directed along the *x* axis Fig. 17–23c. Applying component, which is directed along the *x* axis, Fig. 17–23*c*. Applying the relative acceleration equation to points *G* and *B*,

$$
\mathbf{a}_G = \mathbf{a}_B + \boldsymbol{\alpha} \times \mathbf{r}_{G/B} - \omega^2 \mathbf{r}_{G/B}
$$

$$
-(a_G)_{y} \mathbf{j} = a_B \mathbf{i} + (\alpha \mathbf{k}) \times (-1.5\mathbf{i}) - \mathbf{0}
$$

$$
-(a_G)_{y} \mathbf{j} = a_B \mathbf{i} - 1.5\alpha \mathbf{j}
$$

Equating the **i** and **j** components of both sides of this equation,

$$
0 = a_B
$$

$$
(a_G)_y = 1.5\alpha
$$

Solving Eqs. (1) through (3) yields

$$
\alpha = 4.905 \text{ rad/s}^2
$$
Ans.

$$
T_B = 123 \text{ N}
$$
Ans.

$$
(a_G)_y = 7.36 \text{ m/s}^2
$$

(3)

FUNDAMENTAL PROBLEMS

F17–13. The uniform 60-kg slender bar is initially at rest on a smooth horizontal plane when the forces are applied. Determine the acceleration of the bar's mass center and the angular acceleration of the bar at this instant.

F17–13

F17–14. The 100-kg cylinder rolls without slipping on the horizontal plane. Determine the acceleration of its mass center and its angular acceleration.

100-kg cylinder rolls without slipping on the **F17–17.** The 200-kg spool has a radius of gyration about its **F17-17.** The 200-kg spool has a radius of gyration about its
mass center of $k_G = 300$ mm. If the couple moment is
applied to the spool and the coefficient of kinetic friction applied to the spool and the coefficient of kinetic friction applied to the spool and the coefficient of kinetic friction
between the spool and the ground is $\mu_k = 0.2$, determine
the appular acceleration of the spool, the acceleration of G the angular acceleration of the spool, the acceleration of G and the tension in the cable.

F17–17

F17–18. The 12-kg slender rod is pinned to a small roller A that slides freely along the slot. If the rod is released from that slides freely along the slot. If the rod is released from that slides freely along the slot. If the rod is released from
rest at $\theta = 0^{\circ}$, determine the angular acceleration of the rod and the acceleration of the roller immediately after the release.

F17–14

F17–15. The 20-kg wheel has a radius of gyration about its **F17–15.** The 20-kg wheel has a radius of gyration about its center O of $k_O = 300$ mm. When the wheel is subjected to the couple moment it slips as it rolls. Determine the appular the couple moment, it slips as it rolls. Determine the angular acceleration of the wheel and the acceleration of the wheel's center O. The coefficient of kinetic friction between
the wheel and the plane is $u_0 = 0.5$ the wheel and the plane is $\mu_k = 0.5$.

PROBLEMS

17–91. If a disk *rolls without slipping* on a horizontal surface, show that when moments are summed about the instantaneous center of zero velocity, IC , it is possible to use instantaneous center of zero velocity, IC, it is possible to use
the moment equation $\Sigma M_{IC} = I_{IC}\alpha$, where I_{IC} represents
the moment of inertia of the disk calculated about the the moment of inertia of the disk calculated about the instantaneous axis of zero velocity.

***17–92.** The 10-kg semicircular disk is rotating at *17–92. The 10-kg semicircular disk is rotating at $\omega = 4$ rad/s at the instant $\theta = 60^{\circ}$. Determine the normal and frictional forces it exerts on the ground at A at this instant. Assume the disk does not slip as it rolls.

•17–93. The semicircular disk having a mass of 10 kg is •17–93. The semicircular disk having a mass of 10 kg is rotating at $\omega = 4$ rad/s at the instant $\theta = 60^{\circ}$. If the rotating at $\omega = 4$ rad/s at the instant $\theta = 60^{\circ}$. If the coefficient of static friction at *A* is $\mu_s = 0.5$, determine if the disk slips at this instant disk slips at this instant.

17–94. The uniform 50-lb board is suspended from cords at *C* and *D*. If these cords are subjected to constant forces of 30 lb and 45 lb, respectively, determine the initial acceleration of the board's center and the board's angular acceleration. Assume the board is a thin plate. Neglect the mass of the pulleys at *E* and *F*.

***17–96.** The 75-kg wheel has a radius of gyration about the ***17–96.** The 75-kg wheel has a radius of gyration about the z axis of $k_z = 150$ mm. If the belt of negligible mass is subjected to a force of $P = 150$ N determine the acceleration z axis of $k_z = 150$ mm. If the belt of negligible mass is
subjected to a force of $P = 150$ N, determine the acceleration
of the mass center and the angular acceleration of the wheel of the mass center and the angular acceleration of the wheel. The surface is smooth and the wheel is free to slide.

•17–97. The wheel has a weight of 30 lb and a radius of **17–97.** The wheel has a weight of 30 lb and a radius of gyration of $k_G = 0.6$ ft. If the coefficients of static and kinatic friction between the wheel and the plane are kinetic friction between the wheel and the plane are kinetic friction between the wheel and the plane are $\mu_s = 0.2$ and $\mu_k = 0.15$, determine the wheel's angular acceleration as it rolls down the incline. Set $\theta = 12^{\circ}$. acceleration as it rolls down the incline. Set $\theta = 12^{\circ}$.

17–98. The wheel has a weight of 30 lb and a radius of 17–98. The wheel has a weight of 30 lb and a radius of gyration of $k_G = 0.6$ ft. If the coefficients of static and kinetic friction between the wheel and the plane are kinetic friction between the wheel and the plane are kinetic friction between the wheel and the plane are $\mu_s = 0.2$ and $\mu_k = 0.15$, determine the maximum angle θ of the inclined plane so that the wheel rolls without sliming the inclined plane so that the wheel rolls without slipping.

Probs. 17–97/98

CONCEPTUAL PROBLEMS

P17–1. The truck is used to pull the heavy container. To be most effective at providing traction to the rear wheels at A , is it best to keep the container where it is or place it at the front of the trailer? Use appropriate numerical values to explain your answer.

P17–1 P17–3

P17–2. The tractor is about to tow the plane to the right. Is it possible for the driver to cause the front wheel of the plane to lift off the ground as he accelerates the tractor? Draw the free-body and kinetic diagrams and explain algebraically (letters) if and how this might be possible.

P17–3. How can you tell the driver is accelerating this SUV? To explain your answer, draw the free-body and kinetic diagrams. Here power is supplied to the rear wheels. Would the photo look the same if power were supplied to the front wheels? Will the accelerations be the same? Use appropriate numerical values to explain your answers.

P17–4. Here is something you should not try at home, at least not without wearing a helmet! Draw the free-body and kinetic diagrams and show what the rider must do to maintain this position. Use appropriate numerical values to explain your answer.

CHAPTER REVIEW

Moment of Inertia

The moment of inertia is a measure of the resistance of a body to a change in its angular velocity. It is defined by and will be different for each axis about which it is computed. angular
 $I = \int r^2$ axis abo

Many bodies are composed of simple shapes. If this is the case, then tabular values of *I* can be used, such as the ones given on the inside back cover of this book. To obtain the moment of inertia of a composite body about any specified axis, the moment of inertia of each part is determined about the axis and the results are added together. Doing this often requires use of the parallel-axis theorem.

Planar Equations of Motion

The equations of motion define the translational, and rotational motion of a rigid body. In order to account for all of the terms in these equations, a free-body diagram should always accompany their application, and for some problems, it may also be convenient to draw the kinetic diagram which shows ma_G and $I_G\alpha$.

The principle of work and energy plays an important role in the motion of the draw works used to lift pipe on this drilling rig.

Planar Kinetics of a [Rigid Body: Work and](#page-14-0) Energy

18

[CHAPTER OBJECTIVES](#page-14-0)

- To develop formulations for the kinetic energy of a body, and define the various ways a force and couple do work.
- To apply the principle of work and energy to solve rigid–body planar kinetic problems that involve force, velocity, and displacement.
- To show how the conservation of energy can be used to solve rigid–body planar kinetic problems.

18.1 [Kinetic Energy](#page-14-0)

In this chapter we will apply work and energy methods to solve planar motion problems involving force, velocity, and displacement. But first it will be necessary to develop a means of obtaining the body's kinetic energy when the body is subjected to translation, rotation about a fixed axis, or general plane motion.

To do this we will consider the rigid body shown in Fig. 18–1, which is represented here by a *slab* moving in the inertial *x–y* reference plane.An arbitrary *i*th particle of the body, having a mass *dm*, is located a distance *r* from the arbitrary point *P*. If at the *instant* shown the particle has a *r* from the arbitrary point *P*. If at the *instant* shown the particle's kinetic energy is $T_i = \frac{1}{2} dm v_i^2$.

The kinetic energy of the entire body is determined by writing similar expressions for each particle of the body and integrating the results, i.e.,

$$
T = \frac{1}{2} \int_m dm \, v_i^2
$$

This equation may also be expressed in terms of the velocity of point *P*. If the body has an angular velocity $\boldsymbol{\omega}$, then from Fig. 18–1 we have

$$
\mathbf{v}_i = \mathbf{v}_P + \mathbf{v}_{i/P}
$$

= $(v_P)_x \mathbf{i} + (v_P)_y \mathbf{j} + \omega \mathbf{k} \times (x \mathbf{i} + y \mathbf{j})$
= $[(v_P)_x - \omega y] \mathbf{i} + [(v_P)_y + \omega x] \mathbf{j}$

The square of the magnitude of
$$
\mathbf{v}_i
$$
 is thus
\n
$$
\mathbf{v}_i \cdot \mathbf{v}_i = v_i^2 = [(v_P)_x - \omega y]^2 + [(v_P)_y + \omega x]^2
$$
\n
$$
= (v_P)_x^2 - 2(v_P)_x \omega y + \omega^2 y^2 + (v_P)_y^2 + 2(v_P)_y \omega x + \omega^2 x^2
$$
\n
$$
= v_P^2 - 2(v_P)_x \omega y + 2(v_P)_y \omega x + \omega^2 r^2
$$

Substituting this into the equation of kinetic energy yields

$$
T = \frac{1}{2} \left(\int_m dm \right) v_P^2 - (v_P)_x \omega \left(\int_m y dm \right) + (v_P)_y \omega \left(\int_m x dm \right) + \frac{1}{2} \omega^2 \left(\int_m r^2 dm \right)
$$

The first integral on the right represents the entire mass *m* of the body. Since $\overline{y}m = \int y dm$ and $\overline{x}m = \int x dm$, the second and third integrals locate the body's center of mass *G* with respect to *P*. The last integral represents the body's moment of inertia I_P , computed about the *z* axis passing through point *P* Thus passing through point *P*. Thus, rst integral on the right represents
 $\overline{y}m = \int y \, dm$ and $\overline{x}m = \int x \, dm$,

the body's center of mass G with

$$
T = \frac{1}{2}mv_P^2 - (v_P)_{x}\omega \overline{y}m + (v_P)_{y}\omega \overline{x}m + \frac{1}{2}I_P\omega^2
$$
 (18-1)

As a special case, if point *P* coincides with the mass center *G* of the As a special case, if point *P* coinc
body, then $\overline{y} = \overline{x} = 0$, and therefore

$$
T = \frac{1}{2}mv_G^2 + \frac{1}{2}I_G\omega^2
$$
 (18–2)

Both terms on the right side are *always positive*, since v_G and ω are squared. The first term represents the translational kinetic energy squared. The first term represents the translational kinetic energy, referenced from the mass center, and the second term represents the body's rotational kinetic energy about the mass center.

Translation. When a rigid body of mass *m* is subjected to either rectilinear or curvilinear *translation*, Fig. 18–2, the kinetic energy due to rectilinear or curvilinear *translation*, Fig. 18–2, the kinetic energy due to rotation is zero, since $\omega = 0$. The kinetic energy of the body is therefore

$$
T = \frac{1}{2}mv_G^2\tag{18-3}
$$

Rotation About a Fixed Axis. When a rigid body *rotates about a fixed axis* passing through point *O*, Fig. 18–3, the body has both *translational* and *rotational* kinetic energy so that

$$
T = \frac{1}{2}mv_G^2 + \frac{1}{2}I_G\omega^2
$$
 (18-4)

The body's kinetic energy may also be formulated for this case by noting The body's kinetic energy may also be formulated for this case by noting
that $v_G = r_G \omega$, so that $T = \frac{1}{2}(I_G + mr_G^2)\omega^2$. By the parallel–axis
theorem the terms inside the parentheses represent the moment of theorem, the terms inside the parentheses represent the moment of inertia I_O of the body about an axis perpendicular to the plane of motion and passing through point O . Hence,*

$$
T = \frac{1}{2}I_0\omega^2 \tag{18-5}
$$

From the derivation, this equation will give the same result as Eq. 18–4, since it accounts for *both* the translational and rotational kinetic energies of the body.

General Plane Motion. When a rigid body is subjected to general plane motion, Fig. 18–4, it has an angular velocity $\boldsymbol{\omega}$ and its mass center has a velocity \mathbf{v}_G . Therefore, the kinetic energy is

$$
T = \frac{1}{2}mv_G^2 + \frac{1}{2}I_G\omega^2
$$
 (18–6)

This equation can also be expressed in terms of the body's motion about its instantaneous center of zero velocity i.e.,

$$
T = \frac{1}{2}I_{IC}\omega^2 \tag{18-7}
$$

where I_{IC} is the moment of inertia of the body about its instantaneous center. The proof is similar to that of Eq. 18–5. (See Prob. 18–1.)

^{*}The similarity between this derivation and that of $\Sigma M_O = I_O \alpha$, Eq. 17–16, should be sted. Also the same result can be obtained directly from Eq. 18, 1 by selecting point P noted. Also the same result can be obtained directly from Eq. 18–1 by selecting point *P* at *O*, realizing that $v_O = 0$.

The total kinetic energy of this soil compactor consists of the kinetic energy of the body or frame of the machine due to its translation, and the translational and rotational kinetic energies of the roller and the wheels due to their general plane motion. Here we exclude the additional kinetic energy developed by the moving parts of the engine and drive train.

System of Bodies. Because energy is a scalar quantity, the total kinetic energy for a system of *connected* rigid bodies is the sum of the kinetic energies of all its moving parts. Depending on the type of motion, the kinetic energy of *each body* is found by applying Eq. 18–2 or the alternative forms mentioned above.

18.2 [The Work of a Force](#page-14-0)

Several types of forces are often encountered in planar kinetics problems involving a rigid body.The work of each of these forces has been presented in Sec. 14.1 and is listed below as a summary.

Work of a Variable Force. If an external force **F** acts on a body, the work done by the force when the body moves along the path *s*, Fig. 18–5, is

$$
U_F = \int \mathbf{F} \cdot d\mathbf{r} = \int_s F \cos \theta \, ds \qquad (18-8)
$$

Here θ is the angle between the "tails" of the force and the differential displacement. The integration must account for the variation of the force's direction and magnitude.

Fig. 18–5

Work of a Constant Force. If an external force \mathbf{F}_c acts on a hody. Fig. 18.6, and maintains a constant magnitude \mathbf{F}_c and constant body, Fig. 18–6, and maintains a constant magnitude F_c and constant direction θ , while the body undergoes a translation *s*, then the above equation can be integrated, so that the work becomes

$$
U_{F_c} = (F_c \cos \theta)s \tag{18-9}
$$

Work of a Weight. The weight of a body does work only when the body's center of mass G undergoes a *vertical displacement* Δy . If this body's center of mass *G* undergoes a *vertical displacement* Δy. If this displacement is *upward*, Fig. 18–7, the work is negative, since the weight is opposite to the displacement.

$$
U_W = -W \Delta y \qquad (18-10)
$$

Likewise, if the displacement is *downward* $(-\Delta y)$ the work becomes
nositive. In both cases the elevation change is considered to be small so *positive*. In both cases the elevation change is considered to be small so that **W**, which is caused by gravitation, is constant.

Work of a Spring Force. If a linear elastic spring is attached to a **Work of a Spring Force.** If a linear elastic spring is attached to a body, the spring force $F_s = ks$ *acting on the body* does work when the spring either stretches or compresses from s, to a *further* position s. In spring either stretches or compresses from s_1 to a *further* position s_2 . In
both cases the work will be *negative* since the *displacement* of the hody is both cases the work will be *negative* since the *displacement of the body* is in the opposite direction to the force, Fig. 18–8. The work is

$$
U_s = -\left(\frac{1}{2}ks_2^2 - \frac{1}{2}ks_1^2\right)
$$

where $|s_2| > |s_1|$.

Forces That Do No Work. There are some external forces that do no work when the body is displaced. These forces act either at *fixed points* on the body, or they have a direction *perpendicular to their displacement*. Examples include the reactions at a pin support about which a body rotates, the normal reaction acting on a body that moves along a fixed surface, and the weight of a body when the center of gravity of the body moves in a *horizontal plane*, Fig. 18–9. A frictional force \mathbf{F}_f acting on a round body as it rolls without slipping over a round surface acting on a round body as it *rolls without slipping* over a rough surface also does no work.* This is because, during any *instant of time dt*, \mathbf{F}_f acts
at a point on the body which has zero velocity (instantaneous center *LC*) at a point on the body which has *zero velocity* (instantaneous center,*IC*) and so the work done by the force on the point is zero. In other words, the point is not displaced in the direction of the force during this instant. Since \mathbf{F}_f contacts successive points for only an instant, the work of \mathbf{F}_f will be zero.

18.3 [The Work of a Couple Moment](#page-14-0)

Consider the body in Fig. 18–10*a*, which is subjected to a couple moment Consider the body in Fig. $18-10a$, which is subjected to a couple moment $M = Fr$. If the body undergoes a differential displacement, then the work done by the couple forces can be found by considering the displacement done by the couple forces can be found by considering the displacement as the sum of a separate translation plus rotation.When the body *translates*, the work of each force is produced only by the *component of displacement* along the line of action of the forces ds_t , Fig. 18–10*b*. Clearly the "positive" work of one force *cancels* the "pegative" work of the other "positive" work of one force *cancels* the "negative" work of the other. When the body undergoes a differential rotation $d\theta$ about the arbitrary point Ω . Fig. 18–10c, then each force undergoes a displacement point *O*, Fig. 18–10*c*, then each force undergoes a displacement point O, Fig. 18–10c, then each force undergoes a displacement $ds_{\theta} = (r/2) d\theta$ in the direction of the force. Hence, the total work done is

$$
dU_M = F\left(\frac{r}{2}d\theta\right) + F\left(\frac{r}{2}d\theta\right) = (Fr) d\theta
$$

$$
= M d\theta
$$

The work is *positive* when **M** and $d\theta$ have the *same sense of direction* and *negative* if these vectors are in the *opposite sense negative* if these vectors are in the *opposite sense*.

When the body rotates in the plane through a finite angle θ measured in radians, from θ_1 to θ_2 , the work of a couple moment is therefore

$$
U_M = \int_{\theta_1}^{\theta_2} M \, d\theta \qquad (18-12)
$$

If the couple moment **M** has a *constant magnitude*, then

$$
U_M = M(\theta_2 - \theta_1) \tag{18-13}
$$

(c)

Fig. 18–10

The bar shown in Fig. 18–11*a* has a mass of 10 kg and is subjected to a The bar shown in Fig. 18–11*a* has a mass of 10 kg and is subjected to a couple moment of $M = 50$ N·m and a force of $P = 80$ N, which is always applied perpendicular to the end of the bar. Also, the spring always applied perpendicular to the end of the bar. Also, the spring has an unstretched length of 0.5 m and remains in the vertical position due to the roller guide at *B*. Determine the total work done by all the due to the roller guide at *B*. Determine the total work done by all the forces acting on the bar when it has rotated downward from $\theta = 0^{\circ}$ to $\theta = 90^\circ$.

SOLUTION

First the free-body diagram of the bar is drawn in order to account for all the forces that act on it, Fig. 18–11*b*.

Weight W. Since the weight $10(9.81)$ N = 98.1 N is displaced downward 1.5 m, the work is

 $U_W = 98.1 \text{ N}(1.5 \text{ m}) = 147.2 \text{ J}$

Why is the work positive?

Couple Moment M. The couple moment rotates through an angle **Couple Moment M.**
of $\theta = \pi/2$ rad. Hence, Let us the couple moment rotate.
 $U_M = 50 \text{ N} \cdot \text{m}(\pi/2) = 78.5 \text{ J}$

$$
U_M = 50 \,\mathrm{N} \cdot \mathrm{m}(\pi/2) = 78.5 \,\mathrm{J}
$$

Spring Force F_s. When $\theta = 0^\circ$ the spring is stretched $(0.75 \text{ m} - 0.5 \text{ m})$ **ipring Force F_s.** When $\theta = 0^\circ$ the spring is stretched $(0.75 \text{ m} - 0.5 \text{ m})$
= 0.25 m, and when $\theta = 90^\circ$, the stretch is $(2 \text{ m} + 0.75 \text{ m})$ $= 0.25 \text{ m}$, and when
 $- 0.5 \text{ m} = 2.25 \text{ m}$. Thus,

$$
U_s = -\left[\frac{1}{2}(30 \text{ N/m})(2.25 \text{ m})^2 - \frac{1}{2}(30 \text{ N/m})(0.25 \text{ m})^2\right] = -75.0 \text{ J}
$$

By inspection the spring does negative work on the bar since \mathbf{F}_s acts in the opposite direction to displacement. This checks with the result the opposite direction to displacement. This checks with the result.

Force P. As the bar moves downward, the force is displaced through **Force P.** As the bar moves downward, the force is displaced the a distance of $(\pi/2)(3 \text{ m}) = 4.712 \text{ m}$. The work is positive. Why?

$$
U_P = 80 \text{ N} (4.712 \text{ m}) = 377.0 \text{ J}
$$

Pin Reactions. Forces \mathbf{A}_x and \mathbf{A}_y do no work since they are not displaced displaced.

Total Work. The work of all the forces when the bar is displaced is thus

 $U = 147.2 \text{ J} + 78.5 \text{ J} - 75.0 \text{ J} + 377.0 \text{ J} = 528 \text{ J}$ *Ans.*

18

18.4 [Principle of Work and Energy](#page-14-0)

By applying the principle of work and energy developed in Sec. 14.2 to each of the particles of a rigid body and adding the results algebraically, since energy is a scalar, the principle of work and energy for a rigid body becomes

$$
T_1 + \Sigma U_{1-2} = T_2 \tag{18-14}
$$

This equation states that the body's initial translational *and* rotational kinetic energy, plus the work done by all the external forces and couple moments acting on the body as the body moves from its initial to its final position, is equal to the body's final translational *and* rotational kinetic energy. Note that the work of the body's *internal forces* does not have to be considered.These forces occur in equal but opposite collinear pairs, so that when the body moves, the work of one force cancels that of its counterpart. Furthermore, since the body is rigid, *no relative movement* between these forces occurs, so that no internal work is done.

When several rigid bodies are pin connected, connected by inextensible cables, or in mesh with one another, Eq. 18–14 can be applied to the *entire system* of connected bodies. In all these cases the internal forces, which hold the various members together, do no work and hence are eliminated from the analysis.

The work of the torque or moment developed by the driving gears on the motors is transformed into kinetic energy of rotation of the drum.

Procedure for Analysis

The principle of work and energy is used to solve kinetic problems that involve *velocity, force*, and *displacement*, since these terms are involved in the formulation. For application, it is suggested that the following procedure be used.

Kinetic Energy (Kinematic Diagrams).

- The kinetic energy of a body is made up of two parts. Kinetic energy of translation is referenced to the velocity of the mass energy of translation is referenced to the velocity of the mass
center, $T = \frac{1}{2}mv_G^2$, and kinetic energy of rotation is determined
using the moment of inertia of the body about the mass center using the moment of inertia of the body about the mass center, using the moment of inertia of the body about the mass center,
 $T = \frac{1}{2} I_G \omega^2$. In the special case of rotation about a fixed axis (or

rotation about the *IC*) these two kinetic energies are combined rotation about the *IC*), these two kinetic energies are combined rotation about the IC), these two kinetic energies are combined
and can be expressed as $T = \frac{1}{2}I_O\omega^2$, where I_O is the moment of
inertia about the axis of rotation inertia about the axis of rotation. $\frac{1}{2}I_0\omega^2$,
- *Kinematic diagrams* for velocity may be useful for determining v_G and ω or for establishing a *relationship* between v_G and ω .*

Work (Free–Body Diagram).

- Draw a free–body diagram of the body when it is located at an intermediate point along the path in order to account for all the forces and couple moments which do work on the body as it moves along the path.
- A force does work when it moves through a displacement in the direction of the force.
- Forces that are functions of displacement must be integrated to obtain the work. Graphically, the work is equal to the area under the force–displacement curve.
- The work of a weight is the product of its magnitude and the The work of a weight is the product of its magnitude and the vertical displacement, $U_W = Wy$. It is positive when the weight moves downwards moves downwards.
- moves downwards.

 The work of a spring is of the form $U_s = \frac{1}{2}k s^2$, where *k* is the spring stiffness and *s* is the stretch or compression of the spring spring stiffness and *s* is the stretch or compression of the spring.
- The work of a couple is the product of the couple moment and The work of a couple is the product of the couple moment
the angle in radians through which it rotates, $U_M = M\theta$.
Since algebraic addition of the work terms is required it is in
- Since *algebraic addition* of the work terms is required, it is important that the proper sign of each term be specified. Specifically, work is *positive* when the force (couple moment) is in the *same direction* as its displacement (rotation); otherwise, it is negative.

Principle of Work and Energy.

• Apply the principle of work and energy.

• Apply the principle of work and energy, $T_1 + \Sigma U_{1-2} = T_2$. Since this is a scalar equation it can be used to solve for only one this is a scalar equation, it can be used to solve for only one unknown when it is applied to a single rigid body.

*A brief review of Secs. 16.5 to 16.7 may prove helpful when solving problems, since computations for kinetic energy require a kinematic analysis of velocity.

The 30–kg disk shown in Fig. 18–12*a* is pin supported at its center. Determine the number of revolutions it must make to attain an angular velocity of 20 rad/s starting from rest. It is acted upon by a constant force $F = 10$ N, which is applied to a cord wrapped around its periphery, and a constant couple moment $M = 5 \text{ N} \cdot \text{m}$. Neglect the mass of the cord in the calculation. y of 20 rad/s starting from rest. It is acted up
 $F = 10$ N, which is applied to a cord wrapped

a constant couple moment $M = 5$ N·m.

cord in the calculation

SOLUTION

Kinetic Energy. Since the disk rotates about a fixed axis, and it is initially at rest, then
 $T_1 = 0$

$$
T_1 = 0
$$

\n
$$
T_2 = \frac{1}{2}I_0\omega_2^2 = \frac{1}{2}[\frac{1}{2}(30 \text{ kg})(0.2 \text{ m})^2](20 \text{ rad/s})^2 = 120 \text{ J}
$$

Work (Free–Body Diagram). As shown in Fig. 18–12*b*, the pin reactions \mathbf{O}_x and \mathbf{O}_y and the weight (294.3 N) do no work, since they are not displaced. The *couple moment*, having a constant magnitude, are not displaced. The *couple moment*, having a constant magnitude,
does positive work $U_M = M\theta$ as the disk *rotates* through a clockwise
angle of θ rad, and the *constant force* **F** does positive work $U_R = Fs$ as does positive work $U_M = M\theta$ as the disk *rotates* through a clockwise
angle of θ rad, and the *constant force* **F** does positive work $U_{Fc} = Fs$ as
the cord moves downward $s = \theta r = \theta(0.2 \text{ m})$ angle of θ rad, and the *constant force* **F** does po
the cord moves downward $s = \theta r = \theta(0.2 \text{ m})$.

Principle of Work and Energy.

$$
\{T_1\} + \{\Sigma U_{1-2}\} = \{T_2\}
$$

$$
\{T_1\} + \{M\theta + Fs\} = \{T_2\}
$$

$$
\{0\} + \{(5 \text{ N} \cdot \text{m})\theta + (10 \text{ N})\theta(0.2 \text{ m})\} = \{120 \text{ J}\}
$$

$$
\theta = 17.14 \text{ rad} = 17.14 \text{ rad} \left(\frac{1 \text{ rev}}{2\pi \text{ rad}}\right) = 2.73 \text{ rev} \quad Ans.
$$

The wheel shown in Fig. 18–13*a* weighs 40 lb and has a radius of The wheel shown in Fig. 18–13*a* weighs 40 lb and has a radius of gyration $k_G = 0.6$ ft about its mass center *G*. If it is subjected to a clockwise couple moment of 15 lb ft and rolls from rest without The wheel shown in Fig. 18–13*a* weighs 40 lb and has a radius of gyration $k_G = 0.6$ ft about its mass center *G*. If it is subjected to a clockwise couple moment of 15 lb \cdot ft and rolls from rest without slipping, determine its angular velocity after its center *G* moves 0.5 ft. slipping, determine its angular velocity after its center G moves 0.5 ft.
The spring has a stiffness $k = 10 \text{ lb/ft}$ and is initially unstretched
when the couple moment is applied when the couple moment is applied.

SOLUTION

Kinetic Energy (Kinematic Diagram). Since the wheel is initially at rest,

$$
T_1 = 0
$$

The kinematic diagram of the wheel when it is in the final position is shown in Fig. 18–13*b*. The final kinetic energy is determined from

$$
T_2 = \frac{1}{2} I_{IC} \omega_2^2
$$

= $\frac{1}{2} \left[\frac{40 \text{ lb}}{32.2 \text{ ft/s}^2} (0.6 \text{ ft})^2 + \left(\frac{40 \text{ lb}}{32.2 \text{ ft/s}^2} \right) (0.8 \text{ ft})^2 \right] \omega_2^2$
 $T_2 = 0.6211 \omega_2^2$

Work (Free–Body Diagram). As shown in Fig. 18–13*c*, only the spring force \mathbf{F}_s and the couple moment do work. The normal force does not move along its line of action and the frictional force does no does not move along its line of action and the frictional force does *no work*, since the wheel does not slip as it rolls.

prk, since the wheel does not slip as it rolls.
The work of \mathbf{F}_s is found using $U_s = -\frac{1}{2}k s^2$. Here the work is negative
ace \mathbf{F}_s is in the opposite direction to displacement. Since the wheel since \mathbf{F}_s is in the opposite direction to displacement. Since the wheel does not slip when the center *G* moves 0.5 ft, then the wheel rotates does not slip when the center G moves 0.5 ft, then the wheel rotates $\theta = s_G/r_{G/IC} = 0.5$ ft/0.8 ft = 0.625 rad, Fig. 18–13*b*. Hence, the spring stretches $s = \theta r = (0.625 \text{ rad})(1.6 \text{ ft}) = 1 \text{ ft}$ $\theta = s_G/r_{G/IC} = 0.5 \text{ ft}/0.8 \text{ ft} = 0.625 \text{ rad}, \text{ Fig. 18-13}$
spring stretches $s = \theta r_{A/IC} = (0.625 \text{ rad})(1.6 \text{ ft}) = 1 \text{ ft}.$

Principle of Work and Energy.

$$
\{T_1\} + \{\Sigma U_{1-2}\} = \{T_2\}
$$

$$
\{T_1\} + \{M\theta - \frac{1}{2}ks^2\} = \{T_2\}
$$

$$
\{0\} + \{15 \text{ lb} \cdot \text{ft}(0.625 \text{ rad}) - \frac{1}{2}(10 \text{ lb/ft})(1 \text{ ft})^2\} = \{0.6211 \omega_2^2 \text{ ft} \cdot \text{ lb}\}
$$

$$
\omega_2 = 2.65 \text{ rad/s } \lambda
$$
Ans.

The 700-kg pipe is equally suspended from the two tines of the fork lift shown in the photo. It is undergoing a swinging motion such that when shown in the photo. It is undergoing a swinging motion such that when $\theta = 30^{\circ}$ it is momentarily at rest. Determine the normal and frictional forces acting on each tine which are needed to support the pipe at the forces acting on each tine which are needed to support the pipe at the instant $\theta = 0^{\circ}$. Measurements of the pipe and the suspender are shown in Fig. 18–14*a*. Neglect the mass of the suspender and the thickness of the pipe.

SOLUTION

We must use the equations of motion to find the forces on the tines since these forces do no work. Before doing this, however, we will apply the principle of work and energy to determine the angular apply the principle of work and velocity of the pipe when $\theta = 0^{\circ}$.

Kinetic Energy (Kinematic Diagram). Since the pipe is originally at rest, then

 $T_1 = 0$

The final kinetic energy may be computed with reference to either the fixed point *O* or the center of mass *G*. For the calculation we will fixed point *O* or the center of mass *G*. For the calculation we will consider the pipe to be a thin ring so that $I_G = mr^2$. If point *G* is considered we have considered, we have

$$
T_2 = \frac{1}{2}m(v_G)_2^2 + \frac{1}{2}I_G\omega_2^2
$$

= $\frac{1}{2}(700 \text{ kg})[(0.4 \text{ m})\omega_2]^2 + \frac{1}{2}[700 \text{ kg}(0.15 \text{ m})^2]\omega_2^2$
= 63.875 ω_2^2

If point *O* is considered then the parallel-axis theorem must be used to determine I_O . Hence,

$$
T_2 = \frac{1}{2}I_0\omega_2^2 = \frac{1}{2}[700 \text{ kg}(0.15 \text{ m})^2 + 700 \text{ kg}(0.4 \text{ m})^2]\omega_2^2
$$

= 63.875 ω_2^2

Work (Free-Body Diagram). Fig. 18–14*b*. The normal and frictional forces on the tines do no work since they do not move as the pipe swings. The weight does positive work since the weight moves downward The weight does positive work since the weight moves downward
through a vertical distance $\Delta y = 0.4$ m $- 0.4$ cos 30° m $= 0.05359$ m.

Principle of Work and Energy.

$$
\{T_1\} + \{\Sigma U_{1-2}\} = \{T_2\}
$$

$$
\{0\} + \{700(9.81) \text{ N}(0.05359 \text{ m})\} = \{63.875\omega_2^2\}
$$

$$
\omega_2 = 2.400 \text{ rad/s}
$$

Equations of Motion. Referring to the free-body and kinetic diagrams shown in Fig. 18–14*c*, and using the result for ω_2 , we have

$$
\begin{aligned}\n&\stackrel{\text{d}}{\Leftarrow} \Sigma F_t = m(a_G)_t; \quad F_T = (700 \text{ kg})(a_G)_t \\
&+ \uparrow \Sigma F_n = m(a_G)_n; \quad N_T - 700(9.81) \text{ N} = (700 \text{ kg})(2.400 \text{ rad/s})^2(0.4 \text{ m}) \\
&\stackrel{\text{d}}{\Leftarrow} \Sigma M_O = I_O \alpha; \quad 0 = [(700 \text{ kg})(0.15 \text{ m})^2 + (700 \text{ kg})(0.4 \text{ m})^2] \alpha\n\end{aligned}
$$

Since $(a_G)_t = (0.4 \text{ m})\alpha$, then

then
\n
$$
\alpha = 0, \quad (a_G)_t = 0
$$
\n
$$
F_T = 0
$$
\n
$$
N_T = 8.480 \text{ kN}
$$

There are two tines used to support the load, therefore

$$
F'_T = 0
$$
 Ans.
\n $N'_T = \frac{8.480 \text{ kN}}{2} = 4.24 \text{ kN}$ Ans.
\nAns.

NOTE: Due to the swinging motion the tines are subjected to a *greater* normal force than would be the case if the load were static, in which assa $N' = 700(0.81) N(2 - 3.42) N$ greater normal force than would be the case
which case $N_T' = 700(9.81)$ $N/2 = 3.43$ kN.

The 10–kg rod shown in Fig. 18–15*a* is constrained so that its ends The 10-kg rod shown in Fig. 18–15*a* is constrained so that its ends move along the grooved slots. The rod is initially at rest when $\theta = 0^{\circ}$. move along the grooved slots. The rod is initially at rest when $\theta = 0^{\circ}$.
If the slider block at *B* is acted upon by a horizontal force $P = 50$ N, determine the angular velocity of the rod at the instant $\theta = 45^{\circ}$ If the slider block at *B* is acted upon by a horizontal force $P = 50$ N, determine the angular velocity of the rod at the instant $\theta = 45^{\circ}$. Neglect friction and the mass of blocks *A* and *B*.

SOLUTION

Why can the principle of work and energy be used to solve this problem?

Kinetic Energy (Kinematic Diagrams). Two kinematic diagrams of the rod, when it is in the initial position 1 and final position 2, are the rod, when it is in the initial position 1 and final position 2, are
shown in Fig. 18–15*b*. When the rod is in position 1, $T_1 = 0$ since
 $(\mathbf{v}_c)_i = \mathbf{\omega}_i = 0$. In position 2 the appular velocity is $\mathbf{\omega}_i$ and the shown in Fig. 18–15*b*. When the rod is in position 1, $T_1 = 0$ since $(\mathbf{v}_G)_1 = \mathbf{\omega}_1 = \mathbf{0}$. In position 2 the angular velocity is $\mathbf{\omega}_2$ and the velocity of the mass center is (\mathbf{v}_1) . Hence the kinetic energy velocity of the mass center is $(\mathbf{v}_G)_2$. Hence, the kinetic energy is
 $T_2 = \frac{1}{2} m(v_G)^2 + \frac{1}{2} I_G \omega^2$

$$
T_2 = \frac{1}{2}m(v_G)^2 + \frac{1}{2}I_G\omega_2^2
$$

= $\frac{1}{2}(10 \text{ kg})(v_G)^2 + \frac{1}{2}[\frac{1}{12}(10 \text{ kg})(0.8 \text{ m})^2]\omega_2^2$
= $5(v_G)^2 + 0.2667(\omega_2)^2$

The two unknowns $(v_G)_2$ and ω_2 can be related from the instantaneous
center of zero velocity for the rod. Fig. 18–15b. It is seen that as A center of zero velocity for the rod. Fig. 18–15*b*. It is seen that as *A* moves downward with a velocity $(v_A)_2$, *B* moves horizontally to the left with a velocity $(v_B)_2$. Knowing these directions, the *IC* is located as shown in the figure. Hence,

e. Hence,
\n
$$
(v_G)_2 = r_{G/IC}\omega_2 = (0.4 \tan 45^\circ \text{ m})\omega_2
$$

\n= 0.4 ω_2

Therefore,

$$
T_2 = 0.8\omega_2^2 + 0.2667\omega_2^2 = 1.0667\omega_2^2
$$

Of course, we can also determine this result using $T_2 = \frac{1}{2} I_{IC} \omega_2^2$.

Work (Free–Body Diagram). Fig. $18-15c$. The normal forces N_A
and N_A do no work as the rod is displaced N/bv^2 . The 08.1 N weight is and N_B do no work as the rod is displaced. Why? The 98.1-N weight is
displaced a vertical distance of $\Lambda_{\rm M} = (0.4 - 0.4 \cos 45^\circ)$ m; whereas displaced a vertical distance of $\Delta y = (0.4 - 0.4 \cos 45^\circ)$ m; whereas
the 50-N force moves a horizontal distance of $s = (0.8 \sin 45^\circ)$ m.
Both of these forces do positive work Why? the 50-N force moves a horizontal distance of $s = (0.8 \sin 45^\circ)$ m. Both of these forces do positive work. Why? isplaced. Why? The 98.1-N
 $y = (0.4 - 0.4 \cos 45^\circ)$ m;
tal distance of $s = (0.8 \text{ si})$

Principle of Work and Energy.

$$
\begin{aligned}\n\text{Principle of Work and Energy.} \\
\{T_1\} + \{\Sigma U_{1-2}\} &= \{T_2\} \\
\{T_1\} + \{W \Delta y + Ps\} &= \{T_2\} \\
\{0\} + \{98.1 \text{ N}(0.4 \text{ m} - 0.4 \cos 45^\circ \text{ m}) + 50 \text{ N}(0.8 \sin 45^\circ \text{ m})\} \\
&= \{1.0667\omega_2^2 \text{ J}\}\n\end{aligned}
$$

Solving for ω_2 gives

$$
\omega_2 = 6.11 \text{ rad/s} \, \lambda \qquad \qquad \text{Ans.}
$$

18–31. The slender beam having a weight of 150 lb is supported by two cables. If the cable at end *B* is cut so that supported by two cables. If the cable at end *B* is cut so that the beam is released from rest when $\theta = 30^{\circ}$, determine the speed at which end *A* strikes the wall. Neglect friction at *B*.

18–33. The beam has a weight of 1500 lb and is being raised to a vertical position by pulling very slowly on its raised to a vertical position by pulling very slowly on its bottom end *A*. If the cord fails when $\theta = 60^{\circ}$ and the beam is essentially at rest, determine the speed of *A* at the instant cord *BC* becomes vertical. Neglect friction and the mass of the cords, and treat the beam as a slender rod.

***18–32.** The assembly consists of two 15-lb slender rods ***18–32.** The assembly consists of two 15-lb slender rods and a 20-lb disk. If the spring is unstretched when $\theta = 45^{\circ}$ and the assembly is released from rest at this position, determine the angular velocity of rod *AB* at the instant $\theta = 0^{\circ}$. The disk rolls without slipping.

18–34. The uniform slender bar that has a mass *m* and a length *L* is subjected to a uniform distributed load w_0 , which is always directed perpendicular to the axis of the bar. If the bar is released from rest from the position shown, determine its angular velocity at the instant it has rotated 90°. Solve the problem for rotation in (a) the horizontal plane, and (b) the vertical plane.

18.5 [Conservation of Energy](#page-14-0)

When a force system acting on a rigid body consists only of *conservative forces*, the conservation of energy theorem can be used to solve a problem that otherwise would be solved using the principle of work and energy.This theorem is often easier to apply since the work of a conservative force is *independent of the path* and depends only on the initial and final positions of the body. It was shown in Sec. 14.5 that the work of a conservative force can be expressed as the difference in the body's potential energy measured from an arbitrarily selected reference or datum.

Gravitational Potential Energy. Since the total weight of a body can be considered concentrated at its center of gravity, the *gravitational potential energy* of the body is determined by knowing the height of the body's center of gravity above or below a horizontal datum.

$$
V_g = W y_G \tag{18-15}
$$

Here the potential energy is *positive* when y_G is positive upward, since the weight has the ability to do *positive work* when the body moves back the weight has the ability to do *positive work* when the body moves back
to the datum, Fig. 18–16. Likewise, if *G* is located *below* the datum $(-y_G)$,
the gravitational potential energy is *negative*, since the weight the gravitational potential energy is *negative*, since the weight does *negative work* when the body returns to the datum.

Elastic Potential Energy. The force developed by an elastic spring is also a conservative force. The *elastic potential energy* which a spring imparts to an attached body when the spring is stretched or spring imparts to an attached body when the spring is stretched or compressed from an initial undeformed position $(s = 0)$ to a final position s Fig. 18–17 is position *s*, Fig. 18–17, is

> (18–16) $V_e = +\frac{1}{2}k s^2$

In the deformed position, the spring force acting *on the body* always has the ability for doing positive work when the spring returns back to its original undeformed position (see Sec. 14.5).

Elastic potential energy

Gravitational potential energy

Conservation of Energy In general, if a body is subjected to both gravitational and elastic forces, the total *potential energy* can be expressed as a potential function represented as the algebraic sum

$$
V = V_g + V_e \tag{18-17}
$$

Here measurement of *V* depends upon the location of the body with respect to the selected datum.

Realizing that the work of conservative forces can be written as a Realizing that the work of conservative forces can be written as a difference in their potential energies, i.e., $(\Sigma U_{1-2})_{\text{cons}} = V_1 - V_2$, Eq. 14–16 we can rewrite the principle of work and energy for a rigid Eq. 14–16, we can rewrite the principle of work and energy for a rigid body as

$$
T_1 + V_1 + (\Sigma U_{1-2})_{\text{noncons}} = T_2 + V_2 \tag{18-18}
$$

Here $(\Sigma U_{1-2})_{\text{noncons}}$ represents the work of the nonconservative forces
such as friction If this term is zero, then such as friction. If this term is zero, then

$$
T_1 + V_1 = T_2 + V_2 \tag{18-19}
$$

This equation is referred to as the conservation of mechanical energy. It states that the *sum* of the potential and kinetic energies of the body remains *constant* when the body moves from one position to another. It also applies to a system of smooth, pin-connected rigid bodies, bodies connected by inextensible cords, and bodies in mesh with other bodies. In all these cases the forces acting at the points of contact are *eliminated* from the analysis, since they occur in equal but opposite collinear pairs and each pair of forces moves through an equal distance when the system undergoes a displacement.

It is important to remember that only problems involving conservative force systems can be solved by using Eq. 18–19. As stated in Sec. 14.5, friction or other drag-resistant forces, which depend on velocity or acceleration, are nonconservative. The work of such forces is transformed into thermal energy used to heat up the surfaces of contact, and consequently this energy is dissipated into the surroundings and may not be recovered. Therefore, problems involving frictional forces can be solved by using either the principle of work and energy written in the form of Eq. 18–18, if it applies, or the equations of motion.

The torsional springs located at the top of the garage door wind up as the door is lowered. When the door is raised, the potential energy stored in the springs is then transferred into gravitational potential energy of the door's weight, thereby making it easy to open.

Procedure for Analysis

The conservation of energy equation is used to solve problems involving *velocity, displacement*, and *conservative force systems*. For application it is suggested that the following procedure be used.

Potential Energy.

- Draw two diagrams showing the body located at its initial and final positions along the path.
- If the center of gravity, *G*, is subjected to a *vertical displacement*, establish a fixed horizontal datum from which to measure the body's gravitational potential energy V_g .
- Data pertaining to the elevation y_G of the body's center of gravity from the datum and the extension or compression of any connecting springs can be determined from the problem geometry and listed on the two diagrams.
- The potential energy is determined from $V = V_g + V_e$. Here The potential energy is determined from $V = V_g + V_e$. Here $V_g = Wy_G$, which can be positive or negative, and $V_e = \frac{1}{2}ks^2$, which is always positive.

Kinetic Energy.

- The kinetic energy of the body consists of two parts, namely The kinetic energy of the body consists of two parts, namely
translational kinetic energy, $T = \frac{1}{2}mv_G^2$, and rotational kinetic
energy $T = \frac{1}{2}I_{\text{co}}^2$ translational kinet
energy, $T = \frac{1}{2} I_G \omega^2$.
- Kinematic diagrams for velocity may be useful for establishing a *relationship* between v_G and ω .

Conservation of Energy.

• Apply the conservation of energy equation $T_1 + V_1 = T_2 + V_2$.

Fig. 18–18

(c)

The 10-kg rod *AB* shown in Fig. 18–18*a* is confined so that its ends move in the horizontal and vertical slots. The spring has a stiffness of move in the horizontal and vertical slots. The spring has a stiffness of $k = 800$ N/m and is unstretched when $\theta = 0^{\circ}$. Determine the angular velocity of AR when $\theta = 0^{\circ}$ if the rod is released from rest when $k = 800$ N/m and is unstretched when $\theta = 0^{\circ}$. Determine the angular velocity of *AB* when $\theta = 0^{\circ}$, if the rod is released from rest when velocity of *AB* when $\theta = 0^{\circ}$, if the rod is re $\theta = 30^{\circ}$. Neglect the mass of the slider blocks.

SOLUTION

Potential Energy. The two diagrams of the rod, when it is located at its initial and final positions, are shown in Fig. 18–18*b*. The datum, used to measure the gravitational potential energy, is placed in line with the rod when $\theta = 0^{\circ}$. with the rod when $\theta = 0^{\circ}$.

When the rod is in position 1, the center of gravity *G* is located *below the datum* so its gravitational potential energy is *negative*. Furthermore, (positive) elastic potential energy is stored in the spring, Furthermore, (positive) elastic potential energy is stored in since it is stretched a distance of $s_1 = (0.4 \sin 30^\circ)$ m. Thus,

$$
V_1 = -Wy_1 + \frac{1}{2}ks_1^2
$$

 $= -(98.1 \text{ N})(0.2 \sin 30^\circ \text{ m}) + \frac{1}{2}(800 \text{ N/m})(0.4 \sin 30^\circ \text{ m})^2 = 6.19 \text{ J}$

When the rod is in position 2, the potential energy of the rod is zero, since the center of gravity *G* is located at the datum, and the spring is since the center of gravity
unstretched, $s_2 = 0$. Thus,

$$
V_2 = 0
$$

Kinetic Energy. The rod is released from rest from position 1, thus **Kinetic Energy.** The re
 $(\mathbf{v}_G)_1 = \boldsymbol{\omega}_1 = \mathbf{0}$, and so

$$
T_1 = 0
$$

In position 2, the angular velocity is ω_2 and the rod's mass center has a velocity of $(\mathbf{v}_G)_2$. Thus,

$$
T_2 = \frac{1}{2}m(v_G)_2^2 + \frac{1}{2}I_G\omega_2^2
$$

= $\frac{1}{2}(10 \text{ kg})(v_G)_2^2 + \frac{1}{2}[\frac{1}{12}(10 \text{ kg})(0.4 \text{ m})^2]\omega_2^2$

Using *kinematics*, $(\mathbf{v}_G)_2$ can be related to $\boldsymbol{\omega}_2$ as shown in Fig. 18–18*c*.
At the instant considered, the instantaneous center of zero velocity At the instant considered, the instantaneous center of zero velocity At the instant considered, the instantaneous center of zero velocity (*IC*) for the rod is at point *A*; hence, $(v_G)_2 = (r_{G/IC})\omega_2 = (0.2 \text{ m})\omega_2$.
Substituting into the above expression and simplifying (or using Substituting into the above expression and simplifying (or using $\frac{1}{2}I_{IC}\omega_2^2$, we get

 $T_2 = 0.2667\omega_2^2$ 2

Conservation of Energy.

{
$$
T_1
$$
} + { V_1 } = { T_2 } + { V_2 }
{0} + {6.19 J} = {0.2667 ω_2 } + {0}
 ω_2 = 4.82 rad/s \degree Ans.

The wheel shown in Fig. 18–19*a* has a weight of 30 lb and a radius of The wheel shown in Fig. 18–19*a* has a weight of 30 lb and a radius of gyration of $k_G = 0.6$ ft. It is attached to a spring which has a stiffness $k = 2$ lb/ft and an unstretched length of 1 ft. If the disk is released gyration of $k_G = 0.6$ ft. It is attached to a spring which has a stiffness $k = 2$ lb/ft and an unstretched length of 1 ft. If the disk is released from rest in the position shown and rolls without slipping determine from rest in the position shown and rolls without slipping, determine its angular velocity at the instant *G* moves 3 ft to the left.

SOLUTION

Potential Energy. Two diagrams of the wheel, when it at the initial and final positions, are shown in Fig. 18–19*b*. A gravitational datum is not needed here since the weight is not displaced vertically. From the needed here since the weight is not displaced vertically. From the problem geometry the spring is stretched $s_1 = (\sqrt{3^2 + 4^2} - 1) = 4$ ft problem geometry the spring is stretched $s_1 = (\sqrt{3^2 + 4^2} - 1) = 4$ ft
in the initial position, and $s_2 = (4 - 1) = 3$ ft in the final position. Hence,

$$
V_1 = \frac{1}{2}k s_1^2 = \frac{1}{2}(2 \text{ lb/ft})(4 \text{ ft})^2 = 16 \text{ J}
$$

$$
V_2 = \frac{1}{2}k s_2^2 = \frac{1}{2}(2 \text{ lb/ft})(3 \text{ ft})^2 = 9 \text{ J}
$$

Kinetic Energy. The disk is released from rest and so $(v_G)_1 = 0$, $(v_G)_2 = 0$ **Kinetic Energy.**
 $\boldsymbol{\omega}_1 = 0$. Therefore,

$$
T_1 = 0
$$

Since the instantaneous center of zero velocity is at the ground, Fig. 18–19*c*, we have

$$
T_2 = \frac{1}{2} I_{IC} \omega_2^2
$$

= $\frac{1}{2} \left[\left(\frac{30 \text{ lb}}{32.2 \text{ ft/s}^2} \right) (0.6 \text{ ft})^2 + \left(\frac{30 \text{ lb}}{32.2 \text{ ft/s}^2} \right) (0.75 \text{ ft})^2 \right] \omega_2^2$
= 0.4297 ω_2^2

Conservation of Energy.

$$
\{T_1\} + \{V_1\} = \{T_2\} + \{V_2\}
$$

$$
\{0\} + \{16 \text{ J}\} = \{0.4297\omega_2^2\} + \{9 \text{ J}\}
$$

$$
\omega_2 = 4.04 \text{ rad/s}^2
$$
Ans.

NOTE: If the principle of work and energy were used to solve this problem, then the work of the spring would have to be determined by considering both the change in magnitude and direction of the spring force.

Fig. 18–20

The 10-kg homogeneous disk shown in Fig. 18–20*a* is attached to a uniform 5-kg rod *AB*. If the assembly is released from rest when uniform 5-kg rod *AB*. If the assembly is released from rest when $\theta = 60^{\circ}$, determine the angular velocity of the rod when $\theta = 0^{\circ}$. Assume that the disk rolls without slipping. Neglect friction along the guide and the mass of the collar at *B*.

SOLUTION

Potential Energy. Two diagrams for the rod and disk, when they are located at their initial and final positions, are shown in Fig. 18–20*b*. For convenience the datum passes through point *A*.

When the system is in position 1, only the rod's weight has positive potential energy. Thus,

$$
V_1 = W_r y_1 = (49.05 \text{ N})(0.3 \sin 60^\circ \text{ m}) = 12.74 \text{ J}
$$

When the system is in position 2, both the weight of the rod and the weight of the disk have zero potential energy. Why? Thus,

$$
V_2 = 0
$$

Kinetic Energy. Since the entire system is at rest at the initial position,

$$
T_1 = 0
$$

In the final position the rod has an angular velocity $(\omega_r)_2$ and its mass
center has a velocity (\mathbf{v}_r) . Fig. 18, 20c, Since the rod is fully extended center has a velocity $(\mathbf{v}_G)_2$, Fig. 18–20*c*. Since the rod is *fully extended*
in this position, the disk is momentarily at rest, so $(\mathbf{v}_G)_1 = 0$ and center has a velocity $(\mathbf{v}_G)_2$, Fig. 18–20*c*. Since the rod is *fully extended*
in this position, the disk is momentarily at rest, so $(\boldsymbol{\omega}_d)_2 = \mathbf{0}$ and
 $(\mathbf{v}_d) = \mathbf{0}$. For the rod (\mathbf{v}_d) , can be related to in this position, the disk is momentarily at rest, so $(\omega_d)_2 = 0$ and $(v_A)_2 = 0$. For the rod $(v_G)_2$ can be related to $(\omega_r)_2$ from the instantaneous center of zero velocity which is located at point A. instantaneous center of zero velocity, which is located at point *A*, instantaneous center of zero velocity, which is located at poir
Fig. 18–20*c*. Hence, $(v_G)_2 = r_{G/IC}(\omega_r)_2$ or $(v_G)_2 = 0.3(\omega_r)_2$. Thus,

$$
T_2 = \frac{1}{2} m_r (v_G)_2^2 + \frac{1}{2} I_G(\omega_r)_2^2 + \frac{1}{2} m_d (v_A)_2^2 + \frac{1}{2} I_A(\omega_d)_2^2
$$

= $\frac{1}{2} (5 \text{ kg}) [(0.3 \text{ m})(\omega_r)_2]^2 + \frac{1}{2} \Big[\frac{1}{12} (5 \text{ kg})(0.6 \text{ m})^2 \Big] (\omega_r)_2^2 + 0 + 0$
= $0.3 (\omega_r)_2^2$

Conservation of Energy.

$$
\{T_1\} + \{V_1\} = \{T_2\} + \{V_2\}
$$

$$
\{0\} + \{12.74 \text{ J}\} = \{0.3(\omega_R)_2^2\} + \{0\}
$$

$$
(\omega_r)_2 = 6.52 \text{ rad/s } \lambda
$$
Ans.

NOTE: We can also determine the final kinetic energy of the rod using **NOTE:** We c
 $T_2 = \frac{1}{2} I_{IC} \omega_2^2$.

CHAPTER REVIEW

Kinetic Energy

The kinetic energy of a rigid body that undergoes planar motion can be referenced to its mass center. It includes a scalar sum of its translational and rotational kinetic energies.

Work of a Force and a Couple Moment A force does work when it undergoes a displacement *ds* in the direction of the force. In particular, the frictional and normal forces that act on a cylinder or any circular body that rolls *without slipping* will do no work, since the normal force does not undergo a displacement and the frictional force acts on successive points on the surface of the body. *s* **F F** *s* **F***c* **F***c* $F_c \cos \theta$ $F_c \cos \theta$ θ θ $U_F = \int F \cos \theta \, ds$ Constant Force $U_{F_c} = (F_c \cos \theta)s$

Principle of Work and Energy

Problems that involve velocity, force, and displacement can be solved using the principle of work and energy. The kinetic energy is the sum of both its rotational and translational parts. For application, a freebody diagram should be drawn in order to account for the work of all of the forces and couple moments that act on the body as it moves along the path.

Conservation of Energy

If a rigid body is subjected only to conservative forces, then the conservationof-energy equation can be used to solve the problem. This equation requires that the sum of the potential and kinetic energies of the body remain the same at any two points along the path.

The potential energy is the sum of the body's gravitational and elastic potential energies.The gravitational potential energy will be positive if the body's center of gravity is located above a datum. If it is below the datum, then it will be negative. The elastic potential energy is always positive, regardless if the spring is stretched or compressed.

where $V = V_g + V_e$ $T_1 + V_1 = T_2 + V_2$

Elastic potential energy

The docking of the space shuttle to the international space station requires application of impulse and momentum principles to accurately predict their orbital motion and proper orientation.

Planar Kinetics of a [Rigid Body: Impulse](#page-15-0) and Momentum

19

[CHAPTER OBJECTIVES](#page-15-0)

- To develop formulations for the linear and angular momentum of a body.
- To apply the principles of linear and angular impulse and momentum to solve rigid-body planar kinetic problems that involve force, velocity, and time.
- To discuss application of the conservation of momentum.
- To analyze the mechanics of eccentric impact.

19.1 [Linear and Angular Momentum](#page-15-0)

In this chapter we will use the principles of linear and angular impulse and momentum to solve problems involving force, velocity, and time as related to the planar motion of a rigid body. Before doing this, we will first formalize the methods for obtaining a body's linear and angular momentum, assuming the body is symmetric with respect to an inertial *x*–*y* reference plane.

Linear Momentum. The linear momentum of a rigid body is determined by summing vectorially the linear momenta of all the determined by summing vectorially the linear momenta of all the particles of the body, i.e., $\mathbf{L} = \sum m_i \mathbf{v}_i$. Since $\sum m_i \mathbf{v}_i = m\mathbf{v}_G$ (see Sec. 15.2) we can also write we can also write

$$
\mathbf{L} = m\mathbf{v}_G \tag{19-1}
$$

This equation states that the body's linear momentum is a vector quantity having a *magnitude mv_G*, which is commonly measured in units of kg \cdot m/s or slug \cdot ft/s and a *direction* defined by v_G the velocity of the body's mass center. is equation states that the body's linear mome

Angular Momentum. Consider the body in Fig. 19–1*a*, which is subjected to general plane motion. At the instant shown, the arbitrary point *P* has a known velocity \mathbf{v}_P , and the body has an angular velocity
 $\boldsymbol{\omega}$. Therefore the velocity of the *i*th particle of the body is ω . Therefore the velocity of the *i*th particle of the body is

$$
\mathbf{v}_i = \mathbf{v}_P + \mathbf{v}_{i/P} = \mathbf{v}_P + \boldsymbol{\omega} \times \mathbf{r}
$$

The angular momentum of this particle about point *P* is equal to the "moment" of the particle's linear momentum about *P*, Fig. 19–1*a*. Thus,

$$
(\mathbf{H}_P)_i = \mathbf{r} \times m_i \mathbf{v}_i
$$

Expressing \mathbf{v}_i in terms of \mathbf{v}_P and using Cartesian vectors, we have

$$
(H_P)_i \mathbf{k} = m_i(x\mathbf{i} + y\mathbf{j}) \times [(v_P)_x \mathbf{i} + (v_P)_y \mathbf{j} + \omega \mathbf{k} \times (x\mathbf{i} + y\mathbf{j})]
$$

$$
(H_P)_i = -m_i y(v_P)_x + m_i x(v_P)_y + m_i \omega r^2
$$

Letting $m_i \rightarrow dm$ and integrating over the entire mass m of the body, we obtain obtain

$$
H_P = -\bigg(\int_m y \, dm\bigg)(v_P)_x + \bigg(\int_m x \, dm\bigg)(v_P)_y + \bigg(\int_m r^2 \, dm\bigg)\omega
$$

Here H_p represents the angular momentum of the body about an axis (the \overline{z} axis) perpendicular to the plane of motion that passes through point *P*. Since $\overline{y}m = \int y dm$ and $\overline{x}m = \int x dm$ the integrals for the first and second terms on the right are used to locate the body's center of mass *G* with respect to *P*, Fig. 19–1*b*.Also, the last integral represents the body's moment of inertia about point *P.* Thus, erpendicular to the plane of mo
 $\overline{y}m = \int y dm$ and $\overline{x}m = \int x dm$

rms on the right are used to loc

$$
H_P = -\overline{y}m(v_P)_x + \overline{x}m(v_P)_y + I_P\omega
$$
 (19–2)

This equation reduces to a simpler form if *P* coincides with the mass center *G* for the body,* in which case $\bar{x} = \bar{y} = 0$. Hence,

y P x x **v***P G* (b) **v***G _* **r** ω *_ x _ y* **Fig. 19–1**

^{*}It also reduces to the same simple form, $H_P = I_{P}\omega$, if point *P* is a *fixed point* (see Eq. 19–9) or the velocity of *P* is directed along the line *PG*.

$$
H_G = I_G \omega \tag{19-3}
$$

Here the angular momentum of the body about G is equal to the product of the moment of inertia of the body about an axis passing through G and the body's angular velocity. Realize that H_G is a vector quantity having a magnitude L ω which is commonly magnitude in units of having a *magnitude* $I_G\omega$, which is commonly measured in units of $k\sigma \cdot m^2/s$ or slug- $\mathbf{f}t^2/s$ and a *direction* defined by $\boldsymbol{\omega}$, which is always and the body's angular velocity. Realize that H_G is a vector quantity having a *magnitude* $I_G\omega$, which is commonly measured in units of kg·m²/s or slug·ft²/s, and a *direction* defined by ω , which is always perpendicular to the plane of motion.

Equation 19–2 can also be rewritten in terms of the *x* and *y* components of the velocity of the body's mass center, $(\mathbf{v}_G)_x$ and $(\mathbf{v}_G)_y$, and the body's moment of inertia L. Since G is located at coordinates and the body's moment of inertia I_G . Since *G* is located at coordinates
 $(\overline{x} \overline{y})$ then by the parallel-axis theorem $I_D = I_G + m(\overline{x}^2 + \overline{y}^2)$ and the body's moment of inertia I_G . Since G is located at coordinates $(\overline{x}, \overline{y})$, then by the parallel-axis theorem, $I_P = I_G + m(\overline{x}^2 + \overline{y}^2)$.
Substituting into Eq. 19–2 and rearranging terms we have Substituting into Eq. 19–2 and rearranging terms, we have

$$
H_P = \overline{y}m[-(v_P)_x + \overline{y}\omega] + \overline{x}m[(v_P)_y + \overline{x}\omega] + I_G\omega \qquad (19-4)
$$

From the kinematic diagram of Fig. $19-1b$, \mathbf{v}_G can be expressed in terms of \mathbf{v}_G as of \mathbf{v}_P as

$$
\mathbf{v}_G = \mathbf{v}_P + \boldsymbol{\omega} \times \overline{\mathbf{r}}
$$

$$
(v_G)_x \mathbf{i} + (v_G)_y \mathbf{j} = (v_P)_x \mathbf{i} + (v_P)_y \mathbf{j} + \boldsymbol{\omega} \mathbf{k} \times (\overline{x} \mathbf{i} + \overline{y} \mathbf{j})
$$

Carrying out the cross product and equating the respective **i** and **j** components yields the two scalar equations

$$
(v_G)_x = (v_P)_x - \overline{y}\omega
$$

$$
(v_G)_y = (v_P)_y + \overline{x}\omega
$$

Substituting these results into Eq. 19–4 yields

$$
(\zeta +) H_P = -\bar{y}m(v_G)_x + \bar{x}m(v_G)_y + I_G\omega
$$
 (19-5)

As shown in Fig. 19–1*c*, *this result indicates that when the angular momentum of the body is computed about point P, it is equivalent to the moment of the linear momentum m* \mathbf{v}_G , *or its components m* $(\mathbf{v}_G)_x$ *and* $\mathbf{w}(\mathbf{v}_G)$ *about P plus the angular momentum* L₆ \mathbf{a} . Using these results $m(\mathbf{v}_G)_{y}$, about *P* plus the angular momentum $I_G \boldsymbol{\omega}$. Using these results, we will now consider three types of motion we will now consider three types of motion.

19

Fig. 19–2

19

Translation. When a rigid body is subjected to either rectilinear or **Translation.** When a rigid body is subjected to either rectilinear or curvilinear *translation*, Fig. 19–2*a*, then $\omega = 0$ and its mass center has a curvilinear *translation*, Fig. 19–2*a*, then $\omega = 0$ and its mass center has a velocity of $\mathbf{v}_G = \mathbf{v}$. Hence, the linear momentum, and the angular momentum about G become momentum about *G*, become

$$
L = mv_G
$$

\n
$$
H_G = 0
$$
\n(19-6)

If the angular momentum is computed about some other point *A*, the "moment" of the linear momentum **L** must be found about the point. Since *d* is the "moment arm" as shown in Fig. 19–2*a*, then in accordance Since *d* is the "moment arm" as si
with Eq. 19–5, $H_A = (d)(mv_G)$.

Rotation About a Fixed Axis. When a rigid body is *rotating about a fixed axis*, Fig. 19–2*b*, the linear momentum, and the angular momentum about *G,* are

$$
L = mv_G
$$

\n
$$
H_G = I_G \omega
$$
\n(19-7)

It is sometimes convenient to compute the angular momentum about point *O*. Noting that **L** (or \mathbf{v}_G) is always *perpendicular to* \mathbf{r}_G , we have

$$
(\zeta +) H_O = I_G \omega + r_G(mv_G)
$$
 (19–8)

Since $v_G = r_G \omega$, this equation can be written as $H_O = (I_G + mr_G^2)$ Using the parallel-axis theorem,* 2 $v_G = r_G\omega$, this equation can be written as $H_O = (I_G + mr_G^2)\omega$.

$$
H_O = I_O \omega \tag{19-9}
$$

For the calculation, then, either Eq. 19–8 or 19–9 can be used.

*The similarity between this derivation and that of Eq. 17–16 ($\sum M_O = I_O \alpha$) and Eq. 18–5
 $\Gamma = \frac{1}{2} I_{\alpha/2}$) should be noted. Also note that the same nearly see he alterined from Eq. 19–2 *The similarity between this derivation and that of Eq. 1/-16 ($\Sigma M_O = I_O \alpha$) and Eq. 18-5
 $(T = \frac{1}{2}I_O\omega^2)$ should be noted. Also note that the same result can be obtained from Eq. 19-2

by selecting point P at O realizi by selecting point *P* at *O*, realizing that $(v_O)_x = (v_O)_y = 0$.

General Plane Motion When a rigid body is subjected to general plane motion, Fig. 19–2*c*, the linear momentum, and the angular momentum about *G*, become

$$
L = mv_G
$$

\n
$$
H_G = I_G \omega
$$
\n(19-10)

If the angular momentum is computed about point *A*, Fig. 19–2*c*, it is necessary to include the moment of **L** and H_G about this point. In this case this case,

$$
(\zeta +) \qquad H_A = I_G \omega + (d)(m v_G)
$$

Here *d* is the moment arm, as shown in the figure.

As a special case, if point *A* is the instantaneous center of zero velocity then, like Eq. 19–9, we can write the above equation as

$$
H_{IC} = I_{IC}\omega
$$
 (19-11)

where I_{IC} is the moment of inertia of the body about the *IC*. See Prob. 19–2.

As the pendulum swings downward, its angular momentum about point *O* can be determined by computing the moment of $I_G \omega$ and mv_G about *O*.
This is $H_0 = I_G \omega + (mv_G)d$. Since $v_G = \omega d$, then computing the moment of $I_G \omega$ and $m\mathbf{v}_G$ about O.
This is $H_O = I_G \omega + (mv_G)d$. Since $v_G = \omega d$, then This is $H_O = I_G \omega + (mv_G)d$. Since $v_G = \omega d$, t
 $H_O = I_G \omega + m(\omega d)d = (I_G + md^2)\omega = I_O\omega$.

At a given instant the 5-kg slender bar has the motion shown in Fig. 19–3*a*. Determine its angular momentum about point *G* and about the *IC* at this instant.

SOLUTION

Bar. The bar undergoes *general plane motion*. The *IC* is established in Fig. 19–3*b*, so that

$$
\omega = \frac{2 \text{ m/s}}{4 \text{ m} \cos 30^{\circ}} = 0.5774 \text{ rad/s}
$$

$$
v_G = (0.5774 \text{ rad/s})(2 \text{ m}) = 1.155 \text{ m/s}
$$

Thus,

Thus,
\n
$$
(\zeta +) H_G = I_G \omega = \left[\frac{1}{12} (5 \text{ kg}) (4 \text{ m})^2 \right] (0.5774 \text{ rad/s}) = 3.85 \text{ kg} \cdot \text{m}^2/\text{s} \sqrt{24} n \text{s}.
$$

Adding $I_G\omega$ and the moment of mv_G about the *IC* yields

$$
(\zeta +) H_{IC} = I_G \omega + d(mv_G)
$$

= $\left[\frac{1}{12}(5 \text{ kg})(4 \text{ m})^2\right](0.5774 \text{ rad/s}) + (2 \text{ m})(5 \text{ kg})(1.155 \text{ m/s})$
= 15.4 kg \cdot \text{m}^2/\text{s} \ \ \text{Ans.}

We can also use

$$
(\zeta +) H_{IC} = I_{IC}\omega
$$

= $\left[\frac{1}{12} (5 \text{ kg})(4 \text{ m})^2 + (5 \text{ kg})(2 \text{ m})^2\right] (0.5774 \text{ rad/s})$
= 15.4 kg·m²/s \gtrsim Ans.

19.2 [Principle of Impulse and](#page-15-0) Momentum

Like the case for particle motion, the principle of impulse and momentum for a rigid body can be developed by *combining* the equation of motion with kinematics. The resulting equation will yield a *direct solution to problems involving force, velocity, and time.*

Principle of Linear Impulse and Momentum. The equation of translational motion for a rigid body can be written as ©If translational motion for a rigid body can be writt $\mathbf{F} = m\mathbf{a}_G = m(d\mathbf{v}_G/dt)$. Since the mass of the body is constant,

$$
\Sigma \mathbf{F} = \frac{d}{dt} (m \mathbf{v}_G)
$$

Multiplying both sides by *dt* and integrating from $t = t_1$, $\mathbf{v}_G = (\mathbf{v}_G)_1$ to $t = t_2$, $\mathbf{v}_G = (\mathbf{v}_G)_2$ yields Multiplying both sides b
 $t = t_2$, $\mathbf{v}_G = (\mathbf{v}_G)_2$ yields

$$
\sum \int_{t_1}^{t_2} \mathbf{F} dt = m(\mathbf{v}_G)_2 - m(\mathbf{v}_G)_1
$$

This equation is referred to as the *principle of linear impulse and momentum*. It states that the sum of all the impulses created by the *external force system* which acts on the body during the time interval t_1 to i ernal force system which acts on the body during the time lifet value i_1 to is equal to the change in the linear momentum of the body during this u_2 is equal to the change
time interval, Fig. 19–4.

Principle of Angular Impulse and Momentum. If the body **Principle of Angular Impulse and Momentum.** If the body has *general plane motion* then $\Sigma M_G = I_G \alpha = I_G (d\omega/dt)$. Since the moment of inertia is constant moment of inertia is constant,

$$
\Sigma M_G = \frac{d}{dt} (I_G \omega)
$$

Multiplying both sides by *dt* and integrating from $t = t_1$, $\omega = \omega_1$ to $t = t_2$, $\omega = \omega_2$ gives Multiplying both si
 $t = t_2, \omega = \omega_2$ gives

$$
\Sigma \int_{t_1}^{t_2} M_G dt = I_G \omega_2 - I_G \omega_1 \tag{19-12}
$$

In a similar manner, for *rotation about a fixed axis* passing through In a similar manner, for *rotation about a fixed axis* pass
point *O*, Eq. 17–16 ($\Sigma M_O = I_O \alpha$) when integrated becomes

$$
\Sigma \int_{t_1}^{t_2} M_O \, dt = I_O \omega_2 - I_O \omega_1 \tag{19-13}
$$

Equations 19–12 and 19–13 are referred to as the *principle of angular impulse and momentum*. Both equations state that the sum of the angular impulses acting on the body during the time interval t_1 to t_2 is equal to the Impulses acting on the body's during the time interval t_1 to t_2 is equal change in the body's angular momentum during this time interval.

Fig. 19–4 (repeated)

To summarize these concepts, if motion occurs in the *x*–*y* plane, the following *three scalar equations* can be written to describe the *planar motion* of the body.

$$
m(v_{Gx})_1 + \sum \int_{t_1}^{t_2} F_x dt = m(v_{Gx})_2
$$

\n
$$
m(v_{Gy})_1 + \sum \int_{t_1}^{t_2} F_y dt = m(v_{Gy})_2
$$

\n
$$
I_G\omega_1 + \sum \int_{t_1}^{t_2} M_G dt = I_G\omega_2
$$
\n(19-14)

The terms in these equations can be shown graphically by drawing a set of impulse and momentum diagrams for the body, Fig. 19–4. Note that the linear momentum $m\mathbf{v}_G$ is applied at the body's mass center, Figs. 19–4*a*
and 19–4*c*; whereas the appular momentum $I_G\boldsymbol{\omega}$ is a free vector, and and 19–4*c*; whereas the angular momentum $I_G \boldsymbol{\omega}$ is a free vector, and therefore like a couple moment it can be applied at any point on the therefore, like a couple moment, it can be applied at any point on the body. When the impulse diagram is constructed, Fig. 19–4*b*, the forces **F** and moment **M** vary with time, and are indicated by the integrals. However, if **F** and **M** are *constant* integration of the impulses yields However, if **F** and **M** are *constant* integration of the impulses yields $\mathbf{F}(t_2 - t_1)$ and $\mathbf{M}(t_2 - t_1)$, respectively. Such is the case for the body's weight **W** Fig. 19–4*h* weight **W**, Fig. 19–4*b*.

Equations 19–14 can also be applied to an entire system of connected bodies rather than to each body separately. This eliminates the need to include interaction impulses which occur at the connections since they are *internal* to the system. The resultant equations may be written in symbolic form as

$$
\left(\sum_{\text{momentum}}^{\text{syst. linear}}\right)_{x1} + \left(\sum_{\text{impulse}}^{\text{syst. linear}}\right)_{x(1-2)} = \left(\sum_{\text{momentum}}^{\text{syst. linear}}\right)_{x2}
$$
\n
$$
\left(\sum_{\text{momentum}}^{\text{syst. linear}}\right)_{y1} + \left(\sum_{\text{impulse}}^{\text{syst. linear}}\right)_{y(1-2)} = \left(\sum_{\text{momentum}}^{\text{syst. linear}}\right)_{y2}
$$
\n
$$
\left(\sum_{\text{momentum}}^{\text{syst. angular}}\right)_{01} + \left(\sum_{\text{impulse}}^{\text{syst. angular}}\right)_{0(1-2)} = \left(\sum_{\text{momentum}}^{\text{syst. angular}}\right)_{02}
$$
\n
$$
\left(\sum_{\text{momentum}}^{\text{syst. a}}\right)_{y(1-2)} = \left(\sum_{\text{momentum}}^{\text{syst. a}}\right)_{02}
$$

 $(19-15)$

As indicated by the third equation, the system's angular momentum and angular impulse must be computed with respect to the *same reference point O* for all the bodies of the system.

Procedure For Analysis

Impulse and momentum principles are used to solve kinetic problems that involve *velocity, force*, and *time* since these terms are involved in the formulation.

Free-Body Diagram.

- Establish the *x*, *y*, *z* inertial frame of reference and draw the freebody diagram in order to account for all the forces and couple moments that produce impulses on the body.
- The direction and sense of the initial and final velocity of the body's mass center, \mathbf{v}_G , and the body's angular velocity $\boldsymbol{\omega}$ should
be established. If any of these motions is unknown assume that the be established. If any of these motions is unknown, assume that the sense of its components is in the direction of the positive inertial coordinates.
- Compute the moment of inertia I_G or I_O .
- As an alternative procedure, draw the impulse and momentum diagrams for the body or system of bodies. Each of these diagrams represents an outlined shape of the body which graphically accounts for the data required for each of the three terms in Eqs. 19–14 or 19–15, Fig. 19–4. These diagrams are particularly helpful in order to visualize the "moment" terms used in the principle of angular impulse and momentum, if application is about the *IC* or another point other than the body's mass center *G* or a fixed point *O*.

Principle of Impulse and Momentum.

- Apply the three scalar equations of impulse and momentum.
- The angular momentum of a rigid body rotating about a fixed axis is the moment of mv_G plus $I_G \omega$ about the axis. This is equal to $H_G = I_G \omega$, where I_G is the moment of inertia of the body axis is the moment of $m\mathbf{v}_G$ plus $I_G \boldsymbol{\omega}$ about the axis. This is equal to $H_O = I_O \boldsymbol{\omega}$, where I_O is the moment of inertia of the body about the axis about the axis.
- All the forces acting on the body's free-body diagram will create an impulse; however, some of these forces will do no work.
- Forces that are functions of time must be integrated to obtain the impulse.
- The principle of angular impulse and momentum is often used to eliminate unknown impulsive forces that are parallel or pass through a common axis, since the moment of these forces is zero about this axis.

Kinematics.

• If more than three equations are needed for a complete solution, it may be possible to relate the velocity of the body's mass center to the body's angular velocity using *kinematics*. If the motion appears to be complicated, kinematic (velocity) diagrams may be helpful in obtaining the necessary relation.

The 20-lb disk shown in Fig. 19–5*a* is acted upon by a constant couple moment of $4 \text{ lb} \cdot \text{ft}$ and a force of 10 lb which is applied to a cord wrapped around its periphery. Determine the angular velocity of the disk two seconds after starting from rest. Also, what are the force components of reaction at the pin? sk shov
4 lb \cdot ft

SOLUTION

Since angular velocity, force, and time are involved in the problems, we will apply the principles of impulse and momentum to the solution.

Free-Body Diagram. Fig. 19–5*b*. The disk's mass center does not move; however, the loading causes the disk to rotate clockwise.

The moment of inertia of the disk about its fixed axis of rotation is

$$
I_A = \frac{1}{2}mr^2 = \frac{1}{2}\left(\frac{20 \text{ lb}}{32.2 \text{ ft/s}^2}\right)(0.75 \text{ ft})^2 = 0.1747 \text{ slug} \cdot \text{ft}^2
$$

Principle of Impulse and Momentum.

$$
m(v_{Ax})_1 + \sum \int_{t_1}^{t_2} F_x dt = m(v_{Ax})_2
$$

\n
$$
0 + A_x(2 \text{ s}) = 0
$$

\n
$$
(\uparrow \uparrow)
$$

\n
$$
m(v_{Ay})_1 + \sum \int_{t_1}^{t_2} F_y dt = m(v_{Ay})_2
$$

\n
$$
0 + A_y(2 \text{ s}) - 20 \text{ lb}(2 \text{ s}) - 10 \text{ lb}(2 \text{ s}) = 0
$$

\n
$$
I_A \omega_1 + \sum \int_{t_1}^{t_2} M_A dt = I_A \omega_2
$$

\n
$$
0 + 4 \text{ lb} \cdot \text{ft}(2 \text{ s}) + [10 \text{ lb}(2 \text{ s})](0.75 \text{ ft}) = 0.1747 \omega_2
$$

$$
0 + 4 \text{ lb} \cdot \text{ft}(2 \text{ s}) + [10 \text{ lb}(2 \text{ s})](0.75 \text{ ft}) = 0.1747 \omega_2
$$

Solving these equations yields

$$
A_x = 0
$$
 Ans.

$$
A_y = 30 \text{ lb}
$$
Ans.

$$
\omega_2 = 132 \text{ rad/s} \lambda
$$
Ans.

The 100-kg spool shown in Fig. 19–6*a* has a radius of gyration The 100-kg spool shown in Fig. 19–6*a* has a radius of gyration $k_G = 0.35$ m. A cable is wrapped around the central hub of the spool, and a phorizontal force having a variable magnitude of and a horizontal force having a variable magnitude of and a horizontal force having a variable magnitude of $P = (t + 10)$ N is applied, where *t* is in seconds. If the spool is initially at rest determine its angular velocity in 5 s. Assume that the spool at rest, determine its angular velocity in 5 s. Assume that the spool rolls without slipping at *A*.

Fig. 19–6

SOLUTION

Free-Body Diagram. From the free-body diagram, Fig. 19–6*b*, the *variable* force **P** will cause the friction force \mathbf{F}_A to be variable, and thus the impulses created by both **P** and **F**_A must be determined by thus the impulses created by both **P** and \mathbf{F}_A must be determined by integration. Force **P** causes the mass center to have a velocity \mathbf{v}_a to integration. Force **P** causes the mass center to have a velocity \mathbf{v}_G to the right and so the spool has a clockwise appular velocity ϵ . the right, and so the spool has a clockwise angular velocity $\boldsymbol{\omega}.$

Principle of Impulse and Momentum. A direct solution for $\boldsymbol{\omega}$ can be obtained by applying the principle of angular impulse and momentum about point *A*, the *IC*, in order to eliminate the unknown friction impulse.

$$
I_A\omega_1 + \Sigma \int M_A dt = I_A\omega_2
$$

\n
$$
0 + \left[\int_0^{5s} (t + 10) N dt \right] (0.75 m + 0.4 m) = [100 \text{ kg } (0.35 m)^2 + (100 \text{ kg})(0.75 m)^2] \omega_2
$$

\n
$$
62.5(1.15) = 68.5 \omega_2
$$

\n
$$
\omega_2 = 1.05 \text{ rad/s } \lambda
$$
 Ans.

NOTE: Try solving this problem by applying the principle of impulse and momentum about *G* and using the principle of linear impulse and momentum in the *x* direction.

The cylinder shown in Fig. 19–7*a* has a mass of 6 kg. It is attached to a cord which is wrapped around the periphery of a 20-kg disk that has a The cylinder shown in Fig. 19–7*a* has a mass of 6 kg. It is attached to a cord which is wrapped around the periphery of a 20-kg disk that has a moment of inertia $I_A = 0.40 \text{ kg} \cdot \text{m}^2$. If the cylinder is initially mov downward with a speed of 2 m/s , determine its speed in 3 s . Neglect the mass of the cord in the calculation.

SOLUTION I

Free-Body Diagram. The free-body diagrams of the cylinder and disk are shown in Fig. 19–7*b*. All the forces are *constant* since the weight of the cylinder causes the motion. The downward motion of the cylinder, \mathbf{v}_B , causes $\boldsymbol{\omega}$ of the disk to be clockwise.

Principle of Impulse and Momentum. We can eliminate \mathbf{A}_x and \mathbf{A}_x from the analysis by applying the principle of appular impulse and \mathbf{A}_y from the analysis by applying the principle of angular impulse and momentum about point A. Hence momentum about point *A*. Hence

Disk

$$
I_A \omega_1 + \Sigma \int M_A dt = I_A \omega_2
$$

0.40 kg·m²(ω_1) + T(3 s)(0.2 m) = (0.40 kg·m²

$$
0.40 \text{ kg} \cdot \text{m}^2(\omega_1) + T(3 \text{ s})(0.2 \text{ m}) = (0.40 \text{ kg} \cdot \text{m}^2)\omega_2
$$

Cylinder

$$
m_B(v_B)_1 + \sum \int F_y dt = m_B(v_B)_2
$$

-6 kg(2 m/s) + T(3 s) - 58.86 N(3 s) = -6 kg(v_B)_2

Kinematics. Since $\omega = v_B/r$, then $\omega_1 = (2 \text{ m/s})/(0.2 \text{ m}) = 10 \text{ rad/s}$
and $\omega_2 = (v_B)_2/(0.2 \text{ m}) = 5(v_B)_2$. Substituting and solving the **Kinematics.** Since $\omega = v_B/r$, then $\omega_1 = (2 \text{ m/s})/(0.2 \text{ m}) = 10 \text{ rad/s}$
and $\omega_2 = (v_B)_2/0.2 \text{ m} = 5(v_B)_2$. Substituting and solving the
equations simultaneously for $(v_B)_2$ yields equations simultaneously for $(v_B)_2$ yields

$$
(v_B)_2 = 13.0 \text{ m/s } \downarrow
$$
 Ans.

Fig. 19–7

SOLUTION II

Impulse and Momentum Diagrams. We can obtain $(v_B)_2$ directly **Impulse and Momentum Diagrams.** We can obtain $(v_B)_2$ *airectly* by considering the *system* consisting of the cylinder, the cord, and the disk. The impulse and momentum diagrams have been drawn to clarify application of the principle of angular impulse and momentum about point *A*, Fig. 19–7*c*.

Principle of Angular Impulse and Momentum. Realizing that $\omega_1 = 10$ rad/s and $\omega_2 = 5(v_B)_2$, we have

$$
(\zeta +) \bigg(\sum_{\text{momentum}}^{\text{syst. angular}} \bigg)_{A1} + \bigg(\sum_{\text{impulse}}^{\text{syst. angular}} \bigg)_{A(1-2)} = \bigg(\sum_{\text{momentum}}^{\text{syst. angular}} \bigg)_{A2}
$$

$$
(6 \text{ kg})(2 \text{ m/s})(0.2 \text{ m}) + (0.40 \text{ kg} \cdot \text{m}^2)(10 \text{ rad/s}) + (58.86 \text{ N})(3 \text{ s})(0.2 \text{ m})
$$

$$
= (6 \text{ kg})(v_B)_2(0.2 \text{ m}) + (0.40 \text{ kg} \cdot \text{m}^2)[5(v_B)_2(0.2 \text{ m})]
$$

$$
(v_B)_2 = 13.0 \text{ m/s} \downarrow \qquad \qquad \text{Ans.}
$$

(a)

Fig. 19–8

The Charpy impact test is used in materials testing to determine the energy absorption characteristics of a material during impact.The test is performed using the pendulum shown in Fig. 19–8*a*, which has a mass *m*, mass center at *G*, and a radius of gyration k_G about *G*. Determine the distance r_P from the pin at *A* to the point *P* where the impact with the specimen S should occur so that the horizontal force at the pin *A* is essentially zero during the impact. For the calculation, assume the specimen absorbs all the pendulum's kinetic energy gained during the time it falls and thereby stops the pendulum from gained during the time
swinging when $\theta = 0^{\circ}$.

SOLUTION

Free-Body Diagram. As shown on the free-body diagram, Fig. 19–8*b*, the conditions of the problem require the horizontal force at *A* to be zero. Just before impact, the pendulum has a clockwise angular velocity $\boldsymbol{\omega}_1$, and the mass center of the pendulum is moving to angular velocity $\boldsymbol{\omega}_1$, and
the left at $(v_G)_1 = \overline{r}\omega_1$.

Principle of Impulse and Momentum. We will apply the principle of angular impulse and momentum about point *A*. Thus,

 $I_{\alpha} \omega_t + \Sigma M_{\alpha} dt = I_{\alpha} \omega_2$

 $(\zeta^+$

$$
I_A \omega_1 + \sum_{A \omega_2} I_A \omega_2
$$

\n
$$
I_A \omega_1 - \left(\int F dt \right) r_P = 0
$$

\n
$$
m(v_G)_1 + \sum \int F dt = m(v_G)_2
$$

\n
$$
-m(\bar{r}\omega_1) + \int F dt = 0
$$

Eliminating the impulse $\int F dt$ and substituting $I_A = mk_G^2 +$ yields $\int F dt$ and substituting $I_A = mk_G^2 + m\bar{r}^2$

$$
[mk_G^2 + m\bar{r}^2]\omega_1 - m(\bar{r}\omega_1)r_P = 0
$$

Factoring out $m\omega_1$ and solving for r_p , we obtain

$$
r_P = \bar{r} + \frac{k_G^2}{\bar{r}} \qquad \qquad \text{Ans.}
$$

NOTE: Point *P*, so defined, is called the *center of percussion*. By placing the striking point at *P*, the force developed at the pin will be minimized. Many sports rackets, clubs, etc. are designed so that collision with the object being struck occurs at the center of percussion. As a consequence, no "sting" or little sensation occurs in the hand of the player. (Also see Probs. 17–66 and 19–1.)

FUNDAMENTAL PROBLEMS

F19–1. The 60-kg wheel has a radius of gyration about its \blacksquare F19–4. Gears A and B of mass 10 kg and 50 kg \blacksquare center Ω of $k_{\Omega} = 300$ mm. 19.3 [Conservation of Momentum](#page-15-0)

Conservation of Linear Momentum If the sum of all the *linear impulses* acting on a system of connected rigid bodies is *zero* in a specific direction, then the linear momentum of the system is constant, or conserved in this direction, that is,

$$
\left(\sum_{\text{momentum}}^{\text{syst. linear}}\right)_1 = \left(\sum_{\text{momentum}}^{\text{syst. linear}}\right)_2
$$
 (19-16)

This equation is referred to as the *conservation of linear momentum*.

Without inducing appreciable errors in the calculations, it may be possible to apply Eq. 19–16 in a specified direction for which the linear impulses are small or *nonimpulsive*. Specifically, nonimpulsive forces occur when small forces act over very short periods of time. Typical examples include the force of a slightly deformed spring, the initial contact force with soft ground, and in some cases the weight of the body.

Conservation of Angular Momentum The angular momentum of a system of connected rigid bodies is conserved about the system's center of mass *G*, or a fixed point *O*, when the sum of all the angular impulses about these points is zero or appreciably small (nonimpulsive). The third of Eqs. 19–15 then becomes

$$
\left(\sum_{\text{momentum}}^{\text{syst. angular}} \right)_{O1} = \left(\sum_{\text{momentum}}^{\text{syst. angular}} \right)_{O2}
$$
 (19-17)

This equation is referred to as the *conservation of angular momentum*. In the case of a single rigid body, Eq. 19–17 applied to point *G* becomes the case of a single rigid body, Eq. 19–17 applied to point G becomes $(I_G\omega)_1 = (I_G\omega)_2$. For example, consider a swimmer who executes a somersault after jumping off a diving board. By tucking his arms and legs somersault after jumping off a diving board. By tucking his arms and legs in close to his chest, he *decreases* his body's moment of inertia and thus *increases* his angular velocity $(I_G\omega$ must be constant). If he straightens out just before entering the water his body's moment of inertia is out just before entering the water, his body's moment of inertia is *increased*, and so his angular velocity *decreases*. Since the weight of his body creates a linear impulse during the time of motion, this example also illustrates how the angular momentum of a body can be conserved and yet the linear momentum is *not*. Such cases occur whenever the external forces creating the linear impulse pass through either the center of mass of the body or a fixed axis of rotation.
Procedure for Analysis

The conservation of linear or angular momentum should be applied using the following procedure.

Free-Body Diagram.

- Establish the *x*, *y* inertial frame of reference and draw the freebody diagram for the body or system of bodies during the time of impact. From this diagram classify each of the applied forces as being either "impulsive" or "nonimpulsive."
- By inspection of the free-body diagram, the *conservation of linear momentum* applies in a given direction when *no* external impulsive forces act on the body or system in that direction; whereas the *conservation of angular momentum* applies about a fixed point *O* or at the mass center *G* of a body or system of bodies when all the external impulsive forces acting on the body or system create zero moment (or zero angular impulse) about *O* or *G*.
- As an alternative procedure, draw the impulse and momentum diagrams for the body or system of bodies. These diagrams are particularly helpful in order to visualize the "moment" terms used in the conservation of angular momentum equation, when it has been decided that angular momenta are to be computed about a point other than the body's mass center *G*.

Conservation of Momentum.

• Apply the conservation of linear or angular momentum in the appropriate directions.

Kinematics.

If the motion appears to be complicated, kinematic (velocity) diagrams may be helpful in obtaining the necessary kinematic relations.

EXAMPLE 19.6

The 10-kg wheel shown in Fig. 19–9*a* has a moment of inertia The 10-kg wheel shown in Fig. 19–9*a* has a moment of inertia
 $I_G = 0.156 \text{ kg} \cdot \text{m}^2$. Assuming that the wheel does not slip or rebound,

determine the minimum velocity yout must have to just roll over the determine the minimum velocity \mathbf{v}_G it must have to just roll over the obstruction at A obstruction at *A*.

SOLUTION

Impulse and Momentum Diagrams. Since no slipping or rebounding occurs, the wheel essentially *pivots* about point *A* during contact. This condition is shown in Fig. 19–9*b*, which indicates, respectively, the momentum of the wheel *just before impact*, the impulses given to the wheel *during impact*, and the momentum of the wheel *just after impact*. Only two impulses (forces) act on the wheel. By comparison, the force at *A* is much greater than that of the weight, and since the time of impact is very short, the weight can be considered nonimpulsive. The impulsive force **F** at *A* has both an unknown magnitude and an unknown direction θ . To eliminate this force from the analysis, note that angular momentum θ . To eliminate this force from the analysis, note that an about *A* is essentially *conserved* since $(98.1 \Delta t) d \approx 0$.

Conservation of Angular Momentum. With reference to Fig. 19–9*b*,
 $(\zeta +)$ $(H_A)_1 = (H_A)_2$ $(\zeta^+$ $-$ 0.03 m)(10 kg)(v_G)₁ + (0.156 kg ·
(0.2 m)(10 kg)(v_G)₂ + (0.156 kg · m² $(0.2 \text{ m})(10 \text{ kg})(v_G)$ ₂ + $(0.156 \text{ kg} \cdot \text{m}^2)(\omega_2)$ $r'm(v_G)_1 + I_G\omega_1 = rm(v_G)_2 + I_G\omega_2$
 $(0.2 \text{ m} - 0.03 \text{ m})(10 \text{ kg})(v_G)_1 + (0.156 \text{ kg} \cdot \text{m}^2)(\omega_1) =$ $(H_A)_1 = (H_A)_2$
r'm(v_G)₁ + I_Gω₁ = rm(v_G)₂ + I_Gω₂

Kinematics. Since no slipping occurs, in general $\omega = v_G/r$
= $v_G/0.2 \text{ m} = 5v_G$ Substituting this into the above equation and **Kinematics.** Since no slipping occurs, in general $\omega = v_G/r = v_G/0.2 \text{ m} = 5v_G$. Substituting this into the above equation and simplifying vields simplifying yields

$$
(v_G)_2 = 0.8921(v_G)_1\tag{1}
$$

Conservation of Energy.* In order to roll over the obstruction, the wheel must pass position 3 shown in Fig. 19–9*c*. Hence, if (v_G) [or I must pass position 3 shown in Fig. 19–9c. Hence, if $(v_G)_2$ [or] is to be a minimum, it is necessary that the kinetic energy of the (v_G) ₁ is to be a minimum, it is necessary that the kinetic energy of the wheel at position 2 be equal to the potential energy at position 3. Placing the datum through the center of gravity, as shown in the

figure, and applying the conservation of energy equation, we have
\n
$$
\{T_2\} + \{V_2\} = \{T_3\} + \{V_3\}
$$
\n
$$
\{\frac{1}{2}(10 \text{ kg})(v_G)_2^2 + \frac{1}{2}(0.156 \text{ kg} \cdot \text{m}^2)\omega_2^2\} + \{0\} =
$$
\n
$$
\{0\} + \{(98.1 \text{ N})(0.03 \text{ m})\}
$$

Substituting $\omega_2 = 5(v_G)_2$ and Eq. 1 into this equation, and solving,
 $(v_G)_1 = 0.729 \text{ m/s} \rightarrow$ Ans. $\omega_2 = 5(v_G)_2$

$$
(v_G)_1 = 0.729 \text{ m/s} \rightarrow \text{A}n
$$

*This principle *does not apply during impact*, since energy is *lost* during the collision. However, just after impact, as in Fig. 19–9*c*, it can be used.

19

EXAMPLE 19.7

The 5-kg slender rod shown in Fig. 19–10*a* is pinned at *O* and is initially at rest. If a 4-g bullet is fired into the rod with a velocity of 400 m/s , as shown in the figure, determine the angular velocity of the rod just after the bullet becomes embedded in it.

SOLUTION

Impulse and Momentum Diagrams. The impulse which the bullet exerts on the rod can be eliminated from the analysis, and the angular velocity of the rod just after impact can be determined by considering the bullet and rod as a single system.To clarify the principles involved, the impulse and momentum diagrams are shown in Fig. 19–10*b*. The momentum diagrams are drawn *just before and just after impact*. During impact, the bullet and rod exert equal but *opposite internal impulses* at *A*.As shown on the impulse diagram, the impulses that are external to the system are due to the reactions at O and the weights of the bullet and rod. Since the time of impact, Δt , is very short, the rod
moves only a slight amount and so the "moments" of the weight moves only a slight amount, and so the "moments" of the weight impulses about point *O* are essentially zero. Therefore angular momentum is conserved about this point.

Conservation of Angular Momentum. From Fig. 19–10*b*, we have $(\zeta +)$
 $\Sigma(H_O)_1 = \Sigma(H_O)_2$

$$
m_B(v_B)_1 \cos 30^\circ (0.75 \text{ m}) = m_B(v_B)_2 (0.75 \text{ m}) + m_R(v_G)_2 (0.5 \text{ m}) + I_G \omega_2
$$

(0.004 kg)(400 cos 30° m/s)(0.75 m) =

$$
(0.004 \text{ kg})(v_B)_2(0.75 \text{ m}) + (5 \text{ kg})(v_G)_2(0.5 \text{ m}) + \left[\frac{1}{12}(5 \text{ kg})(1 \text{ m})^2\right]\omega_2
$$

or

$$
1.039 = 0.003(v_B)_2 + 2.50(v_G)_2 + 0.4167\omega_2 \tag{1}
$$

Kinematics. Since the rod is pinned at *O*, from Fig. 19–10*c* we have
 $(v_G)_2 = (0.5 \text{ m})\omega_2$ $(v_B)_2 = (0.75 \text{ m})\omega_2$

$$
(v_G)_2 = (0.5 \text{ m})\omega_2 \qquad (v_B)_2 = (0.75 \text{ m})\omega_2
$$

Substituting into Eq. 1 and solving yields

$$
\omega_2 = 0.623 \text{ rad/s}^3
$$
Ans.

 \overrightarrow{G} (**v***G*)₂ (\mathbf{v}_B) ₂ ω *O* 0.5 m 0.75 m (c)

Fig. 19–10

*19.4 [Eccentric Impact](#page-15-0)

The concepts involving central and oblique impact of particles were presented in Sec. 15.4. We will now expand this treatment and discuss the eccentric impact of two bodies. *Eccentric impact* occurs when the line connecting the *mass centers* of the two bodies *does not* coincide with the line of impact.* This type of impact often occurs when one or both of the bodies are constrained to rotate about a fixed axis. Consider, for example, the collision at *C* between the two bodies *A* and *B*, shown in Fig. 19–11*a*. It is assumed that just before collision *B* is rotating counterclockwise with an angular velocity $(\omega_B)_1$, and the velocity of the contact point *C* located
on *A* is (**u**) Kinematic diagrams for both bodies just before collision on *A* is $(\mathbf{u}_A)_1$. Kinematic diagrams for both bodies just before collision are shown in Fig. 19, 11*b* Provided the bodies are smooth the impulsive are shown in Fig. 19–11*b*. Provided the bodies are smooth, the impulsive forces they exert on each other are directed along the line of impact. Hence, the component of velocity of point *C* on body *B*, which is directed Hence, the component of velocity of point C on body B, which is directed
along the line of impact, is $(v_B)_1 = (\omega_B)_1 r$, Fig. 19–11*b*. Likewise, on body
4 the component of velocity (\mathbf{u}_α) , along the line of impact is $(\$ *A* the component of velocity $(\mathbf{u}_A)_1$ along the line of impact is $(\mathbf{v}_A)_1$. In order for a collision to occur $(\mathbf{v}_A) \geq (\mathbf{v}_A)$ A the component of velocity $(\mathbf{u}_A)_1$ along th
order for a collision to occur, $(v_A)_1 > (v_B)_1$.
During the impact an equal but opposite

During the impact an equal but opposite impulsive force **P** is exerted between the bodies which *deforms* their shapes at the point of contact. The resulting impulse is shown on the impulse diagrams for both bodies, Fig. 19–11*c*. Note that the impulsive force at point *C* on the rotating body creates impulsive pin reactions at *O*. On these diagrams it is assumed that the impact creates forces which are much larger than the nonimpulsive weights of the bodies, which are not shown. When the deformation at point *C* is a maximum, *C* on both the bodies moves with a common velocity **v** along the line of impact, Fig. 19–11*d*. A period of *restitution* then occurs in which the bodies tend to regain their original shapes. The restitution phase creates an equal but opposite impulsive force **R** acting between the bodies as shown on the impulse diagram, Fig. 19–11*e*. After restitution the bodies move apart such that point *C* on body *B* has a velocity $(v_B)_2$ and point *C* on body *A* has a velocity $(u_A)_2$, body *B* has a velocity $(v_B)_2$ and p
Fig. 19–11*f*, where $(v_B)_2 > (v_A)_2$.
In general a problem involvi-

In general, a problem involving the impact of two bodies requires determining the *two unknowns* $(v_A)_2$ and $(v_B)_2$, assuming $(v_A)_1$ and $(v_B)_2$, are known (or can be determined using kinematics energy $(v_B)_1$ are known (or can be determined using kinematics, energy
methods the equations of motion etc.) To solve such problems two methods, the equations of motion, etc.). To solve such problems, two equations must be written. The *first equation* generally involves application of *the conservation of angular momentum to the two bodies*. In the case of both bodies *A* and *B*, we can state that angular momentum is conserved about point *O* since the impulses at *C* are internal to the system and the impulses at *O* create zero moment (or zero angular impulse) about *O*. The *second equation* can be obtained using the definition of the *coefficient of restitution, e*, which is a ratio of the restitution impulse to the deformation impulse.

* When these lines coincide, central impact occurs and the problem can be analyzed as discussed in Sec. 15.4.

Fig. 19–11

Here is an example of eccentric impact occurring between this bowling ball and pin.

Is is important to realize, however, that *this analysis has only a very limited application in engineering, because values of e for this case have been found to be highly sensitive to the material, geometry, and the velocity of each of the colliding bodies.*To establish a useful form of the coefficient of restitution equation we must first apply the principle of angular impulse and momentum about point *O* to bodies *B* and *A* separately. Combining the results, we then obtain the necessary equation. Proceeding in this manner, the principle of impulse and momentum applied to body *B* from the time just before the collision to the instant of maximum deformation, Figs. 19–11*b*, 19–11*c*, and 19–11*d*, becomes

$$
I_O(\omega_B)_1 + r \int P dt = I_O \omega
$$
 (19-18)
Here I_O is the moment of inertia of body *B* about point *O*. Similarly,

applying the principle of angular impulse and momentum from the instant of maximum deformation to the time just after the impact, Figs. 19–11*d*, 19–11*e*, and 19–11*f*, yields

$$
I_O\omega + r \int R dt = I_O(\omega_B)_2 \tag{19-19}
$$

Solving Eqs. 19–18 and 19–19 for $\int P dt$ and $\int R dt$, respectively, and rmulating e, we have formulating *e*, we have

$$
e = \frac{\int R dt}{\int P dt} = \frac{r(\omega_B)_2 - r\omega}{r\omega - r(\omega_B)_1} = \frac{(v_B)_2 - v}{v - (v_B)_1}
$$

(f) after collision

Fig. 19–11 (cont.)

In the same manner, we can write an equation which relates the magnitudes of velocity $(v_A)_1$ and $(v_A)_2$ of body *A*. The result is

$$
e = \frac{v - (v_A)_2}{(v_A)_1 - v}
$$

Combining the above two equations by eliminating the common velocity *v* yields the desired result, i.e.,

$$
(+\mathcal{I}) \qquad \qquad e = \frac{(v_B)_2 - (v_A)_2}{(v_A)_1 - (v_B)_1} \qquad (19-20)
$$

This equation is identical to Eq. 15–11, which was derived for the central impact between two particles. It states that the coefficient of restitution is equal to the ratio of the relative velocity of *separation* of the points of contact (*C*) *just after impact* to the relative velocity at which the points *approach* one another *just* before impact. In deriving this equation, we assumed that the points of contact for both bodies move up and to the right *both* before and after impact. If motion of any one of the contacting points occurs down and to the left, the velocity of this point should be considered a negative quantity in Eq. 19–20.

During impact the columns of many highway signs are intended to break out of their supports and easily collapse at their joints. This is shown by the slotted connections at their base and the breaks at the column's midsection.

EXAMPLE 19.8

The 10-lb slender rod is suspended from the pin at *A*, Fig. 19–12*a*. If a 2-lb ball *B* is thrown at the rod and strikes its center with a velocity of 30 ft/s, determine the angular velocity of the rod just after impact. The 30 ft/s, determine the angular velocoefficient of restitution is $e = 0.4$.

SOLUTION

Conservation of Angular Momentum. Consider the ball and rod as a system, Fig. 19–12*b*.Angular momentum is conserved about point *A* since the impulsive force between the rod and ball is *internal*. Also, the *weights* of the ball and rod are *nonimpulsive*. Noting the directions of the velocities of the ball and rod just after impact as shown on the kinematic diagram, Fig. 19–12*c*, we require

$$
(\zeta +)
$$
\n
$$
(H_A)_1 = (H_A)_2
$$
\n
$$
m_B(v_B)_1(1.5 \text{ ft}) = m_B(v_B)_2(1.5 \text{ ft}) + m_R(v_G)_2(1.5 \text{ ft}) + I_G \omega_2
$$
\n
$$
\left(\frac{2 \text{ lb}}{32.2 \text{ ft/s}^2}\right)(30 \text{ ft/s})(1.5 \text{ ft}) = \left(\frac{2 \text{ lb}}{32.2 \text{ ft/s}^2}\right)(v_B)_2(1.5 \text{ ft}) + \left[\frac{1}{12}\left(\frac{10 \text{ lb}}{32.2 \text{ ft/s}^2}\right)(3 \text{ ft})^2\right]\omega_2
$$

Since $(v_G)_2 = 1.5\omega_2$ then

$$
2.795 = 0.09317(v_B)_2 + 0.9317\omega_2 \tag{1}
$$

Coefficient of Restitution. With reference to Fig. 19–12*c*, we have

$$
\begin{aligned} \text{(1)} \quad &= \frac{(v_G)_2 - (v_B)_2}{(v_B)_1 - (v_G)_1} \qquad 0.4 = \frac{(1.5 \text{ ft})\omega_2 - (v_B)_2}{30 \text{ ft/s} - 0} \\ \text{12.0} &= 1.5\omega_2 - (v_B)_2 \end{aligned}
$$

Solving,

$$
(v_B)_2 = -6.52 \text{ ft/s} = 6.52 \text{ ft/s} \leftarrow
$$

$$
\omega_2 = 3.65 \text{ rad/s} \leftarrow
$$
Ans.

Fig. 19–12

PROBLEMS

•19–33. The 75-kg gymnast lets go of the horizontal bar in a fully stretched position *A*, rotating with an angular a fully stretched position A, rotating with an angular velocity of $\omega_A = 3$ rad/s. Estimate his angular velocity when he assumes a tuaked position B. Assume the argument when he assumes a tucked position *B*. Assume the gymnast at positions *A* and *B* as a uniform slender rod and a uniform circular disk, respectively.

Prob. 19–33

19–34. A 75-kg man stands on the turntable *A* and rotates a 6-kg slender rod over his head. If the angular velocity of the 6-kg slender rod over his head. If the angular velocity of the rod is $\omega_r = 5$ rad/s measured relative to the man and the turntable is observed to be rotating in the opposite direction turntable is observed to be rotating in the opposite direction turntable is observed to be rotating in the opposite direction
with an angular velocity of $\omega_t = 3$ rad/s, determine the radius
of guaration of the man about the govie Consider the turntable of gyration of the man about the *z* axis. Consider the turntable as a thin circular disk of 300-mm radius and 5-kg mass.

19–35. A horizontal circular platform has a weight of 300 lb and a radius of gyration $k_z = 8$ ft about the *z* axis passing through its center *O*. The platform is free to rotate about the *z* axis and is initially at rest. A man having a weight of 150 lb begins to run along the edge in a circular path of radius 10 ft. If he maintains a speed of 4 ft/s relative to the platform, determine the angular velocity of the platform. Neglect friction.

Prob. 19–35

***19–36.** A horizontal circular platform has a weight of **300 lb and a radius of gyration** $k_z = 8$ **ft about the** *z* **axis nassing through its center O. The platform is free to rotate** passing through its center *O*. The platform is free to rotate about the *z* axis and is initially at rest. A man having a weight of 150 lb throws a 15-lb block off the edge of the platform with a horizontal velocity of 5 ft/s, *measured relative to the platform*. Determine the angular velocity of the platform if the block is thrown (a) tangent to the platform, along the $+t$ axis, and (b) outward along a radial platform, along the $+t$ axis, and (b) outwar
line, or $+n$ axis. Neglect the size of the man.

•19–37. The man sits on the swivel chair holding two 5-lb weights with his arms outstretched. If he is rotating at 3 rad/s in this position, determine his angular velocity when the weights are drawn in and held 0.3 ft from the axis of rotation. Assume he weighs 160 lb and has a radius of rotation. Assume he weighs 160 lb and has a radius of gyration $k_z = 0.55$ ft about the *z* axis. Neglect the mass of his arms and the size of the weights for the calculation arms and the size of the weights for the calculation.

CONCEPTUAL PROBLEMS

P19–1. The soil compactor moves forward at constant velocity by supplying power to the rear wheels. Use appropriate numerical data for the wheel, roller, and body and calculate the angular momentum of this system about point A at the ground, point B on the rear axle, and point G , the center of gravity for the system the center of gravity for the system.

P19–1

P19–2. The swing bridge opens and closes by turning 90° using a motor located under the center of the deck at A that applies a torque M to the bridge. If the bridge was supported at its end B , would the same torque open the bridge at the same time, or would it open slower or faster? Explain your answer using numerical values and an impulse and momentum analysis. Also, what are the benefits of making the bridge have the variable depth as shown?

P19–3. Why is it necessary to have the tail blade B on the helicopter that spins perpendicular to the spin of the main blade A ? Explain your answer using numerical values and a n impulse and momentum analysis an impulse and momentum analysis.

P19–3

P19–4. The amusement park ride consists of two gondolas A and B , and counterweights C and D that swing in opposite directions. Using realistic dimensions and mass, calculate the angular momentum of this system for any angular position of the gondolas. Explain through analysis why it is a good idea to design this system to have counterweights with each gondola.

P19–2

CHAPTER REVIEW

Linear and Angular Momentum

The linear and angular momentum of a rigid body can be referenced to its mass center *G*.

If the angular momentum is to be determined about an axis other than the one passing through the mass center, then the angular momentum is determined by summing vector \mathbf{H}_G and the moment of vector **L** about this axis vector \bf{L} about this axis.

Principle of Impulse and Momentum

The principles of linear and angular impulse and momentum are used to solve problems that involve force, velocity, and time. Before applying these equations, it is important to establish the *x, y, z* inertial coordinate system. The free-body diagram for the body should also be drawn in order to account for all of the forces and couple moments that produce impulses on the body.

$$
m(v_{Gx})_1 + \sum \int_{t_1}^{t_2} F_x dt = m(v_{Gx})_2
$$

$$
m(v_{Gy})_1 + \sum \int_{t_1}^{t_2} F_y dt = m(v_{Gy})_2
$$

$$
I_G \omega_1 + \sum \int_{t_1}^{t_2} M_G dt = I_G \omega_2
$$

Conservation of Momentum

Provided the sum of the linear impulses acting on a system of connected rigid bodies is zero in a particular direction, then the linear momentum for the system is conserved in this direction. Conservation of angular momentum occurs if the impulses pass through an axis or are parallel to it. Momentum is also conserved if the external forces are small and thereby create nonimpulsive forces on the system. A free-body diagram should accompany any application in order to classify the forces as impulsive or nonimpulsive and to determine an axis about which the angular momentum may be conserved.

$$
\left(\sum_{\text{momentum}}^{\text{syst. linear}}\right)_1 = \left(\sum_{\text{momentum}}^{\text{syst. linear}}\right)_2
$$

$$
\left(\sum_{\text{momentum}}^{\text{syst. angular}}\right)_{O1} = \left(\sum_{\text{momentum}}^{\text{syst. angular}}\right)_{O2}
$$

Eccentric Impact

If the line of impact does not coincide with the line connecting the mass centers of two colliding bodies, then eccentric impact will occur. If the motion of the bodies just after the impact is to be determined, then it is necessary to consider a conservation of momentum equation for the system and use the coefficient of restitution equation.

$$
e = \frac{(v_B)_2 - (v_A)_2}{(v_A)_1 - (v_B)_1}
$$

2 REVIEW

[Planar Kinematics](#page-15-0) and Kinetics of a Rigid Body

Having presented the various topics in planar kinematics and kinetics in Chapters 16 through 19, we will now summarize these principles and provide an opportunity for applying them to the solution of various types of problems.

Kinematics. Here we are interested in studying the geometry of motion, without concern for the forces which cause the motion. Before solving a planar kinematics problem, it is *first* necessary to *classify the motion* as being either rectilinear or curvilinear translation, rotation about a fixed axis, or general plane motion. In particular, problems involving general plane motion can be solved either with reference to a fixed axis (absolute motion analysis) or using translating or rotating frames of reference (relative motion analysis). The choice generally depends upon the type of constraints and the problem's geometry. In all cases, application of the necessary equations can be clarified by drawing a kinematic diagram. Remember that the *velocity* of a point is always *tangent* to its path of motion, and the *acceleration* of a point can have *components* in the $n-t$ directions when the path is *curved*.

Translation. When the body moves with rectilinear or curvilinear translation, *all* the points on the body have the *same motion.*

$$
\mathbf{v}_B = \mathbf{v}_A \qquad \mathbf{a}_B = \mathbf{a}_A
$$

Rotation About a Fixed Axis. Angular Motion. *Variable Angular Acceleration.* Provided a mathematical relationship is given between *any two* of the *four* variables θ , ω , α , and *t*, then a *third* given between *any two* of the *four* variables θ , ω , α , and *t*, then a *third* variable can be determined by solving one of the following equations which relate all three variables.

$$
\omega = \frac{d\theta}{dt} \qquad \alpha = \frac{d\omega}{dt} \qquad \alpha \, d\theta = \omega \, d\omega
$$

Constant Angular Acceleration. The following equations apply when it is *absolutely certain* that the angular acceleration is constant.

 $\theta = \theta_0 + \omega_0 t + \frac{1}{2} \alpha_c t^2$ $\omega = \omega_0 + \alpha_c t \quad \omega^2 = \omega_0^2 + 2\alpha_c(\theta - \theta_0)$

Motion of Point P. Once ω and α have been determined, then the circular motion of point P can be specified using the following scalar or vector equations.

$$
v = \omega r
$$

\n
$$
v = \omega \times r
$$

\n
$$
a_t = \alpha r
$$

$$
a_n = \omega^2 r
$$

\n
$$
a = \alpha \times r - \omega^2 r
$$

General Plane Motion—Relative-Motion Analysis. Recall that when *translating axes* are placed at the "base point" A, the *relative motion* of point B with respect to \overrightarrow{A} is simply *circular motion of B about A*. The following equations apply to two points \overrightarrow{A} and \overrightarrow{B} located on the *same* rigid body.

$$
\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A} = \mathbf{v}_A + \boldsymbol{\omega} \times \mathbf{r}_{B/A}
$$

$$
\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A} = \mathbf{a}_A + \boldsymbol{\alpha} \times \mathbf{r}_{B/A} - \omega^2 \mathbf{r}_{B/A}
$$

Rotating and translating axes are often used to analyze the motion of rigid bodies which are connected together by collars or slider blocks.

$$
\mathbf{v}_B = \mathbf{v}_A + \mathbf{\Omega} \times \mathbf{r}_{B/A} + (\mathbf{v}_{B/A})_{xyz}
$$

$$
\mathbf{a}_B = \mathbf{a}_A + \dot{\mathbf{\Omega}} \times \mathbf{r}_{B/A} + \mathbf{\Omega} \times (\mathbf{\Omega} \times \mathbf{r}_{B/A}) + 2\mathbf{\Omega} \times (\mathbf{v}_{B/A})_{xyz} + (\mathbf{a}_{B/A})_{xyz}
$$

Kinetics. To analyze the forces which cause the motion we must use the principles of kinetics. When applying the necessary equations, it is important to first establish the inertial coordinate system and define the positive directions of the axes.The *directions* should be the *same* as those selected when writing any equations of kinematics if *simultaneous solution* of equations becomes necessary.

Equations of Motion. These equations are used to determine accelerated motions or forces causing the motion. If used to determine position, velocity, or time of motion, then kinematics will have to be considered to complete the solution. Before applying the equations of motion, *always draw a free-body diagram* in order to identify all the forces

acting on the body.Also, establish the directions of the acceleration of the mass center and the angular acceleration of the body. (A kinetic diagram may also be drawn in order to represent ma_G and $I_G\alpha$ graphically. This diagram is particularly convenient for resolving ma_G into components diagram is particularly convenient for resolving $m\mathbf{a}_G$ into components
and for identifying the terms in the moment sum $\Sigma(M, \cdot)$ and for identifying the terms in the moment sum $\Sigma(\mathcal{M}_k)_P$.
The three equations of motion are

The three equations of motion are

$$
\Sigma F_x = m(a_G)_x
$$

\n
$$
\Sigma F_y = m(a_G)_y
$$

\n
$$
\Sigma M_G = I_G \alpha \quad \text{or} \quad \Sigma M_P = \Sigma (M_k)_P
$$

In particular, if the body is *rotating about a fixed axis,* moments may also be summed about point O on the axis, in which case

$$
\Sigma M_O = \Sigma (\mathcal{M}_k)_O = I_O \alpha
$$

Work and Energy. *The equation of work and energy is used to solve problems involving force, velocity, and displacement.* Before applying this equation, *always draw a free-body diagram* of the body in order to identify the forces which do work. Recall that the kinetic energy of the body is due to translational motion of the mass center, \mathbf{v}_G , and rotational motion of the body Ω motion of the body, $\boldsymbol{\omega}$.

$$
T_1 + \Sigma U_{1-2} = T_2
$$

where

$$
T = \frac{1}{2} m v_G^2 + \frac{1}{2} I_G \omega^2
$$

\n
$$
U_F = \int F \cos \theta \, ds \qquad \text{(variable force)}
$$

\n
$$
U_{F_c} = F_c \cos \theta (s_2 - s_1) \qquad \text{(constant force)}
$$

\n
$$
U_W = -W \Delta y \qquad \text{(weight)}
$$

\n
$$
U_s = -(\frac{1}{2} k s_2^2 - \frac{1}{2} k s_1^2) \qquad \text{(spring)}
$$

\n
$$
U_M = M\theta \qquad \text{(constant couple moment)}
$$

If the forces acting on the body are *conservative forces,* then apply the *conservation of energy equation.* This equation is easier to use than the equation of work and energy, since it applies only at *two points* on the path and *does not* require calculation of the work done by a force as the body moves along the path.

$$
T_1 + V_1 = T_2 + V_2
$$

where $V = V_g + V_e$ and

$$
V_g = Wy
$$
 (gravitational potential energy)

$$
V_e = \frac{1}{2}ks^2
$$
 (elastic potential energy)

Impulse and Momentum. *The principles of linear and angular impulse and momentum are used to solve problems involving force, velocity, and time.* Before applying the equations, *draw a free-body diagram* in order to identify all the forces which cause linear and angular impulses on the body. Also, establish the directions of the velocity of the mass center and the angular velocity of the body just before and just after the impulses are applied. (As an alternative procedure, the impulse and momentum diagrams may accompany the solution in order to graphically account for the terms in the equations. These diagrams are particularly advantageous when computing the angular impulses and angular momenta about a point other than the body's mass center.)

$$
m(\mathbf{v}_G)_1 + \Sigma \int \mathbf{F} dt = m(\mathbf{v}_G)_2
$$

$$
(\mathbf{H}_G)_1 + \Sigma \int \mathbf{M}_G dt = (\mathbf{H}_G)_2
$$

or

$$
(\mathbf{H}_O)_1 + \Sigma \int \mathbf{M}_O dt = (\mathbf{H}_O)_2
$$

Conservation of Momentum. If nonimpulsive forces or no impulsive forces act on the body in a particular direction, or if the motions of several bodies are involved in the problem, then consider applying the conservation of linear or angular momentum for the solution. Investigation of the free-body diagram (or the impulse diagram) will aid in determining the directions along which the impulsive forces are zero, or axes about which the impulsive forces create zero angular impulse. For these cases,

$$
m(\mathbf{v}_G)_1 = m(\mathbf{v}_G)_2
$$

$$
(\mathbf{H}_O)_1 = (\mathbf{H}_O)_2
$$

The problems that follow involve application of all the above concepts. They are presented in *random order* so that practice may be gained at identifying the various types of problems and developing the skills necessary for their solution.

The three-dimensional motion of this industrial robot must be accurately specified.

Three-Dimensional Kinematics of a Rigid Body

[CHAPTER OBJECTIVES](#page-15-0)

- To analyze the kinematics of a body subjected to rotation about a fixed point and general plane motion.
- To provide a relative-motion analysis of a rigid body using translating and rotating axes.

20.1 [Rotation About a Fixed Point](#page-15-0)

When a rigid body rotates about a fixed point, the distance *r* from the point to a particle located on the body is the *same* for *any position* of the body. Thus, the path of motion for the particle lies on the *surface of a sphere* having a radius *r* and centered at the fixed point. Since motion along this path occurs only from a series of rotations made during a finite time interval, we will first develop a familiarity with some of the properties of rotational displacements.

The boom can rotate up and down, and because it is hinged at a point on the vertical axis about which it turns, it is subjected to rotation about a fixed point.

[20](#page-15-0)

Euler's Theorem. Euler's theorem states that two "component" rotations about different axes passing through a point are equivalent to a single resultant rotation about an axis passing through the point. If more than two rotations are applied, they can be combined into pairs, and each pair can be further reduced and combined into one rotation.

Finite Rotations. If component rotations used in Euler's theorem are *finite*, it is important that the *order* in which they are applied be are *finite*, it is important that the *order* in which they are applied be maintained. To show this, consider the two finite rotations $\theta_1 + \theta_2$ applied to the block in Fig. 20–1*a*. Each rotation has a magnitude of 90° and a direction defined by the right-hand rule, as indicated by the arrow. The final position of the block is shown at the right. When these two The final position of the block is shown at the right. When these two rotations are applied in the order $\theta_2 + \theta_1$, as shown in Fig. 20–1*b*, the final position of the block is *not* the same as it is in Fig. 20–1*a*. Because *finite rotations* do not obey the commutative law of addition *finite rotations* do not obey the commutative law of addition $(\theta_1 + \theta_2 \neq \theta_2 + \theta_1)$, they cannot be classified as vectors. If smaller, yet finite, rotations had been used to illustrate this point, e.g., 10° instead of 90°, the *final position* of the block after each combination of rotations would also be different; however, in this case, the difference is only a small amount.

Infinitesimal Rotations. When defining the angular motions of a body subjected to three-dimensional motion, only rotations which are *infinitesimally small* will be considered. *Such rotations can be classified as vectors, since they can be added vectorially in any manner*.To show this, for purposes of simplicity let us consider the rigid body itself to be a sphere which is allowed to rotate about its central fixed point *O*, Fig. 20–2*a*. If we which is allowed to rotate about its central fixed point O, Fig. 20–2*a*. If we
impose two infinitesimal rotations $d\theta_1 + d\theta_2$ on the body, it is seen that
point P moves along the path $d\theta_1 \times r + d\theta_2 \times r$ and ends up at impose two infinitesimal rotations $d\theta_1 + d\theta_2$ on the body, it is seen that
point *P* moves along the path $d\theta_1 \times \mathbf{r} + d\theta_2 \times \mathbf{r}$ and ends up at *P'*. Had
the two successive rotations occurred in the order $d\theta_2$ point P moves along the path $d\theta_1 \times \mathbf{r} + d\theta_2 \times \mathbf{r}$ and ends up at P'. Had
the two successive rotations occurred in the order $d\theta_2 + d\theta_1$, then the
resultant displacements of P would have been $d\theta_2 \times \mathbf{r} + d\theta_$ the two successive rotations occurred in the order $d\theta_2 + d\theta_1$, then the resultant displacements of *P* would have been $d\theta_2 \times \mathbf{r} + d\theta_1 \times \mathbf{r}$. Since the vector cross product obeys the distributive law by compari the vector cross product obeys the distributive law, by comparison the vector cross product obeys the distributive law, by comparison $(d\theta_1 + d\theta_2) \times \mathbf{r} = (d\theta_2 + d\theta_1) \times \mathbf{r}$. Here infinitesimal rotations $d\theta$ are vectors since these quantities have both a magnitude and direction are vectors, since these quantities have both a magnitude and direction for which the order of (vector) addition is not important, i.e., for which the order of (vector) addition is not important, i.e.,
 $d\theta_1 + d\theta_2 = d\theta_2 + d\theta_1$. As a result, as shown in Fig. 20–2*a*, the two

"component" rotations $d\theta_1$ and $d\theta_2$ are equivalent to a single resultant "component" rotations $d\theta_1$ and $d\theta_2$ are equivalent to a single resultant rotation $d\theta = d\theta_1 + d\theta_2$ a consequence of Euler's theorem "component" rotations $d\theta_1$ and $d\theta_2$ are equivalent to a sing rotation $d\theta = d\theta_1 + d\theta_2$, a consequence of Euler's theorem.

Angular Velocity. If the body is subjected to an angular rotation $d\theta$ about a fixed point, the angular velocity of the body is defined by the time derivative time derivative,

 $\omega = \dot{\theta}$

 $(20-1)$

 ω

The line specifying the direction of ω , which is collinear with $d\theta$, is
referred to as the instantaneous axis of rotation. Fig. 20, 2b, In general referred to as the *instantaneous axis of rotation*, Fig. 20–2*b*. In general, this axis changes direction during each instant of time. Since $d\theta$ is a vector quantity so too is α and it follows from vector addition that if the vector quantity, so too is $\boldsymbol{\omega},$ and it follows from vector addition that if the vector quantity, so too is $\boldsymbol{\omega}$, and it follows from vector addition that if the body is subjected to two component angular motions, $\boldsymbol{\omega}_1 = \dot{\boldsymbol{\theta}}_1$ and body is subjected to two component angular motions $\omega_2 = \dot{\theta}_2$, the resultant angular velocity is $\omega = \omega_1 + \omega_2$. # $\boldsymbol{\theta}_2$, # $\boldsymbol{\theta}_1$

Angular Acceleration. The body's angular acceleration is determined from the time derivative of its angular velocity, i.e.,

> $(20-2)$ $\alpha = \dot{\omega}$

For motion about a fixed point, α must account for a change in *both* the magnitude and direction of $\boldsymbol{\omega},$ so that, in general, $\boldsymbol{\alpha}$ is not directed along the instantaneous axis of rotation, Fig. 20–3.

As the direction of the instantaneous axis of rotation (or the line of action of ω) changes in space, the locus of the axis generates a fixed *space cone*, Fig. 20–4. If the change in the direction of this axis is viewed with respect to the rotating body, the locus of the axis generates a *body cone*.

$$
\overset{\alpha}{\rightarrow}
$$

Instantaneous axis of rotation

Fig. 20–3

P

r

O

Fig. 20–4

(a)

Fig. 20–5

At any given instant, these cones meet along the instantaneous axis of rotation, and when the body is in motion, the body cone appears to roll either on the inside or the outside surface of the fixed space cone. Provided the paths defined by the open ends of the cones are described by the head of the $\boldsymbol{\omega}$ vector, then $\boldsymbol{\alpha}$ must act tangent to these paths at any given instant, since the time rate of change of $\boldsymbol{\omega}$ is equal to $\boldsymbol{\alpha}$. Fig. 20–4.

To illustrate this concept, consider the disk in Fig. 20–5*a* that spins about the rod at ω_s , while the rod and disk precess about the vertical axis at ω_p .
The resultant appular velocity of the disk is therefore $\omega = \omega + \omega$. the rod at ω_s , while the rod and disk precess about the vertical axis at ω_p .
The resultant angular velocity of the disk is therefore $\omega = \omega_s + \omega_p$.
Since both point *Q* and the contact point *P* have zero velocity th Since both point *O* and the contact point *P* have zero velocity, then both $\boldsymbol{\omega}$ and the instantaneous axis of rotation are along *OP*.Therefore, as the disk rotates, this axis appears to move along the surface of the fixed space cone shown in Fig. 20–5*b*. If the axis is observed from the rotating disk, the axis then appears to move on the surface of the body cone. At any instant, though, these two cones meet each other along the axis OP . If ω has a constant magnitude then α indicates only the change in the direction of ω . constant magnitude, then α indicates only the change in the direction of ω , which is tangent to the cones at the tip of ω as shown in Fig. 20–5*b*.

Velocity. Once $\boldsymbol{\omega}$ is specified, the velocity of any point on a body rotating about a fixed point can be determined using the same methods as for a body rotating about a fixed axis. Hence, by the cross product,

$$
\mathbf{v} = \boldsymbol{\omega} \times \mathbf{r} \tag{20-3}
$$

Here **r** defines the position of the point measured from the fixed point *O*, Fig. 20–3.

Acceleration. If ω and α are known at a given instant, the acceleration of a point can be obtained from the time derivative of Eq. 20–3, which yields

$$
\mathbf{a} = \boldsymbol{\alpha} \times \mathbf{r} + \boldsymbol{\omega} \times (\boldsymbol{\omega} \times \mathbf{r})
$$
 (20-4)

*20.2 The Time Derivative of a Vector [Measured from Either a Fixed or](#page-15-0) Translating-Rotating System

Instantaneous axis of rotation

In many types of problems involving the motion of a body about a fixed point, the angular velocity $\boldsymbol{\omega}$ is specified in terms of its components. Then, if the angular acceleration α of such a body is to be determined, it is often easier to compute the time derivative of $\boldsymbol{\omega}$ using a coordinate system that has a *rotation* defined by one or more of the components of $\boldsymbol{\omega}$. For has a *rotation* defined by one or more of the components of $\boldsymbol{\omega}$. For example, in the case of the disk in Fig. 20–5*a*, where $\boldsymbol{\omega} = \boldsymbol{\omega}_s + \boldsymbol{\omega}_p$, the *x*, *y, z* axes can be given an angular velocity of ω_p . For this reason, and for other uses later an equation will now be derived which relates the time other uses later, an equation will now be derived, which relates the time derivative of any vector **A** defined from a translating-rotating reference to its time derivative defined from a fixed reference.

Consider the *x, y, z* axes of the moving frame of reference to be ærotating with an angular velocity $\boldsymbol{\Omega},$ which is measured from the fixed $X_{\!\star}$ *Y, Z* axes, Fig. 20–6*a*. In the following discussion, it will be convenient to express vector **A** in terms of its **i**, **j**, **k** components, which define the directions of the moving axes. Hence,

$$
\mathbf{A} = A_x \mathbf{i} + A_y \mathbf{j} + A_z \mathbf{k}
$$

In general, the time derivative of **A** must account for the change in both its magnitude and direction. However, if this derivative is taken *with respect to the moving frame of reference*, only the change in the magnitudes of the components of **A** must be accounted for, since the directions of the components do not change with respect to the moving reference. Hence,

$$
(\dot{\mathbf{A}})_{xyz} = \dot{A}_x \mathbf{i} + \dot{A}_y \mathbf{j} + \dot{A}_z \mathbf{k}
$$
 (20–5)

When the time derivative of **A** is taken *with respect to the fixed frame of reference*, the *directions* of **i**, **j**, and **k** change only on account of the æ*rotation* Ω of the axes and not their translation. Hence, in general, # \mathbf{r} #:
; $\mathbf i$ ##

$$
\dot{\mathbf{A}} = \dot{A}_x \mathbf{i} + \dot{A}_y \mathbf{j} + \dot{A}_z \mathbf{k} + A_x \mathbf{i} + A_y \mathbf{j} + A_z \mathbf{k}
$$

The time derivatives of the unit vectors will now be considered. For example, $\mathbf{i} = d\mathbf{i}/dt$ represents only the change in the *direction* of **i** with respect to time since **i** always has a magnitude of 1 unit. As shown in respect to time, since **i** always has a magnitude of 1 unit. As shown in Fig. 20–6*b*, the change, *d***i**, is *tangent to the path* described by the æFig. $20-6b$, the change, at, is *tangent to the path* described by the arrowhead of **i** as **i** swings due to the rotation Ω . Accounting for both the magnitude and direction of d **i**, we can therefore define **i** using the cross product, $\mathbf{i} = \mathbf{\Omega} \times \mathbf{i}$. In general, then
 $\mathbf{i} = \mathbf{\Omega} \times \mathbf{i}$ $\mathbf{j} = \mathbf{\Omega}$ =æ*#

$$
\mathbf{i} \times \mathbf{i}
$$
. In general, then
\n $\mathbf{i} = \mathbf{\Omega} \times \mathbf{i}$ $\mathbf{j} = \mathbf{\Omega} \times \mathbf{j}$ $\mathbf{k} = \mathbf{\Omega} \times \mathbf{k}$

These formulations were also developed in Sec. 16.8, regarding planar motion of the axes. Substituting these results into the above equation and using Eq. 20–5 yields

$$
\dot{\mathbf{A}} = (\dot{\mathbf{A}})_{xyz} + \mathbf{\Omega} \times \mathbf{A}
$$
 (20–6)

This result is important, and will be used throughout Sec. 20.4 and Chapter 21. It states that the time derivative of *any vector* **A** as observed from the fixed *X, Y, Z* frame of reference is equal to the time rate of change of **A** as observed from the *x*, *y*, *z* translating-rotating frame of reference Eq. 20–5 plus $\Omega \times$ **A** the change of **A** caused by the rotation reference, Eq. 20–5, plus $\mathbf{\Omega} \times \mathbf{A}$, the change of \mathbf{A} caused by the rotation of the *x, y, z* frame. As a result, Eq. 20–6 should always be used whenever æ Ω produces a change in the direction of **A** as seen from the *X*, *Y*, *Z* reference. If this change does not occur, i.e., $\Omega = 0$, then $A = (A \cdot A)$ and so the time rate of change of **A** as observed from both coordinate systems will be the *same*. #|
|
| as seen from the *X*, *Y*, *Z*
 $\Omega = 0$, then $\dot{\mathbf{A}} = (\dot{\mathbf{A}})_{xyz}$,

EXAMPLE 20.1

The disk shown in Fig. 20–7 spins about its axle with a constant The disk shown in Fig. 20–7 spins about its axle with a constant
angular velocity $\omega_s = 3$ rad/s, while the horizontal platform on which
the disk is mounted rotates about the vertical axis at a constant rate the disk is mounted rotates about the vertical axis at a constant rate the disk is mounted rotates about the vertical axis at a constant rate
 $\omega_p = 1$ rad/s. Determine the angular acceleration of the disk and the

velocity and acceleration of point A on the disk when it is in the velocity and acceleration of point *A* on the disk when it is in the position shown.

SOLUTION

Point *O* represents a fixed point of rotation for the disk if one considers a hypothetical extension of the disk to this point. To determine the velocity and acceleration of point *A*, it is first necessary to determine the angular velocity $\boldsymbol{\omega}$ and angular acceleration $\boldsymbol{\alpha}$ of the disk, since these vectors are used in Eqs. 20–3 and 20–4.

Angular Velocity. The angular velocity, which is measured from *X, Y, Z*, is simply the vector addition of its two component motions. Thus,

$$
\boldsymbol{\omega} = \boldsymbol{\omega}_s + \boldsymbol{\omega}_p = \{3\mathbf{j} - 1\mathbf{k}\} \text{ rad/s}
$$

Angular Acceleration. Since the magnitude of $\boldsymbol{\omega}$ is constant, only a change in its direction, as seen from the fixed reference, creates the angular acceleration α of the disk. One way to obtain α is to compute the time derivative of *each of the two components* of ω using Eq. 20–6. At the instant shown in Fig. 20–7, imagine the fixed *X, Y, Z* and a rotating *x, y, z* frame to be coincident. If the rotating *x, y, z* frame is rotating x, y, z frame to be coincident. If the rotating x, y, z frame is
chosen to have an angular velocity of $\Omega = \omega_p = \{-1\mathbf{k}\}\$ rad/s, then ω_s will *always* be directed along the *y* (not *Y*) axis, and the time rate
of change of ω , as seen from *x*, *y*, z is zero; i.e. $(\dot{\omega})$ = 0 (the ω_s will *always* be directed along the y (not Y) axis, and the time rate
of change of ω_s as seen from x, y, z is zero; i.e., $(\dot{\omega}_s)_{xyz} = 0$ (the
magnitude and direction of ω_s is constant). Thus magnitude and direction of $\boldsymbol{\omega}_s$ is constant). Thus, #

$$
\dot{\boldsymbol{\omega}}_s = (\dot{\boldsymbol{\omega}}_s)_{xyz} + \boldsymbol{\omega}_p \times \boldsymbol{\omega}_s = 0 + (-1\mathbf{k}) \times (3\mathbf{j}) = \{3\mathbf{i}\} \text{ rad/s}^2
$$

By the same choice of axes rotation, $\Omega = \omega_p$, or even with $\Omega = 0$, the time derivative $\langle \phi \rangle = 0$, eines ω , here a constant meanitude the time derivative $(\dot{\omega}_p)_{xyz} = 0$, since ω_p has a constant magnitude and direction with respect to *x, y, z*. Hence, axes rota
 $_p$ _{xyz} = **0**,

$$
\dot{\boldsymbol{\omega}}_p = (\dot{\boldsymbol{\omega}}_p)_{xyz} + \boldsymbol{\omega}_p \times \boldsymbol{\omega}_p = \boldsymbol{0} + \boldsymbol{0} = \boldsymbol{0}
$$

The angular acceleration of the disk is therefore

$$
\boldsymbol{\alpha} = \dot{\boldsymbol{\omega}} = \dot{\boldsymbol{\omega}}_s + \dot{\boldsymbol{\omega}}_p = \{3\mathbf{i}\} \text{ rad/s}^2
$$
 Ans.

Velocity and Acceleration. Since $\boldsymbol{\omega}$ and $\boldsymbol{\alpha}$ have now been determined, the velocity and acceleration of point *A* can be found determined, the velocity and acceleration of point A can be found
using Eqs. 20–3 and 20–4. Realizing that $\mathbf{r}_A = \{1\mathbf{j} + 0.25\mathbf{k}\}\mathbf{m}$,
Fig. 20–7 we have Fig. 20–7, we have

$$
\mathbf{v}_A = \boldsymbol{\omega} \times \mathbf{r}_A = (3\mathbf{j} - 1\mathbf{k}) \times (1\mathbf{j} + 0.25\mathbf{k}) = \{1.75\mathbf{i}\} \text{ m/s} \qquad \text{Ans.}
$$

\n
$$
\mathbf{a}_A = \boldsymbol{\alpha} \times \mathbf{r}_A + \boldsymbol{\omega} \times (\boldsymbol{\omega} \times \mathbf{r}_A)
$$

\n
$$
= (3\mathbf{i}) \times (1\mathbf{j} + 0.25\mathbf{k}) + (3\mathbf{j} - 1\mathbf{k}) \times [(3\mathbf{j} - 1\mathbf{k}) \times (1\mathbf{j} + 0.25\mathbf{k})]
$$

\n
$$
= \{-2.50\mathbf{j} - 2.25\mathbf{k}\} \text{ m/s}^2 \qquad \text{Ans.}
$$

$EXAMPLE$ 20.2

At the instant $\theta = 60^{\circ}$, the gyrotop in Fig. 20–8 has three components of angular motion directed as shown and having magnitudes defined as:

notion directed as shown and having magnitudes define
 Spin: $\omega_s = 10 \text{ rad/s}$, increasing at the rate of 6 rad/s²

Nutation: $\omega_n = 3$ rad/s, increasing at the rate of 2 rad/s²

Precession: $\omega_p = 5$ rad/s, increasing at the rate of 4 rad/s²

Determine the angular velocity and angular acceleration of the top.

SOLUTION

Angular Velocity. The top rotates about the fixed point *O*. If the fixed and rotating frames are coincident at the instant shown, then the angular velocity can be expressed in terms of **i**, **j**, **k** components, with reference to the *x, y, z* frame; i.e.,

Ans. ω_n **i** + ω_s sin ω **j** + $(\omega_p + \omega_s \cos \theta)$ **k**
= -3**i** + 10 sin 60°**j** + (5 + 10 cos 60°)**k** $= \{-3\mathbf{i} + 8.66\mathbf{j} + 10\mathbf{k}\}\text{ rad/s}$ $\boldsymbol{\omega} = -\omega_n \mathbf{i} + \omega_s \sin \theta \mathbf{j} + (\omega_p + \omega_s \cos \theta) \mathbf{k}$

Angular Acceleration. As in the solution of Example 20.1, the angular acceleration α will be determined by investigating separately the time rate of change of *each of the angular velocity components* as æ*Y*, *y* observed from the fixed *X*, *Y*, *Z* reference. We will choose an Ω for the x, y, z reference so that the component of $\boldsymbol{\omega}$ being considered is viewed as having a *constant direction* when observed from *x, y, z*.

Careful examination of the motion of the top reveals that ω_s
so a constant direction relative to x, y, z if these axes rotate at has a *constant direction* relative to *x*, *y*, *z* if these axes rotate at $\Omega = \omega_1 + \omega_2$. Thus $\Omega = \omega_n + \omega_n$. Thus,

$$
\hat{\boldsymbol{\omega}}_s = (\hat{\boldsymbol{\omega}}_s)_{xyz} + (\hat{\boldsymbol{\omega}}_n + \hat{\boldsymbol{\omega}}_p) \times \hat{\boldsymbol{\omega}}_s
$$

= (6 sin 60°**j** + 6 cos 60°**k**) + (-3**i** + 5**k**) × (10 sin 60°**j** + 10 cos 60°**k**)
= (-43.30**i** + 20.20**j** - 22.98**k**} rad/s²

Since ω_n always lies in the fixed *X–Y* plane, this vector has a *constant* direction if the motion is viewed from axes x, y, z having a rotation of *direction* if the motion is viewed from axes *x, y, z* having a rotation of $\Omega = \omega$ (not $\Omega = \omega + \omega$) Thus ection if the motion is view.
= $\boldsymbol{\omega}_p$ (not $\boldsymbol{\Omega} = \boldsymbol{\omega}_s + \boldsymbol{\omega}_p$).

$$
\Omega = \boldsymbol{\omega}_p \text{ (not } \Omega = \boldsymbol{\omega}_s + \boldsymbol{\omega}_p \text{). Thus,}
$$

$$
\dot{\boldsymbol{\omega}}_n = (\dot{\boldsymbol{\omega}}_n)_{xyz} + \boldsymbol{\omega}_p \times \boldsymbol{\omega}_n = -2\mathbf{i} + (5\mathbf{k}) \times (-3\mathbf{i}) = \{-2\mathbf{i} - 15\mathbf{j}\} \text{ rad/s}^2
$$

Finally, the component ω_p is *always directed* along the *Z* axis so that here it is not necessary to think of *x y z* as rotating i.e. $\Omega = 0$ here it is not necessary to think of x, y, z as rotating, i.e., $\Omega = 0$. Expressing the data in terms of the **i**, **j**, **k** components, we therefore have $\dot{\boldsymbol{\omega}}_p = (\dot{\boldsymbol{\omega}}_p)_{xyz} + \mathbf{0} \times \boldsymbol{\omega}_p = \{4\mathbf{k}\}\text{ rad/s}^2$.
. .
r

$$
\dot{\boldsymbol{\omega}}_p = (\dot{\boldsymbol{\omega}}_p)_{xyz} + \mathbf{0} \times \boldsymbol{\omega}_p = \{4\mathbf{k}\} \text{ rad/s}^2
$$

#

Thus, the angular acceleration of the top is
\n
$$
\boldsymbol{\alpha} = \dot{\boldsymbol{\omega}}_s + \dot{\boldsymbol{\omega}}_n + \dot{\boldsymbol{\omega}}_p = \{-45.3\mathbf{i} + 5.20\mathbf{j} - 19.0\mathbf{k}\} \text{ rad/s}^2 \quad Ans.
$$

20.3 [General Motion](#page-15-0)

Shown in Fig. 20–9 is a rigid body subjected to general motion in three dimensions for which the angular velocity is $\boldsymbol{\omega}$ and the angular acceleration is α . If point *A* has a known motion of v_A and a_A , the motion
of any other point *B* can be determined by using a relative motion analysis of any other point *B* can be determined by using a relative-motion analysis. In this section a *translating coordinate system* will be used to define the relative motion, and in the next section a reference that is both rotating and translating will be considered.

If the origin of the translating coordinate system *x*, *y*, *z* ($\Omega = 0$) is located at the "base point" *A*, then, at the instant shown, the motion of the body can be regarded as the sum of an instantaneous translation of the body having a motion of \mathbf{v}_A , and \mathbf{a}_A , and a rotation of the body about an instantaneous axis passing through point A. Since the body is rigid an instantaneous axis passing through point *A*. Since the body is rigid, the motion of point *B* measured by an observer located at *A* is therefore the same as *the rotation of the body about a fixed point*. This relative motion occurs about the instantaneous axis of rotation and is defined by motion occurs about the instantaneous axis of rotation and is defined by
 $\mathbf{v}_{B/A} = \boldsymbol{\omega} \times \mathbf{r}_{B/A}$, Eq. 20–3, and $\mathbf{a}_{B/A} = \boldsymbol{\alpha} \times \mathbf{r}_{B/A} + \boldsymbol{\omega} \times (\boldsymbol{\omega} \times \mathbf{r}_{B/A})$,

Eq. 20–4. For translating axes, the relative Eq. 20–4. For translating axes, the relative motions are related to Eq. 20–4. For translating axes, the relative motions are related to absolute motions by $\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$ and $\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$, Eqs. 16–15 and 16–17 so that the absolute velocity and acceleration of p and 16–17, so that the absolute velocity and acceleration of point *B* can be determined from the equations

 $\mathbf{v}_B = \mathbf{v}_A + \boldsymbol{\omega} \times \mathbf{r}_{B/A}$

 $(20 - 7)$

and

$$
\mathbf{a}_B = \mathbf{a}_A + \boldsymbol{\alpha} \times \mathbf{r}_{B/A} + \boldsymbol{\omega} \times (\boldsymbol{\omega} \times \mathbf{r}_{B/A})
$$
 (20–8)

These two equations are identical to those describing the general plane motion of a rigid body, Eqs. 16–16 and 16–18. However, difficulty in application arises for three-dimensional motion, because α now measures the change in *both* the magnitude and direction of ω .

EXAMPLE 20.3

If the collar at *C* in Fig. 20–10*a* moves towards *B* with a speed of 3 m/s, determine the velocity of the collar at *D* and the angular velocity of the bar at the instant shown. The bar is connected to the collars at its end points by ball-and-socket joints.

SOLUTION

Bar *CD* is subjected to general motion. Why? The velocity of point *D* on the bar can be related to the velocity of point *C* by the equation
 $\mathbf{v}_D = \mathbf{v}_C + \boldsymbol{\omega} \times \mathbf{r}_{D/C}$

$$
\mathbf{v}_D = \mathbf{v}_C + \boldsymbol{\omega} \times \mathbf{r}_{D/C}
$$

The fixed and translating frames of reference are assumed to coincide at the instant considered, Fig. 20–10*b*. We have

$$
\mathbf{v}_D = -v_D \mathbf{k} \qquad \mathbf{v}_C = \{3\} \text{ m/s}
$$

$$
\mathbf{r}_{D/C} = \{1\mathbf{i} + 2\mathbf{j} - 0.5\mathbf{k}\} \text{ m} \qquad \boldsymbol{\omega} = \omega_x \mathbf{i} + \omega_y \mathbf{j} + \omega_z \mathbf{k}
$$

Substituting into the above equation we get

$$
-v_D \mathbf{k} = 3\mathbf{j} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \omega_x & \omega_y & \omega_z \\ 1 & 2 & -0.5 \end{vmatrix}
$$

Expanding and equating the respective **i**, **j**, **k** components yields
 $-0.5\omega_y - 2\omega_z = 0$

$$
-0.5\omega_{v} - 2\omega_{z} = 0 \tag{1}
$$

$$
-0.5\omega_y - 2\omega_z = 0 \tag{1}
$$

$$
0.5\omega_x + 1\omega_z + 3 = 0 \tag{2}
$$

$$
2\omega_x - 1\omega_y + v_D = 0
$$
 (2)

$$
2\omega_x - 1\omega_y + v_D = 0
$$
 (3)

These equations contain four unknowns.* A fourth equation can be written if the direction of $\boldsymbol{\omega}$ is specified. In particular, any component of ω acting along the bar's axis has no effect on moving the collars. This is because the bar is *free to rotate* about its axis. Therefore, if $\boldsymbol{\omega}$ is specified as acting *perpendicular* to the axis of the bar, then $\boldsymbol{\omega}$ must have a unique magnitude to satisfy the above equations. Perpendicularity is guaranteed provided the dot product of $\boldsymbol{\omega}$ and $\mathbf{r}_{D/C}$
is zero (see Eq. C. 14 of Appendix C). Hence is zero (see Eq. C–14 of Appendix C). Hence,
 $\boldsymbol{\omega} \cdot \mathbf{r}_{D/C} = (\omega_x \mathbf{i} + \omega_y \mathbf{j} + \omega_z \mathbf{k}) \cdot (1\mathbf{i} + 2\mathbf{j} - 0.5\mathbf{k}) = 0$

$$
\boldsymbol{\omega} \cdot \mathbf{r}_{D/C} = (\omega_x \mathbf{i} + \omega_y \mathbf{j} + \omega_z \mathbf{k}) \cdot (1\mathbf{i} + 2\mathbf{j} - 0.5\mathbf{k}) = 0
$$

$$
1\omega_x + 2\omega_y - 0.5\omega_z = 0
$$
 (4)

Solving Eqs. 1 through 4 simultaneously yields

$$
\omega_x = -4.86 \text{ rad/s}
$$
 $\omega_y = 2.29 \text{ rad/s}$ $\omega_z = -0.571 \text{ rad/s}$ Ans.
\n $v_D = 12.0 \text{ m/s}$

$$
h_D = 12.0 \text{ m/s } \downarrow \qquad \qquad Ans.
$$

*Although this is the case, the magnitude of \mathbf{v}_D can be obtained. For example, solve α and α for α , and α in terms of α , and substitute into Eq. 3. It will be noted that Eqs. 1 and 2 for ω_y and ω_x in terms of ω_z and substitute into Eq. 3. It will be noted that ω , will cancel out, which will allow a solution for v_D .

Since there is no rotational component in the **u** direction, i.e., perpendicular to **n** and **j** component in the **u** direction, i.e., perpendicular to **n** and **j** where $\mathbf{u} = \mathbf{j} \times \mathbf{n}$, an additional equation for solution can component in the **u** direction, i.e., perpendicular to **n** and **j** where $\mathbf{u} = \mathbf{j} \times \mathbf{n}$, an additional equation for solution can be obtained from $\boldsymbol{\omega} \cdot \mathbf{u} = 0$. The vector **n** is in the same direction as $\mathbf{r}_{B/C} \times \mathbf{r}_{D/C}$.

Prob. 20–38

*20.4 [Relative-Motion Analysis Using](#page-15-0) Translating and Rotating Axes

The most general way to analyze the three-dimensional motion of a rigid body requires the use of *x, y, z* axes that both translate and rotate relative to a second frame *X,Y, Z*.This analysis also provides a means to determine the motions of two points *A* and *B* located on separate members of a mechanism, and the relative motion of one particle with respect to another when one or both particles are moving along *curved paths*.

As shown in Fig. 20–11, the locations of points *A* and *B* are specified relative to the *X, Y, Z* frame of reference by position vectors \mathbf{r}_A and \mathbf{r}_B .
The base point *A* represents the origin of the *x, y, z* coordinate system. The base point *A* represents the origin of the *x, y, z* coordinate system, which is translating and rotating with respect to *X, Y, Z*. At the instant considered, the velocity and acceleration of point *A* are v_A and a_A , and the angular velocity and angular acceleration of the x, y, z axes are **O** and the angular velocity and angular acceleration of the *x*, *y*, *z* axes are Ω and $\dot{\Omega} = d\Omega/dt$. All these vectors are *measured* with respect to the *X*, *Y*, *Z* frame, of reference, although they can be expressed in $\boldsymbol{\Omega}$ = $d\boldsymbol{\Omega}/dt$. All these vectors are *measured* with respect to the *X*, *Y*, *Z* frame of reference, although they can be expressed in Cartesian component form along either set of axes. .
.

Fig. 20–11

Position. If the position of "*B* with respect to *A*" is specified by the *relative-position vector* $\mathbf{r}_{B/A}$, Fig. 20–11, then, by vector addition,

$$
\mathbf{r}_B = \mathbf{r}_A + \mathbf{r}_{B/A} \tag{20-9}
$$

where

 \mathbf{r}_B = position of *B* \mathbf{r}_A = position of the origin *A* $\mathbf{r}_{B/A}$ = position of "*B* with respect to *A*"

Velocity. The velocity of point *B* measured from *X, Y, Z* can be determined by taking the time derivative of Eq. 20–9,

$$
\dot{\mathbf{r}}_B = \dot{\mathbf{r}}_A + \dot{\mathbf{r}}_{B/A}
$$

The first two terms represent \mathbf{v}_B and \mathbf{v}_A . The last term must be evaluated
by applying Eq. 20.6, since \mathbf{r}_A , is measured with respect to a retating by applying Eq. 20–6, since $\mathbf{r}_{B/A}$ is measured with respect to a rotating reference Hence reference. Hence,

$$
\dot{\mathbf{r}}_{B/A} = (\dot{\mathbf{r}}_{B/A})_{xyz} + \mathbf{\Omega} \times \mathbf{r}_{B/A} = (\mathbf{v}_{B/A})_{xyz} + \mathbf{\Omega} \times \mathbf{r}_{B/A} \hspace{0.2cm} (20-10)
$$

Therefore,

$$
\mathbf{v}_B = \mathbf{v}_A + \mathbf{\Omega} \times \mathbf{r}_{B/A} + (\mathbf{v}_{B/A})_{xyz}
$$
 (20–11)

where

 \mathbf{v}_B = velocity of *B*

- \mathbf{v}_A = velocity of the origin *A* of the *x*, *y*, *z* frame of reference
- $(v_{B/A})_{xyz}$ = velocity of "*B* with respect to *A*" as measured by an observer attached to the retating $x y = 7$ frame of observer attached to the rotating *x, y, z* frame of reference
	- Ω = angular velocity of the *x*, *y*, *z* frame of reference
	- $\mathbf{r}_{B/A}$ = position of "*B* with respect to *A*"

Acceleration. The acceleration of point *B* measured from *X, Y, Z* is determined by taking the time derivative of Eq. 20–11.

$$
\dot{\mathbf{v}}_B = \dot{\mathbf{v}}_A + \dot{\mathbf{\Omega}} \times \mathbf{r}_{B/A} + \mathbf{\Omega} \times \dot{\mathbf{r}}_{B/A} + \frac{d}{dt} (\mathbf{v}_{B/A})_{xyz}
$$

The time derivatives defined in the first and second terms represent \mathbf{a}_B
and \mathbf{a}_B respectively. The fourth term can be evaluated using Eq. 20, 10. and \mathbf{a}_A , respectively. The fourth term can be evaluated using Eq. 20–10, and the last term is evaluated by applying Eq. 20, 6, which vields and the last term is evaluated by applying Eq. 20–6, which yields

$$
\frac{d}{dt}(\mathbf{v}_{B/A})_{xyz} = (\dot{\mathbf{v}}_{B/A})_{xyz} + \mathbf{\Omega} \times (\mathbf{v}_{B/A})_{xyz} = (\mathbf{a}_{B/A})_{xyz} + \mathbf{\Omega} \times (\mathbf{v}_{B/A})_{xyz}
$$

Here $(\mathbf{a}_{B/A})_{xyz}$ is the acceleration of *B* with respect to *A* measured from $\mathbf{a}_{B/A}$ and $\mathbf{b}_{B/A}$ and $\mathbf{b}_{B/A}$ and $\mathbf{b}_{B/A}$ and the above equation and *x, y, z*. Substituting this result and Eq. 20–10 into the above equation and simplifying, we have

$$
\boxed{\mathbf{a}_B = \mathbf{a}_A + \dot{\Omega} \times \mathbf{r}_{B/A} + \Omega \times (\Omega \times \mathbf{r}_{B/A}) + 2\Omega \times (\mathbf{v}_{B/A})_{xyz} + (\mathbf{a}_{B/A})_{xyz}}
$$
(20–12)

where

 \mathbf{a}_B = acceleration of *B*

- \mathbf{a}_A = acceleration of the origin *A* of the *x*, *y*, *z* frame
of reference of reference
- $(a_{B/A})_{xyz}$, $(\mathbf{v}_{B/A})_{xyz}$ = acceleration and relative velocity of "*B* with
respect to A" as measured by an observer respect to *A*" as measured by an observer attached to the rotating *x, y, z* frame of reference
	- $\Omega, \Omega =$ angular acceleration and angular velocity of the *x, y, z* frame of reference , $\Omega =$
	- $\mathbf{r}_{B/A}$ = position of "*B* with respect to *A*"

Equations 20–11 and 20–12 are identical to those used in Sec. 16.8 for analyzing relative plane motion.* In that case, however, application is simplified since Ω and Ω have a *constant direction* which is always perpendicular to the plane of motion. For three-dimensional motion, Ω must be computed by using Eq. 20–6, since Ω depends on the change in *both* the magnitude and direction of Ω . |
|
| |
|
| #

Complicated spatial motion of the concrete bucket *B* occurs due to the rotation of the boom about the *Z* axis, motion of the carriage *A* along the boom, and extension and swinging of the cable *AB*. A translating-rotating *x, y, z* coordinate system can be established on the carriage, and a relative-motion analysis can then be applied to study this motion.

Procedure for Analysis

Three-dimensional motion of particles or rigid bodies can be analyzed with Eqs. 20–11 and 20–12 by using the following procedure.

Coordinate Axes.

- Select the location and orientation of the *X, Y, Z* and *x, y, z* coordinate axes. Most often solutions can be easily obtained if at the instant considered:
	- (1) the origins are *coincident*
	- (2) the axes are collinear
	- (3) the axes are parallel
- If several components of angular velocity are involved in a problem, the calculations will be reduced if the *x, y, z* axes are selected such that only one component of angular velocity is selected such that only one component of angular velocity is
observed with respect to this frame (Ω_{xyz}) and the frame rotates
with Q defined by the other components of angular velocity with Ω defined by the other components of angular velocity.

Kinematic Equations.

• After the origin of the moving reference, A, is defined and the moving point *B* is specified, Eqs. 20–11 and 20–12 should then be written in symbolic form as

which in symmetric form as
\n
$$
\mathbf{v}_B = \mathbf{v}_A + \mathbf{\Omega} \times \mathbf{r}_{B/A} + (\mathbf{v}_{B/A})_{xyz}
$$
\n
$$
\mathbf{a}_B = \mathbf{a}_A + \dot{\mathbf{\Omega}} \times \mathbf{r}_{B/A} + \mathbf{\Omega} \times (\mathbf{\Omega} \times \mathbf{r}_{B/A}) + 2\mathbf{\Omega} \times (\mathbf{v}_{B/A})_{xyz} + (\mathbf{a}_{B/A})_{xyz}
$$

- If \mathbf{r}_A and Ω appear to *change direction* when observed from the fixed *Y Y Z* reference then use a set of primed reference axes *x'*, *y'* If \mathbf{r}_A and Ω appear to *change direction* when observed from the fixed *X,Y,Z* reference then use a set of primed reference axes, *x'*, *y'*, z' having a rotation $\Omega' = \Omega$. Fountion 20–6 is then used to fixed X, Y, Z reference then use a set of primed reference axes, x', y', z' having a rotation $\Omega' = \Omega$. Equation 20–6 is then used to determine $\dot{\Omega}$ and the motion \bf{v} , and \bf{a} , of the origin of the moving determine Ω and the motion \mathbf{v}_A and \mathbf{a}_A of the origin of the moving *x, y, z* axes.
- If $(\mathbf{r}_{B/A})_{xyz}$ and $\mathbf{\Omega}_{xyz}$ appear to change direction as observed from If $(\mathbf{r}_{B/A})_{xyz}$ and $\mathbf{\Omega}_{xyz}$ appear to change direction as observed from
x, *y*, *z*, then use a set of double primed reference axes *x''*, *y''*, *z''*
having $\mathbf{\Omega}'' = \mathbf{\Omega}$ and apply Eq. 20–6 to determine $\mathbf{\$ having $\mathbf{\Omega}'' = \mathbf{\Omega}_{\text{xyz}}$ and apply Eq. 20–6 to determine $\mathbf{\Omega}_{\text{xyz}}$ and the relative motion $(\mathbf{v}_{B/A})_{xyz}$ and $(\mathbf{a}_{B/A})_{xyz}$. ##æ.
.
.
- After the final forms of Ω , \mathbf{v}_A , \mathbf{a}_A , Ω_{xyz} , $(\mathbf{v}_{B/A})_{xyz}$, and $(\mathbf{a}_{B/A})_{xyz}$ are obtained, numerical problem data can be substituted and the kinematic terms evaluated. The components of all these vectors can be selected either along the *X, Y, Z* or along the *x, y, z* axes. The choice is arbitrary, provided a consistent set of unit vectors is used.

EXAMPLE 20.4

A motor and attached rod *AB* have the angular motions shown in Fig. 20–12. A collar *C* on the rod is located 0.25 m from *A* and is moving downward along the rod with a velocity of 3 m/s and an acceleration of 2 m/s^2 . Determine the velocity and acceleration of *C* at this instant.

SOLUTION

Coordinate Axes.

The origin of the fixed *X, Y, Z* reference is chosen at the center of the platform, and the origin of the moving *x, y, z* frame at point *A*, Fig. 20–12. Since the collar is subjected to two components of angular motion, ω_p and ω_M , it will be viewed as having an angular
welocity of $\Omega = \omega$, in x, y, z. Therefore, the x, y, z axes will be angular motion, $\boldsymbol{\omega}_p$ and $\boldsymbol{\omega}_M$, it will be viewed as having an angular velocity of $\Omega_{xyz} = \boldsymbol{\omega}_M$ in *x*, *y*, *z*. Therefore, the *x*, *y*, *z* axes will be attached to the platform so that $\Omega = \boldsymbol{\omega}$. attached to the platform so that $\Omega = \omega_p$.

Fig. 20–12

Kinematic Equations. Equations 20–11 and 20–12, applied to points *C* and *A*, become

 $\mathbf{a}_C = \mathbf{a}_A + \dot{\mathbf{\Omega}} \times \mathbf{r}_{C/A} + \mathbf{\Omega} \times (\mathbf{\Omega} \times \mathbf{r}_{C/A}) + 2\mathbf{\Omega} \times (\mathbf{v}_{C/A})_{\mathbf{x}v} + (\mathbf{a}_{C/A})_{\mathbf{x}v}$ $\mathbf{v}_C = \mathbf{v}_A + \mathbf{\Omega} \times \mathbf{r}_{C/A} + (\mathbf{v}_{C/A})_{xyz}$

Motion of A. Here \mathbf{r}_A changes direction relative to *X, Y, Z.* To find the time derivatives of \mathbf{r}_A we will use a set of \mathbf{r}' , \mathbf{v}' are coincident **Motion of A.** Here \mathbf{r}_A changes direction relative to X, Y, Z. To find the time derivatives of \mathbf{r}_A we will use a set of x', y', z' axes coincident with the X Y Z axes that rotate at $\mathbf{Q}' = \mathbf{\omega}$. Thus the time derivatives of \mathbf{r}_A we will use a set of x' , y' , z' axes coincident
with the *X*, *Y*, *Z* axes that rotate at $\Omega' = \omega_p$. Thus,
 $\Omega = \omega_p = \{5\mathbf{k}\}\text{ rad/s } (\Omega \text{ does not change direction relative to } X, Y, Z.)$

$$
\Omega = \omega_p = \{5k\} \text{ rad/s } (\Omega \text{ does not change direction relative to } X, Y, Z.)
$$

\n
$$
\dot{\Omega} = \dot{\omega}_p = \{2k\} \text{ rad/s}^2
$$

\n
$$
\mathbf{r}_A = \{2\mathbf{i}\} \text{ m}
$$

\n
$$

EXAMPLE 20.5

The pendulum shown in Fig. 20–13 consists of two rods; *AB* is pin supported at *A* and swings only in the *Y–Z* plane, whereas a bearing at *B* allows the attached rod *BD* to spin about rod *AB*. At a given instant, the rods have the angular motions shown. Also, a collar *C*, located 0.2 m from B , has a velocity of 3 m/s and an acceleration of 2 m/s^2 along the rod. Determine the velocity and acceleration of the collar at this instant.

SOLUTION I

Coordinate Axes. The origin of the fixed *X, Y, Z* frame will be placed at *A*. Motion of the collar is conveniently observed from *B*, so the origin of the *x, y, z* frame is located at this point. We will choose æthe origin of the *x*, *y*, *z* fi
 $\Omega = \omega_1$ and $\Omega_{xyz} = \omega_2$.

$$
\nAns.

SOLUTION II

Coordinate Axes. Here we will let the *x, y, z* axes rotate at

æ $\Omega = \omega_1 + \omega_2 = \{4\mathbf{i} + 5\mathbf{k}\}\text{ rad/s}$

Then $\Omega_{xyz} = 0$.

Motion of B. From the constraints of the problem $\boldsymbol{\omega}_1$ does not change direction relative to *X*, *Y*, *Z*; however, the direction of $\boldsymbol{\omega}_2$ is change direction relative to X, Y, Z; however, the direction of ω_2 is
changed by ω_1 . Thus, to obtain Ω consider x', y', z' axes coincident
with the X, V, Z axes at A, so that $\Omega' = \omega$. Then taking the changed by ω_1 . Thus, to obtain Ω consider x', y', z' axes coincident
with the *X*, Y, Z axes at *A*, so that $\Omega' = \omega_1$. Then taking the ##1 1

derivative of the components of
$$
\Omega
$$
,
\n
$$
\dot{\Omega} = \dot{\omega}_1 + \dot{\omega}_2 = [(\dot{\omega}_1)_{x'y'z'} + \omega_1 \times \omega_1] + [(\dot{\omega}_2)_{x'y'z'} + \omega_1 \times \omega_2]
$$
\n
$$
= [1.5\mathbf{i} + \mathbf{0}] + [-6\mathbf{k} + 4\mathbf{i} \times 5\mathbf{k}] = \{1.5\mathbf{i} - 20\mathbf{j} - 6\mathbf{k}\} \text{ rad/s}^2
$$

Also, ω_1 changes the direction of \mathbf{r}_B so that the time derivatives of \mathbf{r}_B can be found using the primed axes defined above. Hence

can be found using the primed axes defined above. Hence,
\n
$$
\mathbf{v}_B = \dot{\mathbf{r}}_B = (\dot{\mathbf{r}}_B)_{x'y'z'} + \boldsymbol{\omega}_1 \times \mathbf{r}_B

CHAPTER REVIEW

Rotation About a Fixed Point

When a body rotates about a fixed point *O,* then points on the body follow a path that lies on the surface of a sphere centered at *O*.

Since the angular acceleration is a time rate of change in the angular velocity, then it is necessary to account for both the magnitude and directional changes of $\boldsymbol{\omega}$ when finding its time derivative. To do this, the angular velocity is often specified in terms of its component motions, such that the direction of some of these components will remain constant relative to rotating *x, y, z* axes. If this is the case, then the time derivative relative to the fixed axis can be determined using $\mathbf{A} = (\mathbf{A})$!
. |
|
| xis can be d
 $y_{xyz} + \mathbf{\Omega} \times \mathbf{A}$.

Once ω and α are known, the velocity and acceleration of any point *P* in the body can then be determined.

General Motion

If the body undergoes general motion, then the motion of a point *B* on the body can be related to the motion of another point *A* using a relative motion analysis, with translating axes attached to *A*.

Relative Motion Analysis Using Translating and Rotating Axes

The motion of two points *A* and *B* on a body, a series of connected bodies, or each point located on two different paths, can be related using a relative motion analysis with rotating and translating axes at *A*.

When applying the equations, to find \mathbf{v}_B
and \mathbf{v}_B it is important to account for and \mathbf{a}_B , it is important to account for
both the megnitude and directional both the magnitude and directional both the magnitude and direction
changes of \mathbf{r}_A , $(\mathbf{r}_{B/A})_{xyz}$, Ω , and Ω when taking their time derivatives to find æ \mathbf{v}_A , \mathbf{a}_A , $(\mathbf{v}_{B/A})_{xyz}$, $(\mathbf{a}_{B/A})_{xyz}$, $\mathbf{0}$, and Ω_{xyz} . To do this properly, one must use Eq. 20–6. .
. # \mathbf{r}_A , $(\mathbf{r}_{B/A})_{xyz}$, Ω , and Ω_{xyz}
their time derivatives to find

$$
a = \alpha \times r + \omega \times (\omega \times r)
$$

$$
\mathbf{v}_B = \mathbf{v}_A + \boldsymbol{\omega} \times \mathbf{r}_{B/A}
$$

$$
\mathbf{a}_B = \mathbf{a}_A + \boldsymbol{\alpha} \times \mathbf{r}_{B/A} + \boldsymbol{\omega} \times (\boldsymbol{\omega} \times \mathbf{r}_{B/A})
$$

$$
\mathbf{v}_B = \mathbf{v}_A + \mathbf{\Omega} \times \mathbf{r}_{B/A} + (\mathbf{v}_{B/A})_{xyz}
$$

$$
\mathbf{a}_{B} = \mathbf{a}_{A} + \dot{\mathbf{\Omega}} \times \mathbf{r}_{B/A} + \mathbf{\Omega} \times (\mathbf{\Omega} \times \mathbf{r}_{B/A}) + 2\mathbf{\Omega} \times (\mathbf{v}_{B/A})_{xyz} + (\mathbf{a}_{B/A})_{xyz}
$$

The design of amusement-park rides requires a force analysis that depends upon their three-dimensional motion.

Three-Dimensional Kinetics of a Rigid Body

[21](#page-15-0)

[CHAPTER OBJECTIVES](#page-15-0)

- To introduce the methods for finding the moments of inertia and products of inertia of a body about various axes.
- To show how to apply the principles of work and energy and linear and angular momentum to a rigid body having three-dimensional motion.
- To develop and apply the equations of motion in three dimensions.
- To study gyroscopic and torque-free motion.

*21.1 [Moments and Products of Inertia](#page-15-0)

When studying the planar kinetics of a body, it was necessary to introduce the moment of inertia I_G , which was computed about an axis
perpendicular to the plane of motion and passing through the body's mass perpendicular to the plane of motion and passing through the body's mass center *G*. For the kinetic analysis of three-dimensional motion it will sometimes be necessary to calculate six inertial quantities. These terms, called the moments and products of inertia, describe in a particular way the distribution of mass for a body relative to a given coordinate system that has a specified orientation and point of origin.

Moment of Inertia. Consider the rigid body shown in Fig. 21–1. The *moment of inertia* for a differential element *dm* of the body about any one of the three coordinate axes is defined as the product of the mass of the element and the square of the shortest distance from the axis mass of the element and the square of the shortest distance from the axis
to the element. For example, as noted in the figure, $r_x = \sqrt{y^2 + z^2}$, so
that the mass moment of inertia of the element about the *x* axis is that the mass moment of inertia of the element about the *x* axis is

$$
dI_{xx} = r_x^2 dm = (y^2 + z^2) dm
$$

The moment of inertia I_{xx} for the body can be determined by integrating this expression over the entire mass of the body. Hence, for each of the axes, we can write

$$
I_{xx} = \int_m r_x^2 dm = \int_m (y^2 + z^2) dm
$$

\n
$$
I_{yy} = \int_m r_y^2 dm = \int_m (x^2 + z^2) dm
$$

\n
$$
I_{zz} = \int_m r_z^2 dm = \int_m (x^2 + y^2) dm
$$
\n(21-1)

Here it is seen that the moment of inertia is *always a positive quantity*, since it is the summation of the product of the mass *dm*, which is always positive, and the distances squared.

Product of Inertia. The *product of inertia* for a differential element *dm* with respect to a set of *two orthogonal planes* is defined as the product of the mass of the element and the perpendicular (or shortest) distances from the planes to the element. For example, this distance is *x* to the *y–z* plane and it is *y* to the *x–z* plane, Fig. 21–1. The product of inertia dI_{xy} for the element is therefore

$$
dI_{xy} = xy \, dm
$$

Note also that $dI_{yx} = dI_{xy}$. By integrating over the entire mass, the products of inertia of the body with respect to each combination of products of inertia of the body with respect to each combination of planes can be expressed as

$$
I_{xy} = I_{yx} = \int_m xy dm
$$

\n
$$
I_{yz} = I_{zy} = \int_m yz dm
$$

\n
$$
I_{xz} = I_{zx} = \int_m xz dm
$$
\n(21-2)

Unlike the moment of inertia, which is always positive, the product of inertia may be positive, negative, or zero. The result depends on the algebraic signs of the two defining coordinates, which vary independently from one another. In particular, if either one or both of the orthogonal planes are *planes of symmetry* for the mass, the *product of inertia* with respect to these planes will be *zero*. In such cases, elements of mass will occur in *pairs* located on each side of the plane of symmetry. On one side of the plane the product of inertia for the element will be positive, while on the other side the product of inertia of the corresponding element will be negative, the sum therefore yielding zero. Examples of this are shown in Fig. 21–2. In the first case, Fig. 21–2*a*, the *y–z* plane is a plane of in Fig. 21–2. In the first case, Fig. 21–2*a*, the y–*z* plane is a plane of symmetry, and hence $I_{xy} = I_{xz} = 0$. Calculation of I_{yz} will yield a nositive result since all elements of mass are located using only positiv *positive* result, since all elements of mass are located using only positive *y* and *z* coordinates. For the cylinder, with the coordinate axes located as shown in Fig. 21–2*b*, the *x–z* and *y–z* planes are both planes of symmetry. shown in Fig. 21–2*b*, the *x*-
Thus, $I_{xy} = I_{yz} = I_{zx} = 0$.

Parallel-Axis and Parallel-Plane Theorems. The techniques of integration used to determine the moment of inertia of a body were described in Sec. 17.1. Also discussed were methods to determine the moment of inertia of a composite body, i.e., a body that is composed of simpler segments, as tabulated on the inside back cover. In both of these cases the *parallel-axis theorem* is often used for the calculations. This theorem, which was developed in Sec. 17.1, allows us to transfer the moment of inertia of a body from an axis passing through its mass center *G* to a parallel axis passing through some other point. If *G* has coordinates x_G , y_G , z_G defined with respect to the *x*, *y*, *z* axes, Fig. 21–3, then the parallel-axis equations used to calculate the moments of inertial then the parallel-axis equations used to calculate the moments of inertia about the *x, y, z* axes are

$$
I_{xx} = (I_{x'x'})_G + m(y_G^2 + z_G^2)
$$

\n
$$
I_{yy} = (I_{y'y'})_G + m(x_G^2 + z_G^2)
$$

\n
$$
I_{zz} = (I_{z'z'})_G + m(x_G^2 + y_G^2)
$$

Fig. 21–3

Fig. 21–3 (repeated)

The products of inertia of a composite body are computed in the same manner as the body's moments of inertia. Here, however, the *parallelplane theorem* is important. This theorem is used to transfer the products of inertia of the body with respect to a set of three orthogonal planes passing through the body's mass center to a corresponding set of three parallel planes passing through some other point *O*. Defining the perpendicular distances between the planes as x_G , y_G and z_G , Fig. 21–3, the parallel-plane equations can be written as the parallel-plane equations can be written as

$$
I_{xy} = (I_{x'y'})_G + mx_Gy_G
$$

\n
$$
I_{yz} = (I_{y'z'})_G + my_Gz_G
$$

\n
$$
I_{zx} = (I_{z'x'})_G + mz_Gx_G
$$
\n(21-4)

The derivation of these formulas is similar to that given for the parallelaxis equation, Sec. 17.1.

Inertia Tensor. The inertial properties of a body are therefore completely characterized by nine terms, six of which are independent of one another. This set of terms is defined using Eqs. 21–1 and 21–2 and can be written as

$$
\begin{pmatrix} I_{xx} & -I_{xy} & -I_{xz} \\ -I_{yx} & I_{yy} & -I_{yz} \\ -I_{zx} & -I_{zy} & I_{zz} \end{pmatrix}
$$

This array is called an *inertia tensor*.* It has a unique set of values for a body when it is determined for each location of the origin *O* and orientation of the coordinate axes.

In general, for point *O* we can specify a unique axes inclination for which the products of inertia for the body are zero when computed with respect to these axes. When this is done, the inertia tensor is said to be "diagonalized" and may be written in the simplified form

$$
\begin{pmatrix} I_x & 0 & 0 \\ 0 & I_y & 0 \\ 0 & 0 & I_z \end{pmatrix}
$$

Here $I_x = I_{xx}$, $I_y = I_{yy}$, and $I_z = I_{zz}$ are termed the *principal moments*
of *inertia* for the body which are computed with respect to the *principal of inertia* for the body, which are computed with respect to the *principal axes of inertia*. Of these three principal moments of inertia, one will be a maximum and another a minimum of the body's moment of inertia.

The dynamics of the space shuttle while it orbits the earth can be predicted only if its moments and products of inertia are known relative to its mass center.

^{*}The negative signs are here as a consequence of the development of angular momentum, Eqs. 21–10.

x

The mathematical determination of the directions of principal axes of inertia will not be discussed here (see Prob. 21–20). However, there are many cases in which the principal axes can be determined by inspection. From the previous discussion it was noted that if the coordinate axes are oriented such that *two* of the three orthogonal planes containing the axes are planes of *symmetry* for the body, then all the products of inertia for the body are zero with respect to these coordinate planes, and hence these coordinate axes are principal axes of inertia. For example, the *x, y, z* axes shown in Fig. 21–2*b* represent the principal axes of inertia for the cylinder at point *O*.

Moment of Inertia About an Arbitrary Axis. Consider the body shown in Fig. 21–4, where the nine elements of the inertia tensor have been determined with respect to the *x, y, z* axes having an origin at *O*. Here we wish to determine the moment of inertia of the body about the *Oa* axis, which has a direction defined by the unit vector \mathbf{u}_a . By definition $I_a = \int b^2 dm$, where h is the nervous distance from due definition $I_{Oa} = \int b^2 dm$, where *b* is the *perpendicular distance* from *dm* to *Oa*. If the position of *dm* is located using **r**, then $b = r \sin \theta$, which represents the *magnitude* of the cross product $\mathbf{u}_a \times \mathbf{r}$. Hence, the moment of inertia can be expressed as represents the *magnitude* of the cross product $\mathbf{u}_a \times \mathbf{r}$. Hence, the moment of inertia can be expressed as distance from $b = r \sin \theta$,
 \times **r** Heno is, which has a
 $I_{Oa} = \int b^2 dm$, the position of

$$
I_{Oa} = \int_{m} |(\mathbf{u}_{a} \times \mathbf{r})|^2 dm = \int_{m} (\mathbf{u}_{a} \times \mathbf{r}) \cdot (\mathbf{u}_{a} \times \mathbf{r}) dm
$$

Provided $\mathbf{u}_a = u_x \mathbf{i} + u_y \mathbf{j} + u_z \mathbf{k}$ and $\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$, then $\mathbf{u}_a \times \mathbf{r} = (u, z - u, y)\mathbf{i} + (u, x - u, z)\mathbf{j} + (u, y - u, x)\mathbf{k}$. After substituting and Provided $\mathbf{u}_a = u_x \mathbf{i} + u_y \mathbf{j} + u_z \mathbf{k}$ and $\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$, then $\mathbf{u}_a \times \mathbf{r} = (u_y z - u_z y)\mathbf{i} + (u_z x - u_x z)\mathbf{j} + (u_x y - u_y x)\mathbf{k}$. After substituting and performing the dot product operation the moment of ine performing the dot-product operation, the moment of inertia is

$$
I_{Oa} = \int_{m} [(u_y z - u_z y)^2 + (u_z x - u_x z)^2 + (u_x y - u_y x)^2] dm
$$

= $u_x^2 \int_{m} (y^2 + z^2) dm + u_y^2 \int_{m} (z^2 + x^2) dm + u_z^2 \int_{m} (x^2 + y^2) dm$
- $2u_x u_y \int_{m} xy dm - 2u_y u_z \int_{m} yz dm - 2u_z u_x \int_{m} zx dm$

Recognizing the integrals to be the moments and products of inertia of the body, Eqs. 21–1 and 21–2, we have

$$
I_{Oa} = I_{xx}u_x^2 + I_{yy}u_y^2 + I_{zz}u_z^2 - 2I_{xy}u_xu_y - 2I_{yz}u_yu_z - 2I_{zx}u_zu_x
$$
 (21–5)

Thus, if the inertia tensor is specified for the *x, y, z* axes, the moment of inertia of the body about the inclined *Oa* axis can be found. For the calculation, the direction cosines u_x, u_y, u_z of the axes must be determined These terms specify the cosines of the coordinate direction determined. These terms specify the cosines of the coordinate direction angles α, β, γ made between the positive *Oa* axis and the positive *x*, *y*, *z* axes, respectively (see Appendix C).

EXAMPLE 21.1

Determine the moment of inertia of the bent rod shown in Fig. 21–5*a* about the *Aa* axis. The mass of each of the three segments is given in the figure.

SOLUTION

Before applying Eq. 21–5, it is first necessary to determine the moments and products of inertia of the rod with respect to the *x, y, z* axes. This is done using the formula for the moment of inertia of a axes. This is done using the formula for the moment of inertia of a
slender rod, $I = \frac{1}{12}ml^2$, and the parallel-axis and parallel-plane
theorems Eqs. 21–3 and 21–4. Dividing the rod into three parts and theorems, Eqs. $21-\overline{3}$ and $21-4$. Dividing the rod into three parts and locating the mass center of each segment, Fig. 21–5*b*, we have

$$
I_{xx} = \left[\frac{1}{12}(2)(0.2)^2 + 2(0.1)^2\right] + [0 + 2(0.2)^2]
$$

+ $\left[\frac{1}{12}(4)(0.4)^2 + 4((0.2)^2 + (0.2)^2)\right] = 0.480 \text{ kg} \cdot \text{m}^2$

$$
I_{yy} = \left[\frac{1}{12}(2)(0.2)^2 + 2(0.1)^2\right] + \left[\frac{1}{12}(2)(0.2)^2 + 2((-0.1)^2 + (0.2)^2)\right]
$$

+ $[0 + 4((-0.2)^2 + (0.2)^2)] = 0.453 \text{ kg} \cdot \text{m}^2$

$$
I_{zz} = [0 + 0] + \left[\frac{1}{12}(2)(0.2)^2 + 2(-0.1)^2\right] + \left[\frac{1}{12}(4)(0.4)^2 + 4((-0.2)^2 + (0.2)^2)\right] = 0.400 \text{ kg} \cdot \text{m}^2
$$

$$
I_{xy} = [0 + 0] + [0 + 0] + [0 + 4(-0.2)(0.2)] = -0.160 \text{ kg} \cdot \text{m}^2
$$

$$
I_{yz} = [0 + 0] + [0 + 0] + [0 + 4(0.2)(0.2)] = 0.160 \text{ kg} \cdot \text{m}^2
$$

$$
I_{zx} = [0 + 0] + [0 + 2(0.2)(-0.1)] +
$$

$$
[0 + 4(0.2)(-0.2)] = -0.200 \text{ kg} \cdot \text{m}^2
$$

The *Aa* axis is defined by the unit vector

$$
\begin{bmatrix}\n2 \text{ kg} & \text{u}_{Aa} = \frac{\mathbf{r}_D}{r_D} = \frac{-0.2\mathbf{i} + 0.4\mathbf{j} + 0.2\mathbf{k}}{\sqrt{(-0.2)^2 + (0.4)^2 + (0.2)^2}} = -0.408\mathbf{i} + 0.816\mathbf{j} + 0.408\mathbf{k} \\
\frac{2 \text{ kg}}{(-0.2, 0.2, 0.2)} & \text{Thus,} \\
\frac{2 \text{ kg}}{(0, 0, 0.1)} & u_x = -0.408 & u_y = 0.816 & u_z = 0.408 \\
\end{bmatrix}
$$
\n
$$
\begin{aligned}\n\text{Substituting these results into Eq. 21-5 yields} \\
\text{Fig. 21-5} & = 0.480(-0.408)^2 + (0.453)(0.816)^2 + 0.400(0.408)^2 \\
- 2(-0.160)(-0.408)(0.816) - 2(0.160)(0.816)(0.408) \\
- 2(-0.200)(0.408)(-0.408)\n\end{aligned}
$$

21.2 [Angular Momentum](#page-15-0)

In this section we will develop the necessary equations used to determine the angular momentum of a rigid body about an arbitrary point. These equations will provide a means for developing both the principle of impulse and momentum and the equations of rotational motion for a rigid body.

Consider the rigid body in Fig. 21–6, which has a mass *m* and center of mass at *G*. The *X, Y, Z* coordinate system represents an inertial frame of reference, and hence, its axes are fixed or translate with a constant velocity.The angular momentum as measured from this reference will be determined relative to the arbitrary point *A*. The position vectors \mathbf{r}_A and \mathbf{r}_B are drawn from the origin of coordinates to point *A* and from *A* to ρ_A are drawn from the origin of coordinates to point *A* and from *A* to the integration of the body. If the particle's mass is *m*, the angular the *i*th particle of the body. If the particle's mass is m_i , the angular momentum about point A is momentum about point *A* is

$$
(\mathbf{H}_A)_i = \boldsymbol{\rho}_A \times m_i \mathbf{v}_i
$$

where \mathbf{v}_i represents the particle's velocity measured from the *X, Y, Z* coordinate system. If the body has an angular velocity $\boldsymbol{\omega}$ at the instant coordinate system. If the body has an angular velocity $\boldsymbol{\omega}$ at the instant considered, \mathbf{v}_i may be related to the velocity of *A* by applying Eq. 20–7, i.e.,

$$
\mathbf{v}_i = \mathbf{v}_A + \boldsymbol{\omega} \times \boldsymbol{\rho}_A
$$

Thus,

$$
(\mathbf{H}_A)_i = \boldsymbol{\rho}_A \times m_i (\mathbf{v}_A + \boldsymbol{\omega} \times \boldsymbol{\rho}_A)
$$

= $(\boldsymbol{\rho}_A m_i) \times \mathbf{v}_A + \boldsymbol{\rho}_A \times (\boldsymbol{\omega} \times \boldsymbol{\rho}_A) m_i$

Summing the moments of all the particles of the body requires an integration. Since $m_i \rightarrow dm$, we have

$$
\mathbf{H}_A = \left(\int_m \boldsymbol{\rho}_A \, dm\right) \times \mathbf{v}_A + \int_m \boldsymbol{\rho}_A \times (\boldsymbol{\omega} \times \boldsymbol{\rho}_A) \, dm \qquad (21-6)
$$

Fig. 21–6

Fixed Point O. If *A* becomes a *fixed point O* in the body, Fig. 21–7*a*, **Fixed Point O.** If A becomes a then $\mathbf{v}_A = \mathbf{0}$ and Eq. 21–6 reduces to

$$
\mathbf{H}_O = \int_m \boldsymbol{\rho}_O \times (\boldsymbol{\omega} \times \boldsymbol{\rho}_O) \, dm \qquad (21-7)
$$

Center of Mass G. If *A* is located at the *center of mass G* of the body, Fig. 21–7*b*, then $\int_{m} \rho_{A} dm = 0$ and **5.** If A is loop $\int_m \rho_A dm = 0$

$$
\mathbf{H}_G = \int_m \boldsymbol{\rho}_G \times (\boldsymbol{\omega} \times \boldsymbol{\rho}_G) \, dm \qquad (21-8)
$$

Arbitrary Point A. In general, *A* can be a point other than *O* or *G*, Fig. 21–7*c*, in which case Eq. 21–6 may nevertheless be simplified to the following form (see Prob. 21–21).

$$
\mathbf{H}_A = \boldsymbol{\rho}_{G/A} \times m\mathbf{v}_G + \mathbf{H}_G
$$
 (21–9)

Here the angular momentum consists of two parts—the moment of the linear momentum $m\mathbf{v}_G$ of the body about point *A* added (vectorially) to the approximation \mathbf{H}_G . Fountion 21–9 can also be used to the angular momentum H_G . Equation 21–9 can also be used to determine the angular momentum of the hody about a fixed point Ω determine the angular momentum of the body about a fixed point *O.* The results, of course, will be the same as those found using the more convenient Eq. 21–7.

Rectangular Components of H. To make practical use of Eqs. 21–7 through 21–9, the angular momentum must be expressed in terms of its scalar components. For this purpose, it is convenient to

choose a second set of *x, y, z* axes having an arbitrary orientation relative to the *X, Y, Z* axes, Fig. 21–7, and for a general formulation, note that Eqs. 21–7 and 21–8 are both of the form

$$
\mathbf{H} = \int_m \boldsymbol{\rho} \times (\boldsymbol{\omega} \times \boldsymbol{\rho}) dm
$$

Expressing **H**, ρ , and ω in terms of *x*, *y*, *z* components, we have

$$
H_x \mathbf{i} + H_y \mathbf{j} + H_z \mathbf{k} = \int_m (x \mathbf{i} + y \mathbf{j} + z \mathbf{k}) \times [(\omega_x \mathbf{i} + \omega_y \mathbf{j} + \omega_z \mathbf{k})
$$

$$
\times (x \mathbf{i} + y \mathbf{j} + z \mathbf{k})] dm
$$

Expanding the cross products and combining terms yields

$$
H_x \mathbf{i} + H_y \mathbf{j} + H_z \mathbf{k} = \left[\omega_x \int_m (y^2 + z^2) dm - \omega_y \int_m xy dm - \omega_z \int_m xz dm \right] \mathbf{i}
$$

$$
+ \left[-\omega_x \int_m xy dm + \omega_y \int_m (x^2 + z^2) dm - \omega_z \int_m yz dm \right] \mathbf{j}
$$

$$
+ \left[-\omega_x \int_m zx dm - \omega_y \int_m yz dm + \omega_z \int_m (x^2 + y^2) dm \right] \mathbf{k}
$$

Equating the respective **i**, **j**, **k** components and recognizing that the integrals represent the moments and products of inertia, we obtain

$$
H_x = I_{xx}\omega_x - I_{xy}\omega_y - I_{xz}\omega_z
$$

\n
$$
H_y = -I_{yx}\omega_x + I_{yy}\omega_y - I_{yz}\omega_z
$$

\n
$$
H_z = -I_{zx}\omega_x - I_{zy}\omega_y + I_{zz}\omega_z
$$
\n(21-10)

These equations can be simplified further if the *x, y, z* coordinate axes are oriented such that they become *principal axes of inertia* for the body at the point. When these axes are used, the products of inertia at the point. When these axes are used, the products of inertia $I_{xy} = I_{yz} = I_{zx} = 0$, and if the principal moments of inertia about the *x*, $\frac{y}{z}$ axes are represented as $I = I - I = I$ and $I = I$ the three $I_{xy} = I_{yz} = I_{zx} = 0$, and if the principal moments of inertia about the x, y, z axes are represented as $I_x = I_{xx}$, $I_y = I_{yy}$, and $I_z = I_{zz}$, the three components of angular momentum become components of angular momentum become

$$
H_x = I_x \omega_x \qquad H_y = I_y \omega_y \qquad H_z = I_z \omega_z \qquad (21-11)
$$

The motion of the astronaut is controlled by use of small directional jets attached to his or her space suit. The impulses these jets provide must be carefully specified in order to prevent tumbling and loss of orientation.

Fig. 21–8

Principle of Impulse and Momentum. Now that the formulation of the angular momentum for a body has been developed, the *principle of impulse and momentum*, as discussed in Sec. 19.2, can be used to solve kinetic problems which involve *force, velocity, and time*. For this case, the following two vector equations are available:

$$
m(\mathbf{v}_G)_1 + \Sigma \int_{t_1}^{t_2} \mathbf{F} dt = m(\mathbf{v}_G)_2
$$
 (21–12)

$$
(\mathbf{H}_O)_1 + \Sigma \int_{t_1}^{t_2} \mathbf{M}_O \, dt = (\mathbf{H}_O)_2 \tag{21-13}
$$

In three dimensions each vector term can be represented by three scalar components, and therefore a total of *six scalar equations* can be written. Three equations relate the linear impulse and momentum in the *x, y, z* directions, and the other three equations relate the body's angular impulse and momentum about the *x, y, z* axes. Before applying Eqs. 21–12 and 21–13 to the solution of problems, the material in Secs. 19.2 and 19.3 should be reviewed.

21.3 [Kinetic Energy](#page-15-0)

In order to apply the principle of work and energy to solve problems involving general rigid body motion, it is first necessary to formulate expressions for the kinetic energy of the body. To do this, consider the rigid body shown in Fig. 21–8, which has a mass *m* and center of mass at *G*. The kinetic energy of the *i*th particle of the body having a mass m_i and velocity \mathbf{v}_i , measured relative to the inertial *X*, *Y*, *Z* frame of reference, is $\frac{1}{2} m_i(\mathbf{v}_i \cdot \mathbf{v}_i)$

$$
T_i = \frac{1}{2}m_i v_i^2 = \frac{1}{2}m_i(\mathbf{v}_i \cdot \mathbf{v}_i)
$$

Provided the velocity of an arbitrary point *A* in the body is known, v_i can be related to v_i , by the equation $v_i = v_i + \omega \times a$, where ω is the Provided the velocity of an arbitrary point A in the body is known, \mathbf{v}_i can
be related to \mathbf{v}_A by the equation $\mathbf{v}_i = \mathbf{v}_A + \boldsymbol{\omega} \times \boldsymbol{\rho}_A$, where $\boldsymbol{\omega}$ is the
angular velocity of the body measured from angular velocity of the body, measured from the *X, Y, Z* coordinate system, and ρ_A is a position vector extending from *A* to *i*. Using this

expression, the kinetic energy for the particle can be written as
\n
$$
T_i = \frac{1}{2} m_i (\mathbf{v}_A + \boldsymbol{\omega} \times \boldsymbol{\rho}_A) \cdot (\mathbf{v}_A + \boldsymbol{\omega} \times \boldsymbol{\rho}_A)
$$
\n
$$
= \frac{1}{2} (\mathbf{v}_A \cdot \mathbf{v}_A) m_i + \mathbf{v}_A \cdot (\boldsymbol{\omega} \times \boldsymbol{\rho}_A) m_i + \frac{1}{2} (\boldsymbol{\omega} \times \boldsymbol{\rho}_A) \cdot (\boldsymbol{\omega} \times \boldsymbol{\rho}_A) m_i
$$

The kinetic energy for the entire body is obtained by summing the kinetic energies of all the particles of the body. This requires an

integration. Since
$$
m_i \to dm
$$
, we get
\n
$$
T = \frac{1}{2}m(\mathbf{v}_A \cdot \mathbf{v}_A) + \mathbf{v}_A \cdot (\boldsymbol{\omega} \times \int_m \boldsymbol{\rho}_A dm) + \frac{1}{2} \int_m (\boldsymbol{\omega} \times \boldsymbol{\rho}_A) \cdot (\boldsymbol{\omega} \times \boldsymbol{\rho}_A) dm
$$

The last term on the right can be rewritten using the vector identity The last term on the right can be rewritten using the vector identity $\mathbf{a} \times \mathbf{b} \cdot \mathbf{c} = \mathbf{a} \cdot \mathbf{b} \times \mathbf{c}$, where $\mathbf{a} = \boldsymbol{\omega}$, $\mathbf{b} = \boldsymbol{\rho}_A$, and $\mathbf{c} = \boldsymbol{\omega} \times \boldsymbol{\rho}_A$. The final result is final result is

final result is
\n
$$
T = \frac{1}{2}m(\mathbf{v}_A \cdot \mathbf{v}_A) + \mathbf{v}_A \cdot (\boldsymbol{\omega} \times \int_m \boldsymbol{\rho}_A dm) + \frac{1}{2} \boldsymbol{\omega} \cdot \int_m \boldsymbol{\rho}_A \times (\boldsymbol{\omega} \times \boldsymbol{\rho}_A) dm
$$
\n(21-14)

This equation is rarely used because of the computations involving the integrals. Simplification occurs, however, if the reference point *A* is either a fixed point or the center of mass.

Fixed Point O. If *A* is a *fixed point O* in the body, Fig. 21–7*a*, then **Fixed Point O.** If *A* is a fixed point *O* in the body,
 $\mathbf{v}_A = \mathbf{0}$, and using Eq. 21–7, we can express Eq. 21–14 as
 $T = \frac{1}{2}\boldsymbol{\omega} \cdot \mathbf{H}_O$

$$
T = \frac{1}{2}\boldsymbol{\omega} \cdot \mathbf{H}_O
$$

If the *x, y, z* axes represent the principal axes of inertia for the body, then If the x, y, z axes represent the principal axes of inertia for the body, then $\boldsymbol{\omega} = \omega_x \mathbf{i} + \omega_y \mathbf{j} + \omega_z \mathbf{k}$ and $\mathbf{H}_O = I_x \omega_x \mathbf{i} + I_y \omega_y \mathbf{j} + I_z \omega_z \mathbf{k}$. Substituting into the above equation and performing the do into the above equation and performing the dot-product operations yields

$$
T = \frac{1}{2}I_x\omega_x^2 + \frac{1}{2}I_y\omega_y^2 + \frac{1}{2}I_z\omega_z^2
$$
 (21–15)

Center of Mass G. If *A* is located at the *center of mass G* of the body, Fig. 21–7*b*, then $\int \rho_A dm = 0$ and, using Eq. 21–8, we can write Eq. 21–14 as $\frac{1}{2} \boldsymbol{\omega} \cdot \mathbf{H}_G$ **.** If A is loc
 $\int \rho_A dm = 0$

$$
T = \frac{1}{2}mv_G^2 + \frac{1}{2}\boldsymbol{\omega} \cdot \mathbf{H}_G
$$

In a manner similar to that for a fixed point, the last term on the right side may be represented in scalar form, in which case

$$
T = \frac{1}{2}mv_G^2 + \frac{1}{2}I_x\omega_x^2 + \frac{1}{2}I_y\omega_y^2 + \frac{1}{2}I_z\omega_z^2
$$
 (21-16)

Here it is seen that the kinetic energy consists of two parts; namely, the translational kinetic energy of the mass center, $\frac{1}{2}mv_G^2$, and the body's rotational kinetic energy rotational kinetic energy.

Principle of Work and Energy. Having formulated the kinetic energy for a body, the *principle of work and energy* can be applied to solve kinetics problems which involve *force, velocity, and displacement*. For this case only one scalar equation can be written for each body, namely,

$$
T_1 + \Sigma U_{1-2} = T_2 \tag{21-17}
$$

Before applying this equation, the material in Chapter 18 should be reviewed.

y

EXAMPLE 21.2

Fig. 21–9

The rod in Fig. $21-9a$ has a weight per unit length of 1.5 lb/ft . Determine its angular velocity just after the end *A* falls onto the hook at *E*. The hook provides a permanent connection for the rod due to the spring-lock mechanism *S*. Just before striking the hook the rod is the spring-lock mechanism *S*. Just before striki
falling downward with a speed $(v_G)_1 = 10$ ft/s.

SOLUTION

The principle of impulse and momentum will be used since impact occurs.

Impulse and Momentum Diagrams. Fig. 21–9*b*. During the short time Δt , the impulsive force **F** acting at *A* changes the momentum of the rod (The impulse created by the rod's weight **W** during this time the rod. (The impulse created by the rod's weight **W** during this time is small compared to $\int \mathbf{F} dt$, so that it can be neglected, i.e., the weight is small compared to $\int \mathbf{F} dt$, so that it can be neglected, i.e., the weight is a nonimpulsive force.) Hence, the angular momentum of the rod is *conserved* about point *A* since the moment of $\int \mathbf{F} dt$ about *A* is zero. *conserved* about point *A* since the moment of $\int \mathbf{F} dt$ about *A* is zero.
Conservation of Angular Momentum. Equation 21–9 must be

used to find the angular momentum of the rod, since *A* does not become a *fixed point* until *after* the impulsive interaction with the hook. Thus, with reference to Fig. 21–9*b*, $(\mathbf{H}_A)_1 = (\mathbf{H}_A)_2$, or
 $\mathbf{r}_{G/A} \times m(\mathbf{v}_G)_1 = \mathbf{r}_{G/A} \times m(\mathbf{v}_G)_2 + (\mathbf{H}_G)_2$ **1H**_A $)$ ₁ = **(H**_A $)$ ₂, $\left(\frac{H_A}{H_B}\right)$

$$
\mathbf{r}_{G/A} \times m(\mathbf{v}_G)_1 = \mathbf{r}_{G/A} \times m(\mathbf{v}_G)_2 + (\mathbf{H}_G)_2 \tag{1}
$$

From Fig. 21–9*a*, $\mathbf{r}_{G/A} = \{-0.667\mathbf{i} + 0.5\mathbf{j}\}\text{ ft. Furthermore, the$ From Fig. 21–9a, $\mathbf{r}_{G/A} = \{-0.667\mathbf{i} + 0.5\mathbf{j}\}\$ ft. Furthermore, the primed axes are principal axes of inertia for the rod because $I_{x'y'} = I_{x'} = 0$. Hence, from Ess. 21.11. (**H**) = $I_{x'y'} =$ primed axes are principal axes of inertia for the rod because $I_{x'y'} = I_{x'z'} = 0$. Hence, from Eqs. 21–11, $(\mathbf{H}_G)_2 = I_{x'\omega_x}\mathbf{i} +$ $I_{x'z'} = I_{z'y'} = 0$. Hence, from Eqs. 21–11, $(\mathbf{H}_G)_2 = I_{x'}\omega_x \mathbf{i} + I_{y'}\omega_y \mathbf{j} + I_{z'}\omega_z \mathbf{k}$. The principal moments of inertia are $I_{x'} = 0.0272$ slug ft², $I_x = 0.0155$ slug ft², $I_y = 0.0427$ slug ft² (see Prob. $I_{x'z'} = I_{z'y'} = 0$. Hence, from Eqs. 21–11, $(\mathbf{H}_G)_2 = I_{x'}\omega_x \mathbf{i} + I_{y'}\omega_y \mathbf{j} + I_{z'}\omega_z \mathbf{k}$. The principal moments of inertia are $I_{x'} = 0.0272 \text{ slug} \cdot \text{ft}^2$, $I_{y'} = 0.0155 \text{ slug} \cdot \text{ft}^2$, $I_{z'} = 0.0427 \text{ slug} \cdot \text{ft}^$ 21–13). Substituting into Eq. 1, we have

$$
(-0.667\mathbf{i} + 0.5\mathbf{j}) \times \left[\left(\frac{4.5}{32.2} \right) (-10\mathbf{k}) \right] = (-0.667\mathbf{i} + 0.5\mathbf{j}) \times \left[\left(\frac{4.5}{32.2} \right) (-v_G)_2 \mathbf{k} \right] + 0.0272\omega_x \mathbf{i} + 0.0155\omega_y \mathbf{j} + 0.0427\omega_z \mathbf{k}
$$

Expanding and equating the respective **i** is **k** components yields

Expanding and equating the respective **i**, **j**, **k** components yields
 $-0.699 = -0.0699(v_G)_2 + 0.0272\omega_x$

$$
-0.699 = -0.0699(vG)2 + 0.0272\omegax
$$
 (2)

$$
-0.699 = -0.0699(vG)2 + 0.0272\omegax
$$

$$
-0.932 = -0.0932(vG)2 + 0.0155\omegay
$$
 (3)

$$
0 = 0.0427\omega_z \tag{4}
$$

 $-0.932 = -0.0932(v_G)₂ + 0.0155\omega_{y}$ (3)
 $0 = 0.0427\omega_{z}$ (4)
 Kinematics. There are four unknowns in the above equations; however, another equation may be obtained by relating ω to $(v_G)_2$
weing kinematics Since $\omega = 0$ (Eq. 4) and ofter impact the red retator however, another equation may be obtained by relating ω to (v_G)
using *kinematics*. Since $\omega_z = 0$ (Eq. 4) and after impact the rod rotates
about the fixed point $A \to \infty$ 20.3 can be applied in which case about the fixed point *A*, Eq. 20–3 can be applied, in which case about the fixed poin
 $(\mathbf{v}_G)_2 = \boldsymbol{\omega} \times \mathbf{r}_{G/A}$, or

$$
(\mathbf{v}_G)_2 = \boldsymbol{\omega} \times \mathbf{r}_{G/A}, \text{ or}
$$

- $(v_G)_2 \mathbf{k} = (\omega_x \mathbf{i} + \omega_y \mathbf{j}) \times (-0.667\mathbf{i} + 0.5\mathbf{j})$
- $(v_G)_2 = 0.5\omega_x + 0.667\omega_y$ (5)
Solving Eqs. 2, 3 and 5 simultaneously yields

 $(\mathbf{v}_G)_2 = \{-8.41\mathbf{k}\}$ ft/s $\boldsymbol{\omega} = \{-4.09\mathbf{i} - 9.55\mathbf{j}\}$ rad/s Ans.

EXAMPLE 21.3
A 5-N · m torque i

A $5-N \cdot m$ torque is applied to the vertical shaft *CD* shown in Fig. 21–10*a*, which allows the 10-kg gear *A* to turn freely about *CE*. Assuming that gear *A* starts from rest, determine the angular velocity of *CD* after it has turned two revolutions. Neglect the mass of shaft *CD* and axle *CE* and assume that gear *A* can be approximated by a thin disk. Gear *B* is fixed.

SOLUTION

The principle of work and energy may be used for the solution. Why?

Work. If shaft *CD*, the axle *CE*, and gear *A* are considered as a system of connected bodies, only the applied torque **M** does work. For two ©**Work.** If shaft *CD*, the axle *CE*, and gear *A* are considered as a system of connected bodies, only the applied torque **M** does work. For two revolutions of *CD*, this work is $\Sigma U_{1-2} = (5 \text{ N} \cdot \text{m})(4\pi \text{ rad}) = 62.83 \text$

Kinetic Energy. Since the gear is initially at rest, its initial kinetic energy is zero.A kinematic diagram for the gear is shown in Fig. 21–10*b*. If the angular velocity of *CD* is taken as ω_{CD} , then the angular velocity
of gear *A* is $\omega = \omega_{CD} + \omega_{CD}$. The gear may be imagined as a portion If the angular velocity of *CD* is taken as ω_{CD} , then the angular velocity
of gear *A* is $\omega_A = \omega_{CD} + \omega_{CE}$. The gear may be imagined as a portion
of a massless extended body which is rotating about the *fixed noint C* of a massless extended body which is rotating about the *fixed point C*. The instantaneous axis of rotation for this body is along line *CH*, because both points *C* and *H* on the body (gear) have zero velocity and must therefore lie on this axis. This requires that the components ω_{CD}
and ω_{CD} be related by the equation $\omega_{CD}/0.1 \text{ m} = \omega_{CD}/0.3 \text{ m}$ or must therefore lie on this axis. This requires that the components ω_{CD}
and ω_{CE} be related by the equation $\omega_{CD}/0.1$ m = $\omega_{CE}/0.3$ m or and ω_{CE} be relat
 $\omega_{CE} = 3\omega_{CD}$. Thus,

Thus,

$$
\boldsymbol{\omega}_A = -\omega_{CE} \mathbf{i} + \omega_{CD} \mathbf{k} = -3\omega_{CD} \mathbf{i} + \omega_{CD} \mathbf{k}
$$
(1)

The *x, y, z* axes in Fig. 21–10*a* represent *principal axes of inertia* at *C* for the gear. Since point *C* is a fixed point of rotation, Eq. 21–15 may be applied to determine the kinetic energy, i.e.,
 $T = \frac{1}{2}I \omega^2 + \frac{1}{2}I \omega^2 + \frac{1}{2}I$

$$
T = \frac{1}{2}I_x \omega_x^2 + \frac{1}{2}I_y \omega_y^2 + \frac{1}{2}I_z \omega_z^2
$$
 (2)

Using the parallel-axis theorem, the moments of inertia of the gear about point *C* are as follows: llows:
 $\frac{1}{2}$ (10 kg)(0.1 m)² = 0.05 kg · m²

$$
I_x = \frac{1}{2}(10 \text{ kg})(0.1 \text{ m})^2 = 0.05 \text{ kg} \cdot \text{m}^2
$$

$$
I_y = I_z = \frac{1}{4}(10 \text{ kg})(0.1 \text{ m})^2 + 10 \text{ kg}(0.3 \text{ m})^2 = 0.925 \text{ kg} \cdot \text{m}^2
$$

 $\omega_x = -3\omega_{CD}, \omega_y = 0, \omega_z = \omega_{CD},$

Since
$$
\omega_x = -3\omega_{CD}
$$
, $\omega_y = 0$, $\omega_z = \omega_{CD}$, Eq. 2 becomes
\n
$$
T_A = \frac{1}{2}(0.05)(-3\omega_{CD})^2 + 0 + \frac{1}{2}(0.925)(\omega_{CD})^2 = 0.6875\omega_{CD}^2
$$

Principle of Work and Energy. Applying the principle of work and energy, we obtain

$$
T_1 + \Sigma U_{1-2} = T_2
$$

0 + 62.83 = 0.6875 ω_{CD}^2
 $\omega_{CD} = 9.56 \text{ rad/s}$ Ans.

PROBLEMS

***21–20.** If a body contains *no planes of symmetry,* the principal moments of inertia can be determined mathematically. To show how this is done, consider the rigid body which is spinning with an angular velocity $\boldsymbol{\omega}$, directed along one of its principal axes of inertia. If the principal moment of inertia about this axis is *I*, the angular momentum moment of inertia about this axis is *I*, the angular momentum
can be expressed as $\mathbf{H} = I\boldsymbol{\omega} = I\omega_x \mathbf{i} + I\omega_y \mathbf{j} + I\omega_z \mathbf{k}$. The
components of **H** may also be expressed by Eqs. 21–10 components of **H** may also be expressed by Eqs. 21–10, where the inertia tensor is assumed to be known. Equate the **i**, **j**, and **k** components of both expressions for **H** and consider ω_x , ω_y , and ω_z to be unknown. The solution of these three
countions is obtained provided the determinant of the equations is obtained provided the determinant of the coefficients is zero. Show that this determinant, when expanded, yields the cubic equation

$$
I^3 - (I_{xx} + I_{yy} + I_{zz})I^2
$$

+ $(I_{xx}I_{yy} + I_{yy}I_{zz} + I_{zz}I_{xx} - I_{xy}^2 - I_{yz}^2 - I_{zx}^2)I$
- $(I_{xx}I_{yy}I_{zz} - 2I_{xy}I_{yz}I_{zx} - I_{xx}I_{yz}^2 - I_{yy}I_{zx}^2 - I_{zz}I_{xy}^2) = 0$

The three positive roots of *I,* obtained from the solution of this equation, represent the principal moments of inertia I_x , I_y , and I_z .

•**21–21.** Show that if the angular momentum of a body is determined with respect to an arbitrary point *A*, then \mathbf{H}_{A}
can be expressed by Eq. 21.0. This requires substituting can be expressed by Eq. 21–9. This requires substituting can be expressed by Eq. 21–9. This requires substituting $\rho_A = \rho_G + \rho_{G/A}$ into Eq. 21–6 and expanding, noting that $\int \rho_G dm = 0$ by definition of the mass center and $\mathbf{v}_G = \mathbf{v}_A + \boldsymbol{\omega} \times \boldsymbol{\rho}_{G/A}.$ $\rho_G + \rho_{G/A}$
 $\int \rho_G dm = 0$
 $\mathbf{v}_A + \omega \times \rho_G$

21–22. The 4-lb rod *AB* is attached to the disk and collar using ball-and-socket joints. •**21–37.** The plate has a mass of 10 kg and is suspended from parallel cords. If the plate has an angular velocity of 1.5 rad/s about the *z* axis at the instant shown, determine how high the center of the plate rises at the instant the plate momentarily stops swinging.

21–39. The bent rod has a mass per unit length of 6 kg/m , and its moments and products of inertia have been calculated in Prob. 21–9. If shaft *AB* rotates with a constant calculated in Prob. 21–9. If shaft *AB* rotates with a constant
angular velocity of $\omega_z = 6$ rad/s, determine the angular
momentum of the rod about point *O* and the kinetic energy momentum of the rod about point *O*, and the kinetic energy of the rod.

Prob. 21–39

*21.4 [Equations of Motion](#page-15-0)

Having become familiar with the techniques used to describe both the inertial properties and the angular momentum of a body, we can now write the equations which describe the motion of the body in their most useful forms.

Equations of Translational Motion. The *translational motion* of a body is defined in terms of the acceleration of the body's mass center, which is measured from an inertial *X, Y, Z* reference. The equation of translational motion for the body can be written in vector form as

$$
\Sigma \mathbf{F} = m \mathbf{a}_G \tag{21-18}
$$

or by the three scalar equations

$$
\Sigma F_x = m(a_G)_x
$$

\n
$$
\Sigma F_y = m(a_G)_y
$$

\n
$$
\Sigma F_z = m(a_G)_z
$$
\n(21-19)

Here, $\Sigma \mathbf{F} = \Sigma F_x \mathbf{i} + \Sigma F_y \mathbf{j} + \Sigma F_z \mathbf{k}$ represents the sum of all the external forces acting on the body external forces acting on the body.

Equations of Rotational Motion. In Sec. 15.6, we developed Eq. 15–17, namely,

$$
\Sigma \mathbf{M}_O = \dot{\mathbf{H}}_O \tag{21-20}
$$

which states that the sum of the moments of all the external forces acting on a system of particles (contained in a rigid body) about a fixed point *O* is equal to the time rate of change of the total angular momentum of the body about point *O*. When moments of the external forces acting on the particles are summed about the system's *mass center G*, one again obtains the same simple form of Eq. $21-20$, relating the moment summation $\Sigma \mathbf{M}_G$ to the angular momentum \mathbf{H}_G . To show this, consider the system of particles in Fig. 21, 11, where Y, Y, Z represents an inertial the system of particles in Fig. 21–11, where *X, Y, Z* represents an inertial frame of reference and the *x, y, z* axes, with origin at *G, translate* with respect to this frame. In general, *G* is *accelerating*, so by definition the translating frame is *not* an inertial reference. The angular momentum of the *i*th particle with respect to this frame is, however,

$$
(\mathbf{H}_i)_G = \mathbf{r}_{i/G} \times m_i \mathbf{v}_{i/G}
$$

where $\mathbf{r}_{i/G}$ and $\mathbf{v}_{i/G}$ represent the position and velocity of the *i*th particle with represent to G . Taking the time derivative we have with respect to *G*. Taking the time derivative we have |
|
| |
|
| \mathbf

$$
(\dot{\mathbf{H}}_i)_G = \dot{\mathbf{r}}_{i/G} \times m_i \mathbf{v}_{i/G} + \mathbf{r}_{i/G} \times m_i \dot{\mathbf{v}}_{i/G}
$$

Fig. 21–11

By definition, $\mathbf{v}_{i/G} = \dot{\mathbf{r}}_{i/G}$. Thus, the first term on the right side is zero since the gross product of the same vectors is zero. Also $\mathbf{g}_{\text{max}} = \dot{\mathbf{g}}$, so that By definition, $\mathbf{v}_{i/G} = \dot{\mathbf{r}}_{i/G}$. Thus, the first term on the right side is zero since the cross product of the same vectors is zero. Also, $\mathbf{a}_{i/G} = \dot{\mathbf{v}}_{i/G}$, so that $\overline{}$ $\ddot{v}_{i/G},$ $\frac{\dot{r}_{i/G}}{\delta^{f+1}}$

$$
(\dot{\mathbf{H}}_i)_G = (\mathbf{r}_{i/G} \times m_i \mathbf{a}_{i/G})
$$

Similar expressions can be written for the other particles of the body. When the results are summed, we get **a**

$$
\dot{\mathbf{H}}_G = \Sigma(\mathbf{r}_{i/G} \times m_i \mathbf{a}_{i/G})
$$

Here H_G is the time rate of change of the total angular momentum of the body computed about point *G*. G

The relative acceleration for the *i*th particle is defined by the equation The relative acceleration for the *i*th particle is defined by the equation $\mathbf{a}_{i/G} = \mathbf{a}_i - \mathbf{a}_G$, where \mathbf{a}_i and \mathbf{a}_G represent, respectively, the accelerations of the *i*th particle and point G measured of the *i*th particle and point *G* measured with respect to the *inertial frame of reference*. Substituting and expanding, using the distributive property of the vector cross product, yields #

$$
\dot{\mathbf{H}}_G = \Sigma(\mathbf{r}_{i/G} \times m_i \mathbf{a}_i) - (\Sigma m_i \mathbf{r}_{i/G}) \times \mathbf{a}_G
$$

By definition of the mass center, the sum $(\sum m_i \mathbf{r}_{i/G}) = (\sum m_i)\mathbf{\bar{r}}$ is equal to zero, since the position vector $\mathbf{\bar{r}}$ relative to G is zero. Hence, the last to zero, since the position vector $\bar{\mathbf{r}}$ relative to G is zero. Hence, the last term in the above equation is zero. Using the equation of motion, the product $m_i \mathbf{a}_i$ can be replaced by the resultant *external force* \mathbf{F}_i acting on the *i*th particle Denoting $\sum \mathbf{M}_G = \sum (\mathbf{r}_{\text{trG}} \times \mathbf{F})$, the final result can be product m_i **a**_i can be replaced by the resultant *external force* \mathbf{F}_i acting on the *i*th particle. Denoting $\sum \mathbf{M}_G = \sum (\mathbf{r}_{i/G} \times \mathbf{F}_i)$, the final result can be written as written as

$$
\Sigma \mathbf{M}_G = \dot{\mathbf{H}}_G \tag{21-21}
$$

The rotational equation of motion for the body will now be developed from either Eq. 21–20 or 21–21. In this regard, the scalar components of the angular momentum H_O or H_G are defined by Eqs. 21–10 or, if
principal axes of inertia are used either at point O or G by Eqs. 21–11 If principal axes of inertia are used either at point *O* or *G*, by Eqs. 21–11. If these components are computed about *x, y, z* axes that are *rotating* with æan angular velocity Ω that is *different* from the body's angular velocity ω , then the time derivative $\dot{\mathbf{H}} = d\mathbf{H}/dt$, as used in Eqs. 21–20 and 21–21, must account for the rotation of the x y z axes as measure then the time derivative $H = dH/dt$, as used in Eqs. 21–20 and 21–21, must account for the rotation of the *x*, *y*, *z* axes as measured from the inertial *X*, *Y*, *Z* axes. This requires application of Eq. 20–6, in which case Eqs. 21–20 and 21–21 become |
|
|

$$
\Sigma \mathbf{M}_O = (\dot{\mathbf{H}}_O)_{xyz} + \mathbf{\Omega} \times \mathbf{H}_O
$$

$$
\Sigma \mathbf{M}_G = (\dot{\mathbf{H}}_G)_{xyz} + \mathbf{\Omega} \times \mathbf{H}_G
$$
 (21–22)

Here $(\mathbf{H})_{xyz}$ is the time rate of change of **H** measured from the *x*, *y*, *z* reference reference.

There are three ways in which one can define the motion of the *x, y, z* axes. Obviously, motion of this reference should be chosen so that it will yield the simplest set of moment equations for the solution of a particular problem.

x, y, z Axes Having Motion $\Omega = 0$. If the body has general motion, the *x, y, z* axes can be chosen with origin at *G*, such that the axes only *translate* relative to the inertial *X*, *Y*, *Z* frame of reference. Doing this simplifies Eq. 21–22, since $\Omega = 0$. However, the body may have a this simplifies Eq. 21–22, since $\Omega = 0$. However, the body may have a rotation $\boldsymbol{\omega}$ about these axes, and therefore the moments and products of inertia of the body would have to be expressed as *functions of time*. In most cases this would be a difficult task, so that such a choice of axes has restricted application.

x, y, z Axes Having Motion $\Omega = \omega$ **.** The *x*, *y*, *z* axes can be chosen such that they are *fixed in and move with the body*. The moments and products of inertia of the body relative to these axes will then be constant during the motion. Since $\Omega = \omega$. Eqs. 21–22 become *constant* during the motion. Since $\Omega = \omega$, Eqs. 21–22 become

$$
\Sigma \mathbf{M}_O = (\dot{\mathbf{H}}_O)_{xyz} + \boldsymbol{\omega} \times \mathbf{H}_O
$$

\n
$$
\Sigma \mathbf{M}_G = (\dot{\mathbf{H}}_G)_{xyz} + \boldsymbol{\omega} \times \mathbf{H}_G
$$
\n(21-23)

We can express each of these vector equations as three scalar equations using Eqs. 21–10. Neglecting the subscripts *O* and *G* yields

$$
\Sigma M_x = I_{xx} \dot{\omega}_x - (I_{yy} - I_{zz}) \omega_y \omega_z - I_{xy} (\dot{\omega}_y - \omega_z \omega_x)
$$

\n
$$
- I_{yz} (\omega_y^2 - \omega_z^2) - I_{zx} (\dot{\omega}_z + \omega_x \omega_y)
$$

\n
$$
\Sigma M_y = I_{yy} \dot{\omega}_y - (I_{zz} - I_{xx}) \omega_z \omega_x - I_{yz} (\dot{\omega}_z - \omega_x \omega_y)
$$

\n
$$
- I_{zx} (\omega_z^2 - \omega_x^2) - I_{xy} (\dot{\omega}_x + \omega_y \omega_z)
$$

\n
$$
\Sigma M_z = I_{zz} \dot{\omega}_z - (I_{xx} - I_{yy}) \omega_x \omega_y - I_{zx} (\dot{\omega}_x - \omega_y \omega_z)
$$

\n
$$
- I_{xy} (\omega_x^2 - \omega_y^2) - I_{yz} (\dot{\omega}_y + \omega_z \omega_x)
$$

\n(21-24)

If the *x, y*, *z* axes are chosen as *principal axes of inertia*, the products of If the *x*, *y*, *z* axes are chosen as *principal axes of inertia*, the pr inertia are zero, $I_{xx} = I_x$, etc., and the above equations become

$$
\Sigma M_x = I_x \dot{\omega}_x - (I_y - I_z) \omega_y \omega_z
$$

\n
$$
\Sigma M_y = I_y \dot{\omega}_y - (I_z - I_x) \omega_z \omega_x
$$

\n
$$
\Sigma M_z = I_z \dot{\omega}_z - (I_x - I_y) \omega_x \omega_y
$$
\n(21-25)

This set of equations is known historically as the *Euler equations of motion*, named after the Swiss mathematician Leonhard Euler, who first developed them. They apply *only* for moments summed about either point *O* or *G*.

When applying these equations it should be realized that $\dot{\omega}_x$, $\dot{\omega}_y$, $\dot{\omega}_z$ represent the time derivatives of the magnitudes of the *x, y, z* components of ω as observed from *x*, *y*, *z*. To determine these components, it is first necessary to find ω_x , ω_y , ω_z when the *x*, *y*, *z* axes
are oriented in a *general* nosition and than take the time derivative of the are oriented in a *general position* and *then* take the time derivative of the magnitude of these components, i.e., $(\dot{\omega})_{xyz}$. However, since the *x*, *y*, *z* axes are rotating at $\Omega = \omega$, then from Eq. 20–6, it should be noted that axes are rotating at $\Omega = \omega$, then from Eq. 20–6, it should be noted that $\dot{\omega} = (\dot{\omega})_{xyz} + \omega \times \omega$. Since $\omega \times \omega = 0$, then $\dot{\omega} = (\dot{\omega})_{xyz}$. This important result indicates that the time derivative of ω with respect ω)_{xyz} + $\omega \times \omega$. Since $\omega \times \omega = 0$, then $\omega = (\omega)_{xyz}$. This important result indicates that the time derivative of $\boldsymbol{\omega}$ with respect to the fixed X, Y, Z axes, that is $\dot{\omega}$, can also be used to obtain $(\dot{\omega})_{xyz}$. Generally this is the easiest way to determine the result. See Example 21.5 Example 21.5. #.
.
. .
. .
. .
. rotating at $\Omega =$
 $\int_{xyz} + \omega \times \omega$. # $\dot{\omega}_x$, $\dot{\omega}_y$,

x, y, z Axes Having Motion $\Omega \neq \omega$. To simplify the calculations for the time derivative of $\boldsymbol{\omega}$, it is often convenient to choose the *x*, *y*, *z* axes having an angular velocity Ω which is different from the angular velocity $\boldsymbol{\omega}$ of the body. This is particularly suitable for the analysis of spinning tops and gyroscopes which are *symmetrical* about their spinning axes.* When this is the case, the moments and products of inertia remain constant about the axis of spin.

Equations 21–22 are applicable for such a set of axes. Each of these two vector equations can be reduced to a set of three scalar equations which are derived in a manner similar to Eqs. 21–25,[†] i.e.,

$$
\Sigma M_x = I_x \dot{\omega}_x - I_y \Omega_z \omega_y + I_z \Omega_y \omega_z \n\Sigma M_y = I_y \dot{\omega}_y - I_z \Omega_x \omega_z + I_x \Omega_z \omega_x \n\Sigma M_z = I_z \dot{\omega}_z - I_x \Omega_y \omega_x + I_y \Omega_x \omega_y
$$
\n(21–26)

Here Ω_x , Ω_y , Ω_z represent the *x, y, z* components of Ω , measured from the inertial frame of reference and ϕ , ϕ , ϕ , must be determined the inertial frame of reference, and $\dot{\omega}_x$, $\dot{\omega}_y$, $\dot{\omega}_z$ must be determined relative to the *x*, *y*, *z* axes that have the rotation Ω . See Example 21.6. ## $\dot{\omega}_x$, $\dot{\omega}_y$,

Any one of these sets of moment equations, Eqs. 21–24, 21–25, or 21–26, represents a series of three first-order nonlinear differential equations. These equations are "coupled," since the angular-velocity components are present in all the terms. Success in determining the solution for a particular problem therefore depends upon what is unknown in these equations. Difficulty certainly arises when one attempts to solve for the unknown components of $\boldsymbol{\omega}$ when the external moments are functions of time. Further complications can arise if the moment equations are coupled to the three scalar equations of translational motion, Eqs. 21–19. This can happen because of the existence of kinematic constraints which relate the rotation of the body to the translation of its mass center, as in the case of a hoop which rolls

^{*}A detailed discussion of such devices is given in Sec. 21.5. †See Prob. 21–42.

without slipping. Problems that require the simultaneous solution of differential equations are generally solved using numerical methods with the aid of a computer. In many engineering problems, however, we are given information about the motion of the body and are required to determine the applied moments acting on the body. Most of these problems have direct solutions, so that there is no need to resort to computer techniques.

Procedure for Analysis

Problems involving the three-dimensional motion of a rigid body can be solved using the following procedure.

Free-Body Diagram.

- Draw a *free-body diagram* of the body at the instant considered and specify the *x, y, z* coordinate system. The origin of this reference must be located either at the body's mass center *G*, or at point *O*, considered fixed in an inertial reference frame and located either in the body or on a massless extension of the body.
- Unknown reactive force components can be shown having a positive sense of direction.
- Depending on the nature of the problem, decide what type of rotational motion Ω the *x*, *y*, *z* coordinate system should have, i.e., $\Omega = 0$, $\Omega = \omega$, or $\Omega \neq \omega$. When choosing, keep in mind i.e., $\Omega = 0$, $\Omega = \omega$, or $\Omega \neq \omega$. When choosing, keep in mind that the moment equations are simplified when the axes move in such a manner that they represent principal axes of inertia for the body at all times.
- Compute the necessary moments and products of inertia for the body relative to the *x, y, z* axes.

Kinematics.

- Determine the *x*, *y*, *z* components of the body's angular velocity and find the time derivatives of ω . ##
- Note that if $\Omega = \omega$, then $\dot{\omega} = (\dot{\omega})_{xyz}$. Therefore we can either find the time derivative of $\boldsymbol{\omega}$ with respect to the *X*, *Y*, *Z* axes, $\boldsymbol{\omega}$, and then determine its components $\dot{\omega}_x$, $\dot{\omega}_y$, $\dot{\omega}_z$, or we can find the components of ω along the *x*, *y*, *z* axes, when the axes are oriented in a general position, and then take the time derivative of the magnitudes of these components, $(\dot{\boldsymbol{\omega}})_{xyz}$. .
. # $\vec{w}_x, \vec{w}_y, \vec{w}_z,$
 $\vec{w}_x, \vec{w}_y, \vec{w}_z,$.
. time derivatives of $\boldsymbol{\omega}$.
 $\boldsymbol{\Omega} = \boldsymbol{\omega}$, then $\dot{\boldsymbol{\omega}} = (\dot{\boldsymbol{\omega}})_{xyz}$.

Equations of Motion.

• Apply either the two vector equations $21-18$ and $21-22$ or the six scalar component equations appropriate for the *x, y, z* coordinate axes chosen for the problem.

$EXAMPLE$ 21.4

The gear shown in Fig. 21–12*a* has a mass of 10 kg and is mounted at an angle of 10° with the rotating shaft having negligible mass. If The gear shown in Fig. 21–12*a* has a mass of 10 kg and is mounted at
an angle of 10° with the rotating shaft having negligible mass. If
 $I_z = 0.1 \text{ kg} \cdot \text{m}^2$, $I_x = I_y = 0.05 \text{ kg} \cdot \text{m}^2$, and the shaft is rotating with $I_z = 0.1 \text{ kg} \cdot \text{m}^2$, $I_x = I_y = 0.05 \text{ kg} \cdot \text{m}^2$, and the shaft is rotating with a constant angular velocity of $\omega = 30 \text{ rad/s}$, determine the components of reaction that the thrust bearing *A* and journal bearing *B* exert on the shaft at the instant shown.

SOLUTION

Free-Body Diagram. Fig. 21–12*b*. The origin of the *x, y, z* coordinate system is located at the gear's center of mass *G*, which is also a fixed point. The axes are fixed in and rotate with the gear so that these axes will then always represent the principal axes of inertia
for the gear. Hence $\Omega = \omega$. for the gear. Hence $\Omega = \omega$.

Kinematics. As shown in Fig. 21–12*c*, the angular velocity $\boldsymbol{\omega}$ of the gear is constant in magnitude and is always directed along the axis of the shaft *AB*. Since this vector is measured from the *X, Y, Z* inertial frame of reference, for any position of the *x*, *y*, *z* axes,
 $\omega_x = 0$ $\omega_y = -30 \sin 10^\circ$ $\omega_z = 30 \cos 10^\circ$

$$
\omega_x = 0
$$
 $\omega_y = -30 \sin 10^\circ$ $\omega_z = 30 \cos 10^\circ$

These components remain constant for any general orientation of These components remain constant for any general orientation of
the *x*, *y*, *z* axes, and so $\omega_x = \omega_y = \omega_z = 0$. Also note that since $\Omega = \omega$,
then $\phi = (\omega)$. Therefore, we gen find these time derivatives then $\dot{\boldsymbol{\omega}} = (\dot{\boldsymbol{\omega}})_{xyz}$. Therefore, we can find these time derivatives relative to the *X, Y, Z* axes. In this regard ω has a constant magnitude
and direction (+*Z*) since $\dot{\omega} = 0$, and so $\dot{\omega}_x = \dot{\omega}_y = \dot{\omega}_z = 0$.
Furthermore since *G* is a fixed point $(a_1) = (a_2) = (a_3) = 0$ and direction (+Z) since $\dot{\omega} = 0$, and so $\dot{\omega}$ and direction $(+Z)$ since $\dot{\omega} = 0$, and so $\dot{\omega}_x = \dot{\omega}_y = \dot{\omega}_z$.

Furthermore, since *G* is a fixed point, $(a_G)_x = (a_G)_y = (a_G)_z = 0$. # $(a_G)_y =$
 $(\Omega = \omega)$ $\omega_x = \dot{\omega}$
= (c) #t magi
 $y = \omega$.

A_X(0.2) \sin 10^\circ - B_X(0.25) \sin 10^\circ = 0 - 0
$$
\n
$$
A_X = 1.25B_X \text{ (check)}
$$

$$
A_X = B_X = 0
$$
 $A_Y = 71.6$ N $B_Y = 26.5$ N *An*.

EXAMPLE 21.5

The airplane shown in Fig. 21–13*a* is in the process of making a steady *horizontal* turn at the rate of ω_p . During this motion, the propeller is spinning at the rate of ω_s . If the propeller has two
blades determine the moments which the propeller shaft exerts on blades, determine the moments which the propeller shaft exerts on the propeller at the instant the blades are in the vertical position. For simplicity, assume the blades to be a uniform slender bar having a moment of inertia *I* about an axis perpendicular to the blades passing through the center of the bar, and having zero moment of inertia about a longitudinal axis.

SOLUTION

Free-Body Diagram. Fig. 21–13*b*. The reactions of the connecting shaft on the propeller are indicated by the resultants \mathbf{F}_R and \mathbf{M}_R . (The propeller's weight is assumed to be negligible). The x y z axes will be propeller's weight is assumed to be negligible.) The *x, y, z* axes will be taken fixed to the propeller, since these axes always represent the principal axes of inertia for the propeller. Thus, $\Omega = \omega$. The moments principal axes of inertia for the propeller. Thus, $\boldsymbol{\Omega} = \boldsymbol{\omega}.$ The moments principal axes of inertia for the propeller. Thus, $\Omega = \omega$
of inertia I_x and I_y are equal $(I_x = I_y = I)$ and $I_z = 0$.

Kinematics. The angular velocity of the propeller observed from the *X*, *Y*, *Z* axes, coincident with the *x*, *y*, *z* axes, Fig. 21–13*c*, is the *X*, *Y*, *Z* axes, coincident with the *x*, *y*, *z* axes, Fig. 21–13*c*, i
 $\omega = \omega_s + \omega_p = \omega_s \mathbf{i} + \omega_p \mathbf{k}$, so that the *x*, *y*, *z* components of ω are

$$
\omega_x = \omega_s \qquad \omega_y = 0 \qquad \omega_z = \omega_p
$$

Since $\Omega = \omega$, then $\dot{\omega} = (\dot{\omega})_{xyz}$. To find $\dot{\omega}$, which is the time derivative with respect to the fixed *X, Y, Z* axes, we can use Eq. 20–6 since ω changes direction relative to *X*, *Y*, *Z*. The time rate of change of each of these components $\dot{\omega} = \dot{\omega}_s + \dot{\omega}_p$ relative to the *X,Y, Z* axes can
be obtained by introducing a third coordinate system *x'*, *y'*, *z'*, which
has an angular velocity $Q' = \omega$, and is coincident with the *X* be obtained by introducing a third coordinate system x', y', z', which
has an angular velocity $\Omega' = \omega_{\text{eq}}$ and is coincident with the X Y Z axes has an angular velocity $\Omega' = \omega_p$ and is coincident with the *X, Y, Z* axes at the instant shown. Thus at the instant shown.Thus ## $\frac{1}{s} + \dot{\omega}$ # $\mathbb{R}^{\mathbb{Z}_2}$ $=(\dot{\boldsymbol{\omega}})$ $\Omega = \omega$, then $\dot{\omega} = (\dot{\omega})_{xyz}$.

$$
\dot{\boldsymbol{\omega}} = (\dot{\boldsymbol{\omega}})_{x'y'z'} + \boldsymbol{\omega}_p \times \boldsymbol{\omega}
$$

$$
= (\dot{\boldsymbol{\omega}}_s)_{x'y'z'} + (\dot{\boldsymbol{\omega}}_p)_{x'y'z'} + \boldsymbol{\omega}_p \times (\boldsymbol{\omega}_s + \boldsymbol{\omega}_p)
$$

$$
= 0 + 0 + \boldsymbol{\omega}_p \times \boldsymbol{\omega}_s + \boldsymbol{\omega}_p \times \boldsymbol{\omega}_p
$$

$$
= 0 + 0 + \boldsymbol{\omega}_p \mathbf{k} \times \boldsymbol{\omega}_s \mathbf{i} + \mathbf{0} = \boldsymbol{\omega}_p \boldsymbol{\omega}_s \mathbf{j}
$$

#

#

Since the *X, Y, Z* axes are coincident with the *x, y, z* axes at the instant shown, the components of $\dot{\boldsymbol{\omega}}$ along *x*, *y*, *z* are therefore #***** ##

$$
\dot{\omega}_x = 0 \qquad \dot{\omega}_y = \omega_p \omega_s \qquad \dot{\omega}_z = 0
$$

These same results can also be determined by direct calculation of $(\dot{\omega})_{xyz}$; however, this will involve a bit more work. To do this, it will be necessary to view the propeller (or the x, y, z axes) in some general necessary to view the propeller (or the *x, y, z* axes) in some *general position* such as shown in Fig. 21–13*d*. Here the plane has turned through an angle ϕ (phi) and the propeller has turned through an angle ψ (psi) relative to the plane. Notice that ω_p is always directed
clong the fixed Z axis and ω follows the x axis. Thus the general along the fixed *Z* axis and ω_s follows the *x* axis. Thus the general components of ω are components of $\boldsymbol{\omega}$ are #

$$
\omega_x = \omega_s
$$
 $\omega_y = \omega_p \sin \psi$ $\omega_z = \omega_p \cos \psi$

Since ω_s and ω_p are constant, the time derivatives of these components become

$$
\dot{\omega}_x = 0
$$
 $\dot{\omega}_y = \omega_p \cos \psi \dot{\psi}$ $\omega_z = -\omega_p \sin \psi \dot{\psi}$

But $\phi = \psi = 0^{\circ}$ and $\psi = \omega_s$ at the instant considered. Thus, $\phi = \psi = 0^{\circ}$ and $\dot{\psi} = \omega_s$

$$
\omega_x = \omega_s \qquad \omega_y = 0 \qquad \omega_z = \omega_p
$$

$$
\dot{\omega}_x = 0 \qquad \dot{\omega}_y = \omega_p \omega_s \qquad \dot{\omega}_z = 0
$$

which are the same results as those obtained previously.

Equations of Motion. Using Eqs. 21–25, we have #

$$

$$
 Ans.

$EXAMPLE$ 21.6

Fig. 21–14

The 10-kg flywheel (or thin disk) shown in Fig. 21–14*a* rotates (spins) The 10-kg flywheel (or thin disk) shown in Fig. 21–14*a* rotates (spins) about the shaft at a constant angular velocity of $\omega_s = 6$ rad/s. At the same time, the shaft rotates (precessing) about the begring at A with same time, the shaft rotates (precessing) about the bearing at *A* with same time, the shaft rotates (precessing) about the bearing at *A* with
an angular velocity of $\omega_p = 3$ rad/s. If *A* is a thrust bearing and *B* is a
journal bearing determine the components of force reaction at each journal bearing, determine the components of force reaction at each of these supports due to the motion.

SOLUTION I

Free-Body Diagram. Fig. 21–14*b*. The origin of the *x, y, z* coordinate system is located at the center of mass *G* of the flywheel. Here we will let these coordinates have an angular velocity of $\Omega = \omega_{\text{R}} = \{3k\}$ rad/s. system is located at the center of mass G of the flywheel. Here we will let
these coordinates have an angular velocity of $\Omega = \omega_p = {\{3\mathbf{k}\}}$ rad/s.
Although the wheel spins relative to these axes, the moments of inertial Although the wheel spins relative to these axes, the moments of inertia *remain constant*,* i.e.,

* i.e.,
\n
$$
I_x = I_z = \frac{1}{4}(10 \text{ kg})(0.2 \text{ m})^2 = 0.1 \text{ kg} \cdot \text{m}^2
$$
\n
$$
I_y = \frac{1}{2}(10 \text{ kg})(0.2 \text{ m})^2 = 0.2 \text{ kg} \cdot \text{m}^2
$$

Kinematics. From the coincident inertial *X, Y, Z* frame of reference, Fig. 21–14*c*, the flywheel has an angular velocity of reference, Fig. 21–14*c*, the
 $\omega = \{6j + 3k\}$ rad/s, so that

$$
\omega_x = 0
$$
 $\omega_y = 6 \text{ rad/s}$ $\omega_z = 3 \text{ rad/s}$

The time derivative of $\boldsymbol{\omega}$ must be determined relative to the *x*, *y*, *z* axes. In this case both $\boldsymbol{\omega}_p$ and $\boldsymbol{\omega}_s$ do not change their magnitude or direction and so direction, and so

$$
\dot{\omega}_x = 0 \quad \dot{\omega}_y = 0 \quad \dot{\omega}_z = 0
$$

Equations of Motion. Applying Eqs. 21-26 ($\Omega \neq \omega$) yields

$$
\Sigma M_x = I_x \dot{\omega}_x - I_y \Omega_z \omega_y + I_z \Omega_y \omega_z
$$

- $A_z(0.5) + B_z(0.5) = 0 - (0.2)(3)(6) + 0 = -3.6$
 $\Sigma M_y = I_y \dot{\omega}_y - I_z \Omega_x \omega_z + I_x \Omega_z \omega_x$
 $0 = 0 - 0 + 0$
 $\Sigma M_z = I_z \dot{\omega}_z - I_x \Omega_y \omega_x + I_y \Omega_x \omega_y$
 $A_x(0.5) - B_x(0.5) = 0 - 0 + 0$

* This would not be true for the propeller in Example 21.5.

Applying Eqs. 21–19, we have ©

$$
\Sigma F_X = m(a_G)_X; \qquad A_x + B_x = 0
$$

\n
$$
\Sigma F_Y = m(a_G)_Y; \qquad A_y = -10(0.5)(3)^2
$$

\n
$$
\Sigma F_Z = m(a_G)_Z; \qquad A_z + B_z - 10(9.81) = 0
$$

Solving these equations, we obtain

NOTE: If the precession ω_p had not occurred, the *z* component of force at *A* and *B* would be equal to 49.05 N. In this case, however the force at *A* and *B* would be equal to 49.05 N. In this case, however, the difference in these components is caused by the "gyroscopic moment" created whenever a spinning body precesses about another axis. We will study this effect in detail in the next section.

SOLUTION II

This example can also be solved using Euler's equations of motion, This example can also be solved using Euler's equations of motion,
Eqs. 21–25. In this case $\Omega = \omega = \{6j + 3k\}$ rad/s, and the time derivative $(\dot{\omega})_{xyz}$ can be conveniently obtained with reference to the fixed X, Y, Z axes since $\dot{\omega} = (\dot{\omega})$. This coloring can be fixed *X, Y, Z* axes since $\dot{\omega} = (\dot{\omega})_{xyz}$. This calculation can be nonformed by chaosing *v', y', z' axes* to have an angular velocity of fixed X, Y, Z axes since $\dot{\omega} = (\dot{\omega})_{xyz}$. This calculation can be performed by choosing x', y', z' axes to have an angular velocity of X, x, x'
 $\Omega' = \omega$. Fig. 21, 14c so that performed by choosing x', y'
 $\Omega' = \omega_p$, Fig. 21–14*c*, so that # $= \boldsymbol{\omega}_p,$ #|
|

$$
\dot{\boldsymbol{\omega}} = (\dot{\boldsymbol{\omega}})_{x'y'z'} + \boldsymbol{\omega}_p \times \boldsymbol{\omega} = 0 + 3\mathbf{k} \times (6\mathbf{j} + 3\mathbf{k}) = \{-18\mathbf{i}\} \text{ rad/s}^2
$$

$$
\dot{\boldsymbol{\omega}}_x = -18 \text{ rad/s} \quad \dot{\boldsymbol{\omega}}_y = 0 \quad \dot{\boldsymbol{\omega}}_z = 0
$$

The moment equations then become **.**

$$
\Sigma M_x = I_x \dot{\omega}_x - (I_y - I_z) \omega_y \omega_z
$$

-A_z(0.5) + B_z(0.5) = 0.1(-18) - (0.2 - 0.1)(6)(3) = -3.6

$$
\Sigma M_y = I_y \dot{\omega}_y - (I_z - I_x) \omega_z \omega_x
$$

0 = 0 - 0

$$
\Sigma M_z = I_z \dot{\omega}_z - (I_x - I_y) \omega_x \omega_y
$$

A_x(0.5) - B_x(0.5) = 0 - 0

The solution then proceeds as before.

PROBLEMS

***21–40.** Derive the scalar form of the rotational equation ***21–40.** Derive the scalar form of the rotational equation of motion about the *x* axis if $\Omega \neq \omega$ and the moments and products of inertia of the body are *not constant* with respect to time.

•**21–41.** Derive the scalar form of the rotational **•21–41.** Derive the scalar form of the rotational equation of motion about the *x* axis if $\Omega \neq \omega$ and the moments and products of inertia of the body are *constant* with respect to time.

21–42. Derive the Euler equations of motion for $\Omega \neq \omega$, i.e., Eqs. 21–26.

21–43. The uniform rectangular plate has a mass of **21–43.** The uniform rectangular plate has a mass of $m = 2$ kg and is given a rotation of $\omega = 4$ rad/s about its bearings at 4 and B If $\alpha = 0.2$ m and $\alpha = 0.3$ m determine $m = 2$ kg and is given a rotation of $\omega = 4$ rad/s about its
bearings at *A* and *B*. If $a = 0.2$ m and $c = 0.3$ m, determine the vertical reactions at *A* and *B* at the instant the plate is vertical as shown. Use the *x*, *y*, *z* axes shown and note that

*21–44. The disk, having a mass of 3 kg , is mounted eccentrically on shaft *AB.* If the shaft is rotating at a constant rate of 9 rad/s, determine the reactions at the journal bearing supports when the disk is in the position shown.

21

•**21–45.** The slender rod *AB* has a mass *m* and it is connected to the bracket by a smooth pin at *A*. The bracket is rigidly attached to the shaft. Determine the required constant angular velocity of ω of the shaft, in order for the rod to make an angle of θ with the vertical.

Prob. 21–45

21–46. The 5-kg rod *AB* is supported by a rotating arm.The support at *A* is a journal bearing, which develops reactions normal to the rod.The support at *B* is a thrust bearing, which develops reactions both normal to the rod and along the axis of the rod. Neglecting friction, determine the *x*, *y*, *z* components of reaction at these supports when the frame rotates with a constant angular velocity of $\omega = 10$ rad/s.

21–47. The car travels around the curved road of radius ρ such that its mass center has a constant speed v_G . Write the equations of rotational motion with respect to the *x*, *y*, *z* axes. Assume that the car's six moments and products of inertia with respect to these axes are known.

Prob. 21–47

***21–48.** The shaft is constructed from a rod which has a mass per unit length of 2 kg/m . Determine the *x*, *y*, *z* components of reaction at the bearings *A* and *B* if at the instant shown the shaft spins freely and has an angular instant shown the shaft spins freely and has an angular velocity of $\omega = 30$ rad/s. What is the angular acceleration of the shaft at this instant? Bearing *A* can support a component of force in the *y* direction, whereas bearing *B* cannot.

•**21–49.** Four spheres are connected to shaft *AB.* If •21–49. Four spheres are connected to shaft AB. If $m_C = 1$ kg and $m_E = 2$ kg, determine the mass of spheres D and E and the angles of the rods θ_2 and θ_3 so that the *D* and *F* and the angles of the rods, θ_D and θ_F , so that the solution of the solution shaft is dynamically balanced, that is, so that the bearings at *A* and *B* exert only vertical reactions on the shaft as it rotates. Neglect the mass of the rods.

21–50. A man stands on a turntable that rotates about a vertical axis with a constant angular velocity of vertical axis with a constant angular velocity of $\omega_p = 10 \text{ rad/s}$. If the wheel that he holds spins with a constant angular speed of $\omega = 30 \text{ rad/s}$ determine the $\omega_p = 10 \text{ rad/s}$. If the wheel that he holds spins with a constant angular speed of $\omega_s = 30 \text{ rad/s}$, determine the magnitude of moment that he must exert on the wheel to magnitude of moment that he must exert on the wheel to hold it in the position shown. Consider the wheel as a thin circular hoop (ring) having a mass of 3 kg and a mean radius of 300 mm.

21–51. The 50-lb disk spins with a constant angular rate of **21–51.** The 50-lb disk spins with a constant angular rate of $\omega_1 = 50$ rad/s about its axle. Simultaneously, the shaft $\omega_1 = 50 \text{ rad/s}$ about its axle. Simultaneously, the shaft rotates with a constant angular rate of $\omega_2 = 10 \text{ rad/s}$. Determine the *x*, *y*, *z* components of the moment developed in the arm at *A* at the instant shown. Neglect the weight of arm *AB*.

Prob. 21–51

***21–52.** The man stands on a turntable that rotates about a ***21–52.** The man stands on a turntable that rotates about a vertical axis with a constant angular velocity of $\omega_1 = 6$ rad/s. If he tilts his head forward at a constant angular velocity of If he tilts his head forward at a constant angular velocity of $\omega_2 = 1.5$ rad/s about point *O*, determine the magnitude of the moment that must be resisted by his neck at *O* at the the moment that must be resisted by his neck at O at the instant $\theta = 30^{\circ}$. Assume that his head can be considered as a uniform 10-lb sphere, having a radius of 4.5 in. and center of gravity located at *G*, and point *O* is on the surface of the sphere.

21–54. Rod *CD* of mass *m* and length *L* is rotating with a constant angular rate of ω_1 about axle *AB*, while shaft *EF* rotates with a constant angular rate of ω_2 . Determine the *X*, *Y*, and *Z* components of reaction at thrust bearing *E* and journal bearing *F* at the instant shown. Neglect the mass of the other members.

Prob. 21–54

Prob. 21–52

•**21–53.** The blades of a wind turbine spin about the shaft *S* with a constant angular speed of ω_s , while the frame
processes about the vertical exist with a constant angular precesses about the vertical axis with a constant angular speed of ω_p . Determine the *x*, *y*, and *z* components of moment that the shaft exerts on the blodes as a function of moment that the shaft exerts on the blades as a function of . Consider each blade as a slender rod of mass *m* and u length *l*.

Prob. 21–55

***21–56.** A stone crusher consists of a large thin disk which is pin connected to a horizontal axle. If the axle rotates at a constant rate of 8 rad/s , determine the normal force which the disk exerts on the stones. Assume that the disk rolls without slipping and has a mass of 25 kg. Neglect the mass of the axle.

21–59. If shaft *AB* rotates with a constant angular velocity **21–59.** If shaft *AB* rotates with a constant angular velocity of $\omega = 50$ rad/s, determine the *X*, *Y*, *Z* components of reaction at journal bearing *A* and thrust bearing *B* at the instant shown. The thin plate has a mass of 10 kg. Neglect the mass of shaft *AB*.

•**21–57.** The 25-lb disk is *fixed* to rod *BCD*, which has negligible mass. Determine the torque **T** which must be applied to the vertical shaft so that the shaft has an angular applied to the vertical shaft so that the shaft has an angular acceleration of $\alpha = 6$ rad/s². The shaft is free to turn in its bearings.

21–58. Solve Prob. 21–57, assuming rod *BCD* has a weight per unit length of $2 \frac{\text{lb}}{\text{ft}}$.

***21–60.** A thin uniform plate having a mass of 0.4 kg spins with a constant angular velocity $\boldsymbol{\omega}$ about its diagonal AB . If the person holding the corner of the plate at *B* releases his finger, the plate will fall downward on its side *AC.* Determine the necessary couple moment **M** which if applied to the plate would prevent this from happening.

Prob. 21–60

(b)

*21.5 [Gyroscopic Motion](#page-15-0)

In this section we will develop the equations defining the motion of a body (top) which is symmetrical with respect to an axis and rotating about a fixed point. These equations also apply to the motion of a particularly interesting device, the gyroscope.

The body's motion will be analyzed using *Euler angles* ϕ , θ , ψ (phi, theta, psi). To illustrate how they define the position of a body, consider the top shown in Fig. 21–15*a*. To define its final position, Fig. 21–15*d*, a second set of *x, y, z* axes is fixed in the top. Starting with the *X, Y, Z* and *x, y, z* axes in coincidence, Fig. 21–15*a*, the final position of the top can be determined using the following three steps:

- **1.** Rotate the top about the *Z* (or *z*) axis through an angle Rotate the top about the ϕ (0 $\leq \phi < 2\pi$), Fig. 21–15*b*.
- ϕ ($0 \le \phi < 2\pi$), Fig. 21-15*b*.
 2. Rotate the top about the *x* axis through an angle θ ($0 \le \theta \le \pi$), Fig. 21–15*c*.
- **3.** Rotate the top about the *z* axis through an angle ψ ($0 \le \psi < 2\pi$) to obtain the final position, Fig. 20–15*d*.

The sequence of these three angles, ϕ , θ , then ψ , must be maintained, since finite rotations are *not vectors* (see Fig. 20–1). Although this is the case, the differential rotations $d\phi$, $d\theta$, and $d\psi$ are vectors, and thus the angular velocity ω of the top can be expressed in terms of the time angular velocity ω of the top can be expressed in terms of the time derivatives of the Euler angles. The angular-velocity components angular velocity ω or the top can be expressed in terms of the time
derivatives of the Euler angles. The angular-velocity components $\dot{\phi}$, $\dot{\theta}$
and $\dot{\psi}$ are known as the *precession, nutation*, and *spin*, res s the
time
 $\dot{\phi}$, $\dot{\theta}$, $\boldsymbol{\omega}$

Fig. 21–15

Their positive directions are shown in Fig. 21–16. It is seen that these vectors are not all perpendicular to one another; however, $\boldsymbol{\omega}$ of the top can still be expressed in terms of these three components.

Since the body (top) is symmetric with respect to the *z* or spin axis, there is no need to attach the *x, y, z* axes to the top since the inertial properties of the top will remain constant with respect to this frame properties of the top will remain constant with respect to this frame
during the motion. Therefore $\Omega = \omega_p + \omega_n$, Fig. 21–16. Hence, the
angular velocity of the body is angular velocity of the body is

$$
\boldsymbol{\omega} = \omega_x \mathbf{i} + \omega_y \mathbf{j} + \omega_z \mathbf{k}
$$

= $\dot{\theta} \mathbf{i} + (\dot{\phi} \sin \theta) \mathbf{j} + (\dot{\phi} \cos \theta + \dot{\psi}) \mathbf{k}$ (21–27)

And the angular velocity of the axes is æ

$$
\Omega = \Omega_x \mathbf{i} + \Omega_y \mathbf{j} + \Omega_z \mathbf{k}
$$

= $\dot{\theta} \mathbf{i} + (\dot{\phi} \sin \theta) \mathbf{j} + (\dot{\phi} \cos \theta) \mathbf{k}$ (21–28)

Have the *x, y, z* axes represent principal axes of inertia for the top, and so Have the x, y, z axes represent principal axes of inertia for the top, and so
the moments of inertia will be represented as $I_{xx} = I_{yy} = I$ and $I_{zz} = I_z$.
Since $\Omega \neq \omega$. Eqs. 21–26 are used to establish the rotational equ Since $\Omega \neq \omega$, Eqs. 21–26 are used to establish the rotational equations of motion. Substituting into these equations the respective angular-velocity components defined by Eqs. 21–27 and 21–28, their corresponding time derivatives, and the moment of inertia components, yields #.
.
. #

$$
\Sigma M_x = I(\ddot{\theta} - \dot{\phi}^2 \sin \theta \cos \theta) + I_z \dot{\phi} \sin \theta (\dot{\phi} \cos \theta + \dot{\psi})
$$

\n
$$
\Sigma M_y = I(\ddot{\phi} \sin \theta + 2\dot{\phi}\dot{\theta} \cos \theta) - I_z \dot{\theta} (\dot{\phi} \cos \theta + \dot{\psi})
$$
 (21–29)
\n
$$
\Sigma M_z = I_z(\ddot{\psi} + \ddot{\phi} \cos \theta - \dot{\phi}\dot{\theta} \sin \theta)
$$

Each moment summation applies only at the fixed point *O* or the center of mass *G* of the body. Since the equations represent a coupled set of nonlinear second-order differential equations, in general a closed-form solution may not be obtained. Instead, the Euler angles ϕ , θ , and ψ may be obtained graphically as functions of time using numerical analysis and computer techniques.

A special case, however, does exist for which simplification of Eqs. 21–29 is possible. Commonly referred to as *steady precession*, it occurs when the nutation angle θ , precession ϕ , and spin ψ all remain *constant*. Equations 21–29 then reduce to the form ##

$$
\begin{bmatrix}\Sigma M_x = -I\dot{\phi}^2 \sin\theta \cos\theta + I_z\dot{\phi} \sin\theta (\dot{\phi} \cos\theta + \dot{\psi}) \\
\Sigma M_y = 0 \\
\Sigma M_z = 0\n\end{bmatrix}
$$
(21-30)

Equation 21–30 can be further simplified by noting that, from Equation 21–30 can be further
Eq. 21–27, $\omega_z = \dot{\phi} \cos \theta + \dot{\psi}$, so that #can be
 $\cos \theta + \dot{\psi}$,

$$
\Sigma M_x = -I\dot{\phi}^2 \sin\theta \cos\theta + I_z\dot{\phi} (\sin\theta)\omega_z
$$

or

or

$$
\Sigma M_x = \dot{\phi} \sin \theta (I_z \omega_z - I \dot{\phi} \cos \theta)
$$
 (21-31)

It is interesting to note what effects the spin ψ has on the moment about the *x* axis. To show this, consider the spinning rotor in Fig. 21–17. about the *x* axis. To show this, consider the spinning rotor
Here $\theta = 90^{\circ}$, in which case Eq. 21–30 reduces to the form #|
|

©

$$
\Sigma M_x = I_z \dot{\phi} \dot{\psi}
$$

$$
\Sigma M_x = I_z \Omega_y \omega_z
$$
 (21-32)

From the figure it can be seen that Ω_y and ω_z act along their respective *positive axes* and therefore are mutually perpendicular. Instinctively, one would expect the rotor to fall down under the influence of gravity! However, this is not the case at all, provided the product of gravity! However, this is not the case at all, provided the product $I_z \Omega_y \omega_z$ is correctly chosen to counterbalance the moment $\Sigma M_x = W r_G$
of the rotor's weight about O. This unusual phenomenon of rigid-body of the rotor's weight about *O*. This unusual phenomenon of rigid-body motion is often referred to as the *gyroscopic effect*.

X Perhaps a more intriguing demonstration of the gyroscopic effect comes from studying the action of a *gyroscope*, frequently referred to as a *gyro*. A gyro is a rotor which spins at a very high rate about its axis of symmetry. This rate of spin is considerably greater than its precessional rate of rotation about the vertical axis. Hence, for all practical purposes, the angular momentum of the gyro can be assumed directed along its the angular momentum of the gyro can be assumed directed along its
axis of spin. Thus, for the gyro rotor shown in Fig. 21–18, $\omega_z \gg \Omega_y$, and
the magnitude of the angular momentum about point O as determined the magnitude of the angular momentum about point O , as determined the magnitude of the angular momentum about point O, as determined
from Eqs. 21–11, reduces to the form $H_0 = I_z \omega_z$. Since both the
magnitude and direction of **H**_o are constant as observed from x y z magnitude and direction of H_0 are constant as observed from *x*, *y*, *z*, direct application of Eq. 21, 22 yields direct application of Eq. 21–22 yields

$$
\Sigma \mathbf{M}_x = \mathbf{\Omega}_y \times \mathbf{H}_O \tag{21-33}
$$

Using the right-hand rule applied to the cross product, it can be seen ©Using the right-hand rule applied to the cross product, it can be seen
that Ω_y always swings H_O (or ω_z) toward the sense of ΣM_x . In effect,
the *change in direction* of the avro's appular momentum dH is the *change in direction* of the gyro's angular momentum, $d\mathbf{H}_O$, is
equivalent to the angular impulse caused by the gyro's weight about O equivalent to the angular impulse caused by the gyro's weight about *O*, æequivalent to the angular impulse caused by the gyro's weight about *O*,
i.e., $d\mathbf{H}_O = \sum \mathbf{M}_x dt$, Eq. 21–20. Also, since $H_O = I_z \omega_z$ and $\sum \mathbf{M}_x$, Ω_y , and
H_O are mutually perpendicular. Eq. 21–33 reduces to E H_O are mutually perpendicular, Eq. 21–33 reduces to Eq. 21–32.
When a gyro is mounted in gimbal rings Fig. 21–10 it become

When a gyro is mounted in gimbal rings, Fig. 21–19, it becomes *free* of external moments applied to its base. Thus, in theory, its angular momentum **H** will never precess but, instead, maintain its same fixed orientation along the axis of spin when the base is rotated. This type of gyroscope is called a *free gyro* and is useful as a gyrocompass when the spin axis of the gyro is directed north. In reality, the gimbal mechanism is never completely free of friction, so such a device is useful only for the local navigation of ships and aircraft. The gyroscopic effect is also useful as a means of stabilizing both the rolling motion of ships at sea and the trajectories of missiles and projectiles. Furthermore, this effect is of significant importance in the design of shafts and bearings for rotors which are subjected to forced precessions.

H*^O* **W** *O* V*p*

The spinning of the gyro within the frame of this toy gyroscope produces angular momentum H_O , which is changing
direction as the frame precesses ω direction as the frame precesses ω_p
about the vertical axis. The avroacance about the vertical axis. The gyroscope will not fall down since the moment of its weight **W** about the support is balanced by the change in the direction of H_O .

21

EXAMPLE 21.7

The top shown in Fig. 21–20*a* has a mass of 0.5 kg and is precessing about The top shown in Fig. 21–20*a* has a mass of 0.5 kg and is precessing about the vertical axis at a constant angle of $\theta = 60^{\circ}$. If it spins with an angular the vertical axis at a constant angle of $\theta = 60^{\circ}$. If it spins with an angular velocity $\omega_s = 100$ rad/s, determine the precession ω_p . Assume that the axial and transverse moments of inertia of the top are the axial and transverse moments of inertia of the top are velocity $\omega_s = 100 \text{ rad/s}$, determine the precession ω_p . Assume that the axial and transverse moments of inertia of the top are 0.45(10⁻³) kg·m² and 1.20(10⁻³) kg·m², respectively, measured with respect to the fixed point *O*.

SOLUTION

Equation 21–30 will be used for the solution since the motion is *steady precession*. As shown on the free-body diagram, Fig. 21–20*b*, the coordinate axes are established in the usual manner, that is, with the positive *z* axis in the direction of spin, the positive *Z* axis in the direction of precession, and the positive x axis in the direction of the moment (refer to Fig. 21–16).Thus, ©# \overline{y}

and

$$
\dot{\phi} = 5.72 \text{ rad/s} \qquad \text{(low precession)} \qquad \qquad \text{Ans.}
$$

NOTE: In reality, low precession of the top would generally be observed, since high precession would require a larger kinetic energy.

EXAMPLE 21.8

The 1-kg disk shown in Fig. 21–21*a* spins about its axis with a constant The 1-kg disk shown in Fig. 21–21*a* spins about its axis with a constant angular velocity $\omega_D = 70$ rad/s. The block at *B* has a mass of 2 kg, and by adjusting its position s one can change the precession of the disk by adjusting its position *s* one can change the precession of the disk about its supporting pivot at *O* while the shaft remains horizontal. Determine the position *s* that will enable the disk to have a constant Determine the position *s* that will enable the disk to have a constant precession $\omega_p = 0.5$ rad/s about the pivot. Neglect the weight of the shaft shaft.

SOLUTION

The free-body diagram of the assembly is shown in Fig. 21–21*b*. The origin for both the *x, y, z* and *X, Y, Z* coordinate systems is located at the fixed point *O*. In the conventional sense, the *Z* axis is chosen along the axis of precession, and the *z* axis is along the axis of spin, so that the axis of precession, and the *z* axis is along the axis of spin, so that $\theta = 90^{\circ}$. Since the precession is *steady*, Eq. 21–32 can be used for the solution.

$$
\Sigma M_x = I_z \Omega_y \omega_z
$$

Substituting the required data gives

$$
(98.1 \text{ N}) (0.2 \text{ m}) - (19.62 \text{ N})s = \left[\frac{1}{2}(1 \text{ kg})(0.05 \text{ m})^2\right] 0.5 \text{ rad/s}(-70 \text{ rad/s})
$$

$$
s = 0.102 \text{ m} = 102 \text{ mm}
$$
Ans.

21.6 [Torque-Free Motion](#page-15-0)

When the only external force acting on a body is caused by gravity, the general motion of the body is referred to as *torque-free motion*.This type of motion is characteristic of planets, artificial satellites, and projectiles provided air friction is neglected.

In order to describe the characteristics of this motion, the distribution of the body's mass will be assumed *axisymmetric*. The satellite shown in Fig. 21–22 is an example of such a body, where the *z* axis represents an axis of symmetry. The origin of the *x, y, z* coordinates is located at the axis of symmetry. The origin of the x, y, z coordinates is located at the mass center *G*, such that $I_{zz} = I_z$ and $I_{xx} = I_{yy} = I$. Since gravity is the only external force present, the summation of moments about the mass only external force present, the summation of moments about the mass center is zero. From Eq. 21–21, this requires the angular momentum of the body to be constant, i.e.,

$$
\mathbf{H}_G = \text{constant}
$$

At the instant considered, it will be assumed that the inertial frame of reference is oriented so that the positive *Z* axis is directed along \mathbf{H}_G and the v axis lies in the plane formed by the z and *Z* axes. Fig. 21, 22, The the *y* axis lies in the plane formed by the *z* and *Z* axes, Fig. 21–22. The Euler angle formed between Z and z is θ , and therefore, with this choice of axes the angular momentum can be expressed as

$$
\mathbf{H}_G = H_G \sin \theta \, \mathbf{j} + H_G \cos \theta \, \mathbf{k}
$$

Furthermore, using Eqs. 21–11, we have

$$
\mathbf{H}_G = I\omega_x \mathbf{i} + I\omega_y \mathbf{j} + I_z\omega_z \mathbf{k}
$$

Equating the respective **i**, **j**, and **k** components of the above two equations yields

$$
\omega_x = 0
$$
\n $\omega_y = \frac{H_G \sin \theta}{I}$ \n $\omega_z = \frac{H_G \cos \theta}{I_z}$ \n(21-34)

or

$$
\boldsymbol{\omega} = \frac{H_G \sin \theta}{I} \mathbf{j} + \frac{H_G \cos \theta}{I_z} \mathbf{k}
$$
 (21–35)

In a similar manner, equating the respective **i**, **j**, **k** components of Eq. 21–27 to those of Eq. 21–34, we obtain

$$
\dot{\theta} = 0
$$

$$
\dot{\phi} \sin \theta = \frac{H_G \sin \theta}{I}
$$

$$
\dot{\phi} \cos \theta + \dot{\psi} = \frac{H_G \cos \theta}{I_z}
$$

Solving, we get

$$
\theta = \text{constant}
$$
\n
$$
\dot{\phi} = \frac{H_G}{I}
$$
\n
$$
\dot{\psi} = \frac{I - I_z}{II_z} H_G \cos \theta
$$
\n(21-36)

Thus, for torque-free motion of an axisymmetrical body, the angle θ formed between the angular-momentum vector and the spin of the body remains constant. Furthermore, the angular momentum H_G , precession ϕ , and spin ψ for the body remain constant at all times during the motion. ##

Eliminating H_G from the second and third of Eqs. 21–36 yields the following relation between the spin and precession:

$$
\dot{\psi} = \frac{I - I_z}{I_z} \dot{\phi} \cos \theta \qquad (21-37)
$$

These two components of angular motion can be studied by using the body and space cone models introduced in Sec. 20.1. The *space cone* defining the precession is fixed from rotating, since the precession has a fixed direction, while the outer surface of the *body cone* rolls on the space cone's outer surface. Try to imagine this motion in Fig. 21–23*a*. The interior angle of each cone is chosen such that the resultant angular velocity of the body is directed along the line of contact of the two cones. This line of contact represents the instantaneous axis of rotation for the body cone, and hence the angular velocity of both the body cone and the body must be directed along this line. Since the spin is a function of the moments of inertia *I* and I_z of the body, Eq. 21–36, the cone model in Fig. 21–23*a* is satisfactory for describing the motion, the cone model in Fig. 21–23*a* is satisfactory for describing the motion,
provided $I > I_z$. Torque-free motion which meets these requirements
is called *reqular precession* If $I < I$, the spin is pegative and the provided $I > I_z$. Torque-free motion which meets these requirements
is called *regular precession*. If $I < I_z$, the spin is negative and the
precession positive This motion is represented by the satellite motion precession positive. This motion is represented by the satellite motion precession positive. This motion is represented by the satellite motion
shown in Fig. 21–23*b* ($I < I_z$). The cone model can again be used to
represent the motion: however to preserve the correct vector addition represent the motion; however, to preserve the correct vector addition of spin and precession to obtain the angular velocity $\boldsymbol{\omega}$, the inside surface of the body cone must roll on the outside surface of the (fixed) space cone. This motion is referred to as *retrograde precession*.

Satellites are often given a spin before they are launched. If their angular momentum is not collinear with the axis of spin, they will exhibit precession. In the photo on the is not collinear with the axis of spin, they will exhibit precession. In the photo on the left, regular precession will occur since $I > I_z$, and in the photo on the right, retrograde precession will occur since $I < I$ precession will occur since $I < I_z$.

EXAMPLE 21.9

The motion of a football is observed using a slow-motion projector. From the film, the spin of the football is seen to be directed 30° from the horizontal, as shown in Fig. 21–24*a*. Also, the football is =precessing about the vertical axis at a rate $\phi = 3$ rad/s. If the ratio of the axial to transverse moments of inertia of the football is $\frac{1}{3}$, measured with respect to the center of mass, determine the magnitude of the football's spin and its angular velocity. Neglect the effect of air resistance.

Fig. 21–24

SOLUTION

Since the weight of the football is the only force acting, the motion is torque-free. In the conventional sense, if the *z* axis is established along the axis of spin and the *Z* axis along the precession axis, as shown in **!** axis alon
 $\theta = 60^{\circ}$.

Fig. 21–24*b*, then the angle
$$
\theta = 60^\circ
$$
. Applying Eq. 21–37, the spin is
\n
$$
\dot{\psi} = \frac{I - I_z}{I_z} \dot{\phi} \cos \theta = \frac{I - \frac{1}{3}I}{\frac{1}{3}I} (3) \cos 60^\circ
$$
\n
$$
= 3 \text{ rad/s} \qquad \text{Ans.}
$$

 $H_G = \dot{\phi}$

Using Eqs. 21–34, where
$$
H_G = \phi I
$$
 (Eq. 21–36), we have
\n
$$
\omega_x = 0
$$
\n
$$
\omega_y = \frac{H_G \sin \theta}{I} = \frac{3I \sin 60^\circ}{I} = 2.60 \text{ rad/s}
$$
\n
$$
\omega_z = \frac{H_G \cos \theta}{I_z} = \frac{3I \cos 60^\circ}{\frac{1}{3}I} = 4.50 \text{ rad/s}
$$

Thus,

$$
\omega = \sqrt{(\omega_x)^2 + (\omega_y)^2 + (\omega_z)^2}
$$

= $\sqrt{(0)^2 + (2.60)^2 + (4.50)^2}$
= 5.20 rad/s *Ans.*

PROBLEMS

21–61. Show that the angular velocity of a body, in terms of Euler angles ϕ , θ , and ψ , can be expressed as $(\phi \cos \theta + \psi)$ **k**, where **i**, **j**, and **k** are directed along the *x*, *y*, *z* axes as shown in Fig. 21–15*d*. .

CHAPTER REVIEW

Moments and Products of Inertia

A body has six components of inertia for any specified *x*,*y*, *z* axes. Three of these are moments of inertia about each of the axes, I_{xx} , I_{yy} , I_{zz} , and three are products
of inertial each defined from two of inertia, each defined from two orthogonal planes, I_{xy} , I_{yz} , I_{xz} . If either one or both of these planes are planes of one or both of these planes are planes of symmetry, then the product of inertia with respect to these planes will be zero.

The moments and products of inertia can be determined by direct integration or by using tabulated values. If these quantities are to be determined with respect to axes or planes that do not pass through the mass center, then parallel-axis and parallel-plane theorems must be used.

Provided the six components of inertia are known, then the moment of inertia about any axis can be determined using the inertia transformation equation.

Principal Moments of Inertia

At any point on or off the body, the *x*, *y*, *z* axes can be oriented so that the products of inertia will be zero. The resulting moments of inertia are called the principal moments of inertia, one of which will be a maximum and the other a minimum.

Principle of Impulse and Momentum

The angular momentum for a body can be determined about any arbitrary point *A*.

Once the linear and angular momentum for the body have been formulated, then the principle of impulse and momentum can be used to solve problems that involve force, velocity, and time.

Principle of Work and Energy

The kinetic energy for a body is usually determined relative to a fixed point or the body's mass center.

Center of Mass

Spring suspensions can induce vibrations in moving vehicles, such as this railroad car. In order to predict the behavior we must use a vibrational analysis.

Vibrations [22](#page-15-0)

[CHAPTER OBJECTIVES](#page-15-0)

- To discuss undamped one-degree-of-freedom vibration of a rigid body using the equation of motion and energy methods.
- To study the analysis of undamped forced vibration and viscous damped forced vibration.

*22.1 [Undamped Free Vibration](#page-15-0)

A *vibration* is the periodic motion of a body or system of connected bodies displaced from a position of equilibrium. In general, there are two types of vibration, free and forced. *Free vibration* occurs when the motion is maintained by gravitational or elastic restoring forces, such as the swinging motion of a pendulum or the vibration of an elastic rod. *Forced vibration* is caused by an external periodic or intermittent force applied to the system. Both of these types of vibration can either be damped or undamped. *Undamped* vibrations can continue indefinitely because frictional effects are neglected in the analysis. Since in reality both internal and external frictional forces are present, the motion of all vibrating bodies is actually *damped*.

The simplest type of vibrating motion is undamped free vibration, represented by the block and spring model shown in Fig. 22–1*a*. Vibrating motion occurs when the block is released from a displaced position *x* so that the spring pulls on the block. The block will attain a position x so that the spring pulls on the block. The block will attain a
velocity such that it will proceed to move out of equilibrium when $x = 0$,
and provided the supporting surface is smooth, the block will oscillate and provided the supporting surface is smooth, the block will oscillate back and forth.

The time-dependent path of motion of the block can be determined by applying the equation of motion to the block when it is in the displaced position *x*. The free-body diagram is shown in Fig. 22–1*b*. The elastic position x. The free-body diagram is shown in Fig. 22–1*b*. The elastic
restoring force $F = kx$ is always directed toward the equilibrium
position whereas the acceleration a is assumed to act in the direction of position, whereas the acceleration **a** is assumed to act in the direction of position, whereas the acceleration **a** is assumed to act *positive displacement*. Since $a = d^2x/dt^2 = \ddot{x}$, we have $\ddot{x},$

 $-kx = m\ddot{x}$ $\Rightarrow \Sigma F_x = ma_x;$

Note that the acceleration is proportional to the block's displacement. Motion described in this manner is called *simple harmonic motion*. Rearranging the terms into a "standard form" gives

$$
\ddot{x} + \omega_n^2 x = 0 \tag{22-1}
$$

The constant ω_n is called the *natural frequency*, and in this case

$$
\omega_n = \sqrt{\frac{k}{m}} \tag{22-2}
$$

Equation 22–1 can also be obtained by considering the block to be suspended so that the displacement *y* is measured from the block's *equilibrium position*, Fig. 22–2*a*. When the block is in equilibrium, the *equilibrium position*, Fig. 22–2*a*. When the block is in equilibrium, the spring exerts an upward force of $F = W = mg$ on the block. Hence, when the block is displaced a distance y downward from this position when the block is displaced a distance *y* downward from this position, when the block is displaced a distance y downward from this position,
the magnitude of the spring force is $F = W + ky$, Fig. 22–2*b*. Applying
the equation of motion gives the equation of motion gives

$$
+\bigdownarrow\Sigma F_y = ma_y; \qquad -W - ky + W = m\ddot{y}
$$

or

$$
\ddot{y} + \omega_n^2 y = 0
$$

which is the same form as Eq. 22–1 and ω_n is defined by Eq. 22–2.

Fig. 22–2

Equation 22–1 is a homogeneous, second-order, linear, differential equation with constant coefficients. It can be shown, using the methods of differential equations, that the general solution is

$$
x = A \sin \omega_n t + B \cos \omega_n t \qquad (22-3)
$$

Here *A* and *B* represent two constants of integration. The block's velocity and acceleration are determined by taking successive time derivatives, which yields |
|
|

$$
v = \dot{x} = A\omega_n \cos \omega_n t - B\omega_n \sin \omega_n t \qquad (22-4)
$$

$$
a = \ddot{x} = -A\omega_n^2 \sin \omega_n t - B\omega_n^2 \cos \omega_n t \qquad (22-5)
$$

When Eqs. 22–3 and 22–5 are substituted into Eq. 22–1, the differential equation will be satisfied, showing that Eq. 22–3 is indeed the solution to Eq. 22–1.

The integration constants in Eq. 22–3 are generally determined from the initial conditions of the problem. For example, suppose that the block in Fig. 22–1*a* has been displaced a distance x_1 to the right from its In Fig. $22 - u$ has been displaced a distance x_1 to the right from its equilibrium position and given an initial (positive) velocity \mathbf{v}_1 directed to equilibrium position and given an initial (positive) velocity \mathbf{v}_1 directed to
the right. Substituting $x = x_1$ when $t = 0$ into Eq. 22–3 yields $B = x_1$.
And since $v = v_1$ when $t = 0$ using Eq. 22–4 we obtain $A = v_1/\omega$ the right. Substituting $x = x_1$ when $t = 0$ into Eq. 22–3 yields $B = x_1$.
And since $v = v_1$ when $t = 0$, using Eq. 22–4 we obtain $A = v_1/\omega_n$. If these values are substituted into Eq. 22–3, the equation describing the these values are substituted into Eq. 22–3, the equation describing the motion becomes

$$
x = \frac{v_1}{\omega_n} \sin \omega_n t + x_1 \cos \omega_n t \tag{22-6}
$$

Equation 22–3 may also be expressed in terms of simple sinusoidal motion. To show this, let

$$
A = C \cos \phi \tag{22-7}
$$

and

$$
B = C \sin \phi \tag{22-8}
$$

where *C* and ϕ are new constants to be determined in place of *A* and *B*. Substituting into Eq. 22–3 yields

$$
x = C \cos \phi \sin \omega_n t + C \sin \phi \cos \omega_n t
$$

And since $sin(\theta + \phi) = sin \theta cos \phi + cos \theta sin \phi$, then

$$
x = C \sin(\omega_n t + \phi) \tag{22-9}
$$

If this equation is plotted on an *x* versus $\omega_n t$ axis, the graph shown in α 22–3 is obtained. The maximum displacement of the block from its Fig. 22–3 is obtained. The maximum displacement of the block from its equilibrium position is defined as the *amplitude* of vibration. From either the figure or Eq. 22–9 the amplitude is *C*. The angle ϕ is called the *phase angle* since it represents the amount by which the curve is displaced from angle since it represents the amount by which the curve is displaced from
the origin when $t = 0$. We can relate these two constants to *A* and *B*
using Eqs. 22–7 and 22–8. Squaring and adding these two equations the using Eqs. 22–7 and 22–8. Squaring and adding these two equations, the amplitude becomes

$$
C = \sqrt{A^2 + B^2} \tag{22-10}
$$

amplitude becomes
 $C = \sqrt{A^2 + B^2}$
If Eq. 22–8 is divided by Eq. 22–7, the phase angle is then

$$
\phi = \tan^{-1}\frac{B}{A} \tag{22-11}
$$

Note that the sine curve, Eq. 22-9, completes one *cycle* in time Note that the sine curve, $t = \tau$ (tau) when $\omega_n \tau = 2\pi$, or

$$
\tau = \frac{2\pi}{\omega_n} \tag{22-12}
$$

This time interval is called a *period*, Fig. 22–3. Using Eq. 22–2, the period can also be represented as

$$
\tau = 2\pi \sqrt{\frac{m}{k}}\tag{22-13}
$$

Finally, the *frequency f* is defined as the number of cycles completed per unit of time, which is the reciprocal of the period; that is,

$$
f = \frac{1}{\tau} = \frac{\omega_n}{2\pi}
$$
 (22-14)

or

$$
f = \frac{1}{2\pi} \sqrt{\frac{k}{m}} \tag{22-15}
$$

The frequency is expressed in cycles/s. This ratio of units is called a *hertz* The frequency is expressed in cycles/s. Thi (Hz), where $1 \text{ Hz} = 1 \text{ cycle/s} = 2\pi \text{ rad/s}$.

When a body or system of connected bodies is given an initial displacement from its equilibrium position and released, it will vibrate with the *natural frequency*, ω_n . Provided the system has a single degree of freedom, that is it requires only one coordinate to specify completely of freedom, that is, it requires only one coordinate to specify completely the position of the system at any time, then the vibrating motion will have the same characteristics as the simple harmonic motion of the block and spring just presented. Consequently, the motion is described by a differential equation of the same "standard form" as Eq. 22–1, i.e., \$

$$
\ddot{x} + \omega_n^2 x = 0 \qquad (22-16)
$$

Hence, if the natural frequency ω_n is known, the period of vibration τ , natural frequency *f*, and other vibrating characteristics can be established using Eqs. 22–3 through 22–15.

Fig. 22–3

Important Points

- Free vibration occurs when the motion is maintained by gravitational or elastic restoring forces.
- The amplitude is the maximum displacement of the body.
- The period is the time required to complete one cycle.
- The frequency is the number of cycles completed per unit of time, The frequency is the nun
where $1 \text{ Hz} = 1 \text{ cycle/s}.$
- Only one position coordinate is needed to describe the location of a one-degree-of-freedom system.

Procedure for Analysis

As in the case of the block and spring, the natural frequency ω_n of a
hody or system of connected bodies having a single degree of body or system of connected bodies having a single degree of freedom can be determined using the following procedure:

Free-Body Diagram.

- Draw the free-body diagram of the body when the body is displaced a *small amount* from its equilibrium position.
- Locate the body with respect to its equilibrium position by using an appropriate *inertial coordinate q*. The acceleration of the body's mass center \mathbf{a}_G or the body's angular acceleration α
should have an assumed sense of direction which is in the nositive should have an assumed sense of direction which is in the *positive direction* of the position coordinate.
- airection of the position coordinate.

 If the rotational equation of motion $\Sigma M_P = \Sigma (M_k)_P$ is to be

used then it may be beneficial to also draw the kinetic diagram used, then it may be beneficial to also draw the kinetic diagram since it graphically accounts for the components $m(\mathbf{a}_G)_x$, $m(\mathbf{a}_G)_y$, and Low and thereby makes it convenient for visualizing the and $I_G\boldsymbol{\alpha}$, and thereby makes it convenient for visualizing the terms needed in the moment sum $\Sigma(M_1)$. terms needed in the moment sum $\Sigma(\mathcal{M}_k)_P$.

Equation of Motion.

● Apply the equation of motion to relate the elastic or gravitational *restoring* forces and couple moments acting on the body to the body's accelerated motion.

Kinematics.

- Using kinematics, express the body's accelerated motion in terms of the second time derivative of the position coordinate, \ddot{q} .
- Substitute the result into the equation of motion and determine ω_n by rearranging the terms so that the resulting equation is in
the "standard form" $\ddot{a} + \omega^2 a = 0$ the "standard form," $\ddot{q} + \omega_n^2$ s so the $q = 0$.

Determine the period of oscillation for the simple pendulum shown in Fig. 22–4*a*. The bob has a mass *m* and is attached to a cord of length *l*. Neglect the size of the bob.

SOLUTION

Free-Body Diagram. Motion of the system will be related to the **Free-Body Diagram.** Motion of the system will be related to the position coordinate $(q =) \theta$, Fig. 22–4*b*. When the bob is displaced by a small angle θ , the *restoring force* acting on the bob is created by the a small angle θ , the *restoring force* acting on the bob is created by the tangential component of its weight, $mg \sin \theta$. Furthermore, \mathbf{a}_t acts in the direction of *increasing* s (or θ) the direction of *increasing* s (or θ).

Equation of Motion. Applying the equation of motion in the tangential direction, since it involves the restoring force, yields

$$
+ \mathcal{I} \Sigma F_t = ma_t; \qquad \qquad -mg \sin \theta = ma_t \tag{1}
$$

Kinematics. $a_t = d^2s/dt^2 = \ddot{s}$. Furthermore, *s* can be related to θ by the equation $s = l\theta$ so that $s = l\ddot{\theta}$. Hence Eq. 1 reduces to **Kinematics.** $a_t = d^2s/dt^2 = s$. Furthermore, *s* can be relate
the equation $s = l\theta$, so that $a_t = l\ddot{\theta}$. Hence, Eq. 1 reduces to $a_t = d^2s/dt^2 = s$. Fu
 $s = l\theta$, so that $a_t = l\ddot{\theta}$. \ddot{s} .

$$
\ddot{\theta} + \frac{g}{l}\sin\theta = 0\tag{2}
$$

The solution of this equation involves the use of an elliptic integral. The solution of this equation involves the use of an ellip
For *small displacements*, however, $\sin \theta \approx \theta$, in which case

$$
\ddot{\theta} + \frac{g}{l}\theta = 0 \tag{3}
$$

Comparing this equation with Eq. 22–16 $(\ddot{x} + \omega_n^2 x = 0)$, it is seen
at $y = \sqrt{n/l}$. From Eq. 22–12, the pariod of time required for the Comparing this equation with Eq. 22–16 ($x + \omega_n^2 x = 0$), it is seen
that $\omega_n = \sqrt{g/l}$. From Eq. 22–12, the period of time required for the bob to make one complete swing is therefore \mathbf{r} $+\omega_n^2$ $x = 0$,

$$
\tau = \frac{2\pi}{\omega_n} = 2\pi \sqrt{\frac{l}{g}}
$$
Ans.

This interesting result, originally discovered by Galileo Galilei through experiment, indicates that the period depends only on the length of the cord and not on the mass of the pendulum bob or the angle θ .

NOTE: The solution of Eq. 3 is given by Eq. 22–3, where $\omega_n = \sqrt{g/l}$
and θ is substituted for x. I ike the block and spring, the constants A and θ is substituted for *x*. Like the block and spring, the constants A and *B* in this problem can be determined if, for example, one knows the displacement and velocity of the bob at a given instant.

22

The 10-kg rectangular plate shown in Fig. 22–5*a* is suspended at its center from a rod having a torsional stiffness $k = 1.5 \text{ N} \cdot \text{m/rad}$. Determine the natural period of vibration of the plate when it is given a small angular displacement θ in the plane of the plate. is suspended at its
 $k = 1.5 \text{ N} \cdot \text{m/rad.}$

ate when it is given

SOLUTION

Free-Body Diagram. Fig. 22–5*b*. Since the plate is displaced in its own plane, the torsional *restoring* moment created by the rod is own plane, the torsional *restoring* moment created by the rod is $M = k\theta$. This moment acts in the direction opposite to the angular displacement θ . The angular acceleration $\hat{\theta}$ acts in the direction of displacement θ . The angular acceleration θ acts in the direction of <mark>positive θ.</mark>

Equation of Motion.
Exercise of Motion.

 $-k\theta = I_O \ddot{\theta}$ $\sum M_O = I_O \alpha$;

or

$$
\ddot{\theta} + \frac{k}{I_0} \theta = 0
$$

Since this equation is in the "standard form," the natural frequency is $\omega_n = \sqrt{k/I_{\Omega}}$. $\overline{}$

From the table on the inside back cover, the moment of inertia of From the table on the inside back cover, the moment of inertia of
the plate about an axis coincident with the rod is $I_O = \frac{1}{12}m(a^2 + b^2)$. Hence,

$$
I_O = \frac{1}{12} (10 \text{ kg}) [(0.2 \text{ m})^2 + (0.3 \text{ m})^2] = 0.1083 \text{ kg} \cdot \text{m}^2
$$

The natural period of vibration is therefore,

$$
\tau = \frac{2\pi}{\omega_n} = 2\pi \sqrt{\frac{I_O}{k}} = 2\pi \sqrt{\frac{0.1083}{1.5}} = 1.69 \text{ s}
$$
 Ans.

22

The bent rod shown in Fig. 22–6*a* has a negligible mass and supports a 5-kg collar at its end. If the rod is in the equilibrium position shown, determine the natural period of vibration for the system.

SOLUTION

Free-Body and Kinetic Diagrams. Fig. 22–6*b*. Here the rod is displaced by a small angle θ from the equilibrium position. Since the spring is subjected to an initial compression of x_{st} for equilibrium, then spring is subjected to an initial compression of x_{st} for equilibrium, then
when the displacement $x > x_{st}$ the spring exerts a force of
 $F = kx - kx$ on the rod To obtain the "standard form " Eq. 22–16.59 when the displacement $x > x_{st}$ the spring exerts a force of $F_s = kx - kx_{st}$ on the rod. To obtain the "standard form," Eq. 22–16, 5**a**_y must act *unward* which is in accordance with positive θ displacement must act *upward*, which is in accordance with positive θ displacement.

Equation of Motion. Moments will be summed about point *B* to eliminate the unknown reaction at this point. Since θ is small,

$$
\zeta + \Sigma M_B = \Sigma (M_k)_B;
$$

$$
kx(0.1 \text{ m}) - kx_{st}(0.1 \text{ m}) + 49.05 \text{ N}(0.2 \text{ m}) = -(5 \text{ kg})a_y(0.2 \text{ m})
$$

The second term on the left side, $-kx_{st}(0.1 \text{ m})$, represents the moment created by the spring force which is necessary to hold the moment created by the spring force which is necessary to hold the moment created by the spring force which is necessary to hold the collar in *equilibrium*, i.e., at $x = 0$. Since this moment is equal and opposite to the moment 49.05 N(0.2 m) created by the weight of the opposite to the moment 49.05 $N(0.2 \text{ m})$ created by the weight of the collar, these two terms cancel in the above equation, so that

$$
kx(0.1) = -5a_y(0.2)
$$
 (1)

Kinematics. The deformation of the spring and the position of the collar can be related to the angle θ , Fig. 22–6*c*. Since θ is small, related to the angle θ , Fig. 22–6*c*. Since θ is small,
and $y = (0.2 \text{ m})\theta$. Therefore, $a_y = \ddot{y} = 0.2\theta$. Substituting into Eq. 1 yields collar can be related to the angle θ , Fig. 22–6*c*. Since $x = (0.1 \text{ m})\theta$ and $y = (0.2 \text{ m})\theta$. Therefore, $a_y = \ddot{y} = 0.2\theta$.
into Eq. 1 yields

$$
400(0.1\theta) 0.1 = -5(0.2\ddot{\theta})0.2
$$

Rewriting this equation in the "standard form" gives \$

$$
\dddot{\theta} + 20\theta = 0
$$

Compared with $\ddot{x} + \omega_n^2 x = 0$ (Eq. 22–16), we have \mathbf{r} $+ \omega_n^2$ $x = 0$

$$
\omega_n^2 = 20 \qquad \omega_n = 4.47 \text{ rad/s}
$$

The natural period of vibration is therefore

$$
\tau = \frac{2\pi}{\omega_n} = \frac{2\pi}{4.47} = 1.40 \text{ s}
$$
Ans.

A 10-lb block is suspended from a cord that passes over a 15-lb disk, A 10-lb block is suspended from a cord that passes over a 15-lb disk, as shown in Fig. $22-7a$. The spring has a stiffness $k = 200 \text{ lb/ft}$.
Determine the natural period of vibration for the system Determine the natural period of vibration for the system.

SOLUTION

Free-Body and Kinetic Diagrams. Fig. 22–7*b*. The *system* consists \$of the disk, which undergoes a rotation defined by the angle θ , and the block, which translates by an amount *s*. The vector $I_O \theta$ acts in the direction of positive θ and consequently m , a acts downward in the direction of *positive* θ , and consequently $m_B \mathbf{a}_b$ acts downward in the direction of *positive* s direction of *positive s*.

Equation of Motion. Summing moments about point *O* to **Equation of Motion.** Summing moments about point O eliminate the reactions \mathbf{O}_x and \mathbf{O}_y , realizing that $I_O = \frac{1}{2}mr^2$, yields eliminate the reaction
 $\zeta + \Sigma M_O = \Sigma (M_k)_O;$

$$
10 \text{ lb}(0.75 \text{ ft}) - F_s(0.75 \text{ ft})
$$

=
$$
\frac{1}{2} \left(\frac{15 \text{ lb}}{32.2 \text{ ft/s}^2} \right) (0.75 \text{ ft})^2 \ddot{\theta} + \left(\frac{10 \text{ lb}}{32.2 \text{ ft/s}^2} \right) a_s(0.75 \text{ ft})
$$
 (1)

Kinematics. As shown on the kinematic diagram in Fig. 22–7*c*, a small positive displacement θ of the disk causes the block to lower by small positive displacement θ of the disk causes the block to lower by
an amount $s = 0.75\theta$; hence, $a_b = \ddot{s} = 0.75\dot{\theta}$. When $\theta = 0^{\circ}$, the spring
force required for *equilibrium* of the disk is 10 lb acting force required for *equilibrium* of the disk is 10 lb, acting to the right. force required for *equilibrium* of the disk is 10 lb, acting to the right.
For position θ , the spring force is $F_s = (200 \text{ lb/ft})(0.75\theta \text{ ft}) + 10 \text{ lb}$.
Substituting these results into Eq. 1 and simplifying yields Substituting these results into Eq. 1 and simplifying yields ve displacement θ of the disk cause $s = 0.75\theta$; hence, $a_{\theta} = \dot{s} = 0.75\dot{\theta}$.
red for equilibrium of the disk is

$$
\ddot{\theta} + 368\theta = 0
$$

Hence,

$$
\omega_n^2 = 368 \qquad \omega_n = 19.18 \text{ rad/s}
$$

 $\omega_n^2 = 368 \qquad \omega_n = 19.$
Therefore, the natural period of vibration is

$$
\tau = \frac{2\pi}{\omega_n} = \frac{2\pi}{19.18} = 0.328 \text{ s}
$$
Ans.

PROBLEMS

•**22–1.** A spring is stretched 175 mm by an 8-kg block. Prob. 22–25

Prob. 22–27

*22.2 [Energy Methods](#page-15-0)

The simple harmonic motion of a body, discussed in the previous section, is due only to gravitational and elastic restoring forces acting on the body. Since these forces are *conservative*, it is also possible to use the conservation of energy equation to obtain the body's natural frequency or period of vibration. To show how to do this, consider again the block and spring model in Fig. 22–8. When the block is displaced *x* the block and spring model in Fig. 22–8. When the block is displaced x
from the equilibrium position, the kinetic energy is $T = \frac{1}{2}mv^2 = \frac{1}{2}m\dot{x}^2$
and the potential energy is $V = \frac{1}{2}kx^2$. Since energy is conser from the equilibrium position, the kinetic energy is $T = \frac{1}{2}mv^2 = \frac{1}{2}mx^2$
and the potential energy is $V = \frac{1}{2}kx^2$. Since energy is conserved, it is necessary that

$$
T + V = \text{constant}
$$

$$
\frac{1}{2}m\dot{x}^2 + \frac{1}{2}kx^2 = \text{constant}
$$
 (22-17)

The differential equation describing the *accelerated motion* of the block can be obtained by *differentiating* this equation with respect to time; i.e.,

$$
m\ddot{x}\ddot{x} + kx\dot{x} = 0
$$

$$
\dot{x}(m\ddot{x} + kx) = 0
$$

Since the velocity \dot{x} is not *always* zero in a vibrating system,

$$
\ddot{x} + \omega_n^2 x = 0 \qquad \omega_n = \sqrt{k/m}
$$

which is the same as Eq. 22–1.

If the conservation of energy equation is written for a *system of connected bodies*, the natural frequency or the equation of motion can also be determined by time differentiation. It is *not necessary* to dismember the system to account for the internal forces because they do no work.

Fig. 22–8

The suspension of a railroad car consists of a set of springs which are mounted between the frame of the car and the wheel truck. This will give the car a natural frequency of vibration which can be determined.

Procedure for Analysis

The natural frequency ω_n of a body or system of connected bodies
can be determined by applying the conservation of energy equation can be determined by applying the conservation of energy equation using the following procedure.

Energy Equation.

- Draw the body when it is displaced by a *small amount* from its equilibrium position and define the location of the body from its equilibrium position by an appropriate position coordinate *q*.
- Formulate the conservation of energy for the body, $T + V =$ constant in terms of the position coordinate constant, in terms of the position coordinate.
- In general, the kinetic energy must account for both the body's
translational and rotational motion $T = \frac{1}{2}mv^2 + \frac{1}{2}I_{\infty}^2$ In general, the kinetic energy must account for both the body's
translational and rotational motion, $T = \frac{1}{2}mv_G^2 + \frac{1}{2}I_G\omega^2$,
Eq. 18–2 Eq. 18–2.
- The potential energy is the sum of the gravitational and elastic The potential energy is the sum of the gravitational and elastic
potential energies of the body, $V = V_g + V_e$, Eq. 18–17. In
particular V should be measured from a datum for which $a = 0$ potential energies of the body, $V = V_g + V_e$, Eq. 18–17. In particular, V_g should be measured from a datum for which $q = 0$ (equilibrium position) (equilibrium position).

Time Derivative.

• Take the time derivative of the energy equation using the chain rule of calculus and factor out the common terms. The resulting differential equation represents the equation of motion for the system. The natural frequency of ω_n is obtained after rearranging
the terms in the "standard form" $\ddot{a} + \omega^2 a = 0$ the terms in the "standard form," $\ddot{q} + \omega_n^2$ tained
 $q = 0$.

O

EXAMPLE 22.5

The thin hoop shown in Fig. 22–9*a* is supported by the peg at *O*. Determine the natural period of oscillation for small amplitudes of swing. The hoop has a mass *m*.

SOLUTION

Energy Equation. A diagram of the hoop when it is displaced a small **Energy Equation.** A diagram of the hoop when it is displaced a small amount $(q =) \theta$ from the equilibrium position is shown in Fig. 22–9*b*.
Lising the table on the inside back cover and the parallel-axis theorem Using the table on the inside back cover and the parallel-axis theorem to determine I_O , the kinetic energy is

$$
T = \frac{1}{2}I_0\omega_n^2 = \frac{1}{2}[mr^2 + mr^2]\dot{\theta}^2 = mr^2\dot{\theta}^2
$$

If a horizontal datum is placed through point O , then in the displaced position, the potential energy is

$$
V = -mg(r\cos\theta)
$$

The total energy in the system is

$$
T + V = mr^2\dot{\theta}^2 - mgr\cos\theta
$$

Time Derivative.

$$
mr^{2}(2\dot{\theta})\ddot{\theta} + mgr \sin \theta \dot{\theta} = 0
$$

$$
mr\dot{\theta}(2r\ddot{\theta} + g \sin \theta) = 0
$$

Since θ is not always equal to zero, from the terms in parentheses,

$$
\ddot{\theta} + \frac{g}{2r}\sin\theta = 0
$$

For small angle θ , sin $\theta \approx \theta$.

$$
\ddot{\theta} + \frac{g}{2r} \theta = 0
$$

$$
\omega_n = \sqrt{\frac{g}{2r}}
$$

so that

$$
\tau = \frac{2\pi}{\omega_n} = 2\pi \sqrt{\frac{2r}{g}}
$$
Ans.

Fig. 22–10

A 10-kg block is suspended from a cord wrapped around a 5-kg disk, A 10-kg block is suspended from a cord wrapped around a 5-kg disk,
as shown in Fig. 22–10*a*. If the spring has a stiffness $k = 200$ N/m,
determine the natural period of vibration for the system determine the natural period of vibration for the system.

SOLUTION

Energy Equation. A diagram of the block and disk when they are displaced by respective amounts s and θ from the equilibrium position displaced by respective amounts *s* and θ from the equilibrium position
is shown in Fig. 22–10*b*. Since $s = (0.15 \text{ m})\theta$, then $v_b \approx \dot{s} = (0.15 \text{ m})\dot{\theta}$
Thus the kinetic energy of the system is Thus, the kinetic energy of the system is #ints s and θ from the equilibrium position
 $s = (0.15 \text{ m})\theta$, then $v_b \approx \dot{s} = (0.15 \text{ m})\dot{\theta}$.

e system is

$$
T = \frac{1}{2} m_b v_b^2 + \frac{1}{2} I_O \omega_d^2
$$

= $\frac{1}{2} (10 \text{ kg}) [(0.15 \text{ m})\dot{\theta}]^2 + \frac{1}{2} [\frac{1}{2} (5 \text{ kg}) (0.15 \text{ m})^2](\dot{\theta})^2$
= 0.1406($\dot{\theta}$)²

Establishing the datum at the equilibrium position of the block and realizing that the spring stretches s_{st} for equilibrium, the potential energy is energy is

$$
V = \frac{1}{2}k(s_{st} + s)^{2} - Ws
$$

= $\frac{1}{2}(200 \text{ N/m})[s_{st} + (0.15 \text{ m})\theta]^{2} - 98.1 \text{ N}[(0.15 \text{ m})\theta]$

The total energy for the system is therefore, #

$$
T + V = 0.1406(\dot{\theta})^2 + 100(s_{\rm st} + 0.15\theta)^2 - 14.715\theta
$$

Time Derivative.

$$
0.28125(\dot{\theta})\ddot{\theta} + 200(s_{\rm st} + 0.15\theta)0.15\dot{\theta} - 14.72\dot{\theta} = 0
$$

Since $s_{st} = 98.1/200 = 0.4905$ m, the above equation reduces to the "standard form" "standard form"

$$
\ddot{\theta} + 16\theta = 0
$$

so that

$$
\omega_n = \sqrt{16} = 4 \text{ rad/s}
$$

Thus,

$$
\tau = \frac{2\pi}{\omega_n} = \frac{2\pi}{4} = 1.57 \text{ s}
$$
Ans.

22

*22.3 [Undamped Forced Vibration](#page-15-0)

Undamped forced vibration is considered to be one of the most important types of vibrating motion in engineering. Its principles can be used to describe the motion of many types of machines and structures.

Periodic Force. The block and spring shown in Fig. 22–11*a* provide a convenient model which represents the vibrational characteristics of a convenient model which represents the vibrational characteristics of a
system subjected to a periodic force $F = F_0 \sin \omega_0 t$. This force has an
annitude of E, and a forcing frequency ω_0 . The free-body diagram for amplitude of F_0 and a *forcing frequency* ω_0 . The free-body diagram for the block when it is displaced a distance x is shown in Fig. 22–11*b*. the block when it is displaced a distance *x* is shown in Fig. 22–11*b*.

Applying the equation of motion, we have
\n
$$
\Rightarrow \Sigma F_x = ma_x; \qquad F_0 \sin \omega_0 t - kx = m\ddot{x}
$$

or

$$
\ddot{x} + \frac{k}{m}x = \frac{F_0}{m}\sin\omega_0 t \qquad (22-18)
$$

This equation is a nonhomogeneous second-order differential equation. The general solution consists of a complementary solution, x_c , plus a particular solution x_c particular solution, x_p .
The complementary

The *complementary solution* is determined by setting the term on the right side of Eq. 22–18 equal to zero and solving the resulting homogeneous equation. The solution is defined by Eq. 22–9, i.e.,

$$
x_c = C \sin(\omega_n t + \phi) \tag{22-19}
$$

where ω_n is the natural frequency, $\omega_n = \sqrt{k/m}$, Eq. 22–2.
Since the motion is periodic, the *narticular solution* of Eq.

Since the motion is periodic, the *particular solution* of Eq. 22–18 can be determined by assuming a solution of the form

$$
x_p = X \sin \omega_0 t \tag{22-20}
$$

where X is a constant. Taking the second time derivative and substituting into Eq. 22–18 yields

$$
-X\omega_0^2\sin\omega_0 t + \frac{k}{m}(X\sin\omega_0 t) = \frac{F_0}{m}\sin\omega_0 t
$$

Factoring out $\sin \omega_0 t$ and solving for *X* gives

$$
X = \frac{F_0/m}{(k/m) - \omega_0^2} = \frac{F_0/k}{1 - (\omega_0/\omega_n)^2}
$$
 (22-21)

Substituting into Eq. 22–20, we obtain the particular solution

$$
x_p = \frac{F_0/k}{1 - (\omega_0/\omega_n)^2} \sin \omega_0 t
$$
 (22–22)

Shaker tables provide forced vibration and are used to separate out granular materials.

The *general solution* is therefore the sum of two sine functions having different frequencies.

$$
x = x_c + x_p = C \sin(\omega_n t + \phi) + \frac{F_0/k}{1 - (\omega_0/\omega_n)^2} \sin \omega_0 t
$$
 (22–23)

The *complementary solution* x_c defines the *free vibration*, which depends The *complementary solution* x_c defines the *free vibration*, which depends
on the natural frequency $\omega_n = \sqrt{k/m}$ and the constants *C* and ϕ . The
narticular solution x, describes the *forced vibration* of the block *particular solution* x_p describes the *forced vibration* of the block caused particular solution x_p describes the forced vibration of the block caused
by the applied force $F = F_0 \sin \omega_0 t$. Since all vibrating systems are
subject to friction the free vibration x , will in time dampen out For this subject to *friction*, the free vibration, x_c , will in time dampen out. For this reason the free vibration is referred to as *transient* and the forced reason the free vibration is referred to as *transient*, and the forced vibration is called *steady-state*, since it is the only vibration that remains.

From Eq. 22–21 it is seen that the *amplitude* of forced or steady-state vibration depends on the *frequency ratio* ω_0/ω_n . If the *magnification*
factor ME is defined as the ratio of the applitude of steady state *factor* MF is defined as the ratio of the amplitude of steady-state vibration, *X*, to the static deflection, F_0/k , which would be produced by the amplitude of the periodic force F_0 , then from Eq. 22–21 the amplitude of the periodic force F_0 , then, from Eq. 22–21,

The soil compactor operates by forced vibration developed by an internal motor. It is important that the forcing frequency not be close to the natural frequency of vibration of the compactor, which can be determined when the motor is turned off; otherwise resonance will occur and the machine will become uncontrollable.

displacement is applied with a frequency close to the natural frequency
of the system, i.e.,
$$
\omega_0/\omega_n \approx 1
$$
, the amplitude of vibration of the block
becomes extremely large. This occurs because the force **F** is applied to
the block so that it always follows the motion of the block. This condition

This equation is graphed in Fig. 22–12. Note that if the force or displacement is applied with a frequency close to the natural frequency

 $\text{MF} = \frac{X}{F_0/k} = \frac{1}{1 - (\omega_0/\omega_n)^2}$

is called *resonance*, and in practice, resonating vibrations can cause

Periodic Support Displacement. Forced vibrations can also arise from the periodic excitation of the support of a system. The model shown in Fig. 22–13*a* represents the periodic vibration of a block which is shown in Fig. 22–13*a* represents the periodic vibration of a block which is caused by harmonic movement $\delta = \delta_0 \sin \omega_0 t$ of the support. The free-
body diagram for the block in this case is shown in Fig. 22–13*b*. The body diagram for the block in this case is shown in Fig. 22–13*b*. The displacement δ of the support is measured from the point of zero displacement, i.e., when the radial line *OA* coincides with *OB*.Therefore, displacement, i.e., when the radial line *OA* coincides with *OB*. Therefore, general deformation of the spring is $(x - \delta_0 \sin \omega_0 t)$. Applying the equation of motion vields

$$
\Rightarrow F_x = ma_x; \qquad -k(x - \delta_0 \sin \omega_0 t) = m\ddot{x}
$$

equation of motion yields

tremendous stress and rapid failure of parts.*

or

$$
\ddot{x} + \frac{k}{m}x = \frac{k\delta_0}{m}\sin \omega_0 t
$$

By comparison, this equation is identical to the form of Eq. 22–18, *provided* F_0 is *replaced* by $k\delta_0$. If this substitution is made into the solutions defined by Eqs. 22–21 to 22–23 the results are appropriate for solutions defined by Eqs. 22–21 to 22–23, the results are appropriate for describing the motion of the block when subjected to the support displacement $\delta = \delta_0 \sin \omega_0 t$.

*A swing has a natural period of vibration, as determined in Example 22.1. If someone pushes on the swing only when it reaches its highest point, neglecting drag or wind resistance, resonance will occur since the natural and forcing frequencies are the same.

22.3 UNDAMPED FORCED VIBRATION 653

 -2

(22–24)

Fig. 22–13

The instrument shown in Fig. 22–14 is rigidly attached to a platform *P*, which in turn is supported by *four* springs, each having a stiffness which in turn is supported by *four* springs, each having a stiffness $k = 800$ N/m. If the floor is subjected to a vertical displacement $\delta = 10 \sin(8t)$ mm where *t* is in seconds determine the amplitude of $k = 800$ N/m. If the floor is subjected to a vertical displacement $\delta = 10 \sin(8t)$ mm, where t is in seconds, determine the amplitude of steady-state vibration. What is the frequency of the floor vibration steady-state vibration. What is the frequency of the floor vibration required to cause resonance? The instrument and platform have a total mass of 20 kg.

SOLUTION

The natural frequency is

$$
\omega_n = \sqrt{\frac{k}{m}} = \sqrt{\frac{4(800 \text{ N/m})}{20 \text{ kg}}} = 12.65 \text{ rad/s}
$$

The amplitude of steady state vibration is found using Eq. 22–21, with $k\delta_0$ replacing F_0 .

$$
X = \frac{\delta_0}{1 - (\omega_0/\omega_n)^2} = \frac{10}{1 - [(8 \text{ rad/s})/(12.65 \text{ rad/s})]^2} = 16.7 \text{ mm}
$$
Ans.

Resonance will occur when the amplitude of vibration *X* caused by the floor displacement approaches infinity. This requires

$$
\omega_0 = \omega_n = 12.6 \text{ rad/s}
$$
 Ans.

*22.4 [Viscous Damped Free Vibration](#page-15-0)

The vibration analysis considered thus far has not included the effects of friction or damping in the system, and as a result, the solutions obtained are only in close agreement with the actual motion. Since all vibrations die out in time, the presence of damping forces should be included in the analysis.

In many cases damping is attributed to the resistance created by the substance, such as water, oil, or air, in which the system vibrates. Provided the body moves slowly through this substance, the resistance to motion is directly proportional to the body's speed. The type of force developed under these conditions is called a *viscous damping force*. The magnitude of this force is expressed by an equation of the form
 $F = c\dot{x}$

$$
F = c\dot{x} \tag{22-26}
$$

where the constant *c* is called the *coefficient of viscous damping* and has units of $N \cdot s/m$ or $lb \cdot s/ft$. ne constant *c* is cal
N · s/m or lb · s/ft.

The vibrating motion of a body or system having viscous damping can be characterized by the block and spring shown in Fig. 22–15*a*.The effect of damping is provided by the *dashpot* connected to the block on the right side. Damping occurs when the piston *P* moves to the right or left within the enclosed cylinder. The cylinder contains a fluid, and the motion of the piston is retarded since the fluid must flow around or through a small hole in the piston. The dashpot is assumed to have a coefficient of viscous damping *c*.

If the block is displaced a distance *x* from its equilibrium position, the resulting free-body diagram is shown in Fig. 22–15*b*. Both the spring and damping force oppose the forward motion of the block, so that applying

the equation of motion yields
\n
$$
\Rightarrow \Sigma F_x = ma_x; \qquad -kx - c\dot{x} = m\ddot{x}
$$

 e

or

$$
m\ddot{x} + c\dot{x} + kx = 0
$$
 (22-27)

This linear, second-order, homogeneous, differential equation has a solution of the form

 $x = e^{\lambda t}$

where e is the base of the natural logarithm and λ (lambda) is a constant. The value of λ can be obtained by substituting this solution and its time derivatives into Eq. 22–27, which yields

$$
m\lambda^2 e^{\lambda t} + c\lambda e^{\lambda t} + k e^{\lambda t} = 0
$$

$$
\lambda t (m \lambda^2 + c \lambda + k) = 0
$$

or

Since $e^{\lambda t}$ can never be zero, a solution is possible provided

$$
m\lambda^2 + c\lambda + k = 0
$$

Hence, by the quadratic formula, the two values of λ are

$$
\lambda_1 = -\frac{c}{2m} + \sqrt{\left(\frac{c}{2m}\right)^2 - \frac{k}{m}}
$$
\n
$$
\lambda_2 = -\frac{c}{2m} - \sqrt{\left(\frac{c}{2m}\right)^2 - \frac{k}{m}}
$$
\n(22-28)

The general solution of Eq. 22–27 is therefore a combination of exponentials which involves both of these roots. There are three possible combinations of λ_1 and λ_2 which must be considered. Before discussing these combinations, however, we will first define the critical damping coefficient c_c as the value of c which makes the radical in Eqs. 22–28 equal to zero; i.e.,

$$
\left(\frac{c_c}{2m}\right)^2 - \frac{k}{m} = 0
$$

or

$$
c_c = 2m\sqrt{\frac{k}{m}} = 2m\omega_n
$$
 (22–29)

Overdamped System. When $c > c_c$, the roots λ_1 and λ_2 are both real. The general solution of Eq. 22–27 can then be written as real. The general solution of Eq. 22–27 can then be written as

$$
x = Ae^{\lambda_1 t} + Be^{\lambda_2 t} \tag{22-30}
$$

Motion corresponding to this solution is *nonvibrating*. The effect of damping is so strong that when the block is displaced and released, it simply creeps back to its original position without oscillating.The system is said to be *overdamped*.

Critically Damped System. If $c = c_c$, then $\lambda_1 = \lambda_2 = -c_c/2m = -\omega_n$.
This situation is known as *critical damning* since it represents a This situation is known as *critical damping*, since it represents a condition where *c* has the smallest value necessary to cause the system to be nonvibrating. Using the methods of differential equations, it can be shown that the solution to Eq. 22–27 for critical damping is

$$
x = (A + Bt)e^{-\omega_n t}
$$
 (22-31)

Underdamped System. Most often $c < c_c$, in which case the system is referred to as *underdamped*. In this case the roots λ_1 and λ_2 system is referred to as *underdamped*. In this case the roots λ_1 and λ_2 are complex numbers, and it can be shown that the general solution of Eq. 22–27 can be written as

$$
x = D[e^{-(c/2m)t} \sin(\omega_d t + \phi)]
$$
 (22-32)

where D and ϕ are constants generally determined from the initial conditions of the problem. The constant ω_d is called the *damped natural* transmission of the system. It has a value of *frequency* of the system. It has a value of

$$
\omega_d = \sqrt{\frac{k}{m} - \left(\frac{c}{2m}\right)^2} = \omega_n \sqrt{1 - \left(\frac{c}{c_c}\right)^2}
$$
 (22-33)

where the ratio c/c_c is called the *damping factor*.
The graph of Eq. 22–32 is shown in Fig. 22.

The graph of Eq. 22–32 is shown in Fig. 22–16. The initial limit of motion, *D*, diminishes with each cycle of vibration, since motion is confined within the bounds of the exponential curve. Using the damped natural frequency ω_d , the period of damped vibration can be written as

$$
\tau_d = \frac{2\pi}{\omega_d} \tag{22-34}
$$

Since $\omega_d < \omega_n$, Eq. 22–33, the period of damped vibration, τ_d , will be greater than that of free vibration, $\tau = 2\pi/\omega_n$.

Fig. 22–16

*22.5 [Viscous Damped Forced Vibration](#page-15-0)

The most general case of single-degree-of-freedom vibrating motion occurs when the system includes the effects of forced motion and induced damping. The analysis of this particular type of vibration is of practical value when applied to systems having significant damping characteristics.

If a dashpot is attached to the block and spring shown in Fig. 22–11*a*, the differential equation which describes the motion becomes

$$
m\ddot{x} + c\dot{x} + kx = F_0 \sin \omega_0 t \qquad (22-35)
$$

A similar equation can be written for a block and spring having a periodic support displacement, Fig. 22–13*a*, which includes the effects of damping. In that case, however, F_0 is replaced by $k\delta_0$. Since Eq. 22–35 is
nonhomogeneous the general solution is the sum of a complementary nonhomogeneous, the general solution is the sum of a complementary solution, x_c , and a particular solution, x_p . The complementary solution
is determined by setting the right side of Eq. 22–35 equal to zero and is determined by setting the right side of Eq. 22–35 equal to zero and solving the homogeneous equation, which is equivalent to Eq. 22–27. The solution is therefore given by Eq. 22–30, 22–31, or 22–32, depending on the values of λ_1 and λ_2 . Because all systems are subjected to friction, then this solution will dampen out with time. Only the particular solution, which describes the *steady-state vibration* of the system, will remain. Since the applied forcing function is harmonic, the steady-state motion will also be harmonic. Consequently, the particular solution will be of the form

$$
X_P = X' \sin(\omega_0 t - \phi') \tag{22-36}
$$

The constants X' and ϕ' are determined by taking the first and second
time derivatives and substituting them into Eq. 22–35, which after time derivatives and substituting them into Eq. 22–35, which after simplification yields

$$
-X'm\omega_0^2\sin(\omega_0 t - \phi') +X'c\omega_0\cos(\omega_0 t - \phi') + X'k\sin(\omega_0 t - \phi') = F_0\sin\omega_0 t
$$

Since this equation holds for all time, the constant coefficients can be Since this equation holds for all time, the constant coefficients can be obtained by setting $\omega_0 t - \phi' = 0$ and $\omega_0 t - \phi' = \pi/2$, which causes the above equation to become above equation to become

$$
X'c\omega_0 = F_0 \sin \phi'
$$

$$
-X'm\omega_0^2 + X'k = F_0 \cos \phi'
$$

The amplitude is obtained by squaring these equations, adding the The amplitude is obtained by squaring these equations, acresuts, and using the identity $\sin^2 \phi' + \cos^2 \phi' = 1$, which gives

Dividing the first equation by the second gives
\n
$$
X' = \frac{F_0}{\sqrt{(k - m\omega_0^2)^2 + c^2\omega_0^2}}
$$
\n
$$
(22-37)
$$

$$
\phi' = \tan^{-1} \left[\frac{c\omega_0}{k - m\omega_0^2} \right] \tag{22-38}
$$

Since $\omega_n = \sqrt{k/m}$ and $c_c = 2m\omega_n$, then the above equations can also be written as written as

$$
X' = \frac{F_0/k}{\sqrt{[1 - (\omega_0/\omega_n)^2]^2 + [2(c/c)(\omega_0/\omega_n)]^2}}
$$

$$
\phi' = \tan^{-1} \left[\frac{2(c/c_c)(\omega_0/\omega_n)}{1 - (\omega_0/\omega_n)^2} \right]
$$
 (22-39)

The angle ϕ' represents the phase difference between the applied force and the resulting steady-state vibration of the damped system.

The *magnification factor* MF has been defined in Sec. 22.3 as the ratio of the amplitude of deflection caused by the forced vibration to the

deflection caused by a static force
$$
F_0
$$
. Thus,
\n
$$
MF = \frac{X'}{F_0/k} = \frac{1}{\sqrt{[1 - (\omega_0/\omega_n)^2]^2 + [2(c/c_c)(\omega_0/\omega_n)]^2}}
$$
(22-40)

The MF is plotted in Fig. 22–17 versus the frequency ratio ω_0/ω_n for various values of the damping factor c/c . It can be seen from this graph various values of the damping factor c/c_c . It can be seen from this graph that the magnification of the amplitude increases as the damping factor that the magnification of the amplitude increases as the damping factor decreases. Resonance obviously occurs only when the damping factor is zero and the frequency ratio equals 1.

The 30-kg electric motor shown in Fig. 22–18 is supported by *four* springs, each spring having a stiffness of 200 N/m . If the rotor is unbalanced such that its effect is equivalent to a 4-kg mass located 60 mm from the axis of rotation, determine the amplitude of vibration 60 mm from the axis of rotation, determine the amplitude of vibration when the rotor is turning at $\omega_0 = 10$ rad/s. The damping factor is $c/c_c = 0.15$.

Fig. 22–18

SOLUTION

The periodic force which causes the motor to vibrate is the centrifugal

force due to the unbalanced rotor. This force has a constant magnitude of

$$
F_0 = ma_n = mr\omega_0^2 = 4 \text{ kg}(0.06 \text{ m})(10 \text{ rad/s})^2 = 24 \text{ N}
$$

Since $F = F_0 \sin \omega_0 t$, where $\omega_0 = 10 \text{ rad/s}$, then
 $F = 24 \sin 10t$ $F = F_0 \sin \omega_0 t$, where $\omega_0 = 10 \text{ rad/s}$,

$$
F=24\sin 10t
$$

The stiffness of the entire system of four springs is The stiffness of the entire system of four springs is
 $k = 4(200 \text{ N/m}) = 800 \text{ N/m}$. Therefore, the natural frequency of

vibration is vibration is

$$
\omega_n = \sqrt{\frac{k}{m}} = \sqrt{\frac{800 \text{ N/m}}{30 \text{ kg}}} = 5.164 \text{ rad/s}
$$

Since the damping factor is known, the steady-state amplitude can be determined from the first of Eqs. 22–39, i.e.,

$$
X' = \frac{F_0/k}{\sqrt{[1 - (\omega_0/\omega_n)^2]^2 + [2(c/c_c)(\omega_0/\omega_n)]^2}}
$$

=
$$
\frac{24/800}{\sqrt{[1 - (10/5.164)^2]^2 + [2(0.15)(10/5.164)]^2}}
$$

= 0.0107 m = 10.7 mm *Ans.*

*22.6 [Electrical Circuit Analogs](#page-15-0)

The characteristics of a vibrating mechanical system can be represented by an electric circuit. Consider the circuit shown in Fig. 22–19*a*, which consists of an inductor *L*, a resistor *R*, and a capacitor *C*. When a voltage *E*(*t*) is applied, it causes a current of magnitude *i* to flow through the circuit. As the current flows past the inductor the voltage drop is $L(di/dt)$, when
it flows across the resistor the drop is Ri and when it arrives at the capacitor it flows across the resistor the drop is *Ri*, and when it arrives at the capacitor the drop is $(1/C)$ *i dt*. Since current cannot flow past a capacitor, it is only the drop is $(1/C)$ *J i dt*. Since current cannot flow past a capacitor, it is only possible to measure the charge *q* acting on the capacitor. The charge can, possible to measure the charge q acting on the capacitor. The charge can,
however, be related to the current by the equation $i = dq/dt$. Thus, the
voltage drops which occur across the inductor resistor, and capacitor voltage drops which occur across the inductor, resistor, and capacitor becomes $L d^2q/dt^2$, $R dq/dt$, and q/C , respectively. According to Kirchhoff's voltage law the applied voltage balances the sum of the voltage Kirchhoff's voltage law, the applied voltage balances the sum of the voltage drops around the circuit. Therefore,

$$
L\frac{d^2q}{dt^2} + R\frac{dq}{dt} + \frac{1}{C}q = E(t)
$$
 (22-41)
Consider now the model of a single-degree-of-freedom mechanical

system, Fig. 22–19*b*, which is subjected to both a general forcing function $F(t)$ and damping. The equation of motion for this system was established in the previous section and can be written as

$$
m\frac{d^2x}{dt^2} + c\frac{dx}{dt} + kx = F(t)
$$
 (22-42)
By comparison, it is seen that Eqs. 22-41 and 22-42 have the same form,

and hence mathematically the procedure of analyzing an electric circuit is the same as that of analyzing a vibrating mechanical system. The analogs between the two equations are given in Table 22–1.

This analogy has important application to experimental work, for it is much easier to simulate the vibration of a complex mechanical system using an electric circuit, which can be constructed on an analog computer, than to make an equivalent mechanical spring-and-dashpot model.

Fig. 22–19
PROBLEMS

22–42. If the block-and-spring model is subjected to the 22–42. If the block-and-spring model is subjected to the periodic force $F = F_0 \cos \omega t$, show that the differential equation of motion is $\ddot{x} + (k/m)x = (F_0/m) \cos \omega t$ where periodic force $F = F_0 \cos \omega t$, show that the differential
equation of motion is $\ddot{x} + (k/m)x = (F_0/m) \cos \omega t$, where
x is measured from the equilibrium position of the block \overline{x} is measured from the equilibrium position of the block. What is the general solution of this equation?

CHAPTER REVIEW

Undamped Free Vibration

A body has free vibration when gravitational or elastic restoring forces cause the motion. This motion is undamped when friction forces are neglected. The periodic motion of an undamped, freely vibrating body can be studied by displacing the body from the equilibrium position and then applying the equation of motion along the path.

For a one-degree-of-freedom system, the resulting differential equation can be written in terms of its natural frequency ω_n .

Energy Methods

Provided the restoring forces acting on the body are gravitational and elastic, then conservation of energy can also be used to determine its simple harmonic motion. To do this, the body is displaced a small amount from its equilibrium position, and an expression for its kinetic and potential energy is written. The time derivative of this equation can then be rearranged in the standard form $\ddot{x} + \omega_n^2$ $x = 0.$

Undamped Forced Vibration

When the equation of motion is applied to a body, which is subjected to a periodic force, or the support has a displacement with a frequency ω_0 , then the solution of the differential equation consists of a complementary solution and a particular solution. The complementary solution is caused by the free vibration and can be neglected. The particular solution is caused by the forced vibration.

Resonance will occur if the natural frequency of vibration ω_n is equal to the forcing frequency ω_n . This should be forcing frequency ω_0 . This should be avoided, since the motion will tend to become unbounded.

$$
\ddot{x} + \omega_n^2 x = 0 \qquad \qquad \tau = \frac{2\pi}{\omega_n} \qquad \qquad f = \frac{1}{\tau} = \frac{\omega_n}{2\pi}
$$

$$
x_p = \frac{F_0/k}{1 - (\omega_0/\omega_n)^2} \sin \omega_0 t
$$

Viscous Damped Free Vibration

A viscous damping force is caused by fluid drag on the system as it vibrates. If the motion is slow, this drag force will be proportional to the velocity, that is,
 $F = c\dot{x}$. Here c is the coefficient of

viscous damping By comparing its value Here *c* is the coefficient of . viscous damping. By comparing its value to the critical damping coefficient to the critical damping coefficient
 $c_c = 2m\omega_n$, we can specify the type of

vibration that occurs If $c > c$ it is an $c_c = 2m\omega_n$, we can specify the type of
vibration that occurs. If $c > c_c$, it is an
overdamped system: if $c = c$ it is a vibration that occurs. If $c > c_c$, it is an overdamped system; if $c = c_c$, it is a critically damped system; if $c < c$ it is overdamped system; if $c = c_c$, it is a
critically damped system; if $c < c_c$, it is
an underdamped system an underdamped system.

Viscous Damped Forced Vibration

The most general type of vibration for a one-degree-of-freedom system occurs when the system is damped and subjected to periodic forced motion.The solution provides insight as to how the damping factor, c/c_c , and the frequency
ratio c/c_c influence the vibration ratio, ω_0/ω_n , influence the vibration.

Resonance is avoided provided $c/c_c \neq 0$
and $c_0/c_0 \neq 1$ and $\omega_0/\omega_n \neq 1$.

Electrical Circuit Analogs

The vibrating motion of a complex mechanical system can be studied by modeling it as an electrical circuit.This is possible since the differential equations that govern the behavior of each system are the same.

B

APPENDIX [Vector Analysis](#page-15-0)

The following discussion provides a brief review of vector analysis.A more detailed treatment of these topics is given in *Engineering Mechanics: Statics*.

Vector. A vector, **A**, is a quantity which has magnitude and direction, and adds according to the parallelogram law. As shown in Fig. B–1, and adds according to the parallelogram law. As shown in Fig. B–1, $\mathbf{A} = \mathbf{B} + \mathbf{C}$, where \mathbf{A} is the *resultant vector* and \mathbf{B} and \mathbf{C} are *component vectors*.

Unit Vector. A unit vector, \mathbf{u}_A , has a magnitude of one "dimensionless" unit and acts in the same direction as \mathbf{A} . It is determined by dividing \mathbf{A} by its unit and acts in the same direction as **A**. It is determined by dividing **A** by its magnitude *A*, i.e,

$$
\mathbf{u}_A = \frac{\mathbf{A}}{A} \tag{B-1}
$$

Fig. B–1

Cartesian Vector Notation. The directions of the positive *x, y, z* axes are defined by the Cartesian unit vectors **i**, **j**, **k**, respectively.

As shown in Fig. B–2, vector **A** is formulated by the addition of its *x, y, z* components as

$$
\mathbf{A} = A_x \mathbf{i} + A_y \mathbf{j} + A_z \mathbf{k}
$$
 (B-2)

The *magnitude* of **A** is determined from

$$
A = \sqrt{A_x^2 + A_y^2 + A_z^2}
$$
 (B-3)

The *direction* of **A** is defined in terms of its *coordinate direction angles*, a, β , γ , measured from the *tail* of **A** to the *positive x*, y, z axes, Fig. B-3. These angles are determined from the *direction cosines* which represent the **i**, **j**, **k** components of the unit vector \mathbf{u}_A ; i.e., from Eqs. B–1 and B–2

$$
\mathbf{u}_A = \frac{A_x}{A}\mathbf{i} + \frac{A_y}{A}\mathbf{j} + \frac{A_z}{A}\mathbf{k}
$$
 (B-4)

so that the direction cosines are

$$
\cos \alpha = \frac{A_x}{A} \qquad \cos \beta = \frac{A_y}{A} \qquad \cos \gamma = \frac{A_z}{A}
$$
 (B-5)

Hence, $\mathbf{u}_A = \cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}$, and using Eq. B-3, it is seen that

$$
\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1
$$
 (B-6)

The Cross Product. The cross product of two vectors **A** and **B**, which yields the resultant vector **C**, is written as

$$
\mathbf{C} = \mathbf{A} \times \mathbf{B} \tag{B-7}
$$

and reads **C** equals **A** "cross" **B**. The *magnitude* of **C** is

$$
C = AB \sin \theta \tag{B-8}
$$

where θ is the angle made between the *tails* of **A** and **B** ($0^{\circ} \le \theta \le 180^{\circ}$). The *direction* of **C** is determined by the right-hand rule, whereby the fingers of the right hand are curled *from* **A** *to* **B** and the thumb points in the direction of **C**, Fig. B–4. This vector is perpendicular to the plane containing vectors **A** and **B**.

B

A

Fig. B–4

 θ

C

The vector cross product is *not* commutative, i.e., $\mathbf{A} \times \mathbf{B} \neq \mathbf{B} \times \mathbf{A}$. Rather,

$$
\mathbf{A} \times \mathbf{B} = -\mathbf{B} \times \mathbf{A}
$$
 (B-9)

The distributive law is valid; i.e.,

$$
\mathbf{A} \times (\mathbf{B} + \mathbf{D}) = \mathbf{A} \times \mathbf{B} + \mathbf{A} \times \mathbf{D}
$$
 (B-10)

And the cross product may be multiplied by a scalar *m* in any manner; i.e.,

$$
m(\mathbf{A} \times \mathbf{B}) = (m\mathbf{A}) \times \mathbf{B} = \mathbf{A} \times (m\mathbf{B}) = (\mathbf{A} \times \mathbf{B})m \quad (\text{B-11})
$$

Equation B–7 can be used to find the cross product of any pair of Equation B-7 can be used to find the cross product of any pair of Cartesian unit vectors. For example, to find $\mathbf{i} \times \mathbf{j}$, the magnitude is Cartesian unit vectors. For example, to find $\mathbf{i} \times \mathbf{j}$, the magnitude is $(i)(j) \sin 90^\circ = (1)(1)(1) = 1$, and its direction $+\mathbf{k}$ is determined from the right-hand rule applied to $\mathbf{i} \times \mathbf{i}$ Fig B-2. A simple scheme s $(t)(j)$ sin 90° = $(1)(1)(1) = 1$, and its direction $+\mathbf{k}$ is determined from the right-hand rule, applied to **i** \times **j**, Fig. B–2. A simple scheme shown in Fig. B–5 may be helpful in obtaining this and other results when the need arises. If the circle is constructed as shown, then "crossing" two of the unit vectors in a *counterclockwise* fashion around the circle yields a *positive* third unit vector, e.g., $\mathbf{k} \times \mathbf{i} = \mathbf{j}$. Moving *clockwise*, a *negative* positive third unit vector, e.g., $\mathbf{k} \times \mathbf{i} =$
unit vector is obtained, e.g., $\mathbf{i} \times \mathbf{k} = -\mathbf{j}$.

If **A** and **B** are expressed in Cartesian component form, then the cross product, Eq. B–7, may be evaluated by expanding the determinant

$$
\mathbf{C} = \mathbf{A} \times \mathbf{B} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ A_x & A_y & A_z \\ B_x & B_y & B_z \end{vmatrix}
$$
 (B-12)

which yields

$$
\mathbf{C} = (A_y B_z - A_z B_y)\mathbf{i} - (A_x B_z - A_z B_x)\mathbf{j} + (A_x B_y - A_y B_x)\mathbf{k}
$$

Recall that the cross product is used in statics to define the moment of a force **F** about point *O*, in which case

$$
\mathbf{M}_O = \mathbf{r} \times \mathbf{F} \tag{B-13}
$$

where **r** is a position vector directed from point *O* to *any point* on the line of action of **F**.

The Dot Product. The dot product of two vectors **A** and **B**, which yields a scalar, is defined as

$$
\mathbf{A} \cdot \mathbf{B} = AB \cos \theta \tag{B-14}
$$

and reads \mathbf{A} "dot" \mathbf{B} . The angle θ is formed between the *tails* of \mathbf{A} and \mathbf{B} $(0^{\circ} \leq \theta \leq 180^{\circ}).$

The dot product is commutative; i.e.,

$$
\mathbf{A} \cdot \mathbf{B} = \mathbf{B} \cdot \mathbf{A}
$$
 (B-15)

The distributive law is valid; i.e.,

$$
\mathbf{A} \cdot (\mathbf{B} + \mathbf{D}) = \mathbf{A} \cdot \mathbf{B} + \mathbf{A} \cdot \mathbf{D}
$$
 (B-16)

And scalar multiplication can be performed in any manner, i.e.,

$$
m(\mathbf{A} \cdot \mathbf{B}) = (m\mathbf{A}) \cdot \mathbf{B} = \mathbf{A} \cdot (m\mathbf{B}) = (\mathbf{A} \cdot \mathbf{B})m
$$
 (B-17)

Using Eq. B–14, the dot product between any two Cartesian Using Eq. B–14, the dot product between any two Cartesian vectors can be determined. For example, $\mathbf{i} \cdot \mathbf{i} = (1)(1) \cos 0^\circ = 1$ and $\mathbf{i} \cdot \mathbf{j} = (1)(1) \cos 90^\circ = 0.$

If **A** and **B** are expressed in Cartesian component form, then the dot product, Eq. C–14, can be determined from

$$
\mathbf{A} \cdot \mathbf{B} = A_x B_x + A_y B_y + A_z B_z \tag{B-18}
$$

The dot product may be used to determine the *angle* θ *formed between two vectors*. From Eq. B–14,

$$
\theta = \cos^{-1}\left(\frac{\mathbf{A} \cdot \mathbf{B}}{AB}\right) \tag{B-19}
$$

Fig. B–6

It is also possible to find the *component of a vector in a given direction* using the dot product. For example, the magnitude of the component (or projection) of vector **A** in the direction of **B**, Fig. B–6, is defined by A cos θ . From Eq. B–14, this magnitude is

$$
A \cos \theta = \mathbf{A} \cdot \frac{\mathbf{B}}{B} = \mathbf{A} \cdot \mathbf{u}_B
$$
 (B-20)

where \mathbf{u}_B represents a unit vector acting in the direction of **B**, Fig. B–6.

Differentiation and Integration of Vector Functions. The rules for differentiation and integration of the sums and products of scalar functions also apply to vector functions. Consider, for example, the two vector functions $\mathbf{A}(s)$ and $\mathbf{B}(s)$. Provided these functions are smooth and continuous for all *s*, then

$$
\frac{d}{ds}(\mathbf{A} + \mathbf{B}) = \frac{d\mathbf{A}}{ds} + \frac{d\mathbf{B}}{ds}
$$
 (B-21)

$$
\int (\mathbf{A} + \mathbf{B}) ds = \int \mathbf{A} ds + \int \mathbf{B} ds
$$
 (B-22)

For the cross product,

$$
\frac{d}{ds}(\mathbf{A} \times \mathbf{B}) = \left(\frac{d\mathbf{A}}{ds} \times \mathbf{B}\right) + \left(\mathbf{A} \times \frac{d\mathbf{B}}{ds}\right) \tag{B-23}
$$

Similarly, for the dot product,

$$
\frac{d}{ds}(\mathbf{A} \cdot \mathbf{B}) = \frac{d\mathbf{A}}{ds} \cdot \mathbf{B} + \mathbf{A} \cdot \frac{d\mathbf{B}}{ds}
$$
(B-24)

[The Chain Rule](#page-15-0) APPENDIX

The chain rule of calculus can be used to determine the time derivative of a composite function. For example, if y is a function of x and x is a function of t , then we can find the derivative of y with respect to t as follows \mathbf{r} the theorem the theorem \mathbf{y} and \mathbf{r} theorem

$$
\dot{y} = \frac{dy}{dt} = \frac{dy}{dx}\frac{dx}{dt} \tag{C-1}
$$

In other words, to find y we take the ordinary derivative $\left(\frac{dy}{dx}\right)$ and
ultiply it by the time derivative $\left(\frac{dx}{dt}\right)$ multiply it by the time derivative $\left(\frac{dx}{dt}\right)$.
If several variables are functions of

If several variables are functions of time and they are multiplied If several variables are functions of time and they are multiplied
together, then the product rule $d(uv) = du v + u dv$ must be used along
with the chain rule when taking the time derivatives. Here are some with the chain rule when taking the time derivatives. Here are some examples.

C

$EXAMPLE $|C-1|$$

If $y = x^3$ and $x = t^4$, find y, the second derivative of y with respect to time. y $x = t$ 4 $y = x^3$

\$

SOLUTION.

Using the chain rule, Eq. C–1,

y
x $\dot{y} = 3x^2$

To obtain the second time derivative we must use the product rule since x and x are both functions of time, and also, for $3x^2$ the chain
rule must be applied. Thus with $u = 3x^2$ and $v = x$ we have d also
 $v = \dot{x}$ #x and x are both functions of tim

uust be applied. Thus, with $u = 3x^2$ #

rule must be applied. Thus, with
$$
u = 3x^2
$$
 and $v = \dot{x}$, we have
\n
$$
\ddot{y} = [6\dot{x}\dot{x}]\dot{x} + 3x^2[\ddot{x}] \\
= 3x[2\dot{x}^2 + x\ddot{x}] \\
\text{Since } x = t^4 \text{, then } \dot{x} = 4t^3 \text{ and } \ddot{x} = 12t^2 \text{ so that} \\
\ddot{y} = 3(t^4)[2(4t^3)^2 + t^4(12t^2)] \\
= 132t^{10}
$$

Note that this result can also be obtained by combining the functions, then taking the time derivatives, that is,
 $y = x^3 = (t^4)$

$$
y = x3 = (t4)3 = t12
$$

\n
$$
\dot{y} = 12t11
$$

\n
$$
\ddot{y} = 132t10
$$

EXAMPLE C-2

If $y = xe^x$, find \ddot{y} . $y = xe^x$

\$

SOLUTION

Since x and e^x are both functions of time the product and chain rules must be applied. Have $u = x$ and $v = e^x$.
 $\dot{y} = [\dot{x}]e^x + x[e^x]$.
.
. x and e^x are both functions of time
be applied. Have $u = x$ and $v = e^x$

$$
\dot{y} = [\dot{x}]e^x + x[e^x \dot{x}]
$$

The second time derivative also requires application of the product and chain rules. Note that the product rule applies to three time variables in the last term, i.e., x , e^x , and \dot{x} . =
--
--**.** ### $\frac{1}{2}$ \mathbf{L} #

If $x = t^2$ then $\dot{x} = 2t$, $\ddot{x} = 2$ so that in terms in t, we have y $\frac{1}{2}$. $= e^{t^2}$ $\frac{2}{2}(1 + t)$ 2 $+ 4t$ 2 $\sin t,$
 $(2 + t)$ $^{2})]$ x^x [$\ddot{x}(1 + x) + \dot{x}^2(2 + x)$]
 $\dot{x} = 2t, \ddot{x} = 2$ so that in terms in t $= e^x[\ddot{x}(1 +$ $x = t^2$ then $\dot{x} = 2t$, $\ddot{x} = 2$ $= \{[\ddot{x}]$ $(1 + x) + x$ \cdot^2 $(x_1^2 + x_2^2 + x)$ \overline{a} $=$ {[\ddot{x}] $\int e^x + x$ $\ddot{x}[e^x]$ $\{x, y, z, \ldots\}$ + $\{x, y, z, \ldots\}$ \ddot{x}] $e^x \dot{x}$ $+ x[e^x \dot{x}] \dot{x}$ $+ xe^x[\ddot{x}]$

EXAMPLE C-3

If the path in radical coordinates is given as $r = 5\theta^2$, where θ is a known function of time find \ddot{r} known function of time, find \ddot{r} .

SOLUTION

First, using the chain rule then the chain and product rules where ng the chain rule
and $v = \dot{\theta}$, we have First, us
 $u = 10\theta$

 $= 10\dot{\theta}^2 + 10\dot{\theta}\dot{\theta}$ |
| # $r = \frac{1}{2}$ \dot{r} = $= 10[(\dot{\theta})\dot{\theta} +$ # $+ \theta(\theta)]$ # $\frac{1}{2}$ $=1000$ $r = 5\theta^2$

EXAMPLE <mark>C–4</mark>

If $r^2 = 6\theta^3$, find *i*. $r^2 = 6\theta^3$

SOLUTION

Here the chain and product rules are applied as follows.
\n
$$
r^2 = 6\theta^3
$$
\n
$$
2r\dot{r} = 18\theta^2\dot{\theta}
$$
\n
$$
2[(\dot{r})\dot{r} + r(\dot{r})] = 18[(2\theta\dot{\theta})\dot{\theta} + \theta^2(\dot{\theta})]
$$
\n
$$
\dot{r}^2 + r\dot{r} = 9(2\theta\dot{\theta}^2 + \theta^2\dot{\theta})
$$

To find \ddot{r} at a specified value of θ which is a known function of time, we can first find $\dot{\theta}$ and $\ddot{\theta}$. Then using these values, evaluate *r* from the first equation, \dot{r} from the second equation and \ddot{r} using the last equation equation. $\ddot{r}^2 + r\ddot{r} =$
 \ddot{r} at a specified value of θ

first find $\dot{\theta}$ and $\ddot{\theta}$. Then usi
