| Zimbabwe | 1.2 | 7 | 2,005 | 12 | 1.96 |

*Note:* The industrial water productivity shows the economic value (US$) obtained annually by industry per cubic meter of water used. Very high differences can be noted, between high-income countries such as the United Kingdom, showing a per capita industrial water efficiency of US$ 7.10/m$^3$, and many low-income countries, such as Moldova, with only US$ 0.07/m$^3$. Observe, however, that countries having small populations or highly specialized industries (high-value gems tourism)—such as Gabon, Namibia, or Mauritius—have also achieved high productivity.

[a] Data refer to any year from 1980 to 1999.
[b] Withdrawal shares are mostly estimated for 1987.
[c] US constant dollar 1995, data for 1999.
[d] Data estimated for 1999.
[e] Population is expressed in millions, U.S. constant dollar 1995.

**Table 7H.93 Water Requirements for Selected Industries in the World**

| Industry, Product, and Country | Unit of Product (Ton, Except as Specified) | Water Required per Unit (L) |
|---|---|---|
| **Food Products** | | |
| Bread or pastry, Belgium | | 1,100 |
| Bread, United States | | 2,100–4,200 |
| Bread, Cyprus[a] | | 600 |
| **Canned food** | | |
| *Belgium* | | |
| Fish, canned | | 400 |
| Fish, preserved | | 1,500 |
| Fruit | | 15,000 |
| Vegetables | | 8,000–80,000 |
| *Canada* | | |
| Fruits and vegetables[a] | | 10,000–50,000 |
| *Cyprus* | | |
| Citrus/tomato juice[a] | | 2,800 |
| Grapefruit sections[a] | | 16,000 |
| Peaches/pears[a] | | 10,000–15,000 |
| Grapes[a] | | 30,000 |
| Tomatoes, whole[a] | | 2,000 |
| Tomato paste[a] | | 21,000 |
| Peas[a] | | 10,000 |
| Carrots[a] | | 16,000 |
| Spinach[a] | | 30,000 |
| *Israel* | | |
| Citrus fruits[a] | Ton of raw citrus | 4,000 |
| Vegetables[a] | | 10,000–15,000 |
| *United States* | | |
| Apricots | | 21,200 |
| Asparagus | | 20,500 |
| Beans, green | | 9,300 |
| Beans, lima | | 69,800 |
| Beets, corn and peas | | 7,000 |
| Grapefruit juice | | 2,800 |
| Grapefruit sections | | 15,600 |
| Peaches and pears | | 18,100 |
| Pork and beans | | 9,300 |
| Pumpkin and squash | | 7,000 |
| Sauerkraut | | 950 |
| Spinach | | 49,400 |
| Succotash | | 34,800 |
| Tomato products | | 20,500 |
| Tomatoes, whole | | 2,200 |
| Industry average, fruits, vegetables, and juices (1965)[a] | | 24,000 |
| **Meat** | | |
| Meat freezing, Cyprus[a] | Ton of carcass | 500 |
| Meat freezing, New Zealand | | 3,000–8,600 |
| Meat packing, United States[a] | Ton of prepared meat | 23,000 |
| Meat packing, Canada[a] | Ton of carcass | 8,800–34,000 |
| Meat products, Belgium | Ton of prepared meat | 200 |
| Sausage factory, Finland | | 20,000–35,000 |
| Sausage factory, Cyprus[a] | | 25,000 |
| Slaughtering, Finland | Ton, live weight | 4,000–9,000 |
| Slaughtering, Cyprus[a] | Ton of carcass | 10,000 |
| Meat preserving, Israel[a] | Ton of prepared meat | 10,000 |
| **Fish** | | |
| Fresh and frozen fish, Canada[a] | | 30,000–300,000 |
| Canned fish, Canada[a] | | 58,000 |
| Canning and preserving fish, Israel[a] | Ton of raw fish | 16,000–20,000 |
| **Poultry** | | |
| Poultry, Canada[a] | Ton | 6,000–43,000 |
| Chickens, Israel[a] | Ton of dressed chicken | 33,000 |
| Chickens, United States[a] | Per bird | 25 |
| Turkeys, United States[a] | Per bird | 75 |
| **Milk and Milk Products** | | |
| *Butter* | | |
| New Zealand[a] | | 20,000 |

**Table 7H.93 (Continued)**

| Industry, Product, and Country | Unit of Product (Ton, Except as Specified) | Water Required per Unit (L) |
|---|---|---|
| *Cheese* | | |
| Cyprus[a] | | 10,000 |
| New Zealand[a] | | 2,000 |
| United States[a] | | 27,500 |
| *Milk* | | |
| Belgium | 1,000 L | 7,000 |
| Finland | | 2,000–5,000 |
| Israel[a] | | 2,700 |
| Sweden | | 2,000–4,000 |
| United States[a] | | 3,000 |
| *Milk powder* | | |
| New Zealand[a] | | 45,000 |
| South Africa | | 200,000 |
| Whey, United States[a] | | 10,000 |
| Dairy products, general, Canada[a] | | 12,200 |
| Ice cream, United States[a] | | 10,000 |
| Yogurt, Cyprus[a] | | 20,000 |
| **Sugar** | | |
| Denmark[a] | Ton of sugar beets | 4,800–15,800 |
| Finland | Ton of sugar beets | 10,000–20,000 |
| France[a] | Ton of sugar beets | 10,900 |
| Germany, Federal[a] | Ton of sugar beets | 10,400–14,000 |
| Great Britain[a] | Ton of sugar beets | 14,900 |
| Israel[a] | Ton of sugar beets | 1,800 |
| Italy[a] | Ton of sugar beets | 10,500–12,500 |
| Republic of China[a] | Ton of sugar cane | 15,000 |
| United States[a] | Ton of sugar beets (range) | 3,200–8,300 |
| United States[a] | Ton of sugar beets (average) | 6,000 |
| **Beverages** | | |
| *Beer* | | |
| Belgium | Kiloliter | 7,000–20,000 |
| Canada[a] | Kiloliter | 10,000–20,000 |
| Cyprus[a] | Kiloliter (incl. cleaning bottles) | 22,000–30,000 |
| Finland | Kiloliter | 10,000–20,000 |
| France[a] | Kiloliter | 14,500 |
| Israel[a] | Kiloliter | 13,500 |
| United Kingdom[a] | Kiloliter | 6,000–10,000 |
| United States | Kiloliter | 15,200 |
| Whiskey, United States[a] | Kiloliter of proof spirit | 2,600–76,000 |
| Distilled spirits, Israel[a] | Kiloliter | 30,000 |
| Wine, France[a] | Kiloliter | 2,900 |
| Wine, Israel[a] | Kiloliter | 500 |
| **Miscellaneous Food Products** | | |
| Chocolate confectionery, Belgium | | 15,000–17,000 |
| Gelatin (edible), United States | | 55,100–83,500 |
| Maize (wet milling), United States | Liter of maize | 15.0–25.5 |
| Maize syrup, United States | Liter of maize | 3.8–4.3 |
| Wheat milling, Cyprus[a] | | 2,000 |
| Wheat milling, Israel[a] | | 700–1,300 |
| Potato flour, Finland | Ton of potatoes | 10,000–20,000 |
| Potato starch, Canada[a] | Ton of starch | 80,000–150,000 |
| Macaroni, Cyprus[a] | | 1,200 |
| Molasses, Belgium | Hectoliter of raw material | 1,000–12,000 |
| Molasses, United States | Hectoliter of 100 proof | 840 |
| **Pulp and Paper** | | |
| *Groundwood pulp* | | |
| Finland | Ton of wood-pulp | 30,000–40,000 |
| *Sulphate pulp* | | |
| China, Republic of[a] | Ton of bleached pulp | 340,000 |
| China, Republic of[a] | Ton of unbleached pulp | 230,000 |
| Finland | Ton of pulp | 250,000–350,000 |
| Sweden[a] | Ton of unbleached pulp | 75,000–300,000 |
| Sweden[a] | Ton of bleached pulp | 170,000–500,000 |
| *Sulphite pulp* | | |

**Table 7H.93 (Continued)**

| Industry, Product, and Country | Unit of Product (Ton, Except as Specified) | Water Required per Unit (L) |
|---|---|---|
| Finland | Ton of bleached pulp | 450,000–500,000 |
| Finland | Ton of unbleached pulp | 250,000–300,000 |
| Sweden[a] | Ton of bleached pulp | 300,000–700,000 |
| Sweden[a] | Ton of unbleached pulp | 140,000–500,000 |
| *Wood pulp* | | |
| Sweden[a] | Ton of dry pulp | 50,000–100,000 |
| South Africa | | 150,000 |
| Blotting paper, Sweden | | 350,000–400,000 |
| Craft, printing and fine paper, Finland | | 375,000 |
| Printing paper, Republic of China[a] | | 340,000 |
| Newsprint, Republic of China[a] | | 190,000 |
| Newsprint, Canada[a] | | 165,000–200,000 |
| Fine paper, Republic of China[a] | | 800,000 |
| Fine paper, Sweden | | 900,000–1,000,000 |
| Newsprint paper, Sweden | | 200,000 |
| Packing and cartridge paper, Sweden | | 125,000 |
| Press paper, Finland | | 200,000 |
| Printing paper, Sweden | | 500,000 |
| Cardboard, Finland | | 125,000 |
| Paperboard, United States | | 62,000–376,000 |
| Paper and cardboard, Belgium | | 180,000 |
| Strawboard, United States | | 109,000 |
| Wallboard, Finland | | 125,000 |
| Wallboard, Sweden[a] | | 50,000 |
| Industry average, United States[a] | Ton of pulp and paper | 236,000 |
| Industry average, United Kingdom[a] | Ton of paper and board | 90,000[b] |
| Industry average, France[a] | Ton of pulp and paper | 150,000 |
| **Petroleum and Synthetic Fuels** | | |
| Aviation gasoline, United States | Kiloliter | 25,000 |
| Aviation gasoline, Republic of China[a] | Kiloliter | 25,000 |
| Gasoline, United States | Kiloliter | 7,000–10,000 |
| Gasoline, Republic of China[a] | Kiloliter | 8,000 |
| Gasoline, polymerization, United States | Kiloliter | 34,000 |
| Kerosene, Belgium | Ton | 40,000 |
| Synthetic gasoline, United States | Kiloliter | 377,000 |
| Oilfields, United States | Kiloliter of crude petroleum | 4,000 |
| *Oil refineries* | | |
| Belgium[a] | | |
| China, Republic of[a] | Ton of crude petroleum | 30,500 |
| Sweden | Ton of crude petroleum | 10,000 |
| United States[a] | | |
| *Synthetic fuel* | | |
| From coal | | |
| South Africa | | 50,100 |
| United States | Kiloliter | 265,500 |
| From natural gas, United States | Kiloliter | 88,900 |
| From shale, United States | Kiloliter | 20,800 |
| **Chemicals** | | |
| Acetic acid, United States | | 417,000–1,000,000 |
| Alcohol, 100 proof, United States | Liter | 138 |
| Alcohol, 190 proof, United States | Liter | 52–100 |
| Alumina (Bayer process), United States | | 26,300 |
| Ammonia, synthetic, United States | Ton of liquid $NH_3$ | 129,000 |
| Ammonia (Naphtha, reforming), Japan[a] | | 255,000 |
| Ammonium nitrate, Belgium | | 52,000 |
| Ammonium sulphate, United States | | 835,000 |
| Calcium carbide, United States | | 125,000 |
| Calcium metaphosphate, United States | | 16,700 |
| Carbon dioxide, United States | | 83,500 |
| Caustic soda and chlorine, Canada[a] | | 125,000 |
| Caustic soda (Solvay process), United States[a] | | 60,500 |
| Caustic soda (Dual process), Federal Republic of Germany[a] | | 160,000 |
| Caustic soda (Dual process), Republic of China[a] | | 200,000 |

**Table 7H.93 (Continued)**

| Industry, Product, and Country | Unit of Product (Ton, Except as Specified) | Water Required per Unit (L) |
|---|---|---|
| Caustic soda (Solvay process), Republic of China[a] | | 150,000 |
| Cellulose nitrate, United States | | 41,700 |
| Charcoal and wood chemicals, United States | Ton of crude $CaAc_2$ | 271,000 |
| Chlorine, Federal Republic of Germany[a] | | 12,600 |
| Ethylene, Israel[a] | | 16,000 |
| Gases, compressed and liquified, Canada[a] | Cubic meter | 60–70 |
| Glycerine, United States | | 4,600 |
| Gunpowder, United States | | 401,000–835,000 |
| Hydrochloric acid (salt process), United States | Ton of 20 Be HCl | 12,100 |
| Hydrochloric acid (synthetic process), United States | Ton of 20 Be HCl | 2,000–4,200 |
| Hydrogen, United States | | 2,750,000 |
| Lactose, United States | | 835,000–918,000 |
| Magnesium carbonate, basic | Ton of basic $MgCO_3$ | 18,000 |
| United States | Ton of $MgCO_3$ | 163,000 |
| Oxygen, United States | Cubic meter of $O_2$ | 243 |
| Polyethylene, Federal Republic of Germany[a] | | 231,000 (incl. 225,000 cooling water) |
| Polyethylene, Israel[a] | | 8,400 |
| Potassium chloride (sylvinite), United States | | 167,000–209,000 |
| Smokeless powder, United States | | 209,000 |
| Soap, Belgium | | 37,000 |
| Soap, Cyprus[a] | | 4,500 |
| Soap (laundry), United States | | 960–2,100 |
| Soda ash (ammonia soda process), 58 percent, United States | | 62,600–75,100 |
| Sodium chlorate, United States | | 250,000 |
| Sodium silicate, United States | Ton of 40 Be water-glass | 670 |
| Stearine, soap and washing agents, Sweden | Ton of fat | 70,000–200,000 |
| Sulfuric acid, Belgium | | 20,000–25,000 |
| Sulfuric acid (chamber process), United States | Ton of 100 percent $H_2SO_4$ | 10,400 |
| Sulfuric acid (contact process), United States | Ton of 100 percent $H_2SO_4$ | 2,700–20,300 |
| Sulfuric acid, Federal Republic of Germany[a] | Ton of $SO_3$ | 83,500 |
| **Textiles** | | |
| *Steeping, dressing, scouring and bleaching* | | |
| Steeping flax, Belgium | | 30,000–40,000 |
| Dressing flax, Sweden | | 30,000–40,000 |
| Scouring wool, Belgium | | 240,000–250,000 |
| Washing wool, Sweden | | 10,000 |
| Bleaching textiles, Belgium | | 180,000 |
| *Dyeing* | | |
| Textiles, Belgium | | 200,000 |
| Textiles, France (range)[a] | | 52,000–560,000 |
| Textiles, France (average)[b] | | 180,000 |
| *Finishing* | | |
| Wet finishing of textiles, Belgium | | 100,000–150,000 |
| *Dyeing and finishing* | | |
| Cotton yarn, Israel[a] | | 60,000–180,000 |
| Synthetic yarn, Israel[a] | | 90,000–180,000 |
| Wool yarn, Israel | | 70,000–140,000 |
| Fabrics, Israel[a] | | 60,000–100,000 |
| *Mills* | | |
| Cotton | | |
| Finland | | 50,000–150,000 |
| Sweden | | 10,000–250,000 |
| Canada[a] | Square yard | 1.0 |
| *Wool* | | |
| Finland | Ton of cloth or yarn | 150,000–350,000 |
| Sweden | Ton of wool | 400,000 |
| *Synthetic fibers* | | |
| Artificial silk, Sweden | | 2,000,000 |
| *Rayon* | | |
| Belgium | | 2,000,000 |
| Finland | | 1,000,000–2,000,000 |
| Rayon staple, Belgium | | 550,000 |

**Table 7H.93 (Continued)**

| Industry, Product, and Country | Unit of Product (Ton, Except as Specified) | Water Required per Unit (L) |
|---|---|---|
| Industrial duck products, Canada[a] | | 22,000 |
| Carpets, Canada[a] | Square yard | 20 |
| **Mining and Quarrying** | | |
| Gold, South Africa | Ton of ore | 1,000 |
| Iron ore (brown), United States | | 4,200 |
| Bauxite, United States[a] | Ton of ore | 300 |
| Sulfur, United States | | 12,500 |
| Copper, Finland | | 3,750 |
| Copper, Israel[a] | | 3,100 |
| Gravel, Israel[a] | | 400 |
| Limestone and by-products, Belgium | | 200–6,500 |
| **Iron and Steel Products** | | |
| *Belgium* | | |
| Blast furnace, no recycling | | 58,000–73,000 |
| Blast furnace, with recycling | | 50,000 |
| Finished and semi-finished steel, no recycling[a] | | 61,000 |
| Finished and semi-finished steel, with recycling | | 27,000 |
| *Canada* | | |
| Pig iron[b] | | 130,000 |
| Open hearth steel[a] | | 22,000 |
| *France* | | |
| Smelting[a] | | 46,000 |
| Martin process (Open hearth)[a] | | 15,000 |
| Thomas process (Bessemer converter)[a] | | 10,000 |
| Electric furnace steel[a] | | 40,000 |
| Rolling mills[a] | | 30,000 |
| *Germany, Federal Republic* | | |
| Steel works[a] | | 8,000–12,000 |
| *South Africa* | | |
| Steel | | 12,500 |
| *Sweden* | | |
| Iron and steel works | | 10,000–30,000 |
| *United States (average)* | | |
| Fully integrated mills[a] | | 86,000 |
| Rolling and drawing mills[a] | | 14,700 |
| Blast furnace smelting[a] | | 103,000 |
| Electrometallurgical ferroalloys[a] | | 72,000 |
| Industry, consumptive use (est.)[a] | | 3,800 |
| **Miscellaneous Products** | | |
| Automobiles, United States[a] | Vehicle | 38,000 |
| Boilers, steam, United States | Horsepower-hour | 15 |
| Casein, New Zealand[a] | | 55,000 |
| *Cement, Portland* | | |
| Belgium[a] | | 1,900 |
| Cyprus (dry process)[a] | | 550 |
| Finland | | 2,500 |
| United States (wet process)[a] | | 900 |
| Ceramics and tiles, Belgium | | 1,800–2,000 |
| *Coal*:[c] | | |
| Ruhr (Fed. Rep. Of Germany)[a] | | 1,000 (min.)–1,750 (avg.) |
| Great Britain[a] | | <3,000 |
| Netherlands[a] | | 2,650 |
| Coal, Belgium | | 5,000–6,000 |
| Coal, coke and by-product coke, United States | | 6,300–15,000 |
| Coal washing, United States | | 840 |
| Condensers, surface, United States | Pound of condensed steam | 9.1–27.3 |
| *Distilling, grain* | | |
| Belgium | Hectoliter of grain treated | 6,000–7,000 |
| United States | Hectoliter of grain treated | 6,450 |
| Distilling, Sweden | Kiloliter of 100 percent alcohol | 15,000–100,000 |
| *Electric power (conventional thermal)* | | |
| Sweden | Ton of coal | 200,000–400,000 |
| South Africa | Kilowatt-hour (consumptive use) | 5 |
| United States[a] | Kilowatt-hour | 200 |

| Industry, Product, and Country | Unit of Product (Ton, Except as Specified) | Water Required per Unit (L) |
|---|---|---|
| Republic of China[a] | Kilowatt-hour | 230 |
| *Explosives* | | |
| Sweden | | 800,000 |
| United States | | 835,000 |
| Fertilizer plant, Finland | Ton of saltpeter (25 percent nitrogen) | 270,000 |
| Glass, Belgium | | 68,000 |
| *Laundry* | | |
| Cyprus[a] | Ton of washed goods | 45,000 |
| Finland | Ton of washed goods | 20,000 |
| Sweden | Ton of washed goods | 30,000–50,000 |
| Leather, South Africa | | 50,100 |
| Leather factory, Finland | Ton of hides | 50,000–125,000 |
| Leather tanning, United States[a] | Sq. meter of hide | 20–2,550 (range) |
| Leather tanning, United States[a] | Sq. meter of hide | 440 (average) |
| Leather tanning, Cyprus[a] | Sq. meter of small animal skins | 110 |
| Non-ferrous metals, raw and semi-finished, Belgium | | 80,000 |
| Rock wool, United States | | 16,700–20,900 |
| *Rubber, synthetic, United States* | | |
| Butadiene | | 83,500–2,750,000 |
| Buna S | | 125,000–2,630,000 |
| Grade GR-S | | 117,000–2,800,000 |
| *Starch* | | |
| Belgium | Ton of maize | 13,000–18,000 |
| Sweden | Ton of potatoes | 10,000 |

*Note:* Water requirements for unit of product produced. Other figures based on older data (pre-1950).

[a] Figures based on newer data (post-1960).
[b] Does not include cooling water for power generating plants.
[c] Includes generation of electricity. If this is not included, the quantities above are reduced by about one-half.

*Note:* NA, Not applicable.

[a] Land in Farms includes agricultural land used for crops, pasture, or grazing. It also includes woodland and wasteland not actually under cultivation or used for pasture or grazing, provided it is part of the farm operator's total operation.

[b] The 2002 Census of Agriculture estimates include an area-frame adjustment for incompleteness of the list frame. Similar estimates were calculated for 1997 for the purpose of comparison with the 2002 Census estimates.

**Table 7I.105 Standards for Classification of Lands as Irrigable**

| Land Characteristics | Minimum Requirements |
|---|---|
| **Soils** | |
| Texture | Loamy sand to permeably clay |
| Depth | |
| To sand, gravel, or cobble | 18 in. of good free-working soil of the fine sandy loam or heavier, or from 24–30 in. of lighter textured soil |
| To bedrock | At least 18 inches over shattered bedrock or tilted shale bedrock; or 24 in. over massive bedrock or hardpan |
| **Topography** | |
| Slopes | Smooth slopes up to no more than 30 percent in general gradient in reasonably large-sized bodies sloping in the same plane; or undulating slopes which are less than 20 percent in general gradient |
| Rock cover | No more than enough loose rock and rock outcroppings to moderately reduce productivity and interfere with cultural practices. Varies with soil depth and topographic conditions |
| Erosion | No more than moderate erosion, with very few gullies which are not crossable by tillage implements |
| **Drainage** | |
| Soil and topography | Such that moderate farm drainage may be required, but without excessive cost |
| Salinity | Total salts in the soil solution do not exceed 0.5 percent, except in readily drained soils where reclamation appears feasible |
| Alkalinity | The pH value is 9.0 or less, unless the soil is calcareous in which case higher values may be allowed. If there is evidence of black alkali a lower pH value may be limiting |

*Source*: From California State Water Resources Board, 1955.

**Table 7I.106 Summary of Losses and Waste of Irrigation Water**

| | |
|---|---|
| **During Delivery** | |
| Average field evaporation before topsoil dries | 0.5 in. per irrigation |
| Surface waste, allowance for large projects | 10 per cent of diversions |
| Seasonal percolation losses, except on porous soils | 0–1.5 acre-ft per acre |
| Losses of flow in farm ditches | 5–50 per cent per mile |
| Deliveries to farms | 1–7 acre-ft per acre |
| Consumptive use, diversified crops | 1–3.5 acre-ft per acre |
| Irrigation efficiencies, common farm crops | 20–50 per cent |
| Irrigation efficiencies, fruit, and special crops | 35–70 per cent |
| Average irrigation efficiencies on large projects | 30–50 per cent |
| **During Conveyance** | |
| Evaporation from canal surfaces | Negligible |
| Evapotranspiration at canal banks | Negligible |
| Canal seepage, large projects, mostly unlined canals | 15–45 per cent of diversions |
| Seepage losses, most canals lined | 5–15 per cent of diversions |
| Waste on large projects, ample water supplies | 5–30 per cent of diversions |
| Waste on large projects, limited water supplies | 1–10 per cent of diversions |
| Over-all efficiencies, large projects | 20–35 per cent |
| Diversions for large projects | 2–10 acre-ft per acre |

**Table 7I.107 Typical Water-Application Losses and Irrigation Efficiencies for Different Soil Conditions**

| | General Soil Type | | |
|---|---|---|---|
| **Item** | **Open, Porous (%)** | **Medium Loam (%)** | **Heavy Clay (%)** |
| Farm-lateral loss[a] | 15 | 10 | 5 |
| Surface runoff loss | 5 | 10 | 25 |
| Deep percolation loss | 35 | 15 | 10 |
| Field-irrigation efficiency[b] | 60 | 75 | 65 |
| Farm-irrigation efficiency[c] | 45 | 65 | 60 |

[a] Unlined ditches (loss in new-lined ditches and pipelines is usually about one percent).
[b] For water measured at the field.
[c] For water measured at the farm headgate.

**Table 7I.108 Adaptations and Limitations of Common Irrigation Methods**

| | Suitabilities and Conditions of Use | | | | |
|---|---|---|---|---|---|
| **Irrigation Method** | **Crops** | **Topography** | **Water Supply** | **Soils** | **Remarks** |
| Small rectangular basins | Grain, field crops, orchards, rice | Relatively flat land; area within each basin should be levelled | Can be adapted to streams of various sizes | Suitable for soils of high or low intake rates; should not be used on soils that tend to puddle | High installation costs. Considerable labor required for irrigating. When used for close-spaced crops, a high percentage of land is used for levees and distribution ditches. High efficiencies of water use possible |
| Large rectangular basins | Grain, field crops, rice | Flat land; must be graded to uniform plane | Large flows of water | Soils of fine texture with low intake rates | Lower installation costs and less labor required for irrigation than with small basins. Substantial levees needed |
| Contour checks | Orchards, grain, rice, forage crops | Irregular land; slopes less than 2 percent | Flows greater than 30 L (1 cubic foot) per second | Soils of medium to heavy texture which do not crack on drying | Little land grading required. Checks can be continuously flooded as for rice, water ponded as for orchards, or intermittently flooded as for pastures |
| Narrow borders up to 5 m (16 ft) wide | Pasture, grain, lucerne, vineyards, orchards | Uniform slopes less than 7 percent | Moderately large flows | Soils of medium to heavy texture | Borders should be in direction of maximum slope. Accurate cross-levelling required between guide levees |
| Wide borders up to 30 m (100 ft) wide | Grain, lucerne, orchards | Land graded to uniform plane with maximum slope less than 0.5 percent | Large flows, up to 600 L (20 cubic feet) per second | Deep soils of medium to fine texture | Very careful land grading necessary. Minimum of labor required for irrigation. Little interference with use of farm machinery |
| Wild flooding | Pasture, grain | Irregular surfaces with slopes up to 20 percent | Can utilize small continuous flows on steeper land or large flows or large flows on flatter land | Soils of medium to fine texture with stable aggregate which do not crack on drying | Little land grading required. Low initial cost for system. Best adapted to shallow soils since percolation losses may be high on deep permeable soils |
| Benched terraces | Grain, field crops, forage crops, orchards, vineyards | Slopes up to 20 percent | Streams of small to medium size | Soils must be sufficiently deep that grading operations will not impair crop growth | Care must be taken in constructing benches and providing adequate drainage channels for excess water. Irrigation water must be properly managed. Misuse of water can result in serious soil erosion |

**Table 7I.108 (Continued)**

| Irrigation Method | Suitabilities and Conditions of Use | | | | Remarks |
|---|---|---|---|---|---|
| | Crops | Topography | Water Supply | Soils | |
| Straight furrows | Vegetables, row crops, orchards, vineyards | Uniform slopes not exceeding 2 percent for cultivated crops | Flows up to 350 L (12 cubic ft) per second | Can be used on all soils if length of furrows is adjusted to type of soil | Best suited for crops which cannot be flooded. High irrigation efficiency possible. Well adapted to mechanized farming |
| Graded contour furrows | Vegetables, field crops, orchards, vineyards | Undulating land with slopes up to 8 percent | Flows up to 100 L (3 cubic ft) per second | Soils of medium to fine texture which do not crack on drying | Rodent control is essential. Erosion hazard from heavy rains or water breaking out of furrows. High labor requirement for irrigation |
| Corrugations | Close-spaced crops such as grain, pasture, lucerne | Uniform slopes of up to 10 percent | Flows up to 30 L (1 cubic foot) per second | Best on soils of medium to fine texture | High water losses possible from deep percolation or surface run-off. Care must be used in limiting size of flow in corrugations to reduce soil erosion. Little land grading required |
| Basin furrows | Vegetables, cotton, maize and other row crops | Relatively flat land | Flows up to 150 L (5 cubic ft) per second | Can be used with most soil types | Similar to small rectangular basins, except crops are planted on ridges |
| Zigzag furrows | Vineyards, bush berries, orchards | Land graded to uniform slopes of less than 1 percent | Flows required are usually less than for straight furrows | Used on soils with low intake rates | This method is used to slow the flow of water in furrows to increase water penetration into soil |

**Table 7I.116 Types of Microirrigation Systems**

| Type | Description | Discharge Rate |
|---|---|---|
| Point-source emitters (drip/trickle/bubbler) | Water is applied to the soil surface as discrete or continuous drops, tiny streams, or low volume fountain through small openings | Discharge is in units of gallons per hour (gph) or gallons per minute (gpm) over a specified pressure range. Discharge rates typically range from 0.5 gph to nearly 0.5 gpm for individual drip emitters. Discharge rates are adjusted by varying the length of the tubing. The longer the tube, the greater the friction loss, which decreases the discharge rate. Flows for bubblers are generally less than 1 gal/min |
| | Microtubes (spaghetti tubing) are classed as point-source emitters even though they are actually tubes rather than emitters. Microtubes consist of various lengths of flexible tubing that is small in diameter (0.020–0.040 in.). Typically, no other water control device is used. Because discharge orifices are small, complete filtration of water is required | |
| Surface or subsurface line-source emitter systems | This type of irrigation uses surface or buried flexible tubing with uniformly spaced emitter points (or porous tubing). The tubing comes as layflat tubing, flexible tubing or as a semirigid tubing that retains its shape. Because discharge orifices are small, complete filtration of water is required | Surface or subsurface line-source emitter systems have a uniform discharge units of gallons per hour per foot (gph/ft) or gallons per minute per 100 feet (gpm/100 ft) over a specified pressure range |
| Basin bubblers | The basin bubbler microirrigation system applies water to the soil surface in small fountain type streams. The discharge rate normally exceeds the infiltration rate of the soil, so small basins are used to contain the water until infiltration occurs. Discharge is generally from a small diameter (3/8–1/2 in.) flexible tube that is attached to a buried or surface lateral and located at each plant vine or tree. The typical emitter device is not used, and discharge pressures are very low ($<5$ lb/in$^2$) | The streams have a point discharge rate greater than that for a typical drip or line source system, but generally less than 1 gal/min |
| | The discharge orifice is larger than that of the other systems, so little or no water filtration is required. Generally, screening of coarse debris and small creatures is sufficient. Drains must be provided to allow discharge of any collected sediment. | |
| | Bubbler basins apply water to a larger soil volume than do drip emitters; therefore, only one outlet device is needed per plant or tree | |
| Spray or mini sprinkler | With spray or mini sprinkler micro irrigation systems, water is applied to the soil surface as spray droplets from small, low-pressure heads. The typical wetted diameter is 2–7 ft. The wetted pattern is larger than that of typical drip emitter devices, and generally fewer application devices are needed per plant. Spray and mini sprinklers also have less plugging problems and less filtration required than point-source emitters (drippers). Many spray heads only require the replacement of the orifice to change discharge rate. If an orifice becomes plugged, it is easily removed and cleaned or replaced. Spray or mini sprinkler head application patterns can be full, half circle, or partial circle (both sides) | Discharge rates are generally less than 30 gallons per hour (0.5 gph) |

**Table 7I.117 Advantages and Disadvantages of Microirrigation**

| Advantages | Disadvantages |
|---|---|
| Little if any run-off and little evaporation occur, and deep percolation can be controlled with good water management. Water is applied at the point of use (plant transpiration) | Microirrigation is considered expensive to install and maintain. In general, the cost of micro systems is greater than that for sprinkle or surface systems |
| Systems are easily automated with soil moisture sensors and computer controlled for low labor requirements | Frequent maintenance is essential, and a high level of management is required to obtain optimum application efficiencies |
| Soil moisture levels can be maintained at predetermined levels for start-stop operation | Clogging is a major problem in all micro systems. Emitter outlets are very small, and can be easily clogged with chemical precipitates, soil particles, or organic materials. Clogging can reduce or stop water emission. Chemical treatment of the water is often necessary, and filters are almost always required. Filtration and treatment can be costly, especially where water is taken from surface sources containing sediment and debris. During installation, care should be taken to clean all construction debris from the inside of pipelines as this material can cause plugging |
| Fertilizer can be efficiently added to irrigation water. With proper water management, there is minimum waste caused by deep percolation, and less opportunity for groundwater pollution | Animals, especially rodents, can damage surface (and shallow subsurface) installed plastic pipe less than 4 in. in diameter |
| Much of the soil surface remains dry, reducing weed growth and soil surface evaporation | With low operating pressures, poor distribution uniformity can result because of elevation differences on undulating ground. Pressure regulators or pressure compensated emitters are then necessary. However, they require about 2 pounds per square inch for operation |
| The soil surface remains firm for use by farm workers and equipment | On steep terrain, automatic gravity draining of laterals to a low point within the field can cause low distribution uniformity, especially in low pressure, high volume systems. This problem is aggravated by frequent on-off cycles, but can be overcome by installing air-vacuum valves in a raised pipe arch (i.e., dog leg) at one or more locations in the lateral. Drains are installed just upstream of each pipe arch. This increases the number of sites affected by lateral pipe drainage, thus decreasing effects on distribution uniformity because each drain discharges less water |
| Frequent irrigations can be used to keep salts in the soil water more diluted and moved away from plant roots. Irrigation with water of higher salinity is possible (requires a high level of management). Where salts are present, soil-water movement must always be toward the edges of the wetted bulb (away from roots). A common mistake is to shut the system down when precipitation occurs, often creating soil-water movement into the plant root zone | When soil water is reduced in the plant root zone, light rains can move salts in surrounding soil into the plant root zone, which can constitute a potential hazard. Salts also concentrate below the soil surface at the perimeter of the soil volume wetted by each emitter. If the soil dries between irrigations, reverse movement of soil water can carry salts from the perimeter back into the root zone. To avoid salt damage to roots, water movement must always be away from the emitter and from the plant root zone. In high soil salinity areas or when using high saline or sodic water for irrigation, one may need to irrigate when it rains |
| Microirrigation can be used on all terrain and most agricultural crops and soils and is often used on steep, rocky ground that is unsuitable for other forms of irrigation | A smaller volume of soil is wetted at each plant. Plants can be quickly stressed if the system fails (i.e., pump failure, water source cutoff, pipeline or valve failure). Daily checking of the system is necessary even when all or part is automated. Storing a 3-day plant-water supply in the soil is recommended along with daily replacement of water used |
| Low tension water availability to plants enhances growth and improves crop yield and quality | Multiple emitters at each plant are recommended to decrease effects of manufacturer variability, to increase area of root development, and to reduce risk of plant damage should an emitter become plugged |

**Table 7l.128 Supply Sources and Variables Costs of Irrigation Water, 1998[a]**

| Water Source | Acre Irrigated (Million) | Share of Acres Irrigated[b] (Percent) | Average cost[b] ($/Acre) | Cost Range[b] ($/Acre) | Comments |
|---|---|---|---|---|---|
| **Groundwater** | | | 32[c] | 7–69[d] | Pumping cost varies with energy prices, depth to water, and efficiency of pumping system |
| Only source[e] | 23.5 | 47 | | | |
| Combined sources | 6.3 | 13 | | | |
| **Onfarm surface water** | | | n/a | 0–15[f] | Costs are very low in most cases. Some water is pumped from surface sources at higher costs, since energy is required |
| Only source | 4.2 | 8 | | | |
| Combined sources | 2.7 | 5 | | | |
| **Off-farm surface water[g]** | | | 41[h] | 10–85[i] | Most actress relying on off-farm sources are located in West |
| Only source | 10.3 | 21 | | | |
| Combined sources | 4.8 | 10 | | | |
| **Total** | | | n/a | n/a | The sum of acres is greater than the irrigated total in the Farm and Ranch Irrigation Survey due to double counting of combined water sources |
| Only source | 37.9 | 76 | | | |
| Combined sources | 13.8 | 27 | | | |

*Note:* n/a indicates data not available.

[a] These values include only energy costs for pumping or purchased water costs. Management and labor costs associated with irrigation decisions, system maintenance, and water distribution are not included.
[b] Available data are from the 1998 Farm and Ranch Irrigation Survey.
[c] Reported national average energy expense for the on-farm pumping of irrigation water.
[d] Range in State energy expenses for the onfarm pumping of irrigation water.
[e] Only source means that farms used no other irrigation water source.
[f] Cost estimates based on engineering formulas with an efficient electric system.
[g] Included a minor amount of groundwater supplied from off-farm suppliers.
[h] Reported average cost for off-farm supplies.
[i] Range in reported State average cost of water from off-farm suppliers for State irrigating 50,000 or more acres from off-farm sources. If all States are included, the range expands to $2–$175 per acre.

**Table 7I.132 Irrigation Technology and Water Management: Conventional Methods and Improved Practices**

| System and Aspect | Conventional Technology or Management Practice | Improved Technology or Management Practice |
|---|---|---|
| **Onfarm conveyance** | Open earthen ditches | Concrete or other ditch linings; aboveground pipe; belowground pipe |
| **Gravity application systems** | | |
| Release of water | Dirt or canvas checks with siphon tubes | Ditch portals or gates; gated pipe; gated pipe with surge flow or cablegation |
| Length of irrigation run | Length of field, often one-half mile or more | Shorter runs, one-quarter mile or less |
| Field gradient | Natural field slope, often substantial; uneven field surface | Land leveled to reduce and smooth field surface gradient |
| Field runoff | Water allowed to move off field | Applications controlled to avoid runoff; tailwater return systems |
| Furrow management | Full furrow wetting; furrow bottoms uneven | Alternate furrow wetting; furrow bottoms smooth and consistent |
| **Pressurized application systems** | | |
| Pressure requirements | High pressure, typically above 60 pounds per square inche (psi) | Reduced pressure requirements, often 10–30 psi |
| Water distribution | Large water dispersal pattern | More narrow water dispersal through sprinkler droptubes, improved emitter spacing, and low-flow systems |
| Automation | Handmove systems; manually operated systems | Self-propelled systems; computer control of water applications |
| Versatility | Limited to specific crops; used only to apply irrigation | Multiple crops; various uses—irrigation, chemigation, manure applications, frost protection, crop cooling |
| **Water management** | | |
| Assessing crop needs | Judgment estimates | Soil moisture monitoring; plant tissue monitoring; weather-based computations |
| Timing of applied water | Fixed calendar schedule | Water applied at needed by crop; managed for profit (not yield); managed for improved effectiveness of rainfall |
| Measurement of water | Not metered | Measured using canal flumes, weirs, and meters; external and in-pipe flow meters |
| **Drainage** | Runoff to surface-water system or Evaporation ponds; percolation to aquifers | Applications managed to limit drainage; reuse through tailwater pumpback; dual-use systems with subirrigation |

**Table 7I.133 Efficient Water Management Practices for Agricultural Water Suppliers in California**

| |
|---|
| **List A-Generally Applicable EWMPs** |
| Prepare and adopt and water management plan |
| Designate a water conservation coordinator |
| Support the availability of water management services to water users |
| Improve communication and among water suppliers, water users, and other agencies |
| Evaluate the need, if any for change in institutional policies to which the water supplier is subject |
| Evaluate and improve efficiencies of the water supplier's pumps |
| **List B-Conditionally Applicable EWMPs** |
| Facilitate alternative land use |
| Facilitate using available recycled water that otherwise would not be used beneficially, meets all health and safety criteria and does not cause harm to crops or soil |
| Facilitate financing capital improvements for on-farm irrigation systems |
| Facilitate voluntary water transfers that do not unreasonably affect the water user, water supplier, the environment, or third parties |
| Line or pipe ditches and canals |
| Increase flexibility in water ordering by, and delivery to, water users within operational limits |
| Construct and operate water supplier spill and tailwater recovery systems |
| Optimize conjunctive use of surface and groundwater |
| Automate canal structures |
| **List C-Other EWMPs** |
| Water measurement and water use reporting |
| Pricing or other incentives |

*Note:* Units are given in $km^2$.

a. Areas equipped to provide water to the crops. These include areas equipped for full and partial control irrigation, spate irrigation areas, and equipped wetland or inland valley bottoms. All figures are rounded to the nearest 10 $km^2$.
- JPN, Rice irrigation only;
- KOR, Rice irrigation only;
- BEL, Data for Belgium include Luxembourg.

**Table 7J.144 Average Unit Costs for World Bank Irrigation Projects**

| | Unit Cost ($/ha) | Number | Adjusted Unit Cost ($/ha) | Number | Adjusted/ Unadjusted Ratio |
|---|---|---|---|---|---|
| All | 4,837 | 191 | 7,950 | 184 | 1.64 |
| Satisfactory | 2,643 | 128 | 2,906 | 125 | 1.10 |
| Unsatisfactory | 9,294 | 63 | 18,637 | 59 | 2.01 |
| Gravity | 5,584 | 113 | 10,355 | 112 | 1.85 |
| Pump (mostly from groundwater) | 3,766 | 52 | 4,415 | 46 | 1.17 |
| Mixed | 3,727 | 26 | 3,846 | 26 | 1.03 |
| New construction | 7,740 | 86 | 12,915 | 81 | 1.67 |
| Rehabilitation | 1,633 | 34 | 5,258 | 34 | 3.22 |
| Rehabilitation and extension | 3,171 | 55 | 3,834 | 54 | 1.21 |
| Paddy | 6,374 | 73 | 11,063 | 72 | 1.74 |
| Nonpaddy | 3,886 | 118 | 5,950 | 112 | 1.53 |
| *Selected areas* | | | | | |
| East and South Asia | 2,831 | 112 | 4,694 | 107 | 1.66 |
| East Asia | 4,291 | 56 | 7,379 | 56 | 1.72 |
| South Asia | 1,370 | 56 | 1,746 | 51 | 1.27 |
| India | 1,421 | 30 | 1,596 | 27 | 1.12 |
| Europe | 4,743 | 17 | 4,759 | 17 | 1.00 |
| Middle East | 5,062 | 9 | 4,663 | 7 | 0.92 |
| Africa | 12,925 | 30 | 20,833 | 30 | 1.61 |
| North Africa | 4,911 | 12 | 5,226 | 12 | 1.06 |
| Sub-Saharan Africa | 18,269 | 18 | 31,238 | 18 | 1.71 |
| Latin America and Caribbean | 3,923 | 20 | 10,283 | 20 | 2.62 |

*Note:* Two measures of unit cost are used. "Unit cost" is defined as the actual project cost ($US) measured at evaluation divided by the completion command area (hectares) measured at evaluation. "Adjusted unit cost" is "unit cost" with the denominator adjusted by the completion achievement of construction target (%) measured at evaluation. Two projects, Lake Chad Polders (Chad) and Black Bush Irrigation (Guyana), had completion command areas measured at evaluation equal to zero. This resulted in infinite measures of unit cost, and thus they were not included in the calculation of averages.

## SECTION 7K LIVESTOCK

**Table 7K.145 Water Requirements for Farm Animals and Poultry**

| | |
|---|---|
| Horse, work | 12 |
| Mule | 12 |
| Cattle | |
| Holstein calves (liquid milk or dried milk and water supplied) | |
| 4 weeks of age | 1.2–1.4 |
| 8 weeks of age | 1.6 |
| 12 weeks of age | 2.2–2.4 |
| 16 weeks of age | 3.0–3.4 |
| 20 weeks of age | 3.8–4.3 |
| 26 weeks of age | 4.0–5.8 |
| Dairy heifers—Pregnant | 7.2–8.4 |
| Steers | |
| Maintenance ration | 4.2 |
| Fattening ration | 8.4 |
| Range cattle | 4.2–8.4 |
| Jersey cows[a] | |
| Milk production 5–30 lbs/day | 7.2–12 |
| Holstein cows[a] | |
| Milk production 20–50 lbs/day | 7.8–22 |
| Milk production 80 lbs/day | 23 |
| Dry | 11 |
| Pigs | |
| Body weight—30 lbs | 0.6–1.2 |
| Body weight—60–80 lbs | 0.8 |
| Body weight—75–125 lbs | 1.9 |
| Body weight—200–380 lbs | 1.4–3.6 |
| Pregnant sows | 3.6–4.6 |
| Lactating sows | 4.8–6.0 |
| Sheep | |
| On range of dry pasture | 0.6–1.6 |
| On range (salty feeds) | 2.0 |
| On rations of hay and grain or hay, roots and grain | 0–0.7 |
| On good pasture | Little, if any |
| Chickens (100 birds) | |
| 1–3 weeks of age | 0.4–2.0 |
| 3–6 weeks of age | 1.4–3.0 |
| 6–10 weeks of age | 3.0–4.0 |
| 9–13 weeks of age | 4.0–5.0 |
| Pullets | 3.0–4.0 |
| Nonlaying hens | 5.0 |
| Laying hens (moderate temperatures) | 5.0–7.5 |
| Laying hens (temperature 90 °F) | 9.0 |
| Turkeys (100 birds) | |
| 1–3 weeks of age | 1.1–2.6 |
| 7–4 weeks of age | 3.7–8.4 |
| 9–13 weeks of age | 9–14 |
| 15–19 weeks of age | 17 |
| 21–26 weeks of age | 14–15 |

*Note:* Gallons per day.

[a] Allow 15–20 additional gallons per day for each cow for flushing stables and washing dairy utensils.

## SECTION 7L NAVIGATION AND WATERWAYS

**Table 7L.147 Projected Flows Required for Efficient Navigation on Inland Waterways of the United States**

| Waterway | Critical Flow[a] ($ft^3/s$) 1,959 | 1,980 | 2,000 | Comments |
|---|---|---|---|---|
| New England, existing waterways: all | 0 | 0 | 0 | All waterways are in tidal reaches |
| Middle Atlantic, existing waterways | | | | |
| Great Lakes to Hudson River and Champlain Canals | 2,000 | 2,000 | 2,000 | Available flow 13,000 c.f.s. |
| Delaware | [b] | [b] | [b] | If depth increased to 45 ft minimum flow will have to be increased by 2,900, c.f.s. to repel salinity |
| South Atlantic | | | | |
| Existing waterways | | | | |
| Cape Fear River above Wilmington, NC | 50 | 100 | [c] | |
| Savannah River below Augusta, GA | 5,000 | 5,800 | [c] | |
| Altamaha River below junction of Ocmulgee and Oconee Rivers | 1,000 | 5,000 | [c] | |
| Okeechobee Waterway | 50 | 50 | [c] | |
| Apalachicola below Jim Woodruff lock and dam | 9,300 | 9,300 | [c] | |
| Alabama River below Selma, AL | 3,000 | 3,000 | [c] | |
| Warrior system | 540 | 540 | [c] | |
| Possible future waterways | | | | |
| Santee-Congaree | — | 5,200 | [c] | Project might be found feasible if river developed for power |
| Ocmulgee River below Macon, GA | — | 300 | [c] | |
| Cross-Florida Barge Canal | — | 700 | [c] | Authorized project |
| Chattahoochee River below Atlanta, GA | — | 300 | [c] | |
| Flint River below Albany, GA | — | 200 | [c] | |
| Coosa River | — | 300 | [c] | Do |
| Tennessee-Tombigbee | — | 1,246 | [c] | Completed project. (1,246 c.f.s. to be diverted from the Tennessee River.) |
| Arkansas-White-Red | | | | |
| Existing waterways | | | | |
| White River (to mile 168.7) | 6,500 | 10,000 | 10,000 | |
| Ouachita-Black | 100 | 100 | 100 | |
| Waterways under construction | | | | |
| Verdigris River (at Catoosa, OK) | — | 115 | 115 | Provision of 9-ft waterway as part of multiple-purpose development of the Arkansas River |
| Arkansas (at Webber Falls) | — | 300 | 300 | Do |
| Arkansas (at Short Mountain) | — | 530 | 530 | Do |
| Arkansas (at Dardanelle) | — | 505 | 505 | Do |
| Arkansas (Dardenelle to mouth) | — | 1,000 | 1,000 | Do |
| Possible future waterways: Overton-Red Waterway | — | 300 | | Authorized project |
| Gulf-Southwest | | | | |
| Waterways under construction: Guadalupe to Victoria | — | 0–1,800 | 0–1,800 | For periodic flushing |

[a] Rate below which streamflow cannot drop without reducing the efficiency of navigation.
[b] Anticipated flows will meet the needs of navigation.
[c] Estimates not available.
[d] Flows required from April through November, assuming continuation of open river navigation. Canalization now being studied. If Missouri canalized these flows would be greatly reduced.
[e] Average annual flow required at Lockport, III. Includes 250 c.f.s. to prevent reversal of flow into Lake Michigan when storm runoff occurs. Excludes 120 c.f.s. of present industrial usage which bypasses Lockport lock.
[f] Requirements for recommended duplicate lock system.

| No. Marianas | 85 | 297 | 3 | 0 | 68 | 2 | 0 | 0 | 0 | 455 |

[a] The figures in this table are derived from reports from the State and jurisdictions. There are a total of 12,794,616 registered recreational vessels. This table classifies registered motorboats and registered nonpowered boats for each State and jurisdiction. Please note that the scope of the boat registration system for each State and jurisdiction is not the same. This explains why some States report the number of non-powered vessels such as rowboats, canoes, and non-powered sailboats and others do not. Also notice that some State and jurisdictions report Personal Watercraft (PWC) as a separate vessel category and others report PWC as an inboard motorboat. An accurate figure on the number of PWC will be provided when all States and jurisdictions classify and report PWC as a separate as a separate vessel category.

[b] Estimate.

**Table 7N.162 Life Expectancy in Water**

| | Water Temperature | | | | |
|---|---|---|---|---|---|
| **Duration, Hours** | **30°F** | **40°F** | **50°F** | **60°F** | **70°F** |
| 1 | M | M | M | S | S |
| 2 | L | L | M | M | S |
| 3 | L | L | M | M | S |
| 4 | L | L | L | M | S |

*Note:* Exposure by immersion in low temperature water can have serious consequences. Life expectancies for various durations of exposure are indicated by: L — Lethal, 100 percent expectancy of death; M — Marginal, 50 percent expectancy of unconsciousness which will probably result in drowning; S — Safe. It should also be noted that sudden immersion in ice cold water can cause temporary paralysis with resulting helplessness and loss of buoyancy, causing the victim to sink to the bottom.

*Note:* Landings are reported in round (live) weight for all items except univalve and bivalve mollusks such as clams, oysters, scallops, which are reported in weight of meats (excluding the shell). Landings for Mississippi River drainage area States are not available. Data are preliminary. Landings of Alaska pollock, Pacific whiting, and other Pacific groundfish that are caught in waters off Washington, Oregon, and Alaska and are processed at-sea aboard U.S. vessels are credited to the State nearest to the area of capture. Totals may not add due to roundings. Data do not include landings by U.S.-flag vessels at Puerto Rico and other ports outside the 50 States. Data do not include aquaculture products, except oysters and clams.

*Note:* All figures are three year averages for the range of years specified. Numbers in this table are reported with varying precision: values greater than 0.5 thousand metric tons are rounded to the nearest whole number, values between 0.05 and 0.5 thousand metric tons are rounded to the nearest tenth (one decimal place), value between 0.005 and 0.05 are rounded to the nearest hundredth (two decimal places), and "0" represents a value of less than 0.005 thousand metric tons.

**Variable Definitions and Methodology.**

***Total Capture and Aquaculture Production for All Species*** includes both capture and aquaculture production of fish, crustaceans, molluscs, aquatic mammals, and other aquatic animals, taken for commercial, industrial, recreational and subsistence purposes from inland, brackish and marine waters. For each country, the four sub-categories of production (Marine Aquaculture, Inland Aquaculture, Marine Capture, and Inland Capture) listed in this table should sum to *Total Capture and Aquaculture Production for All Species.*

***Marine Aquaculture Production*** data include fish, crustaceans, molluscs, aquatic mammals, and other aquatic animals, taken for commercial, industrial, recreational and subsistence purposes from marine and brackish environments. The harvest from inland waters is not included. Aquaculture production is defined by FAO as "the farming of aquatic organisms, including fish, molluscs, crustaceans, and aquatic plants. Farming implies some form of intervention in the rearing process to enhance production, such as regular stocking, feeding, protection from predators, etc. [It] also implies ownership of the stock being cultivated." Aquatic organisms that are exploitable by the public as a common property resource are not included in the aquaculture production.

***Inland Aquaculture production*** data include fish, molluscs, crustaceans, aquatic mammals, and other aquatic animals, taken for commercial, industrial, recreational and subsistence purposes from inland waters, such as lakes and rivers. The harvest from marine areas is not included. Some inland lakes are saltwater, thus the data include not only freshwater species but also saltwater species. Aquaculture production is defined by FAO as "the farming of aquatic organisms, including fish, molluscs, crustaceans, and aquatic plants. Farming implies some form of intervention in the rearing process to enhance production, such as regular stocking, feeding, protection from predators, etc. [It] also implies ownership of the stock being cultivated." Aquatic organisms that are exploitable by the public as a common property resource are not included in the aquaculture production.

***Marine Capture Production*** data include fish, crustaceans, molluscs, aquatic mammals, and other aquatic animals, taken for commercial, industrial, recreational and subsistence purposes from marine and brackish environments. The harvest from inland waters is not included. Capture production data refer to the nominal catch of fish, crustaceans, molluscs, aquatic mammals, and other aquatic animals, taken for commercial, industrial, recreational and subsistence purposes from marine, brackish, and inland waters. The harvest from aquaculture and other kind of farming are excluded.

***Inland Capture Production*** data include fish, molluscs, crustaceans, aquatic mammals, and other aquatic animals, taken for commercial, industrial, recreational and subsistence purposes from inland waters, such as lakes and rivers. The harvest from marine areas is not included. Some inland lakes are saltwater, thus the data include not only freshwater species but also saltwater species. Capture production data refer to the nominal catch of fish, crustaceans, molluscs, aquatic mammals, and other aquatic animals, taken for commercial, industrial, recreational and subsistence purposes from marine, brackish, and inland waters. The harvest from aquaculture and other kind of farming are excluded.

Statistics for aquatic plants are excluded from country totals. For a more detailed listing of species groups represented in the table, please refer to the original source at fao.org/waicent/faostat/agricult/fishitems-e-e.html.

Data include all quantities caught for both food and feed purposes but exclude discards. The harvest of fish, crustaceans and molluscs are expressed in live weight, that is the nominal weight of the aquatic organisms at the time of capture.

Aquatic organisms included in the FAO FISHSTAT capture production database have been classified according to approximately 1290 commercial species items, further arranged within the 50 groups of species constituting the nine divisions of the FAO International Standard Statistical Classification of Aquatic Animals and Plants (ISSCAAP). Most fisheries statistics are collected by FAO from official national reports. When these data are missing or considered unreliable, FAO estimates fishery production based on regional fishery organizations, project documents, industry magazines, or statistical interpolations. Fishery production statistics were revised completely by FAO in the 1990s. At this time, FAO estimated missing data points, updated taxonomical classifications, and discriminated more clearly between aquaculture and capture fisheries production.

Fisheries production statistics typically refer to the calendar years (January 1–December 31) with exception of data from Antarctic waters, which use a split year (July 1–June 30).

***Frequency of Update by Data Providers***. FAO publishes updated data sets annually for FishStat. This table represents data through the year 2001; data were acquired by WRI in May, 2003.

***Data Reliability and Cautionary Notes***. While the FAO data set provides the most extensive, global time series of fishery statistics since 1970, there are some problems associated with the data. Funding for the development and maintenance of fisheries statistics at the national level has been decreasing in real terms since 1992, while the demand is growing for a variety of global statistics on discards, fish inventories, aquaculture, and illegal activites. Country-level data are often submitted with a 1–2 year delay, and countries are declaring an increasing percentage of their catch as "unidentified fish." As a result, species-item totals frequently underestimate the real catch of individual species. Stock assessment working groups can more accurately estimate the composition of a catch; however, due to financial constraints, these groups are rare, especially in developing countries. Statistics from smaller artisanal and subsistence fisheries are particularly sparse.

FAO states that "general trends are probably reliably reflected by the available statistics…but the annual figures and the assessments involve a certain degree of uncertainty and small changes from year to year are probably not statistically significant." These statistics provide a good overview of regional fisheries trends. However, when reviewing the state of fisheries stocks, evaluating food security, etc., these data should be used with caution and supplemented with estimates from regional organizations, academic literature, expert consultations, and trade data.

For more information, please consult Fishery Statistics: Reliability and Policy Implications, published by the FAO Fisheries Department and available on-line at fao.org/fi/statist/naturechina/30jan02.asp.

### Variable Definitions and Methodology

**Marine and Freshwater Catch** data refer to marine and freshwater fish caught or trapped for commercial, industrial, and subsistence use (catches from recreational activities are included where available); they include fish caught by a country's fleet anywhere in the world. Statistics for mariculture, aquaculture, and other kinds of fish or shellfish farming are not included in the country totals. Marine fish includes demersal fish (flounders, halibuts, soles, etc; cods, hakes, haddocks, etc; redfishes, basses, congers, etc; and sharks, rays, chimeras, etc.), pelagic fish (jacks, mullets, sauries, etc; herrings, sardines, anchovies, etc; tunas, bonitos, billfishes, etc; and mackerels, snooks, cutlassfishes, etc.), and diadromous fish caught in marine areas (i.e. sturgeons, paddlefishes, river eels, salmons, trouts, smelt, shads, and miscellaneous diadromous fishes), marine molluscs (squids, cuttlefishes, octopuses, etc; abalones, winkles, conchs, etc; oysters; mussels; scallops, pectens, etc; clams, cockles, arkshells, etc; and miscellaneous marine molluscs) and marine crustaceans (sea-spiders, crabs, etc; lobsters, spiny-rock lobsters, etc; squat lobsters; shrimps, prawns, etc; krill, planktonic crustaceans, etc; and miscellaneous marine crustaceans).

© 2006 by Taylor & Francis Group, LLC

Freshwater fish includes fish caught in inland waters (i.e. carps, barbels, and other cyprinids; tilapias and other cichlids; and miscellaneous and freshwater fishes), and diadromous fish caught in inland waters, as well as freshwater molluscs and crustaceans. Catch figures are the national totals averaged over a 3-year period. Data are represented as nominal catches, which are the landings converted to a live-weight basis, that is, the weight when caught. Fish catch does not include discards. Landings for some countries are identical to catches. Catch data are provided annually to the FAO Fisheries Department by national fishery offices and regional fishery commissions. Some recent data are provisional. If no data are submitted, FAO uses the previous year's figures or makes estimates based on other information.

**Aquaculture** is defined by FAO as "the farming of aquatic organisms, including fish, molluscs, and crustaceans. Farming implies some form of intervention in the rearing process to enhance production, such as regular stocking, feeding, and protection from predators, etc. [It] also implies ownership of the stock being cultivated¥" Aquatic organisms that are exploitable by the public as a common property resource are included in the harvest of fisheries.
FAO's global collection of aquaculture statistics from questionnaires to national fishery offices was begun in 1984. FAO's aquaculture database has 337 "species items" that are grouped into six categories. **Total Aquaculture Production** includes marine, freshwater, and diadromous fishes, molluscs and crustaceans cultivated in marine, inland, or brackish environments. For a detailed listing of species, please refer to the original source. Aquaculture production is expressed as an annual average over a 3-year period.

**Trade in Fish and Fish Products** expresses the value associated with imports and exports of fish that are live, fresh, chilled, frozen, dried, salted, smoked, or canned, and other derived products and preparations. Trade includes freshwater and marine fish, aquaculture, molluscs and crustaceans, meals, and solubles. Aquatic plants are not included. Figures are the national totals averaged over a 3-year period in millions of U.S. dollars. Exports are generally on a free-on-board basis (i.e. not including insurance or freight costs). Imports are usually on a cost, insurance, and freight basis (i.e. insurance and freight costs added in). Regional totals are calculated by adding up imports or exports of each country included in that region.
Therefore, the regional totals should not be taken as a net trade for that region, since there may also be trade occurring within a region. To collate national data, FAO uses its International Standard Statistical Classification of Fishery Commodities. Commodities produced by aquaculture and other kinds of fish farming are also included.

**Food Supply from Fish and Fish Products** is defined as the quantity of both freshwater and marine fish, seafood and derived products available for human consumption. Data were calculated by taking a country's fish production plus imports of fish and fishery products, minus exports, minus the amount of fishery production destined to non-food uses (i.e. reduction to meal, etc.), and plus or minus variations in stocks. The quantity of fish and fish products consumed include the bones and all parts of the fish.

**Fish Protein as a Percent of Animal Protein Supply** is defined as the quantity of protein from both freshwater and marine fish, seafood and derived products available for human consumption as a percentage of all available animal protein. FAO calculates food supply for all products, including fish, in its food balance sheets. FAOSTAT maintains statistics on apparent consumption of fish and fishery products, in live weight, for 220 countries in a collection of Supply/Utilization Accounts (SUAs). For each product, the SUA traces supplies from production, imports, and stocks to its utilization in different forms–addition to stocks; exports; animal feed; seed; processing for food and non-food purposes; waste (or losses); and lastly; as food available for human consumption, where appropriate. For more detailed information, please refer to the following article: "Supply Utilization Accounts and Food Balance Sheets in the Context of a National Statistical System", maintained on-line by FAO at fao.org/es/ESS/Suafbs.htm.

**Number of Fishers** includes the number of people employed in commercial and subsistence fishing (both personnel on fishing vessels and on shore), operating in freshwater, brackish and marine areas, and in aquaculture production activities. Data on people employed in fishing and aquaculture are collected by the FAO through annual questionnaires submitted to the national reporting offices of the member countries. When possible, other national and/or regional published sources are also used to estimate figures. Please refer to the original source for further information on collection methodologies (available online at fao.org/fi/statist/fisoft/fishers.asp) or to the following publication: *Numbers of Fishers 1970–1997, FAO Fisheries Circular N.929 Revision 2, Fishery Information, Data and Statistics Unit (FAO, Rome, 1999).*

**Decked Fishery Vessels** include trawlers, purse seiners, gill netters, long liners, trap setters, other seiners and liners, multipurpose vessels, dredgers, and other fishing vessels. Data on undecked vessels are being collected by FAO, but are not yet available. Fleet data are collected by the FAO through questionnaires submitted to the national reporting offices of the member countries. Other national or regional published sources, such as the registry of fishing vessels, are also used to estimate fleet size. The flag of the vessel is used to assign its nationality. However, in many cases vessels are flagged in one country, while the ownership, landings, and trade resides with another nation. This approach is referred to as a "flag of convenience," and fishers or corporations use this method to facilitate registration of a vessel (i.e. some countries have fewer registration restrictions), to gain access to fish in different Exclusive Economic Zones, or to avoid having to follow set fishing quotas in their own nation, among other reasons.

**Population within 100 km of the Coast** refers to estimates of the percentage of the population living within the coastal area based on 1995 population figures. These estimates were calculated using a data set that provides information on the spatial distribution of the world's human population on a 2.5-minute grid. Populations are distributed according to administrative districts, which vary in scale, level, and size from country to country. A 100-km coastal buffer was used to calculate the number of people in the coastal zone for each country. The percentage of the population in the coastal zone was calculated from 1995 United Nations Population Division totals for each country.

© 2006 by Taylor & Francis Group, LLC

**Frequency of Update by Data Providers**

The Food and Agriculture Organization updates the FishStat database annually. Updates can be found on the FishStat website at fao.org/fi/statist/FISOFT/FISHPLUS.asp. The FAO updates the data on Food Supply variables annually; the most recent updates incorporated in these tables are from July 2002. Data on the number of fishers and decked fishery vessels are updated by the Fishery Information, Data and Statistics Unit (FIDI) of FAO.

**Data Reliability and Cautionary Notes**

**Marine Catch, Freshwater Catch, Total Aquaculture Production, and Trade in Fish and Fishery Products.** While the FAO data set provides the most extensive, global time series of fishery statistics since 1 970, there are some problems associated with the data. Funding for the development and maintenance of fisheries statistics at the national level has been decreasing in real terms since 1992, while the demand is growing for a variety of global statistics on discards, fish inventories, aquaculture, and illegal activities. Country-level data are often submitted with a 1–2 year delay, and countries are declaring an increasing percentage of their catch as "unidentified fish." Stock assessment working groups can more accurately estimate the composition of a catch; however, due to financial constraints, these groups are rare, especially in developing countries. Statistics from smaller artisanal and subsistence fisheries are particularly sparse. In addition, fishers sometimes underreport their catches because they have not kept within harvest limits established to manage the fishery. In some cases, catch statistics are inflated to increase the importance of the fishing industry to the national economy. FAO states that "general trends are probably reliably reflected by the available statistics¥ but the annual figures and the assessments involve a certain degree of uncertainty and small changes from year to year are probably not statistically significant." The quality of the aquaculture production estimates varies because many countries lack the resources to adequately monitor landings within their borders.

These statistics provide a good overview of regional fisheries trends. However, when reviewing the state of fisheries stocks, evaluating food security, etc., these data should be used with caution and supplemented with estimates from regional organizations, academic literature, expert consultations, and trade data. For more information, please consult Fishery Statistics: Reliability and Policy Implications, published by the FAO Fisheries Department and available on-line at fao.org/fi/statist/nature-china/30janO2.asp.

**Food Supply from Fish and Fishery Products and Fish Protein as a Percent of Total Protein:** Food supply is different from actual consumption. Figures do not account for discards (including bones) and losses during storage and preparation. Supply data should only be used to assess food security if it is combined with an analysis of food availability and accessibility. Per capita supply averages can also mask disparate food availability within a particular country. Nonetheless, the data are subject to "vigorous consistency checks." According to FAO, the food supply statistics, "while often far from satisfactory in the proper statistical sense, do provide an approximate picture of the overall food situation in a country and can be useful for economic and nutritional studies, for preparing development plans and for formulating related projects." For more information see Food Balance Sheets: A Handbook, maintained on-line by FAO at fao.org/DOCREP/003/X9892E/X9892E00.htm.

**Number of Fishers:** Numbers presented in this table are gross estimates. Many countries do not submit data on fishers, or submit incomplete information; therefore the quality of these data is poor. Apart from the gaps and the heavy presence of estimates due to non-reporting, the information provided by national statistical offices may not be strictly comparable since different definitions and methods are used in assessing the number of people engaged in fishing and aquaculture.

FAO recognizes that these statistics are incomplete and may not accurately reflect the current level of employment in the fishing sector. Specifically, it is aware that some countries failed to report for several years, that those which reported regularly have occasionally omitted fish farmers from the total or included subsistence and sport fishers as well as family members living on fishing.

**Decked Fishery Vessels:** As with the number of fishers, FAO recognizes that these fleet statistics are incomplete and may not accurately reflect current world fishing capacity. These data may include vessels that are no longer in operation. The quality of the estimates varies because many countries lack the resources to adequately monitor and report on fleet size. For further information, please refer to the original source or to *"Fishery Fleet Statistics, 1970 1975, 1980 1985, 1989–95"* Bulletin of Fishery Statistics No. 35 (FAO, Rome, 1998).

[a] Includes marine fish and diadromous fish caught in marine areas, as well as molluscs and crustaceans.
[b] Includes freshwater fish and diadromous fish caught in inland waters or low-salinity marine areas, as well as molluscs and crustaceans.
[c] Includes trade of all marine and freshwater catch, and total aquaculture production, excluding aquatic plants.
[d] Per capita values are expressed on a live-weight equivalent basis, which means that all parts of the fish, including bones, are taken into account when estimating consumption of fish and fishery products.
[e] Includes fishing vessels such as trawlers, long liners, etc., and nonfishing vessels such as motherships, fish carriers, etc.
[f] Data were collected between 1991 and 1996.
[g] Data are for 1997.
[h] Does not include Taiwan or Hong Kong.
[i] Data are for 1998.
[j] Data are for 1999.
[k] Data for Ethiopia before 1993 include Eritrea.
[l] Since independence, data include a substantial but unquantifiable number of sport fishers.
[m] Data are for 1980.
[n] Per capita fish consumption in Iceland includes quantities of fish and fish products destined for the export market.

# SECTION 8A WATER QUALITY

**Table 8A.1 Summary of Quality Inputs to Surface and Groundwaters**

| Contributing Factor | Principal Quality Input to Surface Waters |
|---|---|
| Meteorological water | Dissolved gases native to atmosphere<br>Soluble gases from man's industrial activities<br>Particulate matter from industrial stacks, dust, and radioactive particles<br>Material washed from surface of earth, e.g.,<br>Organic matter such as leaves, grass, and other vegetation in all stages of biodegradation<br>Bacteria associated with surface debris (including intestinal organisms)<br>Clay, silt, and other mineral particles<br>Organic extractives from decaying vegetation<br>Insecticide and herbicide residues |
| Domestic use (exclusive of industrial) | Undecomposed organic matter, such as garbage ground to sewer, grease, etc.<br>Partially degraded organic matter such as raw wastes from human bodies<br>Combination of above two after biodegradation to various degrees of sewage treatment<br>Bacteria (including pathogens), viruses, worm eggs<br>Grit from soil washings, eggshells, ground bone, etc.<br>Miscellaneous organic solids, e.g., paper, rags, plastics, and synthetic materials<br>Detergents |
| Industrial use | Biodegradable organic matter having a wide range of oxygen demand<br>Inorganic solids, mineral residues<br>Chemical residues ranging from simple acids and alkalis to those of highly complex molecular structure<br>Metal ions |
| Agricultural use | Increased concentration of salts and ions<br>Fertilizer residues<br>Insecticide and herbicide residues<br>Silt and soil particles<br>Organic debris, e.g., crop residue |
| Consumptive use (all sources) | Increased concentration of suspended and dissolved solids by loss of water to atmosphere |
| **Contributing Factor** | **Principal Quality Input to Groundwater** |
| Meteorological water | Gases, including $O_2$ and $CO_2$, $N_2$, $H_2S$, and H<br>Dissolved minerals, e.g.:<br>Bicarbonates and sulfates of Ca and Mg dissolved from earth minerals<br>Nitrates and chlorides of Ca, Mg, Na and K dissolved from soil and organic decay residues<br>Soluble iron, Mn, and F salts |
| Domestic use (principally via septic tank systems and seepage from polluted surface waters) | Detergents<br>Nitrates, sulfates, and other residues of organic decay<br>Salts and ions dissolved in the public water supply<br>Soluble organic compounds |
| Industrial use (not much direct disposal to soil) | Soluble salts from seepage of surface waters containing industrial wastes |
| Agriculture use | Concentrated salts normal to water applied to land<br>Other materials as per meteorological waters |
| Land disposal of solid wastes (not properly installed) | Hardness-producing leaching from ashes<br>Soluble chemical and gaseous products or organic decay |

*Note:* This list includes the types of things that may come from any contributing factor. Not all are present in each specific instance.

*Source*: From McGauhey, *Engineering Management of Water Quality*, McGraw-Hill, Copyright 1968.

© 2006 by Taylor & Francis Group, LLC

**Table 8A.2 Conditions That May Cause Variations in Water Quality**

| | |
|---|---|
| Climatic conditions | Runoff from snowmelt—muddy, soft, high bacterial count<br>Runoff during drought—high mineral content, hard, groundwater characteristics<br>Runoff during floods—less bacteria than snowmelt, may be muddy (depending upon other factors listed below) |
| Geographic conditions | Steep headwater runoff differs from lower valley areas in ground cover, gradients, transporting power, etc. |
| Geologic conditions | Clay soils produce mud<br>Organic soils or swamps produce color<br>Cultivated land yields silt, fertilizers, herbicides, and insecticides<br>Fractured or fissured rocks may permit silt, bacteria, etc., to move with groundwater<br>Mineral content dependent upon geologic formations |
| Season of year | Fall runoff carries dead vegetation—color, taste, organic extractives, bacteria<br>Dry season yields dissolved salts<br>Irrigation return water, in growing season only<br>Cannery wastes seasonal<br>Aquatic organisms seasonal<br>Overturn of lakes and reservoirs seasonal<br>Floods generally seasonal<br>Dry period, low flows, seasonal |
| Resource management practices | Agricultural soils and other denuded soils are productive of sediments, etc. (See third item under Geologic conditions.)<br>Forested land and swampland yield organic debris<br>Overgrazed or denuded land subject to erosion<br>Continuous or batch discharge of industrial wastes alters shock loads<br>Inplant management of waste streams governs nature of waste |
| Diurnal variation | Production of oxygen by planktonic algae varies from day to night<br>Dissolved oxygen in water varies in some fashion<br>Raw sewage flow variable within 24-hr period; treated sewage variation less pronounced<br>Industrial wastes variable—process wastes during productive shift; different material during washdown and cleanup |

**Table 8A.3 Principal Chemical Constituents in Water — Their Sources, Concentrations, and Effects upon Usability**

| Constituent | Major Sources | Concentration in Natural Water | Effect upon Usability of Water |
|---|---|---|---|
| Silica ($SiO_2$) | Feldspars, ferromagnesium and clay minerals, amorphous silicachert, opal | Ranges generally from 1.0 to 30 mg/L, although as much as 100 mg/L is fairly common; as much as 4,000 mg/L is found in brines | In the presence of calcium and magnesium, silica forms a scale in boilers and on steam turbines that retards heat; the scale is difficult to remove. Silica may be added to soft water to inhibit corrosion of iron pipes |
| Iron (Fe) | 1. Natural sources<br>*Igneous rocks:*<br>Amphiboles, ferromagnesian micas, ferrous sulfide (FeS), ferric sulfide or iron pyrite ($FeS_2$), magnetite ($Fe_3O_4$)<br>*Sandstone rocks:*<br>Oxides, carbonates, and sulfides or iron clay minerals<br>2. Man-made sources:<br>Well casing, piping, pump parts, storage tanks, and other objects of cast iron and steel which may be in contact with the water<br>Industrial wastes | Generally less than 0.50 mg/L in fully aerated water. Groundwater having a pH less than 8.0 may contain 10 mg/L; rarely as much as 50 mg/L may occur. Acid water from thermal springs, mine wastes and industrial may contain more than 6,000 mg/L | More than 0.1 mg/L precipitates after exposure to air; causes turbidity, stains plumbing fixtures, laundry and cooking utensils, and imparts objectionable tastes and colors to foods and drinks. More than 0.2 mg/L is objectionable for most industrial uses |
| Manganese (Mn) | Manganese in natural water probably comes most often from soils and sediments. Metamorphic and sedimentary rocks and mica biotite and amphibole hornblende minerals contain large amounts of manganese | Generally 0.20 mg/L or less. Groundwater and acid mine water may contain more than 10 mg/L. Reservoir water that has "turned over" may contain more than 150 mg/L | More than 0.2 mg/L precipitates upon oxidation; causes undesirable tastes, deposits on foods during cooking, stains plumbing fixtures and laundry and fosters growths in reservoirs, filters, and distribution systems. Most industrial users object to water containing more than 0.2 mg/L |
| Calcium (Ca) | Amphiboles, feldspars, gypsum, pyroxenes, aragonite, calcite, dolomite, clay minerals | As much as 600 mg/L in some western streams; brines may contain as much as 75,000 mg/L | Calcium and magnesium combine with bicarbonate, carbonate, sulfate, and silica to form heat-retarding, pipe-clogging scale in boilers and in other heat-exchange equipment. Calcium and magnesium combine with ions of fatty acid in soaps to form soap suds; the more calcium and magnesium, the more soap required to form suds. A high concentration of magnesium has a laxative effect, especially on new users of the supply |
| Magnesium (Mg) | Amphiboles, olivine, pyroxenes, dolomite, magnesite, clay minerals | As much as several hundred mg/L in some western streams; ocean water contains more than 1,000 mg/L and brines may contain as much as 57,000 mg/L | |
| Sodium (Na) | Feldspars (albite), clay minerals, evaporates, such as halite (NaCl) and mirabilite ($Na_2SO_410H_2O$), industrial wastes | As much as 1,000 mg/L in some western streams; about 10,000 mg/L in sea water; about 25,000 mg/L in brines | More than 50 mg/L sodium and potassium in the presence of suspended matter causes foaming, which accelerates scale formation |

© 2006 by Taylor & Francis Group, LLC

| | | | |
|---|---|---|---|
| Potassium (K) | Feldspars (orthoclase and microcline), feldspathoids, some micas, clay minerals | Generally less than about 10 mg/L; as much as 100 mg/L in hot springs; as much as 25,000 mg/L in brines | and corrosion in boilers. Sodium and potassium carbonate in recirculating cooling water can cause deterioration of wood in cooling towers. More than 65 mg/L of sodium can cause problems in ice manufacture |
| Carbonate ($CO_3$) | | Commonly 0 mg/L in surface water; commonly less than 10 mg/L in groundwater. Water high in sodium may contain as much as 50 mg/L of carbonate | Upon heating, bicarbonate is changed into steam, carbon dioxide, and carbonate. The carbonate combines with alkaline earths—principally calcium and magnesium—to form a crustlike scale of calcium carbonate that retards flow of heat through pipe walls and restricts flow of fluids in pipes. Water containing large amounts of biocarbonate and alkalinity are undesirable in many industries |
| Bicarbonate ($HCO_3$) | Limestone, dolomite | Commonly less than 500 mg/L; may exceed 1,000 mg/L in water highly charged with carbon dioxide | |
| Sulfate ($SO_4$) | Oxidation of sulfide ores; gypsum; anhydrite; industrial wastes | Commonly less than 1,000 mg/L except in streams and wells influenced by acid mine drainage. As much as 200,000 mg/L in some brines | Sulfate combines with calcium to form an adherent, heat-retarding scale. More than 250 mg/L is objectionable in water in some industries. Water containing about 500 mg/L of sulfate tastes bitter; water containing about 1,000 mg/L may be cathartic |
| Chloride (Cl) | Chief source is sedimentary rock (evaporates); minor sources are igneous rocks. Ocean tides force salty water upstream in tidal estuaries | Commonly less than 10 mg/L in humid regions; tidal streams contain increasing amounts of chloride (as much as 19,000 mg/L) as the bay or ocean is approached. About 19,300 mg/L in seawater, and as much as 200,000 mg/L in brines | Chloride in excess of 100 mg/L imparts a salty taste. Concentrations greatly in excess of 100 mg/L may cause physiological damage. Food processing industries usually require less than 250 mg/L. Some industries—textile processing, paper manufacturing, and synthetic rubber manufacturing—desire less than 100 mg/L |
| Fluoride (F) | Amphiboles (hornblende), apatite, fluorite, mica | Concentrations generally do not exceed 10 mg/L in groundwater or 1.0 mg/L in surface water. Concentrations may be as much as 1,600 mg/L in brines | Fluoride concentration between 0.6 and 1.7 mg/L in drinking water has a beneficial effect on the structure and resistance to decay of children's teeth. Fluoride in excess of 1.5 mg/L in some areas causes "mottled enamel" in children's teeth. Fluoride in excess of 6.0 mg/L causes pronounced mottling and disfiguration of teeth |

**Table 8A.3 (Continued)**

| Constituent | Major Sources | Concentration in Natural Water | Effect upon Usability of Water |
|---|---|---|---|
| Nitrate ($NO_3$) | Atmosphere; legumes, plant debris, animal excrement, nitrogenous fertilizer in soil and sewage | In surface water not subjected to pollution, concentration of nitrate may be as much as 5.0 mg/L but is commonly less than 1.0 mg/L. In groundwater the concentration of nitrate may be as much as 1,000 mg/L | Water containing large amount of nitrate (more than 100 mg/L) is bitter tasting and may cause physiological distress. Water from shallow wells containing more than 45 mg/L has been reported to cause methemoglobinemia in infants. Small amounts of nitrate help reduce cracking of high-pressure boiler steel |
| Dissolved solids | The mineral constituents dissolved in water constitute the dissolved solids | Surface water commonly contains less than 3,000 mg/L; streams draining salt beds in arid regions may contain in excess of 15,000 mg/L. Groundwater commonly contains less than 5,000 mg/L; some brines contain as much as 300,000 mg/L | More than 500 mg/L is undesirable for drinking and many industrial uses. Less than 300 mg/L is desirable for dyeing of textiles and the manufacture of plastics, pulp paper, rayon. Dissolved solids cause foaming in steam boilers; the maximum permissible content decreases with increases in operating pressure |

**Table 8A.4 Relative Abundance of Dissolved Solids in Potable Water**

| Major Constituents (1.0 to 1000 mg/L) | Secondary Constituents (0.01 to 10.0 mg/L) | Minor Constituents (0.0001 to 0.1 mg/L) | Trace Constituents (generally less than 0.001 mg/L) |
|---|---|---|---|
| Sodium | Iron | Antimony[a] | Beryllium |
| Calcium | Strontium | Aluminum | Bismuth |
| Magnesium | Potassium | Arsenic | Cerium[a] |
| Bicarbonate | Carbonate | Barium | Cesium |
| Sulfate | Nitrate | Bromide | Gallium |
| Chloride | Fluoride | Cadmium[a] | Gold |
| Silica | Boron | Chromium[a] | Indium |
| | | Cobalt | Lanthanum |
| | | Copper | Niobium[a] |
| | | Germanium[a] | Platinum |
| | | Iodide | Radium |
| | | Lead | Ruthenium[a] |
| | | Lithium | Scandium[a] |
| | | Manganese | Silver |
| | | Molybdenum | Thallium[a] |
| | | Nickel | Thorium[a] |
| | | Phosphate | Tin |
| | | Rubidium[a] | Tungsten[a] |
| | | Selenium | Ytterbium |
| | | Titanium[a] | Yttrium[a] |
| | | Uranium | Zirconium |
| | | Vanadium | |
| | | Zinc | |

[a] These elements occupy an uncertain position in the list.

*Source*: From Davis and DeWiest, *Hydrogeology*, John Wiley & Sons, Copyright 1966.

**Table 8A.5 Characteristics of Water That Affect Water Quality**

| Characteristic | Principal Cause | Significance | Remarks |
|---|---|---|---|
| Hardness | Calcium and magnesium dissolved in the water | Calcium and magnesium combine with soap to form an insoluble precipitate (curd) and thus hamper the formation of a lather. Hardness also affects the suitability of water for use in the textile and paper industries and certain others and in steam boilers and water heating | USGS classification of hardness (mg/L as $CaCO_3$)<br>0–60: Soft<br>61–120: Moderately hard<br>121–180: Hard<br>More than 180: Very hard |
| pH (or hydrogen-ion activity) | Dissociation of water molecules and of acids and bases dissolved in water | The pH of water is a measure of its reactive characteristics. Low values of pH, particularly below pH 4, indicate a corrosive water that will tend to dissolve metals and other substances that it contacts. High values of pH, particularly above pH 8.5, indicate an alkaline water that, on heating, will tend to form scale. The pH significantly affects the treatment and use of water | pH values: less than 7, water is acidic; value of 7, water is neutral; more than 7, water is basic |

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 8A.5 (Continued)**

| Characteristic | Principal Cause | Significance | Remarks |
|---|---|---|---|
| Specific electrical conductance | Substances that form ions when dissolved in water | Most substances dissolved in water dissociate into ions that can conduct an electrical current. Consequently, specific electrical conductance is a valuable indicator of the amount of material dissolved in water. The larger the conductance, the more mineralized the water | Conductance values indicate the electrical conductivity, in micromhos, of 1 $cm^3$ of water at a temperature of 25°C |
| Total dissolved solids | Mineral substances dissolved in water | Total dissolved solids is a measure of the total amount of minerals dissolved in water and is, therefore, a very useful parameter in the evaluation of water quality. Water containing less than 500 mg/L is preferred for domestic use and for many industrial processes | USGS classification of water based on dissolved solids (mg/L)<br>Less than 1,000: Fresh<br>1,000–3,000: Slightly saline<br>3,000–10,000: Moderately saline<br>10,000–35,000: Very saline<br>More than 35,000: Briny |

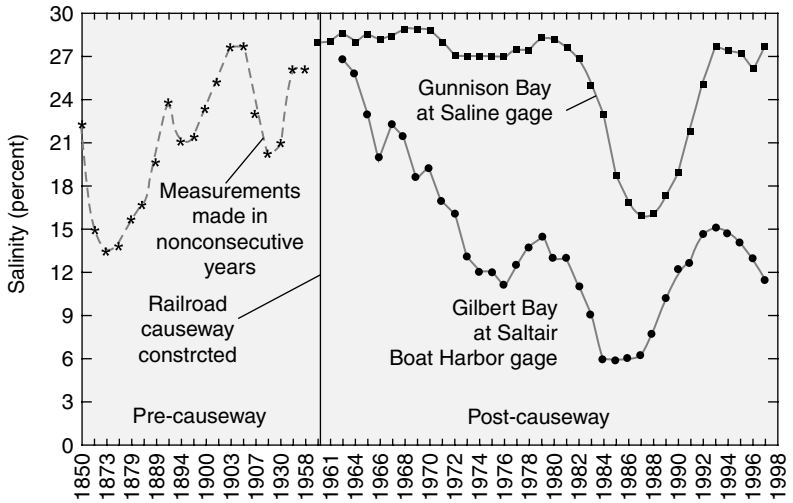

**Figure 8A.6** Salinity in the Great Salt Lake, Utah 1950–1998. The Salinity of Great Salt Lake is determined by the amount of inflow (and its salt content) and the amount of evaporation. When there is a lot of inflow, the lake elevation increases and the salinity of the water decreases. When there is less inflow or the evaporation rate is high, the lake elevation declines and the water becomes saltier. In 1959, a solid-fill railroad causeway was constructed across the middle of the lake. The causeway divides the lake into two parts: the north part (Gunnison Bay), which receives little freshwater inflow, and the south part (Gilbert Bay), which receives almost all the inflow. For any given lake elevation, the salinity of Gunnison Bay is always greater than the salinity of Gilbert Bay. The USGS measures salinity periodically at Saltair Boat Harbor and at Promontory (Gilbert Bay) and at Saline (Gunnison Bay). (From U.S. Geological Survey, http://ut.water.usgs.gov/salinity/index.html.)

**Table 8A.9 Natural Inorganic Constituents Commonly Dissolved in Groundwater That Are Most Likely to Affect Use of the Water**

| Substance | Major Natural Sources | Effect on Water Use | Concentrations of Significance (mg/L)[a] |
|---|---|---|---|
| Bicarbonate ($HCO_3$) and carbonate ($CO_3$) | Products of the solution of carbonate rocks, mainly limestone ($CaCO_3$) and dolomite ($CaMgCO_3$), by water containing carbon dioxide | Control the capacity of water to neutralize strong acids. Bicarbonates of calcium and magnesium decompose in steam boilers and water heaters to form scale and release corrosive carbon dioxide gas. In combination with calcium and magnesium, cause carbonate hardness | 150–200 |
| Calcium (Ca) and magnesium (Mg) | Soils and rocks containing limestone, dolomite, and gypsum ($CaSO_4$). Small amounts from igneous and metamorphic rocks | Principal cause of hardness and of boiler scale and deposits in hot-water heaters | 25–50 |
| Chloride (Cl) | In inland areas, primarily from seawater trapped in sediments at time of deposition; in coastal areas, from seawater in contact with freshwater in productive aquifers | In large amounts, increase corrosiveness of water and, in combination with sodium, gives water a salty taste | 250 |
| Fluoride (F) | Both sedimentary and igneous rocks. Not widespread in occurrence | In certain concentrations, reduces tooth decay; at higher concentrations, causes mottling of tooth enamel | 0.7–1.2[b] |
| Iron (Fe) and manganese (Mn) | Iron present in most soils and rocks; manganese less widely distributed | Stain laundry and are objectionable in food processing, dyeing, bleaching, ice manufacturing, brewing, and certain other industrial processes | Fe > 0.3, Mn > 0.05 |
| Sodium (Na) | Same as for chloride. In some sedimentary rocks, a few hundred milligrams per liter may occur in freshwater as a result of exchange of dissolved calcium and magnesium for sodium in the aquifer materials | See chloride. In large concentrations, may affect persons with cardiac difficulties, hypertension, and certain other medical conditions. Depending on the concentrations of calcium and magnesium also present in the water, sodium may be detrimental to certain irrigated crops | 69 (irrigation), 20–170 (health)[c] |
| Sulfate ($SO_4$) | Gypsum, pyrite (FeS), and other rocks containing sulfur (S) compounds | In certain concentrations, gives water a bitter taste and, at higher concentrations, has a laxative effect. In combination with calcium, forms a hard calcium carbonate scale in steam boilers | 300–400 (taste), 600–1,000 (laxative) |

[a] A range in concentration is intended to indicate the general level at which the effect on water use might become significant.
[b] Optimum range determined by the U.S. Public Health Service, depending on water intake.
[c] Lower concentration applies to drinking water for persons on a strict diet; higher concentration is for those on a moderate diet.

BOD: MEX) 1985: 1984 data. 1998: the data's variations can be explained by fluctuations of meteorological conditions and the CNA's actions on control of residual water discharges; JPN) Data refer to fiscal year (April to March); KOR) Han: samples were taken at 26 km upstream from the mouth of the river due to the tidal influence; FRA) Data refer to hydrological year (September–August). Seine: station under marine influence. Rhöne since 1987 data refer to another station; DEU) Weser: 1990–1997—BOD7 (20°); NLD) Mass-Eijsden 1990 and 1993–1994; Rijn-Lobith 1993–1996: average include limit of detection values; ESP) Guadalquivir: from 1990 onwards data refer to another station closer to the mouth and further away from Sevilla influence; TUR) 1980: 1982 data; UKD) When the parameter is unmeasurable (quantity is too small), the limit of detection values are used when calculating annual averages. Actual averages may therefore to lower. Clyde 1980: 1982 data.

Nitrates: CAN) Saskatchewan: N02 + N03; U.S.A.) Delaware 1985: 1984 data; KOR) Han: samples were taken at 26 km upstream from the mouth of the rivers due to the tidal influence; AUT) 1985: 1984 data; DNK) Data refer to N02 + N03; FRA) Data refer to hydrological year (September–August). Loire and Seine: dissolved concentrations. Seine: station under marine influence. Rhöne: since 1987 data refer to another station; DEU) Dissolved concentrations; ITA) Po: until 1986 data refer to Ponte Polesella (76 km far from the mouth); since 1989 data refer to Pontelagoscuro (91 km far from the mouth). Metaure 1985: 1984 data; NLD) Rijn-Lobith: dissolved concentrations; NOR) Skienselva and Drammenselva: until 1990 data refer to stations which may have marine influence; from 1990 onwards, data refer to new stations further away from the outlet Skienselva and Glomma 1985: 1983 data. Drammenselva 1985: 1984 data; SPAIN) Dissolved concentrations. Guadalquivir: from 1990 onwards data refer to another station closer to the mouth and farther away from Sevilla influence. Ebro 1980: 1981 data; UKD) When the parameter is unreasonable (quantity too small) the limit of detection values are used when calculating annual averages. Actual averages may therefore be lower.

Phosphorus: CAN) Columbia 1980: 1981 data; MEX) Orthophosphate concentrations; U.S.A.) Mississippi 1985 and 1990 and Delaware 1998 and 1999: annual averages include estimated values; KOR) Han samples were taken at 26 km upstream from the mouth of the river due to the tidal influence; AUT) 1985: 1984 data; FRA) Data refer to hydrological year (September–August). Loire—1980: 1982 data: since 1982 data refer to another station. Seine: station under marine influence. Rhöne: sicne 1987 data refer to another station; GRC) Strimonas: 1998 and 1999 data refer to ortho-phosphate; IRL) Boyne: Data refers to ortho-phosphate; ITA) Po: Data until 1988 refer to Ponte Polesella (76 km from the mouth); since 1989 data refer to Pontelagoscuro (91 km from the mouth); Metauro 1985: 1984 data; NOR) Skienselva and Drammenselva: until 1990 data refer to stations which may have marine influence; from 1990 onwards, data refer to new stations further away from the outlet; Skienselva and Glomma 1985: 1983 data; SLO) Maly Dunaj: orthophosphate concentrations; 1980: 1981 data; SPAIN) Guadalquivir: from 1990 onwards data refer to another station closer to the mouth and farther away from Sevilla influence; TUR) Orthophosphate concentrations; Yesilirmak 1980 and Gediz 1980: 1982 and 1981 data; UKD) Orthophosphate concentrations. When a parameter is unmeasurable (quantity too small), limit of detection values are used when calculating annual averages. Actual averages may therefore be lower.

Ammorium: CAN) Dissolved concentrations. 1980: 1981 data; U.S.A.) Delaware and Mississippi: dissolved concentrations; Mississippi: 1980, 1985 and 1999 data include limit of detection values; Delaware: 1982, 1983, 1985, 1988, 1992–1999 include limit of detection values; KOR) Han: samples were taken at 26 km upstream from the mouth of the river due to the tidal influence; AUT) 1985: 1984 data; FRA) Data refer to hydrological year (September–August). Loire and Seine: data refer to dissolved concentrations. Seine: station under marine influence. Rhöne: since 1987 data refer to another station; DEU) Dissolved concentrations; GRC) 1980: 1982 data; ITA) Po: until 1988 data refer to Ponte Polesella (76 km from the mouth): since 1989 data refer to Pontelagoscuro (91 km from the mouth). Adige 1988 and Metauro 1995: averages represent upper limits. Adige 1985: 1984 data; LUX) Moselle 91, 96 to 99: upper limits; Süre-Wasserbillig: 1985, 1990–1992, 1994–1999: upper detection limits; NLD) Rhine-Lobith: dissolved concentrations; NOR) Skienselva: until 1990 data refer to a station which may have marine influence; from 1990 onwards, data refer to a different station further away from the outlet; ESP) Dissolved concentrations. Guadalquivir: from 1990 onwards data refer to another station closer to the mouth and farther away from Sevilla influence; TUR) Excepted for 1990–1991 data refer to NH3. Yesihrmak 1980: 1982 data; UKD) When the parameter is unmeasurable (quantity too small) the limit of detection values are used when calculating annual averages. Actual averages may therefore be lower.

Lead: U.S.A.) Delaware: 1988 data represent upper limits: dissolved concentrations. Mississippi: dissolved concentrations; KOR) Han: samples were taken at 26 km upstream from the mouth of the river due to the tidal influence; AUT) 1985: 1984 data. Donau 1980, 82, 86, Inn 1982, 84 and Grossache 1980, 86: limit of detection values; CZE) Labe: from 1988 to 1993 data are upper limit values. Morava: 1995 data is an upper limit value; FIN) Tornionjoki and Kymijoki: include limit of detection values; Kokemäenjoki 1980: 1981 data; FRA) Data refer to hydrological year (September–August); DEU) Elbe: dissolved concentrations: 1988–1989, 1991–1993 and 1995: include limit of detection values. Rhein 1994, 95, Weser 1988–1991 and Donau 1996, 97: include limit of detection values; HUN) Until 1994: total concentrations: 1994–1999: dissolved concentrations; LUX) Moselle and Süre all years: include limit of detection values; Both analysis methods and limit of detection have changed over the years; NLD) Rijn-Maas Delta 1992 and 1996, and Rijn-Lobith 1995: include limit of detection values; NOR) Glomma 1985: 1983 data. Drammenselva: until 1990 data refer to a station which may have marine influence; from 1990 onwards, data refer to a new station further away from the outlet. All rivers: from 1991 heavy metal concentrations have been determined by a different analysing method; SPAIN) Dissolved concentration. Guadalquivir: from 1990 onwards data refer to another station closer to the mouth and farther away from Sevilla influence; SWE) Dissolved concentrations based on analysis of unfiltered samples; TUR) Porsuk 1999: upper limit; UKD) When the parameter is unmeasurable (quantity too small), the limit of detection values are used when calculating annual averages; actual averages may therefore be lower.

## SECTION 8B DRINKING WATER QUALITY STANDARDS UNITED STATES

The U.S. Environmental Protection Agency's National Primary Drinking-Water Regulations and National Secondary Drinking-Water Regulations are summarized in the following tables. The primary regulations specify maximum contaminant levels (MCLs), and health advisories. The MCLs, which are the maximum permissible level of a contaminant in water at the tap, are health related and are legally enforceable. If these concentrations are exceeded or if required monitoring is not performed the public must be notified. The secondary drinking-water regulations specify the secondary maximum contaminant levels (SMCL). The SMCLs are for contaminants in drinking water that primarily affect the esthetic qualities related to public acceptance of drinking water; they are intended to be guidelines for the States and are not federally enforceable. Health advisories are guidance contaminant levels that would not result in adverse health effects over specified short-time periods for most people.

As provided by the Safe Drinking Water Act of 1974, the U.S. Environmental Protection Agency has the primary responsibility for establishing and enforcing regulations. However, States may assume primacy if they adopt regulations that are at least as stringent as the Federal regulations in levels specified for protection of public health and in provision of surveillance and enforcement. The States may adopt more stringent regulations and may establish regulations for other constituents.

| **Contaminants regulated** | *nickel* | bromate<br>chloramine<br>chlorine<br>chlorine dioxide<br>chlorine<br>haloacetic acids (HAAS)[2]<br>*TTHMs* | Cryptosporidium<br>*Glardia*<br>*turbidity* | grass alpha<br>gross-beta<br>radium-226[1]<br>radium-228[1]<br>uranium | arsenic |

**Notes:**

1. Radium-226 and radium-228 arecontrol as two contaminants althoughtheir standard is combined.
2. Total THMs, haloacetic acids, and total coliforms are counted as one contaminant although both are combined standards: THMs (chloroform, bromodichloromethane, dibromochloromethane, bromoform), TC (total coliform bacteria including fecal coliform and E coli); HAAS (monochloroacetic acid, dichloroacetic acid, trichloroacetic acid, bromoacetic acid, and dibromoacetic acid).
3. Vinyl chloride is also known aschloroethylene & monochloroethylene.
4. These nine contaminants have a treatment technique instead of aMCL.
5. Aldicarb, aldicarb sulfone, and aldicarb sulfoxide are considered regulated contaminants although their MCLs are strayed.
6. Dichloromethane is also known as methylene chloride.

| | zero | |
| Uranium | zero | 30 ug/L as of 12/08/03 |

*Note:*

[1]Definitions:
**Maximum Contaminant Level (MCL)**—The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to MCLGs as feasible using the best available treatment technology and taking cost into consideration. MCLs are enforceable standards.

**Maximum Contaminant Level Goal (MCLG)**—The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety and are non-enforceable public health goals.

**Maximum Residual Disinfectant Level (MRDL)**—The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

**Maximum Residual Disinfectant Level Goal (MRDLG)**—The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

**Treatment Technique**—A required process intended to reduce the level of a contaminant in drinking water.

[2]Units are in milligrams per liter (mg/L) unless otherwise noted. Milligrams per liter are equivalent to parts per million.

[3]EPA's surface water treatment rules require systems using surface water or groundwater under the direct influence of surface water to (1) disinfect their water, and (2) filter their water or meet criteria for avoiding filtration so that the following contaminants are controlled at the following levels:

*Cryptosporidium*: (as of 1/1/02 for systems serving >10,000 and 1/14/05 for systems serving <10,000) 99% removal;
*Giardia lamblia*: 99.9% removal/inactivation;

*Viruses*: 99.99% removal/inactivation;

*Legionella*: No limit, but EPA believes that if *Giardia* and viruses are
*Turbidity*: At no time can turbidity (cloudiness of water) go above 5 nephelolometric
*HPC*: No more than 500 bacterial colonies per milliliter.

Long Term 1 Enhanced Surface Water Treatment (Effective Date: January 14, 2005); Surface water systems or (GWUDI) systems serving fewer than 10,000 people must comply with the applicable Long Term 1 Enhanced Surface Water Treatment Rule provisions (e.g. turbidity standards, individual filter monitoring, *Cryptosporidium* removal requirements, updated watershed control requirements for unfiltered systems).

Filter Backwash Recycling; The Filter Backwash Recycling Rule requires systems that recycle to return specific recycle flows through all processes of the system's existing conventional or direct filtration system or at an alternate location approved by the state.

[4]More than 5.0% samples total coliform-positive in a month. (For water systems that collect fewer than 40 routine samples per month, no more than one sample can be total coliform-positive per month.) Every sample that has total coliform must be analyzed for either fecal coliforms or *E. coli* if two consecutive TC-positive samples, and one is also positive for *E.coli* fecal coliforms, system has an acute MCL violation.

**Table 8A.14 (Continued)**

[5]Fecal coliform and *E. coli* are bacteria whose presence indicates that the water may be contaminated with human or animal wastes. Disease-causing microbes (pathogens) in these wastes can cause diarrhea, cramps, nausea, headaches, or other symptoms. These pathogens may pose a special health risk for infants, young children, and people with severely compromised immune systems.

[6]Although there is no collective MCLG for this contaminant group, there are individual MCLGs for some of the individual contaminants:

*Trihalomethanes*: bromodichloromethane (zero); bromoform (zero); dibromochloromethane (0.06 mg/L). Chloroform is regulated with this group but has no MCLG.

*Haloacetic acids*: dichloroacetic acid (zero); trichloroacetic acid (0.3 mg/L). Monochloroacetic acid, bromoacetic acid, and dibromoacetic acid are regulated with this group but have no MCLGs.

[7]MCLGs were not established before the 1986 Amendments to the Safe Drinking Water Act. Therefore, there is no MCLG for this contaminant.

[8]Lead and copper are regulated by a Treatment Technique that requires systems to control the corrosiveness of their water. If more than 10% of tap water samples exceed the action level, water systems must take additional steps. For copper, the action level is 1.3 mg/L, and for lead is 0.015 mg/L.

[9]Each water system must certify, in writing, to the state (using third-party or manufacturer's certification) that when acrylamide and epichlorohydrin are used in drinking water systems, the combination (or product) of dose and monomer level does not exceed the levels specified, as follows:

Acrylamide = 0.05% dosed at 1 mg/L (or equivalent);
Epichlorohydrin = 0.01% dosed at 20 mg/L (or equivalent)

**Table 8B.15 National Secondary Drinking Water Standards**

| Constituent | SMCL Level |
|---|---|
| Aluminum | 0.05 to 0.2 mg/L |
| Chloride | 250 mg/L |
| Color | 15 (color units) |
| Copper | 1.0 mg/L |
| Corrosivity | Noncorrosive |
| Fluoride | 2.0 mg/L |
| Foaming Agents | 0.5 mg/L |
| Iron | 0.3 mg/L |
| Manganese | 0.05 mg/L |
| Odor | 3 threshold odor number |
| pH | 6.5–8.5 |
| Silver | 0.10 mg/L |
| Sulfate | 250 mg/L |
| Total Dissolved Solids | 500 mg/L |
| Zinc | 5 mg/L |

*Note:* National Secondary Drinking Water Regulations (NSDWRs or secondary standards) are nonenforceable guidelines regulating contaminants that may cause cosmetic effects (such as skin or tooth discoloration) or aesthetic effects (such as taste, odor, or color) in drinking water. EPA recommends secondary standards to water systems but does not require systems to comply. However, states may choose to adopt them as enforceable standards.

**Table 8B.16 National Proposed MRDLGs, MRDLs, MCLGs, MCLs, AND AMCLs for Radon, Disinfectanct Residuals, and Disinfection Byproducts**

| Radon | MCLG | MCL | AMCL |
|---|---|---|---|
| Radon | zero | 300 pCi/L | 4000 pCi/L |
| **Stage 1 Disinfectants and Disinfection Byproducts Rule** | | | |
| **Disinfectant Residual** | **MRDLG (mg/L)** | **MRDL (mg/L)** | **Compliance Based on** |
| Chlorine | 4 (as $Cl_2$) | 4.0 (as $Cl_2$) | Annual Average |
| Chloramine | 4 (as $Cl_2$) | 4.0 (as $Cl_2$) | Annual Average |
| Chlorine Dioxide | 0.8 (as $ClO_2$) | 0.8 (as $ClO_2$) | Daily Samples |
| **Disinfection Byproducts** | **MCLG (mg/L)** | **MCL (mg/L)** | **Compliance Based on** |
| Total trihalomethanes (TTHM)[a] | N/A | 0.080 | Annual Average |
| Chloroform | *** | | |
| Bromodichloromethane | 0 | | |
| Dibromochloromethane | 0.06 | | |
| Bromoform | 0 | | |
| Haloacetic acids (five) (HAA5)[b] | N/A | 0.060 | Annual Average |
| Dichloroacetic acid | 0 | | |
| Trichloroacetic acid | 0.3 | | |
| Chlorite | 0.8 | 1.0 | Monthly Average |
| Bromate | 0 | 0.010 | Annual Average |

*Notes:* N/A-Not applicable because there are individual MCLGs for TTHMs or HAAs; MRDLGs, Maximum residual disinfectant level goals; MRDLs, Maximum residual disinfectant level; MCLGs, Maximum contaminant level goal; MCLs, Maximum contaminant level; AMCL, Alternate Maximum Contaminant Level; pCi/L, picoCuries per liter; mg/L, milligrams per liter.

[a] Total trihalomethanes is the sum of the concentrations of chloroform, bromodichloromethane, dibromochloromethane, and bromoform.
[b] Haloacetic acids (five) is the sum of the concentrations of mono-, di-, and trichloroacetic acids and mono—and dibromoacetic acids.

**Legend**

* = 1 sample at each entry point to distribution system (EPTDS).

** = 2 quarterly samples at each EPTDS. Samples must be taken during 1 calendar year during each 3-year compliance period.

**** = 4 quarterly samples at each EPTDS within time frame designated by the primacy agency.

× = No sampling required unless required by the primacy agency.

# = Systems must monitor at a frequency specified by the primacy agency.

! = When allowed by the primacy agency, data collected between June 2000 and December 8, 2003 may be grandfathered to satisfy the initial monitoring requirements due in 2004 for gross alpha, radium 226/228, and uranium.

[1]Until January 22, 2006 the maximum contaminant level (MCL) for arsenic is 50 μg/L; on January 23, 2006 the MCL for arsenic becomes 10 μg/L.

[2]Based on 3 rounds of monitoring at each EPTDS with all analytical results below the MCL. Waivers are not permitted under the current arsenic requirements, however systems are eligible for arsenic waivers after January 23, 2006.

[3]A system with a sampling point result above the MCL must collect quarterly samples, at that sampling point, until the system is determined by the primacy agency to be reliably and consistently below the MCL.

[4]Samples must be taken during the quarter which previously resulted in the highest analytical result. Systems can apply for a waiver after 3 consecutive annual sampling results are below the detection limit.

[5]Groundwater systems must update their vulnerability assessments during the time the waiver is effective. Primacy agencies must re-confirm that the system is nonvulnerable within 3 years of the initial determination or the system must return to annual sampling.

[6]If all monitoring results during initial quarterly monitoring are less than the detection limit, the system can take annual samples. If after a minimum of 3 years of annual sampling with all analytical results less than the detection limit, the primacy agency can allow a system to take 1 sample during each compliance period. Systems are also eligible for a waiver.

[7]Primacy agencies must determine that a surface water system is nonvulnerable based on a vulnerability assessment during each compliance period or the system must return to annual sampling.

[8]If all monitoring results during initial quarterly monitoring are less than the detection limit, the system can take annual samples. Systems are also eligible for a waiver.

[9]Samples must be taken during the quarter which previously resulted in the highest analytical result.

[10]Systems are required to monitor for asbestos during the first 3-year compliance period of each 9-year compliance cycle. A system vulnerable to asbestos contamination due solely to corrosion of asbestos-cement pipe must take 1 sample at a tap served by that pipe. A system vulnerable to asbestos contamination at the source must sample at each EPTDS.

© 2006 by Taylor & Francis Group, LLC

*Note:* The Standardized Monitoring Framework (SMF), was promulgated in the Phase II Rule on January 30, 1991 (56 FR 3526). The purpose of the SMF is to standardize, simplify, and consolidate monitoring requirements across contaminant groups. The SMF increases public health protection by simplifying monitoring plans and synchronizing monitoring schedules leading to increased compliance with monitoring requirements. The SMF reduces the variability within monitoring requirements for chemical and radiological contaminants across system sizes and types. The SMF summarizes existing systems' ongoing federal monitoring requirements only. Primacy agencies have the flexibility to issue waivers, with EPA approval, which take into account regional and state specific characteristics and concerns. To determine exact monitoring requirements, the SMF must be used in conjunction with any EPA approved waiver and additional requirements as determined by the primacy agency. New water systems may have different and additional requirements as determined by the primacy agency.

**Regulated Contaminants:**
Inorganic Contaminants (IOCs) — Fifteen (15) (Nitrate, Nitrite, total Nitrate/Nitrite, and Asbestos are exceptions to SMF)
Synthetic Organic Contaminants (SOCs) & Volatile Organic Contaminants (VOCs) — Fifty-One (51)
Radionuclides — Four (4)

**Utilities Covered:**
All PWS must monitor for Nitrate and Nitrite
CWSs must monitor for IOCs, SOCs, VOCs, and Radionuclides
NTNCWSs must monitor for IOCs SOCs, and VOCs.

**Table 8B.19 Drinking Water Priority Rulemaking: Microbial and Disinfection Byproduct Rules Summary**

**Existing M–DBP Regulations**

- Microbial Contaminants: The Surface Water Treatment Rule (SWTR), promulgated in 1989, applies to all public water systems using surface water sources or groundwater sources under the direct influence of surface water. It establishes maximum contaminant level goals (MCLGs) for viruses, bacteria and *Giardia lamblia*. It also includes treatment technique requirements for filtered and unfiltered systems that are specifically designed to protect against the adverse health effects of exposure to these microbial pathogens. The Total Coliform Rule, revised in 1989, applies to all PWSs and establishes a maximum contaminant level (MCL) for total coliforms
- Disinfection Byproducts: In 1979, EPA set an interim MCL for total trihalomethanes of 0.10 mg/L as an annual average. This applies to any community water system serving at least 10,000 people that adds a disinfectant to the drinking water during any part of the treatment process

**Information Collection Rule (ICR)**: To support the M–DBP rulemaking process, the ICR required large public water systems serving at least 100,000 people to monitor and collect data on microbial contaminants, disinfectants and disinfection byproducts for 18 months. The data provide EPA with information about disinfection byproducts, disease-causing microorganisms, including *Cryptosporidium*, and engineering data to control these contaminants

**Interim Enhanced Surface Water Treatment Rule (IESWTR):**

The IESWTR applies to systems using surface water, or groundwater under the direct influence of surface water, that serve 10,000 or more persons. The rule also includes provisions for states to conduct sanitary surveys for surface water systems regardless of system size. The rule builds upon the treatment technique requirements of the SWTR with the following key additions and modifications

- Maximum contaminant level goal (MCLG) of zero for *Cryptosporidium*
- 2-log *Cryptosporidium* removal requirements for systems that filter
- Strengthened combined filter effluent turbidity performance standards
- Individual filter turbidity monitoring provisions
- Disinfection profiling and benchmarking provisions
- Systems using groundwater under the direct influence of surface water now subject to the new rules dealing with *Crypdosporidium*
- Inclusion of *Cryptosporidium* in the watershed control requirements for unfiltered public water systems
- Requirements for covers on new finished water reservoirs
- Sanitary surveys, conducted by states, for all surface water systems regardless of size

The IESWTR, with tightened turbidity performance criteria and required individual filter monitoring, is designed to optimize treatment reliability and to enhance physical removal efficiencies to minimize the *Cryptosporidium* levels in finished water. In addition, the rule includes disinfection benchmark provisions to assure continued levels of microbial protection while facilities take the necessary steps to comply with new DBP standards

**Stage 1 Disinfectants and Disinfection Byproducts Rule (DBPR):**

The final Stage 1 DBPR applies to community water systems and nontransient noncommunity systems, including those serving fewer than 10,000 people, that add a disinfectant to the drinking water during any part of the treatment process

The final Stage 1 DBPR includes the following key provisions

- Maximum residual disinfectant level goals (MRDLGs) for chlorine (4 mg/L), chloramines (4 mg/L), and chlorine dioxide (0.8 mg/L)
- Maximum contaminant level goals (MCLGs) for four trihalomethanes (chloroform (zero), bromodichloromethane (zero), dibromochloromethane (0.06 mg/L), and bromoform (zero)), two haloacetic acids (dichloroacetic acid (zero) and trichloroacetic acid (0.3 mg/L)), bromate (zero), and chlorite (0.8 mg/L); EPA subsequently removed the zero MCLG for chloroform from its National Primary Drinking Water Regulations, effective May 30, 2000, in accordance with an order of the U.S. Court of Appeals for the District of Columbia Circuit
- MRDLs for three disinfectants (chlorine (4.0 mg/L), chloramines (4.0 mg/L), and chlorine dioxide (0.8 mg/L))
- MCLs for total trihalomethanes—a sum of the four listed above (0.080 mg/L), haloacetic acids (HAA5) (0.060 mg/L)—a sum of the two listed above plus monochloroacetic acid and mono—and dibromoacetic acids), and two inorganic disinfection byproducts (chlorite (1.0 mg/L)) and bromate (0.010 mg/L)); and
- A treatment technique for removal of DBP precursor material

The terms MRDLG and MRDL, which are not included in the SDWA, were created during the negotiations to distinguish disinfectants (because of their beneficial use) from contaminants. The final rule includes monitoring, reporting, and public notification requirements for these compounds. This final rule also describes the best available technology (BAT) upon which the MRDLs and MCLs are based

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 8B.19 (Continued)**

**Filter Backwash Recycling Rule (FBRR)**

The FBRR requires public water systems (PWSs) to review their backwash water recycling practices to ensure that they do not compromise microbial control. Under the FBRR, recycled filter backwash water, sludge thickener supernatant, and liquids from dewatering processes must be returned to a location such that all processes of a system's conventional or direct filtration including coagulation, flocculation, sedimentation (conventional filtration only) and filtration, are employed. Systems may apply to the State for approval to recycle at an alternate location. The Filter Backwash Rule applies to all public water systems, regardless of size

**Long-Term 1 Enhanced Surface Water Treatment Rule (Long-Term 1 ESWTR)**

While the Stage 1 DBPR applies to systems of all sizes, the IESWTR only applies to systems serving 10,000 or more people. The Long Term 1 ESWTR, promulgated in January 2002, will strengthen microbial controls for small systems i.e. those systems serving fewer than 10,000 people. The rule will also prevent significant increase in microbial risk where small systems take steps to implement the Stage 1 DBPR

EPA believes that the rule will generally track the approaches in the IESWTR for improved turbidity control, including individual filter monitoring and reporting. The rule will also address disinfection profiling and benchmarking. The Agency is considering what modifications of some large system requirements may be appropriate for small systems

**Future M–DBP Rules**

**Groundwater Rule**

EPA has proposed a Groundwater Rule that specifies the appropriate use of disinfection while addressing other components of groundwater systems to ensure public health protection. There are more than 158,000 public groundwater systems. Almost 89 million people are served by community groundwater systems, and 20 million people are served by noncommunity groundwater systems. Ninety-nine percent (157,000) of groundwater systems serve fewer than 10,000 people. However, systems serving more than 10,000 people serve 55% (more than 60 million) of all people who get their drinking water from public groundwater systems. The Groundwater Rule will be promulgated summer 2001

**Long-Term 2 Enhanced Surface Water Treatment Rule (Long-Term 2 ESWTR)**

EPA is proposing the Long-Term 2 ESWTR to reduce disease incidence associated with Cryptosporidium and other pathogenic microorganisms in drinking water. The Long-Term 2 ESWTR will supplement existing regulations by targeting additional Cryptosporidium treatment requirements to higher risk systems. This proposed regulation also contains provisions to mitigate risks from uncovered finished water storage facilities and to ensure that systems maintain microbial protection as they take steps to reduce the formation of disinfection byproducts. The Long-Term 2 ESWTR will apply to all systems that use surface water or groundwater under the direct influence of surface water

**Stage 2 Disinfectants and Disinfection Byproducts Rule (Stage 2 DBPR)**

The Stage 2 DBPR is one part of the Stage 2 Microbial and Disinfection Byproducts Rules (M–DBP), which are a set of interrelated regulations that address risks from microbial pathogens and disinfectants/disinfection byproducts (D/DBPs). The Stage 2 M–DBP Rules are the final phase in the M–DBP rulemaking strategy, affirmed by Congress as part of the 1996 Amendments to the SDWA. The Stage 2 DBPR focuses on public health protection by limiting exposure to DBPs, specifically total trihalomethanes (TTHM) and five haloacetic acids (HAA5), which can form in water through disinfectants used to control microbial pathogens. This rule will apply to all community water systems (CWSs) and nontransient noncommunity water systems (NTNCWSs) that add a primary or residual disinfectant other than ultraviolet (UV) light or deliver water that has been disinfected by a primary or residual disinfectant other than UV

**Table 8B.20 Unregulated Chemical Contanminents (1999 List) to Be Monitored in Public Supply Systems in the United States**

| | | |
|---|---|---|
| **List 1 Contaminants—Assessment Monitoring** | | |
| 2,4-dinitrotoluene | DCPA mono-acid degradate | MTBE |
| 2,6-dinitrotoluene | DDE | Nitrobenzene |
| Acetochlor | EPTC | Perchlorate |
| DCPA di-acid degradate | Molinate | Terbacil |
| **List 2 Contaminants—Screening Surveys** | | |
| 1,2-diphenylhydrazine | Diazinon | Prometon |
| 2-methyl-phenol | Disulfoton | RDX |
| 2,4-dichlorophenol | Diuron | Terbufos |
| 2,4-dinitrophenol | Fonofos | *Aeromonas* |
| 2,4,6-trichlorophenol | Linuron | |
| Alachlor ESA | Nitrobenzene (low-level)[a] | |
| **List 3 Contaminants—Pre-Screen Testing** | | |
| Lead-210 | Cyanobacteria (blue–green algae), other fresh water algae, and their toxins | Echoviruses |
| Polonium-210 | Caliciviruses | *Helicobacter pylori* |
| Adenoviruses | Coxsackieviruses | Microsporidia |

[a] Nitrobenzene has been added to List 2 from the original UCMR (1999) List to track its occurrence at a concentration lower than the List 1 nitrobenzene minimum reporting level.

*Source*: From USEPA, 2001, *Unregulated Contaminant Monitoring Regulation Reporting Guidance*, (EPA 815-R-01-029, November 2001), www.epa.gov.

**Table 8B.21 Monitoring Requirements for Unregulated Contaminant Program**

| Contaminant Type | Water Source Type | Timeframe | Frequency |
|---|---|---|---|
| Chemical | Surface water | Twelve (12) months | Four (4) quarterly samples taken as follows: Select either the first, second, or third month of a quarter and sample in that same month of each of four (4) consecutive quarters[a] to ensure that one of those sampling events occurs during the vulnerable time[b] |
| | Groundwater | Twelve (12) months | Two (2) times in a year taken as follows: Sample during one (1) month of the vulnerable time[b] and during one (1) month five (5) to seven (7) months earlier or later[c] |
| Microbiological | Surface and groundwater | Twelve (12) months | Six (6) times in a year taken as follows: Select either the first, second, or third month of a quarter and sample in that same month of each of four (4) quarters, and sample an additional two (2) months during the warmest (vulnerable) quarter of the year[d] |

[a] "Select either the first, second, or third month of a quarter and sample in that same month of each of four consecutive quarters" means that the system must monitor during each of the 4 months of either: January, April, July, October; or February, May, August, November; or March, June, September, December.

[b] "Vulnerable time" means May 1 through July 31, unless the State or EPA informs the system that it has selected a different time period for sampling as its vulnerable time.

[c] "Sample during one month of the vulnerable time and during one month five to seven months earlier or later" means, for example, that if the system selects May as its "vulnerable time" month to sample, then one month five to seven months earlier would be either October, November, or December of the preceding year, and one month five to seven months later would be either, October, November, or December of the same year.

[d] This means that the system must monitor during each of the six months of either: January, April, July, August, September, October, or February, May, July, August, September, November, or March, June, July, August, September, December; unless the State or EPA informs the system that a different vulnerable quarter has been selected for it.

## SECTION 8C DRINKING WATER STANDARDS — WORLD

**Table 8C.23 World Health Organization Drinking Water Guideline Values for Chemicals That Are of Health Significance**

| Chemical | Guideline Value[a] (mg/L) | Remarks |
|---|---|---|
| Acrylamide | 0.0005[b] | |
| Alachlor | 0.02[b] | |
| Aldicarb | 0.01 | Applies to aldicarb sulfoxide and aldicarb sulfone |
| Aldrin and dieldrin | 0.00003 | For combined aldrin plus dieldrin |
| Antimony | 0.02 | |
| Arsenic | 0.01 (P) | |
| Atrazine | 0.002 | |
| Barium | 0.7 | |
| Benzene | 0.01[b] | |
| Benzo[a]pyrene | 0.0007[b] | |
| Boron | 0.5 (T) | |
| Bromate | 0.01[b] (A, T) | |
| Bromodichloromethane | 0.06[b] | |
| Bromoform | 0.1 | |
| Cadmium | 0.003 | |
| Carbofuran | 0.007 | |
| Carbon tetrachloride | 0.004 | |
| Chloral hydrate (trichloroacetaldehyde) | 0.01 (P) | |
| Chlorate | 0.7 (D) | |
| Chlordane | 0.0002 | |
| Chlorine | 5 (C) | For effective disinfection, there should be a residual concentration of free chlorine of $\geq$0.5 mg /L after at least 30 min contact time at pH $<$8.0 |
| Chlorite | 0.7 (D) | |
| Chloroform | 0.2 | |
| Chlorotoluron | 0.03 | |
| Chlorpyrifos | 0.03 | |
| Chromium | 0.05 (P) | For total chromium |
| Copper | 2 | Staining of laundry and sanitary ware may occur below guideline value |
| Cyanazine | 0.0006 | |
| Cyanide | 0.07 | |
| Cyanogen chloride | 0.07 | For cyanide as total cyanogenic compounds |
| 2,4-D (2,4-dichlorophenoxyacetic acid) | 0.03 | Applies to free acid |
| 2,4-DB | 0.09 | |
| DDT and metabolites | 0.001 | |
| Di(2-ethylhexyl)phthalate | 0.008 | |
| Dibromoacetonitrile | 0.07 | |
| Dibromochloromethane | 0.1 | |
| 1,2-Dibromo-3-chloropropane | 0.001[b] | |
| 1,2-Dibromoethane | 0.0004[b] (P) | |
| Dichloroacetate | 0.05 (T, D) | |
| Dichloroacetonitrile | 0.02 (P) | |
| Dichlorobenzene, 1,2− | 1 (C) | |
| Dichlorobenzene, 1,4− | 0.3 (C) | |
| Dichloroethane, 1,2− | 0.03[b] | |
| Dichloroethene, 1,1− | 0.03 | |
| Dichloroethene, 1,2− | 0.05 | |
| Dichloromethane | 0.02 | |
| 1,2-Dichloropropane (1,2-DCP) | 0.04 (P) | |

**Table 8C.23 (Continued)**

| Chemical | Guideline Value[a] (mg/L) | Remarks |
|---|---|---|
| Epichlorohydrin | 0.0004 (P) | |
| Ethylbenzene | 0.3 (C) | |
| Fenoprop | 0.009 | |
| Fluoride | 1.5 | Volume of water consumed and intake from other sources should be considered when setting national standards |
| Formaldehyde | 0.9 | |
| Hexachlorobutadiene | 0.0006 | |
| Isoproturon | 0.009 | |
| Lead | 0.01 | |
| Lindane | 0.002 | |
| Manganese | 0.4 (C) | |
| MCPA | 0.002 | |
| Mecoprop | 0.01 | |
| Mercury | 0.001 | For total mercury (inorganic plus organic) |
| Methoxychlor | 0.02 | |
| Metolachlor | 0.01 | |
| Microcystin-LR | 0.001 (P) | For total microcystin-LR (free plus cell-bound) |
| Molinate | 0.006 | |
| Molybdenum | 0.07 | |
| Monochloramine | 3 | |
| Monochloroacetate | 0.02 | |
| Nickel | 0.02 (P) | |
| Nitrate (as $NO_3^-$) | 50 | Short-term exposure |
| Nitrilotriacetic acid (NTA) | 0.2 | |
| Nitrite (as $NO_2^-$) | 3 | Short-term exposure |
| | 0.2 (P) | Long-term exposure |
| Pendimethalin | 0.02 | |
| Pentachlorophenol | 0.009[b] (P) | |
| Pyriproxyfen | 0.3 | |
| Selenium | 0.01 | |
| Simazine | 0.002 | |
| Styrene | 0.02 (C) | |
| 2,4,5-T | 0.009 | |
| Terbuthylazine | 0.007 | |
| Tetrachloroethene | 0.04 | |
| Toluene | 0.7 (C) | |
| Trichloroacetate | 0.2 | |
| Trichloroethene | 0.07 (P) | |
| Trichlorophenol, 2,4,6− | 0.2[b] (C) | |
| Trifluralin | 0.02 | |
| Trihalomethanes | | The sum of the ratio of the concentration of each to its respective guideline value should not exceed 1 |
| Uranium | 0.015 (P, T) | Only chemical aspects of uranium addressed |
| Vinyl chloride | 0.0003[b] | |
| Xylenes | 0.5 (C) | |

[a] P, provisional guideline value, as there is evidence of a hazard, but the available information on health effects is limited; T, provisional guideline value because calculated guideline value is below the level that can be achieved through practical treatment methods, source protection, etc.; A, provisional guideline value because calculated guideline value is below the achievable quantification level; D, provisional guideline value because disinfection is likely to result in the guideline value being exceeded; C, concentrations of the substance at or below the health-based guideline value may affect the appearance, taste or odour of the water, leading to consumer complaints.

[b] For substances that are considered to be carcinogenic, the guideline value is the concentration in drinking water associated with an upper-bound excess lifetime cancer risk of $10^{-5}$ (one additional cancer per 100000 of the population ingesting drinking-water containing the substance at the guideline value for 70 years). Concentrations associated with upper-bound estimated excess lifetime cancer risks of $10^{-4}$ and $10^{-6}$ can be calculated by multiplying and dividing, respectively, the guideline value by 10.

| Xylenes (total) | | ≤0.3 |
| Zinc[b] | | ≤5.0 |

[a] A health-based guideline for aluminum in drinking water has not been established. However, water treatment plants using aluminum-based coagulants should optimize their operations to reduce residual aluminum levels in treated water to the lowest extent possible as a precautionary measure. *Operational guidance values* of less than 100 μg/L total aluminum for conventional treatment plants and less than 200 μg/L total aluminum for other types of treatment systems are recommended. Any attempt to minimize aluminum residuals must not compromise the effectiveness of disinfection processes or interfere with the removal of disinfection by-product precursors.

[b] Because first-drawn water may contain higher concentrations of metals than are found in running water after flushing, faucets should be thoroughly flushed before water is taken for consumption or analysis.

[c] The guideline is considered protective of human health against exposure to other microcystins (total microcystins) that may also be present.

[d] TCU = true colour unit.

[e] In cases where total dichlorobenzenes are measured and concentrations exceed the most stringent value (0.005 mg/L), the concentrations of the individual isomers should be established.

[f] It is recommended, however, that the concentration of fluoride be adjusted to 0.8–1.0 mg/L, which is the optimum range for the control of dental caries.

[g] Equivalent to 10 mg/L as nitrate-nitrogen. Where nitrate and nitrite are determined separately, levels of nitrite should not exceed 3.2 mg/L.

[h] Equivalent to 0.007 mg/L for paraquation.

[i] No units.

[j] It is recommended that sodium be included in routine monitoring programmes, as levels may be of interest to authorities who wish to prescribe sodium-restricted diets for their patients.

[k] There may be a laxative effect in some individuals when sulphate levels exceed 500 mg/L.

[l] The IMAC for trihalomethanes is expressed as a running annual average. It is based on the risk associated with chloroform, the trihalomethane most often present and in greatest concentration in drinking water. The guideline is designated as interim until such time as the risks from other disinfection by-products are ascertained. The preferred method of controlling disinfection byproducts is precursor removal; however, any method of control employed must not compromise the effectiveness of water disinfection.

[m] NTU = Nephelometric turbidity unit.

[n] At the point of consumption.

[a] The activity concentrations of natural corresponding to the guideline of 0.02 mg/L is about 0.5 Bq/L.
[b] Tritium is also produced naturally in the atmosphere in significant quanties.
[c] The activity concentration of natural uranium corresponding to the chemical guideline of 0.1 mg/L (see separate criteria summary on uranium in the Supporting Documentation) is about 2.6 Bq/L.
[d] Tritium and $^{14}C$ are also produced naturally in the atmosphere in significant quantities.

**Table 8C.27 (Continued)**

| Characteristic | Guideline Values[a] Health | Aesthetic[b] |
|---|---|---|
| Sodium | [e] | 180 |
| Styene (vinylbenzene) | 0.03 | 0.004 |
| Sulfate | 500 | 250 |
| Taste and odor | Not necessary | Acceptable to most people |
| Temperature | Not necessary | No value set |
| Tetrachloroethene | 0.05 | |
| Tin | [e] | |
| Toluene | 0.8 | 0.025 |
| Total dissolved solids | Not necessary | 500 |
| Trichloroacetaldehyde (chloral hydrate) | 0.02 | |
| Trichlorobenzenes (total) | 0.03 | 0.005 |
| 1,1,1-Trichloroethane | [c] | |
| Trichloroethylene | [c] | |
| Trihalomethanes (THMs) (Total) | 0.25 | |
| True Color | Not necessary | 15 HU |
| Turbidity | [c] | 5 NTU |
| Uranium | 0.02 | |
| Vinyl chloride | 0.0003 | |
| Xylene | 0.6 | 0.02 |
| Zinc | [c] | 3 |

*Note:* All values are as "total" unless otherwise stated; Routine monitoring for these compounds is not required unless there is potential for contamination of water supplies (e.g. accidental spillage); The concentration of all chlorination byproducts can be minimized by removing naturally occurring organic matter from the source water, reducing the amount of chlorine added, or using an alternative disinfectant (which may produce other byproducts). Action to reduce trihalomethanes and other byproducts is encouraged, but must not compromise disinfection.
HU, Hazen units; NTU, Nephelometric turbidity units; THMs, trihalomethanes.

[a] All values mg/L unless otherwise stated.
[b] Aesthetic values are not listed if the compound does not cause aesthetic problems, or if the value determined from health considerations is the same or lower.
[c] Insufficient data to set a guideline value based on health considerations.
[d] The guideline value is below the limit of determination. Improved analytical procedures are required for this compound.
[e] No health-based guideline value is considered necessary.

*Note:* Routine monitoring for pesticides is not required unless potential exists for contamination of water supplies.

[a] These are generally based on the analytical limit of determination (the level at which the pesticide can be reliably detected using practicable, readily available and validated analytical methods). If a pesticide is detected at or above this value the source should be identified and action taken to prevent further contamination.

[b] Based on 10% of acceptable daily intake (ADI).

[c] These pesticides have either been detected on occasions in Australian drinking water or their likely use would indicate that they may occasionally be detected.

**Table 8C.29 Australian Drinking Water Guideline Values for Radiological Quality**

| Guideline value |
|---|
| The total estimated dose per year from all radionuclides in drinking water, excluding the dose from potassium-40, should not exceed 1.0 mSv |
| If this guideline value of exceeded, the water provider, in conjunction with the relevant health authority, should evaluate possible remedial actions on a cost-benefit basis of assess what action can be justified to reduce the annual exposure |
| **Screening of water supplies** |
| Compliance with the guideline for radiological quality of drinking water should be assessed, initially, by screening for gross alpha and gross beta activity concentration. The recommended screening level for gross alpha activity is 0.5 Bq/L. The recommended screening level for gross beta activity is 0.5 Bq/L after subtraction of the contribution form potassium-40 |
| If either of these activity concentrations is exceeded, specific radionuclides should be identified and their activity concentrations determined. The concentration of both radium-226 and radium-228 should always be determined, as these are the most significant naturally occurring radionuclides in Australian water supplies. Other radionuclides should be identified in necessary of ensure all gross alpha and beta activity is accounted for, after taking into account the counting and other analytical uncertainties involved in the determination |

## SECTION 8D MUNICIPAL WATER QUALITY

**Table 8D.33 Range in Quality of Finished Water in Public Water Supplies of the 100 Largest Cities in the United States**

| Constituent or Property | Maximum | Median | Minimum |
|---|---|---|---|
| **Chemical Analyses (parts per million)** | | | |
| Silica ($SiO_2$) | 72 | 7.1 | 0.0 |
| Iron (Fe) | 1.30 | 0.02 | 0.00 |
| Manganese (Mn) | 2.50 | 0.00 | 0.00 |
| Calcium (Ca) | 145 | 26 | 0.0 |
| Magnesium (Mg) | 120 | 6.25 | 0.0 |
| Sodium (Na) | 198 | 12 | 1.1 |
| Potassium (K) | 30 | 1.6 | 0.0 |
| Bicarbonate ($HCO_3$) | 380 | 46 | 0 |
| Carbonate ($CO_3$) | 26 | 0 | 0 |
| Sulfate ($SO_4$) | 572 | 26 | 0.0 |
| Chloride (Cl) | 540 | 13 | 0.0 |
| Fluoride (F) | 7.0 | 0.4 | 0.0 |
| Nitrate ($NO_3$) | 23 | 0.7 | 0.0 |
| Dissolved solids | 1,580 | 186 | 22 |
| Hardness as $CaCO_3$ | 738 | 90 | 0 |
| Noncarbonate hardness as $CaCO_3$ | 446 | 34 | 0 |
| Specific conductance micromhos at 25°C | 1,660 | 308 | 18 |
| pH, pH units | 10.5 | 7.5 | 5.0 |
| Color, color units | 24 | 2 | 0 |
| Turbidity | 13 | 0 | 0 |
| **Spectrographic Analyses (μg/L)** | | | |
| Silver (Ag) | 7.0 | 0.23 | ND |
| Aluminum (Al) | 1,500 | 54 | 3.3 |
| Boron (B) | 590 | 31 | 2.5 |
| Barium (Ba) | 380 | 43 | 1.7 |
| Chromium (Cr) | 35 | 0.43 | ND |
| Copper (Cu) | 250 | 8.3 | <0.61 |
| Iron (Fe) | 1,700 | 43 | 1.9 |
| Lithium (Li) | 170 | 2.0 | ND |
| Manganese (Mn) | 1,100 | 5.0 | ND |
| Molybdenum (Mo) | 68 | 1.4 | ND |
| Nickel (Ni) | 34 | <2.7 | ND |
| Lead (Pb) | 62 | 3.7 | ND |
| Rubidium (Rb) | 67 | 1.05 | ND |
| Strontium (Sr) | 1,200 | 110 | 2.2 |
| Titanium (Tl) | 49 | <1.5 | ND |
| Vanadium (V) | 70 | <4.3 | ND |
| **Radiochemical Analyses** | | | |
| Beta activity picocuries per liter | 130 | 7.2 | <1.1 |
| Radium (Ra) picocuries per liter | 2.5 | <0.1 | <0.1 |
| Uranium (U) micrograms per liter | 250 | 0.15 | <0.1 |

*Note:* Maximum, median, and minimum values of as of 1962; ND means not detected.

**Table 8D.49 Summary of Documented Cases of Naturally-Occurring Arsenic Problems in World Groundwaters**

| Country/Region | Area ($km^2$) | Population Exposed[a] | Concentration Ranges ($\mu g\ L$) | Aquifer Type | Groundwater Conditions | Reference |
|---|---|---|---|---|---|---|
| Bangladesh | 150,000 | ca. $3\times10^7$ | <0.5–2,500 | Holocene alluvial/deltaic sediments. Abundance of solid organic matter | Strongly reducing, neutral pH, high alkalinity, slow groundwater flow rates | DPHE/BGS/MML (1999) |
| West Bengal | 23,000 | $6\times10^6$ | <10–3,200 | As Bangladesh | As Bangladesh | CGWB (1999); POA (1999) |
| China | | $5.6\times10^6$ | | | | Sun et al. (2000) |
| Taiwan | 4000 | $10^5$ (formerly) | 10–1820 | Sediments, including black shale | Strongly reducing, artesian conditions, some groundwaters contain humic acid | Kuo (1968), Tseng et al. (1968) |
| Inner Mongolia (Huhhot Basin (HB), Bayingao, Hexi, Ba Meng, Tumet Plain) | 4300 (HB) 30,000 total | ca. $10^5$ in HB | <1–2400 | Holocene alluvial and lacustrine sediments | Strongly reducing conditions, neutral pH, high alkalinity. Deep groundwaters often artesian, some have high concentrations of humic acid | Luo et al. (1997), Zhai et al. (1998), Ma et al. (1999), Sun et al. (1999), Smedley et al. (2000b, 2001b) |
| Xinjiang (Tianshan Plain) | 38,000 | (500 diagnosed) | 40–750 | Holocene alluvial plain | Reducing, deep wells (up to 660 m) are artesian | Wang and Huang (1994) |
| Shanxi | | | | Alluvial plain | Reducing | Sun et al. (1999) |
| Hungary, Romania (Danube Basin) | 110,000 | 29,000 | <2–176 | Quaternary alluvial plain | Reducing groundwater, some artesian. Some high in humic acid | Varsányi et al. (1991); Gurzau (2000) |
| Argentina (Chaco-Pampean Plain | $10^6$ | $2\times10^6$ | <1–5300 (7800 in some porewaters) | Holocene and earlier loess with rhyolitic volcanic ash | Oxidizing, neutral to high pH, high alkalinity. Groundwaters often saline. As(V), accompanied by high B, V, Mo, U. Also high As concentrations in some river waters | Nicolli et al., 1989; Nicolli and Merino (2001); Smedley et al. (2001a); Sancha and Castro (2000) |
| Northern Chile (Antofagasta) | 125,000 | 500,000 | 100–1000 | Quaternary volcanogenic sediment | Generally oxidizing. Arid conditions, high salinity, high B. Also high-As river waters | Cáceres et al. (1992), Karcher et al. (1999); Sancha and Castro (2000) |
| Southwest U.S.A. | | $3.5\times10^5$ (tot) | | | | Smith et al. (1992) |
| Basin & Range, Arizona | 200,000 | | up to 1300 | Alluvial basins, some evaporites | Oxidizing, high pH. As (mainly As (V)) correlates positively with Mo, Se, V, F | Robertson (1989) |

© 2006 by Taylor & Francis Group, LLC

| | | | | | | |
|---|---|---|---|---|---|---|
| Tulare Basin, San Joaquin Valley, California | 5000 | | <1–2600 | Holocene and older basin-fill sediments | Internally-drained basin. Mixed redox conditions. Proportion of As(III) increases with well depth. High salinity in some shallow groundwaters. High Se, U, B, Mo | Fujii and Swain (1995) |
| Southern Carson Desert, Nevada | 1300 | | up to 2600 | Holocene mixed aeolian, alluvial, lacustrine sediments, some thin volcanic ash bands | Largely reducing, some high pH. Some with high salinity due to evaporation. Associated high, U, P, Mn, DOC (Fe to a lesser extent) | Welch and Lico (1998) |
| Salton Sea Basin | | | | | Some saline groundwaters, with high U | Welch and Lico (1998) |
| Mexico (Lagunera) | 32,000 | $4\times10^5$ | 8–620 | Volcanic sediments | Oxidising, neutral to high pH, As mainly as As(V) | Del Razo et al. (1990) |
| **Some problem areas related to mining activity and mineralized areas** | | | | | | |
| Thailand (Ron Phibun) | 100 | 15,000 | 1–5000 | Dredged quatemary alluvium (some problems in limestone), tailings | Oxidation of disseminated arsenopyrite due to former tin mining, subsequent groundwater rebound | Williams et al. (1996), Williams (1997) |
| Greece (Lavrion) | | | | Mine tailings | Mining | |
| Fairbanks, Alaska, U.S.A. | | | up to 10,000 | Schist, alluvium, mine tailings | Gold mining, arsenopyite, possibly scorodite | Wilson and Hawkins (1978); Welch et al. (1988) |
| Moira Lake, Ontario, Canda | 100 | | 50–3000 | Mine tailings | Ore mining (gold, hematite, magnetite, lead, cobalt) | Azcue and Nriagu (1995) |
| Coeur d'Alene, Idaho, U.S.A. | | | up to 1400 | Valley-fill deposits | River water and groundwater affected by lead-zinc-silver mining | Welch et al. (1988). Mok and Wai (1990) |
| Lake Oahe, South Datoka, U.S.A. | | | up to 2000 | Lake sediments | As in sediment porewaters from gold mining in the Black Hills | Ficklin and Callender (1989) |
| Bowen Island, British Colombia | 50 | | 0.5–580 | Sulphide mineral veins in volcanic country rocks | Neutral to high-pH groundwaters (up to 8.9), As correlated with B, F | Boyle et al. (1998) |

[a] Exposed refers to population drinking water with As $>50\ \mu g\ L^{-1}$ (drinking-water standard of most countries).

**Table 8D.50 The Effects of Too Little — and Too Much — Fluoride**

| Level in Water | Effects |
|---|---|
| 0.8–1.2 mg/L | Prevention of tooth decay, strengthening of skeleton |
| Above 1.5 mg/L | Fluorosis: pitting of tooth enamel and deposits in bones |
| Above about 10 mg/L | Crippling skeletal fluorosis |

*Note:* Fluoride is a desirable substance: it can prevent or reduce dental decay and strengthen bones, thus preventing bone fractures in older people. Where the fluoride level is naturally low, studies have shown higher levels of both dental caries (tooth decay) and fractures. Because of its positive effect, fluoride is added to water during treatment in some areas with low levels. But you can have too much of a good thing; and in the case of fluoride, water levels above 1.5 mg/L may have long-term undesirable effects. Much depends on whether other sources, such as vegetables, also have high levels. The risk of toxic effect rises with the concentration. It only becomes obvious at much higher levels than 1.5 mg/L.

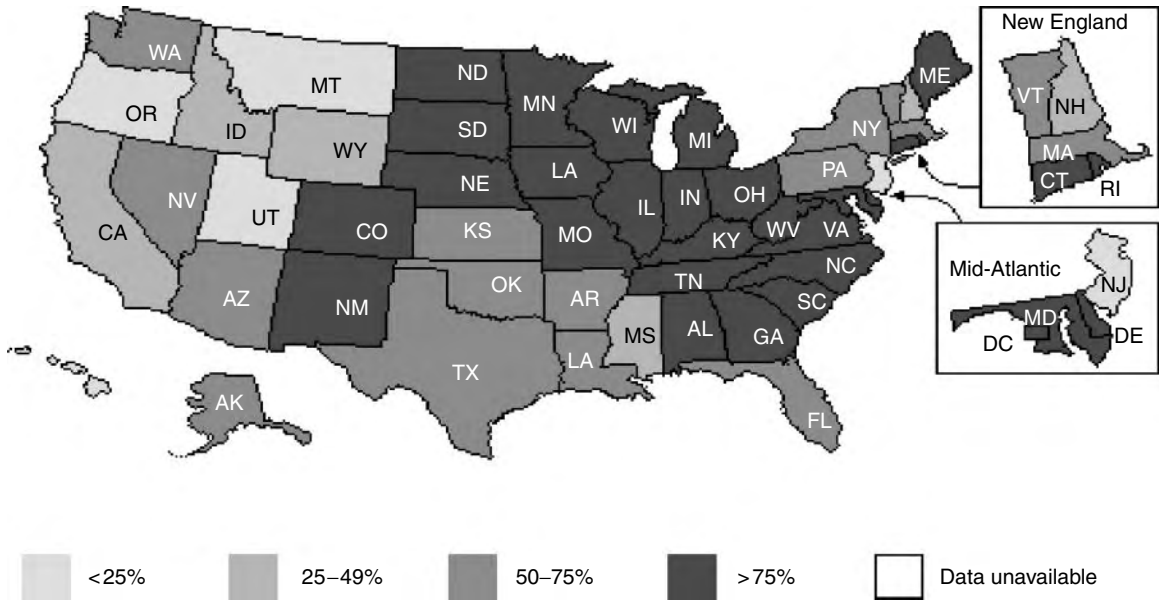

**Figure 8D.18** Percent of United States population on fluoridated water, 2002. (From Center of Disease Control, cdc.gov/nohss/FluoridationMapV.asp?Year=2002.)

Geographical belts of high fluoride concentrations in groundwater extend from Syria through Jordan, Egypt, Libya, Algeria, Morocco and the Rift Valley of Western Africa through the Sudan and Kenya. Another belt stretches from Turkey through Iraq, Iran and Afghanistan to India, Northern Thailand and China. The highest natural fluoride concentration ever found in water (2,800 mg/L) was recorded in Lake Nakuru in the Rift Valley in Kenya. High groundwater fluoride concentrations are associated with igneous and metamorphic rocks such as granites and gneisses, volcanic rocks, and salt deposits of marine origin.

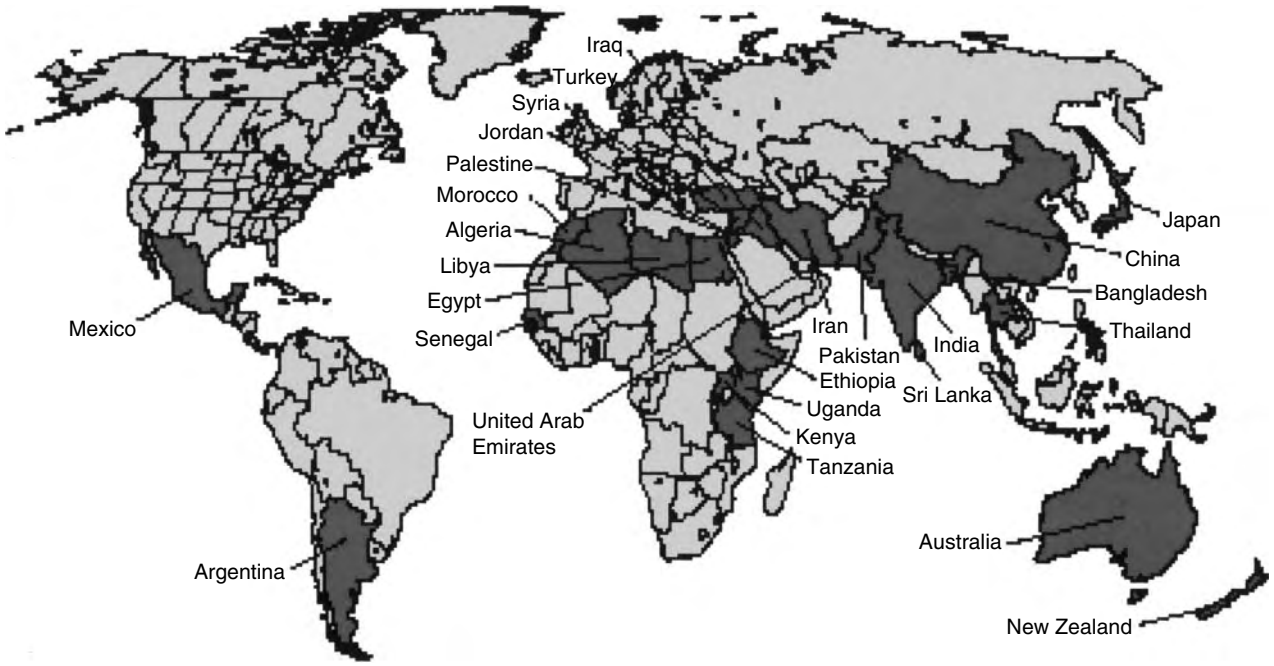

**Figure 8D.19** Countries with endemic fluorosis due to excess fluoride in drinking water. (From UNICEF, *Fluoride and Fluoridation*, UNICEF Questions Benefits and Safety, rvi.net/~Flouride/000133.htm.)

**Table 8D.55 Detections of Giardia Cysts in Source Waters of Public Drinking Water Supplies in the United States**

| Classification | Samples | No. of Sites | No. of Positive Samples | No. of Positive Sites | Percent | |
|---|---|---|---|---|---|---|
| | | | | | Positive of Samples | Positive of Sites |
| Creeks | 444 | 75 | 181 | 38 | 41 | 51 |
| Rivers | 449 | 74 | 163 | 38 | 36 | 51 |
| Lakes | 829 | 49 | 138 | 19 | 17 | 39 |
| Springs[a] | 84 | 6 | 16 | 2 | 19 | 33 |
| Wells[a] | 63 | 40 | 2 | 2 | 3 | 5 |

[a] Samples represent finished water. Most water from springs and wells is unfiltered and may or may not be disinfected before consumption.

**Table 8D.57 United States National Source Water (Untreated) Levels of Giardia, January to December 1998**

| Level of Total Giardia (#cysts/100 mL) | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | Oct | Nov | Dec |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Number of Water Treatment Plants | | | | | | | | | | | |
| 0 | 220 | 232 | 248 | 268 | 262 | 281 | 276 | 280 | 290 | 265 | 264 | 233 |
| 0.1–0.9 | | 1 | 1 | 1 | | 1 | 1 | 2 | | 1 | | 1 |
| 1–9 | 18 | 18 | 10 | 13 | 14 | 9 | 14 | 6 | 6 | 7 | 8 | 11 |
| 10–99 | 45 | 35 | 39 | 25 | 20 | 25 | 24 | 20 | 19 | 33 | 32 | 26 |
| 100–999 | 37 | 38 | 28 | 23 | 24 | 15 | 10 | 21 | 13 | 21 | 16 | 28 |
| 1,000–9,999 | | 2 | 3 | | 2 | 1 | | 1 | | 1 | 3 | |

*Note:* Data Purpose, The Information Collection Rule (ICR) data were collected as part of a national research project to support development of national drinking water standards. They should NOT be used to determine local water systems compliance with drinking water standards, nor should they be used to make personal judgements about health risks.
Results of Zero: A measurement of zero means that no *Giardia* was found in the sample volume that was analyzed. Zero results do not indicate the absence of Giardia in the source water because the method recovery is low and the amount of sample analyzed is small. In other words, Giardia may be present in source water even if no oocysts are counted for the sample volume analyzed. The presence of Giardia may also be mistakenly identified as other organic material such as algae. The current ICR method for detecting *Giardia* and *Cryptosporidium* has significant technical limitations: Better detection methods are currently being developed to detect and count protozoa. It is difficult to accurately estimate the numbers of protozoan cysts without testing large quantities of water, and this is not always feasible. The actual levels of these pathogens in source water may be much higher than those found by the tests. However, the current ICR detection method does not distinguish between species of *Giardia* and *Cryptosporidium* that may cause illness and those that do not. The method may also misidentify algae as a Cryptosporidium. With the ICR detection method, both false positive (microbe is counted when it is not actually present) and false negative (microbe is not counted when it is present) results are possible. The ICR detection method cannot determine whether the microbes are alive or whether they are able to cause illness.

| Cotton bandage[m] | 5 | 5 | — | — | Low | 20 | — | — | — | 0.2 | 0.2 | 0.2 | — | — | — | — | — | — | — | — | — |

*Note:* Milligrams per liter, except as indicated.

[a] Abbreviations as follows: D.O., dissolved oxygen; ppm, parts per million; pH, hydrogen-ion concentration.
[b] A—no corrosiveness; B—no slime formation; C—conformity with federal drinking water standards necessary; D—NaCl, 275 ppm; E—free $CO_2$ less than 10 mg/L; F—copper less than 5 mg/L; G—calcium 100–200 mg/L; H—calcium 200–500 mg/L
[c] Water with algae, or hydrogen sulphide odors, is most unsuitable for air conditioning.
[d] Some hardness desirable.
[e] Water for distilling must meet the same general requirements as for brewing (gin and spirits mashing water of light-beer quality, whiskey mashing water of dark-beer quality).
[f] Clear, odorless, sterile water for syrup and carbonization. Water consistent in character. Most high quality filtered municipal water not satisfactory for beverages.
[g] Hard candy requires pH of 7.0 or greater, as low value favors inversion of sucrose, causing sticky products.
[h] Control of corrosiveness is necessary, as is also control of organisms, such as sulphur and iron bacteria, which tend to form slimes.
[i] Ca $(HCO_3)_2$ particularly troublesome. $Mg(HCO_3)_2$ tends to greenish color. $CO_2$ assists in preventing cracking. Sulphates and chlorides of Ca, Mg, Na should each be less than 300 ppm (white butts).
[j] Uniformity of composition and temperature desirable. Iron objectionable since cellulose absorbs iron from dilute solutions. Manganese very objectionable, clogs pipelines and is oxidized to permanganates by chlorine, causing reddish color.
[k] Excessive iron, manganese, or turbidity creates spots and discoloration in tanning of hides and leather goods.
[l] Constant composition; residual alumina $<0.5$ ppm.
[m] Calcium, magnesium, iron, manganese, suspended matter, and soluble organic matter may be objectionable.

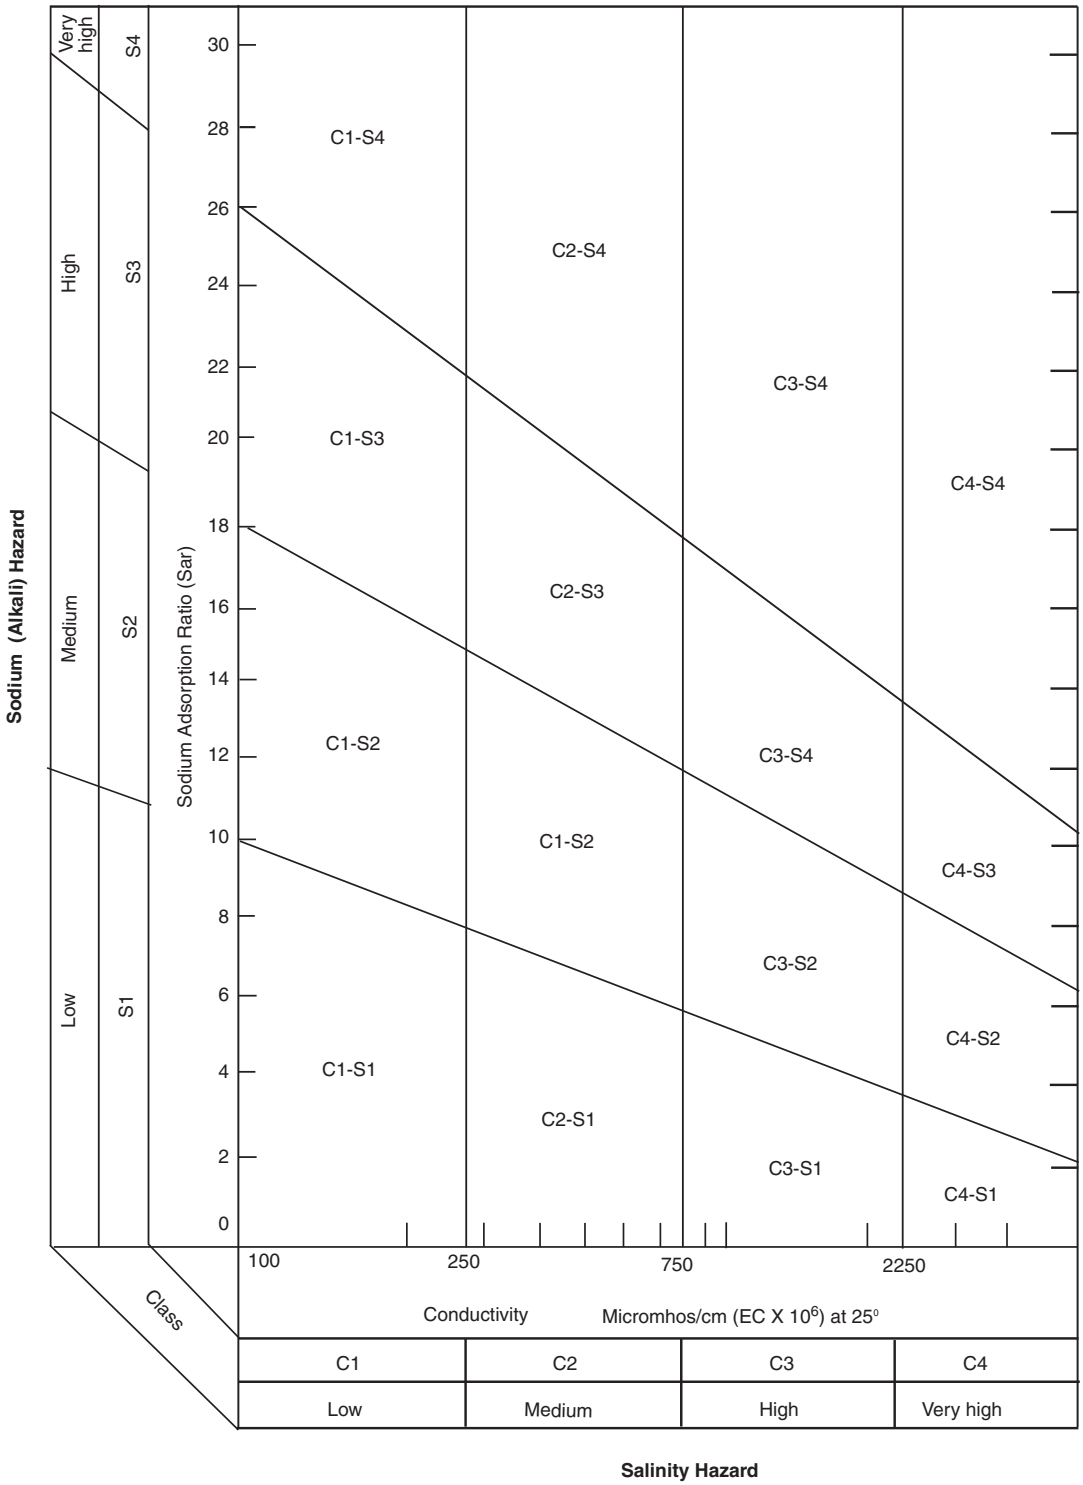

**Figure 8F.20** Quality criteria for irrigation water. Note: Sodium Adsorption Ratio SAR = Na/(Ca + Mg)/2 where concentrations are expressed in millequivalents per liter.

*Conductivity*

Low-salinity water (C1) can be used for irrigation with most crops on most soils with little likelihood that soil salinity will develop. Some leaching is required, but this occurs under normal irrigation practices except in soils of extremely low permeability.

Medium-salinity water (C2) can be used if a moderate amount of leaching occurs. Plants with moderate salt tolerance can be grown in most cases without special practices for salinity control.

High-salinity water (C3) cannot be used on soils with restricted drainage. Even with adequate drainage, special management for salinity control may be required and plants with good salt tolerance should be selected.

Very high-salinity water (C4) is not suitable for irrigation under ordinary conditions, but may be used occasionally under very special

© 2006 by Taylor & Francis Group, LLC

circumstances. The soils must be permeable, drainage must be adequate, irrigation water must be applied in excess to provide considerable leaching, and very salt-tolerant crops should be selected.

*Sodium*

Low-sodium water (S1) can be used for irrigation on almost all soils with little danger of the development of harmful levels of exchangeable sodium. However, sodium-sensitive crops such as stone-fruit trees and avocados may accumulate injurious concentrations of sodium.

Medium-sodium water (S2) will present an appreciable sodium hazard in fine-textured soils having high cation-exchange-capacity, especially under low-leaching conditions, unless gypsum is present in the soil. This water may be used on coarse-textured or organic soils with good permeability.

High-sodium water (S3) may produce harmful levels of exchangeable sodium in most soils and will require special soil management-good drainage, high leaching, and organic matter additions. Gypsiferous soils may not develop harmful levels of exchangeable sodium from such waters. Chemical amendments may be required for replacement of exchangeable sodium, except that amendments may not be feasible with waters of very high salinity.

Very high sodium water (S4) is generally unsatisfactory for irrigation purposes except at low and perhaps medium salinity, where the solution of calcium from the soil or use of gypsum or other amendments may make the use of these waters feasible.

Another criterion for the evaluation of irrigation water is:

Residual Sodium Carbonate (RSC) = (CO3 + HCO3) − (Ca + Mg) where concentrations are expressed in meq/liter.

When RSC > 2.5 Probably not suitable for irrigation

1.25-2.5 Marginal

< 1.25 Probably safe for irrigation. (From U.S. Department of Agriculture.)

**Table 8F.70 Guides for Evaluating the Quality of Water Used for Irrigation**

| Quality Factor | Threshold Concentration[a] | Limiting Concentration[b] |
|---|---|---|
| Coliform organisms, MPN per 100 mL | 1000[c] | —[d] |
| Total dissolved solids (TDS), mg/L | 500[c] | 1500[c] |
| Electrical conductivity, μmhos/cm | 750[c] | 2250[c] |
| Range of pH | 7.0–8.5 | 6.0–9.0 |
| Sodium adsorption ratio (SAR) | 6.0[c] | 15 |
| Residual sodium carbonate (RSC), meq | 1.25[c] | 2.5 |
| Arsenic, mg/L | 1.0 | 5.0 |
| Boron, mg/L | 0.5[c] | 2.0 |
| Chloride, mg/L | 100[c] | 350 |
| Sulfate, mg/L | 200[c] | 1000 |
| Copper, mg/L | 0.1[c] | 1.0 |

*Note:* MPN is most probable number. Sodium absorption ratio is defined by the formula SAR = Na/ (Ca + Mg)/2 where the concentrations are expressed in milliequivalents per liter. Residual sodium carbonate is the sum of the equivalents of normal carbonate and bicarbonate minus the sum of the equivalents of calcium and magnesium.

[a] Threshold values at which irrigator might become concerned about water quality and might consider using additional water for leaching. Below these values, water should be satisfactory for almost all crops and almost any arable soil.

[b] Limiting values at which the yield of high-value crops might be reduced drastically, or at which an irrigator might be forced to less valuable crops.

[c] Values not to be exceeded more than 20 percent of any 20 consecutive samples, nor in any 3 consecutive samples. The frequency of sampling should be specified.

[d] Aside from fruits and vegetables which are likely to be eaten raw, no limits can be specified. For such crops, the threshold concentration would be limiting.

*Source*: From Calif. State Water Quality Control Board, 1963.

**Table 8F.71 FAO Guidelines for Evaluating the Quality of Water for Irrigation**

| | | Degree of Restriction on Use | | |
|---|---|---|---|---|
| **Potential Irrigation Problem** | **Units** | **None** | **Slight to Moderate** | **Severe** |
| Salinity (affects crop water availability)[a] | | | | |
| $EC_W$ | dS/m | <0.7 | 0.7–3.0 | >3.0 |
| or TDS | mg/L | <450 | 450–2000 | >2000 |
| Infiltration (affects infiltration rate of water into the soil. Evaluate using $EC_W$ and SAR together)[b] | | | | |
| SAR = 0–3 and $EC_W$ = | | >0.7 | 0.7–0.2 | <0.2 |
| =3–6 = | | >1.2 | 1.2–0.3 | <0.3 |
| =6–12= | | >1.9 | 1.9–0.5 | <0.5 |
| =12–20= | | >2.9 | 2.9–1.3 | <1.3 |
| =20–40= | | >5.0 | 5.0–2.9 | <2.9 |
| Specific Ion Toxicity (affects sensitive crops) | | | | |
| Sodium (Na) | | | | |
| Surface irrigation | SAR | <3 | 3–9 | >9 |
| Sprinkler irrigation | me/L | <3 | >3 | |
| Chloride (Cl) | | | | |
| Surface irrigation | me/L | <4 | 4–10 | >10 |
| Sprinkler irrigation | me/L | <3 | <3 | |
| Boron (B) | mg/L | <0.7 | 0.7–3.0 | >3.0 |
| Trace elements (see Table 8F–77) | | | | |
| Miscellaneous Effects (affects susceptible crops) | | | | |
| Nitrogen ($NO_3$-N) | mg/L | <5 | 5–30 | >30 |
| Bicarbonate ($HCO_3$)(overhead sprinkling only) | me/L | <1.5 | 1.5–8.5 | >8.5 |
| pH | | | Normal range 6.5–8.4 | |

[a] $EC_W$ means electrical conductivity, a measure of the water salinity, reported in deciSiemens per meter at 25°C (dS/m) or in units millimhos per centimeter (mmho/cm). Both are equivalent. TDS means total dissolved solids, reported in milligrams per liter (mg/L).

[b] SAR means sodium absorption ratio.

**Table 8F.76 Limits of Boron in Irrigation Water**

**A. Permissible Limits (Boron in parts per million)**

| | Crop Group | | |
|---|---|---|---|
| **Class of Water** | **Sensitive** | **Semitolerant** | **Tolerant** |
| | | | Excellent |
| <0.33 | <0.67 | <1.00 | Good |
| 0.33–0.67 | 0.67–1.33 | 1.00–2.00 | Permissible |
| 0.67–1.00 | 1.33–2.00 | 2.00–3.00 | Doubtful |
| 1.00–1.25 | 2.00–2.50 | 3.00–3.75 | Unsuitable |
| >1.25 | >2.50 | >3.75 | |

**B. Crop Groups of Boron Tolerance (In each group, the plants first named are considered as being more tolerant; the last named, more sensitive.)**

| **Sensitive** | **Semitolerant** | **Tolerant** |
|---|---|---|
| Pecan | Sunflower (native) | Athel (*Tamarix aphylla*) |
| Walnut (Black; and Persian, or English) | Potato | Asparagus |
| | Cotton (Acala and Pima) | Palm (*Phoenix canariensis*) |
| Jerusalem-artichoke | Tomato | Date palm (*P. dactylifera*) |
| Navy bean | Sweetpea | Sugar beet |
| American elm | Radish | Mangel |
| Plum | Field pea | Garden beet |
| Pear | Ragged robin rose | Alfalfa |
| Apple | Olive | Gladiolus |
| Grape (Sultanina and Malaga) | Barley | Broadbean |
| Kadota fig | Wheat | Onion |
| Persimmon | Corn | Turnip |
| Cherry | Milo | Cabbage |
| Peach | Oat | Lettuce |
| Apricot | Zinnia | Carrot |
| Thornless blackberry | Pumpkin | |
| Orange | Bell pepper | |
| Avocado | Sweet potato | |
| Grapefruit | Lima bean | |
| Lemon | | |

*Source*: From U.S. Dept. of Agriculture.

**Table 8F.77 FAO Recommended Maximum Concentrations of Trace Elements in Irrigation Water**

| **Element** | **Recommended Maximum Concentration[a] (mg/L)** | **Remarks** |
|---|---|---|
| Al | 5.0 | Can cause nonproductivity in acid soils (pH <5.5), but more alkaline soils at >pH 7.0 will precipitate the Ion and eliminate any toxicity |
| As | 0.10 | Toxicity to plants varies widely, ranging from 12 mg/L for Sudan grass to less than 0.05 mg/L for rice |
| Be | 0.10 | Toxicity to plants varies widely, ranging from 5 mg/L for kale to 0.5 mg/L for bush beans |
| Cd | 0.01 | Toxic to beans, beets and turnips at concentrations as low as 0.1 mg/L in nutrient solutions. Conservative limits recommended due to its potential for accumulation in plants and soils to concentrations that may be harmful to humans |
| Co | 0.05 | Toxic to tomato plants at 0.1 mg/L in nutrient solution. Tends to be inactivated by neutral and alkaline soils |
| Cr | 0.10 | Not generally recognized as an essential growth element. Conservative limits recommended due to lack of knowledge on its toxicity to plants |
| Cu | 0.20 | Toxic to a number of plants at 0.1 to 1.0 mg/L in nutrient solutions |
| F | 1.0 | Inactivated by neutral and alkaline soils |

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 8F.77 (Continued)**

| Element | Recommended Maximum Concentration[a] (mg/L) | Remarks |
|---|---|---|
| Fe | 5.0 | Not toxic to plants in aerated soils, but can contribute to soil acidification and loss of availability of essential phosphorus and molybdenum. Overhead sprinkling may result in unsightly deposits on plants, equipment and buildings |
| Li | 2.5 | Tolerated by most crops up to mg/L; mobile in soil. Toxic to citrus at low concentrations (0.075 mg/L). Acts similarly to boron |
| Mn | 0.20 | Toxic to a number of crops at a few-tenths to a few mg/L, but usually only in acid soils |
| Mo | 0.01 | Not toxic to plants at normal concentrations in soil and water. Can be toxic to livestock if forage is grown in soils with high concentrations of available molybdenum |
| Ni | 0.20 | Toxic to a number of plants at 0.5 mg/L to 1.0 mg/L; reduced toxicity at neutral or alkaline pH |
| Pd | 5.0 | Can inhibit plant cell growth at very high concentrations |
| Se | 0.02 | Toxic to plants at concentrations as low as 0.025 mg/L and toxic to livestock if forage is grown in soils with relatively high levels of added selenium. An essential element to animals but in very low concentrations |
| Sn | | |
| Ti | | Effectively excluded by plants; specific tolerance unknown |
| W | | |
| V | 0.10 | Toxic to many plants at relatively low concentrations |
| Zn | 2.0 | Toxic to many plants at widely varying concentrations; reduced toxicity at pH $>$ 6.0 and in fine textured or organic soils |

[a] The maximum concentration is based on a water application rate which is consistent with good irrigation practices (10000 $m^3$/ha/yr). If the water application rate greatly exceeds this, the maximum concentrations should be adjusted downward accordingly. No adjustment should be made for application rates less than 10000 $m^3$/ha/yr. The values given are for water used on a continuous basis at one site.

| Uranium[d] | 10[f] | 1987 |
| Vanadium[d] | 100 | 1987 |
| Zinc[d] | 1,000–5,000[u] | 1987 |

*Note:* ug/L—Micrograms per liter.

[a] Unless otherwise indicated, supporting documents are available from the guidelines and Standards Division, Environment Canada.

[b] The guidelines dated 1987 have been carried over from *Canadian Water Quality Guidelines* (CCREM 1987) and no fact sheet was prepared. The guidelines dated 1989 to 1997 were developed and initially published in CCREM 1987 as appendixes on the date indicated. They are published as fact sheets in this document. Other guidelines dated 1997 and those dated 1999 are published for the first time in this document.

[c] Concentration of total aldicarb residues.

[d] No fact sheet created.

[e] The technical document for the guideline is available from the Ontario Ministry of the Environment.

[f] Interim guideline.

[h] Boron guideline
=500 $\mu g\ L^{-1}$ for blackberries
=500–1000 $\mu g\ L^{-1}$ for peaches, cherries, plums, grapes, cowpeas, onions, garlic, sweet potatoes, wheat, barley, sunflowers, mungbeans, sesame, lupins, strawberries, Jerusalem artichokes, kidney beans, and lima beans
=1000–2000 $\mu g\ L^{-1}$ for red peppers, peas, carrots, radishes, potatoes, and cucumbers
=2000–4000 $\mu g\ L^{-1}$ for lettuce, cabbage, celery, turnips, Kentucky bluegrass, oats, corn, artichokes, tobacco, mustard, clover, squash, and muskmelons
=4000–6000 $\mu g\ L^{-1}$ for sorghum, tomatoes, alfalfa, purple vetch, parsley, red beets, and sugar beets
=6000 $\mu g\ L^{-1}$ for asparagus.

[i] Guideline value slightly modified from CCREM 1987 + Appendixes due to re-evaluation of the significant figures.

[j] Guideline is crop-specific (see fact sheet).

[k] Chloride guideline
Foliar damage
=100–178 mg $L^{-1}$ for almond, apricots, and plums
=178–355 mg $L^{-1}$ for grapes, peppers, potatoes, and tomatoes
=355–710 mg $L^{-1}$ for alfalfa, barley, corn, and cucumbers
$>$710 mg $L^{-1}$ for cauliflower, cotton, safflower, sesame, sorghum, sugar beets, and sunflowers
Rootstocks
=180–600 mg $L^{-1}$ for stone fruit (peaches, plums, etc)
=710–900 mg $L^{-1}$ for grapes
Cultivars
=110–180 mg $L^{-1}$ for strawberries
=230–460 mg $L^{-1}$ for grapes
=250 mg $L^{-1}$ for boysenberries, blackberries, and raspberries.

[n] Substance has been re-evaluated since CCREM 1987 + Appendixes. Either a new guideline has been derived or insufficient data existed to derive a new guideline.

[o] Copper guideline
= 200 $\mu g\ L^{-1}$ for cereals
= 1000 $\mu g\ L^{-1}$ for tolerant crops

[r] Molybdenum guideline = 50 $\mu g\ L^{-1}$ for short-terms use on acidic soils

[s] Selenium guideline = 20 $\mu g\ L^{-1}$ for continuous use
=50 $\mu g\ L^{-1}$ for intermittent use

[t] Total dissolved solids guideline =500 mg $L^{-1}$ for strawberries, raspberries, beans, and carrots
=500–800 mg $L^{-1}$ for boysenberries, currants, blackberries, gooseberries, plums, grapes, apricots, peaches, pears, cherries, apples, onions, parsnips, radishes, peas, pumpkins, lettuce, peppers, muskmelons, sweet potatoes, sweet corn, potatoes, celery, cabbage, kohlrabi, cauliflower, cowpeas, broadbeans, flax, sunflowers, and corn
=800–1500 mg $L^{-1}$ for spinach, cantaloupe, cucumbers, tomatoes, squash, brussels sprouts, broccoli, turnips, smooth brome, alfalfa, big trefoil, beardless wild rye, vetch, timothy, and crested wheat grass
=1500–2500 mg $L^{-1}$ for beets, zucchini, rape, sorghum, oat hay, wheat hay, mountain brome, tall fescue, sweet clover, reed canary grass, birdsfoot trefoil, perennial ryegrass
=3500 mg $L^{-1}$ for asparagus, soybeans, safflower, oats, rye, wheat, sugar beets, barley, barley hay, and tall wheat grass

[u] Zinc guideline =1000 mg $L^{-1}$ when soil pH $<$ 6.5
=5000 mg $L^{-1}$ when soil pH $>$ 6.5

**Table 8F.80 Australian Trigger Values for Thermotolerant Coliforms in Irrigation Water Used for Food and Nonfood Crops**

| Intended use | Level of thermotolerant coliforms[a] (mL) |
|---|---|
| Raw human food crops in direct contact with irrigation water (e.g. via sprays, irrigation of salad vegetables) | <10 cfu[b] / 100 |
| Raw human food crops not in direct contact with irrigation water (edible product separated from contact with water, e.g. by peel, use of trickle irrigation); or crops sold to consumer cooked or processed | <1000 cfu / 100 |
| Pasture and fodder for dairy animals (without withholding period) | <100 cfu / 100 |
| Pasture and fodder for dairy animals (with withholding period of 5 days) | <1000 cfu / 100 |
| Pasture and fodder (for grazing animals except pigs and dairy animals, i.e. cattle, sheep, and goats) | <1000 cfu / 100 |
| Silviculture, turf, cotton, etc (restricted public access) | <10 000 cfu / 100 |

[a] Median values.
[b] cfu = colony forming units.

**Table 8F.84 Corrosion Potential of Waters on Metal Surface and Fouling Potential as Indicated by pH, Hardness, Langelier Index, Ryznar Index, and the Log of Chloride Carbonate Ratio**

| Parameter[a] | Value | Comments |
|---|---|---|
| **Corrision Potential** | | |
| pH | <5 | High corrosion potential |
| | 5–6 | Likelihood of corrosion |
| | >6 | Limited corrosion potential |
| Hardness | <60 mg/L CaCO3 | Increased corrosion potential |
| Langelier index | < −0.5 | Increased corrosion potential |
| | −0.5–0.5 | Limited corrosion potential |
| Ryznar index | <6 | Limited corrosion potential |
| | >7 | Increased corrosion potential |
| Log of chloride to carbonate ratio | >2 | Increased corrosion potential |
| **Fouling potential** | | |
| pH | <7 | Limited fouling potential |
| | 7–8.5 | Moderate fouling potential (groundwater)[b] |
| | >8.5 | Increased fouling potential (groundwater)[c] |
| Hardness | <350 mg/L $CaCO_3$ | Increased fouling potential |
| Langelier index | >0.5 | Increased fouling potential |
| | −0.5–0.5 | Limited fouling potential |
| Ryznar index | <6 | Increased fouling potential |
| | >7 | Limited fouling potential |
| Log of chloride to carbonate ratio | <2 | Increased fouling potential |

[a] For further information on these parameters refer to Volume 3, Section 9.2.9.1.
[b] For surface waters, pH range 7 to 9.
[c] For surface waters, pH >9.

# SECTION 8G WATER QUALITY FOR AQUATIC LIFE

## United States National Recommended Water Quality Criteria for Priority Toxic Pollutants

Section 304(a)(1) of the Clean Water Act requires the United States Environmental Protection Agency (EPA) to develop criteria for water quality that accurately reflects the latest scientific knowledge. These criteria are based solely on data and scientific judgments on pollutant concentrations and environmental or human health effects. Section 304(a) also provides guidance to states and tribes in adopting water-quality standards. Criteria are developed for the protection of aquatic life as well as for human health.

The Criteria Maximum Concentration (CMC) is an estimate of the highest concentration of a material in surface water to which an aquatic community can be exposed briefly without resulting in an unacceptable effect. The Criterion Continuous Concentration (CCC) is an estimate of the highest concentration of a material in surface water to which an aquatic community can be exposed indefinitely without resulting in an unacceptable effect. The CMC and CCC are just two of the six parts of an aquatic life criterion; the other four parts are the acute averaging period, chronic averaging period, acute frequency of allowed exceedence, and chronic frequency of allowed exceedence. Because 304(a) aquatic life criteria are national guidance, they are intended to be protective of the vast majority of the aquatic communities in the United States.

The tables below lists all priority toxic pollutants and some non priority toxic pollutants, and both human health effect and organoleptic effect criteria issued pursuant to CWA §304(a). Blank spaces indicate that EPA has no CWA §304(a) criteria recommendations. For a number of nonpriority toxic pollutants not listed, CWA §304(a) "water + organism" human health criteria are not available, but EPA has published MCLs under the SDWA that may be used in establishing water-quality standards to protect water supply designated uses.

The human health criteria for the priority and nonpriority pollutants are based on carcinogenicity of $10^{-6}$ risk. Alternate risk levels may be obtained by moving the decimal point (e.g., for a risk level of $10^{-5}$, move the decimal point in the recommended criterion one place to the right).

The compilation contains 304(a) criteria for pollutants with toxicity-based criteria as well as nontoxicity based criteria. The basis for the nontoxicity based criteria are organoleptic effects (e.g., taste and odor) which would make water and edible aquatic life unpalatable but not toxic to humans. The table includes criteria for organoleptic effects for 23 pollutants. Pollutants with organoleptic effect criteria more stringent than the criteria based on toxicity (e.g., included in both the priority and nonpriority pollutant tables) are footnoted as such.

[A] This criterion has been revised to reflect The Environmental Protection Agency's q1* or RfD, as contained in the Integrated Risk Information System (IRIS) as of May 17, 2002. The fish tissue bioconcentration factor (BCF) from the 1980 Ambient Water Quality Criteria document was retained in each case.

[B] This recommended water quality criterion was derived from data for arsenic (III), but is applied here to total arsenic, which might imply that arsenic (III) and arsenic (V) are equally toxic to aquatic life and that their toxicities are additive. In the *arsenic criteria document* (EPA 440/5–84–033, January 1985), Species Mean Acute Values are given for both arsenic (III) and arsenic (V) for five species and the ratios of the SMAVs for each species range from 0.6 to 1.7. Chronic values are available for both arsenic (III) and arsenic (V) for one species; for the fathead minnow, the chronic value for arsenic (V) is 0.29 times the chronic value for arsenic (III). No data are known to be available concerning whether the toxicities of the forms of arsenic to aquatic organisms are additive.

[C] Freshwater and saltwater criteria for metals are expressed in terms of the dissolved metal in the water column. The recommended water quality criteria value was calculated by using the previous 304(a) aquatic life criteria expressed in terms of total recoverable metal, and multiplying it by a conversion factor (CF). The term "Conversion Factor" (CF) represents the recommended conversion factor for converting a metal criterion expressed as the total recoverable fraction in the water column to a criterion expressed as the dissolved fraction in the water column. (Conversion Factors for saltwater CCCs are not currently available. Conversion factors derived for saltwater CMCs have been used for both saltwater CMCs and CCCs). See "*Office of Water Policy and Technical Guidance on Interpretation and Implementation of Aquatic Life Metals Criteria*," October 1, 1993, by Martha G. Prothro, Acting Assistant Administrator for Water, available from the *Water Resource Center* and 40CFR§131.36(b)(1). Conversion Factors applied in the table can be found in Appendix A to the Preamble-Conversion Factors for Dissolved Metals.

[D] This recommended criterion is based on a 304(a) aquatic life criterion that was issued in the 1995 *Updates*: *Water Quality Criteria Documents for the Protection of Aquatic Life in Ambient Water*, (EPA-820-B-96-001, September 1996). This value was derived using the GLI Guidelines (60FR15393–15399, March 23, 1995; 40CFR132 Appendix A); the difference between the 1985 Guidelines and the GLI Guidelines are explained on page iv of the 1995 Updates. None of the decisions concerning the derivation of this criterion were affected by any considerations that are specific to the Great Lakes.

[E] This water quality criterion is based on a 304(a) aquatic life criterion that was derived using the *1985 Guidelines* (*Guidelines for Deriving Numerical National Water Quality Criteria for the Protection of Aquatic Organisms and Their Uses*, PB85–227049, January 1985) and was issued in one of the following criteria documents: *Arsenic* (EPA 440/5-84-033), *Cadmium* (EPA-822-R-01-001), *Chromium* (EPA 440/5-84-029), *Copper* (EPA 440/5-84-031), *Cyanide* (EPA 440/5- 84-028), Lead (EPA 440/5-84-027), Nickel (EPA 440/5-86-004), Pentachlorophenol (EPA 440/5-86-009), Toxaphene, (EPA 440/5-86-006), Zinc (EPA 440/5-87- 003).

[F] This criterion is based on carcinogenicity of $10^{-6}$ risk. Alternate risk levels may be obtained by moving the decimal point (e.g., for a risk level of $10^{-5}$, move the decimal point in the recommended criterion one place to the right).

[G] EPA is currently reassessing the criteria for arsenic.

[H] This recommended water quality criterion for arsenic refers to the inorganic form only.

[I] A more stringent MCL has been issued by EPA. Refer to drinking water regulations (40 CFR 141) or Safe Drinking Water Hotline (1-800-426-4791) for values.

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 8G.86 (Continued)**

J The freshwater criterion for this metal is expressed as a function of hardness (mg/L) in the water column. The value given here corresponds to a hardness of 100 mg/L. Criteria values for other hardness may be calculated from the following: CMC (dissolved) $= \exp\{m_A [\ln(\text{hardness})] + b_A\}$ (CF), or CCC (dissolved) $= \exp\{m_C [\ln (\text{hardness})] + b_C\}$ (CF) and the parameters specified in Appendix B- Parameters for Calculating Freshwater Dissolved Metals Criteria That Are Hardness-Dependent.

K When the concentration of dissolved organic carbon is elevated, copper is substantially less toxic and use of Water-Effect Ratios might be appropriate.

L This recommended water quality criterion was derived in *Ambient Water Quality Criteria Saltwater Copper Addendum* (Draft, April 14, 1995) and was promulgated in the Interim final National Toxics Rule (*60FR22228–222237*, May 4, 1995).

M The organoleptic effect criterion is more stringent than the value for priority toxic pollutants.

N EPA is actively working on this criterion and so this recommended water quality criterion may change substantially in the near future.

O This recommended water quality criterion was derived from data for inorganic mercury (II), but is applied here to total mercury. If a substantial portion of the mercury in the water column is methylmercury, this criterion will probably be under protective. In addition, even though inorganic mercury is converted to methylmercury and methylmercury bioaccumulates to a great extent, this criterion does not account for uptake via the food chain because sufficient data were not available when the criterion was derived.

P This recommended water quality criterion was derived on page 43 of the *mercury criteria document* (EPA 440/5-84-026, January 1985). The saltwater CCC of 0.025 ug/L given on page 23 of the criteria document is based on the Final Residue Value procedure in the 1985 Guidelines. Since the publication of the Great Lakes Aquatic Life Criteria Guidelines in 1995 (60FR15393–15399, March 23, 1995), the Agency no longer uses the Final Residue Value procedure for deriving CCCs for new or revised 304(a) aquatic life criteria.

Q This fish tissue residue criterion for methylmercury is based on a total fish consumption rate of 0.0175 kg/day.

R The CMC $= 1/[(f1/CMC1) + (f2/CMC2)]$ where f1 and f2 are the fractions of total selenium that are treated as selenite and selenate, respectively, and CMC1 and CMC2 are 185.9 g/L and 12.82 g/L, respectively.

S This value for selenium was announced (*61FR58444–58449*, November 14, 1996) as a proposed GLI 303(c) aquatic life criterion. EPA is *currently working on this criterion* and so this value might change substantially in the near future.

T This recommended water quality criterion for selenium is expressed in terms of total recoverable metal in the water column. It is scientifically acceptable to use the conversion factor (0.996- CMC or 0.922- CCC) that was used in the GLI to convert this to a value that is expressed in terms of dissolved metal.

U The selenium criteria document (EPA 440/5-87-006, September 1987) provides that if selenium is as toxic to saltwater fishes in the field as it is to freshwater fishes in the field, the status of the fish community should be monitored whenever the concentration of selenium exceeds 5.0 g/L in salt water because the saltwater CCC does not take into account uptake via the food chain.

V This Criterion is based on 304(a) aquatic life criterion issued in 1980, and was issued in one of the following documents: *Aldrin/Dieldrin* (EPA 440/5-80-019), *Chlordane* (EPA 440/5-80-027), *DDT* (EPA 440/5-80-038), *Endosulfan* (EPA 440/5-80-046), *Endrin* (EPA 440/5-80-047), *Heptachlor* (EPA 440/5-80-052), *Hexachlorocyclohexane* (EPA 440/5-80-054), Silver (EPA 440/5-80-071). The Minimum Data Requirements and derivation procedures were different in the 1980 Guidelines than in the *1985 Guidelines*. For example, a "CMC" derived using the 1980 Guidelines was derived to be used as an instantaneous maximum. If assessment is to be done using an averaging period, the values given should be divided by 2 to obtain a value that is more comparable to a CMC derived using the *1985 Guidelines*.

W This recommended water quality criterion is expressed as g free cyanide (as CN)/L.

X This recommended water quality criterion is expressed as total cyanide, even though the IRIS RFD we used to derive the criterion is based on free cyanide. The multiple forms of cyanide that are present in ambient water have significant differences in toxicity due to their differing abilities to liberate the CN-moiety. Some complex cyanides require even more extreme conditions than refluxing with sulfuric acid to liberate the CN-moiety. Thus, these complex cyanides are expected to have little or no 'bioavailability' to humans. If a substantial fraction of the cyanide present in a water body is present in a complexed form (e.g. $Fe_4[Fe(CN)_6]_3$), this criterion may be over conservative.

Y This criterion for asbestos is the Maximum Contaminant Level (MCL) developed under the Safe Drinking Water Act (SDWA).

Z Although a new RfD is available in IRIS, the surface water criteria will not be revised until the National Primary Drinking Water Regulations: Stage 2 Disinfectants and Disinfection Byproducts Rule (Stage 2 DBPR) is completed, since public comment on the relative source contribution (RSC) for chloroform is anticipated.

aa This recommended water quality criterion was derived using the cancer slope factor of 1.4 (LMS exposure from birth).

bb Freshwater aquatic life values for pentachlorophenol are expressed as a function of pH, and are calculated as follows: $\text{CMC} = \exp(1.005(\text{pH}) - 4.869)$; $\text{CCC} = \exp(1.005(\text{pH}) - 5.134)$. Values displayed in table correspond to a pH of 7.8.

cc No criterion for protection of human health from consumption of aquatic organisms excluding water was presented in the 1980 criteria document or in the 1986 *Quality Criteria for Water*. Nevertheless, sufficient information was presented in the 1980 document to allow the calculation of a criterion, even though the results of such a calculation were not shown in the document.

dd There is a full set of aquatic life toxicity data that show that DEHP is not toxic to aquatic organisms at or below its solubility limit.

ee Although EPA has not published a completed criteria document for butylbenzyl phthalate it is EPA's understanding that sufficient data exist to allow calculation of aquatic criteria. It is anticipated that industry intends to publish in the peer reviewed literature draft aquatic life criteria generated in accordance with EPA Guidelines. EPA will review such criteria for possible issuance as national WQC.

ff This criterion is based on a 304(a) aquatic life criterion issued in 1980 or 1986, and was issued in one of the following documents: *Aldrin/Dieldrin* (EPA 440/5-80-019), *Chlordane* (EPA 440/5-80-027), *DDT* (EPA 440/5-80-038), *Endrin* (EPA 440/5-80-047), *Heptachlor* (EPA 440/5-80-052), Polychlorinated biphenyls (EPA 440/5-80-068), Toxaphene (EPA 440/5-86-006). This CCC is currently based on the Final Residue Value (FRV) procedure. Since the publication of the Great Lakes Aquatic Life Criteria Guidelines in 1995 (60FR15393–15399, March 23, 1995), the Agency no longer uses the Final Residue Value procedure for deriving CCCs for new or revised 304(a) aquatic life criteria. Therefore, the Agency anticipates that future revisions of this CCC will not be based on the FRV procedure.

© 2006 by Taylor & Francis Group, LLC

[gg] This criterion applies to DDT and its metabolites (i.e. the total concentration of DDT and its metabolites should not exceed this value).
[hh] The derivation of the CCC for this pollutant (Endrin) did not consider exposure through the diet, which is probably important for aquatic life occupying upper trophic levels.
[ii] This value was derived from data for endosulfan and is most appropriately applied to the sum of alpha-endosulfan and beta-endosulfan.
[jj] This value was derived from data for heptachlor and the criteria document provides insufficient data to estimate relative toxicities of heptachlor and heptachlor epoxide.
[kk] This criterion applies to total pcbs, (e.g. the sum of all congener or all isomer or homolog or Aroclor analyses.)

Appendix C — Calculation of Freshwater Ammonia Criterion

1. The one-hour average concentration of total ammonia nitrogen (in mg N/L) does not exceed, more than once every 3 years on the average, the CMC (acute criterion) calculated using the following equations

Where salmonid fish are present:

$$\text{CMC} = \frac{0.275}{1 + 10^{7.204-\text{pH}}} + \frac{39.0}{1 + 10^{\text{pH}-7.204}}$$

Or where salmonid fish are not present:

$$\text{CMC} = \frac{0.411}{1 + 10^{7.204-\text{pH}}} + \frac{58.4}{1 + 10^{\text{pH}-7.204}}$$

2A. The 30 average concentration of total ammonia nitrogen (in mg N/L) does not exceed, more than once every 3 years on the average, the CCC (chronic criterion) calculated using the following equations

When fish early life stages are present:

$$\text{CCC} = \frac{0.0577}{1 + 10^{7.688-\text{pH}}} + \frac{2.487}{1 + 10^{\text{pH}-7.688}} \times \text{MIN}\left(2.85, 1.45 \times 10^{0.028(25-T)}\right)$$

When fish early life stages are absent:

$$\text{CCC} = \frac{0.0577}{1 + 10^{7.688-\text{pH}}} + \frac{2.487}{1 + 10^{\text{pH}-7.688}} \times 1.45 \times 10^{0.028(25-\text{MAX}(T,7))}$$

2B. In addition, the highest 4-day average within the 30-day period should not exceed 2.5 times the CCC.

*Notes:*

**Narrative Statements: National Recommended Water Quality Criteria for Nonpriority Pollutants**

*Aesthetic Qualities*

All waters free from substances attributable to wastewater or other discharges that

(1) settle to form objectionable deposits
(2) float as debris, scum, oil, or other matter to form nuisances
(3) produce objectionable color, odor, taste, or turbidity
(4) injure or are toxic or produce adverse physiological responses in humans, animals, or plants, and

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 8G.87 (Continued)**

(5) produce undesirable or nuisance aquatic life

*Color*

Waters shall be virtually free from substances producing objectionable color for aesthetic purposes

the source of supply should not exceed 75 color units on the platinum-cobalt scale for domestic water supplies; and

Increased color (in combination with turbidity) should not reduce the depth of the compensation point for photosynthetic activity by more than 10 percent from the seasonally established norm for aquatic life

*Gases, Total Dissolved*

To protect freshwater and marine aquatic life, the total dissolved gas concentrations in water should not exceed 110 percent of the saturation value for gases at the existing atmospheric and hydrostatic pressures

*Oil and Grease*

For aquatic life

(1) 0.01 of the lowest continuous flow 96-hour LC50 to several important freshwater and marine species, each having a demonstrated high susceptibility to oils and petrochemicals

(2) Levels of oils or petrochemicals in the sediment which cause deleterious effects to the biota should not be allowed

(3) Surface waters shall be virtually free from floating nonpetroleum oils of vegetable or animal origin, as well as petroleum-derived oils

*Solids (Suspended, Settleable) and Turbidity*

*Freshwater* fish and other aquatic life

Settleable and suspended solids should not reduce the depth of the compensation point for photosynthetic activity by more than 10 percent from the seasonally established norm for aquatic life

*Tainting Substances*

Materials should not be present in concentrations that individually or in combination produce undesirable flavors which are detectable by organoleptic tests performed on the edible portions of aquatic organisms

[a] The derivation of this value is presented in the *Red Book* (EPA 440/9-76-023, July, 1976).

[b] This value is based on a 304(a) aquatic life criterion that was derived using the 1985 Guidelines (*Guidelines for Deriving Numerical National Water Quality Criteria for the Protection of Aquatic Organisms and Their Uses*, PB85-227049, January 1985) and was issued in one of the following criteria documents: Aluminum (EPA 440/5-86-008); Chloride (EPA 440/5-88-001); Chloropyrifos (EPA 440/5-86-005).

[c] This value for aluminum is expressed in terms of total recoverable metal in the water column.

[d] There are three major reasons why the use of Water-Effect Ratios might be appropriate. (1) The value of 87 ug/L is based on a toxicity test with the striped bass in water with pH = 6.5–6.6 and hardness $<10$ mg/L. Data in "Aluminum Water-Effect Ratio for the 3M Plant Effluent Discharge, Middleway, West Virginia" (May 1994) indicate that aluminum is substantially less toxic at higher pH and hardness, but the effects of pH and hardness are not well quantified at this time. (2) In tests with the brook trout at low pH and hardness, effects increased with increasing concentrations of total aluminum even though the concentration of dissolved aluminum was constant, indicating that total recoverable is a more appropriate measurement than dissolved, at least when particulate aluminum is primarily aluminum hydroxide particles. In surface waters, however, the total recoverable procedure might measure aluminum associated with clay particles, which might be less toxic than aluminum associated with aluminum hydroxide. (3) EPA is aware of field data indicating that many high quality waters in the U.S. contain more than 87 μg aluminum/L, when either total recoverable or dissolved is measured.

[e] According to the procedures described in the *Guidelines for Deriving Numerical National Water Quality Criteria for the Protection of Aquatic Organisms and Their Uses*, except possibly where a very sensitive species is important at a site, freshwater aquatic life should be protected if both conditions specified in Appendix C to the Preamble- Calculation of Freshwater Ammonia Criterion are satisfied.

[f] This human health criterion is the same as originally published in the Red Book(EPA 440/9-76-023, July, 1976) which predates the 1980 methodology and did not utilize the fish ingestion BCF approach. This same criterion value is now published in the *Gold Book*(Quality Criteria for Water: 1986. EPA 440/5-86-001).

[g] A more stringent Maximum Contaminant Level (MCL) has been issued by EPA under the Safe Drinking Water Act. Refer to drinking water regulations 40CFR141 or Safe Drinking Water Hotline (1-800-426-4791) for values.

[h] This criterion has been revised to reflect EPA's q1* or RfD, as contained in the Integrated Risk Information System (IRIS) as of May 17, 2002. The fish tissue bioconcentration factor (BCF) used to derive the original criterion was retained in each case.

[i] This criterion is based on carcinogenicity of $10^{-6}$ risk. Alternate risk levels may be obtained by moving the decimal point (e.g., for a risk level of $10^{-5}$, move the decimal point in the recommended criterion one place to the right).

[j] This criterion for manganese is not based on toxic effects, but rather is intended to minimize objectionable qualities such as laundry stains and objectionable tastes in beverages. U.S. EPA. 1973. Water Quality Criteria 1972. EPA-R3-73-033. National Technical Information Service, Springfield, VA.; U.S. EPA. 1977. Temperature Criteria for Freshwater Fish: Protocol and Procedures. EPA-600/3-77-061. National Technical Information Service, Springfield, VA.

[K] U.S. EPA. 1986. *Ambient Water Quality Criteria for Dissolved Oxygen*. EPA 440/5-86-003. National Technical Information Service, Springfield, VA.

[l] This value is based on a 304(a) aquatic life criterion that was issued in the 1995 *Updates*: *Water Quality Criteria Documents for the Protection of Aquatic Life in Ambient Water* (EPA-820-B-96-001). This value was derived using the GLI Guidelines (60FR15393–15399, March 23, 1995; 40CFR132 Appendix A); the differences between the 1985 Guidelines and the GLI Guidelines are explained on page iv of the 1995 Updates. No decision concerning this criterion was affected by any considerations that are specific to the Great Lakes.

© 2006 by Taylor & Francis Group, LLC

[m] According to page 181 of the *Red Book*: For open ocean waters where the depth is substantially greater than the euphotic zone, the pH should not be changed more than 0.2 units from the naturally occurring variation or any case outside the range of 6.5 to 8.5. For shallow, highly productive coastal and estuarine areas where naturally occurring pH variations approach the lethal limits of some species, changes in pH should be avoided but in any case should not exceed the limits established for fresh water, i.e. 6.5–9.0.

[n] *Lakes and Reservoirs in Nutrient Ecoregion*: II EPA 822-B-00-007, III EPA 822-B-01-008, IV EPA 822-B-01-009, V EPA 822-B-01-010, VI EPA 822-B-00-008, VII EPA 822-B-00-009, VIII EPA 822-B-01-015, IX EPA 822-B-00-011, XI EPA 822-B-00-012, XII EPA 822-B-00-013, XIII EPA 822-B-00-014, XIV EPA 822-B-01-011; *Rivers and Streams in Nutrient Ecoregion*: I EPA 822-B-01-012, II EPA 822-B-00-015, III EPA 822-B-00-016, IV EPA 822-B-01-013, V EPA 822-B-01-014, VI EPA 822-B-00-017, VII EPA 822-B-00-018, VIII EPA 822-B-01-015, IX EPA 822-B-00-019, X EPA 822-B-01-016, XI EPA 822-B-00-020, XII EPA 822-B-00-021, XIV EPA 822-B-00-022; and *Wetlands in Nutrient Ecoregion* XIII EPA 822-B-00-023.

[p] EPA announced the availability of a draft updated tributyltin (TBT) document on August 7, 1997 (62FR42554). The Agency *has reevaluated this document* and anticipates releasing an updated document for public comment in the near future.

[q] The organoleptic effect criterion is more stringent than the value presented in the nonpriority pollutants table.

*Note:* The Effects Range-Low (ERLs) and Effects Range-Median (ERMs) plus the marine Threshold Effects Levels (TELs) and Probable Effects Levels (PELs) are based upon a similar data compilations, but use different calculations. The ERL is calculated as the lower 10th percentile concentration of the available sediment toxicity data which has been screened for only those samples which were identified as toxic by original investigators. It is *not* an $LC_{10}$. Since the ERL is at the low end of a range of levels at which effects were observed in the studies compiled, it represents the value at which toxicity may begin to be observed in sensitive species. The ERM is simply the median concentration of the compilation of just toxic samples. It is *not* an $LC_{50}$. The TEL is calculated as the geometric mean of the 15th percentile concentration of the toxic effects data set and the median of the no-effect data set; as such, it represents the concentration below which adverse effects are expected to occur only rarely. The PEL, as the geometric mean of the 50% of impacted, toxic samples and the 85% of the non-impacted samples, is the level above which adverse effects are frequently expected.

From Apparent Effect Thresholds (AETs) relate chemical concentrations in sediments to synoptic biological indicators of injury (i.e., sediment bioassays or diminished benthic infaunal abundance). Individual AETs are essentially equivalent to the concentration observed in the highest nontoxic sample. As such, they represent the concentration above which adverse biological impacts would *always* be expected by that biological indicator due to exposure to that contaminant alone. Conversely, adverse impacts are known to occur at levels below the AET. Only the lowest of the potential AETs is listed. AET values were developed for use in Puget Sound (Washington) and are not easily compared directly to other benchmarks based on single-chemical models and broader data sources. SquiRT cards have been updated with interim AET values which are subject to change. (All sediment and soil values in ppb dry weight, except as noted.)

[a] Entry is lowest value among AET tests. I, infaunal community impacts; A, amphipod; B, bivalve; M, microtox; O, Oyster larvae; E, Echinoderm larvae; L, $larval_{max}$; or, N-Neanthes bioassays.

[b] EPA proposed criteria, based on equilibrium partitioning, for Dieldrin are 11,000 and 20,000, and for Endrin are 4,200 and 760 μg/kg O.C. in freshwater and marine sediment, respectively.

[c] For PCP, freshwater $CMC = e^{1.005pH-4.869}$ and $CCC = e^{1.005pH-5.134}$.

[a] Unless otherwise indicated, supporting documents are available from the Guidelines and standards division, environment Canada.
[b] The guidelines dated 1987 have been carried over from *Canadian Water Quality Guidelines* (CCREM 1987) and no fact sheet was prepared. The guidelines dated 1989 to 1997 were developed and initially published in CCREM 1987 as appendixes on the date indicated. They are published as fact sheets in this document. Other guidelines dated 1997 and those dated 1999 are published for the first time in this document.
[c] Interim guideline.
[d] No fact sheet created. For more information on this guideline, please refer to *Canadian Water Quality Guidelines* (CCREM 1987).
[e] This guideline (originally published in *Canadian Water Quality Guidelines* [CCREM 1987 + Appendixes] in 1987 or 1991 [PCBs in marine water]) is no longer recommended and the value is withdrawn. A water quality guideline is not recommended. Environmental exposure is predominantly via sediment, soil, and/or tissue, therefore, the reader is referred to the respective guidelines for these media.
[f] This substance meets the criteria for Track 1 substances under the national CCME Policy for the Management of Toxic Substances (PMTS) (i.e., persistent, bioaccumulative, primarily the result of human activity, and CEPA-toxic or equivalent), and should be subject to virtual elimination strategies. Guidelines can serve as action levels or interim management objectives toward virtual elimination.
[g] Aluminium guideline = 5 μg/L at pH < 6.5; $[Ca^{2+}] < 4$ mg/L; DOC < 2 mg/L = 100 μg/L at pH ≥ 6.5; $[Ca^{2+}] \geq 4$ mg/L; DOC ≥ 2 mg/L.
[h] Ammonia guideline: Guideline for total ammonia is temperature and pH dependent, please consult factsheet for more information.
[i] Guideline value slightly modified from CCREM 1987 + Appendixes due to re-evaluation of the significant figures.
[j] The technical document for the guideline is available from the Ontario Ministry of the Environment.
[k] Substance has been re-evaluated since CCREM 1987 + Appendixes. Either a new guideline has been derived or insufficient data existed to derive a new guideline.
[l] Cadmium guideline = $10^{\{0.86[\log(\text{hardness})]-3.2\}}$.
[m] Copper guideline = 2 μg/L at $[CaCO_3]$ = 0–120 mg/L; = 3 μg/L at $[CaCO_3]$ = 120–180 mg/L; = 4 μg/L at $[CaCO_3] > 180$ mg/L.
[n] Dissolved oxygen for warm-water biota: early life stages = 6,000 μg/L; other life stages = 5,500 μg/L; for cold-water biota: early life stages = 9,500 μg/L; other life stages = 6,500 μg/L
[o] No recommended guideline.

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 8G.96 (Continued)**

[p] Lead guideline = 1 g/L at $[CaCO_3]$ = 0–60 mg/L; = 2 μg/L at $[CaCO_3]$ = 60–120 mg/L; = 4 μg/L at $[CaCO_3]$ = 120–180 mg/L; = 7 μg/L at $[CaCO_3]$ = > 180 mg/L.
[q] Nickel guideline = 25 μg/L at $[CaCO_3]$ = 0–60 mg/L; = 65 μg/L at $[CaCO_3]$ = 60–120 mg/L; = 110 μg/L at $[CaCO_3]$ = 120–180 mg/L; = 150 μg/L at $[CaCO_3]$ = > 180 mg/L.
[r] Expressed on a TEQ basis using NP TEFs, see Table 2 in factsheet.
[s] The guideline of 4.0 μg/L for phenoxy herbicides is based on data for ester formulations of 2,4-dichlorophenoxyacetic acid.
[t] Temperature: (for more information, see CCREM 1987).
*Thermal Stratification*: Thermal additions to receiving waters should be such that thermal stratification and subsequent turnover dates are not altered from those existing prior to the addition of heat from artificial origins.
*Maximum Weekly Average Temperature*: Thermal additions to receiving waters should be such that the maximum weekly average temperature is not exceeded.
*Short-term Exposure to Extreme Temperature*: Thermal additions to receiving waters should be such that the short-term exposures to maximum temperatures are not exceeded. Exposures should not be so lengthy or frequent as to adversely affect the important species.
[u] The technical document for the guideline is available from British Columbia Ministry of Environment, Lands and Parks.
[v] For protection from direct toxic effects; the guidelines do not consider indirect effects due to eutrophication.
[w] May not prevent accumulation of methylmercury in aquatic life, therefore, may not protect wildlife that consume aquatic life; see factsheet for details. Consult also the appropriate Canadian Tissue Residue Guideline for the Protection of Wildlife consumers of Aquatic Biota
[x] May not protect fully higher trophic level fish; see factsheet for details.
[y] Canadian Trigger Ranges (for further narrative see factsheet). Total Phosphorus ($ugL^{-1}$):
ultra-oligotrophic < 4
oligotrophic 4–10
mesotrophic 10–20
eutrophic 35–100
hyper-eutrophic > 100

In: *Canadian Environmental Quality Guidelines*, 1999, Canadian Council of Ministers of the Environment, Winnipeg, www.ec.gc.ca/CEQG-RCQE.

**Table 8G.97 Canadian Tissue Residue Guidelines for the Protection of Wildlife Consumers of Aquatic Biota**

| Parameter[a] | Guideline (μg/kg diet ww)[b] | Date |
|---|---|---|
| DDT (total) | 14.0 | 1997 |
| Methylmercury | 33.0 | 2001 |
| Polychlorinated biphenyls (PCBs) | Mammalian: 0.79 ng TEQ/kg diet ww[c] | 1998 |
| | Avian: 2.4 ng TEQ/kg diet ww[d] | 1998 |
| Polychlorinated dibenzo-*p*-dioxins/polychlorinated dibenzofurans | Mammalian: 0.71 ng TEQ/kg diet ww[c] | 2001 |
| | Avian: 4.75 ng TEQ/kg diet ww[d] | 2001 |
| Toxaphene | 6.3 | 1997 |

[a] Supporting documents are available from the Guidelines and Standards Division, Environment Canada.
[b] Guideline refers to the total concentration of the contaminant found in an aquatic organism on a wet weight (ww) basis that is not expected to result in adverse effects in predaceous wildlife.
[c] TEQ refers to dioxin toxic equivalents using toxic equivalency factors (TEFs) for PCBs for mammals developed by the World Health Organization in 1998. See fact sheet or supporting document for more details.
[d] TEQ refers to dioxin toxic equivalents using toxic equivalency factors (TEFs) for PCBs for birds developed by the World Health Organization in 1998. See fact sheet or supporting document for more details.

[a] ISQG: Interim sediment quality guideline Canadian Environmental Quality Guidelines Summary Table December 2003.
[b] PEL: Probable effect level.
[c] Sum of *p,p'* and *o,p'* isomers.
[d] Provisional: adoption of marine ISQG.
[e] Provisional: adoption of marine PEL.
[f] Provisional; use of equilibrium partitioning approach.
[g] Note that the incidence of adverse biological effects below the TEL, between the TEL and PEL, and above the PEL were 22%, 24%, and 65%, respectively, prior to the application of a safety factor.
[h] Expressed in a toxic equivalency (TEQ) basis using NP TEFs; assumes 1% TOC.
[i] Provisional: adoption of lowest effect level from Ontario (Persaud et al. 1993).
[j] Provisional: 1% TOC: adoption of severe effect level of 34μg.g-*1*TOC from Ontario (Persaud et al. 1993).
[k] Values are expressed as toxic equivalency (TEQ) units, based on WHO 1998 TEF values for fish.
[l] Provisional; 1% TOC: adoption of the chronic sediment quality criterion of 0.01 ug/gl TOC of the New York State Department of Environmental Conservation (NYSDEC 1994).
[m] No PEL derived.

**Australia and New Zealand**
**Physico-Chemical Stressor Low-Risk Guideline Trigger Values for Ecosystems**

The default approach to deriving trigger values has used the statistical distribution of reference data collected within five geographical regions across Australia and New Zealand. Here, depending on the stressor, a *measureable perturbation* in slightly to moderately disturbed ecosystems has been defined using the 80th and/or 20th percentile of the reference data.

First, New Zealand and Australian state and territory representatives used percentile distributions of available data and professional judgement to derive trigger values for each ecosystem type in their regions.Trigger values were then collated, discussed and agreed for southeast Australia (VIC, NSW, ACT, south-east QLD, and TAS,) southwest Australia (southern WA), tropical Australia (northern WA, NT, northern QLD), south central Australia —— low rainfall area (SA) and New Zealand.

The default trigger values in the present guidelines were derived from ecosystem data for unmodified or slightly-modified ecosystems supplied by state agenicies. However, the choice of these reference systems was not based on any objective biological criteria. This lack of specificity may have resulted in inclusion of reference systems of varying quality, and further emphasises that the default trigger values should only be used until site- or ecosystem-specific values can be generated.

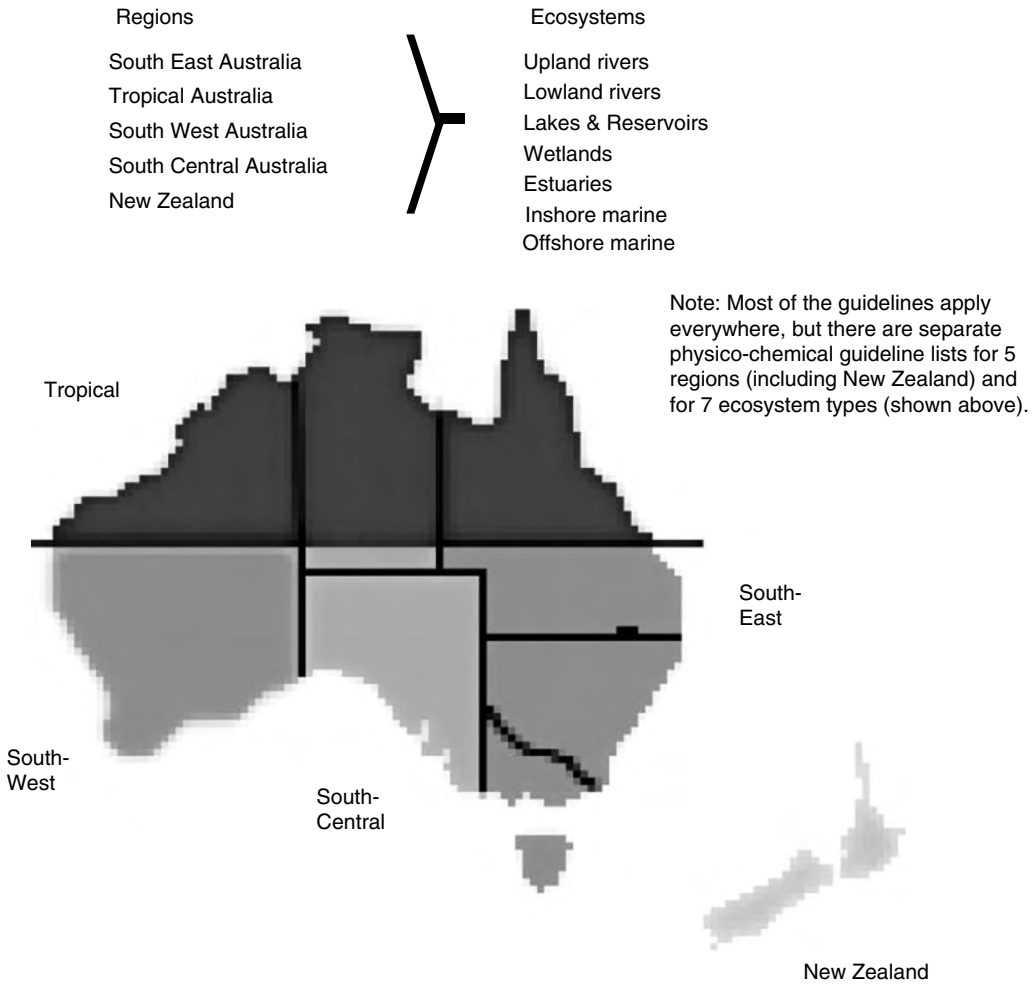

**Figure 8G.22** Geographic regions of Australia and New Zealand. (From Australia Water Quality — Introduction, *The Guideline Value Lists*; www.ozh2o.com/ozh3a.html.)

**Table 8G.103 Default Trigger Values for Physical and Chemical Stressors for Southeast Australia for Slightly Disturbed Ecosystems**

| Ecosystem Type | Chl *a* (μg/L) | TP (μg P/L) | FRP (μg P/L) | TN (μg N/L) | $NO_x$ (μg N/L) | $NH_4^+$ (μg N/L) | DO (% saturation)[a] Lower Limit | DO (% saturation)[a] Upper Limit | pH Lower Limit | pH Upper Limit |
|---|---|---|---|---|---|---|---|---|---|---|
| Upland river | na[b] | 20[c] | 15[d] | 250[e] | 15[f] | 13[k] | 90 | 110 | 6.5 | 7.5[g] |
| Lowland river[h] | 5 | 50 | 20 | 500 | 40[i] | 20 | 85 | 110 | 6.5 | 8.0 |
| Freshwater lakes & Reservoirs | 5[j] | 10[k] | 5 | 350 | 10 | 10 | 90 | 110 | 6.5 | 8.0[g] |
| Wetlands | no data | no data | no data | no data | no data | no data | no data | no data | no data | no data |
| Estuaries[l] | 4[m] | 30 | 5[n] | 300 | 15 | 15 | 80 | 110 | 7.0 | 8.5 |
| Marine[l] | 1[o] | 25[o] | 10 | 120 | 5[p] | 15[p] | 90 | 110 | 8.0 | 8.4 |

*Note:* Trigger values are used to assess risk of adverse effects due to nutrients, biodegradable organic matter and pH in various ecosystem types. Data derived from trigger values supplied by Australian states and territories. Chl *a*, chlorophyll *a*; TP, total phosphorus; FRP, filterable reactive phosphate; TN, total nitrogen; $NO_x$, oxides of nitrogen; $NH_4^+$, ammonium; DO, dissolved oxygen; na, not applicable.

[a] Dissolved oxygen values were derived from daytime measurements. Dissolved oxygen concentrations may very diurnally and with depth. Monitoring programs should assess this potential variability.
[b] Monitoring of periphyton and not phytoplankton biomass is recommended in upland rivers — values for periphyton biomass (mg Chl a $m^{-2}$) to be developed.
[c] Values are 30 μg/L for Qld rivers, 10 μg/L for Vic. Alpine streams and 13 μg/L for Tas. Rivers.
[d] Values is 5 μg/L for Vic. alpine streams and Tas. rivers;
[e] Values are 100 μg/L for Vic. alpine streams and 480 μg/L for Tas. rivers.
[f] Value is 190 μg/L for Tas. rivers.
[g] Values for NSW upland rivers are 6.5–8.0, for NSW lowland rivers 6.5–8.5, for humic rich Tas. lakes and rivers 4.0–6.5.
[h] Values are 3 μg/L for Chl *a*, 25 μg/L for TP and 350 μg/L for TN for NSW & Vic. east flowing coastal rivers.
[i] value is 60 μg/L for Qld rivers.
[j] Values are 3 μg/L for Tas. lakes.
[k] Values is 10 μg/L for Qld. rivers.
[l] No data available for Tasmanian estuarine and marine waters. A precautionary approach should be adopted when applying default trigger values to these systems.
[m] Values is 5 μg/L for Qld estuaries.
[n] Value is 15 μg/L for Qld. estuaries.
[o] values are 20 μg/L for TP for offshore waters and 1.5 μg/L for Chl a for Old inshore waters.
[p] Values of 25 μg/L for $NO_x$ and 20 μg/L for $NH_4^+$ for NSW are elevated due to frequent upwelling events.

**Table 8G.105 Default Trigger Values for Physical and Chemical Stressors for Tropical Australia for Slightly Disturbed Ecosystems**

| Ecosystem type | | Chl *a* (μg/L) | TP (μg P/L) | FRP (μg P/L) | TN (μg N/L) | $NO_x$ (μg N/L) | $NH_4^+$ (μg N/L) | DO (% saturation)[a] Lower limit | DO (% saturation)[a] Upper limit | pH Lower limit | pH Upper limit |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Upland river[b] | | na[c] | 10 | 5 | 150 | 30 | 6 | 90 | 120 | 6.0 | 7.5 |
| Lowland river[b] | | 5 | 10 | 4 | 200–300[d] | 10[e] | 10 | 85 | 120 | 6.0 | 8.0 |
| Freshwater lakes & Reservoirs | | 3 | 10 | 5 | 350[f] | 10[e] | 10 | 90 | 120 | 6.0 | 8.0 |
| Wetlands | | 10 | 10–50[g] | 5–25[g] | 350–1,200[g] | 10 | 10 | 90[e] | 120[e] | 6.0 | 8.0 |
| Estuaries[b] | | 2 | 20 | 5 | 250 | 30 | 15 | 80 | 120 | 7.0 | 8.5 |
| Marine | Inshore | 0.7–1.4[h] | 15 | 5 | 100 | 2–8[h] | 1–10[h] | 90 | no data | 8.0 | 8.4 |
| | Offshore | 0.5–0.9[h] | 10 | 2–5[h] | 100 | 1–4[h] | 1–6[h] | 90 | no data | 8.2 | 8.2 |

*Note:* Trigger values are used to assess risk of adverse effects due to nutrients, biodegradable organic matter and pH in various ecosystem types. Data derived from trigger values supplied by Australian states and territories for the Northern Territory and regions north of Carnarvon in the west and Rockhampton in the east. Chl *a*, chlorophyll *a*; TP, total phosphorus; FRP, filterable reactive phosphate; TN, total nitrogen; $NO_x$, oxides of nitrogen; $NH_4^+$, ammonium; DO, dissolved oxygen; na, not applicable.

[a] Dissolved oxygen values were derived from daytime measurements. Dissolved oxygen concentrations may vary diurnally and with depth. Monitoring programs should assess this potential variability.
[b] No data available for tropical WA estuaries or rivers. A precautionary approach should be adopted when applying default trigger values to these systems.
[c] Monitoring of periphyton and not phytoplankton biomass is recommended in upland rivers — values for periphyton biomass (mg Chl a $m^{-2}$) to be developed.
[d] Lower values from rivers draining rainforest catchments.
[e] Northern Territory values for 5 μg/L for $No_x$, and $<80$ (lower limit) and $>110$% saturation (upper limit) for DO.
[f] This value represents turbid lakes only. Clear lakes have much lower values.
[g] Higher values are indicative of tropical WA river pools.
[h] The lower values are typical of clear coral dominated waters (e.g. Great Barrier Reef), while higher values typical of turbid macrotidal systems (e.g. Northwest Shelf of WA).

**Table 8G.106 Ranges of Default Trigger Values for Conductivity (EC, salinity), Turbidity and Suspended Particulate Matter (SPM) Indicative of Slightly Disturbed Ecosystems in Tropical Australia**

| Ecosystem Type | Salinity (μS/cm) | Turbidity (NTU) |
|---|---|---|
| Upland & lowland rivers | 20–250 | 2–15 |
| Lakes, reservoirs & wetlands | 90–900 | 2–200 |
| Estuarine & marine | — | 1–20 |

*Note:* Ranges for turbidity and SPM are similar and only turbidity is reported here. Values reflect high site-specific and regional variability. Explanatory notes provide detail on specific variability issues for groupings of ecosystem type can be found in the guidance document.

*Source:* From Australian and New Zealand Environment and Conservation Council and Agriculture and Resource Management Council of Australia and New Zealand, 2000, *National Water Quality Management Strategy*, Paper No. 4, *Australian and New Zealand Guidelines for Fresh and Marine Water Quality*, Volume I, The Guidelines, October 2000, www.deh.gov.au.

**Table 8G.107 Default Trigger Values for Physical and Chemical Stressors for South-West Australia for Slightly Disturbed Ecosystems**

| | | | | | | | | DO (% saturation)[a] | | pH | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Ecosystem type | | Chl *a* (μg/L) | TP (μg P/L) | FRP (μg P/L) | TN (μg N/L) | $NO_x$ (μg N/L) | $NH_4^+$ (μg N/L) | Lower Limit | Upper Limit | Lower Limit | Upper Limit |
| Upland river[b] | | na[c] | 20 | 10 | 450 | 200 | 60 | 90 | na | 6.5 | 8.0 |
| Lowland river[b] | | 3–5 | 65 | 40 | 1,200 | 150 | 80 | 80 | 120 | 6.5 | 8.0 |
| Freshwater lakes & reservoirs | | 3–5 | 10 | 5 | 350 | 10 | 10 | 90 | no data | 6.5 | 8.0 |
| Wetlands[d] | | 30 | 60 | 30 | 1,500 | 100 | 40 | 90 | 120 | 7.0[e] | 8.5[e] |
| Estuaries | | 3 | 30 | 5 | 750 | 45 | 40 | 90 | 110 | 7.5 | 8.5 |
| Marine[f,g] | Inshore[h] | 0.7 | 20[i] | 5[i] | 230 | 5 | 5 | 90 | na | 8.0 | 8.4 |
| | Offshore | 0.3[i] | 20[i] | 5 | 230 | 5 | 5 | 90 | na | 8.2 | 8.2 |

*Note:* Trigger values are used to assess risk of adverse effects due to nutrients, biodegradable organic matter and pH in various ecosystem types. Data derived from trigger values supplied by Western Australia. Chl *a*, chlorophyll *a*; TP, total phosphorus; FRP, filterable reactive phosphate; TN, total nitrogen; $NO_x$, oxides of nitrogen; $NH_4^+$, ammonium; DO, dissolved oxygen; na, not applicable.

[a] Dissolved oxygen values were derived from daytime measurements. Dissolved oxygen concentrations may vary diumally and with depth. Monitoring programs should assess this potential variability.
[b] All values derived during base river flow conditions not storm events.
[c] Monitoring of periphyton and not phytoplankton biomass is recommended in upland rivers—values for periphyton biomass (mg Chl a $m^{-2}$) to be developed.
[d] Elevated nutrient concentrations in highly coloured wetlands (given $>52$ $g_{440}$/m) do not appear to stimulate algal growth.
[e] In highly coloured wetlands (given $>52$ $g_{440}$/m) pH typically ranges 4.5–6.5.
[f] Nutrient concentrations alone are poor indicators of marine trophic status.
[g] These trigger values are generic and therefore do not necessarily apply in all circumstances, e.g. for some unprotected coastlines, such as Albany and Geographe Bay, it may be more appropriate to use offshore values for inshore waters.
[h] Inshore waters defined as coastal lagoons (excluding estuaries) and embayments and waters less than 20 m depth.
[i] Summer (low rainfall) values, values higher in winter for Chi a (1.0 μg/L), TP (40 μg P/L), FRP (10 μg P/L).

**Table 8G.111 Default Trigger Values for Physical and Chemical Stressors in New Zealand for Slightly Disturbed Ecosystems**

| Ecosystem Type | Chl *a* (μg/L) | TP (μg P/L) | FRP (μg P/L) | TN (μg N/L) | $NO_x$ (μg N/L) | $NH_4^+$ (μg N/L) | DO[a] (% Saturation) Lower Limit | DO[a] (% Saturation) Upper Limit | pH[a] Lower Limit | pH[a] Upper Limit |
|---|---|---|---|---|---|---|---|---|---|---|
| Upland river | na[b] | 26[c] | 9[c] | 295[c] | 167[c] | 10[c] | 99 | 103 | 7.3 | 8.0 |
| Lowland river | no data | 33[d] | 10[d] | 614[d] | 444[d] | 21[d] | 98 | 105 | 7.2 | 7.8 |

*Note:* Trigger values are used to assess risk of adverse effects due to nutrients, biodegradable organic matter and pH in various ecosystem types. Chl *a*, chlorophyll *a*; TP, total phosphorus; FRP, filterable reactive phosphate; TN[e], total nitrogen; $NO_x$, oxides of nitrogen; $NH_4^+$, ammonium nitrogen; DO, dissolved oxygen, na, not applicable.

[a] DO and pH percentiles may not be very useful as trigger values because of diurnal and seasonal variation—values listed are for daytime sampling.

[b] Monitoring of periphyton and not phytoplankton biomass is recommended in upland rivers—values for periphyton biomass (mg Chl a $m^{-2}$) to be developed. New Zealand is currently making routine observations of periphyton cover.

[c] Values for glacial and lake-fed sites in upland rivers are lower;

[d] Values are lower for Haast River which receives waters from alpine regions;

[e] Commonly referred to dissolved reactive phosphorus in New Zealand.

*Source:* From Australian and New Zealand Environment and Conservation Council and Agriculture and Resource Management Council of Australia and New Zealand, 2000, *National Water Quality Management Strategy*, Paper No. 4, *Australian and New Zealand Guidelines for Fresh and Marine Water Quality*, Volume I, The Guidelines, October 2000, www.deh.gov.au.

**Table 8G.112 Default Trigger Values for Water Clarity (Lower Limit) and Turbidity (Upper Limit) Indicative of Unmodified or Slightly Disturbed Ecosystems in New Zealand**

| Ecosystem types | Upland rivers[a,b] Clarity (1/m)[c,d] | Upland rivers[a,b] Turbidity (NTU)[c,d] | Lowland rivers Clarity (1/m) | Lowland rivers Turbidity (NTU) |
|---|---|---|---|---|
| | 0.6 | 4.1 | 0.8 | 5.6 |

[a] Light availability is generally less of an issue in NZ rivers and streams than is visual clarity because, in contrast to many of Australia's rivers, most NZ rivers are comparatively clear and/or shallow. Davies-Colley et al. (1992) recommend that visual clarity, light penetration and water colour are important optical properties of an ecosystem which need to be protected. Neither turbidity nor visual clarity provide a useful estimate of light penetration—light penetration should be considered separately to turbidity or visual clarity. Clarity relates to the transmission of light through water and is measured by the visual range of a black disk (see NZ Ministry for the Environment (1994)) or a Secchi disk.

[b] Recent work has shown that at least some NZ indigenous fish are sensitive to low levels of turbidity; however, it may also be desirable to protect the naturally high turbidities of alpine glacial lakes to prevent possible ecological impacts, such as change in predator-prey relationships.

[c] Note that turbidity and visual water clarity are closely and inversely related, and the 80th percentile for turbidity is consistent with the 20th percentile for visibility and vice versa.

[d] Clarity and turbidity values for glacial sites in upland rivers are lower and higher, respectively.

**Table 8G.113 General Framework for Applying Australian Levels of Protection for Toxicants to Different Ecosystem Conditions**

| Ecosystem Condition | Level of Protection |
|---|---|
| 1 High conservation/ecological value | For anthropogenic toxicants, detection at any concentration could be grounds for source investigation and management intervention; for natural toxicants background concentrations should not be exceeded[a]<br>*Where local biological or chemical data have not yet been gathered,* apply the 99% protection levels (Table 8.114) as default values<br>Any relaxation of these objectives should only occur where comprehensive biological effects and monitoring data clearly show that biodiversity would not be altered<br>In the case of effluent discharges, Direct Toxicity Assessment (DTA) should also be required on the effluent<br>Precautionary approach taken to assessment of post-baseline data through trend analysis or feedback triggers |
| 2 Slightly to moderately disturbed ecosystems | Always preferable to use local biological effects data (including DTA) to derive guidelines<br>*If local biological effects data unavailable*, apply 95% protection levels (Table 8.114) as default, low-risk trigger values.[b] 99% values are recommended for certain chemicals as noted in Table 8.114[c]<br>Precautionary approach may be required for assessment of post-baseline data through trend analysis or feedback triggers<br>In the case of effluent discharges DTA may be required |
| 3 High disturbed ecosystems | Apply the same guidelines as for slightly-moderately disturbed systems. However, the lower protection levels provided in the Guidelines may be accepted by stakeholders<br>DTA could be used as an alternative approach for deriving site-specific guidelines |

[a] This means that indicator values at background and test sites should be statistically indistinguishable. It is acknowledged that it may not be strictly possible to meet this criterion in every situation.

[b] For slightly disturbed ecosystems where the management goal is no change in biodiversity, users may prefer to apply a higher protection level.

[c] 99% values recommended for chemicals that bioaccumulate or for which 95% provides inadequate protection for key test species. Jurisdictions may choose 99% values for some ecosystems that are more towards the slightly disturbed end of the continuum.

*Note:* ID, Insufficient data to derive a reliable trigger value. Users advised to check if a low reliability value or an ECL is available **Section 8.3.7.** Values in grey shading are the trigger values applying to typical *slightly-moderately disturbed systems*; see Table 8-113. And Section 3.4.2.4 of the guidance document for guidance on applying these levels to different ecosystem conditions. Where the final water quality guideline to be applied to a site is below current analytical practical quantitation limits, see Section 3.4.3.3 of guidance document. Most trigger values listed here for metals and metalloids are *High reliability* figures, derived from field or chronic NOEC data. The exceptions are *Moderate reliability* for freshwater aluminium (pH $>6.5$), manganese and marine chromium (III). Most trigger values listed here for non-metallic inorganices and organic chemicals are *Moderate reliability* figures, derived for acute $LC_{50}$ data. The exceptions are *High reliability* for freshwater ammonia, 3,4-DCA, endosulfan chlorpyrifos, esfenvalerate, tebuthiuron, three surfactants and marine for 1, 1,2-TCE and chlorpyrifos.

[a] Figure may not protect key test species from chronic toxicity (this refers to experimental chronic figures or geometric mean for species)—check Section 8.3.7 of guidance document for spread of data and its significance. Where grey shading and 'C' coincide, refer to text in Section 8.3.7. of guidance document.

[b] Chemicals for which algorithms have been provided in Table 3.4.3 of guidance document to account for the effects of hardness. The values have been calculated using a hardness of 30 mg/L $CaCO_3$. These should be adjusted to the site-specific hardness (see Section 3.4.3) of guidance document.

[c] Chemicals for which possible bioaccumulation and secondary poisoning effects should be considered.

[d] Figure may not protect key test species from acute toxicity (and chronic)—check Section 8.3.7 for spread of data and its significance. 'A' indicates that trigger value > acute toxicity figure; note that trigger value should be $<1/3$ of acute figure.

[e] Ammonla as TOTAL ammonia as ($NH_3$-N) at pH 8. For changes in trigger value with ph refer to Section 8.3.7.2 of the guidance document.

[f] Chlorine as total chlorine, as [Cl].

[g] Cyanide as unionised HCN, measured as [CN] of the guidance document.

[h] Figures protect against toxicity and do not relate to eutrophication issues. Refer to Section 3.3 if eutrophication is the issue of concern.

[i] Sulfide as un-lonised $H_2S$, measured as [S] of the guidance document.

[j] Tainting or flavour impairment of fish flesh may possibly occur at concentrations below the trigger value.

[k] *High reliability* figure for esfenvalerate derived form mesocosm NOEC data (no alternative protection levels available).

*Source:* From Australian and New Zealand Environment and Conservation Council and Agriculture and Resource Management Council of Australia and New Zealand, 2000, *National Water Quality Management Strategy*, Paper No. 4, *Australian and New Zealand Guidelines for Fresh and Marine Water Quality*, Volume I, The Guidelines, October 2000, www.deh.gov.au.

**Table 8G.115 Australian Guidelines for the Protection of Human Consumers of Fish and Other Aquatic Organisms from Bacterial Infection**

| Toxicant | Guideline *in Shellfishing Water* | Standard *in Edible Tissue* |
|---|---|---|
| Faecal (thermotolerant) coliforms | The median faecal coliform bacterial concentration should not exceed 14 MPN/100 mL, with no more than 10% of the samples exceeding 43 MPN/100 mL | Fish destined for human consumption should not exceed a limit of 2.3 MPN *E. coli lg* of flesh with a standard place count of 100,000 organisms/g |

*Note:* MPN: Most probable number, The guideline for faecal (thermotolerant) coliforms should not be used in conjunction with the data from a sanitary survey of the shellfish harvesting areas for the purpose of harvesting area classification.

## SECTION 8H RECREATIONAL WATER QUALITY

**Table 8H.120 Water Quality Characteristics Relevant to Recreational Use**

| Characteristics | Primary Contact (e.g. swimming) | Secondary Contact (e.g. boating) | Visual Use (no contact) |
|---|---|---|---|
| Microbiological guidelines | X | X | |
| Nulsance organisms (e.g., algae) | X | X | X |
| Physical and chemical guidelines: | | | |
| Aesthetics | X | X | X |
| Clarity | X | X | X |
| Color | X | X | X |
| pH | X | | |
| Temperature | X | | |
| Toxic chemicals | X | X | |
| Oil, debris | X | X | X |

*Source*: From Australian and New Zealand Environment and Conservation Council and Agriculture and Resource Management Council of Australia and New Zealand, 2000, *National Water Quality Management Strategy*, Paper No. 4, *Australian and New Zealand Guidelines for Fresh and Marine Water Quality*, vol. 1, The Guidelines, October 2000, www.deh.gov.au.

**Table 8H.121 Guides for Evaluating Recreational Waters**

| | Water Contact | | Boating and Aesthetic | |
|---|---|---|---|---|
| Determination | Noticeable Threshold | Limiting Threshold | Noticeable Threshold | Limiting Threshold |
| Coliforms, MPN per 100 mL | 1,000[a] | —[b] | | |
| Visible solids of sewage origin | None | None | None | None |
| ABS (detergent) (mg/L) | 1[a] | 2 | 1[a] | 5 |
| Suspended solids (mg/L) | 20[a] | 100 | 20[a] | 100 |
| Flotable oil and grease, mg/L | 0 | 5 | 0 | 10 |
| Emulsified oil and grease (mg/L) | 10[a] | 20 | 20[a] | 50 |
| Turbidity, silica scale units | 10[a] | 50 | 20[a] | —[c] |
| Color, standard cobalt scale units | 15[a] | 100 | 15[a] | 100 |
| Threshold odor number | 32[a] | 256 | 32[a] | 256 |
| Range of pH | 6.5–9.0 | 6.0–10.0 | 6.5–9.0 | 6.0–10.0 |
| Temperature, maximum °C | 30 | 50 | 30 | 50 |
| Transparency, Secchi disk (ft) | — | — | 20[a] | —[c] |

*Note:* Noticeable threshold represents the level at which people begin to notice and perhaps to complain. Limiting threshold in the level at which recreational use of water is prohibited or seriously impaired.

[a] Value not to be exceeded in more than 20 percent of 20 consecutive samples, nor in any 3 consecutive samples.
[b] No limiting concentration can be specified in the basis of epidemiological evidence, provided no fecal pollution is evident.
[c] No concentration likely to be found in surface waters would impede use.

*Source*: From California State Water Quality Control Board, 1963.

© 2006 by Taylor & Francis Group, LLC

**Table 8H.122 United States Criteria for Bathing (Full Body Contact) Recreational Waters**

**Freshwater**

Based on a statistically sufficient number of samples (generally not less than 5 samples equally spaced over a 30-day period), the geometric mean of the indicated bacterial densities should not exceed one or the other of the following[a]:

| | |
|---|---|
| *E. coli* | 126 per 100 mL; or |
| *Enterococci* | 33 per 100 mL; |

No sample should exceed a one sided confidence limit (C.L.) calculated using the following as guidance:

| | |
|---|---|
| Designated bathing beach | 75% C.L. |
| Moderate use for bathing | 82% C.L. |
| Light use for bathing | 90% C.L. |
| Infrequent use for bathing | 95% C.L. |

based on a site-specific log standard deviation, or if site data are insufficient to establish a log standard deviation, then using 0.4 as the log standard deviation for both indicators

**Marine Water**

Based on a statistically sufficient number of samples (generally not less than 5 samples equally spaced over a 30-day period), the geometric mean of the enterococci densities should not exceed 35 per 100 mL;

No sample should exceed a one sided confidence limit using the following as guidance:

| | |
|---|---|
| Designated bathing beach | 75% C.L. |
| Moderate use for bathing | 82% C.L. |
| Light use for bathing | 90% C.L. |
| Infrequent use for bathing | 95% C.L. |

based on a site-specific log standard deviation, or if site data are insufficient to establish a log standard deviation, then using 0.7 as the log standard deviation

[a] Only one indicator should be used. The Regulatory agency should select the appropriate indicator for its conditions.

*Source*: From United States Environmental Protection Agency, 2003, *Bacterial Water Quality Standards for Recreational Waters (Freshwater and Marine Waters) Status Report*, EPA-823-R-03-008, www.epa.gov.

**Table 8H.123 WHO Guidelines for Safe Practice in Managing Recreational Waters**

| Guidance Level or Situation | How Guidance Level Derived | Health Risks | Typical Actions[a] |
|---|---|---|---|
| **Relatively low probability of adverse health effects** | | | |
| 20,000 cyanobacterial cells/mL or 10 μg chlorophyll-a/L with dominance of cyanobacteria | From human bathing epidemiological study | Short-term adverse health outcomes, e.g., skin irritations, gastrointestinal illness | Post on site risk advisory signs<br>Inform relevant authorities |
| **Moderate probability of adverse health effects** | | | |
| 100,000 cyanobacterial cells/ml or 50 μg chlorophyll-a/L with dominance of cyanobacteria | From provisional drinking-water guideline value for microcystin-LR[b] and data concerning other cyanotoxins | Potential for long-term illness with some cyanobactieral species<br>Short-term adverse health outcomes, e.g., skin irritations, gastrointestinal illness | Watch for scums or conditions conducive to scums<br>Discourage swimming and further investigate hazard<br>Post on-site risk advisory signs<br>Inform relevant authorities |
| **High probability of adverse health effects** | | | |
| Cyanobacterial scum formation in areas where whole-body contact and/or risk of ingestion/aspiration occur | Inference from oral animal lethal poisonings<br>Actual human illness case histories | Potential for acute poisoning<br>Potential for long-term illness with some cyanobacterial species<br>Short-term adverse health outcomes, e.g., skin irritations, gastrointestinal illness | Immediate action to control contact with scums; possible prohibition of swimming and other water contact activities<br>Public health follow-up investigation<br>Inform public and relevant authorities |

[a] Actual action taken should be determined in light of extent of use and public health assessment of hazard.
[b] The provisional drinking-water guideline value for microcystin-LR is 1 μg/L (WHO, 1998).

© 2006 by Taylor & Francis Group, LLC

**Table 8H.124 WHO Guideline Values for Microbial Quality of Recreational Waters**

| 95th Percentile Value of Intestinal Enterococci/100 mL (rounded values) | Basis of Derivation | Estimated Risk Per Exposure |
|---|---|---|
| **≤40**<br>**A** | This range is below the NOAEL in most epidemiological studies | **<1% GI illness risk**<br>**<0.3% AFRI risk**<br>This upper 95th percentile value of 40/100 mL relates to an average probability of less than one case of gastroenteritis in every 100 exposures. The AFRI burden would be negligible |
| **41–200**<br>**B** | The 200/100 ml value is above the threshold of illness transmission reported in most epidemiological studies that have attempted to define a NOAEL or LOAEL for GI illness and AFRI | **1–5% GI illness risk**<br>**0.3–1.9% AFRI risk**<br>The upper 95th percentile value of 200/100 mL relates to an average probability of one case of gastroenteritis in 20 exposures. The AFRI illness rate at this upper value would be less than 19 per 1,000 exposures, or less than approximately 1 in 50 exposures |
| **201–500**<br>**C** | This range represents a substantial elevation in the probability of all adverse health outcomes for which dose-response data are available | **5–10% GI illness risk**<br>**1.9–3.9% AFRI risk**<br>This range of 95th percentiles represents a probability of 1 in 10 to 1 in 20 of gastroenteritis for a single exposure. Exposures in this category also suggest a risk of AFRI in the range of 19–39 per 1,000 exposures, or a range of approximately 1 in 50 to 1 in 25 exposures |
| **>500**<br>**D** | Above this level, there may be a significant risk of high levels of minor illness transmission | **>10% GI illness risk**<br>**>3.9% AFRI risk**<br>There is a greater than 10% chance of gastroenteritis per single exposure. The AFRI illness rate of the 95th percentile point of >500/100 mL would be greater than 39 per 1,000 exposures, or greater than approximately 1 in 25 exposures |

*Note:* 1. Abbreviations used: A–D are the corresponding microbial water quality assessment categories used as part of the classification procedure; AFRI = acute febrile respiratory illness; GI = gastrointestinal; LOAEL = lowest-observed-adverse-effect level; NOAEL = no observed-adverse-effect level.
2. The "exposure" in the key studies was a minimum of 10 min of swimming involving three head immersions. It is envisaged that this is equivalent to many immersion activities of similar duration, but it may underestimate risk for longer periods of water contact or for activities involving higher risks of water ingestion.
3. The "estimated risk" refers to the excess risk of illness (relative to a group of non-bathers) among a group of bathers who have been exposed to faecally contaminated recreational water under conditions similar to those in the key studies.
4. The functional form used in the dose-response curve assumes no further illness outside the range of the data (i.e. at concentrations above 158 intestinal enterococci/100 mL). Thus, the estimates of illness rate reported above this value are likely to be underestimates of the actual disease incidence attributable to recreational water exposure.
5. This estimated risks were derived from sewage-impacted marine waters. Different sources of pollution and more or less aggressive environments may modify the risks.
6. This table is derived from risk to healthy adult bathers to marine waters in temperate north European waters.

© 2006 by Taylor & Francis Group, LLC

**Table 8H.125 Summary of Guidelines for Canadian Recreational Water Quality**

| Parameter | Guideline |
|---|---|
| Microbiological | |
| *Escherichia coli* (fecal coliforms) | The geometric mean of at least five samples, taken during a period not to exceed 30 days, should not exceed 2,000 *E. coli*/L. Resampling should be performed when any sample exceeds 4,000 *E. coli*/L |
| Enterococci | The geometric mean of at least five samples, taken during a period not to exceed 30 days, should not exceed 350 enterococci/L. Resampling should be performed when any sample exceeds 700 enterococci/L |
| Coliphages | Limits on coliphages can not be specified at this time. See Health and Welfare Canada (1992) for additional information |
| Waterborne pathogens | The pathogens most frequently responsible for diseases associated with recreational water use are described in Health and Welfare Canada (1992), i.e. *Pseudomonas aeruginosa*, *Staphylococcus aureus*, *Salmonella*, *Shigella*, *Aeromonas*, *Campylobacter jejuni*, *Legionella*, human enteric viruses, *Giardia lamblia*, and *Cryptosporidium* |
| Cyanobacteria (blue–green algae) | Limits have not been specified. Health Canada is in the process of developing a numerical guideline for microcystin, a cyanobacterial toxin. Water with blue-green surface scum should be avoided because of reduced clarity and possible presence of toxins |
| Chemical characteristics | Limits for chemicals have not been specified because of lack of data. Decisions for use should be based on an environmental health assessment and the aesthetic quality. Dermal exposures to environmental contaminants has recently been reviewed by Moody and Chu (1995) |
| Aquatic plants | Bathers should avoid areas with rooted or floating plants; very dense growths could affect other activities such as boating and fishing |
| Aesthetics | All water should be free from<br>• materials that will settle to form objectionable deposits;<br>• floating debris, oil, scum, and other matter;<br>• substances producing objectionable color, odor, taste, or turbidity; and<br>• substances and conditions or combinations thereof in concentrations that produce undesirable aquatic life |
| Nuisance organisms | Bathing areas should be as free as possible from nuisance organisms that<br>• endanger the health and physical comfort of users or<br>• render the area unusable<br>Common examples include biting and nonbiting insects and poisonous organisms, for example jellyfish |
| pH | The pH of the waters used for total body contact recreation should be in the pH range of 6.5 to 8.5. If the water has a very low buffering capacity, pH values from 5.0 to 9.0 should be acceptable |
| Temperature | The thermal characteristics of waters used for bathing and swimming should not cause an appreciable increase or decrease in the deep body temperature of bathers and swimmers |
| Turbidity | 50 Nephelometric Turbidity Units (NTU) |
| Clarity—Light penetration | Water should be sufficiently clear that a Secchi disc is visible at a minimum depth of 1.2 m |
| Color | Color should not be so intense as to impede visibility in areas used for swimming. A maximum limit of 100 platinum-cobalt (Pt-Co) units was proposed by Environment Canada (1972) |
| Oil and grease | Oil or petrochemicals should not be present in concentrations that<br>• Can be detected as a visible film, sheen, or discoloration on the surface<br>• Can be detected by odor<br>• Can form deposits on shorelines and bottom sediments that are detectable by sight or odor (International Joint Commission 1977) |

*Note*: See guidance document for a complete narrative of recreational water quality guidelines.

*Source*: From Health and Welfare Canada, 1992, *Guidelines for Canadian Recreational Water Quality*, www.ccme.ca.

© 2006 by Taylor & Francis Group, LLC

**Table 8H.126 Summary of Australian Water Quality Guidelines of Recreational Waters**

| Parameter | Guideline |
|---|---|
| ***Microbiological*** | |
| Primary contact[a] | The median bacterial content in fresh and marine waters taken over the bathing season should not exceed 150 fecal coliform organisms/100 mL or 35 enterococci organisms/100 mL. Pathogenic free-living protozoans should be absent from bodies of fresh water[b] |
| Secondary contact[a] | The median value in fresh and marine waters should not exceed 1,000 fecal coliform organisms/100 mL or 230 enterococci organisms/100 mL[b] |
| Nuisance organisms | Macrophytes, phytoplankton scums, filamentous algal mats, sewage fungus, leeches, etc., should not be present in excessive amounts[a]. Direct contact activities should be discouraged if algal levels of 15,000–20,000 cells/mL are present, depending on the algal species. Large numbers of midges and aquatic worms should also be avoided |
| ***Physical and chemical*** | |
| Visual clarity & color | To protect the aesthetic quality of a waterbody:<br>• the natural visual clarity should not be reduced by more than 20%<br>• the natural hue of the water should not be changed by more than 10 points on the Munsell Scale<br>• the natural reflectance of the water should not be changed by more than 50%<br>To protect the visual clarity of waters used for swimming, the horizontal sighting of a 200 mm diameter black disc should exceed 1.6 m |
| pH | The pH of the water should be within the range 5.0–9.0, assuming that the buffering capacity of the water is low near the extremes of the pH limits |
| Temperature | For prolonged exposure, temperatures should be in the range 15–35°C |
| Toxic chemicals | Water containing chemicals that are either toxic or irritating to the skin or mucous membranes are unsuitable of recreation. Toxic substances should not exceed values in Table 8.127 and 8.128 |
| Surface films | Oil and petrochemicals should not be noticeable as a visible film on the water nor should they be detectable by odor |

[a] Refer to Section 3.3 of this revised Australian Guidelines relating to nutrient concentrations necessary to limit excessive aquatic plant growth.

[b] Sampling frequency and maximum values are given in Section 5.2.3.1 of the guidance document.

# SECTION 8I WATER QUALITY FOR LIVESTOCK AND AQUACULTURE

**Table 8I.129 Guides for Evaluating the Quality of Water Used by Livestock**

| Quality Factor (mg/L) | Threshold Concentration[a] | Limiting Concentration[b] |
|---|---|---|
| Total dissolved solids (TDS) | 2500 | 5000 |
| Cadmium | 5 | |
| Calcium | 500 | 1000 |
| Magnesium | 250 | 500[c] |
| Sodium | 1000 | 2000[c] |
| Arsenic | 1 | |
| Bicarbonate | 500 | 500 |
| Chloride | 1500 | 3000 |
| Fluoride | 1 | 6 |
| Nitrate | 200 | 400 |
| Nitrite | None | None |
| Sulfate | 500 | 1000[c] |
| Range of pH | 6.0–8.5 | 5.6–9.0 |

[a] Threshold values represent concentrations at which poultry or sensitive animals might show slight effects from prolonged use of such water. Lower concentrations are of little or no concern.
[b] Limiting concentrations based on interim criteria, South Africa. Animals in lactation or production might show definite adverse reactions.
[c] Total magnesium compounds plus sodium sulfate should not exceed 50 percent of the total dissolved solids.

*Source*: From California State Water Quality Control Board, 1963.

**Table 8I.130 Guide to the Use of Saline Waters for Livestock and Poultry**

| Total Soluble Salts Content of Waters | Uses |
|---|---|
| Less than 1,000 mg/L (EC < 1.5 mmhhos/cm) | Relatively low level of salinity. Excellent for all classes of livestock and poultry |
| 1,000–3,000 mg/L (EC = 1.5–5 mmhos/cm) | Very satisfactory for all classes of livestock and poultry. May cause temporary and mild diarrhea in livestock not accustomed to them; may cause watery droppings in poultry |
| 3,000–5,000 mg/L (EC = 5–8 mmhos/cm) | Satisfactory for livestock, but may cause temporary diarrhea or be refused at first by animals not accustomed to them. Poor waters for poultry, often causing watery feces, increased mortality, and decreased growth, especially in turkeys |
| 5,000–7,000 mg/L (EC = 8–11 mmhos/cm) | Can be used with reasonable safety for dairy and beef cattle, sheep, swine, and horses. Avoid use for pregnant or lactating animals. Not acceptable for poultry |
| 7,000–10,000 mg/L (EC = 11–16 mmhos/cm) | Unfit for poultry and probably for swine. Considerable risk in using for pregnant or lactating cows, horses or sheep, or for the young of these species. In general, use should be avoided although older ruminants, horses, poultry, and swine may subsist on them under certain conditions |
| Over 10,000 mg/L (EC > 11–16 mmhos/cm) | Risks with these highly saline waters are so great that they cannot be recommended for use under any condition |

| Tebuthiuron | 130[f] |
| Toluene[d,e] | 24 |
| Total dissolved solids (salinity)[d] | 3,000,000 |
| Toxaphene[d] | 5[l,m] |
| Triallate[d] | 230[f] |
| Trifluralin | 45[f] |
| Uranium[d] | 200 |
| Vanadium[d] | 100 |
| Zinc[d] | 50,000 |

*Note:* μg/L is microgram per liter.

[a] Unless otherwise indicated, supporting documents are available from the Guidelines and Standards Division, Environment Canada.
[b] The guidelines dated 1987 have been carried over from *Canadian Water Qualify Guidelines* (CCREM 1987) and no fact sheet was prepared. The guidelines dated 1989 to 1997 were developed and initially published in CCREM 1987 as appendixes on the date indicated. They are published as fact sheets in this document. Other guidelines dated 1997 and those dated 1999 are published for the first time in this document.
[c] Concentration of total aldicarb residue.
[d] No fact sheet created.
[e] The technical document for the guideline is available from the Ontario Ministry of the Environment.
[f] Interim guideline.
[g] During the initial development of this guideline, insufficient data were available to derive a livestock watering guideline value. Therefore, the Canadian drinking water quality guideline (Health and Welfare Canada 1987) was adopted. Since then, this value has been revised by Health Canada (1996). This revised drinking water quality guideline in now adopted as the guideline for livestock water.
[h] Guideline value slightly modified from CCREM 1987 + Appendixes due to re-evaluation of the significant figures.
[i] Guideline is crop-specific (see fact sheet).
[j] This guideline (originally published in *Canadian Water Quality Guidelines* [CCREM 1987]) is no longer recommended and the value is withdrawn. A water quality guideline is not recommended. Environmental exposure is predominantly via sediment, soil, and/or tissue, therefore, the reader is referred to the respective guidelines for these media.
[k] This substance meets the criteria for Track substances under (the national CCME Policy for the Management of Toxic Substances (PMTS) (i.e., persistent, bioaccumulative, primarily result of human activity, and CEPA-toxic or equivalent) and should be subject to virtual elimination strategies. Guidelines can serve as action levels or interim management objectives towards virtual elimination.
[l] Substance has been re-evaluated since CCREM 1987+Appendixes. Either a new guideline has been derived or insufficient data existed to derive a new guideline.
[m] Copper guideline =500 $\mu g L^{-1}$ for sheep, 1000 $\mu g\ L^{-1}$ for cattle, 5000 $\mu g\ L^{-1}$ for swine and poultry.
[n] Fluoride guideline = 1000 $\mu g\ L^{-1}$ if feed contains fluoride.
[o] Molybdenum guideline = 50 $\mu g\ L^{-1}$ for short-term use on acidic soils.

**Table 8I.132 Tolerances of Livestock to Total Dissolved Solids (Salinity) in Drinking Water**

| | Total Dissolved Solids (mg/L) | | |
|---|---|---|---|
| **Livestock** | **No Adverse Effects on Animals Expected** | **Animals May Have Initial Reluctance to Drink or There May Be Some Scouring, but Stock Should Adapt without Loss of Production** | **Loss of Production and a Decline in Animal Condition and Health Would Be Expected. Stock may Tolerate These Levels for Short Periods if Introduced Gradually** |
| Beef cattle | 0–4,000 | 4,000–5,000 | 5,000–10,000 |
| Dairy cattle | 0–2,500 | 2,500–4,000 | 4,000–7,000 |
| Sheep | 0–5,000 | 5,000–10,000 | 10,000–13,000[a] |
| Horses | 0–4,000 | 4,000–6,000 | 6,000–7,000 |
| Pigs | 0–4,000 | 4,000–6,000 | 6,000–8,000 |
| Poultry | 0–2,000 | 2,000–3,000 | 3,000–4,000 |

[a] Sheep on lush green feed may tolerate up to 13,000 mg/L TDS without loss of condition or production.

**Table 8I.133 Recommended Water Quality Trigger Values (Low Risk) for Heavy Metals and Metalloids in Livestock Drinking Water**

| **Metal or Metalloid** | **Trigger Value (low risk)[a] (mg/L)** |
|---|---|
| Aluminum | 5 |
| Arsenic | 0.5<br>up to 5[c] |
| Beryllium | ND[b] |
| Boron | 5 |
| Cadmium | 0.01 |
| Chromium | 1 |
| Cobalt | 1 |
| Copper | 0.4 (sheep)<br>1 (cattle)<br>5 (pigs)<br>5 (poultry) |
| Fluoride | 2 |
| Iron | Not sufficiently toxic |
| Lead | 0.1 |
| Manganese | Not sufficiently toxic |
| Mercury | 0.002 |
| Molybdenum | 0.15 |
| Nickel | 1 |
| Selenium | 0.02 |
| Uranium | 0.2 |
| Vanadium | ND |
| Zinc | 20 |

[a] Higher concentrations may be tolerated in some situations (details provided in Volume 3, Section 9.3.5).
[b] ND = not determined, insufficient background data to calculate.
[c] May be tolerated if not provided as a food additive and natural levels in the diet are low.

## SECTION 8J WATER TREATMENT PROCESSES

**Table 8J.137 Common Water Quality Problems, Effects, and Treatment**

| Probable Cause | General Effect | Probable Remedy |
|---|---|---|
| Hardness (Calcium and Magnesium) | Scales in pipes and water heaters; causes "soap curd" on fixtures, tiles, dishes and laundry; low sudsing characteristics | Removal by ion exchange softener |
| Iron, Manganese, Copper, Zinc | Causes discolored water; red, brown, orange or black stains on fixtures, appliances and laundry; dark scale in pipes and water heaters | Low level (2 ppm) removal by ion exchange softener when hardness is also present; best removed by oxidizing iron filter, aeration and/or chlorination followed by filtration in some cases |
| Iron, Manganese, Sulfur Bacteria | Same general effects as above plus slimey deposits that form in pumps, pipes, softeners and toilet tanks | Low level removal possible by oxidizing iron filter; best removed by disinfection followed by filtration |
| Hydrogen Sulfide Gas | Foul rotten-egg odor; corrosion to plumbing; tarnishes silver and stains fixtures and laundry; ruins the taste of foods and beverages | Best removed by aeration, scrubbing and filtration; also removed by oxidizing filters or chlorination followed by filtration |
| Turbidity | Suspended matter in water; examples include mud, clay, silt and sand; can ruin seals and moving parts in appliances | Removal by backwashing sediment filters; extra fine treatment utilizing sediment cartridge elements |
| Acid Water (low pH) | Corrosive water attacks piping and other metals; red and/or green staining of fixtures and laundry | Best corrected by neutralizing filters or soda ash feeding |
| Taste, Odor, Color (organic matter) | Makes water unpalatable; can cause staining | Depending on the nature of contaminant, aeration followed by filtration; carbon filtration; oxidation followed by filtration |
| Tannins, Humic Acid | Can impart an "iced-tea" color to water; causes light staining; can affect the taste of foods and beverages | Removal by special ion exchange or oxidizing agents and filtration |
| Coliform Bacteria, Cryptosporidium, Giardia Lamblia, Viruses | Can cause serious disease and intestinal disorders | Disinfection and filtration is most widely practiced |
| Organic Halides (e.g., herbicides and pesticides) | Can cause serious disease and/or poisoning | Most are readily removed by absorption with carbon filters; some can also be removed by hydrolysis and oxidation |
| Nitrates, Chlorides and Sulfates | Can cause health-related problems if quantities are high | Removal by special ion exchange, deionization process or reverse osmosis |
| Sodium Salts | Imparts an alkaline or soda taste to water | Removal by deionization process or reverse osmosis, distillation can be used |
| Arsenic[a] | Can cause health-related problems; Known carcinogen | Removal using conventional coagulation with iron or aluminum salts followed by filtration; may also be removed by adsorption onto activated alumina or by ion exchange |
| Radionuclides[b] | Can cause health-related problems | Best Available Technology (BAT) identified for removal include ion exchange, reverse osmosis, lime softening, and conventional coagulation followed by filtration |
| Synthetic Organic Compounds[a] | Can cause health-related problems | Removal using aeration, air stripping for volatile organic compounds; removal using granular activated carbon adsorption or chemical oxidation for volatile or non-volatile compounds |

**Table 8J.138 Summary of Conventional Processes and Systems for Water Quality Control**

| Type or Process | Common Application | Approximate Limit of Quality Input | Principal Change in Quality Factors (Approximate) |
|---|---|---|---|
| | | **Gravity Separation** | |
| Plain sedimentation | Reduction in suspended solids in raw water to be pumped | No theoretical limit: 3,000–5,000 mg/L typical maximum in flood waters | Removes larger and heavier suspended solids |
| | Primary sewage treatment | Unspecified | 50% reduction in suspended solids<br>35–40% reduction in BOD<br>50% reduction in turbidity |
| | Secondary sewage treatment | Unspecified | Unreported |
| | Concentrating return activated sludge (secondary treatment) | Unspecified | Thickens sludge to 20–25% original volume |
| | Concentrating or reducing suspended solids in industrial wastes, organic and inorganic | Unspecified | Highly dependent upon nature of waste treated |
| | Grit removal-raw sewage | Unspecified | Removes heavy suspended solids not transported at velocity of 1 ft/sec |
| Plain sedimentation plus skimming | Primary sewage treatment | Unspecified | 25–40% reduction in BOD<br>40–70% reduction in suspended solids<br>25–75% reduction in bacteria<br>2% reduction in detergents |
| | Various industrial wastes | Unspecified | Dependent upon nature of waste |
| Trickling filter plus plain sedimentation | Secondary sewage treatment | 0.25-3.0 lb BOD/cu yd/filter | 80–95% reduction in BOD<br>70–92% reduction in suspended solids<br>90–95% reduction in bacteria<br>30–35% reduction in ABS<br>80–90% reduction in LAS |
| | Organic industrial wastes (e.g., milk process) | Dependent upon waste treated | Dependent upon nature of waste |
| Activated sludge plus plain sedimentation | Secondary sewage treatment | Unspecified | 80–95% reduction in BOD<br>85–95% reduction in suspended solids<br>95–98% reduction in bacteria<br>50% reduction in BAS<br>90–99% reduction in LAS |
| Sedimentation after mechanical flocculation | Raw sewage (experimentally) | Unspecified | 64% reduction in turbidity<br>40% reduction in suspended solids<br>60% reduction in BOD |
| | Industrial wastes | Unspecified | Variable, depending upon nature of wastes treated |
| Sedimentation after chemical coagulation | Municipal and industrial water supply water softening | Unspecified | Seldom evaluated separate from filtration |
| | Raw sewage (not common) | Unspecified | 50–85% reduction in BOD<br>70–90% reduction in suspended solids<br>40–80% reduction in bacteria |
| | Industrial wastes | Dependent upon waste | Variable, dependent upon nature of waste |

© 2006 by Taylor & Francis Group, LLC

| | | | |
|---|---|---|---|
| Chemical coagulation plus sedimentation | Municipal water supply | Unspecified | Coalesces and precipitates dispersed clay colloids<br>Reduces turbidity<br>Reduces color |
| | Phosphate removal from waste waters | Unspecified | Reduces soluble phosphates to trace amounts |
| | Lime-soda softening of water supplies | Applicable to waters containing Ca and Mg sulfates and bicarbonates; Iron and Mg in natural waters (e.g. maximum from 10 mg/L; minimum, 3 mg/L) | Reduces hardness to approximately 75 mg/L; by excess lime to 30–50 mg/L; by hot process to $<10$ mg/L as $CaCO_3$<br>Reduces Fe to 0.1 mg/L ($\pm$)<br>Removes $CO_2$—requiring restabilization<br>80–100% reduction in bacteria by excess lime |
| | | **Filtration** | |
| Slow sand (gravity) | Tertiary treatment of sewage effluent<br>Water reclamation systems | Relatively low turbidity | 90–95% reduction in BOD<br>85–95% reduction in suspended solids<br>95–98% reduction in bacteria<br>90–99% reduction in surfactants |
| | Municipal water supply | Turbidity 40 mg/L | 99% reduction in bacteria<br>95–100% reduction in turbidity<br>30% reduction in color<br>Odors and tastes removed<br>60% reduction in iron |
| | Industrial wastes | Unspecified | Varies with nature of waste |
| Rapid sand (gravity) | Municipal and industrial water supply (little used without coagulation) | Low turbidity, e.g., 50 mg/L, maximum coliform MPN 5,000/100 mL | 95% reduction in bacteria<br>90% reduction in turbidity |
| Rapid sand plus chemical coagulation (gravity) | Municipal and industrial water supply | No limit specified for maximum turbidity<br>Maximum coliform MPN 5,000–20,000/100 mL | 90–99% reduction in bacteria<br>100% ($-$) reduction in turbidity<br>Color reduction to less than 5 mg/L<br>Alkali increased 7.7 mg/L/gr. alum<br>$CO_2$ increased 6.8 mg/L/gr. alum<br>Slight reduction in iron<br>Odor and taste partially removed |
| Rapid sand plus chemical coagulation, chlorination, and activated carbon | Municipal and industrial water supply | No limit specified for maximum turbidity<br>Maximum coliform MPN 5,000–20,000/100 mL | Approximately 100% reduction in bacteria<br>100% reduction in turbidity<br>Color reduced to near zero<br>Iron and Mn reduced<br>Taste and odor removed |
| Rapid sand (pressure) (precoat with chemical floc) | Small municipal supplies<br>Institutional water supply<br>Swimming pools Industrial supply and process Emergency and military use | Generally unspecified<br>Low turbidity desirable | Similar to rapid sand filter but more variable in performance |

**Table 8J.138 (Continued)**

| Type or Process | Common Application | Approximate Limit of Quality Input | Principal Change in Quality Factors (Approximate) |
|---|---|---|---|
| | | **Filtration (Continued)** | |
| Diatomaceous earth (pressure and vacuum) | Small municipal supplies<br>Institutional water supply<br>Swimming pools<br>Industrial supply and process<br>Emergency and military use | None specified, but operation depends upon nature of water | Capable of good clarification of water; efficiency, however, not well documented<br>40–90% reduction in suspended solids<br>50% reduction in color |
| Contact filters | Manganese removal<br>Iron removal | None specified | Reduces to USPHS Standards<br>88% reduction in iron |
| Bag filters | Swimming pools | Unspecified | Strains out hair and coarser suspended solids, reduces bacteria to level controllable by chlorination practice |
| Microstraining | Primary clarification of water prior to filtration<br>Clarification of sewage effluents<br>Treatment of industrial wastes | Size of particles to be removed greater than screen size<br>Material suitable for microstraining | 87–96% reduction in microscopic organisms<br>60–90% reduction in microscopic particulates<br>50–60% reduction in suspended solids trickling filter effluent<br>30–40% reduction on turbidity |
| Fine screening | Raw sewage | None specified | 5–10% reduction in BOD<br>2–20% reduction on suspended solids<br>10–20% reduction in bacteria |
| | Industrial wastes (e.g., cannery, pulp mill, etc.) | None specified | Varies with nature of waste |
| Carbon filters | Special municipal and industrial water applications | Very low turbidity, other not specified | Adsorbs exotic organic chemicals, including surfactants<br>Removes tastes and odors<br>Adsorbs miscellaneous gases |
| | | **Aeration** | |
| Spray or cascade | Municipal and industrial water supply<br>Industrial waste treatment | Unspecified | Releases gases producing taste and odor<br>Reduces $CO_2$ in groundwaters to normal surface water levels<br>Partial removal of $H_2S$<br>Partial removal of gases of decomposition<br>Oxidation and removal of soluble iron in groundwaters; 80–97% reduction observed |
| Pressure aerators | Treatment of sewage and industrial wastes | Limits variable or unspecified | Grit precipitated<br>Grease concentrated at surface<br>Separates various solids by flotation<br>Maintains aerobic conditions in biological systems, e.g., activated sludge, aerated ponds<br>Reduces ABS or LAS 1–2 mg/L<br>Reduces septicity of sewage |

© 2006 by Taylor & Francis Group, LLC

| | | | |
|---|---|---|---|
| | **Aeration (Continued)** | | |
| Oxidation ponds | Treatment of domestic sewage and organic industrial wastes | No toxic substances | 75–96% reduction in BOD<br>90–99% reduction in suspended solids<br>98–99.9% reduction in bacteria<br>56–93% reduction in LAS |
| | **Deminerlization** | | |
| Ion exchange (natural or synthetic zeolite) | Softening of groundwater supplies for municipal or industrial use | Hardness (Ca and Mg sulfates and bicarbonates) of natural waters $>$850–1,000 mg/L $CaCO_3$<br>Iron $<$1.5–2 mg/L<br>Low in silica $CO_2<15$ mg/L | Increases sodium content by exchange with removed Ca and Mg |
| Ion exchange (greensand or styrene base gels) | Iron or Mn removal from groundwater | Iron less than approximately 2.0 mg/L | 90–100% removal of iron<br>Mn partially removed |
| Ion exchange (organic cation exchangers) | Special water conditioning for industry and commerce | Unspecified | Removes all cations (Na, K, Mg, Fe, Cu, Mn) |
| Ion exchange (anion exchangers) | Special water conditioning for industry and commerce | Unspecified | Removes $SO_4$, Cl, $NO_3$, etc. |
| Ion exchange (fluoride exchangers) | Defluoridation of public water supply | More than 1.5 mg/L F in water supply | Approximately 100% removal possible<br>Normally reduced to $<$1.5 mg/L |
| Electrochemical desalting | Reclaiming water from saline sources, public and industrial supplies<br>Demineralizing municipal waste effluents | Applicable to highly saline or brackish waters | Removes anions and cations |
| Reverse osmosis | Reclamation of water from brackish natural or waste waters (experimental) | Brackish waters, upper limit not specified | Reduces ions depending upon concentration difference across membrane<br>97–98% reduction in TDS, ABS, and COD |
| Distillation | Reclamation of water from saline sources<br>Specialty industrial and commercial supplies | No limit | Produces distilled water (may be contamination with $NH_3$, volatile organics, etc.) |
| Freezing | Reclamation of water from saline sources<br>Specialty industrial and commercial supplies | No limit | (Experimental) |
| | **Disinfection** | | |

*(Continued)*

**Table 8J.138 (Continued)**

| Type or Process | Common Application | Approximate Limit of Quality Input | Principal Change in Quality Factors (Approximate) |
|---|---|---|---|
| Liquid $Cl_2$ and $Cl_2$ Compounds such as chlorine dioxide and chloramines[a] | Public water supply<br>Industrial water supply | Turbidity low for waters to be sterilized by $Cl_2$<br>Total organic carbon (TOC) concentration $<2$ mg/L to minimize disinfection byproduct (DBP) formation | Reduces bacterial load on filters<br>Oxidizes organic matter<br>Reduces odor<br>Assists in color removal<br>100% (—) reduction in bacteria<br>Controls plankton growth in reservoirs<br>Reduces Mn concentration in breakpoint |
| | | **Disinfection (Continued)** | |
| | Municipal and industrial waste-water treatment and management. | Unspecified | Assists in grease removal<br>Controls filter fly nuisance<br>Cleans air stones in aeration systems<br>Removes $H_2S$<br>Removes $NH_3$ Controls slime formation in sewers and cooling towers<br>Assists in control of digester foaming<br>Disinfects effluent; 98–99% reduction in bacteria |
| Ozone[a] | Public water supply | Bromide concentrations less than 0.1 mg/L to minimize potential for bromate formation | Oxidizes organics<br>Microbial inactivation including coliform, giardia, cryptosporidium, and viruses<br>Reduces odor<br>Removes color |
| Utraviolet Radiation[a] | Small public water supply | Low turbidity | Microbial inactivation including coliform and viruses<br>Some organic oxidation |
| | | **Digestion** | |
| Anaerobic digestion | Stabilization of sewage solids<br>Stabilization of organic industrial wastes | pH above 6.8<br>Acids limited<br>No toxic substances in significant amounts<br>Minimum of grit | Reduces organic sludges to humus and relatively stable chemical compounds<br>Produces offensive supernatant |

| POU Cost | N/A | N/A | N/A | N/A | N/A |

[a] Activated alumina is assumed to operate in a nonregenerated mode.
[b] USEPA 2002a.
[c] IBS's track record in U.S. was not established enough to be considered as Best Available Technology (BAT) or Small System Compliance Technology (SSCT) at the time the rule was promulgated.
[d] Affordable for systems with the given number of people served.
[e] USEPA, 2000.
[f] Pre-oxidation only required for As(III).
[g] Some iron based sorbents may catalyze the As(III) to As(V) oxidation and therefore would not require a pre-oxidation step.
[h] RO will remove As(III), but its efficiency is not consistent and pre-oxidation will increase removal efficiency.
[i] AwwaRF, 2002.
[j] Kempic, 2002.
[k] Wang, 2000.
[l] AA can be used economically at higher pHs, but with a significant decrease in the capacity of the media.
[m] Clifford, 2001.
[n] Tumalo, 2002.
[o] With increased domestic use, IBS cost will significantly decrease.
[p] Depends on arsenic and iron concentrations.
[q] Fields, et al., 2002a.
[r] Cost for enhanced LS and enhanced CF are based on modification of an existing technology. Most small systems will not have this technology in place.

**Table 8J.144 Water Treatment Processes Considered for Best Available Technology**

| Conventional Processes | Advanced Processes |
|---|---|
| Coagulation, sedimentation, filtration | Activated alumina |
| Direct filtration | Adsorption |
| Diatomaceous earth filtration | GAC |
| Slow sand filtration | Powdered activated carbon |
| Lime softening | Resins |
| Ion exchange | Aeration |
| Oxidation-disinfection | Packed column |
| Chlorination | Diffused air |
| Chorine dioxide | Spray |
| Chloramines | Slat tray |
| Ozone | Mechanical |
| Bromine | Cartridge filtration |
| Others | Electrodialysis |
| | Reverse osmosis |
| | Ultrafiltration |
| | Ultraviolet light (UV) |
| | UV with other oxidants |

**Table 8J.145 Chemicals Used for Treatment by Public Water-Supply Systems in the United States and Canada**

| Chemical | Total Use Tons |
|---|---|
| Quick lime | 330,988 |
| Aluminum sulfate | 188,986 |
| Chlorine | 79,034 |
| Hydrated lime | 44,679 |
| Caustic soda | 39,030 |
| Carbon dioxide | 18,111 |
| Soda ash | 13,750 |
| Ferrous sulfate | 10,590 |
| Powdered activated carbon | 9,016 |
| Ferric sulfate | 7,956 |
| Sodium silicofluoride | 7,903 |
| Polyelectrolytes | 5,915 |
| Ammonia | 5,232 |
| Phosphate | 3,970 |
| Copper sulfate | 2,825 |
| Granular activated carbon | 2,587 |
| Potassium permanganate | 1,231 |
| Sodium aluminate | 1,129 |
| Hypochlorites | 1,112 |
| Sodium chloride | 828 |
| Clays | 133 |

*Note:* Based on data from 430 of the largest U.S. utilities and 24 of the 75 largest Canadian utilities.

**Table 8J.146 Costs of Some Water Treatment Technologies**

| Population Range | Type of Treatment | Cost per Family per Year |
|---|---|---|
| 501–1,000 | conventional coagulation | $125 |
| 50,001–75,000 | filtration and disinfection to | $ 50 |
| >1,000,000 | control microbial contaminants | $ 25 |
| 501–1,000 | corrosion control (stabilization | $ 60 |
| 50,001–75,000 | with lime) to control lead and | $ 15 |
| >1,000,000 | other corrosion products | <$ 10 |
| 501–1,000 | packed tower aeration to | $ 55 |
| 50,000–75,000 | control organic chemicals | $ 28 |
| >1,000,000 | | $ 20 |
| 501–1,000 | granular activated carbon to | $190 |
| 50,001–75,000 | control synthetic organic | $130 |
| >1,000,000 | chemicals | $ 40 |

*Note:* Basic Assumptions: 3.2 persons per household; each person using 180 gallons per day; total cost per household including operation, maintenance and amortization of capital at 10 percent per year for 20 years.

**Table 8J.147 Cost of Treating Contaminated Groundwater (Portable Treatment Systems, 1987)**

| Unit type | Cost (dollars/unit[a]) |
|---|---|
| *In situ* biological treatment (suspended growth reactor) | $15–40/cu yd, treated |
| Rotating biodisks | 0.20–1.10 |
| Trickling filter | 0.08–0.15 |
| Activated sludge | 0.10–0.30 |
| Packed towers | 0.02–0.10 |
| Aeration basins | 0.02–0.08 |
| Carbon adsorption | 0.20–0.90 |
| Ultraviolet/hydrogen peroxide | 0.04–0.18 |
| Belt press | 0.01–0.05 |
| Mixing tangs (including chemicals) | 0.03–0.29 |
| Equalization tanks | 0.005–0.01 |
| Clarifiers | 0.008–0.06 |
| Solidification of solids in situ | 0.20–1.00 |

*Note:* Portable treatment systems — 1987.

[a] All costs per 1,000 gal except as noted.

**Table 8J.148 Treatment Costs for Removal of Trichloroethylene from Drinking Water [US Dollars; Cost Data as of 1984]**

| | Treatment Technique | | | | | |
|---|---|---|---|---|---|---|
| | GAC absorption[a] | | | Packed-Tower Aeration[b] | | |
| | System Size | | | | | |
| Cost Component[c] | 0.037 mgd | 0.95 mgd | 36.8 mgd | 0.037 mgd | 0.95 mgd | 36.8 mgd |
| Capital[d] (*Thousand$)* | 24 | 240 | 9,000 | 69 | 264 | 4,789 |
| Annual O&M (*Thousand $*) | 4.5 | 86 | 710 | 1.4 | 18 | 617 |
| Total (¢ per 1,000 gal) | 57.0 | 34.0 | 14.0 | 79.0 | 15.5 | 9.4 |

*Note:* Raw water concentration 500 ug/L; assuming 99-percent removal.

[a] Based on 10-min empty bad contact time.
[b] Does not include air pollution controls.
[c] USEPA estimates in August 1983 dollars.
[d] Includes site work, engineering, contractor overhead and profit, and contingencies.

| Clarify | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 |
| Blending | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 |

*Note:* Represents treatment practices for plants treating water that comes entirely or partly from surface sources. Chlorination only is indicated when a plant chlorinated but did not filter. It includes plants that only chlorinated and plants that chlorinated and used other nonfiltration practices. The tabulations presented in the Community Water System Survey 2000 are based on data collected from a sample of U.S. Water Systems, not from a census of every water system in the United States. Percentages may not sum to 100 percent because systems may perform more than one treatment.

*Note:* Represents treatment practices for plants treating water that comes entirely or partly from ground sources. Percentages may not sum to 100 percent because systems may perform more than one treatment. Chlorination only is indicated when a plant chlorinated but did not filter. It includes plant that only chlorinated and plants that chlorinated and used other nonfiltration practices. The tabulations presented in the Commonly Water System Survery 2000 are based on data collected from a sample of U.S. Water Systems, not from a census of every water system in the United States.

**Table 9A.5 Terminology Used to Quantify Observed Variations in Flowrate and Constituent Concentrations**

| Item | Description |
|---|---|
| Average dry-weather flow (ADWF) | The average of the daily flows sustained during dry-weather periods with limited infiltration |
| Average wet-weather flow (AWWF) | The average of the daily flows sustained during wet-weather periods when infiltration is a factor |
| Average annual daily flow | The average flowrate occurring over a 24-h period based on annual flowrate data |
| Instantaneous peak | Highest record flowrate occurring for a period consistent with the recording equipment. In many situations the recorded peak flow may be considerably below the actual peak flow because of metering and recording equipment limitations |
| Peak hour | The average of the peak flows sustained for a period of 1 h in the record examined (usually based on 10-min increments) |
| Maximum day | The average of the peak flows sustained for a period of 1 day in the record examined (the duration of the peak flows may vary) |
| Maximum month | The average of the maximum daily flows sustained for a period of 1 month in the record examined |
| Minimum hour | The average of the minimum flows sustained for a period of 1 h in the record examined (usually based on 10-min increments) |
| Minimum day | The average of the minimum flows sustained for a period of 1 day in the record examined (usually for the period from 2 a.m. to 6 a.m.) |
| Minimum month | The average of the minimum daily flows sustained for a period of 1 month in the record examined |
| Sustained flow (and load) | The value (flowrate or mass loading) sustained or exceeded for a given period of time (e.g., 1 h, 1 day, or 1 month) |

*Source*: From Metcalf & Eddy, Inc., McGraw-Hill, *Wastewater Engineering Treatment and Reuse, Fourth Edition*, 2003, Table 3.11, p. 179. With permission. Adapted in part from Crites and Tchobanoglous (1998).

**Table 9A.6 Terminology Commonly Used in the Field of Wastewater Engineering**

| Term | Definition |
|---|---|
| Biosolids | Primarily an organic, semisolid wastewater product that remains after solids are stabilized biologically or chemically and are suitable for beneficial use |
| Class A biosolids[a] | Biosolids in which the pathogens (including enteric viruses, pathogenic bacteria, and viable helminth ova) are reduced below current detectable levels |
| Class B biosolids[a] | Biosolids in which the pathogens are reduced to levels that are unlikely to pose a threat to public health and the environment under specific use conditions. Class B biosolids cannot be sold or given away in bags on other containers or applied on lawns or home gardens |
| Characteristics (wastewater) | General classes of wastewater constituents such as physical, chemical, biological, and biochemical |
| Composition | The makeup of wastewater, including the physical, chemical, and biological constituents |
| Constituents[b] | Individual components, elements, or biological entities such as suspended solids or ammonia nitrogen |
| Contaminants | Constituents added to the water supply through use |
| Disinfection | Reduction of disease-causing microorganisms by physical or chemical means |
| Effluent | The liquid discharged from a processing step |
| Impurities | Constituents added to the water supply through use |
| Nonpoint sources | Sources of pollution that originate from multiple sources over a relatively large area |
| Nutrient | An element that is essential for the growth of plants and animals. Nutrients in wastewater, usually nitrogen and phosphorus, may cause unwanted algal and plant growths in lakes and streams |
| Parameter | A measurable factor such as temperature |
| Point sources | Pollutional loads discharged at a specific location from pipes, outfalls, and conveyance methods from either municipal wastewater treatment plants or industrial waste treatment facilities |
| Pollutants | Constituents added to the water supply through use |
| Reclamation | Treatment of wastewater for subsequent reuse application or the act of reusing treated wastewater |

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 9A.6 (Continued)**

| Term | Definition |
|---|---|
| Recycling | The reuse of treated wastewater and biosolids for beneficial purposes |
| Repurification | Treatment of wastewater to a level suitable for a variety of applications including indirect or direct potable reuse |
| Reuse | Beneficial use of reclaimed or repurified wastewater or stabilized biosolids |
| Sludge | Solids removed from wastewater during treatment. Solids that are treated further are termed biosolids |
| Solids | Material removed from wastewater by gravity separation (by clarifiers, thickeners, and logoons) and is the solid residue from dewatering operations |

[a] U.S. EPA (1997b).
[b] To avoid confusion, the term "constituents" is used in this text in place of contaminants, impurities, and pollutants.

*Source*: From Metcalf & Eddy, Inc., McGraw-Hill, *Wastewater Engineering Treatment and Reuse, Fourth Edition*, 2003, Table 1.1, p. 4. With permission. Adapted in part from Crites and Tchobanoglous (1998).

**Table 9A.7 Levels of Wastewater Treatment**

| Treatment Level | Description |
|---|---|
| Preliminary | Removal of wastewater constituents such as rags, sticks, floatables, grit, and grease that may cause maintenance or operational problems with the treatment operations, processes, and ancillary systems |
| Primary | Removal of a portion of the suspended solids and organic matter from the wastewater |
| Advanced primary | Enhanced removal of suspended solids and organic matter from the wastewater. Typically accomplished by chemical addition or filtration |
| Secondary | Removal of biodegradable organic matter (in solution or suspension) and suspended solids. Disinfection is also typically included in the definition of conventional secondary treatment |
| Secondary with nutrient removal | Removal of biodegradable organics, suspended solids, and nutrients (nitrogen, phosphorus, or both nitrogen and phosphorus) |
| Tertiary | Removal of residual suspended solids (after secondary treatment), usually by granular medium filtration or microscreens. Disinfection is also typically a part of tertiary treatment. Nutrient removal is often included in this definition |
| Advanced | Removal of dissolved and suspended materials remaining after normal biological treatment when required for various water reuse applications |

*Source*: From Metcalf & Eddy, Inc., McGraw-Hill, *Wastewater Engineering Treatment and Reuse, Fourth Edition*, 2003, Table 1.4, p. 11. Adapted in part from Crites and Tchobanoglous (1998).

**Table 9A.8 Commonly Used Treatment Processes and Optional Treatment Methods**

| Treatment Objective | Treatment Process | Treatment Methods |
|---|---|---|
| Suspended solids removal | Sedimentation | Septic tank |
| | | Free water surface constructed wetland |
| | | Vegetated submerged bed |
| | Filtration | Septic tank effluent screens |
| | | Packed-bed media filters (incl. dosed systems) |
| | | Granular (sand, gravel, glass, bottom ash) |
| | | Peat, textile |
| | | Mechanical disk filters |
| | | Soil infiltration |
| Soluble carbonaceous BOD and ammonium removal | Aerobic, suspended-growth reactors | Extended aeration |
| | | Fixed-film activated sludge |
| | | Sequencing batch reactors (SBRs) |
| | Fixed-film aerobic bioreactor | Soil infiltration |
| | | Packed-bed media filters (incl. dosed systems) |
| | | Granular (sand, gravel, glass) |
| | | Peat, textile, foam |
| | | Trickling filter |
| | | Fixed-film activated sludge |
| | | Rotating biological contactors |
| | Lagoons | Facultative and aerobic lagoons |
| | | Free water surface constructed wetlands |
| Nitrogen transformation | Biological | Activated sludge (N) |
| | Nitrification (N) | Sequencing batch reactors (N) |
| | Denitrification (D) | Fixed film bio-reactor (N) |
| | | Recirculating media filter (N, D) |
| | | Fixed-film activated sludge (N) |
| | | Anaerobic upflow filter (N) |
| | | Anaerobic submerged media reactor (D) |
| | | Submerged vegetated bed (D) |
| | | Free water surface constructed wetland (N, D) |
| | Ion exchange | Cation exchange (ammonium removal) |
| | | Anion exchange (nitrate removal) |
| Phosphorus removal | Physical/Chemical | Infiltration by soil and other media |
| | | Chemical flocculation and settling |
| | | Iron-rich packed-bed media filter |
| | Biological | Sequencing batch reactors |
| Pathogen removal (bacteria, viruses, parasites) | Filtration/Predation/Inactivation | Soil infiltration |
| | | Packed-bed media filters |
| | | Granular (sand, gravel, glass bottom, ash) |
| | | Peat, textile |
| | Disinfection | Hypochlorite feed |
| | | Ultraviolet light |
| Grease removal | Flotation | Grease trap |
| | | Septic tank |
| | Adsorption | Mechanical skimmer |
| | Aerobic biological treatment (incidental removal will occur; overloading is possible) | Aerobic biological systems |

**Table 9A.11 Number of Treatment Facilities by Flow Range**

| Treatment Facilities in Operation in 2000[a,b] | | |
|---|---|---|
| **Existing Flow Range (mgd)** | **Number of Facilities** | **Total Existing Flow (mgd)** |
| 0.001–0.100 | 6,583 | 290 |
| 0.101–1.000 | 6,462 | 2,339 |
| 1.001–10.000 | 2,665 | 8,328 |
| 10.001–100.000 | 487 | 12,741 |
| 100.001 and greater | 46 | 11,201 |
| Other[c] | 12 | — |
| Total | 16,255 | 34,899 |

| Treatment Facilities in Operation in 2000 if All Documented Needs Are Met[a,b] | | |
|---|---|---|
| **Design Flow Range (mgd)** | **Number of Facilities** | **Total Future Design Flow Capacity (mgd)** |
| 0.001–0.100 | 6,112 | 298 |
| 0.101–1.000 | 7,223 | 2,750 |
| 1.001–10.000 | 3,525 | 12,081 |
| 10.001–100.000 | 748 | 19,873 |
| 100.001 and greater | 64 | 15,040 |
| Other[c] | 2 | — |
| Total | 17,674 | 50,042 |

[a] California, Colorado, New York, and South Dakota did not have the resources to complete the updating of these data.
[b] Results presented in this table for American Samoa, Guam, Nevada, Northern Mariana Islands, Puerto Rico, Virgin Islands, and Wyoming are from the 1996 survey because these States and Territories did not participate in the CWNS 2000.
[c] Flow data for these facilities were unavailable.

*Source*: From 2000 Clean Watersheds Needs Survey Report to Congress, Published 2003, Appendix C, Table C.3, p. C.4. www.epa.gov/owm/mtb/cwns/2000rtc/cwns2000-appendix-c.pdf, www.epa.gov/owm/mtb/cwns/2000rtc/toc.htm.

**Table 9A.12 Improvements in Treatment Level of the Nation's Municipal Wastewater Treatment Facilities**

| Level of Treatment | 1992 Number of Facilities | 1996 Number of Facilities | Change 1992–1996 (%) | 2000 Number of Facilities | Change 1992–2000 (%) | Change 1996–2000 (%) |
|---|---|---|---|---|---|---|
| No discharge[a] | 1,981 | 2,032 | 2.6 | 1,938 | −2.2 | −4.6 |
| Less than secondary[b] | 868 | 176 | −79.7 | 47 | −94.5 | −73.3 |
| Secondary | 9,086 | 9,388 | 3.3 | 9,156 | 0.8 | −2.5 |
| Greater than secondary | 3,678 | 4,428 | 20.4 | 4,892 | 33.0 | 10.5 |
| Total facilities | 15,613 | 16,024 | 2.6 | 16,255[c] | 4.1 | 1.4 |

*Note:* A secondary treatment level is defined as meeting an effluent quality of 30 mg/L for biochemical oxygen demand (BOD) and suspended solids.

[a] *No discharge* refers to facilities that do not discharge effluent to surface waters (e.g., spray irrigation, groundwater recharge).
[b] Includes facilities granted section 301(h) waivers from secondary treatment for discharges to marine waters. As of January 1, 2000, waivers for 34 facilities in the CWNS 2000 database had been granted or were pending.
[c] The number of facilities includes 222 facilities that provide partial treatment and whose flow goes to another facility for further treatment.

**Table 9A.13 Comparison of Total Needs for the 1992 Needs Survey, 1996 Clean Water Needs Survey, and CWNS 2000 (January 2000 Dollars in Billions)**

| Needs Category | | 1992[a] | 1996[a] | 2000 |
|---|---|---|---|---|
| **Publicly Owned Wastewater Treatment and Collection Systems and Storm Water Management Programs** | | | | |
| I | Secondary wastewater treatment | 39.3 | 29.4 | 36.8 |
| II | Advanced wastewater treatment | 19.4 | 19.4 | 20.4 |
| III-A | Infiltration/inflow correction | 3.4 | 3.7 | 8.2 |
| III-B | Sewer replacement/rehabilitation | 4.6 | 7.7 | 16.8 |
| IV-A | New collector sewers and appurtenances | 22.5 | 12.0 | 14.3 |
| IV-B | New interceptor sewers and appurtenances | 18.4 | 11.9 | 14.8 |
| V | Combined sewer overflow correction | 51.7[b] | 49.6 | 50.6 |
| VI | Storm water management programs | 0.1[b] | 8.2[b] | 5.5 |
| **Nonpoint Source Pollution Control Projects** | | | | |
| VII-A | Agriculture (cropland) | 4.7[b] | 4.2[b] | 0.5 |
| VII-B | Agriculture (animals) | 3.4[b] | 2.3[b] | 0.7 |
| VII-C | Silviculture | 3.0[b] | 3.9[b] | 0.04 |
| VII-D | Urban | — | 1.1 | 4.4 |
| VII-E | Groundwater protection: unknown source | 1.4 | 1.1 | 0.9 |
| | Estuaries[c] | 0.01 | 0.04 | — |
| | Wetlands[c] | 0.04 | 0.01 | — |
| VII-F | Marinas | — | — | 0.002 |
| VII-G | Resource extraction | — | — | 0.04 |
| VII-H | Brownfields | — | — | 0.4 |
| VII-I | Storage tanks | — | — | 1.0 |
| VII-J | Sanitary landfills | — | — | 1.8 |
| VII-K | Hydromodification | — | — | 4.1 |
| | Total needs | 172.0 | 154.6 | 181.2 |
| | Treatment categories I and II only | 58.7 | 48.8 | 57.2 |
| | Collection and conveyance categories III and IV only | 48.9 | 35.3 | 54.1 |
| | Category I to V subtotal | 159.3 | 133.7 | 161.9 |

[a] The needs from 1992 and 1996 were inflated to January 2000 dollars for comparison with CWNS 2000 data.
[b] Modeled needs.
[c] Documented needs for estuaries and wetlands were provided by States during the 1992 and 1996 surveys, but they are no longer reported as individual categories.

**Table 9A.14 Number of Treatment Facilities by Level of Treatment**

**Treatment Facilities in Operation in 2000[a,b]**

| Level of Treatment | Number of Facilities | Present Design Capacity (mgd) | Number of People Served | Percent of U.S. Population |
|---|---|---|---|---|
| Less than secondary[c] | 47 | 1,023 | 6,426,062 | 2.3 |
| Secondary | 9,156 | 19,268 | 88,221,896 | 32.0 |
| Greater than secondary | 4,892 | 22,165 | 100,882,207 | 36.6 |
| No discharge[d] | 1,938 | 2,039 | 12,283,047 | 4.5 |
| Partial treatment[e] | 222 | 563 | — | — |
| Total | 16,255 | 45,058 | 207,813,212[f] | 75.4 |

**Treatment Facilities in Operation in 2000 if All Documented Needs Are Met[a,b]**

| Level of Treatment | Number of Facilities | Future Design Capacity (mgd) | Number of People Served | Percent of U.S. Population |
|---|---|---|---|---|
| Less than secondary[c] | 27 | 481 | 3,851,000 | 1.2 |
| Secondary | 9,463 | 20,008 | 103,716,058 | 31.9 |
| Greater than secondary | 5,739 | 26,239 | 140,251,554 | 43.2 |
| No discharge[d] | 2,221 | 2,579 | 21,224,596 | 6.5 |
| Partial treatment[e] | 224 | 734 | — | — |
| Total | 17,674 | 50,041 | 269,043,208[f] | 82.8 |

[a] California, Colorado, New York, and South Dakota did not have the resources to complete the updating of these data.
[b] Results presented in this table for American Samoa, Guam, Nevada, Northern Mariana Islands, Puerto Rico, Virgin Islands, and Wyoming are from the 1996 survey because these States and Territories did not participate in the CWNS 2000.
[c] Less-than-secondary facilities include facilities granted or pending section 301(h) waivers from secondary treatment for discharges to marine waters.
[d] No-discharge facilities do not discharge treated wastewater to the Nation's waterways. These facilities dispose of wastewater via methods such as industrial reuse, irrigation, or evaporation.
[e] These facilities provide some treatment to wastewater and discharge their effluents to wastewater facilities for further treatment and discharge.
[f] This table does not include the results for approximately 3.3 million people (present) and 3.5 million people (future) that are receiving centralized collection because the data related to flow and effluent levels were not complete for the CWNS 2000.

VI Storm water management programs
VII NPS pollution control (see Table A.2 for totals by subcategory)

*Note:* NR, not reported. American Samoa, Guam, Nevada, Northern Mariana Islands, Puerto Rico, Virgin Islands, and Wyoming did not participate in the CWNS 2000.

[a] Estimate is less than $0.5 million.

**Table 9A.16 (Continued)**

| State | Number of Facilities Providing Listed Effluent Level | | | | Population Served by Listed Effluent Level | | | |
|---|---|---|---|---|---|---|---|---|
| | Less than Secondary[a] | Secondary | Greater than Secondary | No Discharge[b] | Less than Secondary[a] | Secondary | Greater than Secondary | No Discharge[b] |
| Virgin Islands[e] | 1 | 10 | 1 | 0 | 19,531 | 58,294 | 50 | 0 |
| Total | 47 | 9,156 | 4,892 | 1,938 | 6,426,062 | 88,221,896 | 100,882,207 | 12,283,047 |

[a] Less-than-secondary facilities include facilities granted or pending section 301(h) waivers from secondary treatment for discharges to marine waters.
[b] No-discharge facilities do not discharge treated wastewater to the Nation's waterways. These facilities dispose of wastewater via methods such as industrial reuse, irrigation, or evaporation.
[c] California, Colorado, New York, and South Dakota did not have the resources to complete updating of these data.
[d] The reported population served for the District of Columbia includes populations from Maryland and Virginia that receive wastewater treatment at the Blue Plains facility in the District of Columbia.
[e] Results presented in this table for American Samoa, Guam, Northern Mariana Islands, Nevada, Puerto Rico, Virgin Islands, and Wyoming are from the 1996 survey because these States and Territories did not participate in the CWNS 2000.

*Source*: From 2000 Clean Watersheds Needs Survey Report to Congress, Published 2003, Appendix C, Table C.7, p. C.10 and C.11. www.epa.gov/owm/mtb/cwns/2000rtc/cwns2000-appendix-c.pdf, www.epa.gov/owm/mtb/cwns/2000rtc/toc.htm.

**Table 9A.17 Typical Wastewater Pollutants of Concern**

| Pollutant | Reason for Concern |
|---|---|
| Total suspended solids (TSS) and turbidity (NTU) | In surface waters, suspended solids can result in the development of sludge deposits that smother benthic macroinvertebrates and fish eggs and can contribute to benthic enrichment, toxicity, and sediment oxygen demand. Excessive turbidity (colloidal solids that interfere with light penetration) can block sunlight, harm aquatic life (e.g., by blocking sunlight needed by plants), and lower the ability of aquatic plants to increase dissolved oxygen in the water column. In drinking water, turbidity is aesthetically displeasing and interferes with disinfection |
| Biodegradable organics (BOD) | Biological stabilization of organics in the water column can deplete dissolved oxygen in surface waters, creating anoxic conditions harmful to aquatic life. Oxygen-reducing conditions can also result in taste and odor problems in drinking water |
| Pathogens | Parasites, bacteria, and viruses can cause communicable diseases through direct/indirect body contact or ingestion of contaminated water or shellfish. A particular threat occurs when partially treated sewage pools on ground surfaces or migrates to recreational waters. Transport distances of some pathogens (e.g., viruses and bacteria) in groundwater or surface waters can be significant |
| Nitrogen | Nitrogen is an aquatic plant nutrient that can contribute to eutrophication and dissolved oxygen loss in surface waters, especially in lakes, estuaries, and coastal embayments. Algae and aquatic weeds can contribute trihalomethane (THM) precursors to the water column that may generate carcinogenic THMs in chlorinated drinking water. Excessive nitrate-nitrogen in drinking water can cause methemoglobinemia in infants and pregnancy complications for women. Livestock can also suffer health impacts from drinking water high in nitrogen |
| Phosphorus | Phosphorus is an aquatic plant nutrient that can contribute to eutrophication of inland and coastal surface waters and reduction of dissolved oxygen |
| Toxic organics | Toxic organic compounds present in household chemicals and cleaning agents can interfere with certain biological processes in alternative OWTSs. They can be persistent in groundwater and contaminate downgradient sources of drinking water. They can also cause damage to surface water ecosystems and human health through ingestion of contaminated aquatic organisms (e.g., fish, shellfish) |
| Heavy metals | Heavy metals like lead and mercury in drinking water can cause human health problems. In the aquatic ecosystem, they can also be toxic to aquatic life and accumulate in fish and shellfish that might be consumed by humans |
| Dissolved inorganics | Chloride and sulfide can cause taste and odor problems in drinking water. Boron, sodium, chlorides, sulfate, and other solutes may limit treated wastewater reuse options (e.g., irrigation). Sodium and to a lesser extent potassium can be deleterious to soil structure and SWIS performance |

**Table 9A.18 Wastewater Constituents of Concern and Representative Concentrations in the Effluent of Various Treatment Units**

| | | Tank-Based Treatment Unit Effluent Concentrations | | | | | |
|---|---|---|---|---|---|---|---|
| **Constituents of Concern** | **Example Direct or Indirect Measures (Units)** | **Domestic STE[a]** | **Domestic STE with N-Removal Recycle[b]** | **Aerobic Unit Effluent** | **Sand Filter Effluent** | **Foam or Textile Filter Effluent** | **SWIS Percolate into Groundwater at 3 to 5 ft Depth (% Removal)** |
| Oxygen demand | $BOD_5$ (mg/L) | 140–200 | 80–120 | 5–50 | 2–15 | 5–15 | >90 |
| Particulate solids | TSS (mg/L) | 50–100 | 50–80 | 5–100 | 5–20 | 5–10 | >90 |
| Nitrogen | Total N (mg N/L) | 40–100 | 10–30 | 25–60 | 10–50 | 30–60 | 10–20 |
| Phosphorus | Total P (mg P/L) | 5–15 | 5–15 | 4–10 | $<1$–$10^4$ | 5–$15^4$ | 0–100 |
| Bacteria (e.g., *Clostridium perfringens, Salmonella Shigella*) | Fecal coliform (organisms per 100 mL) | $10^6$–$10^8$ | $10^6$–$10^8$ | $10^3$–$10^4$ | $10^1$–$10^3$ | $10^1$–$10^3$ | >99.99 |
| Virus (e.g., hepatitis, polio, echo, coxsackie, coliphage) | Specific virus (pfu/mL) | 0–$10^5$ (episodically present at high levels) | 0–$10^5$ (episodically present at high levels) | 0–$10^5$ (episodically present at high levels) | 0–$10^5$ (episodically present at high levels) | 0–$10^5$ (episodically present at high levels) | >99.9% |
| Organic chemicals (e.g., solvents, petrochemicals, pesticides) | Specific organics or totals (μg/L) | 0 to trace levels (?) | 0 to trace levels (?) | 0 to trace levels (?) | 0 to trace levels (?) | 0 to trace levels (?) | >99% |
| Heavy metals (e.g., Pb, Cu, Ag, Hg) | Individual metals (μg/L) | 0 to trace levels | 0 to trace levels | 0 to trace levels | 0 to trace levels | 0 to trace levels | >99% |

[a] Septic tank effluent (STE) concentrations given are for domestic wastewater. However, restaurant STE is markedly higher particularly in BOD, COD, and suspended solids while concentrations in graywater STE are noticeably lower in total nitrogen.

[b] N-removal accomplished by recycling STE through a packed bed for nitrification with discharge into the influent end of the septic tank for denitrification.

**Table 9B.24 Common Sewer Cleaning Methods**

| Technology | Uses and Applications |
|---|---|
| **Mechanical** | |
| Rodding | Uses an engine and a drive unit with continuous rods or sectional rods. As blades rotate they break up grease deposits, cut roots, and loosen debris<br>Rodders also help thread the cables used for TV inspections and bucket machines<br>Most effective in lines up to 300 mm (12 in.) in diameter |
| Bucket machine | Cylindrical device, closed on one end with 2 opposing hinged jaws at the other<br>Jaws open and scrape off the material and deposit it in the bucket<br>Partially removes large deposits of silt, sand, gravel, and some types of solid waste |
| **Hydraulic** | |
| Balling | A threaded rubber cleaning ball that spins and scrubs the pipe interior as flow increases in the sewer line<br>Removes deposits of settled inorganic material and grease build-up<br>Most effective in sewers ranging in size from 13 to 60 cm (5–24 in.) |
| Flushing | Introduces a heavy flow of water into the line at a manhole. Removes floatables and some sand and grit<br>Most effective when used in combination with other mechanical operations, such as rodding or bucket machine cleaning |
| Jetting | Directs high velocities of water against pipe walls. Removes debris and grease build-up, clears blockages, and cuts roots within small diameter pipes<br>Efficient for routine cleaning of small diameter, low flow sewers |
| **Technology** | **Applications** |
| Scooter | Round, rubber-rimmed, hinged metal shield that is mounted on a steel framework on small wheels. The shield works as a plug to build a head of water<br>Scours the inner walls of the pipe lines<br>Effective in removing heavy debris and cleaning grease from line |
| Kites, bags, and poly pigs | Similar in function to the ball<br>Rigid rims on bag and kite induce a scouring action<br>Effective in moving accumulations of decayed debris and grease downstream |
| Silt traps | Collect sediments at convenient locations<br>Must be emptied on a regular basis as part of the maintenance program |
| Grease traps and sand/oil interceptors | The ultimate solution to grease build-up is to trap and remove it<br>These devices are required by some uniform building codes and/or sewer-use ordinances. Typically sand/oil interceptors are required for automotive business discharge<br>Need to be thoroughly cleaned to function properly<br>Cleaning frequency varies from twice a month to once every 6 months, depending on the amount of grease in the discharge<br>Need to educate restaurant and automobile businesses about the need to maintain these traps |
| **Chemicals**<br>Before using these chemicals review the material safety data sheets (MSDS) and consult the local authorities on the proper use of chemicals as per local ordinance and the proper disposal of the chemicals used in the operation. If assistance or guidance is needed regarding the application of certain chemicals, contact the U.S. EPA or state water pollution control agency | Used to control roots, grease, odors ($H_2S$ gas), concrete corrosion, rodents and insects<br>Root control — Longer lasting effects than power rodder (approximately 2–5 years)<br>$H_2S$ gas — Some common chemicals used are chlorine ($Cl_2$), hydrogen peroxide ($H_2O_2$), pure oxygen ($O_2$), air, lime ($Ca(OH_2)$), sodium hydroxide (NaOH), and iron salts<br>Grease and soap problems — Some common chemicals used are bioacids, digester, enzymes, bacteria cultures, catalysts, caustics, hydroxides, and neutralizers |

**Table 9B.25 Frequency of Maintenance Activities for Sewer Lines**

| Activity | Average (% of system/year) |
|---|---|
| Cleaning | 29.9 |
| Root removal | 2.9 |
| Manhole inspection | 19.8 |
| CCTV inspection | 6.8 |
| Smoke testing | 7.8 |

*Source*: From ASCE, 1998; USEPA, *Collection Systems, O&M Fact Sheet, Sewer Cleaning and Inspection*, Office of Water, Municipal Technology Branch, Table 2 (EPA/823/f-99/031), September 1999. www.epa.gov/owm/mtb/sewcl.pdf.

**Table 9B.26 Limitations of Standard Inspection Techniques for Sewer Lines**

| Inspection Technique | Limitations |
|---|---|
| Visual inspection | In smaller sewers, the scope of problems detected is minimal because the only portion of the sewer that can be seen in detail is near the manhole. Therefore, any definitive information on cracks or other structural problems is unlikely. However, this method does provide information needed to make decisions on rehabilitation |
| Camera inspection | When performing a camera inspection in a large diameter sewer, the inspection crew is essentially taking photographs haphazardly, and as a result, the photographs tend to be less comprehensive |
| Closed circuit television (CCTV) | This method requires late night inspection and as a result the TV operators are vulnerable to lapses in concentration. CCTV inspections are also quite expensive and time-consuming |
| Lamping inspection | The video camera does not fit into the pipe and during the inspection it remains only in the maintenance hole. As a result, only the first 10 ft of the pipe can be viewed or inspected using this method |

*Source*: From Water Pollution Control Federation, 1989; USEPA, *Collection Systems, O&M Fact Sheet, Sewer Cleaning and Inspection*, Office of Water, Municipal Technology Branch, Table 3 (EPA/823/F-99/031), September 1999. www.epa.gov/owm/mtb/-sewcl.pdf.

**Table 9B.27 Limitations of Cleaning Methods for Sewer Lines**

| Cleaning Method | Limitations |
|---|---|
| Balling, jetting, scooter | In general, these methods are only successful when necessary water pressure or head is maintained without flooding basements or houses at low elevations. Jetting—The main limitation of this technique is that caution needs to be used in areas with basement fixtures and in steep-grade hill areas. Balling—Balling cannot be used effectively in pipes with bad offset joints or protruding service connections because the ball can become distorted<br>Scooter—When cleaning larger lines, the manholes need to be designed to a larger size in order to receive and retrieve the equipment. Otherwise, the scooter needs to be assembled in the manhole. Caution also needs to be used in areas with basement fixtures and in steep-grade hill areas |
| Bucket, machine | This device has been known to damage sewers. The bucket machine cannot be used when the line is completely plugged because this prevents the cable from being threaded from one manhole to the next. Set-up of this equipment is time-consuming |
| Flushing | This method is not very effective in removing heavy solids. Flushing does not remedy this problem because it only achieves temporary movement of debris from one section to another in the system |
| High velocity cleaner | The efficiency and effectiveness of removing debris by this method decreases as the cross-sectional areas of the pipe increase. Backups into residences have been known to occur when this method has been used by inexperienced operators. Even experienced operators require extra time to clear pipes of roots and grease |
| Kite or bag | When using this method, use caution in locations with basement fixtures and steep-grade hill areas |
| Rodding | Continuous rods are harder to retrieve and repair if broken and they are not useful in lines with a diameter of greater than 300 mm (0.984 ft) because the rods have a tendency to coil and bend. This device also does not effectively remove sand or grit, but may only loosen the material to be flushed out at a later time |

**Table 9B.28 Comparison of Various Sewer Rehabilitation Techniques**

| Method | | Diameter Range (mm) | Maximum Installation (m) | Liner Material |
|---|---|---|---|---|
| In-line expansion | Pipe bursting | 100–600 (4–24 in.) | 230 (750 ft) | PE, PP, PVC, GRP |
| Sliplining | Segmental | 100–4,000 (4–158 in.) | 300 (1,000 ft) | PE, PP, PVC, GRP (−EP & −UP) |
| | Continuous | 100–1,600 (4–63 in.) | 300 (1,000 ft) | PE, PP, PE/EPDM, PVC |
| | Spiral wound | 150–2,500 (6–100 in.) | 300 (1,000 ft) | PE, PVC, PP, PVDF |
| Cured-in-place Product linings | Inverted-in-place | 100–2,700 (4–108 in.) | 900 (3,000 ft) | Thermoset Resin/fabric composite |
| | Winched-in-place | 100–1,400 (4–54 in.) | 150 (500 ft) | Thermoset resin/fabric composite |
| | Spray-on-linings | 76–4,500 (3–180 in.) | 150 (500 ft) | Epoxy resins/cement mortar |
| Modified cross-sectional methods | Fold and form | 100–400 (4–15 in.) | 210 (700 ft) | PVC |
| | Deformed/reformed | 100–400 (4–15 in.) | 800 (2,500 ft) | (Thermoplastics) HDPE (thermoplastics) |
| | Drawdown | 62–600 (3–24 in.) | 300 (1,000 ft) | HDPE, MDPE |
| | Rolldown | 62–600 (3–24 in.) | 300 (1,000 ft) | HDPE, MDPE |
| | Thin-walled lining | 500–1,100 (20–46 in.) | 960 (3,000 ft) | HDPE |
| Internal point Repair | Robotic repair | 200–760 (8–30 in.) | N/A | Exopy resins Cement mortar |
| | Grouting/sealing & spray-on | N/A | N/A | Chemical grouting |
| | Link seal | 100–600 (4–24 in.) | N/A | Special sleeves |
| | Point CIPP | 100–600 (4–24 in.) | 15 (50 ft) | Fiberglass/polyester, etc |

*Note:* Spiral wound sliplining, robotic repair, and point CIPP can only be used only with gravity pipeline. All other methods can be used with both gravity and pressure pipeline. EPDM, ethylene polypelene diene monomer; GRP, glassfiber reinforced polyester; HDPE, high density polyethylene; MDPE, medium density polyethylene; PE, polyethylene; PP, polypropylene; PVC, poly vinyl chloride; PVDF, poly vinylidene chloride.

**Table 9B.29 Limitations of Trenchless Sewer Rehabilitation Techniques**

| Method | Limitations |
|---|---|
| Pipe bursting | Bypass or diversion of flow required |
| | Insertion pit required |
| | Percussive action can cause significant ground movement may not be suitable for all materials |
| Sliplining | Insertion pit required |
| | Reduces pipe diameter |
| | Not well suited for small diameter pipes |
| CIPP | Bypass or diversion of flow required |
| | Curing can be difficult for long pipe segments |
| | Must allow adequate curing time |
| | Defective installation may be difficult to rectify |
| | Resin may clump together on bottom of pipe |
| | Reduces pipe diameter |
| Modified cross section | Bypass or diversion of flow required |
| | The cross section may shrink or unfold after expansion |
| | Reduces pipe diameter |
| | Infiltration may occur between liner and host pipe unless sealed |
| | Liner may not provide adequate structural support |

*Source*: From USEPA, *Collection Systems, O&M Fact Sheet, Trenchless Sewer Rehabilitation*, Office of Water, Municipal Technology Branch, Table 2 (EPA/823/F-99/0032), September 1999. www.epa.gov/owm/mtb/rehabl.pdf.

**Table 9B.30 Characteristics of Common Force Main Pipe Materials**

| Material | Application | Key Advantages | Key Disadvantages |
|---|---|---|---|
| Cast or ductile iron, cement lined | High pressure available sizes of 4–54 in. | Good resistance to pressure surges | More expensive than concrete and fiberglass |
| Steel, cement lined | High pressure all pipe sizes | Excellent resistance to pressure surges | More expensive than concrete and fiberglass |
| Asbestos cement | Moderate pressure for 36-in. + pipe sizes | No corrosion slow grease buildup | Relatively brittle |
| Fiberglass reinforced epoxy pipe | Moderate pressure for up to 36-in. pipe sizes | No corrosion slow grease buildup | 350 psi max pressure |
| Plastic | Low pressure for up to 36-in. pipe sizes | No corrosion slow grease buildup | Suitable for small pipe sizes and low pressure only |

**Table 9B.47 Wastewater Characteristics Affecting Chlorination Performance**

| Wastewater Characteristic | Effects on Chlorine Disinfection |
|---|---|
| Ammonia | Forms chloramines when combined with chlorine |
| Biochemical oxygen demand (BOD) | The degree of interference depends on their functional groups and chemical structures |
| Hardness, iron, nitrate | Minor effect, if any |
| Nitrite | Reduces effectiveness of chlorine and results in THMs |
| pH | Affects distribution between hypochlorous acid and hypochlorite ions and among the various chloramine species |
| Total suspended solids | Shielding of embedded bacteria and chlorine demand |

*Source*: From Darby et al., with permission from the water environment research foundation, 1995; USEPA, *Wastewater Technology Fact Sheet, Chlorine Disinfection*, Office of Water, Municipal Technology Branch, Table 2 (EPA/823/F-99/063) September 1999. www.epa.gov/owm/mtb/chlo.pdf.

**Table 9B.48 Wastewater Characteristics Affecting Ultraviolet Disinfection Performance**

| Wastewater Characteristic | Effects on UV Disinfection |
|---|---|
| Ammonia | Minor effect, if any |
| Nitrite | Minor effect, if any |
| Nitrate | Minor effect, if any |
| Biochemical oxygen demand (BOD) | Minor effect, if any. Although, if a large portion of the BOD is humic and/or unsaturated (or conjugated) compounds, then UV transmittance may be diminished |
| Hardness | Affects solubility of metals that can absorb UV light. Can lead to the precipitation of carbonates on quartz tubes |
| Humic materials, iron | High absorbency of UV radiation |
| pH | Affects solubility of metals and carbonates |
| TSS | Absorbs UV radiation and shields embedded bacteria |

*Source*: From USEPA, *Wastewater Technology Fact Sheet, Ultraviolet Disinfection*, Office of Water, Municipal Technology Branch, Table 2 (EPA/823/F-99/064) September 1999. www.epa.gov/owm/mtb/uv.pdf.

**Table 9B.49 Comparison of Design and Operating Parameters, Land Treatment Systems**

| Parameters | Irrigation | Overland Flow | Rapid Infiltration |
|---|---|---|---|
| Weekly application rate (in.) | 0.5–4.0 | 2.4–6.0 | 4–96 |
| Annual application rate (ft) | 2–18 | 8–40 | 20–410 |
| Estimated land required for 100,000 gpd (acres) | 20–25 | 5–10 | 1–7 |
| Minimum preapplication treatment requirements | Lagoons | Screening and grit removal | Lagoons |
| Climate restrictions | Storage needed for cold and wet climates | Storage needed for cold and wet climates | Cold weather may reduce hydraulic loading cycles |
| Slopes | $<$20% | Smooth sloes of 2–8% | Not critical |
| Soil permeability | Slow to moderate | Impermeable (clays, silts, soils with impermeable barriers) | Rapid |

**Table 9B.50 Design Criteria for Rapid Land Infiltration Land Treatment**

| Item | Range |
|---|---|
| Basin infiltration area | 0.3–5.5 ha/$10_3m_3$/d (3–56 acres/MGD) |
| Hydraulic loading rate | 6–90 m/yr (20–300 ft/yr) [6–92 $m_3/m_2$/yr (150–2250 gal/$ft_2$/yr)] |
| BOD loading | 22–112 kg/ha/d (20–100 lb/acre/d) |
| Soil depth | At least 3–4.5 m (10–15 ft) |
| Soil permeability | At least 1.5 cm/h (0.6 in./h) |
| Wastewater application period | 4 h to 2 wks |
| Drying period | 8 h to 4 wks |
| Soil texture | Coarse sands, sandy gravels |
| Individual basin size (at least 2 basins in parallel) | 0.4–4 ha (1–10 acres) |
| Height of dikes | 0.15 m (0.5 ft) above maximum expected water level |
| Application method | flooding or sprinkling |
| Pretreatment required | primary or secondary |

**Table 9B.55 Factors Affecting Gravity Thickening Performance**

| Factor | Effect |
|---|---|
| Nature of the solids feed | Affects the thickening process because some solids thicken more easily than others |
| Freshness of feed solids | High solids age can result in septic conditions |
| High volatile solids concentrations | Hamper gravity settling due to reduced particle specific gravity |
| High hydraulic loading rates | Increase velocity and cause turbulence that will disrupt settling and carry the lighter solids past the weirs |
| Solids loading rate | If rates are high, there will be insufficient detention time for settling. If rates are too low, septic conditions may arise |
| Temperature and variation in temperature of thickener contents | High temperatures will result in septic conditions. Extremely low temperatures will result in lower settling velocities. If temperature varies, settling decreases due to stratification |
| High solids blanket depth | Increases the performance of the settling by causing compaction of the lower layers, but it may result in solids being carried over the weir |
| Solids residence time | An increase may result in septic conditions. A decrease may result in only partial settling |
| Mechanism and rate of solids withdrawal | Must be maintained to produce a smooth and continuous flow. Otherwise, turbulence, septic conditions, altered settling, and other anomalies may occur |
| Chemical treatment | Chemicals—such as potassium permanganate, polymers, or ferric chloride—may improve settling and/or supernatant quality |
| Presence of bacteriostatic agents or oxidizing agents | Allows for longer detention times before anaerobic conditions create gas bubbles and floating solids |
| Cationic polymer addition | Helps thicken waste-activated solids and clarify the supernatant |
| Use of metal salt coagulants | Improves overflow clarity but may have little impact on underflow concentration |

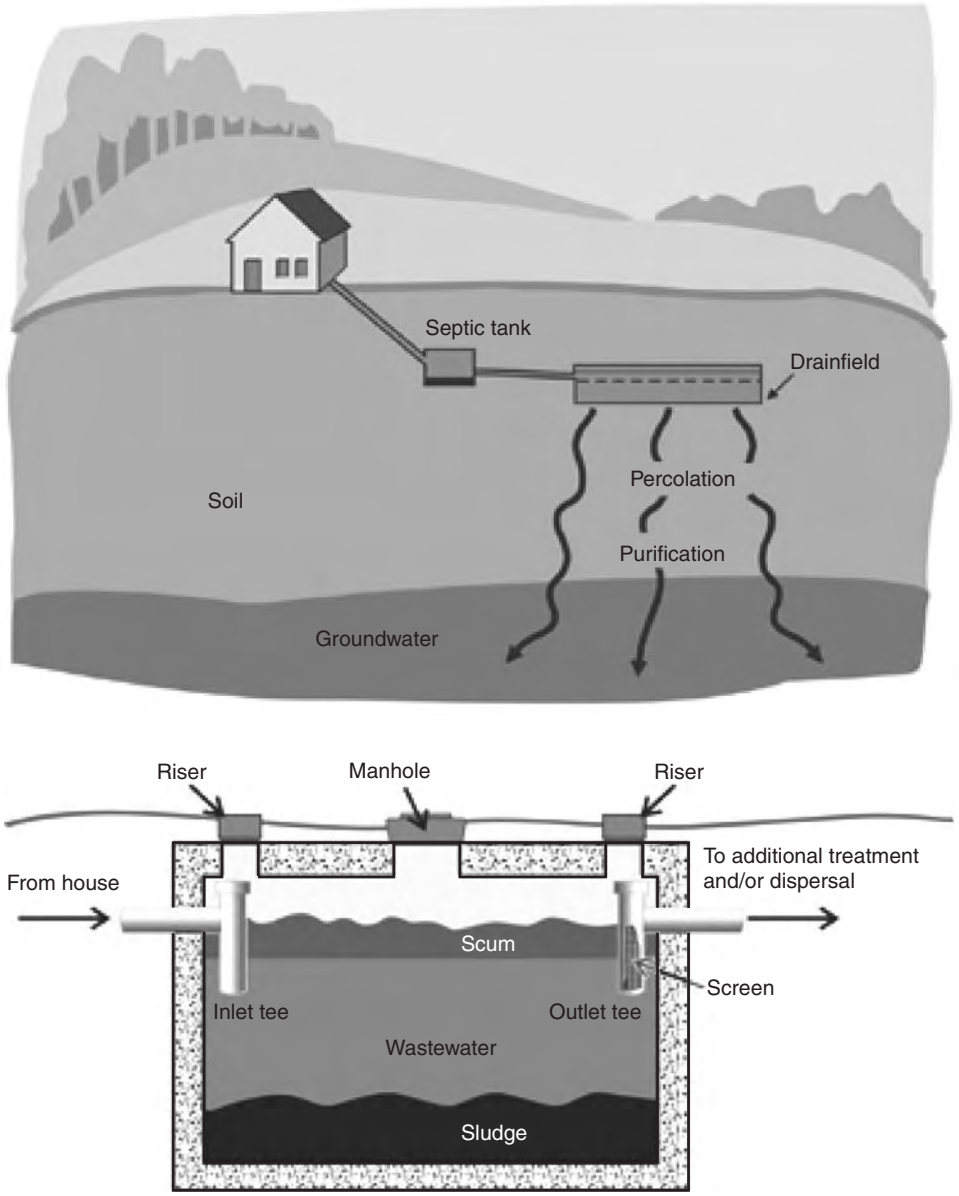

**Figure 9C.18** Conventional system. (From USEPA website. www.epa.gov.)

**Table 9C.60 Types of Decentralized Wastewater Treatment Systems**

| Type of System | Description |
|---|---|
| Individual on-site systems | Systems that serve an individual residence and can range from conventional septic tank/drainfield systems to systems composed of complex mechanical treatment trains |
| Cluster systems | Wastewater collection and treatment systems that serve two or more dwellings or buildings, but less than an entire community, on a suitable site near the served structures |
| Commercial, residential, institutional, and recreational facilities | Systems designed to treat larger and sometimes more complex wastewater sources from commercial buildings (e.g. restaurants), apartments, or institutional or recreational facilities |

*Source*: From USEPA, *Draft Handbook for Management of On-Site and Clustered (Decentralized) Wastewater Treatment Systems*, Office of Water, Table 1.1, p. 12 (EPA/PA 823/P-03/001), February 2003.

**Table 9C.61 Characteristics of Septage Conventional Parameters**

| Concentration Parameter | Minimum | Maximum |
|---|---|---|
| Total solids | 1,132 | 130,475 |
| Total volatile solids | 353 | 71,402 |
| Total suspended solids | 310 | 93,378 |
| Volatile suspended | 95 | 51,500 |
| Biochemical oxygen demand | 440 | 78,600 |
| Chemical oxygen demand | 1,500 | 703,000 |
| Total kjeldahl nitrogen | 66 | 1,060 |
| Ammonia nitrogen | 3 | 116 |
| Total phosphorus | 20 | 760 |
| Alkalinity | 522 | 4,190 |
| Grease | 208 | 23,368 |
| $P^H$ | 1.5 | 12.6 |
| Total coliform | $10^7$/100 mL | $10^9$/100 mL |
| Fecal coliform | $10^6$/100 mL | $10^8$/100 mL |

*Note:* The measurements above are in mg/L unless otherwise indicted.

*Source*: From USEPA, 1994; USEPA, *Decentralized Systems, Technology Fact Sheet, Septage Treatment/Disposal*, Office of Water, Table 1 (EPA/823/F-99/068), September 1999. www.epa.gov/owm/mtb/septage.pdf.

**Table 9C.62 Sources of Septage**

| Description Rate | Removal Pump-out | Characteristics |
|---|---|---|
| Septic tank | 2–6 years, but can vary with location local ordinances | Concentrated BOD, solids, nutrients, variable toxins (such as metals), inorganics (sand), odor, pathogens, oil, and grease |
| Cesspool | 2–10 years | Concentrated BOD, solids, nutrients, variable toxins, inorganics, sometimes high grit, odor, pathogens, oil, and grease |
| Privies/portable toilets | 1 week to months | Variable BOD, solids, inorganics, odor, pathogens, and some chemicals |
| Aerobic tanks | Months to 1 year | Variable BOD, inorganics, odor, pathogens, and concentrated solids |
| Holding tanks (septic tank with no drain-field, typically a local requirement | Days to weeks | Variable BOD, solids, inorganics, odor, and pathogens, similar to raw wastewater solids |
| Dry pits (associated with septic fields) Miscellaneous may exhibit characteristics of septage | 2–6 years | Variable BOD, solids, inorganics, and odor |
| Private wastewater treatment plants | Variable | Septic tank |
| Boat pump-out station | Variable | Portable toilets |
| Grit traps | Variable | Oil, grease, solids, inorganics, odor, and variable BOD |
| Grease traps | Weeks to months | Oil, grease, BOD, viscous solids, and odor |

**Table 9C.67 Design Parameters for Continuous-Flow, Suspended Growth Systems Extended Aeration Package Plant**

| Parameter | Extended Aeration |
|---|---|
| Pretreatment (if needed) | Septic tank or equivalent |
| Mixed liquor suspended solids (mg/L)a | 2,000–6,000 |
| F/M Load (lb BOD/d/MLVSS), | 0.05–0.15 |
| Hydraulic retention time (h) | 24–120 |
| Solids retention time (days) | 20–40 |
| Mixing power inpuf | 0.2–3.0 hp/1,000 $ft^3$ |
| Clarifier overflow rate (gpd/$ft^2$) | 200–400 avg., 800 peak |
| Clarifier solids loading (lb/d/$ft^2$) | 30 avg., 50 peak |
| Dissolved oxygen (mg/L) | >2.0 |
| Residuals generated | 0.6–0.9 lb TSS/Lb BOD removed |
| Sludge removal | 3–6 months as needed |

*Source*: From USEPA, *On-site Wastewater Treatment Systems Manual Technology Fact Sheet 1, Table 1.1, Continuous-flow, Suspended growth systems (CFSGAS)*, Office of Water, Office of Research and Development, EPA, (EPA/625/ R-00/0008). www.epa.gov/ord/NRMRL/Pubs/625R00008/6250R0008totaldocument.pdf.

**Table 9C.68 Common Operational Problems of Extended Aeration Package Plants**

| Observation | Cause | Remedy |
|---|---|---|
| Excessive local turbulence | Diffuser plugging | Remove and clean |
| In aeration tank | Pipe breakage | Replace as required |
| | Excessive aeration | Throttle blower |
| White, thick, billowy foam on aeration tank | Insufficient MLSS | Avoid wasting solids |
| Thick, scummy, dark tan foam on aeration tank | High MLSS | Waste solids |
| Dark brown/black foam and mixed liquor in aeration tank | Anaerobic conditions Aerator failure | Check aeration system, aeration tank DO |
| Billowing sludge washout in clarifier | Hydraulic or solids overload | Waste sludge; check flow to unit |
| | Bulking sludge | See EPA, 1977 |
| Clumps of rising sludge in clarifier | Denitrification | Increase sludge return rate to decrease sludge retention time in clarifier |
| | Septic conditions in clarifier | Increase return rate |
| Fine dispersed floc, turbid effluent | Turbulence in aeration tank | Reduce power input |
| | Siudae age too high | Waste sludae |
| Poor TSS and/or BOD removal | Excess flow and strength variations | Install flow smoothing system |
| Poor nitrification | Low temperatures | Insulate, upgrade to high biomass, etc |
| | Excessive biocide use | Reduce biocide loading |

*Source*: From USEPA, *On-site Wastewater Treatment Systems Manual Technology Fact Sheet 1, Table 1.2, Continuous-flow, suspended growth systems (CFGAS)*, Office of Water, Office of Research and Development, EPA, (EPA/625/R-00/0008). www.epa.gov/ord/NRMRL/Pubs/625R00008/625R00008totaldocument.pdf.

**Table 9C.69 Design Parameters for Fixed Film Systems**

| Parameter | Trickling Filter | RBC |
|---|---|---|
| Pretreatment | Septic tank (primary clarifier) | Septic tank (primary clarifier) |
| Surface hydraulic loading | 10–25 gal/d-ft$^2$ | N/A |
| Organic loading[a] | 5–20 lb BOD/d-ft$^2$ (3–10 Lb BOD/d-ft$^2$ to nitrify) | 2.5 lb SBOD/d-1,000 ff (6.4 lb BOD/d-1,000 ft$^2$) |
| *Clarifier overflow rate* | | |
| Average flow | 600–800 gal/d-ft$^2$ | 600–800 gal/d-ft$^2$ |
| Peak flow | 1,000–1,200 gal/d-ft$^2$ | 1,000–1,200 gal/d-ft' |
| *Clarifier TSS loading rate* | | |
| Average flow | 0.8–1.2 LbTSS/d-ft' | 0.8–1.2 Lb TSS *Id-ft*$^2$ |
| Peak flow | 2.0 Lb TSS *Id-W* | 2.0 Lb TSS *Id-ft'* |
| Recirculation | Optional | Optional |
| Sludge generated[b] | 0.6–1.1 Lb TSS lib BOD removed | 0.6–1.1 Lb TSS lib BOD removed |

[a] Loading rates for RBC are expressed per 1,000 ft$^2$ of total disk surface.
[b] Sludge generated is in addition to solids removed in septic tank.

*Source*: From USEPA, *On-site Wastewater Treatment Systems Manual Technology Fact Sheet 2, Table 1, Fixed Film Processes, Office of Water*, Office of Research and Development, EPA, (EPA/625/R-00/0008). www.epa.gov/ord/NRMRL/Pubs/625R00008/625R00008total document.pdf.

**Table 9C.70 Design Parameters for IF-Type Sequencing Batch Reactors Systems Treatment Systems**

| Parameter | SBR Systems |
|---|---|
| Pretreatment | Septic tank or equivalent |
| Mixed liquor suspended solids (mg/L) | 2,000–6,500 |
| F/M load (Lb BOD/d/MLVSS) | 0.04–0.20 |
| Hydraulic retention time (h) | 9–30 |
| Total cycle times (h)[a] | 4–12 |
| Solids retention time (days) | 20–40 |
| Decanter overflow ratea (gpm/ff) | $<$100 |
| Sludge wasting | As needed to maintain performance |

[a] Cycle times should be tuned to effluent quality requirements, wastewater flow, and other site constraints.

*Source*: From USEPA, *On-site Wastewater Treatment Systems Manual Technology Fact Sheet 3,Sequencing Batch Reactors Systems*, Office of Water, Office of Research and Development, EPA, (EPA/625/R-00/0008). www.epa.gov/ord/NRMRL/Pubs/625R00008/625R00008total document.pdf.

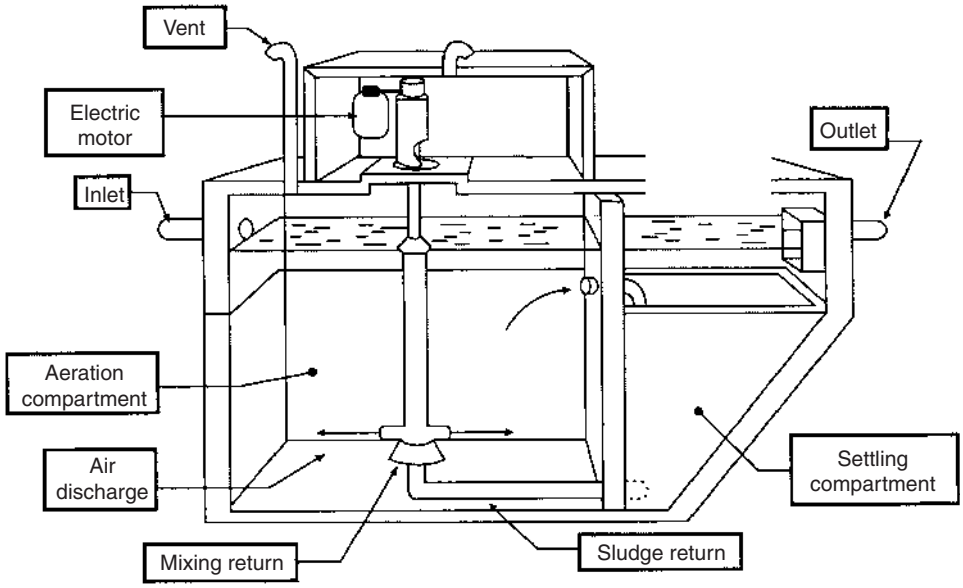

**Figure 9C.20** Components of a typical aerobic treatment system. (From USEPA, *Draft Handbook for Management of On-site and Clustered (Decentralized) Wastewater Treatment Systems*, Office of Water, Figure 3 (EPA/PA 823/P-03/001), February 2003. www.epa.gov/ord/NRMRL/Pubs/625R00008/625R00008totaldocument.pdf.)

**Table 9C.71 Chlorine Disinfection Dose (in mg/L) Design Guidelines for On-Site Applications**

| Calcium Hypochlorite | Septic Tank Effluent | Biological Treatment Effluent | Sand Filter Effluent |
|---|---|---|---|
| pH 6 | 35–50 | 15–30 | 2–10 |
| pH 7 | 40–55 | 20–35 | 10–20 |
| pH 8 | 50–65 | 30–45 | 20–35 |

*Note:* Contact time = 1 h at average flow and temperature 20 °C. Increase contact time t 02 h at 10 °C and 8 h at 5 °C for comparable efficiency. Dose = mg/L as CI. Doses assume typical chlorine demand and are conservative estimates based on fecal coliform data.

*Source*: From USEPA, *On-site Wastewater Treatment Systems Manual Technology Fact Sheet 4, Table 1, Effluent Disinfection Processes*, Office of Water, Office of Research and Development, EPA, (EPA/625/R-00/0008). www.epa.gov/ord/NRMRL/Pubs/625R00008/625R00008total document.pdf.

**Table 9C.72 Typical Design Guidance for Aquatic System**

| Parameter | Facultative Lagoon | Aerated Lagoon | FWS Constructed Wetland |
|---|---|---|---|
| HRT (days) | 30–180 | 3 (max) | 6 (min) |
| Power (hp/1 06gal) | 0 | 30 | 0 |
| Depth (ft) | 3–5 | 10 | 2–5 |
| Minimum no. of celis | 3 | 2 | 3 |
| BOD loading (Lb/acre-day) | 20–60 | 200–600 | 40–53 |
| TSS loading (Lb/acre-day) | N/A | N/A | 27–45 |

*Source*: From USEPA, *On-site Wastewater Treatment Systems Manual Technology Fact Sheet 7, Table 1, Stabilization Ponds, FWS Constructed Wetlands, and Other Aquatic Systems*, Office of Water, Office of Research and Development, EPA, (EPA/625/R-00/0008). www.epa.gov/ord/NRMRL/Pubs/625R00008/625R00008total document.pdf.

**Table 9C.73 Typical N-Removal Ranges for Managed Systems**

| Process | Percent TN Removal |
|---|---|
| RSF | 40–50 |
| RSF (with recycle to ST or AUF) | 70–80 |
| ST-FFS (with recycle to ST or AUF)[a] | 65–75 |
| SBR[a] | 50–80 |
| SS and removal | 60–80 |
| (SS-TT R)[a] | 40–60 |
| ISF-AUF | 55–75 |

*Note:* RSF, recirculating sand filters; AUF, anaerobic upflow filter; ST, septic tank; FFS, fixed film system; SBR, sequencing batch reactor; SS, source separation; TT, treatment applied to both systems; R, recombined; ISF, intermittent sand filter.

[a] Commercially available systems.

*Source*: From USEPA, *On-site Wastewater Treatment Systems Manual Technology Fact Sheet 10, Table 1, Enhanced Nutrient Removal-Nitrogen*, Office of Water, Office of Research and Development, EPA, (EPA/625/R-00/0008). www.epa.gov/ord/NRMRL/Pubs/625R00008/625R00008total document.pdf.

**Table 9C.74 Types of Mass Loadings to Subsurface Wastewater Infiltrations Systems**

| Mass Loading Type | Units | Typical Loading Rates |
|---|---|---|
| *Hydraulic* | | |
| Daily | Volume per day per unit area of boundary surface | *Septic tank effluent*: 0.15–1.0 gpd/ft$^2$ (0.6–4.0 cm/d)<br>*Secondary effluent*: 0.15→2.0 gpd/ft$^2$ (0.6→8.0 cm/d) |
| Instantaneous | Volume per dose per unit area of boundary surface | 1/24–1/8 of the average daily wastewater volume |
| Contour (Linear) | Volume per day per unit length of boundary surface contour (which can be a critical design parameter in areas with high water tables) | Depends on soil $K_{sai}$[a], maximum allowable thickness of saturated zone, and slope of the boundary surface (see section 5.3) |
| *Constituent* | | |
| Organic | Mass of BOD per day unit area of boundary surface | 0.2–5.0 Lb BOD/1,000 ft$^2$ (1.0–29.4.4 kg BOD/1,000 m$^2$) |
| Other pollutants | Mass of specific wastewater pollutant of concern per unit area of boundary surface (e.g., number of fecal coliforms, mass of nitratre nitrogen, etc | Variable with the constituent, its fate and transport and the considered risk it imposes |

[a] $K_{sai}$ is the saturated conductivity of the soil.

**Table 10A.1 Causes of Damage to the Quality of Water Resources**

| Types of Waste | Wastewater Sources | Water-Quality Measures | Effects on Water Quality | Effects on Aquatic Life | Effects on Recreation |
|---|---|---|---|---|---|
| Disease-carrying agents — human feces, warm-blooded animal feces | Municipal discharges, watercraft discharges, urban runoff, agricultural runoff, feedlot wastes, combined sewer overflows, industrial discharges | Fecal coliform, fecal streptococcus, other microbes | Health hazard for human consumption and contact | Inedibility of shellfish for humans | Reduced contact recreation |
| Oxygen-demanding wastes — high concentrations of biodegradable organic matter | Municipal discharges, industrial discharges, combined sewer overflows, watercraft discharges, urban runoff, agricultural runoff, feedlot wastes, natural sources | Biochemical oxygen demand, dissolved oxygen, volatile solids sulfides | Deoxygenation, potential for septic conditions | Fish kills | If severe, eliminated recreation |
| Suspended organic and inorganic material | Mining discharges, municipal discharges, industrial discharges, construction runoff, agricultural runoff, urban runoff, silvicultural runoff, natural sources, combined sewer overflows | Suspended solids, turbidity, biochemical oxygen demand, sulfides | Reduced light penetration, deposition on bottom, benthic deoxygenation | Reduced photosynthesis, changed bottom organism population, reduced fish production, reduced sport fish population, increased nonsport fish population | Reduced game fishing, aesthetic appreciation |
| Inorganic materials, mineral substances — metal, salts, acids, solid matter, other chemicals, oil | Mining discharges, acid mine drainage, industrial discharges, municipal discharges, combined sewer overflows, urban runoff, oil fields, agricultural runoff, irrigation return flow, natural sources, cooling tower blowdown, transportation spills, coal gasification | pH, acidity, alkalinity, dissolved solids, chlorides, sulfates, sodium, specific metals, toxicity bioassay, visual (oil spills) | Acidity, salination, toxicity of heavy metals, floating oils | Reduced biological productivity, reduced flow, fish kills, reduced production, tainted fish | Reduced recreational use, fishing, aesthetic appreciation |
| Synthetic organic chemicals — dissolved organic material, e.g., detergents, household aids, pesticides | Industrial discharges, urban runoff, municipal discharges, combined sewer overflow, agricultural runoff, silvicultural runoff, transportation spills, mining discharges | Cyanides, phenols, toxicity bioassay | Toxicity of natural organics, biodegradable or persistent synthetic organics | Fish kills, tainted fish, reduced reproduction, skeletal development | Reduced fishing, inedible fish for humans |
| Nutrients — nitrogen, phosphorus | Municipal discharges, agricultural runoff, combined sewer overflows, industrial discharges, urban runoff, natural sources | Nitrogen, phosphorus | Increased algal growth, dissolved oxygen reduction | Increased production, reduced sport fish population, increased nonsport fish population | Tainted drinking water, reduced fishing and aesthetic appreciation |
| Radioactive materials | Industrial discharges, mining | Radioactivity | Increased radioactivity | Altered natural rate of genetic mutation | Reduced opportunities |
| Heat | Cooling water discharges, industrial discharges, municipal discharges, cooling tower blowdown | Temperature | Increased temperature, reduced capacity to absorb oxygen | Fish kills, altered species composition | Possible increased sport fishing by extended season for fish, which might otherwise migrate |

**Table 10A.2 Point- and Nonpoint Sources of Water Pollution**

| Sources | Common Pollutant Categories |
|---|---|
| POINT SOURCES | |
| Municipal sewage treatment plants | BOD; bacteria; nutrients; ammonia; toxics |
| Industrial facilities | Toxics; BOD |
| Combined sewer overflows | BOD; bacteria; nutrients; turbidity; total dissolved solids; ammonia; toxics; bacteria |
| NONPOINT SOURCES | |
| Agricultural runoff | Nutrients; turbidity; total dissolved solids; toxics; bacteria |
| Urban runoff | Turbidity; bacteria; nutrients; total dissolved solids; toxics |
| Construction runoff | Turbidity; nutrients; toxics |
| Mining runoff | Turbidity; acids; toxics; total dissolved solids |
| Septic systems | Bacteria; nutrients |
| Landfills/spills | Toxics; miscellaneous substances |
| Silvicultural runoff | Nutrients; turbidity; toxics |

**Table 10A.3 Classes of Nonpoint Source Pollution**

| Class | | Description | Common Pollutants |
|---|---|---|---|
| **Agriculture** | | | |
| | Animal feedlots<br>Irrigation Cultivation<br>Pastures Dairy farming<br>Orchards Aquaculture | Runoff from all categories of agriculture leading to surface and groundwater pollution. In northern climates, runoff from frozen ground is a major problem, especially where manure is spread during the winter. Vegetable handling, especially washing in polluted surface waters in many developing countries, leads to contamination of food supply. Growth of aquaculture is becoming a major polluting activity in many countries. Irrigation return flows carry salts, nutrients, and pesticides. Tile drainage rapidly carries leachates such as nitrogen to surface waters | Phosphorus, nitrogen, metals, pathogens, sediment, pesticides, salt, BOD[a], trace elements (e.g., selenium) |
| Forestry | | Increased runoff from disturbed land. Most damaging is forest clearing for urbanization | Sediment, pesticides |
| Liquid waste disposal | | Disposal of liquid wastes from municipal wastewater effluents, sewage sludge, industrial effluents and sludges, wastewater from home septic systems; especially disposal on agricultural land, and legal or illegal dumping in watercourses | Pathogens, metals, organic compounds |
| **Urban Areas** | | | |
| | Residential<br>Commercial Industrial | Urban runoff from roofs, streets, parking lots, etc. leading to overloading of sewage plants from combined sewers, or polluted runoff routed directly to receiving waters; local industries and businesses may discharge wastes to street gutters and storm drains; street cleaning; road salting contributes to surface and groundwater pollution | Fertilizers, greases and oils, fecal matter and pathogens, organic contaminants (e.g., PAHs[b] and PCBs[c]), heavy metals, pesticides, nutrients, sediment, salts, BOD, COD[d], etc. |
| Rural sewage systems | | Overloading and malfunction of septic systems leading to surface runoff and/or direct infiltration to groundwater | Phosphorus, nitrogen, pathogens (fecal matter) |
| Transportation | | Roads, railways, pipelines, hydroelectric corridors, etc. | Nutrients, sediment, metals, organic contaminants, pesticides (especially herbicides) |
| Mineral extraction | | Runoff from mines and mine wastes, quarries, well sites | Sediment, acids, metals, oils, organic contaminants, salts (brine) |
| Recreational land use | | Large variety of recreational land uses, including ski resorts, boating and marinas, campgrounds, parks; waste and "grey" water from recreational boats is a major pollutant, especially in small lakes and rivers. Hunting (lead pollution in waterfowl) | Nutrients, pesticides, sediment, pathogens, heavy metals |
| Solid waste disposal | | Contamination of surface and groundwater by leachates and gases. Hazardous wastes may be disposed of through underground disposal | Nutrients, metals, pathogens, organic contaminants |
| Dredging | | Dispersion of contaminated sediments, leakage from containment areas | Metals, organic contaminants |
| Deep well disposal | | Contamination of groundwater by deep well injection of liquid wastes, especially oilfield brines and liquid industrial wastes | Salts, heavy metals, organic contaminants |
| Atmospheric deposition | | Long-range transport of atmospheric pollutants (LRTAP) and deposition of land and water surfaces. Regarded as a significant source of pesticides (from agriculture, etc.), nutrients, metals, etc. especially in pristine environments | Nutrients, metals, organic contaminants |

[a] BOD, Biological Oxygen Demand.
[b] PAH, Polycyclic Aromatic Hydrocarbons.
[c] PCB, Polycyclic Chlorinated Bi-Phenyls.
[d] COD, Chemical Oxygen Demand.

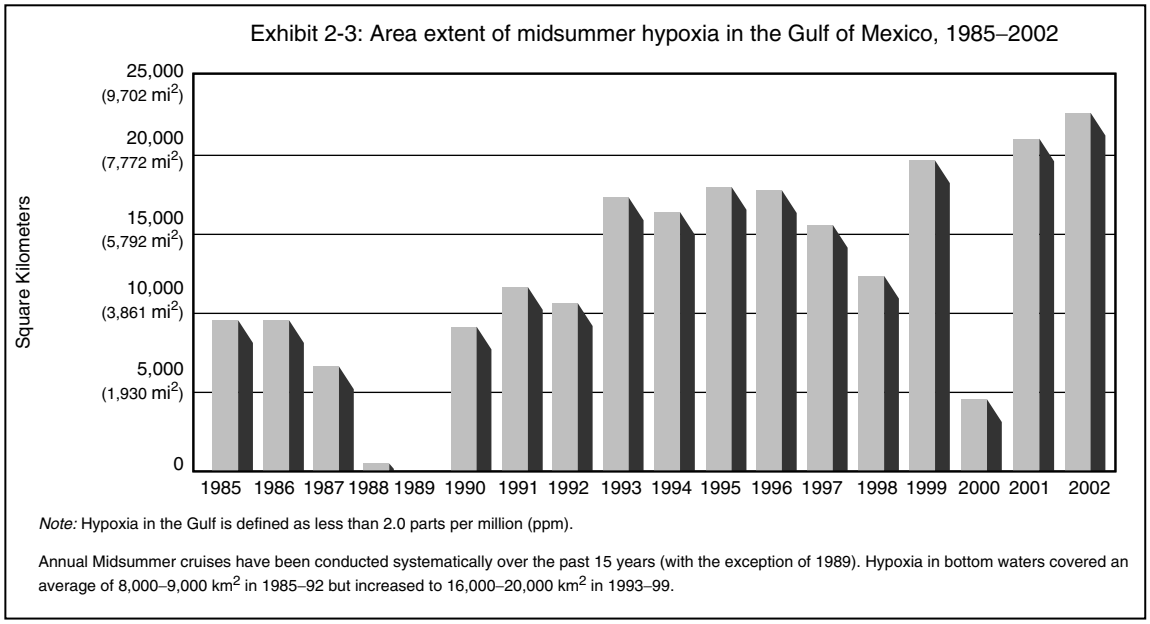
*The area and duration of hypoxia are tracked in the Gulf of Mexico and Long Island Sound as indicators of the natural variability in those waterbodies to determine whether actions to control nutrients are having the desired effect and how local species are affected.*

*The largest of oxygen-depleted coastal waters in the U.S. is in the northern Gulf of Mexico on the Louisiana/Texas continental shelf. Hypoxic waters are most prevalent from late spring through late summer and are more widespread and persistent in some years that in others, depending on river flow, winds, and other environmental variables. Hypoxia occurs mostly in the lower water column, but can encompass as much as the lower half to two-thirds of the entire column.*

*The midsummer bottom area extent of hypoxic water in the Gulf of Mexico increased from 3,500 mi$^2$ (9,000 km$^2$) in 1985 to 8,500 mi$^2$ (22,000 km$^2$) in July 2002 (Exhibit 2-3). The primary cause of the hypoxic conditions is probably the eutrophication of those waters from nutrient enrichment delivered to the Gulf by the Mississippi River and its drainage basin.*[13,14]



*The maximum area of hypoxia in Long Island Sound averaged 201* mi$^2$ *(521* km$^2$*) from 1987 through 2001. The largest area was 395* mi$^2$ *(1,023* km$^2$*) in 1994, and the smallest was 30* mi$^2$ *(78* km$^2$*) in 1997 (Exhibit 2-4). The duration of hypoxia averaged 56 days during the same period, with a low of 34 days in 1996 and a high of 82 days in 1989. Hypoxia is typically more severe in the western portions of the sound, where the nitrogen load is higher and mixing of fresh and salt water is more restricted.*[15]

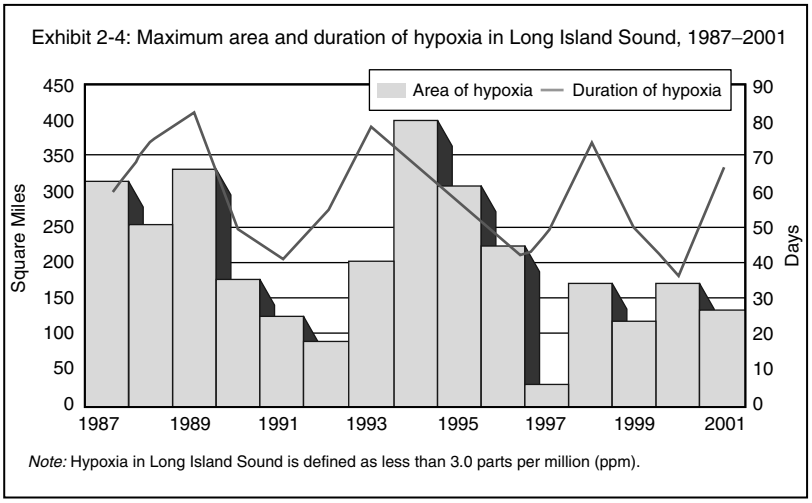


**Figure 10B.15** Hypoxia in the Gulf of Mexico and Long Island Sound. (From United States Environmental Protection Agency, 2003, *EPA's Draft Report on the Environment*, 2003, EPA 600-R-03-050, www.epa.gov.)

*Note:* Data were taken over the period 1990 to 2002.
These Water Quality Index (WQI) results are preliminary and should not be regarded as a benchmark or starting point for future trends. Rather, this pilot study provides a first approximation for a national picture of ambient fresh water quality in Canada. Improvements in consistency of application and representation will be sought in the near future.
The WQI values have been calculated by each province and territory (except Quebec) using the methodology developed and endorsed by the Canadian Council of Ministers of the Environment (CCME) in September 2001. According to the CCME user's manual,[1] the specific variables, objectives and time periods used in the index are not specified by the methodology and, because of differences in local conditions, monitoring programs and water quality issues, they vary from one jurisdiction to another. In this regard, it is expected that the variables and objectives chosen to calculate the index provide relevant information about a particular site.
In Quebec, water quality was evaluated using an index other than the CCME WQI: *L'indice de la qualité bactériologique et physico-chimique*. The results between the two indexes have a reasonable degree of comparability. The premise is that the evaluation of water quality in one jurisdiction by water quality experts familiar with the local conditions should be comparable with a similar evaluation by experts in another jurisdiction, even though the index tools may have some variation.
The national portrayal of the WQI results includes information from all provinces and territories except Nunavut and the Yukon, for which suitable data were unavailable at this time. The water bodies included in the WQI calculations do not provide uniform coverage across Canada, but rather tend to be concentrated in the more populated areas of the country where the potential threats to water quality are generally greatest. The coverage and the density of sites are also higher in some provinces than in others.

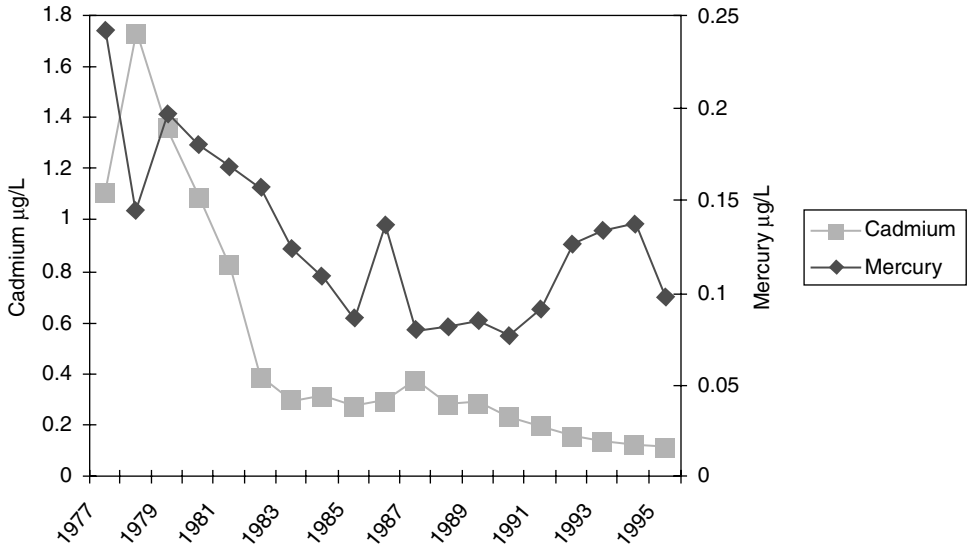

**Figure 10B.35** Trends in concentrations of cadmium and mercury at river stations included in the European Union exchange of information decision. The EU environmental quality standards for cadmium and mercury in inland waters are 5µg/L and 1µg/L as annual averages, respectively. In less polluted areas in e.g. Nordic countries concentrations of cadmium and mercury are only 10% and 1% of these values. Average of country annual average concentrations. Cadmium data from Belgium, Germany, Ireland, Luxembourg, Netherlands, UK. Mercury data from Belgium, France Germany, Ireland, Netherlands, UK. (From EEA, Indicator fact sheet, *Hazardous Substances in River Water (WHS02)*, www.eea.europa.eu. Reprinted with permission © EEA.)

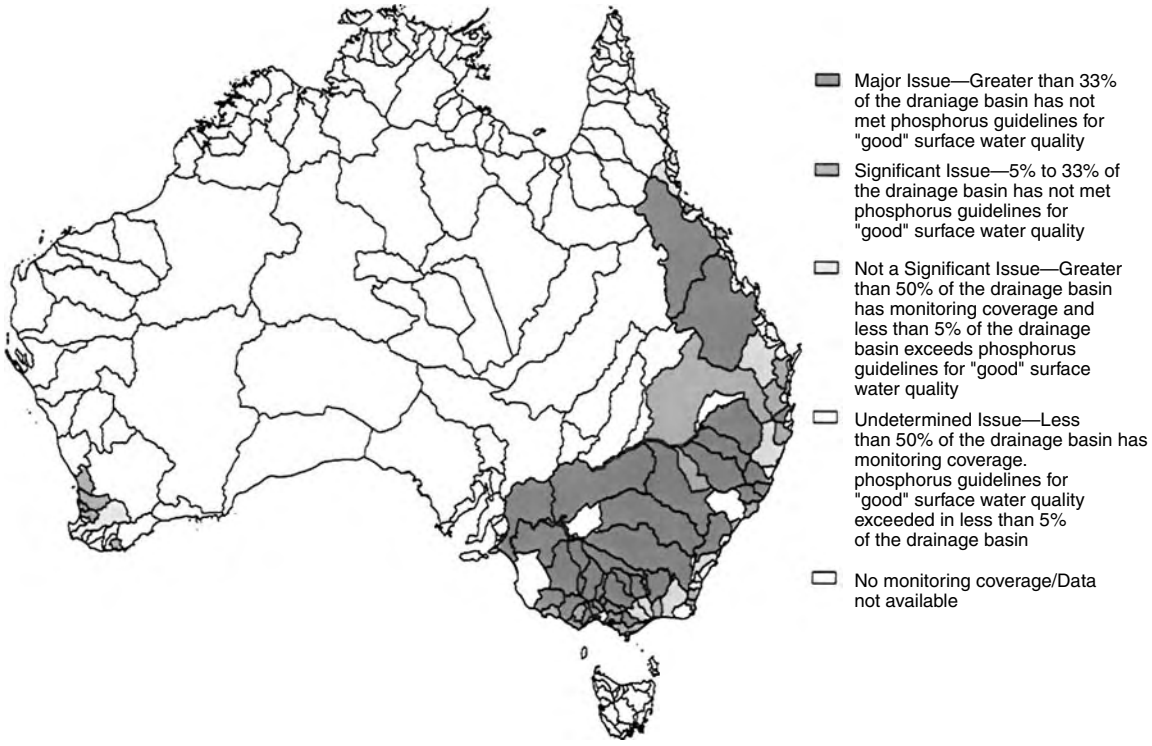

**Figure 10B.41** Australian river systems where phosphorous levels exceed state or territory guidelines for the protection of ecosystems. (From Ball, J. et al., 2001, *Inland Waters, Australia State of Environment Report 2001 (Theme Report)*, CSIRO Publishing on behalf of the Department of the Environment and Heritage, Canberra, www.deh.gov.au. Reprinted with permission.) Original Source: National Land and Water Resources Audit, 2001a.

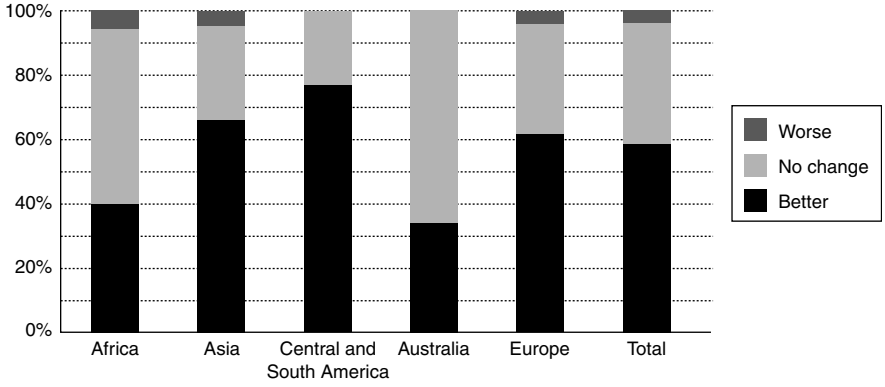

*Note*: This figure is based on a sample of 93 lakes. Although there has been improvement of lake water condition in some areas of all regions, the overwhelming trend illustrated here is deterioration in quality, most notably in Central and South America where close to 80 percent of sampled lakes deteriorated in the studied period.

**Table 10B.11 Top 100 Impairments of Waters in the United States Reported in 1998 for Section 303(d) of the Clean Water Act**

| General Impairment Name | Impairments Reported | Percent of Reported |
|---|---|---|
| Metals | 11,538 | 19.22 |
| Pathogens | 7,902 | 13.16 |
| Nutrients | 5,586 | 9.31 |
| Sediment/siltation | 5,047 | 8.41 |
| Organic enrichment/low DO | 4,405 | 7.34 |
| Fish consumption advis. | 3,178 | 5.29 |
| pH | 2,906 | 4.84 |
| Other habitat alterations | 2,389 | 3.98 |
| Thermal modifications | 2,200 | 3.67 |
| Biological criteria | 2,116 | 3.53 |
| Flow alteration | 1,576 | 2.63 |
| Pesticides | 1,468 | 2.45 |
| Turbidity | 1,140 | 1.90 |
| Salinity/TDS/chlorides | 994 | 1.66 |
| Suspended solids | 969 | 1.61 |
| Cause unknown | 896 | 1.49 |
| PCBs | 884 | 1.47 |
| Unionized ammonia | 797 | 1.33 |
| Priority organics | 681 | 1.13 |
| Sulfates | 621 | 1.03 |
| Algal growth/chlorophylla | 476 | 0.79 |
| Noxious aquatic plants | 351 | 0.58 |
| Oil and grease | 286 | 0.48 |
| Unknown toxicity | 282 | 0.47 |
| Other cause | 221 | 0.37 |
| General WQS (benthic) | 195 | 0.32 |
| Dioxins | 184 | 0.31 |
| Other inorganics | 144 | 0.24 |
| Chlorine | 98 | 0.16 |
| Nonpriority organics | 97 | 0.16 |
| Taste and odor | 85 | 0.14 |
| Stream bottom deposits | 75 | 0.12 |
| Total toxics | 48 | 0.08 |
| Cyanide | 47 | 0.08 |
| Biodiversity impacts | 47 | 0.08 |
| Exotic species | 42 | 0.07 |
| Radiation | 22 | 0.04 |
| Natural limits (wetlands) | 13 | 0.02 |
| Fish kill(s) | 12 | 0.02 |
| Hydrogen sulfide | 4 | 0.01 |
| Ambient water quality criteria | 2 | 0.00 |
| Low nutrients | 1 | 0.00 |
| RDX—Hexahydro-1,3,5-trinitro-1,3,5-triazine | 1 | 0.00 |
| 1,2-Diphenylhdrazine | 1 | 0.00 |

*Note:* Total impairments reported nationwide: 60,027.

**Table 10B.16 Point Source Loadings to Receiving Waters in the United States, mid 1980s**

| Industry | TSS | BOD | Phosphorus | Metals |
|---|---|---|---|---|
| Minerals & metals | 0.355 | 0.006 | 0.255 | 4.931 |
| Chemical & manufacturing | 0.086 | 0.125 | 0.267 | 2.919 |
| Agriculture & fisheries | 0.277 | 0.404 | 92.800 | 0.000 |
| POTWs | 1.594 | 1.830 | 49.555 | 2.838 |
| Total | 2.312 | 2.365 | 142.877 | 10.688 |

*Note:* Millions of tons per year for TSS, BOD, and phosphorus and millions of pounds per year for metals; mid1980s. Minerals & metals includes aluminum forming, coal mining, copper forming, foundries, iron and steel, metal finishing, nonferrous metals mining, nonferrous metals forming, ore mining and petroleum refining industries. Chemical & manufacturing includes battery manufacturing, coil coating, electrical and electronic components, organic and inorganic chemicals, plastics, synthetic fibers, pesticide manufacturing, pharmaceuticals manufacturing, plastics molding and forming, porcelain enameling, leather tanning, pulp and paper, and textile industries. Agriculture & fisheries includes animal feedlots, fish hatcheries, food and beverages, fruits and vegetables, meat packing, and seafood industries. POTWs, publicly owned treatment works. TSS, total suspended solids, BOD, biochemical oxygen demand. Metals, cadmium, copper, lead, mercury and zinc. Industrial loadings are direct discharges based on long-term average concentrations and total industry flows at Best Available Technology (BAT) presented in U.S. EPA (1983), except as follows: loadings for electrical and electronic components reflect current level of treatment (U.S. EPA, 1983); conventional loadings for agriculture & fisheries industries represent post-BAT treatment levels; and conventional and toxic pollutant loadings for POTWs include indirect industrial and residential/commercial loadings not removed by the POTWs. Phosphorus loadings for POTWs represent effluent levels of 5 mg/L.

| Small feedlots | 2 | 0.05 | 0.17 | 0.032 |
| Landfills | NA | 0.3 | 0.026 | NA |
| Background | 1,260.00 | 5.00 | 2.50 | 1.10 |
| **Total** | **4,886.00** | **20.35** | **10.04** | **3.88** |

*Note:* By source; millions of tons per year; 1980. TSS, total suspended solids. BOD, biochemical oxygen demand. Excluded from the survey area are 207 million acres in public land (14% of the contiguous United States), mostly in the Rocky Mountains, because of inadequacy of information. Urban runoff includes storm water sewers only.

*Note:* Section 305(b) of the Clean Water Act requires states and other jurisdiction to assess the health of their waters and the extent to which their waters support quality standards. Section 305(b) requires that states submit reports describing water quality conditions to the Environment Protection Agency every two years. Water quality standard have three elements (designated uses, criteria developed to protect each use, and an antidegradation policy). For information on survey methodology and assessment criteria, see report. —, Representation zero. NA, Not available.

[a] Includes waterbodies accessed as not attainable for one or more uses. Most states do not assess all their waterbodies during the 2-year reporting cycle, but use a "rotating basin approach" whereby all waters are monitored over a set period of time.

[b] Based on accessment of available data, water quality supports all designated uses. Water quality meets narrative and/or numberic criteria adopted to protect and support a designated use.

[c] Although all assessed uses are currently met, data show a declining trend in water quality. Projections based on this trend indicate water quality will be impaired in the future, unless action is taken to prevent further degradation.

[d] Impaired or not attainable. The reporting state or jurisdiction has performed a "use-attainability analysis" and demonstrated that support of one or more designated beneficial uses is not attainable due to specific biological, chemical, physical, or economic/social conditions.

[e] Excludes unknown and natural sources.

**Table 10B.27 River and Stream Miles Supporting Uses in the United States, 1972–1982**

| Status | 1972 Miles | Percent | 1982 Miles | Percent |
|---|---|---|---|---|
| Supporting uses | 272 | 36 | 488 | 64 |
| Partially supporting uses | 46 | 6 | 167 | 22 |
| Not supporting uses | 30 | 4 | 35 | 5 |
| Unknown or not reported | 410 | 54 | 68 | 9 |

*Note:* Thousand of miles and percentage of waters assessed. Forty-nine (49) states reported on water-quality conditions between 1972 and 1982 for 758,000 river and stream miles. Some proportion of the 1972 data unknown or not reported fell into each of the levels of use support.

**Table 10B.29 Sources of Drinking Water Use Impairment in the United States**

| Contaminant Group | Specific Contaminant | |
|---|---|---|
| Pesticides | Atrazine | Molinate |
| | Metolachlor | Ethylene dibromide |
| | Triazine | |
| Volatile organic chemicals | Trichloroethylene | Dichloromethane |
| | Tetrachloroethylene | 1,1-Dichloroethane |
| | 1,1,1-Trichloroethane | 1,1-Dichloroethylene |
| | cis-1,2-Dichloroethylene | Toluene |
| | Trihalomethanes | Benzene |
| | Carbon tetrachloride | Dichlorobenzene |
| | Ethylbenzene | Methyl tertiary butyl ether |
| | 1,1,2,2-Tetrachloroethane | Xylene |
| Inorganic chemicals | Arsenic | Fluoride |
| | Nitrates | Manganese |
| | Iron | Lead |
| | Copper | Sodium |
| | Chloride | |
| Microbiological contaminants | Exceedance of total coliform rule | Exceedance of fecal coliform rule |

*Note:* CASRN, Chemical Abstracts service Registry Number; *N*, number of samples; RL, reporting level; freq, frequency of detection; max, maximum concentration; med, median detectable concentration; MCL, maximum contaminant level; HAL, health advisory level; $LC_{50}$, lethal concentration with 50% mortality; Nd, not detected; —, not available; PAH, polycyclic aromatic hydrocarbon.

[a] Daphnia magna (water flea), 48 h exposure $LC_{50}$.
[b] Other species and variable conditions.
[c] Oncorhynchus mykiss (rainbow trout), 96 h exposure $LC_{50}$.
[d] Concentration estimated, average recovery $<60\%$.
[e] Concentration estimated, compound routinely detected in laboratory blanks.
[f] Concentration estimated, reference standard prepared from a technical mixture.
[g] Concentration estimated, value greater than highest point on calibration curve.
[h] Compounds suspected of being hormonally active.
[i] Pimephales promelas (fathead minnow), 96 h exposure $LC_{50}$.

**Table 10B.32 Regions 1–10: River Reach and Watershed Evaluation Summary, United States National Sediment Quality Survey**

| EPA Region (State) | River Reach Evaluation[a] | | | | | Watershed Evaluation | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | Total Number of River Reaches | River Reaches with at Least One Tier 1 Station | River Reaches with at Least One Tier 2 Station and Zero Tier 1 Stations | River Reaches with All Tier 3 Stations | River Reaches with No Data | Total Number of Watersheds | Watersheds Containing APCs | Watersheds with at Least One Tier 1 Station | Watersheds with at Least One Tier 2 Station and Zero Tier 1 Stations | Watersheds with All Tier 3 Stations | Watersheds with No Data |
| Region 1 (CT, ME, MA, NH, RI, VT) | 2,764 | 97 (3.5%) | 23 (0.8%) | 5 (0.2%) | 2,639 (95.5%) | 62 | 9 (14.5%) | 13 (21.0%) | 6 (9.7%) | 0 (0.0%) | 34 (54.8%) |
| Region 2 (NJ, NY, PR) | 1,845 | 217 (11.8%) | 102 (5.5%) | 45 (2.4%) | 1,481 (80.3%) | 71 | 17 (23.9%) | 35 (49.3%) | 3 (4.2%) | 3 (4.2%) | 13 (18.3%) |
| Region 3 (DE, DC, MD, PA, VA, WV) | 3,388 | 385 (11.4%) | 313 (9.2%) | 301 (8.9%) | 2,389 (70.5%) | 126 | 7 (5.6%) | 96 (76.2%) | 11 (8.7%) | 4 (3.2%) | 8 (6.3%) |
| Region 4 (AL, FL, GA, KY, MS, NC, SC, TN) | 10,078 | 444 (4.4%) | 461 (4.6%) | 301 (3.0%) | 8,872 (88.0%) | 307 | 13 (4.2%) | 142 (46.3%) | 57 (18.6%) | 25 (8.1%) | 70 (22.8%) |
| Region 5 (IL, IN, MI, MN, OH, WI) | 6,151 | 532 (8.6%) | 401 (6.5%) | 316 (5.1%) | 4,902 (79.7%) | 278 | 25 (9.0%) | 144 (51.8%) | 31 (11.2%) | 19 (6.8%) | 59 (21.2%) |
| Region 6 (AR, LA, NM, OK, TX) | 7,577 | 226 (3.0%) | 222 (2.9%) | 289 (3.8%) | 6,840 (90.3%) | 402 | 4 (1.0%) | 117 (29.1%) | 69 (17.2%) | 44 (10.9%) | 168 (41.8%) |
| Region 7 (IA, KS, MO, NE) | 4.915 | 94 (1.9%) | 161 (3.3%) | 136 (2.8%) | 4,524 (92.0%) | 238 | 1 (0.4%) | 60 (25.2%) | 72 (30.3%) | 29 (12.2%) | 76 (31.9%) |
| Region 8 (CO, MT, ND, SD, UT, WY) | 13,860 | 59 (0.4%) | 77 (0.6%) | 68 (0.5%) | 13,656 (98.5%) | 385 | 1 (0.3%) | 34 (8.8%) | 41 (10.6%) | 31 (8.1%) | 278 (72.2%) |
| Region 9 (AZ, CA, HI, NV) | 4,686 | 156 (3.3%) | 63 (1.3%) | 40 (0.9%) | 4,427 (94.5%) | 288 | 19 (6.6%) | 41 (14.2%) | 19 (6.6%) | 15 (5.2%) | 194 (67.4%) |
| Region 10 (AK, ID, OR, WA) | 10,462 | 177 (1.7%) | 121 (1.2%) | 49 (0.5%) | 10,115 (96.7%) | 355 | 10 (2.8%) | 48 (13.5%) | 29 (8.2%) | 21 (5.9%) | 247 (69.6%) |
| **Total for United States[b]** | **64,591** | **2,298 (3.6%)** | **1,891 (2.9%)** | **1,506 (2.3%)** | **58,896 (91.2%)** | **2,264** | **96 (4.2%)** | **658 (29.1%)** | **302 (13.3%)** | **168 (7.4%)** | **1,040 (45.9%)** |

Tier 1, Associated adverse effects on aquatic life or human health are probable.
Tier 2, Associated adverse effects on aquatic life or human health are possible.
Tier 3, No indication of adverse effects.

[a] River reaches based on EPA River Reach File (RF1). RF1 does not include data outside the contiguous United States.
[b] Because some reaches and watersheds occur in more than one region, the total number of reaches and watersheds in each category or the country might not equal the sum of reaches or watersheds in the regions.

Rockville, MD; U.S. Geological Survey, National Water Summary 1986.

**Table 10B.36 United States Shellfish Growing Waters, 1966–1995**

| Year | 1966 | 1971 | 1974 | 1980 | 1985 | 1990 | 1995 |
|---|---|---|---|---|---|---|---|
| | | | | 1000 acres | | | |
| Approved for harvest | 8,100 | 10,362 | 10,560 | 10,685 | 11,402 | 12,304 | 14,853 |
| Harvested limited | 2,090 | 3,738 | 4,232 | 3,533 | 5,435 | 6,398 | 6,721 |
| Conditionally approved | 88 | 410 | 387 | 587 | 1,463 | 1,571 | 1,695 |
| Restricted | na | 30 | 34 | 55 | 637 | 463 | 2,106 |
| Conditionally restricted | na | na | na | na | na | 0 | 119 |
| Prohibited | 2,002 | 3,298 | 3,811 | 2,891 | 3,335 | 4,364 | 2,801 |
| Total | 10,190 | 14,100 | 14,792 | 14,218 | 16,837 | 18,702 | 21,574 |

*Note:* Based on National Shellfish Registers published only in years indicated. Data do not include Alaska, Hawaii, or waters designated as unclassified. The total acreage of classified shellfish growing waters varies with each register. There may be several reasons why shellfish harvest is prohibited, including water-quality problems, lack of funding for complete surveying and monitoring, conservation measures, and other management/administrative actions.

*Note:* —, no data.

[a] Conditionally approved waters do not always meet criteria for harvesting shellfish, but may be harvested when criteria are met.
[b] Restricted water may be harvested if the shellfish are purified with clean water following harvest.
[c] Shellfish may not be harvested in prohibited waters.
[d] Preventative closures due to a lack of data or proximity to point sources or marinas.
[e] Includes water that are classified as conditionally approved, restricted, prohibited, and management closures.

**Table 10B.40 United States National Coastal Condition Rating Scores by Indicator and Region**

| Indicator | Northeast Coast | Southeast Coast | Gulf Coast | West Coast | Great Lakes | Puerto Rico | United States[a] |
|---|---|---|---|---|---|---|---|
| Water-quality index | 2 | 4 | 3[b] | 3 | 3 | 3 | 3.0 |
| Sediment quality index | 1 | 4 | 3 | 2 | 1 | 1 | 2.1 |
| Benthic index | 1 | 3 | 2 | 3 | 2 | 1 | 2.0 |
| Coastal habitat index | 4 | 3 | 1 | 1 | 2 | —[c] | 1.7 |
| Fish tissue contaminants index | 1 | 5 | 3 | 1 | 3 | —[c] | 2.7 |
| Overall condition | 1.8 | 3.8 | 2.4 | 2.0 | 2.2 | 1.7 | 2.3 |

*Note:* Rating scores are based on a 5-point system, where 1 is poor and 5 is good.

[a] The U.S. score is based on an aerially weighted mean of regional scores.
[b] This rating score does not include the impact of the hypoxic zone in offshore Gulf Coast waters.
[c] No coastal habitat index loss or fish tissue contaminants index results were available for Puerto Rico.

*Source*: From United States Environmental Protection Agency, 2004, *National Coastal Condition Report II*, EPA-620/R-03/002, December 2004, www.epa.gov.

**Table 10B.41 Percent of United States National Coastal Area in Poor Condition by Indicator (except Coastal Habitat Index) and Region**

| Indicator | Northeast Coast | Southeast Coast | Gulf Coast | West Coast | Great Lakes | Puerto Rico | United States |
|---|---|---|---|---|---|---|---|
| Water-quality index[a] | 19 | 5 | 9[b] | 3 | — | 9 | 11 |
| Sediment quality index[c] | 16 | 8 | 12 | 14 | — | 61 | 13 |
| Benthic index | 22 | 11 | 17 | 13 | — | 35 | 17 |
| Coastal habitat index[d] | 1.00 | 1.06 | 1.30 | 1.90 | — | — | 1.26 |
| Fish tissue contaminants index[e] | 31 | 5 | 14 | 27 | — | — | 22 |
| Overall condition[f] | 40[g] | 23 | 40 | 23 | — | 77 | 35 |

*Note:* The percent area of poor condition is the percentage of total estuarine surface area in the region or the nation (proportional area information is not available for the Great Lakes).

[a] The water-quality index is based on a combination of water quality measurements (dissolved oxygen, chlorophyll *a*, nitrogen, phosphorus, and water clarity).
[b] The area of poor condition does not include the hypoxic zone in offshore Gulf Coast waters.
[c] The sediment quality index is based on a combination of sediment quality measurements (sediment toxicity, sediment contaminants, and sediment TOC).
[d] The coastal habitat index is based on the average of the mean long-term, decadal wetland loss (1780–1990) and the present decadal wetland loss rate (1990–2000).
[e] The fish tissue contaminants index is based on analyses of whole fish (not fillets).
[f] The overall percentage is based on the overlap of the five indicators and includes estuarine area for all of the conterminous 48 states (by region and total) and Puerto Rico.
[g] In Northeast Coast estuaries, at least one of the five indicators is rated poor at sites representing 40% of total estuarine area.

**Table 10B.45 Cadmium and Lead in Sediments of the Chesapeake Bay Mainstem**

| | Concentration | | Aquatic Life Benchmark | | Location of Maximum | |
|---|---|---|---|---|---|---|
| **Contaminant** | **Median (ppm)** | **Maximum (ppm)** | **NOEL[a] (ppm)** | **PEL[b] (ppm)** | **Concentrations** | **Trends** |
| Cadmium | 0.4 | 2.9 | 1.0 | 7.5 | Baltimore region south to the Little Choptank River; mouth of Potomac River | Concentrations are declining |
| Lead | 35 | 86 | 21 | 160 | Baltimore region | Concentrations are declining in some areas |

[a] No Observed Effect Level. Level above which impacts are considered "possible."
[b] Probable Effect Level. Level above which impacts are considered "probable."

*Note*: I, Increasing; D, Decreasing; NT, No trend. Increasing and decreasing trends for NERRs are given in parentheses. *Individual organic compound concentrations have been aggregated into these groups:

ΣBTs, the sum of the concentrations of tributyltin and its breakdown products dibutyltin and monobutyltin;
ΣCdance, the sum of *cis*-chlordane, *trans*-nonachlor, heptachlor and heptachlorepoxide;
ΣDDTs, the sum of concentrations of DDTs and its metabolities, DDEs and DDDs;
ΣDield, the sum of concentrations of aldrin and dieldrin;
ΣPAHs, the sum of concentrations of the 18 PAH compounds;
ΣPCBs, the sum of the concentrations of homologs, which is approximately twice the sum of the 18 congeners.

*Note*: Oligotrophic, Clear waters with little organic matter or sediment and minimum biological activity; Mesotrophic, Waters with more nutrients, and therefore, more biological productivity; Eutrophic, Waters extremely rich in nutrients, with high biological productivity. Some species may be choked out; Hypereutrophic, Murky, highly productive waters, closest to the wetland status. Many clearwater species cannot survive; Dystrophic, Low in nutrients, highly colored with dissolved humic organic material. (Not necessarily a part of the natural trophic progression.); —, no data.

**Table 10B.53 Atmospheric Loading Estimates for Selected Pollutants (kg/yr) in the Great Lakes**

| Pollutant of Concern | Superior | Michigan | Huron | Erie | Ontario |
|---|---|---|---|---|---|
| PCBs[a] (wet and dry) | | | | | |
| 1988 | 550 | 400 | 400 | 180 | 140 |
| 1992 | 160 | 110 | 110 | 53 | 42 |
| 1994 | 85 | 69 | 180 | 37 | 64 |
| 1996 | 50 | 42 | N/A | 34 | N/A |
| PCBs[a] (net gas transfer)[b] | | | | | |
| 1988 | −1900 | −5140 | −2560 | −1100 | −708 |
| 1994 | −1,700 | −2,700 | — | −420 | −440 |
| DDT (wet and dry) | | | | | |
| 1988 | 90 | 64 | 65 | 33 | 26 |
| 1992 | 34 | 25 | 25 | 12 | 10 |
| 1994 | 17 | 32 | 37 | 46 | 16 |
| 1996 | 4 | 12 | N/A | 2 | N/A |
| DDT (net gas transfer) | | | | | |
| 1988 | −681 | −480 | −495 | −213 | −162 |
| 1994 | 30 | 67 | — | 34 | 13 |
| Benzo(a)pyrene (wet and dry) | | | | | |
| 1988 | 69 | 180 | 180 | 81 | 62 |
| 1992[c] | 120 | 84 | 84 | 39 | 31 |
| 1994 | 200 | 250 | — | 240 | 120 |

*Note:* —, Not determined or reported.

[a] Data presented for PCB congeners 18, 44, 52, and 101 (each with 3–5 chlorines in chemical structure).
[b] The convention is to assign a negative number to loss of pollutant from the lake (i.e., volatilization). Thus, the resulting number expresses the mass of a pollutant going into or coming out of the lake per year (i.e., a positive net gas transfer indicates a net input of the pollutant to the lake and a negative net gas transfer indicates a net loss or output from the lake).
[c] Data from 1992 may represent an underestimation in the measurement of benzo(a)pyrene.

*Note:* NA, No data available; Bold texts indicate exceedances of GLWQC; bold-italic texts indicate exceedances of AW/QC for human health.

[a] Values are for freshwater chronic criteria (U.S. EPA 1986).
[b] Values are for human chronic exposure through both fish consumption and drinking water (U.S. EPA 1986).
[c] Values are for protection of the most sensitive user of the water among humans, aquatic life and wildlife (IJC 1978).
[d] Values are the most stringent (i.e., lowest) among those for protection of human health, aquatic life, or wildlife (U.S. EPA 1995a).
[e] Concentrations are taken from De Vault et al. (1995) and L'Italian (1993). Concentrations of dieldrin and PCBs that are reported as ranges represent two different concentrations reported in two different studies. For α-HCH, the range of concentrations in Lake Ontario represents the range reported in a single study.
[f] Sampling data are for *p,p'*-DDE.
[g] Value for aldrin and dieldrin combined.
[h] AWQC for human health is for polycyclic aromatic hydrocarbons (PAHs), a subset of POM, sampling data are for benzo(a)pyrene, a PAH.

**Table 10B.60 Mercury Sources Identified for Lake Michigan, Chesapeake Bay, and Long Island Sound in Mass Balance Studies (by Percent Contribution)**

| Location | Atmospheric Deposition (%) | Urban Area (%) | Riverine | Groundwater | Direct Discharge | Comments |
|---|---|---|---|---|---|---|
| Lake Michigan[a] | ~80 | ~30 (Chicago) | ~17 | <1 | Not reported | Air-water exchange and sediment burial account for the major loss pathways from the lake, but atmospheric deposition dominates inputs |
| Chesapeake Bay[b] | >50 (Wet 47–53) (Dry 9–11) | Baltimore (percent not known) | ~33–49 | Not reported | Not reported | Over 90 percent of the mercury entering the watershed is retained in the terrestrial system and does not reach the aquatic system |
| Long Island Sound[c] | ~10 | New York New Jersey (percent not known) | ~52 | Not reported | ~36 | Tidal exchange, sediment burial, and air-water exchange are major loss pathways, 45 percent of the mercury entering the sound is re-emitted |

*Source*: From United States Environmental Protection Agency, 2000, *Deposition of Air Pollutants to the Great Waters, Third Report to Congress*, EPA-453/R-00-005, www.epa.gov.
*Original Source*: From [a] Mason and Sullivan (1997); [b] Mason et al., (1997); [c] Fitzgerald (1998).

**Table 10B.61 Preliminary Estimates of Total Atmospheric Mercury Deposition to Lake Michigan**

| Deposition | Annual Total (kg) | Annual Mean ($\mu g/m^2$) |
|---|---|---|
| Wet | $614 \pm 186$ | $10.6 \pm 3.2$ |
| Aerosol Dry | $69 \pm 38$ | $1.2 \pm 0.7$ |
| Reactive Gaseous Mercury[a] | 506 | 8.8 |
| Dissolved Gaseous Mercury[b] | $-460$ | $-8.0$ |
| Total | 729 | 12.6 |

[a] Reactive gaseous mercury (RGM) deposition values do not include error bars because they reflect a sensitivity analysis performed on a single measurement in place of direct measurements since no measurement method was available for RGM at the time of the study.

[b] Dissolved gaseous mercury (DGM) deposition values do not include error bars because the values reflect a single measurement taken to establish modeling parameters.

**Table 10B.73 The World's Major Water-Quality Issues**

| Issue Scale | Water Bodies Polluted | Sector Affected | Time Lag between Cause and Effect | Effects Extent |
|---|---|---|---|---|
| Organic pollution | Rivers[a]<br>Lakes[a]<br>Groundwater[b] | Aquatic environment | <1 yr | Local to district |
| Pathogens | Rivers[a]<br>Lakes[b]<br>Groundwater[b] | Health[a] | <1 yr | Local |
| Salinization | Groundwater[a]<br>Rivers[b] | Most uses<br>Aquatic environment<br>Health | 1–10 yrs | District to region |
| Nitrate | Rivers[b]<br>Lakes[b]<br>Groundwater[a] | Health | >10 yrs | District to region |
| Heavy metals | All bodies | Health<br>Aquatic environment<br>Ocean fluxes | <1 to >10 yrs | Local to global |
| Organic | All bodies | Health<br>Aquatic environment<br>Ocean fluxes | 1 to 10 yrs | Local to global |
| Acidification | Rivers[a]<br>Lakes[a]<br>Groundwater[b] | Health<br>Aquatic environment | >10 yrs | District to region |
| Eutrophication | Lakes[a]<br>Rivers[b] | Aquatic environment<br>Most uses<br>Ocean fluxes | > 10 yrs | Local |
| Sediment load (increase and decrease) | Rivers[b]<br>Lakes | Aquatic environment<br>Most uses<br>Ocean fluxes | 1–10 years | Regional |
| Diversions, dams | Rivers[a]<br>Lakes[b]<br>Groundwater[a] | Aquatic environment<br>Most uses | 1–10 yrs | District to region |

*Note:* Pollutants of many kinds eventually find their way into water bodies at all levels. Although it may take some years for problems to become evident, poor water quality affects both human health and ecosystem health.

[a] Very serious issue on a global scale.
[b] Series issue on a global scale.

*Total Phosphorus Note:* CAN, Ontario, Haron and Superior: data represent annual mean surface values from several hundred open water samples for each lake (mainly spring and summer); MEX, Orthophosphates; U.S.A., W. Twin(Ohio), samples obtained from the deepest point in each lake, generally weekly from late spring-eady fall and less frequently the rest of the year at 0.1, 2, 4, 7 and 10 m; FIN, data refer to surface measurements; DEU, Bodensee, Lac Constance (Switzerland); IRL, Derg, 1996 and 1997 data refer to mean values recorded in samples taken in Apr, Jul, Sep and Oct each year; LUX, Weiswarnpach, 96 and 98, upper limits; POL, Data refer to spring and summer surveys, and to surface measurements; CHE, Lac Constance, Bodensee (Germany); UKD, Lomond and Bewl Water: annual averages were calculated using the limit of detection values; actual average may therefore be lower. Bowl Water: 1994–1999 data refer to Total inorganic Phosphate.

*Total Nitrogen Note:* CAN, Ontario, Huron and Superior data represent annual mean surface values from several handed open water samples for each lake (mainly spring and summer); MEX, Data refer to nitrates only; U.S.A., W: Twin(Ohio): total inorganic nitrogen ($NH_4+NO_3+NO_2$). Samples obtained from the deepest point in each lake, generally weekly from late-spring early fall, and less frequently the rest of the year at 0.1, 2, 4, 7 and 10 m; AUT, data refer to total inorganic nitrogen ($NH_4+NO_3+NO_2$) measured in the epilimnion; FIN, Data refer to surface measurements; FRA, Réservoirs Marne and Seine, and Lac d'Annecy: Kjeldhai nitrogen. Réservoirs Marme and Seine 1980: 1981 data; DEU, Total inorganic nitrogen ($NH_4+NO_3+NO_2$). Bodensee: Lac Constance (Switzerland); IRL, Nitrates and nitrites only. Ennel and Owel: 1990–99 data refer to nitrate only and to limited surveys (March–October). Derg: 1996 and 1997 data refer to mean values recorded in samples taken in Apr, Jul, Sep and Oct each year; ITA, Maggiore: total inorganic nitrogen ($NH_4+NO_3+NO_2$). Average of monthly samples taken at the deepest point of the lake; LUX, Nitrates only; POL, Data refer to spring and summer surveys; CHE, Lac Constance: Bodensee (Germany); TUR, Total inorganic nitrogen ($NH_4+NO_3+NO_2$); UKD, Neath and Lomond; nitrates ($NO_3$) only. Lomond and Bewel Water: annual averages were calculated using the limit of detection values; actual averages may therefore be lower.

[a] Average over the latest 3 years available: data prior to 1953 have not been taken into account.

**Table 10B.80 Top Releases of Chemicals to Water in Canada, 2001**

| Chemical | Release Tons |
|---|---|
| Ammonia (total)[a] | 26,106 |
| Nitrate ion in solution at pH $\geq$6.0 | 22,450 |
| Manganese (and its compounds) | 1,157 |
| Methanol | 697 |
| Zinc (and its compounds) | 308 |

[a] Refers to the total of both ammonia ($NH_3$) and ammonium ion ($NH_4^+$) in solution.

*Source*: From Environment Canada, National Pollutant Release Inventory Database, www.ec.gc.ca/pdb/npri, 2001. Reproduced with the permission of the Minister of Public Works and Government Services, 2006.

**Table 10B.81 Water Bodies Receiving over 500 Tons of Pollutants in Canada, 2001**

| Water Body | Total Release (tons) | Dominant Release | Share of Total Release (percent) |
|---|---|---|---|
| Fraser River | 9,168 | Ammonia[a] | 49.2 |
| Lake Ontario | 8,877 | Ammonia[a] | 41.6 |
| Bow River | 8,264 | Nitrate Ion | 90.8 |
| Ottawa River | 3,066 | Ammonia[a] | 76.6 |
| North Saskatchewan River | 2,953 | Nitrate ion | 61.3 |
| Red River | 2,766 | Ammonia[a] | 72.7 |
| Hamilton Harbour | 1,516 | Ammonia[a] | 70.6 |
| South Saskatchewan River | 1,275 | Nitrate Ion | 62.4 |
| St. Lawrence River | 1,088 | Nitrate Ion | 43.6 |
| Saint John River | 984 | Methanol | 28.6 |
| Frank Lake | 818 | Nitrate ion | 70.3 |
| Detroit River | 679 | Ammonia[a] | 83.8 |
| Kelly Lake | 619 | Nickel (and its compounds) | 29.6 |
| Neroutsos Inlet | 526 | Nitrate ion | 64.4 |

*Note:* The information in this table is not intended to be an assessment of environmental impact or water quality. The totals do not include releases to tributaries of the named rivers.

[a] Refers to the total of both ammonia ($NH_3$) and ammonium ion ($NH_4^+$) in solution.

**Table 10C.83 Major Groundwater Contaminants Reported by States**

| | Reported as a Major Contaminant | |
|---|---|---|
| **Contaminant** | **No. of States[a]** | **% of States** |
| Sewage | 46 | 89 |
| Inorganic chemicals | | |
| Nitrates | 42 | 75 |
| Brine/Salinity | 36 | 69 |
| Arsenic | 19 | 37 |
| Fluorides | 18 | 35 |
| Sulfur compounds | 7 | 14 |
| Organic chemicals | | |
| Synthetic | 37 | 71 |
| Volatile | 36 | 69 |
| Metals | 34 | 65 |
| Pesticides | 31 | 60 |
| Petroleum | 21 | 40 |
| Radioactive materials | 12 | 23 |

[a] Based on a total of 52 States and territories which cited groundwater contaminants in their 305(b) submittals.

**Table 10C.84 Activities Contributing to Groundwater Contamination in the United States**

| Activity | States Citing | Estimated Sites[a] | Contaminants Frequently Cited as Result of Activity | Remarks |
|---|---|---|---|---|
| **Waste disposal** | | | | |
| Septic systems | 41 | 22 million | Bacteria, viruses, nitrate, phosphate, chloride, and organic compounds such as trichloroethylene | Between 820 and 1,460 billion gallons per year discharged to shallowest aquifers (Office of Technology Assessment, 1984) |
| Landfills (active) | 51 | 16,400 | Dissolved solids, iron, manganese, trace metals, acids, organic compounds, and pesticides | Traditional disposal method for municipal and industrial solid waste. Unknown number of abandoned landfills |
| Surface impoundments | 32 | 191,800 | Brines, acidic mine wastes, feedlot wastes, trace metals, and organic compounds | Used to store oil/gas brines (125,100 sites), mine wastes (19,800), agricultural wastes (17,200), industrial liquid wastes (16,200), municipal sewage sludges (2,400), other wastes (11,100) (U.S. Environmental Protection Agency, 1987) |
| Injection wells | 10 | 280,800 | Dissolved solids, bacteria, sodium, chloride, nitrate, phosphate, organic compounds, pesticides, and acids. | Wells used for injecting waste below drinking-water sources (550), oil/gas brine disposal (161,400), solution mining (22,700), injecting waste into or above drinking-water sources (14), and storm-water disposal, agricultural drainage, heat pumps (69,100) (U.S. Environmental Protection Agency, 1987) |
| Land application of wastes | 12 | 19,000 land application units | Bacteria, nitrate, phosphate, trace metals, and organic compounds | Waste disposal from municipal waste-treatment plants (11,900), industry (5,600), oil/gas production (730), petroleum and wood-preserving wastes (250), others (620) (U.S. Environmental Protection Agency, 1987) |
| **Storage and handling of materials** | | | | |
| Underground storage tanks | 39 | 2.4–4.8 million | Benzene, toluene, xylene, and petroleum products | Useful life of steel tanks, 15–20 yrs. About 25–30 percent of petroleum tanks may leak (Conservation Foundation, 1987) |
| Above-ground storage tanks | 16 | Unknown | Organic compounds, acids, metals, and petroleum products | Spills/overflows may contaminate groundwater |
| Material handling and transfers | 29 | 10,000–16,000 spills per year | Petroleum products, aluminum, iron, sulfate, and trace metals | Includes coal storage piles, bulk chemical storage, containers, and accidental spills |
| **Mining activities** | | | | |
| Mining and spoil disposal—coal mines | 23 | 15,000 active; 67,000 inactive | Acids, iron, manganese, sulfate, uranium, thorium, radium, molybdenum, selenium, and trace metals | Leachates from spoil piles of coal, metal, and nonmetallic mineral mining contain a variety of contaminants. Coal mines are sources of acid drainage |

© 2006 by Taylor & Francis Group, LLC

| | | | | |
|---|---|---|---|---|
| **Oil and gas activities** | | | | |
| Wells | 20 | 550,000 production; 1.2 million abandoned | Brines | Contamination from improperly plugged wells and oil brine stored in ponds or injected underground |
| **Agricultural activities** | | | | |
| Fertilizer and pesticide applications | 44 | 363 million acres[b] | Nitrate, phosphate, and pesticides | Fertilizer applied 1982–83, 42.3 million tons per year (U.S. Bureau of the Census, 1984); active ingredients of pesticides applied 1982, 660 million pounds (Gianessi, 1987) |
| Irrigation practices | 22 | 376,000 wells; 49 million acres irrigated[c] | Dissolved solids, nitrate, phosphate, and pesticides | Salts, fertilizers, pesticides can concentrate in groundwater. Improperly plugged abandoned wells contamination source |
| Animal feedlots | 17 | 1,900 | Nitrate, phosphate, and bacteria | Primarily in the Corn Belt and High Plains States (Office of Technology Assessment, 1984) |
| **Urban activities** | | | | |
| Runoff | 15 | 47.3 million acres urban land[d] | Bacteria, hydrocarbons, dissolved solids, lead, cadmium, and trace metals | Infiltration from detention basins, drainage wells, pits, shafts can reach groundwater. Karst areas particularly vulnerable |
| Deicing chemical storage and use | 14 | Not reported | Sodium chloride, ferric ferrocyanide, sodium ferrocyanide, phosphate, and chromate | Winter 1983, 9.35 million tons dry salts/abbrasives, 7.78 million gallons of liquid salts applied (Office of Technology Assessment 1984) |
| **Other** | | | | |
| Saline intrusion or upconing | 29 | Not reported | Dissolved solids and brines | Present in coastal areas and in many inland areas |

**Table 10C.85 Profile of Sources of Groundwater Contamination in the United States**

| Source | Potential Contaminants | Number/Volume | Geographic Distribution |
|---|---|---|---|
| Subsurface percolation systems | Organics, metals, nitrates, phosphates, microorganisms | 22 million domestic systems 25,000 industrial systems | Highest concentration in eastern third of country and portions of west coast |
| Injection wells | Organics, metals, inorganic acids, microorganisms, radionuclides | 280,752 active wells | Varies by well type<br>Class I (hazardous waste)—Gulf Coast and Great Lakes<br>Class II (oil/gas)—throughout the U.S.<br>Class III (mining)—Southwest<br>Class V—agricultural wells in IA, ID, TX, CA; industrial wells in NY and NJ |
| Land application | Nitrogen, phosphorous, metals organics, microorganisms | 2,463 POTWs—sludge application<br>1,000 POTWs—land treatment<br>250 hazardous waste land treatment units<br>18,889 nonhazardous units | Unknown |
| Landfills | Organics, inorganics, microorganisms, radionuclides | 16,416 landfills<br>9,284 municipal<br>3,155 industrial | Urban locations nationwide |
| Open dumps | Organics, inorganics, microorganisms | 1,856–2,396 dumps | 55 states and territories |
| Residential disposal | Organics, metals, other inorganics, microorganisms | Unknown | Nationwide |
| Surface impoundments | Organics, metals and other inorganics, microorganisms, radionuclides | 191,822 surface impoundments<br>16,232 industrial<br>2,426 municipal<br>17,159 agricultural<br>19,813 mining<br>125,074 oil and gas<br>11,118 other | 70% in hydrogeologically vulnerable areas<br>37% over current groundwater sources of drinking water<br>Highest number of non-hazardous are in AR, KS, LA, MN, OH, OK, PA, TX, WV |
| Waster tailings and piles | Arsenic, sulfuric acid, copper, selenium, molybdenum, uranium, thorium, radium,<br>lead, manganese, vanadium | Total mining—2.3 billion tons/yr<br>Metal—250 million tons/yr<br>Uranium—215 million tons/yr.<br>Hazardous waste—0.39 billion tons | Unknown |
| Material stockpiles | Metals, inorganics, radionuclides | Annual materials production—3.4 billion tons/yr<br>Stockpiles—700 million tons/yr | Nationwide |
| Graveyards | Metals, nonmetals, microorganisms | Unknown | Nationwide |
| Animal burial | | Unknown | Unknown |
| Aboveground storage | Organics, inorganics, microorganisms, radionuclides | Unknown | Nationwide |
| Underground storage | Organics, inorganics, microorganisms, radionuclides | Steel—2.4–4.8 million tanks<br>Fiberglass—0.1 million tanks<br>Total capacity—25 billion gallons Hazardous storage—2,032 tanks | Nationwide |

© 2006 by Taylor & Francis Group, LLC

| | | | |
|---|---|---|---|
| Pipelines | Microorganisms, organics, inorganics | 175,000 miles of petroleum product pipelines (1976) carrying 9.63 billion bbls<br>700,000 miles of sewer pipeline (1976) carrying 5.6 trillion gallons | Nationwide |
| Materials transport | Organics, inorganics, microorganisms | 10,000–16,000 spills per year; spills account for approximately 0.35 percent of 4 billion tons shipped annually (1984) | Nationwide |
| Mining/mine drainage | Acids, metals, radionuclides | 15,000 active coal mines (1986)<br>67,000 inactive coal mines phospate mines; metalic ore mines | Varies by mining type |
| Production wells | Organics, inorganics, microorganisms | 548,000 oil wells produced approximately 3.1 billion bbls crude oil (1980)<br>376,000 irrigation wells for 126,000 farms Up to 1.2 million abandoned wells | Oil Wells—nationwide<br>Geothermal wells—primarily CA, NV, ID<br>Water wells—mostly in the Southwest, Central Plains, Idaho, and Florida |
| Other wells (monitoring and exploration) | Organics, inorganics, microorganisms radionuclides | Unknown | Unknown |
| Pesticide application | Organics—1,200–1,400 active ingredients<br>Approximately 280 million acre-treatments annually | 552 million pounds of active ingredients applied to crops in 1982 | 17 pesticides confirmed in 23 states (1986) due to normal agricultural application |
| Fertilizer applications | Nitrates, phosphates | Fertilizer use has declined from 54 million tons to 42.3 million tons (1980–1983); fertilizers in 1981–1982 contained 11 million tons of nitrogen, 4.8 million tons of phosphates, 5.6 million tons of potash | Highest fertilizer use in 1981–1982: CA, IL, IN, IO, TX |
| Deicing | Salts | 9.35 million tons dry salts, and abrasives; 1.78 million gallons liquid salts applied to U.S. highways (1982–1983) | Northeast, Mid-Atlantic, Midwest |
| Irrigation practices | Fertilizers, pesticides, naturally occurring contaminants (e.g., selenium), sediment | 14 percent of cropland is irrigated | Water, Central, and South Plains, Arkansas, Florida |
| Percolation of atmospheric pollutants | Sulfhur and nitrogen compounds, asbestos, heavy metals | Unknown | Acid rain around Great Lakes, Northeast<br>Distribution of other pollutants varies |
| Groundwater/surface water interaction | Organics, inorganics, microorganisms, radionuclides | Unknown | Unknown |
| Natural leaching | Inorganics, radionuclides | Unknown | Unknown, very localized |
| Salt water intrusion | Inorganics, radionuclides | Unknown | Predominantly coastal areas—CA, TX, LA, FL, NY, Southwest, Central Plains |

*Note:* IOC, Regulated: includes all the regulated IOCs; SOCs, Group 1: includes alachlor, atrazine, and simazine; SOCs, Group 2: includes bis(2-ethylhexyl)phthalate, bis(2-ethylhexyl)adipate, and benzo(a)pyrene; VOCs, Regulated: includes all the regulated VOCs; VOCs, Group 1: includes benzene, ethyl benzene, toluene, and total xylenes (LNAPLEs); VOCs, Group 2: includes cis-1, 2-dichloroethylene, trans-1,2-dichloroethylene, 1,1-dichloroethene, tetrachloroethylene, trichloroethene, and vinyl chloride (DNAPLEs). Percent MCL Violations Derived from SDWIS Information for 1/1/93-3/31/1998.

[a] % >MCL indicates the proportion of systems with any analytical results exceeding the concentration value of the MCL; it does not necessarily indicate an MCL violation. An MCL violation occurs when the MCL is exceeded by the average results from four quarterly samples or confirmation samples as required by the primacy State.

*Note:* MCL, maximum contaminant level; HAL, health advisory level (as of December 2000); HRL, health reference level (concentration values used only as reference levels for analyses in this report); MRL, minimum reporting level.
The MCL, HAL, HRL, and MRL values are used in this report only as reference levels to facilitate occurrence assessments.
"% PWS > Threshold" indicates the proportion of systems with any analytical results exceeding the concentration value of the HRL/MCL/HAL. (Note that results for % PWSs greater than an MCL value does not indicate a MCL violation. A formal MCL violation occurs when the MCL is exceeded by the average of four consecutive quarterly samples or confirmation samples as required by the primacy States.)
N/A, there is no HRL/MCL/HAL available.

[a] Massachusetts data not included in summary statistics for this contaminant.
[b] New Hampshire data not included in summary statistics for this contaminant.

**Table 10C.94 Number of Injection Wells in the United States in 1998**

| Well Class | Number of Wells (Rounded to Nearest 100) | Description of Injection Practice |
|---|---|---|
| Class I | 500 | Inject fluids into deep, confined geologic formations Associated with municipal or industrial waste disposal, hazardous or radioactive waste sites |
| Class II | 164,300 | Inject fluids used in oil and gas production into deep, confined geologic formations |
| Class III | 29,600 | Inject fluids into shallower formations for mineral extraction |
| Class IV | Banned by all states and EPA under the Safe Drinking Water Act unless authorized for groundwater cleanup | Inject hazardous or radioactive wastes directly or indirectly into drinking water sources |
| Class V | Actual numbers unavailable | Includes all injection methods not included in other four categories |

*Note:* This information does not indicate whether (or to what degree) the public has been exposed to toxic chemicals. Therefore, no conclusions on the potential risks can be made based solely on this information (including any ranking information). For more detailed information on this subject refer to *The Toxics Release Inventory (TRI) and Factors to Consider When Using TRI Data* document at www.epa.gov/trl/tridata.

On-site Disposal or Other Releases include Underground injection to Class I Wells (Section 5.4.1), RCRA Subtitle C Landfills (5.5.1A), Other Landfills (5.5.1B), Fugitive or Non-point Air Emissions (5.1), Stack or Point Source Air Emissions (5.2), Surface Water Discharges (5.3), Class II–V Wells (5.4.2), Land Treatment (5.5.2), RCRA Subtitle C Surface impoundments (5.5.3A), Other Surface Impoundments (5.5.3B) and Other Land Disposal (5.5.4). Off-site Disposal or Other Releases include from Section 6.2 Underground Injection to Class I Wells (M81), RCRA Subtitle C Landfills (M65), Other Landfills (M64, M72), Storage Only (M10), Solidification/Stabilization—Metals and Metal Category Compounds only (M41 or M40), Wastewater Treatment (excluding POTWs)—Metals and Metal Category Compounds only (M62 or M61), RCRA Subtitle C Surface Impoundments (M66), Other Surface Impoundments (M67, M63), Land Treatment (M73), Other Land Disposal (M79), Underground Injection to Class II–V Wells (M82, M71), Other Off-site Management (M90), Transfers to Waste Broker—Disposal (M94, M91), and Unknown (M99) and, from Section 6.1, Transfers to POTWs (metals and metal category compounds only).

Does not include Off-site Disposal or Other Releases transferred to other TRI facilities that reported the amounts as On-site Disposal or Other Releases.

*Note:* This information does not indicate whether (or to what degree) the public has been exposed to toxic chemicals. Therefore, no conclusions on the potential risks can be made based solely on this information (including any ranking information). For more detailed information on this subject refer *Toxics Release Inventory (TRI) and Factors to Consider When Using TRI Data* document at www.epa.gov/tri/tridata.

On-site Disposal or Other Releases include Underground Injection to Class I Wells (Section 5.4.1), RCRA Subtitle C Landfills (5.5.1A), Other Landfills (5.5.1B), Fugitive or Non-point Air Emissions (5.1), Stack or Point Source Air Emissions (5.2), Surface Water Discharges (5.3), Class II–V Wells (5.4.2). Land Treatment (5.5.2), RCRA Subtitle C Surface Impoundments (5.5.3A), Other Surface Impoundments (5.5.3B) and Other Land Disposal (5.5.4). Off-site Disposal or Other Releases include from Section 6.2 Underground Injection to Class I Wells (M81), RCRA Subtitle C Landfills (M65), Other Landfills (M64, M72), Storage Only (M10), Solidification/Stabilization—Metals and Metal Category Compounds only (M41 or M40), Wastewater Treatment (excluding POTWs)—Metals and Metal Category Compounds only (M62 or M61), RCRA Subtitle C Surface Impoundments (M66), Other Surface Impoundments (M67, M63), Land Treatment (M73), Other Land Disposal (M79), Underground Injection to Class II–V Wells (M82, M71), Other Off-site Management (M90), Transfers to Waste Broker—Disposal (M94, M91), and Unknown (M99) and, from Section 6.1, Transfers to POTWs (metals and metal category compounds only).

Does not include Off-site Disposal or Other-Releases transferred to other TRI facilities that reported the amounts as On-site Disposal or Other Releases.

**Table 10C.102 Trichloroethene Concentrations Detected in Municipal/Communal and Private/Domestic Water Supplies in Canada**

| Supply | Number of Supplies | Percentage of Supplies Where TCE Was Detected | Average Maximum Concentration |
|---|---|---|---|
| Municipal/communal | 481 | 8.3 | 25 ug/L |
| Private/domestic | 215 | 3.3 | 1,680 ug/L |

| TCE Concentration Range | Percentage of Sites within TCE Range | Percent of Population Supplied with Groundwater within TCE Range[a] |
|---|---|---|
| Nondetectable levels (<0.01–10 ug/L) | 93 | 49 |
| <1 ug/L | 3.6 | |
| 1–10 ug/L | 1.4 | 48 |
| 10–100 ug/L | 0.43 | 2.1 |
| >100 ug/L | 1.3 | 0.8 |

[a] 1.67 Million of the 7.1 million Canadians who relied on groundwater for household use in 1995 were covered this study. Most of sites were from Ontario and New Brunswick.

**Table 10C.104 Known Occurrences of Hydrocarbon Contamination of Groundwater in Australia**

| State or Territory | Area | Source |
|---|---|---|
| Victoria | 9 sites | Industrial/manufacturing/storage facilities |
| | 2 sites in Melbourne–Geelong region | Landfill |
| | 1 site | Fuel station |
| Western Australia | 8 sites including 2 sites on the Swan Coastal Plain[a] | Fuel stations |
| NSW | 5 sites, including Anna Bay, Botany and Matraville | Industrial/manufacturing/storage facilities |
| | 1 site | Landfill |
| ACT | 3 sites | Fuel stations |
| Queensland | 1 site in Cairns | Fuel station |
| South Australia | 6 Sites Mt Gambler (2 sites), Bordertown, Jamestown, Fregon and Minlayton | Fuel stations |
| Northern Territory | 1 site Croker Island | Fuel station |
| Tasmania | Several (number and locations unknown) | Fuel stations |

[a] The two sites on the Swan Coastal Plain are documented in Davis et al. (1993).

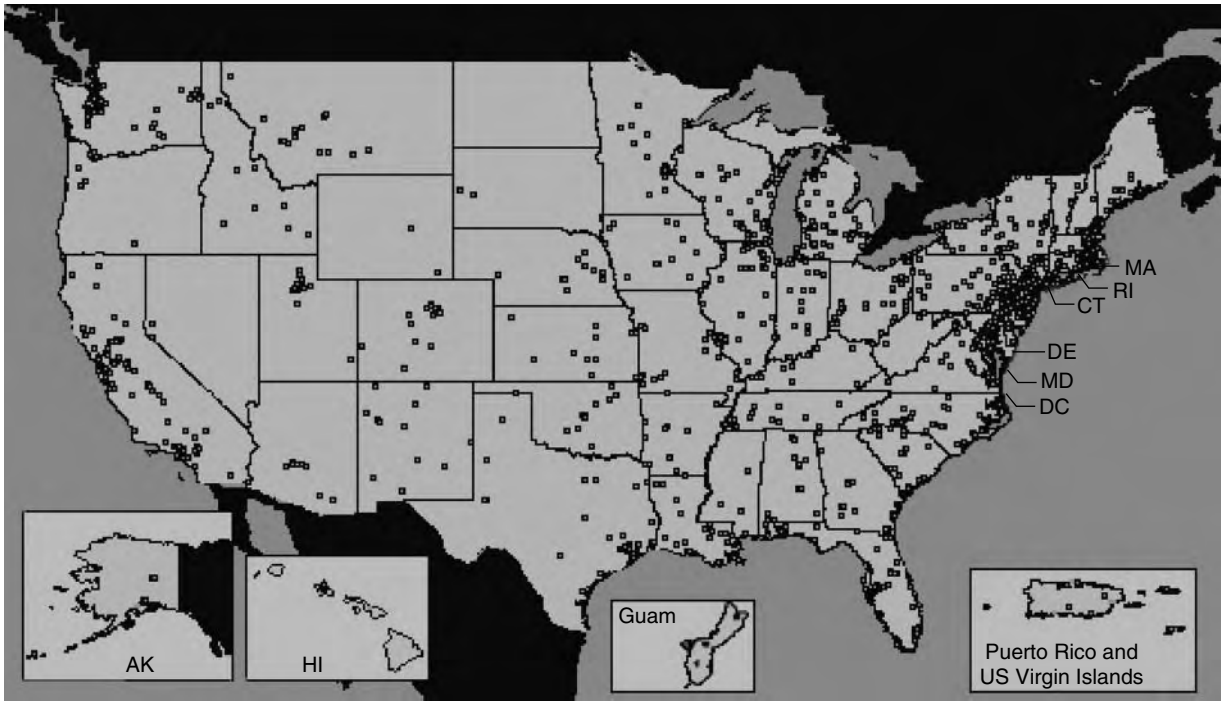

**Figure 10D.72** Superfund sites in the United States. (From www.images.google.com.)

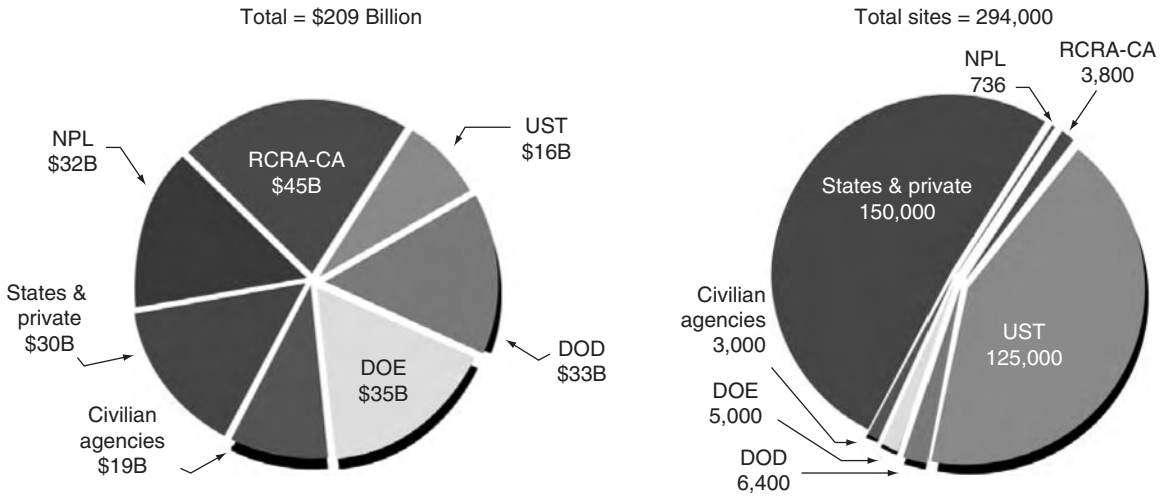

These estimates are derived from judgements regarding the most likely scenarios within a range of estimates. The estimates described in the report, include a number of assumptions such as the average cleanup cost per site, number of new site discoveries, and future additons to the NPL.

NPL: National Priorites List, or Superfund; RCRA-CA: Resource Conservation and Recovery Act Corrective Action program; UST: Underground Storage Tanks; DOD; Department of Defense; DOE: Department of Energy; Civilian agencies: non-DOD and non-DOE federal agencies; and State & private: state mandatory, voluntary, and brownfields sites, and private sites.

Totals may not add due to rounding.

**Figure 10D.73** Estimated number of hazardous waste sites and cleanup costs: 2004–2033. (From clu-in.org/download/market/2004market.)

**Table 10D.107 Summary Data on Solid Waste Facilities in the United States**

| Percent of uncontrolled sites that are solid waste facilities | |
|---|---|
| Of 1,389 sites with actual or presumed problems of releases of hazardous substances | 18% |
| Of 550 sites on National Priority List | 20% |
| Two most prevalent effects at problem solid waste sites | |
| Leachate migration, groundwater pollution: at 89% of sites | |
| Drinking water contamination: at 49% of sites | |
| Mean size of problem solid wastes sites | 67.4 acres |
| Median hazard ranking score[a] | |
| Solid waste sites on the NPL | 40.8 |
| All NPL sites | 42.2 |
| Estimates for national number of solid waste sites | |
| Operating sanitary, municipal landfills | 14,000 |
| Closed sanitary, municipal landfills | 42,000 |
| Operating industrial landfills | 75,000 |
| Closed industrial landfills | 150,000 |
| Operating surface impoundments | 170,000 |
| Closed surface impoundments | 170,000 |
| Total | 621,000 |
| Estimate of need for future cleanup | |
| Low: 5% landfills, 1% impoundments likely to release toxic substances | 17,400 |
| High: 10% landfills, 2% impoundments likely to release toxic substances | 34,800 |
| Conservative figure used for cleanup by superfund | 5,000 |

[a] 28.5 required for placement on National Priorities List; current highest site score is 75.6.

| Transportation equipment | 3.8 | 4.3 | 4.7 | 5.2 | 4.3 | 4.2 | 4.0 | 2.9 | 3.0 | 0.3 | 2.7 |

*Note:* In millions of short tons. Excludes recovered materials. Data included both wet and dry weight figures. Excludes apparel and other textiles, and, beginning 1978, establishments with less than 20 employees. Z, Less than 50,000 short tons.

[a] Covers waste, which because of its quantity, concentration, or physical, chemical, or infectious characteristics, may cause, or significantly contribute to an increase in serious irreversible, or incapacitating reversible illness; or pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, or disposed of or managed. See Resource Conservation and Recovery Act 1976, Public Law 94-580, for listing of hazardous wastes.

[b] Includes industries not shown separately.

**Table 10D.109 Future Use of Containment Technologies for Cleanup of Hazardous Waste Sites in the United States**

| Technique | Applicability | Effectiveness | Confidence | Capital Cost | Cap/O&M | Projected Level of Use |
|---|---|---|---|---|---|---|
| Barriers | | | | | | |
| Slurry wall | 2 | 1 | 2 | 2 | 1 | Extensive |
| Grout curtain | 2–3 | 1 | 2 | 2–3 | 1 | Limited |
| Vibrating beam | 2 | 1 | 2–3 | 2–3 | 1 | Moderate |
| Sheet pile | 3 | 1–2 | 2 | 2–3 | 1 | Nil-Limited |
| Block displacement | 3 | 1 | 4 | 3 | 1 | Nil |
| Hydraulic controls (wells) | 2 | 1,3 | 1 | 1 | 3 | Extensive |
| Subsurface drains | 2 | 1 | 2 | 1 | 2 | Moderate |
| Runon/runoff controls | 1 | 3 | 1 | 1 | 2 | Extensive |
| Surface seals and caps | 1 | 2,3 | 2 | 1 | 1 | Extensive |
| Solidification, etc. | 2 | 1,3 | 3–4 | 2 | 1 | Moderate-Limited |

*Key*:
*Applicability*: (1) Very broadly applicable; little or no site dependency. (2) Broadly applicable; some sites unfavorable. (3) Limited to sites of specific characteristics. *Effectiveness*: (1) Can produce "leak-tight" containment. (2) Can reduce migration—some leakage likely. (3) Used as supporting technique in conjunction with other elements. *Confidence*: (1) Well proven—long-term effectiveness—high. (2) Well proven—long-term effectiveness—unknown. (3) Limited experience; used in other applications. (4) Developmental; little data. *Capital cost for function provided*: (1) Low. (2) Normal. (3) High. *Capital to operation and maintenance (O&M) cost ratio*: (1) Capital higher than O&M. (2) Capital about same as O&M. (3) Capital lower than O&M.

*Source*: From U.S. Congress, Office of Technology Assessment, 1985, *Superfund Strategy*.

*Original source*: Little, A.D., *Evaluation of Available Cleanup Technologies for Uncontrolled Sites*, contractor report prepared for the Office of Technology Assessment, Nov. 15, 1984.

**Table 10D.110 Future Use of Treatment Technologies for Cleanup of Hazardous Waste Sites in the United States**

| Technique | Applicability | Effectiveness | Confidence | Capital Cost | Cap/O&M | Secondary Disposal | Projected Level Use of |
|---|---|---|---|---|---|---|---|
| Biological treatment | Or, 1–2 | 2 | 1 | 1 | 1–2 | 3 | Moderate |
| Chemical treatment | | | | | | | |
| Neutralization/precipitation | In, 1 | 1 | 1 | 1 | 2 | 4 | Moderate–Extensive |
| Wet air oxidation | Or, 2 | 2 | 2 | 3 | 1–2 | 1 | Limited |
| Chlorination | In, 3 | 1 | 2 | 2 | 2 | 1 | Limited |
| Ozonation | Or, 3 | 2 | 3 | 3 | 2–3 | 2 | Nil |
| Reduction (Cr) | In, 3 | 1 | 2 | 2 | 2 | 3 | Limited |
| Physical treatment | | | | | | | |
| Carbon adsorption | Or, In, 1 | 1 | 1 | 2 | 2–3 | 2–3 | Moderate–Extensive |
| Sedimentation/filtration | Or, In, 1 | 1 | 1 | 1 | 2–3 | 4 | Moderate–Extensive |
| Stripping | Or, 2 | 1 | 1 | 1 | 2 | 4 | Moderate |
| Flotation | Or, 2 | 2 | 1 | 1 | 1 | 4 | Limited |
| Ion exchange | In, 3 | 1–3 | 3 | 3 | 3 | 4 | Nil |
| Reverse osmosis | Or, In, 3 | 1–2 | 3 | 3 | 3 | 4 | Nil |
| Gas stream controls | | | | | | | |
| Thermal oxidation | Or, 1 | 1 | 1 | 3 | 3 | 1 | Limited–Moderate |
| Carbon adsorption | Or, 1 | 1 | 1 | 3 | 2–3 | 2–3 | Limited–Moderate |

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 10D.110 (Continued)**

| Technique | Applicability | Effectiveness | Confidence | Capital Cost | Cap/O&M | Secondary Disposal | Projected Level Use of |
|---|---|---|---|---|---|---|---|
| Incineration | | | | | | | |
| Onsite | Or, 1 | 1 | 2 | 3 | 1 | 3[a] | Limited |
| Offsite | Or, 1 | 1 | 1 | 3 | NA | 3[b] | Moderate |
| *In situ* biodegradation | Or, 3 | 2 | 3 | 2 | 3 | 1 | Limited |

*Key*:
*Class*: Or, Organic compounds. In, Inorganic compounds. *Range*: (1) Broadly applicable to compounds in indicated class. (2) Moderated applicable: depends on waste composition concentration. (3) Limited to special situations. *Effectiveness*: (1) Highest levels available. (2) Output may need further treatment; may have pockets untreated (in situ). *Confidence*: (1) Well proven—easily transferable to site cleanup. (2) Well proven—but not in clean-up settings. (3) Limited experience. (4) Developmental; little data. *Capital cost for function provided*: (1) Low. (2) Normal. (3) High. *Capital to operations and maintenance (O&M) cost basis*: (1) Capital higher than O&M. (2) Capital about the same. (3) Capital lower than O&M. *Secondary treatment or disposal*: (1) None. (2) Minor. (3) Major, but does not require hazardous waste techniques. (4) Basically a separation process; must be used with subsequent hazardous waste treatment or secure disposal step.

[a] Must dispose solid residues.
[b] Depends on reactive material used.

*Source*: From U.S. Congress, Office of Technology Assessment, 1985, Superfund Strategy.

OPs were most often detected in samples from small streams draining urban watersheds and from some agricultural watersheds. Chlorpyrifos, diazinon, and malathion were often detected in samples from rivers in medium and large watersheds. The three pesticides Chlorpyrifos, Malathion and Diazinon have substantial non-cropland use. Aquatic-life criteria were exceeded most often in streams in small urban watersheds. Boxplots illustrate the distribution of percent detections (or percent aquatic-life exceedances) among sites. For example, the median percent detections of chlorpyrifos among the 46 NASQAN sites is 9%; percent detections range from no detections at the Snake River at Burbank, Washington, to 90% detections at the Arroyo Colorado at Harlingen, Texas. Percentiles presented are not adjusted for varied detection limits and sampling frequency

*Note:* The pesticide compounds found most often in fish and bed sediment are related to three major groups of insecticides that were heavily used in the 1960s. Organochlorine compounds related to DDT and dieldrin were widely used in both agricultural and urban areas, and chlordane was mainly used in urban areas.

**Figure 10E.107** The most frequently detected pesticides in fish and bed sediment in the United States, 1991–1996. (From United States Geological Survey, 1999, The Quality of Our Nation's Waters, Nutrients and Pesticides, *U.S. Geological Survey Circular. 1225*, www.usgs.gov.)

Changes in sediment yield reflect changes in basin conditions, including climate, solis, erosion rates, vegetation, topography and land use. It is influenced strongly by human actions, such as in the construction of dams and levees (see high sediment load in China and the Amason basin, where large dams have been implemeted), forest harvesting and farming in drainage basins

Nitrate concentrations in rivers

Nitrate pollution in rivers is higher in the EU-15 than in the New -10 (but lowest of all in the Nordic countries). This reflects differences in agricultural intensity and practices. In 2000/2001, rivers in 14 European countries (out of 24 with available information) exceeded the EU drinking water directive's guide concentration for nitrate; five also exceeded the maximum allowable concentration. In general nitrate concentrations in rivers are declining: 25% of monitoring stations on Europe's rivers recorded a decrease between 1992 and 2001. However, around 15% of river monitoring stations showed an increasing trend in nitrate concentrations over the same period.

| 1998 | 55.0 | 12.3 | 4.6 | 5.3 | 22.3 |

*Note:* Includes Puerto Rico. Detailed State data shown in (USDA, 1997). Fertilizer statistics used in this table include commercial fertilizers purchased for use on farms such as chemical fertilizers and natural processed and dried organic materials. Purchased natural processed and dried organic materials historically have represented about 1 percent of total nutrient use.

[a] Includes secondary and micronutrients. Most of the difference between total primary nutrient tons and total fertilizer materials is carrier or filler materials.

[b] Totals may not add due to rounding.

*Note:* μg/L, microgram per liter; lb/yr = pounds per year; nd, no available data; nr, none reported. *See footnote[b].

[a] Detection limits shown are for water samples. Bed-sediment reporting limits are 10 times greater and are expressed in units micrograms per kilogram (Lucas and others, 1980).

[b] All criteria are from U.S. Environmental Protection Agency (1980), except for values marked by asterisks, which are from U.S. Environmental Protection Agency (1976). The human-health criteria for all pesticides except endrin, lindane, methoxychlor, 2,4-D, and 2,4,5-T represent the estimated average concentrations associated with an incremental increase in cancer risk of $10^{-8}$ (one additional cancer per 100,000 people over a lifetime of exposure). The aquatic-life criteria are for freshwater and are 24-hour average concentrations.

[c] Data from Kenaga and Goring (1980).

[d] Relative persistence within each pesticide group as estimated from Hiltbold (1974) and Wauchope (1978).

[e] Data for 1966, from Eichers and others (1970); for 1971, Andrilenas (1974); for 1976, Eichers and others (1978); for 1982, U.S. Department of Agriculture (1983). Data for 1982 do not include use on livestock or use in California, Colorado, Connecticut, Maine, Massachusetts, Nevada, New Hampshire, New Jersey, New Mexico, Oregon, Rhode Island, Utah, Vermont, West Virginia, and Wyoming.

[f] Data from Mark H. Glaze (U.S. Environmental Protection Agency, written communication, 1983).

**Table 10E.150 Comparison of Organochlorine Concentrations in Sediment in the United States with Sediment-Quality Guidelines, 1992–1995**

| | EPA Sediment-Quality Criteria | | Boundary Values and Tier Assignments | | | | |
|---|---|---|---|---|---|---|---|
| | | | | | NAWQA Sites in Each Tier (percent) | | |
| Target Analytes | Criterion (μg/kg-oc) | Tier 1 Percent of Sites Exceeding Criterion | Tier 2–3 Boundary Value[a] (μg/kg dry weight) | Tier 1–2 Boundary Value[b] (mg/kg dry weight) | Tier 1 | Tier 2 | Tier 3 |
| Total chlordane | — | — | 0.5 | 6 | 10.4 | 8.3 | 81.3 |
| Total DDT | — | — | 1.58 | 46.1 | 4.7 | 32.1 | 63.2 |
| Dieldrin | 11,000 | 0 | 0.02 | 6.67[c] | 0 | 14.3 | 85.7 |
| Endosulfan I | — | — | 2.9 | i | — | 1.2 | 98.8 |
| Endrin | 4,200 | 0 | 0.02 | 45[c] | 0 | 0 | 100 |
| Total HCH | — | — | 0.32 | 3.7 | 0.2 | 1.2 | 98.5 |
| Heptachlor epoxide | — | — | 0.6 | i | — | 1.2 | 98.8 |
| Hexachlorobenzene | — | — | 22 | i | — | 0 | 100 |
| Lindane | — | — | 0.32 | 1.38 | 0.7 | 0.2 | 99 |
| Total methoxychlor | — | — | 19 | i | — | 0.5 | 99.5 |
| Total PCBs | — | — | 21.6 | 189 | 3.5 | 2.3 | 94.2 |
| Toxaphene | — | — | 1.5 | 100 | 0.2[d] | 0[d] | 99.8[d] |
| Probability of adverse effects | | High | | | High | Intermediate | No indication |

*Note:* Percentage of NAWQA sites in Tiers 1, 2, and 3 based on exceedance of sediment-quality guidelines. EPA sediment-quality criteria, and the percent exceedance, are shown because exceedance of this criterion triggers classification in Tier 1 for sites with sediment organic carbon data. Tier 1-2 and Tier 2-3 boundary values are also shown (see text for explanation). The probability of adverse effects on aquatic life is shown for each tier. I, insufficient guidelines to determine a Tier 1-2 boundary value; EPA, U.S. Environmental Protection Agency; PCB, polychlorinated biphenyl; wt., weight; μg/kg, microgram per kilogram; μg/kg-oc, microgram per kilogram of sediment organic carbon; —, no guideline available.

[a] Lowest of the lower screening values.
[b] Second lowest of the upper screening values.
[c] Values are appropriate only for site with no sediment organic carbon data; if sediment organic carbon data are available, the EPA sediment-quality criterion (column 1) should be used instead.
[d] Because the boundary values (1.5 and 100 μg/kg) for this compound are well below its detection limit in the present study (200 μg/kg), the percentage of sites in Tiers 1 and 2 must be considered as underestimates.

| Toxaphene | B2 | 5,000 | 0 | 100[d] | 0.4 |

*Note:* Because chemical concentrations are in whole fish, whereas standards and guidelines apply to edible fish tissues, exceedance indicates that additional sampling of game fish fillets may be warranted. All concentrations are wet weight. EPA cancer group: B2, probable human carcinogen; C, possible human carcinogen; D, not classified; E, no evidence of carcinogenicity. FDA, Food and Drug Administration; EPA, U.S. Environmental Protection Agency; μg/kg, microgram per kilogram; —, no standard or guideline available.

[a] From U.S. Environmental Protection Agency (1995).
[b] From Food and Drug Administration (1990), unless otherwise specified.
[c] Based on chronic toxicity, unless otherwise specified.
[d] Based on 1 in 100,000 cancer risk.
[e] Not classified by EPA; however, classified as a probable human carcinogen by International Agency for Research on Cancer.
[f] FDA tolerance level (from Food and Drug Administration, 1984).

**Table 10E.156 (Continued)**

*Note:* Pesticide or Transformation Product: Compounds listed are those for which one or more of the multistate studies or the studies included in the Pesticides In Ground Water Database conducted analyses, and for which one or more of the indicated criteria were reported by Nowell and Resek (1994); Transformation products are indented. Criteria listed do not account for the protection of aquatic organisms. Ranges of Observed Concentrations: Numbers of significant figures given for concentrations in the original references have been retained; Concentration data for the Pesticides In Ground Water Database exclude values given in original reference (U.S. Environmental Protection Agency, 1992b) as "0," "trace" or "$<$X," where X is some maximum value. CWS, Community water system wells; HA, lifetime health advisory level for a 70-kg adult; MCL, maximum contaminant level (MCL values given are the most recent ones for which, according to Nowell and Resek [1994], a published rationale is available); MCPS, Midcontinent Pesticide Study (Kolpin and others, 1995; Kolpin, 1995b; data shown are based on all three years of sampling reported to date [1991–1993], unless otherwise indicated); MMS, Metolachlor Monitoring Study (Roux and others, 1991a); NA, not applicable; NAS, National Academy of Sciences: NAWWS, National Alachlor Well Water Survey (Holden and others, 1992; Klein, 1993); ND, not detected; NPS, National Pesticide Survey (U.S. Environmental Protection Agency, 1990a); NR, health advisories for exposures over the longer term are not recommended due to the carcinogenic risk associated with this compound; nsr, no standard or guideline reported by Nowell and Resek (1994) for this compound, unless states otherwise; PGWDB, Pesticides In Ground Water Database (U.S.Environmental Protection Agency, 1992b); Q, Compound may have been present, be "[could not] be quantified or reliable detected" (U.S.Environmental Protection Agency, 199a); RD, Rural domestic wells; USEPA, U.S. Environmental Protection Agency; Blank cells indicate no information applicable or available; $<$, less than; kg, kilograms; $\mu$g/L, micrograms per liter.

[a] Detection reported in the overall summary of analytical results (U.S. Environmental Protection Agency, 1990a), but not in the data reported for the individual wells sampled for the NPS (U.S. Environmental Protection Agency, 1994b). No distinction made between detections in CWS and RD wells.

[b] Value for frequency of exceedance of MCL for alachlor pertains to 1993 sampling only (Kolpin and Thurman, 1995). No samples exceeded the MCL for alachlor in 1991 or 1992 (Kolpin and others, 1995).

[c] Basis for reported MCL or HA exceedance not provided in original reference (U.S. Environmental Protection Agency, 1992b).

[d] Source: U.S. Environmental Protection Agency (1992b).

[e] Original reference did not differentiate between $\alpha$, $\beta$ and $\delta$ isomers.

[f] No isomers specified.

[g] Ethylenebis(dithiocarbamate) fungicide transformation product.

[h] Compound detected, but full concentration range not reported.

[i] Exceedance frequency based on an MCL (1 $\mu$g/L) that has been superceded by a higher value of 4 mg/L (Nowell and Resek, 1994) since the publication of the Pesticides In Ground Water Database (U.S. Environmental Protection Agency, 1992b.)

**Table 10E.160 Summary of Nitrate Concentrations in Groundwater Below Agricultural Land, by Region**

| Region[a,b] | Median Nitrate Concentration (mg/L) | Samples with Concentrations >3 mg/L[c] (percent) | Samples with Concentrations > 10 mg/L[d] (percent) |
|---|---|---|---|
| Northeastern states | 4.3 | 58.2 | 19.6 |
| Appalachian and Southeastern states | 0.2 | 16.3 | 2.0 |
| Corn Belt states | 0.2 | 22.6 | 1.5 |
| Lake states | 0.1 | 25.5 | 14.6 |
| Northern Plains states | 6.0 | 60.6 | 35.2 |
| Southern Plains states | | (numbers requested) | |
| Mountain states | 0.7 | 24.9 | 8.1 |
| Pacific states | 5.5 | 75.0 | 26.9 |

[a] Only includes wells less than 100 ft below the earth's surface.
[b] Only 17 of the 20 study units fit easily into the regional classification. Regions are based on R.F. Spalding and Exner, 1991. *Nitrate contamination in the contiguous United States.* Berlin, Springer-Verlag, NATO ASI Series, vol. G 30, P. 12–48. The eight regions correspond to the 10 USDA Farm Production Regions, except that three USDA regions (Delta, Appalachian, and Southeast) are combined.
[c] May indicate elevated concentration resulting from human activities.
[d] Maximum contaminate level for drinking water.

*Source*: From United States Department of Agriculture Natural Resources Conservation Services, 1997, *Water Quality and Agriculture, Status, Conditions, and Trends*, www.nrcs.usda.gov.

**Table 10E.163 Comparison of Phosphorus and Nitrogen Loading to Canadian Surface and Groundwaters from Various Sources, 1996**

| Nutrient Source | Nitrogen ($10^3$ t/yr) | Phosphorus ($10^3$ t/yr) |
|---|---|---|
| Municipality | | |
| Municipal wastewater treatment plants | 80.3 | 5.6 |
| Sewers | 11.8 | 2.3 |
| Septic systems | 15.4 | 1.9 |
| Industry[a] | 11.8 | 2.0 |
| Agriculture[b] (residual in the field after crop harvest) | 293 | 55 |
| Aquaculture | 2.3 | 0.5 |
| Atmospheric deposition to water | 182 ($NO_3-$ and $NH_4+$ only) | N/A |

[a] Industrial N loads are based on $NO_3 + NH_3$ and are thus DIN not TN; industrial loads do not include New Brunswick, Prince Edward Island or Nova Scotia. Quebec data are only for industries discharging to the St. Lawrence River.

[b] Agricultural residual is the difference between the amount of N or P available to the growing crop and the amount removed in the harvested crop; data are not available as to the portion of this residual that moves to surface or groundwaters.

**Table 10E.164 Aspects of Water Quality of Some Alberta Canada Surface Waters**

| Water Body | Intensity of Farming | Nutrient | No. of Samples | Share That Exceeded Provincial Guidelines for Aquatic life[a] (%) |
|---|---|---|---|---|
| Streams (1995–1996) | High | Total nitrogen | 214 | 87 |
| | | Total phosphorus | 220 | 99 |
| | | Ammonia | 70 | 0 |
| | Moderate | Total nitrogen | 343 | 65 |
| | | Total phosphorus | 341 | 88 |
| | | Ammonia | 126 | 0 |
| | Low | Total nitrogen | 163 | 32 |
| | | Total phosphorus | 164 | 89 |
| | | Ammonia | 162 | 0 |
| Lakes (1995–1996) | High | Total phosphorus | 69 | 96 |
| | Low | Total phosphorus | 23 | 38 |
| Irrigation canals (1977–1996) | | Total phosphorus | | |
| Supply source | | | 183 | 16 |
| Return flow | | | 1,034 | 61 |

[a] The limits for aquatic life are the Alberta Environment Protection guidelines of 1 mg/L total nitrogen, 0.05 mg/L total phosphorous, and the *Canadian Water Quality Guidelines for the Protection of Aquatic Life* maximum acceptable concentration of 1.13–1.81 mg/L ammonia-nitrogen (depending on temperature and pH).

*Note:* na, none reported.

[a] Emissions of Total Phosphorus and nitrogen from Reporting Facilities 1990–2000.

[b] Emissions of Total Phosphorus and Nitrogen to Water from Aggregate Sources 1999–2000. Diffuse source pollution represents aggregated data for which there may be significant error of estimation, ranging up to +/−50% for data for WA and 3–13 times for diffuse source estimates in Tasmania. There are significant qualifications to the National Pollutant Inventory estimates and information on the website should be consulted before quoting and/or interpreting these figures.

| | Tons (Active Ingredients) | | | | | |
|---|---|---|---|---|---|---|
| | Year | Total Pesticides | Insecticides | Fungicides | Herbicdies | Other Pesticides |
| Sweden | 1998 | 1,629 | 27 | 300 | 1,269 | 33 |
| Switzerland | 1999 | 1,528 | 188 | 708 | 613 | 19 |
| Turkey | 1995 | 33,243 | 14,850 | 4,937 | 7,583 | 5,873 |
| UK | 2000 | 32,989 | 667 | 5,282 | 22,702 | 4,339 |
| Russian Fed. | 1997 | 25,961 | 1,686 | 12,110 | 12,152 | 13 |

*Note:* CAN, Data refer to agriculture uses only. Insecticides: data exclude Bacillus thuringiensis. Other pesticides; include growth regulators, animal repellents, rodenticides and fumigants; USA, Agricultural pesticides only. Other pesticides include fumigants, nematocides, rodenticides, molluscicides, insect regulators and other pesticides; JPN, Data refer to national production of pesticides; NZL, Data refer to use in agriculture; AUT, Data refer to sales; BEL, Data refer to sales; CZE, Data refer to agricultural pesticides and sales of chemical pesticides. Other pesticides: include growth regulators, rodenticides, animal repellents, additives, adhesives and other pesticides; DNK, Data refer to sales for use in plant production in open agriculture; FIN, Data refer to sales: other pesticides include growth regulators and forest pesticides; FRA, Data refer to quantities sold to agriculture. Fungicides: include copper and sulphur compounds but not elemental sulphur; DEU, Data refer to sales; GRC, Data refer to sales; IRL, Data based on pesticide imports, which gives a reasonable estimation of the quantities used as the country imports most of its pesticides; NLD, Data refer to sales of chemical pesticides; Other pesticides: include soil disinfectants which correspond, for the years presented, about the half of the total consumption; NOR, Data refer to sales to the agricultural sector; POL, Other pesticides: include growth regulators, rodenticides, animal repellents and other pesticides; PRT, Data refer to sales; ESP, Data refer to sales. Data is provisional; SWE, Data refer to sales; CHE, Data refer to sales and have been estimated to represent 95 percent of the total market volume; Liechtenstein included; TUR, Formulation weight. Powdered sulphur and copper sulphate excluded; UKD, Great Britain only. Insecticides: include acarides, insecticides nematocides and tar oil/acid. Fungicides: include fungicides and sulfur; Herbicides; include herbicides and dessicants.

[a] Unless otherwise specified, data refer to active ingredients. Insecticides: acaricides, molluscicides, nematocides, and mineral oils. Fungicides: bactericides and seed treatments. Herbicides; defoliants and dessicants. Other pesticides: plant growth regulators and rodenticides.

*Note:* See next page.

CAN, Survey coverage has varied greatly (different active ingredients, registrants and products); survey trends therefore may not reflect actual trends but simply changes in the survey coverage. Data include non-agricultural uses, such as home and garden plants, golf course, etc; they represent, however, a small part of the total use (between 1 and 6% of the total depending on category). 1994: data refer to agriculture uses only (non-agricultural uses excluded). Insecticides: data exclude Bacillus thuringiensis. Total: includes animal repellents and fumigants; U.S.A., Agricultural pesticides only. Other pesticides include fumigants, nematocides, rodenticides, molluscicides, insect regulators and other pesticides; JPN, Data refer to national production of pesticides; NZL, Data refer to use in agriculture; AUT, Data refer to sales; BEL, Data refer to sales; CZE, Data refer to agricultural pesticides and sales of chemical pesticides. Other pesticides: include growth regulators, rodenticides, animal repellents, additives, adhesives and other pesticides; DNK, Data refer to sales for use in plant production in open agriculture; FIN, Data refer to sales; other pesticides include growth regulators and forest pesticides; FRA, Data refer to quantities sold to agriculture. Fungicides: include copper and sulphur compounds but not elemental sulphur; DEU, Data refer to sales; GRC, Data refer to sales; IRL, 1994–1997: data based on pesticide imports, which gives a reasonable estimation of the quantities used as the country imports most of its pesticides; ITA, From 1985, data include only agricultural pesticides. Data refer to formulation weight. 1996 total in active ingredients: 48 050 t; NLD, Sales of chemical pesticides. Total: includes soil disinfectants which correspond, for the years presented, to about the half of the total consumption. Insecticides: from 1988 onwards include mineral oils; NOR, Data refer to sales to the agricultural sector; POL, Other pesticides: growth regulators, rodenticides, animal repellents and other pesticides; PRT, Data refer to sales. 1991–1994 data do not include all sales (some enterprises trading in these substances are excluded); since 1995 data refer to all sales (all enterprises included). The increase in sales for 1995 corresponding to the increase in the number of enterprises covered was about 12%. The decrease of sales in 1992 results from the 1991–1992 years drought, which led to a decrease in the agricultural activity; ESP, Data refer to sales. Data is provisional; SWE, A special sales tax has been applied to pesticides since 1987. Another tax was applied in 1995. Data refer to sales; CHE, Data refer to sales and have been estimated to represent 95% of the total market volume; Liechtenstein included; TUR, Formulation weight. Powdered sulphur and copper sulphate excluded; UKD, Great Britain only. Insecticides: include acarides, insecticides nematocides and tar oil/acid. Fungicides: include fungicides and sulfur. Herbicides: include herbicides and dessicants.

[a] Unless otherwise specified, data refer to active ingredients and the reference year is 1985. Insecticides: acaricides, molluscicides, nematocides and mineral oils. Fungicides: bactericides and seed treatments. Herbicides: defoliants and dessicants. Total pesticides may include other pesticides such as plant growth regulators and rodenticides.

**Table 10E.177 Water Quality in Relation to Pesticides in Four Rivers Located in Quebec's Intensive Corn−Cropping Areas, 1992–1995**

| Pesticide | Frequency of Detection, 1992–1995 (%) | Frequency of Exceeding Canadian Water Quality Guildlines (%) | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | Aquatic Life Guidelines | | | | Drinking Water Guidelines | | | |
| | | 1992 | 1993 | 1994 | 1995 | 1992 | 1993 | 1994 | 1995 |
| **Herbicides: Atrazine** | 100 | 43 | 36 | 23 | 16 | 22 | 12 | 10 | 6 |
| Metolachlor | 94 | 0 | 2.5 | 2.8 | 1.7 | 0 | 0 | 0 | 0 |
| Cyanazine | 67 | 0 | 0.8 | 2.1 | 1.4 | 0 | 0 | 0.7 | 0 |
| **Insecticides: Carbaryl** | 6 | 0 | 0 | 8.5 | 5.6 | 0 | 0 | 0 | 0 |
| Diazinon | 3 | 0 | 0 | 4.3 | 6.3 | 0 | 0 | 0 | 0 |
| Malathion | 2 | 0 | 0 | 0 | 0.7 | 0 | 0 | 0 | 0 |
| Azinphos-methyl | 2 | 0 | 0.8 | 4.3 | 1.4 | 0 | 0 | 0 | 0 |
| Chloropyrifos | 1 | 0 | 0 | 0 | 3.5 | 0 | 0 | 0 | 0 |

*Notes:* The total number of samples was 441. Seven other herbicides (phenoxy and benzoic compounds) were detected although their concentrations did not exceed *Canadian Water Quality Guidelines*. Among them, the frequency of detection was 66.4% for dicamba, 59.1% for 2,4-D, 44.3% for mecoprop and 31.2% for MCPA. Six other pesticides were detected in 3% to 67% of the samples and showed concentrations in water lower than the *Canadian Water Quality Guidelines*. Four additional pesticides, for which no water quality guidelines exist, were detected in trace amounts (from less than 0.2% to 20% of the samples).

*Note:* Disclaimer: The data in Waterbase are sub-samples of national data assembled for the purpose of providing comparable indicators of pressures, state and impact of waters on a Europe-wide scale and the data sets are not intended for assessing compliance with any European Directive or any other legal instrument. Information on the national and sub-national scales should be sought from other sources.
Values below the limit of quantification and values below the limit of detection were replaced by half the value. Interval/Individual classes: classes for nitrate rely on Council Directive 98/83/EC on the quality of water intended for human consumption and on 91/676/EEC the Nitrate Directive: 10 mg/L $NO_3$—Background level, 25 mg/L $NO_3$—Drinking water Guide Level (related to replaced 80/778/EC—Drinking water Directive), 50 mg/L $NO_3$—91/676/EEC and parametric value (98/83/EC).
Unit: The table gives the number of GW-bodies according to concentration classes for nitrate. Annual mean values of nitrate are calculated for each GW-body for the latest year available (based on the annual mean values of the sampling sites) and GW-bodies are assigned to frequency classes accordingly.

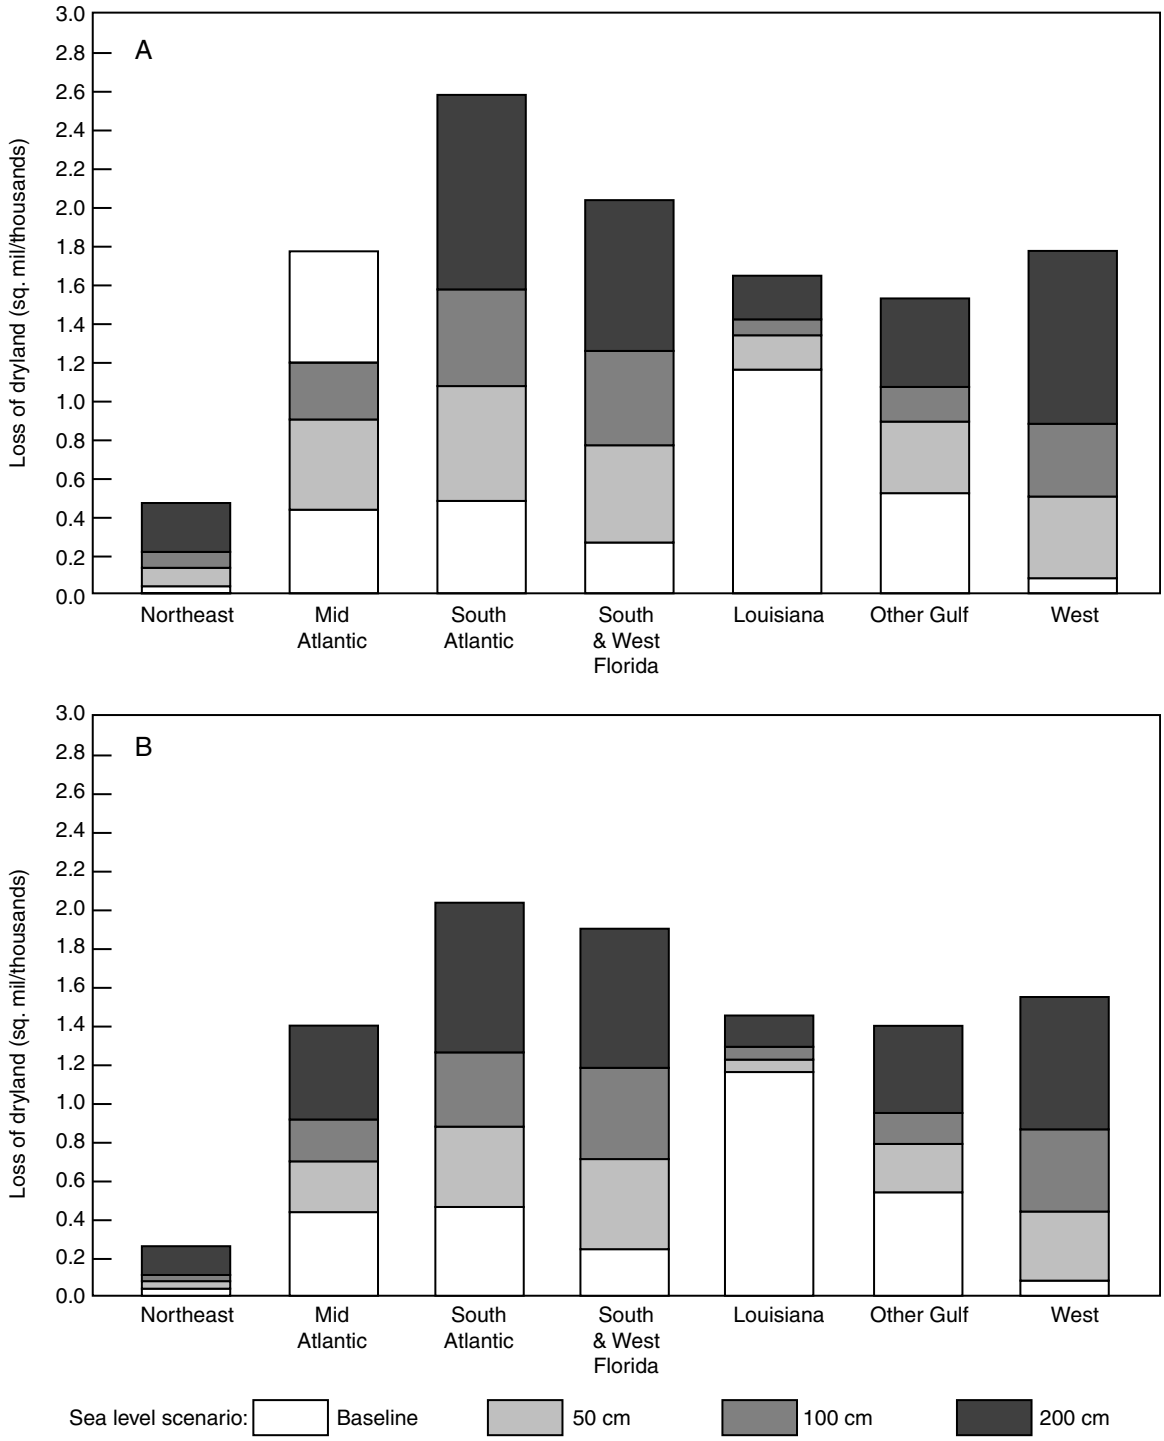

**Figure 10G.140** Loss of dry land in the United States by 2100 (A) if no shores are protected and (B) if developed areas are protected for sea level rise. (From U.S.EPA 1988. The Potential Effects of Global Climate Change on the U.S. Draft report to Congress. Prepared by Titus and Greene, adapted from Park and others.)

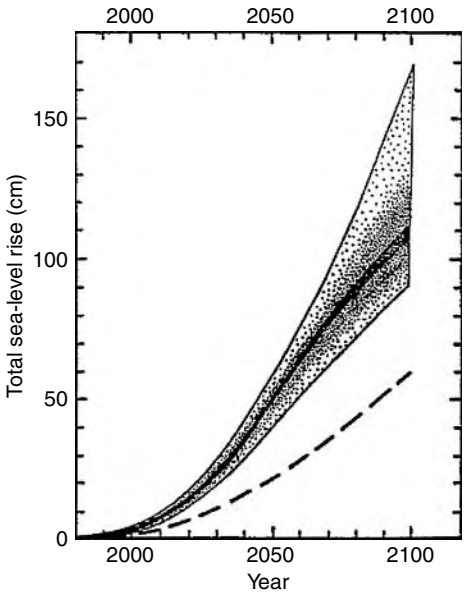
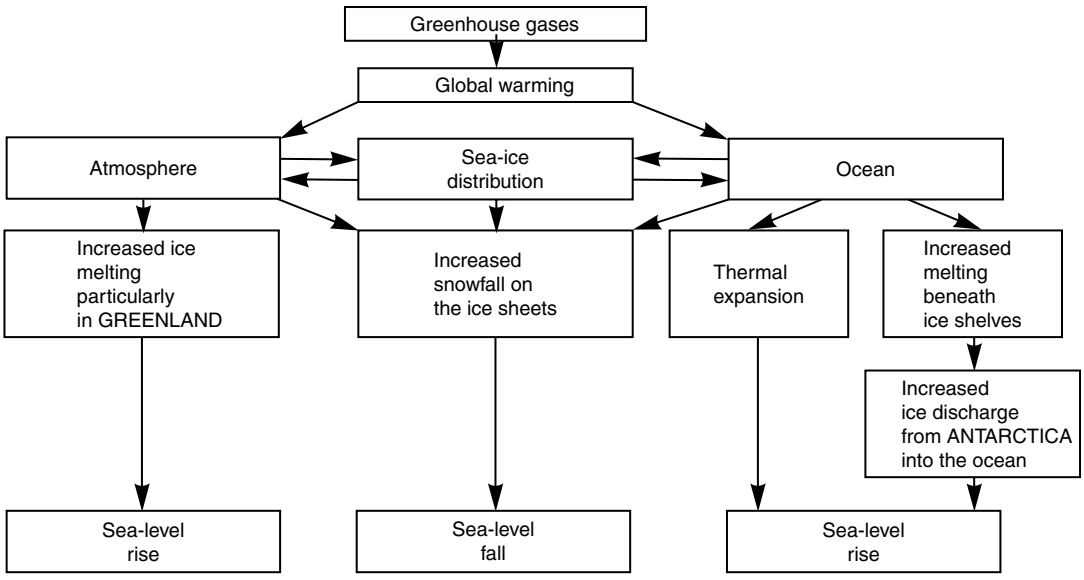
© 2006 by Taylor & Francis Group, LLC



The dark shading indicates the most probable response to the climate scenario shown in Figure 10G-142. The broken line depicts the response to a warming trend delayed 100 years by thermal inertia of the ocean. A global warming of 6°C by 2100, which represents an extreme upper limit, would result in a sea level rise of about 2.3 m, but errors on this estimate are very large.

**Figure 10G.141** Total estimated sea-level rise, 1980–2100. (From Thomas, Robert 1986, Future sea-level rise and its early detection by satellite remote sensing, in *Effects of Change in Stratospheric Ozone and Global Climate*, vol. 4.)



Heat trapped by greenhouse gases raises the temperature of the atmosphere and the ocean. The response of sea level to this warming is strongly determined by the partition of available heat between these two processes. If most of the heat remains in the atmosphere, air temperatures rise rapidly and sea level is affected most by increased melting of ice. Alternatively, rapid transfer of heat into the sea would increase ocean temperatures, and sea level would rise because of thermal expansion and by accelerated Antarctic ice discharge associated with increased melting from beneath the floating ice shelves. Moreover, sea-ice distribution both influences, and is affected by, thermal interactions between atmosphere and ocean.

**Figure 10G.142** Major processes relating greenhouse warming to average worldwide sea level. (From Thomas Robert 1986, Future sea-level rise and its early detection by satellite remote sensing, in *Effects of Changes in Stratospheric Ozone and Global Climate*, vol. 4.)

© 2006 by Taylor & Francis Group, LLC

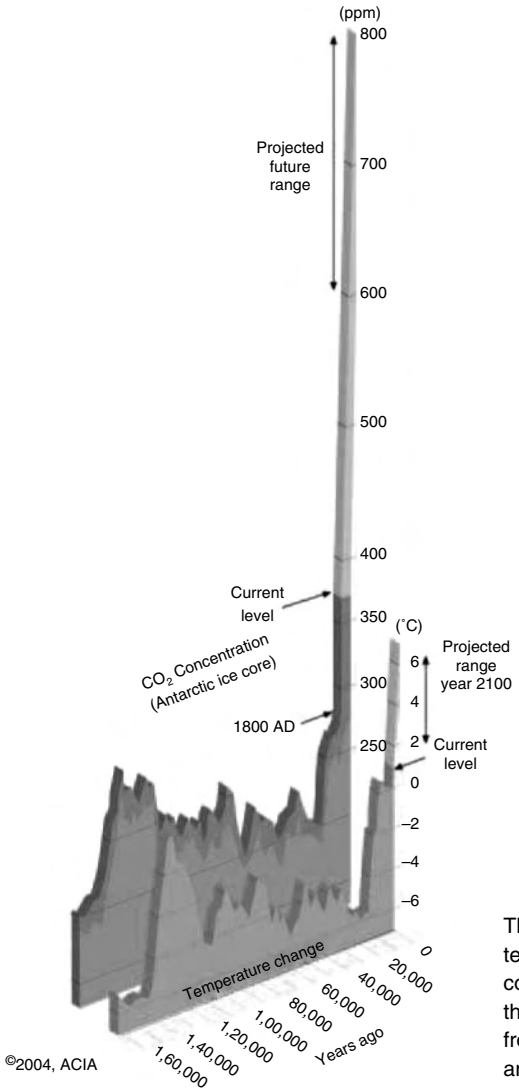
This 1000-year record tracks the rise in carbon emissions due to human activities (fossil fuel burning and land clearing) and the subsequent increase in atmospheric carbon dioxide concentrations, and air temperatures. The earlier parts of this Northern Hemisphere temperature reconstruction are derived from historical data, tree rings, and corals, while the later parts were directly measured. Measurements of carbon dioxide ($CO_2$) in air bubbles trapped in ice cores form the earlier part of the $CO_2$ record; direct atmospheric measurements of $CO_2$ concentration began in 1957.

**Figure 10G.147** 1000 years of changes in carbon emissions, $CO_2$ concentrations and temperature, www.amap.no/acia.

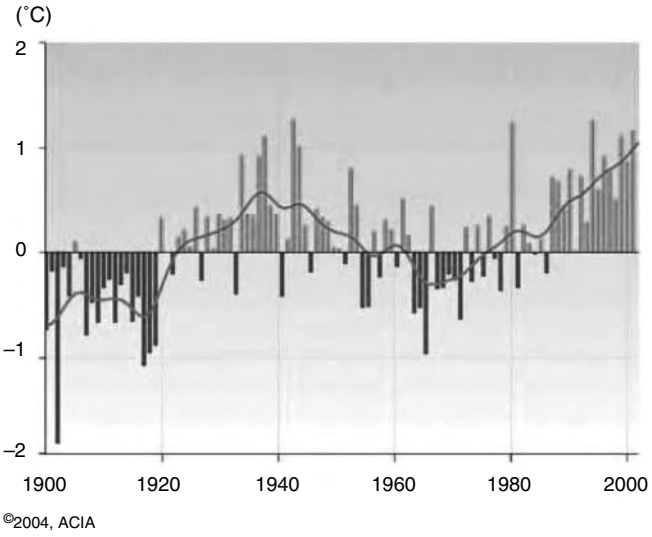
© 2006 by Taylor & Francis Group, LLC



This record illustrates the relationship between temperature and atmospheric carbon dioxide concentrations over the past 160,000 yrs and the next 100 yrs. Historical data are derived from ice cores, recent data were directly measured, and model projections are used for the next 100 yrs.

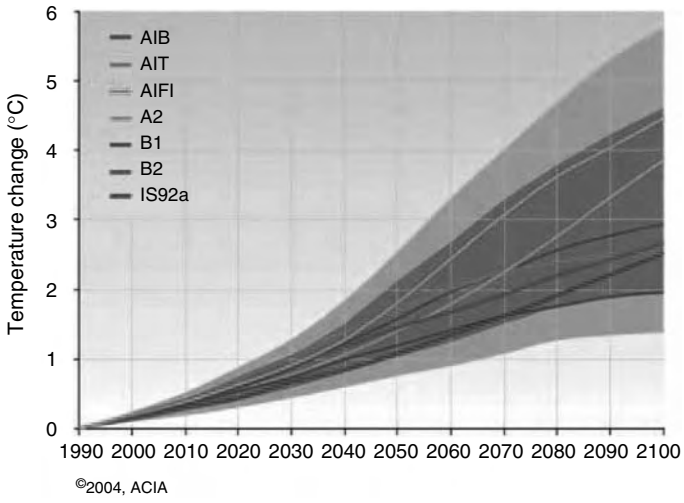
**Figure 10G.148** Atmospheric carbon dioxide concentration and temperature change, www.amap.no/acia.

© 2006 by Taylor & Francis Group, LLC



Annual average change in near surface air temperature from stations on land relative to the average for 1961–1990, for the region from 60 to 90˚N.

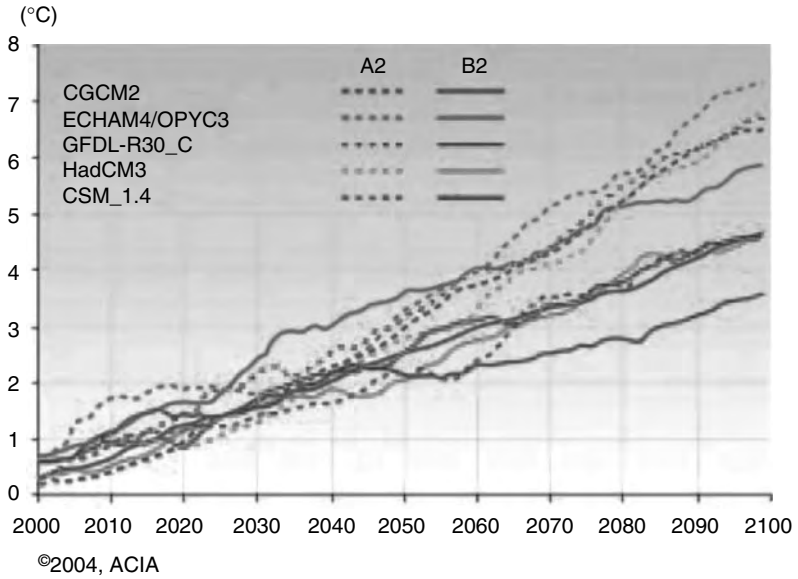
**Figure 10G.149** Observed arctic temperature, 1900 to present, www.amap.no/acia.



Projections of global temperature change (shown as departures from the 1990 temperature) from 1990 to 2100 for seven illustrative emissions scenarios. The brown line shows the projection of the B2 emissions scenario, the primary scenario used in this assessment and this scenario on which the maps in this report showing projected climate changes are based. The pink line shows the A2 emissions scenario, used to a lesser degree in this assessment. The dark gray band shows the range of results for all the SRES emissions scenarios with one everage model while the light gray band shows the full range of scenarios using climate models.

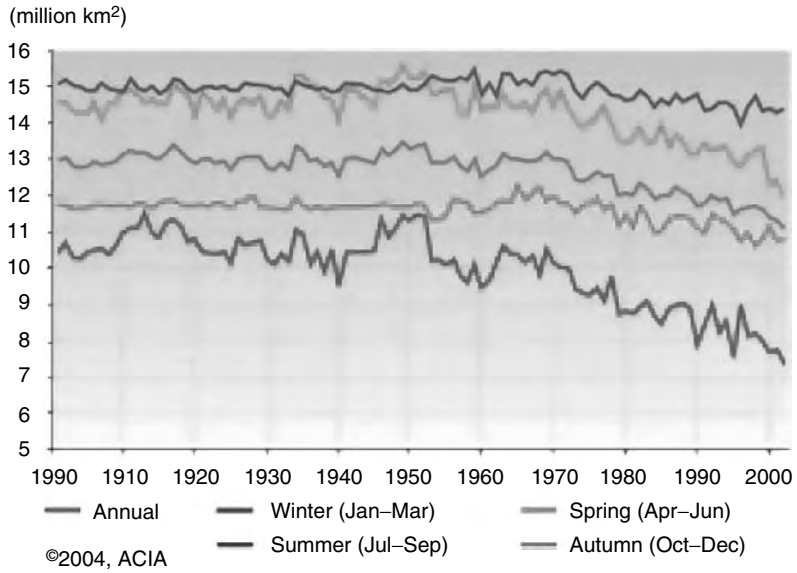
**Figure 10G.150** Projected global temperature rise, www.amap.no/acia.

© 2006 by Taylor & Francis Group, LLC



The ten lines show air temperatures for the region from 60˚N to the pole as projected by each of the five ACIA global climate models using two different emissions scenarios. The projections remain similar through about 2040, showing about a 2˚C temperature rise, but then diverge, showing increases from around 4˚ to over 7˚C by 2100. The full range of models and scenarios reviewed by the IPCC cover a wider range of possible futures. Those used in this assessment fall roughly in the middle of this range, and thus represent neither best- nor worst-case scenarios.

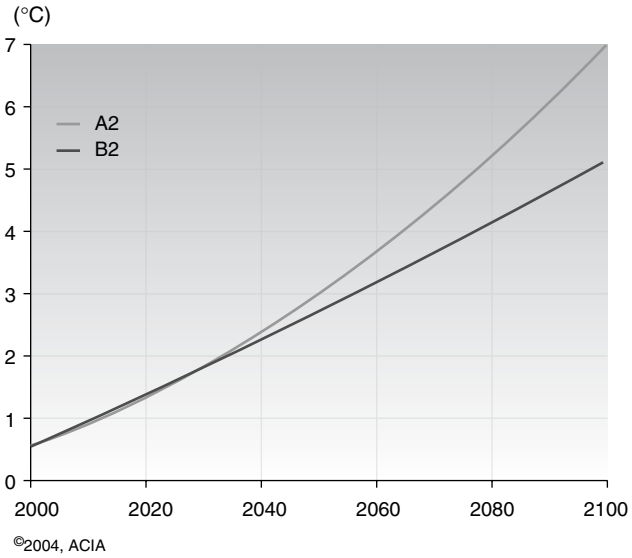
**Figure 10G.151** Projected arctic surface air temperatures 2000–2100 60°N—Pole: change from 1981–2000 average, www.amap.no/acia.



Annual average extent of arctic sea ice from 1900 to 2003. A decline in sea-ice extent began about 50 years ago and this decline sharpened in recent decades, corresponding with the arctic warming trend. The decrease in sea-ice extent during summer is the most dramatic of the trends.

**Figure 10G.152** Observed seasonal Arctic sea-ice extent (1900–2003), www.amap.no/acia.

© 2006 by Taylor & Francis Group, LLC



Increases in arctic temperature (for 60°–90°N) projected by an average of ACIA models for the A2 and B2 emissions scenarios, relative to 1981–2000.

**Figure 10G.153** Projected arctic temperature rise, www.amap.no/acia.

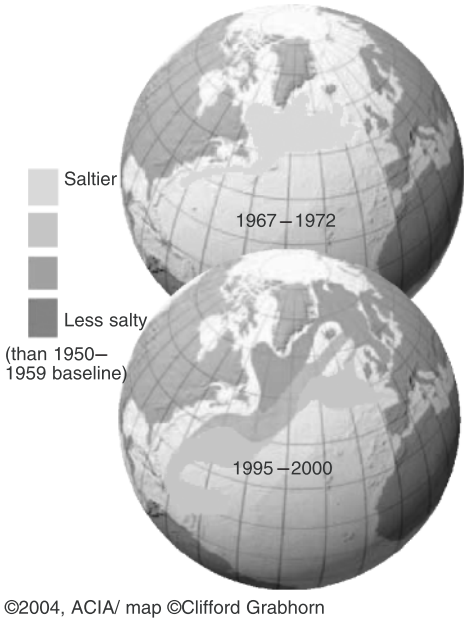


**Figure 10G.154** Reduced salinity of North Atlantic waters, www.amap.no/acia.

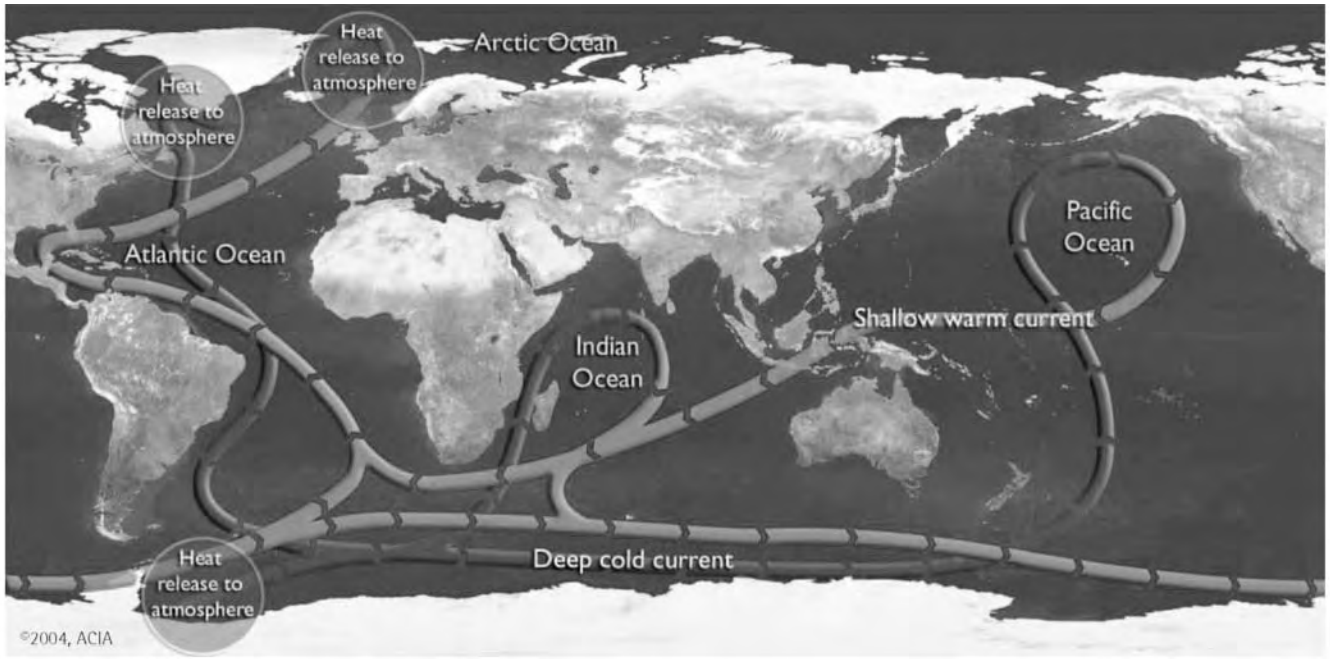
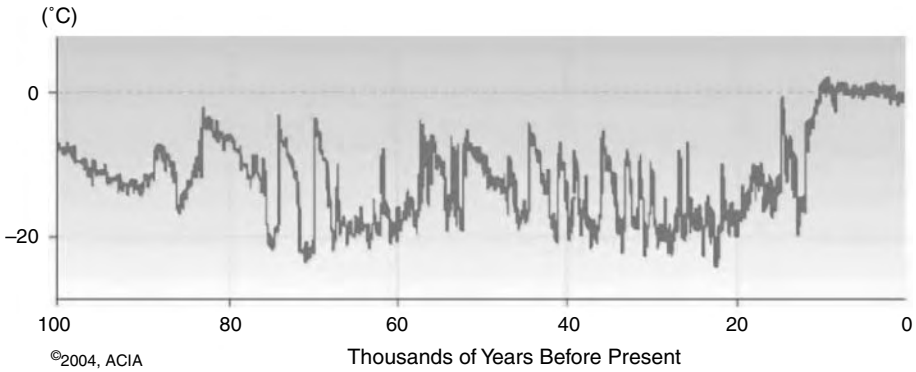
© 2006 by Taylor & Francis Group, LLC



Changes in global ocean circulation can lead to abrupt climate change. Such change can be initiated by increases in arctic precipitation and river runoff, and the melting of arctic snow and ice, because these lead to reduced salinity of ocean waters in the North Atlantic.

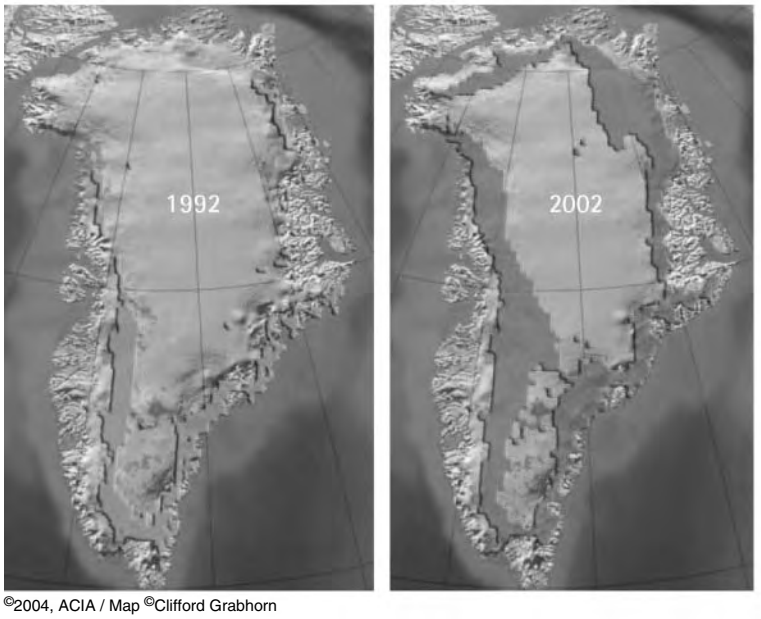
**Figure 10G.155** Global ocean circulation, www.amap.no/acia.

© 2006 by Taylor & Francis Group, LLC

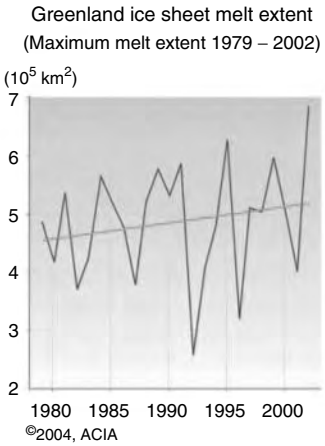


This record of temperature change (departures from present conditions) has been reconstructed from a Greenland ice core. The record demonstrates the high variability of the climate over the past 100,000 yrs. It also suggests that the climate of the past 10000 years or so, which was the time during which human civilization developed, has been unusually stable. There is concern that the rapid warming caused by the increasing concentrations of greenhouse gases due to human activities could destabilize this state.

**Figure 10G.156** 1000,000 yrs of temperature variation in Greenland, www.amap.no/acia.



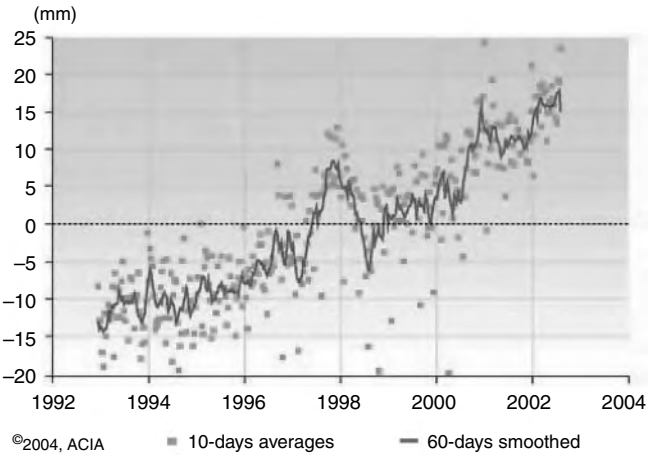
©2004, ACIA / Map ©Clifford Grabhorn



Seasonal surface melt extent on the Greenland Ice Sheet has been observed by satellite since 1979 and shows an increasing trend. The melt zone, where summer warmth turns snow and ice around the edges of the ice sheet into slush and ponds of meltwater, has been expanding inland and to record high elevations in recent years. When the meltwater seeps down through cracks in the ice sheet, it may accelerate melting and, in some areas, allow the ice to slide more easily over the bedrock below, speeding its movement to the sea. In addition to contributing to global sea-level rise, this process adds fresh water to the ocean, with potential impacts on ocean circulation and thus regional climate.

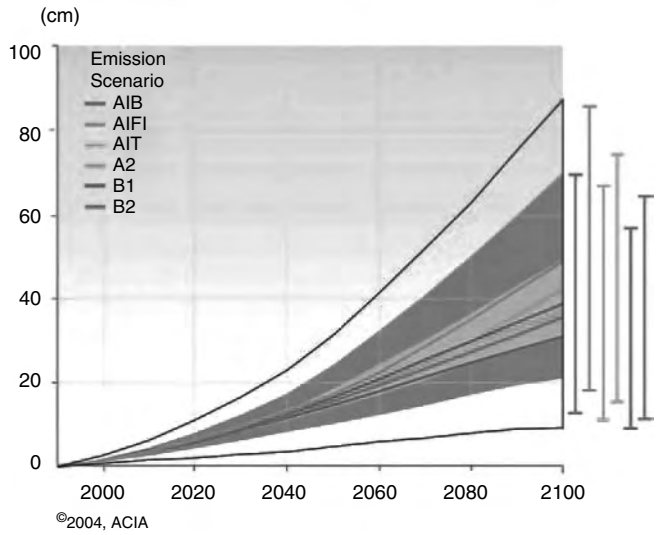
**Figure 10G.157** Greenland ice sheet melt extent, www.amap.no/acia.

© 2006 by Taylor & Francis Group, LLC



These data, from a satellite launched in 1992, show the rise in global average sea level over the past decade.

**Figure 10G.158** Observed global sea level rise, www.amap.no/acia.



The graph shows future increases in global average sea level in centimeters as projected by a suite of climate models using six IPCC emissions scenarios. The bars at right show the range projected by a group of models for the designated emissions scenarios.

**Figure 10G.159** Projected global sea level rise, www.amap.no/acia.

| Nitrogen oxides ($NO_x$)[c] | 26.9 | 26.4 | 27.1 | 25.8 | 25.2 | 24.7 | 22.3 | 18.8 |
| Particulate matter (PM)[d] | | | | | | | | |
| PM10 | 12.2[a] | 7.0 | 6.2 | 3.6 | 3.2 | 3.1 | 2.3 | 2.5 |
| PM2.5[e] | NA | NA | NA | NA | 2.3 | 2.2 | 1.8 | 1.9 |
| Sulfur dioxide ($SO_2$) | 31.2 | 28.0 | 25.9 | 23.3 | 23.1 | 18.6 | 16.3 | 15.2 |
| Volatile organic compounds (VOC) | 33.7 | 30.2 | 30.1 | 26.9 | 23.1 | 21.6 | 16.9 | 15.0 |
| Lead[f] | 0.221 | 0.16 | 0.074 | 0.022 | 0.005 | 0.004 | 0.003 | 0.003 |
| Totals[g] | 301.5 | 275.8 | 267.2 | 249.2 | 218.2 | 188.0 | 160.2 | 138.7 |

[a] In 1985 and 1996 EPA refined its methods for estimating emissions. Between 1970 and 1975, EPA revised its methods for estimating particulate matter emissions.
[b] The estimates for 2004 are preliminary.
[c] $NO_x$ estimates prior to 1990 include emissions from fires. Fires would represent a small percentage of the $NO_x$ emissions.
[d] PM estimates do not include condensable PM, or the majority of PM2.5 that is formed in the atmosphere from "precursor" gases such as $SO_2$ and $NO_x$.
[e] EPA has not estimated PM2.5 emissions prior to 1990.
[f] The 1999 estimate for lead is used to represent 2000 and 2003 because lead estimates do not exist for these years.
[g] PM2.5 emissions are not added when calculating the total because they are included in the PM10 estimate.

## SECTION 10I ENERGY DEVELOPMENT

**Table 10I.209 Water-Quality Impacts of Various Energy Processes**

| Process | Water-Quality Impacts | Frequency and Areal Scale | | Time Frame | Severity | Effectiveness of Control |
|---|---|---|---|---|---|---|
| | | Regional | Local | | | |
| Extraction and on-site processing | | | | | | |
| Coal mining | | | | | | |
| Underground mining | Most damaging problems are acid mines drainage and disruption of aquifers, which affect pH, dissolved solids and specific ion content, and thus impair utility of streams and groundwaters for other uses. | | | | | |
| | a. Surface waters | H | | L | 3 | Poor |
| | b. Groundwaters | | M | L | 3 | Ineffective |
| Surface mining | Surface disturbance results in high sediment transport potential. Discharge from mines may impair water quality through increase in dissolved solids and specific ions. | | | | | |
| | a. Surface waters | H | | M | 3 | Fair |
| | b. Groundwaters | | L | S | 1 | Good |
| Beneficiation | Release of chemical and physical treatment materials to streams can impair water quality. Leaching of solid wastes results in pollution similar to acid drainage. | | | | | |
| | a. Surface waters | H | | M | 2 | Fair |
| | b. Groundwaters | | L | M | 1 | Fair |
| Oil and gas extraction | | | | | | |
| Primary recovery | Principal problems are handling of saline waste waters. Leaks in casings, pipes, and storage ponds can release brines to groundwaters and streams. | | | | | |
| | a. Surface waters | M | | S | 2 | Good |
| | b. Groundwaters | | M | M | 3 | Fair |
| Secondary and tertiary recovery | Principal concerns are escape of oil and formation waters through casing, pipe, and storage tank leaks releasing organic and inorganic contaminants to the environment. | | | | | |
| | a. Surface waters | | L | S | 2 | Good |
| | b. Groundwaters | | L | L | 3 | Good |
| Offshore operation | Blowouts with resulting massive oil contamination are a rare but catastrophic problem. | L | | S | 3 | Good |
| Oil-shale extraction and processing | Most significant concerns relate to potential for escape of noxious organic and inorganic contaminants to streams. Disruption of aquifers likely, low hazard due to limited occurrence of oil shale. | | | | | |
| Undergoing mining | Concerns center on disruption of aquifers and disposal of sometimes saline dewatering by injection. | | | | | |
| | a. Surface waters | | L | L | 1 | Good |
| | b. Groundwaters | | L | L | 1 | Good |

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 10I.209 (Continued)**

| Process | Water-Quality Impacts | Frequency and Areal Scale: Regional | Frequency and Areal Scale: Local | Time Frame | Severity | Effectiveness of Control |
|---|---|---|---|---|---|---|
| Surface mining | Surface disturbance results in high sediment transport potential. | | | | | |
| | a. Surface waters | | L | S | 2 | Excellent |
| | b. Groundwaters | | L | M | 1 | Excellent |
| Surface retorting | Concerns center on potential for escape of organic and inorganic contaminants from plant site to accidental leaks and spills. A more significant concern is escape of contaminants from waste piles through leaching. | | | | | |
| | a. Surface waters | | M | L | 2 | Good to fair |
| | b. Groundwater | | L | L | 1 | Good |
| In-situ recovery | Underground effects mainly involve contamination of groundwaters by organic and inorganic compounds produced in combustion; where applicable surface effects are similar to those of surface retorting. | | | | | |
| | a. Surface waters | | L | S | 2 | Excellent |
| | b. Groundwaters | | M | L | 3 | Untested |
| Tar-sands extraction and processing | | | | | | |
| Surface mining and processing | Main concerns are accidental release of organic contaminants to streams and potential for failure of waste impoundment structures leading to massive downstream damage from fine waste. | | | | | |
| | a. Surface waters | | M | S | 2 | Good to fair |
| | b. Groundwaters | | L | L | 1 | Untested |
| In-situ recovery | Concerns center on potential for escape of noxious organic and inorganic chemicals to groundwaters. | | | | | |
| | a. Surface waters | | L | S | 2 | Untested |
| | b. Groundwaters | | M | L | 3 | Untested |
| Geothermal extraction | | | | | | |
| Vapor-dominated systems | Main concerns are escape of noxious inorganic contaminants to groundwater from waste disposal, blowouts, and leaks in casings and pipes. | | | | | |
| | a. Surface waters | | L | S | 2 | Good |
| | b. Groundwaters | | M | L | 1 | Fair |
| Water-dominated systems | Main problems involve escape of noxious and toxic constituents of thermal waters to surface and groundwaters from production operations, waste disposal, blowouts, and leaks in casings and pipes. | | | | | |
| | a. Surface waters | H | | M | 4 | Fair |
| | b. Groundwaters | | H | L | 3 | Fair |

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 10I.209 (Continued)**

| Process | Water-Quality Impacts | Frequency and Areal Scale: Regional | Frequency and Areal Scale: Local | Time Frame | Severity | Effectiveness of Control |
|---|---|---|---|---|---|---|
| Uranium mining and milling | | | | | | |
| Underground mining | Escape of radioactive and other inorganic contaminants to the environment through disposal of dewatering waste and escape from tailings ponds can seriously impair downstream water uses. | | | | | |
| | a. Surface waters | M | | S | 4 | Good |
| | b. Groundwaters | | M | L | 4 | Poor |
| Surface mining | Some concern about high sediment transport potential, but main source of concern is potential for radioactive contamination of streams and groundwaters through leakage from tailings disposal ponds. | | | | | |
| | a. Surface waters | M | | S | 4 | Good |
| | b. Groundwaters | | M | L | 4 | Poor |
| Solution mining | Main concern centers on escape of radioactive and inorganic process chemicals to off-site groundwaters. | | | | | |
| | a. Surface waters | | L | S | 1 | Excellent |
| | b. Groundwater | | L | L | 4 | Excellent |
| Transportation | | | | | | |
| Coal slurry lines | Main concern centers on pipeline breaks and the potential for contamination of streams. | | | | | |
| | a. Surface waters | | L | S | 2 | Excellent |
| | b. Groundwaters | | L | L | 1 | Excellent |
| Oil pipelines | Most significant problems are pipeline breaks and resulting oil pollution of streams. | | | | | |
| | a. Surface waters | | M | S | 2 | Fair |
| | b. Groundwaters | | L | L | 1 | Good |
| Oil tankers | Escape of oil to marine environment as result of shipwrecks can be catastrophic to marine life over wide areas. | L | | M | 3 | Poor |
| Refining | | | | | | |
| Oil refining | Controlled release of waste water and accidental releases of organic and inorganic contaminants are most significant issues; concerns center on impairment of water supplies of other water users. | | | | | |
| | a. Surface waters | | M | M | 3 | Good |
| | b. Groundwaters | | L | L | 3 | Good |
| Nuclear fuel cycle | Accidental releases of radioactive materials to surface and groundwaters from processing and reprocessing plants are main concern; both high- and low-level waste disposal also have potential for escape of radioactivity to the water environment. Controlled release of nonradioactive inorganic chemicals adds to chemical load of receiving waters. | | | | | |
| | a. Surface waters | | M | S | 4 | Good |
| | b. Groundwaters | | M | L | 4 | Fair to poor |

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 10I.209 (Continued)**

| Process | Water-Quality Impacts | Frequency and Areal Scale | | Time Frame | Severity | Effectiveness of Control |
|---|---|---|---|---|---|---|
| | | Regional | Local | | | |
| Conversion | | | | | | |
| Fossil-fueled steam electric generation | Controlled release of cooling-system blowdown to streams and/or leakage from cooling ponds add dissolved solids and treatment chemicals to stream loads. Once-through cooling contributes to thermal pollution. | | | | | |
| | a. Surface waters | M | | M | 2 | Good |
| | b. Groundwater | | L | L | 1 | Good |
| Nuclear steam-electric generation | Small controlled releases of radioactive materials and discharge of cooling-system blowdown add radioactivity, dissolved solids, and treatment chemicals to stream loads. Accidental release of radioactivity through reactor containment failure could endanger human life over wide area. | | | | | |
| | a. Surface waters | M | | M | 5 | Good |
| | b. Groundwaters | | L | L | 4 | Good |
| Geothermal electric generation | Disposal of waste and condensate containing noxious inorganic compounds and thermal load to streams impair downstream uses and damages aquatic life. | | | | | |
| | a. Surface waters | H | | M | 4 | Fair |
| | b. Groundwaters | | H | L | 3 | Fair |
| Hydroelectric generation | Changes in stream temperature and dissolved gases due to storage and reservoir releases seriously alter the aquatic environment. | | | | | |
| | a. Surface waters | H | | L | 2 | Fair |
| | b. Groundwaters | | L | S | 1 | Good |
| Coal conversion processes | Controlled release of cooling system blowdown and accidental releases of organic and inorganic contaminants, as in oil refining and with similar concern about impairment of other water uses. | | | | | |
| | a. Surface waters | | M | M | 3 | Good |
| | b. Groundwaters | | L | L | 3 | Good |

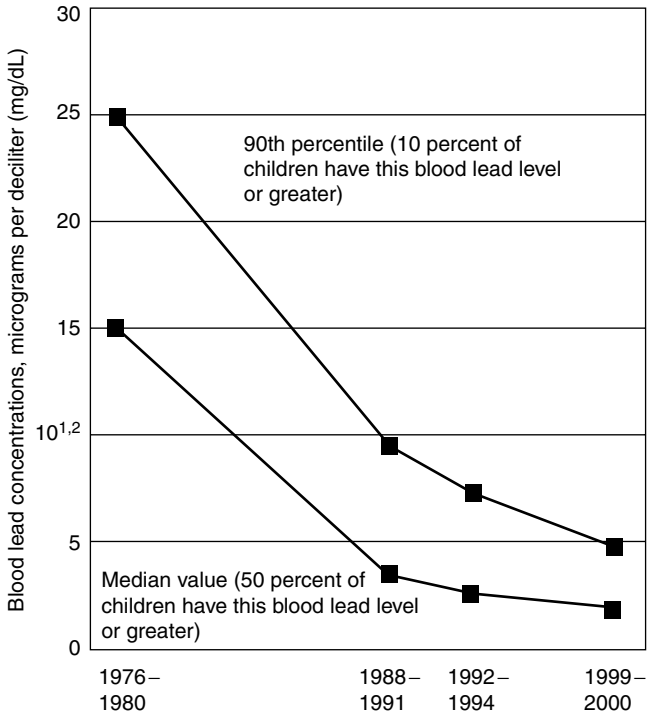

**Figure 10J.186** Concentration of lead in blood of children age 5 and under, 1976–1980, 1988–1991, 1992–1994, 1999–2000. (From United States Environmental Protection Agency, 2003, EPA's Draft Report on the Environment, 2003, EPA 600-R-03-050. U.S. Environmental Protection Agency. *America's Children and the Environment Measures of Contaminants, Body Burdens, and Illnesses, Second Edition*, February 2003. Data from CDC National Center for Health Statistics, National Health and Nutrition Examination Survey, 1976–2000, www.epa.gov.
[1] 10 μg/dL of blood lead has been identified by CDC as elevated, which indicates the need for interventions. (CDC *Preventing Lead Poisoning in Young Children*, 1991.)
[2] Recent research suggests that blood levels less than 10 μg/dL may still produce subtle, subclinical health effects in children. (Schmidt, C.W. *Poisoning Young Minds*, 1999.)

| Total | 57 | 422,364 | 64 | 8,934 | 34 | 548 | 155 | 431,846 |

*Note:* Data are compiled from CDC Morbidity and Mortality Weekly Report Surveillance Summaries for 1991–1992, 1993–1994, 1995–1996, 1997–1998 and 1999–2000. Figures include adjustments to numbers of outbreaks and illness cases originally reported, based on more recent CDC data.

[a] Community water systems are those that serve communities of an average of at least 25 year-round residents and have at least 15 service connections.

[b] Non-community water systems are those that serve an average of at least 25 residents and have at least 15 service connections and are used at least 60 days $y^{-1}$.

[c] Individual water systems are those serving less than 25 residents and have less than 15 service connections.

[d] There were 403,000 cases of illness reported in Milwaukee in 1993.

[a] Com, community; Ncom, noncommunity; Ind, individual. Community and noncommunity water systems are public water systems that serve $>15$ serv connections or an average of $\geq 25$ residents for $\geq 60$ days/year. A community water system serves year-round residents of a community, subdivision, mobile home park with $\geq 15$ service connections or an average of $\geq 25$ residents. A noncommunity water system can be nontransient or transient. Nontransient systems serve $\geq 25$ of the same persons for $>6$ months of the year, but not year-round (e.g., factories or schools), whereas transient systems provide water to places in which persons do not remain for long periods of time (e.g., restaurants, highway rest stations, or parks). Individual water systems are small systems not owned or operated by a water utility that serve $<15$ connections or $<25$ persons. Outbreaks associated with water not intended for drinking (e.g., lakes, springs and creeks used by campers and boaters, irrigation water, and other nonpotable sources with or without taps) are also classified individual systems.

[b] Acute gastrointestinal illness of unknown etiology.

**Table 10J.233 Epidemiological Characteristics of the Principal Pathogenic Agents in Wastewater**

| Agents | Quantity Excreted per g/feces | Latency[a] | Survival[b] | Multiplication in the Environment | Infecting Dose ID 50[c] |
|---|---|---|---|---|---|
| **Virus** | | | | | |
| Enterovirus (including polio, echo and coxsackie) | $10^7$ | 0 | 3 mo | no | 100 |
| Hepatitis A | $10^6$? | 0 | ? | no | ? |
| Rotavirus | $10^6$? | 0 | ? | no | ? |
| **Bacteria** | | | | | |
| Colibacilli | $10^8$ | 0 | 3 mo | yes | $\pm 10^9$ |
| Salmonella thyphi | $10^8$ | 0 | 2 mo | yes | $10^7$ |
| Other salmonellas | $10^8$ | 0 | 2–3 mo | yes | $10^6$ |
| Shigella | $10^7$ | 0 | 1 mo | yes | $10^4$ |
| Campylobacter | $10^7$ | 0 | 7 d | yes | $10^6$ |
| Cholera | $10^7$ | 0 | 1 mo | yes | $10^8$ |
| Yersinia enterocolitica | $10^5$ | 0 | 3 mo | yes | $10^9$ |
| Leptospira | urine | 0 | 7 d | no | low |
| **Parasites** | | | | | |
| Dysentery amoeba | $10^7$ | 0 | 25 d | no | 10–100 |
| Glardia | $10^5$ | 0 | 25 d | no | 25–100 |
| Balantidium coli | ? | 0 | 20 d? | no | 25–100 |
| Ascaris | $10^4$ | 10 d | 1 y | no | Several units |
| Ancyclostoma | $10^2$ | 7 d | 3 mo | no | 1 |
| Anguillula | 10 | 3 d | 3 wks | yes | 1 |
| Trichocephalus | $10^3$ | 20 d | 9 mo | no | Several units |
| Hymenolepis | ? | 0 | 10 d | no | 1 |
| Taenia | $10^4$ | 2 mo | 9 mo | no | 1 |
| Fasciola hepatica | ? | 2 mo | 4 mo | yes | Several units |
| Other flukes | $10^2$ | 6–8 wks | Life of Host | yes | Several units |

[a] Period necessary for excreted pathogenic agent to become infectious to receiving or susceptible individual; (0, is immediate).
[b] In environment, outside final host (man or animal).
[c] Dose sufficient to provoke the appearance of clinical symptoms in 50% of individuals tested.

**Table 10J.234 Microbial Pathogens Linked to Drinking Water or Recreational Water Contact**

| Organism | Disease | Transmission | Clinical Features |
|---|---|---|---|
| **Helminths** | | | |
| *Schistosoma* spp. | Schistosomaisis | Contact with surface water infected with free swimming cercariae | Urinary and intestinal damage. Bladder cancer |
| *Dracunculus medinentis* | Dracunculiasis | Drinking water | Painful ulcers on lower limbs and feet |
| **Protozoa** | | | |
| *Giardia duodenalis* | Giardiasis | Faecal oral spread through drinking water or recreational water | Diarrhoea and abdominal pain, weight loss and failure to thrive |
| *Cryptosporidium parvum* | Cryptosporidiosis | Faecal oral spread through drinking water or recreational water | Diarrhoea often prolonged |
| *Cyclospora cayetanensis* | Cyclosporiasis | Faecal oral spread through drinking water | Diarrhoea and abdominal pain, weight loss and failure to thrive |
| *Entamoeba histolytica* | Amebiasis | Faecal and spread through drinking water | Diarrhoea, may be severe dysentery |
| *Toxoplasma gondii* | Toxoplasmosis | Drinking water contaminated by feline animals | Glandular fever, foetal damage in pregnant women |
| Free-living amoebae | Amoebic meningoencephalitis | Aspiration of infected surface water into nose | Fatal encephalitis |
| **Algae** | | | |
| Cyanobacteria | Various | Toxins in drinking water or direct contact with surface water blooms | Dermatitis, hepatitis, respiratory symptoms, potentially fatal |
| *Pfesteria piscicida* | Estuary-associated syndrome | Toxins in water | Respiratory and eye irritation, deficiencies in learning and memory and acute confusional states |
| **Bacteria** | | | |
| *Vibrio cholerae* | Cholera | Drinking water | Watery diarrhoea, may be severe |
| *Salmonella* spp. | Salmonellosis | Occasional outbreaks with drinking water | Diarrhoea, colicky abdominal pain and fever |
| *Salmonella typhi* | Typhoid | Drinking water | Fever, malaise and abdominal pain with high mortality |
| *Shigella* spp. | Shigellosis (bacillary dysentery) | Both drinking and recreational water | Diarrhoea frequently with blood loss |
| *Campylobacter* spp. | Campylobacteriois | Both drinking and recreational water | Diarrhoea frequently with blood loss |
| Enterotoxigenic *E. coli* | | Drinking water | Watery diarrhoea |
| Enterohaemorrhagic *E. coli* | | Drinking water and recreational water contact | Bloody diarrhoea and haemolyic uraemic syndrome in children |
| *Yersinia* spp. | Yersiniosis | Drinking water | Fever, diarrhoea and abdominal pain |
| *Francisella tularensis* | Tularaemia | Drinking water | Typhoid-like or mucocutaneous with suppurative skin lesions |
| *Helicobacter pylori* | | Drinking water | Gastritis that can progress to gastric cancer |
| *Mycobacteria* spp. not *M. tuberculosis* | Varies | Potable water systems in hospitals, some recreation | Varies, includes respiratory disease, wound infections, skin disease |
| **Viruses** | | | |
| Hepatitis A and Hepatitis E viruses | Viral hepatitis | Drinking and recreational water contact | Hepatitis |
| Various, esp. Norwalk-like viruses | Viral gastroenteritis | Drinking and recreational water contact | Vomiting and diarrhoea |
| Enteroviruses | Various, including poliomyelitis | Drinking and recreational water contact | Various |

| Hookworm infection | 4 | 0.0 | 2 | 0.0 | 2 | 0.0 | 1,825 | 0.1 | 932 | 0.1 | 893 | 0.1 |
| Unintentional injuries overall | 3,508 | 6.2 | 2,251 | 7.6 | 1,256 | 4.7 | 129,853 | 8.9 | 82,378 | 10.7 | 47,475 | 6.8 |
| Drowning | 402 | 0.7 | 276 | 1.0 | 126 | 0.5 | 11,778 | 0.8 | 8,150 | 1.1 | 3,628 | 0.5 |

*Note:* The burden of disease is calculated through an indicator of population health the DALY: a DALY represents a lost year of healthy life and is the unit used to estimate the gap between the current health of a population and an idea situation in which everyone in that population in which everyone in that population would live into old age in full health. This table shows the total deaths and burden of disease caused by communicable diseases, maternal and perinatal conditions and nutritional deficiencies noncommunicable diseases and injuries related to water.

**Table 10J.252 Deaths and DALYs from Selected Water-Related Diseases, 2000**

| | Deaths | DALYs |
|---|---|---|
| Diarrheal diseases | 2,019,585 | 63,345,722 |
| Childhood cluster diseases | | |
| Poliomyelitis | 1,136 | 188,543 |
| Diphtheria | 5,527 | 187,838 |
| Tropical-cluster diseases | | |
| Trypanosomiasis | 49,129 | 1,570,242 |
| Schistosomiasis | 15,335 | 1,711,522 |
| Trachoma | 72 | 3,892,326 |
| Intestinal nematode infections | | |
| Ascariasis | 4,929 | 1,204,384 |
| Trichuriasis | 2,393 | 1,661,689 |
| Hookworm disease | 3,477 | 1,785,539 |
| Other Intestinal Infections | 1,692 | 53,222 |
| Total | 2,103,274 | 75,601,028 |

*Notes*: DALYs, The DALY is a measure of population health that combines in a single indicator years of life lost from premature death and years of life lived with disabilities. One DALY can be thought of as one lost year of "healthy" life. This table excludes mortality and DALYs associated with water-related insect vectors, such as malaria, onchocerciasis, and dengue fever. Trachoma, while few deaths from trachoma are reported, approximately 5.9 million cases of blindness or severe complications occur annually.

**Table 10J.253 Annual Number of Diarrhoeal Cases Avoided if the Combined Water and Sanitation Millennium Goals Are Achieved by WHO subregion**

| WHO Sub-Region | Region/ Country | Pop. (m) | Cases of Diarrhoea (million) | Number of Cases Avoided Per Year ('000s), by Intervention | | | | |
|---|---|---|---|---|---|---|---|---|
| | | | | 1[a] | 2[b] | 3[c] | 4[d] | 5[e] |
| 2 | AFR-E | 481 | 619 | 28′548 | 87′405 | 127′049 | 345′132 | 439′980 |
| 5 | AMR-D | 93 | 93 | 3′250 | 9′307 | 13′208 | 48′679 | 64′106 |
| 11 | EUR-D | 223 | 43 | 112 | 568 | 1′056 | 19′816 | 27′983 |
| 13 | SEAR-D | 1,689 | 1,491 | 26′895 | 146′829 | 272′361 | 807′596 | 1′04′922 |
| 15 | WPR-B1 | 1,488 | 1,193 | 39′454 | 131′171 | 239′104 | 659′687 | 844′381 |
| World | | 7,183 | 5,388 | 154′854 | 545′950 | 903′004 | 2′860′951 | 3′717′971 |

*Notes:* Therefore, in the analysis, account is taken of the proportion of populations in each country who did not have access to improved" water and sanitation in 2000.
Level VI, No improved water supply and no basic sanitation in a country which is not extensively covered by those services, and where water supply is not routinely controlled;
Level Vb, Improved water supply and no basic sanitation in a country which is not extensively covered by those services, and where water supply is not routinely controlled;
Level Va, Improved sanitation but no improved water supply in a country which is not extensively covered by those services, and where water supply is not routinely controlled;
Level IV, Improved water supply and improved sanitation in a country which is not extensively covered by those services, and where water supply is not routinely controlled;
Level III, Improved water supply and improved sanitation in a country which is not extensively covered by those services, and where water supply is not routinely controlled, plus household water treatment;
Level II, Regulated water supply and full sanitation coverage, with partial treatment for sewage, corresponding to a situation typically occurring in developed countries;
Level I, Ideal situation, corresponding to the absence of transmission of diarrhoeal disease through water, sanitation and hygiene.

[a] Intervention 1. Millennium targets: halving the proportion of people who do not have access to improved water sources by 2015, with priority given to those already with priority given to those already with improved sanitation. This means: Scenario Va to IV (applied to half the population without improved water supply).

[b] Intervention 2. Millennium targets with sanitation targets: halving the proportion of people who do not have access to improved water sources and improved sanitation facilities, by 2015. This means: Scenario VI to IV, or Scenario Va or Vb to IV (applied to half the population without improved water supply and half the population without improved sanitation).

[c] Intervention 3. Access for all to improved water and improved sanitation. This means: Scenario VI, Va and Vb to IV (applied to the entire population without improved water and the entire population without improved water and the entire population without improved sanitation).

[d] Intervention 4. A minimum of water disinfected at the point of use for all, on top of improved water and sanitation services. This means: Scenarios VI, Va, Vb and IV go to Scenario III.

[e] Intervention 5. Access for all to a regulated piped water supply and sewage connection into their houses. This means: Scenarios VI, Va, Vb, IV and III go to Scenario II. All the interventions were compared to the situation in 2000, which was defined as the baseline year.

**Table 10J.254 Clinical Syndromes and Incubation Periods of Infectious and Chemical Agents Causing Acute Waterborne Disease in the United States**

| Agent | Incubation Period | Clinical Syndrome |
|---|---|---|
| **Bacteria** | | |
| *Campylobacter jejuni* | 2–5 d | Gastroenteritis, often with fever |
| Enterotoxigenic *Escherichia coli* | 6–36 hr | Gastroenteritis |
| *Salmonella* | 6–48 hr | Either gastroenteritis (often with fever), enteric fever, or extraintestinal infection |
| *Salmonella typhi* | 10–14 d | Enteric fever — fever, anorexia, malaise, transient rash, splenomegaly, and leukopenia |
| *Shigella* | 12–48 hr | Gastroenteritis, often with fever and bloody diarrhea |
| *Vibrio cholerae 01* | 1–5 d | Gastroenteritis, often with significant dehydration |
| *Yersinia enterocolitica* | 3–7 d | Either gastroenteritis, mesenteric lymphadenitis, or acute terminal ileitis; may mimic appendicitis |
| **Viruses** | | |
| Hepatitis A | 2–6 wks | Hepatitis — nausea, anorexia, jaundice, dark urine |
| Norwalk virus | 24–48 hr | Gastroenteritis, of short duration |
| Rotavirus | 24–72 hr | Gastroenteritis, often with significant dehydration |
| **Parasites** | | |
| *Entamoeba histolytica* | 2–4 wks | Varies from mild gastroenteritis to acute fulminating dysentery with fever and bloody diarrhea |
| *Giardia lamblia* | 1–4 wks | Chronic diarrhea, epigastric pain, bloating, malabsorption, and weight loss |
| **Chemicals** | | |
| Fluoride | $<$1 hr | Nausea, vomiting, and abdominal cramps |
| **Heavy metals** | | |
| Antimony | | |
| Cadmium | | |
| Copper | | |
| Lead | | |
| Tin | | |
| Zinc, etc | $<$1 hr | Nausea, vomiting, and abdominal cramps, often accompanied by a metallic taste |
| **Others** | | |
| Pesticides | | |
| Petroleum products, etc | Variable | Variable |

**Table 10J.255 Pathogens in Drinking Water, Infectious Dose, Estimated Incidence through Consumption of Drinking Water in the United States, Survival in Drinking Water, and Potential Survival Strategies**

| | Infectious Dose[a] | Estimated Incidence[b] | Survival in Drinking Water (Days) | Survival Strategies[c] |
|---|---|---|---|---|
| Bacteria | | | | |
| *Vibrio cholera* | $10^8$ | (very few)[c] | 30 | VNC, IC |
| *Salmonella spp.* | $10^{6-7}$ | 59,000 | 60–90 | VNC, IC |
| *Shigella spp.* | $10^2$ | 35,000 | 30 | VNC, IC |
| *Toxigenic Escherichia coli* | $10^{2-9}$ | 150,000 | 90 | VNC, IC |
| *Campylobacter spp.* | $10^6$ | 320,000 | 7 | VNC, IC |
| *Leptospira spp.* | 3 | ?[d] | ? | ? |
| *Francisella tularensis* | 10 | ? | ? | ? |
| *Yersinia enterocolitica* | $10^9$ | ? | 90 | ? |
| *Aeromonas spp.* | $10^8$ | ? | 90 | ? |
| *Helicobacter pylori* | ? | High | ? | ? |
| *Legionella pneumophila* | $>10$ | 13,000[e] | Long | VNC, IC |
| *Mycobacterium avium* | ? | ? | Long | IC |
| Protozoa | | | | |
| *Giardia lambia* | 1–10 | 260,000 | 25 | Cyst |
| *Cryptosporidium parvum* | 1–30 | 420,000 | ? | Oocyst |
| *Naegleria fowleri* | ? | ? | ? | Cyst |
| *Acanthamoeba spp.* | ? | ? | ? | Cyst |
| *Entamoeba histolica* | 10–100 | ? | 25 | Cyst |
| *Cyclospora cayetanensis* | ? | ? | ? | Oocyst |
| *Isospora belli* | ? | ? | ? | Oocyst |
| The microsporidia | ? | ? | ? | Spore, IC[d] |
| *Ballantidium coli* | 25–100 | ? | 20 | Cyst |
| *Toxoplasma gondii* | ? | ? | ? | Oocyst |
| Viruses[f] | | | | |
| Total estimates | 1–10 | 6,500,000 | 5–27[g] | Adsorption/ absorption |

*Note:* ?, unknown; IC, intracellular survival and/or growth; VNC, viable but not culturable.

[a] Infectious dose is number of infectious agents that produce symptoms in 50% of teted volunteers. Volunteers are not usually susceptible individuals, and therefore these numbers are not useful for risk estimates.
[b] U.S. point estimates.
[c] Very few outbreaks of cholera occur in the United States, and these are usually attributable to imported foods (14).
[d] Possible IC with microsporidialike organisms (15).
[e] Data form Breiman and Butler (14).
[f] Includes Norwalk virus, poliovirus, coxsachievirus, echovirus, reovirus, adenovirus, HAV, HEV, rotavirus, SRSV, astrovirus, coronavirus, calicivirus, and unknown viruses.
[g] Estimated for HAV, Norwalkvirus, and rotavirus (13).

*Original Source*: Except where noted, data are compiled from Morris and Levin (2), WHO (10), Hazen and Toranzos (11), and Geldreich (12).

**Table 10J.256 Survival of Bacteria In Various Media**

| Organism | Survival Time | Media |
|---|---|---|
| E. coli | 63 days | Recharge well |
| E. coli | 3–3.5 months | Groundwater in the field |
| E. coli | 4–4.5 months | Groundwater held in lab |
| Coliforms | 17 hours-50 percent reduction | Well water |
| Salmonella | 44 days | Water infiltrating sand column |
| S. typhi | 2–85 days | Soil |
| S. typhi | 24–27 days | Septic tank |
| S. typhi | 25–41 days | Soil |
| Shigella | 24 days | Water infiltrating sand column |
| S. flexneri | 26.8 hours-50 percent reduction | Well water |
| Vibrio cholerae | 7.2 hours-50 percent reduction | Well water |

**Table 10J.260 Selected Human Health and Environmental Effects from Toxic Chemicals**

| Chemical | Human Health Effects[a] | | | Environmental Effects |
|---|---|---|---|---|
| | Carcinogen[b] | Teratogen[b] | Others | |
| Aldrin/dieldrin | ○ | | Tremors, convulsions, kidney damage | Toxic to aquatic organisms, reproductive failure in birds and fish, bioaccumulation in aquatic organisms |
| Arsenic | ● | ○ | Vomiting, poisoning, liver and kidney damage | Toxic to legume crops |
| Benzene | ● | | Anemia, bone marrow damage | Toxic to some fish and aquatic invertebrates |
| Cadmium | | ○ | Suspected causal factor in many human pathogies: tumors, renal dysfunction, hypertension, arteriosclerosis, Itai-itai disease (weakened bones), emphysema | Toxic to fish, bioaccumulates significantly in bivalve mollusks |
| Carbon tetrachloride | ● | | Kidney and liver damage, heart failure | |
| Chromium | | | Kidney and gastrointestinal damage, respiratory complications | Toxic to some aquatic organisms |
| Copper | | | Gastrointestinal irritant, liver damage | Toxic to juvenile fish & other aquatic organisms |
| DDT | ○ | ○ (minimal) | Tremors, convulsions, kidney damage | Reproductive failure of birds and fish, bioaccumulates in aquatic organisms, biomagnifies in food chain |
| Di-*n*-butyl phthalate | | | Central nervous system damage | Eggshell thinning in birds, toxic to some fish |
| Dioxin | ○ | ○ | Acute skin rashes, systemic damage, mortality | Bioaccumulates, lethal to aquatic organisms birds and mammals |
| Lead | | ○ | Convulsions, anemia, kidney and brain damage | Toxic to domestic plants and animals, bio-magnifies to some degree in food chain |

*(Continued)*

© 2006 by Taylor & Francis Group, LLC

**Table 10J.260 (Continued)**

| Chemical | Human Health Effects[a] | | | Environmental Effects |
|---|---|---|---|---|
| | Carcinogen[b] | Teratogen[b] | Others | |
| Methyl Mercury | | ○ | Irritability, depression, kidney and liver damage, Minamata disease | Reproductive failure in fish species, inhibits growth and kills fish; biomagnifies |
| PCBs | ○ | ○ | Vomiting, abdominal pain, temporary blindness, liver damage | Liver damage in mammals, kidney damage and eggshell thinning in birds, suspected reproductive failure in fish |
| Phenols | | | Effects on central nervous system, death at high doses | Reproductive effective in aquatic organisms toxic to fish |
| Toxaphene | ○ | ○ | Pathological changes in kidney & liver; changes in blood chemistry | Decreased productivity of phytoplankton communities, birth defects in fish and birds, toxic to fish and invertebrates |

[a] In many cases human health effects are based upon the results of animal tests.
[b] If a substance is identified as a carcinogen, there is evidence that it has the potential for causing cancer in humans; if it is identified as a teratogen, it has the potential for causing birth defects in humans.

**Table 10J.261 Chemicals Causing Distribution System Outbreaks in the United States — 1971–98**

| Chemical | CWS[a] | NCWS[b] |
|---|---|---|
| Copper | 16 | 2 |
| Chlordane | 3 | |
| Nitrite | 2 | |
| Unidentified herbicide | 2 | |
| Ethylene glycol | 2 | |
| Oil | 1 | 1 |
| Other chemicals[c] | 9 | |
| Total | 35 | 3 |

[a] CWS — community water system.
[b] NCWS — noncommunity water system.
[c] Each of the following was responsible for one outbreak; fluoride, lead, chromium, sodium hydroxide, chlorine, liquid soap, ethyl acrylate, morpholine, and hydroquinone.

**Table 10J.262 Potential Exposure to Lead in Tap Water**

| Age of House | pH of Water[a] | Percent of Samples >20 ug/L | |
|---|---|---|---|
| | | First-Flush (%) | Fully-Flushed (2 min) (%) |
| 0–2 yrs | <6.4 | 93 | 51 |
| | 7.0–7.4 | 83 | 5 |
| | ≥:8.0 | 72 | 0 |
| 2–5 yrs | ≤6.4 | 84 | 19 |
| | 7.0–7.4 | 28 | 7 |
| | ≥8.0 | 18 | 4 |
| 6+yrs | ≤6.4 | 51 | 4 |
| | 7.0–7.4 | 14 | 0 |
| | ≥8.0 | 13 | 3 |

*Note:* Percentage of samples taken from kitchen taps exceeding 20 ug/L of lead at different pH levels, by age of house. The United States Environmental Protection Agency (EPA) sets drinking water standards and has determined that lead is a health concern at certain levels of exposure. There is currently an action level of 15 parts per billion (μg/L). The most common cause of lead entering drinking water is corrosion, a reaction between the water and the lead pipes or the lead-based solder. When water stands in the pipes of a residence for several hours without use, there is a potential for lead to leach, or dissolve, into the water if a lead source is present. Soft water (water that makes soap suds easily) can be more corrosive and, therefore, has higher levels of dissolved lead. Some home water treatment devices may also make water more corrosive.

[a] A measure of the concentration of hydrogenions and potential electrochemical corrosion.

*Source*: From U.S. EPA, 1987, Preliminary Results from "Lead Solder Aging Study" More recent data are available at: U.S. EPA, 2005, Is there Lead in my Drinking Water? www.epa.gov/safewater/lead.

**Table 10J.263 Geometric Mean and Selected Percentiles of Lead in Blood in the United States. Population Aged 1 Yr and Older, National Health, and Nutrition Examination Survey, 1999–2002**

| | Survey Yrs | Geometric Mean (95% Conf. Interval) | Selected Percentiles (95% Confidence Interval) | | | | Sample Size |

**Table 10J.268 Estimated Drinking Water Concentration Corresponding to a $1 \times 10^{-6}$ Excess Lifetime Cancer Risk for Selected Known, Probable, or Possible Carcinogens for a Lifetime Consumption of Water**

| Chemical | Drinking Water Concentration (μg/L) | Sex, Species | Tumor Type |
|---|---|---|---|
| Benzene | 1–10 | Human | Leukemia |
| α-BHC | 0.006 | M mouse | Hepatocellular carcinoma |
| β-BHC | 0.02 | M mouse | Hepatocellular carcinoma |
| Carbon tetrachloride | 0.3 | Various | Hepatocellular carcinoma |
| 1,2-Dichloroethane | 0.4 | M rat | Hemangiosarcoma of circulatory system |
| 1,4-Dioxane[a] | 3 | M rat | Nasal squamous cell carcinoma |
| Ethylene dibromide (EDB) | 0.02 | Mrat | Forestomach tumors, hemangiosarcomas, thyroid follicular cell adenomas or carcinomas |
| DDT | 0.1 | Mouse/rat | Benign and malignant liver tumors |
| Heptachlor | 0.008 | Mouse | Hepatocellular carcinomas |
| 1,1,2,2-Tetrachloroethane | 0.2 | Mouse | Hepatocellular carcinoma |
| 1,1,2-Trichloroethane | 0.5 | Mouse | Hepatocellular carcinoma |
| Vinyl chloride — continuous lifetime exposure from birth | 0.024 | F rat | Total of liver angiosarcoma, hepatocellular carcinoma, and neoplastic nodules |
| Vinyl chloride — continuous lifetime exposure during adulthood | 0.048 | F rat | Total of liver angiosarcoma, hepatocellular carcinoma, and neoplastic nodules |

[a] Toxicity values under review; revised assessment due in 2006 or 2007.
