b. $\text{curl}(\text{grad } f) = \text{curl} \langle f_x, f_y, f_z \rangle = \langle f_{zy} - f_{yz}, f_{xz} - f_{zx}, f_{yx} - f_{xy} \rangle = \mathbf{0}$

21. Let $f(x, y, z) = -c|r|^{-3}$, so
 $\text{grad}(f) = 3c|r|^{-4} \frac{\mathbf{r}}{|r|} = 3c|r|^{-5} \mathbf{r}$.
 Then $\text{curl } \mathbf{F} = \text{curl} \left[\left(-c|r|^{-3} \right) \mathbf{r} \right]$
 $= \left(-c|r|^{-3} \right) (\text{curl } \mathbf{r}) + \left(3c|r|^{-5} \mathbf{r} \right) \times \mathbf{r}$ (by 20d)
 $= \left(-c|r|^{-3} \right) (\mathbf{0}) + \left(3c|r|^{-5} \right) (\mathbf{r} \times \mathbf{r}) = \mathbf{0} + \mathbf{0} = \mathbf{0}$
 $\text{div } \mathbf{F} = \text{div} \left[\left(-c|r|^{-3} \right) \mathbf{r} \right]$
 $= \left(-c|r|^{-3} \right) (\text{div } \mathbf{r}) + \left(3c|r|^{-5} \mathbf{r} \right) \cdot \mathbf{r}$ (by 20c)
 $= \left(-c|r|^{-3} \right) (1 + 1 + 1) + \left(3c|r|^{-5} \right) |r|^2$
 $= \left(-3c|r|^{-3} \right) + 3c|r|^3 = \mathbf{0}$

22. $\text{curl} \left[-c|r|^{-m} \mathbf{r} \right] = \left(-c|r|^{-m} \right) (\mathbf{0}) + mc|r|^{-m-2} (\mathbf{0})$
 $= \mathbf{0}$
 $\text{div} \left[-c|r|^{-m} \mathbf{r} \right] = \left(-c|r|^{-m} \right) (3) + mc|r|^{-m-2} |r|^2$
 $= (m-3)c|r|^{-m}$

23. $\text{grad } f = \langle f'(r)xr^{-1/2}, f'(r)yr^{-1/2}, f'(r)zr^{-1/2} \rangle$
 (if $r \neq 0$)
 $= f'(r)r^{-1/2} \langle x, y, z \rangle = f'(r)r^{-1/2} \mathbf{r}$
 $\text{curl } \mathbf{F} = [f(r)][\text{curl } \mathbf{r}] + [f'(r)r^{-1/2} \mathbf{r}] \times \mathbf{r}$
 $= [f(r)][\text{curl } \mathbf{r}] + [f'(r)r^{-1/2} \mathbf{r}] \times \mathbf{r}$
 $= \mathbf{0} + \mathbf{0} = \mathbf{0}$

24. $\text{div } \mathbf{F} = \text{div}[f(r)\mathbf{r}] = [f(r)](\text{div } \mathbf{r}) + \text{grad}[f(r)] \cdot \mathbf{r}$
 $= [f(r)](\text{div } \mathbf{r}) + [f'(r)r^{-1} \mathbf{r}] \cdot \mathbf{r}$
 $= [f(r)](3) + [f'(r)r^{-1}](\mathbf{r} \cdot \mathbf{r})$
 $= 3f(r) + [f'(r)r^{-1}](r^2) = 3f(r) + rf'(r)$

Now if $\text{div } \mathbf{F} = 0$, and we let $y = f(r)$, we have the differential equation $3y + r \frac{dy}{dr} = 0$, which can be solved as follows:

$$\frac{dy}{y} = -3 \frac{dr}{r}; \quad \ln|y| = -3 \ln|r| + \ln|C| = \ln|Cr^{-3}|,$$

for each $C \neq 0$. Then $y = Cr^{-3}$, or

$$f(r) = Cr^{-3}, \text{ is a solution (even for } C = 0).$$

25. a. Let $P = (x_0, y_0)$.

$\text{div } \mathbf{F} = \text{div } \mathbf{H} = 0$ since there is no tendency toward P except along the line $x = x_0$, and along that line the tendencies toward and away from P are balanced; $\text{div } \mathbf{G} < 0$ since there is no tendency toward P except along the line $x = x_0$, and along that line there is more tendency toward than away from P ; $\text{div } \mathbf{L} > 0$ since the tendency away from P is greater than the tendency toward P .

- b. No rotation for \mathbf{F} , \mathbf{G} , \mathbf{L} ; clockwise rotation for \mathbf{H} since the magnitudes of the forces to the right of P are less than those to the left.

- c. $\text{div } \mathbf{F} = 0$; $\text{curl } \mathbf{F} = \mathbf{0}$

$$\text{div } \mathbf{G} = -2ye^{-y^2} < 0 \text{ since } y > 0 \text{ at } P; \text{ curl } \mathbf{G} = \mathbf{0}$$

29. a. $\mathbf{F} \times \mathbf{G} = (f_y g_z - f_z g_y)\mathbf{i} - (f_x g_z - f_z g_x)\mathbf{j} + (f_x g_y - f_y g_x)\mathbf{k}$

Therefore,

$$\text{div}(\mathbf{F} \times \mathbf{G}) = \frac{\partial}{\partial x}(f_y g_z - f_z g_y) - \frac{\partial}{\partial y}(f_x g_z - f_z g_x) + \frac{\partial}{\partial z}(f_x g_y - f_y g_x).$$

Using the product rule for partials and some algebra gives

$$\begin{aligned} \text{div}(\mathbf{F} \times \mathbf{G}) &= g_x \left[\frac{\partial f_z}{\partial y} - \frac{\partial f_y}{\partial z} \right] + g_y \left[\frac{\partial f_x}{\partial z} - \frac{\partial f_z}{\partial x} \right] + g_z \left[\frac{\partial f_y}{\partial x} - \frac{\partial f_x}{\partial y} \right] \\ &\quad + f_x \left[\frac{\partial g_z}{\partial y} - \frac{\partial g_y}{\partial z} \right] + f_y \left[\frac{\partial g_x}{\partial z} - \frac{\partial g_z}{\partial x} \right] + f_z \left[\frac{\partial g_y}{\partial x} - \frac{\partial g_x}{\partial y} \right] \\ &= \mathbf{G} \cdot \text{curl}(\mathbf{F}) - \mathbf{F} \cdot \text{curl}(\mathbf{G}) \end{aligned}$$

- b. $\nabla f \times \nabla g = \left(\frac{\partial f}{\partial y} \frac{\partial g}{\partial z} - \frac{\partial f}{\partial z} \frac{\partial g}{\partial y} \right) \mathbf{i} - \left(\frac{\partial f}{\partial x} \frac{\partial g}{\partial z} - \frac{\partial f}{\partial z} \frac{\partial g}{\partial x} \right) \mathbf{j} + \left(\frac{\partial f}{\partial x} \frac{\partial g}{\partial y} - \frac{\partial f}{\partial y} \frac{\partial g}{\partial x} \right) \mathbf{k}$

Therefore,

$$\text{div}(\nabla f \times \nabla g) = \frac{\partial}{\partial x} \left(\frac{\partial f}{\partial y} \frac{\partial g}{\partial z} - \frac{\partial f}{\partial z} \frac{\partial g}{\partial y} \right) - \frac{\partial}{\partial y} \left(\frac{\partial f}{\partial x} \frac{\partial g}{\partial z} - \frac{\partial f}{\partial z} \frac{\partial g}{\partial x} \right) + \frac{\partial}{\partial z} \left(\frac{\partial f}{\partial x} \frac{\partial g}{\partial y} - \frac{\partial f}{\partial y} \frac{\partial g}{\partial x} \right).$$

Using the product rule for partials and some algebra will yield the result

$$\text{div}(\nabla f \times \nabla g) = 0$$

$$\text{div } \mathbf{L} = (x^2 + y^2)^{-1/2}; \quad \text{curl } \mathbf{L} = \mathbf{0}$$

$$\text{div } \mathbf{H} = 0; \quad \text{curl } \mathbf{H} = \langle 0, 0, -2xe^{-x^2} \rangle \text{ which}$$

points downward at P , so the rotation is clockwise in a right-hand system.

26. $\text{div } \mathbf{v} = 0 + 0 + 0 = 0$;

$$\text{curl } \mathbf{v} = \langle 0, 0, w + w \rangle = 2\omega \mathbf{k}$$

27. $\nabla f(x, y, z) = \frac{1}{2} m\omega^2 \langle 2x, 2y, 2z \rangle = m\omega^2 \langle x, y, z \rangle = \mathbf{F}(x, y, z)$

28. $\nabla^2 f = \text{div}(\text{grad } f) = \text{div} \langle f_x, f_y, f_z \rangle = f_{xx} + f_{yy} + f_{zz}$

a. $\nabla^2 f = 4 - 2 - 2 = 0$

b. $\nabla^2 f = 0 + 0 + 0 = 0$

c. $\nabla^2 f = 6x - 6x + 0 = 0$

d. $\nabla^2 f = \text{div}(\text{grad } f) = \text{div}(\text{grad } |r|^{-1}) = \text{div}(-|r|^{-3} \mathbf{r}) = 0$ (by problem 21)

Hence, each is harmonic.

30. $\lim_{(x, y, z) \rightarrow (a, b, c)} F(x, y, z) = L$ if for each $\varepsilon > 0$ there is a $\delta > 0$ such that $0 < \|(x, y, z) - (a, b, c)\| < \delta$ implies that $|F(x, y, z) - L| < \varepsilon$.
 F is continuous at (a, b, c) if and only if $\lim_{(x, y, z) \rightarrow (a, b, c)} F(x, y, z) = F(a, b, c)$.

4. \mathbf{F} is conservative.

Problem Set 17.3

1. $M_y = -7 = N_x$, so \mathbf{F} is conservative.
 $f(x, y) = 5x^2 - 7xy + y^2 + C$
2. $M_y = 6y + 5 = N_x$, so \mathbf{F} is conservative.
 $f(x, y) = 4x^3 + 3xy^2 + 5xy - y^3 + C$
3. $M_y = 90x^4 y - 36y^5 \neq N_x$ since
 $N_x = 90x^4 y - 12y^5$, so \mathbf{F} is not conservative.
4. $M_y = -12x^2 y^3 + 9y^8 = N_x$, so \mathbf{F} is conservative.
 $f(x, y) = 7x^5 - x^3 y^4 + xy^9 + C$
5. $M_y = \left(-\frac{12}{5} \right) x^2 y^{-3} = N_x$, so \mathbf{F} is conservative.
 $f(x, y) = \left(\frac{2}{5} \right) x^3 y^{-2} + C$
6. $M_y = (4y^2)(-2xy \sin xy^2) + (8y)(\cos xy^2) \neq N_x$
since $N_x = (8x)(-y^2 \sin xy^2) + (8)(\cos xy^2)$, so \mathbf{F} is not conservative.

7. $M_y = 2e^y - e^x = N_x$ so \mathbf{F} is conservative.
 $f(x, y) = 2xe^y - ye^x + C$
8. $M_y = -e^{-x} y^{-1} = N_x$, so \mathbf{F} is conservative.
 $f(x, y) = e^{-x} \ln y + C$
9. $M_y = 0 = N_x$, $M_z = 0 = P_x$, and $N_z = 0 = P_y$,
so \mathbf{F} is conservative. f satisfies

$$f_x(x, y, z) = 3x^2, \quad f_y(x, y, z) = 6y^2, \quad \text{and}$$

$$f_z(x, y, z) = 9z^2.$$

Therefore, f satisfies

1. $f(x, y, z) = x^3 + C_1(y, z)$,
2. $f(x, y, z) = 2y^3 + C_2(x, z)$, and
3. $f(x, y, z) = 3z^3 + C_3(x, y)$.

A function with an arbitrary constant that satisfies 1, 2, and 3 is

$$f(x, y, z) = x^3 + 2y^3 + 3z^3 + C.$$

10. $M_y = 2x = N_y$, $M_z = 2z = P_x$, and
 $N_z = 0 = P_y$, so \mathbf{F} is conservative.
 $f(x, y, z) = x^2 y + xz^2 + \sin \pi z + C$
11. $M_y = 2y + 2x = N_x$, so integral is path
independent. $f(x, y) = xy^2 + x^2 y$
 $\int_{(-1,2)}^{(3,1)} (y^2 + 2xy) dx + (x^2 + 2xy) dy = [xy^2 + x^2 y]_{(-1,2)}^{(3,1)}$
 $= 14$ (Or use paths.)
12. $M_y = e^x \cos y = N_x$, so the line integral is
independent of the path.
Let $f_x(x, y) = e^x \sin y$ and $f_y(x, y) = e^x \cos y$.
Then $f(x, y) = e^x \sin y + C_1(y)$ and

$$f(x, y) = e^x \sin y + C_2(x).$$

Choose $f(x, y) = e^x \sin y$.

By Theorem A,

$$\int_{(0,0)}^{(1,\pi/2)} e^x \sin y \, dx + e^x \cos y \, dy = [e^x \sin y]_{(0,0)}^{(1,\pi/2)} = e.$$

(Or use line segments (0, 0) to (1, 0), then (1, 0)

$$\text{to } \left(1, \frac{\pi}{2}\right).$$

13. $M_y = 18xy^2 = N_x, M_z = 4x = P_x, N_z = 0 = P_y.$

By paths (0, 0, 0) to (1, 0, 0); (1, 0, 0) to (1, 1, 0); (1, 1, 0) to (1, 1, 1)

$$\int_0^1 0 \, dx + \int_0^1 9y^2 \, dy + \int_0^1 (4z + 1) \, dz = 6$$

(Or use $f(x, y) = 3x^2y^3 + 2xz^2 + z$.)

14. $M_y = z = N_x, M_z = y = P_x, N_z = x = P_y.$

$$f(x, y) = xyz + x + y + z$$

Thus, the integral equals

$$[xyz + x + y + z]_{(0,0,0)}^{(1,1,1)} = 3. \text{ (Or use paths.)}$$

15. $M_y = 1 = N_x, M_z = 1 = P_x, N_z = 1 = P_y$ (so path

independent). From inspection observe that $f(x, y, z) = xy + xz + yz$ satisfies

$f = \langle y + z, x + z, x + y \rangle$, so the integral equals

$$[xy + xz + yz]_{(0,0,0)}^{(-1,0,\pi)} = -\pi. \text{ (Or use line$$

segments (0, 1, 0) to (1, 1, 0), then (1, 1, 0) to (1, 1, 1).)

16. $M_y = 2z = N_x, M_z = 2y = P_x, N_z = 2x = P_y$ by paths (0, 0, 0) to (π , 0, 0), (π , 0, 0) to (π , π , 0).

$$\int_0^\pi \cos x \, dx + \int_0^\pi \sin y \, dy = 2$$

Or use $f(x, y, z) = \sin x + 2xyz - \cos y + \frac{z^2}{2}$.

17. $f_x = M, f_y = N, f_z = P$

$$f_{xy} = M_y, \text{ and } f_{yx} = N_x, \text{ so } M_y = N_x.$$

$$f_{xz} = M_z \text{ and } f_{zx} = P_x, \text{ so } M_z = P_x.$$

$$f_{yz} = N_z \text{ and } f_{zy} = P_y, \text{ so } N_z = P_y.$$

18. $f_x(x, y, z) = \frac{-kx}{x^2 + y^2 + z^2}$, so

$$f(x, y, z) = \frac{-k}{2} \ln(x^2 + y^2 + z^2) + C_1(y, z).$$

Similarly,

$$f(x, y, z) = \frac{-k}{2} \ln(x^2 + y^2 + z^2) + C_2(y, z),$$

using f_y ; and

$$f(x, y, z) = \frac{-k}{2} \ln(x^2 + y^2 + z^2) + C_3(y, z),$$

using f_z .

Thus, one potential function for F is

$$f(x, y, z) = \frac{-k}{2} \ln(x^2 + y^2 + z^2).$$

19. $F(x, y, z) = k|\mathbf{r}| \frac{\mathbf{r}}{|\mathbf{r}|} = k\mathbf{r} = k\langle x, y, z \rangle$

$$f(x, y, z) = \left(\frac{k}{2}\right)(x^2 + y^2 + z^2) \text{ works.}$$

20. Let $f = \left(\frac{1}{2}\right)h(u)$ where $u = x^2 + y^2 + z^2$.

$$\text{Then } f_x = \left(\frac{1}{2}\right)h'(u)u_x = \left(\frac{1}{2}\right)g(u)(2x) = xg(u).$$

Similarly, $f_y = yg(u)$ and $f_z = zg(u)$.

Therefore, $f(x, y, z) = g(u)\langle x, y, z \rangle$

$$= g(x^2 + y^2 + z^2)\langle x, y, z \rangle = F(x, y, z).$$

21. $\int_C \mathbf{F} \cdot d\mathbf{r} = \int_a^b (m\mathbf{r}' \cdot \mathbf{r}') \, dt$

$$= m \int_a^b (x'^2 + y'^2 + z'^2) \, dt$$

$$= m \left[\frac{(x')^2}{2} + \frac{(y')^2}{2} + \frac{(z')^2}{2} \right]_a^b$$

$$= \frac{m}{2} \left[|\mathbf{r}'(t)|^2 \right]_a^b = \frac{m}{2} \left[|\mathbf{r}'(b)|^2 - |\mathbf{r}'(a)|^2 \right]$$

22. The force exerted by Matt is not the only force acting on the object. There is also an equal but opposite force due to friction. The work done by the sum of the (equal but opposite) forces is zero since the sum of the forces is zero.

23. $f(x, y, z) = -gmz$ satisfies

$\nabla f(x, y, z) = \langle 0, 0, -gm \rangle = \mathbf{F}$. Then, assuming the path is piecewise smooth,

$$\text{Work} = \int_C \mathbf{F} \cdot d\mathbf{r} = [-gmz]_{(x_1, y_1, z_1)}^{(x_2, y_2, z_2)}$$

c. Green's Theorem applies here. The integral is 0 since $N_x - M_y$.

$$\oint_C (-y) \, dx = \iint_S [0 - (-1)] \, dA = A(S)$$

$$18. \oint M \, dx + N \, dy = \iint_S (N_x - M_y) \, dA = 0$$

Therefore, $\int_C \mathbf{F} \cdot d\mathbf{r}$ is independent of path since

$$\int_{C_1} \mathbf{F} \cdot d\mathbf{r} - \int_{C_2} \mathbf{F} \cdot d\mathbf{r} = \int_C \mathbf{F} \cdot d\mathbf{r} = 0$$

(Where C is the loop C_1 followed by $-C_2$.)

Therefore, $\int_{C_1} \mathbf{F} \cdot d\mathbf{r} = \int_{C_2} \mathbf{F} \cdot d\mathbf{r}$, so \mathbf{F} is conservative.

4.
$$\int_0^{2\pi} \int_0^1 r^2 (4r^2 + 1)^{1/2} r dr d\theta = \left(\frac{\pi}{60} \right) (25\sqrt{5} + 1)$$

$$\iint_R y(4y^2 + 1)^{1/2} dA = \int_0^3 \int_0^2 (4y^2 + 1)^{1/2} y dy dx$$

7.
$$\iint_R (x+y)(0+0+1)^{1/2} dA$$

Bottom ($z=0$): $\int_0^1 \int_0^1 (x+y) dx dy = 1$

Top ($z=1$): Same integral

Left side ($y=0$): $\int_0^1 \int_0^1 (x+0) dx dz = \frac{1}{2}$

Right side ($y=1$): $\int_0^1 \int_0^1 (x+1) dx dz = \frac{3}{2}$

Back ($x=0$): $\int_0^1 \int_0^1 (0+y) dy dz = \frac{1}{2}$

8. Bottom ($z=0$): The integrand is 0 so the integral is 0.

$$= \lim_{\epsilon \rightarrow 0} \int_0^{2\pi} \int_0^{3-\epsilon} 3r dr d\theta = \lim_{\epsilon \rightarrow 0} 3(3-\epsilon)^2 \pi = 27\pi$$

17. a. 0 (By symmetry, since $g(x, y, -z) = -g(x, y, z)$.)

b. 0 (By symmetry, since $g(x, y, -z) = -g(x, y, z)$.)

c. $\iint_G (x^2 + y^2 + z^2) dS = \iint_G a^2 dS$

$$= a^2 \text{Area}(G) = a^2(4\pi a^2) = 4\pi a^4$$

d. Note:

$$\iint_G (x^2 + y^2 + z^2) dS = \iint_G x^2 dS + \iint_G y^2 dS$$

$$= \iint_G z^2 dS = 3 \iint_G x^2 dS$$

(due to symmetry of the sphere with respect to the origin.)

Therefore,

$$\iint_G x^2 dS = \left(\frac{1}{3}\right) \iint_G (x^2 + y^2 + z^2) dS$$

$$= \left(\frac{1}{3}\right) 4\pi a^4 = \frac{4\pi a^4}{3}$$

e. $\iint_G (x^2 + y^2) dS = \left(\frac{2}{3}\right) 4\pi a^4 = \frac{8\pi a^4}{3}$

18. a. Let the diameter be along the z -axis.

$$I_z = \iint_G k(x^2 + y^2) dS$$

$$1. \iint_G x^2 dS = \iint_G y^2 dS = \iint_G z^2 dS \text{ (by symmetry of the sphere)}$$

$$2. \iint_G (x^2 + y^2 + z^2) dS = \iint_G a^2 dS$$

$$= a^2 (\text{Area of sphere}) = a^2(4\pi a^2) = 4\pi a^4$$

Thus,

$$I_z = \iint_G k(x^2 + y^2) dS = \frac{2}{3} k(4\pi a^4) = \frac{8\pi a^4 k}{3}$$

(using 1 and 2)

- b. Let the tangent line be parallel to the z -axis.

$$\begin{aligned} \text{Then } I &= I_z + ma^2 = \frac{8\pi a^4 k}{3} + [k(4\pi a^2)]a^2 \\ &= \frac{20\pi a^4 k}{3} \end{aligned}$$

19. a. Place center of sphere at the origin.

$$\begin{aligned} F &= \iint_G k(a-z) dS = ka \iint_G 1 dS - k \iint_G z dS \\ &= ka(4\pi a^2) - 0 = 4\pi a^3 k \end{aligned}$$

- b. Place hemisphere above xy -plane with center at origin and circular base in xy -plane.

$$\begin{aligned} F &= \text{Force on hemisphere} + \text{Force on circular base} \\ &= \iint_G k(a-z) dS + ka(\pi a^2) \\ &= ka \iint_G 1 dS - k \iint_G z dS + \pi a^3 k \\ &= ka(2\pi a^2) - k \iint_R z \sqrt{a^2 - x^2 - y^2} dA + \pi a^3 k \\ &= 3\pi a^3 k - k \iint_R z \frac{a}{z} dA \\ &= 3\pi a^3 k - ka(\pi a^2) = 2\pi a^3 k \end{aligned}$$

- c. Place the cylinder above xy -plane with circular base in xy -plane with the center at the origin.

$$\begin{aligned} F &= \text{Force on top} + \text{Force on cylindrical side} \\ &\quad + \text{Force on base} \\ &= 0 + \iint_G k(h-z) dS + kh(\pi a^2) \\ &= kh \iint_G 1 dS - k \iint_G z dS + \pi a^2 hk \end{aligned}$$

$$= kh(2\pi ah) - 4k \iint_R z \sqrt{\frac{a^2}{a^2 - y^2} + 0 + 1} dA + \pi a^2 hk$$

(where R is a region in the yz -plane:

$$0 \leq y = a, 0 \leq z \leq h)$$

$$\begin{aligned} &= 2\pi ah^2 k + \pi a^2 hk - 4k \int_0^a \int_0^h \frac{az}{\sqrt{a^2 - y^2}} dz dy \\ &= 2\pi ah^2 k + \pi a^2 hk - \pi kah^2 \\ &= \pi ah^2 k + \pi a^2 hk = \pi ahk(h+a) \end{aligned}$$

20. $\bar{x} = \bar{y} = 0$

Now let G' be the 1st octant part of G .

$$M_{xy} = \iint_G k dS = 4 \iint_{G'} kz dS = 4k \iint_{R'} z \left(\frac{a}{z}\right) dA$$

(See Problem 19b.)

$$\begin{aligned} &= 4ak [\text{Area}(R')] \\ &= 4ak\pi \left[\frac{(a^2 - h_1^2)}{4} - \frac{(a^2 - h_2^2)}{4} \right] \\ &= ak\pi(h_2^2 - h_1^2) \end{aligned}$$

$$m(G) = \iint_G k dS = k[\text{Area}(G)]$$

$$= k[2\pi a(h_2 - h_1)] = 2\pi ak(h_2 - h_1)$$

$$\text{Therefore, } \bar{z} = \frac{\pi ak(h_2^2 - h_1^2)}{2\pi ak(h_2 - h_1)} = \frac{h_1 + h_2}{2}$$

3.

$$\begin{aligned} \iint_S (\text{curl } \mathbf{F}) \cdot \mathbf{n} \, dS &= \oint_{\partial S} \mathbf{F} \cdot \mathbf{T} \, ds = \oint_{\partial S} (y+z)dx + (x^2+z^2)dy + y \, dz \\ &= \int_0^1 1 \, dt + \int_0^\pi [(1+\sin t)(-\sin t) + \cos t]dt + \int_0^1 -1 \, dt + \int_0^\pi \sin^2 t \, dt \quad (*) \\ &= \int_0^\pi (-\sin t + \cos t)dt = -2 \end{aligned}$$

The result at (*) was obtained by integrating along S by doing so along C_1, C_2, C_3, C_4 in that order.

Along C_1 : $x = 1, y = t, z = 0, dx = dz = 0, dy = dt, t$ in $[0, 1]$

Along C_2 : $x = \cos t, y = 1, z = \sin t, dx = -\sin t \, dt, dy = 0, dz = \cos t \, dt, t$ in $[0, \pi]$

Along C_3 : $x = -1, y = 1 - t, z = 0, dx = dz = 0, dy = -dt, t$ in $[0, 1]$

Along C_4 : $x = -\cos t, y = 0, z = \sin t, dx = \sin t \, dt, dy = 0, dz = \cos t \, dt, t$ in $[0, \pi]$

4. ∂S is the circle $x^2 + y^2 = 1, z = 0$ (in the xy -plane).

$$\begin{aligned} \oint_{\partial S} \mathbf{F} \cdot \mathbf{T} \, ds &= \oint_{\partial S} xy^2 dx + x^3 dy = (\cos xz)dz \\ &= \oint_S x^3 dy = \int_0^{2\pi} (\cos^3 t)(-\cos t)dt = \left(-\frac{3}{4}\right)\pi \\ &\approx -2.3562 \end{aligned}$$

5. ∂S is the circle $x^2 + y^2 = 12, z = 2$.

Parameterization of circle:

$$x = \sqrt{12} \cos t, y = \sqrt{12} \sin t, z = 2, t \text{ in } [0, 2\pi]$$

$$\begin{aligned} \oint_{\partial S} \mathbf{F} \cdot \mathbf{T} \, ds &= \oint_{\partial S} yz \, dx + 3xz \, dy + z^2 \, dz \\ &= \int_0^{2\pi} (24 \sin^2 t - 72 \cos^2 t)dt = -48\pi \approx -150.80 \end{aligned}$$

6. ∂S is the circle $x^2 + y^2 = 1, z = 0$

$$\begin{aligned} \iint_S (\text{curl } \mathbf{F}) \cdot \mathbf{N} \, dS &= \oint_{\partial S} \mathbf{F} \cdot \mathbf{T} \, ds \\ &= \oint_S (z-y)dx + (z+x)dy + (-x-y)dz \\ &= \int_0^{2\pi} [(-\sin t)(-\sin t) + (\cos t)(\cos t)]dt = 2\pi \approx 6.2832 \end{aligned}$$

$$\begin{aligned} x &= \cos t \\ y &= \sin t \\ z &= 0 \\ t &\text{ in } [0, 2\pi] \end{aligned}$$

$$7. (\text{curl } \mathbf{F}) \cdot \mathbf{n} = \langle 3, 2, 1 \rangle \cdot \left\langle \left(\frac{1}{\sqrt{2}}\right)1, 0, -1 \right\rangle = \sqrt{2}$$

$$\begin{aligned} \oint_{\partial S} \mathbf{F} \cdot \mathbf{T} \, ds &= \iint_S \sqrt{2} \, dS = \sqrt{2}A(S) \\ &= \sqrt{2}[\sec(45^\circ)](\text{Area of a circle}) = 8\pi \approx 25.1327 \end{aligned}$$

$$8. (\text{curl } \mathbf{F}) \cdot \mathbf{n} = \langle -1, -1, -1 \rangle \cdot \left[\left(\frac{1}{\sqrt{2}}\right) \langle 0, 1, -1 \rangle \right] = 0,$$

so the integral is 0.

$$9. (\text{curl } \mathbf{F}) = \langle -1+1, 0-1, 1-1 \rangle = \langle 0, -1, 0 \rangle$$

The unit normal vector that is needed to apply Stokes' Theorem points downward. It is

$$\mathbf{n} = \frac{\langle -1, -2, -1 \rangle}{\sqrt{6}}$$

18. $\text{curl } \mathbf{F} = 0$ by Problem 23, Section 17.1. The result then follows from Stokes' Theorem since the left-hand side of the equation in the theorem is the work and the integrand of the right-hand side equals 0.

19. a. Let C be any piecewise smooth simple closed oriented curve C that separates the "nice" surface into two "nice" surfaces, S_1 and S_2 .

$$= \oint_C \mathbf{F} \cdot \mathbf{T} \, ds + \oint_{-C} \mathbf{F} \cdot \mathbf{T} \, ds = 0 \quad (-C \text{ is } C \text{ with opposite orientation.})$$

b. $\text{div}(\text{curl } \mathbf{F}) = 0$ (See Problem 20, Section 17.1.) Result follows.

$$\begin{aligned} 20. \quad \oint_S (f \nabla g) \cdot \mathbf{T} \, ds &= \iint_S \text{curl}(f \nabla g) \cdot \mathbf{n} \, dS \\ &= \iint_S [f(\text{curl } \nabla g) + (\nabla f \times \nabla g)] \cdot \mathbf{n} \, dS \\ &= \iint_S (\nabla f \times \nabla g) \cdot \mathbf{n} \, dS, \text{ since } \text{curl } \nabla g = 0. \end{aligned}$$
