# Preface

"Just do an Internet search." "It's on the Internet." How often have we said or been told that we could find it on the Internet. This third edition of *The Water Encyclopedia: Hydrologic Data and Internet Resources* started from a premise that most of the information provided within this publication could be found on the Internet. As our team of contributing authors started reviewing each section within each chapter, it soon became apparent that you cannot always find it on the internet. This edition represents many hours of effort to identify the most current information on a wide range of water-related topics whether it can be found on the internet or in other sources.

The *Encyclopedia* has retained many of the elements of the previous editions but has also been expanded to reflect the many changes within the environmental industry as well as the current and topical water-related matters of the last decade. Prepared by scientists and engineers, this publication is intended to serve as a valuable resource to all professionals dealing with water-related issues as well as the general public. The material presented has been footnoted to provide the user with the opportunity to return to the original source material for additional research. Where possible, an Internet URL address is provided to guide the user to the appropriate source.

The third edition of the *Encyclopedia* has been significantly expanded beyond the previous edition. The first two chapters of this edition are new and discuss data management and international data collection. Data management concepts are presented to review the use of databases, geographic information systems (GIS), data reporting and metadata. Data repositories and availability vary around the world and range in ease of access and usability. The international data collection provides some direction on potential data sources in less developed areas as well as case histories of actual project work and Internet sources for international water-related data.

This edition contains more than 1100 tables and 500 figures providing data related to weather, surface water, groundwater, water use, water quality, waste water, pollution, and water resource management. The pollution chapter alone has grown to contain some 450 plus tables and figures. Wastewater, previously included within the pollution chapter, is presented as a stand-alone chapter to facilitate use of this reference. A chapter of useful conversion factors and constants concludes this edition.

Whether you are looking for a specific piece of information or exploring one or more of the many topics related to water, this edition provides its users with a tremendous wealth of data whether on the Internet or not.

# Acknowledgments

We want to extend our thanks and appreciation to the many individuals, publishers, and organizations that have made this third edition a reality. Without their time, cooperation, collaboration, this work would not have been possible. Most importantly, the support and access to resources for the management of this compilation provided by ARCADIS G&M was invaluable, and their on-going support and encouragement to undertake these efforts are deeply appreciated.

A number of individual contributors were involved in compiling the relevant information for each of the chapters and they are identified at the start of their chapters. Our thanks and appreciation to you and your families for the time committed to completing this task. Behind the scenes and the backbone of keeping everything organized, we want to extend a special thanks to Chris Worden and Carla Gerstner for their encouragement, patience, and the occasional stern word. Additionally, we want to acknowledge Barbara Kelly and Amanda Fierro for their efforts in preparing materials for the manuscript.

# The Editors

**Pedro Fierro, Jr.** is a hydrogeologist and associate vice president with ARCADIS G&M, Inc., where he is involved with a wide variety of environmental assessments and remediation programs. He has been responsible for the direction of several hundred sites addressing environmental issues. Fierro has addressed various audiences on topics ranging from sampling methodologies, regulatory compliance, site assessment techniques, liability management, and remediation technologies.

Fierro received his bachelor's degree in geology from the University of Rochester, Rochester, New York and his master's degree in geology with an emphasis on groundwater studies from the University of Kentucky. He currently holds geological professional licenses/registrations in Alabama, Florida, Georgia, Kentucky, Pennsylvania, and Tennessee. He is a certified groundwater professional and a certified professional geologist. He was a contributing author to *In Situ Treatment Technology*.

**Evan K. Nyer** is a senior vice president with ARCADIS G&M, Inc., where he is responsible for maintaining and expanding the company's technical expertise in geology/hydrogeology, engineering, fate and transport, and remediation technologies. He has been active in the development of new treatment technologies for many years. He has been responsible for the strategies, technical designs and installations of more than 400 groundwater and soil remediation systems at contaminated sites throughout the United States. Nyer also lectures, provides expert testimony, and serves as the public spokesperson for one technically complicated site.

Nyer received his graduate degree in environmental engineering from Purdue University and has authored five books: *Practical Techniques for Groundwater and Soil Remediation*, published by Lewis Publishers, Inc.; *Groundwater Treatment Technology*, first and second edition, published by Van Nostrand Reinhold; *Groundwater and Soil Remediation*, and *In Situ Treatment Technology* (now in its second edition) published by CRC Press; and is co-author of *Bioremediation*, published by the American Academy of Environmental Engineers. Nyer is a regular contributor to *Groundwater Monitoring and Remediation* having had his own column "Treatment Technology" in the periodical for the past 20 years.

1.10 Conclusions . . . . . 1-9

## 1.1 INTRODUCTION

Data management encompasses many tasks, priorities, and decisions. Underlying these activities is the need for an accurate data from sampling and monitoring programs designed to measure the effects of operational activities. To understand the value of good data management, it is helpful to understand the nature of how this information is generated and used to support management decisions.

So what is data? The American Heritage Dictionary defines data as factual information, especially information organized for analysis or used to reason or make decisions, or values derived from scientific experiments. Scientific professionals generate huge quantities of data every day. It is estimated that scientists spend 80% of their time managing the data and 20% analyzing and interpreting. By establishing sound data management practices, more time can be spent in data analysis and interpretation.

Throughout this chapter, we will provide examples of data management practices within the context of an investigation of contaminated groundwater and surface water. These practices are directly applicable to managing other types of data, such as those found in this book.

## 1.2 DATABASE OVERVIEW

A discussion of data management would be incomplete without a general discussion of databases.

A very general definition of a database might be "*A collection of related items of information contained on*

© 2006 by Taylor & Francis Group, LLC

**Table 1.1 Groundwater and Surface Water Location Data**

| Location ID | Area of Concern | *x* | *y* | *z* |
|---|---|---|---|---|
| SW-01 | Upstream | 1,75,470.994 | 16,35,550.124 | 100.203 |
| SW-02 | Upstream | 1,77,126.487 | 16,35,925.814 | 100.102 |
| SW-03 | Outfall 1 | 1,77,047.029 | 16,35,676.853 | 100.00 |
| SW-04 | Downstream | 1,76,871.093 | 16,35,674.137 | 98.97 |

| MW-01 | Background area | 1,74,345.077 | 16,32,431.087 | 96.597 |
| MW-02 | Oil storage area | 1,74,251.127 | 16,32,466.059 | 97.384 |
| MW-03 | Oil storage area | 1,74,690.942 | 16,31,435.707 | 97.384 |

*various media organized in a way that allows easy search and retrieval of subsets of the items of information*." Note that, strictly speaking, a database does not have to be electronic: Boxes containing recipes, telephone books, or paper address books are all databases. A database used for environmental purposes might be composed of a combination of paper copies of information along with items of information contained in electronic form, with perhaps some sort of paper or electronic index to or inventory list of all of the data.

Electronic data are nearly always organized into tables. Consider the example shown in Table 1.1.

Each row of this table represents a single data point; in this case the first row provides data about location SW-1, and only SW-1. Each column of this table represents a type of data that is stored for each row. In our example, the Area of Concern column identifies the spatial group that each location belongs to.

The rows in a database table are typically called "records," while the columns are called "fields." Thus, a useful definition of an electronic database is "A collection of related items of data organized into one or more tables." Each field is constrained to a single data type. Table 1.2 lists the most common data types.

Electronic databases are typically either "flat file databases," in which the entire database resides in a single table, or "relational databases," in which the data are distributed into more than one table, which are then linked together by a common key field. The tables will be related to one another according to a one-to-one (each record in one table has a single matching record in the other table) or one-to-many relationship (each record in one table may have one or more matching records in the other table, but not the reverse).

**Table 1.2 Common Data Types**

| Data Type | Description or Example |
|---|---|
| Integer | Typically stores numbers that relate to counts quantities, or, ID numbers |
| Decimal | Numbers with fractional parts such as percentages or rates |
| Floating point | Numbers with a scientific notation that can be calculated approximately, such as distance or weight |
| Fixed length character | Names, descriptions, addresses |
| Date/Time | Storage of date and/or time or intervals of dates or times |
| Boolean | Explicit constraints (Yes/No, True/False) or logical constraints (AND/OR) |
| Unstructured data | Images, video, audio |

One significant advantage of relational databases to flat-file databases is the ability to query the data in different ways. A query is defined as a statement to retrieve database records that match certain criteria. By structuring the query statement a certain way, different information can be returned from the data set.

The most popular general-purpose software for managing data is an electronic spreadsheet program such as Microsoft Excel. Electronic spreadsheets are excellent tools for managing electronic data that fit in a single table. However, spreadsheets are cumbersome or inadequate tools for managing relational data, where more than one table is required. For managing relational data, other more powerful data management programs should be used. There are many popular relational database management systems available, including Microsoft Access. It should be noted that, in contrast to flat-file databases, which typically can be managed by the casual computer user, large relational databases require management by trained individuals, and will usually be beyond the capabilities of the casual user.

The field of database management is continually in flux, and would have changed by the time this book is published. Thus, it is impossible to cover all the facets of data management and database theory here. However, it can be said that the relational database model overwhelmingly dominates large-scale data management and database theory. For further information about relational databases, the reader is directed to any of the numerous references on this subject. A particularly helpful book designed for the casual database user is by Michael J. Hernandez (2003) entitled *Database Design for Mere Mortals: A Hands-On Guide to Relational Database Design*, Addison–Wesley Developers Press.

© 2006 by Taylor & Francis Group, LLC

## 1.3 GEOGRAPHIC INFORMATION SYSTEMS OVERVIEW

Data are often presented in a tabular format. Sometimes, a visual representation is helpful in drawing conclusions, particularly if the data have a spatial component. A Geographical Information System (GIS) is a way to display information with a spatial component. GIS can be defined as a software package that manages and displays information in a database composed of data that are associated with spatial information. That is to say, there will be both tabular and spatial information in the database, it will be possible to query the database for specific data, and the user will be able to display the data spatially, as a map.

The software package comprising the GIS may be a single program, a set of programs from a single vendor, a combination of programs that together constitute the GIS, a custom-programmed software package, or any combination thereof.

In the groundwater arena, the tabular data could typically be depth to water data, water table elevation data, water chemistry data, and water quality data. In addition, the tabular data will have some spatial component in either two or three dimensions, as $x$–$y$–$z$ coordinates. Spatial data, in addition to the $x$–$y$–$z$ coordinates mentioned above, often will include digitally processed air or satellite photographs, computer-aided design (CAD) drawings, or other electronic spatial entities. Clearly, depth to water data and water chemistry data, which can be displayed in both plan view (two-dimensional) and side view (three-dimensional), are well suited to management using a GIS. Table 1.3 is an example of data from a GIS system representing depth to groundwater.

When generated in a GIS system in plan view, the view can look like Figure 1.1.

The primary attraction of a GIS is the ability to manage, query and display a large amount of data spatially, in real time. Using most GISs, the user can view the data on a map, query for a subset of the data while viewing the map, and then see the distribution of the subset data when the map is refreshed. This process can be repeated as many times as necessary to answer a question. For example, the temporary wells in the previous figure were not measured during the August sampling event. By querying the GIS system only for locations that were measured during the August event, we return a subset of the data, shown in Table 1.4.

From this set of data, our map would look like Figure 1.2.

The literature on GISs is voluminous. Because GISs have a wide applicability throughout many disciplines, the reader is directed to the internet, where search engines associated with any popular internet portal (Yahoo! or America Online, for example) may be used to find literally thousands of references on the subject.

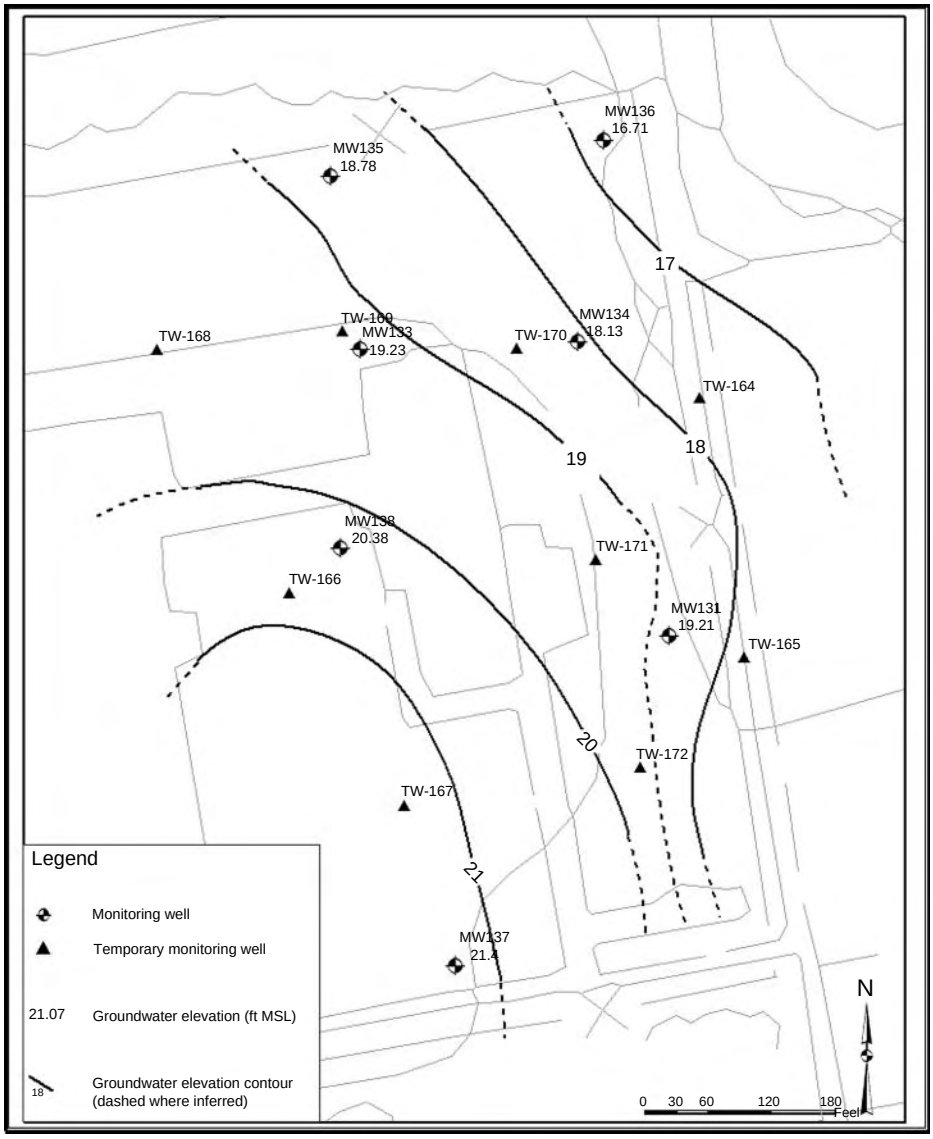

**Figure 1.1** Example of groundwater elevation data from GIS System.

## 1.4 UNDERSTANDING DATA MANAGEMENT NEEDS

Initially designing a data management program for an investigation or experiment requires significant scientific expertise. However, after design and implementation, the processes generally follow a well-defined and straightforward cycle. In our groundwater contamination example, samples are routinely collected and sent to laboratories where they are analyzed with the results reported in the form of a hard-copy analytical results report. From this point on, the data are put to multiple uses to meet a variety of needs. Some portion of the data are collected and reported under the requirements of environmental permits, while additional data are generated voluntarily to further the objectives of sound environmental management. Accountability for effectively managing the collection and utilization of this information according to well-defined processes within

**Table 1.4 Subset of Table 1.3 Data for August Events Only**

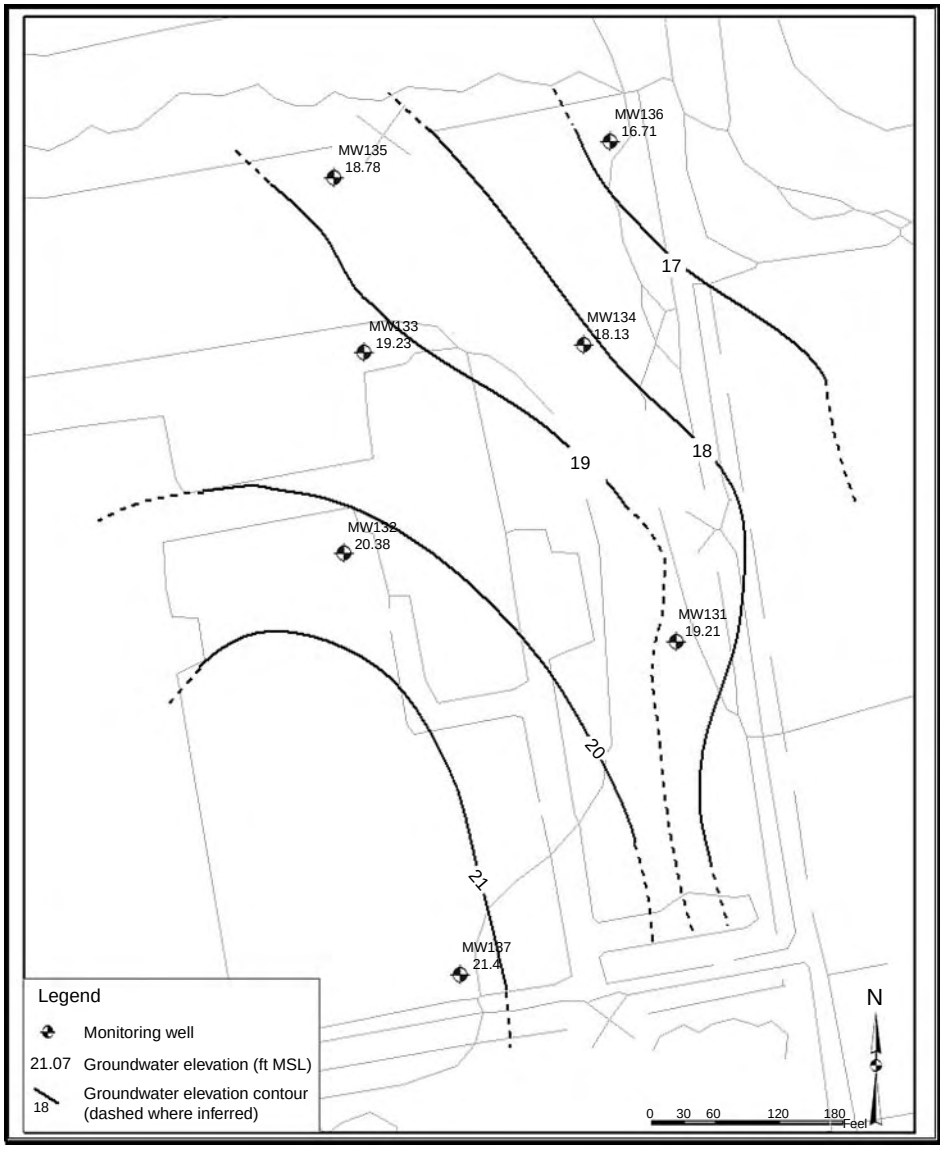

**Figure 1.2** Groundwater elevation data from August only.

standardized software environments is essential to effective environmental management.

Problems with data collection can be mitigated with a data management plan. This plan will typically specify how data are to be labeled and categorized, the format that the data are to be stored in, how to handle data collected over a period of time or over a significant geographic area, and procedures to account for changes in the investigation and experiment. The advantage to having a data management plan is that it allows the users to collect, label, and record data in a consistent manner. By doing so, retrieval of that data does not have to take into account bias on the part of the individual collecting the data. Consistent terms, units, methods and procedures, will allow any user to retrieve data accurately and quickly.

## 1.5 DATA CATEGORIZATION

### 1.5.1 Spatial Data

Data found in this book are often of two distinct types: data with a spatial representation and that of a temporal representation. Water quality, for example, can be represented as changing over an area based on land use, and can also be represented as changing over time due to urban development changing the drainage pathways.

It is often helpful to have a defined nomenclature when collecting and categorizing data. This nomenclature makes it easy to glean basic information from the raw data, as well as expediting queries from the data management system. As an example, consider the following spatial data, shown in Table 1.5.

© 2006 by Taylor & Francis Group, LLC

**Table 1.5 Spatial Data for Groundwater and Surface Water Locations**

| Location ID | Area of Concern | *x* | *y* | *z* |
|---|---|---|---|---|
| SW-01 | Upstream | 1,75,470.994 | 16,35,550.124 | 100.203 |
| SW-02 | Upstream | 1,77,126.487 | 16,35,925.814 | 100.102 |
| SW-03 | Outfall 1 | 1,77,047.029 | 16,35,676.853 | 100.00 |
| SW-04 | Downstream | 1,76,871.093 | 16,35,674.137 | 98.97 |
| SW-05 | Downstream | 1,75,790.418 | 16,35,597.208 | 97.96 |
| MW-01 | Background area | 1,74,345.077 | 16,32,431.087 | 96.597 |
| MW-02 | Oil storage area | 1,74,251.127 | 16,32,466.059 | 97.384 |
| MW-03 | Oil storage area | 1,74,690.942 | 16,31,435.707 | 97.384 |

Consistent nomenclature for identifying spatial locations is crucial to maintaining data integrity, particularly where there is sensitivity to geographic, political, and physical boundaries. In addition, each location should be unique in order to maintain referential integrity within the data management system. This unique value in this table is referred to as a *primary key*. The location IDs are coded in such a way to let the reader know at a glance what type of location it is. Acceptable locations types in this example include:

| Location Type Identifier | Location Type Description |
|---|---|
| MW | Monitoring well |
| SW | Surface water |

The Area of Concern column provides a general categorization of where the location occurs within the context of the immediate surroundings. This is useful for queries that would ask for all data found in a particular site-specific area.

The example table also presents spatial data in the form of *x*, *y*, and *z* coordinates. Spatial data for each location should be collected in a form that is consistent with use at the site, but that can also reference features that are located nearby, such as surface water bodies, wetland areas, or other physiographic features. Use of a consistent coordinate system will make sure that all the data can be compared to each other.

Examples of coordinate systems include latitude, longitude and height, Universal Transverse Mercator (UTM), Earth Centered, Earth Fixed Cartesian (ECEF), and State Plane coordinates. In our example, the coordinates are in State Plane Coordinates. In the United States, the State Plane System was developed in the 1930s and was based on the North American Datum 1927 (NAD27), which are based on the foot. A more recent variation is the NAD83 system, which is based on the North American 1983 datum and is based on the meter. The State Plane System was developed to provide local references tied to a national datum. Most USGS 7.5 Minute Quadrangles use several coordinate system grids including latitude and longitude, UTM kilometer tic marks, and applicable State Plane coordinates.

## 1.6 TEMPORAL DATA

With the establishment of the spatial locations, data collected over time can be collected and referenced. Consider Table 1.6, which summarizes data from samples collected from our groundwater and surface water locations.

Consistent nomenclature for sample identifications is crucial to maintaining data integrity. And sample identifications should be unique in order to maintain referential integrity. Character limits are often in place in database management systems; therefore, care should be taken in minimizing spaces, dashes, or parentheses. In our example, the date of collection is captured in the sample ID in parentheses, which allows each sample to be unique.

By including the Location ID in this table, we establish a relationship to the previous table. This relationship allows us to query the data in different ways. Because the relationship is of one location to many samples, this is referred to as a *one-to-many relationship*. The Location ID in this table is referred to as a *foreign key* because it matches primary key values in our spatial data table presented earlier. Together the primary and foreign keys create a parent/child relationship, which is at the heart of relational database systems.

The Sample Type column provides an identifier to discriminate individual samples from each other based on quality assurance needs. In this example, all of the samples have a normal "N" type. If duplicate samples were required for quality assurance purpose to check on the validity of the data set, one could identify the sample type as a "D" for duplicate.

The Sample Matrix column identifies what the medium collected for each sample was, through

**Table 1.6 Sample Information from Groundwater and Surface Water Locations**

| Sample ID | Location ID | Sample Type | Sample Matrix | Sample Date | Sample Time |
|---|---|---|---|---|---|
| SW-1(081602) | SW-1 | N | WS | 8/16/2002 | 13:00 |
| SW-2(081602) | SW-2 | N | WS | 8/16/2002 | 13:10 |
| SW-3(081602)) | SW-3 | N | WS | 8/16/2002 | 13:20 |
| SW-4(081602) | SW-4 | N | WS | 8/16/2002 | 13:30 |
| SW-5(081602) | SW-5 | N | WS | 8/16/2002 | 14:31 |
| MW-01(111301) | MW-01 | N | WG | 11/13/2001 | 15:22 |
| MW-01(111401) | MW-01 | N | WG | 11/14/2001 | 16:31 |
| MW-01(111501) | MW-01 | N | WG | 11/15/2001 | 11:00 |

© 2006 by Taylor & Francis Group, LLC

an abbreviated two-digit code. Examples of these kinds of matrices are:

| Sample Matrix | Matrix Description |
|---|---|
| WB | Water collected from borehole or during geoprobe investigation |
| WE | Estuary water |
| WG | Ground water |
| WL | Leachate |
| WO | Ocean water |
| WP | Drinking water |
| WQ | Water quality control matrix |
| WS | Surface water |
| WW | Waste water |

The sample date and time columns allow the data to be sorted from more recent to historical and can provide a context for how the data changes over time.

Continuing with our groundwater contamination example, consider Table 1.7, which summarizes the data obtained from an analytical laboratory.

The primary key (Sample ID) is present again to establish the relationship back to the other tables. The other columns relate information related to the analyses performed on the samples and the results.

Each of these records represents a concentration of a given chemical at a given location for a specific point in time. As chemical concentrations, detection limits and detections change, those data points would be represented as new records in the database. This can be illustrated in the following query result, shown in Table 1.8.

## 1.7 DATA VALIDATION AND VERIFICATION

Once data are collected into the database, steps must be taken to ensure that it was collected accurately and is representative of the source. Data verification checks the compliance of the collected data against known requirements of the experiment or investigation. For example, using the data set shown above, we would verify with the analytical laboratory that the groundwater samples were analyzed according to specific methods, such as the use of the calibration samples for laboratory equipment. If a verification check fails, then the data may be considered suspect.

Data validation, by contrast, must take into account the suitability of the data, and must take into account how the data were collected, how the data were analyzed, and finally, based on the results of the review of the collection and analysis processes, how the data should be used. If the collection process is found to be flawed, the data might be discarded or used for qualitative purposes only. The United States Environmental Protection Agency has provided guidance documents on validating data, which can be found at www.epa.gov/superfund/programs/clp/guidance.htm.

## 1.8 DATA REPORTING

Once the data have been collected and validated into the data management system, it is time to retrieve the data and make some conclusions about its meaning. Data retrieval usually takes the form of querying the data and then reporting the data.

### 1.8.1 Querying Data

A query is a programmatic statement that asks a question about the data. Each query usually specifies a criterion, which is a condition or test that must be met in order for a given record to be selected. Queries produce subsets of data, which are the records that match the conditions of the query. For example, a query might request the locations where a certain chemical, e.g. carbon tetrachloride, exceeds a certain concentration, e.g. 500 µg/L. This query would produce a result like the one presented below in Table 1.9.

**Table 1.7 Analytical Data Summary**

| Sample ID | Matrix | SDG | Lab Method | Chemical | Result | RDL | Detect | Unit |
|---|---|---|---|---|---|---|---|---|
| SW-1(081602) | WG | 884825 | SW8260 | Carbon disulfide | | 2.5 | N | µg/L |
| SW-1(081602) | WG | 884825 | SW8260 | Xylene (total) | | 2.5 | N | µg/L |
| SW-1(081602) | WG | 884825 | SW8260 | Ethylbenzene | | 0.2 | N | µg/lL |
| SW-1(081602) | WG | 884825 | SW8260 | Carbon tetrachloride | 670 | 25 | Y | µg/L |

**Table 1.8 Additional Analytical Data**

| Sample ID | Matrix | SDG | Sample Date | Lab Method | Chemical | Result | RDL | Detect | Unit |
|---|---|---|---|---|---|---|---|---|---|
| SW-1(081602) | WG | 884825 | 8/16/2002 | SW8260 | Carbon tetrachloride | 670 | 25 | Y | µg/L |
| SW-1(111602) | WG | 884825 | 11/16/2002 | SW8260 | Carbon tetrachloride | 340 | 25 | Y | µg/L |
| SW-1(011603) | WG | 884825 | 01/16/2003 | SW8260 | Carbon tetrachloride | 100 | 5 | Y | µg/L |
| SW-1(031603) | WG | 884825 | 03/16/2003 | SW8260 | Carbon tetrachloride | | 5 | N | µg/L |

© 2006 by Taylor & Francis Group, LLC

**Table 1.9 Query Results for Carbon Tetrachloride Concentrations over 500 μg/L**

| Sample ID | Matrix | SDG | Lab Method | Chemical | Result | RDL | Detect | Unit |
|---|---|---|---|---|---|---|---|---|
| SW-1(081602) | WG | 884825 | SW8260 | Carbon tetrachloride | 670 | 25 | Y | μg/L |

**Table 1.10 Data Summary for Crosstab Query**

| Loc ID | AoC | Nitrate | Iron | Sulfate Concentration |
|---|---|---|---|---|
| SW-01 | Upstream | 200 | 599 | 100.203 |
| SW-02 | Upstream | 250 | 342 | 100.102 |
| SW-03 | Background area | 300 | 105 | 100 |
| SW-04 | Downstream | 100 | 20 | 98.97 |
| SW-05 | Downstream | 50 | 40 | 97.96 |
| MW-01 | Background area | 75 | 50 | 96.597 |
| MW-02 | Oil storage area | 60 | 65 | 97.384 |
| MW-03 | Oil storage area | 35 | 10 | 97.384 |

This type of query is referred to a selection query; it returns the selection based on the criteria. Other types of queries, available in Microsoft Access for example, include action queries and crosstab queries. Action queries change record information by specifying criteria and changing the values in given fields based on those criteria. An example of an action query would be the application of data qualifiers following a rigorous validation of the collected data. For example, in our surface water example, the data validation process might uncover that the analytical laboratory initially reported the reported detection limit of carbon tetrachloride as 25 μg/L but in fact it should have been 100 μg/L. An action query could be used to specify the criteria (Sample SW-1(081602) and carbon tetrachloride) and correct the reported detection limit (RDL) from 25 to 100.

Crosstab queries perform aggregate calculations on the value of a field, using one or more other fields as rows and one field's data as columns. For example, consider the data set shown in Table 1.10.

An analysis of this data might help refine a remedial course of action for impacted groundwater. Useful calculations to perform would be the average and the maximum values of each of the constituents. A crosstab query of this data would generate the following results, shown in Table 1.11.

### 1.8.2 Reporting Data

Once data have been retrieved through a query process, it can be reported in tabular format, like those found in this chapter and elsewhere in this book, graphically in the form of charts and graphs, or if there is a spatial representation to the data, as a figure in a GIS system.

**Table 1.11 Crosstab Query Results**

| | Area of Concern | | | |
|---|---|---|---|---|
| Data | Background Area | Downstream | Oil Storage Area | Upstream |
| Average of nitrate | 187.5 | 75 | 47.5 | 225 |
| Average of iron | 77.5 | 30 | 37.5 | 470.5 |
| Average of sulfate concentration | 98.2985 | 98.465 | 97.384 | 100.1525 |
| Max of nitrate | 300 | 100 | 60 | 250 |
| Max of iron | 105 | 40 | 65 | 599 |
| Max of sulfate concentration | 100 | 98.97 | 97.384 | 100.203 |

## 1.9 METADATA

The formal definition of metadata is simply "data about data." Metadata is the information about a data source, for example, a book contains information, but there is also information about that book such as the author and publisher—this is the metadata.

Metadata in the context of this book can be used to describe how a particular data table was assembled, who collected the data, what method was used to collect and aggregate the data, the sources of the data. In our groundwater contamination example, metadata might include who did the surveying for the locations, the date of that survey, and the coordinate system specification.

For the sample data, the metadata might consist of the following components, shown in Table 1.12.

**Table 1.12 Examples of Metadata Components**

| Field Name | Field Description |
|---|---|
| $COC^{num}$ | Chain of custody identifier |
| Sent_to_lab_date | Date sample was sent to lab |
| Sample_receipt_date | Date that sample was received at laboratory |
| Sampler | Name or initials of sampler |
| Sampling_company | Name or initials of sampling company |
| Sampling_reason | Reason for sampling |
| Sampling_technique | Sampling technique |
| Task_code | Code used to identify the task under which sample was retrieved |
| Collection_quarter | Quarter of the year sample was collected (e.g., "1Q96") |
| Composite_yn | Boolean field used to indicate whether a sample is a composite sample |
| Composite_desc | Description of composite sample (if composite_yn is YES) |

© 2006 by Taylor & Francis Group, LLC

Within the context of GISs, metadata almost always refers to "data about digital geospatial data." Throughout this discussion, the term "metadata" is used under this restricted definition to refer to the *content, quality, condition, and other characteristics of digital geospatial data*.

Metadata for electronic images should include, as a minimum:

- How the image was created
- Who created it originally
- What has been done to enhance the image
- Coordinate system to which the image has been rectified
- Projection system to which the image has been rectified
- Other information unique to these particular images

With regard to electronic spatial data, in the United States, efforts are being made to try to develop a universal standard format for metadata for GIS systems. This would make accessing and using metadata much easier than it is today. Toward this end, the Federal Geographic Data Committee (FGDC) has approved a standard for metadata. Development of the standard was a part of the development of the National Spatial Data Infrastructure.

The standard is known as the Content Standard for Digital Geospatial Metadata (Version 2). It may be downloaded as a pdf file from the FGDC web site (www.fgdc.gov/standards/documents/standards/metadata/v2_0698.pdf).

While this standard is intended to facilitate the use of metadata and associated data (particularly images), it appears to not have been universally accepted outside of U.S. government bodies. Accordingly, within this definition metadata may take many forms, ranging from simple (on the paper map, the map legend is the metadata) to separate electronic text files, often multi-page, associated with a specific electronic aerial or satellite photo image.

The primary use of metadata is to correlate spatial image information, particularly aerial photos, satellite photos, and computer aided design (CAD) images, in three-dimensional space, with tabular data obtained in the field. There are, thus, two aspects to this process.

The first aspect is the creation of an electronic base map image on which tabular data may be electronically posted. Typically, the user will need to overlay images together (a CAD image superimposed on an aerial photo, for example) or combine smaller images together to create larger maps, or some combination of both. In this process, it is often possible to obtain access to additional tabular data already associated with (i.e. linked to, or posted on) images.

The second aspect is creating or obtaining the tabular data, and orienting it in two- or three-dimensional space. Tabular data are usually oriented in three-dimensional space according to surveys taken by hand on the ground, either using traditional surveying methods (compass, transit, etc) or global positioning satellite data. Because of the availability of extremely inexpensive receivers, GPS is rapidly becoming the dominate tool to obtain two- and three-dimensional positioning data in the field.

Typically the orientation metadata associated with the spatial data must be used to convert (reproject or recoordinate) the spatial data to conform to the orientation data associated with the tabular data, or vice-versa, or both. This process of correlation is called "rectification." Metadata are thus typically used to rectify the spatial image data to the tabular data.

## 1.10 CONCLUSIONS

The data management process is intended to reduce the amount of time spent on manipulating data and increase the level of utility of the data to the end users. The goals of the data management process should be as follows:

- Understand your data needs and how you are collecting it;
- Have a plan to accurately categorize all facets of your data;
- Promote accuracy of data through validation and verification;
- Promote consistency of data querying and reporting; and
- Understand the role of metadata in GIS.

The data presented in this book are categorized in a way to facilitate effective data management, and through querying and reporting, would be a verifiable and validated source of data for experimentation and investigation purposes.

CHAPTER 2

# International Data Collection

**Daniel Zell**

## CONTENTS

2.1 Introduction ..... 2-1
2.2 Data Sources ..... 2-2
2.3 Case Studies ..... 2-3
2.3.1 Latin America ..... 2-3
2.3.2 Central Asia ..... 2-4
2.3.3 South Asia ..... 2-4
2.4 General Process for Data Collection ..... 2-5
2.5 Internet Sources ..... 2-5

In developing countries, dams, irrigation schemes, watershed management plans, water and wastewater systems, and flood mitigation works have grown in both number and complexity. Because these data intensive approaches, such as river basin planning, are being embraced worldwide and funded by multilateral and bilateral organizations, the need for data has increased. China, for example, has undertaken massive water resources projects on a scale never seen before, and vast irrigation rehabilitation projects are underway in Afghanistan. In many Latin American countries, water management projects are a top priority. With the demand for such types of projects comes the need for data, information, knowledge management, and, in particular, people who fall under the broad category of water resources engineers. This need is made sharper given the imminent retirement of the seasoned professionals of the post-WWII generation who have spent their lives in water resources, leaving a younger, less experienced cohort of engineers to tackle the future.

## 2.1 INTRODUCTION

When, as often happens, engineers and other technical professionals in the water resources field are asked to render a technical judgment, they usually need a large set of data to analyze the issue. In the United States, general information such as precipitation, topography, streamflow, and other related data is usually readily available from standard sources: previous studies are usually on-hand with the implementing agency, e.g., state government, military, and the private sector. But sometimes, data are harder to find, less reliable, maybe even lost. This latter case is the normal starting point for water resources projects in less developed countries. The engineer will have to invest a good deal of time, effort,

© 2006 by Taylor & Francis Group, LLC

and sometimes money to get the sort of data that are, usually, freely available in developed countries. This chapter gives engineers an idea of what to expect, some approaches to gathering data, and international internet data sources.

There has been and always will be a need for rapid and complete data collection for water resources projects in the developing world, a process made even more challenging since data are fragmented among various government and private organizations. Due to both varied organizational arrangements and cultural factors, procedures for data collection vary from region to region and country to country, and it is not possible within the confines of this chapter to give a comprehensive step-by-step method for accomplishing it. Here, we present a brief picture of the challenges of data collection through some selected examples, an outline of a brief process, and a listing of sources of data for international water resources projects. This chapter, then, will be most useful for those with little experience in water resources projects in developing nations.

Now, before getting into the details, a few definitions and explanations.

1. *Less developed countries* is a term of convenience, generally meaning any country except the United States, the former Soviet Union, Canada, Western Europe, Australia, New Zealand, and Japan. But even though such a simple dichotomy does not really exist—other countries undoubtedly deserve to be considered developed and may indeed boast superior data repositories—this term, because of its widespread acceptance, will be used throughout this chapter.
2. *Engineer* is defined here as a person responsible for technical aspects of a water-related project. Although the engineer is normally an outsider to the country or region under study and perhaps initially unfamiliar with its cultural norms and practices, he or she engineer understands not only the data collection need but also its intended application and eventual output. In some cases engineers will be scientists, economists, even policymakers. The term, again, is chosen out of convenience.
3. To make the chapter as useful as possible to the widest audience, it generally refers to data in the generic sense, rather than, for example, average precipitation and uses illustrative examples rather than an analytical examination.

Without digressing too much into the world of development economics, we note that the engineer needs to understand the stage or level of development. In general, there is a positive correlation between wealth, or Gross Domestic Product per capita, and the centralization and quality of water resources data. In Afghanistan, one of the poorest countries in the world, for example, where data sources are widely scattered, the results are incomplete, with much historical data, and studies lost in the warfare over the past few decades. Climate also plays a factor, as natural disasters, humidity, and even rodents often destroy hard copies in countries with limited computerized archives. The overall lesson is that even in the relatively more developed countries of Central and South America, the engineer will need to search for secondary sources of data *outside* of the government, such as previous consultants' reports, private water companies' data, and others (see the list of websites at the end of this chapter). An outside engineer's local contacts will be essential in setting appointments, identifying possible resources, and even collecting data themselves.

But—a word of caution—it is unlikely that this task can be accomplished without the involvement of the engineer. If you are not willing to travel to the country of assignment, then you should probably find somebody else to do the job. Both the credibility and realism of the outputs will suffer from a lack of field presence. Besides, as an outsider, typically seen as immune to local politics and prejudices, the engineer who is willing to travel and spend enough time in country can surmount obstacles that an indigenous assistant could not.

## 2.2 DATA SOURCES

For general purposes, let us consider a simple dichotomy in terms of data availability:

- Initial Conditions (given data), and
- Needs (data objectives).

Initial data may be given by your client or employer or may be found through some cursory searching of the internet resources listed in this chapter. Data needs or objectives depend on the particular assignment and will likely evolve throughout the problem solving process. In any case, it is well worth taking the time to explore most, if not all, of the websites listed at the end of the chapter with a high-speed internet connection. You will spend much less time than trying to find data from alternate sources, such as government departments, previous and/or current projects, and well-known experts in the field. And the websites listed are generally regarded as reliable.

But website searches are not the only route. I recommend a variety of methods, especially if the

© 2006 by Taylor & Francis Group, LLC

country and region are unfamiliar to the engineer. Before arriving in a country, establish primary contacts and introductions through the employer or client. Email, however convenient, is no substitute for phone calls in building relationships. These contacts may, if sufficiently motivated, be in a much better position to collect the required data. Unfortunately, due primarily to the long and frequently inconclusive history of most local water resources projects with international engineers, it will be a difficult task convincing someone unknown to you, that your cause is worthwhile. This is yet another reason why you should use your in-country network, even if it is only your employer or client, as a foundation for collecting data. The social ties and relationships that locals have established are a resource you should not ignore.

A frequent issue when working in an unfamiliar region and culture is payment. How much do things cost? From CAD and GIS operators, to internet usage, to maps, most, if not all, goods and services have a value. In my experience, the issue is not whether or not to pay, but rather, "what is the correct price?" This is not to say that you can not get data for free; indeed, that is how I got most of mine. The engineer will have to rely on his or her in-country network and awareness of local social norms to determine whether or not a payment is required. In general, if work is required beyond normal hours or duties, then a payment is more likely to be required.

Another thing to be prepared for is equipment and procedures that do not work. Copiers, for example, are usually broken because of a lack of basic supplies and/or maintenance. Or it may not exist or be available to anyone except the senior staff. Regulations may not let you take records from the office for off-site duplication. Unless you have a penchant for data entry, this is another case where it may be appropriate to pay the correct fee for the data to be digitally entered. I suggest offering an electronic copy of the records by email to both the department and data entry person. By making them part of the process, rather than a cog in a wheel, you may use these people as resources for a long time to come, as I did with a local hydrologist in Afghanistan months after my return. (It did, however, take much longer than expected and required several phone calls and visits by contacts in Afghanistan.)

## 2.3 CASE STUDIES

The following case studies will give the engineer a general perspective of the operational aspects of data collection in a few developing nations. Let me note at once, however, the enormous importance of learning about and paying attention to the unique cultures, conditions, and particularly the values of each nation or region. Ignoring them will imperil both the engineer and the project itself.

### 2.3.1 Latin America

Overall, although collecting water resources data in Latin America is like working in developing countries worldwide,* the relatively higher income in Latin America can make the work easier, as education level generally correlates with income. Because hydropower is a highly developed sector in Latin America, its organizations often have the best data. However, the data are often considered proprietary and, being tightly controlled, take concerted and time-consuming effort by the engineer and local counterparts to get it.

As in other regions, engineers should rely on their counterparts, local staff, or client by insisting that reasonable efforts be expended to gather data in advance. Due to the culture of Latin America, counterparts can be relied on quite heavily, and will likely be highly competent. In this manner, the engineer's time can be best and efficiently used to address the remaining obstacles, like analyzing the data and writing reports.

Still, the engineer should be prepared to complete an assignment with much less data in both quantity and quality than is the norm in developed countries. When no data are found for a specific basin, data for a similar region—in combination with field interviews, maps, and surveys—is used to build a model. The uncertainties resulting from using such data should be plainly and simply stated in the engineer's work.

According to Dr Molina, the process of cleaning data—searching for errors—although time consuming and tedious, has repeatedly proved itself to be worth the trouble. Common errors include converting units, converting gauge readings to flow, and a myriad of other possibilities. These errors, if unchecked and corrected, will skew the results of an analysis. On the other hand, careful advance planning can minimize delays, for example, by contracting a local firm or consultants to carefully screen the data for anomalies and enter it into a useful format.

* According to a June 25, 2004, interview with Dr Medardo Molina, a Peruvian-born water resources expert who has been active in water resources since 1965 as an international consultant and professor. Dr Molina has published numerous papers in both Spanish and English.

© 2006 by Taylor & Francis Group, LLC

### 2.3.2 Central Asia

In Afghanistan, collecting water resources data were quite complicated, based on my personal experiences in 2003. What little historical data existed was fragmented and incomplete. Thirty years of instability destroyed critical records and the hydrological network. The language barrier, with data sometimes recorded in Dari, Pashto, or Russian, further complicated data collection.

The assigned task—to construct a national water balance and determine water availability for rehabilitating irrigation—necessitated casting a wide net to collect all sources of data. Before visiting Afghanistan, my thorough search of libraries and databases yielded only few results, but one of them, a previous water balance study, was quite useful. Although I made contacts in advance, scheduling appointments from outside of Afghanistan did not work. I now understand that the local custom is to pay a brief introductory visit, without an appointment. Then, a later appointment can be scheduled where the useful work will be accomplished.

This introductory visit may seem full of pleasantries and even a bit useless. To the novice it may seem not along the critical path. Quite to the contrary, the visits are used to evaluate the engineer, to understand what the engineer is doing, and to understand if the engineer is worthy of help. Besides, since data are rarely immediately available, the first meeting gives the local source time to prepare.

The team conducted initial and follow-up visits to the following organizations:

> *Ministries*: Irrigation and Water Resources and Environment, Rehabilitation and Rural Development, Agriculture and Animal Husbandry, and the Central Statistics Office
> *United Nations*: Food and Agriculture Organization and World Food Program, in particular the Vulnerability Analysis Mapping Unit for socio-economic data, and the Development Program
> *Others*: ICARDA (International Center for Agricultural Research in the Dry Areas), the U.S. Agency for International Development, and various private consultants, firms, and non-government organizations

From these and subsequent visits over a 12-month period, the consultant team gathered the hydrological station data. We hired a local professional consultant to both construct and digitize a map of the monitoring stations. More importantly, the team was able to persuade a wide range of policy makers and water resources professionals of the report's thoroughness and usefulness by conducting follow-up visits to the data repositories, courtesy calls to government officials to present the report and findings, and formal presentations.

The United Nations' organizations provided the most accurate satellite and agricultural data, and previous consultants' reports were essential in constructing the overall water balance. Although we still had to do careful fact checking based on the newly available data, the efforts of independent and knowledgeable local staff helped us get data not only more rapidly but also with a higher degree of reliability than would have otherwise been possible.

It is important to note that the local staff's efforts had to be supplemented with continual phone calls and emails by the consultants as well as periodic visits to Afghanistan. As outsiders, foreign consultants can often bypass the social norms and traditions that hamper local staff. At the same time, continued communication and visits let the team more completely understand the extent of the problem or issues to be addressed and more importantly, convey the engineers' recommended solution to the client as it evolved. This served two purposes:

1. By avoiding the "parachute in" approach where a consultant works rapidly and alone, often behind a closed door, the team won a sense of buy-in and respect from the client, which ensured that the client would actually understand the results of the work.
2. By working hand-in-hand with a client who lacked basic institutional capacity, the consultant team was able to increase the client's capacity to use the team's results.

With so many people interested in the report, the team decided to circulate a draft copy. The resulting informal peer review process increased the credibility of the findings, and although it led to a series of revisions, in the end, it was the only way to accomplish the task.

### 2.3.3 South Asia

In contrast to the situation in Afghanistan, data availability was relatively high during a 2004 assignment to the Indian State of Orissa. At the state water resources agency, I saw many rooms with neatly bound papers stacked literally from floor to ceiling. More remarkably, when motivated by the department head, almost everything we asked for was quickly found. And because the information requested was relatively recent,

© 2006 by Taylor & Francis Group, LLC

we did not encounter the issue of deteriorating paper records in a humid environment without climate control. The main problems were poor database design and data entry, and resistance to improving quality control standards.

To make sure that our primary data on average daily flow from reservoirs were accurate, my team went to one of the more remote locations to look at primary records. This entailed a journey across the small rice paddies that characterize the regions, a courtesy call to the local supervisor, and even more driving to where the road literally ended at the reservoir. The water resources department had told the reservoir about our trip, and the records were ready. However, local customs dictated a long, slow, and quite good meal as well as an exchanging of pleasantries before the ledger was produced. Then, we asked the data recorders how they recorded the gate height and translated that measurement into a daily flow. Spot checking a few calculations for accuracy, we found no mistakes.

A universal issue when dealing with government agencies is territorialism. This issue nearly derailed the entire project in India. An agency insisted that a task was within their realm of authority but showed neither the will nor the capacity to perform the work as required. Rather the agency did the bare minimum and strongly resisted any efforts at improvement. The lesson the engineer should take from this is that relying on someone or some agency out of your control is risky. In hindsight, the solution would have been to accept the agency as a partner, then help them, as cooperatively and diligently as possible, to complete the project.

## 2.4 GENERAL PROCESS FOR DATA COLLECTION

The following process serves as a guideline for engineers unfamiliar with international water resources engineering. It is highly likely that additional steps will be needed in any actual project depending on the requirements and country.

1. Learn key features of the country's culture norms and values by both talking to someone from the country and reading appropriate articles and even the literature.
2. Identify the problem.
   This step consists of more than simply reading the terms of reference. The engineer should plan on conducting one-to-one discussions with senior and mid-level staff at the local or client agency.
3. Identify data requirements.
4. Identify local staff requirements such as cartographers, hydrologists, statisticians, field surveyors, etc.
5. Contact the client or local agency.
   5.1. Contact made well in advance of the initial visit so that the staff are aware of the planned work and can plan accordingly.
   5.2. Contact at regular intervals, at least weekly. Contact by phone and email is recommended.
6. Make initial visit.
   Prearranged visits with organizations should be conducted. Social outings, while exhausting, may prove useful for particularly difficult data collection situations.
7. Collect the data.
8. Review data collected.
   Determine what steps need to be taken to ensure the data are both accurate and in a usable format.
9. Conduct field validation if required.
10. Make more visits.
    These visits will supplement initial data gatherings and present initial findings.
11. Perform analysis.
12. Prepare and circulate draft report.
13. Incorporate comments as appropriate.
14. Prepare report.

## 2.5 INTERNET SOURCES

The following addresses give access to a lot of data. The descriptions of the 2006 websites come directly from the web pages themselves.

AQUASTAT is the Food and Agricultural Organization's (FAO) global information system of water and agriculture developed by the Land and Water Development Division of FAO. AQUASTAT is FAO's global information system of water and agriculture developed by the Land and Water Development Division of FAO. The objective of AQUASTAT is to provide users with comprehensive information on the state of agricultural water management across the world, with emphasis on developing countries and countries in transition (www.fao.org/WAICENT/FAOINFO/AGRICULT/AGL/AGLW/aquastat/main/index.stm).

The following is an excerpt from the AQUASTAT country profile of Afghanistan

© 2006 by Taylor & Francis Group, LLC

### Water Resources

Based on the hydrographic systems, the country can be divided into four zones:

- the northern basin (24% of the territory) with the Amu Darya and its tributaries (14%), which drain toward the Aral sea, and the rivers of northern Afghanistan (10%), which disappear within the country before joining the Amu Darya;
- the western region (12%) consisting of the Hari Rud river basin (6%) and the Murgab river basin (6%), both rivers disappearing in Turkmenistan;
- the south-western basin (52%) with the Helmand river flowing toward the Sistan swamps, located on the border of Iran and Afghanistan. In 1972, a document was signed between Afghanistan and Iran to allocate a discharge of 26 m/s of Helmand river water to Iran all year round;
- the eastern Kabul basin (12%), which is the only river system having an outlet to the sea, joining the Indus at Attock in Pakistan.

Internal renewable water resources are estimated at 55 $km^3yr^{-1}$. The Kunar river, which originates in Pakistan, crosses the border with an average annual flow of 10 $km^3$ and joins the Kabul river at Jalalabad about 180 km further downstream. The Kabul river flows again into Pakistan 80 km further downstream.

Total water withdrawal was estimated at 26.11 $km^3$ in 1987, of which 99% for agricultural purposes. Recently, there has been a large development of groundwater use in some provinces.

In 1986, there were two dams higher than 15 m. The installed capacity of the hydroelectric plants was 281 MW in 1992, which is about 70% of total installed capacity. There is considerable potential for the generation of hydropower, by both large dams and microhydropower stations.

FAOSTAT is an on-line and multilingual database currently containing over 3 million time-series records covering international statistics in the following areas:

| | | |
|---|---|---|
| Production | Land use and irrigation | Fertilizer and pesticides |
| Trade | Forest products | Agricultural machinery |
| Food balance sheets | Fishery products | Food aid shipments |
| Producer prices | Population | Exports by destination |
| Forestry trade flow | Food quality control | |

The tables above are an example of the output produced by FAO STAT, in this case rural and urban populations in African Developing Nations from 1993 to 2003. The output is also available in .csv format.

GRDC (Global Runoff Data Center) The GRDC makes the unique offer to the international research and science community of easy and universal access to river flow information on a global scale. On request, data

© 2006 by Taylor & Francis Group, LLC

products are developed and specialized databases are assembled for projects on both regional and global scale. The GRDC serves as a communication platform between institutions, advisors, and scientists and also transfers information about other relevant databases with a hydrological content such as the Global Precipitation Climatology Centre (GPCC) and the Programme Office of the Global Environment Monitoring System—Water (GWPO) of UNEP. It also maintains close ties to the UNESCO Water project "Flow Regimes from International Experimental and Network Data" (FRIEND).

The GRDC contains long-term mean annual freshwater surface water fluxes into the world oceans. Estimates are based on 251 discharge stations of major rivers. Data available include mean, minimum, maximum monthly discharges, and time series of mean, minimum, maximum annual discharge for 3035 stations. UNH-GRDC Global Composite Runoff Fields combines observed river discharge information with a climate-driven Water Balance Model (http://grdc.bafg.de).

The following is a sample output:

```
# GRDC-No.:          2903425
# River:             LENA
# Station:           UST-KUT
# Country:           RU
# Lat (dec. degree):    56.7700
# Lon (dec. degree):   105.6500
# Area (km**2):       71400.000
#
#
# General procedure to calculate the statistics:
# Original monthly values are used whenever available.
# In order to extend the time series, monthly data derived from daily values
# is added where applicable. Then the calculation of a monthly value
# allows a maximum to 5 missing daily values per month
#
# -999 indicates missing value or insufficient data
#
# Time series: 1936 - 1948
#
# Missing original monthly values (%): 17.00
# Missing original daily values (%):    not available
#
Number of values used for calc.:     |   127.000
Absolute minimum discharge (m**3/s): |    37.800
Absolute maximum discharge (m**3/s): |  1790.000
Average annual discharge (m**3/s):   |   402.554
Average annual volume (km**3/yr):    |    12.695
Average annual runoff (mm/yr):       |   177.801
#
# Long-term monthly characteristics (m**3/s)
# (Calculation requires at least 5 years of data)
Mo|Min       |Year|Max       |Year|Mean      |S. deviation|No. values

CGIAR is a global link to research on agriculture, hunger, poverty, and the environment. CGIAR (Consultative Group on International Agricultural Research) is a good starting point for international water issues related to agriculture (www.cigar.org).

To access any of CGIARs publications published by the 15 research centers, go to the CGIAR Library Gateway (www.cgiar.org/publications/library/index.html).

CGIAR Reefbase—ReefBase is the world's premier online information system on coral reefs, and provides information services to coral reef professionals involved in management, research, monitoring, conservation, and education. Its goal is to facilitate sustainable management of coral reefs and related coastal/marine environments, in order to benefit poor people in developing countries whose livelihoods depend on these natural resources. ReefBase's Online Geographic Information System (GIS) allows you to display coral reef related data and information on interactive maps. You can zoom, search, and query datalayers, and save or bookmark the map (www.reefbase.org).

ICARDA (International Center for Research in the Dry Areas) is one of the research centers of CGIAR, whose mission is to improve and integrate the management of soil, water, nutrients, plants, and animals in ways that optimize sustainable agricultural production. There are many relevant articles, publications, and datasets on on-farm water use and water efficiency (www.icarda.cgiar.org).

IWMI's (International Water Management Institute) on-line publication section contains several thousand pages of peer reviewed research on water management. All research outputs and publications produced by IWMI are international public goods, freely available to partners in developing countries and to members of the international development, academic and research communities (www.iwmi.cgiar.org/pubs/mindex.htm).

The Remote Sensing and GIS Unit (RS GIS Unit) of the International Water Management Institute (IWMI), is a centralized facility for all spatial data-related activities of IWMI at the headquarters in Sri Lanka and Regional Offices located in different parts of the world.

Currently, the RS GIS Unit holds over 1 terabyte of data. Although the emphasis is on IWMI benchmark river basins, large volumes of data are also available at National, Regional, and Global levels. These data are catalogued, streamlined, and released to the public through the IWMI Data Storehouse Pathway (DSP). Much of the river basin and other datasets are composed as single mega files of hundreds or sometimes thousands of bands consisting of continuous streams of 8-day or monthly time series data in several wavebands and/or indices.

Large volumes of multitemporal data from multiple satellite sensors are used in several IWMI research projects. These projects include: (a) Global Irrigated Area Mapping (GIAM) at global to local scales, (b) the Wetland project in the Limpopo river basin of four Southern African Nations, (c) the Krishna river basin project in India, (d) the Indo-Gangetic river basin project in India and Pakistan, (e) the Drought Assessment and Mitigation project in Afghanistan, Pakistan, and parts of India, and (f) the biodiversity project in Sri Lanka.

More information on the RS GIS Unit and its activities can be found in several areas of this web site (www.iwmidsp.org/iwmi/info/centerprofile.asp).

Hydrological Processes is a relevant international journal with abstracts freely accessible on the web. Of particular interest are the past articles on mathematical and methodological aspects of hydrological processes and modeling.

Accessed through Wiley Intersciences (www.interscience.wiley.com).

Although traditionally thought of as a repository of United States data sets only, the United States Geological Survey (USGS) has a notably thorough database on selected countries that will likely grow over time. In particular, datasets for Jordan and Israel can be found through their project websites (www.watercare.org and www.exact-me.org).

Also on USGS, a general homepage with linkages to Ukraine, United Arab Emirates, Bangladesh, and Cyprus (international.usgs.gov/disciplines/water.htm).

Winrock Water is both a discussion forum and data clearinghouse that includes an annotated bibliography. Winrock water has selected leading reference materials, research and discussions of major issues in the water resources field through the internet. The links section is of particular interest to those in data collection (www.winrockwater.org).

Sakia.org is an information and communication service in the area of "land and water". Sakia.org hosts several services such as the email discussion list IRRIGATION-L the WWW Virtual Library Irrigation & Hydrology (content filling stage), the WWW Database on Irrigation & Hydrology Software—IRRISOFT (under revision), the e-Journal of Land and Water, an open access and peer reviewed international scientific journal for research and developments and the *Journal of Applied Irrigation Science*. Sakia.org is fostering the open and free access to knowledge in support of the "land and water" community (www.sakia.org).

The mean number of days with a minimum temperature of 32°F or lower indicates the frequency of occurrence of days with freezing temperatures.
The annual value is the total of the unrounded monthly values, it may not agree with the sum of the rounded monthly values.

*Note:* Based on 30-year average values 1971–2000. Degree-day data are used to estimate amounts of energy required to maintain comfortable indoor temperature levels. Each degree that a day's mean temperature is above 65°F is counted as one cooling degree day.

*Note:* Through 2002. This table expresses both a maximum wind speed and where available, the direction (referenced to true North) from which it blew. Short gusts are listed only for stations denoted with a (G). If the direction is expressed as one of the 16 compass points (N, NNE, NE, etc) the maximum speed is calculated from the minimum time during which one mile of wind passed the station. If the direction is expressed numerically, the maximum speed is the highest one-minute average value recorded by the observer. Direction is given in tens of degrees clockwise from true North.

*Note:* The relative humidity is expressed as a percentage measure of the amount of moisture in the air compared to the maximum amount of moisture the air can hold at the same temperature and pressure. Average humidity values are given for selected morning and afternoon observations. Maximum relative humidity values usually occur during morning hours. In this publication, the Local Standard Time (LST) of morning and afternoon humidity is shown below. Atlantic, Alaskan (M morning 8 A.M.) (Afternoon 2 P.M.), Eastern, Bering, 165W Meridian (M morning 7 A.M.) (Afternoon 1 P.M.), Central, 180E Meridian (M morning 6 A.M.) (Afternoon NOON), Mountain, 165E Meridian (M morning 5 A.M.) (Afternoon 5 P.M.), Pacific, 150E Meridian (M morning 4 A.M.) (Afternoon 4 P.M.), 135E Meridian (M morning 9 A.M.) (Afternoon 3 P.M.).

*Note:* 1. "Length of Record" refers to average daily maximum and minimum temperatures and precipitation. A standard period of the 30 years from 1931–1960 had been used for locations in the United States and some other countries. The length of record of extreme maximum and minimum temperatures includes all available years of data for a given location and is usually for a longer period. 2. * = Less than 0.05″. 3. Except for Antarctica, amounts of solid precipitation such as snow or hail have been converted to their water equivalent. Because of the frequent occurrence of blowing snow, it has not been possible to determine the precise amount of precipitation actually falling in Antarctica. The values shown are the average amounts of solid snow accumulating in a given period as determined by snow markers. The liquid content of the accumulation is undetermined.

**Table 3C.18 World-Wide Extremes of Temperature and Precipitation**

**Temperature**

A. *Highest*

World, 58°C (136°F), El Azizia, Libya, 13 September 1922
Western Hemisphere, 57°C (134°F), Death Valley, California, 10 July 1913
Antarctica, −13.6°C (7.5°F), 27 December 1978
Asia, 54°C (129°F), Tirat Tsvi, Israel, 21 June 1942
Australia, 53°C (128°F), Cloncurry, Queensland, 16 January 1889
Europe, 50°C (122°F), Seville, Spain, 4 August 1881
South America, 49°C (120°F), Rivadavia, Argentina, 11 December 1905
Canada, 45°C (113°F), Midale and Yellow Grass, Saskatchewan, 5 July 1937
Vanda Station, Antarctica, had a 15°C (59°F) maximum, 5 January 1974 (possibly Antarctica's highest)
South Pole, −14°C (7.5°F), 27 December 1978
Persian Gulf had a 36°C (96°F) sea-surface, 5 August 1924
Annual Mean, 34.4°C (94°F), Dallol, Ethiopia

B. *Lowest*

World, −89°C (−129°F), Vostok, Antarctica, 21 July 1983
Northern Hemisphere, −68°C (−90°F), Verkhoyansk, U.S.S.R., 5 and 7 February 1892 and Oimekon, U.S.S.R., 6 February 1933
Greenland, −66°C (−87°F), Northice, 9 January 1954
North America, excluding Greenland, −63°C (−81°F), Snag, Yukon Territory, 3 February 1947
U.S., −62°C (−80°F), Prospect Creek, Endicott Mts., Alaska, 23 January 1971
U.S., excluding Alaska, −56.5°C (−70°F), Rogers Pass, Montana, 20 January 1954
Europe, −55°C (−67°F), Ust 'Shchugor, U.S.S.R., January (date not known, lowest in 15-year period)
South America, −33°C (−27°F), Sarmiento, Argentina, 1 June 1907
Africa, −24°C (−11°F), Ifrane, Morocco, 11 February 1935
Antarctica, annual mean temperature −57°C, (−71°F), Sovietskaya, Antarctica
Australia, −23°C (−9°F), Charlotte Pass, New South Wales, 29 June 1994
Upper Air, −153°C (−243°F) at 93 km (58 mi) above Point Barrow, AK

**Precipitation**

A. *Greatest Rainfall*

World, 1-minute, 3.1 cm (1.23″), Unionville, Maryland, 4 July 1956
World, 20-minute, 20.5 cm (8″), Curtea-de-Arges, Romania, 7 July 1889
World, 42-minute, 30.5 cm (12″), Holt, Missouri, 22 June 1947
World, 60-minute, 30.5 cm (12″), Holt, Missouri, 22 June 1947 and Kilauea Sugar Plantaion 24–25 January 1956
World, 12-hour, 117 cm (46″), Grand Ilet, La R'eunion Island, 28 January 1980
World, 24-hour, 183 cm (72″), Foc-Foc, La R'eunion Island, 7–8 January 1966
World, 5-day, 430 cm (169″), Commerson, La R'eunion Island, 23–28 January 1980
World, 1-month, 930 cm (366″), Cherrapunji, India, July 1861
World, 12-month, 2,647 cm (1042″), Cherrapunji, India, August 1860–1861
Northern Hemisphere, 24-hour, 125 cm (49″), Paishih, Taiwan, 10–11 September 1963
Australia, 24-hour, 114 cm (44″), Bellenden Ker, Queensland, 4 January 1979
Canada, 24-hour, 49 cm (19″), Ucluelet Brynnor Mines, British Columbia, 6 October 1967
United States, 24-hour, 109 cm (43″), Alvin, Texas, 25–26 July 1979
United States, 12-month, 1878 cm (793″), Kukui, Maui, Hawaii, December 1981–1982

B. *Greatest Average Yearly Precipitation*

World, 1,168 cm (460i″), Mount Waialeale, Kauai, HI (1931–1960), 1187 cm (467 Mawsynram,India (1941–1979), 1330 cm (524″), Lloro, Colombia (1932–1960)
Asia, 1187 cm (467″) during a 38-year period, Mawsynrami, India
Africa, 1029 cm (405″) during a 32-year period, Debundscha, Cameroon
South America, 899 cm (354″) during a 10–16 year period, Quibdo, Colombia
North America, 650 cm (256″) during a 14-year period Henderson Lake, British Columbia
Europe, 465 cm (183″) during a 22-year period, Crkvice, Yugoslavia
Australia, average yearly, 864 cm (340″), Bellenden Ker, Queensland
Bahia Felix, Chile, averages 325 days/year with rain
Canada, highest frequency of days with precipitation, 242 per year average, Langara, Queen Charlotte Islands, British Columbia

C. *Least Precipitation*

Arica, Chile, had no rain for more than 14 consecutive years, October 1903 to January 1918
U.S., longest dry period, 767 days from 3 October 1912 to 8 November 1914, Bagdad, California
Canada, least precipitation during a calendar year, 1.27 cm (0.05″), Arctic Bay, Northwest Territories, 1949 Canada, lowest frequency of days with precipitation, 8 per year average, Rea Point, Northwest Territories

D. *Lowest Average Yearly Precipitation*

World, 0.08 cm (0.03″) during a 59-year period, Arica, Chile

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 3C.18 (Continued)**

Africa, <0.25 cm (<0.1″> during a 39-year period, Wadi Haifa, Sudan
North America, 3.0 cm (1.2″) during a 14-year period, Bataques, Mexico
United States, 4.1 cm (1.63″) during a 42-year period, Death Valley, California
Asia, 4.6 cm (1.8″) during a 50-year period, Aden, South Yemen
Australia, 10 cm (4.05″) during a 42-year period, Troudaninna, South Australia
Europe, 16 cm (6.4″) during a 25-year period, Astrakhan, U.S.S.R.

E. *Hailstones*
U.S., largest hailstone, 44.5 cm (17.5″) circumference, Coffeyville, Kansas, 3 September 1979 Canada, heaviest hailstone, 290 gm (10.23 oz),
Cedoux, Saskatchewan, 27 August 1973 Canada, highest frequency of days with hail, 7 per year average, Edson and Red Deer, Alberta
United States, highest frequency of days with hail, 9.4 per year average, Cheyenne, Wyoming
World, heaviest hailstone, 1.02 kg (2.25 lbs) in the Gopalganj district, Bangladesh, 14 April 1986

F. *Greatest Snowfall*
North America, 24-hour, 192.5 cm (76″), Silver Lake, Colorado, 14–15 April 1921
Bessans, France, had a snowfall of 172 cm (68″) in 19 hours, 5–6 April 1969
Canada, climatological day, 118 cm (46″), Lakelse Lake, British Columbia, 17 January 1974
North America, one storm, 480 cm (189″), Mt. Shasta Ski Bowl, California, 13–19 February 1959
North America, one season, 2850 cm (1122″), Rainier Paradise Ranger Station, Washington, 1971–1972
Canada, one season, 2446.5 cm (964″), Revelstoke Mt. Copeland, British Columbia, 1971–1972
Canada, highest frequency of days with snow, 142 per year average, Old Glory Mountain, British Columbia
North America, greatest depth of snow on the ground, 1145.5 cm (451″), Tamarack, California, 11 March 1911
Canada, greatest depth of snow on the ground, 775 cm (305″), Loch Lomond, British Columbia

**Other Elements**

A. *Thunderstorms*
Kampala, Uganda, averages 242 days/year with thunderstorms, during a 10-year period
Bogor, Indonesia, averaged 322 days/year with thunderstorms from 1916 to 1920
Canada, highest frequency of days with thunderstorms, 34 per year average, Windsor, Ontario
North America, highest average annual days with thunderstorms, 100 per year average, Tampa, Florida

B. *Fog Frequency*
U.S. West Coast, highest average, 2552 hours per year during a 10-year period or more, Cape Disappointment, Washington U.S. East Coast, highest average, 1580 hours per year during a 10-year period or more, Moose Peak Lighthouse, Mistake Island, Maine
Canada, highest average, 158 days per year, Cape Race, Newfoundland

*Note:* Based on 30-year average values 1971–2000. The normal precipitation is the arithmetic mean for each month over the 30-year period and includes the liquid water equivalent of snowfall. The annual value is the total of the unrounded monthly values and may not agree with the sum of the rounded monthly values.

*Note:* Through 2002. This table shows mean number of days per month with at least 0.01 in. of precipitation. This is the smallest amount of precipitation numerically recorded, and includes the liquid water equivalent of frozen precipitation. The frequency of days with precipitation should not be considered as frequency of cloudy days.

**Table 3E.26 Physical Properties of Snow and Ice**

| | Density ($g/cm^3$) | Porosity (percent) | Air Permeability ($g/cm^3/sec$) | Grain Size (mm) |
|---|---|---|---|---|
| New Snow | 0.01–0.3 | 99–67 | >400–40 | 0.01–5 |
| Old Snow | 0.2–0.6 | 78–35 | 100–20 | 0.5–3 |
| Firm[a] | 0.4–0.84 | 56–8 | 40–0 | 0.5–5 |
| Glacier Ice | 0.84–0.917 | 8–0 | 0 | 1–100 |

[a] Firm is snow which has been modified into a dense compact material by deformation, refreezing, recrystallization, and other processes.

**Table 3E.27 Heat Supplied to Melting Snow by Different Processes**

| Heat Supply | Extreme Conditions | Approximate Heat Supplied[a] |
|---|---|---|
| Convection from turbulent air | 70° dry bulb, 20-mile wind | 600 |
| Condensation of atmospheric moisture | 60° dew point, 20-mile wind | 600 |
| Absorption of solar radiation | Very moist air, cloudy at night | 200 |
| Warm rain | 4 in., 50° wet bulb | 100 |
| Conduction from soil | New snow | 20 |

[a] Calories per square centimeter per day.

**Table 3E.28 Relation of Snow Melt to Snow Evaporation**

| Air Temperature (°C) | Relative Humidity (%) | Snow Evaporated ($g\ cm^{-2}\ day^{1}$) | Heat Transfer from Air to Snow ($cal\ cm^{-2}\ day^{1}$) | Heat Required in Evaporation Process[a] ($cal\ cm^{-2}\ day^{1}$) | Heat Available to Melt Snow ($cal\ cm^{-2}\ day^{1}$) | Melted Snow ($g\ cm^{-2}\ day^{1}$) | Melt/Evaporation |
|---|---|---|---|---|---|---|---|
| 5 | 20 | 2.02 | 900 | 1,370 | 0 | 0 | |
| 10 | 20 | 1.69 | 1,790 | 1,150 | 640 | 8.0 | 4.7 |
| 15 | 20 | 1.25 | 2,690 | 850 | 1,840 | 23.0 | 18.4 |
| 20 | 20 | 0.67 | 3,590 | 460 | 3,130 | 39.1 | 58.4 |

[a] Heat required in evaporation process is equal to heat transfer from air to snow plus heat obtained by lowering of snow-surface temperature.

**Table 3E.29 Melting Constant for Snow**

| Location | Descriptive Notes | Melting Period | Melting Constant |
|---|---|---|---|
| Albany, NY | Tests of small cylinders | 8–12 hours | 0.04–0.06 |
| Donner Summit, CA | Observations in 1917 | Apr 1–May 6 | 0.071 |
| Gooseberry Creek, UT | Field measurements | Apr 23–May 9 | 0.091 |
| Gooseberry Creek, UT | Tests of cores | 6–9 hr | 0.05–0.07 |
| Finland | All basins, 1934–1937 | Apr | 0.108 |
| Soda Springs, CA | Average, 1936–1941 | Apr | 0.051 |
| New England floods | Studies by Boston Soc. C.E. | 1–14 days | 0.01–0.04 |
| NY and PA basins | Flood runoff studies | Mar or Apr | 0.04–0.07 |
| LaGrange Brook, NY | Basin area, 36 acres | Mar 28–Apr 6 | 0.09 |
| New England floods, 1936 | Geol. Survey, average values | Mar 9–22 | 0.03–0.05 |
| Permigewasset Basin, NH | Flood of March 1936 | Mar 17–20 | 0.16 |
| Crater Lake, OR | Small test plots | Mar 3–Jun 9 | 0.153 |
| Crater Lake, OR | Small test plots | May 26–Jun 2 | 0.658 |

*Note:* The melting constant is the depth of water in inches melted per degree day. A degree day is a unit of heat resulting from a day with a mean temperature one degree Fahrenheit above 32°F.

**Table 3E.30 Snow Survey Reports — Western United States**

SNOTEL (SNOWpack Telemetry) is an extensive system operated by the Natural Resources Conservation Services (NRCS). The system supports the Congressional mandate from the mid-1930's "to measure snow pack in the mountains of the West and forecast the water supply." SNOTEL has been in operation since 1980 replacing manual measurements and provides the data necessary to support the data needs of the NRCS and others

Specific products (data) supported include

- Climate Information
- Data Collection Technology
- Snow Survey Information
- Water Supply Forecasting
  - Colorado River Basin
  - Columbia River Basin/Alaska
  - Great Basin/California/Pacific Coastal
  - Missouri River Basin
- Hydraulics and Hydrology
- Irrigation and Water Management
- Water and Wind Erosion
- Water Quality Assessment and Monitoring
- Wetlands and Drainage

**Table 3E.31 Greatest Snowfalls in North America**

| | Place | Date | In. | Cm |
|---|---|---|---|---|
| 24 hr | Silver Lake, CO | Apr 14–15, 1921 | 76 | 195.6 |
| 1 month | Tamarack, CA | Jan 1911 | 390 | 991 |
| 1 storm | Mt. Shasta Ski Bowl, CA | Feb 13–19, 1959 | 189 | 480 |
| 1 season | Mount Baker, WA | 1998–1999 | 1,140 | 2,895.6 |

**Table 3E.32 National Snowfall and Snow Depth Extremes**

| | | Location | | | | | |
|---|---|---|---|---|---|---|---|
| Coop Station Number | Snow Amount (in.) | Station Name | State | | Ending Date | Number of Years of Non-Missing Data | Data Period Analyzed |
| Greatest daily snowfall | 62.0 | 509146 | Thompson Pass | AK | 12/29/1955 | 19 | 1952–1973 |
| Greatest 2-day snowfall (snowed both days) | 120.6 | 509146 | Thompson Pass | AK | 12/30/1955 | 19 | 1952–1073 |
| Greatest 3-day snowfall (snowed all 3 days) | 147.0 | 509146 | Thompson Pass | AK | 12/30/1955 | 19 | 1952–1973 |
| Greatest 4-day snowfall (snowed all 4 days) | 163.0 | 509146 | Thompson Pass | AK | 12/30/1955 | 19 | 1952–1973 |
| Greatest 5-day snowfall (snowed all 5 days) | 175.4 | 509146 | Thompson Pass | AK | 12/31/1955 | 19 | 1952–1973 |
| Greatest 6-day snowfall (snowed all 6 days) | 172.6 | 509146 | Thompson Pass | AK | 2/24/1953 | 19 | 1952–1973 |
| Greatest 7-day snowfall (snowed all 7 days) | 186.9 | 509146 | Thompson Pass | AK | 2/25/1993 | 19 | 1952–1973 |
| Greatest monthly snowfall total | 297.9 | 509146 | Thompson Pass | AK | 2/1953 | 17 | 1952–1973 |
| Greatest Aug–July snowfall total | 1069.8 | 456898 | Rainier Paradise Rangers | WA | 1974 | 17 | 1948–2000 |
| Greatest daily snow depth | 293.0 | 456898 | Rainier Paradise Rangers | WA | 4/12/1974 | 11 | 1948–2000 |

*Note:* Missing data may cause apparent discrepancies between the daily extreme, monthly total, and seasonal total snowfall values. The monthly and seasonal totals were based on complete data; if any days were missing, then the monthly or seasonal total could not be computed for that year. Daily snowfall extremes were not as susceptible to missing data. Consequently, it may be possible for a 1-day extreme to be greater than a multiple-day extreme, a daily extreme to be greater than a monthly total, and a monthly total to be greater than a seasonal total. Checking the "number of years with non-missing data" parameter is an important part of using this snow climatology.

## SECTION 4A HYDROLOGIC CYCLE

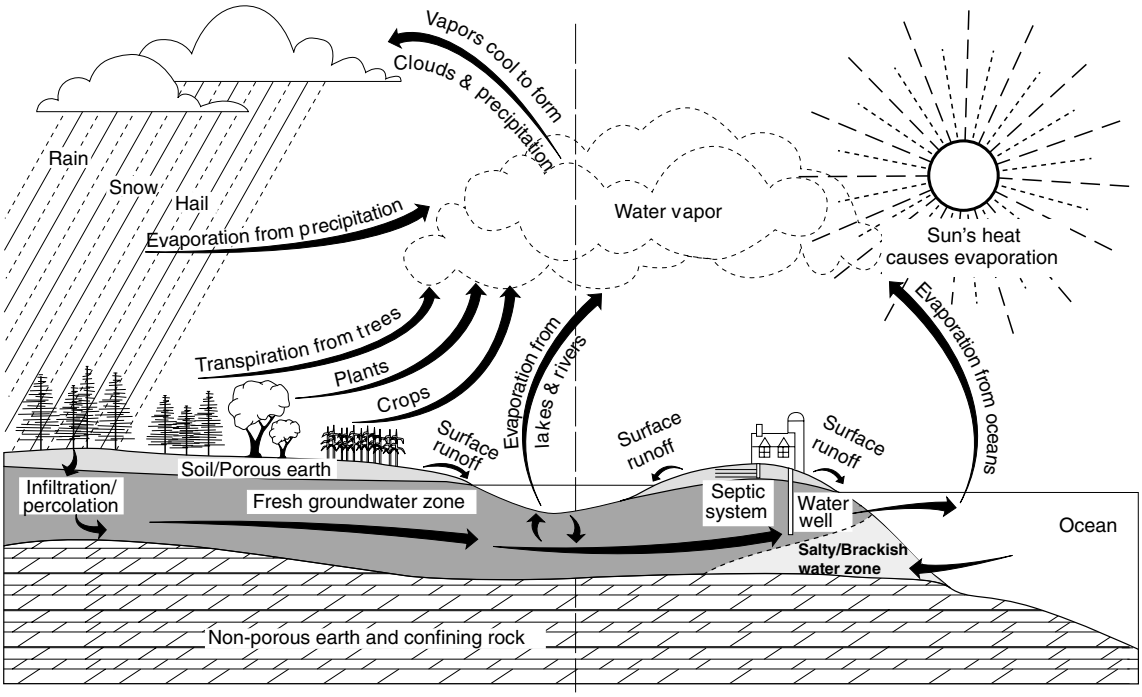

**Figure 4A.1** The hydrologic cycle. (From www.dnr.ohio.gov.)

© 2006 by Taylor & Francis Group, LLC

**Table 4A.1 Hydrologic Effects of Urbanization**

| Change in Land or Water Use | Possible Hydrologic Effect |
|---|---|
| **Transition from Pre-Urban to Early-Urban Stage:** | |
| Removal of trees or vegetation | Decrease in transpiration and increase in storm flow |
| Construction of scattered city-type houses and limited water and sewage facilities | Increased sedimentation of streams |
| Drilling of wells | Some lowering of water table |
| Construction of septic tanks and sanitary drains | Some increase in soil moisture and perhaps a rise in water table. Perhaps some waterlogging of land and contamination of nearby wells or streams from overloaded sanitary drain system |
| **Transition from Early-Urban to Middle-Urban State:** | |
| Bulldozing of land for mass housing, some topsoil removed, farm ponds filled in | Accelerated land erosion and stream sedimentation and aggradation. Increased flood flows. Elimination of smallest streams |
| Mass construction of houses, paving of streets, building of culverts | Decreased infiltration, resulting in increased flood flows and lowered groundwater levels. Occasional flooding at channel constrictions (culverts) on remaining small streams. Occasional overtopping or undermining of banks of artificial channels on small streams |
| Discontinued use and abandonment of some shallow wells | Rise in water table |
| Diversion of nearby streams for public water supply | Decrease in runoff between points of diversion and disposal |
| Untreated or inadequately treated sewage discharged into streams or disposal wells | Pollution of stream or wells. Death of fish and other aquatic life. Inferior quality of water available for supply and recreation at downstream populated areas |
| **Transition from Middle-Urban to Late-Urban Stage:** | |
| Urbanization of area completed by addition of more houses and streets and of public, commercial, and industrial buildings | Reduced infiltration and lowered water table. Streets and gutters act as storm drains, creating higher flood peaks and lower base flow of local streams |
| Larger quantities of untreated waste discharged into local streams | Increased pollution of streams and concurrent increased loss of aquatic life. Additional degradation of water available to downstream users |
| Abandonment of remaining shallow wells because of pollution | Rise in water table |
| Increase in population requires establishment of new water-supply and distribution systems, construction of distant reservoirs diverting water from upstream sources within or outside basin | Increase in local streamflow if supply is from outside basin |
| Channels of streams restricted at least in part to artificial channels and tunnels | Increased flood damage (higher stage for a given flow). Changes in channel geometry and sediment load. Aggradation |
| Construction of sanitary drainage system and treatment plant for sewage | Removal of additional water from the area, further reducing infiltration and recharge of aquifer |
| Improvement of storm drainage system | A definite effect is alleviation or elimination of flooding of basements, streets, and yards, with consequent reduction in damages, particularly with respect to frequency of flooding |
| Drilling of deeper, large-capacity industrial wells | Lowered water-pressure surface of artesian aquifer; perhaps some local overdrafts (withdrawal from storage) and land subsidence. Overdraft of aquifer may result in salt-water encroachment in coastal areas and in pollution or contamination by inferior or brackish waters |
| Increased use of water for air conditioning | Overloading of sewers and other drainage facilities. Possibly some recharge to water table, due to leakage of disposal lines |
| Drilling of recharge wells | Raising of water-pressure surface |
| Waste-water reclamation and utilization | Recharge to groundwater aquifers. More efficient use of water resources |

*Note:* A selected sequence of changes in land and water use associated with urbanization.

## SECTION 4B WATER RESOURCES — UNITED STATES

**Table 4B.2 Distribution of Water in the Continental United States**

| | Volume | | Annual Circulation | Replacement Period |
|---|---|---|---|---|
| | $\times 10^9$ m$^3$ | % | ($\times 10^9$ m$^3$/yr) | (yr) |
| Liquid water | | | | |
| Groundwater | | | | |
| Shallow (<800 m deep) | 63,000 | 43.2 | 310 | >200 |
| Deep (>800 m deep) | 63,000 | 43.2 | 6.2 | >10,000 |
| Freshwater lakes | 19,000 | 13.0 | 190 | 100 |
| Soil moisture (1-m root zone) | 630 | 0.43 | 3,100 | 0.2 |
| Salt lakes | 58 | 0.04 | 5.7 | >10 |
| Average in stream channels | 50 | 0.03 | 1,900 | <0.03 |
| Water vapor in atmosphere | 190 | 0.13 | 6,200 | >0.03 |
| Frozen water, glaciers | 67 | 0.05 | 1.6 | >40 |

**Table 4B.3 Some Purposes of Water-Resources Development**

| Purpose | Description | Type of Works and Measures |
|---|---|---|
| Flood control | Flood-damage abatement or reduction, protection of economic development, conservation storage, river regulation, recharging of groundwater, water supply, development of power, protection of life | Dams, storage reservoirs, levees, floodwalls, channel improvement, floodways, pumping stations, floodplain zoning, flood forecasting |
| Irrigation | Agricultural production | Dams, reservoirs, walls, canals, pumps and pumping plants, weed-control and desilting works, distribution systems, drainage facilities, farmland grading |
| Hydroelectricity | Provision of power for economic development and improved living standards | Dams, reservoirs, penstocks, power plants, transmission lines |
| Navigation | Transportation of goods and passengers | Dams, reservoirs, canals, locks, open-channel improvements, harbor improvements |
| Domestic and industrial water supply | Provision of water for domestic, industrial, commercial, municipal, and other uses | Dams, reservoirs, walls, conduits, pumping plants, treatment plants, saline-water conversion, distribution systems |
| Watershed management | Conservation and improvement of the soil, sediment abatement, runoff retardation, forests and grassland improvement, and protection of water supply | Soil-conservation practices, forest and range management practices, headwater-control structures, debris-detention dams, small reservoirs, and farm ponds |
| Recreational use of water | Increased well-being and health of the people | Reservoirs, facilities for recreational use, works for pollution control, preservation of scenic and wilderness areas |
| Fish and wildlife | Improvement of habitat for fish and wildlife, reduction or prevention of fish or wildlife losses associated with man's works, enhancement of sports opportunities, provision for expansion of commercial fishing | Wildlife refuges, fish hatcheries, fish ladders and screens, reservoir storage, regulation of streamflows, stocking of streams and reservoirs with fish, pollution control, and land management |
| Pollution abatement | Protection or improvement of water supplies for municipal, domestic, industrial and agricultural uses and for aquatic life and recreation | Treatment facilities, reservoir storage for augmenting low flows, sewage-collection systems, legal control measures |
| Insect control | Public health, protection of recreational values, protection of forests and crops | Proper design and operation of reservoirs and associated works, drainage, and extermination measures |
| Drainage | Agricultural production, urban development and protection of public health | Ditches, tile drains, levees, pumping stations, soil treatment |
| Sediment control | Reduction or control of slit load in streams and protection of reservoirs | Soil conservation, sound forest practices, proper highway and railroad construction, desilting works, channel and revetment works, bank stabilization, special dam construction and reservoir operations |
| Salinity control | Abatement or prevention of salt-water contamination of agricultural, industrial, and municipal water supplies | Reservoirs for augmenting low stream-flow, barriers, groundwater recharge, coastal jetties |

## SECTION 4D HYDROLOGIC DATA

*The networks included 63 HBN stations from 1962-95 and 618 NASQAN stations from 1973-95. Stations located outside of the conterminous United States for NASQAN included 13 in Alaska. 8 in Hawaii, 6 in Puerto Rico, and 1 in Guam; HBN stations included 1 each in Alaska and Hawaii.*

**Figure 4D.5** Locations of NASQAN and national hydrologic bench-mark stations in the United States. (From http://water.usgs.gov.)

**Table 4D.9 National Stream Water Quality Accounting Network (NASQAN) — Stations Operated by NASQAN 1996–2000**

| USGA Station ID | Station Name | USGS Office Sampling Station | Latitude | Longitude | Hydrologic Unit Code | Location of Stream Gage and Sampling Site | Drainage Area | Remarks |
|---|---|---|---|---|---|---|---|---|
| **Mississippi River Basin** | | | | | | | | |
| 03216600 | Ohio River at Greenup Dam near Greenup, KY | Louisville, KY | 38°38′48″ | 82°51′38″ | 05090103 | At left bank at downstream end of lock guidewall in lower poolat Greenup locks, 1.1 mi upstream from Grays Branch, 4.7 mi downstream from Little Sandy River, 5.0 mi north of Greenup and at mile 341.5 | 62,000 sq. mi., approximately | |
| 03303280 | Ohio River at Cannelton Dam at Cannelton, IN | Louisville, KY | 37°53′58″ | 86°42′20″ | 05140201 | At Cannelton Dam, 0.7 mi upstream from Indian Creek, 3.3 mi upstream from Lead Creek, and at mile 720.8. Water-quality samples are collected 2.0 mi upstream from discharge station | 97,000 sq. mi, approximately | |
| 03378500 | Wabash River at New Harmony, IN | Paducah, KY | 38°07′55″ | 87°56′25″ | 05120113 | At bridge on U.S. Highway 66 at New Harmony and at mile 51.5 | 29,234 sq. mi | Water discharge obtained from station Wabash river at Mount Carmel, IL (03377500) |
| 03609750 | Tennessee River at Highway 60 near Paducah, KY | Paducah, KY | 37°02′16″ | 88°31′46″ | 06040006 | At auxiliary gaging station at bridge on U.S. Highway 60, 16.3 mi downstream from gagin station, 2.4 mi east of Paducah, and at mile 5.3 | 40,330 sq. mi., 40,200 sq. mi. at gage | Records of daily discharge are taken from gaging station near Paducah (03609500). Flow completely regulated. Barkley-Kentucky Cannal (03438190) diverts water from and to Lake Barkley in the Cumberland River Basin |
| 03612500 | Ohio River at Dam 53 near Grand Chain, IL | Paducah, KY | 37°12′11″ | 89°02′30″ | 05140206 | At auxiliary gaging station, 0.5 mi upstream from Gar Creek, 3.0 mi southwest of Grand Chain, 18.1 mi downstream from gaging station at Metropolis, and at mile 962.2 | 203,100 sq. mi, approximately | Water discharge obtained from Ohio River at Metropolis, IL (03611500). Flow regulated by many dams and reservoirs |
| 05420500 | Mississippi River at Clinton, IA | Iowa City, IA | 41°46′50″ | 90°15′07″ | 07080101 | At river end of 3rd St., at downstream end of ADM repair dock, 10.3 miles upstream from Wapsipinicon River, 4.8 mi upstream from Camanche gage, 5.9 mi downstream from Lock and Dam 13, and at mile 516.6 upstream from Ohio River. Water-quality samples collected at Fulton-Lyons Bridge, 6.4 mi upstream of discharge station | 85,600 sq. mi., approximately, at Fulton-Lyons Bridge in Clinton | |
| 05587455 | Mississippi River below Grafton, IL | Rolla, MO | 38°58′05″ | 90°25′42″ | 07110009 | On left bank 0.2 mi downstream from the mouth of the Illinois River, 15.3 mi above Lock and Dam 26, 23.0 mi above mouth of Missouri River and at mile 218.6 upstream of the mouth o the Ohio River. Water-quality samples collected 4 mi downstream of discharge station | 171,300 sq. mi., approximately | |
| 06185500 | Missouri River near Culbertson, MT | Fort Peck, MT | 48°07′30″ | 104°28′20″ | 10060005 | On right bank at upstream side of bridge on State Highway 16, 2.5 mi southeast of Culbertson, 10 mi downstream from Big Muddy Creek and at river mile 1,620.76 | 91,557 sq. mi | |

© 2006 by Taylor & Francis Group, LLC

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| 06329500 | Yellowstone River near Sidney, MT | Fort Peck, MT | 47°40′42″ | 104°09′22″ | 10100004 | On left bank at Montana-Dakota Utilities Company powerplant, 0.2 mi downstream from bridge on State Highway 23, 2.5 mi south of Sidney, 3.0 mi downstream from Fox Creek, and at river mile 29.2 | 69,103 sq. mi; | |
| 06338490 | Missouri River at Garrison Dam, ND | Bismark, ND | 47°30′08″ | 101°25′50″ | 10130101 | In control structure of Garrison Dam, 2.5 mi west of Riverdale, 14 mi upstream from Knife River, and at mile 1,389.9 | 181,400 sq. mi., approximately | |
| 06440000 | Missouri River at Pierre SD | Pierre, SD | 44°22′23″ | 100°22′03″ | 10140101 | On left bank downstream from Dakota Minnesota and Eastern Railroad bridge, 1.3 mi upstream from Bad River, 5.8 mi downstream from Oahe Dam, and at mile 1066.5. Water-quality samples collected 0.25 mile below Oahe Dam, about 5.55 mile upstream from gaging station. Inflow between these two locations generally are negligible | 243,500 sq. mi., approximately | |
| 06610000 | Missouri River at Omaha, NE | Council Bluffs, IA | 41°15′32″ | 95°55′20″ | 10230006 | On right bank on left side of concrete floodwall, at foot of Douglas Street, 275 ft downstream of Interstate 480 Highway bridge in Omaha and at mile 615.9 Water-quality samples are collected at Interstate-80 bridge, 2.0 miles downstream of gaging station | 322,800 sq. mi. approximately. The 3,959 sq. mi. in the Great Divide basin are not included | Flow regulated by upstream mainstem reservoirs. US Army Corps of Engineers raingage and satellite data collection platform at station |
| 06805500 | Platte River at Louisville, NE | Linclon, NE | 41°00′55″ | 96°09′28″ | 10200202 | On the left bank at the upstream side of bridge on Nebraska Highway 50, 1 mi north of Louisville, and at mile 16.5 | 85,370 sq. mi., appoximately, of which about 71,000 sq. mi., contributes directly to surface runoff | |
| 06934500 | Missouri River at Hermann, MO | Rolla, MO | 38°42′36″ | 91°26′21″ | 10300300 | On downstream side of third pier from right abutment of bridge on State Highway 19 at Hermann, and at mile 97.9 | 524,200 sq. mi., approximately | |
| 07022000 | Mississippi River at Thebes, IL | Rolla, MO | 37°13′00″ | 89°27′50″ | 07140105 | Near center span on downstream side of railroad bridge at Thebes, 5.0 mi downstream from Headwater Diversion Channel and at mile 43.7 above Ohio River | 713,200 sq. mi., approximately | |
| 07263620 | Arkansas River at David D. Terry Lock & Dam below Little Rock, AR | Little Rock, AR | 34°40′07″ | 92°09′18″ | 11110207 | At upper end of upstream wall at David D. Terry Lock and Dam. 10.7 mi downstream from Main Street bridge at Little Rock, and at mile 124.2 | 158,288 sq. mi., of which 22,241 sq. mi. is probably non-contributing | Discharge is from station 07263450, 16.8 mi. upstream |
| 07373420 | Mississippi River near St. Francisville, LA | Baton Rouge, LA | 30°45′30″ | 91°23′45″ | 08070100 | At State Highway 10 ferry crossing, 2.0 mi southwest of St. Francisville and at mile 266.0 | 1,125,300 sq. mi. contributing | Discharge is from Mississippi River at Tarbert Landing, MS, station 07295100 |
| 07381495 | Atchafalaya River at Melville, LA | Baton Rouge, LA | 30°41′26″ | 91°44′10″ | 08080101 | At bridge on Texas and Pacific Railroad in Melville | 93,316 sq. mi | Discharge is from station 07381490, Atachafalaya river at Simmesport, LA |

| USGA Station ID | Station Name | USGS Office Sampling Station | Latitude | Longitude | Hydrologic Unit Code | Location of Stream Gage and Sampling Site | Drainage Area | Remarks |
|---|---|---|---|---|---|---|---|---|
| | | | | | **Rio Grande Basin** | | | |
| 08364000 | Rio Grand at El Paso, TX | Albuquerque, NM | 31°48′10″ | 106°32′25″ | 13030102 | At gaging stati on the downstream side of the Courchesne Bridge, 5.6 mi upstream from the Santa Fe Street-Juarez Avenue bridge betwen El Paso, Tx, and Cd. Juarez, Chihuahua at mile 1,249 and 1.7 mi upstream from the American Dam | 29,267 sq. mi | Discharge measured by International Boundary and Water Commission |
| 08377200 | Rio Grande at Foster Ranch, near Langtry, TX | San Angelo, TX | 29°46′50″ | 101°45′20″ | 13040212 | At gaging station 0.1 mi downstream from Terrell-Val Verde Country line, 16.9 mi from Langtry, and 597.2 midownstream from the American Dam at El Paso | 80,742 sq. mi | Discharge measured by International Boundary and Water Commission |
| 08447410 | Pecos River near Langtry, TX | San Angelo, TX | 29°48′10″ | 101°26′45″ | 13040212 | At gaging station 7.4 mi east of Langtry and 15.0 mi upstream from confluence with Rio Grande | 35,179 sq. mi | Discharge measured by International Boundary and Water Commission |
| 08450900 | Rio Grande below Amistad Dam near Del Rio, TX | San Angelo, TX | 29°25′30″ | 101°02′27″ | 13080001 | 2.2 mi downstream from Amistad Dam and 10 mi northwest of Del Rio | 123,143 sq. mi | Discharge measured by International Boundary and Water Commission |
| 08459200 | Rio Grande at Pipeline Crossing below Laredo, TX | San Angelo, TX | 27°24′01″ | 99°29′18″ | 13080002 | 8.7 Mi (14.0 km) downstream from Texas-Mexican Railway Bridge near Laredo, and at mile 352.69 (567.48 km) | 132,578 | Discharge measured by International Boundary and Water Commission |
| 08461300 | Rio Grande below Falcon Dam, TX | San Angelo, TX | 26°33′25″ | 99°10′05″ | 13090001 | U.S. tailrace at Falcon Dam | 159,270 sq. mi | Discharge measured by International Boundary and Water Commission |
| 08470400 | Arroyo Colorado at Harlingen, TX map of lower basin | San Angelo, TX | 26°10′24″ | 97°42′01″ | 13090002 | On downstream side of northbound service road on U.S. Highways 83&77, about 18 mi from point of main floodway that divides into North Floodway and Arroyo Colorado | 182 sq. mi | Discharge measured by International Boundary and Water Commission |
| 08475000 | Rio Grande near Brownsville, TX map of lower basin | San Angelo, TX | 25°52′35″ | 97°27′15″ | 13090002 | At International Boundary and Water Commission gaging station, 1000 ft downstream from El Jardin pumping plant, 6.8 mi below International bridge between Brownsville and Matamoras, Tamps., Mex. And 48.8 miles above the Gulf of Mexico | 176,333 sq. mi | Discharge measured by International Boundary and Water Commission |
| | | | | | **Colorado River Basin** | | | |
| 09180500 | Colorado River near Cisco, UT | Moab, UT | 38°48′38″ | 109°17′34″ | 14030005 | On left bank 1 mi downstream from Dolores River, 11 mi south of Cisco, 36 mi downstream from Colorado-Utah state line, 97 mi upstream from Green River and 235 mi upstream from San Juan River, at mile 1022.3 from Arizona-Sonora | 24,100 sq. mi., approximately | |

© 2006 by Taylor & Francis Group, LLC

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| 09315000 | Green River at Green River, UT | Moab, UT | 38°59′10″ | 110°09′02″ | 14060008 | On right bank, 1,400 ft upstream from railroad bridge, 0.9 mi southeast of town of Green River, 22.7 mi upstream from San Rafael River, at mile 117.6 upstream from mouth | 44,850 sq. mi. of which about 4,260 sq. mi. (including 3,959 sq. mi. in Great Divide Basin in southern Wyoming) i noncontributing | Flow regulated by Flaming gorge Reservoir (09234400) |
| 09379500 | San Juan River near Bluff, UT | Moab UT | 37°08′49″ | 109°51′52″ | 14080205 | On left bank, 1,600 ft downstream from Gypsum Creek, 1,800 ft upstream from highway bridge, 20 mi southwest of Bluff, at mile 113.5 | 23,000 sq. mi., approximately | No diversions between station and mouth of river. Flow regulated by Navajo Reservoir, NM (09355100) |
| 09380000 | Colorado River at Lees Ferry, AZ | Flagstaff, AZ | 36°51′53″ | 111°35′15″ | 14070006 | In Navajo Indian Reservation, on left bank at head of Marble gorge at lees ferry, just upstream from Paria River, 16 mi downstream of Glen Canyon Dam, 28 mi downstream from UT-AZ state line, and 61.5 mi upstream from Little Colorado River | 111,800 sq. mi., approximately, including 3,959 sq. mi. in Great Divide basin in southern Wyoming, which is noontributing | Many diversions above Lake Powell for irrigation, municipal, and industrial use. No diversion or inflow between Lake Powell and the gage |
| 09404200 | Colorado River above Diamond Creek near Peach Springs, AZ | Flagstaff, AZ | 36°46′25″ | 113°21′46″ | 15010002 | In Lake Mead NRA, on the right bank, 0.6 mi upstream from Diamond Creek, 138 mi downstream from Phantom Ranch, 25 mi north of Peach Springs, 242 mi downstream from Glen Canyon Dam, and 130 mi upstream from Hoover Dam | 149,316 sq. mi., including 3,959 sq. mi. in Great Divide Basin in southern Wyoming nand 697 sq. mi. on the Colorado Plateau | Several unregulated tributaries below Glen Canyon Dam |
| 09421500 | Colorado River below Hoover Dam, AZ-NV | Las Vegas, NV | 36°00′55″ | 114°44′16″ | 15030101 | In powerhouse at downstream side of Hoover Dam. Water-quality samples collected at gaging station 0.3 mi downstream from Hoover Dam | 171,700 sq. mi., approximately, included 3,959 sq. mi. in Great Divide Basin in southern Wyoming, which is non-contributing | |
| 09429490 | Colorado River above Imperial Dam, CA-AZ. schematic map of Lower Colorado River | Yuma, AZ | 32°52′59″ | 114°27′55″ | 15030104 | Imperial Dam is 5 mi upstream from Laguna Dam, 15 mi northeast of Yuma, 90 mi downstream from Palo Verde Dam and 147 mi downstream from Parker Dam. Water-quality samples collected below trash racks at All-American Canal headworks at west end of Imperial Dam | 188,500 sq. mi., approximately, including 3,959 sq. mi. in Great Divide basin in southern Wyoming, which is non-contributing | Records show flow of Colorado River reaching Imperial Dam and are synthesized from records of several other stations |

**Table 4D.10 Water Quality Characteristics Are Measured as NASQAN Stations**

| Code | Parameter | Description |
|---|---|---|
| 4S | 5S | 75S |
| MAJ | 00010 | Water temperature (degree Celsius) |
| MAJ | 00061 | Discharge, instantaneous (cubic feet per second) |
| MAJ | 00076 | Turbidity (nephelometric turbidity units, NTU) |
| MAJ | 00095 | Specific conconductance (microsiemens per centimeter at 25 Celsius) |
| MAJ | 00300 | Oxygen, dissolved (milligrams per liter) |
| MAJ | 00400 | Ph, field (standard units) |
| MAJ | 00452 | Carbonate, filtered (milligrams per liter as $CO_3$) |
| MAJ | 00453 | Bicarbonate, filtered (milligrams per liter as $HCO_3$) |
| MAJ | 00608 | Ammonia–nitrogen (milligrams per liter as N) |
| MAJ | 00613 | Nitrite–nitrogen (milligrams per liter as N) |
| MAJ | 00623 | Ammonia-plus-organic-nitrogen, dissolved (milligrams per liter as N) |
| MAJ | 00625 | Ammonia-plus-organic-nitrogen (milligrams per liter as N) |
| MAJ | 00631 | Nitrite-plus-nitrate-nitrogen, dissolved (milligrams per liter as N) |
| MAJ | 00665 | Phosphorus, total (milligrams per liter as P) |
| MAJ | 00666 | Phosphorus, dissolved (milligrams per liter as P) |
| MAJ | 00671 | Orthophosphate-phosphorus (milligrams per liter as P) |
| MAJ | 00681 | Carbon, organic, dissolved (milligrams per liter as C) |
| MAJ | 00689 | Carbon, organic, suspended (milligrams per liter as C) |
| MAJ | 00915 | Calcium, dissolved (milligrams per liter as Ca) |
| MAJ | 00925 | Magnesium, dissolved (milligrams per liter as Mg) |
| MAJ | 00930 | Sodium, dissolved milligrams per liter as Na) |
| MAJ | 00935 | Potassium, dissolved (milligrams per liter as K) |
| MAJ | 00940 | Chloride, dissolved (milligrams per liter as Cl) |
| MAJ | 00945 | Sulfate, dissolved (milligrams per liter as $SO_4$) |

**Table 4D.10 (Continued)**

| Code | Parameter | Description |
|---|---|---|
| PEST | 04037 | Prometon, dissolved (micrograms per liter) |
| PEST | 04040 | Desethyl atrazine, dissolved (micrograms per liter) |
| PEST | 04041 | Cyanazine, dissolved (micrograms per liter) |
| PEST | 04095 | Fonofos, dissolved (micrograms per liter) |
| PEST | 22703 | Uranium, natural, dissolved (micrograms per liter) |
| PEST | 34253 | Alpha BHC, dissolved (micrograms per liter) |
| PEST | 34653 | P, P′ DDE, dissolved (micrograms per liter) |
| PEST | 38933 | Chlorpyrifos, dissolved (micrograms per liter) |
| PEST | 39341 | Lindane, dissolved (micrograms per liter) |
| PEST | 39381 | Dieldrin, dissolved (micrograms per liter) |
| PEST | 39415 | Metolachlor, dissolved (micrograms per liter) |
| PEST | 39532 | Malathion, dissolved (micrograms per liter) |
| PEST | 39542 | Parathion, dissolved (micrograms per liter) |
| PEST | 39572 | Diazinon, dissolved (micrograms per liter) |
| PEST | 39632 | Atrazine, dissolved (micrograms per liter) |
| PEST | 46342 | Alachlor, dissolved (micrograms per liter) |
| PEST | 49260 | Acetochlor, dissolved (micrograms per liter) |
| PEST | 82630 | Metribuzin, dissolved (micrograms per liter) |
| PEST | 82660 | Diethylanilene, dissolved (micrograms per liter) |
| PEST | 82661 | Trifluralin, dissolved (micrograms per liter) |
| PEST | 82663 | Ethalfluralin, dissolved (micrograms per liter) |
| PEST | 82664 | Phorate, dissolved (micrograms per liter) |
| PEST | 82665 | Terbacil, dissolved (micrograms per liter) |
| PEST | 82666 | Linuron, dissolved (micrograms per liter) |
| PEST | 82667 | Methyl parathion, dissolved (micrograms per liter) |
| PEST | 82668 | EPTC, dissolved (micrograms per liter) |
| PEST | 82669 | Pebulate, dissolved (micrograms per liter) |
| PEST | 82670 | Tebuthiuron, dissolved (micrograms per liter) |
| PEST | 82671 | Molinate, dissolved (micrograms per liter) |
| PEST | 82672 | Ethoprop, dissolved (micrograms per liter) |
| PEST | 82673 | Benfluralin, dissolved (micrograms per liter) |
| PEST | 82674 | Carbofuran, dissolved (micrograms per liter) |
| PEST | 82675 | Terbufos, dissolved (micrograms per liter) |
| PEST | 82676 | Pronamide, dissolved (micrograms per liter) |
| PEST | 82677 | Disultoton, dissolved (micrograms per liter) |
| PEST | 82678 | Triallate, dissolved (micrograms per liter) |
| PEST | 82679 | Propanil, dissolved (micrograms per liter) |
| PEST | 82680 | Carbaryl, dissolved (micrograms per liter) |
| PEST | 82681 | Thiobencarb, dissolved (micrograms per liter) |
| PEST | 82682 | DCPA, dissolved (micrograms per liter) |
| PEST | 82683 | Pendimethalin, dissolved (micrograms per liter) |
| PEST | 82684 | Napropamide, dissolved (micrograms per liter) |
| PEST | 82685 | Propargite, dissolved (micrograms per liter) |
| PEST | 82686 | Azinphos-methyl, dissolved (micrograms per liter) |
| PEST | 82687 | Permethrin, dissolved (micrograms per liter) |
| PEST | 91063 | Diazinon, D-10 surrogate (percent) |
| PEST | 91065 | HCH, alpha, D-6 surrogate (percent) |
| PEST | 99108 | Spike volume (milliters) |
| PEST | 99856 | Sample volume (milliters) |

*Note:* ASCII text file containing parameter code definitions for constituents.
Analyzed by the USGS National Stream Quality Accounting Network (1996–2000).
File is tab-delimited.
The first header contains column names.
The second header contains column formats.
Code = Constituent group, defined as follows:
MAJ = instantaneous Q, field parameters, major ions, nutrients, suspended sediment
SEDCHEM = sediment chemistry
TE = trace elements (dissolved)
PEST = pesticides
Parameter = WATSTORE code
Description = Constituent name (units of measure)

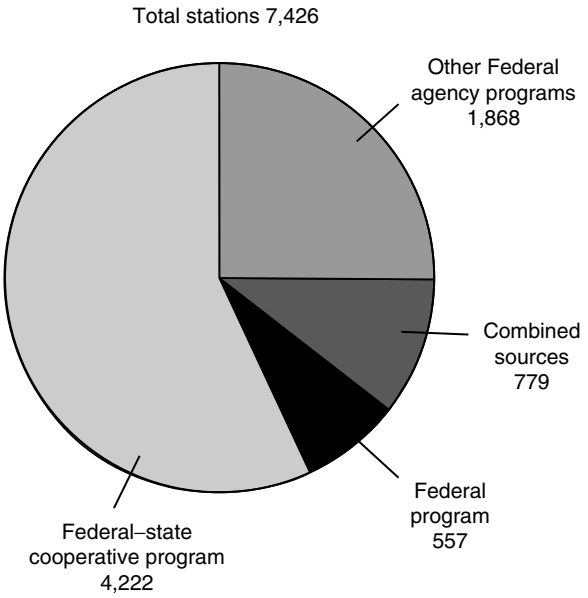

**Figure 4D.7** Sources of funds for operation of continuous surface-water discharge stations. (From U.S. Geological Survey Water Data Program, http://water.usgs.gov.)

**Table 4D.11 Hydrologic and Related Data Collection Networks in the United States**

| Type of Network | Number of Stations |
|---|---|
| Automatic meterological observing stations (full parameter); temperature, dew point, wind, pressure, precipitation) | 92 |
| National weather service synoptic and basic observation stations (high quality observations for basic weather program) | 67 |
| Cooperative station services (observations by lay persons): | |
| Temperature and precipitation | 5,568 |
| Precipitation only — daigeoly | 3,200 |
| Precipitation only — storage | 32 |
| Hourly precipitation stations equipped with recording precipitation gages | 3,205 |
| Cooperative stations equipped with both recording and nonrecording precipitations gages | 1,995 |
| Crop reporting stations | 566 |
| River and/or rainfall reporting stations | |
| River stage reports only | 998 |
| Rainfall reports only | 3,656 |
| River stage and rainfall reports | 1,069 |
| Evaporation storage | 448 |
| Reference Climatological Stations | 21 |
| Automated Hydrologic Observing System (AHOS) — river and rainfall data for flood forecasting | |
| AHOS/T[a] | 506 |
| AHOS/S[b] | 75 |
| Special reporting stations | 293 |
| Cooperative station data published | |
| Temperature and precipitation | 8,256 |
| Precipitation only | 3,055 |
| Evaporation | 431 |
| Soil temperature | 308 |
| Miscellaneous (snow density, special meteorological, etc) | 473 |

**Table 4D.12 USGS Programs Managed by the Water Resources Discipline**

- *Cooperative Water Program* — The Cooperative Program, a partnership between the USGS and state and local agencies, provides information that forms the foundation for many of the Nation's water resources management and planning activities
- *National Streamflow Information Program* (NSIP) — The National Streamflow Information Program (NSIP) is a conceptual plan developed by the USGS for a new approach to the acquisition and delivery of streamflow information
- *National Water Quality Assessment Program* (NAWQA) — Since 1991, USGS scientists with the NAWQA program have been collecting and analyzing data and information in more than 50 major river basins and aquifers across the Nation. The goal is to develop long-term consistent and comparable information on streams, groundwater, and aquatic ecosystems to support sound management and policy decisions. The NAWQA program is designed to answer these questions:
  1. What is the condition of our Nation's streams and groundwater?
  2. How are these conditions changing over time?
  3. How do natural features and human activities affect these conditions?
- *Toxic Substances Hydrology (Toxics) Program* — provides unbiased earth science information on the behavior of toxic substances in the Nation's hydrologic environments. The information is used to avoid human exposure, to develop effective cleanup strategies, and to prevent further contamination
- *Groudwater Resources Program* — The Groundwater Resources Program encompasses regional studies of groundwater systems, multidisciplinary studies of critical groundwater issues, access to groundwater data, and research and methods development. The program provides unbiased scientific information and many of the tools that are used by Federal, State, and local management and regulatory agencies to make important decisions about the Nation's groundwater resources
- *Hydrologic Research and Development* — Hydrologic Research and Development focuses on long-term investigations that integrate hydrological, geological, chemical, climatic, and biological information related to water resources issues. The program provides the primary support for the *National Research Program* (NRP) in the hydrologic sciences and for *Water, Energy, and Biogeochemical Budgets (WEBB) program*
- *State Water Resoruces Research Institute Program* — A matching grant program to support water resources research, education, and information transfer at the 54 university based Water Resources Research Institutes. This program includes the National Institutes for Water Resources USGS *Student Internship Program*

Subprograms:

- *Water Information Coordination Program* (WICP) — ensures the availability of water information required for effective decision making for natural resources management and environmental protection and to do it cost effectively
- *Drinking Water Programs* — The wide range of monitoring, assessment, and research activities conducted by the USGS to help understand the protect the quality of our drinking water resources is described on these pages. These studies are often done in collaboration with other federal, state, tribal, and local agencies
- *National Stream Quality Accounting Network* (NASQAN) — Focus is on monitoring the water quality of four of the Nation's largest river systems — the Mississippi (including the Missouri and Ohio), the Columbia, the Colorado, and the Rio Grande
- *Hydrologic Benchmark Network* (HBN) — was established in 1963 to provide long-term measurements of streamflow and water quality in areas that are minimally affected by human activities. These data were to be used to study time trends and to serve as controls for separating natural from artificial changes in other streams. The network has consisted of as many as 58 drainage basins in 39 State
- *National Atmospheric Deposition Program/National Trends Network* (NADP/NTN) — A nationwide network of precipitation monitoring sites. The first sites in the network were established in 1978. The network currently consists of approximately 200 sites
- *National Research Program* (NRP) — conducts basic and problem-oriented hydrologic research in support of the mission of the U.S. Geological Survey (USGS)
- *National Water Summary Program* — a series of publications designed to increase public understanding of the nature, geographic distribution, magnitude, and trends of the Nation's water resources. It is often referred to as the USGS "encyclopedia of water"
- *National Water-Use Program* — examines the withdrawal, use, and return flow of water on local, state, and national levels
- *USGS Environmental Affairs Program* — provides guidance and information on the National Environmental Policy Act and other environmental issues
- *Water, Energy, and Biogeochemical Budgets* (WEBB) — understands the processes controlling water, energy, and biogeochemical fluxes over a range of temporal and spatial scales and to understand the interactions of these processes, including the effect of atmospheric and climatic variables
- *National Irrigation Water Quality Program* — A Department of Interior program to identify and address irrigation-induced water quality and contamination problems related to Department of Interior water projects in the west

International Programs:

- *Cyprus Water Resources Database Development* — This project met the USGS goal of supporting U.S. foreign policy. It was requested by the U.S. Ambassador to Cyprus and coordinated closely through the U.S. Department of State. It took 5 years of negotiations with senior Cypriot officials, Embassy staff, U.S. Department of State, and selected United Nations offices to design and implement this project. This project enabled water managers on Cyprus to manage their limited water resources, which will directly contribute to enhancement and protection of the quality of life for Cypriot citizens
- *Public Awareness and Water Conservation* — The project, which began in 1996, is part of the Middle East Peace Process and is one of several projects sponsored by the Multilateral Working Group on Water Resources. The U.S. Department of State requested the USGS to undertake this activity and has provided political guidance throughout the project. The project meets the USGS goal of supporting U.S. foreign policy and fostering outreach and public awareness activities

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 4D.12 (Continued)**

- *Regional Water Data Banks* — The Executive Action Team Multilateral Working Group on Water Resoruces, Water Data Banks Project consists of a series of specific actions to be taken by the Israelis, Jordanians, and Palestinians that are designed to foster the adoption of common, standardized data collection and storage techniques among the Parties, improve the quality of the water resources data collected in the region, and to improve communication among the scientific community in the region
- *Ukraine Streamflow Project* — Floods are among the most frequent and costly natural disasters in terms of human hardship and economic loss. In Ukraine, two major floods (one in 1998 and one in 2001) have occurred in the Tisa River Basin in the last 5 years. Both floods caused several fatalities, damaged or destroyed several thousand homes, destroyed bridges and roads, and created severe personal and economic hardship for the residents of Zakarpattia Oblast in western Ukraine. Near real-time streamflow data can be used to forecast and manage floods and improve public safety
- *Groundwater Research Program for the Emirate of Abu Dhabi, United Arab Emirates* — Since 1988 the USGS has been partnering with the National Drilling Company (NDC) of the Abu Dhabi Emirate to collect information on the groundwater resources of the Emirate, to conduct research on the hydrology of the arid environment, to provide training in water resources investigations, and to document the results of the cooperative work in scientific publications
- *Geologic, Hydrologic, and Geochemical Characterization of the Deep Groundwater Aquifer System In the Bengal Delta of Bangladesh* — The USGS is currently conducting research on the deeper aquifer system in Bangladesh in areas associated with high levels of arsenic in the shallow groundwater. This work is an integral step in the characterization of the hydrogeolocial framework needed to define the potential for developing safe and sustainable groundwater sources
- *Botswana–Village Flood Watch* — The Village Flood Watch project, which was completed in 2002, was designed to help establish an early-warning system for potential flooding events by adding or upgrading six gauging stations to near real-time capabilities and providing training on hydrologic runoff modeling
- *Jordan Groundwater Management* — The project objective is to enhance current Jordanian technical capacities for hydrogeologic data and information development, management and analysis; development and use of groundwater management models; and joint design and conduct of outreach workshops and meetings to increase public understanding of the benefits of local efforts in groundwater management and conservation
- *Summary of Palestinian Hydrologic Data 2000* — The project provides a critical tool to the USAID Water Resources Program including several investigative, development, and construction projects, in the West Bank and Gaza, designed to comprehensively develop, manage, and protect water resources. This activity demonstrates the USGS leadership role in the natural sciences and confirms the mission of providing scientific information to manage natural resources to enhance and protect the quality of life

## SECTION 4E INTERCEPTION

**Table 4E.15 Interception by Trees**

| Type or Species | Age or Size | Place in Succession | Locality | Interception (Percent) |
|---|---|---|---|---|
| Hemlock | Mature | Climax | Connecticut | 48 |
| Douglas fir | 25 yr | Climax | Washington | 43 |
| Hemlock | Mature | Climax | New Hampshire | 38 |
| Spruce-fir | Mature | Climax | Maine | 37 |
| Hemlock | Mature | Climax | Adirondacks, New York | 34 |
| Douglas fir | Mature | Climax | Washington | 34 |
| Hemlock | Mature | Climax | Ithaca, New York | 31 |
| Spruce — fir — paper birch | Mature | Climax | Maine | 26 |
| White pine — hemlock | Mature | Climax | Massachusetts | 24 |
| Western white pine — western hemlock | Overmature | Climax | Idaho | 21 |
| Maple — beech | Mature | Climax | New York | 43 |
| Mixed | Mature | Climax | New York | 40 |
| Maple — hemlock | Mature, cutover | Climax | Wisconsin | 25 |
| Beech — birch — maple | Mature | Climax | Ontario | 21 |
| Ponderosa pine | Mature | Preclimax | Arizona | 40 |
| Lodgepole pine | Mature | Preclimax | Colorado | 32 |
| Ponderosa pine | Mature | Preclimax | Idaho | 27 |
| Jeffrey pine | Mature | Preclimax | Southern California | 26 |
| Lodgepole pine | 32 yr | Preclimax | Colorado | 23 |
| Ponderosa pine | Mature | Preclimax | Idaho | 22 |
| Ponderosa pine | Young | Pioneer | Colorado | 18 |
| Calif, scrub oak | 6 ft | — | Southern California | 31 |
| Mixed brush | Mature | Preclimax | North Fork, California | 19 |
| White pine — red pine | 40 yr | Preclimax | Ontario | 37 |
| Jack pine | 50 yr | Pioneer | Wisconsin | 21 |
| Shortleaf pine | 45 yr | Pioneer | North Carolina | 16 |
| Quaking aspen | 32 yr | Pioneer | Colorado | 16 |
| Chaparral, mixed | 6 ft | | Southern California | 17 |
| Maple — hemlock | Mature (after leaf fall) | Climax (under-stocked) | Wisconsin | 16 |
| Hemlock | Mature | Climax | New York | 13 |
| Oak-pine | Open, second growth | Preclimax | New Jersey | 13 |
| Ponderosa — lodgepole pine | 25 ft | Preclimax | Idaho | 8 |
| Beech — maple | Mature | Climax | New York | 6 |
| Chamise | 6 ft | Pioneer | Southern California | 3 |

**Table 4G.28 Values of Runoff Coefficient in the Rational Formula**

| Types of Drainage Area | Runoff Coefficient (*C*) | Type of Drainage Area | Runoff Coefficient (*C*) |
|---|---|---|---|
| Lawns: | | Industrial: | |
| Sandy soil, flat, 2% | 0.05–0.10 | Light areas | 0.50–0.80 |
| Sandy soil, average, 2–7% | 0.10–0.15 | Heavy areas | 0.60–0.90 |
| Sandy soil, steep, 7% | 0.15–0.20 | Parks, cemeteries | 0.10–0.25 |
| Heavy soil, flat, 2% | 0.13–0.17 | Playgrounds | 0.20–0.35 |
| Heavy soil, average, 2–7% | 0.18–0.22 | Railroad yard areas | 0.20–0.40 |
| Heavy soil, steep, 7% | 0.25–0.35 | Unimproved areas | 0.10–0.30 |
| Business: | | Streets: | |
| Downtown areas | 0.70–0.95 | Asphaltic | 0.70–0.95 |
| Neighborhood areas | 0.50–0.70 | Concrete | 0.80–0.95 |
| Residential: | | Brick: | 0.70–0.85 |
| Single-family areas | 0.30–0.50 | Drives and walks | 0.75–0.85 |
| Multi units, detached | 0.40–0.60 | Roofs | 0.75–0.95 |
| Multi units, attached | 0.60–0.75 | | |
| Suburban | 0.25–0.40 | | |
| Apartment dwelling areas | 0.50–0.70 | | |

*Note:* Formula is applicable to drainage areas less than about 5000 acres and has the form $Q = CiA$ where $Q$ is peak discharge in cfs, $C$ is a dimensionless runoff coefficient, $i$ is rainfall intensity for the time of concentration in inches per hour, and $A$ is drainage area in acres.

**Table 4G.29 Watershed Characteristics for Determining Runoff Coefficient in the Rational Formula**

| Designation of Watershed Characteristics | Runoff-Producing Characteristics | | | |
|---|---|---|---|---|
| | **100 Extreme** | **75 High** | **50 Normal** | **25 Low** |
| Relief | (40) Steep, rugged terrain, with average slopes generally above 30% | (30) Hilly, with average slopes of 10–30% | (20) Rolling, with average slopes of 5–10% | (10) Relatively flat land, with average slopes of 0–5% |
| Soil infiltration | (20) No effective soil cover, either rock or thin soil mantle of negligible infiltration capacity | (15) Slow to take up water; clay or other soil of low infiltration capacity, such as heavy gumbo | (10) Normal; deep loam with infiltration about equal to that of typical prairie soil | (5) High; deep sand or other soil that takes up water readily and rapidly |
| Vegetal cover | (20) No effective plant cover; bare or very sparse cover | (15) Poor to fair; clean-cultivated crops or poor natural cover; less than 10% of drainage area under good cover | (10) Fair to good; about 50% of drainage area in good grassland, woodland, or equivalent cover; not more than 50% of area in clean-cultivated crops | (5) Good to excellent; about 90% of drainage area in good grassland, woodland, or equivalent cover |
| Surface storage | (20) Negligible; surface depressions few and shallow; drainage-ways steep and small; no ponds or marshes | (15) Low; well-defined system of small drainage-ways; no ponds or marshes | (10) Normal; considerable surface-depression storage; drainage system similar to that of typical prairie lands; lakes, ponds and marshes less than 2% of drainage area | (5) High; surface-depression storage high; drainage system not sharply defined; large flood-plain storage or a large number of lakes, ponds, or marshes |

*Note:* For each watershed characteristic in left column select appropriate descriptive box; add four numerical values given in parentheses to obtain runoff coefficient as a percentage.

*Note:* Values are time in minutes for water to travel from the most distant point in a watershed to the watershed outlet. Length is distance along the main stream from the watershed outlet to the most distant ridge; height is difference in elevation between the watershed outlet and the most distant ridge.

**Table 4G.31 Total Impervious Area for Specific Land-Use Categories**

| | Typical Values of Total Impervious Area (Precent) | | |
|---|---|---|---|
| **Land-Use Category** | **Low** | **Intermediate** | **High** |
| Single-family residential[a] | 16 | 27 | 45 |
| Multifamily residential[b] | 50 | 60 | 70 |
| Commercial[c] | 80 | 88 | 95 |
| Industrial[d] | 50 | 75 | 90 |
| Public facilities[e] | 50 | 60 | 75 |
| Parks and undeveloped land[f] | 0 | 1 | 3 |

[a] Single-family residential — Single-family dwellings predominate.
[b] Multifamily residential — Multiple-family units predominate. These include duplexes, apartment buildings, and condominiums.
[c] Commercial — Zone consisting of various types of business.
[d] Industrial — Manufacturing complexes, railroad yards, and large utilities.
[e] Public facilities — School, hospitals, churches, airports, and other public buildings.
[f] Parks and undeveloped land-parks, forests, and open undeveloped land.

**Table 4H.36 Selected Quantitative Effects of Man's Activities on Surface Erosion**

| Initial Status of Land Use | Type of Disturbance | Magnitude of Specific Disturbance[a] |
|---|---|---|
| Forestland | Planting row crops | 100 to 1,000 Times |
| Grassland | Planting row crops | 20 to 100 Times |
| Forestland | Building logging roads | 220 Times |
| Forestland | Woodcutting and skidding | 1.6 Times |
| Forestland | Fire | 7 to 1,500 Times |
| Forestland | Mining | 1,000 Times |
| Row crop | Construction | 10 Times |
| Pastureland | Construction | 200 Times |
| Forestland | Construction | 2,000 Times |

[a] Relative magnitude of surface erosion from disturbed surface, assuming "I" for the initial status. The first row of the table, for example, indicates that transforming a forestland into row crops may increase surface erosion 100 to 1000 times.

**Table 4H.39 Dissolved and Suspended Sediment Loads in Selected Rivers of the United States**

| River and Location | Elevation (ft) | Drainage Area (sq mi) | Average Discharge, *Q* (cfs) | Discharge + Drainage Area (cfs/sq mi) | Years of Record in Sample[a] | Average Suspended Load | Average Dissolved Load (millions of tons/yr) | Total Average Suspended and Dissolved Load | Total Average Load + Drainage Area (tons sq mi/yr) | Dissolved Load as Percent of Total Load (%) |
|---|---|---|---|---|---|---|---|---|---|---|
| Little Colorado at Woodruff, Arizona | 5,129 | 8,100 | 63.3 | 0.0078 | 6 | 1.6 | 0.02 | 1.62 | 199 | 1.2 |
| Canadian River near Amarillo, Texas | 2,989 | 19,445 | 621 | 0.032 | 1 | 6.41 | 0.124 | 6.53 | 336 | 1.9 |
| Colorado River near San Saba, Texas | 1,096 | 30,600 | 1,449 | 0.047 | 5 | 3.02 | 0.208 | 3.23 | 105 | 6.4 |
| Bighorn River at Kane, Wyoming | 3,609 | 15,900 | 2,391 | 0.150 | 1 | 1.60 | 0.217 | 1.82 | 114 | 12 |
| Green River at Green River, Utah | 4,040 | 40,600 | 6,737 | 0.166 | 26–20 | 19 | 2.5 | 21.5 | 530 | 12 |
| Colorado River near Cisco, Utah | 4,090 | 24,100 | 8,457 | 0.351 | 25–20 | 15 | 4.4 | 19.4 | 808 | 23 |
| Iowa River at Iowa City, Iowa | 627 | 3,271 | 1,517 | 0.464 | 3 | 1.184 | 0.485 | 1.67 | 510 | 29 |
| Mississippi River at Red River Landing, Louisiana | | 1,144,500[b] | 569,500[b] | 0.497 | 3 | 284 | 101.8 | 385.8 | 337 | 26 |
| Sacramento River at Sacramento, California | 0 | 27,000[c] | 25,000[c] | 0.926 | 3 | 2.85 | 2.29 | 5.14 | 190 | 44 |
| Flint River near Montezuma, Georgia | 256 | 2,900 | 3,528 | 1.22 | 1 | 0.400 | 0.132 | 0.53 | 183 | 25 |
| Juniata River near New Port, Pennsylvania | 364 | 3,354 | 4,329 | 1.29 | 7 | 0.322 | 0.566 | 0.89 | 265 | 64 |
| Delaware River at Trenton, New Jersey | 8 | 6,780 | 11,730 | 1.73 | 9–4 | 1.003 | 0.830 | 1.83 | 270 | 45 |

[a] Computation of load, dissolved or suspended, depends on discharge for same period. Years of record pertain to number of years used for related values of discharge and of suspended and dissolved load. Where two figures are shown, the first is for suspended load and the second is for dissolved load.
[b] From USGS records for Vicksburg, Mississippi station.
[c] Estimated.

**Table 4H.40 Discharge of Suspended Sediment to the Coastal Zone by 10 Major rivers of the United States, About 1980**

| Rivers | Average Annual Sediment Discharge (million ton/yr) |
|---|---|
| Rivers that discharge the largest sediment loads: | |
| Mississippi | 230[a] |
| Copper | 80 |
| Yukon | 65 |
| Susitna | 25 |
| Eel | 15 |
| Brazos | 11 |
| Columbia: | |
| Before Mount St. Helens eruption | 10 |
| Since Mount St. Helens eruption-approximate | 40 |
| Rivers with large drainage areas: | |
| St. Lawrence | 1.5 |
| Rio Grande | 0.8 |
| Colorado | 0.1 |

[a] Includes Atchafalaya River.

**Table 4H.43 Matrix of Laws Relating to Beach Nourishment**

| Law | Provisions | Relevance |
|---|---|---|
| P.L. 71-520 of 1930 | Authorized the USACE to conduct shoreline erosion control studies (not construction) in cooperation with state governments; the Beach Erosion Board (BEB) was also established | First federal involvement in shoreline protection activities |
| P.L. 79-727 of 1946 | Expanded the use of federal funds to now include one third of construction costs in addition to the studies for projects along publicly owned shores | Expanded federal involvement as a result of major hurricanes |
| Submerged Lands Act of 1953 (43 USC 1301 and following) | Gave coastal states authority over the resources of submerged lands from the shore out to three miles seaward | Affected the availability of offshore sand for beach nourishment |
| Outer Continental Shelf Lands Act of 1953 (43 USC 1331 and following) | Provided for the federal government to manage the mineral resources of the OCS lying on or under the seabed that extends seaward from state waters out to the edge of the shelf | Affected the availability of offshore sand for beach nourishment |
| P.L. 84-826 of 1956 | Expanded the authority for federal shore protection to include privately owned shores where substantial public benefits would result; also defined periodic renourishment as construction for the protection of shores for a period of usually ten years | Federal authority now included shore protection on privately owned shores where public benefits result |
| River and Harbor Act (33 USC 401 and following) of 1962 (P.L. 87-874) and 1968 (P.L. 980-483) | Under Section 103 (33 USC 426g), the Corps was authorized to participate in the cost of protecting the shores of publicly owned property and private property where public benefits result; increased federal aid from one third to 100 percent for shore protection study costs leading to authorization; also increased federal participation in the cost of beach erosion and shore protection to 50 percent of the construction cost when the beaches were publicly owned or used, and 70 percent for seashore parks and conservation areas when certain conditions of ownership and use of the beaches were met | Resulted in a large number of studies and subsequent authorizations in the 1950's and 60's; Required USACE to fund mitigation for downdrift erosion caused by federal navigation works |

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 4H.43 (Continued)**

| Law | Provisions | Relevance |
|---|---|---|
| | Under Section 111 (33 USC 426i), mitigation could be conducted for shoreline erosion that results from federal navigation works | |
| P.L. 88-172 of 1963 | Established the Coastal Engineering Research Board (CERB) and the Coastal Engineering Research Center (CERC), replacing the Beach Erosion Board | Resulted from increased need for additional engineering and study in the area of beach erosion, coupled with increased beach development and more demand for erosion relief from the federal government |
| Coastal Zone Management Act of 1972 (16 USC 1451 and following) (P.L. 92-583) | Required all federal agencies with activities directly affecting the coastal zone, or with development projects within the zone, to assure that those activities or projects are consistent with the approved state Coastal Zone Management Program | Established a national program to assist the states in comprehensively managing the nation's coastal resources through wise management practices. Encouraged coastal zone management and provided grants (Section 306A) for maintaining coastal areas |
| Coastal Barrier Resources Act of 1982 (16 USC 3501 and following) (P.L. 97-384) | Established the Coastal Barrier Resources System (CBRS); areas in the CBRS may no longer receive federal financial assistance for new construction or improvements. The CBRS was greatly expanded with the passage of the Coastal Barrier Improvement Act (CBIA) of 1990 (P.L. 101-591) | The intent of the law was to discourage development. The law applied only to areas within the defined CBRS |
| Water Resources Development Act (33 USC 2201 and following) of 1976 (P.L. 94-587), 1986 (P.L. 99-662), 1988 (P.L. 100-676), 1992 (P.L. 102-580), 1996 (P.L. 104-303), 1999 (P.L. 106-53), and 2000 (P.L. 106-541) | Established a broad congressional policy to encourage conservation efforts among federal, state, and local governments. Authorized the Secretary of the Army to construct, operate, and maintain any water resource development project. The resource development projects over which the USACE currently maintains jurisdiction are navigation, flood control, shore protection, and beach renourishment projects | Authorized beach nourishment projects. Set cost-sharing percentage, with a general trend to reduce federal percentage and increase non-federal percentage (will be 50/50 by 2003) |
| Shore Protection Act of 1996 (Section 227 of the WRDA of 1996) (33 USC 2601 and following) | Recommended funding for shore protection project studies and construction | Rejected the Administration's position of not authorizing funding for new projects |
| National Environmental Policy Act of 1969 (42 USC 4321 and following) | Required federal agencies to evaluate the environmental impacts associated with major actions they fund, support, permit, or implement | Required that actions be the least environmentally damaging practicable alternative. Most beach nourishment projects have the potential for adverse impacts and will trigger a required NEPA analysis |
| Clean Water Act (33 USC 1251 and following) | Under section 404, a permit was required for the discharge of dredged or fill materials into the waters of the U.S. The USACE has the permitting authority for the 404 program | Proponents of beach nourishment projects must obtain a Section 404 permit |
| Endangered Species Act (16 USC 1531 and following) | Federal agencies must review actions they undertake or support to determine whether they may affect endangered species or their habitats; agency must consult with the USFWS | Significant impacts on beach nourishment projects; limitations on construction typically exclude construction in certain seasons, for example, the nesting season for sea turtles on the Atlantic and Gulf Coasts. There are short-term environmental impacts associated with both removing the sand from the source and depositing it onto the beach |
| National Historic Preservation Act (16 USC 470 and following) | Federal agencies must consider the effects of their undertakings (including the issuance of permits, the expenditure of federal funding, and the initiation of federal projects) on historic resources that the either eligible for listing or are listed on the National Register of Historic Places | Areas worthy of historic preservation must be avoided in the beach nourishment site selection process |

**Table 4H.47 Permissible Velocities for Channels Lined with Vegetation**

| Cover | Slope Range[a] (Percent) | Permissible Velocity | |
|---|---|---|---|
| | | Erosion Resistant Soils (ft/sec) | Easily Eroded Soils (ft/sec) |
| | 0–5 | 8 | 6 |
| Bermudagrass | 5–10 | 7 | 5 |
| | over 10 | 6 | 4 |
| Buffalograss | 0–5 | 7 | 5 |
| Kentucky bluegrass | 5–10 | 6 | 4 |
| Smooth brome | over 10 | 5 | 3 |
| Blue grama | | | |
| Grass mixture | 0–5[a] | 5 | 4 |
| | 5–10 | 4 | 3 |
| Lespedeza sericea | | | |
| Weeping lovegrass | | | |
| Yellow bluestem | | | |
| Kudzu | 0–5[b] | 3.5 | 2.5 |
| Alfalfa | | | |
| Crabgrass | | | |
| Common lespedeza[c] | | | |
| Sudangrass[c] | 0–5[d] | 3.5 | 2.5 |

*Note:* Use velocities exceeding 5 feet per second only where good covers and proper maintenance can be obtained. Values apply to average, uniform stands of each type of cover.

[a] Do not use on slopes steeper than 10 percent except for side slopes in a combination channel.
[b] Do not use on slopes steeper than 5 percent except for side slopes in a combination channel.
[c] Annuals — used on mild slopes or as temporary protection until permanent covers are established.
[d] Use on slopes steeper than 5 percent is not recommended.

**Table 4H.50 Classification of Alluvial Channels Based on Channel Stability and on Mode of Sediment Transport**

| Mode of Sediment Transport | Silt-Clay in Channel Sediment, Percent[a] | Proportion of Total Sediment Load | | Channel Stability | | |
|---|---|---|---|---|---|---|
| | | Suspended Load Percent | Bedload, Percent | Stable (Graded Stream) | Depositing (Excess Load) | Eroding (Deficiency of Load) |
| Suspended load | 30–100 | 85–100 | 0–15 | Stable suspended-load channel. Width-depth ratio less than 7; sinuosity greater than 2.1; gradient relatively gentle | Depositing suspended load channel. Major deposition on banks cause narrowing of channel; streambed deposition minor | Eroding suspended-load channel. Streambed erosion predominant; channel widening minor |
| Mixed load | 8–30 | 65–85 | 15–35 | Stable mixed-load channel. Width-depth ratio greater than 7 less than 25; sinuosity, less than 2.1 greater than 1.5; gradient moderate | Depositing mixed-load channel. Initial major deposition on banks followed by streambed deposition | Eroding mixed-load channel. Initial streambed erosion followed by channel widening |
| Bedload | 0–8 | 30–65 | 35–70 | Stable bedload channel. Width-depth ratio greater than 25; sinuosity, less than 1.5; gradient relatively steep | Depositing badload channel. Streambed deposition and island formation | Eroding bedload channel. Little streambed erosion; channel widening predominant |

[a] The percentage of sediment finer than 0.074 mm in the perimeter of the channel.

## SECTION 4I TRANSPIRATION

**Table 4I.51 Transpiration Ratios for Crops**

| Crop | Varieties Tested, No | Transpiration Ratio | |
|---|---|---|---|
| | | Range | Mean |
| Grains | | | |
| Proso | 2 | 531–603 | 567 |
| Millet | 3 | 863–1117 | 959 |
| Buckwheat | 1 | — | 969 |
| Sorgo | 3 | 863–1804 | 1237 |
| Grain sorghum | 4 | 750–1050 | 868 |
| Barley | 4 | 1128–1464 | 1241 |
| Corn | 2 | 821–1998 | 1405 |
| Oats | 4 | 1379–1915 | 1627 |
| Wheat, emmer | 1 | — | 1167 |
| Wheat, durum | 6 | 1365–1622 | 1475 |
| Wheat, common | 11 | 1244–3398 | 1872 |
| Wheat, hybrids | 2 | 1995–2163 | 2079 |
| Rye | 1 | — | 2142 |
| Flax | 6 | 2010–5162 | 3252 |
| Legumes | | | |
| Clover | 2 | 636–759 | 698[a] |
| Clover, sweet | 1 | — | 731[a] |
| Vetch | 5 | 562–899 | 708[a] |
| Alfalfa | 10 | 626–920 | 844[a] |
| Cowpeas | 1 | — | 1632 |
| Beans | 2 | 1583–1815 | 1699 |
| Beans, soy | 1 | — | 1974 |
| Chickpeas | 1 | — | 1685 |
| Peas, Canadian field | 1 | — | 2153 |
| Lupinus albus | 1 | — | 4734 |
| Grassses | | | |
| Sudan grass | 1 | — | 380[a] |
| Wheat grass | 1 | — | 678[a] |
| Brome grass | 1 | — | 977[a] |
| Miscellaneous | | | |
| Cotton | 1 | — | 568[a] |
| Sugar beets | 1 | — | 629 |
| Potatoes | 2 | 1325–2877 | 2101 |
| Cabbage | 1 | — | 518[a] |
| Rape | 1 | — | 714[a] |
| Watermelons | 1 | — | 1102 |
| Cantaloupes | 1 | — | 1754 |
| Turnips | 1 | — | 1471 |
| Cucumbers | 1 | — | 1549 |

*Note:* Transpiration ratios are weighted values in pounds of water per pound of crop product. Data measured at Akron, Colorado.

**Table 4J.55 Evaporation Equations**

For pan evaporation, the expression is

$$E_P = \{\exp[(T_a - 212)(0.1024 - 0.01066\ln R)] - 0.0001 + 0.025(e_s - e_a)^{0.88}(0.37 + 0.0041U_p)\} \times \{0.025 + (T_a + 398.36)^{-2}4.7988 \times 10^{10}\exp[-7482.6/(T_a + 398.36)]\}^{-1}$$

For lake evaporation, the expression is

$$E_L = \{\exp[(T_a - 212)(0.1024 - 0.01066\ln R)] - 0.0001 + 0.0105(e_s - e_a)^{0.88}(0.37 - 0.0041U_P)\} \times \{0.015 + (T_a + 398.36)^{-2}6.8554 \times 10^{10}\exp[-7482.6/(T_a + 398.36)]\}^{-1}$$

The terms in these expressions are

$E_P$ = pan evaporation, inches
$E_L$ = lake evaporation, inches
$T_a$ = air temperature, degrees Fahrenheit
$e_a$ = vapor pressure, inches of mercury at temperature $T_a$
$e_s$ = vapor pressure, inches of mercury at temperature $T_d$
$T_d$ = dew point temperature, degrees Fahrenheit
$R$ = solar radiation, langleys per day
$U_P$ = wind movement, miles per day

*Notes*: The equations enable pan and lake evaporation to be computed from climatic data at first-order weather stations. Daily values of evaporation are obtained using mean daily temperature and vapor pressure data together with data on solar radiation and wind movement as specified.

| 70 | 72.3 | 42 | 3.5 | 63 | 5.3 | 84 | 7.1 | 105 | 8.9 | 126 | 10.6 |
| 80 | 84.3 | 48 | 4.1 | 72 | 6.2 | 96 | 8.3 | 120 | 10.3 | 144 | 12.4 |
| 90 | 94.5 | 54 | 4.7 | 81 | 7.0 | 108 | 9.3 | 135 | 11.6 | 162 | 13.9 |
| 100 | 100.0 | 60 | 4.9 | 90 | 7.4 | 120 | 9.8 | 150 | 12.3 | 180 | 14.7 |

[a] Growing Period refers to the entire time from planting to the time the plant dies, which is usually longer than the period from planting to harvesting. Flowering will occur at about 50 to 60 percent of the growing period and fruiting after 60 percent.

**Table 4K.61 Variations in Consumptive Use by Crops**

| Crop | No. of Tests | Range in Water Requirements (ft) |
|---|---|---|
| **(A) Farm crops in the southwest** | | |
| Alfalfa | 369 | 3.47–5.08 |
| Rhodes grass | 12 | 3.49–4.43 |
| Sudan grass | 25 | 2.88–3.16 |
| Barley | 3 | 1.24–1.83 |
| Oats | 2 | 1.90–2.09 |
| Wheat | 46 | 1.46–2.24 |
| Corn | 42 | 1.44–1.99 |
| Kafir | 16 | 1.32–1.54 |
| Flax | 3 | 1.23–1.59 |
| Broomcorn | 9 | 0.97–1.15 |
| Emmer | 6 | 1.19–1.87 |
| Feterita | 8 | 0.97–1.10 |
| Millet | 5 | 0.91–1.09 |
| Milo | 35 | 0.96–1.67 |
| Sorghum | 34 | 1.69–2.08 |
| Cotton | 103 | 2.35–3.51 |
| Potatoes | 12 | 1.59–2.04 |
| Soybeans | 36 | 1.66–2.81 |
| Sugar beets | 5 | 1.77–2.72 |
| Sugar cane[a] | 41 | 3.48–4.56 |
| **(B) Vegetable crops in the southwest** | | |
| Beans, snap | 9 | 0.83–1.44 |
| Beets, table | 28 | 0.87–1.37 |
| Cabbage | 21 | 0.94–1.49 |
| Carrots | 6 | 1.27–1.60 |
| Cauliflower | 6 | 1.43–1.77 |
| Lettuce | 49 | 0.72–1.35 |
| Onions | 4 | 0.73–1.52 |
| Peas | 8 | 1.21–1.56 |
| Melons | 3 | 0.80–1.07 |
| Spinach | 12 | 0.80–1.07 |
| Sweet potatoes | 3 | 1.77–2.25 |
| Tomatoes | 17 | 0.95–1.42 |
| **(C) Crops in the Missouri and Arkansas Basins** | | |
| Forage, including alfalfa | 648 | 1.94–2.62 |
| Barley | 335 | 1.33–1.82 |
| Oats | 409 | 1.35–1.81 |
| Wheat | 542 | 1.36–1.80 |
| Corn | 70 | 1.23–1.83 |
| Kafir corn | 15 | 1.43–1.57 |
| Flax | 50 | 1.47–1.85 |
| Millet | 14 | 0.81–0.94 |
| Milo maize | 27 | 1.09–1.70 |
| Sorghum | 26 | 1.06–1.47 |
| Apples | 4 | 2.10–2.60 |
| Beans | 4 | 1.30–1.60 |
| Buckwheat | 3 | 1.05–1.30 |
| Cantaloupes | 10 | 1.50–2.30 |
| Peas | 168 | 1.36–1.94 |
| Potatoes | 350 | 1.38–1.70 |
| Sugar beets | 128 | 1.60–2.50 |
| Sunflowers | 16 | 1.20–1.40 |
| Tomatoes | 6 | 2.10–2.80 |
| Cucumbers | 7 | 1.73–3.75 |

[a] Not commonly produced in the Southwest.

**Table 4K.62 Consumptive Use of Water by Crops in Florida**

| Month | Citrus | Pasture[a] | Sugarcane | Rice[b] | Rainfall | Pan Evapotranspiration[c] |
|---|---|---|---|---|---|---|
| January | 2.09 | 2.01 | 1.42 | 0 | 1.97 | 3.39 |
| February | 2.60 | 2.52 | 1.10 | 0 | 1.97 | 4.00 |
| March | 3.58 | 3.35 | 2.52 | 0 | 3.21 | 5.70 |
| April | 4.49 | 4.21 | 3.39 | 1.63 | 2.96 | 6.54 |
| May | 5.31 | 5.20 | 4.80 | 3.07 | 4.74 | 7.06 |
| June | 4.41 | 4.25 | 5.98 | 5.82 | 9.08 | 6.24 |
| July | 4.88 | 4.80 | 6.50 | 8.43 | 8.58 | 6.36 |
| August | 4.80 | 4.80 | 6.69 | 3.05 | 8.21 | 6.12 |
| September | 4.02 | 3.86 | 5.12 | (5.00) | 8.82 | 5.31 |
| October | 3.59 | 3.43 | 5.20 | (3.00) | 5.65 | 4.82 |
| November | 2.72 | 2.48 | 3.19 | 0 | 1.74 | 3.71 |
| December | 2.09 | 1.93 | 2.59 | 0 | 1.80 | 3.19 |
| Total | 44.58 | 42.84 | 48.50 | 22.00 | 58.76 | 62.44 |

*Note:* Everglades agricultural area; in inches.

[a] Mean monthly values averaged over 5 years and averaged over water table depth of 12, 24, and 36 inches maintained in lysimeters at Ft. Lauderdale. These turfgrass evapotranspiration values are assumed to be valid for pastures adequately supplied with water.

[b] Assuming planting date of April 15 which is approximately the middle of the planting season. Values in parentheses are estimates for a ratoon crop. Rice is not always ratoon cropped.

[c] Pan evapotranspiration is a measure of the capability of the air to evaporate water. A relatively higher indicates relatively high consumptive use of water.

## Blaney-Criddle Consumptive Use Formula

The consumptive use of an irrigated crop in which ample water supply is available can be estimated by the Blaney-Criddle formula. For a given month the consumptive use is given by

$$u = k(tp) \tag{4.1}$$

where $u$ is the monthly consumptive use measured in inches, $k$ is a monthly consumptive use coefficient dependent on the crop and location, $t$ is the mean monthly temperature in degrees Fahrenheit, and $p$ is the monthly percentage of daytime hours of the year.

Because $t$ and $p$ can be found from climatic data at a given location, they are often combined into a monthly consumptive use factor $f$, so that Equation 4.1 becomes simply

$$u = kf \tag{4.2}$$

For an entire growing season the consumptive use is given by

$$U = KF \tag{4.3}$$

where $U$ is the seasonal consumptive use measured in inches, $K$ is a seasonal consumptive use coefficient, and $F$ is the sum of the monthly consumptive use factors.

Values for the Western United States of $k$ are given in Table 4K.66, $K$ in Table 4K.67, $p$ in Table 4K.69, and $f$ in Table 4K.70.

**Table 4K.66 Monthly Consumptive Use Coefficients ($k$) for Irrigated Crops in the Western United States**

| Crop | Location | Mar | Apr | May | June | July | Aug | Sept | Oct | Nov |
|---|---|---|---|---|---|---|---|---|---|---|
| Alfalfa | California, coastal | 0.60 | 0.65 | 0.70 | 0.80 | 0.85 | 0.85 | 0.80 | 0.70 | 0.60 |
| | California, interior | 0.65 | 0.70 | 0.80 | 0.90 | 1.10 | 1.00 | 0.85 | 0.80 | 0.70 |
| | North Dakota | — | 0.84 | 0.89 | 1.00 | 0.86 | 0.78 | 0.72 | | |

**Table 4K.67 Seasonal Consumptive Use Coefficients (*k*) for Irrigated Crops in the Western United States**

| Crop | Length of Normal Growing Season or Period[a] | Consumptive Use Coefficient (*K*)[b] |
|---|---|---|
| Alfalfa | Between frosts | 0.80 to 0.90 |
| Bananas | Full year | 0.80 to 1.00 |
| Beans | 3 months | 0.60 to 0.70 |
| Cocoa | Full year | 0.70 to 0.80 |
| Coffee | Full year | 0.70 to 0.80 |
| Corn (Maize) | 4 months | 0.75 to 0.85 |
| Cotton | 7 months | 0.60 to 0.70 |
| Dates | Full year | 0.65 to 0.80 |
| Flax | 7 to 8 months | 0.70 to 0.80 |
| Grains, small | 3 months | 0.75 to 0.85 |
| Grain, sorghums | 4 to 5 months | 0.70 to 0.80 |
| Oilseeds | 3 to 5 months | 0.65 to 0.75 |
| Orchard crops | | |
| Avocado | Full year | 0.50 to 0.55 |
| Grapefruit | Full year | 0.55 to 0.65 |
| Orange and lemon | Full year | 0.45 to 0.55 |
| Walnuts | Between frosts | 0.60 to 0.70 |
| Deciduous | Between frosts | 0.60 to 0.70 |
| Pasture crops | | |
| Grass | Between frosts | 0.75 to 0.85 |
| Ladino whiteclover | Between frosts | 0.80 to 0.85 |
| Potatoes | 3 to 5 months | 0.65 to 0.75 |
| Rice | 3 to 5 months | 1.00 to 1.10 |
| Sisal | Full year | 0.65 to 0.70 |
| Sugar beets | 6 months | 0.65 to 0.75 |
| Sugarcane | Full year | 0.80 to 0.90 |
| Tobacco | 4 months | 0.70 to 0.80 |
| Tomatoes | 4 months | 0.65 to 0.70 |
| Truck crops, small | 2 to 4 months | 0.60 to 0.70 |
| Vineyard | 5 to 7 months | 0.50 to 0.60 |

*Note:* For use with the Blaney-Criddle consumptive use formula.

[a] Length of season depends largely on variety and time of year when the crop is grown. Annual crops grown during the winter period may take much longer than if grown in the summertime.

[b] The lower values of *K* for use in the Blaney-Criddle formula, $U = KF$, are for the more humid areas, and the higher values are for the more arid climates.

**Table 4K.68 Monthly and Seasonal Consumptive Use Coefficients (*k*) for Mature Urban Landscape Plantings**

| Planting Type | Monthly (Maximum K) | Seasonal (Average) |
|---|---|---|
| Warm-season grass (Bermuda, buffalo), Mesa and Tempe, Arizona (elevation 1200 ft) | 1.17 | 0.97 |
| Warm-season grass (Bermuda, buffalo), Laramie and Wheatland, Colorado (elevation 7200 and 4700 ft) | 1.08 | 0.79 |
| Cool-season grass (Kentucky bluegrass), Mesa and Tempe, Arizona (elevation 1200 ft) | 1.41 | 1.20 |
| Cool-season grass (Kentucky bluegrass), Laramie and Wheatland, Colorado (elevation 7200 and 4700 ft) | 1.30 | 0.95 |
| Deciduous fruit or nut tree in bare soil, Mulch, or Paved Area | 0.90 | 0.70 |
| Deciduous fruit or nut tree with cover crop (turf, ground cover, etc) | 1.25 | 1.00 |
| Grapefruit in bare soil, mulch, or paved area | 0.75 | 0.65 |
| Lemon, orange | 0.65 | 0.55 |
| Other trees | 0.90 | 0.80 |
| Grapevine, Mesa and Tempe, Arizona (elevation 1200 ft) | 0.80 | 0.70 |
| Grapevine, elsewhere | 0.75 | 0.60 |
| Other vines | 0.80 | 0.70 |
| Shrubs over 4 ft diameter | 0.80 | 0.70 |
| Shrubs under 4 ft diameter | 1.00 | 0.90 |
| Ground cover plants, other small plants | 1.00 | 0.90 |
| Arid climate native plants | 0.35 | 0.25 |
| Pavements, mulches, nonliving soil covers | 0.00 | 0.00 |

*Note:* For use with the Blaney-Criddle consumptive use formula; the higher the monthly or seasonal factor, the greater the planting's water demand in that time period.

[a] Census of agriculture.
[b] Excludes rice, which was grown on 342,000 acres in South Atlantic and Gulf States in 1899.
[c] Preliminary estimates constructed from unpublished USDA sources and the Census. Partial returns from 1992 Census were incorporated.
[d] Forecast based on March Planting Intentions (NASS).
[e] Northeast, Appalachian, and Southeast farm production regions.
[f] Lake States and Corn Belt production regions. Remaining regions correspond to single farm production regions.
[g] Includes Alaska and Hawaii.

[a] Census of Agriculture.
[b] Estimates constructed by State, by crop, from Farm and Ranch Irrigation Surveys (FRIS) (USDC, 1990, 1986, and 1982a) and ERS estimates of irrigated area.
[c] Aggregated from FRIS State/crop application rates adjusted to reflect annual changes in precipitation. Sensitivity to precipitation is estimated as a function of average precipitation and soil hydrologic group.
[d] Forecast using precipitation records through May 1994.
[e] Values rounded to nearest 0.5 inches.
[f] Northeast, Appalachian, and Southeast production regions.
[g] Lake States and Corn Belt farm production regions.
[h] Includes Alaska and Hawaii.

*Source*: USDA, ERS data.

**Table 4K.78 Irrigated Area, 1992 Census of Agriculture**

| State | 1987 | 1992 | Change |
|---|---|---|---|
| | 1,000 acres | | Percent |
| Colorado | 3,014 | 3,170 | 5 |
| Connecticut | 7 | 6 | −19 |
| Delaware | 61 | 62 | 2 |
| Florida | 1,623 | 1,783 | 10 |
| Idaho | 3,219 | 3,260 | 1 |
| Illinois | 208 | 328 | 58 |
| Indiana | 170 | 241 | 42 |
| Iowa | 92 | 116 | 25 |
| Kansas | 2,463 | 2,680 | 9 |
| Maine | 6 | 10 | 69 |
| Maryland | 51 | 57 | 12 |
| Massachusetts | 20 | 20 | −1 |
| Michigan | 315 | 368 | 17 |
| Missouri | 535 | 709 | 33 |
| New Hampshire | 3 | 2 | −41 |

# SECTION 4L PHREATOPHYTES

**Table 4L.79 Phreatophyte Areas and Their Consumptive Use in Selected Western States (Estimates as of 1953)**

| State | Area (Acres) | Annual Use (Acre-Feet) |
|---|---|---|
| Arizona | 405,000 | 1,280,000 |
| California[a] | 317,000 | 1,150,000 |
| Colorado[a] | 737,000 | 1,056,000 |
| Idaho | 500,000 | 1,000,000 |
| Montana | 1,600,000 | 3,200,000 |
| Nebraska[a] | 515,000 | 709,000 |
| Nevada | 2,801,000 | 1,500,000 |
| New Mexico | 300,000 | 900,000 |
| North Dakota | 1,035,000 | 1,660,000 |
| Oregon[a] | 40,800 | 21,200 |
| South Dakota | 850,000 | 1,240,000 |
| Texas[a] | 262,000 | 436,500 |
| Utah | 1,200,000 | 1,500,000 |
| Wyoming | 527,000 | 1,100,000 |
| Total (approximate)[b] | 11,090,000 | 16,750,000 |

[a] Partial data, from published reports on areas within the state.
[b] Partial data.

**Table 4L.81 Phreatophyte Areas and their Consumptive Use in River Basins of the Western United States**

| State and River or Valley | Area in Acres | Estimated Annual Water Use in Acre-Feet | Year of Survey or Estimate | Principal Species of Phreatophytes |
|---|---|---|---|---|
| Arizona | | | | |
| Little Colorado River | | | | |
| Main stem only St. Johns to mouth | 49,560 | 64,720 | 1951 | Saltcedar, cottonwood, willow, brush |
| Total Little Colorado including Zuni and Puerco Rivers | 65,310 | 74,360 | 1951 | Saltcedar, cottonwood, willow, brush |
| Gila River | | | | |
| Virden, NM to Clifton, AZ | 5,600 | 6,310 | 1951 | Cottonwood, willow, seepwillow |
| Head of Safford Valley to Coolidge Dam | 25,520 | 61,500 | 1951 | Saltcedar, mesquite, willow, seepwillow, cotton wood, arrowweed |
| Coolidge Dam to Kelvin | 3,970 | 7,460 | 1951 | Saltcedar, mesquite, willow, seepwillow, cotton wood, arrowweed |
| Kelvin to Gillespie Dam downstream from Granite Reef Dam on Salt River, Rillito on Santa Cruz River and Lake Pleasant on Agua Fria River | 142,880 | 282,770 | 1951 | Saltcedar, mesquite, willow, seepwillow, cotton wood, arrowweed |
| Gillespie Dam to Dome | 51,270 | 69,220 | 1951 | Saltcedar, mesquite, seepwillow |
| Total Gila River including San Pedro River, Palominas to mouth, Verde River, Bartlett Dam to mouth, Salt River, Stewart Mountain Dam to Granite Reef Dam | 300,710 | 522,510 | 1951 | |
| Salt River: Stewart Mountain Dam to Granite Reef Dam | 2,710 | 2,070 | 1951 | Saltcedar, mesquite |
| San Pedro River: Palominas to Gila at mouth | 42,510 | 69,420 | 1951 | Saltcedar, mesquite |
| Verde River: Bartlett to Gila at mouth | 3,790 | 5,720 | 1951 | Saltcedar, mesquite, seepwillow |
| California | | | | |
| San Luis Rey River: IN San Diego County | 6,390 | 17,800 | 1945 | Cottonwood, willow |
| Santa Anna River: Below Prado Dam | 1,071 | 3,000 | 1946 | Cottonwood, willow |
| Kings River: Kings River Soil Conservation District | 1,080 | 6,500 | 1958 | Cottonwood, willow |
| Idaho: Malad Valley | 10,900 | 32,400 | 1953 | Grasses and rushes |
| New Mexico | | | | |
| Pecos River: Alamogordo Dam to Texas State line | 42,500 | 117,000 | 1956 | Saltcedar |
| Rio Grande: Bernardo to San Marcial | 52,000 | 77,800 | 1955 | Saltcedar |
| Nevada | | | | |
| Little Humboldt River: Paradise Valley | 36,500 | 23,000 | 1947 | Greasewood, saltgrass, willows |
| Muddy River: To mouth | 4,900 | 10,330 | 1951 | Saltcedar |
| Nevada-Utah-Arizona-California | | | | |
| Virgin River: Littlefield to mouth | 7,360 | 27,160 | 1951 | Saltcedar |
| Lower Colorado River: | | | | |
| Main stem | | | | |
| Lee Ferry to Hoover Dam | 1,480 | 5,920 | 1951 | Saltcedar, willow |
| Hoover Dam to Davis Dam | 4,500 | 11,450 | 1951 | Saltcedar, willow |
| Davis Dam to Parker Dam | 57,490 | 209,290 | 1950 | Saltcedar, willow |
| Parker Dam to Laguna Dam | 191,890 | 314,360 | 1951 | Saltcedar, willow |
| Laguna Dam to International Boundary | 33,510 | 54,210 | 1951 | Saltcedar, willow |
| Total main stem | 288,920 | 595,230 | 1951 | |
| Total Lower Colorado River Basin, including Little Colorado River, Virgin River, and Gila River Basins | 667,200 | 1,230,090 | 1951 | |

**Table 4L.82 Phreatophytes in the Western United States**

| Scientific Name | Common Name | Occurrence as a Phreatophyte | Relation to Groundwater: Depth to Water Below Land Surface (ft) | Relation to Groundwater: Quality | Relation to Groundwater: Use (acre feet/acre) | Remarks |
|---|---|---|---|---|---|---|
| *Acacia greggii* A. Gray | Catclaw, devilsclaw, una de gato | Southern California to western Texas | — | 1 | — | Uses more water than mesquite. Forms thickets along streams and washes |
| *Acer negundo* Linnacus | Boxelder | Canada to Oklahoma and Arizona | — | — | — | Occurs in moist places and along streams, chiefly in mountains. Observed in the flood plain of the North Canadian River near Oklahoma City, Okla. Widely used as a shade tree |
| *Alhagi camelorum* Fischer | Camelthorn | Arizona | — | — | — | Introduced into Southwestern United States from Asia Minor. Poor browse plant. Observed growing as a phreatophyte along Little Colorado River between Holbrook and Winslow, AZ, in localities where the depth to water ranged from 4 to 6 ft. Aggressive and thicket forming, root system deep and extensive |
| *Allenrolfea occidentalis* (S. Watson) Kuntze | Pickleweed, iodinebush | California to western Texas | 1–20 | 3 | — | |
| *Alnus* | Alder | — | — | — | 5.3 | Occurs along streams, river bottom land, and other wet sites. The use of 5.3 ft was for the period May to October 1932 in Cold-water Canyon, altitude 2400 ft, San Bernardino Mountains, CA, where alder constituted 82 percent of the vegetation |
| *Anemopsis californica* (Nuttall) Hooker and Arnott | Yerba mansa | So. California, So. Nevada to Utah and Texas | Shallow | 3 | — | Used by Pima Indians as a herbal remedy. Common in saline and wet lowlands |
| *Aster spinosus* Bentham | Spiny aster | Arizona | — | — | — | Identified as phreatophyte in bottom land of lower Safford Valley, AZ |
| *Atriplex canescens* (Pursh) Nuttall | Fourwing saltbush, Chamiso, chamiza | South Dakota to Oregon, south to Mexico | 8–62 | 1–2 | — | Tolerates alkali. Valuable browse plant. Useful in erosion control. Taproots 30–40 ft deep. May not always occur as a phreatophyte |
| *hastata* Linnaeus | — | Oregon and California to Kansas and New Mexico | — | 3 | — | Occurs in saline soils, especially around alkaline lakes, in salt marshes, and in other water-soaked soils |
| *lentiformis* (Torrey) Watson | Quailbrush, lenscale Nevada saltbush | Southern Utah and Nevada to California and Sonora, Mexico | 6–15 | 3 | — | High tolerance for alkali and saline soil. Fair browse plant. Reaches height of 10 ft where water table is shallow |

**Table 4L.82 (Continued)**

| Scientific Name | Common Name | Occurrence as a Phreatophyte | Relation to Groundwater: Depth to Water Below Land Surface (ft) | Relation to Groundwater: Quality | Relation to Groundwater: Use (acre feet/acre) | Remarks |
|---|---|---|---|---|---|---|
| *Baccharis emoryi* A. Gray | Emory baccharis | Texas to southern California and southern Utah | — | 2 | | |
| *glutinosa* Persoon | Batamote, seepwillow, water motie, waterwillow | Colorado and Texas to California and Mexico | 2–15 | 2 | 4.7 | Evapotranspiration for plants grown in tanks ranged from 10.3 ft with water level at 2 ft to 4.6 ft with water level of 6 ft. Safford Valley, AZ |
| *sarothroides* A. Gray | Broom baccharis, desertbroom, rosinbrush | Southern California, Arizona, southwestern New Mexico | — | — | — | Occurs along streams in draws, in canyon bottoms and wet alkaline sites |
| *sergiloides* A. Gray | Squaw baccharis, waterweed | Arizona, southern California, southern Nevada, southwestern Utah | — | 2 | — | Occurs as a phreatophyte in lower Safford Valley, AZ |
| *viminea* Crandolle | Mulefat | Southwestern Utah, southern California, Nevada, Arizona | — | — | — | Useful in erosion control |
| *Bigelovia hartwegii,* probably *Aplopappus heterophyllus* A. Gray | Rayless goldenrod | | — | — | — | Will grow in dry places but thrives where groundwater is within reach |
| *Celtis reticulata* Torrey | Hackberry, cumaru, kom | Arizona | — | — | — | A large tree that may reach 3 ft in diameter and 50 ft in height. Usually occurs along streams |
| *Cercidium floridum* Bentham | Blue palo verde | Southwestern Arizona, southeastern California | — | — | — | Common along washes, canyons, valleys, alluvial plains, grassland at sites where groundwater is plentiful |
| *Chilopsis linearis* Sweet | Desertwillow | Western Texas to southern Nevada, Arizona, southern California | To 50 | — | — | May not always occur as a phreatophyte |
| *Chrysothamnus pumilus* (Nuttall) | Rabbitbrush | Mud Lake, Idaho | — | — | — | |

© 2006 by Taylor & Francis Group, LLC

| | | | | | | |
|---|---|---|---|---|---|---|
| *nauseosus consimilis* (Greene) | Rubber rabbitbrush | Nevada, Utah, Idaho, Wyoming | — | 2–3 | — | |
| *nauseosus graveolens* (Nuttall) | Rubber rabbitbrush | Montana, Idaho, Utah, Nevada, New Mexico | 2.5–15 | 2–3 | — | |
| *nauseosus mohavensis* (Greene) | Rubber rabbitbrush | Northern California, Nevada | — | 2–3 | — | |
| *nauseosus oreophilus* (Al Nelson) | Rubber rabbitbrush | Wyoming, Colorado, Utah | — | — | — | |
| *nauseosus viridulus* | Rubber rabbitbrush | Colorado to Oregon; Nevada, New Mexico | — | — | — | |
| *Cowania stansburiana* (Torrey) | Vanadium bush | Arizona, Idaho, Utah | — | — | — | Used as an indicator of vanadium–uranium deposits by prospectors in the Colorado Plateau. Able to grow in highly mineralized ground and to absorb large amounts of uranium |
| *Dalea spinosa* Gray | Smoketree, smokethorn | Southeastern California, southwestern Arizona | — | — | — | Its persistent occurrence in gravelly and sandy washes suggests it depends upon groundwater underflow and occurs as a phreatophyte |
| *Dasiphora fruticosa* Linnaeus | Bush or shrubby cinquefoil | Locally in Idaho but widespread in Oregon, Washington, Utah, Nevada and Arizona | Shallow | — | — | Occurs as a phreatophyte in Pahsimeroi Valley, Idaho. Grows on subalpine meadows, along streams, about cold springs in peaty, sandy, or clayey loams |
| *Distichlis spicata* (Linnaeus) Greene | Seashore saltgrass | Western United States | — | — | — | |
| *stricta* (Torrey) Rydberg | Saltgrass, or desert saltgrass | All Western States | 2–14 | 1–3 | — | |
| *Elymus condensatus* Presl | Giant wildrye | All Western States except New Mexico | 1–12 | 1–2 | — | Fair forage, Killed by overgrazing. Extensive root system |
| *triticoides* Buckley | Creeping wildrye | Western United States | — | 1–2 | — | Good forage. Frequently cut for hay. Associated with giant wild-rye along Humboldt River, Nev |
| *Eragrostis obtusiflora* (Fournier) Scribner | Mexican saltgrass, alkali lovegrass | Southeastern Arizona, southwestern New Mexico | 4–15 | 2–3 | — | Commonly locally in saline soil near Wilcox, AZ. Observed growing in Sulphur Springs Valley, AZ, where depth to water table was from 4–15 ft |

*(Continued)*

**Table 4L.82 (Continued)**

| Scientific Name | Common Name | Occurrence as a Phreatophyte | Relation to Groundwater: Depth to Water Below Land Surface (ft) | Relation to Groundwater: Quality | Relation to Groundwater: Use (acre feet/acre) | Remarks |
|---|---|---|---|---|---|---|
| *Fraxinus velutina* Torrey | Velvet ash, Arizona ash | Southwestern Utah, southern Nevada, California, Arizona, New Mexico, and western Texas | — | 1 | — | Prominent stream-bank and canyon tree; restricted to areas with a permanent groundwater supply. Popular as a shade tree in Arizona and California |
| *Hedysarum boreale* Nuttall | Sweet vetch | Colorado, Utah | — | — | — | Deep tap root. Identified as a phreatophyte in Colorado |
| *Heliotropium curassavicum* Linnaeus | Heliotrope, Chinese pusley | Southwestern Utah to southern California | Shallow | 2–3 | — | High tolerance for alkali. Occurs on moist saline soil |
| *Hymenoclea monogyra* Torrey and Gray | Burrobush | Western Texas to southern California | Shallow | 1–2 | — | Occurs largely along streams, washes, and in bottom lands; aggressive. Often forming thickets. Unpalatable to livestock |
| *salsola* Torrey and Gray | White burrobush | Utah to Arizona and California | — | — | — | Occurs in sandy desert |
| *Juglans microcarpa* Berlandier | Walnut, nogal, butternut | Arizona, New Mexico | 2–20 | 1 | — | Occurs along watercourses and washes; intolerant of shade. Deep tap root |
| *Juncus balticus* Willdenow | Wirerush, wiregrass | Western United States | — | — | 7.8 | Grows in wet sites where groundwater is shallow, also in shallow ponds. Appears to occur both as phreatophyte and hydrophyte. Deep root system. Fair to good forage |
| *Juncus cooperi* Engelmann | Desertrush | Southern Utah to California | — | 2–3 | — | Occurs on the margins of salt marshes and alkaline meadows, common in Death Valley, CA, along the edge of the playa often associated with saltgrass |
| *Juniperus scopulorum?* | Rocky Mountain juniper; locally "swampcedar." | Nevada | 10 | 1–2 | — | Occurs locally as a phreatophyte in White River and Spring Valleys, Nev. May be a hybrid between *J. scopulorum* and *J. utahensis.* |
| *Leptochola fascicularis* (Lamarck) A. Gray | Sprangletop | Western United States | — | 1–3 | — | Occurs along ditches and in moist waste places, often in brackish marshes; most places in alkali plains. Often invades rice fields |
| *Medicago sativa* Linnaeus | Alfalfa | Western United States | 4+ | 1–2 | — | |
| *Phragmites communis* Trinius | Reed, giant reed-grass, carrizo | Western United States | 0–8± | 1–2 | — | Occurs also as a hydrophyte in the shallow water of streams, lakes, ponds, and marshes |
| *Picea engelmanni* Parry | Engelmann spruce | Mountain areas of western United States | — | 1 | — | Requires a good water supply and depends upon groundwater in many localities. Shallow root system |

© 2006 by Taylor & Francis Group, LLC

| | | | | | | |
|---|---|---|---|---|---|---|
| *Platanus wrightil* Watson | Arizona sycamore | Southern Arizona, southeastern and southwestern California, New Mexico | — | 1 | — | Common along stream and rocky canyons, in foothills and mountains, upper desert, desert grassland, and oak woodland zones. Valuable in erosion control |
| *Pluchea sericea* Coville | Arrowweed | Texas to southern Utah and southern California | 0–10± | 1–2 | — | Occurs along streams and flood plains. Abundant along lower reaches of Colorado River and tributaries. Arrowweed may grow where depth to water is 25 ft |
| *Populus* | Cottonwood | Western United States | — | 1–2 | — | |
| *tremuloides aurea* Tidestorm | Quaking aspen | Mountainous areas of Western United States | — | 1 | — | Considered a phreatophyte when it grows along streams, around springs, and in other wet areas. Shallow root system |
| *Prosopis juliflora* (Swartz.) | Mesquite, honey mesquite | Southern Kansas to southeastern California and Mexico | — | 1–2 | — | Extensive root development. Reported to penetrate 60 ft below surface |
| *velutina* Wooton | Velvet mesquite | Southern Arizona | 10+ | 1–2 | 3.3 | Occurs in bottom lands. Extensive root development |
| *pubescens* Bentham | Screwbean mesquite, tornillo | Western Texas to southern Nevada and southern California | — | — | — | Characteristic of bottom lands along desert streams and water holes of Mojave and Colorado Deserts |
| *Quercus agrifolia* Nee | California live oak | California | 35± | 1 | — | Occurrence related to depth to water table |
| *lobata* Nee | Roble oak | California | 10–20 | — | — | |
| *Salicornia europaea* Linnaeus | Glasswort | — | — | 3 | — | Frequently occurs in salt flats with salts approximately 1.0 percent of weight of soil |
| *rubra* Linnaeus | Glasswort | Colorado, New Mexico, Nevada, Utah | — | 3 | — | Some value as waterfowl feed. In Nevada occurs along edges of channels draining into playas |
| *utahensis* Tidestrom | Glasswort | Utah | — | 3 | — | Occurs on borders of salt lakes and alkaline places |
| *Salix* | Willow | Western United States | — | — | — | |
| *Sambucus* | Elder, elderberry | Western United States | — | 1 | — | Eleven species reported to grow in Western United States. Grows along streams, in canyons and in moist sites |
| *Sarcobatus vermiculatus* (Hook). Torrey | Big greasewood | Western United States | 60± | — | — | |
| *Sequoia gigantea* (Lindley) | Giant or bigtree sequoia | California | — | 1 | — | Appears to prefer localities where a water table is within reach of its roots but will grow elsewhere |
| *Sesuvium* portulocostrum | Lowland purslane | Southern Nevada and California | — | 3 | — | Reported as a plant that grows on moist alkaline soils. Indicative of groundwater but usually of poor quality. Alkali resistant |

**Table 4L.82 (Continued)**

| Scientific Name | Common Name | Occurrence as a Phreatophyte | Relation to Groundwater: Depth to Water Below Land Surface (ft) | Relation to Groundwater: Quality | Relation to Groundwater: Use (acre feet/acre) | Remarks |
|---|---|---|---|---|---|---|
| *verrucosum* Rafinesque | Warty sesuvium, sea purslane | Southern Arizona, California, and New Mexico | Shallow | 3 | — | |
| *Shepherdia* | Buffalo berry | Arizona, New Mexico, Nevada, Oregon, Black Hills | — | 1 | — | Fruit edible. Grows in moist sites and along streams and river bottoms. One species reported growing as a phreatophyte in Big Smoky Valley, Nev. Occurs also as a phreatophyte in Mason Valley, Nev. |
| *Sporobolus airoides* Torrey | Alkali sacaton | Western United States | 5–25± | 1–3 | 3.7 | Most common in the Southwest where it is important as forage; deep, coarse root system. Prefers moist alkali flats. Grows in very saline or saline-alkali soils. Soil salinity may range from 0.3 to 3.0 percent. Grows best in range 0.3 to 0.5 percent |
| *wrightii* Munro | Sacaton | Arizona to western Texas | — | 1–2 | — | Occurs in alluvial flats and bottom lands. Will not grow on highly alkaline soils |
| *Suaeda depressa* Watson | Seepweed, saltwort | Southwest | — | 3 | — | Browsed when other forage is scarce. Occurs on saline or saline-alkali soils with salt content in first foot as much as 3.2 percent |
| *Suaeda suffrutescens* Watson | Desert seepweed | Western Texas, New Mexico, Arizona | — | 3 | — | Browsed when other forage is scarce. Occurs on saline or saline-alkali soils with salt content in first foot as much as 3.2 percent |
| *torreyana* Watson | Torrey seepweed, iodineweed, inkweed | Eastern Oregon to New Mexico and California | 4–15 | 3 | — | Browsed when other forage is scarce. Occurs on saline or saline-alkali soils with salt content in first foot as much as 3.2 percent |
| *Tamarix aphylla* Linnaeus | Athel tree | Southwest | — | 1–3 | — | |
| *Gallica* Linnaeus | Saltcedar, French tamarisk | Southwest | — | 1–3 | — | |
| *Washingtonia filifera* Wendland | Fan palm, California palm | Southern Arizona, California, SE New Mexico | — | 1–3 | — | Highly tolerant to alkali. Generally grows where groundwater is at shallow depth |

*Note:* The quality of the groundwater with respect to its suitability for crop growth is indicated by numerals as follows: 1 = excellent to good; 2 = good to poor; 3 = poor to unsatisfactory. The use of groundwater, including precipitation, unless otherwise stated is presumed to be for a plant growth of 100-percent volume density.

**Table 5A.1 Average Discharge at Downstream Gaging Stations on Large Rivers of the United States, 1931–1960, and 1941–1970**

| River | Gaging-Station Location | Drainage Area (Square Miles) | Average Discharge (1931–1960) ($ft^3$/sec) | Average Discharge (1941–1970) ($ft^3$/sec) |
|---|---|---|---|---|
| Alabama | At Claiborne, AL | 22,000 | 31,140 | 31,510 |
| Allegheny | At Natrona, PA | 11,410 | 19,200 | 18,810 |
| Apalachicola | At Chattahoochee, FL | 17,200 | 20,700 | 21,700 |
| Arkansas | At Little Rock, AR | 158,000 | 41,300 | 42,130 |
| Atchafalaya[a] | At Krotz Springs, LA | 93,320 | 160,800[b] | 180,800[b] |
| Colorado | Below Hoover Dam, AZ–NV[c] | 167,800 | 14,580[d] | 14,530 |
| Columbia | At The Dalles, OR | 237,000 | 183,000 | 189,000 |
| Cumberland | Near Grand Rivers, KY | 17,598 | 26,900 | 28,030[e] |
| Delaware | At Trenton, NJ[f] | 9,397 | 16,100 | 14,500[g] |
| Hudson | At Green Island, NY | 8,090 | — | 12,520[h] |
| Illinois | At Merdosia, IL | 25,300 | 20,500 | 20,670 |
| Mississippi | At Alton, IL | 171,500 | 91,300 | 98,300 |
| Mississippi | At Vicksburg, MS | 1,144,500 | 554,000 | 565,300 |
| Missouri | At Hermann, MO | 528,200 | 69,200 | 76,200 |
| Ohio | At Metropolis, IL | 203,000 | 257,000 | 257,200 |
| Pend Oreille | At international boundary | 25,200 | 26,900 | 28,420 |
| Red | At Alexandria, LA | 67,412 | 32,470 | 32,100 |
| Sacramento | At Verona, CA[i] | — | 25,700 | 27,200 |
| St. Lawrence | At Cornwall, Ontario-near Massena, NY[j] | 299,000 | 233,000[k] | 239,000[k] |
| Snake | Near Clarkston, WA | 103,200 | 48,600 | 48,960 |
| Susquehanna | At Marietta, PA | 25,990 | 36,100 | 35,060 |
| Tennessee | Near Paducah, KY | 40,200 | 63,400 | 64,050[f] |
| Tombigbee | At Jackson Lock and Dam near Coffeeville, AL | 18,500 | 25,200 | 25,130 |
| Wabash | At Mount Carmel, IL | 28,600 | 26,400 | 26,600 |
| White | At Clarendon, AR | 25,497 | 29,490 | 29,360 |
| Willamette | At Salem, OR | 7,280 | 23,870 | 24,780 |
| Yukon | At Ruby, AK | 259,000 | — | 170,000[l] |

[a] Continuation of Red River.
[b] Includes diversion from Mississippi River through Old River or Old River diversion channel.
[c] Very little tributary flow downstream. Downstream station located at Yuma, AZ., drainage area 242,900 square miles. The greater part of the natural flow is diverted for irrigation and other uses in the basin above Yuma. Average flow at Yuma, 1963–1970, is less than 1,000 $ft^3sec^{-1}$.
[d] For the period 1934–1960.
[e] Interbasin diversion beginning June 1966 between Lake Barkley on Cumberland River and Lake Kentucky on Tennessee River through Barkley–Kentucky Canal.
[f] Five tributaries below Trenton have been added.
[g] Unadjusted for diversion by New York City reservoirs since 1954.
[h] October 1946 to September 1970 (24 years).
[i] American River and Yolo bypass have been added.
[j] Formerly at Ogdensburg, NY
[k] Furnished by the U.S. Army Corps of Engineers through International St. Lawrence River Board of Control.
[l] Average is for 1957–1970; station operated only since 1956.

Gaging station: Period of analysis is for the water years used to compute average discharge and may differ from that used to compute other streamflow characteristics. Streamflow characteristics: The 7-day, 10-year low flow is a discharge statistic; the lowest average discharge during 7 consecutive days of a year will be equal to or less than this value, on the average, once every 10 years. The average discharge is the arithmetic average annual discharges during the period of analysis. The 100-year flood is the peak flow that has a 1-percent chance of being equaled or exceeded in a given year. The degree of regulation is the effect of dams on the natural flow of the river. Abbreviations: Do = ditto; $mi^2$ = square miles; $ft^3$/sec = cubic feet per second; … = insufficient data or not applicable.

[a] Less than 10 years of record. Minimum discharge and maximum instantaneous discharge for period of record are shown.
[b] Record interrupted.
[c] Adjusted for no-flow periods.
[d] Adjusted for high-outlier in period of record. Did not use 1981 peak because it was regulated.
[e] Adjusted for high-outlier in period of record.
[f] Sutter and Yolo Bypasses Carry Much of Floodflow Past Verona gage.
[g] Regulation has Little Effect on High Floodflows.
[h] From Upper Mississippi River Basin Commission, 1978.
[i] Within the Upper Mississippi–Black–Root, Upper Mississippi–Maquoketa–Plum, and Upper Mississippi–Iowa–Skunk–Wapsipinicon Subregion (Seaber and Others, 1984).
[j] Within the Upper Mississippi–Iowa–Skunk–Wapsipinicon Subregions (Seaber and Others, 1984).
[k] Within the Minnesota Des Moines Subregions(Seaber and Others, 1984).
[l] Within the Missouri–Big Sioux, Missouri–Little Sioux, and Missouri–Nishnabotna Subregions (Seaber and Others, 1984).
[m] Flow Parameters Based Only on 1929–1931 and 1939–1956 Water Years.
[n] From U.S. Army Corps of Engineers, February 1978.
[o] Within the Missouri–Big Sioux, Missouri–Little Sioux, and Missouri–Nishnabotna Subregions (Seaber and Others, 1984).
[p] Within the Missouri–Nishnabotna, Chariton–Grand, and Upper Mississippi–Salt Subregions (Seaber and Others, 1984).
[q] Based on period of analysis since regulation began. These values are not based on detailed analyses, are approximate estimates, and are for information purposes only.

**Table 5A.2 (Continued)**

| | |
|---|---|
| r | From flood-insurance hydrology study. Based on detailed analyses of regulated-flow conditions. |
| s | Prior to opening of Barkley–Kentucky Canal (1889–1965). |
| t | Since the opening of Barkley–Kentucky Canal (1965–1983). |
| u | Includes all or parts of the Lower Mississippi–Yazoo, Lower Mississippi–Big Black, Lower Mississippi–Lake Maurepas, and the Lower Mississippi Subregions (Seaber, Kapinos, and Knapp, 1984). |
| v | Includes the Mississippi Headwaters and the Upper Mississippi Black-Roof Subregions. |
| w | Data furnished by U.S. Army Corps of Engineers. |
| x | Includes the Saskatchewan, the Missouri Headwaters, the Missouri–Marias, the Missouri–Musselshell, the Milk, and the Missouri–Polar Subregions. |
| y | Includes the upper Yellowstone, the Big Horn, the Powder–Tongue, the lower Yellowstone, and the Missouri–Little Missouri Subregions. |
| z | Contained within the Kootenai–Pend Oreille–Spokane Subregion. |
| aa | Within the Missouri–Big Sioux, Missouri–Little Sioux, and Missouri–Nishnabotna Subregions. |
| bb | Analysee based on period of record since regulation began. |
| cc | Based on record to 1981. |
| dd | Period of record not continuous. |
| ee | Adjusted for diversion and change in reservoir contents. |
| ff | Analysis based no regulated period 1955–1984. |
| gg | Period of record not continuous. |
| hh | Also includes parts of the Upper Arkansas, Upper Cimarron, Lower Canadian, North Canadian, and Red Headwaters Subregions. |
| ii | Fifteen years, prior to completion of Conchas Dam. |
| jj | Twenty-four years, prior to completion of Ute dam. |
| kk | Twenty-one years (1963–1983), subsequent to completion of Ute Dam. |
| ll | Includes all or parts of Rio Grande Headwaters, Rio Grande–Elephant–Butte, Rio Grande–Mimbres, and Rio Grande Closed basins Subregions. |
| mm | Thirty-two years, prior to closure of Cochiti Dam. |
| nn | Ten years (1974–1983), subsequent to closure of Cochiti Dam. |
| oo | Includes parts of the Little Colorado, Upper Gila and Sonora Subregions. |
| pp | Approximate. |
| qq | Noncontributing. |
| rr | Includes parts or all of the Upper Cimarron, Arkansas–Keystone, Lower Cimarron, Lower Arkansas, Neosho–Verdigris, Lower Canadian and North Canadian Subregions. |
| ss | Includes parts or all of the Red Headwaters, Red–Washita, and Red–Sulphur Subregions. |
| tt | Estimated. |
| uu | Drainage area includes 38 $mi^2$ which are partly or entirely noncontributing and excludes 6.0 $mi^2$ upstream from Lago El Guinea and Lago de Matrullas. |
| vv | Drainage area includes 25.4 $mi^2$ which do not contribute directly to surface runoff. |
| ww | Drainage area excludes 8.2 $mi^2$ upstream form Lago Carite, flow from which is diverted to the Rio Guamani. |
| xx | Drainage area includes 39.7 $mi^2$ from headwaters of Lago Yahuecas (17.05 $mi^2$), Lago Guayo (9.67 $mi^2$), Lago prieto (9.50 $mi^2$), and Lago Toro (3.5 $mi^3$) which does not contribute to surface runoff except at high stages. |
| yy | Analysis based on records collected since regulation began. |
| zz | Within the Missouri–Oahe, Missouri–White, and Missouri–Big Sioux Subregions. |
| aaa | Station discontinued subsequent to construction of Oahe Dam in 1962. |
| bbb | Analysis based on period of record after regulation began. |
| ccc | Within the Missouri–Oahe, Missouri–Little Missouri, Cheyenne, Missouri–White, and Niobrara Subregions. |
| ddd | Period of record not continuous. |
| eee | Within the James and Missouri–Big Sioux Subregions. |
| fff | Within the Upper Canadian, Lower Canadian, North Canadian, Red Headwaters, Red–Washita, and Red–Sulphur Subregions. |
| ggg | Within the Sabine, neches, Triniy, and Galveston Bay–San Subregions. |
| hhh | Within the Brazos Headwaters, Middle Brazos, Lower Brazos, Upper Colorado, and Lower Colorado–San Bernard Coastal Subregions. |
| iii | Within the Central Texas Coastal and Nueces–Southwestern Texas Coastal Subregions. |
| jjj | Within the Rio Grande–Mimbres, Rio Grande Amistad, Rio Grande Closed Basins, Upper Pecos, Lower Pecos, Rio Grande–Falcon, and Lower Rio Grande Subregions. |
| kkk | Discharge represents highest recorded. Data available are not adequate to determine a discharge–frequency relation, but it is estimated to have exceeded the 100-year flood. |
| lll | Discharge represents highest recorded. |
| mmm | Within the Upper Colorado–Dolores and Upper Colorado–Dirty Devil Subregions. |
| nnn | Approximate. |
| ooo | Period of analysis not continuous. |
| ppp | Since completion of Flaming Gorge Reservoir in 1963. |
| qqq | Based on record to 1981. |

**Table 5A.4 Length of Principal Rivers in the United States and Canada**

| River/Outflow | Length | |
|---|---|---|
| | Miles | km |
| Alabama/Mobile River | 735 | 1,183 |
| Albany/James Bay | 610 | 981 |
| Arkansas/Mississippi River | 1,459 | 2,348 |
| Black/Chantrey Inlet | 600 | 965 |
| Brazos/Gulf of Mexico | 870 | 1,400 |
| Canadian/Arkansas River | 906 | 1,458 |
| Churchill/Hudson Bay | 1,000 | 1,609 |
| Cimarron/Arkansas River | 600 | 965 |
| Colorado (U.S.-Mex.)/Gulf of California | 1,450 | 2,333 |
| Colorado (Texas)/Matagorda Bay | 840 | 1,352 |
| Columbia/Pacific Ocean | 1,243 | 2,000 |
| Columbia, Upper Mouth of Snake River | 890 | 1,432 |
| Cumberland/Ohio River | 720 | 1,158 |
| Fraser/Strait of Georgia | 850 | 1,368 |
| Gila/Colorado River | 630 | 1,014 |
| Green (UT–WY)/Colorado River | 730 | 1,175 |
| Hamilton/Atlantic Ocean | 600 | 965 |
| James (ND–SD)/Missouri River | 710 | 1,142 |
| Kuskokwim/Kuskokwim Bay | 680 | 1,094 |
| Liard/Mackenzie River | 693 | 1,115 |
| Mackenzie/Arctic Ocean | 900 | 1,448 |
| Milk/Missouri River | 625 | 1,006 |
| Mississippi/Mouth of SW Pass | 2,348 | 3,778 |
| Mississippi, Upper/to Mouth of Missouri River | 1,171 | 1,884 |
| Mississippi–Missouri–Red Rock/Mouth of SW Pass | 3,710 | 5,969 |
| Missouri/Mississippi River | 2,315 | 3,725 |
| Missouri–Red Rock/Mississippi River | 2,533 | 4,076 |
| Mobile-Alabama–Coosa/Mobile Bay | 780 | 1,255 |
| North Canadian/Canadian River | 760 | 1,223 |
| North Platte/Platte River | 618 | 994 |
| Ohio/Mississippi River | 981 | 1,578 |
| Ohio–Allegheny/Mississippi River | 1,306 | 2,101 |
| Ottawa/St. Lawrence | 790 | 1,271 |
| Ouachita/Red River | 605 | 973 |
| Peace/Slave River | 1,195 | 1,923 |
| Pecos/Rio Grande | 735 | 1,183 |
| Red (OK–TX–LA)/Mississippi River | 1,270 | 2,043 |
| Rio Grande/Gulf of Mexico | 1,885 | 3,033 |
| St. Lawrence/Lake Ontario | 800 | 1,287 |
| Saskatchewan N./Lake Winnipeg | 1,100 | 1,770 |
| Saskatchewan S./Lake Winnipeg | 1,205 | 1,939 |
| Severn (Ontario)/Hudson Bay | 610 | 981 |
| Snake/Columbia River | 1,038 | 1,670 |
| Tanana/Yukon River | 620 | 998 |
| Tennessee/Ohio River | 652 | 1,049 |
| Tennessee–French Broad/Ohio River | 900 | 1,448 |
| White (AR–MO)/Mississippi River | 720 | 1,158 |
| Yellowstone/Missouri River | 671 | 1,080 |
| Yukon/Bering Sea | 1,979 | 3,185 |

*Note:* Comprises rivers 600 miles or more in length. Length represents distance to designated outflow from (a) original headwater of named river where name applies to entire length of channel, or (b) upper limit of channel so named, usually the junction of two tributaries or headwater streams.

**Table 5A.5 Flowing Water Resources of the United States**

| Stream Order[a] | Number Streams | Average Length Miles | Total Length Miles (L) | Drainage Area Sq. Miles ($A_d$) | Mean Flow For Area Drained (CFS) | Mean Width Feet (W) | Mean Depth Feet (D) | Mean Velocity ft/sec (V) | Calculated Discharge CFS = WDV | Total Surface Area, $A_s$Sq. Miles (thousands) | Total Channel Storage Acre Feet (millions) |
|---|---|---|---|---|---|---|---|---|---|---|---|
| 1 | 1,570,000 | 1 | 1,570,000 | 1 | 0.65 | 4 | 0.15 | 1.0 | 0.60 | 1.2 | 0.11 |
| 2 | 350,000 | 2.1 | 810,000 | 4.7 | 3.1 | 10 | 0.29 | 1.3 | 3.7 | 1.5 | 0.29 |
| 3 | 80,000 | 5.3 | 420,000 | 23 | 15.0 | 18 | 0.58 | 1.5 | 15.6 | 1.4 | 0.53 |
| 4 | 18,000 | 12 | 220,000 | 109 | 71.0 | 37 | 1.10 | 1.8 | 73 | 1.5 | 1.1 |
| 5 | 4,200 | 28 | 116,000 | 518 | 340 | 75 | 2.20 | 2.3 | 380 | 1.6 | 2.4 |
| 6 | 950 | 64 | 61,000 | 2,500 | 1,600 | 160 | 4.1 | 2.7 | 1,800 | 1.8 | 4.9 |
| 7 | 200 | 147 | 30,000 | 12,000 | 7,600 | 320 | 8.0 | 3.3 | 8,500 | 1.8 | 9.3 |
| 8 | 41 | 338 | 14,000 | 56,000 | 36,000 | 650 | 15.0 | 3.9 | 38,000 | 1.7 | 16.5 |
| 9 | 8 | 777 | 6,200 | 260,000 | 171,000 | 1,300 | 29.0 | 5.6 | 211,000 | 1.5 | 28.3 |
| 10 | 1 | 1,800 | 1,800 | 1,250,000 | 810,000 | 2,800 | 55.0 | 5.9 | 900,000 | 1.0 | 34.3 |
| Total | 2,023,000 | | 3,249,000 | | | | | | | 15.0 | 97.0 |

*Note:* Based on stream order and channel morphology.

[a] Stream order classification based on river characteristics. A first order stream has no tributary channels; a second order stream is formed when two first order streams merge. When two second order streams merge, a third order stream is formed, and so on, downstream in the drainage basin until the water is discharged to the sea.

**Table 5A.6 Velocity of Low Flows and Average Length of Streams in the United States**

| Water Resource Region | Mean Velocity (mi/hour) | Average Stream Length (miles) | Mean Depth at Velocities Given in Col. 1 (ft) | Mean Flow at Velocity Given in Col. 1 ($ft^3$/sec) |
|---|---|---|---|---|
| New England | 1½ | 100 | 4.0 | 1,500 |
| Delaware-Hudson | 1½ | 75 | 3.0 | 500 |
| Eastern Great Lakes | 1½ | 50 | 3.0 | 800 |
| Western Great Lakes | 1½ | 50 | 3.0 | 800 |
| Chesapeake Bay | 1½ | 75 | 5.0 | 2,500 |
| Ohio | 1 | 100 | 4.0 | 1,500 |
| Cumberland | 1½ | 100 | 3.0 | 500 |
| Tennessee | 1½ | 75 | 4.0 | 1,200 |
| Southeast | 1½ | 150 | 5.0 | 2,500 |
| Upper Mississippi | 1 | 150 | 3.0 | 500 |
| Lower Mississippi | 1½ | 150 | 4.0 | 1,200 |
| Upper Missouri | 1½ | 250 | 3.0 | 500 |
| Lower Missouri | 1 | 125 | 3.5 | 900 |
| Upper Arkansas, Red | 1½ | 200 | 2.0 | 200 |
| Lower Arkansas, Red, and White | 1½ | 175 | 3.5 | 1,000 |
| Western Gulf | 1 | 300 | 4.0 | 1,500 |
| Rio Grande and Pecos | 1½ | 150 | 1.5 | 100 |
| Colorado | 1 | 150 | 2.0 | 300 |
| Great Basin | 1 | 100 | 1.0 | 50 |
| Pacific Northwest | 1 | 150 | 4.0 | 1,500 |
| Central Pacific | 1½ | 100 | 4.0 | 1,500 |
| South Pacific | | 50 | 0.5 | 20 |

*Note:* Velocities are estimated for discharges which are exceeded 95 percent of the time. Stream lengths are estimated for representative streams in each region. For location of river basins see Figure 2.6.

| | 22. North Shore-Gaspé | 6,437 | 8,706 | 10,980 |
| | 23. St. John-St. Croix[e] | 507 | 779 | 1,050 |
| | 24. Maritime Coastal | 2,079 | 3,081 | 4,085 |
| | 25. Newfoundland-Labrador | 6,908 | 9,324 | 11,739 |
| Canada | | 75,856 | 105,135 | 134,674 |

*Note:* For map of river basin regions see Figure 2.8.

[a] From recorded flows except in Prairie basins where natural flows have been estimated.
[b] Flow equalled or exceeded in 19 years out of 20.
[c] Flow equalled or exceeded in 1 year out of 20.
[d] Excludes flow transferred into neighboring basin region; because this flow is recorded in importing basin, transfers have little effect on national total.
[e] Excludes inflow from United States portion of basin region.
[f] Excludes inflow from upper basin region.

*Note:* Lakes are arranged by states; the Great Lakes are excluded.

[a] May be salt water.
[b] California and Nevada.
[c] Mildly saline, less than 1,000 ppm.
[d] Idaho and Utah.
[e] 136 sq. mi including Mud Lake.
[f] Submerged marsh.
[g] Originally brackish; now kept fresh by controls on salt water intrusion.
[h] Louisiana and Texas.
[i] Shrinks to small area at extremely low stages.
[j] Includes Ripogenus and Caribou.
[k] Maine and Quebec.
[l] Maine and New Hampshire.
[m] Michigan and Ontario.
[n] Formerly called Pine.
[o] Minnesota and Ontario.
[p] Minnesota and Wisconsin.
[q] Minnesota and South Dakota.
[r] At normal high water; 188 sq. mi at medium low water; lake regulated for power between these limits.
[s] Includes 4 islands having area of about 1 sq. mi.
[t] New York, Vermont, and Quebec.
[u] Includes islands totaling about 55 sq. mi.
[v] The lake originally landlocked, was drained and provided with outlet and is fresh water; level regulated to some extent by control works on canals draining the area.
[w] At upper level; dam at outlet allows regulation so that area varies between 93 and 142 sq. mi.
[x] Includes islands totaling 3 sq. mi.
[y] Enlarged by dam; original area, 30 sq. mi.

**Table 5B.14 Selected Facts about the Great Lakes System**

| Outlet | Remarks |
|---|---|
| St. Marys River to Lake Huron | Largest surface area of all the freshwater lakes in the world. Outflow controlled by St. Marys River Compensating works |
| Straits of Mackinac to Lake Huron | Sixth largest surface area of world's freshwater lakes |
| St. Clair River to Lake St. Clair | Fifth largest surface area of world's freshwater lakes |
| Detroit River to Lake Erie | Shallowest lake in the Great Lakes system |
| Niagara River and Falls to Lake Ontario | Eleventh largest surface area of world's freshwater lakes |
| St. Lawrence River to Atlantic Ocean | Outflow controlled by St. Lawrence Seaway and Power Project |

**Table 5B.17 Principal Saline Lakes of the United States**

| Lake | Present Area (sq. mi) | Remarks |
|---|---|---|
| **California** | | |
| Salton Sea | 350 | About 650 sq. mi at highest stage in 1905–07 |
| Owens | Dry at times each year since 1943 | 110 sq. mi in 1872, prior to diversions from Owens River; 35 sq. mi in 1943 |
| Mono | 76 | Maximum, 89 sq. mi in 1919 |
| Goose (in California and Oregon) | About 100 | Maximum, 186 sq. mi, 125 in California and 61 in Oregon; overflowed into Pitt River in 1869 and 1881; dry in 1930; 150 sq. mi in 1958 |
| Eagle | 41 | Some question as to whether Eagle Lake should be considered saline or fresh water. It has no surface outlet (Martin, 1962), but since 1924 it has been tapped by tunnel to Willow Creek. Salinity is considerably less than 1,000 ppm, according to California Dept. of Water Resources. During period 1895–1925 lake rose to highest level since at least 1650 (Harding, 1935); rise believed due to closing of subterranean outlet by earthquake in 1890 (Antevs, 1938) |
| Honey | Dry | 90 sq. mi in 1867, possibly higher in 1890; dry in 1903; high in 1904; dry in 1924. Contained some water April 1958 to September 1960, and early in 1962 |
| **Louisiana** | | |
| Pontchartrain | 625 | These lakes are connected with the Gulf of Mexico, and are subject to tidal fluctuation |
| Sabine (Louisiana and Texas) | 95 | As above |
| Calcasieu | 90 | As above |
| Maurepas | 90 | As above |
| Salvador | 70 | As above |
| **Nevada** | | |
| Pyramid | 180 | Maximum size, 220 sq. mi. Low until 1860; reached extreme high level in 1862 and 1868 or 1869; nearly as high in 1890; began to drop in 1917 (Hardman and Venstrom, 1941) |
| Walker | 107 | Maximum size, 125 sq. mi |
| Winnemucca | Dry | Maximum size, 180 sq. mi. Dry in 1840, but began to fill shortly thereafter (Zones, 1961). According to Russell (1885) the lake rose more than 50 ft and approximately doubled its area between 1867 and 1882. Was 87 ft deep in 1882. Dry since 1945 |
| Carson | Nearly dry | Maximum size, 41 sq. mi. A few water-filled pot holes remain. Once called South Carson Lake; received flow of Carson River before Lahontan Reservoir was built |

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 5B.17 (Continued)**

| Lake | Present Area (sq. mi) | Remarks |
|---|---|---|
| Carson Sink | Dry | A shallow playa some 250 sq. mi in area shown on some maps as a body of water. Russell (1885) called it North Carson Lake. Dry in 1882, but probably has had some water at times since. Once received water from both Carson and Humboldt Rivers |
| Ruby | | Maximum size, 37 sq. mi. Shown as swamp on recent maps of Army Map Service and Nevada Dept. of Highways |
| Franklin | | Maximum size, 32 sq. mi. Shown as swamp on recent maps of the Army Map Service and Nevada Dept. of Highways |
| **North Dakota** | | |
| Devils | 24 | 140 sq. mi in 1867; 70 sq. mi in 1883; 45 sq. mi in 1900; 10 sq. mi in 1940. Since 1940 lake has been rising |
| **Oregon** | | |
| Malheur and Harney | Probably dry | Malheur, the larger of the two lakes, overflows into Harney, which has no outlet. Maximum combined size, 125 sq. mi. Reported dry in 1931; high in late 1950s; about 1 sq. mi in 1961, and expected to go dry in 1962 |
| Goose (see California) | | |
| Abert | 52 | Maximum size, 60 sq. mi. Dry in 1930 or thereabouts, but fairly high in 1958 |
| Summer | Probably dry | Maximum size, 70 sq. mi. Nearly dry in 1961 |
| Silver | Dry | Maximum size, 15 sq. mi. Dry in 1961. Because of the transient nature of the lake, the water—whenever there is any—is relatively fresh; hay is raised on the dry lake bed |
| Warner | Probably less than 10 | A series of shallow lakes; combined area about 30 sq. mi in 1953, a wet year, estimated from Army Map Service map based on aerial photograph taken in 1953. Present lakes are all that is left of Pleistocene Warner Lake, which covered about 300 sq. mi and was about 270 ft deep |
| **Utah** | | |
| Great Salt | About 1,000 | Maximum size since 1851, 2,400 sq. mi in 1870s; minimum, 950 sq. mi in October 1961; seasonal high in 1962 was 1,050 sq. mi in June |
| Sevier | Dry | Maximum size, 125 sq. mi; has been dry for several years |

*Source*: From U.S. Geological Survey, 1963.

**Table 5B.18 Hydrologic Data for Great Salt Lake and West Desert Pumping Project**

| | |
|---|---|
| **Great Salt Lake** | |
| Dimensions | 80×35 mi |
| Average depth | 22 ft |
| Maximum depth | 42 ft |
| Contents in dissolved minerals (mainly chloride, sodium, sulfate, magnesium, potassium with lesser amounts of calcium, lithium, bromium and boron[a]) | 4–5 billion tons |
| **West Desert Pumping Project** | |
| Flood control project by State of Utah to lower water level of Great Salt Lake | |
| Start of construction July 1986 | |
| Cost of construction and 1st year of operation | 71.7 million |
| Projected volume of diversion | 2.73 million acre ft total |
| Water is lifted by 3 large pumps (capacity 1,000 cfs each) through 4.1 mi long outlet canal to evaporation pond (west pond) | |
| Surface area of west pond | 500 sq. mi |
| Rate of evaporation from west pond | 825,000 acre-ft/yr |
| Salinity of water in west pond | 350 g/L |

Rock and earthfill Southern Pacific Transportation Co. railroad causeway separates the lake into two parts, Southern part of lake (60% of total area) receives 90% of lake's freshwater inflow, Total annual inflow 1931–76 averaged 2.9 million acre-ft, Northern part of lake receives most of its water as brine flowing through culverts and causeway from southern part of lake, Lake salinity varies with lake level, Northern lake is 16% salt and about 3 times saltier than southern lake (June 1987).

[a] For chemical analysis of brine see Chapter 6 Table 6.8.

*Note:* These lakes occupy topographic sinks with no discharges by surface streams or seepage and with a groundwater gradient toward the lake.

[a] Coefficient of variation of lake area is equal to the standard deviation of lake volume divided by the area of the lake.
[b] Response time is the ratio of a change in lake volume to the corresponding change in rate of discharge.
[c] Net evaporation is gross evaporation minus precipitation.
[d] Before 1924.
[e] Milligrams per liter.

**Table 5D.26 (Continued)**

| Location | Area (sq. km) | |
|---|---|---|
| | Meier (1961a) | More Recent Source, Where Available |
| Idaho | | |
| 24. Sawtooth Mountains | — | 1.0[h]* |
| Utah | | |
| 25. Wasatch Mountains | — | 0.2[i] |
| Nevada | | |
| 26. Wheeler Peak | 0.2 | 0.2 |

*Note:* Glacier areas in the first column are taken from Meier (1961a); dashes mean not determined by Meier. Glacier areas in the second column are from Meier (1961a) where a more recent source is not available. The change in area between 1961 and the more recent source is normally due to a more complete data set rather than a true change. An asterisk indicates that the value is estimated.

[a] The region bounded by the Canadian border on the north, Snoqualmie Pass on the south, the Puget Lowlands on the west, and the Columbia and Okanogan Rivers on the east.
[b] Post and Others, 1971.
[c] Spicer, 1986.
[d] Driedger and Kennard, 1986.
[e] Brugman and Meier, 1981. Before/after eruption of 18 May 1980.
[f] Raub and Others, 1980; unpub. data. The 50 $km^2$area includes glaciers plus moraine-covered ice; the 63 $km^2$ area includes glaciers, moraine-covered ice, and small ice bodies not large enough to be considered glaciers.
[g] Graf, 1977.
[h] Estimated; various observers have reported numerous small glaciers.
[i] Timpanogos Cave, Utah, USGS 1:24,000-scale topographic map.

*Note:*
- NR: Record number
- Glacier Name: 15 alphabetic or numeric digits
- PSFG Number: 5 digits identifying glacier with alphabetic prefix denoting country
- Method:
  - A = aerial photogrammetry
  - B = terrestrial photogrammetry
  - C = geodetic ground survey (theodolite, tape etc.)
  - D = combination of a, b, or c
  - E = other methods or no information
- 1ST Survey: Day, month, and year of survey
- 2ND Survey: Day, month, and year of following survey
- Variation in Meters: Variation in the position of the glacier front in horizontal projection expressed as the change in length between the surveys
- Key to Symbols:
  - +X: Glacier in advance
  - −X: Glacier in retreat
  - ST: Glacier stationary
  - SN: Glacier front covered by snow

*Note:*
- NR: Record number
- Glacier Name: 15 alphabetic or numeric digits
- PSFG Number: 5 digits identifying glacier with alphabetic prefix denoting country
- Method:
  - A = aerial photogrammetry
  - B = terrestrial photogrammetry
  - C = geodetic ground survey (theodolite, tape etc.)
  - D = combination of a, b or c
  - E = other methods or no information
- 1ST Survey: Year when glacier was first surveyed
- Last Survey: Last survey before reported period
- Variation in Meters: Variation in the position of the glacier front in horizontal projection expressed as the change in length between the surveys
- Key to Symbols:
  - +X: Glacier in advance
  - −X: Glacier in retreat
  - ST: Glacier stationary
  - SN: Glacier front covered by snow

*Note:*
NR — Record number
Glacier Name — 15 alphabetic or numeric digits
Period From To — Period in which the changes take place
Altitude — Altitude interval in meters above sea level
Area Mean — Mean area of altitude interval for period of change (thousand square meters)
Area Change — Change in area of altitude interval for period of change (thousand square meters)
Volume Change — Change in volume of altitude interval for period of change (thousand cubic meters)
Thick Change — Change in thickness of altitude interval for period of change (millimeters)

## SECTION 5E FLOODS

[In thousands of cfs; for a typical 300 $mi^2$ (780 $km^2$) drainage basin; a mean annual flood is one that will be exceeded in about half the years; the probability of a mean annual flood in any given year is about 50%]

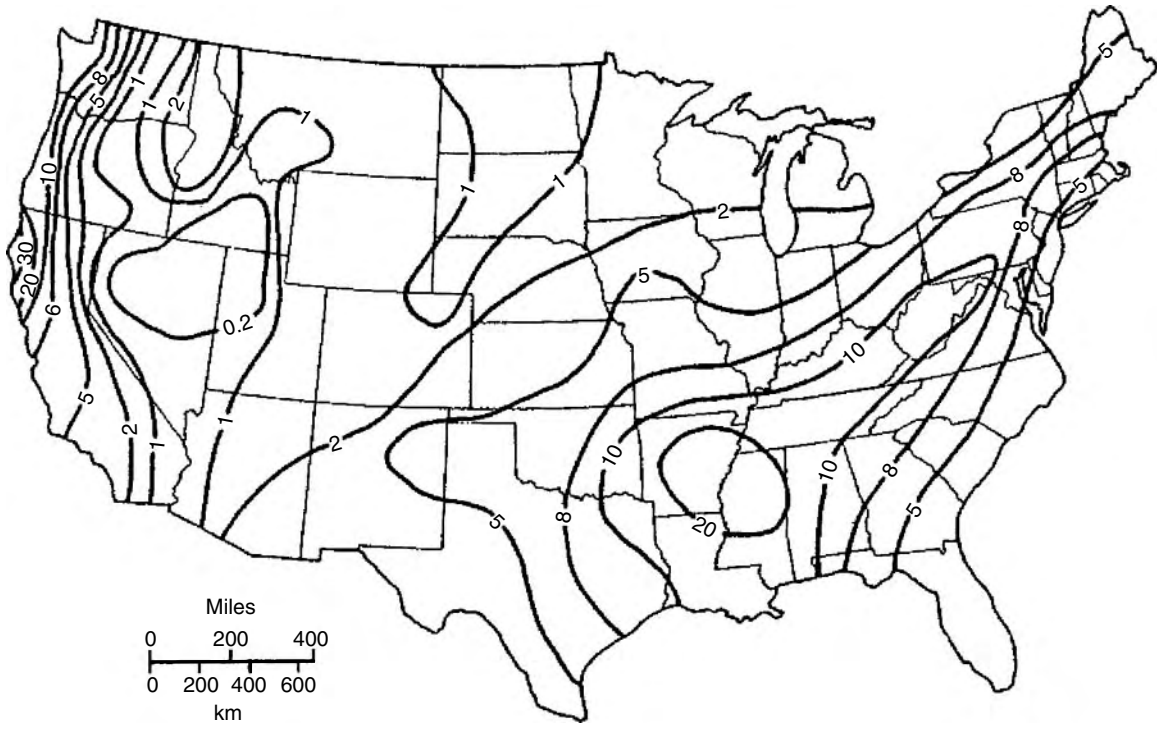

**Figure 5E.15** Mean annual flood potential in the United States. (From U.S. Geological Survey, National Atlas Map 121, 1965.)

© 2006 by Taylor & Francis Group, LLC

[In thousands of cfs; for a typical 300 $mi^2$ (780 $km^2$) drainage basin; a 10-year flood will be exceeded at irregular intervals that average 10 years; the probability of a 10-year flood in any given year is 10%]

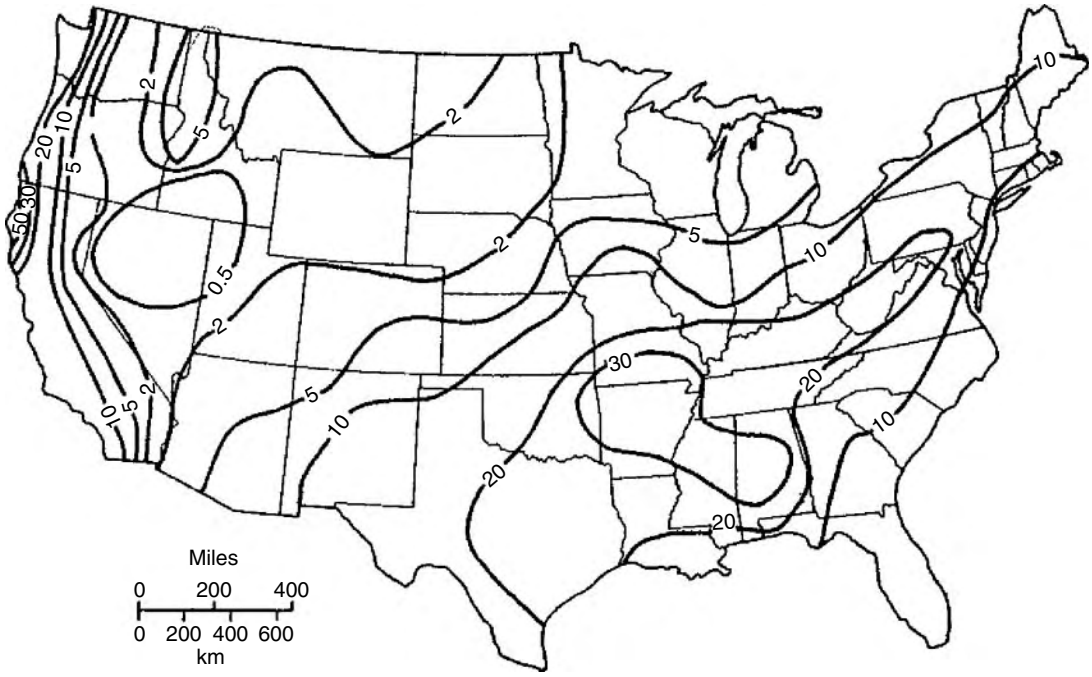

**Figure 5E.16** Ten-year flood potential in the United States. (From U.S. Geological Survey, National Atlas Map 121, 1965.)

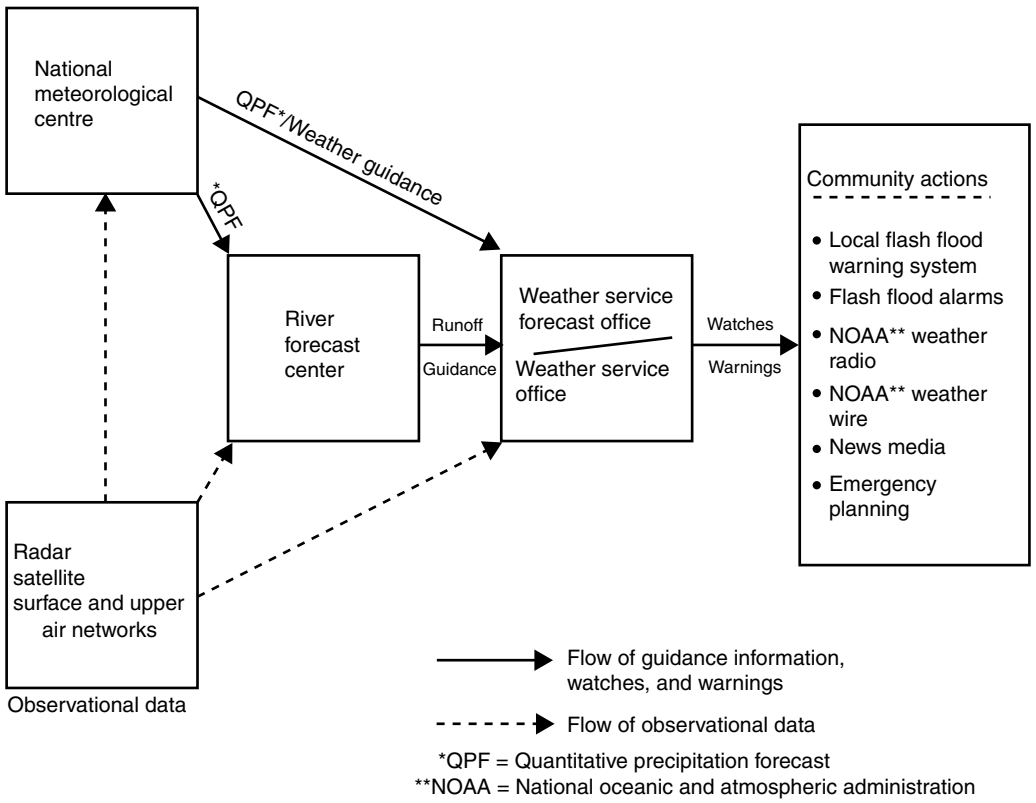

**Figure 5E.17** Flash flood warning system in the United States. (From National weather service, Operations of the national weather service. U.S. Department of Commerce, 1985.)

| Indiana | Ohio R. | 19.29 | 310 | 0 | 3 | 3 |
| Ohio | Ohio R. | 22.06 | 313 | 3 | 5 | 4 |
| Missouri | Upper Miss. | 25.42 | 3,577 | 0 | 7 | 12 |
| California | | 45.64 | 2,007 | 3 | 4 | 13 |
| Texas | | 77.44 | 691 | 1 | 1 | 16 |

[a] Estimates of maximum damage can be misleading. For example, in Idaho the maximum was caused by failure of the Teton Dam in 1976; the worst damage directly from precipitation and streamflow is estimated at $120 million. In Texas, the maximum appears small but much greater damage occurred in a year not covered by this table ($3.76 billion in 1979). States are ordered by increasing median damage. Missing estimates are treated as zero; all estimates are in millions of 1995 dollars.

**Table 5E.43 Major Natural Disasters in the United States, 1965–1985**

| Type of Disaster | Number | Federal Outlay (thousands of current dollars) | Federal Outlay (thousands of 1982 dollars) |
|---|---|---|---|
| Ice and snow events | 19 | 151,427 | 205,511 |
| Hurricanes/tropical storms | 39 | 1,173,141 | 1,947,939 |
| Earthquakes | 7 | 203,881 | 405,706 |
| Dam and levee failures | 7 | 55,764 | 80,806 |
| Rains, storms & flooding[a] | 337 | 1,684,702 | 2,439,852 |
| High winds & waves | 2 | 125,313 | 120,536 |
| Coastal storms & flooding | 7 | 158,261 | 205,357 |
| Tornadoes | 109 | 441,685 | 648,352 |
| Drought/water shortage | 4 | 1,134 | 5,344 |
| Totals | 531 | 3,995,308 | 6,059,403 |

*Note:* Federally-declared disasters, by type.

[a] Includes land, mud, and debris flows and slides.

**Table 5E.44 No. 375. Major U.S. Weather Disasters: 1990–2003**

| Event | Description | Estimated cost | | |
|---|---|---|---|---|
| | | Time period | (bill. dot.) | Deaths |
| Southern California wildfires | Dry weather, high winds, and resulting wildfires in southern CA burned 743,000 acres & destroyed 3,700 homes | Oct–early Nov 2003 | 2.5 | 22 |
| Hurricane Isabel | Category 2 hurricane makes landfall in eastern NC, causing damage along coasts of NC, VA, and MD with wind damage and flooding in NC, VA, MD, DE, WV, NJ, NY and PA | September 2003 | over 4 | 47 |
| Midwest severe storms and tornadoes | Numerous tornadoes over the Midwest, MS River valley, and OH/TN River valleys with record 400 tornadoes in one week | Early May 2003 | over 3.1 | 41 |
| Storms and hail | Sever storms and large hail over southern plains, lower MS River valley, and TX | Early April 2003 | over 1.6 | — |
| Widespread drought | Moderate to extreme drought over large portions of 30 states | Spring to fall 2002 | over 10 | — |
| Western fire season | Major fires over 11 western states from Rockies to west coast | Spring to fall 2002 | over 2 | 21 |
| Tropical Storm Allison | Tropical storm produced rainfall and severe flooding in coastal portions of TX & LA & damage in MS, FL, VA. and PA | June 2001 | 5.0 | 43 |
| Midwest and Ohio Valley hail and tornadoes | Storms, tornadoes, and hail in TX, OK, KS, NE, IA, MO, IL, IN, WI, MI, OH, KY, and PA | April 2001 | 1.7 | 3 |
| Southern drought/heat wave | Severe drought and heat over south-central and southeast states cause significant losses in agriculture and related industries | Springer-summer 2000 | over 4.0 | 140 |
| Western fire season | Severe fire season in western states | Spring-summer 2000 | over 2.0 | — |
| Hurricane Floyd | Category 2 hurricane in NC, causing severe flooding in NC and some flooding in SC, VA, MD, PA, NY, NJ, DE, RI, CT, MA, and VT | September 1999 | 6.0 | 75 |
| Drought/heat wave | Drought/heatwave over eastern U.S. | Summer 1999 | 1.0 | 256 |
| Oklahoma-Kansas tornadoes | Category F4–F5 tornadoes hit OK, KS, TX, and TN | May 1999 | 1.0 | 55 |
| Arkansas-Tennessee tornadoes | Two outbreaks of tornadoes in 6-day period | January 1999 | 1.3 | 31 |
| Texas flooding | Severe flooding in southeast Texas from 2 heavy rain events with 10–20 in. totals | Oct–Nov 1998 | 1.0 | 31 |
| Hurricane Georges | Category 2 hurricane in Puerto Rico, Florida Keys, and Gulf coasts fo LA, MS, AL, and FL | September 1998 | 3–4 | 16 |
| Hurricane Bonnie | Category 3 hurricane in eastern NC and VA | August 1998 | 1.0 | 2 |
| Southern drought/heat wave | Severe drought and heat wave from TX/OK to the Carolinas | Summer 1998 | 6.0 | 200 |
| Minnesota severe storms/hail | Very damaging severe thunderstorms with large hail over wide areas of Minnesota | May 1998 | 1.5 | 1 |
| Southeast severe weather | Tornadoes and flooding related to strong El Nino in the southeast | Winter/Spring 1998 | 1.0 | Over 130 |
| Northeast ice storm | Intense ice storm hits ME, NH, VT, and NY | January 1998 | 1.4 | 16 |
| Northern plains flooding | Severe flooding in Dakotas and Minnesota due to heavy spring snowmelt | April–May 1997 | 2.0 | 11 |
| MS and OH valleys flooding and tornadoes | Tornadoes and severe flooding hit the slates of AR, MO, MS, TN, IL, IN, KY, OH, and WV | March 1997 | 1.0 | 67 |
| West Coast flooding | Flooding from rains and snowmelt in CA, WA, OR, ID, NV, & MT | Dec 1996–Jan 1997 | 2–3 | 36 |
| Hurricane Fran | Category 3 hurricane in NC and VA | Sep 1996 | 5.0 | 37 |
| Southern Plains severe drought | Drought in agricultural areas of TX & OK | Fall 1995-summer 1996 | Over 4 | (NA) |
| Pacific Northwest severe flooding | Flooding from heavy rain & snowmelt in OR, WA, ID, and MT. | Feb 1996 | 1.0 | 9 |
| Blizzard of ’96 followed by flooding | Heavy snowstorm followed by severe flooding in Appalachians, Mid-Atlantic, and Northeast | Jan 1996 | 3.0 | 187 |
| Hurricane Opal | Category 3 hurricane in FL, AL, parts of GA, TN, & Carolinas. | Oct 1995 | Over 3 | 27 |
| Hurricane Marilyn | Category 2 hurricane in Virgin Islands | Sep 1995 | 2.1 | 13 |
| TX/OK/LA/MS severe weather and flooding | Flooding, hail, & tornadoes across TX, OK, parts of LA, MS, Dallas & New Orleans hardest hit | May 1995 | 5–6 | 32 |

© 2006 by Taylor & Francis Group, LLC

| | | | | |
|---|---|---|---|---|
| California flooding | Flooding from frequent winter storms across much of CA | Jan–Mar 1995 | 3.0 | 27 |
| Western Fire Season | Severe fire season in western states due to dry weather | Summer-Fall 1994 | 1.0 | (NA) |
| Texas flooding | Flooding from torrential rain & thunderstorms across southeast TX | Oct 1994 | 1.0 | 19 |
| Tropical Storm Alberto | Flooding due to 10–25 inch rain across GA, AL, part of FL intense ice storm in pts of TX, OK, AR, LA, MS, AL, TN, GA, | July 1994 | 1.0 | 32 |
| Southeast ice storm | SC, NC, & VA | Feb 1994 | 3.0 | 9 |
| California wildfires | Out-of-control wildfires over southern CA | Fall 1993 | 1.0 | 4 |
| Midwest flooding | Extreme flooding across central U.S. | Summer 1993 | 15–20 | 48 |
| Drought/heat wave | Extreme drought/heatwave across southeastern U.S. | Summer 1993 | 1.0 | (NA) |
| Storm/blizzard | "Storm of the Century" hits entire eastern seaboard | Mar 1993 | 3–6 | 270 |
| Nor'easter of 1992 | Slow-moving storm batters northeast U.S. coast, New England. | Dec 1992 | 1–2 | 19 |
| Hurricane Iniki | Category 4 hurricane hit Hawaiian Island of Kauai | Sep 1992 | 1.8 | 7 |
| Hurricane Andrew | Category 4 hurricane hit FL & LA | Aug 1992 | 27.0 | 58 |
| Oakland Firestorm | Oakland, CA firestorm due to low humidity & high winds | Oct 1991 | 1.5 | 25 |
| Hurricane Bob | Category 2 hurricane-mainly coastal NC, Long Island, & New England | Aug 1991 | 1.5 | 18 |
| TX/OK/LA/AR Flooding | Torrential rains cause flooding along Trinity, Red, and Arkansas rivers | May 1990 | 1.0 | 13 |

*Note:* 5.0 represents $5,000,000,000. Covers only weather related disasters costing $1 billion or more. — Represents zero. NA not available or not reported. $del.

## SECTION 5F FLOOD PREVENTION

**Table 5F.48 Strategies and Tools for Achieving Flood Hazard Reduction**

**Nonstructural**

A. Modify susceptibility to flood damage and disruption
- 1. Floodplain regulations
  - a. State regulations for flood hazard areas
  - b. Local regulations for flood hazard areas
    - (1) Zoning
    - (2) Subdivision regulations
    - (3) Building codes
    - (4) Housing codes
    - (5) Sanitary and well codes
    - (6) Other regulatory tools
- 2. Development and redevelopment policies
  - a. Design and location of services and utilities
  - b. Land-right acquisition and open-space use
  - c. Redevelopment and renewal
  - d. Permanent evacuation
- 3. Disaster preparedness and response planning
- 4. Floodproofing
- 5. Flood forecasting and warning systems and emergency plans

B. Modify the impact of flooding on individuals and the community
- 1. Information and education
- 2. Flood insurance
- 3. Tax adjustments
- 4. Flood emergency measures
- 5. Postflood recovery

**Structural**

C. Modify flooding
- 1. Dams and reservoirs
- 2. Dikes, levees, and floodwalls
- 3. Channel alterations
- 4. High-flow diversions and spillways
- 5. Land treatment measures
- 6. On-site detention measures

*Source*: From U.S. Water Resources Council, 1981.

© 2006 by Taylor & Francis Group, LLC

**Table 5F.49 Structural Adjustments as Floodproofing Measures**

| Measure | Material Protected | Class of Measure | Prerequisites | |
|---|---|---|---|---|
| | | | Structural | Hydrologic |
| Seepage control | St–Co | P–C | Well constructed | None |
| Sewer adjustment | St–Co | P–C | None | H–W |
| Permanent closure | St–Co | P | Impervious walls | H–S |
| Openings protected | St–Co | C–E | Impervious walls | H–S–W |
| Interiors protected | St | P–C | None | S–W |
| Protective coverings | St–Co | P–C–E | None | H–W–F |
| Fire protection | St–Co | P | None | None |
| Appliance protection | Co | E | None | W |
| Utilities service | Co | P–C–E | None | S–W–V |
| Roadbed protection | St | P–E | Sound structure | H–W–V–D |
| Elevation | St–Co | P–C–E | Sound structure | S–W–V–F |
| Temporary removal | Co | E | None | W–F |
| Rescheduling | Co | E | Alternatives | W |
| Proper salvage | Co | — | None | None |
| Watertight caps | Co | P–C | None | W |
| Proper anchorage | St–Co | P–C | Sound structure | S–W–V–D |
| Underpinning | St | P | Sound structure | V |
| Timber treatment | St | P | None | None |
| Deliberate flooding | St–Co | E | None | None |
| Structural design | St–Co | P | Design | H–S |
| Reorganized use | Co | P | Alternatives | None |

St = structure; P = permanent; H = hydrostatic pressure; F = flood-to-peak interval; Co = content; C = contingent; S = stage of flood; V = velocity of flow; E = emergency; W = warning; D = duration of flood.

*Source*: From Schaeffer, Univ. Chicago, Dept. Geography Research Paper, 1960.

**Table 5F.50 Flood Safety Rules**

**Before the Flood**

1. Keep on hand materials like sandbags, plywood, plastic sheeting, and lumber
2. Install check valves in building sewer traps, to prevent flood water from backing up in sewer drains
3. Arrange for auxiliary electrical supplies for hospitals and other operations which are critically affected by power failure
4. Keep first aid supplies at hand
5. Keep your automobile fueled; if electric power is cut off, filling stations may not be able to operate pumps for several days
6. Keep a stock of food which requires little cooking and no refrigeration; electric power may be interrupted
7. Keep a portable radio, emergency cooking equipment, lights and flashlights in working order

**When You Receive a Flood Warning**

8. Store drinking water in clean bathtubs, and in various containers. Water service may be interrupted
9. If forced to leave your home and time permits, move essential items to safe ground; fill tanks to keep them from floating away; grease immovable machinery
10. Move to a safe area before access is cut off by flood water

**During the Flood**

11. Avoid areas subject to sudden flooding
12. Do not attempt to cross a flowing stream where water is above your knees
13. Do not attempt to drive over a flooded road—you can be stranded, and trapped

**After the Flood**

14. Do not use fresh food that has come in contact with flood waters
15. Test drinking water for potability; wells should be pumped out and the water tested before drinking
16. Seek necessary medical care at nearest hospital. Food, clothing, shelter, and first aid are available at Red Cross shelters
17. Do not visit disaster area; your presence might hamper rescue and other emergency operations
18. Do not handle live electrical equipment in wet areas; electrical equipment should be checked and dried before returning to service
19. Use flashlights, not lanterns or torches, to examine buildings; flammables may be inside
20. Report broken utility lines to appropriate authorities

During any flood emergency, stay tuned to your radio or television station. Information from NOAA and civil emergency forces may save your life.

**Table 5F.51 Methods of Flood Control and Organization**

Solutions for the flood problem fall into two distinct classes. The first includes those aimed at preventing the overflow of valley lands. The second embraces measures for human adjustment to the flood hazard

The overflow of the valley lands may be prevented, or reduced in frequency and extent, by

1. Providing an additional or an alternative channel to carry flood flows;
2. Increasing the capacity of the existing channel, so that the same flood may be passed downstream at lesser heights, thus reducing flood damages—a solution commonly known as channel improvement;
3. Reducing flood heights and damages by holding back a part of the floodwaters by means of reservoirs;
4. Constructing levees and flood walls to prevent the spread of floodwaters, or
5. Any combination of the above.

Measures of the second class, aimed at adjustment to the hazard include

1. Zoning of the flood plain to inhibit the development of high damageable values in hazardous areas;
2. Abandonment of efforts to use parts of the flood plain;
3. Use of flood forecasting so that damage may be minimized by removal of people and movable property;
4. Use of flood insurance, not to reduce flood damages, but to spread out the cost of floods over a period of years and thus minimize economic shock;
5. Flood relief in the event of disasters.

*Source*: From Task Force on Water Resources and Power, 1955.

## SECTION 5G FLOOD CONTROLS WORKS

**Table 5G.52 Upstream Flood Control Works in the United States**

| Region | Projects | Watershed Area | Flood Prevention Cost | | | |
|---|---|---|---|---|---|---|
| | | | Land Treatment | Reservoirs | Channel Improvement | Total |
| | *No.* | *1,000 acres* | *Mil. dol.* | *Mil. dol.* | *Mil. dol* | *Mil. dol.* |
| North Atlantic | 120 | 4,906 | 27.0 | 108.8 | 52.5 | 181.3 |

| Puerto Rico-Virgin Islands | 3 | 252 | 2.7 | 3.2 | 7.6 | 13.5 |
| Total | 1,129 | 70,869 | 602.5 | 1,046.8 | 467.3 | 2,089.6 |

*Note:* Data covers the existing and approved program of the Soil Conservation Service only. In addition, there have been many projects in upstream areas constructed by the Corps of Engineers, the Bureau of Reclamation, and the Bureau of Land Management. Neither the totals nor regional data are available, but this construction amounted to over 1,000 projects, with an estimated cost of about $1 billion.

| Oregon | 296 | 476 | 1,410 | 2,269 |
| Washington | 157 | 253 | 3,026 | 4,869 |
| **Arctic coast** | | | | |
| Alaska | 1,060 | 1,706 | 2,521 | 4,056 |

*Note:* — Represents zero.

[a] Figures are lengths of general outline of seacoast. Measurements were made with a unit measure of 30 min of latitude on charts as near the scale of 1:1,200,000 as possible. Coastline of sounds and bays is included to a point where they narrow to width of unit measure, and includes the distance across at such point.

[b] Figures obtained in 1939–1940 with a recording instrument on the largest-scale charts and maps then available. Shoreline of outer coast, offshore islands, sounds, bays, rivers, and creeks is included to the head of tidewater or to a point where tidal waters narrow to a width of 100 ft.

| Freshwater forested[f] | 51,929.6 | 50,728.5 | −1,201.1 |
| Freshwater shrub[g] | 17,235.2 | 18,365.6 | 1,130.4 |

*Note:* In thousands of acres (144,673.3 represents 144,677,300). Wetlands and deepwater habitats are defined separately because the term wetland does not included permanent water bodies. Deepwater habitats are permanently flooded land lying below the deepwater boundary of wetlands. Deepwater habitats include environments where surface water is permanent and often deep, so that water, rather than air, is the principal medium within which the dominant organisms live, whether or not they are attached to the substrate. As in wetlands, the dominant plants are hydrophytes; however, the substrates are considered nonsoil because the water is too deep to support emergent vegetation. In general terms, wetlands are lands where saturation with water is the dominant factor determining the nature of soil development and the types of plant and animal communities living in the soil and on its surface. The single feature that most wetlands share is soil or substrate that is at least periodically saturated with or covered by water. Wetlands are lands transitional between terrestrial and aquatic systems where the water table is usually at or near the surface or the land is covered by shallow water.

[a] The lacustrine system includes deepwater habitats with all of the following characteristics: (1) situated in a topographic depression or a dammed river channel: (2) lacking trees, shrubs, persistent emergents, emergent mosses or lichens with greater than 30 percent coverage; (3) total area exceeds 20 acres.

[b] The riverine system includes deepwater habitats contained within a channel, with the exception of habitats with water containing ocean derived salts in excess of 0.5 parts per thousand.

[c] The estuarine system consists of deepwater tidal habitats and adjacent tidal wetland that are usually semi-enclosed by land but have open, partly obstructed, or sporadic access to the open ocean, and in which ocean water is at least occasionally diluted by freshwater runoff from the land. Subtidal is where the substrate is continuously submerged by marine or estuarine waters.

[d] Intertidal is where the substrate is exposed and flooded by tides. Intertidal includes the splash zone of coastal waters.

[e] Emergent wetlands are characterized by erect, rooted herbaceous hydrophytes, excluding mosses and lichens. This vegetation is present for most of the growing season in most years. These wetlands are usually dominated by perennial plants.

[f] Forested wetlands are characterized by woody vegetation that is 20 ft tall or taller.

[g] Shrub wetlands include areas dominated by woody vegetation less than 20 ft tall. The species include true shrubs, young trees, and trees or shrubs that are small or stunted because of environmental conditions.

Wetlands occur in every state of the country and due to regional differences in climate, vegetation, soil and hydrologic conditions, they exist in a variety of sizes, shapes and types. Although more abundant in other areas, wetlands even exist in deserts.

Wetlands and deepwater habitats are divided into five ecological systems: (1) Marine, (2) Estuarine, (3) Riverine, (4) Lacustrine, and (5) Palustrine. The Marine System generally consists of the open ocean and its associated coastline. It is mostly a deepwater habitat system, with marine wetlands limited to intertidal areas like beaches, rocky shores and some coral reefs. The Estuarine System includes coastal wetlands like salt and brackish tidal marshes, mangrove swamps, and intertidal flats, as well as deepwater bays, sounds and coastal rivers. The Riverine System is limited to freshwater river and stream channels and is mainly a deepwater habitat system. The Lacustrine System is also a deep water dominated system, but includes standing waterbodies like lakes, reservoirs and deep ponds. The Palustrine System encompasses the vast majority of the country's inland marshes, bogs and swamps and does not include any deepwater habitat.

**Table 5H.58 Wetlands Lost in the United States**

| State or Region | Original Wetlands (acres) | Wetlands in 1984 (acres) | Percentage of Wetlands Lost |
|---|---|---|---|
| Iowa's natural marshes | 2,333,000 | 26,470 | 99 |
| California | 5,000,000 | 450,000 | 91 |
| Nebraska's rainwater basin | 94,000 | 8,460 | 91 |
| Mississippi alluvial plain | 24,000,000 | 5,200,000 | 78 |
| Michigan | 11,200,000 | 3,200,000 | 71 |
| North Dakota | 5,000,000 | 2,000,000 | 60 |
| Minnesota | 18,400,000 | 8,700,000 | 53 |
| Louisiana's forested wetlands | 11,300,000 | 5,635,000 | 50 |
| Connecticut's coastal marshes | 30,000 | 15,000 | 50 |
| North Carolina's pocosins | 2,500,000 | 1,503,000[a] | 40 |
| South Dakota | 2,000,000 | 1,300,000 | 35 |
| Wisconsin | 10,000,000 | 6,750,000 | 32 |

[a] Only 695,000 acres of pocosins remain undisturbed; the rest are partially drained, developed or planned for development.

**Table 5H.61 Major Causes of Wetland Loss and Degradation**

| |
|---|
| **Human Threats** |
| Direct |
| 1. Drainage for crop production, timber production and mosquito control |
| 2. Dredging and stream channelization for navigation channels, flood protection, coastal housing developments, and reservoir maintenance |
| 3. Filling for dredged spoil and other solid waste disposal, roads and highways, and commercial, residential and industrial development |
| 4. Construction of dikes, dams, levees and seawalls for flood control, water supply, irrigation and storm protection |
| 5. Discharges of materials (e.g., pesticides, herbicides, other pollutants, nutrient loading from domestic sewage and agricultural runoff, and sediments from dredging and filling, agricultural and other land development) into waters and wetlands |
| 6. Mining of wetland soils for peat, coal, sand, gravel, phosphate and other materials |
| Indirect |
| 1. Sediment diversion by dams, deep channels and other structures |
| 2. Hydrologic alterations by canals, spoil banks, roads and other structures |
| 3. Subsidence due to extraction of groundwater, oil, gas, sulphur, and other minerals |
| **Natural Threats** |
| 1. Subsidence (including natural rise of sea level) |
| 2. Droughts |
| 3. Hurricanes and other storms |
| 4. Erosion |
| 5. Biotic effects, e.g., muskrat, nutria and goose “eat-outs” |

**Table 6A.1 Occurrence of Aquifers in the United States**

| (1) Geologic Age and Rock Type | (2) Western Mountain Ranges | (3) Arid Basin | (4) Columbi Lava Plateau | (5) Colorado Plateau | (6) High Plains | (7) Unglaciated Central Region | (8) Glaciated Central Region | (9) Unglaciated Appalachian Region | (10) Glaciated Appalachian Region | (11) Atlantic and Gulf Coastal Plain | (12) Special Comments |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Cenozoic | | | | | | | | | | | |
| Quaternary | | | | | | | | | | | |
| Aluvium and related deposits (primarily. Recent and Pleistocene sediments and may include some of Pliocene age) | S and G deposits in valleys and along stream courses. Highly productive but not greatly developed — P to M | S and G deposits in valleys and along stream courses. Highly developed with local depletion. Storage large but perennial recharge limited-P | S and G deposits along streams, interbedded with basalt — I to M | U | S and G along water courses. Sand dune deposits — P (in part) | S and G along water courses and in terrace deposits — I (limited) | S and G along water courses — M | S and G along water courses and in terrace deposits. Not developed | | S and G along water courses and in terrace and littoral deposits, especially in the Mississippi and tributary valleys. Not highly developed in East and South. Some depletion in Gulf Coast — I | The most widespread and important aquifers in the United States. Well over one-half of all groundwater pumped in the United States is withdrawn from these aquifers. Many are easily available for artificial recharge and induced infiltration. Subject to saltwater contamination in coastal areas |
| Glacial drift, especially outwash (Pleisto-cene) | S and G deposits in northern part of region — I | S and G deposits especially in northern part of region and in some valleys — I | S and G outwash, especially in Spokane area — I | U | S and G outwash, much of it reworked (see above) — I | S and G outwash especially along northern boundary of region — I | S and G outwash, terrace deposits and lenses in till throughout region — P (in part) | S and G outwash in northern part. Not highly developed — M | S and G outwash, terrace deposits and lenses in till. Locally highly deve-loped — I | S and G outwash in Mississippi Valley (see above) — I | |
| Other Pleisto-cene sediments | Alluvial Fm and other basin deposits in the southern part — M to P (see Alluvium above) | | U | U | Alluviated plains and valley fills — M to I | | U | U | U | Coquina, limestone, sand, and marl Fms in Florida — M | |

**Table 6A.3 Basic Data Required for Groundwater Studies**

**A. Maps, Cross Sections, and Fence Diagrams**

1. Planimetric
2. Topographic
3. Geologic
   a. Structure
   b. Stratigraphy
   c. Lithology
4. Hydrologic
   a. Location of wells, observation wells, and springs
   b. Groundwater table and potentiometric contours
   c. Depth to water
   d. Quality of water
   e. Recharge, discharge, and contributing areas
5. Vegetative cover, location of wetlands
6. Soils
7. Aerial photographs

**B. Data on Wells and Springs**

1. Location, depth, diameter, types of well, and logs
2. Static and pumping water level, hydrographs, yield, specific capacity, quality of water
3. Present and projected groundwater development and use
4. Corrosion, incrustation, well interference, and similar operation and maintenance problems
5. Location, type, geologic setting, and hydrographs of springs
6. Observation well networks
7. Water sampling sites

**C. Aquifer Data**

1. Type, such as unconfined, artesian, or perched
2. Thickness, depths, and formational designation
3. Boundaries
4. Transmissivity, storativity, and permeability
5. Specific retention
6. Discharge and recharge
7. Ground and surface water relationships
8. Aquifer models

**D. Climatic Data**

1. Precipitation
2. Temperature
3. Evapotranspiration

**E. Surface Water**

1. Use
2. Quality
3. Runoff distribution, reservoir capacities, inflow and outflow data
4. Return flows, section gain or loss
5. Recording stations
6. Low flow data

**F. Environment**

1. Location of hazardous waste sites or other potential sources of pollution
2. Use of herbicides, pesticides, fertilizers, and road salt
3. Site history

**G. Local Drilling Facilities and Practices**

1. Size and types of drilling rigs locally available
2. Logging services locally available
3. Locally used materials, well designs, and drilling practices
4. State or local rules and regulations

The U.S. Geological Survey initiated the Regional Aquifer-System Analysis (RASA) Program in 1978 in response to Federal and State needs for information to improve management of the Nation's groundwater resources. The objective of the RASA Program is to define the regional geohydrology and establish a framework of background information—geologic, hydrologic, and geochemical—that can be used for regional assessment of groundwater resources and in support of detailed local studies. The program was completed in 1995.

A total of 25 aquifer systems were studied under the RASA Program.

## SECTION 6C WATER WELLS

© 2006 by Taylor & Francis Group, LLC

**Table 6C.9 Water Well Construction Methods and Applications**

| Method | Materials for Which Best Suited | Water Table Depth for Which Best Suited (m) | Usual Maximum Depth (m) | Usual Diameter Range (cm) | Usual Casing Material | Customary Use | Yield $m^3/day$[a] | Remarks |
|---|---|---|---|---|---|---|---|---|
| **Augering** Hand auger | Clay, silt sand, gravel less than 2 cm | 2–9 | 10 | 5–20 | Sheet metal | Domestic, drainage | 15–250 | Most effective for penetrating and removing clay. Limited by gravel over 2 cm. Casing required if material is loose |
| Power auger | Clay, silt sand, gravel less than 5 cm | 2–15 | 25 | 15–90 | Concrete, steel or wrought-iron pipe | Domestic, irrigation, drainage | 15–500 | Limited by gravel over 5 cm, otherwise same as for hand auger |
| **Driven Wells** Hand, air hammer | Silt, sand, gravel less than 5 cm | 2–5 | 15 | 3–10 | Standard weight pipe | Domestic, drainage | 15–200 | Limited to shallow water table, no large gravel |
| **Jetted Wells** Light, portable rig | Silt, sand, gravel less than 2 cm | 2–5 | 15 | 4–8 | Standard weight pipe | Domestic, drainage | 15–150 | Limited to shallow water table, no large gravel |
| **Drilled Wells** Cable tool | Unconsolidated and consolidated medium hard and hard rock | Any depth | 450[b] | 8–60 | Steel or wrought-iron pipe | All uses | 15–15,000 | Effective for water exploration. Requires casing in loose materials. Mudscow and hollow rod bits developed for drilling unconsolidated fine to medium sediments |
| Rotary | Silt, sand, gravel less than 2 cm; soft to hard consolidated rock | Any depth | 450[b] | 8–45 | Steel or wrought-iron pipe | All uses | 15–15,000 | Fastest method for all except hardest rock. Casing usually not required during drilling. Effective for gravel envelope wells |
| Reserve-circulation rotary | Silt, sand, gravel, cobble | 2–30 | 60 | 40–120 | Steel or wrought-iron pipe | Irrigation, industrial, municipal | 2500–20,000 | Effective for large-diameter holes in unconsolidated and partially consolidated deposits. Requires large volume of water for drilling. Effective for gravel envelope wells |
| Rotary-percussion | Silt, sand, gravel less than 5 cm; soft to hard consolidated rock | Any depth | 600[b] | 30–50 | Steel or wrought–iron pipe | Irrigation, industrial, municipal | 2500–15,000 | Now used in oil exploration. Very fast drilling. Combines rotary and percussion methods (air drilling) cuttings removed by air. Would be economical for deep water wells |

[a] Yield influenced primarily by geology and availability of groundwater.
[b] Greater depths reached with heavier equipment.

**Table 6C.10 Relative Performance of Different Drilling Methods in Various Types of Geologic Formations**

| Type of Formation | Cable Tool | Direct Rotary (with Fuids) | Direct Rotary (with Air) | Direct Rotary (Down-the-Hole Air Hammer) | Direct Rotary (Drill-Through Casing Hammer) | Reverse Rotary (with fluids) | Reverse Rotary (Dual Wall) | Hydr-aulic Percu-ssion | Jetting | Driven | Auger |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Dune sand | 2 | 5 | | | 6 | 5[a] | 6 | 5 | 5 | 3 | 1 |
| Loose sand and gravel | 2 | 5 | | | 6 | 5[a] | 6 | 5 | 5 | 3 | 1 |
| Quicksand | 2 | 5 | | | 6 | 5[a] | 6 | 5 | 5 | | 1 |
| Loose boulders in alluvial fans or glacial drift | 3–2 | 2–1 | | | 5 | 2–1 | 4 | 1 | 1 | | 1 |
| Clay and slit | 3 | 5 | | | 5 | 5 | 5 | 3 | 3 | | 3 |
| Firm shale | 5 | 5 | | | 5 | 5 | 5 | 3 | | | 2 |
| Sticky shale | 3 | 5 | | | 5 | 3 | 5 | 3 | | | 2 |
| Brittle shale | 5 | 5 | | | 5 | 5 | 5 | 3 | | | |
| Sandstone — poorly cemented | 3 | 4 | | | | 4 | 5 | 4 | | | |
| Sandstone — well cemented | 3 | 3 | 5 | | | 3 | 5 | 3 | | | |
| Chert nodules | 5 | 3 | 3 | | | 3 | 3 | 5 | | | |
| Limestone | 5 | 5 | 5 | 6 | | 5 | 5 | 5 | | | |
| Limestone with chert nodules | 5 | 3 | 5 | 6 | | 3 | 3 | 5 | | | |
| Limestone with small cracks or fractures | 5 | 3 | 5 | 6 | | 2 | 5 | 5 | | | |
| Limestone, cavernous | 5 | 3–1 | 2 | 5 | | 1 | 5 | 1 | | | |
| Dolomite | 5 | 5 | 5 | 6 | | 5 | 5 | 5 | | | |
| Basalts, thin layers in sedimentary rocks | 5 | 3 | 5 | 6 | | 3 | 5 | 5 | | | |
| Basalts — thick layers | 3 | 3 | 4 | 5 | | 3 | 4 | 3 | | | |
| Basalts — highly fractured (lost circulation zones) | 3 | 1 | 3 | 3 | | 1 | 4 | 1 | | | |
| Metamorphic rocks | 3 | 3 | 4 | 5 | | 3 | 4 | 3 | | | |
| Granite | 3 | 3 | 5 | 5 | | 3 | 4 | 3 | | | |

Not recommended (Dune sand – Brittle shale)

Not recommended (Dune sand – Sandstone — well cemented)

Not applicable (Sandstone — poorly cemented – Granite)

Not recommended (Jetting)

Not recommended (Driven)

Not applicable (Auger)

*Note:* Rate of Penetration: 1, Impossible; 2, Difficult; 3, Slow; 4, Medium; 5, Rapid; 6, Very rapid.

[a] Assuming sufficient hydrostatic pressure is available to contain active sand (under high confining pressures).

**Table 6C.11 Description of Drilling Methods**

**Methods Without Drilling Fluids**

**Displacement Boring**

Pros:
- Does not require heavy equipment (by hand or lightweight equipment)
- Clean method for shallow well installation

Cons:
- Method limited to shallow depths
- Method limited to soft soils and boulder, cobble-free zones
- Not efficient if necessary to install several wells
- Practical limitation up to $\sim 2''$ diameter sampler

Similar to the above method is "Direct Push Technology" or DPT. A common trade name is GeoProbe. DPT does not require heavy equipment, most units are pickup mounted or ATV mounted for easy accessibility

**Driven Wells**

Pros:
- Cost effective
- Easy access in most conditions

Cons:
- Limited to shallow depths ($< 50$ ft)
- Limited to unconsolidated, soft formations relatively free of cobbles or boulders
- May require pre-drilling a hole of slightly greater diameter that the well point

**Solid-Stem Auger**

Pros:
- Rapid and low-cost drilling in clayey formations
- Clean method, does not require circulation fluids
- No casing necessary where the formation is stable
- Allows collection of representative sample in semi-consolidated formations

Cons:
- Practical limitation to $24''$ diameter
- Inefficient in loose, sandy material (depends on the depth)
- Inefficient below the water table (depends on the depth)

**Hollow-Stem Auger (HSA)**

Pros:
- Allows collection of uncontaminated sample in unconsolidated formation
- Can be used as temporary casing to prevent caving
- Relatively rapid, especially in clayey formations

Cons:
- Ineffective through boulders
- Limited drilling in loose, granular soils, particularly below the water table where sample recovery can be compromised
- Difficult to retrieve a sample in loose, granular soil because cuttings do not always want to come to the surface. Samples must be collected with a split spoon or a continuous corer, either of which can provide excellent samples if done correctly
- Limited to rather shallow depths

**Sonic Drilling**

Pros:
- Drilling can proceed with or without the use of drilling fluids
- Method can be utilized in unconsolidated and some consolidated formations
- Minimal disturbance to soil samples
- Good recovery of quasi-continuous samples
- Conventional air rotary or down-hole hammer methods can be employed through the outer drive casing
- The rig can also be operated as a fluid rotary machine

Cons:
- A relatively new method that is not available everywhere
- Relatively expensive compared to other drilling methods

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 6C.11 (Continued)**

- Dry casing advancement generates heat that can affect the sample integrity
- Maximum nominal diameter of less than 12 in.
- Practical depth limitation of less than 500 ft

**Methods that Use Drilling Fluids**

**Rotary (Direct) Drilling**

Pros:

- High penetration rate
- Drilling operation requires a minimum amount of casing
- Rapid mobilization and demobilization

Cons:

- Use of a drilling fluid, both in terms of sample contamination and water management (in the case of water-based fluids and air injected by gasoline compressors)
- Circulation of drilling fluid may be lost in loose/coarse formations, hence making difficult to transport drill cuttings
- Difficult to collect accurate samples, i.e. a sample from a discrete zone since the cuttings accumulate at surface around the rim of the borehole

**Reverse Circulation Rotary Drilling (RC)**

Pros:

- Applicable to a wide variety of formations
- Possible to drill large-diameter holes, both quickly and economically
- Minimal disturbance to the formation due to the pressure being applied inside and outside the pipe string
- Easier recovery of cuttings since the up-hole velocity is controlled by the size of the drill pipe and less subject to lost-circulation
- No casing required during drilling and advantageous when high risks of caving inches. If there is a risk of caving, mud should be used as a stabilizer. In the case of air drilling, it presents the same risk than regular air rotary, since the flow is down the annular space

Cons:

- High water requirements (not for air drilling)
- Collection of a representative sample is difficult due to potential material mixing
- Rig size can render access difficult
- Need for drilling mud management (not for air drilling)

**Dual-Wall Reverse Circulation Drilling**

Pros:

- Good sample recovery due to controlled up-hole fluid velocity
- Fast penetration in coarse alluvial or broken, fissured rock
- Possible to obtain continuous representative samples of the formation and groundwater
- Easy estimate of aquifer yield at many depths in the formation
- Reduction of lost-circulation problems

Cons:

- Practical borehole diameter limited to 10 in.
- Maximum depth of ~1,400 ft, although greater depths can be achieved in hard rock
- Possible to dry out or to not detect a thin of low-yield aquifer
- Possible sample contamination due to the oil used in the air-compressor unless quality air filters are used (this is true for all air methods, unless the contractor uses filters)

**Cable-Tool Percussion**

Pros:

- In situations where the aquifer is thin and yield is low, the method permits identification of zones that might be overlooked by other drilling methods
- Recovery of representative soil samples at every depth, although samples are disturbed due to the impact of the blow which can affect material several feet below the bottom of the hole
- Allows well construction with low chance of contamination
- Borehole can be bailed at any time to determine approximate yield of the formation at a given depth
- Easy access to rough terrain

Cons:

- Slow penetration rate
- Due to the constant mixing of water, it is not possible to obtain groundwater samples during drilling

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 6C.11 (Continued)**

- Expensive casing for larger diameters
- Difficult to pull back casing in some geologic conditions

**Air Percussion Down-the-Hole Hammer**

Pros:

- Rapid removal of cuttings
- No use of drilling mud
- High penetration rate, especially in resistant rock formation (e.g. basalt)
- Easy soil and groundwater sampling during drilling
- Possible to measure yield estimate at selected depth in the formation

Cons:

- Restricted to semi-consolidated to consolidated formations

**Air Percussion Casing Hammer**

Pros:

- Wells can be drilled in unconsolidated materials that could be difficult to drill with cable-tool or direct rotary method
- No water-based fluid (drilling mud) is required in unconsolidated materials
- Representative formation and groundwater samples can be collected
- Borehole is fully stabilized during drilling operations through the use of casing
- Rapid penetration rates even in difficult drilling conditions
- Lost circulation problem is rarely a concern, except in very loose materials (e.g. mine waste rock)
- Operates well in cold weather

Cons:

- Method does not permit yield measurements during drilling
- When groundwater static levels are low, the high air pressure in the hole can prevent water from entering the borehole; a “rest” period is necessary to assess the true static level
- Relatively expensive method (increased cost of driving casing in)
- Very noisy (driving of casing)
- Borehole diameter limited to 12 in.

**ODEX Percussion Down-the-Hole Hammer (Odex, Stratex, and Tubex are Trade Names)**

Pros:

- Rapid removal of cuttings
- No use of drilling mud
- High penetration rate, especially in resistant rock formation (e.g. basalt)
- Easy soil and groundwater sampling during drilling
- Possible to measure yield estimate at selected depth in the formation
- Advantageous in unconsolidated formations with a high risk of caving (this is the probably the most important feature)

Cons:

- Practically restricted to unconsolidated formations
- Relatively a more expensive method

| | | | 30 | 0.625 | 236.13 | 34.750 | 100 |

[a] ASA Standard B36.10 schedule numbers (S) indicates standard weight pipe.
[b] Maximum settings were estimated for the worst possible conditions in unconsolidated formation. A design factor of approximately 1.5 was used for steel with yield strength less than 40,000 lb/in$^2$. A 50-percent increase in depth of setting beyond those given is considered safe under favorable conditions.
[c] Indicates a non-API standard.

Minimum billing length is 3 ft for all diameters. For Tightwind or Super Construction Screen: Add 25% to Screen Price/Feet. Please specify water well or environmental when ordering. Must add "Clean & Bag" charge for environmental screen. Environmental screens supplied in "Shoulder to Shoulder" lengths. For loose plate bottom deduct (1) weld righ from plate bottom assembly.

[a] Dimensions, weights and collapse strength are approximate (based on an average slot and depth).

[b] Minimum order requirement for ½″ through 1″PS is $300 (net).

[c] Standard weld ring length 2PS″ through 6PS″ is 1-1/2″.

[d] Bail Loop prices Do Not include plate.

[e] SS point is weld on. For threaded point add appropriate thread price.

Minimum billing length is 3 ft. Sumps: Add Weld Ring and Plate Bottom price to the sump length needed (minimum billing is 3 ft). Sch40 & Sch80 Threads: 1″ = 8 TPI; 1.25 & 1.5 = 4 TPI; 2″ > 2 TPI. Locking Cap Lugs are $7.00 and shipped loose. (Part Number 248242). 1 For Slip Cap deduct $7.00 from Locking Cap Price. * Price per foot includes beveling

[l] Must add "Clean & Bag" charge for environmental casing.

*Note:* The maximum transmitting capacity of the screen can be derived from these figures. To determine GPM per feet of screen, multiply the intake area in square inches by 0.31. It must be remembered that this is the maximum capacity of the screen under ideal conditions with an entrance velocity of 0.1 ft/sec.

**Table 6D.25 Classes of Injection Wells**

***Regulatory Definitions of Injection Wells (§144.6)***

The UIC Program provides standards, technical assistance and grants to State governments to regulate injection wells in order to prevent them from contaminating drinking water resources. EPA defines the five classes of wells according to the type of fluid they inject and where the fluid is injected. EPA has published regulations related to the sitting, drilling, construction and operation of many types of injection wells

***Class I wells*** are technologically sophisticated and inject hazardous and non-hazardous wastes below the lowermost underground source of drinking water (*USDW*). Injection occurs into deep, isolated rock formations that are separated from the lowermost USDW by layers of impermeable clay and rock

***Class I wells*** are oil and gas production brine disposal and other related wells. Operators of these wells inject fluids associated with oil and natural gas production. Most of the injected fluid is brine that is produced when oil and gas are extracted from the earth (about 10 barrels of brine for every barrel of oil)

***Class III wells*** are wells that inject superheated steam, water, or other fluids into formations in order to extract minerals. The injected fluids are then pumped to the surface and the minerals in solution are extracted. Generally, the fluid is treated and re-injected into the same formation. More than 50 percent of the salt and 80 percent of the uranium extraction in the U.S. is produced this way

***Class IV wells*** inject hazardous or radioactive wastes into or above underground sources of drinking water. These wells are banned under the UIC program because they directly threaten public health

***Class V wells*** are injection wells that are not included in the other classes. Some Class V wells are technologically advanced wastewater disposal systems used by industry, but most are "low-tech" wells, such as septic systems and cesspools. Generally, they are shallow and depend upon gravity to drain or "inject" liquid waste into the ground above or into underground sources of drinking water. Their simple construction provides little or no protection against possible groundwater contamination, so it is important to control what goes into them

In general, owners and operators of most new Classes I, II and III injection wells are required to:

- Site the wells in a location that is free of faults and other adverse geological features
- Drill to a depth athat allows the injection into formations that do not contain water that can potentially be used as a source of drinking water. These injection zones are confined from any formation that may contain water that may potentially be used as a source of drinking water
- Build to inject through an internal pipe (tubing) that is located inside another pipe (casing). This outer pipe has cement on the outside to fill any voids occurring between the outside pipe and the hole that was bored for the well (borehole). This allows for multiple layers of containment of the potentially contaminating injection fluids
- Test for integrity at the time of completion and every five years thereafter (more frequently for hazardous waste wells, §146.68(d))
- Monitor continuously to assure the integrity of the well

Operators of Class I wells injecting hazardous waste are required to demonstrate that the waste will never return to the surface or impact an underground source of drinking water (for 10,000 years). These wells inject at 4,000 ft below the surface or more. Over 9 billion gallons of hazardous waste is injected into wells each year in the US

The largest number of injection wells are shallow wells that inject non-hazardous fluids into very shallow aquifers that are or can be used as sources of drinking water. Some of the wells in this category are:

- Drainage wells in industrial setting that can receive surface runoff contaminated with a variety of pollutants;
- Septic tank systems and dry-wells used in automotive shops that receive fluids from repair and maintenance bays;
- Cesspools that receive sewage from a community;
- Agricultural drainage wells that may receive water contaminated with pesticides and fertilizers

| EPA R9 tribal | | | 542 | | | |
| | 122 | 364 | 146,878 | 164 | 16,577 | 5 |

*Note:* Types of wells: Class I, Deep industrial waste disposal; Class II, For oil and natural gas production; Class III, Related to mineral recovery; Class IV, Banned, inject hazardous or radioactive waste above USDWs; Class V, Generally shallow disposal wells. There are an estimated 650,000 Class V wells nationally. Class I through IV data from annual reporting by states and EPA Regions. The Class V estimate is based on state estimates and modeling of storm water and large capacity septics.

**Key to Abbreviations**

**Facility**
EX — Exploratory well only
HW — Hazardous waste
I — Industrial (non-hazardous)
RO — Reverse osmosis concentrate
RRF — Resource recovery facility.

**Status**
TA — Temporarily abandoned well
PA — Permanently abandoned well
IA — Inactive well
SB — Standby well
UC — Under Construction/testing

EX — Exploratory well
EXI — Inactive exploratory well
EXW — Exploratory well converted to an injection well
EXM — Exploratory well converted to a monitor well
EXP — Exploratory well plugged and abandoned.

**Table 6E.30 Characteristics of Pumps Frequently Employed in Wells**

| Type of Pump | Practical Suction Lift[a] | Usual Well-Pumping Depth | Usual Pressure Heads | Advantages | Disadvantages |
|---|---|---|---|---|---|
| Reciprocating | | | | | |
| Shallow well | 6–7 m | 6–7 m | 30–60 m | Positive action; discharge against variable heads; pumps water containing sand and silt; especially adapted to low capacity and high lifts | Pulsating discharge; subject to vibration and noise; maintenance cost may be high; may cause destructive pressure if operated against closed valve |
| Deep well | 6–7 m | Up to 180 m | Up to 180 m above cylinder | | |
| Centrifugal | | | | | |
| Shallow well straight centrifugal (single stage) | 6 m max | 3–6 m | 30–45 m | Smooth, even flow; pumps water containing sand and silt; pressure on system is even and free from shock; low-starting torque; usually reliable and good service life | Loses prime easily; efficiency depends on operating under design heads and speed |
| Regenerative vane turbine type (single impeller) | 8 m max | 8 m | 30–60 m | Same as straight centrifugal except not suitable for pumping water containing sand or silt; self-priming | Same as straight centrifugal except maintains priming easily |
| Deep well | | | | | |
| Vertical line shaft turbine (multistage) | Impellers submerged | 15–90 m | 30–250 m | Same as shallow well turbine | Efficiency depends on operating under design head and speed; requires straight well large enough for turbine bowls and housing; lubrication and alignment of shaft critical; abrasion from sand |
| Submersible turbine (multistage) | Pump and motor submerged | 15–120 m | 15–120 m | Same as shallow well turbine; easy to frostproof installation; short pump shaft to motor | Repair to motor or pump requires pulling from well; sealing of electrical equipment from water vapor critical; abrasion from sand |
| Jet | | | | | |
| Shallow well | 4–6 m below ejector | Up to 4–6 m below ejector | 25–45 m | High capacity at low heads; simple in operation; does not have to be installed over well; no moving parts in well | Capacity reduces as lift increases; air in suction or return line will stop pumping |
| Deep well | 4–6 m below ejector | 7–35 m 60 m max. | 25–45 m | Same as shallow well jet | Same as shallow well jet |
| Rotary | | | | | |
| Shallow well (gear type) | 7 m | 7 m | 15–75 m | Positive action; discharge constant under variable heads; efficient operation | Subject to rapid wear if water contains sand or silt; wear of gears reduces efficiency |
| Deep well (helical rotary type) | Usually submerged | 15–150 m | 30–150 m | Same as shallow well/rotary; only one moving pump device in well | Same as shallow well rotary except no gear wear |

[a] Practical suction lift at sea level. Reduce lift 0.3 m for each 300 m above sea level.

**Table 6E.34 Pumping Costs in the Texas High Plains (THP) and in South/Central Texas (SCT) Per Acre-inch of Water at 100 ft Total Head from Irrigation Pumping Plant Efficiency Tests Conducted by the Texas Agricultural Extension Service**

| | | Cost ($) Per Acre-Inches per 100 ft Head | | |
|---|---|---|---|---|
| Type and Price[a] | Region[b] | Lowest | Highest | Average |
| Natural Gas | THP | 0.40 | 3.93 | 0.81 |
| @ $3.00 MCF | SCT | 0.31 | 1.96 | 0.76 |
| Electricity | THP | 0.49 | 3.10 | 1.35 |
| @ $0.07/KWH | SCT | 0.29 | 20.20 | 1.49 |
| Diesel | THP | 0.57 | 1.91 | 0.77 |
| @ $0.65/gal | SCT | 0.36 | 3.43 | 0.83 |

[a] Assumed price — actual prices varied in each region.
[b] THP (Texas High Plains) results are from more than 240 efficiency tests. SCT (South/Central Texas) results are from 240 efficiency tests.

*Source*: From Texas Agricultural Extension Service, the Texas A&M University.

**Table 6E.35 Irrigation Pumping Equipment Efficiency**

| Equipment | Attainable Efficiency (Percent) |
|---|---|
| Pumps (centrifugal, turbine) | 75–82 |
| Right-angle pump drives (gear head) | 95 |
| Automotive-type engines | 20–26 |
| Industrial engines | |
| Diesel | 25–37 |
| Natural gas | 24–27 |
| Electric motors | |
| Small | 75–85 |
| Large | 85–92 |

*Source*: From New L.L. Pumping plant efficiency and irrigation cost L-2218, Texas Agricultural Extension Service.

**Table 6E.36 Typical Values of Overall Efficiency for Representative Pumping Plants, Expressed as Percent**

| Power Source | Recommended as Acceptable | Average Values from Field Tests[a] |
|---|---|---|
| Electric | 72–77 | 45–55 |
| Diesel | 20–25 | 13–15 |
| Natural gas | 18–24 | 9–13 |
| Butane, propane | 18–24 | 9–13 |
| Gasoline | 18–23 | 9–12 |

Ranges are given because of the variation in efficiencies of both pumps and power units. The difference in efficiency for high and low compression engines used for natural gas, propane and gasoline must be considered especially. The higher value of efficiency can be used for higher compression engines.

[a] Typical average observed values reported by pump efficiency test teams.

*Source*: From New L.L. Pumping plant efficiency and irrigation cost L-2218, Texas Agricultural Extension Service.

**Table 6E.37 Nebraska Performance Criteria for Pumping Plants. Fuel Use by New or Reconditioned Plants Should Equal or Exceed These Rates**

| Energy Source | Water Horsepower-hours[a] Per Unit of Energy | Energy Units |
|---|---|---|
| Diesel | 12.5 | gal |
| Gasoline[b] | 8.7 | gal |
| Natural gas | 66.7[c] | 1000 ft[c] |
| Electricity | 0.885[d] | Kwh |

[a] Based on 75 percent efficiency.
[b] Includes drive losses and assumes no cooling fan.
[c] Assumes natural gas content of 1000 btu $ft^{-3}$
[d] Direct connection-no drive.

*Source*: From College of Agriculture, University of Nebraska.

Overdraft of groundwater occurs when water is withdrawn from sources that cannot be renewed or is withdrawn more quickly than they can be recharged.
Of the 106 Water Resources Council subregions, the overdraft in 8 is considered critical–that is, more than, 500 million gallons of water are withdrawn per day; and in 30, groundwater overdraft is moderate–21 to 500 million gallons per day. Groundwater overdraft is a serious problem in the High Plains from Nebraska to Texas and in parts of Arizona and California.

**Table 6G.44 Features of Groundwater Systems Useful in the Classification of Groundwater Regions**

| Feature | Aspect | Range in Conditions | Significance of Feature |
|---|---|---|---|
| Component of the system | Unconfined aquifer | Thin, discontinuous, hydrologically insignificant<br>Minor aquifer, serves primarily as a storage reservoir and recharge conduit for underlying aquifer<br>The dominant aquifer | Affects response of the system to pumpage and other stresses. Affects recharge and discharge conditions for the system. Determines susceptibility of the system to pollution |
| | Confining beds | Not present, or hydrologically insignificant<br>Thin, markedly discontinuous, or very leaky<br>Thick, extensive, and impermeable<br>Complexly interbedded with aquifers or productive zones | |
| | Confined aquifers | Not present, or hydrologically insignificant<br>Thin or not highly productive<br>Multiple thin aquifers interbedded with non productive zones<br>The dominant aquifer — thick and productive | |
| | Presence and arrangement of components | A single, hydrologically-dominant, unconfined aquifer<br>Two interconnected aquifers of essentially equal hydrologic importance<br>A three-unit system consisting of an unconfined aquifer, a confining bed, and a confined aquifer<br>A complexly interbedded sequence of aquifers and confining beds | |
| Water-bearing openings of dominant aquifer | Primary openings | Pores in unconsolidated deposits<br>Pores in semiconsolidated rocks<br>Pores, tubes, and cooling fractures in volcanic (extrusive-igneous) rocks | Controls water-storage and transmission characteristics. Affects dispersion and dilution of wastes |
| | Secondary openings | Fractures and faults in crystalline and consolidated sedimentary rocks<br>Solution-enlarged openings in limestones and other soluble rocks | |
| Composition of rock matrix of dominant aquifer | Insoluble | Essentially insoluble<br>Both relatively insoluble and soluble constituents | Affects water-storage and transmission characteristics. Has major influence on water quality |
| | Soluble | Relatively soluble | |
| Storage and transmission characteristics of dominant aquifer | Porosity | Large, as in well-sorted, unconsolidated deposits<br>Moderate, as in poorly-sorted unconsolidated deposits and semiconsolidated rocks<br>Small, as in fractures crystalline and consolidated sedimentary rocks | Controls response to pumpage and other stresses. Determines yield of wells. Affects long-term yield of system. Affects rate at which pollutants move |

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 6G.44 (Continued)**

| Feature | Aspect | Range in Conditions | Significance of Feature |
|---|---|---|---|
| | Transmissivity | Large, as in cavernous limestones, lava flows with flow tubes, and clean gravels<br>Moderate, as in well-sorted, coarse-grained sands, and semiconsolidated limestones<br>Small, as in poorly-sorted, fine-grained deposits and fractures rocks<br>Very small, as in confining beds, which are commonly clay-rich | |
| Recharge and discharge conditions of dominant aquifer | Recharge | In upland areas between streams<br>Through channels of losing streams<br>Largely or entirely by leakage across confining beds from adjacent aquifers | Affects (a) response to stress and (b) long-term yields. Determines susceptibility to pollution. Affects water quality |
| | Discharge | Through springs or by seepage to stream channels, lakes, estuaries, or the ocean<br>By evaporation on flood plains and in basin "sinks"<br>By seepage across confining beds into adjacent aquifers | |

**Table 6G.46 Rocks of Greatest Importance in Groundwater Hydrology**

| Sedimentary Rocks | | | Igneous Rocks | |
|---|---|---|---|---|
| **Unconsolidated (Pores)** | **Consolidated (Pores, Fractures, and Solution Openings)** | **Metamorphic Rocks (Fractures)** | **Intrusive (Fractures)** | **Extrusive (Pores, Tubes, Rubble Zones, and Fractures)** |
| GRAVEL[a] | Conglomerate[b] | Gneiss | Granite and other coarse-grained igneous rocks | BASALT and other fine-grained igneous rocks |
| SAND | SANDSTONE | Quartzite-schist | | |
| Silt | Siltstone | Schist | | |
| *Clay*[c] | *Shale* | Slate-schist | | |
| Till | Tillite (rare) | | | |
| *Marl* | LIMESTONE-DOLOMITE | Marble | | |
| Coquina | | | | |

[a] Capitalized names indicate rocks that are major sources of large groundwater supplies.
[b] Lowercase names indicate rocks of relatively wide extent that are sources of small to moderate groundwater supplies.
[c] Italic names indicate rocks that function primarily as confining beds.

Clay and gravel, water bearing
Clay & rock, some loose rock
Clay, sand and gravel
Clay, silt, sand, and gravel
Conglomerate, gravel, and boulders
Conglomerate, sticky clay, sand and gravel
Dirty gravel
Fine gravel, hard
Gravel and hardpan strata
Gravel, cemented sand
Gravel with streaks of clay
Hard gravel
Hard sand and gravel
Packed gravel
Packed sand and gravel
Quicksand and cobbles
Rock sand and clay
Sand and gravel, cemented Streaks
Sand and silt, many gravel
Sand, clay, streaks of gravel
Sandy clay and gravel
Set gravel
Silty sand and gravel (cobbles)
Tight gravel

More of less sand
Muddy sand
Pack sand
Poor water sand
Powder sand
Pumice sand
Quicksand
Sand, mucky or dirty
Set sand
Silty sand
Sloppy sand
Sticky sand
Streaks fine and coarse sand
Surface sand and clay
Tight sand

Brittle clay and sand
Clay and sand
Clay, sand, and water
Clay with sand
Clay with sand streaks
More or less clay, hard sand and boulders
Mud and sand
Mud, sand, and water
Sand and mud with chunks of clay
Silt and fine sand
Silt and sand
Soil, sand, and clay
Topsoil and light sand
Water sand sprinkled with clay

Float rock (stone)
Laminated
Pumice
Seep water
Soft sandstone
Strong seepage

**Gravel, Sand, Sand and Gravel, and Similar Materials**
Specific yield 25 percent

Boulders
Coarse gravel
Coarse sand
Cobbles
Cobbles stones
Dry gravel (if above water table
Float rocks
Free sand
Gravel
Loose gravel
Loose sand
Rocks

Gravel and sand
Gravel sand sandrock
Medium sand
Rock and gravel
Running sand
Sand
Sand, water
Sand and boulders
Sand and cobbles
Sand and fine gravel
Sand and gravel
Sand gravel
Water gravel

**Table 6G.51 Representative Values of Hydraulic Conductivity**

| Material | Hydraulic Conductivity | | Type of Measurement[a] |
|---|---|---|---|
| | ft day$^{-1}$ | m day$^{-1}$ | |
| Gravel, coarse | 490 | 150 | R |
| Gravel, medium | 890 | 270 | R |
| Gravel, fine | 1,500 | 450 | R |
| Sand, coarse | 150 | 45 | R |
| Sand, medium | 40 | 12 | R |
| Sand, fine | 8.2 | 2.5 | R |
| Silt | 0.62 | 0.08 | H |
| Clay | 0.00068 | 0.0002 | H |
| Sandstone, fine-grained | 0.66 | 0.2 | V |
| Sandstone, medium-grained | 10 | 3.1 | V |
| Limestone | 3 | 0.94 | V |
| Dolomite | 0.0033 | 0.001 | V |
| Dune sand | 66 | 20 | V |
| Loess | 0.26 | 0.08 | V |
| Peat | 19 | 5.7 | V |
| Schist | 0.66 | 0.2 | V |
| Slate | 0.00026 | 0.0008 | V |
| Till, predominantly sand | 1.6 | 0.49 | R |
| Till, predominantly gravel | 100 | 30 | R |
| Tuff | 0.66 | 0.2 | V |
| Basalt | 0.033 | 0.01 | V |
| Gabbro, weathered | 0.66 | 0.2 | V |
| Granite, weathered | 4.6 | 1.4 | V |

[a] H is horizontal hydraulic conductivity, R is repacked sample, and V is vertical hydraulic conductivity.

# SECTION 6I SPRINGS

**Table 6I.58 Classification of Springs According to Magnitude of Discharge**

| Magnitude | Old System English Units | New System Metric Units |
|---|---|---|
| First | Greater than 100 $ft^3$ sec | $>10$ $m^3$/sec |
| Second | 10 to 100 $ft^3$ sec | 1–10 $m^3$/sec |
| Third | 1 to 10 $ft^3$ sec | 0.1–1 $m^3$/sec |
| Fourth | 100 gal/min to 1 $ft^3$/sec | 10–100 L/sec |
| Fifth | 10 to 100 gal/min | 1–10 L/sec |
| Sixth | 1 to 10 gal/min | 0.1–1 L/sec |
| Seventh | 1 pt/min to 1 gal/min | 10–100 mL/sec |
| Eighth | Less than 1 pt/min | $<10$ mL/sec |

*Source*: From U.S. Geological Survey.

**Table 6I.59 Number of First Magnitude Springs in the United States, by State**

| State | Number | Rock type | References[a] |
|---|---|---|---|
| Florida | 27 | Limestone | — |
| Idaho | 14 | Limestone and basalt | 3, 5 |
| Oregon | 15 | Balsalt | 3 |
| Missouri | 8 | Limestone | 3, 8 |
| California | 4 | Basalt | 3 |
| Hawaii | 3 | do. | 2, 6, 7 |
| Montana | 3 | Sandstone | 3, 4 |
| Texas | 2 | Limestone | 1, 3 |
| Arkansas | 1 | Basalt | 3 |

Twenty-three states in the United States have Thermal Springs that are included in the database. This table shows the number of Thermal Springs in each state. The first column shows the state abbreviation, the second shows the number of thermal spring in the state, and the third shows a graph of those counts. Nevada has 312 thermal springs, the largest number in any state.

| State | Number of Springs | Graph |
|---|---|---|
| AK | 108 | |
| AR | 6 | |
| AZ | 60 | |
| CA | 304 | |
| CO | 47 | |
| FL | 2 | |
| GA | 7 | |

[a] The limits of a hydrothermal area are very difficult to define and meaningful criteria are difficult to apply. Depending upon the definition, the "limits" of an area can vary by at least an order of magnitude. The definition used here is: "The rather broad boundaries containing specific areas with some surface evidence for abnormally high temperatures at depth. The evidence can consist of one or more of the following: hot springs, fumaroles, active hydrothermal alteration, and abnormally high near-surface geothermal gradient. Closely spaced 'hot spots' not separated by areas of approximately 'normal' gradient for the region are included in a single thermal area".

[b] (S) indicates temperatures measured at the surface; (D) temperatures from drill holes.

[c] Most heat flows are relative to mean annual surface temperatures but a few are relative to 0° or 4°C; such differences are small compared to the uncertainties and have not been modified. $1 \times 10^6$ cal/$cm^2$/sec approximates the "normal" heat flow from 60 to 70 $km^2$.

**Table 6J.64 Operation and Maintenance Problems of Artificial Recharge Projects**

| Problem | Manifestation | Corrective Actions to be Considered |
|---|---|---|
| Silt | Lodging of particles within interstices of soil near the surface area, reducing the infiltration rate | (1) Desilt in retention reservoir and/or in uppermost series of basins. Flocculating agent such as "Separan" has been used with success.<br>(2) Bypass water until concentration of silt will not be detrimental, with concentration depending upon soil condition. Ditches and furrows generally can accept waters containing higher concentrations of silt if sufficient velocity is maintained through the project to carry silt back to the main canal.<br>(3) Scrape, harrow, and/or disc after proper drying. Period of drying usually ranges from one to seven days depending upon soil and weather conditions.<br>(4) Remove silt after drying. Silt may be used to build up levees of basins or bridges of ditches or furrows.<br>(5) Sustain vegetative growth.<br>(6) Sluice the silt out of ditches and furrows, and from channels, with due regard to erosion problems.<br>(7) Pump injection well to loosen silt from interstices and remove silt from the well. |
| Weeds | Increases percolation rate and shortens drying period required for working an area or removing silt from the basin. There is a disadvantage in that vegetative growth may be a fire hazard | (1) Control by chemical means and/or remove when weeds become a fire hazard, especially around structures. Consider use of hand labor instead of mechanical means in order to maintain infiltration rates. However, if possible, leave vegetation undisturbed in wetted area.<br>(2) Prolonged deep submergence will kill vegetation.<br>(3) The control of weeds is generally not considered a problem in the operation of pits and shafts, or injection wells. |
| Rodents | Leaks and failures of dikes and levees. Public nuisance near urban area | (1) Set out poison about twice a year.<br>(2) Use of traps. |
| Public health and safety | Rodents and mosquito problem and possible injury to individuals. Potential problems of injury is greatest when depth of water is large in basins and pits | (1) Enclose area with fence and gates with locks.<br>(2) Patrol area with particular attention to children and structural failures, before and during oper-ation, especially near inhabited area.<br>(3) Vector control by use of mosquito fish, chemicals, and/or drying.<br>(4) Rodent control by poisoning or traps.<br>(5) Proper posting of signs when using chemical which is poisonous. |

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 6J.64 (Continued)**

| Problem | Manifestation | Corrective Actions to be Considered |
|---|---|---|
| Maintaining of percolation rates | Reduction of percolation rates will decrease efficiency of system, increasing the unit cost of the amount of water actually recharged | (1) Proper treatment of water. Desilt water to concentration desired. Use chlorine or copper sulfate for control of bacterial slime and algae. Use of chemicals to reduce the possibility of chemical incrustation, which is usually deposition of calcium carbonate.<br>(2) Schedule intermittent drying periods to prevent problems due to swelling of soil particles. Permit growth of vegetation to decrease the drying period by removing the water in the root zone and loosening the soil. Studies have shown that bermuda grass has been successfully used to maintain rates, even under prolonged periods of deep submergence.<br>(3) Prevent aeration of water, especially when operating recharge wells, pits, and shafts.<br>(4) Increase head of water generally by increasing depth of water.<br>(5) Use hand labor whenever possible to decrease the possibility of using heavy equipment which will cause surface compaction especially when soil is wet.<br>(6) Scrape, harrow, and/or disc after proper drying.<br>(7) Remove silt, chemical incrustation, and/or any material decreasing infiltration rates after proper drying period.<br>(8) Maintain the design velocity to reduce silting to a minimum in use of ditches and furrows.<br>(9) Recondition injection wells by use of dry ice, hydrochloric acid, and/or sulfuric acid.<br>(10) Prevent freezing of water during winter by continuous spreading.<br>(11) Check the possibility of base exchange reactions.<br>(12) Soil can be reconditioned by using organic material such as cotton gin trash, or chemical agents, such as krilium. |
| Maintenance to diversion structures | Breakdown of spreading operations | (1) Systematic and routine maintenance check as well as patrolling when in operation. Attention should be given to wooden structures since they deteriorate faster due to frequent wetting and drying cycles. Also attention should be given to settlement of structures thus changing flow condition.<br>(2) Attention should be given to undercutting of structure particularly on the downstream end with preventive maintenance primarily in the form of riprapping.<br>(3) Sluicing of channel to remove silt and debris which have accumulated near and at diversion structure. |

## SECTION 6K GEOPHYSICAL LOGGING

**Table 6K.65 Borehole Geophysical Logging Methods and Their Uses in Hydrologic Studies**

| Method | Uses | Recommended Conditions |
|---|---|---|
| Electric logging: Single-electrode resistance | Determining depth and thickness of thin beds. Identification of rocks, provided general lithologic information is available, and correlation of formations. Determining casing depths | Fluid-filled hole. Fresh mud required. Hole diameter less than 8 to 10 in. Log only in uncased holes |
| Short normal (electrodes spacing of 16 in.) | Picking tops of resistive beds. Determining resistivity of the invaded zone. Estimating porosity of formations (deeply invaded and thick interval). Correlation and identification, provided general lithologic information is available | Fluid-filled hole. Fresh mud. Ratio of mud resistivity to formation-water resistivity should be 0.2 to 4. Log only in uncased part of hole |
| Long normal (electrode spacing of 64 in.) | Determining true resistivity in thick beds where mud invasion is not too deep. Obtaining data for calculation of formation-water resistivity | Fluid-filled hole. Ratio of mud resistivity to formation-water resistivity should be 0.2 to 4. Log only in uncased part of hole |
| Deep lateral (electrode spacing approximately 19 ft) | Determining true resistivity where mud invasion is relatively deep. Locating thin beds | Fluid-filled uncased hole. Fresh mud. Formations should be of thickness different from electrode spacing and should be free of thin limestone beds |
| Limestone sonde (electrode spacing of 32 in.) | Detecting permeable zones and determining porosity in hard rock. Determining formation factor *in situ* | Fluid-filled uncased hole. May be salty mud. Uniform hole size. Beds thicker than 5 ft |
| Laterolog | Investigating true resistivity of thin beds. Used in hard formations drilled with very salty muds. Correlation of formations, especially in hard-rock regions | Fluid-filled uncased hole. Salty mud satisfactory. Mud invasion not too deep |
| Microlog | Determining permeable beds in hard or well-consolidated formations. Detailing beds in moderately consolidated formations. Correlation in hard-rock country. Determining formation factor in situ in soft or moderately consolidated formations. Detailing very thin beds | Fluid required in hole. Log only in uncased part of hole. Bit-size hole (caved sections may be logged, provided hole enlargements are not too great) |
| Microlaterolog | Determining detailed resistivity of flushed formation at wall of hole when mudcake thickness is less than three-eighths inch in all formations. Determining formation factor and porosity. Correlation of very thin beds | Fluid-filled uncased hole. Thin mud cake. Salty mud permitted |
| Spontaneous potential | Helps delineate boundaries of many formations and the nature of these formations. Indicating approximate chemical quality of water. Indicate zones of water entry in borehole. Locating cased interval. Detecting and correlating permeable beds | Fluid-filled uncased hole. Fresh mud |

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 6K.65 (Continued)**

| Method | Uses | Recommended Conditions |
|---|---|---|
| Radiation logging: Gamma Ray | Differentiating shale, clay, and marl from other formations. Correlations of formations. Measurement of inherent radioactivity in formations. Checking formation depths and thicknesses with reference to casing collars before perforating casing. For shale differentiation when holes contain very salty mud. Radioactive tracer studies. Logging dry or cased holes. Locating cemented and cased intervals. Logging in oil-base muds. Locating radioactive ores. In combination with electric logs for locating coal or lignite beds | Fluid-filled or dry cased or uncased hole. Should have appreciable contrast in radioactivity between adjacent formations |
| Neutron | Delineating formations and correlation in dry or cased holes. Qualitative determination of shales, tight formations, and porous sections in cased wells. Determining porosity and water content of formations, especially those of low porosity. Distinguishing between water- or oil-filled and gas-filled reservoirs. Combining with gamma-ray log for better identification of lithology and correlation of formations. Indicating cased intervals. Logging in oil-base muds | Fluid-filled or dry cased or uncased hole. Formations relatively free from shaly material. Diameter less than 6 inches for dry holes. Hole diameter similar throughout |
| Induction logging | Determining true resistivity, particularly for thin beds (down to about 2 feet thick) in wells drilled with comparatively fresh mud. Determining resistivity of formations in dry holes. Logging in oil-base muds. Defining lithology and bed boundaries in hard formations. Detection of water-bearing beds | Fluid-filled or dry uncased hole. Fluid should not be too salty |
| Sonic logging | Logging acoustic velocity for seismic interpretation. Correlation and identification of lithology. Reliable indication of porosity in moderate to hard formations; in soft formations of high porosity it is more responsive to the nature rather than quantity of fluid contained in pores | Not affected materially by type of fluid, hole size, or mud invasion |
| Temperature logging | Locating approximate position of cement behind casing. Determining thermal gradient. Locating depth of lost circulation. Locating active gas flow. Used in checking depths and thickness of aquifers. Locating fissures and solution openings in open holes and leaks or perforated sections in cased holes. Reciprocal-gradient temperature log may be more useful in correlation work | Cased or uncased hole. Can be used in empty hole if logged at very slow speed, but fluid preferred in hole. Fluid should be undisturbed (no circulation) for 6 to 12 hr minimum before logging; possibly several days may be required to reach thermal equilibrium |
| Fluid-conductivity logging | Locating point of entry of different quality water through leaks or perforations in casing or opening in rock hole. (Usually resistivity is determined and must be converted to conductivity.) Determining quality of fluid in hole for improved interpretation of electric logs. Determining fresh-water-salt-water interface | Fluid required in cased or uncased hole. Temperature log required for quantitative information |

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 6K.65 (Continued)**

| Method | Uses | Recommended Conditions |
|---|---|---|
| Fluid-velocity logging | Locating zones of water entry into hole. Determining relative quantities of water flow into or out of these zones. Determine direction of flow up or down in sections of hole. Locating leaks in casing. Determine approximate permeability of lithologic sections penetrated by hole, or perforated section of casing | Fluid-filled cased or uncased hole. Injection pumping, flowing, or static (at surface) conditions. Flange or packer units required in large diameter holes. Caliper (section gage) logs required for quantitative interpretation |
| Casing-collar locator | Locating position of casing collars and shoes for depth control during perforating. Determining accurate depth references for use with other types of logs | Cased hole |
| Caliper (section gage) survey | Determining hole or casing diameter. Indicates lithologic character of formations and coherency of rocks penetrated. Locating fractures, solution opening, and other cavities. Correlation of formations. Selection of zone to set a packer. Useful in quantitative interpretation of electric, temperature, and radiation logs. Used with fluid-velocity logs to determine quantities of flow. Determining diameter of underreamed section before placement of gravel pack. Determining diameter of hole for use in computing volume of cement to seal annular space. Evaluating the efficiency of explosive development of rock wells. Determining construction information on abandoned wells | Fluid-filled or dry cased or uncased hole. (In cased holes does not give information on beds behind casing.) |
| Dipmeter survey | Determining dip angle and dip direction (from magnetic north) in relation to well axis in the study of geologic structure. Correlation of formations | Fluid-filled uncased hole. Carefully picked zones needing survey, because of expense and time required. Directional survey required for determination of true dip and strike (generally obtained simultaneously with dipmeter curves) |
| Directional (inclinometer) survey | Locating points in a hole to determine deviation from the vertical. Determining true depth. Determining possible mechanical difficulty for casing installation or pump operation. Determining true dip and strike from dipmeter survey | Fluid-filled or dry uncased hole |
| Magnetic logging | Determining magnetic field intensity in borehole and magnetic susceptibility of rocks surrounding hole. Studying lithology and correlation, especially in igneous rocks | Fluid-filled or dry uncased hole |

*Note:* Data for 1995 and earlier from Solley and others (1998). The water-use data are in billion gallons per day (thousand million gallons per day) and are rounded to two significant figures for 1950–80, and to three significant figures for 1985–2000; percentage change is calculated from unrounded numbers. —, not available.

[a] 48 States and district of Columbia, and Hawaii.
[b] 48 States and district of Columbia.
[c] 50 States and district of Columbia, Puerto Rico, and U.S. Virgin Islands.
[d] 50 States and district of Columbia, and Puerto Rico.
[e] From 1985 to present this category includes water use for fish farms.
[f] Data not available for all States; partial total was 5.46.
[g] Commercial use not available; industrial and mining use totaled 23.2.
[h] Data not available.

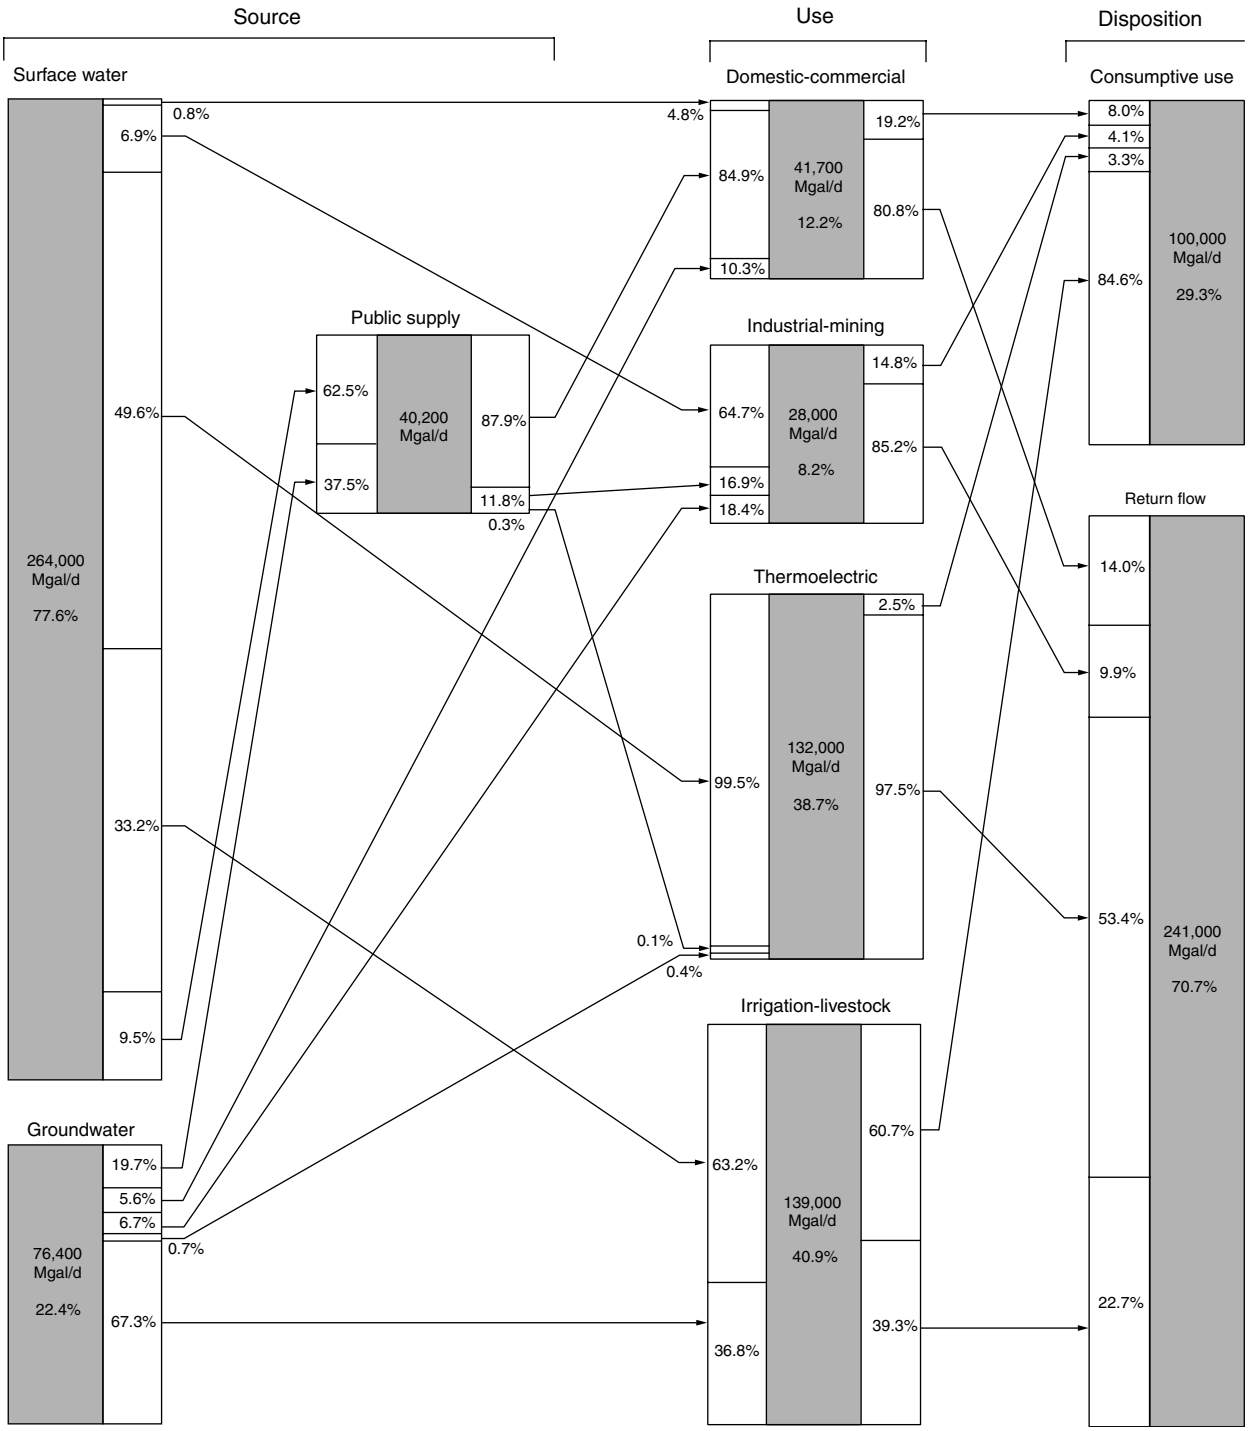

**Figure 7A.5** Source, use, and disposition of freshwater in the United States, 1995. For each water-use category, this diagram shows the relative proportion of water source and disposition and the general distribtion of water from source to disposition. The lines and arrows indicate the distribution of water from source to disposition for each category; for example, surface water was 77.6 percent of total freshwater withdrawn, and going from "Source" to "Use" columns, the line from the surface-water block to the domestic and commercial block indicates that 0.8 percent of all surface water withdrawn was the source for 4.8 percent of total water (self-supplied withdrawals, public-supply deliveries) for domestic and commercial purposes. In addition, going from the "Use" to "Disposition" columns, the line from the domestic and commercial block to the consumptive use block indicates that 19.2 percent of the water for domestic and commercial purposes was consumptive use; this represents 8.0 percent of total consumptive use by all water-use categories. (From Solley, W.B. et al., 1998, Estimated use of water in the United States in 1995, *U.S. Geological Survey Circular 1200*, www.usgs.gov.)

**Table 7A.8 Common Uses of Water in Relation to Consumptive and Nonconsumptive Uses**

| Common Uses of Water | Consumptive | Nonconsumptive |
|---|---|---|
| Steam generation (locomotive or stationary) | Steam released to atmosphere | [a] |
| Air conditioning | | |
| Evaporative | Cooling achieved by evaporation | [a] |
| Recirculating | Some water evaporated with each use | [a] |
| Other cooling (recirculating) | Some water evaporated with each use | [a] |
| Storage in surface reservoirs | Evaporation from water surface | Seepage underground |
| Irrigation by sprinkling | Evaporation and transpiration | Little seepage |
| Irrigation by flooding | Evaporation from ponds, transpiration | Seepage varies |
| Cooking | Steam to atmosphere | Contributes to sewage |
| Processing foods, beverages, plastics | Some water goes into manufactured products | Carries organic compounds |
| Processing | | |
| Petroleum products | Proportion of consumptive use is increased by reuse of the nonconsumptive water | Carries chemicals |
| Paper and pulp | Proportion of consumptive use is increased by reuse of the nonconsumptive water | Carries pulp and chemicals |
| Chemicals | Proportion of consumptive use is increased by reuse of the nonconsumptive water | Carries toxic or other chemicals |
| Metal products | Proportion of consumptive use is increased by reuse of the nonconsumptive water | Carries sludge and soluble chemicals |
| Atomic fission | Evaporation from tanks | Carries radioactive materials |
| Stock watering | Evaporation from tanks and ponds | Organic wastes into ground |
| Drinking | Perspiration | Organic wastes into sewage |
| Irrigation by furrow | Evapotranspiration | Dissolves chemicals from soil |
| Washing | Evaporation in drying | Carries sediment and soluble matter |
| Mining (metals, coal, oil) | | Carries natural brines and acids, sediments |
| Cooling (once-through) | [b] | Water temperature increased by use |
| Air conditioning (once-through) | [b] | Water temperature increased by use |
| Fish culture | [c] | |
| Steam heating | [d] | Steam condenses and is reused |
| Year-round heat exchange | [d] | Requires storage of water and heat from one season to another |
| Sanitation (bath, toilet, dishwasher) | [d] | Sewage carries chiefly organic wastes |
| Hydroelectric power | [e] | Takes water toward oceans |
| Navigation | [e] | Inland waterways require maintenance of flow |

[a] With efficient operation, nonconsumptive use is limited to that required for cooling and/or cleaning equipment.
[b] Increase in water temperature may cause increased evaporation.
[c] Consumptive use by evaporation from water surfaces; may be increased by aerators.
[d] Consumptive use is limited to losses through leaking pipes, valves, etc.
[e] Consumptive use is limited to evaporation from lakes, reservoirs, etc. that are required for continuous operation.

*Note:* Figures may not add up to totals due to rounding.

[a] The quantity of water withdrawn from a water source.
[b] The amount of water used more than once in an industrial application.
[c] Gross water use equals total water intake plus recirculation.
[d] The quantity of water returned to the water source.
[e] Consumption is that part of water intake that is evaporated, incorporated into products or crops, consumed by humans or livestock, or otherwise removed from the local hydrologic environment.

Variable Definitions and Methodology: *Internal Renewable Water Resources* (IRWR) include the average annual flow of rivers and the recharge of groundwater (aquifers) generated from endogenous precipitation — precipitation occurring within a country's borders. IRWR are measured in cubic kilometers per year ($km^3$/year).

*Groundwater recharge* is the total volume of water entering aquifers within a country's borders from endogenous precipitation and surface water flow. Groundwater resources are estimated by measuring rainfall in arid areas where rainfall is assumed to infiltrate into aquifers. Where data are available, groundwater resources in humid areas have been considered as equivalent to the base flow of rivers.

*Surface water* produced internally includes the average annual flow of rivers generated from endogenous precipitation and base flow generated by aquifers. Surface water resources are usually computed by measuring or assessing total river flow occurring in a country on a yearly basis.

*Overlap* is the volume of water resources common to both surface and groundwater. It is subtracted when calculating IRWR to avoid double counting. Two types of exchanges create overlap: contribution of aquifers to surface flow, and recharge of aquifers by surface run-off. In humid temperate or tropical regions, the entire volume of groundwater recharge typically contributes to surface water flow. In karstic domains (regions with porous limestone rock formations), a portion of groundwater resources are assumed to contribute to surface water flow. In arid and semi-arid countries, surface water flows recharge groundwater by infiltrating through the soil during floods. This recharge is either directly measured or inferred by characteristics of the aquifers and piezometric levels.

Total internal renewable water resources is the sum of surface and groundwater resources minus overlap; in other words, IRWR = Surface Water Resources + Groundwater Recharge — Overlap.

*Natural Renewable Water Resources*, measured in cubic kilometers per year ($km^3$/year), is the sum of internal renewable water resources and natural flow originating outside of the country. Natural Renewable Water Resources are computed by adding together both internal renewable water resources (IRWR — see above) and natural flows (flow to and from other countries). Natural incoming flow is the average amount of water which would flow into the country without human influence. In some arid and semi-arid countries, actual water resources are presented instead of natural renewable water resources. These actual totals, labeled with a footnote in the freshwater data table, include the quantity of flows reserved to upstream and downstream countries through formal and informal agreements or treaties. The actual flows are often much lower than natural flow due to water scarcity in arid and semi-arid regions.

*Per Capita Natural Renewable Water Resources* are measured in cubic meters per person per year ($m^3$/person/year). Per capita values were calculated by using national population data for 2002.

*Water Withdrawals (annual)*, measured in million cubic meters, refers to total water removed for human uses in a single year, not counting evaporative losses from storage basins. Water withdrawals also include water from nonrenewable groundwater sources, river flows from other countries, and desalination plants.

*Per Capita Annual Withdrawals* were calculated using national population data for the year the withdrawal data were collected.

*Water Withdrawals as a Percent of Renewable Water Resources* is the proportion of renewable water resources withdrawn on a per capita basis, expressed in cubic meters per person per year ($m^3$/person/year). The value is calculated by dividing water withdrawals per capita by actual renewable water resources per capita.

*Sector Share of water withdrawals*, expressed as a percentage, refers to the proportion of water used for one of three purposes: agriculture, industry, and domestic uses. All water withdrawals are allocated to one of these three categories.

Agricultural uses of water primarily include irrigation and, to a lesser extent, livestock maintenance.

Domestic uses include drinking water plus water withdrawn for homes, municipalities, commercial establishments, and public services (e.g. hospitals).

Industrial uses include cooling machinery and equipment, producing energy, cleaning and washing goods produced as ingredients in manufactured items, and as a solvent.

**Table 7B.11 (Continued)**

Desalinated Water Production, expressed in million cubic meters, refers to the amount of water produced by the removal of salt from saline waters — usually seawater — using a variety of techniques including reverse osmosis. Most desalinated water is used for domestic purposes.

Most Freshwater resources data were provided by AQUASTAT, a global database of water statistics maintained by the Food and Agriculture Organization of the United Nations. AQUASTAT collects its information from a number of sources — national water resources and irrigation master plans; national yearbooks, statistics and reports; FAO reports and project documents; international surveys; and, results from surveys done by national or international research centers. In most cases, a critical analysis of the information was necessary to ensure consistency among the different data collected for a given country.

When possible, cross-checking of information among countries was used to improve assessment in countries where information was limited. When several sources gave different or contradictory figures, preference was always given to information collected at the national or sub-national level. This preference is based on the assumption by FAO that no regional information can be more accurate than studies carried out at the country level. Unless proven to be wrong, official rather than unofficial sources were used. In the case of shared water resources, a comparison among countries was made to ensure consistency at river-basin level.

For more information on the methodology used to collect these data, please refer to the original source or: Food and Agriculture Organization of the United Nations (FAO): Water Resources, Development and Management Service. October, 2001. Statistics on Water Resources by Country in FAO's AQUASTAT Programme (available on-line at fao.org/ag/agl/aglw/aquastat/water_res/index.stm). Rome: FAO.

*Frequency of Update by Data Providers*: AQUASTAT was developed by the Food and Agriculture Organization of the United Nations in 1993; data have been available on-line since 2001. Most freshwater data are not available in a time series, and the global data set contains data collected over a time span of up to 30 years. AQUASTAT updates their website as new data become available, or when FAO conducts special regional studies. Studies were conducted in Africa in 1994, the Near East in 1995–96, the former Soviet republics in 1997, selected Asian countries in 1998–99, and Latin America & the Caribbean in 2000. Data from the Blue Plan on Mediterranean water withdrawals were last updated in 2002. Most data updates include revisions of past data.

*Data Reliability and Cautionary Notes*: While AQUASTAT represents the most complete and careful compilation of country-level water resources statistics to date, freshwater data are generally of poor quality. Information sources are various but rarely complete. Some governments will keep internal water resources information confidential because they are competing for water resources with bordering countries. Many instances of water scarcity are highly localized and are not reflected in national statistics. In addition, the accuracy and reliability of information vary greatly among regions, countries, and categories of information, as does the year in which the information was gathered. As a result, no consistency can be ensured among countries on the duration and dates of the period of reference. All data should be considered order-of-magnitude estimates.

*Groundwater Recharge* tends to be overestimated in arid areas and underestimated in humid areas.

*Natural Renewable Water Resources* vary with time. Exchanges between countries are complicated when a river crosses the same border several times. Part of the incoming water flow may thus originate from the same country in which it enters, making it necessary to calculate a "net" inflow to avoid double counting of resources. In addition, the water that is actually accessible to humans for consumption is often much smaller than the total renewable water resources indicated in the data table.

*Renewable Water Resources Per Capita* contains water resources data from a different set of years than the population data used in the calculation. While the water resources data are usually long-term averages, inconsistencies may arise when combining it with 2002 population data.

*Water Withdrawals as a Percentage of Actual Water Resources* are also calculated using per capita data from two different years. While this ratio can indicate that some countries are depleting their water resources, it does not accurately reflect localized over-extraction from aquifers and streams. In addition, the calculation does not distinguish ground and surface water.

*Sectoral Withdrawal Data* may not add to 100 because of rounding. Evaporative losses from storage basins are not considered; users should keep in mind, however, that in some parts of the world up to 25 percent of water that is withdrawn and placed in reservoirs evaporates before it is used by an sector.

*Desalinated Water Production* may exist in some countries where the volume of production is indicated to be zero, since AQUASTAT assumes that production is zero if no value has been given for those countries where information on water use is available.

[a] Although data were obtained from FAC in 2002, they are long-term averages originating from multiple sources and years. For more information, please consult the original source at fao.org/waicent/faoinfo/agricult/agl/aglw/aquastat/water_res/index.stm.
[b] Natural renewable water resources include internal renewable water resources plus or minus the flows of surface and groundwater entering or leaving the country.
[c] Sectoral withdrawal data may not add up to 100 because of rounding.
[d] Groundwater and surface water cannot be added together to calculate total available water resources because of overlap — water that is counted in both the groundwater and surface water totals.
[e] At the country level, total internal renewable water resources = surface water + groundwater — overlap. Regional and global totals represent a sum of available country-level data.
[f] Calculation is based on withdrawals from various years, and population data from 2002.
[g] Data on desalinated water originate from FAO country surveys conducted in various regions between 1992 and 2000.
[h] Data account for the portion of flow secured through treaties or agreements to other countries.
[i] River discharges in Siberia are not well documented and highly uncertain.
[j] Data are for the continental United States.

*Note:* Figures may not add to totals due to independent rounding. 2000 Population numbers: medium United Nations variant.

Limitations: Extreme care should be used when applying these data — they are often the least reliable and most inconsistent of all water resources information. They come from a wide variety of sources and are collected using different approaches with few formal standards. Consistent data collection is needed in this area, using standard methods and assumptions. As a result, this table includes data that are actually measured, estimated, modeled using different assumptions, or derived from other data. The data also come from different years, making direct comparisons difficult, though the effort of FAO to standardize water-use data for 2000 has somewhat reduced this problem. Industrial withdrawals for Panama, St. Lucia, St. Vincent, and the Grenadines are included in the domestic category. Another major limitation of these data is that they do not include the use of rainfall in agriculture. Many countries use a significant fraction of the rain falling on their territory for agricultural production, but this water use is neither accurately measured nor reported.

*Note*: a) In general, the data for the four sectors will not sum to 100%, since "agricultural uses other than irrigation", "agricultural uses other than irrigation", "industrial cooling", and "other uses" are not covered here. Exceptions occur when the % are based on partial totals or the categories presented include other uses.
b) "Public water supply" refers to water supply by waterworks, and may include other uses besides the domestic sector. "Irrigation", "Industry no cooling" and "Electrical cooling" refer to self supply (abstraction for own final use).
c) Data refer to 1999 or latest available year. Data prior to 1995 have not been considered.

*Note:* CAN, 1980, 1985 and 1990: 1981, 1986 and 1991 data; MEX, 1980: % based on totals excluding agricultural uses other than irrigation. Industry no cooling: includes cooling. Electrical cooling 1980: data include Secretariat estimates; U.S.A., Industry no cooling: includes cooling; JPN, Industry no cooling: includes industrial and electrical cooling; KOR, % based on partial totals: electrical cooling excluded. Public supply: data refer to domestic sector. Irrigation: includes other agric, uses. Industry no cooling includes cooling, 1999: 1997 data; AUS, 1980: 1977 data adjusted for average climatic year. 1985: data refer to fiscal year 1983/84 and to both waterworks and self-supply; public supply: data refer to domestic sector; industry no cooling: may include industrial and electrical cooling, 1999: 1996/97 data; NZL, % based on partial totals; AUT, % based on partial totals. Irrigation and industry no cooling: groundwater only. Electrical cooling (includes all industrial cooling): surface water only. 1990:1992 data; irrigation includes other agricultural abstractions. 1999: 1997 data; BEL, 1999: 1998 data including Secretariat estimates; CZE, Industry no cooling: includes cooling; DNK, 1980: 1977 data. 1990; % based on totals referring to groundwater abstractions only, which represent the majority of total freshwater abstractions (e.g. 95–99% for 1995). Industry no cooling: includes some industrial and electrical cooling (self-supply). 1999: 1998 data, Irrigation: 1995 data; FIN, % based on partial total: 1985 and 1990 exclude agricultural uses besides irrigation (1985 data); industry no cooling: includes cooling. Irrigation: 1999 data is country estimate; FRA, 1980 and 1999: 1981 and 1997 data. Irrigation: includes other agricultural uses, but irrigation is the main use. Industry no cooling: includes cooling. 1997: break in time series; DEU, % based on totals excluding agricultural uses other than irrigation. Industry no cooling: includes cooling. 1980 and 1985: 1979 and 1983 data, for western Germany only. 1990 and 1999: 1991 and 1998 data for total Germany; GRC, % based on partial totals excluding agricultural uses other than irrigation, 1999: 1997 data. Public water supply: supply by 42 out of 75 great water distribution enterprises; HUN, 1999: 1998 data; ISL, Public supply: includes the domestic use of geothermal water. Industry no cooling: includes cooling. After 1985, fish farming is a major user of abstracted water, explaining the change in the relative contribution of other sectors. 1990: 1992 data; IRL, Industry no cooling: includes cooling. Irrigation: includes other agricultural uses (e.g. rural domestic use). % based on totals including 1980 data for electrical cooling; ITA, % based on totals excluding agricultural uses besides irrigation. 1990 and 1999: 1989 and 1998 data; LUX, Industry no cooling: includes cooling. 1990: 1989 data, except for industry and electrical cooling (1983 data); irrigation; estimated data; NLD, % based on partial totals excluding all agricultural uses. 1980, 1985, 1990 and 1999: 1981, 1986, 1991 and 1996 data; NOR, Data include 1978 data for industry. 1985: 1983 data. Industry no cooling: includes industrial cooling; POL, % based on totals including abstractions for agriculture, which include aquaculture (areas over 10 ha) and irrigation (Arabic land and forest areas greater than 20 ha); animal production and domestic needs of rural inhabitants are not covered (selfsupply); PRT, % based on totals excluding agricultural uses besides irrigation. 1990 and 1999: 1991 and 1998 data; SLO, Irrigation: Secretariat estimates. Industry no cooling: includes cooling; ESP, % based on totals excluding agricultural uses other than irrigation. Industry no cooling: surface water only; includes industrial cooling. Electrical cooling: until 1990 data include total industrial use. 1990 and 1999: 1991 and 1997 data; SWE, Irrigation: 1980 and refer to 1976; since 1985 data are estimates for dry year. Industry no cooling: 1980 data refer to 1974 and include mining and quarrying and electrical cooling: 1985 and 1990 data refer to 1983. Electrical cooling: 1985 and 1990 data refer to 1983. 1999: 1995 data; CHE, % based on partial totals excluding all agricultural uses. Public supply: includes industry (total industry—ISIC 10–45 rev. 3), which totals 215 million $m^3$ (1994), and other activities (101 million $m^3$ (1994)). 1999: 1998 data; TUR, % based on totals excluding agricultural uses other than irrigation. 1985: % based on partial totals excluding electrical cooling. Industry no cooling: includes cooling. 1990: 1991 data. Electrical cooling 1999: estimation (1995 data); UKD, England and Wales only. Data include miscellaneous uses for power generation, but exclude hydroelectric power water use; RUS, 1990 and 1999: 1991 and 1996 data.

*Note:* CAN, 1980, 1985, and 1990: 1981, 1986, and 1991 data. 1999: WWF estimate for 1995; MEX, 1980: excluding agricultural uses besides irrigation. Data include Secretariat estimates for electrical cooling based on electricity generated in power stations in 1980. 1999: Total gross abstraction excluding 143 $km^3$ used in hydroelectric energy generation; U.S.A., 1999: WWF estimate for 1995; JPN, 1999: 1997 data; KOR, Partial totals excluding electrical cooling. 1999: 1997 data; AUS, 1980: 1977 data adjusted for an average climatic year. 1985: fiscal year 1983/84. 1999: 1996/97 data; NZL, Partial totals excluding industrial and electrical cooling. 1980: composite total based on data for various years. 1999: 1993 estimates; AUT, Partial totals. Surface water: excluding agriculture, irrigation and industry except cooling. Groundwater: excluding industry and electrical cooling. 1999: 1997 data; BEL, 1999: 1998 data; data include Secretariat estimates; DNK, 1980 and 1999: 1977 and 1998 data. 1990 refer only to groundwater abstractions, which represent the majority of total freshwater abstractions (e.g. 95–99% for 1995); FIN, Partial totals. 1985 and 1990: exclude agricultural uses besides irrigations. 1999: includes country estimate for agriculture; FRA, 1980 and 1999: 1981 and 1997 data. 1997: Break in time series; DEU, Excluding agricultural uses besides irrigation. 1980 and 1985: 1979 and 1983 data for western Germany only. 1990 and 1999: 1991 and 1998 data for total Germany. Data include electrical cooling; GRC, Partial totals excluding agricultural uses besides irrigation. 1999: 1997 data including, for public water supply, data from 42 out of 75 great water distribution enterprises; HUN, 1999: 1998 data; ISL, Totals include the domestic use of geothermal water. 1990: 1992 data; IRL, 1999: 1994 data; totals include 1980 data for electrical cooling; ITA, Excluding agricultural uses besides irrigation. 1980: including 1973 estimates for industrial cooling. 1990 and 1999: 1989 and 1998 data; LUX, 1990: 1989 data, including 1983 data; NLD, Partial totals excluding all agricultural uses. 1980, 1985, 1990 and 1999: 1981, 1986, 1991 and 1996 data; NOR, Data include 1978 data for industry. 1985: 1983 data. 1999: data are estimates for 1994; POL, Totals include abstractions for agriculture, which refer to aquaculture (areas over 10 ha) and irrigation (arable land and forest areas greater than 20 ha); animal production and domestic needs of rural inhabitants are not covered (selfsupply); PRT, Excluding agricultural uses besides irrigation. 1990: 1991 data. 1999: 1998 data; ESP, Excluding agricultural uses besides irrigation. Groundwater: excluding industry. 1990 and 1999: 1991 and 1997 data; SWE, 1980, 1985 and 1990: include data from different years. 1999: 1995 data; CHE, Partial totals excluding all agricultural uses. 1999: 1998 data; TUR, Partial totals. Excluding agricultural uses besides irrigation. 1980 and 1985: excluding electrical cooling. 1990: 1991 data. 1999: total: country estimates; surface and groundwater: 1997 data; UKD, Partial totals. England Wales only. Data include miscellaneous uses for power generation, but exclude hydroelectric power water use; RUS, 1990: 1991 data; Totals, Rounded figures, including Secretarial estimates. OECD and EU until 1985: western Germany only. % of renewable resources: calculated using the estimated totals for internal resources (not total resources as for countries), and considering England and Wales only.

[a] Data refer to total abstraction divided by total renewable resources, except for regional totals, where the internal resource estimates were used to avoid double counting. Total renewable resources represent the maximum quantity of water available on average.
[b] Data refer to 1999 or latest available year. Data prior to 1994 have not been considered.
[c] Data refer to 1999 or latest available year.

[a] Estimates are typically approximate and therefore the sum of the sectoral data may not add to 100 percent.
[b] Sum of all groundwater flows, including base flow (as a constituent of surface water flows).
[c] Sum of all aquifer recharge flows.
[d] Sectoral data for Madagascar equal 0.32 percent for domestic for 1984 as reported by Margat 1990.
[e] Sectoral data for Canada are calculated using a groundwater withdrawal value of 1.6 $km^3$ from 1985 as reported by Margat 1990.
[f] Data for the United States are from Economic Commission for Europe (1992) without a specific date. Data reported by Margat (1990) are 660 $km^3$ from a source dated 1974 and refer to the U.S. Including the 50 states and Puerto Rico.
[g] Sectoral data for the U.S. are calculated using a groundwater withdrawal value of 101.3 $km^3$ from 1985 as reported by Margat 1990.
[h] Data refer to 1995 or latest available year (generally from 1991, 1992, 1993, or 1994).

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 7B.16 (Continued)**

[i] Sectoral data are calculated using a groundwater withdrawal value of 23.5 $km^3$ from around 1985 as reported by Margat 1990.
[j] Domestic and industrial withdrawals have been combined.
[k] Sectoral data for Australia are calculated using a groundwater withdrawal value of 2.46 $km^3$ from 1983 as reported by Margat 1990.
[l] Sectoral data for Bangladesh are calculated using a groundwater withdrawal value of 3.4 $km^3$ from 1979 as reported by Margat 1990.
[m] Sectoral data are from around 1990 as provided by Shiklomonov; total withdrawal data also are from 1990 but are from FAO, Irrigation in Asia in Figures, p. 95.
[n] Data are from FAO, Irrigation in Asia in Figures (1999) which states "The renewable potential of groundwater resources is estimated at about 27 $km^3$/yr—." A value of 185 $km^3$/yr is provided by Margat (1990) cited from L'vovich 1974.
[o] Sectoral data for Japan are from 1987 as provided by Shiklomonov 1997 based on groundwater withdrawal of 12.88 $km^3$.
[p] Data are from 1996.
[q] Both withdrawal and sectoral data are estimated from a bar graph from FAO Report: Irrigation in the Former Soviet Union Countries in Figures, p. 116.
[r] Data are from 1993.
[s] Sectoral data for the Republic of Korea are calculated using a groundwater withdrawal value of 1.2 $km^3$ from around 1985 as provided by Margat 1990.
[t] Kyrgystan data: FAO Irrigation in the Former Soviet Union Countries in Figures, p. 129, "In 1994, more than 0.6 $km^3$ of water was withdrawn from groundwater." We have entered a value of 0.6 but the figure may be higher; we have calculated the sectoral data from the figure in this report on page 129, using the 0.6 figure for total withdrawal.
[u] Sectoral data for Pakistan are from Shiklomonov who reports "approximately 90 percent" for agriculture share; total withdrawal also is approximately 60 $km^3$/yr for around 990 (table p. 57).
[v] Sectoral data for Uzbekistan are from 1994 FAO Irrigation in the Former Sovet Union Countries in Figures estimated from a bar graph, p. 217.
[w] Sectoral data for Austria are calculated using a groundwater withdrawal value of 1.17 $km^3$ from 1980 as reported by Margat 1990.
[x] Sectoral data Belarus are calculated using a groundwater withdrawal value of 1.06 $km^3$ from 1985 as reported by Margot 1990.
[y] Data for Bulgaria are from ECE (1992) and refer to the year 1988; Margat (1990) reports data from a 1989 source (Anonyme 1989) as 3.1 $km^3$.
[z] Data for Denmark are from ECE (1992) and refer to the year 1985; Margat (1990) reports data from a 1981 source (Anonyme 1981) as 4.3 $km^3$.
[aa] Sectoral data are calculated using a groundwater withdrawal value of 1.32 $km^3$ from 1977 as reported by Margat 1990.
[bb] Data for Finland are from ECE (1992) without a year specified; Margat (1990) reports data from a 1989 source (Anonyme 1989) as 2.2 $km^3$.
[cc] Sectoral data are calculated using a groundwater withdrawal value of 0.37 $km^3$ from 1980 as reported by Margat 1990.
[dd] Data are from Margat (1990) and refer to a source dated 1989 (Margat 1989); data reported from ECE (1992) is 26.0 $km^3$ for 1981.
[ee] Sectoral data are from Margat (1990) and combine his data for both Germanys. Margat's total withdrawal data are from different dates for the two Germanys. Germany—RFA is 7.77 $km^3$ from 1981 and Germany—ex DDR is from 1975; the combined total is 9.55 which is used to calculate the sectoral percentage. The sectoral data also are from 1981 (Germany RFA) and 1975 (Germany—ex DDR).
[ff] Sectoral data are calculated using a groundwater withdrawal value of 1.6 $km^3$ from 1972 as reported by Margat 1990.
[gg] Sectoral data for Ireland are calculated using a groundwater withdrawal value of 0.17 $km^3$ from 1980 as reported by Margat 1990.
[hh] Sum of the total groundwater flow that is exploitable.
[ii] Sectoral data are calculated using a groundwater withdrawal value of 1.28 $km^3$ from 1981 as reported by Margat 1990.
[jj] Sectoral data for Norway are calculated using a groundwater withdrawal value of 0.11 $km^3$ from 1985 as reported by Margat 1990.
[kk] Sectoral data are calculated using a groundwater withdrawal value of 2.0 $km^3$ from 1980–81 as reported by Margat 1990.
[ll] Sectoral data are calculated using a groundwater withdrawal value of 2.0 $km^3$ from 1980 as reported by Margat 1990.
[mm] Sectoral data are calculated using a groundwater withdrawal value of 1.18 $km^3$ from 1975 as reported by Margat 1990.
[nn] Sectoral data for Sweden are calculated using a groundwater withdrawal value of 0.48 $km^3$ from 1985 as reported by Margat 1990.
[oo] Sectoral data for Switzerland are calculated using a groundwater withdrawal value of 1.0 $km^3$ from 1983 as reported by Margat 1990.
[pp] Sectoral data are calculated using a groundwater withdrawal value of 4.22 $km^3$ from 1985 at reported by Margat 1990.
[qq] Sectoral data are calculated using a groundwater withdrawal value of 2.38 $km^3$ from 1975 as reported by Margat 1990.
[rr] Sectoral data are from 1992, Margat Blue Plan.
[ss] Data are from 1991.
[tt] Sectoral data are from 1994, Margat Blue Plan.
[uu] Data are from Margat, personal communication February 2000.
[vv] Groundwater withdrawal and sectoral data are estimated from a bar graph for 1993 from FAD water Report: Irrigation in the Near East Region in Figures, Rome, 1997, p. 115.
[ww] Groundwater withdrawal and sectoral data are estimated from a bar graph for 1994 from FAD Water Report: Irrigation in the Near East Region in Figures, Rome, 1997, p. 124.
[xx] Data are from 1994; from FAD irrigation in the Near East Region in Figures, p. 29.
[yy] Sectoral percentages are calculated using groundwater withdrawal of 3.81 $km^3$ which is an estimate provided with sectoral data for 1995 in Margat Blue Plan.
[zz] Sectoral data are from 1991, Margat Blue Plan.
[aaa] Data are from 1992.
[bbb] Data are from 1995.
[ccc] Sectoral percentage for UAE are a combination of data from text and a bar graph for 1995 from FAO Water Report: Irrigation in the Near East Region in Figures, Rome 1997, p. 266.

© 2006 by Taylor & Francis Group, LLC

[ddd] Sectoral data are from 1990, Margat Blue Plan.
[eee] Groundwater withdrawal data are from Margat 1990, presented as two separate values, one for Yemen du Nord for around 1985 equal to 1 bill $m^3$/yr; the other for Yemen du Sud for 1975 equal to 0.35 billion m3 per year. These two figures have been added.
[fff] Data are from 1989.
[ggg] Sectoral data are from Margat Blue Plan for 1989.
[hhh] Sectoral data refer only to Mauritius Island only.

Margat, Les eau — souterraines sand le monde (Bureau de recherches géologiques et minières [BRGM], Département eau, Oriéans, France, December 1990); J. Margat and D. Vallée, Water Resources and Uses in the Mediterranean Countries (Blue Plan, Sophia Antipolis, 1999); I.A. Shiklomanov, Comprehensive Assessment of the Freshwater Resources of the World (Stockholm Environment Institute, Stockholm, 1997); Organisation for Economic Co-Operation and Development (OECD), OECD Environmental Data Compendium 1997 (OECD, Paris, 1997); and Economic Commission for Europe, The Environment in Europe and North America (United Nations, New York, 1992).

Groundwater resources and desalinization activities: J. Margat, Le — Eau — Souterraines Dans Le Bassin Mediterraneen. Resources et Utilisations Plan Bleu, Doc. BRGM 282 (Ed. BRGM, Orléans, France, 1998); Food and Agriculture Organization of the United Nations (FAO), Irrigation in Africa in Figures, Water Reports No. 7 (FAO, Rome, 1995); FAO, Irrigation in the Near East Region in Figures, Water Reports No. 9 (FAO, Rome, 1997); FAO, Irrigation in the Former Soviet Union in Figures, Water Report No. 15 (FAO, Rome, 1997); FAO, Irrigation in Asia in Figures, Water Reports No. 18 (FAO, Rome, 1999); and FAO, Irrigation in Latin America in Figures, Water Reports (FAO, Rome, in preparation). Population data: United Nations (U.N.) Population Division, World Population Prospects, 1950–2050 (The 1998 Revision), on diskette (U.N., New York, 1999).

Average annual groundwater recharge is the amount of water that is estimated to annually infiltrate soils, including water from rivers and streams that lose it to underlying strata. In general, this figure would represent the maximum amount of water that could be withdrawn annually without ultimately depleting the groundwater resource. These data are estimated in a variety of ways and caution should be used in comparing values for different countries.

Per capita recharge is the amount of water that annually infiltrates soils on a per person basis, using 2000 population estimates from the U.N. Population Division.

Annual total groundwater withdrawals refers to abstractions from all groundwater sources — even nonrenewable sources. The percentage of annual recharge refers to total groundwater withdrawals. Per capita annual withdrawals were calculated using national population data for the year of data shown.

Sectoral share of withdrawals of groundwater is classified as domestic (drinking water, homes, commercial establishments, public services, and municipal use), industry including water withdrawn to cool thermoelectric plants), and agriculture (irrigation and livestock).

Desalinated water production refers to the removal of salt from saline waters — usually seawater — using a variety of techniques including reverse osmosis. Most desalinated water is used for domestic purposes.

Totals may not add due to rounding.

*Note:* Active, current systems, from Safe Drinking Water Information System/Federal version (SDWIS/FED) 03Q4 frozen inventory table. CWS, Community Water System: A public water system that supplies water to the same population year-round; NTNCWS, Non-Transient Non-Community Water System: A public water system that regularly supplies water to at least 25 of the same people at least six months per year, but not year-round. Some examples are schools, factories, office buildings, and hospitals which have their own water systems; TNCWS, Transient Non-Community Water System: A public water system that provides water in a place such as a gas station or compground where people do not remain for long periods of time. Groundwater systems, groundwater (GW), purchased groundwater (GWP); Surface water systems, surface water (SW), purchased surface water (SWP), groundwater under the direct influence of surface water (GU), purchased groundwater under the direct influence of surface water (GUP).

| *Confidence Interval* | * | ±0.0 | ±0.0 | ±6.1 | ±8.0 | ±9.2 | ±3.6 | ±6.0 | ±2.5 |
| % Purchased Water | * | 66.7 | 57.2 | 67.7 | 80.3 | 69.5 | 72.2 | 75.7 | 66.2 |
| *Confidence Interval* | * | ±0.0 | ±4.6 | ±9.7 | ±10.3 | ±7.2 | ±4.7 | ±8.2 | ±6.1 |
| Observations | 6 | 22 | 47 | 19 | 17 | 22 | 23 | 7 | 163 |
| **All Systems** | | | | | | | | | |
| Average Daily Production | 0.011 | 0.033 | 0.166 | 0.995 | 3.589 | 11.305 | 28.811 | 222.672 | 1.103 |
| *Confidence Interval* | ±0.008 | ±0.007 | ±0.024 | ±0.131 | ±0.518 | ±1.093 | ±5.427 | ±41.741 | ±0.124 |
| Observations | 138 | 166 | 208 | 170 | 159 | 116 | 201 | 58 | 1,216 |

*Note:* *No purchased water systems of this size in sample. Definitions: Production is the amount of water drawn from each source. It includes water delivered to customers and system losses.

The tabulations presented in the Community Water System Survery 2000 are based on data collected from a sample of U.S. Water Systems, not from a census of every water system in the United States. A confidence interval is one way to gauge how precisely a given tabulation of survey data can be generalized to the entirety of U.S. Systems represented by the surveyed systems. Any result presented in the table must be viewed as the center of a range that would encompass the precise number that would be found if every U.S. water system could have been included in the tabulation, and not only those who were sampled and responded to the 2000 Community Water System Survey. The confidence interval expresses the range as a "plus/minus," that is, an amount to be added to and subtracted from the calculated data point actually presented in the table. The confidence interval is designed to include the true value in the stated rage 95 perecent of the time.

*Note:* Unaccounted for water includes system losses, water for fire suppression, and water used in the treatment process.
The tabulations presented in the Community Water System Survery 2000 are based on data collected from a sample of U.S. Water Systems, not from a census of every water system in the United States. A confidence interval is one way to gauge how precisely a given tabulation of survey data can be generalized to the entirety of U.S. Systems represented by the surveyed systems. Any result presented in the table must be viewed as the center of a range that would encompass the precise number that would be found if every U.S. water system could have been included in the tabulation, and not only those who were sampled and responded to the 2000 Community Water System Survey. The confidence interval expresses the range as a "plus/minus," that is, an amount to be added to and subtracted from the calculated data point actually presented in the table. The confidence interval is designed to include the true value in the stated range 95 percent of the time.

## SECTION 7D PUBLIC WATER SUPPLY—WORLD

**Table 7D.25 Groundwater Use in Canada, 1996**

| Province/Territory | Population Reliant on Groundwater[a] | | Municipal Water Systems Reliant on Groundwater[b] | |
|---|---|---|---|---|
| | Number | Percent | Number | Percent |
| Newfoundland and Labrador | 189,921 | 33.9 | 19 | 23.5 |
| Prince Edward Island | 136,188 | 100.0 | 5 | 100.0 |
| Nova Scotia | 426,433 | 45.8 | 15 | 41.7 |
| New Brunswick | 501,075 | 66.5 | 40 | 72.7 |
| Quebec | 2,013,340 | 27.7 | 142 | 36.7 |
| Ontario | 3,166,662 | 28.5 | 132 | 42.7 |
| Manitoba | 342,601 | 30.2 | 22 | 50.0 |
| Saskatchewan | 435,941 | 42.8 | 44 | 65.7 |
| Alberta | 641,350 | 23.1 | 36 | 29.0 |
| British Columbia | 1,105,803 | 28.5 | 63 | 45.3 |
| Yukon Territory | 15,294 | 47.9 | 4 | 100.0 |
| Northwest Territories[c] | 18,971 | 28.1 | 0 | 0.0 |
| Canada | 8,993,579 | 30.3 | 522 | 41.2 |

[a] It is assumed that the population not covered by the Municipal Water Use Database is rural and that 90% of this population is groundwater reliant (except in Prince Edward Island, where 100% of the population is known to be groundwater reliant).
[b] Includes population and municipal water systems that are reliant on groundwater only, as well as those that are reliant on groundwater and surface water.
[c] Includes Nunavut.

*Note:* [a]Prices calculated on the basis of a family of four (two adults and two children) living in a house with garden rather than an apartment. Where there are water meters, the price is based on annual consumption of 200 $m^3$. Where supply is normally unmeasured the average price has been used (Norway and UK). VAT is not included.
KOR, 1996: national data.
NZL, 1996: Secretariat estimates based on country data for water meter charges for the 1997/98 fiscal year, and considering an annual consumption of 200 $m^3$.
DEU, 1996: country data which refer to 1997 and are provisional.
GRC, 1996 data refer to 1995; source: Ministry of Development.
NOR, Unmeasured data: refer to the average price.
TUR, 1996 data refer to 1995.
UKD, Unmeasured data: refer to the average price.

**Table 7D.36 Constraints in Improving Water Supply and Sanitation Services in Developing Countries**

| Constraints | Number of Countries Indicting Constraint | | | Ranking Index[a] |
|---|---|---|---|---|
| | Very Severe | Severe | Moderate | |
| Insufficiency of trained personnel (professional) | 16 | 40 | 27 | 155 |
| Funding limitations | 21 | 31 | 30 | 155 |
| Insufficiency of trained personnel (sub-professional) | 16 | 38 | 29 | 153 |
| Operation and maintenance[b] | 16 | 36 | 23 | 143 |
| Logistics[b] | 11 | 35 | 23 | 126 |
| Inadequate cost-recovery framework | 11 | 34 | 22 | 123 |
| Inappropriate institutional framework | 6 | 30 | 35 | 113 |
| Insufficient health education efforts | 7 | 24 | 43 | 112 |
| Intermittent water service | 10 | 19 | 32 | 100 |
| Lack of planning and design criteria | 6 | 17 | 41 | 93 |
| Noninvolvement of communities | 6 | 15 | 44 | 92 |
| Inadequate or outmoded legal framework | 10 | 14 | 34 | 92 |
| Inappropriate technology | 5 | 18 | 33 | 84 |
| Insufficient knowledge of water resources | 1 | 20 | 39 | 82 |
| Inadequate water resources | 5 | 11 | 40 | 77 |
| Lack of definite government policy for sector | 4 | 10 | 44 | 76 |
| Import restrictions | 5 | 12 | 21 | 60 |

*Note:* Ranking and frequency of constraints as reported by 87 countries.

[a] Ranking index = (No. very severe × 3) + (No. severe × 2) + (No. moderate × 1).
[b] "Logistics" is ranked ahead of "Operation and maintenance" in the group of Least Developed Countries.

**Table 7E.40 Typical Urban Water Use by a Family of Four**

| | Daily Use | | |
|---|---|---|---|
| | Per Family | | |
| | Gal/day | % | Per Capita gal/day |
| Drinking and water used in kitchen | 8 | 2 | 2.00 |
| Dishwasher (3 loads per day) | 15 | 4 | 3.75 |
| Toilet (16 flushes per day) | 96 | 28 | 24.00 |
| Bathing (4 baths or showers per day) | 80 | 23 | 20.00 |
| Laundering (6 loads per week) | 34 | 10 | 8.50 |
| Automobile washing (2 car washes per month) | 10 | 3 | 2.50 |
| Lawn watering and swimming pools (180 hr/yr) | 100 | 29 | 25.00 |
| Garbage disposal unit (1 percent of all other uses) | 3 | 1 | 0.75 |
| Total | 346 | 100 | 86.50 |

*Note:* Assuming no water delivery losses.

**Table 7E.41 Flow Rates for Certain Plumbing, Household, and Farm Fixtures**

| Location | Flow Pressure[a] (psi) | Flow Rate (gpm) |
|---|---|---|
| Ordinary basin faucet | 8 | 2.0 |
| Self-closing basin faucet | 8 | 2.5 |
| Sink faucet, 3/8 in. | 8 | 4.5 |
| Sink faucet, 1/2 in. | 8 | 4.5 |
| Bathtub faucet | 8 | 6.0 |
| Laundry tub faucet, 1/2 in. | 8 | 5.0 |
| Shower | 8 | 5.0 |
| Ball-cock for closet | 8 | 3.0 |
| Flush valve for closet (toilet) | 15 | 15–40[b] |
| Flushometer valve for closet (toilet) | 15 | 15.0 |
| Garden hose (50 ft, 3/4 in. sill cock) | 30 | 5.0 |
| Garden hose (50 ft, 5/8 in. outlet) | 15 | 3.33 |
| Drinking fountains | 15 | 0.75 |
| Fire hose 1 1/2 in., 1/2 in. nozzle | 30 | 40.0 |

[a] Flow pressure is the pressure in the supply near the faucet or water outlet while the faucet or water outlet is wide open and flowing.
[b] Wide Range due to variation in design and type of closet (toilet) flush valves.

*Source*: From U.S. Public Health Service, 1962, *Manual of Individual Water Supply Systems*.

**Table 7E.42 Summary of California and Federal Plumbing Fixture Requirements**

| Plumbing Device | California (Covers Sale and Installation) | Effective Date | Energy Policy Act of 1992 (Covers Only Manufacture) |
|---|---|---|---|
| Showerheads | 2.5 gpm | CA 3/20/92 | |
| | | US 1/1/94 | 2.5 gpm[c] |
| Lavatory Faucets[a] | 2.75 gpm | CA 12/22/78 | |
| | 2.2 gpm | CA 3/20/92 | |
| | | US 1/1/94 | 2.5 gpm[c] |
| Sink Faucets[a] | 2.2 gpm | CA 3/20/92 | |
| | | US 1/1/94 | 2.5 gpm[c] |
| Metering (self-closing) Faucets[b] (public restrooms) | Hot water maximum flow rates range from 0.25 to 0.75 gal/cycle and/or from 0.5 gpm to 2.5 gpm, depending on controls and hot water system | CA 7/1/92<br>US 1/1/94 | 0.25 gal/cycle (maximum water delivery per cycle)[c] |
| Tub Spout Diverter[a] | 0.1 (new), to 0.3 gpm (after 15,000 cycles of diverting) | CA 3/20/92 | (does not appear to be included in EPA) |
| Toilets (residential) | 1.6 gpf | CA 1/1/92 (new construction) | |
| | | CA 1/1/94 (all toilets for sale or installation) | |
| | | US 1/1/94 (non-commercial) | 1.6 gpf |
| Flushometer valves[a] | 1.6 gpf | CA 1/1/92 (new construction) | |
| | | CA 1/1/94 (all toilets) | |
| | | US 1/1/94 (commercial) | 3.5 gpf |
| | | US 1/1/97 (commercial) | 1.6 gpf |
| Toilets (Commercial)[a] | 1.6 gpf | CA 1/1/94 (all toilets for sale or installation) | |
| | | US 1/1/97 | 1.6 gpf |
| Urinals | 1.0 gpf | CA 1/1/92 (new) | |
| | | CA 1/1/94 (all) | |
| | | US 1/1/94 | 1.0 gpf |

[a] California requirements are pre-existing and more stringent than federal law; therefore California requirements prevail in California.
[b] Federal law is more stringent than California requirements.
[c] Measured at a flowing water pressure of 80 pounds/sq.in.

**Table 7E.43 Indoor Residential Water Use by Fixture or Appliance**

| Fixture/Use | Gal/Use: Average Range | Uses/Person/Day: Average Range | Gal/Person/Day: Average Range[a] | % Total: Average Range |
|---|---|---|---|---|
| Toilet | 3.5 | 5.05 | 18.5 | 26.7 |
| | 2.9–3.9 | 4.5–5.6 | 15.7–22.9 | 22.6–30.6 |
| Shower | 17.2[b] | 0.75[b] | 11.6 | 16.8 |
| | 14.9–18.6 | 0.6–0.9 | 8.3–15.1 | 11.8–20.2 |
| Bath | See shower | See shower | 1.2 | 1.7 |
| | | | 0.5–1.9 | 0.9–2.7 |
| Clothes washer | 40.5 | 0.37 | 15.0 | 21.7 |
| | — | 0.30–0.42 | 12.0–17.1 | 17.8–28.0 |
| Dishwasher | 10.0 | 0.10 | 1.0 | 1.4 |
| | 9.3–10.6 | 0.06–0.13 | 0.6–1.4 | 0.9–2.2 |
| Faucets | 1.4[c] | 8.1[d] | 10.9 | 15.7 |
| | — | 6.7–9.4 | 8.7–12.3 | 12.4–18.5 |
| Leaks | NA | NA | 9.5 | 13.7 |
| | | | 3.4–17.6 | 5.3–21.6 |
| Other domestic | NA | NA | 1.6 | 2.3 |
| | | | 0.0–6.0 | 0.0–8.5 |
| Total | NA | NA | 69.3 | 100 |
| | | | 57.1–83.5 | |

*Note:* Results from AWWARF REUWS at 1,188 homes in 12 metropolitan areas. Homes surveyed were served by public water supplies, which operate at higher pressure than private water sources. Leakage rates might be lower for homes on private water supplies. Results are averages over range. Range is the lowest to highest average for 12 metropolitan areas.

[a] Gal/person/day might not equal gal/use multiplied by uses/person/day because of differences in the number of data points used to calculate means.
[b] Includes shower and bath.
[c] Gallons per minute.
[d] Minutes of use per person per day.

**Table 7E.45 Potential Water Savings from Efficient Fixtures**

| Fixture[a] | Fixture Capacity[b] | Water Use (gpd) | | Water Savings (gpd) | |
|---|---|---|---|---|---|
| | | Per Capita | 2.7-Person Household | Per Capita | 2.7-Person Household |
| **Toilets[c]** | | | | | |
| Efficient | 1.5 gallons/flush | 6.0 | 16.2 | na | na |
| Low-flow | 3.5 gallons/flush | 14.0 | 37.8 | 8.0 | 21.6 |
| Conventional | 5.5 gallons/flush | 22.0 | 59.4 | 16.0 | 43.2 |
| Conventional | 7.0 gallons/flush | 28.0 | 75.6 | 22.0 | 59.4 |
| **Showerheads[d]** | | | | | |
| Efficient | 2.5 [1.71 gal/min | 8.2 | 22.1 | na | na |
| Low-flow | 3.0 to 5.0 f2.61 gal/min | 12.5 | 33.8 | 4.3 | 11.7 |
| Conventional | 5.0 to 8.0 [3.4] gal/min | 16.3 | 44.0 | 8.1 | 22.0 |
| **Faucets[e]** | | | | | |
| Efficient | 2.5 [1.7] gal/min | 6.8 | 18.4 | na | na |
| Low-flow | 3.0 [2.0] gal/min | 8.0 | 21.6 | 1.2 | 3.2 |
| Conventional | 3.0 to 7.0 [3.3] gal/min | 13.2 | 36.6 | 6.4 | 17.2 |
| **Toilets, Showerheads, and Faucets Combined** | | | | | |
| Efficient | na | 21.0 | 56.7 | na | na |
| Low-flow | na | 34.5 | 93.2 | 13.4 | 36.4 |
| Conventional | na | 54.5 | 147.2 | 33.5 | 90.4 |

*Note:* na = not applicable

[a] Efficient = post-1994
Low-flow = post-1980
Conventional = pre-1980

[b] For showerheads and faucets: maximum rated fixture capacity (measured fixture capacity). Measured fixture capacity equals about two-thirds the maximum.

[c] Assumes four flushes per person per day; does not include losses through leakage.

[d] Assumes 4.8 shower-use-minutes per person per day.

[e] Assumes 4.0 faucet-use-minutes per person per day.

**Table 7E.47 Water Requirements for Various Types of Establishments in the United States**

| Types of Establishments | Gal/day |
|---|---|
| Airports (per passenger) | 3–5 |
| Apartments, multiple family (per resident) | 60 |
| Bath houses (per bather) | 10 |
| Camps: Construction, semipermanant (per worker) | 50 |
| Day with no meals served (per camper) | 15 |
| Luxury (per camper) | 100–150 |
| Resorts, day and night, with limited plumbing (per camper) | 50 |
| Tourist with central bath and toilet facilities (per person) | 35 |
| Cottages with seasonal occupancy (per resident) | 50 |
| Courts, tourist with individual bath units (per person) | 50 |
| Clubs: Country (per resident member) | 100 |
| Country (per nonresident member) | 25 |
| Dwelling: Boardinghouse (per boarder) | 50 |
| Luxury (per person) | 100–150 |
| Multiple-family apartments (per resident) | 40 |
| Rooming houses (per resident) | 60 |
| Single family (per resident) | 50–75 |
| Estates (per resident) | 100–150 |
| Factories (gallons per shift) | 15–30 |
| Highway rest area (per person) | 5 |
| Hotels with private baths (2 persons per room) | 60 |
| Hotels without private baths (per person) | 50 |
| Institutions other than hospitals (per person) | 75–125 |
| Hospitals (per bed) | 250–400 |
| Laundaries, self-serviced (gallons per washing, i.e., per customer) | 50 |
| Motels with bath, toilet, and kitchen facilities (per bed space) | 50 |
| With bed and toilet (per bed space) | 40 |
| Parks: Overnight with flush toilets (per camper) | 25 |
| Trailers with individual bath units, no sewer connections (per trailer) | 25 |
| Trailers with individual baths, connected to sewer (per person) | 50 |
| Picnic: With bathhouses, showers, and flush toilets (per picnicker) | 20 |
| With toilet facilities only (gallons per picnicker) | 10 |
| Resturants with toilets facilities (per patron) | 7–10 |
| Without toilet facilities (per patron) | 21/2–3 |
| With bars and cocktail lounge (additional quantity per patron) | 2 |
| Schools: Boarding (per pupil) | 75–100 |
| Day with cafeteria, gymnasiums, and showers (per pupil) | 25 |
| Day with cafeteria but no gymnasium or showers (per pupil) | 20 |
| Day without cafeteria, gymnasiums, or showers (per pupil) | 15 |
| Service stations (per vehicle) | 10 |
| Stores (per toilet room) | 400 |
| Swimming pools (per swimmer) | 10 |
| Theaters (per seat) | 5 |
| Workers: Construction (per person per shift) | 50 |
| Day (school or offices per person per shift) | 15 |

**Table 7F.55 Bottled Water Consumption by Country in North America and South America, 1997–2002**

| Region | Country | Year (1000 $m^3$) | | | | | |
|---|---|---|---|---|---|---|---|
| | | 1997 | 1998 | 1999 | 2000 | 2001 | 2002(P) |
| North America | United States | 14,361.6 | 15,634.8 | 17,348.2 | 18,563.2 | 20,534.8 | 22,893.4 |
| North America | Mexico | 10,484.1 | 10,882.5 | 11,579.0 | 12,424.3 | 13,244.3 | 14,767.4 |
| South America | Brazil | 3,931.7 | 4,741.7 | 5,658.3 | 6,816.6 | 8,166.3 | 9,628.1 |
| North America | Canada | 541.2 | 650.5 | 754.6 | 847.9 | 938.6 | 1,027.3 |
| South America | Argentina | 568.9 | 575.2 | 594.2 | 598.9 | 600.1 | 603.1 |
| South America | Colombia | 562.8 | 579.0 | 560.0 | 549.0 | 548.4 | 556.7 |
| South America | Venezuela, Republic of Bolivia | 201.6 | 220.9 | 230.3 | 247.9 | 263.3 | 289.6 |
| South America | Peru | 75.6 | 80.9 | 89.1 | 103.5 | 118.0 | 132.1 |
| South America | Chile | 66.8 | 80.6 | 88.6 | 95.8 | 103.8 | 113.0 |
| South America | Paraguay | 46.2 | 50.2 | 53.5 | 56.9 | 60.6 | 64.5 |
| South America | Uruguay | 17.3 | 18.7 | 20.5 | 21.9 | 23.2 | 24.5 |
| South America | Nicaragua | 13.2 | 14.5 | 15.7 | 17.2 | 19.0 | 20.4 |
| North America | Cuba | 10.7 | 12.0 | 13.2 | 14.9 | 16.8 | 18.7 |

*Note:* (P) Preliminary. Not all of the water put into a water system reaches customers or is paid for by water users. This water is typically called "unaccounted-for water," but it is measured and define in a variety of ways. Many in the water industry consider all water that is not metered and billed to customer accounts to be unaccounted-for water. High rates of unaccounted-for water result in financial losses and poor performance of the water agency.

| Asia | Bangladesh[a] | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 |
| Asia | Fiji Islands[b] | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 |

*Note:* (P) Preliminary. Not all of the water put into a water system reaches customers or is paid for by water users. This water is typically called "unaccounted-for water," but it is measured and define in a variety of ways. Many in the water industry consider all water that is not metered and billed to customer accounts to be unaccounted-for water. High rates of unaccounted-for water result in financial losses and poor performance of the water agency.

[a] Commercial bottled water essentially does not exist in Bangladesh.
[b] Consumption in Fiji is virtually nil, immeasurable in terms of thousands of cubic meters.

| All Others | | 507.9 | 595.3 | 737.1 | 891.0 | 1,032.7 | 1,233.6 |

*Note:* (P) Preliminary. Not all of the water put into a water system reaches customers or is paid for by water users. This water is typically called "unaccounted-for water," but it is measured and define in a variety of ways. Many in the water industry consider all water that is not metered and billed to customer accounts to be unaccounted-for water. High rates of unaccounted-for water result in financial losses and poor performance of the water agency.

[a] Includes the Caroline Islands (Micronesia excluding Palau), the Marshall Islands, and the Northern Marianas (excluding Guam).

*Note:* Tabular Valves are in percentages.

[a] Hospitality includes restaurant/bar, overnight accommodations, and other group shelter.
[b] Office includes finance, insurance, real estate, and government.
[c] Irrigation includes parks, gardens, botanical, zoological, cemeteries, and open land.
[d] Miscellaneous commercial includes warehousing, warehouse-cold storage, and boat dock.
[e] Sales include grocery stores, convenience stores, and dry goods.
[f] Services include miscellaneous repair services, crematories, funeral homes, laboratories, and printing.
[g] Meeting and recreation include convention center, recreation and theaters, and amusement parks.
[h] Landscape includes landscape horticultural service, agriculture, soil preparation, crop services, veterinary, equestrian, livestock, poultry, and game propagation.

**Table 7G.68 Characteristics of Significant Commercial and Institutional Categories in Five Participating Agencies**

| Customer Category Description | Average Annual Daily Use (gpdc)[a] | Coefficient of Variation in Daily Use (gpdc)[b] | Percent of Total CI Use (%) | Percent of CI Customers (%)[c] | Percent Seasonal Use (%)[d] | Scaled Average Daily Use (gpdc)[e] |
|---|---|---|---|---|---|---|
| Urban irrigation | 2,596 | 8.73 | 28.48 | 30.22 | 86.90 | 739.0 |
| Schools and colleges | 2,117 | 12.13 | 8.84 | 4.79 | 57.99 | 187.0 |
| Hotels and motels | 7,113 | 5.41 | 5.82 | 1.92 | 23.07 | 414.0 |
| Laundries and laundromats | 3,290 | 8.85 | 3.95 | 1.38 | 13.35 | 130.0 |
| Office buildings | 1,204 | 6.29 | 10.19 | 11.67 | 29.04 | 123.0 |
| Hospitals and medical offices | 1,236 | 78.50 | 3.90 | 4.19 | 23.16 | 48.0 |
| Restaurant | 906 | 7.69 | 8.83 | 11.18 | 16.13 | 80.0 |
| Food stores | 729 | 16.29 | 2.86 | 5.20 | 19.37 | 21.0 |
| Auto shops | 687 | 7.96 | 1.97 | 6.74 | 27.16 | 14.0 |
| Membership organizations | 629 | 6.42 | 1.95 | 5.60 | 46.18 | 12.0 |
| Car washes | 3,031 | 3.12 | 0.82 | 0.36 | 14.22 | 25.0 |

[a] gpdc: gallons per day per customer.
[b] Coefficient of variation in daily use: The ratio of standard deviation of daily use to average of daily use.
[c] Percent of CI customers pertains to CI customers in agencies that have respective category only.
[d] Percent seasonal use = [(total annual use —12 × minimum month use]/total annual use.
[e] Scaled average daily use = average annual daily use in category × percent of total CI use attributed to the category.

| Transportation equipment | 380 | 1,011 | 2,661 | 153 | 859 | 139 | 67.6 | 55 | 171 |
| Instruments and related products | 154 | 112 | 727 | 30 | 82 | 28 | 50.0 | 10 | 45 |
| Miscellaneous manufacturing | 80 | 15 | 188 | 4 | 11 | 4 | (D) | 2 | 7 |

*Note:* Based on establishments reporting water intake of 20 mil gal. This represented 95 percent and 96 percent of the total water use estimated for mining and manufacturing industries. Water intake refers to that which is used/consumed in the production and processing operations and for sanitary services. D, Withheld to avoid disclosing individual company data; NA, Not available; S, Figure does not meet publication standards; Z, Less than $500,000.

[a] Establishments reporting water intake of 20 million gallons or more. These counts do not apply to water pollutants abatement columns for manufacturing in 1983.
[b] Refers to water recirculated and water reused.
[c] Data estimated; not strictly comparable to other years.

[a] Total gross water used is equal to sum of water intake plus water reciruclated and reused without regard to evaporation.
[b] Volume of water discharged may be greater than water intake due to mine water that is drained and discharged.

**Table 7G.80 Typical Water Uses in Paper Mills**

| | Gross Water Use | | Intake Requirement (Low Reuse) | | Intake Requirement (High Reuse) | |
|---|---|---|---|---|---|---|
| **Purpose** | **ML/day** | **mgd** | **ML/day** | **mgd** | **ML/day** | **mgd** |
| Kraft pulping (process use) | 118 | 32 | 51 | 14 | 22 | 6 |
| Kraft pulping (cooling system) | 44 | 12 | 44 | 12 | 1.5 | 0.4 |
| Bleaching | 140 | 38 | 70 | 19 | 18 | 5 |
| Paper forming (process system) | 129 | 35 | 44 | 12 | 22 | 6 |
| Paper forming (cooling system) | 14 | 4 | 14 | 4 | 0.7 | 0.2 |
| Electric power cooling[a] | 51 | 14 | 51 | 14 | 1.8 | 0.5 |
| Net totals[b] | 499 | 135 | 225 | 61 | 44 | 12.1 |

*Note:* 1,000 ton per day integrated bleached kraft paper mill.

[a] Condenser cooling requirements for a steam electric plant producing half of the total electric power needs.
[b] Intake net totals are less than the sum of the individual components because much of the wastewater from high quality uses is cascaded to lower quality uses.

**Table 7G.81 Water Intake Requirements in the United States — Average Plants Versus High Recycling Plants**

| | | Intake | | Recycling Rate[a] | |
|---|---|---|---|---|---|
| Industry | Parameters of Water Use | 1973 Industry Average | BAT[b] with Maximum Feasible Recycling | 1973 Industry Average | BAT[b] with Maximum Feasible Recycling |
| Meatpacking | gal/lb carcass weight | 2.2 gal/lb | 0.5 gal/lb | 1.66 | 6.67 |
| Poultry dressing | gal/bird poultry slaughter | 10.3 gal/bird | 1.7 gal/bird | 1.13 | 6.71 |
| Dairy products | gal/lb milk processed | 0.52 gal/lb | 0.13 gal/lb | 1.64 | 6.67 |
| Canned fruits and vegetables | gal/case 24–303 cans eq | 107 gal/case | 29 gal/case | 2.10 | 7.75 |
| Frozen fruits and vegetables | gal/lb frozen product | 7.1 gal/lb | 1.6 gal/lb | 1.60 | 7.25 |
| Wet corn milling | gal/bu corn grind | 223 gal/bu | 46 gal/bu | 1.86 | 9.09 |
| Cane sugar | gal/ton cane sugar | 18,250 gal/ton | 5,300 gal/ton | 1.54 | 5.26 |
| Beet sugar | gal/ton beet sugar | 11,100 gal/ton | 6,200 gal/ton | 2.98 | 5.38 |
| Malt beverages | gal/barrel malt beverage | 420 gal/bbl | 105 gal/bbl | 3.50 | 14.3 |
| Textile mills | gal/lb fiber consumption | 14 gal/lb | 1.8 gal/lb | 2.23 | 18.2 |
| Sawmills | gal/bd ft lumber | 3.3 gal/ft | 0.8 gal/ft | 1.64 | 6.85 |
| Pulp and paper mills | gal/ton pulp and paper | 38,000 gal/ton | 10,700 gal/ton | 3.42 | 12.2 |
| Paper converting | gal/ton paper converted | 3,900 gal/ton | 750 gal/ton | 1.70 | 8.93 |
| Alkalis and chlorine | gal/ton chlorine | 22,200 gal/ton | 860 gal/ton | 1.34 | 34.5 |
| Industrial gases | gal/1,000 cu ft industrial gases | 226 gal/mcf | 18 gal/mcf | 2.82 | 34.5 |
| Inorganic pigments | gal/ton inorganic pigments | 49,400 gal/ton | 6,100 gal/ton | 1.98 | 16.1 |
| Industrial inorganic chemicals | gal/ton chemicals 100 percent basis | 4,750 gal/ton | 470 gal/ton | 3.08 | 31.2 |
| Plastic materials and resins | gal/lb plastic | 6.7 gal/lb | 0.7 gal/lb | 3.53 | 33.3 |
| Synthetic rubber | gal/lb synthetic rubber | 6.5 gal/lb | 1.6 gal/lb | 8.38 | 33.3 |
| Cellulosic man-made fibers | gal/lb fibers | 68 gal/lb | 8.4 gal/lb | 3.42 | 27.8 |
| Organic fibers, noncellulosic | gal/lb fibers | 38 gal/lb | 5.0 gal/lb | 2.64 | 20.0 |
| Paints and pigments | gal/gal paint | 7.8 gal/gal | 0.8 gal/gal | 1.69 | 16.1 |
| Industrial organic chemicals | gal/ton chemical building blocks | 54,500 gal/ton | 4,000 gal/ton | 2.29 | 31.2 |
| Nitrogenous fertilizers | gal/ton fertilizer | 4,000 gal/ton | 900 gal/ton | 7.12 | 31.2 |
| Phosphatic fertilizers | gal/ton fertilizer | 8,500 gal/ton | 2,400 gal/ton | 4.21 | 14.7 |
| Carbon black | gal/lb carbon black | 3.9 gal/lb | 0.3 gal/lb | 1.17 | 16.1 |
| Petroleum refining | gal/barrel crude oil input | 289 gal/bbl | 55 gal/bbl | 6.38 | 33.3 |
| Tires and inner tubes | gal/tire car and truck tires | 153 gal/tire | 18 gal/tire | 3.39 | 29.4 |
| Hydraulic cement | gal/ton cement | 830 gal/ton | 180 gal/ton | 1.63 | 7.41 |
| Steel | gal/ton steel net production | 38,200 gal/ton | 5,300 gal/ton | 1.64 | 11.9 |
| Iron and steel foundries | gal/ton ferrous castings | 3,030 gal/ton | 1,080 gal/ton | 4.10 | 11.5 |
| Primary copper | gal/lb copper | 17 gal/lb | 4.5 gal/lb | 3.12 | 11.9 |
| Primary aluminum | gal/lb aluminum | 12 gal/lb | 2.9 gal/lb | 4.11 | 16.9 |
| Automobiles | gal/car domestic automobiles | 11,500 gal/car | 2,200 gal/car | 3.18 | 16.3 |

[a] The recycling rate is obtained by dividing gross water use by intake.
[b] Best available technology economically achievable as defined by Water Pollution Control Act amendments of 1972.
